

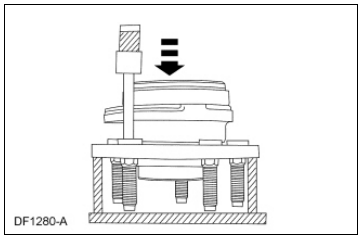
Item	Part Number	Description
1	1104	Wheel hub
2	1107	Wheel stud

Removal

1. Remove the wheel hub. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

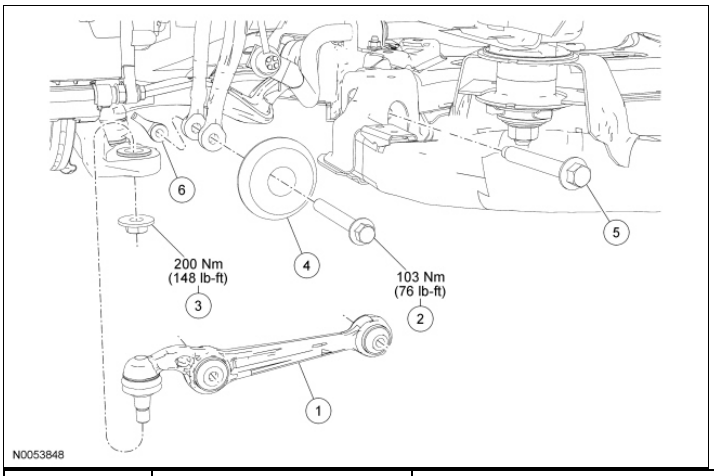


2. Using a press, remove the wheel stud from the wheel bearing and hub assembly.

Installation

1. Position the new wheel stud in the wheel hub, aligning the serrations in the wheel hub flange made by the original wheel stud.

2. Using a press, install a new wheel stud.



3. Install the wheel hub. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

Lower Arm - Front

Special Tool(s)

 ST2646-A	Adapter for 204-592 204-592/1
 ST2945-A	Separator, Ball Joint 204-592

Item	Part Number	Description
1	3A423	Lower arm (front)
2	W500550	Damper fork-to-lower arm bolt
3	3C499	Lower ball joint nut (front)
4	3C156	Damper
5	W712840	Front lower arm-to-subframe bolt
6	3C347	Damper fork-to-lower arm flagnut

Removal Installation

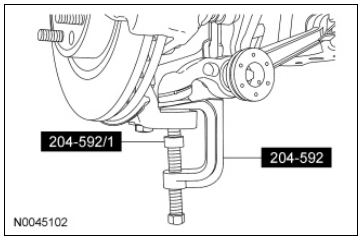
NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Using a suitable jack, support the front wheel knuckle at the rear lower ball joint.

3. Remove the front lower arm-to-subframe bolt.

- Discard the bolt.
- To install, tighten the new bolt to 110 Nm (81 lb-ft), then tighten an additional 90 degrees with the suspension at the bushing fastener tightening position.



4. Remove the damper fork-to-lower arm bolt flagnut and damper.
   - Discard the bolt and flagnut.
   - To install, tighten the new bolt and flagnut to 103 Nm (76 lb-ft) with the suspension at the bushing fastener tightening position.

5. Remove and discard the front lower ball joint nut.
   - To install, tighten the new nut to 200 Nm (148 lb-ft).

6. ***NOTICE:*** **When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer Constant Velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.**

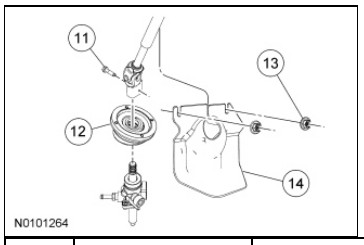
   NOTE: Once pressure is applied to the ball joint with the Ball Joint Separator and Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

   Using the Ball Joint Separator and Adapter, separate the front lower ball joint from the wheel knuckle and remove the front lower arm.

7. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.**

   To install, reverse the removal procedure.

Lower Arm - Rear



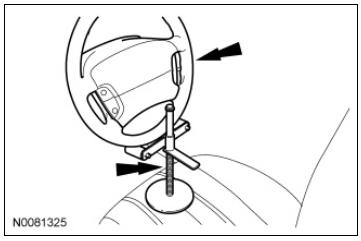
Special Tool(s)

 ST2646-A	Adapter for 204-592 204-592/1
 ST2945-A	Separator, Ball Joint 204-592

Item	Part Number	Description
1	3079 LH/ 3078 RH	Lower arm (rear)
2	3C499	Lower ball joint nut (rear)
3	W500752	Rear lower arm-to-subframe bolt
4	999581222	Washer
5	W520416	Subframe bracket-to-subframe nut (2 required)
6	5A552	Subframe bracket-to-subframe washer (2 ired)
7	3B155 LH/ 3B154 RH	Subframe bracket (2 required)
8	3C496	Subframe bracket-to-body bolts (4 required)
9	5E212	Catalytic converter
10	W705443	

		Catalytic converter manifold-to-exhaust flexible pipe nuts (2 required)

Item	Part Number	Description
11	3R827	Steering column shaft bolt
12	3C611B	Steering column shaft-to-dash seal
13	5801691	Lower steering column shaft joint cover nut (2 required)
14	3C611A	Lower steering column shaft joint cover



Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the lower shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

2. Remove the 2 lower steering column shaft joint cover nuts and cover.

3. ***NOTICE:*** **Do not allow the steering column shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the steering column shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   NOTE: If equipped with Hydraulic Power Assist Steering (HPAS), index-mark the steering column shaft position to the steering gear for reference during installation.

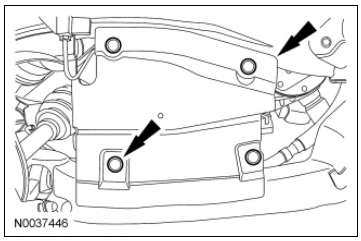
   Remoe the bolt and disconnect the steering column shaft from the steering gear.

- To install on HPAS vehicles, align the index marks and tighten to 25 Nm (18 lb-ft).
- To install on Electronic Power Assist Steering (EPAS) vehicles, tighten to 20 Nm (177 lb-in).

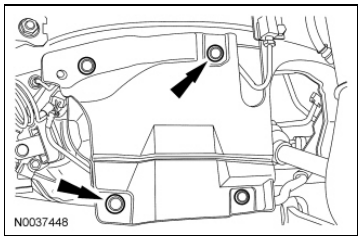
4. ***NOTICE:*** **Remove the steering column shaft-to-dash seal or damage to the seal can occur.**

   NOTICE: **When installing, make sure that the dash seal is correctly positioned on the steering gear and the retaining clips are fully engaged into the body or damage to the steering gear can result.**

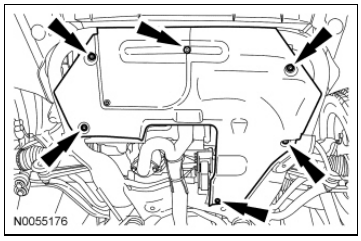
   Remove the steering column shaft-to-dash seal.



5. Remove the wheel and tire. For additional information, refer to Section 204-04 .



6. Remove the 8 screws and position the LH and RH splash shields aside.



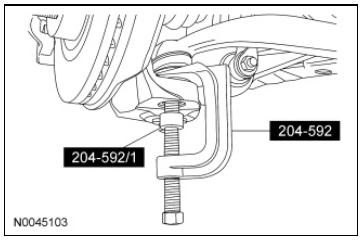
7. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

8. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

9. If equipped, remove the 7 screws and the underbody cover shield.
   - To install, tighten 7 Nm (62 lb-in).

10. Remove and discard the 2 catalytic converter manifold-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.
    - To install, tighten the new nuts to 40 Nm (30 lb-ft).

11. Using 2 suitable jack stands, support the rear of the subframe assembly.



12. Remove and discard the 4 subframe bracket-to-body bolts, the 2 subframe bracket-to-subframe nuts and washers. Lower the rear of the subframe.
    - To install, tighten the new bolts to 103 Nm (76 lb-ft).
    - To install, tighten the new nuts to 150 Nm (111 lb-ft).

13. Remove and discard the rear lower ball joint nut.
    - To install, tighten the new nut to 200 Nm (148 lb-ft).

14. ***NOTICE:*** **When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer Constant Velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.**

    NOTE: Once pressure is applied to the ball joint with the Ball Joint Separator and Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

    Using the Ball Joint Separator and Adapter, separate the rear lower ball joint from the wheel knuckle.

15. Remove the rear lower arm-to-subframe bolt and washer and remove the rear lower arm.
    - Discard the bolt and washer.
    - To install, tighten the new bolt to 65 Nm (48 lb-ft), then tighten an additional 90 degrees.

16. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.**

    To install, reverse the removal procedure.

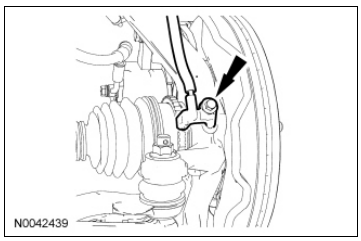
402 mm (15.83 in)
N0044310

Upper Arm

Special Tool(s)

 ST1263-A	Remover, Steering Arm 211-003 (T64P-3590-F)

Item	Part Number	Description
1	3091 LH/ 3084 RH	Upper arm
2	3C498	Upper ball joint nut
3	W500525	Upper arm-to-body bolt (2 required)
4	5B800	Shock absorber upper mount nut (3 required)
5	W500020	Wheel speed sensor harness bolt
6	W500222	Wheel speed sensor bolt
7	2C204 RH/ 2C205 LH	Wheel speed sensor

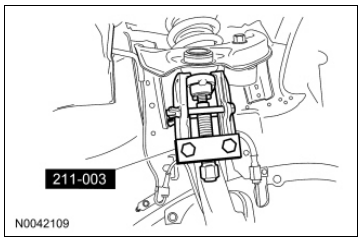


Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove and discard the 3 shock absorber upper mount nuts.

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .



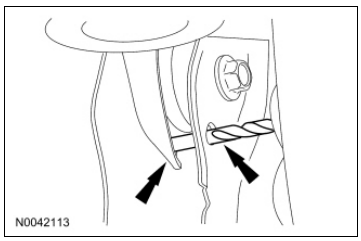
3. Remove the wheel speed sensor bolt.

4. Remove the wheel speed sensor harness bolt and position the wheel speed sensor aside.

5. Remove and discard the upper ball joint nut.

6. Using the Steering Arm Remover, separate the upper ball joint from the wheel knuckle.

7. Position the shock absorber and spring assembly toward the wheel knuckle to access the upper arm-to-body bolts.



8. Remove the 2 upper arm-to-body bolts and the upper arm.
   - Discard the bolts.

Installation

1. **NOTE:** Do not tighten the upper arm-to-body bolts at this time.

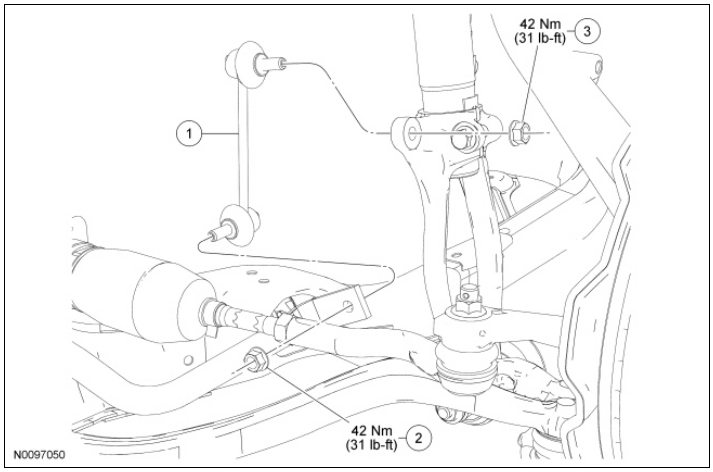
   Position the upper arm and install the 2 new upper arm-to-body bolts.

2. Set the upper arm bushing fastener tightening position by aligning the hole in the upper arm with the hole in the body bracket and inserting a 6.35 mm (0.25 in) drill bit through both holes.

3. Tighten the upper arm-to-body bolts to 55 Nm (41 lb-ft) and remove the drill bit.

4. Position the shock and spring assembly and install the 3 new shock upper mount nuts.
   - Tighten to 30 Nm (22 lb-ft).

5. Position the upper ball joint and install a new nut.
   - Tighten to 48 Nm (35 lb-ft).



6. Position the wheel speed sensor harness and install the bolt.
    - Tighten to 23 Nm (17 lb-ft).

7. Position the wheel speed sensor and install the bolt.
    - Tighten to 23 Nm (17 lb-ft).

8. Install the wheel and tire. For additional information, refer to Section 204-04 .

9. Check and, if necessary, align the front end. For additional information, refer to Section 204-00 .

Stabilizer Bar Link

Item	Part Number	Description
1	3053 LH/ 3052 RH	Stabilizer bar link
2	3C494	Stabilizer bar link lower nut
3	3C494	Stabilizer bar link upper nut

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. **NOTE:** Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.

   Remove and discard the stabilizer bar link upper nut.

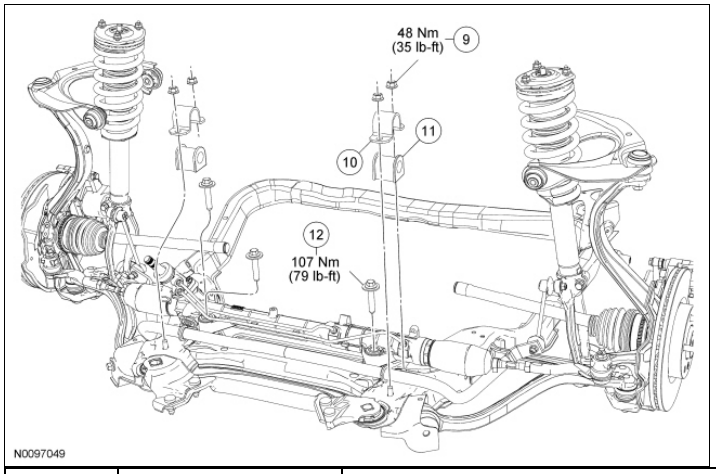
   - To install, tighten the new nut to 42 Nm (31 lb-ft).

3. **NOTE:** Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.

   Remove and discard the stabilizer bar link lower nut and remove the stabilizer bar link.

   - To install, tighten the new nut to 42 Nm (31 lb-ft).

4. To install, reverse the removal procedure.



Stabilizer Bar Bushing

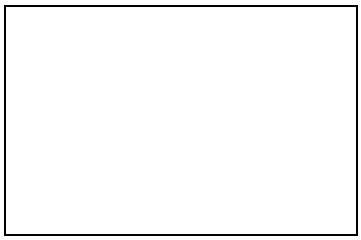
Special Tool(s)

 ST1408-A	Remover, Tie-Rod End 211-105 (T85M-3395-A)

Item	Part Number	Description
1	W705443	Catalytic converter-to-exhaust flexible pipe nuts (2 required)
2	W711918	Rear driveshaft-to-Power Transfer Unit (PTU) bolt (4 required)
3	5006930	Rear driveshaft assembly
4	5E212	Catalytic converter
5	3R827	Steering column shaft bolt
6	3C611B	Steering column shaft-to-dash seal
7	5801691	Lower steering column shaft joint cover nut (2 required)
8	3C611A	Lower steering column shaft joint cover

Item	Part Number	Description
9	W520414	Stabilizer bar bracket nut (4 required)
10	5486	Stabilizer bar bushing bracket (2 required)
11	5484	Stabilizer bar bushing (2 required)
12	3C497	Steering gear-to-subframe bolt (3 required)

Removal and Installation



NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

All vehicles

1. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the lower shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

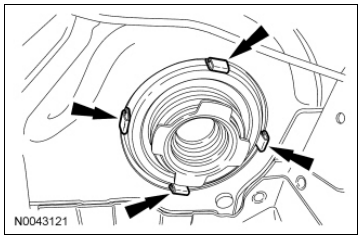
   NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

2. Remove the 2 lower steering column shaft joint cover nuts and cover.

3. ***NOTICE:*** **Do not allow the steering column shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the steering column shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   NOTE: If equipped with Hydraulic Power Assist Steering (HPAS), index-mark the steering column shaft position to the steering gear for reference during installation.



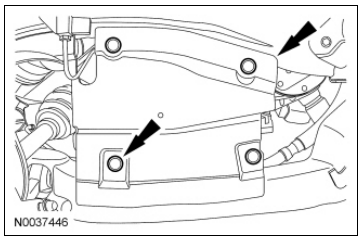
Remove the bolt and disconnect the steering column shaft from the steering gear.

- To install on HPAS vehicles, align the index marks and tighten to 25 Nm (18 lb-ft).
- To install on Electronic Power Assist Steering (EPAS) vehicles, tighten to 20 Nm (177 lb-in).

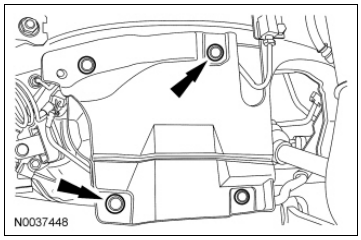
4. ***NOTICE:*** **Remove the steering column shaft-to-dash seal or damage to the seal can occur.**

   NOTICE: **When installing, make sure that the dash seal is correctly positioned on the steering gear and the retaining clips are fully engaged into the body or damage to the steering gear can result.**

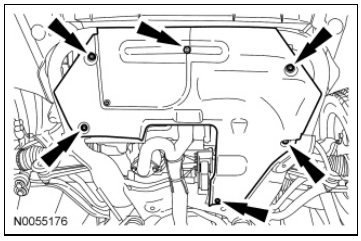
   Remove the steering column shaft-to-dash seal.



5. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



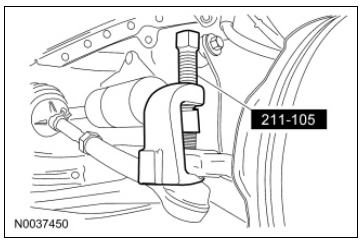
6. Remove the 8 screws and position the LH and RH splash shields aside.



7. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

8. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

9. If equipped, remove the 7 screws and the underbody cover shield.
   - To install, tighten 7 Nm (62 lb-in).



10. Remove and discard the 2 tie-rod end cotter pins and nuts.
    - To install, tighten the new nuts to 48 Nm (35 lb-ft).
    - Install new cotter pins.

11. ***NOTICE:*** **Do not use a hammer to separate the tie-rod end from the wheel knuckle or damage to the wheel knuckle can result.**

    NOTE: RH shown, LH similar.

    Using the Tie-Rod End Remover, separate the 2 tie-rod ends from the wheel knuckles.

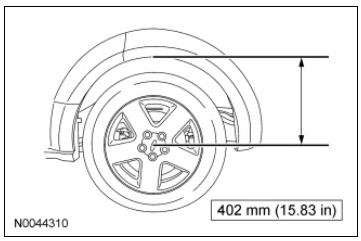
12. Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.
    - To install, tighten the new nuts to 40 Nm (30 lb-ft).

All-Wheel Drive (AWD) vehicles

13. Index the rear driveshaft-to-Power Transfer Unit (PTU).
    - Remove and discard the 4 bolts and position the driveshaft aside.
    - To install, tighten the new bolts to 70 Nm (52 lb-ft).

All vehicles

14. Remove RH steering gear-to-subframe bolt.
    - To install, tighten to 107 Nm (79 lb-ft).

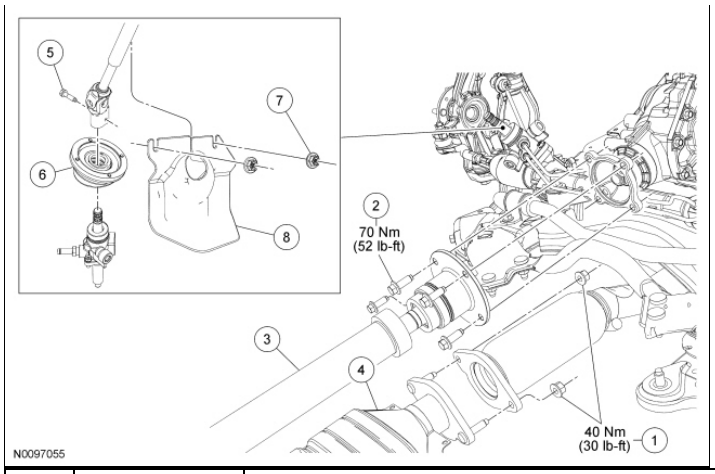


15. Remove the 2 LH steering gear-to-subframe bolts and position the steering gear to access the stabilizer bar LH bracket front nut.
    - To install, tighten to 107 Nm (79 lb-ft).

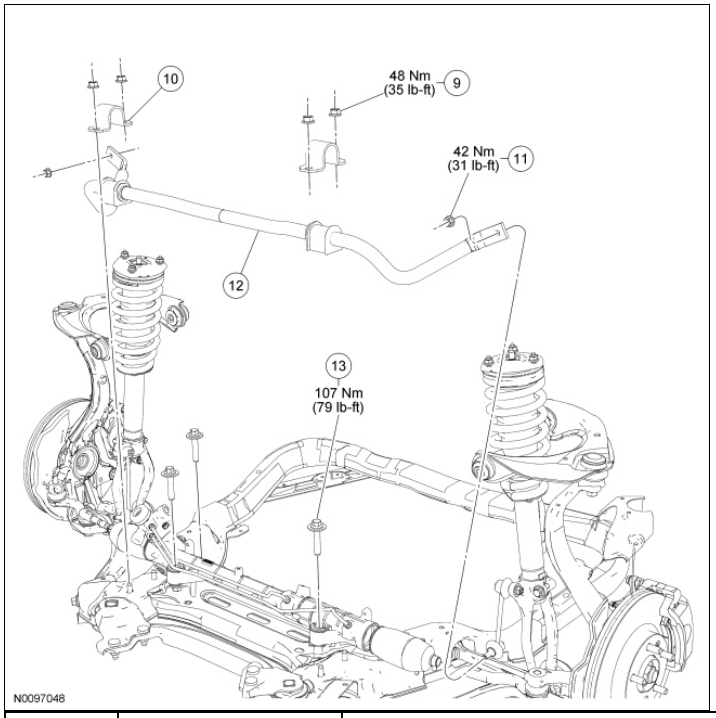
16. Remove and discard the 4 stabilizer bar bracket nuts and remove the 2 stabilizer bar brackets.
    - To install, tighten the new bracket nuts to 48 Nm (35 lb-ft).

17. Remove the 2 stabilizer bar bushings.

18. ***NOTICE:*** **Before tightening the stabilizer bar bracket nuts, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.**



To install, reverse the removal procedure.



Stabilizer Bar

Special Tool(s)

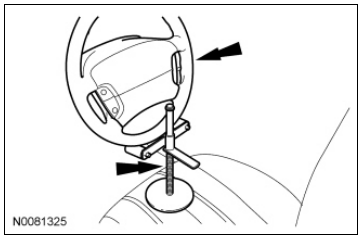
 ST1408-A	Remover, Tie-Rod End 211-105 (T85M-3395-A)

Item	Part Number	Description
1	W705443	Catalytic converter-to-exhaust flexible pipe nuts (2 required)
2	W711918	Rear driveshaft-to-Power Transfer Unit (PTU) bolt (4 required)
3	5006930	Rear driveshaft assembly
4	5E212	Catalytic converter
5	3R827	Steering column shaft bolt
6	3C611B	Steering column shaft-to-dash seal
7	5801691	Lower steering column shaft joint cover nut (2 required)
8	3C611A	Lower steering column shaft joint cover

Item	Part Number	Description
9	W520414	Stabilizer bar bracket nut (4 required)
10	5486	Stabilizer bar bracket (2 required)
11	3C494	Stabilizer bar link lower nut (2 required)
12	5494	Stabilizer bar
13	3C497	Steering gear-to-subframe bolt (3 required)

Item	Part Number	Description
14	W520416	Subframe bracket-to-subframe nut (4 required)
15	5A552	Front subframe washer (4 required)
16	3C496	Subframe-to-body bolt (4 required)
17	3B154	RH front subframe support bracket
18	3B155	LH front subframe support bracket
19	5C145	Front subframe

Removal and Installation



NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

All vehicles

1. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected or damage to the clockspring may result. If there is evidence that the lower shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   NOTE: Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

2. Remove the 2 lower steering column shaft joint cover nuts and cover.

3. ***NOTICE:*** **Do not allow the steering column shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the steering column shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   NOTE: If equipped with Hydraulic Power Assist Steering (HPAS), index-mark the steering column shaft position to the steering gear for reference during installation.

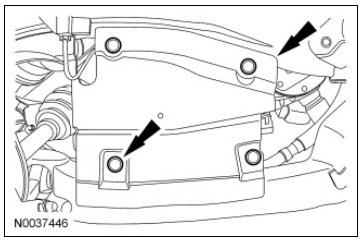
   Remove the bolt and disconnect the steering column shaft from the steering gear.

   - To install on HPAS vehicles, align the index marks, tighten to 25 Nm (18 lb-ft).
   - To install on Electronic Power Assist Steering (EPAS) vehicles, tighten to 20 Nm (177 lb-in).

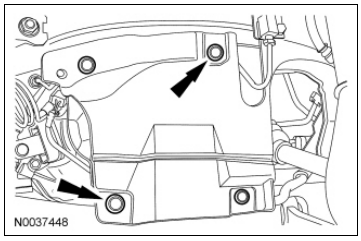
4. ***NOTICE:*** **Remove the steering column shaft-to-dash seal or damage to the seal can occur.**

   NOTICE: **When installing, make sure that the dash seal is correctly positioned on the steering gear and the retaining clips are fully engaged into the body or damage to the steering gear can result.**

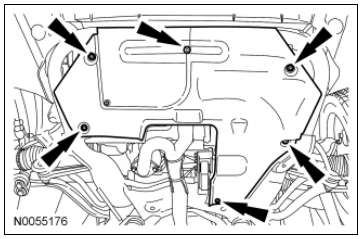
   Remove the steering column shaft-to-dash seal.



5. Remove the wheel and tire. For additional information, refer to Section 204-04 .



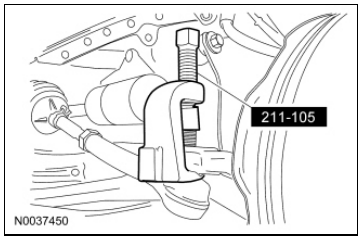
6. Remove the 8 screws and position the LH and RH splash shields aside.



7. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

8. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

9. If equipped, remove the 7 screws and the underbody cover shield.
   - To install, tighten 7 Nm (62 lb-in).



10. Remove and discard the 2 tie-rod end cotter pins and nuts.
    - To install, tighten the new nuts to 48 Nm (35 lb-ft) and install new cotter pins.

11. ***NOTICE:*** **Do not use a hammer to separate the tie-rod end from the wheel knuckle or damage to the wheel knuckle can result.**

    NOTE: RH shown, LH similar.

    Using the Tie-Rod End Remover, separate the tie-rod ends from the wheel knuckles.

12. **NOTE:** Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nuts.

    Remove and discard the 2 stabilizer bar link lower nuts and disconnect both stabilizer bar links from the stabilizer bar.

    - To install, tighten the new nuts to 42 Nm (31 lb-ft).

13. Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.
    - To install, tighten the new nuts to 40 Nm (30 lb-ft).

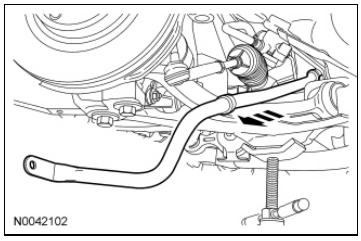
All-Wheel Drive (AWD) vehicles

14. Index-mark the rear driveshaft-to-Power Transfer Unit (PTU).
    - Remove and discard the 4 bolts and position the driveshaft aside.
    - To install, tighten the new bolts to 70 Nm (52 lb-ft).

All vehicles

15. Using 2 suitable jackstands, support the rear of the subframe assembly.

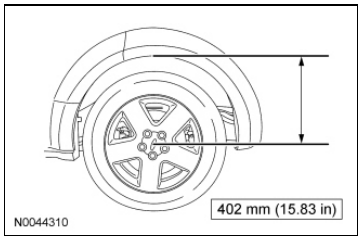
16. Remove and discard the 4 subframe bracket-to-body bolts, the 2 subframe bracket-to-subframe nuts and lower the rear of the subframe.
    - To install, tighten the new bolts to 103 Nm (76 lb-ft).
    - To install, tighten the new nuts to 150 Nm (111 lb-ft).



17. Remove the RH steering gear-to-subframe bolt.
    - To install, tighten to 107 Nm (79 lb-ft).

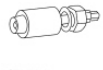
18. Remove the 2 LH steering gear-to-subframe bolts and position the steering gear to access the stabilizer bar LH bracket front nut.
    - To install, tighten to 107 Nm (79 lb-ft).

19. Remove and discard the 4 stabilizer bar bracket nuts and remove the 2 stabilizer bar brackets.
    - To install, tighten the new bracket nuts to 48 Nm (35 lb-ft).



20. Remove the 2 stabilizer bar bushings.

21. Remove the stabilizer bar through the LH wheel opening.



22. ***NOTICE:*** **Before tightening the stabilizer bar bracket nuts, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.**

    To install, reverse the removal procedure.

Wheel Knuckle

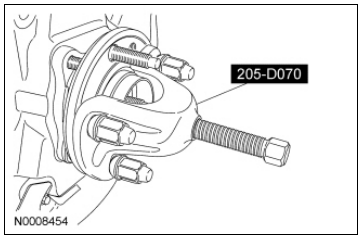
Special Tool(s)

 ST2646-A	Adapter for 204-592 204-592/1
 ST2138-A	Installer, Halfshaft 204-161 (T97P-1175-A)
 ST2330-A	Remover, Front Hub 205-D070 (D93P-1175-B) or equivalent
 ST1263-A	Remover, Steering Arm 211-003 (T64P-3590-F)
 ST1408-A	Remover, Tie-Rod End 211-105 (T85M-3395-A)
 ST2945-A	Separator, Ball Joint 204-592

Item	Part Number	Description
1	3N405	Wheel hub nut

2	-	Brake caliper and anchor plate assembly
3	W505741	Brake disc bolt (2 required)
4	1032	Brake disc
5	3K171 LH/ 3K170 RH	Wheel knuckle
6	3C499	Lower ball joint nut (2 required)
7	W711241	Brake caliper anchor plate bolt (2 required)
8	3C498	Upper ball joint nut
9	3D000	Tie-rod end nut
10	W500020	Wheel speed sensor harness bolt
11	W500222	Wheel speed sensor bolt
12	W505263	Brake flexible hose bracket-to-wheel knuckle bolt

Removal



NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

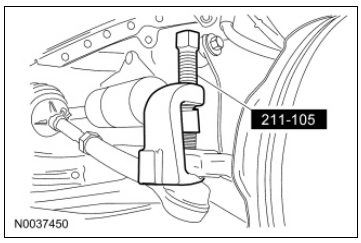
1. Remove the wheel and tire. For additional information, refer to Section 204-04 .
2. If equipped, remove the wheel speed sensor bolt.
3. If equipped, remove e wheel speed sensor harness bolt and position the wheel speed sensor aside.
4. Remove the brake flexible hose bracket-to-wheel knuckle bolt and position the hose and bracket aside.
5. **NOTE:** Apply the brake to keep the halfshaft from rotating.

   Remove and discard the wheel hub nut.
6. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

   Remove the bolts and position the caliper and anchor plate assembly aside.

   - Support the caliper and anchor plate assembly using mechanic's wire.
7. Remove the 2 brake disc bolts and the brake disc.
8. Using the Front Hub Remover, separate the halfshaft from the wheel hub.

9. Remove and discard the upper ball joint nut.

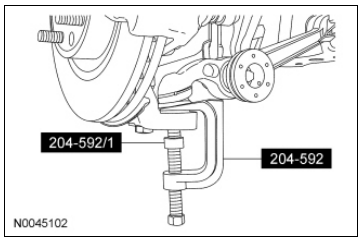


10. Using the Steering Arm Remover, separate the upper ball joint from the wheel knuckle.

11. Remove and discard the tie-rod end cotter pin and nut.

12. ***NOTICE:*** **Do not use a hammer to separate the tie-rod end from the wheel knuckle or damage to the wheel knuckle can result.**

    Using the Tie-Rod End Remover, separate the tie-rod end from the wheel knuckle.



13. Remove and discard the 2 lower ball joint nuts.

14. ***NOTICE:*** **When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer Constant Velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.**

    NOTE: Once pressure is applied to the ball joint with the Ball Joint Separator and Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

    Using the Ball Joint Separator and Adapter, separate the 2 lower ball joints from the wheel knuckle and remove the wheel knuckle.

Installation

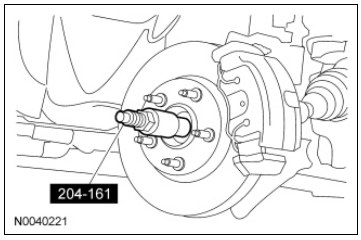
1. Position the wheel knuckle and install the 2 new lower ball joint nuts.
   - Tighten to 200 Nm (148 lb-ft).

2. Position the tie-rod end and install the new nut and cotter pin.

- Tighten to 48 Nm (35 lb-ft).

3. Position the upper ball joint and install the new nut.
   - Tighten to 48 Nm (35 lb-ft).

4. If equipped, position the wheel speed sensor and install the bolt.
   - Tighten to 23 Nm (17 lb-ft).



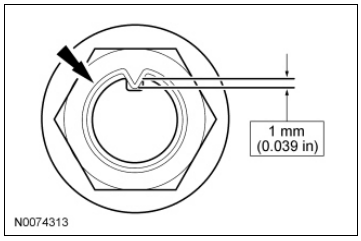
5. If equipped, install the wheel speed sensor harness bolt.
   - Tighten to 23 Nm (17 lb-ft).

6. Position the brake flexible hose bracket and install the bolt.
   - Tighten to 20 Nm (177 lb-in).

7. Position the brake caliper and anchor plate assembly and install the 2 bolts.
   - Tighten to 90 Nm (66 lb-ft).

8. Install the brake disc and the 2 brake disc bolts.
   - Tighten to 20 Nm (177 lb-in).

9. Using the Halfshaft Installer, install the halfshaft into the wheel hub.



10. ***NOTICE:*** **Do not tighten the halfshaft nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

    NOTE: Apply the brake to keep the halfshaft from rotating.

    Install the wheel hub nut.

    - Tighten to 255 Nm (189 lb-ft).

11. Stack the new nut in line with the keyway to a recommended depth of 1 mm (0.039 in) below the keyway diameter to engage the locking feature.

Shock Absorber and Spring Assembly

Item	Part Number	Description
1	W500550	Damper fork-to-lower arm bolt
2	3C156	Damper
3	3C494	Stabilizer bar link upper nut
4	-	Shock absorber and spring assembly
5	W302117	Damper fork-to-lower arm flagnut
6	W302128	Shock absorber upper mount nut (3 required)
7	3462	Damper fork
8	W302119	Shock absorber-to-damper fork bolt
9	W500020	Wheel speed sensor harness bolt
10	W500222	Wheel speed sensor bolt
11	2C204 RH/ 2C205 LH	Wheel speed sensor

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove and discard the 3 shock absorber upper mount nuts.
    - To install, tighten the new nuts to 30 Nm (22 lb-ft).

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. Remove the wheel speed sensor bolt.
   - To install, tighten to 23 Nm (17 lb-ft).

4. Remove the wheel speed ssor harness bolt and position the wheel speed sensor aside.
   - To install, tighten to 23 Nm (17 lb-ft).

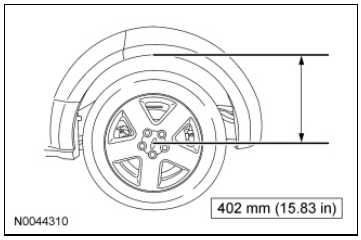
5. Using a suitable jack, support the wheel knuckle at the lower ball joints.

6. **NOTE:** Use the hex-holding feature to prevent the ball stud from turning while removing or installing the stabilizer bar link nut.

   Remove and discard the stabilizer bar link upper nut.

   - To install, tighten the new nut to 42 Nm (31 lb-ft).

7. Remove the damper fork-to-front lower arm bolt, flagnut and damper.
   - Discard the bolt and flagnut.
   - To install, tighten the new bolt and flagnut to 103 Nm (76 lb-ft) with the suspension at the bushing fastener tightening position.

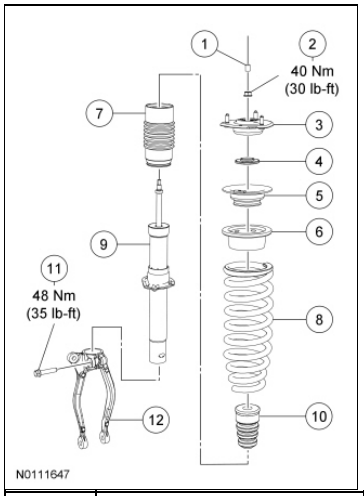


8. Remove and discard the shock absorber-to-damper fork bolt and separate the damper fork from the shock absorber and spring assembly.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).

9. Lower the wheel knuckle and remove the shock absorber and spring assembly.

10. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 402 mm (15.83 in). This will prevent incorrect clamp load and bushing damage.**

    To install, reverse the removal procedure.



11. For additional information on the disassembly and assembly of the shock absorber and spring assembly, refer to Shock Absorber and Spring Assembly in this section.

Shock Absorber and Spring Assembly

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Item	Part Number	Description
1	18A179	Shock absorber rod protective cap
2	18A161	Shock absorber rod nut
3	18183	Shock absorber upper mount
4	-	Strut bearing (part of 18183)
5	-	Spring seat (part of 18183)
6	5793	Spring seat - rubber
7	3C239	Dust boot
8	5310	Spring
9	18184	Shock absorber and lower mount assembly
10	18198	Jounce bumper
11	W302119	Shock absorber-to-damper fork bolt
12	3463 LH/ 3462 RH	Damper fork

Disassembly and Assembly

⚠ WARNING: Do not apply heat or flame to the shock absorber or strut tube. The shock absorber and strut tube are gas pressurized and could explode if heated. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Keep all body parts clear of shock absorbers or strut rods. Shock absorbers or struts can extend unassisted. Failure to follow this instruction may result in serious personal injury.

⚠ **WARNING: The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.**

NOTICE: **The coil spring is coated with long-term corrosion protective paint. Do not damage the paint during component servicing or damage to the coil spring may occur.**

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

2. ⚠ **WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

   Position the shock and spring assembly in a suitable spring compressor.

3. Compress the spring enough to relieve the tension on the shock and spring assembly.

4. Remove the shock rod protective cap.

5. *NOTICE:* **Do not use an impact wrench on the shock absorber rod nut or damage to the shock absorber may occur.**

   NOTE: Use the hex-holding feature to prevent the shock absorber rod from turning while removing or installing the nut.

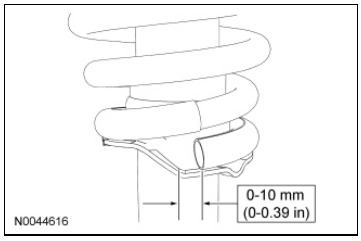
   While holding the shock absorber rod, remove and discard the nut.

   - To install, tighten the new nut to 40 Nm (30 lb-ft).

6. Remove the shock absorber and lower mount assembly.

7. Remove the shock absorber upper mount, spring upper seat and dust boot.

8. Carefully release the tension on the spring compressor and remove the spring.



9. Remove and discard the shock absorber-to-damper fork bolt, then separate the shock and damper fork.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).

10. **NOTE:** Before installing the jounce bumper, apply silicone brake caliper grease and dielectric compound 360 degrees around the upper and lower contact surfaces.

    Remove the jounce bumper.

11. **NOTE:** Before tightening the shock absorber rod nut, position the end of the spring within 0-10 mm (0-0.39 in) of the step on the spring mount.

    To assemble, reverse the disassembly procedure.

0-10 mm
(0-0.39 in)
N0044616

Material

Item	Specification	Fill Capacity
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B	-

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake caliper anchor plate bolt	70	52	-
Brake disc bolt	20	-	177
Brake disc shield bolt	23	17	-
Jounce stop	55	41	-
Lower arm cam adjuster nut	101	74	-
Lower arm outboard nut	103	76	-
Parking brake cable bracket bolt	10	-	89
Shock absorber bracket bolt	40	30	-
Shock absorber lower bolt - All-Wheel Drive (AWD)	90		

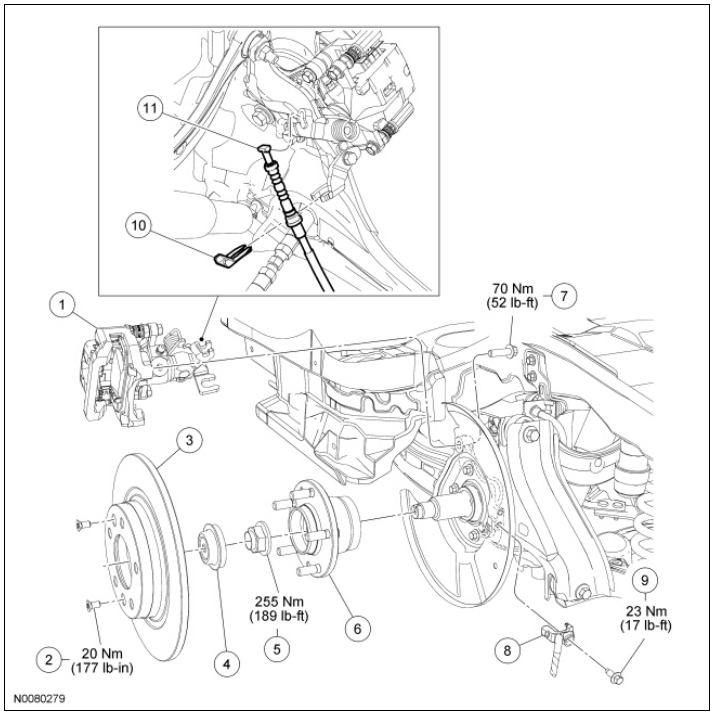
Rear Suspension

The rear suspension consists of the following components:

- Wheel bearing and wheel hub assemblies
- Wheel studs
- Upper arms
- Lower arms
- Toe links
- Stabilizer bar
- Stabilizer bar bushings
- Stabilizer bar links
- Trailing arms
- Wheel knuckles
- Wheel spindles
- Shock absorbers
- Coil springs

The rear suspension utilizes an independent short/long arm design. This suspension system incorporates a separate wheel knuckle for each wheel and allows the wheels to react to road imperfections independent of each other. This independent action offers improved isolation from the effects of jounce and rebound.

Rear Suspension

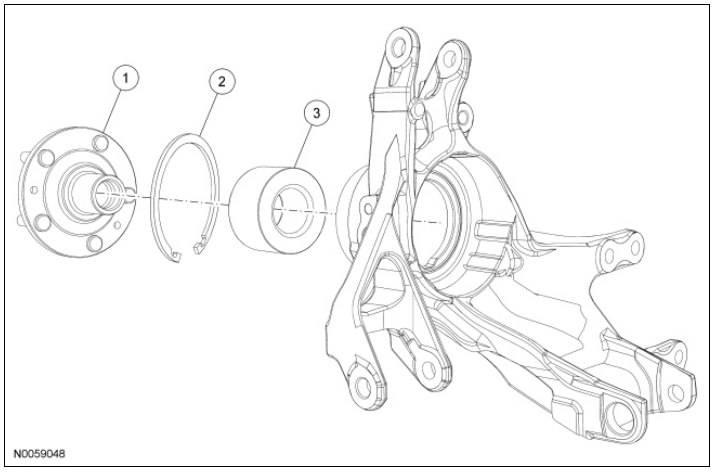


Refer to Section 204-00 .

Wheel Bearing and Wheel Hub

Special Tool(s)

 ST2446-A	Installer, Wheel Bearing Cup 205-147
 ST1895-A	Remover, Drive Pinion Bearing Cone 205-D002 (D79L-4621-A) or equivalent
 ST2446-A	Remover/Installer, Wheel Bearing Cup 204-020
 ST2446-A	Step Plate 205-117



Front Wheel Drive (FWD) Vehicles

Item	Part Number	Description
1	-	Brake caliper and anchor plate assembly
2	W505741	Brake disc bolt (2 required)
3	2C026	Brake disc

4	1N135	Grease cap
5	W712435	Wheel hub nut
6	1104	Wheel hub and bearing assembly
7	W711240	Brake caliper anchor plate bolt (2 required)
8	2C187	Wheel speed sensor
9	W500222	Wheel speed sensor bolt
10	2860	Parking brake cable clip
11	2A815	Rear parking brake cable assembly

All-Wheel Drive (AWD) Vehicles

Item	Part Number	Description
1	1104	Wheel hub
2	W303280	Snap ring
3	1215	Wheel bearing

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement partf lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

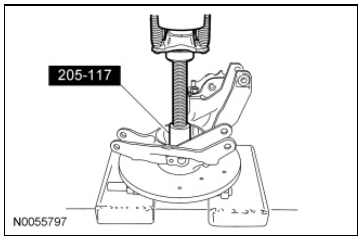
Front Wheel Drive (FWD) vehicles

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove the wheel speed sensor bolt and position the sensor aside.

3. Disconnect the parking brake cable from the brake caliper in the following sequence.
    1. Remove the clip.
    2. Disconnect the parking brake cable from the brake caliper.

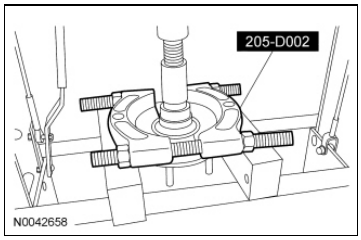
4. ***NOTICE:*** **Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**



Remove the anchor plate bolts and position the brake caliper and anchor plate assembly aside.

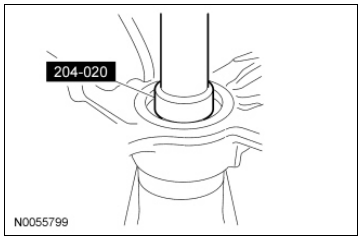
- Support the brake caliper and anchor plate assembly using mechanic's wire.

5. Remove the 2 brake disc bolts and the brake disc.
6. Remove and discard the grease cap.
7. Remove and discard the wheel hub nut and remove the wheel hub and bearing assembly.



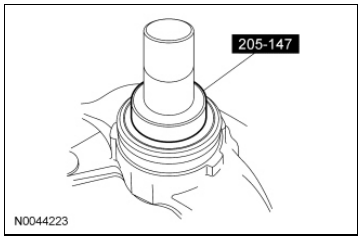
All-Wheel Drive (AWD) vehicles

8. Remove the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.
9. Using the Step Plate, press the wheel hub from the wheel bearing.

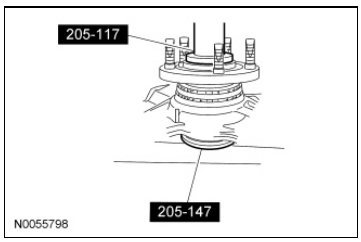


10. **NOTE:** This step may be necessary if the inner wheel bearing race remains in the wheel knuckle after removing the wheel hub.

    Install the Drive Pinion Bearing Cone Remover, position in a suitable press and press the inner wheel bearing race from the wheel hub.



11. Remove the snap ring.
12. Using the Wheel Bearing Cup Remover/Installer, press the outer wheel bearing race from the wheel knuckle.



Installation

AWD vehicles

1. Using the Wheel Bearing Cup Installer, press the wheel bearing into the wheel knuckle.

2. Using the Wheel Bearing Cup Installer and Step Plate, press the wheel hub into the wheel bearing.

3. Install the wheel knuckle. For additional information, refer to Wheel Knuckle in this section.

FWD vehicles

4. Position the wheel speed sensor and install the bolt.
   - Tighten to 23 Nm (17 lb-ft).

5. Install the brake disc and the 2 brake disc bolts.
   - Tighten to 20 Nm (177 lb-in).

6. Position the brake caliper and install the brake caliper anchor plate bolts.
   - Tighten to 70 Nm (52 lb-ft).

7. ***NOTICE:*** **Do not tighten the rear wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the bearing is loaded with the weight of the vehicle applied.**

   Install the new wheel hub and bearing and a new wheel hub nut.

   - While applying the brakes to keep the halfshaft from rotating, tighten to 255 Nm (189 lb-ft).

8. Connect the parking brake cable to the brake caliper in the following sequence.
   1. Install the clip.
   2. Connect the parking brake cable to the brake caliper.

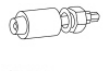
9. Install the wheel and tire. For additional information, refer to Section 204-04 .

Wheel Studs

NOTE: Front Wheel Drive (FWD) vehicle shown, All-Wheel Drive (AWD) similar.

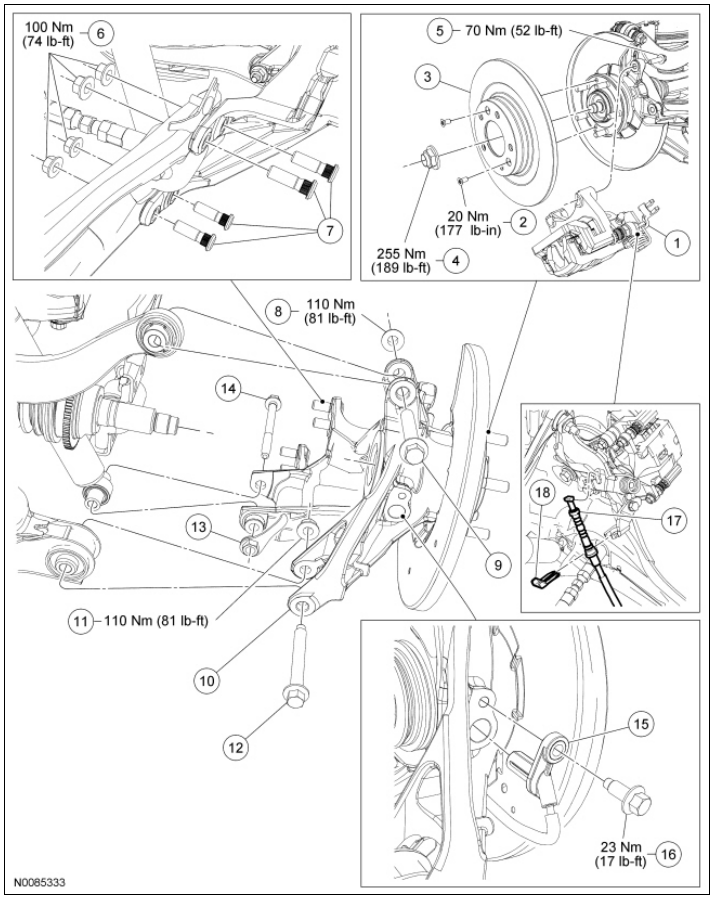
Item	Part Number	Description
1	1104	Wheel bearing and wheel hub assembly
2	1107	Wheel stud

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the wheel bearing and wheel hub. For additional information, refer to Wheel Bearing and Wheel Hub in this section.
3. Using a press, remove the wheel stud from the wheel hub.

Installation



1. Position the new wheel stud in the wheel hub, aligning the serrations in the wheel hub flange made by the original wheel stud.
2. Using a press, install the new wheel stud.
3. Install the wheel bearing and wheel hub. For additional information, refer to Wheel Bearing and Wheel Hub in this section.

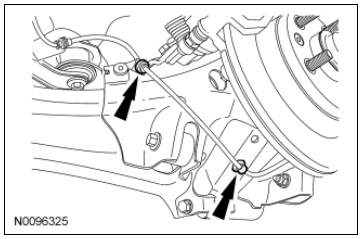
Wheel Knuckle

Special Tool(s)

 ST2138-A	Installer, Halfshaft 204-161 (T97P-1175-4)
 ST2330-A	Remover, Front Wheel Hub 205-D070 (D93P-1175-B) or equivalent

NOTE: All-Wheel Drive (AWD) MKZ vehicle shown, other vehicles similar.

Item	Part Number	Description
1	-	Brake caliper and anchor plate assembly
2	W505741	Brake disc bolt (2 required)
3	2C026	Brake disc
4	W712435	Wheel hub nut



5	W711240	Brake caliper anchor plate bolt (2 required)
6	W520515	Trailing arm-to-wheel knuckle nuts (4 required)
7	5B860	Trailing arm-to-wheel knuckle bolts (4 required)
8	W520515	Upper arm outboard nut
9	W500547	Upper arm outboard bolt
10	5A968	Wheel knuckle
11	W520215	Lower arm outboard nut
12	W513798	Lower arm outboard bolt
13	W302116	Shock absorber lower flagnut
14	W704586	Shock absorber lower bolt
15	2C187 LH/ 2C187 RH	Wheel speed sensor
16	W500222	Wheel speed sensor bolt
17	2A815	Parking brake cable assembly
18	2860	Parking brake cable clip

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make surof correct retention of these parts.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

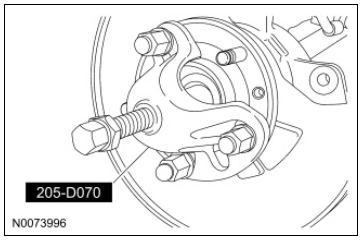
2. Detach the 2 wheel speed sensor harness retainers.

3. Remove the wheel speed sensor bolt and position the sensor aside.

4. Disconnect the parking brake cable from the brake caliper in the following sequence.
    1. Remove the clip.
    2. Disconnect the parking brake cable from the brake caliper.

5. **NOTE:** Apply the brake to keep the halfshaft from rotating.

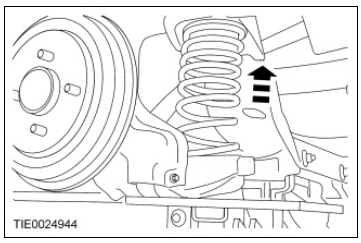
   Remove and discard the wheel hub nut.



6. ***NOTICE:*** **Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

   Remove the anchor plate bolts and position the brake caliper and anchor plate assembly aside.

- Support the brake caliper and anchor plate assembly using mechanic's wire.



7. Remove the 2 brake disc bolts and the brake disc.

8. Using the Front Wheel Hub Remover, separate the halfshaft from the wheel hub.

9. Remove and discard the shock absorber lower bolt and flagnut.
   - If equipped, remove the shock absorber damper.

10. Using a suitable jack, raise the lower arm.

11. Remove and discard the upper arm outboard bolt.

12. Remove and discard the lower arm outboard bolt.

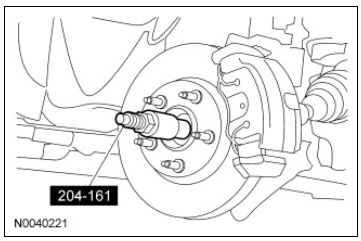
13. Remove the 4 trailing arm-to-knuckle nuts and the wheel knuckle.
    - Discard the nuts.

Installation

NOTICE: **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.**

1. Position the wheel knuckle and loosely install the 4 new trailing arm-to-knuckle nuts.

2. Loosely install the new lower arm outboard bolt.



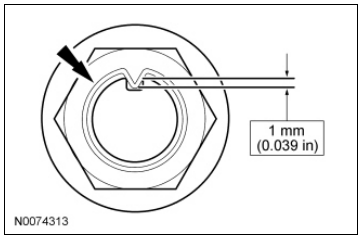
3. Loosely install the new upper arm outboard bolt.

4. Loosely install the new shock absorber lower bolt and flagnut.

5. Install the brake disc and the 2 brake disc bolts.
   - Tighten to 20 Nm (177 lb-in).

6. Position the brake caliper and anchor plate assembly and install the 2 bolts.
   - Tighten to 70 Nm (52 lb-ft).

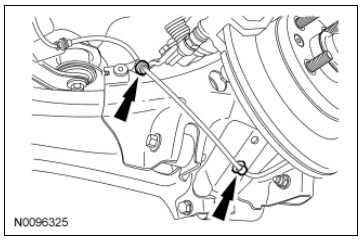
7. Using the Halfshaft Installer, install the halfshaft into the wheel hub.



8. ***NOTICE:*** **Do not tighten the wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

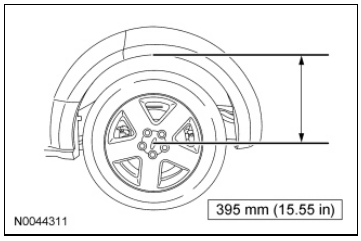
   Install a new wheel hub nut.

   - While applying the brakes to prevent the wheel hub nut from turning, tighten to 255 Nm (189 lb-ft).



9. Stake the new nut in line with the keyway to a recommended depth of 1 mm (0.039 in) below the keyway diameter to engage the locking feature.

10. Connect the parking brake cable to the brake caliper in the following sequence.
    1. Install the clip.
    2. Connect the parking brake cable to the brake caliper.



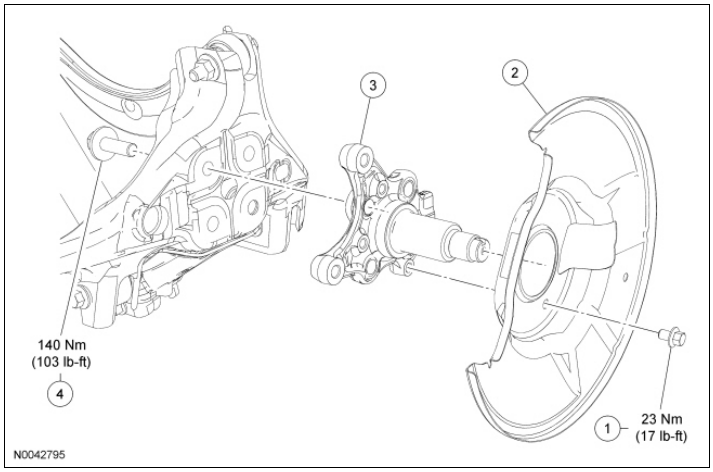
11. Install the wheel speed sensor and the bolt.
    - Tighten to 23 Nm (17 lb-ft).

12. Attach the 2 wheel speed sensor harness retainers.

13. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent unequal clamp load and bushing damage.**

    Using the positioned suitable jack, raise the lower arm to bushing fastener tightening position.

14. Tighten the 4 trailing arm-to-knuckle nuts to 100 Nm (74 lb-ft).



15. Tighten the lower arm outboard bolt to 103 Nm (76 lb-ft).

16. Tighten the upper arm outboard bolt to 110 Nm (81 lb-ft).

17. Tighten the shock absorber lower bolt.
    - Tighten to 90 Nm (66 lb-ft), All-Wheel Drive (AWD) vehicles.
    - Tighten to 115 Nm (85 lb-ft), Front Wheel Drive (FWD) vehicles.

18. Lower and remove the jack.

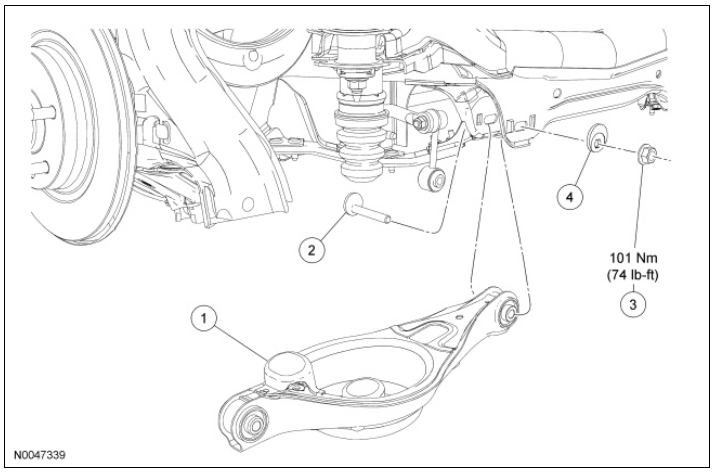
Wheel Spindle

Item	Part Number	Description
1	W500020	Brake disc shield bolt (3 required)
2	2K046 LH/ 2K045 RH	Brake disc shield
3	4A013	Wheel spindle
4	W715590	Wheel spindle bolt (4 required)

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the wheel bearing and wheel hub assembly. For additional information, refer to Wheel Bearing and Wheel Hub in this section.



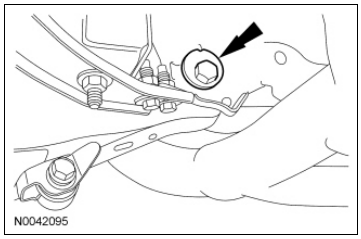
2. Remove the 3 brake disc shield bolts and remove the brake disc shield.
   - To install, tighten to 23 Nm (17 lb-ft).

3. Remove and discard the 4 wheel spindle bolts and remove the wheel spindle.
   - To install, tighten the new bolts to 140 Nm (103 lb-ft).

4. To install, reverse the removal procedure.

Lower Arm

NOTE: Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.



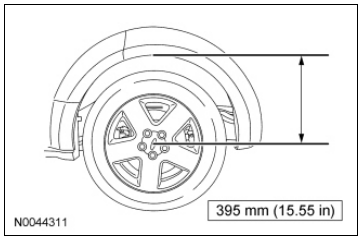
Item	Part Number	Description
1	5A649	Lower arm
2	5K751	Cam bolt
3	W520515	Cam adjuster nut
4	6269	Cam adjuster

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the spring. For additional information, refer to Spring in this section.

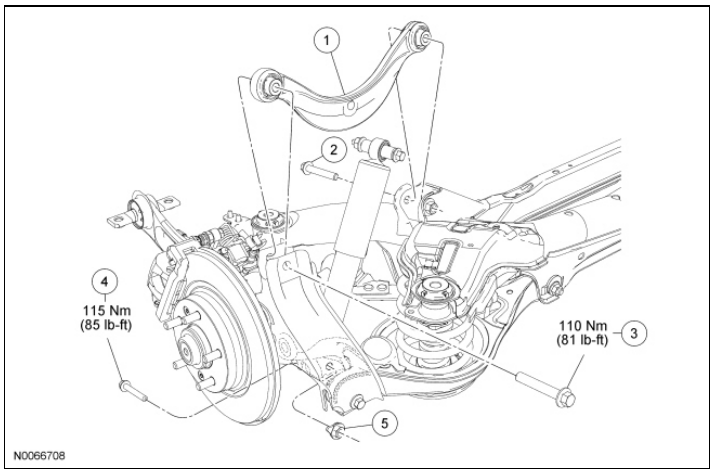
2. Remove the cam adjuster nut, cam adjuster, cam bolt and the lower arm.
   - Discard the nut.
   - To install, tighten the new nut to 101 Nm (74 lb-ft) with the suspension at the bushing fastener tightening position.



3. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the**

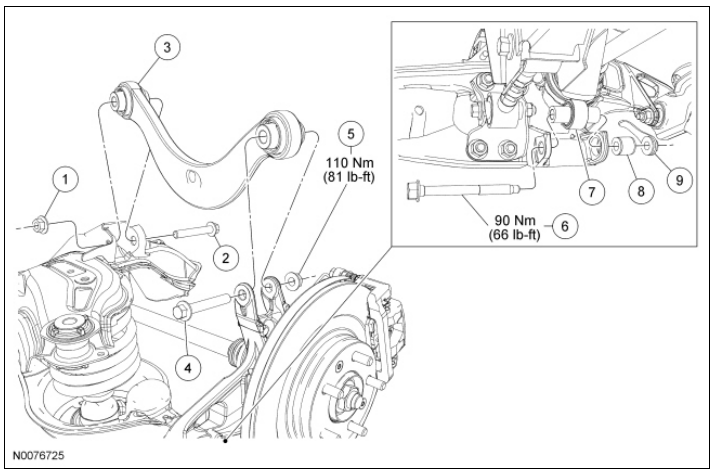
distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.

NOTE: Do not fully tighten the cam adjuster nut until the rear alignment has been checked and, if necessary, adjusted.



NOTE: Install the cam bolt and the cam adjuster with the cam facing upward.

To install, reverse the removal procedure.



Upper Arm

Front Wheel Drive (FWD) Vehicles

Item	Part Number	Description
1	5500	Upper arm
2	W712769	Upper arm inboard bolt
3	W500546	Upper arm outboard bolt
4	W704586	Shock absorber lower bolt
5	W302116	Shock absorber lower flagnut

All-Wheel Drive (AWD) Vehicles

Item	Part Number	Description
1	W520215	Upper arm inboard nut
2	W712769	Upper arm inboard bolt
3	5500	Upper arm

4	W500547	Upper arm outboard bolt
5	W520215	Upper arm outboard nut
6	W712880	Shock absorber lower bolt
7	18080	Shock absorber
8	-	Shock absorber lower mount bushing
9	W302116	Shock absorber lower flagnut

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

All vehicles

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Using a suitable jack, support the trailing arm.

3. ***NOTICE:*** **Do not fully tighten the shock absorber lower nut until the suspension is at the bushing fastener tightening position. This will prevent incorrect clamp load and bushing damage.**

   Remove and discard the shock absorber lower bolt and flagnut.

   - To install, tighten the new bolt and flagnut to 90 Nm (66 lb-ft), All-Wheel Drive (AWD) vehicles.
   - To install, tighten the new bolt and flagnut to 115 Nm (85 lb-ft), Front Wheel Drive (FWD) vehicles.

Front Wheel Drive (FWD) vehicles

4. Remove and discard the upper arm outboard bolt.
   - To install, tighten the new bolt to 110 Nm (81 lb-ft) with the suspension at the bushing fastener thtening position.

All-Wheel Drive (AWD) vehicles

5. Remove and discard the upper arm outboard bolt and nut.
   - To install, tighten the new nut and bolt to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

All vehicles

6. Carefully lower the trailing arm and remove the jack.

7. **NOTE:** Position the shock absorber as necessary to remove the upper arm.

   NOTE: When tightening the upper arm inboard bolt, the suspension must be at the bushing fastener tightening position.

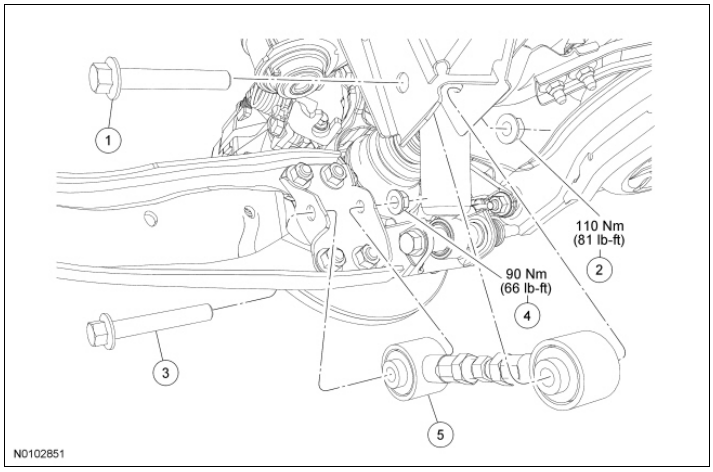
   Remove and discard the upper arm inboard bolt and remove the upper arm.

- To install, tighten the new bolt to 100 Nm (74 lb-ft) and then rotate an additional 90 degrees.

8. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.**

   To install, reverse the removal procedure.

9. Check and, if necessary, adjust the rear camber. For additional information, refer to Section 204-00 .



Toe Link

Front Wheel Drive (FWD) Vehicles

Item	Part Number	Description
1	5G095	Toe link shield
2	W709453	Pushpin
3	5B674	Toe link
4	W500214	Toe link shield bolt
5	W520515	Toe link inboard nut
6	W500547	Toe link outboard bolt
7	W500547	Toe link inboard bolt

All-Wheel Drive (AWD) Vehicles

Item	Part Number	Description
1	W500547	Toe link inboard bolt

2	W520515	Toe link inboard nut
3	W500547	Toe link outboard bolt
4	W520515	Toe link outboard nut
5	5B674	Toe link

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

All vehicles

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

Front Wheel Drive (FWD) vehicles

2. Remove the toe link shield bolt.
   - To install, tighten to 8 Nm (71 lb-in).

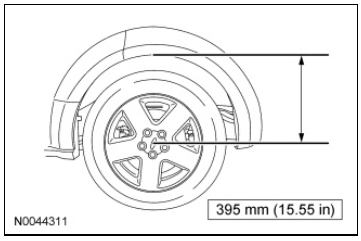
3. Remove the pushpin and the shield.

All vehicles

4. Remove and discard the toe link inboard nut and bolt.
   - To install, tighten the new nut to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

All-Wheel Drive (AWD) vehicles

5. Remove and discard the toe link outboard nut and bolt and remove the toe link.
   - To install, tighten the new nut to 90 Nm (66 lb-ft) with the suspension at the bushing fastener tightening position.



FWD vehicles

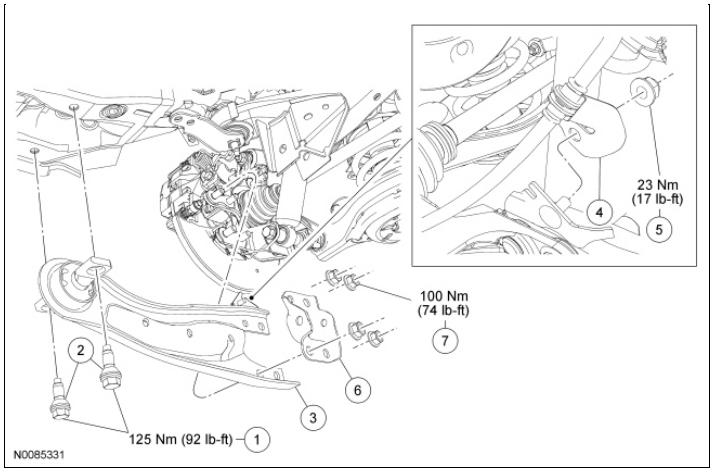
6. Remove the toe link outboard bolt and remove the toe link.
   - To install, tighten the new bolt to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

All vehicles

7. *NOTICE:* **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.**

   To install, reverse the removal procedure.

8. Check and, if necessary, adjust the rear toe. For additional information, refer to Section 204-00 .



Trailing Arm

Front Wheel Drive (FWD) Vehicles

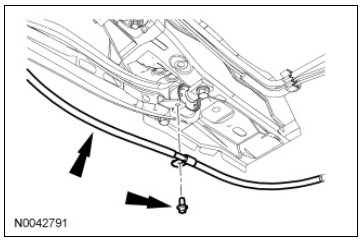
Item	Part Number	Description
1	W711493	Trailing arm-to-frame bolt (2 required)
2	W704586	Shock absorber lower bolt
3	W302116	Shock absorber lower flagnut
4	W500546	Toe link outboard bolt
5	5A995 LH/ 5A994 RH	Trailing arm
6	W513798	Lower arm outboard bolt
7	W500546	Upper arm outboard bolt
8	6C028	Cone washer (2 required)

All-Wheel Drive (AWD) Vehicles

Item	Part Number	Description

1	W711493	Trailing arm-to-frame bolts (2 required)
2	6C028	Cone washers (2 required)
3	5A995 LH/ 5A994 RH	Trailing arm
4	-	Wheel speed sensor bracket (part of 2C186 RH/2C187 LH)
5	W520102	Wheel speed sensor bracket nut
6	5A757	Trailing arm toe link bracket
7	5B860	Trailing arm-to-knuckle nut (4 required)

Removal and Installation

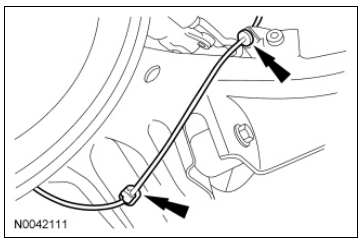


NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

All-Wheel Drive (AWD) vehicles

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

All vehicles



2. Remove the parking brake cable bracket bolt and position the parking brake cable aside.
   - To install, tighten to 10 Nm (89 lb-in).

Front Wheel Drive (FWD) vehicles

3. Remove the wheel spine. For additional information, refer to Wheel Spindle in this section.

4. If equipped, detach the wheel speed sensor harness from the trailing arm.

5. Using a suitable jack, support the trailing arm.

6. ⚠ **WARNING: The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.**

Remove and discard the lower arm outboard bolt.

- To install, tighten the new bolt to 103 Nm (76 lb-ft) with the suspension at the bushing fastener tightening position.

7. Remove and discard the upper arm outboard bolt.
   - To install, tighten the new bolt to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

8. Carefully lower the trailing arm and remove the jack.

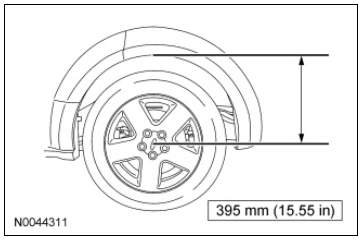
9. Remove and discard the shock absorber lower bolt and flagnut.
   - To install, tighten the new bolt and flagnut to 115 Nm (85 lb-ft) with the suspension at the bushing fastener tightening position.

10. Remove and discard the toe link outboard bolt.
    - To install, tighten the new bolt to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

AWD vehicles

11. Remove the wheel speed sensor harness bracket nut and position aside the bracket.
    - To install, tighten to 23 Nm (17 lb-ft).

12. Remove the toe link. For additional information, refer to Toe Link in this section.



13. Remove the 4 trailing arm-to-wheel knuckle nuts and the trailing arm toe link bracket.
    - Discard the nuts.
    - To install, tighten the new nuts to 100 Nm (74 lb-ft).

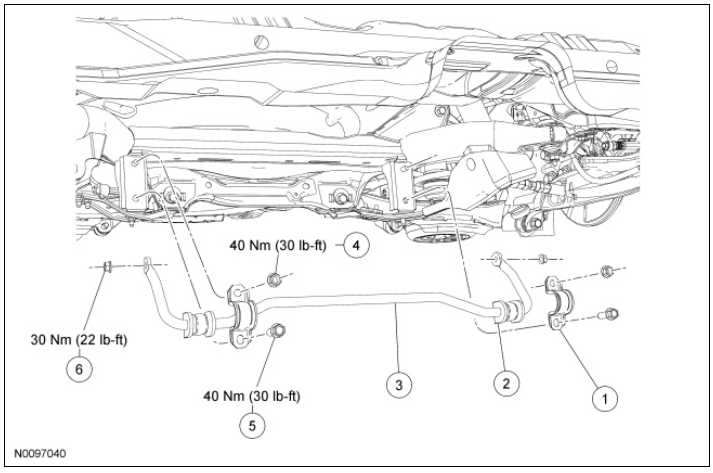
All vehicles

14. Remove the 2 trailing arm-to-frame bolts, cone washers and the trailing arm.
    - Discard the bolts.
    - To install, tighten the new bolts to 125 Nm (92 lb-ft).

15. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.**

    To install, reverse the removal procedure.

16. Check and, if necessary, align the rear end. For additional information, refer to Section 204-00 .



Stabilizer Bar and Link

NOTE: Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.

Item	Part Number	Description
1	5A486	Stabilizer bar link
2	W302134	Stabilizer bar link lower bolt
3	3C494	Stabilizer bar link upper nut

NOTE: Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.

Item	Part Number	Description
1	5B498	Stabilizer bar bracket (2 required)
2	5493	Stabilizer bar bushing (2 required)
3	5A772	Stabilizer bar
4	W302118	Stabilizer bar bracket nut (2 required)

5	W302131	Stabilizer bar bracket bolt (2 required)
6	3C494	Stabilizer bar link upper nut (2 required)

Removal and Installation

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

All-Wheel Drive (AWD) vehicles

1. Remove the rear halfshafts. For additional information, refer to Section 205-05 .

2. Remove the RH side spring.

Front Wheel Drive (FWD) vehicles

3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

All vehicles

4. Remove and discard the 2 stabilizer bar link upper nuts.
   - To install, tighten the new nuts to 30 Nm (22 lb-ft).

5. Remove the 2 stabilizer bar link lower bolts and the stabilizer bar links.
   - Discard the bolts.
   - To install, tighten the new bolts to 45 Nm (33 lb-ft) with the suspension at the bushing fastener tightening position.

6. Remove and discard the stabilizer bar bracket nuts.
   - To install, tighten the new nuts to 40 Nm (30 lb-ft) with the suspension at the bushing fastener tightening position.

7. Remove the stabilizer bar bracket bolts and the brackets.
   - Discard the bolts.
   - To install, tighten the new bolts to 40 Nm (30 lb-ft) with the suspension at the bushing fastener tightening position.

FWD vehicles

8. Remove the stabilizer bar.

AWD vehicles

9. ***NOTICE:*** **Be careful not to contact the fuel lines or wiring harness when removing and installing the stabilizer bar or damage to the wiring harness or fuel lines may occur.**

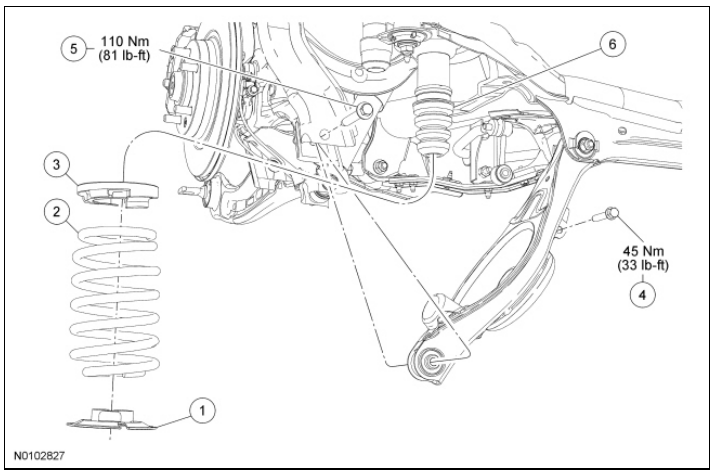
   Remove the stabilizer bar from the RH side of the vehicle.

All vehicles

10. Inspect the stabilizer bar bushings and install a new bushing(s), if necessary.

11. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. This will prevent incorrect clamp load and bushing damage.**

    To install, reverse the removal procedure.



Spring

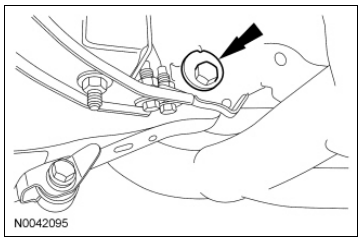
Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

NOTE: Front Wheel Drive (FWD) shown, AWD similar.

Item	Part Number	Description
1	5536A	Spring lower seat
2	5560	Spring
3	5536B	Spring upper seat
4	W302134	Stabilizer bar link lower bolt
5	W302125	Lower arm outboard bolt
6	5K570	Jounce bumper

Removal



NOTICE: **The coil spring is coated with long-term corrosion protective paint. Do not damage the paint during component servicing or spring damage may occur.**

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. **NOTE:** Do not fully tighten the cam adjuster nut until the rear alignment has been checked and, if necessary, adjusted.

   Index-mark the cam bolt and cam adjuster and then loosen the cam adjuster nut.

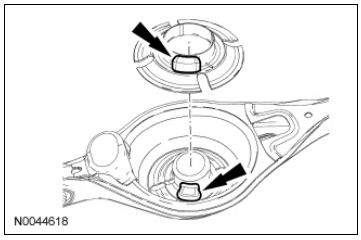
3. Remove and discard the stabilizer bar link lower bolt.

4. Using a suitable jack, support the lower arm.

5. ⚠ **WARNING: The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.**

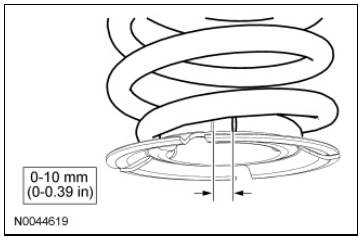
   Remove and discard the lower arm outboard bolt.

6. Lower the lower arm and remove the spring.
   - Inspect the spring upper and lower seats and install new seats as necessary.



Installation

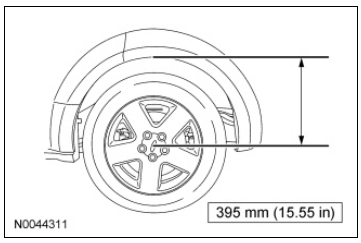
1. Inspect and if necessary, install a new jounce bumper.
   - Lubricate the top of the new jounce bumper with grease.



2. Position the spring upper seat onto the spring with the end of the spring 0-10 mm (0-0.39 in) from the step on the seat.

3. If removed, position the spring lower seat into the lower arm aligning the recess in the seat with the projection on the lower arm.

4. Position the spring onto the lower arm with the end of the spring 0-10 mm (0-0.39 in) from the step on the spring seat.



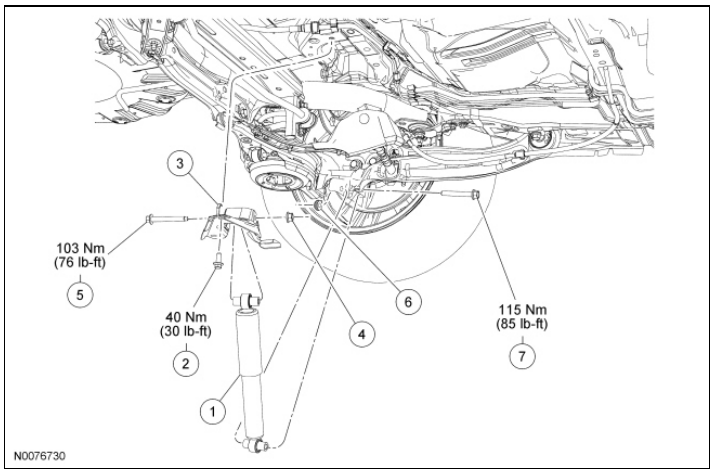
5. **NOTE:** Do not tighten the bolt at this time.

   Using the jack, raise the lower arm and install a new lower arm outboard bolt.

6. ***NOTICE:*** **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. This will prevent incorrect clamp load and bushing damage.**

   Using the jack, raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in).

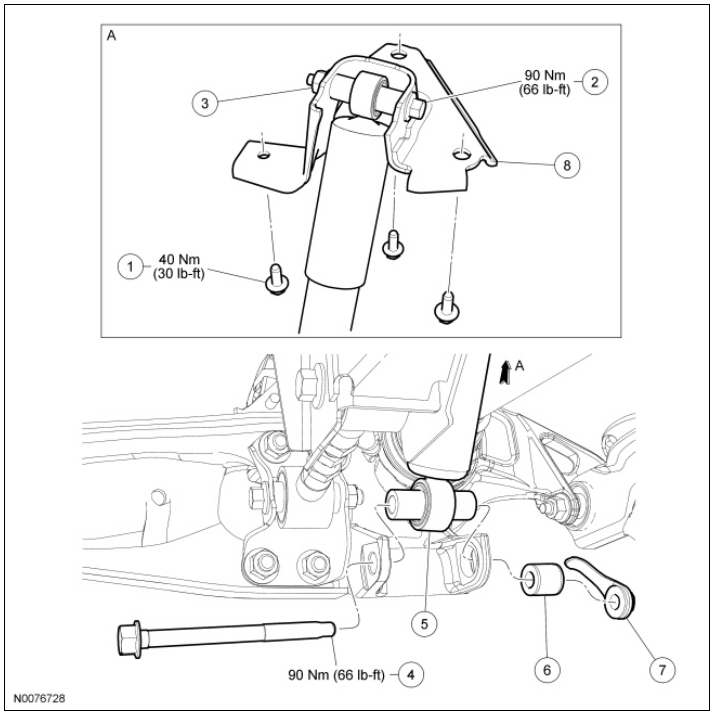
7. Tighten the lower arm outboard bolt to 110 Nm (81 lb-ft).



8. Install a new stabilizer bar link lower bolt.
   - Tighten to 45 Nm (33 lb-ft).

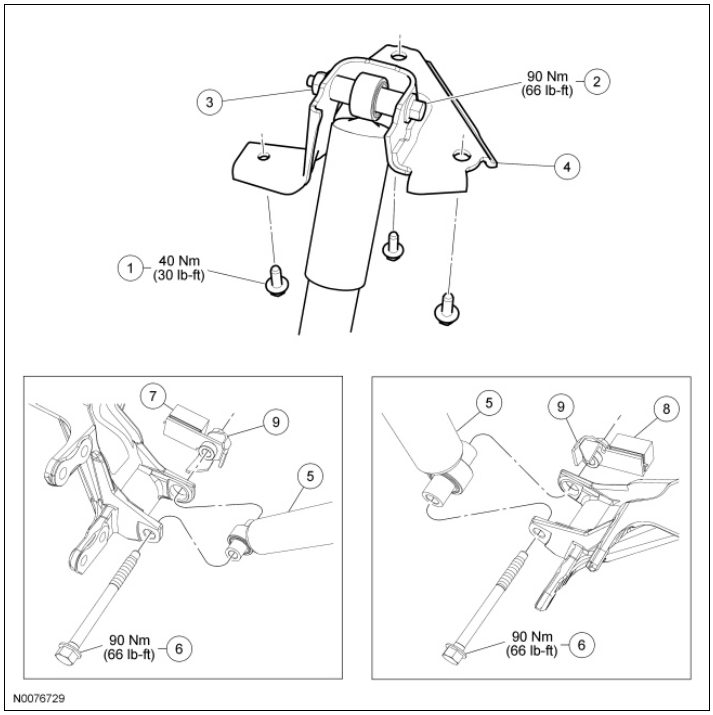
9. Align the index mark on the cam bolt and cam adjuster with the index mark on the lower arm and tighten the cam adjuster nut to 101 Nm (74 lb-ft).

10. Check and, if necessary, align the rear end. For additional information, refer to Section 204-00 .



Shock Absorber

Front Wheel Drive (FWD) Vehicles



Item	Part Number	Description
1	18125	Shock absorber
2	W302277	Shock absorber bracket bolt (3 required)
3	18165 LH/ 18164 RH	Shock absorber bracket
4	W520515	Shock absorber upper nut
5	W500748	Shock absorber upper bolt
6	W302116	Shock absorber lower flagnut
7	W704586	Shock absorber lower bolt

All-Wheel Drive (AWD) MKZ Vehicles

Item	Part Number	Description
1	W302277	Shock absorber bracket bolt (3 required)
2	W500748	Shock absorber upper bolt
3	W520515	Shock absorber upper nut
4	W704586	Shock absorber lower bolt
5	18125	Shock absorber
6	18199	Shock absorber lower mount bushing
7	W302117	Shock absorber lower flagnut
8	18165 LH/ 18164 RH	Shock absorber bracket

All-Wheel Drive (AWD) Fusion/Milan Vehicles

Item	Part Number	Description
1	W302277	Shock absorber bracket bolt (3 required)
2	W500748	Shock absorber upper bolt
3	W520515	Shock absorber upper nut
4	18165 LH/ 18164 RH	Shock absorber upper bracket
5	18125	Shock absorber
6	W712880	Shock absorber lower bolt
7	5B695	Shock absorber damper LH side
8	5B695	Shock absorber damper RH side
9	W712848	Shock absorber lower flagnut (with 17-in wheel)
9	W302117	Shock absorber lower flagnut (with 16-in wheel)

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

NOTE: The new shock absorber is shipped with a strap securing it in the compressed position. Do not remove this strap until the shock absorber and bracket assembly are in position and the 3 bracket bolts have been installed.

1. Remove the upper arm. For additional information, refer to Upper Arm in this section.

2. Compress the shock absorber and secure it in the compressed position using tie straps or a similar item.

3. Remove the 3 shock absorber bracket bolts and remove the shock absorber and upper bracket.

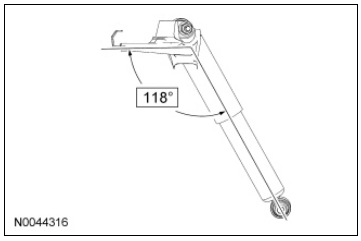
- Discard the bolts.

4. Index-mark the shock absorber to the bracket.

5. Remove the shock absorber upper bolt, nut and the bracket.

Installation

1. Copy the index mark from the shock absorber that was removed to the shock absorber that is being installed.



2. **NOTE:** Do not fully tighten the shock absorber upper bolt and nut at this time.

   Position the shock absorber into the bracket and loosely install a new shock absorber upper bolt and nut.

3. ***NOTICE:*** **Do not allow the angle between the shock absorber and bracket to change while tightening the shock absorber upper nut or damage to the shock absorber may occur.**

   Align the index marks so the center line of the shock absorber is approximately 118 degrees from the alignment tab on the bracket and tighten the shock absorber upper bolt.

   - For All-Wheel Drive (AWD) vehicles, tighten to 90 Nm (66 lb-ft).
   - For Front Wheel Drive (FWD) vehicles, tighten to 103 Nm (76 lb-ft).

4. Position the shock absorber and bracket assembly and install the 3 new bracket bolts.
   - Tighten to 40 Nm (30 lb-ft).

5. Install the upper arm. For additional information, refer to Upper Arm in this section.

Wheels And Tires

Safety Precautions

⚠ WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always match the tire size to the wheel size during assembly. Incorrect matching can result in tire bead damage or tire separation from the wheel. Failure to follow this instruction may result in serious personal injury to technician or vehicle occupant(s).

⚠ WARNING: Before servicing any tire, ask the customer if anyone injected a tire sealant into the tire. Tire sealants may be flammable and can burn or explode if exposed to an ignition source. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Replacement wheels must be equivalent to the original equipment wheels in:

- load carrying capacity.
- diameter, width and offset.
- pilot hole and bolt circle.

Combined load carrying capacity of replacement wheels for a given axle, must be equal to or greater than that axle's gross axle weight rating (GAWR) identified on the vehicle's Safety Compliance Certification label. All other specifications should be evaluated by measurement of both the original wheel and the replacement wheel. If specifications are not equivalent, the safety and handling of the vehicle may be degraded, which may result in serious injury to the vehicle occupant(s).

⚠ WARNING: Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Keep eyes away from valve stem when deflating tires. Reduce air pressure in tire as much as possible by pushing in valve core plunger prior to removing the core. Escaping air can carry particles that can injure the eyes. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Only use replacement tires that are the same size, load index, speed rating and type (such as P-metric versus LT-metric or all-season versus all-terrain) as those originally provided by Ford. The recommended tire and wheel size may be found on either the Safety Compliance Certification Label or the Tire Label, which is located on the B-pillar or edge of the driver's door. If the information is not found on these labels, consult a Ford dealer. Use of any tire or wheel not recommended by Ford can affect the safety and performance of the vehicle, which could result in an increased risk of loss of vehicle control, vehicle rollover, personal injury and death. Additionally, the use of non-recommended tires and wheels could cause steering, suspension, axle or transfer case/power transfer unit failure.

NOTICE: **Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents or damage to the wheel finish may occur. Use Wheel and Tire Cleaner ZC-37-A or -B or equivalent.**

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

To equalize tire wear, the tires should be rotated at recommended intervals.

Tire Pressure Monitoring System (TPMS)

NOTE: The Smart Junction Box (SJB) is also identified as the Generic Electronic Module (GEM).

The Tire Pressure Monitoring System (TPMS) includes:

- the SJB , TPMS functionality is integrated within the SJB .
- four valve stem mounted tire pressure sensors.
- an Instrument Cluster (IC) indicator.
- a message center (if equipped).

Tire Pressure Monitoring System (TPMS) Module

The SJB contains the TPMS functionality. Refer to Tire Pressure Monitoring System (TPMS) in Diagnosis and Testing for TPMS fault diagnosis and repair.

The SJB compares the information of each tire pressure sensor transmission against a pressure limit. If the SJB determines that the tire pressure has fallen below the low limit, the SJB communicates this to the IC on the vehicle communication bus.

Tire Pressure Monitoring System (TPMS) Pressure Sensor

The SJB monitors the air pressure in the 4 road tires with tire pressure sensors. The sensors transmit radio frequency signals to the SJB approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph).

The tire pressure sensors are battery operated and are mounted to the valve stem.

Instrument Cluster (IC) and Message Center

The IC illuminates the TPMS indicator when it receives a message from the TPMS to do so and displays the appropriate message(s) in the message center (if equipped).

The IC and message center are diagnosed and serviced in their own respective workshop manual sections. Refer to the appropriate section in Group 413 for the procedure.

Wheels And Tires

Special Tool(s)

 ST2869-A	Digital Tire Gauge 204-354
 ST3058-A	Hunter Road Force® Wheel Balancer GSP9700 Series

Inspection and Verification

⚠ **WARNING: Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.**

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, GO to Symptom Chart - NVH .

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

The use of any other tire/wheel size, load range or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- braking performance.

New wheels need to be installed when the vehicle wheels:

- are bent.
- are cracked.
- are dented.

- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

It is mandatory to use only the tire sizes recommended on the tire label located on the driver door or door pillar attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect the tires for signs of uneven wear. Refer to the following descriptions to identify the type of wear and GO to Symptom Chart - Tire Wear for the appropriate repair action to be carried out.

2. Check the tires for:
   - cuts.
   - stone bruises.
   - abrasions.
   - blisters.
   - embedded objects.

3. Check the valve stems for:
   - cracks.
   - cuts.

Install a new valve stem when damage is found or anytime a new tire is installed.

4. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become less than 2/32 inch.

Tire Wear

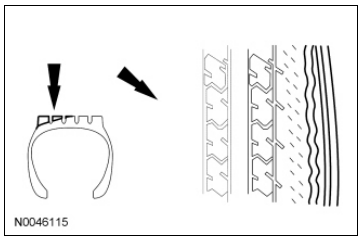
Tire wear is commonly defined as a loss of tread depth. Tire tread wear occurs due to friction with the contact surface (road/pavement). The tread should wear down uniformly all the way around the circumference of the tire and all the way across the tread face. When this does not occur, the tire may have abnormal/incorrect wear.

Normal Tire Wear

Normal tire wear is identified as even wear around and across the tread. Because there are many factors (driving style, road surfaces, type of vehicle, type of tire) that can affect tire wear, there is no absolute mileage expectation for a normal wear condition. A tire is considered worn-out when the tread has worn to the level of the tread-wear indicators.

Abnormal/Incorrect Tire Wear

Abnormal/incorrect tire wear is identified as tire wear that is not even around or across the tread and that creates performance-related issues.

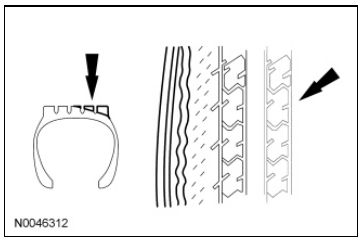


Abnormal/incorrect wear can be caused by numerous factors, some of which include driving style (aggressive, passive), climate (hot, cold), road conditions, vehicle loading and maintenance (correct tire pressure, rotation intervals and balance). It is important to determine the root cause of wear on a vehicle before carrying out repair. Tires exhibiting abnormal/incorrect tire wear may still be serviceable provided that the minimum tread depth is greater than 2/32 inch and the tire is not causing a vehicle performance (noise/vibration) concern.

Some abnormal/incorrect wear patterns look the same all the way around the tread of the tire, other wear patterns are not consistent and can occur in various spots on the tread area. The underlying causes of the 6 wear categories are different. Refer to the following descriptions to identify the type of wear and GO to Symptom Chart - Tire Wear for the appropriate repair action to be carried out.

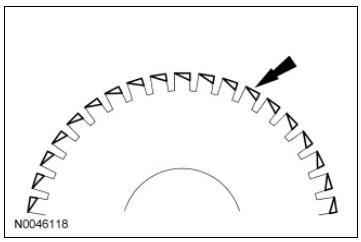
Inner Edge/Shoulder Wear

Inner edge (or shoulder) wear occurs on the inside edge of the tire and is usually caused by excessive toe out and/or excessive negative camber. If the tread depth of the outer shoulder is at least 50% greater than the tread depth of the inner shoulder, the tire is experiencing inner edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.



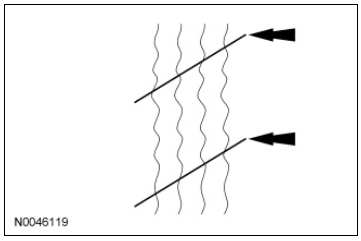
NOTE: RF tire shown, others similar.

Outer Edge/Shoulder Wear



Outer edge (or shoulder) wear occurs on the outside edge of the tire and is usually caused by excessive toe in and/or excessive positive camber. If the tread depth of the inner shoulder is at least 50% greater than the tread depth of the outer shoulder, the tire is experiencing outer edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.

NOTE: RF tire shown, others similar.



Heel/Toe Wear

Heel/toe wear (also known as feathering) occurs along the outside or inside edge/shoulder of the tire. To determine whether tires have this type of wear, visually inspect the tires in both the inside and outside shoulder ribs. In some instances, it may be necessary to measure the difference in tread depth of leading versus trailing edge of each lug in the inside and outside shoulder rib.

Diagonal Wear

Diagonal wear occurs diagonally across the tread area and around the circumference of the tire. To determine whether tires have this type of wear, visually inspect the tires to determine if the wear pattern runs diagonally across the tread and around the circumference of the tire. In some instances, the difference in tread depth along the diagonal wear pattern may need to be measured.

Symptom Chart - Tire Wear

Symptom Chart - Tire Wear
NOTE: For suspension system and additional alignment diagnosis, refer to Section 204-00 .

Condition	Possible Sources	Action
• Inner edge/shoulder wear	• Excessive toe out and/or negative camber	• GO to Pinpoint Test A .
• Incorrect wheel and tire assembly rotation intervals		• GO to Pinpoint Test A .
• High-speed cornering		• GO to Pinpoint Test A .
• Outer edge/shoulder wear	• Excessive toe in and/or positive camber	• GO to Pinpoint Test B .
• Incorrect wheel and tire assembly rotation intervals		• GO to Pinpoint Test B .
• High-speed cornering		• GO to Pinpoint Test B .
• Heel/toe wear		

- Excessive toe in/out
- Incorrect wheel and tire assembly rotation intervals

- ROTATE the wheel and tire assemblies. CHECK the alignment, ADJUST as necessary.

- Diagonal wear

- Excessive toe in/out

- GO to Pinpoint Test C .

- Incorrect tire rotation intervals

- GO to Pinpoint Test C .

- Loose, worn or damaged suspension components

- REFER to Section 204-00 .

Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glry of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Wobble or shimmy

- Bent wheel

- INSTALL a new wheel as necessary.

- Damaged tire

- INSTALL a new tire as necessary.

- Loose wheel nuts

- TIGHTEN to specification.

- High-speed shake

- Tires/wheels

- REFER to Wheel and Tire Runout Component Tests in this section.

- Vehicle vibration

- Tires/wheels
- REFER to Wheel and Tire Runout Component Tests in this section.

Pinpoint Tests

For a description of the various tire wear patterns, refer to Inspection and Verification.

Pinpoint Test A: Inner Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:
- Excessive toe out
- Incorrect wheel and tire rotation

PINPOINT TEST A: INNER EDGE/SHOULDER WEAR

Test Step	Result / Action to Take
A1 MEASURE THE TREAD DEPTH	
• Using a tread depth gauge or similar tool, measure the inside edge/shoulder tread depth. • **Is the tread depth greater than 2/32 inch?**	**Yes** ROTATE the wheel and tire assemblies. CHECK and ADJUST the toe to nominal +0.15 degrees (toe in). CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 .

Pinpoint Test B: Outer Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:
- Excessive toe in
- Incorrect wheel and tire rotation

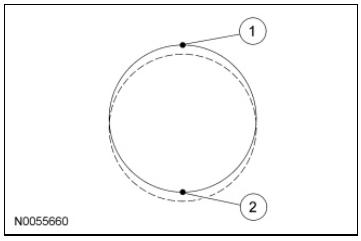
PINPOINT TEST B: OUTER EDGE/SHOULDER WEAR

Test Step	Result / Action to Take
B1 MEASURE THE TREAD DEPTH	
• Using a tread depth gauge or similar tool, measure the outside edge/shoulder tread depth.	**Yes** ROTATE the wheel and tire assemblies. CHECK and ADJUST the toe to nominal -0.15 degrees (toe

• **Is the tread depth greater than 2/32 inch?**	out). CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to Section 204-00 .

Pinpoint Test C: Diagonal Wear

This pinpoint test is intended to diagnose the following:
- Incorrect wheel and tire rotation
- Excessive toe in/out
- Incorrect tire inflation
- Loose, worn or damaged suspension components



PINPOINT TEST C: DIAGONAL WEAR

Test Step	Result / Action to Take
C1 MEASURE THE TREAD DEPTH	
• Using a tread depth gauge or similar tool, measure the tread depth of the wear pattern. • **Is the tread depth greater than 2/32 inch?**	**Yes** If no performance concerns (noise/vibration) are present, the tire can remain in service. CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to Section 204-00 . **No** INSTALL a new tire(s). CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to Section 204-00 .

Component Tests

Radial Runout

Radial runout is the egg-shaped deviation from a perfect circle and is measured perpendicular to the circumference. On a wheel and tire assembly, this means measuring the center tire tread rib. The center rib is indicative of the condition of the tire as a whole. Total runout is the difference between the maximum-to-minimum gauge reading. The high spot is the location of maximum runout.

Item	Description
1	High spot
2	Low spot

Loaded Runout Measurement (Hunter Road Force® 9700 Series Wheel Balancer)

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat spotting) may correct themselves after the tires have been in service for 320 km (200 mi).

This procedure is intended to assist with the diagnosis of wheel and tire assembly runout and/or force variation issues.

The Hunter Road Force® 9700 Series Wheel Balancer measures the wheel and tire assembly's loaded runo and the tire's radial spring rate. The balancer then converts the runout into pounds of force (termed as Road Force®). Measuring loaded runout (Road Force®) is more effective than measuring unloaded runout using a dial indicator.

1. Using a tire crayon, record the vehicle position on the inward sidewall of all 4 tires.

2. Remove the wheel and tire assemblies. Refer to Wheel and Tire in this section.

3. **NOTE:** Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.

   Make sure that the tire pressures are set to the correct pressure as indicated on the Vehicle Certification (VC) label.

4. ***NOTICE:*** **Make sure that the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.**

   NOTE: Make sure that the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

   NOTE: The wheel balancer inflation station must be turned OFF for tires with inflation pressures of 414 kPa (60 psi) or above.

   Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown. Refer to the list of recommended wheel bancer adapters on the PTS website.

Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

5. Measure the Road Force®.
    - Temporarily mark the high spot and the Road Force® value on the sidewall of the tire. If the wheel and tire assembly Road Force® value is greater than 9 kg (20 lb), carry out the Match Mounting procedure to optimize the wheel and tire assembly.
    - If the wheel and tire assembly Road Force® value is 9 kg (20 lb) or less, permanently mark the high spot and the Road Force® value on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.

Runout Measurement (Dial Indicator)

NOTE: Diagnosis of tire/wheel vibration should not be performed on tires with less than 320 km (200 mi). Some initial tire/wheel vibration issues (such as flat sng) will correct themselves after the tires have been in service for 320 km (200 mi).

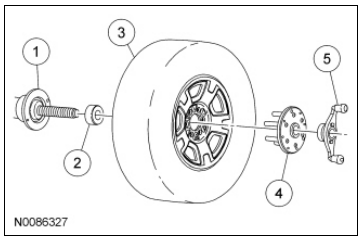
NOTE: Loaded run-out measurements are the preferred method for verifying tire serviceability. While a dial indicator can be used to optimize the position of the tire on the wheel, the unloaded run-out measurement cannot accurately determine if the tire should be removed from service.

The following procedures should be used if normal diagnostics leads to a potential runout issue.

Some vehicles may exhibit a wheel and tire vibration caused by excessive runout. Radial runout measurements can be taken using a dial indicator and should be measured with the wheel and tire assembly mounted on a suitable wheel balancer. The dial indicator should be mounted securely to eliminate gauge movement when measuring runout.

1. **NOTE:** Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.

   Make sure that the tire pressures are set to the correct pressure as indicated on the VC label.



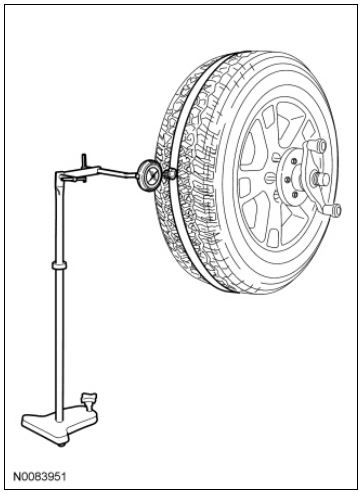
2. Using a tire crayon, record the vehicle position on the inward sidewall of all 4 tires.

3. Remove the wheel and tire assemblies. Refer to Wheel and Tire in this section.

4. ***NOTICE:*** **Make sure that the correct wheel balancer adapters are used when mounting the assembly to the wheel balancer or damage to the wheel may occur.**

   NOTE: Make sure that the wheel and tire assembly is clean and free of foreign material prior to installation on the balancer.

   Mount the wheel and tire assembly on a suitable wheel balancer using the correct wheel balancer adapters as shown. Refer to the list of recommended wheel balancer adapters on the PTS website.



Item	Description
1	Wheel balancer
2	Cone
3	Wheel and tire assembly
4	Finger plate
5	Balancer wing nut

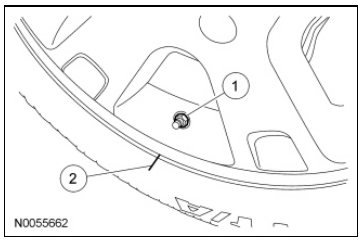
5. **NOTE:** Masking tape can be applied on the center tread rib to allow for a smoother measuring surface. Some fluctuation of the gauge reading is expected. Observe the overall sweep of the gauge from the highest to the lowest spot on the tire.

   Position a suitable dial indicator and stand with the dial indicator on the center tread rib.

   - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
   - Adjust the runout gauge to read 0.
   - Rotate the wheel and tire assembly one complete revolution to make sure that the low spot has been found and that the dial indicator returns to a 0 reading.

6. While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the radial runout.

- Note the variance (runout) from 0 on the dial of the gauge.
- If the runout reading of a wheel and tire assembly is greater than 1.14 mm (0.045 in), locate and temporarily mark the high spot and runout reading on the sidewall of the tire and carry out the Match Mounting procedure to optimize the wheel and tire assembly.
- If the runout reading of a wheel and tire assembly is 1.14 mm (0.045 in) or less, permanently mark the high spot and the runout reading on the inward sidewall of the tire for reference during future wheel and tire service. Balance the assembly and install the wheel and tire on the vehicle using the Wheel-to-Hub Optimization procedure.



Match Mounting

NOTE: Road Force® values in illustrations are shon in pounds.

Match mounting is a technique used to reduce radial runout or road force on wheel and tire assemblies. Excessive runout is a source of ride quality complaints and match mounting can be used to minimize the runout. Match mounting can be accomplished by changing the position of the tire on the wheel.

1. Position the wheel and tire assembly on a tire machine and put a reference mark on the tire sidewall at the valve stem position.

Item	Description
1	Valve stem
2	Reference mark

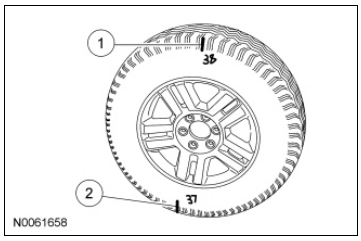
2. ***NOTICE:*** **For vehicles equipped with a Tire Pressure Monitoring System (TPMS), the sensor may be damaged by incorrect tire mounting or dismounting. Dismount the tire from the wheel as instructed in the Disassembly and Assembly procedure. Failure to follow these instructions may result in TPMS component damage.**

   NOTE: Always make sure that the final high spot and measurement values are permanently marked on the inward sidewall of the tire for reference during future wheel and tire service.

   Using a suitable tire machine, separate the tire beads from the wheel.

   - Lubricate the tire beads using a suitable fast drying, corrosion inhibiting tire bead lubricant.

- Position the tire 180 degrees (half-way around) on the rim so the valve stem reference mark is now opposite the valve stem.

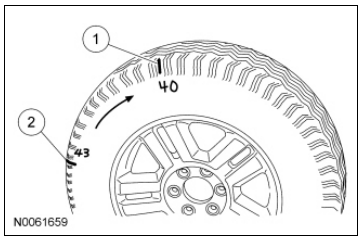


3. Re-inflate the wheel and tire assembly to the specified air pressure and measure the assembly again using a suitable dial indicator or Hunter Road Force® 9700 Series Wheel Balancer. Mark the second high spot on the tire.
    - If the runout or Road Force® is reduced to within specifications, the concern has been resolved. Balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.

4. If the second runout or Road Force® measurement is still not within specification and both high spots are close to each other (within 101.6 mm [4 in]), the root cause is probably the tire (the high spot followed the tire).
    - To be **SURE** that the tire is causing the high runout, it is necessary to have 2 runout or Road Force® measurements that are not within specification and the high spots must be in approximately the same location on the tire's sidewall. If the tire is the cause, install a new tire, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.
    - If the second high spot is not within 101.6 mm (4 in) of the first high spot, proceed to the next step.

Item	Description
First high spot on the tire	
2	Second high spot on the tire

5. If the second high spot is still above specification and is within 101.6 mm (4 in) of being opposite the first high spot on the wheel, the root cause is probably the wheel (the high spot followed the wheel). Dismount the tire from the wheel, mount the wheel on a balancer and check the wheel runout. If the wheel runout exceeds 1.14 mm (0.045 in), install a new wheel, balance the assembly and install on the vehicle using the Wheel-to-Hub Optimization procedure.

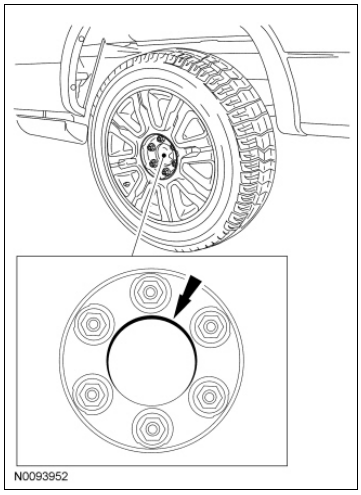


Item	Description
1	First high spot on the tire
2	Second high spot on the tire

6. **NOTE:** If the second high spot did not follow the wheel or the tire and the runout is still not within specification, improvements may be made by rotating the tire 90 degrees (one-fourth turn).

   Draw an arrow on the tire sidewall from the second high spot towards the first high spot (in the shortest direction).

   - Separate the tire beads from the wheel and rotate the tire 90 degrees (one-fourth turn) in the direction of the arrow.



Item	Description
1	First high spot on the tire
2	Second high spot on the tire

Wheel-to-Hub Optimization

Wheel-to-hub optimization is important. Clearance between the wheel and hub can be used to offset or neutralize the Road Force® or run-out of the wheel and tire assembly. For every 0.001 inch of wheel-to-hub clearance, the Road Force® can be affected between 1 and 3 pounds depending on the tire stiffness.

NOTE: The example below illustrates how the clearance between the wheel and the hub can be used to offset the high spot of radial run-out or Road Force®. Following the procedure will make sure of the best optimization.

1. Position the wheel and tire assembly on the vehicle so that the high spot location of radial run-out or Road Force® is at the 6 o'clock position and install the wheel nuts by hand until snug.

2. **NOTE:** Do not allow the full weight of the vehicle to rest on the tires while tightening the wheel nuts.

   Lower the vehicle until the tires make contact with the ground, sliy loading the suspension. Tighten

the wheel nuts as described in Wheel and Tire in this section.

Tire Pressure Monitoring System (TPMS)

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
 ST2869-A	Digital Tire Pressure Gauge 204-354
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also referred to as the Generic Electronic Module (GEM).

The Tire Pressure Monitoring System (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency signals, to the SJB . TPMS functionality is integral to the SJB . These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the Instrument Cluster (IC). The IC then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

Ambient Temperature Change and Tire Pressure

⚠ WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not inflate tire higher than maximum pressure stamped on tire sidewall. Premature tire wear or damage to the tire may result.**

Tire pressures fluctuate with temperature changes. For this reason, tire pressure must be set to specification when tires are at outdoor ambient temperatures. If the vehicle is allowed to warm up to shop temperatures, and the outside temperature is less than shop temperature, the tire inflation pressure must be adjusted accordingly.

If the tires are inflated to specification at shop temperatures, and the vehicle is moved outdoors when the outdoor ambient temperature is significantly lower, the tire pressure may drop enough to be detected by the TPMS and activate the TPMS warning lamp.

As the ambient temperature decreases by 6°C (10°F), tire pressure decreases 7 kPa (1 psi). Adjust the tire pressure by 7 kPa (1 psi) for each 6°C (10°F) ambient temperature drop as necessary to keep the tire at the specified Vehicle Certification (VC) label pressure. Refer to the following tables to adjust the tire pressure indoors for colder outside temperatures.

Table 1. Use Table to Adjust Tire Pressure Inside Garage for Colder Outside Temperature[1]
** Do Not Inflate Tire Higher than Maximum Pressure Stamped on Tire Sidewall. **

Table is based on a Garage Temperature of 70˚F. Max Pressure Adjustment is 7 psi.

-40	255	270	285	290	310	325	330	340	360	395	425	460	495	530	565	600	635	670

[1]When Outside (Ambient) Temperature is greater than 21˚C (70˚F), Inflate tires to placard pressure.
[1]Use the table to adjust tire pressure for P-metric and LT tires only.
[1]Do NOT use table for Commercial Truck Tires (i.e. 19.5 inch tires for F450 & F550). See F-Super Duty Service Manual for tire inflation procedure.

N0057700

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

>

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the TPMS indicator to illuminate.

1. The TPMS indicator remains on continuously for the following condition:
    - Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are

low. When this condition exists, the tire pressure must be adjusted to the recommended cold pressure as indicated on the VC label.

2. **NOTE:** The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB .

   If the vehicle has been stationary for more than 30 minutes, carry out the Tire Pressure Monitoring System (TPMS) Sensor Activation procedure in this section.

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds, then remains ON solid when the ignition swch is turned to the ON position, for the following conditions:

1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE PRESSURE SENSOR FAULT when a tire pressure sensor is malfunctioning. GO to Symptom Chart .

2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the IC has not received any signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE PRESSURE MONITOR FAULT. GO to Som Chart .

3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE PRESSURE MONITOR FAULT when the TPMS is malfunctioning or communication with the IC has been lost. GO to Symptom Chart .

Tire Pressure Monitoring System (TPMS) PID Definitions and Intermittent Troubleshooting

TPMS Status PID

The SJB monitors the TPMS status. The current status can be viewed by accessing the TPMS status PID: TP_STAT using the scan tool. This helps identify the current system status and may aid in diagnosing the system. The PID has 4 valid states:

1. TP_STAT = SENSOR FAULT.
   - If the module has not received the tire pressure status from 1 3 TPMS sensors for 20 minutes when the vehicle speed is above 32 km/h (20 mph), the PID displays SENSOR FAULT.

2. TP_STAT = SYSTEM FAULT.
   - If the module has not received the tire pressure status from **all** 4 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph), the PID displays SYSTEM FAULT.

3. TP_STAT = LOW.
   - If the module has detected that at least 1 TPMS sensor is reporting low tire pressure, the PID displays LOW.

4. TP_STAT = SYSTEM ACTIVE.
   - If the TPMS is functioning normally, the PID displays SYSTEM ACTIVE.

TPMS Last Warning Event PID Definitions

The TPMS uses the TPMS last warning event PIDs to store detailed information about the last 5 times the

TPMS warning indicator was activated. These PIDs can be used to acquire more information about a particular TPMS event.

EVT1_IGN through EVT5_IGN

The number of key cycles since the TPMS warning indicator was activated. This PID cycles from zero to 255 and then starts over from zero again. This can be used to determine how long ago a TPMS event occurred and the time (in key cycles) between events.

EVT1_TLOC through EVT5_TLOC

This is the last programmed location for the sensor identifier causing each TPMS event. Due to tire rotation, the sensor may no longer be at the original location. It is suggested that all the PIDs be recorded, the system retrained, and then the sensor identifier PIDs be used to pinpoint the actual location of each sensor.

EVT1_PSI through EVT5_PSI

This is the tire pressure associated with each TPMS warning indicator event. This can be used along with the function code to clearly identify the TPMS events that were strictly due to low pressure. It can also be used to determine when a sensor is transmitting inaccurate tire pressure.

EVT1_STAT through EVT5_STAT

Describes the warning status of each TPMS event by using the information received from the TPMS status (TP_STAT) PID. If there is a communication issue, the status could be Normal.

- Unknown
- Normal (normal operation)
- Low (low pressure event)
- Fault (sensor fault or system fault)

EVT1_TxID through EVT5_TxID

This is the identifier of the sensor involved in each TPMS event. EVT1 is the most recent event that triggered the TPMS warning indicator.

Wheel Rotation and Sensor Training Techniques

Moving a Problem Sensor/Wheel to a Different Position

If a sensor in a certain location has caused several events, yet the sensor trains and seems to operate normally, moving that particular wheel to a different location on the vehicle is a good way to isolate the issue to a certain sensor/wheel location. Rotate the wheels and road test the vehicle. This can be done in an attempt to replicate the issue. This determines if the issue followed the sensor or remained in the original sensor location.

Training Sensors in a Different Order

This is a technique to get past a left front sensor that may not be responding to determine if the remaining sensors train to the module. This can help save time determining if other sensors are having issues or if the module is experiencing training difficulties with a certain location.

Training Known Good Sensors From Another Vehicle

Training known good sensors from another vehicle cannot differentiate between a faulted module and Radio Frequency Interference (RFI), as some noise source could be preventing the module from receiving the tire pressure status from the original sensors as well as the known good sensors. This technique that can be used to

differentiate between a sensor and module issue. If the module in the vehicle cannot train any of its own sensors, and likewise cannot train known good sensors from another vehicle, then the issue is with the module or the RFI , and not with the original sensors. The original sensors should not be replaced.

Items That Cause RFI

Non-OEM Equipment

The following equipment has been found to sometimes cause RFI :

- Video equipment has been found to cause RFI especially when the video and power supply lines are near the TPMS .
- Car alarms (even those installed by dealerships) have been found to create enough RFI to cause the TPMS to malfunction or lose considerable range. These car alarms can sometimes be difficult to locate, as they are usually hidden somewhere out of the way for reduced accessibility.
- Many different in-vehicle cell phone chargers have been found to cause considerable RFI . The vehicles with the power point closest to the TPM are the most affected. It must be noted that most cell phone chargers do not produce high levels of RFI all the time. This depends on the state of charge of the cell phone battery. The phone must be almost completely discharged in some cases.
- Power supplies and DC/AC inverters typically create a lot of RFI . Most consumer grade equipment has very little filtering or shielding.

OEM Modules

In some cases, the RFI may actually be caused by a module or ground on the vehicle. Depending on the severity of the issue, a dirty ground, improperly built ground shield or module can disable the system. Modules that have microcontrollers using clock circuits to create the timing pulses for the microprocessor may radiate RFI .

Using Customer's Electronics to Pinpoint the Radio Frequency Interference (RFI) Source

This can be a way to determine the cause of an issue well before the sensors and module are replaced with little or no affect on the system performance. Since this takes more up-front work, it relies on working with the customer to determine what equipment was being used at the time of the event.

Options for Eliminating Intermittent TPMS Conditions Caused by RFI

- If an OEM component or customer device is causing an RFI issue, replace the device.
- If a phone charger is causing an RFI issue, the customer should consult their cell phone provider to acquire a different phone charger.
- If a device such as a dealer-installed alarm is causing an RFI issue, move the device to another location on the vehicle. In the case of a portable device, move the power cord to another power point location.

In summary, if the RFI source is present and cannot be moved or replaced, the intermittent issue remains. The vehicle owner must accept RFI and the unwanted system operation it can cause.

Inspection and Verification

1. **NOTE:** The tire pressure sensors are not designed to be used with aftermarket wheels.

   NOTE: The use of run-flat tires (tires with steel body cord plies in the tire sidewall) where not originally equipped, may cause the TPMS to malfunction and is therefore not recommended.

Verify the customer concern by inspecting the vehicle and observing the message center (if equipped) and the TPMS indicator.

2. **NOTE:** The valve-mounted TPMS sensors and the strap-mounted TPMS sensors are not compatible. Swapping wheels from one vehicle to another with the different systems will adversely affect TPMS operation.

   NOTE: Swapping wheels between vehicles with the same TPMS will cause a TPMS fault to be set if the sensors are not trained. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.

   NOTE: Non-OEM modifications made to the vehicle may result in false TPMS warnings.

   Inspect to determine if one of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
• Low tire pressure • Tire Pressure Monitoring System (TPMS) sensor damaged or missing • Spare tire installed as a road wheel • Incorrect TPMS sensor installed • TPMS sensor installed incorrectly • Sensors not trained after a tire rotation on vehicles with different front and rear tire pressures • Non-OEM wheels installed (aftermarket rims) • Non-OEM equipped run-flat tires installed • Other non-OEM modifications (roll cages, service barriers, part racks, ladder racks)	• Wiring, terminals or connectors • Smart Junction Box (SJB) • Aftermarket electronic accessories

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.

- refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the SJB (the TPMS is part of the SJB).

9. If the DTCs retrieved are related to the concern, go to the Tire Pressure Monitoring System (TPMS) DTC Chart. For all other DTCs, refer to the Master DTC Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Tire Pressure Monitoring System (TPMS) DTC Chart

DTC	Description	Source	Action
B106B	Tire Pressure Sensor Low Battery	Smart Junction Box (SJB)	DTC B106B can be set during SJB configuration. GO to Pinpoint Test G .
B106D	Tire Pressure Monitoring System (TPMS) Initiators Not Configured	SJB	DTC B106D is only present when a new SJB is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. VERIFY the SJB is correctly configured. If DTC B106D is still present, REFER to Section 418-01 .
B2477	Module Configuration Failure/Mismatch	SJB	DTC B2477 is only present when a new SJB is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. MAKE SURE the SJB is configured correctly. If DTC B2477 is still present, REFER to Section 418-01 .
B2868	LF Tire Pressure Sensor Fault	SJB	DTC B2868 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2869	RF Tire Pressure Sensor Fault	SJB	DTC B2869 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2870	RR Tire Pressure Sensor Fault	SJB	DTC B2870 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2871	LR Tire Pressure Sensor Fault	SJB	DTC B2871 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
B2872		SJB	

	Tire Pressure Sensor Fault		**NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB . ACTIVATE the TPMS sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section. GO to Pinpoint Test F .
B287A	Tire Pressure System Fault	SJB	GO to Pinpoint Test F .
C2780	ECU in Manufacturing Mode	SJB	DTC C2780 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
U0155	Lost Communication with Instrument Cluster (IC)	SJB	REFER to Section 418-00 to diagnose the no communication problem.
All other SJB DTCs	-	SJB	REFER to the Master DTC Chart in Section 419-10 .

Symptom Chart

Symptom Chart
NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the Tire Pressure Monitoring System (TPMS) indicator to illuminate.

For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Failure of a TPMS component may not cause the message center to display a fault message or a DTC to be stored. The Symptom Chart is a starting point to begin diagnosis of these concerns.

ConditionPossible SourcesAction

- Tire Pressure Monitoring System (TPMS) indicator ON solid and message center (if equipped) displays LOW TIRE PRESSURE
- Spare tire currently in use
- INSTALL the repaired road wheel/tire in place of the spare tire.
- Air pressure not set to specifications listed on the Vehicle Certification (VC) label
- GO to Pinpoint Test D .
- Sensors not trained following tire rotation

- ADVISE customer that on vehicles with different front and rear tire pressure, the sensors must be trained as directed in the Owner's Literature.

- Smart Junction Box (SJB) will not enter sensor training mode when using the TPMS sensor training procedure

- Brake ON/OFF switch
- Ignition switch
- Vehicle communication bus
- SJB

- GO to Pinpoint Test E .

- TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE SENSOR FAULT and DTC B2872 is present

- Intermittent TPMS operation due to Radio Frequency Interference (RFI)
- TPMS sensors not trained
- Not all TPMS sensors are installed
- TPMS sensor(s)
- SJB

- **NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB .

  ACTIVATE the TPMS sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section. GO to Pinpoint Test F .

- TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE MONITOR FAULT and DTC B287A is present

- TPMS sensors not trained
- Not all TPMS sensors are installed

- **NOTE:** If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB .

  ACTIVATE the TPMS sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section. GO to Pinpoint Test F .

- TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE MONITOR FAULT and there are no DTCs present

- Vehicle communication issue between the SJB and the Instrument Cluster (IC)

- REFER to Section 418-00 to diagnose the no communication concern.

- SJB

- REFER to Section 419-10 to diagnose the SJB .

- One or more sensors will not train

- TPMS sensor(s)
- Vehicle communication issue
- SJB

- RETRIEVE and RECORD DTCs. REFER to Tire Pressure Monitoring System (TPMS) DTC Chart in this section.

- One or more sensors will not train and no DTCs are present

- TPMS sensor(s)
- Attempting to install a banded TPMS sensor that is not compatible with a valve mounted sensor

- TRAIN all 4 tire pressure sensors. REFER to Tire Pressure Monitoring System (TPMS) Sensor Training in this section.
- If a sensor does not respond to the Tire Pressure Monitor Activation Tool, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor again. If the sensor still does not respond, ATTEMPT to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, ATTEMPT to train the sensor with the vehicle doors open.
- If the sensor(s) fails to train a second time, INSTALL a new sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Pinpoint Tests

Pinpoint Test D: Tire Pressure Monitoring System (TPMS) Indicator ON Solid and Message Center (if equipped) Displays LOW TIRE PRESSURE

Normal Operation

The Tire Pressure Monitoring System (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency signals, to the Smart Junction Box (SJB). TPMS functionality is integral to the SJB . These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function (integral to the SJB) compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the Instrument Cluster (IC). The IC then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

This symptom can also be caused by a spare tire currently being used in place of a road tire. Make sure that the spare tire is not currently in use. On vehicles with different front and rear tire pressures, if the sensors are not trained following a tire rotation, this symptom will also be present. Advise the customer that on vehicles with different front and rear tire pressures, the sensors must be trained as directed in the Owner's Literature.

This pinpoint test is intended to diagnose the following:

- Low air pressure in tire(s)
- Tire pressure sensor(s)

PINPOINT TEST D: TIRE PRESSURE MONITORING SYSTEM (TPMS) INDICATOR ON SOLID AND MESSAGE CENTER (IF EQUIPPED) DISPLAYS LOW TIRE PRESSURE

NOTE: Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.

NOTE: If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.

Test Step	Result / Action to Take
D1 CHECK THE TIRE PRESSURE	
• Using the Digital Tire Gauge, measure and record the air pressure in all 4 road tires. • Adjust the air pressure for those found to be below the specification listed on the Vehicle Certification (VC) label. • **NOTE:** If the vehicle has been stationary for more than 30 minutes, activate each TPMS sensor. Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section. The TPMS sensor does not transmit when the vehicle is stationary. • Verify system operation. • **Have the TPMS indicator and the message center (if equipped) warnings gone out?**	**Yes** The system is functioning normally, diagnosis is complete. INFORM the customer of correct tire pressure maintenance as instructed in the scheduled maintenance guide and the Owner's Literature. **No** GO to D2 .
D2 CHECK THE SYSTEM COMPONENTS	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Read and record the following PIDs: ♦ Left Front Tire Pressure (LF_PRES) ♦ Right Front Tire Pressure (RF_PRES) ♦ Left Rear Outer Tire Pressure (LRO_PRES) ♦ Right Rear Outer Tire Pressure (RRO_PRES)	**Yes** The system is functioning normally, diagnosis complete. **No** **Before installing a new sensor(s):** If a sensor does not respond to the Tire Pressure Monitor Activation Tool, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor again. If the sensor still does not respond, ATTEMPT to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, ATTEMPT to train the sensor with the vehicle doors open. INSTALL new tire pressure sensors for those with discrepancies or those that fail to activate. REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

• Compare the air pressure readings recorded from the function test to those recorded in D1. • **Do the compared tire pressure values match within ±5 psi, and have the TPMS indicator and the message center (if equipped) warnings gone out?**	

Pinpoint Test E: Smart Junction Box (SJB) Will Not Enter Sensor Training Mode When Using the Tire Pressure Monitoring System (TPMS) Sensor Training Procedure

Normal Operation

For the Smart Junction Box (SJB) to enter Tire Pressure Monitoring System (TPMS) sensor training mode, the SJB must receive valid inputs from the brake ON/OFF switch (OFF-ON-OFF) and ignition switch (both OFF and RUN), and it must receive valid vehicle speed sensor input (0 km/h [0 mph]) from the Instrument Cluster (IC). Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section for the complete sensor training procedure.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Brake ON/OFF switch
- Ignition switch
- SJB

PINPOINT TEST E: SMART JUNCTION BOX (SJB) WILL NOT ENTER SENSOR TRAINING MODE WHEN USING THE TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR TRAINING PROCEDURE

Test Step	Result / Action to Take
E1 CHECK THE SJB BRAKE ON/OFF (GEM_BOO) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the GEM_BOO PID (SJB reads the brake switch directly). • Press and release the brake pedal while monitoring the PID. • **Do the brake pedal PID values match the brake pedal positions?**	**Yes** GO to E2 . **No** REFER to Section 417-01 to continue diagnosis of the stoplamp switch.
E2 CHECK THE SJB IGNITION SWITCH PIDs	
• Monitor the following ignition switch PIDs: ♦ Ignition Switch Off (IGN_O_ECU)	**Yes** GO to E3 . **No** REFER to Section 211-05 to continue diagnosis of the ignition switch.

♦ Ignition Switch RUN (IGN_R_ECU) • Cycle the ignition switch to the RUN and OFF position while monitoring the PIDs (SJB reads the ignition switch directly). • **Do the ignition switch status PID values match the ignition switch positions?**	
E3 CHECK THE SJB VEHICLE SPEED SENSOR (VSS_GEM) PID	
• Monitor the VSS_GEM PID (SJB receives vehicle speed from the IC). • **Is the vehicle speed less than 5 km/h (3 mph)?**	**Yes** GO to E4 . **No** REFER to Section 413-01 to continue diagnosis of the IC /vehicle speed concern.
E4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check the connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect all the SJB connectors and make sure that they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: TPMS Indicator FLASHES for 70 Seconds and Then Remains ON Solid When the Ignition Key is Turned to the ON Position, the Message Center (if equipped) Displays TIRE PRESSURE SENSOR or MONITOR FAULT and DTC B2872 or B287A is Present

Normal Operation

If there is a fault with 1, 2 or 3 of the Tire Pressure Monitoring System (TPMS) sensors, DTC B2872 sets. The TPMS warning indicator flashes for 70 seconds and then remains ON continuously when the ignition switch is turned to the ON position and the message center (if equipped) displays TIRE PRESSURE SENSOR FAULT.

If the Smart Junction Box (SJB) does not get a response from **all** 4 of the TPMS sensors, DTC B287A sets and the message center (if equipped) displays TIRE PRESSURE MONITOR FAULT.

It should be noted that TPMS communication can be interrupted by Radio Frequency Interference (RFI), which can cause intermittent issues. RFI is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment. Anytime the TPMS sensor training procedure is performed successfully, the warning indicator is extinguished and the vehicle must be driven for 18-20 minutes before the SJB initiates a self test to verify system operation.

- DTC B2872 (Tire Pressure Sensor Fault) - set by the SJB when 1, 2 or 3 of the tire pressure sensors

are faulted, not responding or when data is not received by the SJB .
- DTC B287A (Tire Pressure Monitor Fault) - When **all** 4 of the tire pressure sensors are faulted, not responding or when data is not received by the SJB .
- TP_STAT PID = SYSTEM FAULT is displayed if the SJB does not receive a signal transmission from **all** 4 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph).
- TP_STAT PID = SENSOR FAULT is displayed if the SJB does not receive a signal transmission from 1, 2, or 3 TPMS sensors for 20 minutes and the vehicle speed is above 32 km/h (20 mph).

This pinpoint test is intended to diagnose the following:
- Intermittent TPMS operation due to RFI
- TPMS sensor(s) not trained
- Not all TPMS sensors are installed
- TPMS sensor(s)
- SJB

PINPOINT TEST F: TPMS INDICATOR FLASHES FOR 70 SECONDS AND THEN REMAINS ON SOLID WHEN THE IGNITION KEY IS TURNED TO THE ON POSITION, THE MESSAGE CENTER (IF EQUIPPED) DISPLAYS TIRE PRESSURE SENSOR OR MONITOR FAULT AND DTC B2872 OR B287A IS PRESENT

Test Step	Result / Action to Take
F1 CHECK THE HORN OPERATION	
• Press the steering wheel horn pad for 2 seconds. • **Does the horn sound?**	**Yes** GO to F2 . **No** For horn diagnosis, REFER to Section 413-06 .
F2 CHECK THE TPMS STATUS (TP_STAT) PID	
NOTE: Make sure that all aftermarket electronic equipment has been disconnected (if possible) and that the customer has been questioned about the kinds of electronic equipment they may have been using in the vehicle when this issue was identified. • Connect the scan tool. • **NOTE:** A spare tire cannot be programmed to the vehicle, even if equipped with a TPMS sensor. If a damaged road wheel is located in the trunk and the SJB cannot communicate with it, or if the damaged wheel has been dropped off at a dealership or repair shop, the SJB sets a TPMS sensor fault. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the TP_STAT PID.	**Yes** GO to F3 . **No** If the TP_STAT PID displays **SYSTEM** FAULT, GO to F5 .

• **Does the PID display SENSOR FAULT?**	
F3 CARRY OUT THE SENSOR TRAINING PROCEDURE	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each TPMS sensor transmitted to the SJB ?**	**Yes** The system is operating correctly at this time. The concern may have been caused by RFI . CLEAR the DTCs. REPEAT the self-test. TEST for normal operation. REFER to PID Definitions and Intermittent Troubleshooting in this section for information on locating sources of RFI . **No** GO to F4 .
F4 CHECK FOR CORRECT TPMS OPERATION	
• Move the vehicle to rotate the wheels at least one-fourth of a turn. Leave the vehicle doors open. Start the sensor training procedure at a different wheel. • Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did any of the tire pressure sensors transmit correctly and did the horn sound when each TPMS sensor transmitted to the SJB ?**	**Yes** If some of the TPMS sensors trained, INSTALL a new TPMS sensor for the TPMS sensor(s) that failed to train. REFER to Wheel and Tire in this section. If all of the TPMS sensors trained, the concern may have been cause by RFI . CLEAR the DTCs. REPEAT the self-test. TEST for normal operation. REFER to PID Definitions and Intermittent Troubleshooting in this section for information on locating sources of RFI . **No** GO to F5 .
F5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB electrical connectors. • Check the connectors for: ♦ corrosion ♦ pushed-out pins ♦ bent pins ♦ spread terminals • Connect all the SJB connectors and make sure that they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** **NOTE:** The sensors may not be present. DISMOUNT the tire. REFER to Wheel and Tire in this section. VERIFY the sensors are present and mounted to the wheels. If missing, INSTALL new sensors. If the sensors are present, INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTC B106B

Normal Operation

If there is a fault in the Tire Pressure Monitoring System (TPMS), such as a damaged or missing sensor(s), damaged module or a communication issue within the vehicle, DTCs are set in the Smart Junction Box (SJB), the TPMS warning indicator will flash for 70 seconds and then remain ON solid when the ignition switch is turned to the ON position and the message center (if equipped) will display TIRE PRESSURE SENSOR FAULT.

The tire pressure sensor is battery powered.

This DTC may be set when attempting to train a tire pressure sensor(s) with a low battery.

This pinpoint test is intended to diagnose the following:

- Tire pressure sensor battery
- Tire pressure sensor(s)

PINPOINT TEST G: DTC B106B

Test Step	Result / Action to Take
G1 DETERMINE WHICH SENSOR HAS A LOW BATTERY	
• Train all 4 tire pressure sensors. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training in this section. • **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB ?**	**Yes** CLEAR the DTCs. REPEAT the self-test. VERIFY system operation. **No** **Before installing a new sensor(s)** : If a sensor does not respond to the Tire Pressure Monitor Activation Tool, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor again. If the sensor still does not respond, ATTEMPT to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, ATTEMPT to train the sensor with the vehicle doors open. If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to Tire Pressure Monitoring System (TPMS) Sensor in this section.

Tire Pressure Monitoring System (TPMS) Sensor Training

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the BCM . For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation in this section.

NOTE: The Tire Pressure Monitoring System (TPMS) Training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with a Tire Pressure Monitoring System (TPMS).

Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: If a sensor does not respond to the Tire Pressure Monitor Activation Tool, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again. If the sensor still does not respond, attempt to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, attempt to train the sensor with the vehicle doors open.

NOTE: The BCM has a 2-minute time limit between sensor responses. If the BCM does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.

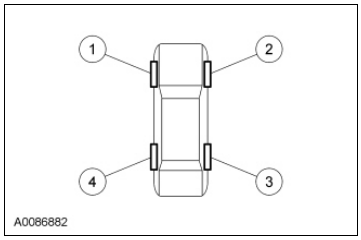
NOTE: For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

1. **NOTE:** An animated version of this procedure is available on-line.

   Turn the ignition switch to the OFF position, then press and release the brake pedal.

2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.

3. Press and release the brake pedal.



4. Turn the ignition switch to the OFF position.

5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
    - The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

6. **NOTE:** It may take up to 6 seconds to activate a tire pressure sensor. During this time, the Tire Pressure Monitor Activation Tool must remain in place at the valve stem.

   Place the Tire Pressure Monitor Activation Tool on the LF tire sidewall at the valve stem. Press and release the test button on the Tire Pressure Monitor Activation Tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the BCM .

7. Within 2 minutes of the horn sounding, place the Tire Pressure Monitor Activation Tool on the RF tire sidewall at the valve stem and press and release the test button to train the RF tire pressure sensor.

8. **NOTE:** Do not wait more than 2 minutes between training each sensor or the BCM will time out and the entire procedure must be repeated.

   Repeat Step 7 for the RR and LR tires.
   The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.
   For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor identifiers trained to the BCM and document them on the applicable warranty claim.

10. **NOTE:** This step is required to clear DTC C2780, cause the BCM to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed BCM .

    If the sensors are being trained due to the installation of a new BCM , clear any DTCs and carry out the BCM On-Demand Self Test.

Tire Pressure Monitoring System (TPMS) Sensor Activation

Special Tool(s)

 ST2941-A	Activation Tool, Tire Pressure Monitor 204-363, or Customer Activation Tool, Tire Pressure Monitor

NOTE: The tire pressure sensors will go into a "sleep mode" when a vehicle is stationary to conserve battery power. The sensors do not transmit information while in sleep mode. It will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position.

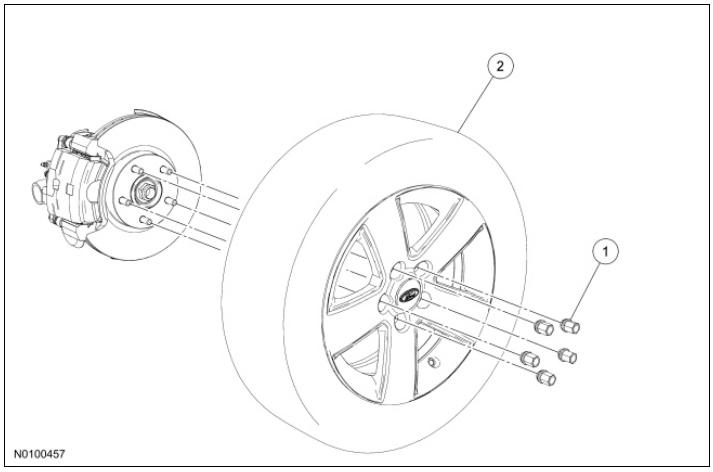
2. Position the Tire Pressure Monitor Activation Tool against the LF tire sidewall at the tire valve stem.

3. **NOTE:** The Tire Pressure Monitor Activation Tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor. This feedback may not always be present, do not rely on it as a confirmation that the module heard a particular sensor.

   NOTE: If a sensor does not respond to the Tire Pressure Monitor Activation Tool, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again. If the sensor still does not respond, attempt to activate the same sensor again using the customer activation tool (if available). If the sensor still fails to train, attempt to train the sensor with the vehicle doors open.

   Press the test button on the Tire Pressure Monitor Activation Tool to activate the sensor. Activate the sensor at least 2 times.

4. Repeat Steps 2 and 3 for the remaining tires.



5. If the Tire Pressure Monitoring System (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the Symptom Chart in Diagnosis and Testing in this section.

Wheel and Tire

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	-

NOTE: Typical 5 lug wheel shown.

Item	Part Number	Description
1	1012	Wheel nut (5 required)
2	-	Wheel and tire assembly

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. ***NOTICE:*** **Do not use heat to loosen a seized wheel nut or damage to the wheel and wheel bearing can occur.**

   NOTICE: **If equipped with full wheel cover with exposed wheel nuts, the wheel nuts must be removed prior to removing the wheel cover or damage to the wheel cover will occur.**

   Remove the 5 wheel nuts.
3. Remove the wheel and tire assembly.

Installation

1. ⚠ **WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surface of the wheel and the mounting surface of the wheel hub, brake drum or brake disc. Make sure that any fasteners that attach the rotor to the hub are secured so they do not interfere with the mounting surfaces of the wheel. Failure to follow these instructions when installing wheels may result in the wheel nuts loosening and the wheel coming off while the vehicle is in motion, which could result in loss of control, leading to serious injury or death to vehicle occupant(s).**

   NOTICE: **Make sure to apply a thin coat of anti-seize lubrication only to the interface between the wheel pilot bore and the hub pilot. Do not allow the anti-seize to make contact with the wheel-to-brake disc/drum mounting surface, wheel studs, wheel nuts, brake pads or brake disc friction surfaces or damage to components may occur.**

   Clean the wheel mounting surfaces and apply a thin coat of anti-seize to the wheel hub pilot surface (wheel only).

2. Install the wheel and tire assembly.

3. ⚠ **WARNING: Retighten wheel nuts within 160 km (100 mi) after a wheel is reinstalled. Wheels can loosen after initial tightening. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

   NOTICE: **Failure to tighten the wheel nuts in a star/cross pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder and vibration.**

   NOTE: The wheel nut torque specification is for clean, dry wheel stud and wheel nut threads.

   Install the 5 wheel nuts by hand.

   - Tighten the wheel nuts in a star/cross pattern to 135 Nm (100 lb-ft).

Wheel and Tire

Special Tool(s)

 ST2669-A	Digital Tire Pressure Gauge 204-354

Item	Part Number	Description
1	1508	Tire
2	1007	Wheel
3	1700	Valve stem and screw (also part of 1A189)
4	1A189	Tire Pressure Monitoring System (TPMS) sensor (a new sensor assembly includes W714266 screw and 1700 valve stem and cap)
5	-	Valve stem-to- TPMS sensor screw (part of 1700)
6	1A163	Valve stem cap (also part of 1A189)

Disassembly

⚠ WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Failure to follow the instructions below may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.**

NOTICE: **The Tire Pressure Monitoring System (TPMS) sensor is mounted to the valve stem. Removal of the valve stem requires dismounting the tire from the wheel and removal of the TPMS sensor.**

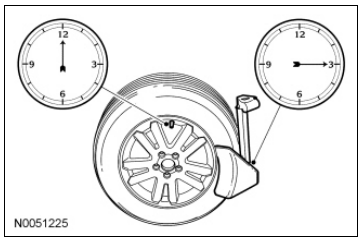
NOTE: Use only the Digital Tire Pressure Gauge any time tire pressures are measured to be sure that accurate values are obtained.

1. Remove the wheel and tire. For additional information, refer to Wheel and Tire in this section.

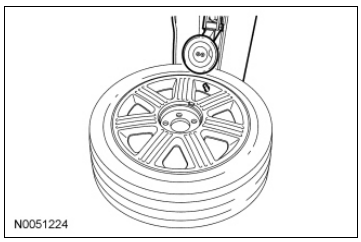
2. ***NOTICE:*** **The valve stem is connected to the Tire Pressure Monitoring System (TPMS) sensor. Do not pull the valve stem from the wheel, or damage to the sensor will occur.**

   Remove the valve stem core and fully deflate all air from the tire.

   - If a new Tire Pressure Monitoring System (TPMS) sensor is being installed, remove and discard the valve stem-to-sensor screw and the sensor.



NOTICE: **Do not allow the tire beads to move beyond the wheel mid-plane (middle of the wheel) when separating the beads from the wheels, damage to the Tire Pressure Monitoring System (TPMS) sensor may occur.**



3. ***NOTICE:*** **Tire and valve stem position is critical to prevent damage to the Tire Pressure Monitoring System (TPMS) sensor when using a paddle-type bead separator.**

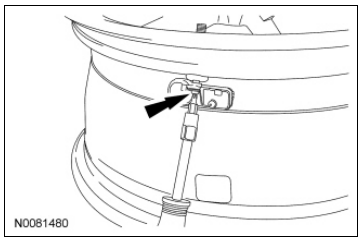
   NOTE: Some machines may have a nylon roller bead separator at the 12 o'clock position instead of the paddle-type bead separator at the 3 o'clock position.

   Position the wheel and tire assembly on a suitable tire machine and separate both beads of the tire from the wheel.

   - For a paddle-type tire machine, position the valve stem at the 12 o'clock or 6 o'clock position and the paddle at the 3 o'clock position.
   - For a roller-type tire machine, align the valve stem with the roller at any position.

4. **NOTE:** Index-mark the valve stem and wheel weight positions on the tire.

   Place the wheel and tire assembly on the turntable of the tire machine with the valve stem at the 11:30 position and the machine arm at the 12 o'clock position and dismount the outer bead from the wheel.



5. Reset the wheel and tire assembly on the turntable of the tire machine with the valve stem at the 11:30 position and the machine arm at the 12 o'clock position and dismount the inner bead from the wheel.

6. **NOTE:** A new valve stem must be installed whenever a new tire or wheel is installed.

   Remove the TPMS sensor in the following sequence.

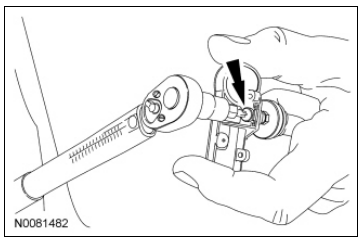
   1. Using a T10 Torx, remove the valve stem-to- TPMS sensor screw.
   2. Carefully and firmly, pull the sensor straight down and separate it from the valve stem.

7. ***NOTICE:*** **Use care not to damage the wheel surface when removing the valve stem.**

   Using a suitable valve stem puller and a wood block, remove the valve stem from the wheel.

8. **NOTE:** When installing a new wheel, always install a new valve stem and sensor screw. Reuse the TPMS sensor from the previous wheel if possible. The TPMS will not have to be trained if the sensor is reused.

   If the TPMS sensor is being reused, inspect the TPMS sensor for damage and install a new sensor as necessary.



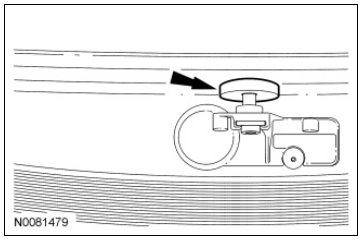
Assembly

NOTICE: **Damage to the Tire Pressure Monitoring System (TPMS) sensor may result if the tire mounting is not carried out as instructed.**

1. ***NOTICE:*** **To prevent Tire Pressure Monitoring System (TPMS) sensor and valve stem damage, the valve stem must be installed onto the TPMS sensor and then installed into the wheel as an assembly.**

   Install a new valve stem onto the TPMS sensor.

   - Tighten the new valve stem-to- TPMS sensor screw to 1.5 Nm (13 lb-in).

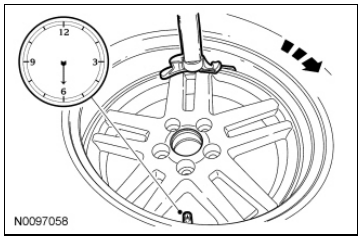


2. ***NOTICE:*** **It is important to pull the valve stem and Tire Pressure Monitoring System (TPMS) sensor assembly through the wheel rim hole in a direction parallel to the valve stem hole axis. If the assembly is pulled through at an angle, damage to the valve stem and sensor assembly may occur.**

   NOTICE: **Use care not to damage the wheel surface when installing the valve stem and Tire Pressure Monitoring System (TPMS) sensor assembly.**

   Lubricate the valve stem with soapy water and install the valve stem and TPMS sensor assembly into the wheel using a block of wood and a suitable valve stem installer.

3. Make sure the valve stem rubber is fully seated against the wheel.



4. **NOTE:** Lubricate the tire beads using a suitable fast-drying, corrosion-inhibiting tire bead lubricant.

   NOTE: Do not mount the tire at this time.

   Position the wheel on the turntable of the tire machine, then lubricate and position the bottom bead of the tire on the wheel.

5. Position the wheel to align the valve stem with the machine arm, at the 6 o'clock position, and mount the bottom bead of the tire.

6. Reposition the wheel to align the valve stem with the machine arm at the 6 o'clock position, and mount the top bead of the tire.

7. **NOTE:** Use only the Digital Tire Pressure Gauge any time tire pressures are measured to make sure that accurate values are obtained.

   Inflate the tire to the pressure specified on the Vehicle Certification (VC) label located on the driver door or door pillar.

   - Proceed to Step 8 if the tire beads do not seat at the specified inflation pressure.

8. ⚠ **WARNING: If there is a need to exceed the maximum pressure indicated on the sidewall of the tire in order to seat the beads, follow all steps listed below. Failure to follow these steps may result in serious personal injury.**

   The following steps should only be carried out if the tire beads cannot be seated by inflating the tire up to the maximum inflation pressure listed on the tire sidewall.

   1. Relubricate the tire bead and wheel bead seat area.
   2. Install a remote valve and pressure gauge.
   3. Wear eye and ear protection and stand at a minimum of 3.65 m (12 ft) away from the wheel and tire assembly.
   4. Inflate the tire using the remote valve and tire gauge until the beads have seated or until the pressure gauge is 138 kPa (20 psi) more than maximum inflation pressure on tire sidewall. If beads have not seated, deflate the tire and proceed to the next step.
   5. Place the wheel and tire assembly in an OSHA-approved tire safety cage.
   6. Inflate the tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 276 kPa (40 psi) more than maximum inflation pressure on the tire sidewall. **Do not exceed 276 kPa (40 psi) above the maximum pressure on tire sidewall. Install a new tire if the beads do not seat at this pressure.**

9. Install the wheel and tire. For additional information, refer to Wheel and Tire in this section.

Tire Pressure Monitoring System (TPMS) Sensor

Disassembly

1. **NOTE:** The Tire Pressure Monitoring System (TPMS) sensor cannot be removed without disassembly of the wheel and tire.

   Disassemble the wheel and tire. For additional information, refer to Wheel and Tire in this section.

Material

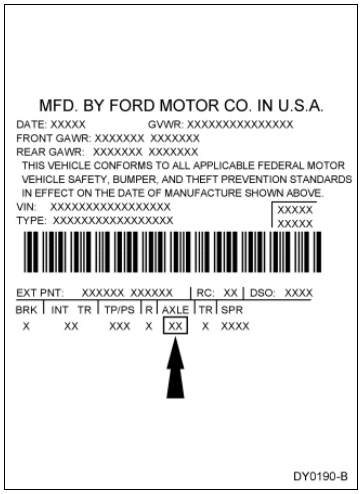
Item	Specification	Fill Capacity
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A	1.15L (2.43 pt)

General Specifications

Item	Specification
End play	
Wheel bearing end play	0.00 mm (0.000 in) maximum
Runout	
Driveshaft runout	0.89 mm (0.035 in)
Pilot runout	0.15 mm (0.006 in) maximum
Wheel hub face runout	0.254 mm (0.010 in) maximum
Wheel hub flange bolt circle runout	0.38 mm (0.015 in) maximum

Driveline System

The driveline system consists of the following components:



- Center support bearing
- Driveshaft assembly
- Front halfshafts
- Rear halfshafts
- Active torque coupling/rear axle

On Front Wheel Drive (FWD) vehicles, the transaxle transmits power from the engine to the halfshafts.

On All-Wheel Drive (AWD) vehicles, power is transmitted from the engine through the transaxle to the Power Transfer Unit (PTU). The PTU transfers engine power from the transaxle to the front halfshafts, and through the driveshaft to the active torque coupling/rear axle and halfshafts. For information on the PTU , refer to Section 308-07A or Section 308-07B .

The engine angle is built into the engine mounts. If the engine angle is out of specification, the engine mounts must be inspected for damage. Refer to Section 303-01A , Section 303-01B or Section 303-01C .

Vehicle Certification (VC) Label Example

The Vehicle Certification (VC) label is located in the driver door jamb. The axle code is on the VC label. Refer to Section 100-01 .

The axle ratio is 2.93 and the ring gear has a diameter of 174 mm (6.85 in).

The wheel speed sensor rings for FWD vehicles are located on the front halfshafts and are mounted to the rear inner spindles.

The wheel speed sensor rings are located on the front and rear halfshafts for AWD vehicles.

Driveshaft

The driveshaft is a 3-piece shaft with rubber-isolated center bearings.

The driveshaft has traditional balance weights attached (spot-welded) by the manufacturer.

U-joints

The CV and U-joints are installed new with the driveshaft.

The front CV joint is:

- lubricated with a special lubricant and requires no additional lubrication.

The center U-joints are:

- a lubed-for-life design that requires no periodic lubrication.
- equipped with nylon thrust washers located at the base of each bearing cup which control end play, position the needle bearings and improve grease movement.

Rear Drive Unit

The active torque coupling/Rear Drive Unit (RDU) is serviced as an assembly.

The RDU housing cover uses a silicone sealant rather than a gasket.

Each halfshaft is held in the RDU case by a halfshaft circlip that is located on the inner CV joint stub shaft pilot bearing housing. When each halfshaft is installed, the halfshaft circlip engages a slot in the differential side gear.

The RDU operates as follows:

- The RDU pinion receives power from the engine through the transaxle, PTU , driveshaft and active torque coupling, and is always engaged.
- The pinion gear rotates the differential case, which is bolted to the differential case outer flange.
- Inside the differential case, 2 differential pinion gears are mounted on a differential pinion shaft that is pinned to the differential case.
- These differential pinion gears are engaged with the differential side gears, to which the halfshafts are splined.
- As the differential case turns, it rotates the halfshafts and rear wheels.
- When it is necessary for one wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the 2 halfshafts.

Halfshafts

The drive halfshafts consist of the following components:

- Inner CV joints
- Outer CV joints
- CV joint boot clamps
- CV joint boots
- Tripod joint housings
- Retainer circlips
- Front intermediate shaft bearing

The front intermediate shaft bearing is pressed on and is only serviced as an assembly with the intermediate shaft.

NOTICE: **An inspection of the outer and inner Constant Velocity (CV) joint boots is necessary so that if damage or grease leakage is evident, installation of a new halfshaft can take place immediately. Continued operation with damage or grease leakage will result in CV joint wear and noise due to contamination and loss of the CV joint grease.**

- The inner and outer CV joints connect to a splined shaft. A circlip holds the cross groove inner race assembly (inner CV joint) together.
- A circlip retains the splined inner CV joint. Install a new axle circlip each time the halfshaft is removed from the vehicle.
- A wheel hub nut secures the side shaft assembly (interconnecting shaft and outer CV joint) to the wheel hub. Install a new wheel hub nut each time the halfshaft is removed from the vehicle.

Halfshaft Handling

NOTICE: **Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the Constant Velocity (CV) joints. Damage will occur to an assembled inner CV joint if it is over-plunged outward from the joint housing or over angled.**

Handle all halfshaft components carefully during removal and installation procedures. Never use a hammer to remove or install the halfshafts. Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft. Do not allow the boots to contact sharp edges or hot exhaust components. Do not drop assembled halfshafts. The impact may cut the boots from the inside without evidence of external damage.

Driveline System

Material

Item	Specification
Additive Friction Modifier XL-3 (US); CXL-3 (Canada)	EST-M2C118-A
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A

Principals of Operation

Driveline System - General Information

The driveline system enables the power generated by the engine and transferred through the transmission in Front Wheel Drive (FWD), or the transmission and the Power Transfer Unit (PTU) in All-Wheel Drive (AWD) to place the vehicle in motion. Rotational torque received from the transmission or PTU is delivered to the front wheels by halfshafts or the rear axle by way of the driveshaft(s). The U-joints or CV joints at the ends of the shafts allow the shafts to rotate smoothly in an allowable angle plane. The rotational torque is introduced into the axle drive pinion which drives the differential ring gear. The ring gear is bolted to the axle differential which divides the torque between the left and right axle shafts, while permitting the shafts to turn at different speeds when required, such as when cornering.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• U-joints • CV joints • Center bearings • Driveshaft tubes • Mounting brackets • Flanges • Housing and cover damage • Differential bearings

- Differential gearsets
- Pinion bearings

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - NVH .

Driveshaft Center U-Joint and CV Joint Inspection

With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . Rotate the driveshaft by hand. Check for rough operation or seizure of the U-joints or CV joints. Install a new driveshaft if it shows signs of seizure, excessive wear or incorrect seating. Refer to Section 205-01 .

Driveshaft Center Bearing

With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . Rotate the driveshaft by hand. If the bearing shows signs of roughness or is noisy, install a new driveshaft assembly. Refer to Section 205-01 .

Symptom Charts - NVH

Symptom Charts - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Axle howling or whine - front or rear axle
- Axle lubricant low
- CHECK the lubricant level. FILL the axle to specification.
- Axle housing damage
- INSPECT the axle housing for damage. INSTALL a new axle as necessary. REFER to Section 205-02 .
- Damaged or worn wheel hub bearings
- CHECK for abnormal wheel hub bearing play or roughness. REFER to Section 204-01 or Section 204-02 .
- Damaged or worn differential ring and pinion

- INSPECT and INSTALL a new axle assembly as necessary. REFER to Section 205-02 .
- Damaged or worn differential side or pinion bearings
- INSPECT and INSTALL a new axle assembly as necessary. REFER to Section 205-02 .
- Driveline clunk - loud clunk when shifting from reverse to drive
- Incorrect axle lubricant level
- CHECK the lubricant level. FILL the axle to specification.
- Excessive backlash in the axle
- CHECK the axle backlash. INSPECT and INSTALL a new axle assembly as necessary. REFER to Section 205-02 .
- Damaged or worn pinion bearings
- INSPECT and INSTALL a new axle assembly as necessary. REFER to Section 205-02 .
- Damaged or worn U-joints
- INSPECT the U-joints for wear or damage. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Driveline clunk - occurs as the vehicle starts to move forward following a stop
- Worn driveshaft CV joint or U-joints with excessive play
- INSPECT the CV joint and U-joints for a worn condition. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Loose rear axle mount
- CHECK the axle for loose bolts. TIGHTEN to specification. REFER to Section 205-02 .
- Driveline clunk (Front Wheel Drive (FWD) vehicles) - occurs during acceleration or from cruise to coast/deceleration
- Damaged or worn inner CV joint
- INSPECT the inner CV joint and boot. INSTALL a new CV joint as necessary. REFER to Section 205-04 .
- Clicking, popping or grinding - occurs while the vehicle is turning
- Inadequate or contaminated lubrication in the CV joints
- CHECK the CV boots and joints for wear or damage. INSTALL new components as necessary. REFER to Section 205-04 .
- Loose wheel end nut

- CHECK wheel hub nut torque. REPAIR as necessary. REFER to Section 205-04 .
- Another component contacting the halfshaft
- CHECK the halfshafts and the area around the halfshafts. REPAIR as necessary.
- High pitched chattering - noise from the rear axle when the vehicle is turning
- Incorrect or contaminated lubricant
- CHECK the vehicle by driving in tight circles (5 clockwise, 5 counterclockwise). DRAIN and REFILL with the specified rear axle lubricant and friction modifier as necessary.
- Damaged or worn differential (differential side gears and pinion gears)
- INSPECT and INSTALL a new axle assembly as necessary. REFER to Section 205-02 .
- Buzz - buzzing noise is the same at cruise or coast/deceleration
- Incorrect driveline angles
- CHECK for correct driveline angles. REPAIR as necessary. REFER to Driveline Angle Measurement in this section.
- Rumble or boom - noise occurs at coast/deceleration, usually driveshaft speed-related and noticeable over a wide range of speeds
- Driveshaft is out-of-balance
- CHECK the driveshaft for damage, missing balance weights or undercoating. REFER to Driveshaft Runout and Balancing in this section.
- U-joints are binding or seized
- ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Grunting - normally associated with a shudder experienced during acceleration from a complete stop
- Driveshaft CV joint binding
- INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Loose rear axle mount bolts or suspension fasteners
- INSPECT the rear suspension and axle. TIGHTEN the fasteners to specification. REFER to Section 205-02 .
- Howl - can occur at various speeds and driving conditions. Affected by acceleration and deceleration
- Incorrect ring and pinion contact, incorrect bearing preload or gear damage
- INSPECT and INSTALL a new axle assembly as necessary. REFER to Section 205-02 .

- Chuckle - heard at coast/deceleration. Also described as a knock
- Incorrect ring and pinion contact or damaged teeth on the coast side of the ring and pinion
- INSPECT and INSTALL a new axle assembly as necessary. REFER to Section 205-02 .
- Knock - noise occurs at various speeds. Not affected by acceleration or deceleration
- Gear tooth damage to the drive side of the ring and pinion
- INSPECT and INSTALL a new axle assembly as necessary. REFER to
- Scraping noise - a continuous low pitched noise starting at low speeds
- Worn or damaged pinion bearings
- INSTALL a new axle assembly as necessary. REFER to Section 205-02 .
- Driveline shudder - occurs during acceleration from a slow speed or stop
- Rear drive axle assembly mispositioned
- CHECK the axle mounts and the rear suspension for damage or wear. REPAIR as necessary. REFER to Section 205-02 .
- Loose rear axle bolts
- CHECK the rear axle for loose bolts. TIGHTEN the bolts to specification. REFER to Section 205-02 .
- Driveline angles out of specification
- CHECK for correct driveline angles. REFER to Driveline Angle Measurement in this section.
- U-joints binding or seized
- ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Binding or damaged driveshaft CV joint
- INSPECT the driveshaft CV joint and coupling shaft for wear or damage. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Driveline vibration - occurs at cruising speeds
- Worn U-joints
- CHECK for wear or incorrect seating. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Worn or damaged driveshaft center bearing support
- CHECK the insulator for damage or wear. ROTATE the driveshaft and CHECK for rough operation. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .

- Loose axle pinion flange bolts
- INSPECT the axle pinion flange. TIGHTEN the pinion flange bolts to specification. REFER to Section 205-01 .
- Excessive axle pinion flange runout
- CARRY OUT a runout check. REPAIR as necessary. REFER to Section 205-02 .
- Driveshaft is out-of-balance
- CHECK the driveshaft for damage, missing balance weights or undercoating. CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REFER to Driveshaft Runout and Balancing in this section.
- Binding or damaged driveshaft CV joint
- INSPECT the driveshaft CV joint for wear or damage. INSTALL a new driveshaft as necessary. REFER to Section 205-01 .
- Excessive driveshaft runout
- CARRY OUT a runout check. REFER to Driveshaft Runout and Balancing in this section.
- Driveline angles out of specification
- CHECK for correct driveline angles. REPAIR as necessary. REFER to Driveline Angle Measurement in this section.
- Incorrectly seated CV joint in the wheel hub
- CHECK the outer CV joint for correct seating into the hub. REPAIR as necessary. REFER to Section 205-04 for the front CV joints or Section 205-05 for the rear CV joints.

Analysis of Leakage

Clean up the leaking area enough to identify the exact source.

A plugged Rear Drive Unit (RDU) housing vent can cause excessive pinion seal lip wear due to internal pressure buildup.

Verify the RDU lubricant level is at least 3-5 mm (1/8-3/16 in) below the bottom of the fill hole.

Axle Vent

A plugged vent will cause excessive seal lip wear due to internal pressure buildup. If a leak occurs, check the vent. If the vent cannot be cleared, install a new vent.

Drive Pinion Seal

Leaks at the drive pinion seal originate from the following causes:

- Damaged seal

- Worn seal journal surface

Any damage to the seal bore (dings, dents, gouges or other imperfections) distorts the seal casing and allows leakage past the outer edge of the drive pinion seal.

The drive pinion seal can be torn, cut or gouged if it is not installed correctly. The spring that holds the drive pinion seal against the pinion flange may be knocked out and allow fluid to pass the lip.

Metal chips trapped at the sealing lip can cause oil leaks. These can cause a wear groove on the drive pinion flange and result in pinion seal wear.

When a seal leak occurs, install a new drive pinion seal and check the vent to make sure it is clean and free of foreign material.

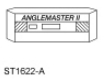
A new drive pinion flange must be installed if any of these conditions exist.

Drive Pinion Nut

NOTICE: **Install the drive pinion nut to the correct torque specifications or damage to the differential components may occur.**

On some high-mileage vehicles, oil may leak through the threads of the drive pinion nut. This condition can be corrected by installing a new nut.

Differential Seals



NOTICE: **When installing shafts, do not allow splines to contact seals during installation or damage to the seals may occur.**

Halfshaft pilot bearing housing seals are susceptible to the same types of damage as drive pinion seals if incorrectly installed. The seal bore must be clean and the lip handled carefully to avoid cutting or tearing it. The seal journal surface must be free of nicks, gouges and rough surface texture.

For information on differential seals, refer to Section 205-02 .

Driveline Angle Measurement

Special Tool(s)

 ST1622-A	Anglemaster II Driveline Inclinometer/Protractor 164-R2402 or equivalent

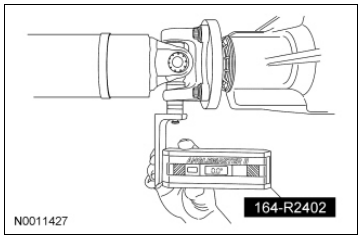
NOTE: This procedure does not apply to CV joints, flex couplers or double cardan joints that are used in some driveshafts. This check is for single-cross and roller-style joints found in the driveshafts.

NOTE: Prior to checking driveline angularity, inspect the U-joints for correct operation.

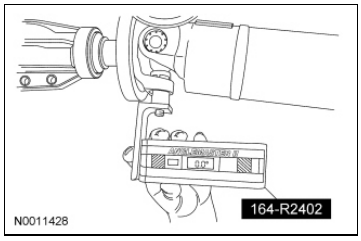
NOTE: An incorrect driveline angle can cause a vibration or shudder. For additional information, refer to Section 100-04 .

NOTE: Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height, rear spring and engine mounts.

All vehicles



1. Carry out the following preliminary setup steps:
   - Inspect the U-joints for correct operation.
   - Park the vehicle on a level surface such as a drive-on hoist, or back onto a front end alignment rack.
   - Verify the curb position ride height is within specifications with the vehicle unloaded and all of the tires are inflated to their normal operating pressures.
   - Calibrate the Anglemaster II Driveline Inclinometer/Protractor by placing it on a clean, flat level section of the frame rail and press the ALT-ZERO button.



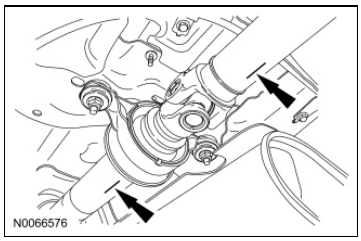
Vehicles with flat-flanged, split-pin or slip-flanged U-joints

2. **NOTE:** If equipped, remove the snap ring to allow access to the base of the U-joint cup. Make sure the Anglemaster II Driveline Inclinometer/Protractor is seated against the U-joint cup.

   NOTE: Rotate the driveshaft until the flange U-joint cup is parallel with the floor. This will simplify taking measurements.

   To check the U-joint operating angle, install the Anglemaster II Driveline Inclinometer/Protractor. Check and record the flange angle as angle A.

3. Using the Anglemaster II Driveline Inclinometer/Protractor, measure the slope of the connecting component. Record the measurement of the component angle as angle B.



Multiple piece driveshafts

4. **NOTE:** Repeat this step for each center support bearing on the driveshaft.

   NOTE: It is not necessary to remove the U-joint snap ring, if equipped, for these measurements.

   Using the Anglemaster II Driveline Inclinometer/Protractor, measure the slope of the components in front and behind the center support bearing U-joint in the area indicated. Record the front component as angle A and the rear component as angle B.

All vehicles

5. **NOTE:** When 2 connected components slope in the same direction, subtract the smallest number from the larger number to find the U-joint operating angle. When 2 connected components slope in the opposite direction, add the measurements to find the U-joint operating angle.

   Calculate the difference in the slope of the components to determine the U-joint operating angle.

   - The U-joint operating angle is the angle formed by 2 yokes connected by a cross and bearing kit. Ideally, the operating angles on each connection of the driveshaft must:
     - be equal or within one degree of each other.
     - have a 3 degree maximum operating angle.
     - have at least one-half of one degree continuous operating angle.

6. If the angle is not within specifications, repair or adjust to obtain the correct angle. Inspect the engine mounts, transmission mounts, center support bearing mounting, rear suspension, rear axle, rear axle mounting or the frame for wear or damage.

Driveshaft Runout and Balancing

Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 ST3025-A	Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) 257-00018 or equivalent

Driveshaft Inspection

NOTE: Driveline vibration exhibits a higher frequency and lower amplitude than high-speed shake. Drivee vibration is directly related to the speed of the vehicle and is noticed at various speeds. Driveline vibration can be perceived as a tremor in the floorpan or heard as a rumble, hum or boom.

NOTE: Refer to Specifications in this section for all runout specifications.

1. **NOTE:** Do not make any adjustments before carrying out a road test. Do not change the tire pressure or the vehicle load.

   Carry out a visual inspection of the vehicle. Operate the vehicle and verify the condition by reproducing it during the road test.

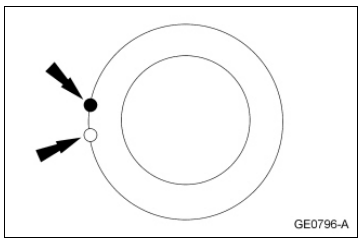
   - The concern should be directly related to vehicle road speed, not affected by acceleration or deceleration or could not be reduced by coasting in NEUTRAL.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
   - The driveshaft should be kept at an angle equal to or close to the curb-weighted position. Use a twin-post hoist or a frame hoist with jackstands.

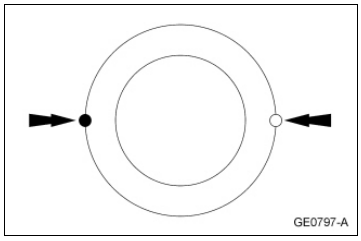
3. Inspect the driveshaft for damage, undercoating or incorrectly seated U-joints. Rotate the driveshaft slowly by hand and feel for binding or end play in the U-joint trunnions. Remove the driveshaft. For additional information, refer to Section 205-01 . Inspect the slip yoke splines for any galling, dirt, rust or incorrect lubrication. Clean the driveshaft or install new U-joints as necessary. Install a new driveshaft if damaged. After any corrections or new components are installed, recheck for the vibration at the road test speed.
   - If the vibration is gone, test drive the vehicle.
   - If the vibration persists or the driveshaft passes visual inspection, measure the driveshaft runout.

Driveshaft Runout

1. Install the Dial Indicator Gauge with Holding Fixture. Rotate the driveshaft by turning the axle and measure the runout at the front, the center and the rear of the driveshaft.



- If the runout exceeds 1 mm (0.040 in) at the front or center, install a new driveshaft.
- If the front and center is within 1 mm (0.040 in), but the rear runout is not, index-mark the rear runout high point and proceed to Step 2.
- If the runout is within 1 mm (0.040 in) at all points, recheck for vibration at road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.



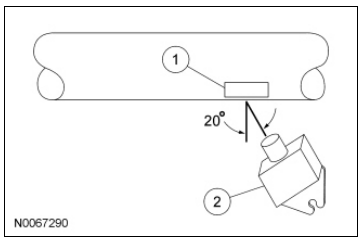
2. **NOTE:** Circular pinion flanges can be turned in 90 degree or one-fourth increments. Half-round pinion flanges are limited to 2 positions.

   Index-mark the driveshaft to the pinion flange. Disconnect the driveshaft and rotate it 180 degrees. Reconnect the driveshaft. Recheck the runout at the rear of the driveshaft.

   - If the runout is still over specification, mark the high point and proceed to Step 3.
   - If the runout is within specification, check for the vibration at the road test speed. If the vibration is still present, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.

3. Excessive driveshaft runout can originate in the driveshaft itself or from the pinion flange. To find the source, compare the 2 high points previously determined.
   - If the index marks are close together, within 25 mm (1 in), the driveshaft is eccentric. Install a new driveshaft.
   - If the marks are on opposite sides of the driveshaft, 180 degrees apart, the slip yoke or pinion flange is responsible. Check the pinion flange runout. If the pinion flange runout exceeds specifications, a bent pinion is indicated.
   - If the pinion flange and pinion runouts are within specifications, road test and check for the vibration at the road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to Driveshaft Balancing in this procedure.

Driveshaft Balancing - Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)

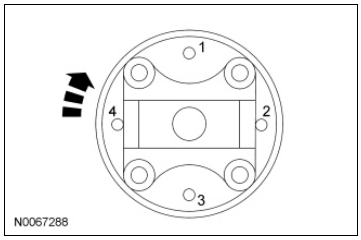


All vehicles

1. Install the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) to the vehicle.

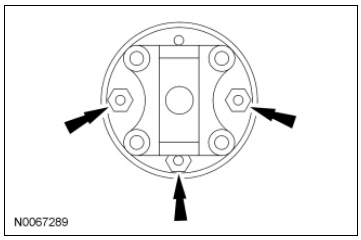
2. Working under the vehicle, install ccelerometer. The accelerometer can be attached and mounted near

either the transmission or differential end of the driveshaft.



3. Clean an area of the driveshaft and install the reflective tape, then install the photo-tachometer sensor. The sensor should be placed at approximately a 20-degree angle from perpendicular to the surface of the reflective tape. Make sure the sensor does not get moved during the balance procedure.
    1. Reflective tape.
    2. Photo-tachometer sensor.

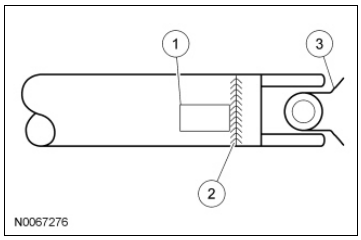
4. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a driveshaft balance test with the driveshaft unmodified.



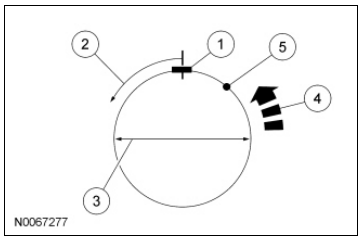
Vehicles with tapped pinion flanges

5. Label the tapped holes in the pinion flange numerically, starting at the top hole as 1. Mark the remaining holes 2, 3 and 4. Label in the direction of rotation.

6. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with the 12 mm (0.47 in) test weight set screw in the No. 1 hole, previously marked on the pinion flange.



7. Remove the test weight, then install the weight combination directed by the Maertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix).

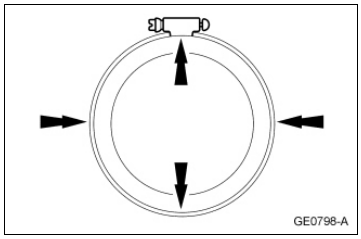


Vehicles without tapped pinion flanges

8. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with a test weight. Using a metal band, secure the test weight to the end of the driveshaft. The weight should be placed at the end of the driveshaft tube, as close to the tube-to-yoke weld seam as possible. Mark the location of the test weight on the driveshaft, as shown in the figure below.
    1. Test weight.
    2. Tube-to-yoke weld seam.
    3. Driveshaft pinion flange.

- Select the test weight based on driveshaft size. Larger driveshafts use 10 g (0.353 oz). Smaller driveshafts use 5 g (0.176 oz).

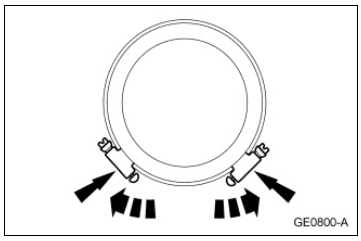
9. Remove the test weight, then install the recommended weight at the position directed by the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix). Using a metal band and epoxy, secure the test weight to the driveshaft, as shown in the figure below.
    1. Test weight.
    2. Measure in this direction.
    3. Driveshaft diameter.
    1. Directional rotation.
    5. Balance weight relative to test weight centerline.
    - The results are displayed with respect to the location to where the test weight was placed.



All vehicles

10. Using the Mastertech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a third test to verify the repair.

Driveshaft Balancing - Hose Clamp Method



1. Install 1 or 2 hose clamps on the driveshaft, near the rear. Position of the hose clamp head(s) can be determined through trial and error.

2. Mark the rear of the driveshaft into 4 approximately equal sectors and number the marks 1 through 4. Install a hose clamp on the driveshaft with its head at position No. 1, as shown in the figure below. Check for vibration at road speed. Recheck with the clamp at each of the other positions to find the position that shows minimum vibration. If 2 adjacent positions show equal improvement, position the clamp head between them.

3. If the vibration persists, add a second clamp at the same position and recheck for vibration.

4. If no improvement is noted, rotate the clamps in opposite directions, equal distances from the best position determined in Step 2. Separate the clamp heads about 13 mm (1/2 in) and recheck for vibration at the road speed.

5. Repeat the process with increasing separation until the best combination is found or the vibration is reduced to an acceptable level.

Torque Specifications

Description	Nm	lb-ft
Center bearing support nuts	55	41
Exhaust flex pipe nuts	40	30
Front driveshaft-to-Power Transfer Unit (PTU) flange bolts	70	52
Rear driveshaft-to-pinion flange bolts	70	52

Driveshaft

NOTE: All driveshaft assemblies are balanced. If undercoating the vehicle, protect the driveshaft to prevent overspray of any undercoating material.

The driveshaft assembly consists of the following:

- Rubber isolated center support bearings
- CV joint at the Power Transfer Unit (PTU)
- U-joints at the center support and pinion flange
- Assembly balanced with traditional balance weights
- Lubed-for-life joints requiring no periodic lubrication

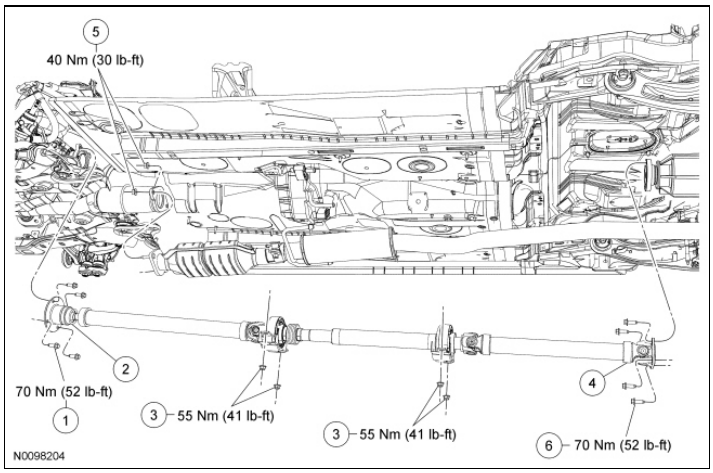
The driveshaft transfers torque from the PTU to the rear axle. It is attached to the PTU flange with a CV joint. The driveshaft is connected by a staked U-joint at the center bearing and attached to the rear pinion flange. The driveshaft joints allow the smooth continuous rotation of the driveshaft through the allowable angle planes and length variations required in normal vehicle operation. The driveshaft is always turning at front wheel speed. The driveshaft is not serviceable. A new driveshaft must be installed if worn or damaged.

Universal Joints

The U-joints consist of the following:

- A single spider (cross)
- Lubed-for-life design and require no periodic lubrication
- Nylon thrust washers, located at each base of the bearing cup, which control end play, position the needle bearing and improve grease movement
- Grease seals located at the opening of each bearing cup to retain the grease for the bearing lubrication
- Bearing cups that retain the needle bearings and locate the spider on the centerline of the shaft bore to control shaft runout and balance

The U-joints are staked in place and are not serviced individually. If worn or damaged, install a new driveshaft assembly.



The U-joints in this driveshaft assembly allow the driveshaft tubes to rotate smoothly through the varying angles of the Power Transfer Unit (PTU), the center support bearings and the Rear Drive Unit (RDU). The angles that cause the U-joints to accelerate and decelerate may cause vibration in the driveshaft assembly if the angles are either too great or too small. Refer to Section 205-00 .

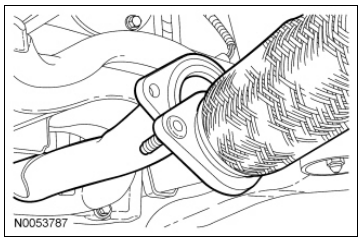
Driveshaft

Refer to Section 205-00 .

Driveshaft

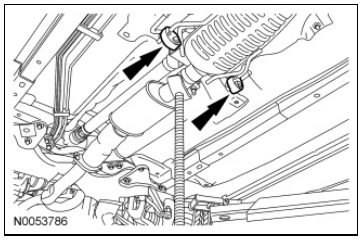
Driveshaft

Item	Part Number	Description
1	W711960	Front driveshaft-to-Power Transfer Unit (PTU) Driveshaft flange bolt (4 required)
2	-	Front driveshaft flange
3	W520113	Center bearing support nuts (4 required)
4	-	Rear driveshaft flange
5	W705443	Exhaust flex pipe flange nuts (2 required)
6	W711960	Rear driveshaft-to-pinion flange bolt (4 required)



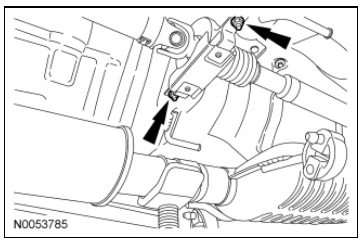
Removal and Installation

NOTE: Index-mark both the driveshaft flanges.



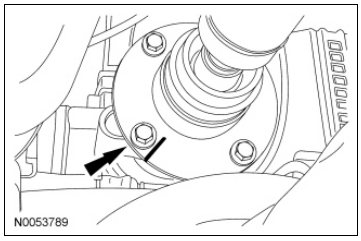
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

NOTICE: **Make sure to adequately support the exhaust flex pipe or damage may occur.**

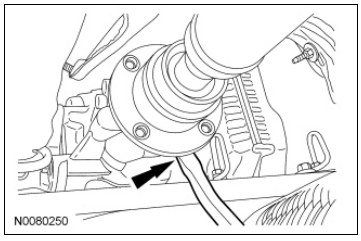


2. Remove and discard the 2 nuts and separate the exhaust system at the flex pipe.
   - Install new nuts and tighten to 40 Nm (30 lb-ft).

3. Support the exhaust system and disconnect the 2 front exhaust hangers from the exhaust system.



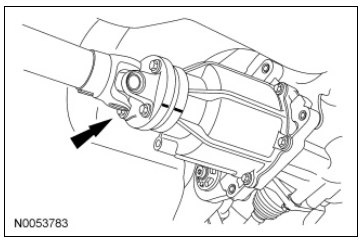
4. Carefully lower the exhaust system to allow clearance for removal of the driveshaft.



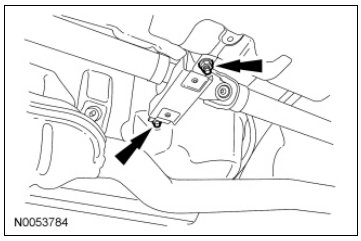
5. **NOTE:** Do not reuse the CV joint bolts.

   Remove and discard the 4 front driveshaft-to-Power Transfer Unit (PTU) flange bolts.

   - Install new bolts and tighten to 70 Nm (52 lb-ft).



6. Using a suitable pry bar as shown, separate the driveshaft flange from the PTU flange.



7. ***NOTICE:*** **Do not reuse the bolts for the rear U-joint flange. Install new bolts or damage to the component may occur.**

   Remove and discard the 4 rear driveshaft-to-pinion flange bolts.

   - Install new bolts and tighten to 70 Nm (52 lb-ft).

8. With the help of an assistant, remove the 4 center bearing support nuts and the driveshaft.
    - To install, tighten to 55 Nm (41 lb-ft).

9. **NOTE:** If a driveshaft is installed and driveshaft vibration is encountered after installation, index the driveshaft. For additional information, refer to Section 205-00 .

    To install, reverse the removal procedure.

Material

Description	Nm	lb-ft
Differential housing cover bolts	23	17
Differential housing-to-front insulator bracket bolts	90	66
Filler plug	29	21
Pinion nut	244	180
Side insulator bracket-to-rear axle differential bolts	90	66

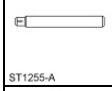
Rear Drive Axle and Differential

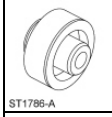
The rear drive axle consists of the following components:

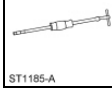
- Dished circular flange
- Full-time fluid drive coupling
- Aluminum housing with steel housing cover
- Matched ring and pinion
- Conventional open differential
- Rubber bushing isolated mounting points
- Cover mounted axle vent
- Silicone sealant rather than a gasket

The rear drive axle is serviced as follows:

- The active torque coupling is installed new as an assembly with the rear axle
- The pinion seal and the differential halfshaft seals are the only serviced components of the rear drive axle. If other components of the rear drive axle are worn or damaged, the assembly must be installed new



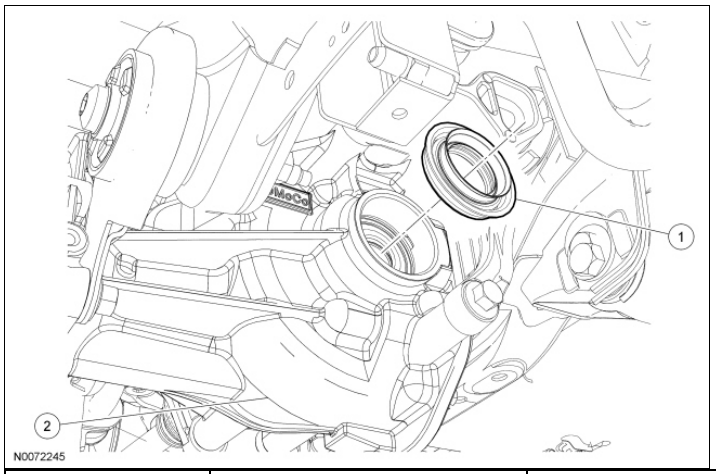




The rear axle drive pinion receives power from the engine through the transaxle, Power Transfer Unit (PTU), driveshaft and active torque coupling, and is engaged ON DEMAND. The pinion gear rotates the differential ring gear, which is bolted to the differential case outer flange. Inside the differential case, 2 differential pinion gears are mounted on a differential pinion shaft, which is pinned to the case. These differential pinion gears are engaged with the splined differential side gears. The halfshafts are held in the differential side gears by a retainer circlip that is located on the inboard CV joint stub shaft. When each halfshaft is installed, the retainer circlip engages a step in the differential side gear. There are no stub shaft bearings in the differential housing. As the differential case turns, it rotates the halfshafts and rear wheels. When it is necessary for one wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the 2 halfshafts.

Rear Drive Axle and Differential

Refer to Section 205-00 .



Stub Shaft Seal

Special Tool(s)

 ST1255-A	Adapter for 303-224 (Handle) 205-153 (T80T-4000-W)

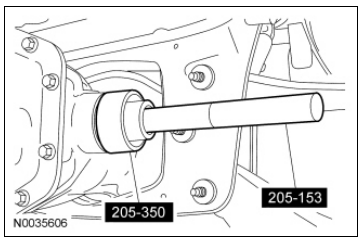
Item	Part Number	Description
1	4B416	Stub shaft seal
2	4010	Differential housing

Removal

NOTE: The Rear Drive Unit (RDU) does not have stub shaft pilot bearings. It has stub shaft seals only.

1. Remove the halfshaft. For additional information, refer to Section 205-05 .



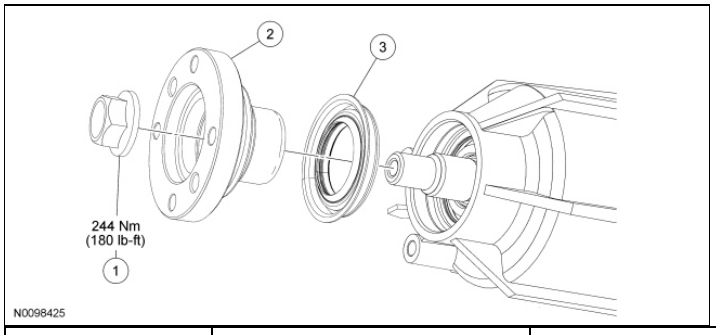
2. Using the Torque Converter Fluid Seal Remover and Slide Hammer, remove the stub shaft seal.

Installation

1. **NOTE:** Lubricate the new stub shaft seal with grease.

   Using the Front Axle Oil Seal Installer and Adapter Handle, install the stub shaft pilot bearing housing seal.

2. Install the halfshaft assembly. For additional information, refer to Section 205-05 .



Drive Pinion Seal

Special Tool(s)

 ST1321-A	2 Jaw Puller 205-D072 (D97L-4221-A) or equivalent

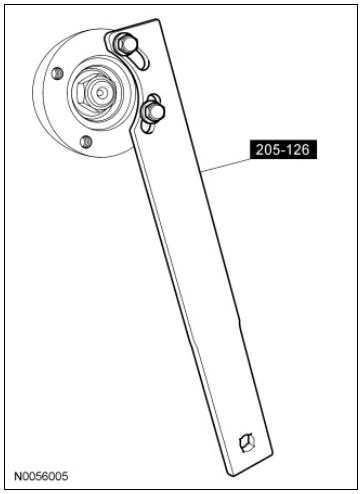
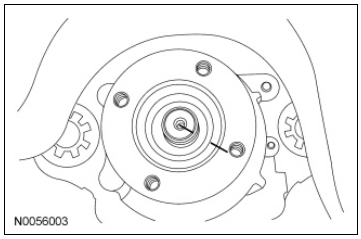
Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B



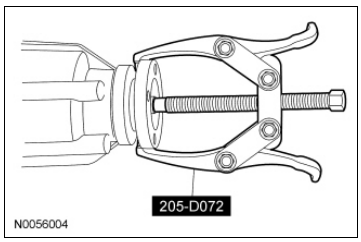
Item	Part Number	Description
1	4320	Drive pinion nut
2	4858	Drive pinion flange
3	4N299	Drive pinion seal

Removal

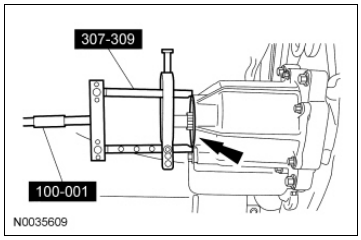


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the driveshaft. For additional information, refer to Section 205-01 .

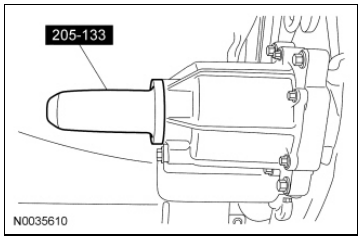


3. Using the Drive Pinion Flange Holding Fixture, hold the pinion flange and remove the pinion flange nut.
    - Discard the nut.



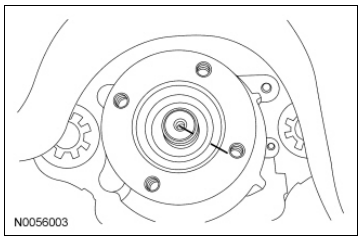
4. Index-mark the location of the pinion flange to the yoke.

5. Using the 2 Jaw Puller, remove the pinion flange.



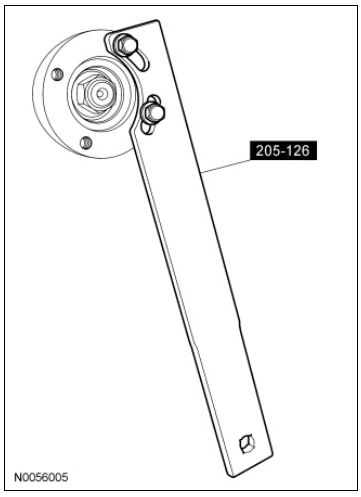
6. Using the Converter Seal Remover and Slide Hammer, remove and discard the drive pinion seal.

Installation



1. **NOTE:** Make sure that the mating surface is clean before installing the new seal.

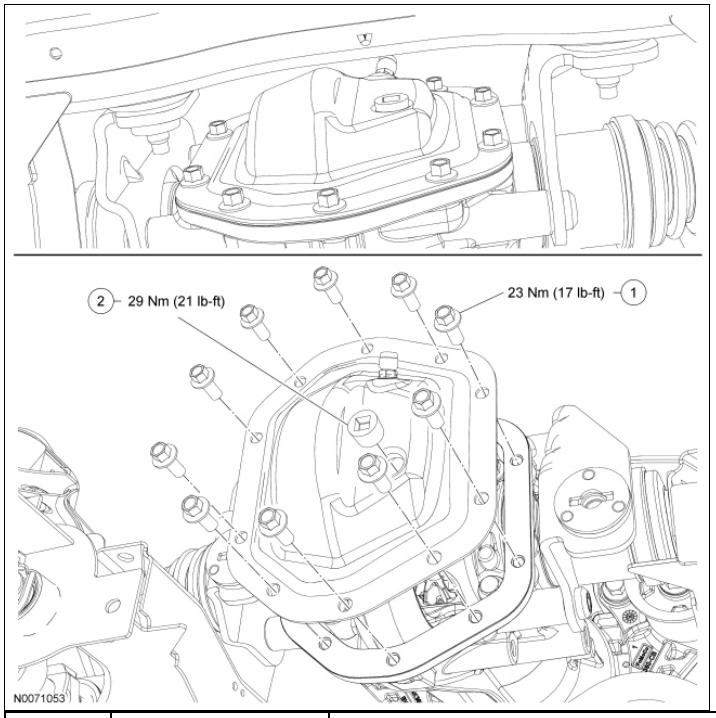
   Using the Pinion Seal Replacer, install the drive pinion seal.



2. **NOTE:** Lubricate the pinion flange splines with grease.

   Line up the index marks and position the pinion flange.

3. Using the Drive Pinion Flange Holding Fixture, install the new pinion flange nut.
   - Tighten to 244 Nm (180 lb-ft).

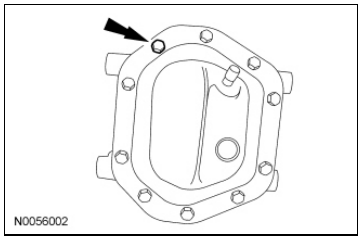


4. Install the driveshaft. For additional information, refer to Section 205-01 .

Differential Housing Cover

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Motorcraft® SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A



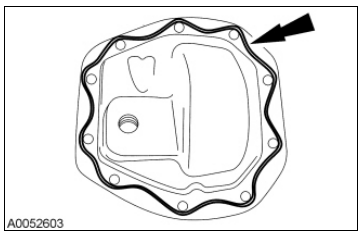
Item	Part Number	Description
1	W505262	Differential housing cover bolt (10 required)
2	4N282	Filler plug

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 10 bolts and the differential housing cover.
   - Drain the differential fluid from the housing.

Installation



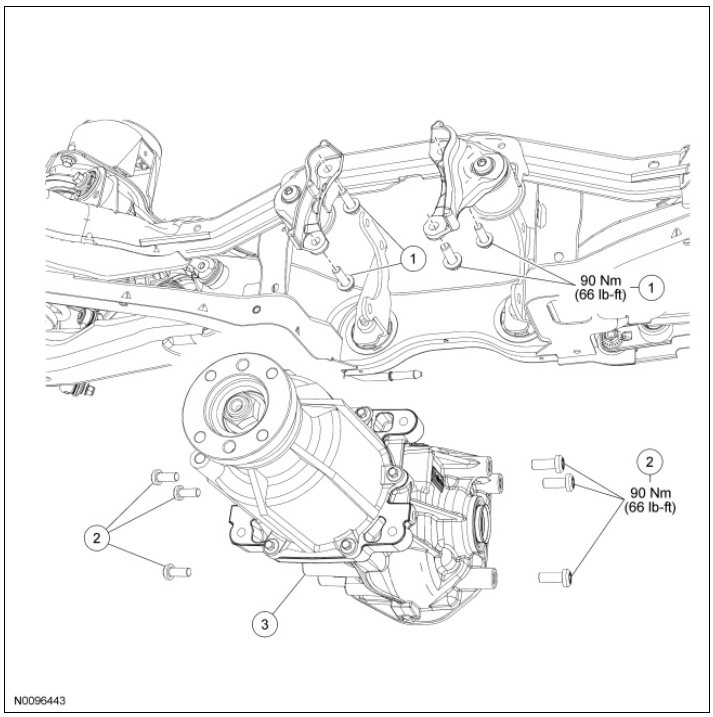
1. *NOTICE:* **Make sure the machined surfaces on the rear axle housing and the differential housing cover are clean and free of oil before installing the new silicone rubber. The inside of the rear axle must be covered when cleaning the machined surface to prevent damage to the component.**

   NOTE: Make sure the differential vent located on the rear cover is free of obstruction.

   Clean the gasket mating surfaces of the differential housing and the differential housing cover.

2. **NOTE:** The differential housing cover must be installed within 15 minutes of application of the silicone rubber, or new silicone rubber must be applied. If possible, allow one hour before filling with lubricant to make sure the silicone rubber has correctly cured.

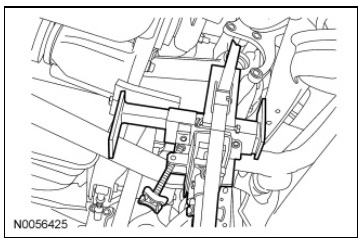
   Apply a continuous bead of clear silicone rubber as shown in the illustration.



3. Install the differential housing cover and the 10 bolts.
   - Tighten to 23 Nm (17 lb-ft).

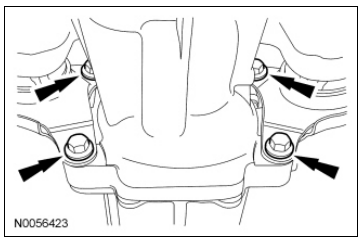
4. Remove the filler plug, fill the rear axle with 1.15L (2.43 pt) of rear axle lubricant, 3-5 mm (0.118-0.196 in) below the bottom of the filler hole and install the filler plug.
   - Tighten to 29 Nm (21 lb-ft).

Axle Assembly



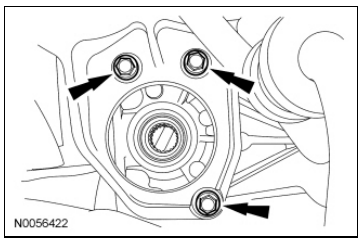
Axle Assembly

Item	Part Number	Description
1	W500442	Differential housing-to-front insulator bracket bolts (4 required)
2	W500444	Side insulator bracket-to-rear axle differential bolts (6 required)
3	4000	Rear axle assembly

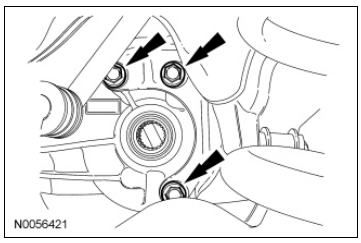


Removal and Installation

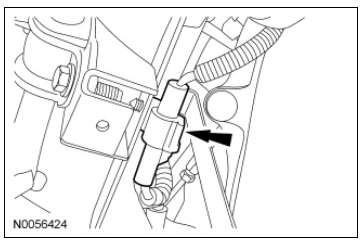
1. Remove the driveshaft. For additional information, refer to Section 205-01 .
2. Remove the rear halfshafts. For additional information, refer to Section 205-05 .
3. Position a suitable transmission hydraulic jack to the axle housing. Securely strap the jack to the housing.



4. Remove the 4 differential housing-to-front insulator bracket bolts.



- To install, tighten to 90 Nm (66 lb-ft).



5. Remove the 3 RH side insulator bracket-to-rear axle differential bolts.
   - To install, tighten to 90 Nm (66 lb-ft).

6. Remove the 3 LH side insulator or bracket-to-rear axle differential bolts.
   - To install, tighten to 90 Nm (66 lb-ft).

7. Lower the axle to gain clearance and disconnect the active torque coupling electrical connector.

8. Remove the rear axle assembly.

9. To install, reverse the removal procedure.

Torque Specifications

Wheel hub nut	255	185	-
Wheel speed sensor bolt	23	17	-
Wheel speed sensor harness bracket-to-wheel knuckle bolt	23	17	-

Front Drive Halfshafts

The halfshaft and intermediate shaft consist of the following components:

- Inner CV joints
- Outer CV joints
- Interconnecting shafts

The halfshafts are splined on the outboard stub shaft to drive the wheel hubs. They are retained in the wheel hubs by special wheel hub nuts which also control the wheel bearing preload. The LH halfshaft is splined on the inboard stub shaft and is retained in the differential side gear in the transaxle by a circlip. The RH halfshaft has internal splines which are driven by the intermediate shaft. The intermediate shaft has a circlip on the outboard end and is retained inside the inboard stub shaft. The circlips must be installed new whenever they are removed. The intermediate shaft is retained in the transaxle differential side gear by bolts that go through the intermediate shaft support bearing. The intermediate shaft also goes through the Power Transfer Unit (PTU) on All-Wheel Drive (AWD) vehicles. The outer seal of the PTU must be installed new whenever the intermediate shaft is removed.

The front drive halfshaft CV joints consist of the following components:

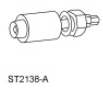
- CV joint boot clamps
- Convoluted CV joint boots
- Tripod joint housings
- Ball and cage housings
- Special CV high-temperature grease

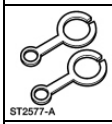
Halfshaft handling consists of the following:

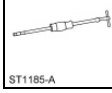
- On the LH side, the inboard CV joint is retained in the differential side gear with a unique retainer circlip. Install a new circlip every time the halfshaft is disconnected
- On the RH side, a unique driveshaft bearing retainer circlip retains the splined inboard CV joint to the intermediate shaft. Install a new circlip every time the halfshaft is disconnected from the intermediate shaft
- A staked front axle wheel hub retainer secures the splined outboard CV joint to the wheel hub
- Do not overangle the CV joints
- Damage will occur to an assembled inboard CV joint if it is overplunged outward from the joint housing
- Never use a hammer to remove or install the halfshafts from the front hub
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft
- Do not allow the boots to contact sharp edges or hot exhaust components
- Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints
- Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage
- Do not remove the outer CV joint by pulling on the interconnecting shaft
- Inspect all machined surfaces and splines for damage

The CV joint mates the interconnecting shaft with the stub shaft. The joint allows for smooth rotation of the interconnecting shaft and the stub shafts. They also adjust for length variances and angle requirements as the

vehicle goes through jounce and rebound.







The halfshaft joints are not repairable and are serviced as assemblies only.

Front Drive Halfshafts

Item	Part Number	Description
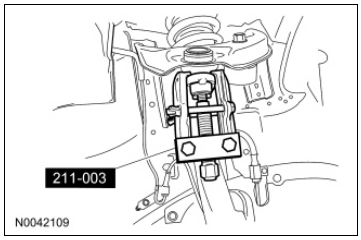
8	3A427/3A428	LH/RH halfshaft

Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

RH and LH halfshafts



1. Remove the wheel and tire. For additional information, refer to Section 204-04 .
2. **NOTE:** Apply the brake to keep the halfshaft from rotating.

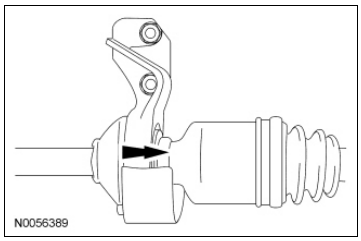
   Remove and discard the wheel hub nut.
3. Remove wheel speed ssor harness bracket-to-wheel knuckle bolt.
4. Remove the wheel speed sensor bolt and position the wheel speed sensor aside.
5. Remove the brake flexible hose bracket-to-wheel knuckle bolt.
6. ⚠ **WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.**

   NOTICE: **Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.**

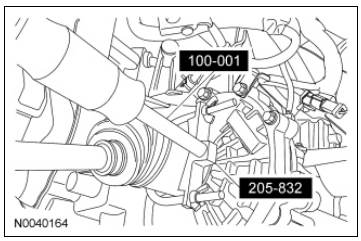
   Remove the 2 brake caliper anchor plate bolts and position the caliper and anchor plate assembly aside.

   - Support the caliper using mechanic's wire.
7. Remove and discard the upper ball joint nut.
8. Using the Steering Arm Remover, separate the upper ball joint from the wheel knuckle.

9. Remove and discard the damper fork-to-front lower arm bolt and flagnut.
10. Using the Front Wheel Hub Remover, separate the halfshaft from the wheel hub.

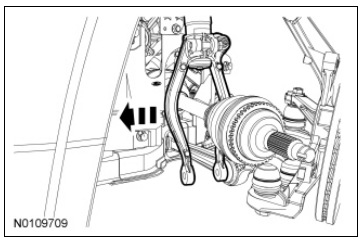


11. Remove the pin-type retainers and position the splash shield aside.



RH halfshaft

12. Use a brass drift to strike the RH halfshaft in the indicated area and separate the RH halfshaft from the intermediate shaft.

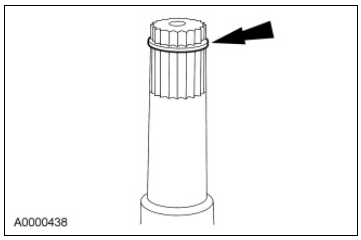


LH halfshaft

13. Using the Halfshaft Remover and Slide Hammer, separate the halfshaft from the transmission.

RH and LH halfshafts

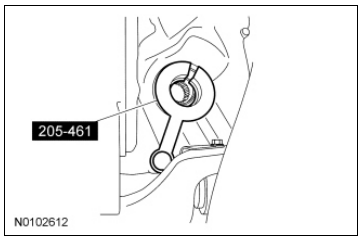
14. Position the damper fork and halfshaft forward of the front lower arm and remove the halfshaft.



15. Remove and discard the stub shaft circlip (LH) or the intermediate shaft circlip (RH).

Installation

RH and LH halfshafts



1. *NOTICE:* **Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft damage during vehicle operation.**

   Install a new circlip.

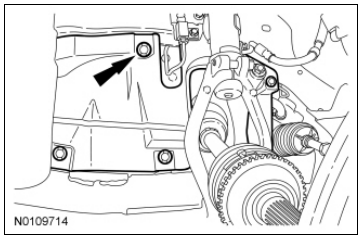
LH halfshaft

2. Install the Differential Oil Seal Protector.

3. *NOTICE:* **The sharp edges on the stub shaft splines can slice or puncture the oil seal. Use care when inserting the stub shaft into the transmission or damage to the seal may occur.**

   Push the stub shaft into the transmission so the circlip locks into the differential side gear.

   - After insertion, pull the halfshaft inner end to make sure the circlip is locked.



RH halfshaft

4. Align the splines on the RH halfshaft with the intermediate shaft and push the stub shaft in until the circlip locks the shafts together.
   - After insertion, pull the halfshaft inner end to make sure the circlip is locked.

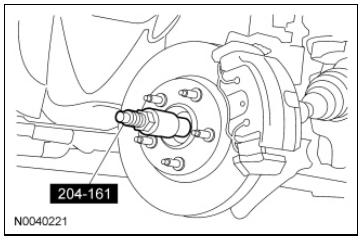
RH and LH halfshafts

5. Position the damper fork and install a new damper fork-to-front lower arm bolt and flagnut.
   - Tighten to 103 Nm (76 lb-ft).

6. Position the splash shield and install the pin-type retainers.

7. Insert the halfshaft into the wheel hub.

8. Insert the upper ball joint into the wheel knuckle and install a new nut.
   - Tighten to 48 Nm (35 lb-ft).



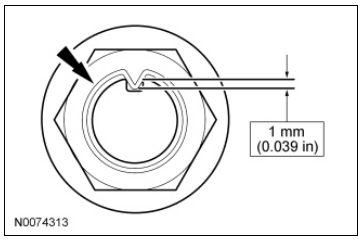
9. Position the brake caliper and anchor plate assembly and install the 2 bolts.
   - Tighten to 90 Nm (66 lb-ft).

10. Position the brake flexible hose bracket and install the bolt.
    - Tighten to 23 Nm (17 lb-ft).

11. Position the wheel speed sensor and install the bolt.
    - Tighten to 23 Nm (17 lb-ft).

12. Position the wheel speed sensor harness bracket and install the bolt.
    - Tighten to 23 Nm (17 lb-ft).

13. Using the Halfshaft Installer, seat the halfshaft into the wheel hub.



14. ***NOTICE:*** **Do not tighten the front wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

    NOTE: Apply the brake to keep the halfshaft from rotating.

    Install a new front wheel hub nut.

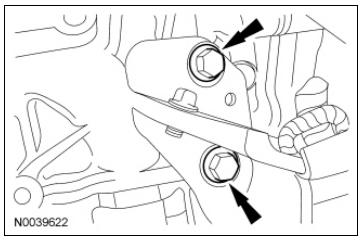
    - Tighten to 255 Nm (185 lb-ft).

15. Stake the new nut in line with the keyway to a recommended minimum depth of 1 mm (0.039 in) below the keyway diameter to engage the locking feature.

16. Install the wheel and tire. For additional information, refer to Section 204-04 .

Intermediate Shaft - Front Wheel Drive (FWD)

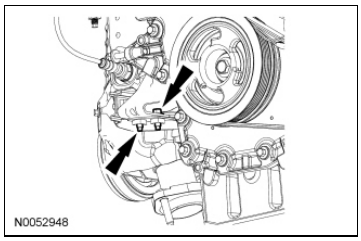
Item	Part Number	Description
1	W500235	Halfshaft support bracket bolts (2 required)
2	3A329	Intermediate shaft assembly



Removal

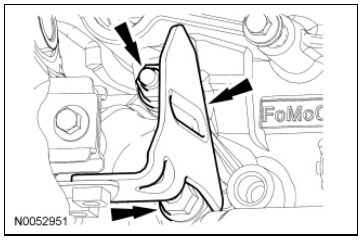
All vehicles

1. Remove the RH halfshaft. For additional information, refer to Halfshaft in this section.

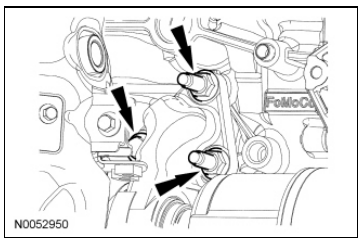


3.0L vehicles

2. Remove the 2 halfshaft support bracket bolts.



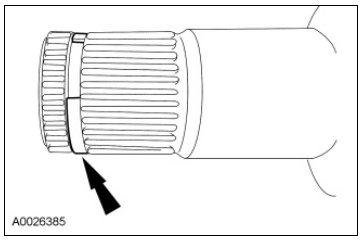
3.5L vehicles



3. Remove the 2 catalytic converter bracket bolts.

4. Remove the 2 nuts and the catalytic converter support bracket.

5. Remove the 3 halfshaft support bracket bolts.

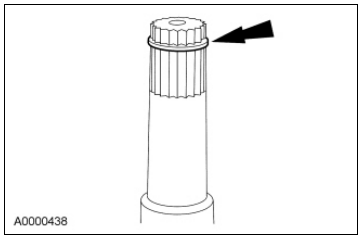


All vehicles

6. ***NOTICE:*** **Use care when removing the intermediate shaft or damage to the transaxle seals may occur.**

   Carefully remove the intermediate shaft while supporting both ends of the intermediate shaft.

7. Remove and discard the circlip from the outboard end of the intermediate shaft.



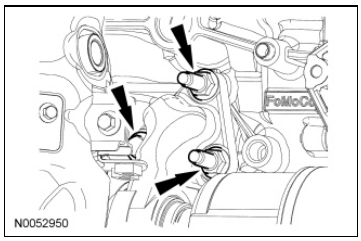
Installation

All vehicles

1. ***NOTICE:*** **Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft damage during vehicle operation.**

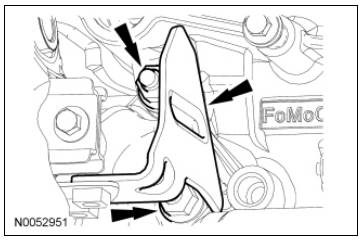
   Install a new circlip on the outboard end of the intermediate shaft.

2. Position the intermediate shaft in the transaxle and engage the intermediate shaft splines with the transaxle side gears. Make sure the circlip is locked in the gear.

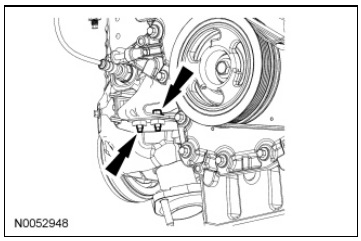


3.0L vehicles

3. Install the 2 halfshaft support bracket bolts.
    - Tighten to 40 Nm (30 lb-ft).

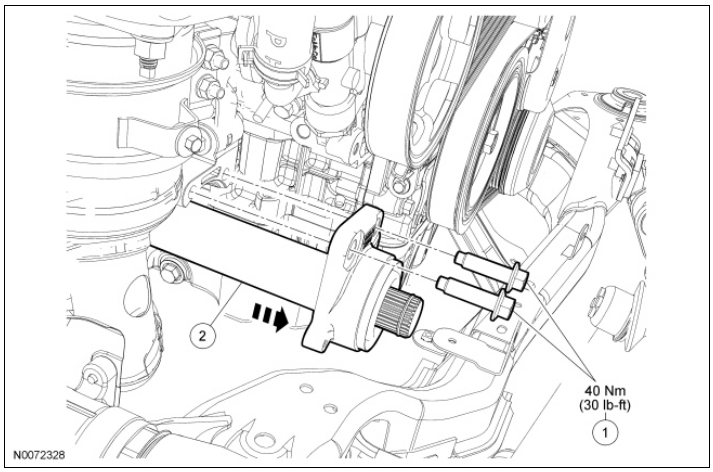


3.5L vehicles



4. Install the 3 halfshaft support bracket bolts.
    - Tighten to 40 Nm (30 lb-ft).

5. Install the catalytic converter support bracket and the 2 nuts.
    - Tighten to 23 Nm (17 lb-ft).

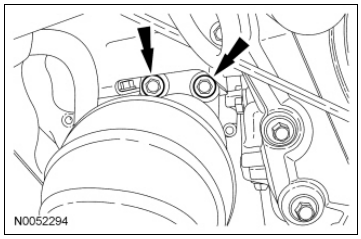


6. Install the 2 catalytic converter bracket bolts.
    - Tighten to 20 Nm (177 lb-in).

All vehicles

7. Install the RH halfshaft. For additional information, refer to Halfshaft in this section.

Intermediate Shaft - All Wheel Drive (AWD)

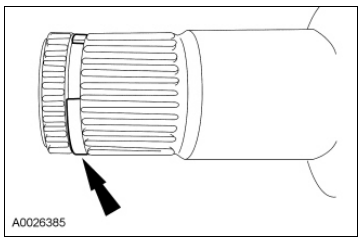


Item	Part Number	Description
1	W500235	Intermediate shaft bearing support bolts (2 required)
2	3A329	Intermediate shaft assembly

Removal

NOTICE: **A new intermediate shaft seal in the Power Transfer Unit (PTU) must be installed whenever the intermediate shaft is removed or damage to the seal may occur. For additional information, refer to Section 308-07B .**

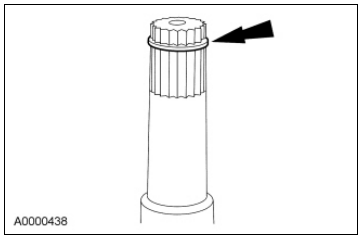
1. Remove the RH halfshaft. For additional information, refer to Halfshaft in this section.



2. Remove the 2 intermediate shaft bearing support bolts.

3. **NOTE:** Do not damage the transaxle seals when removing the intermediate shaft.

   Carefully remove the intermediate shaft while supporting both ends of the intermediate shaft.



4. Remove and discard the circlip from the outboard end of the intermediate shaft.

Installation

1. ***NOTICE:*** **Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft damage during vehicle operation.**

   Install a new circlip on the outboard end of the intermediate shaft.

2. Install a new intermediate shaft seal. For additional information, refer to Section 308-07B .

3. Position the intermediate shaft in the transaxle and engage the intermediate shaft splines with the transaxle side gears. Make sure the circlip is locked in the gear.

4. Install the 2 intermediate shaft bearing support bolts.
   - Tighten to 40 Nm (30 lb-ft).

5. Install the RH halfshaft. For additional information, refer to Halfshaft in this section.

Material

Item	Specification	Fill Capacity
Motorcraft SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A	1.15L (2.43 pt)

Torque Specifications

Description	Nm	lb-ft
ABS wheel speed sensor bolt	23	17
Shock absorber lower bolt	115	85
Tie-rod bracket nuts	90	66
Toe link bracket nut	90	66
Upper arm bolt	110	81
Wheel hub nut	255	188

Rear Drive Halfshafts

The halfshafts consist of the following components:

- Inner CV joints
- Outer CV joints
- Interconnecting shafts

The halfshafts are splined on the outboard stub shaft to drive the wheel hubs. They are retained in the wheel hubs by special wheel hub nuts which also control the wheel bearing preload. The halfshafts are splined on the inboard stub shaft and are retained by circlips. New circlips must be installed whenever the old circlips are removed.

Halfshaft Joint

CV joints consist of the following components:

- CV joint boot clamps
- Convoluted CV joint boots
- Tripod joint housings
- Ball and cage housings
- Retainer circlips
- Special CV high-temperature grease

The CV joints mate the interconnecting shaft with the stub shaft. The joints allow for smooth rotation of the interconnecting shaft and the stub shafts. They also adjust for length variances and angle requirements as the vehicle goes through jounce and rebound.

The halfshaft joints are not repairable and are serviced as assemblies only.

Halfshaft Handling

Handle all halfshaft components carefully during removal and installation and during various component disassembly and assembly procedures.

- Never pick up or hold the halfshaft only by the inboard or outboard CV joint.
- Do not overangle the CV joints.
- Damage will occur to an assembled inboard CV joint if it is overplunged outward from the joint housing.
- Never use a hammer to remove or install the halfshafts from the rear hub.
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft.
- Do not allow the boots to contact sharp edges or hot exhaust components.
- Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints.
- Excessive pulling force on the interconnecting shaft between joints of the halfshaft will result in internal joint damage. Axial loads used in assisting removal must be applied through the inboard joint housing only.

- Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage.
- Do not remove the outer CV joint by pulling on the interconnecting shaft.
- Inspect all machined surfaces and splines for damage.

Rear Drive Halfshafts

Refer to Section 205-00 .

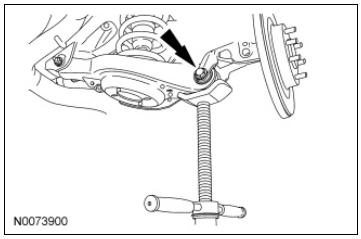
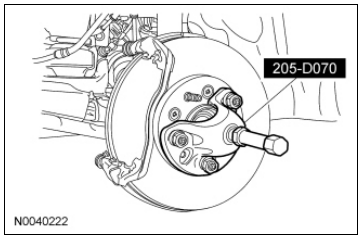
Material

Item	Specification
Motorcraft SAE 80W-90 Premium Rear Axle Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A



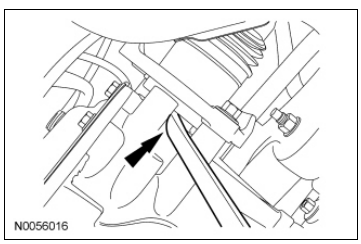
Item	Part Number	Description
1	3N405	Wheel hub nut
2	W500547	ABS wheel speed sensor bolt
3	2C187	ABS wheel speed sensor



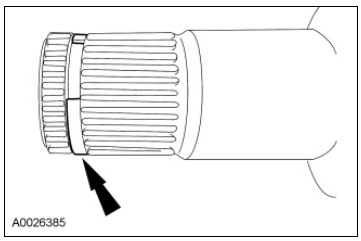
4	W500547	Upper arm bolt
5	W520515	Upper arm nut
6	W520515	Tie-rod bracket nuts (4 required)
7	W712880	Lower shock absorber bolt
8	W712848	Shock absorber lower flagnut (with 17-in wheel)
8	W302117	Shock absorber lower flagnut (with 16-in wheel)
9	4B402	Halfshaft assembly

Removal

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .
2. Remove and discard the wheel hub nut.
3. Remove the bolt and position the ABS wheel speed sensor aside.
4. Remove the shock absorber lower bolt and flagnut.
5. Support the lower arm.

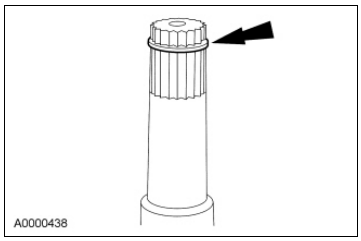


6. Remove the upper arm nut and bolt.
7. Remove the 4 toe link bracket nuts.
8. Using the Front Hub Remover, separate the halfshaft from the wheel hub.

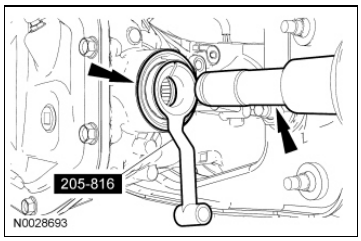


9. ***NOTICE:*** **Do not damage the oil seal protector when removing the axle halfshaft from the differential.**

   Using a suitable pry bar, remove the halfshaft.



10. Remove and discard the circlip from the stub shaft.



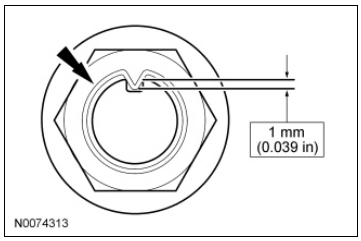
Installation

1. ***NOTICE:*** **Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft separation during vehicle operation.**

   Install a new circlip on the stub shaft.

2. Using the Axle Seal Protector, install the halfshaft into the differential.
   - Make sure the circlip locks in the side gear.

3. Using the Halfshaft Installer, install the halfshaft into the hub assembly.



4. Install the upper arm bolt and nut.
   - Tighten to 110 Nm (81 lb-ft).

5. ***NOTICE:*** **Do not tighten the rear wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered to the ground. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.**

   Install the new wheel hub nut.

- To install, tighten to 255 Nm (188 lb-ft).

6. Stake the new nut in line with the keyway to a recommended minimum depth of 1 mm (0.039 in) below the keyway diameter to engage the locking feature.

7. Install the 4 rear toe link bracket nuts.
   - Tighten to 90 Nm (66 lb-ft).

8. Install the shock absorber lower bolt and flagnut.
   - Tighten to 115 Nm (85 lb-ft).

9. Position the ABS wheel speed sensor and install the bolt.
   - Tighten to 23 Nm (17 lb-ft).

10. Fill the axle with the specified quantity of the specified lubricant.

11. Install the wheel and tire. For additional information, refer to Section 204-04 .

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	590-790 ml (1.24-1.66 pt) [a]
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-	-
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A	-

[a] Actual brake fluid capacity will vary depending on vehicle options.

General Specifications

Item	Specification
Front Disc Brake	
Brake disthickness	23.0 mm (0.905 in)
Brake pad maximum taper wear (in any direction)	3.0 mm (0.118 in)
Brake pad minimum thickness	3.0 mm (0.118 in)
Rear Disc Brake	
Brake disc minimum thickness	8.0 mm (0.314 in)
Brake pad maximum taper wear (in any direction)	3.0 mm (0.118 in)
Brake pad minimum thickness	3.0 mm (0.118 in)

Torque Specifications

Description	Nm	lb-ft	lb-in
Bleeder screw	8	-	71
Brake caliper guide pin bolts	26	19	-
Master cylinder brake tubes	28	21	-

Brake System

The brake system has the following components:

- Brake master cylinder and fluid reservoir
- Cable/caliper actuated parking brake system
- Clevis pin
- Electric vacuum pump (hybrid vehicles)
- Fixed position brake pedal (non-hybrid vehicles)
- Fixed position brake pedal with integrated brake-by-wire system (hybrid vehicles)
- Four-wheel ABS
- Front and rear disc brake systems
- Vacuum-assisted power brake booster (non-hybrid vehicles)
- Vacuum-assisted active booster (hybrid vehicles)
- Red brake light indicator

Conventional Brake System (Non-Hybrid Vehicles)

The brake pedal is connected to the vacuum power brake booster, which is connected to the brake master cylinder. When the brake pedal is applied, brake fluid is pushed through the double-walled steel tubes and flexible hoses to the disc brake calipers. The brake fluid enters the disc brake calipers, forcing the caliper pistons and brake pads outward against theke disc friction surfaces, slowing or stopping wheel rotation. When the brake pedal is released, brake fluid pressure is relieved, returning the disc brake systems to the unapplied position.

Regenerative Braking System (Hybrid Vehicles)

During braking, the regenerative brake system utilizes the electric motor portion of the hybrid electric power train as a generator to create electrical current. This recharges the High Voltage Traction Battery (HVTB) in combination with the vehicle's conventional friction brakes while slowing the vehicle. The amount of brake torque provided by the electric motor is dependent upon the state of charge of the HVTB . When the HVTB is almost fully charged, the amount of regenerative braking is limited to avoid overcharging, and the requested deceleration is produced by conventional friction braking alone.

For information on the following components:

- Front disc brakes, refer to Section 206-03
- Rear disc brakes, refer to Section 206-04
- Parking brake actuation, refer to Section 206-05
- Hydraulic brake actuation, refer to Section 206-06
- Vacuum-assisted power brake booster, refer to Section 206-07
- ABS, refer to Section 206-09
- Vacuum-assisted active brake booster, refer to Section 206-09
- Electric vacuum pump, refer to Section 206-09

Principles of Operation

Conventional Brake System

Applying the brake pedal produces hydraulic pressure in the master cylinder. Using engine vacuum, the brake booster increases the pressure applied to the master cylinder. The pressure builds in the master cylinder and brake tubes as the brake pedal is applied further. The pressure between the primary and secondary piston forces the secondary piston to compress, building pressure in its circuit. The hydraulic pressure is transmitted by brake fluid through the brake tubes to the ABS Hydraulic Control Unit (HCU), which then distributes that pressure to the individual brake calipers. The brake calipers use hydraulic pressure to apply the pads. The application of the brake pads will cause the rotation of the wheels to slow or stop, depending on how murake pressure is applied. The parking brakes carry out the same function except that they are mechanically actuated by a cable that only connects to the rear brakes.

Brake Master Cylinder Compensator Ports

The purpose of the compensator ports in the brake master cylinder is to supply additional brake fluid from the master cylinder reservoir when needed by the brake system due to brake lining wear and allow brake fluid to return to the master cylinder reservoir when the brakes are released. The returning brake fluid creates a slight turbulence in the master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged. Clogged compensator ports may cause the brakes to hang up or not fully release.

Red Brake Warning Indicator

The red brake warning indicator alerts the driver to certain conditions that exist in the brake system. The Instrument Cluster (IC) performs a bulb check when the ignition key is turned to the RUN position. The conditions that cause the indicator to illuminate are low brake fluid level, the parking brake is applied or there is a fault in the brake system. To diagnose red brake warning indicator concerns, refer to Section 413-01 .

For information on the following hybrid systems, refer to Section 206-09 .

- Regenerative brake system
- Brake-by-wire
- Electric vacuum pump

Inspection And Verification

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Blistering or swelling of rubber brake components can indicate contamination of the brake fluid by a petroleum-based substance. The entire hydraulic brake system must be flushed with clean, specified brake fluid and contaminated rubber components must be replaced to prevent recontamination.**

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

On a conventional brake system, the first indication that something may be wrong in the brake system is a change in the feel through the brake pedal. The brake warning indicator in the Instrument Cluster (IC) and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. If multiple wheels are locked, check the brake pedal free play to verify brake pedal is not partially applied. These operations may release the brakes, but will not correct the concern. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

1. Verify the customer concern.

- For parking brake concerns, refer to Section 206-05 .
- For vacuum pump (hybrid vehicles) concerns, refer to Section 206-09 .
- For ABS concerns, refer to Section 206-09 .
- For brake-by-wire (hybrid vehicles) concerns, refer to Section 206-09 .
- For active brake booster (hybrid vehicles) concerns, refer to Section 206-09 .
- For vacuum sensor (3.0L AWD and 3.5L) concerns, refer to Section 206-09 .

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Brake fluid level and condition • Brake master cylinder • Brake master cylinder reservoir • Brake booster • Brake booster check valve • Brake booster vacuum hose • Brake hoses and tubes • Brake caliper, guide pins and anchor plate • Brake discs • Brake pads • Brake pedal, bracket and booster linkage • Electric vacuum pump (hybrid vehicles) • Aftermarket modifications	• Active brake booster sensors (hybrid vehicles) ♦ Brake booster travel sensor ♦ Vacuum pressure sensor • Battery Junction Box (BJB) fuse(s): ♦ 3 (40A) ♦ 7 (40A) ♦ 8 (50A) ♦ 10 (30A) ♦ 37 (5A) ♦ 47 (10A) • Electric vacuum pump mechanical relay (hybrid vehicles) • Electric vacuum pump solid state relay (hybrid vehicles) • PCM relay • Active brake booster solenoid (hybrid vehicles) • Brake pedal cut off valve (hybrid vehicles) • Brake-by-wire pedal sensors (hybrid vehicles) ♦ Brake pedal angle sensor ♦ Brake pedal simulator pressure sensor • Brake fluid level switch • Parking brake switch • Vacuum sensor (3.0L All-Wheel Drive (AWD) and 3.5L) • Wiring, terminals or connectors

3. If brake system concern is not evident, visually inspect the suspension system and tires for obvious signs of wear or damage.

- For suspension system concerns, refer to Section 204-00 .
- For tire concerns, refer to Section 204-04 .

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. If the cause is not visually evident, refer to Symptom Chart in this section.

Symptom Chart

Symptom Chart - Brake System (Non-Hybrid Vehicles)

Symptom Chart - Brake System (Non-Hybrid Vehicles)

Symptom Chart - Brake System (Hybrid Vehicles)

Symptom Chart - Brake System (Hybrid Vehicles)

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Vibration when the brakes are applied	• Brake disc(s) • Suspension components	• GO to Pinpoint Test A .
• Brake vibration/shudder - occurs when the brake pedal is released		
• Brake drag		• GO to Symptom Chart - Brake System .
• Rattling noise	• Caliper guide pins or guide pin bolts	• CHECK the caliper guide pins and guide pin bolts. REFER to Brake System Inspection in this section.
	• Missing or damaged anti-rattle clips or springs	

- CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Loose brake disc shield
- TIGHTEN the brake disc shield bolts to specification. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Squealing noise - occurs on first (morning) brake application
- Brake pads
- Acceptable condition. Caused by humidity and low brake pad temperature.
- Squealing noise - a continuous squeal
- Brake pads
- INSPECT the brake pads/shoes. REFER to Brake System Inspection in this section.
- Squealing noise - an intermittent squeal
- Brake pads
- Acceptable condition. Caused by cold, heat, water, mud or snow.
- Groaning noise - occurs at low speeds with brake lightly applied (creeping)
- Brake pads
- Grinding/moaning noise - continuous
- Brake pads
- Brake disc
- INSPECT the brake pads/discs and attaching hardware for damage. VERIFY brake components are within specifications. REFER to Brake System Inspection in this section.
- Excessive vacuum pump noise (above 60-70 dB)
- Vacuum pump
- INSTALL new vacuum pump as necessary.

Pinpoint Tests

Pinpoint Test A: Vibration When the Brakes are Applied

Normal Operation

During moderate to heavy braking, noise from the Hydraulic Control Unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS. Pedal pulsation or steering wheel nibble when the brakes are applied (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component.

PINPOINT TEST A: VIBRATION WHEN THE BRAKES ARE APPLIED

Test Step	Result / Action to Take
A1 ROAD TEST THE VEHICLE - LIGHT BRAKING	
• Road test the vehicle. Warm the brakes by slowing the vehicle from 80 to 32 km/h (50 to 20 mph) using light brake force. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using light pedal force. • **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**	**Yes** GO to A4 . **No** GO to A2 .
A2 ROAD TEST THE VEHICLE - MODERATE TO HEAVY BRAKING	
• Road test the vehicle. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force. • **Is there a vibration/shudder?**	**Yes** GO to A3 . **No** The concern is not present at this time.
A3 CHECK ABS OPERATION	
• **NOTE:** During moderate to heavy braking, noise from the HCU and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct operation of the ABS. Pedal pulsation or steering wheel nibble with the frequency proportional to vehicle speed indicates a concern with a brake or suspension component. • Road test the vehiclend apply the brakes on a dry, firm surface, then apply the brakes on a wet, snowy or loose surface (such as gravel). • **Is the vibration/shudder only present on a wet, snowy or loose surface?**	**Yes** This is a normal operating condition of the ABS. **No** GO to A5 .
A4 ISOLATE BRAKE VIBRATION	

• **NOTE:** This test is not applicable to vehicles with drum-in-hat type parking brakes. For vehicles with drum-in-hat parking brakes, proceed to the next test step. For all other vehicles, apply the parking brake to identify if the problem is in the front or rear brake. • Apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89-97 km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test. • **Is there a vibration/shudder?**	**Yes** GO to A7 . **No** GO to A5 .
A5 CHECK THE FRONT SUSPENSION	
• Check the front suspension. Refer to Section 204-00 . • **Are all the suspension components in satisfactory condition?**	**Yes** GO to A6 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
A6 CHECK THE FRONT BRAKE DISCS	
• Inspect the front brake discs. Refer to Brake System Inspection in this section. • Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** GO to A7 . **No** The concern has been repaired.
A7 CHECK THE REAR SUSPENSION	
• Check the rear suspension. Refer to Section 204-00 . • **Are all the suspension components in satisfactory condition?**	**Yes** INSPECT the rear brake discs. REFER to Brake System Inspection in this section. **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

Component Tests

Brake Booster (Non-Hybrid Vehicles)

1. Inspect the brake booster. For additional information, refer to Brake System Inspection in this section.

2. Disconnect the check valve/vacuum hose from the brake booster and connect a suitable vacuum/pressure tester to the booster side of the check valve/vacuum hose.

3. Apply the parking brake, start the engine and place the transmission in NEUTRAL.
   - Allow the engine to reach normal operating temperature.

4. **NOTE:** Subtract approximately 3.38 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 ft) of elevation above sea level.

   Verify that vacuum iailable at the check valve/vacuum hose with engine running at normal idle speed.

   - The vacuum gauge should read between 51-74 kPa (15-22 in-Hg).
   - If specified vacuum is available, stop the engine, connect the check valve/vacuum hose and continue with Step 5.
   - On vehicles equipped with a check valve, if specified vacuum is not available, continue with Step 4.
   - On vehicles not equipped with a check valve, if specified vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to Section 303-00 to diagnose the no/low vacuum condition.

5. Disconnect the check valve from the vacuum hose and verify that the specified vacuum is available at the hose with the engine at idle speed and the transmission in NEUTRAL.
   - If specified vacuum is available, stop the engine, install a new check valve and continue with Step 5.
   - If specified vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to Section 303-00 to diagnose the no/low vacuum condition.

6. Apply the brake pedal several times to exhaust all vacuum from the system.

7. Apply the brake pedal and hold it in the applied position. Start the engine and verify that the brake pedal moves downward after the engine starts.
   - If the brake pedal moves, the brake booster is operating correctly.
   - If the brake pedal does not move, install a new brake booster. Refer to Section 206-07 .

8. Operate the engine a minimum of 20 seconds at idle. Stop the engine and let the vehicle stand for 10 minutes, then apply the brake pedal. The brake pedal feel should be the same as that noted with the engine operating.
   - If the brake pedal feels hard (no power assist), install a new brake booster check valve and retest.
   - If condition still exists, install a new brake booster. Refer to Section 206-07 .
   - If the brake pedal feels the same as noted with the engine operating, the check valve is functioning properly.

Brake Master Cylinder - Bypass Condition

1. Disconnect the brake tubes from the master cylinder.

2. Plug the outlet ports of the master cylinder.

3. **NOTE:** Make sure the outlet port plugs do not show signs of leakage.

   Lightly apply the brakes d hold for 10 seconds. Release the brakes and then reapply with heavy force. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new brake master cylinder must be installed.

Brake Master Cylinder - Compensator Port

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

2. Apply and release the brakes.

3. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If an excessive amount of brake drag exists at multiple wheels, continue to Step 4.
   - If an excessive amount of brake drag exists at only one wheel, it indicates a possible seized brake caliper, brake wheel cylinder or parking brake component. Repair or install new components as necessary.

4. Check the brake stoplamp switch and the brake pedal free play to verify that the brake pedal is not partially applied.

5. Loosen the brake master cylinder nuts and position the brake master cylinder away from the brake booster.

6. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If the brake drag is no longer present, install a new brake booster. Refer to Section 206-07 .
   - If the brake drag is still present, install a new master cylinder. Refer to Section 206-06 .

Brake System Inspection

Material

Item	Specification
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Brake Pads

NOTE: It is not required to install new brake pads when the brake discs are machined.

1. Inspect the brake pad friction material for contamination.
   - If the friction material shows evidence of contamination, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.

2. Inspect and measure the thickness of the brake pad friction material. For additional information, refer to Specifications in this section.
   - Minor surface cracks do not require pad replacement, however, if there are missing chunks or cracks in the lining through to the backing plate, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.
   - If the thickness of the friction material is less than the specified thickness, install new brake pads. For additional information, refer to Section 206-03 for front brake pads or Section 206-04 for rear brake pads.
   - If the friction material shows taper wear that is not within specifications, install new brake pads and verify the caliper guide pins are functioning correctly. For additional information, refer to Brake Caliper Guide Pins inspection in this section.

Brake Discs

NOTICE: **Using an impact tool without a torque socket will lead to unevenly tightened wheel nuts. This causes brake disc on-vehicle lateral runout and brake roughness.**

1. Inspect the brake discs and measure the brake disc thickness. Record the measurements. Refer to Specifications in this section.
   - If the brake disc is cracked or otherwise damaged, install a new brake disc. For additional information, refer to Section 206-03 for front brakes or Section 206-04 for rear brakes.
   - If the measurement is below the minimum thickness specification, install a new brake disc. For additional information, refer to Section 206-03 for front brakes or Section 206-04 for rear brakes.

- If the diagnosis has revealed vibration in the steering wheel, seat or pedal while braking that varies with vehicle speed, machine the brake disc. Heavily scored brake discs, similar to that caused by pads worn down to the backing plate, should also be machined. In order to machine, discs must be above the minimum thickness specification. For additional information, refer to Specifications and Brake Disc Machining in this section.

Brake Calipers

1. Inspect the brake calipers for leaks, damage to seals and piston corrosion or binding.
    - If the brake caliper is leaking or otherwise damaged, install a new brake caliper. For additional information, refer to Section 206-03 for front brake calipers or Section 206-04 for rear brake calipers.

Brake Caliper Guide Pins

1. The guide pins should slide with a reasonable amount of hand force. If the brake pads show taper wear or the guide pins are difficult to move, carry out the following steps.
    - Disassemble the brake caliper guide pins and inspect the guide pins and guide pin bores for wear, damage and corrosion. If bore is worn or damaged, replace the damaged component.
    - Use a wire brush, rolled-up sandpaper or emery cloth to remove all corrosion and foreign material from the caliper guide pin bores. Clean any remaining foreign material from the bores with brake parts cleaner and compressed air.
    - Assemble the caliper seals, boots and guide pins. Use an ample amount of the specified grease to lubricate the bores and guide pins.
    - Inspect the brake pads. For additional information, refer to Brake Pads inspection in this section.

Brake Flexible Hoses and Tubes

NOTICE: **Never use copper tubing. It is subject to fatigue, cracking and corrosion, which may result in brake tube failure.**

NOTE: Double-wall steel tubing is used throughout the brake hydraulic system. All brake tube fittings must be correctly double flared to provide strong, leakproof connections. When bending tubing to fit the underbody or rear axle contours, be careful not to kink or crack the tube.

1. Inspect brake tubes for corrosion, cracks, leaks or any other signs of damage.
    - If a section of the brake tube is damaged, the entire section must be installed with a new tube of the same type, size, shape and length.
    - When installing the hydraulic brake tubing, hoses or connectors, tighten all connections to specifications. After installation, bleed the brake system. For additional information, refer to Brake System Bleeding in this section.

2. Inspect the brake flexible hoses for cracks, leaks and swelling during brake application or any other signs of damage.
    - Install a new brake flexible hose if the hose shows signs of softening, cracking or other damage. For additional information, refer to Section 206-03 for the front brake flexible hose or Section 206-04 for the rear brake flexible hose.

Brake Master Cylinder

NOTE: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will fall during brake application and rise during release. The returning brake fluid creates a slight turbulence in the master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged. Clogged compensator ports may cause the brakes to hang up or not fully release. The net fluid level (such as after brake application and release) will remain unchanged. Fluid level will decrease with pad wear.

NOTE: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

1. Inspect the brake master cylinder for fluid leaks.
    - Install a new master cylinder or brake fluid reservoir if signs of excessive leaking are present. For additional information, refer to Section 206-06 .
    - To check for correct brake master cylinder operation, refer to Component Tests in this section.

Brake Booster (Non-Hybrid Vehicles)

1. Inspect the brake booster for excessive corrosion or damage. Inspect the vacuum hoses for leaks and kinks.
    - Install a new brake booster if signs of excessive corrosion or damage is found. For additional information, refer to Section 206-07 .
    - Repair or replace vacuum hoses as necessary.
    - To check for correct brake booster operation, refer to Component Tests in this section.

Brake Booster (Hybrid Vehicles)

1. Inspect the brake booster for excessive corrosion or damage. Inspect the vacuum hoses for leaks and kinks.
    - Install a new brake booster if signs of excessive corrosion or damage are found. For additional information, refer to Section 206-07 .
    - Repair or replace vacuum hoses as necessary.

2. Check all electrical connections by wiggling connectors and flexing the wire harnesses.
    - Repair the connectors, terminals or wire harnesses as necessary.

3. Retrieve any ABS module DTCs. For additional information, refer to Section 206-09 .

Brake Disc Machining

NOTE: Do not use a bench lathe to machine the brake discs. Use an on-vehicle brake lathe only. Read the entire operating manual and/or view the video shipped with the lathe before installing, operating or repairing the lathe.

NOTE: An on-vehicle brake lathe with an automatic runout adjustment feature is preferred. However, if the lathe is not self adjusting, the lathe oscillation must be adjusted using a dial indicator. The total indicated runout target is 0.000 mm (0.000 i. The maximum indicated runout should be no more than 0.050 mm (0.002 in). If the runout adjustment (automatic or manual) is carried out correctly prior to machining, then the final brake disc runout will be within specification and a runout measurement is not necessary after machining.

NOTE: Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe will make sure that these dimensions are within specification.

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. ***NOTICE:*** **Do not allow the caliper to hang from the brake hose or damage to the hose may occur.**

   Remove the bolts and position the brake caliper or brake caliper and anchor plate assembly aside, as required.

   - Support the brake caliper using mechanic's wire.

3. Install the hub adapter using:
   - four wheel nuts on a 4-stud wheel hub.
   - five wheel nuts on a 5-stud wheel hub.
   - six wheel nuts on a 6-stud wheel hub.
   - four wheel nuts on a 7- or 8-stud wheel hub.
   - five wheel nuts on a 10-stud wheel hub.

4. Install the cutting lathe.

5. If the lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in).

6. Center the cutting head, adjust the cutting bits and install the chip deflector/silencer.

7. **NOTE:** The depth of the cut should be between 0.10 and 0.40 mm (0.004 and 0.015 in). Lighter cuts will cause the bit to heat up and wear faster. Heavier cuts will cause poor brake disc surface finish.

   Machine the brake disc.

8. Remove the lathe and the silencer.

9. Remove the wheel nuts and hub adapter.

10. Remove the metal shavings.

11. Measure the brake disc thickness.
    - If the measurement is below the minimum specification, install a new brake disc. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

12. **NOTE:** It is not required to install new brake pads if friction material is within specifications. For additional information, refer to Specifications in this section.

    Position the brake caliper or brake caliper and anchor plate assembly.

    - Install the bolts.
    - For fastener torque specifications, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

13. Install the wheel and tire. For additional information, refer to Section 204-04 .

Brake System Bleeding

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Pressure Bleeding

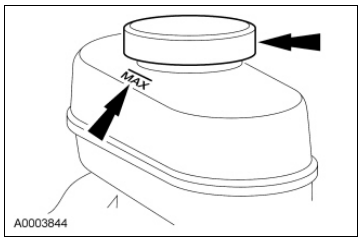
⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: Due to the complexity of the fluid path within the hydraulic system, it is necessary to pressure bleed the system.



NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected.

NOTE: Due to the complexity of the fluid path within the rear integral parking brake calipers, it is necessary to press and release the parking brake during the bleed procedure.

NOTE: The Hydraulic Control Unit (HCU) bleeding procedure must be carried out if the HCU or any components upstream of the HCU are installed new.

All vehicles

1. Clean all the dirt from around the brake fluid reservoir cap and remove the cap. Fill the brake master cylinder reservoir with clean, specified brake fluid.

2. **NOTE:** Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.

   Install the bleeder adapter to the brake master cylinder reservoir and attach the bleeder tank hose to the fitting on the adapter.

3. **NOTE:** Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.

   Open the valve on the bleeder tank.

   - Apply 207-345 kPa (30-50 psi) to the brake system.

4. Remove the RH rear bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain tube to the RH rear bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.

5. Loosen the RH rear bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RH rear bleeder screw.
   - Press and release the parking brake 5 times.
   - Repeat until clear, bubble-free fluid comes out.

6. Tighten the RH rear bleeder screw to specifications, refer to Specifications in this section. Remove the rubber hose and install the bleeder screw cap.

7. Repeat Steps 4 through 6 for the LH rear brake caliper.

8. Remove the RH front bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain tube to the RH front bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.

9. Loosen the RH front bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RH front bleeder screw.

10. Tighten the LH rear bleeder screw to specifications, refer to Specifications in this section. Remove the rubber hose and install the bleeder screw cap.

11. Repeat Steps 8 through 10 for the LH front brake caliper.

12. Close the bleeder tank valve and release the pressure. Remove the tank hose from the adapter and remove the adapter. Fill the reservoir with clean, specified brake fluid and install the reservoir cap.

Hybrid vehicles

13. **NOTE:** On hybrid vehicles, the brake booster push rod has an elongated slot that attaches to the brake pedal with a clevis pin. The elongated slot allows for a small amount of pedal travel (free play) to occur without the brake pedal applying pressure on the booster push rod. When performing a bleed procedure, it is important to push the pedal through the air gap, so that the clevis pin is contacting the brake booster push rod. Except when required by the scan tool, the ignition key must remain off during the bleed procedure to allow minimal force required to push through the gap.

    With the ignition off, press the brake pedal through the gap to seat the clevis pin against the brake booster push rod and then confirm the pedal is firm.

    - If the brake pedal is spongy (soft), repeat the Pressure Bleeding procedure to remove any remaining air from the system.

Non-hybrid vehicles

14. Apply the brakes several times to verify correct brake operation.
    - If the brake pedal is spongy (soft), repeat the Pressure Bleeding procedure to remove any remaining air from the system.

Hydraulic Control Unit (HCU) Bleeding

⚠ **WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

⚠ **WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

⚠ **WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

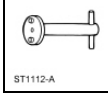
NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: When any part of the hydraulic system is disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it is correctly connected.

All vehicles

1. Use the Pressure Bleeding procedure to bleed the system. For additional information, refer to Brake System Bleeding in this section.

2. Connect the scan tool and follow the ABS HCUHydraulic Control Unit (HCU) bleeding instructions.



3. Repeat the Pressure Bleeding procedure to bleed the system.

Hybrid vehicles

4. Following the scan tool instructions, carry out the Multi-Calibration Routine.

Component Bleeding

Special Tool(s)

 ST1112-A	Adjuster, Rear Caliper Piston 206-026 (T87P-2588-A)

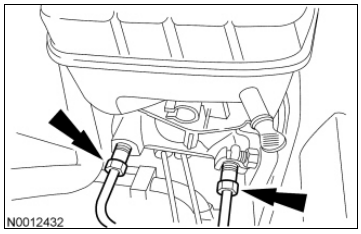
Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Master Cylinder

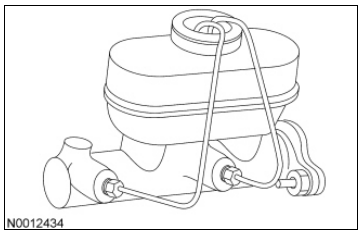
⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**



NOTE: When any part of the hydraulic system is disconnected for repair or installation of new components, air can enter the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it is correctly connected.

NOTE: When a new brake master cylinder has been installed, or the system is emptied or partially emptied, it should be primed to prevent air from entering the system.

1. Disconnect the brake tubes from the master cylinder.

2. Install short brake tubes onto the primary and secondary ports with the ends submerged in the brake master cylinder reservoir.

3. Fill the brake master cylinder reservoir with clean, specified brake fluid.

4. **NOTE:** On hybrid vehicles, the brake booster push rod has an elongated slot that attaches to the brake pedal with a clevis pin. The elongated slot allows for a small amount of pedal travel (free play) to occur without the brake pedal applying pressure on the booster push rod. When performing a bleed procedure, it is important to push the pedal through the air gap, so that the clevis pin is contacting the brake booster push rod. Except when required by the scan tool, the ignition key must remain off during the bleed procedure to allow minimal force required to push through the gap.

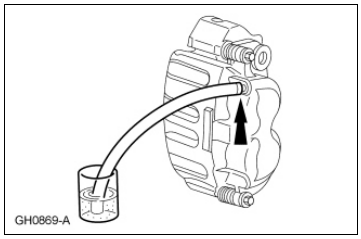
   Have an assistant slowly pump the brake pedal until clear fluid flows from the brake tubes, without air bubbles.

5. Remove the short brake tubes and install the master cylinder brake tubes.
   - Tighten to specifications, refer to Specifications in this section.

6. Bleed the brake system, refer to Brake System Bleeding in this section.

Front Brake Caliper

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.



⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: It is not necessary to do a complete brake system bleed if only the brake caliper was disconnected or installed new.

1. Remove the brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

2. **NOTE:** On hybrid vehicles, the brake booster push rod has an elongated slot that attaches to the brake pedal with a clevis pin. The elongated slot allows for a small amount of pedal travel (free play) to occur without the brake pedal applying pressure on the booster push rod. When performing a bleed procedure, it is important to push the pedal through the air gap, so that the clevis pin is contacting the brake booster push rod. Except when required by the scan tool, the ignition key must remain off during the bleed procedure to allow minimal force required to push through the gap.

   Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal.

3. Loosen the bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.

4. Tighten the bleeder screw to specifications, refer to Specifications in this section. Remove the rubber hose and install the bleeder screw cap.

Rear Brake Caliper

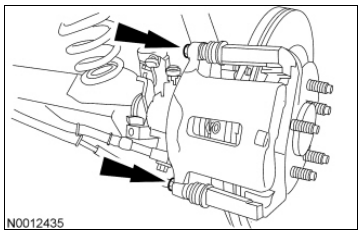
⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

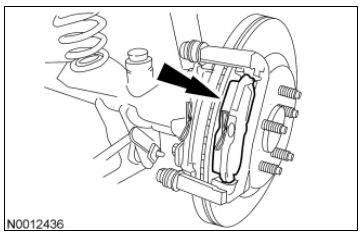
NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: When any part of the hydraulic system is disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it is correctly connected. The hydraulic system can be bled manually or with pressure bleeding



equipment.

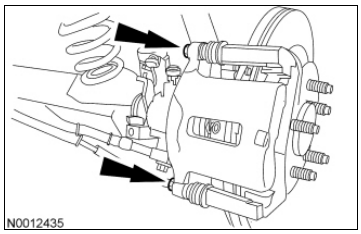
NOTE: Due to the complexity of the fluid path within the rear integral parking brake calipers, it may be necessary to follow this procedure when new calipers are installed.



1. **NOTE:** This procedure is necessary only when installing a new rear brake caliper. To bleed the brake system, refer to Brake System Bleeding in this section.

   Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove the 2 brake caliper guide pin bolts and position the brake caliper aside.

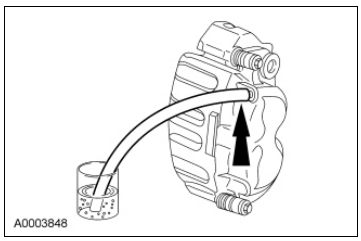


3. Remove the outer brake pad.

4. **NOTE:** Place a shop towel between the caliper and the brake disc.

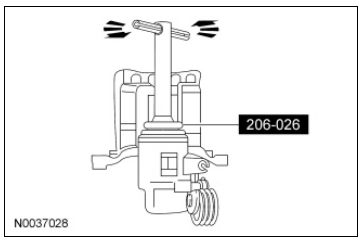
   Install the brake caliper using the 2 guide pin bolts.

   - Tighten to specifications, refer to Specifications in this section.



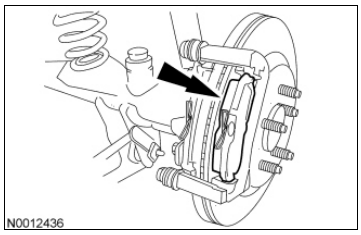
5. Slowly apply the brake pedal to extend the brake caliper piston outward.

6. Remove the 2 guide pin bolts and position the brake caliper aside.

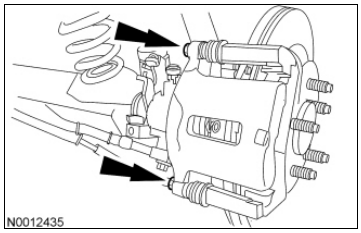


7. Remove the brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

8. Loosen the brake caliper bleeder screw.



9. Using the Rear Caliper Piston Adjuster, fully retract the brake caliper piston and tighten the bleeder screw to specifications, refer to Specifications in this section.



10. Repeat Steps 4 through 9 until clear, bubble free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.
    - Remove the rubber hose and install the bleeder screw cap.

11. Remove the 2 guide pin bolts and the shop towel.

12. Install the outer brake pad.

13. Position the brake caliper and install the 2 guide pin bolts.
    - Tighten to specifications, refer to Specifications in this section.

14. Install the wheel and tire. For additional information, refer to Section 204-04 .

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	590-790 ml (1.24-1.66 pt) [a]
High Temperature Nickel Anti-Seize Lubricant XL-2	-	-
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-	-

[a] Actual brake fluid capacity will vary depending on vehicle options.

General Specifications

Item	Specification
Brake disc minimum thickness	23.0 mm (0.905 in)
Brake pad maximum taper wear (in any direction)	3.0 mm (0.118 in)
Brake pad minimum thickness	3.0 mm (0.118 in)

Torque Specifications

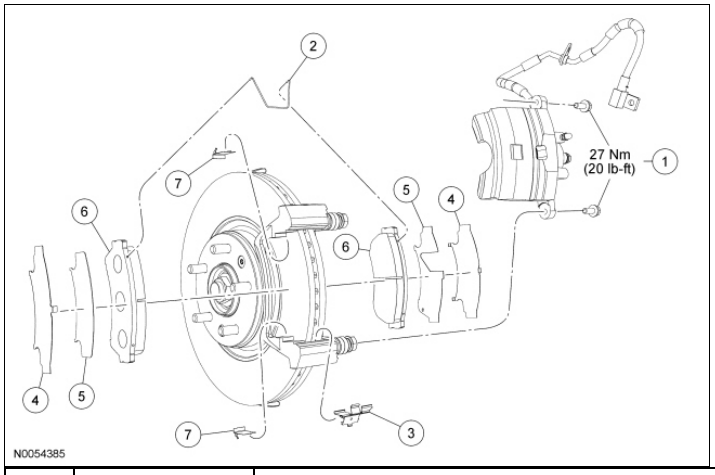
Description	Nm	lb-ft	lb-in
Brake caliper anchor plate bolts	90	66	-
Brake caliper flow bolt	25	18	-
Brake caliper guide pin bolts	27	20	-
Brake disc screws	20	-	177
Brake flexible hose bracket-to-body bolt	18	-	159
Brake flexible hose bracket-to-wheel knuckle bolt	23	17	-
Brake tube fitting	17	-	150

Front Disc Brake

The front brake disc system consists of the following components:

- Brake pads
- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake disc shield
- Brake flexible hose

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing of wheel rotation and the vehicle.



Front Disc Brake

Refer to Section 206-00 .

Brake Pads

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	2L527	Brake caliper guide pin bolts (2 required) (part of kit)
2	-	Brake pad retraction spring (2 required) (part of 2001)
3	-	Brake pad slide (2 required) (part of 2001)
4	-	Stainless steel shims (2 required) (part of 2001)
5	-	Brake pad shims (2 required) (part of 2001)
6	2001	Brake pads (2 required)
7	-	Brake pad slide clips (4 required) (part of 2001)

Removal

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Check the brake fluid level in the brake master cylinder reservoir.
   - If required, remove the fluid until the brake master cylinder reservoir is half full.

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. ***NOTICE:*** **Do not pry in the caliper sight hole to retract the pistons as this can damage the pistons and boots.**

   NOTICE: **Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.**

   Remove the 2 brake caliper guide pin bolts and position the caliper aside.

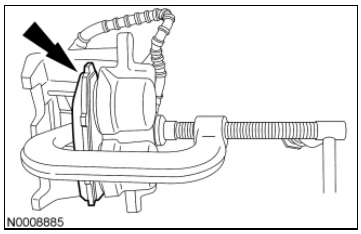
   - Support the caliper using mechanic's wire.

4. Remove the 2 brake pad retraction springs.

5. Remove the brake pads, brake pad shims and stainless steel shims.
   - Inspect the brake pads and shims for wear or contamination.

6. Remove the brake pad slides.

7. Remove the 4 brake pad slide clips.



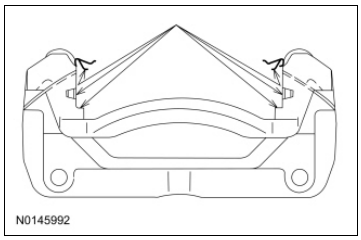
Installation

1. Install the 4 brake pad slide clips.

2. ***NOTICE:*** **Protect the piston and boots when pushing the caliper piston into the caliper piston bores or damage to components may occur.**

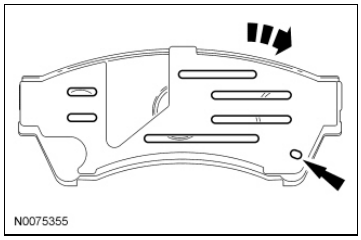
   NOTICE: **Make sure that the caliper guide pin boots are fully seated or damage to the caliper guide pin boots can occur.**

   If installing new brake pads, using a C-clamp and a worn brake, compress the disc brake caliper pistons into the caliper.



3. Install the brake pad slides.

4. Apply the black grease (6E1-2L064-AA) that is supplied to the pad backing plate and shims in the areas indicated.
   1. Apply grease to the back of the brake pad.
   2. Apply grease to the inner piston side stainless steel shim.
   3. Apply grease to the outer stainless steel shim.



5. Apply the white grease (6E1-2L064-BA) that is supplied to the brake pad retainer clips as indicated.

6. **NOTE:** LH inboard shim shown.

   NOTE: The cut shim is directional and used on the inboard pad only. The cut is positioned toward the leading side. Correct installation can be verified if the shim hole is positioned on the bottom side.

   Install the brake pad shims and the stainless steel shims to the brake pads.

7. Install the 2 brake pad retraction springs.

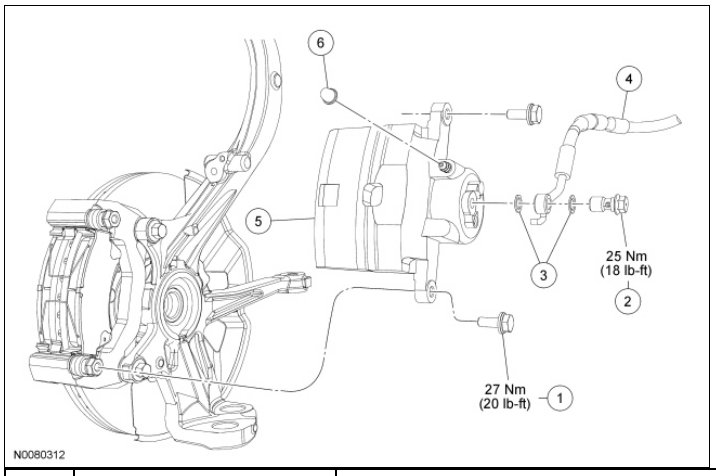
8. ***NOTICE:*** **The caliper guide pin boots must be seated correctly on the anchor plate or the guide pins may become contaminated.**

   Inspect the guide pin boots and make sure they are seated on the anchor plate correctly. The boot has a lip that fits under the edge of the anchor plate extension.

9. **NOTE:** Make sure that the brake caliper hose does not become twisted.

   Position the brake caliper and install the 2 guide pin bolts.

   - Tighten to 27 Nm (20 lb-ft).



10. Fill the brake master cylinder reservoir with clean, specified brake fluid.

11. Install the wheel and tire. For additional information, refer to Section 204-04 .
    - Apply brakes several times to verify correct brake operation.

Brake Caliper

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	2L527	Brake caliper guide pin bolt (2 required) (part of kit)
2	2M085	Brake caliper flow bolt
3	99562	Copper washers (2 required)
4	2078	Front brake hose
5	2B120 RH/ 2B121 LH	Brake caliper
6	2L126	Bleeder screw cap

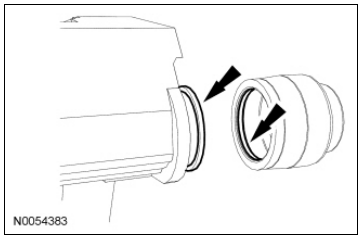
Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: The brake caliper and anchor plate are serviced together as a kit.



1. Remove the brake pads. For additional information, refer to Brake Pads in this section.

2. Remove the brake caliper flow bolt and position the hose aside.
   - Discard the 2 copper washers.
   - To install, tighten to 25 Nm (18 lb-ft).

3. Remove the 2 brake caliper anchor plate bolts.
   - To install, tighten to 90 Nm (66 lb-ft).

4. ***NOTICE:*** **The caliper guide pin boots must be seated correctly on the anchor plate or the guide pins may become contaminated.**

   Inspect the guide pin boots and make sure they are seated on the anchor plate correctly. The boot has a lip that fits under the edge of the anchor plate extension.

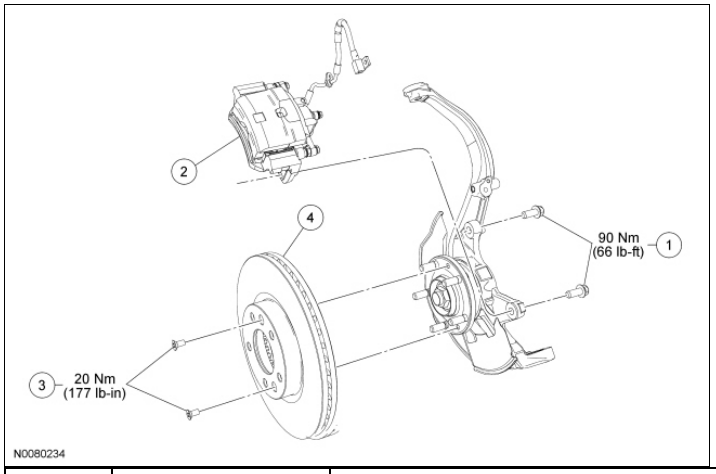
5. **NOTE:** During installation, make sure that the brake caliper hose does not become twisted.

   To install, reverse the removal procedure.

   - Install new copper washers.
   - Bleed the brake caliper. For additional information, refer to Component Bleeding in Section 206-00 .

Brake Caliper Anchor Plate

Removal and Installation



NOTE: The brake caliper and anchor plate are serviced together as a kit.

For additional information, refer to Brake Caliper in this section.

Brake Disc

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	-
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-

Item	Part Number	Description
1	W711241	Brake caliper anchor plate bolts (2 required)
2	2B292	Brake caliper and anchor plate assembly
3	W505741	Brake disc screws (2 required)
4	1032	Brake disc

Removal and Installation

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

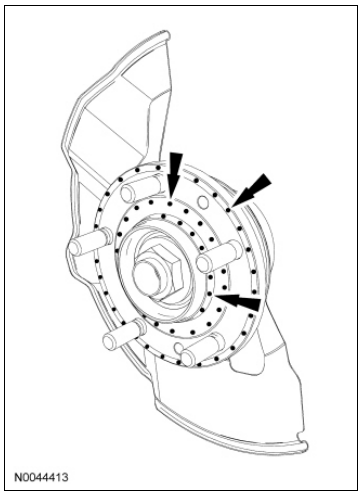
2. ***NOTICE:*** **Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.**

   Remove the brake caliper anchor plate bolts and position the brake caliper, pads and anchor plate aside as an assembly.

   - Support the caliper using mechanic's wire.
   - To install, tighten the bolts to 90 Nm (66 lb-ft).

3. Remove the 2 brake disc screws.
   - Tstall, tighten to 20 Nm (177 lb-in).

4. Remove the brake disc.



5. **NOTE:** During installation, make sure that the brake caliper hose does not become twisted.

   NOTE: Make sure the brake disc-to-hub mounting surface is free of rust and foreign material before applying anti-seize lubricant.

   NOTE: Do not allow anti-seize to make contact with the wheel studs.

   To install, reverse the removal procedure.

   - Using the specified brake cleaner, clean the mating surfaces.
   - Apply specified lubricant as shown.

Brake Flexible Hose

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	-	Brake tube fitting (part of 2263 RH/ 2264 LH)
2	W505263	Brake flexible hose bracket-to-body bolt
3	W500020	Brake flexible hose bracket-to-wheel knuckle bolt
4	2L122	Brake caliper flow bolt
5	2149	Copper washers (2 required)
6	2078	Brake flexible hose

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call:

1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid ispilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Remove the brake caliper flow bolt and discard the 2 copper washers.
    - To install, tighten to 25 Nm (18 lb-ft).

2. Disconnect the brake tube fitting from the brake flexible hose.
    - To install, tighten to 17 Nm (150 lb-in).

3. Remove the brake flexible hose bracket-to-wheel knuckle bolt.
    - To install, tighten to 23 Nm (17 lb-ft).

4. Remove the brake flexible hose bracket-to-body bolt and the brake flexible hose.
    - To install, tighten bolt to 18 Nm (159 lb-in).

5. To install, reverse the removal procedure.
    - Install new copper washers.
    - Bleed the brake caliper. For additional information, refer to Component Bleeding in Section 206-00 .

Brake tube fitting	17	-	150

Rear Disc Brake

The rear disc brake system consists of the following components:

- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake flexible hose
- Brake pads

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing or stopping of wheel rotation and the vehicle.

Rear Disc Brake

Refer to Section 206-00 .

Removal

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Check the brake fluid level in the brake master cylinder reservoir.
   - If required, remove the fluid until the brake master cylinder reservoir is 1/2 full.

2. Remove the wheel and tire. For additional information, refer to Section 204-04 .

3. Disconnect the parking brake cable from the brake caliper.
   - Pull back the parking brake lever.
   - Disconnect the cable from the parking brake lever.
   - Remove the cable conduit retaining clip.
   - Disconnect the cable from the brake caliper.

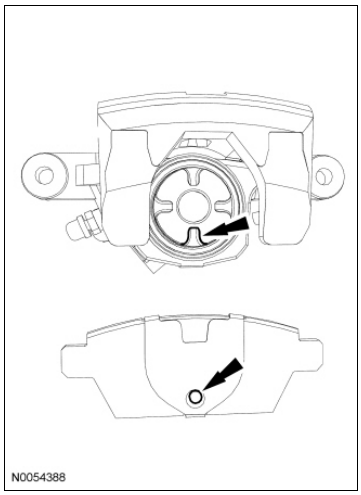
4. ***NOTICE:*** **Do not pry in the caliper sight hole to retract the pistons, as this can damage the pistons and boots.**

   NOTICE: **Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.**

   Remove the 2 brake caliper guide pin bolts and position the caliper aside.

   - Support the caliper using mechanic's wire.

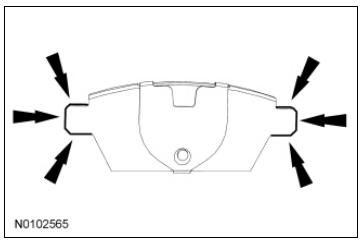
5. Remove the 2 brake pads, shims and retraction clips. Inspect the brake pads and shims for wear, damage or contamination.
   - Discard the slide clips.
   - Inspect the brake pads for wear and contamination.



Installation

1. **NOTE:** Make sure the caliper piston boot is clean and free of foreign material.

   Using the Rear Brake Caliper Piston Adjuster Adapter, compress the brake caliper piston into the brake caliper bore.



2. Position the notch in the caliper piston so that it will correctly align with the pin on the backside of the inboard brake pad.

3. **NOTE:** If installing new brake pads, install all new hardware as supplied with the brake pad kit.

   Install the shims and slide clips to the brake caliper anchor plate.

4. Apply equal amounts of lubricant (supplied with brake pad kit) to all brake pad-to-caliper anchor plate contact points and install brake pads.

5. **NOTE:** Make sure that the brake caliper hose is not twisted.

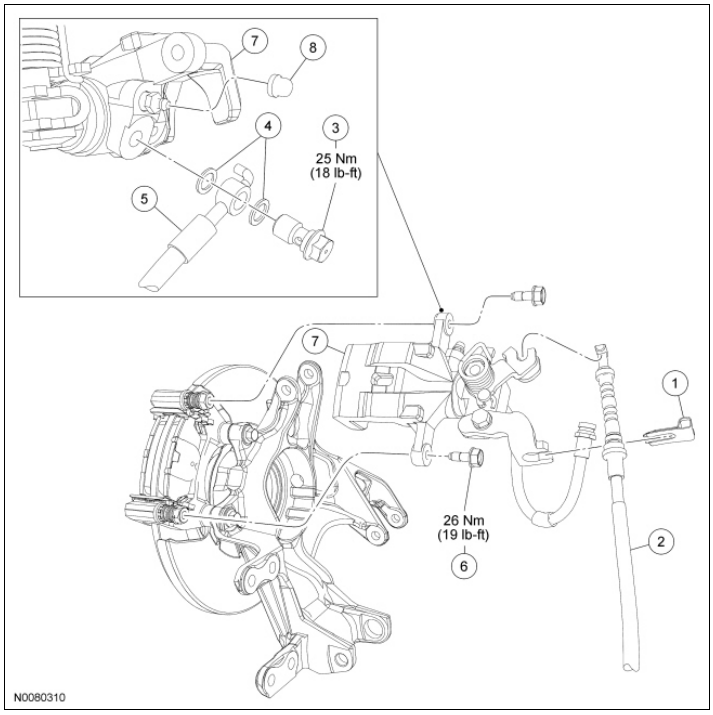
   Position the brake caliper on the anchor plate and install the 2 bolts.

   - Tighten to 26 Nm (19 lb-ft).

6. Install the parking brake cable to the brake caliper.
   - Pull back the parking brake lever.
   - Connect the cable to the parking brake lever.
   - Install the cable conduit retaining clip.

7. Install the wheel and tire. For additional information, refer to Section 204-04 .

8. Fill the brake master cylinder reservoir with clean, specified brake fluid.



9. Cycle the park brake several times to verify normal operation. For additional information on parking brake adjustment, refer to Section 206-05 .
    - Apply brakes several times to verify correct brake operation.

Brake Caliper

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.

Item	Part Number	Description
1	2860	Parking brake cable conduit retaining clip
2	2A815	Parking brake cable
3	2M085	Brake caliper flow bolt
4	99562	Copper washers
5	2282	Brake hose
6	-	Brake caliper guide pin bolt (2 required) (part of 2386)
7	2552 LH/ 2553 RH	Brake caliper

8	2426	Brake caliper bleeder screw cap

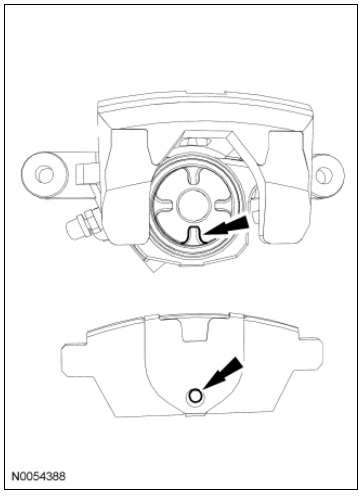
Removal

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Remove the wheel and tire. For additional information, refer to Section 204-04 .



2. Disconnect the parking brake cable from the brake caliper.
   - Pull back the parking brake lever.
   - Disconnect the cable from the parking brake lever.
   - Remove the cable conduit retaining clip.
   - Disconnect the cable from the brake caliper.

3. Remove the brake caliper flow bolt and position the brake hose aside.
   - Discard the 2 copper washers.

4. Remove the 2 brake caliper guide pin bolts and the brake caliper.
   - If a leaking or damaged caliper piston boot is found, install a new disc brake caliper.

Installation

1. Position the notch in the caliper piston so that it will correctly align with the pin on the backside of the inboard brake pad.

2. **NOTE:** Make sure that the brake caliper hose is not twisted.

   Position the brake caliper onto the anchor plate.

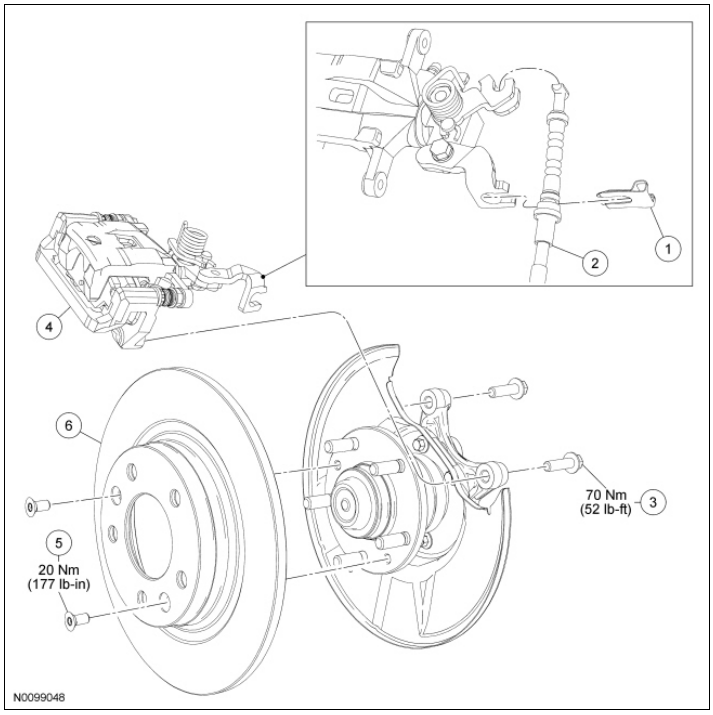
3. Install the 2 brake caliper guide pin bolts.

- To install, tighten to 26 Nm (19 lb-ft).

4. Using 2 new copper washers, position the brake hose and install the brake caliper flow bolt.
   - Tighten to 25 Nm (18 lb-ft).

5. Install the parking brake cable to the brake caliper.
   - Pull back the parking brake lever.
   - Connect the cable to the parking brake lever.
   - Install the cable conduit retaining clip.

6. Bleed the brake caliper. For additional information, refer to Section 206-00 Component Bleeding.



7. Cycle the park brake several times to verify normal operation.

Brake Disc

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-

NOTE: Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.

Item	Part Number	Description
1	2860	Parking brake cable conduit retaining clip
2	2A815	Parking brake cable
3	W711240	Brake caliper anchor plate bolt (2 required)
4	-	Brake caliper, brake pads and brake caliper anchor plate assembly
5	W505741	Brake disc screw (2 required)
6	2C026	Brake disc

Removal

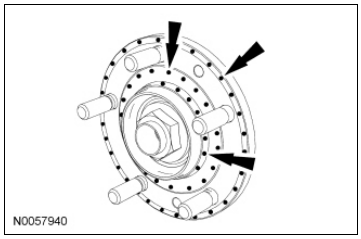
1. Remove the wheel and tire. For additional information, refer to Section 204-04 .

2. Disconnect the parking brake cable from the brake caliper.
   - Pull back the parking brake lever.
   - Disconnect the cable from the parking brake lever.
   - Remove the cable conduit retaining clip.
   - Disconnect the cable from the brake caliper.

3. ***NOTICE:*** **Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.**

   Remove the 2 brake caliper anchor plate bolts and position the brake caliper, brake pads and brake caliper anchor plate aside as an assembly.

   - Support the brake caliper, brake pads and brake caliper anchor plate assembly using mechanic's wire.



4. Remove the 2 brake disc screws and the brake disc.

Installation

1. **NOTE:** Make sure the brake disc-to-hub mounting surface is free of rust and foreign material before applying anti-seize lubricant.

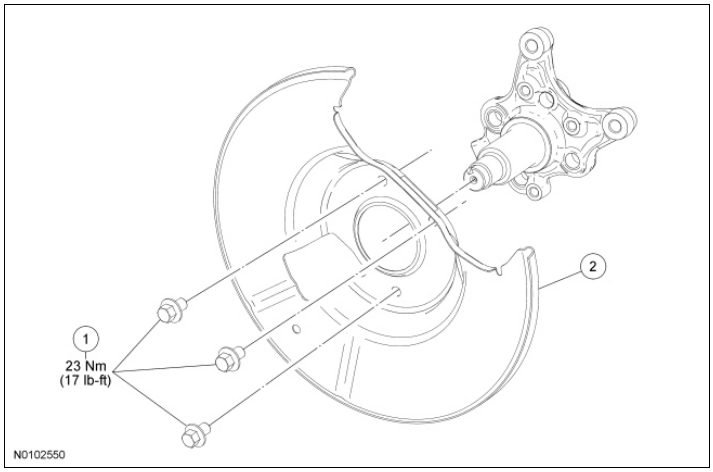
   Install the brake disc and the 2 brake disc screws.

   - Using the specified brake cleaner, clean the mating surfaces.
   - Apply specified lubricant as shown.
   - Tighten the screws to 20 Nm (177 lb-in).

2. **NOTE:** Make sure that the brake caliper hose is not twisted.

   Position the brake caliper, brake pads and brake caliper anchor plate assembly and install the 2 brake caliper anchor plate bolts.

   - Tighten to 70 Nm (52 lb-ft).



3. Install the parking brake cable to the brake caliper.
   - Pull back the parking brake lever.
   - Connect the cable to the parking brake lever.
   - Install the cable conduit retaining clip.

4. Install the wheel and tire. For additional information, refer to Section 204-04 .

5. Cycle the park brake several times to verify normal operation.

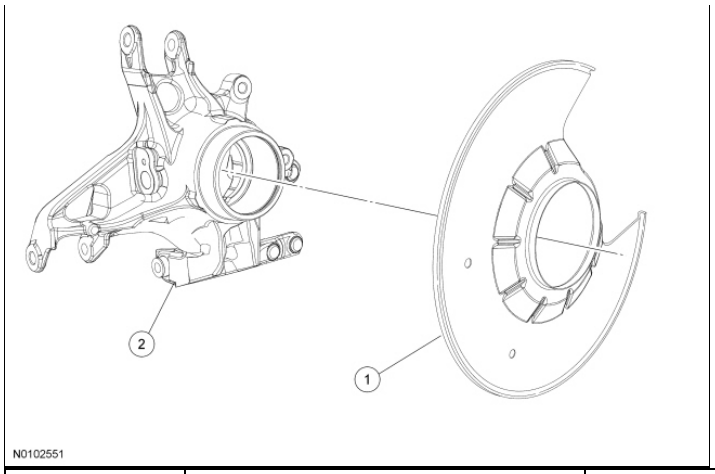
- Apply brakes several times to verify correct brake operation.

Brake Disc Shield - Front Wheel Drive (FWD)

Item	Part Number	Description
1	N500020	Brake disc shield bolts (3 required)
2	2K045 RH/ 2K046 LH	Brake disc shield

Removal and Installation

1. Remove the wheel bearing and wheel hub. For additional information, refer to Section 204-02 .



2. Remove the 3 brake disc shield bolts and the brake disc shield.
   - To install, tighten to 23 Nm (17 lb-ft).

3. To install, reverse the removal procedure.

Brake Disc Shield - All Wheel Drive (AWD)

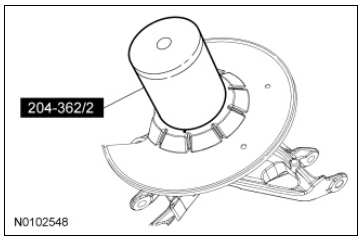
Special Tool(s)

 ST1569-A	Remover/Installer, Front Subframe Bushing 204-362/2

Item	Part Number	Description
1	2K005 LH/ 2K004 RH	Brake disc shield
2	3K186 LH/ 3K185 RH	Wheel knuckle

Removal

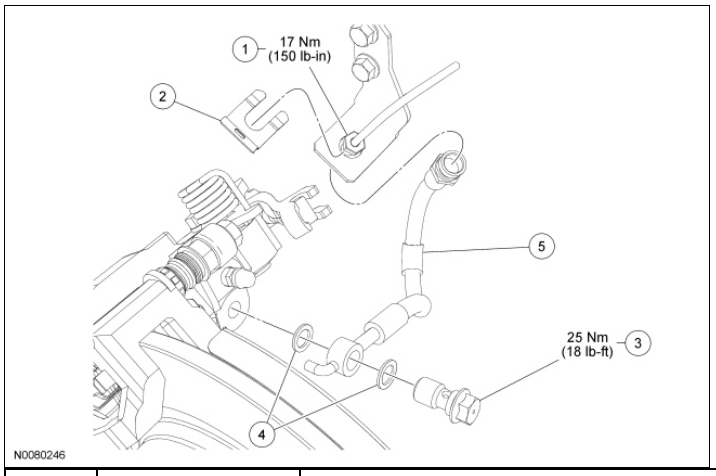
1. Remove the wheel bearing and wheel hub. For additional information, refer to Section 204-02 .
2. Index-mark the brake disc shield to the wheel knuckle.



3. Cut the brake disc shield and remove it from the wheel knuckle.

Installation

1. Transfer the index mark from the removed brake disc shield to the new brake disc shield.
2. Position the brake disc shield onto the wheel knuckle.



3. Align the index marks and install the brake disc shield onto the wheel knuckle using the Front Subframe Bushing Remover/Installer.

Brake Flexible Hose

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	-	Brake tube fitting (part of 2268 RH/ 9J279 LH)
2	2L198	Brake flexible hose retaining clip (part of 2282)
3	2L122	Brake caliper flow bolt
4	2149	Copper washers
5	2282	Brake flexible hose

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. move the wheel and tire. For additional information, refer to Section 204-04 .

2. Remove the brake caliper flow bolt and discard the 2 copper washers.
    - To install, tighten to 25 Nm (18 lb-ft).

3. Disconnect the brake tube fitting from the brake flexible hose.
    - To install, tighten to 17 Nm (150 lb-in).

4. Remove the brake flexible hose retaining clip and the brake hose.

5. To install, reverse the removal procedure.
    - Bleed the brake caliper. For additional information, refer to Section 206-00 Component Bleeding.

Torque Specifications

Description	Nm	lb-ft	lb-in
Catalytic converter-to-exhaust flexible pipe nut	40	30	-
Parking brake cable routing bracket bolts	23	17	-
Parking brake cable routing bracket nuts	9	-	80
Parking brake control bolt	20	-	177
Parking brake control nuts	20	-	177

Parking Brake

The parking brake system consists of the following components:

- Parking brake control
- Parking brake warning indicator switch
- Rear parking brake cable assembly

The parking brake system is a mechanical system that activates a self-adjusting brake system within the rear brake caliper.

The parking brake system is cable-actuated and controlled by an independent, hand-operated parking brake control. The parking brake control applies tension to rear brake pads through the front parking brake cable and conduit and the LH and RH rear parking brake cables. The parking brake warning indicator is located in the instrument cluster. It illuminates to signal the driver that the parking brake is applied or to signal a low brake fluid condition. The warning indicator system is diagnosed in Section 413-01 .

Parking Brake

Principles of Operation

Parking Brake System

The parking brake system is cable-actuated and controlled by an independent, hand-operated parking brake control that is not self adjusting. The parking brake system is actuated when the parking brake control is pulled up. When the parking brake control is pulled, tension is applied to the front parking brake cable. This tension pulls on both rear parking brake cables, which are attached to the brake caliper parking brake actuators and apply the brake pads. When the parking brake release button is pressed and the brake control is released, the return springs on the brake calipers and the parking brake control return the system to the released position.

Inspection and Verification

NOTE: Prior to carrying out any diagnosis, make sure the red brake warning indicator is functional. Refer to Section 413-01 .

The first indication that something may be wrong in the brake system is a change in the feeling through the parking brake control. The parking brake not holding on an incline or dragging after being released are also indicators of system concerns.

Check the operation of the parking brake system with the vehicle on a hoist and the parking brake control fully released. Check for any damaged cables and install new components as necessary. Carry out the brake system diagnosis.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• Front parking brake cable and conduit • Parking brake control • Parking brake equalizer • Rear brake calipers • Rear parking brake cables and conduits

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

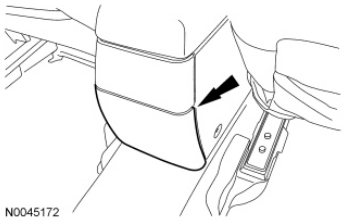
4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

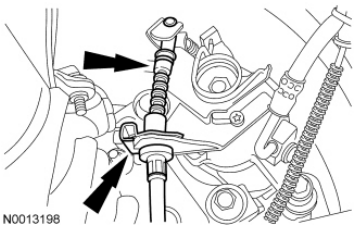
Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Parking Brake Will Not Apply





Normal Operation

The parking brake system is cable-actuated and controlled by an independent, hand-operated parking brake control that is not self adjusting. The parking brake system is actuated when the parking brake control is pulled up. When the parking brake control is pulled, tension is applied to the front parking brake cable. This tension pulls on both rear parking brake cables, which are attached to the brake caliper parking brake actuators and apply the brake pads.

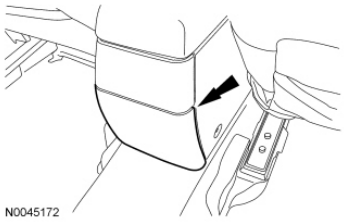
This pinpoint test is intended to diagnose the following:
- Parking brake control
- Parking brake cables
- Rear brake calipers

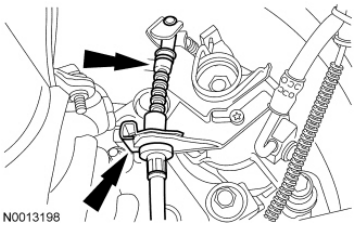
PINPOINT TEST A: THE PARKING BRAKE WILL NOT APPLY

Test Step	Result / Action to Take
A1 CHECK THE PARKING BRAKE CONTROL	
• Apply the parking brake control. • **Does the parking brake control move?**	**Yes** GO to A2 . **No** GO to A3 .
A2 CHECK FOR BROKEN CABLES	
• **NOTE:** Have an assistant apply and release the parking brake control to help isolate disconnected cables or cables that do not move. • Inspect the following items for damage and correct connections: ♦ Parking brake control ♦ Front cable ♦ Equalizer ♦ LH rear cable ♦ RH rear cable	**Yes** CONNECT the component(s) or INSTALL a new parking brake component(s) as necessary. TEST the system for normal operation. **No** VERIFY that the rear pads are within thickness specifications. REFER to Specifications in Section 206-00 . If the rear pads are OK, INSTALL new rear brake

♦ Rear brake caliper actuators • **Is any damage found or are any components disconnected?**	calipers. REFER to Section 206-04 .
A3 ISOLATE THE PARKING BRAKE CONTROL AND FRONT PARKING BRAKE CABLE	
• Remove the floor console rear access panel.  N0045172 • Loosen the parking brake adjustment nut and disconnect the rear cables from the equalizer. • Apply the parking brake control. • **Does the parking brake control move?**	**Yes** GO to A4 . **No** INSTALL a new parking brake control. REFER to Parking Brake Control in this section. TEST the system for normal operation.
A4 ISOLATE THE REAR PARKING BRAKE CABLES	
• Disconnect the LH and RH parking brake cables from the brake calipers.  N0013198 • While holding the cable conduit, attempt to slide the cable inside the conduit. • **Does the cable slide freely inside the conduit?**	**Yes** INSTALL new rear brake calipers. REFER to Section 206-04 . ADJUST the parking brake cable. REFER to Parking Brake Cable Adjustment in this section. **No** INSTALL a new rear brake cable(s). REFER to Parking Brake Cable - Rear in this section. TEST the system for normal operation.

Pinpoint Test B: The Parking Brake Will Not Release



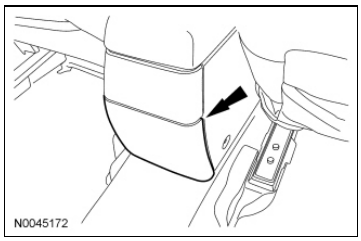


Normal Operation

When the parking brake release button is pressed and the brake control is released, the return springs on the brake calipers and the parking brake control return the system to the released position.

This pinpoint test is intended to diagnose the following:

- Parking brake cables
- Parking brake control
- Parking brake rear wheel components



PINPOINT TEST B: THE PARKING BRAKE WILL NOT RELEASE

Test Step	Result / Action to Take
B1 CHECK THE PARKING BRAKE CONTROL	
• Press the release button on the parking brake control and release the handle. • **Does the parking brake control move?**	**Yes** GO to B2 . **No** INSTALL a new parking brake control. REFER to Parking Brake Control in this section. TEST the system for normal operation.
B2 CHECK THE REAR PARKING BRAKE CABLES	
• Remove the floor console rear access panel.  N0045172 • Loosen the parking brake adjustment nut and disconnect the rear cables from the equalizer. • Disconnect the LH and RH parking brake cables from the brake calipers.  N0013198 • While holding the rear cable conduit, attempt to slide the rear cable inside the conduit. • **Does the cable slide freely inside the conduit?**	**Yes** INSTALL new rear brake calipers. REFER to Section 206-04 . ADJUST the parking brake cable. REFER to Parking Brake Cable Adjustment in this section. **No** INSTALL new rear brake cable(s). REFER to Parking Brake Cable - Rear in this section. TEST the system for normal operation.

Parking Brake Cable Adjustment

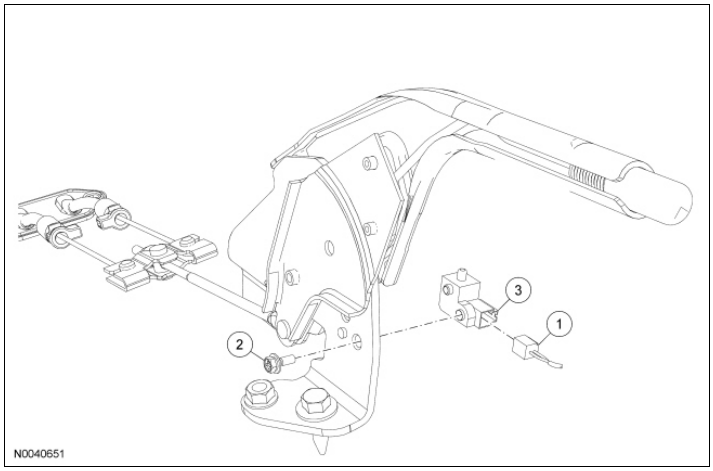
1. **NOTE:** Do not pry at the floor console rear access panel with a screwdriver or damage to the panel may occur.

   Remove the floor console rear access panel.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. **NOTE:** The dimension will vary depending on the amount of cable stretch. New cables require cycling the parking brake control 5-10 times to remove the cable slack.

   Adjust the parking brake adjustment nut as shown.

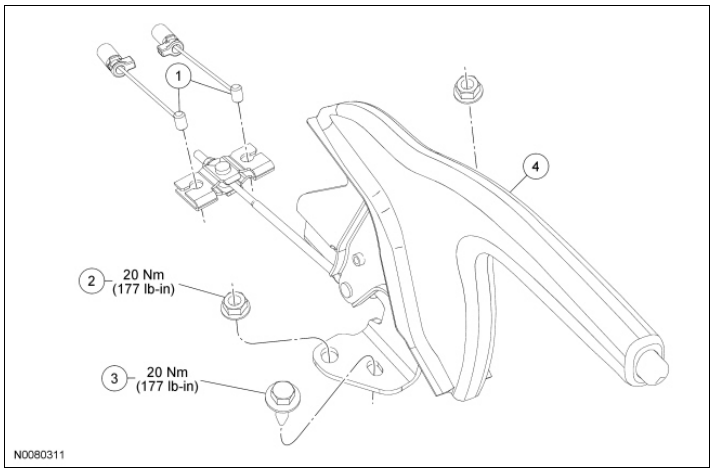


4. Verify correct operation of the parking brake system.
   - At 2 clicks of the parking brake control, slight drag at the rear wheels should be present.
   - At 5 clicks of the parking brake control, no movement at the rear wheels should be present.

5. Install the floor console rear access panel.

Parking Brake Warning Indicator Switch

NOTE: Parking brake control cover removed for clarity.



Item	Part Number	Description
1	-	Parking brake warning indicator switch electrical connector
2	-	Parking brake warning indicator switch screw
3	-	Parking brake warning indicator switch

Removal and Installation

1. Remove the floor console. For additional information, refer to Section 501-12 .
2. Disconnect the parking brake warning indicator switch electrical connector.
3. Remove the parking brake warning indicator switch screw.
4. Remove the parking brake warning indicator switch.
5. To install, reverse the removal procedure.

Parking Brake Control

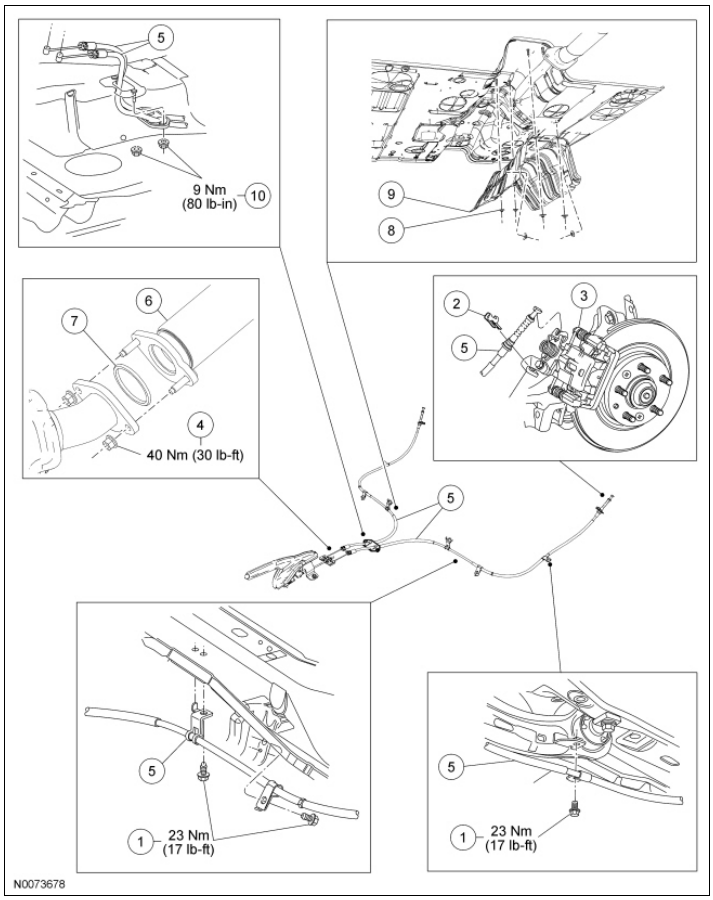
Item	Part Number	Description
1	2A815	Rear parking brake cables
2	W520413	Parking brake control nut (2 required)
3	W706246	Parking brake control bolt
4	2780	Parking brake control

Removal and Installation

1. Remove the floor console. For additional information, refer to Section 501-12 .

2. Make sure the parking brake control is in the released position.

3. Disconnect the warning indicator switch electrical connector.



4. Loosen the parking brake control adjusting nut.

5. Remove the 2 parking brake control nuts.
   - To install, tighten to 20 Nm (177 lb-in).

6. Remove the parking brake control bolt and the parking brake control.
   - To install, tighten to 20 Nm (177 lb-in).

7. To install, reverse the removal procedure.
   - Adjust the parking brake cable. For additional information, refer to Parking Brake Cable Adjustment in this section.

Parking Brake Cable - Rear

Item	Part Number	Description
1	W505263	Parking brake cable routing bracket bolts (6 required)
2	2860	Parking brake cable routing clip (2 required)
3	2552 LH/ 2553 RH	Brake caliper
4	W705443	Catalytic converter-to-exhaust flexible pipe nut (2 required)
5	2A815	Rear parking brake cable assembly
6	5G203	Exhaust flexible pipe
7	9451	Gasket
8	W709729	Heat shield nut (6 required)
9	114B04	Heat shield
10	W707142	Parking brake cable routing bracket nuts (2 required)

Removal and Installation

NOTE: Do not use oil or grease-based lubricants on the isolators.

1. Remove the floor console. For additional information, refer to Section 501-12 .

2. Loosen the parking brake control adjusting nut.

3. Disconnect the rear parking brake cables from the equalizer.

4. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

5. Support the muffler and tailpipe with a suitable jackstand.

6. Separate the 2 muffler and tailpipe isolators from the vehicle.

7. Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe and the catalytic converter.
    - Discard the gasket.
    - To install, position a new gasket and tighten the new nuts to 40 Nm (30 lb-ft).

8. Remove the heat shield.
    - Remove the 6 nuts, the 2 pin-type retainers and the heat shield.

9. Remove the 2 parking brake cable routing bracket nuts.
    - To install, tighten to 9 Nm (80 lb-in).

10. Remove the 6 parking brake cable routing bracket bolts.
    - To install, tighten to 23 Nm (17 lb-ft).

11. Remove the 2 parking brake cable routing clips.

12. Disconnect the rear parking brake cables from the calipers and remove the cables.

13. To install, reverse the removal procedure.
    - Adjust the parking brake cable. For additional information, refer to Parking Brake Cable Adjustment in this section.

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	590-790 ml (1.24-1.66 pt) [a]

[a] Actual brake fluid capacity will vary depending on vehicle options.

Torque Specifications

Description	Nm	lb-ft	lb-in
Brake booster nuts [a]	-	-	-
Brake fluid remote reservoir nuts	7	-	62
Brake fluid reservoir pin bolt	6	-	53
Brake master cylinder brake tube fittings (non-hybrid)	28	21	-
Brake master cylinder brake tube fittings (hybrid)	20	-	177
Brake master cylinder nuts	20	-	177
Brake pedal and bracket upper bolts	23	17	-
Brake pedal angle sensor screws	2	-	18
Brake pedal bracket bolts [a]	-	-	-
Brake pressure control valve bolts	11	-	97
Brake pressure control valve brake tube fittings 20	-	177	
Steering column opening trim panel reinforcement bolts	3	-	27

[a] Refer to the procedure in this section.

Hydraulic Brake Actuation

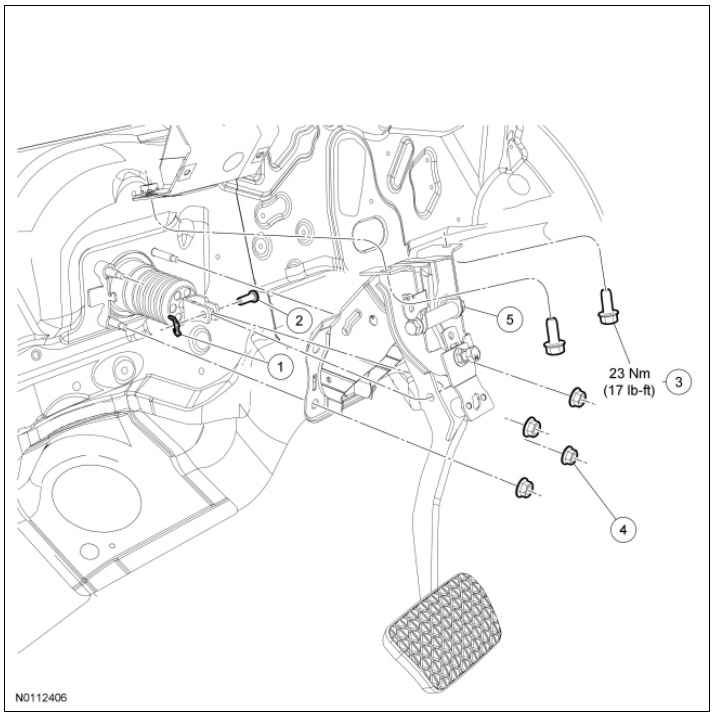
The hydraulic brake actuation system consists of the following components:

- Brake master cylinder
- Brake pedal and bracket assembly
- Brake tubes and hoses
- Hydraulic Control Unit (HCU)
- Pressure control valve (non-hybrid vehicles only)

The hydraulic brake system is diagonally split with the LH front and RH rear brakes on one circuit and the RH front and LH rear brakes on the other circuit.

Hydraulic Brake Actuation

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is pushed from the master cylinder through the steel tubes, HCU , pressure control valve (non-hybrid vehicles only) and flexible hoses to the front brake calipers and rear wheel cylinders. When the brake pedal is released, brake fluid pressure is relieved, returning the front and rear brake components to the unapplied position.



Brake Pedal Assembly - Hybrid

Hybrid vehicles are equipped with a brake pedal assembly that utilizes driver input and electronic components to apply the brakes. The brake booster push rod has an elongated slot that attaches to the brake pedal with a clevis pin. The elongated slot allows for a small amount of pedal travel (freeplay) to occur without the brake pedal applying pressure on the booster push rod. This freeplay allows regenerative braking to occur. To compensate for the freeplay, the pedal assembly is equipped with a hydraulic brake pedal feel simulator that provides the same feel and resistance as a conventional brake pedal. On light or normal brake applications, sensors attached to the brake pedal assembly measure brake pedal angle and the amount of pressure applied to the brake pedal. The sensors send signals to ABS module which activates a solenoid inside the brake booster. The solenoid draws the booster push rod into the booster, applying pressure to the master cylinder piston which then applies hydraulic pressure to the brake system. On hard brake applications, the brake pedal will travel to the end of the elongated slot, eliminating the freeplay and physically engaging the booster push rod, operating the brakes similar to a conventional brake actuation system.

Hydraulic Brake Actuation

Refer to Section 206-00 .

Brake Pedal and Bracket - Non-Hybrid

Item	Part Number	Description
1	7B096	Brake booster push rod pin clip
2	2N513	Brake booster push rod pin
3	W505263	Brake pedal bracket bolt (2 required)
4	W520212	Brake pedal bracket nut (4 required)
5	2455	Brake pedal and bracket

Removal and Installation

1. ***NOTICE:*** **Do not service the brake pedal or brake booster without first removing the stoplamp switch. This switch must be removed with the brake pedal in the at-rest position. The switch plunger must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.**

   Remove the stoplamp switch. For additional information, refer to Section 417-01 .

2. Remove the brake booster push rod pin clip.

3. Remove the brake booster push rod pin.

4. Remove the 2 brake pedal bracket bolts.
   - To install, tighten to 23 Nm (17 lb-ft).

5. ***NOTICE:*** **Use only hand tools to remove the fasteners or damage to the booster may occur.**

   Remove the 4 brake pedal bracket nuts and the brake pedal and bracket assembly.

6. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch. This switch must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing this switch with the brake pedal in any other position will result in incorrect adjustment and may damage the switch.**

   To install, reverse the removal procedure.

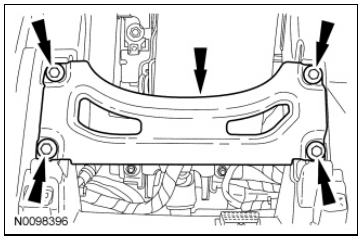
7. ***NOTICE:*** **Use only hand tools to install the fasteners or damage to the booster may occur.**

   Tighten the brake pedal bracket nuts to 23 Nm (17 lb-ft) in the sequence shown.

Brake Pedal and Bracket - Hybrid

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Item	Part Number	Description
1	2L523	Brake booster push rod clevis locking pin
2	-	Brake pedal angle sensor electrical connector (part of 14290)
3	-	Simulator cut off valve solenoid electrical connector (part of 14290)
4	-	Simulator fluid pressure sensor electrical connector (part of 14290)
5	W520112	Brake booster nut (4 required)
6	W505263	Brake pedal and bracket upper bolts (2 required)
7	W505263	Brake pedal bracket bolt (2 required)
8	2455	
9	2468	Brake pedal bracket

Removal and Installation

1. Remove the knee air bag module. For additional information, refer to Section 501-20B .

2. Remove the 4 steering column opening trim panel reinforcement bolts and the steering column opening trim panel reinforcement.
   - To install, tighten to 3 Nm (27 lb-in).

3. ***NOTICE:*** **Do not service the brake pedal without first removing the stoplamp switch. This switch must be removed with the brake pedal in the at-rest position. The switch plunger must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.**

   Remove the stoplamp switch. For additional information, refer to Section 417-01 .

4. Remove the 3 lower steering column shroud screws and separate the lower steering column shroud from the upper shroud.

5. Disconnect the 3 electrical connectors from the brake pedal and bracket assembly.

6. **NOTE:** The booster push rod clevis-locking pin is a one-time use only part. Any time the booster push rod clevis-locking pin is removed, a new booster push rod clevis-locking pin should be used.

   NOTE: Remove the clevis-locking pin by squeezing the locking tabs and pulling outward on the opposite end.

   Remove and discard the booster push rod clevis-locking pin.

7. Remove the 2 brake pedal and bracket upper bolts.
   - To install, tighten to 23 Nm (17 lb-ft).

8. ***NOTICE:*** **Use only hand tools to remove and install the fasteners or damage to the booster may occur.**

   Remove and discard the 4 brake booster nuts.

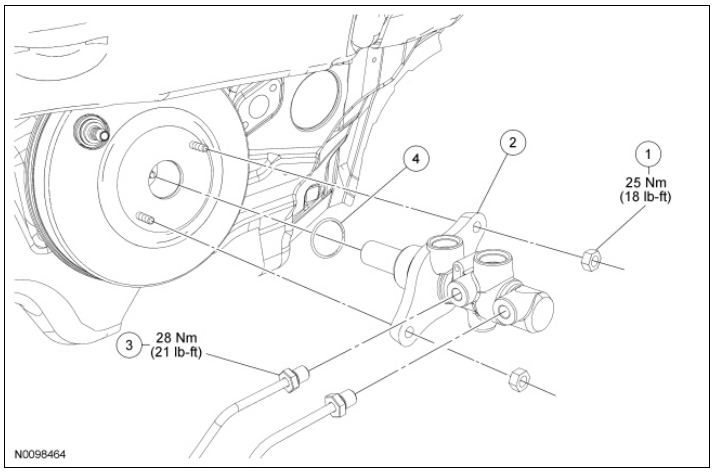
   - To install, tighten new nuts to 23 Nm (17 lb-ft) following a clockwise pattern starting with the lower left nut.

9. From the engine compartment, pull the brake booster toward the front of the vehicle until the brake booster studs are clear of the brake pedal bracket holes.

10. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch. This switch must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing this switch with the brake pedal in any other position will result in incorrect adjustment and may damage the switch.**

    To install, reverse the removal procedure.

11. Carry out the Multi-Calibration Routine. Follow the scan tool directions.



Brake Master Cylinder

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: Automatic transmission shown, manual transmission similar.

NOTE: Non-hybrid vehicle shown, hybrid vehicle similar.

Item	Part Number	Description
1	2L364	Brake master cylinder nut (2 required)
2	2140	Brake master cylinder assembly
3	-	Brake master cylinder brake tube fitting (2 required) (part of 2C360)
4	2152	Brake master cylinder-to-brake booster seal

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. Remove the brake fluid reservoir. For additional information, refer to Brake Fluid Reservoir in this section.

2. If equipped with a manual transmission, disconnect the clutch master cylinder feed hose.
   - Plug the clutch master cylinder feed hose.

3. Disconnect the brake master cylinder brake tube fittings, plug the brake tubes and the brake master cylinder ports.
   - **Non-hybrid vehicles:** To install, tighten to 28 Nm (21 lb-ft).
   - **Hybrid vehicles:** To install, tighten to 20 Nm (177 lb-in).

4. ***NOTICE:*** **Use only hand tools to remove and install the fasteners or damage to the booster may occur.**

   Remove the 2 brake master cylinder nuts.

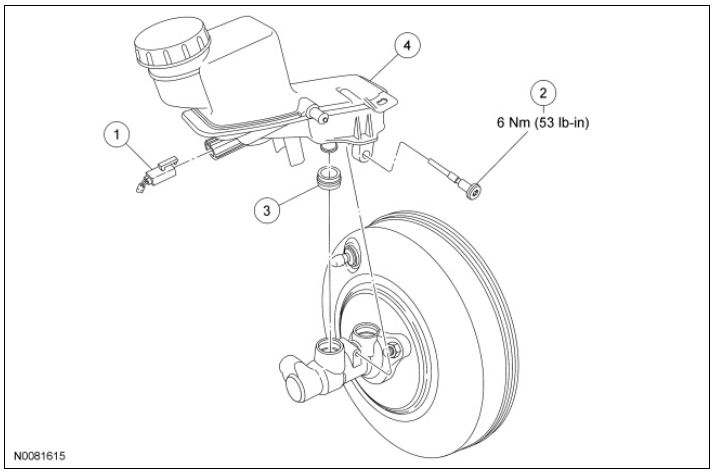
   - To install, tighten to 20 Nm (177 lb-in).

5. Remove the brake master cylinder.

6. ***NOTICE:*** **Do not allow the flexible portion of the brake tubes to twist during installation, or damage to the brake tubes may occur.**

   To install, reverse the removal procedure.

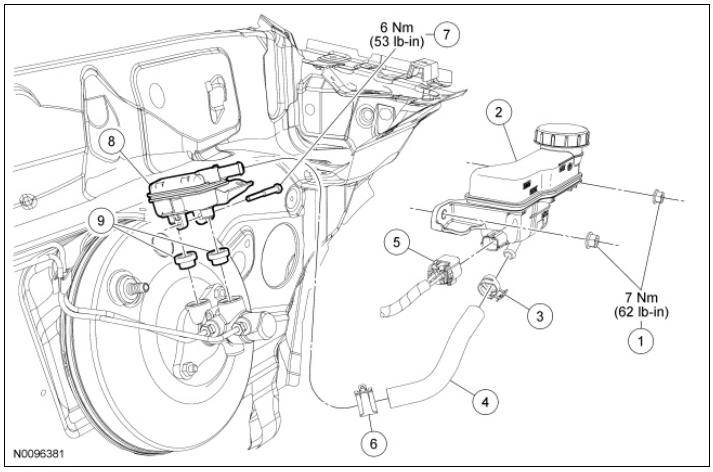
   - Bleed the master cylinder. For additional information, refer to Section 206-00 .
   - If equipped with a manual transmission, bleed the clutch master cylinder. For additional information, refer to Section 308-00 .



Brake Fluid Reservoir

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1



2.5L Non-Hybrid

NOTE: Automatic transmission shown, manual transmission similar.

Item	Part Number	Description
1	-	Brake fluid level warning switch electrical connector (part of 14290)
2	2B176	Brake fluid reservoir pin bolt
3	2L074	Brake fluid reservoir seal (2 required)
4	2C246	Brake fluid reservoir

2.5L Hybrid, 3.0L and 3.5L

Item	Part Number	Description
1	W520111	Brake fluid remote reservoir nuts (2 required)
2	2K478	Brake fluid remote reservoir
3	-	Spring clamp (part of 2K478)
4	-	Brake fluid reservoir hose (part of 2K478)
5	-	Brake fluid level warning switch electrical connector (part of 14290)
6	-	Spring clamp (part of 2K478)
7	2B176	Brake fluid reservoir pin bolt
8	2K478	Brake fluid reservoir
9	2L074	Brake fluid reservoir seals (2 required)

Removal and Installation

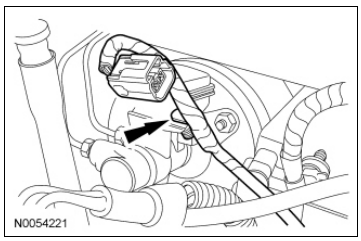
⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

All vehicles

1. Using a suitable suction device, remove the brake fluid from the remote reservoir.



2. Disconnect the brake fluid level switch electrical connector.

2.5 Hybrid, 3.0L and 3.5L vehicles

3. Remove the lower cowl panel grille. For additional information, refer to Section 501-02 .

4. Disconnect the hose from the remote reservoir.

5. Disconnect the brake fluid level switch harness from the brake fluid reservoir.

All vehicles

6. Remove the brake fluid reservoir pin bolt and the brake fluid reservoir.
    - To install, tighten to 6 Nm (53 lb-in).

7. Remove and discard the 2 brake fluid reservoir seals.

8. **NOTE:** Install new brake fluid reservoir seals. Lubricate the seals with clean, specified brake fluid.

   To install, reverse the removal procedure.

    - Bleed the brake system. For additional information, refer to Section 206-00 .
    - If equipped with a manual transmission, bleed the clutch master cylinder. For additional information, refer to Section 308-00 .

Brake Pedal Angle Sensor

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

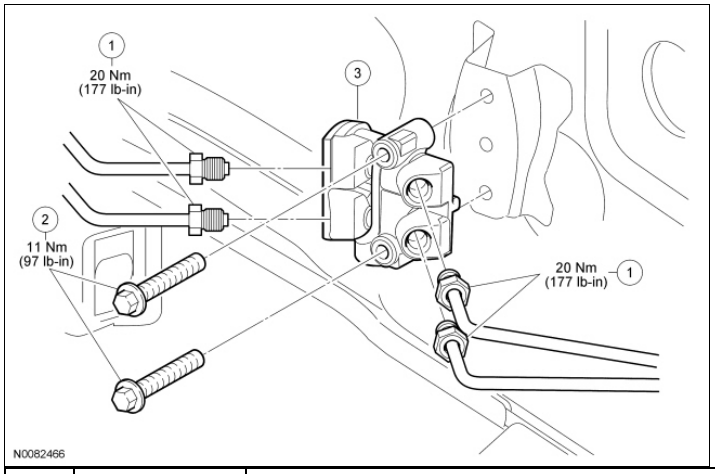
Item	Part Number	Description
1	-	Brake pedal angle sensor electrical connector (part of 14290)
2	-	Brake pedal angle sensor screws (2 required) (part of 14F385A)
3	14F385A	Brake pedal angle sensor

Removal and Installation

1. Remove the brake pedal bracket. For additional information, refer to Brake Pedal and Bracket - Hybrid in this section.

2. Remove and discard the 2 brake pedal angle sensor screws.

3. Remove the brake pedal angle sensor.



4. To install, reverse the removal procedure.
   - Install new brake pedal angle sensor screws.

5. Carry out the Multi-Calibration Routine. Follow the scan tool directions.

Brake Pressure Control Valve

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	-	Brake pressure control valve brake tube fittings (part of 9J279)
2	W711239	Brake pressure control valve bolts (2 required)
3	43900	Brake pressure control valve

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section

100-02 .

3.0L and 3.5L vehicles

2. Remove the RH fender splash shield. For additional information, refer to Section 501-02 .

All vehicles

3. Remove the nut and the brake tube heat shield.

4. Disconnect the brake pressure control valve brake tube fittings, plug the tubes and the ports on the brake pressure control valve.
    - To install, tighten to 20 Nm (177 lb-in).

5. Remove the 2 brake pressure control valve bolts and the brake pressure control valve.
    - To install, tighten to 11 Nm (97 lb-in).

6. To install, reverse the removal procedure.
    - Bleed the brake system. For additional information, refer to Section 206-00 .

Torque Specifications

Brake Booster

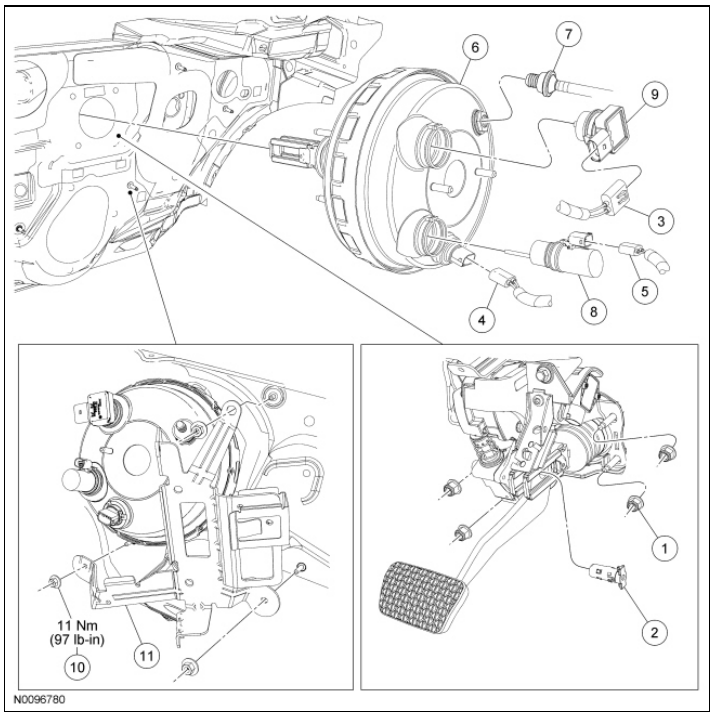
The power brake actuation system consists of the following components:

- Brake booster
- Brake booster check valve
- Brake booster vacuum supply hose
- Brake booster vacuum sensor
- Brake booster travel sensor (hybrid vehicles)
- Engine-mounted vacuum pump (hybrid vehicles)

Conventional brake booster

The brake booster uses engine vacuum from the intake manifold to create a partial vacuum inside the vacuum booster on both sides of the diaphragm. When the brake pedal is pressed, the booster rod opens a valve, allowing air to enter the booster on one side of the diaphragm while sealing off the opposite side. This increases pressure on that side of the diaphragm so that it helps push the rod, which in turn pushes the piston in the master cylinder. As the brake pedal is released, the valve seals off the outside air supply while opening the vacuum valve. This restores vacuum to both sides of the diaphragm, allowing everything to return to its original position. Vehicles with 3.0L All-Wheel Drive (AWD) and 3.5L engines are equipped with a vacuum sensor. The ABS module uses the signals produced by the vacuum pressure sensor to verify that vacuum maintained in the brake booster.

Active brake booster (hybrid vehicles)

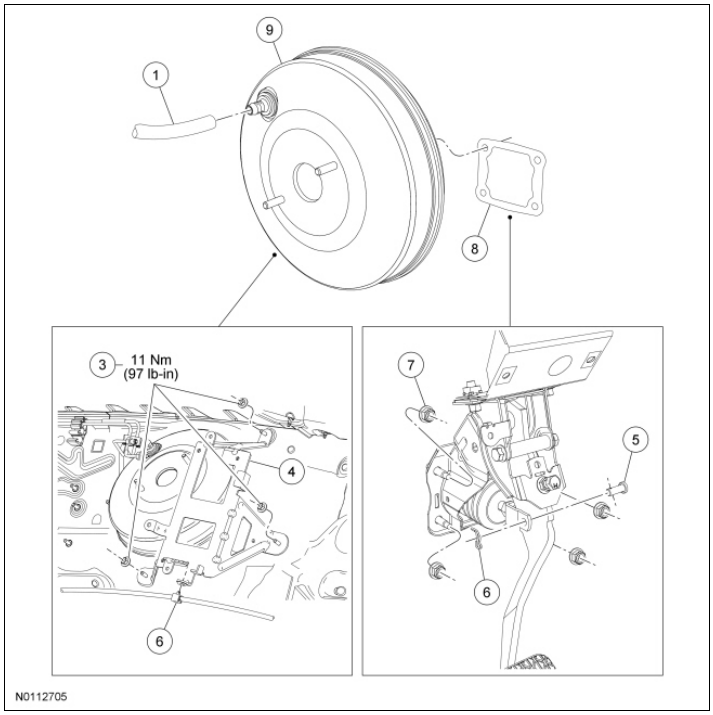


The active brake booster uses vacuum supplied by an electric vacuum pump mounted on the engine when engine vacuum is unavailable. The active brake booster is similar to a conventional brake booster but with the addition of a brake booster (vacuum) solenoid, a brake booster travel sensor and a vacuum sensor. If it is necessary to apply the friction brakes, the ABS module will send a Pulse Width Modulated (PWM) signal to the brake booster solenoid that is proportional to the amount of brake torque requested. The booster solenoid will open to allow vacuum to draw the booster diaphragm and push rod toward the master cylinder piston, building hydraulic pressure. The vacuum sensor is used by the ABS module to monitor vacuum maintained inside the brake booster. The brake booster travel sensor is used to monitor the performance of the brake booster.

Power Brake System

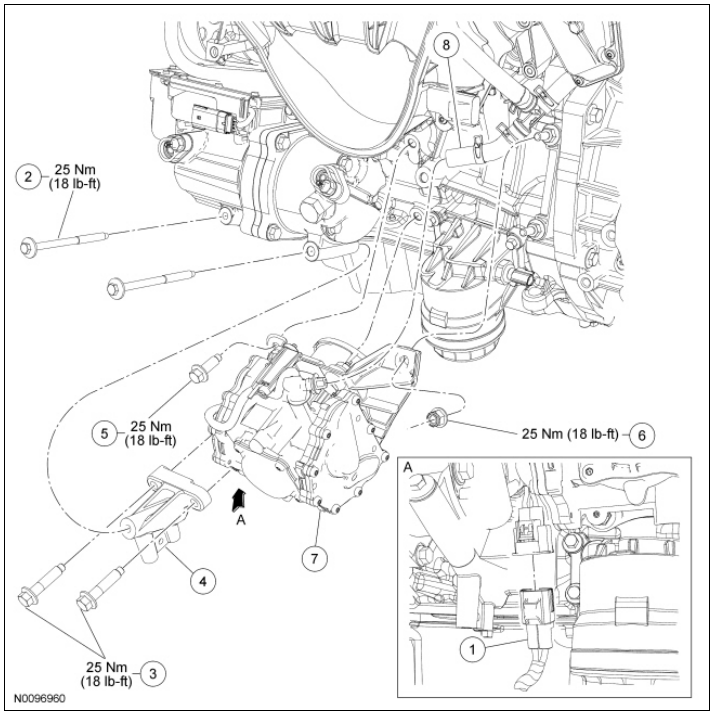
Refer to Section 206-00 .

Brake Booster - Exploded View



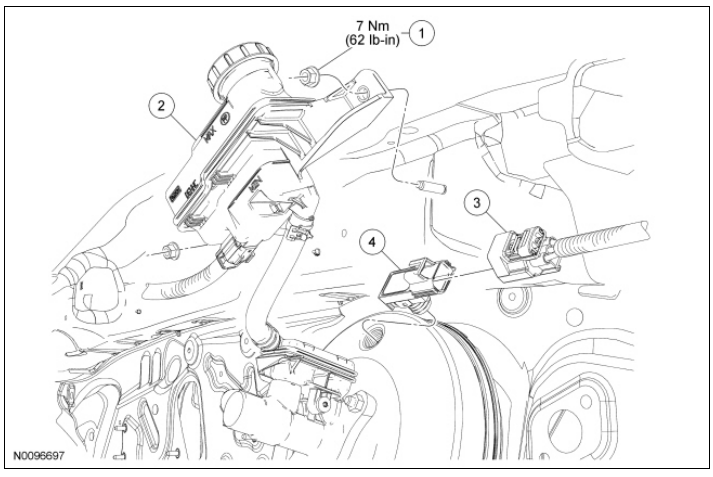
Brake Booster - Hybrid Vehicles

Item	Part Number	Description
1	W520413	Brake booster nut (4 required)
2	2L523	Booster rod clevis-locking pin
3	-	Vacuum sensor electrical connector (part of 14290)
4	-	Booster solenoid electrical connector (part of 14290)
5	-	Booster travel sensor electrical connector (part of 14290)
6	2005	Brake booster
7	9C482	Vacuum supply tube
8	2M113	Brake booster travel sensor
9	2365	Brake booster vacuum sensor
10	N804795	PCM bracket nut (3 required)
11	12A659	PCM bracket



Brake Booster - Non-Hybrid Vehicles

NOTE: 3.0L Front Wheel Drive (FWD) shown, 3.0L All-Wheel Drive (AWD) and 3.5L similar.



Item	Part Number	Description
1	9C840	Vacuum hose/aspirator assembly
2	-	Harness fastener (part of 14290)
3	N804795	PCM bracket nuts
4	12A659	PCM bracket
5	2N513	Brake booster push rod pin
6	7B096	Brake booster push rod clip
7	W520212	Brake booster nut (4 required)
8	2B022	Brake booster-to-cowl gasket
9	2B195	Brake booster with check valve

Vacuum Pump - Hybrid Vehicles

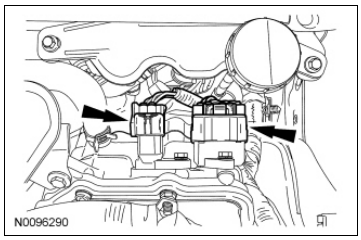
Item	Part Number	Description
1	-	Vacuum pump electrical connector (part of 14A411)
2	W701626	A/C compressor bolt (2 required)
3 W500320	A/C compressor bracket bolts	
4	19D624	A/C compressor bracket
5	W500233	Vacuum pump bracket bolt
6	W520212	Vacuum pump bracket nut
7	2A451	Vacuum pump assembly
8	9C482	Vacuum hose

Vacuum Sensor - 3.0L All-Wheel Drive (AWD) and 3.5L Vehicles

Item	Part Number	Description

1	W520111	Remote brake fluid reservoir nut (2 required)
2	2K478	Remote brake fluid reservoir
3	-	Vacuum sensor electrical connector (part of 14290)
4	2C444	Vacuum sensor

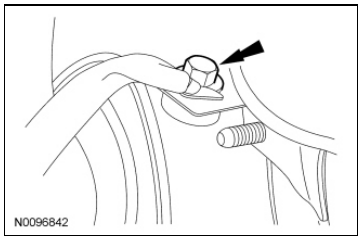
1. For additional information, refer to the procedures in this section.



Brake Booster - Hybrid

Special Tool(s)

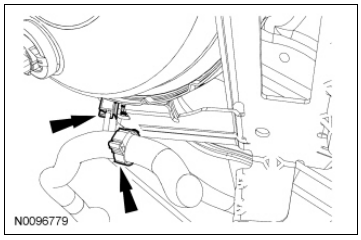
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Removal and Installation

1. Disconnect the 2 low-voltage electrical connectors.

N0096290



2. Remove the master cylinder. For additional information, refer to Section 206-06 .

3. Remove the bolt and position the ground cable aside.
   - To install, tighten the bolt to 12 Nm (106 lb-in).

N0096842

4. Remove the PCM. For additional information, refer to Section 303-14D .

5. Detach the wiring harness and brake tube routing retainers from the PCM bracket.

N0096779

6. Remove the 3 nuts and the PCM mounting bracket.
   - To install, tighten the nuts to 11 Nm (97 lb-in).

7. Disconnect the vacuum hose/check valve assembly from the brake booster.

8. Disconnect the vacuum sensor, booster solenoid and the booster travel sensor electrical connectors.

9. ***NOTICE:*** **Do not service the brake pedal or brake booster without first removing the stoplamp switch. This switch must be removed with the brake pedal in the at-rest position. The switch plunger must be compressed for the switch to rotate in the bracket. Attempting to remove the switch when the plunger is extended (during pedal apply) will result in damage to the switch.**

   Remove the stoplamp switch. For additional information, refer to Section 417-01 .

10. **NOTE:** The booster push rod clevis-locking pin is a one-time-use only part. Any time the booster push rod clevis-locking pin is removed, a new booster push rod clevis-locking pin must be used.

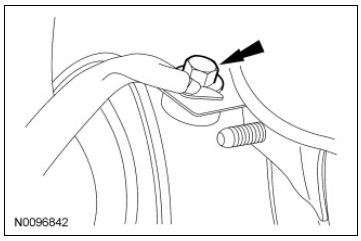
    NOTE: Remove the clevis-locking pin by squeezing the locking tabs and pulling outward on the opposite end.

    Remove and discard the booster push rod clevis-locking pin.

11. Remove and discard the 4 brake booster nuts and remove the brake booster.
    - To install, tighten the new nuts to 23 Nm (17 lb-ft) in a clockwise pattern, starting with the lower left nut.

12. ***NOTICE:*** **Do not press, pull or otherwise move the brake pedal while installing the stoplamp switch. This switch must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing this switch with the brake pedal in any other position will result in incorrect adjustment and may damage the switch.**

    To install, reverse the removal procedure.



13. Following the scan tool instructions, carry out the Multi-Calibration Routine.

Brake Booster - Non-Hybrid

Removal and Installation

All vehicles

1. Remove the brake master cylinder. For additional information, refer to Section 206-06 .
2. Remove the PCM. For additional information, refer to Section 303-14A or Section 303-14B .
3. Remove the battery tray. For additional information, refer to Section 414-01 .
4. If equipped, remove the brake booster vacuum sensor. For additional information, refer to Brake Booster Vacuum Sensor - Non-Hybrid in this section.
5. Remove the bolt and position the ground cable aside.
    - To install, tighten the bolt to 12 Nm (106 lb-in).

6. Disconnect the harness fastener and remove the 3 nuts and the PCM bracket.
    - To install, tighten the nuts to 11 Nm (97 lb-in).
7. *NOTICE:* **Make sure that the aspirator tube is routed correctly and that the clamps are positioned so they do not make contact with surrounding components or damage to the tube may occur.**

   Disconnect the vacuum hose/check valve assembly from the brake booster.

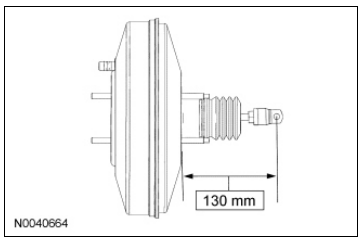
Automatic transmission vehicles

8. **NOTE:** It is not necessary to remove the fluid level indicator tube from the transmission. The tube can be positioned aside with only the bolt removed.

   Remove the transmission fluid level indicator tube bolt and position the tube aside.

    - To install, tighten to 8 Nm (71 lb-in).

All vehicles



9. Remove the brake booster push rod pin and clip and disconnect the push rod from the brake pedal.
10. *NOTICE:* **Use only hand tools to remove the fasteners or damage to the booster may occur.**

    Remove the 4 nuts and the brake booster

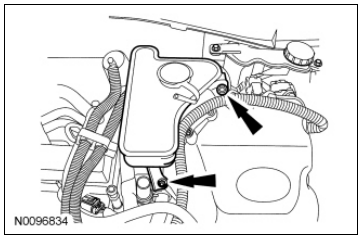
11. ***NOTICE:*** **Prior to installation, make sure that the distance between the booster mating surface and the push rod center point is as shown or reduced brake assist may occur.**

    To install, reverse the removal procedure.

    - Check for correct booster push rod distance and adjust as necessary.
        - ♦ Tighten the booster push rod jam nut to 17 Nm (150 lb-in).

12. ***NOTICE:*** **Use only hand tools to install the fasteners or damage to the booster may occur.**

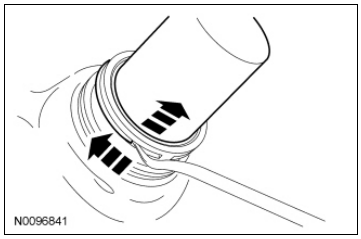
    Tighten the brake booster nuts to 23 Nm (17 lb-ft) in the sequence shown.



Brake Booster Travel Sensor - Hybrid

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Removal and Installation

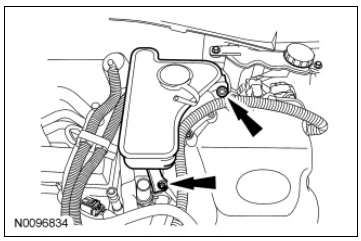
1. Remove the Motor Electronics Cooling System (MECS) expansion tank nut and bolt, position the tank aside.
    - To install, tighten the nut and bolt to 12 Nm (106 lb-in).

2. Disconnect the brake booster travel sensor electrical connector.

3. Release the brake booster travel sensor retainer ring and remove the travel sensor.

4. To install, reverse the removal procedure.

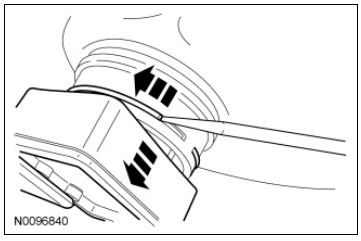
5. Following the scan tool instructions, carry oue Multi-Calibration Routine.



Brake Booster Vacuum Sensor - Hybrid

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Removal and Installation

1. Remove the Motor Electronics Cooling System (MECS) expansion tank nut and bolt, position the tank aside.
    - To install, tighten the nut and bolt to 12 Nm (106 lb-in).

2. Disconnect the brake booster vacuum sensor electrical connector.

3. Release the brake booster vacuum sensor retainer ring and remove the vacuum sensor.

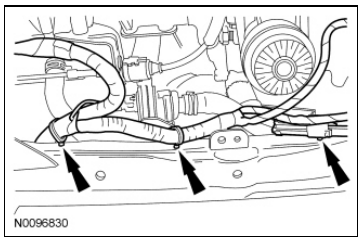
4. To install, reverse the removal procedure.

5. Following the scan tool instructions, carry oue Multi-Calibration Routine.

Brake Booster Vacuum Sensor - Non-Hybrid

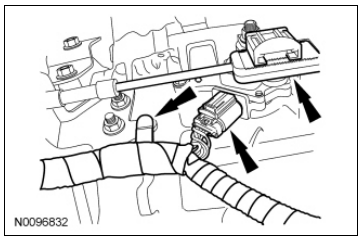
1. Remove the battery. For additional information, refer to Section 414-01 .

2. Remove the 2 brake fluid remote reservoir nuts and position the reservoir aside.
   - To install, tighten the nuts to 7 Nm (62 lb-in).



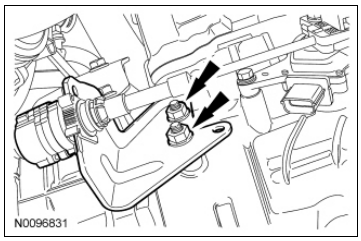
3. Disconnect the vacuum sensor electrical connector and remove the vacuum sensor.

4. To install, reverse the removal procedure.

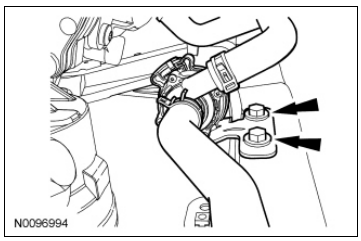


Brake Vacuum Pump

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

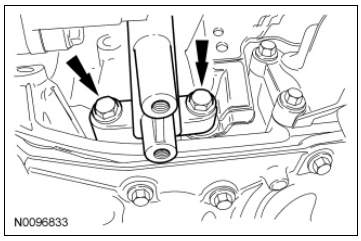


2. Detach the 3 wiring harness retainers from the subframe.

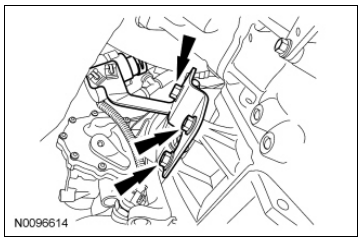


3. Disconnect the electrical connector and the selector lever cable.
   - Detach the harness retainer and position harness aside.

4. Remove the 2 transmission selector lever cable bracket nuts and position cable and bracket aside.
   - To install, tighten the nuts to 23 Nm (17 lb-ft).



5. Remove the Motor Electronics Cooling System (MECS) coolant pump bolts and position the pump aside.
   - To install, tighten the bolts to 20 Nm (177 lb-in).



6. Remove the 2 lower A/C compressor bolts.
   - To install, tighten to 25 Nm (18 lb-ft).

7. Remove the 2 A/C compressor bracket bolts and the bracket.
    - To install, tighten the bolts to 25 Nm (18 lb-ft).

8. Remove the 3 auxiliary coolant pump bracket bolts and position the auxiliary coolant pump aside.
    - To install, tighten the bolts to 25 Nm (18 lb-ft).

9. Disconnect the vacuum pump electrical connector.

10. Remove the vacuum pump bracket nut.
    - To install, tighten to 25 Nm (18 lb-ft).

11. Remove the vacuum pump bracket bolt.
    - To install, tighten the bolts to 25 Nm (18 lb-ft).
    - Position the vacuum pump to release the clamp, detach the vacuum hose and remove the vacuum pump.

12. To install, reverse the removal procedure.

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	590-790 ml (1.24-1.67 pt) [a]

[a] Actual brake fluid capacity will vary depending on vehicle options.

Torque Specifications

Description	Nm	lb-ft	lb-in
ABS module screws - Hybrid [a]	-	-	-
ABS module screws - Non-hybrid	2	-	18
Degas bottle hose nut	20	177	-
Front brake tube fittings - Hybrid	20	-	177
Front brake tube fittings - Non-hybrid	20	-	177
Front wheel speed sensor bolt	23	17	-
Front wheel speed sensor harness bracket-to-body bolt	7	-	62
Hydraulic Control Unit (HCU) bracket bolts	23	17	-
HCU bracket-to-frame bolt	23	17	-
HCU bracket-to-frame nut	23	17	-
HCU bracket-to-frame stud bolt	23	17	-
HCU bracket-to- HCU bolt	9	-	80
Master cylinder brake tube fittings - Hybrid	20	-	177
Master cylinder brake tube fittings - Non-hybrid	27	20	-
Rear brake tube fittings - Hybrid	20	-	177
Rear brake tube fittings - Non-hybrid	20	-	177
Rear wheel speed sensor bolt	23	17	
Rear wheel speed sensor harness bolt - All-Wheel Drive (AWD)	23	17	-
Rear wheel speed sensor harness nut - AWD	23	17	-
Windshield washer reservoir filler neck bolt	7	62	-

[a] Refer to the procedure for the specification.

Anti-Lock Control

ABS with AdvanceTrac® Stability Enhancement System

The ABS with AdvanceTrac® system coists of the following components:

- ABS module - attached to the Hydraulic Control Unit (HCU), but can be serviced separately from the HCU .
- Front wheel speed sensors - one sensor is located in each front wheel knuckle. The sensors are serviced separately from the knuckle.
- Front wheel speed sensor tone rings - one tone ring is located on the outer CV joint of each halfshaft and is serviced with the halfshaft.
- HCU - which contains several valves (inlet, outlet, isolation and dump) and the hydraulic pump motor. On hybrid vehicles, the HCU is mounted in the rear, RH side of the engine compartment near the RH shock tower. On all other vehicles, the HCU is mounted in the front, RH side of the engine compartment near the degas bottle.
- Rear wheel speed sensors - one sensor is located in each rear wheel knuckle, the sensors are serviced separately from the knuckle).
- Rear wheel speed sensor tone rings - on All-Wheel Drive (AWD) vehicles, one tone ring is located on the outer CV joint of each halfshaft and is serviced with the halfshaft. On Front Wheel Drive (FWD) vehicles, one tone ring is located on each rear wheel hub and is serviced with the wheel hub.
- Stability control sensors - located inside the Restraints Control Module (RCM) and consist of the following sensors: yaw rate, lateral accelerometer and longitudinal accelerometer. The sensors are integral to the RCM and cannot be serviced separately.
- Steering wheel rotation sensor - only on vehicles equipped with a 3.5L engine, the rotation sensor is located on the RH side of the clockspring and is serviced separately from the clockspring assembly. On all other vehicles, steering wheel rotation position information is sent from the Power Steering Control Module (PSCM) over the High Speed Controller Area Network (HS-CAN).
- Steering wheel rotation sensor ring - only on vehicles equipped with a 3.5L engine, the rotation sensor ring is located on the clockspring and is serviced with the clockspring assembly.
- Traction control switch - on Fusion and Milan vehicles, the switch is part of a 2 or 3 switch package (depending on vehicle options) located in the instrument panel center finish panel and is serviced separately from the finish panel. On MKZ vehicles, the switch is part of the Front Controls Interface Module (FCIM) and is serviced with the module.
- Vacuum sensor (3.0L AWD , 3.5L and hybrid) - located on the front of the brake booster in the 12 o'clock position on non-hybrid vehicles, and in the 10 o'clock position on hybrid vehicles. The sensor can be serviced separately from the booster, refer to Section 206-07 .

Anti-Lock Braking

The anti-lock braking system aids in the prevention of wheel lock-up during braking events which allows the driver to maintain control and stop in the shortest distance possible under most conditions. This is accomplished by the ABS module and HCU modulating brake fluid pressure to the affected brake caliper(s).

When the ABS activates, both of the following can occur:

- A rumble or grinding sound may be heard
- If the driver's foot is on the brake pedal, a vibration may be felt in the brake pedal

Electronic Brake Distribution (EBD)

The ABS module and HCU incorporate a strategy called Electronic Brake Distribution (EBD). The EBD strategy uses the HCU as an electronic proportioning valve to create a balanced braking condition between the front and rear wheels and minimize the chance of rear wheel lockup during hard braking.

AdvanceTrac® Stability Enhancement System

The AdvanceTrac® system is made up of 2 distinct vehicle systems: traction control and ESC .

Traction Control System

The traction control system aids in the prevention of excessive wheel spin which allows the vehicle to maintain traction during acceleration. This is accomplished by the ABS module and the HCU modulating brake fluid pressure to the affected brake caliper(s) and by the PCM modulating engine torque.

ESC System

The ESC system constantly monitors the vehicle's direction of travel relative to the driver's intended course, except when the vehicle is traveling in reverse, and aids in keeping the vehicle traveling along that course. This is accomplished by the ABS module and the HCU modulating brake fluid pressure to the affected brake caliper(s) and by the PCM modulating engine torque.

When the ABS, traction control or ESC system activates, any of the following can occur:

- A rumble or grinding sound may be heard, much like ABS
- If the driver's foot is on the brake pedal, a vibration may be felt in the brake pedal, much like ABS
- A small deceleration or a reduction in the acceleration of the vehicle
- The stability/traction control indicator (also known as the sliding car icon) flashes

Traction Control Switch

The traction control switch can be used by the driver to disable and enable the traction control portion of the AdvanceTrac® system. When the switch is pressed, the sliding car OFF icon in the Instrument Panel Cluster (IPC) illuminates The conventional ABS and the ESC system cannot be disabled through the use of the traction control switch. If a MyKeyTM restricted key is in use with AdvanceTrac® always-on feature configured to "on", the traction control system cannot be disabled. An admin key must be used in order to enable and disable the traction control system.

Stability/Traction Control Indicators

There are 2 separate sliding car icons; the sliding car OFF icon and the sliding car icon. The sliding car OFF icon is used to alert the driver that the traction control portion of the AdvanceTrac® system has been disabled by the driver. This icon only illuminates continuously and does not flash. The sliding car icon is used to alert the driver that a stability/traction event is taking place (flashes twice per second) and to alert the driver of potential concerns in the AdvanceTrac® system (illuminates solidly).

Optimized Hydraulic Braking (3.0L All-Wheel Drive (AWD) and 3.5L only)

Optimized hydraulic braking is a system built into the ABS module to aid in bringing the vehicle to a safe, controlled stop in the event of severe vacuum loss at the brake booster. The ABS module continually monitors the vacuum in the brake booster through the use of a sensor. If a loss of vacuum is detected, the ABS module activates the pump motor in the HCU to assist with vehicle braking.

Hybrid Braking System

The hybrid vehicle is equipped with a few additional components, including:

- Active brake booster - which includes the booster vacuum sensor, the active brake booster solenoid and the active brake booster travel sensor. The sensors are serviced separately from the active brake booster. The booster solenoid is not serviced separately from the active brake booster.
- Brake pedal angle sensor - located on the brake pedal bracket and can be serviced separately from the pedal bracket.
- Brake pedal feel cut-off solenoid - located on the brake pedal bracket and is serviced with the pedal bracket.
- Brake pedal feel simulator - located on the brake pedal bracket and is serviced with the pedal bracket.
- Electric vacuum pump - located in the front of the engine compartment below the intake manifold.
- Vacuum pump relays - vacuum pump operation is controlled by 1 solid state relay and 1 mechanical relay. Both relays are located in the auxiliary relay box.

Regenerative Braking

During a braking event (not an ABS or other stability control event), the regenerative braking system utilizes the electric motor portion of the Electronically Controlled Continuously Variable Transmission (eCVT) as a generator to create electrical current. This current is used to recharge the High Voltage Traction Battery (HVTB) and creates brake torque that is used in place of, or in combination with, the conventional friction brakes to slow the vehicle. The amount of brake torque provided by the electric motor is dependent upon the state-of-charge of the HVTB . When the HVTB is almost fully charged, the amount of brake torque provided is limited to avoid overcharging the HVTB and vehicle deceleration is produced by conventional friction braking alone.

Brake-By-Wire

Because much of the necessary brake torque required to stop the vehicle can be accomplished through regenerative braking, it is not always necessary to apply the conventional friction brakes. Under most normal brake applications, the ABS module applies the friction brakes as needed.

During a normal brake application, the brake pedal feel simulator allows the pressure applied to the brake pedal by the driver's foot to act against a spring instead of the brake booster push rod. The brake pedal angle sensor is mounted to the brake pedal assembly and provides the ABS module with an analog signal indicating the amount of deceleration the driver is demanding. If it is necessary for the conventional friction brakes to be applied, the ABS module applies a Pulse Width Modulated (PWM) voltage to a solenoid inside the active brake booster. The solenoid allows vacuum from either the combustion engine (if the engine is running) or the electric vacuum pump to move the booster push rod. This in turn pushes the piston in the master cylinder creating hydraulic brake pressure. If the brake pedal is applied quickly and forcefully enough, the driver can overcome the brake pedal feel simulator spring pressure, allowing a direct connection between the brake pedal, booster push rod and master cylinder.

Anti-Lock Control - Non-Hybrid

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3030-A	Rotunda Active Wheel Speed Sensor Tester 105-R0110 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operations

Anti-Lock Braking

The ABS module continuously monitors and compares the rotational speed of each wheel. This is accomplished through the use of 4 active wheel speed sensors, 1 for each wheel. The wheel speed sensors are connected to the ABS module by 2 circuits. One circuit provides voltage for sensor operation and the other circuit provides sensor input to the ABS module. As the wheels spin, the wheel speed sensor tone rings pass through the magnetic field generated by the active wheel speed sensor. This creates a square-wave signal that is sent to the ABS module to indicate individual wheel speed.

The ABS module uses a Hydraulic Control Unit (HCU) to prevent the wheels from locking up during a braking event. The HCU contains several solenoid-controlled valves, a pump motor, an accumulator and several sensors. The fluid flows through 4 normally open inlet valves inside the HCU , and through the outlet ports of the HCU to the brake calipers. If the ABS module senses that a wheel is about to lock up, based on wheel speed sensor data, the module closes the normally open inlet valve for that wheel. This prevents more fluid from getting to the brake caliper. The ABS module then reads the wheel speed sensor signal from the affected wheel again. If the wheel is still decelerating (locking up), the module opens the normally closed outlet valve. This allows a controlled amount of hydraulic pressure in the brake caliper to be relieved into the HCU accumulator. The ABS pump motor runs during an ABS braking event so that sufficient brake fluid pressure is consistently available to the HCU valves. This procedure of closing and opening valves is repeated several times per second until the speed of the affected wheel matches the speeds of the other wheels. Once this has been accomplished, the ABS module returns the solenoid valves to their normal position.

The ABS module is self-monitoring. When the ignition switch is turned to the RUN position, the ABS module carries out a preliminary electrical check of the wheel speed sensor circuitry by sending voltage through the sensor and checking for the voltage to return. At speeds above 15 km/h (9 mph), without the brake pedal being pressed, the pump motor is commanded ON for approximately one-half second to check pump motor

operation. Also, during all phases of operation while the vehicle is in motion, the ABS module checks for correct operation of the wheel speed sensors. In the event that the ABS module detects a concern, the module sets a DTC and sends a message to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) bus to illuminate the yellow ABS warning indicator, the stability/traction control indicator (also known as the sliding-car icon) and/or the red brake warning indicator. If the concern is severe enough, ABS may be disabled. Normal power-assisted braking, however, remains.

Electronic Brake Distribution (EBD)

The ABS module incorporates a strategy called Electronic Brake Distribution (EBD). The EBD strategy uses the HCU as an electronic proportioning valve. On initial application of the brake pedal, full pressure is applied to the rear brakes. The ABS module uses wheel speed input to calculate an estimated rate of deceleration. Once vehicle deceleration exceeds a certain threshold, the ABS module closes the appropriate solenoid valves in the HCU to hold the rear brake pressure constant while allowing the front brake pressure to build. This creates a balanced braking condition between the front and rear wheels and minimizes the chance of rear wheel lockup during hard braking. As the vehicle decelerates, the valves are opened to increase the rear brake pressure in proportion to the front brake pressure.

If there is a DTC in the ABS module specifically for the HCU or there are 2 or more wheel speed sensor DTCs, EBD is disabled. When EBD is disabled, the ABS warning indicator, the red brake warning indicator and the sliding-car icon illuminates.

Optimized Hydraulic Braking (3.0L All-Wheel Drive (AWD) and 3.5L only)

When the vacuum sensor in the booster indicates vacuum is below a predetermined level, a DTC is set in the ABS module. A low vacuum DTC is set after a pre-determined time, depending on driving conditions. It could take as long as 10 minutes to set the DTC with vehicle speed above 2 km/h and greater than 30% throttle. If the brake pedal is applied with low vacuum in the booster, the ABS module activates the pump motor in the HCU to assist with braking.

Refer to Section 206-07 for sensor removal and installation information.

AdvanceTrac® Stability Enhancement System

The AdvanceTrac® system provides the following stability enhancement features for certain driving situations:

- Traction Control System - helps to avoid excessive drive-wheel spin and loss of traction.
- Electronic Stability Control (ESC) System - helps to avoid skids and lateral slides.

Traction Control System

The traction control system uses the ABS and the PCM to limit wheel spin. When the ABS module detects a wheel spinning excessively, brake pressure to the appropriate brake caliper is modulated. This is accomplished by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the bus that a traction control event is taking place. When the IPC receives this message, it flashes the sliding-car icon (twice per second). If the event is severe enough, the ABS module also sends a message to the PCM over the HS-CAN bus to assist with traction control. When the PCM receives this message, it adjusts engine timing and decrease fuel injector pulses. Once the affected wheel returns to normal speed, the ABS module returns the solenoid valves in the HCU to their normal position, deactivates the hydraulic pump motor and sends another message over the HS-CAN bus indicating that the traction event has ended. The PCM returns engine timing and fuel

injectors to normal operation and the IPC extinguishes the sliding-car icon.

Once vehicle speed reaches or exceeds 100 km/h (62 mph), traction control is accomplished only through PCM intervention.

Certain DTCs in the ABS module disables the traction control system. Depending on the DTCs present, the yellow ABS warning indicator and/or the sliding-car icon is illuminated.

Electronic Stability Control (ESC) System

The ESC system is controlled by the ABS module and uses the same wheel speed sensors and tone rings that are used for anti-lock braking. The ESC system also uses input from the steering wheel rotation sensor (3.5L) or Power Steering Control Module (PSCM) (2.5L, 3.0L and Hybrid), and the stability control sensors (yaw rate, longitudinal acceleration and lateral acceleration), which are internal to the Restraints Control Module (RCM). Additional information from other modules is sent over the HS-CAN bus to help maintain vehicle stability.

The ABS module uses the various sensors to continuously monitor vehicle direction of travel relative to the driver's intended course. If the ABS module determines from all these inputs that the vehicle is unable to travel in the intended direction, it modulates brake pressure to the appropriate brake caliper(s) by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the HS-CAN bus that a stability event is taking place. When the IPC receives this message, it flashes the sliding-car icon. Under certain conditions during a stability event, the PCM may be requested to reduce engine torque as it does for traction control. Once the stability condition has been corrected, the ABS module sends another message over the HS-CAN bus indicating that the event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IPC extinguishes the sliding-car icon.

Certain DTCs being present in the ABS module may disable the ESC system. Depending on the DTCs present, the yellow ABS warning indicator and/or the sliding-car icon is illuminated.

Traction Control Switch

Unlike conventional ABS, the traction control portion of the AdvanceTrac® can be deactivated by the driver through the use of the traction control switch. The switch is hardwired to the IPC . When pressed, the switch sends a ground signal to the IPC . The IPC then sends a message over the HS-CAN bus indicating that the driver has requested that the system be deactivated and illuminates the sliding-car OFF icon. One disabled, the system remains in that state until the driver presses the switch again or the ignition key is cycled.

Stability Control Sensors

The stability control sensors for the AdvanceTrac® system consist of the yaw rate sensor, lateral accelerometer and longitudinal accelerometer. The sensors are housed in the RCM which sends sensor information to the ABS module over the dedicated Controller Area Network (CAN) bus. If any of the sensors are defective, a new RCM must be installed. Refer to Section 501-20B for additional information on the RCM .

- The yaw rate sensor measures the relative vehicle motion about the vertical axis through the vehicle center of gravity.
- The longitudinal accelerometer measures the acceleration corresponding to the force involved when the vehicle moves forward and rearward in the horizontal plane, along the centerline of the vehicle's front and rear wheels.

- The lateral accelerometer measures the acceleration that corresponds to the force involved when the vehicle moves sideways.

Lateral acceleration has 2 forms. The first is the centrifugal acceleration that is generated when the vehicletravels around in a circle. The second is the acceleration due to gravity. On level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor measures some lateral acceleration due to gravity, even though the vehicle is not moving.

Steering Wheel Position Information

On vehicles equipped with Electronic Power Assist Steering (EPAS) (2.5L, 3.0L and Hybrid vehicles), the steering wheel position information is sent to the ABS module from the PSCM along the HS-CAN bus. The PSCM calculates steering position based on motor position within the EPAS steer gear. For information on EPAS , refer to Section 211-00A .

On vehicles equipped with Hydraulic Power Assist Steering (HPAS) (3.5L vehicles only), the steering wheel rotation information is sent from the steering wheel rotation sensor. The steering wheel rotation sensor measures the rate of rotation of the steering wheel by monitoring the steering wheel rotation ring as it passes through the sensor gap. The rotation sensor uses 2 signal lines to transmit information to the ABS module about whether the steering wheel is being turned left or right and how far it is being turned. The rotation sensor does not indicate the position of the steering wheel relative to straight-ahead. The ESC system learns this position by comparing the steering wheel position with other signals and storing the position it has learned. The ESC system confirms this position and modifies it as necessary during every new driving cycle.

ABS Module Configuration

Module configuration is a scan tool process which configures specific vehicle settings in a new module. If installing a new ABS module and/or a new HCU , the ABS module must be configured. To configure the ABS module, refer to Programmable Module Installation (PMI) in Section 418-01 .

ABS Module Calibration

Non-hybrid vehicles do not require a module calibration. For module calibration information for hybrid vehicles, refer to ABS Module Calibration in Anti-Lock Control - Hybrid in this section.

Inspection and Verification

1. Verify the customer concern.
2. Verify the stoplamps operate correctly by pressing and releasing the brake pedal with the ignition switch in the ON position. If the stoplamps do not operate correctly, refer to Section 417-01 . If the stoplamps operate correctly, proceed to the next step.
3. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical

• Base brake system • Hydraulic Control Unit (HCU) • Incorrectly inflated tires • Mismatched wheels or tires on vehicle • Steering wheel rotation sensor ring • Wheel speed sensor tone ring	• ABS module • Battery Junction Box (BJB) fuse(s): ♦ 8 (40A) ♦ 10 (30A) • Electronic Power Assist Steering (EPAS) gear (2.5L and 3.0L only) • Restraints Control Modu (RCM) • Smart Junction Box (SJB) fuse 42 (10A) • Stoplamp switch • Traction control switch • Steering wheel rotation sensor (3.5L only) • Vacuum sensor (2.5L and 3.0L only) • Wheel speed sensors • Wiring, terminals or connectors

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

9. Clear the CMDTCs and carry out the self-test diagnostics for the ABS module.

10. If the DTCs retrieved are related to the concern, go to the ABS Module DTC Chart. For all other DTCs, refer to Section 419-10 .

DTC Charts

NOTE: This DTC chart applies to non-hybrid vehicles **only** . For hybrid vehicle DTCs, refer to the ABS Module DTC Chart in Anti-Lock Control - Hybrid in this section.

ABS Module DTC Chart

DTCs	Description	Action
B1342	ECU is Faulted	CLEAR the DTCs. CYCLE the ignition switch. REPEAT the self-test. RETRIEVE the DTCs. If other DTCs are retrieved, ADDRESS those DTCs before addressing DTC B1342. If only DTC B1342 is returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section.
B83	Brake Pedal Input Open Circuit	GO to Pinpoint Test A .
B1676	Battery Pack Voltage Out of Range	GO to Pinpoint Test B .
B2477	Module Configuration Failure	CLEAR the DTCs. REPEAT the self-test. If DTC B2477 is retrieved again, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test.
B2900	VIN Mismatch	**NOTE:** This DTC is usually set when a new ABS module is installed. GO to Pinpoint Test H .
C1095	ABS Hydraulic Pump Motor Circuit Failure	GO to Pinpoint Test E .
C109D	Low Vacuum Condition	GO to Pinpoint Test K .
C109E	Vacuum Sensor Circuit Fault	GO to Pinpoint Test K .
C109F	Vacuum Sensor Signal Fault	GO to Pinpoint Test K .
C1145	Wheel Speed Sensor RF Input Circuit Failure	GO to Pinpoint Test C .
C1155	Wheel Speed Sensor LF Input Circuit Failure	GO to Pinpoint Test C .
C1165	Wheel Speed Sensor RR Input Circuit Failure	GO to Pinpoint Test C .
C1175	Wheel Speed Sensor LR Input Circuit Failure	GO to Pinpoint Test C .
C1233	Wheel Speed LF Signal Fault	GO to Pinpoint Test D .
C1234	Wheel Speed RF Signal Fault	GO to Pinpoint Test D .
C1235	Wheel Speed RR Signal Fault	GO to Pinpoint Test D .

C1236	Wheel Speed LR Signal Fault	GO to Pinpoint Test D .
C1277	Steering Wheel Angle 1 and 2 Circuit Failure	GO to Pinpoint Test F .
C1278	Steering Wheel Angle 1 and 2 Signal Faulted	GO to Pinpoint Test F .
C1280	Yaw Rate Sensor Signal Fault	**NOTE:** The yaw rate sensor is integral to the Restraints Control Module (RCM) and cannot be serviced separately. If a new yaw rate sensor is needed, a new RCM must be installed. REFER to Restraints Control Module (RCM) Removal and Installation in Section 501-20B . ADHERE to all safety warnings in the procedure. INSPECT the RCM for damage. VERIFY that all RCM fasteners are tightened to their correct specification. CLEAR the DTCs. TEST DRIVE the vehicle at speeds above 20 km/h (12 mph). REPEAT the self-test. If DTC C1280 returns, INSTALL a new RCM . REFER to Section 501-20B .
C1282	Lateral Accelerometer Signal Fault	**NOTE:** The lateral acceleration sensor is integral to the RCM and cannot be serviced separately. If a new lateral acceleration sensor is needed, a new RCM must be installed. REFER to Restraints Control Module (RCM) Removal and Installation in Section 501-20B . ADHERE to all safety warnings in the procedure. INSPECT the RCM for damage. VERIFY that all RCM fasteners are tightened to their correct specification. CLEAR the DTCs. TEST DRIVE the vehicle at speeds above 20 km/h (12 mph). REPEAT the self-test. If DTC C1282 returns, INSTALL a new RCM . REFER to Section 501-20B .
C1288	Pressure Sensor Main/Primary Input Circuit Failure	GO to Pinpoint Test I .
C1440	Pressure Sensor Main/Primary Signal Faulted	GO to Pinpoint Test I .
C1470	TCS Function Temporarily Disabled (Thermal Brake Protection) [a]	ALLOW the brake fluid time to cool. CLEAR the DTC. TEST DRIVE the vehicle and VERIFY traction control system operation.
C1805	Mismatched PCM and/or ABS-TC Module [b]	GO to Pinpoint Test H .
C1963	Stability Assist Inhibit Warning	**NOTE:** This DTC cannot clear until the vehicle has been driven above 48 km/h (30 mph) with input from the steering wheel rotation sensor. **NOTE:** REPAIR all other non-communication DTCs before repairing DTC C1963. GO to Pinpoint Test F .
C1991	Module Calibration Failure	CLEAR the DTCs. CYCLE the ignition switch. REPEAT the self-test.

		RETRIEVE the DTCs. If DTC C1991 is present, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section.
C1996	Active Yaw and/or Roll Control Disabled	GO to Pinpoint Test J .
C2770	Longitudinal Acceleration Sensor Signal Fault	**NOTE:** The longitudinal acceleration sensor is integral to the RCM and cannot be serviced separately. If a new longitudinal acceleration sensor is needed, a new RCM must be installed. REFER to Restraints Control Module (RCM) Removal and Installation in Section 501-20B . ADHERE to all safety warnings in the procedure. INSPECT the RCM for damage. VERIFY that all RCM fasteners are tightened to their correct specification. CLEAR the DTCs. TEST DRIVE the vehicle at speeds above 20 km/h (12 mph). REPEAT the self-test. If DTC C2770 returns, INSTALL a new RCM . REFER to Section 501-20B .
C2777	Sensor Cluster Bus Failure	GO to Pinpoint Test G .
U0001	HS-CAN Communication Bus	REFER to Section 418-00 to diagnose the HS-CAN bus.
U0100	Lost Communication With ECM /PCM	REPAIR all other DTCs first. If DTC U0100 is still present, REFER to Section 418-00 to diagnose the HS-CAN bus.
U0101	Lost Communication With TCM	REPAIR all other DTCs first. If DTC U0101 is still present, REFER to Section 418-00 to diagnose the HS-CAN bus.
U0114	Lost Communication With Four-Wheel Drive (4WD) Clutch Control Module	REPAIR all other DTCs first. If DTC U0114 is still present, REFER to Section 418-00 to diagnose the HS-CAN bus.
U0140	Lost Communication with Body Control Module	REPAIR all other DTCs first. If DTC U0140 is still present, REFER to Section 418-00 to diagnose the HS-CAN bus.
U0151	Lost Communication With Restraints Control Module (RCM)	GO to Pinpoint Test G .
U0155	Lost Communication With Instrument Panel Cluster (IPC) Control Module	REPAIR all other DTCs first. If DTC U0155 is still present, REFER to Section 418-00 to diagnose the HS-CAN bus.
U0401	Invalid Data Received From ECM /PCM	VERIFY the correct ABS module configuration. VERIFY that the correct Vehicle Identification Number (VIN) is programmed to the PCM. CARRY OUT the PCM self-test, RETRIEVE and RECORD any DTCs. REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
U0402	Invalid Data Received From TCM	VERIFY the correct ABS module configuration. VERIFY that the correct VIN is programmed to the PCM. CARRY OUT the PCM self-test, RETRIEVE and RECORD any DTCs. REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
U0414	Invalid Data Received From Four-Wheel Drive (4WD) Clutch Control Module	VERIFY the correct ABS module configuration. VERIFY that the correct VIN is programmed to the PCM. CARRY OUT the on-demand self test for the 4x4 Control Module, RETRIEVE and RECORD any DTCs. REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

U0452	Invalid Data Received From Restraints Control Module (RCM)	GO to Pinpoint Test G .
U1901	CAN Network #2 Communication Bus Fault	GO to Pinpoint Test G .
U2050	No Application Present	VERIFY that the ABS module installed is the correct module for the vehicle configuration. If the ABS module is OK, CLEAR the DTCs. CARRY OUT the self-test, RETRIEVE and RECORD any DTCs. If DTC U2050 is retrieved again, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: DTC B1483

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

When the brake pedal is pressed, the Brake Pedal Position (BPP) switch opens, this interrupts a voltage signal that is sent to the PCM. When the PCM detects this interruption, it sends a message over the High Speed Controller Area Network (HS-CAN) bus indicating that the brake pedal has been pressed. The PCM uses the BPP switch information for the speed control system. The ABS module receives the BPP switch information

from the PCM over the HS-CAN bus.

The BPP is also known as the stoplamp switch.

- DTC B1483 (Brake Pedal Input Open Circuit) - The ABS module compares the BPP message against other inputs (brake pressure and wheel speed) and if the message does not match the other inputs and there are no DTCs present for those inputs, DTC B1483 is set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- BPP switch
- PCM
- ABS module

PINPOINT TEST A: DTC B1483

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE ABS MODULE DTCs	
• Review the DTCs recorded during Inspection and Verification. • **Were any wheel speed sensor DTCs retrieved?**	**Yes** For DTC C1145, C1155, C1165 or C1175, GO to Pinpoint Test C . For DTC C1233, C1234, C1235 or C1236, GO to Pinpoint Test D . **No** GO to A2 .
A2 CHECK FOR PCM DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: KOEO Self Test - PCM. • Retrieve and record any PCM DTCs. • **Are any DTCs present in the PCM?**	**Yes** REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** GO to A3 .
A3 CHECK THE ABS MODULE DTCs	
• Review the DTCs recorded during Inspection and Verification. • **Are DTCs U0100 and/or U0401 also present?**	**Yes** DIAGNOSE DTCs U0100 and/or U0401 before diagnosing B1483. REFER to the ABS Module DTC Chart. **No** If DTCs C1288 and/or C1440 are present, GO to Pinint Test I . If no other DTCs are present, GO to A4 .
A4 CHECK THE ABS MODULE BRAKE ON/OFF (BOO_ABS) PID	

• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • Monitor the BOO_ABS PID while pressing and releasing the brake pedal. • **Does the PID agree with the pedal position?**	**Yes** The system is operating correctly at this time. CLEAR the DTC. REPEAT the self-test. **No** GO to A5 .
A5 CHECK THE PCM BOO1 PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • Monitor the BOO1 PID while pressing and releasing the brake pedal. • **Does the PID agree with the pedal position?**	**Yes** REFER to to diagnose the communication concern. **No** REFER to Section 419-03 and diagnose the speed control deactivation switch.

Pinpoint Test B: DTC B1676

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

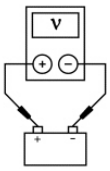
The operating voltage required to supply the ABS module, hydraulic pump and isolation valves is in a range between 10 and 16 volts.

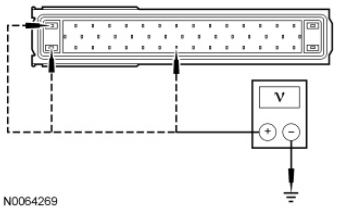
Fused battery voltage is supplied to the ABS module from the Battery Junction Box (BJB). Fused ignition voltage is supplied to the ABS module from the Smart Junction Box (SJB).

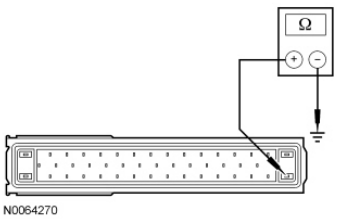
- DTC B1676 (Battery Pack Voltage Out of Range) - If during normal operation, the vehicle battery voltage becomes less than 9.7 volts for more than 210 ms with vehicle speed greater than 20 km/h (12 mph), or the vehicle battery voltage becomes greater than 18 volts at any time, DTC B1676 is set. Also, if during the ABS module self-test the vehicle battery voltage becomes higher than 18 volts, DTC B1676 sets.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Charging system
- ABS module







PINPOINT TEST B: DTC B1676

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: DTC B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
B1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - All CMDTCs . • **Is DTC B1317, B1318 or B1676 present in one or more modules AND DTC P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** GO to B2 .
B2 CHECK BATTERY CONDITION	
• Ignition OFF. • Refer to Section 414-01 and carry out the Battery - Condition Test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test, but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR the DTCs. REPEAT the self-test. If the battery passed the condition test and did not require a recharge, GO to B3 . **No** INSTALL a new battery. REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test.
B3 CHECK CHARGING SYSTEM VOLTAGE	
NOTE: Do not allow the engine speed to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery with and without a load on the charging system as follows: ♦ Turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage. ♦ Turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes while measuring battery voltage.	**Yes** GO to B4 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR the DTCs. REPEAT the self-test.

 AJ0210-A • **Are the voltages between 13 and 15.2 volts?**	
B4 CHECK THE VOLTAGE TO THE ABS MODULE	
NOTE: The degas bottle may need to be positioned aside to access the ABS module connector. • Ignition OFF. • Disconnect: ABS Module C135. • Ignition ON. • Measure the voltage between ground and: ♦ ABS module C135-1, SBB08 (VT/RD), harness side. ♦ ABS module C135-8, CBP42 (GN), harness side. ♦ ABS module C135-32, SBB10 (YE/RD), harness side.  N0064269 • **Are the voltages greater than 10 volts?**	**Yes** GO to B5 . **No** VERIFY BJB fuse 8 (40A) is OK. If OK, REPAIR circuit SBB08 (VT/RD). VERIFY SJB fuse 42 (10A) is OK. If OK, REPAIR circuit CBP42 (GN). VERIFY BJB fuse 10 (30A) is OK. If OK, REPAIR circuit SBB10 (YE/RD). If any fuse is not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test.
B5 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ABS module C135-16, circuit GD123 (BK/GY), harness side and ground.  N0064270 • **Is the resistance less than 5 ohms?**	**Yes** CLEAR the DTCs. REPEAT the self-test. If DTC B1676 is retrieved again, GO to B6 . **No** REPAIR circuit GD123 (BK/GY). CLEAR the DTCs. REPEAT the self-test.
B6 CHECK FOR CORRECT ABS MODULE OPERATION	
• Check ABS module C135 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals.	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs.

• Connect: ABS Module C135. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTCs C1145, C1155, C1165 and C1175

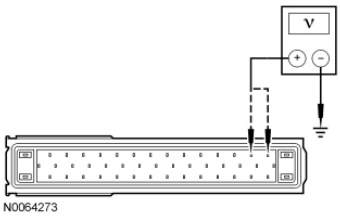
Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

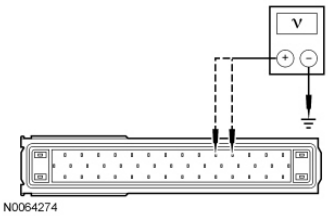
Normal Operation

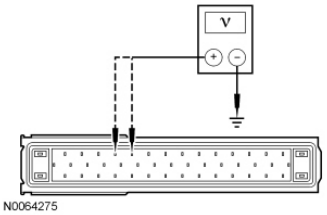
Active wheel speed sensors generate a square wave signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module through 2 wires and a connector at each wheel speed sensor. When the ignition switch is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage through the wheel speed sensors and their circuitry.

DTC Description	Fault Trigger Condition
• C1145 - RF Wheel Speed Sensor Input Circuit Failure • C1155 - LF Wheel Speed Sensor Input Circuit Failure • C1165 - RR Wheel Speed Sensor Input Circuit Failure • C1175 - LR Wheel Speed Sensor Input Circuit Failure	If, during the ABS module on-demand self test or during normal operation, the ABS module detects an open, short to ground or voltage or a defecti speed sensor input circuit, the appropriate DTC is set. These DTCs are usually set by a damaged sensor or a circuit fault.

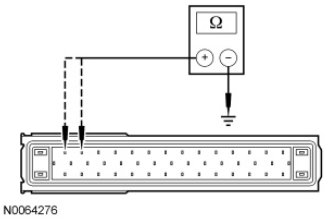
This pinpoint test is intended to diagnose the following:

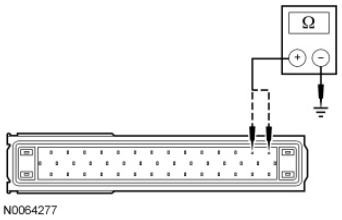


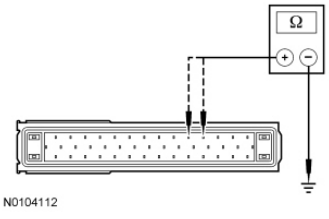




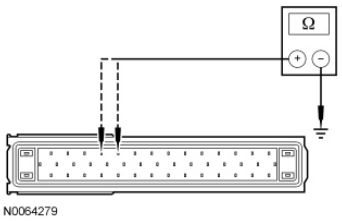
- Wiring, terminals or connectors
- Wheel speed sensor ring (part of the wheel bearing and hub assembly)
- Wheel speed sensors
- ABS module







PINPOINT TEST C: DTCs C1145, C1155, C1165 AND C1175



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK FOR FAULT REPEATABILITY	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear the ABS module DTCs. • Drive the vehicle at least 16 km/h (10 mph). • Retrieve and record the ABS module DTCs. • **Is DTC C1145, C1155, C1165 or C1175 retrieved?**	**Yes** For DTC C1145 or C1155, if the Rotunda Active Wheel Speed Sensor Tester is available, GO to C2 . For DTC C1165 or C1175, or if the Rotunda Active Wheel Speed Sensor Tester is not available, GO to C4 . **No** INSPECT the wheel speed sensors, wheel speed sensor wiring and wheel speed sensor tone rings. REPAIR or INSTALL new as necessary. If any other DTCs are retrieved, GO to the ABS Module DTC Chart.
C2 CHECK THE ABS MODULE OUTPUT USING THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
NOTE: The front wheel speed sensor electrical connectors are located behind the wheel well splash shields. The rear wheel speed sensor electrical connectors are located under the rear seat cushion. • Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor. • Connect the Rotunda Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Ignition ON. • Select the correct system polarity on the Rotunda Active Wheel Speed Sensor Tester and turn the power switch to the ON position. • **Is the module output LED illuminated?**	**Yes** GO to C3 . **No** GO to C6 .
C3 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the Rotunda Active Wheel Speed Sensor Tester, slowly spin	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

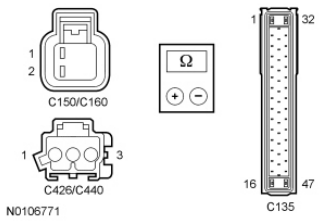
the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front or Wheel Speed Sensor - Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green, but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. If tone ring is OK, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front or Wheel Speed Sensor - Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the self-test.
C4 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
NOTICE: **No measurements should be taken with the wheel speed sensor connected. Damage to the wheel speed sensor results.** **NOTE:** Both circuits must be checked for each DTC. **NOTE:** The degas bottle may need to be positioned aside to access the ABS module connector. **NOTE:** The front wheel speed sensor electrical connectors are located behind the wheel well splash shields. The rear wheel speed sensor electrical connectors are located under the rear seat cushion. • Ignition OFF. • Disconnect: ABS Module C135. • Disconnect: Suspect Wheel Speed Sensor. • Ignition ON. • **For DTC C1145** , measure the voltage between ground and: ♦ ABS module C135-34, circuit VCA05 (GY/VT), harness side. ♦ ABS module C135-33, circuit RCA19 (VT), harness side.	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to C5 .

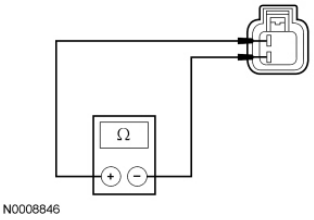
• **For DTC C1155** , measure the voltage between ground and: ♦ ABS module C135-45, circuit VCA03 (VT/WH), harness side. ♦ ABS module C135-46, circuit RCA17 (YE), harness side.  N0064273 • **For DTC C1165** , measure the voltage between ground and: ♦ ABS module C135-43, circuit VCA06 (WH/OG), harness side. ♦ ABS module C135-42, circuit RCA20 (BN), harness side.  N0064274 • **For DTC C1175** , measure the voltage between ground and: ♦ ABS module C135-36, circuit VCA04 (BU/OG), harness side. ♦ ABS module C135-37, circuit RCA18 (BN/GN), harness side.  N0064275 • **Is any voltage present?**	
C5 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO GROUND	

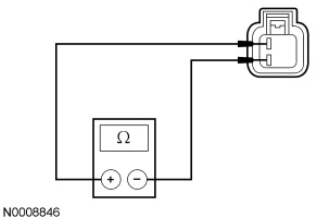
NOTE: Both circuits must be checked for each DTC. • Ignition OFF. • **For DTC C1145** , measure the resistance between ground and: ♦ ABS module C135-34, circuit VCA05 (GY/VT), harness side. ♦ ABS module C135-33, circuit RCA19 (VT), harness side.  N0064276 • **For DTC C1155** , measure the resistance between ground and: ♦ ABS module C135-45, circuit VCA03 (VT/WH), harness side. ♦ ABS module C135-46, circuit RCA17 (YE), harness side.  N0064277 • **For DTC C1165** , measure the resistance between ground and: ♦ ABS module C135-43, circuit VCA06 (WH/OG), harness side. ♦ ABS module C135-42, circuit RCA20 (BN), harness side.  N0104112 • **For DTC C1175** , measure the resistance between ground and: ♦ ABS module C135-36, circuit VCA04 (BU/OG), harness side. ♦ ABS module C135-37, circuit RCA18 (BN/GN), harness side.	**Yes** GO to C6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

- **Are the resistances greater than 10,000 ohms?**

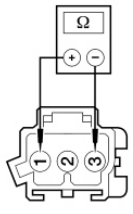
C6 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN

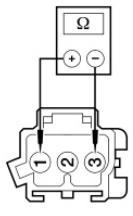


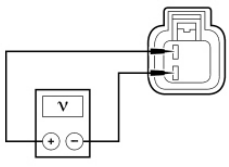




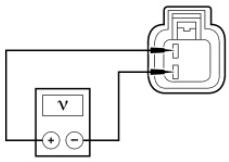
NOTE: Both circuits must be checked for each DTC.

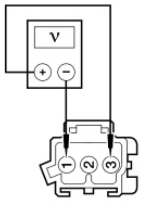


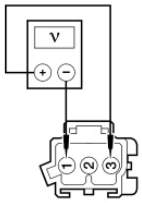




- Ignition OFF.
- Disconnect: ABS Module C135.
- Disconnect: Suspect Wheel Speed Sensor.
- Measure the resistance between ABS module C135, harness side and the suspect wheel speed sensor connector, harness side as indicated in the following chart:







ABS Module	Circuit	Wheel Speed Sensor
DTC C1145		
C135-34	VCA05 (GY/VT)	C160-1
C135-33	RCA19 (VT)	C160-2
DTC C1155		
C135-45	VCA03 (VT/WH)	C150-1
C135-46	RCA17 (YE)	C150-2
DTC C1165		
C135-43	VCA06 (WH/OG)	C426-3
C135-42	RCA20 (BN)	C426-1
DTC C1175		
C135-36	VCA04 (BU/OG)	C440-3
C135-37	RCA18 (BN/GN)	C440-1

Yes
GO to C7 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the ABS self-test.

 • **Are the resistances less than 5 ohms?**	
C7 CHECK FOR SHORTED WHEEL SPEED SENSOR CIRCUITS	
• **For DTC C1145** , measure the resistance between: ♦ RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.  • **For DTC C1155** , measure the resistance between: ♦ LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.  • **For DTC C1165** , measure the resistance between: ♦ RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.	**Yes** GO to C8 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

 N0086936 • **For DTC C1175** , measure the resistance between: ♦ LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.  N0086936 • **Are the resistances greater than 10,000 ohms?**	
C8 CHECK THE ABS MODULE OUTPUT	
• Connect: ABS Module C135. • Ignition ON. • **For DTC C1145** , measure the voltage between: ♦ RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.  N0086939 • **For DTC C1155** , measure the voltage between: ♦ LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.	**Yes** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front , Wheel Speed Sensor - Rear, All Wheel Drive (AWD) or Wheel Speed Sensor - Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to C9 .

 N0086939 • **For DTC C1165** , measure the voltage between: ♦ RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.  N0106658 • **For DTC C1175** , measure the voltage between: ♦ LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.  N0106658 • **Are the voltages greater than 10 volts?**	
C9 CHECK FOR CORRECT ABS MODULE OPERATION	
• Ignition OFF. • Disconnect: ABS Module C135. Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C135. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTCs C1233, C1234, C1235 and C1236

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The wheel speed sensor and sensor ring generate a square wave signal to the ABS module that is proportional to the wheel speed. The ABS module compares the wheel speed inputs from all the wheel speed sensors to determine an impending wheel lockup.

DTC Description	Fault Trigger Condition
• C1233 - LF Wheel Speed Sensor Signal Fault • C1234 - RF Wheel Speed Sensor Signal Fault • C1235 - RR Wheel Speed Sensor Signal Fault • C1236 - LR Wheel Speed Sensor Signal Fault	If the ABS module does not receive a signal from a wheel speed sensor when the vehicle speed is greater than 15 km/h (9 mph), the appropriate DTC is set. If the difference of 2 wheel speed values is greater than 25 km/h (16 mph), the appropriate DTC sets. These DTCs are usually set by a damaged wheel speed sensor or damaged sensor tone ring, they can also be set by wheels and/or tires of different sizes being installed on the vehicle or a difference in tire pressures.

This pinpoint test is intended to diagnose the following:

- Mismatched tire sizes
- Wheel speed sensor ring (part of the wheel bearing and hub assembly)
- Wheel speed sensor
- ABS module

PINPOINT TEST D: DTCs C1233, C1234, C1235 AND C1236

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE DTCs FROM THE SELF-TEST	
• Review the DTCs recorded during Inspection and Verification.	**Yes** GO to Pinpoint Test C . **No**

• **Are DTCs C1145, C1155, C1165 or C1175 present?**	GO to D2 .

D2 CHECK THE TIRES SIZE AND PRESSURE

• Verify that the tires are the correct size for the vehicle as indicated on the Vehicle Certification (VC) label. • Verify that the air pressure in all the tires is correct as indicated on the VC label. • **Are the wheels and tires OK?**	**Yes** GO to D3 . **No** INSTALL the correct tires or ADJUST tire pressure as necessary. CLEAR the DTCs. TEST the system for normal operation.

D3 INSPECT THE WHEEL SPEED SENSOR MOUNTING

• Ignition ON. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Inspect the suspect wheel speed sensor for looseness. • **Is the wheel speed sensor loose?**	**Yes** TIGHTEN the wheel speed sensor to specification. REFER to Specifications in this section. CLEAR the DTCs. GO to D4 . **No** GO to D5 .

D4 RECHECK THE WHEEL SPEED PIDs

• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • Monitor the following PIDs while iving the vehicle at a constant speed: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **Are all the wheel speed sensor PID values similar?**	**Yes** The vehicle is OK. The concern may have been caused by a loose wheel speed sensor. **No** GO to D5 .

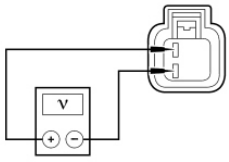
D5 INSPECT THE WHEEL SPEED SENSOR FOR DAMAGE

• **NOTE:** Examine the wheel speed sensor wire carefully with a good light source. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component. • Inspect the suspect wheel speed sensor for general damage. • **Is the wheel speed sensor OK?**	**Yes** GO to D6 . **No** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front , Wheel Speed Sensor - Rear, Front Wheel Drive (FWD) or Wheel Speed Sensor - Rear, All Wheel Drive (AWD) in this section. CLEAR the DTCs. REPEAT the self-test.

D6 INSPECT THE WHEEL SPEED SENSOR RING AND WHEEL BEARING FOR DAMAGE

• Inspect the wheel bearing for damage. • Inspect the suspect wheel speed sensor ring for damaged or missing teeth. Rotate the wheel to verify that no teeth are missing. • **Is the wheel speed sensor ring and wheel bearing OK?**	**Yes** If the Active Wheel Speed Sensor Tester is available, GO to D7 . If the Active Wheel Speed Sensor Tester is not available, GO to D9 . **No** INSTALL a new front or rear wheel hub and bearing. REFER to Section 204-01 for front wheel hubs or Section 204-02 for rear wheel hubs. CLEAR the DTCs. REPEAT the self-test.

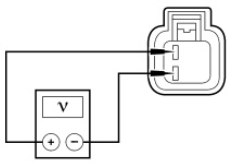
D7 CHECK THE ABS MODULE OUTPUT USING THE ACTIVE WHEEL SPEED SENSOR TESTER



• Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor. • Connect the Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Select the correct system polarity on the tester and turn the tester power switch to the ON position. • Ignition ON. • **Is the module output LED illuminated?**	**Yes** GO to D8 . **No** GO to D10 .

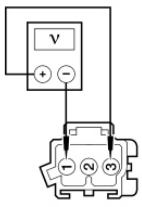
D8 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ACTIVE WHEEL SPEED SENSOR TESTER

• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the Active Wheel Speed Sensor Tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** INSPECT the wheel speed sensor tone ring for damage and looseness. INSTALL new components as necessary. If the tone ring is OK, the concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front , Wheel Speed Sensor - Rear, Front Wheel Drive (FWD) or Wheel Speed Sensor - Rear, All Wheel Drive (AWD) in this section. CLEAR the DTCs. REPEAT the self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green, but do not flash, INSPECT the wheel hub and bearing (tone ring is part of the wheel bearing). INSTALL new as necessary. If the wheel hub and bearing are OK, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front , Wheel Speed Sensor - Rear, Front Wheel Drive (FWD) or Wheel Speed Sensor - Rear, All Wheel Drive (AWD) in this



D9 ABS MODULE OUTPUT

- Ignition OFF.
- Disconnect: Suspect Wheel Speed Sensor.
- Ignition ON.
- **For DTC C1233** , measure the voltage between:
    - ♦ LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.

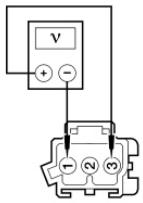


N0086939

- **For DTC C1234** , measure the voltage between:
    - ♦ RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.

N0086939

- **For DTC C1235** , measure the voltage between:
    - ♦ RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.



N0106658

section. CLEAR the DTCs. REPEAT the self-test.

Yes
INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front , Wheel Speed Sensor - Rear, Front Wheel Drive (FWD) or Wheel Speed Sensor - Rear, All Wheel Drive (AWD) in this section. CLEAR the DTCs. REPEAT the self-test.

No
GO to D10 <

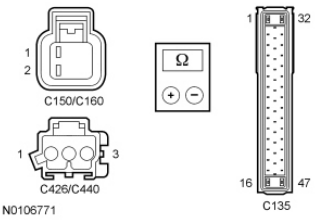
- **For DTC C1236** , measure the voltage between:
  - ♦ LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.

N0106658

- **Is the voltage greater than 10 volts?**

D10 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.



- Ignition OFF.
- Disconnect: Suspect Wheel Speed Sensor (if not previously disconnected).
- Disconnect: ABS Module C135.
- Measure the resistance between the ABS module connector, harness side and the suspect wheel speed sensor connector, harness side as indicated in the following chart:

Yes
GO to D11 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

Wheel Speed Sensor	Circuit	ABS Module
DTC C1233 - LF Wheel Speed Sensor Signal Fault		
C150-1	VCA03 (VT/WH)	C135-45
C150-2	RCA17 (YE)	C135-46
DTC C1234 - RF Wheel Speed Sensor Signal Fault		
C160-1	VCA05 (GY/VT)	C135-34
C160-2	RCA19 (VT)	C135-33
DTC C1235 - RR Wheel Speed Sensor Signal Fault		
C426-1	RCA20 (BN)	C135-42
C426-3		

	VCA06 (WH/OG)	**DTC C1236 - LR Wheel Speed Sensor Signal Fault**
C440-1	RCA18 (BN/GN)	C135-37
C440-3	VCA04 (BU/OG)	C135-36

- **Are the resistances less than 5 ohms?**

D11 CHECK FOR CORRECT ABS MODULE OPERATION

- Disconnect: ABS Module C135.
- Check for:
  - ♦ corrosion.
  - ♦ pushed-out pins.
  - ♦ spread terminals.
- Connect the ABS module connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTC C1095

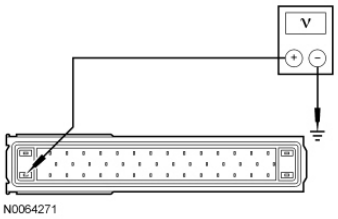
Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

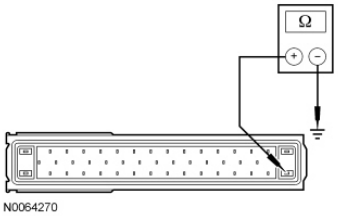
The operating voltage required to supply the hydraulic pump motor is in a range between 10 and 16 volts. Fused battery voltage for the hydraulic pump is supplied to the ABS module from Battery Junction Box (BJB). Ground for the hydraulic pump is provided through the ABS module.

- DTC C1095 (ABS Hydraulic Pump Motor Circuit Failure) - If the ABS module detects an open circuit, a short to voltage or ground or a defective internal power transistor during normal operation or the ABS module self-test, DTC C1095 sets. The ABS module commands the pump motor ON for 100 ms (±6 ms), then command the motor OFF and measure the voltage produced by the motor after 6 ms. If the voltage indicates that the motor is spinning at less than 500 rpm, there may be a locked motor. If this condition is detected 4 times, then DTC C1095 is set. The pump motor is also checked for an open circuit 2 seconds after the most recent successful pump motor off command. If the pump motor feedback remains greater than 0.75 volt for more than 50 ms (±6 ms) after these conditions have been

met, then DTC C1095 sets.



This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- Hydraulic Control Unit (HCU)
- ABS module

PINPOINT TEST E: DTC C1095

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE ABS PUMP MOTOR	
• Ignition OFF. • Ignition ON. • **Is the ABS pump motor running all the time?**	**Yes** GO to E2 . **No** GO to E3 .
E2 CHECK THE ABS MODULE CONNECTOR	
• Ignition OFF. • Disconnect: ABS Module C135. • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • **Is the connector undamaged and free of any corrosion?**	**Yes** INSTALL a new ABS module and HCU . REFER to Anti-Lock Brake System (ABS) Module and Hydraulic Control Unit (HCU) in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.
E3 CHECK THE PUMP MOTOR OUTPUT COMMAND (PMP_MOTOR)	
• Enter the following diagnostic mode on the scan tool: DataLogger - ABS. • Toggle the PMP_MOTOR output command ON. • **Does the ABS pump motor run for approximately 2 seconds?**	**Yes** TOGGLE the PMP_MOTOR output command OFF. GO to E4 . **No** TOGGLE the PMP_MOTOR output command OFF. CLEAR the DTCs. CYCLE the ignition switch. RETRIEVE and RECORD the ABS module DTCs. If DTC C1095 is retrieved, GO to E5 . For all other ABS module DTCs, GO to the ABS Module DTC Chart.
E4 CHECK FOR RETURNING ABS MODULE DTCs	

• Enter the following diagnostic mode on the scan tool: Self Test - ABS Module. • Retrieve and record the ABS module DTCs. • **Are any ABS module DTCs present?**	**Yes** If DTC C1095 is retrieved, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. CLEAR the DTCs. REPEAT the self-test. For all other ABS module DTCs, GO to the ABS Module DTC Chart. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CARRY OUT the self-test with the brake pedal not applied.
E5 CHECK THE VOLTAGE TO THE ABS MODULE	
NOTE: The degas bottle may need to be positioned aside to access the ABS module connector. • Ignition OFF. • Disconnect: ABS Module C135. • Ignition ON. • Measure the voltage between ABS module C135-1, circuit SBB08 (VT/RD), harness side and ground.  N0064271 • **Is the voltage greater than 10 volts?**	**Yes** GO to E6 . **No** VERIFY BJB fuse 8 (40A) is OK. If OK, REPAIR circuit SBB08 (VT/RD). CLEAR the DTCs. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
E6 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN	
• Measure the resistance between ABS module C135-16, circuit GD123 (BK/GY), harness side and ground.	**Yes** GO to E7 . **No** REPAIR circuit GD123 (BK/GY). CLEAR the DTCs. REPEAT the self-test.

 • **Is the resistance less than 5 ohms?**	
E7 CHECK FOR CORRECT ABS MODULE OPERATION	
• Ignition OFF. • Disconnect: ABS Module C135. • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C135. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module and HCU . REFER to Anti-Lock Brake System (ABS) Module and Hydraulic Control Unit (HCU) in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTCs C1277, C1278 and C1963

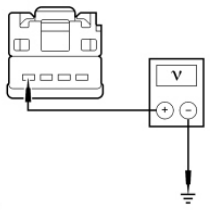
Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

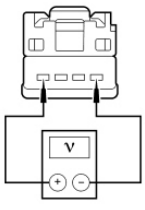
On vehicles equipped with Hydraulic Power Assist Steering (HPAS) (3.5L vehicles only), a slotted wheel is attached to the steering column inside the clockspring and the steering wheel rotation sensor is attached to the RH side of the multifunction switch just above the ignition lock cylinder. The steering wheel rotation senor has a LED and an opposing optical sensor. As the steering wheel is turned, the slotted wheel passes between the LED and the sensor, interrupting the signal and indicating how far and how fast the steering wheel is being turned. This information is sent to the ABS module and is used to help determine if the AdvanceTrac® system needs to be activated.

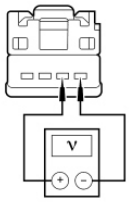
On vehicles equipped with Electronic Power Assist Steering (EPAS), the steering wheel rotation sensor is located inside the EPAS gear assembly. Rotation speed and angle are sent to the ABS module from the Power Steering Control Module (PSCM) along the High Speed Controller Area Network (HS-CAN) bus.

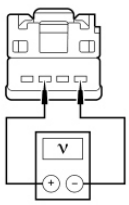
DTC Description	Fault Trigger Condition
• C1277 - Steering Wheel Angle 1 and 2 Circuit Failure (vehicles with HPAS)	If the ABS module detects an open circuit, short to voltage or short to ground during normal operation or an on-demand self test, DTC C1277 sets. An internal failure of the steering wheel rotation sensor may also cause DTC C1277 to set.



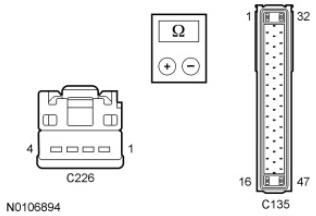
• C1277 - Steering Wheel Angle 1 and 2 Circuit Failure (vehicles with EPAS)	If the ABS module does not receive the steering wheel rotation/angle message from the PSCM for more than 5 seconds with vehicle speed above 3 km/h (2 mph), DTC C1277 sets. This could be due to a failure of the HS-CAN bus or a failure of the EPAS system, which causes other ABS module DTCs to set.
• C1278 - Steering Wheel Angle 1 and 2 Signal Faulted	If during normal operation or the ABS module on-demand self test, the ABS module does not receive the steering wheel rotation sensor input or if the input received does not agree with the input from other sensors, DTC C1278 sets.
• C1963 - Stability Assist Inhibit Warning	If conditions exist during normal operation that prevent the AdvanceTrac® system from operating, DTC C1963 sets. This DTC is usually set due to the steering wheel rotation sensor being damaged/installed incorrectly or due to invalid/missing data from the Restraints Control Module (RCM).



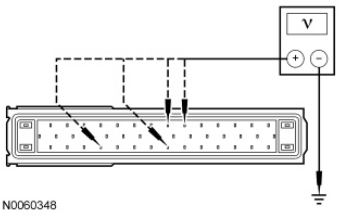


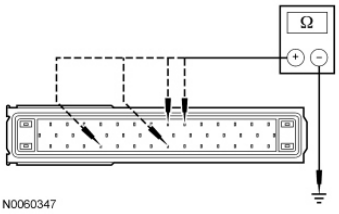


This pinpoint test is intended to diagnose the following:
- Wiriminals or connectors
- Steering wheel rotation sensor incorrectly installed
- Steering wheel rotation sensor
- ABS module

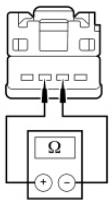


PINPOINT TEST F: DTCs C1277, C1278 AND C1963





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
F1 VERIFY THE VEHICLE STEERING SYSTEM TYPE	
• **NOTE:** Steering system type can be identified by checking for the presence of a power steering pump. Vehicles equipped with EPAS do not have a power steering pump. • Verify the type of steering system the vehicle is equipped with, HPAS or EPAS . • **Is the vehicle equipped with HPAS ?**	**Yes** GO to F4 . **No** GO to F2 .
F2 CHECK THE ABS MODULE DTCs	
• Review the DTCs retrieved during Inspection and Verification. • **Are there any communication "U-code" DTCs present in the ABS module?**	**Yes** REFER to the ABS Module DTC Chart and DIAGNOSE the U-code DTCs before diagnosing DTC C1963. **No** GO to F3 .
F3 CHECK FOR PSCM DTCs	
• Connect the scan tool.	**Yes** REFER to Section 211-00A to diagnose the EPAS

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - PSCM . • **Are there any DTCs present in the PSCM ?**	system concern. **No** GO to Pinpoint Test G .
F4 MONITOR THE STEERING ROTATION SENSOR POSITION (SWA POS) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module. • Monitor the SWA POS PID while rotating the steering wheel clockwise and counterclockwise very slowly, from lock to lock. • **Does the PID move in intervals of 1.5 degrees?**	**Yes** CLEAR the DTCs. DRIVE the vehicle above 48 km/h (30 mph) with input from the steering wheel rotation sensor. RETRIEVE the DTCs. If DTC C1277 or C1278 is still present, GO to F13 . If DTC C1963 is present, INSPECT the steering wheel rotation sensor for damage and correctnstallation. INSPECT for possible sources of light intrusion (cracked, missing or poor fitting steering shroud). REINSTALL or INSTALL new as necessary. If the sensor is OK, GO to F5 . **No** GO to F5 .
F5 CHECK THE VOLTAGE TO THE STEERING WHEEL ROTATION SENSOR	
NOTE: The steering wheel rotation sensor is located on the RH side of the multifunction switch. • Ignition OFF. • Disconnect: Steering Wheel Rotation Sensor C226. • Ignition ON. • Measure the voltage between steering wheel rotation sensor C226-4, circuit CCA40 (GY/BU), harness side and ground.  N0057967 • **Is the voltage greater than 9.5 volts?**	**Yes** GO to F6 . **No** REPAIR circuit CCA40 (GY/BU). CLEAR the DTCs. REPEAT the self-test.
F6 CHECK THE GROUND CIRCUIT FOR AN OPEN	

• Measure the voltage between steering wheel rotation sensor C226-4, circuit CCA40 (GY/BU), harness side and steering wheel rotation sensor C226-1, circuit RCA40 (BN/VT), harness side.  N0043016 • **Is the voltage greater than 9.5 volts?**	**Yes** GO to F7 . **No** REPAIR circuit RCA40 (BN/VT). CLEAR the DTCs. REPEAT the self-test.
F7 CHECK THE CHANNEL "A" CIRCUIT FOR AN OPEN OR A SHORT TO GROUND	
• Measure the voltage between steering wheel rotation sensor C226-2, circuit VCA41 (VT/GN), harness side and steering wheel rotation sensor C226-1, circuit RCA40 (BN/VT), harness side.  N0043017 • **Is the voltage between 4.75 volts and 5.25 volts?**	**Yes** GO to F8 . **No** REPAIR circuit VCA41 (VT/GN). CLEAR the DTCs. REPEAT the self-test.
F8 CHECK THE CHANNEL "B" CIRCUIT FOR AN OPEN OR A SHORT TO GROUND	
• Measure the voltage between steering wheel rotation sensor C226-3, circuit VCA42 (VT/OG), harness side and steering wheel rotation sensor C226-1, circuit RCA40 (BN/VT), harness side.  N0043018	**Yes** GO to F9 . **No** REPAIR circuit VCA42 (VT/OG). CLEAR the DTCs. REPEAT the self-test.

• **Is the voltage between 4.75 volts and 5.25 volts?**	
F9 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR AN OPEN	
NOTE: The degas bottle may need to be positioned aside to access the ABS module connector. • Ignition OFF. • Disconnect: ABS Module C135. • Disconnect: Steering Wheel Rotation Sensor C226. • Measure the resistance between ABS module C135, harness side and steering wheel rotation sensor C226, harness side using the following table: **Steering Wheel Rotation Sensor** / **Circuit** / **ABS Module** C226-1 / RCA40 (BN/VT) / C135-40 C226-2 / VCA41 (VT/GN) / C135-41 C226-3 / VCA42 (VT/OG) / C135-9 C226-4 / CCA40 (GY/BU) / C135-5  • **Are the resistances less than 5 ohms?**	**Yes** GO to F10 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
F10 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between: ♦ ABS module C135-5, circuit CCA40 (GY/BU), harness side and ground. ♦ ABS module C135-9, circuit VCA42 (VT/OG), harness side and	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to F11 .

ground. ♦ ABS module C135-40, circuit RCA40 (BN/VT), harness side and ground. ♦ ABS module C135-41, circuit VCA41 (VT/GN), harness side and ground.  N0060348 • **Is any voltage present?**	
F11 CHECK THE STEERING POSITION SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between: ♦ ABS module C135-5, circuit CCA40 (GY/BU), harness side and ground. ♦ ABS module C135-9, circuit VCA42 (VT/OG), harness side and ground. ♦ ABS module C135-40, circuit RCA40 (BN/VT), harness side and ground. ♦ ABS module C135-41, circuit VCA41 (VT/GN), harness side and ground.  N0060347 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to F12 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
F12 CHECK THE CHANNEL "A" AND "B" CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between steering wheel rotation sensor C226-2, circuit VCA41 (VT/GN), harness side and steering wheel rotation sensor C226-3, circuit VCA42 (VT/OG), harness side.	**Yes** If DTC C1963 is present, GO to Pinpoint Test G . INSTALL a new steering wheel rotation sensor. REFER to Steering Wheel Rotation Sensor in this section. CLEAR the DTCs. REPEAT the self-test.

 • **Are the resistances greater than 10,000 ohms?**	**No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
F13 CHECK FOR CORRECT ABS MODULE OPERATION	
• Ignition OFF. • Disconnect: ABS Module C135. • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C135. • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTCs C1963, C2777, U0151, U0452 and U1901

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The yaw rate sensor, lateral accelerometer and longitudinal accelerometer are contained in Restraints Control Module (RCM). The RCM measures vehicle yaw rate, lateral acceleration and longitudinal acceleration and then sends the information to the ABS module along the dedicated Controller Area Network (CAN) bus. This dedicated CAN bus is used only for communication between the RCM and the ABS module. The information sent to the ABS module is used to help determine if the AdvanceTrac® system needs to be activated.

DTC Description	Fault Trigger Conditions
• C2777 - Sensor Cluster Bus Failure • U0151 - Lost Communication With Restraints Control Module (RCM) • U1901 - CAN Network #2 Communication Bus	If, during normal operation or the ABS module on-demand self test the ABS module detects an open circuit, a short to voltage or a short to ground on one or both of the dedicated CAN bus circuits, or a failure of the RCM causes the appropriate DTC to set.

Fault	
• C1963 - Stability Control Inhibit Warning	If conditions exist during normal operation that prevent the AdvanceTrac® system from operating, DTC C1963 sets. This DTC is usually set due to the steering wheel rotation sensor or the RCM being damaged or installed incorrectly.
• U0452 - Invalid Data Received From RCM	This DTC indicates that one or more of the stability/traction control system sensors internal to the RCM have failed and the RCM is transmitting on "invalid data" message.

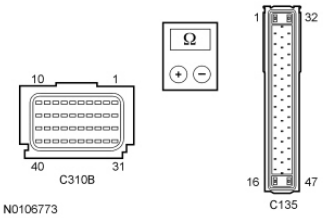
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- RCM incorrectly mounted
- RCM
- ABS module

PINPOINT TEST G: DTCs C1963, C2777, U0151, U0452 AND U1901

⚠ WARNING: Never probe the electrical connectors on airbag, Safety Canopy® or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

⚠ WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

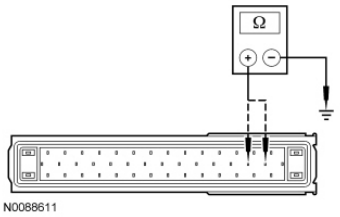


NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS .

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Test Step	Result / Action to Take
G1 CHECK FOR AN HS-CAN CONCERN WITH THE RCM	
• Connect the scan tool. • Ignition ON. • **NOTE:** The Network Test does not test the dedicated CAN communications between the ABS module and RCM . • Using the scan tool, carry out the Network Test. • **Does the RCM pass the Network Test?**	**Yes** GO to G2 . **No** REFER to Section 418-00 to diagnose the High Speed Controller Area Network (HS-CAN) concern.
G2 CHECK FOR CORRECT RCM	
• Ignition OFF.	**Yes** GO to G3 .

• **⚠ WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Gain access to the RCM and check the part number on the RCM against the part number listed in the master parts catalog. Refer to Section 501-20B . • **Does the part number on the RCM match the part number listed in the master parts catalog?**	**No** INSTALL the correct RCM . REFER to Section 501-20B . GO to G13 .
G3 CHECK FOR CORRECT ABS MODULE	
• Enter the following diagnostic mode on the scan tool: Log Viewer. • Retrieve and record the ABS module part number from Log Viewer and check the part number on the ABS module against the part number listed in the master parts catalog. • **Does the part number retrieved from the ABS module match the part number listed in the master parts catalog?**	**Yes** GO to G4 . **No** INSTALL the correct ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. GO to G13 .
G4 CHECK THE RCM CONDITION AND INSTALLATION	
• Depower the Supplemental Restraint System (SRS). Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Inspect the RCM for cracks in the case, broken anchor tabs, broken electrical connector and correct installation. Refer to Removal and Installation, Restraints Control Module (RCM) in Section 501-20B . • **Is the RCM installed correctly and undamaged?**	**Yes** GO to G5 . **No** REINSTALL or INSTALL new as necessary. GO to G13 .
G5 CHECK THE DEDICATED CAN CIRCUITS FOR AN OPEN	
• Disconnect: ABS Module C135. • Disconnect: RCM C310B. • Measure the resistance between the ABS module C135, harness side and the RCM C310B, harness side as indicated in the following chart: **ABS Module** | **Circuit** | **RCM**	**Yes** GO to G6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. CYCLE the ignition key. REPEAT the self-test. GO to G13 .

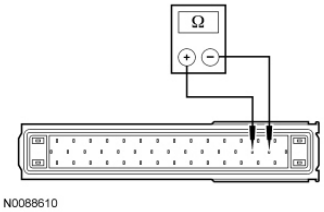


C135-18	VCA23 (BU/WH)	C310B-20
C135-19	VCA24 (GN/OG)	C310B-19

- **Are the resistances less than 5 ohms?**

G6 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO GROUND

- Measure the resistance between ground and:
  - ABS module C135-19, circuit VCA24 (GN/OG), harness side.
  - ABS module C135-18, circuit VCA23 (BU/WH), harness side.



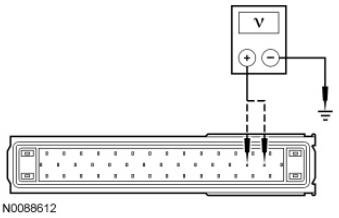
- **Are the resistances greater than 10,000 ohms?**

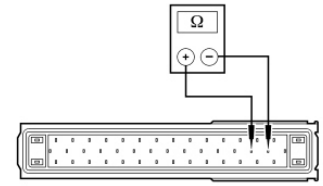
Yes
GO to G7 .

No
REPAIR the affected circuit(s). GO to G13 .

G7 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TOGETHER

- Measure the resistance between ABS module C135-19, circuit VCA24 (GN/OG), harness side and ABS module C135-18, circuit VCA23 (BU/WH), harness side.





- **Are the resistances greater than 10,000 ohms?**

Yes
GO to G8 .

No
REPAIR the affected circuit(s). GO to G13 .

G8 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO VOLTAGE

• Ignition ON. • Measure the voltage between ground and: ♦ ABS module C135-19, circuit VCA24 (GN/OG), harness side. ♦ ABS module C135-18, circuit VCA23 (BU/WH), harness side.  N0088612 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). GO to G13 . **No** GO to G9 .
G9 CHECK RCM TERMINATING RESISTOR	
• Ignition OFF. • Connect: RCM C310B. • Measure the resistance between ABS module C135-18, circuit VCA23 (BU/WH), harness side and C135-19, circuit VCA24 (GN/OG), harness side.  N0088610 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to G10 . **No** GO to G11 .
G10 CHECK THE ABS MODULE FOR CORRECT OPERATION	
• Prior to reconnecting any previously disconnected SRS component: ♦ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. ♦ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to RCM in Section 501-20B .	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. GO to G13 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. GO to G13 .

♦ inspect ABS module C135 for dirt, corrosion, water intrusion, pushed out, loose or spread terminals and loose or frayed wire connections at terminals. ♦ repair any concerns found. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component(s)/Connector(s). • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module. • **Do any of the DTCs listed in Normal Operation return?**	
G11 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs can be recorded. • If previously directed to repower the SRS , depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Prior to reconnecting any previously disconnected SRS component: ♦ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. ♦ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to RCM Removal and Installation in Section 501-20B . ♦ inspect ABS module C135 for dirt, corrosion, water intrusion, pushed out, loose or spread terminals and loose or frayed wire connections at terminals. ♦ repair any concerns found.	**Yes** INSTALL a new RCM . REFER to Section 501-20B . GO to G13 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test. b> GO to G12 .**

Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component(s)/Connector(s). • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Were DTCs U0028:08 and/or U0028:88 retrieved on-demand during self-test?**	
G12 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Disconnect RCM C310B and ABS module C135: ♦ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. ♦ repair any concerns found. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component(s)/Connector(s). • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • **Are any RCM DTCs retrieved on-demand during thself-test?**	**Yes** REFER to Diagnosis and Testing in Section 501-20B . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** GO to G13 .
G13 CHECK FOR ADDITIONAL RCM AND ABS MODULE DTCs	
• Ignition OFF.	Do not clear any DTCs until all DTCs have been

• ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - RCM . • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module. • **Were any DTCs retrieved on-demand from the RCM or ABS module during self-test?**	resolved. GO to the appropriate DTC Chart in this section and/or Section 501-20B for pinpoint test direction. **No** CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). PROVE OUT the SRS . REFER to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test H: DTCs B2900 and C1805

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

When the ignition is turned to the RUN position, the ABS module and the PCM share Vehicle Identification Number (VIN) information over the High Speed Controller Area Network (HS-CAN) bus.

- DTC B2900 (VIN Mismatched) - If the VIN information stored in the ABS module does not match the information transmitted by the PCM, DTC B2900 set.
- DTC C1805 (Mismatched PCM and/or ABS Module) - If the VIN information stored in the ABS module does not match the information transmitted by the PCM, DTC C1805 sets.

This pinpoint test is intended to diagnose the following:
- Module configuration (ABS and PCM)
- ABS module

PINPOINT TEST H: DTCs B2900 AND C1805

Test Step	Result / Action to Take
H1 VERIFY PCM VIN	&nbs
• Connect the scan tool. • Ignition ON. • Using the scan tool, carry out the Network Test.	**Yes** GO to H2 . **No** RECONFIGURE the PCM. FOLLOW the instructions on the scan tool. CLEAR the DTCs. CYCLE the ignition key. REPEAT the

• Enter the following diagnostic mode on the scan tool: Log Viewer. • Compare the VIN in Log Viewer to the vehicle VIN plate. • **Does VIN in Log Viewer match the vehicle VIN plate?**	self-test.
H2 VERIFY ABS MODULE PART NUMBER	
• Retrieve and record the ABS module part number from Log Viewer and verify that the vehicle has the correct ABS module installed. • **Is the correct ABS module installed in the vehicle?**	**Yes** CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available in Section 418-01 . CLEAR the DTC. CYCLE the ignition key. REPEAT the self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. CYCLE the ignition key. REPEAT the self-test.

Pinpoint Test I: DTCs C1288 and C1440

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The ABS module monitors the pressure of the hydraulic brake system through the use of a brake pressure transducer. The brake pressure transducer is internal to the Hydraulic Control Unit (HCU). The brake pressure transducer cannot be serviced separately. If a new brake pressure transducer is needed, a new HCU must be installed.

- DTC C1288 (Pressure Transducer Main/Primary Input Circuit Failure) - If there is an improper connection between the ABS module and HCU , if the brake pressure transducer is faulted or if the ABS module is faulted internally, this DTC sets.
- DTC C1440 (Pressure Transducer Main/Primary Signal Faulted) - If there is an improper connection between the ABS module and the HCU , if there is air in the hydraulic brake system, if the brake pressure transducer is faulted or if the ABS module is faulted internally, this DTC sets.

This pinpoint test is intended to diagnose the following:

- HCU
- ABS module

PINPOINT TEST I: DTCs C1288 AND C1440

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step h>	Result / Action to Take

I1 MONITOR THE PCM BRAKE ON/OFF (BOO) PID	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • Press and release the brake pedal while monitoring the BOO PID. • **Does the PID switch to ON with the brake pedal pressed and then to OFF with the brake pedal released?**	**Yes** GO to I2 . **No** RETRIEVE any PCM DTCs. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for non-communication DTCs and REFER to Section 418-00 for any communication DTCs.
I2 REVIEW THE ABS MODULE DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear All ABS Module DTCs. • Ignition OFF. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • Retrieve and record any ABS module DTCs. • **Is DTC C1288 or C1440 present?**	**Yes** G I4 . **No** GO to I3 .
I3 CHECK FOR RETURNING DTCs	
• Enter the following diagnostic mode on the scan tool: Clear All ABS Module DTCs. • Drive the vehicle in a straight line at a speed greater than 40 km/h (25 mph) for at least 60 seconds. • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • Retrieve and record any ABS module DTCs. • **Is DTC C1288 or C1440 present?**	**Yes** For DTC C1288, GO to I5 . For DTC C1440, GO to I4 . **No** The concern is not present at this time. For all other DTCs, REFER to the ABS Mule DTC Chart.
I4 CARRY OUT THE ABS SERVICE BLEED	
	Yes GO to I6 .

• Carry out the Brake System Service Bleed, refer to Section 206-00 . Clear the DTCs. Repeat the self-test. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear All ABS Module DTCs. • Drive the vehicle in a straight line at a speed greater than 40 km/h (25 mph) for at least 60 seconds. • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module . • **Is DTC C1288 or C1440 present?**	**No** The system is operating correctly at this time. The concern may have been caused by air trapped in the hydraulic brake system. CLEAR the DTCs. REPEAT the self-test.
I5 CHECK THE ABS TO HCU CONNECTION	
• Ignition OFF. • Disconnect: ABS Module C135. • Remove the ABS module. Refer to Anti-Lock Brake System (ABS) Module in this section. • Inspect the ABS module-to-HCU mating surfaces for damage or contamination. ♦ Inspect the 4-pin pressure sensor connector in the ABS module and on the HCU side for damage, corrosion or contamination. • **Are the ABS-to- HCU mating surfaces undamaged and free of contamination or corrosion?**	**Yes** GO to I6 . **No** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. If there is visible damage to the ABS module, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section.
I6 CHECK THE ABS MAIN BRAKE PRESSURE (MPRETDR) PID	
• If not already done, separate the ABS module from the HCU . Refer to Anti-Lock Brake System (ABS) Module in this section. • With the ABS module separated from the HCU , connect ABS module C135. • Ignition ON.	**Yes** INSTALL a new HCU . REFER Hydraulic Control Unit (HCU) in this section. CLEAR the DTCs. TEST the system for normal operation. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. TEST the system for normal operation.

• Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module . • Monitor the MPRETDR PID. • **Is the PID value between 21.13K and 22.59K?**	

Pinpoint Test J: DTC C1996

Normal Operation

The ABS module uses information (wheel speed, steering wheel position, vehicles stability) received from various sensors and modules to determine if a vehicle instability event is about to occur. If an event is going to occur, the ABS module adjusts the brake torque at specific wheels and the PCM reduces engine torque to make the vehicle more stable. Once the ABS module has determined that the stability event has been corrected, it returns brake and engine torque to normal and continues to monitor the vehicle.

- DTC C1996 (Active Yaw and/or Roll Control Disabled) - The ABS module monitors the stability event and is programmed to set DTC C1996 and disable the stability control system if the stability event lasts longer than 15 seconds.

This pinpoint test is intended to diagnose the following:

- Steering wheel rotation sensor (3.5L only)
- Restraints Control Module (RCM)
- Wheel speed sensors
- ABS module
- High Speed Controller Area Network (HS-CAN)
- Power Steering Control Module (PSCM)

PINPOINT TEST J: DTC C1996

J1 CHECK FOR ABS MODULE DTCs	
• Review the DTCs recorded during Inspection and Verification. • **Are any DTCs other than C1996 present?**	**Yes** REPAIR all other DTCs before repairing C1996. GO to the ABS Module DTC Chart in this section. **No** GO to J2 .
J2 CHECK RETURNING DTCs	
• Connect the scan tool. • Ignition ON. • Using the scan tool, clear all ABS module DTCs. • Cycle the ignition switch from RUN to	**Yes** If **only** DTC C1996 is present, GO to J3 . If DTC C1996 is present along with other DTCs, REPAIR the other DTCs before repairing DTC C1996. GO to the ABS Module DTC Chart in this section. **No**

OFF and back to RUN. • Test drive the vehicle above 49 km/h (30 mph). • Enter the following diagnostic mode on the scan tool: Self Test - ABS Module. • **Are any ABS module DTCs present?**	The condition is not present at this time.
a>**J3 CHECK THE WHEEL SPEED SENSOR PIDs**	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module . • While driving the vehicle, have an assistant monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **Do all the PIDs match the vehicle speed and match each other?**	**Yes** GO to J8 . **No** GO to J4 .
J4 INSPECT THE WHEEL SPEED SENSOR MOUNTING	
• Ignition OFF. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .	**Yes** GO to J5 . **No** TIGHTEN the wheel speed sensor bolt to specification. REFER to Specifications in this section. CLEAR the DTCs.

• Verify the bolt of the suspect wheel speed sensor is tightened to specifications. • **Is the bolt tightened to specifications?**	
J5 INSPECT THE WHEEL SPEED SENSOR AND HARNESS FOR DAMAGE	
• **NOTE:** Examine the wheel speed sensor harness carefully with a good light source. Failure to verify damage in the sensor harness can lead to unnecessary installation of a new component. • Inspect the suspect wheel speed sensor and harness for cuts, broken tabs, broken casing and/or corrosion. • **Are the wheel speed sensor and harness OK?**	**Yes** GO to J6 . **No** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front , href="SCS~us~en~file=SCS69011.HTM~gen~ref.HTM" >Wheel Speed Sensor - Rear, All Wheel Drive (AWD) or Wheel Speed Sensor - Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the self-test.
J6 INSPECT THE WHEEL SPEED SENSOR RING FOR DAMAGE	
• **NOTE:** Examine the wheel speed sensor ring carefully with a good light source. Failure to verify damage in the sensor ring can lead to unnecessary installation of a new component. • Inspect the suspect wheel speed sensor ring for cracks, chips or missing teeth. Rotate the wheel to verify that no teeth are missing. • **Is the wheel speed sensor ring OK?**	**Yes** GO to J7 . **No** INSTALL a new wheel hub and bearing assembly (wheel speed sensor rings are part of the wheel hub and bearing assembly). Refer to the appropriate section in Group 204 for the procedure. CLEAR the DTCs. REPEAT the self-test.
J7 INSPECT THE WHEEL BEARING FOR DAMAGE AND LOOSENESS	
• Verify that the wheel bearing has no end-play	**Yes** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor - Front , Wheel Speed Sensor - Rear, All Wheel Drive (AWD) or Wheel

and is undamaged. • **Is the wheel bearing OK?**	Speed Sensor - Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new wheel hub and bearing assembly. Refer to the appropriate section in Group 204 for the procedure. CLEAR the DTCs. REPEAT the self-test.
J8 CHECK THE ABS MODULE YAW RATE (YAWRATE) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the YAWRATE PID. • **Is the YAWRATE PID value between -0.05 and 0.05?**	**Yes** GO to J9 . **No** GO to J11 .
J9 CHECK THE ABS MODULE LATERAL ACCELERATION (LAT_ACCL) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the LAT_ACCL PID. • **Is the LAT_ACCL PID value between -0.4 and 0.4?**	**Yes** If the vehicle is equipped with All-Wheel Drive (AWD), GO to J10 . For all other vehicles, GO to J12 . **No** GO to J11 .
J10 CHECK THE ABS MODULE LONGITUDINAL ACCELERATION (LONG_ACCL) PID	
• **NOTE:** The vehicle must be on level ground and at a complete standstill. Any vehicle movement results in false values for this test. • Monitor the LONG_ACCL PID. • **Is the LONG_ACCL PID value between**	**Yes** GO to J12 . **No** GO to J11 .

-0.4 and 0.4?	
J11 CHECK THE RCM INSTALLATION AND MOUNTING SURFACE	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Gain access to the RCM and inspect the RCM installation. Make sure that the nuts are fully seated and tightened correctly. Refer to Section 501-20B . • Inspect the mounting surface for damage, corrosion or dirt. • **Is the RCM installed correctly and is the mounting surface clean and free from damage?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation. **No** REPAIR, REINSTALL or INSTALL new as necessary. CLEAR the DTC. REPEAT the self-test.
J12 CHECK THE STEERING WHEEL ANGLE SENSOR POSITION (SWA POS) PID	
NOTE: For all vehicles **except** those with a 3.5L engine, the steering wheel angle information is sent to the ABS module from the PSCM over the HS-CAN bus. • Monitor the SWA POS PID while rotating the steering wheel clockwise and counterclockwise very slowly, from lock to lock.	**Yes** GO to J13 . **No** For vehicles equipped with a 3.5L engine, INSTALL a new steering wheel rotation sensor. REFER to Steering Wheel Rotation Sensor in this section. CLEAR the DTCs. REPEAT the self-test. For all other vehicles, CARRY OUT a self-test of the PSCM . REFER to Section 211-00A .

• **Does the PID change in intervals of 1.5 degrees on vehicles with a 3.5L engine (intervals of 0.05-0.25 degrees on all other vehicles) and show a 360-degree increase for each complete revolution of the steering wheel?**	
J13 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C155. • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C155. • Make sure the ABS module electrical connector is fully seated, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: DTCs C109D, C109E and C109F

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The vacuum sensor is used by the ABS module to determine if hydraulic pump intervention is necessary due to loss of vacuum. The ABS module sends a 5-volt reference voltage to the sensor, the sensor compares the pressure in the booster to the ambient air pressure in the engine compartment and sends a varying voltage back to the ABS module based on the difference between the pressures. Normally, the pressure in the booster is much lower than ambient air pressure, as the pressure in the booster gets higher (closer to matching ambient air pressure), the lower the voltage sent back to the ABS module becomes.

When the vacuum in the brake booster falls below a predetermined level, the ABS module commands the hydraulic pump motor to activate on the next (and any subsequent) brake pedal application to assist with vehicle braking. The ABS module continues to use the pump motor for braking assist as long as the low vacuum condition exists.

- DTC C109D (Low Vacuum Condition Detected) - This DTC is set when the optimized hydraulic brake system is activated and does not necessarily indicate a concern with the vacuum sensor, the related wiring or the ABS module. This DTC most likely indicates a vacuum concern in the brake booster, engine and any related vacuum hoses/tubes. High altitude locations with low ambient air temperatures can cause a low vacuum condition to exist in the booster until the engine compartment warms up.
- DTC C109E (Vacuum Sensor Circuit Fault) - If, during normal operation or the ABS module on-demand self test, the ABS module detects an open circuit, a short to voltage or a short to ground on the vacuum sensor circuits, DTC C109E sets. Also, a failure of the vacuum sensor causes DTC C109E to set.
- DTC C109F (Vacuum Sensor Signal Fault) - The vacuum sensor has 4 ambient air pressure inlet ports (2 on each side). If these ports become restricted or clogged, DTC C109F sets.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Vacuum sensor
- ABS module

PINPOINT TEST K: DTCs C109D, C109E AND C109F

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.Test StepResult / Action to Take K1 CHECK THE ABS MODULE DTCs**

- Review the DTCs recorded during Inspection and Verification.
- **Was DTC C109D the only recorded DTC?**

Yes
GO to K2 .

No
If DTC C109E and/or C109F was retrieved, GO to K6 .

For all other DTCs, REFER to the ABS Module DTC Chart in this section. **K2 CHECK DTC RETURNABILITY**

- Using the scan tool, clear the ABS module DTCs.
- Ignition OFF.
- Disconnect the scan tool.
- Start the engine.
- **NOTE:** It may take up to 3 minutes for DTC C109D to set.
- Allow the vehicle to idle for a minimum of 4 minutes.
- Ignition OFF.
- Connect the scan tool.
- Ignition ON.
- Enter the following diagnostic mode on the scan tool: Self Test - ABS Module.
- **Is DTC C109D the only vacuum sensor DTC present?**

Yes
GO to K3 .

No
If DTC C109E and/or C109F was retrieved, GO to K6 .

For all other DTCs, REFER to the ABS Module DTC Chart in this section. **K3 CHECK THE ENGINE VACUUM**

- Carry out the Intake Manifold Vacuum Test, refer to Diagnosis and Testing in Section 303-00 .
- Record the vacuum reading.
- **Does the vacuum gauge indicate normal vacuum?**

Yes
GO to K4 .

No
FOLLOW the diagnostic direction as laid out in Section 303-00 . **K4 CHECK THE BRAKE BOOSTER**

- Carry out the Brake Booster Component Test, refer to Diagnosis and Testing in Section 206-00 .
- **Do the brake booster and check valve pass the component test?**

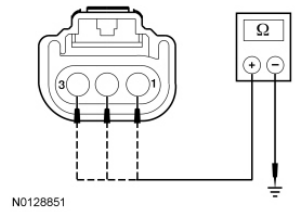
Yes
GO to K5 .

No
REPAIR or INSTALL new as necessary. CLEAR the DTC. REPEAT the self-test. **K5 CHECK THE BRAKE BOOSTER VACUUM LEVEL PID**

- Connect the scan tool.
- Start the engine.
- Enter the following diagnostic mode on the scan tool: DataLogger - ABS Module.
- Compare the recorded vacuum reading to the brake booster vacuum level PID.
- **Does the PID match the recorded vacuum reading?**

Yes
INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST The system for normal operation.

No
INSTALL a new brake booster vacuum sensor. REFER to Section 206-07 . CLEAR the DTCs. TEST the system for normal operation. **K6 CHECK THE BRAKE BOOSTER VACUUM SENSOR**



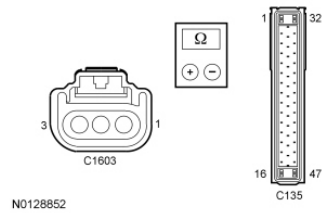
- Inspect the vacuum sensor ambient air pressure inlet ports.
- **Are all 4 ports free of contamination and/or foreign material?**

Yes
GO to K7 .

No
REPAIR or INSTALL a new vacuum sensor as necessary. REFER to Section 206-07 . CLEAR the DTCs. REPEAT the self-test. **K7 CHECK THE BRAKE BOOSTER VACUUM SENSOR CIRCUITS FOR A SHORT TO GROUND**

- Ignition OFF.
- Disconnect: ABS Module C135.
- Disconnect: Brake Booster Vacuum Sensor C1603.
- Measure the resistance between ground and:
    - ♦ brake booster vacuum sensor C1603-1, circuit VCA38 (BN/VT), harness side.

- ♦ brake booster vacuum sensor C1603-2, circuit RCA37 (WH/BU), harness side.
- ♦ brake booster vacuum sensor C1603-3, circuit LCA37 (YE/OG), harness side.



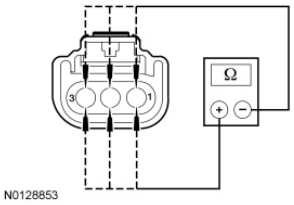
- **Are the resistances greater than 10,000 ohms?**

Yes
GO to K8 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **K8 CHECK THE BRAKE BOOSTER VACUUM SENSOR CIRCUITS FOR AN OPEN**

- Measure the resistance between the ABS module C135, harness side and the brake booster vacuum sensor C1603, harness side as indicated in the following chart:

ABS Module	Circuit	Vacuum Sensor
C135-30	VCA38 (BN/VT)	C1603-1
C135-27	RCA37 (WH/BU)	C1603-2
C135-26	LCA37 (YE/OG)	C1603-3



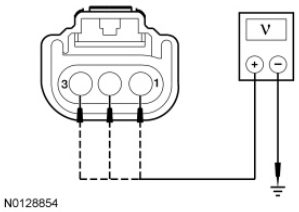
- **Are the resistances less than 5 ohms?**

Yes
GO to K9 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **K9 CHECK THE BRAKE BOOSTER VACUUM SENSOR CIRCUITS FOR A SHORT TOGETHER**

- Measure the resistance between:
  - ♦ brake booster vacuum sensor C1603-1, circuit VCA38 (BN/VT), harness side and brake booster vacuum sensor C1603-2, circuit RCA37 (WH/BU), harness side.
  - ♦ brake booster vacuum sensor C1603-1, circuit VCA38 (BN/VT), harness side and brake booster vacuum sensor C1603-3, circuit LCA37 (YE/OG), harness side.

- ♦ brake booster vacuum sensor C1603-2, circuit RCA37 (WH/BU), harness side, and brake booster vacuum sensor C1603-3, circuit LCA37 (YE/OG), harness side.



- **Are the resistances greater than 10,000 ohms?**

Yes
GO to K10 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **K10 CHECK THE ACTIVE BRAKE BOOSTER CIRCUITS FOR A SHORT TO VOLTAGE**

- Ignition ON.
- Measure the voltage between ground and:
  - ♦ brake booster vacuum sensor C1603-1, circuit VCA38 (BN/VT), harness side.
  - ♦ brake booster vacuum sensor C1603-2, circuit RCA37 (WH/BU), harness side.
  - ♦ brake booster vacuum sensor C1603-3, circuit LCA37 (YE/OG), harness side.

- **Is any voltage present?**

Yes
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

No
GO to K11 . **K11 CHECK THE ABS MODULE CONNECTORS**

- Check ABS module C135 for:
  - ♦ corrosion.
  - ♦ pushed-out pins.
  - ♦ spread terminals.
- Connect: ABS Module C135.
- Make sure the connector seats correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.

No

The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test L: Poor Vehicle Tracking During Anti-Lock Function

Normal Operation

The operating voltage required to supply the ABS module, hydraulic pump and isolation valves is in a range between 10 and 16 volts. The ABS module uses input from several different sensors (wheel speed sensors, Brake Pedal Position (BPP) switch, sensor cluster, etc.) to determine if an ABS event is necessary. If an ABS event is necessary, the ABS module commands the hydraulic pump motor on and command the Hydraulic Control Unit (HCU) to actuate the appropriate solenoids. During an ABS event, the front and rear end of the vehicle should track true to the direction of travel along the vehicle centerline unless driver input dictates otherwise, there is an internal issue with the HCU or an issue with the base brake system (caliper, tubes, etc.) that allows one or more wheels to lock up.

Fused battery voltage is supplied to the ABS module from Battery Junction Box (BJB) fuse 10 (30A) along circuit SBB10 (YE/RD) and fuse 8 (40A) along circuit SBB08 (VT/RD). Fused ignition voltage is supplied to the ABS module from Smart Junction Box (SJB) fuse 42 (10A) along CBP42 (GN) and ground is provided to the module along circuit GD123 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Base brake system
- HCU

PINPOINT TEST L: POOR VEHICLE TRACKING DURING ANTI-LOCK FUNCTION

Test Step	Result / Action to Take
L1 BLEED THE BRAKE SYSTEM	
• Bleed the brake system using the scan tool. Refer to Section 206-00 . • Test drive the vehicle. • **Does the vehicle track correctly?**	**Yes** The brake system is operating correctly. The concern may have been caused by air in the hydraulic system or a sticking valve in the HCU . **No** GO to L2 .
L2 VERIFY VEHICLE TRACKING DURING NON-ABS BRAKING	
• Test drive the vehicle and verify vehicle tracking during normal braking. • **Does the vehicle track correctly during normal braking?**	**Yes** GO to L3 . **No** The condition could be caused by a base brake component or vehicle alignment. REFER to Section 206-00 to verify base brake components and REFER to Section 204-00 to verify suspension components.
L3 CHECK THE ABS INLET VALVE (CLOSED POSITION)	
	Yes TOGGLE the LF_INLET output command OFF.

• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Rotate all the wheels to make sure they rotate freely (the transaxle must be in NEUTRAL). • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: ABS DataLogger. • Apply moderate brake pedal effort. • Toggle the left front inlet valve (LF_INLET) active command ON and at the same time, have an assistant attempt to rotate the LF wheel. • **Does the LF wheel rotate?**	GO to L4 . **No** TOGGLE the LF_INLET output command OFF. INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
L4 CHECK THE ABS INLET VALVE (OPEN POSITION)	
• Apply moderate brake pedal effort. • Have an assistant attempt to rotate the LF wheel. • **Does the LF wheel rotate?**	**Yes** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** GO to L5 .
L5 CHECK THE ABS OUTPUT VALVE (OPEN POSITION)	
• Apply moderate brake pedal effort. • **NOTE:** Each activation of the output command runs the pump for 2 seconds. • Toggle the following active commands ON: ♦ LF_INLET ♦ Left front outlet valve (LF_OUTLET) ♦ Hydraulic pump motor (PMP_MOTOR) • At the same time, have an assistant attempt to rotate the LF wheel. • **Does the LF wheel rotate?**	**Yes** TOGGLE all output commands OFF. GO to L6 . **No** TOGGLE all output commands OFF. INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation.
L6 CHECK THE ABS INLET AND OUTLET VALVE (CLOSED POSITION)	
• Apply moderate brake pedal effort. • Have an assistant attempt to rotate the LF wheel. • **Does the LF wheel rotate?**	**Yes** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** Beginning with Step L3, REPEAT this procedure for the RF, LR and RR wheels using the appropriate output commands. If no failure occurs, the system is operating normally.

Pinpoint Test M: The Stability/Traction Control System Cannot Be Disabled

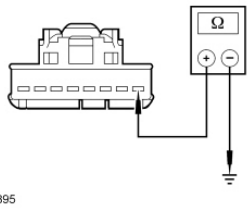
Normal Operation

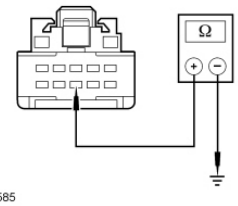
The traction control portion of the AdvanceTrac® can be disabled by pressing the traction control switch located on the instrument panel center finish panel. When the system is disabled, the sliding car OFF icon in the Instrument Panel Cluster (IPC) illuminates continuously. On MKZ vehicles, the traction control switch is part of the Front Controls Interface Module (FCIM). On Fusion and Milan vehicles, the traction control switch is part of the ambient lighting switch.

The IPC sends 5 volts to the traction control switch along circuit CCA15 (YE/GY). When the traction control switch is pressed, this voltage is sent through the switch and to ground along circuit GD116 (BK/VT). When the IPC detects this ground, it sends a message to the PCM and the ABS module along the High Speed Controller Area Network (HS-CAN) bus that the driver has disabled the system. An open circuit or a defective traction control switch prevents the system from being disabled, but does not set a DTC.

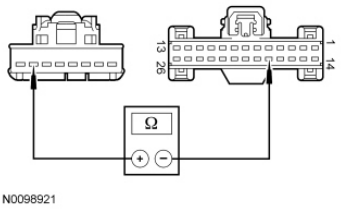
If a MyKeyTM restricted key is in use with Advance Trac® always-on feature configured to "on", the traction control system cannot be disabled. An admin key must be used irder to enable and disable the traction control system.

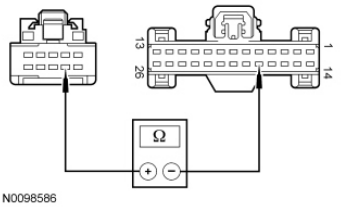
DTC C0089:11 (TCS Disable Switch: Circuit Short to Ground) - If the IPC detects the ground signal during the on-demand self test or if it is shorted to ground, DTC C0089:11 sets. Also, if the traction control switch is held or stuck closed for more than 2 minutes during normal operation, DTC C0089:11 sets.

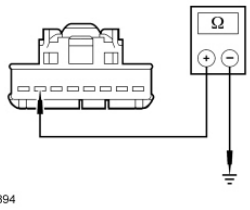


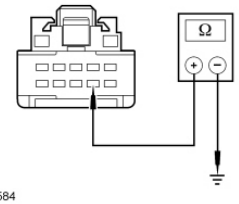


This pinpoint test is intended to diagnose the following:









- Wiring, terminals or connectors
- Traction control switch
- IPC

PINPOINT TEST M: THE STABILITY/TRACTION CONTROL SYSTEM CANNOT BE DISABLED

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
M1 CHECK FOR ANY COMMUNICATION DTCs	
• Connect the scan tool. • Ignition ON. • Check the IPC , the PCM and the ABS module for any communication DTCs. • **Are any communication DTCs present?**	**Yes** For ABS communication DTCs, GO to the ABS Module DTC Chart. For IPC and PCM mmunication DTCs, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** GO to M2 .
M2 ISOLATE THE TRACTION CONTROL SWITCH	
	Yes GO to M3 .

NOTE: If a MyKeyTM restricted key is in use with Advance Trac® always-on feature configured to "on", the traction control system cannot be disabled. An admin key must be used in order to enable and disable the traction control system. • Ignition OFF. • Disconnect: FCIM C2402 (MKZ). • Disconnect: Traction Control/Ambient Lighting Switch C2304 (Fusion/Milan). • **For Fusion or Milan** , measure the resistance between traction control/ambient lighting switch C2304 pin-7 and pin-1, component side, while pressing and releasing the traction control switch. • **For MKZ** , measure the resistance between FCIM C2402 pin-7 and pin-8, component side, while pressing and releasing the switch. • **Is the resisnce less than 5 ohms with the switch pressed and greater than 10,000 ohms with the switch released?**	**No** **For Fusion or Milan** , INSTALL a new traction control switch. REFER to Traction Control Switch in this section. **For MKZ** , INSTALL a new FCIM . REFER to Section 415-00 . TEST the system for normal operation.
M3 CHECK THE TRACTION CONTROL SWITCH GROUND CIRCUIT FOR AN OPEN	
• **For Fusion or Milan** , measure the resistance between traction control/ambient lighting switch C2304-1, circuit GD116 (BK/VT), harness side and ground.  N0098895 • **For MKZ** , measure the resistance between FCIM C2402-8, circuit GD116 (BK/VT), harness side and ground.  N0098585 • **Is the resistance less than 5 ohms?**	**Yes** GO to M4 . **No** REPAIR circuit GD116 (BK/VT). TEST the system for normal operation.
M4 CHECK THE TRACTION CONTROL SWITCH CONTROL CIRCUIT FOR AN OPEN	
• Disconnect: IPC C220. • **For Fusion or Milan** , measure the resistance between traction control/ambient lighting switch C2304-7, circuit CCA15 (YE/GY), harness side and IPC C220-18, circuit CCA15 (YE/GY), harness side.	**Yes** GO to M5 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal

 N0098921 • **For MKZ** , measure the resistance between FCIM C2402-7, circuit CCA15 (YE/GY), harness side and IPC C220-18, circuit CCA15 (YE/GY), harness side.  N0098586 • **Is the resistance less than 5 ohms?**	operation.
M5 CHECK THE TRACTION CONTROL SWITCH CONTROL CIRCUIT FOR A SHORT TO GROUND	
• **For Fusion or Milan** , measure the resistance between traction control/ambient lighting switch C2304-7, circuit CCA15 (YE/GY), harness side and ground.  N0098894 • **For MKZ** , measure the resistance between FCIM C2402-7, circuit CCA15 (YE/GY), harness side and ground.  N0098584 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M6 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation.
M6 CHECK FOR CORRECT IPC OPERATION	
• Ignition OFF.	**Yes** INSTALL a new IPC .

• Check IPC C220 for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: IPC C220. • Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	REFER to Section 413-01. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Anti-Lock Control â Hybrid

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3030-A	Rotunda Active Wheel Speed Sensor Tester 105-R0110 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Regenerative Braking

The regenerative brake system utilizes the electric motor portion of the hybrid electric powertrain as a generator to create electrical current. This recharges the High Voltage Traction Battery (HVTB) and delivers brake torque to be used in place of or in combination with the conventional friction brakes to slow the vehicle. The amount of brake torque provided by the electric motor is dependent upon the state of charge of the HVTB . When the HVTB is almost fully charged, the amount of regenerative braking is limited to avoid overcharging, and the requested deceleration is produced by conventional friction braking alone.

Conventional Friction Braking

If the HVTB is almost fully charged, or the requested amount of braking cannot be achieved by regenerative braking alone, the ABS module applies the conventional friction brakes. The friction brakes utilize components similar to those found in a conventional vacuum assisted brake system with ABS. For a list of components, refer to Section 206-00 .

Brake-By-Wire

During a normal brake application, the brake pedal feel simulator allows the pressure applied to the brake pedal by the driver's foot to act against a spring instead of the brake booster push rod. The brake pedal angle sensor is mounted to the brake pedal assembly and provides the ABS module with an analog signal indicating the amount of deceleration the driver is demanding. If it is necessary for the conventional friction brakes to be applied, the ABS module applies a Pulse Width Modulated (PWM) voltage to a vacuum solenoid inside the active brake booster. The solenoid allows vacuum from either the combustion engine (if the engine is running)

or the electric vacuum pump to move the booster push rod which in turn pushes the piston in the master cylinder and create hydraulic brake pressure. If the brake pedal is applied quickly and forcefully enough, the driver can overcome the brake pedal feel simulator spring pressure, allowing a direct connection between the brake pedal, booster push rod and master cylinder.

Brake Pedal Feel Simulator and Cut-Off Device

When the ignition is turned on, the ABS module runs a series of checks to make sure the system is running properly. Once these checks are complete, the ABS module closes the valve in the simulator cut-off device which puts the brake system into brake-by-wire mode. Brake-by-wire mode is when the pedal feedback to the driver is provided by the pedal feel simulator and not the pressure in the base brake system. The simulator uses spring pressure to provide a familiar brake pedal sensation. When the driver presses the brake pedal, the ABS module interprets the pedal movement through the brake pedal angle sensor. Based on the pedal angle and the amount of brake torque that can be provided through regenerative braking, the ABS module determines how much brake torque is provided by the power train and how much is provided by the hydraulic brakes. The brake pedal is uncoupled from the brake booster push rod allowing the system to hold off hydraulic pressure when regenerative braking is providing the necessary brake torque. When hydraulic braking is required, the ABS module activates the booster solenoid, this allows the vacuum booster to push on the master cylinder creating pressure in the hydraulic system. In the event a fault occurs which inhibits the brake-by-wire mode, the ABS module opens the cut-off device valve. This puts the system into conventional mode with vacuum boosted hydraulic brakes and no regenerative braking. In this mode, the pedal feedback to the driver is provided by the booster. When the driver pushes the pedal, the uncoupling between the pedal and the booster push rod is overcome, and the pedal arm pushes on the booster push rod as in a conventional brake system.

Active Brake Booster

The active brake booster is similar to a conventional vacuum assisted brake booster with the addition of a brake booster solenoid, a brake booster travel sensor and a vacuum pressure sensor. If it is necessary to apply the friction brakes due to inadequate deceleration from regenerative braking, the ABS module sends a PWM voltage to the brake booster solenoid that is proportional to the amount of brake torque requested. The booster solenoid opens, which allows the vacuum booster push rod to push on the master cylinder creating pressure in the hydraulic system.

The ABS module uses the signals produced by the vacuum pressure sensor to verify that vacuum is being maintained in the brake booster. The ABS module uses the signals produced by the brake booster travel sensor to monitor brake booster performance.

Electric Vacuum Pump

When the combustion engine is not running, an electric vacuum pump is used to maintain vacuum inside the brake booster. The ABS module turns the electric vacuum pump on and off through the use of a mechanical relay and a solid state relay. If the ABS module detects a vacuum pump motor circuit concern, a vacuum system leak or a vacuum pump performance concern, a DTC sets in the ABS module and the combustion engine runs to provide vacuum for the brake booster.

Anti-Lock Braking

The ABS module continuously monitors and compares the rotational speed of each wheel. This is accomplished through the use of 4 active wheel speed sensors, one for each wheel. The wheel speed sensors

are connected to the ABS module by 2 circuits. One circuit provides voltage for sensor operation and the other circuit provides sensor input to the ABS module. As the wheels spin, the wheel speed sensor tone rings pass through the magnetic field generated by the active wheel speed sensor. This creates a square-wave signal that is sent to the ABS module to indicate individual wheel speed.

The ABS module uses a Hydraulic Control Unit (HCU) to prevent the wheels from locking up during a braking event. The HCU contains several solenoid-controlled valves, a pump motor, an accumulator and several sensors. The fluid flows through 4 normally open inlet valves inside the HCU and through the outlet ports of the HCU to the brake calipers. If the ABS module senses that a wheel is about to lock up, based on wheel speed sensor data, the module closes the normally open inlet valve for that wheel. This prevents more fluid from getting to the brake caliper. The ABS module then reads the wheel speed sensor signal from the affected wheel again. If the wheel is still decelerating (locking up), the module opens the normally closed outlet valve. This allows a controlled amount of hydraulic pressure in the brake caliper to be relieved into the HCU accumulator. The ABS pump motor runs during an ABS braking event so that sufficient brake fluid pressure is consistently available to the HCU valves. This procedure of closing and opening valves is repeated several times per second until the speed of the affected wheel matches the speeds of the other wheels. Once this has been accomplished, the ABS module returns the solenoid valves to their normal positions.

The ABS module is self-monitoring. When the ignition switch is turned to the RUN position, the ABS module carries out a preliminary electrical check of the wheel speed sensor circuitry by sending voltage through the sensor and checking for the voltage to return. At speeds above 20 km/h (12 mph), without the brake pedal being pressed, the pump motor is commanded ON for less than 2 seconds to check pump motor operation. Also, during all phases of operation while the vehicle is in motion, the ABS module checks for correct operation of the wheel speed sensors. In the event that the ABS module detects a concern, the module sets a DTC and send a message to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) bus to illuminate the yellow ABS warning indicator, the stability/traction control indicator (also known as the sliding-car icon) and/or the red brake warning indicator. If the concern is severe enough, ABS may be disabled. Normal power-assisted braking, however, remains.

Electronic Brake Distribution (EBD)

The ABS module incorporates a strategy called Electronic Brake Distribution (EBD). The EBD strategy uses the HCU as an electronic proportioning valve. On initial application of the brake pedal, full pressure is applied to the rear brakes. The ABS module uses wheel speed input to calculate an estimated rate of deceleration. Once vehicle deceleration exceeds a certain threshold, the ABS module closes the appropriate solenoid valves in the HCU to hold the rear brake pressure constant while allowing the front brake pressure to build. This creates a balanced braking condition between the front and rear wheels and minimizes the chance of rear wheel lockup during hard braking. As the vehicle decelerates, the valves are opened to increase the rear brake pressure in proportion to the front brake pressure.

Some drivers may feel a slight bump sensation in the brake pedal when EBD is active.

If there is a DTC in the ABS module specifically for the HCU or there are 2 or more wheel speed sensor DTCs, EBD is disabled. When EBD is disabled, the ABS warning indicator, the red brake warning indicator and the sliding-car icon is illuminated.

AdvanceTracÂ® Stability Enhancement System

The AdvanceTracÂ® system provides the following stability enhancement features for certain driving situations:

- Traction Control System â helps to avoid excessive drive-wheel spin and loss of traction.

- Electronic Stability Control (ESC) System â helps to avoid skids and lateral slides.

The traction control system uses the ABS and the PCM to limit wheel spin. When the ABS module detects a wheel spinning excessively, brake pressure to the appropriate brake caliper is modulated. This is accomplished by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the HS-CAN bus that a traction control event is taking place. When the IPC receives this message, it flashes the sliding-car icon (twice per second). If the event is severe enough, the ABS module also sends a message to the PCM over the HS-CAN bus to assist with traction control. When the PCM receives this message, it adjusts engine timing and decreases fuel injector pulses. Once the affected wheel returns to normal speed, the ABS module returns the solenoid valves in the HCU to their normal position, deactivates the hydraulic pump motor and sends another message over the HS-CAN bus indicating that the traction event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IPC extinguishes the sliding-car icon.

Once vehicle speed reaches or exceeds 100 km/h (62 mph), traction control is accomplished only through PCM intervention.

Certain DTCs in the ABS module disables the traction control system. Depending on the DTCs present, the yellow ABS warning indicator and/or the sliding-car icon are illuminated.

Electronic Stability Control (ESC) System

The ESC system is controlled by the ABS module and uses the same wheel speed sensors and tone rings that are used for anti-lock braking. The ESC system also uses input from the steering wheel rotation sensor and the stability control sensors (yaw rate, roll rate, longitudinal acceleration and lateral acceleration), which are internal to the Restraints Control Module (RCM). Additional information from other modules is sent over the HS-CAN bus to help maintain vehicle stability.

The ABS module uses the various sensors to continuously monitor vehicle direction of travel relative to the driver's intended course. If the ABS module determines from all these inputs that the vehicle is unable to travel in the intended direction, it modulates brake pressure to the appropriate brake caliper(s) by opening and closing the appropriate solenoid valves inside the HCU while the hydraulic pump motor is activated. At the same time, the ABS module sends a message over the HS-CAN bus that a stability event is taking place. When the IPC receives this message, it flashes the sliding-car icon. Under certain conditions during a stability event, the PCM may be requested to reduce engine torque as it does for traction control. Once the stability condition has been corrected, the ABS module sends another message over the HS-CAN bus indicating that the event has ended. The PCM returns engine timing and fuel injectors to normal operation and the IPC extinguishes the sliding-car icon.

Certain DTCs being present in the ABS module may disable the ESC system. Depending on the DTCs present, the yellow ABS warning indicator and/or the sliding-car icon is illuminated.

Traction Control Switch

Unlike conventional ABS, the traction control portion of the AdvanceTracÂ® can be deactivated by the driver through the use of the traction control switch. The switch is hardwired to the IPC . When pressed, the switch sends a ground signal to the IPC . The IPC then sends a message over the HS-CAN bus indicating that the driver has requested that the system be deactivated and illuminates the sliding-car OFF icon. Once disabled, the system remains in that state until the driver presses the switch again or the ignition is cycled.

Stability Control Sensors

The stability control sensors for the AdvanceTracÂ® system consist of the yaw rate sensor, lateral accelerometer and longitudinal accelerometer. The sensors are housed in the RCM which sends sensor information to the ABS module over the dedicated Controller Area Network (CAN) bus. If any of the sensors are defective, a new RCM must be installed. Refer to Section 501-20B for additional information on the RCM .

- The yaw rate sensor measures the relative vehicle motion about the vertical axis through the vehicle center of gravity.
- The longitudinal accelerometer measures the acceleration corresponding to the force involved when the vehicle moves forward and rearward in the horizontal plane, along the centerline of the vehicle's front and rear wheels.
- The lateral accelerometer measures the acceleration that corresponds to the force involved when the vehicle moves sideways.

Lateral acceleration has 2 forms. The first is the centrifugal acceleration that is generated when the vehicle travels around in a circle. The second is the acceleration due to gravity. On level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor measures some lateral acceleration due to gravity, even though the vehicle is not moving.

Steering Wheel Position Information

The steering wheel position information is sent to the ABS module from the Power Steering Control Module (PSCM) along the HS-CAN bus. The PSCM calculates steering position based on motor position within the Electronic Power Assist Steering (EPAS) steering gear. For information on the PSCM and EPAS system, refer to Section 211-00A .

ABS Module Calibration (Multi-Calibration Routine)

When an ABS fault has been corrected or an ABS component has been replaced, it is necessary to calibrate the ABS module. The calibration procedure is required for the brake-by-wire sensors to learn the "zero-position" of the vehicle which means the vehicle must not be moving and that the brake pedal must not be applied.

To carry out the calibration procedure, connect the scan tool, proceed to the Multi-Calibration routine and follow the scan tool instructions.

ABS Module Configuration

When a new ABS module is installed, it must be configured. To configure the ABS module, refer to Programmable Module Installation (PMI) in Section 418-01 .

Inspection and Verification

NOTE: If a new ABS module is installed, it must be configured and the multi-calibration completed. Follow the scan tool directions.

1. Verify the customer concern.

2. Verify the stoplamps operate correctly by applying and releasing the brake pedal with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to Section 417-01 . If the stoplamps operate correctly, proceed to the next step.

3. Verify the PRNDL operates correctly on the instrument cluster. If the PRNDL does not operate correctly, refer to Section 413-01 . If the PRNDL operates correctly, proceed to the next step.

4. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Active brake booster • Base brake system • Brake pedal assembly • Electric vacuum pump • Hydraulic Control Unit (HCU) • Incorrectly inflated tires • Mismatched wheels or tires on vehicle • Restraints Control Module (RCM) installation • Steering components and suspension components • Wheel speed sensor ring	• ABS module • Battery Junction Box (BJB) fuse(s): ♦ 3 (40A) ♦ 7 (40A) ♦ 8 (50A) ♦ 10 (30A) ♦ 37 (5A) ♦ 47 (10A) • Brake fluid level switch • Electric vacuum pump mechanical relay • Electric vacuum pump solid state relay • PCM relay • RCM • Stoplamp switch • Traction control switch • Wheel speed sensor • Wiring, terminals or connectors

5. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

6. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

7. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

8. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

9. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

10. **NOTE:** The vehicle must be at a complete standstill and on a level surface while carrying out the self-test. Any movement of the vehicle during the self-test may result in false DTCs being set.

    Carry out the self-test diagnostics for the ABS module.

11. If the DTCs retrieved are related to the concern, go to ABS Module DTC Chart in this section. For all other DTCs, refer to Section 419-10 .

12. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

NOTE: This DTC chart applies to hybrid vehicles **only** . For non-hybrid vehicle DTCs, refer to the ABS Module DTC Chart in Anti-Lock Control â Non-Hybrid in this section.

ABS Module DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
C0001:49	TCS Control Channel A Valve 1: Internal Electric Failure [a]	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0001:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0002:49	TCS [a] Control Channel A Valve 2: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0002:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0003:49	TCS [a] Control Channel "B" Valve 1: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0003:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0004:49	TCS [a] Control Channel "B" Valve 2: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0004:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.

C0010:49	Left Front Inlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0010:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0011:49	Left Front Outlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0011:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0014:49	Right Front Inlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0014:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0015:49	Right Front Outlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0015:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0018:49	Left Rear Inlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0018:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0019:49	Left Rear Outlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0019:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C001C:49	Right Rear Inlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C001C:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C001D:49	Right Rear Outlet Control: Internal Electronic Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C001D:49 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C0020:11	ABS Pump Motor Control: Circuit Short To Ground	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0020:11 returns, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C0020:12	ABS Pump Motor Control: Circuit Short To Battery	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C0020:12 returns, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C0020:13	ABS Pump Motor Control: Circuit Open	GO to Pinpoint Test N .

C0020:71	ABS Pump Motor Control: Actuator Stuck	GO to Pinpoint Test N .
C0021:21	Brake Booster Performance: Signal Amplitude	GO to Pinpoint Test Q .
C0021:66	Brake Booster Performance: Signal Has Too Many Transitions/Events	GO to Pinpoint Test Q .
C0021:77	Brake Booster Performance: Commanded Position Not Reachable	GO to Pinpoint Test Q .
C0022:11	Brake Booster Solenoid: Circuit Short To Ground	GO to Pinpoint Test P .
C0022:12	Brake Booster Solenoid: Circuit Short To Battery	GO to Pinpoint Test P .
C0022:13	Brake Booster Solenoid: Circuit Open	GO to Pinpoint Test P .
C0022:14	Brake Booster Solenoid: Circuit Short To Ground or Open	GO to Pinpoint Test P .
C0022:1D	Brake Booster Solenoid: Circuit Current Out of Range	GO to Pinpoint Test P .
C0022:49	Brake Booster Solenoid: Internal Electronic Failure	GO to Pinpoint Test P .
C0030:07	Left Front Tone Wheel: Mechanical Failure	GO to Pinpoint Test S .
C0031:01	Left Front Wheel Speed Sensor: General Electrical Failure	GO to Pinpoint Test R .
C0031:29	Left Front Wheel Speed Sensor: Signal Invalid	GO to Pinpoint Test S .
C0031:2F	Left Front Wheel Speed Sensor: Signal Erratic	GO to Pinpoint Test S .
C0031:64	Left Front Wheel Speed Sensor: Signal Plausibility Failure	GO to Pinpoint Test S .
C0033:07	Right Front Tone Wheel: Mechanical Failure	GO to Pinpoint Test S .
C0034:01	Right Front Wheel Speed Sensor: General Electrical Failure	GO to Pinpoint Test R .
C0034:29	Right Front Wheel Speed Sensor: Signal Invalid	GO to Pinpoint Test S .
C0034:2F	Right Front Wheel Speed Sensor: Signal Erratic	GO to Pinpoint Test S .
C0034:64	Right Front Wheel Speed Sensor: Signal Plausibility Failure	GO to Pinpoint Test S .
C0036:07	Left Rear Tone Wheel: Mechanical Failure	GO to Pinpoint Test S .

C0037:01	Left Rear Wheel Speed Sensor: General Electrical Failure	GO to Pinpoint Test R .
C0037:29	Left Rear Wheel Speed Sensor: Signal Invalid	GO to Pinpoint Test S .
C0037:2F	Left Rear Wheel Speed Sensor: Signal Erratic	GO to Pinpoint Test S .
C0037:64	Left Rear Wheel Speed Sensor: Signal Plausibility Failure	GO to Pinpoint Test S .
C0039:07	Right Rear Tone Wheel: Mechanical Failure	GO to Pinpoint Test S .
C003A:01	Right Rear Wheel Speed Sensor: General Electrical Failure	GO to Pinpoint Test R .
C003A:29	Right Rear Wheel Speed Sensor: Signal Invalid	GO to Pinpoint Test S .
C003A:2F	Right Rear Wheel Speed Sensor: Signal Erratic	GO to Pinpoint Test S .
C003A:64	Right Rear Wheel Speed Sensor: Signal Plausibility Failure	GO to Pinpoint Test S .
C0044:28	Brake Pressure Sensor "A": Signal Bias Level Out of Range/Zero Adjustment Failure	This DTC is set if the brake pressure sensor signals do not match. This fault could set by either an internal ABS module failure or a pressure sensor failure. The pressure sensors are internal to the HCU and cannot be serviced separately. CLEAR the DTCs. REPEAT the self-test. If DTC C0044:28 returns, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C0044:28 returns again, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C0044:49	Brake Pressure Sensor "A": Internal Electronic Failure	This DTC is set if the brake pressure sensor signals do not match. This fault could set by either an internal ABS module failure or a pressure sensor failure. The pressure sensors are internal to the HCU and cannot be serviced separately. CLEAR the DTCs. REPEAT the self-test. If DTC C0044:49 returns, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test.

		If C0044:49 returns again, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C0044:64	Brake Pressure Sensor "A": Signal Plausibility Failure	This DTC is set if the brake pressure sensor signals do not match. This fault could set by either an internal ABS module failure or a pressure sensor failure. The pressure sensors are internal to the HCU and cannot be serviced separately. CLEAR the DTCs. REPEAT the self-test. If DTC C0044:64 returns, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C0044:64 returns again, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C0048:11	Brake Booster Travel Sensor: Circuit Short To Ground	GO to Pinpoint Test T .
C0048:12	Brake Booster Travel Sensor: Circuit Short To Battery	GO to Pinpoint Test T .
C0048:64	Brake Booster Travel Sensor: Signal Plausibility Failure	**NOTE:** This DTC can set as a result of a booster travel sensor circuit fault or a circuit fault with other brake system components. GO to Pinpoint Test T .
C0061:28	Lateral Acceleration Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	GO to Pinpoint Test Y .
C0061:64	Lateral Acceleration Sensor: Signal Plausibility Failure	GO to Pinpoint Test Y .
C0063:28	Yaw Rate Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	GO to Pinpoint Test Y .
C0063:64	Yaw Rate Sensor: Signal Plausibility Failure	GO to Pinpoint Test Y .
C100A:28	Brake Pedal Angle Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	This DTC indicates the brake pedal cannot return to the fully released position. INSTALL a new brake pedal and bracket. REFER to Brake Pedal and Bracket â Hybrid in Section 206-06 .
C100A:41	Brake Pedal Angle Sensor: General Checksum Failure	This DTC indicates that part of the ABS module has failed internally. CLEAR the DTCs. REPEAT the self-test. If DTC C100A:41 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C100A:62	Brake Pedal Angle Sensor: Signal Compare Failure	GO to Pinpoint Test U .
C100A:64	Brake Pedal Angle Sensor: Signal Plausibility Failure	This DTC can set due to a brake pedal angle sensor, brake pedal feel simulator cut-off pressure sensor or brake pedal feel simulator cut-off valve solenoid fault or a mechanical fault with the brake

		pedal assembly. CORRECT all other DTCs for the brake pedal angle sensor and brake pedal feel simulator first. If only DTC C100A:64 is present, INSTALL a new brake pedal assembly. REFER to Brake Pedal and Bracket â Hybrid in Section 206-06 .
C100D:21	Brake Pedal Angle Sensor Circuit 1: Signal Amplitude â © Minimum	GO to Pinpoint Test U .
C100D:22	Brake Pedal Angle Sensor Circuit 1: Signal Amplitude > Maximum	GO to Pinpoint Test U .
C100E:21	Brake Pedal Angle Sensor Circuit 2: Signal Amplitude â © Minimum	GO to Pinpoint Test U .
C100E:22	Brake Pedal Angle Sensor Circuit 2: Signal Amplitude > Maximum	GO to Pinpoint Test U .
C100F:11	Brake Pedal Angle Sensor Supply: Circuit Short To Ground	GO to Pinpoint Test U .
C100F:12	Brake Pedal Angle Sensor Supply: Circuit Short To Battery	GO to Pinpoint Test U .
C1011:1C	Brake Pedal Feel Simulator Cut-Off Pressure Sensor: Circuit Voltage Out of Range	GO to Pinpoint Test V .
C1011:1F	Brake Pedal Feel Simulator Cut-Off Pressure Sensor: Circuit Intermittent	GO to Pinpoint Test V .
C1011:67	Brake Pedal Feel Simulator Cut-Off Pressure Sensor: Signal Incorrect After Event	GO to Pinpoint Test V .
C1012:01	Brake Pedal Feel Simulator Cut-Off Valve Solenoid: General Electrical Failure	GO to Pinpoint Test V .
C1014:07	Brake System Total Volume Balance: Mechanical Failure	This DTC can set as a result of a brake booster travel sensor fault, a brake fluid pressure sensor fault or air trapped in the hydraulic brake system. CORRECT all DTCs that indicate a brake booster travel sensor fault or a hydraulic brake pressure sensor fault. If only DTC C1014:07 is present, CARRY OUT the Brake System Service Bleed, REFER to Brake System Bleeding in Section 206-00 . CLEAR the DTCs, REPEAT the self-test. If DTC C1014:07 returns, INSTALL a new brake booster. REFER to Brake Booster in Section 206-07 . CLEAR the DTCs. REPEAT the self-test. If DTC C1014:07 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. REPEAT the self-test.

		If DTC C1014:07 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1015:64	Vacuum Supply: Signal Plausibility Failure	This DTC sets if the ABS module detects a vacuum leak. If other DTCs are present for the vacuum pump, vacuum pressure sensor or booster travel sensor, DIAGNOSE them first. If only DTC C1015:64 is present, INSPECT the vacuum hoses, lines and fittings for vacuum leaks. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. If DTC C1015:64 returns, INSTALL a new vacuum pump. REFER to Brake Vacuum Pump in Section 206-07 .
C1015:7A	Vacuum Supply: Fluid Leak or Seal Failure	This DTC sets if the ABS module detects a vacuum leak. CARRY OUT the brake booster component test. REFER to Section 206-00 . INSTALL new as necessary. CLEAR the DTCs. REPEAT the self-test.
C1015:7B	Vacuum Supply: Low Fluid Level	This DTC sets if the ABS module detects a vacuum leak. If other DTCs are present for the vacuum pump, vacuum pressure sensor or booster travel sensor, DIAGNOSE them first. If only DTC C1015:7B is present, INSPECT the vacuum hoses, lines and fittings for vacuum leaks. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. If DTC C1015:7B returns, INSTALL a new vacuum pump. REFER to Brake Vacuum Pump in Section 206-07 .
C1018:00	Regenerative Braking: No Sub Type Information	This DTC can set as a result of missing network messages or invalid data from the PCM over the High Speed Controller Area Network (HS-CAN) bus. RETRIEVE the DTCs from the PCM. REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
C1018:46	Regenerative Braking: Calibration/Parameter Memory Failure	Using the scan tool, CARRY OUT the Multi-Calibration routine. Follow the scan tool instructions. CLEAR the DTCs. REPEAT the self-test.
C1018:62	Regenerative Braking: Signal Compare Failure	This DTC indicates that the PCM cannot provide the amount of brake torque that the ABS module is requesting. RETRIEVE the DTCs from the PCM. REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
C101A:1C	Vacuum Pressure Sensor: Circuit Voltage Out of Range	GO to Pinpoint Test W .
C101A:62	Vacuum Pressure Sensor: Signal Compare Failure	GO to Pinpoint Test W .
C101A:64	Vacuum Pressure Sensor: Signal Plausibility Failure	GO to Pinpoint Test W .
C101B:1C	Vacuum Pressure Sensor Circuit B: Circuit Voltage Out of Range	GO to Pinpoint Test W .
C101C:01	Brake Vacuum Pump: General Electrical Failure	GO to Pinpoint Test X .

C101C:71	Brake Vacuum Pump: Actuator Stuck	GO to Pinpoint Test X .
C1021:21	ABS Booster Control Pressure: Signal Amplitude â © Minimum	This DTC indicates that other DTCs are present for the brake pedal angle sensor, the vacuum pressure sensor or a brake (fluid) pressure sensor. If DTCs for one or more of these components is present, DIAGNOSE them first. CLEAR the DTCs. REPEAT the self-test. If only DTC C1021:21 is present, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR all DTCs. REPEAT the self-test. If DTC C1021:21 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1021:22	ABS Booster Control Pressure: Signal Amplitude > Maximum	This DTC indicates that other DTCs are present for the brake pedal angle sensor, the vacuum pressure sensor or a brake (fluid) pressure sensor. If other DTCs are present for the brake pedal angle sensor, the vacuum pressure sensor or a brake (fluid) pressure sensor, DIAGNOSE them first. CLEAR the DTCs. REPEAT the self-test. If only DTC C1021:22 is present, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
C1025:21	Brake Primary Circuit Overboost Pressure: Signal Amplitude â © Minimum	INSPECT the brake system for brake fluid leaks. REPAIR as necessary. If no leaks are found, CARRY OUT the Brake System Service Bleed, REFER to Brake System Bleeding in Section 206-00 . CLEAR the DTCs, REPEAT the self-test. If DTC C1025:21 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C1025:21 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1025:22	Brake Primary Circuit Overboost Pressure: Signal Amplitude > Maximum	INSPECT the brake system for brake fluid leaks. REPAIR as necessary. If no leaks are found, CARRY OUT the Brake System Service Bleed, REFER to Brake System Bleeding in Section 206-00 . CLEAR the DTCs, REPEAT the self-test. If DTC C1025:22 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C1025:22 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1026:21	ABS Secondary Circuit Overboost Pressure: Signal Amplitude â © Minimum	INSPECT the brake system for brake fluid leaks. REPAIR as necessary. If no leaks are found, CARRY OUT the Brake System Service Bleed, REFER to Brake System Bleeding in Section 206-00 . CLEAR the DTCs, REPEAT the self-test.

		If DTC C1026:21 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C1026:21 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1026:22	ABS Secondary Circuit Overboost Pressure: Signal Amplitude > Maximum	INSPECT the brake system for brake fluid leaks. REPAIR as necessary. If no leaks are found, CARRY OUT the Brake System Service Bleed, REFER to Brake System Bleeding in Section 206-00 . CLEAR the DTCs, REPEAT the self-test. If DTC C1026:22 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C1026:22 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1027:62	Master Cylinder (MC) to Primary Circuit Pressure: Signal Amplitude > Maximum	INSPECT the brake system for brake fluid leaks. REPAIR as necessary. If no leaks are found, CARRY OUT the Brake System Service Bleed, REFER to Brake System Bleeding in Section 206-00 . CLEAR the DTCs, REPEAT the self-test. If DTC C1027:62 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C1027:62 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1028:62	ABS Primary Circuit Wheel Pressure: Signal Compare Failure	INSPECT the brake system for brake fluid leaks. REPAIR as necessary. If no leaks are found, CARRY OUT the Brake System Service Bleed, REFER to Brake System Bleeding in Section 206-00 . CLEAR the DTCs, REPEAT the self-test. If DTC C1028:62 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C1028:62 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1029:00	ABS Primary Circuit Pressure Lower Than Secondary: No Sub Type Information	GO to Pinpoint Test AC
C102A:62	Brake Secondary Circuit Pressure Mismatch Between Wheels: Signal Compare Failure	INSPECT the brake system for brake fluid leaks. REPAIR as necessary. If no leaks are found, CARRY OUT the Brake System Service Bleed, REFER to Brake System Bleeding in Section 206-00 . CLEAR the DTCs, REPEAT the self-test. If DTC C102A:62 returns, INSTALL a new ABS module. REFER

		to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C102A:62 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C102B:00	ABS Secondary Circuit Pressure Lower Than Primary: No Sub Type Information	GO to Pinpoint Test AC
C1108:11	Pedal Sensor(s) Supply Voltage: Circuit Short To Ground	GO to Pinpoint Test T .
C1108:12	Pedal Sensor(s) Supply Voltage: Circuit Short To Battery	GO to Pinpoint Test T .
C1108:1C	Pedal Sensor(s) Supply Voltage: Circuit Voltage Out of Range	GO to Pinpoint Test T .
C1133:28	Left Front Brake Pressure Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1133:28 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1133:49	Left Front Brake Pressure Sensor: Internal Electronic Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1133:49 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1133:64	Left Front Brake Pressure Sensor: Signal Plausibility Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1133:64 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1134:28	Right Front Brake Pressure Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1134:28 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1134:49	Right Front Brake Pressure Sensor: Internal Electronic Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1134:49 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications,

		INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1134:64	Right Front Brake Pressure Sensor: Signal Plausibility Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1134:64 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1135:28	Left Rear Brake Pressure Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1135:28 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1135:49	Left Rear Brake Pressure Sensor: Internal Electronic Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1135:49 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1135:64	Left Rear Brake Pressure Sensor: Signal Plausibility Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1135:64 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1136:28	Right Rear Brake Pressure Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1136:28 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1136:49	Right Rear Brake Pressure Sensor: Internal Electronic Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1136:49 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1136:64	Right Rear Brake Pressure Sensor: Signal Plausibility Failure	CLEAR the DTCs. REPEAT the self-test. If DTC C1136:64 is present, make sure all ABS module-to- HCU fasteners are tightened to their correct torque specifications. If all fasteners are tightened to their correct torque specifications, INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1A99:28		

	Pressure Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	This DTC is set if the brake pressure sensor signals do not match. This fault could set by either an internal ABS module failure or a pressure sensor failure. The pressure sensors are internal to the Hydraulic Control Unit (HCU) and cannot be serviced separately. If all fasteners are tightened to their correct torque specifications, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTCs. TEST DRIVE the vehicle. REPEAT the self-test. If C1A99:28 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section.
C1B00:28	Steering Angle Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	**NOTE:** The Electronic Power Assist Steering (EPAS) gear assembly contains the steering wheel angle sensor. The sensor is not serviceable separately from the assembly. The ABS module receives the steering wheel angle sensor information from the Power Steering Control Module (PSCM) over the HS-CAN bus. The cause of this DTC is indicated by a DTC in the PSCM . CARRY OUT a self-test of the PSCM . REFER to Diagnosis and Testing in Section 211-00A to diagnose the DTCs retrieved.
C1B00:29	Steering Angle Sensor: Signal Invalid	**NOTE:** The EPAS gear assembly contains the steering wheel angle sensor. The sensor is not serviceable separately from the assembly. The ABS module receives the steering wheel angle sensor information from the PSCM over the HS-CAN bus. The cause of this DTC is indicated by a DTC in the PSCM . CARRY OUT a self-test of the PSCM . REFER to Diagnosis and Testing in Section 211-00A to diagnose the DTCs retrieved.
C1B00:64	Steering Angle Sensor: Signal Plausibility Failure	**NOTE:** The EPAS gear assembly contains the steering wheel angle sensor. The sensor is not serviceable separately from the assembly. The ABS module receives the steering wheel angle sensor information from the PSCM over the HS-CAN bus. The cause of this DTC is indicated by a DTC in the PSCM . CARRY OUT a self-test of the PSCM . REFER to Diagnosis and Testing in Section 211-00A to diagnose the DTCs retrieved.
C1B00:86	Steering Angle Sensor: Signal Invalid	**NOTE:** The EPAS gear assembly contains the steering wheel angle sensor. The sensor is not serviceable separately from the assembly. The ABS module receives the steering wheel angle sensor information from the PSCM over the HS-CAN bus. The cause of this DTC is indicated by a DTC in the PSCM . CARRY OUT a self-test of the PSCM . REFER to Diagnosis and Testing in Section 211-00A to diagnose the DTCs retrieved.
P0561:1C		

	System Voltage Unstable: Circuit Voltage Out Of Range	The ABS module receives low voltage system information from the DC to DC Converter Control Module (DC/DC) over the HS-CAN bus. If the message the ABS module receives indicates that system voltage has dropped below 9 volts or has risen above 16 volts, DTC P0561:1C sets. CARRY OUT a self-test of the DC/DC converter. REFER to Diagnosis and Testing in Section 414-05 to diagnose the DTCs retrieved.
U0001:88	High Speed Controller Area Network (HS-CAN) Communication Bus: Bus Off	REFER to Section 418-00 to diagnose the network communication concern.
U0100:00	Lost Communication With ECM /PCM "A": No Sub Type Information	REFER to Section 418-00 to diagnose the network communication concern.
U0131:87	Lost Communication With Power Steering Control Module: Missing Message	This DTC can set due to a fault in the EPAS system or because the PSCM is unable to communicate over the HS-CAN bus. CARRY OUT a self-test of the PSCM . If the scan tool indicates that the PSCM is not responding, REFER to Section 418-00 to diagnose the network communication concern. If PSCM DTCs are present, REFER to Section 211-00A to diagnose the EPAS system fault.
U0151:87	Lost Communication With Restraints Control Module (RCM): Missing Message	GO to Pinpoint Test Y .
U0151:88	Lost Communication With RCM : Bus off	GO to Pinpoint Test Y .
U0155:87	Lost Communication With Instrument Panel Cluster (IPC) Control Module: Missing Message	This DTC can set due to an IPC fault or because the IPC is unable to communicate over the HS-CAN bus. CARRY OUT a self-test of the IPC . If the scan tool indicates that the IPC is not responding, REFER to Section 418-00 to diagnose the network communication concern. If IPC DTCs are present, REFER to Section 413-01 to diagnose the IPC fault.
U0298:87	Lost Communication With DC to DC Converter Control Module (DC/DC) "A": Missing Message	This DTC can set due to a DC/DC fault or because the DC/DC is unable to communicate over the HS-CAN bus. CARRY OUT a self-test of the DC/DC . If the scan tool indicates that the module is not responding, REFER to Section 418-00 to diagnose the network communication concern. If DTCs are present in the DC/DC , REFER to Section 414-05 to diagnose the module fault.
U0300:51	Internal Control Module Software Incompatibility: Not Programmed	CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) in Section 418-01 . REPEAT the self-test.

		If U0300:51 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U0401:00	Invalid Data Received From ECM /PCM "A": No Sub Type Information	The PCM sends an "invalid data" message to the ABS module if there are DTCs in the PCM that prevent known good data from being sent. RETRIEVE the DTCs from the PCM. REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 to diagnose the powertrain fault.
U0420:87	Invalid Data Received From Power Steering Control Module: Missing Message	This DTC can set due to a fault in the EPAS system or because the PSCM is unable to communicate over the HS-CAN bus. CARRY OUT a self-test of the PSCM . If the scan tool indicates that the PSCM is not responding, REFER to Section 418-00 to diagnose the network communication concern. If PSCM DTCs are present, REFER to Section 211-00A to diagnose the EPAS system fault.
U0423:64	Invalid Data Received From Instrument Panel Control Module: Signal Plausibility Failure	This DTC indicates that the ABS module has not received network messages from the IPC . This DTC can set due to an IPC fault or because the IPC is unable to communicate over the HS-CAN bus. CARRY OUT a self-test of the IPC . If the scan tool indicates that the IPC is not responding, REFER to Section 418-00 to diagnose the network communication concern. If IPC DTCs are present, REFER to Section 413-01 to diagnose the IPC fault.
U0452:29	Invalid Data Received From Restraints Control Module (RCM): Signal Invalid	GO to Pinpoint Test Y .
U2100:00	Initial Configuration Not Complete: No Sub Type Information	CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) in Section 418-01 . REPEAT the self-test. If U2100:00 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U2100:41	Initial Configuration Not Complete: General Checksum Failure	CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) in Section 418-01 . REPEAT the self-test. If U2100:41 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U2100:56	Initial Configuration Not Complete: Invalid/Incompatible Configuration	CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) in Section 418-01 . REPEAT the self-test. If U2100:56 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U3000:41	Control Module: General Checksum Failure	CORRECT all other DTCs prior to addressing DTC U3000:41. If only DTC U3000:41 was retrieved from the ABS module,

		INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U3000:43	Control Module: Special Memory Failure	CLEAR the DTCs. REPEAT the self-test. If U3000:43 is returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U3000:47	Control Module: Watchdog/Safety WC Failure	This DTC can set if the ABS module electrical connector is not fully seated and locked. DISCONNECT the ABS module C135. INSPECT the connector for bent or loose pins. REPAIR as necessary. If OK, RECONNECT C135. CLEAR the DTCs. REPEAT the self-test. If DTC U3000:47 is retrieved again, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U3000:49	Control Module: Internal Electronic Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:49 is present, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U3000:4B	Control Module: Over Temperature	This DTC is set if the signal from the temperature sensor internal to the ABS module is out of range or is implausible when compared to the temperature sensors inside the HCU . CLEAR the DTCs. REPEAT the self-test. If DTC U3000:4B is present, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section.
U3002:62	Vehicle Identification Number: Signal Compare Failure	**NOTE:** This DTC can set as if the ABS module cannot communicate with the PCM. Correct any network communications DTCs prior to diagnosing DTC U3002:62. GO to Pinpoint Test Z .
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test O .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test O .

[a] Traction Control System

Instrument Panel Cluster (IPC) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Source	Action
C0089:11	TCS Disable Switch: Circuit Short to Ground [a]	Instrument Panel Cluster (IPC)	GO to Pinpoint Test AA .
â	All Other IPC DTCs	IPC	REFER to the Master DTC Chart in Section 419-10 .

[a] Traction Control System

Symptom Chart

Symptom Chart

Pinpoint Tests

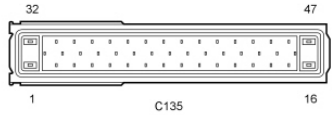
Pinpoint Test N: DTCs C0020:13 and 71

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

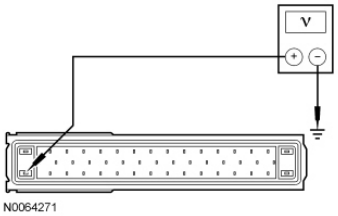
Normal Operation

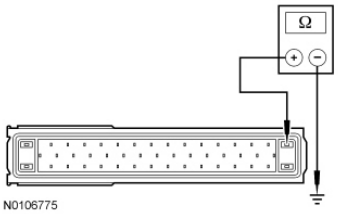
The ABS module uses an internal solid state switch to operate the ABS pump motor. When the engine speed is above 700 rpm or the vehicle speed is at approximately 7 km/h (4 mph), the ABS module tests the ABS pump motor by activating it for 30 milliseconds. While the pump motor is being activated, the ABS module monitors the voltage drop across the ABS pump motor solid state switch and the amount of current the ABS pump motor draws through the solid state switch. If the voltage drop is too high or if the ABS pump motor is drawing too much current, the ABS module sets a DTC. After 30 milliseconds have passed, the ABS module stops applying voltage to the pump motor and observe the voltage that the spinning ABS pump motor is generating. The voltage generated by the motor indicates how fast the motor is spinning. A voltage that is too low indicates that the motor is not spinning freely and a DTC sets.

- DTC C0020:13 (ABS Pump Motor Control: Circuit Open) â If the voltage supplied to the ABS module is less than 10 volts, if there is an open or high resistance on the ABS pump motor circuit between the ABS module and the Hydraulic Control Unit (HCU), or if the ABS module is faulted internally, this DTC sets.
- DTC C0020:71 (ABS Pump Motor Control: Circuit Actuator Stuck) â If the ABS module detects that the ABS pump motor is not rotating, when it is commanded to run, this DTC sets.



This pinpoint test is intended to diagnose the following:





- Fuse(s)
- Wiring, terminals or connectors
- HCU
- ABS module

PINPOINT TEST N: DTCs C0020:13 AND 71

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
N1 VERIFY ALL WIRING CONNECTIONS	

• Disconnect: ABS Module C135 . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-1 ♦ C135-47  N0108946 • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	**Yes** GO to N2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.
N2 CHECK THE PUMP MOTOR (PMP_MTR) ACTIVE COMMAND	
• Connect: ABS Module C135 . • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger â ABS Module . • Toggle the PMP_MTR active command ON. • **Does the ABS pump motor run for approximately 4 seconds?**	**Yes** TOGGLE the PMP_MTR active command OFF. CLEAR the DTCs. DRIVE the vehicle at speeds greater than 20 km/h (12 mph). RETRIEVE the DTCs. If DTCs C0020:13 or 71 are retrieved, GO to N5 . For all other ABS module DTCs, GO to the ABS Module DTC Chart in this section. **No** TOGGLE the ABS module PMP_MTR active command OFF. GO to N3 .
N3 CHECK THE PUMP MOTOR VOLTAGE SUPPLY TO THE ABS MODULE	
• Ignition OFF. • Disconnect: ABS Module C135 . • Ignition ON. • Measure the voltage between ABS module C135-1, circuit SBB08 (VT/RD), harness side and ground.	**Yes** GO to N4 . **No** VERIFY that BJB fuse 8 (50A) is OK. If OK, REPAIR circuit SBB08 (VT/RD). If the fuse is not OK, REFER to the Wiring Diagrams manual to identify the cause of the circuit short.

 N0064271 • **Is the voltage greater than 10 volts?**	CLEAR the DTCs and REPEAT the self-test.
N4 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ABS module C135-47, circuit GD121 (BK/YE), harness side and ground.  N0106775 • **Is the resistance less than 5 ohms?**	**Yes** GO to N5 . **No** REPAIR circuit GD121 (BK/YE). CLEAR the DTCs. REPEAT the self-test.
N5 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C135 . • Check for: ♦ corrosion ♦ pushed-out pins ♦ spread terminals • Connect: ABS Module C135 . • Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HCU and ABS module. REFER to Hydraulic Control Unit (HCU) â Hybrid in this section. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

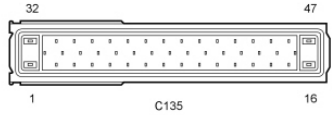
Pinpoint Test O: DTCs U3003:16 and 17

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

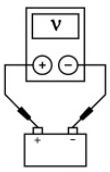
Normal Operation

The voltage required for correct ABS operation is between 10 and 17.8 volts. Fused battery voltage is supplied to the ABS module from the Battery Junction Box (BJB), BJB). Fused ignition voltage is supplied to the ABS module from the BJB .

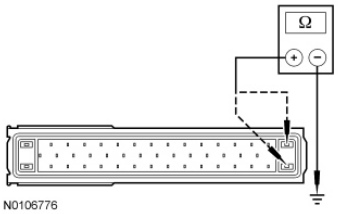
- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) â If the voltage is below 10 volts, this DTC sets.

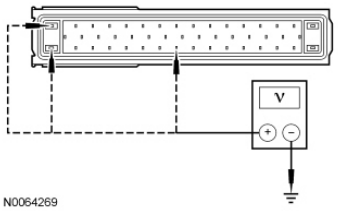


- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) â If the voltage is above 17 volts, this DTC sets.



This pinpoint test is intended to diagnose the following:
- Fuses
- Wiring, terminals or connectors
- ABS module





PINPOINT TEST O: DTCs U3003:16 AND 17

NOTE: DTCs U3003:16 and 17 can set if the vehicle has been recently jump started, the 12-volt battery has been recently charged or the 12-volt battery has been discharged. The 12-volt battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
O1 VERIFY ALL WIRING CONNECTIONS	
• Disconnect: ABS Module C135 . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-1 ♦ C135-8 ♦ C135-16 ♦ C135-32 ♦ C135-47  N0108946 • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	**Yes** GO to O2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.

O2 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Connect: ABS Module C135 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test â All CMDTCs . • **Is DTC U3003:16 or 17, DTCs B1317, B1318 and/or B1676 present in one or more modules AND DTC P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-05 for diagnosis of the battery and charging system. **No** GO to O3 .
O3 CHECK BATTERY CONDITION	
• Ignition OFF. • Refer to Section 414-01 and carry out the Battery â Condition Test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to O4 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
O4 CHECK CHARGING SYSTEM VOLTAGE	
• Start the vehicle, verify that the ready indicator is illuminated. • Measure the voltage of the battery with and without a load on the charging system as follows: ♦ Turn off all accessories and measure battery voltage. ♦ Turn on headlights and HVAC fan on high and measure battery voltage.  AJ0210-A • **Are the voltages between 13 and 15.2 volts?**	**Yes** GO to O5 . **No** REFER to Section 414-05 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.
O5 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN	

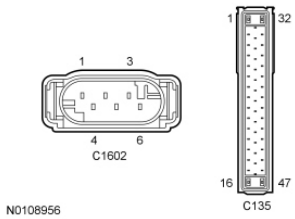
• Ignition OFF. • Disconnect: ABS Module C135 . • Measure the resistance between ground and: ♦ ABS module C135-16, circuit GD121 (BK/YE), harness side. ♦ ABS module C135-47, circuit GD121 (BK/YE), harness side. ♦ Repeat this measurement while wiggling the harness.  N0106776 • **Is the resistance less than 5 ohms?**	**Yes** GO to O6 . **No** REPAIR circuit GD121 (BK/YE). CLEAR all CMDTCs . REPEAT the self-test.
O6 CHECK FOR VOLTAGE AT THE ABS MODULE	
• Ignition ON. • Measure the voltage between ground and: ♦ ABS module C135-1, SBB08 (VT/RD), harness side. ♦ ABS module C135-8, CBK03 (GY), harness side. ♦ ABS module C135-32, SBB10 (YE/RD), harness side.  N0064269 • **Are the voltages greater than 10 volts?**	**Yes** GO to O7 . **No** VERIFY that BJB fuses 8 (50A), 10 (30A) and 47 (10A) are OK. If OK, REPAIR the affected circuit(s). If the fuses are not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs and REPEAT the self-test.
O7 CHECK FOR CORRECT ABS MODULE OPERATION	
• Ignition OFF. • Disconnect: ABS Module C135 . • Check for: ♦ corrosion ♦ pushed-out pins ♦ spread terminals • Connect: ABS Module C135 . • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test P: DTCs C0022:11, 12, 13, 14, 1D and 49

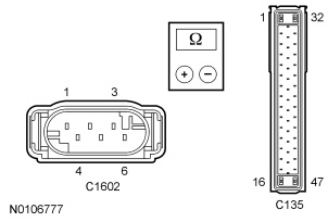
Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

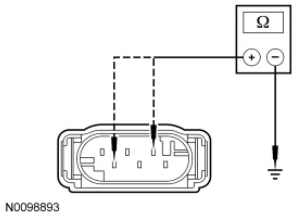
Normal Operation

The brake booster solenoid is internal to the brake booster. During normal braking, the ABS module applies a Pulse Width Modulated (PWM) voltage to the brake booster solenoid. The ABS module provides ground to the solenoid along circuit VCA22 (GN/BN). The ABS module constantly checks the integrity of the booster solenoid and circuits. If a booster solenoid fault is detected, the brake system transitions from brake-by-wire mode to conventional friction braking. Other DTCs for brake booster performance may set as a result of a brake booster solenoid circuit fault. The brake booster solenoid cannot be serviced separately from the brake booster. If a new brake booster solenoid is needed, a new brake booster must be installed.

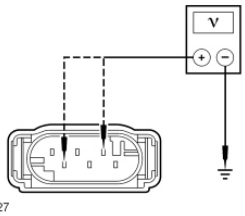


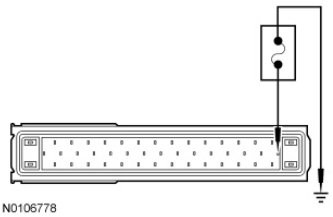
DTC Description	Fault Trigger Conditions
• C0022:11 â Brake Booster Solenoid: Circuit Short to Ground	If the ABS module detects a short to ground on either circuit, this DTC sets.
• C0022:12 â Brake Booster Solenoid: Circuit Short to Battery	If the ABS module detects a short to voltage on either circuit, this DTC sets.
• C0022:13 â Brake Booster Solenoid: Circuit Open	If the ABS module detects an open or high resistance on either circuit, this DTC sets.
• C0022:14 â Brake Booster Solenoid: Circuit Short to Ground or Open	If the ABS module detects a short to ground, open or high resistance on either circuit or the solenoid, this DTC sets.
• C0022:1D â Brake Booster Solenoid: Circuit Current Out of Range	If the ABS module detects a short to ground, open or high resistance on either circuit , the solenoid or if the ABS module is faulted internally, this DTC sets.
• C0022:49 â Brake Booster Solenoid: Internal Electronic Failure	If the ABS module detects a short to ground on either circuit, the solenoid or if the ABS module is faulted internally, this DTC sets.

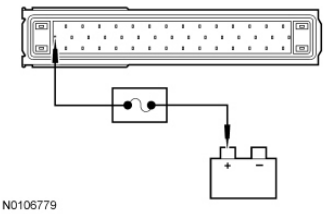




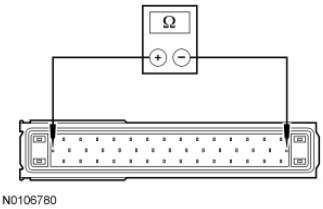
This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Brake booster
- ABS module



PINPOINT TEST P: DTCs C0022:11, 12, 13, 14, 1D and 49

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
P1 VERIFY ALL WIRING CONNECTIONS	
• Disconnect: ABS Module C135 . • Disconnect: Brake Booster C1602 . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-17 ♦ C135-31 ♦ C1602-3 ♦ C1602-4  • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	**Yes** GO to P2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.
P2 REVIEW THE DTCs FROM THE ABS MODULE SELF-TEST	
• Review the DTCs retrieved and recorded during Inspection and Verification. • **Is DTC C0022:13, C0022:14 or C0022:1D present?**	**Yes** GO to P3 . **No** If DTC C0022:11 or C0022:49 were retrieved from the self-test, GO to P4 . If DTC C0022:12 was retrieved from the self-test, GO to P5 .
P3 CHECK THE BRAKE BOOSTER SOLENOID CIRCUITS FOR AN OPEN	

• Ignition OFF. • Measure the resistance between ABS module C135 harness side, and brake booster solenoid C1602 harness side as indicated in the following chart: | ABS Module	Circuit	Brake Booster Solenoid | |---|---|---| | C135-17 | CCA22 (GY/YE) | C1602-3 | | C135-31 | VCA22 (GN/BN) | C1602-4 |  • **Are the resistances less than 5 ohms?**	**Yes** If DTC C0022:14 or C0022:1D was retrieved from the self-test, GO to P4 . If DTC C0022:13 was retrieved from the self-test, GO to P6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
P4 CHECK THE BRAKE BOOSTER SOLENOID CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ♦ brake booster solenoid C1602-3, circuit CCA22 (GY/YE), harness side. ♦ brake booster solenoid C1602-4, circuit VCA22 (GN/BN), harness side.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to P6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
P5 CHECK THE BRAKE BOOSTER SOLENOID CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ brake booster solenoid C1602-3, circuit CCA22 (GY/YE), harness side. ♦ brake booster solenoid C1602-4, circuit VCA22 (GN/BN), harness side.	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to P6 .

 N0098927 • **Is any voltage present?**	
P6 CHECK THE BRAKE BOOSTER SOLENOID FOR CORRECT OPERATION	
• Ignition OFF. • Connect: Brake Booster C1602 . • Connect: ABS Module C135 . • Ignition ON. • Start then engine. • Apply and release the brake pedal. • Allow the engine to run for 10 to 15 seconds in order to build vacuum in the brake booster. • Ignition OFF. • Disconnect: ABS Module C135 . • Connect a fused jumper wire between ABS module C135-31, circuit VCA22 (GN/BN), harness side and ground.  N0106778 • While observing the clevis on the brake booster push rod for movement, **momentarily** connect a fused jumper wire between ABS module C135-17, circuit CCA22 (GY/YE), harness side and the battery positive post.  N0106779 • **Does the brake pedal move?**	**Yes** GO to P8 . **No** GO to P7 .
P7 CHECK THE BRAKE BOOSTER SOLENOID	

• Disconnect: All fused jumper wires . • Measure the resistance between ABS module C135-17, circuit CCA22 (GY/YE), harness side and ABS module C135-31, circuit VCA22 (GN/BN), harness side.  N0106780 • **Is the resistance between 1 and 3 ohms?**	**Yes** GO to P8 . **No** INSTALL a new brake booster. REFER to Brake Booster in Section 206-07 . CLEAR the DTCs. REPEAT the self-test.
P8 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: All Fused Jumper Wires (if not previously disconnected) . • Check for: ♦ corrosion ♦ pushed-out pins ♦ spread terminals • Connect: ABS Module C135 . • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Q: DTCs C0021:21, 66 and 77

Normal Operation

The ABS module measures the amount of hydraulic brake pressure generated every time the brakes are applied. The ABS module tests the brake booster every key cycle by operating the brake booster independently of brake pedal input and measuring the hydraulic brake pressure generated. The ABS module utilizes input from the brake pedal angle sensor, brake booster travel sensor, the brake pressure sensors internal to the Hydraulic Control Unit (HCU) and the vacuum pressure sensor to determine if the required amount of hydraulic brake pressure is being generated. If the ABS module detects that the brake booster is not able to build adequate hydraulic brake pressure in the master cylinder, the brake system transitions from brake-by-wire mode into low temperature conventional mode. While in low temperature conventional mode, the ABS module continues to test the brake booster. If the brake booster begins to generate the expected amount of pressure in hydraulic system, the brake system recovers into brake-by-wire mode. If the brake system has to transition from brake-by-wire mode to low temperature conventional mode 3 times in the same ignition cycle because of a brake booster performance fault, the brake system downgrades to conventional brake pedal operation for the rest of the ignition cycle.

- DTC C0021:21 (Brake Booster Performance: Signal Amplitude â © Minimum) â This DTC is for information only and does not cause any indicators to illuminate. However, other DTCs that cause DTC C0021:21 to set may cause indicators to illuminate. If the red brake warning indicator is illuminated, diagnose all other DTCs before diagnosing DTC C0021:21. Otherwise, disregard DTC C0021:21.

- ♦ If the brake booster is not able to build adequate hydraulic brake pressure when the brakes are applied either through input from the driver or when the ABS module checks the brake booster, DTC C0021:21 sets. In most cases DTC C0021:21 sets if the vehicle was started in low ambient temperatures or as a result of low ambient temperatures causing slow booster reaction time. This DTC set as a result of other brake booster, brake pedal angle sensor, hydraulic brake pressure sensors or vacuum pressure sensor DTCs being set.

- DTC C0021:66 (Brake Booster Performance: Signal Has Too Many Transitions) â This DTC indicates that the regenerative brake system has switched from brake-by-wire mode to low temperature conventional mode 3 times due to the cause of DTC C0021:21. When this DTC is present, the regenerative brake system downgrades to conventional mode until the cause of DTC C0021:21 has been corrected. The red brake warning indicator illuminates when this DTC is set. If only DTCs C0021:21 and 66 are present, there is likely to be mechanical damage to the brake booster, brake pedal and bracket, master cylinder, a hydraulic brake fluid leak, air trapped in the hydraulic system or a vacuum leak may be present.
- DTC C0021:77 (Brake Booster Performance: Commanded Position is Not Reachable) â This DTC is for information only and does not indicate a fault with the brake system. If the hydraulic brake pressure does not change when the ABS module checks the brake booster, this DTC sets. This DTC does not cause any indicators to illuminate and may set as a result of low ambient temperatures causing slow booster reaction time. If the red brake warning indicator is not illuminated, this DTC should be disregarded. Diagnose all other DTCs retrieved along with this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Wheel speed sensor
- ABS module

PINPOINT TEST Q: DTCs C0021:21, 66 AND 77

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Q1 CHECK THE DTCs FROM THE SELF-TEST	
• Review the DTCs retrieved and recorded in Inspection and Verification. • **Are other DTCs present along with DTC C0021:21, 66 or 77?**	**Yes** The other ABS module DTCs indicates the cause of DTCs C0021:21, 66 and/or 77. DIAGNOSE all other ABS module DTCs before diagnosing DTC C0021:21, 66 or 77. REFER to the ABS Module DTC Chart in this section. **No** GO to Q2 .
Q2 CHECK THE BRAKE PEDAL AND BRACKET	
• Inspect the brake pedal and bracket and the clevis end of the booster push rod for misalignment or damage. Verify that all brake pedal and bracket fasteners are tightened to the specified torque. Apply	**Yes** GO to Q3 . **No** REPAIR or INSTALL new components

and release the brake pedal. Verify that the brake pedal moves freely and returns to the full released position. • **Is the brake pedal and bracket OK?**	as necessary. REFER to Section 206-06 .
Q3 CHECK THE BRAKE BOOSTER AND BRAKE MASTER CYLINDER	
• Inspect the brake booster and brake master cylinder for misalignment or damage. Verify that all brake booster and master cylinder fasteners are tightened to the specified torque. • **Is the brake booster and the brake master cylinder OK?**	**Yes** GO to Q4 . **No** REPAIR or INSTALL new components as necessary. REFER to Section 206-07 for the brake booster. REFER to Section 206-06 for the brake master cylinder.
Q4 CHECK FOR VACUUM LEAKS	
• Inspect the vacuum pump and brake booster vacuum hoses, lines and fittings for vacuum leaks. • **Are the vacuum pump and brake booster vacuum hoses, lines and fittings OK?**	**Yes** GO to Q5 . **No** REPAIR or INSTALL new components as necessary. REFER to Section 206-07 .
Q5 CHECK THE BRAKE SYSTEM FOR BRAKE FLUID LEAKS	
• Inspect the brake system for brake fluid leaks. • **Are any brake fluid leaks found?**	**Yes** REPAIR as necessary. FILL the brake master cylinder reservoir using the specified brake fluid. BLEED the brake system, REFER to Brake System Bleeding in Section 206-00 . **No** GO to Q6 .
Q6 CHECK FOR AIR IN THE BRAKE SYSTEM	
• Bleed the brake system, refer to Brake System Bleeding in Section 206-00 . • Ignition ON. • Using the scan tool, clear all Continuous Memory Diagnostic Trouble Codes (CMDTCs). • Disconnect the scan tool. • Test drive the vehicle at speeds greater than 32 km/h (20 mph). • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test â ABS Module . • Carry out the ABS module self-test. • **Are DTCs C0021:21, 66 and 77 present?**	**Yes** GO to Q7 . **No** The system is operating correctly at this time. The concern may have been caused by air trapped in the hydraulic brake system. CLEAR the DTCs. REPEAT the self-test.
Q7 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C135 .	**Yes** INSTALL a ABS module. REFER to

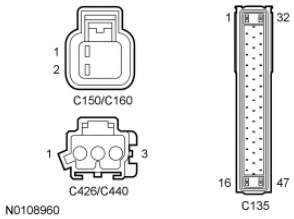
• Using a good light source, carefully inspect ABS module connector C135 for corroded terminals. • Inspect for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each pin location. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Connect: ABS Module C135 . • Make sure the connector seats correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. CLEAR the DTCs. DRIVE the vehicle. REPEAT the self-test. If the DTCs identified in the normal operation of this pinpoint test are retrieved, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) â Hybrid in this section. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test R: DTC C0031:01; C0034:01; C0037:01 or C003A:01

Normal Operation

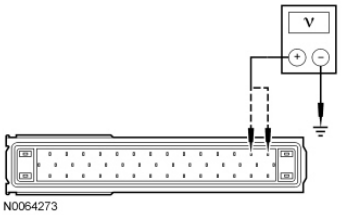
Active wheel speed sensors generate a square wave signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module through 2 wires and a connector at each wheel speed sensor. When the ignition switch is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage through the wheel speed sensors and their circuitry.

Both voltage and ground are supplied to the active wheel speed sensors from the ABS module.

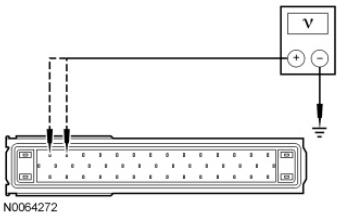


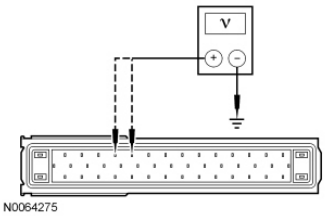
DTC Description	Fault Trigger Conditions
• C0031:01 â Left Front Wheel Speed Sensor: General Electrical Failure	If the left front wheel speed sensor signal current is below 45 mA or above 20 mA for longer than 140 milliseconds, this DTC sets.
• C0034:01 â Right Front Wheel Speed Sensor: General Electrical Failure	If the right front wheel speed sensor signal current is below 45 mA or above 20 mA for longer than 140 milliseconds, this DTC sets.
• C0037:01 â Left Rear Wheel Speed Sensor: General Electrical Failure	If the left rear wheel speed sensor signal current is below 45 mA or above 20 mA for longer than 140 milliseconds, this DTC sets.
• C003A:01 â Right Rear Wheel Speed Sensor: General Electrical Failure	If the right rear wheel speed sensor signal current is below 45 mA or above 20 mA for longer than 140 milliseconds, this DTC sets.

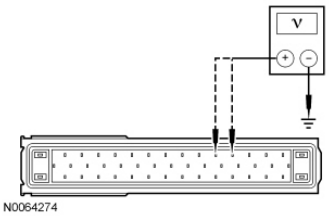
This pinpoint test is intended to diagnose the following:



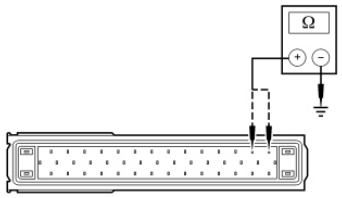
- Wiring, terminals or connectors
- Wheel speed sensor
- ABS module





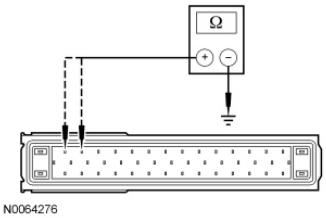


PINPOINT TEST R: DTC C0031:01; C0034:01; C0037:01 OR C003A:01



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

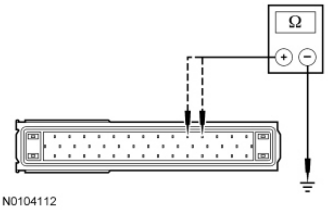
Test Step	Result / Action to Take
R1 VERIFY ALL WIRING CONNECTIONS	
• Disconnect: ABS Module C135 . • Disconnect: Suspect Wheel Speed Sensor . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-33 ♦ C135-34 ♦ C135-36 ♦ C135-37 ♦ C135-42 ♦ C135-43 ♦ C135-45 ♦ C135-46 ♦ Suspect wheel speed sensor, pin-1 ♦ Suspect wheel speed sensor, pin-2 (front sensor) or pin-3 (rear sensor)  • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	**Yes** GO to R2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.



R2 CHECK FOR FAULT REPEATABILITY	
• Connect: ABS Module C155 . • Connect: Suspect Wheel Speed Sensor . • Connect the scan tool. • Ignition ON. • Using the scan tool, clear the ABS module DTCs. • Drive the vehicle at least 20 km/h (12 mph). • Enter the following diagnostic mode on the scan tool: Self Test â ABS Module . • Retrieve and record the ABS module DTCs. • **Are DTCs C0031:01, C0034:01, C0037:01 and/or C003A:01 retrieved?**	**Yes** For DTCs C0031:01 and C0034:01, if the Rotunda Active Wheel Speed Sensor Tester is available, GO to R3 . If the Rotunda Active Wheel Speed Sensor Tester is not available, GO to R5 . For DTCs C0037:01 and C003A:01, GO to R5 . **No** INSPECT the wheel speed sensors, wheel speed sensor wiring and wheel speed sensor tone rings. REPAIR or INSTALL new as necessary. If any other DTCs are retrieved, GO to the ABS Module DTC Chart in this section.
R3 CHECK THE ABS MODULE OUTPUT USING THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
NOTE: The front wheel speed sensor electrical connectors are located behind the wheel well splash shields. The rear wheel speed sensor electrical connectors are located under the rear seat cushion. • Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor . • Connect the Rotunda Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Ignition ON. • Select the correct system polarity on the Rotunda Active Wheel Speed Sensor Tester and turn the power switch to the ON position. • **Is the module output LED illuminated?**	**Yes** GO to R4 . **No** GO to R7 .
R4 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the Rotunda Active Wheel Speed Sensor Tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor â Front or Wheel Speed Sensor â Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the

	self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green, but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. If the tone ring is OK, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor â Front or Wheel Speed Sensor â Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the self-test.
R5 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO POWER	
NOTICE: **No measurements should be taken with the wheel speed sensor connected. Damage to the wheel speed sensor results.** **NOTE:** The front wheel speed sensor electrical connectors are located behind the wheel well splash shields. The rear wheel speed sensor electrical connectors are located under the rear seat cushion. • Ignition OFF. • Disconnect: ABS Module C135 . • Disconnect: Suspect Wheel Speed Sensor . • Ignition ON. • **For DTC C0031:01 (LF)** , measure the voltage between ground and: ♦ ABS module C135-45, circuit VCA03 (VT/WH), harness side. ♦ ABS module C135-46, circuit RCA17 (YE), harness side.  • **For DTC C0034:01 (RF)** , measure the voltage between ground and: ♦ ABS module C135-33, circuit RCA19 (VT), harness side. ♦ ABS module C135-34, circuit VCA05 (GY/VT), harness side.	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to R6 .

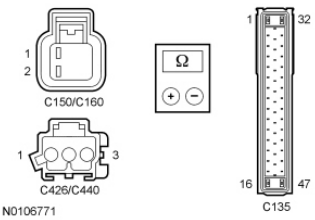
 N0064272 • **For DTC C0037:01 (LR)** , measure the voltage between ground and: ♦ ABS module C135-36, circuit VCA04 (BU/OG), harness side. ♦ ABS module C135-37, circuit RCA18 (BN/GN), harness side.  N0064275 • **For DTC C003A:01 (RR)** , measure the voltage between ground and: ♦ ABS module C135-42, circuit RCA20 (BN), harness side. ♦ ABS module C135-43, circuit VCA06 (WH/OG), harness side.  N0064274 • **Is any voltage present?**	
R6 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO GROUND	
NOTE: Both circuits must be checked for each DTC. • Ignition OFF. • **For DTC C0031:01 (LF)** , measure the resistance between ground and: ♦ ABS module C135-45, circuit VCA03 (VT/WH), harness side. ♦ ABS module C135-46, circuit RCA17 (YE), harness side.	**Yes** GO to R7 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.



- **For DTC C0034:01 (RF)** , measure the resistance between ground and:
  - ♦ ABS module C135-34, circuit VCA05 (GY/VT), harness side.
  - ♦ ABS module C135-33, circuit RCA19 (VT), harness side.

- **For DTC C0037:01 (LR)** , measure the resistance between ground and:
  - ♦ ABS module C135-36, circuit VCA04 (BU/OG), harness side.
  - ♦ ABS module C135-37, circuit RCA18 (BN/GN), harness side.

- **For DTC C003A:01 (RR)** , measure the resistance between ground and:
  - ♦ ABS module C135-43, circuit VCA06 (WH/OG), harness side.
  - ♦ ABS module C135-42, circuit RCA20 (BN), harness side.



- **Are the resistances greater than 10,000 ohms?**

R7 CHECK THE WHEEL SPEED CIRCUITS FOR AN OPEN	

NOTE: The front wheel speed sensor electrical connectors are located behind the wheel well splash shields. The rear wheel speed sensor electrical connectors are located under the rear seat cushion.

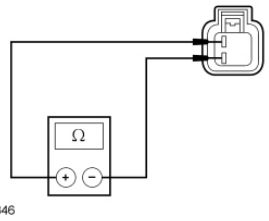
- Ignition OFF.
- Disconnect: ABS Module C135 .
- Disconnect: Suspect Wheel Speed Sensor .
- Measure the resistance between ABS module connector C135, harness side and the suspect wheel speed sensor connector, harness side as indicated in the following chart:

ABS Module	Circuit	Wheel Speed Sensor
DTC C0031:01 (LF)		
C135-45	VCA03 (VT/WH)	C150-1
C135-46	RCA17 (YE)	C150-2
DTC C0034:01 (RF)		
C135-34	VCA05 (GY/VT)	C160-1
C135-33	RCA19 (VT)	C160-2
DTC C0037:01 (LR)		
C135-36	VCA04 (BU/OG)	C440-3
C135-37	RCA18 (BN/GN)	C440-1
DTC C003A:01 (RR)		
C135-43	VCA06 (WH/OG)	C426-3
C135-42	RCA20 (BN)	C426-1

- **Are the resistances less than 5 ohms?**

Yes
GO to R8 .

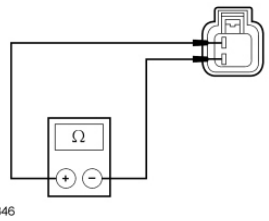
No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.



R8 CHECK FOR SHORTED WHEEL SPEED SENSOR CIRCUITS

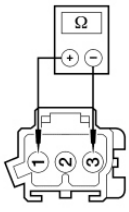
- **For DTC C0031:01 (LF)** , measure the resistance between:
  - ♦ LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit

Yes
GO to R9 .



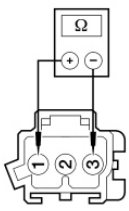
No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

RCA17 (YE), harness side.



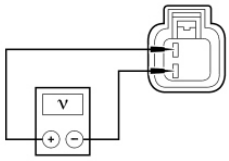
N0008846

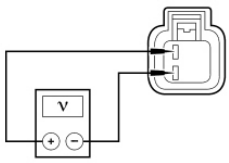
- **For DTC C0034:01 (RF)** , measure the resistance between:
  - ♦ RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.

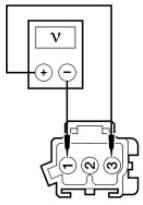


N0008846

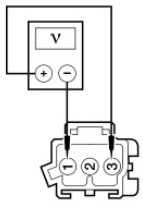
- **For DTC C0037:01 (LR)** , measure the resistance between:
  - ♦ LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.







N0086936



- **For DTC C003A:01 (RR)** , measure the resistance between:
  - ♦ RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.

N0086936

- **Is the resistance greater 10,000 ohms?**

R9 CHECK FOR CORRECT ABS MODULE OUTPUT	
• Connect: ABS Module C135 . • Ignition ON. • **For DTC C0031:01 (LF)** , measure the voltage between: ♦ LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.  N0086939 • **For DTC C0034:01 (RF)** , measure the voltage between: ♦ RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.  N0086939 • **For DTC C0037:01 (LR)** , measure the voltage between: ♦ LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.  N0106658 • **For DTC C003A:01 (RR)** , measure the voltage between: ♦ RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.	**Yes** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor â Front , Wheel Speed Sensor â Rear, Front Wheel Drive (FWD) or Wheel Speed Sensor â Rear, All Wheel Drive (AWD) in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to R10 .

 • **Is the voltage greater than 10 volts?**	
R10 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C135 . • Check for: ♦ corrosion ♦ pushed-out pins ♦ spread terminals • Connect: ABS Module C135 . • Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test S: DTC C0030:07; C0031:29, 2F, 64; C0033:07; C0034:29, 2F, 64; C0036:07: C0037:29, 2F, 64; C0039:07; C003A:29, 2F or 64

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

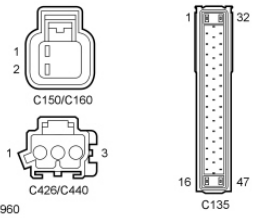
Normal Operation

The wheel speed sensor and sensor ring generate a square wave signal to the ABS module that is proportional to wheel speed. The ABS module compares wheel speed inputs from all wheel speed sensors to determine an impending wheel lockup.

DTC Description	Fault Trigger Conditions
• C0030:07 â Left Front Wheel Speed Sensor: Mechanical Failure	Damage to the wheel speed sensor ring or damage to the wheel bearing causes this DTC to set.
• C0031:29 â Left Front Wheel Speed Sensor: Signal Invalid	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor, a wheel speed sensor that is not mounted properly or mismatched tire sizes.
• C0031:2F â Left Front Wheel Speed Sensor: Signal Erratic	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor or a wheel speed sensor that is not mounted properly.
	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor, a wheel speed sensor

• C0031:64 â Left Front Wheel Speed Sensor: Signal Plausibility Failure	that is not mounted properly or mismatched tire sizes.
• C0033:07 â Right Front Wheel Speed Sensor: Mechanical Failure	Damage to the wheel speed sensor ring or damage to the wheel bearing causes this DTC to set.
• C0034:29 â Right Front Wheel Speed Sensor: Signal Invalid	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor, a wheel speed sensor that is not mounted properly or mismatched tire sizes.
• C0034:2F â Right Front Wheel Speed Sensor: Signal Erratic	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor or a wheel speed sensor that is not mounted properly.
• C0034:64 â Right Front Wheel Speed Sensor: Signal Plausibility Failure	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor, a wheel speed sensor that is not mounted properly or mismatched tire sizes.
• C0036:07 â Left Rear Wheel Speed Sensor: Mechanical Failure	Damage to the wheel speed sensor ring or damage to the wheel bearing causes this DTC to set.
• C0037:29 â Left Rear Wheel Speed Sensor: Signal Invalid	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor, a wheel speed sensor that is not mounted properly or mismatched tire sizes.
• C0037:2F â Left Rear Wheel Speed Sensor: Signal Erratic	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor or a wheel speed sensor that is not mounted properly.
• C0037:64 â Left Rear Wheel Speed Sensor: Signal Plausibility Failure	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor, a wheel speed sensor that is not mounted properly or mismatched tire sizes.
• C0039:07 â Right Rear Wheel Speed Sensor: Mechanical Failure	Damage to the wheel speed sensor ring or damage to the wheel bearing causes this DTC to set.
• C003A:29 â Right Rear Wheel Speed Sensor: Signal Invalid	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor, a wheel speed sensor that is not mounted properly or mismatched tire sizes.
• C003A:2F â Right Rear Wheel Speed Sensor: Signal Erratic	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor or a wheel speed sensor that is not mounted properly.
• C003A:64 â Right Rear Wheel Speed Sensor: Signal Plausibility Failure	This DTC can set by a damaged wheel speed sensor ring, a damaged or defective wheel speed sensor, a wheel speed sensor that is not mounted properly or mismatched tire sizes.

This pinpoint test is intended to diagnose the following:

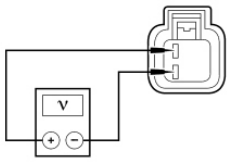


- Wiring, terminals or connectors
- Tire size
- Tire pressure

- Wheel speed sensor
- Wheel speed sensor ring
- Wheel bearing
- ABS module

PINPOINT TEST S: DTC C0030:07; C0031:29, 2F, 64; C0033:07; C0034:29, 2F, 64; C0036:07: C0037:29, 2F, 64; C0039:07; C003A:29, 2F or 64

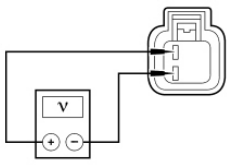
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
S1 VERIFY ALL WIRING CONNECTIONS	
• Disconnect: ABS Module C135 . • Disconnect: Suspect Wheel Speed Sensor . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-33 ♦ C135-34 ♦ C135-36 ♦ C135-37 ♦ C135-42 ♦ C135-43 ♦ C135-45 ♦ C135-46 ♦ Suspect wheel speed sensor, pin-1 ♦ Suspect wheel speed sensor, pin-2 (front sensor) or pin-3 (rear sensor)	**Yes** GO to S2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.

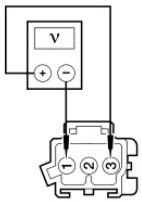
 • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	
S2 CHECK THE DTCs FROM THE SELF-TEST	
• Review the DTCs retrieved and recorded during Inspection and Verification. • **Are DTCs C0031:01; C0034:01; C0037:01 and/or C003A:01 present?**	**Yes** GO to Pinpoint Test P . **No** If DTC C0030:07; C0033:07; C0036:07; or C0039:07 is present, GO to S5 . If DTCs C0031:2F; C0034:2F; C0037:2F; and/or C003A:2F are present, GO to S4 . If DTCs C0031:29, 64; C0034:29, 64; C0037:29, 64; C003A:29 and/or 64 are present, GO to S3 . For all other DTCs, REFER to the ABS Module DTC Chart in this section.
S3 CHECK THE TIRES SIZE AND PRESSURE	
• Verify that all tires and wheels are the same size and that the inflation pressures are correct as indicated on the Vehicle Certification (VC) label. • **Are the wheels and tires OK?**	**Yes** GO to S4 . **No** INSTALL the correct size tire or ADJUST tire pressure as necessary.
S4 MONITOR THE WHEEL SPEED SENSOR PIDs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger â ABS Module . • Drive the vehicle at a speed greater than 20 km/h (12 mph) while monitoring the following PIDs: ♦ Left front wheel speed sensor (LF_WSPD) ♦ Right front wheel speed sensor (RF_WSPD) ♦ Left rear wheel speed sensor (LR_WSPD)	**Yes** CLEAR the DTCs. DRIVE the vehicle. RETRIEVE the DTCs. If DTCs C0031:29, 2F, 64; C0034:29, 2F, 64; C0037:29, 2F, 64; C003A:29, 2F; and/or C003A:64 are present, GO to S14 . **No** GO to S5 .

♦ Right rear wheel speed sensor (RR_WSPD) • **Are the wheel speed PIDs consistent with each other, within 5 km/h (3 mph) and the vehicle speed as indicated on the speedometer?**	
S5 INSPECT THE WHEEL SPEED SENSOR MOUNTING	
• Ignition OFF. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Inspect the wheel speed sensor and fastener for looseness. • **Are the wheel speed sensor and fastener tight?**	**Yes** GO to S7 . **No** TIGHTEN the wheel speed sensor to specification. REFER to Specifications in this section. CLEAR the DTCs. GO to S6 .
S6 RECHECK THE WHEEL SPEED PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger â ABS Module . • Drive the vehicle at a speed greater than 20 km/h (12 mph) while monitoring the following PIDs: ♦ LF_WSPD ♦ RF_WSPD ♦ LR_WSPD ♦ RR_WSPD • **Are the wheel speed PIDs consistent with each other, within 5 km/h (3 mph) and the vehicle speed as indicated on the speedometer?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose wheel speed sensor. **No** GO to S7 .
S7 CHECK THE WHEEL SPEED SENSOR FOR DAMAGE	
• Ignition OFF. • With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • **NOTE:** Examine the wheel speed sensor wire carefully with a good light source. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component. • Inspect the wheel speed sensor and harness for abrasion, broken connector tabs or water intrusion. • **Is the wheel speed sensor and harness OK?**	**Yes** GO to S8 . **No** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor â Front , Wheel Speed Sensor â Rear, Front Wheel Drive (FWD) or Wheel Speed Sensor â Rear, All Wheel Drive (AWD) in this section. CLEAR the DTCs. REPEAT the self-test.



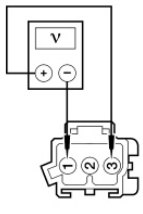
S8 CHECK FOR WHEEL SPEED SENSOR RING DAMAGE	
• Inspect the wheel speed sensor ring for damaged or missing teeth. Rotate the wheel to verify that no teeth are missing. • **Is the wheel speed sensor ring OK?**	**Yes** GO to S9 . **No** INSTALL a new halfshaft. For front halfshafts, REFER to Section 205-04 . For rear halfshafts, REFER to Section 205-05 . CLEAR the DTCs. REPEAT the self-test.
S9 CHECK FOR WHEEL BEARING DAMAGE	
• Inspect the wheel bearings for damage. • **Are the wheel bearings OK?**	**Yes** For front wheel speed sensor concerns, if the Rotunda Active Wheel Speed Sensor Tester is available, GO to S10 . If the Rotunda Active Wheel Speed Sensor Tester is not available, GO to S12 . For rear wheel speed sensor concerns, GO to S12 . **No** INSTALL new wheel bearings as necessary. REFER to Section 204-01 for front wheel bearings or Section 204-02 for rear wheel bearings. CLEAR the DTCs. REPEAT the self-test.
S10 CHECK THE ABS MODULE OUTPUT USING THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
NOTE: The front wheel speed sensor electrical connectors are located behind the wheel well splash shields. The rear wheel speed sensor electrical connectors are located under the rear seat cushion. • Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor . • Connect the Rotunda Active Wheel Speed Sensor Tester to the wheel speed sensor connectors. • Ignition ON. • Select the correct system polarity on the Rotunda Active Wheel Speed Sensor Tester and turn the power switch to the ON position. • **Is the module output LED illuminated?**	**Yes** GO to S11 . **No** GO to S14 .

S11 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE ROTUNDA ACTIVE WHEEL SPEED SENSOR TESTER	
• Raise the suspect wheel until it can spin freely. Refer to Section 100-02 . • While monitoring the Rotunda Active Wheel Speed Sensor Tester, slowly spin the suspect wheel. • **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. **No** If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor â Front or Wheel Speed Sensor â Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the self-test. If the current level LED is not illuminated and the sensor output LEDs illuminate green, but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. If the tone ring is OK, INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor â Front or Wheel Speed Sensor â Rear, Front Wheel Drive (FWD) in this section. CLEAR the DTCs. REPEAT the self-test.
S12 CHECK FOR CORRECT ABS MODULE OUTPUT	
NOTE: The front wheel speed sensor electrical connectors are located behind the wheel well splash shields. The rear wheel speed sensor electrical connectors are located under the rear seat cushion. • Ignition OFF. • Disconnect: Suspect Wheel Speed Sensor . • Ignition ON. • **For LF wheel speed sensor DTCs** , measure the voltage between: ♦ LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.	**Yes** GO to S13 . **No** GO to S14 .



N0086939

- **For RF wheel speed sensor DTCs** , measure the voltage between:
  - ♦ RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.



N0086939

- **For LR wheel speed sensor DTCs** , measure the voltage between:
  - ♦ LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.

N0106658

- **For RR wheel speed sensor DTCs** , measure the voltage between:
  - ♦ RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.

 N0106658 • **Is the voltage greater than 10 volts?**	
S13 CHECK THE WHEEL SPEED SENSOR OUTPUT	
NOTE: The front wheel speed sensor electrical connectors are located behind the wheel well splash shields. The rear wheel speed sensor electrical connectors are located under the rear seat cushion. • Disconnect: Suspect Wheel Speed Sensor . • **For LF wheel speed sensor DTCs** : ♦ connect the meter between LF wheel speed sensor C150-1, circuit RCA17 (YE), harness side and LF wheel speed sensor pin-1, component side. ♦ connect a fused jumper wire between LF wheel speed sensor C150-2, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor pin-2, component side. • **For RF wheel speed sensor DTCs** : ♦ connect the meter between RF wheel speed sensor C160-1, circuit RCA19 (VT), harness side and RF wheel speed sensor pin-1, component side. ♦ connect a fused jumper wire between RF wheel speed sensor C160-2, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor pin-2, component side. • **For LR wheel speed sensor DTCs** : ♦ connect the meter between LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor pin-1, component side. ♦ connect a fused jumper wire between LR wheel speed sensor C440-3, circuit VCA04	**Yes** GO to S14 . **No** INSTALL a new wheel speed sensor. REFER to Wheel Speed Sensor â Front , Wheel Speed Sensor â Rear, Front Wheel Drive (FWD) or Wheel Speed Sensor â Rear, All Wheel Drive (AWD) in this section. CLEAR the DTCs. REPEAT the self-test.

(BU/OG), harness side and LR wheel speed sensor pin-3, component side. • **For RR wheel speed sensor DTCs** : ♦ connect the meter between RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side and RR wheel speed sensor pin-1, component side. ♦ connect a fused jumper wire between RR wheel speed sensor C426-3, circuit VAC06 (WH/OG), harness side and RR wheel speed sensor pin-3, component side. • Ignition ON. • Measure the current while slightly rotating the wheel, using incremental turns. • **Does the automotive meter switch between the low state (5 to 8 mA) and the high state (12 to 16 mA)?**	
S14 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C135 . • Check for: ♦ corrosion ♦ pushed-out pins ♦ spread terminals • Connect: ABS Module C135 . • Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

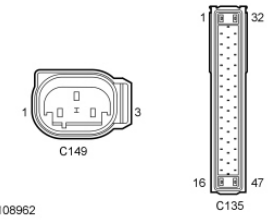
Pinpoint Test T: DTCs C0048:11, 12, 64; C1108:11, 12 and 1C

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

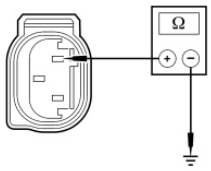
Normal Operation

The booster travel sensor provides the ABS module with an analog signal indicating the position of the diaphragm inside the brake booster. The ABS module supplies a 5-volt reference voltage to the sensor and ground. The ABS module receives a varying voltage proportional to the position of the diaphragm inside the brake booster. The ABS module monitors the brake booster travel sensor circuits for circuit faults. The ABS module compares the brake booster travel sensor signal with other brake system inputs to verify that the brake booster travel sensor signal is accurate. If a brake booster travel sensor circuit or signal fault is detected, the red brake warning indicator illuminates.

DTC Description	Fault Trigger Conditions
• C0048:11 â Brake Booster Travel Sensor: Circuit Short To Ground	If circuit VCB34 (WH/BU) is open or shorted to ground or if the ABS module is faulted internally, this DTC sets.
• C0048:12 â Brake Booster Travel Sensor: Circuit Short to Battery	If the circuit is open, or if the ABS module is faulted internally, this DTC sets.
• C0048:64 â Brake Booster Travel Sensor: Signal Plausibility Failure	This DTC can set if the booster travel sensor is improperly mounted, if the booster travel sensor is faulted internally or if the ABS module is faulted internally. This DTC can also set as a result of other brake booster travel sensor faults. All other brake booster travel sensor DTCs should be diagnosed prior to diagnosing DTC C0048:64.
• C1108:11 â Pedal Sensor(s) (Booster Travel Sensor) Supply Voltage: Circuit Short to Ground	This DTC is set if the brake booster travel sensor supply circuit is shorted ground, if the booster travel sensor is shorted internally or if the ABS module is faulted internally.
• C1108:12 â Pedal Sensor(s) (Booster Travel Sensor) Supply Voltage: Circuit Short to Battery	This DTC is set if the brake booster travel sensor supply circuit is shorted voltage, if the booster travel sensor is shorted internally or if the ABS module is faulted internally.
• C1108:1C â Pedal Sensor(s) (Booster Travel Sensor) Supply Voltage: Circuit Voltage Out of Range	This DTC can set as a result of other brake booster travel sensor circuit faults or if the ABS module is faulted internally. All other booster travel sensor DTCs should be diagnosed prior to diagnosing DTC C1108:1C.



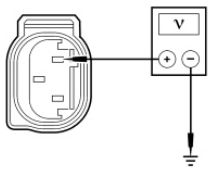
This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Booster travel sensor
- ABS module

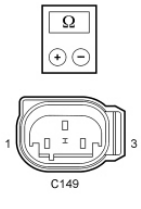
PINPOINT TEST T: DTCs C0048:11, 12, 64; C1108:11, 12 and 1C

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



Test Step	Result / Action to Take
T1 VERIFY ALL WIRING CONNECTIONS	

• Disconnect: ABS Module C135 . • Disconnect: Brake Booster Travel Sensor C149 . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-26 ♦ C135-27 ♦ C135-38 ♦ C149-1 ♦ C149-2 ♦ C149-3  • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	**Yes** GO to T2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.
T2 CHECK THE DTCs FROM THE SELF-TEST	
• Review the DTCs retrieved and recorded during Inspection and Verification. • **Is DTC C0048:11, 12 or 64 present?**	**Yes** If DTC C0048:11 is present, GO to T3 . If DTC C0048:12 is present, GO to T4 . If only DTC C0048:64 is present, GO to T5 . **No** If DTC C1108:11 is present, GO to T8 . If DTC C1108:12 is present, GO to T7 . If only DTC C1108:1C is present, GO to T10 . For all other DTCs, REFER to the ABS Module DTC Chart in this section.
T3 CHECK THE SENSOR SIGNAL RETURN CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Booster Travel Sensor C149 . • Disconnect: ABS Module C135 . • Measure the resistance between brake booster travel sensor C149-3, circuit VCB34 (WH/BU), harness side and ground.	**Yes** GO to T5 . **No** REPAIR circuit VCB34 (WH/BU). CLEAR the DTCs. REPEAT the self-test.



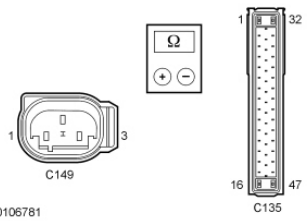
N0088577

- **Is the resistance greater than 10,000 ohms?**

T4 CHECK THE SENSOR SIGNAL RETURN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Booster Travel Sensor C149 . • Disconnect: ABS Module C135 . • Ignition ON. • Measure the voltage between brake booster travel sensor C149-3, circuit VCB34 (WH/BU), harness side and ground.  N0088578 • **Is any voltage present?**	**Yes** REPAIR circuit VCB34 (WH/BU). CLEAR the DTCs. REPEAT the self-test. **No** GO to T5 .
T5 CHECK ALL SENSOR CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Disconnect: Booster Travel Sensor C149 . • Disconnect: ABS Module C135 . • Measure the resistance between brake booster travel sensor C149 pins, harness side, as indicated in the following chart:	**Yes** GO to T6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

Brake Booster Travel Sensor	Circuit	Brake Booster Travel Sensor
C149-1	CCB33 (GY/OG)/ RCB33 (VT/GY)	C149-2
C149-1	CCB33 (GY/OG)/	C149-3

	VCB34 (WH/BU)	
C149-2	VCB34 (WH/BU)/ RCB33 (VT/GY)	C149-3

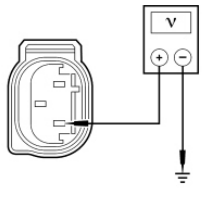


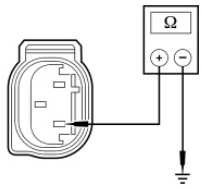
- **Are the resistances greater than 10,000 ohms?**

T6 CHECK ALL SENSOR CIRCUITS FOR AN OPEN

- Measure the resistance between ABS module C135, harness side and brake booster travel sensor C149, harness side as indicated in the following chart:

ABS Module	Circuit	Brake Booster Travel Sensor
C135-26	CCB33 (GY/OG)	C149-1
C135-27	RCB33 (VT/GY)	C149-2
C135-38	VCB34 (WH/BU)	C149-3





- **Are the resistances less than 5 ohms?**

Yes
If only DTC C0048:64 was retrieved from the self-test, INSPECT the installation of the sensor. CORRECT the installation as necessary.

If the sensor is correctly installed, INSTALL a new brake booster travel sensor. REFER to Booster Travel Sensor in Section 206-07 . For DTCs C0048:11 and C0048:12, GO to T9 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

T7 CHECK THE SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

• Ignition OFF. • Disconnect: Booster Travel Sensor C149 . • Disconnect: ABS Module C135 . • Ignition ON. • Measure the voltage between the brake booster travel sensor C149-1, circuit CCB33 (GY/OG), harness side and ground.  N0088580 • **Is any voltage present?**	**Yes** REPAIR circuit CCB33 (GY/OG). CLEAR the DTCs. REPEAT the self-test. **No** GO to T9 .
T8 CHECK THE SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Booster Travel Sensor C149 . • Disconnect: ABS Module C135 . • Measure the resistance between the brake booster travel sensor C149-1, circuit CCB33 (GY/OG), harness side and ground.  N0088581 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to T9 . **No** REPAIR circuit CCB33 (GY/OG). CLEAR the DTCs. REPEAT the self-test.
T9 CHECK THE BOOSTER TRAVEL SENSOR INSTALLATION	
• Inspect the installation of the booster travel sensor to the brake booster. Verify the booster travel is securely attached to the booster and that the booster and booster travel sensor are free of damage. • **Is the booster travel sensor installed correctly and are the sensor and booster free of any damage?**	**Yes** GO to T10 . **No** INSTALL a new brake booster travel sensor and/or brake booster as necessary. REFER to Booster Travel Sensor and/or Brake Booster in Section 206-07 .
T10 CHECK THE BOOSTER TRAVEL SENSOR (BRKBST_MEMB) PID	
• Connect: Booster Travel Sensor C149 . • Connect: ABS Module C135 .	**Yes** CLEAR the DTCs. DRIVE the vehicle. REPEAT the self-test. If any of the DTCs

• Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger â ABS Module . • Monitor the BRKBST_MEMB PID while applying and releasing the brake pedal. • **Does the PID value increase when the brake pedal is pressed and decrease when the brake pedal is released?**	identified in the normal operation of this pinpoint test return, GO to T11 . **No** INSTALL a new brake booster travel sensor. REFER to Booster Travel Sensor in Section 206-07 .
T11 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C135 . • Check for: ♦ corrosion ♦ pushed-out pins ♦ spread terminals • Connect: ABS Module C135 . • Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

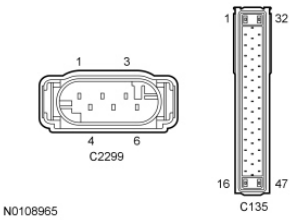
Pinpoint Test U: DTCs C100A:62; C100D:21, 22; C100E:21, 22 and C100F:11, 12

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

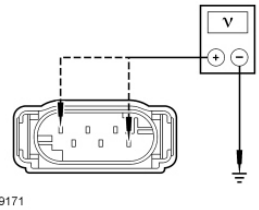
Normal Operation

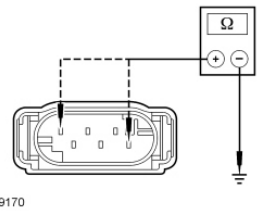
The ABS module uses input from the brake pedal angle sensor to determine the amount of deceleration the driver is requesting. The brake pedal angle sensor utilizes 2 Hall-effect sensors that provide redundant signals indicating the position of the brake pedal. The ABS module provides a 5-volt reverence voltage used by both of the sensors. The ABS module provides a signal return common to both sensors.

DTC Description	Fault Trigger Conditions
• C100A:62 â Brake Pedal Angle Sensor: Signal Compare Failure	This DTC sets if 1 of the 2 sensors inside the brake pedal angle sensor is inconsistent with the other or if the ABS module is faulted internally. This DTC can set as a result of other DTCs indicating a brake pedal angle sensor circuit fault. If DTCs C100D:21, 22 or C100E:21, 22 are present along with this DTC, diagnose them first.
• C100D:21 â Brake Pedal Angle Sensor Circuit 1: Signal Amplitude â © Minimum	If the voltage is less than 300 millivolts or if the ABS module is faulted internally, this DTC can set. This DTC can set as a result of a brake pedal sensor supply or signal return circuit fault (such as an open circuit). Diagnose DTC C100F:11 or 12 first if it is retrieved along with this DTC.
• C100D:22 â Brake Pedal Angle	If the voltage is greater than 4.72 volts, this DTC can set. This DTC can set as a result of a brake pedal angle sensor supply or signal return circuit fault (such as an open circuit), an internal brake pedal angle sensor fault or an internal ABS

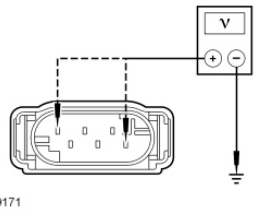


Sensor Circuit 1: Signal Amplitude > Maximum	module fault. Diagnose DTC C100F:11 or 12 first if it is retrieved along with this DTC.
• C100E:21 â Brake Pedal Angle Sensor Circuit 2: Signal Amplitude â © Minimum	If the voltage is less than 300 millivolts, this DTC can set. This DTC can set as a result of a brake pedal angle sensor supply or signal return circuit fault (such as an open circuit), an internal brake pedal angle sensor fault or an internal ABS module fault. Diagnose DTC C100F:11 or 12 first if it is retrieved along with this DTC.
• C100E:22 â Brake Pedal Angle Sensor Circuit 2: Signal Amplitude > Maximum	If the voltage is greater than 4.72 volts, this DTC can set. This DTC can set as a result of a brake pedal angle sensor supply or signal return circuit fault (such as an open circuit), an internal brake pedal angle sensor fault or an internal ABS module fault. Diagnose DTC C100F:11 or 12 first if it is retrieved along with this DTC.
• C100F:11 â Brake Pedal Angle Sensor Supply: Circuit Short To Ground	If the circuit is shorted to ground, this DTC sets. The ABS module supplies power to both of the sensors inside the brake pedal angle sensor. Correct this DTC before diagnosing DTCs C100D:21, 22 or C100E:21, 22.
• C100F:12 â Brake Pedal Angle Sensor Supply: Circuit Short To Battery	If the circuit is shorted to voltage, this DTC sets. Correct this DTC before diagnosing DTCs C100D:21, 22 or C100E:21, 22.

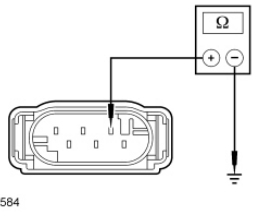


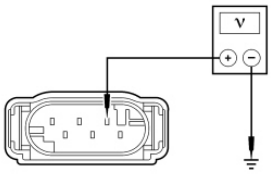


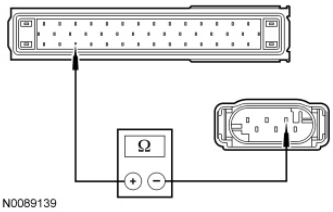
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Brake pedal angle sensor
- ABS module



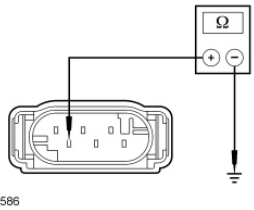
PINPOINT TEST U: DTCs C100A:62; C100D:21, 22; C100E:21, 22 AND C100F:11, 12

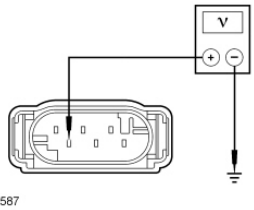




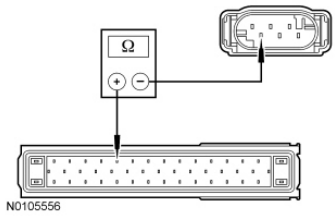


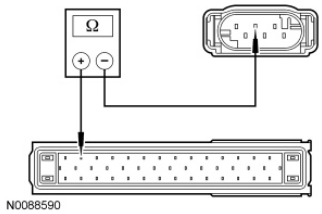
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

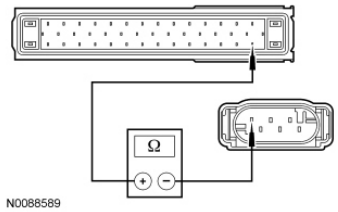




Test Step	Result / Action to Take
U1 VERIFY ALL WIRING CONNECTIONS	
• Disconnect: Brake Pedal Angle Sensor C2299 . • Disconnect: ABS Module C135 . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins.	**Yes** GO to U2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.







Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-2 ♦ C135-11 ♦ C135-14 ♦ C135-44 ♦ C2299-1 ♦ C2299-2 ♦ C2299-3 ♦ C2299-4 ♦ C2299-5 ♦ C2299-6 • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information.  • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	
U2 CHECK THE DTCs FROM THE ABS MODULE	
• Review the DTCs retrieved and recorded during Inspection and Verification. • **Is DTC C100F:11 or 12 present?**	**Yes** If DTC C100F:11 or 12 is present, GO to U3 . **No** If DTC C100D:21 is present, GO to U10 . If DTC C100D:22 is present, GO to U11 . If DTC C100E:21 is present, GO to U7 . If DTC C100E:22 is present, GO to U8 . If only DTC C100A:62 is present, GO to U6 . If DTCs C100D:22 **and** C100E:22 are present, GO to U13 . For all other ABS module DTCs, REFER to the ABS Module DTC Chart in this section.
U3 CHECK THE VOLTAGE SUPPLY TO THE PEDAL ANGLE SENSOR	

• Connect: ABS Module C135 . • Ignition ON. • Measure the voltage between ground and: ♦ brake pedal angle sensor C2299-1, circuit LCA27 (BN/WH), harness side. ♦ brake pedal angle sensor C2299-6, circuit LCA27 (BN/WH), harness side.  N0099171 • **Are the voltages approximately 5 volts?**	**Yes** INSTALL a new brake pedal angle sensor. REFER to Brake Pedal Angle Sensor in Section 206-06 . **No** If the voltage is less than 5 volts, GO to U4 . If the voltage is greater than 5 volts, GO to U5 .
U4 CHECK THE SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: ABS Module C135 . • Measure the resistance between ground and: ♦ brake pedal angle sensor C2299-1, circuit LCA27 (BN/WH), harness side. ♦ brake pedal angle sensor C2299-6, circuit LCA27 (BN/WH), harness side.  N0099170 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No** REPAIR circuit LCA27 (BN/WH). CLEAR the DTCs. REPEAT the self-test.
U5 CHECK THE SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: ABS Module C135 . • Ignition ON. • Measure the voltage between ground and: ♦ brake pedal angle sensor C2299-1, circuit LCA27 (BN/WH), harness side. ♦ brake pedal angle sensor C2299-6, circuit LCA27 (BN/WH), harness side.  N0099171 • **Is any voltage present?**	**Yes** REPAIR circuit LCA27 (BN/WH). CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation.
U6 CHECK THE BRAKE PEDAL ANGLE SENSOR PIDs	
• Connect: ABS Module C135 . • Connect: Brake Pedal Angle Sensor C2299 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger â ABS Module . • Monitor the following PIDs while applying and releasing the brake pedal: ♦ Brake Pedal Angle Sensor Circuit 1 (BRK_PDL) ♦ Brake Pedal Angle Sensor Circuit 2 (BRK_PDL_B) • **Do the PID values reflect the movement of the brake pedal?**	**Yes** CLEAR the DTCs. REPEAT the self-test. If DTC C100A:62 returns, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No** If the BRK_PDL PID does not reflect the movement of the brake pedal, GO to U10 . If the BRK_PDL_B PID does not reflect the movement of the brake pedal, GO to U7 .
U7 CHECK THE SENSOR SIGNAL 1 RETURN CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Brake Pedal Angle Sensor C2299 (if not previously disconnected) . • Disconnect: ABS Module C135 (if not previously disconnected) . • Measure the resistance between brake pedal angle sensor C2229-3, circuit VCA30 (YE/VT), harness side and ground.	**Yes** GO to U9 . **No** REPAIR circuit VCA30 (YE/VT). CLEAR the DTCs. REPEAT the self-test.

 N0088584 • **Is the resistance greater than 10,000 ohms?**	
U8 CHECK THE SENSOR SIGNAL 1 RETURN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Brake Pedal Angle Sensor C2299 . • Disconnect: ABS Module C135 . • Ignition ON. • Measure the voltage between brake pedal angle sensor C2299-3, circuit VCA30 (YE/VT), harness side and ground.  N0080073 • **Is any voltage present?**	**Yes** REPAIR circuit VCA30 (YE/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to U13 .
U9 CHECK THE SENSOR SIGNAL 1 RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between brake pedal angle sensor C2299-3, circuit VCA30 (YE/VT), harness side and ABS module C135-44, circuit VCA30 (YE/VT), harness side.  N0089139 • **Is the resistance less than 5 ohms?**	**Yes** GO to U14 . **No** REPAIR circuit VCA30 (YE/VT). CLEAR the DTCs. REPEAT the self-test.

U10 CHECK THE SENSOR SIGNAL 2 RETURN CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Brake Pedal Angle Sensor C2299 (if not previously disconnected) . • Disconnect: ABS Module C135 (if not previously disconnected) . • Measure the resistance between brake pedal angle sensor C2299-4, circuit VCA43 (WH/GN), harness side and ground.  N0088586 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to U12 . **No** REPAIR circuit VCA43 (WH/GN). CLEAR the DTCs. REPEAT the self-test.
U11 CHECK THE SENSOR SIGNAL 2 RETURN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between brake pedal angle sensor C2299-4, circuit VCA43 (WH/GN), harness side and ground.  N0088587 • **Is any voltage present?**	**Yes** REPAIR circuit VCA43 (WH/GN). CLEAR the DTCs. REPEAT the self-test. **No** GO to U13 .
U12 CHECK THE SENSOR SIGNAL 2 RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between brake pedal angle sensor C2299-4, circuit VCA43 (WH/GN), harness side and ABS module C135-11, circuit VCA43 (WH/GN), harness side.	**Yes** GO to U14 . **No** REPAIR circuit VCA43 (WH/GN). CLEAR the DTCs. REPEAT the self-test.

 N0105556 • **Is the resistance less than 5 ohms?**	
U13 CHECK THE SENSOR GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between brake pedal angle sensor C2299-2, circuit RCA27 (WH), harness side and ABS module C135-14, circuit RCA27 (WH), harness side.  N0088590 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new brake pedal angle sensor. REFER to Brake Pedal Angle Sensor in Section 206-06 . **No** REPAIR circuit RCA27 (WH). CLEAR the DTCs. REPEAT the self-test.
U14 CHECK THE SENSOR VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Measure the resistance between brake pedal angle sensor C2299-1, circuit LCA27 (BN/WH), harness side and ABS module C135-2, circuit LCA27 (BN/WH), harness side.  N0088589 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new brake pedal angle sensor. REFER to Brake Pedal Angle Sensor in Section 206-06 . **No** REPAIR circuit LCA27 (BN/WH). CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test V: DTCs C1011:1C, 1F, 67 and C1012:01

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

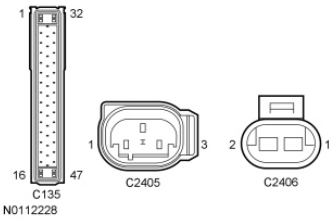
Normal Operation

The brake pedal feel simulator cut-off solenoid valve and brake pedal feel simulator cut-off pressure sensor are located within the brake pedal feel simulator, which is attached to the brake pedal assembly. The ABS module applies a Pulse Width Modulated (PWM) ground signal to the brake pedal feel simulator cut-off solenoid valve to increase the resistance felt when the driver applies the brake pedal. The ABS module uses input from the brake pedal feel simulator cut-off valve pressure sensor to verify that the brake pedal feel simulator cut-off solenoid valve is functioning properly. If the ABS module detects a fault with a brake system component that would adversely affect brake-by-wire operation, the module removes power from the brake pedal feel simulator cut-off valve solenoid, relieving simulator fluid pressure.

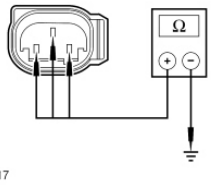
The ABS module provides power to the brake pedal feel simulator cut-off valve solenoid.

The ABS module provides the brake pedal feel simulator cut-off pressure sensor a 5-volt reference voltage. The brake pedal feel simulator provides a signal voltage proportional to the fluid pressure in the brake pedal feel simulator cut-off device to the ABS module. The ABS module provides a signal return for brake pedal feel simulator cut-off pressure sensor.

Both the brake pedal feel simulator cut-off solenoid valve and brake pedal feel simulator cut-off pressure sensor are internal to the brake pedal feel simulator and cannot be serviced separately. If a new brake pedal feel simulator is needed, a new brake pedal assembly must be installed.

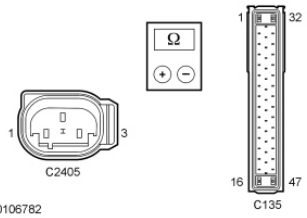


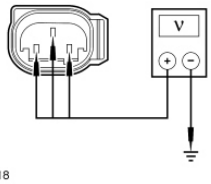
DTC Description	Fault Trigger Conditions
• C1011:1C â Brake Pedal Feel Simulator Cut-Off Pressure Sensor: Circuit Voltage Out of Range	If the brake pedal feel simulator cut-off pressure sensor circuits are intermittently shorted to ground, shorted to voltage or have high resistance, this DTC sets.
• C1011:1F â Brake Pedal Feel Simulator Cut-Off Pressure Sensor: Circuit Intermittent	If the brake pedal feel simulator cut-off pressure sensor circuits are shorted to ground, shorted to voltage or have high resistance, this DTC sets.
• C1011:67 â Brake Pedal Feel Simulator Cut-Off Pressure Sensor: Signal Incorrect After Event	If the test signal produced by the brake pedal feel simulator cut-off pressure sensor is incorrect, this DTC sets.
• C1012:01 â Brake Pedal Feel Simulator Cut-Off Valve Solenoid: General Electrical Failure	If the brake pedal feel simulator cut-off valve solenoid circuits are shorted to ground, shorted to power or have high resistance or if the brake pedal feel simulator cut-off valve solenoid is shorted internally, this DTC sets.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Brake pedal feel simulator cut-off pressure sensor
- Brake pedal feel simulator valve solenoid
- ABS module





PINPOINT TEST V: DTCs C1011:1C, 1F, 67 AND C1012:01

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
V1 VERIFY ALL WIRING CONNECTIONS	
• Disconnect: ABS Module C135 . • Disconnect: Brake Pedal Feel Simulator Cut-Off Pressure Sensor C2405 . • Disconnect: Brake Pedal Feel Simulator Cut-Off Valve Solenoid C2406 . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-5 ♦ C135-40 ♦ C135-41 ♦ C2405-1 ♦ C2405-2 ♦ C2405-3 ♦ C2406-1 ♦ C2406-2  • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	**Yes** GO to V2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.
V2 CHECK THE DTCs FROM THE ABS MODULE SELF-TEST	
• Review the DTCs retrieved and recorded during Inspection and Verification. • **Is DTC C1011:1C, 1F, 67 or C1012:01 present?**	**Yes** If DTC C1011:1C, 1F, or 67 is present, GO to V3 . If DTC C1012:01 is present, GO to V8 .

	No For all other ABS module DTCs, REFER to the ABS Module DTC Chart in this section.
V3 CHECK THE BRAKE PEDAL FEEL SIMULATOR CUT-OFF PRESSURE SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and: ♦ brake pedal feel simulator cut-off pressure sensor C2405-1, circuit RCA16 (BU/BN), harness side. ♦ brake pedal feel simulator cut-off pressure sensor C2405-2, circuit VCA13 (YE/BU), harness side. ♦ brake pedal feel simulator cut-off pressure sensor C2405-3, circuit LCA16 (GN), harness side.  N0093117 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to V4 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
V4 CHECK THE BRAKE FLUID PRESSURE SENSOR CIRCUITS FOR AN OPEN	
• Measure the resistance between ABS module C135, harness side and brake pedal feel simulator cut-off pressure sensor C2405, harness side as indicated in the following chart:	**Yes** GO to V5 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

ABS Module	Circuit	Brake Pedal Feel Simulator Cut-Off Pressure Sensor
C135-5	LCA16 (GN)	C2405-3
C135-41	VCA13 (YE/BU)	C2405-2
C135-40	RCA16 (BU/BN)	C2405-1

 • **Are the resistances less than 5 ohms?**	
V5 CHECK THE BRAKE PEDAL FEEL SIMULATOR CUT-OFF PRESSURE SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ brake pedal feel simulator cut-off pressure sensor C2405-1, circuit RCA16 (BU/BN), harness side. ♦ brake pedal feel simulator cut-off pressure sensor C2405-2, circuit VCA13 (YE/BU), harness side. ♦ brake pedal feel simulator cut-off pressure sensor C2405-3, circuit LCA16 (GN), harness side.  • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to V6 .
V6 CHECK THE BRAKE PEDAL FEEL SIMULATOR CUT-OFF PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between brake pedal feel simulator cut-off pressure sensor C2405 pins, harness side, as indicated in the following chart:	**Yes** GO to V7 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

Brake Pedal Feel Simulator Cut-off Pressure Sensor	Circuit	Brake Pedal Feel Simulator Cut-off Pressure Sensor
C2405-1	RCA16 (BU/BN)/ VCA13 (YE/BU)	C2405-2
C2405-1	RCA16 (BU/BN)/	C2405-3

	LCA16 (GN)	
C2405-2	VCA13 (YE/BU)/ LCA16 (GN)	C2405-3

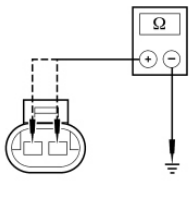
- **Are the resistances greater than 10,000 ohms?**

V7 CHECK THE ABS MODULE OUTPUT

- Ignition OFF.
- Connect: ABS Module C135 .
- Ignition ON.
- Measure the voltage between brake pedal feel simulator cut-off pressure sensor C2405-3, circuit LCA16 (GN), harness side and ground.

- **Is the voltage approximately 5 volts?**

Yes
INSTALL a new brake pedal and bracket assembly. REFER to Brake Pedal and Bracket â Hybrid in Section 206-06 . CLEAR the DTCs. REPEAT the self-test.



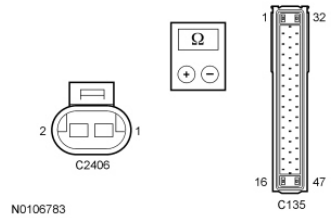
No
GO to V12 .

V8 CHECK THE BRAKE PEDAL FEEL SIMULATOR CUT-OFF VALVE SOLENOID CIRCUITS FOR A SHORT TO GROUND

- Ignition OFF.
- Disconnect: Brake Pedal Feel Simulator Cut-Off Valve Solenoid C2406 .
- Disconnect: ABS Module C135 .
- Measure the resistance between ground and:
  - ♦ brake pedal feel simulator cut-off valve solenoid C2406-1, circuit CCB31 (BU/OG), harness side.
  - ♦ brake pedal feel simulator cut-off valve solenoid C2406-2, circuit CCB32 (GN/VT), harness side.

Yes
GO to V9 .

No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.



- **Is the resistance greater than 10,000 ohms?**

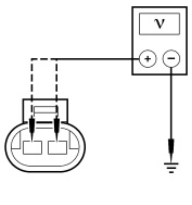
V9 CHECK THE BRAKE PEDAL FEEL SIMULATOR CUT-OFF VALVE SOLENOID CIRCUITS FOR AN OPEN

- Measure the resistance between ABS module C135, harness side and brake pedal feel simulator cut-off valve solenoid C2406, harness side as indicated in the following chart:

ABS Module	Circuit	Brake Pedal Feel Simulator Cut-Off Valve Solenoid
C135-4	CCB31 (BU/OG)	C2406-1
C135-3	CCB32 (GN/VT)	C2406-2

- **Are the resistances less than 5 ohms?**

Yes
GO to V10 .



No
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

V10 CHECK THE BRAKE PEDAL FEEL SIMULATOR CUT-OFF VALVE SOLENOID CIRCUITS FOR A SHORT TO VOLTAGE

- Ignition ON.
- Measure the voltage between ground and:
  - ♦ brake pedal feel simulator cut-off valve solenoid C2406-1, circuit CCB31 (BU/OG), harness side.
  - ♦ brake pedal feel simulator cut-off valve solenoid C2406-2, circuit CCB32 (GN/VT), harness side.

Yes
REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

No
GO to V11 .

 • **Is any voltage present?**	
V11 ISOLATE THE BRAKE PEDAL FEEL SIMULATOR CUT-OFF VALVE SOLENOID	
• Measure the resistance between brake pedal feel simulator cut-off valve solenoid C2406 pin-1 and pin-2, component side. • **Is the resistance between 18 and 20 ohms?**	**Yes** GO to V12 . **No** INSTALL a new brake pedal assembly. REFER to Brake Pedal and Bracket in Section 206-06 .
V12 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C135 . • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C135 . • Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test W: DTC C101A:1C, 62, 64 or C101B:1C

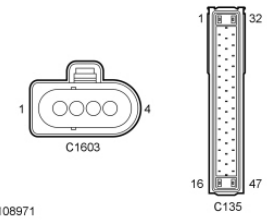
Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

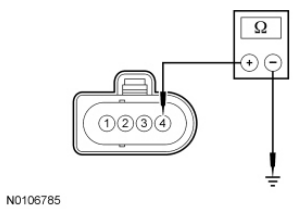
Normal Operation

The vacuum pressure sensor produces 2 signals used by the ABS module to check the integrity of the vacuum lines, hoses and fittings, and to measure the performance of the brake vacuum pump and brake booster. The ABS module provides a 5-volt reference voltage to the vacuum pressure sensor. The ABS module provides a signal return to the vacuum pressure sensor along circuit.

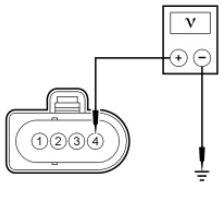
DTC Description	Fault Trigger Conditions
• C101A:1C â Vacuum Pressure Sensor: Circuit Voltage Out of Range	If vacuum pressure sensor circuit is shorted to ground, shorted to voltage or has high resistance, this DTC sets. A short to ground or a short to voltage, or an open on or short to voltage on circuit could cause both DTCs C101A:1C and C101B:1C to set.

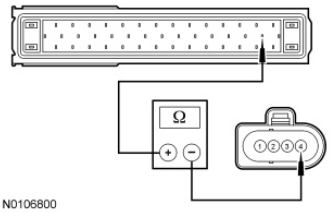
• C101A:62 â Vacuum Pressure Sensor: Signal Compare Failure	If the 2 vacuum pressure signals produced by the vacuum pressure sensor do not match, this DTC sets. If vacuum sensor circuit has high resistance (open circuit), this DTC sets. This DTC can set as a result of DTCs C101A:1C, 64 and C101B:1C.
• C101A:64 â Vacuum Pressure Sensor: Signal Plausibility Failure	If the vacuum pressure sensor signal A, circuit is shorted to vacuum pressure sensor signal B, circuit, this DTC sets.
• C101B:1C â Vacuum Pressure Sensor Circuit B: Circuit Voltage Out of Range	If vacuum pressure sensor circuit is shorted to ground, shorted to voltage or has high resistance, this DTC sets. A short to ground or a short to voltage on circuit, or an open on or short to voltage on circuit could cause both DTCs C101A:1C and C101B:1C to set.

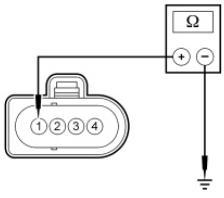




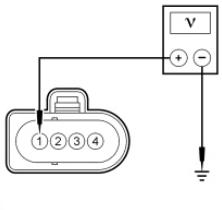
This pinpoint test is intended to diagnose the following:

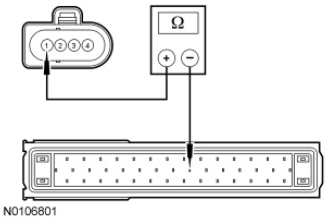


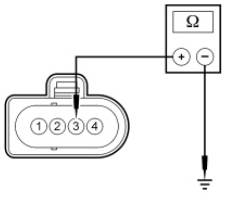




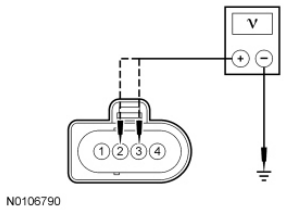
- Wiring, terminals or connectors
- Vacuum pressure sensor
- ABS module

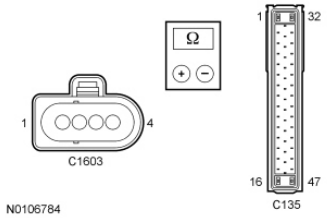






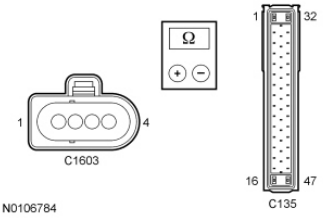
PINPOINT TEST W: C101A:1C, 62, 64 or C101B:1C





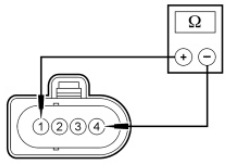
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

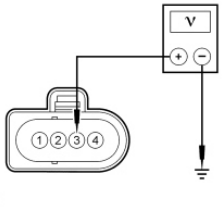
Test Step	Result / Action to Take
W1 VERIFY ALL WIRING CONNECTIONS	
• Ignition OFF. • Disconnect: Vacuum Sensor C1603 . • Disconnect: ABS Module C135 . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-6 ♦ C135-25 ♦ C135-28 ♦ C135-30 ♦ C1603-1 ♦ C1603-2 ♦ C1603-3	**Yes** GO to W2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.



♦ C1603-4 • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information.  • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	
W2 CHECK THE DTCs FROM THE ABS MODULE SELF-TEST	
• Review the DTCs recorded during Inspection and Verification. • **Are both DTCs C101A:1C and C101B:1C present?**	**Yes** GO to W9 . **No** If DTC C101A:1C is present without DTC C101B:1C, GO to W3 . If DTC C101B:1C is present without DTC C101A:1C, GO to W6 . If DTC C101A:64 is present, GO to W13 . If only DTC C101A:62 is present, GO to W11 . For all other DTCs, GO to the ABS Module DTC Chart in this section.
W3 CHECK THE SENSOR SIGNAL 1 RETURN CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between vacuum sensor C1603-4, circuit VCA38 (BN/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to W4 . **No** REPAIR circuit VCA38 (BN/VT). CLEAR the DTCs. REPEAT the self-test.

W4 CHECK THE SENSOR SIGNAL 1 RETURN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between vacuum sensor C1603-4, circuit VCA38 (BN/VT), harness side and ground.  N0106786 • **Is any voltage present?**	**Yes** REPAIR circuit VCA38 (BN/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to W5 .
W5 CHECK THE SENSOR SIGNAL 1 RETURN CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between vacuum sensor C1603-4, circuit VCA38 (BN/VT), harness side and ABS module C135-30, circuit VCA38 (BN/VT), harness side.  N0106800 • **Is the resistance less than 5 ohms?**	**Yes** GO to W9 . **No** REPAIR circuit VCA38 (BN/VT). CLEAR the DTCs. REPEAT the self-test.
W6 CHECK THE SENSOR SIGNAL 2 RETURN CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between vacuum sensor C1603-1, circuit VCA39 (BU/GN), harness side and ground.  N0106787 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to W7 . **No** REPAIR circuit VCA39 (BU/GN). CLEAR the DTCs. REPEAT the self-test.





W7 CHECK THE SENSOR SIGNAL 2 RETURN CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between vacuum sensor C1603-1, circuit VCA39 (BU/GN), harness side and ground.  N0106788 • **Is any voltage present?**	**Yes** REPAIR circuit VCA39 (BU/GN). CLEAR the DTCs. REPEAT the self-test. **No** GO to W8 .
W8 CHECK THE SENSOR SIGNAL 2 RETURN CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between vacuum sensor C1603-1, circuit VCA39 (BU/GN), harness side and ABS module C135-25, circuit VCA39 (BU/GN), harness side.  N0106801 • **Is the resistance less than 5 ohms?**	**Yes** GO to W9 . **No** REPAIR circuit VCA39 (BU/GN). CLEAR the DTCs. REPEAT the self-test.
W9 CHECK THE SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between vacuum sensor C1603-3, circuit LCA37 (YE/OG), harness side and ground.  N0106789 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to W10 . **No** REPAIR circuit LCA37 (YE/OG). CLEAR the DTCs. REPEAT the self-test.

W10 CHECK THE SENSOR VOLTAGE SUPPLY AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ C1603-3, circuit LCA37 (YE/OG), harness side. ♦ C1603-2, circuit RCA37 (WH/BU), harness side.  N0106790 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. **No** GO to W11 .
W11 CHECK THE SENSOR VOLTAGE SUPPLY AND GROUND CIRCUITS FOR AN OPEN	
• Ignition OFF. • Measure the resistance between ABS module C135, harness side and vacuum sensor C1603, harness side as indicated in the following chart: **ABS Module / Circuit / Vacuum Sensor** C135-6 / LCA37 (YE/OG) / C1603-3 C135-28 / RCA37 (WH/BU) / C1603-2  N0106784 • **Are the resistances less than 5 ohms?**	**Yes** If only DTC C101A:62 is present, GO to W12 . For all other DTCs, GO to W13 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
W12 CHECK BOTH SENSOR SIGNAL RETURN CIRCUITS FOR AN OPEN	
• Measure the resistance between ABS module C135, harness side and vacuum sensor C1603, harness side as indicated in the following chart:	**Yes** GO to W13 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

ABS Module	Circuit	Vacuum Sensor
C135-30	VCA38 (BN/VT)	C1603-4
C135-25	VCA39 (BU/GN)	C1603-1

- **Are the resistances less than 5 ohms?**

W13 CHECK BOTH SENSOR SIGNAL RETURN CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between vacuum sensor C1603-1, circuit VCA39 (BU/GN), harness side and ABS module C1603-4, circuit VCA38 (BN/VT), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to W14 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.
W14 CHECK ABS MODULE OUTPUT	
• Connect: ABS Module C135 . • Ignition ON. • Measure the voltage between vacuum sensor C1603-3, circuit LCA37 (YE/OG) and ground.  • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new vacuum sensor. REFER to Section 206-07 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. REPEAT the self-test.

Pinpoint Test X: DTCs C101C:01 and 71

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

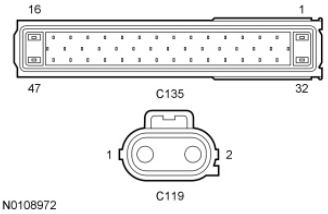
Normal Operation

When the combustion engine is not running, the electric vacuum pump is utilized to maintain a vacuum inside the brake booster. The ABS module controls the electric vacuum pump through the use of a mechanical relay located in the Battery Junction Box (BJB) and a solid state relay located in the auxiliary relay box. The mechanical relay provides power to the solid state relay. The solid state relay provides power to the electric vacuum pump motor. When the ignition is in the RUN position, the ABS module closes the mechanical relay. After the vehicle is started (the ready indicator is illuminated), the ABS module activates the solid state relay as necessary to maintain a vacuum inside the brake booster.

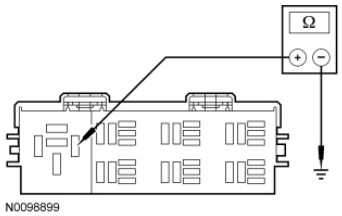
Fused battery voltage is provided to the mechanical relay from the BJB . When the ignition switch is turned to the RUN position, the ABS module grounds the output side of the mechanical relay solenoid. This closes the mechanical relay and send voltage to the solid state relay. When it is necessary to build vacuum in the brake booster, the ABS module grounds the solid state relay along circuit. The solid state relay then sends voltage to the vacuum pump and BJB fuse 37. The voltage passes through BJB fuse 37 (5A) and is delivered to the ABS module along circuit. The ABS module uses this voltage input to monitor the vacuum pump.

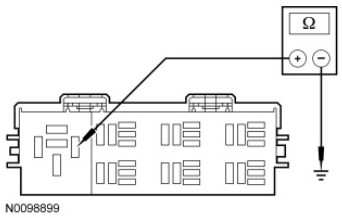
The logic internal to the solid state relay provides circuit protection for the vacuum pump circuit. If a short to ground on circuit is detected, the relay stops applying power until the short has been repaired.

If a vacuum pump DTC is set, the red brake warning indicator illuminates and the combustion engine runs to supply vacuum to the brake booster.

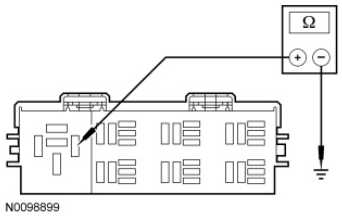


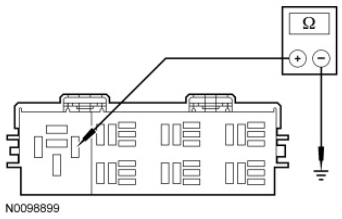
- DTC C101C:01 (Brake Vacuum Pump: General Electrical Failure) â If the ABS module detects a short to ground, an open or high resistance on circuits CBB37 (WH), CCB29 (WH/VT) and CCB30 (GY/VT), or an open or high resistance , this DTC sets.
- DTC C101C:71 (Brake Vacuum Pump: Actuator Stuck) â If the ABS module detects that vacuum in the brake booster is increasing when the vacuum pump is commanded off and the combustion engine is not running, this DTC sets.



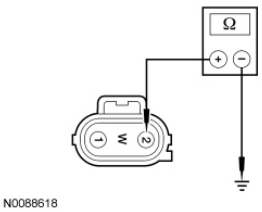


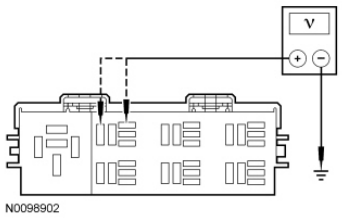
This pinpoint test is intended to diagnose the following:

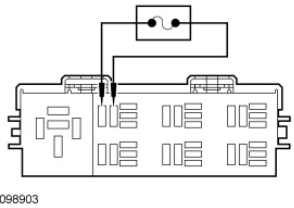




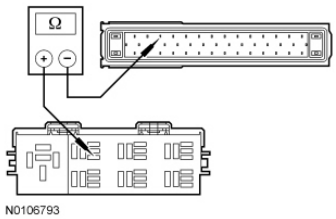
- Fuses
- Wiring, terminals or connectors
- Electric vacuum pump solid state relay
- Electric vacuum pump solid mechanical relay
- Electric vacuum pump
- ABS module

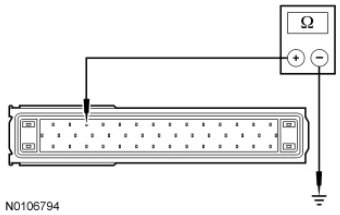


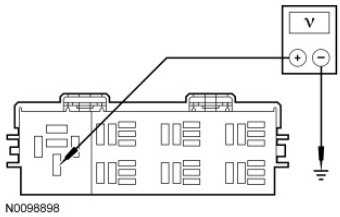




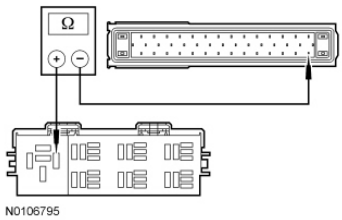
PINPOINT TEST X: DTCs C101C:01 AND 71

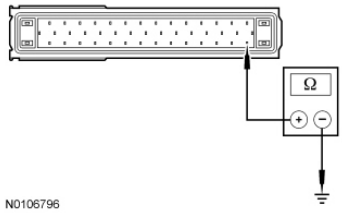


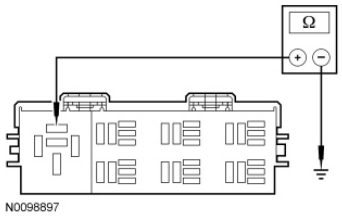




Test Step	Result / Action to Take
X1 VERIFY ALL WIRING CONNECTIONS	
• Disconnect: Vacuum Pump Motor C1119 . • Disconnect: ABS Module C135 . • Disconnect: Vacuum Pump Solid State Relay . • Disconnect: Vacuum Pump Mechanical Relay . • Using a good light source, inspect each connector terminal for any corrosion.	**Yes** GO to X2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.







• Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C135-15 ♦ C135-20 ♦ C135-35 ♦ C1119-1 ♦ C1119-2 ♦ Vacuum pump solid state relay cavities ♦ Vacuum pump mechanical relay cavities • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information.  • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	
X2 CHECK THE DTCs FROM THE ABS MODULE SELF-TEST	
• Connect: Vacuum Pump Motor C1119 . • Connect: ABS Module C135 . • Connect: Vacuum Pump Solid State Relay . • Connect: Vacuum Pump Mechanical Relay . • Review the DTCs retrieved and recorded during Inspection and Verification. • **Is DTC C101C:01 or C101C:71 present?**	**Yes** If DTC C101C:01 is present, GO to X5 . If DTC C101C:71 is present, GO to X3 . **No** For all other ABS module DTCs, GO to the ABS Module DTC Chart in this section.
X3 CHECK THE SOLID STATE RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Vacuum Pump Solid State Relay . • Measure the resistance between the vacuum pump solid state relay socket 86, circuit CCB30 (GY/VT) and ground.	**Yes** INSTALL a new vacuum pump solid state relay. **No** GO to X4 .

 • **Is the resistance greater than 10,000 ohms?**	
X4 ISOLATE THE SOLID STATE RELAY CONTROL CIRCUIT	
• Ignition OFF. • Disconnect: ABS Module C135 . • Measure the resistance between the vacuum pump solid state relay socket 86, circuit CCB30 (GY/VT) and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to X24 . **No** REPAIR circuit CCB30 (GY/VT). CLEAR the DTCs. REPEAT the self-test.
X5 CHECK THE VACUUM PUMP MOTOR	
• Ignition ON. • **Is the vacuum pump running all the time?**	**Yes** GO to X6 . **No** GO to X11 .
X6 ISOLATE THE SOLID STATE RELAY	
• Disconnect: Vacuum Pump Solid State Relay . • **Is the vacuum pump running all the time?**	**Yes** GO to X9 . **No** GO to X7 .
X7 CHECK THE SOLID STATE RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the vacuum pump solid state relay cavity 86, circuit CCB30 (GY/VT) and ground.	**Yes** INSTALL a new solid state relay. CLEAR the DTCs. REPEAT the self-test. **No** GO to X8 .

 • **Is the resistance greater than 10,000 ohms?**	
X8 ISOLATE THE ABS MODULE	
• Disconnect: ABS Module C135 . • Measure the resistance between the vacuum pump solid state relay cavity 86, circuit CCB30 (GY/VT) and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to X24 . **No** REPAIR circuit CCB30 (GY/VT). CLEAR the DTCs. REPEAT the self-test.
X9 ISOLATE THE VACUUM PUMP MOTOR CONTROL CIRCUIT	
• Disconnect: BJB Fuse 37 (5A) . • **Is the pump running all the time?**	**Yes** REPAIR circuit CCB29 (WH/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to X10 .
X10 CHECK THE ABS MODULE PUMP MOTOR MONITOR CIRCUIT	
• Connect: BJB Fuse 37 (5A) . • Ignition OFF. • Disconnect: ABS Module C135 . • Ignition ON. • **Is the pump running all the time?**	**Yes** REPAIR circuit CBB37 (WH). CLEAR the DTCs. REPEAT the self-test. **No** GO to X24 .
X11 CHECK THE VACUUM PUMP GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Vacuum Pump Motor C1119 . • Measure the resistance between vacuum pump motor C1119-2, circuit GD121 (BK/YE), harness side and ground.	**Yes** GO to X12 . **No** REPAIR circuit GD121 (BK/YE). CLEAR the DTCs. REPEAT the self-test.

 N0088618 • **Is the resistance less than 5 ohms?**	
X12 CHECK THE VACUUM PUMP MECHANICAL RELAY INPUT CIRCUIT FOR VOLTAGE	
• Connect: Vacuum Pump Motor C1119 . • Measure the voltage between ground and: ♦ vacuum pump mechanical relay cavity 3, circuit SBB07 (WH/RD). ♦ vacuum pump mechanical relay cavity 2, circuit SBB07 (WH/RD).  N0098902 • **Are the voltages greater than 10 volts?**	**Yes** GO to X13 . **No** VERIFY BJB fuse 7 (40A) is OK. If OK, REPAIR circuit SBB07 (WH/RD). If not OK, REFER to the Wiring Diagrams manual to identify the cause of the circuit short. CLEAR the DTCs. REPEAT the self-test.
X13 ISOLATE THE VACUUM PUMP MECHANICAL RELAY	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger â ABS Module . • Install a fused jumper wire between vacuum pump mechanical relay cavity 3, circuit SBB07 (WH/RD) and cavity 5, circuit CBB07 (GN/BU).  N0098903 • Using the scan tool, toggle the vacuum pump (VAC_PMP) active command on. • **Does the pump motor run?**	**Yes** REMOVE the fused jumper wire. GO to X14 . **No** GO to X16 .
X14 CHECK THE MECHANICAL RELAY CONTROL CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: ABS Module C135 . • Measure the resistance between ABS module C135-35, circuit CBB30 (GY/BK), harness side and vacuum pump mechanical relay socket 1, circuit CBB30 (GY/BK).  N0106793 • **Is the resistance less than 5 ohms?**	**Yes** GO to X15 . **No** REPAIR circuit CBB30 (GY/BK). CLEAR the DTCs. REPEAT the self-test.
X15 CHECK THE MECHANICAL RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between ABS module C135-35, circuit CBB30 (GY/BK), harness side and ground.  N0106794 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new vacuum pump mechanical relay. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit CBB30 (GY/BK). CLEAR the DTCs and REPEAT the self-test.
X16 CHECK THE SOLID STATE RELAY INPUT CIRCUIT FOR VOLTAGE	
• Disconnect: Vacuum Pump Solid State Relay . • Measure the voltage between vacuum pump solid state relay cavity 30, circuit CBB07 (GN/BU) and ground.  N0098898 • **Is the voltage greater than 10 volts?**	**Yes** REMOVE the fused jumper wire. GO to X17 . **No** REPAIR circuit CBB07 (GN/BU). CLEAR the DTCs and REPEAT the self-test.
X17 CHECK THE SOLID STATE RELAY CONTROL CIRCUIT FOR AN OPEN CIRCUIT	

• Disconnect: ABS Module C135 . • Measure the resistance between the vacuum pump solid state relay cavity 86, circuit CCB30 (GY/VT), and ABS module C135-15, circuit CCB30 (GY/VT), harness side.  N0106795 • **Is the resistance less than 5 ohms?**	**Yes** GO to X18 . **No** REPAIR circuit CCB30 (GY/VT). CLEAR the DTCs. REPEAT the self-test.
X18 CHECK THE SOLID STATE RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between ABS module C135-15, circuit CCB30 (GY/VT), harness side and ground.  N0106796 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to X19 . **No** REPAIR circuit CCB30 (GY/VT). CLEAR the DTCs and REPEAT the self-test.
X19 CHECK THE VACUUM PUMP SOLID STATE RELAY OUTPUT CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: Vacuum Pump Motor C1119 . • Disconnect: BJB Fuse 37 (5A) . • Measure the resistance between the vacuum pump solid state relay cavity 87, circuit CBB29 (WH/VT), harness side and ground.  N0098897 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to X20 . **No** REPAIR circuit CBB29 (WH/VT). CLEAR the DTCs and REPEAT the self-test.
X20 CHECK THE VACUUM PUMP SOLID STATE RELAY OUTPUT CIRCUIT FOR AN OPEN CIRCUIT	

• Measure the resistance between the vacuum pump solid state relay cavity 87, circuit CBB29 (WH/VT) and: ♦ vacuum pump motor C1119-1, circuit CBB29 (WH/VT), harness side. ♦ BJB fuse 37 (5A), circuit CBB29 (WH/VT), input side.  N0099105 • **Is the resistance less than 5 ohms?**	**Yes** GO to X21 . **No** REPAIR circuit CBB29 (WH/VT). CLEAR the DTCs and REPEAT the self-test.
X21 CHECK THE VACUUM PUMP MONITOR CIRCUIT FOR AN OPEN CIRCUIT	
• Measure the resistance between BJB fuse 37 (5A), circuit CBB37 (WH), input side and ABS module C135-20, circuit CBB37 (WH), harness side.  N0106797 • **Is the resistance less than 5 ohms?**	**Yes** GO to X22 . **No** REPAIR circuit CBB37 (WH). CLEAR the DTCs and REPEAT the self-test.
X22 CHECK THE VACUUM PUMP MONITOR CIRCUIT FOR A SHORT TO GROUND	

• Measure the resistance between ABS module C135-20, circuit CBB37 (WH), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to X23 . **No** REPAIR circuit CBB37 (WH). CLEAR the DTCs and REPEAT the self-test.
X23 CHECK THE VACUUM PUMP OPERATION	
• Connect: Vacuum Pump Motor C1119 . • Connect: Vacuum Pump Motor Solid State Relay . • Install a fused jumper wire between vacuum pump mechanical relay cavity 3, circuit SBB07 (WH/RD) and cavity 5, circuit CBB07 (GN/BU).  • **Momentarily** connect a fused jumper wire between ABS module C135-15, circuit CBB30 (GY/BK), harness side and ground.  • **Does the pump run when the jumper wire is connected to ground?**	**Yes** REMOVE both fused jumper wires. GO to X24 . **No** REMOVE the fused jumper wire from the ABS module connector. GO to X25 .
X24 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect: ABS Module C135 . • Check the connector for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: ABS Module C135 .	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. TEST the system for normal operation. **No**

• Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
X25 ISOLATE THE VACUUM PUMP MOTOR	
• Disconnect: Vacuum Pump Motor Solid State Relay . • **NOTE:** The fused jumper wire on the mechanical relay should still be installed from the previous step. • **Momentarily** connect a fused jumper wire between vacuum pump solid state relay cavity 30, circuit CCB29 (WH/VT) and cavity 87, circuit CBB07 (GN/BU).  N0098896 • **Does the pump run when the jumper wire is connected?**	**Yes** INSTALL a new solid state relay. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new vacuum pump. REFER to Brake Vacuum Pump in Section 206-07 . CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Y: DTCs C0061:28, 64; C0063:28, 64; U0151:87, 88 and U0452:29

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The yaw rate sensor, lateral accelerometer and longitudinal accelerometer are contained in the Restraints Control Module (RCM). The RCM measures vehicle yaw rate and lateral acceleration and then sends the information to the ABS module along the dedicated Controller Area Network (CAN) bus. This CAN bus is used only for communication between the RCM and the ABS module. The information sent to the ABS module is used to help determine if the AdvanceTracÂ® system needs to be activated.

DTC Description	Fault Trigger Conditions
• C0061:28 â Lateral Acceleration Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	This DTC is set if the lateral acceleration sensor measures acceleration when the vehicle is not moving.
	This DTC indicates that the lateral acceleration sensor is inconsistent with other acceleration sensor, steering wheel angle sensor and wheel

• C0061:64 â Lateral Acceleration Sensor: Signal Plausibility Failure	speed sensor signals.
• C0063:28 â Yaw Rate Sensor: Signal Bias Level Out of Range/Zero Adjustment Failure	This DTC indicates that the yaw rate sensor is measuring rotation when the vehicle is not moving.
• C0063:64 â Yaw Rate Sensor: Signal Plausibility Failure	This DTC indicates that the yaw rate sensor is inconsistent with other acceleration sensor, steering wheel angle sensor and wheel speed sensor signals.
• U0151:87 â Lost Communication With Restraints Control Module: Missing Message	This DTC sets as a result of a loss of communication with the RCM over either the High Speed Controller Area Network (HS-CAN) bus or the dedicated CAN bus.
• U0151:88 â Lost Communication With Restraints Control Module: Bus Off	This DTC can set if either the dedicated CAN circuits are open, shorted to ground or shorted to each other. Other DTCs indicating missing messages or invalid signal from the RCM sensors can set as a result of a dedicated CAN bus fault.
• U0452:29 â Invalid Data Received From Restraints Control Module: Signal Invalid	This DTC indicates that one or more of the stability/traction control system sensors internal to the RCM have failed and the RCM is transmitting an "invalid data" message.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM incorrectly mounted
- RCM
- ABS module

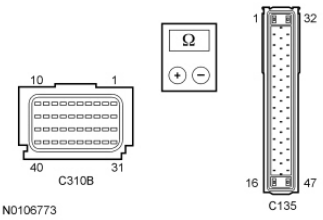
PINPOINT TEST Y: DTCs C0061:28, 64; C0063:28, 64; U0151:87, 88 AND U0452:29

⚠ WARNING: Never probe the electrical connectors on airbag, Safety CanopyÂ® or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.

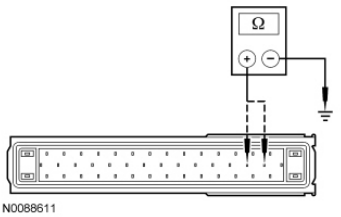
⚠ WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

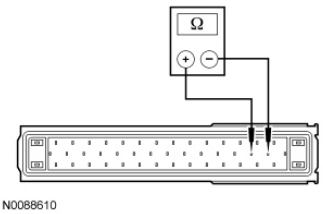
NOTE: Supplemental Restraint System (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in

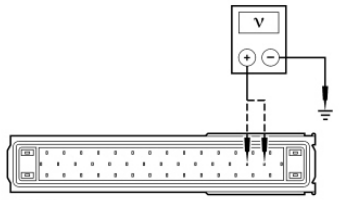


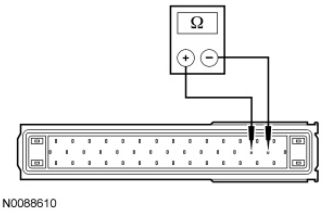
incorrect diagnosis of the SRS .



NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.







Test Step	Result / Action to Take
Y1 CHECK FOR AN HS-CAN CONCERN WITH THE RCM	
• Connect the scan tool. • Ignition ON. • **NOTE:** The Network Test does not test the dedicated CAN communications between the ABS module and RCM . • Using the scan tool, carry out the Network Test. • **Does the RCM pass the Network Test?**	**Yes** GO to Y2 . **No** REFER to Section 418-00 to diagnose the HS-CAN concern.
Y2 CHECK FOR CORRECT RCM	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Gain access to the RCM and check the part number on the RCM against the part number listed in the master parts catalog. Refer to Section 501-20B . • **Does the part number on the RCM match the part number listed in the master parts catalog?**	**Yes** GO to Y3 . **No** INSTALL the correct RCM . REFER to Section 501-20B . GO to Y13 .
Y3 CHECK FOR CORRECT ABS MODULE	
• Enter the following diagnostic mode on the scan tool: Log Viewer . • Retrieve and record the ABS module part number from Log Viewer and check the part number on the ABS module against the part number listed in the master parts catalog. • **Does the part number retrieved from the ABS module match the part number listed in the master parts catalog?**	**Yes** GO to Y4 . **No** INSTALL the correct ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. GO to Y13 .
Y4 CHECK THE RCM CONDITION AND INSTALLATION	
• Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Inspect the RCM for cracks in the case, broken anchor tabs, broken electrical connector and correct installation. Refer to	**Yes** GO to Y5 . **No** REINSTALL or INSTALL new as necessary. GO to Y13 .

Removal and Installation, Restraints Control Module (RCM) in Section 501-20B . • **Is the RCM installed correctly and undamaged?**	
Y5 CHECK THE DEDICATED CAN CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: ABS Module C135 . • Disconnect: RCM C310B . • Measure the resistance between the ABS module C135, harness side and the RCM C310B, harness side as indicated in the following chart: • **Are the resistances less than 5 ohms?**	**Yes** GO to Y6 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. CYCLE the ignition key. REPEAT the self-test. GO to Y13 .
Y6 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between ground and: ♦ ABS module C135-19, circuit VCA24 (GN/OG), harness side. ♦ ABS module C135-18, circuit VCA23 (BU/WH), harness side. • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to Y7 . **No** REPAIR the affected circuit(s). GO to Y13 .
Y7 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TOGETHER	

ABS Module	Circuit	RCM
C135-18	VCA23 (BU/WH)	C310B-20
C135-19	VCA24 (GN/OG)	C310B-19

• Measure the resistance between ABS module C135-19, circuit VCA24 (GN/OG), harness side and ABS module C135-18, circuit VCA23 (BU/WH), harness side.  N0088610 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to Y8 . **No** REPAIR the affected circuit(s). GO to Y13 .
Y8 CHECK THE DEDICATED CAN CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and: ♦ ABS module C135-19, circuit VCA24 (GN/OG), harness side. ♦ ABS module C135-18, circuit VCA23 (BU/WH), harness side.  N0088612 • **Is any voltage present?**	**Yes** REPAIR the affected circuit(s). GO to Y13 . **No** GO to Y9 .
Y9 CHECK RCM TERMINATING RESISTOR	
• Ignition OFF. • Connect: RCM C310B . • Measure the resistance between ABS module C135-18, circuit VCA23 (BU/WH), harness side and C135-19, circuit VCA24 (GN/OG), harness side.  N0088610 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to Y10 . **No** GO to Y11 .

Y10 CHECK THE ABS MODULE FOR CORRECT OPERATION	
• Prior to reconnecting any previously disconnected SRS component: ♦ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. ♦ inspect RCM C310A and C310B Connector Position Assurance (CPA) lever/lock for correct operation. Refer to Restraints Control Module (RCM) in Section 501-20B . ♦ inspect ABS module C135 for dirt, corrosion, water intrusion, pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ♦ repair any concerns found. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component(s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Enter the following diagnostic mode on the scan tool: Self Test â ABS Module . • **Do any of the DTCs listed in Normal Operation return?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. GO to Y13 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. GO to Y13 .
Y11 CONFIRM THE RCM FAULT	
NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the self-test. If not, DTCs can be set. • If previously directed to repower the SRS , depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Prior to reconnecting any previously disconnected SRS component:	**Yes** INSTALL a new RCM . REFER to Section 501-20B . GO to Y13 . **No** In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS**

♦ inspect connector(s) (including any in-line connectors) for pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. ♦ inspect RCM C310A and C310B CPA lever/lock for correct operation. Refer to Restraints Control Module (RCM) Removal and Installation in Section 501-20B . ♦ inspect ABS module C135 for dirt, corrosion, water intrusion, pushed-out, loose or spread terminals and loose or frayed wire connections at terminals. ♦ repair any concerns found. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component(s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Enter the following diagnostic mode on the scan tool: Self Test â RCM . • **Were DTCs U0028:08 and/or U0028:88 retrieved on-demand during self-test?**	**components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** GO to Y12 .
Y12 CHECK FOR AN INTERMITTENT FAULT	
• Ignition OFF. • Depower the SRS . Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Disconnect RCM C310B and ABS module C135: ♦ inspect connector(s) (including any in-line connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals. ♦ inspect wire harness for any damage, pinched, cut or pierced wires. ♦ repair any concerns found. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ	**Yes** REFER to Diagnosis and Testing in Section 501-20B . **No** The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** GO to Y13 .

Hybrid), Connector Repair Procedures for schematic and connector information. • Connect: All Previously Disconnected Component(s)/Connector(s) . • Repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test â RCM . • **Are any RCM DTCs retrieved on-demand during the self-test?**	
Y13 CHECK FOR ADDITIONAL RCM AND ABS MODULE DTCs	
• Ignition OFF. • ⚠ **WARNING: Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.** • Reconnect all SRS components (if previously disconnected). • If previously directed to depower the SRS , repower the SRS . **Do not** prove out the SRS at this time. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test â RCM . • Enter the following diagnostic mode on the scan tool: Self Test â ABS Module . • **Were any DTCs retrieved on-demand from the RCM or ABS module during self-test?**	**Yes** Do not clear any DTCs until all DTCs have been resolved. GO to the appropriate DTC Chart in this section and/or Section 501-20B for pinpoint test direction. **No** CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). PROVE OUT the SRS . REFER to Supplemental Restraint System (SRS) Depowering and Repowering in Section 501-20B . Repair is complete. RETURN the vehicle to the customer.

Pinpoint Test Z: DTC U3002:62

Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

When the ignition is turned to the RUN position, the ABS module and the PCM share Vehicle Identification Number (VIN) information over the High Speed Controller Area Network (HS-CAN) bus.

- DTC U3002:62 (Vehicle Identification Number: Signal Compare Failure) â This DTC indicates that the VIN message sent by the PCM over the HS-CAN bus does not match the VIN stored in the ABS module.

This pinpoint test is intended to diagnose the following:

- Module configuration (ABS and PCM)
- ABS module

PINPOINT TEST Z: DTC U3002:62

Test Step	Result / Action to Take
Z1 VERIFY PCM VIN	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Log Viewer . • Compare the VIN in Log Viewer to the vehicle VIN plate. • **Does VIN in Log Viewer match the vehicle VIN plate?**	**Yes** GO to Z2 . **No** RECONFIGURE the PCM. FOLLOW the instructions on the scan tool. CLEAR the DTCs. CYCLE the ignition key. REPEAT the self-test.
Z2 VERIFY ABS MODULE PART NUMBER	
• Retrieve and record the ABS module part number from Log Viewer and verify that the vehicle has the correct ABS module installed. • **Is the correct ABS module installed in the vehicle?**	**Yes** CONFIGURE the ABS module. REFER to Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available in Section 418-01 . CLEAR the DTC. CYCLE the ignition key. REPEAT the self-test. **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module â Hybrid in this section. CLEAR the DTC. CYCLE the ignition key. REPEAT the self-test.

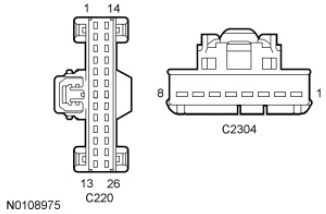
Pinpoint Test AA: The Stability/Traction Control System Cannot Be Disabled

Normal Operation

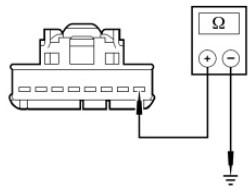
The traction control portion of the AdvanceTracÂ® can be disabled by pressing the traction control switch located on the instrument panel. When the system is disabled, the sliding car OFF icon in the Instrument Panel Cluster (IPC) illuminates continuously. The traction control switch is part of the ambient lighting switch.

The IPC sends 5 volts to the traction control switch. When the traction control switch is pressed, this voltage is sent through the switch and to ground. When the IPC detects this ground, it sends a message to the PCM and the ABS module along the High Speed Controller Area Network (HS-CAN) bus that the driver has disabled the system. An open circuit or a defective traction control switch prevents the system from being disabled, and does not set a DTC.

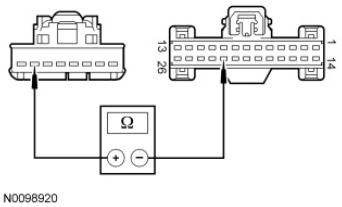
If a MyKeyâ ¢ restricted key is in use with Advance TracÂ® always-on feature configured to "on", the traction control system cannot be disabled. An admin key must be used in order to enable and disable the traction control system.

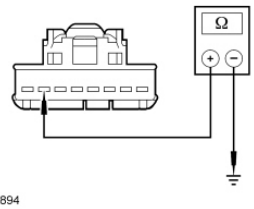


DTC C0089:11 (TCS Disable Switch: Circuit Short to Ground) â If the IPC detects the ground signal during the on-demand self test or if circuit CCA15 (YE/GY) is shorted to ground, DTC C0089:11 is set. Also, if the traction control switch is held or stuck closed for more than 2 minutes during normal operation, DTC C0089:11 is set. If a MyKeyâ ¢ restricted key is in use with Advance TracÂ® always-on feature configured to "on", an admin key must be used in order to enable and disable the traction control system.



This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Traction control switch
- IPC

PINPOINT TEST AA: THE STABILITY/TRACTION CONTROL SYSTEM CANNOT BE DISABLED

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AA1 VERIFY ALL WIRING CONNECTIONS	
• Disconnect: Instrument Panel Cluster (IPC) C220 . • Disconnect: Traction Control/Ambient Lighting Switch C2304 . • Using a good light source, inspect each connector terminal for any corrosion. • Inspect both connectors for any pushed-out pins. Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • Using a suitable mating terminal, check each female terminal for deformed or enlarged contacts by comparing the mating terminal's fit between each of the following pins: ♦ C220-22 ♦ C2304-1 ♦ C2304-7  • Refer to Wiring Diagrams Cell 5 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information. • **Is each terminal free of corrosion, pushed-out pins or spread terminals?**	**Yes** GO to AA2 . **No** REPAIR the affected terminal(s). CLEAR the DTCs. REPEAT the self-test.
AA2 CHECK FOR ANY COMMUNICATION DTCs	
• Connect: Traction Control/Ambient Lighting Switch C2304 . • Connect: IPC C220 . • Connect the scan tool. • Ignition ON.	**Yes** For ABS communication DTCs, GO to the ABS Module DTC Chart.

• Check the IPC , the PCM and the ABS module for any communication DTCs. • **Are any communication DTCs present?**	For IPC and PCM communication DTCs, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** GO to AA3 .
AA3 ISOLATE THE TRACTION CONTROL SWITCH	
NOTE: If a MyKeyâ ¢ restricted key is in use with Advance TracÂ® always-on feature configured to "on", the traction control system cannot be disabled. An admin key must be used in order to enable and disable the traction control system. • Ignition OFF. • Disconnect: Traction Control/Ambient Lighting Switch C2304 . • Measure the resistance between traction control/ambient lighting switch C2304 pin-7 and pin-1, component side, while pressing and releasing the traction control switch. • **Is the resistance less than 5 ohms with the switch pressed and greater than 10,000 ohms with the switch released?**	**Yes** GO to AA4 . **No** INSTALL a new traction control switch. REFER to Traction Control Switch in this section. TEST the system for normal operation.
AA4 CHECK THE TRACTION CONTROL SWITCH GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between traction control/ambient lighting switch C2304-1, circuit GD116 (BK/VT), harness side and ground.  N0098895 • **Is the resistance less than 5 ohms?**	**Yes** GO to AA5 . **No** REPAIR circuit GD116 (BK/VT). TEST the system for normal operation.
AA5 CHECK THE TRACTION CONTROL SWITCH CONTROL CIRCUIT FOR AN OPEN	
• Disconnect: IPC C220 . • Measure the resistance between traction control/ambient lighting switch C2304-7, circuit CCA15 (YE/GY), harness side and IPC C220-22, circuit CCA15 (YE/GY), harness side.	**Yes** GO to AA6 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
AA6 CHECK THE TRACTION CONTROL SWITCH CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between traction control/ambient lighting switch C2304-7, circuit CCA15 (YE/GY), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AA7 . **No** REPAIR circuit CCA15 (YE/GY). TEST the system for normal operation.
AA7 CHECK FOR CORRECT IPC OPERATION	
• Ignition OFF. • Disconnect: IPC C220 . • Check for: ♦ corrosion ♦ pushed-out pins ♦ spread terminals • Connect: IPC C220 . • Make sure the connector is seated correctly, then operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AB: Soft or Excessive Brake Pedal Travel

Normal Operation

The brake pedal should be firm at all times when applied.

This pinpoint test is intended to diagnose the following:

- Leak in the hydraulic system
- Air in brake system
- Brake master cylinder
- Hydraulic Control Unit (HCU)

PINPOINT TEST AB: SOFT OR EXCESSIVE BRAKE PEDAL TRAVEL

Test Step	Result / Action to Take
AB1 RETRIEVE THE RECORDED DTCs FROM THE ABS SELF-TEST	
• Check for recorded ABS DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC charts in this section. **No** GO to AB2 .
AB2 CHECK THE BRAKE SYSTEM COMPONENTS FOR CORRECT INSTALLATION OR DAMAGE	
• Inspect the brake system for the following concerns: ♦ Check the brake pedal and bracket, brake master cylinder, brake calipers and fluid lines/hoses for correct installation. ♦ Check the brake pedal and bracket, brake master cylinder, brake calipers and fluid lines/hoses for damage or leaks. ♦ Check the flexible brake hoses for bulging with the brake pedal is pressed. ♦ For brake pedal and master cylinder, refer to Section 206-06 . ♦ For brake booster, refer to Section 206-07 . • **Are the brake system components correctly installed and free from leaks or damage?**	**Yes** GO to AB3 . **No** REPAIR the identified concern. TEST the system for normal operation.
AB3 BLEED THE BRAKE SYSTEM	
• Bleed the brake system including the Hydraulic Control Unit (HCU) bleeding procedure. Refer to Section 206-00 . • **Is the concern still present?**	**Yes** GO to AB4 . **No** The system is operating correctly at this time. The concern may have been caused by air in the brake system.
AB4 CHECK BRAKE MASTER CYLINDER	
• Carry out the Brake Master Cylinder â Bypass Condition Test in Section 206-00 , Component Tests. • **Did the master cylinder pass the component test?**	**Yes** INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. TEST the system for normal operation. **No** INSTALL a new master cylinder. REFER to Section 206-06 . TEST the system for normal operation.

Pinpoint Test AC: DTCs C1029:00, C102B:00

Normal Operation

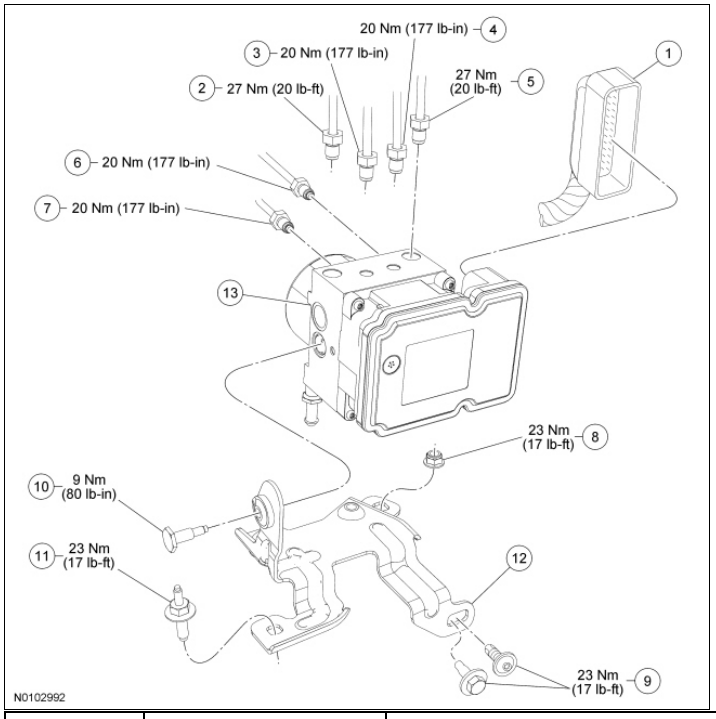
The primary channel consists of the RF and LR hydraulic circuits, and the secondary brake channel consists of the LF and RR hydraulic circuits. Pressure imbalances between the primary or secondary hydraulic pressure could be caused by air in the lines or fluid leaks in the brake fluid system.

- C1029:00 (ABS Primary Circuit Pressure Lower Than Secondary: No Sub type Information) â this DTC sets if the ABS module detects that the pressure in the primary circuit is less than in the secondary circuit.
- C102B:00 (ABS Secondary Circuit Pressure Lower Than Primary: No Sub Type Information) â this DTC sets if the ABS module detects that the pressure in the secondary circuit is less than in the primary circuit .

This pinpoint test is intended to diagnose the following:

- Air in brake fluid system
- Master Cylinder
- Hydraulic Control Unit.

PINPOINT TEST AC: DTC C1029:00, C102B:00



Test Step	Result / Action to Take
AC1 BLEED THE BRAKES	
• Bleed the brakes. Refer to Section 206-00 . ♦ Clear the DTCs. ♦ Road test the vehicle. • **Is the concern still present?**	**Yes** GO to AC2 **No** The system is operating correctly at this time. The concern may have been caused by air in the brake system.
AC2 MONITOR THE ABS PRIMARY AND SECONDARY CHANNEL PRESSURES	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: ABS Module DataLogger. • Select the following PIDs to monitor the primary and secondary channels. ♦ Left front brake pressure (LF_BRK_PRS) ♦ Right rear brake pressure (RR_BRK_PRS) ♦ Right front brake pressure (RF_BRK_PRS) ♦ Left rear brake pressure (LR_BRK_PRS) • Depress the brake pedal firmly and note the brake pressures displayed by each PID.	**Yes** CLEAR the DTCs, REPEAT the self-test. If C1029:00 or C102B:00 returns, INSTALL a new HCU . REFER to Hydraulic Control Unit (HCU) in this section. **No** CLEAR the DTCs, REPEAT the self-test. If C1029:00 or C102B:00 returns, INSTALL a new brake master cylinder. REFER to Section 206-06 .

• Add the pressures for the left front brake pressure and the right rear brake pressure together (secondary channel). • Add the pressures for the right front brake pressure and the left rear brake pressure together (primary channel). • **Are the primary and secondary channel pressures within 10% of each other?**	

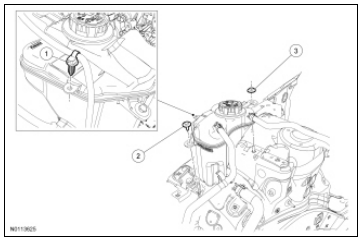
Hydraulic Control Unit (HCU)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Item	Part Number	Description
1	-	ABS module electrical connector (part of 14290)
2	-	Master cylinder secondary brake tube fitting (part of 2C360)
3	-	RH front brake tube fitting (part of 2263)
4	-	Rear back pressure valve brake tube fitting (part of 2C360)
5	-	Master cylinder primary brake tube fitting (part of 2C360)
6	-	Rear back pressure valve brake tube fitting (part of 2C360)
7	-	LH front brake tube fitting (part of 2C360)
8	W520102	Hydraulic Control Unit (HCU) bracket-to-frame nut

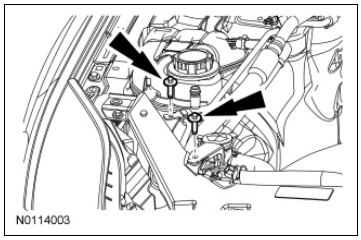
9	W712710	HCU bracket-to-frame bolt (Torx head) (3.5L only)
9	W505433	HCU bracket-to-frame bolt (hex head) all other engines
10	2C398	HCU bracket-to- HCU bolt
11	W704925	HCU bracket-to-frame stud bolt
12 4	HCU bracket	
13	2C346	HCU



Removal and Installation

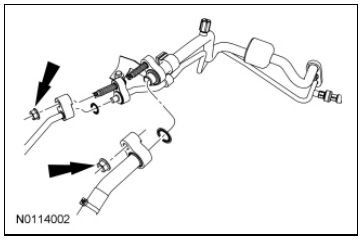
⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.



NOTICE: **Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.**

1. Position the engine coolant degas bottle aside.
    1. If equipped, detach the wiring harness retainer from the degas bottle.
    2. Remove the bolt.
        - ♦ To install, tighten to 9 Nm (80 lb-in).
    3. Remove the nut.
        - ♦ To install, tighten to 9 Nm (80 lb-in).



2. Recover the refrigerant. For additional information, refer to Section 412-00A .

3. Remove the condenser-to-evaporator line and compressor manifold and tube bracket bolts.
    - To install, tighten to 6 Nm (53 lb-in).

4. Remove the condenser-to-evaporator line and compressor manifold and tube fitting nuts. Disconnect the fittings.
    - Discard the gasket seals.
    - To install, tighten to 15 Nm (133 lb-in).

5. Disconnect the ABS module electrical connector.

6. Disconnect the brake tube fittings.
   - To install:
     - ♦ tighten the front and rear brake tube fittings to 20 Nm (177 lb-in).
     - ♦ tighten the master cylinder brake tube fittings to 27 Nm (20 lb-ft).

7. Remove the HCU bracket-to- HCU bolt.
   - To install, tighten to 9 Nm (80 lb-in).

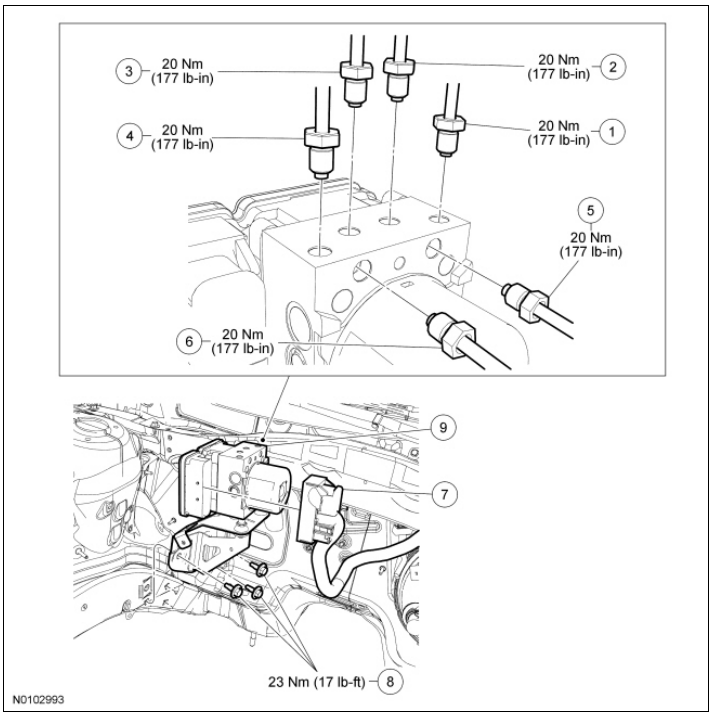
8. Remove the HCU .

9. **NOTE:** Make sure the HCU and ABS module are clean and free of any brake fluid or foreign material before separating the components.

   To install, reverse the removal procedure.

   - Install new O-ring seals and new gasket seals.
   - Add the correct amount of clean PAG oil. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A
   - Bleed the brake system. For additional information, refer to Section 206-00 .

10. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A



Hydraulic Control Unit (HCU) - Hybrid

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

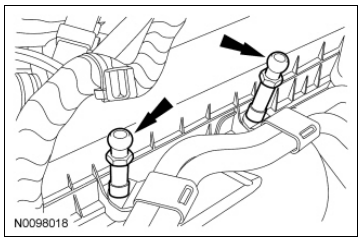
Item	Part Number	Description
1	-	Master cylinder primary brake tube fitting (part of 2C360)
2	-	RH front brake tube fitting (part of 2263)
3	-	LH front brake tube fitting (part of 2C360)
4	-	Master cylinder secondary brake tube fitting (part of 2C360)
5	-	
6	-	LH rear brake tube fitting (part of 9J279)

7	-	ABS module electrical connector (part of 14290)
8	W505433	Hydraulic Control Unit (HCU) bracket-to-frame bolts
9	2C065	HCU

Removal and Installation

⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

⚠ WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.



NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the sue may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

1. **NOTE:** This step is necessary only if a new ABS module is being installed.

   Connect the scan tool and upload the module configuration information from the ABS module. For additional information, refer to Section 418-01 .

2. Remove the Thermostatic Expansion Valve (TXV) manifold and tube assembly. For additional information, refer to Section 412-01 .

3. Remove the 2 engine cover studs from the valve cover stud bolts.

4. Disconnect the ABS module electrical connector.

5. Detach the wire harness push-type fastener from the Hydraulic Control Unit (HCU) bracket and position the harness aside.

6. Disconnect the brake tube fittings.
   - To install, tighten to 20 Nm (177 lb-in).

7. With the vehicle in NEUTRAL, position it on a hoist. For additional information refer to Section 100-02 .

8. Remove the HCU bracket-to-frame bolts.
   - To install, tighten to 23 Nm (17 lb-ft).

9. Remove the HCU and bracket assembly.

10. **NOTE:** Make sure the HCU and ABS module are clean and free of any brake fluid or foreign material before separating the components.

    To install, reverse the removal procedure.

    - Bleed the brake system. For additional information, refer to Section 206-00 .

11. If a new ABS module was installed, download the module configuration information from the scan tool. For additional information, refer to Section 418-01 .

12. If a new ABS module and/or a new HCU was installed, carry out the Multi-Calibration routine, follow the scan tool directions.

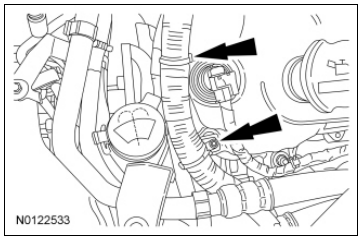
Anti-Lock Brake System (ABS) Module

Item	Part Number	Description
1	-	ABS module electrical connector (part of 14290)
2	2M101	ABS module screw (4 required)
3	2C219	ABS module

Removal and Installation

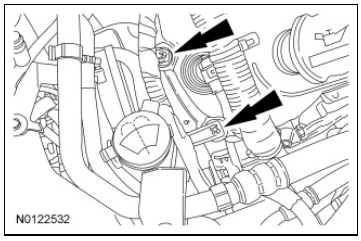
NOTICE: **Electronic modules are sensitive to electrical charges. The ABS module can be damaged if exposed to these charges.**

NOTICE: **Do not allow any brake fluid or foreign material to enter the mating side of the ABS module or damage to the solenoids can occur.**



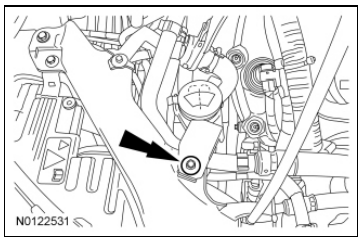
All vehicles

1. If a new ABS module is being installed, connect the scan tool and upload the module configuration from the ABS module. For additional information, refer to Section 418-01 .

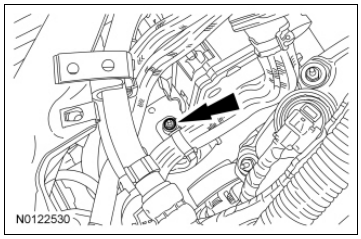


2. Remove the degas bottle. For additional information, refer to Section 303-03A .

Vehicles equipped with a 3.5L engine



3. Detach the body harness from the 2 valve cover studs and position the harness aside.



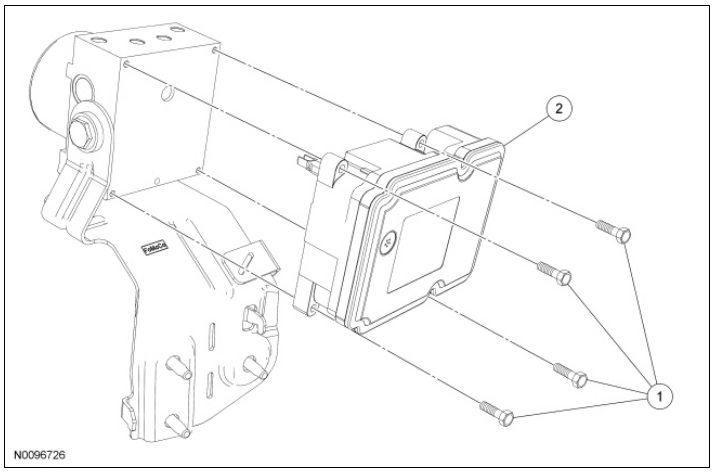
4. Detach the wire harness from the 2 valve cover studs and position the harness aside.

5. Remove the bolt and position the windshield washer reservoir filler neck aside.
    - To install, tighten to 7 Nm (62 lb-in).

6. Remove the nut and position the degas bottle hose aside.
    - To install, tighten to 20 Nm (177 lb-in).

All vehicles

7. Disconnect the ABS module electrical connector.



8. Remove the 4 ABS module screws and the ABS module.
    - To install, tighten to 2 Nm (18 lb-in).

9. **NOTE:** Visually inspect the ABS module terminals for damage before installation.

    To install, reverse the removal procedure.

10. If a new ABS module was installed, download the module configuration information from the scan tool. For additional information, refer to Section 418-01 .

Anti-Lock Brake System (ABS) Module - Hybrid

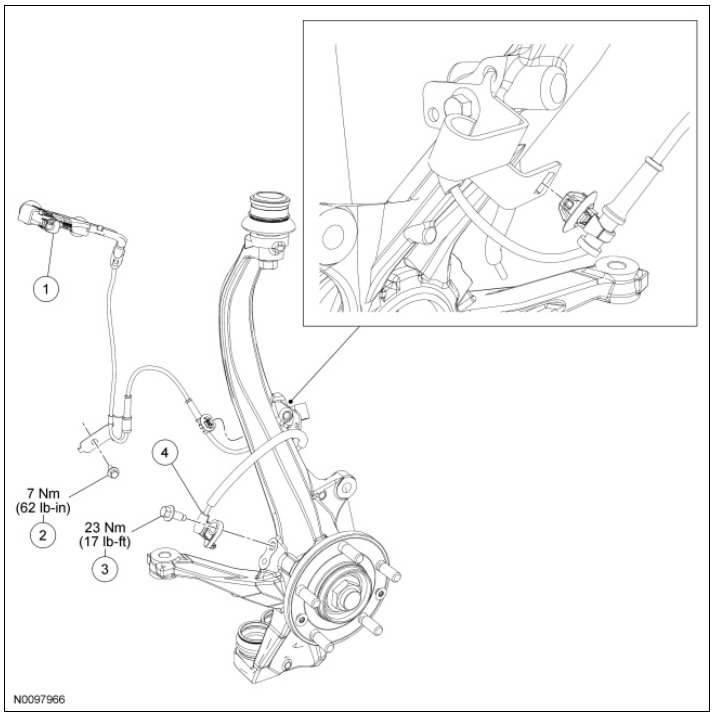
Item	Part Number	Description
1	2M101	ABS module screws (4 required)
2	2C219	ABS module

Removal and Installation

NOTICE: **Electronic modules are sensitive to electrical charges. The Anti-lock Brake System (ABS) module can be damaged if exposed to these charges.**

NOTICE: **Do not allow any brake fluid or foreign material to enter the mating side of the Anti-lock Brake System (ABS) module or damage to the solenoids can occur.**

1. Remove the Hydraulic Control Unit (HCU). For additional information, refer to Hydraulic Control Unit (HCU) - Hybrid in this section.



2. **NOTE:** Make sure the HCU and ABS module are clean and free of any brake fluid or foreign material before separating the components.

   Remove the 4 ABS module screws and the ABS module.

3. **NOTE:** Visually inspect the ABS module terminals for damage before installation.

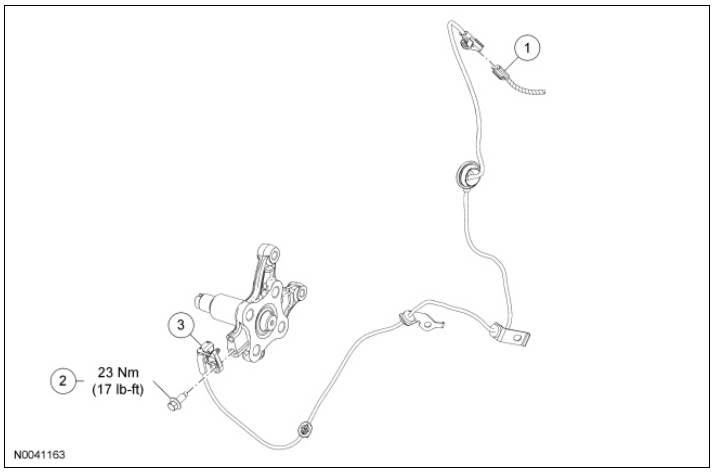
   To install, reverse the removal procedure.

Wheel Speed Sensor - Front

Item	Part Number	Description
1	-	Wheel speed sensor electrical connector (part of 14290)
2	W500020	Wheel speed sensor harness bracket-to-body bolt
3	W500222	Wheel speed sensor bolt
4	2C204 RH/ 2C205 LH	Wheel speed sensor

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



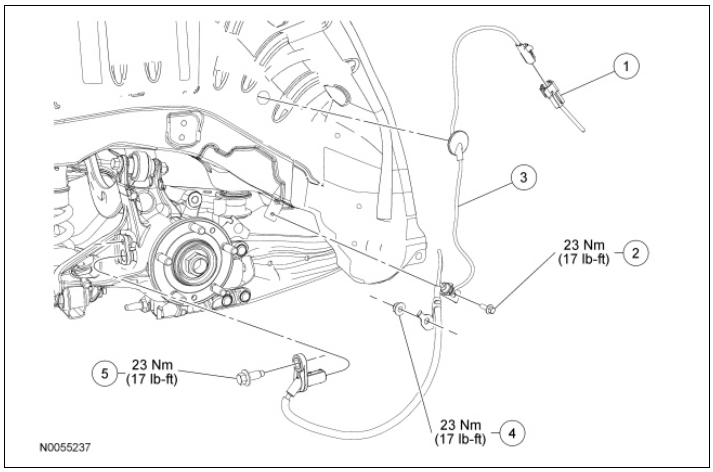
2. Remove the fender splash shield. For additional information, refer to Section 501-02 .

3. Disconnect the wheel speed sensor electrical connector.

<

4. Remove the wheel speed sensor harness bracket-to-body bolt.
   - To install, tighten to 7 Nm (62 lb-in).
5. Detach the wheel speed sensor harness from the wheel knuckle bracket.
6. Remove the wheel speed sensor bolt and the wheel speed sensor.
   - To install, tighten to 23 Nm (17 lb-ft).
7. To install, reverse the removal procedure.

Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)



Item	Part Number	Description
1	-	Wheel speed sensor electrical connector (part of 14A227)
2	W500222	Wheel speed sensor bolt
3	2C186 RH/ 2C187 LH	Wheel speed sensor

Removal and Installation

1. Remove the rear seat bolster. For additional information, refer to Section 501-10 .
2. Disconnect the wheel speed sensor electrical connector.
3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
4. Using a suitable tool, disconnect theet from the body.
5. **NOTE:** It is not necessary to remove the harness routing brackets.

   Disconnect the wheel speed sensor harness from the brackets.
6. Remove the wheel speed sensor wire bolt and the wheel speed sensor.
   - To install, tighten to 23 Nm (17 lb-ft).
7. To install, reverse the removal procedure.

Wheel Speed Sensor - Rear, All Wheel Drive (AWD)

Item	Part Number	Description
1	-	Wheel speed sensor electrical connector (part of 14A227)
2	W505253	Wheel speed sensor harness bolt
3	2C186 RH/ 2C187 LH	Wheel speed sensor
4	W520102	Wheel speed sensor harness nut
5	W500222	Wheel speed sensor bolt

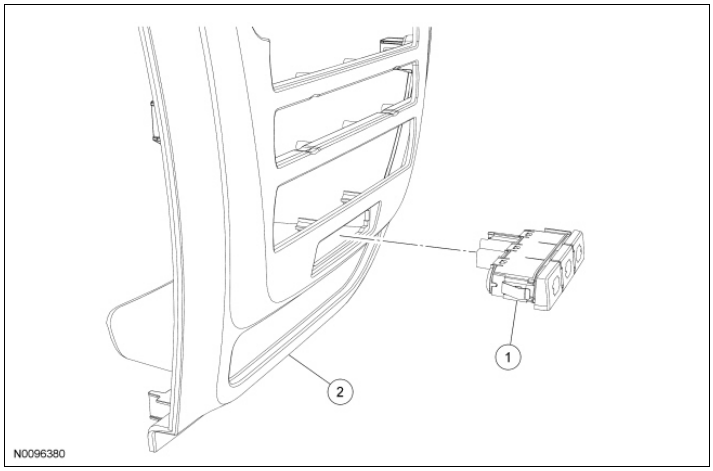
Removal and Installation

1. Remove the rear seat bolster. For additional information, refer to Section 501-10 .

2. Disconnect the wheel speed sensor electrical connector.

3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

4. Using a suitable tool, disconnect the grommet from the body.



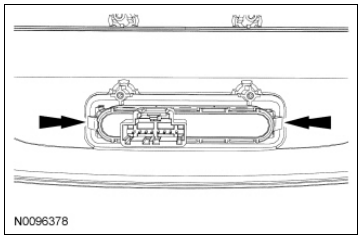
5. Remove the wheel speed sensor harness nut and bolt.
   - To install, tighten to 23 Nm (17 lb-ft).

6. Remove the wheel speed sensor bolt and the wheel speed sensor.
   - To install, tighten to 23 Nm (17 lb-ft).

7. To install, reverse the removal procedure.

Traction Control Switch

NOTE: Fusion shown, MKZ similar.



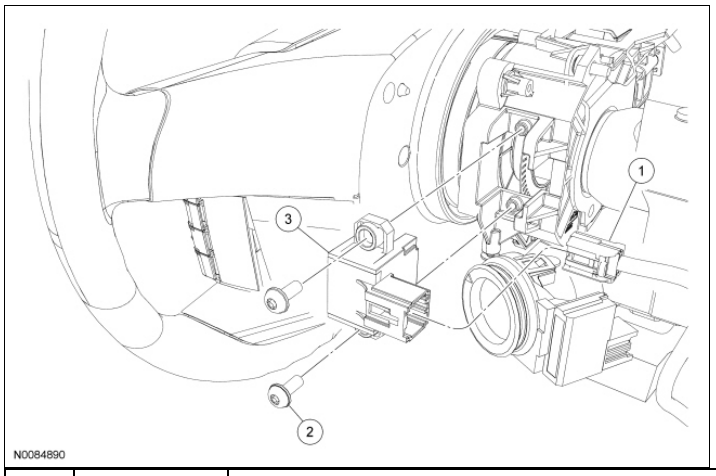
Item	Part Number	Description
1	432A38	Traction control switch
2	04302	Instrument panel center finish panel

Removal and Installation

NOTE: For MKZ when equipped with a navigation system, the traction control switch is serviced with the Front Controls Interface Module (FCIM). For additional information, refer to Section 415-00 .

1. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .

2. Press the retaining tabs and remove the traction control switch.



3. To install, reverse the removal procedure.

Steering Wheel Rotation Sensor

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Item	Part Number	Description
1	-	Steering wheel rotation sensor electrical connector (3.5L Fusion part of 2C011, MKZ part of 14401)
2	W506942	Steering wheel rotation sensor bolt (2 required)
3	3F818	Steering wheel rotation sensor

Removal and Installation

1. Remove the steering column shroud. For additional information, refer to Section 211-04 .
2. Disconnect the steering wheel rotation sensor electrical connector.
3. Remove the 2 bolts and the steering wheel rotation sensor.
4. To install, reverse the removal procedure.
   - Using the scan tool, calibrate the new steering wheel rotation sensor to the ABS module. Follow the scan tool instructions for Interactive Vehicle Dynamics (IVD) Initialization.

Material

Item	Specification	Fill Capacity
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-	-
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A	7.0L (7.4 qt)

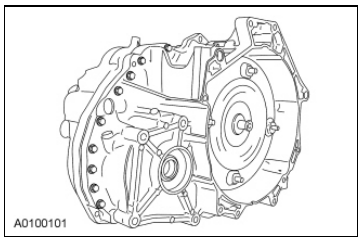
[a] Refer to the procedure in this section.

[b] When reinstalling fasteners originally coated with threadlock, clean the fasteners with a wire brush prior to applying new threadlock. Apply threadlock and sealer to threads of the bolt.

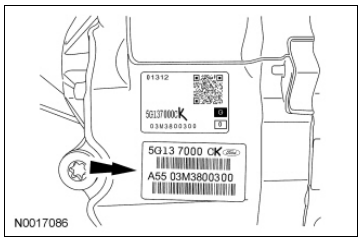
Transaxle Description



This transaxle is a compact, lightweight, next generation electronically controlled, 6-speed automatic transaxle that employs Ravigeneaux-type and one single planetary gear set.

This transaxle contains a high-precision clutch hydraulic control system for a smooth, highly responsive gear shift feel.

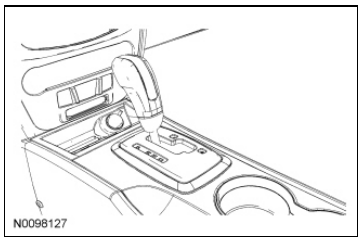
All hydraulic functions are directed by electronic solenoids to control:



- engagement feel.
- shift feel.
- shift scheduling.
- modulated Torque Converter Clutch (TCC) applications.
- engine braking, utilizing the coast clutch.

Automatic Transmission

Identification Tags



When servicing the automatic transaxle, use the bar code identification label located on side of the transaxle case.

Range Selection

Range Selection

This transaxle has 5 fixed range positions: P, R, N, D, M and 2 spring-loaded manual positions (-) and (+).

Park

In the P position:

- the transmission is locked and prevents the wheels from turning.
- there is no powerflow through the transaxle.
- the parking pawl locks the final drive.
- the engine may be started.
- the ignition key may be removed.

Reverse

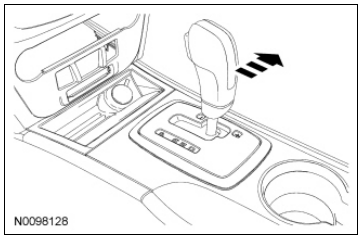
In the R position:

- the vehicle may be operated in a backward direction, at a reduced gear ratio. i>
- engine braking will occur.

Neutral

In the N position:

- the vehicle is able to roll.
- there is no powerflow through the transaxle.
- the output shaft is not held and is free to turn.
- the engine may be started.



Drive

D is the normal position for most forward driving.

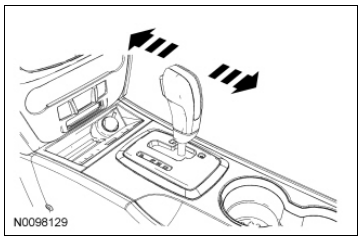
D provides:

- automatic shifts - 1st through 6th gears, which includes Overdrive (O/D).
- apply and release of the Torque Converter Clutch (TCC).
- maximum fuel economy during normal operation.

Manual

The transaxle is in MANUAL when the selector lever is moved to the right (M) position without commanding a gear by pushing the selector lever backward (+) or forward (-).

In the M position:



- O/D is cancelled.
- the transmission operates in gears 1st through 4th.
- grade assist is activated.
- some engine braking may occur.

Grade Assist

- Improves vehicle handling in hilly terrain or mountainous areas by providing additional engine braking and extends lower gear operation on uphill climbs.
- Additional engine braking is provided through the automatic transaxle shift strategy which reacts to vehicle inputs including vehicle acceleration, accelerator pedal, brake pal and vehicle speed.
- The transaxle will select gears that will provide the engine braking desired, based on the vehicle inputs, this will increase engine rpm during engine braking.

It is recommended to return to DRIVE mode on flat terrain to provide the best fuel economy and transaxle function. The transaxle returns to O/D when the selector lever is moved back into the D position.

Select Shift Transmission Selector Lever

The select shift transmission selector lever gives the driver the ability to change gears up or down manually as desired.

The transaxle is in the select shift whenever the selector lever is moved backward to the (+) position or forward to the (-) position from the (M) position.

In the - M + position:

- Gears 1 through 6 available.
- Moving the selector lever to the forward (-) or backward (+) position will allow the transmission to utilize the Manual Mode for select shifting.
- Moving the spring-loaded selector lever forward into (-) in the gate and releasing the selector lever, the selector lever will return to the M position and the transmission will downshift.
- Moving the spring-loaded selector lever backward into (+) in the gate and releasing the selector lever, the selector lever will return to the M position and the transmission will upshift.

When selecting the appropriate gear in select shift transmission mode, the instrument cluster will display the current selected gear.

The select shift transmission will make some shifts automatically, primarily to protect the engine from stalling.

The transmission will not upshift if the redline is approached and must be shifted manually by moving the selector lever back into (+) and releasing.

Gear Availability

MANUAL LEVER POSITION	TRANSAXLE GEAR OPERATION	DESCRIPTION
P	Park	Forward or reverse gears not available. Final drive is held to the transaxle case.
R	Reverse	Transaxle allows reverse only.
N	Neutral	Forward or reverse gears not available. Final drive moves freely.
D	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ⇆ 6	6 forward gears are available. Gears are dependent on vehicle speed and throttle position with coast braking.
M	1 ⇆ 2 ⇆ 3 ⇆ 4 ⟝ 5 ⟝ 6	1st through 4th gears are available. Transaxle shifts to 4th gear if the selector lever is moved to the M position when the transaxle is in 6th or 5th gear. Transaxle provides engine braking.
(-) (+)	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ⇆ 6	1st through 6th gears are available upon deceleration. The transaxle will make downshifts to first gear if a stop from 4th, 5th or 6th gear occurs. The transaxle also makes downshifts if the accelerator pedal is depressed past 90%. Upshifts are done manually with the selector lever. Transaxle can start in 1st, 2nd or 3rd gear.

N0109017

Shift Patterns

Based on signals from the sensors, the system controls gear shift lockup.

Downshifts

Under certain conditions the transaxle will downshift automatically to a lower gear range (without moving the selector lever). There are 3 categories of automatic downshifts:

- Coastdown
- Torque demand
- Forced or kickdown shifts

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide hat gear ratio. If applied, the transaxle will disengage the Torque Converter Clutch (TCC) to provide added acceleration.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine and transmission calibration requirements.

Transaxle Operational Strategies

Automatic Gearshift Control

In automatic gearshift control, based on each gearshift pattern, Shift Solenoid A (SSA) and Shift Solenoid B (SSB) turn ON or OFF and Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E (SSE) and Shift Solenoid F (SSF) are operated linearly according to information that includes vehicle speed, the degree to which the accelerator is open and brake signal.

Driver Adaptive Shift Control

This automatic transaxle does not have a driving mode selection switch that allows drivers to select a mode themselves. The vehicle is ordinarily in adaptive mode. However, when specific conditions are met, the Transmissiontrol Module (TCM) selects a shifting pattern appropriate to driving conditions from all of the shifting patterns and switches automatically.

- GREEN - Mode 1 - Switched from mode 2 to warm up the transmission fluid. This mode acts to protect the transaxle before the adaptive mode.
- GREEN - Mode 2 - After engine start-up, warm-up speed is increased for a certain period when transmission fluid temperature is low and the vehicle speed is 0.
- HIGH TEMP - When transmission fluid temperature becomes too high, this mode activates lock-up at an earlier timing to stop the temperature rise and lower the temperature.

- DOWN SLOPE - When driving down a slope, the TCM detects a down slope based on the engine control unit signal and output rpm. TCM switches to down slope mode to alleviate the load to the brake by downshifting.

Gear Shift Control

When the selector lever is moved from N to D or from N to R, after the engine is started, shift control solenoid assembly SSC , SSD or SSE is used for the fluid pressure required by C1 clutch or C3 clutch and appropriately regulated fluid pressure is supplied to the clutch, engaging smoothly without shov>

Reverse Converter Control

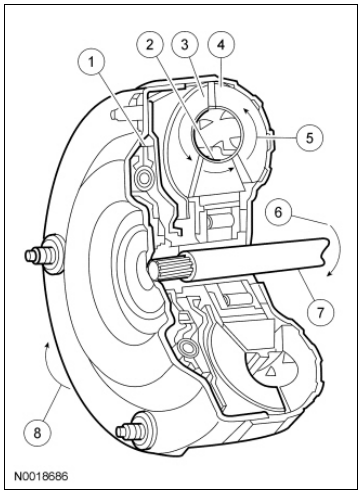
If the selector lever is moved from N to R while the vehicle is moving forward and the transaxle shifts into REVERSE, the wheels will be locked, which is extremely dangerous. In order to avoid this, the TCM inhibits the transaxle from shifting into REVERSE while moving forward.

Torque Converter Clutch (TCC)

Based on output rpm signals, signals from the engine control unit (engine rpm and throttle opening) and vehicle speed, a smooth engagement is carried out through linear control of the Torque Converter Clutch (TCC) solenoid. Also, the slip rate is detected by adding input rpm signals and slip control is carried out.

- Engagement Control - control is carried out using a TCC solenoid. The TCC solenoid is linearly turned ON and OFF. The clutch inside the torque converter is operated and the pump impeller and turbine runner are connected. Through this, the engine and the transaxle are coupled and engine output is connected directly to the transaxle, eliminating transaxle loss and enhancing fuel economy
- Slip Control - control is carried out using a TCC solenoid. The TCC soleno is linearly turned ON and OFF and the clutch within the torque converter is operated outside of the engagement range. The clutch slides without being in a completely coupled condition, increasing transaxle efficiency and enhancing fuel economy.

Torque Converter



The torque converter transmits and multiplies torque by means of transmission fluid inside the torque converter. The torque converter is composed of the following:

- Converter case
- Pump impeller assembly
- Turbine assembly
- Stator assembly/One-Way Clutch (OWC)
- Lock-up clutch

In addition, the use of the lock-up clutch is intended to improve fuel economy as a direct coupling between the engine and the transaxle.

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller sets the transmission fluid in motion.
- The turbine reacts to the transmission fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The tor redirects transmission fluid going back into the impeller, providing for torque multiplication.
- The clutch and damper assembly dampens powertrain torsional vibration and provides a direct mechanical connection for improved efficiency.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Item	Description
1	Converter clutch and damper (part of 7902)
2	Reactor (part of 7902)
3	Turbine (part of 7902)
4	Impeller (part of 7902)
5	Transmission fluid motion
6	Transmission input rotation

7	Input shaft
8	Engine rotation

Geartrain

The geartrain consists of the planetary gearsets, apply components, final drive gearset and differential.

Gear Ratio

Gear	Ratio
1st	4.148 to 1
2nd	2.370 to 1
3rd	1.556 to 1
4th	1.155 to 1
5th	0.859 to 1
6th	0.686 to 1
Reverse	3.394 to 1
Final drive	3.to 1

Differential

The differential allows the halfshafts and wheels to rotate at different speeds during cornering.

The differential assembly consists of the following components:

- Differential case (part of the final drive carrier)
- Two pinion gears supported by a pinion shaft
- Two side gears supported by the differential case and halfshafts

When driving in a straight line, both front wheels rotate at relatively the same speed. This means both side gears are rotating at the same speed, as well, while both pinion gears revolve (but do not rotate) with the side gears. During cornering, the wheel on the outside of the turn is forced to rotate faster than the wheel on the inside of the turn. Since the side gears must now rotate at different speeds, the pinion gears rotate on the pinion shaft allowing the drive axles to rotate at different speeds while still transferring output torque.

Apply Components

C1 Drive Clutch

The C1 clutch connects the front planetary carrier to the rear sun gear of the rear planetary set. The C1 clutch is applied in 1st (typical operation during engine braking), 2nd, 3rd and 4th gears.

C2 Drive Clutch

The C2 clutch connects the intermediate shaft to the rear planetary carrier. The C2 clutch is applied in 4th, 5th and 6th gears.

C3 Drive Clutch

The C3 clutch connects the front planetary carrier to the middle sun gear of the rear planetary set. The C3 clutch is applied in 3rd and 5th gears, and also in REVERSE when the vehicle speed is 7 km/h (4 mph) or less.

B1 Brake Clutch

The B1 brake locks the middle sun gear of the rear planetary gear set. The B1 brake is applied in 2nd and 6th gears.

B2 Brake Band

The B2 brake locks the rear planetary carrier in REVERSE gear when the vehicle speed is 7 km/h (4 mph) or less.

F1 One-Way Clutch

The F1 one-way clutch locks the counterclockwise rotation of the rear planetary carrier during 1st gear operation (during both normal operation and engine braking).

Hydraulic Systems

Valve Body

The valve body supplies transmission fluid by switching the transmission fluid circuit for the hydraulic pressure that is generated by the transmission fluid pump. Based on the hydraulic pressure generated by the transmission fluid pump the Transmission Control Module (TCM) sends control signals to the solenoid valves in accordance with vehicle conditions. When the solenoid valve is activated, the control hydraulic pressure to the clutch and brakes is determined (according to the equilibrium with the obtained hydraulic pressure) and gear shift and lockup are accomplished. In addition, an appropriate amount of transmission fluid is supplied to

the torque converter, planetary gears and lubricating parts.

Transaxle Electronic Control System

Transmission Control Module (TCM) Control Function

The Transmission Control Module (TCM) and its input/output network controls the following operations:

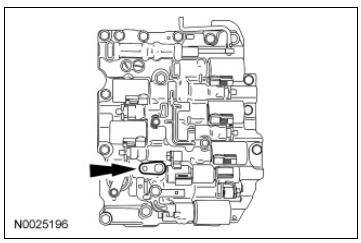
- Shift timing
- Line pressure (shift feel)
- Torque Converter Clutch (TCC)

The transaxle control is separate from the engine control strategy in the PCM, although some of the input signals are shared between the TCM and PCM. When determining the best operating strategy for transaxle operation, the TCM uses input information from certain engine-related and driver-demand related sensors and switches supplied by the PCM.

In addition, the TCM receives input signals from certain transaxle-related sensors and switches. The TCM also uses these signals when determining transaxle operating strategy.

Using all of these input signals, the TCM can determine when the time and conditions are right for a shift, or when to apply or release the torque converter clutch. It will also determine the best line pressure needed to optimize shift feel. To accomplish this the TCM uses output solenoids to control transaxle operation.

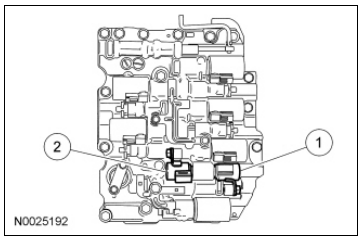
The following provides a brief description of each of the sensors and actuators used to control transaxle operation.



Transmission Range (TR) Sensor

The Transmission Range (TR) sensor is built in the TCM , it detects the automatic transmission range information via the Hall-effect sensor and outputs the information to the TCM . The TCM reads the voltage and adjusts the automatic transmission range.

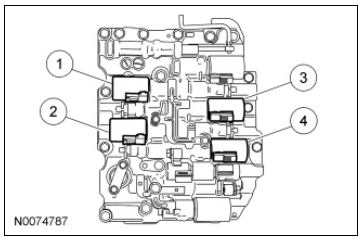
Brake Pedal Position (BPP)



The Brake Pedal Position (BPP) switch tells the PCM when the brakes are applied. The TCC disengages when the brakes are applied and the BPP switch closes when the brakes are applied and opens when they are released.

Transmission Fluid Temperature (TFT) Sensor

The Transmission Fluid Temperature (TFT) sensor, which is integrated within the transmission wiring, is installed on the front of the valve body. It directs the transmission fluid temperature within the hydraulic pressure control circuit and transmits a signal based on that temperature to the TCM . Through this it controls gear shift, lockup and slip in response to changes in transmission fluid temperature for smooth shifting across wide fluid temperature zones.

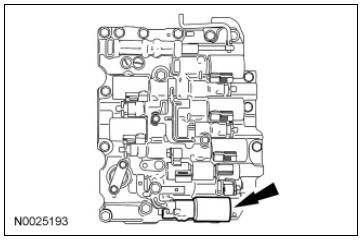


Transaxle Shift Solenoids SSA , SSB

Item	Description
1	Shift Solenoid A (SSA)
2	Shift Solenoid B (SSB)

The transaxle Shift Solenoid A (SSA) is installed on the middle valve body. The transaxle solenoid assembly Shift Solenoid B (SSB) is installed on the front valve body. The solenoids turn ON and OFF in response to signals output from the TCM . According to the ON or OFF status of SSA or SSB , the 1st gear engine brake operates or the gear shifts into REVERSE. As a fail-safe function, if any transaxle solenoid assembly abnormality occurs, the TCM will disable the current to the solenoids.

Shift Control Solenoids (SSC , SSD , SSE , SSF)



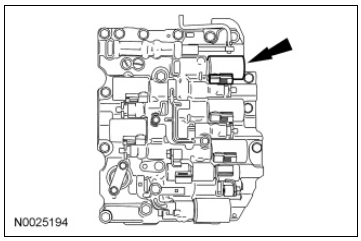
Item	Description
1	Shift Solenoid C (SSC)
2	Shift Solenoid D (SSD)
3	Shift Solenoid E (SSE)
4	Shift Solenoid F (SSF)

The shift control solenoid assembly (Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E (SSE), Shift Solenoid F (SSF)) is installed on the front valve body. The solenoids linearly control hydraulic pressure in response to signals, output from the TCM . Through this, it controls hydraulic pressure to the clutch (C1, C2, C3) and brakes (B1) for smooth shifting. According to the combination of ON or OFF status of the shift control solenoid assembly, the transaxle shifts from 1st gear into 6th gear and vice versa. As a fail-safe

function, if any shift control solenoid assembly abnormality occurs, the TCM will disable the current to the shift control solenoids.

Line Pressure Control (LPC)

The Line Pressure Control (LPC) is installed on the front valve body. Based on a signal indicating the degree to which the throttle is opened, engine torque, and according to a duty ratio predetermined in the TCM , the solenoids control line hydraulic pressure by linearly changing the comparable throttle hydraulic pressure. Through this, it controls operating hydraulic pressure to the clutch and brakes for smooth shifting. As a fail-safe function, if any shift control solenoid assembly abnormality occurs, the TCM will disable the current to the shift control solenoids. The line pressure is maximized, if the shift control solenoid assembly current is disabled when any abnormality other than locking occurs.



Speed Sensor

The 2 speed sensors are installed in the transaxle case. One speed sensor detects revolutions of the intermediate shaft's C2 drum as input shaft revolutions. The other speed sensor detects the counterdrive gear as output shaft revolutions. These signals are transmitted to the TCM . Based on these signals, the TCM controls engine torque, shift timing and lockup.

Adaptive Shift Control

The TCM has an adaptive learning strategy to electronically control the transaxle which will automatically adjust the shift feel. The first few hundred miles of operation of the transaxle may have abrupt shifting. This is a normal operation. If the battery has been disconnected for any reason it will need to be kept disconnected for approximately 20 minutes to reset the adaptive shift pressure strategy or use the scan tool to carry out the keep alive memory reset.

Torque Converter Clutch (TCC) Solenoid

The TCC solenoid is used in the transaxle control system to control the application, modulation and release of the torque converter clutch.

The TCC control solenoid is installed on the front valve body. Based on engine rpm, throttle opening degree signals and speed sensor signals, it linearly controls clutch hydraulic pressure. Through this, engagement and

slip are controlled. As a fail-safe function, if any control solenoid assembly abnormality occurs, the TCM will disable the current to the TCC solenoid.

Diagnostic Strategy

Troubleshooting an electronically controlled automatic transaxle is simplified by using the proven method of diagnosis. One of the most important things to remember is there's a definite procedure to follow.

NOTE: Do not take short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- Powertrain Control/Emissions Diagnosis (PC/ED) manual
- TSBs
- Wiring Diagrams manual

These publications provide the information required when diagnosing transaxle concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the transmission fluid level and condition.
- Check for nontory-installed items and verify correct installation.
- Check selector lever linkage for correct adjustment.
- Check TSBs regarding the concern.
- Retrieve and record all DTCs.

Diagnostics

- Retrieve and record all DTCs.
- Repair all non-transaxle codes first.
- Repair all transaxle codes second.
- Erase all continuous codes and attempt to repeat them with the drive cycle test. Refer to Transaxle Drive Cycle Test in this section.
- Repair all continuous memory codes.
- If only pass codes are obtained, proceed to the Diagnosis By Symptom in this section for further information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Diagnostic Flow Chart

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Prior to carrying out the flow test, the following items should be checked:

- Know and understand the customer concerns
- Verify the concern by operating the vehicle
- Check the transmission fluid level and condition
- Check for non-factory-installed items and verify correct installation
- Check the selector lever linkage for correct adjustment
- Check TSBs regarding the concern
- Retrieve and recorl DTCs

Diagnostic Flow Chart

Test	Result	Action
1) Are any DTCs recorded?	Yes	• REPAIR all hard DTCs. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first, then this workshop manual, GO to Step 2.
	No	• REFER to Diagnosis By Symptom in this section, GO to Step 5.
2) Are any continuous test memory codes present?	Yes	• CLEAR codes and CARRY OUT the drive cycle test. If code returns, GO to Step 3.
	No	• GO to Step 4.
3) Did the continuous test memory codes reappear?	Yes	• REPAIR all continuous test memory codes. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, then the Transmission Reference manual, then this workshop manual, GO to Step 2.
	No	• GO to Step 4.
4) Is the concern repaired?	Yes	• VERIFY no DTCs are present. CLEAR memory codes.
	No	

		• REFER to Diagnosis By Symptom in this section.
5) Was the transmission concern corrected when the scan tool was installed?	Yes	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, intermittent fault diagnosis section and use the scan tool to diagnose cause of concern in the processor, vehicle harness or external inputs (sensors or switches).
	No	• REFER to the hydraulic and mechanical routine to diagnose the concern, GO to Step 6.
6) Is the concern repaired?	Yes	• CARRY OUT the drive cycle test and VERIFY no DTCs are present. CLEAR memory codes.
	No	• Concern should have been repaired. GO back through the Diagnostic Flow Chart and REVIEW other components that may have contributed to the concern. CHECK and DIAGNOSE those components. GET assistance from other sources.

Preliminary Inspection

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

The following items must be checked prior to beginning the diagnostic procedures.

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer complaint or condition. Customer contact may be required in order to begin to verify the concern. Understand the conditions as to when the concern occurs. For example:

- Hot or cold vehicle temperature
- Hot or cold ambient temperatures
- Vehicle driving conditions
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to verifying the concern.

Verification of Condition

This section provides information which must be used in both determining the actual cause of customer concerns and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission.

Determine Customer Concern

NOTE: Some transaxle conditions may cause engine concerns. An Electronic Pressure Control (EPC) short circuit can cause engine misfiring. The Torque Converter Clutch (TCC) not disengaging will stall the engine.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift
- Downshift
- Coasting
- Engagement (harsh or soft)
- Noise/vibration - check for engine rpm, vehicle speed, shift, gear, range or temperature dependencies

Check Transmission Fluid Level and Condition p>

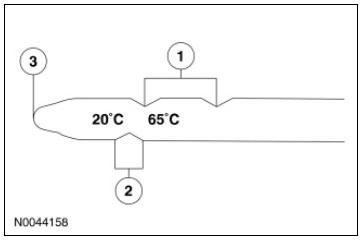
NOTICE: **The vehicle should not be driven if the transmission fluid level indicator shows the transmission fluid below the DO NOT DRIVE mark or internal failure could result.**

If the vehicle is operated for an extended period of time at highway speeds, city traffic, hot weather or while pulling a trailer, the transmission fluid needs to cool down to obtain an accurate reading.

The transmission fluid level reading on the transmission fluid level indicator will differ depending on operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Transmission Fluid Level Check

NOTE: Transmission fluid should be checked at normal operating temperature 60°C-70°C (140°F-158°F) on a level surface. Normal operating temperature is reached after approximately 32 km (20 mi) of driving and can be checked using the scan tool.



Check the transmission fluid level during normal maintenance. If the transaxle starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

1. With the selector lever in PARK, engine at idle, brake pedal applied, move the selector lever through each gear range and allow engagement of each gear. Place the selector lever in the PARK position.

2. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.

3. Wipe the transmission fluid level indicator with a clean cloth.

4. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the indicator. The transmission fluid level should be within the normal operating range.

Item	Description

1	Transmission fluid level at operating temperature 60°C-70°C (140°F-158°F)
2	Transmission fluid level cold 15°C-25°C (59°F-77°F)
3	Do not drive mark

High Transmission Fluid Level

Transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transaxle malfunction and/or damage. If an overfill reading is indicated, refer to Transmission Fluid Exchange in this section.

Low Transmission Fluid Level

Low transmission fluid level could result in poor transaxle engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transaxle seals or gaskets.

Adding Transmission Fluid

NOTICE: **The use of any type of transmission fluid other than specified could result in transaxle malfunction and/or damage.**

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid filler tube. Do not the transmission fluid. For transmission fluid type, refer to the specification chart in this section.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Hold the transmission fluid level indicator over a white facial tissue and allow the transmission fluid to drip onto the facial tissue and examine the stain.
3. Observe the color and the odor. The color under normal circumstances should be dark red, not brown or black or have a burnt odor.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If the stain is a foamy pink color this may indicate coolant in the transaxle. The engine cooling system should also be inspected at this time.
6. If transmission fluid contamination or transaxle failure is confirmed by the sediment in the bottom of the transmission fluid pan, install a new transaxle. If installing a new transaxle the transmission fluid cooler bypass valve, transmission fluid coolers and transmission cooler tubes should be cleaned.
7. Carry out diagnostic checks and adjustments. Refer to Diagnosis By Symptom in this section.

Water in Transmission Fluid

To correctly repair an automatic transaxle that had water or coolant introduced into the system, only install a new transaxle for the units that cannot be disassembled and cleaned. Prior to installing the transaxle, the transmission fluid cooler(s), transmission fluid cooler tubes and transmission fluid cooler hoses need to be

flushed and cleaned.

Road Testing Vehicle

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

The Shift Point Road Test and Torque Converter Operation Tests provide diagnostic information on shift controls and torque converter operation.

Shift Point Road Test

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: Shift speed ranges are approximate for all applications.

This test verifies that the shift control system is operating correctly.

1. Bring engine and transaxle up to normal operating temperature.
2. Operate vehicle with selector lever in D range.
3. Using the shift speed charts, apply minimum throttle and observe the speeds at which the transaxle upshifts. The transaxle willhift 1st through 6th gears.
4. Press the accelerator pedal to the floor, Wide Open Throttle (WOT). The transaxle should downshift to the next lower gear depending on the vehicle speed. The Torque Converter Clutch (TCC) should release.

Shift Speed

Manual D	km/h	mph
1-2 upshift	14-21	9-13
2-3 upshift	21-29	13-18
3-4 upshift	33-40	20-25
4-5 upshift	49-55	30-35
5-6 upshift	65-70	40-44
3-1 downshift	7-17	4-11
4-3 downshift	26-36	16-24
5-4 downshift	38-46	24-29
6-5 downshift	56-63	35-39

5. If the transaxle fails to upshift/downshift or the TCC does not apply and release, refer to Diagnosis By Symptom in this section for possible causes.

Torque Converter Diagnosis

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Prior to torque converter installation, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of new or remanufactured torque converters. Only after a complete diagnostic evaluation can the decision be made to installew or remanufactured torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary Inspection

2. Know and Understand the Customer Concern

3. Verify the Concern - carry out the torque converter operation test

4. Carry out Diagnostic Procedures:
   - Retrieve and record all DTCs. Refer to Diagnostics in this section.
     - Repair all non-transaxle related DTCs first.
     - Repair all transaxle DTCs.
     - Carry out Pressure Test. Refer to Special Testing Procedures in this section.
     - Carry out Stall Speed Test. Refer to Special Testing Procedures in this section.
     - Carry out diagnostic routines. Refer to Diagnosis By Symptom in this section.
     - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and repair as required, before repairing the torque converter.

Torque Converter Operation Test

NOTE: The Torque Converter Clutch (TCC) will not engage if the Transmission Fluid Temperature (TFT) is below 0°C (32°F).

1. Using the scan tool, make sure the TFT is within specification 43°C-47°C (109°F-117°F).

2. Accelerate the vehicle to 35-60 km/h (22-37 mph) and maintain a consistent speed.

3. Release the accelerator pedal to close the throttle then press the accelerator to partially open the throttle while monitoring the scan tool engine speed and TCCAMP_MES. The PID will read 0 when the TCC is released, and 1 when the TCC is applied. The engine speed will increase when the TCC is released and decrease when the TCC is appl

4. If these actions do not occur, see Torque Converter Operations Concerns, refer to Diagnosis By Symptom in this section.

Visual Inspection

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
  - A/C
  - Generator (alternator)
  - Engine turbo
  - Cellular telephone
  - Cruise control
  - CB radio
  - Linear amplifiers
  - Backup alarm signal
  - Computer
- Vehicle modification:
  - These items, if not installed correctly, will affect the PCM or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.
  - Leaks. Refer to Leakage Inspectiona> in this section.
  - Correct selector lever linkage adjustments. Refer to Section 307-05A .

Selector Lever Linkage Check

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the selector lever linkage is not correctly adjusted. Refer to Section 307-05A for selector lever linkage adjustment.

Check TSBs

Refer to all TSBs which pertain to the concern and follow the procedure.

Diagnostics

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Self DiagnoFunction

The Transmission Control Module (TCM) monitors the communication status of each sensor, electronic component and the PCM. If any malfunctions occur, the TCM function warns the driver and stores the malfunction as a diagnosis code.

Fail-Safe

With the fail-safe function, if any malfunction should occur in the transaxle system, the TCM will output a control signal, and control will be carried out to make traveling a minimum distance possible. If all shift solenoids malfunction, the TCM will cancel the output of control signals to the solenoids. If this happens, the automatic transmission gear shifting will be controlled by transmission fluid pressure circuits only and the gears will shift as shown in the following table.

Selector Lever Position	Gear Position
R	Reverse
D	3rd or 5th gear

On-Board Diagnostic (OBD) With Scan Tool

NOTE: For detailed instruction and other diagnostic methods using the scan tool or equivalent, refer to the Scan Tool Tester manual and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

These Self Tests should be used to diagnose the PCM and should be carried out in order.

- Self Test - Key ON Engine OFF (KOEO)
- Self Test - Continuous Memory Codes
- Self Test - Key ON Engine Running (KOER)
- Special Test Modes
    - Wiggle Test Mode
    - Output Test Mode

- PCM Reset Mode
- Clearing DTCs P1000
- On-Board Diagnostic (OBD) II Drive Cycle
- Other scan tool features

Diagnostic Parameters Identification (PID) Chart

TORQUE	Net engine torque	Torque (lb-ft)
TP_REL	Relative Throttle Position (TP)	Percentage
TR	Transmission Range (TR)	• P = 7 • R = 6 • N = 5 • D = 4 • L = 1

TRAN_RAT	Transmission gear ratio	Ratio		
TSS_SRC	Turbine Shaft Speed (TSS)	TSS	TSS	rpm
TR_V	TR	Voltage		
VPWRTCM	Module supply voltage VBAT	Voltage		
VSS	Vehicle Speed Sensor (VSS)	Speed (mph)		

Transaxle Drive Cycle Test

NOTICE: **Prior to carrying out the Transaxle Drive Cycle Test, make sure that the transaxle is full of transmission fluid or damage to the transaxle may occur.**

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

Use the Transaxle Drive Cycle Test for checking continuous codes.

NOTE: The Transaxle Drive Cycle Test must be followed exactly. Malfunctions must occur multiple times consecutively for shift error or Torque Converter Clutch (TCC) codes to set.

NOTE: When carrying out the Transaxle Drive Cycle Test, see the Solenoid Operation Chart for correct solenoid operation. Refer to Specifications in this section.

1. Record and then erase all DTCs.

- Warm engine to normal operating temperature.

3. Make sure transmission fluid level is correct.

4. With the selector lever in DRIVE, moderately accelerate from stop to 80 km/h (50 mph). This allows the transaxle to shift into 6th gear. Hold speed and throttle steady for minimum of 15 seconds. Brake to a stop and remain stopped for minimum of 20 seconds.

5. Repeat Step 4 at least 5 times.

6. Retrieve and record any DTCs.

- If DTCs are present, refer to Diagnostic Trouble Code (DTC) Charts in this section. Service all non-transaxle DTCs first as they can directly affect the operation of the transaxle. Repeat the Road Test to verify the correction. Erase DTCs, carry out the Transaxle Drive Cycle Test, and road test after completing service on the DTCs.
- If the continuous test passes (system pass) and a concern is still present, refer to Diagnosis By Symptom in this section and check TSBs for diagnostic concern.

After On-Board Diagnostic (OBD)

NOTE: The vehicle wiring harness, PCM and non-transaxle sensors may affect transaxle operations. Service these concerns first.

After the On-Board Diagnostic (OBD) procedures are completed, service all DTCs.

Begin with non-transaxle related DTCs, then service any transaxle related DTCs. Refer to the Diagnostic Trouble Code (DTC) Charts in this section for information on Condition and Symptoms. This chart will be helpful in referring to the correct manual(s) and to aid in diagnosing internal transaxle concerns and external non-transaxle inputs. The pinpoint tests are used in diagnosing electrical concerns of the transaxle. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosing non-transaxle electronic components. The diagnostic routine

hydraulic/mechanical charts will help in diagnosing internal transaxle concerns and external non-transaxle inputs.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the PCM wiring harness for correct connections, bent or broken pins, corrosion, loose wires, correct routing, correct seals and their condition. Check the PCM, sensors and actuators for damage. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

NOTE: If a concern still exists after electrical diagnosis has been carried out, refer to Diagnosis By Symptom in this section.

If DTCs appear while carrying out the on-board diagnostics, refer to the Diagnostic Trouble Code (DTC) Charts in this section for the appropriate repair procedure. Prior to entering pinpoint tests, refer to TSBs for transaxle concerns.

Diagnostic Trouble Code (DTC) Charts

DTC Chart

NOTICE: **This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as open or shorted to ground circuits. Continuous Memory Diagnostic Trouble Code (CMDTC) has an additional 2-character DTC status code suffix to assist in determining DTC history.**

DTC	Component	Description	Condition	Symptom	Action
P0562:00	Battery	System vol low.	PCM detected a voltage level below 9 volts.	No engagements, no adaptive or self-learning strategy.	CHECK charging system, REFER to Section 414-01 .
P0563:00	Battery	System voltage high.	PCM detected a voltage level above 18 volts.	No adaptive or self-learning strategy.	CHECK charging system, REFER to Section 414-01 .
P0601:00	Transmission Control Module (TCM)	TCM Read-Only Memory (ROM) error.	TCM detected an internal software concern with ROM .	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM .
P0603:00	TCM	TCM Keep Alive Memory (KAM) error.	TCM detected an internal software concern with KAM .	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM .
P0604:00	TCM	TCM Random Access Memory (RAM) error.	TCM detected an internal software concern with RAM .	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM .
P0706:00	Transmission Range (TR)	TR sensor range or performance error.	TR sensor signal is out of normal range.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self-learning strategy.	INSTALL a new TCM .
P0707:00	TR Sensor	TR sensor circuit low input.	TR sensor signal is below threshold of 0.127 volt, sensor/circuit electrical malfunction.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self-learning strategy.	INSTALL a new TCM .
P0708:00	TR Sensor				INSTALL a new TCM .

		TR sensor circuit high input.	TR sensor signal is above threshold of 4.87 volts, sensor/circuit electrical malfunction.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self-learning strategy.	
P0711:00	Transmission Fluid Temperature (TFT) Sensor	No change in TFT during operation.	PCM has detected no TFT change during operation. TFT value stuck at some normal reading.	TFT indicates 80°C (176°F) at all times, no self-learning strategy, no Torque Converter Clutch (TCC) engagement.	GO to Pinpoint Test B .
P0712:00	TFT Sensor	200°C (329°F) indicated, TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature -43°C (-45°F).	TFT indicates 80°C (176°F) at all times, no self-learning strategy, no TCC engagement.	GO to Pinpoint Test B .
P0713:00	TFT Sensor	-43°C (-45°F) indicated, TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature -43°C (-45°F).	TFT indicates 80°C (176°F) at all times, no self-learning strategy, no TCC engagement.	GO to Pinpoint Test B .
P0716:00	Turbine Shaft Speed (TSS) Sensor	TSS range out of performance, insufficient input from TSS .	PCM has detected a loss or noisy TSS signal during operation.	No TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test D .
P0717:00	TSS Sensor	No TSS signal.	PCM has not detected a TSS signal. No TSS signal when Output Shaft Speed (OSS) signal present.	No TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test D .
P0721:00	OSS Sensor	OSS range out of performance, insufficient input from OSS .	PCM has detected a loss or noisy OSS signal during operation.	No adaptive or self-learning strategy.	GO to Pinpoint Test C .
P0722:00	OSS Sensor	No OSS signal.	PCM has detected no OSS signal.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test C .
P0729:00	Transaxle	6th gear ratio.	No 6th gear ratio detected by TCM .	No 6th gear, no TCC	GO to Pinpoint Test A .

				engagements, no adaptive or self-learning strategy.	
P0730:00	Clutch Control Solenoids or Internal Parts	Gear ratio error.	PCM has detected a gear ratio error.	No self-learning strategy.	GO to Pinpoint Test A .
P0731:00	Solenoid or Internal Parts	1st gear ratio.	No 1st gear ratio detected by TCM .	No 1st gear, no TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0732:00	Solenoid or Internal Parts	2nd gear ratio.	No 2nd gear ratio detected by TCM .	No 2nd gear, no TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0733:00	Solenoid or Internal Parts	3rd gear ratio.	No 3rd gear ratio detected by TCM .	No 3rd gear, no TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0734:00	Solenoid or Internal Parts	4th gear ratio.	No 4th gear ratio detected by TCM .	No 4th gear, no TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0735:00	Solenoid or Internal Parts	5th gear ratio.	No 5th gear ratio detected by TCM .	No 5th gear, no TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0736:00	Transaxle	Reverse gear ratio.	No reverse gear ratio detected by TCM .	No reverse gear, no self-learning strategy.	GO to Pinpoint Test A .
P0780:00	Solenoid or Valve Internal to Transaxle	Universal shifting (stuck valve).	Valve stuck.	Increase rpm during shifts. Slipping or erratic shifting.	GO to Main Control Valve Body in this section.
P0813:00	Reverse Output Circuit	Reverse lamp circuit.	Reverse lamp circuit short to ground, power or open.	Reverse lamps inoperative.	GO to Section 417-01 .
P0817:00	TCM /PCM Starter Circuit	Starter disable circuit open or shorted to	TCM detected a failure in the starter lock circuit, failed	DTC is set. Warning lamp is illuminated.	GO to Pinpoint Test E .

		power/ground.	ON or OFF. Ignition switch is ON, TCM and PCM communication is normal. No voltage is detected on the start lock circuit for more than 0.1 second or a continuous 12-volt output is detected for more than 0.1 second. Conditions present 2 times to set DTC.		
P0819:00	SelectShiftTM Transmission Control Circuit	Up And Down Shift Swich To Transmission Range (TR) Correlation	The associated circuitry connected to the SelectShiftTM switch or fuse, or the SelectShiftTM switch itself may have an issue causing a SelectShiftTM malfunction.	No manual up or down shift available.	GO to Section 307-05A .
P0961:00	Line Pressure Control (LPC)	LPC circuit or solenoid failure.	LPC circuit or solenoid failed during operation. Incorrect commanded current detected by TCM .	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0962:00	LPC	LPC solenoid signal or grounded circuits either short or open, solenoid circuit failure.	Voltage through LPC is checked. An error will be noted if tolerance is exceeded.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0963:00	LPC	LPC solenoid short to power circuit failure.	Voltage through LPC is checked. An error will be noted if tolerance is exceeded.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0973:00	Shift Solenoid A (SSA)	SSA solenoid or circuit shorted to ground.	Voltage through SSA (S1) circuit is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0974:00	SSA				GO to Pinpoint Test A .

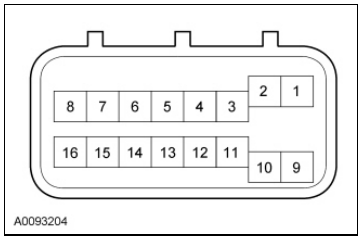
		SSA or circuit shorted to power or open.	Voltage through SSA (S1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	
P0976:00	Shift Solenoid B (SSB)	SSB solenoid or circuit shorted to ground.	Voltage through SSB (S2) circuit is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0977:00	SSB	SSB solenoid or circuit shorted to power or open.	Voltage through SSB solenoid (S2) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0978:00	Shift Solenoid C (SSC)	SSC circuit or solenoid failure.	SSC circuit or solenoid failed during operation. Incorrect commanded current detected by TCM .	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0979:00	SSC	SSC solenoid signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSC circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0980:00	SSC	SSC solenoid or circuit shorted to power.	Voltage through SSC circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0981:00	Shift Solenoid D (SSD)	SSD circuit or solenoid failure.	SSD circuit or solenoid failed during operation.	No engagements, no adaptive or	GO to Pinpoint Test A .

			Incorrect commanded current detected by TCM .	self-learning strategy.	
P0982:00	SSD	SSD signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSD circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0983:00	SSD	SSD or circuit shorted to power.	Voltage through SSD circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0984:00	Shift Solenoid E (SSE)	SSE circuit or solenoid failure.	SSE circuit or solenoid failed during operation. Incorrect commanded current detected by TCM .	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0985:00	SSE	SSE signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSE circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0986:00	SSE	SSE or circuit shorted to power.	Voltage through SSE circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0997:00	Shift Solenoid F (SSF)	SSF circuit or solenoid failure.	SSF circuit or solenoid failed during operation. Incorrect commanded current detected by TCM .	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P0998:00	SSF	SSF signal or grounded circuits	Voltage through SSF circuit is	No engagements,	GO to Pinpoint Test A .

		either shorted or open, solenoid circuit failure.	checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	no adaptive or self-learning strategy.	
P0999:00	SSF	SSF or circuit shorted to power.	Voltage through SSF circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P1573:00	Accelerator Pedal Position (APP) Sensor	APP sensor input error.	PCM has detected an input error from the APP sensor.	No adaptive or self-learning strategy.	**NOTE:** If this DTC is displayed, a malfunction occurred in the vehicle not the TCM . Do not install a new TCM . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1576:00	Throttle Position (TP) Sensor	TP sensor input error.	TP not available.	Limited function.	**NOTE:** If this DTC is displayed, a malfunction occurred in the vehicle not the TCM . Do not install a new TCM . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1657:00	TCM	TCM communication link error.	Controller Area Network (CAN) link error detected by PCM.	No engagements, no adaptive or self-learning strategy. Limited fuel and spark.	INSTALL a new TCM .
P1700:00	Transaxle	Drive engagement error.	TCM detected neutral in the DRIVE position.	No engagements, no adaptive or self-learning strategy.	REFER to Diagnosis By Symptom in this section.
P1701:00	Transaxle	Reverse engagement error.	TCM detected neutral in the REVERSE position.	No self-learning strategy.	REFER to Diagnosis By Symptom in this section.
P1719:00	PCM	Engine torque signal.	Torque engine accuracy from PCM	Firm shifts and no adaptive	PERFORM self-test of PCM. REFER to the

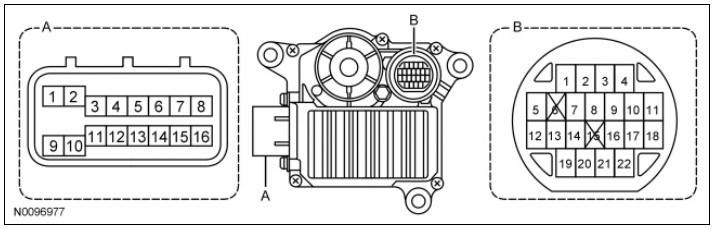
			inaccurate.	learning.	Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose any DTCs present. If no DTCs, IDENTIFY the driveability symptom present and REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for further diagnosis.
P1919:00	Engine Coolant Temperature (ECT)	Sensor signal error.	PCM/ TCM have detected an error in the CAN ECT information.	No TCC engagements, ECT set to 80°C (176°F).	**NOTE:** If this DTC is displayed, a malfunction occurred in the vehicle not, the TCM . Do notnstall a new TCM . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P2757:00	TCC Solenoid	TCC solenoid circuit failure, stuck OFF.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open, shorted or PCM driver failure during On-Board Diagnostic (OBD).	No TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P2758:00	TCC Solenoid	TCC solenoid circuit failure, stuck ON.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open, shorted or PCM driver failure during OBD .	No TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P2762:00	TCC Solenoid	TCC circuit or solenoid failure.	TCC circuit or solenoid failed during operation. Incorrect commanded current detected by TCM .	No engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P2763:00	TCC Solenoid	TCC circuit shorted to power.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit shorted to power.	No TCC engagements, no adaptive or self-learning strategy.	GO to Pinpoint Test A .
P2764:00	TCC Solenoid				GO to Pinpoint Test A .

		TCC solenoid signal or grounded circuits either short or open solenoid circuit failure.	TCC solenoid circuit fails to provide voltage drop across solenoid.	No TCC engagements, no adaptive or self-learning strategy.	
U0073:00	TCM CAN	TCM communication link error.	CAN link error detected by PCM.	No engagements, no adaptive or self-learning strategy.	REFER to Section 418-00 .
U0100:00	TCM CAN	TCM communication link error.	CAN link error detected by PCM.	No engagements, no adaptive or self-learning strategy.	**NOTE:** If this DTC is displayed, a malfunction occurred in the vehicle not the TCM . Do not install a new TCM . A module cannot communicate with other modules on the communication network while being reprogrammed. CLEAR any network communication DTCs which may have been set in other modules during reprogramming. CHECK CAN harness between TCM and other modules. For diagnostic information, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and REFER to Section 418-00 .



Transaxle Connector Layouts

Transaxle Bulkhead Electrical Connector



Pin Number	Circuit Function
1	Line Pressure Control (LPC) ground
2	Shift Solenoid B (SSB)

Transaxle Control Module Terminal Testing

NOTE: For testing, place the positive lead on the terminal with the + sign and place the negative lead on the terminal with the - sign.

Pin Number	Pin Acronym	Description	Input / Output to Trans-mission Control Module (TCM)	Measure pins	Condition For Testing	Reference Value

A1	B+	Battery voltage	-	+A1 to ground	Hot at all times	10-14 volts
A3	SST(+)	Select shift upshift signal	Input	+A3 to -A9	Voltage high when upshift commanded by select shift	10-14 volts
A4	SST(-)	Select shift downshift signal	Input	+A4 to -A9	Voltage high when downshift commanded by select shift	10-14 volts
A5	STLK	Start lock signal output	Output	+A5 to -A9	Ignition ON in PARK Ignition ON in other than PARK	0-0.8 volt 9-14 volts
A6	CAN L	Controller Area Network (CAN) communi-cation low	Input/output	+A6 to -A9	Engine idling	-
A8	K	Diagnostic signal	Input/output	+A8 to -A9	-	-
A9	GRND	Transmission Control Module (TCM) ground	-	+ground to chassis ground	-	-
A11	IG	Ignition switch signal input	Input	+A11 to -A9	Ignition ON	10-14 volts
A12	Reverse Lamp	Reverse lamp is indicated in reverse	Output	+A12 to -A9	Voltage high when not in REVERSE Voltage low when in REVERSE	0-14 volts
A14	CAN H	communi-cation high	Input/output	+A14 to -A9	Engine idling	-
B1	LPC ground	Line Pressure Control (LPC) ground (SLTG)	-	-	-	-
B2	SSB	Shift Solenoid B (SSB) (S2)	Output	+B2 to ground	Vehicle in PARK, engine idling	0-1.5 volts
B3	LPC	LPC	Output	+B3 to -B1	Vehicle in PARK, engine idling	-
B4	TCC solenoid ground	Torque Converter Clutch (TCC) solenoid ground (SLUG)	-	-	-	-
B5	SSA		Output	+B5 to ground		0-1.5 volts

		Shift Solenoid A (SSA) (S1)			Vehicle in PARK, engine idling	
B7	TFT ground	Transmission Fluid Temperature (TFT) sensor ground (OTG)	-	-	-	-
B8	TFT	TFT sensor (OT)	Input	+B8 to -B7	TFT at 10°C to 110°C (50°F to 230°F)	4.0 to 0.0 volts
B9	TCC	TCC solenoid (SLU)	Output	+B9 to -B4	Vehicle in PARK, engine idling	-
B10	SSC ground	Shift Solenoid C (SSC) ground (SLC1G)	-	-	-	-
B11	SSC (SLC1)	Output	+B11 to -B10	Vehicle in PARK, engine idling	-	
B12	ISS	Input shaft speed sensor signal (NIN)	Input	+B12 to -B13	Vehicle in PARK, engine idling	-
B13	ISS ground	Input shaft speed sensor signal (NIN)	-	-	-	-
B14	SSE	Shift Solenoid E (SSE)	Output	+B14 to -B22	Vehicle in PARK, engine idling	-
B16	SSF ground	Shift Solenoid F (SSF) ground (SLB1G)	-	-	-	-
B17	SSD	Shift Solenoid D (SSD) (SLC2)	Output	+B17 to="top" align="left">Vehicle in PARK, engine idling	-	
B18	SSD ground	SSD ground (SLC2G)	-	-	-	-
B19	OSS	Output Shaft Speed (OSS) sensor signal (SP+)	Input	+B19 to -B20	Vehicle speed approximately 20 km/h (12 mph)	-
B20	OSS ground	OSS sensor ground (SP-)	-	-	-	-
B21	SSF	SSF (SLB1G)	Output	+B21 to -B16	Vehicle in PARK, engine idling	-
B22	SSE ground	SSE ground (SLC3G)	-	-	-	-

Pinpoint Tests - OSC Equipped Vehicle

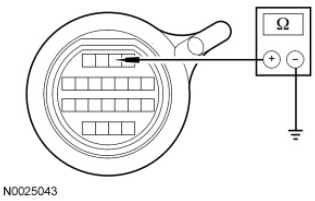
Special Tool(s)

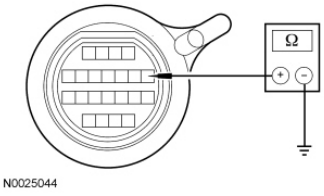
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Anyelectrical connector or solenoid body is disconnected, inspect the connector for pin condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install a new connector as required.

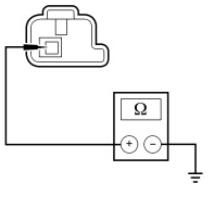
Prior to carrying out the pinpoint tests, check the following:

- Transmission fluid level
- Transmission fluid condition (burned, metal particles or discolored)
- Engine cooling system
- Other non-related transmission DTCs





Pinpoint Tests



Refer to Wiring Diagrams Cell 29 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information.

PINPOINT TEST A: SHIFT SOLENOIDS

NOTE: Refer to the Transaxle Vehicle Harness Connector illustrations within the Transaxle Connector Layouts procedure in this section.

Test Step	Result / Action to Take
A1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the transaxle harness connector is fully seated, pins are fully engaged in the connector and in good condition before proceeding. • Ignition OFF. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Retrieve DTCs.	**Yes** For Shift Solenoid A (SSA) and Shift Solenoid B (SSB), GO to A2 . For the Line Pressure Control (LPC), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E (SSE), Shift Solenoid F (SSF) and Torque Converter Clutch (TCC), GO to A4 . **No** CLEAR all DTCs. ROAD TEST to verify if concern is still present. Concern could be intermittent. If concern is

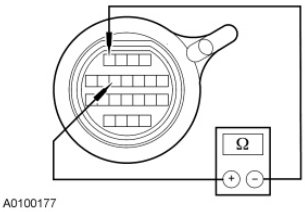
• **Are there any transmission DTC faults present?**	still present or reappears, GO to the appropriate pinpoint test steps: For shift solenoids SSA and SSB , GO to A2 . For shift solenoids LPC , SSC , SSD , SSE , SSF and TCC , GO to A4 .
A2 CHECK RESISTANCE OF THE ON/OFF SOLENOID CIRCUIT	
• Ignition OFF. • Remove the Transmission Control Module (TCM). • Measure the resistance at the transaxle bulkhead electrical connector between pin 2 and ground for SSB .  N0025043 • Measure the resistance at the transaxle bulkhead electrical connector between pin 5 and ground for SSA .  N0025044 • **Is the resistance between 11-15 ohms?**	**Yes** INSTALL a new Transmission Control Module (TCM) and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to A3 . **No** GO to A3 .
A3 CHECK RESISTANCE OF THE ON/OFF SOLENOIDS	
• Remove the transaxle side cover. • Remove the wiring connector from the affected solenoid (SSA or SSB). • Measure the resistance between solenoid pin 1 and ground of the affected solenoid.	**Yes** INSTALL a new internal wire harness or REPAIR affected circuit. **No** INSTALL a new main control.

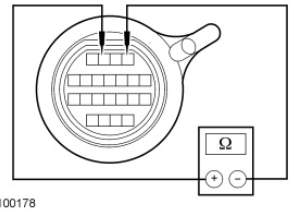
- **Is the solenoid resistance between 11-15 ohms?**

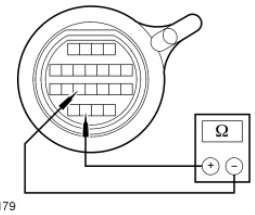
A4 CHECK LINEAR SOLENOID SHORT TO GROUND

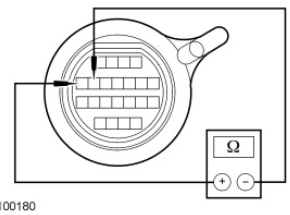
- Ignition OFF.
- Remove the TCM .
- Measure the resistance between the transaxle bulkhead electrical connector pin and ground using the following chart:

Transaxle Bulkhead Electrical Connector

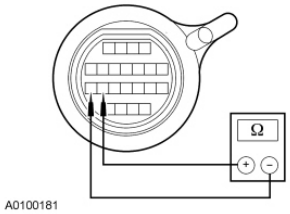


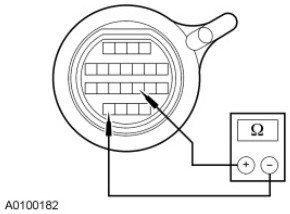






Pin Number	Circuit Function
1	Line Pressure Control (LPC) ground
3	LPC signal
4	Torque Converter Clutch (TCC) ground
9	TCC signal
10	Shift Solenoid C (SSC) ground
11	SSC signal
14	Shift Solenoid E (SSE) signal
16	Shift Solenoid F (SSF) ground
17	Shift Solenoid D (SSD) signal
18	SSD ground
21	SSF signal
22	SSE ground





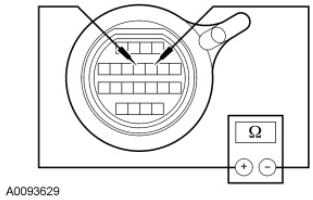
- **Is each resistance greater than 10,000 ohms?**

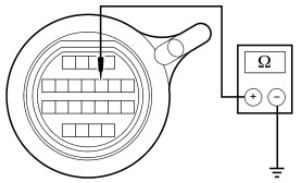
Yes
GO to A5 .

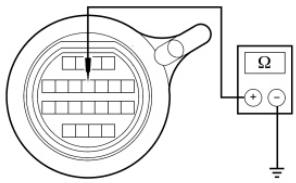
No
GO to A6 .

A5 CHECK RESISTANCE OF THE LINEAR SOLENOID(S)

• Inspect both sides of the TCM for damaged or pushed-out pins, corrosion or damaged seals. • For the TCC solenoid, measure the resistance between pin 4 and pin 9 at the transaxle.  A0100177 • For the LPC solenoid, measure the resistance between pin 3 and pin 1 at the transaxle.  A0100178 • For the SSF solenoid, measure the resistance between pin 21 and pin 16 at the transaxle.  A0100179 • For the SSC solenoid, measure the resistance between pin 11 and pin 10 at the transaxle.  A0100180	**Yes** INSTALL a new TCM and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to A6 . **No** GO to A6 .





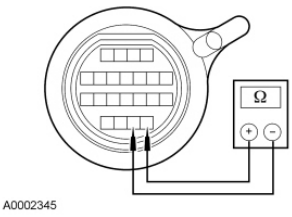


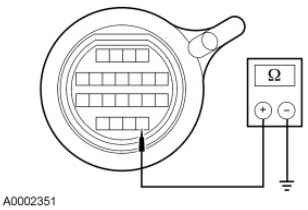
• For the SSD solenoid, measure the resistance between pin 17 and pin 18 at the transaxle.  A0100181 • For the SSE solenoid, measure the resistance between pin 14 and pin 22 at the transaxle.  A0100182 • **Is the resistance between 5.0 - 5.6 ohms?**	
A6 CHECK CONTINUITY OF THE INTERNAL HARNESS	
• Remove the transaxle side cover. • Remove the wiring connector from the affected solenoid(s) (LPC , SSC , SSD , SSE , SSF and TCC). • Measure the resistance between the bulkhead connector and the affected solenoid electrical connector. • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new main control. **No** INSTALL a new internal wire harness or repair affected circuit.

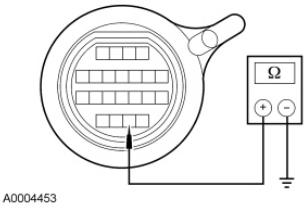
PINPOINT TEST B: TFT SENSOR

NOTE: Refer to the Transaxle Vehicle Harness Connector illustrations within the Transaxle Connector Layouts procedure in this section.

Test Step	Result / Action to Take
B1 ELECTRONIC DIAGNOSTICS	
• Connect the scan tool. • Check to make sure the transaxle harness connector is fully seated, pins are fully engaged in connector and in good condition before proceeding. • Ignition ON.	**Yes** GO to B2 . **No** REPEAT procedure to enter DataLogger. If vehicle did not enter DataLogger,





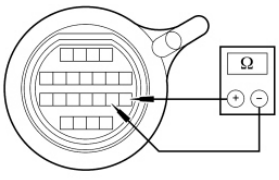


• Select DataLogger. • Select PID/TFT. • **Does the vehicle enter DataLogger?**	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B2 TEMPERATURE SIGNAL CHECK	
• Ignition ON. • Select DataLogger. • Select TFT PID. • Monitor the TFT PID. The temperature value should be within -55°C to 175°C (-67°F to 347°F). • **Is the Transmission Fluid Temperature (TFT) within specified range?**	**Yes** GO to B3 . **No** GO to B4 .
B3 WARM-UP/COOL-DOWN CYCLE	
• While monitoring the TFT PIDs, carry out the following test: If transmission is cold, run transmission to warm it up. If transmission is warm, allow transmission to cool down. • **Do the TFT PIDs increase as the transmission is warmed up, decrease as the transmission is cooled and does the TFT stay within the specified range?**	**Yes** INSTALL a new Transmission Control Module (TCM) and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to B4 . **No** GO to B4 .
B4 SIGNAL RESISTANCE	
• Remove the TCM . • Inspect both sides of the TCM for damaged or pushed-out pins, corrosion or damaged seals. • Measure the resistance between pins 7 and 8 at the transaxle bulkhead electrical connector. Refer to the following table. **TRANSMISSION FLUID TEMPERATURE (TFT) Sensor Resistance** **°C** / **°F** / **Resistance (Ohms)** 10 / 50 / 6.445 25 / 77 / 3.5 110 / 230 / 0.247	**Yes** GO to B5 . **No** INSTALL a new internal harness and TFT assembly.

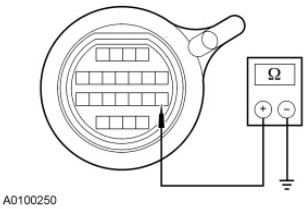
 A0093629 • Record the resistance. • **Is the resistance within range?**	
B5 SHORT TO GROUND	
• Measure the resistance between pin 7 and ground at the transaxle bulkhead electrical connector.  A0093630 • Measure the resistance between pin 8 and ground at the transaxle bulkhead electrical connector.  A0093631 • Record the resistances. • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new TCM and REFLASH to the latest level calibration. **No** INSTALL a new internal harness and TFT assembly.

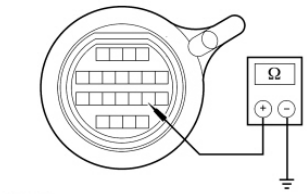
PINPOINT TEST C: OSS SENSORS

NOTE: Refer to the Transaxle Vehicle Harness Connector illustrations within the Transaxle Connector Layouts procedure in this section.



Test Step	Result / Action to Take
C1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the Transmission Control Module (TCM) connector is fully seated, pins are fully engaged in the connector and in good condition before proceeding. • Connect the scan tool. • Ignition ON. • Monitor the PID for the Output Shaft Speed (OSS) sensor.	**Yes** CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to C2 . **No** GO to C2 .



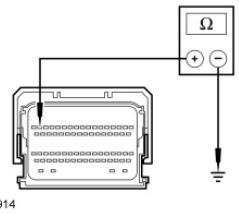


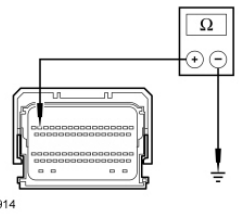
• Monitor and record speed. • **Does the OSS match the vehicle speed?**	
C2 CHECK OSS SENSOR RESISTANCE	
• Remove the TCM . • Measure the resistance at the transaxle bulkhead electrical connector between pin 19 and 20.  A0002345 • **Is the resistance less than 5 ohms?**	**Yes** CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to C3 . **No** GO to C4 .
C3 CHECK OSS SENSOR FOR SHORT TO GROUND	
• Remove the TCM . • Measure the resistance at the transaxle bulkhead electrical connector between pin 19 and ground.  A0002351 • Measure the resistance at the transaxle bulkhead electrical connector between pin 20 and ground.  A0004453 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new TCM and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to C4 . **No** GO to C4 .
C4 CHECK OSS SENSOR RESISTANCE	

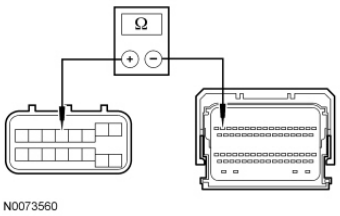
• Remove the transaxle side cover. • Measure the resistance at the speed sensor electrical connector between pin 1 and 2.  A0100200 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new internal harness. **No** INSTALL a new transaxle assembly.

PINPOINT TEST D: TSS SENSOR

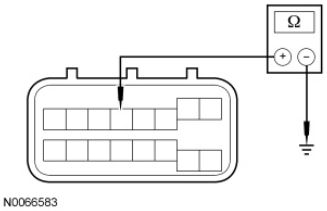
NOTE: Refer to the Transaxle Vehicle Harness Connector illustrations within the Transaxle Connector Layouts procedure in this section.







Test Step	Result / Action to Take
D1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the Transmission Control Module (TCM) connector is fully seated, pins are fully engaged in connector and in good condition before proceeding. • Connect the scan tool. • Ignition ON. • Monitor the PID for the Turbine Shaft Speed (TSS) sensor. • Monitor and record speed. • **Does the TSS match the engine rpm?**	**Yes** CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to D2 . **No** GO to D2 .
D2 CHECK TSS SENSOR RESISTANCE	
• Remove the TCM . • Measure the resistance at the transaxle bulkhead electrical connector between pin 12 and 13.  A0100249 • **Is the resistance less than 5 ohms?**	**Yes** CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to D3 . **No** GO to D4 .
D3 CHECK TSS SENSOR CIRCUIT FOR SHORT TO GROUND	



• Remove the TCM . • Measure the resistance at the transaxle bulkhead electrical connector between pin 12 and ground.  A0100250 • Measure the resistance at the transaxle bulkhead electrical connector between pin 13 and ground.  A0100251 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new TCM and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, GO to D4 . **No** GO to D4 .
D4 ELECTRONIC DIAGNOSTICS	
• Remove the transaxle side cover. • Measure the resistance at the TSS sensor electrical connector between pin 1 and 2. • **Is the resistance less than 5 ohms?**	**Yes** CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, INSTALL a new internal harness. **No** The sensor is defective, INSTALL a new TSS sensor.

PINPOINT TEST E: PARK NEUTRAL SIGNAL

NOTE: Refer to the Transaxle Vehicle Harness Connector illustrations within the Transaxle Connector Layouts procedure in this section.

Test Step	Result / Action to Take
E1 CHECK RESISTANCE ON CIRCUIT CET40 (GN/OG)	
• Disconnect: PCM C175B. • Selector lever in PARK or NEUTRAL. • Measure the resistance between C175B-16, circuit CET40 (GN/OG) and chassis ground.	**Yes** GO to E2 . **No** GO to E3 .

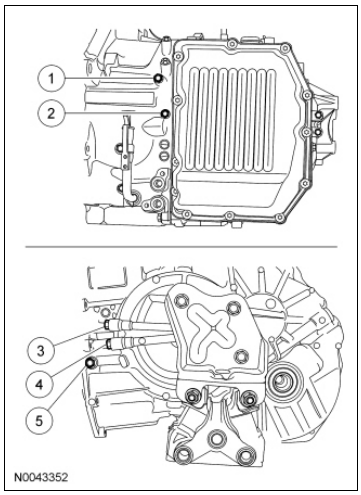
 N0110914 • **Is the resistance between 13 to 40 ohms?**	
E2 CHECK RESISTANCE ON CIRCUIT CET40 (GN/OG)	
• Selector lever in REVERSE, DRIVE or M. • Measure the resistance between C175B-16, circuit CET40 (GN/OG) and chassis ground.  N0110914 • **Is the resistance greater than 1000 ohms?**	**Yes** INSTALL a new TCM . After installing the new TCM , VERIFY that the starting system is operating correctly. If not, REFER to Section 303-03A to check starting system. **No** GO to E3 .
E3 CHECK VEHICLE HARNESS CIRCUIT CET40 (GN/OG) FOR AN OPEN	
• Disconnect: Transmission Control Module (TCM) C1533. • Measure the resistance between C1533-5, circuit CET40 (GN/OG) and C175B-16.  N0073560 • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR circuit CET40 (GN/OG) for an open.
E4 CHECK VEHICLE HARNESS CIRCUIT CET40 (GN/OG) FOR A SHORT TO GROUND	

• Measure the resistance between C1533-5, circuit CET40 (GN/OG) and chassis ground.  N0066583 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new PCM. After installing the new PCM, VERIFY that the starting system is operating correctly. If not, REFER to Section 303-03A to check starting system. **No** REPAIR circuit CET40 (GN/OG) for a short to ground.

Special Testing Procedures

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST1565-A	Transmission Fluid Pressure Gauge 307-004 (T57L-77820-A)
 ST2834-A	Vehicle Communication Module and Integrated Diagnostic System software with appropriate hardware, or equivalent scan tool



The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transaxle.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.

Pressure Test

Pressure Tap Location

Item	Description
1	Clutch C1 drive
2	Clutch C2 drive

3	Clutch C3 drive
4	Lube circuit
5	Clutch B2

NOTICE: **If the pressure is low at stall, do not continue with the test or further transaxle damage will occur. Do not maintain Wide Open Throttle (WOT) in any transaxle range for more than 5 seconds.**

This test verifies that the pressure is within specification.

1. Connect the Transmission Fluid Pressure Gauge to the appropriate pressure tap.
2. Start the engine and check the pressures, see the pressure charts to determine if the pressures are within specification.

Clutch and Brake Pressure Chart

Clutch/Band	Range	Pressure
C1 (Drive Clutch)	Drive (1st-4th)	196-1,372 kPa (28-199 psi)
C2 (Drive Clutch)	Drive (4th-6th)	196-1,372 kPa (28-199 psi)
C3 (Drive Clutch)	Drive (3rd-5th)	196-1,372 kPa (28-199 psi)
C3 (Drive Clutch)	Reverse	392-1,863 kPa (57-270 psi)
B1 (Brake Clutch)	Drive (2nd and 6th)	196-1,372 kPa (28-199 psi)
B2 (Brake Band)	Low manual (1st)	588-1,372 kPa (85-199 psi)
B2 (Brake Band)	Reverse	392-1,863 kPa (57-270 psi)

Pressure Diagnostic Chart

Test Results	Possible Source
Values of both DRIVE and REVERSE ranges are lower than the standards	• Line Pressure Control (LPC)

	• Primary regulator valve failure • Transmission oil pump failure • Leak from hydraulic circuit of DRIVE or REVERSE range
Only the value of DRIVE range is lower than the standards	• DRIVE range hydraulic circuit failure • C1 clutch failure
Only the value of REVERSE range is lower than the standards	• REVERSE range hydraulic circuit failure • C3 clutch failure • B2 brake failure

3. If the pressure is not within specification, install a new main control valve body.

4. If the pressures are OK, clear all DTCs. Test drive vehicle, code could be intermittent. If DTC returns, install a new valve body.

Stall Speed Test

⚠ WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.

The Stall Speed Test checks:

- Torque Converter Clutch (TCC) operation and installation.
- holding ability of the forward clutch.
- reverse clutch (the low-reverse bands).
- planetary One-Way Clutch (OWC).
- engine driveability concerns.

Conduct this test with the engine coolant and transmission fluid at correct levels and at normal operating temperature.

Apply the park brake firmly for each Stall Speed Test.

1. Find the specified stall rpm for the vehicle, see the Stall Speed Chart. Use a grease pencil to mark the rpm on the dial of a tachometer.

Stall Speed

Engine	rpm
3.5L	1,878-2,678

2. Connect a scan tool.

3. **NOTE:** If the rpm recorded by the scan tool exceeds the maximum limits, release the accelerator pedal immediately because clutch or band slippage is indicated.

   In each of the following range REVERSE, DRIVE and LOW, press the accelerator pedal to the floor and hold it just long enough to let the engine get to Wide Open Throttle (WOT). Do not hold the throttle open for more than 5 seconds at a time.

4. Note the results in each range.

5. After each range, move the selector lever to NEUTRAL and run the engine at 1,000 rpm for about 15 seconds to cool the torque converter before the next test.

6. Use the stall speed diagnosis chart for corrective actions.

7. **NOTE:** The stall speed in REVERSE will be lower.

   If stall speeds were too high, see the Stall Speed Chart. If stall speeds were too low, first check engine idle speed and tune up. If engine is OK, remove torque converter and check TCC for slippage.

Pressure Diagnostic Chart

Test Results	Possible Source
Values of both DRIVE and REVERSE ranges are lower than the standards	• Insufficient engine power • Torque converter stator One-Way Clutch (OWC) slipping
Only the value of DRIVE range is higher than the standards	• Low line pressure. Shift control solenoid assembly failure, primary regulator valve failure • Valve body failure (hydraulic pressure system) • C1 clutch slipping • OWC F1 failure
Only the value of REVERSE range is higher than the standards	• Low line pressure. Shift control solenoid assembly failure, primary regulator valve failure • Valve body failure (hydraulic pressure system) • C3 clutch failure • B2 brake failure
Values of both DRIVE and REVERSE ranges are higher than the standards	• Low line pressure. Shift control solenoid assembly failure, primary regulator valve failure • Primary regulator valve failure • Oil pump failure • Oil strainer clogging

Leakage Inspection

Material

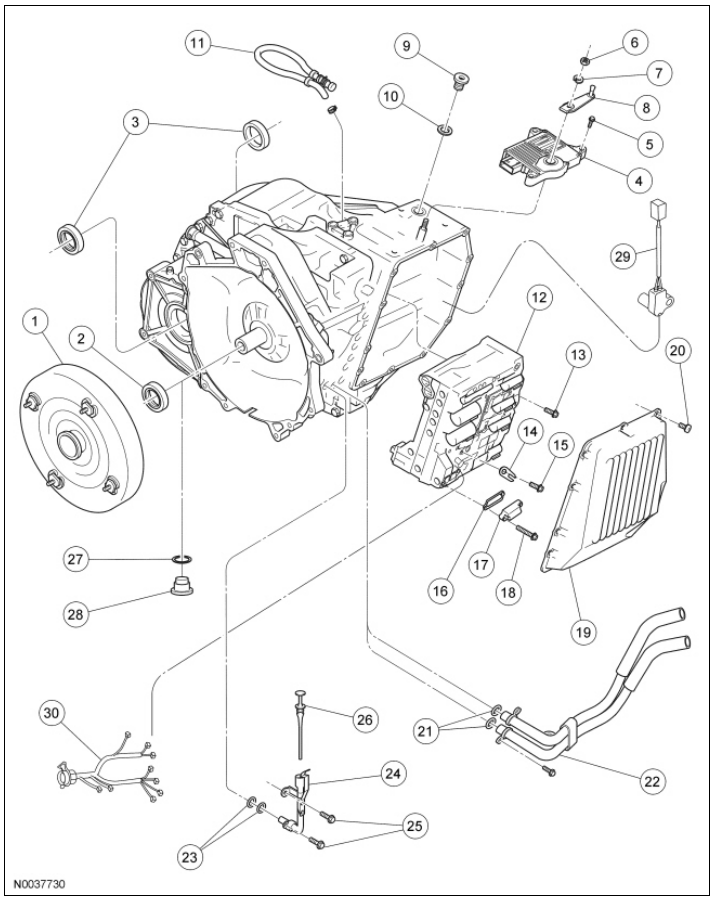
Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

NOTICE: **Do not try to stop the fluid leak by increasing the torque beyond specifications. This may cause damage to the case threads.**

Use the following chart to inspect and correct any external transmission fluid leaks.

External Transmission Fluid Leaks

Description	Action
Leaks at the transmission fluid pan to case	Tighten to specification or i new transmission fluid gasket.
Transmission fluid filler plug leaks	Install a new transmission fluid filler plug.
Transmission fluid cooler or fittings leaking	Tighten to specification or install new transmission fluid cooler tubes. Refer to Section 307-02A .
Transmission fluid cooler nut to case fitting leaking	Inspect for damage or missing O-ring seals. Tighten to specification, install new transmission fluid cooler tubes or install new O-rings. Refer to Section 307-02A .
Leaks at the transmission fluid cooler	Inspect the transmission fluid cooler for damage, if damaged, install a new transmission fluid cooler. Refer to Section 307-02A .
Leaks at the manual control lever seal	Install a new manual control lever seal.
Leaks at the solenoid body harness connector	Install a new solenoid body harness connector O-ring seal, either on the harness end or the solenoid body.



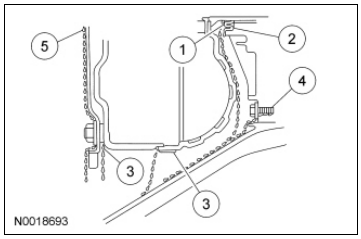
External Sealing

The transaxle has the following parts to prevent external transmission fluid leakage:

- Gaskets

- Lip type seals
- O-ring seals
- Seal rings
- Seal grommets
- Thread sealant

External Sealing



Item	Part Number	Description
1	7902	Torque converter
2	-	Torque converter hub seal
3	1177	Axle shaft seals
4	-	Transmission Control Module (TCM)
5	-	TCM bolt
6	7045	Manual control lever shaft nut
7	7C208	Manual control lever shaft nut washer
8	7A256	Manual control lever
td>	7A010	Transmission fluid fill plug
10	7E050	Transmission fluid fill plug O-ring
11	-	Breather hose
12	-	Main control valve body assembly
13	-	Main control valve body bolt
14	-	Lock plate

15	-	Lock plate bolt
16	-	Suction cover gasket
17	-	Suction cover
18	-	Suction cover bolt
19	-	Main control valve body side cover
20	-	Main control valve body side cover bolt
21	7J227	Transmission fluid cooler O-rings
22	7R081	Transmission fluid cooler tube
23	7E050	Transmission fluid level indicator tube O-rings
24	7A228	Transmission fluid level indicator tube
25	7A443	Transmission fluid level indicator tube bolts
26	7A228	Transmission fluid level indicator tube
27	7L101	Transmission fluid drain plug gasket
28	7A010	Transmission fluid drain plug
29	7M101	Turbine Shaft Speed (TSS) sensor
30	7G276	Internal wire harness and Transmission Fluid Temperature (TFT) sensor

Transmission Fluid Leakage in Torque Converter Area

Leakage at the front of transmission, as evidenced by transmission fluid around the torque converter housing part of the case, may have several sources. By careful observation it is possible, in many instances, to pinpoint the source of a leak before removing the transmission from the vehicle. The paths which the transmission fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 5 numbers in the illustration correspond with the 5 flow path steps.

Leak Path	Symptom	Possible Source
1, 2 and 4	Leak at front of transmission	Torque converter hub seal
1, 2 and 4	Leak at front of transmission	Vent
1, 2 and 4	Leak at front of transmission	Converter hub weld
1, 2 and 4	Leak at front of transmission	External pump seal (large)
1, 2 and 4	Leak at front of transmission	Pump to case screws
1, 2 and 4	Leak at front of transmission	Pump gasket
3	Leak at front of transmission	Torque converter seal weld
3	Leak at front of transmission	Torque converter stud
5	Leak at front of transmission	Engine oil leak; rear main seal
5	Leak at front of transmission	Engine valve cover
5	Leak at front of transmission	Oil galley
5	Leak at front of transmission	Pump lip seal
5	Leak at front of transmission	Engine Oil Pressure (EOP) sensor

Leak Check Test With Ultraviolet Lamp

Use Dye-Lite® ATF /Power Steering Fluid Leak Detection Dye to detect a transmission fluid leak.

1. Add dye to the transmission fluid. Use 30.0 ml (1 oz) of dye solution for every 3.8L (4 qt) of transmission fluid.

2. Start and run the engine until the transaxle reaches its normal operating temperature. Using an ultraviolt light, observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Raise the vehicle on a hoist and run the engine at fast idle, then at engine idle, occasionally shifting to the DRIVE and REVERSE ranges to increase pressure within the transaxle. Observe the front of the flexplate, back of the cylinder block (in as far as possible), and inside the torque converter housing and front of the case. Continue running the engine until fluid leakage is evident and the probable source of leakage can be determined.

Diagnosis By Symptom

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

The Diagnosis by Symptom charts give the techni diagnostic information, direction and suggest possible components, using a symptom as a starting point.

The Diagnosis by Symptom charts are divided into 2 categories: Electrical Routines, indicated by 200 series numbers, and Hydraulic/Mechanical Routines, indicated by 300 series numbers. The Electrical Routines list the possible electrical components that could cause or contribute to the symptom described. The Hydraulic/Mechanical Routines list the possible hydraulic or mechanical components that could cause or contribute to the symptom described.

Diagnosis by Symptom Chart Directions

1. Using the Diagnosis by Symptom Index, select the concern/symptom that best describes the condition.

2. See the routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom with:
    1. Preliminary inspections.
    2. Verifications of condition.
    3. Checking the fluid levels.
    4. Carry out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a DTC. Be aware that the components listed may still be the cause. Verify correct function of these components prior to proceeding to the routine listed.

   Begin with the routine indicated. Follow the reference or action required statements. Always carry out the On-Board Diagnostic (OBD) tests as required. Never skip steps. Repair as required. These components are listed in the removal sequence and by the most probable cause. All components listed must be inspected to make sure of correct repair.

Diagnosis by Symptom Index

Title	Routines
Engagement Concerns	
No forward and/or No reverse	207
Harsh	208
Soft	209
Torque Converter Clutch Operation Concerns	
Does not apply	240
Cycling/shudder/chatters	242
NVH	
Noise/vibration - forward or reverse	254
Other Concerns	
Transmission fluid level	286
Transmission fluid condition	287
Transmission control module software	288

Diagnostic Routines

Engagement Concerns: No Forward and/or No Reverse

Possible Component	Reference/Action
207 - ROUTINE	
No Forward, No Reverse, No Forward or Reverse	
• Selector lever linkage damaged or out of position	• Using a scan tool, CHECK selector lever position. REFER to Section 307-05A .
• Incorrect neutral switch position	• CARRY OUT neutral position learning. REFER to Neutral Position Learning in this section.
	• DISCONNECT the Transmission Control Module (TCM) electrical connector. If concern still exists, this indicates an internal mechanical problem. CONNECT the TCM and CARRY OUT pressure checks.
	• If concern is resolved by disconnecting the TCM , this indicates an electrical concern. INSTALL a new TCM . REFER to Transmission Control Module (TCM) in this section. CHECK wiring harness (external and internal) valve body connections.
• Halfshafts broken	• INSPECT for damaged or broken halfshafts. REFER to Section 205-04 .

Engagement Concerns: Harsh

Possible Component	Reference/Action
208 - ROUTINE	
Harsh Engagements	
• Initial learn values wrong	• CARRY OUT Transmission Control Module (TCM) initial learning procedure. REFER to Transmission Control Module (TCM) Initial Learning in this section.
• Damaged internal transaxle components causing high or low pressures	• CARRY OUT pressure test. Refer to Special Testing Procedures in this section.
• Damaged or malfunctioning solenoids	• CARRY OUT pinpoint test. REFER to Pinpoint Tests - OSC Equipped Vehicle in this section.

Engagement Concerns: Soft

Possible Component	Reference/Action		
209 - ROUTINE			
Soft Engagements			
• Initial learn values wrong	• CARRY OUT Transmission Control Module (TCM) initial learning procedure. REFER to	• Damaged internal transaxle components causing high or low pressures	• CARRY OUT pressure test. REFER to Special Testing Procedures in this section.
• Damaged or malfunctioning solenoids	• CARRY OUT pinpoint test. REFER to Pinpoint Tests - OSC Equipped Vehicle in this section.		

Torque Converter Clutch Operations Concerns: Does Not Apply

Possible Component	Reference/Action
240 - ROUTINE	
Torque Converter Does Not Apply	

	• Damaged or malfunctioning solenoid	• CARRY OUT pinpoint test. REFER to Pinpoint Tests - OSC Equipped Vehicle in this section. INSTALL a new main control valve body. REFER to Main Control Valve Body in this section.
	• Damaged or disconnected wire harness	• INSPECT wire harness. CHECK connections to the Torque Converter Clutch (TCC) solenoid.
	• Damaged or malfunctioning torque converter	• INSTALnew torque converter. REFER to Torque Converter in this section.

Torque Converter Clutch Operations Concerns: Cycling/Shutter/Chatters

Possible Component	Reference/Action
242 - ROUTINE	
Torque Converter Cycling/Shudder/Chatters	
• Damaged or malfunctioning Torque Converter Clutch (TCC) solenoid	• INSTALL a new main control valve body. REFER to Main Control Valve Body in this section.
• Damaged or disconnected wire harness	• INSPECT wire harness. CHECK connections to the TCC solenoid.
• Damaged or malfunctioning torque converter	• INSTALL a new torque converter. REFER to Torque Converter in this section.

Other Concerns: Noise/Vibration - Forward or Reverse

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Possible Component	Reference/Action
254 - ROUTINE	
Powertrain Control System	
• Transmission Control Module (TCM), vehicle wiring harnesses, Shift Solenoid A (SSA) and Shift Solenoid B (SSB)	• CARRY OUT On-Board Diagnostic (OBD) tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the TCM . GO to Pinpoint Test A . REPAIR as required. CLEAR the DTCs, road

		test and retrieve any DTCs.
Incorrect Transmission Fluid Level		
	• Transmission flu level low/overfilled	• CHECK the transmission fluid level. ADJUST the transmission fluid level as necessary. REFER to Preliminary Inspection in this section.
Torque Converter		
	• Worn or damaged torque converter	• REFER to Torque Converter Diagnosis in this section.
Transaxle Support Insulator		
	• Worn or damaged transaxle support insulator	• INSPECT the transaxle support insulator for damage. INSTALL new as necessary. REFER to Transaxle Support Insulator in this section.

Other Concerns: Transmission Fluid Level

Possible Component	Reference/Action
286 - ROUTINE	
Low Transmission Fluid Level	
• Axle shaft seal leaking	• INSTALL new axle shaft seals. REFER to Differential Seals - LH , Differential Seals - RH, Front Wheel Drive (FWD) and Differential Seals - RH, All Wheel Drive (AWD) in this section.
• Transmission fluid pan leaking	• RESEAL the transmission fluid pan.
• Torque converter hub seal leaking	• INSTALL a new torque converter hub seal. REFER to Torque Converter Hub Seal in this section.
• Transmission fluid cooler tubes leaking	• INSTALL new transmission fluid cooler tube O-rings.
• Manual control lever seal leaking	• INSTALL a new manual control lever seal. REFER to Manual Control Lever Shaft and Seal in this section.
• Transmission fluid drain plug leaking	• INSTALL a new transmission fluid drain plug seal.

Other Concerns: Transmission Fluid Condition

Possible Component	Reference/Action
287 - ROUTINE	
Transmission Fluid Burnt or Contaminated	
• Internal components damaged (clutch plate material)	• INSTALL a new transaxle. REFER to Transaxle in this section.

Other Concerns: Transmission Control Module (TCM) Software

Possible Component	Reference/Action	
288 - ROUTINE		
Shifting and Driveability Concerns		
	• Transmission Control Module (TCM) not at current software level	• REPROGRAM the TCM to current software level.

Transmission Fluid Cooler - Backflushing and Cleaning

Special Tool(s)

 ST2971-A	Transmission Heated Cooler Line Flusher 222-00007, 222-00004 or equivalent

Material

Item	Specification
Motorcraft® Premium Autansmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

NOTE: Transmission fluid cooler backflushing and cleaning will be performed using the Transmission Heated Cooler Line Flusher or equivalent. Follow the manufacturer's instructions included with the machine. Test the equipment to make sure that a vigorous fluid flow is present before proceeding.

NOTE: If the vehicle is equipped with an in-line transmission fluid thermal by-pass valve, the in-line transmission fluid thermal by-pass valve must be removed prior to flushing out the transmission fluid cooler and transmission fluid cooler lines.

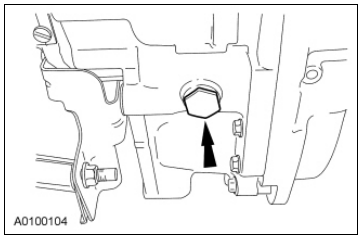
1. Check and top off fluid level of the cooler line flusher tank with transmission fluid.
2. Allow the fluid in the cooler line flusher 15-30 minutes to heat up to 60°C (140°F) before using.
3. Install the line adapters into the transmission cooler lines.
4. Attach the cooler line flusher red line to the transmission fluid cooler pressure line quick disconnect fitting.
5. Attach the cooler line flusher blue line to the transmission fluid cooler return line quick disconnect fitting.
6. Follow the equipment instructions to purge the cooler lines and cooler prior to starting the flushing procedure.
7. Allow the cooling system to backflush for 10-15 minutes, then flush the cooler in a normal flow direction for an additional 10-15 minutes.
8. Clean the transaxle mounted cooler tubes by hand.

Transmission Fluid Drain and Refill

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

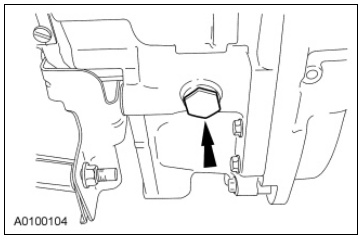
Material



Item	Specification
Moraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

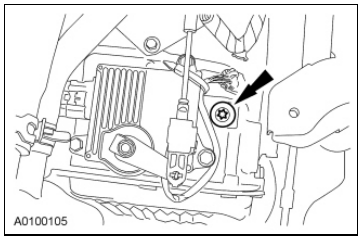
NOTICE: **The use of any fluid other than what is recommended for this transmission will cause transmission damage.**

Draining



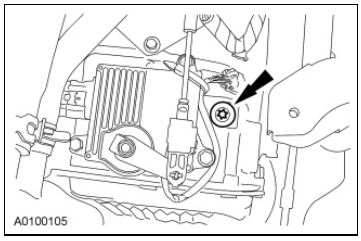
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

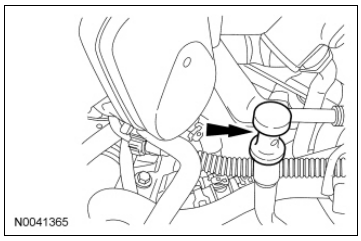


Refill

3. Install the transmission fluid drain plug.
   - Tighten to 47 Nm (35 lb-ft).



4. Remove the transmission fluid fill plug.

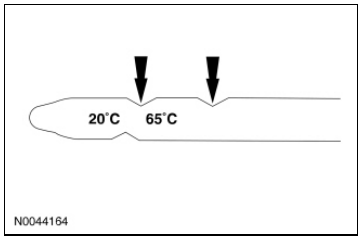


5. Fill the transaxle with approximately 3.7L (4 qt) of clean transmission fluid.

6. Install the transmission fluid fill plug.
   - Tighten to 39 Nm (29 lb-ft).

7. With the transaxle in (P) PARK, the vehicle should be on a level surface, the engine at idle (680-780 rpm), foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.

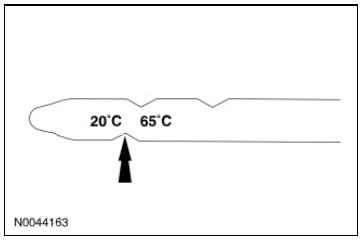
8. Wipe the transmission fluid level indicator cap and remove the fluid level indicator.



9. Wipe the transmission fluid level indicator with a clean cloth.

10. **NOTE:** In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface, the engine at idle (680-780 rpm) for 5 minutes and the transmission fluid temperature should be at least 60°C-70°C (140°F-158°F) using the scan tool.

    If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pint) increments through the transmission fluid fill plug located on top of the transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the indicator. The transmission fluid level should be at the upper-most mark on the transmission fluid level indicator. Only fill to the upper-most mark on the transmission fluid indicator. Do not overfill. Damage to the transaxle will occur.



11. **NOTE:** The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.

    Fill the transaxle to the correct transmission fluid level.

12. **NOTE:** The correct transmission fluid level at cool operating temperature of 15°C-25°C (59°F-77°F), is at the bottom mark on the transmission fluid level indicator.

    If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.

Torque Converter Contamination Inspection

Material

Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
    - A torque converter malfunction has been determined based on complete diagnostic procedures.
    - The torque converter stud or studs, impeller hub or bushing are damaged.
    - The torque converter exhibits external discoloration (due to overheating).
        - There is evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes.
            - Major metallic failure
            - Multiple clutch plates or band failures
            - Sufficient component wear which results in metallic contamination
            - Water or antifreeze contamination

2. If none of the above conditions are present, continue with the following fluid inspection.

3. Pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter.

4. Examine the fluid for contaminants, color and smell. The fluid must be free of contaminants, red in color and not have a burnt smell.

5. ***NOTICE:*** **Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur.**

   If the fluid passed inspection:

    - drain the remaining fluid from the torque converter.
    - using only the recommended transmission fluid, add 1.9L (2 qt) of clean fluid into the converter and agitate by hand.
    - thoroughly drain the fluid.

Transmission Fluid Exchange

Special Tool(s)

 ST3088-A	ATF Fluid Exchanger W/Power Steering Fluid Exchanger 199-00059 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

NOTICE: **Use transmission fluid specific for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products can cause internal transmission components to fail, which will affect the operation of the transmission.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Use the ATF Fluid Exchanger W/Power Steering Fluid Exchanger to change the fluid.
3. Connect the ATF Fluid Exchanger W/Power Steering Fluid Exchanger to the transmission fluid coler tube after the transmission fluid cooler on the return tube. This will help remove any foreign material trapped in the transmission fluid coolers.
4. Perform the transmission fluid exchange using the ATF Fluid Exchanger W/Power Steering Fluid Exchanger. Follow the manufacturer's instructions included with the machine.
5. Once the transmission fluid exchange is completed, disconnect the ATF Fluid Exchanger W/Power Steering Fluid Exchanger. Reconnect any disconnected transmission fluid cooler tubes.
6. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 66-77°C (150-170°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

Neutral Position Learning

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: When installing a new Transmission Control Module (TCM), the initialized learned values will need to be carried out.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Install the scan tool.

3. Turn the ignition ON.

4. The scan tool should indicate NEUTRAL.
   - If the scan tool does not indicate NEUTRAL, carry out TCM adjustment. For additional information, refer to Transmission Control Module (TCM) in this section.

5. If NEUTRAL is indicated on the scan tool, move the selector lever to PARK and turn the ignition OFF.

6. Turn the ignition ON and move the selector lever from PARK to DRIVE.
   - The scan tool should indicate each PRNDL position.

7. If the diagnostic display indicates each PRNDL position, check for any DTCs.

8. If the diagnostic display does not indicate each PRNDL position, carry out Transmission Control Module (TCM) Initial Learning in this section.

Transmission Control Module (TCM) Initial Learning

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTICE: **Do not raise the Transmission Fluid Temperature (TFT) by stalling the engine, internal transaxle damage will occur.**

NOTE: Clear all DTCs first.

NOTE: When insing a new transmission, Transmission Control Module (TCM) or reflashing the TCM , the initialized learned values will need to be carried out.

NOTE: This procedure cannot be carried out if the transmission fluid is not within the correct temperature specification.

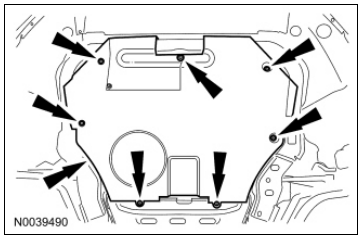
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Install the scan tool.
3. Monitor and note the engagement and shift harshness.
4. With the engine idling, monitor the Transmission Fluid Temperature (TFT). The TFT should be between 66°C-110°C (151°F-230°F).
5. With a foot on the brake, move the selector lever to NEUTRAL and hold for 3 seconds. Then move the selector lever to DRIVE and hold for 3 seconds. Carry this out 5 times. Then move the selector lever to PARK.
6. With a foot on the brake, move the selector lever to NEUTRAL and hold for 3 seconds. Then move the selector lever to REVERSE and hold for 3 seconds. Carry this out 5 times. Then move the selector lever to PARK.
7. Drive the vehicle and monitor the scan tool.
8. Drive the vehicle with the throttle opening between 20-25%. Drive until the vehiceaches 6th gear, not to exceed 80 km/h (50 mph). Then release the accelerator and coast to a stop within 60 seconds. Carry this out 10 times.
9. If engagements and/or shifts are harsh, repeat Steps 4 through 8 one more time.

Main Control Valve Body

Special Tool(s)

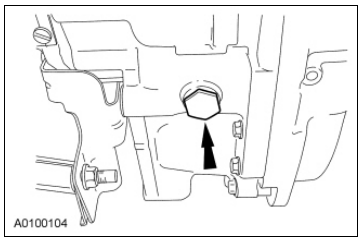
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material



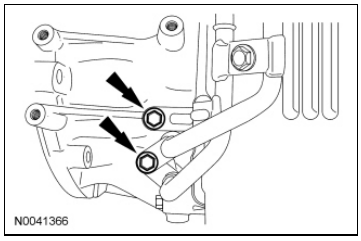
Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A
Ultra Silicone Sealant TA-29	-

Removal

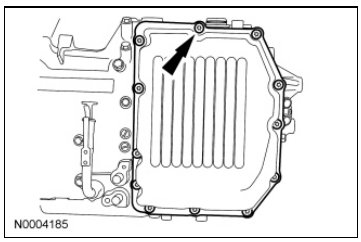


NOTICE: **The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

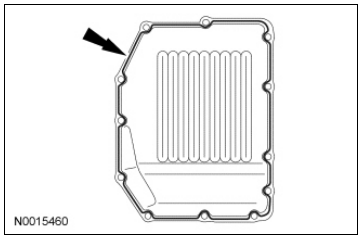


2. Remove the screws and the underbody cover.

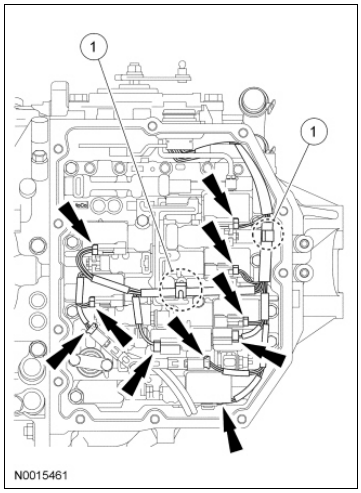


3. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

4. Disconnect the transmission fluid cooler tubes at the transaxle and position the tubes aside.

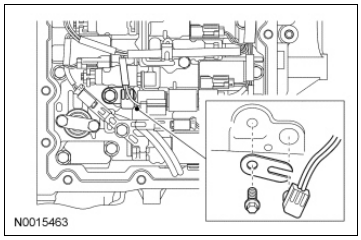


5. Remove and discard the transmission fluid pan bolts and remove the pan.

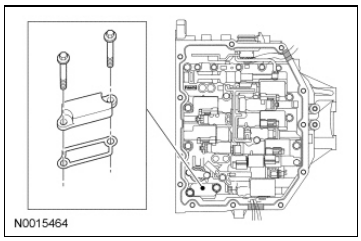


6. ***NOTICE:*** **When removing the sealer, use care not to damage the sealing surfaces.**

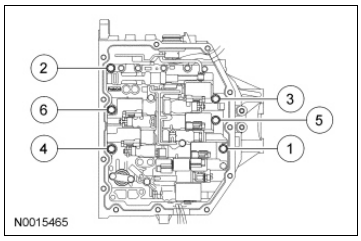
   Remove the sealer off the fluid pan.



7. Disconnect the wire harness from the solenoids.
   1. Remove the wire harness from the clamps.
   - Disconnect the 8 solenoid connectors and the 2 speed sensor connectors.

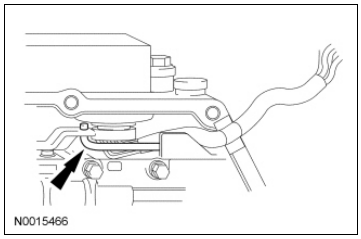


8. Remove the 2 speed sensor wire connectors from the solenoid clamp.
   1. Remove the Output Shaft Speed (OSS) sensor wire connector from the solenoid clamp.
   2. Remove the Turbine Shaft Speed (TSS) sensor wire connector from the solenoid clamp.



9. Remove the bolt and the lock plate and pull out the Transmission Fluid Temperature (TFT) sensor.

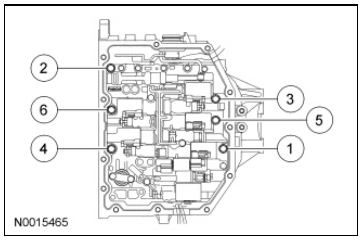
10. Remove the 2 bolts, suction cover and gasket.



11. Remove the 6 main control valve body bolts in the sequence shown.

12. **NOTE:** Be careful when removing the main control valve body, the manual control lever will fall out of its bore. Also, once all the bolts are removed, the main control valve body will fall out of the transaxle.

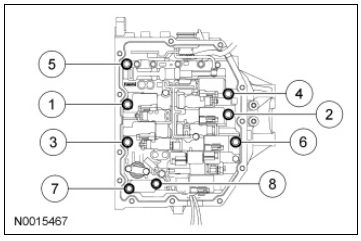
    Remove the main control valve body.



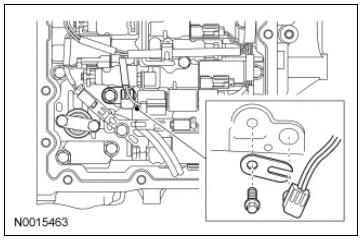
Installation

1. ***NOTICE:*** **When installing the main control valve body, place the wire harness in the open space of the separate plate, being careful not to pinch the harness. Damage to the harness will occur.**

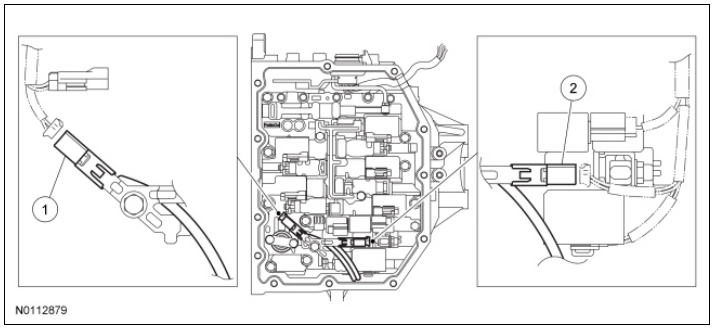
   Connect the manual valve link and position the main control valve body in place.



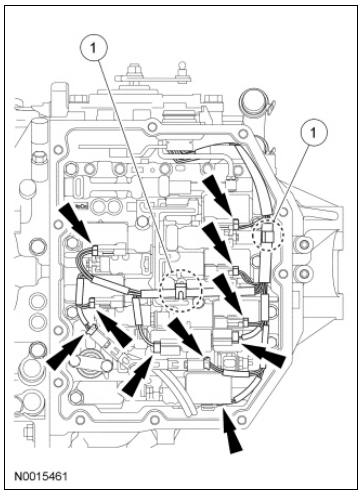
2. Loosely install the 6 main control valve body bolts in the sequence shown.



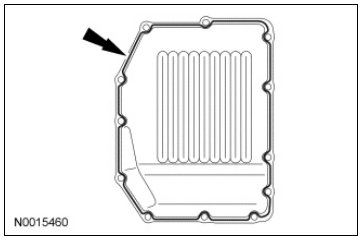
3. Install the suction cover gasket, cover and loosely install the 2 bolts.



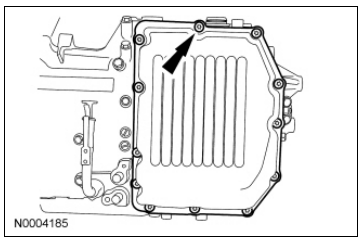
4. Tighten the 8 bolts to 10 Nm (89 lb-in) in the sequence shown.



5. Lubricate the O-ring with clean automatic transmission fluid and install the TFT sensor.
   - Tighten to 10 Nm (89 lb-in).

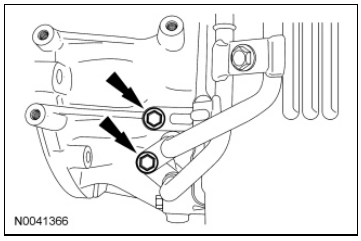


6. Install the 2 speed sensor wire connectors on the solenoid clamp.
   1. Install the Output Shaft Speed (OSS) sensor wire connector on the solenoid clamp.
   2. Install the Turbine Shaft Speed (TSS) sensor wire connector on the solenoid clamp.

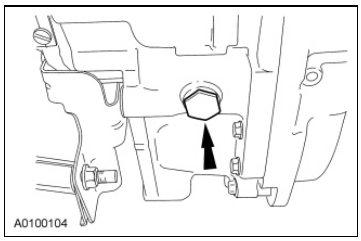


7. Connect the wire harness to the solenoids.
    1. Install the wire harness into the clamps.
    - Connect the 8 solenoid connectors and the 2 speed sensor connectors.

8. Install a bead of sealer to the fluid pan.



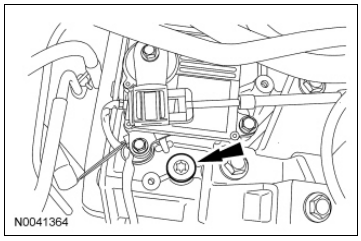
9. Using new pan bolts, install the fluid pan.
    - Tighten to 13 Nm (115 lb-in).



10. **NOTE:** Lubricate the new O-rings with clean automatic transmission fluid and install them onto the transmission fluid cooler tubes.

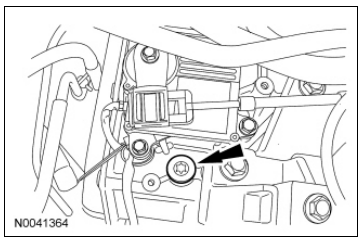
    Connect the transmission fluid cooler tubes to the transaxle.

    - Tighten to 10 Nm (89 lb-in).



11. Install the transmission fluid drain plug.
    - Tighten to 47 Nm (35 lb-ft).

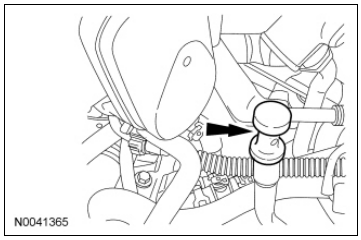
12. Install the underbody cover and the screws.



13. Remove the transmission fluid fill plug.

14. Fill the transaxle with approximately 4.7L (5 qt) of clean transmission fluid.

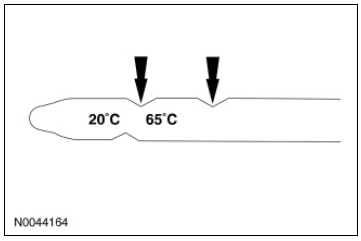
15. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).



16. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.

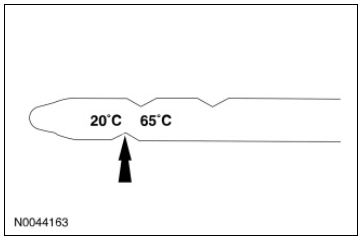
17. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.

18. Wipe the transmission fluid level indicator with a clean cloth.



19. **NOTE:** In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.

    If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the top of the transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the transmission fluid level indicator. The transmission fluid level should be at the upper most mark on the transmission fluid level indicator. Only fill to the upper most mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.

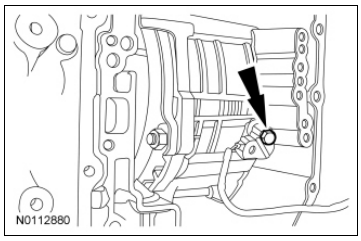


20. **NOTE:** The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.

    Fill the transaxle to the correct transmission fluid level.

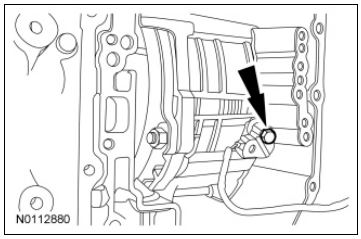
21. **NOTE:** The correct transmission fluid level at cool operating temperature of 15°C-25°C (59°F-77°F), is at the bottom mark on the transmission fluid level indicator.

    If the TFT is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.



Turbine Shaft Speed (TSS) Sensor

Removal



1. Remove the main control valve body. For additional information, refer to Main Control Valve Body in this section.

2. Remove the bolt and the Turbine Shaft Speed (TSS) sensor.

Installation

1. Lubricate the O-ring with clean automatic transmission fluid and install the TSS sensor.
   - Tighten to 12 Nm (106 lb-in).

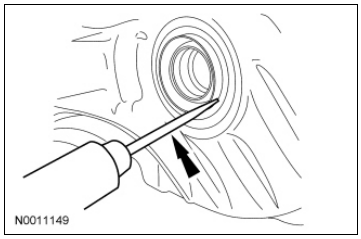
2. Install the main control valve body. For additional information, refer to Main Control Valve Body in this section.

Differential Seals - LH

Special Tool(s)

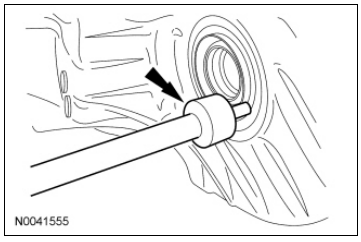
 ST2959-A	Installer, Output Shaft Seal 307-567
 ST2834-A	Vehicle Communicaule (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material



Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

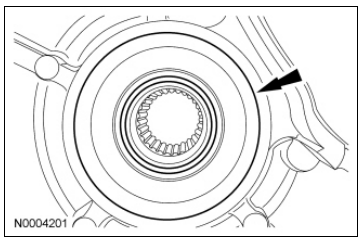
Removal



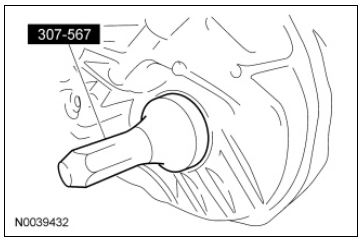
NOTICE: **The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.**

1. Remove the LH halfshaft. For additional information, refer to Section 205-04 .
2. ***NOTICE:*** **Be careful not to damage the case while removing the seal.**

   Using a suitable awl, poke a small hole in the seal.



3. Using a suitable dent puller, remove the LH differential fluid seal.

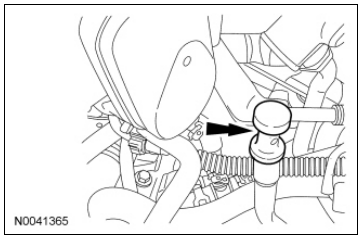


Installation

1. Position the new differential fluid seal in place.

2. Using the Output Shaft Seal Installer, install the outer differential fluid seal.

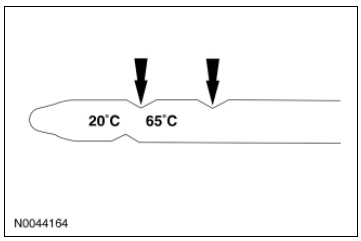
3. Install the LH halfshaft. For additional information, refer to Section 205-04 .



4. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.

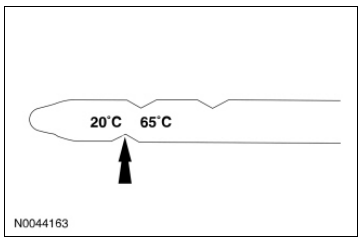
5. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.

6. Wipe the transmission fluid level indicator with a clean cloth.



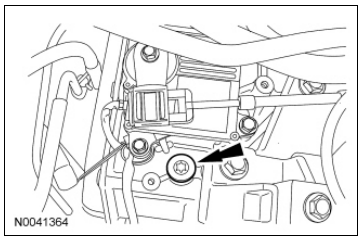
7. **NOTE:** In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.

   If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the top of the transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the transmission fluid level indicator. The transmission fluid level should be at the uppermost mark on the transmission fluid level indicator. Only fill to the uppermost mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.



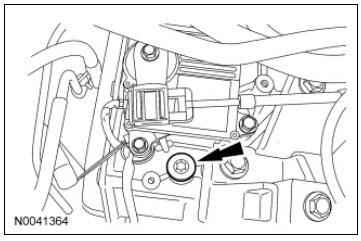
8. **NOTE:** The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.

Fill the transaxle to the correct transmission fluid level.



9. **NOTE:** The correct transmission fluid level at cold operating temperature of 15°C-25°C (59°F-77°F) is at the bottom mark on the transmission fluid level

   If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.



10. Remove the transmission fluid fill plug.

11. Fill the transaxle with clean transmission fluid.

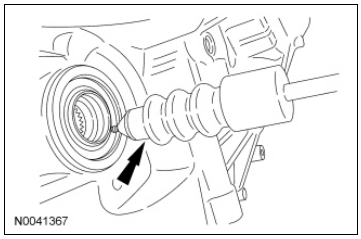
12. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

Differential Seals - RH, Front Wheel Drive (FWD)

Special Tool(s)

 ST2960-A	Installer, Output Shaft Seal 307-568
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

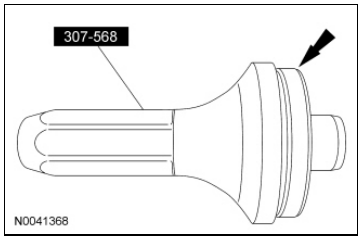
Material



Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

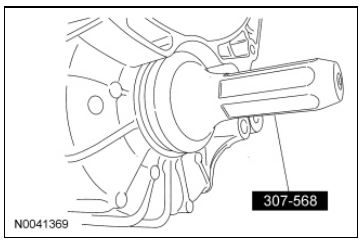
Removal

NOTICE: **The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.**



1. Remove the RH halfshaft. For additional information, refer to Section 205-04 .
2. ***NOTICE:*** **Be careful not to damage the case while removing the seal.**

   Using a suitable dent puller, remove the differential fluid seal.

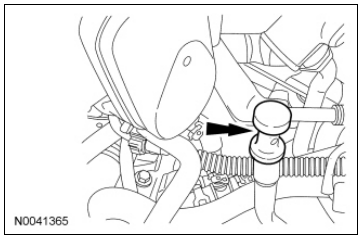


Installation

1. Position the new differential fluid seal on the Output Shaft Seal Installer.

2. Using the Output Shaft Seal Installer, install the outer differential fluid seal.

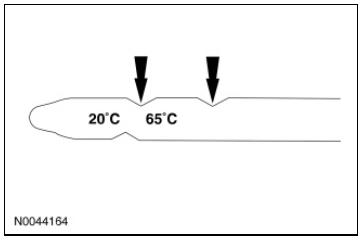
3. Install the RH halfshaft. For additional information, refer to Section 205-04 .



4. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.

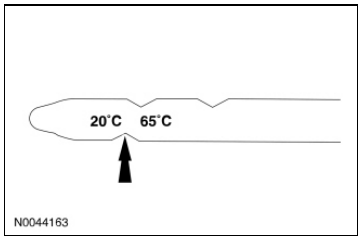
5. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.

6. Wipe the transmission fluid level indicator with a clean cloth.



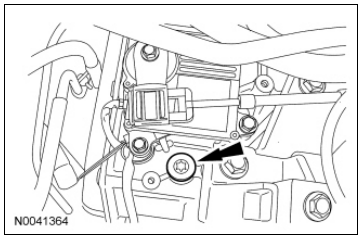
7. **NOTE:** In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.

   If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the topthe transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the transmission fluid lever indicator. The transmission fluid level should be at the uppermost mark on the transmission fluid level indicator. Only fill to the uppermost mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.



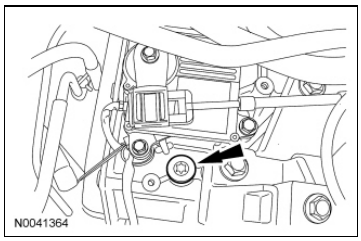
8. **NOTE:** The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.

   Fill the transaxle to the correct transmission fluid level.

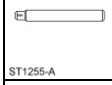


9. **NOTE:** The correct transmission fluid level at cold operating temperature of 15°C-25°C (59°F-77°F) is at the bottom mark on the transmission fluid level indicator.

   If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.



10. Remove the transmission fluid fill plug.



11. Fill the transaxle with clean transmission fluid.

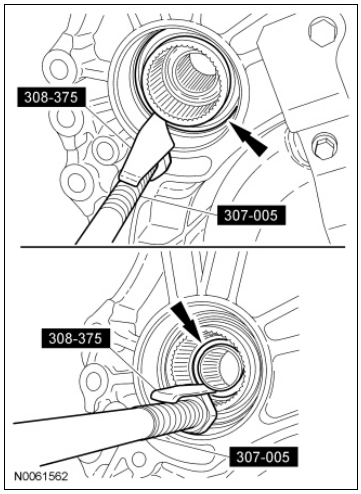
12. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

Differential Seals - RH, All Wheel Drive (AWD)

Special Tool(s)

 ST2978A	Axle Seal Installer 307-593
 ST1255-A	Handle 205-153 (T80T-4000-W)
 ST2924-A	Remover, Input Shaft Oil Seal 308-375
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

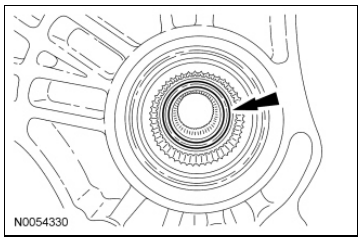
Material



Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

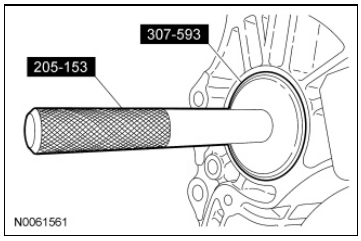
Removal

NOTICE: **The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.**

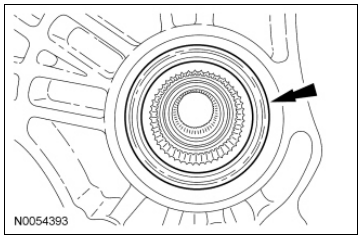


1. Remove the Power Transfer Unit (PTU). For additional information, refer to Section 308-07B .
2. **NOTE:** Transaxle removed for clarity.

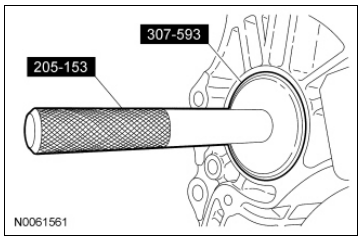
   Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the differential fluid seals.



Installation



1. Position the new inner differential fluid seal in place.

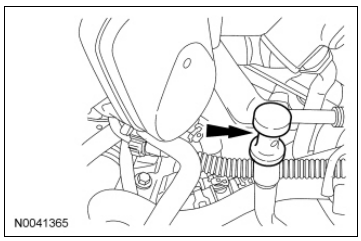


2. Using the Axle Seal Installer and Handle, install the inner differential fluid seal.

3. Position the new outer differential fluid seal in place.

4. Using the Axle Seal Installer and Handle, install the outer differential fluid seal.

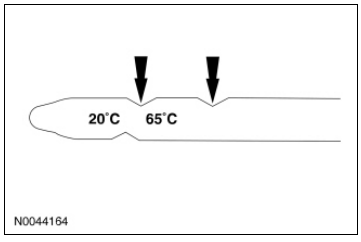
5. Install the PTU . For additional information, refer to Section 308-07B .



6. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.

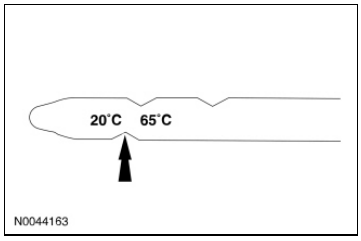
7. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.

8. Wipe the transmission fluid level indicator with a clean cloth.



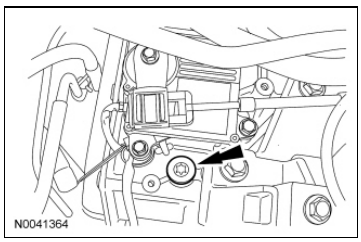
9. **NOTE:** In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior tousting the transmission fluid level.

   If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the top of the transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the transmission fluid level indicator. The transmission fluid level should be at the uppermost mark on the transmission fluid level indicator. Only fill to the uppermost mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.



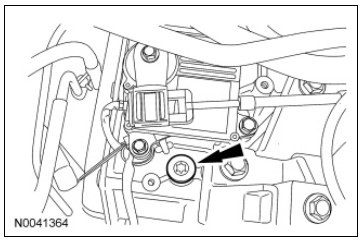
10. **NOTE:** The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.

    Fill the transaxle to the correct transmission fluid level.



11. **NOTE:** The correct transmission fluid level at cold operating temperature of 15°C-25°C (59°F-77°F) is at the bottom mark on the transmission fluid level indicator.

    If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level i. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.



12. Remove the transmission fluid fill plug.

13. Fill the transaxle with clean transmission fluid.

14. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

Intermediate Servo

Special Tool(s)

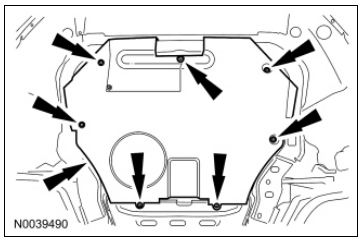
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

Servo Kit - 3.5L Engine

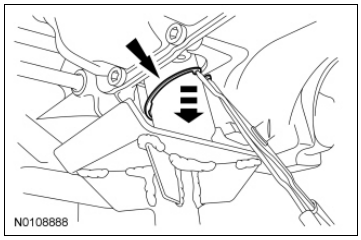
NOTE: Kit assembly part number is 7D027.



Item	Part Number	Description
1	-	Servo spring
2	-	Servo piston
3	7D024	Servo piston O-ring

4	7D027	Servo cover
5	7D024	Servo cover O-rings (2 required)
6	7H074	Servo retainer

Removal

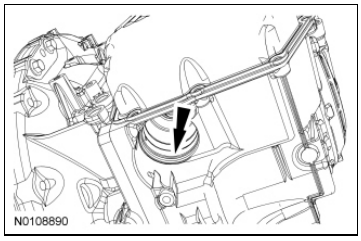


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the screws and the underbody cover.

3. ***NOTICE:*** **The servo cover is under pressure from the servo spring. Failure to use a jackstand can result in damage to the snap ring, servo piston, servo cover or the transaxle case.b>**

   Using an adjustable jackstand and a suitable tool, support the load of the servo spring and remove the servo snap ring.

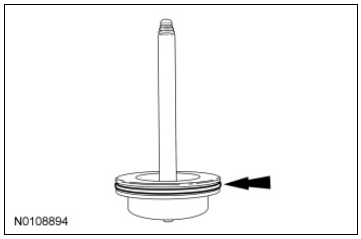


4. **NOTE:** Transmission fluid will drain from the transaxle when removing the servo cover.

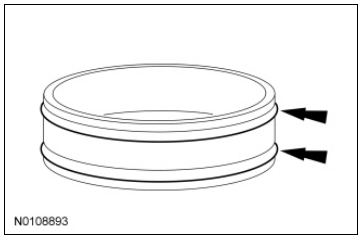
   NOTE: If the servo cover is stuck in the bore, lightly tap on the servo cover to dislodge it from the bore.

   Position a drain pan under the transaxle and slowly lower the jackstand to allow the servo spring to push the servo cover out of the bore. Remove the servo cover, servo piston and the servo spring from the transaxle case.

5. Using a pick, gently scrape the snap ring groove to clean the groove of any loose corrosion or debris.

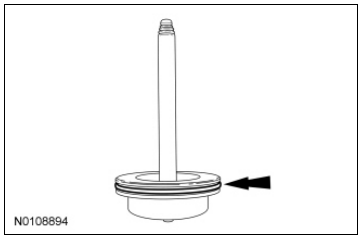


6. Remove the servo spring and the servo piston from the servo cover.



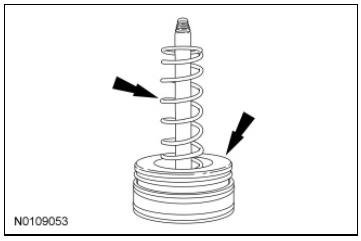
7. Discard the servo cover.

8. Remove the O-ring from the piston.

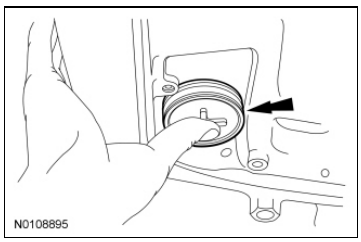


Installation

1. Install 2 new O-rings on the new servo cover and lubricate them with clean transmission fluid.



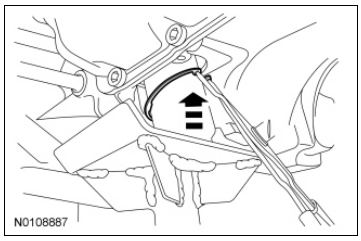
2. Install a new O-ring on the servo piston and lubricate it with clean automatic transmission fluid.



3. **NOTE:** The piston will rest on top of the servo.

   Position the servo spring on the piston and install the servo piston in the servo cover.

4. Position the servo in place in the servo bore.

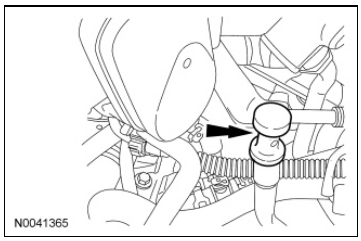


5. ***NOTICE:*** **Shake the servo cover when installing the servo to help align it in the bore or damage to the O-ring can result causing a leak.**

   NOTICE: **Install the snap ring with the bevel facing down or the snap ring can come loose causing damage to the transaxle.**

   NOTE: Position the snap ring under the servo cover before positioning the tool used to push the servo in the transaxle case.

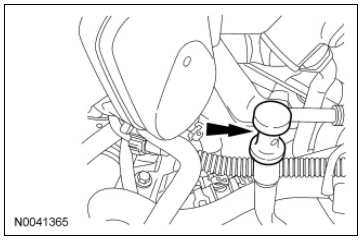
   Using a suitable tool and an adjustable jackstand, compress the servo spring. Install the servo and the snap ring into the transaxle case with the snap ring gap facing the right (engine side) of the transaxle.



6. Inspect the snap ring to be sure it is fully seated in the snap ring groove. Be sure that the snap ring gap is facing right.

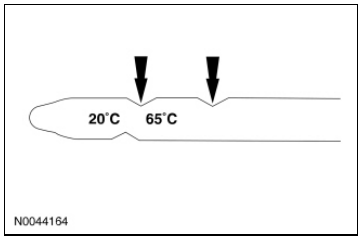
7. Install the underbody cover and the screws.

8. Slowly fill the transaxle through the transmission fluid level indicator tube with approximately 1.9L (2 qt) of clean transmission fluid.



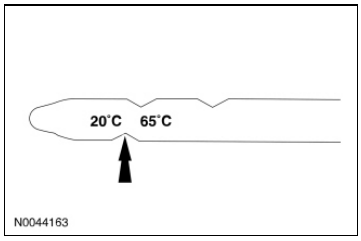
9. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.

10. Wipe the transmission fluid level indicator with a clean cloth.



11. **NOTE:** In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.

    If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid level indicator tube. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube unit is fully seated, then remove the transmission fluid level indicator. The transmission fluid level should be at the upper most mark on the transmission fluid level indicator. Only fill to the upper most mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.

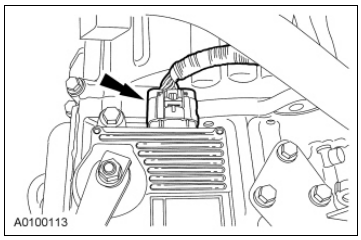


12. **NOTE:** The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.

    Fill the transaxle to the correct transmission fluid level.

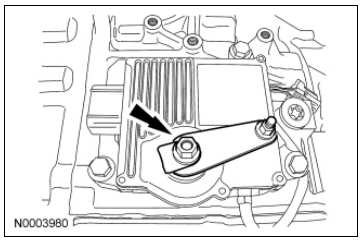
13. **NOTE:** The correct transmission fluid level at cool operating temperature of 15°C-25°C (59°F-77°F), is at the bottom mark on the transmission fluid level indicator.

    If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.

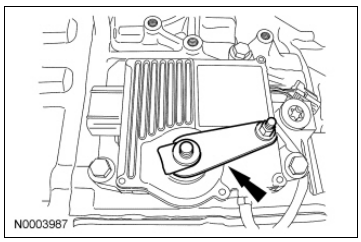


Transmission Control Module (TCM)

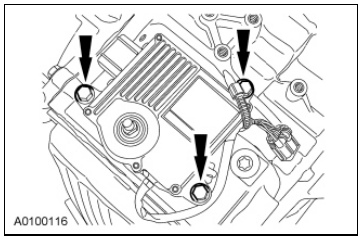
Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12C .
4. Disconnect the selector lever cable end.

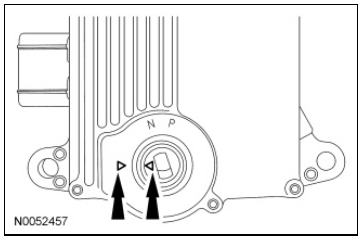


5. Disconnect the Transmission Control Module (TCM) electrical connector.

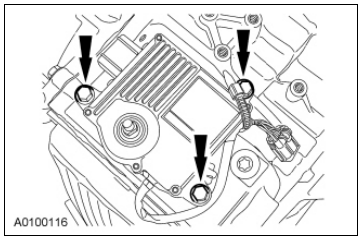


6. Remove the manual control lever nut.

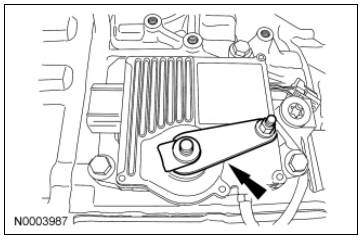
7. Remove the manual control lever.



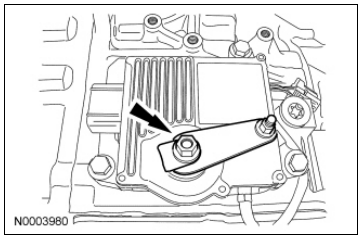
8. Remove the bolts and remove the TCM .



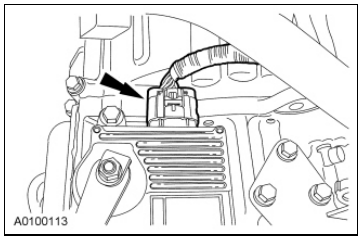
Installation



1. Verify that the manual lever position markings are aligned. Markings should indicate that the manual lever is in the OVERDRIVE position.

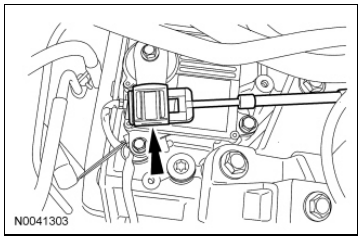


2. Install the TCM .
    - Tighten to 24 Nm (18 lb-ft).



3. Install the manual control lever.

4. Install the manual control lever nut.
    - Tighten to 12 Nm (106 lb-in).



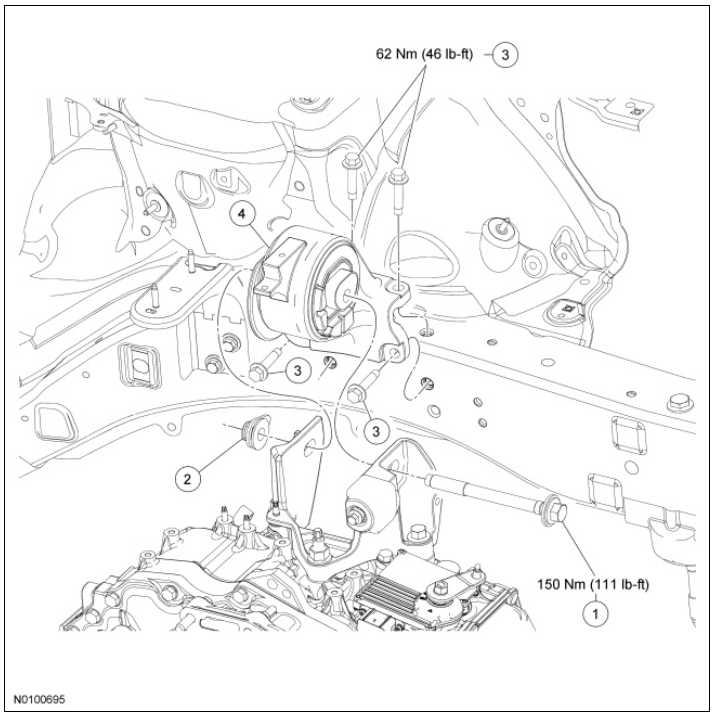
5. Connect the TCM electrical connector.

6. ***NOTICE:*** **Support the underside of the manual control lever when installing the selector lever cable or damage to the manual control lever or shaft may occur.**

   Connect the selector lever cable end.

7. Install the ACL assembly. For additional information, refer to Section 303-12C .
8. Connect the battery ground cable. For additional information, refer to Section 414-01 .
9. Carry out the TCM initial learning procedure. For additional information, refer to Transmission Control Module (TCM) Initial Learning in this section.
10. Check for correct vehicle operation.

Transaxle Support Insulator



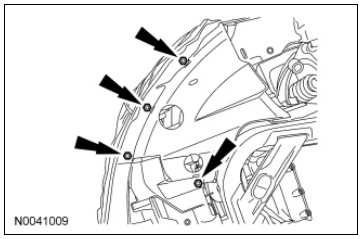
Special Tool(s)

 ST3034-A	Oil Pan Holding Fixture 303-1295

Material

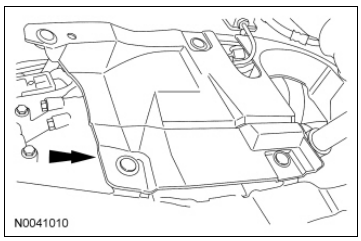
Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

Transaxle Support Insulator



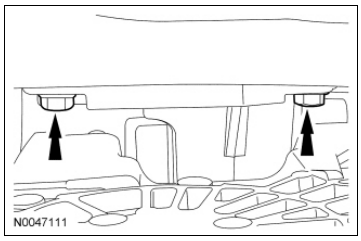
Item	Part Number	Description
1	W711873	Transaxle insulator through bolt
2	W711872	Transaxle insulator through bolt flagnut
3	W709234	Transaxle insulator-to-frame bolts
4	6F020	Transaxle insulator

Removal



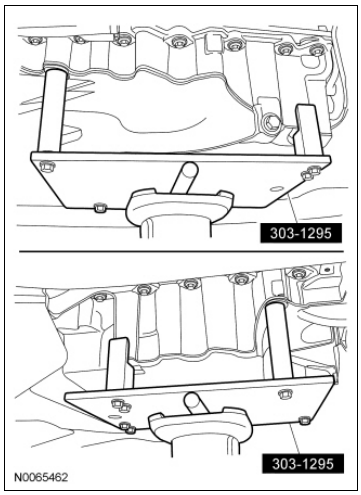
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the battery and battery tray. For additional information, refer to Section 414-01 .



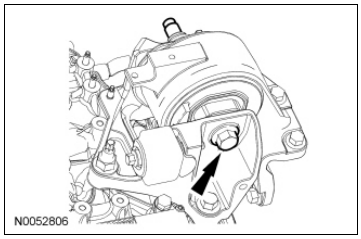
3. Remove the 4 screws and position the LH fender splash shield aside.

4. Remove the 6 pin-type retainers and the LH front structure-to-subframe splash shield.



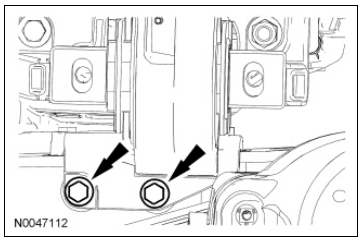
5. Remove the lower 2 transaxle insulator-to-frame bolts.

6. Remove the exhaust Y-pipe. For additional information, refer to Section 309-00 .



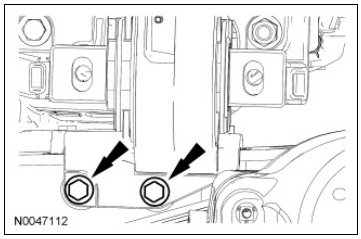
7. ***NOTICE:*** **The Oil Pan Holding Fixture must be carefully aligned to the mounting bosses on the oil pan. Failure to follow these instructions may result in damage to the oil pan.**

   Position a floor jack and the Oil Pan Holding Fixture under the oil pan.

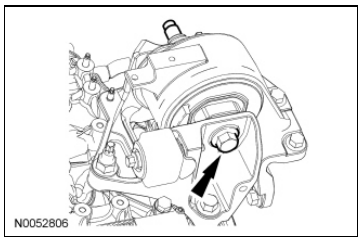


8. Remove the Air Cleaner (ACL). For additional information, refer to Section 303-01C .

9. Remove the transaxle support insulator through bolt.

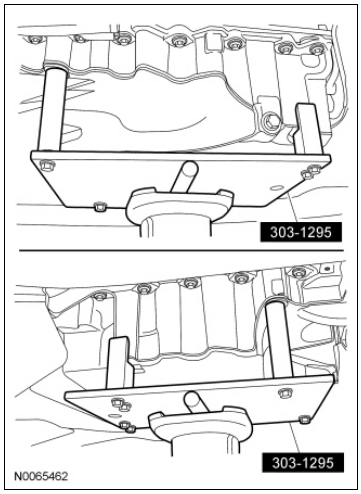


10. Remove the upper 2 transaxle insulator-to-frame bolts and remove the transaxle insulator.



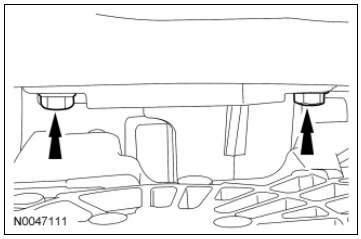
Installation

1. Clean the rear transaxle support insulator bolts using a wire brush and apply new threadlock to the threads.

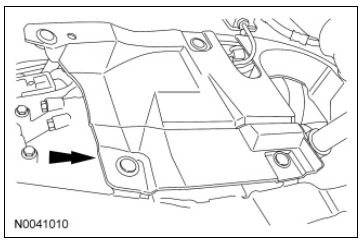


2. Position the transaxle support insulator in place and install the upper 2 transaxle insulator-to-frame bolts.
   - Tighten to 62 Nm (46 lb-ft).

3. Install the transaxle insulator through bolt and flagnut.
   - Tighten to 150 Nm (111 lb-ft).

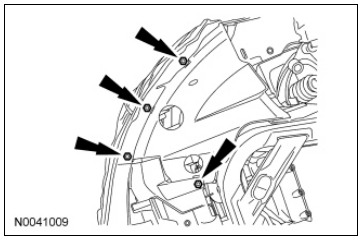


4. Remove the floor jack and the Oil Pan Holding Fixture.



5. Install the ACL . For additional information, refer to Section 303-01C .

6. Install the exhaust Y-pipe. For additional information, refer to Section 309-00 .

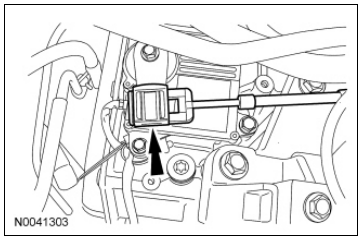


7. Position the transansaxle support insulator in place and install the lower 2 transaxle insulator-to-frame bolts.
    - Tighten to 62 Nm (46 lb-ft).

8. Position the LH front structure-to-subframe splash shield in place and install the 6 pin-type retainers.

9. Position the LH splash shield in place and install the 4 screws.

10. Install the battery and battery tray. For additional information, refer to Section 414-01 .

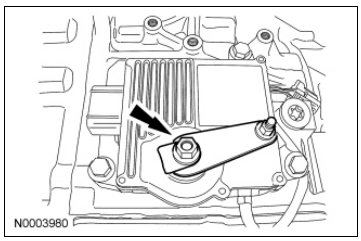


Manual Control Lever Shaft and Seal

Special Tool(s)

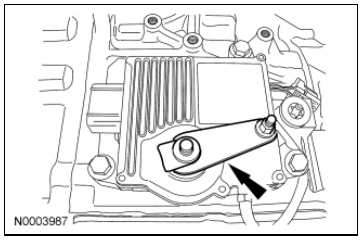
 ST2474-A	Installer, Shift Shaft Fluid Seal 307-549

Removal



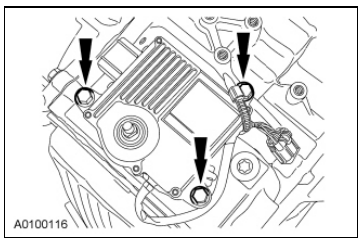
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cabler additional information, refer to Section 414-01 .
3. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12C .
4. Disconnect the selector lever cable end.

N0041303



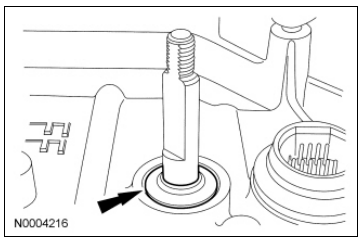
5. Disconnect the Transmission Control Module (TCM) electrical connector.

A0100113



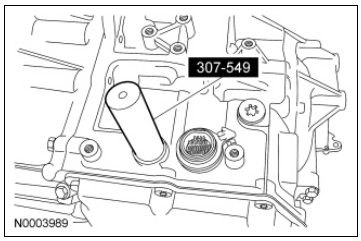
6. Remove the manual control lever nut.

N0003980

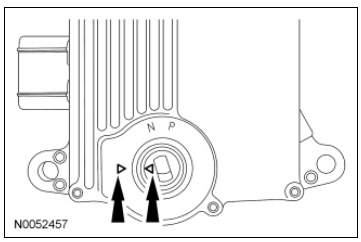


7. Remove the manual control lever.

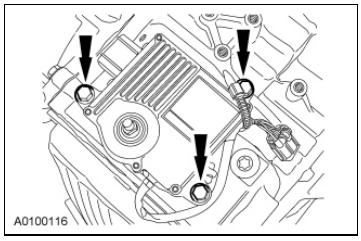
8. Remove the bolts and remove the TCM .



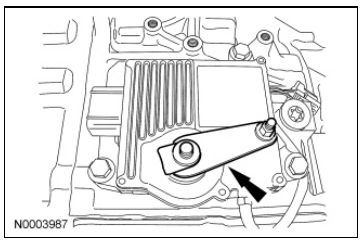
9. Using a suitable pick, remove the manual control lever seal.



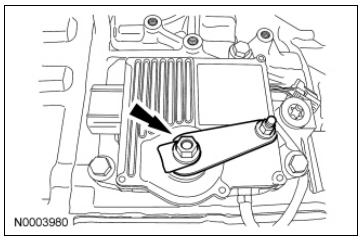
Installation



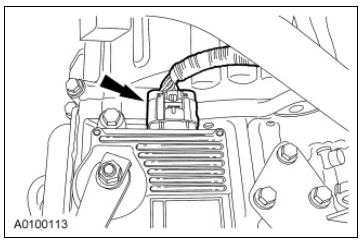
1. Using the Shift Shaft Fluid Seal Installer, install the manual control lever seal.



2. Verify that the manual lever position markings are aligned. Markings should indicate that the manual lever is in the OVERDRIVE position.

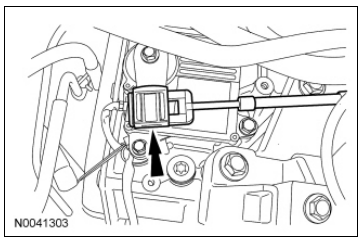


3. Install the TCM .
   - Tighten to 24 Nm (18 lb-ft).



4. Install the manual control lever.

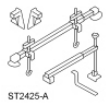
5. Install the manual control lever nut.
   - Tighten to 12 Nm (106 lb-in).



6. Connect the TCM electrical connector.

7. ***NOTICE:*** **Support the underside of the manual control lever when installing the selector lever cable or damage to the manual control lever or shaft may occur.**

   Connect the selector lever cable end.

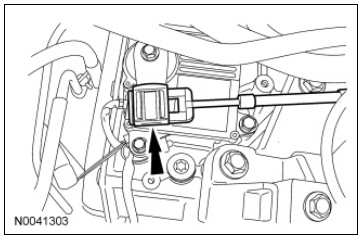


8. Install the ACL assembly. For additional information, refer to Section 303-12C .

9. Connect the battery ground cable. For additional information, refer to Section 414-01 .

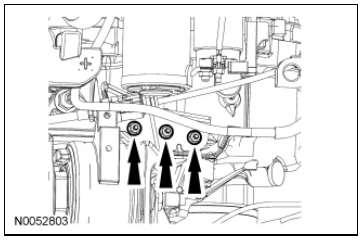
10. Check for correct vehicle operation.

Transaxle



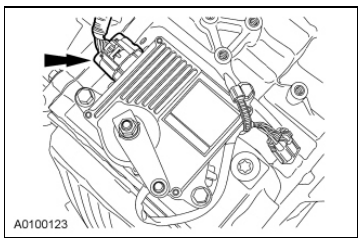
Special Tool(s)

 ST2976A	Eye, Engine Lift 303-1245
 ST2977-A	Bar, Engine Spreader 303-1246
	Powertrain Lift With Tilting Plate 300-OTC-1585AE
 ST1408-A	Remover, Tie-Rod End 211-105
 ST2425-A	Support Bar, Engine 303-F072

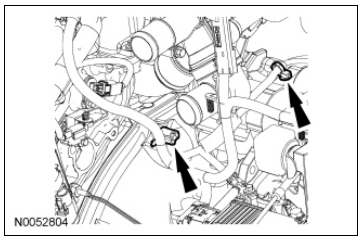


NOTE: Refer to the Transmission Cooler Flushing Job Aid on the FMCDealer website.

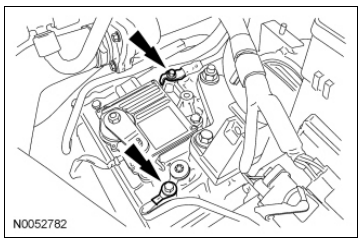
All vehicles



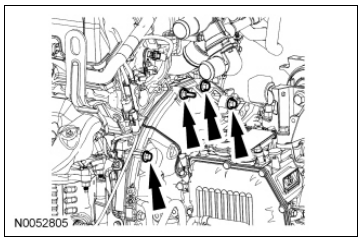
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the Air Cleaner (ACL) and the outlet pipe. For additional information, refer to Section 303-12C .
3. Remove the starter motor. For additional information, refer to Section 303-06 .
4. Remove the upper intake manifold. For additional information, refer to Section 303-01C .
5. Disconnect the selector lever cable end.



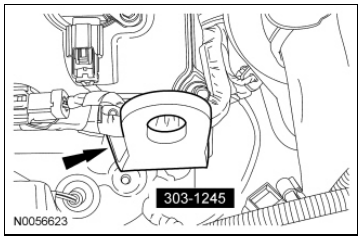
6. Remove the 2 bolts and the nut for the selector lever cable bracket and position the cable and bracket aside.



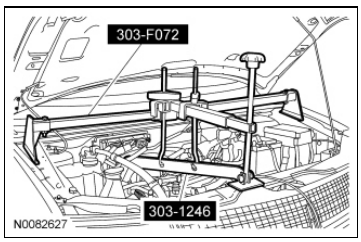
7. Disconnect the wire harness from the Transmission Control Module (TCM).



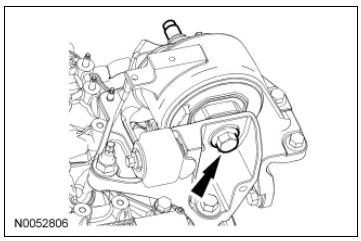
8. Disconnect the wiring harness fasteners from the torque converter housing stud bolt and the starter motor.



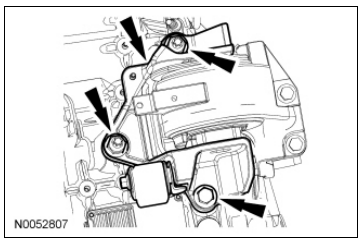
9. Remove the 2 ground strap bolts and position aside the ground straps.



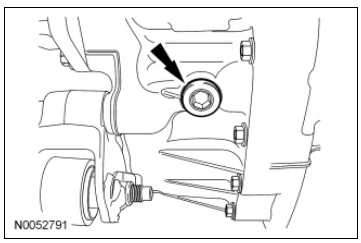
10. Remove the 4 upper torque converter housing bolts.



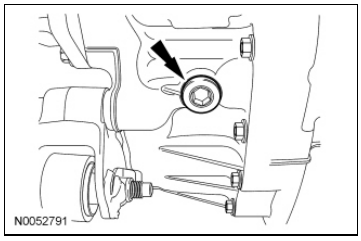
11. Install the Engine Lift Eye on the LH cylinder head.



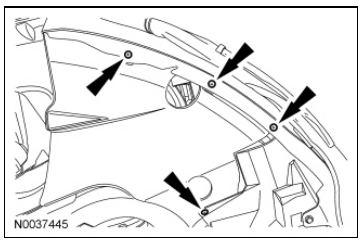
12. Install the Engine Support Bar and Engine Spreader Bar to support the engine.



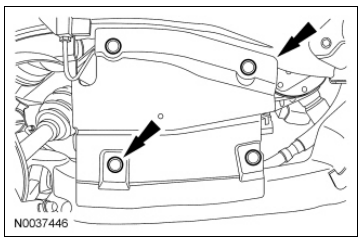
13. Remove the transaxle support insulator through bolt.



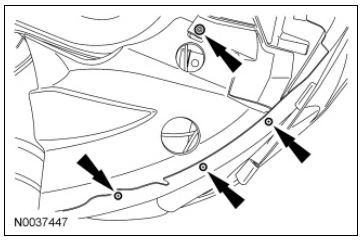
14. Using the Engine Support Bar, lower the transaxle and remove the 2 transaxle support insulator bracket nuts, the bolt and the bracket.



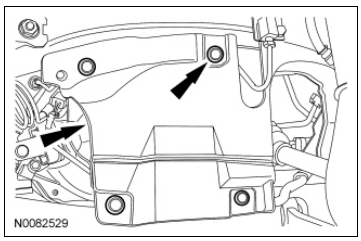
15. If a transaxle exchange or overhaul is required, the transmission fluid must be drained.
    - Remove the transmission drain plug and allow the transmission fluid to drain.



16. If removed, install the transmission fluid drain plug.
    - Tighten to 47 Nm (35 lb-ft).



17. Remove the 4 screws and position the RH fender splash shield aside.



18. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

19. Remove the 4 screws and position the LH fender splash shield aside.

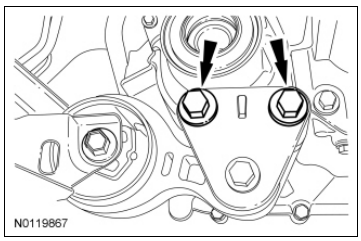
20. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

21. Remove the LH halfshaft. For additional information, refer to Section 205-04 .

Front Wheel Drive (FWD)

22. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .

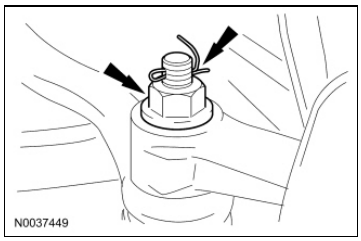
23. Remove the RH intermediate shaft. For additional information, refer to Section 205-04 .



All-Wheel Drive (AWD) vehicles

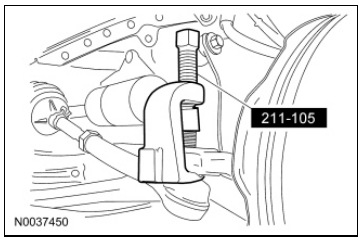
24. Remove the PTU . For additional information, refer to Section 308-07B .

All vehicles



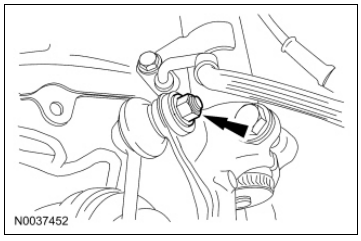
25. **NOTE:** Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.

    Remove the 2 roll restrictor bracket bolts.



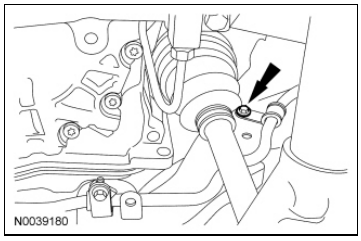
26. **NOTE:** LH shown, RH similar.

    Remove the cotter pins and nuts from the tie-rod ends.



27. **NOTE:** LH shown, RH similar.

    Using the Tie-Rod End Remover, separate the tie-rod ends from the steering knuckles.

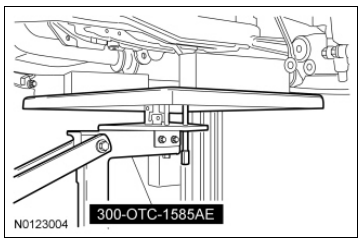


28. **NOTE:** LH shown, RH similar.

    Remove the nuts and separate the stabilizer bar links from the struts.

29. Remove the 3 power steering return line bolts.

30. Remove the 3 steering gear mounting bolts.

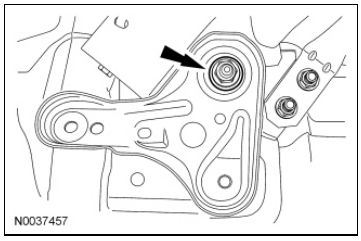


31. ***NOTICE:*** **Use care when handling the steering gear to avoid unseating the steering gear/dash seal. If the steering gear/dash seal becomes unseated, water and foreign material may enter the passenger compartment and damage to the vehicle interior can occur.**

    NOTE: The steering gear is not removed with the front subframe and must be positioned aside.

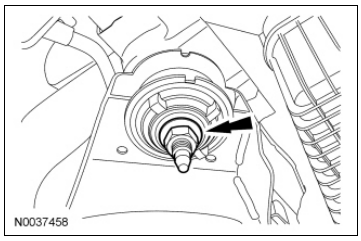
    Position the steering gear aside using mechanic's wire.

32. Position the Powertrain Lift With Tilting Plate under the subframe assembly.



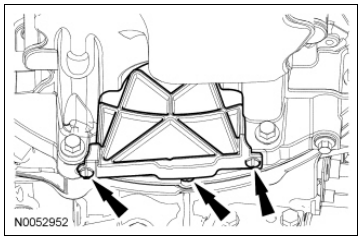
33. **NOTE:** LH shown, RH similar.

    Remove the 4 subframe bracket-to-body bolts.



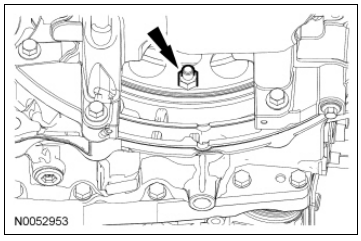
34. **NOTE:** LH shown, RH similar.

    Remove the 2 rear subframe nuts and the 2 subframe brackets.

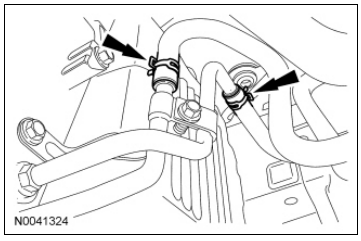


35. **NOTE:** LH shown, RH similar.

    Remove the 2 front subframe nuts.

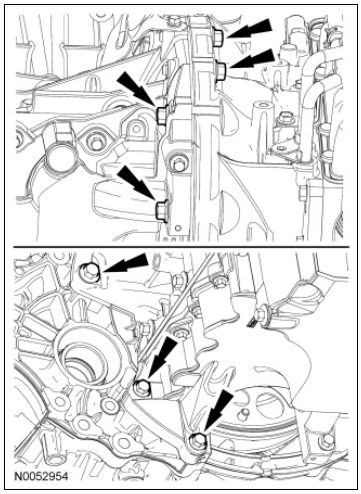


36. Lower the subframe assembly from the vehicle.



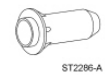
37. Remove the 2 fasteners and the inspection cover.

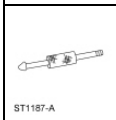
38. Remove and discard the 4 torque converter nuts.



39. Disconnect the transmission fluid cooler hoses from the transmission fluid cooler tubes.

40. Support the transaxle with a suitable transmission jack. Secure the transaxle to the transmission jack with a safety strap.

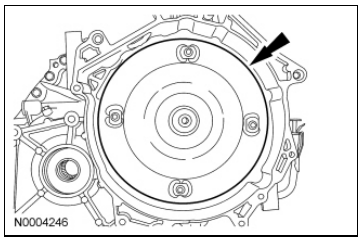




41. Remove the 7 torque converter housing bolts and remove the transaxle.

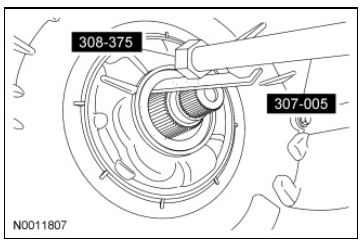
42. If installing a new transaxle, the transmission fluid cooler will need to be backflushed and cleaned. Carry out transmission fluid cooler tube backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler - Backflushing and Cleaning in this section.

Torque Converter Hub Seal



Special Tool(s)

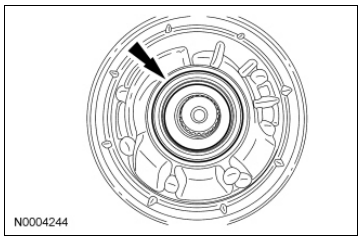
 ST2286-A	Installer, Fluid Pump Seal 307-548
 ST2924-A	Remover, Input Shaft Oil Seal 308-375
 ST1187-A	Slide Hammer 307-005 (T59L100-B)



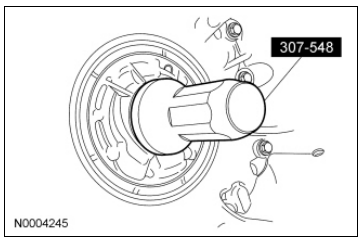
Disassembly

1. Remove the transaxle. For additional information, refer to Transaxle in this section.

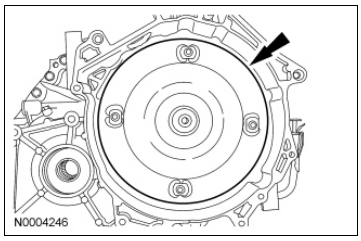
2. Remove the torque converter.



3. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the torque converter hub seal.



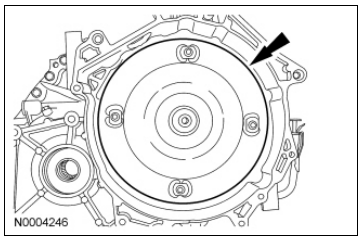
Assembly



1. Position the torque converter hub seal in place.

2. Using the Fluid Pump Seal Installer, install the torque converter hub seal.

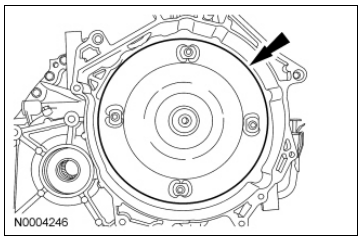
3. Install the torque converter.



4. Install the transaxle. For additional information, refer to Transaxle in this section.

Torque Converter

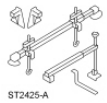
Disassembly



1. Remove the transaxle. For additional information, refer to Transaxle in this section.

2. Remove the torque converter.

Assembly



1. Install the torque converter.

2. Install the transaxle. For additional information, refer to Transaxle in this section.

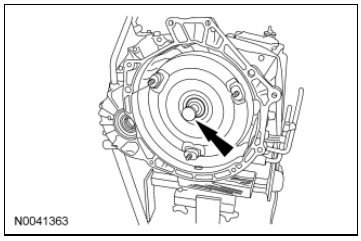
Transaxle

Special Tool(s)

 ST2976A	Eye, Engine Lift 303-1245
 ST2977-A	Bar, Engine Spreader 303-1246
 ST1293-A	Powertrain Lift With Tilting Plate 300-OTC-1585AE
 ST2425-A	Support Bar, Engine 303-F072
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

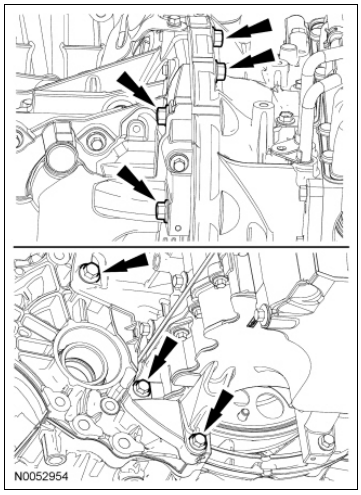
Item	Specification
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B
Threadlock and Sealer TA-25	WSK-M2G351-A5



NOTICE: **The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.**

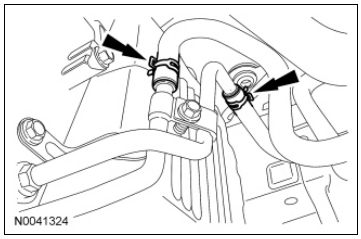
NOTE: If the transaxle was overhauled, or if installing a new transaxle and the transmission fluid cooler has not been flushed, flush the transmission fluid cooler at this time. For additional information, refer to Transmission Fluid Cooler - Backflushing and Cleaning in this section.

All vehicles

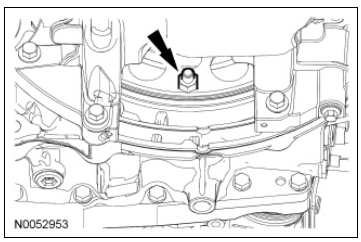


1. Secure the transaxle to a suitable transmission jack with a safety strap.

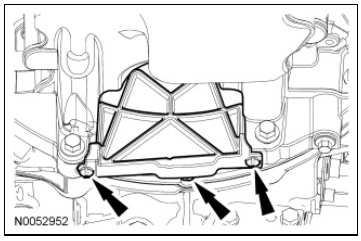
2. Prior to installing the transaxle, apply multi-purpose grease to the torque converter pilot hub.



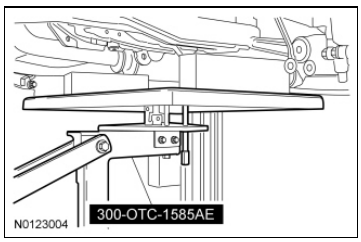
3. Position the transaxle to the back of the engine.



4. Install the 7 transaxle-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).

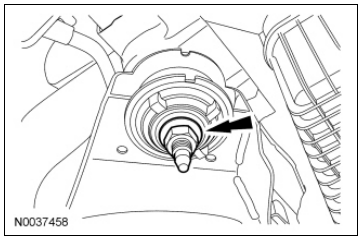


5. Connect the transmission fluid cooler hoses to the transmission cooler tubes.



6. Install 4ew torque converter nuts.
   - Tighten to 36 Nm (27 lb-ft).

7. Position the inspection cover in place and install the 2 fasteners.



8. Using the Powertrain Lift With Tilting Plate, raise the subframe into the installed position.

9. **NOTE:** LH shown, RH similar.

   Install the 2 front subframe nuts.

   - Tighten to 150 Nm (111 lb-ft).

10. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the 4 bolts finger-tight.

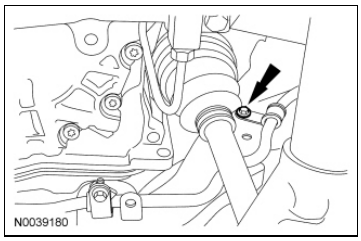
11. **NOTE:** LH shown, RH similar.

    Install the 2 rear subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

12. **NOTE:** LH shown, RH similar.

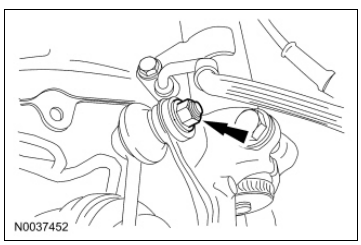
    Tighten the 4 subframe bracket-to-body bolts to 103 Nm (76 lb-ft).



13. ***NOTICE:*** **Use care when handling the steering gear to avoid unseating the steering gear/dash seal. If the steering gear/dash seal becomes unseated, water and foreign material may enter the passenger compartment and damage to the vehicle interior can occur.**

    Position the steering gear.

    1. Install the 3 steering gear mounting bolts.
    2. Tighten to 107 Nm (79 lb-ft).



14. Install the 3 power steering return line bolts.
    - Tighten to 9 Nm (80 lb-in).

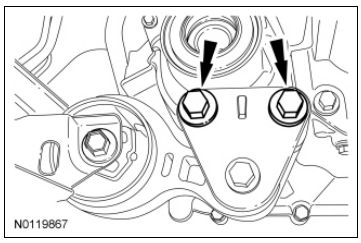
15. **NOTE:** LH shown, RH similar.

    Install the stabilizer bar links and nuts to the struts.

    - Tighten to 40 Nm (30 lb-ft).

16. **NOTE:** LH shown, RH similar.

Install the tie-rod ends and nuts.



- Tighten to 48 Nm (35 lb-ft).
- Install new cotter pins.

17. **NOTE:** Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.

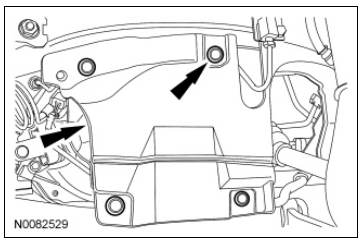
    Install the 2 roll restrictor bracket bolts.

    - Tighten to 90 Nm (66 lb-ft).

All-Wheel Drive (AWD) vehicles

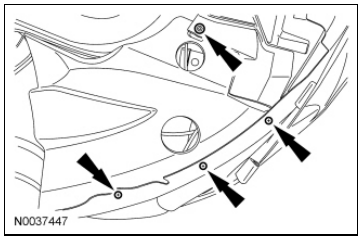
18. Install the Power Transfer Unit (PTU). For additional information, refer to Section 308-07B .

Front Wheel Drive (FWD)



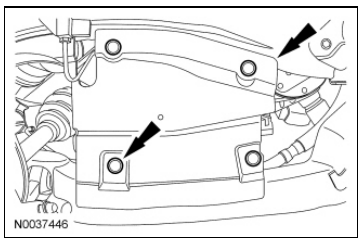
19. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .

20. Install the RH intermediate shaft. For additional information, refer to Section 205-04 .

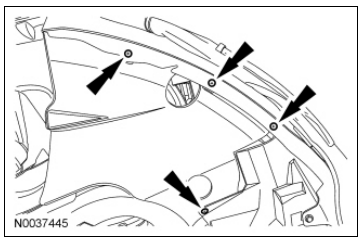


All vehicles

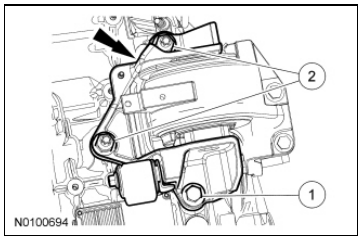
21. Install the LH halfshaft. For additional information, refer to Section 205-04 .



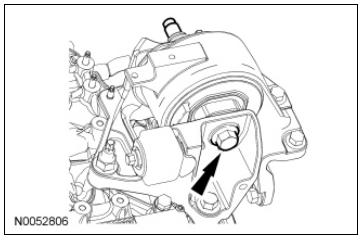
22. Install the LH splash shield and the 6 pin-type retainers (4 shown).



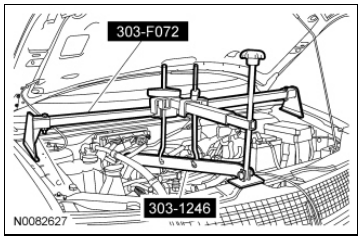
23. Position the LH fender splash shield and install the 4 screws.



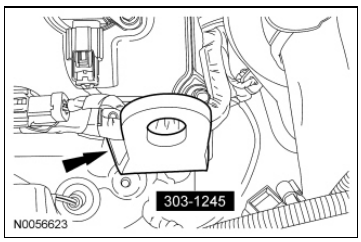
24. Install the RH splash shield and the 6 pin-type retainers (4 shown).



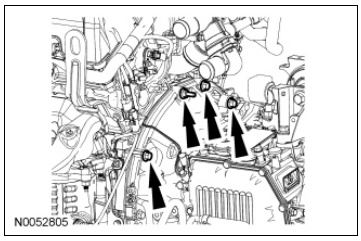
25. Position the RH fender splash shield and install the 4 screws.



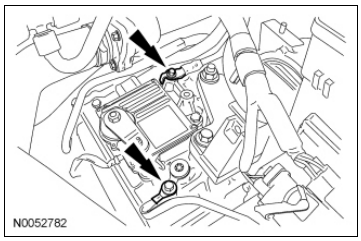
26. Apply threadlock and sealer to the threads and install the transaxle support insulator bracket, the 2 nuts and the bolt.
    1. Tighten the bolt to 80 Nm (59 lb-ft).
    2. Tighten the nuts to 90 Nm (66 lb-ft).



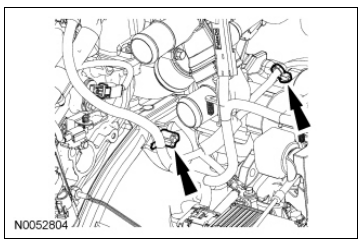
27. Using the Engine Support Bar, raise the transaxle. Apply threadlock and sealant to the threads and install the transaxle support insulator through bolt.
    - Tighten to 150 Nm (111 lb-ft).



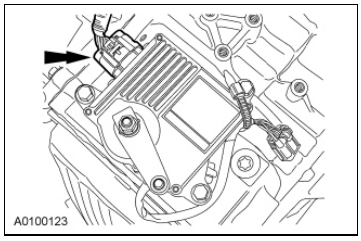
28. Remove the Engine Support Bar and Engine Spreader Bar.



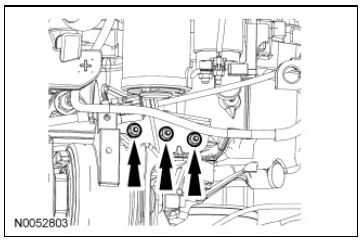
29. Remove the Engine Lift Eye from the LH cylinder head.



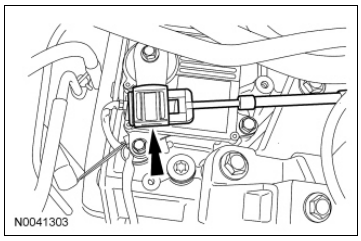
30. Install the 4 upper transaxle-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



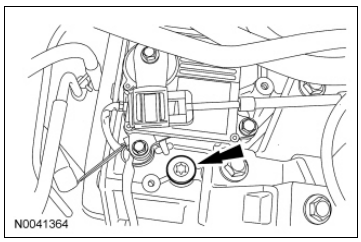
31. Position the 2 ground straps in place and install the 2 ground strap bolts.
    - Tighten to 12 Nm (106 lb-in).



32. Connect the wiring harness fasteners on the torque converter housing stud bolt and the starter motor.

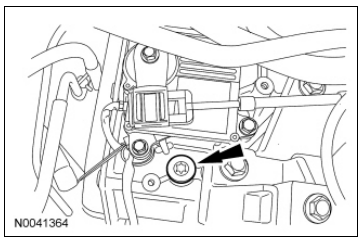


33. Connect the Transmission Control Module (TCM) electrical connector.



34. Position the selector lever cable bracket in place and install the 2 bolts and the nut.
    - Tighten to 12 Nm (106 lb-in).

35. Connect the selector lever cable end.



36. Remove the transmission fluid fill plug.

37. Fill the transaxle with clean transmission fluid.

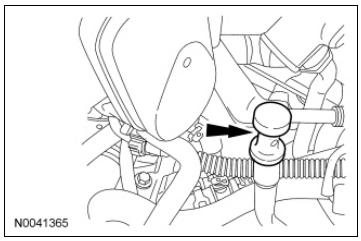
38. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

39. Install the upper intake manifold. For additional information, refer to Section 303-01C .

40. Install the starter. For additional information, refer to Section 303-06 .

41. Install the Air Cleaner (ACL) and outlet tube. For additional information, refer to Section 303-12C .

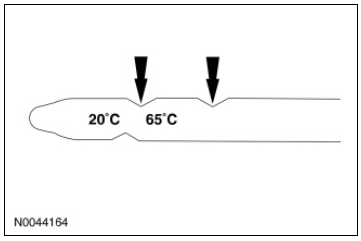
42. Remove the transmission fluid level indicator and make sure that the transaxle has transmission fluid in it.



43. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.

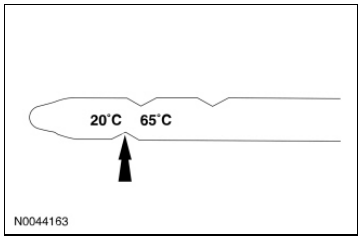
44. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.

45. Wipe the transmission fluid level indicator with a clean cloth.



46. **NOTE:** In order to get an accurate transmission fluid level reading the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.

    If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the top of the transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the indicator. The transmission fluid level should be at the upper most mark on the transmission fluid level indicator. Only fill to the upper most mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.



47. **NOTE:** The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.

    Fill the transaxle to the correct transmission fluid level.

48. **NOTE:** The correct transmission fluid level at cold operating temperature of 15°C-25°C (59°F-77°F) is at the bottom mark on the transmission fluid level indicator.

    If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission flold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.

49. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

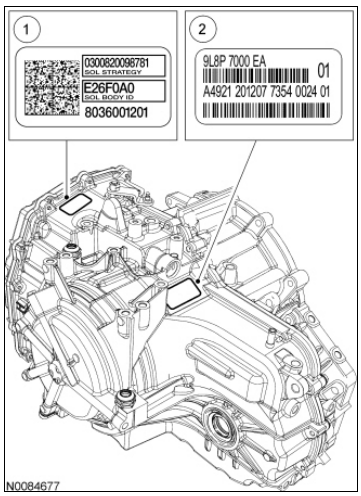
Transaxle Description

This automatic transaxle is a 6-speed transaxle with electronic shift control. It is designed for operation in a transverse powertrain for Front Wheel Drive (FWD) and All-Wheel Drive (AWD) vehicles.

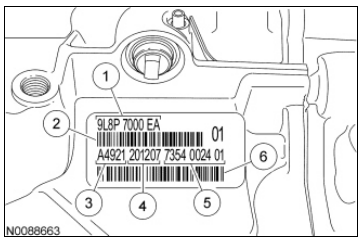
This transaxle has a 4-element torque converter design, which includes a Torque Converter Clutch (TCC) and a geartrain with 3 planetary gearsets.



The hydraulic control system of this transaxle uses 7 electronically controlled solenoids for:

- Shift feel (through line pressure control and shift pressure control)
- Shift scheduling and timing
- TCC operation

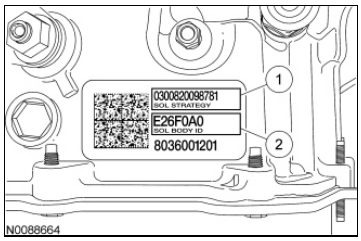
p;



Identification Tags

Identification Tag Location

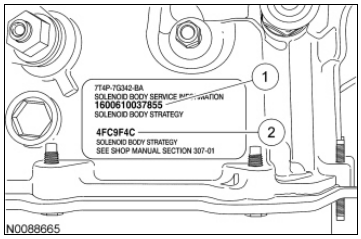
Item	Part Number	Description
1	7G342	Solenoid body identification tag
2	7B148	Transaxle identification tag



Transaxle Identification Tag

Description	
1	Transaxle part number
2	Bar code 1
3	Assembly plant line shift
4	Transaxle build date (DDMMYY)
5	Transaxle serial number
6	Bar code 2

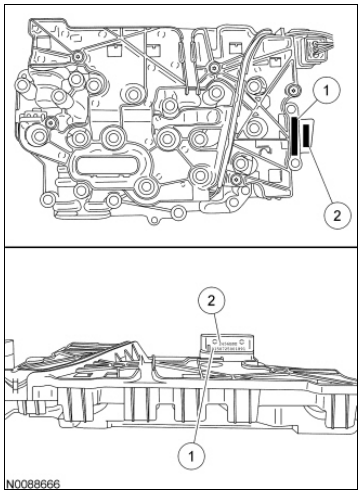
When servicing the transaxle, use the transaxle identification tag located on top of the transaxle case.



Original Solenoid Body Tag

Item	Description
1	Thirteen-digit solenoid body strategy
2	Seven-digit solenoid body identification

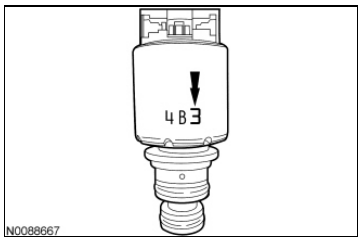
The solenoid body strategy is a file that is programmed into the PCM to control the shift, Line Pressure Control (LPC) and Torque Converter Clutch (TCC) solenoids to prevent harsh shifts. The solenoid body tag on the transaxle case contains the 13-digit solenoid body strategy and the 7-digit solenoid body identification.



Replacement Solenoid Body Tag

Item	Description
1	Thirteen-digit solenoid body strategy
2	Seven-digit solenoid body identification

Any time a new solenoid body is installed, a new solenoid body strategy file is downloaded into the PCM using the scan tool. A replacement solenoid body tag is supplied with the new solenoid body which contains the 13-digit solenoid body strategy and the 7-digit solenoid body identification. The new tag is placed over the original solenoid body tag.

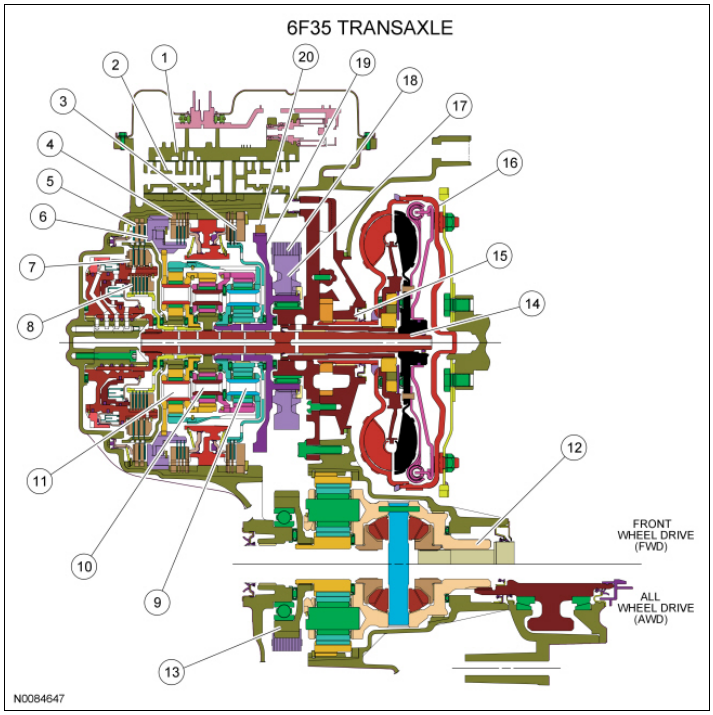


Solenoid Body Identification and Strategy

Item	Description
1	Thirteen-digit solenoid body strategy
2	Seven-digit solenoid body identification

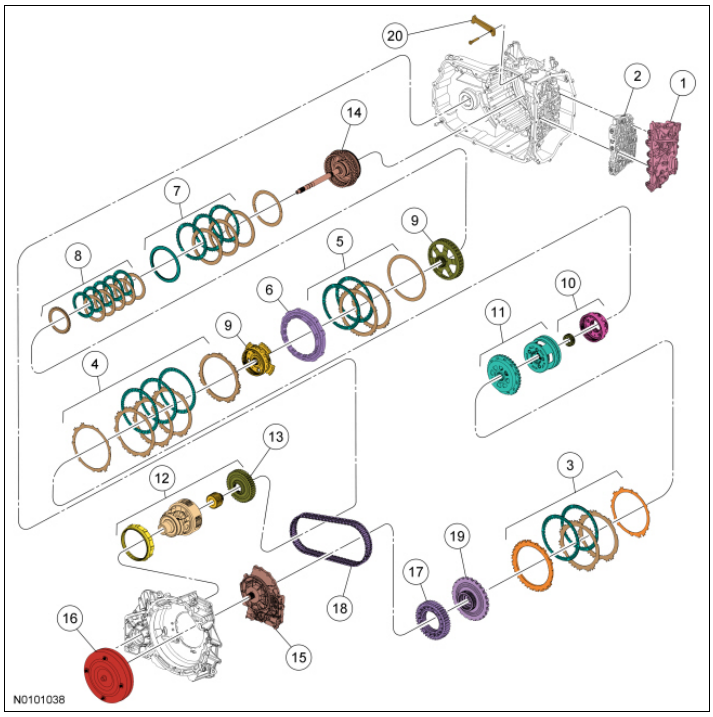
If the solenoid body strategy printed on the solenoid body connector does not match the solenoid body tag, a new solenoid body must be installed and the solenoid body strategy must be downloaded into the PCM or harsh shifts will result.

Solenoid Band Number



The solenoids are calibrated from the factory and are not all the same. The solenoids can be replaced separately, but only with a replacement solenoid with a band that matches the solenoid being replaced. When solenoid(s) are replaced, the new solenoid band number must match the old solenoid band number. The band number is the last digit of the number stamped on the side of the solenoid and will be a 1, 2, 3, 4 or 5.

Major Components



This transaxle has the following major components:

- Case with torque converter housing
- Two drive clutches:
  - Direct clutch
  - Overdrive (O/D) clutch
- Four brake clutches:
  - Forward clutch
  - Low one-way clutch
  - Low/reverse clutch
  - Intermediate clutch
- Three planetary gearsets:
  - Front
  - Center
  - Rear
- Drive chain and sprockets
- Final drive planetary gearset and differential assembly
- Pump and filter assembly
- Main control:
  - Valve body assembly
  - Solenoid body assembly

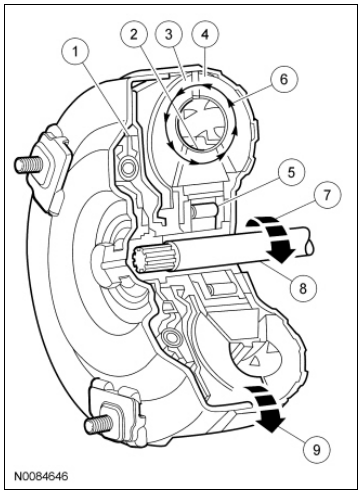
3rd	1.912:1
4th	1.446:1
5th	1:1
6th	0.746:1
Reverse	2.94:1

Torque Converter

The torque converter transmits and multiplies torque. The torque converter is a 4-element device:

- Impeller and cover assembly
- Turbine
- Reactor
- Clutch and damper assembly



Rotation of the torque converter housing and impeller set the transmission fluid in motion by driving the impeller blades and pump.

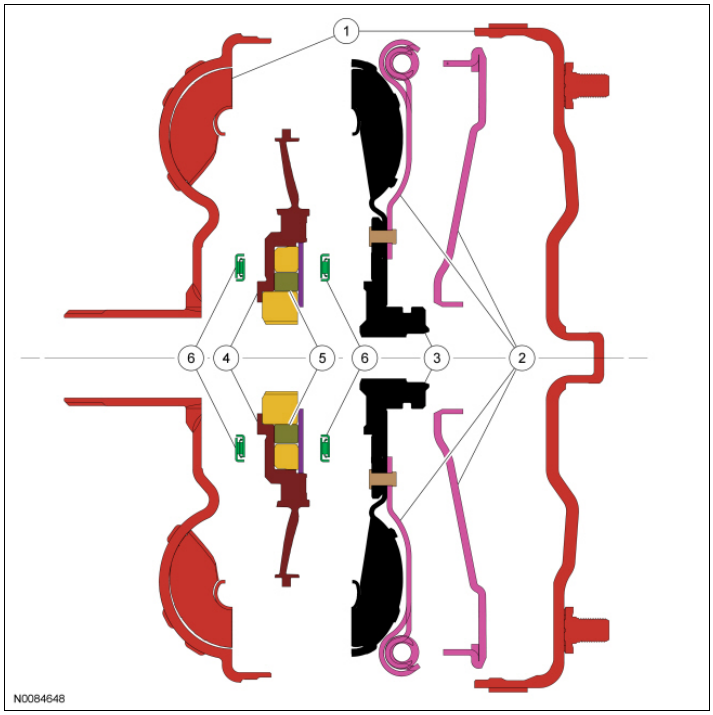
The turbine is driven by the transmission fluid from the impeller and transmits power to the input shaft.

The reactor redirects transmission fluid flow returned from the turbine to the impeller so that it rotates in the same direction as the impeller. This action assists in torque multiplication.

The reactor has a One-Way Clutch (OWC) to hold it stationary during torque multiplication and allows it to rotate at higher vehicle speeds.

Torque Converter Operation

Item	Description
1	Torque Converter Clutch (TCC)
2	Reactor
3	Turbine
4	Impeller and cover assembly
5	One-Way Clutch (OWC)
6	Fluid motion
7	Input shaft rotation
8	Input shaft
9	Engine rotation



The Torque Converter Clutch (TCC) connects the torque converter housing to the damper when the TCC is applied.

During TCC release, the direction that the transmission fluid flows through the torque converter allows the TCC to release. During TCC apply, the transmission fluid flows in the opposite direction to apply the TCC .

The PCM controls TCC operation using the TCC solenoid in the solenoid body. TCC solenoid operation provides the modulation of hydraulic pressure to change the position of the TCC control valve and TCC regulator apply valve which changes the pressure and transmission fluid direction in the torque converter.

The TCC can be applied in 3rd, 4th, 5th and 6th gears.

Shift Patterns

Upshifts

Upshifting is controlled by the PCM. The PCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and Torque Converter Clutch (TCC) operation.

The PCM has an adaptive learn strategy to electronically control the transaxle which will automatically adjust the shift feel through the life of the vehicle. The first few hundred miles of operation of the transaxle may have abrupt shifting. This is a normal operation. To reset the adaptive shift pressure strategy, use the scan tool to clear the transmission keep alive memory tables.

Downshifts

Under certain conditions, the transaxle will downshift automatically to a lower gear range (without moving the selector lever). There are 3 categories of automatic downshifts: coastdown, torque demand and forced or kickdown shifts.

Coastdown

The coastdown downshift occurs when the vehicle is ting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. If applied, the transmission will disengage the TCC to provide added acceleration.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine and transaxle calibration requirements.

Mechanical Components and Functions

Planetary Gearset

This transaxle has 3 planetary gearsets to provide operation in reverse and 6 forward speeds.

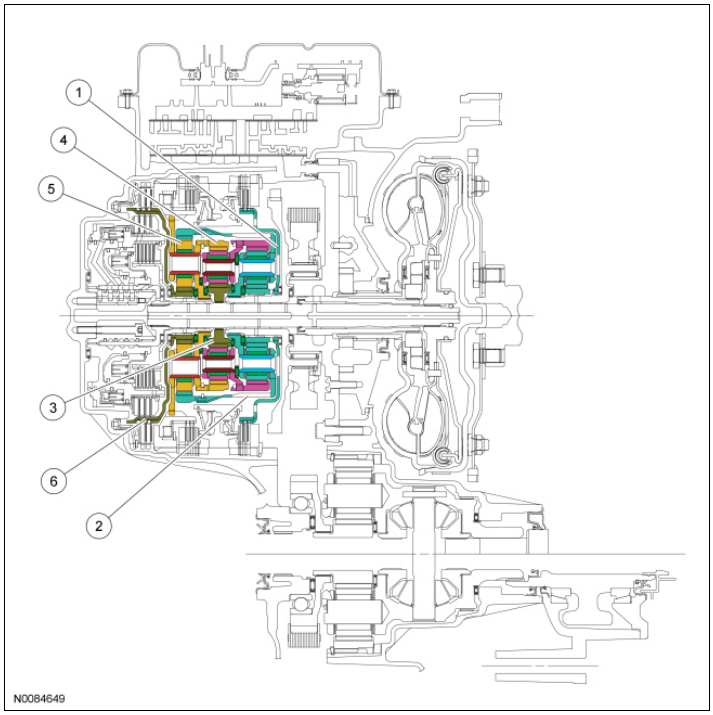
The gearsets are comprised of the following components:

- Front planetary sun gear (part of the front sun gear and shell assembly)
- Front planetary carrier
- Front planetary ring gear
- Center planetary sun gear
- Center planetary carrier
- Center planetary ring gear
- Rear planetary ring gear
- Rear planetary carrier
- Rear planetary sun gear and shell assembly

The front planetary sun gear is splined to the forward (1, 2, 3, 4) clutch and is held stationary in 1st, 2nd, 3rd and 4th gears.

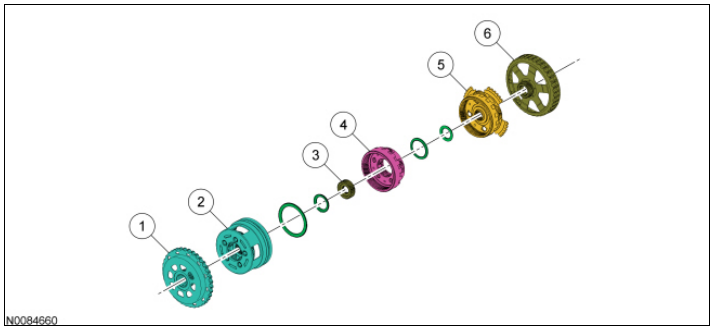
The front planetary carrier is splined to the rear planetary ring gear and transfers power from the rear planetary gearset to the front planetary gearset in 2nd, 3rd, 5th and 6th gears and reverse. The front planetary carrier is splined to the drive chain drive sprocket. The front planetarrrier is the output component for the planetary gearset.

The front planetary ring gear is splined to the center planetary carrier and transfers power from the center planetary gearset to the front planetary gearset in 1st, 2nd, 3rd and 4th gears.



The center planetary sun gear is splined to the input shaft and is used as input to the planetary gearsets in 1st, 2nd, 3rd and 4th gear.

The center planetary ring gear is splined to the rear planetary carrier and transfers power from the center planetary gearset to the rear planetary gearset in 3rd gear, from the rear planetary gearset to the center planetary gearset in 4th gear and is held stationary by the low One-Way Clutch (OWC) and low/reverse clutch in 1st gear and reverse.



The rear planetary carrier is splined to the Overdrive (O/D) (4, 5, 6) clutch hub and transfers power from the input shaft to the rear planetary carrier in 4th, 5th and 6th gears.

The rear planetary sun gear and shell assembly is splined to both the intermediate (2, 6) clutch and the direct (3, 5, R) clutch. The rear planetary sun gear and shell assembly is held stationary by the intermediate (2, 6) clutch in 2nd and 6th gear and is driven by the direct (3, 5, R) clutch in 3rd and 5th gears and reverse.

Input Shaft

The input shaft is part of the direct/ O/D clutch assembly and is splined to the torque converter turbine and the center planetary sun gear. The input shaft transfers power from the torque converter to the rear planetary gearset through the center planetary sun gear and the direct (3, 5, R) and O/D (4, 5, 6) clutches.

Front Planetary Carrier Hub (Output Hub)

The front planetary carrier hub/park gear is splined to the front planetary carrier and the drive chain drive sprocket. This allows torque to be transferred from the planetary gearset to the final drive gearset.

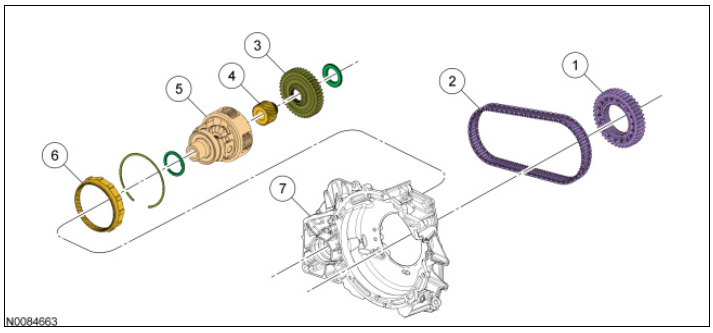
Final Drive Chain, Sprockets and Planetary Gearset

The final drive consists of a drive chain and sprockets and a planetary gearset and differential assembly. The drive chain and sprockets transfer torque from the front planetary carrier hub to the differential assembly that has a planetary gearset integrated into it for final drive torque multiplication.



The final drive consists of the following components:

- Drive sprocket
- Drive chain
- Driven sprocket
- Final drive sun gear
- Final drive ring gear
- Final drive planetary carrier and differential assembly

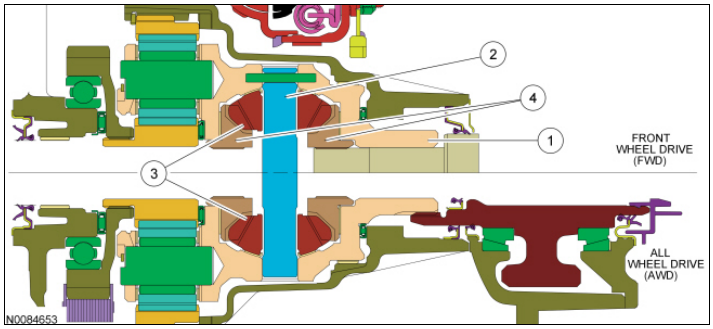
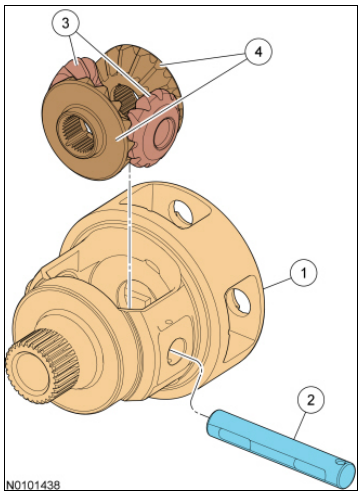
Differential

The differential allows the halfshafts and wheels to rotate at different speeds during cornering and transfers power to the Power Transfer Unit (PTU) for All-Wheel Drive (AWD) vehicles.



The differential assembly consists of the following components:

- Differential case (part of the final drive carrier)



- Two pinion gears supported by a pinion shaft
- Two side gears supported by the differential case and halfshafts

When driving in a straight line, both front wheels rotate at relatively the same speed. This means both side gears are rotating at the same speed, as well, while both pinion gears revolve (but do not rotate) with the side gears. During cornering, the wheel on the outside of the turn is forced to rotate faster than the wheel on the inside of the turn. Since the side gears must now rotate at different speeds, the pinion gears rotate on the pinion shaft allowing the drive axles to rotate at different speeds while still transferring output torque.

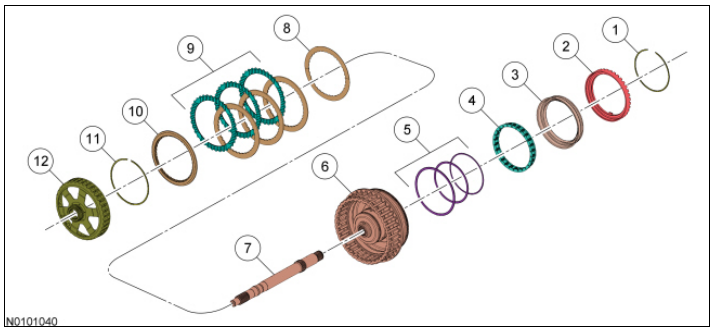
Direct (3, 5, R) Clutch



The direct clutch is a drive clutch that transfers power from the direct/ O/D clutch hub assembly to the rear planetary sun gear and shell assembly. The direct clutch is applied in 3rd and 5th gears and reverse.

Hydraulic pressure from the regulator valve in the valve body pushes the direct clutch piston against the direct clutch pack to apply the clutch. The input shaft and direct/ O/D clutch hub assembly transfers torque to the rear planetary sun gear and shell assembly as a result of the clutch being applied.

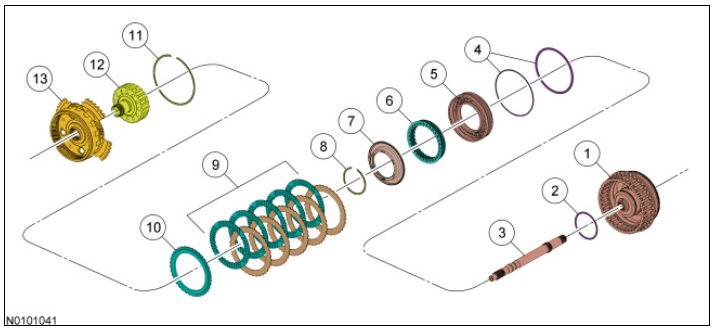
Overdrive (O/D) (4, 5, 6) Clutch



The O/D clutch is a drive clutch that transfers power from the direct/ O/D clutch hub assembly to the rear planetary carrier. The O/D clutch is applied in 4th, 5th and 6th gears.

Hydraulic pressure from the regulator valve in the valve body pushes the O/D clutch piston against the O/D clutch pack to apply the clutch. The input shaft and direct/ O/D clutch hub assembly transfers torque to the rear planetary carrier as a result of the clutch being applied.

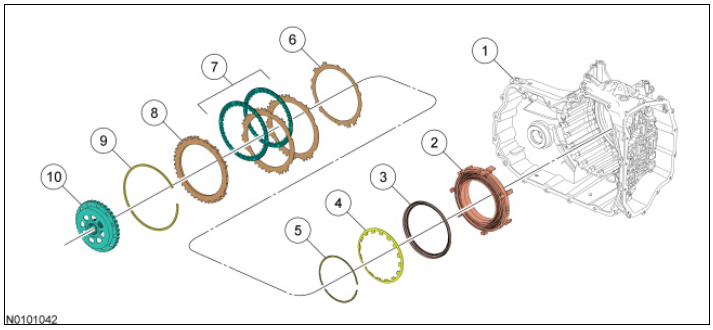
Forward (1, 2, 3, 4) Clutch



The forward clutch is a brake clutch that holds the front sun gear and shell assembly. The forward clutch is applied in 1st, 2nd, 3rd and 4th gears.

Hydraulic pressure from the regulator valve in the valve body pushes the forward clutch piston against the forward clutch pack to apply the clutch. The front sun gear and shell assembly is held stationary to the transaxle case as a result of the clutch being applied.

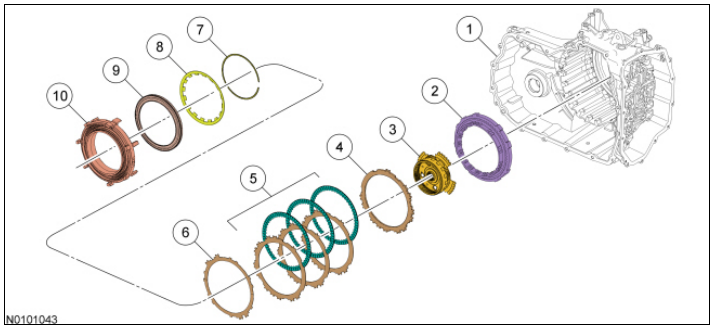
Low/Reverse Clutch



The low/reverse clutch is a brake clutch that holds the low OWC which is splined to the rear planetary carrier. The low/reverse clutch is applied in manual LOW, REVERSE and 1st gear up to 8 km/h (5 mph).

Hydraulic pressure from the regulator valve in the valve body pushes the low/reverse clutch piston against the low/reverse clutch pack to apply the clutch. The rear planetary carrier is held stationary to the transaxle case as a result of the clutch being applied.

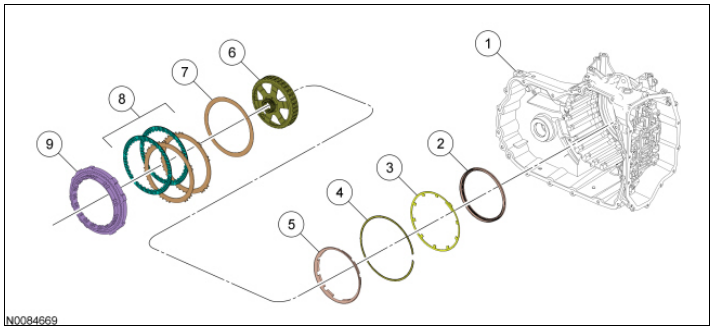
Intermediate (2, 6) Clutch



The intermediate clutch is a brake clutch that holds the rear planetary sun gear and shell assembly. The intermediate clutch is applied in 2nd and 6th gears.

Hydraulic pressure from the regulator valve in the valve body pushes the intermediate clutch piston against the intermediate clutch pack to apply the clutch. The low OWC works as a pressure plate for the intermediate (2, 6) clutch. The rear planetary sun gear and shell assembly is held stationary to the transaxle case as a result of the clutch being applied.

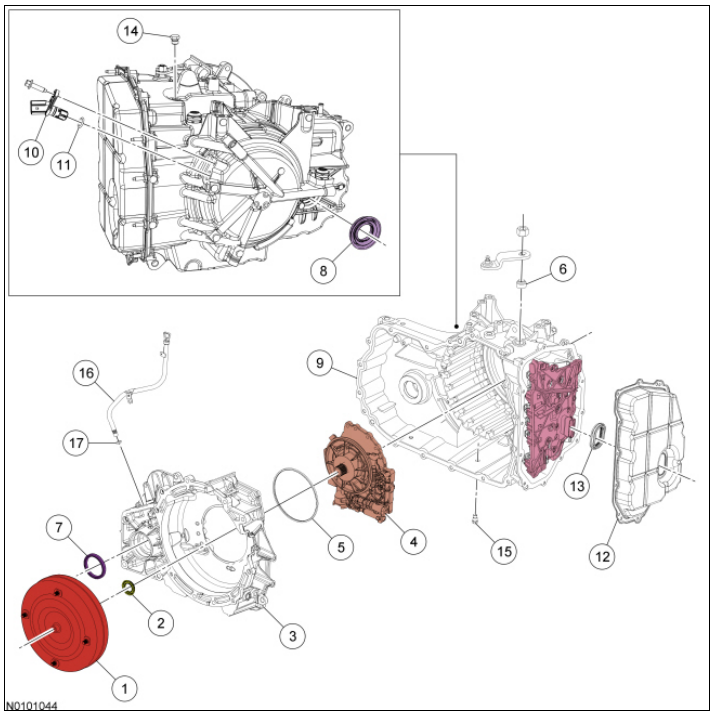
External Sealing

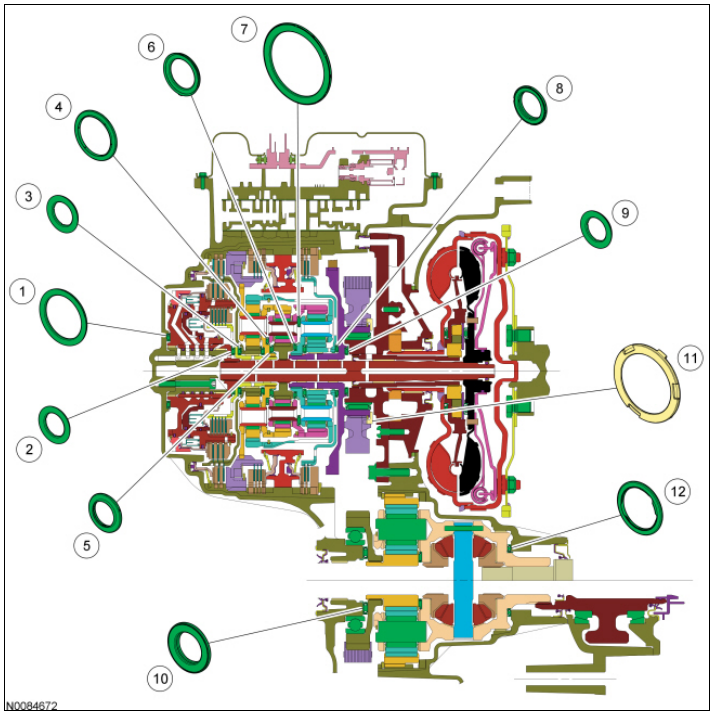
The torque converter housing has a lip-type seal that seals the torque converter hub. The pump assembly seals to the torque converter housing with a rubber seal. The manual shaft and halfshafts also use lip-type seals. All-Wheel Drive (AWD) vehicles do not use a RH halfshaft seal, the transaxle is sealed by the Power Transfer Unit (PTU) on the RH side.



The torque converter housing is sealed to the transaxle case with silicone sealant.

The main control cover is sealed to the transaxle case with silicone sealant and seals to the solenoid body with a reusable rubber gasket. The Turbine Shaft Speed (TSS) sensor is sealed to the transaxle case with an O-ring seal.

The line pressure tap plug and transmission fluid drain plug have pipe threads and seal when tightened to specification.



The transmission fluid filler tube is sealed to the torque converter housing with an O-ring seal.

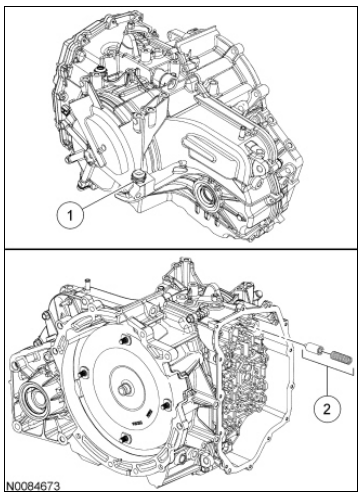
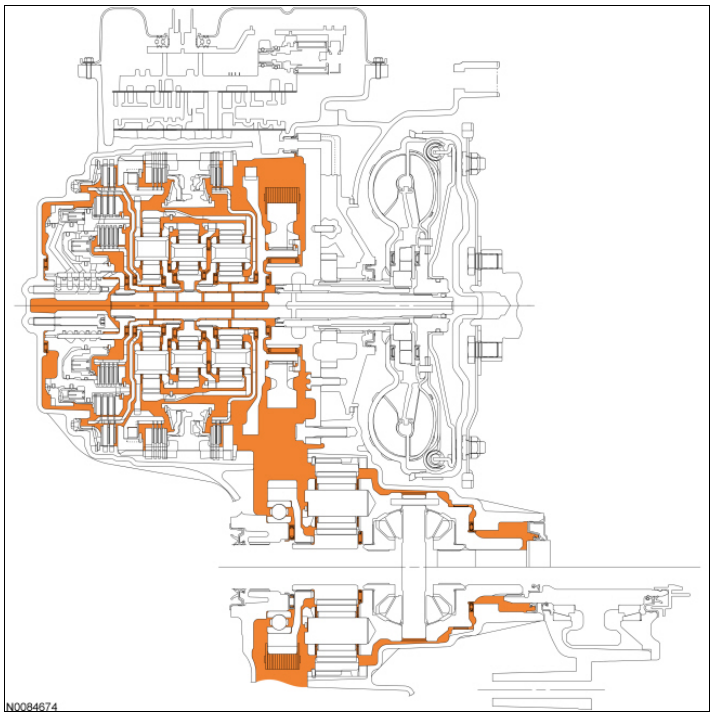
10	7G355	No. 12 thrust bearing
11	7G099	No. 13 thrust washer
12	7G112	No. 15 thrust bearing



The No. 4 thrust bearing is part of the rear planetary carrier assembly. The No. 9 thrust bearing is part of the front planetary carrier assembly. The No. 14 thrust bearing is part of the differential assembly.

Lubrication

Transmission fluid enters the lubrication circuits after flowing through the transmission fluid cooler. The transmission fluid cooler is mounted at the front of the vehicle. When the transmission fluid is not up to operating temperature, an internal thermal bypass valve allows the transmission fluid to bypass the transmission fluid cooler. When the transmission fluid circulates through the transmission fluid cooler, the transmission fluid returns to the transaxle from the transmission fluid cooler tubes through the back transmission fluid cooler tube.



The transmission fluid enters main lubrication circuit through the transaxle case and flows through passages in the input shaft to lubricate the transaxle.

The transmission fluid in the input shaft circuit flows from the back of the input shaft toward the front of the input shaft and passes through ports in the input shaft to lubricate the planetary gearset, clutches, final drive assembly and other components of the transaxle.

Item	Part Number	Description

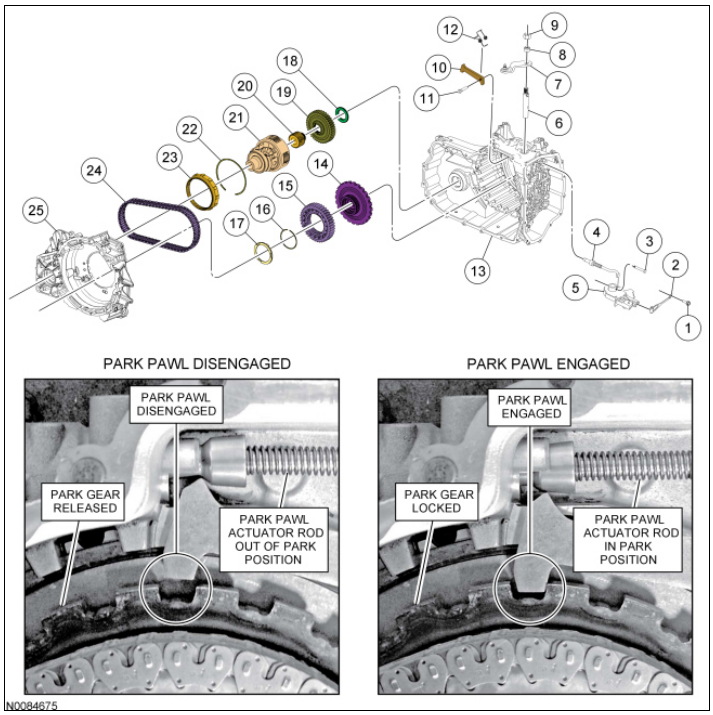
Lubrication Passages



Park

The park gear is splined to the front planetary carrier and the drive chain drive sprocket. There are lugs around the outer diameter of the park gear to allow the park pawl to hold the park gear stationary to the transaxle case which holds the final drive assembly in place and keeps the vehicle from moving.

When the manual control lever is rotated to the PARK position, the park lock works as follows:

- The Transmission Range (TR) sensor rotates the range detent plate which pushes the park pawl actuator rod towards the park pawl.
- The actuator rod pivots the park pawl into the lugs on the park gear, locking the gear stationary to the transaxle case.

Hydraulic System

Transmission Fluid Filter

The transmission fluid in the sump area at the bottom of the transaxle case flows through a transmission fluid filter to the pump assembly. The pump is bolted to the torque converter housing and is driven by the torque converter hub.

Fluid Pump and Transmission Fluid Filter Components

Item	Part Number	Description
1	7902	Torque converter

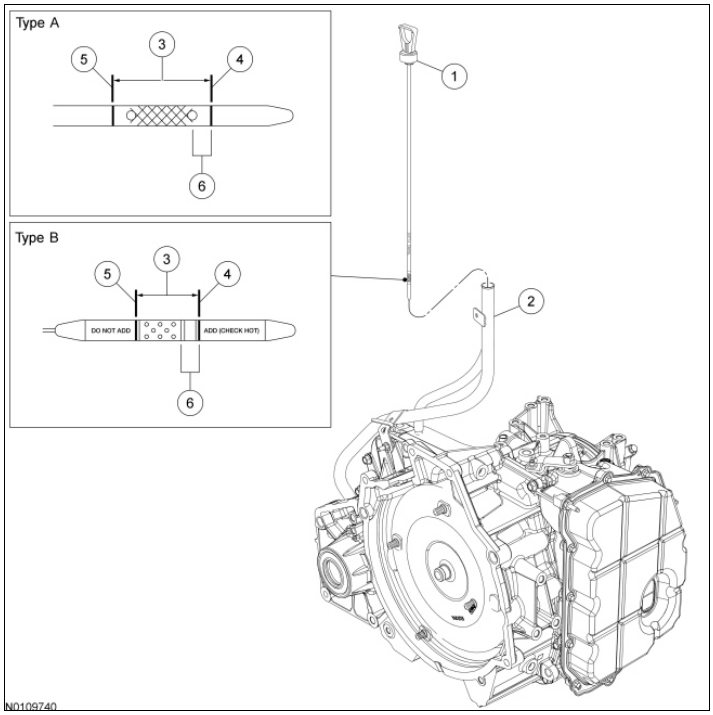
3	7A098	Transmission fluid filter
4		
5	W302860	Pump-to-torque converter housing bolt
6	7005	Transaxle case



Transmission Fluid Level

The transmission fluid level is checked with the transaxle at normal operating temperature between 85°C and 93°C (185°F and 200°F).

The transmission fluid level indicator is part of the transmission fluid filler tube located at the back of the torque converter housing.

The correct transmission fluid level is between the minimum and maximum marks on the transmission fluid level indicator.

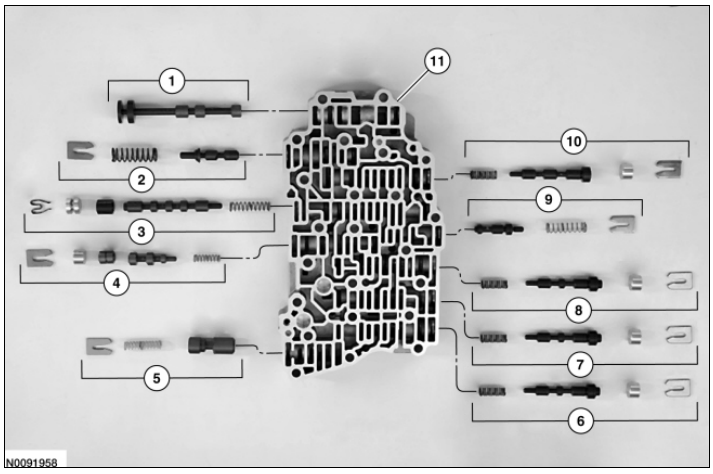
4	-	Minimum transmission fluid level mark
5	-	Maximum transmission fluid level mark
6	-	Flat tow transmission fluid level

Main Control

The hydraulic system has a main contromain control assembly consists of a valve body and a solenoid body. Both the valve body and the solenoid body contain hydraulic shift valves. The solenoid body contains the shift solenoids that control the hydraulic valves. The solenoid body can be serviced as an assembly with the solenoids or the solenoids can be serviced individually. The solenoid body is controlled by the PCM. The PCM has software stored in it specific to the solenoid body currently in the transaxle, called the solenoid body strategy. A new solenoid body strategy must be downloaded into the PCM anytime a new solenoid body is installed.



The pump assembly contains the main pressure regulator valve assembly and the Torque Converter Clutch (TCC) control valve assembly.

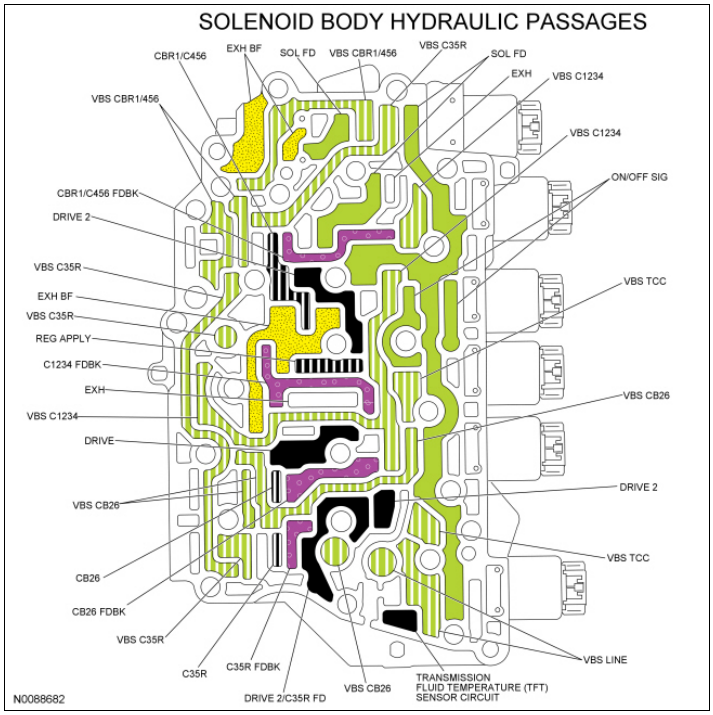
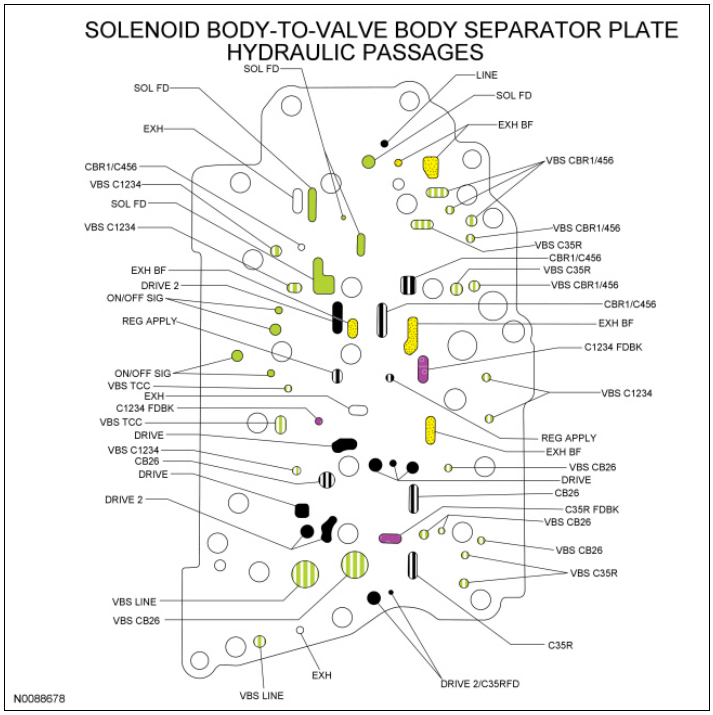
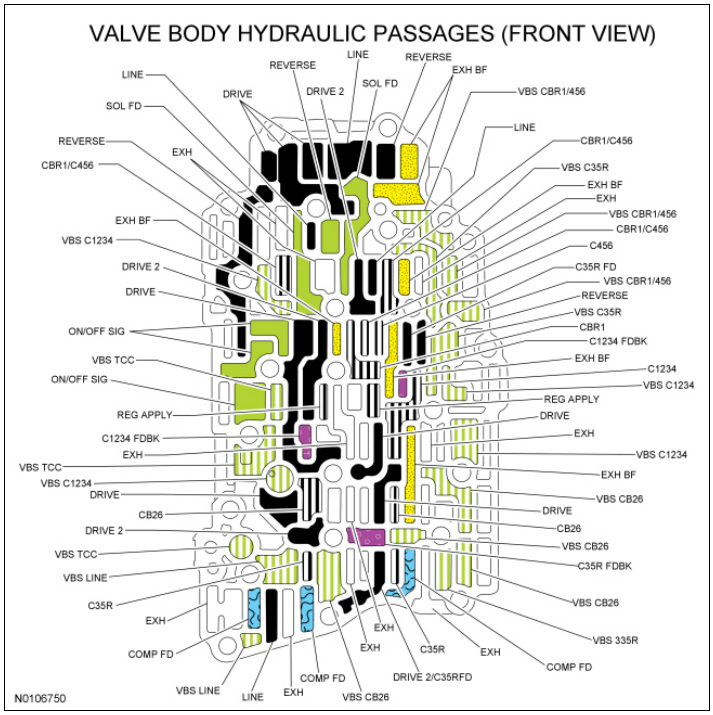
Hydraulic Circuits

Hydraulic Circuit Identification and Function





Hydraulic Circuit Identification Chart



Circuit Name	Description
BYPASS	Pressure from the main pressure regulator valve to the pump assembly suction circuit for line pressure control.
C1234	Regulated line pressure from the 1234 regulator valve supplied to the forward (1, 2, 3, 4) clutch to apply the clutch.
C1234 FDBK	C1234 pressure from the 1234 latch valve supplied to the 1234 regulator valve to oppose movement of the valve from VBS C1234 pressure during forward (1, 2, 3, 4) clutch application.
C35R	Regulated line pressure from the 35R regulator valve supplied to the direct (3, 5, R) clutch to apply the clutch.
C35R FD	Line pressure from the REVERSE circuit supplied to the DRIVE 2/C35R FD shuttle valve by the clutch control bypass valve to supply the 35R regulator valve with line pressure in reverse.
C35R FDBK	C35R pressure from the 35R latch valve supplied to the 35R regulator valve to oppose movement of the valve from VBS C35R pressure during direct (3, 5, R) clutch application.
C456	Regulated line pressure from the low reverse/456 regulator valve directed to the Overdrive (O/D) (4, 5, 6) clutch by the clutch control bypass valve. C456 also provides latch pressure for the clutch control bypass valve.
CB26	Regulated line pressure from the 26 regulator valve to the intermediate (2, 6) clutch to apply the clutch in 2nd and 6th gears.
CB26 FDBK	CB26 pressure from the 26 latch valve supplied to the 26 regulator valve to oppose movement of the valve from VBS C26 pressure during intermediate (2, 6) clutch application.
CBR1	Regulated line pressure from the low reverse/456 regulator valve directed to the low/reverse clutch by the clutch control bypass valve.
CBR1/C456	

	Regulated line pressure from the low reverse/456 regulator valve to the clutch control bypass valve.
CBR1/C456 FDBK	CBR1/C456 pressure from the low reverse/456 latch valve supplied to the low reverse/456 regulator valve to oppose movement of the valve from VBS CBR1/456 pressure during low/reverse or O/D (4, 5, 6) clutch application.
COMP FD	Pressure supplied to the opposite side of the O/D (4, 5, 6) and direct (3, 5, R) clutch apply pistons to oppose centrifugal application of the clutches.
CONV FD	Line pressure from the main pressure regulator valve supplied to the Torque Converter Clutch (TCC) control valve for TCC release.
COOLER FD	Return pressure from the torque converter during TCC release that is directed to the transmission fluid cooler by the TCC control valve.
DRIVE	Line pressure directed to the clutch control bypass valve, 1234 regulator valve and the 26 regulator valve by the manual valve in the DRIVE position.
DRIVE 2	DRIVE pressure directed to the TCC regulator valve and the DRIVE 2/C35R FD shuttle valve by the clutch control bypass valve to supply the 35R regulator valve with line pressure in 3rd and 5th gears.
DRIVE 2/C35R FD	DRIVE 2 or C35R FD pressure supplied to the 35R regulator valve from the DRIVE 2/C35R FD shuttle valve during direct (3, 5, R) clutch application.
EXH	Fluid exhausted from the valves that drains to the sump area.
EXH BF	Unpressurized fluid from the manual valve that fills the unused hydraulic circuits.
LINE	Pressure from the pump to the control pressure regulator, solenoid regulator valve, manual valve and low reverse/456 regulator valve. Line pressure is regulated by the main pressure regulator valve.
LUBE	Transaxle lubrication circuit (through the input shaft)
ON/OFF SIG	Full solenoid output pressure from Shift Solenoid E (SSE) to the clutch control bypass valve and the TCC regulator valve. ON/OFF SIG pressure positions the clutch control bypass valve to apply either the low/reverse clutch or the O/D (4, 5, 6) clutch.
REG APPLY	Regulated DRIVE 2 pressure supplied to the TCC control valve by the control pressure regulator for TCC application.
REVERSE	Line pressure directed to the clutch control bypass valve by the manual valve in the REVERSE position.
SOL FD	Regulated line pressure supplied to the shift, TCC and Line Pressure Control (LPC) solenoids.
TCC APPLY	Pressure supplied to the torque converter by the TCC control valve to apply the clutch. TCC APPLY is also the return circuit for the TCC RELEASE circuit.
TCC RELEASE	Pressure supplied to the torque converter by the TCC control valve to release the clutch. TCC RELEASE is also the return circuit for the TCC APPLY circuit.
VBS C1234	Variable SOL FD pressure supplied to the 1234 regulator valve and 1234 latch valve by Shift Solenoid A (SSA) to position the valves to apply the forward (1, 2, 3, 4) clutch.
VBS C35R	Variable SOL FD pressure supplied to the 35R regulator valve and 35R latch valve by Shift Solenoid B (SSB) to position the valves to apply the direct (3, 5, R) clutch.
VBS CB26	Variable SOL FD pressure supplied to the 26 regulator valve and 26 latch valve by Shift Solenoid C (SSC) to position the valves to apply the intermediate (2, 6) clutch.
VBS CBR1/456	Variable SOL FD pressure supplied to the low reverse/456 regulator valve and low reverse/456 latch valve by Shift Solenoid D (SSD) to position the valves to apply the low/reverse clutch or O/D (4, 5, 6) clutch.
VBS LINE	Variable SOL FD pressure supplied to the main pressure regulator valve by the LPC solenoid to control line pressure.
VBS TCC	

	Variable SOL FD pressure supplied to the TCC regulator valve and TCC control valve to position the valves by the TCC solenoid to apply the TCC .

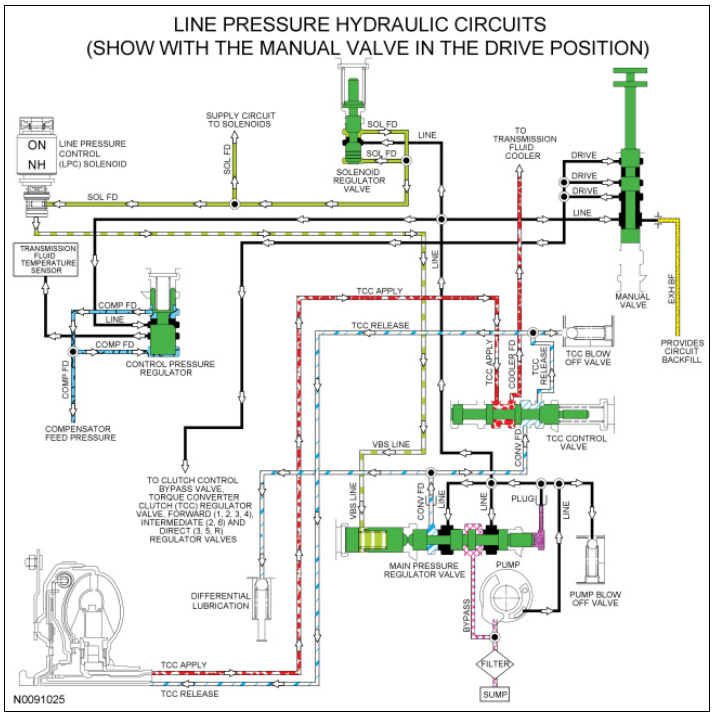
Line Pressure Hydraulic Circuits



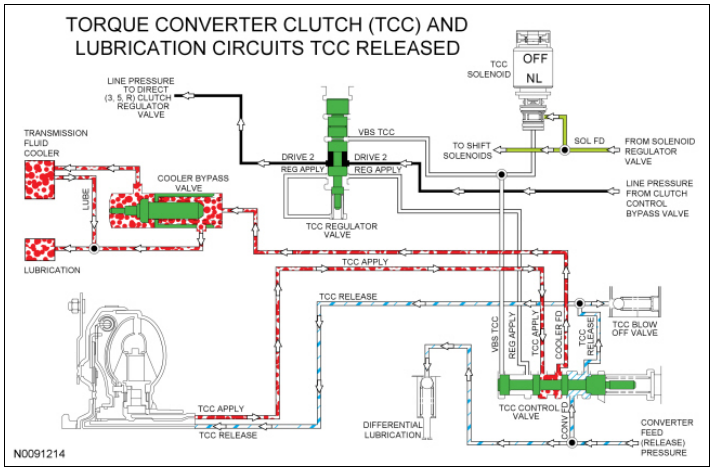
Line pressure is controlled by the Line Pressure Control (LPC) solenoid, which is controlled by the PCM. This effects shift feel and apply component operation.

When the engine is running, the pump supplies pressure to the main pressure regulator valve, which is controlled by the LPC solenoid. The main pressure regulator valve controls the line pressure to the LINE circuit which supplies the manual valve solenoid regulator valve and the control pressure regulator valve.

When the manual valve is in the reverse position, it supplies the clutch control bypass valve with line pressure to position it to supply line pressure to the direct (3, 5, R) regulator valve and regulated line pressure to the low/reverse clutch to apply the clutch.

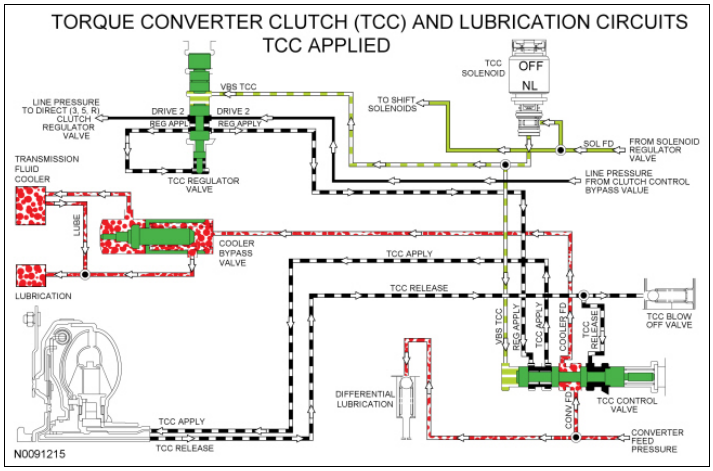
When the manual valve is in the DRIVE or LOW positions, it directs line pressure from the LINE circuit to the DRIVE circuit to supply line pressure to the:

- Clutch control bypass valve
- Forward (1, 2, 3, 4) regulator valve
- Intermediate (2, 6) regulator valve
- Torque Converter Clutch (TCC) regulator valve
- Direct (3, 5, R) clutch regulator valve



Torque Converter Clutch (TCC) And Lubrication Hydraulic Circuits

Pressure for TCC release is supplied by the main pressure regulator valve to the TCC control valve through the CONV FD circuit. The CONV FD circuit also supplies lubrication for the differential. When the TCC is released, the TCC control valve is positioned by the TCC solenoid to direct CONV FD pressure to the TCC RELEASE circuit to release the TCC . TCC RELEASE pressure returns to the TCC control valve through the TCC APPLY circuit. The position of the TCC control valve opens the TCC APPLY circuit to the COOLER FD circuit which allows the transmission fluid returned from the torque converter to cycle through the thermal bypass valve circuit when the Transmission Fluid Temperature (TFT) is below 80°C-93°C (176°F-200°F) or the transmission fluid cooler when the temperature is above 80°C-93°C (176°F-200°F).

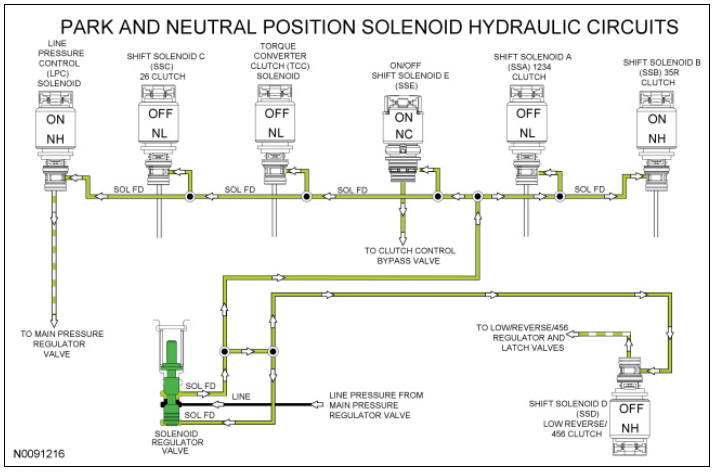


Return transmission fluid from tal bypass valve or the transmission fluid cooler supplies transaxle lubrication through the LUBE circuit which runs through the input shaft.

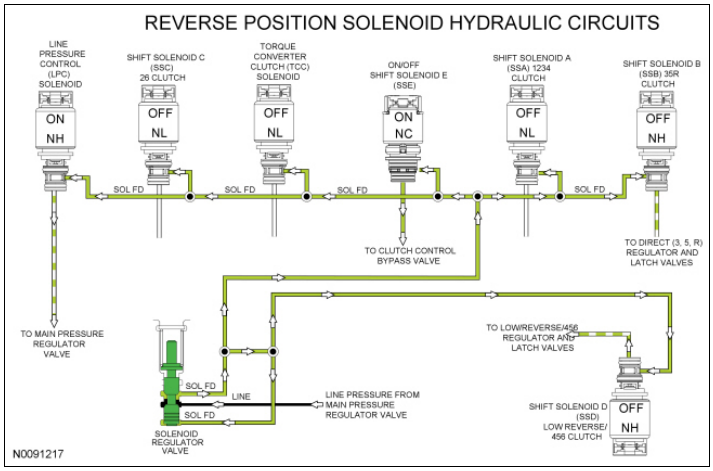
For lubrication passage location and description, refer to Mechanical Components and Functions in this section.

The position of the TCC control valve is controlled by pressure from the TCC solenoid through the VBS TCC circuit. The TCC solenoid is controlled by the PCM.

When the TCC clutch is applied, the TCC solenoid applies pressure to the TCC control and regulator valves to position the valves to apply the TCC clutch. Regulated line pressure is supplied to the TCC control valve through the REG APPLY circuit by the TCC regulator valve. The TCC control valve directs the regulated line pressure from the REG APPLY circuit to the TCC APPLY circuit to apply the TCC . The TCC control valve blocks the TCC RELEASE circuit to maintain pressure in the TCC APPLY circuit. The TCC control valve directs the CONV FD circuit to the COOLER FD circuit to allow the transmission fluid to flow through the thermal bypass valve or the transmission fluid cooler to the LUBE circuit to lubricate the transaxle.



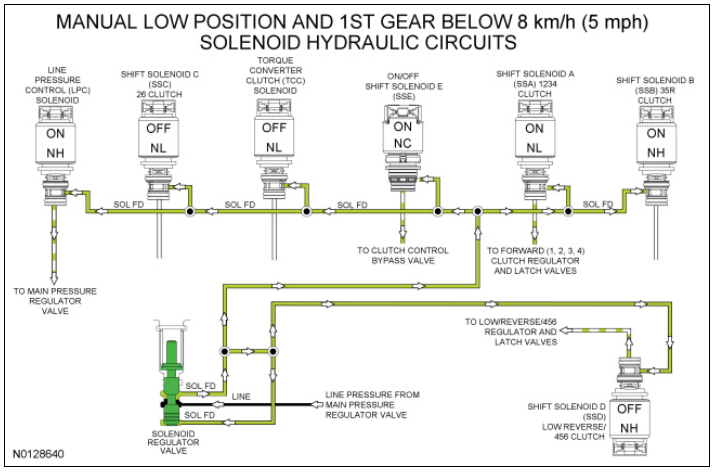
Solenoid Hydraulic Circuits

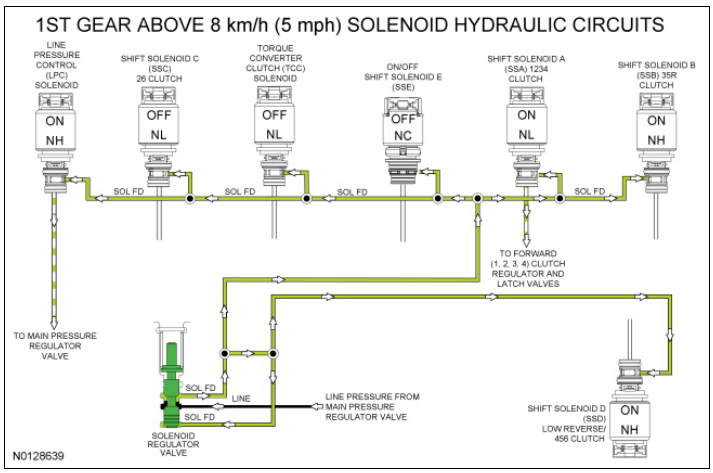


Line pressure from the main pressure regulator valve is directed to the individual shift, TCC and LPC solenoids by the solenoid regulator valve through the SOL FD circuit. The solenoids, controlled by the PCM, direct the fluid to the valves that they control.

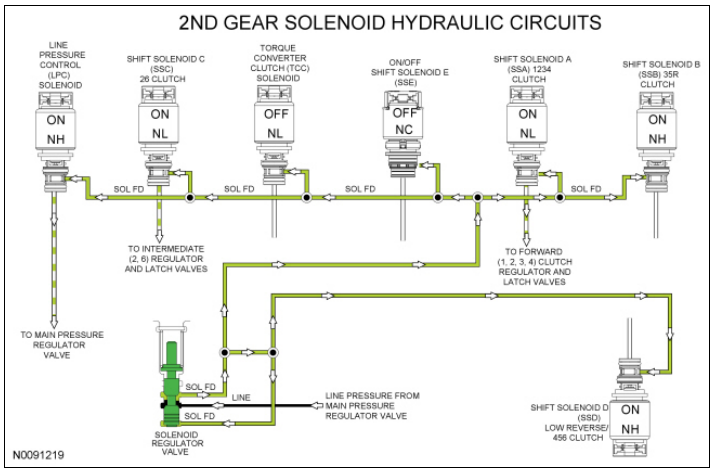
The LPC solenoid applies varying pressure to the main pressure regulator valve to control line pressure.

In the PARK and NEUTRAL positions, Shift Solenoid D (SSD) applies varying pressure to the low reverse/456 regulator and latch valves through the VBS CBR1/456 hydraulic circuit to position the valves to apply the low/reverse clutch. ON/OFF Shift Solenoid E (SSE) directs pressure to the clutch control bypass valve to position the valve to direct regulated line pressure from the low reverse/456 regulator valve to the low/reverse clutch.



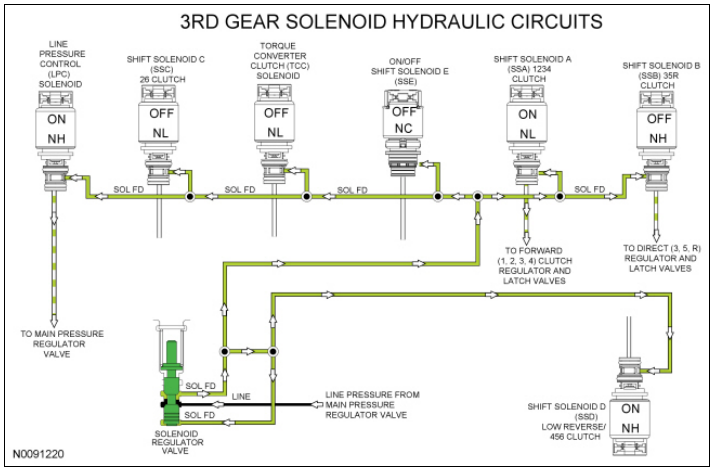


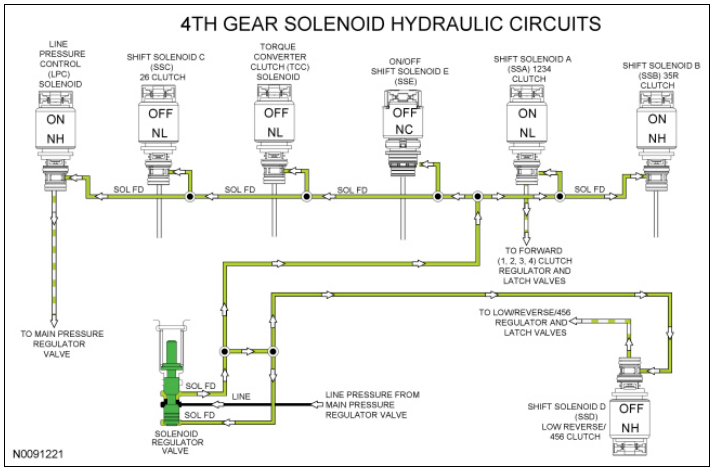
In the REVERSE position, SSD applies varying pressure to the low reverse/456 regulator and latch valves through the VBS CBR1/456 hydraulic circuit to position the valves to apply the low/reverse clutch. ON/OFF SSE directs pressure to the clutch control bypass valve to position the valve to direct regulated line pressure from the low reverse/456 regulator valve to the low/reverse clutch. The clutch control bypass valve also directs line pressure from the REVERSE circuit to the 35R regulator valve through the C35R FD and DRIVE 2/C35R FD circuits. Shift Solenoid B (SSB) directs varying pressure to the 35R regulator and latch valves through the VBS C35R hydraulic circuit to apply the direct (3, 5, R) clutch.



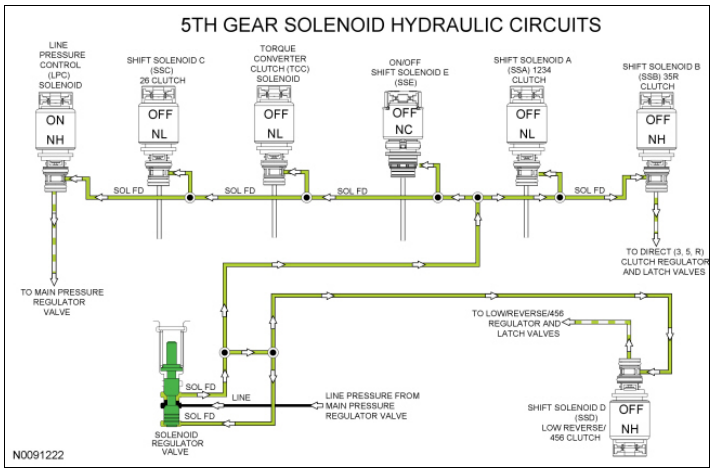
In 1st gear, Shift Solenoid A (SSA) applies varying pressure to the 1234 clutch regulator and latch valves through the VBS C1234 hydraulic circuit to apply the forward (1, 2, 3, 4) clutch.

When vehicle speed is below 8 km/h (5 mph), or the selector lever is in the manual low position, SSD applies varying pressure to the low reverse/456 regulator and latch valves through the VBS CBR1/456 hydraulic circuit to position the valves to apply the low/reverse clutch. ON/OFF SSE directs pressure to the clutch control bypass valve to position the valve to direct regulated line pressure from the low reverse/456 regulator valve to the low/reverse clutch. As vehicle speed increases above 8 km/h (5 mph) in 1st gear, SSD removes pressure from the low reverse/456 regulator and latch valves and SSE removes pressure from the clutch control bypass valve to release the low/reverse clutch.



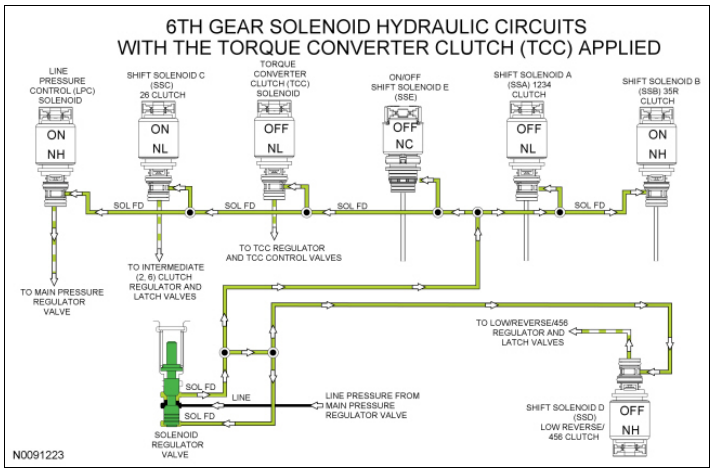


In 2nd gear, the forward (1, 2, 3, 4) clutch remains applied. SSC applies varying pressure to the 26 regulator and latch valves through the VBS CB26 hydraulic circuit to apply the intermediate (2, 6) clutch.

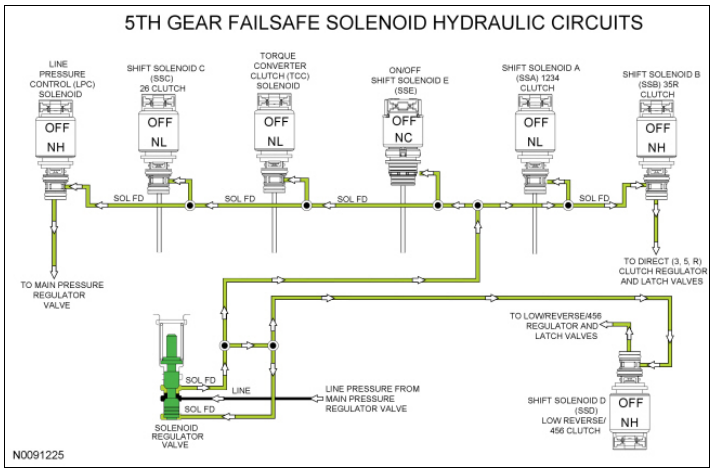


In 3rd gear, the forward (1, 2, 3, 4) clutch remains applied. SSC releases pressure to the 26 regulator and latch valves to release the intermediate (2, 6) clutch. SSB directs pressure to the 35R regulator and latch valves through the VBS CB26 hydraulic circuit to apply the direct (3, 5, R) clutch.

In 4th gear, the forward (1, 2, 3, 4) clutch remains applied. SSB releases pressure to the 35R regulator and latch valves. SSD directs pressure to the low reverse/456 regulator and latch valves through the VBS CBR1/456 hydraulic circuit. With SSE released, the clutch control bypass valve directs the regulated line pressure from the low reverse/456 regulator valve to the Overdrive (O/D) (4, 5, 6) clutch to apply the clutch.

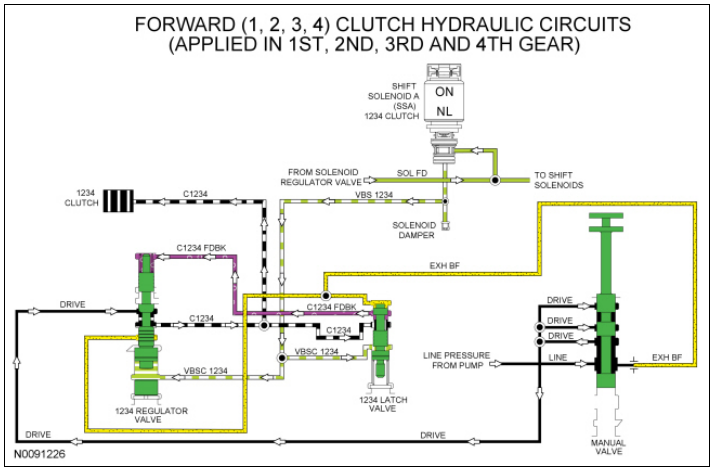


In 5th gear, the O/D (4, 5, 6) clutch remains applied. SSA releases pressure to the 1234 regulator and latch valves to release the forward (1, 2, 3, 4) clutch. SSB directs pressure to the 35R regulator and latch valves through the VBS C35R hydraulic circuit to apply the direct (3, 5, R) clutch.



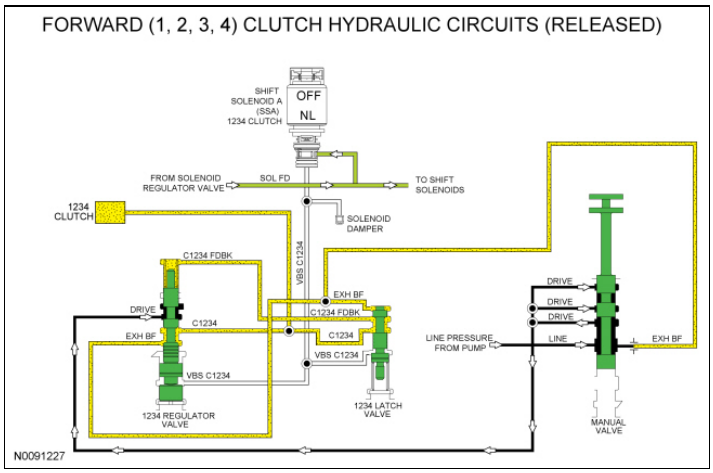
In 6th gear, the O/D (4, 5, 6) clutch remains applied. SSB releases pressure to the 35R regulator and latch valves. SSC applies varying pressure to the 26 clutch regulator and latch valves through the VBS CB26 hydraulic circuit to apply the intermediate (2, 6) clutch.

The TCC can be applied in 4th, 5th or 6th gear. To apply the TCC , the TCC solenoid applies pressure to the TCC regulator valve and the TCC control valve to position the valves to apply the clutch.



During a mechanical, hydraulic or electrical failure with the manual lever in the DRIVE position, the transaxle defaults to 5th gear. When the transaxle is in 5th gear failsafe, the PCM does not control the shift solenoids and they default to their normal state (maximum pressure, minimum pressure, on or off). The LPC solenoid defaults to maximum pressure, SSA defaults to minimum pressure, SSB defaults to maximum pressure, SSC defaults to minimum pressure, SSD defaults to maximum pressure and the TCC solenoid defaults to minimum pressure.

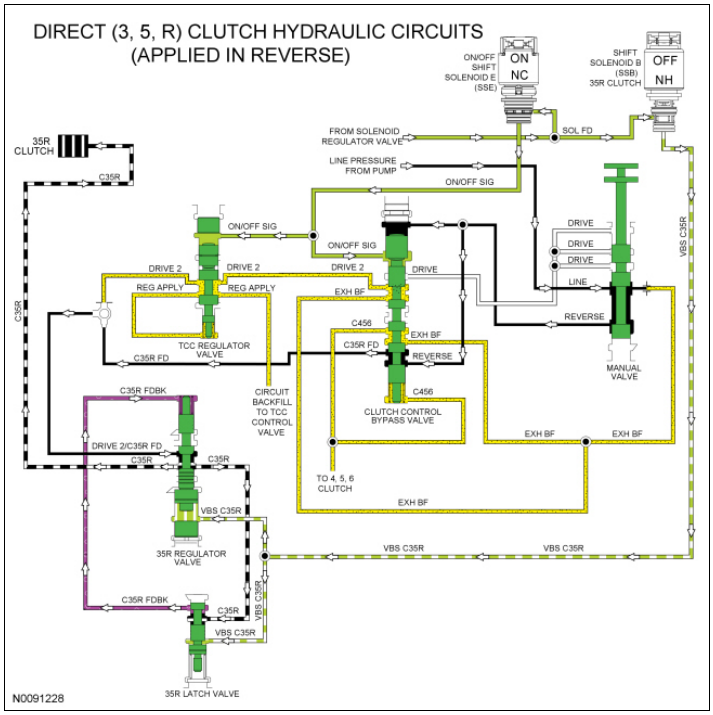
With SSB applying maximum pressure to the direct (3, 5, R) regulator and latch valves, the direct (3, 5, R) clutch is applied. With SSD applying maximum pressure to the low reverse/456 regulator and latch valves with SSE in the OFF position, the O/D (4, 5, 6) clutch is applied, providing 5th gear.



Forward (1, 2, 3, 4) Clutch Hydraulic Circuits

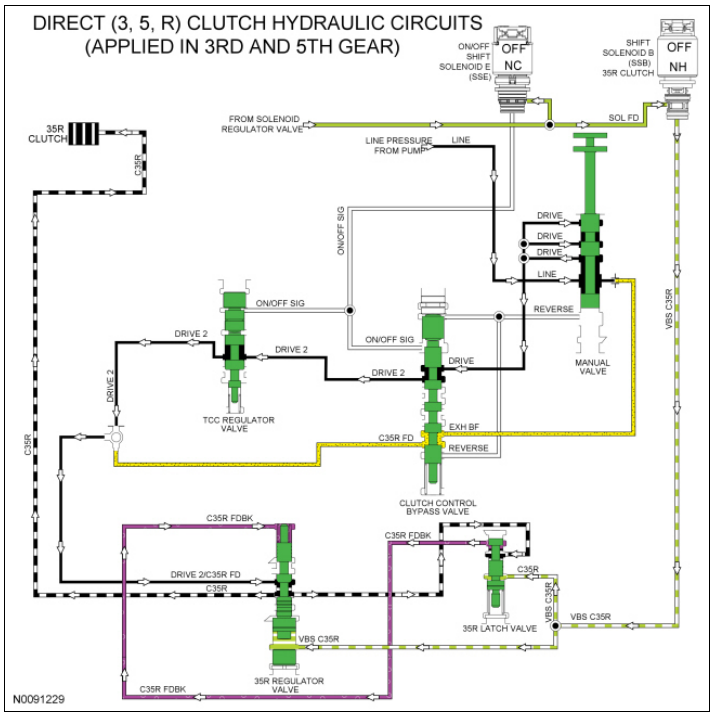
Line pressure is supplied to the 1234 regulator valve by the manual valve in the DRIVE and LOW position. To apply the forward (1, 2, 3, 4) clutch, SSA supplies varying solenoid pressure to the 1234 regulator and latch valves. As the regulator valve moves, it supplies the forward (1, 2, 3, 4) clutch and 1234 latch valve with regulated line pressure through the C1234 circuit. The 1234 latch valve directs the regulated line pressure to the opposite side of the 1234 regulator valve through the C1234 FDBK circuit for gradual forward (1, 2, 3, 4) clutch engagement. The forward (1, 2, 3, 4) clutch is applied in 1st, 2nd, 3rd and 4th gears and manual LOW position.

When the forward (1, 2, 3, 4) clutch is released in 5th and 6th gears, solenoid pressure from SSA is removed from the 1234 regulator and latch valves which positions the valves to block line pressure and release the forward (1, 2, 3, 4) clutch. When the forward (1, 2, 3, 4) clutch is released in the PARK, REVERSE or NEUTRAL position, line pressure is not supplied to the forward (1, 2, 3, 4) regulator valve.



In the released position, exhaust backfill supplied to the 1234 regulator and latch valves by the manual valve through the EXH BF circuit is directed to the forward (1, 2, 3, 4) clutch to fill the unused circuits with unpressurized transmission fluid.

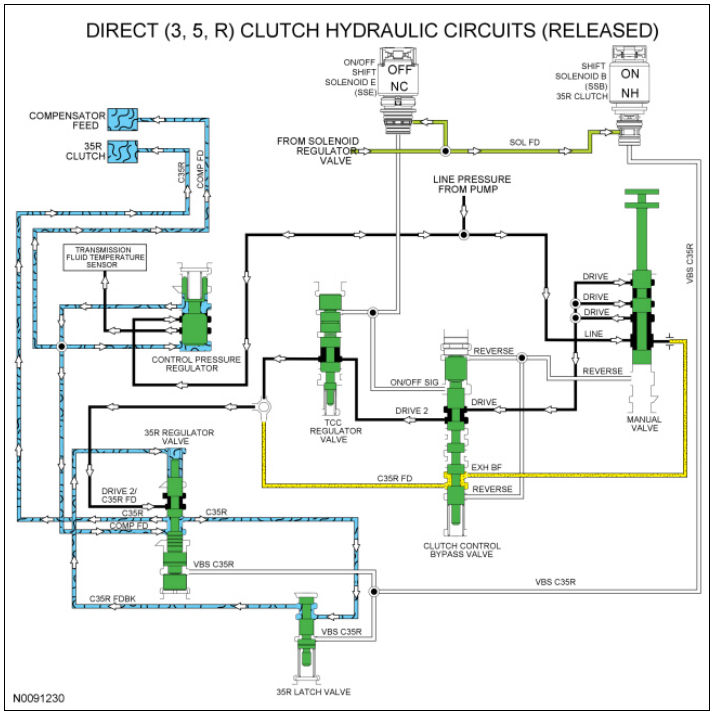
Direct (3, 5, R) Clutch Hydraulic Circuits



When the direct (3, 5, R) clutch is applied in the REVERSE position, line pressure from the manual valve is directed to the clutch control bypass valve through the REVERSE circuit. Line pressure in the REVERSE circuit positions the clutch control bypass valve and supplies line pressure to apply the direct (3, 5, R) clutch. Line pressure from the clutch control bypass valve is supplied to the 35R regulator valve through the C35R FD circuit, DRIVE 2/C35R FD shuttle ball and DRIVE 2/C35R FD circuit.

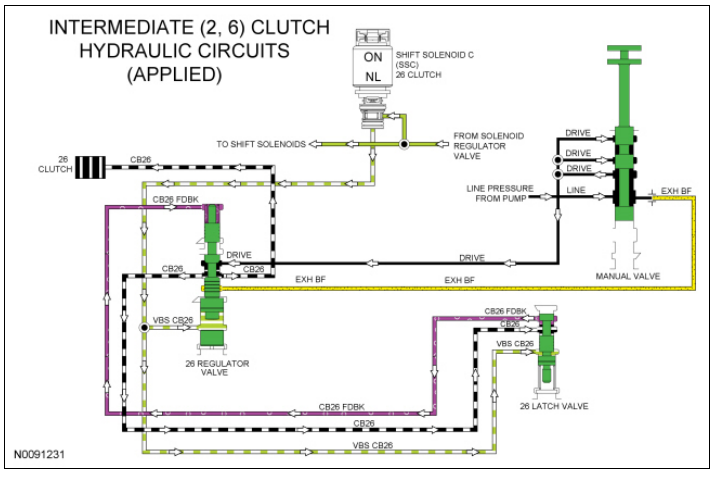
To apply the direct (3, 5, R) clutch, SSB applies varying solenoid pressure to the 35R regulator and latch valves. As the regulator valve moves, it supplies the direct (3, 5, R) clutch and 35R latch valve with regulated line pressure through the C35R circuit. The 35R latch valve directs the regulated line pressure to the opposite side of the 35R regulator valve through the C35R FDBK circuit for gradual direct (3, 5, R) clutch engagement.

When the direct (3, 5, R) clutch is applied in 3rd and 5th gear, line pressure from the pump is directed to the clutch control bypass valve by the manual valve through the DRIVE hydraulic circuit. The clutch control bypass valve directs the pressure to the 35R regulator valve through the TCC regulator valve, DRIVE 2 circuit, DRIVE 2/C35R FD shuttle ball and DRIVE 2/C35R FD circuit.



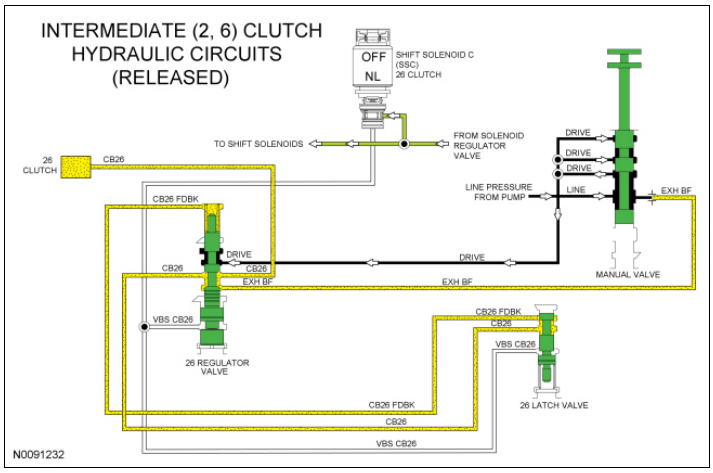
To apply the direct (3, 5, R) clutch, SSB applies varying solenoid pressure to the 35R regulator and latch valves. As the 35R regulator valve moves, it supplies the direct (3, 5, R) clutch and 35R latch valve with regulated line pressure through the C35R circuit. The 35R latch valve directs the regulated line pressure to the opposite side of the regulator valve through the C35R FDBK circuit for gradual direct (3, 5, R) clutch engagement.

When the direct (3, 5, R) clutch is released, solenoid pressure from SSB is removed from the 35R regulator



and latch valves which positions the valves to block line pressure and release the direct (3, 5, R) clutch. When the direct (3, 5, R) clutch is released in the PARK or NEUTRAL position, line pressure is not supplied to the 35R regulator valve.

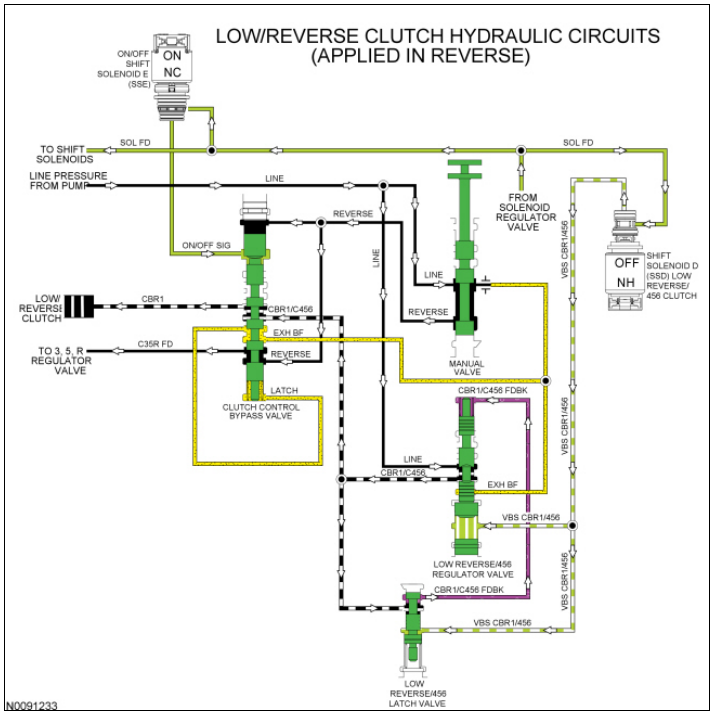
Compensator feed pressure is supplied to the 35R regulator valve from the control pressure regulator through the COMP FD circuit and is supplied to the opposite side of the direct (3, 5, R) and O/D (4, 5, 6) clutch pistons to keep the clutches from centrifugally applying. COMP FD pressure is only about 83 kPa (12 psi) and is applied through all gears. When the direct (3, 5, R) clutch is released, COMP FD is applied by the 35R regulator valve to the direct (3, 5, R) clutch to fill the unused circuits.



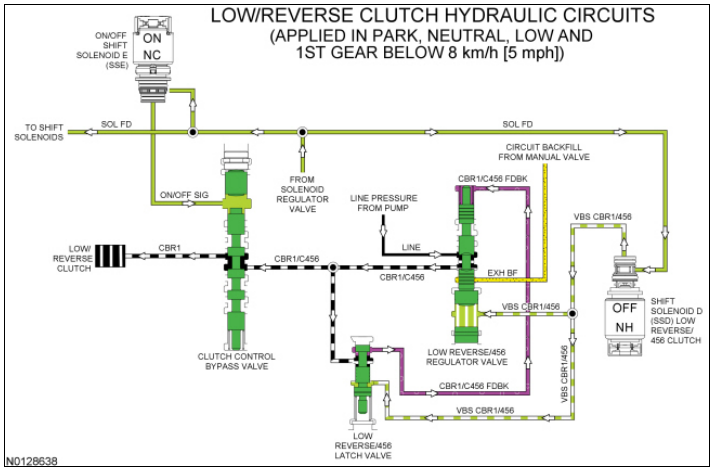
Intermediate (2, 6) Clutch Hydraulic Circuits

Line pressure is supplied to the 26 regulator valve by the manual valve in the DRIVE and LOW positions. To apply the intermediate (2, 6) clutch, SSC supplies varying solenoid pressure to the 26 regulator and latch valves. As the 26 regulator valve moves, it supplies the intermediate (2, 6) clutch and 26 latch valve with regulated line pressure through the CB26 circuit. The 26 latch valve directs the regulated line pressure to the opposite side of the 26 regulator valve through the CB26 FDBK circuit for gradual intermediate (2, 6) clutch engagement. The intermediate (2, 6) clutch is applied in 2nd and 6th gears.

When the intermediate (2, 6) clutch is released in 1st, 3rd, 4th and 5th gears and manual LOW position, solenoid pressure from SSC is removed from the 26 regulator and latch valves which positions the valves to block line pressure and release the intermediate (2, 6) clutch. When the intermediate (2, 6) clutch is released in the PARK, REVERSE or NEUTRAL position, line pressure is not supplied to the 26 regulator valve.



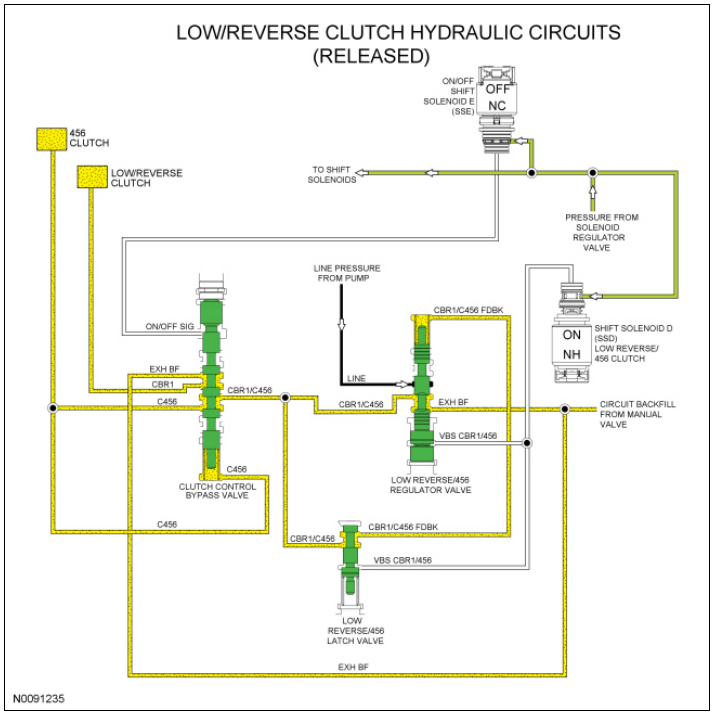
In the released position, exhaust backfill supplied to the 26 clutch regulator valve by the manual valve through the EXH BF circuit is directed to the intermediate (2, 6) clutch and 26 latch valve to fill the unused circuits with unpressurized transmission fluid.



Low/Reverse Clutch Hydraulic Circuits

Line pressure is supplied to the low reverse/456 regulator valve by the pump in every gear and manual lever position. To apply the low/reverse clutch, SSD supplies varying solenoid pressure to the low reverse/456 regulator and latch valves. As the low reverse/456 regulator valve moves, it supplies the clutch control bypass valve and low reverse/456 latch valve with regulated line pressure through the CBR1/C456 circuit. The low reverse/456 latch valve directs the regulated line pressure to the opposite side of the 456 regulator valve through the CBR1/C456 FDBK circuit for gradual low reverse/456 clutch engagement. The low/reverse clutch is applied in PARK, REVERSE, NEUTRAL, 1st gear below 8 km/h (5 mph) and manual LOW position.

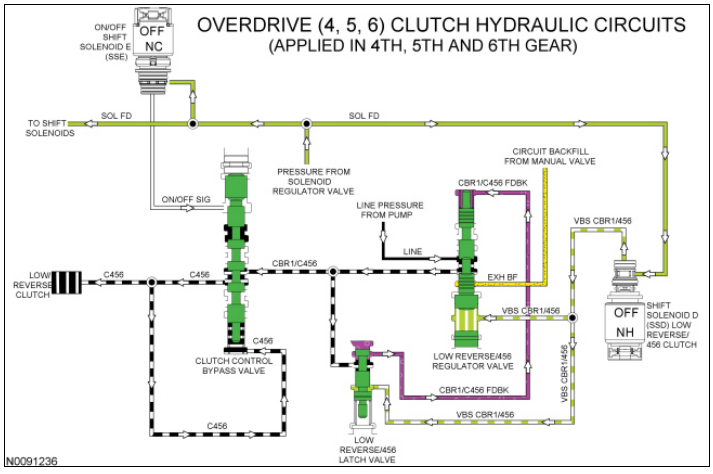
In REVERSE, both solenoid pressure from ON/OFF SSE and line pressure from the manual valve in the REVERSE circuit apply pressure to the clutch control bypass valve to position it for low/reverse clutch application. Regulated line pressure from the CBR1/C456 circuit is directed to the low/reverse clutch by the clutch control bypass valve through the CBR1 circuit to apply the low/reverse clutch.



When the low/reverse clutch is applied in PARK, NEUTRAL, LOW or 1st gear below 8 km/h (5 mph), only pressure from ON/OFF SSE , positions the clutch control bypass valve. Line pressure from the REVERSE circuit is not supplied by the manual valve.

When the low/reverse clutch is released in 1st gear above 8 km/h (5 mph), 2nd and 3rd gears, solenoid pressure from SSD is removed from the low reverse/456 regulator and latch valves which positions the valves to block line pressure and release the low/reverse clutch. Solenoid pressure from SSE is removed from the clutch control bypass valve to position it to apply the O/D (4, 5, 6) clutch.

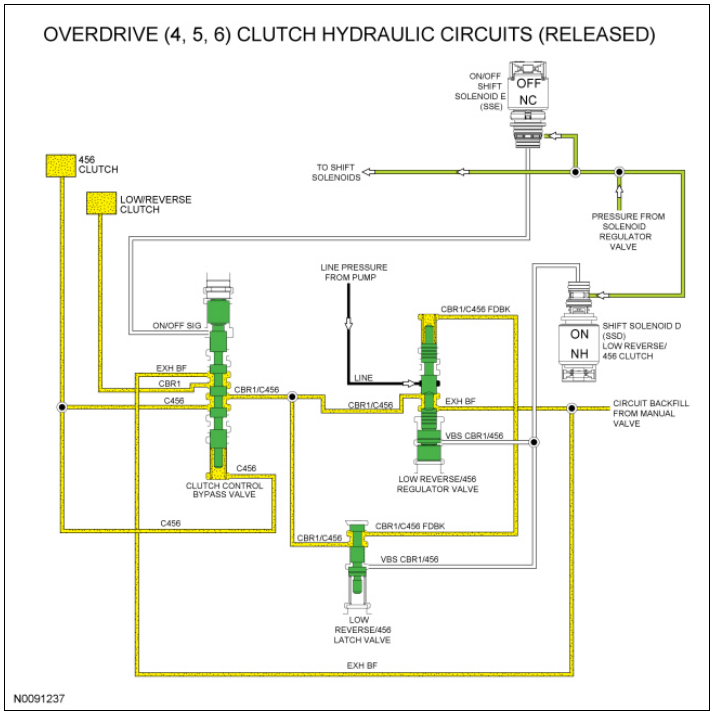
When the low/reverse clutch is released in 1st gear above 8 km/h (5 mph), 2nd and 3rd gears, exhaust backfill supplied to the low reverse/456 clutch regulator valve and the clutch control bypass valve by the manual valve through the EXH BF circuit is directed to the low reverse/456 latch valve, low/reverse clutch and O/D (4, 5, 6) clutch to fill the unused circuits with unpressurized transmission fluid.



When the low/reverse clutch is released in 4th, 5th and 6th gears, the low reverse/456 regulator valve supplies regulated pressure to the clutch control bypass valve through the CBR1/C456 circuit. With ON/OFF SSE in the OFF position, the regulated pressure is directed to the O/D (4, 5, 6) clutch.

Overdrive (4, 5, 6) Clutch Hydraulic Circuits

Line pressure is supplied to the low reverse/456 regulator valve by the pump in every gear and manual lever position. To apply the low/reverse clutch, SSD supplies varying solenoid pressure to the low reverse/456 regulator and latch valves. As the regulator valve moves, it supplies the clutch control bypass valve and low reverse/456 latch valve with regulated line pressure through the CBR1/C456 circuit. The low reverse/456 latch valve directs the regulated line pressure to the opposite side of the low reverse/456 regulator valve through the CBR1/C456 FDBK circuit for gradual O/D (4, 5, 6) clutch engagement.



To apply the O/D (4, 5, 6) clutch, the position of the clutch control bypass valve allows the regulated line pressure in the CBR1/C456 circuit to supply the C456 circuit, applying the O/D (4, 5, 6) clutch. Clutch control bypass valve latch pressure is supplied by the C456 circuit. The O/D (4, 5, 6) clutch is applied in 4th, 5th and 6th gears.

When the O/D (4, 5, 6) clutch is released in 1st gear above 8 km/h (5 mph), 2nd and 3rd gears, solenoid pressure from SSD is removed from the low reverse/456 regulator and latch valves which positions the valves to block line pressure and release the O/D (4, 5, 6) clutch.

When the O/D (4, 5, 6) clutch is released in 1st gear above 8 km/h (5 mph), 2nd and 3rd gears, exhaust backfill supplied to the low reverse/456 clutch regulator valve and the clutch control bypass valve by the manual valve through the EXH BF circuit is directed to the low reverses latch valve, low/reverse clutch and O/D (4, 5, 6) clutch to fill the unused circuits with unpressurized transmission fluid.

When the O/D (4, 5, 6) clutch is released in PARK, REVERSE, NEUTRAL and 1st gear below 8 km/h (5 mph), the low reverse/456 regulator valve supplies regulated pressure to the clutch control bypass valve through the CBR1/C456 circuit. With ON/OFF SSE in the ON position, the regulated pressure is directed to the low/reverse clutch.

Transaxle Electronic Control System

Electronic System Description

The PCM and its input/output network control the following operations:

- Shift timing
- Line pressure (shift feel)
- Torque Converter Clutch (TCC)

The transaxle control is separate from the engine control strategy in the PCM, although some of the input signals are shared. When determining the best operating strategy for transaxle operation, the PCM uses input information from certain engine-related and driver-demand related sensors and switches.

In addition, the PCM receives input signals from certain transaxle-related sensors and switches. The PCM also uses these signals when determining transaxle operating strategy.

Using all of these input signals, the PCM can determine when the time and conditions are right for a shift, or when to apply or release the TCC . It will also determine the best line pressure needed to optimihift engagement feel. To accomplish this, the PCM uses output solenoids to control transaxle operation.

The following provides a brief description of each of the sensors and actuators used to control transaxle operation.

Electronic Ignition (EI)

The Electronic Ignition (EI) system consists of the PCM, a Crankshaft Position (CKP) sensor and ignition coils. The CKP sensor sends a crankshaft position signal to the PCM. The PCM then sends the appropriate ignition signal to the ignition coils. The PCM also uses this signal as well as Wide Open Throttle (WOT) shift control, TCC control and electronic pressure control.

Accelerator Pedal Position (APP)

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal. The APP detects the position of the accelerator pedal and inputs this information as a voltage to the PCM. The PCM uses APP sensor information to aid in determining line pressure, shift scheduling and TCC operation. Failure of this sensor will cause the transmission to operate at higher line pressure to avoid damage to the transmission. This higher line pressure causes harsh upshifts and harsh engagements.

Throttle Position (TP) Sensor

The Throttle Position (TP) sensor is a potentiometer mounted on the Throttle Body (TB). The TP sensor detects the position of the throttle plate and sends this information to the processor assembly as varying voltage signal.

The PCM uses the monitored voltage level of the TP sensor for control of Line Pressure Control (LPC), TCC operation and shift scheduling.

If a malfunction occurs in the TP sensor circuit, the processor will recognize that the TP sensor signal is out of specification. The processor will then operate the transaxle in a high capacity mode to prevent transaxle damage.

PCM

The PCM controls operation of the transaxle. Many input sensors provide information to the PCM. The PCM then controls the actuators which affect transaxle operation.

Transmission Range (TR) Sensor Assembly

The Transmission Range (TR) sensor assembly is an internally mounted sensor that includes the detent bracket and is located above the main control assembly. The components of the TR sensor are factory adjusted and is installed as a calibrated assembly. The TR sensor contains electronic circuitry that provides the PCM a fixed frequency duty cycle for each of the various positions of the manual lever (PARK, REVERSE, NEUTRAL, DRIVE and LOW to the PCM). The PCM uses the TR sensor signal for engine start, reverse lamps, LPC , shift scheduling and TCC operation.

Brake Pedal Position (BPP) Switch

The Brake Pedal Position (BPP) switch tells the PCM when the brakes are applied. The BPP switch closes when the brakes are applied and opens when they are released. The BPP signal is used for the brake shift interlock actuation.

Turbine Shaft Speed (TSS) Sensor

This Turbine Shaft Speed (TSS) sensor is a Hall-effect pickup that sends a signal to the PCM that indicates transaxle turbine shaft input speed. The TSS sensor provides converter turbine speed information for TCC strategy. Also used in determining static LPC pressure settings.

Output Shaft Speed (OSS) Sensor

The Output Shaft Speed (OSS) sensor is a Hall-effect pickup, located on the transfer shaft drive gear, that sends a signal to the PCM to indicate transmission output speed. The OSS is used for TCC control and shift scheduling.

Solenoid Body

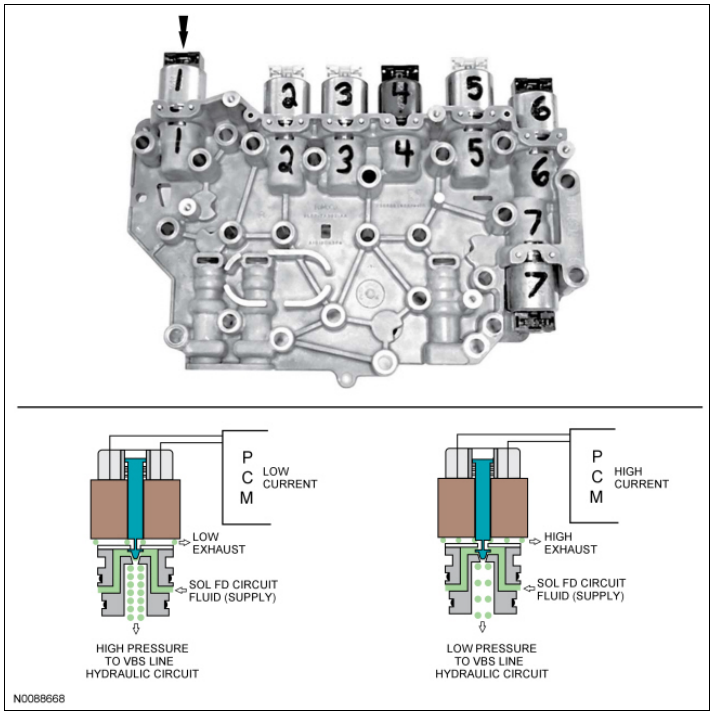
NOTICE: **If the solenoid body identification and strategy does not match the solenoid body information in the Powertrain Control Module (PCM), transaxle damage or driveability concerns can occur.**

The solenoid body contains 7 solenoids, 5 shift solenoids (Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC), Shift Solenoid D (SSD) and Shift Solenoid E (SSE)), TCC solenoid and LPC solenoid. The Transmission Fluid Temperature (TFT) is also located in the solenoid body. The solenoid body is serviced as an assembly.

The solenoid body has a unique strategy data file that must be downloaded to the PCM. There is a 7-digit solenoid body identification and a 13-digit solenoid body strategy for each solenoid body. Any time a new solenoid body is installed or a new transaxle is installed, the scan tool must be used to get the solenoid body strategy data file and download it into the PCM.

If the PCM is replaced, the solenoid body identification and solenoid body strategy must be downloaded into the PCM.

Line Pressure Control (LPC) Solenoid



The LPC solenoid is a Variable Force Solenoid (VFS) that varies hydraulic pressure by actuating a hydraulic valve.

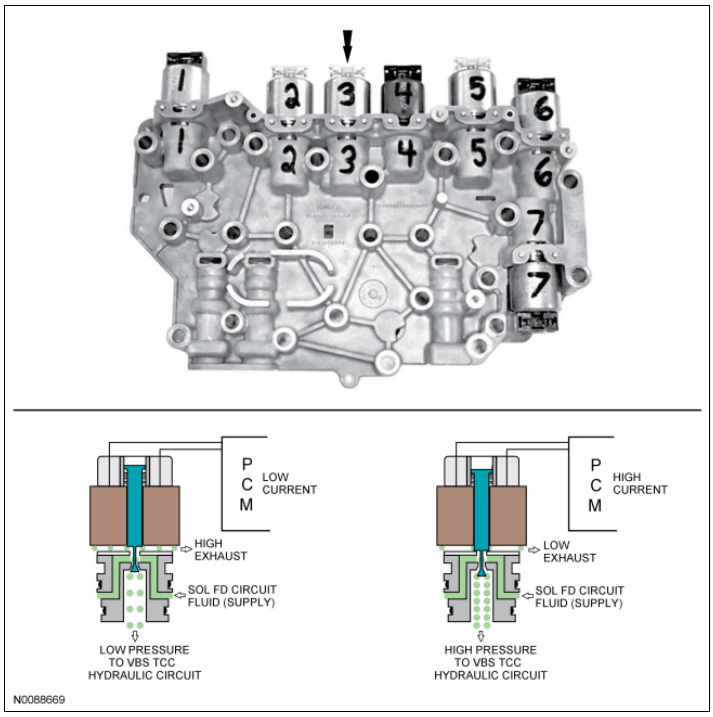
The PCM applies variable current to the LPC solenoid which varies pressure in the VBS LINE hydraulic circuit to the main pressure regulator valve. Refer to Hydraulic Circuits for additional information.

The LPC solenoid uses inversely proportional operation. As the current from the PCM decreases, the pressure from the solenoid increases. As the current from the PCM increases, the pressure from the solenoid decreases. The LPC solenoid is supplied hydraulic pressure from the SOL FD circuit.

With zero current, the LPC solenoid fully opens the hydraulic valve which applies the maximum amount of hydraulic pressure to the Main Pressure Regulator Valve through the VBS LINE hydraulic circuit and applies maximum line pressure in the LINE hydraulic circuit. With maximum current to the solenoid, the hydraulic valve fully closes the outlet port for minimum pressure to the VBS LINE hydraulic circuit to lower the line pressure in the LINE hydraulic circuit.

Line Pressure Control (LPC) Inversely Proportional Variable Force Solenoid (VFS)

Torque Converter Clutch (TCC) Solenoid



The TCC solenoid is a VFS that varies hydraulic pressure by actuating a hydraulic valve.

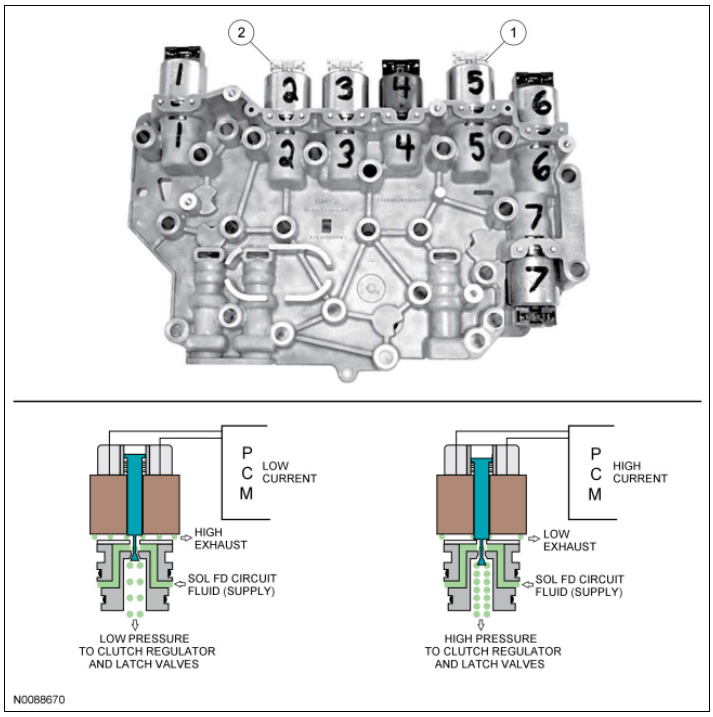
The PCM applies variable current to the TCC solenoid which varies pressure in the VBS TCC hydraulic circuit to the TCC regulator valve and the TCC control valve. Refer to Hydraulic Circuits for additional information.

The TCC solenoid uses proportional operation. As the current from the PCM decreases, the pressure from the solenoid decreases. As the current from the PCM increases, the pressure from the solenoid increases. The TCC solenoid is supplied hydraulic pressure from the SOL FD circuit.

With zero current, the TCC solenoid fully closes the hydraulic valve which applies the minimum amount of hydraulic pressure to the TCC regulator valve through the VBS TCC hydraulic circuit and releases the TCC . With maximum current to the solenoid, the hydraulic valve fully opens the outlet port for maximum pressure to the VBS TCC hydraulic circuit to apply the TCC .

Torque Converter Clutch (TCC) Proportional Variable Force Solenoid (VFS)

Shift Solenoid A (SSA), Shift Solenoid B (SSB), Shift Solenoid C (SSC) and Shift Solenoid D (SSD)



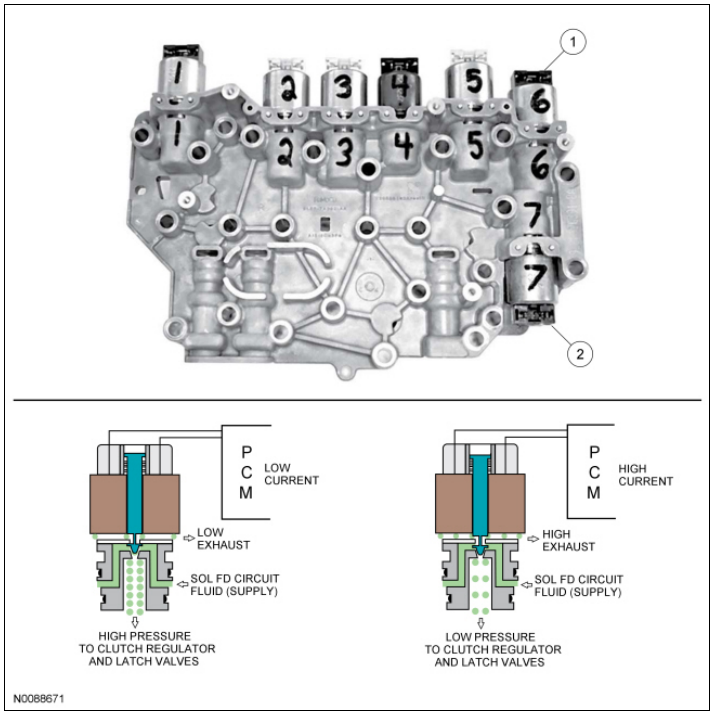
Shift solenoids A-D are variable force type solenoids that vary hydraulic pressure by actuating a hydraulic valve.

The PCM applies variable current to the shift solenoids which varies pressure in the hydraulic circuit to the regulator and latch valves of the clutch that it controls. Refer to Hydraulic Circuits for additional information.

SSA and SSC use proportional operation. As the current from the PCM decreases, the pressure from the solenoid decreases. As the current from the PCM increases, the pressure from the solenoid increases. SSA and SSC are supplied hydraulic pressure from the SOL FD circuit.

With zero current, SSA and SSC fully close the hydraulic valves which applies zero amount of hydraulic pressure to the clutch regulator and latch valves of the clutch that it controls and releases the clutch. With maximum current to the solenoids, the hydraulic valves are fully open for maximum pressure to the clutch regulator and latch valves to apply the clutch.

Shift Solenoid A (SSA) and Shift Solenoid C (SSC) Proportional Variable Force Type Solenoids

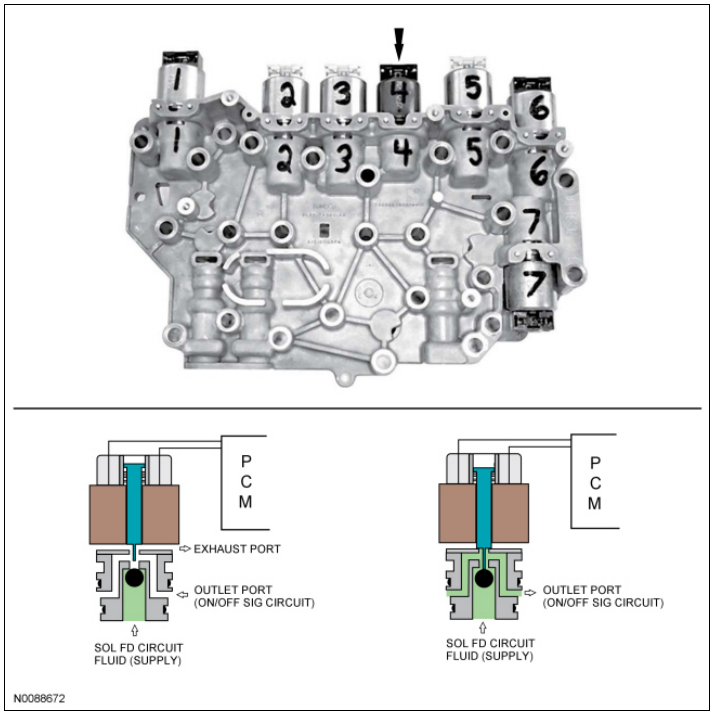


Item	Part Number	Description
1	7G136	Shift Solenoid A (SSA) Variable Force Solenoid (VFS)
2	7G136	Shift Solenoid C (SSC) VFS

SSB and SSD use inversely proportional operation. As the current from the PCM decreases, the pressure from the solenoid increases. As the current from the PCM increases, the pressure from the solenoid decreases. SSB and SSD are supplied hydraulic pressure from the SOL FD circuit.

With zero current, SSB and SSD fully open the hydraulic valves which applies maximum hydraulic pressure to the clutch regulator and latch valves to apply the clutch that it controls. With maximum current to the solenoids, the hydraulic valve is fully closed to apply zero amount of hydraulic pressure to the clutch regulator and latch valves of the clutch that it controls and releases the clutch.

Shift Solenoid B (SSB) and Shift Solenoid D (SSD) Inverse Proportional Variable Force Type Solenoids



Item	Part Number	Description
1	7G383	Shift Solenoid B (SSB) Variable Force Solenoid (VFS)
2	7G383	Shift Solenoid D (SSD) VFS

Shift Solenoid E (SSE)

SSE is an ON/OFF solenoid. When SSE is in the ON position, SSD controls the clutch regulator and latch valves to apply the low/reverse clutch. When SSE is in the OFF position, SSD controls the clutch regulator and latch valves to apply the overdrive (4, 5, 6) clutch. Refer to Hydraulic Circuits for additional information.

SSE is supplied hydraulic pressure from the SOL FD circuit. When SSE is OFF, the solenoid supply is blocked and the outlet port (ON/OFF SIG circuit) is connected to the exhaust port. When SSE is ON, the exhaust port is blocked and the solenoid supply is connected to the outlet port (ON/OFF SIG circuit), supplying pressure to the clutch control bypass valve.

Transaxle Operation

Transaxle Operation Overview

Torque Converter

This transaxle uses a torque converter with the following elements:

- Impeller
- Turbine
- Reactor
- Torque Converter Clutch (TCC)

For component information, refer to Torque Converter in this section.

Planetary Gearsets

Operation of this transaxle involves the use of the following planetary gearsets:

- Front
- Center
- Rear

Apply Clutches

This transaxle uses the following clutches to operate the 3 planetary gearsets:

- Forward (1, 2, 3, 4) clutch
- Low/reverse clutch
- Low One-Way ClutOWC)
- Direct (3, 5, R) clutch
- Intermediate (2, 6) clutch
- Overdrive (O/D) (4, 5, 6) clutch

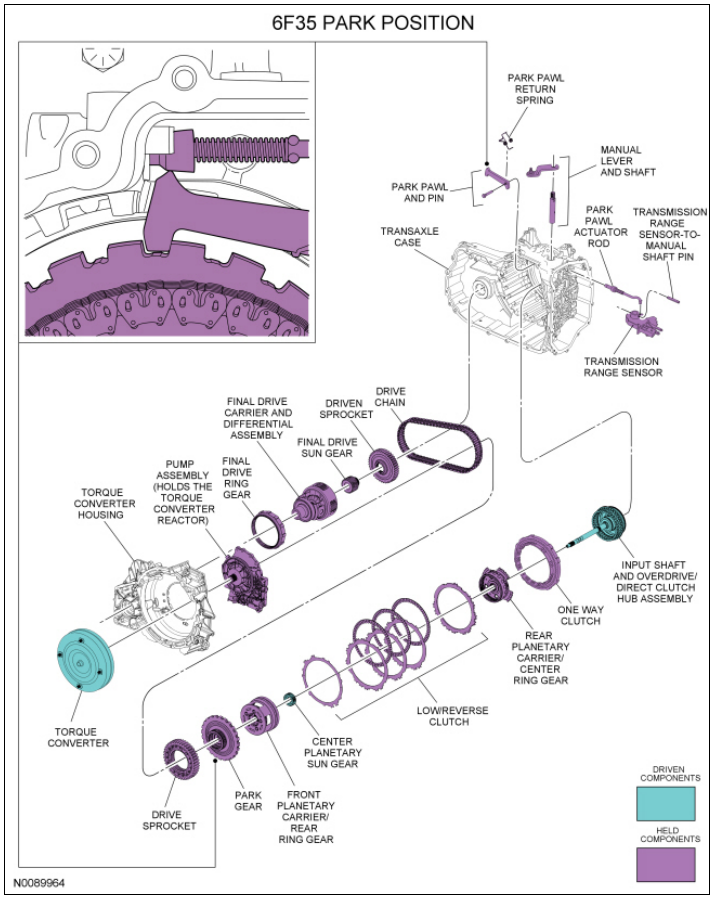
For additional information about planetary gearsets or the apply clutches, refer to Mechanical Components and Functions in this section.

Hydraulic System

The hydraulic system of this transaxle consists of the following components:

- Transmission fluid pump with filter
- Transmission fluid filler tube with transmission fluid level indicator
- Main control assembly (valve body and solenoid body)

For component information, refer to Hydraulic System in this section.



Electronic Operation

The PCM controls the operation of the transaxle with the following solenoids:

- Line Pressure Control (LPC) solenoid
- Shift Solenoid A (SSA)
- Shift Solenoid B (SSB)
- Shift Solenoid C (SSC)
- Shift Solenoid D (SSD)
- Shift Solenoid E (SSE)
- TCC solenoid

For solenoid information, refer to Transaxle Electronic Control System in this section.

Park Position

Mechanical Operation

Apply components:

- Park pawl engaged, holding the final drive assembly stationary
- Low/reverse clutch applied

Planetary Gearset Operation

Front planetary gearset driven components:

- None

Center planetary gearset driven components:

- Sun gear

Rear planetary gearset driven components:

- None

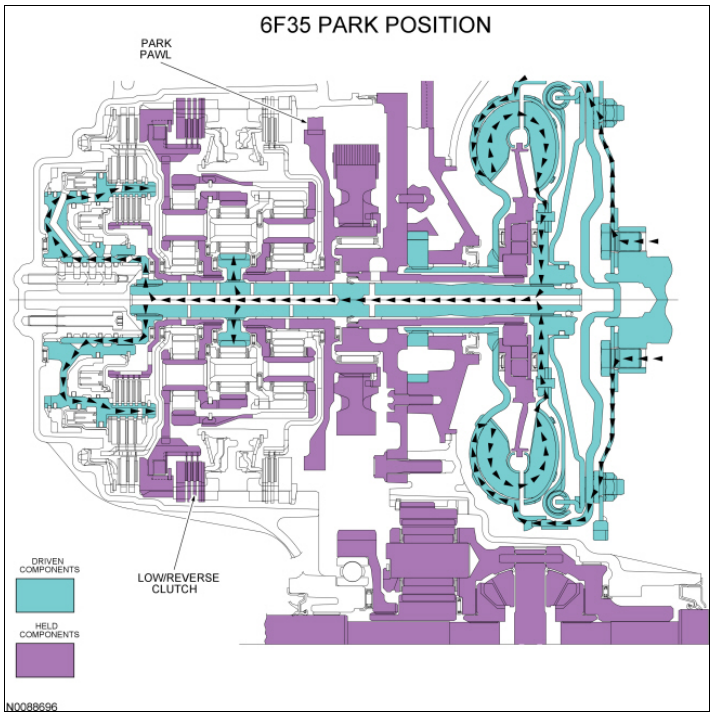
Front planetary gearset held components:

- Planetary carrier assembly (splined to final drive assembly, held stationary by park pawl)

Center planetary gearset held components:

- Center ring gear (splined to rear planetary carrier)

Rear planetary gearset held components:



- Planetary carrier
- Rear ring gear (splined to front carrier)

Park Position Clutch Application Chart

PARK				X		

For component information, refer to Mechanical Components and Functions in this section.

Park Position Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSD applies pressure to the low reverse/456 regulator and latch valves to apply the low/reverse clutch.
- SSE applies pressure to the clutch control bypass valve to position the valve to direct regulated line pressure in the CBR1/C456 circuit to the low/reverse clutch.

Clutch hydraulic circuits:

- Line pressure from the pump is supplied to the low reverse/456 regulator valve. To apply the low/reverse clutch, SSD supplies varying solenoid pressure to the low reverse/456 regulator and latch valves. As the low reverse/456 regulator valve moves, it supplies the clutch control bypass valve and low reverse/456 latch valve with regulated line pressure through the CBR1/C456 circuit. The latch valve directs the regulated line pressure to the opposite side of the regulator valve through the CBR1/C456 FDBK circuit for gradual low/reverse clutch engagement.
- Regulated line pressure at the clutch control bypass valve in the CBR1/C456 circuit is directed to the low/reverse clutch through the CBR1 circuit to apply the clutch.

For additional hydraulic circuit information, refer to Hydraulic Circuits in this section.

Reverse Position Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSB applies pressure to the 35R regulator and latch valves to apply the direct (3, 5, R) clutch.
- SSD applies pressure to the low reverse/456 regulator valve to apply the low/reverse clutch.
- SSE applies pressure to the clutch control bypass valve to position the valve to direct regulated line pressure in the CBR1/C456 circuit to the CBR1 circuit to apply the low/reverse clutch.

Clutch hydraulic circuits:

- Line pressure supplied to the manual valve is directed to the clutch control bypass valve through the REVERSE circuit.
- The clutch control bypass valve directs the REVERSE circuit to the 35R regulator valve through the C35R FD circuit, DRIVE 2/C35R FD shuttle ball and DRIVE 2/C35R FD circuit. To apply the direct (3, 5, R) clutch, SSB applies varying solenoid pressure to the 35R regulator and latch valves. As the 35R regulator valve moves, it supplies the direct (3, 5, R) clutch and 35R latch valve with regulated line pressure through the C35R circuit. The 35R latch valve directs the regulated line pressure to the opposite side of the 35R regulator valve through the C35R FDBK circuit for gradual direct (3, 5, R) clutch engagement.
- Line pressure from the pump is supplied to the low reverse/456 regulator valve. To apply the low/reverse clutch, SSD supplies varying solenoid pressure to the low reverse/456 regulator and latch valves. As the regulator valve moves, it supplies the clutch control bypass valve and low reverse/456 latch valve with regulated line pressure through the CBR1/C456 circuit. The low reverse/456 latch valve directs the regulated line pressure to the opposite side of the regulator valve through the CBR1/C456 FDBK circuit for gradual low/reverse clutch engagement.
- Regulated line pressure at the clutch control bypass valve in the CBR1/C456 circuit is directed to the low/reverse clutch through the CBR1 circuit to apply the clutch.

For additional hydraulic circuit information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSA applies pressure to the 1234 regulator and latch valves to apply the forward (1, 2, 3, 4) clutch.
- SSD releases pressure to the low reverse/456 regulator and latch valves to release the low/reverse clutch.
- SSE releases pressure to the clutch control bypass valve to position it so that regulated line pressure supplied in the CBR1/C456 circuit for 4th, 5th and 6th gear will apply the O/D (4, 5, 6) clutch.

Clutch hydraulic circuits:

- SSD removes pressure from the low reverse/456 regulator and latch valves which positions the valves to block line pressure and release the low/reverse clutch. Solenoid pressure from SSE is removed from the clutch control bypass valve to position it to apply the O/D (4, 5, 6) clutch.
- Line pressure is supplied to the 1234 regulator valve by the manual valve in the DRIVE and LOW position. To apply the forward (1, 2, 3, 4) clutch, SSA supplies varying solenoid pressure to the 1234 regulator and latch valves. As the 1234 regulator valve moves, it supplies the forward (1, 2, 3, 4) clutch and 1234 latch valve with regulated line pressure through the C1234 circuit. The 1234 latch valve directs the regulated line pressure to the opposite side of the regulator valve through the C1234 FDBK circuit for gradual forward (1, 2, 3, 4) clutch engagement.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSA applies pressure to the 1234 regulator and latch valves to apply the forward (1, 2, 3, 4) clutch.
- SSC applies pressure to the 26 regulator and latch valves to apply the intermediate (2, 6) clutch.

Clutch hydraulic circuits:

- Line pressure is supplied to the 1234 regulator valve by the manual valve in the DRIVE and LOW position. To apply the forward (1, 2, 3, 4) clutch, SSA supplies varying solenoid pressure to the 1234 regulator and latch valves. As the regulator valve moves, it supplies the forward (1, 2, 3, 4) clutch and 1234 latch valve with regulated line pressure through the C1234 circuit. The 1234 latch valve directs the regulated line pressure to the opposite side of the regulator valve through the C1234 FDBK circuit for gradual forward (1, 2, 3, 4) clutch engagement.
- Line pressure is supplied to the 26 regulator valve by the manual valve in the DRIVE and LOW positions. To apply the intermediate (2, 6) clutch, SSC supplies varying solenoid pressure to the 26 regulator and latch valves. As the 26 regulator valve moves, it supplies the intermediate (2, 6) clutch and 26 latch valve with regulated line pressure through the CB26 circuit. The 26 latch valve directs the regulated line pressure to the opposite side of the 26 regulator valve through the CB26 FDBK circuit for gradual intermediate (2, 6) clutch engagement.

For additional hydraulic circuit and information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSA applies pressure to the 1234 regulator and latch valves to apply the forward (1, 2, 3, 4) clutch.
- SSC releases pressure to the 26 regulator and latch valves to release the intermediate (2, 6) clutch.
- SSB applies pressure to the 35R regulator and latch valves to apply the direct (3, 5, R) clutch.

Clutch hydraulic circuits:

- Line pressure is supplied to the 1234 regulator valve by the manual valve in the DRIVE and LOW position. To apply the forward (1, 2, 3, 4) clutch, SSA supplies varying solenoid pressure to the 1234 regulator and latch valves. As the regulator valve moves, it supplies the forward (1, 2, 3, 4) clutch and latch valve with regulated line pressure through the C1234 circuit. The 1234 latch valve directs the regulated line pressure to the opposite side of the 1234 regulator valve through the C1234 FDBK

circuit for gradual forward (1, 2, 3, 4) clutch engagement.
- Solenoid pressure from SSC is removed from the 26 regulator and latch valves which positions the valves to block line pressure and release the intermediate (2, 6) clutch.
- Line pressure from the pump is directed to the clutch control bypass valve by the manual valve through the DRIVE hydraulic circuit. The clutch control bypass valve directs the pressure to the 35R regulator valve through the TCC regulator valve, DRIVE 2 circuit, DRIVE 2/C35R FD shuttle ball and DRIVE 2/C35R FD circuit. SSB applies varying solenoid pressure to the 35R regulator and latch valves. As the regulator valve moves, it supplies the direct (3, 5, R) clutch and 35R latch valve with regulated line pressure through the C35R circuit. The 35R latch valve directs the regulated line pressure to the opposite side of the 35R regulator valve through the C35R FDBK circuit for gradual direct (3, 5, R) clutch engagement.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE circuit returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSA applies pressure to the 1234 regulator and latch valves to apply the forward (1, 2, 3, 4) clutch.
- SSB releases pressure to the 35R clutch regulator and latch valves to release the direct (3, 5, R) clutch.
- SSD applies pressure to the low reverse/456 regulator and latch valves to apply the O/D (4, 5, 6) clutch.

Clutch hydraulic circuits:

- Line pressure is supplied to the 1234 regulator valve by the manual valve in the DRIVE and LOW position. To apply the forward (1, 2, 3, 4) clutch, SSA supplies varying solenoid pressure to the 1234

regulator and latch valves. As the regulator valve moves, it supplies the forward (1, 2, 3, 4) clutch and 1234 latch valve with regulated line pressure through the C1234 circuit. The 1234 latch valve directs the regulated line pressure to the opposite side of the 1234 regulator valve through the C1234 FDBK circuit for gradual forward (1, 2, 3, 4) clutch engagement.

- Solenoid pressure from SSB is removed from the 35R regulator and latch valves which positions the valves to block line pressure and release the direct (3, 5, R) clutch.
- Line pressure from the pump is supplied to the low reverse/456 regulator valve. SSD supplies varying solenoid pressure to the low reverse/456 regulator and latch valves. As the regulator valve moves, it supplies the clutch control bypass valve and low reverse/456 latch valve with regulated line pressure through the CBR1/C456 circuit. The low reverse/456 latch valve directs the regulated line pressure to the opposite side of the low reverse/456 regulator valve through the CBR1/C456 FDBK circuit for gradual clutch engagement.
- Regulated line pressure at the clutch control bypass valve in the CBR1/C456 circuit is directed to the O/D (4, 5, 6) clutch through the C456 circuit to apply the clutch.
- Regulated line pressure in the C456 also supplies the latch pressure for the clutch control bypass valve.

For additional hydraulic circuit and information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSD applies pressure to the low reverse/456 regulator and latch valves to apply the O/D (4, 5, 6) clutch.
- SSA releases pressure to the 1234 regulator and latch valves to release the forward (1, 2, 3, 4) clutch.
- SSB applies pressure to the 35R regulator and latch valves to apply the direct (3, 5, R) clutch.

Clutch hydraulic circuits:

- Line pressure from the pump is supplied to the low reverse/456 regulator valve. SSD supplies varying solenoid pressure to the low reverse/456 regulator and latch valves. As the regulator valve moves, it supplies the clutch control bypass valve and low reverse/456 latch valve with regulated line pressure through the CBR1/C456 circuit. The low reverse/456 latch valve directs the regulated line pressure to

the opposite side of the regulator valve through the CBR1/C456 FDBK circuit for gradual clutch engagement.
- Regulated line pressure at the clutch control bypass valve in the CBR1/C456 circuit is directed to the O/D (4, 5, 6) clutch through the C456 circuit to apply the clutch.
- Regulated line pressure in the C456 also supplies the latch pressure for the clutch control bypass valve.
- Solenoid pressure from SSA is removed from the 1234 regulator and latch valves which positions the valves to block line pressure and release the forward (1, 2, 3, 4) clutch.
- Line pressure from the pump is directed to the clutch control bypass valve by the manual valve through the DRIVE hydraulic circuit. The clutch control bypass valve directs the pressure to the 35R regulator valve through the TCC regulator valve, DRIVE 2 circuit, DRIVE 2/C35R FD shuttle ball and DRIVE 2/C35R FD circuit. SSB applies varying solenoid pressure to the 35R regulator and latch valves. As the regulator valve moves, it supplies the direct (3, 5, R) clutch and 35R latch valve with regulated line pressure through the C35R circuit. The 35R latch valve directs the regulated line pressure to the opposite side of the 35R regulator valve through the C35R FDBK circuit for gradual direct (3, 5, R) clutch engagement.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- When the torque converter is applied, line pressure from the manual valve is directed to the TCC regulator valve by the clutch control bypass valve through the DRIVE 2 circuit. The TCC solenoid supplies varying solenoid pressure to the TCC regulator valve and the TCC control valve to position the valves to apply the TCC .
- As the TCC regulator valve moves, it supplies the TCC control valve with regulated line pressure through the REG APPLY circuit. The TCC control valve directs the REG APPLY circuit to the TCC APPLY circuit to apply the TCC .
- Pressure from the torque converter returns to the TCC control valve through the TCC RELEASE circuit.

Cooler and lubrication hydraulic circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit. When the TCC is applied, CONV FD pressure supplies the COOLER FD circuit which circulates through the transmission fluid cooler or the thermal bypass valve.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSD applies pressure to the low reverse/456 regulator and latch valves to apply the O/D (4, 5, 6) clutch.
- SSB releases pressure to the 35R regulator and latch valves to release the direct (3, 5, R) clutch.
- SSC applies pressure to the 26 regulator and latch valves to apply the direct (2, 6) clutch.

- The TCC solenoid applies pressure to the TCC control valve and the TCC regulator valve to apply the TCC .

Clutch hydraulic circuits:

- Line pressure from the pump is supplied to the low reverse/456 regulator valve. SSD supplies varying solenoid pressure to the low reverse/456 regulator and latch valves. As the regulator valve moves, it supplies the clutch control bypass valve and low reverse/456 latch valve with regulated line pressure through the CBR1/C456 circuit. The low reverse/456 latch valve directs the regulated line pressure to the opposite side of the low reverse/456 regulator valve through the CBR1/C456 FDBK circuit for gradual clutch engagement.
- Regulated line pressure at the clutch control bypass valve in the CBR1/C456 circuit is directed to the O/D (4, 5, 6) clutch through the C456 circuit to apply the clutch.
- Regulated line pressure in the C456 circuit also supplies the latch pressure for the clutch control bypass valve.
- Solenoid pressure from SSB is removed from the 35R regulator and latch valves which positions the valves to block line pressure and release the direct (3, 5, R) clutch.
- Line pressure is supplied to the 26 regulator valve by the manual valve in the DRIVE and LOW positions. To apply the intermediate (2, 6) clutch, SSC supplies varying solenoid pressure to the 26 regulator and latch valves. As the regulator valve moves, it supplies the intermediate (2, 6) clutch and 26 latch valve with regulated line pressure through the CB26 circuit. The 26 latch valve directs the regulated line pressure to the opposite side of the regulator valve through the CB26 FDBK circuit for gradual intermediate (2, 6) clutch engagement.

For additional hydraulic circuit and information, refer to Hydraulic Circuits in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit.

Torque converter circuits:

- Regulated line pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies varying pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid regulates line pressure by controlling the position of the main pressure regulator valve.
- SSA applies pressure to the 1234 regulator and latch valves to apply the forward (1, 2, 3, 4) clutch.
- SSD applies pressure to the low reverse/456 regulator and latch valves to apply the low/reverse clutch.
- SSE applies pressure to the clutch control bypass valve to position the valve to direct regulated line pressure in the CBR1/C456 circuit to the low/reverse clutch.

Clutch hydraulic circuits:

- Line pressure is supplied to the 1234 regulator valve by the manual valve in the DRIVE and LOW position. To apply the forward (1, 2, 3, 4) clutch, SSA supplies varying solenoid pressure to the 1234 regulator and latch valves. As the 1234 regulator valve moves, it supplies the forward (1, 2, 3, 4)

clutch and 1234 latch valve with regulated line pressure through the C1234 circuit. The latch valve directs the regulated line pressure to the opposite side of the regulator valve through the C1234 FDBK circuit for gradual forward (1, 2, 3, 4) clutch engagement.

- Line pressure from the pump is supplied to the low reverse/456 regulator valve. To apply the low/reverse clutch, SSD supplies varying solenoid pressure to the low reverse/456 regulator and latch valves. As the regulator valve moves, it supplies the clutch control bypass valve and low reverse/456 latch valve with regulated line pressure through the CBR1/C456 circuit. The low reverse/456 latch valve directs the regulated line pressure to the opposite side of the low reverse/456 regulator valve through the CBR1/C456 FDBK circuit for gradual low/reverse clutch engagement.
- Regulated line pressure at the clutch control bypass valve in the CBR1/C456 circuit is directed to the low/reverse clutch through the CBR1 circuit to apply the clutch.

For additional hydraulic circuit and information, refer to Hydraulic Circuits in this section.

5th Gear Failsafe

5th Gear Failsafe Description

When the transaxle has an electrical, hydraulic or mechanical failure, the PCM removes ground (control) from the shift, TCC and LPC solenoids. The uncontrolled solenoids default to their normal states. SSB , SSD and the LPC solenoid are normally high solenoids which means in their normal state, they provide high pressure to the valves they control. This provides only 5th gear with maximum line pressure.

Mechanical Operation

Apply components:

- O/D (4, 5, 6) clutch
- Direct (3, 5, R) clutch

Planetary Gearset Operation

Front planetary gearset driven components:

5th gear	X	X				

For component information, refer to Mechanical Components and Functions in this section.

Power Flow

Hydraulic Operation

Line pressure hydraulic circuits:

- Line pressure from the pump is supplied to the main pressure regulator valve, low reverse/456 regulator valve, manual valve, solenoid regulator valve and control pressure regulator.
- Line pressure is controlled by the position of the main pressure regulator valve.
- The position of the main pressure regulator valve is controlled by varying pressure from the LPC solenoid through the VBS LINE circuit. In 5th gear failsafe, full solenoid pressure is supplied by the LPC solenoid to the main pressure regulator valve for maximum line pressure.

Torque converter circuits:

- Pressure from the main pressure regulator valve is directed to the TCC control valve through the CONV FD hydraulic circuit.
- When the TCC is released, CONV FD pressure is directed to the TCC RELEASE circuit by the TCC control valve. Pressure from the TCC RELEASE circuit releases the TCC .
- Fluid from the TCC RELEASE circuit returns to the TCC control valve through the TCC APPLY circuit.

Cooler and lubrication hydraulic circuits:

- The TCC control valve directs fluid from the TCC APPLY circuit (return circuit from the torque converter when the TCC is released) to the COOLER FD circuit.
- In the COOLER FD circuit, transmission fluid flows through the transmission fluid cooler or the thermal bypass valve to the LUBE circuit in the input shaft to supply lubrication to the transaxle.

Solenoid hydraulic circuits:

- The LPC solenoid applies maximum solenoid output pressure to the main pressure regulator valve through the VBS LINE hydraulic circuit. The LPC solenoid defaults to maximum output to provide maximum line pressure.
- SSD applies maximum solenoid pressure to the low reverse/456 clutch regulator and latch valves to apply the O/D (4, 5, 6) clutch.
- SSB applies maximum solenoid pressure to the 35R clutch regulator and latch valves to apply the direct (3, 5, R) clutch.

Clutch hydraulic circuits:

- Line pressure from the pump is supplied to the low reverse/456 regulator valve. SSD supplies maximum solenoid pressure to the low reverse/456 regulator and latch valves to provide full line

pressure in the CBR1/C456 circuit.
- Maximum line pressure at the clutch control bypass valve in the CBR1/C456 circuit is directed to the O/D (4, 5, 6) clutch through the C456 circuit to apply the clutch.
- Pressure in the C456 also supplies the latch pressure for the clutch control bypass valve.
- Line pressure from the pump is directed to the clutch control bypass valve by the manual valve through the DRIVE hydraulic circuit. The clutch control bypass valve directs the pressure to the 35R regulator valve through the TCC regulator valve, DRIVE 2 circuit, DRIVE 2/C35R FD shuttle ball and DRIVE 2/C35R FD circuit. SSB applies maximum solenoid pressure to the 35R regulator and latch valves to provide full line pressure to the direct (3, 5, R) clutch.

For additional hydraulic circuit and information, refer to Hydraulic Circuits in this section.

Diagnostic Strategy

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take shortcuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- Transmission reference manual
- Powertrain Control/Emissions Diagnosis (PC/ED) manual
- TSBs
- Wiring diagrams manual

These publications provide the information required when diagnosing transmission concerns.

Use the Diagnostic Flow C as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer concern.
- Verify the concern by operating the vehicle.
- Check the fluid levels and condition.
- Check for non-factory add-on items.
- Check selector lever linkage for correct adjustment.
- Check TSB messages regarding the concern.

Diagnostics

- Carry out OBD test procedures, KOEO and KOER self-tests.
- Record all DTCs.
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Clear all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes are obtained, refer to Diagnosis By Symptom for further information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Diagnostic Flow Chart

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Prior to carrying out the flow test, the following items should be checked:

- Know and understand the customer concern.
- Verify the concern by operating the vehicle.
- Check the transmission fluid level and condition.
- Check for non-factory installed items and verify correct installation.
- Check the selector lever linkage adjustments.
- Check TSB messages for vehicle concerns.
- Carry out both KOEO and KOER self-test.
- Record all DTCs.

Diagnostic Flow Chart

Test	Result	Action
1)â Were any DTCs recorded?	Yes	• REPAIR all hard DTCs. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first, then this workshop manual, GO to Step 2.
	No	• REFER to Diagnosis By Symptom , GO to Step 5.
2)â Are any continuous test memory codes present?	Yes	• CLEAR codes and CARRY OUT drive cycle test, GO to Step 3.
	No	• GO to Step 4.
3)â Did the continuous test memory codes reappear?	Yes	• REPAIR all continuous test memory codes. FOLLOW the pinpoint tests. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, then the transmission reference manual, then this workshop manual, GO to Step 4.
	No	• GO to Step 4.
4)â Is the concern repaired?	Yes	• CARRY OUT the final self-test and verify no DTCs are present. CLEAR memory codes.

	No	• REFER to Diagnosis By Symptom , GO to Step 5.
5)â Are there any electrical concerns?	Yes	• INSTALL the scan tool. CARRY OUT static and drive test with the scan tool, GO to Step 6.
	No	• REFER to the hydraulic and mechanical routine to diagnose and repair the concern, GO to Step 7.
6)â Was the transmission concern corrected when the scan tool was installed?	Yes	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, intermittent fault diagnosis section and use the scan tool to diagnose cause of concern in the processor, vehicle harness or external inputs (sensors or switches).
	No	• REFER to the hydraulic and mechanical routine to diagnose the concern, GO to Step 7.
7)â Is the concern repaired?	Yes	• CARRY OUT the final self-test and verify no DTCs are present. CLEAR memory codes.
	No	• Concern should have been repaired. GO back through the Diagnostic Flow Chart and review other components that may have contributed to the concern. CHECK and DIAGNOSE those components. Get assistance from other sources.

Preliminary Inspection

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

The following items must be checked prior to beginning the diagnostic procedures.

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer complaint or condition. Customer contact may be required in order to begin to verify the concern. Understand the conditions as to when the concern occurs. For example:

- Hot or cold vehicle temperature
- Hot or cold ambient temperature
- Vehicle driving conditili>
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to verifying the concern.

Verification of Condition

This section provides information which is used in determining the actual cause of customer concern and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission.

Determine Customer Concern

NOTE: Some transaxle conditions may cause engine concerns. The torque converter not disengaging may stall the engine.

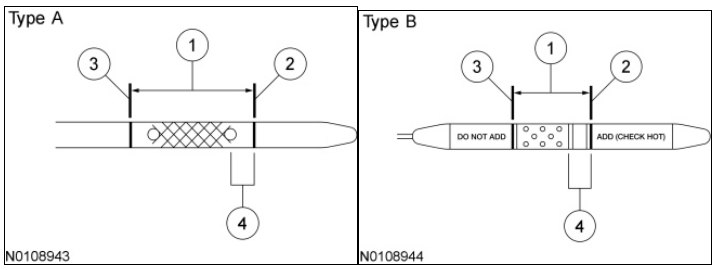
Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift
- Downshift
- Coasting

- Engagement
- Noise/vibration - check for engine rpm , vehicle speed, shift, gear, range or temperature dependencies.

Check Transmission Fluid Level and Condition

NOTICE: **Do not drive the vehicle if the transmission fluid level indicator shows the transmission fluid is below the minimum transmission fluid level mark or internal failure could result.**



If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather or while pulling a trailer, the transmission fluid may need to cool down to obtain an accurate reading.

The transmission fluid level reading on the transmission fluid level indicator will differ depending on operating and ambient temperatures. The correct reading should be within the crosshatch area.

Transmission Fluid Level Check NOTE: Transmission fluid should be checked at normal operating temperature 85°C-93°C (185°F-200°F) on a level surface. Normal operating temperature can be reached after approximately 32 km (20 mi) of driving and can be checked using the scan tool.

Check the transmission fluid level during normal maintenance. If the transaxle starts to slip, shifts slowly or shows signs of leaking, the transmission fluid level should be checked.

1. With the selector lever in PARK, engine at idle, brake pedal applied, move the selector lever through each gear range and allow engagement of each gear. Place the selector lever in the PARK position.
2. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
3. Wipe the transmission fluid level indicator with a clean cloth.
4. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated.
5. Remove the transmission fluid level indicator. The transmission fluid level should be within the crosshatch area.

Item	Description
1	Correct transmission fluid level at operating temperature 85°C-93°C (185°F-200°F)
2	Minimum transmission fluid level mark
3	Maximum transmission fluid level mark
4	Flat tow transmission fluid level

High Transmission Fluid Level

High transmission fluid level may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transaxle malfunction and/or damage. If an overfill reading is indicated, refer to Transmission Fluid Drain and Refill in this section.

Low Transmission Fluid Level

Low transmission fluid level could result in poor transaxle engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transaxle seals or gaskets.

Adding Transmission Fluid

NOTICE: **The use of any type of transmission fluid other than specified could result in transaxle malfunction and/or damage.**

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid filler tube with the selector lever in PARK and the engine idling. Do not overfill the transmission. For transmission fluid type, refer to Material chart in this section.

Flat Tow Fluid Level

Recreati flat towing of the vehicle may require the transmission fluid to be set to a lower fluid level. This will prevent damage to the transmission. The transmission fluid level is within the normal operating range and will not require the transmission fluid level to be readjusted after recreational towing.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Hold the transmission fluid level indicator over a white facial tissue and allow the transmission fluid to drip onto the facial tissue and examine the stain.
3. Observe the color and the odor. Under normal circumstances, the color should be dark red, not brown or black or have a burnt odor.
4. If evidence of solid material is found, remove the transmission fluid pan for further inspection.
5. If the stain is a foamy pink color, this may indicate coolant or water in the transaxle. Inspect the engine cooling system at this time.
6. If transmission fluid contamination or transaxle failure is confirmed by the sediment in the transmission fluid, disassemble and thoroughly clean the transaxle, including the torque converter, cooler bypass valve, coolers and cooler tubes.
7. Carry out diagnostic checks and adjustments, refer to Diagnosis By Symptom in this section.

Water in Transmission Fluid

To correctly repair a transaxle that had water or coolant introduced into the system, completely disassemble, clean and replace the following parts:

- All internal and external seals
- All friction material; clutches

- Torque converter
- All parts with bonded seals
- All solenoids
- All transmission fluid filters

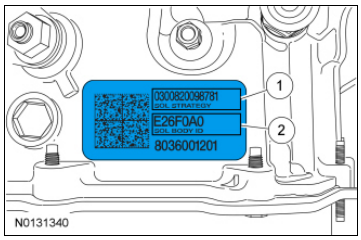
Prior to installing the transaxle, flush and clean the transmission fluid cooler(s), transmission fluid cooler tubes and transmission fluid cooler hoses.

Solenoid Body Strategy

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Solenoid Body Identification Procedure



1. Using the scan tool, select Powertrain, Transmission and Transion Solenoid Body Identification from the toolbox icon and follow the instructions displayed on the scan tool.
   The solenoid body identification screen displays solenoid body identification information:
   - Solenoid body identification 7-digits
   - Solenoid body strategy 13-digits

   The next screen displays the current solenoid body identification and strategy data file stored in the TCM . If the solenoid body strategy field is blank, the module contains a partial transmission solenoid body strategy. This is due to a corrupt or missing file at the time the programmable parameters were completed.

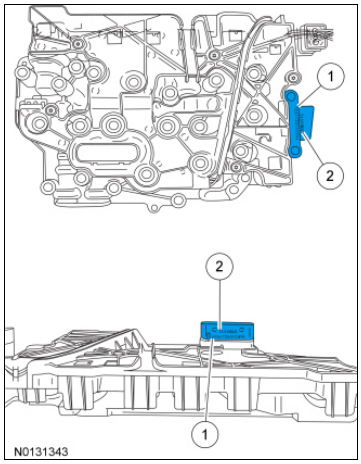
2. **NOTE:** The 13-digit solenoid body strategy number consists of only numbers. Letters are not used.

   Compare the solenoid body identification and strategy (if available) to the solenoid body service tag or the replacement solenoid body tag located on top of the transmission case.

Original Solenoid Body Service Tag

Item	Description
1	13-digit solenoid body strategy
2	7-digit solenoid body identification

Replacement Solenoid Body Service Tag



Item	Description
1	13-digit solenoid body strategy
2	7-digit solenoid body identification

3. If the solenoid body identification and strategy on the scan tool match the solenoid body service tag or replacement tag, then the solenoid body identification and strategy are correct for this transmission and a solenoid body strategy download is not required. If the solenoid body service tag or replacement tag is missing or damaged so that it is not readable or does not match the identification or strategy on the scan tool, remove the solenoid body connector and view the solenoid body identification and strategy printed on the solenoid body connector. If it is not readable, remove the main control cover, refer to Main Control Cover .
   The 7-digit identification number and the 13-digit strategy number are stamped on the solenoid body.

4. ***NOTICE:*** **If the solenoid body information does not match the module information, transmission damage or driveability concerns can occur.**

   Inspect the solenoid body identification and strategy printed on the solenoid body connector and compare this to the solenoid body service tag on the transmission case. If the solenoid body identification and strategy printed on the solenoid body connector does not match the solenoid body service tag or if the solenoid body identification and strategy printed on the solenoid body connector match the solenoid body service tag on the transmission case but do not match the solenoid body identification and strategy numbers displayed on the scan tool, a solenoid body strategy data download is required.

Solenoid Body Identification Tag

Item	Description
1	13-digit solenoid body strategy
2	7-digit solenoid body identification

Solenoid Body Strategy Data Download

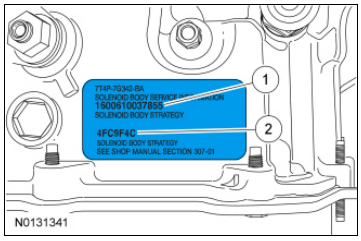
1. Using the scan tool, select Module Programming and Programmable Parameters under the toolbox icon and select transmission. Follow the instructions displayed on the scan tool.
   There are fields to enter the solenoid body 7-digit identification and 13-digit strategy recorded from the solenoid body.

2. ***NOTICE:*** **If the solenoid body information is not correct, transmission damage or driveability concerns can occur.**

   Enter the solenoid body identification and strategy.
   The scan tool will verify the numbers entered are valid and display a message if the information is not valid.
   The scan tool checks to see if the file is present on the scan tool. If the file is present, the technician may proceed with downloading the file to the TCM . If the file is not present, the scan tool will need to be connected to the PTS server to download the file onto the scan tool.

3. Verify the file is present on the scan tool. If the file is present, go to Step 8. If the file is not present, continue with this procedure.

4. Connect the scan tool to the PTS server.
   The screen will display a progress bar when connecting to the network.



5. Follow the instructions on the network to download the strategy file to the scan tool.
   The screen will display a progress bar when downloading the strategy file to the scan tool and display a message if it is downloaded successfully.

6. If the scan tool cannot connect to the PTS server, download the file from www.motorcraft.com.
   If the scan tool cannot download a strategy from the web site, a partial strategy will automatically be downloaded.

7. Reconnect the scan tool to the vehicle.

8. Follow the instructions displayed on the scan tool.

9. If a new solenoid body was installed, compare the 7-digit identification and the 13-digit strategy fields from the solenoid body to the replacement solenoid body tag provided with the solenoid body service kit and place it over the existing identification tag.
   The scan tool will automatically download the strategy file or partial strategy file to the TCM and will display a progress bar while downloading. The scan tool will display a message when it is finished downloading the data that states that the file was downloaded successfully.

Item	Description

1	13-digit solenoid body strategy
2	7-digit solenoid body identification

10. ***NOTICE:*** **If a drive cycle is not completed, the customer may feel erratic shifts and driveability concerns.**

    Test drive the vehicle. Refer to Solenoid Body Strategy Drive Cycle in this procedure.

Solenoid Body Strategy Drive Cycle

Carry out the drive cycle after downloading the solenoid body strategy data file to the TCM .

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

1. **NOTE:** The engine and transmission must be at normal operating temperature.

   Bring the transmission to normal operating temperature.

2. With the engine running and the brake applied, move the selector lever through the gears in the following order, pausing in each gear for 4 seconds: N, R, N, D, R, D, N. Repeat this pattern 2 times. If any engagements feel soft or harsh, repeat this procedure.

3. Drive the vehicle and accelerate at a moderate throttle so the upshifts occur at 2,000 rpm up to 80 km/h (50 mph) and brake lightly to a stop. Repeat this pattern 2 times.

4. Drive the vehicle and accelerate at a moderate throttle so the upshifts occur at 3,000 rpm up to 80 km/h (50 mph) and brake lightly to a stop. Repeat this pattern 2 times.

5. With the engine running and the brake applied, move the selector lever through the gears in the following order, pausing in each gear for 4 seconds: N, R, N, D, R, D, N. Repeat this pattern 2 times.

6. From a stop, accelerate to 25 mph, then release the throttle. Keeping the throttle closed, pull the selector lever into the "L" position and coast down to 10 mph. Repeat this pattern 2 times.

Road Testing Vehicle

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: If a new or remanufactured transmission assembly is being installed or a new solenoid body is installed, the TCM will have to be re-programed with a new solenoid body strategy and identification data file. The solenoid body strategy drive cycle should also be carried out. Refer to Solenoid Body Strategy .

The Shift Point Road Test and Torque Converter Operation Test provide diagnostic information on shift controls and torque converter operation.

Shift Point Road Test

This test verifies the shift control system is operating correctly.

1. Bring engine and transaxle up to normal operating temperature.
2. Operate vehicle with the selector lever in D range.
3. **NOTE:** Shift speed ranges are approximate for all applications.

   Apply minimum throttle and observe the vehicle speed when an upshift occurs and the torque converter engages using the Shift Speeds chart.

Shift Speeds 2.5L

Throttle Position	Range	Shift	KM/H	MPH
Light	D	1-2	11-16	7-10
Throttle [a]	D	2-3	21-27	13-17
	D	3-4	29-37	18-23
	D	4-5	45-56	28-35
	D	5-6	72-90	45-56
Medium	D	1-2	27-43	17-23
Throttle [a]	D	2-3	42-55	26-34
	D	3-4	58-77	36-48
	D	4-5	77-106	48-66
	D	5-6	135-177	84-110
Heavy	D	1-2	51-66	32-41
Throttle [a]	D	2-3	79-100	49-62
	D	3-4	113-143	70-89
	D	4-5	150-190	93-118
	D	5-6	201-245	125-152

[a] Do not exceed the speed limit.

Shift Speeds 3.0L

Throttle Position	Range	Shift	KM/H	MPH
Light	D	1-2	13-18	8-11
Throttle [a]	D	2-3	19-26	12-16
	D	3-4	29-37	18-23
	D	4-5	45-56	28-35
	D	5-6	72-90	45-56

Medium	D	1-2	32-42	20-26
Throttle [a]	D	2-3	48-61	30-38
	D	3-4	63-82	39-51
	D	4-5	80-108	50-67
	D	5-6	117-159	73-99
Heavy	D	1-2	58-72	36-45
Throttle [a]	D	2-3	85-106	53-66
	D	3-4	126-156	78-97
	D	4-5	151-192	94-119
	D	5-6	217-261	135-162

[a] Do not exceed the speed limit.

4. With vehicle speed above 43 km/h (27 mph), press the accelerator pedal to Wide Open Throttle (WOT). The transaxle should shift from 4th to 3rd, or 4th to 2nd, depending on vehicle speed. The torque converter should disengage.

5. With vehicle speed above 56 km/h (35 mph), move the selector lever from the D range to the L range and remove foot from accelerator pedal. The transaxle should immediately downshift to 2nd gear. When vehicle speed drops below 32 km/h (20 mph), the transaxle should downshift into 1st gear.

6. If the transaxle fails to upshift/downshift or the torque converter does not apply and release, refer to Diagnosis By Symptom in this section for possible causes.

Torque Converter Diagnosis

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Prior to torque converter installation, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of new or remanufactured torque convertAfter a complete diagnostic evaluation can a decision be made to install a new or remanufactured torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary inspection

2. Know and understand the customer concern

3. Verify the concern - carry out the Torque Converter Operation Test

4. Carry out diagnostic procedures:
   - Run OBD . Refer to Diagnostics .
     - Repair all non-transmission related DTCs first.
     - Repair all transmission DTCs.
     - Rerun OBD test to verify repair.
     - Carry out Line Pressure Test. Refer to Special Testing Procedures .
     - Carry out Stall Speed Test. Refer to Special Testing Procedures .
     - Carry out diagnostic routines. Refer to Diagnosis By Symptom .
     - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list possible components that may cause or contribute to the symptom. Check each component listed, diagnose and repair as required before installing a new torque converter.

Torque Converter Operation Test

This test verifies the TCC control system and the torque converter are operating correctly.

1. Carry out self-test and check for DTCs.

2. Connect the scan tool and monitor engine rpm.

3. Bring the engine to normal operating temperature by driving the vehicle at highway speeds with the selector lever in the (D) position.

4. If the vehicle stalls in (D) at idle with the vehicle at a stop, move the selector lever to manual L position. If the vehicle stalls, see Torque Converter Operation Concerns, refer to Diagnosis By Symptom . Repair as required. If the vehicle does not stall in (D), refer to Diagnosis By Symptom .

Visual Inspection

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
  - A/C
  - generator (alternators)
  - engine turbo
  - cellular telephone
  - cruise control
  - CB radio
  - linear amplifiers
  - backup alarm signal
  - computer
- Vehicle modification.
- These items, if not installed correctly, will affect PCM or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.
- Leaks, refer to Leakage Inspection in this section.

Section 307-05A .

Selector Lever Linkage Check

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted. Refer to Section 307-05A for selector lever linkage adjustment.

Check TSBs

Refer to all TSBs which pertain to the concern and follow the procedure.

Carry Out On-Board Diagnostics, Key ON Engine OFF (KOEO), Key ON Engine Running (KOER)

After a road test, with the engine and transmission at normal operating temperature and before disconnecting any connectors, use the scan tool to perform the self-test procedure. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the powertrain control system.

Diagnostics

OBD with Scan Tool

These self-tests should be used to diagnose the TCM and should be carried out in order.

NOTE: Make sure to use the latest scan tool software release.

1. If the cause is not visually evident, connect the scan tool to the DLC .

NOTE: The VCM LED prove-out confirms power and ground from the DLC to the VCM .

2. If the scan tool does not communicate with the VCM :
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 to diagnose no power to the scan tool.

3. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the RUN position.
   - verify scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the TCM .

4. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

5. Clear the continuous DTCs and carry out the TCM self-test.

6. If DTCs retrieved are related to the concern, GO to the DTC Chart.

7. If no DTCs related to the concern are retrieved, GO to Diagnosis By Symptom .

Output State Control (OSC) Mode

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Description

Output state control allows a diagnostic scan tool direct control of specific transmissiomponents or functions. Output state control allows the technician to control the main functions or components of the transmission to help the technician diagnose the transmission quickly and easily. For example, output state control may be used to change gears or remain in a specific gear. Output state control may be used to control the operation of the TCC to engage or disengage, or to keep the converter clutch from engaging at all. Output state control may be used to help carry out solenoid electrical pinpoint tests by turning a solenoid off or on by controlling the actual current to the VFS solenoid.

Procedure

NOTE: Retrieve Continuous Codes and carry out a KOEO and KOER On-Demand Self Test before using any output state control. Any DTCs related to the TR sensor, the OSS sensor or the TSS sensor must be fixed or the TCM will not allow the output state control to operate.

Output state control is used to test various transmission components and functions when the vehicle is in the service bay or being driven on the road. Specific vehicle conditions are required for output state control to control each specific function or component. The following describes which transmission functions and components output state control may control and the specific vehicle conditions necessary for its operation.

Service Bay - Vehicle State No. 1

Vehicle state No. 1 is functional ONLY when the ignition is in the ON position and the selector lever is in PARK or NEUTRAL with the engine OFF. Vehicle state No. 1 is required when using output state control to carry out electrical pinpoint tests. The following transmission components may be controlled using output state control in vehicle state No. 1.

- SSA_AMP - Controls the current to SSA , VFS
- SSB_AMP - Controls the current to SSB , VFS
- SSC_AMP - Controls the current to SSC , VFS SSD_AMP - Controls the current to SSD , VFS
- SSE - Directs TCM to command SSE OFF or ON
- LPC_AMP - Controls the current to the LPC VFS
- TCC_AMP - Controls the current to the TCC VFS

The vehicle requirements must be met when sending an output state control value to control each component such as the solenoids stated above. If the vehicle requirements are not met when sending the output state

control value, an error message may appear. When an error message appears, output state control is cancelled and should be restarted.

After sending the output state control value, if the vehicle requirements are no longer met, the error message will not appear but the output state control value will be cancelled by the TCM . Use the scan tool to monitor the PID that corresponds to each output state control function or component to determine if the TCM is using the output state control value or normal control.

Output state control may be cancelled at any time, to return the TCM to normal control for a specific output state control function or component. See instructions for specific scan tool.

Service Bay - Vehicle State No. 2

Vehicle state No. 2 is functional ONLY when the engine is running and the selector lever is in PARK or NEUTRAL with engine speed greater than 1,100 rpm. Vehicle state No. 2 is required when using output state control to carry out a line pressure check. Most, but not all, of the solenoids may be controlled during this vehicle state. It is recommended to use vehicle state No. 1 when using output state control to control the solenoids. The following transmission function and components may be controlled using output state control in vehicle state No. 2.

- LINEDSD - Output state control function to command line pressure to a desired pressure
- SSD_AMP - Controls the current to SSD , VFS
- SSC_AMP - Controls the current to SSC VFS
- SSB_AMP - Controls the current to SSB , VFS
- SSA_AMP - Controls the current to SSA , VFS

The vehicle requirements must be met when sending an output state control value to control each component such as the solenoids stated above. If the vehicle requirements are not met when sending the output state control value, an error message may appear. When an error message appears, output state control is cancelled and should be restarted.

After sending the output state control value, if the vehicle requirements are no longer met, the error message will not appear but the output state control value will be cancelled by the TCM . Use the scan tool to monitor the PID that corresponds to each output state control function or component to determine if the TCM is using the output state control value or normal control.

Output state control may be cancelled at any time, to return the TCM to normal control for a specific output state control function or component. See instructions for specific scan tool.

Output state control values for SSA_AMP, SSB_AMP, SSC_AMP, SSD_AMP, LPC_AMP and TCC_AMP to control the current on the VFS solenoids are between zero (0) and one (1) amp. The following are examples.

- 0 - Commands TCM to control current to zero amps
- 0.25 - Commands TCM to control current to 1/4 amp or 250 milliamps
- 0.50 - Commands TCM to control current to 1/2 amp or 500 milliamps
- 0.75 - Commands TCM to control current to 3/4 amp or 750 milliamps
- 1 - Commands TCM to control current to 1 amp or 1,000 milliamps

Output state control aids in testing the electronic functions of the TCM , VFS solenoid and associated circuitry. Output state control allows the technician to control the TCM commanded current of the VFS solenoids and the commanded state of the on/off solenoid. This allows the technician to accurately test the electronic circuitry by comparing the commanded current with the actual current or the on/off state with the

actual voltage. Shifting the transmission through the various gears tests the mechanical operation of the VFS solenoids. When using output state control to control the VFS current, the technician may measure the circuit current using an inductive pickup or measure the circuit voltage drop to help verify the proper electrical operation of each VFS solenoid.

The output state control values for LINEDSD to command a desired line pressure are between 414 kPa (60 psi) and 1,931 kPa (280 psi). The following are examples.

- 60 psi - Commands TCM to control line pressure to 414 kPa (60 psi)
- 100 psi - Commands TCM to control line pressure to 689 kPa (100 psi)
- 150 psi - Commands TCM to control line pressure to 965 kPa (150 psi)
- 200 psi - Commands TCM to control line pressure to 1,517 kPa (200 psi)

NOTICE: **Do NOT command line pressure LOWER then 414 kPa (60 psi) or HIGHER then 1,931 kPa (280 psi) or damage to the transmission can occur.**

Output state control allows the technician to control the TCM commanded line pressure. This allows the technician to accurately test the electronic pressure control system by comparing the output state control commanded line pressure to the actual line pressure indicated on the pressure gauge. The pressure gauge should be connected to the line pressure tap on the transmission. The PID corresponding to the commanded line pressure must be monitored to make sure the TCM is using the output state control value for the commanded line pressure. This test will help verify the correct operation of the transmission pump assembly, pump regulator valve and the operation of the LPC solenoid.

Drive Test

Output state control allows control of 3 transmission functions while driving on the road.h transmission function has a unique set of vehicle operating requirements that the technician is required to meet before the TCM will allow output state control.

- TCC_OSC - Commands the TCM to engage or disengage the TCC
- GEAR_OSC - Commands the TCM to change gears (upshift or down-shift) or remain in a gear
- HRSH_SFT - Commands a slightly higher hydraulic pressure during engagements and upshifts

The vehicle requirements must be met when sending an output state control value to control the specific functions stated above. If the vehicle requirements are not met when sending the output state control value, an error message may appear. When an error message appears, output state control is cancelled and should be restarted.

After sending the output state control value, if the vehicle requirements are no longer met, the error message will not appear but the output state control value is cancelled by the TCM . Use the scan tool to monitor the PID that corresponds to each output state control function or component to determine if the TCM is using the outpte control value or normal control.

Output state control may be cancelled at any time, to return the TCM to normal control for a specific output state control function or component. See instructions for specific scan tool.

Drive Test - Torque Converter Clutch Control

The output state control values for TCC_OSC to engage or disengage the TCC are as follows:

- 0 - TCM in normal control of TCC and output state control is cancelled

- 1 or OFF - Commands TCM to keep the torque converter clutch from engaging
- 2 or ON - Commands TCM to engage the TCC using a normal ramp rate
- 3 or ON - Commands TCM to engage the TCC using a fast ramp rate

Controlling the TCC will assist the technician in testing the operation of the torque converter for engagements and disengagements. Also, the technician may find it easier to evaluate upshifts and downshifts by first using output state control to keep the TCC from engaging.

Vehicle requirements when using TCC_OSC - Controlling the TCC .

When SENDING the TCC_OSC value [1 or OFF], the engine must be running with the transmission in the DRIVE position and the vehicle speed must be greater than 5 km/h (3 mph).

When SENDING the TCC_OSC value [2 or 3 or ON], the engine must be running with the selector lever in the DRIVE position, transmission in 3rd, 4th, 5th or 6th gear, transmission temperature between 4°C (40°F) and 121°C (250°F), the vehicle speed must be below 24 km/h (15 mph) and engine speed greater than 1,100 rpm with minimal engine load.

Drive Test - Upshift and Downshift Control

NOTE: Once output state control has successfully commanded the transmission to shift to the desired output state control gear, the transmission will remain in that gear until output state control commands a different gear or the vehicle conditions are no longer correct.

The output state control values for GEAR_OSC to control the transmission gear changes are as follows:

- 0 - TCM in normal shift control and output state control is cancelled
- 1 - Commands TCM to shift to 1st gear - no engine braking
- 2 - Commands TCM to shift to 2nd gear - with engine braking
- 3 - Commands TCM to shift to 3rd gear - with engine braking
- 4 - Commands TCM to shift to 4th gear - with engine braking
- 5 - Commands TCM to shift to 5th gear - with engine braking
- 6 - Commands TCM to shift to 6th gear - with engine braking

Controlling the gear changes will assist the technician in testing the various clutches and whether the transmission is slipping in any particular gear. Output state control will command the TCM to upshift or downshift depending on the output state control gear value the technician selects. The transmission will remain in the output state control gear selected until another output state conor until output state control is cancelled and/or the vehicle conditions for using output state control are no longer met.

Vehicle requirements when using GEAR_OSC - Controlling Gear Changes

When SENDING a GEAR_OSC value, the engine must be running with the selector lever in the DRIVE position, and the vehicle speed must be greater than 5 km/h (3 mph).

Additional vehicle conditions required for upshifts:

- Vehicle speed must be greater then 32 km/h (20 mph) when commanding an upshift to 5th or 6th gear

Additional vehicle conditions required for downshifts:

- Vehicle speed must be less then 32 km/h (20 mph) when commanding a downshift to 1st gear
- Vehicle speed must be less then 64 km/h (40 mph) when commanding a downshift to 2nd gear

- Vehicle speed must be less then 97 km/h (60 mph) when commanding a downshift to 3rd gear
- Vehicle speed must be less then 129 km/h (80 mph) when commanding a downshift to 4th gear
- Vehicle speed must be less then 161 km/h (100 mph) when commanding a downshift to 5th gear

Drive Test - Pressure Added for Engagements and Upshifts

The output state control values for HRSH_SHFT to command a slight or moderate increase in hydraulic pressure to test for harsh engagements and upshifts are as follows:

- 0 or OFF - TCM in normal pressure control for shifts and engagements and output state control is cancelled
- 1 or ON - Commands TCM to moderately increase hydraulic pressure during engagements and upshifts

Setting HRSH_SFT to 1 or ON allows the tn to moderately increase the pressure when performing engagements such as P-R, P-D, N-R, N-D, R-D and when performing automatic upshifts. This can provide additional diagnostic information to help the technician determine whether the electronic pressure control system is providing at least limited control (a normal shift would become harsh). Using output state control to control HRSH_SHFT [1 or ON] should make a softer engagement or shift more normal and an already normal shift or engagement harsher by slightly increasing the pressure. This test should only be used to provide additional diagnostic information and should not be the only scan tool or test to determine a faulty electronic or hydraulic component.

Using Output State Control and Monitoring PIDs

To confirm that the output state control value was sent by the scan tool and the TCM has accepted the output state control command, a corresponding PID for each output state control parameter must be monitored. After SENDING the output state control value, the corresponding PID value should be the same as the output state control value that was sent. Additional PIDs are listed that may be monitored to help the technician accurately diagnose the transmission.

The following is a list of output state control parameters and their corresponding PIDs:

Output State Control Parameter	Corresponding PID	Additional PIDs
GEAR_OSC	GEAR	GEAR_RAT
HRSH_SHFT	-	GEAR, GEAR_RAT
LINEDSD	LPC	LPC_F
LPC_AMP	LPC	TCCRAT, TCCMCMD, TSLIP
SSA_AMP	SSPCA	SSPCA_F
SSB_AMP	SSPCB	SSPCB_F
SSC_AMP	SSPCC	SSPCC_F
SSD_AMP	SSPCD	SSPCD_F
TCC AMP	TCC	TCC_F, TCC_RAT
TCC_OSC	TCC	TCC_F, TCC_RAT

Diagnostic Parameters Identification (PID) Chart

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

PID Name	PID Description	Units
GEAR	PCM commanded transaxle gear	P, R, N, 1, 2, 3, 4, 5 and 6
GEAR_OSC	Output state control commanded gear	P, R, N, 1, 2, 3, 4, 5 and 6
GEAR_RAT	Transaxle gear ratio	Ratio
HRSH_SHFT	Output state control commanded firm shift	On/Off
IN_GEAR	PCM commanded transaxle gear	P, R, N, 1, 2, 3, 4, 5 and 6
LINEDSD	Output state control commanded line pressure	Pressure
LPC	PCM commanded pressure for the Line Pressure Control (LPC) Variable Force Solenoid (VFS)	Pressure
LPC AMP	Output state control commanded current for the LPC VFS	Amperes
LPC_F	Fault status for the LPC VFS	Fault/No Fault
OSS_F	Fault status for Output Shaft Speed (OSS) sensor	Fault/No Fault
OSS_SRC	Actual speed of the OSS sensor (rpm)	rpm
SSA_AMP	Output state control commanded current for the Shift Solenoid A (SSA)/CB1234 VFS	Amperes
SSB_AMP	Output state control commanded current for the Shift Solenoid B (SSB)/C35R VFS	Amperes
SSC_AMP	Output state control commanded current for the Shift Solenoid C (SSC)/CB26 VFS	Amperes
SSD_AMP	Output state control commanded current for the Shift Solenoid D (SSD)/CBLR, C456 VFS	Amperes
SSPCA	PCM commanded pressure for the SSA /CB1234 VFS	Pressure
SSPCA_F	Fault status for the SSA /CB1234 VFS	Fault/No Fault
SSPCB	Commanded pressure for the SSB /C35R VFS	Pressure
SSPCB_F	Fault status for the SSB /C35R VFS	Fault/No Fault
SSPCC	PCM commanded pressure for the SSC /CB26 VFS	Pressure
SSPCC_F	Fault status for the SSC /CB26 VFS	Fault/No Fault
SSPCD	PCM commanded pressure for the SSD /CBLR, C456 VFS	Pressure
SSPCD_F	Fault status for the SSD /CBLR, C456 VFS	Fault/No Fault

SSPCE_F	Fault status for On/Off Shift Solenoid E (SSE)/CBLR, C456 VFS	Fault/No Fault
TCC	PCM commanded pressure for the Torque Converter Clutch (TCC) VFS	Pressure
TCC AMP	Output state control commanded current for the TCC VFS	Amperes
TCC_F	Fault status for TCC VFS	Fault/No Fault
TCC_OSC	Output state control commanded pressure to the TCC VFS	Pressure
TCC_RAT	Actual speed ratio of torque converter (1.0 = fully engaged)	Ratio
TCIL	Transmission Control Indicator Lamp (TCIL) status	On/Off
TCS_DEPRES	Transmission Control Switch (TCS) status	Depressed/Not Depressed
TCS_STATE	TCS status	On/Off
TCC_SLIPACT	Actual difference between engine speed and turbine speed, measured in rpm	rpm
TCC_SLIPDSD	PCM commanded difference between engine speed and turbine speed, measured in rpm	rpm
TFT	Transmission Fluid Temperature (TFT)	Degrees
TFTV	TFT voltage	Voltage
TFT_F	Fault status for TFT sensor	Fault/No Fault
TR	Transmission Range (TR)	Range (P, R, N, D, L)
TRAN_RAT	Actual transaxle gear ratio	Ratio
TR_CRANK	TR	Range (P, R, N, D, L)
TR_DC	TR Duty Cycle	Frequency
TR_F	Fault status for TR sensor	Fault/No Fault
TR_FREQ	TR Frequency	Frequency
TSS_F	Fault status for Turbine Shaft Speed (TSS) sensor	Fault/No Fault
TSS_SRC	Actual speed of the TSS sensor (rpm)	rpm

Transaxle Drive Cycle Test

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

After carrying out the self-test, use the followinansmission Drive Cycle Test for checking continuous codes:

NOTE: The Transmission Drive Cycle Test must be followed exactly. Malfunctions must occur 4 times consecutively for the shift error DTC to be set. Torque converter failures must occur 5 times consecutively for a continuous DTC to be set.

NOTE: When carrying out the Transmission Drive Cycle Test, see the Solenoid Operation Chart for correct solenoid operation. Refer to Pinpoint Tests - OSC Equipped Vehicle .

1. Record then clear self-test DTCs.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With transmission in DRIVE, moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into 6th gear. Hold speed and throttle opening steady for a minimum of 15 seconds.
5. With transmission in 6th gear and maintaining steady speed and throttle opening, lightly apply and release the brake to operate the stoplamps. Hold speed and throttle steady for additional 5 seconds minimum.
6. Brake to a stop and remain stopped for minimum of 20 seconds.
7. Repeat Steps 4 through 6 at least 5 times.
8. Carry out the self-test and record continuous codes.

- If DTCs are present, refer to Diagnostic Trouble Code (DTC) Charts . Service all non-transmission DTCs first as they can directly affect the operation of the transmission. Repeat the self-test and road test the vehicle to verify the correction. Clear the DTCs, carry out drive cycle and repeat the self-test after completing service on the DTCs.
- If the self-test passes and a concern is still present, refer to Diagnosis By Symptom . Check TSBs for diagnostic concern.

After OBD

NOTE: The vehicle wiring harness, TCM and non-transmission sensors may affect transmission operations. Service these concerns first.

After the OBD procedures are complete, service all DTCs.

Begin with non-transmission related DTCs, then service any transmission related DTCs. Refer to the Diagnostic Trouble Code (DTC) Charts for information on condition and symptoms. This chart is helpful referring to the correct manual(s) and to aid in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing electrical concerns of the transmission. Make sure the vehicle wiring harness and TCM are diagnosed as well. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosing non-transmission electronic components. The diagnostic routine hydraulic/mechanical charts will help in diagnosing internal transmission concerns and external non-transmission inputs.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the TCM wiring harness for correct connections, bent or broken terminals, corrosion, loose wires, correct routing, correct seals and their condition. Check the TCM , sensors and actuators for damage. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

NOTE: If a concern exists after the electrical diagnosis has been carried out, refer to Diagnosis By Symptom .

If DTCs appear while carrying out the OBD test, refer to the Diagnostic Trouble Code (DTC) Charts for the appropriate repair procedure. Prior to entering pinpoint tests, refer to TSBs for transmission concerns.

Diagnostic Trouble Code (DTC) Charts

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

DTC Chart

NOTE: Using a scan tool, retrieve DTCs. Begin with and repair all non-transmission related DTCs. Start with the U-DTCs (communication link codes) and repair any transmission-related DTCs.

DTC	Grouping	Component H>	Description	Condition	Symptom	Action
P0657	-	Transaxle solenoid power control	Actuator supply voltage A circuit/open	Transaxle solenoid power control provides power to all the solenoids. This DTC sets if the transaxle solenoid power control relay circuit is open.	• Harsh engagements. • No voltage to solenoids. • Maximum line pressure. • Only PARK, REVERSE, NEUTRAL and 5th gear available. • No Torque Converter Clutch (TCC). • Poor launch due to 5th gear drive away. • Will	GO to Pinpoint Test E.

					turn on Malfunction Indicator Lamp (MIL).	
P0701	P2700 (Forward Clutch), P2701 (Direct Clutch), P2702 (Intermediate Clutch), P2703 (Low/Reverse Clutch) and P2704 (Overdrive Clutch)	Transmission hydraulic and clutch systems (including non-electrical shift solenoid faults, main control valve body and clutch(s)).	Transmission control system range/performance	The PCM has detected an intermittent clutch on fault and the control system keeps getting stuck on ratio changes but when it turns off the suspected clutch it releases. No stuck on DTCs s.	• Vehicle decelerates during upshifts or hangs in gear • Will turn on wrench lamp.	Non-electrical failure. REPAIR the more specific DTC first. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0706	P1702, P1921	TR sensor	TR sensor A circuit range/performance.	TR sensor frequency out of range. PCM receives a duty cycle at 125 Hz. If the frequency is out of range (75 to 175 Hz is the acceptable range) this DTC will set. Possible wiring, connector or TR sensor issue.	• Possible no crank. • Only PARK, REVERSE, NEUTRAL and 5th gear available. • Harsh engagements. • Extremely delayed engagements (until a DTC is set). • After a DTC is set and the high side opened. ♦ Harsh engagements. ♦ Poor performance (due to a	REPAIR the more specific DTC first. GO to Pinpoint Test D .

					♦ 5th gear drive away). ♦ No shifts. • Will turn on MIL .	
P0707	P1702, P1921	TR sensor	TR sensor A circuit low.	TR sensor circuit duty cycle out of range, low. TR sensor duty cycle below the minimum value for park (possible open circuit, short to ground, wiring, connector or TR sensor issue).	• Possible no crank. • Only PARK, REVERSE, NEUTRAL and 5th gear available. • Harsh engagements. • Extremely delayed engagements (until a DTC is set). • After a DTC is set and the high side opened. ♦ Harsh engagements. ♦ Poor performance (due to a 5th gear drive away). ♦ No shifts. • Will turn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test D .
P0708	P1702, P1921	TR sensor	TR sensor A circuit high.	TR sensor duty cycle duty cycle out of range, high. Duty	• Possible no	REPAIR the more specific DTC first. GO

				cycle above the maximum value for LOW (possible short to power, wiring, connector or TR sensor issue).	crank. • Only PARK, REVERSE, NEUTRAL and 5th gear available. • Harsh engagements. • Extremely delayed engagements (until a DTC is set). • After a DTC is set and the high side opened. ♦ Harsh engagements. ♦ Poor performance (due to a 5th gear drive away). ♦ No shifts. • Will turn on MIL .	to Pinpoint Test D .
P0710	P0711, P0712, P0713	Transmission Fluid Temperature (TFT) sensor	TFT sensor A circuit	• TFT sensor voltage input too low or too high. TFT input indicates a short to ground or an open circuit (could be a wiring, connector or sensor issue).	• TCC and stabilized shift schedule may be enabled sooner after cold start. • Harsh or soft shifts.	REPAIR the more specific DTC first. GO to Pinpoint Test B .

				• Also see P0711, P0712 and P0713.	• Will turn on wrench lamp.	
P0711	-	TFT sensor	TFT sensor A circuit range/performance.	PCM has detected no TFT sensor change during operation.	• TCC and stabilized shift schedule may be enabled sooner after a cold start. • Harsh or soft shifts. • Will turn on wrench lamp.	GO to Pinpoint Test B .
P0712	P0710, P0712	TFT sensor	TFT sensor A circuit low.	The PCM has detected a voltage drop across the TFT sensor exceeds a temperature greater than 171°C (340°F) for more then 2.5 seconds (grounded circuit).	• TCC and stabilized shift schedule may be enabled sooner after cold start. • Harsh or soft shifts. • Will turn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test B .
P0713	P0710, P0713	TFT sensor	TFT sensor A circuit high.	The PCM has detected a voltage drop across the TFT sensor exceeds a temperature less than -45°C (-50°F) for more then 2.5 seconds (open circuit).	• TCC and stabilized shift schedule may be enabled sooner after cold start.	REPAIR the more specific DTC first. GO to Pinpoint Test B .

					• Harsh or soft shifts. • Will turn on MIL .	
P0715	P0717	Turbine Shaft Speed (TSS) sensor	TSS sensor A circuit.	• PCM has detected TSS sensor signal failed to 0 speed when vehicle conditions (mainly output speed) indicate TSS sensor output should be present. • Electrical failures (open, short) of the TSS sensor wiring, connector or a failure of the sensor itself will cause this failure.	• Failure Mode Effect Management action opens transaxle solenoid power control (removes power from all solenoids). ♦ Provides PARK, REVERSE, NEUTRAL and 5th gear with maximum line pressure and open TCC available (controlled by the manual lever). • Harsh engagements (due to maximum line pressure). • Poor launch performance (due to 5th gear	REPAIR the more specific DTC first. GO to Pinpoint Test F .

					drive away). • Will turn on MIL .	
P0717	P0715	TSS sensor	TSS sensor A circuit no signal.	• Non- MIL sister code to P0715. Used to illuminate the wrench light.	• Failure Mode Effect Management action opens transaxle solenoid power control (removes power from all solenoids). ♦ Provides PARK, REVERSE, NEUTRAL and 5th gear with maximum line pressure and open TCC available (controlled by the manual lever). • Harsh engagements (due to maximum line pressure). • Poor launch performance (due to 5th gear drive	REPAIR the more specific DTC first. GO to Pinpoint Test F .

					away).	
P0718	-	TSS sensor	TSS sensor A circuit intermittent.	PCM has detected an erratic or noisy TSS sensor signal.	Will turn on wrench lamp.	GO to Pinpoint Test F .
P0720	P0722	Output Shaft Speed (OSS) sensor	OSS sensor circuit.	• PCM has detected OSS sensor signal failed to 0 speed when vehicle conditions (mainly turbine speed) indicate OSS sensor output should be present. • Electrical failures (open, short) of the OSS sensor wiring, connector or a failure of the OSS sensor itself will cause this failure.	• Failure Mode Effect Management action opens transaxle solenoid power control (removes power from all solenoids). ♦ provides PARK, REVERSE, NEUTRAL and 5th gear with maximum line pressure and open TCC available (controlled by the manual lever). • Harsh engagements (due to maximum line pressure). • Poor launch performance (due to 5th drive away).	REPAIR the more specific DTC first. GO to Pinpoint Test C .

					• Will turn on MIL .	
P0721	-	OSS sensor	OSS sensor circuit range/performance.	PCM has detected an erratic or noisy OSS sensor signal.	Will turn on wrench lamp.	GO to Pinpoint Test C .
P0722	P0720	OSS sensor	OSS sensor circuit no signal.	• Non- MIL sister code to P0720. Used to illuminate the wrench light.	• Failure Mode Effect Management action opens transaxle solenoid power control (removes power from all solenoids). ♦ Provides PARK, REVERSE, NEUTRAL and 5th gear with maximum line pressure and open TCC available (controlled by the manual lever). • Harsh engagements (due to maximum line pressure). • Poor launch performance (due to 5th gear	REPAIR the more specific DTC first. GO to Pinpoint Test C .

					drive away).	
P0729	-	Transaxle	Gear 6 incorrect ratio	The PCM did not detect a 6th gear ratio. • Shift Solenoid C (SSC) and/or Shift Solenoid D (SSD) stuck off non-electrical fault (no pressure). • Low/reverse clutch and/or overdrive clutch regulator valve stuck in default position. • Low/reverse clutch and/or overdrive clutch boost valve stuck in default position.	• Customer may notice flares or neutral conditions on shifts. • Erratic shifting, flares, neutral conditions while the code is being set. • 6th gear disabled. • Will turn on MIL . • TCIL flashing • Will turn on wrench lamp.	Intermediate (2,6) clutch or overdrive (4,5,6) clutch slip or failed to apply. REFER to the Clutch Application chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0731	-	Transaxle	Gear 1 incorrect ratio	• Forward clutch, low/reverse clutch or One-Way Clutch (OWC) failed to apply. • Shift Solenoid A (A) and/or SSD stuck off non-electrical fault (no pressure). • Forward clutch and/or low/reverse clutch regulator	• Customer might notice flares or neutral conditions, hangs in gear. • Disable 1st gear. • No engine braking. • Will turn on wrench lamp.	Forward (1,2,3,4) clutch, low/reverse (L,R) clutch or OWC slip or failed to apply. REFER to the Clutch Application chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC

				valve stuck in default position. • Forward clutch and/or low/reverse clutch boost valve stuck in default position.		returns, REFER to Diagnosis By Symptom in this section.
P0732	-	Transaxle	Gear 2 incorrect ratio	• Forward clutch or intermediate clutch failed to apply. • SSA and/or SSC stuck off non-electrical fault (no presse). • Forward clutch and/or intermediate clutch regulator valve stuck in default position. • Forward clutch and/or intermediate clutch boost valve stuck in default position.	• Customer might notice flares or neutral condition, hangs in gear. • Disable 2nd gear. • Will turn on wrench lamp.	Forward (1,2,3,4) clutch, or intermediate (2,6) clutch failed to apply. REFER to the Clutch Application chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0733	-	Transaxle	Gear 3 incorrect ratio	• Forward clutch or direct clutch failed to apply. • SSA and/or Shift Solenoid B (SSB) stuck off non-electrical fault (no pressure). • Forward clutch and/or direct clutch regulator valve stuck in	• Customer might notice flares or neutral condition, hangs in gear. • Disable 3rd gear. • Will turn on wrench lamp.	Forward (1,2,3,4) clutch, or direct (3,5,R) clutch failed to apply. REFER to the Ctch Application chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC

				default position. • Forward clutch and/or direct clutch boost valve stuck in default position.		returns, REFER to Diagnosis By Symptom in this section.
P0734	-	Transaxle	Gear 4 incorrect ratio	• Forward clutch or overdrive clutch failed to apply. • SSA and/or SSD stuck off non-electrical fault (no pressure). • Forward clutch and/or overdrive clutch regulator valve stuck in default position. • Forward clutch and/or overdrive clutch boost valve stuck in default position.	• Customer might notice flares or neutral conditions, hangs in gear. • Disable 4th gear. • Will turn on wrench lamp.	Forward (1,2,3,4) clutch, or overdrive (4,5,6) clutch failed to apply. REFER to the Clutch Application chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Diagnosis By Symptom in this section.
P0735	-	Transaxle	Gear 5 incorrect ratio	• Direct clutch or overdrive clutch failed to apply. • SSB and/or SSD stuck off non-electrical fault (no pressure). • Direct clutch, low/reverse clutch and/or overdrive regulator valve stuck in default position.	• Customer might notice flares or neutral conditions, hangs in gear. • Disable 5th gear. • Will turn on wrench lamp.	Direct (3,5,R) clutch, or overdrive (4,5,6) clutch failed to apply. REFER to the Clutch Application chart located in Specifications in this section. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns,

				• Low/reverse clutch and/or overdrive clutch boost valve stuck in default position.		REFER to Diagnosis By Symptom in this section.
P0740	P0743	TCC	TCC solenoid circuit open	Open circuit.	• TCC failed off. • Will turn on MIL . • TCIL flashing	GO to Pinpoint Test A .
P0741	P0748	TCC	TCC solenoid circuit performance/stuck off.	TCC mechanically stuck off.	• Non-electrical TCC solenoid stuck off. • TCC mechanical failure. • TCC regulator apply valve stuck in release position. • TCC control valve stuck in release position. • TCC failed to apply (less than 80 rpm slip error lasting at least 3 seconds when TCC is	DTC P0741 is a non-electrical DTC. CLEAR the DTCs. TEST the system for normal operation. If the DTC returns, REFER to Torque Converter Operation Concerns, No Apply in Diagnosis By Symptom in this section.

					commanded on) 3 consecutive times. • Will turn on MIL . • TCIL flashing	
P0742	P0743	TCC	TCC solenoid circuit stuck on.	Circuit shorted to ground, TCC failed on.	• Failure Mode Effect Management action opens the transaxle solenoid power control, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts.	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					• Will turn on MIL . • TCIL flashing	
P0743	P0740, P0742 or P0744	TCC	TCC solenoid circuit electrical.	Sister code to P0740, P0742 or P0744 used to illuminate the wrench light.	• Will turn on wrench lamp. • TCIL flashing	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0744	P0743	TCC	TCC solenoid circuit intermittent.	Circuit short to power.	• TCC failed off. • Will turn on MIL . • TCIL flashing	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0748	P0960, P0962 and P0963	Line Pressure Control (LPC)	LPC electrical.	LPC circuit failure non- MIL . Sister code to P0960, P0962 and P0963 used to illuminate the wrench light. Additional common fault DTCs, P0750, P0751, P0752.	• Failure Mode Effect Management action, see DTCs P0960, P0962 and P0963. • Will turn on wrench lamp. • TCIL flashing	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0750	P0751	Shift Solenoid A (SSA)	SSA	Open circuit.	• Customer might notice a neutral condition, or a single erratic or unexpected shift. • 5th and 6th	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					gears only. • Poor launch due to 5th gear drive away. • Will turn on MIL .	
P0751	P2700	Forward clutch	SSA performance/stuck off.	Forward (1,2,3,4) clutch failed to apply when commanded. • SSA non-electrical failed stuck off (no pressure). • Forward clutch stuck off due to mechanical failure. • Forward clutch regulator valve stuck in the default position. • Forward clutch boost valve stuck in the default position.	• Customer may notice neutral conditions or flares on downshifts from 5th or 6th gear. • Once the DTC is stored, gears 1 through 4 are disabled - leaving 5th and 6th gears as the only forward gears. • Erratic shifting, harsh engagements, neutral conditions, flares, poor launch performance, harsh	REFER to Diagnosis By Symptom in this section.

					reverse engagements. • Will turn on MIL .	
P0752	-	SSA	SSA stuck o	Forward (1,2,3,4) clutch failed to release when commanded. • SSA non-electrical failed stuck on (pressure). • Forward clutch stuck on due to mechanical failure. • Forward clutch regulator valve stuck in the spring compressed position.	• Customer may notice a vehicle deceleration on a shift into 5th or 6th gear (forward clutch failing to release will cause a tie-up in 5th or 6th gear). • Customer might notice erratic shifting or being stuck in 4th gear. • Once the DTC is stored, 5th and 6th gears are disabled. • Will turn on MIL .	REFER to Diagnosis By Symptom in this section.
P0753	P0750, P0973 and P0974	SSA	SSA electrical.	Sister code to P0750, P0973 and P0974 used to illuminate the wrench light. Additional common	• Failure Mode Effect Management	REPAIR the more specific DTC first. GO to Pinpoint Test A .

				fault DTCs, P0752, P0754, P0755.	action, see DTCs P0750, P0973 and P0974. • Will turn on wrench lamp.	
P0754	-	SSA	SSA intermittent.	Intermittent SSA circuit faults but not lasting long enough to trip DTC, P0750, P0973 or P0974.	• Customer might notice unexpected upshifts, downshifts, flairs or neutral conditions. • Will turn on wrench lamp.	GO to Pinpoint Test A .
P0755	P0756	SSB	SSB .	Open circuit or short to power.	• Customer might notice unexpected upshift. • 3rd and 5th gears available. • Harsh engagements. • Poor launch performance. • Will turn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0756	P2701	Direct clutch	SSB performance/stuck off.	Direct (3,5,R) clutch failed off • Non-electrical failures where SSB direct clutch is stuck off (no pressure). • Direct clutch regulator	• Customer may notice flares or neutral conditions on shifts into 3rd	REFER to Diagnosis By Symptom in this section.

				valve stuck in default position. • Direct clutch mechanical failure.	or 5th gear. • PCM will command 3 shifts into 3rd or 5th gear, and if direct clutch is failed off the customer will notice flares or neutral conditions that last one second or so. • 3rd and 5th gears are disabled, customer might notice transmission hangs in 2nd on acceleration until customer tips out to closed pedal (done to protect overdrive clutch). • Will turn on MIL .	
P0757	P2701	SSB	SSB stuck on.			

				SSB (direct clutch) failed on, causing direct clutch failed on. Since the hydraulic controls prevent direct clutch and low/reverse clutch on together in the forward ranges we can isolate the solenoid from the clutch. This code sets if: • Non-electrical failures where SSB (direct clutch) is stuck on (pressure). • Direct clutch regulator valve stuck in spring compress position.	• Customer may notice a vehicle deceleration on a shift into 2nd, 4th or 6th gear. • Harsh 1-3 shift. • Poor launch performance lack of shifts. • Will turn on MIL .	REFER to Diagnosis By Symptom in this section.
P0758	P0755, P0976 and P0977	SSB	SSB electrical.	Sister code to P0755, P0976 and P0977 used to illuminate the wrench light. Additional common fault DTCs, P0755, P0976, P0977.	• Failure Mode Effect Management action see P0755, P0976 and P0977. • Will turn on wrench lamp.	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0759	-	SSB	SSB intermittent.	Intermittent SSB circuit faults but not lasting long enough to trip DTC, P0755, P0758, P0976 or P0977.	• Customer might notice unexpected upshifts, downshifts, flairs or neutral conditions. • Will turn on	GO to Pinpoint Test A .

					wrench lamp.	
P0760	P0761	SSC	SSC .	Open circuit.	• Customer might notice erratic, delayed or harsh shifts. • Disable 2nd and 6th gears. • Will rn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0761	P2702	Intermediate clutch	SSC performance/stuck off.	Intermediate clutch failed off • Non-electrical failures where SSC intermediate clutch is stuck off (no pressure). • Intermediate clutch stuck off due to mechanical failure. • Intermediate clutch regulator valve stuck in the default position.	• Customer may notice neutral conditions or flares on shifts to 2nd or 6th gear. • Disabled 2nd and 6th gears. • Erratic shifting, neutral conditions, flares, higher engine speeds on highway due to 6th gear being disabled. • Will turn on MIL .	REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P0762	P0763	SSC	SSC stuck on.			

				Intermediate clutch failed on, could be due to: • Intermediate clutch SSC non-electrical failed stuck on (pressure). • Intermediate clutch stuck on due to mechanical failure. • Intermediate clutch regulator valve stuck in the spring compressed position.	• Customer may notice a vehicle deceleration on a shift into 3rd or 5th gear (intermediate clutch failing to release will cause a tie-up in 3rd or 5th gear). • Erratic shifting or being stuck in 6th gear. • 3rd, 4th and 5th gears are disabled. • Hangs in 2nd gear on acceleration since 2nd-6th upshifts only occur at closed pedal (due to energy limitations of overdrive clutch), harsh reverse engagements	REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.

					(since low/reverse clutch is not on in 2nd gear). • Will turn on MIL .	
P0763	P0760, P0979 and P0980	SSC	SSC electrical.	Sister code to P0760, P0979 and P0980 used to illuminate the wrench light. Additional common fault DTCs, P0755, P0976, P0977.	• Failure Mode Effect Management action see P0760, P0979 and P0980. • Will turn on wrench lamp.	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0764	-	SSC	SSC intermittent.	Intermittent SSC circuit faults but not lasting long enough to trip DTC, P0760, P0979 and P0980.	• Customer might notice unexpected upshifts, downshifts, flairs or neutral conditions. • Will turn on wrench lamp.	GO to Pinpoint Test A .
P0765	P0766	SSD	SSD .	Open circuit.	• Overdrive clutch failed on, only 4th, 5th and 6th gears available. • Harsh engagements. • Poor launch due to	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					4th gear drive away. • Will turn on MIL .	
P0766	P2704	Overdrive clutch system fault includes non-electrical SSD fault, main control valve body and clutch	SSD performance stuck off.	Overdrive clutch failed off. • Non-electrical failure where SSD , low/reverse and overdrive clutch is stuck off (no pressure). • Low/reverse clutch/overdrive clutch regulator valve stuck in default position. • Low/reverse clutch/overdrive clutch boost valve stuck in default position.	• Customer may notice flares or neutral conditions on shifts into 4th, 5th or 6th gear. • Erratic shifting, flares, neutral conditions while the code is being set. • 1st, 4th, 5th and 6th gears are disabled - may notice high engine rpm since 3rd is highest available gear. • May get delayed or no reverse engagement (need	REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.

					low/reverse clutch on to achieve reverse). • Will turn on MIL .	
P0767	P07A9, P2704	Overdrive or low/reverse clutch	SSD stuck on.	Overdrive clutch failed on, could be due to: • Low/reverse or overdrive clutch SSD non-electrical failed stuck on (pressure). • Overdrive clutch stuck on due to mechanical failure. • Low/reverse, overdrive clutch regulator valve stuck in the spring-compressed position.	• Customer may notice vehicle deceleration on shifts into 2nd or 3rd gear (overdrive clutch failing to release will cause a tie-up in 2nd or 3rd gear). • 1st, 2nd and 3rd gears are disabled. • Poor launch due to 4th gear drive away. • Harsh engagements. • Will turn on MIL .	REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P0768	P0765, P0982 and P0983	SSD	SSD electrical	Sister code to P0765, P0982 and P0983 used to illuminate the wrench light. Additional common fault DTCs, P0767,	• Failure Mode Effect Management action	REPAIR the more specific DTC first. GO to Pinpoint Test A .

				P0769, P0770.	see P0765, P0982 and P0983. • Will turn on wrench lamp.	
P0769	-	SSD	SSD intermittent.	Intermittent SSD circuit faults but not lasting long enough to trip DTC, P0765, P0768, P0982 and P0983.	• Customer might notice unexpected upshifts, downshifts, flairs or neutral conditions. • Will turn on wrench lamp.	GO to Pinpoint Test A .
P0770	P0773	Shift Solenoid E (SSE)	SSE .	Open, short to ground or short to power.	SSE failed off (no pressure): • Customer might notice 4th gear drive away when 1st gear is commanded. • Failed off (no pressure) then 1st gear with engine braking is disabled. • May or may not notice 2nd gear provided	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					when 1st gear selected in low manual range. • Harsh reverse engagements since low/reverse clutch does not apply in neutral or drive in this failure mode. SSE failed on (pressure): • High side is turned off. • Poor launch performance due to 5th gear drive away. • Harsh engagements. • No TCC apply. • Will turn on MIL .	
P0771	P0984	SSE failed off	SSE performance/stuck off.	• SSE controls the multiplexing of SSD low/reverse and overdrive clutch. If solenoid fails	• If SSE is failed off or valve 2 is stuck in default	REPAIR the more specific DTC first. GO to Pinpoint Test A .

				off (no pressure) then 1st gear is failed to 4th gear. • If clutch select valve 2 sticks in the default position then 1st gear with engine braking is failed to 4th gear and reverse is failed to neutral. • The diagnostic does not distinguish SSE stuck off from valve 2 stuck in default. This code means either: ♦ SSE short to power, failed off (no pressure). ♦ Valve 2 stuck in default position.	position then the customer will get 4th gear when 1st gear is selected. • Will turn on wrench lamp.	
P0772	P0984	SSE failed on	SSE stuck on.	• SSE controls the multiplexing of SSD low/reverse and overdrive clutch. If the solenoid fails on (pressure) then, 1st and 2nd gear are	• If SSE is failed on or valve 2 is stuck in spring compressed position, then 1st	REPAIR the more specific DTC first. GO to Pinpoint Test A .

				the only available gears. 3rd gear is failed to 1st gear, 4th gear is failed to 1st gear, 5th gear is failed to neutral, and 6th gear is a tie-up. • If clutch select valve 2 sticks in the spring-compressed position, the same ratio pattern will occur. This code means either: ♦ SSE short to ground, failed on (pressure). ♦ Valve 2 stuck in spring compressed position.	and 2nd gears are the only available gears. • Customer might notice flares on shifts into 3rd gear. Deceleration on shifts into 4th gear since you get 1st gear or a neutral condition on shifts into 5th gear. High engine rpm since 2nd gear is top available gear. • Will turn on wrench lamp.	
P0773	P0770	SSE	SSE electrical.	Open, short to ground or short to power in solenoid or wiring.	Sister code to P0770 used to illuminate the wrench light. • Failure Mode Effect Management action see	GO to Pinpoint Test A .

					P0770. • Will turn on wrench lamp.	
P0774	-	SSE	SSE intermittent.	Intermittent SSD circuit faults but not lasting long enough to trip DTC, P0770.	• Failure Mode Effect Management action see P0770. • Will turn on wrench lamp.	GO to Pinpoint Test A .
P07A5	-	Direct clutch	Transmission direct clutch stuck on.	Ratio based test. The clutch control bypass valve (multiplex valve) exhausts the direct clutch when the valve is in the compressed position, where SSD points in the low/reverse position, the diagnostic can isolate the direct clutch stuck on from SSB stuck on because getting 3rd gear in 1st when the clutch control bypass valve is in the spring compressed position indicates that SSB cannot be the cause.	• Customer may notice slow acceleration from stop. May be in 3rd gear when 1st gear is commanded. • Once the DTC is stored, 3rd and 5th gears are only available. • Erratic shifting, harsh engagements, poor launch performance. • Will turn on wrench lamp.	REFER to Diagnosis By Symptom in this section.
P07A8	-					

		Low/reverse clutch	Transmission low/reverse clutch performance/stuck off.	SSD is multiplexed through the clutch control bypass valve (multiplex valve) to the low/reverse and overdrive clutch, the diagnostic can isolate the low/reverse clutch failed off from SSD stuck off when the overdrive clutch applies normally and the low/reverse clutch did not.	• Customer may notice no reverse. • Disable 1st gear. • Delayed engagement into drive. • Poor launch performance due to 2nd gear launch. • Will turn on wrench lamp.	REFER to Diagnosis By Symptom in this section.
P07A9	P0767	Low/reverse clutch	Transmission low/reverse clutch stuck on.	SSD is multiplexed through the clutch control bypass valve (multiplex valve) to the low/reverse and overdrive clutch, the diagnostic can isolate the low/reverse stuck on by turning off SSE . If the transaxle shifts into 4th when the clutch control bypass valve moves SSD is stuck on, but if the transaxle stays in 1st then the low/revers is stuck on.	• Low/reverse clutch failed on. • One-Way Clutch (OWC) transmits torque in both directions. • Stuck in 1st gear. • Will turn on wrench lamp.	REFER to Diagnosis By Symptom in this section.
P07AA	-	Overdrive clutch	Transmission overdrive clutch performance/stuck off.	SSD is multiplexed through the clutch control bypass valve (multiplex valve) between the low/reverse and overdrive clutch, the diagnostic can isolate the overdrive clutch failed off from SSD stuck off when the low/reverse clutch	• Overdrive clutch failed off. • Disable 4th, 5th and 6th gears. • Reverse may be delayed	REFER to Diagnosis By Symptom in this section.

				applies normally but the overdrive clutch is stuck off.	or disabled. • High engine rpm. • Will turn on wrench lamp.	
P0815	-	Upshift switch circuit	SelectSwtchTM upshift switch output circuit failure	The associated circuitry to and from the SelectSwtchTM switch, fuse or the SelectSwtchTM switch itself may have an open or is shorted to ground.	• SelectSwtchTM upshift inoperative. • Will turn on wrench lamp.	REFER to Section 307-05A .
P0816	-	Downshift switch circuit	SelectSwtchTM downshift switch output circuit failure	The associated circuitry to and from the SelectSwtchTM switch, fuse or the SelectSwtchTM switch itself may have an open or is shorted to ground.	• SelectSwtchTM downshift inoperative. • Will turn on wrench lamp.	REFER to Section 307-05A .
P0867	-	Transmission hydraulic and clutch systems	Transmission fluid pressure.	The control valve test raissure to insure that the clutch control bypass valve (multiplex valve) is latched, then turns on SSE to test for a stuck TCC control valve under steady state operation in 4th, 5th and 6th gear. If the ratio breaks away the test is aborted. If enough ratio break away occur, the DTC is set.	• Multiplex latch pressure inadequate (valve moves when SSE turns on). • Overdrive clutch pressure issue. • Line pressure issues. • Solenoid regulator valve issues. • Customer may notice flairs during test.	REFER to Diagnosis By Symptom in this section.

					• Will turn on wrench lamp.	
P0960	P0748	LPC	LPC control circuit/open.	LPC circuit has failed to 0 current.	• Failed to maximum line pressure. • Harsh engagements. • Will turn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0961	P0748	LPC	LPC control circuit range/performance.	Intermittent LPC short to ground. Fault present long enough to notice a neutral condition (minimum pressure) but not present long enough to store a DTC.	• Harsh engagement and harsh shifts. • Will turn on wrench lamp.	GO to Pinpoint Test A .
P0962	P0748	LPC	LPC control circuit low.	LPC short to ground circuit failure.	Failed to 0 current, minimum line pressure: • Failure Mode Effect Management action opens the transaxle solenoid power control relay, removing power from all solenoids which provides maximum line pressure. • Harsh engagements.	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					• Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL .	
P0963	P0748	LPC	LPC control circuit high.	LPC short to power circuit fault.	Failed to 0 current, maximum line pressure: • Harsh engagements. • Will turn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0973	P0753	SSA	SSA control circuit low.	Short to ground.	• Failure Mode Effect Management action opens the transaxle solenoid power control relay, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL .	
P0974	P0753	SSA	SSA control circuit high.	Short to power.	• Forward clutch is failed off - 5th and 6th gears only available forward gears. • Neutral condition or flare when fault occurs. • Poor launch due to 5th gear drive away • Will turn on MIL	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0976	P0758	SSB	SSB control circuit low.	Short to ground.	• Failure Mode Effect	REPAIR the more specific DTC first. GO to Pinpoint

					Management action opens the transaxle solenoid power control relay, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL .	Test A .
P0977	P0758	SSB	SSB control circuit high.	Short to power.	• Direct clutch failed on - only 3rd and 5th gears	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					available. • Harsh 1-3 shift if failure occurs while in 1st. • Poor launch due to 3rd gear drive away. • Will turn on MIL .	
P0979	P0763	SSC	SSC control circuit low.	ort to ground.	• Failure Mode Effect Management action opens the transaxle solenoid power control relay, removing power from all solenoids (get PARK, REVERSE, NEUTRAL and 5th gear as the only forward gear with TCC open). • Harsh engagements. • Poor launch performance	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					(due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL .	
P0980	P0763	SSC	SSC control circuit high.	Open circuit.	• If fault occurs while in 2nd or 6th gear, customer might notice a neutral condition before diagnostics disables 2nd and 6th gears. • Erratic, delayed or harsh shifts. • Will turn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0982	P0768	SSD	SSD control circuit low.	Short to ground.	• Failure Mode Effect Management action opens the transaxle solenoid power control relay, removing power	REPAIR the more specific DTC first. GO to Pinpoint Test A .

					from all solenoids (get PARK, REVERSE, NEUTRAL and 5th as the only forward gear with TCC open), harsh engagements. • Poor launch performance (due to 5th gear drive away). • No TCC apply. • No shifts. • Will turn on MIL .	
P0983	P0768	SSD	SSD control circuit high.	Open circuit.	• Only 4th, 5th and 6th gears available. • Harsh engagements. • Poor launch due to 4th gear drive away. • Will turn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test A .
P0984	P0771, P0772	SSE	SSE control circuit range/performance.	This DTC sets with either P0771 or P0772.	• Will turn on	REPAIR the more specific DTC first. GO

					wrench lamp.	to Pinpoint Test A .
P1500	P0722	VSS sensor	OSS sensor circuit.	• PCM has detected VSS sensor signal failed to 0 speed when vehicle conditions (mainly turbine speed) indicate OSS sensor output should be present. • Electrical failures (open, short) of the OSS sensor wiring, connector or a failure of the OSS sensor itself will cause this failure.	• Failure Mode Effect Management action opens transaxle solenoid power control (removes power from all solenoids). ♦ provides PARK, REVERSE, NEUTRAL AND 5th gear with maximum line pressure and open TCC available (controlled by the manual lever). • Harsh engagements (due to maximum line pressure). • Poor launch performance (due to 5th drive away). • Will turn on MIL .	REPAIR the more specific DTC first. GO to Pinpoint Test C .

P1636	-	PCM	Inductive signature chip communication error.	Lost communication with solenoid driver. • The solenoid driver is an internal PCM chip that controls the solenoids. The main microchip communicates with the solenoid driver over a serial interface, sending out the desired solenoid state and receiving back a circuit fault status. • If communication is lost with the solenoid driver, the solenoid states become unknown, so the control system forces the transaxle solenoid power control relay off.	• Traaxle solenoid power control relay turned off, providing PARK, REVERSE, NEUTRAL and 5th gear with TCC open and maximum line pressure. • Harsh engagements. • Poor performance launch (due to 5th drive away). • No TCC apply. • No shifts. • Will turn on MIL .	INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B .
P163E	-	TRID block	Transmission control module programming error.	• TRID version incorrect (TRID version does not match version in PCM Calibration). • 7-digit service banding code checksum or total TRID block checksum invalid.	• Costumer may notice, high engine rpm. • 1st and 3rd gear only. • No TCC apply. • Will turn on MIL .	REFER to Solenoid Body Strategy in this section.

				• Solenoid and Clutch characterization data unavailable. • Failure Me Effect Management will increase pressure and allow only PARK, REVERSE, NEUTRAL, 1st and 3rd gear only.		
P163F	-	TRID block	TRID ID block corrupted, not programmed.	• TRID data not programmed. • Solenoid and Clutch strategy data unavailable. • Failure Mode Effect Management will increase pressure and allow only PARK, REVERSE, NEUTRAL, 1st and 3rd only.	• Failure Mode Effect Management action of limits function to 1st and 3rd gear. • High engine rpm, lack of shifts complaints. • No TCC apply. • Will turn on MIL .	REFER to Solenoid Body Strategy in this section.
P1702	P0706, P0707 and P0708	TR sensor	TR sensor circuit intermittent.	Sister code to P0706 P0707 and P0708 used to illuminate the wrench light.	• Possible no crank, only PARK, REVERSE, NEUTRAL and 5th gear available, harsh engagements.	REPAIR the more specific DTC first. GO to Pinpoint Test D .

					• Extremely delayed engagements (until a DTC is set). • After a DTC is set and the high side opened - harsh engagements, poor performance (due to a 5th gear drive away), no shifts. • Will turn on wrench lamp.	
P1705	-	TR sensor	TR circuit not indicating park/neutral during self-test.	TR sensor not indicating Park or Neutral during Key ON Engine OFF (KOEO) or Key ON Engine Running (KOER) self-test.	-	Rerun KOEO or KOER only.
P1711	-	TFT	TFT sensor out of self-test range.	TFT sensor out of self-test range equals less than -1°C (30°F) or greater than 105°C (220°F) during KOEO or KOER> self-test.	-	RERUN KOEO or KOER only.
P1744	P0741	TCC	TCC solenoid circuit.	Sister code to P0741 used to illuminate the wrench light. Additional common DTC, P163F.	Will turn on wrench lamp.	REFER to Diagnosis By Symptom in this section.
P1780	-	Transmission Control Switch (TCS)	TCS (Overdrive (O/D) Cancel) circuit out of self-test range.	TCS did not change states during KOER self-test.	Customer cannot enter or exit the overdrive feature.	REFER to Section 307-05A .
P1783	-	Transmission overtemperature	Transmission over temperature	Transmission over temperature condition		REFER to Diagnosis By

			condition.	(greater than 135°C [275°F] for at least 5 seconds).	• Torque converter lockup happens earlier than expected. • Will turn on wrench lamp.	Symptom in this section.
P1910	-	Reverse lamp control	Reverse lamp control circuit/open.	Reverse lamp control circuit fault. 6F35 TRan> sensor does not have a high current reverse lamp control switch. This has moved to the PCM.	• Reverse lamps do not function correctly. • Will turn on wrench lamp.	REFER to Section 417-01 .
P1921	P0706, P0707 and P0708	TR switch	Transmission range signal	The PCM sets this DTC when the ignition switch is turned to the crank position and before the PCM receives an engine run signal.	• Engine may not crank.	REPAIR the more specific DTC first. GO to Pinpoint Test D .
P2700	P0751 and P0752	Forward clutch system fault	Transmission forward clutch apply time range/performance.	This code sets with either DTC P0751 or P0752.	• Will turn on wrench lamp.	REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2701	P0756 and P0757	Direct clutch system fault	Transmission direct clutch apply time range/performance.	This code sets with either DTC P0756 or P0757.	• Will turn on wrench lamp.	REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2702	P0761 and P0762	Intermediate clutch system faults	Transmission intermediate clutch apply time range/performance.	This code sets with either DTC P0761 or P0762.	• Will turn on wrench lamp.	REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.
P2703	P0766 and P2704	Low/Reverse clutch and OWC faults (covers just the clutches)	Transmission low/reverse clutch apply time range/performance.	Low/reverse clutch stuck off with overdrive clutch stuck off. Most likely cause	• Low/reverse clutch off is a	REPAIR the more specific DTC first. REFER to

				is SSD non-electrical failure or low/reverse/overdrive regulator valve stuck in default position.	ratio based test. • Low/reverse clutch is only tested for failed off in the low manual lever position. • The customer might notice no engine braking in 1st gear, and erratic shifting as the diagnostics isolates the fault to low/reverse clutch failed off. • Delayed or no reverse engagement. • Will turn on wrench lamp.	Diagnosis By Symptom in this section.
P2704	P0766, P0767 and P2703	Overdrive clutch system faults	Transmission overdrive clutch apply time range/performance.	Overdrive clutch stuck off with low/reverse clutch stuck off. Most likely cause is SSD non-electrical failure or low/reverse/overdrive regulator valve stuck in default position. Overdrive clutch stuck	• Overdrive clutch failed off. • Will turn on wrench lamp.	REPAIR the more specific DTC first. REFER to Diagnosis By Symptom in this section.

				on. Possibly overdrive clutch, SSD , low/reverse/overdrive regulator valve stuck in spring compressed position.		
P2705	-	OWC failed	Transmission OWC apply time range/performance.	• The OWC holds in 1st gear. If the OWC fails off, 1st gear is failed to neutral. • 1st gear is disabled for this failure since low/reverse clutch is not intended to hold power on torque in 1st gear.	• Customer might notice neutral conditions when 1st gear is commanded. • Erratic shifting as the diagnostic isolates the cause of the neutral condition to the OWC being failed. • Poor launch performance (due to 2nd gear drive away). • Harsh engagements. • Will turn on wrench lamp.	REFER to Diagnosis By Symptom in this section.
P2760	P0743 and P0744	TCC solenoid	TCC pressure control solenoid intermittent.	Intermittent TCC solenoid short to ground. A short to ground will cause the TCC to apply, which can stall the engine at low vehicle speeds. The PCM will disable the high side driver until vehicle speed is	• Poor launch performance (due to 5th gear drive away).	REPAIR the more specific DTC first. GO to Pinpoint Test A .

				high enough that the engine won't stall. With the high side driver off the fault can not be detected. If the fault goes away while the high side is off the vehicle will have a 5th gear launch with no DTC. If this occurs 3 times with no DTC P0742 being set, then DTC P2760 will set.	• No TCC apply. • No shifts. • Will turn on wrench lamp.	
P2783	-	Torque converter	Torque converter temperature too high.	• TCC control valve stuck in the apply position. When the TCC is commanded open there will be no flow through the TCC (both apply and release circuits will be exhausted). • Test will run in 3rd gear or higher when valve 2 is in the latched position, pointing SSD at overdrive clutch when the TCC is commanded open. SSE is turned on, if the control valve is stuck, this will cause the TCC to apply even though the TCC solenoid is off.	• Torque converter temperature too high. • Erratic shifts, vehicle disengages at a stop while in drive or low, early TCC apply. • Will turn on MIL .	REFER to Diagnosis By Symptom in this section.

Pinpoint Tests - OSC Equipped Vehicle

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

When an electrical conr solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new components as required.

Shift Solenoid Pre-Diagnosis

Use the following shift solenoid operation information when carrying out Pinpoint Test A.

Solenoid Operation Chart

Base Selector Lever Position	PCM Commanded Gear	Shift Solenoid					TCC (VFS) NL
		SSA (VFS) NL (CB 1,2,3,4)	SSB (VFS) NH (3,5,R)	SSC (VFS) NL (CB 2,6)	SSD (VFS) NH (CB L,R/C 4,5,6)	SSE (On/Off) NC	
P	P	Off	On	Off	Off	On	Off
R	R	Off	Off	Off	Off	On	Off
N	N	Off	On	Off	Off	On	Off
D	1	On	On	Off	Off [a]	On [b]	Off
	2	On	On	On	On	Off	Off

	4	On	On	Off	Off	Off	On/Off
	5	Off	Off	Off	Off	Off	On/Off
	6	Off	On	On	Off	Off	On/Off
L	1	On	On	Off	Off	On	Off

[a] Turns on above 8 km/h (5 mph).
[b] Turns off above 8 km/h (5 mph).

CB = Clutch brake

NC = Normally closed

NH = Normally high

NL = Normally low

Shift Solenoid Failure Mode Chart "Failed ON" or "Failed OFF"

Failed ON/OFF due to PCM and/or vehicle wiring concerns and/or solenoid electrically, mechanically or hydraulically stuck on/off.

Shift Solenoid A (SSA)

Gear Commanded	Actual Gears Obtained	
	Failed ON (High Pressure)	**Failed OFF (Low Pressure)**
R	R	R
D	1, 2, 3, 4	5, 6

Shift Solenoid B (SSB)

Gear Commanded	Actual Gears Obtained	
	Failed ON (Low Pressure)	**Failed OFF (High Pressure)**
R	N [a]	R
D	1, 2, 4, 6	3, 5

[a] Reverse is available if the solenoid circuit failed causing transaxle solenoid power control solenoid to remove voltage to all solenoids.

Shift Solenoid C (SSC)

Gear Commanded	Actual Gears Obtained	
	Failed ON (High Pressure)	**Failed OFF (Low Pressure)**
R	R	R
D	2, 6	1, 3, 4, 5

Shift Solenoid D (SSD)

Gear Commanded	Actual Gears Obtained	
	Failed ON (Low Pressure)	**Failed OFF (High Pressure)**
R	N [a]	R

D	1, 2, 3 [b]	4, 5, 6

[a] Reverse is available if the solenoid circuit failed causing transaxle solenoid power control solenoid to remove voltage to all solenoids.
[b] No engine braking.

Shift Solenoid E (SSE)

Gear Commanded	Actual Gears Obtained	
	Failed ON (High Pressure)	Failed OFF (Low Pressure)
R	R	R
D	1, 2	1, 2, 3, 4, 5, 6 [a]

[a] No engine braking.

Pinpoint Tests

Refer to Wiring Diagrams Cell 30 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for schematic and connector information.

PINPOINT TEST A: TRANSAXLE CONTROL SOLENOIDS

NOTE: Refer to the transaxle connector illustrations and solenoid body leadframe internal wiring diagram Transaxle Connector Layouts in this section.

Test Step	Result / Action to Take
A1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the transaxle harness connector is fully seated, terminals are engaged in connector and in good condition before proceeding. • Connect the scan tool. • Carry out the Key ON Engine OFF (KOEO) until continuous DTCs have been displayed. • Enter the Output Test Mode. • Select the mode ALL ON. Push START to turn outputs ON. Push STOP to turn outputs OFF. • **Does vehicle enter Output Test Mode?**	**Yes** GO to A2 . **No** PRESS START. If vehicle does not enter Output Test Mode, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
A2 CHECK THE SOLENOID CIRCUIT FOR AN OPEN	

- Ignition OFF.
- Disconnect: Transaxle Vehicle Harness C1520A.
- Use a mirror to inspect both ends of the connector for damage or pushed-out pins, corrosion, loose wires and missing or damaged seals.
- Disconnect: PCM Transaxle Harness C175T .
- Use a mirror to inspect both ends of the connector for damage or pushed out pins, corrosion, loose wires and missing or damaged seals.
- Measure the resistance of the suspect solenoid circuit between the PCM transaxle harness C175T and transaxle vehicle harness C1520A using the following chart.

Shift Solenoid	Transaxle Vehicle Harness	PCM
Shift Solenoid A (SSA) CET05 (BU/GN)	C1520A-8	C175T-45
Shift Solenoid B (SSB) CET06 (GN/BN)	C1520A-9	C175T-43
Shift Solenoid C (SSC) CET07 (GY/OG)	C1520A-4	C175T-44
Shift Solenoid D (SSD) CET08 (BN/WH)	C1520A-10	C175T-10
Shift Solenoid E (SSE) CET18 (GY/YE)	C1520A-7	C175T-11
Line Pressure Control (LPC) CET09 (YE/VT)	C1520A-3	C175T-34
Torque Converter Clutch (TCC) CET10	C1520A-6	C175T-46

Yes
GO to A3 .

No
REPAIR the circuit(s) for an open. RECONNECT all components. TEST the system for normal operation.

(BU/GY)		

- **Is the resistance less than 5 ohms?**

A3 CHECK THE SOLENOID CIRCUIT FOR A SHORT TO GROUND

- Measure the resistance between the transaxle vehicle harness C1520A, harness side and ground using the following chart.

Shift Solenoid	Transaxle Vehicle Harness	Ground
Shift Solenoid A (SSA) CET05 (BU/GN)	C1520A-8	Ground
Shift Solenoid B (SSB) CET06 (GN/BN)	C1520A-9	Ground
Shift Solenoid C (SSC) CET07 (GY/OG)	C1520A-4	Ground
Shift Solenoid D (SSD) CET08 (BN/WH)	C1520A-10	Ground
Shift Solenoid E (SSE) CET18 (GY/YE)	C1520A-7	Ground
Line Pressure Control (LPC) CET09 (YE/VT)	C1520A-3	Ground
Torque Converter Clutch (TCC) CET10 (BU/GY)	C1520A-6	Ground

- **Is the resistance greater than 10,000 ohms?**

Yes
GO to A4 .

No
REPAIR the circuit(s) for a short to ground. RECONNECT all components. TEST the system for normal operation.

A4 CHECK THE SOLENOID CIRCUIT FOR A SHORT TO POWER

- Measure the voltage between the transaxle vehicle harness electrical C1520A, harness side and ground using the following chart.

Yes
REPAIR the circuit(s) for a short to power. RECONNECT all components. TEST the system for normal operation.

No
GO to A5 .

Shift Solenoid	Transaxle Vehicle Harness	Ground
Shift Solenoid A (SSA) CET05 (BU/GN)	C1520A-8	Ground
Shift Solenoid B (SSB) CET06 (GN/BN)	C1520A-9	Ground
Shift Solenoid C (SSC) CET07 (GY/OG)	C1520A-4	Ground
Shift Solenoid D (SSD) CET08 (BN/WH)	C1520A-10	Ground
Shift Solenoid E (SSE) CET18 (GY/YE)	C1520A-7	Ground
Line Pressure Control (LPC) CET09 (YE/VT)	C1520A-3	Ground
Torque Converter Clutch (TCC) CET10 (BU/GY)	C1520A-6	Ground

- **Is any voltage present?**

A5 CHECK THE RESISTANCE OF THE SOLENOID FIELD CIRCUIT

- Measure the resistance between the transaxle solenoid body leadframe main electrical connector C1520A-5, component side and the suspect solenoid pin, component side and compare the value to the specifications in the table below.

Shift Solenoid	Solenoid Body Lead - Frame Pin	C1520A-5 (Component Side)
Shift Solenoid A (SSA)	C1520A-8	C1520A-5
Shift Solenoid B (SSB)	C1520A-9	C1520A-5
Shift Solenoid C	C1520A-4	C1520A-5

Yes
INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B . RECONNECT all components. TEST the system for normal operation.

No
REMOVE the main control cover. REFER to Main Control Cover in this section. INSPECT the solenoid body for foreign material such as metal shavings on the exposed metal contacts or other components. CLEAR the solenoid body and RECHECK the resistance values. If the resistance values are still out of specification, GO to A6 . INSTALL a new solenoid(s). REFER to Solenoids in this section. RECONNECT all components. TEST the system for normal operation.

(SSC)		
Shift Solenoid D (SSD)	C1520A-10	C1520A-5
Shift Solenoid E (SSE)	C1520A-7	C1520A-5
Line Pressure Control (LPC)	C1520A-3	C1520A-5
Torque Converter Clutch (TCC)	C1520A-6	C1520A-5

Solenoid Resistance Values: SHIFT SOLENOID A (SSA), SHIFT SOLENOID B (SSB), SHIFT SOLENOID C (SSC), SHIFT SOLENOID D (SSD), TORQUE CONVERTER CLUTCH (TCC) and LINE PRESSURE CONTROL (LPC)

Temperature		Resistance (ohms)
°C	°F	
-20 to -10	-4 to 14	3.24-5.13
-10 to 0	14-32	3.43-5.32
0-10	32-50	3.62-5.51
10-20	50-68	3.81-5.70
20-30	68-86	4.00-5.89
30-40	86-104	4.19-6.08
40-50	104-122	4.38-6.27
50-60	122-140	4.57-6.46
60-70	140-158	4.76-6.65
70-80	158-176	4.95-6.83
80-90	176-194	5.13-7.02
90-100	194-212	5.32-7.21

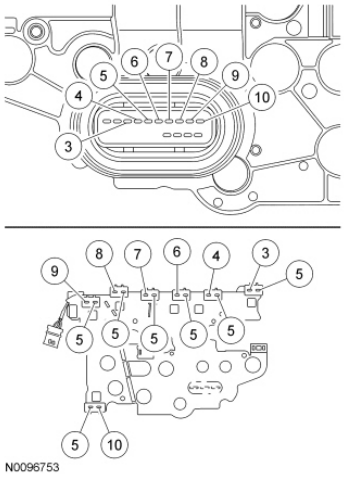
Solenoid Resistance Values: SHIFT SOLENOID E (SSE) (ON/OFF)

Temperature	Resistance (ohms)

°C	°F	
-20 to -10	-4 to 14	15.45-24.35
-10 to 0	14-32	16.35-25.25
0-10	32-50	17.25-26.15
10-20	50-68	18.15-27.05
20-30	68-86	19.05-27.95
30-40	86-104	19.95-28.85
40-50	104-122	20.85-29.75
50-60	122-140	21.75-30.65
60-70	140-158	22.65-31.54
70-80	158-176	23.54-32.44
80-90	176-194	24.44-33.34
90-100	194-212	25.34-34.24

- **Is the resistance within specifications?**

A6 CHECK THE SOLENOID BODY LEADFRAME FOR AN OPEN



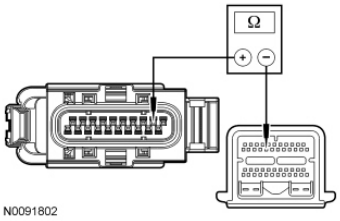
- Remove the solenoid body leadframe. Refer to Solenoid Body Leadframe in this section.
- Measure the resistance between the solenoid body leadframe main electrical connector C1520A, component side and the corresponding solenoid pins using the following chart.

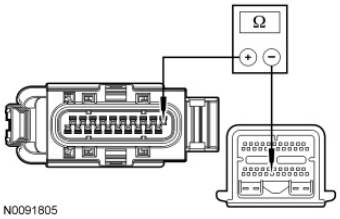
Solenoid Body Leadframe Main Connector Pin Number	Circuit Function
3	Line Pressure Control (LPC) solenoid control
4	Shift Solenoid C (SSC) control
5	Solenoid power supply
6	Torque Converter Clutch (TCC) solenoid control
7	Shift Solenoid E (SSE) control
8	Shift Solenoid A (SSA) control
9	

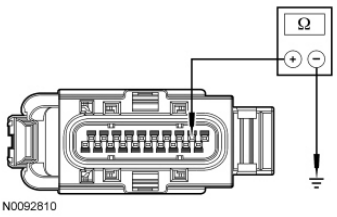
Yes
INSTALL a new solenoid(s). REFER to Solenoids in this section. RECONNECT all components. TEST the system for normal operation.

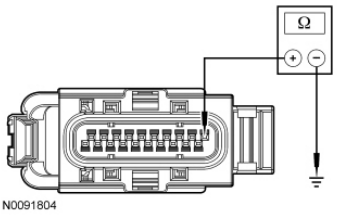
No
INSTALL a new solenoid body leadframe. REFER to Solenoid Body Leadframe in this section.

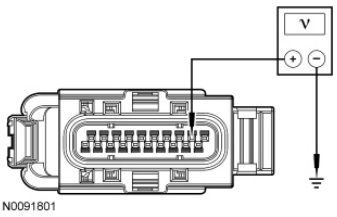
	Shift Solenoid B (SSB) control
10	Shift Solenoid D (SSD) control

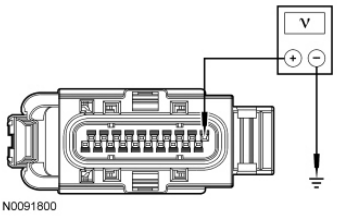


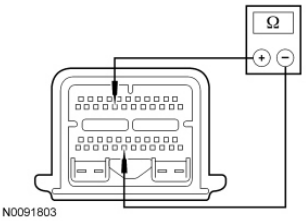












- **Is the resistance less than 5 ohms?**

PINPOINT TEST B: TFT SENSOR

NOTE: Refer to the transaxle connector illustrations and solenoid body leadframe internal wiring diagram Transaxle Connector Layouts in this section.

Test Step	Result / Action to Take
B1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the transaxle vehicle harness C1520A is fully seated, terminals are fully engaged in connector and in good condition before proceeding. • **Have the above items been checked?**	**Yes** GO to B2 . **No** CARRY OUT checks. CLEAR the DTCs. REPEAT the self-test.
B2 CHECK THE TFT SENSOR CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Transaxle Vehicle Harness C1520A. • Disconnect: PCM Transaxle Harness C175T. • Use a mirror to inspect both ends of the connector for damage or pushed-out terminals, corrosion, loose wires and missing or damaged seals. • Measure the resistance between PCM transaxle harness C175T-19, circuit VET27 (BN/YE) and transaxle vehicle harness C1520A-2, circuit VET27 (BN/YE).	**Yes** GO to B3 . **No** REPAIR the circuit(s) for an open. CONNECT all components. TEST the system for normal operation.

 N0091802 • Measure the resistance between PCM transaxle harness C175T-41, circuit RE406 (GY/VT) and transaxle vehicle harness C1520A-1, circuit RE406 (GY/VT).  N0091805 • **Is the resistance less than 5 ohms?**	
B3 CHECK THE TFT SENSOR CIRCUITS FOR A SHORT TO GROUND	
• Disconnect: Catalyst Monitor Sensor (CMS) C141. • Disconnect: CMS C142. • Measure the resistance between transaxle vehicle harness C1520A-2, circuit VET27 (BN/YE) and ground.  N0092810 • Measure the resistance between transaxle vehicle harness C1520A-1, circuit RE406 (GY/VT) and ground.  N0091804 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit(s) for a short to ground. CONNECT all components. TEST the system for normal operation.
B4 CHECK THE TFT CIRCUITS FOR A SHORT TO VPWR	

• Measure the voltage between transaxle vehicle harness C1520A-2, circuit VET27 (BN/YE) and ground.  • Measure the voltage between transaxle vehicle harness C1520A-1, circuit RE406 (GY/VT) and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit(s) for a short to voltage. CONNECT all components. TEST the system for normal operation. **No** GO to B5 .
B5 CHECK THE RESISTANCE OF THE TFT SENSORS/HARNESS	
• Vehicle must be at normal operating temperature. • Connect: Transaxle Vehicle Harness C1520A. • **TEST 1.** • Measure and record the resistance between PCM transaxle harness C175T-19, circuit VET27 (BN/YE) and C175T-41, circuit RE406 (GY/VT).  • Compare the resistance value to the following table ranges: **TRANSMISSION FLUID TEMPERATURE (TFT)** **°C** / **°F** / **Resistance (Ohms)** -40 to -20 / -40 to -4 / 1076K-269K -19 to -1 / -3 to 31 / 309K-91K 0-20 / 32-68 / 104K-35K 21-40 / 69-104 / 40K-15K	**Yes** INSTALL a new PCM. CONNECT all components. TEST the system for normal operation. **No** INSTALL a new solenoid body leadframe. REFER to Solenoid Body Leadframe in this section. RECONNECT all components. TEST the system for normal operation.

41-70	105-158	17K-4.9K
71-90	159-194	5.6K-2.5K
91-110	195-230	3.0K-1.4K
111-130	231-266	1.7K-0.8K
131-150	267-302	0.97K-0.56K

- **TEST 2.**
- Check for intermittent short or open.
- If the resistance was between 0.8K and 100K ohms carry out the following test. If the transaxle is warm, allow it to cool. Check the TFT sensor resistance again. Compare the resistance with the initial resistance. The resistance should decrease if the transaxle was heated and should increase if the transaxle was allowed to cool. If correct, then change in the resistance occurs, repeat On-Board Diagnostic (OBD).
- **Is the resistance in range?**

PINPOINT TEST C: OSS SENSOR

NOTE: Refer to the transaxle connector illustrations and solenoid body leadframe internal wiring diagram Transaxle Connector Layouts in this section.

NOTE: Output Shaft Speed (OSS) codes may be a result of a bad common power or ground shared between the Transmission Range (TR) sensor, OSS sensor and Turbine Shaft Speed (TSS) sensor.

Test Step	Result / Action to Take
C1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the transaxle vehicle harness C1520A is fully seated, terminals are engaged in connector and in good condition before proceeding. • **Have the items above been checked?**	**Yes** GO to C2 . **No** CARRY OUT the checks. CLEAR the codes. RERUN the On-Board Diagnostic (OBD) tests.
C2 ELECTRONIC DIAGNOSTICS	
• Connect the scan tool. • Monitor the OSS sensor PIDs while test driving the vehicle. • **Is the OSS sensor signal present and consistent?**	**Yes** The condition that set the DTC is intermittent and is not currently present. CLEAR the DTCs. RERUN the OBD tests. **No** GO to C3 .
C3 CHECK THE VEHICLE HARNESS FOR AN OPEN CIRCUIT	
• Disconnect: Transaxle Vehicle Harness C1520A. • Disconnect: PCM Transaxle Harness C175T. • Use a mirror to inspect both ends of the connectors for damage or pushed-out terminals, corrosion, loose wires and missing or damaged seals. • Measure the resistance for the OSS sensor circuit,	**Yes** GO to C4 . **No** REPAIR the circuit(s) for an open. CONNECT all components. TEST the system for normal operation.

between the transaxle vehicle harness C1520A and the PCM transaxle harness C175T, harness using the following chart.

Output Shaft Speed Sensor Circuit	Transaxle Vehicle Harness	PCM
Output Shaft Speed (OSS) sensor power supply LE111 (VT/GN)	C1520A-18	C175T-1
OSS sensor ground RET24 (BN/BU)	C1520A-20	C175T-36
OSS sensor signal VET26 (BN/GN)	C1520A-19	C175T-25

- **Is the resistance less than 5 ohms?**

C4 CHECK THE VEHICLE HARNESS FOR A SHORT TO GROUND

- Disconnect: Transaxle Vehicle Harness C1520B.
- Measure the resistance for the OSS sensor circuit between the transaxle vehicle harness C1520A and ground using the following chart.

Output Shaft Speed Sensor Circuit	Transaxle Vehicle Harness	Ground
Transmission Range (TR)/ OSS sensor power supply LE111 (VT/GN)	C1520A-18	Ground
TR / OSS sensor ground RET24 (BN/BU)	C1520A-20	Ground
OSS sensor signal VET26 (BN/GN)	C1520A-19	Ground

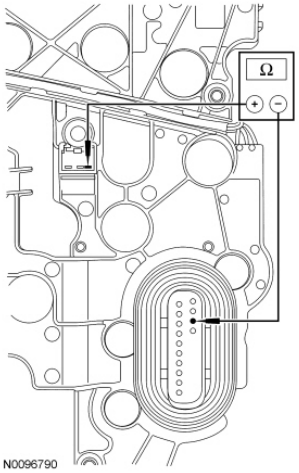
- **Is the resistance greater than 10,000 ohms?**

Yes
GO to C5 .

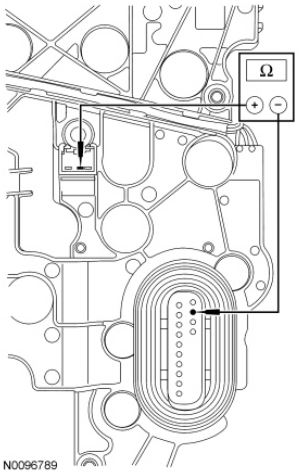
No
REPAIR the circuit(s) for a short to ground. CONNECT all components. TEST the system for normal operation.

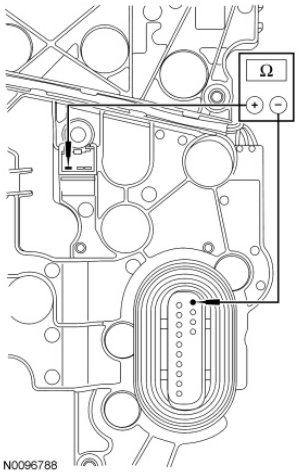
C5 CHECK THE VEHICLE HARNESS FOR A SHORT TO VPWR

- Check for voltage between the OSS sensor circuits and the transaxle vehicle harness C1520A using the following chart.



Yes
REPAIR the circuit(s) for a short to voltage. CONNECT all components. TEST the system for normal operation.





No

	GO to C6 .

Output Shaft Speed Sensor Circuit	Transaxle Vehicle Harness	Ground
Transmission Range (TR)/ OSS sensor power supply LE111 (VT/GN)	C1520A-18	Ground
TR / OSS sensor ground RET24 (BN/BU)	C1520A-20	Ground
OSS sensor signal VET26 (BN/GN)	C1520A-19	Ground

- **Is any voltage present?**

C6 CHECK THE SOLENOID BODY FOR AN INTERNAL OPEN CIRCUIT	
• Remove the main control cover. Refer to Main Control Cover in this section. • Disconnect: TR Sensor. • Disconnect: OSS Sensor. • Use a mirror to inspect both ends of the connectors for damage or pushed-out terminals, corrosion, loose wires and missing or damaged seals. • Measure the resistance of the solenoid body internal sensor power circuit between the main solenoid body leadframe connector pin 18, leadframe side and the OSS sensor connector pin 4, leadframe side.  • Measure the resistance of the solenoid body internal sensor signal circuit between the main solenoid body leadframe connector pin 19, leadframe side and the OSS sensor connector pin 3, leadframe side.	**Yes** GO to C7 . **No** INSTALL a new solenoid body leadframe. REFER to Solenoid Body Leadframe in this section. CONNECT all components. TEST the system for normal operation.

 • Measure the resistance of the solenoid body internal sensor ground circuit between the main solenoid body leadframe connector pin 20, leadframe side and the OSS sensor connector pin 1, leadframe side.  • **Is the resistance less than 5 ohms?**	
C7 CHECK FOR VOLTAGE AND GROUND AT THE OSS SENSOR CONNECTOR	
• Connect: PCM C175T. • Connect: Transaxle Vehicle Harness C1520A. • Ignition ON. • Measure the voltage on the solenoid body leadframe between OSS sensor connector pins 1 and 4.	**Yes** INSTALL a new speed sensor. REFER to Output Shaft Speed (OSS) Sensor in this section. TEST the system for normal operation. If the condition is still present, INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B . **No** INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B . CONNECT all components. TEST the system for normal operation.

 • **Is the voltage greater than 10 volts?**	

PINPOINT TEST D: TR SENSOR

NOTE: Refer to the transaxle connector illustrations and solenoid body leadframe internal wiring diagram Transaxle Connector Layouts in this section.

NOTE: Transmission Range (TR) codes may be a result of a bad common power and ground shared between the TR sensor, Output Shaft Speed (OSS) sensor and Turbine Shaft Speed (TSS) sensor.

Test Step	Result / Action to Take
D1 VERIFY DTCs	
• Ignition OFF. • Select PARK. • Start the engine. • Carry out the On-Board Diagnostic (OBD) Test. DTCs P0706, P0707 and P0708 cannot be set by an incorrectly adjusted selector lever cable. • **Are only TR DTC codes present?**	**Yes** GO to D3 . **No** GO to D2 .
D2 VERIFY SELECTOR LEVER CABLE/LINKAGE ADJUSTMENT	
• Verify that the selector lever cable/linkage is correctly adjusted. Refer to Section 307-05A . • **Is the selector lever cable/linkage correctly adjusted?**	**Yes** GO to D3 . **No** ADJUST the selector lever cable/linkage. REFER to Section 307-05A . GO to D4 .
D3 CHECK THE ELECTRICAL SIGNAL OPERATION	
• Select PARK. • Disconnect: PCM Transaxle C175T. • Disconnect: Transaxle Vehicle Harness C1520A. • Use a mirror to inspect both ends of the connectors for damaged or pushed-out terminals, corrosion, loose wires and missing or damaged seals. • **Is there damage to the connectors, terminals or harness?**	**Yes** REPAIR as required. CLEAR the DTCs and RERUN OBD tests. **No** GO to D4 .
D4 CHECK ELECTRICAL SYSTEM OPERATION (TR AND PCM)	

• Ignition OFF. • Connect the scan tool. • Connect: PCM Transaxle Harness C175T. • Connect: Transaxle Vehicle Harness C1520A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: TR PIDs TR_DC and TR_FREQ. • Move the selector lever into each gear and stop. • Observe the following PIDs; TR_DC and TR_FREQ while wiggling harness or driving the vehicle. • Monitor PID: TR_FREQ. • Compare the PID: TR_DC to the TR position Duty Cycle Chart. **Selector Lever Position / Range (% Duty Cycle)** P: 8.0 - 25.8 R: 37.50 - 49.31 N: 54.54 - 62.49 D: 67.35 - 81.15 L: 81.15 - 92 • **Is PID TR_FREQ between 100 to 150 Hz?** **Is PID TR_DC in range?** **Do the PIDs TR_DC and TR_FREQ remain steady when the harness is wiggled or the vehicle driven?**	**Yes** The problem is not in the TR sensor system. REFER to Diagnosis By Symptom in this section for further diagnosis. **No** If the PIDs change when wiggling the harness or driving the vehicle, the problem may be intermittent. GO to D5 .
D5 CHECK THE TRANSAXLE VEHICLE HARNESS FOR AN OPEN	
• Disconnect: PCM Transaxle Harness C175T. • Disconnect: Transae Harness C1520A. • Measure the resistance for the TR sensor circuits between the transaxle vehicle harness C1520A and the PCM transaxle harness C175T using the following chart. **Transmission Range Sensor Circuit / Transaxle Vehicle Harness / PCM** TR Ground RET24 (BN/BU) / C1520A-20 / C175T-36	**Yes** GO to D6 . **No** REPAIR the circuit. CONNECT all components. TEST the system for normal operation.

TR Signal VET32 (VT)	C1520A-17	C175T-39
TR Power LE111 (VT/GN)	C1520A-18	C175T-1

- **Is the resistance less than 5 ohms?**

D6 CHECK THE TRANSAXLE VEHICLE HARNESS FOR A SHORT TO GROUND

- Disconnect: Transaxle Vehicle Harness C1520B.
- Measure the resistance for the TR sensor circuits between the transaxle vehicle harness C1520A and ground using the following chart.

Transmission Range Sensor Circuit	Transaxle Vehicle Harness	Ground
TR Ground RET24 (BN/BU)	C1520A-20	Ground
TR Signal VET32 (VT)	C1520A-17	Ground
TR Power LE111 (VT/GN)	C1520A-18	Ground

- **Are all resistances greater than 10,000 ohms?**

Yes
GO to D7 .

No
REPAIR shorted circuit(s). RECONNECT all components. TEST the system for normal operation.

D7 CHECK THE TRANSAXLE VEHICLE HARNESS FOR A SHORT TO POWER

- Measure the voltage for the TR sensor circuits between the transaxle vehicle harness C1520A and ground using the following chart.

Transmission Range Sensor Circuit	Transaxle Vehicle Harness	Ground
TR Ground RET24 (BN/BU)	C1520A-20	Ground
TR Signal VET32 (VT)	C1520A-17	Ground
TR Power LE111 (VT/GN)	C1520A-18	Ground

- **Is any voltage present?**

Yes
REPAIR shorted circuit(s). RECONNECT all components. TEST the system for normal operation.

No
GO to D8 .

D8 CHECK FOR A SHORT BETWEEN TR /PCM INPUT SIGNAL CIRCUITS

- Measure the resistance between TR sensor circuits at the transaxle vehicle harness C1520A using the following chart.

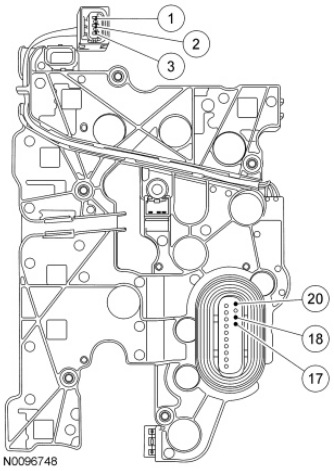
Transaxle Vehicle Harness	TR Sensor Circuit	Transaxle Vehicle Harness
C1520A-20	TR Ground RET24 (BN/BU)	C1520A-17 and C1520A-18
C1520A-17	TR Signal VET32 (VT)	C1520A-18 and C1520A-20
C1520A-18	TR Power LE111 (VT/GN)	C1520A-17 and C1520A-20

- **Are all resistances greater than 10,000 ohms?**

Yes
GO to D9 .

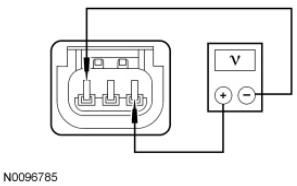
No
REPAIR shorts on circuits having less than 10,000 ohms between other TR /PCM input signal circuits. RECONNECT all components. TEST the system for normal operation.

D9 CHECK FOR AN INTERNAL SOLENOID BODY OPEN FOR THE TR SENSOR CIRCUITS



- Remove the main control cover. Refer to Main Control Cover in this section.
- Disconnect: TR Sensor Connector.
- Use a mirror to inspect both ends of the connector for damage or pushed-out terminals, corrosion, loose wires and missing or damaged seals.
- Measure the resistance of the TR sensor circuits between the solenoid body leadframe main connector, component side and the TR sensor connector, leadframe side.

Solenoid Body Leadframe Main Connector Pin Number	TR Sensor Pin Number	Circuit Function (Wire Color)
18	1	Transmission Range (TR) power (RD)
17	2	TR signal (WH)



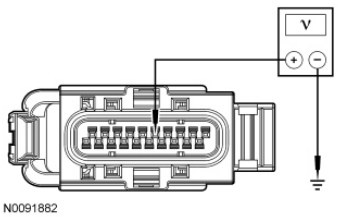
Yes
GO to D10 .

No
INSTALL a new solenoid body leadframe. REFER to Solenoid Body Leadframe in this section. RECONNECT all components. TEST the system for normal operation.

20	3	TR ground (BK)

- **Is the resistance less than 5 ohms?**

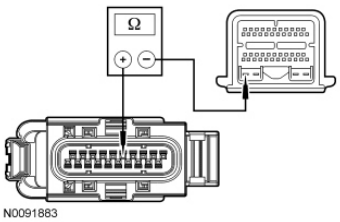
D10 CHECK FOR VOLTAGE AND GROUND AT THE TR SENSOR CONNECTOR	
• Connect: PCM C175T. • Connect: Transaxle Vehicle Harness C1520A. • Ignition ON. • Measure the voltage on the solenoid body leadframe between TR sensor connector pins 1 (RD) and 3 (BK) solenoid body leadframe side.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new TR sensor. REFER to Digital Transmission Range (TR) Sensor in this section. TEST the system for normal operation. If the condition is still present, INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B . **No** INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B . CONNECT all components. TEST the system for normal operation.

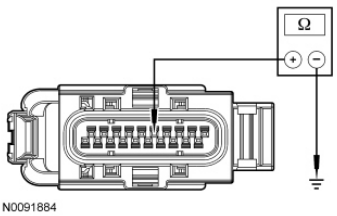


PINPOINT TEST E: TRANSAXLE SOLENOID PRESSURE CONTROL CIRCUIT

NOTE: Refer to the Transaxle Vehicle Harness Connector illustration Transaxle Connector Layouts in this section.

Test Step	Result / Action to Take
E1 CHECK FOR VOLTAGE AT THE TRANSAXLE VEHICLE HARNESS CONNECTOR	





NOTICE: **Do not use a solenoid control circuit that may be at fault. Failure to jump pin 5 to a known good solenoid control circuit can cause incorrect diagnostic results. For additional information, REFER to Diagnostic Trouble Code (DTC) Charts in this section for a fault listing.** • Ignition OFF. • Disconnect: Transaxle Vehicle Harness C1520A. • Inspect the connector for damaged or pushed out terminals, corrosion, loose wires and missing or damaged seals. • Using the chart, connect a fused jumper between one of the 7 solenoid control circuit pins on the transmission vehicle harness C1520A and C1520A-5.	**Yes** INSTALL a new Line Pressure Control (LPC) solenoid. REFER to Solenoids in this section. RECONNECT all components. TEST the system for normal operation. **No** GO to E2 .

Transmission Vehicle Harness C1520A	Solenoid Control Circuit
C1520A-8	Shift Solenoid A (SSA) CET05 (BU/GN)
C1520A-9	Shift Solenoid B (SSB) CET06 (GN/BN)
C1520A-4	Shift Solenoid C (SSC) CET07 (GY/OG)
C1520A-10	Shift Solenoid D (SSD) CET08 (BN/WH)
C1520A-7	Shift Solenoid E (SSE) CET18 (GY/YE)
C1520A-3	Line Pressure Control (LPC) solenoid CET09 (YE/VT)
C1520A-6	Torque Converter Clutch (TCC) solenoid CET10 (BU/GY)

- Ignition ON.
- Measure the voltage between the transaxle vehicle harness C1520A-5 circuit CET25 (BU/GN) harness side to ground.
- **Is the voltage greater than 10 volts?**

E2 CHECK THE TRANSAXLE SOLENOID PRESSURE CONTROL CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: PCM Transaxle Harness C175T. • Measure the resistance between the PCM transaxle C175T-50, circuit CET25 (BU/GN) and transaxle vehicle harness C1520A-5, circuit CET25 (BU/GN).  • **Is the resistance less than 5 ohms?**	**Yes** GO to E3 . **No** REPAIR circuit CET25 (BU/GN) for an open. RECONNECT all components. TEST the system for normal operation.
E3 CHECK THE TRANSAXLE SOLENOID POWER CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between the transaxle vehicle harness C1520A-5, circuit CET25 (BU/GN) and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B . RECONNECT all components. TEST the system for normal operation. **No** REPAIR circuit CET25 (BU/GN) for a short to ground. RECONNECT all components. TEST the system for normal operation.

PINPOINT TEST F: TSS SENSOR

NOTE: Refer to the transaxle connector illustrations and solenoid body leadframe internal wiring diagram Transaxle Connector Layouts in this section.

NOTE: Turbine Shaft Speed (TSS) sensor codes may be a result of bad power and ground circuits shared between the Transmission Range (TR) sensor, Output Shaft Speed (OSS) sensor and TSS sensor.

Test Step	Result / Action to Take
F1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the transaxle vehicle harness C1520A is fully seated, terminals are engaged in connector and in good condition before proceeding. • **Have the items above been checked?**	**Yes** GO to F2 . **No** CARRY OUT the checks. CLEAR the DTCs. RERUN the On-Board Diagnostic (OBD) tests.

<table>
<tr><td>F2 ELECTRONIC DIAGNOSTICS</td><td></td></tr>
<tr><td>• Connect the scan tool.
• Monitor the TSS sensor PIDs while test driving the vehicle.
• Is the TSS sensor signal present and consistent?</td><td>Yes
The condition that set the DTC is intermittent and is not currently present. CLEAR the DTCs. RERUN the OBD tests.

No
GO to F3 .</td></tr>
<tr><td>F3 CHECK THE TRANSAXLE VEHICLE HARNESS FOR AN OPEN CIRCUIT</td><td></td></tr>
<tr><td>• Disconnect: TSS Sensor C1520B.
• Disconnect: PCM Transaxle Harness C175T.
• Use a mirror to inspect both ends of the connectors for damage or pushed-out terminals, corrosion, loose wires and missing or damaged seals.
• Measure the resistance between the TSS C1520B and the PCM transaxle C175T.

<table><tr><th>Turbine Shaft Speed (TSS) Sensor Circuit</th><th>Turbine Shaft Speed (TSS) Sensor</th><th>PCM</th></tr><tr><td>TSS sensor power supply LE111 (VT/GN)</td><td>C1520B-3</td><td>C175T-1</td></tr><tr><td>TSS sensor ground RET24 (BN/BU)</td><td>C1520B-1</td><td>C175T-36</td></tr><tr><td>TSS sensor signal VET33 (WH/OG)</td><td>C1520B-2</td><td>C175T-16</td></tr></table>
• Is the resistance less than 5 ohms?</td><td>Yes
GO to F4 .

No
REPAIR the circuit(s) for an open. CONNECT all components. TEST the system for normal operation.</td></tr>
<tr><td>F4 CHECK THE TRANSAXLE VEHICLE HARNESS FOR A SHORT TO GROUND</td><td></td></tr>
<tr><td>• Disconnect: Transaxle Vehicle Harness Connector C1520A.
• Measure the resistance between TSS sensor C1520B and ground.

<table><tr><th>Turbine Shaft Speed (TSS) Sensor Circuit</th><th>Turbine Shaft Speed (TSS) Sensor</th><th>Ground</th></tr><tr><td>TSS sensor ground RET24 (BN/BU)</td><td>C1520B-1</td><td>Ground</td></tr><tr><td></td><td>C1520B-2</td><td>Ground</td></tr></table></td><td>Yes
GO to F5 .

No
REPAIR the circuit(s) for a short to ground. CONNECT all components. TEST the system for normal operation.</td></tr>
</table>

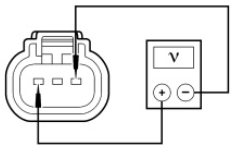
TSS sensor signal VET33 (WH/OG)		
TSS sensor power supply LE111 (VT/GN)	C1520B-3	Ground

- **Is the resistance greater than 10,000 ohms?**

F5 CHECK THE TRANSAXLE VEHICLE HARNESS FOR A SHORT TO POWER

- Check for voltage between the TSS sensor C1520B and ground.

Turbine Shaft Speed (TSS) Sensor Circuit	Turbine Shaft Speed (TSS) Sensor	Ground
TSS sensor ground RET24 (BN/BU)	C1520B-1	Ground
TSS sensor signal VET33 (WH/OG)	C1520B-2	Ground
TSS sensor power supply LE111 (VT/GN)	C1520B-3	Ground



- **Is any voltage present?**

Yes
REPAIR the circuit(s) for a short to voltage. CONNECT all components. TEST the system for normal operation.

No
GO to F6 .

F6 CHECK FOR VOLTAGE AND GROUND AT THE TSS SENSOR CONNECTOR

- Connect: PCM C175T.
- Ignition ON.
- Measure the voltage between TSS sensor C1520B-1 and C1520B-3.

N0096786

- **Is the voltage greater than 10 volts?**

Yes
INSTALL a new speed sensor. REFER to Turbine Shaft Speed (TSS) in this section. TEST the system for normal operation. If the condition is still present, INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B .

No
INSTALL a new PCM. REFER to Section 303-14A or Section 303-14B . CONNECT all components. TEST the system for normal operation.

Special Testing Procedures

Special Tool(s)

 ST1565-A	Transmission Fluid Pressure Gauge 307-004 (T57L-77820-A)
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transaxle.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.

Line Pressure Test

NOTICE: **Carry out the Line Pressure Test prior to carrying out the Stall Speed Test. If the line pressure is low at stall, do not carry out the Stall Speed Test or further transaxle damage will occur. Do not maintain Wide Open Throttle (WOT) in any range for more than 5 seconds.**

This test verifies that the line pressure is within specification.

1. Connect the Transmission Fluid Pressure Gauge to the line pressure tap.
2. Start the engine and check the line pressures. Refer to the Line Pressure Chart to determine if the line pressure is within specification.

Line Pressure Chart

Gear	Line
Pressures at Idle [a]	
P	338-379 kPa (49-55 psi)
R	621-689 kPa (90-100 psi)
N	338-379 kPa (49-55 psi)
D	338-379 kPa (49-55 psi)
L	338-379 kPa (49-55 psi)
Pressure at Wide Open Throttle (WOT) Stall [a]	
P	N/A
R	1,868-2,068 kPa (271-300 psi)
N	N/A
D	1,868-2,068 kPa (271-300 psi)
L	1,868-2,068 kPa (271-300 psi)

[a] All pressures are approximate.

3. If the line pressure is not within specification, see the Line Pressure Diagnosis Chart for line pressure concern causes.

4. When the pressure tests are complete, install the line pressure tap plug.
   - Tighten to 12 Nm (106 lb-in).

Line Pressure Diagnosis Chart

Test Results	Possible Source
HIGH at IDLE - ALL RANGES	Wiring Harnesses Line Pressure Control (LPC) Solenoid Main Regulator Valve
LOW at IDLE - ALL RANGES	Low Transmission Fluid Fluid Inlet Filter/Seal Main Control Body Cross Leaks

	Gaskets Pump Separator Plate
LOW in Park ONLY	Valve Body
LOW in Reverse ONLY	Separator Plate Reverse Clutch Valve Body Forward Clutch
LOW in Neutral ONLY	Valve Body
LOW in Drive O/D ONLY	Forward Clutch Valve Body
LOW in Manual Low ONLY	Forward Clutch Valve Body

Stall Speed Test

⚠ **WARNING: Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **Carry out the Line Pressure Test prior to carrying out the Stall Speed Test. If the line pressure is low at stall, do not carry out the Stall Speed Test or further transaxle damage will occur.**

The Stall Speed Test checks:

- torque convertor operation and installation.
- holding ability of the forward clutch.
- reverse clutch.
- planetary One-Way Clutch (OWC).
- engine driveability concerns.

Conduct this test with the engine coolant and transmission fluid at correct levels and at normal operating temperature.

Apply the park brake firmly for each Stall Speed Test.

Stall Speed Chart

Selector Lever	Engine	rpm
Drive	2.5	2,200-2,500

Drive	3.0	2,400-2,500

1. Connect the scan tool.
2. **NOTE:** If the recorded rpm exceeds the maximum limits, release the accelerator pedal immediately, clutch slippage is indicated.

   In each of the following ranges D, L and R, press the accelerator pedal to Wide Open Throttle (WOT). Do not hold the throttle open for more than 5 seconds at a time.
3. Note the results in each range.
4. After each range, move the selector lever to NEUTRAL and run the engine at 1,000 rpm for about 15 seconds to cool the torque converter before going to the next test.
5. Use the stall speed diagnosis chart for corrective actions.
6. If stall speeds were too high, see the Stall Speed Diagnosis Chart. If stall speeds were too low, first check engine idle speed and tune up. If engine is OK, remove torque converter and check TCC for slippage.

Stall Speed Diagnosis Chart

Range	Possible Source
D, L	Forward Clutch Low/Reverse Clutch Low/One-Way Clutch
R	Low/Reverse Clutch Direct Clutch

Leakage Inspection

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

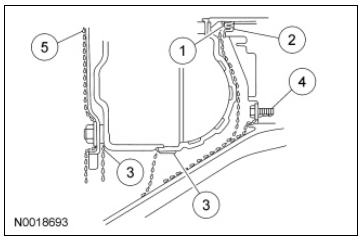
NOTICE: **Do not try to stop the fly increasing the torque beyond specifications. This may cause damage to the case threads.**

Leaks at the transaxle main control cover-to-transaxle often can be stopped by tightening the attaching bolts to 12 Nm (106 lb-in). If necessary, remove the main control cover and inspect for damage. Refer to Main Control Cover in this section.

Check the transmission fluid filler tube connection at the transmission case. If leakage is found here, install a new grommet.

Check transmission fluid tubes and fittings between the transmission and the cooler in the radiator tank for wear or damage. When transmission fluid is found leaking between the case and the transmission fluid cooler tube fitting, check for a missing or damaged O-ring, then tighten the fitting to specification.

If the leak continues, install a new transmission fluid cooler tube fitting and tighten to specification. The same procedure should be followed for transmission fluid leaks between the radiator cooler and the transmission fluid cooler tube fittings. Refer to Section 307-02A .



Check the engine coolant in the radiator. If transmission fluid is present in the coolant, the cooler in the radiator is probably leaking. The cooler can be further checked for leaks by disconnecting the transmission fluid cooler tubes from the cooler fittings and applying no more than 345 kPa (50 psi) air pressure to the fittings. Remove the coolant recovery cap to relieve the pressure at the exterior of the transmission fluid cooler tank. If the cooler is leaking and/or will not hold pressure, install a new cooler.

If transmission fluid leakage is found at the transaxle range selector lever, install a new seal.

If transmission fluid leakage is found at the transaxle internal harness connector, install a new O-ring.

Fluid Leakage in Torque Converter Area

Diagnosing and correcting fluid leaks in the torque converter area, use the following procedures to locate the exact cause of the leakage. Leaks at the front of the transaxle, as evidenced by fluid around the torque converter housing, may have several sources. By careful observation it is possible to pinpoint the source of the leak before removing the transaxle from the vehicle. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 5 steps following correspond with the numbers in the illustration.

1. Transmission fluid leaking by the converter hub seal lip will tend to move along the drive hub and onto the back of the torque converter. Except in the case of a total seal failure, transmission fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing.

2. Transmission fluid leakage by the outside diameter of the converter impeller hub seal and the case will follow the same path that leaks by the ID of the converter hub seal follow.

3. Transmission fluid leakage from the converter cover weld or the converter-to-flexplate stud weld will appear at outside diameter of torque converter on the back face of the flexplate and in the converter housing only near the flexplate. If a converter-to-flexplate lug, lug weld or converter cover weld leak is suspected, remove the converter and pressure check.

4. Transmission fluid leakage from the bolts inside the converter housing will flow down the back of the torque converter housing. Leakage may be from loose or missing bolts.

5. Engine oil leaks are sometimes incorrectly diagnosed as transaxle converter hub seal leaks. The following areas of possible leakage should also be checked to determine if engine oil leakage is causing the concern.
    1. Leakage at the valve cover gasket may allow engine oil to flow over the torque converter housing or seep down between the torque converter housing and cylinder block causing oil to be present in or at the bottom of the torque converter housing.
    2. Oil galley plug leaks will allow engine oil to flow down the rear face of the cylinder block to the bottom of the torque converter housing.
    3. Leakage at the crankshaft rear oil seal will work back to the flexplate, and then into the torque converter housing.
    4. Leakage at oil pressure sensor will allow engine oil to flow down the rear face of the cylinder block to the bottom of the torque converter housing.

Leak Check Test

1. Remove the transmission fluid level indicator and note the color of the transmission fluid.

2. Remove the torque converter housing cover. Clean off any transmission fluid from the top and bottom of the torque converter housing, the front of the case and rear face of the engine and oil pan. Clean the torque converter area by washing with a suitable nonflammable solvent and blow-dry with compressed air.

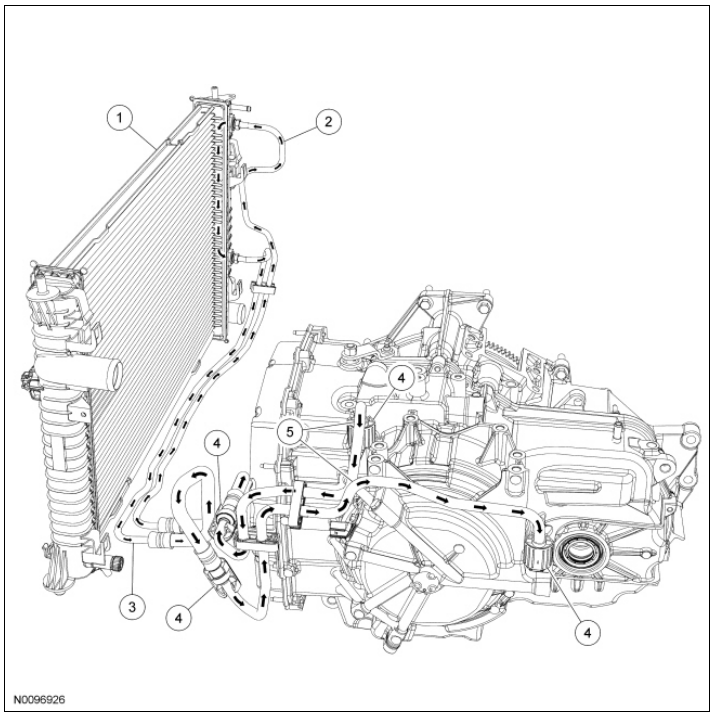
3. Wash the torque converter housing, the front of the flexplate and the converter drain plugs. The torque converter housing may be washed out using cleaning solvent and a squirt-type oil can. Blow-dry all washed areas with compressed air.

4. Using the scan tool, start and run the engine until the transaxle reaches its normal operating temperature. Observe the back of the cylinder block and top of the torque converter housing for evidence of transmission fluid leakage. Raise the vehicle on a hoist and run the engine at fast idle, then at low idle, occasionally shifting to the OVERDRIVE and REVERSE ranges to increase pressure within the transaxle. Observe the front of the flexplate, back of the cylinder block (in as far as possible) and inside the torque converter housing and front of the case. Run the engine until transmission fluid leakage is evident and the probable source of leakage can be determined.

Leak Check Test With Black Light

NOTE: Use Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye to detect a transmission fluid leak.

1. Add dye to the transmission fluid. Use one 30 ml (1 oz) bottle of dye solution for every 3.8L (4 qt) of transmission fluid.



2. Using the scan tool, start and run the engine until the transaxle reaches its normal operating temperature. Using a suitable tool, observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Raise the vehicle on a hoist and run the engine at fast idle, then at low idle, occasionally shifting to the DRIVE and REVERSE ranges to increase pressure within the transaxle. Observe the front of the flexplate, back of the cylinder block (in as far as possible), inside the torque converter housing and the entire case until fluid leakage is evident and theprobable source of leakage can be determined.

Transmission Fluid Cooler

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Transaxle Cooling - 6F35

Item	Part Number	Description
1	8005	Radiator
2	7R081	Transmission fluid cooler supply tube assembly (supplies transmission fluid to the transmission fluid cooler from the transaxle)
3	7R081	Transmission fluid cooler return tube assembly (transmission fluid return tube from the transmission fluid cooler to the transaxle)
4	7J081	Secondary latches
5	7H420	Transaxle mounted transmission fluid cooler tubes

When internal wear or damage has occurred in the transaxle, metal particles or clutch plate material may have been carried into the torque converter and transaxle fluid cooler. These contaminants are a major cause of recurring transaxle issues and must be removed from the system before the transaxle is put back into use.

Refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

Transmission Fluid Cooler Flow Test

NOTE: The selector lever linkage, selector lever cable adjustment, transmission fluid level and line pressure must be within specification before carrying out this test. Refer to Section 307-05A for selector lever linkage and selector lever cable adjustment and refer to Special Testing Procedures in this section for line pressure test. The transmission fluid must be above 85°C (185°F) for the cooler by-pass to open to carry out this test.

1. Using a scan tool, run the engine to establish the correct transmission fluid temperature of 85°C (185°F).
2. Remove the transmission fluid level indicator from the transmission fluid filler tube.
3. Place funnel in the transmission fluid filler tube.
4. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .
5. Remove the transmission fluid cooler return tube (rear fitting) from the fitting on the transaxle case.
6. Connect one end of a hose to the cooler return tube and route other end of the hose up to a point where it can be inserted into the funnel at the transmission fluid filler tube.
7. Start the engine and run it at idle with the transmission in NEUTRAL.
8. When transmission fluid flowing from hose is in a steady stream, a liberal amount of transmission fluid should be observed. "Liberal" is described as about 1L (1 qt) delivered in 30 seconds. If a liberal flow is observed, the test is cote.
9. If the flow is not liberal, stop the engine. Disconnect the hose from the cooler return tube and connect it to the converter outlet tube fitting (front fitting) on the transaxle case.
10. Repeat Steps 7 and 8. If flow is now approximately 1L (1 qt) in 30 seconds, refer to Transmission Fluid Cooler Backflushing and Cleaning . If the flow is still not approximately 1L (1 qt) in 30 seconds, repair the pump and/or the torque converter.
    If new transmission fluid cooler tubes need to be installed, refer to Section 307-02A .

Diagnosis By Symptom

The Diagnostic Routines give the technician diagnostic information, direction and suggest possible components, using a symptom as a starting point.

The Diagnostic Routines are divided into 2 categories: Electrical Routines, indicated by 200 series numbers, and Hydraulic/Mechanical Routines, indicated by 300 series numbers. The Electrical Routines list the possible electrical components that may cause or contribute to the symptom described. The Hydraulic/Mechanical Routines list the possible hydraulic or mechanical components that may cause or contribute to the symptom described.

Diagnosis by Symptom Index Directions

1. Using the Symptom Index, select the Concern/Symptom that best describes the condition.

2. See the routine indicated in the Diagnosis By Symptom Index.

3. Always begin diagnosis of a symptom with:
    1. Preliminary inspections.
    2. Verifications of condition.
    3. Checking the fluid levels.
    4. Carry out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components sets a DTC. Be aware that the components listed may be the cause. Verify correct function of these components prior to proceeding to the Hydraulic/Mechanical Routine.

   Begin with the Electrical Routine, if indicated. Follow the Reference/Action statements. Always carry out the OBD tests as required. Never skip steps. Repair as required. If the concern is still present after electrical diagnosis, then proceed to the Hydraulic/Mechanical Routine.

5. The Hydraulic/Mechanical Routines list possible hydraulic or mechanical components that could cause the concern. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to verify a correct repair.

Diagnosis by Symptom Index

Title	Routines	
	Electrical (1)	Hydraulic/ Mechanical
Engagement Concerns		
No Forward	201	301

Overheating	267	367

(1) Carry out electrical routine first.

Diagnostic Routines

Engagement Concern: No Forward

Possible Component	Reference/Action
201 â ELECTRICAL ROUTINE	
Powertrain Control System	
• No electrical concerns	
301 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage (Internal/External)	
• Damaged or out of adjustment	• INSPECT for damage. REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Incorrect Pressures	
• LPC solenoid stuck â low	• CHECK pressure at line pressure tap. CARRY OUT Line Pressure Tests and Stall Speed Tests. REFER to Special Testing Procedures . SEE the Line Pressure Chart for specification. If pressures are low, CHECK the following possible components: ♦ Main control valve body ♦ Pump assembly ♦ LPC solenoid
Main Control Valve Body	

• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Manual control valve â damaged	• INSTALL new as required.
Pump Assembly	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Porosity/cross leaks/ball missing or leaking	• INSTALL a new pump as required.
• Components â damaged	• INSTALL a new pump as required.

Engagement Concern: No Reverse

Possible Component	Reference/Action
202 â ELECTRICAL ROUTINE	
Powertrain Control System	
• No electrical concerns	
302 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage (Internal/External)	

• Damaged or out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Incorrect Pressures	
• Line pressure â low	• CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . CHECK pressure at line pressure tap. SEE the Line Pressure Chart for specifications. If pressures are low, CHECK the following possible components: ♦ Main control valve body ♦ Pump assembly ♦ Low/reverse clutch assembly ♦ Direct clutch assembly ♦ SSB , SSD and SSE
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gasket and separator plate â damaged, off location	• INSTALL new as required.
• Manual control valve, springs â stuck, damaged	• INSTALL new as required.
• Multiplex valve, springs â stuck, damaged	• INSTALL new as required.
• Low/reverse clutch valve, springs â stuck, damaged	• INSTALL new as required.
• Direct clutch valve, springs â stuck, damaged	• INSTALL new as required.
Pump Assembly	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Porosity/cross leaks, pump	• INSTALL a new pump as required.

assembly leaking, plugged hole	
• Components damaged	• INSTALL a new pump as required.
Low/Reverse Clutch Assembly	
• SSD stuck â low	• INSTALL a new SSD as required. REFER to Solenoids .
• Low/reverse regulator valve stuck	• REPAIR as required.
• Seals, piston, springs â damaged	• REPAIR as required.
• Clearance check out of specification	• CARRY OUT clearance checks.
• Friction elements â damaged or worn	• REPAIR as required.
Direct Clutch Assembly	
• Seals, piston, spring â damaged	• REPAIR or install new as required.
• SSB	• INSTALL a new SSB as required. REFER to Solenoids .
• Direct clutch regulator valve	• REPAIR or install new as required.
• Clearance check out of specification	• CARRY OUT clearance checks.
• Friction elements â damaged, clearance check incorrect	• REPAIR as required.

Engagement Concern: Harsh Reverse

Possible Component	Reference/Action
203 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , MAF sensor, IAT sensor, TP sensor, ISC , PSP sensor, engine rpm, LPC solenoid, TFT sensor, TSS sensor, OSS sensor, TR sensor, SSB , SSD or transmission solenoid power control circuit open/shorted	• RUN OBD . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
Solenoid Body	
• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
303 â HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures	
• Line pressure â high	• CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . CHECK pressure at line pressure tap. SEE the Line Pressure Chart for specifications. If high, CHECK the main control valve body.
Pump Assembly	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Porosity/cross leaks, pump assembly leaking, plugged hole	• INSTALL a new pump as required.
• Components damaged	• INSTALL a new pump as required.
• Main regulator valve â stuck, damaged	• INSTALL new as required.
Main Controls	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gasket and separator plate â damaged, off location	• INSTALL new as required.
• Low/reverse regulator valve â stuck, damaged	• INSTALL new as required.
• Low/Reverse latch valve â stuck, damaged	• INSTALL new as required.
• Direct regulator valve â stuck, damaged	• INSTALL new as required.

• Direct latch valve â stuck, damaged	• INSTALL new as required.
• SSB mechanically stuck â high	• INSTALL a new SSB as required. REFER to Solenoids .
• SSD mechanically stuck â high	• INSTALL a new SSD as required. REFER to Solenoids .
Low/Reverse Clutch Assembly	
• SSD stuck â low	• INSTALL a new SSD as required. REFER to Solenoids .
• Low/reverse regulator valve stuck	• INSTALL a new solenoid body as required.
• Seals, piston, springs â damaged	• REPAIR as required.
• Clearance check out of specification	• CARRY OUT clearance checks.
• Friction elements â damaged or worn	• REPAIR as required.
Direct Clutch Assembly	
• Seals, piston, spring â damaged	• REPAIR or INSTALL new as required.
• SSB stuck	• INSTALL a new SSB as required. REFER to Solenoids .
• Direct clutch regulator valve	• REPAIR or INSTALL new as required.
• Clearance check out of specification	• CARRY OUT clearance checks.
• Friction elements â damaged, clearance check incorrect	• REPAIR or INSTALL new as required.

Engagement Concern: Harsh Forward

Possible Component	Reference/Action
204 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , MAF sensor, IAT sensor, TP sensor, ISC , PSP sensor, engine rpm, LPC solenoid, TFT sensor, TSS sensor, OSS sensor, TR sensor, SSA and or transmission solenoid power control circuit open/shorted	• RUN OBD . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
Solenoid Body	

• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
304 â HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures	
• Line pressure â high	• CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . Check pressure at line pressure tap. SEE the Line Pressure Chart for specifications. If pressures are high, CHECK the main control valve body, pump assembly.
Pump Assembly	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Porosity/cross leaks, pump assembly leaking, plugged hole	• INSTALL a new pump as required.
• Components damaged	• INSTALL a new pump as required.
• Main regulator valve â stuck, damaged	• INSTALL new as required.
Main Controls	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gasket and separator plate â damaged, off location	• INSTALL new as required.
• Forward clutch seal â leaking between valve body and case	• INSTALL new as required.
• Forward clutch regulator valve â stuck, damaged	• INSTALL new as required.
• Forward clutch latch valve â stuck, damaged	• INSTALL new as required.
Forward Clutch Assembly	
• Seals, piston â worn, damaged	• INSTALL new as required.
• Friction elements â damaged	• INSTALL new as required.
• Wave spring â damaged	• INSTALL new as required.

Engagement Concern: Delayed/Soft Reverse

Possible Component	Reference/Action
205 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , LPC solenoid, TFT sensor	• RUN OBD . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A and GO to Pinpoint Test B .
Solenoid Body	
• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
305 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage (Internal/External)	
• Damaged, out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Incorrect Pressures	
• Line pressure â low	• CHECK pressure at line pressure tap. CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . SEE the Line Pressure Chart for specifications. If pressures are low, CHECK the following possible components: main control valve body, pump assembly, low/reverse clutch assembly, direct clutch assembly.
Main Controls	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Low/reverse regulator valve â stuck, damaged	• INSTALL new as required.
	• INSTALL new as required.

• Low/reverse latch valve â stuck, damaged	
• Direct regulator valve â stuck, damaged	• INSTALL new as required.
• Direct latch valve â stuck, damaged	• INSTALL new as required.
• Manual control valve, springs â missing, damaged, misassembled	• REPAIR or INSTALL new as required.
• SSB stuck â low	• INSPECT for damage. GO to Pinpoint Test A . INSTALL a new SSB as required. REFER to Solenoids .
• SSD stuck â low	• INSTALL a new SSD as required. REFER to Solenoids .
Pump Assembly	
• Pump Assembly â worn/cross leaks, leaking	• INSTALL new as required.
• Main regulator valve â stuck, damaged	• INSTALL new as required.
Low/Reverse Clutch Assembly	
• SSD stuck â low	• INSTALL a new SSD as required. REFER to Solenoids .
• Low/reverse regulator valve stuck	• INSTALL new as required.
• Seals, piston, springs â damaged	• REPAIR as required.
• Clearance check out of specification	• CARRY OUT clearance checks.
• Friction elements â damaged or worn	• REPAIR as required.
Direct Clutch Assembly	

• Seals, piston, spring â damaged	• REPAIR or INSTALL new as required.
• SSB stuck	• INSTALL a new SSB as required. REFER to Solenoids .
• Direct clutch regulator valve	• REPAIR or INSTALL new as required.
• Clearance check out of specification	• CARRY OUT clearance checks.
• Friction elements â damaged, clearance check incorrect	• REPAIR as required.

Engagement Concern: Delayed/Soft Forward

Possible Component	Reference/Action
206 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , LPC solenoid, TFT sensor and TSS sensor	• RUN OBD . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test B and GO to Pinpoint Test C .
Solenoid Body	
• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
306 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage	
• Damaged, out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Incorrect Pressures	
• Line pressure â low	

	• CHECK pressure at line pressure tap. CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . SEE the Line Pressure Chart for specifications. If pressures are low, CHECK the following possible components: main control valve body, pump assembly, and forward clutch.
Main Controls	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Forward clutch regulator valve stuck or damaged	• INSTALL new as required.
• Forward clutch latch valve stuck or damaged	• INSTALL new as required.
• LPC solenoid stuck â low	• INSTALL a new LPC as required. REFER to Solenoids .
• SSA stuck â low	• INSTALL a new SSA as required. REFER to Solenoids .
Pump Assembly	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Worn/cross leaks	• INSTALL new as required.
• Main regulator valve â stuck, damaged, missing	• REPAIR as required.
Forward Clutch Assembly	
• Clutch plates, seals, piston â worn, damaged	• INSTALL new as required.
• Wave spring â damaged	• INSTALL new as required.

Engagement Concern: No Forward and No Reverse

Possible Component	Reference/Action

207 â ELECTRICAL ROUTINE	
• No electrical concerns	
307 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Halfshaft	
• Splines â worn, damaged	• REPAIR as required.
• Shaft â misassembled, incorrect	• REPAIR as required.
Selector Lever Linkage (Internal/External)	
• Damaged, out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Incorrect Pressures	
• Line pressure â low	• CHECK pressure at the line pressure tap. CARRY OUT Line Pressure and Stall Tests. REFER to Special Testing Procedures . SEE the Line Pressure Chart for specifications. If pressures are low, CHECK the following possible components: transmission fluid filter and seal assembly, main control, pump assembly, low/reverse clutch assembly, forward clutch assembly.
Transmission Fluid Filter and Seal Assembly	
• Plugged, damaged, not correctly seated	• INSTALL a new filter and seal assembly.
• Filter, seal â damaged	• INSTALL a new filter and seal assembly.
Main Controls	
• Manual valve	• INSTALL new as required.
• Shift valves	• INSTALL new as required.
• Bolts out of torque	• TIGHTEN bolts to specification.

specification	
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Components â damaged, check balls stuck	• REPAIR as required.
Pump Assembly	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Porosity/cross leaks â leaking, plugged hole	• INSTALL a new pump assembly.
• Main regulator valve (only if line pressure is out of specification) â damaged	• REPAIR as required.
Output Shaft	
• Splines â damaged	• REPAIR as required.
Other Possible Components	
• Turbine shaft	• REPAIR as required.
• Flexplate	• REPAIR as required.
• Sun gear and shell assemblies	• REPAIR as required.
• Planetaries	• REPAIR as required.
• Final drive assembly	• REPAIR as required.

Engagement Concern: Delayed/Soft Forward and Reverse

Possible Component	Reference/Action

209 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM TFT sensor, TSS sensor, LPC solenoid	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test B and GO to Pinpoint Test C .
Solenoid Body	
• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
309 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage (Internal/External)	
• Damaged, out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Incorrect Pressures	
• Line pressure â low	• CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . SEE the Line Pressure Chart for specifications. If pressures are low, CHECK the following possible components: main control, pump assembly and LPC solenoid.
Transmission Fluid Filter and Seal Assembly	
• Plugged, damaged, not correctly seated	• INSTALL a new filter and seal assembly.
• Filter, seal â damaged	• INSTALL a new filter and seal assembly.
Main Controls	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Seals, manual valve	• REPAIR or INSTALL new as required.

Pump Assembly	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Worn/cross leaks â leaking	• INSTALL a new pump assembly.
• Components damaged	• INSTALL new as required.
• Main regulator valve â missing, damaged or misassembled	• REPAIR as required.

Shift Concerns: Some or All Shifts Missing

Possible Component	Reference/Action
210 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSA , SSB , SSC , SSD , SSE , TP sensor, MAF sensor, OSS sensor, TSS sensor, TR sensor and LPC solenoid	• RUN OBD . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test C and GO to Pinpoint Test D .
310 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• Incorrect transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage (Internal/External)	
• Damaged, out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Vehicle Speed Input	
• Insufficient, erratic or no input received by the TCM from the OSS sensor	• REPAIR as required. GO to Pinpoint Test C .
Transmission Fluid Filter and Seal Assembly	
• Plugged, damaged, not correctly seated	• INSTALL a new filter and seal assembly.
• Filter, seal â damaged	• INSTALL a new filter and seal assembly.

Main Controls	
• Regulator and/or latch valves â stuck, damaged, misassembled	• REPAIR or install new as required.
• Plugged solenoid body filter	• INSTALL new as required.
Planetary Gear Sets	
• Damaged	• REPAIR as required.
Other Components	
• Clutches	• REPAIR as required.
• Output shafts (differential)	• REPAIR as required.
• Powerflow components	• REPAIR as required.
• Go to shift concerns:	• See the appropriate shift concern and routine: ♦ Shift Concern: No 1-2, Routine 220/320 ♦ Shift Concern: No 2-3, Routine 221/321 ♦ Shift Concern: No 3-4, Routine 222/322 ♦ Shift Concern: No 4-5, Routine 223/323 ♦ Shift Concern: No 5-6, Routine 224/324 ♦ Shift Concern: No 6-5, Routine 225/325 ♦ Shift Concern: No 5-4, Routine 226/326 ♦ Shift Concern: No 4-3, Routine 227/327 ♦ Shift Concern: No 3-2, Routine 228/328 ♦ Shift Concern: No 2-1, Routine 229/329

Shift Concerns: Timing â Early/Late

Possible Component	Reference/Action
211 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSA , SSB , SSC , SSD , SSE , TP sensor, MAF sensor, OSS sensor, TSS sensor, IAT sensor, ECT sensor and LPC solenoid	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test B and GO to Pinpoint Test C .
	• CARRY OUT Shift Point Road Test. REFER to Shift Point Road Test . CARRY OUT Torque Converter Operation Test. REFER to Torque Converter Diagnosis .
Solenoid Body	

• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
311 â HYDRAULIC/MECHANICAL ROUTINE	
Other	
• Tire size	• SEE the specification decal and verify vehicle has original equipment. Changes in tire size will affect shift timing.
Transmission Fluid Level	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage (Internal/External)	
• Damaged, out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Main Controls	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Valves, accumulators, seals, springs, clips, check balls â damaged, missing, misassembled	• REPAIR as required.
One-Way Clutch Assembly	
• Damaged	• REPAIR or INSTALL new as required.
Other Components	
• Clutches	• REPAIR or INSTALL new as required.
Vehicle Speed Input	
• Insufficient, erratic or no input received by the TCM from the OSS or TSS sensors	• REPAIR as required. GO to Pinpoint Test C .
Transmission Fluid Filter and Seal Assembly	
• Plugged, damaged, not correctly seated	• INSTALL a new filter and seal assembly.
• Filter, seal â damaged	• INSTALL a new filter and seal assembly.

Shift Concerns: Timing â Erratic/Hunting

Possible Component	Reference/Action
212 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , TCC solenoid, SSA , SSB , SSC , SSD , SSE , TP sensor, OSS sensor, ECT sensor, IAT sensor, MAF sensor, TR sensor, TFT sensor and TSS sensors	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C , GO to Pinpoint Test D and GO to Pinpoint Test E .
	• CARRY OUT Shift Point Road Test. REFER to Shift Point Road Test . CARRY OUT Torque Converter Operation Test. REFER to Torque Converter Diagnosis .
Solenoid Body	
• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
312 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage (Internal/External)	
• Damaged, out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Valves, seals, clips, check ball â stuck, damaged, contaminated	• REPAIR or INSTALL new as required.
Vehicle Speed Input	

• Insufficient, erratic or no input received by the TCM from the OSS sensor or TSS sensor	• REPAIR as required. GO to Pinpoint Test C .
TCC	
	• SEE Torque Converter Cycling (Routine 254/354).
Planetary Gear Sets	
• Damaged	• REPAIR as required.
Clutch Assemblies	
• Damaged clutch plates, pistons, seals, return springs	• REPAIR or INSTALL new as required.
Transmission Fluid Filter and Seal Assembly	
• Plugged, damaged, not correctly seated	• INSTALL a new filter and seal assembly.
• Filter, seal â damaged	• INSTALL a new filter and seal assembly.
For Diagnosis Related to a Specific Shift	
	• SEE the appropriate shift concern and routine for further diagnosis:
	♦ Shift Concern: No 1-2, Routine 220/320 ♦ Shift Concern: No 2-3, Routine 221/321 ♦ Shift Concern: No 3-4, Routine 222/322 ♦ Shift Concern: No 4-5, Routine 223/323 ♦ Shift Concern: No 5-6, Routine 224/324 ♦ Shift Concern: No 6-5, Routine 225/325 ♦ Shift Concern: No 5-4, Routine 226/326 ♦ Shift Concern: No 4-3, Routine 227/327 ♦ Shift Concern: No 3-2, Routine 228/328 ♦ Shift Concern: No 2-1, Routine 229/329 ♦ Shift Concern: Soft/Slip 1-2, Routine 230/330 ♦ Shift Concern: Soft/Slip 2-3, Routine 231/331 ♦ Shift Concern: Soft/Slip 3-4, Routine 232/332 ♦ Shift Concern: Soft/Slip 4-5, Routine 233/333 ♦ Shift Concern: Soft/Slip 5-6, Routine 234/334 ♦ Shift Concern: Soft/Slip 6-5, Routine 235/335 ♦ Shift Concern: Soft/Slip 5-4, Routine 236/336 ♦ Shift Concern: Soft/Slip 4-3, Routine 237/337 ♦ Shift Concern: Soft/Slip 3-2, Routine 238/338 ♦ Shift Concern: Soft/Slip 2-1, Routine 239/339 ♦ Shift Concern: Harsh 1-2, Routine 240/340 ♦ Shift Concern: Harsh 2-3, Routine 241/341 ♦ Shift Concern: Harsh 3-4, Routine 242/342 ♦ Shift Concern: Harsh 4-5, Routine 243/343 ♦ Shift Concern: Harsh 5-6, Routine 244/344 ♦ Shift Concern: Harsh 6-5, Routine 245/345 ♦ Shift Concern: Harsh 5-4, Routine 246/346

	♦ Shift Concern: Harsh 4-3, Routine 247/347 ♦ Shift Concern: Harsh 3-2, Routine 248/348 ♦ Shift Concern: Harsh 2-1, Routine 249/349

Shift Concerns: Feel â Soft/Slipping

Possible Component	Reference/Action
213 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , LPC solenoid, MAF sensor, TP sensor, ECT sensor, IAT sensor, TFT sensor, OSS sensor and TSS sensor	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test B and GO to Pinpoint Test C .
Solenoid Body	
• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
313 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid	
• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Transmission fluid condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Selector Lever Linkage (Internal/External)	
• Damaged, out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Incorrect Pressures	
• Line pressure â low	• CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . SEE the Line Pressure Chart for specifications. If pressures are low or all shifts are soft/slipping. REFER to Main Control Valve Body .
	• If pressures are OK and a specific shift is soft/slipping, SEE the following chart: ♦ Soft/Slipping Shift 1-2, Routine 230/330 ♦ Soft/Slipping Shift 2-3, Routine 231/331 ♦ Soft/Slipping Shift 3-4, Routine 232/332 ♦ Soft/Slipping Shift 4-5, Routine 233/333 ♦ Soft/Slipping Shift 5-6, Routine 234/334

	♦ Soft/Slipping Shift 6-5, Routine 235/335 ♦ Soft/Slipping Shift 5-4, Routine 236/336 ♦ Soft/Slipping Shift 4-3, Routine 237/337 ♦ Soft/Slipping Shift 3-2, Routine 238/338 ♦ Soft/Slipping Shift 2-1, Routine 239/339
Transmission Fluid Filter and Seal Assembly	
• Plugged, damaged, not correctly seated	• INSTALL a new filter and seal assembly.
• Filter, seal â damaged	• INSTALL a new filter and seal assembly.
Main Controls	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Sticking or binding valves, check balls, clips, springs â damaged, missing	• REPAIR or INSTALL new as required.
Pump Assembly	
• Pump assembly â worn/cross leaks, leaking	• INSTALL new as required.

Shift Concerns: Feel â Harsh

Possible Component	Reference/Action
214 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , LPC solenoid, MAF sensor, TP sensor, OSS sensor, TSS sensor, ECT sensor, IAT sensor, PSP switch, TFT sensor, TR sensor SSA , SSB , SSC , SSD and SSE	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint Test B , GO to Pinpoint Test C and GO to Pinpoint Test D .
Solenoid Body	
• Incorrect solenoid body strategy data stored in the TCM	• VERIFY solenoid body strategy data stored in the TCM , download new identification and strategy as necessary. REFER to Solenoid Body Strategy .
314 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	

• Low transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Incorrect Pressures	
• Line pressure â high	• CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . CHECK pressure at line pressure tap. SEE the Line Pressure Chart for specifications. If pressures are high or all shifts are harsh, CHECK the main control. REFER to Main Control Valve Body . If pressures are OK and a specific shift is harsh. SEE the appropriate shift routine in the following chart: ♦ Shift 1-2, Routine 240/340 ♦ Shift 2-3, Routine 241/341 ♦ Shift 3-4, Routine 242/342 ♦ Shift 4-5, Routine 243/343 ♦ Shift 5-6, Routine 244/344 ♦ Shift 6-5, Routine 245/345 ♦ Shift 5-4, Routine 246/346 ♦ Shift 4-3, Routine 247/347 ♦ Shift 3-2, Routine 248/348 ♦ Shift 2-1, Routine 249/349
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Valves, springs, clips, check balls â stuck, damaged	• REPAIR or INSTALL new as required.
Pump Assembly	
• Pump assembly â worn/cross leaks, leaking	• INSTALL new as required.

Shift Concerns: No 1st Gear, Engages in Higher Gear

Possible Component	Reference/Action
215 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSA , SSB , SSC , SSD , SSE , OSS sensor, TSS sensor	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A , GO to Pinpoint

and transmission solenoid power control circuit â no voltage at transmission connector	Test C and GO to Pinpoint Test E . REPAIR as required. CLEAR the DTCs. ROAD TEST and RERUN OBD .
315 â HYDRAULIC/MECHANICAL ROUTINE	
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Forward clutch regulator valve, springs, clips â stuck, damaged, missing, misassembled	• REPAIR as required.
• Shift solenoid â stuck, damaged	• REPAIR as required. GO to Pinpoint Test A . ACTIVATE solenoid using output state control. REPAIR as required.
• For diagnosis related to a specific gear, use the scan tool to select the gear	• SEE the following routines: ♦ Shift 1-2, Routine 220/320 ♦ Shift 2-3, Routine 221/321 ♦ Shift 3-4, Routine 222/322 ♦ Shift 4-5, Routine 223/323 ♦ Shift 5-6, Routine 224/324
Mechanical	
• Clutches or seals â damaged or worn	• REPAIR or INSTALL new as required.
Low One-Way Clutch Assembly	
• Not overrunning, damaged	• INSTALL new as required.

Shift Concerns: No Manual Low â 1st Gear

Possible Component	Reference/Action
216 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSA , SSD , SSE and TR sensor	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A and GO to Pinpoint Test D . REPAIR as required. CLEAR the DTCs. ROAD TEST and RERUN OBD .
316 â HYDRAULIC/MECHANICAL ROUTINE	
Selector Lever Linkage (Internal/External)	

• Damaged or out of adjustment	• REPAIR as required. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Incorrect Pressures	
• Line pressure â low	• CHECK pressure at line pressure tap. CARRY OUT Line Pressure and Stall Speed Tests. REFER to Special Testing Procedures . SEE the Line Pressure Chart for specifications. If pressures are low, CHECK the following possible components: main control. REFER to Main Control Valve Body .
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Forward latch, forward regulator, low/reverse latch, low/reverse regulator valves, clips â stuck, damaged, missing	• REPAIR as required.
• Multiplex shift valve clips â stuck, damaged, missing	• CHECK 4th gear ratio. REPAIR as required.
• Check ball â damaged, missing	• REPAIR as required.
Low/Reverse Clutch Assembly	
• Seals, piston, spring â damaged	• REPAIR or INSTALL new as required.
• Clutches â damaged, burnt, worn	• INSTALL new as required.
• Worn, damaged, misassembled	• REPAIR as required.
Forward Clutch Assembly	
• Seals, piston, spring â damaged	• REPAIR or INSTALL new as required.
• Clutches â damaged, burnt, worn	• INSTALL new as required.
	• REPAIR as required.

• Worn, damaged, misassembled	
• Case â damaged	• REPAIR as required.

Shift Concerns: No 1-2 Shift (Automatic)

Possible Component	Reference/Action
220 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSC and TR sensor	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A and GO to Pinpoint Test D .
320 â HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures	
• Line pressure	• CHECK pressure at line pressure tap. CARRY OUT Line Pressure Test. REFER to Special Testing Procedures . SEE the Line Pressure Chart for specifications. If not OK, CHECK main control. REFER to Main Control Valve Body .
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Intermediate regulator valve, springs, clips â loose, stuck, missing, misassembled stuck off	• REPAIR or INSTALL new as required.
• SSC not functioning correctly	• ACTIVATE solenoid using scan tool. REFER to Output State Control (OSC) Mode . GO to Pinpoint Test A . INSTALL a new solenoid as required. REFER to Solenoids .
Intermediate Clutch Assembly â Failed Off	
• Seals â damaged	• INSTALL new as required.
• Piston â damaged	• INSTALL new as required.
	• INSTALL new as required.

• Friction â damaged, worn	
• Cylinder hub â damaged	• INSTALL new as required.
• Return spring assembly â damaged	• INSTALL new as required.
Low/Reverse Clutch Assembly â Failed On	
• Piston â damaged	• INSTALL new as required.
• Friction â overheated	• INSTALL new as required.
• Cylinder hub â damaged	• INSTALL new as required.
• Return spring assembly â damaged	• INSTALL new as required.
Pump Assembly	
• Worn/cross leaks	• INSTALL new as required.
• Component damaged	• INSTALL a new pump assembly as required.
Low One-Way Clutch Assembly	
• Not overrunning, damaged	• INSTALL new as required.

Shift Concerns: No 2-3 Shift (Automatic)

Possible Component	Reference/Action
221 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSB failed, SSC stuck on and TR sensor	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A and GO to Pinpoint Test D .
321 â HYDRAULIC/MECHANICAL ROUTINE	
Incorrect Pressures	
• Line pressure	• CARRY OUT Line Pressure Test. REFER to Special Testing Procedures . CHECK pressure at line pressure tap. SEE the Line Pressure Chart for specifications. If not OK, CHECK main control. REFER to Main Control Valve Body .

Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Direct regulator and latch valves, springs, clips â loose, stuck, missing, misassembled, stuck off	• REPAIR or INSTALL new as required.
• Intermediate regulator and latch valves, springs, clips â loose, stuck, missing, misassembled, stuck on	• REPAIR or INSTALL new as required.
• SSB or SSC not functioning correctly	• ACTIVATE solenoid using scan tool. REFER to Output State Control (OSC) Mode . GO to Pinpoint Test A . INSTALL a new solenoid as required. REFER to Solenoids .
Direct Clutch Assembly â Failed Off	
• Seals â damaged	• INSTALL new as required.
• Piston â damaged	• INSTALL new as required.
• Friction â damaged, worn	• INSTALL new as required.
• Cylinder hub â damaged	• INSTALL new as required.
• Return spring assembly â damaged	• INSTALL new as required.
Intermediate Clutch Assembly â Failed On	
• Seals â damaged	• INSTALL new as required.
• Piston â damaged	• INSTALL new as required.
• Friction â damaged, worn	• INSTALL new as required.
• Cylinder hub â damaged	• INSTALL new as required.
• Return spring assembly â damaged	• INSTALL new as required.

Shift Concerns: No 3-4 Shift (Automatic)

Possible Component		Reference/Action
222 â ELECTRICAL ROUTINE		
Powertrain Control System		
	• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSD failed, SSB stuck on and TR sensor	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A and GO to Pinpoint Test D .
322 â HYDRAULIC/MECHANICAL ROUTINE		
Main Control Valve Body		
	• Bolts out of torque specification	• TIGHTEN bolts to specification.
	• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
	• Overdrive regulator and latch valves, springs, clips â loose, stuck, missing, misassembled, clutch failed off	• REPAIR or INSTALL new as required.
	• Direct regulator and latch valves, springs, clips â loose, stuck, missing, misassembled, clutch failed on	• REPAIR or INSTALL new as required.
	• SSD not functioning correctly, SSB stuck on	• ACTIVATE solenoid using scan tool. REFER to Output State Control (OSC) Mode . GO to Pinpoint Test A . INSTALL a new solenoid as required. REFER to Solenoids .
Overdrive Clutch Assembly â Failed Off		
	• Seals â damaged	• INSTALL new as required.
	• Piston â damaged	• INSTALL new as required.
	• Friction â damaged, worn	• INSTALL new as required.
	• Cylinder hub â damaged	• INSTALL new as required.
	• Return spring assembly â damaged	• INSTALL new as required.
Direct Clutch Assembly â Failed On		
	• Seals â damaged	• INSTALL new as required.

	• Piston â damaged	• INSTALL new as required.
	• Friction â damaged, worn	• INSTALL new as required.
	• Cylinder hub â damaged	• INSTALL new as required.
	• Return spring assembly â damaged	• INSTALL new as required.

Shift Concerns: No 4-5 Shift (Automatic)

Possible Component	Reference/Action
223 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSB failed, SSA stuck on and TR sensor	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A and GO to Pinpoint Test D .
323 â HYDRAULIC/MECHANICAL ROUTINE	
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Direct regulator and latch valves, springs, clips â loose, stuck, missing, misassembled, clutch failed off	• REPAIR or INSTALL new as required.
• Forward regulator and latch valves, springs, clips â loose, stuck, missing, misassembled, clutch failed on	• REPAIR or INSTALL new as required.
• SSB not functioning correctly, SSA stuck on	• ACTIVATE solenoid using scan tool. REFER to Output State Control (OSC) Mode . GO to Pinpoint Test A . INSTALL a new solenoid as required. REFER to Solenoids .
Direct Clutch Assembly â Failed Off	
• Seals â damaged	• INSTALL new as required.
• Piston â damaged	• INSTALL new as required.
• Friction â damaged, worn	• INSTALL new as required.

• Cylinder hub â damaged	• INSTALL new as required.
• Return spring assembly â damaged	• INSTALL new as required.
Forward Clutch Assembly â Failed On	
• Seals â damaged	• INSTALL new as required.
• Piston â damaged	• INSTALL new as required.
• Friction â damaged, worn	• INSTALL new as required.
• Cylinder hub â damaged	• INSTALL new as required.
• Return spring assembly â damaged	• INSTALL new as required.

Shift Concerns: No 5-6 Shift (Automatic)

Possible Component	Reference/Action
224 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , SSC failed, SSB stuck on and TR sensor	• RUN OBD . REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test A and GO to Pinpoint Test D .
TCS / O/D Cancel Switch	
• Switch control circuit open/shorted, switch damaged	• REFER to Section 307-05A .
324 â HYDRAULIC/MECHANICAL ROUTINE	
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Intermediate regulator and latch valves, springs, clips â loose, stuck, missing, misassembled, clutch failed off	• REPAIR or INSTALL new as required.
• Direct regulator and latch valves, springs, clips â loose, stuck, missing, misassembled, clutch	• REPAIR or INSTALL new as required.

failed on	
• SSC not functioning correctly, SSB stuck on	• ACTIVATE solenoid using scan tool. REFER to Output State Control (OSC) Mode . GO to Pinpoint Test A . INSTALL a new solenoid as required. REFER to Solenoids .
Intermediate Clutch Assembly â Failed Off	
• Seals â damaged	• INSTALL new as required.
• Piston â damaged	• INSTALL new as required.
• Friction â damaged, worn	• INSTALL new as required.
• Cylinder hub â damaged	• INSTALL new as required.

• No electrical concerns	

360 â HYDRAULIC/MECHANICAL ROUTINE	
Main Control Valve Body	
• Bolts out of torque specification	• TIGHTEN bolts to specification.
• Gaskets and separator plate â damaged, off location	• INSTALL new as required.
• Low/reverse regulator valve, springs, clips â loose, stuck, binding, missing, misassembled	• REPAIR or INSTALL new as required.
• Low/reverse latch valve, springs, clips â loose, stuck, binding, missing, misassembled	• REPAIR or INSTALL new as required.
• SSD not functioning correctly	• ACTIVATE solenoid using scan tool. REFER to Output State Control (OSC) Mode . GO to Pinpoint Test A . INSTALL a new solenoid as required. REFER to Solenoids .
Low/Reverse Clutch Assembly	
• Seals â damaged	• INSTALL new as required.
• Piston â damaged	• INSTALL new as required.
• Friction â damaged, worn	• INSTALL new as required.
• Cylinder hub â damaged	• INSTALL new as required.
• Return spring assembly â damaged	• INSTALL new as required.

Other Concerns: Selector Lever Efforts High

Possible Component	Reference/Action
261 â ELECTRICAL ROUTINE	
• No electrical concerns	
361 â HYDRAULIC/MECHANICAL ROUTINE	
Selector Lever Linkage (Internal, External)	
• Damaged or out of adjustment	• INSPECT for damage. VERIFY selector lever

		adjustment. REFER to Section 307-05A .
Manual Control Lever		
	• External retaining pin â damaged, nut â loose, detent springâ bent, damaged; or park mechanism â damaged, incorrect lever used	• REPAIR or INSTALL new as required.
Main Control Valve Body		
	• Manual valve â stuck	• REPAIR or INSTALL new as required.
	• Bolts out of torque specification	• TIGHTEN bolts to specification.
Brake Shift Interlock		
	• Mechanically damaged	• REFER to Section 307-05A .
	• TR sensor indicating park	• GO to Pinpoint Test D .

Other Concerns: External Leaks

Possible Component	Reference/Action
262 â ELECTRICAL ROUTINE	
• No electrical concerns	
362 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid Level	
• High transmission fluid level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
• Condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Seals, Gaskets	
• Leaks: converter, TSS sensor, halfshaft axles, gasket/seal manual lever, fluid level indicator, main control cover, incorrect hub seal	• LOCATE source of leak. REPAIR as required.
Other	
• Leaks: cooler fitting, pressure taps, transmission connector, transmission pan, cooler tubes, case porosity, case cracked	• LOCATE source of leak. REPAIR as required.

	• Vent â blocked damaged	• REPAIR as required.

Other Concerns: Poor Vehicle Performance

Possible Component	Reference/Action
263 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , TCC Solenoid, TP sensor, OSS sensor, MAF sensor, IAT sensors, internal wiring harness	• RUN OBD . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. GO to Pinpoint Test C . REPAIR as required. CLEAR the DTCs. ROAD TEST and RERUN OBD .
	• CARRY OUT Shift Point Road Test. REFER to Shift Point Road Test and CARRY OUT Torque Converter Operation Test. REFER to Torque Converter Diagnosis .
363 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid	
• Low level	• CHECK transmission fluid level and adjust as necessary. REFER to Preliminary Inspection .
Verify Correct Shift Scheduling, Engagements, Line Pressures and Stall Speed	
	• GO to appropriate Diagnostic Routines per index.
Converter Clutch Always Applied	
	• GO to Routine 351.

Other Concerns: Noise/Vibration â Forward Or Reverse

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Possible Component	Reference/Action
264 â ELECTRICAL ROUTINE	
• No electrical concerns	

364 â HYDRAULIC/MECHANICAL ROUTINE		
For Noises/Vibrations That Change With Engine Speed		
	• Converter components	• LOCATE source of disturbance. REPAIR as required.
		• Transmission fluid level (low) â pump cavitation.
		• Pump assembly.
	• Engine drive accessories	
	• Transmission fluid cooler tubes grounding out	
	• Flexplate	
For Noises/Vibrations That Change With Vehicle Speed		
	• Engine mounts â loose or damaged	• LOCATE source of disturbance. REPAIR as required.
	• Driveline concerns: ♦ Halfshaft shudder ♦ CV joints ♦ Suspension ♦ Modifications	
	• Output/halfshaft splines â worn or damaged	
	• TSS sensor â incorrectly installed	• REPAIR as required.
Other Noises/Vibrations		
	• Main controls â valve resonance	• LOCATE source of disturbance. REPAIR as required.
	• Selector lever cable â vibration, grounding	• LOCATE source of disturbance. REPAIR as required.
	• Transmission fluid cooler tubes â grounding	• LOCATE source of disturbance. REPAIR as required.
	• ABS	• REFER to Section 206-09 .
	• Power steering pump	• REFER to Section 211-02 .

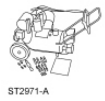
Other Concerns: Engine Will Not Crank

Possible Component	Reference/Action
265 â ELECTRICAL ROUTINE	
Powertrain Control System	
• Electrical inputs/outputs, vehicle wiring harnesses, TCM , TR sensor	• CARRY OUT Torque Converter Operation Test. REFER to Torque Converter Diagnosis . RUN OBD . REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis.
365 â HYDRAULIC/MECHANICAL ROUTINE	
Selector Lever Linkage (Internal, External)	
• Damaged or out of adjustment	• INSPECT for damage. VERIFY selector lever cable adjustment. REFER to Section 307-05A .

Other Concerns: No Park Range

Possible Component	Reference/Action
266 â ELECTRICAL ROUTINE	
• No electrical concerns	
366 â HYDRAULIC/MECHANICAL ROUTINE	
Selector Lever Linkage (Internal/External)	
• Damaged or out of adjustment	• INSPECT for damage. VERIFY selector lever cable adjustment. REFER to Section 307-05A .
Park Mechanism	
• Park brake pawl, park pawl return spring, park rod abutment, park pawl shaft, park pawl actuating rod, manual control lever, manual lever detent spring â damaged	• REPAIR as required.

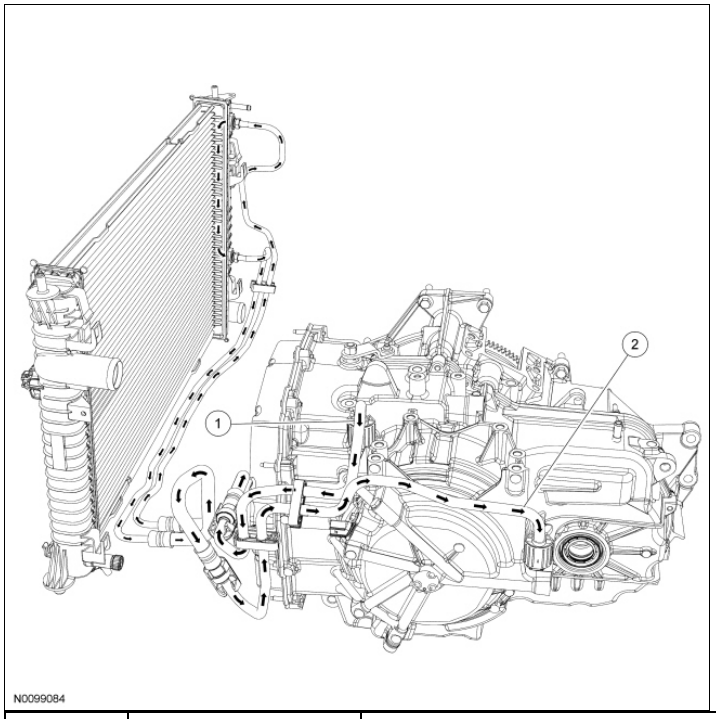
Other Concerns: Transmission Overheating



Possible Component	Reference/Action
267 â ELECTRICAL ROUTINE	
• No electrical concerns	

367 â HYDRAULIC/MECHANICAL ROUTINE	
Transmission Fluid	
• Incorrect transmission fluid level	• CHECK transmission fluid level. ADJUST as necessary. REFER to Preliminary Inspection .
• Condition	• CARRY OUT transmission fluid condition check. REFER to Preliminary Inspection .
Transmission Fluid Cooler Tubes	
• Damaged, blocked, reversed, leaking	• REPAIR as required.
Auxiliary Cooler	
• Damaged, blocked, restricted or incorrectly installed	• REPAIR as required.
Vehicle Concerns Causing Engine Overheating	
	• REFER to Section 303-03A .
Main Control Valve Body	
• Torque converter regulator valve/spring â stuck, damaged	• REPAIR as required.
• Torque converter control valve/spring â stuck, damaged	• REPAIR as required.
Torque Converter Not Applying	
• Seized converter one-way clutch	• SEE Routine 250/350. INSPECT for damage. REPAIR as required.
Excessive Towing Loads	
	• CHECK GVW .
Idle or Driveability Concern	

	• REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
Incorrect Clutch Application or Oil Pressure Control System	
	• CARRY OUT line pressure tests. REFER to Special Testing Procedures and carry out shift point road test. REFER to Shift Point Road Test . REPAIR as required. SEE the Line Pressure Chart, and Clutch Application Chart for specifications. REPAIR as required.



Transmission Fluid Cooler Backflushing and Cleaning

Special Tool(s)

 ST2971-A	Turbo-Tank Heated Cooler Line Flusher 222-00004 or equivalent

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Item	Part Number	Description
1	-	Transmission fluid pressure tube (outlet)
2	-	Transmission fluid return tube (inlet)

NOTE: Transmission fluid cooler backflushing will be carried out using the Turbo-Tank Heated Cooler Line Flusher or equivalent. Follow the manufacturer's instructions included with the machine. Test the equipment to make sure that a vigorous fluid flow is present before proceeding.

1. Check and top off fluid level of the Turbo-Tank Heated Cooler Line Flusher or equivalent tank with transmission fluid.

2. Allow the fluid in the Turbo-Tank Heated Cooler Line Flusher or equivalent 15-30 minutes to heat up to 60°C (140°F) before using.

3. Install the line adapters into the transmission cooler lines.

4. **NOTE:** The TOP transaxle cooler tube on the transaxle is the pressure line.

   Attach the Turbo-Tank Heated Cooler Line Flusher or equivalent red line to the transmission fluid cooler pressure line quick disconnect fitting.

5. Attach the Turbo-Tank Heated Cooler Line Flusher or equivalent blue line to the transmission fluid cooler return line quick disconnect fitting.

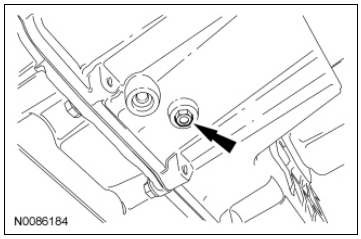
6. Follow the equipment instructions to purge the cooler lines and cooler prior to starting the flushing procedure.

7. Allow the cooling system to backflush for 10-15 minutes, then flush the cooler in a normal flow direction for an additional 10-15 minutes.

8. Clean the transaxle mounted fluid cooler tubes by hand.

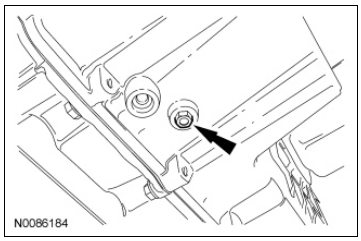
Transmission Fluid Drain and Refill

Material



Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

NOTE: In order to completely clean the torque converter, this procedure needs to be carried out 3 times.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** If an internal problem is suspected, drain the transmission fluid through a paper filter. A small amount of metal or friction particles may be found from normal wear. If an excessive amount of metal or friction material ent, the transaxle will need to be overhauled.

   Remove the transmission fluid drain plug and allow the transmission fluid to drain.

3. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).

4. Fill the transaxle with clean transmission fluid.

5. Start the engine and let it run for 3 minutes. Move the range selector lever into each gear position. Repeat Steps 2, 3, 4 and 5 two more times.

6. After the transmission fluid has been changed a total of 3 times, using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

P>

Transmission Fluid Exchange

Special Tool(s)

 ST3088-A	ATF Fluid Exchanger W/Power Steering Fluid Exchanger 199-00059 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

NOTICE: **Use transmission fluid specific for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products can cause internal transmission components to fail, which will affect the operation of the transmission.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Use the ATF Fluid Exchanger W/Power Steering Fluid Exchanger to change the fluid.
3. Connect the ATF Fluid Exchanger W/Power Steering Fluid Exchanger to the transmission fluid cooler tube after the transmission fluid cooler on the return tube. This will help remove any foreign material trapped in the transmission fluid coolers.
4. Perform the transmission fluid exchange using the ATF Fluid Exchanger W/Power Steering Fluid Exchanger. Follow the manufacturer's instructions included with the machine.
5. Once the transmission fluid exchange is completed, disconnect the ATF Fluid Exchanger W/Power Steering Fluid Exchanger. Reconnect any disconnected transmission fluid cooler tubes.
6. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid ised, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

Torque Converter Contamination Inspection

Material

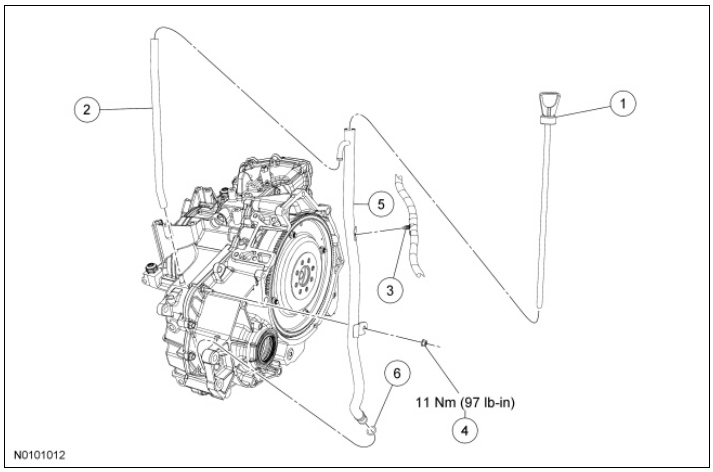
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
   - A torque converter malfunction has been determined based on complete diagnostic procedures.
   - The torque converter stud or studs, impeller hub or bushing are damaged.
   - The torque converter exhibits external discoloration (due to overheating).
   - There is evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes.
     - ♦ Major metallic failure
     - ♦ Multiple clutch plates or band failures

     ficient component wear which results in metallic contamination
   - ♦ Water or antifreeze contamination

2. If none of the above conditions are present, continue with the following fluid inspection.

3. Pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter.



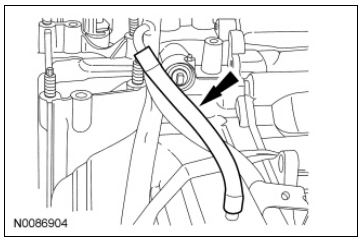
4. Examine the fluid for contaminants. The fluid must be free of metallic contaminants.

5. ***NOTICE:*** **Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur.**

   If the fluid passed inspection:

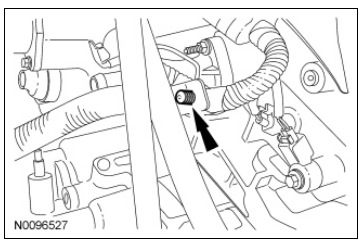
   - drain the remaining fluid from the torque converter.
   - using only the recommended transmission fluid, add 1.9L (2 qt) of clean fluid into the converter and agitate by hand.
   - thoroughly drain the fluid.

Transaxle Filler Tube



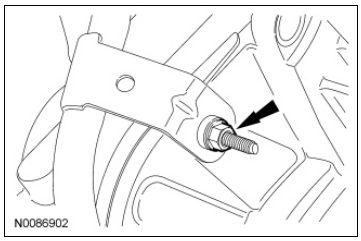
Item	Part Number	Description
1	7A020	Transmission fluid level indicator
2	-	Transaxle vent tube (part of 7A228)
3	13A506	Wiring harness retainer
4	N805320	Transaxle filler tube nut
5	7A228	Transaxle filler tube
6	-	Transaxle filler tube O-ring

Removal



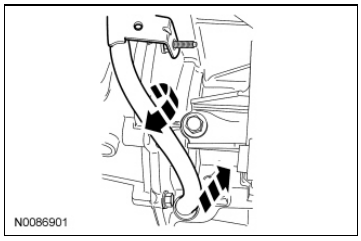
All vehicles

1. Remove the transaxle vent hose from the transaxle filler tui>



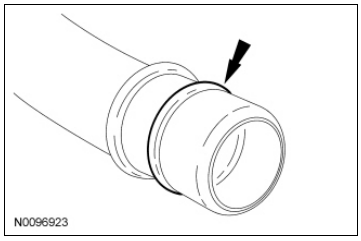
Vehicles equipped with a 3.0L engine

2. Disconnect the wiring harness retainer from the transmission fluid filler tube.



All vehicles

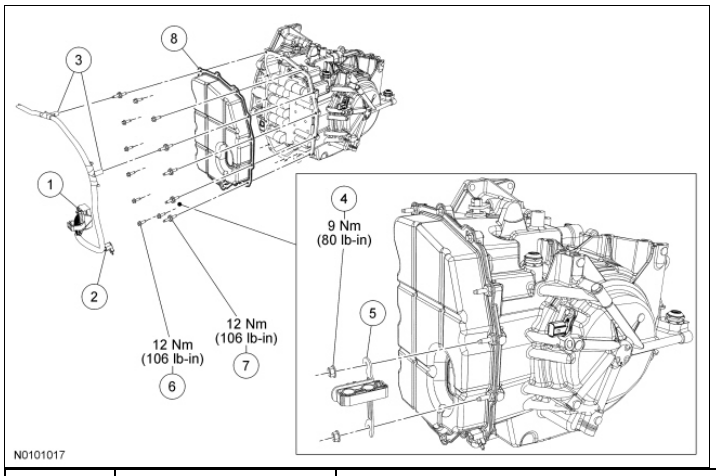
3. Remove the transaxle filler tube nut.
   - To install, tighten to 11 Nm (97 lb-in).



4. Pull and rotate the transaxle filler tube clockwise and remove the transaxle filler tube.

Installation

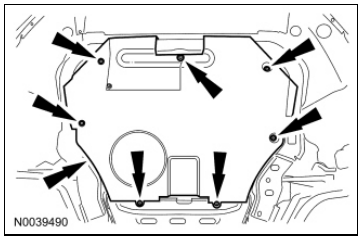
1. Inspect the O-ring seal on the transaxle filler tube for damage and install a new O-ring if needed. Lubricate the O-ring seal with clean automatic transmission fluid.



2. To install, reverse the removal procedure.

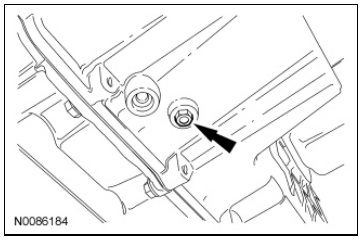
Main Control Cover

Material



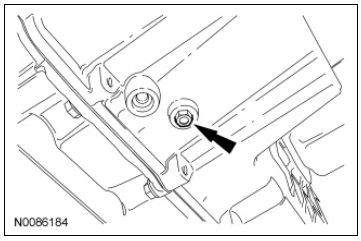
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Ultra Silicone Sealant TA-29	-

Item	Part Number	Description
1	14A464	Transaxle main harness electrical connector
2	9S318	Wiring harness retainer
3	14A163	Wiring harness retainer
4	N805320	Transmission fluid cooler tube nut
5	7H420	Transmission fluid cooler tube bracket
6	W500213	Main control cover bolt
7	W705619	Main control cover studbolt
8	7G004	Main control cover

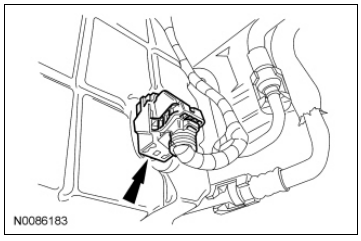


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

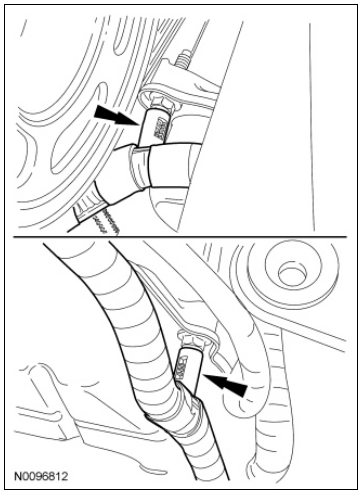
2. Remove the screws and the underbody cover.



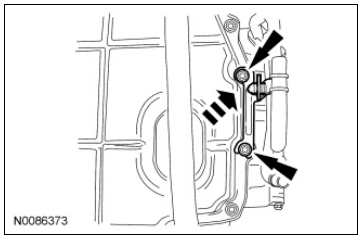
3. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A or Section 303-12B .



4. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

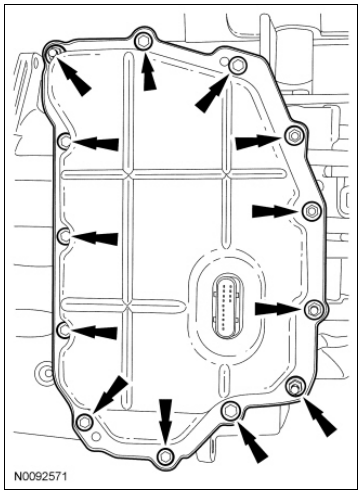


5. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).

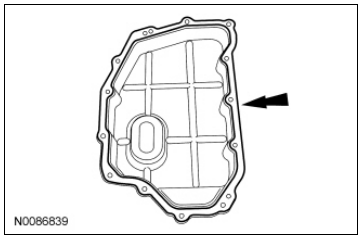


6. Disconnect the transaxle electrical connector.

7. Remove the transaxle electrical wiring harness retainers from the main control cover stud bolts.

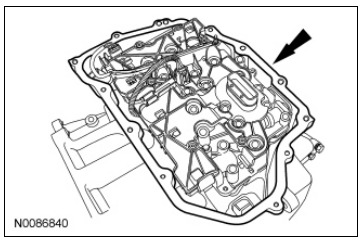


8. Remove the 2 nuts, pull the transmission fluid cooler tube bracket and tubes away from the transaxle and position it aside.

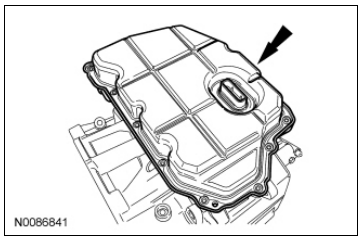


9. **NOTE:** Note the location of the stud bolts for assembly.

   Remove the 8 bolts, 5 stud bolts and the main control cover.



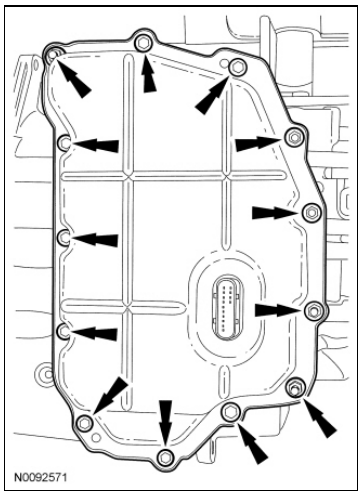
Installation



1. Clean the main control cover sealing surface and inspect for damage.

2. Apply silicone to the main control sealing surface of the transaxle case.

3. Position the main control cover in place.

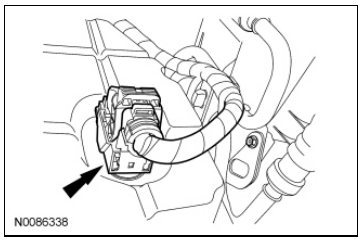


4. ***NOTICE:*** **Inspect the main control-to-main control cover grommet to make sure that the seals is on the inside of the main control cover. Transmission fluid leak will occur.**

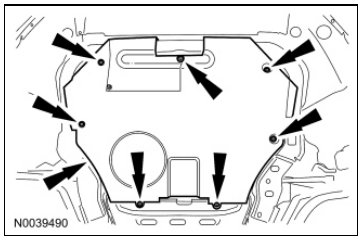
   NOTE: Install the stud bolts in the locations noted during disassembly.

   Tighten the 8 main control cover bolts and 5 stud bolts.

   - Tighten to 12 Nm (106 lb-in).

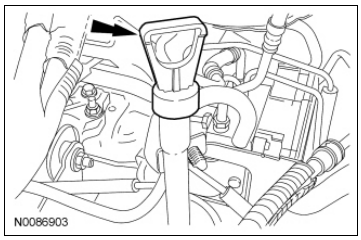


5. Position the transmission fluid cooler tube bracket and transmission fluid cooler tube assembly in place and install the 2 nuts.
   - Tighten to 9 Nm (80 lb-in).



6. Connect the transaxle electrical wiring harness retainers to the main control cover stud bolts.

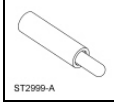
7. Connect the transaxle electrical connector.



8. Install the underbody cover and the screws.

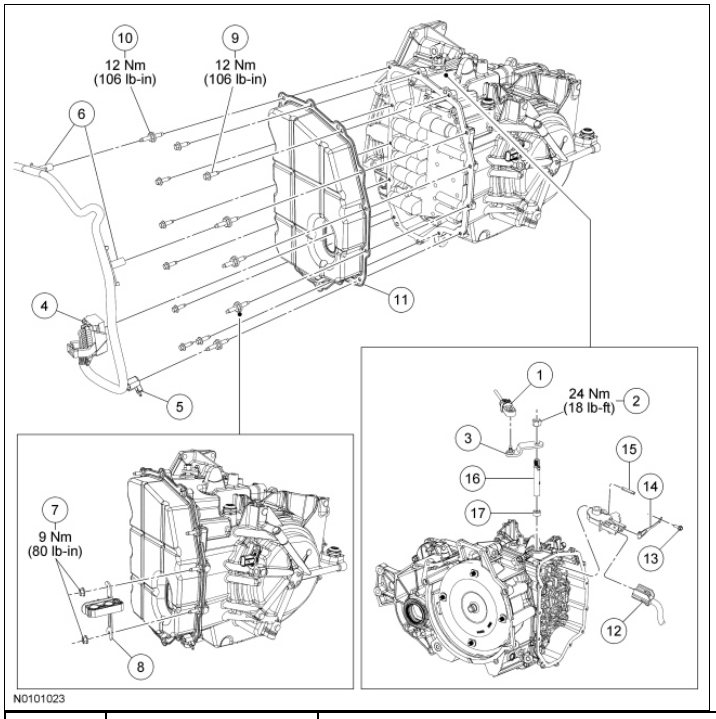
9. Install the ACL assembly. For additional information, refer to Section 303-12A or Section 303-12B .

10. Fill the transaxle with clean transmission fluid.



11. Start the engine and move the range selector lever into each gear position.

12. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.



Manual Control Lever Shaft Seal

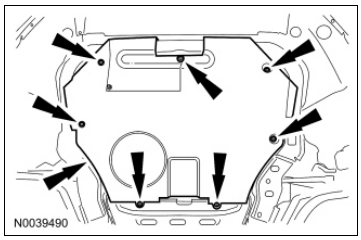
Special Tool(s)

 ST2999-A	Manual Lever Seal Installer 307-581

Material

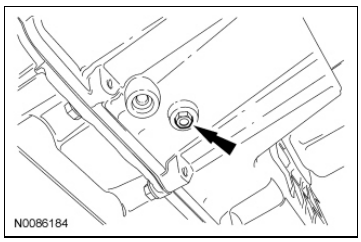
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Ultra Silicone Sealant TA-29	-

Item	Part Number	Description
1	7E395	Selector lever cable
2	W708455	Manual control lever nut
3	7A256	Manual control lever
4	14A464	Transaxle main harness electrical connector
5	9S318	Wiring harness retainer
6	14A163	Wiring harness retainer
7	N805320	Transmission fluid cooler tube nuts



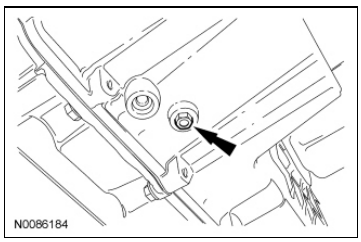
8	7H420	Transmission fluid cooler tube bracket
9	W500213	Main control cover bolts
10	W705619	Main control cover studbolts
11	7G004	Main control cover
12	7G276	Transmission Range (TR) electrical connector
13	W711235	Manual valve detent spring bolt
14	7E332	Manual valve detent spring
15	7G100	Manual control shaft pin
16	7C493	Manual control shaft
17	7F337	Manual control shaft seal

Removal

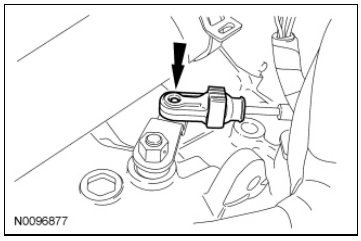


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

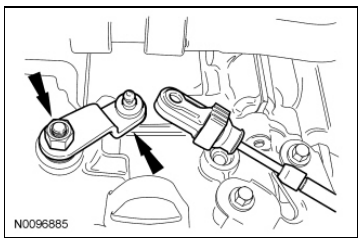
2. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A or Section 303-12B .



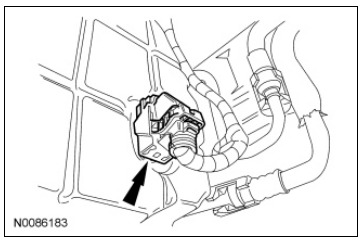
3. Remove the screws and the underbody cover.



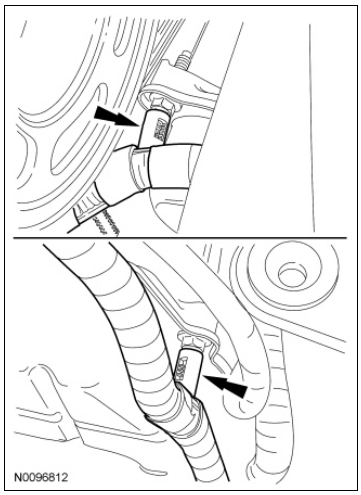
4. Remove the transmission fluid drain plug and allow the transmission fluid to drain.



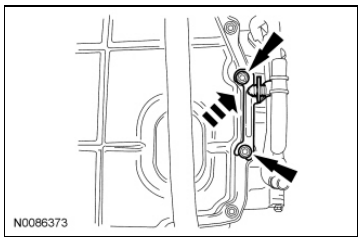
5. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).



6. Disconnect the selector lever cable end from the manual control lever.

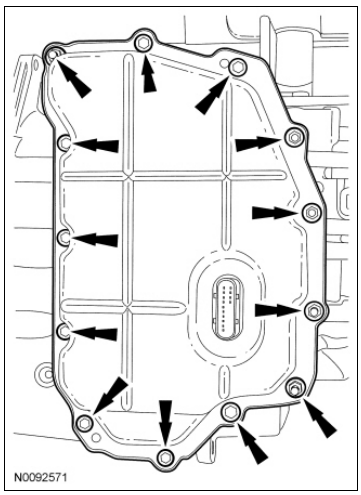


7. Remove the nut and the manual control lever.

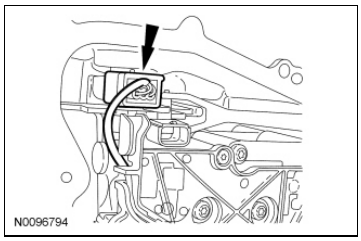


8. Disconnect the transaxle electrical connector.

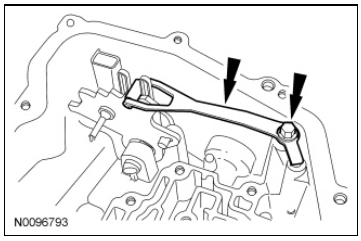
9. Remove the transaxle electrical wiring harness retainers from the main control cover stud bolts.



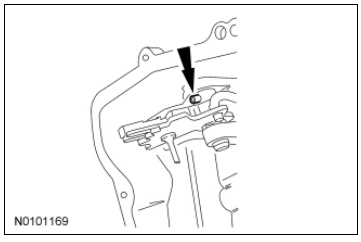
10. Remove the 2 nuts, pull the transmission fluid cooler tube bracket and tubes away from the transaxle and position it aside.



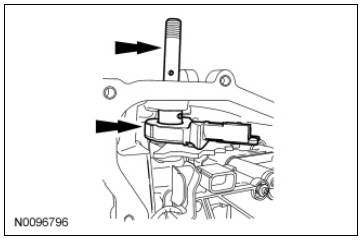
11. **NOTE:** Note the location of the stud bolts for assembly.



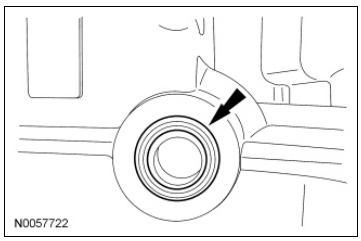
Remove the 8 bolts, 5 stud bolts and the main control cover.



12. Disconnect the Transmission Range (TR) sensor electrical connector.

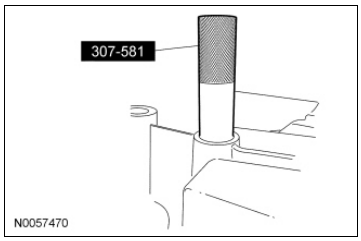


13. Remove the bolt and the TR sensor detent spring.

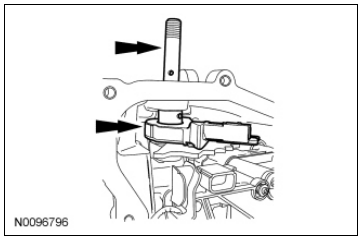


14. Using a small pair of Vise Grips® or an equivalent suitable tool, remove and discard the TR sensor locking pin.

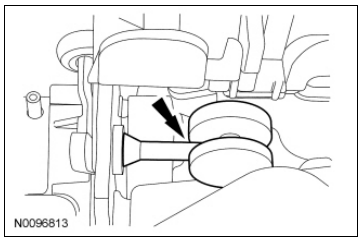
15. Slide the manual shaft out of the transaxle case.



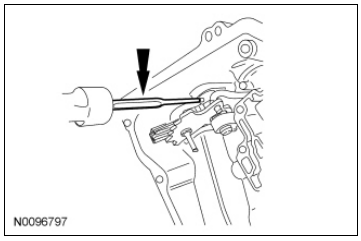
16. Using a suitable tool, remove the manual control lever shaft seal.



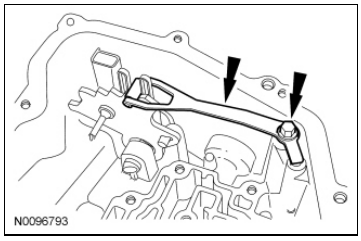
Installation



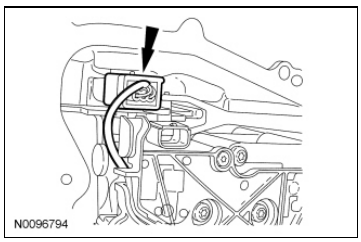
1. Using the Manual Lever Seal Installer, install a new manual control lever shaft seal.



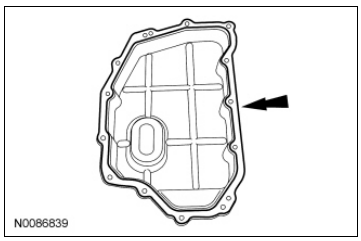
2. Install the manual control lever shaft in the transaxle case and through the TR sensor.



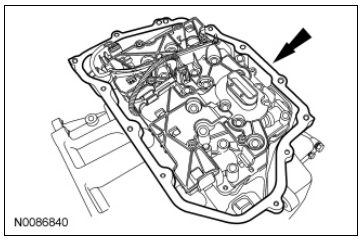
3. Inspect the manual pin to make sure it is correctly installed in the manual valve. If it is not, pull the manual control lever shaft out and correctly install the manual pin in the manual valve and position the manual control lever shaft in place.



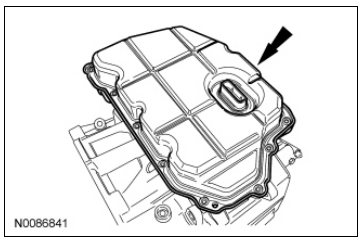
4. Using a suitable tool, install a new TR sensor roll pin.



5. Install the TR sensor detent spring and the bolt.
    - Tighten to 13 Nm (115 lb-in).



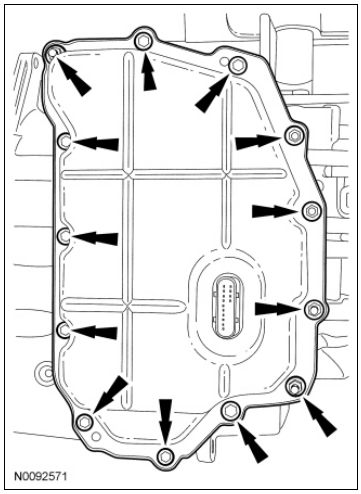
6. Connect the TR sensor electrical connector.



7. Clean the main control cover sealing surface.

8. Apply silicone to the main control sealing surface of the transaxle case.

9. Position the main control cover in place.

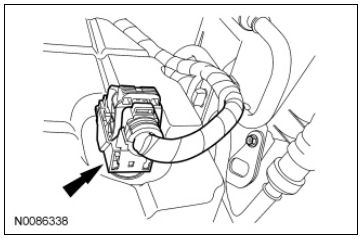


10. ***NOTICE:*** **Inspect the main control-to-main control cover grommet to make sure that the seal is on the inside of the main control cover. Transmission fluid leak will occur.**

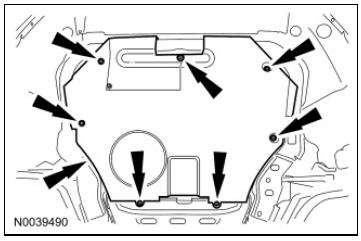
    NOTE: Install the stud bolts in the locations noted during disassembly.

    Tighten the 8 main control cover bolts and 5 stud bolts.

    - Tighten to 12 Nm (106 lb-in).



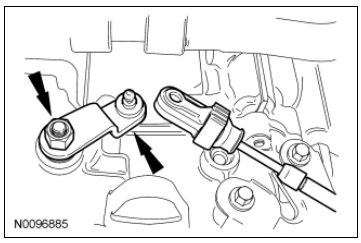
11. Position the transmission fluid cooler tube bracket and transmission fluid cooler tube assembly in place and install the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).



12. Connect the transaxle electrical wiring harness retainers to the main control cover stud bolts.

13. Connect the transaxle electrical connector.

14. Install the underbody cover and the screws.

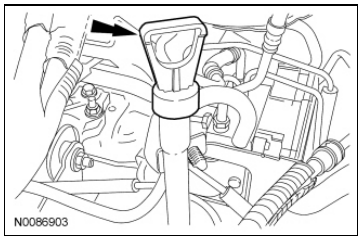


15. ***NOTICE:*** **Make sure that when installing the manual control lever it is fully seated onto the manual control lever shaft or damage to the manual control lever shaft will occur and the lever will come loose.**

    NOTICE: **Make sure to hold the manual control lever while tightening the manual control lever nut or damage to the manual control lever and park components will occur.**

    Install the manual control lever and the nut.

    - Tighten to 24 Nm (18 lb-ft).

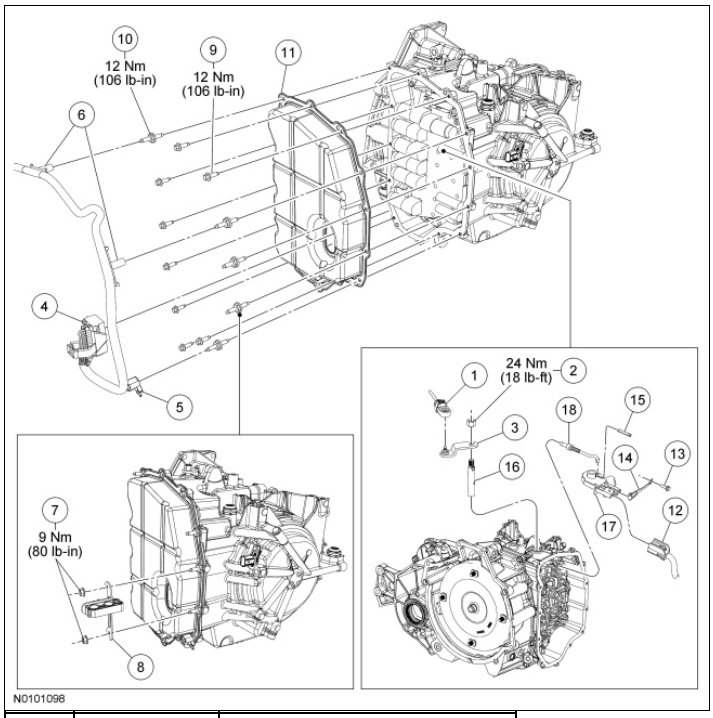


16. Connect the selector lever cable end to the manual control lever with the manual control lever and selector lever in DRIVE. Check selector lever cable adjustment. For additional information, refer to Section 307-05A

17. Install the ACL assembly. For additional information, refer to Section 303-12A or Section 303-12B .

18. Fill the transaxle with clean transmission fluid.

19. Start the engine and move the range selector lever into each gear position.



20. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt)

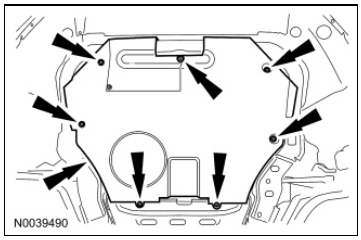
until the correct level is achieved.

Digital Transmission Range (TR) Sensor

Material

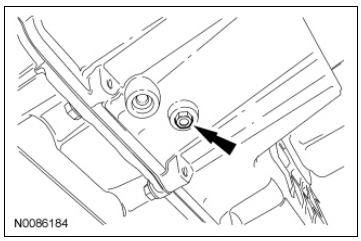
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Ultra Silicone Sealant TA-29	-

Item	Part Number	Description
1	7E395	Selector lever cable
2	W708455	Manual control lever nut
3	7A256	Manual control lever
4	14A464	Transaxle main harness electrical connector
5	9S318	Wiring harness retainer
6	14A163	Wiring harness retainer
7	N805320	Transmission fluid cooler tube nuts
8	7H420	Transmission fluid cooler tube bracket



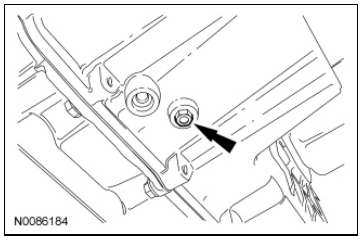
9	W500213	Main control cover bolts
10	W705619	Main control cover studbolts
11	7G004	Main control cover
12	7G276	Transmission Range (TR) electrical connector
13	W711235	Manual valve detent spring bolt
14	7E332	Manual valve detent spring
15	7G100	Manual control shaft pin
16	7C493	Manual control shaft
17	7H155	TR sensor
18	7A232	Park pawl actuator rod

Removal

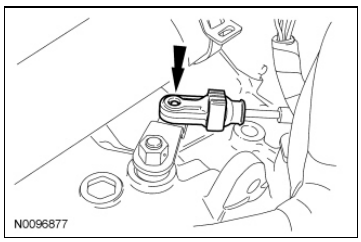


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

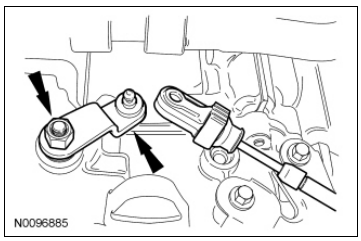
2. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A or Section 303-12B .



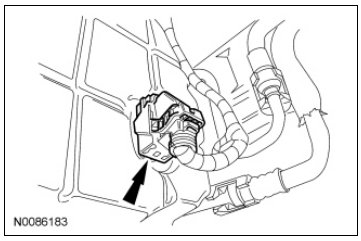
3. Remove the screws and the underbody cover.



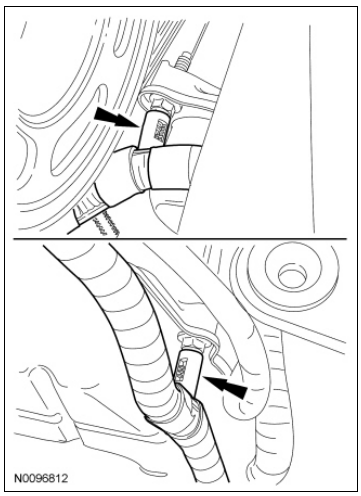
4. Remove the transmission fluid drain plug and allow the transmission fluid to drain.



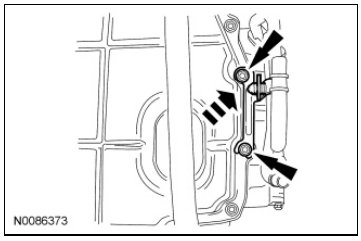
5. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).



6. Disconnect the selector lever cable end from the manual control lever.

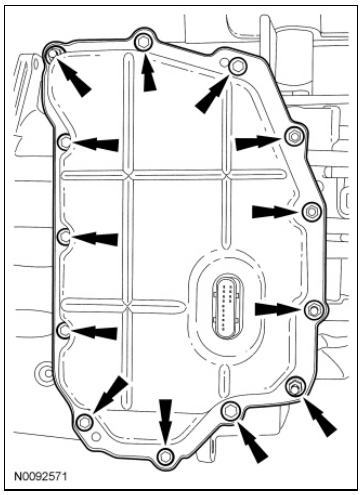


7. Remove the nut and the manual control lever.

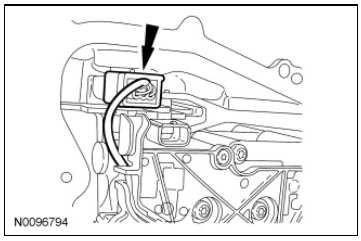


8. Disconnect the transaxle electrical connector.

9. Remove the transaxle electrical wiring harness retainers from the main control cover stud bolts.

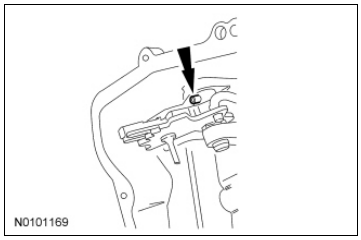


10. Remove the transmission fluid cooler tube bracket nuts from the main control cover studs and position the transmission fluid cooler tubes and bracket aside.

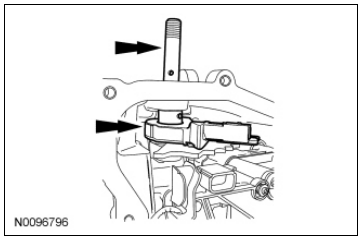


11. **NOTE:** Note the location of the stud bolts for assembly.

    Remove the 8 bolts, 5 stud bolts and the main control cover.

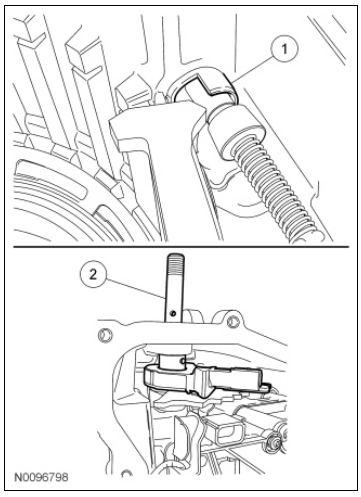


12. Disconnect the Transmission Range (TR) sensor electrical connector.

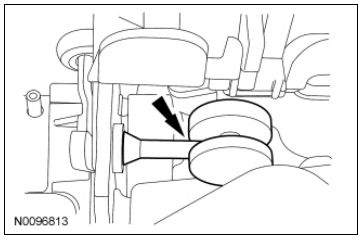


13. Remove the bolt and the TR sensor detent spring.

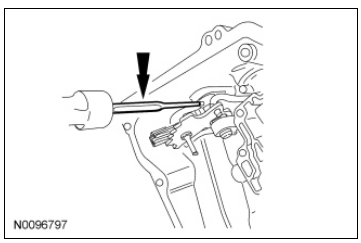
14. Using a small pair of Vise Grips® or an equivalent suitable tool, remove and discard the TR sensor locking pin.



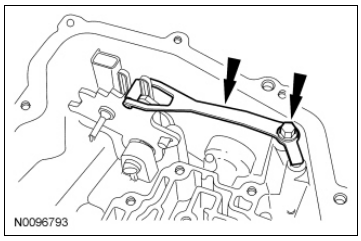
15. Remove the TR sensor in the following sequence.
    1. Hold the TR sensor in place and slide the manual shaft outward until the manual shaft is out of the transaxle case.
    2. Remove the TR sensor from the transaxle, leaving the park pawl actuating rod attached to the TR sensor.



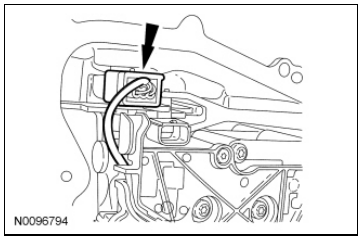
Installation



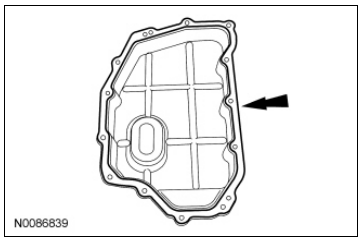
1. Install the TR sensor.
    1. Install the TR sensor and park pawl actuating rod in the transaxle case.
    2. Install the manual shaft in the transaxle case through the TR sensor.



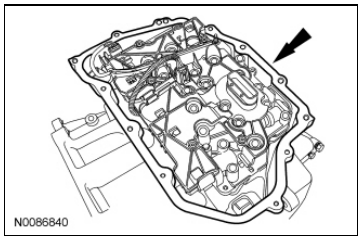
2. Inspect the manual pin to make sure it is correctly installed in the manual valve. If it is not, pull the manual control lever shaft out and correctly install the manual pin in the manual valve and position the manual control lever shaft in place.



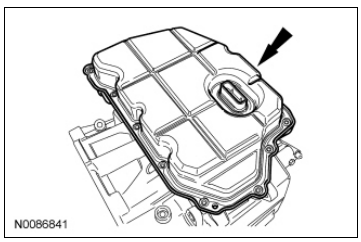
3. Using a suitable tool, install a new TR sensor locking pin.



4. Install the TR sensor detent spring and the bolt.
    - Tighten to 13 Nm (115 lb-in).



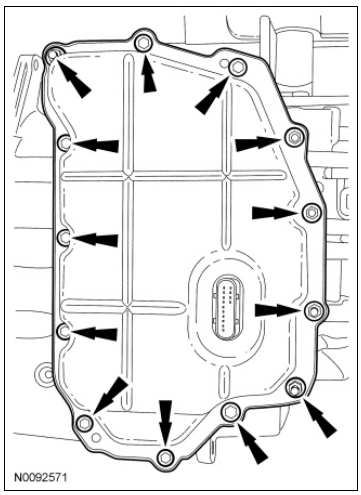
5. Connect the TR sensor electrical connector.



6. Clean the main control cover sealing surface.

7. Apply silicone to the main control sealing surface of the transaxle case.

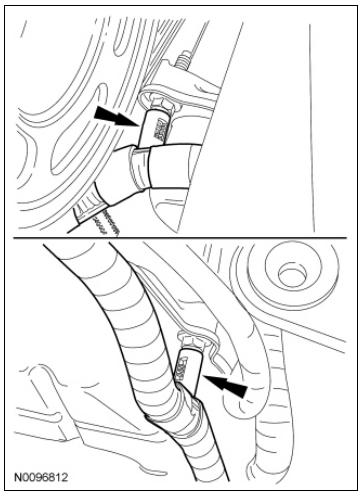
8. Position the main control cover in place.



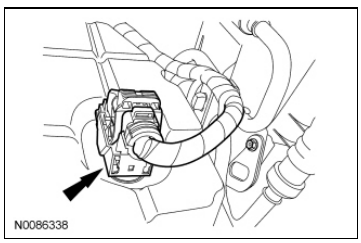
9. ***NOTICE:*** **Inspect the main control cover grommet to make sure that the seal is on the inside of the main control cover. Transmission fluid leak will occur.**

   NOTE: Install the stud bolts in the locations noted during disassembly.

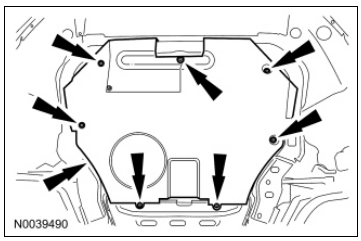
   Install the main control cover 8 bolts and 5 stud bolts.



- Tighten to 12 Nm (106 lb-in).



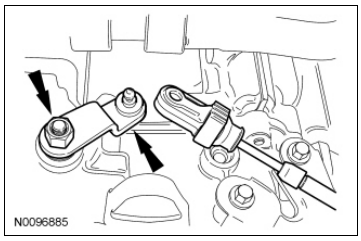
10. Position the transmission fluid cooler tube bracket and transmission fluid cooler tubes in place and install the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).



11. Connect the transaxle electrical wiring harness retainers to the main control cover stud bolts.

12. Connect the transaxle electrical connector.

13. Install the underbody cover and the screws.

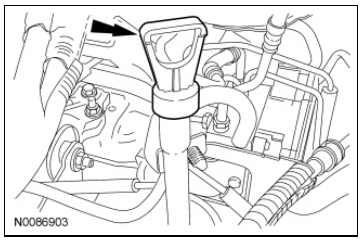


14. ***NOTICE:*** **Make sure that when installing the manual control lever it is fully seated onto the manual control lever shaft or damage to the manual control lever shaft will occur and the lever will come loose.**

    NOTICE: **Make sure to hold the manual control lever while tightening the manual control lever nut or damage to the manual control lever and park components will occur.**

    Install the manual control lever and the nut.

    - Tighten to 24 Nm (18 lb-ft).



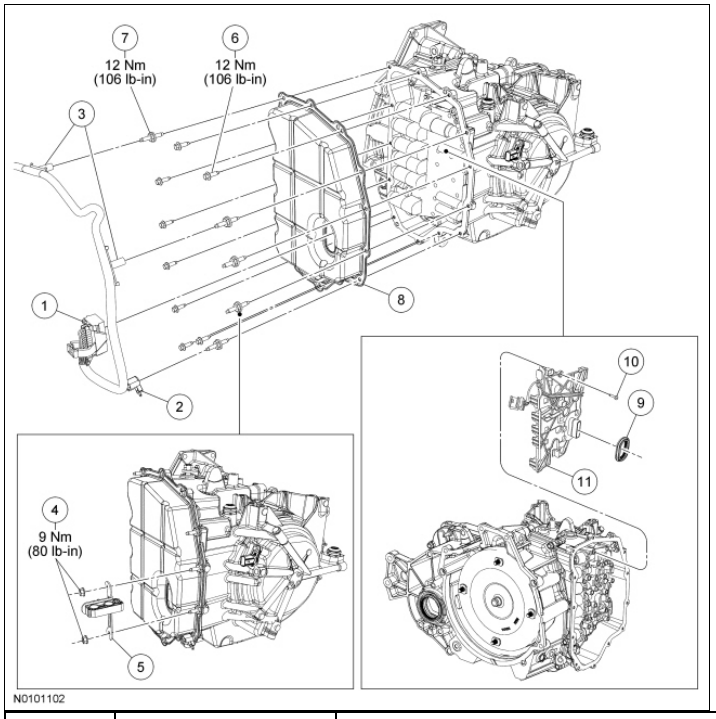
15. Connect the selector lever cable end to the manual control lever with the manual control lever and selector lever in DRIVE. Check selector lever cable adjustment. For additional information, refer to Section 307-05A .

16. Install the ACL assembly. For additional information, refer to Section 303-12A or Section 303-12B .

17. Fill the transaxle with clean transmission fluid.

18. Start the engine and move the range selector lever into each gear position.

19. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.



Solenoid Body Leadframe

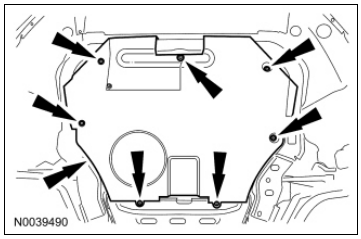
Special Tool(s)

 ST3066-A	Pins, Leadframe Guide 307-636

Material

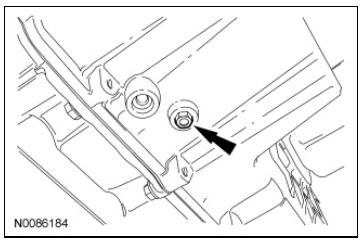
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Ultra Silicone Sealant TA-29	-

Item	Part Number	Description
1	14A464	Transaxle main harness electrical connector
2	9S318	Wiring harness retainer
3	14A163	Wiring harness retainer
4	N805320	Transmission fluid cooler tube nuts
5	7H420	Transmission fluid cooler tube bracket
6	W500213	Main control cover bolts
7	W705619	Main control cover studbolts



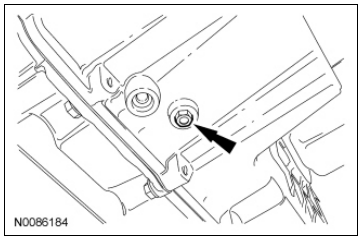
8	7G004	Main control cover
9	7B329	Main control-to-cover seal
10	W505513	Main control leadframe screw (5 required)
11	7G276	Main control leadframe

Removal

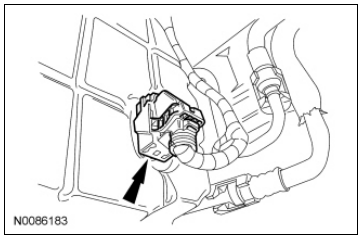


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

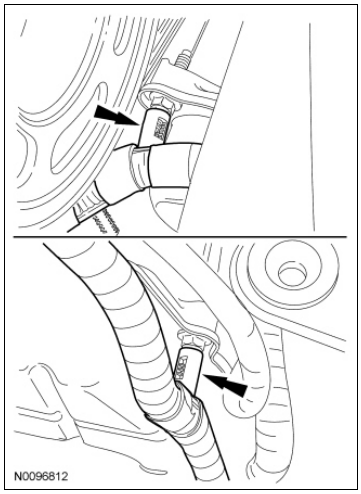
2. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A or Section 303-12B .



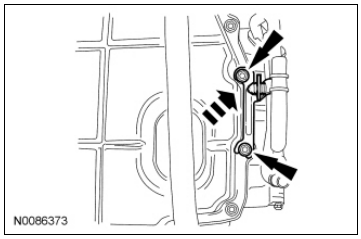
3. Remove the screws and the underbody cover.



4. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

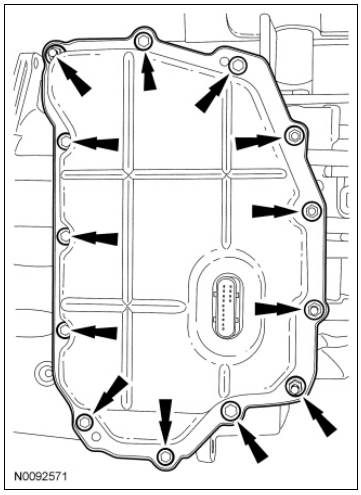


5. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).

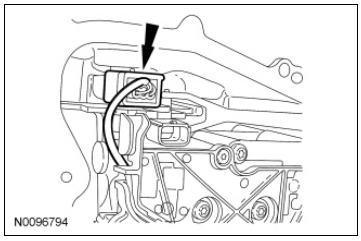


6. Disconnect the transaxle electrical connector.

7. Remove the transaxle electrical wiring harness retainers from the main control cover stud bolts.

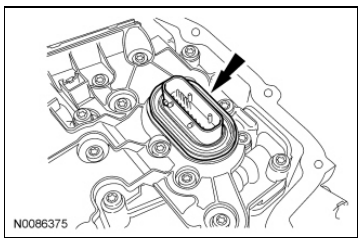


8. Remove the 2 nuts, pull the transmission fluid cooler tube bracket and tubes away from the transaxle and position it aside.



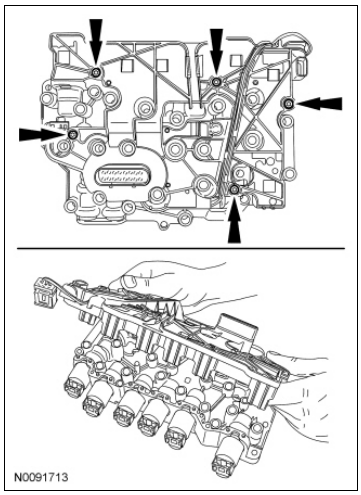
9. **NOTE:** Note the location of the stud bolts for assembly.

   Remove the 8 bolts, 5 stud bolts and the main control cover.

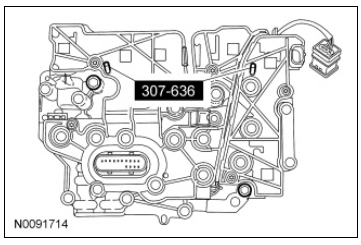


10. Disconnect the Transmission Range (TR) sensor electrical connector.

11. Disconnect the Output Shaft Speed (OSS) sensor electrical connector.

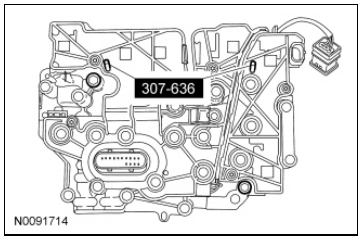


12. Remove the main control cover grommet.



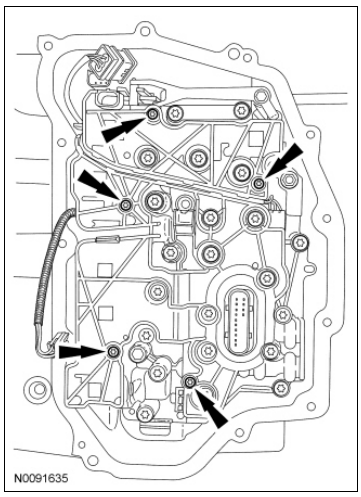
13. ***NOTICE:*** **Be careful not to bend or twist the leadframe or the solenoid terminals when removing the leadframe or damage can occur to the leadframe or the solenoids.**

    Remove the 5 screws and the leadframe from the solenoids by lifting it straight up evenly.

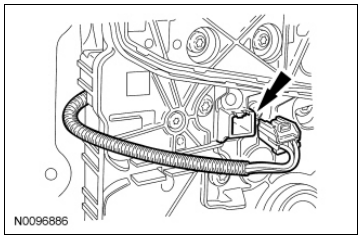


Installation

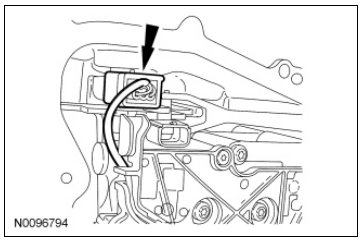
1. Install the Leadframe Guide Pins in the solenoid body to align the lead frame for installation.



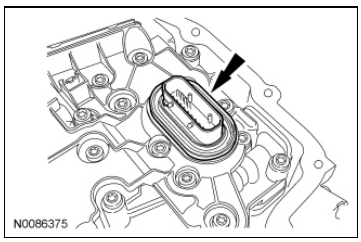
2. Position the leadframe on the Leadframe Guide Pins and carefully install the leadframe by pushing straight down into the solenoids.



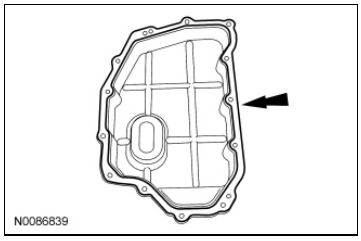
3. Remove the Leadframe Guide Pins.



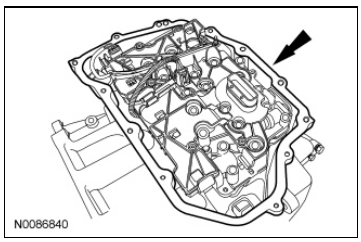
4. Install the 5 leadframe screws.



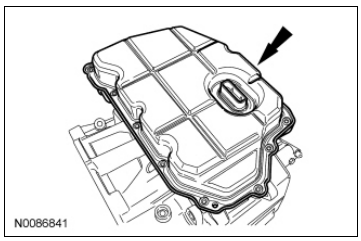
5. Connect the OSS sensor electrical connector.



6. Connect the TR sensor electrical connector.



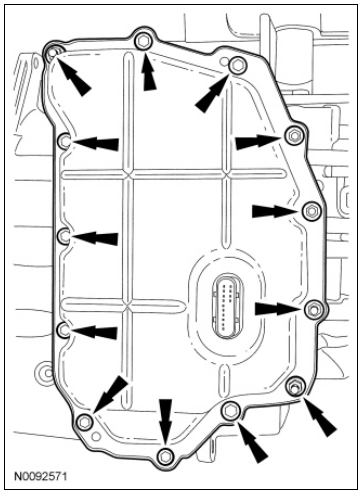
7. Install the main control cover grommet.



8. Clean the main control cover sealing surface and inspect for damage.

9. Apply silicone to the main control sealing surface of the transaxle case.

10. Position the main control cover in place.

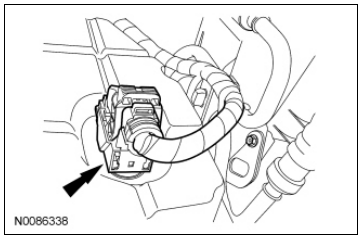


11. ***NOTICE:*** **Inspect the main control cover grommet to make sure that the seal is on the inside of the main control cover. Transmission fluid leak will occur.**

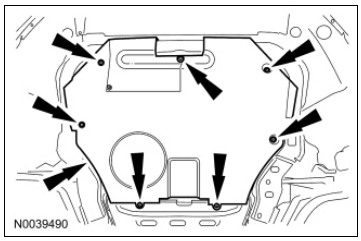
    NOTE: Install the stud bolts in the locations noted during disassembly.

    Tighten the 8 main control cover bolts and 5 stud bolts.

    - Tighten to 12 Nm (106 lb-in).

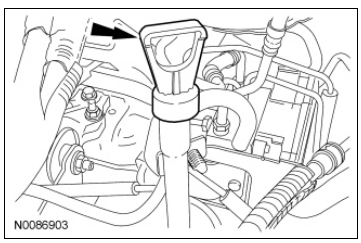


12. Position the transmission fluid cooler tube bracket and transmission fluid cooler tube assembly in place and install the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).



13. Connect the transaxle electrical wiring harness retainers to the main control cover stud bolts.

14. Connect the transaxle electrical connector.



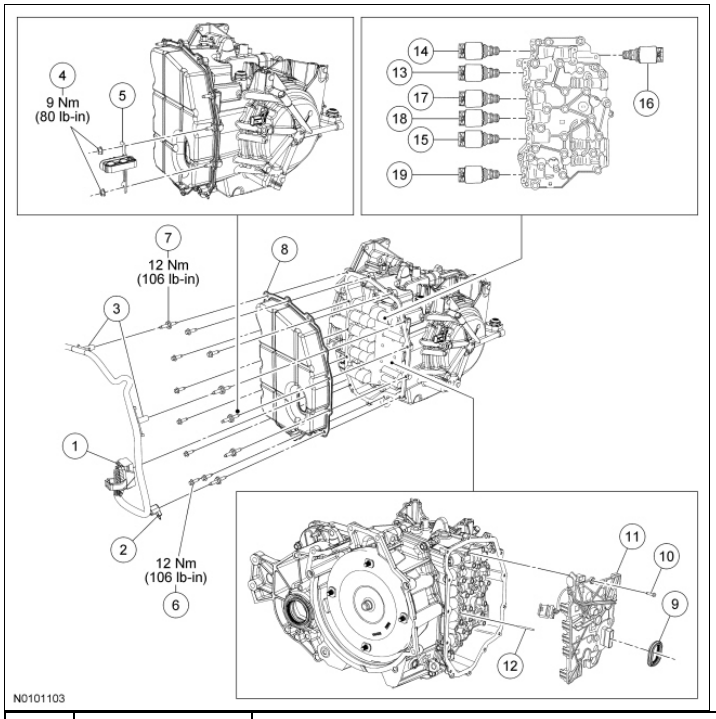
15. Install the underbody cover and the screws.

16. Install the ACL assembly. For additional information, refer to Section 303-12A or Section 303-12B .

17. Fill the transaxle with clean transmission fluid.

18. Start the engine and move the range selector lever into each gear position.

19. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.



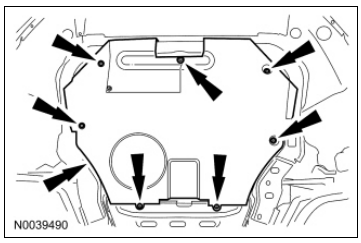
Solenoids

Special Tool(s)

 ST3066-A	Pins, Leadframe Guide 307-636

Material

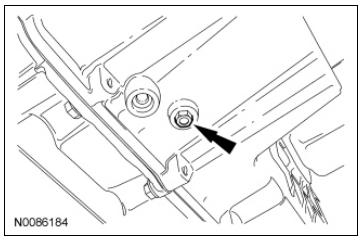
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Ultra Silicone Sealant TA-29	-



Item	Part Number	Description
1	14A464	Transaxle main harness electrical connector
2	9S318	Wiring harness retainer
3	14A163	Wiring harness retainer
4	N805320	Transmission fluid cooler tube nuts
5	7H420	Transmission fluid cooler tube bracket
6	W500213	Main control cover bolts
7	W705619	Main control cover studbolts

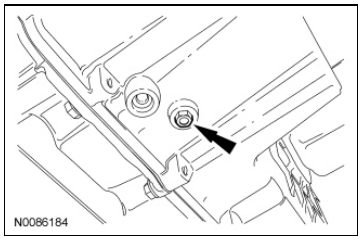
8	7G004	Main control cover
9	7B329	Main control-to-cover seal
10	W505513	Main control leadframe screw (5 required)
11	7G276	Main control leadframe
12	7H111	Solenoid retaining pin (14 required)
13	7G136	Shift Solenoid A (SSA) (normally low)
14	7G383	Shift Solenoid B (SSB) (normally high)
15	7G136	Shift Solenoid C (SSC) (normally low)
16	7G383	Shift Solenoid D (SSD) (normally high)
17	7G484	Shift Solenoid E (SSE) (normally closed [OFF])
18	7G136	Torque Converter Clutch (TCC) solenoid (normally low)
19	7G383	Line Pressure Control (LPC) solenoid (normally high)

Removal

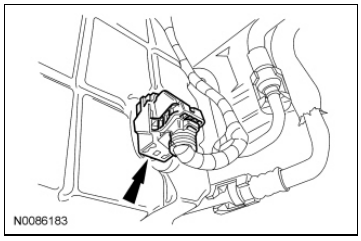


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

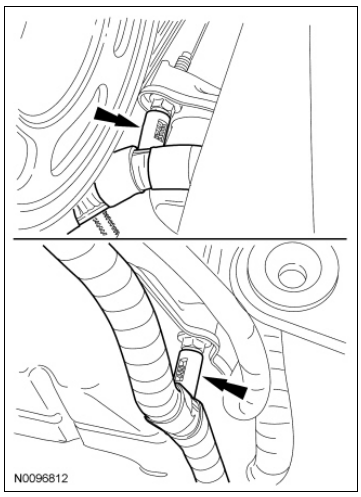
2. Remove the screws and the underbody cover.



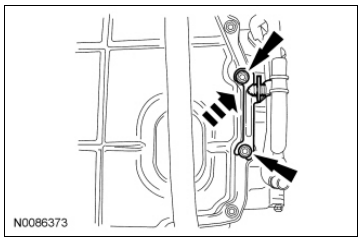
3. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A or Section 303-12B .



4. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

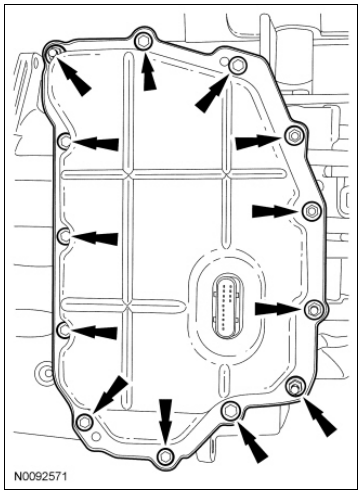


5. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).

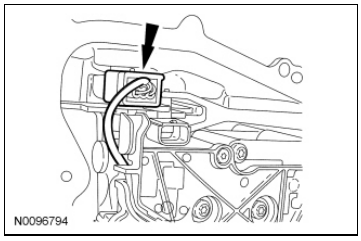


6. Disconnect the transaxle electrical connector.

7. Remove the transaxle electrical wiring harness retainers from the main control cover stud bolts.

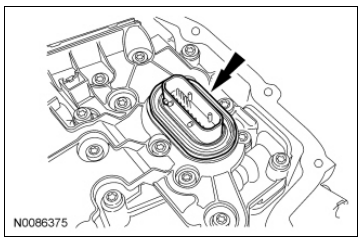


8. Remove the 2 nuts, pull the transmission fluid cooler tube bracket and tubes away from the transaxle and position it aside.



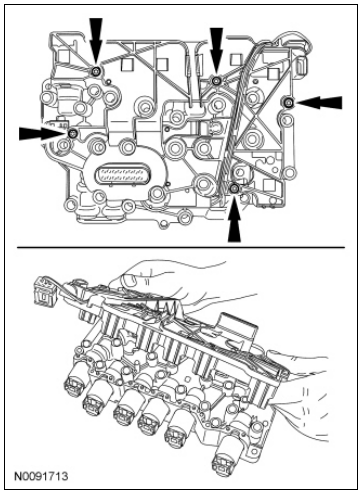
9. **NOTE:** Note the location of the stud bolts for assembly.

   Remove the 8 bolts, 5 stud bolts and the main control cover.

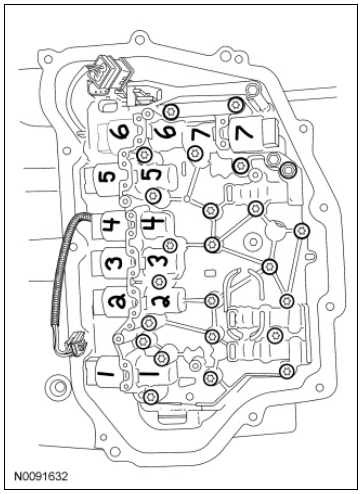


10. Disconnect the Transmission Range (TR) sensor electrical connector.

11. Disconnect the Output Shaft Speed (OSS) sensor electrical connector.



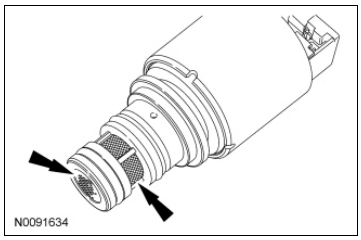
12. Remove the main control cover grommet.



13. ***NOTICE:*** **Be careful not to bend or twist the leadframe or the solenoid terminals when removing the leadframe or damage can occur to the leadframe or the solenoids.**

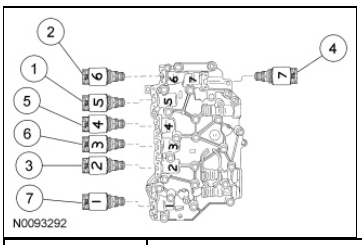
    Remove the 5 screws and the leadframe from the solenoids by lifting it straight up evenly.

14. Using a paint pen, number the solenoids and solenoid body to clearly mark which solenoid was removed from which bore in the solenoid body.



15. Remove the solenoid retaining pin(s).

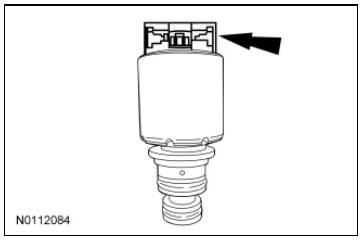
16. Remove the solenoid(s) from the solenoid body.



Installation

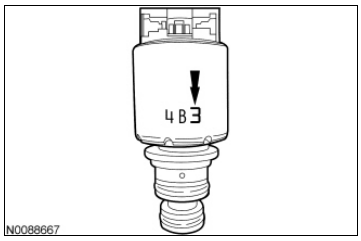
1. Inspect the solenoid(s) for damage.

2. If a new solenoid is not being installed, install the solenoid(s) into the bore from which it was removed.



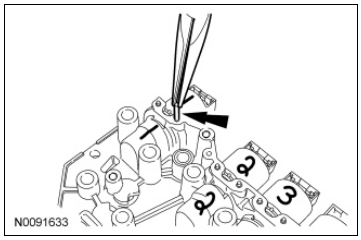
3. If installing a new Variable Force Solenoid (VFS), determine the base part number of the solenoid(s). The Torque Converter Clutch (TCC) solenoid, Shift Solenoid A (SSA) and Shift Solenoid C (SSC) are all normally low pressure solenoids. The Line Pressure Control (LPC) solenoid, Shift Solenoid B (SSB) and Shift Solenoid D (SSD) are all normally high pressure solenoids. Shift Solenoid E (SSE) is not a VFS , it is an ON/OFF solenoid.

Item	Part Number	Description

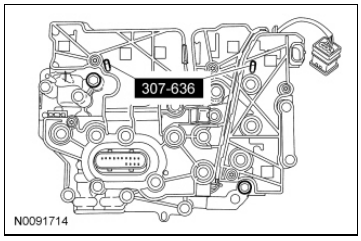


1	7G136	SSA (normally low)
2	7G383	SSB (normally high)
3	7G136	SSC (normally low)
4	7G383	SSD (normally high)
5	7G484	SSE (normally closed [OFF])
6	7G136	TCC solenoid (normally low)
7	7G383	LPC solenoid (normally high)

4. If installing a new LPC solenoid, SSB or SSD , note the color of the electrical terminal area of the solenoid. The color will be blue or green and the solenoid can only be replaced with the same color solenoid. If a new solenoid with that color is not available, install a new solenoid body, refer to Solenoid Body Assembly in this section.

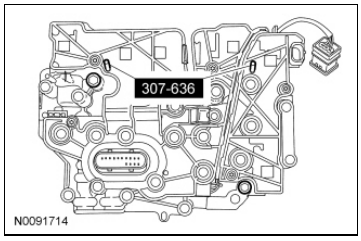


5. Determine the part number suffix by checking the solenoid service band number etched on the side of the solenoid. The band number is the third digit on the side of the solenoid and will be a 1, 2, 3, 4 or 5. Use the following table to determine the part number suffix and match the new solenoid base part number and suffix with the old solenoid. Install the solenoid in the solenoid body.

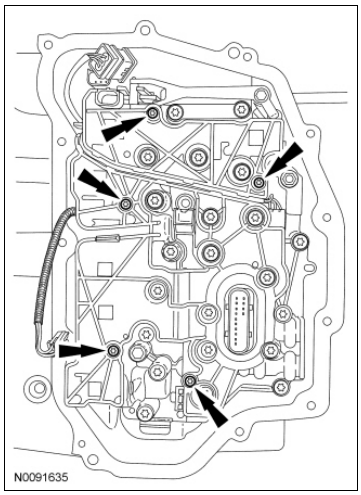


Solenoid Band Number	Part Number Suffix
1	B
2	C
3	D
4	E
5	F

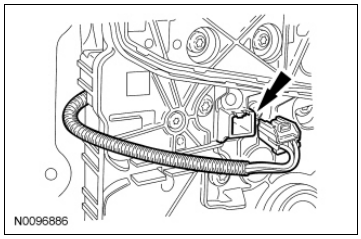
6. Install the solenoid retaining pin(s).



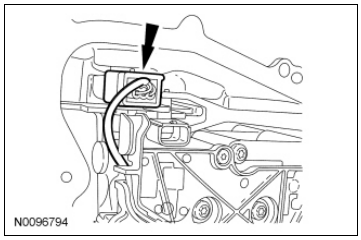
7. Install the Leadframe Guide Pins in the solenoid body to align the lead frame for installation.



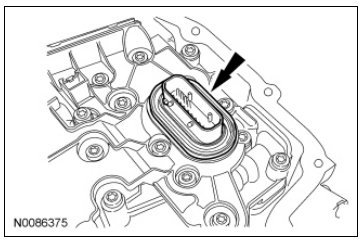
8. Position the leadframe on the Leadframe Guide Pins and carefully install the leadframe by pushing straight down into the solenoids.



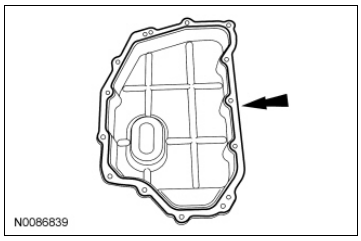
9. Remove the Leadframe Guide Pins.



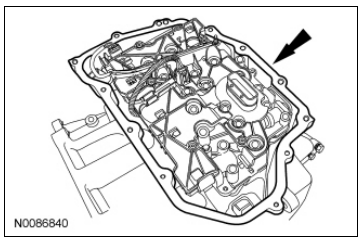
10. Install the 5 leadframe screws.



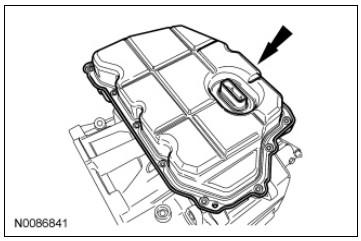
11. Connect the OSS sensor electrical connector.



12. Connect the TR sensor electrical connector.



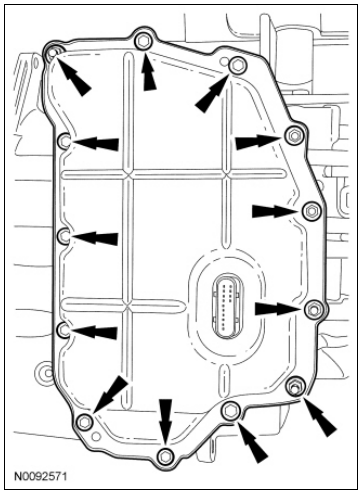
13. Install the main control cover grommet.



14. Clean the main control cover sealing surface and inspect for damage.

15. Apply silicone to the main control sealing surface of the transaxle case.

16. Position the main control cover in place.

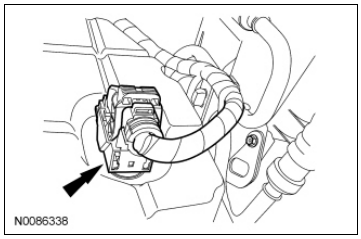


17. ***NOTICE:*** **Inspect the main control cover grommet to make sure that the seal is on the inside of the main control cover, or a transmission fluid leak will occur.**

    NOTE: Install the stud bolts in the locations noted during disassembly.

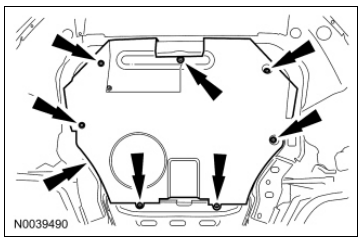
    Tighten the 8 main control cover bolts and 5 stud bolts.

    - Tighten to 12 Nm (106 lb-in).

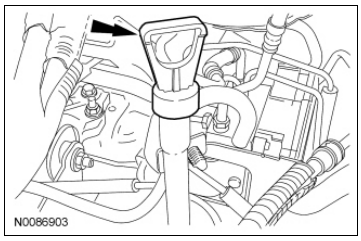


18. Position the transmission fluid cooler tube bracket and transmission fluid cooler tube assembly in place and install the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).

19. Connect the transaxle electrical wiring harness retainers to the main control cover stud bolts.



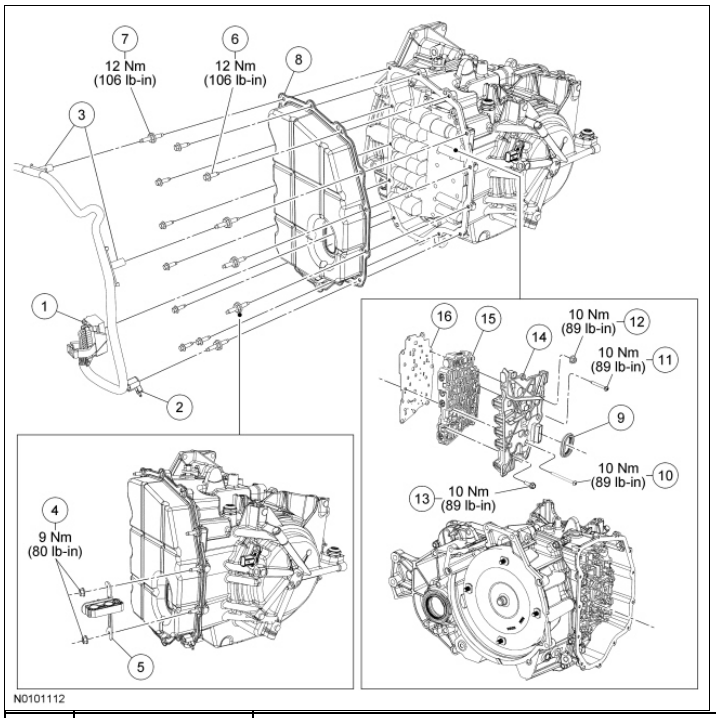
20. Connect the transaxle electrical connector.



21. Install the ACL assembly. For additional information, refer to Section 303-12A or Section 303-12B .

22. Install the underbody cover and the screws.

23. Fill the transaxle with clean transmission fluid.



24. Start the engine and move the range selector lever into each gear position.

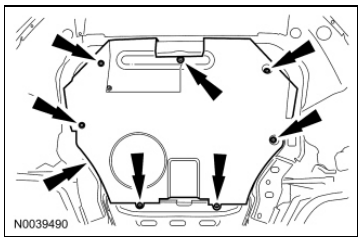
25. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

Main Control Valve Body

Material

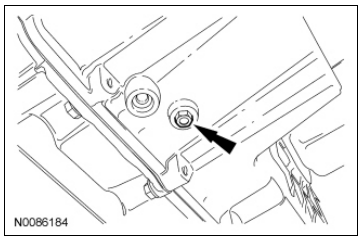
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Ultra Silicone Sealant TA-29	-

Item	Part Number	Description
1	14A464	Transaxle main harness electrical connector
2	9S318	Wiring harness retainer
3	14A163	Wiring harness retainer
4	N805320	Transmission fluid cooler tube nuts
5	7H420	Transmission fluid cooler tube bracket
6	W500213	Main control cover bolts
7	W705619	Main control cover studbolts
8	7G004	Main control cover
9	7B329	Main control-to-cover seal
10	W302863	Main control-to-transaxle case bolt (long) (10 required)
11	W302862	Main control-to-transaxle case bolt (short) (12 required)



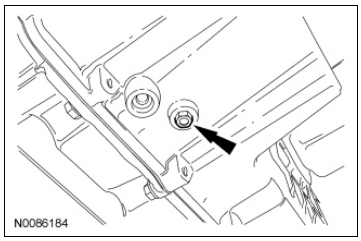
12	W520412	Main control nut
13	W500303	Solenoid body-to-valve body bolt (2 required)
14	7G391	Solenoid body assembly
15	7A100	Valve body assembly
16	7Z490	Main control-to-transaxle case separator plate

Removal

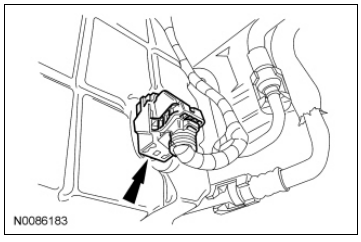


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

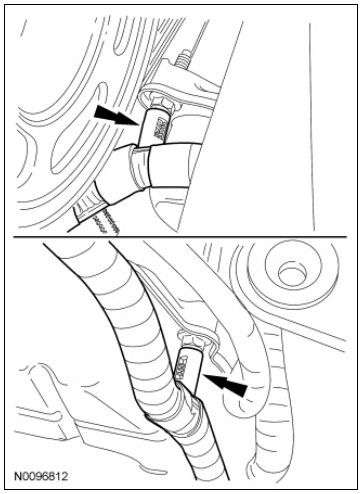
2. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A or Section 303-12B .



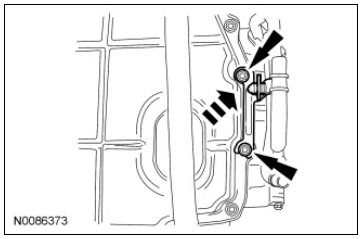
3. Remove the screws and the underbody cover.



4. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

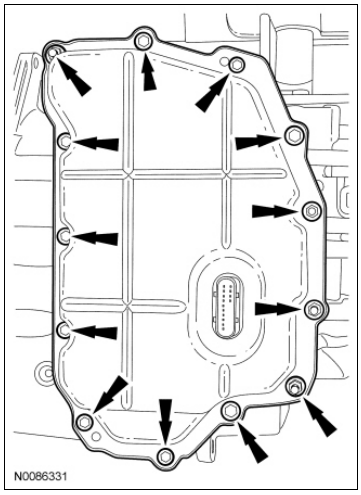


5. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).

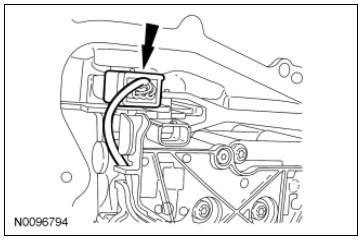


6. Disconnect the transaxle electrical connector.

7. Connect the transaxle electrical wiring harness retainers to the main control cover stud bolts.

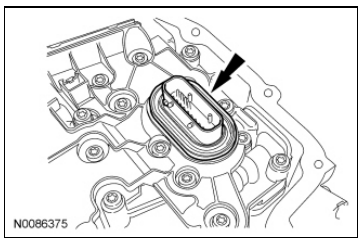


8. Remove the 2 nuts, pull the transmission fluid cooler tube bracket and tubes away from the transaxle and position it aside.



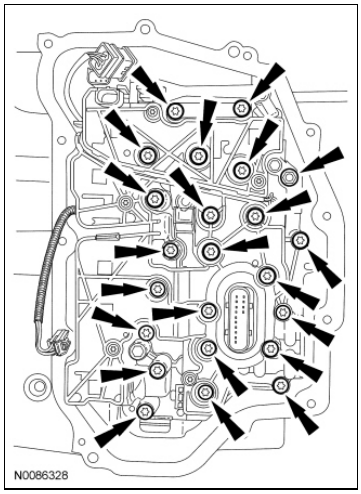
9. **NOTE:** Note the location of the stud bolts for assembly.

   Remove the 8 bolts, 5 stud bolts and the main control cover.



10. Disconnect the Transmission Range (TR) sensor electrical connector.

11. Disconnect the Output Shaft Speed (OSS) sensor electrical connector.

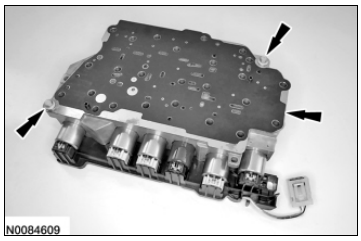


12. Remove the main control-to-main control cover grommet.

13. ***NOTICE:*** **The main control should be handled with care or damage to the main control may occur.**

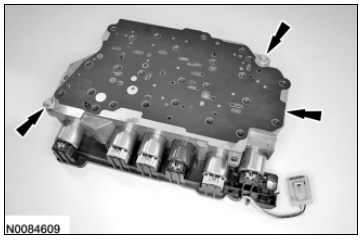
    NOTE: Note the location of the different length bolts for assembly.

    Remove the nut, 22 bolts and the main control.



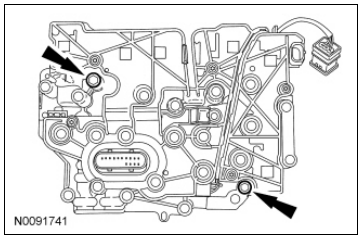
14. Remove and discard the main control-to-transaxle case separator plate.

15. Remove the 2 bolts and separate the solenoid body assembly from the main control valve body.



16. Remove the 2 bolts and remove and discard the separator plate.

Installation

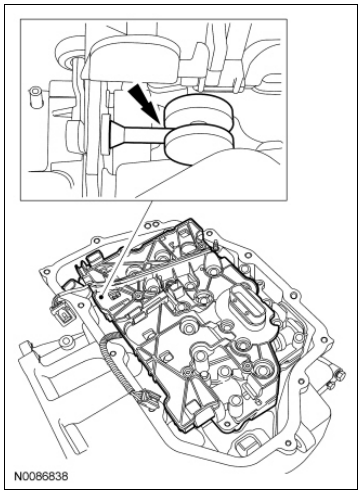


1. Install the new separator plate and the 2 separator bolts.
   - Tighten to 10 Nm (89 lb-in).

2. **NOTE:** If cleaning the main control assembly or inspecting the valves, refer to Main Control Valve Body in this section. If installing a new main control assembly, continue with this procedure.

   Install the solenoid body assembly onto the main control valve body. Install the 2 bolts.

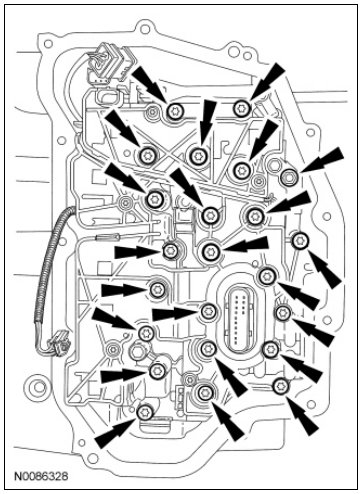
   - Tighten to 10 Nm (89 lb-in).



3. Position the OSS and TR sensor wiring harnesses aside and install the new main control-to-transaxle case separator plate.

4. **NOTE:** Make sure that the manual lever pin (part of the TR sensor) is correctly installed in the manual valve.

   Install the main control.

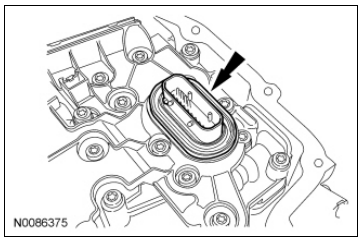


5. ***NOTICE:*** **Make sure not to pinch the Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the main control.**

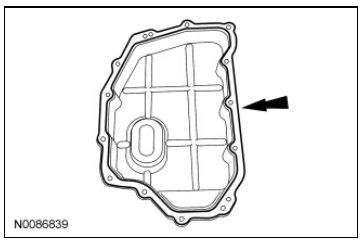
   NOTE: Install the different length bolts in the locations noted during disassembly.

   Install the main control stud nut and 22 main control valve body bolts. Tighten in a crisscross pattern.

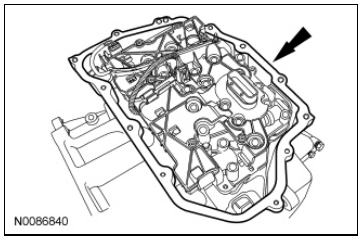
   - Tighten to 10 Nm (89 lb-in).



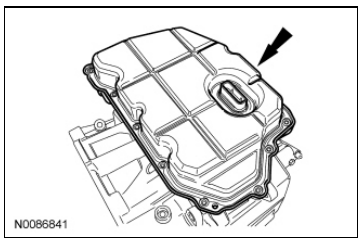
6. Connect the OSS sensor electrical connector.



7. Connect the TR sensor electrical connector.



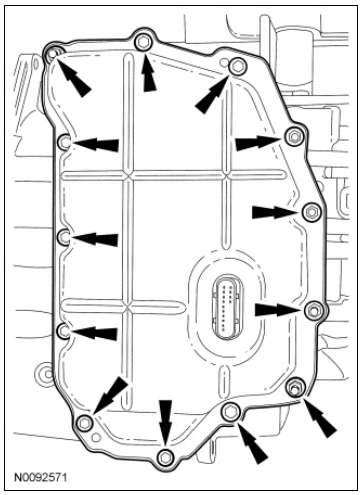
8. Install the main control-to-main control cover grommet.



9. Clean the main control cover sealing surface.

10. Apply silicone to the main control sealing surface of the transaxle case.

11. Position the main control cover in place.

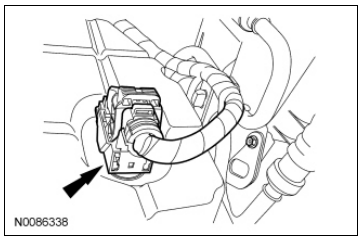


12. ***NOTICE:*** **Inspect the main control-to-main control cover grommet to make sure that the seal is on the inside of the main control cover. Transmission fluid leak will occur.**

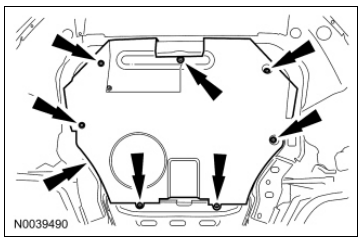
    NOTE: Install the stud bolts in the locations noted during disassembly.

    Tighten the 8 main control cover bolts and 5 stud bolts.

    - Tighten to 12 Nm (106 lb-in).

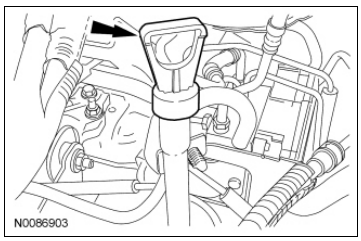


13. Position the transmission fluid cooler tube bracket and transmission fluid cooler tube assembly in place and install the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).



14. Connect the transaxle electrical wiring harness retainers to the main control cover studbolts.

15. Connect the transaxle electrical connector.



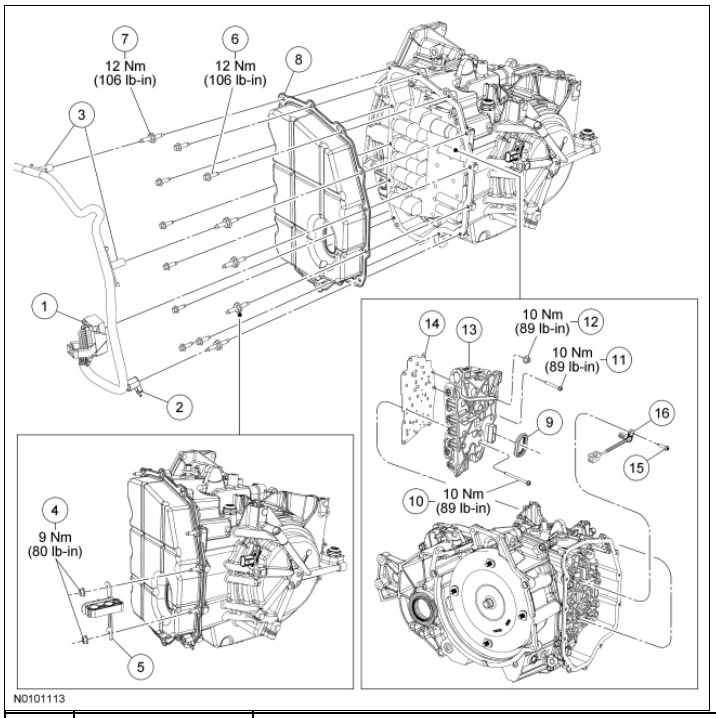
16. Install the underbody cover and the screws.

17. Install the ACL assembly. For additional information, refer to Section 303-12A or Section 303-12B .

18. Fill the transaxle with clean transmission fluid.

19. Start the engine and move the range selector lever into each gear position.

20. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.



21. If a new solenoid body is installed, the solenoid body strategy and solenoid body identification will need to be updated. For additional information, refer to Solenoid Body Strategy in this section

22. If a replacement transaxle assembly is being installed or a new solenoid body is installed, the PCM will have to be reflashed with a new solenoid body strategy and identification data file. For additional information, refer to Solenoid Body Strategy in this section.

Output Shaft Speed (OSS) Sensor

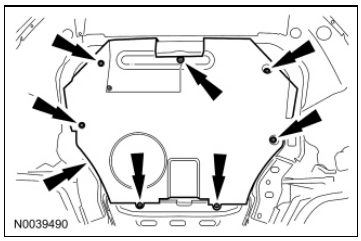
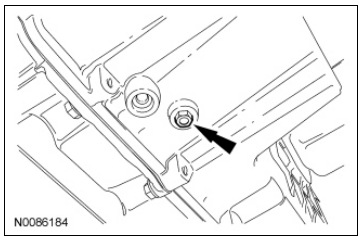
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Ultra Silicone Sealant TA-29	-

Item	Part Number	Description
1	14A464	Transaxle main harness electrical connector
2	9S318	Wiring harness retainer
3	14A163	Wiring harness retatd>
4	N805320	Transmission fluid cooler tube nuts
5	7H420	Transmission fluid cooler tube bracket
6	W500213	Main control cover bolts
7	W705619	Main control cover studbolts
8	7G004	Main control cover
9	7B329	Main control-to-cover seal
10	W302863	Main control-to-transaxle case bolt (long) (10 required)
11	W302862	Main control-to-transaxle case bolt (short) (12 required)



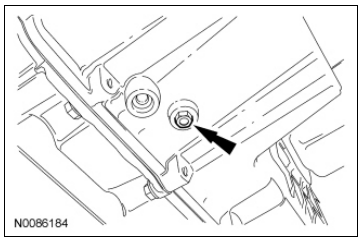
12	W520412	Main control nut
13	7A100	Main control assembly
14	7Z490	Main control-to-transaxle case separator plate
15	W713644	Output Shaft Speed (OSS) sensor bolt
16	7H103	OSS sensor

Removal

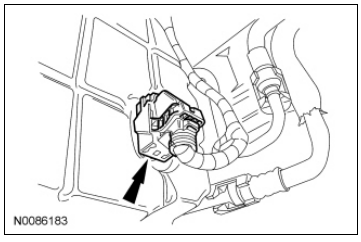


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

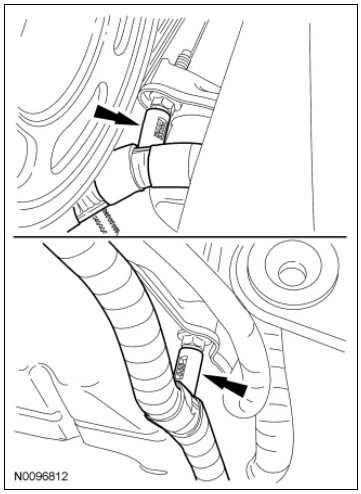
2. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A or Section 303-12B .



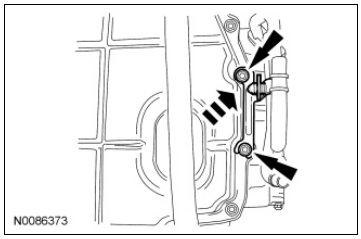
3. Remove the screws and the underbody cover.



4. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

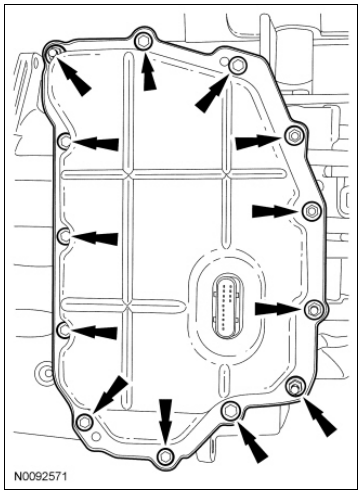


5. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).

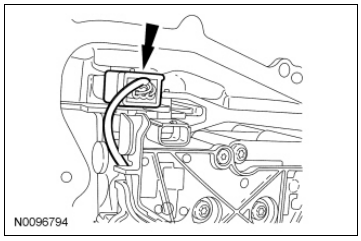


6. Disconnect the transaxle electrical connector.

7. Connect the transaxle electrical wiring harness retainers to the main control cover stud bolts.

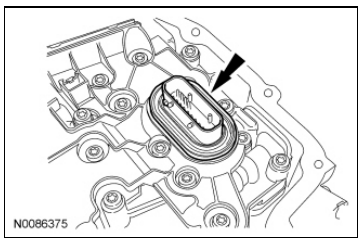


8. Remove the 2 nuts, pull the transmission fluid cooler tube bracket and tubes away from the transaxle and position it aside.



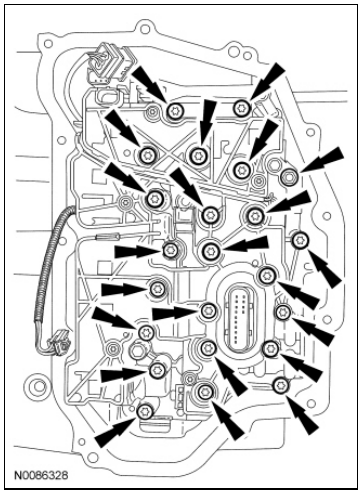
9. **NOTE:** Note the location of the stud bolts for assembly.

   Remove the 8 bolts, 5 stud bolts and the main control cover.



10. Disconnect the Transmission Range (TR) sensor electrical connector.

11. Disconnect the Output Shaft Speed (OSS) sensor electrical connector.



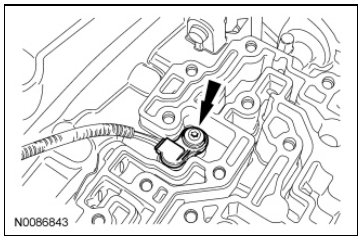
12. Remove the main control-to-main control cover grommet.

13. ***NOTICE:*** **The main control should be handled with care or damage to the main control may occur.**

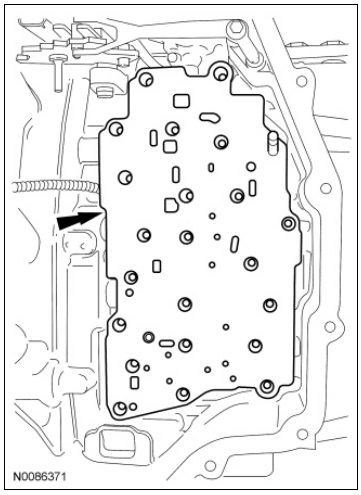
    NOTE: Note the location of the different length bolts for assembly.

    Remove the nut, 22 bolts and the main control.

14. Remove the main control-to-transaxle separator plate.

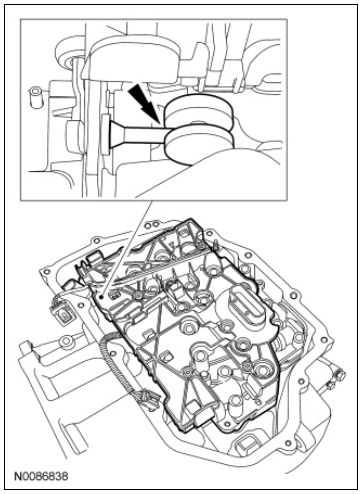


15. Remove the bolt and the OSS sensor.



Installation

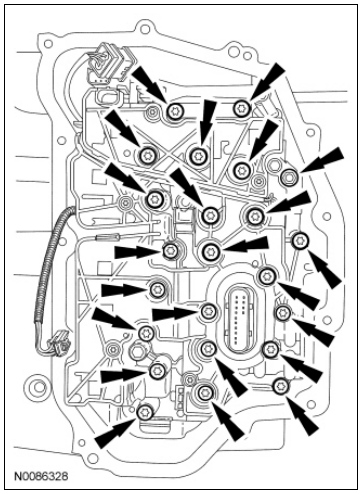
1. Install the OSS sensor and the bolt.
   - Tighten to 10 Nm (89 lb-in).



2. Position the OSS and TR sensor wiring harnesses aside and install the main control-to-transaxle separator plate.

3. **NOTE:** Make sure that the manual lever pin (part of the TR sensor) is correctly installed in the manual valve.

   Install the main control.

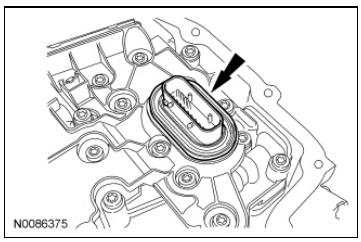


4. ***NOTICE:*** **Make sure not to pinch the Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the main control.**

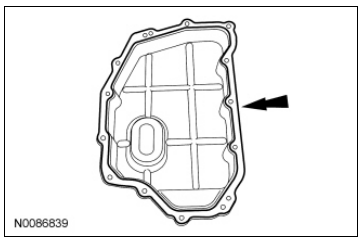
   NOTE: Install the different length bolts in the locations noted during disassembly.

   Install the main control stud nut and 22 main control valve body bolts. Tighten in a crisscross pattern.

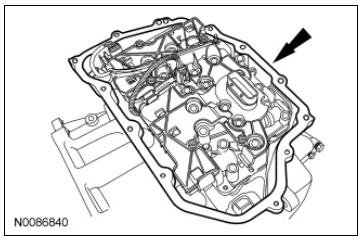
   - Tighten to 10 Nm (89 lb-in).



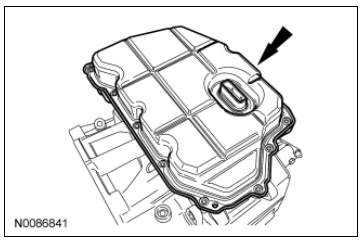
5. Route the OSS sensor wiring harness and connect the electrical connector.



6. Connect the TR sensor electrical connector.



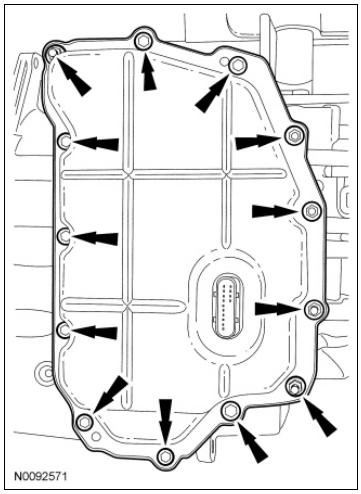
7. Install the main control-to-main control cover grommet.



8. Clean the main control cover sealing surface and inspect for damage.

9. Apply silicone to the main control sealing surface of the transaxle case.

10. Position the main control cover in place.

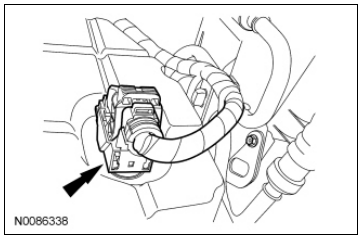


11. ***NOTICE:*** **Inspect the main control-to-main control cover grommet to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will occur.**

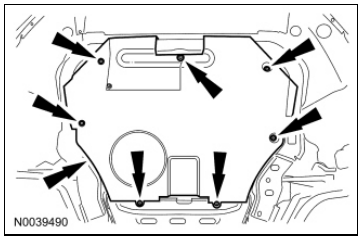
    NOTE: Install the stud bolts in the locations noted during disassembly.

    Install the 8 main control cover bolts and 5 stud bolts.

    - Tighten to 12 Nm (106 lb-in).

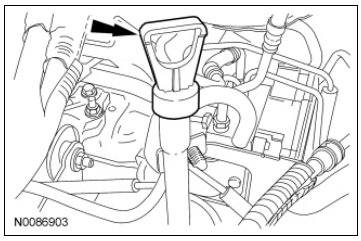


12. Position the transmission fluid cooler tube bracket and transmission fluid cooler tube assembly in place and install the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).



13. Connect the transaxle electrical wiring harness retainers to the main control cover studbolts.

14. Connect the transaxle electrical connector.



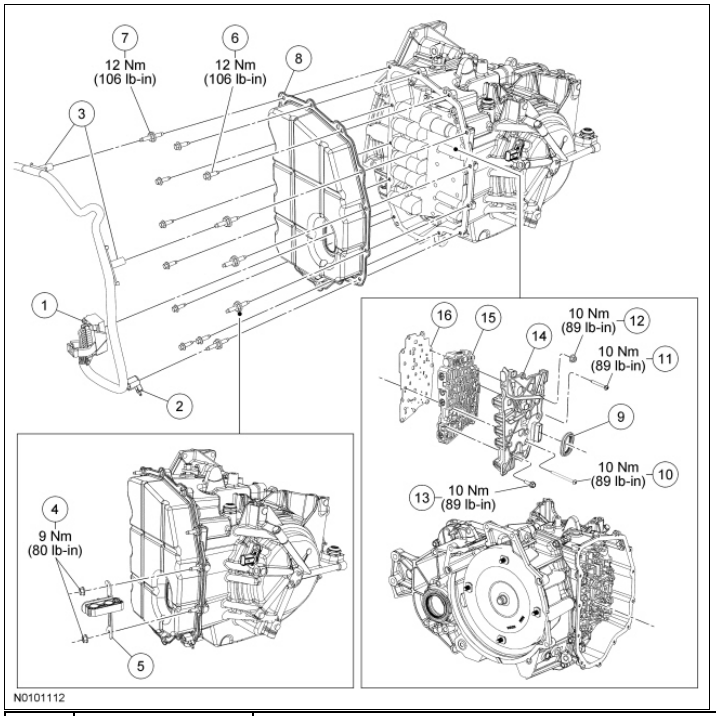
15. Install the underbody cover and the screws.

16. Install the ACL assembly. For additional information, refer to Section 303-12A or Section 303-12B .

17. Fill the transaxle with clean transmission fluid.

18. Start the engine and move the range selector lever into each gear position.

19. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.



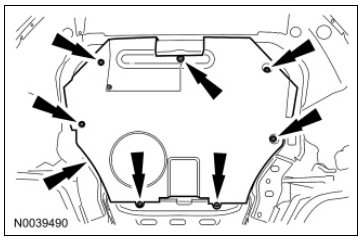
Solenoid Body Assembly

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

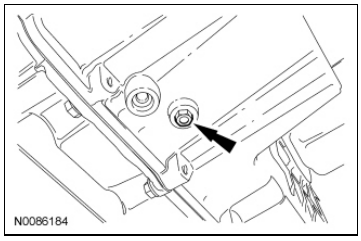
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Ultra Silicone Sealant TA-29	-



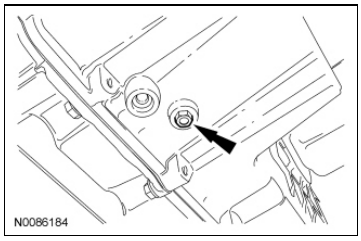
Item	Part Number	Description
1	14A464	Transaxle main harness electrical connector
2	9S318	Wiring harness retainer
3	14A163	Wiring harness retainer
4	N805320	Transmission fluid cooler tube nuts
5	7H420	Transmission fluid cooler tube bracket
6	W500213	Main control cover bolts

7	W705619	Main control cover studbolts
8	7G004	Main control cover
9	7B329	Main control-to-cover seal
10	W302863	Main control-to-transaxle case bolt (long) (10 required)
11	W302862	Main control-to-transaxle case bolt (short) (12 required)
12	W520412	Main control nut
13	W500303	Solenoid body-to-valve body bolt (2 required)
14	7G391	Solenoid body assembly
15	7A100	Valve body assembly
16	7Z490	Main control-to-transaxle case separator plate

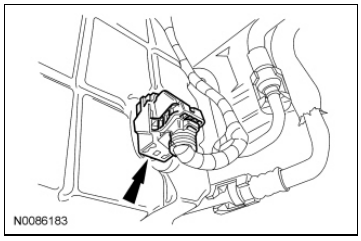


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

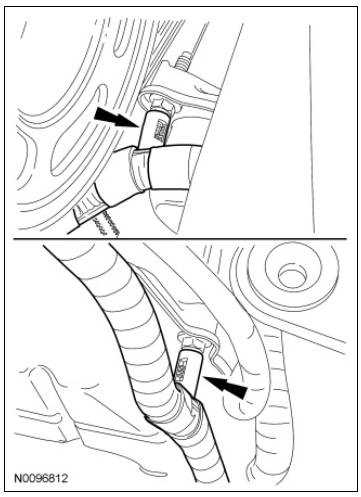
2. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A or Section 303-12B .



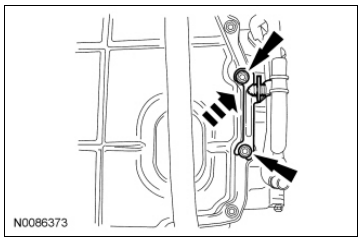
3. Remove the screws and the underbody cover.



4. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

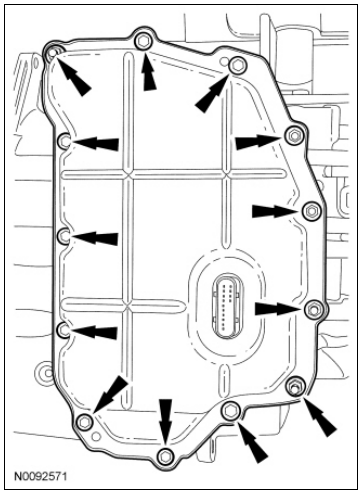


5. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).

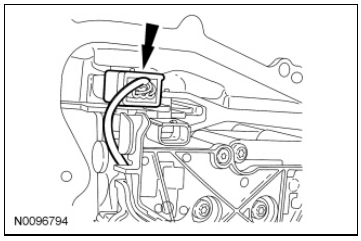


6. Disconnect the transaxle electrical connector.

7. Disconnect the transaxle electrical wiring harness retainers from the main control cover stud bolts.

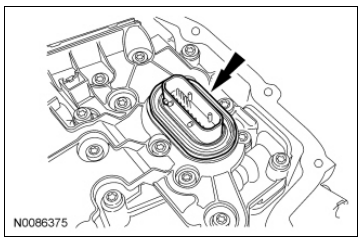


8. Remove the 2 nuts, pull the transmission fluid cooler tube bracket and tubes away from the transaxle and position it aside.



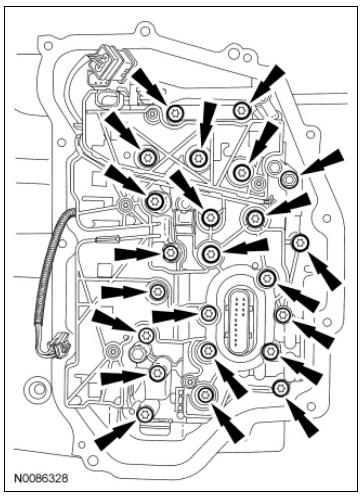
9. **NOTE:** Note the location of the stud bolts for assembly.

   Remove the 8 bolts, 5 stud bolts and the main control cover.



10. Disconnect the Transmission Range (TR) sensor electrical connector.

11. Disconnect the Output Shaft Speed (OSS) sensor electrical connector.

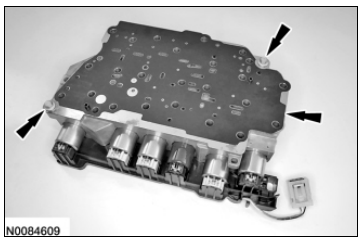


12. Remove the main control cover grommet.

13. ***NOTICE:*** **The main control should be handled with care or damage to the main control may occur.**

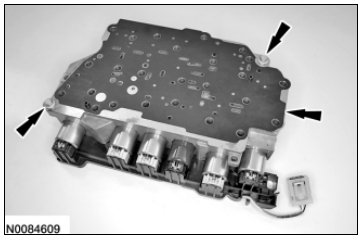
    NOTE: Note the location of the different length bolts for assembly.

    Remove the nut, 22 bolts and the main control.



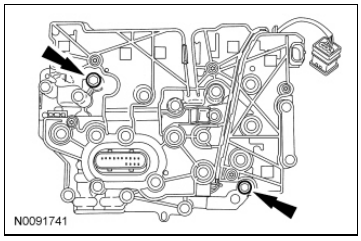
14. Remove and discard the main control-to-transaxle case separator plate.

15. Remove the 2 bolts and separate the solenoid body from the main control valve body.



16. Remove the 2 bolts and remove and discard the separator plate.

Installation

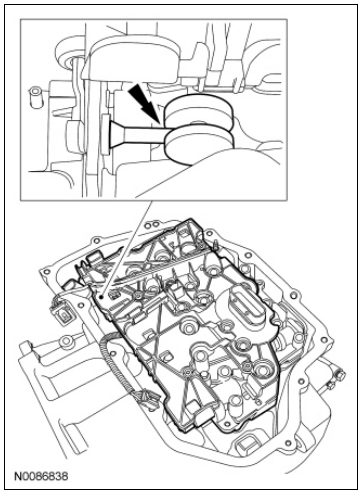


1. Install the new separator plate and the 2 separator bolts.
   - Tighten to 10 Nm (89 lb-in).

2. **NOTE:** If cleaning the solenoid body assembly or inspecting the valves, refer to Solenoid Body Assembly in this section. If installing a new solenoid body assembly, continue with this procedure.

   Install the solenoid body onto the main control valve body. Install the 2 bolts.

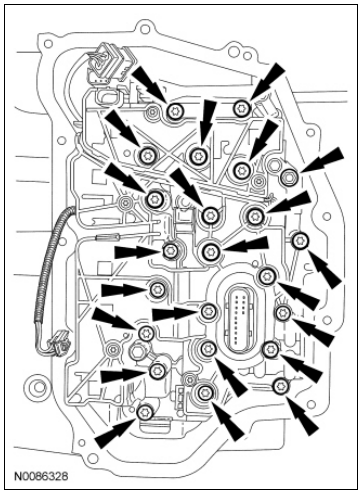
   - Tighten to 10 Nm (89 lb-in).



3. Position the OSS and TR sensor wiring harnesses aside and install the new main control-to-transaxle case separator plate.

4. **NOTE:** Make sure that the manual lever pin (part of the TR sensor) is correctly installed in the manual valve.

   Install the main control.

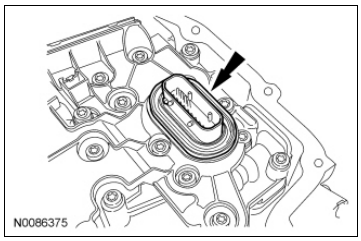


5. ***NOTICE:*** **Make sure not to pinch the Output Shaft Speed (OSS) or Transmission Range (TR) sensor wiring harnesses when installing the main control.**

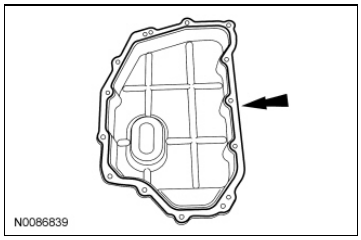
   NOTE: Install the different length bolts in the locations noted during disassembly.

   Install the main control stud nut and 22 main control valve body bolts. Tighten in a crisscross pattern.

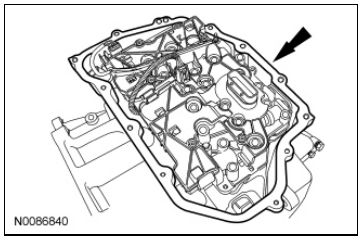
   - Tighten to 10 Nm (89 lb-in).



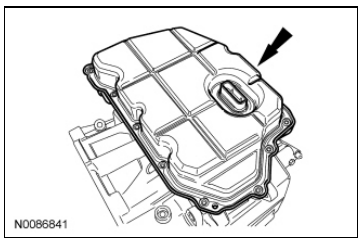
6. Route the OSS sensor wiring harness and connect the electrical connector.



7. Connect the TR sensor electrical connector.



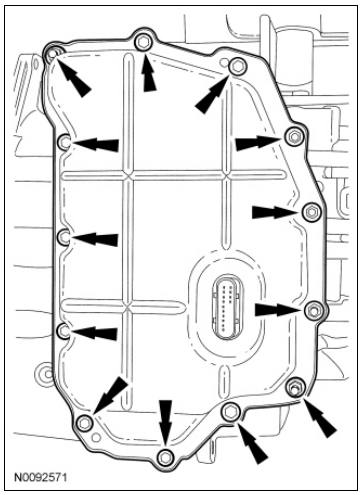
8. Install the main control cover grommet.



9. Clean the main control cover sealing surface.

10. Apply silicone to the main control sealing surface of the transaxle case.

11. Position the main control cover in place.

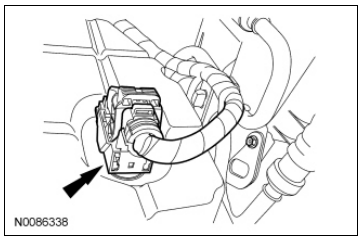


12. ***NOTICE:*** **Inspect the main control-to-main control cover grommet to make sure that the seal is on the inside of the main control cover or a transmission fluid leak will occur.**

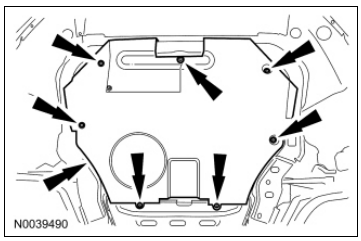
    NOTE: Install the stud bolts in the locations noted during disassembly.

    Tighten the 8 main control cover bolts and 5 stud bolts.

    - Tighten to 12 Nm (106 lb-in).

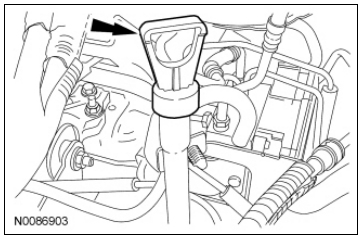


13. Position the transmission fluid cooler tube bracket and transmission fluid cooler tube assembly in place and install the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).



14. Connect the transaxle electrical wiring harness retainers to the main control cover stud bolts.

15. Connect the transaxle electrical connector.



16. Install the underbody cover and the screws.

17. Install the ACL assembly. For additional information, refer to Section 303-12A or Section 303-12B .

18. Fill the transaxle with clean transmission fluid.

19. Start the engine and move the range selector lever into each gear position.

20. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

21. Download a new solenoid body strategy to the PCM. For additional information, refer to Solenoid Body Strategy in this section.

22. Using the scan tool, select Module Programming and Programmable Parameters under the tool box icon and select Transmission. Follow the instructions displayed on the scan tool.
    There are fields to enter the solenoid body 7-digit identification and 13-digit strategy recorded from the solenoid body.

23. ***NOTICE:*** **If the solenoid body information is not correct, transaxle damage or driveability concerns can occur.**

    Enter the solenoid body identification and strategy.
    The scan tool will verify that the numbers entered are valid and display a message if the information is not valid.
    The scan tool checks to see if the file is present on the scan tool. If the file is present, the technician may proceed with downloading the file to the PCM. If the file is not present, the scan tool will need to be connected to the Professional Technician Society (PTS) server to download the file ontohe scan tool.

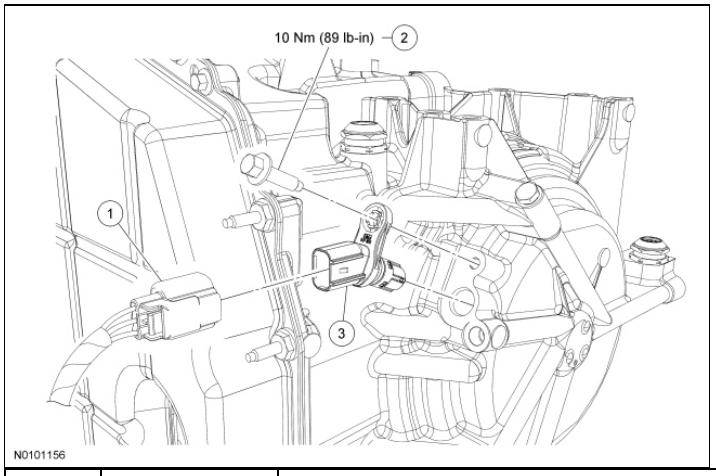
24. Verify that the file is present on the scan tool. If the file is present, go to Step 25. If the file is not present, continue with this procedure.

25. Connect the scan tool to the PTS server.
    The screen will display a progress bar when connecting to the network.

26. Follow the instructions on the network to download the strategy file to the scan tool.
    The screen will display a progress bar when downloading the strategy file to the scan tool and display a message if it is downloaded successfully.

27. If the scan tool cannot connect to the PTS server, download the file from www.motorcraft.com.
    If the scan tool cannot download a strategy from the web site, a partial strategy will automatically be downloaded.

28. Reconnect the scan tool to the vehicle.



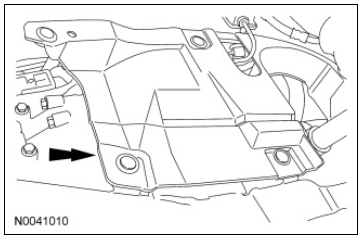
29. Follow the instructions displayed on the scan tool.

30. If a new solenoid body was installed, compare the 7-digit identification and the 13-digit strategy fields from the solenoid body to the replacement solenoid body tag provided with the solenoid body service kit and place it over the existing identification tag.
    The scan tool will automatically download the strategy file or partial strategy file to the PCM and will display a progress bar while downloading. The scan tool will display a message when it is finished downloading the data that states that the file was downloaded successfully.

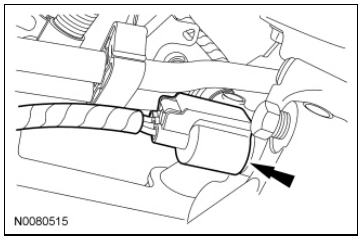
Turbine Shaft Speed (TSS) Sensor

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

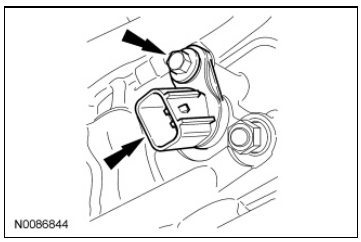


Item	Part Number	Description
1	14A464	Turbine Shaft Speed (TSS) sensor electrical connector
2	W500214	TSS sensor bolt
7M101	TSS sensor	



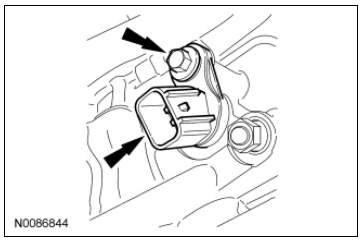
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

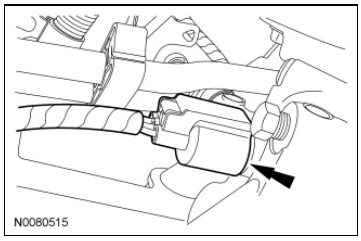


2. Remove the 6 pin-type retainers and the LH front structure-to-subframe splash shield.

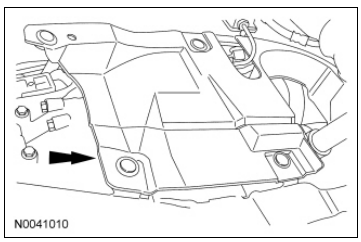
3. Disconnect the Turbine Shaft Speed (TSS) sensor electrical connector.



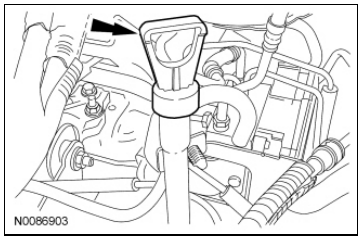
4. Remove the bolt and the TSS sensor.



Installation



1. Install the TSS sensor and the bolt.
   - Tighten to 10 Nm (89 lb-in).



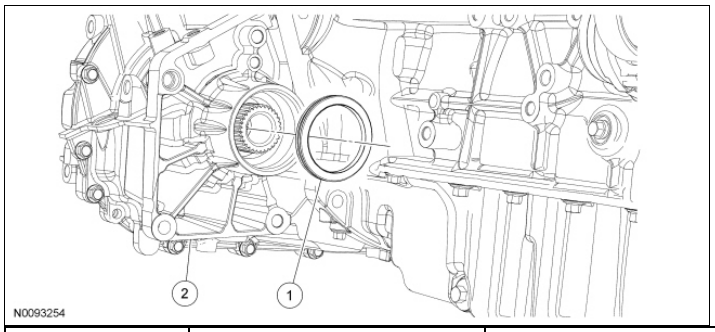
2. Connect the TSS sensor electrical connector.

3. Install the LH front structure-to-subframe splash shield and the 6 pin-type retainers.

4. Fill the transaxle with clean transmission fluid.

5. Start the engine and move the range selector lever into each gear position.

6. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

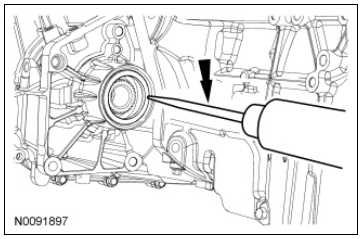


Halfshaft Seal - RH, All Wheel Drive (AWD)

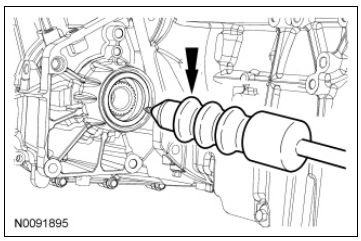
Special Tool(s)

 ST2572-A	Installer, Halfshaft Oil Seal 308-431
 ST2525-A	Installer, Halfshaft Oil Seal 307-428

Material



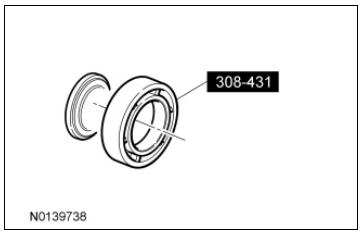
Item	
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV



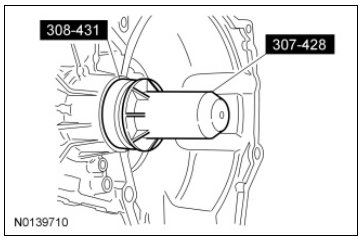
Item	Part Number	Description
1	1177	Seal assembly - halfshaft
2	7000	Transaxle

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the Power Transfer Unit (PTU). For additional information, refer to Section 308-07B .
3. Using a suitable awl, poke a small hole in the RH transaxle differential seal.

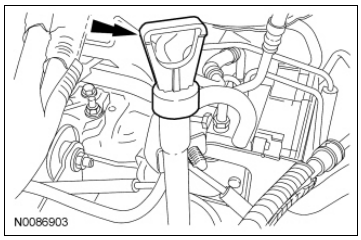


4. Using a suitable dent puller, remove the halfshaft seal.



Installation

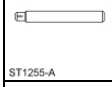
1. Install a new halfshaft seal on the Halfshaft Oil Seal Installer.



2. Using the RH Halfshaft Oil Seal Installers, install the RH halfshaft seal onto the transaxle case.

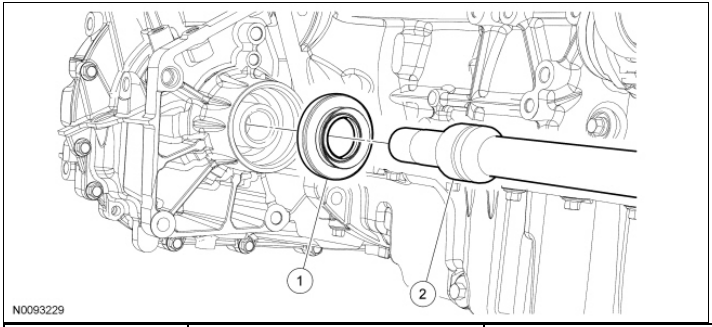
3. Install the PTU . For additional information, refer to Section 308-07B .

4. Fill the transaxle with clean transmission fluid.



5. Start the engine and move the range selector lever into each gear position.

6. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

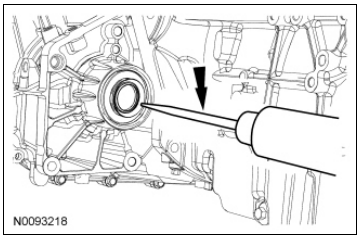


Halfshaft Seal - RH, Front Wheel Drive (FWD)

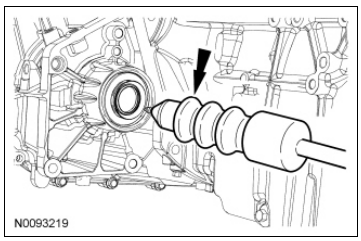
Special Tool(s)

 ST1255-A	Handle 205-153 (T80T-4000-W)
 ST3070-A	Installer, Seal 307-626

Material



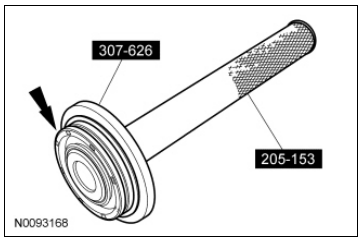
Item	Specification
Motorcraft® MERCON® LV Automatic Transmid XT-10-QLVC	MERCON® LV



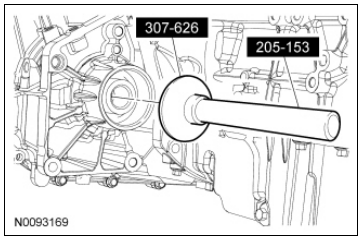
Item	Part Number	Description
1	1177	Seal assembly - halfshaft
2	3K183	Intermediate shaft

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the front RH halfshaft. For additional information, refer to Section 205-04 .
3. Using a suitable awl, poke a small hole in the halfshaft seal.

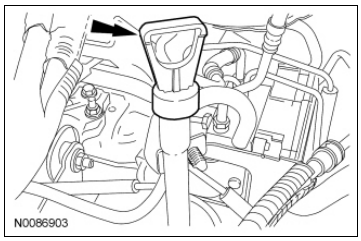


4. Using a suitable dent puller, remove the halfshaft seal.



Installation

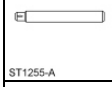
1. Install a new halfshaft seal on the Seal Installer and Handle.



2. Using the Seal Installer and Handle, install the RH halfshaft seal.

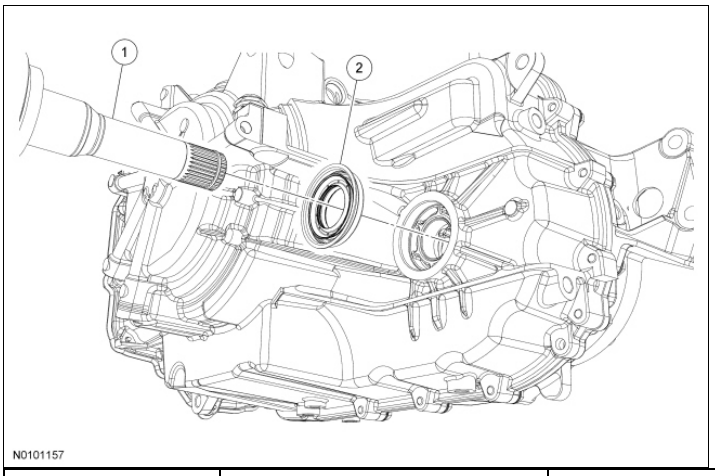
3. Install the front RH halfshaft. For additional information, refer to Section 205-04 .

4. Fill the transaxle with clean transmission fluid.



5. Start the engine and move the range selector lever into each gear position.

6. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

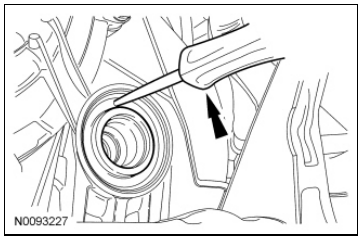


Halfshaft Seal - LH

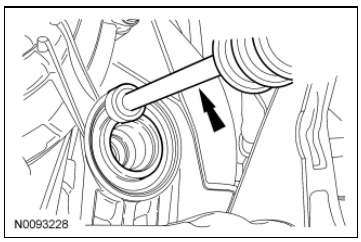
Special Tool(s)

 ST1255-A	Handle 205-153 (T80T-4000-W)
 ST3070-A	Installer, Differential Seal 307-626

Material



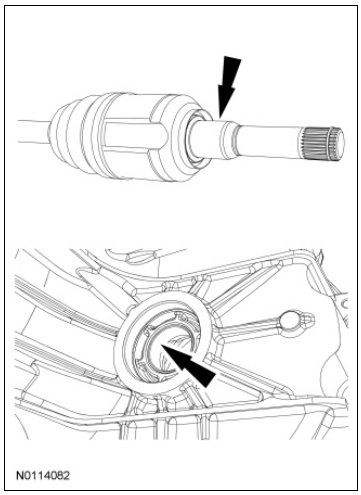
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV



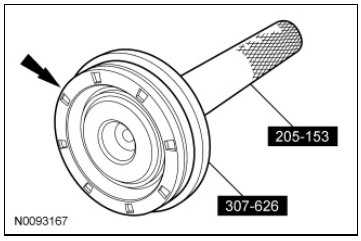
Item	Part Number	Description
1	3A428	LH halfshaft
2	1177	LH halfshaft seal

Removal

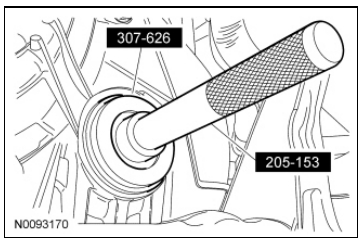
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the front LH halfshaft. For additional information, refer to Section 205-04 .
3. Using a suitable awl, poke a small hole in the halfshaft seal.



4. Using a suitable dent puller, remove the halfshaft seal.

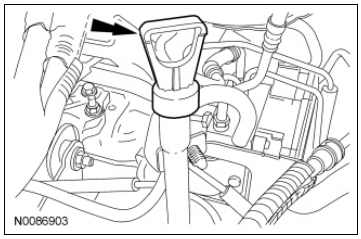


Installation



1. Inspect the bushing surface on the LH halfshaft and the LH halfshaft bushing in the transaxle case for damage or excessive wear. If the LH halfshaft or the LH halfshaft bushing shows signs of excessive wear or damage, inspect the transaxle case for damage. Install a new LH halfshaft. Install a new LH halfshaft bushing. For additional information, refer to Transaxle case bushing in this section.
    - If the LH halfshaft or the LH halfshaft bushing shows signs of excessive wear or damage but the transaxle case does not, install a new LH halfshaft. Install a new LH halfshaft bushing. For additional information, refer to Transaxle case bushing in this section.
    - If the transaxle case is damaged, install a new LH halfshaft. Install a new transaxle case. For additional information, refer to Transaxle - 2.5L or Transaxle - 3.0L and Transaxle in this section.
    - If the bushing is not damaged or worn excessively, clean the area behind the seal and install a new seal following this procedure.

2. Install a new halfshaft seal on the Differential Seal Installer and Handle.

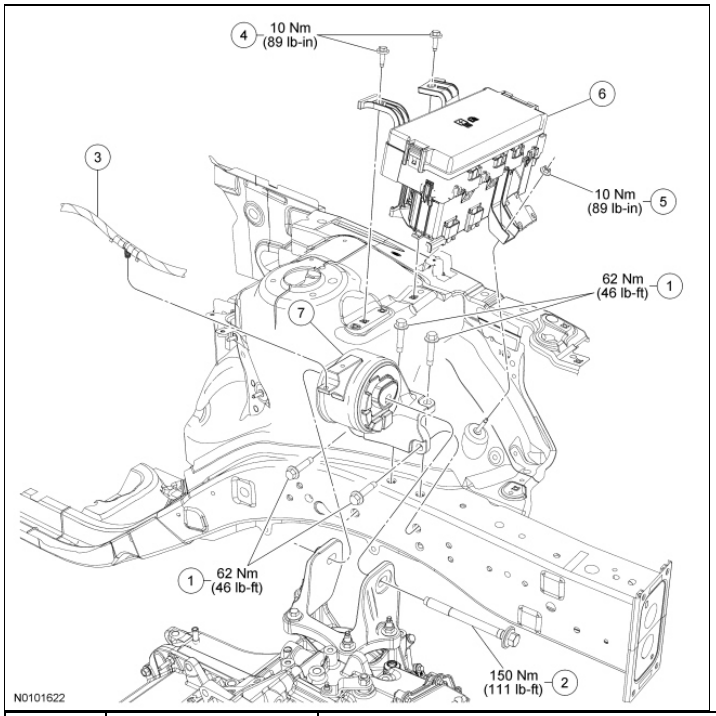


3. Using the Differential Seal Installer and Handle, install the LH halfshaft seal.

4. Install the front LH halfshaft. For additional information, refer to Section 205-04 .

5. Fill the transaxle with clean transmission fluid.

6. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.



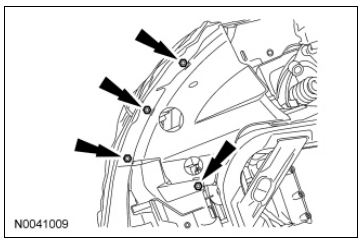
Transaxle Support Insulator - 3.0L

Special Tool(s)

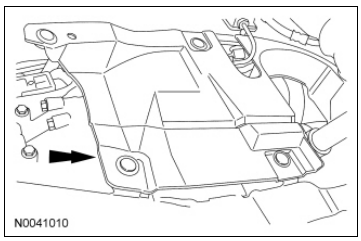
 ST2793-A	Lifting Bracket, Engine 303-050 (T70P-6000)
 ST2363-A	Support Bar, Engine 303-F072
 ST2743A	Universal Adapter Brackets 014-0001

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

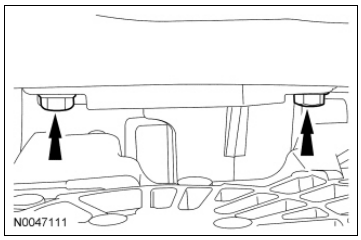


Item	Part Number	Description
1	W709234	Transaxle support insulator-to-frame rail bolts
2	W711873	Transaxle support insulator through bolt
3	13A506	Wiring harness retainer
4	W702434	Power Distribution Box (PDB) bolts

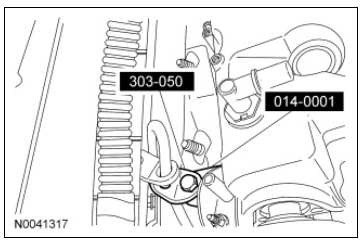


5	N806543	PDB nut
6	180101	PDB
7	6F020	Transaxle support insulator

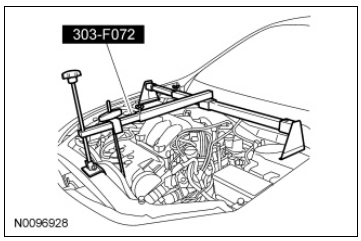
Removal



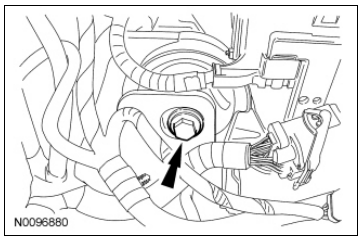
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the Air Cleaner (ACL) and the outlet pipe. For additional information, refer to Section 303-12B .
3. Remove the battery and battery tray. For additional information, refer to Section 414-01 .
4. Remove the 4 screws and position the LH fender splash shield aside.



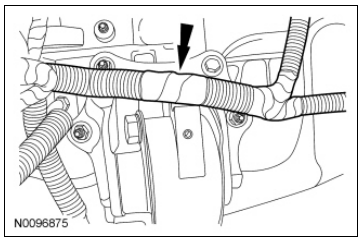
5. Remove the 6 pin-type retainers and the LH front structure-to-subframe splash shield.



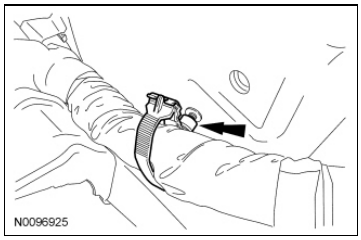
6. Remove the lower 2 transaxle insulator-to-frame bolts.



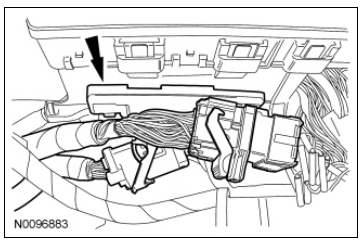
7. Remove the cooling fan motor and shroud. For additional information, refer to Section 303-03A .
8. Install the Engine Lifting Bracket and Universal Adapter Bracket "L" hook on the LH side of the engine.



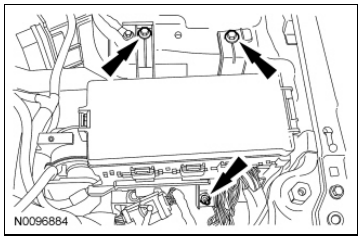
9. Install the Engine Support Bar to support the engine.



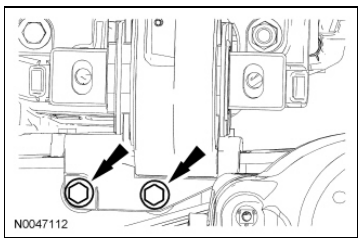
10. Remove the transaxle support insulator through bolt.



11. Remove the wiring harness retainer from the transaxle support insulator and position the wiring harness aside.

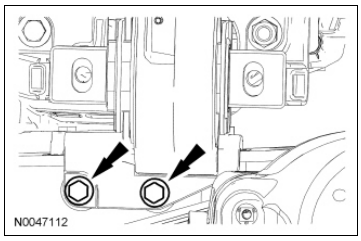


12. Disconnect the wiring harness retainer from the LH shock tower.

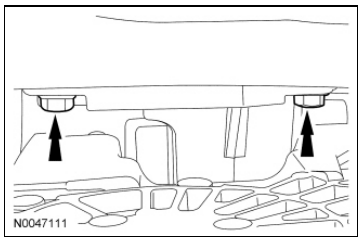


13. Remove the electrical connector bracket from the Battery Junction Box (BJB).

14. Remove the 2 bolts and the nut and position the BJB aside far enough to gain access to the top 2 transaxle support insulator bolts.

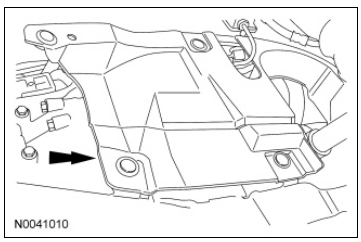


15. Remove the top 2 transaxle support insulator bolts and remove the transaxle support insulator.

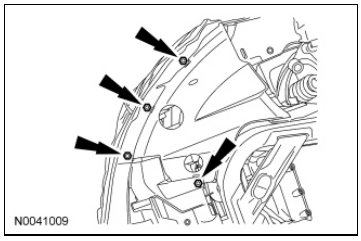


Installation

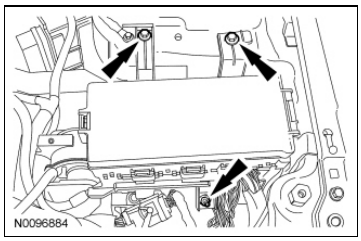
1. Clean the rear transaxle support insulator bolts using a wire brush and apply new threadlock to the threads.



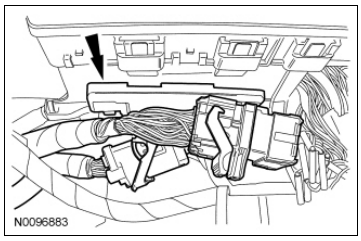
2. Position the transaxle support insulator in place and install the upper 2 transaxle support insulator bolts.
    - Tighten to 62 Nm (46 lb-ft).



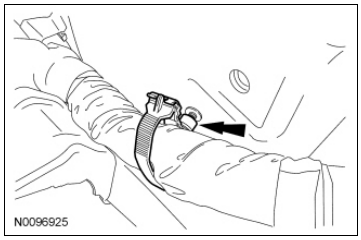
3. Install the lower 2 transaxle insulator-to-frame bolts.
    - Tighten to 62 Nm (46 lb-ft).



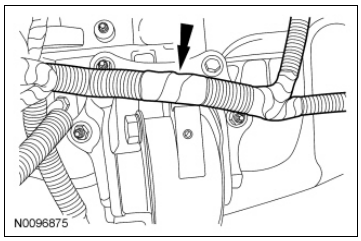
4. Position the LH front structure-to-subframe splash shield in place and install the 6 pin-type retainers.



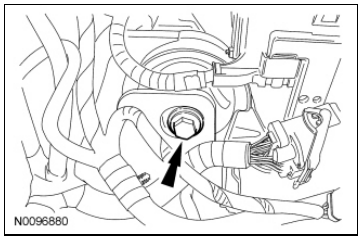
5. Position the LH splash shield in place and install the 4 screws.



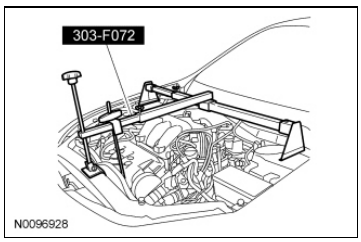
6. Position the BJB and bracket in place and install the 2 bolts and the nut.
    - Tighten to 10 Nm (89 lb-in).



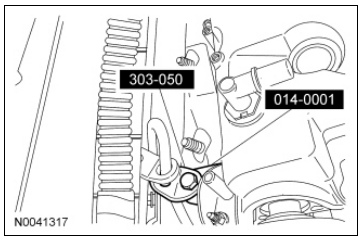
7. Install the electrical connector bracket on the BJB .



8. Connect the wiring harness retainer on the LH shock tower.



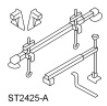
9. Position the wiring harness in place and install the retainer on the transaxle support insulator.



10. Install the through bolt.
    - Tighten to 150 Nm (111 lb-ft).

11. Remove the Engine Support Bar.

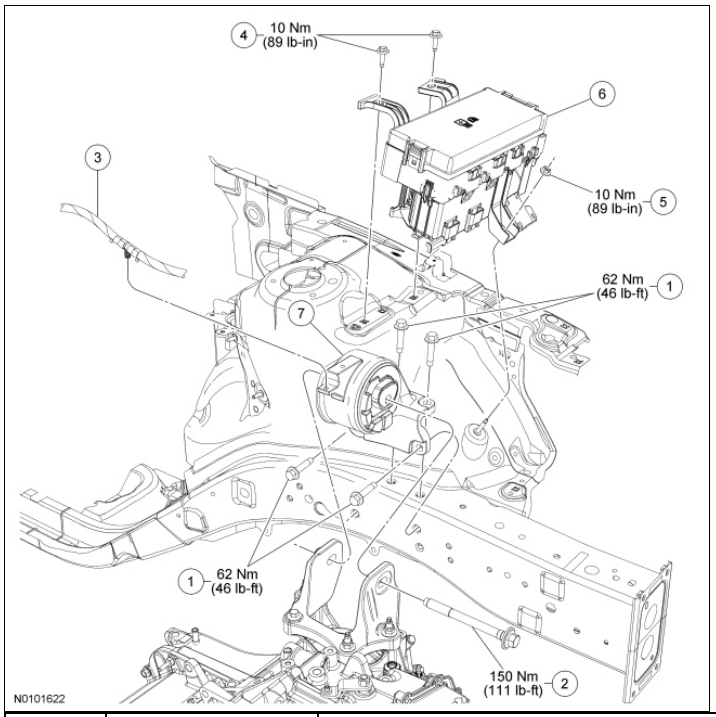
12. Remove the Engine Lifting Bracket and the Universal Adapter Bracket "L" hook from the from the LH side of the engine.



13. Install the cooling fan motor and shroud. For additional information, refer to Section 303-03A .

14. Install the battery and battery tray. For additional information, refer to Section 414-01 .

15. Install the ACL and the outlet pipe. For additional information, refer to Section 303-12B .



Transaxle Support Insulator - 2.5L

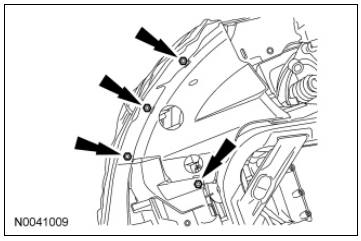
Special Tool(s)

 ST2425-A	Support Bar, Engine 303-F072

Material

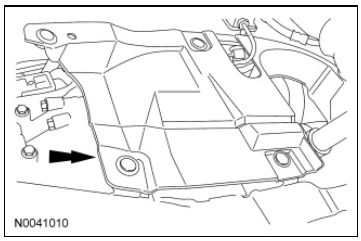
Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

Item	Part Number	Description
1	W709234	Transaxle support insulator-to-frame rail bolts
2	W711873	Transaxle support insulator through bolt
3	13A506	Wiring harness retainer
4	W702434	Power Distribution Box (PDB) bolts
5	N806543	PDB nut
6	180101	PDB
7	6F020	Transaxle support insulator



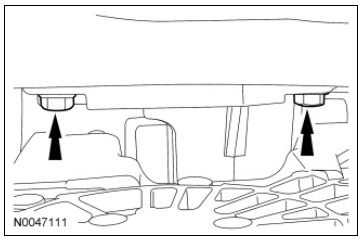
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

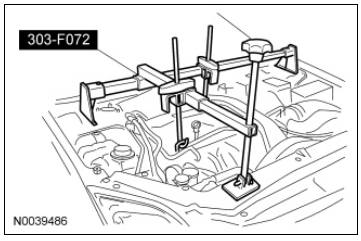


2. Remove the Air Cleaner (ACL) and the outlet pipe. For additional information, refer to Section 303-12A .

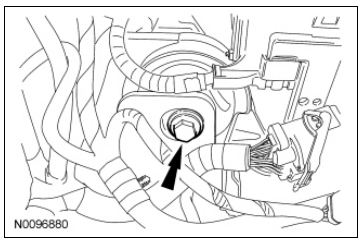
3. Remove the battery and battery tray. For additional information, refer to Section 414-01 .



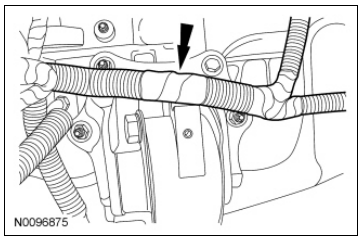
4. Remove the 4 screws and position the LH fender splash shield aside.



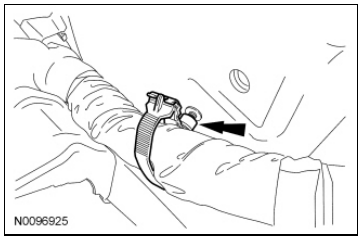
5. Remove the 6 pin-type retainers and the LH front structure-to-subframe splash shield.



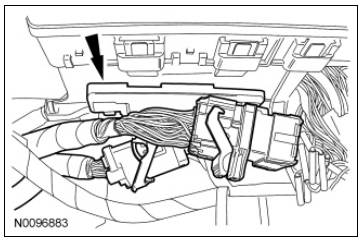
6. Remove the lower 2 transaxle insulator-to-frame bolts.



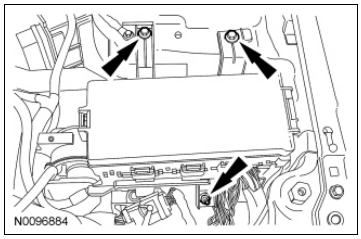
7. Using the Engine Support Bar, support the engine.



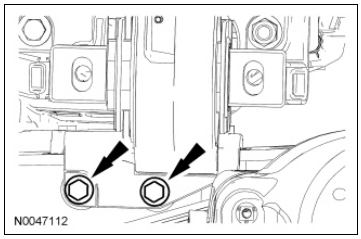
8. Remove the transaxle support insulator through bolt.



9. Remove the wiring harness retainer from the transaxle support insulator and position the wiring harness aside.

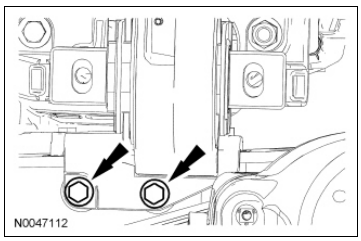


10. Disconnect the wiring harness retainer from the LH shock tower.

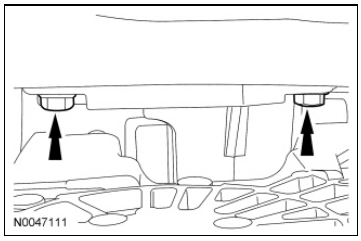


11. Remove the electrical connector bracket from the Battery Junction Box (BJB).

12. Remove the 2 bolts and the nut and position the BJB aside far enough to gain access to the top 2 transaxle support insulator bolts.

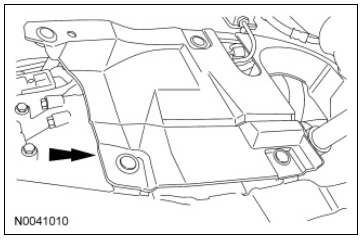


13. Remove the top 2 transaxle support insulator bolts and remove the transaxle support insulator.

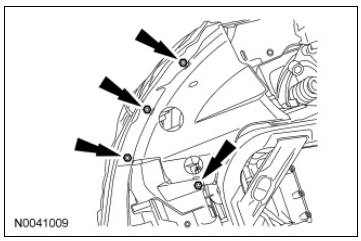


Installation

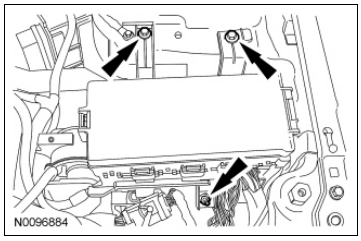
1. Clean the transaxle support insulator frame bolts using a wire brush and apply new threadlock to the threads.



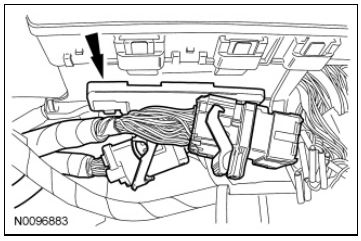
2. Position the transaxle support insulator in place and install the upper 2 transaxle support insulator bolts.
    - Tighten to 62 Nm (46 lb-ft).



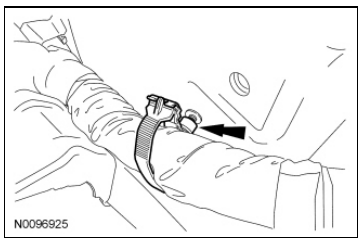
3. Install the lower 2 transaxle support insulator bolts.
    - Tighten to 62 Nm (46 lb-ft).



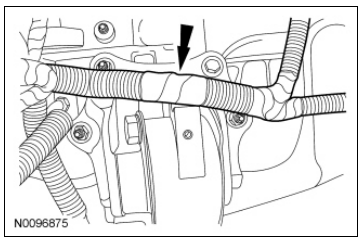
4. Position the LH front structure-to-subframe splash shield in place and install the 6 pin-type retainers.



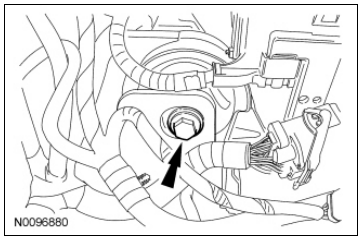
5. Position the LH splash shield in place and install the 4 screws.



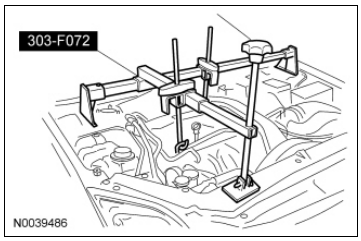
6. Position the BJB and bracket in place and install the 2 bolts and the nut.
    - Tighten to 10 Nm (89 lb-in).



7. Install the electrical connector bracket on the BJB .

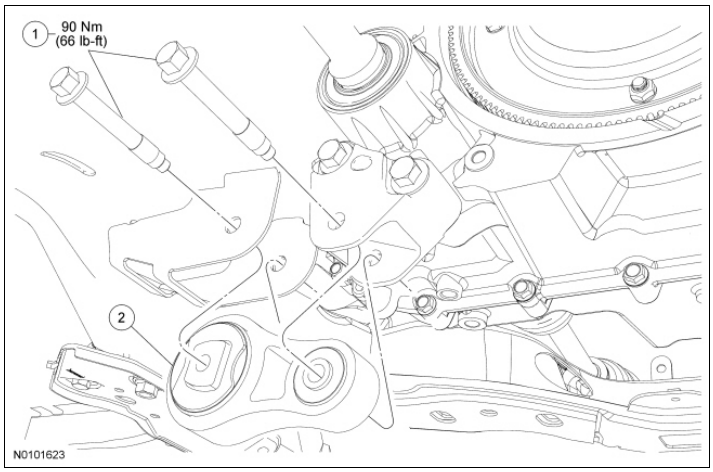


8. Connect the wiring harness retainer on the LH shock tower.



9. Position the wiring harness in place and install the retainer on the transaxle support insulator.

10. Install the through bolt.
    - Tighten to 150 Nm (111 lb-ft).

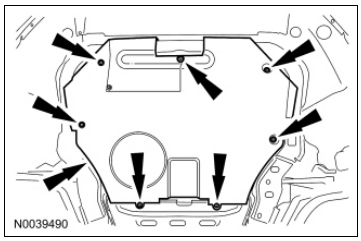


11. Remove the Engine Support Bar.

12. Install the battery and battery tray. For additional information, refer to Section 414-01 .

13. Install the ACL and the outlet pipe. For additional information, refer to Section 303-12A .

Transaxle Support Insulator - Anti-Roll



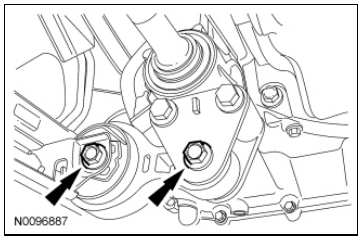
Item	Part Number	Description
1	W711575	Roll restrictor bolts
2	6P082	Roll restrictor

Removal

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

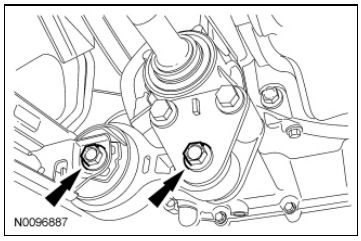
2. Remove the screws and the underbody cover.



Vehicles equipped with a 3.0L engine

3. Remove the Y-pipe. For additional information, refer to Section 309-00 .

All vehicles

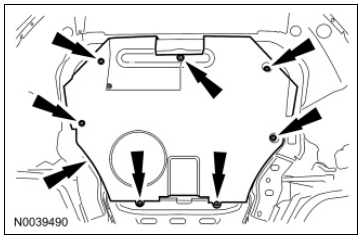


4. Remove the 2 bolts and remove the roll restrictor.

Installation

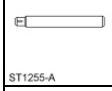
All vehicles

1. Position the roll restrictor in place and install the bolts.
    - Tighten to 90 Nm (66 lb-ft).



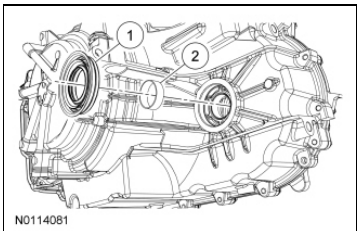
Vehicles equipped with a 3.0L engine

2. Install the Y-pipe. For additional information, refer to Section 309-00 .



All vehicles

3. Install the underbody cover and the screws.



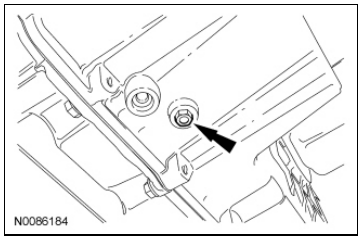
Transaxle Case Bushing

Special Tool(s)

 ST1255-A	Handle 205-153 (T80T-4000-W)
 ST3070-A	Installer, Seal 307-626
 ST1652-A	Step Plate 205-D015 (D80L-630-4) or equivalent
 ST1194-A	Remover, Transmission Extension Housing Bushing 308-070 (T77L-7697-E)
 ST3229-A	Installer, Bushing 307-664

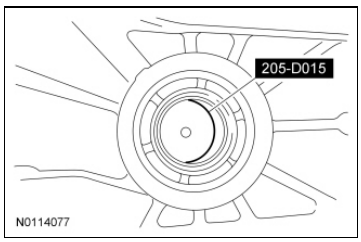
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV



Item	Part Number	Description
1	1177	LH halfshaft seal
2	7025	LH halfshaft bushing

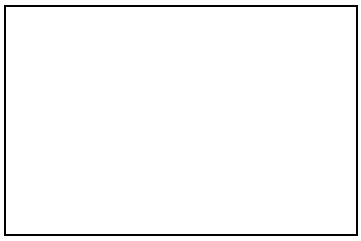
Removal



1. Remove the fronH halfshaft seal. For additional information, refer to Halfshaft Seal - LH in this section.

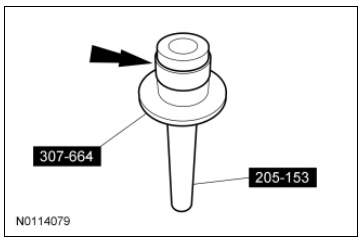
2. **NOTE:** Leave the drain plug out after the transmission fluid drains. The drain plug will need to remain out to clean any debris from the damaged or worn bushing.

   Remove the drain plug and drain the transmission fluid.

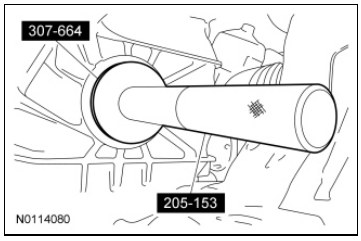


3. Install the Step Plate in the differential carrier.

4. Using the Transmission Extension Housing Bushing Remover remove the LH halfshaft bushing.

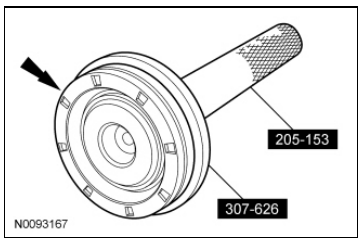


5. Remove the Step Plate from the differential carrier.

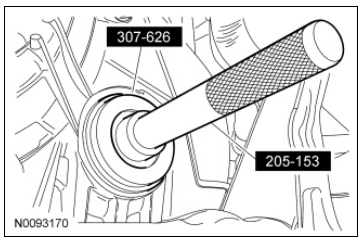


Installation

1. Clean the halfshaft bushing area of the transaxle case.

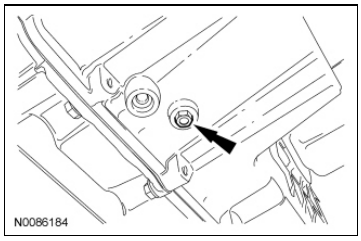


2. Assemble the Handle and the Bushing Installer and install a new bushing on the Bushing Installer.

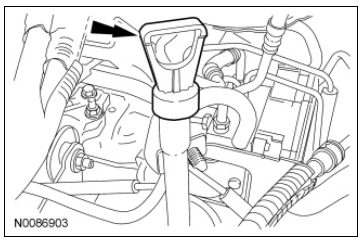


3. Using the Handle and the Bushing Installer, install a new bushing in the transaxle case.

4. Install a new halfshaft seal on the Seal Installer and Handle.



5. Using the Seal Installer and Handle, install the LH halfshaft seal.



6. Install a new LH halfshaft. For additional information, refer to Section 205-04 .

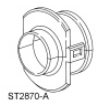
7. Install the transmission fluid drain plug.
   - Tighten to 12 Nm (106 lb-in).

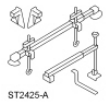
8. Fill the transaxle with clean transmission fluid. For additional information, refer to Transmission Fluid Drain and Refill in this section.

9. Start the engine and let it run for 5 minutes.

10. Remove the transmission fluid drain plug and drain the transmission fluid a second time.

11. Install the transmission fluid drain plug.





- Tighten to 12 Nm (106 lb-in).

12. Fill the transaxle with clean transmission fluid.

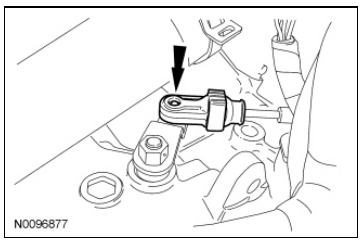
13. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

Transaxle - 2.5L

Special Tool(s)

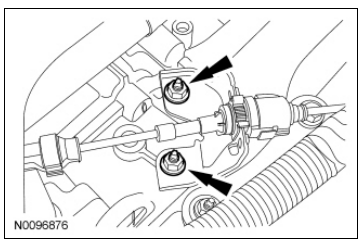
 ST2870-A	Disconnect Tool, Transmission Cooler Line 307-569
 ST1293-A	Powertrain Lift With Tilting Plate 300-OTC-1585AE
 ST1636-A	Retainer, Torque Converter 307-566
 ST2425-A	Support Bar, Engine 303-F072

Removal



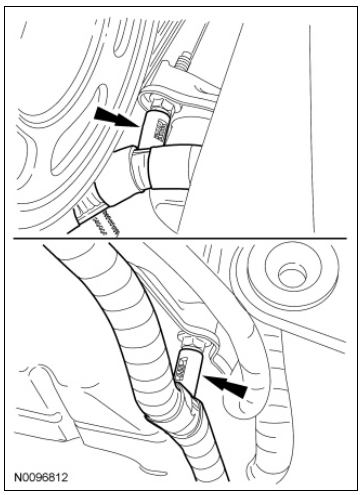
NOTE: Refer to the Transmission Cooler Flushing Job Aid on the FMCDealer website.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

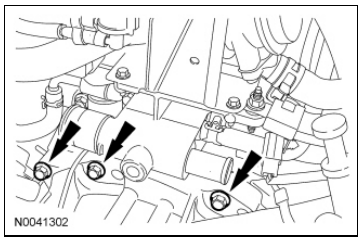


2. Remove the Air Cleaner (ACL) and the outlet pipe. For additional information, refer to Section 303-12A .

3. Remove the battery and battery tray. For additional information, refer to Section 414-01 .

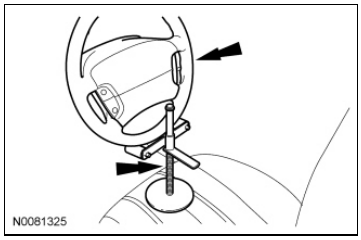


4. Disconnect the selector lever cable end from the manual control lever.

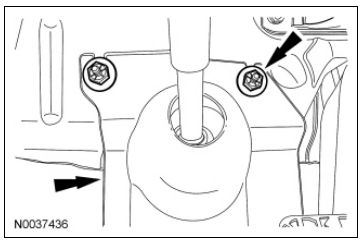


5. Remove the 2 nuts and position the selector lever cable and bracket aside.

6. Disconnect the wiring harness retainers from the main control cover studbolts.

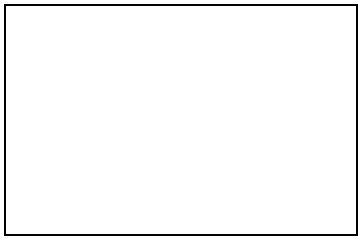


7. Remove the 3 top bellhousing bolts.

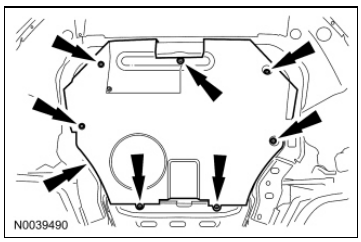


8. **NOTE:** Use a steering wheel holding device such as Hunter® 28-75-1 or equivalent, to hold the steering wheel.

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

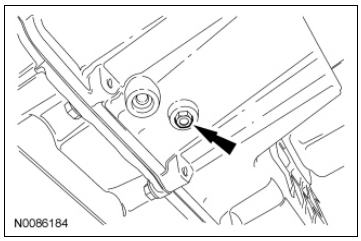


9. Remove the 2 nuts and the steering joint cover.

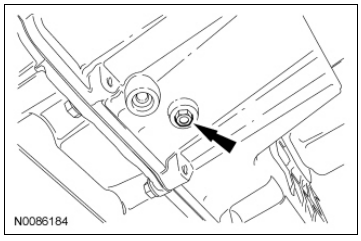


10. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    Remove and discard the bolt and disconnect the steering column shaft from the steering gear.

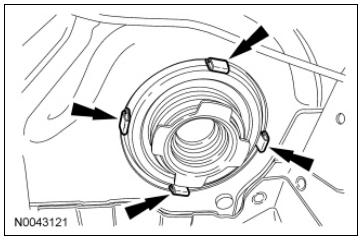


11. If equipped, remove the 7 screws and the underbody cover.

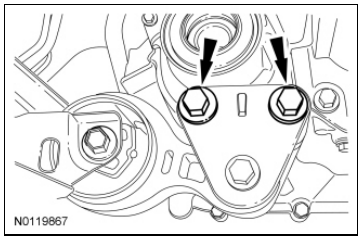


12. **NOTE:** If transaxle disassembly or installation of a new transaxle is necessary, drain the transmission fluid.

    Remove the drain plug and allow the transmission fluid to drain.

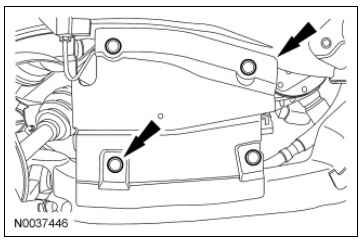


13. Install the transmission fluid drain plug.
    - Tighten to 12 Nm (106 lb-in).

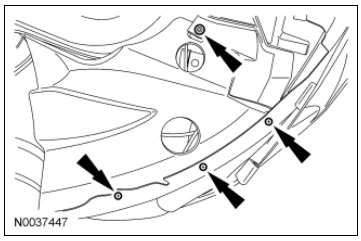


14. ***NOTICE:*** **Remove the steering gear/dash seal or damage to the seal may occur.**

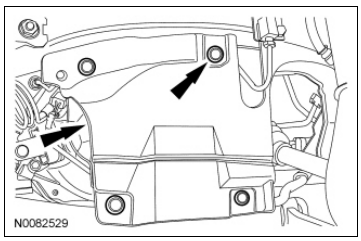
    Release the 4 clips and slide the steering gear/dash seal off of the steering gear.



15. Remove the 2 roll restrictor bracket bolts.

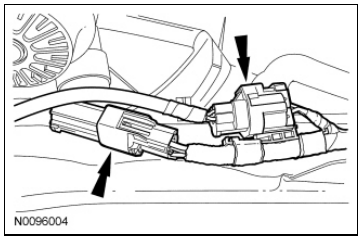


16. Remove the 4 screws and position the RH fender splash shield aside.

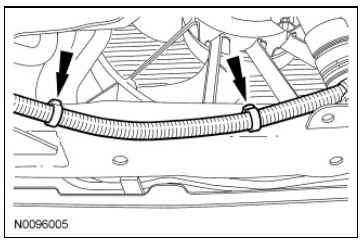


17. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

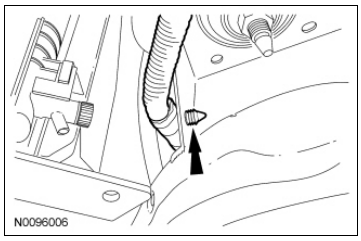
18. Remove the 4 screws and position the LH fender splash shield aside.



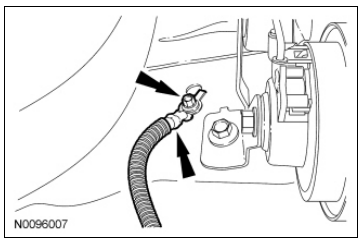
19. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.



20. Remove the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

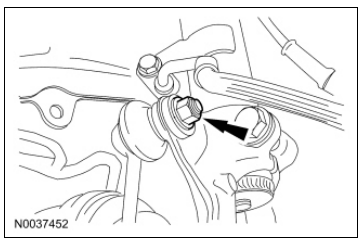


21. Disconnect the 2 in-line Electronic Power Assist Steering (EPAS) system electrical connectors at the front of the subframe.

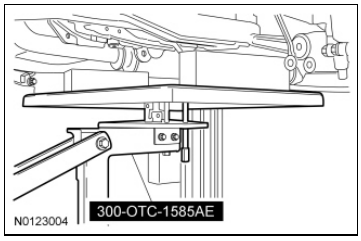


22. Detach the 2 EPAS system wiring harness pin-type retainers from the subframe.

23. Detach the EPAS system wiring harness pin-type retainer from the subframe under the LH fender splash shield.

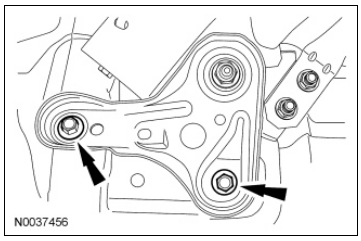


24. Remove the bolt and the EPAS system wiring harness ground from behind the RH splash shield.

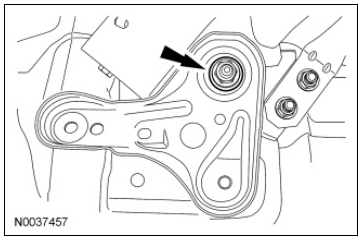


25. **NOTE:** LH shown, RH similar.

    Remove the nuts and separate the sway bar links from the struts.

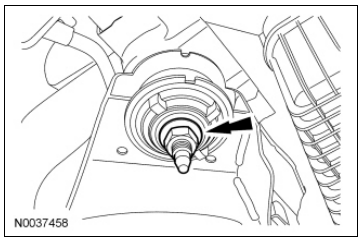


26. Position the Powertrain Lift With Tilting Plate under the subframe assembly.



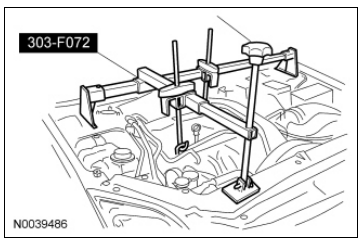
27. **NOTE:** LH shown, RH similar.

    Remove the subframe bracket-to-body bolts.



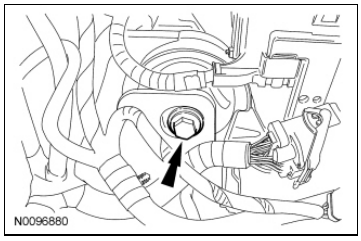
28. **NOTE:** LH shown, RH similar.

    Remove the subframe nuts and the subframe brackets.

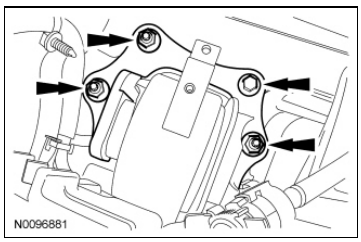


29. **NOTE:** LH shown, RH similar.

    Remove the front subframe nuts.

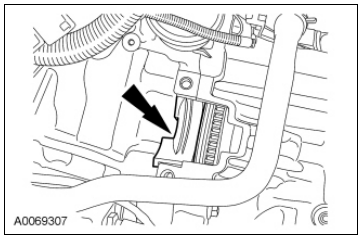


30. Lower the subframe assembly from the vehicle.



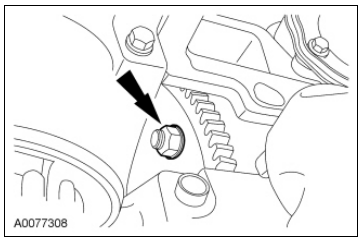
31. Install the Engine Support Bar and support the engine and transaxle.

32. Remove the transaxle support insulator through bolt and lower the transaxle 19 mm (0.748 in).

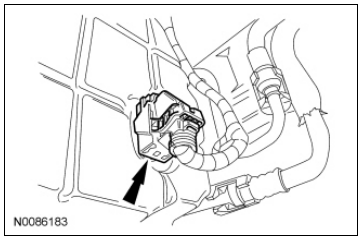


33. Remove the 3 nuts, the bolt and remove the transaxle support insulator bracket.

34. Remove the starter motor. For additional information, refer to Section 303-06 .



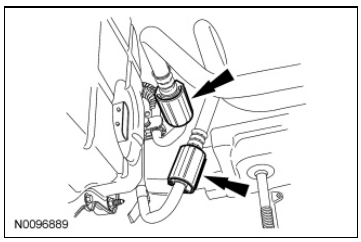
35. Remove the rubber insulator from the bellhousing.



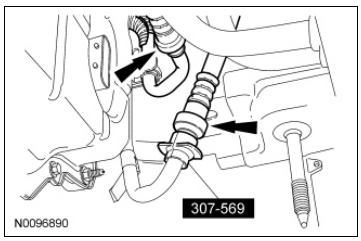
36. ***NOTICE:*** **Only rotate the engine in a clockwise direction or engine damage will occur.**

    NOTE: Mark one stud and the flexplate for assembly reference.

    Remove and discard the 4 torque converter nuts.

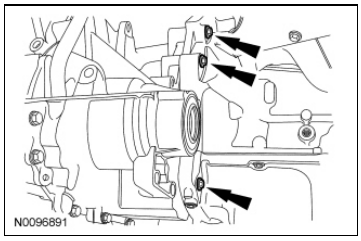


37. Disconnect the transaxle main electrical connector.

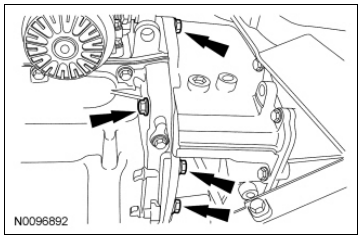


38. Disconnect the Turbine Shaft Speed (TSS) electrical connector.

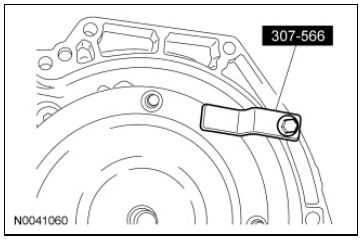
39. Remove the transmission fluid cooler tube secondary latches.



40. Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler tubes.

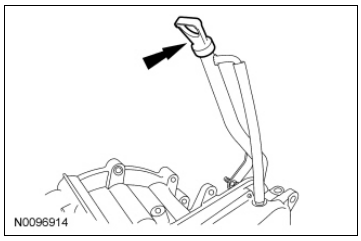


41. Support the transaxle with a suitable transmission jack. Secure the transaxle to the transmission jack with a safety strap.

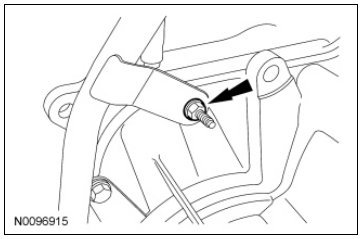


42. Remove the 3 rear torque converter housing bolts.

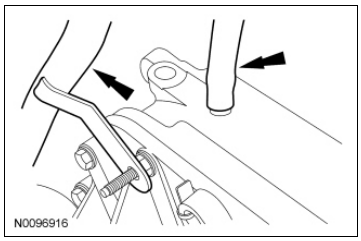
43. Remove the 4 front torque converter housing bolts.



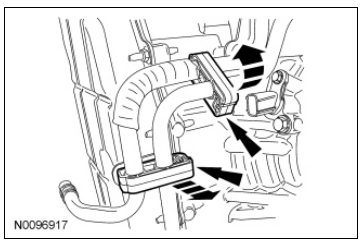
44. Separate the transaxle from the engine and install the Torque Converter Retainer.



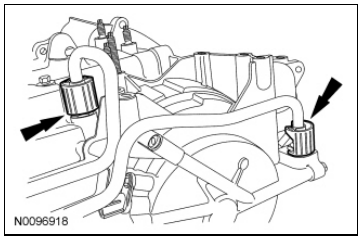
45. Remove the transaxle from the vehicle.



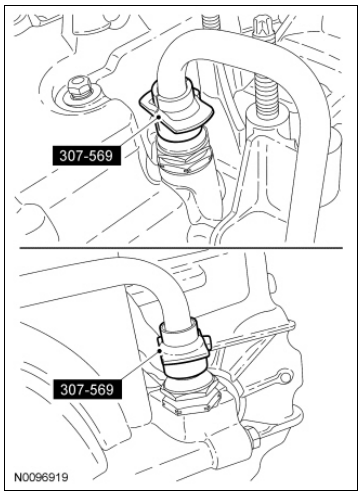
46. Remove the transmission fluid level indicator.



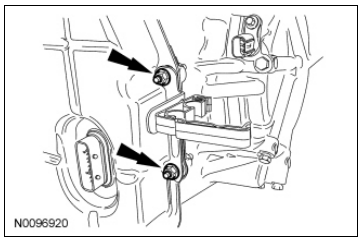
47. Remove the transmission fluid filler tube nut.



48. Remove the transaxle vent tube from the transaxle case and remove the transmission fluid filler tube.

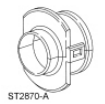


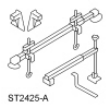
49. Open the transmission fluid cooler tube retainers.



50. Remove the 2 secondary latches.

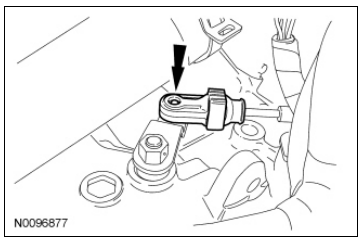
51. Using the Transmission Cooler Line Disconnect Tool, disconnect and remove the transmission fluid cooler tubes from the transaxle.





52. Remove the 2 nuts and remove the transmission fluid cooler tube bracket.

53. If installing a new transaxle or overhauling the transaxle, the transmission fluid cooler will need to be backflushed and cleaned. Carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section. Clean the transaxle-mounted transmission fluid cooler tubes by hand.

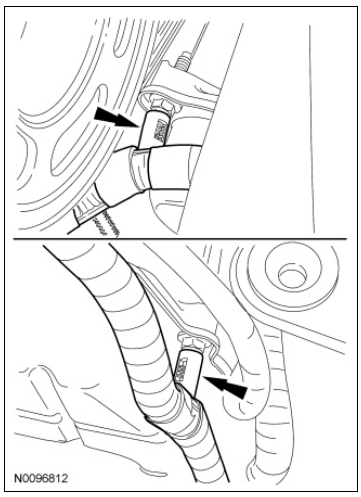


Transaxle - 3.0L

Special Tool(s)

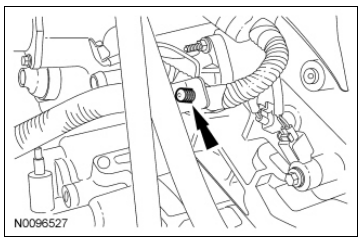
 ST2870-A	Disconnect Tool, Transmission Cooler Line 307-569
 ST2873-A	Engine Lifting Bracket Set 303-1140
 ST2793-A	Lifting Bracket, Engine 303-050 (T70P-6000)
 ST1293-A	Powertrain Lift 014-00765 or equivalent
 ST1636-A	Retainer, Torque Converter 307-566
 ST2425-A	Support Bar, Engine 303-F072

All vehicles

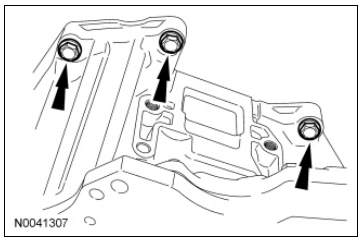


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the Air Cleaner (ACL) and the outlet pipe. For additional information, refer to Section 303-12B .
3. Remove the starter motor. For additional information, refer to Section 303-06 .
4. Disconnect the selector lever cable end from the manual control lever.

N0096877

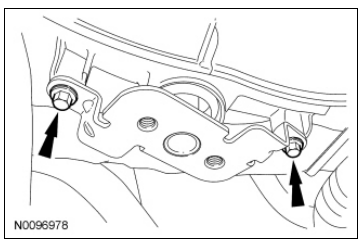


5. Remove the 2 nuts and position the selector lever cable and bracket aside.

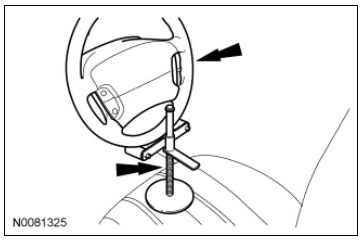


6. Disconnect the wiring harness retainers from the main control cover stud bolts.

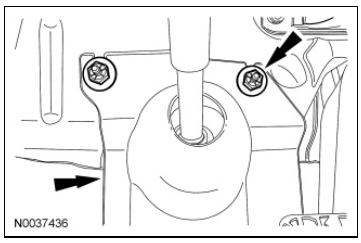
7. Disconnect the wiring harness retainer from the transmission fluid filler tube.



8. Remove the 3 upper torque converter housing bolts.

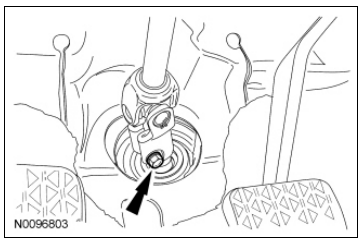


9. Remove the EGR valve and tube. For additional information, refer to Section 303-08B .

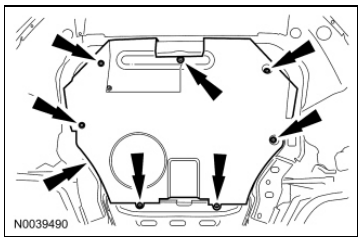


10. Remove the 2 bolts and the EGR valve bracket.

11. **NOTE:** Use a steering wheel holding device such as Hunter® 28-75-1 or equivalent, to hold the steering wheel. Using a suitable holding device, hold the steering wheel in the straight-ahead position.

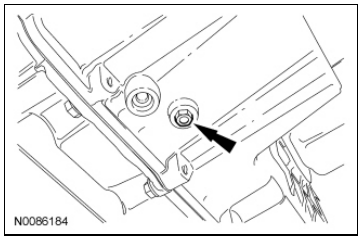


12. Remove the 2 nuts and the steering joint cover.

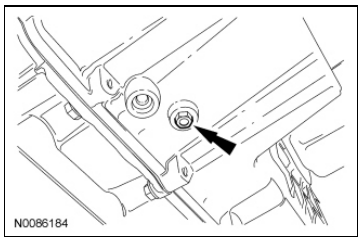


13. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    Remove and discard the bolt and disconnect the steering column shaft from the steering gear.

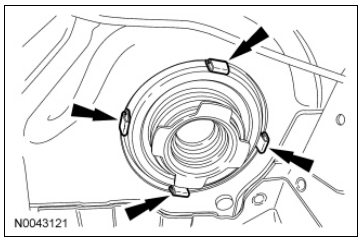


14. If equipped, remove the 7 screws and the underbody cover.

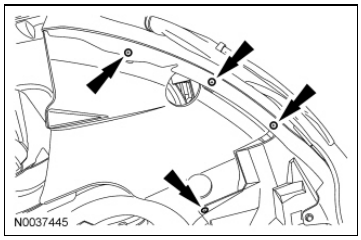


15. **NOTE:** If transaxle disassembly or installation of a new transaxle is necessary, drain the transmission fluid.

    Remove the drain plug and allow the transmission fluid to drain.

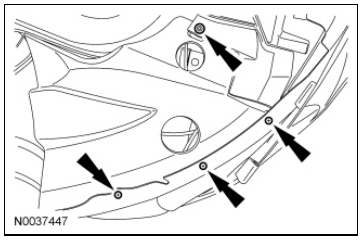


16. Install the transmission fluid drain plug.
    - Tighten to 12 Nm (106 lb-in).

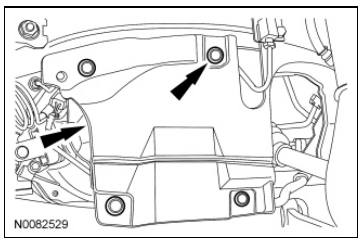


17. ***NOTICE:*** **Remove the steering gear/dash seal or damage to the seal may occur.**

    Release the 4 clips and slide the steering gear/dash seal off of the steering gear.



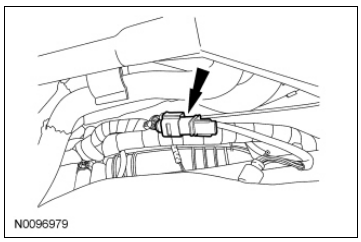
18. Remove the 4 screws and position the RH fender splash shield aside.



19. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

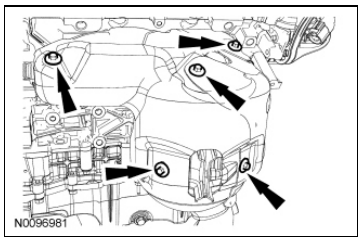
20. Remove the 4 screws and position the LH fender splash shield aside.

21. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.



22. Remove the LH halfshaft. For additional information, refer to Section 205-04 .

Front Wheel Drive (FWD) vehicles

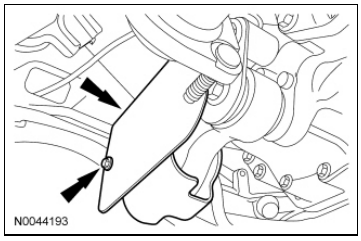


23. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .

24. Remove the intermediate shaft. For additional information, refer to Section 205-04 .

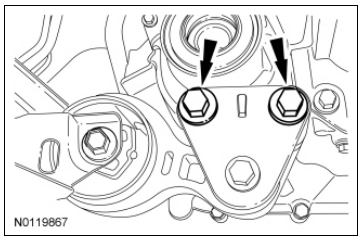
25. Disconnect the RH O2 sensor electrical connector.

26. Remove the 5 bolts and position the RH exhaust manifold heat shield aside.



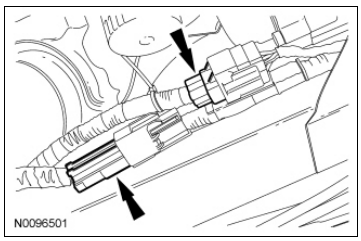
All-Wheel Drive (AWD) vehicles

27. Remove the Power Transfer Unit (PTU). For additional information, refer to Section 308-07B .



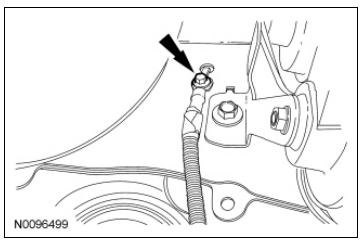
All vehicles

28. If equipped, remove the 2 bolts and the heat shield.



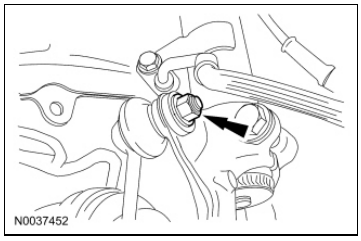
29. **NOTE:** Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.

    Remove the 2 roll restrictor bracket bolts.

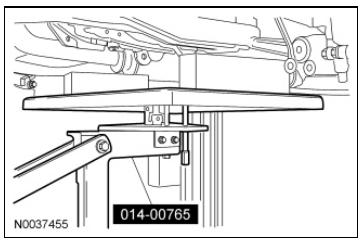


30. Disconnect the 2 in-line EPAS system electrical connectors at the front of the subframe.

31. Detach the 3 wiring harness retainers from the LH front of the subframe.

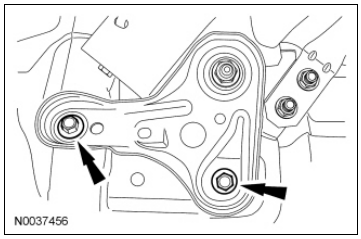


32. Remove the bolt and the Electronic Power Assist Steering (EPAS) system wiring harness ground from behind the RH splash shield.

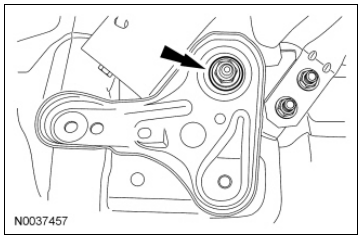


33. **NOTE:** RH shown, LH similar.

    Remove the nuts and separate the stabilizer bar links from the struts.

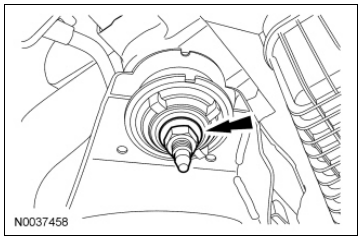


34. Position the Powertrain Lift under the subframe assembly.



35. **NOTE:** LH shown, RH similar.

    Remove the subframe bracket-to-body bolts.

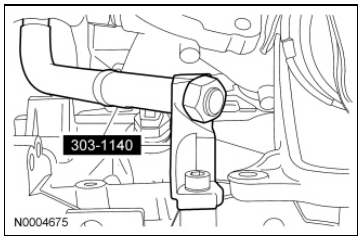


36. **NOTE:** LH shown, RH similar.

    Remove the subframe nuts and the subframe brackets.

37. **NOTE:** LH shown, RH similar.

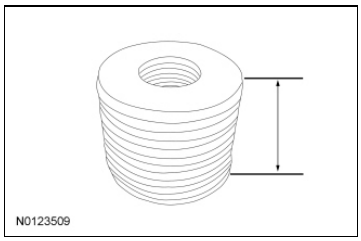
    Remove the front subframe nuts.



38. Lower the subframe assembly from the vehicle.

39. **NOTE:** When installing the Engine Lifting Bracket Set, it will be easier to loosely install the upper bolt first, then install the lower bolt.

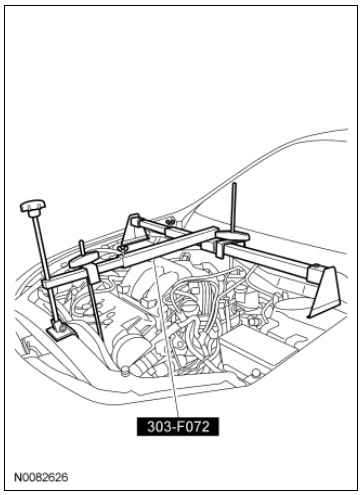
    Install the lower half of the Engine Lifting Bracket Set.



40. Install the upper half of the Engine Lifting Bracket Set.

41. **NOTE:** The washers are used to space the Engine Lifting Bracket far enough from the RH cylinder head so that the Engine Support Bar can clear the RH valve cover. The washers used must fit on a 12 mm X 1.75 bolt.

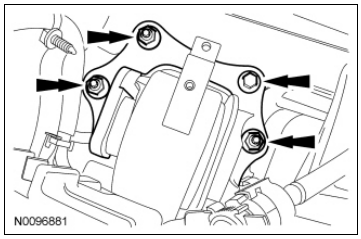
    Stack washers together to reach a 25.4 mm (1 in) to 28.575 mm (1.125 in) height.



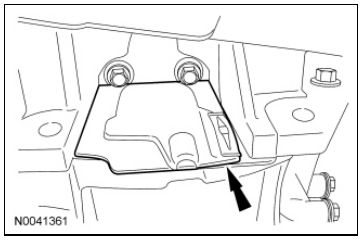
42. **NOTE:** The bolt hole in the LH cylinder head that is used to install the Engine Lifting Bracket is a 12 mm X 1.75 thread.

    NOTE: The bolt used to install the Engine Lifting Bracket must be between 65 mm (2.5 in) and 70 mm (2.75 in) long.

    Assemble a 12 mm X 1.75 bolt with the Engine Lifting Bracket and the washers and install the bolt in the threaded hole on the LH cylinder head with the lifting hook facing up.

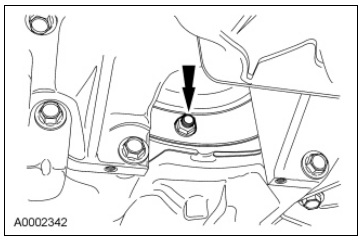


43. Install the Engine Support Bar to support the engine.

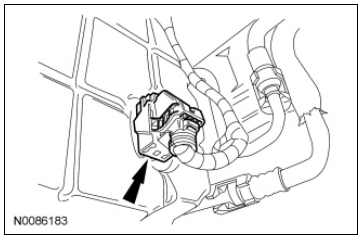


44. Remove the transaxle support insulator through bolt and lower the transaxle 19 mm (0.748 in).

45. Remove the 3 nuts, the bolt and remove the transaxle support insulator bracket.

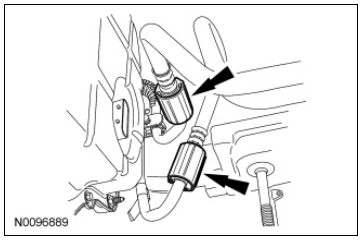


46. Remove the inspection cover.

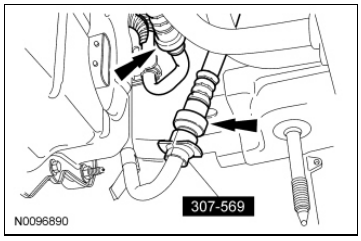


47. **NOTE:** Mark one stud and the flexplate for assembly reference.

    Remove and discard the 4 torque converter nuts.

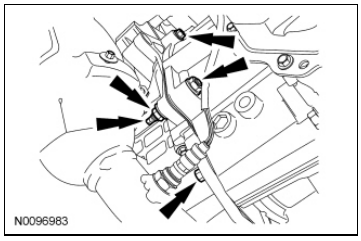


48. Disconnect the transaxle main electrical connector.

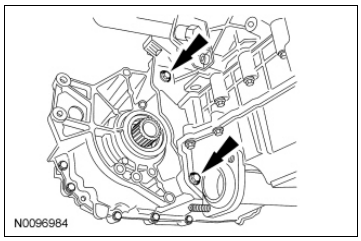


49. Disconnect the Turbine Shaft Speed (TSS) sensor electrical connector.

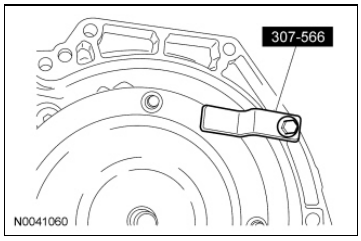
50. Remove the transmission fluid cooler tube secondary latches.



51. Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler tubes.

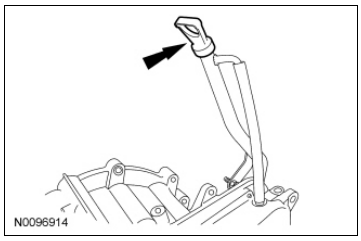


52. Support the transaxle with a suitable transmission jack. Secure the transaxle to the transmission jack with a safety strap.

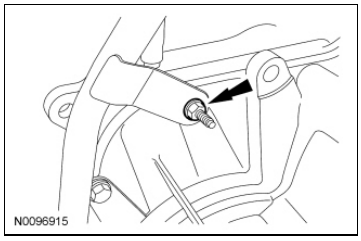


53. Remove the 2 bolts, 2 nuts and the stud from the front of the torque converter housing.

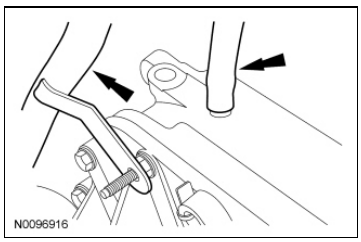
54. Remove the 2 back torque converter housing bolts and remove the transaxle from the dowel pins.



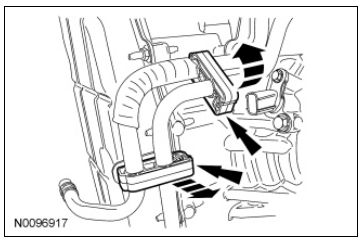
55. Separate the transaxle from the engine and install the Torque Converter Retainer.



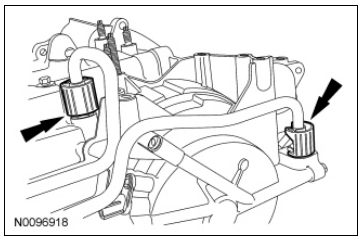
56. Remove the transaxle from the vehicle.



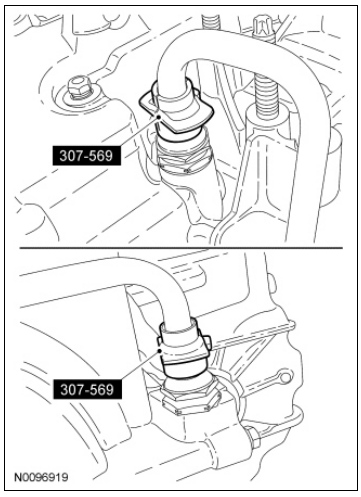
57. Remove the transmission fluid level indicator.



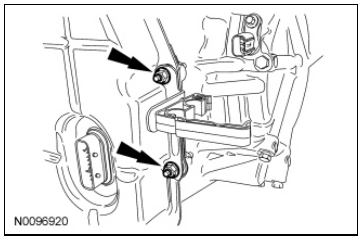
58. Remove the transmission fluid filler tube nut.



59. Remove the transaxle vent tube from the transaxle case and remove the transmission fluid filler tube.

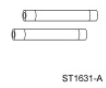


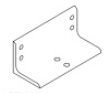
60. Open the transmission fluid cooler tube retainers.



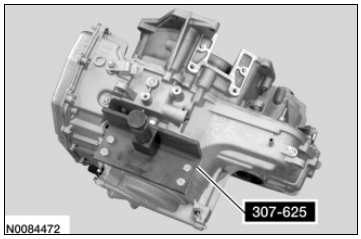
61. Remove the 2 secondary latches.

62. Using the Transmission Cooler Line Disconnect Tool, disconnect and remove the transmission fluid cooler tubes from the transaxle.



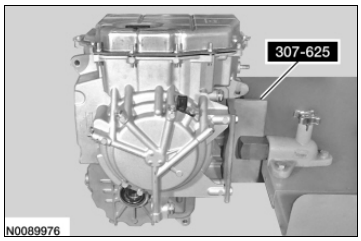


63. Remove the 2 nuts and remove the transmission fluid cooler tube bracket.



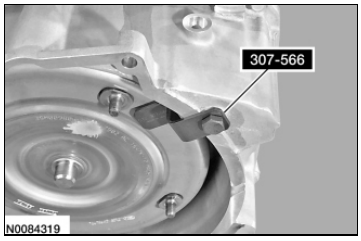
64. If installing a new transaxle, the transmission fluid cooler will need to be backflushed and cleaned. Carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

Transaxle

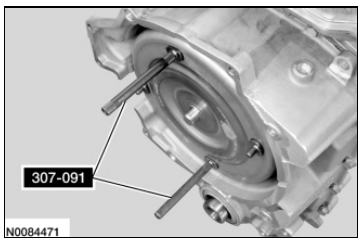


Special Tool(s)

 ST1631-A	Handle, Torque Converter 307-091 (T81P-7902-C)
 ST3069-A	Holding Fixture 307-625
 ST1515-A	Installer, Wheel Speed Sensor Ring 206-084/2
 ST1634-A	Remover, Roll Pin 211-061 (T78P-3504-N1)
 ST1636-A	Retainer, Torque Converter 307-566

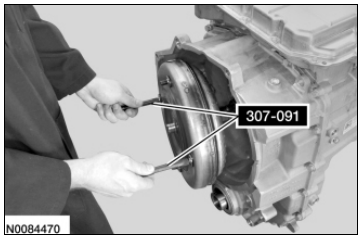


1. Install the Holding Fixture 307-625.

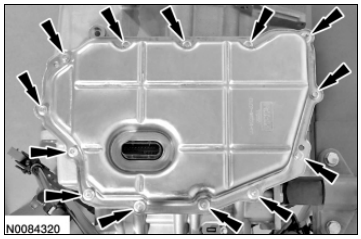


2. Using the Holding Fixture 307-625, install the transaxle on a bench-mounted holding fixture.

3. Remove the Torque Converter Retainer 307-566.

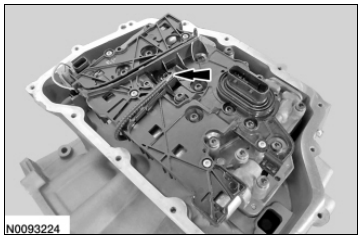


4. Install the Torque Converter Handle 307-091.



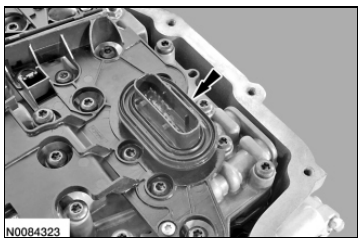
5. ***NOTICE:*** **The torque converter is heavy. Be careful not to drop it or damage will result.**

   Using Torque Converter Handle 307-091, remove the torque converter from the transaxle.



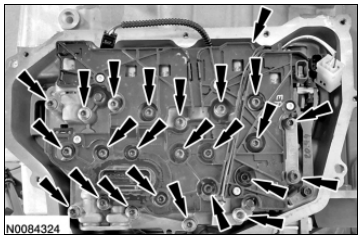
6. **NOTE:** Note the location of the stud bolts for assembly.

   Remove the 13 bolts and the main control cover.

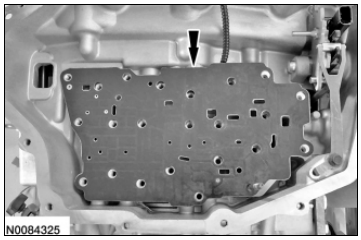


7. Disconnect the Output Shaft Speed (OSS) sensor electrical connector.

8. Disconnect the Transmission Range (TR) sensor electrical connector.

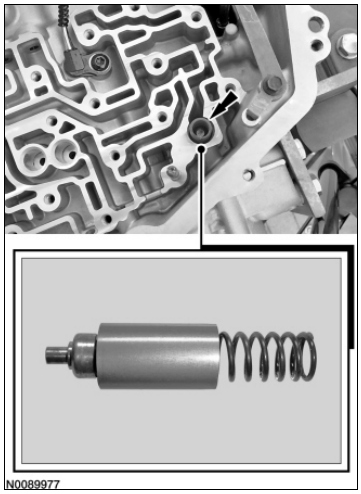


9. Remove the solenoid body-to-main control cover grommet.

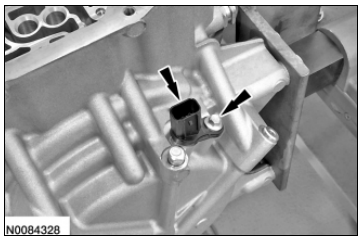


10. **NOTE:** Note the location of the short and long main control bolts for reassembly.

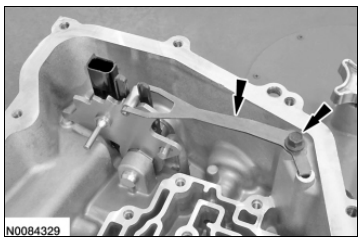
    Remove the nut and the 22 Torx bolts and remove the main control assembly.



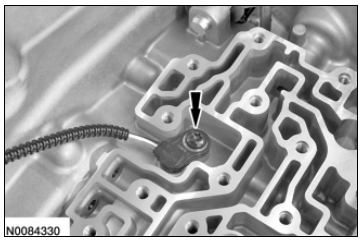
11. Remove and discard the main control-to-transaxle case separator plate.



12. Remove and discard the forward (1, 2, 3, 4) clutch and low/reverse clutch transaxle case-to-center support seals.
    1. Forward (1, 2, 3, 4) clutch transaxle case-to-center support seal.
    2. Low/reverse clutch transaxle case-to-center support seal.

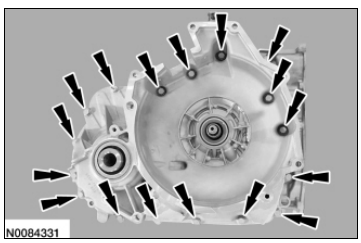


13. Remove the internal cooler bypass spring, sleeve and valve.

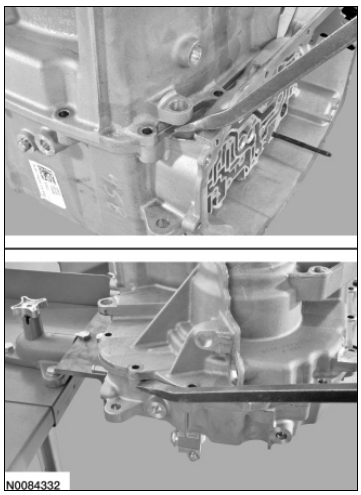


14. Remove the bolt and the Turbine Shaft Speed (TSS) sensor.

15. Remove the bolt and the TR sensor detent spring.

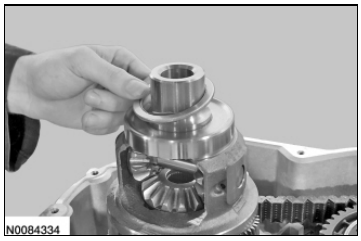


16. Remove the bolt and the OSS sensor.

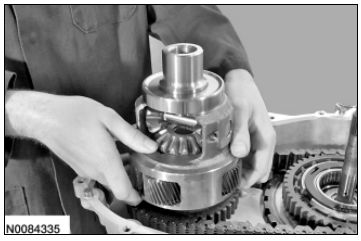


17. **NOTE:** Note the location of the stud bolts for assembly.

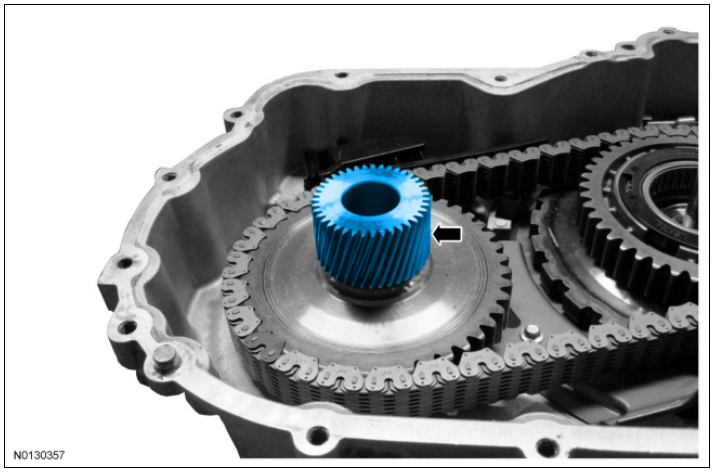
    Remove the 17 torque converter housing bolts.



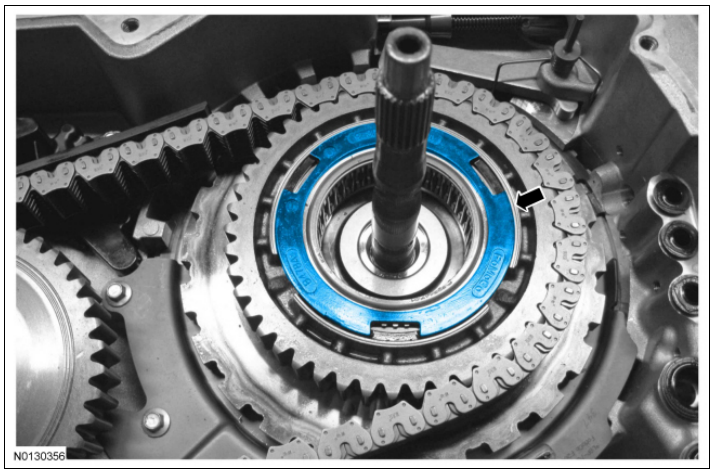
18. Using a suitable tool, pry the torque converter housing loose from the transaxle case.



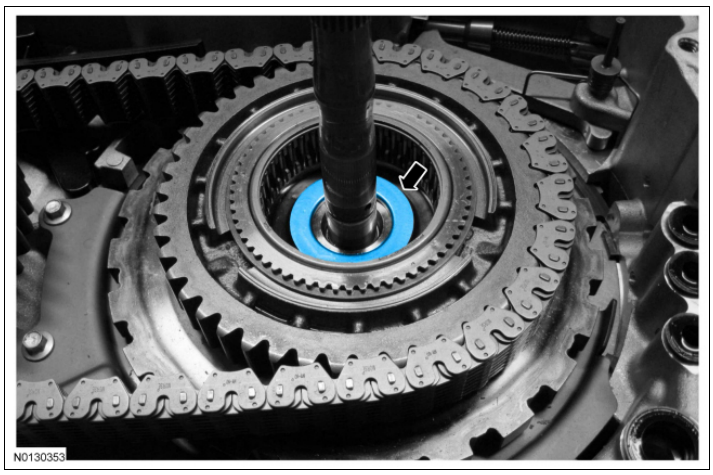
19. Remove the torque converter housing from the transaxle case.



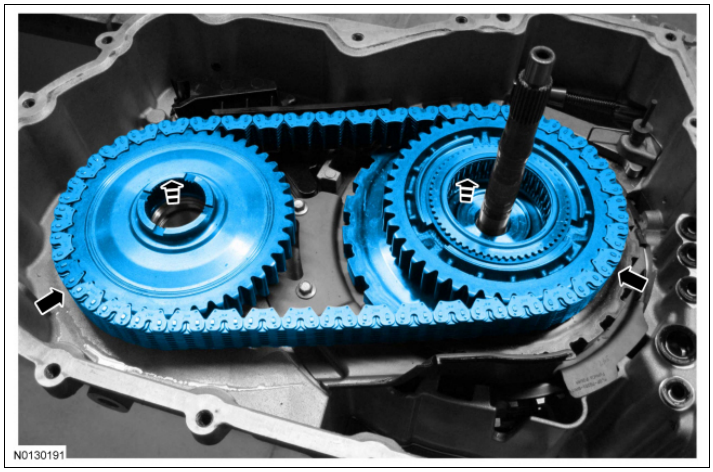
20. Remove the No. 15 differential thrust bearing.



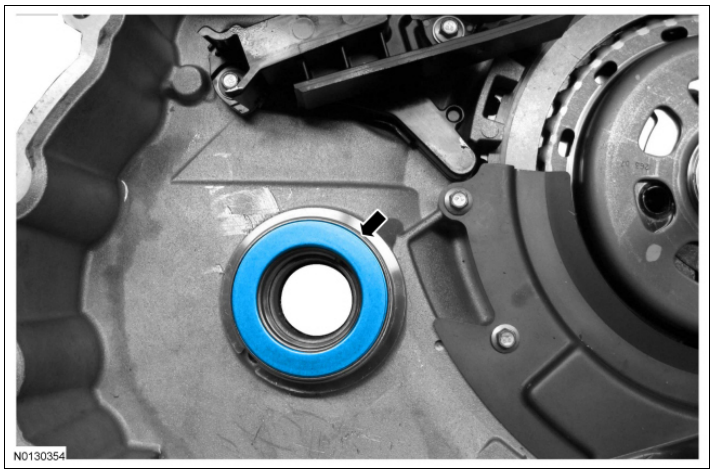
21. Remove the differential.



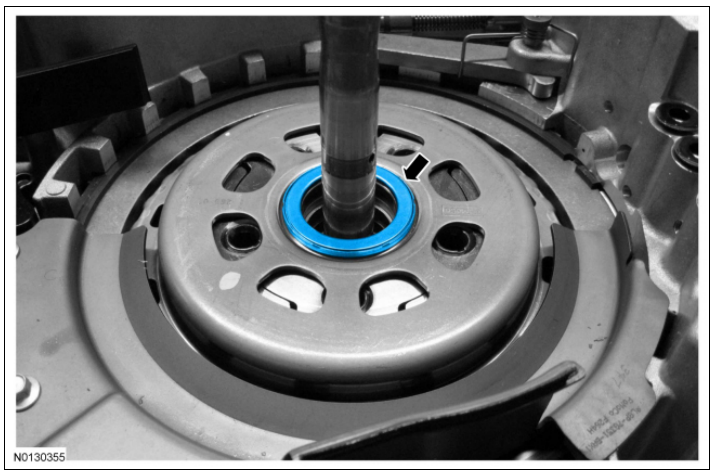
22. Remove the differential planetary sun gear.



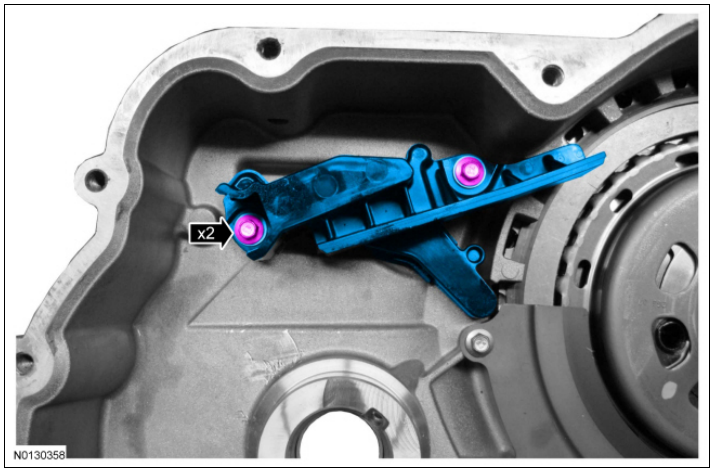
23. Remove the No. 13 thrust washer.



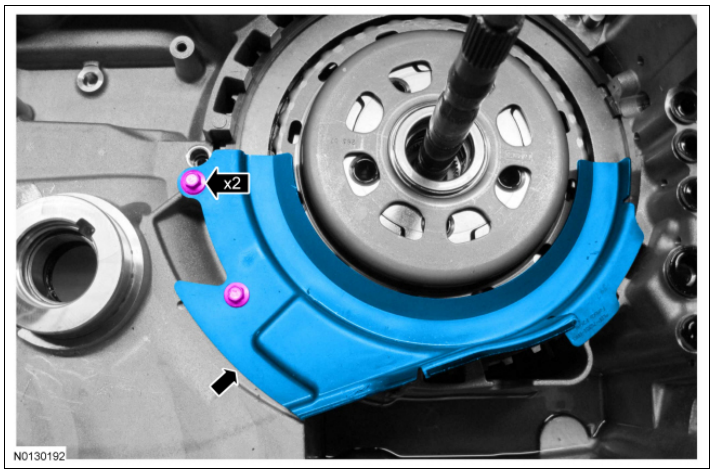
24. Remove the No. 11 drive sprocket thrust bearing.



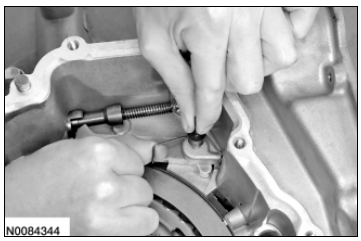
25. Simultaneously remove the drive and driven sprockets and the chain.



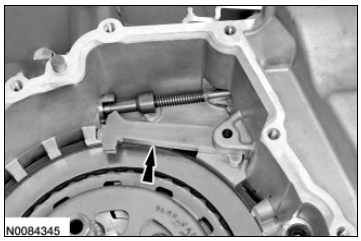
26. Remove the No. 12 driven sprocket thrust bearing.



27. Remove the No. 10 front sun gear and shell assembly thrust bearing.

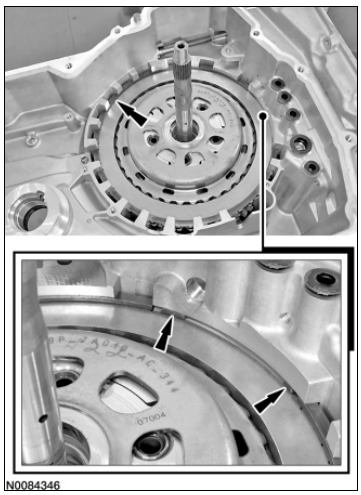


28. Remove the 2 bolts and the transmission fluid reservoir.

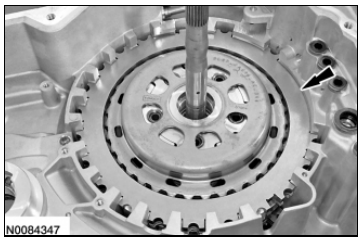


29. Remove the 2 bolts and the transmission fluid baffle.

30. Remove the park pawl pin and spring.

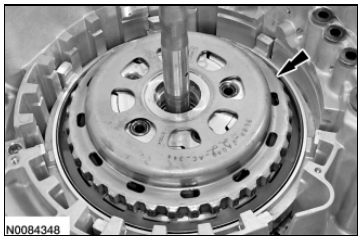


31. Remove the park pawl.

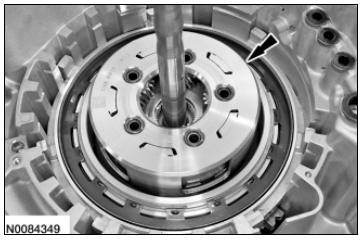


32. **NOTE:** The forward (1, 2, 3, 4) clutch snap ring is beveled. The beveled side of the snap ring goes up (flat side down).

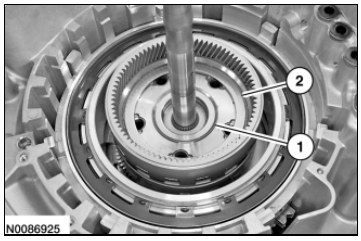
    NOTE: The forward (1, 2, 3, 4) clutch snap ring gap faces the front of the transmission.



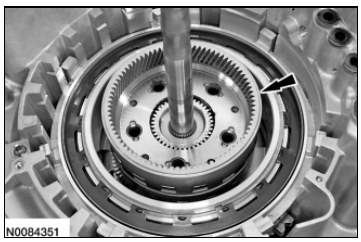
Remove the forward (1, 2, 3, 4) clutch snap ring.



33. Remove the forward (1, 2, 3, 4) clutch pressure plate, clutch assembly and wave spring.

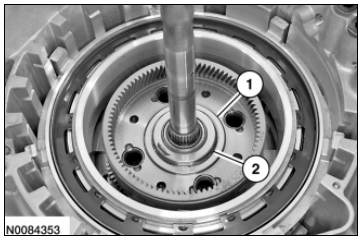


34. Remove the front sun gear and shell assembly.

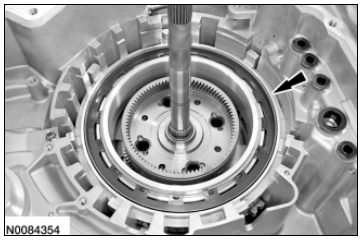


35. Remove the front planetary carrier/rear ring gear assembly.

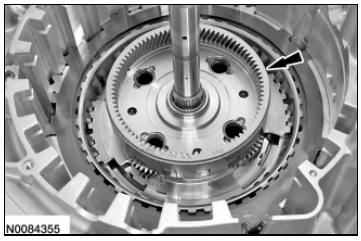
36. Remove the No. 7 and No. 8 thrust bearings.
    1. No. 7 thrust bearing
    2. No. 8 thrust bearing



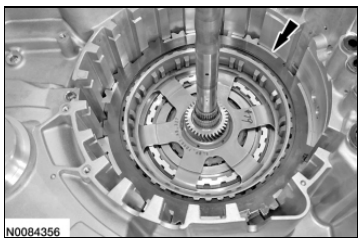
37. Remove the center planetary carrier/front ring gear assembly.



38. Remove the center planetary sun gear.



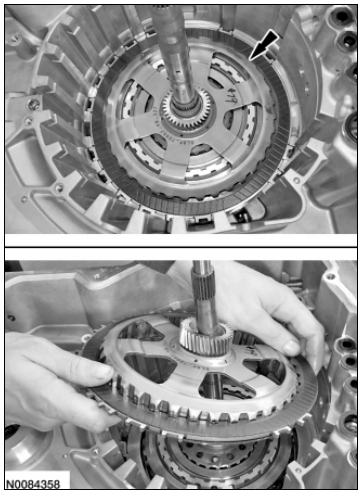
39. Remove the No. 5 and No. 6 thrust bearings.
    1. No. 5 thrust bearing
    2. No. 6 thrust bearing



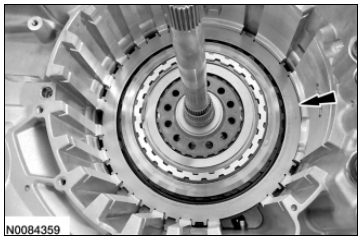
40. Remove the center support assembly.

41. Remove the rear planetary carrier/center ring gear assembly.

42. Remove the low/reverse wave spring, clutch pack and pressure plate.

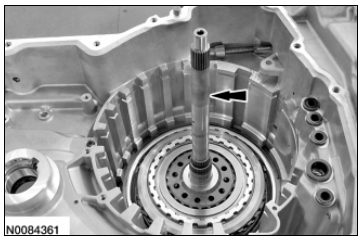


43. Remove the low One-Way Clutch (OWC).



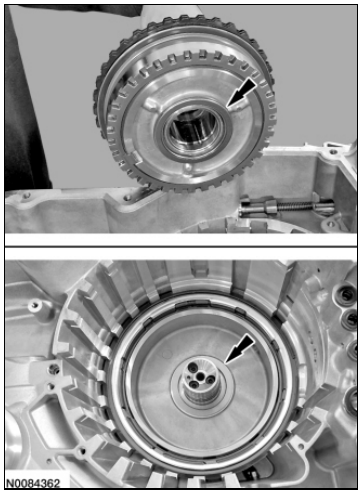
44. **NOTE:** The intermediate (2, 6) clutch is removed with the rear planetary sun gear and shell assembly.

    Remove the rear planetary sun gear and shell assembly and remove the intermediate (2, 6) clutch from the assembly.

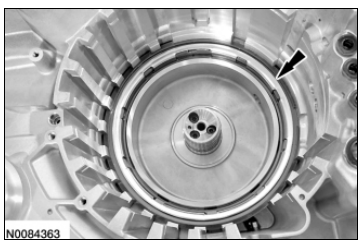


45. Remove the pressure plate and the wave spring.

46. Remove the No. 3 thrust bearing.



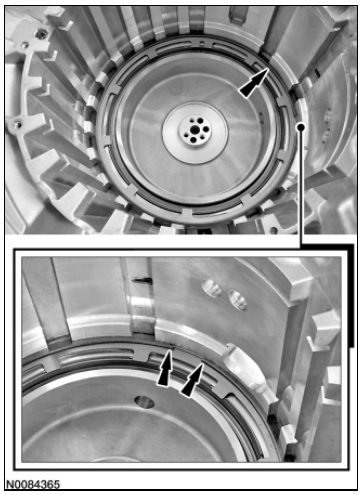
47. Remove the overdrive/direct clutch assembly.



48. **NOTE:** If the No. 1 thrust bearing is stuck to the overdrive/direct clutch assembly, remove the No. 1 thrust bearing from the overdrive/direct clutch assembly.

    Remove the No. 1 thrust bearing.

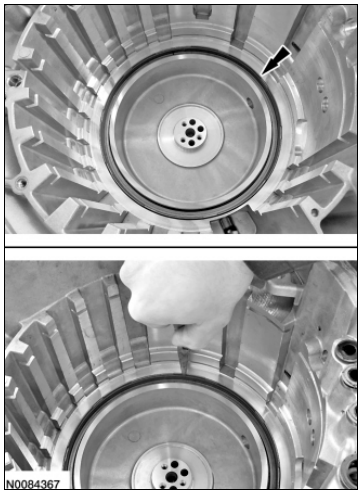
49. Remove the intermediate (2, 6) clutch apply ring.



50. Remove the 3 bolts and the clutch support tower.

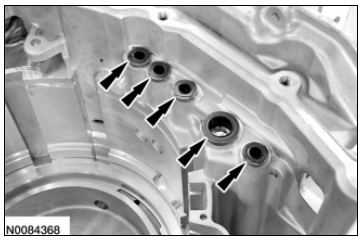
51. **NOTE:** Note the location of the snap ring gap for assembly.

    Remove the intermediate (2, 6) clutch return spring snap ring.



52. **NOTE:** Note the position of the return spring for assembly.

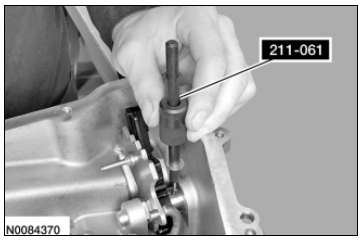
    Remove the intermediate (2, 6) clutch return spring.



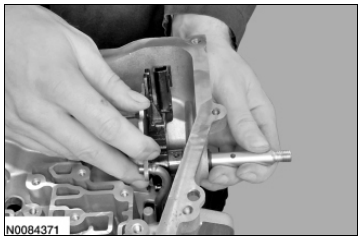
53. **NOTE:** Note the position of the intermediate clutch piston for assembly.

    Remove the intermediate (2, 6) clutch piston.

54. Remove and discard the 5 clutch feed seals.

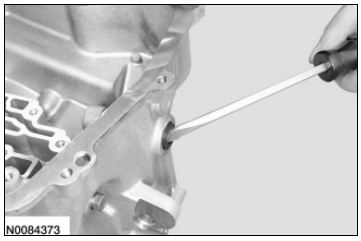


55. Remove the nut and the manual control lever from the manual shaft.

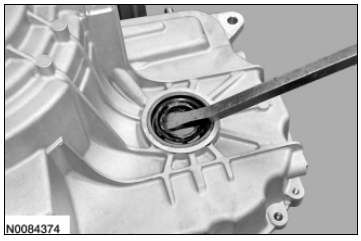


56. ***NOTICE:*** **Do not drive the roll pin through the manual shaft. The roll pin will contact the transaxle case causing damage to the transaxle case.**

    Using Roll Pin Remover 211-061, pull the roll pin out of the manual shaft.

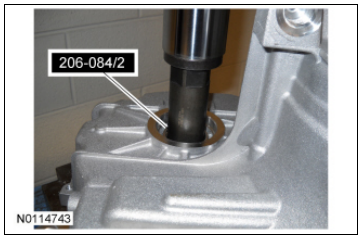


57. Remove the manual shaft.

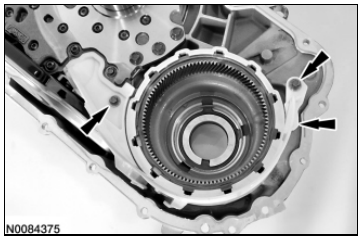


58. Remove the TR sensor and the park pawl actuator rod and remove the park pawl actuator rod from the TR sensor.

59. Using a suitable tool, remove and discard the manual shaft seal.

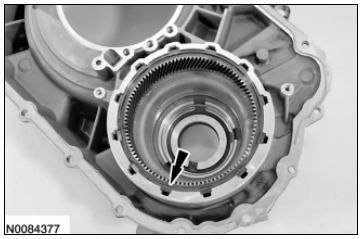


60. Using a suitable tool, remove and discard the LH halfshaft seal.

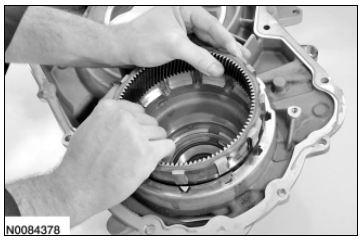


61. **NOTE:** Press the bushing out of the transaxle case from the outside to the inside so that the transaxle case rests on a flat surface.

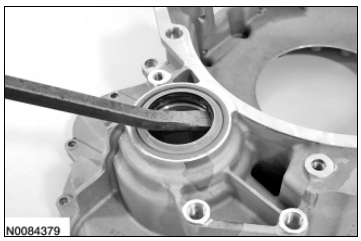
    Using the Wheel Speed Sensor Ring Installer 206-084/2 and a suitable press, remove and discard the LH transaxle case bushing from the transaxle case.



62. Remove the 2 bolts and the oil baffle from the torque converter housing.

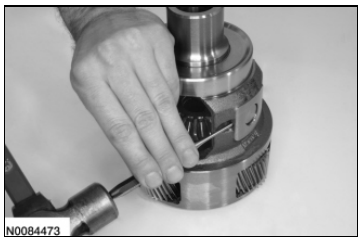


63. Remove the 8 bolts and the pump and filter assembly.

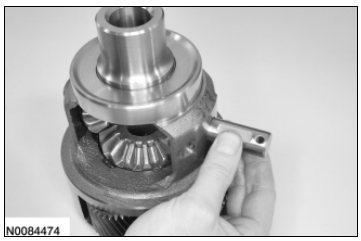


64. Remove the differential ring gear snap ring.

65. Remove the differential ring gear.



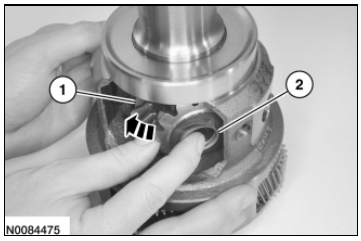
66. Using a suitable tool, remove and discard the RH halfshaft seal.



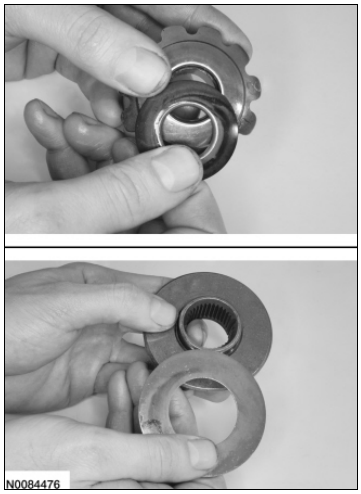
Final Drive Carrier and Differential Assembly

Disassembly

1. Using a suitable tool, drive the roll pin out of the differential. Discard the roll pin.



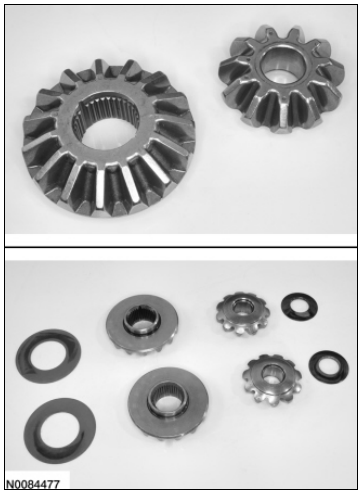
2. Remove the differential pin.



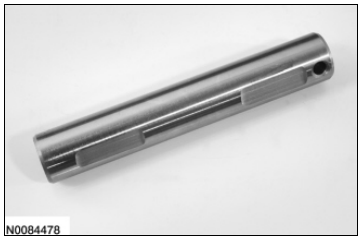
3. ***NOTICE:*** **Do not mix up the washers from the side or spider gears that they were originally assembled with. Assembly of the differential with the wrong washcan cause excessive wear to the differential carrier, spider or side gears.**

   Rotate the side gears along with the spider gears and remove the side gears and the spider gears.

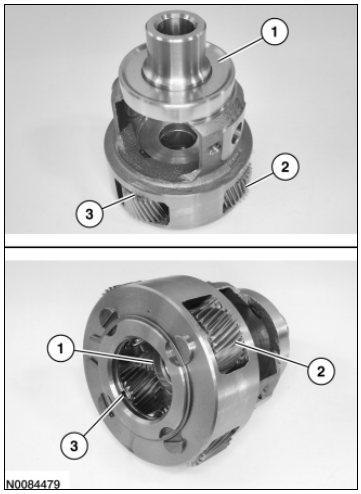
   1. Side gear
   2. Spider gear



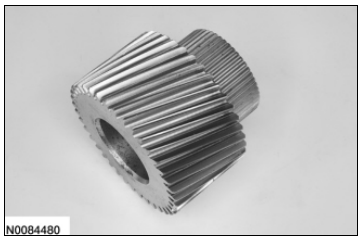
4. Remove the washers from the side and spider gears, but keep the washers with the gear that it was originally assembled with.



Assembly

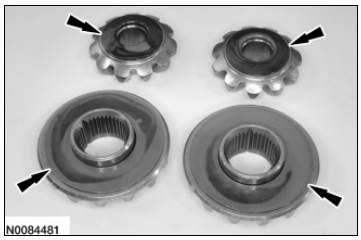


1. Clean and inspect the side gears and spider gears and washers for damage or excessive wear and install new components as necessary.

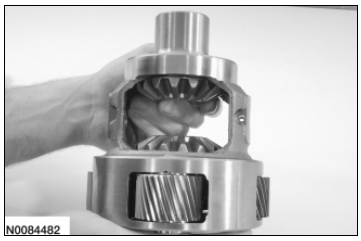


2. Clean and inspect the differential pin for damage or excessive wear and install new if necessary.

3. Clean and inspect the differential for damage and install new if necessary.
    1. Inspect the thrust bearing surfaces.
    2. Inspect the differential planetary gear teeth.
    3. Inspect the differential planetary gear teeth to be sure they spin freely and do not move back and forth or side to side excessively.

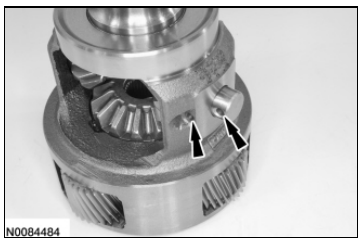


4. Clean and inspect the differential sun gear for damage or excessive wear and install new if necessary.

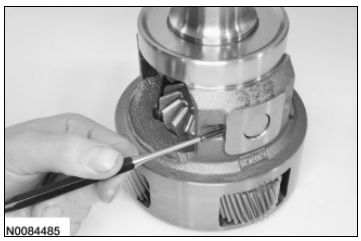


5. ***NOTICE:*** **Do not mix up the washers from the side or spider gears that they were originally assembled with. Assembly of the differential with the wrong washers can cause excessive wear to the differential carrier, spider or side gears.**

   Install the washers on the side or spider gears that they were removed from.

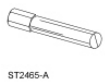


6. Position the side gears in the differential carrier.



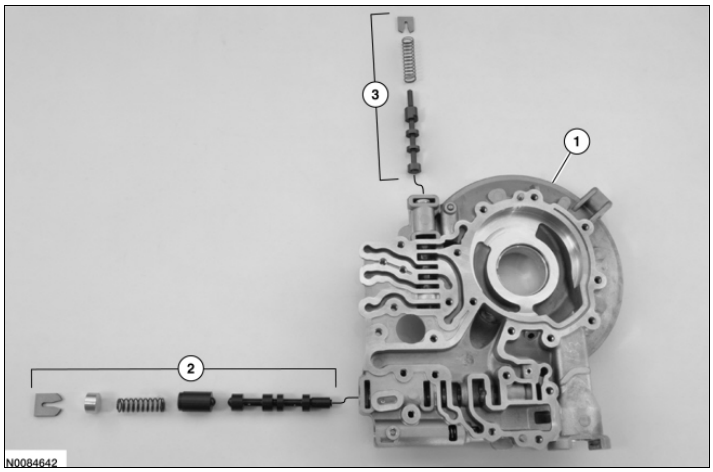
7. Place the spider gears in the differential carrier and rotate the side gears with the spider gears until the differential pin hole lines up to the holes in the spider gears.

8. Install the differential pin with the roll pin holes aligned.



9. Using a suitable tool, install a new roll pin.

Pump and Filter Assembly



Special Tool(s)

 ST2465-A	Collet, 3/4 Inch to 7/8 Inch 303-D019 (D80L-100-Q)
 ST3071-A	Installer, Converter Seal 307-627
 ST3064-A	Seal Installer, Turbine Shaft 307-634
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

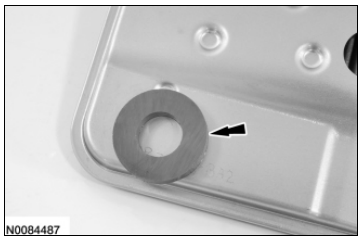
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Pump Assembly

Item	Part Number	Description
1	7A103	Pump housing
2	-	Main pressure regulator valve assembly
3	-	

		Torque Converter Clutch (TCC) control valve assembly

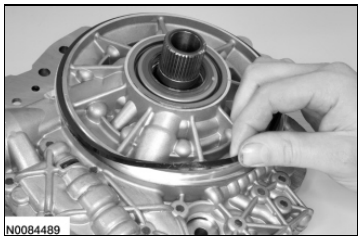
Disassembly



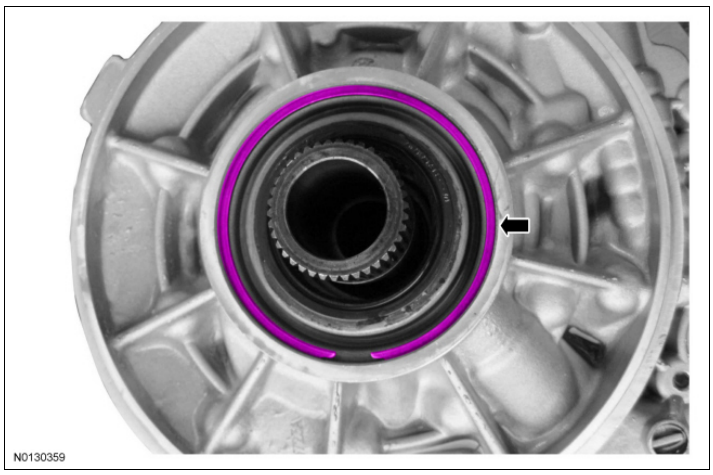
1. **NOTE:** Note the orientation of the fluid filter to the fluid pump.

   Remove the filter from the pump.

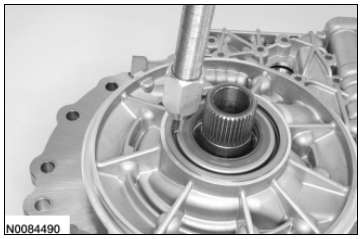
   1. Rotate the filter 90 degrees clockwise.
   2. Pull the filter out pump.



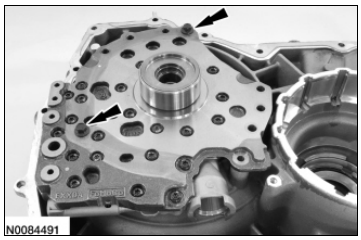
2. Remove the magnet from the filter.



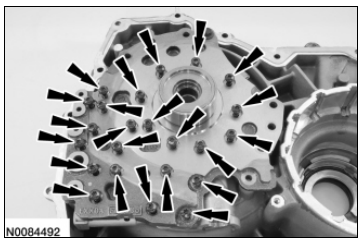
3. Assemble the Slide Hammer 100-001 and 3/4 Inch to 7/8 Inch Collet 303-D019 and remove and discard the input shaft seal.



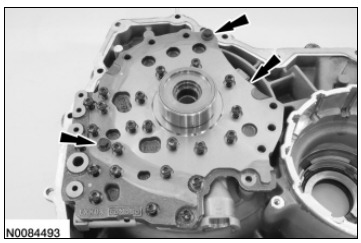
4. Remove the pump-to-torque converter housing seal.



5. If equipped, remove the torque converter hub seal snap ring.



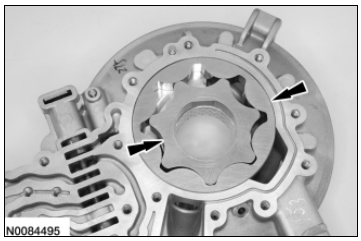
6. Using a suitable dent puller, remove the torque converter hub seal.



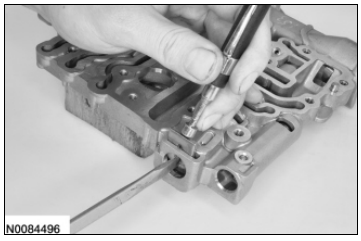
7. Position the pump assembly in the torque converter housing and install 2 pump-to-torque converter housing bolts hand-tight.

8. Loosen the 23 pump bolts.

9. Remove the 2 bolts and the pump from the torque converter housing.

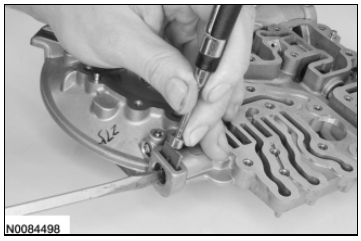


10. Remove the 23 pump bolts and separate the pump halves.

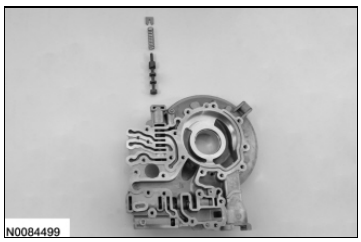


11. **NOTE:** The dot on the inner pump gear faces up.

    Remove the pump gears.



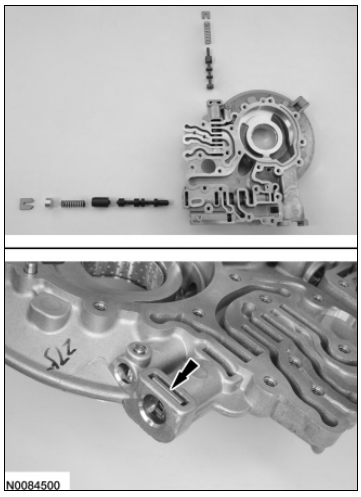
12. Compress the main pressure regulator valve spring with a screwdriver and remove the retainer with a magnet.



13. Install an M4 bolt in the valve and remove the main pressure regulator valve assembly.

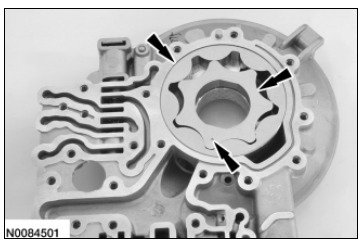
14. Compress the Torque Converter Clutch (TCC) control valve spring with a screwdriver and remove the retainer with a magnet.

15. Remove the TCC control valve assembly.



Assembly

1. Clean and inspect the components of the pump assembly for wear or damage. Inspect the fluid drained from the pump for excessive metal or foreign material. If excessive wear, damage or excessive metal is found, replace the fluid pump as an assembly.

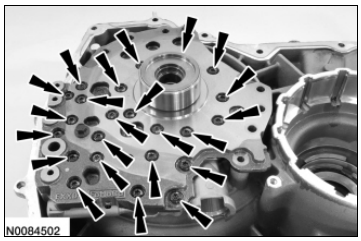


2. **NOTE:** TCC control valve retainer shown assembled in the pump body, main pressure regulator valve retainer similar.

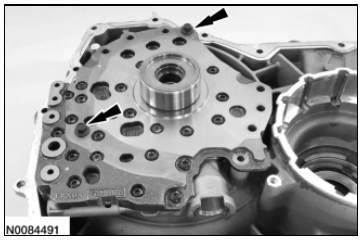
   Assemble the TCC control valve and main pressure regulator valve and install the valves in the pump. Compress the valve springs with a screwdriver and install the retainers.

3. **NOTE:** The dot on the inner pump gear faces up.

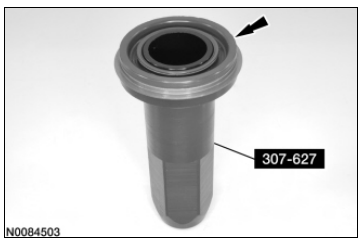
   Install the pump gears.



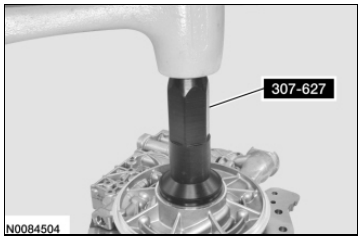
4. Position the stator support on the pump housing and install the 23 bolts hand-tight.



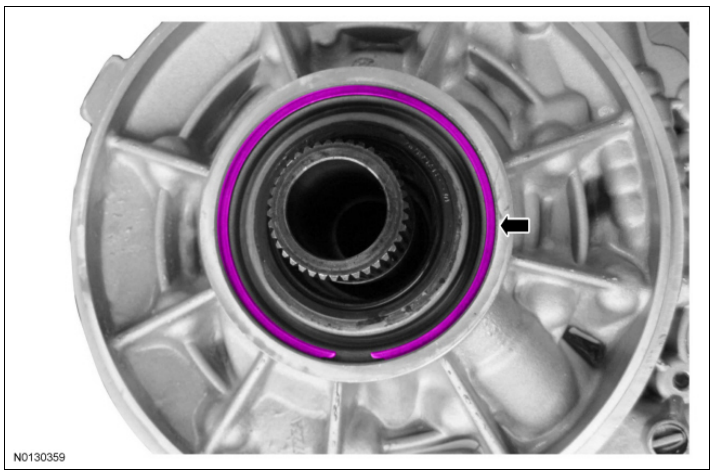
5. Install the pump assembly in the torque converter housing and install 2 bolts hand-tight.



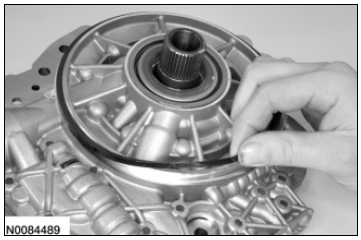
6. Tighten the 23 pump housing bolts.
   - Tighten to 10 Nm (89 lb-in).



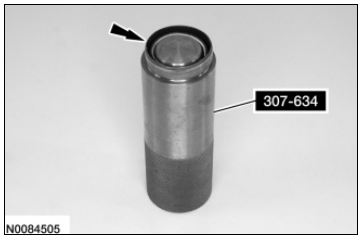
7. Remove the 2 bolts and the pump assembly from the torque converter housing.



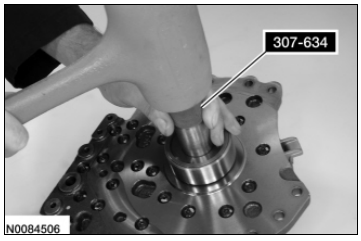
8. Install a new torque converter hub seal on Converter Seal Installer 307-627.



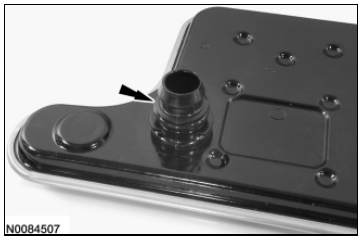
9. Using the Converter Seal Installer 307-627, install a new torque converter hub seal.



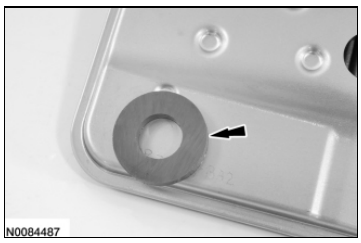
10. If equipped, install the torque converter hub seal snap ring.



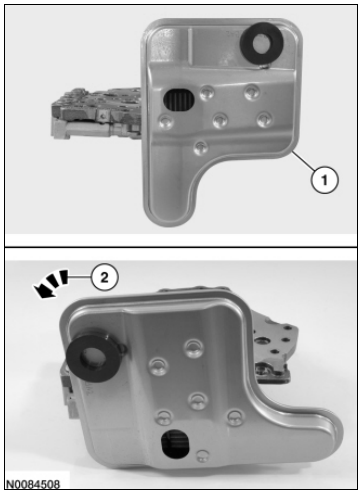
11. Install a new pump-to-torque converter housing seal.



12. Install a new turbine shaft seal on Turbine Shaft Seal Installer 307-634.



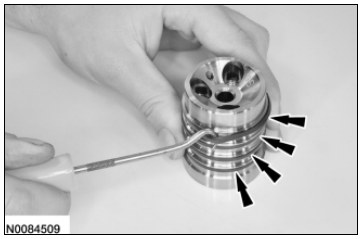
13. Using Turbine Shaft Seal Installer 307-634, install the turbine shaft seal.



14. Install a new O-ring on a new filter and lubricate it with clean automatic transmission fluid.

15. Install the magnet on the filter.

16. Install the filter.
    1. Position the filter in the pump.
    2. Rotate the filter counterclockwise 90 degrees.



Clutch Support Tower

Special Tool(s)

 ST2996-A	Input Shaft Support Seal Installer (Back Plate, Multiple Rings) 307-578 (includes 307-578/1, 307-578/2 and 307-578/3)

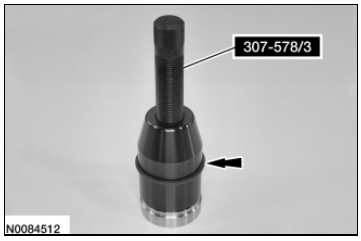
Disassembly

1. Using a suitable tool, remove and discard the 4 Teflon® seals.

N0084509

2. Clean and inspect the clutch support towerdamage. Install a new clutch support tower if damaged.

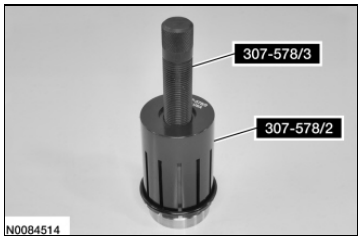
N0084510



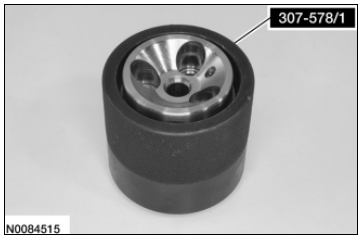
Assembly

1. Install the Input Shaft Support Seal Installer 307-578/3 on the clutch support tower and adjust the Input Shaft Support Seal Installer to align the bottom edge of the tool with the top edge of the bottom Teflon® seal groove.

N0084511

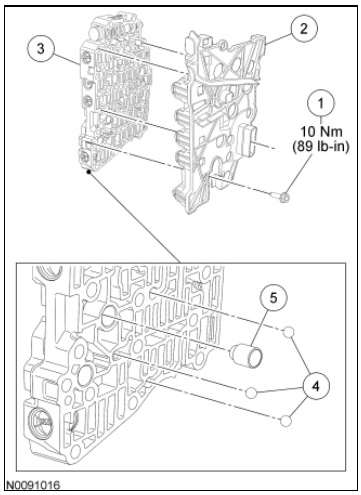


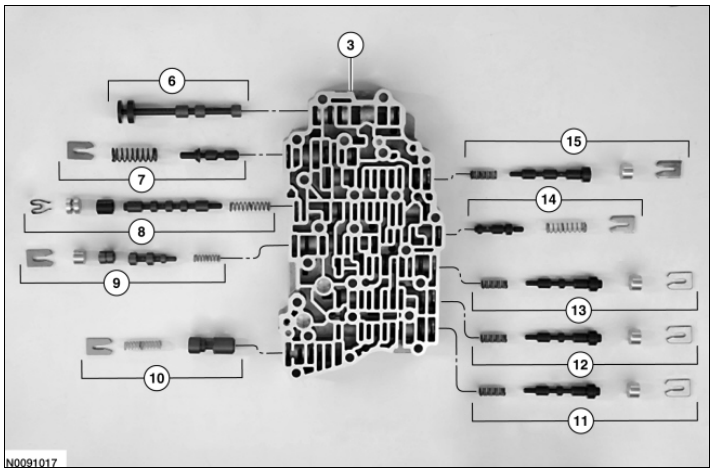
2. Install a new Teflon® seal on the Input Shaft Support Seal Installer 307-578/3.



3. Install the Input Shaft Support Seal Installer 307-578/2 over 307-578/3. Using the Input Shaft Support Seal Installer 307-578/2, slide the Teflon® seal over the clutch support tower and into the groove.

4. Remove the Input Shaft Support Seal Installer 307-578/2 and 307-578/3.
    - Repeat Steps 1 through 4 for the other 3 Teflon® seals.

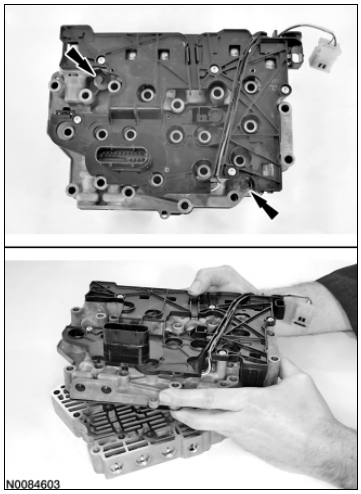




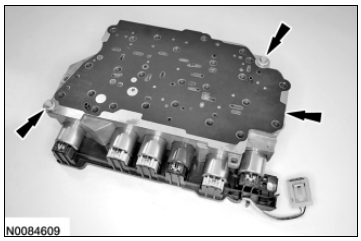
5. Install the Input Shaft Support Seal Installer 307-578/1 on the clutch support tower to size the 4 Teflon® seals.

Main Control Valve Body

Main Control Valve Body

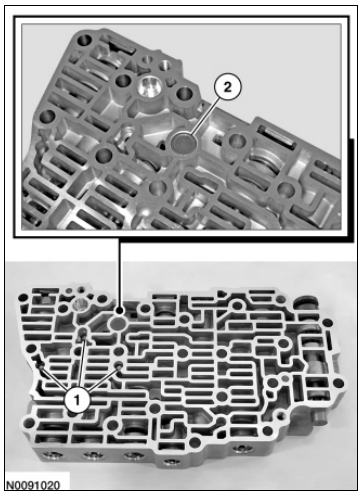


Item	Part Number	Description
1	W500303	Solenoid body-to-valve body bolt
2	7G391	Solenoid body
3	7A100	Main control valve body
4	7E195	Check balls
5	7J191	Solenoid damper (Shift Solenoid A (SSA))
6	7C389	Manual valve
7	7G473	Solenoid pressure regulator valve assembly
8	7G179	Clutch bypass valve
9	7G307	Torque Converter Clutch (TCC) regulator valve
10	7B200	Control pressure regulator
11	7D102	Direct (3, 5, R) clutch regulator valve
12	7D102	Intermediate (2, 6) clutch regulator valve

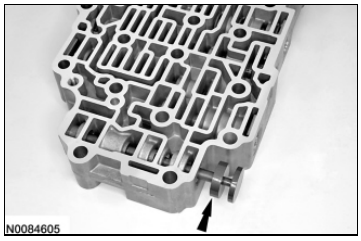


13	7D102	Forward (1, 2, 3, 4) clutch regulator valve
14	7J187	Forward (1, 2, 3, 4) clutch latch valve
15	7D102	Low reverse/overdrive (4, 5, 6) clutch regulator valve

Disassembly



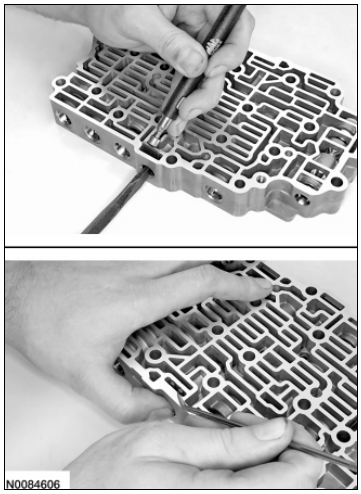
1. Remove the 2 bolts and separate the solenoid body from the valve body.



2. Remove the 2 bolts and remove and discard the separator plate.

3. Remove the 3 check balls and the damper.
    1. Check balls
    2. Solenoid damper

4. Remove the manual valve.

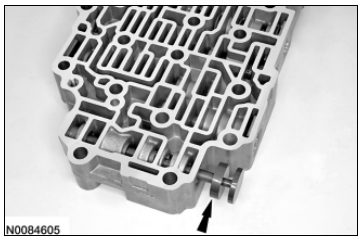


5. ***NOTICE:*** **Remove the valves by tapping the valve body on the palm of the hand to slide the valves out of the bores or by threading a 4-mm bolt into the valves and pulling them out. It may be necessary to remove the valves and springs using a pick. If it is necessary to use a pick, use extreme caution to prevent damaging the valves or valve bores. If necessary, disassemble parts of the main control valve body in small groups. Take special care when handling the main control components, since they are the most precise and delicate parts of the transaxle. Neatly arrange the parts as they are removed to avoid mixing similar pieces.**

   NOTICE: **Do not stone or polish any valves or damage to the valves can occur. If the valves do not move freely, install a new assembly.**

   NOTE: The bypass valve is held in with a spring-loaded retainer. Be careful not to lose the retainer when removing it.

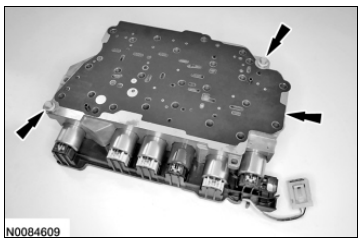
   Compress the valve springs with a screwdriver and remove the retainers with a magnet. Use a pick to remove the bypass valve retainer. Remove the individual valves and springs from the main control valve body by tapping the valve body on the palm of the hand to slide the valves out of the bores. If needed, use a 4-mm bolt to thread into the valves to remove the valves. See the Valve Body illustration for valve and spring locations. Clean valves, springs and main control valve body.



Assembly

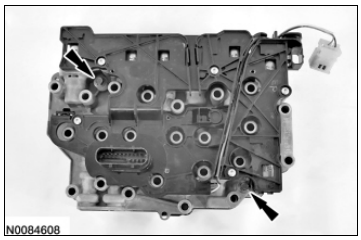
1. ***NOTICE:*** **Do not stone or polish any valves or damage to the valves can occur. If the valves do not move freely during assembly, install a new valve body.**

   Install the valve body valves, springs and retaining clips in the main control valve body. See the Valve Body illustration at the beginning of this procedure for valve and spring locations.



2. Install the manual valve in the valve body.

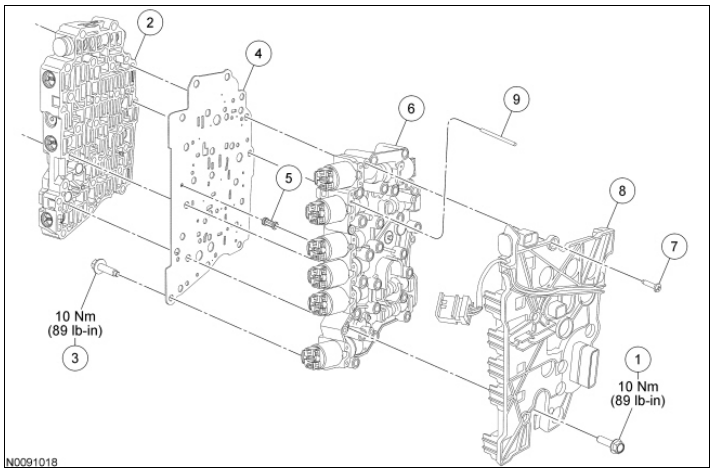
3. Install the 3 check balls and the damper.
    1. Check balls
    2. Solenoid damper

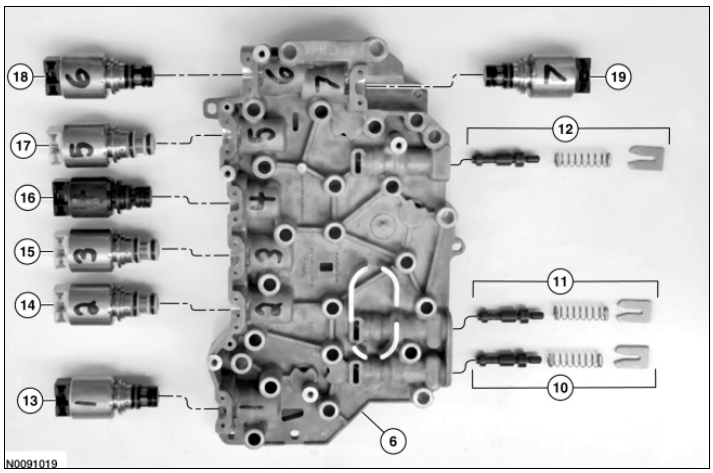


4. Install the new separator plate and the 2 separator bolts.
    - Tighten to 10 Nm (89 lb-in).

5. For disassembly and assembly of the solenoid body, refer to Solenoid Body Assembly in this section.

6. Position the solenoid body assembly on the valve body and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



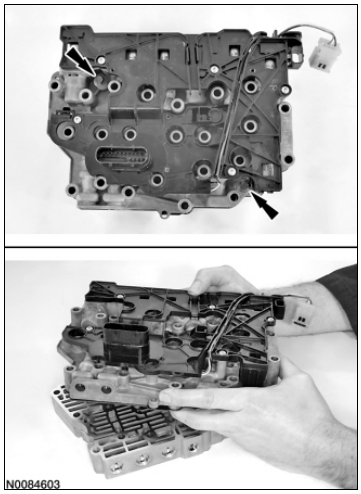


Solenoid Body Assembly

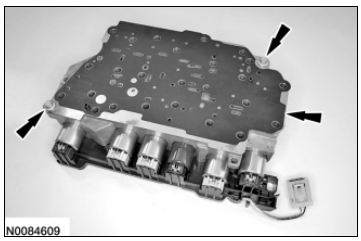
Special Tool(s)

 ST3066-A	Pins, Leadframe Guide 307-636

Solenoid Body

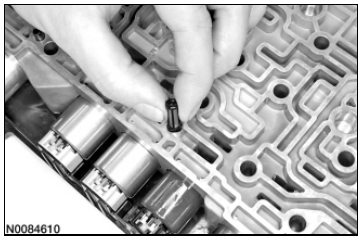


Item	Part Number	Description
1	W500303	Solenoid body-to-valve body bolt
2	7A100	Main control valve body
3	N605770	Solenoid body-to-valve body separator plate bolt (2 required)
4	7Z490	Solenoid body-to-valve body separator plate

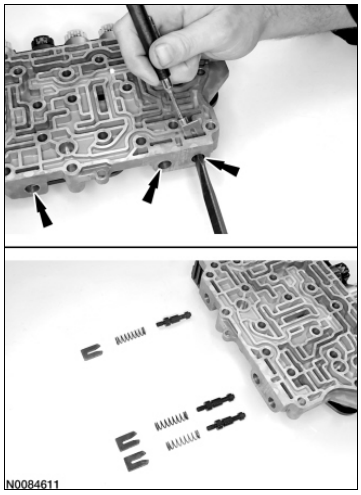


5	7K221	Circuit filter
6	7G391	Solenoid body
7	W505513	Leadframe screw (5 required)
8	7G276	Leadframe
9	7H111	Solenoid retaining pin (14 required)
10	7J187	Direct (3, 5, R) clutch latch valve
11	7J187	Intermediate (2, 6) clutch latch valve
12	7J187	Low reverse/overdrive (4, 5, 6) clutch latch valve
13	7G383	Line Pressure Control (LPC) solenoid
14	7G136	Shift Solenoid C (SSC)
15	7G136	Torque Converter Clutch (TCC) solenoid
16	7G484	Shift Solenoid E (SSE) ON/OFF solenoid
17	7G136	Shift Solenoid A (SSA)
18	7G383	Shift Solenoid B (SSB)
19	7G383	Shift Solenoid D (SSD)

Disassembly

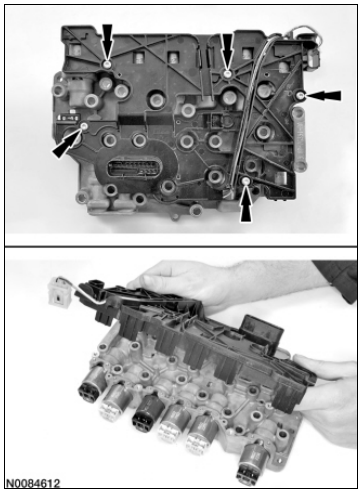


1. If not previously done, remove the 2 bolts and separate the solenoid body from the valve body.

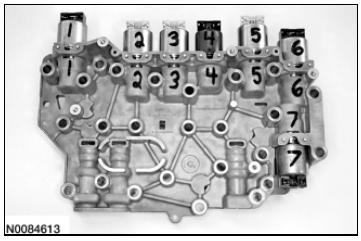


2. Remove the 2 bolts and remove and discard the separator plate.

3. Remove and discard the circuit filter.

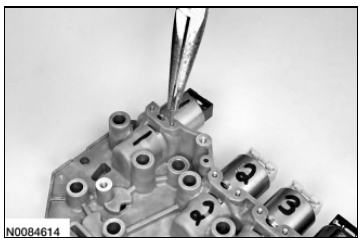


4. Compress the valve springs with a screwdriver and remove the retainers with a magnet. Remove the individual valves and springs from the solenoid body by tapping it on the palm of the hand to slide the valves out of the bores. See the Solenoid Body illustration at the beginning of this procedure for valve and spring locations.



5. ***NOTICE:*** **Be careful not to bend or twist the solenoid body leadframe or the solenoid terminals when removing the leadframe or damage can occur to the leadframe or the solenoids.**

   Remove the 5 screws and carefully remove the leadframe from the solenoids by lifting it straight up evenly.



6. ***NOTICE:*** **The solenoids are calibrated from the factory and are not all the same. Failure to mark the solenoids to the ports they were originally in can result in mixing the solenoids and can cause damage to the transaxle or a harsh shift.**

   Using a paint marker, number the solenoids and the solenoid body to correspond with the ports from which the solenoids are located in the solenoid body.

7. Remove the solenoid retaining pins.

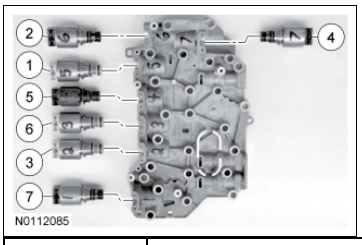
8. Remove the solenoids from the solenoid body.

Assembly

1. ***NOTICE:*** **Be careful not to wash the numbers from the solenoids or the solenoid body. Failure to install the solenoids in the ports they were originally in can result in damage to the transaxle or a harsh shift.**

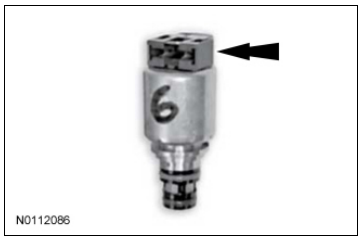
   NOTICE: **Do not stone or polish any valves or damage to the valves can occur. If the valves do not move freely during assembly, install a new solenoid body.**

   Clean and inspect the solenoid body, solenoids and valve assemblies for damage. Inspect the solenoid screens for debris that may restrict fluid flow through the screen.



2. ***NOTICE:*** **The solenoids are calibrated from the factory and are not all the same. Failure to install the solenoids in the ports they were originally in can result in damage to the transaxle or a harsh shift.**

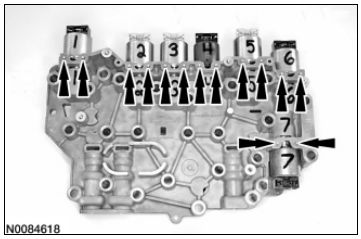
   If new solenoid(s) are not being installed, position the solenoids in the solenoid body ports from which their numbers correspond.



3. If installing a new Variable Force Solenoid (VFS), determine the base part number of the solenoid(s). The Torque Converter Clutch (TCC) solenoid, Shift Solenoid A (SSA) and Shift Solenoid C (SSC) are all normally low pressure solenoids. The Line Pressure Control (LPC) solenoid, Shift Solenoid B (SSB) and Shift Solenoid D (SSD) are all normally high pressure solenoids. Shift Solenoid E (SSE) is not a VFS ; it is an ON/OFF solenoid.

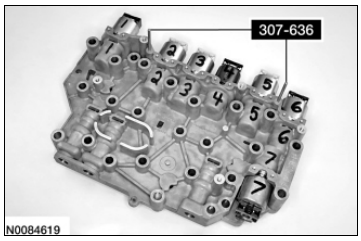
Item	Part Number	Description
1	7G136	SSA (normally low)
2	7G383	SSB (normally high)
3	7G136	SSC (normally low)
4	7G383	SSD (normally high)
5	7G484	SSE (normally closed [OFF])
6	7G136	TCC solenoid (normally low)
7	7G383	LPC solenoid (normally high)

4. If installing a new LPC solenoid, SSB or SSD , note the color of the electrical terminal area of the solenoid. The color will be blue or green and the solenoid can only be replaced with the same color solenoid. If a new solenoid with that color is not available, install a new solenoid body, refer to Solenoid Body Assembly in this section.

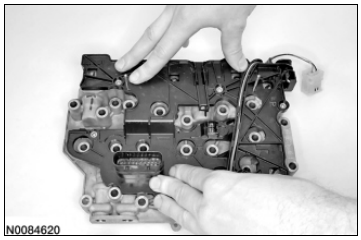


5. Determine the part number suffix by checking the solenoid service band number etched on the side of the solenoid. The band number is the third digit on the side of the solenoid and will be a 1, 2, 3, 4 or 5. Use the following table to determine the part number suffix and match the new solenoid base part number and suffix with the old solenoid. Install the solenoid in the solenoid body.

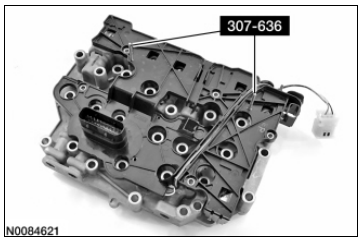
Solenoid Band Number	Part Number Suffix
1	B
2	C
3	D
4	E



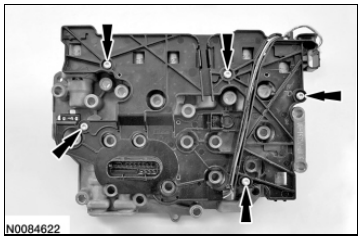
5	F



6. Install the solenoid retaining pins.

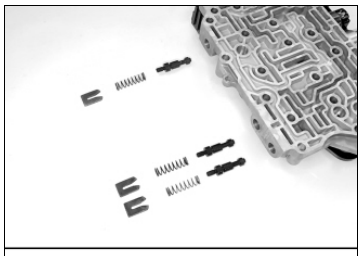


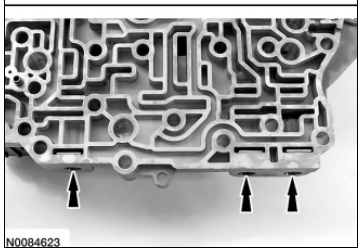
7. Install Leadframe Guide Pins 307-636 in the solenoid body to align the leadframe for installation.



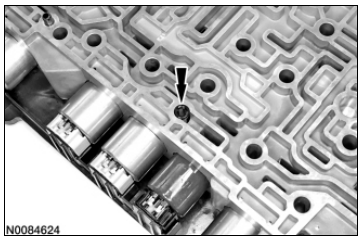
8. Position the leadframe on the guide pins and carefully install the leadframe by pushing it straight down into the solenoids.

9. Remove Leadframe Guide Pins 307-636.



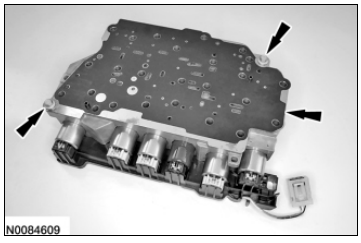


10. Install the 5 leadframe screws.

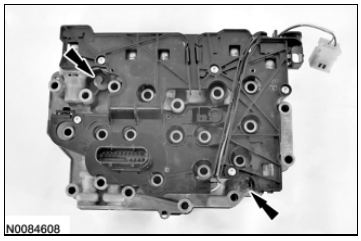


11. ***NOTICE:*** **If the valves do not move freely during assembly, install a new solenoid body. Failure to install a new solenoid body can result in a harsh shift or damage to the transaxle.**

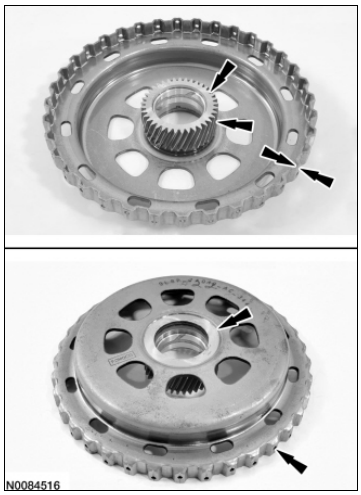
    Install the solenoid body valves, springs and retaining clips in the solenoid body. See the Solenoid Body illustration at the beginning of this procedure for valve and spring locations.



12. Install the circuit filter.



13. Install the new separator plate and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



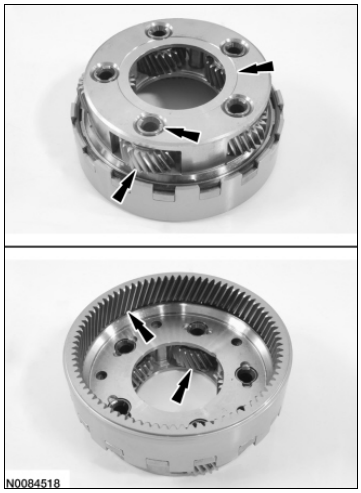
14. If not previously done, refer to Main Control Valve Body in this section for disassembly and assembly of the valve body.

15. Position the solenoid body assembly on the valve body and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

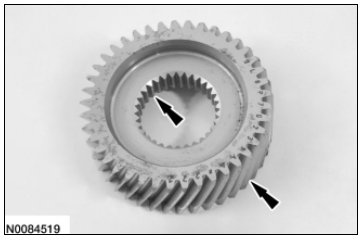
N0084608

Planetary Gearsets And Chain Drive Parts

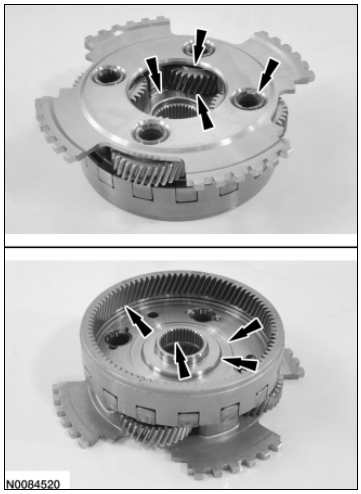
1. Clean and inspect the front planetary sun gear and shell assembly for damage or wear and install new, as necessary.
    - Gear teeth
    - Shell-to-clutch pack surfaces
    - Thrust bearing surfaces



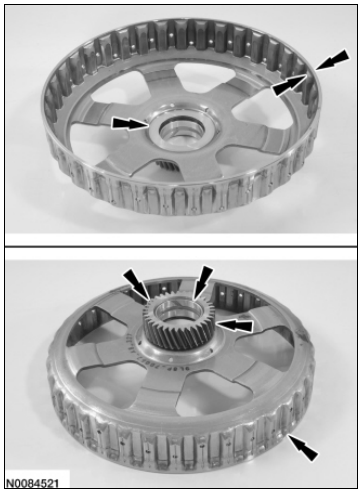
2. Clean and inspect the front planetary gear carrier/rear ring gear assembly for damage or excessive wear and install new, as necessary.
    - Pinion gear teeth
    - Pinion gear surfaces
    - Pinion gear bearings
    - Spline teeth
    - Thrust bearing
    - Thrust bearing surfaces <
    - Ring gear teeth



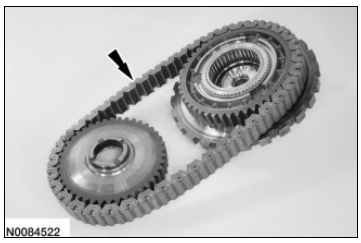
3. Clean and inspect the center planetary gear carrier/front ring gear assembly for damage or excessive wear and install new, as necessary.



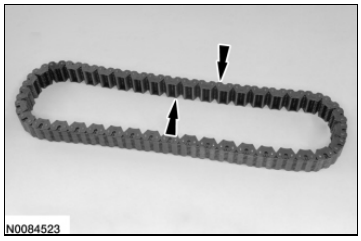
- Pinion gear teeth
- Pinion gear surfaces
- Pinion gear bearings
- Spline teeth
- Thrust bearing surfaces
- Ring gear teeth



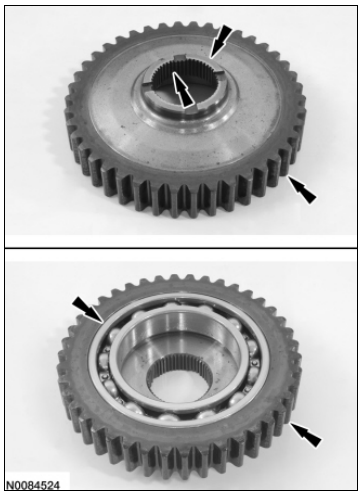
4. Clean and inspect the center planetary sun gear for damage or excessive wear and install new, as necessary.
    - Sun gear teeth
    - Spline teeth



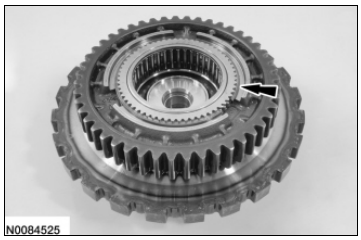
5. Clean and inspect the rear planetary gear carrier/center ring gear assembly for damage or excessive wear and install new, as necessary.
    - Pinion gear teeth
    - Pinion gear surfaces
    - Pinion gear bearings
    - Spline teeth
    - Thrust bearing surfaces
    - Thrust bearing
    - Ring gear teeth



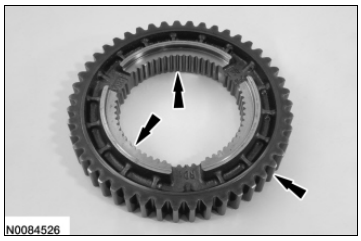
6. Clean and inspect the rear planetary sun gear and shell assembly for damage or wear and install new, if necessary.
    - Sun gear teeth
    - Shell-to-clutch pack surfaces
    - Bearing surfaces



7. Remove the drive chain from the drive and driven sprockets.

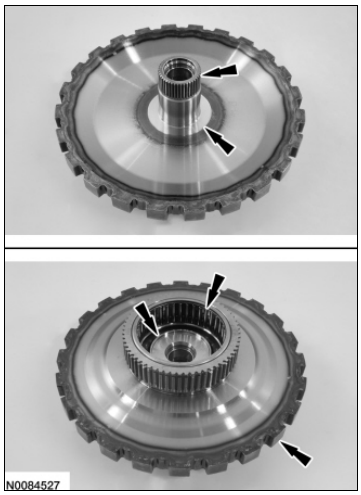


8. Clean and inspect the drive chain for damage or excessive wear and install new, if necessary.
    - Check the drive chain for wear, stretching or tightness of the chain links.
    - Check that the chain moves freely.

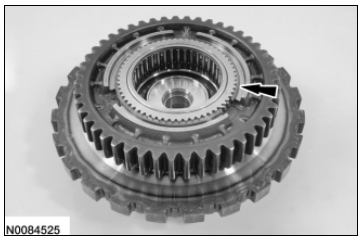


9. Inspect the driven sprocket for damage or excessive wear and install new, if necessary.
    - Chain teeth
    - Spline teeth
    - Thrust bearing surfaces
    - Bearing

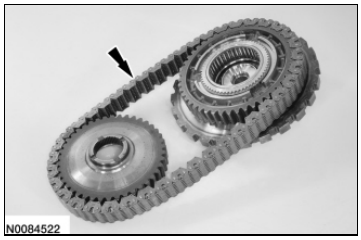
10. Remove the snap ring and remove the drive sprocket from the front planetary hub/park gear assembly.



11. Inspect the drive sprocket for damage or excessive wear and install new, if necessary.
    - Chain teeth
    - Spline teeth
    - Thrust washer surface



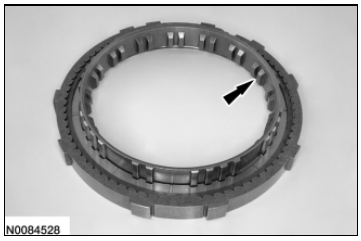
12. Inspect the front planetary hub/park gear assembly for damage or excessive wear and install new, if necessary.
    - Park gear teeth
    - Spline teeth



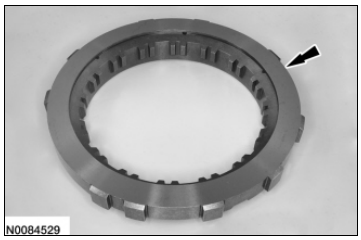
- Thrust washer surface
- Thrust bearing surface
- Bearing surfaces
- Needle bearing

13. Install the drive sprocket on the front planetary hub/park gear assembly and install the snap ring.

14. Install the drive chain on the drive and driven sprockets.



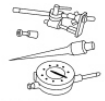
Low One-Way Clutch



1. ***NOTICE:*** **Do not clean in water or with water-based solvents. Damage to the component may occur.**

   NOTE: The low One-Way Clutch (OWC) should not be disassembled.

   Clean and inspect the low OWC for cracks and damaged splines. The internal splined section should rotate clockwise and lock when rotated counterclockwise. If any damage is found or the clutch does not rotate or lock, install a new low OWC .



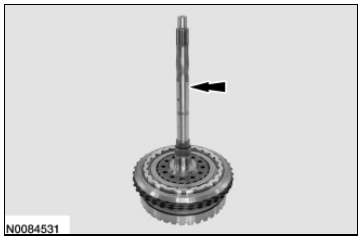
2. Inspect the intermediate () clutch surface for damage. If the surface is burned or worn excessively, install a new OWC .

Overdrive/Direct Clutch Assembly

Special Tool(s)

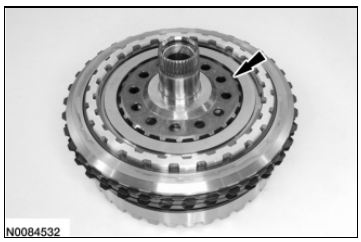
 ST3029-A	Compressor, Forward/Intermediate Spring 307-584 (includes 307-584/1 and 307-584/2)
 ST2994-A	Compressor, Overdrive Clutch, Balance Piston and Direct Clutch 307-589 (includes 307-589/1 and 307-589/2)
 ST1214-A	Dial Indicator Gauge With Holding Fixture 100-002 (TOOL-4201-C)
 ST2996-A	Input Shaft Support Seal Installer (Back Plate, Multiple Rings) 307-578 (includes 307-578/1, 307-578/2 and 307-578/3)

Material

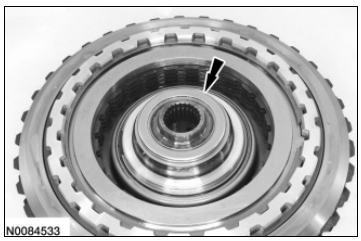


Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

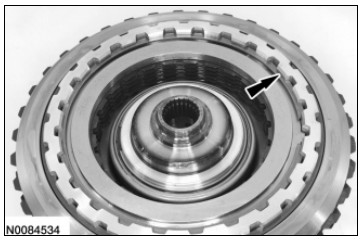
Disassembly



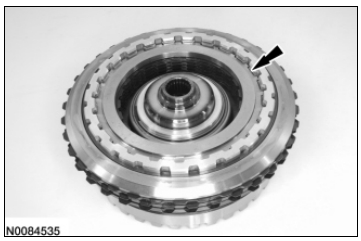
1. Remove the input shaft snap ring.



2. Remove the input shaft.

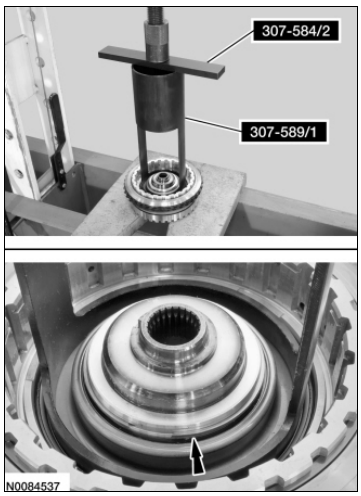


3. Remove thverdrive (O/D) (4, 5, 6) clutch hub.

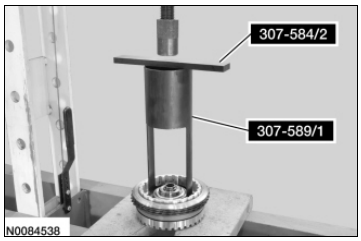


4. Remove the O/D (4, 5, 6) clutch hub, No. 2 thrust bearing.

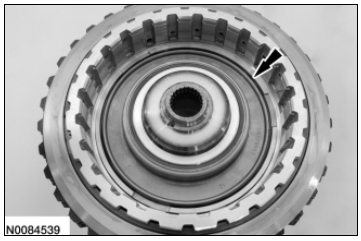
5. Remove the O/D (4, 5, 6) clutch snap ring.



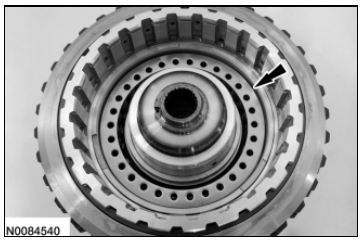
6. Remove the O/D (4, 5, 6) clutch pressure plate and clutch assembly.



7. Install the Overdrive Clutch, Balance Piston and Direct Clutch Compressor 307-589/1 and Forward/Intermediate Spring Compressor 307-584/2 on the balance piston.



8. Using a press, compress the O/D (4, 5, 6) clutch return spring and remove the snap ring.

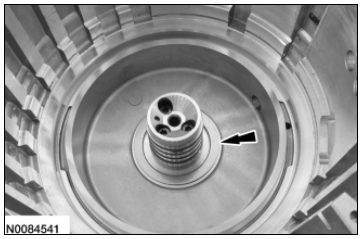


9. Remove the Overdrive Clutch, Balance Piston and Direct Clutch Compressor 307-589/1 and Forward/Intermediate Spring Compressor 307-584/2.

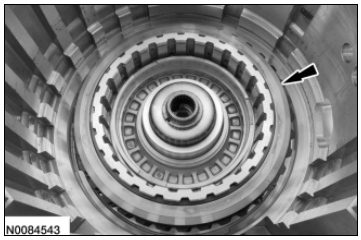
10. Remove and discard the balance piston.

11. Remove the O/D (4, 5, 6) piston return spring.

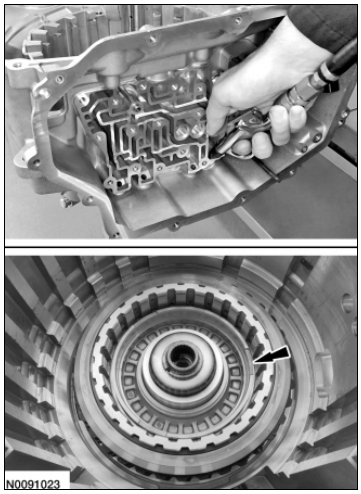
12. Install the clutch support tower in the transmission case and install the 3 bolts.



- Tighten to 12 Nm (106 lb-in).

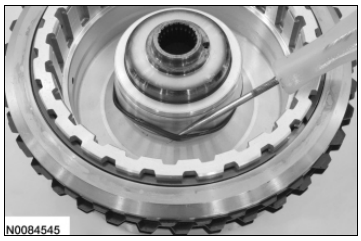


13. Remove the Input Shaft Support Seal Installer 307-578/1 (sizer).

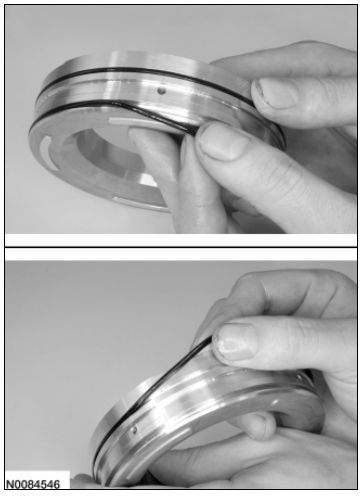


14. Install the No. 1 O/D /direct clutch assembly thrust bearing.

15. Position the O/D /direct clutch assembly in the transaxle case.

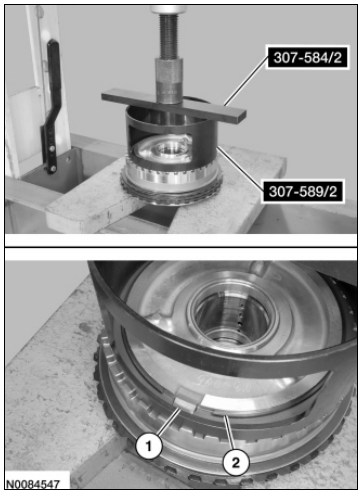


16. Apply compressed air to the O/D (4, 5, 6) clutch piston port and remove the O/D (4, 5, 6) clutch piston.

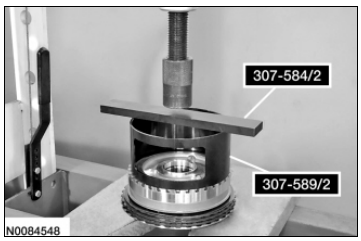


17. Remove the O/D /direct clutch assembly from the transaxle case.

18. Remove the O/D (4, 5, 6) clutch piston seal from the O/D /direct clutch assembly.



19. Remove the 2 seals from the O/D (4, 5, 6) clutch piston.



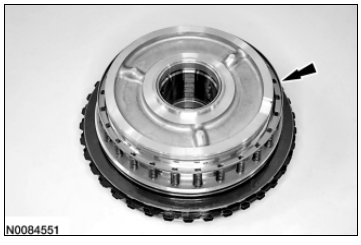
20. ***NOTICE:*** **Only compress the direct clutch piston return spring far enough to take the tension from the direct clutch cylinder off the snap ring. If the piston is compressed too far, the piston alignment tab may be broken off.**

    Install the Overdrive Clutch, Balance Piston and Direct Clutch Compressor 307-589/2 and Forward/Intermediate Spring Compressor 307-584/2 on the direct (3, 5, R) clutch cylinder. Using a press, compress the direct (3, 5, R) clutch piston return spring, and remove the snap ring.

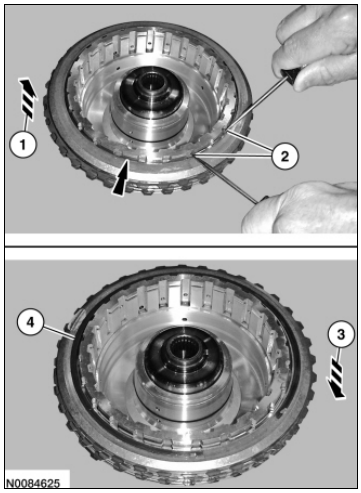
    1. Do not contact the O/D /direct clutch hub and shaft assembly with the direct (3, 5, R) clutch cylinder.
    2. Remove the snap ring.

21. Remove the Overdrive Clutch, Balance Piston and Direct Clutch Compressor 307-589/2 and Forward/Intermediate Spring Compressor 307-584/2.

22. Remove the direct (3, 5, R) clutch cylinder.

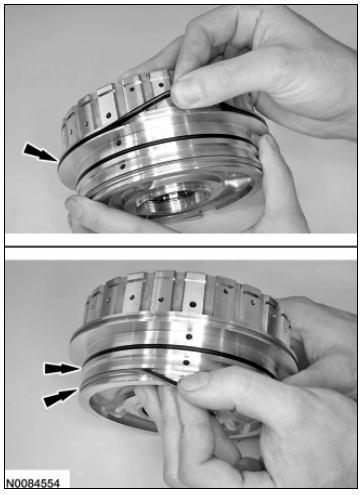


23. Remove and discard the direct (3, 5, R) clutch piston.



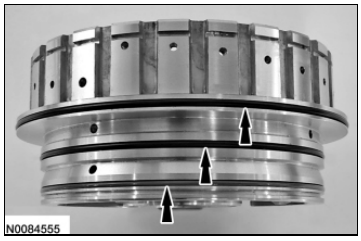
24. **NOTE:** Note the position of the return spring for assembly. The flat side faces down.

    Remove the direct (3, 5, R) clutch piston return spring.

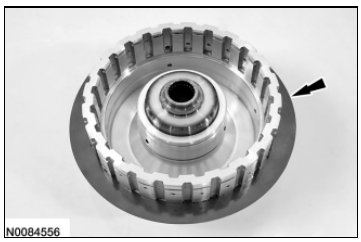


25. Remove the direct (3, 5, R) clutch snap ring.
    1. Slightly lift up on the direct (3, 5, R) clutch so that the snap ring floats freely.
    2. Using a suitable tool, compress the snap ring.
    3. Allow the direct (3, 5, R) clutch and pressure plate to drop so that the snap ring is out of the pressure plate groove.
    4. Remove the snap ring.

26. Remove the direct (3, 5, R) clutch pressure plate, clutch pack and wave spring.

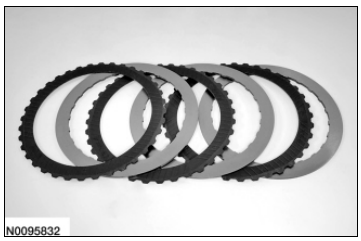


27. Remove and discard the 3 direct (3, 5, R) clutch piston seals.



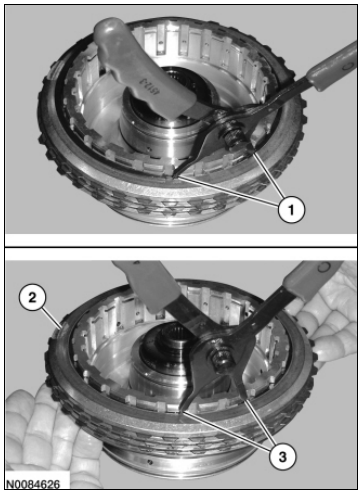
Assembly

1. Clean and inspect the O/D /direct clutch assembly for damage or excessive wear and install new components as necessary.



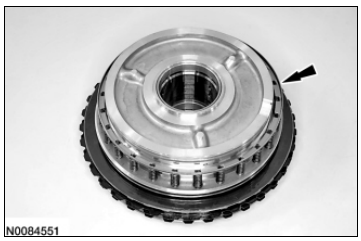
2. Install new direct (3, 5, R) clutch piston seals and lubricate the seals with petroleum jelly.

3. Install the direct (3, 5, R) clutch wave spring.

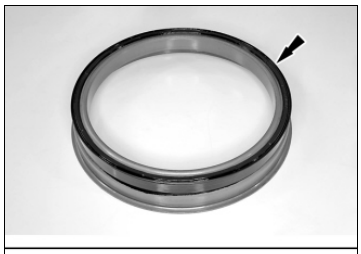


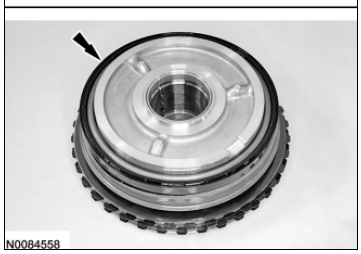
4. Soak the direct (3, 5, R) clutch pack in clean automatic transmission fluid.

5. Install the direct (3, 5, R) clutch assembly and pressure plate.



6. Install the direct (3, 5, R) clutch snap ring.
    1. Using a suitable tool, compress the snap ring.
    2. Lift the direct (3, 5, R) clutch so that the snap ring is in the groove of the pressure plate.
    3. Release the tension on the snap ring.

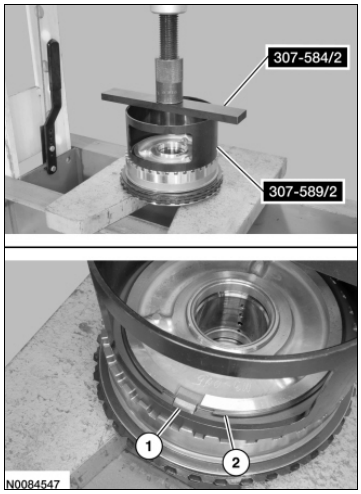




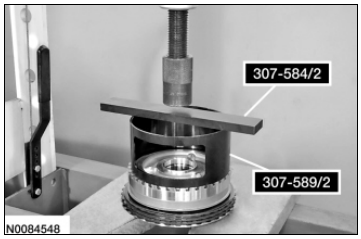
7. **NOTE:** Install the direct (3, 5, R) clutch piston return spring with the flat side facing down.

   Install the direct (3, 5, R) clutch piston return spring.

8. Lubricate a new direct (3, 5, R) clutch piston with petroleum jelly and install the piston.



9. Install the direct (3, 5, R) clutch cylinder.

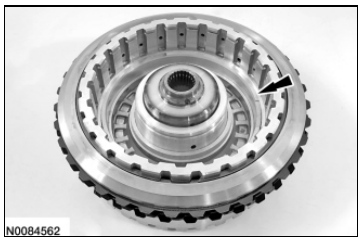


10. ***NOTICE:*** **Only compress the direct clutch piston return spring far enough to take the tension from the direct clutch cylinder off the snap ring. If the piston is compressed too far, the piston alignment tab may be broken off.**

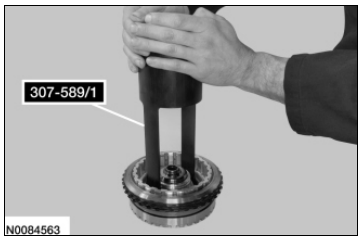
    Install the Overdrive Clutch, Balance Piston and Direct Clutch Compressor 307-589/2 and Forward/Intermediate Spring Compressor 307-584/2 on the direct (3, 5, R) clutch cylinder. Using a press, compress the direct (3, 5, R) clutch piston return spring, and install the snap ring.

    1. Do not contact the O/D /direct clutch hub and shaft assembly with the direct (3, 5, R) clutch cylinder.
    2. Install the snap ring.

11. Remove the Overdrive Clutch, Balance Piston and Direct Clutch Compressor 307-589/2 and Forward/Intermediate Spring Compressor 307-584/2.

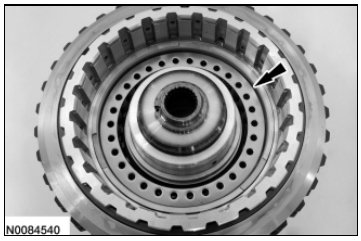


12. Install 2 new seals on the O/D (4, 5, 6) clutch piston and lubricate the seals with petroleum jelly.

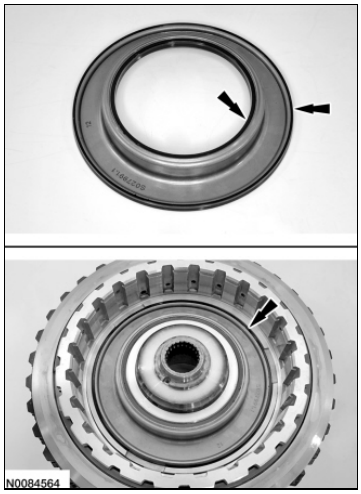


13. Install a new O/D (4, 5, 6) clutch piston inner seal and lubricate the seal with petroleum jelly.

14. Position the O/D (4, 5, 6) clutch piston in place.

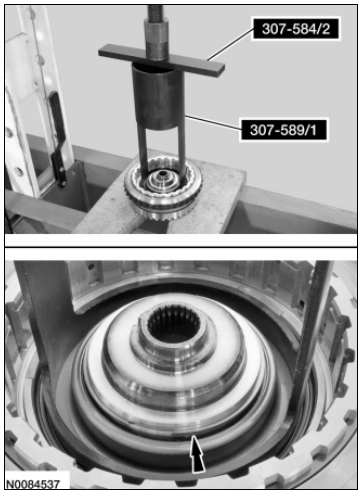


15. Using the Overdrive Clutch, Balance Piston, and Direct Clutch Compressor 307-589/1, install the O/D (4, 5, 6) clutch piston into the O/D /direct clutch assembly by hand.

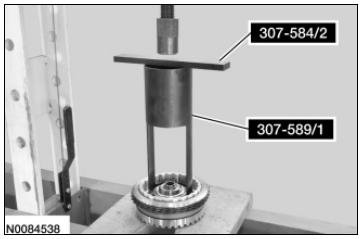


16. **NOTE:** Holes face up on the O/D (4, 5, 6) clutch piston return spring.

    Install the O/D (4, 5, 6) clutch piston return spring.

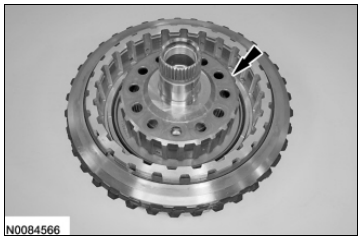


17. Lubricate the seals on a new balance piston and position the piston in place.

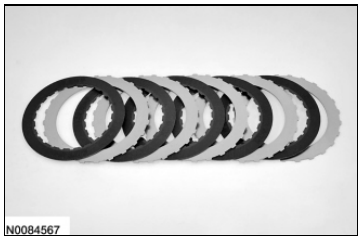


18. Install the Overdrive Clutch, Balance Piston and Direct Clutch Compressor 307-589/1 and Forward/Intermediate Spring Compressor 307-584/2 on the balance piston.

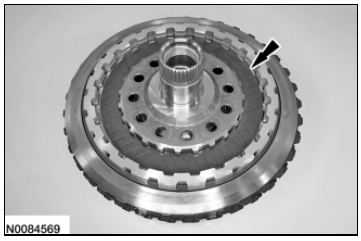
19. Using a press, compress the O/D (4, 5, 6) clutch return spring and install the snap ring.



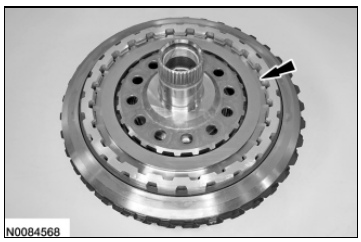
20. Remove the Overdrive Clutch, Balance Piston and Direct Clutch Compressor 307-589/1 and Forward/Intermediate Spring Compressor 307-584/2.



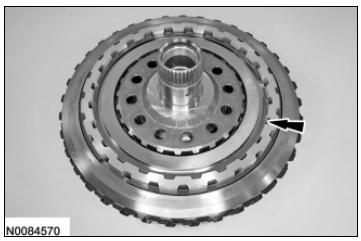
21. Install the No. 2 thrust bearing.



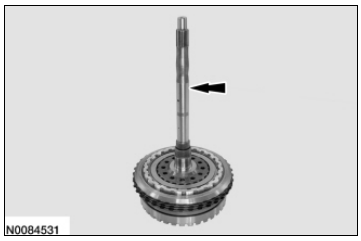
22. Install the O/D (4, 5, 6) clutch hub.



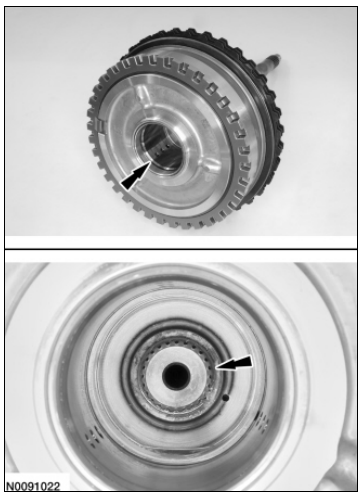
23. Soak the O/D (4, 5, 6) clutch pack in clean automatic transmission fluid.



24. Install the O/D (4, 5, 6) clutch pack.

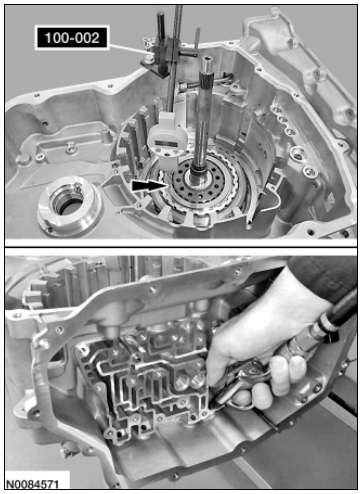


25. Install the O/D (4, 5, 6) clutch pressure plate.

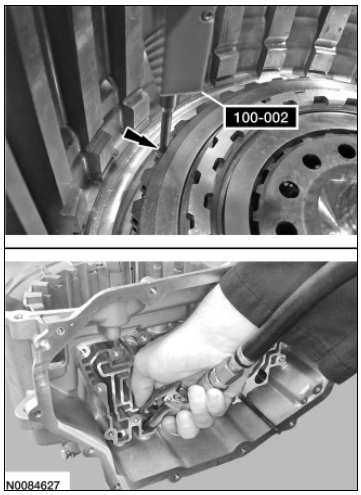


26. Install the O/D (4, 5, 6) clutch snap ring.

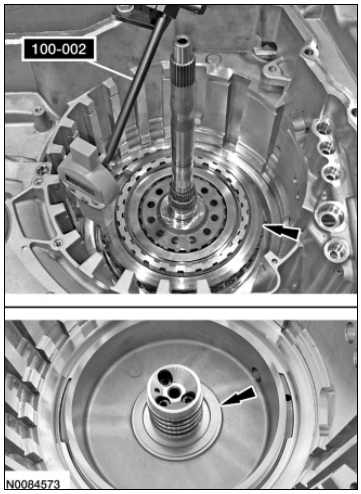
27. Install the input shaft.



28. While holding the input shaft in place, install the snap ring.



29. Position the O/D /direct clutch assembly in the transaxle case, install Dial Indicator Gauge With Holding Fixture 100-002 or a suitable dial indicator and position the plunger on the O/D (4, 5, 6)



clutch pressure plate. Apply 483 kPa (70 psi) of air pressure to the O/D (4, 5, 6) clutch piston port while recording the clutch pack clearance on the Dial Indicator. The clearance should be between 0.950 mm (0.037 in) and 1.778 mm (0.07 in). If the clearance is out of range, check the O/D (4, 5, 6) clutch pack for correct installation. If the O/D (4, 5, 6) clutch pack is correctly installed, install a new O/D (4, 5, 6) clutch pack.

30. Position the plunger on one of the top direct (3, 5, R) clutch plate tabs. Apply 483 kPa (70 psi) of air pressure to the direct (3, 5, R) clutch piston port while recording the clutch pack clearance on Dial Indicator Gauge With Holding Fixture 100-002. The clearance should be between 0.412 mm (0.016 in) and 1.728 mm (0.068 in). If the clearance is out of range, check the direct (3, 5, R) clutch pack for correct installation. If the direct (3, 5, R) clutch pack is correctly installed, install a new direct (3, 5, R) clutch pack.

31. Remove Dial Indicator Gauge With Holding Fixture 100-002, O/D /direct clutch assembly and the No. 1 O/D /direct clutch assembly thrust bearing.

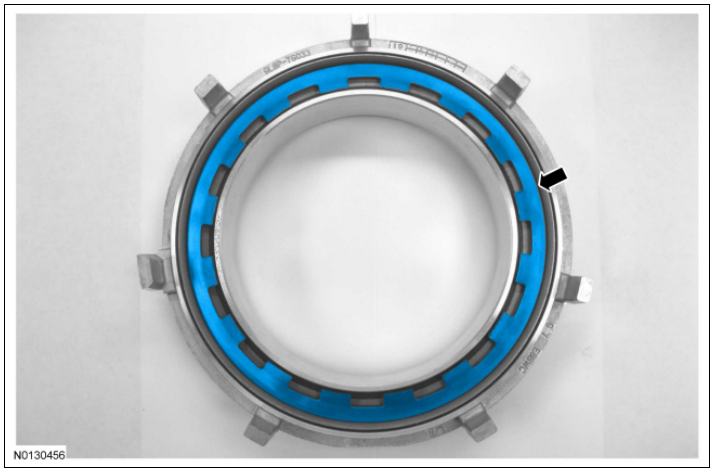
100-002
N0084573

Center Support

Special Tool(s)

 ST3068-A	Compressor, Center Support Piston Spring 307-630
 ST3067-A	Seal Protector, Low Reverse Piston 307-628 (includes 307-628/1 and 307-628/2)
 ST3062-A	Seal Protector, Low Reverse / 1-2-3-4 Piston 307-629

Disassembly

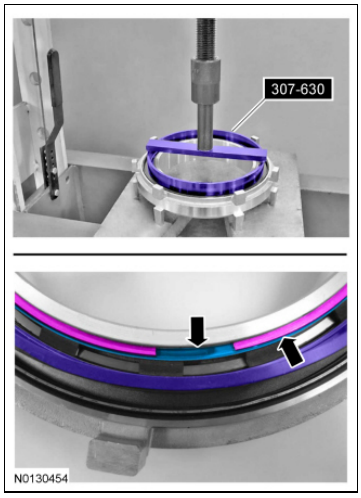


NOTICE: **The piston return spring, snap ring or snap ring retainer from the low/reverse clutch side of the center support are not interchangeable with the forward clutch side of the center support. When disassembling the center support, be careful not to mix the components from the low/reverse clutch side with the forward clutch side of the center support. Failure to assemble the center support with the components in the correct side will result in damage to the center support, low/reverse or forward clutch.**

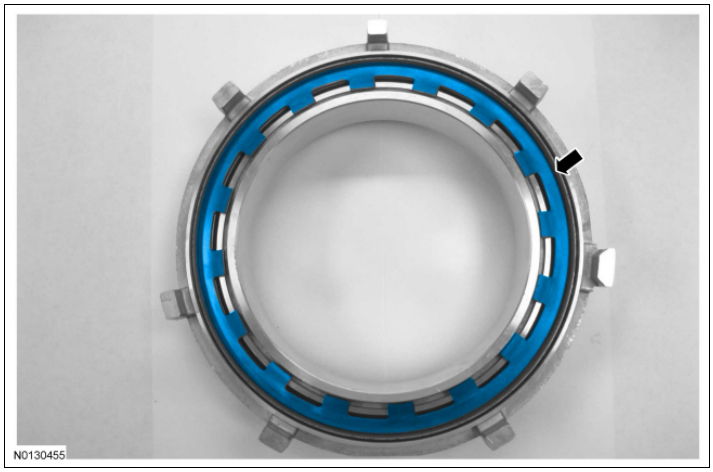
1. **NOTE:** The low/reverse clutch piston in the center support is the side of the center support with the long legs.

   Using the Center Support Piston Spring Compressor 307-630 and a press, compress the low/reverse clutch return spring and remove the snap ring and the snap ring retainer.

2. Remove the low/reverse clutch return spring.



3. Apply 483 kPa (70 psi) of air pressure to the low/reverse clutch piston port and remove the low/reverse clutch piston.

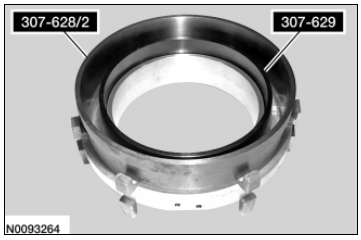


4. **NOTE:** The forward clutch piston in the center support is the side of the center support with the short legs.

   Using the Center Support Piston Spring Compressor 307-630 and a press, compress the forward (1, 2, 3, 4) clutch return spring and remove the snap ring and the snap ring retainer.

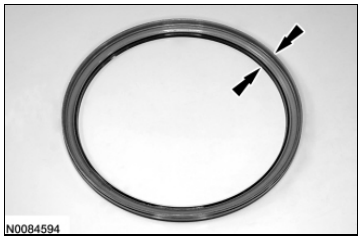
5. Remove the return spring from the forward (1, 2, 3, 4) clutch piston.

6. Apply 483 kPa (70 psi) of air pressure to the forward (1, 2, 3, 4) clutch piston port and remove the forward (1, 2, 3, 4) clutch piston.



Assembly

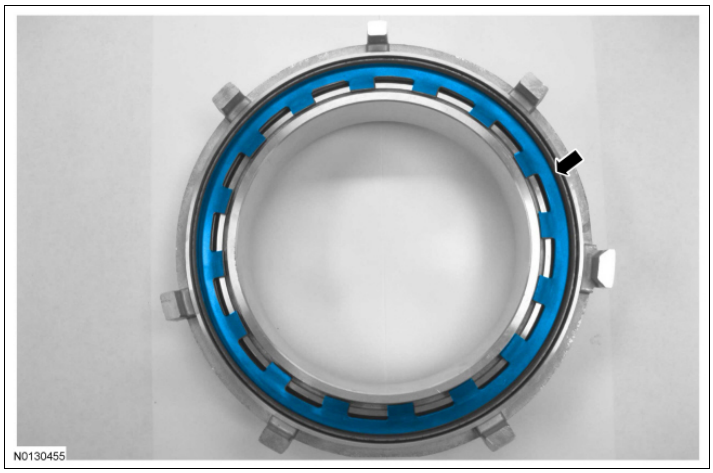
NOTICE: **The piston return spring, snap ring or snap ring retainer from the low/reverse clutch side of the center support are not interchangeable with the forward clutch side of the center support. When assembling the center support, be careful not to mix the components from the low/reverse clutch side with the forward clutch side of the center support. Failure to assemble the center support with the components in the correct side will result in damage to the center support, low/reverse or forward clutch.**



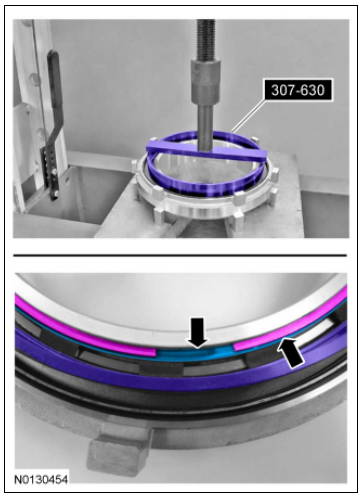
1. Clean and inspect the center support for damage. Install a new center support if necessary.

2. **NOTE:** The forward clutch piston in the center support is the side of the center support with the short legs.

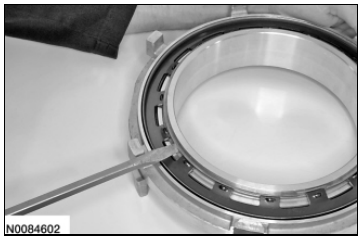
   Install the Low Reverse Piston Seal Protector 307-628/2 and the Low Reverse / 1-2-3-4 Piston Seal Protector 307-629 on the forward clutch piston side of the center support.



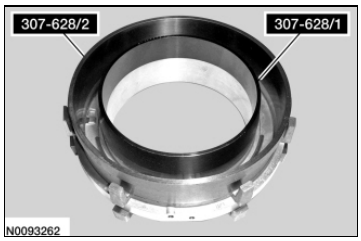
3. Lubricate the sealing surfaces of the forward (1, 2, 3, 4) clutch piston with petroleum jelly.



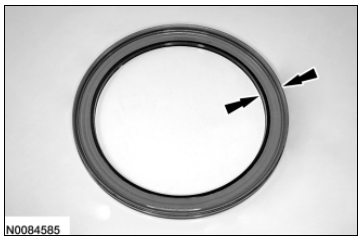
4. Position the forward (1, 2, 3, 4) clutch piston on Low Reverse Piston Seal Protector 307-628/2 and the Low Reverse / 1-2-3-4 Piston Seal Protector 307-629 and push it down into the center support.



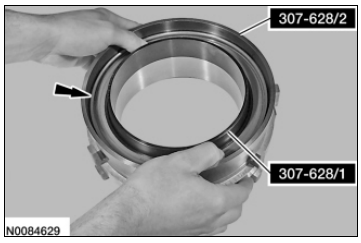
5. Install the forward (1, 2, 3, 4) clutch piston return spring.



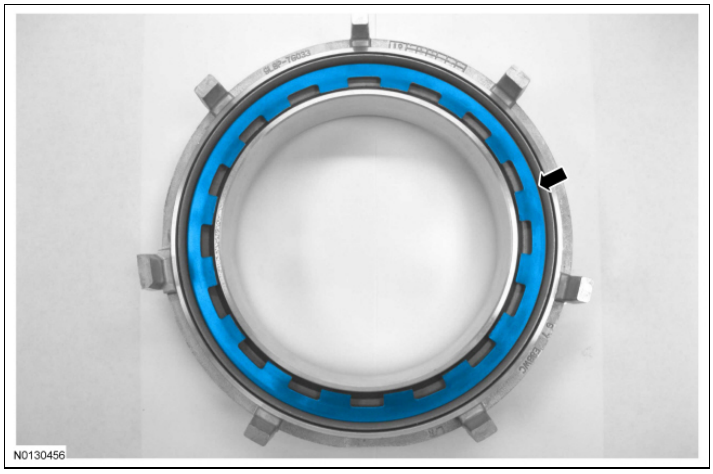
6. Using the Center Support Piston Spring Compressor 307-630 and a press, compress the forward (1, 2, 3, 4) clutch return spring and install the snap ring retainer and the snap ring.



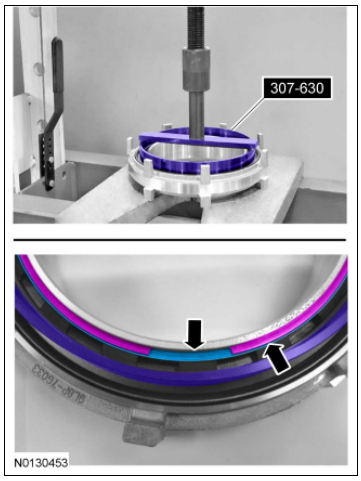
7. Inspect the snap ring to be sure it is seated in the groove on the center support.



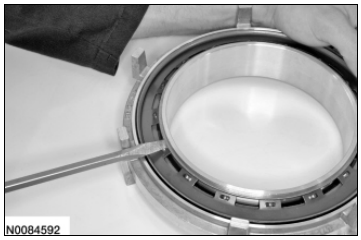
8. Turn the center support over and install the Low Reverse Piston Seal Protector 307-628/1 and 307-628/2 on the low/reverse piston side of the center support.



9. Lubricate the sealing surfaces of the low/reverse piston with petroleum jelly.

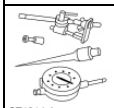


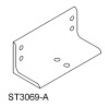
10. Position the low/reverse clutch piston on the Low Reverse Piston Seal Protector 307-628/1 and 307-628/2 and push it down into the center support.

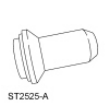


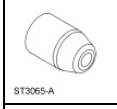
11. Install the low/reverse piston return spring.

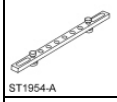
12. Using the Center Support Piston Spring Compressor 307-630 and a press, compress the low/reverse clutch return spring and install the snap ring retainer and the snap ring.











13. Inspect the snap ring to be sure it is seated in the groove on the center support.

Transaxle

Special Tool(s)

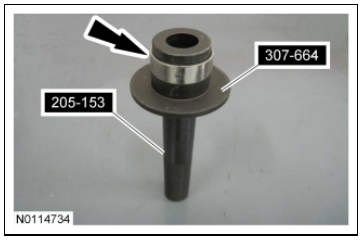
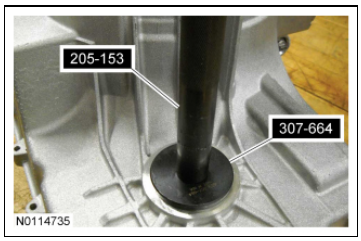
131	N605770	Separator plate-to-soledoid body bolt (2 required)
132	7Z490	Main control valve body-to-solenoid body separator plate
133	7G391	Solenoid body
134	W500303	Solenoid body-to-valve body bolt (2 required)

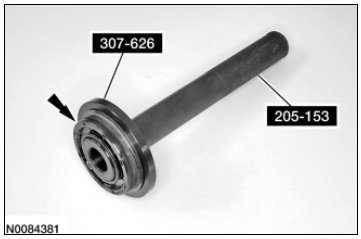


135	W302863	Main control-to-transaxle case bolt (long) (10 required)
136	W302862	Main control-to-transaxle case bolt (short) (12 required)
137	W520412	Main control nut
138	7G276	Main ctrol leadframe
139	W505513	Main control leadframe screw (5 required)
140	7B329	Main control-to-cover seal
141	7G004	Main control cover
142	W714629	Main control cover stud bolt (5 required)
143	W500214	Main control cover bolt (8 required)
144	7010	Drain plug
145	7H398	Line pressure tap
146	7D273	Transmission fluid cooler tube fittings (2 required)
147	1177	LH halfshaft seal
148	7025	LH halfshaft bushing
149	7M101	Turbine Shaft Speed (TSS) sensor
150	W500214	TSS bolt
151	7A246	Vent tube
152	W500214	Lubrication funnel bolts
153	7G342	Solenoid body strategy tag
154	7B148	Transaxle service identification tag
155	-	Direct clutch (3, 5, R)
156	-	Intermediate clutch (2, 6)
157	-	O/D clutch (4, 5, 6)
158 td>-	Forward clutch (1, 2, 3, 4)	
159	-	Low/reverse clutch

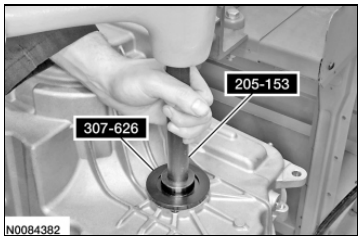
All vehicles



1. Clean and inspect the transaxle case for damage. Clean the silicone from the transaxle case-to-torque converter housing sealing surface and the main control cover sealing surface.

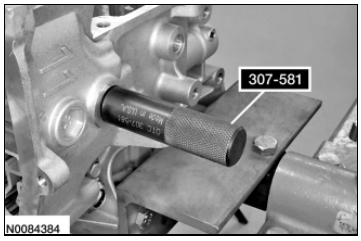


2. Assemble the Handle 205-153 and the Bushing Installer 307-664 and install a new bushing on the Bushing Installer.



3. Using the Handle 205-153 and the Bushing Installer 307-664, install the new bushing in the transaxle case.

4. Assemble the Handle 205-153 and Seal Installer 307-626. Install a new LH halfshaft seal on the Differential Seal Installer 307-626.

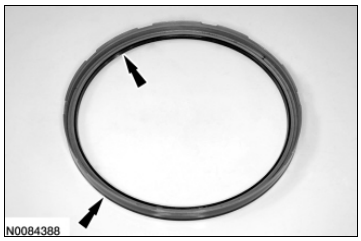


5. Using the Differential Seal Installer 307-626 and Handle 205-153, install the new LH halfshaft seal in the transaxle case.

6. Install a new manual control shaft seal on Manual Lever Seal Installer 307-581.

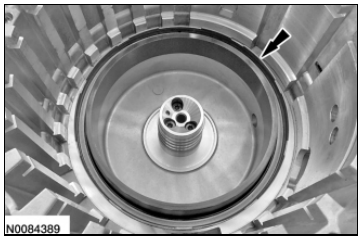
7. Using the Manual Lever Seal Installer 307-581, install the new manual control shaft seal in the transaxle case.

8. If not previously installed, install the clutch support tower and the 3 bolts.
   - Tighten to 12 Nm (106 lb-in).

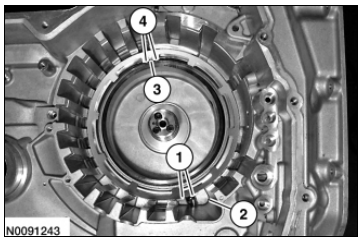


9. Remove Input Shaft Support Seal Installer 307-578/1.

10. Install 2-6 Piston Seal Protector 307-632.

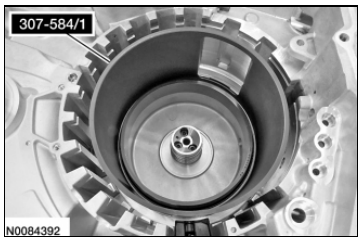


11. Lubricate the seals on the intermediate (2, 6) clutch piston with clean transmission fluid.

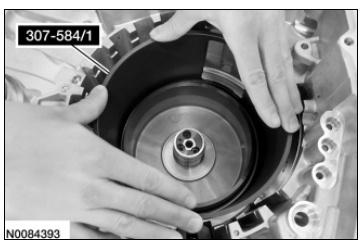


12. ***NOTICE:*** **Be sure the bleed hole is aligned in the correct position as noted during disassembly or damage to the transaxle can occur.**

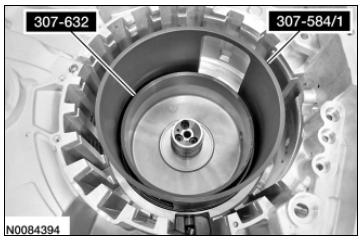
    Install the intermediate (2, 6) clutch piston on the seal protector with the bleed hole aligned at the top of the transaxle case.



13. Position the intermediate (2, 6) clutch piston return spring on the piston to align the piston before pushing it in its bore. The tabs of the return spring should fit into the indentions of the piston and the 2 outer tabs should be at the clockwise most position of the open area at the bottom of the transaxle case. The bleed hole on the piston should be aligned between the inner double tabs of the return spring.
    1. Outer tabs
    2. Open area at the bottom of the transaxle case
    3. Bleed hole
    4. Inner double tabs

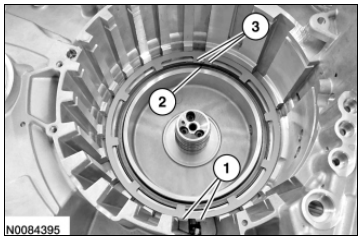


14. Remove the intermediate (2, 6) clutch piston return spring.



15. Install Forward/Intermediate Spring Compressor 307-584/1 on the intermediate (2, 6) clutch piston.

16. Using Forward/Intermediate Spring Compressor 307-584/1, push the intermediate (2, 6) clutch piston into the clutch cylinder by hand.

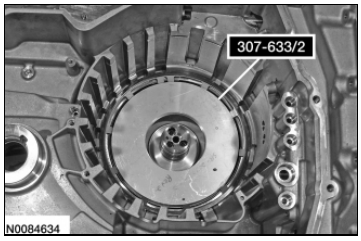


17. Remove Forward/Intermediate Spring Compressor 307-584/1 and Clutch Piston Seal Protector 307-632.

18. ***NOTICE:*** **Be sure the return spring is positioned correctly with the forward clutch bleed hole aligned between the inner double tabs and the outer tab in the clockwise most position of the slot at the bottom of the case or damage to the transaxle can occur.**

    Install the intermediate (2, 6) clutch piston return spring. The tabs of the return spring should fit into the indentions of the piston and the 2 outer tabs should be at the clockwise most position of the slot at the bottom of the case. The bleed hole on the piston should be aligned between the inner double tabs of the return spring.

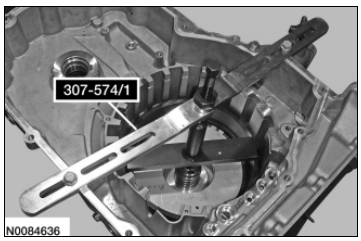
    1. Outer tabs
    2. Bleed hole
    3. Inner double tabs



19. ***NOTICE:*** **Be sure the snap ring is aligned with the gap facing the front of the transaxle or damage to the transaxle can occur. The front of the transaxle is where the low/reverse and forward (1, 2, 3, 4) clutch hydraulic ports are located.**

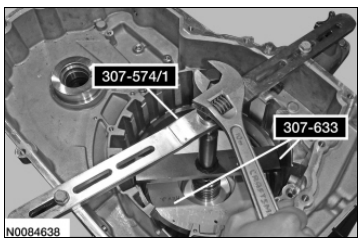
    Position the snap ring in place. Align the gap of the snap ring to face the front of the transaxle.

    1. Snap ring
    2. Snap ring gap
    3. Low/reverse and forward (1, 2, 3, 4) clutch hydraulic ports (located at the front of the transaxle case)

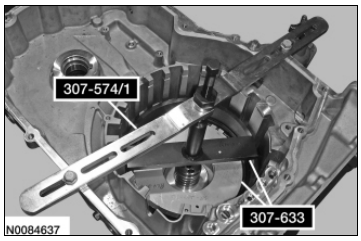


20. Install the 2-6 Piston Return Spring Compressor 307-633/2 on the transaxle case to center the intermediate (2, 6) clutch return spring.

21. Install the 2-6 Piston Return Spring Compressor 307-633/1 on the snap ring.



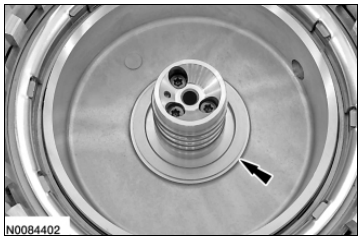
22. Install Forward Clutch Spring Compressor 307-574/1 on the transaxle case.



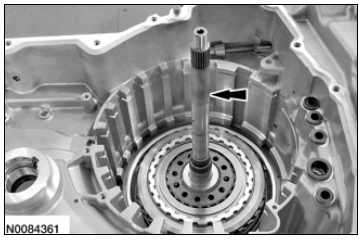
23. ***NOTICE:*** **Be sure the return spring is centered or it can bind on the snap ring groove and cause damage to the transaxle case.**

    Using the Forward Clutch Spring Compressor 307-574/1 and the 2-6 Piston Return Spring Compressor 307-633, install the intermediate (2, 6) clutch snap ring in the groove.

24. Remove the Forward Clutch Spring Compressor 307-574/1 and the 2-6 Piston Return Spring Compressor 307-633.

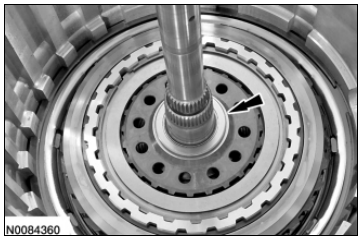


25. Install the intermediate (2, 6) clutch apply ring. Tap the ring in place using a suitable tool.



26. ***NOTICE:*** **Be sure to install the No. 1 thrust bearing with the flat side facing up or damage to the transaxle can occur.**

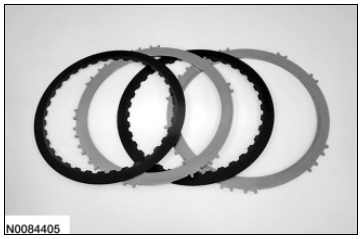
    Install the No. 1 thrust bearing with the flat side facing up.



27. Install the overdrive/direct clutch assembly.

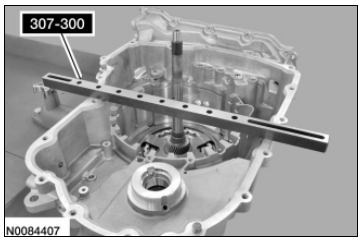
28. ***NOTICE:*** **Be sure to install the No. 3 thrust bearing with the flat side facing down or damage to the transaxle can occur.**

    Install the No. 3 thrust bearing with the flat side facing down.

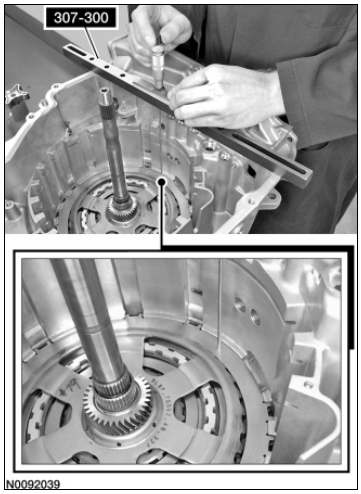


29. Install the direct/intermediate clutch hub and rear sun gear assembly.

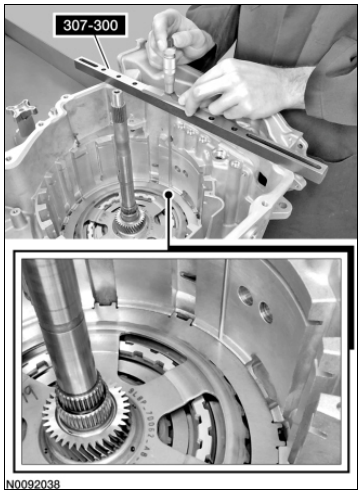
30. Install the intermediate (2, 6) wave spring assembly.



31. Soak the intermediate (2, 6) clutch assembly in clean transmission fluid.



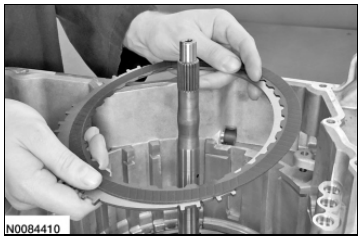
32. Install the intermediate (2, 6) clutch assembly, temporarily reversing the top friction and steel plates for the clutch stack-up measurement.



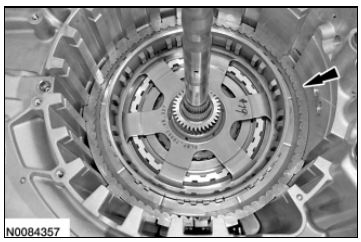
33. Install the Shim Selection Gauge 307-300 on the transaxle case.

34. Using a suitable depth gauge, measure and record as measurement A, the distance from the Shim Selection Gauge 307-300 to the top of the intermediate (2, 6) clutch pack at 3 different points and average the 3 distances.

35. Using a suitable depth gauge, measure and record as measurement B, the distance from the top of Shim Selection Gauge 307-300 to the transaxle case step above the intermediate (2, 6) clutch.



36. Subtract measurement B from measurement A The clearance should be between 0.240 mm (0.009 in) and 2.60 mm (0.102 in). If the clearance is out of range, check the intermediate (2, 6) clutch pack for correct installation. If the intermediate (2, 6) clutch pack is correctly installed, install a new clutch pack.



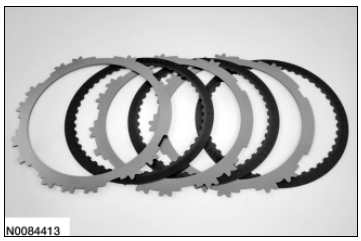
Description	Reading
Measurement A	
Measurement B	
Subtract measurement B from measurement A and check to see if it is within range of 0.240 mm (0.009 in) and 2.60 mm (0.102 in)	

37. **NOTE:** When the intermediate (2, 6) clutch is correctly installed, a friction plate is on top.

    Remove the top intermediate (2, 6) clutch friction and steel plate and correctly install the plates back in the transaxle case.

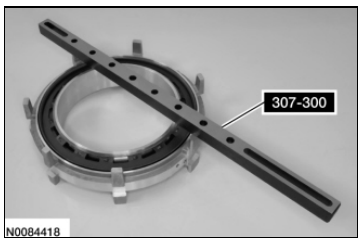
38. Install the One-Way Clutch (OWC) assembly.

39. Install the rear planetary carrier/center ring gear assembly.

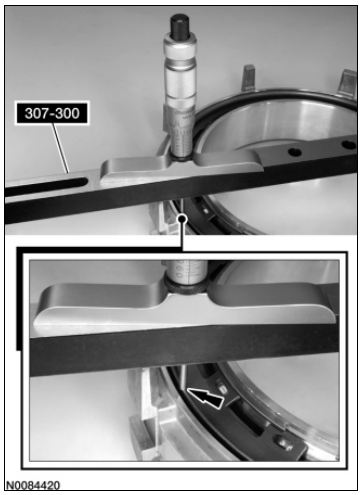


40. **NOTE:** Note the position of the low/reverse pressure plate. When installing the center support, the long support legs must fit through the low/reverse pressure plate and rest on the OWC .

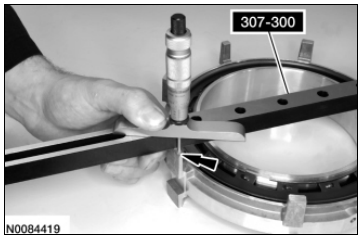
    Position the low/reverse pressure plate so that the center support legs fit through the pressure plate and rest on the OWC and install the low/reverse pressure plate.



41. Soak the low/reverse clutch in clean automatic transmission fluid.

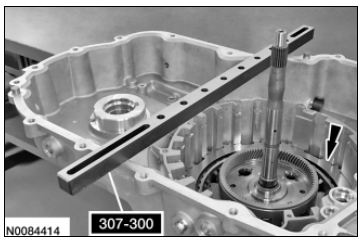


42. Align the low/reverse clutch pack with the pressure plate and install it in the transaxle case temporarily reversing the wave spring and top steel plate.

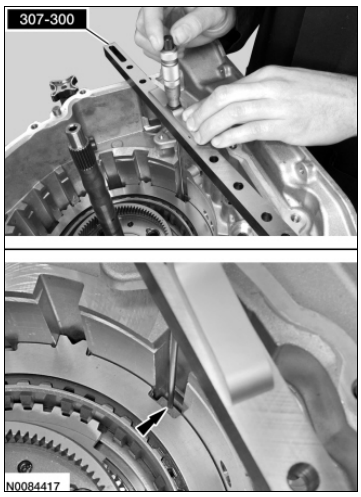


43. Install the Shim Selection Gauge 307-300 on the side of the center support with the long support legs.

44. Using a suitable depth gauge, measure and record as measurement A, the distance from the top of Shim Selection Gauge 307-300 to the contact surface of the low/reverse clutch piston.

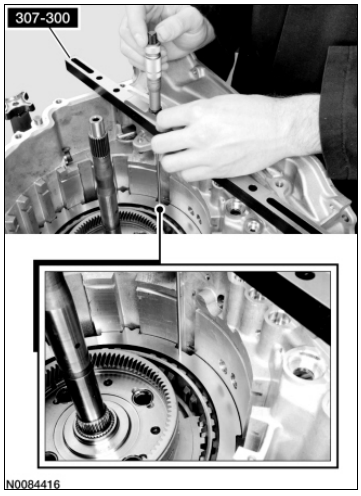


45. Using a suitable depth gauge, measure and record as measurement B, the distance from the top of Shim Selection Gauge 307-300 to the leg surface of the center support.



46. Subtract measurement B from measurement A and record as measurement C.

Description	Reading
Measurement A	
Measurement B	
Subtract measurement B from measurement A and record as measurement C.	

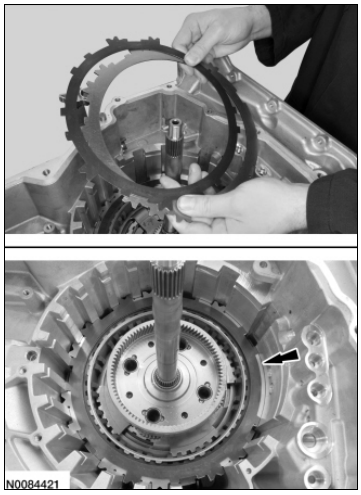


47. Install the Shim Selection Gauge 307-300 on the transaxle case.

48. Using a suitable depth micrometer, measure and record as measurement D, the distance from the Shim Selection Gauge 307-300 to the top of the OWC .

49. Using a suitable depth gauge, measure and record as measurement E, the distance from the top of Shim Selection Gauge 307-300 to the top of the low/reverse clutch at 3 different points and average the 3 distances.

50. Subtract measurement E from measurement D and record as measurement F.



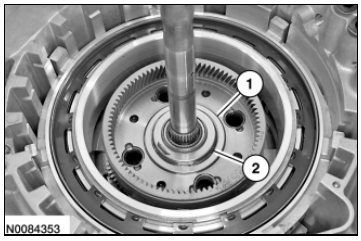
Description	Reading
Measurement D	
Measurement E	
Subtract measurement E from measurement D and record as measurement F	

51. Subtract measurement F from measurement C to get the low/reverse clutch clearance. The clearance should be between 0.406 mm (0.015 in) and 2.000 mm (0.078 in). If the clearance is out of range, check the low/reverse clutch pack for correct installation. If the low/reverse clutch pack is correctly installed, install a new clutch pack.

Description	Reading
Measurement C	
Measurement F	
Subtract measurement F from measurement C and check to see if it is within range of 0.406 mm (0.015 in) and 2.000 mm (0.078 in)	

52. **NOTE:** When the low/reverse clutch is correctly installed, the wave spring is on top.

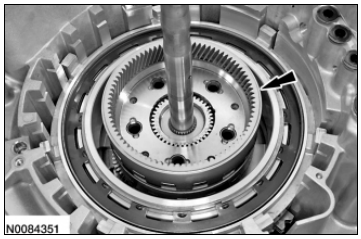
    Remove the top low/reverse clutch steel plate and wave spring and correctly install the plates back in the transaxle case.



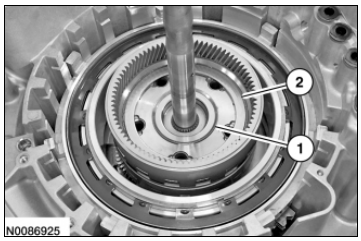
53. **NOTE:** Be sure the center support is installed with the long support legs facing down and the feed holes facing the front of the transaxle.

    Install the center support with the long legs facing down and the feed holes aligned with the feed holes in the transaxle case.

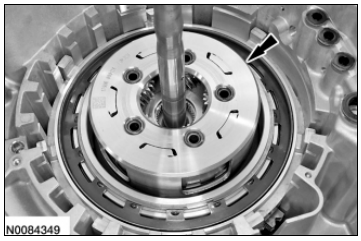
    1. Long center support legs face down
    2. Feed holes face the front of the transaxle case



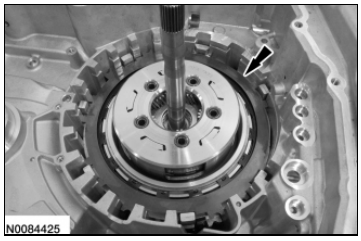
54. Install the No. 5 and No. 6 thrust bearings.
    1. No. 5 thrust bearing
    2. No. 6 thrust bearing



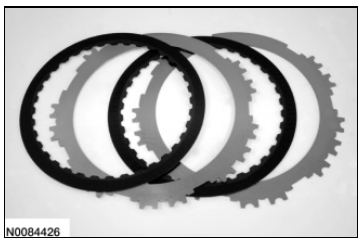
55. Install the center sun gear.



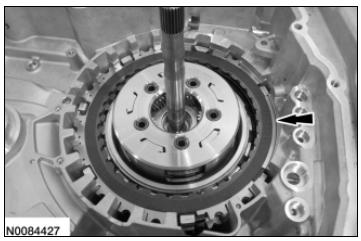
56. Install the center carrier/front ring gear assembly.



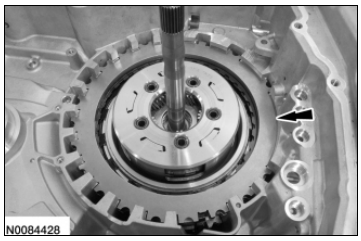
57. Install the No. 7 and No. 8 thrust bearings.
    1. No. 7 thrust bearing
    2. No. 8 thrust bearing



58. Install the front planetary/rear ring gear assembly.

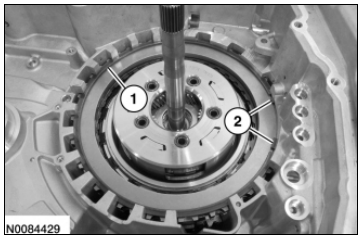


59. Install the forward (1, 2, 3, 4) clutch wave spring.

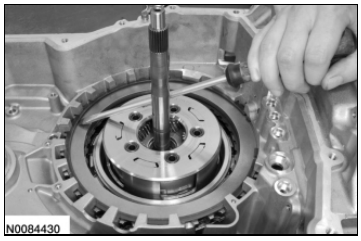


60. Soak the forward (1, 2, 3, 4) clutch pack in clean automatic transmission fluid.

61. Install the forward (1, 2, 3, 4) clutch pack.



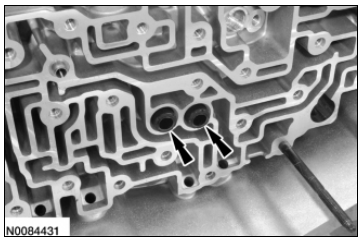
62. Install the forward (1, 2, 3, 4) clutch pressure plate.



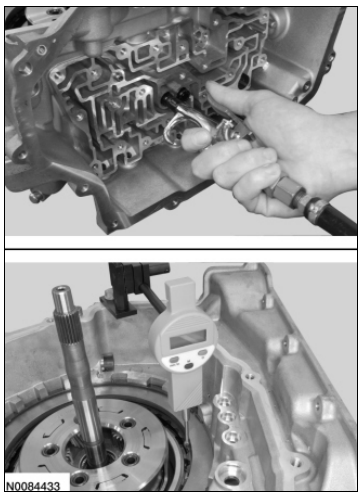
63. ***NOTICE:*** **Be sure to install the forward (1, 2, 3, 4) clutch beveled snap ring with the flat side facing down or the snap ring can come loose, causing damage to the transaxle.**

    Install the forward (1, 2, 3, 4) clutch beveled snap ring with the flat side down with the gap facing the front of the transaxle.

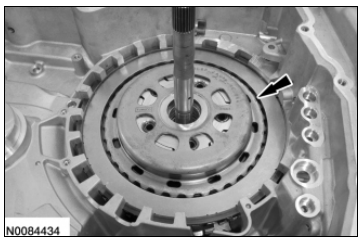
    1. Forward (1, 2, 3, 4) clutch snap ring
    2. Forward (1, 2, 3, 4) clutch snap ring gap



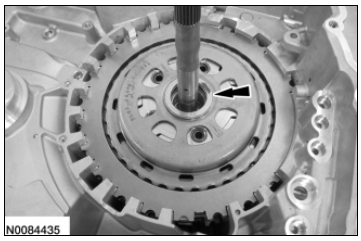
64. Using a suitable tool, seat the snap ring in the snap ring groove.



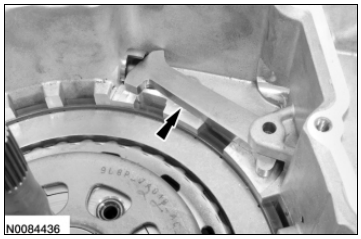
65. Install Dial Indicator Gauge With Holding Fixture 100-002 or a suitable dial indicator on the transaxle case and position the plunger on the top forward (1, 2, 3, 4) clutch friction plate.



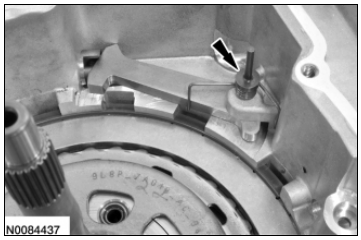
66. Install the new low/reverse and forward (1, 2, 3, 4) clutch feed seals in the transaxle case.



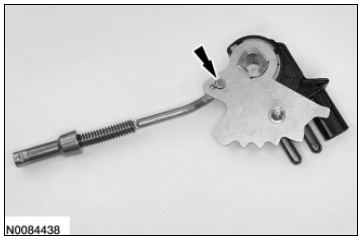
67. Apply 483 kPa (70 psi) of air pressure to the forward (1, 2, 3, 4) clutch piston port while recording the clutch pack clearance on the dial indicator. The clearance should be between 0.076 mm (0.002 in) and 1.840 mm (0.072 in). If the clearance is out of range, check the forward (1, 2, 3, 4) clutch pack for correct installation and the transaxle for correct assembly. If the forward (1, 2, 3, 4) clutch pack is correctly installed, install a new forward (1, 2, 3, 4) clutch pack.



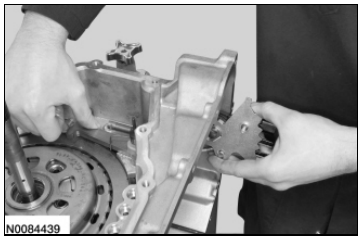
68. Install the front planetary sun gear and shell assembly.



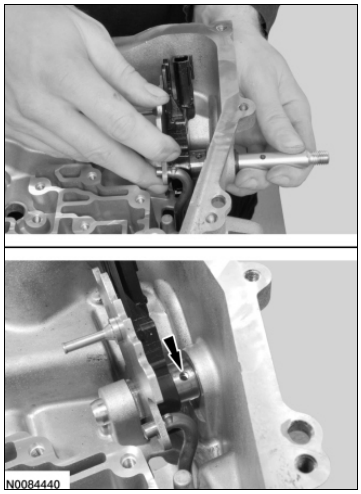
69. Install the No. 10 thrust bearing.



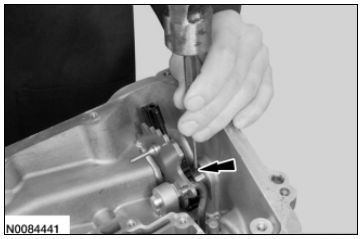
70. Install the park pawl.



71. Install the park pawl pin and spring.

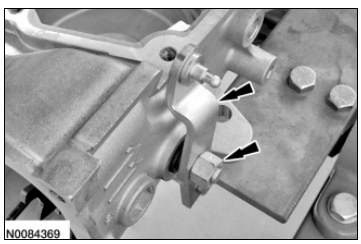


72. Install the park pawl actuator rod in the Transmission Range (TR) sensor.

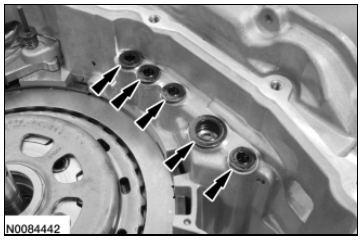


73. Position the park pawl aside and position the park pawl actuator rod and the TR sensor in the transaxle case.

74. Install the manual control shaft and align the roll pin holes.



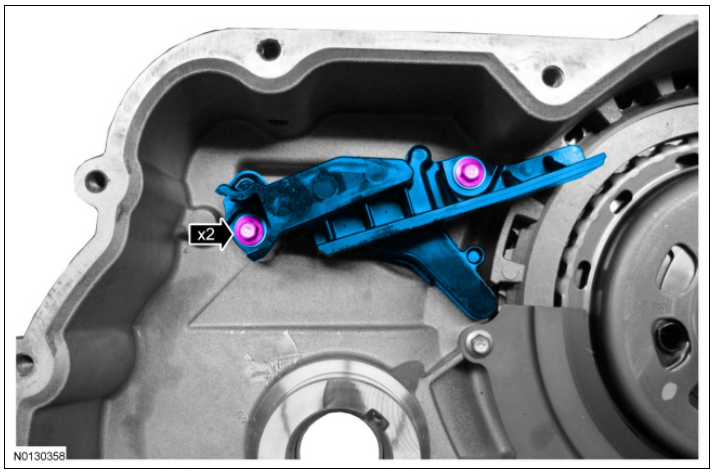
75. Install the manual control shaft roll pin.



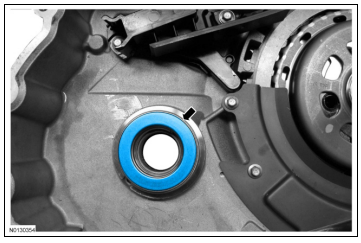
76. ***NOTICE:*** **Make sure to hold the manual control lever while tightening the manual control lever nut or damage to the manual control lever and park components will occur.**

    Install the manual control lever and the nut.

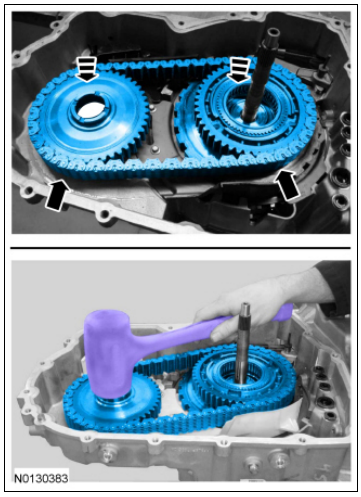
    - Tighten to 24 Nm (18 lb-ft).



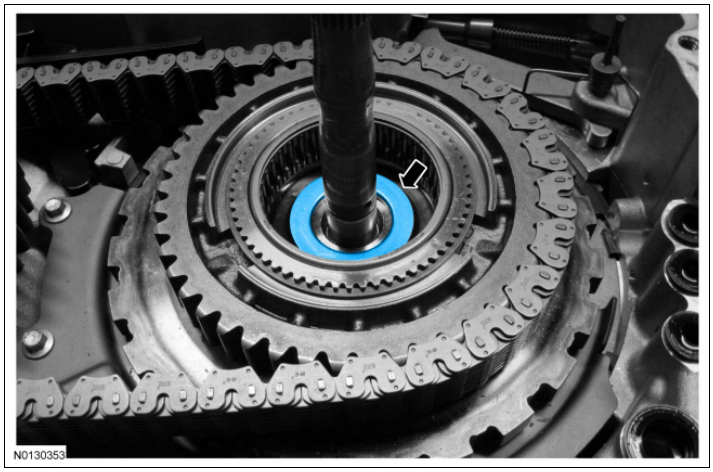
77. Install the 5 new clutch feed seals.



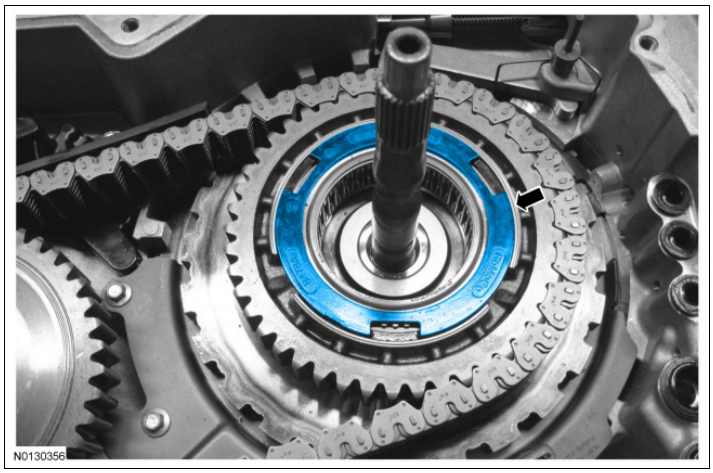
78. Position the transmission fluid baffle in place and install the 2 bolts.
    - Tighten to 12 Nm (106 lb-in).



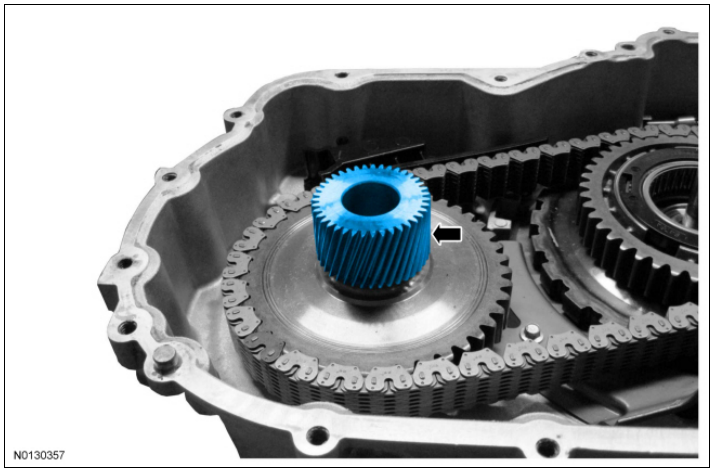
79. Position the lube funnel in place and install the 2 bolts.
    - Tighten to 12 Nm (106 lb-in).



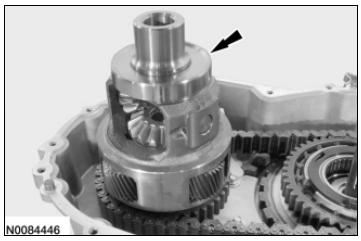
80. Install the No. 12 thrust bearing.



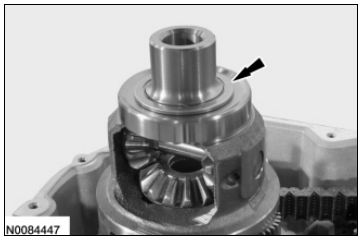
81. Simultaneously install the drive/driven sprocket and chain assembly. Lightly tap on the driven sprocket to be sure it is fully seated in the case.



82. Install the No. 11 thrust bearing.

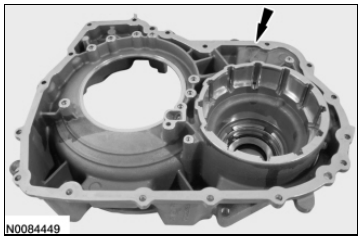


83. Install the No. 13 thrust washer.



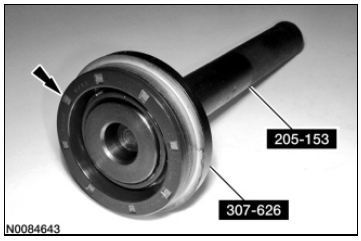
84. Install the final drive sun gear.

85. Install the differential assembly.

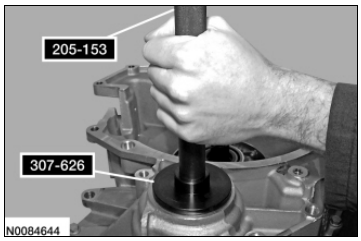


86. Install the No. 15 thrust bearing.

87. Install the Turbine Shaft Seal Protector 307-635 on the input shaft.

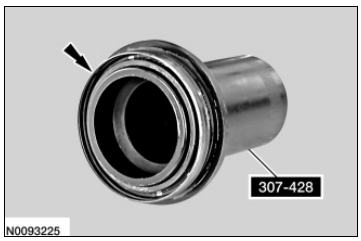


88. Clean the torque converter housing sealing surface.



Front Wheel Drive (FWD) vehicles

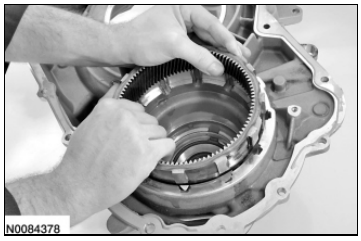
89. Assemble the Handle 205-153 and Differential Seal Installer 307-626. Install a new RH seal on the Seal Installer 307-626.



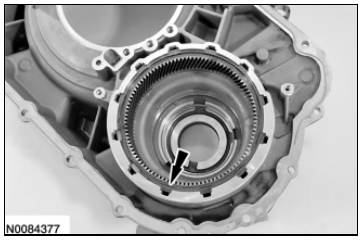
90. Using the Handle 205-153 and Differential Seal Installer 307-626, install the new RH halfshaft seal.

All-Wheel Drive (AWD) vehicles

91. Install a new RH seal on the RH Halfshaft Fluid Seal Installer 307-428.

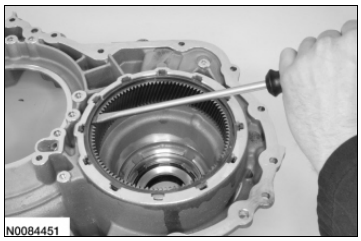


92. Using the RH Halfshaft Fluid Seal Installer 307-428, install the new RH halfshaft seal.



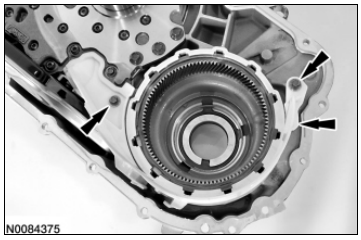
All vehicles

93. Install the differential ring gear in the torque converter housing.



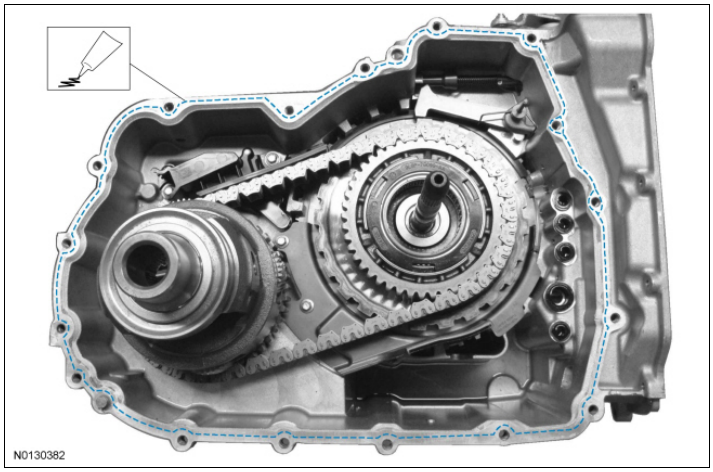
94. ***NOTICE:*** **Be sure the flat side of the beveled snap ring is facing down or the ring can come loose, causing damage to the transaxle.**

    Install the beveled differential ring gear snap ring with the flat side facing down.



95. Seat the snap ring using a suitable tool.

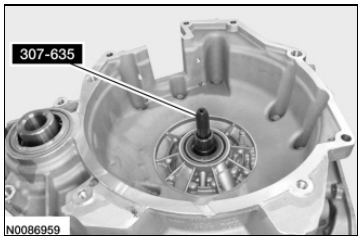
96. Install the pump and filter assembly in the torque converter housing and install the 8 pump bolts.
    - Tighten to 35 Nm (26 lb-ft).



97. Install the transmission fluid baffle and the 2 bolts.
    - Tighten to 12 Nm (106 lb-in).

98. **NOTE:** Be sure the sealing surfaces of the torque converter housing and the transaxle housing are free of oil before applying silicone.

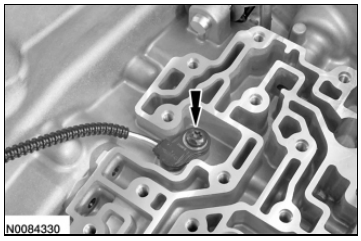
    Apply silicone to the sealing surface of the transaxle case.



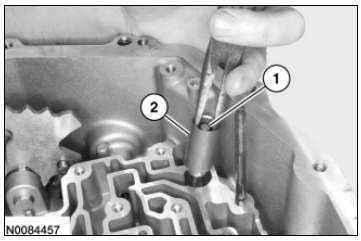
99. **NOTE:** Be sure the stud bolt is in the correct location as noted during disassembly.

    Install the torque converter housing on the transaxle case and install the 17 transaxle case-to-torque converter housing bolts.

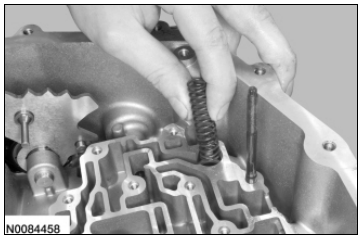
    1. Tighten to 24 Nm (18 lb-ft).
    2. Stud bolt location.



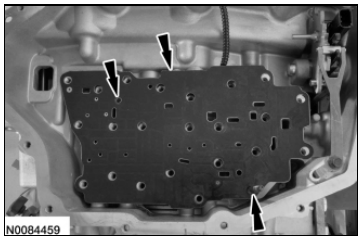
100. Remove the Turbine Shaft Seal Protector 307-635.



101. Install the Turbine Shaft Speed (TSS) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

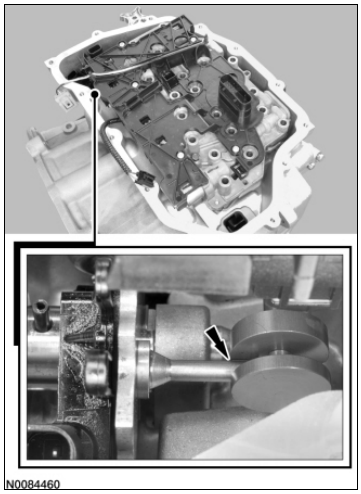


102. Install the Output Shaft Speed (OSS) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).

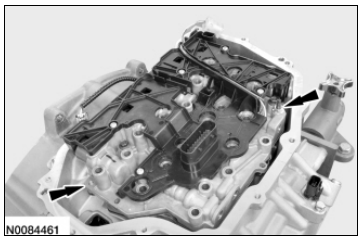


103. Assemble the bypass valve in the sleeve and install the assembly in the case.
    1. Bypass valve
    2. Bypass valve sleeve

104. Install the bypass valve spring.

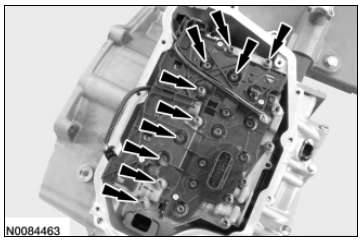


105. Install the new main control-to-transaxle case separator plate and align it on the stud and the guide pin.

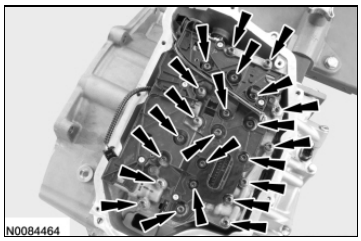


106. **NOTE:** Be sure that the manual pin (part of the TR sensor) is correctly installed in the manual valve.

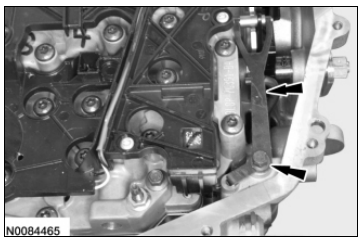
    Position the main control assembly in place and align the manual valve on the TR sensor.



107. Install the nut hand-tight.

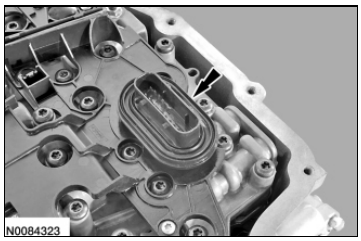


108. Install the short bolts hand-tight.

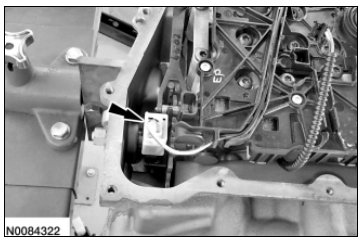


109. Install the long bolts hand-tight.

110. Tighten the main control bolts and the nut in a crisscross pattern.
    - Tighten to 10 Nm (89 lb-in).

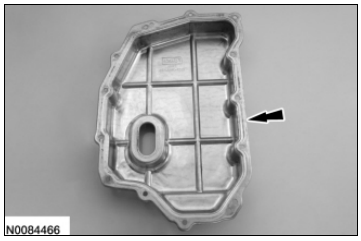


111. Position the TR sensor detent spring in place with the alignment tab in the alignment hole and install the bolt.
    - Tighten to 13 Nm (115 lb-in).

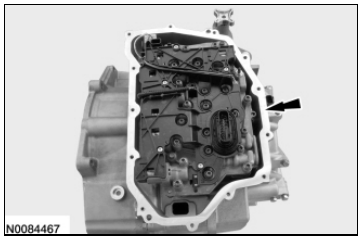


112. **NOTE:** Be sure the solenoid body-to-main control cover seal is installed with the holes facing up.

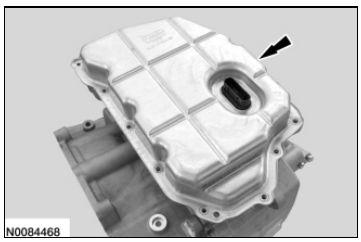
    Install the solenoid body-to-main control cover seal.



113. Connect the TR sensor electrical connector.

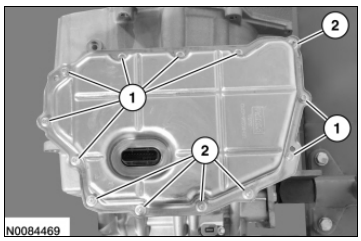


114. Connect the OSS sensor electrical connector.



115. Clean the main control cover sealing surface.

116. Apply silicone to the main control sealing surface of the transaxle case.

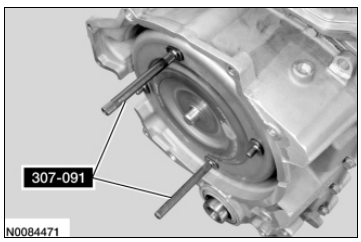


117. Position the main control cover in place.

118. **NOTE:** Install the main control cover stud bolts in the correct location as noted during disassembly.

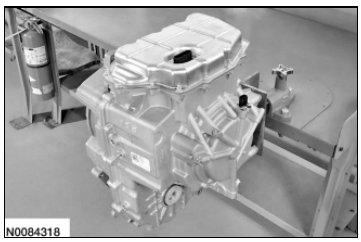
    Install the main control cover bolts.

    1. Bolt location
    2. Stud bolt location
    - Tighten to 12 Nm (106 lb-in).

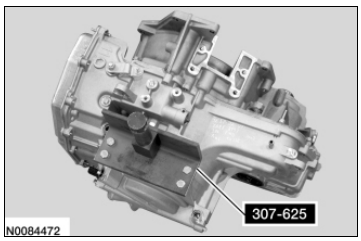


119. ***NOTICE:*** **The torque converter is heavy. Be careful not to drop it or damage will result.**

    Using the Torque Converter Handle 307-091, install the torque converter.

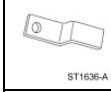


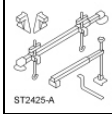
120. Remove the Torque Converter Handle 307-091.

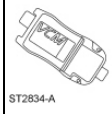


121. Install the Torque Converter Retainer 307-566.

122. Remove the transaxle from the bench-mounted holding fixture.





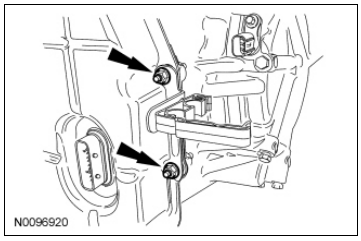


123. Remove the Holding Fixture 307-625.

Transaxle - 2.5L

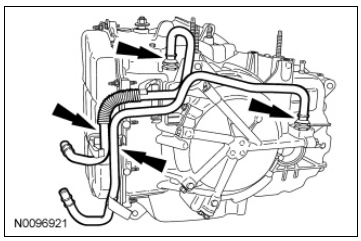
Special Tool(s)

 ST1293-A	Powertrain Lift With Tilting Plate 300-OTC-1585AE
 ST1636-A	Retainer, Torque Converter 307-566
 ST2425-A	Support Bar, Engine 303-F072
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



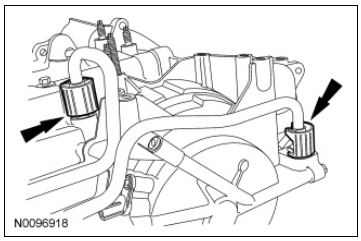
Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B
Threadlock and Sealer TA-25	WSK-M2G351-A5



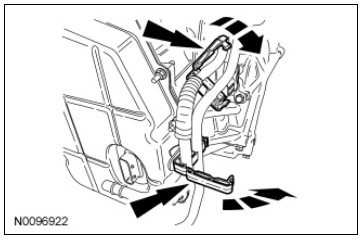
Installation

NOTE: If the transaxle was overhauled, or if installing a new transaxle and the transmission fluid cooler has not been flushed, flush the transmission fluid cooler at this time. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section. Clean the transaxle-mounted transmission fluid cooler tubes by hand.

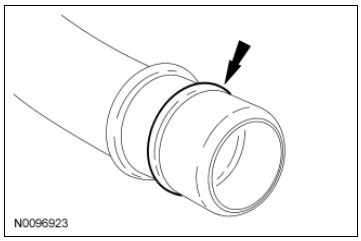


1. Install the transmission fluid cooler tube bracket and the 2 nuts.
2. Tighten to 9 Nm (80 lb-in).

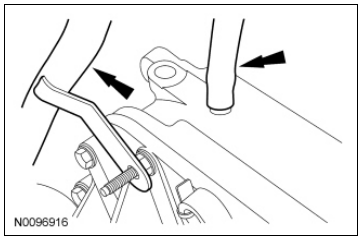
N0096920



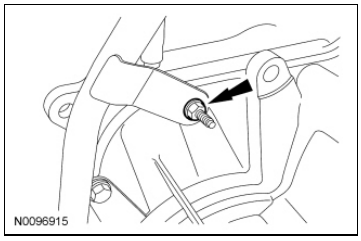
2. Install the transmission fluid cooler tubes in the transaxle by inserting the tube into the fitting until a click is heard/felt. Pull back to confirm connection is secure and position them in the retainer mounted on the main control cover studbolts.



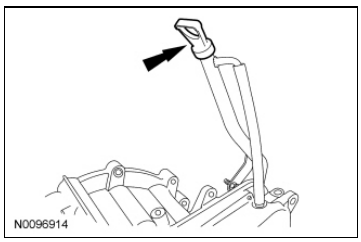
3. Install the 2 secondary latches.



4. Position the transmission fluid cooler tubes in the retainers and close the 2 transmission fluid cooler tube retainers.

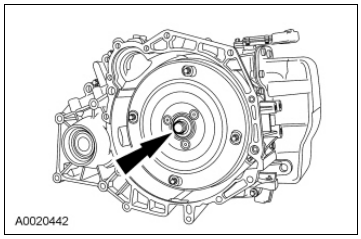


5. Inspect the O-ring seal on the transaxle filler tube for damage and install a new O-ring if needed. Lubricate the O-ring seal with clean automatic transmission fluid.

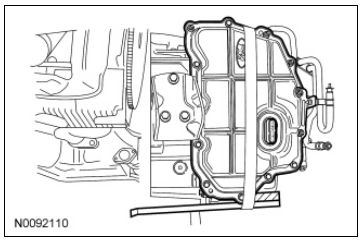


6. Position the transmission fluid cooler tube in place and install the vent tube.

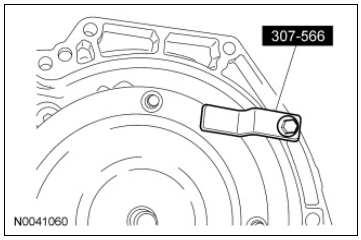
7. Install the transmission fluid filler tube nut.
    - Tighten to 11 Nm (97 lb-in).



8. Install the transmission fluid level indicator.



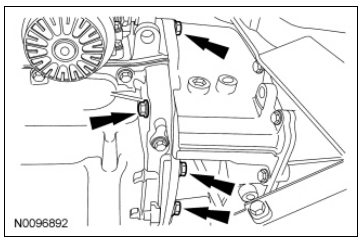
9. Secure the transaxle to a suitable transmission jack with a safety strap.



10. Prior to installing the transaxle, apply multi-purpose grease to the torque converter pilot hub.

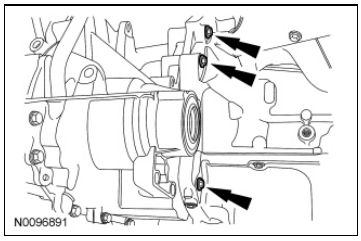
11. Position the transaxle into the engine compartment.

12. Remove the Torque Converter Retainer.



13. **NOTE:** Make sure that the dowel pins are installed in the engine block prior to installing the transaxle.

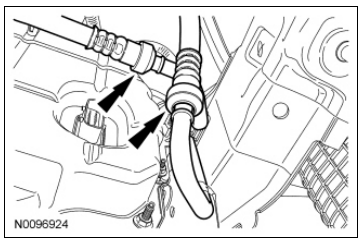
    Position the transaxle on the dowel pins.



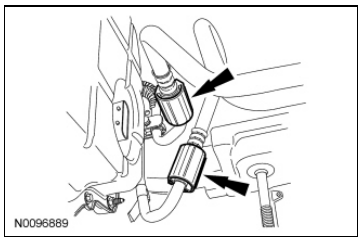
14. **NOTE:** Note the location of the different length bolts.

Install the 4 front torque converter housing bolts.

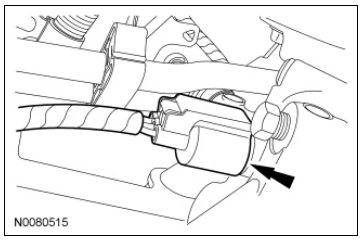
- Tighten to 48 Nm (35 lb-ft).



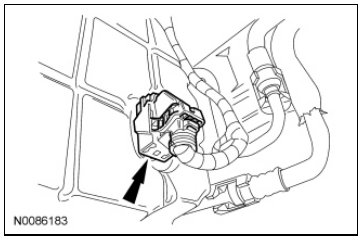
15. Install the 3 rear torque converter housing bolts.
    - Tighten to 48 Nm (35 lb-ft).



16. Remove the transmission jack.

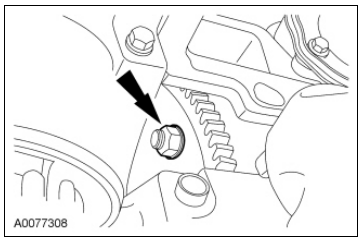


17. Connect the transmission fluid cooler tubes by inserting the tube into the fitting until a click is heard/felt. Pull back to confirm that the connection is secure.

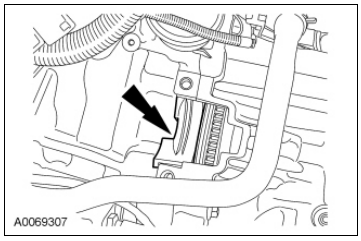


18. Install the transmission fluid cooler tube secondary latches.

19. Connect the Turbine Shaft Speed (TSS) electrical connector.



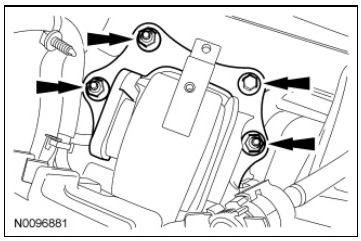
20. Connect the transaxle main electrical connector.



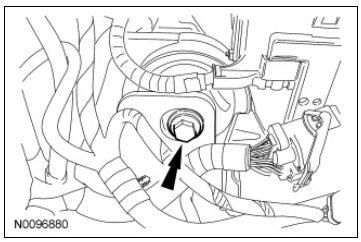
21. ***NOTICE:*** **Rotate the engine in a clockwise direction only or engine damage will occur.**

    Install 4 new torque converter nuts.

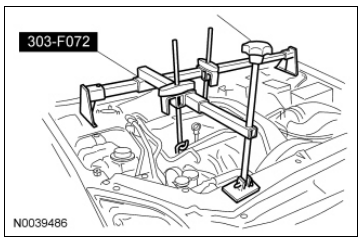
    - Tighten to 40 Nm (30 lb-ft).



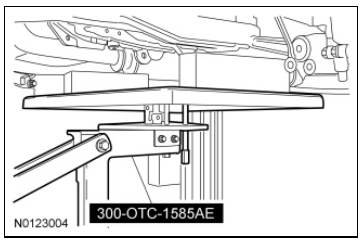
22. Install the rubber insulator in the bellhousing.



23. Install the starter motor. For additional information, refer to Section 303-06 .

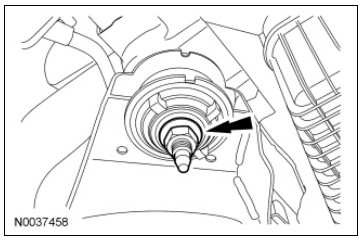


24. Apply threadlock and sealer to the threads and install the transaxle support insulator bracket, the 3 nuts and the bolt.
    - Tighten to 63 Nm (46 lb-ft).



25. Lift the transaxle until the transaxle support insulator bracket is aligned with the transaxle support insulator, apply threadlock and sealant to the threads and install the through bolt.
    - Tighten to 150 Nm (111 lb-ft).

26. Remove the Engine Support Bar.



27. Place the subframe assembly on the Powertrain Lift With Tilting Plate and raise the subframe into the installed position.

28. **NOTE:** LH shown, RH similar.

    Install the front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

29. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the bolts finger-tight.

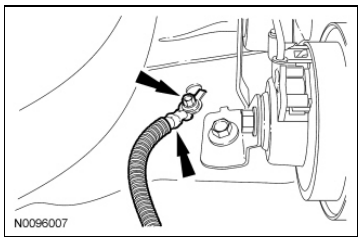
30. **NOTE:** LH shown, RH similar.

    Install the subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

31. **NOTE:** LH shown, RH similar.

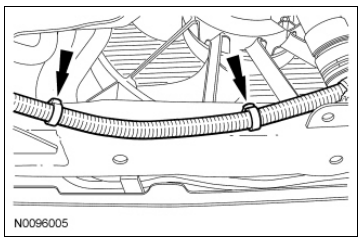
    Tighten the subframe bracket-to-body bolts to 103 Nm (76 lb-ft).



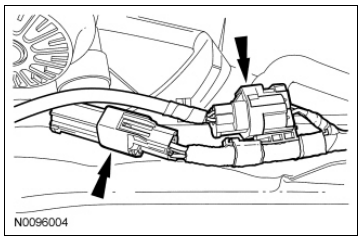
32. **NOTE:** LH shown, RH similar.

    Install the sway bar links and nuts to the struts.

    - Tighten to 40 Nm (30 lb-ft).

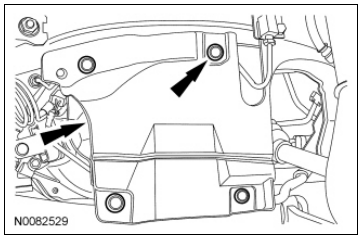


33. Install the Electronic Power Assist Steering (EPAS) system wiring harness ground and the bolt behind the RH splash shield.
    - Tighten to 12 Nm (106 lb-in).

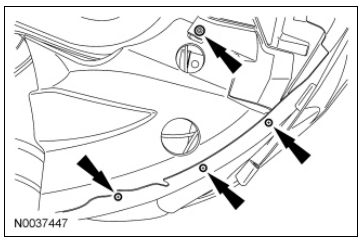


34. Attach the EPAS system wiring harness pin-type retainer to the subframe under the LH fender splash shield.

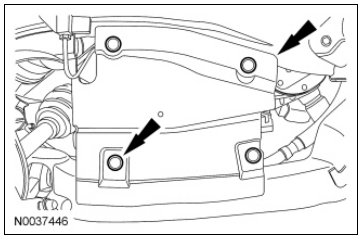
35. Attach the 2 EPAS system wiring harness pin-type retainers to the subframe.



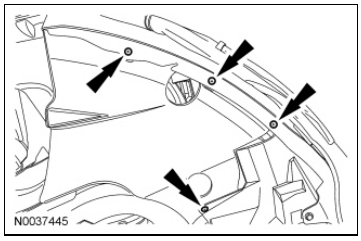
36. Connect the 2 in-line EPAS system electrical connectors at the front of the subframe.



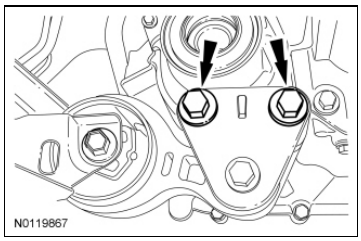
37. Install the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .



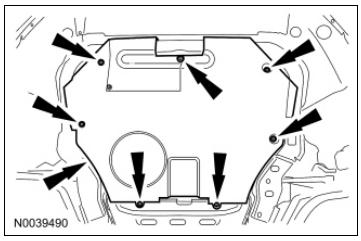
38. Install the LH splash shield and the 6 pin-type retainers (4 shown).



39. Position the LH fender splash shield and install the 4 screws.

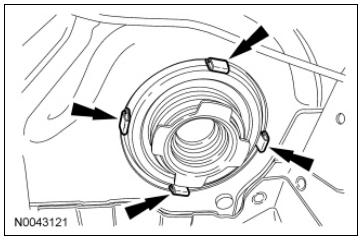


40. Install the RH splash shield and the 6 pin-type retainers (4 shown).

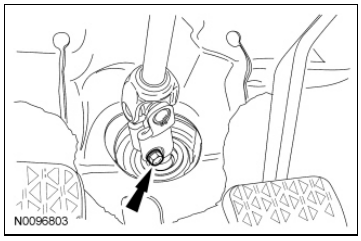


41. Position the RH fender splash shield and install the 4 screws.

42. Install the 2 roll restrictor bracket bolts.
    - Tighten to 90 Nm (66 lb-ft).



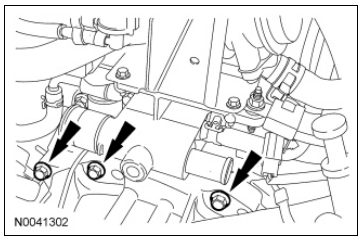
43. If equipped, install the 7 screws and the underbody cover.



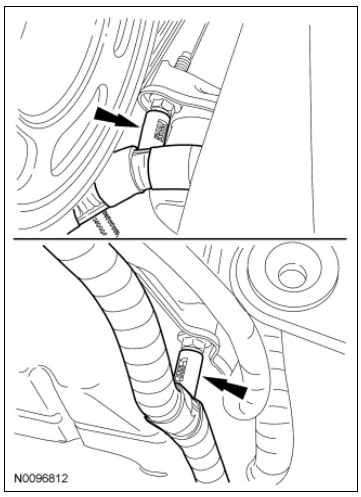
44. ***NOTICE:*** **The steering gear/dash seal must be fully seated in the steering valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment and damage the vehicle interior can occur.**

    Install the steering gear/dash seal.

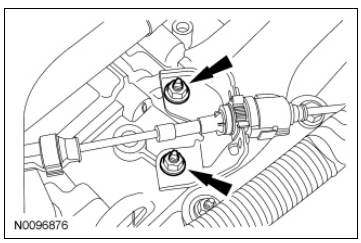
    - Apply hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.



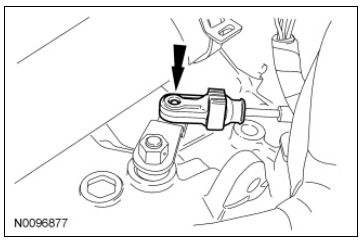
45. Install the steering column shaft onto the steering gear and install a new bolt.
    - Tighten to 20 Nm (177 lb-in).



46. Install the steering joint cover and the 2 nuts.

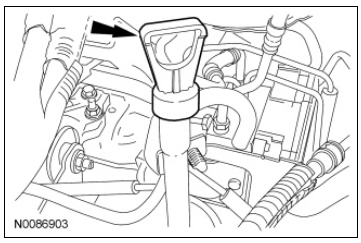


47. Install the 3 top torque converter housing bolts.
    - Tighten to 48 Nm (35 lb-ft).



48. Connect the wiring harness retainers to the main control cover studbolts.

49. Position the selector lever cable bracket in place and install the 2 nuts.
    - Tighten to 12 Nm (106 lb-in).



50. Connect the selector lever cable end to the manual control lever with the manual control lever and selector lever in DRIVE. Check selector lever cable adjustment. For additional information, refer to Section 307-05A .

51. Install the battery and battery tray. For additional information, refer to Section 414-01 .

52. Install the Air Cleaner (ACL) and the outlet pipe. For additional information, refer to Section 303-12A .

53. Fill the transaxle with clean transmission fluid.

54. Start the engine and move the range selector lever into each gear position.

55. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

56. If a replacement transaxle assembly is being installed or a new solenoid body is installed, the PCM will have to be reflashed with a new solenoid body strategy and identification data file. For additional information, refer to Solenoid Body Strategy in this section.

57. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

Transaxle - 3.0L

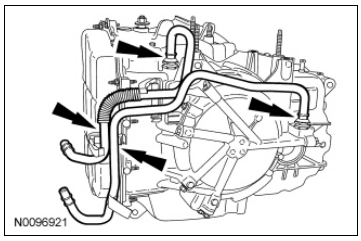
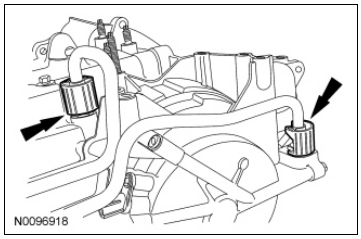
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B
Threadlock and Sealer TA-25	WSK-M2G351-A5

NOTICE: **The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.**

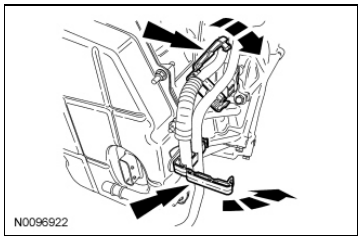


NOTE: If the transaxle was overhauled, or if installing a new transaxle and the transmission fluid cooler has not been flushed, flush the transmission fluid cooler at this time. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

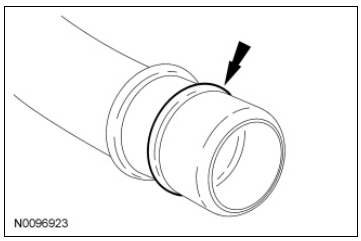
All vehicles



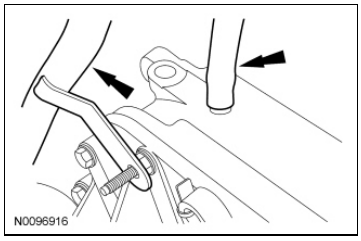
1. Install the transmission fluid cooler tube bracket and the 2 nuts.
   - Tighten to 9 Nm (80 lb-in).



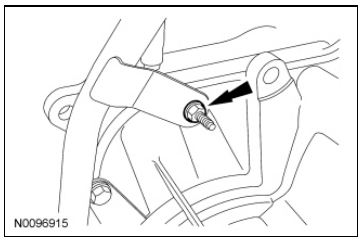
2. Install the transmission fluid cooler tubes in the transaxle by inserting the tube into the fitting until a click is heard/felt. Pull back to confirm connection is secure and position them in the retainer mounted on the main control cover studbolts.



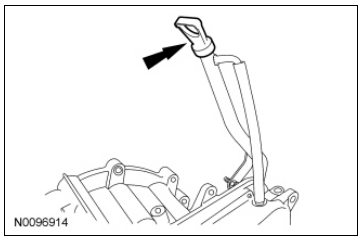
3. Install the 2 secondary latches.



4. Position the transmission fluid cooler tubes in the retainers and close the 2 transmission fluid cooler tube retainers.

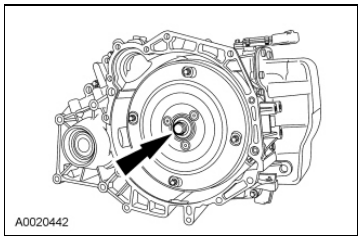


5. Inspect the O-ring seal on the transaxle filler tube for damage and install a new O-ring if needed. Lubricate the O-ring seal with clean automatic transmission fluid.

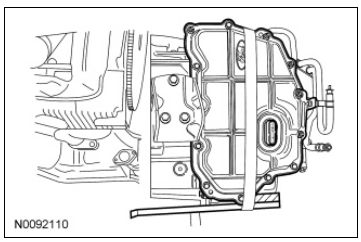


6. Position the transmission fluid filler tube in place and install the vent tube.

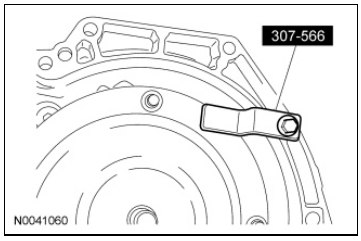
7. Install the transmission fluid filler tube nut.
   - Tighten to 11 Nm (97 lb-in).



8. Install the transmission fluid level indicator.

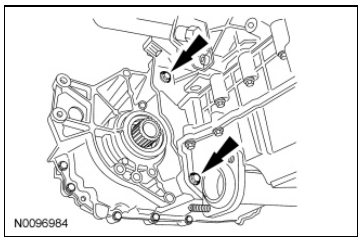


9. Secure the transaxle to a suitable transmission jack with a safety strap.

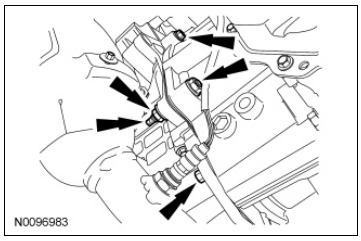


10. Prior to installing the transaxle, apply multi-purpose grease to the torque converter pilot hub.

11. Position the transaxle into the engine compartment.



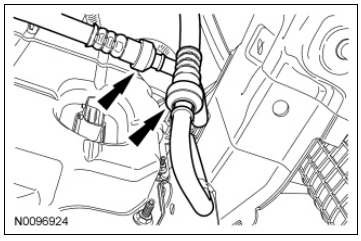
12. Remove the Torque Converter Retainer.



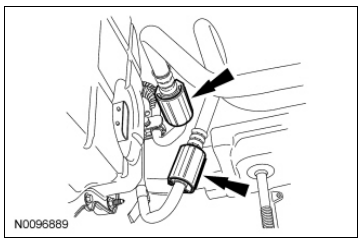
13. **NOTE:** Make sure that the dowel pins are installed in the engine block prior to installing the transaxle.

    Position the transaxle on the dowel pins of the engine.

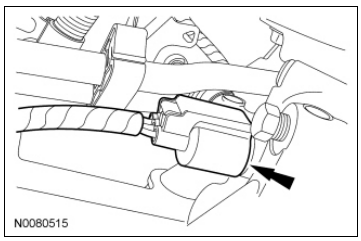
14. Install the 2 back torque converter housing bolts.
    - Tighten to 48 Nm (35 lb-ft).



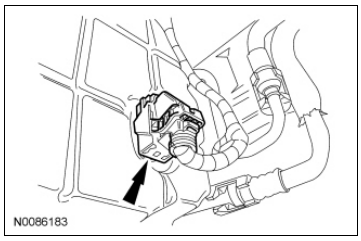
15. Install the 2 bolts, 2 nuts and the stud in the front of the torque converter housing.
    - Tighten to 48 Nm (35 lb-ft).



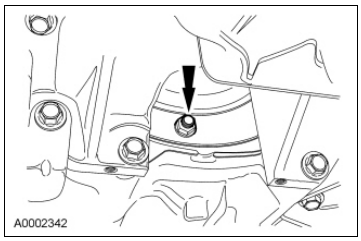
16. Remove the transmission jack.



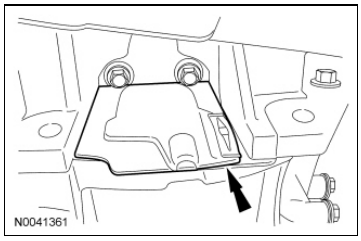
17. Connect the transmission fluid cooler tubes by inserting the tube into the fitting until a click is heard/felt. Pull back to confirm connection is secure.



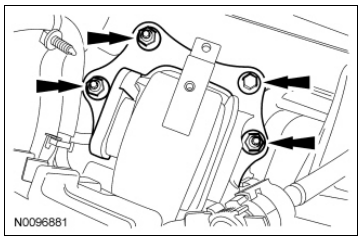
18. Install the transmission fluid cooler tube secondary latches.



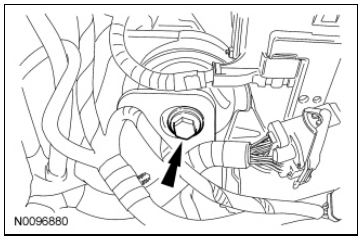
19. Connect the Turbine Shaft Speed (TSS) electrical connector.



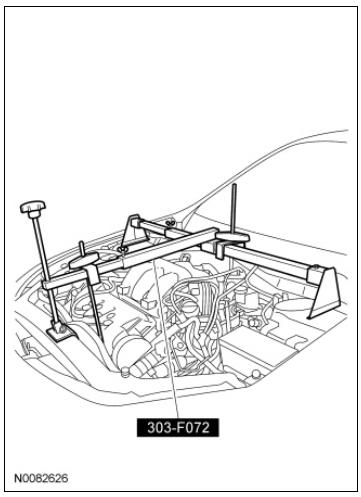
20. Connect the transaxle main electrical connector.



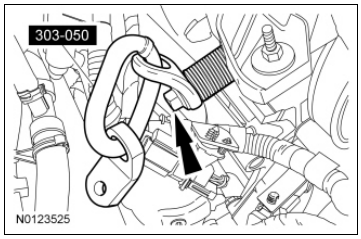
21. Install 4 new torque converter nuts.
    - Tighten to 40 Nm (30 lb-ft).



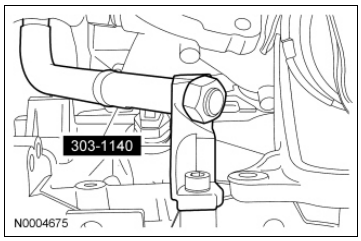
22. Install the inspection cover.



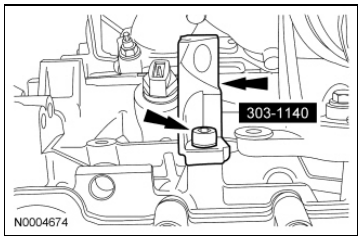
23. Apply threadlock and sealer to the threads and install the transaxle support insulator bracket, the 3 nuts and the bolt.
    - Tighten to 63 Nm (46 lb-ft).



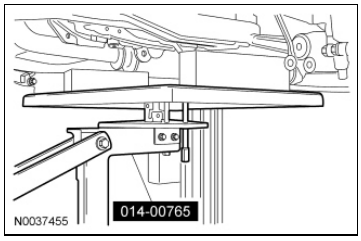
24. Lift the transaxle until the transaxle support insulator bracket is aligned with the transaxle support insulator, apply threadlock and sealant to the threads and install the through bolt.
    - Tighten to 150 Nm (111 lb-ft).



25. Remove the Engine Support Bar.

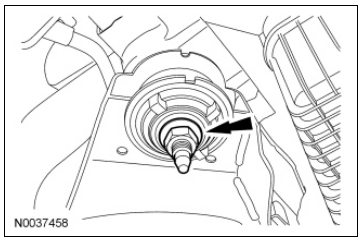


26. Remove the bolt and the Engine Lifting Bracket from the LH cylinder head.



27. Remove the upper half of the Engine Lifting Bracket Set.

28. Remove the lower half of the Engine Lifting Bracket Set.



29. Place the subframe assembly on the Powertrain Lift and raise the subframe into the installed position.

30. **NOTE:** LH shown, RH similar.

    Install the front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

31. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the bolts finger-tight.

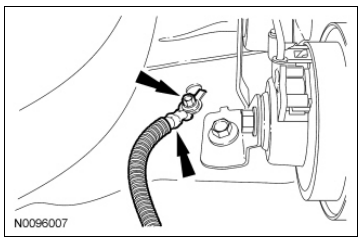
32. **NOTE:** LH shown, RH similar.

    Install the subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

33. **NOTE:** LH shown, RH similar.

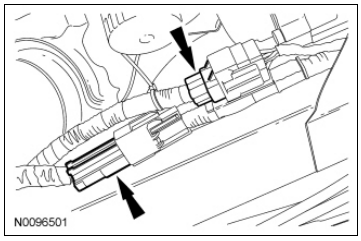
    Tighten the subframe bracket-to-body bolts to 103 Nm (76 lb-ft).



34. **NOTE:** LH shown, RH similar.

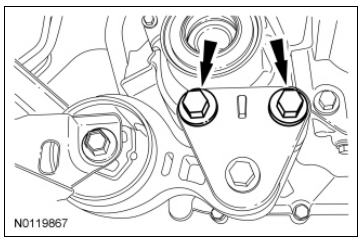
    Install the stabilizer bar links and nuts to the struts.

    - Tighten to 40 Nm (30 lb-ft).

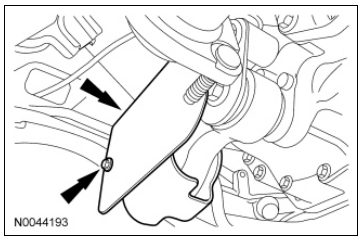


35. Install the Electronic Power Assist Steering (EPAS) system wiring harness ground and the bolt behind the RH splash shield.
    - Tighten to 12 Nm (106 lb-in).

36. Attach the 3 wiring harness retainers to the LH front of the subframe.



37. Connect the 2 in-line EPAS system electrical connectors at the front of the subframe.

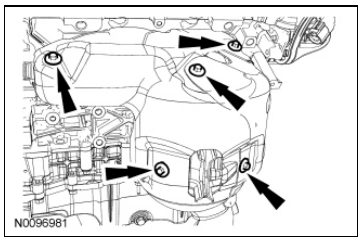


38. **NOTE:** Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.

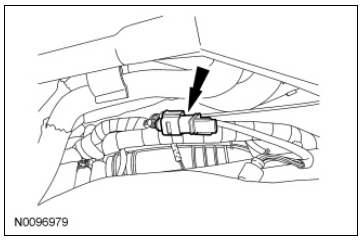
    Install the 2 roll restrictor bracket bolts.

- Tighten to 90 Nm (66 lb-ft).

39. If equipped, install the heat shield and the 2 bolts.



All-Wheel Drive (AWD) vehicles

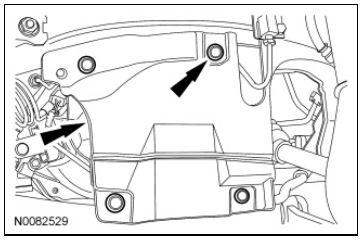


40. Install the Power Transfer Unit (PTU). For additional information, refer to Section 308-07B .

Front Wheel Drive (FWD) vehicles

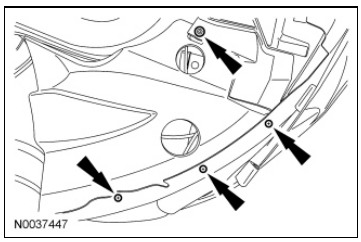
41. Install the RH exhaust manifold heat shield on the manifold and install the 5 bolts.
    - Tighten to 11 Nm (97 lb-in).

42. Connect the RH Heated Oxygen Sensor (HO2S) electrical connector.



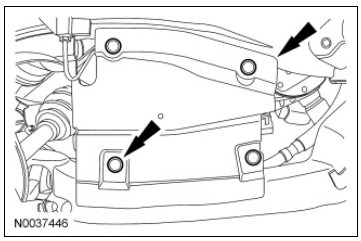
43. Install the intermediate shaft. For additional information, refer to Section 205-04 .

44. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .

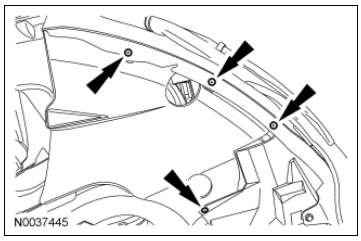


All vehicles

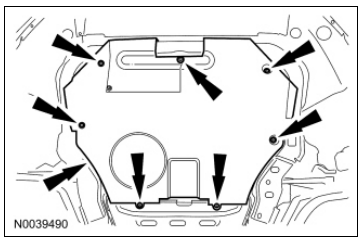
45. Install the LH halfshaft. For additional information, refer to Section 205-04 .



46. Install the LH splash shield and the 6 pin-type retainers (4 shown).

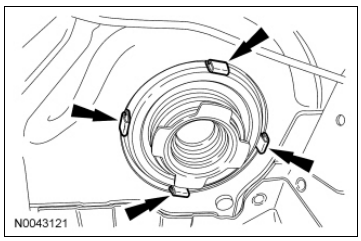


47. Position the LH fender splash shield and install the 4 screws.

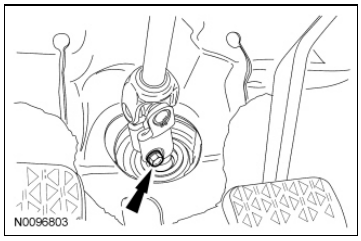


48. Install the RH splash shield and the 6 pin-type retainers (4 shown).

49. Position the RH fender splash shield and install the 4 screws.

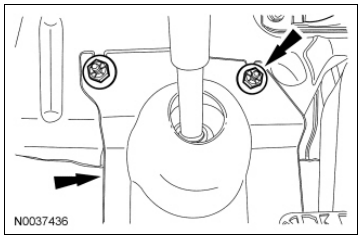


50. If equipped, install the 7 screws and the underbody cover.

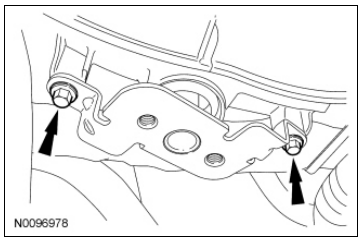


51. ***NOTICE:*** **The steering gear/dash seal must be fully seated in the steering valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment and damage the vehicle interior can occur.**

    Install the steering gear/dash seal.

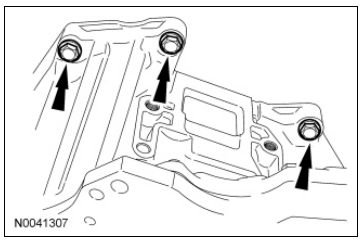


- Apply hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.

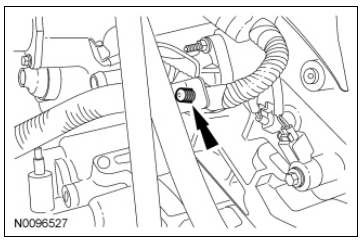


52. Install the steering intermediate shaft onto the steering gear and install a new bolt.
    - Tighten to 20 Nm (177 lb-in).

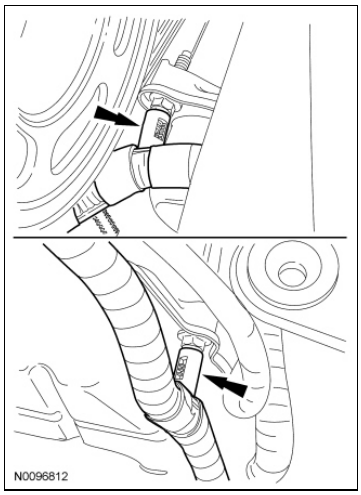
53. Install the steering joint cover and the 2 nuts.



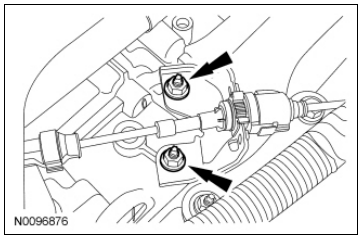
54. Install the EGR valve bracket and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



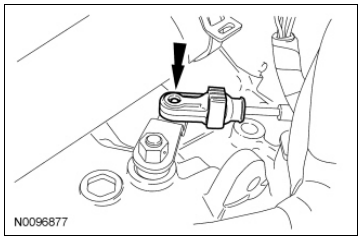
55. Install the EGR valve and tube. For additional information, refer to Section 303-08B .



56. Install the 3 upper torque converter housing bolts.
    - Tighten to 48 Nm (35 lb-ft).

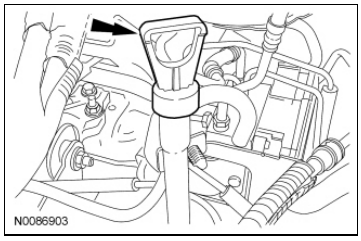


57. Connect the wiring harness retainer on the transmission fluid filler tube.



58. Connect the wiring harness retainers to the main control cover studbolts.

59. Position the selector lever cable bracket in place and install the 2 nuts.
    - Tighten to 12 Nm (106 lb-in).



60. Connect the selector lever cable end to the manual control lever with the manual control lever and selector lever in DRIVE. Check selector lever cable adjustment. For additional information, refer to Section 307-05A .

61. Install the starter motor. For additional information, refer to Section 303-06 .

62. Install the Air Cleaner (ACL) and the outlet pipe. For additional information, refer to Section 303-12B .

63. Fill the transaxle with clean transmission fluid.

64. Start the engine and move the range selector lever into each gear position.

65. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

66. If a replacement transaxle assembly is being installed or a new solenoid body is installed, the PCM will have to be reflashed with a new solenoid body strategy and identification data file. For additional information, refer to Solenoid Body Strategy in this section.

Material

Item	Specification	Fill Capacity
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV	4.05L (4.28 qt) [a] [b]

[a] Transmission filled for life.

[b] The correct transaxle fill level is to the bottom of the fill plug, which is the upper plug.

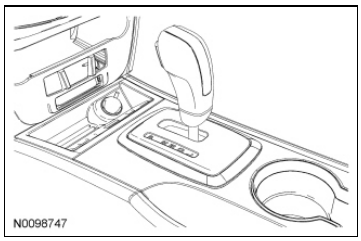
General Specifications

Item	Specification
Weight	
Engine and transaxle assembly weight	257 kg (567 lb)
Transaxle weight	136 kg (300 lb)

Torque Specifications

Description	Nm	lb-ft	lb-in
Battery Junction Box (BJB) bolt	10	-	89
Battery Junction Box (BJB) nut	10	-	89
Drain plug	40	30	-
Fill plug	40	30	-
Manual control lever nut	12	-	106
Roll restrictor bolts	90	66	-
Transaxle support insulator nuts	90	66	-
Transmission Range (TR) sensor bolts	5	-	44

nbsp;



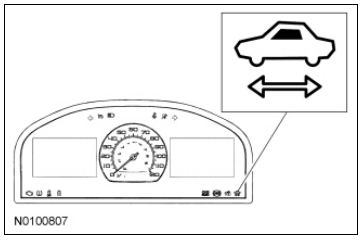
Transaxle Description

Transaxle Components

The Electronically Controlled Continuously Variable Transmission (eCVT) has the following internal components:

- Traction motor
- Generator
- Planetary gearset

Range Selection



Park

With the range selector in PARK:

- the parking pawl locks the output shaft to the case.
- the ignition key can be removed.
- the ignition switch can be cycled from OFF to START or RUN. The ready indicator l will illuminate on the Instrument Cluster (IC) when the ignition switch is cycled to the START postion.

The ready indicator light is located on the lower right hand corner of the IC .

Ready Indicator Light

Reverse

With the range selector in REVERSE:

- the vehicle may be operated in a rearward direction.

- reversing lamps are illuminated.
- if the ready indicator light is not illuminated, which lights when the ignition switch is cycled to the START position, there is no reverse gear engagement.

Neutral

With the range selector in NEUTRAL:

- no power flows through the transmission.
- the output shaft is disengaged from the drive wheels.

Drive

The range selector DRIVE position provides:

- low speed driving.
- acceleration.
- cruise conditions.
- deceleration.
- maximum fuel economy during normal operation.

If the ready indicator light is not illuminated, which lights when the ignition switch is cycled to the START position, there is no forward gear engagement.

Low

The range selector LOW position provides:

- engine braking.
- improved traction on slippery roads.

If the ready indicator light is not illuminated, which lights when the ignition switch is cycled to the START position, there is no forward gear engagement.

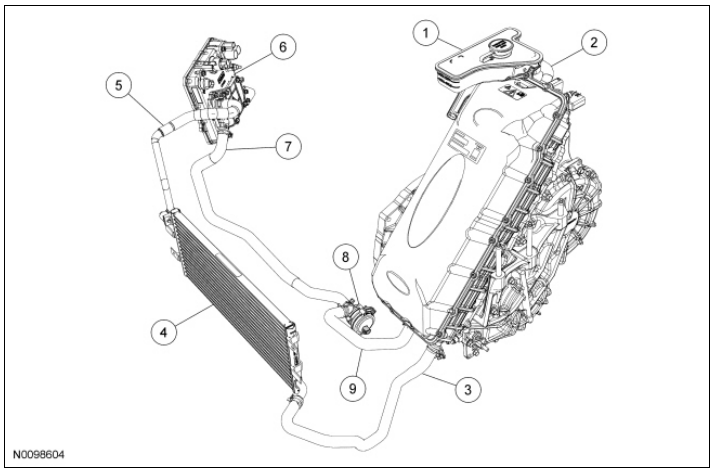
Brake Shift Interlock System

The brake shift interlock system prevents a shift out of PARK unless the brake pedal is depressed. The brake shift interlock system has a Brake Shift Interlock Actuator (BSIA) mounted on the floor selector lever assembly. If the ignition switch is in the RUN position, the BSIA is continually on unless the brake pedal is depressed.

External Controls

The external control of the eCVT is mechanically controlled by a selector lever cable connected to the floor selector lever. The floor selector lever position determines PARK, REVERSE, NEUTRAL, DRIVE and low modes.

Motor Electronics Cooling System (MECS)



The vehicle uses a pump driven cooling system, referred to as the Motor Electronics Cooling System (MECS) pump, to transfer heat generated by the eCVT and the Hybrid Electric Vehicle (HEV) DC/DC converter to the atmosphere. The system uses a coolant-to-air radiator design.

The MECS pump is an electric pump that runs any time the ignition is in the ON position. Unlike traditional cooling systems, there is no thermostat in the MECS , so coolant flow should be continuous and considerably less than traditional powertrain cooling systems.

The flow direction is from the DC/DC converter to the MECS pump through the eCVT , then through the MECS cooler from the LH to RH side of the vehicle back to the DC/DC converter.

The MECS cooling pump will make an audible noise if it is running and a slight vibration may be felt by touch.

The MECS cooling system has a coolant expansion tank mounted on top of the transaxle.

Item	Part Number	Description
1	8C045	Motor Electronics Cooling System (MECS) coolant expansion tank
2	8C351	MECS coolant expansion tank outlet hose
3	8B273	Electronically Controlled Continuously Variable Transmission (eCVT)-to- MECS cooler hose
4	8005	MECS cooler
5	8B274	MECS cooler-to-DC/DC converter tube/hose assembly
6	14B227	DC/DC converter
7	15179	DC/DC converter-to- MECS pump hose
8	8C419	MECS pump
9	8A567	MECS pump-to- eCVT hose

Diagnostics

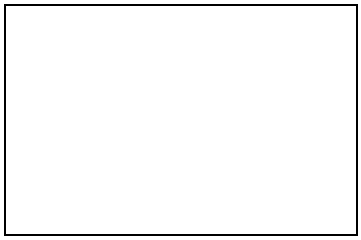
Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

Symptom Chart
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoihe responsible system. If this is not the causal system for the symptom, refer to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Clunk - occurs when shifting from PARK to a DRIVE or REVERSE position	• Damaged transmission insulators	• INSPECT the transmission insulators for damage. INSTALL new insulators as necessary. REFER to Transaxle Support Insulator or Transaxle Support Insulator - Anti-Roll in this section.

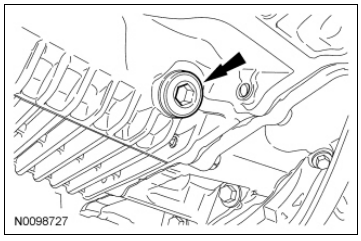
Transmission Fluid Drain and Refill



Material

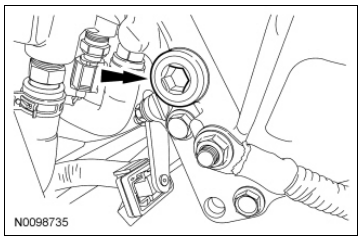
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Turn the ignition to the OFF position.

3. Remove the 7 screws and the underbody cover.



4. **NOTE:** If an integral problem is suspected, drain the transmission fluid through a paper filter. A small amount of metal particles may be found from normal wear. However, if excessive metal particles are present, internal service will be required.

   Remove the drain plug and drain the transmission fluid.

5. Remove the fill plug on the side of the transaxle.

6. **NOTE:** After the transmission fluid has been drained, clean the drain plug threads.

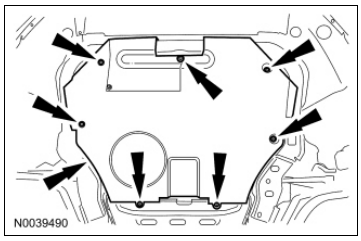
   NOTE: Inspect the plug and washer for damage and install a new plug if necessary.

   Install the drain plug.

   - Tighten to 40 Nm (30 lb-ft).

7. ***NOTICE:*** **Use only clean transmission fluid specific for this transmission. Do not use any supplemental transmission fluid additives or cleaning agents. The use of these products can cause internal transmission components to fail, which will affect the operation of the transmission.**

   Fill the transaxle with clean transmission fluid as specified until the level reaches the bottom of the fill plug hole.



8. **NOTE:** Clean the area around the fill plug removing transmission fluid that may have spilled on the transaxle case.

   NOTE: Inspect the plug and washer for damage and install a new plug if necessary.

   Install the fill plug.

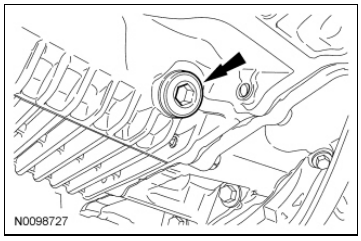
   - Tighten to 40 Nm (30 lb-ft).

9. Install the underbody cover and 7 screws.

Differential Seals - LH

Special Tool(s)

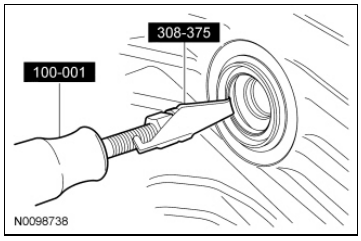
 ST1255-A	Handle 205-153 (T80T-4000-W)
 ST2840-A	Installer, Differential Seals RH and LH 307-665
	Remover, Input Shaft Oil Seal 308-375
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)



Material

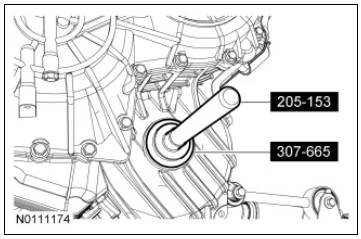
Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Turn the ignition to the OFF position.
3. Remove the 7 screws and the underbody cover.

4. Remove the drain plug and drain the transmission fluid.

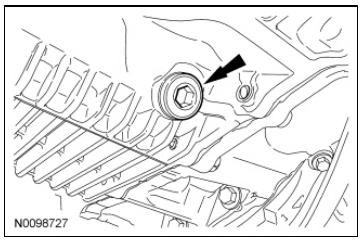


5. Remove the LH halfshaft. For additional Information, refer to Section 205-04 .

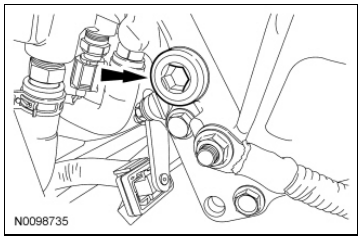
6. Using the Slide Hammer and Input Shaft Oil Seal Remover, remove and discard the LH differential seal.

Installation

1. Using the Differential Seal RH and LH Installer (two sided tool eCVT) and Handle, install the LH differential seal.



2. Install the LH halfshaft. For additional information, refer to Section 205-04 .

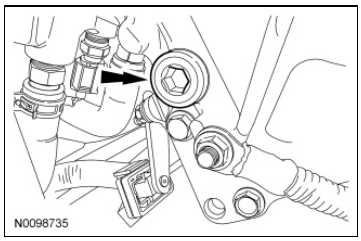


3. **NOTE:** Inspect the plug and washer for damage and install a new plug if necessary.

   Clean the drain plug threads and install the drain plug.

   - Tighten to 40 Nm (30 lb-ft).

4. Remove the fill plug on the side of the transaxle.



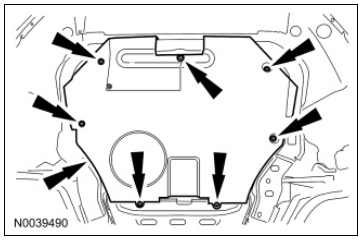
5. Fill the transaxle with clean transmission fluid as specified until the level reaches the bottom of the fill plug hole.

6. **NOTE:** Clean the area around the fill plug removing transmission fluid that may have spilled on the transaxle case.

   NOTE: Inspect the plug and washer for damage and install a new plug if necessary.

   Install the fill plug.

   - Tighten to 40 Nm (30 lb-ft).



7. **NOTE:** The check and fill plug is located on the left side of the transaxle near the front.

   NOTE: The transmission fluid is checked and filled by removing the fill plug and adding transmission fluid to the bottom of the fill plug hole.

   Start the engine and check for correct forward and reverse operation.

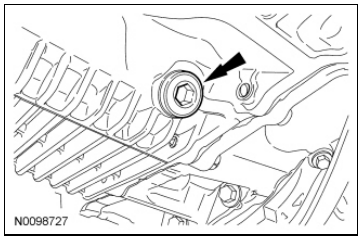
8. Install the underbody cover and 7 screws.

Differential Seals - RH

Special Tool(s)

 ST3082-A	Handle, Driver 32 in 205-907
 ST2840-A	Installer, Differential Seals RH and LH 307-665
	Remover, RH Halfshaft Fluid Seal 307-429
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

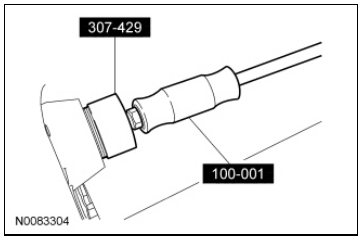
Material



Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV

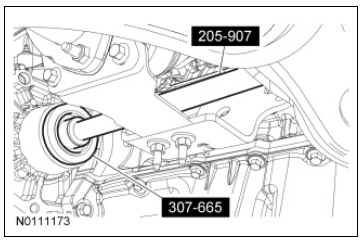
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Turn the ignition to the OFF position.
3. Remove the 7 screws and the underbody cover.



N0039490

4. Remove the drain plug and drain the transmission fluid.

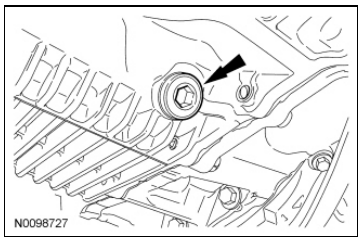


5. Remove the intermediate shaft. For additional information, refer to Section 205-04 .

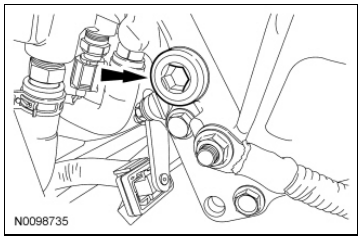
6. Using the Slide Hammer and RH Halfshaft Fluid Seal Remover, remove and discard the RH differential seal.

Installation

1. Using the Differential Seal RH and LH Installer (two sided tool eCVT) and Driver 32 Inch Handle, install the RH differential seal.



2. Install the intermediate shaft. For additional information, refer to Section 205-04 .

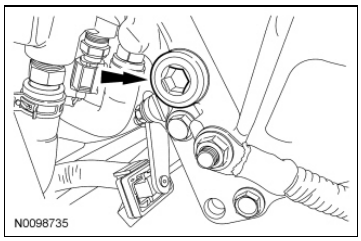


3. **NOTE:** Inspect the plug and washer for damage and install a new plug if necessary.

   Clean the drain plug threads and install the drain plug.

   - Tighten to 40 Nm (30 lb-ft).

4. Remove the fill plug on the side of the transaxle.



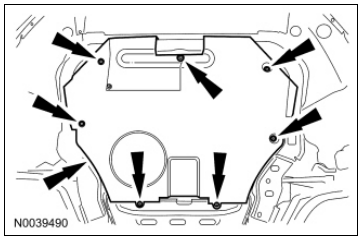
5. Fill the transaxle with clean transmission fluid as specified until the level reaches the bottom of the fill plug hole.

6. **NOTE:** Clean the area around the fill plug removing transmission fluid that may have spilled on the transaxle case.

   NOTE: Inspect the plug and washer for damage and install a new plug if necessary.

   Install the fill plug.

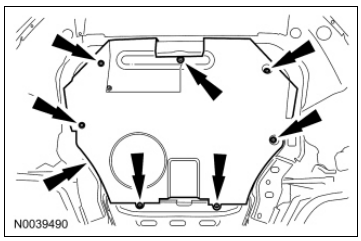
   - Tighten to 40 Nm (30 lb-ft).



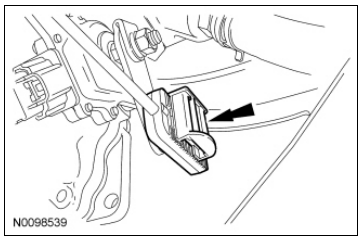
7. **NOTE:** The check and fill plug is located on the left side of the transaxle near the front.

   NOTE: The transmission fluid is checked and filled by removing the fill plug and adding transmission fluid to the bottom of the fill plug hole.

   Start the engine and check for correct forward and reverse operation.

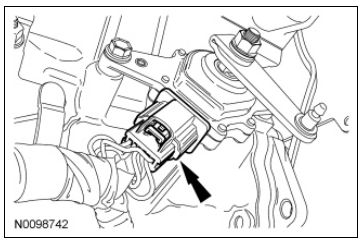


8. Install the underbody cover and 7 screws.

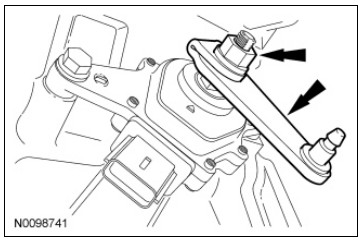


Transmission Range (TR) Sensor

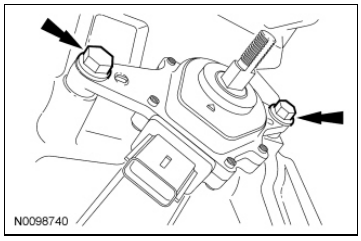
Removal



1. Remove the 7 screws and the underbody cover.

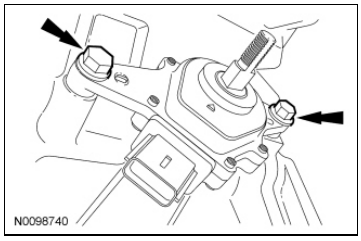


2. Disconnect the selector lever cable end from the manual control lever.

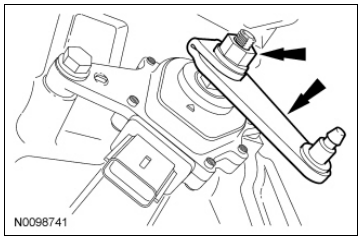


3. Disconnect the Transmission Range (TR) sensor electrical cotor.

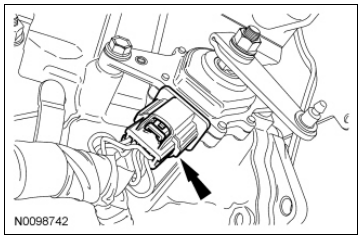
4. Remove the nut and the manual lever.



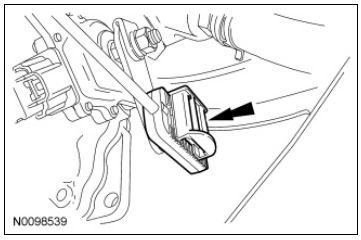
5. Remove the 2 bolts, slide the TR sensor off of the manual shaft and remove the TR sensor.



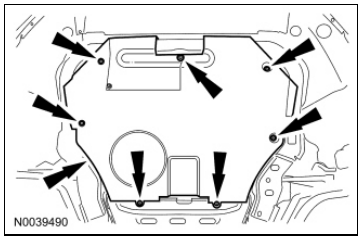
Installation



1. Position TR sensor on the manual shaft, align the 2 TR sensor bolt holes and install the 2 bolts.
   - Tighten to 5 Nm (44 lb-in).

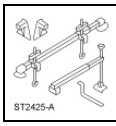


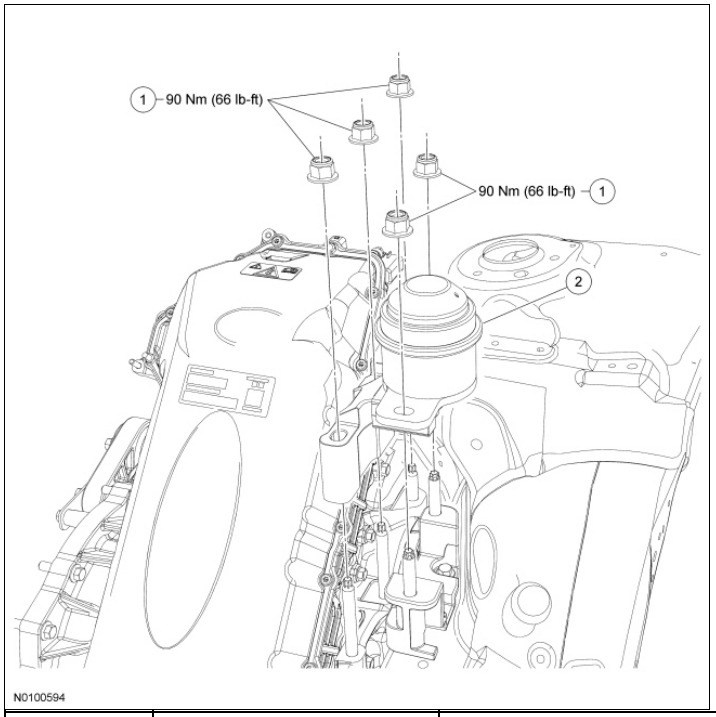
2. Install the manual control lever and the nut.
   - Tighten to 12 Nm (106 lb-in).



3. Connect the TR sensor electrical connector.

4. Adjust the selector lever cable. For additional information, refer to Section 307-05B . Connect the selector lever cable end.





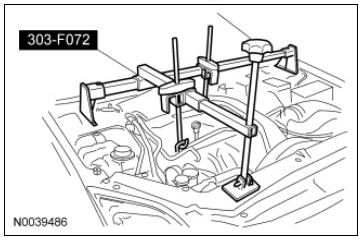
5. Install the underbody cover and 7 screws.

N0039490

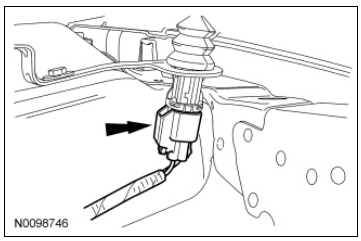
Transaxle Support Insulator

Special Tool(s)

 ST2425-A	Support Bar, Engine 303-F072

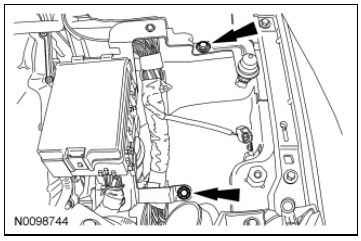


Item	Part Number <	Description
1	W520214	Transaxle support insulator nuts
2	14A464	Transaxle support insulator

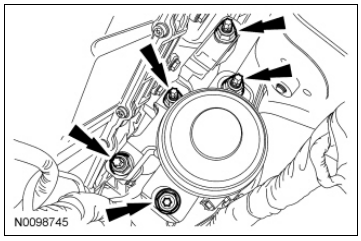


Removal and Installation

1. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12D .

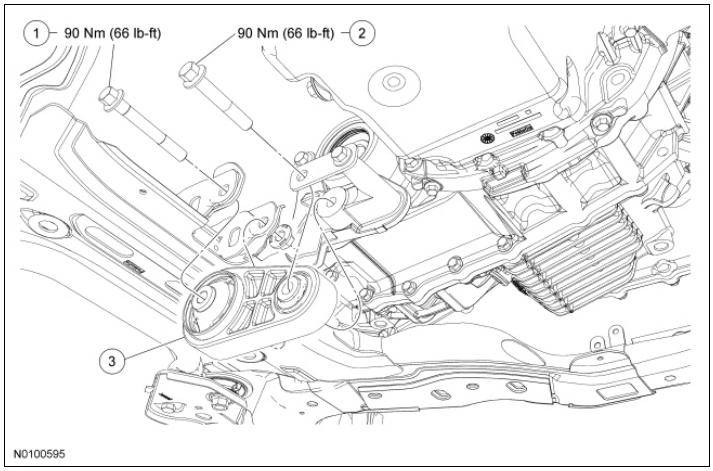


2. Install the Engine Support Bar and support the engine and transaxle.



3. Disconnect the hood ajar electrical connector.

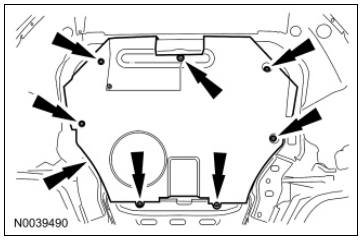
4. Remove the bolt and the nut and position aside the Battery Junction Box (BJB).
    - To install, tighten to 10 Nm (89 lb-in).



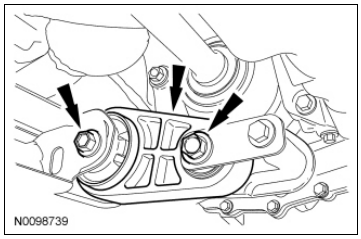
5. Remove the 5 nuts and remove the transaxle support insulator and the bracket.
    - To install, tighten to 90 Nm (66 lb-ft).

6. To install, reverse the removal procedure.

Transaxle Support Insulator - Anti-Roll



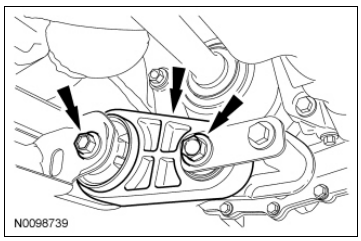
Item	Part Number	Description
1	W706674	Rear roll restrictor bolt
2	W500545	Front roll restrictor bolt
3	6P082	Roll restrictor assembly



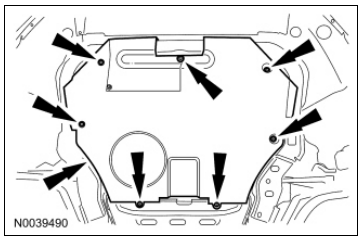
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 7 screws and the underbody cover.



3. Remove the 2 bolts and remove the roll restrictor.

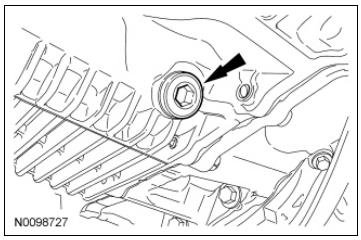


Installation

1. Position the roll restrictor in place and install the 2 bolts.

- Tighten to 90 Nm (66 lb-ft).

2. Install the underbody cover and 7 screws.



Transaxle

1. ***NOTICE:*** **Do not drain the oil when removing the engine to service the transaxle.**

   NOTE: Inspect the plug and washer for damage and install a new plug if necessary.

   To remove the transaxle, follow the engine removal procedure. For additional information, refer to Section 303-01D . Before removing the engine and transaxle from the vehicle, remove the drain plug and drain the transmission fluid.

   - To install, tighten to 40 Nm (30 lb-ft).

SECTION 307-01C: Automatic Transaxle/Transmission - Electronically Controlled Continuously Variable Transmission (eCVT)

2012 Fusion, MKZ, Fusion Hybrid, MKZ Hybrid Workshop Manual

INSTALLATION

Procedure revision date: 06/03/2011

Transaxle

1. To install the transaxle, follow the engine installation procedure. For additional information, refer to Section 303-01D .

Material

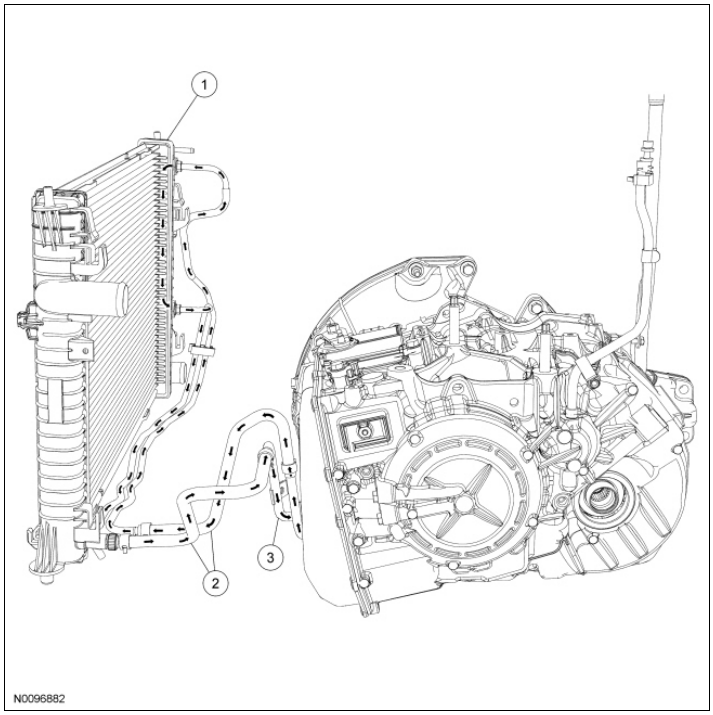
Item	Specification	Fill Capacity
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLV	MERCON® LV	8.5L (9 qt) [a]
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A	7.0L (7.4 qt) [b]

[a] 6F35 Transaxle
[b] Aisin AW21 Transaxle

General Specifications

Item	Specification
Fluid	
The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage. Refer to the material specificatthe correct fluid. The transmission fluid should be changed every 96,560 km (60,000 mi) regardless of normal or special operating conditions.	
NOTICE: **The transmission fluids used in the 6F35 and AW21 transaxles are unique and are not interchangeable.**	

NOTICE: **Do not use water-based cleaners to clean or flush the transmission fluid cooler tubes or transmission damage will occur. Mineral spirits can be used to clean the transmission fluid cooler tubes, providing the transmission fluid cooler tubes are flushed with clean automatic transmission fluid and blown dry with shop air. Use only clean automatic transmission fluid designated for this transaxle and torque converter being serviced.**



Torque Specifications

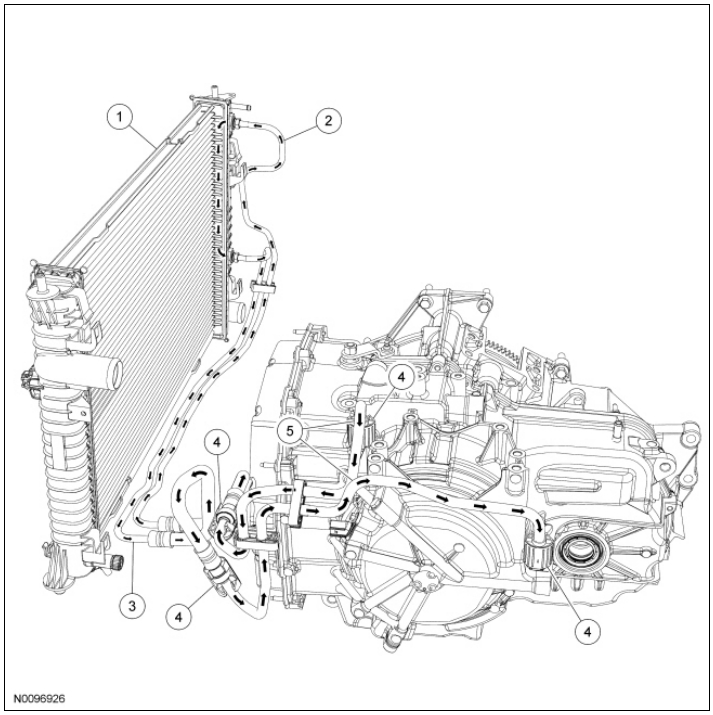
Transmission fluid cooler tubes (at the radiator)	20	-	177
Transmission fluid fill plug (Aisin AW21)	39	29	-

Transaxle Cooling - Aisin AW21

These vehicles are equipped with an internal transmission fluid cooler. The transmission fluid cooler is mounted in the engine radiator tank. During operation, transmission fluid travels from the transaxle to the transmission fluid cooler, then back to the transaxle. The transmission fluid cooler transfers heat from the transmission fluid to the engine coolant.

Transaxle Cooling - Aisin AW21



Item	Part Number	Description
1	8005	Radiator
2	7H420	Transmission fluid e assembly
3	19710-A	Transmission mounted fluid cooler tube

Transaxle Cooling - 6F35

These vehicles are equipped with an internal transmission fluid cooler. The transmission fluid cooler is mounted in the engine radiator tank. During operation, transmission fluid travels from the transaxle to the transmission fluid cooler, then back to the transaxle. The transmission fluid cooler transfers heat from the transmission fluid to the engine coolant.

Inspection and Verification

1. Verify mer concern by operating the vehicle to duplicate the condition.
2. If the inspection reveals an obvious concern(s) that can be readily identified, repair as necessary.
3. Install new components if a transmission fluid leak is found in any of the transaxle cooling components.
4. If the concern(s) remains after the inspection, determine the symptom(s). GO to Symptom Chart - Transaxle Cooling or GO to Symptom Chart - NVH .

Symptom Chart - Transaxle Cooling

Symptom Chart - Transaxle Cooling

Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

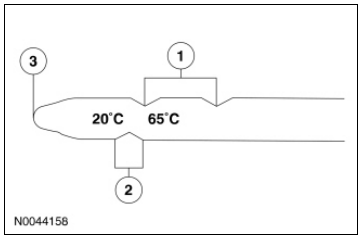
ConditionPossible SourcesAction

- Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed
- Transmission fluid cooler tubes grounded
- CHECK the transmission fluid cooler tubes. REPAIR as necessary.

Check Transmission Fluid Level and Condition

NOTICE: **The vehicle should not be driven if the transmission fluid level indicator shows the transmission fluid below the minimum fluid level mark or internal failure may result.**

If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather or while pulling a trailer, the transmission fluid may need to cool down to obtain an accurate reading.



The transmission fluid level reading on the transmission fluid level indicator will differ depending on operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Transmission Fluid Level Check

NOTE: The transmission fluid should be checked at normal operating temperature 60°C-70°C (140°F-158°F) on a level surface. Normal operating temperature can be reached after approximately 32 km (20 mi) of driving and can be checked using the scan tool.

Under normal circumstances the transmission fluid level should be checked during normal maintenance. If the transaxle starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

1. With the transaxle in PARK, the engine at idle, foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever in the PARK position.
2. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
3. Wipe the transmission fluid level indicator with a clean cloth.
4. Install the transmission fluid level indicator back in the fluid indicator tube until it is fully seated, then remove the indicator. The transmission fluid level should be within the normal operating range.

Item	Part Number	Description
1	-	Transmission fluid level at operating temperature 60°C-70°C (140°F-158°F)

2	-	Transmission fluid level cool 15°C-25°C (59°F-77°F)
3	-	Do not drive mark

High Transmission Fluid Level

A transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transaxle malfunction and/or damage. If an overfill reading is indicated, refer to Section 307-01A .

Low Transmission Fluid Level

A low transmission fluid level could result in poor transaxle engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transaxle seals or gaskets.

Adding Transmission Fluid

NOTICE: **The use of any fluid other than what is recommended for this transaxle will cause transaxle damage.**

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the indicator tube. Do not overfill the transaxle. For transmission fluid type, refer to the specification chart in this section.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Observe the color and the odor. The color under normal circumstances should be a dark red color, not brown or black or have a burnt odor.
3. Hold the transmission fluid level indicator over a white facial tissue and allow the transmission fluid to drip onto the facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If the stain is a foamy pink color, this may indicate coolant in the transaxle. The engine cooling system should also be inspected at this time.
6. If transmission fluid contamination or transaxle failure is confirmed by the sediment in the bottom of the fluid pan, install a new transaxle. If installing a new transaxle, the transmission fluid cooler and transmission fluid cooler tubes should be cleaned.
7. If the transaxle is to be overhauled or if installing a new transaxle, the fluid cooler must be backflushed. Refer to Section 307-01A .

For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

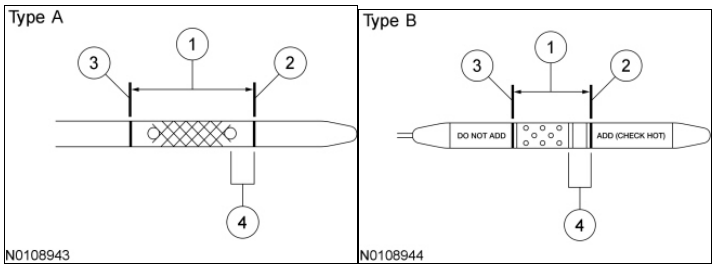
ConditionPossible SourcesAction

- Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed
- Transmission fluid cooler tubes grounded
- CHECK the transmission fluid cooler tubes. REPAIR as necessary.

Check Transmission Fluid Level and Condition (All Vehicles)

NOTICE: **The vehicle should not be driven if the transmission fluid level indicator shows the transmission fluid below the minimum transmission fluid level mark or internal failure could result.**

If the vehicle has been operated for an extended period of time, at highway speeds, in city traffic, in hot weather or while pulling a trailer, the transmission fluid may need to cool down to obtain an accurate reading.



The transmission fluid level reading on the transmission fluid level indicator will differ depending on operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Transmission Fluid Level Check

NOTE: The transmission fluid should be checked at normal operating temperature 85°C-93°C (185°F-200°F) on a level surface. Normal operating temperature can be reached after approximately 32 km (20 mi) of driving and can be checked using the scan tool.

Under normal circumstances the transmission fluid level should be checked during normal maintenance. If the transaxle starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

1. With the transaxle in PARK, gine at idle, foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever in the PARK position.
2. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
3. Wipe the transmission fluid level indicator with a clean cloth.
4. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the indicator. The transmission fluid level should be within the crosshatch.

Item	Description
1	Correct transmission fluid level at operating temperature 85°C-93°C (185°F-200°F)
2	Minimum transmission fluid level mark
3	Maximum transmission fluid level mark

4	Flat tow transmission fluid level

High Transmission Fluid Levelb>

A transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transaxle malfunction and/or damage. If an overfill reading is indicated, refer to Section 307-01B .

Low Transmission Fluid Level

A low transmission fluid level could result in poor transaxle engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transaxle seals or gaskets.

Adding Transmission Fluid

NOTICE: **Automatic transmission fluids are not interchangeable. The use of any fluid other than what is recommended for this transaxle will cause transaxle damage.**

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid level indicator tube with the selector lever in PARK and the engine idling. Do not overfill the transmission fluid. For transmission fluid type, refer to the material chart in this section.

Flat Tow Fluid Level

Recreational flat towing of the vehicle may require the transmission fluid to be set to a lower fluid level. This will prevent damage to the transmission. The transmission fluid level is within the normal operating range and will not require the transmission fluid level to be readjusted after recreational towing.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Observe the color and the odor. The color under normal circumstances should be a dark red color, not brown or black or have a burnt odor.
3. Hold the transmission fluid level indicator over a white facial tissue and allow the transmission fluid to drip onto the facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If transmission fluid contamination or transaxle failure is confirmed by the sediment in the bottom of the transmission fluid pan, repair the transaxle and clean the transmission fluid cooler tubes and the transmission fluid cooler.
6. If the transaxle is to be overhauled or if installing a new transaxle, the transmission fluid cooler must be backflushed. Refer to Section 307-01B .

Transmission Fluid Cooler

1. **NOTE:** The transmission fluid cooler is mounted in the radiator tank and cannot be serviced separately.

   Install a new radiator. For additional information, refer to Section 303-03A .

Transmission Fluid Cooler Tubes - Aisin AW21

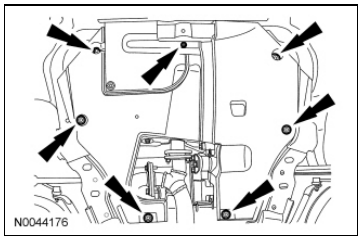
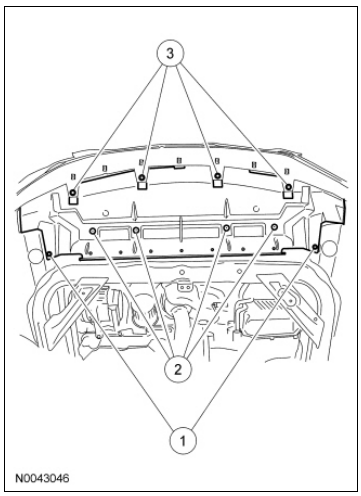
Removal

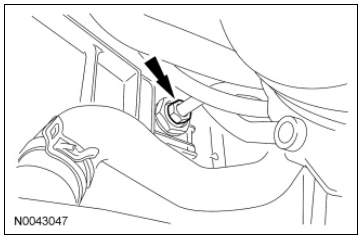


NOTICE: **The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

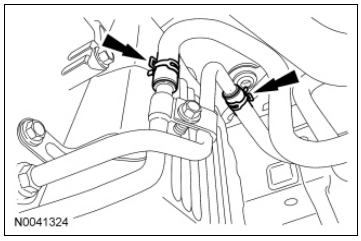


2. Disconnect the upper transmission fluid cooler tube from the radiator.

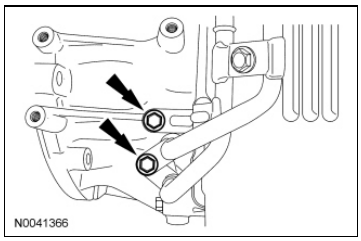


3. Remove the bolts and the splash shield.

4. Remove the front splash shield.
    1. Remove the 2 screws.
    2. Remove the 4 retainers.
    3. Remove the 4 bolts and the splash shield.



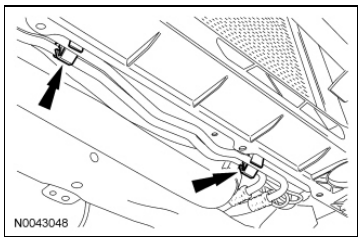
5. Disconnect the lower transmission fluid cooler tube from the radiator.



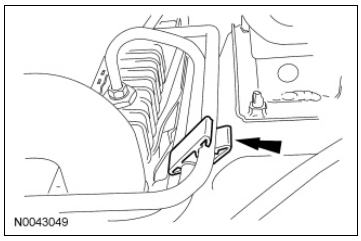
6. ***NOTICE:*** **Use care not to overstretch or extend the hose clamps as damage may occur to the hose clamp and cause a leak.**

NOTICE: **The hose clamps are held on the hose with a special epoxy. Damage may occur to the hose if the clamp is removed from the hose. If the clamp or hose is damaged, install a new fluid cooler tube.**

Disconnect the transmission fluid cooler hoses from the transmission fluid cooler tubes.

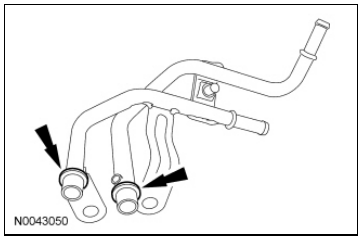


7. Remove the 2 bolts and remove the transmission fluid cooler tubes.

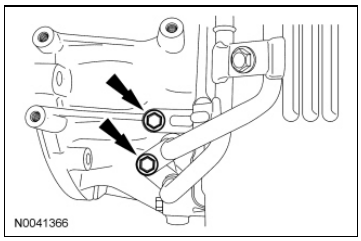


8. **NOTE:** When removing the transmission fluid cooler tubes from the retainers, do not remove the retainers from the shroud.

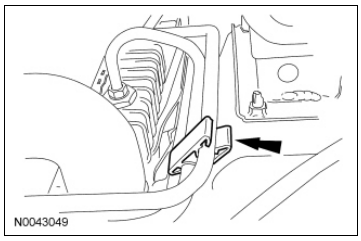
   Remove the transmission fluid cooler tubes from the retainers.



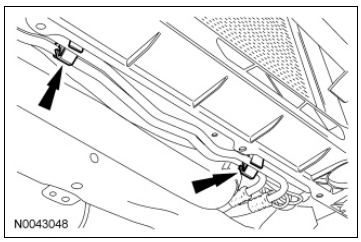
9. Remove the transmission fluid cooler tube retainer and remove the transmission fluid cooler tubes.



Installation

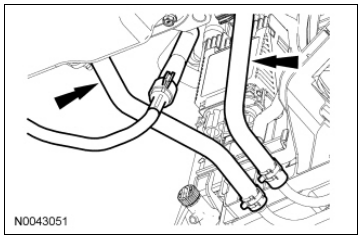


1. Install new O-rings on the transmission fluid cooler tubes.



2. Install the transmission fluid cooler tubes.
    - Tighten to 10 Nm (89 lb-in).

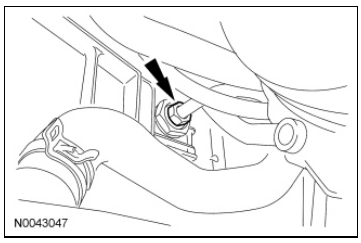
3. Position the transmission fluid cooler tubes in place and install the retainer.



4. Install the transmission fluid cooler tubes in the retainers.

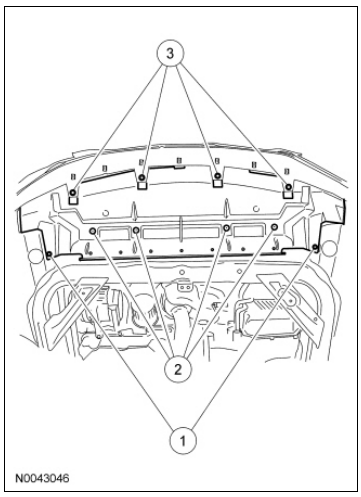
5. **NOTE:** The power steering hose is routed between the 2 transmission fluid cooler hoses.

   Position the transmission fluid cooler hoses in place.

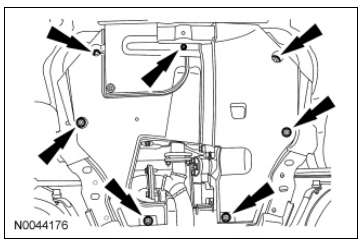


6. ***NOTICE:*** **Use care not to overstretch or extend the hose clamps as damage may occur to the hose clamp and cause a leak.**

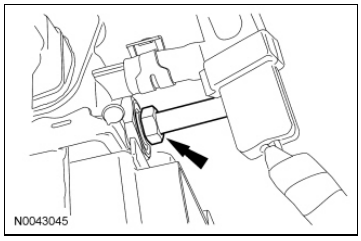
   NOTICE: **The hose clamps are held on the hose with a special epoxy. Damage may occur to the hose if the clamp is removed from the hose. If the clamp or hose is damaged, install a new fluid cooler tube.**



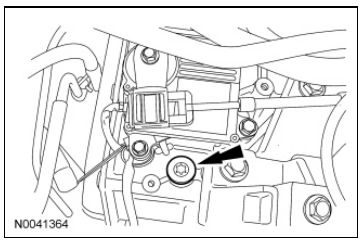
Connect the transmission fluid cooler hoses to the transmission fluid cooler tubes.



7. Install the lower transmission fluid cooler tube in the radiator.
    - Tighten to 20 Nm (177 lb-in).

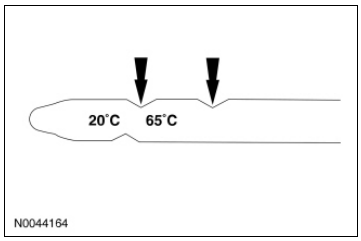


8. Install the front splash shield.
    1. Position the splash shield in place and install the 2 screws.
    2. Install the 4 retainers.
    3. Install the 4 bolts.

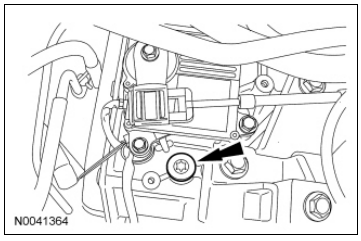


9. Install the bolts and the splash shield.

10. Install the upper transmission fluid cooler tube in the radiator.
    - Tighten to 20 Nm (177 lb-in).

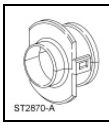


11. Remove the transmission fluid fill plug.



12. **NOTE:** Transmission fluid level at normal operating temperature is between the top 2 marks on the fluid level indicator.

    Check the transmission fluid level and add transmission fluid as necessary.



13. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

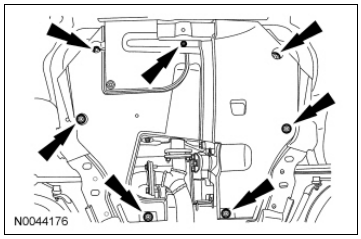
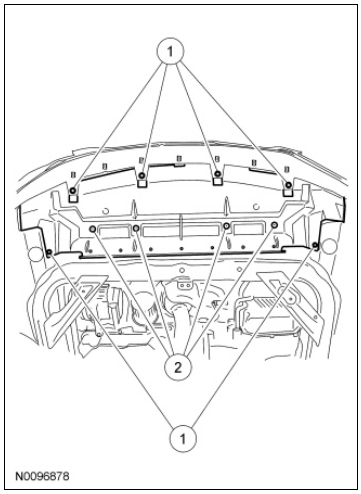
10	-	Transmission fluid cooler tube retainer (part of 7H420)
11	7H420	Transaxle mounted transmission fluid cooler return tube
12	7H420	Transaxle mounted transmission fluid cooler supply tube

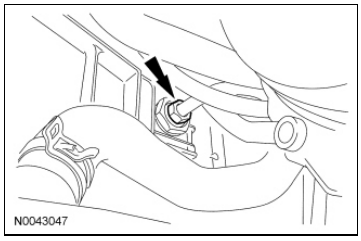


Removal

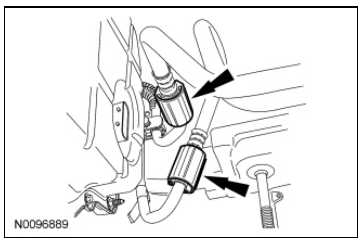
NOTICE: **Automatic transmission fluids are not interchangeable. The use of any fluid other than what is recommended for this transaxle will cause transaxle damage.**



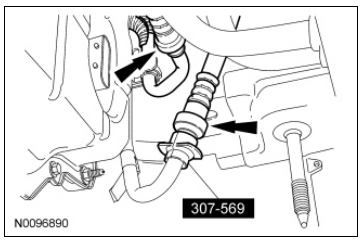
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to
2. Disconnect the upper transmission fluid cooler tube from the radiator.



3. Remove the bolts and the splash shield.

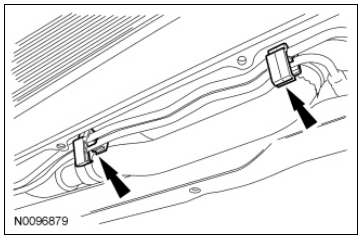


4. Remove the radiator splash shield.
    1. Remove the 6 screws.
    2. Remove the 4 retainers.

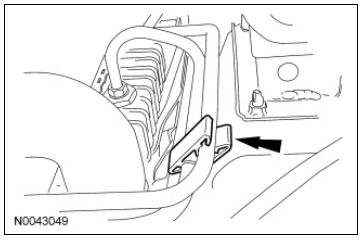


5. Disconnect the lower transmission fluid cooler tube from the radiator.

6. Remove the transmission fluid cooler tube secondary latches.

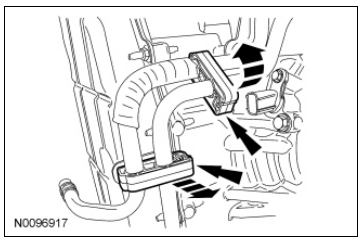


7. Using the Transmission Cooler Line Disconnect Tool, disconnect the transmission fluid cooler tubes.

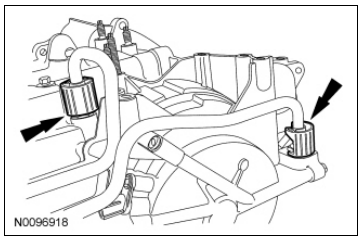


8. **NOTE:** When removing the transmission fluid cooler tubes from the retainers, do not remove the retainers from the shroud.

   Release the transmission fluid cooler tube retainers and remove the transmission fluid cooler tubes from the retainers.

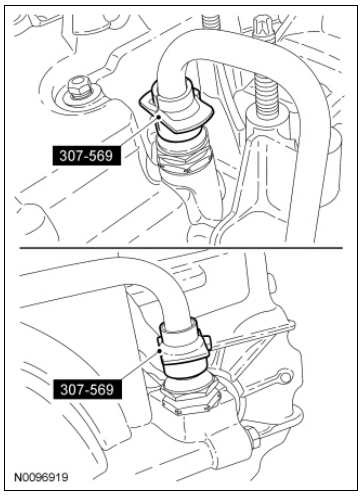


9. Remove the transmission fluid cooler tube retainer and remove the transmission fluid cooler tubes from the vehicle.



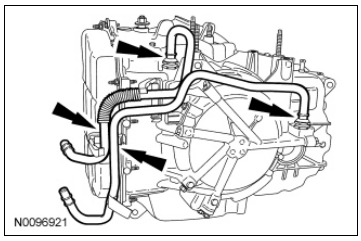
10. Remove the Air Cleaner (ACL) and the outlet pipe. For additional information, refer to Section 303-12A or Section 303-12B .

11. Remove the battery and battery tray. For additional information, refer to Section 414-01 .

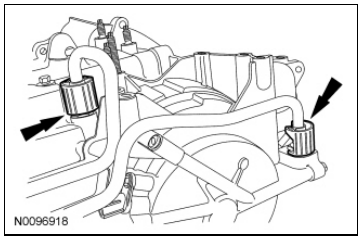


12. Open the transmission fluid cooler tube retainers.

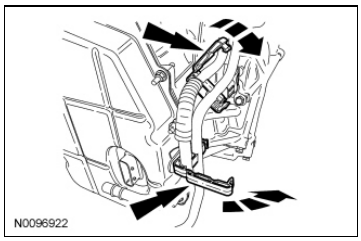
13. Remove the 2 transmission fluid cooler tube secondary latches.



14. Using the Transmission Cooler Line Disconnect Tool, disconnect and remove the transmission fluid cooler tubes from the transaxle.

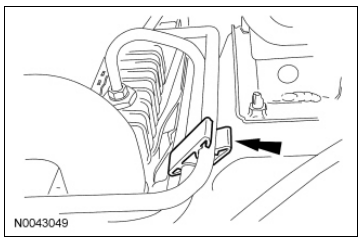


Installation

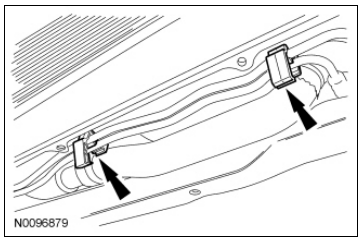


1. Install the transmission fluid cooler tubes in the transaxle by inserting the tube into the fitting until a click is heard/felt. Pull back to confirm connection is secure and position them in the retainer mounted on the main control cover studbolts.

2. Install the 2 transmission fluid cooler tube secondary latches.

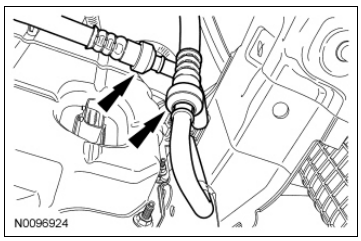


3. Position the transmission fluid cooler tubes in the retainers and close the 2 transmission fluid cooler tube retainers.

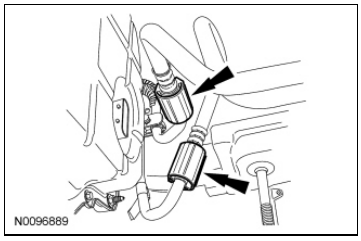


4. Install the battery and battery tray. For additional information, refer to Section 414-01 .

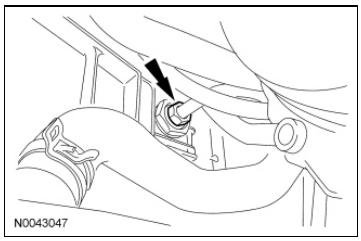
5. Install the ACL and the outlet pipe. For additional information, refer to Section 303-12A or Section 303-12B .



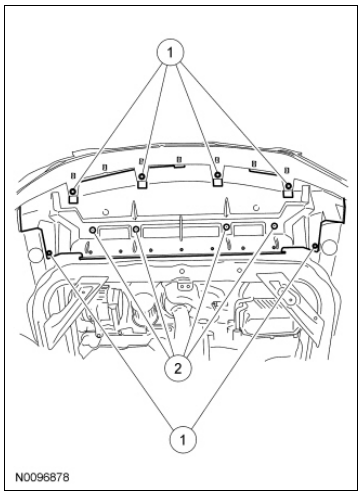
6. Position the transmission fluid cooler tubes in place in the vehicle and install the retainer.



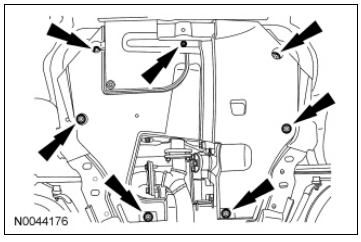
7. Position the transmission fluid cooler tubes in the retainers and close the retainers.



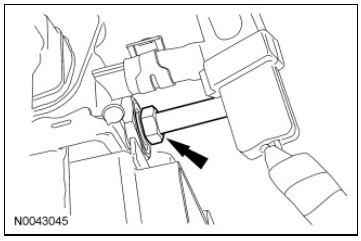
8. Connect the transmission fluid cooler tubes by inserting the tube into the fitting until a click is heard/felt. Pull back to confirm that the connection is secure.



9. Install the transmission fluid cooler tube secondary latches.



10. Install the lower transmission fluid cooler tube in the radiator.
    - Tighten to 20 Nm (177 lb-in).



11. Install the radiator splash shield
    1. Install the 6 screws.
    2. Install the 4 retainers.

12. If equipped, install the bolts and the splash shield.

13. Install the upper transmission fluid cooler tube in the radiator.
    - Tighten to 20 Nm (177 lb-in).

14. Fill the transaxle with clean transmission fluid.

15. Using the scan tool with the engine running, check and make sure that the transmission is at normal operating temperature 85-93°C (185-200°F). Check and adjust the transmission fluid level and check for any leaks. If transmission fluid is needed, add transmission fluid in increments of 0.24L (0.5 pt) until the correct level is achieved.

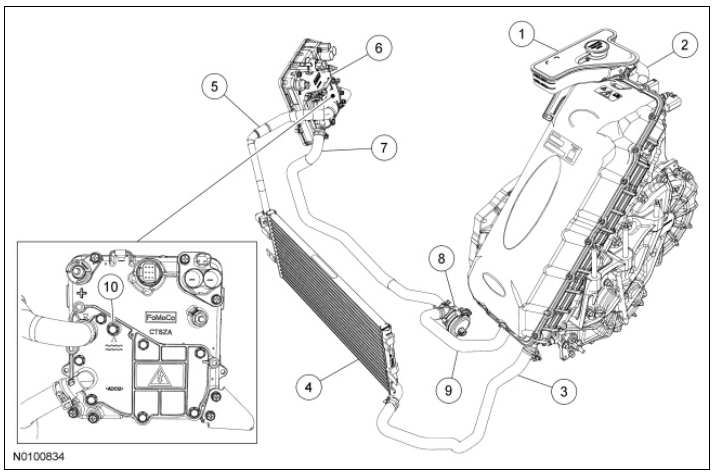
Transaxle Cooling

Motor Electronics Cooling System (MECS)



The vehicle uses a pump driven cooling system, referred to as the Motor Electronics Cooling System (MECS) pump, to transfer heat generated by the Electronically Controlled Continuously Variable Transmission (eCVT) and the Hybrid Electric Vehicle (HEV) DC/DC converter to the atmosphere. The system uses a coolant-to-air radiator design.

The MECS pump is an electric pump that runs any time the ignition is in the ON position. Unlike traditional cooling systems, there is no thermostat in the MECS , so coolant flow should be continuous and considerably less than traditional powertrain cooling systems.

The flow direction is from the DC/DC converter to the MECS pump through the eCVT , then through the MECS cooler from the LH to RH side of the vehicle back to the DC/DC converter.

The MECS cooling pump will make an audible noise if it is running and a slight vibration may be felt by touch.

The MECS cooling system has a coolant expansion tank mounted on top of the transaxle.

Symptom Chart - Transaxle Cooling

Symptom Chart - Transaxle Cooling

Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is

possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever
- Motor Electronics Cooling System (MECS) pump
- CHECK the MECS pump. INSTALL a new pump as necessary.

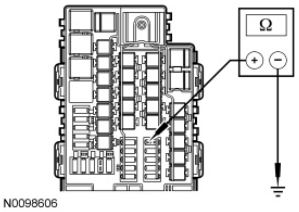
Pinpoint Tests

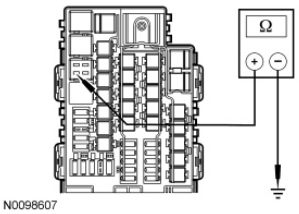
Pint Test A: MECS Cooling Pump Fault

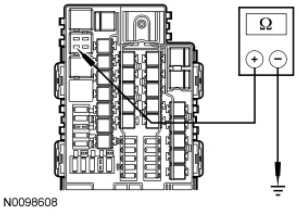
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Climate Control for schematic and connector information.

Normal Operation

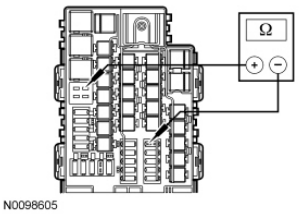
The Motor Electronics Cooling System (MECS) pump is electrically driven and controlled by the PCM through the MECS pump relay. The PCM energizes the MECS pump relay by pulling the MECS pump output to ground when the ignition is in the ON position.

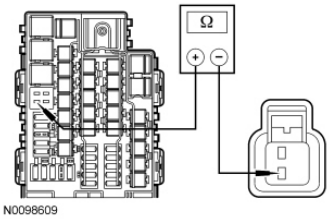




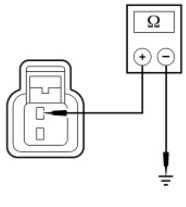


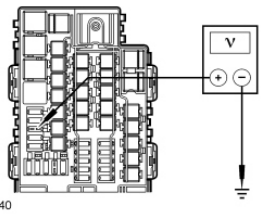
This pinpoint test is intended to diagnose the following:

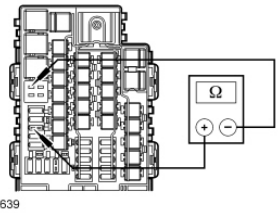




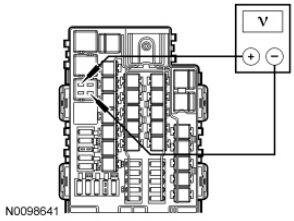
- Battery Junction Box (BJB) fuse 13 (15A)
- BJB fuse 47 (10A)
- MECS coolant pump
- Wiring
- MECS coolant pump relay

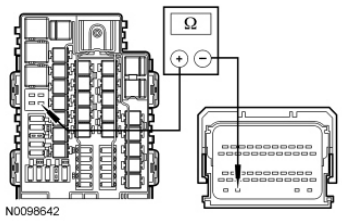






PINPOINT TEST A: MECS COOLING PUMP FAULT





NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
A1 CHECK FOR DTCs	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: RETRIEVE. • Carry out the PCM on-demand self test. • **Are DTCs retrieved?**	**Yes** REFER to Section 307-01C . **No** GO to A2 .
A2 CHECK BJB FUSE 13 (15A)	
• Check fuse: BJB 13 (15A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A5 .

	No GO to A3 .
A3 CHECK THE MECS COOLANT PUMP RELAY POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: BJB Fuse 13 (15A). • Disconnect: BJB Relay 44. • Disconnect: BJB Relay 42. • Measure the resistance between the output side of BJB fuse 13 (15A) and ground.  N0098606 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A4 . **No** REPAIR circuit SBB13 (GY/RD) for a short to ground. CONNECT all components. TEST the system for normal operation.
A4 CHECK THE MECS COOLANT PUMP AND HEATER PUMP POWER SUPPLY CIRCUITS FOR A SHORT TO GROUND	
• Disconnect: MECS Coolant Pump C1466. • Disconnect: Heater Pump Motor C1450. • Measure the resistance between BJB relay 44 pin 5 circuit CE621 (YE/GY), BJB side and ground.  N0098607 • Measure the resistance between BJB relay 42 pin 5 circuit CHC01 (BN/YE), BJB side and ground.  N0098608 • **Are the resistances greater than 10,000 ohms?**	**Yes** The condition that caused BJB fuse 13 (15A) to blow is not present. Inspect the wiring harness for an intermittent condition. Repeat test Steps A3 and A4 while wiggling the vehicle wiring harness and visually checking for damage. **No** REPAIR circuit CE621 (YE/GY) or CHC01 (BN/YE) for a short to ground. CONNECT all components. TEST the system for normal operation.
A5 CHECK THE MECS COOLANT PUMP RELAY (BJB RELAY 44)	

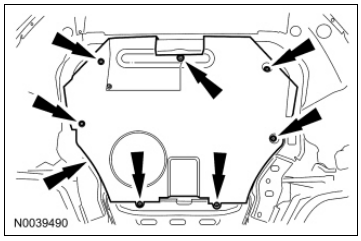
• Carry out the relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Is MECS pump relay (BJB relay 44) OK?**	**Yes** GO to A6 . **No** INSTALL a new MECS pump relay (BJB relay 44). TEST the system for normal operation.
A6 CHECK THE MECS COOLANT PUMP RELAY POWER SUPPLY CIRCUIT FOR AN OPEN	
• Measure the resistance between BJB fuse 13 (15A) circuit CE621 (YE/GY), BJB side and BJB relay 44 pin 5 circuit CE621 (YE/GY), BJB side.  N0098605 • **Is the resistance less than 5 ohms?**	**Yes** GO to A7 . **No** REPAIR circuit CE621 (YE/GY) for an open. CONNECT all components. TEST the system for normal operation.
A7 CHECK THE MECS COOLANT PUMP POWER SUPPLY CIRCUIT FOR AN OPEN	
• Measure the resistance between BJB relay 44 pin 5 circuit CE621 (YE/GY), BJB side and MECS coolant pump C1466-2, circuit CE621 (YE/GY).  N0098609 • **Is the resistance less than 5 ohms?**	**Yes** GO to A8 . **No** REPAIR circuit CE621 (YE/GY) for an open. CONNECT all components. TEST the system for normal operation.
A8 CHECK THE MECS COOLANT PUMP GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between MECS coolant pump 1466-1 circuit GD121 (BK/YE) and ground.	**Yes** GO to A9 . **No** REPAIR circuit GD121 (BK/YE). CONNECT all components. TEST the system for normal operation.

 N0098638 • **Is the resistance less than 5 ohms?**	
A9 CHECK BJB FUSE 47 (10A)	
• Check fuse: BJB 47 (10A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A10 . **No** REPAIR circuit CBK03 (GY) for a short to ground. CONNECT all components. TEST the system for normal operation.
A10 CHECK FOR VOLTAGE SUPPLIED TO BJB FUSE 47 (10A)	
• Disconnect: BJB Fuse 47 (10A). • Ignition ON. • Measure the voltage at the supply side of BJB fuse 47 (10A).  N0098640 • **Is the voltage greater than 10 volts?**	**Yes** GO to A11 . **No** REPAIR circuit CE612 (GY/VT) for an open. CONNECT all components. TEST the system for normal operation.
A11 CHECK THE MECS COOLANT PUMP RELAY CONTROL POWER SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the output side of BJB fuse 47 (10A), circuit CBK03 (GY) and BJB relay 44 pin 1 circuit CBK03 (GY).  N0098639 • **Is the resistance less than 5 ohms?**	**Yes** GO to A12 . **No** REPAIR circuit CBK03 (GY) for an open. CONNECT all components. TEST the system for normal operation.

A12 CHECK FOR GROUND AT THE MECS COOLANT PUMP RELAY	
• Connect: BJB fuse 47 (10A). • Ignition ON. • Measure the voltage between BJB relay 44 pins 1 and 2, BJB side.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new MECS pump. REFER to Motor Electronics Pump in this section. CONNECT all components. TEST the system for normal operation. **No** GO to A13 .
A13 CHECK THE MECS COOLANT PUMP RELAY CONTROL GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175T. • Measure the resistance between BJB relay 44 pin 2, BJB side circuit CE318 (VT) and PCM C175T-49 circuit CE318 (VT).  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14D . CONNECT all components. TEST the system for normal operation. **No** REPAIR circuit CE318 (VT) for an open. CONNECT all components. TEST the system for normal operation.

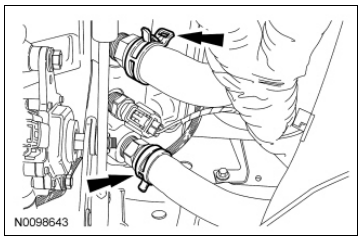
Motor Electronics Cooling System Draining and Filling

Material



Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

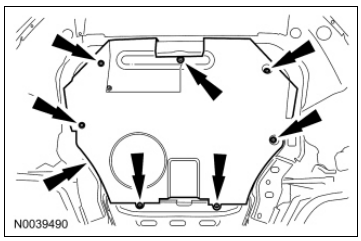
Draining



NOTICE: **The coolant must be recovered in a suitable, clean container for reuse or damage can occur to the transaxle cooling system. If the coolant is contaminated, it must be recycled or disposed of correctly.**

NOTICE: **Always refill the Motor Electronics Cooling System (MECS) with the same type of coolant that was drained from the system. Do not mix coolant types. Mixing coolant types may cause MECS damage.**

1. he vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Turn the ignition to the OFF position.
3. Remove the screws and the underbody cover.



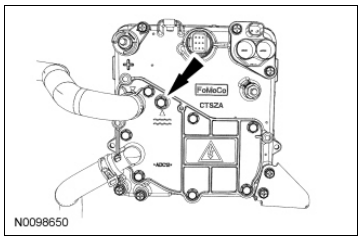
4. Compress the constant tension clamps and remove the hoses from the transaxle to allow the coolant to drain.

5. Connect the hoses to the transaxle and install the hose clamps.

6. Install the underbody cover and the screws.

Filling and Bleeding

NOTICE: **Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle. When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water.**



To maintain the integrity of the coolant and the cooling system:

- Vehicle cooling systems are filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.
- Do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant since a Ford-approved recycling process is not yet available.
- Used engine coolant should be disposed of in an appropriate manner. Follow community regulations and standards for recycling and disposing of automotive fluids.

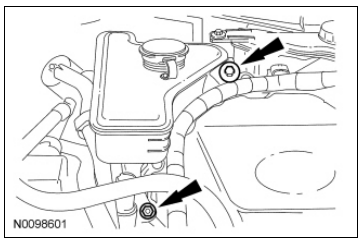
1. ***NOTICE:*** **Adhesives, stop-leak pellets or small foreign material in the Motor Electronics Cooling System (MECS) can cause poor performance or temporary blockage of the motor electronics pump. Only use clean, approved coolant when filling the system.**

   Loosen the Motor Electronics Cooling System (MECS) bleed screw on the DC/DC converter and slowly fill the coolant expansion tank with coolant until it begins to flow out of the bleed hole. Then, close the bleed screw.

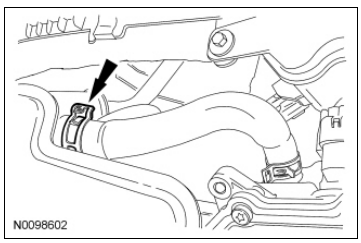
   - Tighten to 3 Nm (27 lb-in).

2. Turn the ignition to the ON position to actuate the MECS coolant pump and continue to fill the coolant expansion tank to the FULL COLD level labeled on the side of the tank.

3. To bleed air from the MECS , turn the ignition switch to the OFF position. Loosen the MECS bleed screw on the DC/DC converter and allow air to escape the MECS .



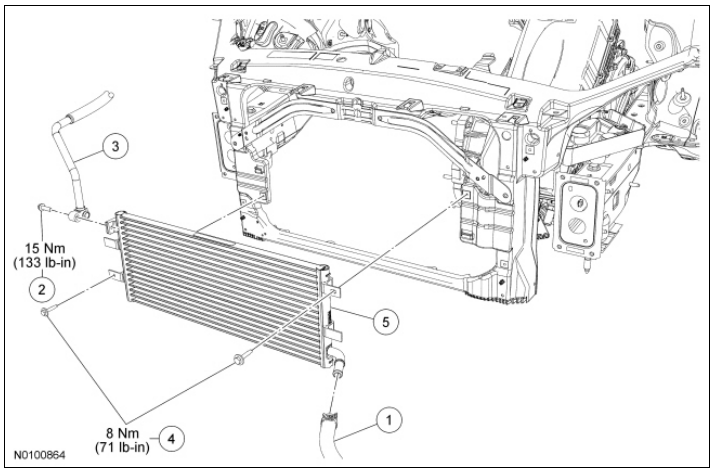
Motor Electronics Coolant Expansion Tank



Item	Part Number	Description
1	W505424	Motor Electronics Cooling System (MECS) coolant expansion tank bolt
2	W701152	MECS coolant expansion tank nut
3	W701152	MECS coolant expansion tank
4	8C045	MECS coolant expansion tank outlet hose

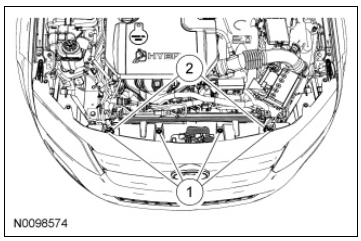
1. Drain the Motor Electronics Cooling System (MECS). For additional information, refer to Motor Electronics Cooling System Draining and Filling in this section.

2. Remove the nut and the bolt and position the MECS coolant expansion tank aside.
   - To install, tighten to 8 Nm (71 lb-in).

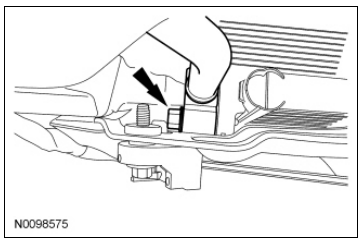


3. Compress the constant tension clamp and remove the MECS hose from the coolant expansion tank.

4. To install, reverse the removal procedure.

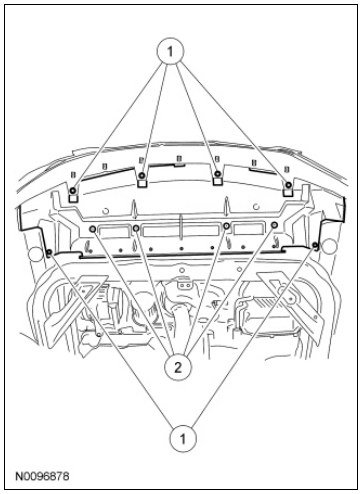


Motor Electronics Cooler

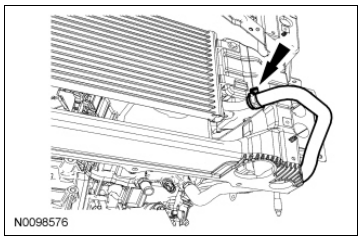


Item	Part Number	Description
1	8B273	Motor Electronics Cooling System (MECS) radiator inlet hose
2	N808349	MECS radiator outlet tube bolt
3	8B274	MECS radiator outlet ho
4	W711685-S	MECS radiator bolts
5	8005	MECS radiator

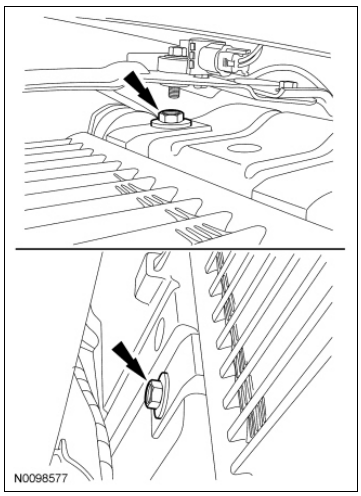
1. Drain the Motor Electronics Cooling System (MECS). For additional information, refer to Motor Electronics Cooling System Draining and Filling in this section.



2. Remove the 4 bolts and the 2 retainers and position the front grille aside far enough to gain access to the MECS radiator. For additional information, refer to Section 501-19 .

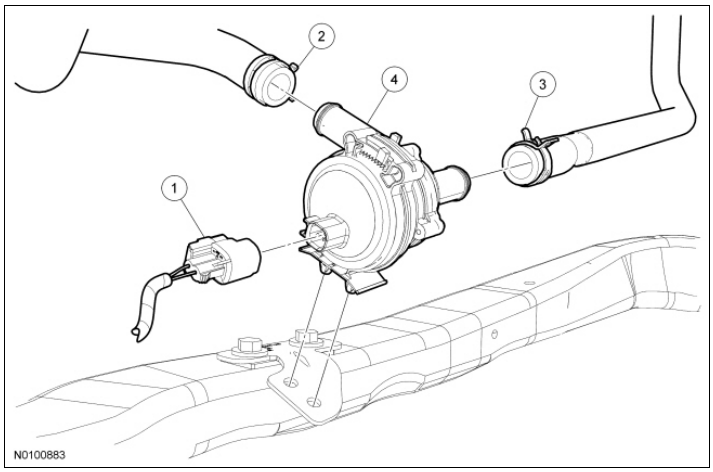


3. Remove the bolt and remove the upper MECS radiator tube from the MECS cooler.
   - To install, tighten to 15 Nm (133 lb-in).



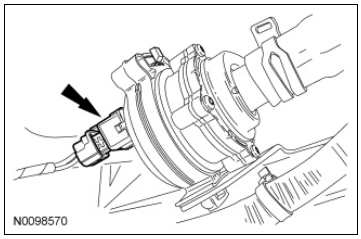
4. Remove the radiator splash shield.
    1. Remove the 6 screws.
    2. Remove the 4 retainers.

5. Compress the constant tension clamp and disconnect the MECS radiator hose from the MECS radiator.

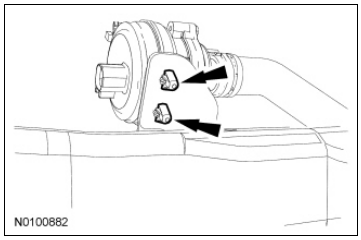


6. Remove the MECS radiator bolts and remove the radiator.
    - To install, tighten to 8 Nm (71 lb-in).

7. To install, reverse the removal procedure.

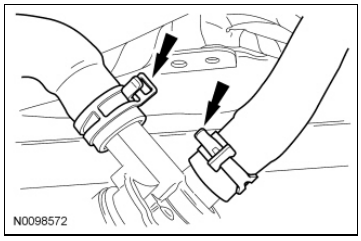


Motor Electronics Pump



Item	Part Number	Description
1	14A464	Motor Electronics Cooling System (MECS) coolant pump electrical connector
2	8A567	MECS coolant pump outlet hose
3	15179	MECS coolant punlet hose
4	8C419	MECS pump

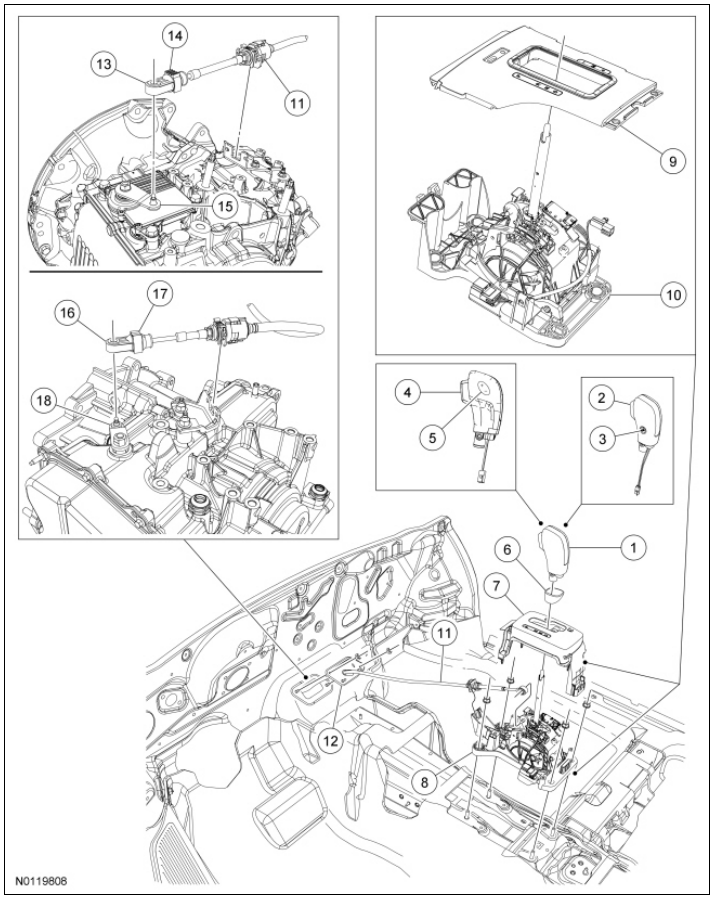
1. Drain the Motor Electronics Cooling System (MECS). For additional information, refer to Motor Electronics Cooling System Draining and Filling in this section.



2. Disconnect the MECS cooling pump electrical connector.

3. Compress the 2 retainers, remove the MECS pump from the bracket and pull the MECS pump down to gain access to the constant tension clamps that hold the hoses on.

4. Compress the constant tension clamps and disconnect the inlet and outlet hoses from the MECS pump.



5. To install, reverse the removal procedure.

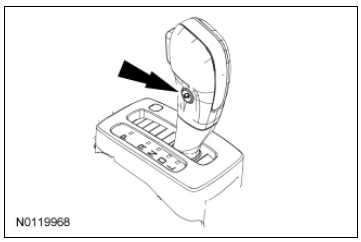
Torque Specifications

Description	Nm	lb-in
Selector lever cable grommet nuts	9	80
Selector lever nuts	20	177

External Controls

Item	Part Number	Description
1	7L010	Selector lever knob (vehicles equipped with a 3.5L engine)
2	7L010	Selector lever knob (vehicles equipped with a 2.5L engine)
3	-	Transmission Control Switch (TCS) (2.5L engine) (part of 7L010)
4	7L010	Selector lever knob (vehicles equipped with a 2.5L or 3.0L (4V) engine)
5	-	SelectShiftTM switch (2.5L or 3.0L (4V) engine) (part of 7L010)
6	-	Lower selector lever knob bezel (part o
7	7E034	Selector lever bezel (Fusion)
8	7K004	Selector lever assembly (Fusion)
9	7E034	Selector lever bezel (MKZ)
10	7K004	Selector lever assembly (MKZ)
11	7E395	Selector lever cable

12	57809	Selector lever cable grommet
13	-	Selector lever cable end (Aisin AW21) (part of 7E395)
14	-	Selector lever cable adjustment lock tab (Aisin AW21) (part of 7E395)
15	7A257	Manual control lever (Aisin AW21)
16	-	Selector lever cable end (6F35) (part of 7E395)
17	-	Selector lever cable adjustment lock tab (6F35) (part of 7E395)
18	7A257	Manual control lever (6F35)



The transaxle selector lever control linkage consists of:

- a selector lever cable that connects the transaxle range selector lever to the selector lever assembly.
- a Brake Shift Interlock Actuator (BSIA) that is integral to the selector lever assembly.

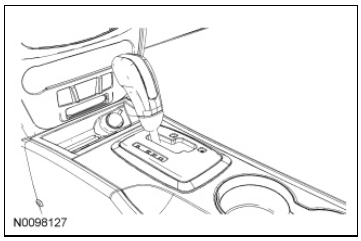
The selector lever assembly:

- locks the transaxle range selector lever in the PARK position when the ignition switch is in the lock position.
- requires the transaxle range selector lever to be in the PARK position to turn the ignition switch to the lock position.

Transmission Control Switch (TCS)-2.5L

Vehicles equipped with a Transmission Control Switch (TCS) have a momentary contact switch located on the selector lever knob that allows the driver to cancel the operation of Overdrive (O/D) and provides grade assist.

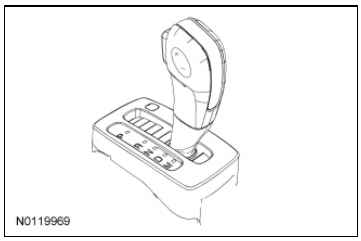
Grade Assist



- Improves vehicle handling in hilly terrain or mountainous areas by providing additional engine braking and extends lower gear operation on uphill climbs.
- Additional engine braking is provided through the automatic transaxle shift strategy which reacts to vehicle inputs including vehicle acceleration, accelerator pedal, brake pedal and vehicle speed.
- The transaxle will select gears that will provide the engine braking desired, based on the vehicle inputs, this will increase engine rpm during engine braking.

It is recommended to return to DRIVE mode on flat terrain to provide the best fuel economy and transaxle function. The transaxle returns to O/D and grade assist is cancelled when the TCS is pressed again.

Range Selection-SelectShiftTM



The H-gate selector lever has 5 fixed range positions: P, R, N, D, M and 2 spring-loaded manual positions (-) and (+).

H-Gate Selector-3.5L

The SelectShiftTM switch selector lever has 5 fixed range positions: P, R, N, D, M and a (-) and (+) SelectShiftTM switch.

SelectShiftTM Switch Selector-2.5L, 3.0L (4V)

Park

In the P position:

- the transaxle is locked and prevents the wheels from turning.
- there is no powerflow through the transaxle.
- the parking pawl locks the final drive.
- the engine may be started.
- the ignition key may be removed.

Reverse

In the R position:

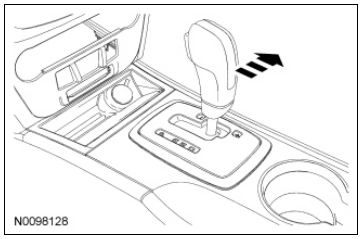
- the vehicle may be operated in a backward direction, at a reduced gear ratio.
- engine braking will occur.

Neutral

In the N position:

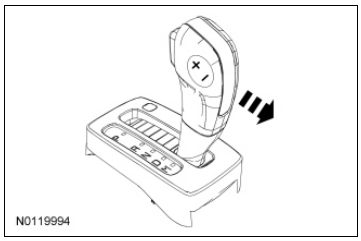
- the vehicle is able to roll.
- there is no powerflow through the transaxle.
- the output shaft is not held and is free to turn.
- the engine may be started.

Drive



D is the normal position for most forward driving.

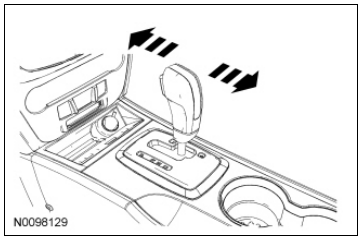
D provides:



- automatic shifts - 1st through 6th gears, which includes O/D .
- apply and release of the Torque Converter Clutch (TCC).
- maximum fuel economy during normal operation.

Ma/b>

H-Gate



SelectShiftTM Switch

In the M position:

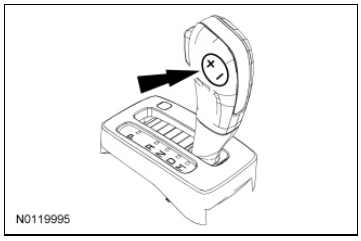
- O/D is cancelled.
- the 6F35 transaxle operates in gears 1st through 5th and the Aisin AW21 operates in gears 1st through 4th.
- grade assist is activated.
- some engine braking may occur.

SelectShiftTM Shift Transmission Selector Lever-H-Gate

The SelectShiftTM shift transmission selector lever gives the driver the ability to change gears up or down manually as desired.

- M +

- O/D can be selected.



- Moving the selector lever to the forward (-) or backward (+) position will allow the transmission to utilize the Manual for SelectShiftTM shifting.
- Moving the spring-loaded selector lever forward into (-) in the gate and releasing the selector lever, the selector lever will return to the M position and the transmission will down shift.
- Moving the spring loaded selector lever backward into (+) in the gate and releasing the selector lever, the selector lever will return to the M position and the transmission will up shift.

When selecting the appropriate gear in SelectShiftTM transmission mode, the instrument cluster will display the current selected gear.

The SelectShiftTM shift transmission will make some shifts automatically, primarily to protect the engine from stalling.

The transmission will not up shift if the redline is approached and must be shifted manually by moving the selector lever back into (+) and releasing.

SelectShiftTM Transmission Selector Lever-SelectShiftTM Switch

The SelectShiftTM transmission selector lever gives the driver the ability to change gears up or down manually as desired.

- M +

- O/D can be selected.
- Moving the selector lever to M position will allow the transmission to utilize the Manual Mode for SelectShiftTM shifting.
- Pressing the SelectShiftTM switch (-) on the selector lever, the transmission will down shift.
- Pressing the SelectShiftTM switch (+) on the selector lever, the transmission will up shift.

When selecting the appropriate ectShiftTM transmission mode, the message center will display the current selected gear.

The SelectShiftTM shift transmission will make some shifts automatically, primarily to protect the engine from stalling.

The transmission will not up shift if the redline is approached and must be shifted manually by pressing the SelectShiftTM switch (+) on the selector lever and releasing.

Gear Availability

MANUAL LEVER POSITION	TRANSAXLE GEAR OPERATION	DESCRIPTION
D Grade Assist	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ← 6	1st through 5th gears are available. Transaxle shifts to 5th gear if the TCS button is pressed when the transaxle is in 6th gear. Transaxle provides engine braking. Grade assist is activated.
M Aisin AW21	1 ⇆ 2 ⇆ 3 ⇆ 4 ← 5 ← 6	1st through 4th gears are available. Transaxle shifts to 4th gear if the selector lever is moved to the M position when the transaxle is in 5th or 6th gear. Transaxle provides engine braking.
M 6F35	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ← 6	1st through 5th gears are available. Transaxle shifts to 5th gear if the selector lever is moved to the M position when the transaxle is in 6th gear. Transaxle provides engine braking.
(-) (+) 6F35	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ⇆ 6	1st through 5th gears are available upon deceleration. The transaxle will make all downshifts. Up shifts will have to be shifted manually. Transaxle will upshift into 6th gear.
(-) (+) Aisin AW21	1 ⇆ 2 ⇆ 3 ⇆ 4 ⇆ 5 ⇆ 6	1st through 6th gears are available upon deceleration. The transaxle will make downshifts to first gear if a stop from 4th, 5th or 6th gear occurs. The transaxle also makes downshifts if the accelerator pedal is depressed past 90%. Upshifts are done manually with the selector lever. Transaxle can start in 1st, 2nd or 3rd gear.

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Inspection and Verification

1. Verify the customer concern by operating the system.

<

2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom. GO to Symptom Chart - External Controls or GO to Symptom Chart - NVH .

Visual Inspection Chart

Mechanical	Electrical
• Transmission selector lever cable • Manual control lever • Selector lever or selector lever knob	• Smart Junction Box (SJB) fuse 5 (10A) • Battery Junction Box (BJB) fuse 47 (10A) • Connections • Wiring harness • Brake Pedal Position (BPP) switch • Brake Shift Interlock Actuator (BSIA) • SelectShiftTM switch • Transmission Control Switch (TCS) (vehicles equipped with a 2.5L engine)

Diagnostic Trouble Code Chart

DTC	Component	Description	Condition	Symptom	Action
B2572					

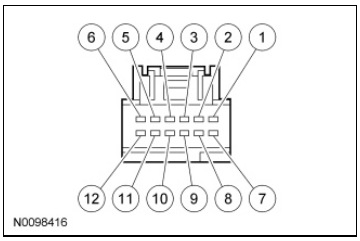
	Brake Shift Interlock	Brake Shift Interlock Output Circuit Failure	The associated circuitry connected to the Smart Junction Box (SJB) or fuse, or the SJB itself may have an issue causing a brake shift interlock concern.	Brake shift interlock is inoperative or does not operate correctly.	GO to Pinpoint Test A .
P0815	SelectShiftTM Switch	SelectShiftTM Switch Output Circuit Failure	The associated circuitry connected to the SelectShiftTM switch or fuse, or the SelectShiftTM switch itself may have an issue causing a fault.	SelectShiftTM operation is inoperative or does not operate correctly.	GO to Pinpoint Test C .
P0816	SelectShiftTM Switch	SelectShiftTM Switch Output Circuit Failure	The associated circuitry connected to the SelectShiftTM switch or fuse, or the SelectShiftTM switch itself may have an issue causing a fault.	SelectShiftTM operation is inoperative or does not operate correctly.	GO to Pinpoint Test C .
P0819	SelectShiftTM Switch	Up And Down Shift Switch To Transmission Range (TR) Correlation	The associated circuitry connected to the SelectShiftTM switch or fuse, or the SelectShiftTM switch itself may have an issue causing a fault.	SelectShiftTM operation is inoperative or does not operate correctly.	GO to Pinpoint Test D .

Symptom Chart - External Controls

Symptom Chart - External Controls

Symptom Chart - NVH

Symptom Chart - NVH



NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed
- Selector lever cable incorrectly routed, grounded out or loose
- CHECK the selector lever cable. REPAIR as necessary.

Electrical Connectors

Selector Lever Harness C3233

Pin Number	Circuit	Circuit Function
1	CET53 (BU/OG)	Brake Shift Interlock Actuator (BSIA) solenoid power circuit
2	CET22 (GY/BN)	Park position signal to ignition switch
3	CET52 (GN)	Park position signal to Instrument Cluster (IC)

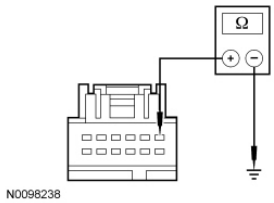
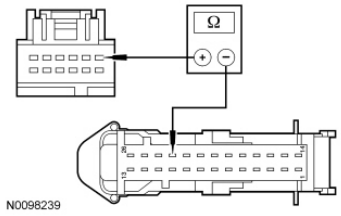
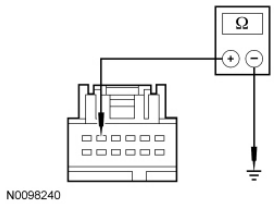
Pinpoint Tests



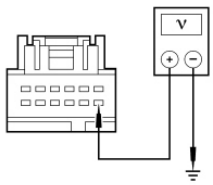


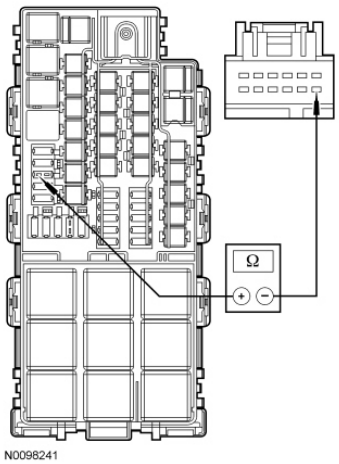


Refer to Wiring Diagrams Cell 29 (Fusion/MKZ , Fusion Hybridybrid), Transmission Controls -Aisin AW21 for schematic and connector information.

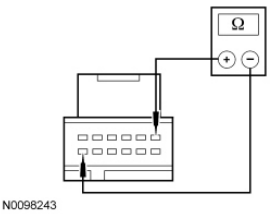
Refer to Wiring Diagrams Cell 30 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Transmission Controls-6F35 for schematic and connector information.

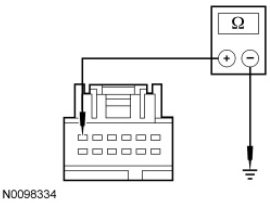
Refer to Wiring Diagrams Cell 37 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Shift Interlock for schematic and connector information.

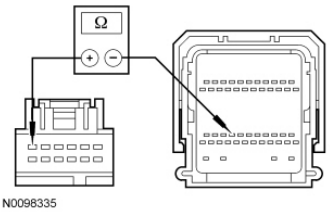




PINPOINT TEST A: THE BRAKE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

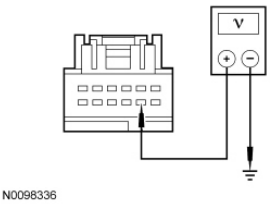




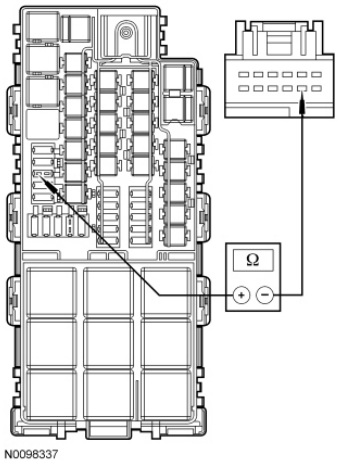


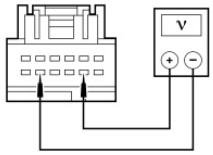
Test Step	Result / Action to Take
A1 CHECK DTCs	
♦ Ignition ON. ♦ Connect the scan tool. ♦ **Is DTC B2575 set?**	**Yes** GO to A2 . **No** The issue may not be in the Brake Shift Interlock Actuator (BSIA) electrical system. GO to Symptom Chart - External Controls in this section.
A2 CHECK FUSE 5 (10A)	
♦ Ignition OFF. ♦ Remove Smart Junction Box (SJB) fuse 5 (10A). ♦ Check fuse: SJB 5 (10A). ♦ **Is the resistance less than 5 ohms?**	**Yes** GO to A3 . **No** GO to A4 .
A3 CHECK THE POWER CIRCUIT FOR VOLTAGE	
♦ Disconnect: Selector Lever C3233. ♦ Ignition ON. ♦ Measure the voltage between selector lever harness C3233-1, circuit CET53 (BU/OG), vehicle harness side and ground, while applying the brake pedal.  N0098237 ♦ **Is the voltage greater than 10 volts?**	**Yes** GO to A6 . **No** GO to A5 .
A4 CHECK THE POWER CIRCUIT FOR A SHORT TO GROUND	
♦ Ignition OFF. ♦ Disconnect: SJB C2280C. ♦ Measure the resistance between selector lever harness C3233-1, circuit CET53 (BU/OG), vehicle harness side and ground.	**Yes** GO to A5 . **No** REPAIR circuit CET53 (BU/OG) for a short to ground. CLEAR the DTCs. TEST the system for normal operation.

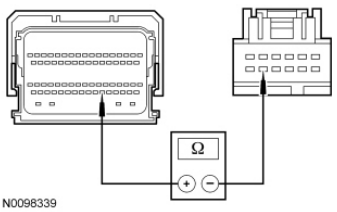
 N0098238 ♦ **Is the resistance greater than 10,000 ohms?**	
A5 CHECK THE POWER CIRCUIT FOR AN OPEN	
♦ Ignition OFF. ♦ Measure the resistance between the selector lever harness C3233-1, circuit CET53 (BU/OG), vehicle harness side and SJB C2280C-23, circuit CET53 (BU/OG), vehicle harness side.  N0098239 ♦ **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new SJB . CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR circuit CET53 (BU/OG) for an open. CLEAR the DTCs. TEST the system for normal operation.
A6 CHECK THE GROUND CIRCUIT FOR AN OPEN	
♦ Ignition OFF. ♦ Measure the resistance between selector lever harness C3233-5, circuit GD116 (BK/VT), vehicle harness side and ground.  N0098240 ♦ **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new selector lever. REFER to Selector Lever - Fusion or Selector Lever - MKZ in this section. **No** REPAIR circuit GD116 (BK/VT) for an open. CLEAR the DTCs. TEST the system for normal operation.



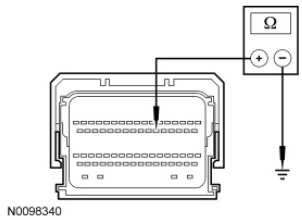
PINPOINT TEST B: TCS DOES NOT OPERATE CORRECTLY (VEHICLES EQUIPPED WITH A 2.5L ENGINE ONLY)

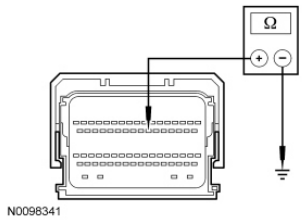


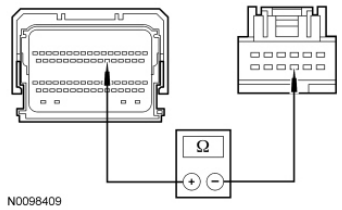


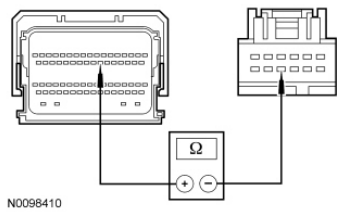


Test Step	Result / Action to Take
B1 CHECK THE IC	
♦ Connect the scan tool. ♦ Using the scan tool, monitor the TCS PID while cycling the Transmission Control Switch (TCS). ♦ **Does the TCS PID cycle from**	**Yes** REFER to Section 413-01 for diagnosis of the Instrument Cluster (IC) illumination. **No**



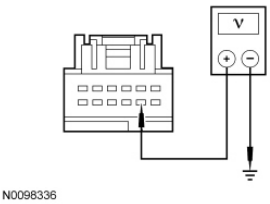




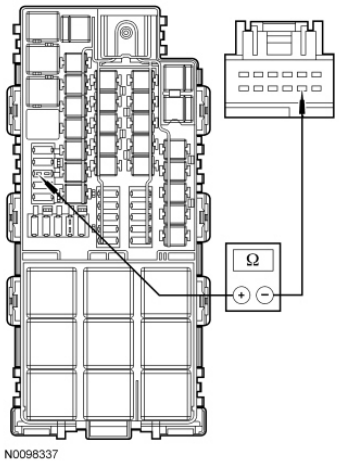


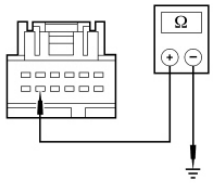
depressed to not depressed?	GO to B2 .
B2 CHECK FUSE 47 (10A)	
♦ Check fuse: Battery Junction Box (BJB) fuse 47 (10A). ♦ **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** GO to B6 .
B3 CHECK THE POWER CIRCUIT FOR VOLTAGE	
♦ Disconnect: Selector Lever C3233. ♦ Ignition ON. ♦ Measure the voltage between selector lever harness C3233-7, circuit CBK03 (GY), vehicle harness side and ground.  N0098242 ♦ **Is the voltage greater than 10 volts?**	**Yes** GO to B5 . **No** GO to B4 .
B4 CHECK THE POWER CIRCUIT FOR AN OPEN	
♦ Ignition OFF. ♦ Disconnect: BJB fuse 47 (10A). ♦ Measure the resistance between the output side of BJB fuse 47 (10A) and selector lever harness C3233-7 circuit CBK03 (GY), vehicle harness side.  N0098241 ♦ **Is the resistance less than 5 ohms?**	**Yes** Install a new BJB . **No** REPAIR circuit CBK03 (GY) for an open. TEST the system for normal operation.
B5 CHECK THE TCS	

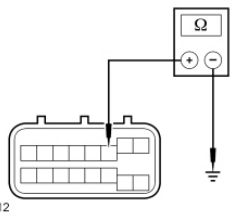
♦ Measure the resistance between selector lever harness C3533 pins 6 and 7, component side, while cycling the TCS .  N0098243 ♦ **Is the resistance less than 5 ohms when pressed and greater than 10,000 ohms when released?**	**Yes** GO to B7 . **No** INSPECT the selector lever wiring harness for damage. REPAIR the wiring harness as required. If the selector lever wiring harness is not damaged, INSTALL a new selector lever knob. REFER to Selector Lever Knob in this section. TEST the system for normal operation.
B6 CHECK THE SIGNAL CIRCUIT FOR A SHORT TO GROUND	
♦ Ignition OFF. ♦ Disconnect: PCM C175T. ♦ Measure the resistance between selector lever harness C3233-6, circuit CET34 (BN/GN) and ground.  N0098334 ♦ **Is the resistance greater than 10,000?**	**Yes** REPAIR circuit CBK03 (GY) for a short to ground. INSTALL a new fuse. TEST the system for normal operation. **No** REPAIR circuit CET34 (BN/GN) for a short to ground. INSTALL a new fuse. TEST the system for normal operation.
B7 CHECK THE SIGNAL CIRCUIT FOR AN OPEN	
♦ Disconnect: PCM C175T. ♦ Measure the resistance between selector lever harness C3233-6, circuit CET34 (BN/GN) and PCM C175T-31, circuit CET34 (BN/GN).  N0098335 ♦ **Is the resistance less then 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A . **No** REPAIR circuit CET34 (BN/GN) for an open. TEST the system for normal operation.



PINPOINT TEST C: SELECTSHIFTTM DOES NOT OPERATE CORRECTLY







Test Step	Result / Action to Take
C1 CHECK FUSE 47 (10A)	
♦ Check fuse: Battery Junction Box (BJB) 47 (10A). ♦ **Is the resistance less than 5 ohms?**	**Yes** GO to C2 . **No** REPAIR circuit CBK03 (GY) for a short to ground. INSTALL a new fuse. CLEAR the DTCs. TEST the system for normal operation.
C2 CHECK THE POWER CIRCUIT FOR VOLTAGE	
♦ Disconnect: Selector Lever C3233. ♦ Ignition ON. ♦ Measure the voltage between selector lever harness C3233-8, circuit CBK03 (GY), vehicle harness side and ground.  N0098336 ♦ **Is the voltage greater than 10 volts?**	**Yes** GO to C4 . **No** GO to C3 .
C3 CHECK THE POWER CIRCUIT FOR AN OPEN	
♦ Ignition OFF. ♦ Disconnect: BJB Fuse 47 (10A). ♦ Measure the resistance between the output side of BJB fuse 47 (10A) and selector lever harness C3233-8 circuit CBK03 (GY), vehicle harness side.	**Yes** INSTALL a new BJB . **No** REPAIR circuit CBK03 (GY) for an open. CLEAR the DTCs. TEST the system for normal operation.

 N0098337 ♦ **Is the resistance less than 5 ohms?**	
C4 CHECK THE GROUND CIRCUIT	
♦ Measure the voltage between selector lever C3233-8, CBK03 (GY), vehicle harness side and C3233-11, circuit RE407 (YE/VT), vehicle harness side.  N0098338 ♦ **Is the voltage greater than 10 volts?**	**Yes** GO to C6 . **No** GO to C5 .
C5 CHECK THE GROUND CIRCUIT FOR AN OPEN	
♦ Disconnect: PCM C175B. ♦ Measure the resistance between selector lever C3233-11, circuit RE407 (YE/VT) and PCM C175B-56, circuit RE407 (YE/VT).  N0098339 ♦ **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14B . **No** REPAIR circuit RE407 (YE/VT) for an open. CLEAR the DTCs. TEST system for normal operation.
C6 CHECK CIRCUITS FOR A SHORT TO GROUND	

♦ Disconnect: PCM C175B. ♦ Measure the resistance between PCM C175B-23, circuit CET43 (GY) and ground.  N0098340 ♦ Measure the resistance between PCM C175B-24, circuit CET42 (GN/VT) and ground.  N0098341 ♦ **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C7 . **No** REPAIR circuit CET43 (GY) or circuit CET42 (GN/VT) for a short to ground. CLEAR the DTCs. TEST system for normal operation.
C7 CHECK CIRCUITS FOR AN OPEN	
♦ Measure the resistance between PCM C175B-23, circuit CET43 (GY) and selector lever C3233-9.  N0098409 ♦ Measure the resistance between PCM C175B-24, circuit CET43 (GY) and selector lever C3233-10.  N0098410 ♦ **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new selector lever. REFER to Selector Lever - Fusion in this section. CLEAR the DTCs. TEST the system for normal operation. If the condition still exists, INSTALL a new PCM. REFER to Section 303-14B . **No** REPAIR circuit CET43 (GY) or circuit CET42 (GN/VT) for an open. CLEAR the DTCs. TEST system for normal operation.

PINPOINT TEST D: SELECTSHIFTTM DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
D1 CHECK FUSE 47 (10A)	
♦ Check fuse: Battery Junction Box (BJB) 47 (10A). ♦ **Is the resistance less than 5 ohms?**	**Yes** GO to D2 . **No** REPAIR circuit CBK03 (GY) for a short to ground. INSTALL a new fuse. CLEAR the DTCs. TEST the system for normal operation.
D2 CHECK THE POWER CIRCUIT FOR VOLTAGE	
♦ Disconnect: Selector Lever C3233. ♦ Ignition ON. ♦ Measure the voltage between selector lever harness C3233-8, circuit CBK03 (GY), vehicle harness side and ground.  N0098336 ♦ **Is the voltage greater than 10 volts? /b>**	**Yes** GO to D4 . **No** GO to D3 .
D3 CHECK THE POWER CIRCUIT FOR AN OPEN	
♦ Ignition OFF. ♦ Disconnect: BJB Fuse 47 (10A). ♦ Measure the resistance between the output side of BJB fuse 47 (10A) and selector lever harness C3233-8 circuit CBK03 (GY), vehicle harness side.	**Yes** INSTALL a new BJB . **No** REPAIR circuit CBK03 (GY) for an open. CLEAR the DTCs. TEST the system for normal operation.

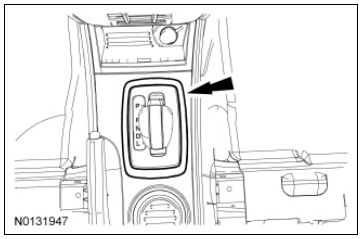
 N0098337 ♦ **Is the resistance less than 5 ohms?**	
D4 CHECK THE GROUND CIRCUIT	
♦ Measure the resistance between selector lever C3233-11, circuit RE407 (YE/VT) (Fusion) or circuit GD116 (BK/VT) (MKZ) and ground.  N0098411 ♦ **Is the resistance less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR circuit RE407 (YE/VT) (Fusion) or circuit GD116 (BK/VT) (MKZ) for an open. CLEAR the DTCs. TEST system for normal operation.
D5 CHECK CIRCUITS FOR A SHORT TO GROUND	
♦ Disconnect: Transmission Control Module (TCM) C1533. ♦ Measure the resistance between TCM C1533-3, circuit CET43 (GY) and ground.  N0098412 ♦ Measure the resistance between TCM C1533-4, circuit CET42 (GN/VT) and ground.	**Yes** GO to D6 . **No** REPAIR circuit CET43 (GY) or circuit CET42 (GN/VT) for a short to ground. CLEAR the DTCs. TEST system for normal operation.

 N0098413 ♦ **Is the resistance greater than 10,000 ohms?**	
D6 CHECK CIRCUITS FOR AN OPEN	
♦ Measure the resistance between TCM C1533-3, circuit CET43 (GY) and selector lever C3233-9.  N0098414 ♦ Measure the resistance between TCM C1533-4, circuit CET43 (GY) and selector lever C3233-10.  N0098415 ♦ **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new selector lever. REFER to Selector Lever - Fusion or Selector Lever - MKZ in this section. CLEAR the DTCs. TEST the system for normal operation. If the condition still exists, INSTALL a new TCM. REFER to Section 307-01A . **No** REPAIR circuit CET43 (GY) or circuit CET42 (GN/VT) for an open. CLEAR the DTCs. TEST system for normal operation.

p;

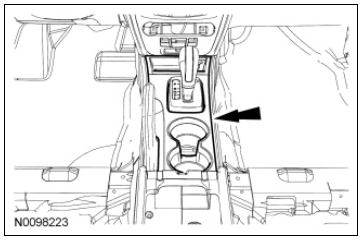
Brake Shift Interlock Override

NOTE: If it is necessary to use the override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the brake lights are not operational. Before driving the vehicle, verify that the brake lights are working.



This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON position unless the brake pedal is depressed.

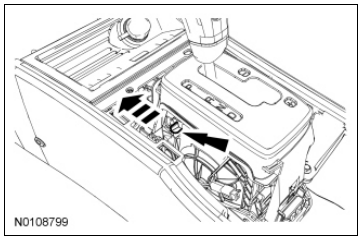
If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is depressed, carry out the following procedure.



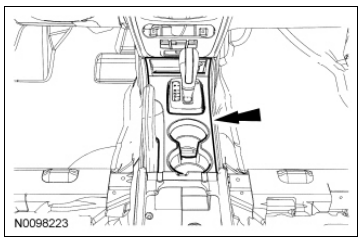
Fusion

1. Apply the parking brake.

2. Remove the selector lever trim ring.

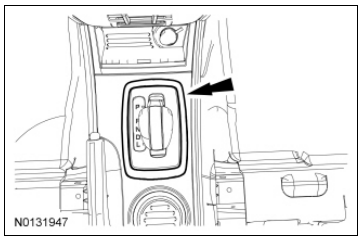


3. Remove tenter console trim panel



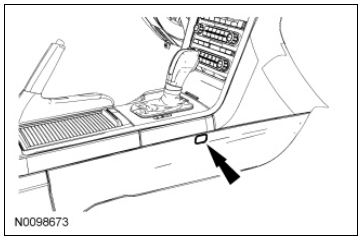
4. **NOTE:** Vehicles equipped with a 3.0L/3.5L shown, vehicles equipped with a 2.5L similar.

   Using a suitable tool, push the brake shift interlock override forward, apply the brake, press the selector lever knob button and move the selector lever into NEUTRAL.

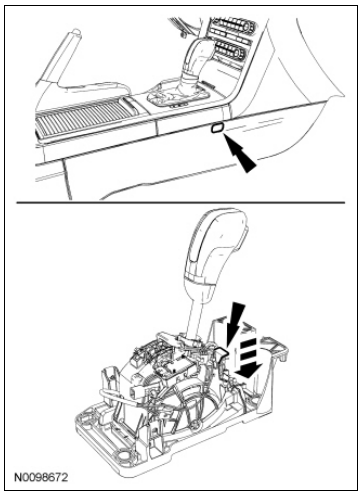


5. Start the vehicle.

6. Install the center console trim panel.

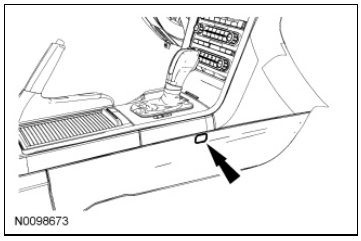


7. Install the selector lever trim ring.



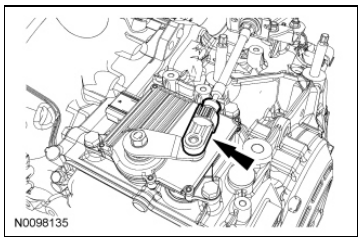
MKZ

8. Remove the access panel.



9. Insert a suitable tool into the access hole, depress the brake shift interlock override mechanism on the selector lever, apply the brake, depress the button on the selector lever knob and move the selector lever into NEUTRAL.

10. Start the vehicle.

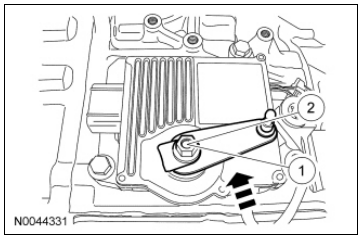


11. Install the access panel.

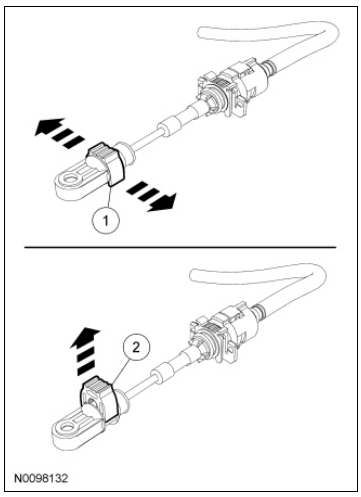
N0098673

Selector Lever Cable Adjustment - Aisin AW21

1. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12C .

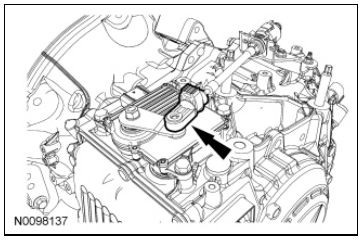


2. Disconnect the selector lever cable end from the manual control lever.

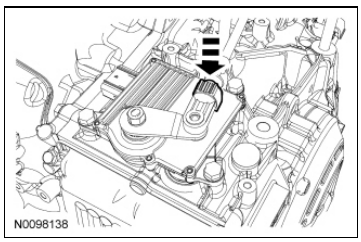


3. Place the selector lever in DRIVE.

.



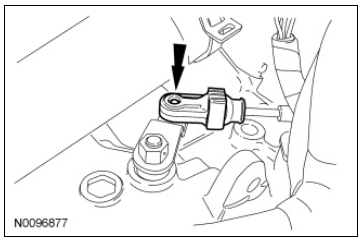
4. Place the manual control lever in DRIVE.
    1. Place the manual control lever in PARK.
    2. Move the manual control lever counterclockwise 3 detents to the DRIVE position.



5. Release the selector lever cable adjuster lock.
    1. Pull out on the adjuster lock tabs.
    2. Slide the lock up to unlock the selector lever cable.

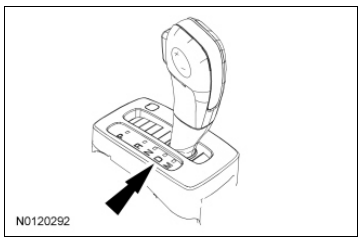
6. Align the selector lever cable end to the manual control lever ball stud and install it with the adjuster unlocked.

7. Slide the adjuster tab in place to lock the selector lever cable.



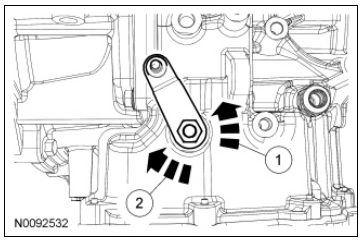
8. Install the ACL assembly. For additional information, refer to Section 303-12C .

9. Verify that the vehicle starts in PARK and NEUTRAL only and that the reverse lamps illuminate in REVERSE.



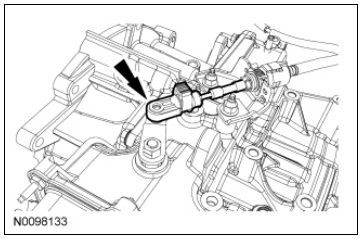
Selector Lever Cable Adjustment - 6F35

1. Disconnect the selector lever cable end from the manual control lever.

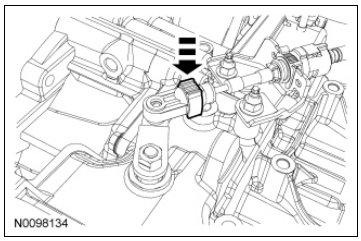


2. **NOTE:** SelectShiftTM shown, Transmission Control Switch (TCS) similar.

   Place the selector lever in the D position.

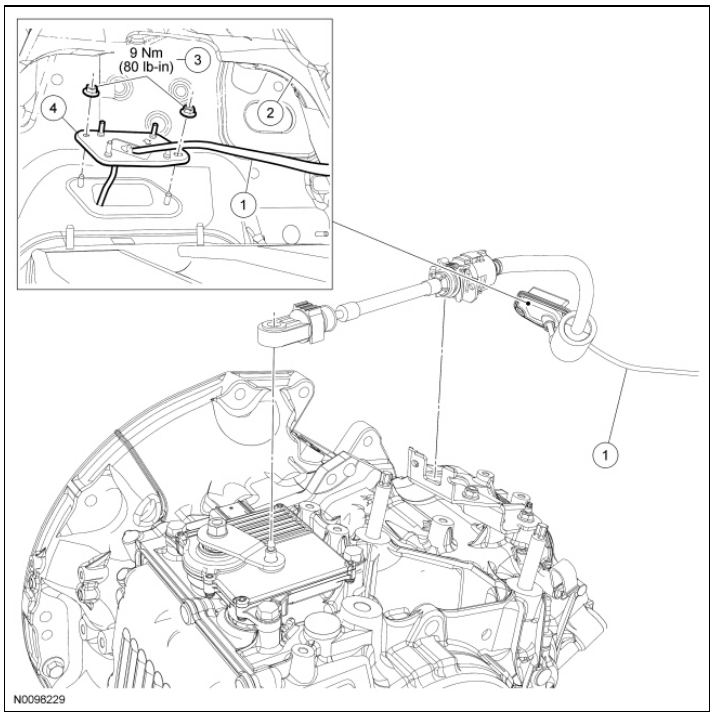


3. Place the manual control lever in the D position.
   1. Rotate the manual control lever counterclockwisPARK position.
   2. Rotate the manual control lever clockwise 3 detents to the D position.

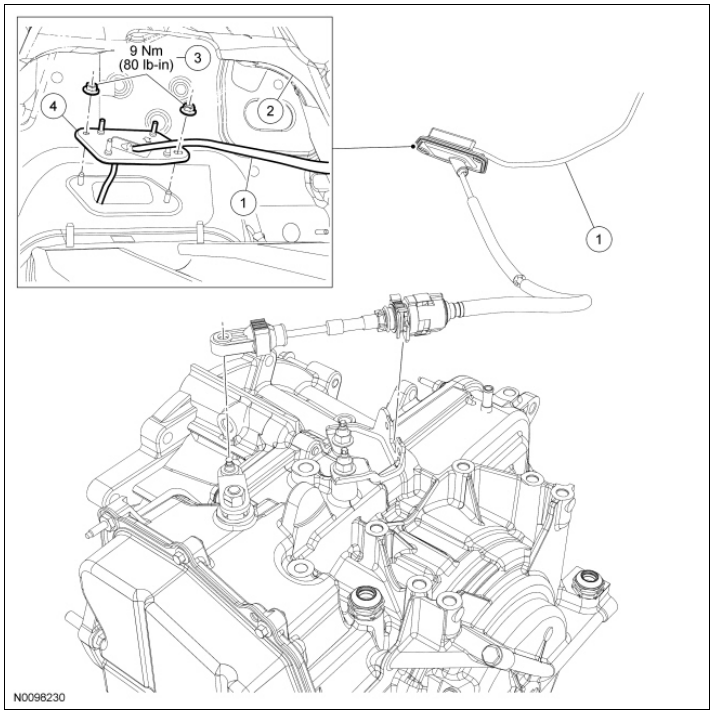


4. Release the selector lever cable adjuster lock.
   1. Pull out on the adjuster lock tabs.
   2. Slide the lock up to unlock the selector lever cable.

5. Align the selector lever cable end to the manual control lever ball stud and install it with the adjuster unlocked.



6. Slide the adjuster tab in place to lock the selector lever cable.

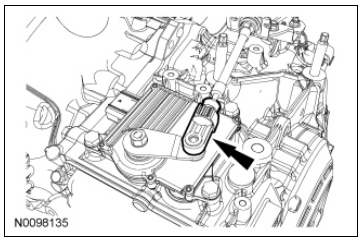


7. Verify that the vehicle starts in PARK and NEUTRAL only and that the reverse lamps illuminate in REVERSE.

Selector Lever Cable

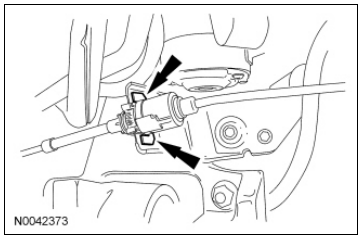
Selector Lever Cable - Aisin AW21

Selector Lever Cable - 6F35 Transaxle



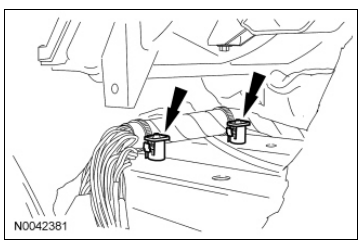
Item	Part Number	Description
1	7E395	Selector lever cable
2	54017A40	
3	W707142	Selector lever cable grommet retaining nuts
4	57809	Selector lever cable grommet

Removal



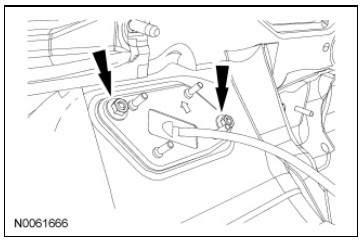
1. Remove the heater core and evaporator core housing. For additional information, refer to Section 412-01 .
2. Remove the Restraints Control Module (RCM). For additional information, refer to Section 501-20B .
3. Remove the battery tray. For additional information, refer to Section 414-01 .
4. **NOTE:** Aisin AW21 shown, 6F35 similar.

   Disconnect the selector lever cable end from the manual control lever.



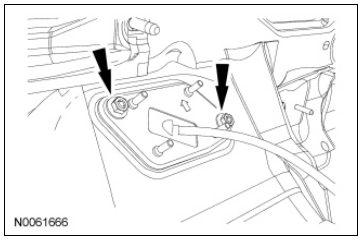
5. **NOTE:** Aisin AW21 shown, 6F35 similar.

   Release the 2 tabs and remove the selector lever cable from the selector lever cable bracket.

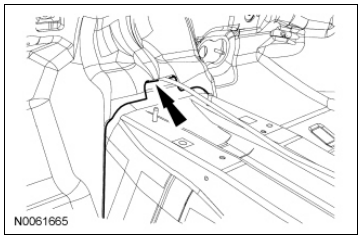


6. Disconnect the 2 wiring harness fasteners and position the RCM wiring harness aside.

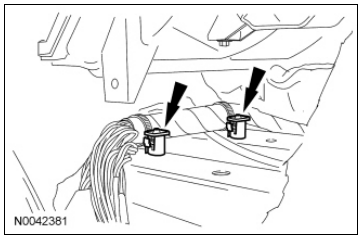
7. Position the insulation blanket away from the bulkhead to gain access to the 2 selector lever cable bracket nuts.



8. Remove the 2 selector lever cable grommet nuts and remove the selector lever cable through the interior of the vehicle.



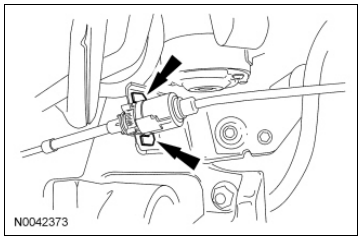
Installation



1. Position the selector lever cable in place and install the 2 nuts.
   - Tighten to 9 Nm (80 lb-in).

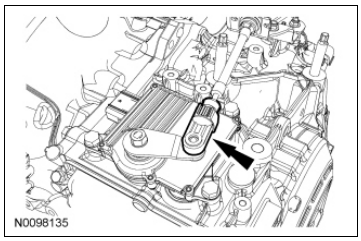
2. Position the insulation blanket in place over the selector lever cable grommet.

3. Position back the RCM wiring harness and install the fasteners on the studs.



4. **NOTE:** Aisin AW21 shown, 6F35 similar.

   NOTE: When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the selector lever cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the selector lever cable to click in place. Pull back on the



selector lever cable to make sure that it is locked into the selector lever cable bracket. Also make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed.

Install the selector lever cable in the bracket. Be sure the tabs are locked in place.

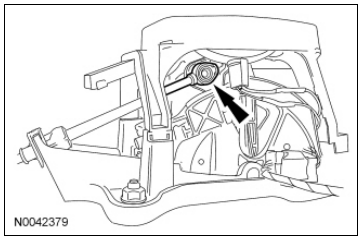
5. **NOTE:** Aisin AW21 shown, 6F35 similar.

   Connect the selector lever cable end on the manual control lever.

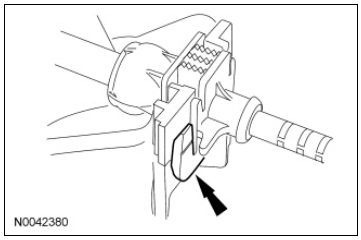
6. Install the battery and battery tray. For additional information, refer to Section 414-01 .
7. Install the RCM . For additional information, refer to Section 501-20B .
8. Install the heater core and evaporator core housing. For additional information, refer to Section 412-01 .
9. Adjust the selector lever cable. For additional information, refer to Selector Lever Cable Adjustment - Aisin AW21 or Selector Lever Cable Adjustment - 6F35 in this section.

Selector Lever - Fusion

NOTE: Transmission Control Switch (TCS) selector lever shown, SelectShiftTM selector lever similar.

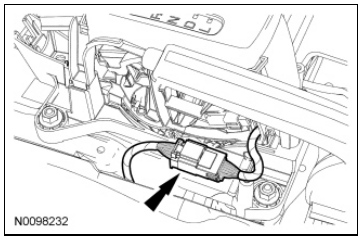


Item	Part Number	Description
1	7E395	Selector lever cable
2	14489	Selector lever electrical connector
3	W714098	Selector lever nuts (4 required)
4	7K004	Selector lever assembly

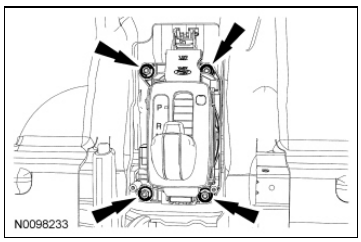


Removal

1. Remove the center console. For additional information, refer to Section 501-12 .

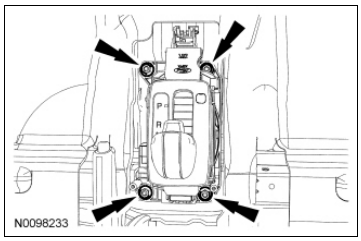


2. Disconnect the selector lever cable end from the selector lever.

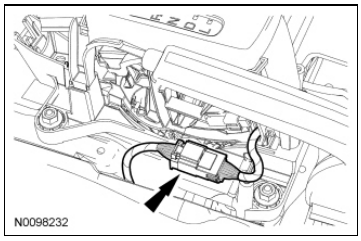


3. Release the tab on the selector lever cable and remove it from the selector lever housing.

4. Disconnect the electrical connector.

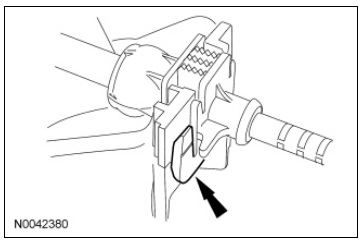


5. Remove the 4 nuts and remove the selector lever.

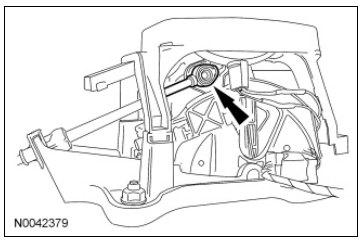


Installation

1. Install the selector lever and the 4 nuts.
   - Tighten to 20 Nm (177 lb-in).

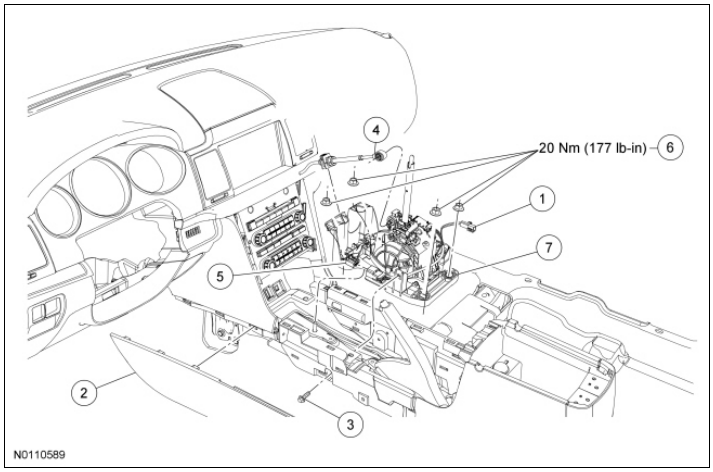


2. Connect the electrical connector.



3. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the selector lever cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the selector lever cable to click in place. Pull back on the selector lever cable to make sure that it is locked into the selector lever cable bracket. Also make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed.

   Install the selector lever cable in the selector lever housing.

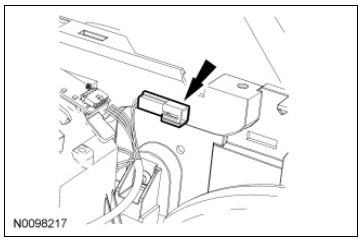


4. Connect the selector lever cable end to the selector lever.

5. Install the center console. For additional information, refer to Section 501-12 .

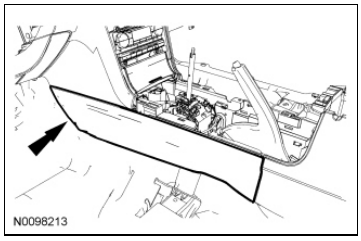
6. Adjust the selector lever cable. For additional information, refer to Selector Lever Cable Adjustment - Aisin AW21 or Selector Lever Cable Adjustment - 6F35 in this section.

Selector Lever - MKZ



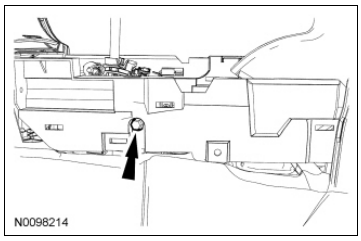
Item	Part Number	Description
1	14A459	Selector lever bezel electrical connector
2	1181081	Floor console lower trim panel
3	W709955	Floor console screw
4	7E395	Selector lever cable
5	14489	Selector lever electrical connector
6	W714098	Selector lever nuts
7 d>7210	Selector lever	

Removal



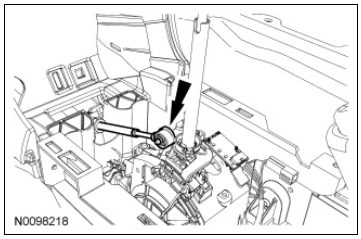
1. Remove the selector lever bezel. For additional information, refer to Selector Lever Bezel - MKZ in this section.

2. Remove the PRNDL electrical connector from the RH side of the center console.



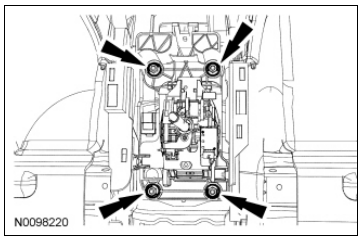
3. **NOTE:** LH shown, RH similar.

   Remove the LH and RH center console trim covers.

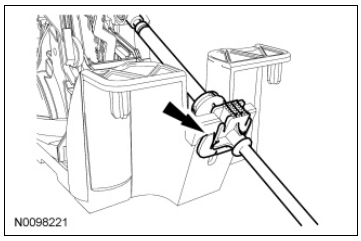


4. **NOTE:** LH shown, RH similar.

   Remove the LH and RH center console-to-selector lever screws.

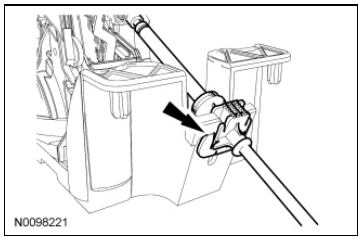


5. Disconnect the selector lever cable end from the selector lever ball stu

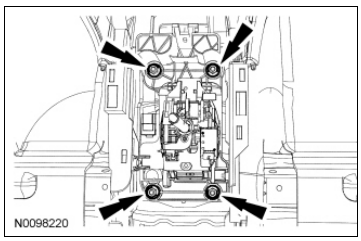


6. Disconnect the selector lever electrical connector.

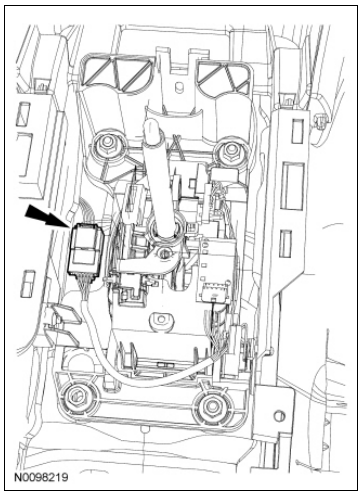
7. Remove the 4 selector lever nuts.



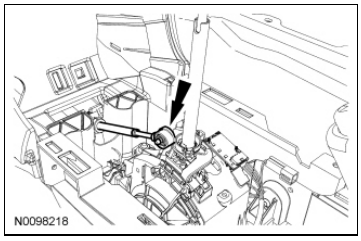
8. Position the selector lever off of the studs, release the tab on the selector lever cable and remove it from the selector lever.



Installation

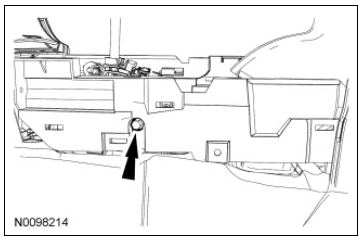


1. Install the selector lever cable in the selector lever and position the selector lever on the studs.

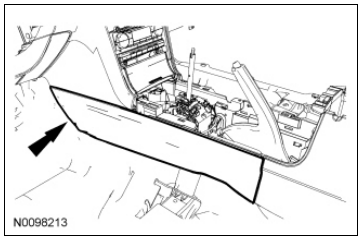


2. Install the 4 selector lever nuts.
   - Tighten to 20 Nm (177 lb-in).

3. Connect the selector lever electrical connector.

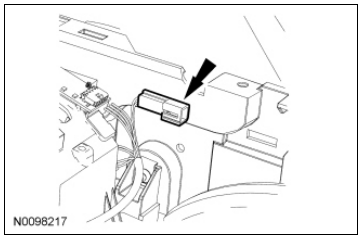


4. Connect the selector lever cable end on the selector lever ball stud.



5. **NOTE:** LH shown, RH similar.

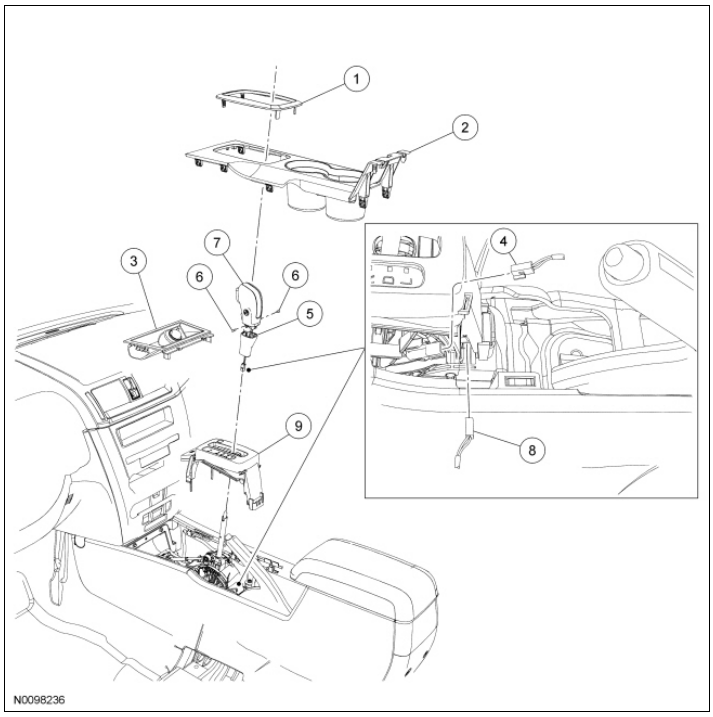
   Install the LH and RH center console-to-selector lever screws.



6. **NOTE:** LH shown, RH similar.

   Install the LH and RH center console trim covers.

7. Install the PRNDL electrical connector on the RH side of the center console.



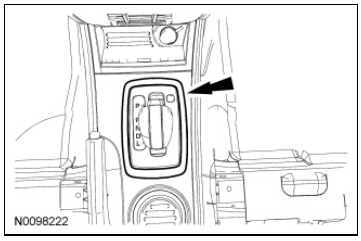
8. Install the selector lever bezel. For additional information, refer to Selector Lever Bezel - MKZ in this section.

9. Check the selector lever cable adjustment. Make sure that the vehicle starts in PARK and NEUTRAL and the reverse lamps illuminate in REVERSE. If an adjustment is necessary, refer to Selector Lever Cable Adjustment - Aisin AW21 in this section.

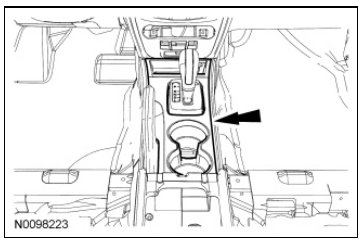
p;

Selector Lever Bezel - Fusion

NOTE: Transmission Control Switch (TCS) shown, SelectShiftTM switch similar.

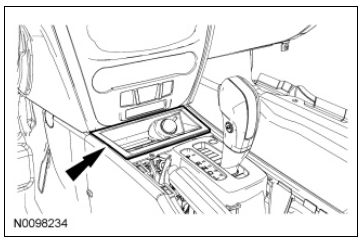


Item	Part Number	Description
1	54061A16	Selector lever trim ring
2	54045A76	Center console trim panel
3	54045A07	Utility tray
4	14A459	Transmission Control Switch (TCS) electrical connector (2.5L engine only)
5	-	Selector lever knob bezel
6	W701894	Selector lever knob screws
7L010	Selector lever knob	
8	14A459	Selector lever bezel electrical connector
9	7E034	Selector lever bezel

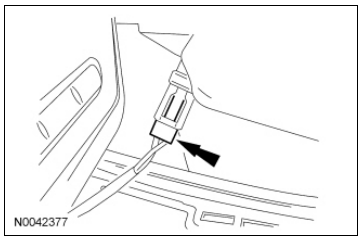


Removal

All vehicles

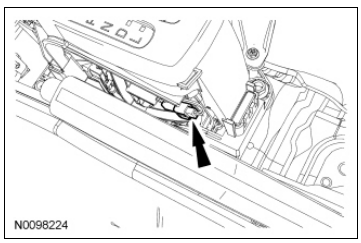


1. Remove the selector lever trim ring.



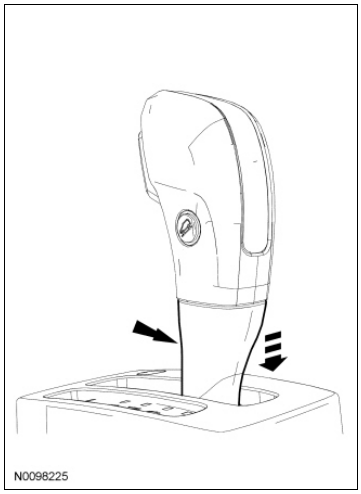
2. Remove the center console trim panel.

3. Remove the utility tray from the center console.



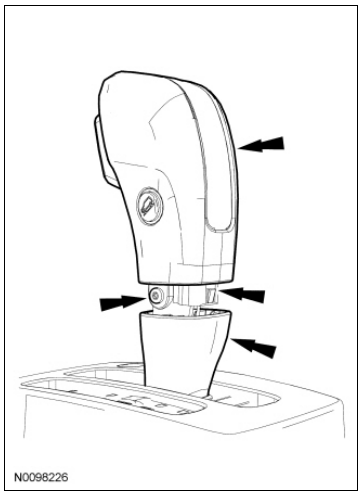
4. Disconnect the electrical connector and remove the utility tray.

Vehicles equipped with a 2.5L or 3.0L (4V) engine



5. Disconnect the Transmission Control Switch (TCS) or SelectShiftTM switch electrical connector.

All vehicles



6. **NOTE:** TCS shown, SelectShiftTM switch similar.

Slide the selector lever knob bezel downward to gain access to the 2 selector lever knob screws.

7. *NOTICE:* **It is necessary to route the Transmission Control Switch (TCS) harness or SelectShiftTM switch harness out of the selector lever bezel when removing the selector lever knob.**

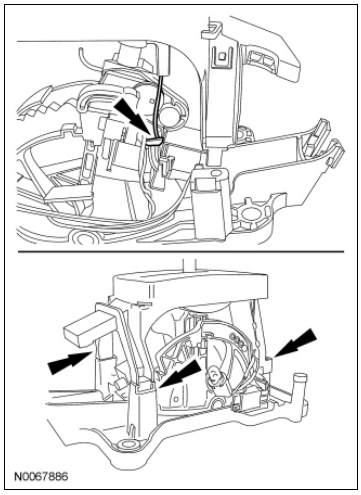
   Remove the 2 screws from the selector lever knob. Remove the selector lever knob and selector lever knob bezel.

8. Disconnect the selector lever bezel electrical connector.

9. **NOTE:** Selector lever removed for clarity.

   Release the 3 tabs and remove the selector lever knob bezel.

Installation



Vehicles equipped with a 2.5L or 3.0L (4V) engine

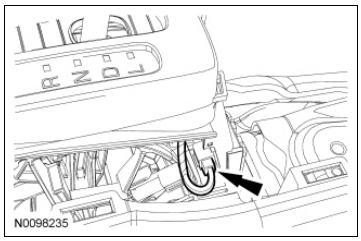
1. ***NOTICE:*** **Be sure that the override lever is inserted in the override lever guide or the shift interlock override button will not work correctly.**

   NOTE: Selector lever removed for clarity.

   Install the selector lever bezel on the selector lever.

   - Position the override lever in the override lever guide.
   - Make sure that the 3 locking tabs are locked in place.

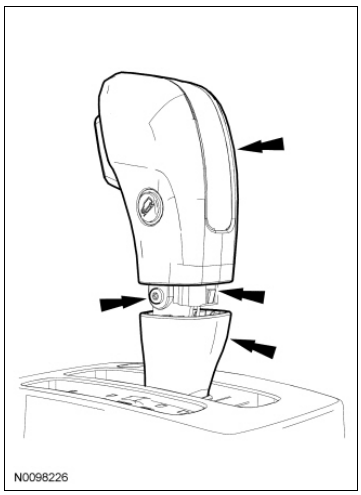
Vehicles equipped with a 3.5L engine



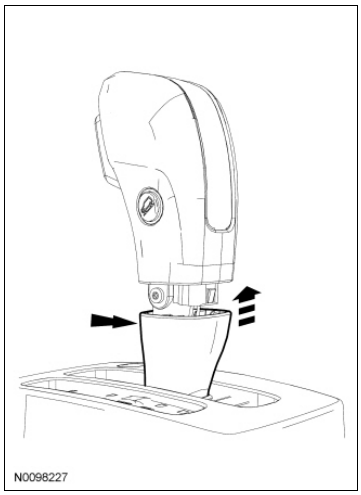
2. **NOTE:** Selector lever removed for clarity.

   Install the selector lever bezel on the selector lever and be sure the 3 tabs are locked in place.

All vehicles



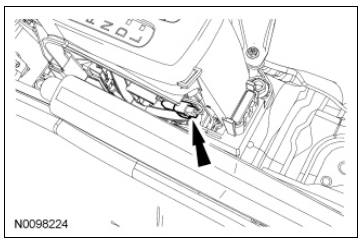
3. Connect the selector lever bezel electrical connector.



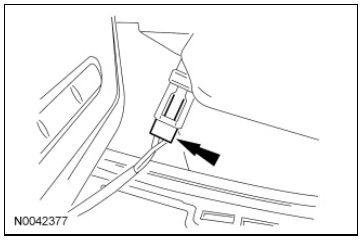
4. ***NOTICE:*** **It is necessary to route the Transmission Control Switch (TCS) harness or SelectShiftTM switch harness out of the selector lever bezel when removing the selector lever knob.**

   NOTE: TCS shown, SelectShiftTM switch similar.

Install the selector lever knob on the selector lever and install the screws.

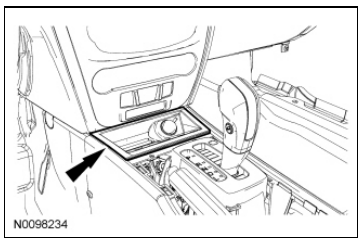


5. Slide the selector lever knob bezel up and install it on the selector lever knob.

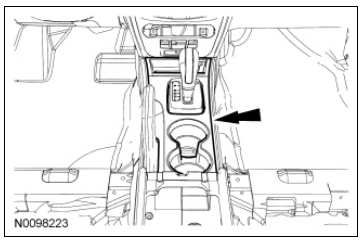


Vehicles equipped with 2.5L or 3.0L (4V) engine

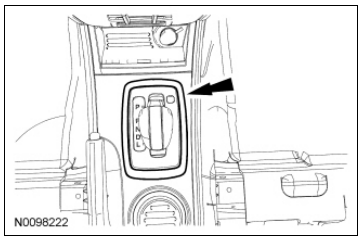
6. Connect the TCS or SelectShiftTM switch electrical connector.



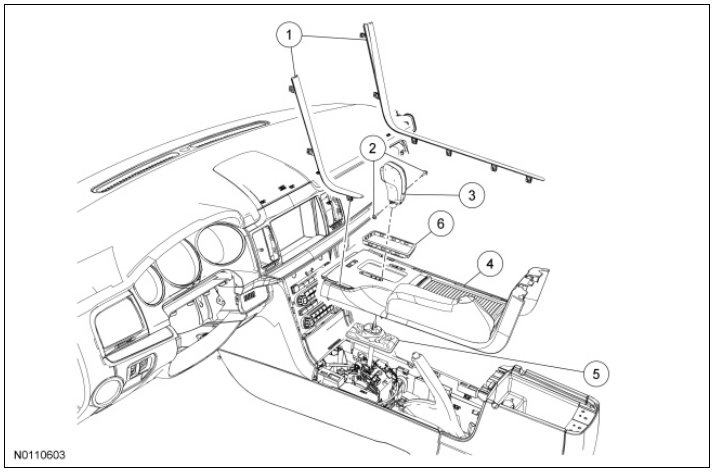
All vehicles



7. Position the utility tray in place and connect the electrical connector.

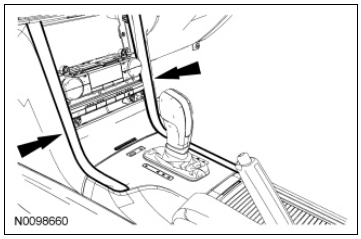


8. Install the utility tray on the center console.

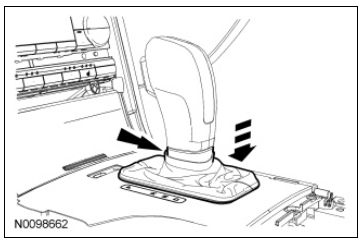


9. Install the center console trim panel.

10. Install the selector lever trim ring.

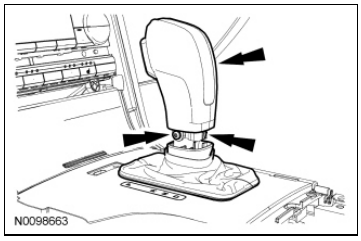


Selector Lever Bezel - MKZ

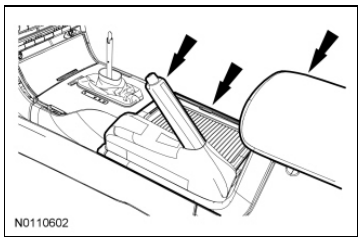


Item	Part Number	Description
1	061A16	Floor console finish moulding
2	W701894	Selector lever knob screws
3	7L010	Selector lever knob
4	7E034	Selector lever bezel
5	7B118	Selector lever boot
6	-	Selector lever trim ring (part of 7B118)

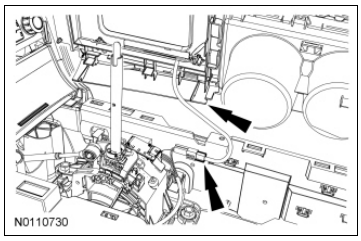
Re>



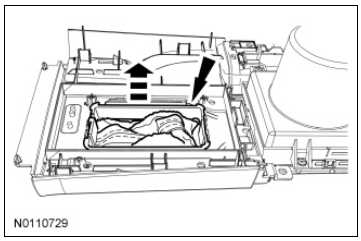
1. Remove the LH and RH console finish moldings.



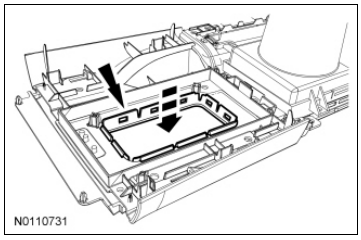
2. Slide the selector lever knob trim ring down to expose the 2 selector lever knob screws.



3. Remove the 2 selector lever knob screws and remove the selector lever knob.

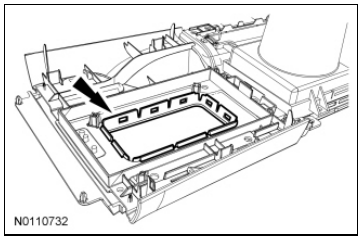


4. Lift the arm rest, apply the emergency brake, pull directly up on the selector lever bezel and remove it from the center console.

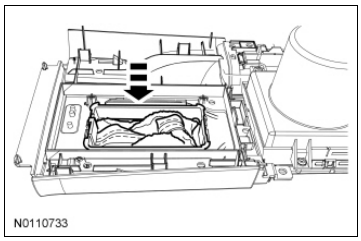


5. Disconnect the selector lever bezel electrical connector and remove the selector lever bezel.

6. Compress the retention tabs on the selector lever boot and remove the boot from the bottom of the selector lever bezel.

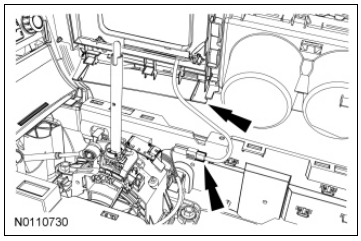


7. Compress the retention tabs on the selector lever trim ring and remove the trim ring through from the top of the selector lever bezel.



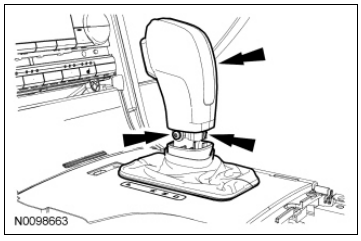
Installation

1. Install the selector lever trim ring in the selector lever bezel.

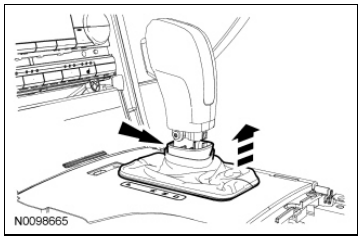


2. ***NOTICE:*** **When installing the selector lever boot, be sure it is in the correct position or the selector lever boot can not be installed on the selector lever knob. If needed, align the selector lever knob to the selector lever boot when installing the boot.**

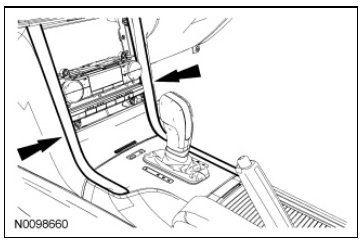
   Install the selector lever boot in the selector lever bezel.



3. Position the selector lever bezel in place and connect the electrical connector.

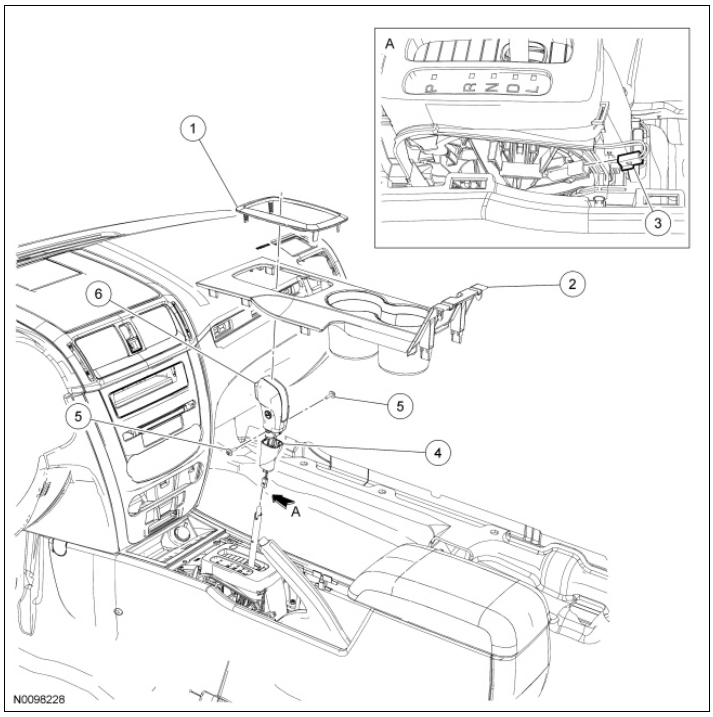


4. Position the selector lever bezel in place and install it onto the center console.



5. Position the selector lever knob onto the selector lever and install the screws.

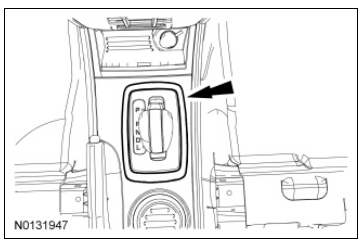
6. Slide the selector lever knob trim ring up and install it on the selector lever knob.



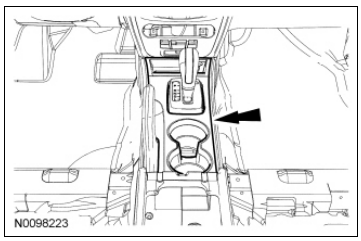
7. Install the LH and RH console finish moldings.

Selector Lever Knob

NOTE: Transmission Control Switch (TCS) shown, select switch similar.

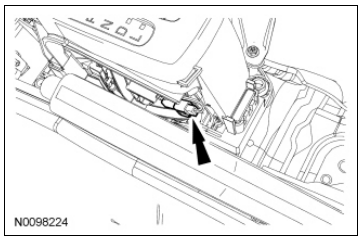


Item	Part Number	Description
1	54061A16	Selector lever trim ring
2	54045A76	Upper console panel
3	14A459	Transmission Control Switch (TCS) electrical connector (2.5L engine only)
4	-	Selector lever knob shroud (part of 7L010)
5	W701894	Selector lever knob screws
6	7L010 td>Selector lever knob	



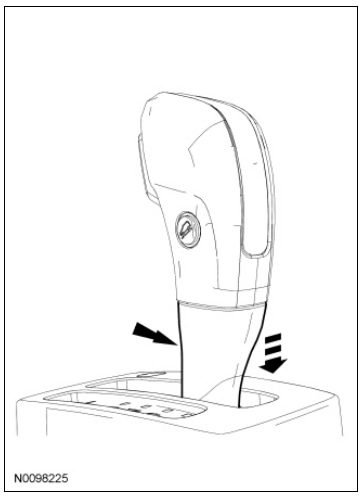
Removal

Vehicles equipped with a 2.5L or 3.0L (4V) engine



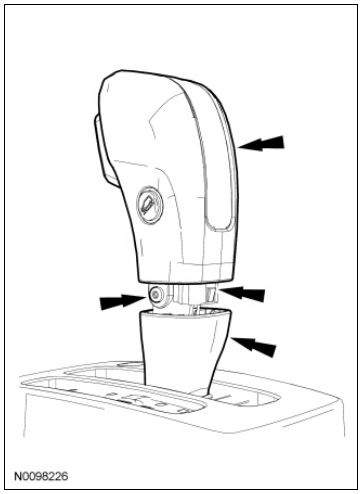
1. Remove the selector lever trim ring.

2. Remove the center console trim panel.



3. Disconnect the Transmission Control Switch (TCS) or select switch electrical connector.

All vehicles

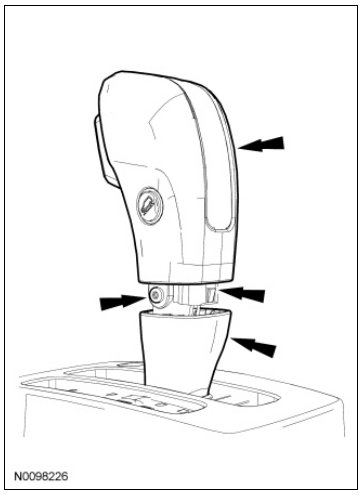


4. **NOTE:** TCS shown, select switch similar.

   Slide the selector lever knob shroud downward to gain access to the 2 selector lever knob screws.

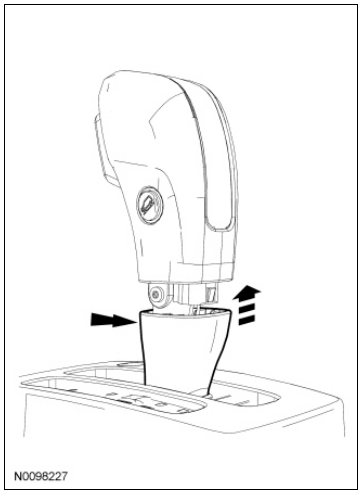
5. ***NOTICE:*** **It is necessary to route the Transmission Control Switch (TCS) harness or select switch harness out of the selector lever shroud when removing the selector lever knob.**

   Remove the 2 screws from the selector lever knob. Remove the selector lever knob and selector lever knob shroud.



Installation

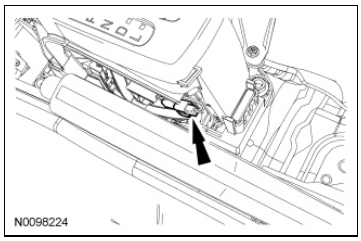
All vehicles



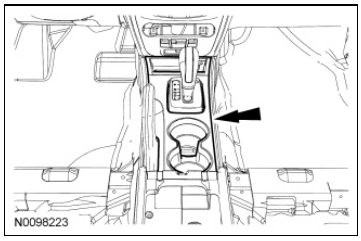
1. ***NOTICE:*** **It is necessary to route the Transmission Control Switch (TCS) harness or select switch harness through the selector lever shroud when installing the selector lever knob.**

   NOTE: TCS shown, select switch similar.

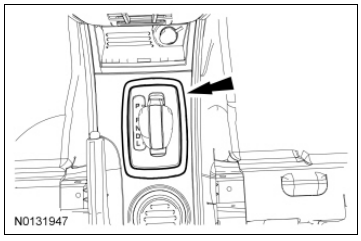
   Install the selector lever knob on the selector lever and install the screws.



2. Slide the selector lever knob shroud up and install it on the selector lever knob.

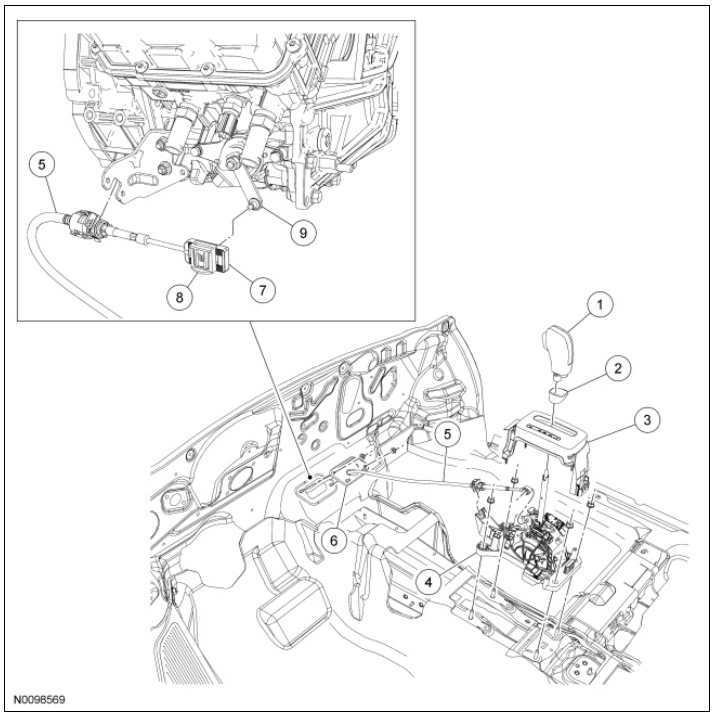


Vehicles equipped with 2.5L or 3.0L (4V) engine



3. Connect the TCS or select switch electrical connector.

4. Install the center console trim panel.



5. Install the selector lever trim ring.

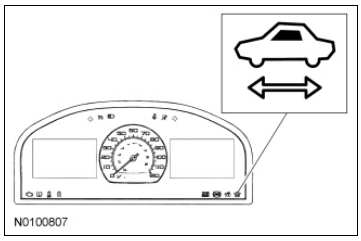
Range Selection



Park

With the range selector in PARK:

- the parking pawl locks the output shaft to the case.
- the ignition key can be removed.
- the ignition switch can be cycled from OFF to START or RUN. The ready indicator light will illuminate on the Instrument Cluster (IC) when the ignition switch is cycled to the START position.

The ready indicator light is located on the lower right hand corner of the IC .

Ready Indicator Light

Reverse

With the range selector in REVERSE:

- the vehicle may be operated in a rearward direction.
- reversing lamps are illuminated.
- if the ready indicator light is not illuminated, which lights when the ignition switch is cycled to the START position, there is no reverse gear engagement.

Neutral

With the range selector in NERAL:

- no power flows through the transmission.
- the output shaft is disengaged from the drive wheels.

Drive

The range selector DRIVE position provides:

- low speed driving.
- acceleration.
- cruise conditions.
- deceleration.
- maximum fuel economy during normal operation.

If the ready indicator light is not illuminated, which lights when the ignition switch is cycled to the START position, there is no forward gear engagement.

Low

The range selector LOW position provides:

- engine braking.
- improved traction on slippery roads.

If the ready indicator light is not illuminated, which lights when the ignition switch is cycled to the START position, there is no forward gear engagement.

Brake Shift Interlock System

The brake shift interlock system prevents a shift out of PARK unless the brake pedal is depressed. The brake shift interlock system has a Brake Shift Interlock Actuator (BSIA) mounted on the selector lever assembly. If the ignition switch is in the RUN position, the BSIA will allow the selector lever to be moved out of PARK only when the brake pedal is pressed.

External Controls

The external control of the Electronically Controlled Continuously Variable Transmission (eCVT) is mechanically controlled by a cable connected to the selector lever and electronically controlled by the TR sensor (located on the transaxle). The selector lever position determines PARK, REVERSE, NEUTRAL, DRIVE and LOW modes. For diagnosis, removal and installation of the TR sensor, refer to Section 307-01C .

External Controls

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom. GO to Symptom Chart .

Visual Inspection Chart

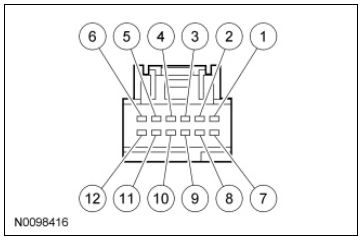
Symptom Chart - External Controls

Symptom Chart - External Controls

Symptom Chart - NVH

Symptom Chart - NVH



NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Vibration - a high frequency (20-80 Hz) vibration that is felt through the seat or the selector lever. Changes with engine speed
- Selector lever cable incorrectly routed, grounded out or loose
- REFER to Selector Lever Cable in this section.
- Loose selector lever cable bracket
- CHECK the selector lever cable and bracket for damage and correct assembly. REFER to Selector Lever Cable in this section. REPAIR as necessary.
- Rattle, noise, buzz or other noise
- Selector lever loose
- Noisy selector lever
- TIGHTEN the selector lever nuts.
- INSTALL a new selector lever. REFER to the Selector Lever in this section.

Pinpoint Test

Refer to Wiring Diagrams Cell 37 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Shift Interlock for schematic and connector information.

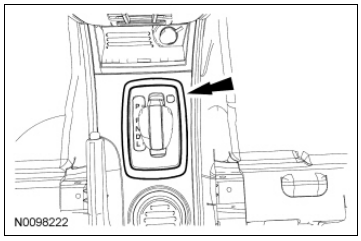
PINPOINT TEST A: THE BRAKE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

Test Step	Result / Action to Take
A1 TEST THE BRAKE LIGHTS	
• Apply the brake pedal and view the brake lights. • **Do the brake lights illuminate?**	**Yes** GO to A2 . **No** REFER to Section 417-01 .
A2 TEST SJB FUSE 5 (10A)	
• Check fuse: Smart Junction Box (SJB) 5 (10A). • **Is the resistance less than 5 ohms?**	**Yes** GO to A3 . **No** INSTALL a new fuse. GO to A3 .
A3 TEST BSIA POWER CIRCUIT	
• Disconnect: Selector Lever Electrical C3233. • Ignition ON. • Measure the voltage between selector lever harness C3233-1, circuit CET53 (BU/OG), vehicle harness side and ground, while applying the brake pedal.	**Yes** GO to A6 . **No** GO to A4 .

 N0098237 • **Is the voltage greater than 10 volts?**	
A4 TEST THE BSIA POWER CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280C. • Measure the resistance between selector lever harness C3233-1, circuit CET53 (BU/OG), vehicle harness side and ground.  N0098238 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 TEST THE BSIA POWER CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the selector lever harness C3233-1, circuit CET53 (BU/OG), vehicle harness side and SJB C2280C-23, circuit CET53 (BU/OG), vehicle harness side.  N0098239 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new SJB . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
A6 TEST THE BSIA GROUND CIRCUIT	
• Ignition OFF. • Measure the resistance between selector lever harness C3233-5, circuit GD116 (BK/VT), vehicle harness side and ground.	**Yes** INSTALL a new selector lever. REFER to Selector Lever in this section. **No** REPAIR the circuit. TEST the system for normal operation.

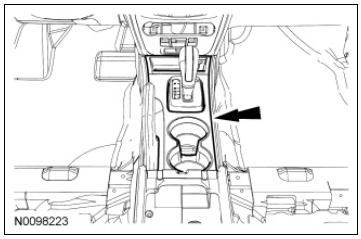
 • **Is the resistance less than 5 ohms?**	

Brake Shift Interlock Override



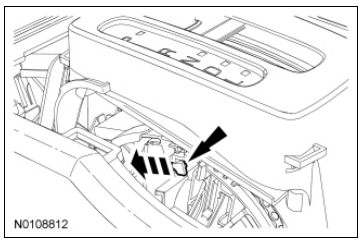
NOTE: If it is necessary to use the override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the brake lights are not operational. Before driving the vehicle, verify that the brake lights are working.

This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON position unless the brake pedal is depressed.



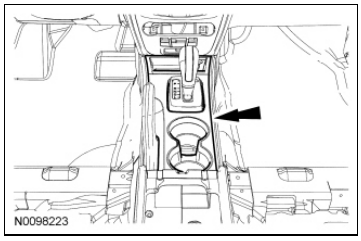
If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is depressed, carry out the following procedure:

1. Apply the parking brake.

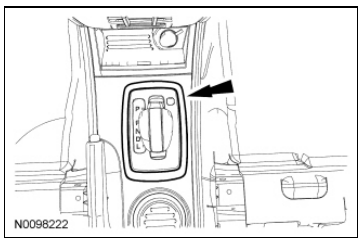


2. Remove the selector lever trim ring.

3. Remove the center console trim panel.



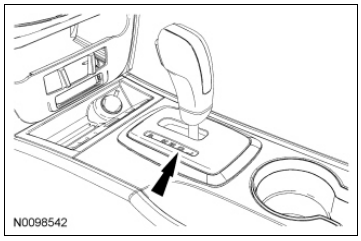
4. Using a suitable tool, push the brake shift interlock override forward, apply the brake, press the selector lever knob button and move the selector lever into NEUTRAL.



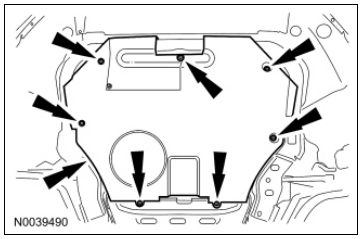
5. Start the vehicle.

6. Install the center console trim panel.

7. Install the selector lever trim ring.

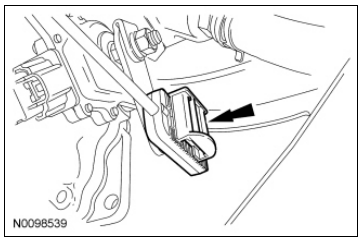


Selector Lever Cable Adjustment

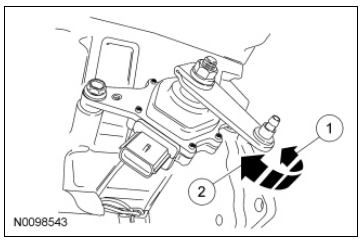


1. ***NOTICE:*** **The ignition must be in the OFF position to make sure that the Electronically Controlled Continuously Variable Transmission (eCVT) and the engine are OFF.**

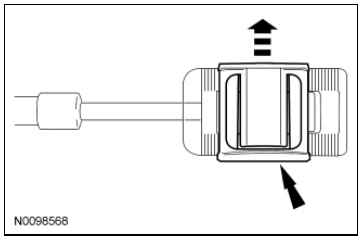
   With vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



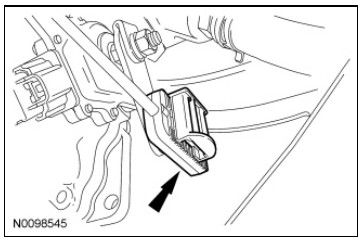
2. Place the selector lever in the D position.



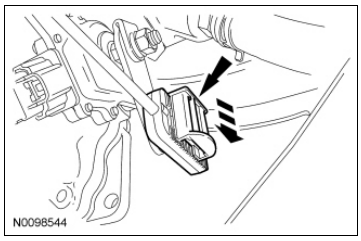
l start="3">
- Remove the bolts and the splash shield.



4. Disconnect the selector lever cable end from the manual control lever.

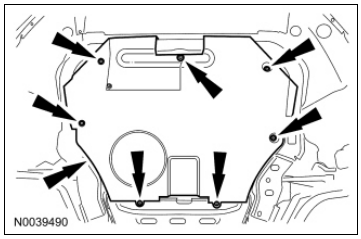


5. Place the manual control lever in the D position.
   1. Rotate the manual control lever counterclockwise to the PARK position.
   2. Rotate the manual control lever clockwise 3 detents to the D position.

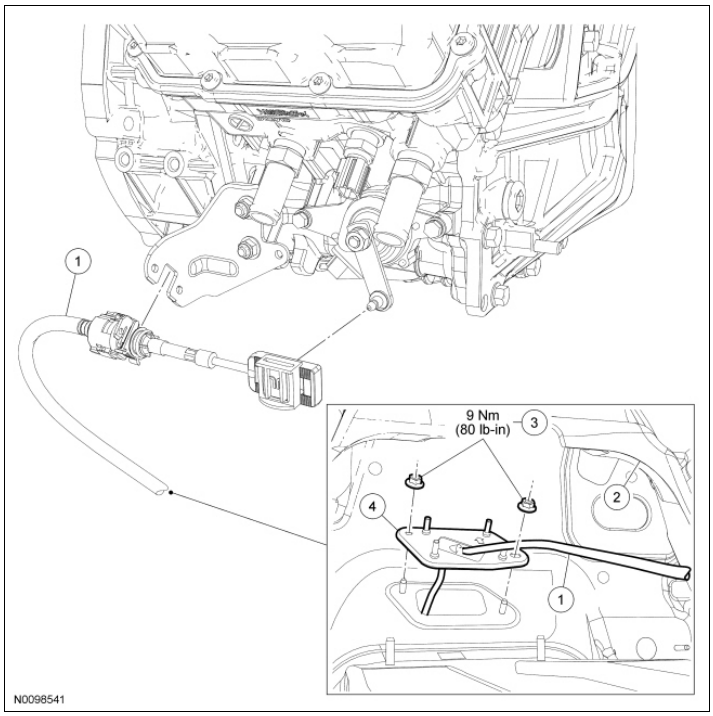


6. Unlock the adjuster by sliding the locking tab over.

7. Align the selector lever cable end to the manual control lever ball stud and install it with the adjuster unlocked.



8. Slide the selector lever cable adjuster tab in place to lock the selector lever cable.

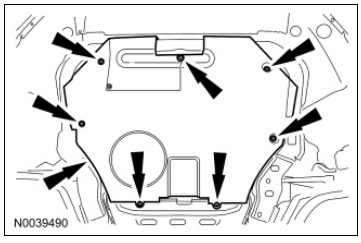


9. Verify that the vehicle starts in PARK and NEUTRAL only and that the reverse lamps illuminate in REVERSE.

10. Install the splash shield and the bolts.

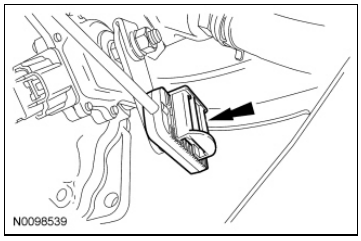
Selector Lever Cable

Item	Part Number	Description
1	7E395	Selector lever cable
2	54017A40	Insulation blanket
3	W707142	Selector lever cable grommet retaining nuts
4	57809	Selector lever cable grommet



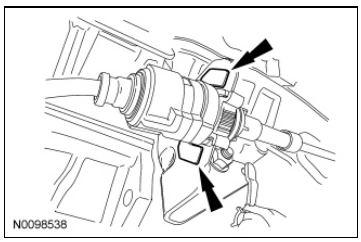
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

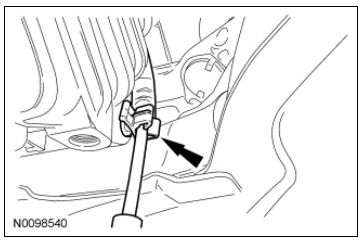


2. Remove the heater core and evaporator core housing. For additional information, refer to Section 412-01 .

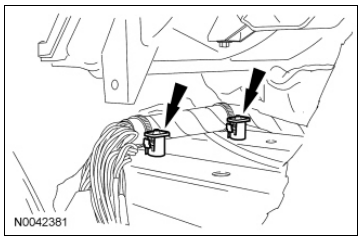
3. Remove the Restraints Control Module (RCM). For additional information, refer to Section 501-20B .



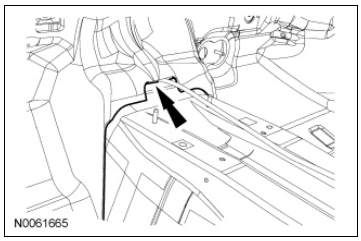
4. Remove the bolts and the splash shield.



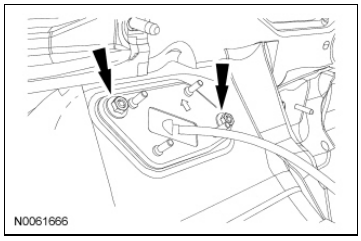
5. Disconnect the selector lever cable end from the manual control lever.



6. Release the 2 tabs and remove the selector lever cable from the selector lever cable bracket.

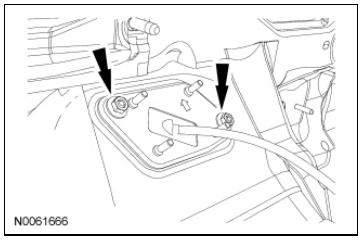


7. Remove the selector lever cable from the retainer.

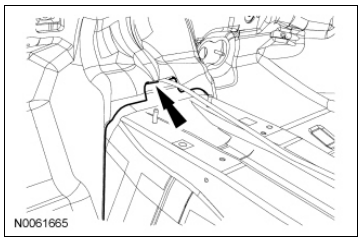


8. Disconnect the 2 wiring harness fasteners and position the RCM wiring harness aside.

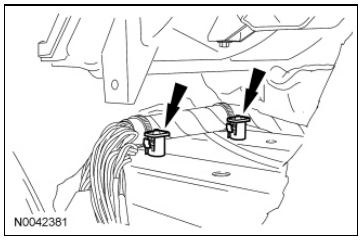
9. Position the insulation blanket away from the bulkhead to gain access to the 2 selector lever cable bracket nuts.



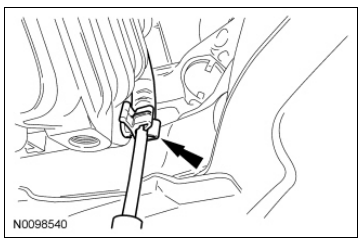
10. Remove the 2 selector lever cable grommet nuts and remove the selector lever cable through the interior of the vehicle.



Installation

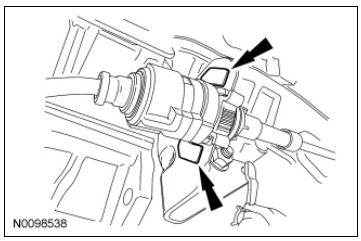


1. Position the selector lever cable in place and install the 2 nuts.
   - Tighten to 9 Nm (80 lb-in).

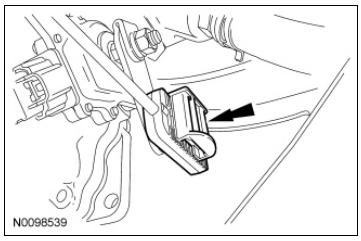


2. Position the insulation blanket in place over the selector lever cable grommet.

3. Position back the RCM wiring harness and install the fasteners on the studs.



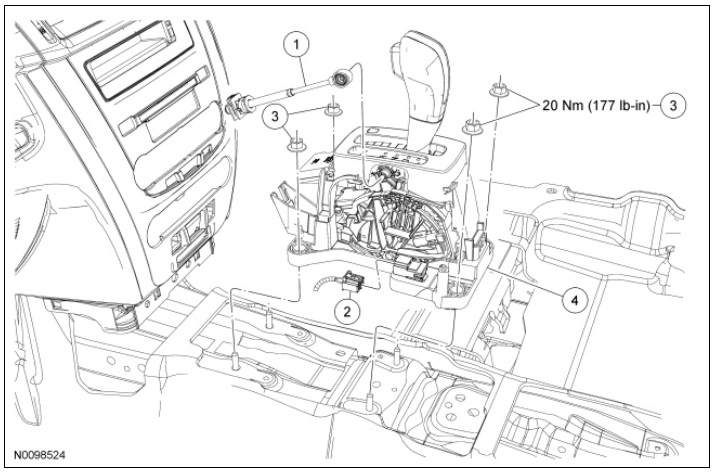
4. Install the selector lever cable in the retainer.



5. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the selector lever cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the selector lever cable to click in place. Pull back on the selector lever cable to make sure that it is locked into the selector lever cable bracket. Also make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed.

Install the selector lever cable in the bracket. Be sure the tabs are locked in place.

6. Connect the selector lever cable end on the manual control lever.

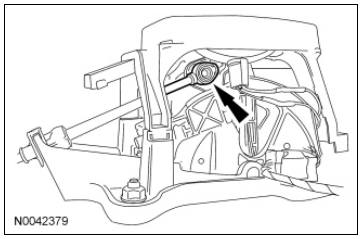


7. Install the RCM . For additional information, refer to Section 501-20B .

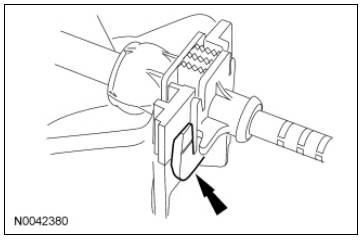
8. Install the heater core and evaporator core housing. For additional information, refer to Section 412-01 .

9. Adjust the selector lever cable.

Selector Lever

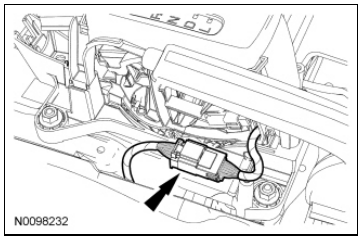


Item	Part Number	Description
1	7E395	Selector lever cable
2	14489	Selector lever electrical connector
3	W714098	Selector lever nuts (4 required)
4	7K004	Selector lever assembly

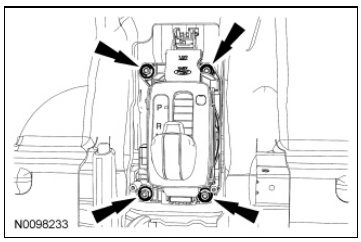


Removal

1. Remove the center console. For additional information, refer to Section 501-12 .

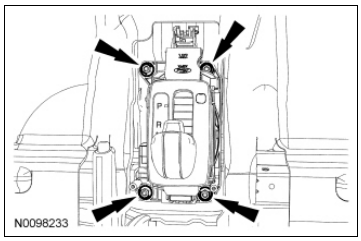


2. Disconnect the selector lever cable end from the selector lever.

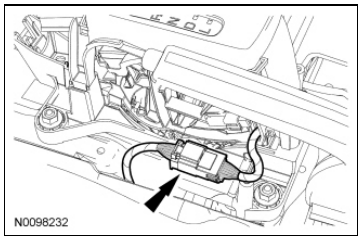


3. Release the tab on the selector lever cable and remove it from the selector lever housing.

4. Disconnect the electrical connector.

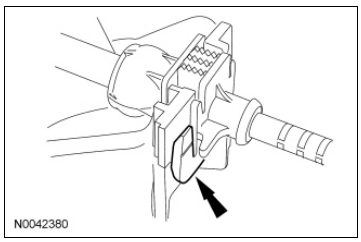


5. Remove the 4 nuts and remove the selector lever.

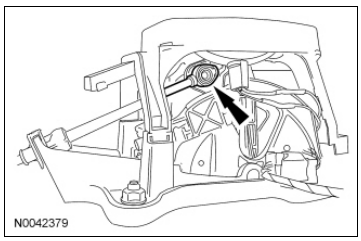


Installation

1. Install the selector lever and the 4 nuts.
   - Tighten to 20 Nm (177 lb-in).

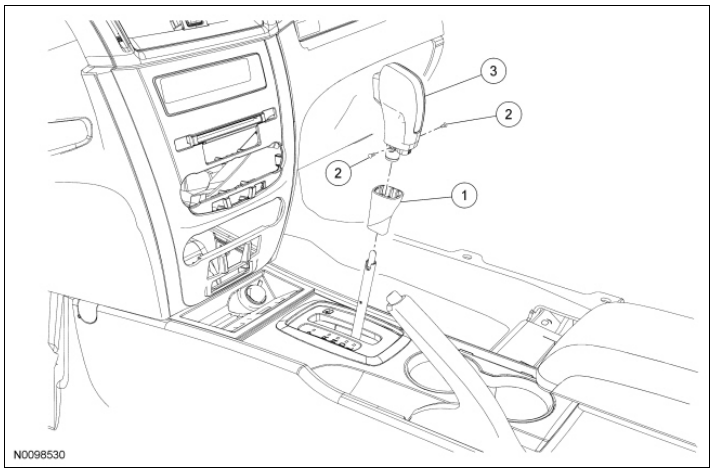


2. Connect the electrical connector.



3. **NOTE:** When installing the selector lever cable, make sure that the selector lever cable locking tabs are locked in place and the selector lever cable end is snapped onto the ball stud. Press the selector lever cable into the bracket and listen for the selector lever cable to click in place. Pull back on the selector lever cable to make sure that it is locked into the selector lever cable bracket. Also make sure that the selector lever cable end is correctly installed onto the ball stud. Pull back on the selector lever cable end to make sure that the selector lever cable end is correctly installed.

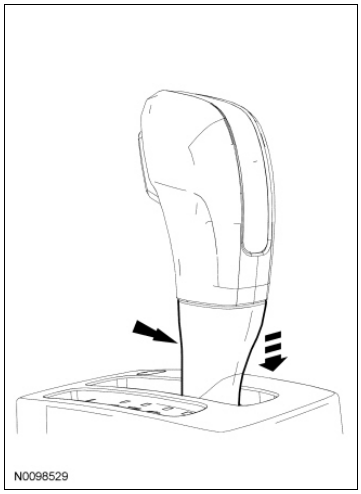
   Install the selector lever cable in the selector lever housing.



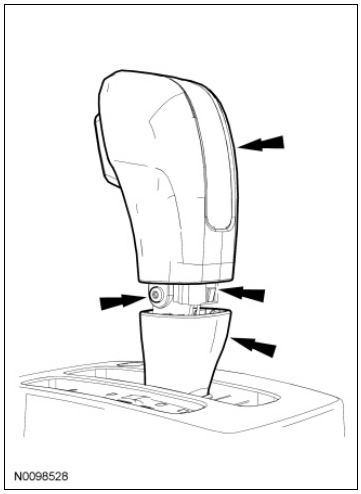
4. Connect the selector lever cable end to the selector lever.

5. Install the center console. For additional information, refer to Section 501-12 .

6. Adjust the selector lever cable. For additional information, refer to Selector Lever Cable Adjustment in this section.



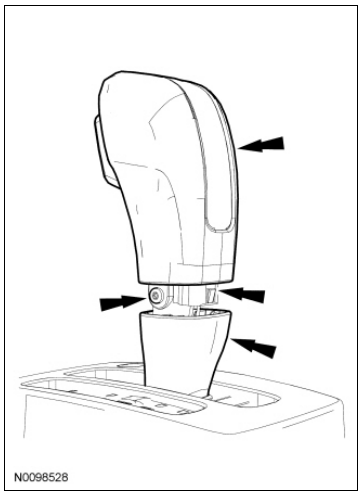
Selector Lever Knob



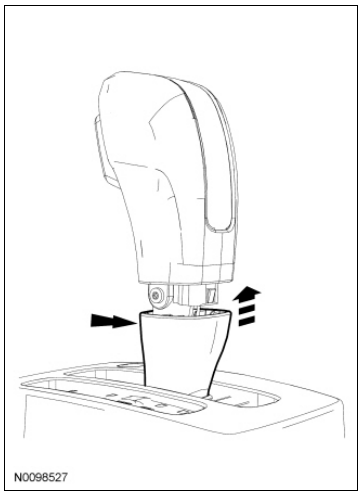
Item	Part Number	Description
1	-	Lower selector lever knob bezel (part of 7L010)
2	W701894	Selector lever knob screws
3	7L010	Selector lever knob

Removal

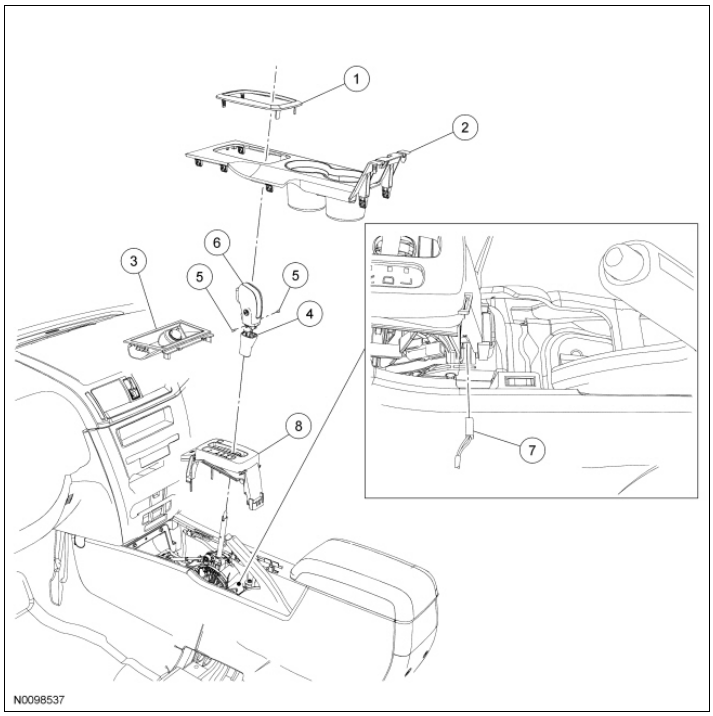
1. Slide the selector lever knob bezel downward to gain access to the 2 selector lever knob screws.



2. Remove the 2 screws from the selector lever knob. Remove the selector lever knob and the selector lever knob bezel.

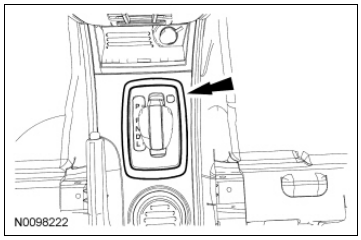


Installation

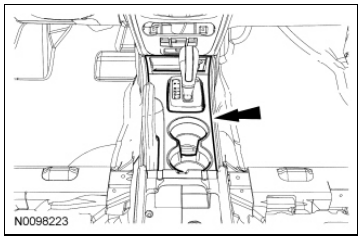


1. Install the selector lever knob on the selector lever and install the screws.

2. Slide the selector lever knob bezel up and install it on the selector lever knob.

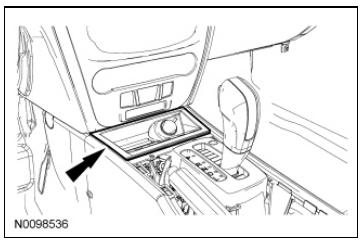


Selector Lever Bezel

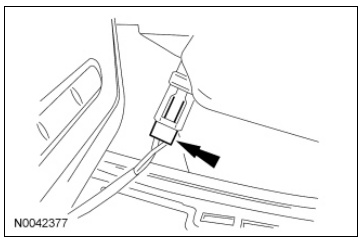


Item	Part Number	Description
1	54061A16	Selector lever trim ring
2	54045A76	Center console trim panel
3	54045A07	Utility tray
4	-	Selector lever knob bezel
5	W701894	Selector lever knob screws
6	7L010	Selector lever knob
7	14A459	Selector lever bezel electricalctor
8	7E034	Selector lever bezel

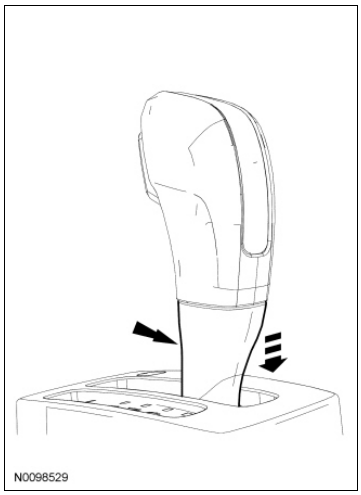
Removal



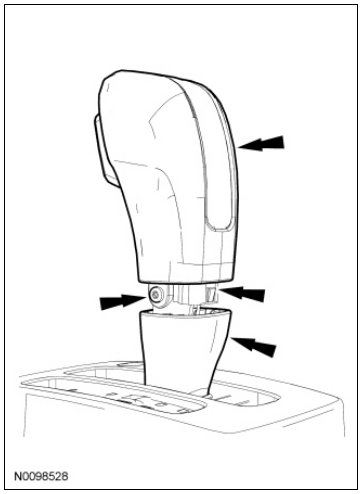
1. Remove the selector lever trim ring.



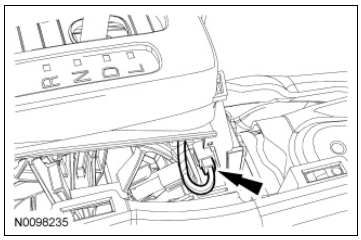
2. Remove the center console trim panel.



3. Remove the utility tray from the center console.

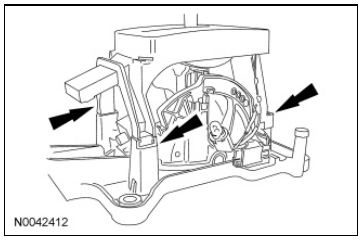


4. Disconnect the electrical connector and remove the utility tray.



5. Slide the selector lever knob bezel downward to gain access to the 2 selector lever knob screws.

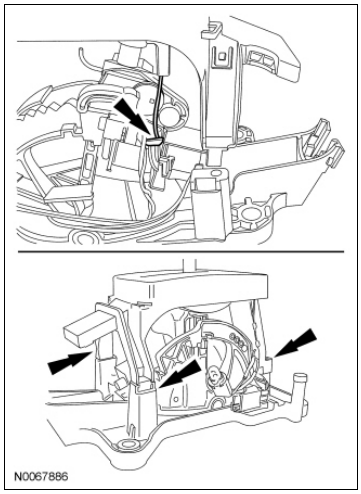
6. Remove the 2 screws from the selector lever knob. Remove the selector lever knob and the selector lever knob bezel.



7. Disconnect the selector lever bezel electrical connector.

8. **NOTE:** Selector lever removed for clarity.

   Release the 3 tabs and remove the selector lever knob bezel.



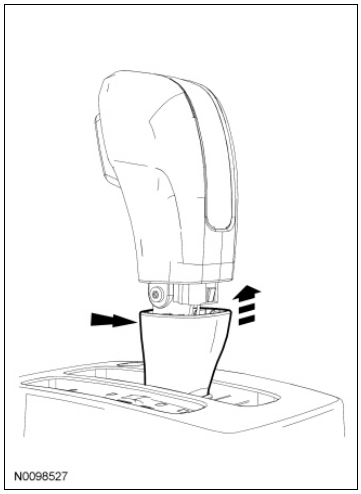
Installation

1. ***NOTICE:*** **Be sure that the override lever is inserted in the override lever guide or the shift interlock override button will not work correctly.**

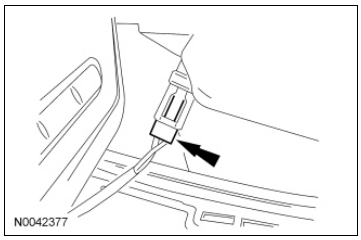
   NOTE: Selector lever removed for clarity.

   Install the selector lever bezel on the selector lever.

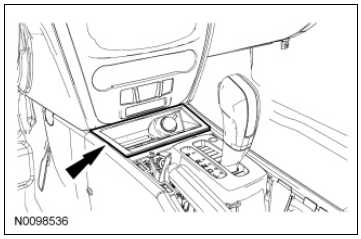
   - Position the override lever in the override lever guide.
   - Make sure that the 3 locking tabs are locked in place.



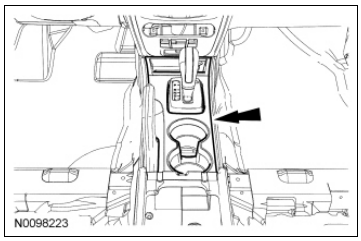
2. Connect selector lever bezel electrical connector.



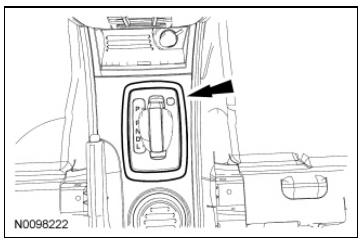
3. Install the selector lever knob on the selector lever and install the screws.



4. Slide the selector lever knob bezel up and install it on the selector lever knob.



5. Position the utility tray in place and connect the electrical connector.



6. Install the utility tray on the center console.

7. Install the center console trim panel.

8. Install the selector lever trim ring.

Manual Transaxle and Clutch

The transaxle and clutch system consist of the following:

- Six-speed manual transaxle
- Clutch disc
- Clutch pressure plate
- Clutch release hub and bearing
- Clutch hydraulic system
- Clutch pedal
- Flywheel
- Pilot bearing
- Shift controls

The function of the transaxle is to move the vehicle from a rest position to motion. The transaxle uses gears to adapt the torque to the demands of load and road conditions. It matches engine power to vehicle needs. This power is delivered from the engine's flywheel to the transaxle. The power is transmitted through a driver-operated clutch, which allows for engagement and disengagement of the engine to the transaxle.

The transaxle input shaft receives the power when the clutch is engaged. The transaxle then uses a system of gears to change the speed and torque relationship between the engine crankshaft and the transaxle differential.

The purpose of the clutch is to connect and dnnect a manually operated transaxle, and the halfshafts, from the engine. This allows starting and stopping the vehicle, shifting and changing vehicle speeds that correspond to the engine speed through gear changes.

The manual transmission has a tag to identify assemblies for repair purposes. Refer to Section 308-03 for the transmission tag information.

Manual Transaxle and Clutch

Material

Item	Specification
SAE 75W-90 API GL-4 Gear Oil XT-4-QGL	WSS-M2C203-A1

Principles of Operation

The function of the transaxle is to move the vehicle from a rest position to motion. The transaxle uses gears to adapt the torque to the demands of load and road conditions. It matches engine power to vehicle needs. This power is delivered from the engine's flywheel to the transaxle. The power is transmitted through a driver-operated clutch, which allows for engagement and disengagement of the engine to the transaxle.

The transaxle input shaft receives the power when the clutch is engaged. The transaxle then uses a system of gears to change the speed and torque relationship between the engine crankshaft and the transaxle differential.

The clutch master cylinder trans hydraulic fluid pressure to the clutch slave cylinder, when the clutch pedal is depressed, which in turn moves the clutch release hub and bearing. The clutch hydraulic system uses brake fluid supplied from the brake master cylinder. The clutch is a single-plate, dry-friction disc with a diaphragm-style spring pressure plate. The clutch disc has frictional material where it contacts the flywheel and the clutch pressure plate. The clutch pressure plate applies pressure to the clutch disc, holding it tightly against the surface of the flywheel.

In the engaged position, the clutch pressure plate diaphragm spring holds the clutch pressure plate against the clutch disc, so that the engine torque is transmitted to the input shaft. When the clutch is depressed, movement is transmitted through the clutch hydraulic system.

Inspection and Verification

NOTICE: **If transaxle noise is reported, first check the manual transmission fluid level. The vehicle should not be driven if the manual transmission fluid level is low or damage can occur.**

NOTE: Before attempting to rectify any concerns, road test the vehicle to ascertain in which system the concern falls.

NOTE: If any evaluation or inspection reveals an obvious concern, repair the vehicle.

The technician should have a thorough knowledge of transaxle/clutch operation and accepted general transaxle/clutch guidelines to detect any problems.

A gear-driven unit will produce a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions. Certain conditions, such as road and weather, will amplify normal vehicle noise.

The following overview is a guide to diagnose a transaxle/clutch concern:

- Verify and document the customer concern.
    - ♦ During the customer interview, if a leak was noticed or if a leak is the concern, check the manual transmission fluid. The vehicle should not be driven if the manual transmission fluid level is low.
- Check the manual transmission fluid level and condition.
- Evaluation of the clutch hydraulic system.
- Evaluation of the clutch.
- Inspect gearshift mechanism.
- Road test.
- Find the cause of the problem and correct it.

Verify Customer Concern

1. Verify and document the customer concern.
    1. When was it first noticed?
    2. Did it appear suddenly or gradually?
    3. Did anything unusual occur that would coincide with it or precede it?
    4. Identify when the condition occurs:
        - ♦ Hot or cold vehicle operating conditions
        - ♦ Type of terrain
        - ♦ City/highway driving
        - ♦ Driving at a particular speed
            - ♦ coasting
            - ♦ hard acceleration
        - ♦ Shifting
            - ♦ upshifts
            - ♦ downshifts
            - ♦ in a particular gear
            - ♦ in all gears
        - ♦ Hot or cold ambient temperatures
    5. Has the transaxle/clutch been repaired before or components installed?
        - ♦ Check the vehicle service record. Note any repairs.

Check Manual Transmission Fluid Level and Condition

NOTE: The vehicle should not be driven if the manual transmission fluid level is low.

An incorrect manual transmission fluid level may affect the transaxle operation and can result in transaxle damage. To correctly check and add manual transmission fluid to the transaxle, refer to transaxle draining and filling in Section 308-03 .

A low manual transmission fluid level can result in poor transaxle shifting, engagement or damage. It can also indicate a leak in one of the transaxle seals or gaskets.

1. Check the manual transmission fluid condition.
    - Observe the color and the odor of the manual transmission fluid. Allow the manual transmission fluid to drip onto a white cloth and examine the stain. Check the manual transmission fluid for contamination or metal particles.
        - ♦ Manual transmission fluid should appear nearly clear, similar to clean engine oil.

Evaluation of Clutch Hydraulic System

1. Verify that the brake/clutch hydraulic fluid reservoir is filled to the correct level.
    - If the clutch hydraulic fluid level is correct, proceed to clutch check.

- If the rear chamber hydraulic fluid level is low, add fluid as necessary. Check the clutch hydraulic system for leaks and repair as necessary.

Evaluation of the Clutch

1. Depress and release the clutch pedal slowly to check if the pedal is binding. Make sure the clutch pedal can be fully depressed and is not restricted by the floor mat. Verify that the pedal return spring is present and functions correctly.

2. Measure the clutch reserve. With the engine idling, the parking brake on and the clutch pedal up, gently move the gearshift lever toward reverse gear until gear clash can be heard. Depress the clutch pedal slowly.
    - If the gears cease to clash (full disengage at 25.4 to 38.1 mm (1 to 1.5 in) from the floor), then hold the pedal at the point of disengagement and increase engine to 4,000 rpm. The clutch should remain disengaged, clutch OK.
    - Any concerns indicate a worn or damaged clutch. Repair as necessary.

3. With the engine idling, move the gearshift lever into 4th gear. Increase the rpm to 2,000 and slowly release the clutch pedal.
    - If the engine stalls, the clutch is OK.
    - If the engine does not stall, the clutch is slipping. Repair as necessary.

4. Compare the clutch evaluation results with the following table. The following list of conditions are typical faults into which clutch concerns will fall.

Inspect the Gearshift Mechanism

1. Inspect the cables for:
    - signs of damage.
    - broken locks.
    - binding.
    - cables not fully seated or in hold-down brackets.
    - hold-down bracket nuts are loose.
    - correct routing.
    - correct adjustment.
        - ♦ If the concern is a gear(s) cannot be selected, adjust the cables. Refer to Gearshift Cable Adjustment in this section.

2. Inspect the gearshift for:
    - free play in the gearshift lever (must be no more than 5 mm [0.196 in]). This specification is for an absolute or "no load" free play.
        - ♦ If the gearshift lever free play is too great, check the gearshift cables and repair as necessary.
        - ♦ If the gearshift lever free play is OK, adjust the gearshift linkage.

Evaluation of the Transmission

1. During the road test, use the following driving methods to diagnose the problem.
    - Start the engine.
    - Evaluate the noise in NEUTRAL while the vehicle is parked.
        - ♦ Check whether the noise is present with the clutch fully disengaged (pedal fully depressed). Check to see if the pedal pulsates abnormally (for clutch diaphragm finger run out).
        - ♦ Check whether the noise is present with the gearshift in the NEUTRAL position and

the clutch fully engaged (foot off pedal). With the parking brake engaged, move the gearshift towards the 1st gear position. Apply very slight pressure and note if the gear noise level is reduced. (for gear rollover noise).

- ♦ With the clutch fully engaged (foot off pedal), check whether the noise is present as the engine speed is raised. If the noise reduces, note the engine speed at which this occurs.

- Listen for any change in noise while depressing and releasing the clutch pedal.
- Listen for any change in noise while changing the engine rpm.
- Drive the vehicle and shift through all of the gear ranges, including reverse. Listen for any change in noise in a particular gear.
- Drive the vehicle in the gear in which the noise is most noticeable. Depress the clutch pedal and leave the gear engaged. Listen for any change in noise.
- Drive the vehicle in the gear in which the noise is most noticeable. Depress the clutch pedal and shift the transmission into NEUTRAL. Release the clutch pedal and allow the vehicle to coast.

2. Compare the road test results with the following symptom charts. It is a list of conditions that are typical faults into which the transaxle will fall:

GO to Symptom Chart - Clutch Operation , GO to Symptom Chart - Transaxle or GO to Symptom Chart - NVH in this section.

Symptom Chart - Clutch Operation

Symptom Chart - Clutch Operation

Symptom Chart - Transaxle

Symptom Chart - Transaxle

Symptom Chart - NVH

Symptom Chart - NVH
NOT NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Clutch related vibrations

- Engine component grounding against frame
- Accessory drive belt
- Clutch release bearing
- Flywheel bolts

- Flywheel
- Imbalanced clutch pressure plate

- GO to Pinpoint Test B .

- Excessive noise

- Clutch disc damper damaged
- Transaxle input shaft pilot bearing worn or damaged
- Excessive crankshaft end play
- Clutch release bearing worn or damaged
- Clutch pedal
- Clutch slave cylinder

- GO to Pinpoint Test C . REFER to Section 308-01 . INSPECT the clutch disc for damage. INSPECT the transaxle input shaft and the transaxle input shaft pilot bearing for wear and damage. CHECK the crankshaft endplay. Refer to the appropriate section in Group 303 for the procedure. CHECK the clutch release hub and bearing, and guide tube for wear and damage. REPAIR all components as necessary. TEST the system for normal operation.

- Clutch rattling noise - occurs with clutch engaged, noise changes/disappears with clutch pedal depressed

- Flywheel bolts, clutch housing bolts or clutch pressure plate bolts loe

- CHECK the bolts for damage. TIGHTEN the bolts to specifications. REFER to Section 308-01 .

- Clutch squeaking noise - noise is heard when the clutch is operated. Vehicle moves slowly or creeps when the clutch is disengaged. Can also be difficult to shift into 1st and REVERSE gears

- Pilot bearing seized or damaged

- INSPECT the transaxle pilot bearing for wear or damage. REPAIR as necessary. REFER to Section 308-01 .

- Clutch squeaking noise - occurs with clutch pedal depressed/released

- Worn clutch pedal shaft or bushings

- INSPECT the clutch pedal for wear or damage. REPAIR as necessary. REFER to Section 308-02 .

- Worn, damaged or misaligned clutch release bearing

- INSPECT the clutch release bearing for wear or damage. REPAIR as necessary. REFER to Section 308-01 .

- Clutch grating/grinding noise - occurs when clutch pedal is depressed

- Clutch pressure plate fingers bent or worn

- INSPECT the clutch pressure plate release fingers. INSTALL a new pressure plate as necessary. REFER to Section 308-01 .

- Contact surface of clutch release bearing worn or damaged

- INSPECT the clutch release bearing. REPAIR as necessary. REFER to Section 308-01 .
- Clutchtter - a small amount of noise when clutch pedal is released at initial take off
- Clutch engagement
- Acceptable operating condition.
- Clutch chatter/grabs - in some cases a shudder is felt. Occurs with clutch pedal depressed/released
- Damaged or worn powertrain/driveline mounts
- INSPECT the powertrain/drivetrain mounts. INSTALL new mounts as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Binding or dragging plunger of the clutch master cylinder or slave cylinder
- CHECK the master and slave cylinder operation. INSPECT the components for damage or wear. INSTALL a new master or slave cylinder as necessary. REFER to Section 308-02 .
- Grease or oil on the clutch disc facing
- CHECK the input shaft seal and rear main oil seal. REPAIR as necessary. INSTALL a new clutch disc. REFER to Section 308-01 .
- Clutch disc surface glazed or damaged
- INSPECT the clutch disc surface for a glazed, hardened or damage condition. CARRY OUT a clutch disc check. INSTALL a new clutch disc as necessary. REFER to Section 308-01 .
- Damaged or worn clutch pressure plate
- INSPECT the clutch pressure plate for wear or damage. INSTALL a new clutch pressure plate as necessary. REFER to Section 308-01 .
- Flywheel surface damaged or glazed
- INSPECT the flywheel for damage or wear. CARRY OUT a flywheel runout check. INSTALL a new flywheel as necessary. Refer to the appropriate section in Group 303 for the procedure.
- Clutch chatter noise - noise when clutch pedal is released at initial take off. Clutch is hard to engage and disengage
- Pilot bearing worn, damaged or not correctly aligned in bore
- INSPECT the clutch pressure plate release fingers for uneven wear, clutch components burnt or a seized pilot bearing. INSTALL a new pilot bearing as necessary. REFER to Section 308-01 .
- Transaxle rattling/clattering noise - occurs in NEUTRAL or in gear, at idle
- Incorrect manual transmission fluid level or fluid quality
- CHECK that the transaxle is filled to the correct level and with the specified manual transmission fluid. REFER to Section 308-03 for the manual transmission fluid type.

- Transaxle rattling/clattering noise - noise at idle in NEUTRAL
- Wornugh reverse idler gear
- CHECK the reverse idler gear. REPAIR as necessary. REFER to Section 308-03 .
- Excessive backlash in gears
- CHECK the gear backlash. ADJUST as necessary. REFER to Section 308-03 .
- Worn countershaft gears
- REPAIR as necessary. REFER to Section 308-03 .
- Transaxle whine - a mild whine at extreme speeds or high rpm
- Rotating gears/geartrain
- Acceptable noise.
- Transaxle whine - a high pitched whine, also described as a squeal
- Transaxle gears are worn (hmileage vehicle)
- Result of normal gear wear. REPAIR as necessary. REFER to Section 308-03 .
- Mismatched gear sets
- INSPECT the gear sets for an uneven wear pattern on the face of the gear teeth. REPAIR as necessary. REFER to Section 308-03 .
- Damaged or worn transaxle bearing
- INSPECT the transaxle bearings. INSTALL new bearings as necessary. REFER to Section 308-03 .
- Transaxle growling/humming - noise occurs in the forward gears. The noise is more prominent when the gear is loaded. The problem gear can be located as the noise occurs in a specific gear position
- Gear is cracked, chipped or rough

INSPECT the transaxle gears for damage or wear. INSTALL new gears as necessary. REFER to Section 308-03 .

- Transaxle hissing - noise in NEUTRAL or in forward gears. As bearings wear or break up, the noise changes to a thumping noise
- Damaged or worn bearings
- INSPECT the transaxle bearings. INSTALL new bearings as necessary. REFER to Section 308-03 .
- Transaxle knocking/thudding - noise at low speeds in forward gears
- Bearings with damaged balls or rollers or with pitted and spalled races

- INSPECT the transaxle bearings. INSTALL new bearings as necessary. REFER to Section 308-03 .
- Transaxle rumble/growl - noise at all speeds in forward gears, monounced in a heavy acceleration condition
- Damaged or worn transaxle bearing or gears (high mileage vehicles)
- CHECK manual transmission fluid for excessive metal particles. REPAIR as necessary.

Pinpoint Tests

Pinpoint Test A: Clutch Pedal Pulsation

Normal Operation

Clutch pedal feel should be smooth when disengaging and engaging the clutch. Clutch pedal movement is transmitted by hydraulic fluid pressure, which actuates the clutch release fork and bearing. The clutch release fork and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:
- Clutch disc
- Clutch pressure plate
- Flywheel

PINPOINT TEST A: CLUTCH PEDAL PULSATION

Test Step	Result / Action to Take
A1 CHECK THE CLUTCH PEDAL PULSATION	
• Start the engine. • With the transmission in NEUTRAL, slowly press the clutch pedal. • **Does the clutch pedal pulsate while being pressed?**	**Yes** GO to A2 . **No** VERIFY customer concern.
A2 INSPECT THE PRESSURE PLATE BOLTS	
• Inspect the pressure plate-to-flywheel bolts. • **Are any of the pressure plate-to-flywheel bolts loose?**	**Yes** TIGHTEN or INSTALL new bolts. REFER to Section 308-01 . TEST the system for normal operation. **No** GO to A3 .
A3 INSPECT THE CLUTCH PRESSURE PLATE	

• Remove the clutch pressure plate. Refer to Section 308-01 . • Inspect the clutch pressure plate for wear or damage. • **Are there any signs of damage present on the clutch pressure plate?**	**Yes** INSTALL a new clutch pressure plate. REFER to Section 308-01 . TEST the system for normal operation. **No** GO to A4 .
A4 INSPECT THE CLUTCH DISC	
• Check the clutch disc for wear or damage. • **Is the clutch disc OK?**	**Yes** GO to A5 . **No** INSTALL a new clutch disc. REFER to Section 308-01 . TEST the system for normal operation.
A5 INSPECT THE FLYWHEEL	
• Inspect the flywheel for wear or damage. • **Is flywheel OK?**	**Yes** VERIFY customer concern. **No** TIGHTEN or INSTALL a new flywheel as necessary. Refer to the appropriate section in Group 303 for the procedure. TEST the system for normal operation.

Pinpoint Test B: Clutch Related Vibrations

Normal Operation

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged and no vibrations are felt.

This pinpoint test is intended to diagnose the following:

- Engine components
- Accessory drive component
- Clutch release bearing
- Flywheel

PINPOINT TEST B: CLUTCH RELATED VIBRATIONS

Test Step	Result / Action to Take
B1 CHECK FOR ENGINE COMPONENT GROUNDING	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Check the engine mount interlocks for grounding.	**Yes** REPAIR any components as necessary. **No** GO to B2 .

• Check for the exhaust manifold or other engine components grounding on the body or frame. • **Is there evidence of grounding on the body or frame?**	
B2 CHECK FOR ACCESSORY DRIVE VIBRATIONS	
• Ignition OFF. • Remove the accessory drive belt and check for vibration. • Start the engine. • **Does the vibration stop when the accessory drive belts are removed from the engine?**	**Yes** REFER to Section 303-05A to diagnose the accessory drive belt components. **No** INSTALL the accessory drive belt. GO to B3 .
B3 CHECK FOR RELEASE BEARING NOISE	
• Start the engine. • Press and hold the clutch pedal but do not disengage the clutch. • **Is a whirring, grating or grinding noise present only when the pedal is pushed?**	**Yes** INSTALL a new clutch release bearing. REFER to Section 308-01 . **No** GO to B4 .
B4 INSPECT THE FLYWHEEL	
• Remove the clutch disc and pressure plate. Refer to Section 308-01 . • Inspect for loose flywheel bolts. • Check for an excessively burnt or severely cracked contact surface. • Inspect the flywheel runout. Refer to Flywheel Runout Check in this section. • **Is the flywheel OK?**	**Yes** GO to B5 . **No** TIGHTEN or INSTALL a new flywheel. Refer to the appropriate section in Group 303 for the procedure.
B5 CHECK FOR PRESSURE PLATE IMBALANCE	
• ***NOTICE:*** **Failure to support the engine correctly could result in damage to the vehicle.** • Support the engine securely. • Operate the engine with the transaxle removed. • **Is the vibration still present?**	**Yes** REFER to Section 100-04 to diagnose the engine vibration concern. **No** INSTALL a new clutch pressure plate. REFER to Section 308-01 .

Pinpoint Test C: Excessive Noise

Normal Operation

The manual transaxle is controlled by a floor-mounted gearshift lever located in the floor console. Connection between the floor-mounted gearshift lever and the manual transaxle shift control lever assembly is made through 2 gearshift cables.

When the operator moves the floor-mounted gearshift lever, that movement is transmitted through 2 gearshift

cables routed through the body to the transaxle. The 2 gearshift cables are attached to the transaxle at the transaxle shift control lever assembly. The transaxle shift control lever assembly transfers the movement of the gearshift cables to the shift rods and shift forks located inside the transaxle.

The clutch is designed to transfer the power from the engine to the transmission, which may be either stationary (starting) or rotating at a different speed (upshifting or downshifting). The clutch is functioning correctly when both the engine and transmission are rotating at the same speed with the clutch engaged. Clutch pedal movement is transmitted by hydraulic fluid pressure, which actuates the clutch release hub and bearing. The clutch release hub and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:

- Internal transaxle components
- Clutch pedal
- Clutch slave cylinder
- Clutch pressure plate
- Clutch disc

PINPOINT TEST C: EXCESSIVE NOISE

Test Step	Result / Action to Take
C1 TRANSAXLE NEUTRAL GEAR ROLLOVER TEST	
• Start the engine and let it idle. • **NOTE:** With the clutch pedal fully pressed, the input shaft should stop rotating. • Press the clutch pedal. • **Does the noise stop when the clutch pedal is pressed?**	**Yes** REFER to Section 308-03 for transaxle concerns. **No** GO to C2 .
C2 CHECK THE CLUTCH PEDAL FREE PLAY	
• Press the clutch pedal lightly by hand. • Measure the distance the clutch pedal travels. • **Is the clutch pedal travel within 1-3 mm (0.039-0.118 in)?**	**Yes** GO to C3 . **No** ADJUST clutch pedal freeplay. REFER to Clutch Pedal Freeplay Adjustment in this section.
C3 CHECK THE CLUTCH SLAVE CYLINDER	
• Inspect the clutch slave cylinder for wear or loss of lubrication. • **Are there signs of wear or loss of lubrication?**	**Yes** INSTALL a new clutch slave cylinder. REFER to Section 308-02 . **No** GO to C4 .
C4 CHECK THE CLUTCH PRESSURE PLATE	
• Inspect the clutch pressure plate for damage or	**Yes** INSTALL a new clutch pressure plate.

material between the pressure plate and flywheel. • **Are there signs of damage?**	REFER to Section 308-02 . **No** GO to C5 .
C5 CHECK CLUTCH PEDAL SWITCHES	
• Inspect clutch pedal switches for damage or incorrect installation. • **Are there any signs of damage or incorrect installation?**	**Yes** REPLACE or REINSTALL clutch pedal switches as necessary. **No** REFER to Section 308-03 for transaxle concerns.

Pinpoint Test D: Clutch System Leakage

Normal Operation

Clutch pedal movement is transmitted to the clutch by hydraulic fluid pressure from the master cylinder reservoir through the hydraulic clutch tubes to the slave cylinder. This actuates the clutch release fork and bearing. The clutch release fork and bearing pushes on the spring center towards the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted in the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transmission.

This pinpoint test is intended to diagnose the following:

- Clutch master cylinder
- Clutch slave cylinder
- Hydraulic tubes

PINPOINT TEST D: CLUTCH SYSTEM LEAKAGE

Test Step	Result / Action to Take
D1 INSPECT THE CLUTCH MASTER CYLINDER	
• Inspect clutch master cylinder for leakage. • **Is the clutch master cylinder OK?**	**Yes** GO to D2 . **No** REPAIR or INSTALL a new clutch master cylinder as necessary. REFER to Section 308-02 .
D2 INSPECT THE CLUTCH SLAVE CYLINDER	
• Inspect clutch slave cylinder for leaks. • **Is the clutch slave cylinder OK?**	**Yes** GO to D3 . **No** REPAIR or INSTALL a new clutch slave cylinder as necessary. REFER to Section 308-02 .
D3 INSPECT THE SYSTEM HYDRAULIC TUBES	
	Yes

• Inspect clutch hydraulic tubes for loose or damaged fittings causing leakage. • **Are the clutch hydraulic tubes OK?**	CARRY OUT a road test to VERIFY customer complaint. **No** REPAIR or INSTALL new components as necessary. TEST the clutch system for normal operation.

Component Tests

Clutch Slippage

1. Chock the wheels.

2. Apply the parking brake.

3. Depress and release the clutch pedal slowly to check if the pedal is binding.
   - If the clutch pedal is not binding, proceed to the next step of this procedure.
   - If the clutch pedal is binding, inspect and repair as necessary. Test the system for normal operation. Proceed to the next step in this procedure, if necessary.

4. Depress the clutch pedal.

5. Start the engine.

6. Shift the transmission to 4th gear.

7. Increase engine rpm to 2,000 and slowly release the clutch pedal. If the engine stalls within 5 seconds, the clutch is not slipping.
   - If the clutch is slipping, remove the clutch disc and pressure plate. Refer to Section 308-01 . Inspect the clutch disc and pressure plate for wear or damage. Inspect the flywheel for glazing and damage. Check the clutch release hub and bearing for binding and inspect the guide tube. Inspect the input shaft for wear and damage. Repair all components as necessary.

Clutch Chatter or Shudder

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

2. Inspect the engine and transmission mounts for looseness and damage.
   - If the mounts are OK, proceed to the next step in this procedure.
   - If the mounts are loose or damaged, tighten or install new mounts as necessary. Test the system for normal operation.

3. Check for loose bolts that retain the clutch pressure plate to the flywheel.
   - If the bolts are tightened to specification proceed to the next step in this procedure.
   - If the bolts are loose, tighten the bolts to specification. Refer to Section 308-01 . Test the system for normal operation.

4. Remove the clutch disc and pressure plate. Refer to Section 308-01 . Inspect the clutch disc and pressure plate for wear and damage, and check the clutch disc runout. Refer to Clutch Disc Check in this section. Inspect the flywheel for glazing and damage. Refer to Flywheel Runout Check in this section. Inspect the input shaft for wear, damage and eccentricity. Repair all components as necessary.

Clutch Drag

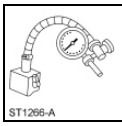
1. Verify that the clutch hydraulic fluid reservoir is filled to the correct level.
    - If the fluid level is correct, proceed to the next step in this procedure.
    - If the fluid level is low, add fluid as necessary. Inspect the clutch hydraulic system for leaks and repair as necessary. Refer to Section 308-02 . Test the system for normal operation.

2. Depress and release the clutch pedal to check for a spongy pedal.
    - If the pedal feels OK, proceed to the next step in this procedure.
    - If the pedal feels spongy, bleed the clutch hydraulic system. Refer to Clutch System Bleeding in this section. Test the system for normal operation.

3. Remove the clutch disc and pressure plate. Refer to Section 308-01 . Inspect the clutch disc and pressure plate for wear and damage, and check the clutch disc runout. Refer to Clutch Disc Check in this section. Repair all components as necessary.

Hard Shifting

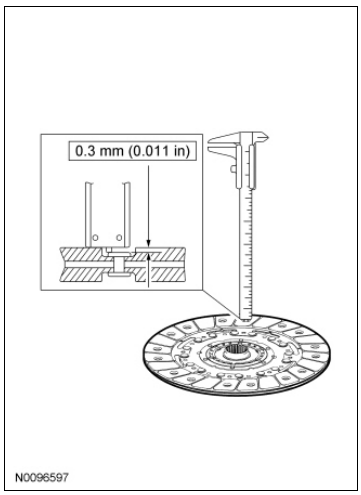
1. Verify that the clutch hydraulic fluid reservoir is filled to the correct level.
    - If the fluid level is correct, proceed to the next step in this procedure.
    - If the fluid level is low, add fluid as necessary. Check the clutch baldric system for leaks, and repair as necessary. Refer to Section 308-02 . Test the system for normal operation.



2. Depress and release the clutch pedal to check for a spongy pedal.
    - If the pedal feels OK, proceed to the next step in this procedure.
    - If the pedal feel spongy, bleed the clutch hydraulic system. Refer to Clutch System Bleeding in this section. Test the system for normal operation.

3. Remove the clutch disc and pressure plate. Refer to Section 308-01 . Inspect the clutch disc and pressure plate for wear or damage. Refer to Clutch Disc Check in this section. Check the clutch release hub and bearing for binding and inspect the guide tube. Inspect the input shaft for wear and damage. If all of the components are OK, proceed to the next step in this procedure. Otherwise, repair all components as necessary. Test the system for normal operation.

4. Inspect the transmission housing, shafts, forks and synchronizer assemblies. Refer to Section 308-03 . Repair all components as necessary.

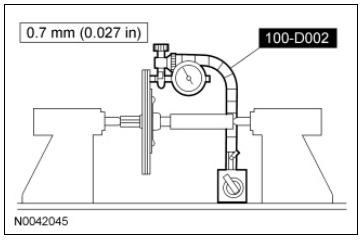


Clutch Disc Check

Special Tool(s)

 ST1266-A	Dial Indicator Gauge with Holding Fixture 100-D002 (D78P-4201-B) or equivalent

1. Check the clutch disc lining surface for hardening, the presence of oil or grease.

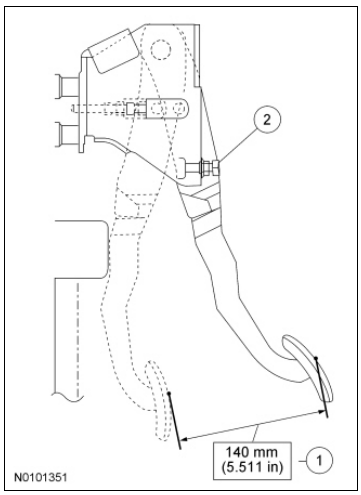


2. Check for a worn clutch disc lining. Measure the minimum allowable depth to the rivet heads with a slide caliper.
   - If the measurement is less than the minimum, install a new clutch disc.

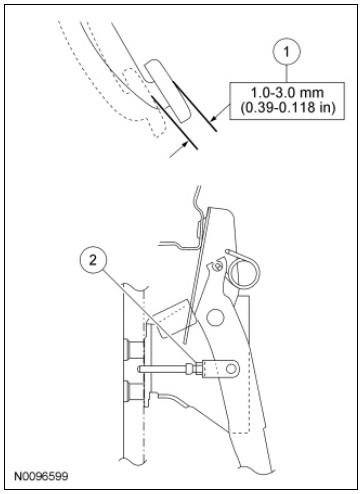
3. Check for loose clutch disc lining rivets.
   - Install a new clutch disc as necessary.

4. Check the clutch disc for cracking, scoring, discoloration or other surface marks.
   - Install a new clutch disc if necessary.

5. Using the Dial Indicator Gauge with Holding Fixture, check the maximum allowable runout of the clutch disc.
   - If the runout exceeds the maximum, install a new clutch disc.



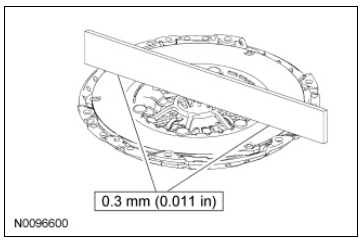
6. Use an emery cloth to remove minor imperfections in the clutch disc lining surface.



7. Check for wear or rust on the splines. If necessary, clean them with an emery cloth.

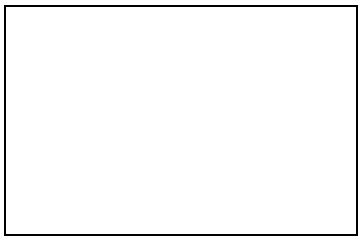
Clutch Pedal Freeplay Adjustment

1. Measure the clutch pedal travel.
    1. If the measurement is not within specification, turn the clutch pedal adjustment bolt as necessary.
    2. Tighten the clutch pedal locknut to 15 Nm (133 lb-in).
        - Recheck the measurement.



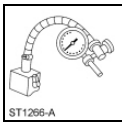
2. Measure clutch pedal free play.
    1. Depress the clutch pedal by hand until the push rod contacts the clutch master cylinder piston.
    2. If the measurement is not within specification, loosen the locknut and turn the push rod as necessary. Tighten the clutch pedal locknut to 15 Nm (133 lb-in).
        - Recheck the measurement.

Clutch Pressure Plate Check



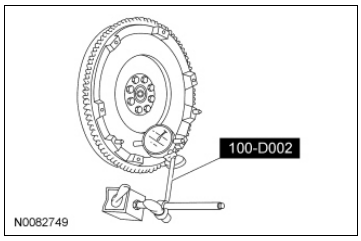
1. Check the clutch pressure plate surface for scoring, cracks or discoloration.
   - Minor scratches or discoloration should be removed with a fine emery cloth.

2. Measure the flatness of the clutch pressure plate surface with a straightedge and a feeler gauge.
   - Install a new pressure plate as necessary.

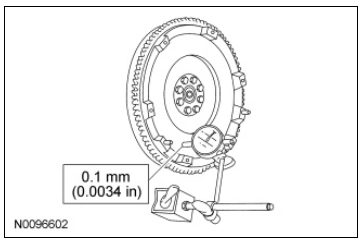


3. Check the diaphragm spring fingers for discoloration, scoring and bent or broken segments.

4. Measure the wear of the diaphragm spring fingers.
   - Install a new pressure plate as necessary.



Flywheel Runout Check



Special Tool(s)

 ST1266-A	Dial Indicator Gauge with Holding Fixture 100-D002 (D78P-4201-B) or equivalent

1. Mount the Dial Indicator Gauge with Holding Fixture so that the Dial Indicator Gauge contact point rides on the clutch disc contact surface.

2. Rotate the flywheel and check the runout.
   - If the runout exceeds the maximum runout 0.076 mm (0.0034 in), install a new flywheel.

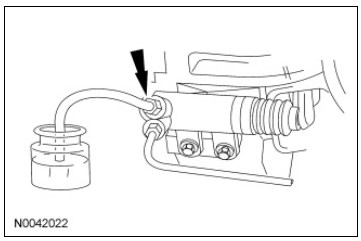
Clutch System Bleeding

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

⚠ WARNING: Carefully read cautionary information on product label. For emergency medical information seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

NOTICE: **Brake fluid is harmful to ted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with cold water.**



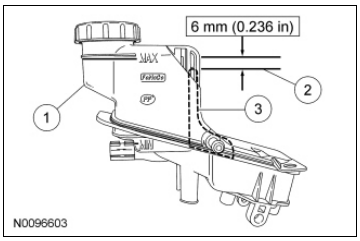
NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. **NOTE:** Make sure the brake fluid reservoir is to the MAX mark before bleeding the clutch system. Do not allow the fluid level to drop below 6 mm (0.236 in) of the MAX mark.

   Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean brake fluid.

2. Press the clutch pedal slowly to the floor.

3. With the clutch pedal held to the floor, loosen the bleeder screw until fluid and air are expelled from the system.



4. With the clutch pedal held to the floor, tighten the bleeder screw.
