5. ***NOTICE:*** **The clutch hydraulic system fluid is separated from the brake system fluid by a separate reservoir within the brake reservoir. Do not allow the clutch hydraulic system fluid level in the reservoir to fall more than 6 mm (0.236 in) below the MAX mark during the bleeding operation or fluid supply to the clutch release system will be starved, allowing air to enter the clutch master cylinder. Keep the brake master cylinder reservoir filled with clean,**

specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

Repeat Steps 2 through 4 until no air bubbles appear in the fluid.

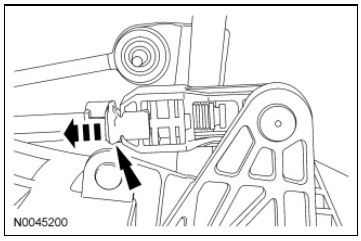
Item	Part Number	Description
1	-	Brake fluid reservoir
2	-	Minimum fluid level for clutch reservoir to fill
3	-	Inner clutch fluid reservoir

6. Tighten the bleeder screw.
    - Tighten to 7 Nm (62 lb-in).

7. Fill the brake reservoir.

8. Check system for normal operation.

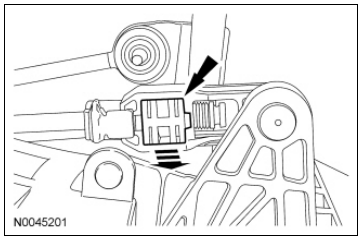
Gearshift Cable Adjustment



1. Set the parking brake.

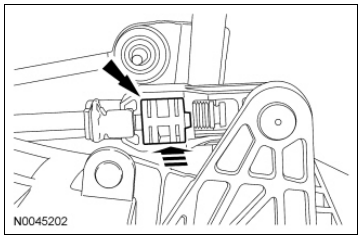
2. Place the gearshift in neutral.

3. Remove the gearshift knob and the floor console finish panel.



4. **NOTE:** Console removed for clarity.

   Disengage the safety lock by sliding it away from the shifter ball stud.



5. **NOTE:** If the cable lock is difficult to slide out, disconnect the shift cable from the stud, push the lock from the rear and reattach the shift cable to the ball stud.

   Disengage the cable lock by sliding it out from the shift cable end fitting.

6. Allow the gearshift lever to center itself. With the shifter and the transmission in NEUTRAL, push the cable lock onto the cable.

7. Engage the safety lock by sliding it over the primary shift cable lock.

8. Check for normal operation.

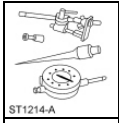
[a] Refer to the procedure in this section.

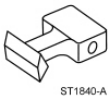
Clutch

The clutch system includes the following components:

- Flywheel
- Clutch disc
- Clutch pressure plate
- Clutch release fork
- Clutch release bearing
- Clutch slave cylinder

The clutch is a single-plate, dry-friction disc with a diaphragm-style spring clutch pressure plate. The clutch disc has a hub which is splined to the transmission input shaft. The clutch disc has friction material where it contacts the flywheel and the clutch pressure plate. The clutch pressure plate applies pressure to the clutch disc, holding it tightly against the surface of the flywheel. In the engaged position, the diaphragm spring holds the clutch pressure plate against the clutch disc, so that engine torque is transmitted to the input shaft.

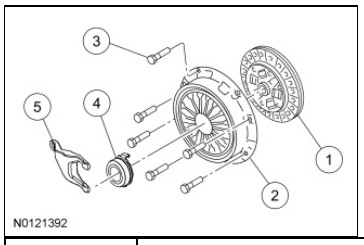




When the clutch pedal is applied, the release bearing pushes the diaphragm spring center of the clutch pressure plate toward the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. The clutch slave cylinder assists in the effort it takes to relieve the load on the clutch pressure plate. Steel spring straps riveted to the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transaxle.

Clutch

Refer to Section 308-00 .



Clutch Disc and Pressure Plate

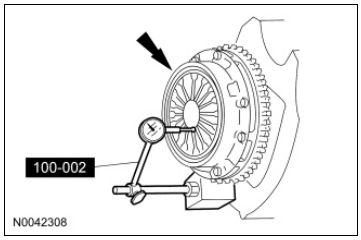
Special Tool(s)

 ST1214-A	Dial Indicator Gauge With Holding Fixture 100-002
 ST1840-A	Flywheel Holding Tool 303-103 (T74P-6375-A)
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

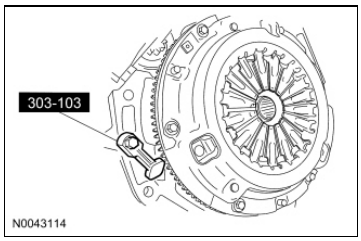
Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

Item	Part Number	Description
1	7550	Clutch disc
2	7563	Clutch pressure plate
3	-	Clutch pressure plate bolt (6 required)
4	7548	Clutch release bearing
5	7515	Clutch release fork



Removal

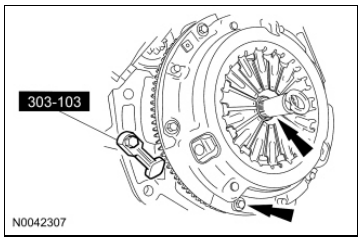
⚠ WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.



Clutch disc and clutch pressure plate

1. Remove the transaxle. For additional information, refer to Section 308-03 .

2. Inspect the clutch pressure plate.
   - Check the diaphragm spring fingers for discoloration, scoring, bent or broken segments.
   - Using the Dial Indicator Gauge with Holding Fixture, rotate the flywheel and check for sprg ends that are higher or lower than the rest.
     - ♦ The specification is 0.6 mm (0.023 in) maximum.



3. Using the Flywheel Holding Tool, lock the flywheel to the engine.

4. **NOTE:** Loosen each bolt, one turn at a time in a star pattern, until spring tension is released.

   Using a suitable clutch disc aligner, remove the bolts, the clutch pressure plate and the clutch disc.

5. **NOTE:** Do not immerse the clutch pressure plate in solvent.

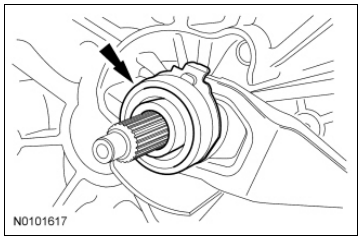
   Using a suitable cleaning solution, clean the clutch pressure plate.

6. Inspect the clutch pressure plate surface for burn marks, scores, flatness, ridges or cracks. For additional information, refer to Section 308-00 .
   - Maximum clearance for flatness check is 0.3 mm (0.011 in).

7. ***NOTICE:*** **If the clutch disc is saturated with oil, inspect the rear engine crankshaft seal or transmission input shaft seal for leakage. If leakage is found, install a new seal prior to clutch disc installation. For additional information, refer to Section 303-01A or Section 308-03 .**

   NOTE: Use an emery cloth to remove minor imperfections in the clutch disc lining surface.

   Inspect the clutch disc for the following:



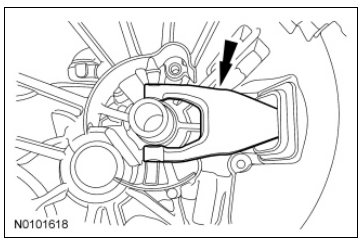
- Oil or grease saturation
- Worn or loose facings
- Warpage or loose rivets at the hub
- Wear or rust on the splines
- Install a new clutch disc if any of these conditions are present.

8. Check the clutch disc runout. For additional information, refer to Clutch Disc Check in Section 308-00 .

9. If necessary, conduct a Flywheel Runout Check. For additional information, refer to Section 308-00 .

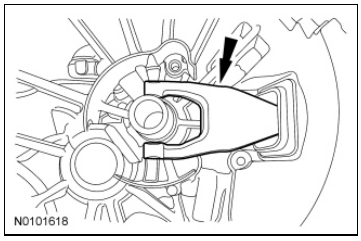
Clutch release bearing and clutch release fork

10. Remove the clutch release bearing.



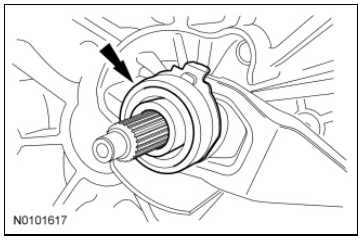
11. Inspect the clutch release bearing for wear or damage.
    - Rotate the bearing while applying pressure in the axial direction. If the bearing feels rough, sticks or has excessive resistance, install a new bearing.

12. Inspect the release bearing guide tube for wear or damage.
    - Slide the release bearing on the guide tube. Check for roughness or sticking.



13. Remove the clutch release fork. Inspect the fork for wear or damage.

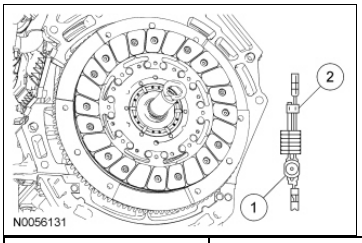
Installation



Clutch release bearing and clutch release fork

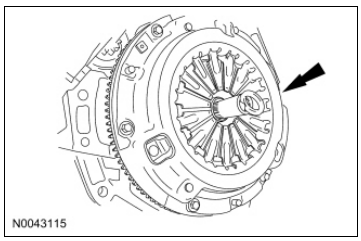
1. Install the clutch release fork.

2. Check for roughness or sticking. If the bearing feels rough, sticks or has excessive resistance, install a new bearing. Slide the release bearing on the guide tube.



3. Install the clutch release bearing.

Clutch disc and clutch pressure plate



4. Apply a very small amount of grease in the clutch disc hub. Wipe off excess grease to avoid contaminating the clutch disc and affecting clutch function.

5. Using a suitable clutch disc aligner, position the clutch disc on the flywheel.

Item	Part Number	Description
1	-	Transaxle side
2	-	Engine side

6. Position the clutch pressure plate on the flywheel and to the dowels. Install the 6 clutch pressure plate bolts.
    - Tighten the bolts one turn at a time in a star pattern. Tighten to 29 Nm (21 lb-ft).

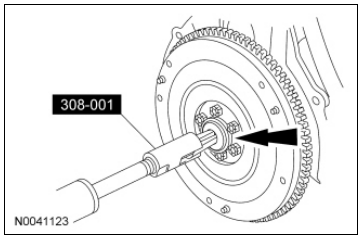
7. Apply a small amount of grease to:
    - the clutch release fork fingers.
    - the clutch release fork spring.
    - the guide tube.
    - the clutch slave cylinder end that contacts the release fork.

8. **NOTE:** Apply a very small amount of grease to the transmission input shaft end and on the splines.

   Install the transaxle. For additional information, refer to Section 308-03 .

9. If the clutch was replaced, use the scan tool to perfohe Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

Pilot Bearing



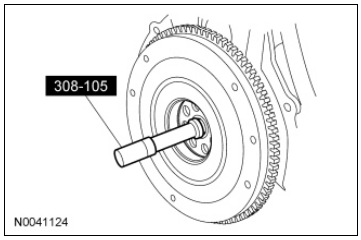
Special Tool(s)

 ST1470-A	Installer, Pilot Bearing 308-105 (T85T-7137-A)
 ST1282-A	Remover, Pilot Bearing 308-001 (T58L-101-B)

Removal

1. Remove the clutch disc and pressure plate. For additional information, refer to Clutch Disc and Pressure Plate in this section.

2. Using the Pilot Bearing Remover, remove the pilot bearing.



3. Inspect the pilot bearing for:
   - misalignment and looseness in the flywheel.
   - needle rollers for scoring, worn or broken needle rollers, inadequate grease or discoloration.
   - seal leakage.

Installation

1. **NOTE:** The pilot bearing can only be installed with the seal facing the transmission. The pilot bearing is pregreased and does not require additional lubrication. A new pilot bearing must be installed whenever it is removed.

   Using a soft-face hammer and the Pilot Bearing Installer, install the pilot bearing.

2. Install the clutch disc and pressure plate. For additional information, refer to Clutch Disc and Pressure

Plate in this section.

Material

Item	Specification	Fill Capacity
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1	-
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B	-

Torque Specifications

Description	Nm	lb-ft	lb-in
Clutch hydraulic tube nut	17	-	150
Clutch master cylinder nuts	21	15	-
Clutch pedal bracket nut	21	15	-
Clutch pedal locknut	10	-	89
Clutch slave cylinder bolts	19	-	168
PCM bolts	10	-	89
PCM bracket nuts	10	-	89

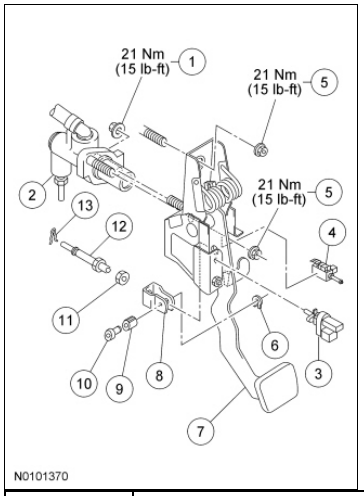
Clutch Controls

The clutch controls system consists of the following components:

- Clutch pedal
- Clutch master cylinder
- Clutch slave cylinder
- Clutch hydraulic fluid tube
- Clutch release fork
- Clutch release bearing

When the clutch pedal is applied, the clutch master cylinder transmits hydraulic fluid pressure to the clutch slave cylinder. The clutch slave cylinder and the clutch release fork transfer the clutch pedal motion to the clutch release bearing. The release bearing presses against the pressure plate diaphragm spring, releasing the clutch disc.

The clutch master cylinder uses brake fluid and shares a common reservoir with the brake master cylinder.



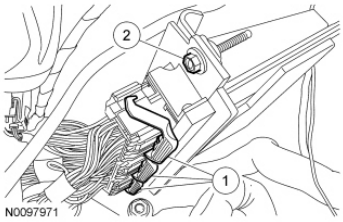
Clutch Controls

For diagnosis and testing of the clutch controls, refer to Section 308-00 .

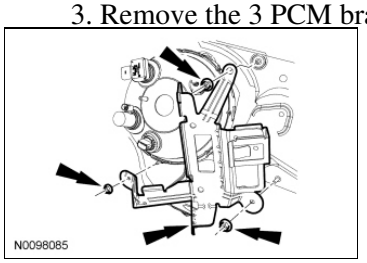
Clutch Pedal

Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

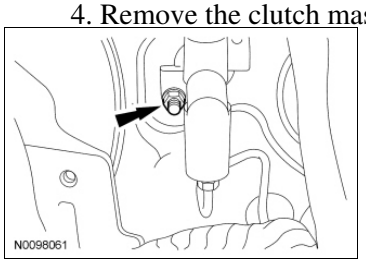


Item	Part Number	Description
1	-	Clutch master cylinder nut (2 required)
2	7A543	Clutch master cylinder
3	-	Clutch switch (cruise control cancel)
4	11A152	Clutch Pedal Position (CPP) switch
5	-	Clutch pedal bracket nuts
6	-	Retaining clip
7	-	Clutch pedal and bracket assembly
8	-	Master cylinder push rod clevis
9	-	Clevis bushing
10	-	Clevis pin
11	-	Clutch pedal locknut
12	-	Master cylinder push rod
13	-	Retaining clip

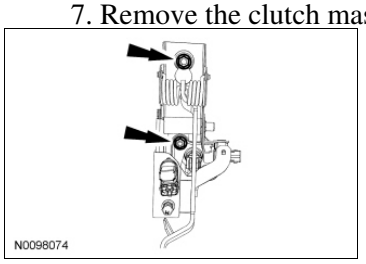


Removal

1. Remove the battery and the battery tray. For additional information, refer to Section 414-01 .
2. Remove the PCM.
    1. Disconnect the electrical connectors.



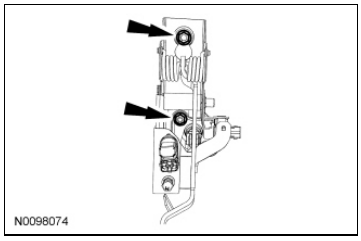
2. Remove the 2 PCM bolts.



3. Remove the 3 PCM bracket nuts and the bracket.

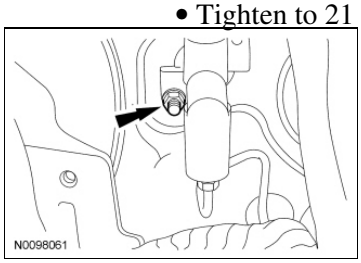
4. Remove the clutch master cylinder nut.

5. Working under the instrument panel, disconnect the clutch switch (cruise control cancel) electrical connector.
6. Disconnect the Clutch Pedal Position (CPP) electrical connector.
7. Remove the clutch master cylinder nut and the clutch pedal bracket nut.



8. Remove the clutch pedal and bracket assembly.

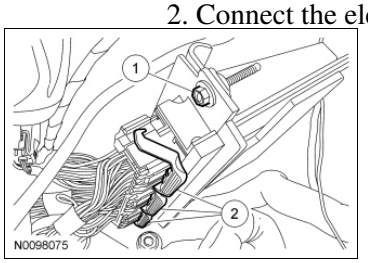
Installation



1. **NOTE:** Make sure to align the push rod into the clutch master cylinder piston as the pedal assembly is installed.

   Install the clutch pedal and bracket assembly

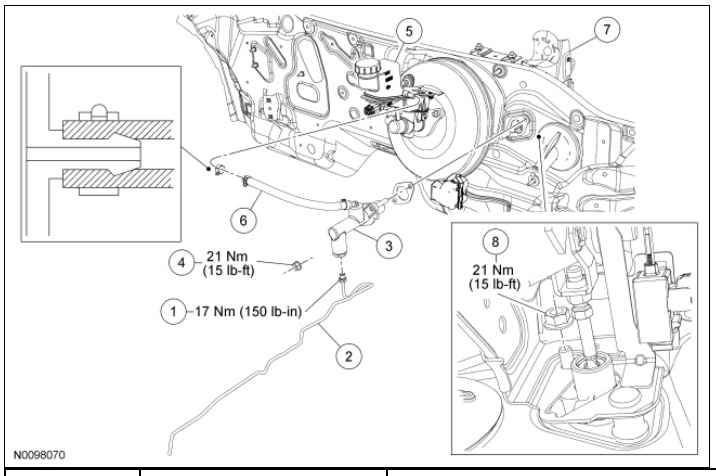
   - Apply a small amount of grease to the:
     - clevis bushing.
     - end of the clutch switch.
     - end of the master cylinder push rod.
2. Working under the instrument panel, connect the clutch switch (cruise control cancel) electrical connector.
3. Install the clutch master cylinder nut and the clutch pedal bracket nut.
   - Tighten to 21 Nm (15 lb-ft).



4. Connect the CPP electrical connector.
5. Install the clutch master cylinder nut.
    - Tighten to 21 Nm (15 lb-ft).

6. Install the PCM bracket and the 3 PCM bracket nuts.
    - Tighten to 10 Nm (89 lb-in).

7. Install the PCM.
    1. Install the 2 PCM bolts.
        - Tighten to 10 Nm (89 lb-in).
    2. Connect the electrical connectors.



8. Install the battery tray and the battery. For additional information, refer to Section 414-01 .

Clutch Master Cylinder

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

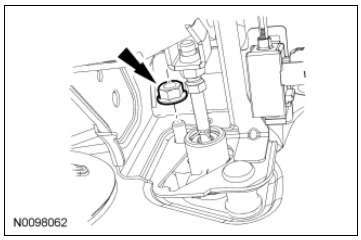
2	-	Clutch hydraulic tube
3	7A543	Clutch master cylinder
4	-	Clutch master cylinder nut
5	2K478	Clutch system reservoir
6	-	Clutch master cylinder reservoir hose
7	7519	Clutch pedal and bracket
8	-	Clutch master cylinder nut

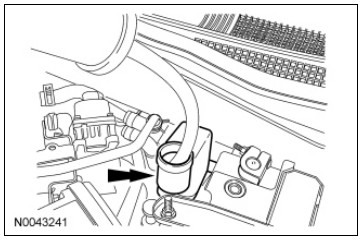
Removal

⚠ WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

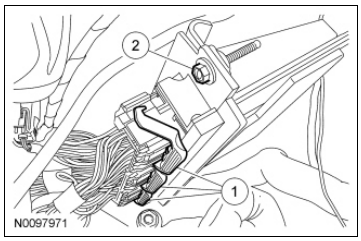
WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.



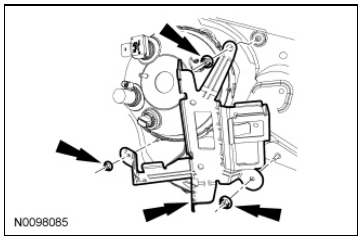
NOTICE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

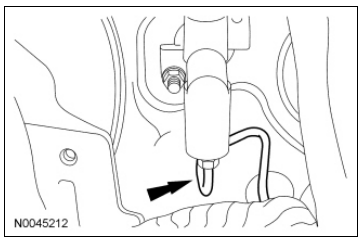
1. Working under the instrument panel, remove the clutch master cylinder nut.



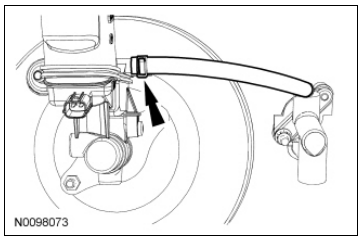
2. Using a suitable suction tool, remove the brake fluid to just below the clutch reservoir hose.



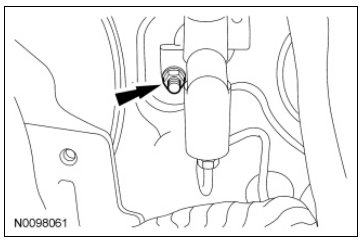
3. Remove the battery tray. For additional information, refer to Section 414-01 .



4. Remove the PCM.
    1. Disconnect the electrical connectors.
    2. Remove the 2 PCM bolts.



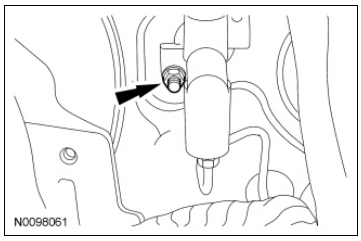
5. Remove 3 PCM bracket nuts and the PCM bracket.



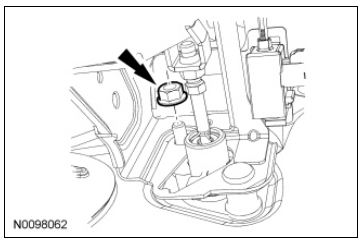
6. Disconnect the clutch master cylinder-to-clutch hydraulic tube.

7. Disconnect the clutch master cylinder reservoir hose.

8. Remove the clutch master cylinder nut.

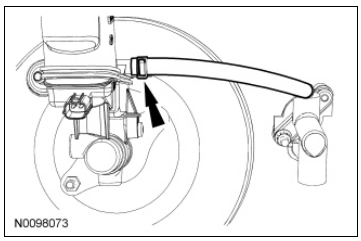


9. Remove the clutch master cylinder assembly.

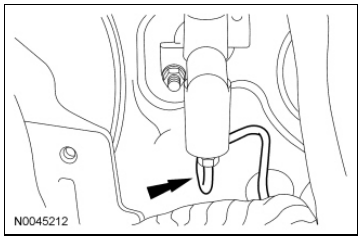


Installation

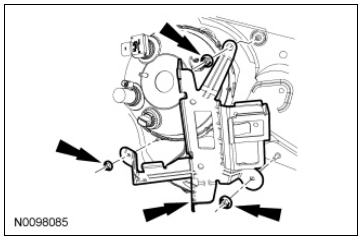
1. Install the clutch master cylinder assembly.



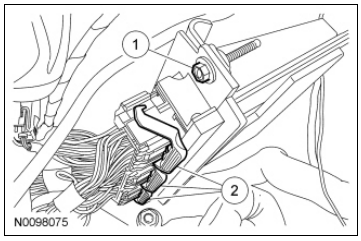
2. Install the clutch master cylinder nut.
   - Tighten to 21 Nm (15 lb-ft).



3. Working under the instrument panel, install the clutch master cylinder nut.
   - Tighten to 21 Nm (15 lb-ft).



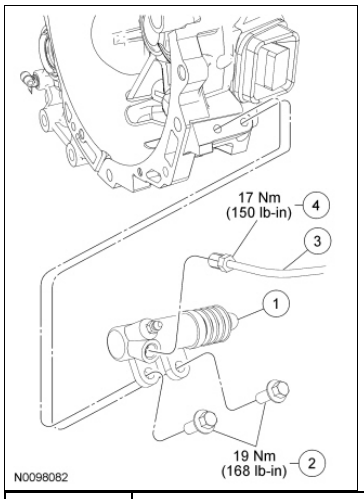
4. Connect the clutch master cylinder reservoir hose.



5. Connect the clutch master cylinder-to-clutch hydraulic tube.
    - Tighten the clutch hydraulic tube nut to 17 Nm (150 lb-in).

6. Install the PCM bracket and 3 PCM bracket nuts.
    - Tighten to 10 Nm (89 lb-in).

7. Install the PCM.
    1. Install the 2 PCM bolts.
        - ♦ Tighten to 10 Nm (89 lb-in).
    2. Connect the electrical connectors.



8. Install the battery tray. For additional information, refer to Section 414-01 .

9. Bleed the clutch hydraulic system. For additional information, refer to Section 308-00 .

Manual Transaxle

Manual Transaxle

The G6M 6-speed manual transaxle features the following:

- Fully synchronized 6-speed transaxle
- Synchronized reverse gear
- Six forward speeds and one reverse speed
- An aluminum main case, clutch housing and structural cover

The function of the transmission is to move the vehicle from a rest position to motion. This is done by transferring the engine torque, through the transaxle, to the front wheels. The transmission input shaft receives power when the clutch is engaged. Torque flows through the input shaft to the drive gear. The forward gears are selected by a synchronizer mechanism. The helical-cut forward gears are in constant mesh with the corresponding gears on the opposing shaft. Reverse gears have helical-cut teeth and are engaged through the reverse idler gear.

External Shift Linkage

The manual transaxle is controlled by a floor-mounted gearshift lever located in the floor console. Connection between the floor-mounted gear shift lever and the manual transaxle gear shift control mechanism is made through 2 shift cables. The clutch pedal disengages the clutch allowing the transaxle to be shifted from one gear to another.

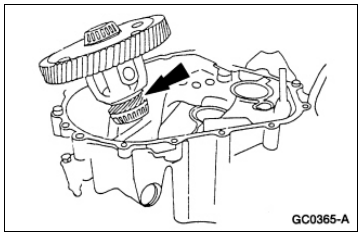
Internal Shift Linkage

The G6M manual transaxle is shifted internally by 4 shift forks. The reverse gear shift fork shifts in and out of the reverse gear. The 1st/2nd, 3rd/4th and 5th/6th shift forks control all forward gear shifts.

Reverse Gear

The reverse idler gear is mounted on a reverse idler gear shaft supported at one end in the clutch housing and at the other in the transaxle case by a reverse idler shaft lock bolt.

When the reverse idler gear slides on the reverse idler gear shaft, it engages the reverse drive gear on the input shaft and the reverse gear on the output shaft. The driving gear is part of the input shaft and the reverse gear is machined on the outside diameter of the 1st/2nd synchronizer sleeve.



When the reverse idler gear rotates on the reverse idler gear shaft, it reverses the power flow to the output shaft.

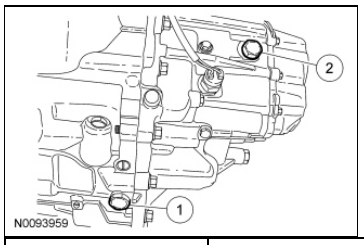
To engage the reverse idler gear, the motion of the shift fork is transferred to the reverse gearshift lever through the shift gate. The reverse gearshift lever is mounted on a meshlock plunger that allows it to act as a fulcrum. When the reverse gearshift selector arm moves its end of the shift fork, the opposite end slides the reverse idler gear into engagement with the input shaft and output shaft reverse gears.

Differential

The ends of the differential are supported on tapered roller differential bearings. The cups for these differential bearings are seated in the transaxle case and the flywheel housing. Differential bearing preload is set using a selective differential bearing shim that is installed under the differential bearing cup in the transaxle case.

The differential includes the differential side gears and the shaft mounted differential pinion gears. Direct contact between the gears and the differential case is prevented by the differential side gear thrust washers installed under the gears. The differential pinion shaft is held in position by a differential pinion shaft lock pin that extends through the end of the differential pinion shaft and the differential case.

The speedometer drive gear is also mounted on the differential case. It is located between the tapered roller differential bearing and the differential case. A tab on the speedometer drive gear and a matching slot in the differential case prevent the speedometer drive gear from spinning on the differential case.



Manual Transaxle

Refer to Section 308-00 .

Transaxle Draining and Filling

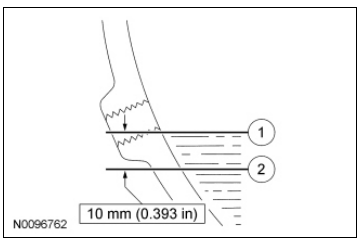
Material

Item	Specification
SAE 75W-90 API GL-4 Gear Oil XT-4-QGL	WSS-M2C203-A1

Item	Part Number	Description
1	-	Transaxle drain plug
2	-	Transaxle fill plug

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the drain plug and drain the fluid.



3. Install a new washer and the drain plug.
   - Tighten to 49 Nm (36 lb-ft).

4. **NOTE:** Prior to removal, clean the area of the fill plug.

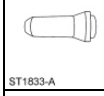
   Remove the fill plug.

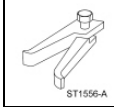
5. **NOTE:** Do not overfill the transaxle. This may result in increased operating temperature or cause transaxle fluid to be forced out of the case.

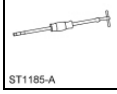
   Fill the transaxle with the recommended fluid.

Item	Part Number	Description

1	-	Correct level
2	-	Low level







6. Install a new washer and fill plug.
   - Tighten to 49 Nm (36 lb-ft).

Halfshaft Seal

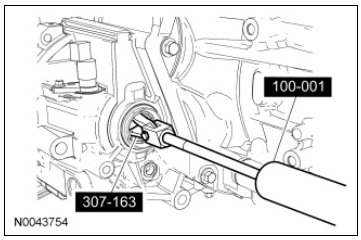
Special Tool(s)

 ST1833-A	Installer, Halfshaft Oil Seal 308-119 (T87C-77000-H)
 ST1556-A	Remover, Stator Case Bearing 307-163 (T86P-70043-A)
 ST1185-A	Slide Hammer 100-001 (T50T-100-A)

Material

Item	Specification
SAE 75W-90 API GL-4 Gear Oil XT-4-QGL	WSS-M2C203-A1

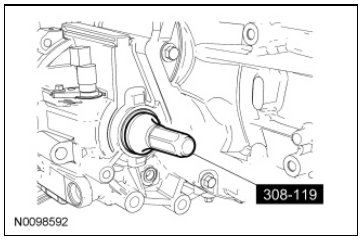
Item	Part Number	Description
1	4B436	LH halfshaft assembly
2	7052	Halfshaft oil seal
3	-	RH intermediate shaft
4	7052	Halfshaft oil seal



Removal and Installation

NOTICE: **New halfshaft oil seals should be installed any time the halfshafts are removed. Failure to install new halfshafts seals may result in transaxle oil leak(s) and damage to the transmission may occur.**

1. Remove the transaxle drain plug and drain the fluid.

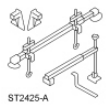


2. Remove the RH intermediate shaft or LH halfshaft. For additional information, refer to Section 205-04 .

3. Using the Slide Hammer with the Stator Case Bearing Remover, remove the RH intermediate shaft oil seal or the LH halfshaft oil seal.

Installation

1. Using the Halfshaft Oil Seal Installer, install the RH intermediate shaft or the LH halfshaft oil seal.



2. **NOTE:** Do not allow t splines on the halfshaft to touch the oil seal.

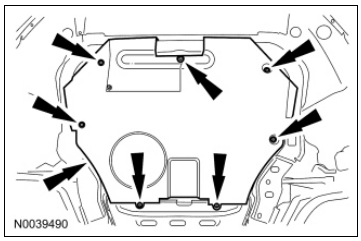
   Install the RH intermediate shaft or LH halfshaft. For additional information, refer to Section 205-04 .

3. Fill the transaxle to specification. For additional information, refer to Transaxle Draining and Filling in this section.

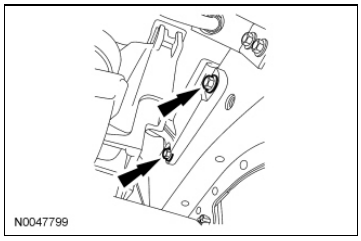
Transaxle Rear Support Insulator

Special Tool(s)

 ST2425-A	Support Bar, Engine 303-F072



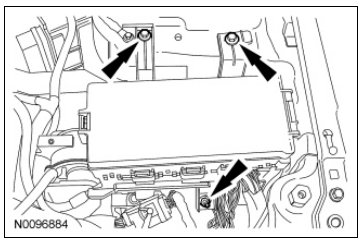
Item	Part Number	Description
1	10723	Battery tray
2	-	Battery tray bolts (2 required)
3	-	Power Distribution Box (PDB) bolt (2 required)
4	-	PDB nut
5	-	PDB electrical connectors
6	14A067	PDB assembly
7	-	Clutch hydraulic tube
8	5410494	Splash shield
9	W707398-S	Splash shield bolt (7 required)
10	6F020	Transaxle rear support insulator
11	W710645-S	Transaxle rear support insulator nut (2 required)
12	W711487-S	Transaxle rear support insulator bolt
13	W709234-S	Transaxle rear support insulator-to-frame bolt (4 required)



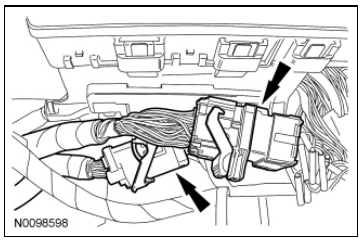
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

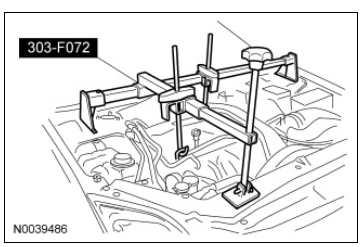
1. Remove the 7 splash shield bolts and the splash shield.



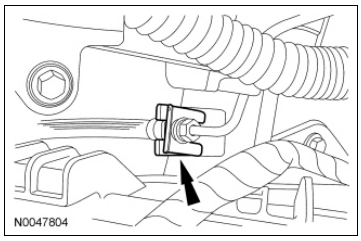
3. Remove the 2 lower transaxle rear support insulator bolts.



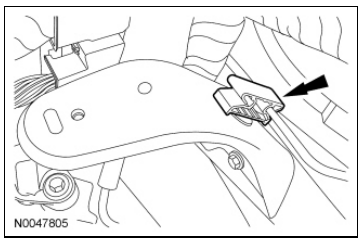
4. Remove the battery tray. For additional information, refer to Section 414-01 .



5. Remove the 2 Power Distribution Box (PDB) bolts and the lower nut. Pull the PDB upward to unclip the pushpin.



6. Disconnect the 2 electrical connectors.



7. Install the Engine Support Bar.

8. Remove the clutch hydraulic tube spring clip. Push downward on the clutch tube to release it from the bracket.

9. Remove the clutch hydraulic tube from the plastic retainer.

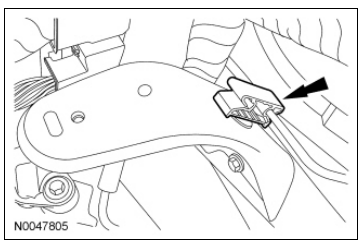
10. **NOTE:** If one or both of the mount studs are removed or come out, do not reinstall the old stud(s). Install a new stud(s). Make sure the studs are properly seated in the case, even if they were not replaced.

    Remove the remaining 2 transaxle rear support insulator-to-frame bolts, the 2 transaxle rear support insulator nuts and the transaxle rear support insulator-to-transaxle bolt.

11. Remove the transaxle rear support insulator.

Installation

1. Install the transaxle rear support insulator.

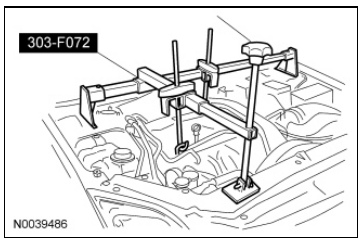


2. **NOTE:** If one or both of the mount studs are removed or come out, do not reinstall the old stud(s). Install a new stud(s). Make sure the studs are properly seated in the case, even if they were not replaced.

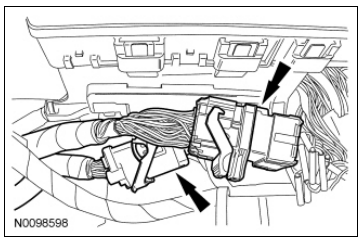
   Install the 2 upper transaxle rear support insulator-to-frame bolts.

   - Tighten to 63 Nm (46 lb-ft).

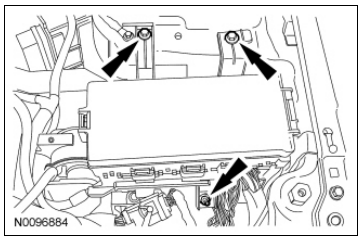
3. Install the 2 transaxle rear support insulator nuts and the transaxle rear support insulator bolt.
   - Tighten to 80 Nm (59 lb-ft).



4. Install the clutch hydraulic tube into the plastic retainer.

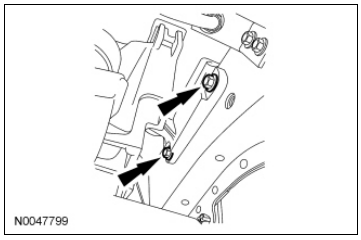


5. Install the clutch hydraulic tube spring clip. Push upward on the clutch tube to attach it to the bracket.

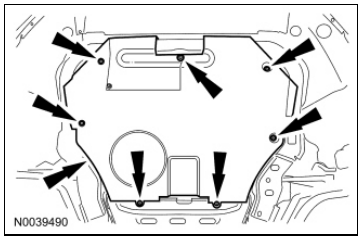


6. Remove the Engine Support Bar.

7. Position the PDB in place. Connect the 2 electrical connectors.

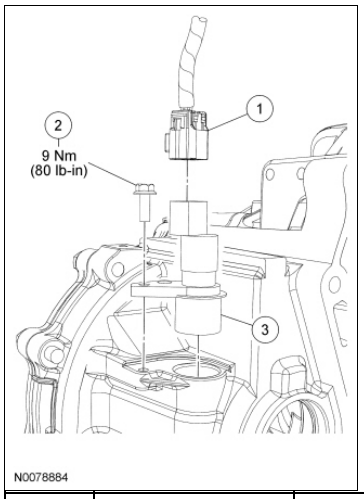


8. Push the PDB downward to clip the pushpin. Install the 2 PDB bolts and the lower nut.



9. Install the battery tray and battery. For additional information, refer to Section 414-01 .

10. Install the 2 lower transaxle rear support insulator-to-frame bolts.
    - Tighten to 63 Nm (46 lb-ft).



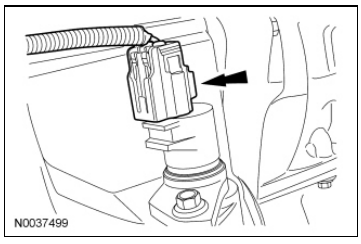
11. Install the splash shield and the 7 splash shield bolts.
    - Tighten to 9 Nm (80 lb-in).

N0039490

Vehicle Speed Sensor (VSS)

Material

Item	Specification
SAE 75W-90 API GL-4 Gear Oil XT-4-QGL	WSS-M2C203-A1

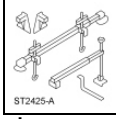


Item	Part Number	Description
1	14487	Vehicle Speed Sensor (VSS) electrical connector
2	-	VSS bolt
3	17271	VSS

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the Vehicle Speed Sensor (VSS) electrical connector.



3. Remove the VSS bolt.
   - To install, tighten to 9 Nm (80 lb-in).

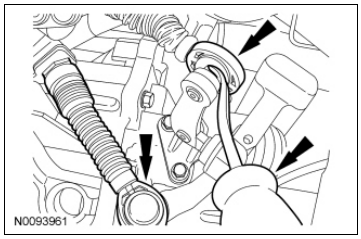
4. Remove the VSS .
   - Discard the O-ring.

5. To install, reverse the removal procedure.
    - Apply clean manual transaxle fluid to a new O-ring and install it on the VSS .

Transaxle

Special Tool(s)

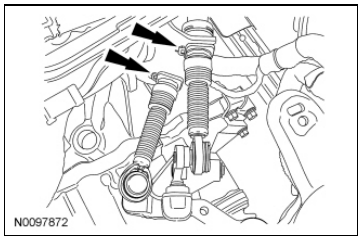
 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent
 ST2425-A	Support Bar, Engine 303-F072



⚠ WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.

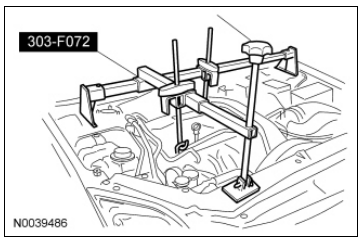
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the battery tray. For additional information, refer to Section 414-01 .



3. Remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A .

4. Disconnect the shift cables from the transaxle shift control lever, using a suitable tool to lightly pry them off the transaxle shift control lever.



N0093961

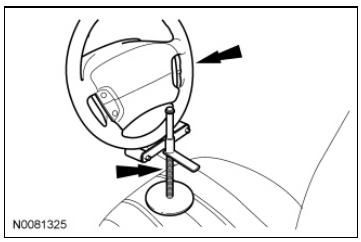
5. ***NOTICE:*** **Carefully pry the retainer on the shift cables. Do not damage the shift cable retainers. Using a small screwdriver push from the back.**

   Disconnect the shift cables from the transaxle bracket.

N0097872

6. Install the Engine Support Bar.

7. Detach the wire harness from the transaxle.



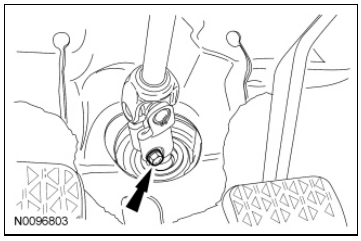
8. Remove the 3 upper transaxle-to-engine bolts.

9. **NOTE:** If one or both of the mount studs are removed or come out, do not reinstall the old stud(s). Install a new stud(s). Make sure the studs are properly seated in the case, even if they were not replaced.

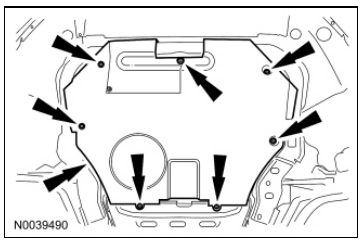
   Remove the transaxle rear support insulator nuts and the transaxle rear support insulator bolt.

10. **NOTE:** Use a steering wheel holding device such as Hunter® 28-75-1 or equivalent, to hold the steering wheel.

    Using a suitable holding device, hold the steering wheel in the straight-ahead position.

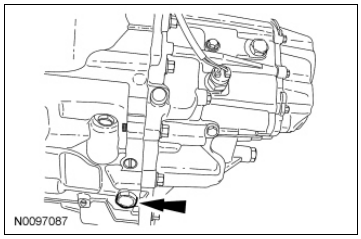


11. Remove the 2 nuts and the steering joint cover.

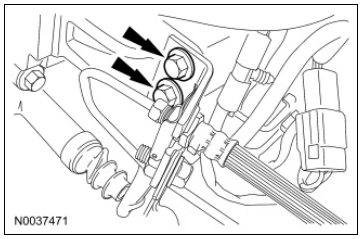


12. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    Remove and discard the bolt and disconnect the steering column shaft from the steering gear.

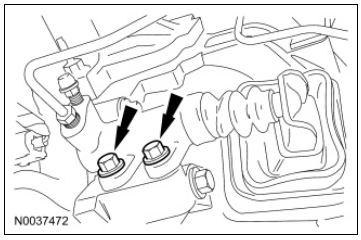


13. If equipped, remove the 7 screws and the underbody cover.



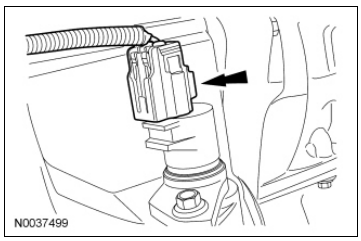
14. **NOTE:** If disassembly of the transaxle is required, remove the drain plug and drain the transaxle.

    Remove the drain plug and drain the transaxle.



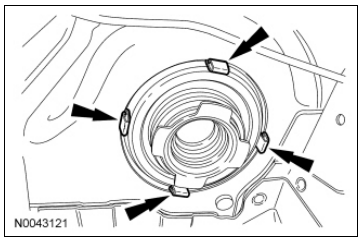
15. Once fluid has drained, install the drain plug.
    - Tighten to 49 Nm (36 lb-ft).

16. Remove the 2 clutch tube hydraulic line bracket bolts.



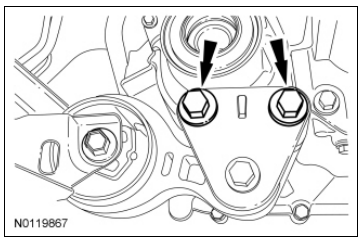
17. Remove the 2 bolts and position the clutch slave cylinder aside.

18. Disconnect the reverse lamp switch electrical connector.



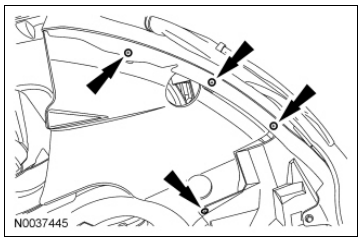
19. Remove the starter motor. For additional information, refer to Section 303-06 .

20. Disconnect the Output Shaft Speed (OSS) electrical connector.

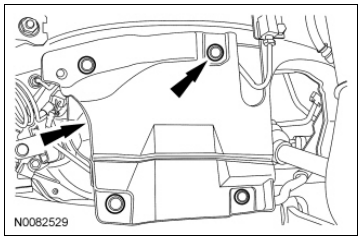


21. ***NOTICE:*** **Remove the steering gear/dash seal or damage to the seal may occur.**

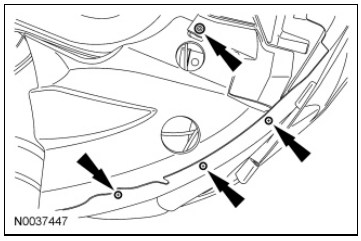
    Release the 4 clips and slide the steering gear/dash seal off of the steering gear.



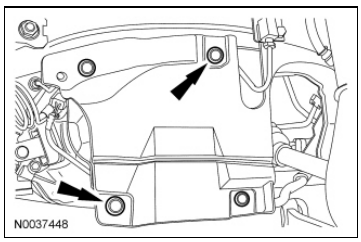
22. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .



23. Remove the 2 roll restrictor bracket bolts.

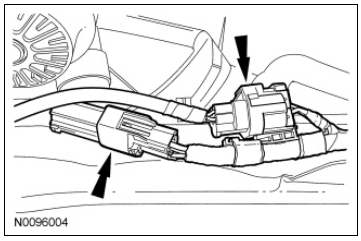


24. Remove the 4 screws and position the RH fender splash shield aside.

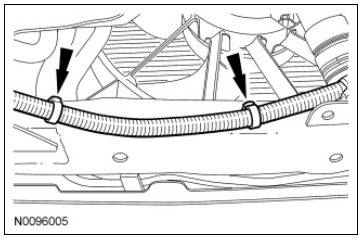


25. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

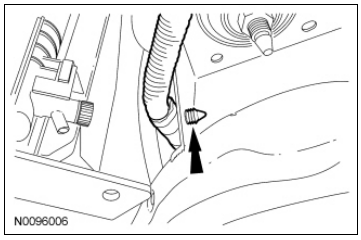
26. Remove the 4 screws and position the LH fender splash shield aside.



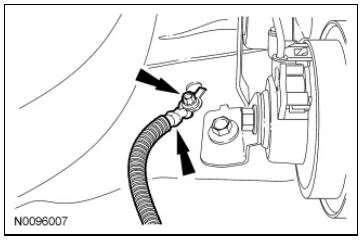
27. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.



28. Remove the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

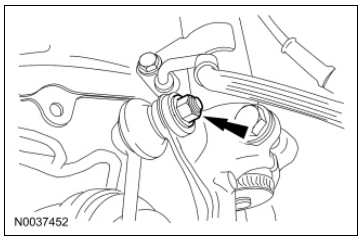


29. Disconnect the 2 in-lineElectronic Power Assist Steering (EPAS) system electrical connectors at the front of the subframe.

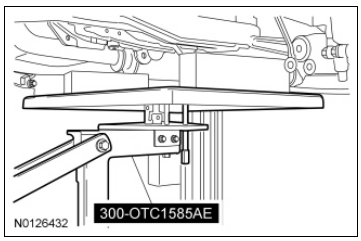


30. Detach the 2 EPAS system wiring harness pin-type retainers from the subframe.

31. Detach the EPAS system wiring harness pin-type retainer from the subframe under the LH fender splash shield.

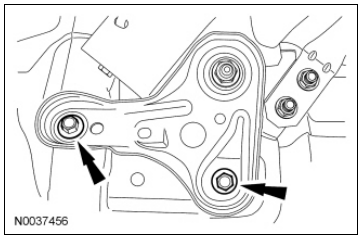


32. Remove the bolt and the EPAS system wiring harness ground from behind the RH splash shield.

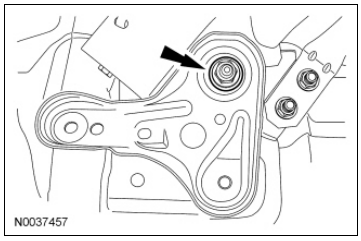


33. **NOTE:** LH shown, RH similar.

    Remove the nuts and separate the stabilizer bar links from the struts.

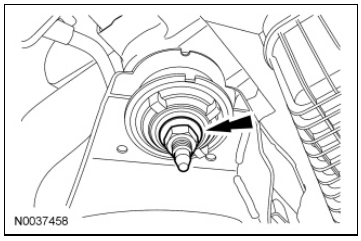


34. Position the Powertrain Lift under the subframe assembly.



35. **NOTE:** LH shown, RH similar.

    Remove the subframe bracket-to-body bolts.

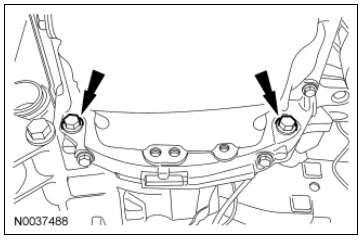


36. **NOTE:** LH shown, RH similar.

    Remove the rear subframe nuts and the subframe brackets.

37. **NOTE:** LH shown, RH similar.

    Remove the front subframe nuts.

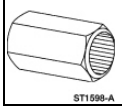


38. Lower the subframe assembly from the vehicle.

39. Support the transaxle with a suitable transmission jack. Secure the transaxle to the transmission jack with a safety strap.

40. Remove the clutch housing-to-oil pan bolt.

41. Remove the 2 oil pan-to-clutch housing bolts.



42. Remove the remaining 4 transaxle-to-engine bolts.

43. Move the transaxle away from the engine and lower it from the vehicle.

Transaxle

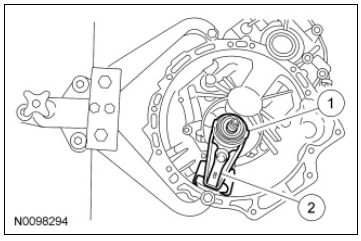
Special Tool(s)

 ST1186-A	Holding Fixture 307-003 (T57L-500-B)
 ST1598-A	Turning Torque Socket, Transmission 308-160 (T88C-7025-GH)

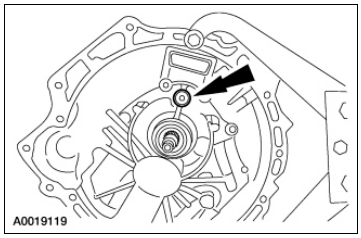
NOTE: Clean the transaxle exterior before disassembly.

NOTE: Clean all removed parts and all sealing surfaces with solvent, and dry with compressed air.

NOTE: Clean out all holes and passages with compressed air and verify that there are no obstructions.



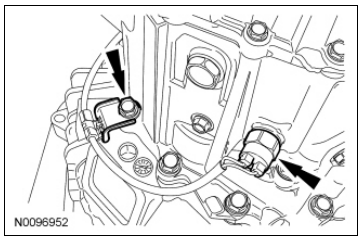
1. Mount the transaxle to the Holding Fixture.



2. Remove the clutch release fork and bearing.

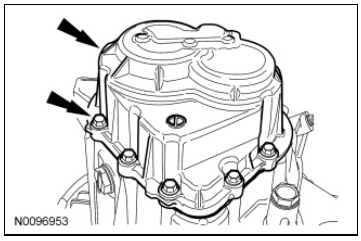
   NOTE: May need to use a screwdriver to pry the clutch release fork off the anchor bolt, if needed.

   1. Remove the clutch release bearing.
   2. Remove the clutch release fork and diaphragm.

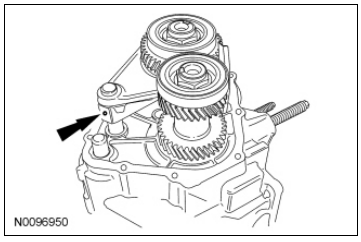


3. If necessary, remove the anchor bolt.

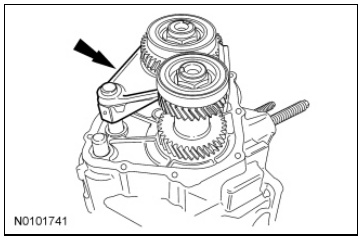
4. Remove the bolt and the Vehicle Speed Sensor (VSS).



5. Remove the reversing lamp switch wiring harness retainer bolt and reversing lamp switch.

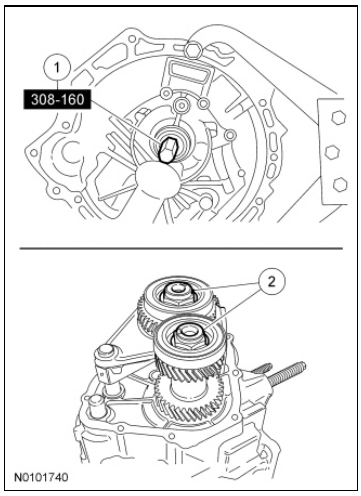


6. Shift the transaxle into the NEUTRAL position.



7. Remove the 9 case cover bolts and the case cover.

8. Remove and discard the 5th/6th gear shift fork roll pin.

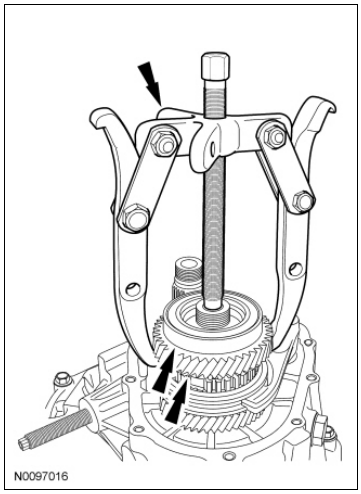


9. Shift the 5th/6th gear shift fork to 5th.

10. **NOTE:** Do not reuse locknuts.

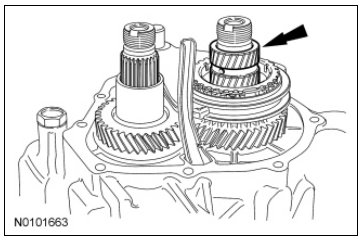
    Remove the primary and secondary shaft locknuts.

    1. Using the Transmission Turning Torque Socket, keep the input shaft from turning.
    2. Using a punch, release the locking tabs from the shafts. Remove and discard the primary and secondary shaft locknuts.



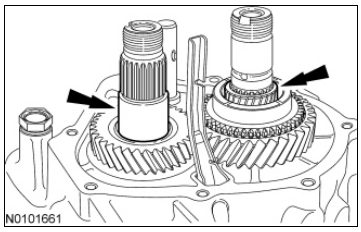
11. ***NOTICE:*** **Make sure the tabs of the suitable tool are securely positioned on the gear or damage to the gear may occur.**

    Using a suitable tool, remove the bearing and 6th gear from the secondary shaft.

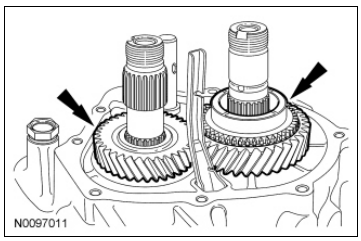


12. ***NOTICE:*** **Make sure the tabs of the suitable tool are securely positioned on the gear or damage to the gear may occur.**

    Using a suitable tool, remove the bearing and 6th gear from the primary shaft.

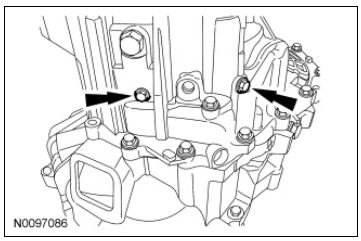


13. Remove the gear sleeve.

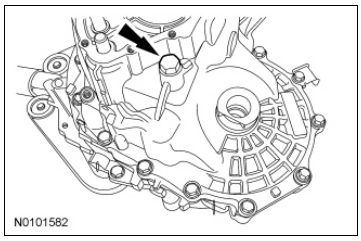


14. Remove the 5th/6th shift fork and synchronizer assembly.

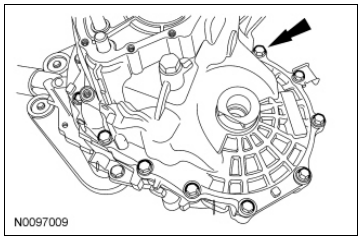
15. Remove the spacer and the gear sleeve.



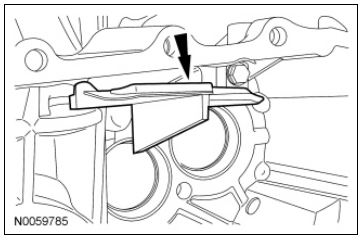
16. Remove the 5th speed primary and secondary gears.



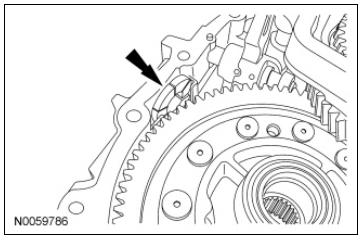
NOTE: Make sure the transaxle is in neutral.



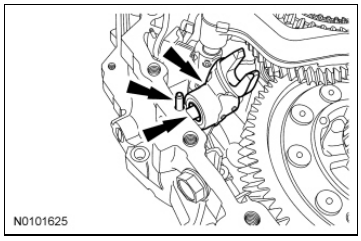
17. Remove the reverse idler shaft lock bolt and shift rail guide bolt.



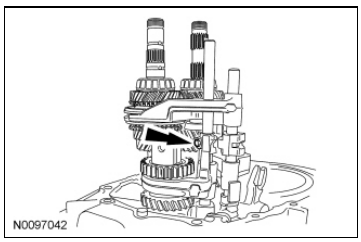
18. Remove the shift detent bolt, spring and ball.



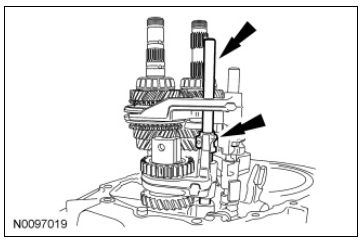
19. Remove the 15 transaxle case bolts and separate the transaxle case.
    - After separating the transaxle cases, position the removed case on its side. Use care not to damage the funnel.



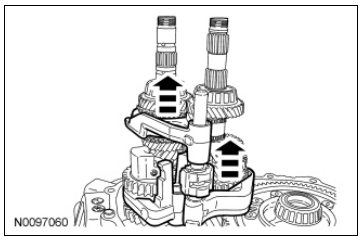
20. Remove the funnel bolt and the funnel.



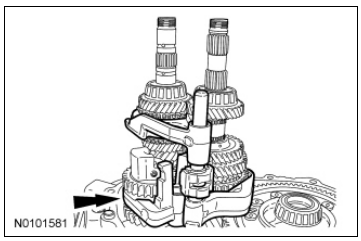
21. Remove the magnet.



22. Remove the shift lever shaft pin, then remove the shift lever shaft and shift fork selector lever.

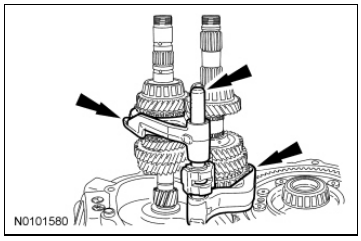


23. Remove the shift gate bolt.

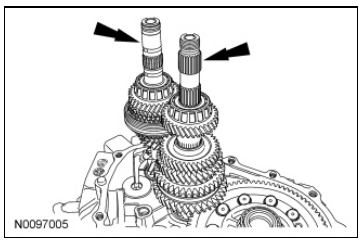


24. Remove the shift control shaft and remove the shift gate.

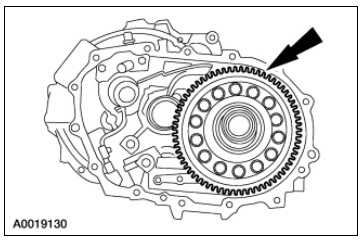
25. Move the shift forks upward into 2nd and 4th gears.



26. Remove the reverse idler gear assembly and shift fork.



27. Rotate the main shift control shaft clockwise to free the interlock from the 1-2 and 3-4 shift forks.



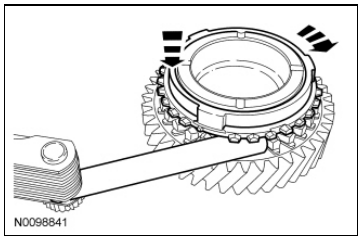
28. Raise the main shift control shaft until it clears the bore in the transaxle case and remove the main shift control shaft assembly, shift forks.

29. Remove the primary and secondary shafts at the same time.

30. Remove the differential.

31. For further disassembly of the transaxle case, refer to Transaxle Case in this section.

5th/6th Gear



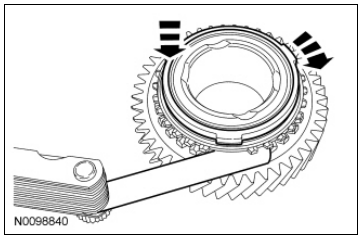
1. Inspect the 5th and 6th gear synchronizer cones, gear teeth and rings for wear or damage. Replace as necessary.

2. **NOTE:** Set the synchronizer ring squarely on the gear and measure around the circumference.

   Using a feeler gauge, while applying pressure and rotating the synchronizer ring, measure the clearance between the 5th gear synchronizer ring and the flank surface of the gear. The measurement should be the same around the entire circumference. Replace the synchronizer ring if less than the minimum specification.

5th Gear Synchronizer Ring Clearance

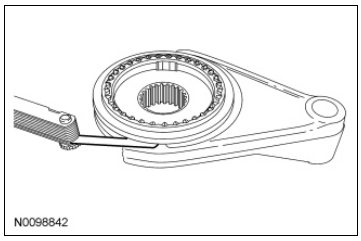
Standard	Minimum
1.50 mm (0.059 in)	0.80 mm (0.031 in)



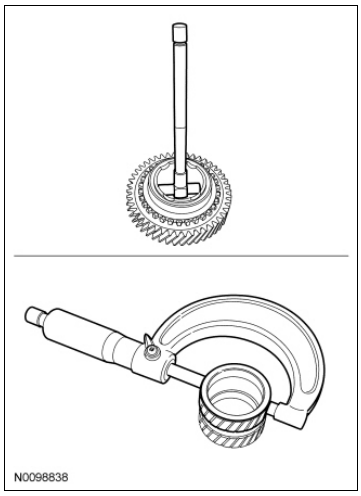
3. **NOTE:** Set the synchronizer ring squarely on the gear and measure around the circumference.

   Using a feeler gauge, while applying pressure and rotating the synchronizer ring, measure the clearance between the 6th gear synchronizer ring and the flank surface of the gear. The measurement should be the same around the entire circumference. Replace the synchronizer ring if less than the minimum specification.

6th Gear Synchronizer Ring Clearance

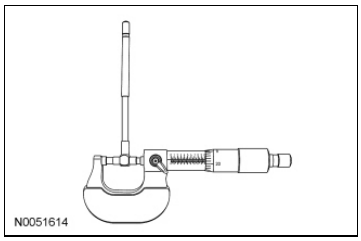


Standard	Minimum
1.50 mm (0.059 in)	0.80 mm (0.031 in)

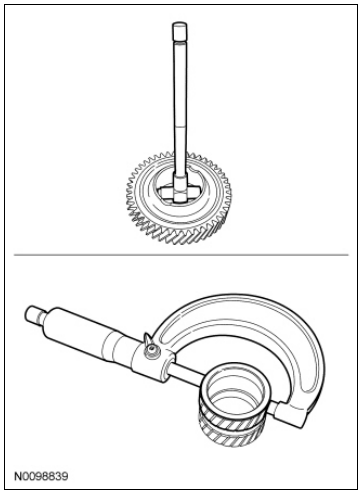


4. Measure the clearance between the clutch hub sleeve and the shift fork. Replace if it exceeds the maximum specification.
    - Inspect the clutch hub sleeve and clutch hub operation. Replace if there is a malfunction.

5th/6th Gear Clutch Hub Sleeve and Shift Fork Clearance

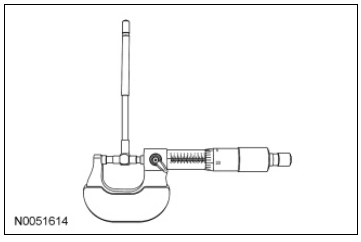


Standard	Maximum
0.10-0.36 mm (0.004-0.014 in)	0.86 mm (0.033 in)



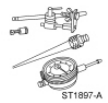
5. Using a telescoping gauge, measure the ID of the 5th gear. Using a micrometer, measure the OD of the gear sleeve.

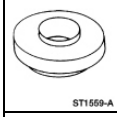
6. Measure the telescoping gauge to determine if the gear to the gear sleeve clearances are within specifications. If not within specifications, replace as needed.

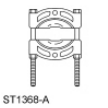


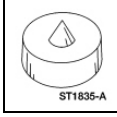
7. Using a telescoping gauge, measure the ID of the 6th gear. Using a micrometer, measure the OD of the gear sleeve.

8. Measure the telescoping gauge to determine if the gear to the gear sleeve clearances are within specifications. If not within specifications, replace as needed.



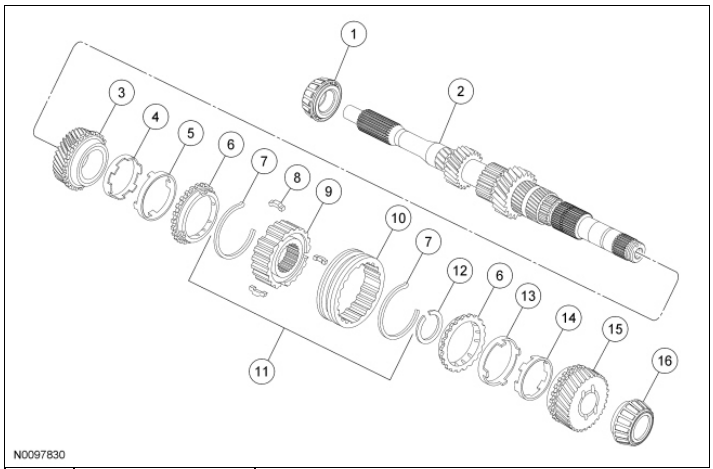






5th and 6th Gear Oil Clearance

Gear	Gear ID	Gear Sleeve OD	Clearance
5th	34.00-34.025 mm (1.3386-1.3395 in)	33.945-33.970 mm (1.3365-1.3373 in)	0.030-0.80 mm (0.001-0.003 in)
6th	34.00-34.025 mm (1.3386-1.3395 in)	33.945-33.970 mm (1.3365-1.3373 in)	0.030-0.80 mm (0.001-0.003 in)



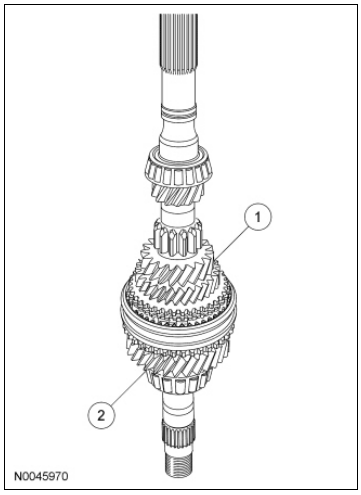
Input Shaft

Special Tool(s)

 ST1897-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-A)
 ST2444-A	Installer, Differential Bearing Cup 308-155 (T88C-7025-DH)
 ST1559-A	Installer, Transaxle Bearing Cone 307-181 (T87C-77000-D)
 ST1254-A	Plate, Bearing/Oil Seal 205-090 (T75L-1165-B)
 ST1368-A	Puller, Bearing 205-D064 (D84L-1123-A) or equivalent
 ST1835-A	Shaft Protector Set 205-DS004 (D80L-625-A) or equivalent

Material

Item	Specification
SAE 75W-90 API GL-4 Gear Oil XT-4-QGL	WSS-M2C203-A1

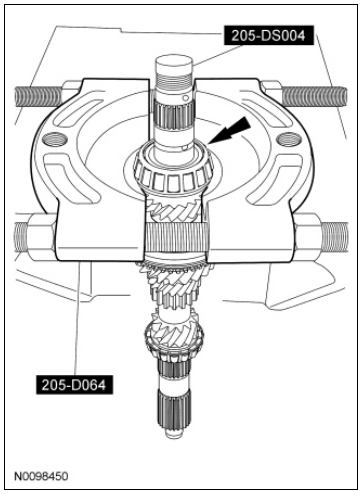


Item	Part Number	Description
1	7025	Bearing

2	7017	Input shaft
3	7101	3rd gear
4	-	Double cone (part of 7Z018)
5	-	Inner cone (part of 7Z018)
6	7Z018	Synchronizer blocking ring (part of blocking ring set)
7	7109	Synchronizer blocking springs (part of 7124)
8	7A044	Synchronizer hub insert (part of 7124)
9	7105	Synchronizer hub (part of 7124)
10	7106	Synchronizer sleeve (part of 7124)
11	7124	Synchronizer hub assembly
12	7064	Snap ring
13	-	Double cone (part of 7Z018)
14	-	Inner cone (part of 7Z018)
15	7110	4th gear
16	7025	Bearing

Disassembly

1. Measure the input shaft clearances.
    1. Measure the clearance between the 3rd and 2nd gears. Third gear thrust clearance is 0.05-0.20 mm (0.001-0.007 in).
    2. Measure the clearance between 4th gear and the bearing cone. Fourth gear endplay is 0.17-0.37 mm (0.006-0.014 in).

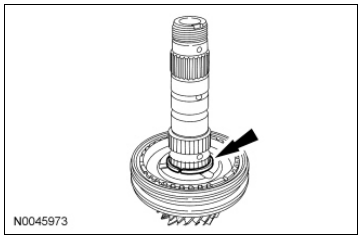


2. **NOTE:** When pressing off components, hold the shaft so it does not fall.

   NOTE: Use the Shaft Protector Set to pamage to the shaft.

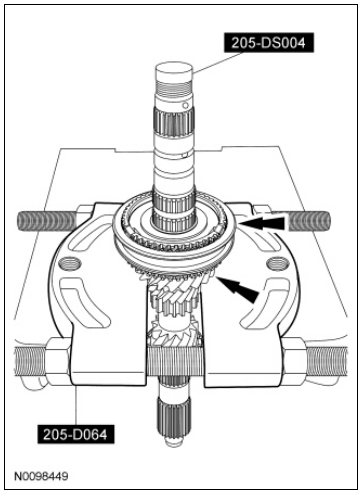
   Using the Bearing Puller and a suitable press, press off the bearing.

   - Discard the bearing.
   - Always install new bearings and cups as a set.



3. **NOTE:** The synchronizer blocking rings are not interchangeable. Make sure to keep them in the order that they were removed.

   Remove 4th gear and the synchronizer blocking ring.



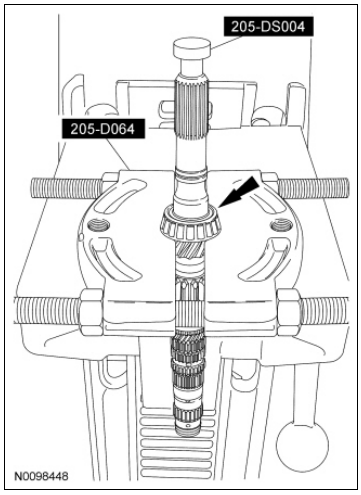
4. Remove and discard the snap ring.

5. ***NOTICE:*** **The synchronizer blocking rings are not interchangeable. Make sure to keep them in the order that they were removed.**

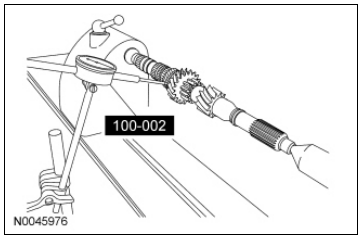
   NOTE: Use the Shaft Protector Set to prevent damage to the shaft.

   Using the Bearing Puller and a suitable press, press off the synchronizer hub assembly, the synchronizer blocking ring and 3rd gear as an assembly.

NOTE: Using a paint pen, mark the hub to sleeve position for reassembly.



6. Disassemble the synchronizer assembly.
    1. Remove the synchronizer blocking spring.
    2. Remove the opposite synchronize spring.
    3. Remove the synchronizer hub inserts.
    4. Separate the synchronizer hub from the sleeve.
        - ♦ Inspect all synchronizer components for wear and damage. Install a new synchronizer as necessary.



7. **NOTE:** Use the Shaft Protector Set to prevent damage to the shaft.

    Using the Bearing Puller and a suitable press, press off the bearing.

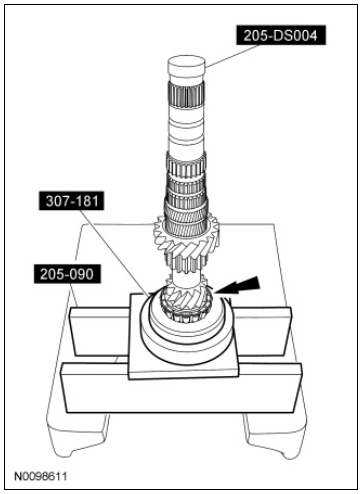
    - Discard the bearing.
    - Always install new bearings and cups as a set.

8. Using the Dial Indicator Gauge with Holding Fixture, measure the input shaft gear runout.
    - Inspect the input shaft for worn or damaged gears. Install a new input shaft as necessary.
    - Input shaft gear maximum runout is 0.05 mm (0.001 in).

9. Set the synchronizer ring set squarely on the gear, then measure around the circumference.
    - Measure the clearance from the side of the gear.
        - ♦ Synchronizer ring clearance is 0.80-1.50 mm (0.031-0.059 in).
    - Inspect for smooth engagement with the gear.
    - Inspect for worn or damaged teeth. Install new components as necessary.

10. Inspect the synchronizer hub.
    - Inspect for worn or damaged splines, synchronizer insert groove or end surface.
    - Inspect for smooth hub sleeve movement when it is installed.

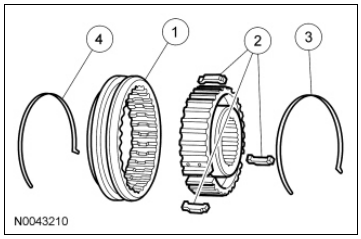
11. Measure the clearance between the 3rd/4th synchronizer hub and its shift fork.
    - Shift fork and hub sleeve clearance is 0.10-0.90 mm (0.003-0.035 in).



Assembly

NOTE: Do not reassemble the input shaft dry.

1. Lubricate all input shaft components with the recommended transmission lubricant during reassembly.



2. **NOTE:** Use the Shaft Protector Set to prevent damage to the shaft.

   Using the Bearing/Oil Seal Plate, Transaxle Bearing Cone Installer and a suitable press, press on the new bearing.

3. Install 3rd gear.

4. Assemble the synchronizer.
    1. Position the synchronizer hub and sleeve together.
    2. Install the synchronizer hub inserts.
    3. Install the synchronizer blocking spring.
    4. Rotate the synchronizer and install the opposite synchronizer blocking spring.

5. Assemble 3rd gear blocking ring set and synchronizer assembly

6. **NOTE:** Use the Shaft Protector Set to prevent damage to the shaft.

    NOTE: When installing the synchronizer blocking ring, align the synchronizer blocking ring groove and synchronizer hub inserts.

    NOTE: Make sure to have the ridge facing the 3rd gear when installing the synchronizer hub assembly.

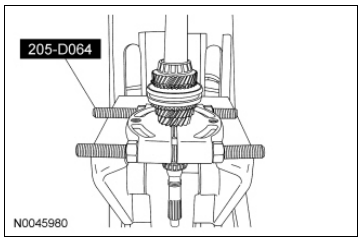
    NOTE: Make sure that the 4 grooves in the synchronizer hub are facing the 3rd gear.

    NOTE: Make sure 3rd gear rotates freely on the shaft.

    Using the Bearing/Oil Seal Plate, Differential Bearing Cup Installer and a suitable press, press the input shaft onto the 3rd gear synchronizer blocking ring and synchronizer assembly.

7. **NOTE:** Invert the input shaft.

   Install a new snap ring.

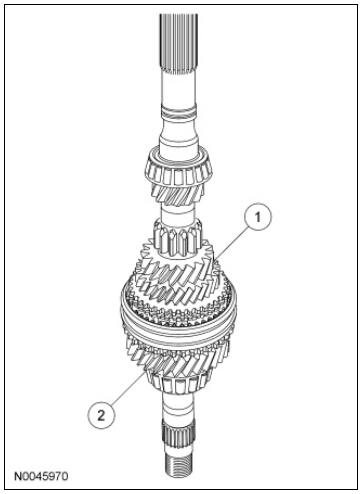


8. Assemble the 4th gear blocking ring set.
9. Assemble the 4th gear synchronizer assembly.
10. Install the 4th gear blocking ring set and synchronizer assembly into the input shaft.
11. ***NOTICE:*** **Press the bearing onto the input shaft by the inner race only. Pressing on the outer race will damage the bearing.**

    NOTE: Make sure 4th gear rotates freely on the shaft.

    NOTE: When installing the synchronizer blocking ring, align the synchronizer blocking ring tab and synchronizer hub inserts.

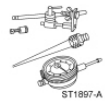
    Using the Bearing Puller and a suitable press, press on a new bearing.



12. **NOTE:** If not within specifications, disassemble and reassemble the input shaft assembly.

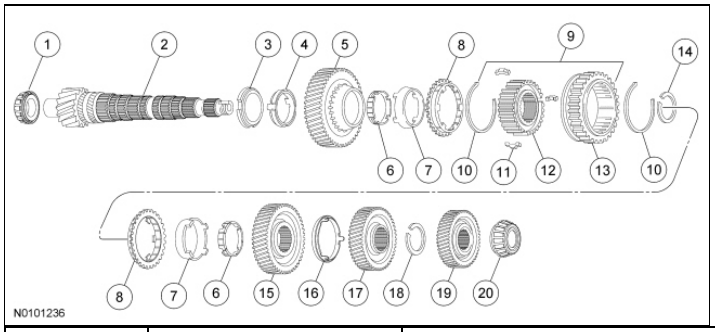
    Measure the input shaft clearances.

    1. Measure the clearance between the 3rd and 2nd gears.



- 2nd gear end play is 0.018-0.46 mm (0.007-0.018 in), maximum end play is 0.51 mm (0.02 in).

2. Measure the clearance between the 4th gear and the bearing cone.
   - 4th gear end play is 0.17-0.37 mm (0.006-0.014 in), maximum end play is 0.42 mm (0.016 in).



Output Shaft

Special Tool(s)

 ST1368-A	Bearing Puller 205-D064 (D84L-1123-A) or equivalent

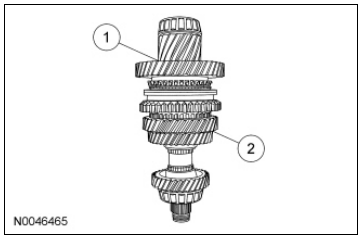
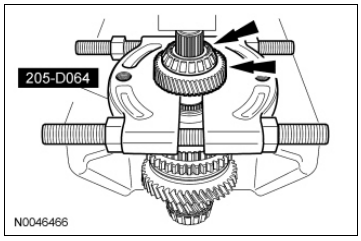
Material

Item	Specification
SAE 75W-90 API GL-4 Gear Oil XT-4-QGL	WSS-M2C203-A1



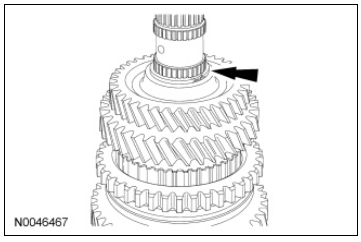
Item	Part Number	Description
1	7F431	Output shaft bearing
2	7061	Output shaft
3	-	Spacer
4	-	Friction dampener
5	7100	1st gear
6	-	Synchronizer inner cones
7	-	Synchronizer outer cones

8	7107	Synchronizer blocking rings
9	-	1st/2nd gear synchronizer assembly
10	-	Synchronizer key springs
11	-	Synchronizer key
12	-	1st/2nd clutch hub
13	-	Clutch hub sleeve (reverse gear)
14	7064	Snap ring
15	7102	2nd gear
16	-	Friction damper cone
17	-	Secondary 3rd gear
18	7064	Snap ring
19	-	Secondary 4th gear
20	7025	Bearing

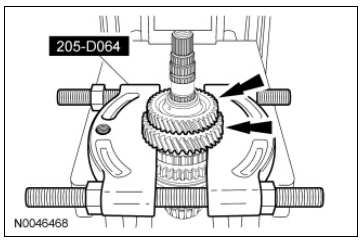


Disassembly

NOTE: When pressing off components, hold the shaft so it does not fall.

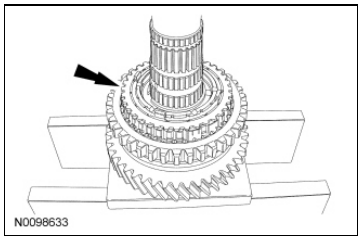


1. Measure the output shaft clearances.
    1. Measure the clearance between 1st gear and the differential drive gear. First gear endplay is 0.05-0.33 mm (0.001-0.012 in).
    2. Measure the clearance between 2nd gear and secondary 3rd gear. Second gear endplay is 0.18-0.51 mm (0.007-0.02 in).

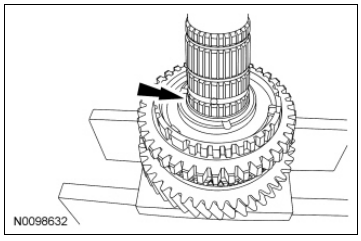


2. Using the Bearing Puller and a suitable press, press off the bearing and 4th gear.
    - Discard the bearing.
    - Always install new bearings and cups as a set.

3. Remove and discard the snap ring.

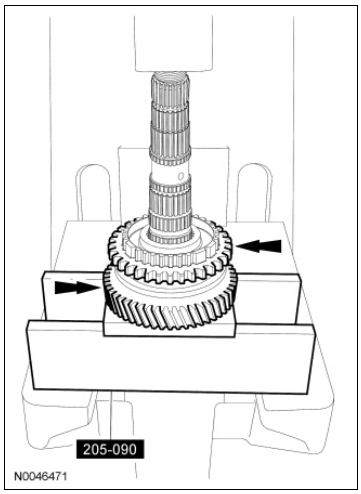


4. Using the Bearing Puller and a suitable press, press off the 3rd gear and 2nd gear.



5. **NOTE:** The synchronizer blocking rings are not interchangeable. Be sure to keep them in the order that they were removed.

   Remove the synchronizer blocking ring, the synchronizer inner cone and the synchronizer outer cone.

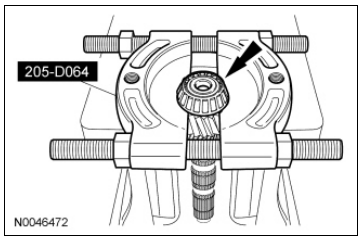


6. Remove and discard the snap ring.

7. **NOTE:** The synchronizer blocking rings are not interchangeable. Make sure to keep them in the order that they were removed.

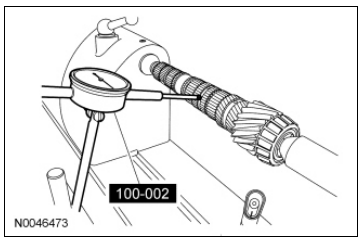
   Using the Bearing/Oil Seal Plate and a suitable press, press off the synchronizer hub, synchronizer blocking ring and 1st gear.

8. **NOTE:** Using a paint pen, mark the hub to sleeve position for reassembly.



Disassemble the synchronizer assembly.

1. Remove the synchronizer blocking spring.
2. Rotate the synchronizer and remove the opposite spring.
3. Remove the hub inserts.
4. Separate the synchronizer hub from the sleeve.
    - ♦ Inspect all synchronizer components for wear or damage. Install a new synchronizer as necessary.



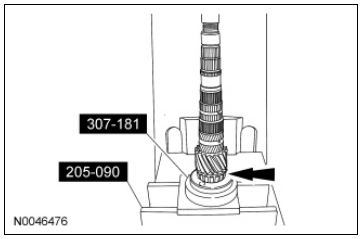
9. **NOTE:** Always install new bearings and cups as a set.

   Using the Bearing Puller and a suitable press, press off the bearing and discard.

10. Using a Dial Indicator Gauge with Holding Fixture, measure the output shaft gear runout.
    - Inspect the output shaft for wear or damage.
    - Inspect the output shaft for a plugged oil passage.
    - Maximum output shaft gear runout is 0.015 mm (0.0006 in).
    - Install a new output shaft as necessary.

11. Set the synchronizer ring squarely in the gear, then measure around the circumference.
    - Measure the clearance from the side of the gear.
        - ♦ Synchronizer ring clearance is 0.80-1.50 mm (0.031-0.059 in).
    - Inspect for smooth engagement with the gear.
    - Inspect for worn or damaged teeth or tapered surface. Install new components as necessary.

12. Inspect the synchronizer hub.
    - Inspect for worn or damaged splines, synchronizer insert groove or end surface.
    - Inspect for smooth hub sleeve movement when it is installed.

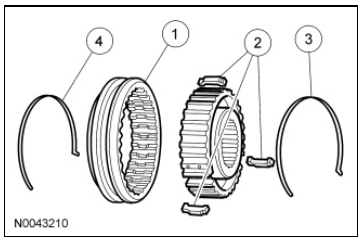


13. Measure the clearance between the 1st/2nd synchronizer hub and its shift fork.
    - Shift fork and hub sleeve clearance is 0.10-0.95 mm (0.003-0.037 in).

Assembly

1. **NOTE:** Do not reassemble the output shaft dry. Apply lubricant throughout the assembly procedure.

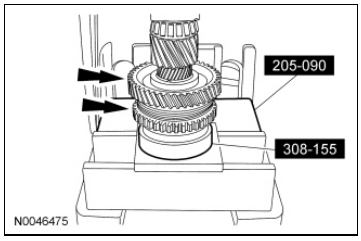
   Lubricate all output shaft components with the recommended transmission lubricant during reassemble.



2. Using the Bearing/Oil Seal Plate, Transaxle Bearing Cup Installer and a suitable press, press on a new bearing.

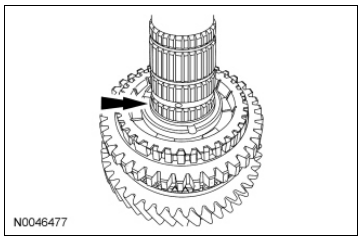
3. If installing a new output shaft, using a suitable press, install the new spacer.

4. Install the friction dampener.



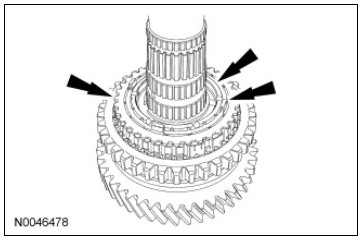
5. Assemble the synchronizer.
    1. Position the synchronizer hub to the sleeve.
    2. Install the hub inserts.
    3. Install the blocking spring.
    4. Rotate the synchronizer and install the opposite blocking spring.

6. Assemble the 1st gear blocking ring set and synchronizer.



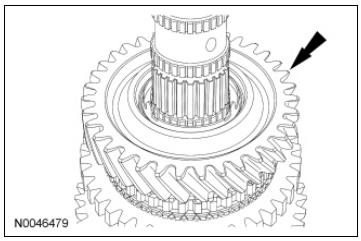
7. **NOTE:** When installing the synchronizer blocking ring, align the synchronizer blocking ring groove and synchronizer hub inserts to prevent damage.

   Using the Bearing/Oil Seal Plate, Differential Bearing Cup Installer and a suitable press, press on the 1st gear, the synchronizer blocking ring and synchronizer assembly.



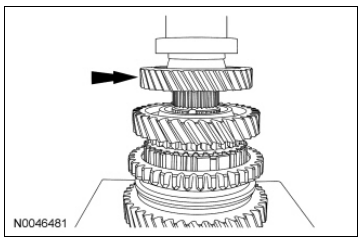
8. Invert the shaft.

9. Install a new snap ring.



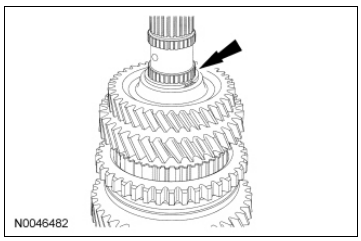
10. **NOTE:** Make sure 1st gear rotates freely.

    Install the synchronizer blocking ring, the synchronizer outer cone and the synchronizer inner cone.

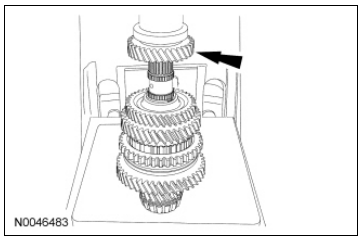


11. Install the friction damper cone onto 2nd gear.

12. Install 2nd gear.



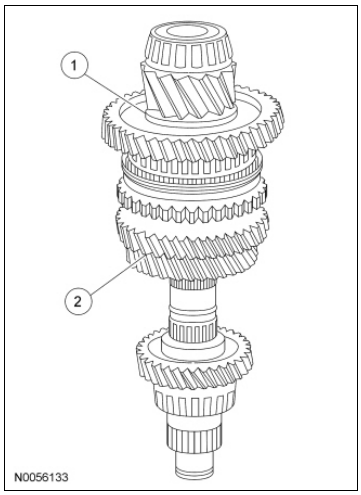
13. Using a suitable tool, press on 3rd gear.
    - Make sure the slots on 3rd gear are aligned with the fingers on the friction damper cone.



14. **NOTE:** Make sure 2nd gear rotates freely.

Install a new snap ring.

15. Using a suitable tool, press on 4th gear.



16. ***NOTICE:*** **Only press on the inner race of the bearing or damage may occur to the bearing.**

    Invert the output shaft in the press. Using a suitable tool, install a new bearing.

17. **NOTE:** If not within specifications, disassemble and reassemble the output shaft assembly.

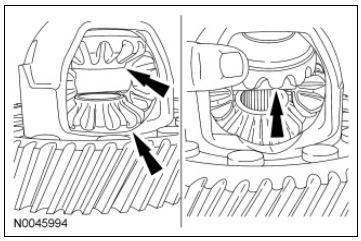
    Measure the output shaft clearances.

    1. Measure the clearance between 1st gear and the differential drive gear. First gear endplay is 0.05-0.33 mm (0.001-0.012 in).
    2. Measure the clearance between 2nd gear and 3rd gear. Second gear endplay is 0.18-0.51 mm (0.007-0.02 in).

Differential

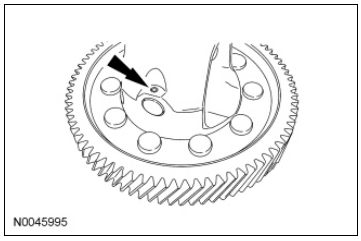
Special Tool(s)

 ST1369-A	Adapter Set, Step Plate 205-DS011 (D80L-630-A) or equivalent
 ST1368-A	Bearing Puller 205-D064 (D84L-1123-A) or equivalent
 ST1897-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-A)
 ST1583-A	Installer, Differential Bearing Cup 308-162 (T88C-77000-EH)
 ST1596-A	Push/Puller Set 205-DS023 (D80L-927-A) or equivalent



Item	Part Number	Description
1	4221	Differential bearings
2	17285	Speedometer drive gear
3	4241	Differential pinion shaft lock pin
4	4026	Differential
5	4228	Differential side gear thrust washers
6	4236	Differential side gears
7	4230	Differential pinion gear thrust washers
8	4215	Differential pinion gears

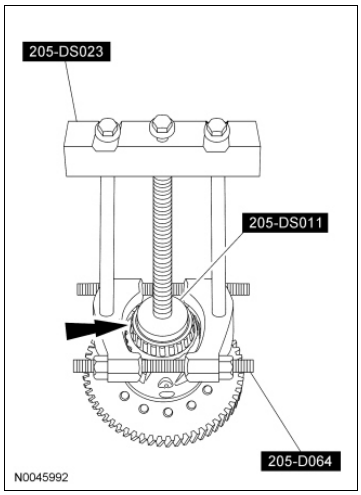
9	4211	Differential pinion shaft



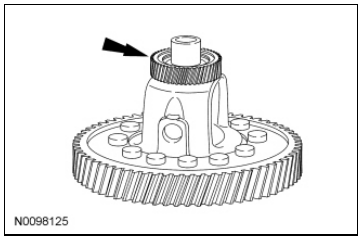
Disassembly

1. Inspect the differential for wear or damage.
    - Inspect for damaged or worn gears.
    - Inspect for worn or damaged differential bearings.
    - Install new components as necessary.

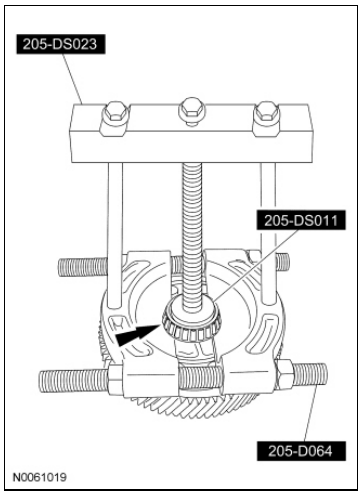
2. Remove the differential side gears and thrust washers.
    - Rotate the differential side gears to remove.



3. Remove and discard the differential pinion shaft lock pin.

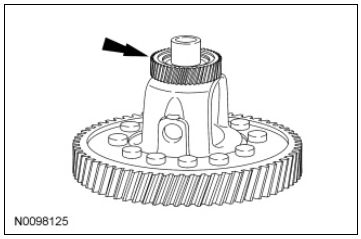


4. Remove the differential pinion shaft, the differential pinon gears and the thrust washers.



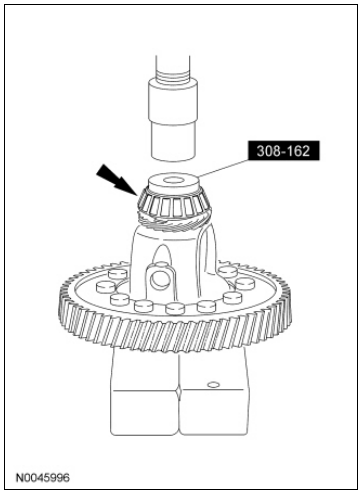
5. Using the Step Plate Adapter Set, Bearing Puller and the Push/Puller Set, remove the differential bearing.
    - Always install new bearings and cups as a set.

6. Remove the speedometer drive gear.

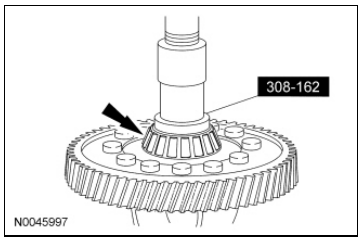


7. Rotate the differential assembly. Using the Step Plate Adapter Set, Bearing Puller and the Push/Puller Set, remove the other differential bearing.
    - Always install new bearings and cups as a set.

Assembly



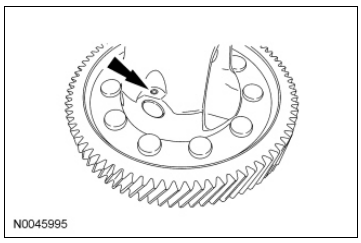
1. Align the locking tabs and install the speedometer drive gear.



2. ***NOTICE:*** **Press the differential bearings onto the differential case by the inner race only. Pressing on the outer race will damage the bearing.**

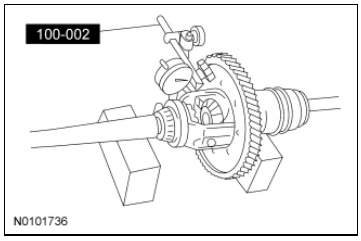
   Using the Differential Bearing Cup Installer and a suitable press, press the differential bearing onto the differential case.

    - Always install new bearings and cups as a set.



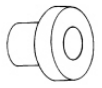
3. Rotate the differential case. Using the Differential Bearing Cup Installer and a suitable press, press on the differential bearing.
    - Always install new bearings and cups as a set.

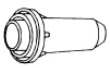
4. Install the differential pinion gears and thrust washers.

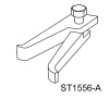


5. Install the differential pinion shaft.

6. Install the new differential pinion shaft lock pin.







7. Install the differential side gears and thrust washers.

8. Measure the differential backlash using the following steps in the following sequence:
    1. Install the LH and RH halfshafts in the differential.
    2. Support the halfshafts on V-blocks as shown.
    3. Using the Dial Indicator Gauge with Holding Fixture, measure the backlash of both pinion gears.
        - ♦ If not within specification, replace worn and damaged parts.

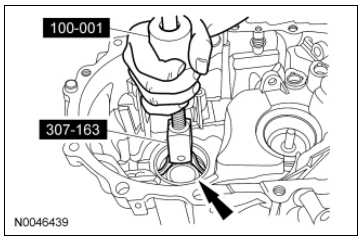
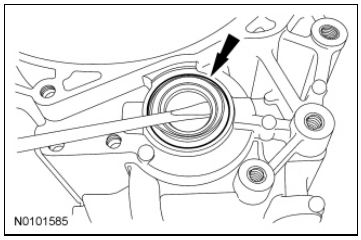
28	7358	Shift lever shaft
29	7288	Oil seal
30	7A174	Oil funnel
31	7141	Bushing

Disassembly and Assembly

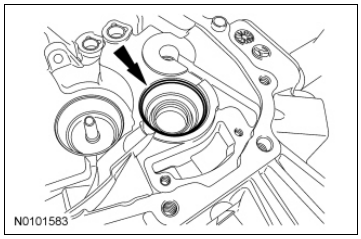


1. Place the transaxle clutch housing on a bench.

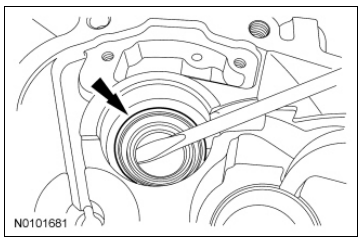
2. Remove the 2 vent cover bolts and the vent cover.



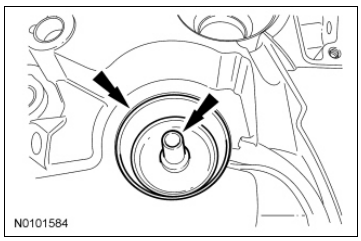
3. Using the Slide Hammer and Stator Case Bearing Remover, remove the differential bearing cup.



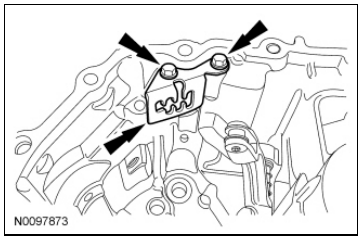
- Inspect the cup for wear or damage. Install a new cup as necessary.
- Always install new bearings and cups as a set.



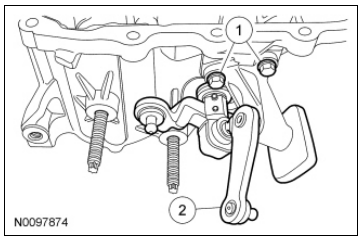
4. Using a screwdriver, remove and discard the differential seal.



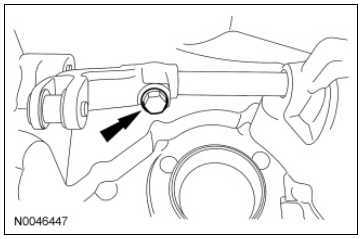
5. Remove the input shaft bearing cup.
    - Inspect the cup for wear or damage. Install a new cup as necessary.
    - Always install new bearings and cups as a set.



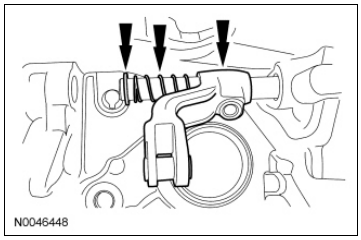
6. Using a screwdriver, remove and discard the input shaft oil seal.



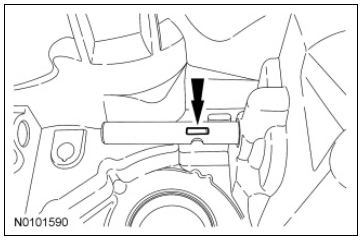
7. Remove the output shaft bearing cup and the funnel.
    - Inspect the cup for wear or damage. Install a new cup as necessary.
    - Always install new bearings and cups as a set.



8. Remove the shift control selector plate bolts and the shift control selector plate.

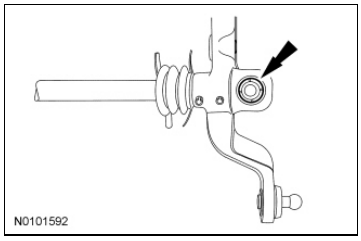


9. Working on the transaxle case:
    1. Remove the 2 shift lever assembly bolts and separate the boot from the case.
    2. Separate the shift arm, boot and bushing from the shift lever assembly.

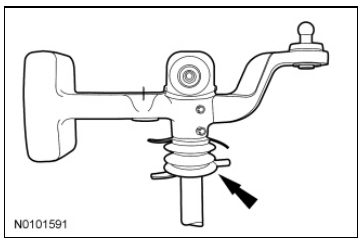


10. Remove the control arm bolt.

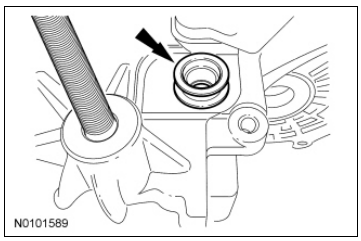
11. Pull the shift lever outward, then remove the washer, spring and the control arm.



12. Remove the control arm key.

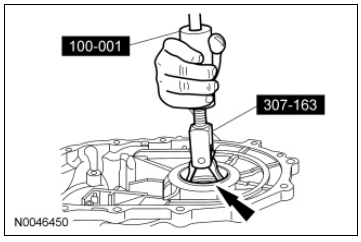


13. Remove the shift lever from the case.
    - Inspect all components for wear or damage. Install new components as necessary.

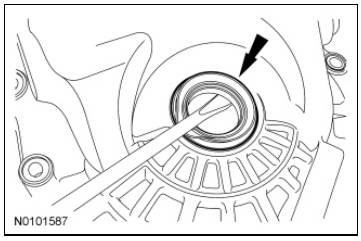


14. Inspect the shift lever bushing and replace if necessary.

15. Remove the shift lever boot.



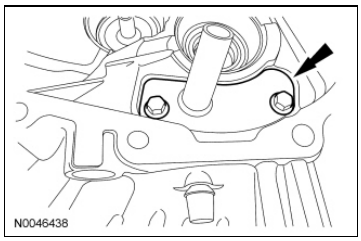
16. Remove the shift lever seal.



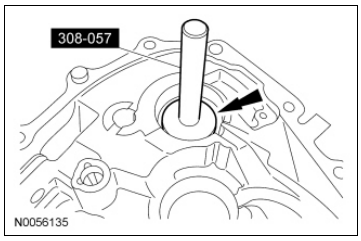
17. Remove the input shaft bearing cup and shims.
    - Inspect the cup for wear or damage. Install a new cup as necessary.
    - Always install new bearings and cups as a set.

18. Remove the output shaft bearing cup and shims.
    - Inspect the cup for wear or damage. Install a new cup as necessary.
    - Always install new bearings and cups as a set.

19. Using the Slide Hammer and Stator Case Bearing Remover, remove the differential bearing cup and shims.
    - Inspect the cup for wear or damage. Install a new cup as necessary.
    - Always install new bearings and cups as a set.

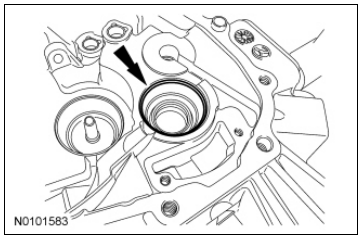


20. Remove and discard the differential oil seal.

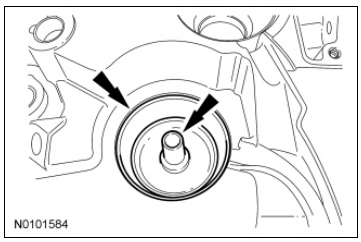


Assembly

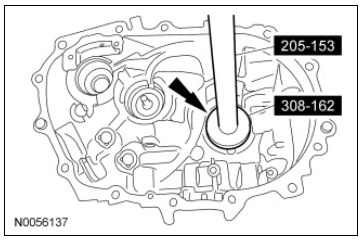
1. Do not install the following components into the transaxle case at this time. These components will be installed during final assembly.
    - Input shaft bearing cup and shim
    - Output shaft bearing cup and shim
    - Differential bearing cup and shim
    - Funnel



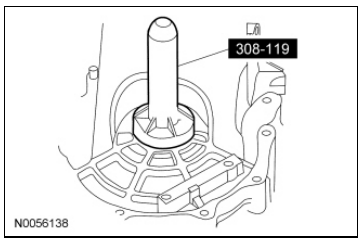
2. Working on the transaxle clutch housing side, install the vent cover and the 2 vent cover bolts.
    - Tighten to 10 Nm (89 lb-in).



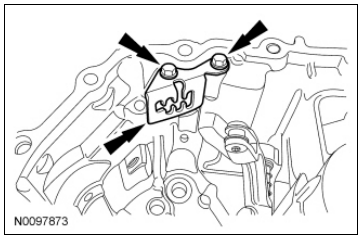
3. Using the Clutch Housing Oil Seal Installer, install a new input shaft seal.



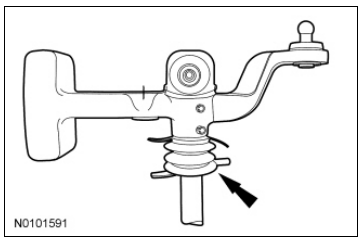
4. Install the input shaft bearing cup into the clutch housing.



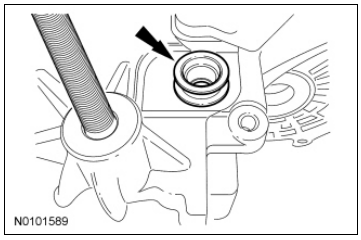
5. Align and install the funnel and the output shaft bearing cup into the clutch housing.



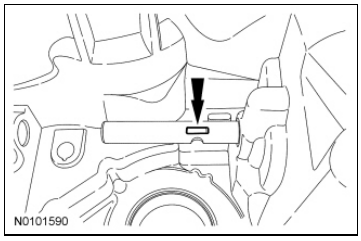
6. Using the Differential Bearing Cup Installer and Handle, install the differential bearing cup into the clutch housing.



7. Using the Halfshaft Oil Seal Installer, install new halfshaft seals.

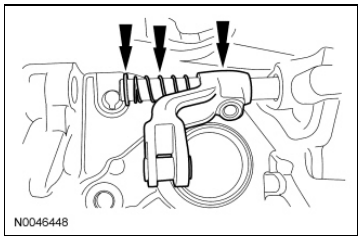


8. Install the shift control selector plate.
    - Tighten the bolt on the left to 10 Nm (89 lb-in).
    - Tighten the bolt on the right to 28 Nm (21 lb-ft).

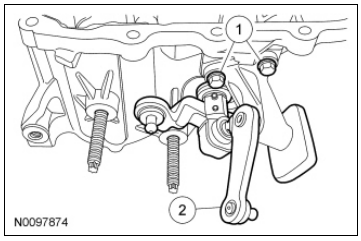


9. Install the shift lever boot.

10. Install shift lever seal into the case.



11. Install the shift lever rod into the case. Install the control arm key.

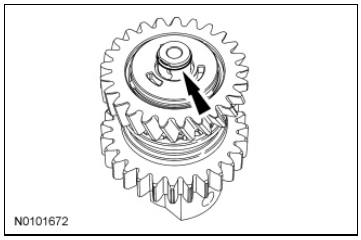


12. **NOTE:** Use care not to let the washer fall off the rod.

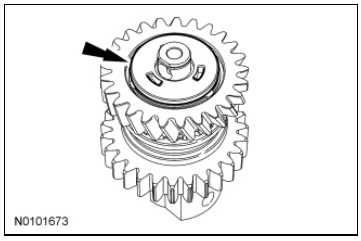
    Install the control arm, the spring and the washer. Push the assembly inward. Align the control arm bolt with the notch on the shift lever rod. Install the bolt.

    - Tighten to 12 Nm (106 lb-in).

13. Install the shift lever assembly.
    1. Install the 2 shift lever assembly bolts and attach the boot and bushing to the case.
        - ♦ Tighten to 22 Nm (16 lb-ft).
    2. Attach the shift arm, boot and bushing to the shift assembly.

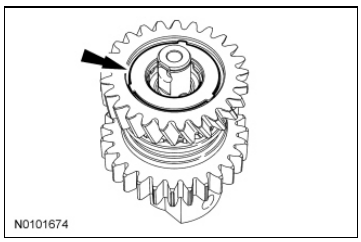


Reverse Idler Gear

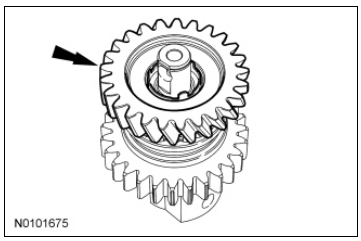


Item	Part Number	Description
1	-	Roll pin
2	-	Reverse idler gear support
3	-	Washer
4	-	Reverse idler gear
5	-	Thrust washer
6	-	Reverse clutch hub sleeve
7	-	Reverse synchronizer ring
8	-	Synchronizer key spring
9	-	Reverse idler gear
10	-	Friction damper
11	-	Reverse idler gear shaft
12	-	Needle bearing
13	-	Thrust washer
14	-	Clip

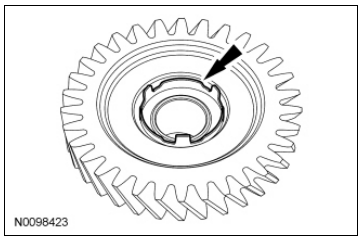
Disassembly



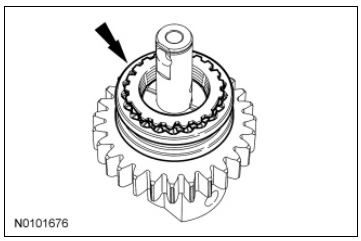
1. Remove the clip.



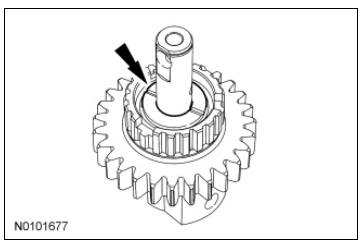
2. Remove the thrust washer.



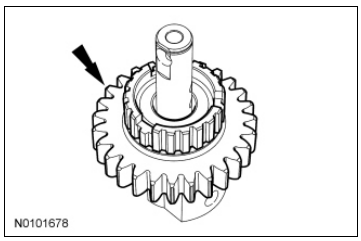
3. Remove the needle bearing.



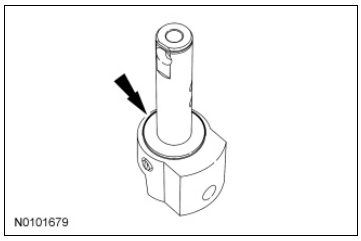
4. Remove the reverse idler gear.



5. Remove the friction damper.

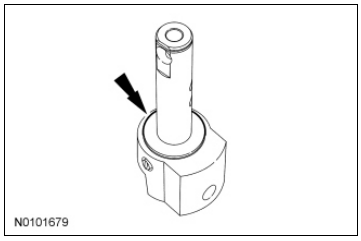


6. Remove the reverse synchronizer assembly.

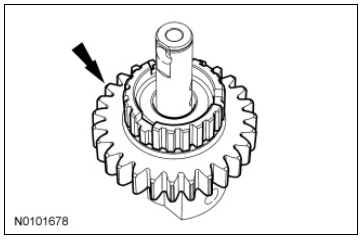


7. Remove the reverse idler gear washer.

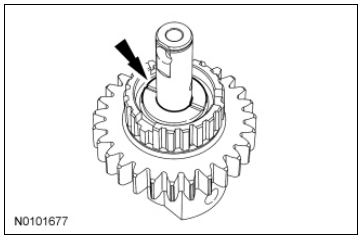
8. Remove the reverse idler gear.



9. Remove the reverse idler gear washer.



Assembly



1. Install the reverse idler gear washer.

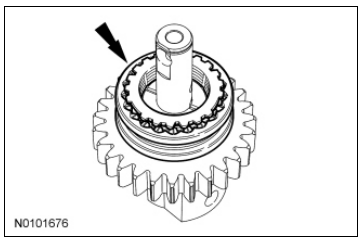
2. Install the reverse idler gear.

3. Install the reverse idler gear washer.

4. Install the reverse synchronizer assembly.
   - Reverse clutch hub inspection.
     - ♦ Inspect the clutch hub sleeve and hub operation. Install new components as necessary.

- ♦ Inspect the gear teeth for damage, wear, and cracks. Install new components as necessary.
- ♦ Measure the clearance between the hub sleeve and shift forks. If it exceeds the maximum specification replace the hub sleeve and shift fork as a set.

Reverse Clutch Hub Sleeve and Shift Fork Clearance



Standard	Maximum
0.10 mm-0.40 mm (0.003-0.015 in)	0.90 mm (0.035 in)

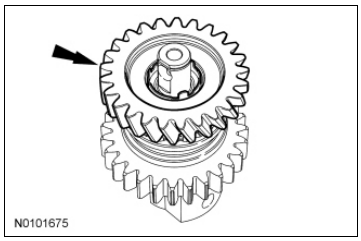
- Reverse synchronizer ring inspection.
  - ♦ Inspect the synchronizer teeth for damage, wear and cracks. Install new components as necessary.
  - ♦ Inspect the tapered surface for wear or cracks. Install new components as necessary.
  - ♦ **NOTE:** Set the synchronizer ring squarely on the gear and measure around the circumference.

    Measure the clearance between the synchronizer ring and the flank surface on the gear. If it is less than minimum specification, replace the synchronizer ring.

Reverse Synchronizer Ring Clearance

Standard	Minimum
1.50 mm (0.059 in)	0.80 mm (0.031 in)

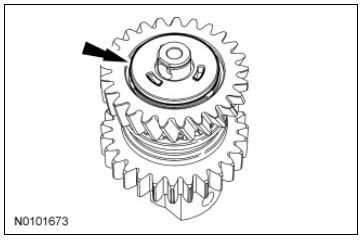
5. Install the friction damper onto the reverse idler gear.



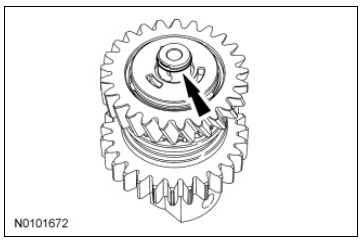
6. **NOTE:** The reverse idler gear is not serviced separately. A kit consisting of the output shaft reverse gear, the countershaft reverse gear and the reverse idler gear is available for service. All 3 gears in the kit must be installed. The replacement gears are not compatible with the existing gears.

   Install the reverse idler gear.

   - Reverse idler gear inspection.
     - ♦ Inspect the synchronizer cones for wear. Install new components as necessary.



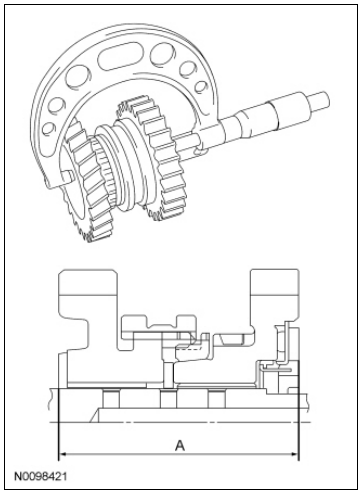
- Inspect the gear teeth for damage, wear and cracks. Install new components as necessary.
- Inspect the synchronizer ring matching teeth for damage or wear. Install new components as necessary.



7. Install the needle bearing.

8. Install the thrust washer.

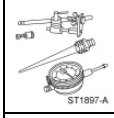
9. Install the clip.

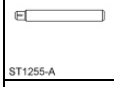


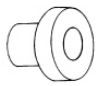
10. Measure the reverse idler gear component dimension.

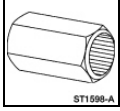
Reverse Thrust Washer Thickness

mm	Inch
2.04	0.080
2.09	0.082
2.14	0.084
2.19	0.086
2.24	0.088
2.29	0.090



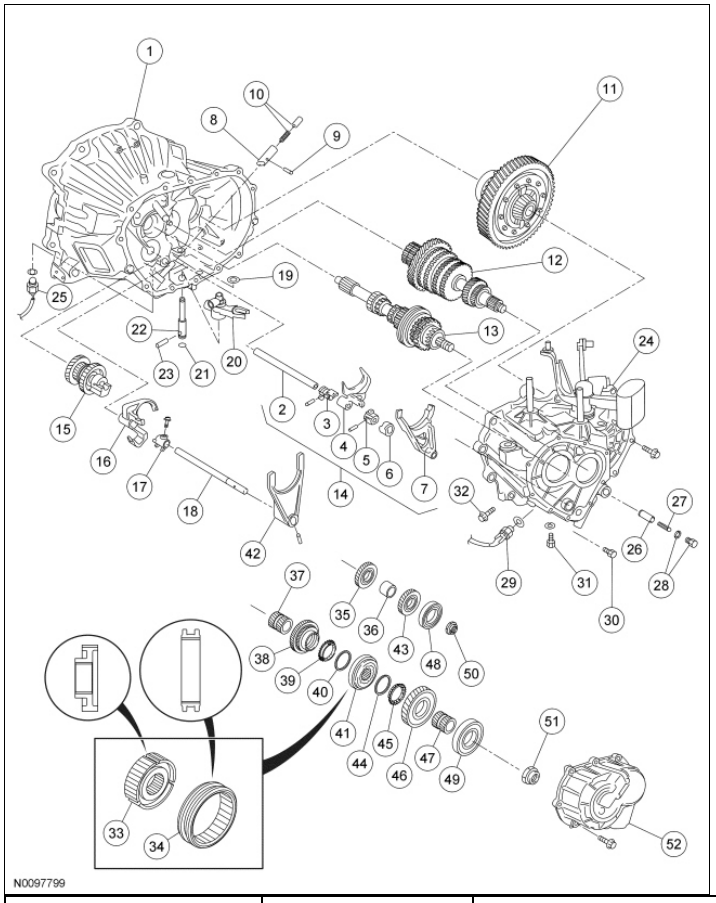






2.34	0.092
2.39	0.094

- If the reverse idler gear component dimension is not within specification, install a thrust washer of the correct thickness.



Transaxle

Special Tool(s)

 ST1897-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-A)
 ST1255-A	Handle 205-153 (T80T-4000-W)

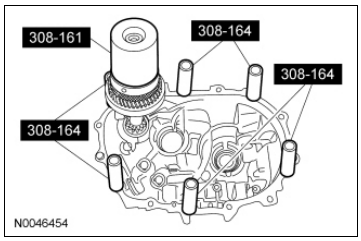
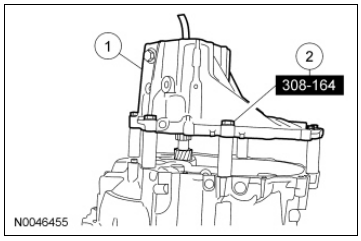
38	-	5th gear
39	-	5th gear synchronizer
40	-	Synchronizer key spring
41	-	5th/6th clutch hub
42	-	5th/6th shift fork
43	-	Secondary 6th gear
44	-	Synchronizer key spring
45	-	6th gear synchronizer
46	-	6th gear
47	-	Gear sleeve
48	-	Bearing (secondary shaft)
49	-	Bearing (primary shaft)
50	7N170	Locknut (secondary shaft)
51	7N170	Locknut (primary shaft)
52	7222	Rear cover

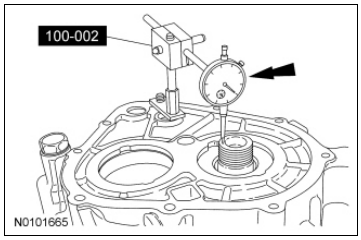
NOTE: Whenever the transaxle has been disassembled, the bearing preload must be and differential bearing preload can be adjusted by selecting shims to insert between the bearing races and the case.



1. Install the input shaft.



2. Install the bearing cup onto the bearing.



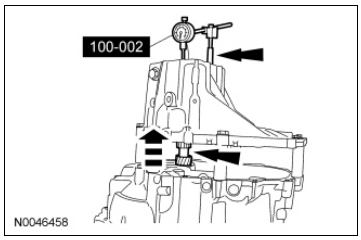
3. Install the Shim Selection Set.

4. Install the transaxle case.
    1. Position the transaxle case in place.
    2. Install the Shim Selection Set bolts.
        - Tighten to 45 Nm (33 lb-ft).

5. Mount the Dial Indicator Gauge with Holding Fixture to the transaxle case.

6. Rotate the input shaft to seat the bearings.

7. Zero the Dial Indicator Gauge with Holding Fixture.



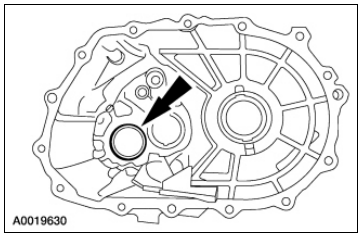
8. **NOTE:** The shaft must be lifted equally on both sides or it may bind on one side, resulting in an incorrect reading.

   Rotate the input shaft until the Dial Indicator Gauge returns to zero, then raise the input shaft and read the end play.

   - Take and record 3 readings within 0.10 mm (0.003 in) of each other. Use the formula below to select the correct shim size.

Average the 3 readings	Example
Reading A	0.019

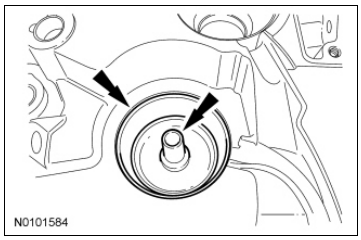
Reading B	0.014
Reading C	+0.021
	0.054 ÷ 3 = 0.018
Final Shim Size	0.018



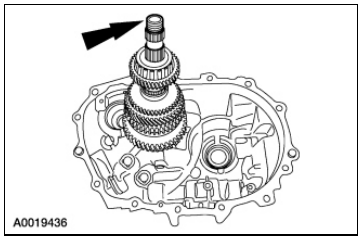
9. **NOTE:** Do not use more than 2 shims.

   From the Shim Selection Set, select the shim(s) that is closest to (or slightly thinner than) the final shim size calculated in the previous step.

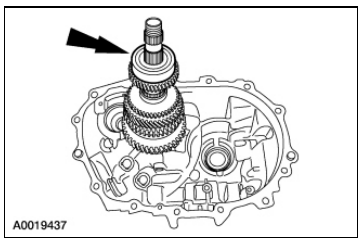
10. Remove the transaxle case, Shim Selection Set, bearing cup and input shaft.



11. Install the input shaft shim(s).

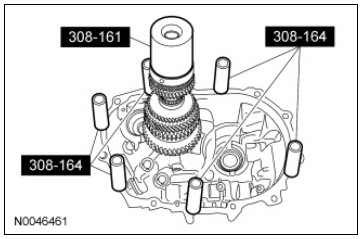


12. Install the input shaft bearing cup.

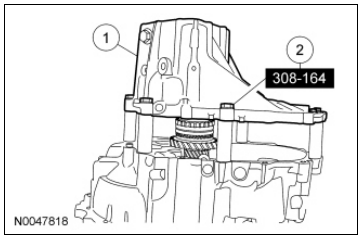


13. Install the funnel and the output shaft bearing cup.

14. Install the output shaft.



15. Install the bearing cup onto the bearing.



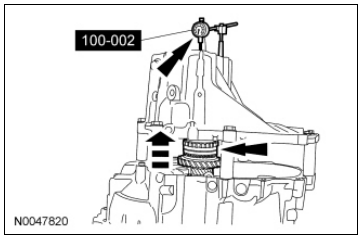
16. **NOTE:** The gauge halves must be turned to eliminate any gap between them.

    Install the Shim Selection Set.

17. Install the transaxle case.
    1. Position the transaxle case in place.
    2. Install the Shim Selection Set bolts.
        - Tighten to 45 Nm (33 lb-ft).

18. Mount the Dial Indicator Gauge with Holding Fixture on the transaxle case.

19. Rotate the output shaft to seat the bearings.



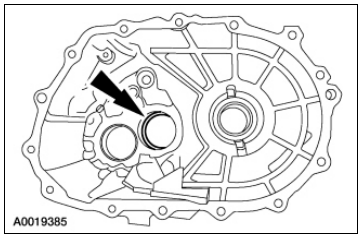
20. Zero the Dial Indicator Gauge.

21. **NOTE:** The shaft must be lifted equally on both sides or it may bind on one side, resulting in an incorrect reading.

    Rotate the output shaft until the Dial Indicator Gauge returns to zero, then raise the output shaft and read the end play.

    - Take and record 3 readings within 0.10 mm (0.003 in) of each other. Use the formula below to select the correct shim size.

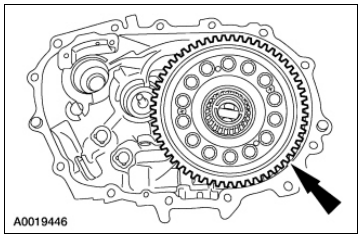
Average the 3 readings	Example
Reading A	0.019
Reading B	0.014
Reading C	+0.021
	0.054 ÷ 3 = 0.018
Final Shim Size	0.018



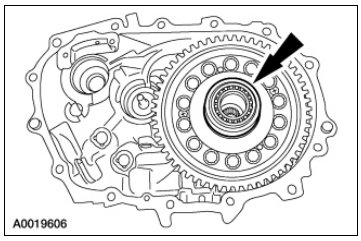
2. **NOTE:** Do not use more than 2 shims.

   From the Shim Selection Set, select the shim(s) that is closest to (or slightly thinner than) the final shim size determined in the previous step.

23. Remove the transaxle case, Shim Selection Set, bearing cup and output shaft.

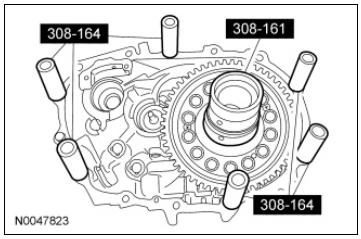


24. Install the shim.

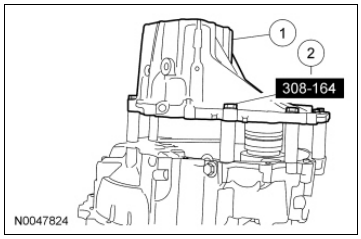


25. Install the funnel and the output shaft bearing cup.

26. Install the differential.

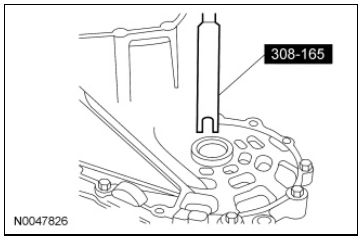


27. Install the bearing cup onto the bearing.

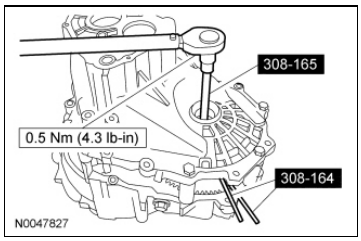


28. **NOTE:** The gauge halves must be turned to eliminate any gap between them.

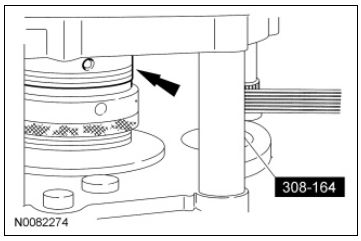
    Install the Shim Selection Set.



29. Install the transaxle case.
    1. Position the transaxle case in place.
    2. Install the Shim Selection Set bolts.
        - Tighten to 45 Nm (33 lb-ft).



30. Using the Shim Selection Set, adjust gauge until the free play is removed. Turn gauge back together.



31. Insert the Differential Rotator through the transaxle case and engage the differential pinion shaft.

32. Using the Differential Rotator and Shim Selector Set, adjust gauge until the differential rotation is within specification.

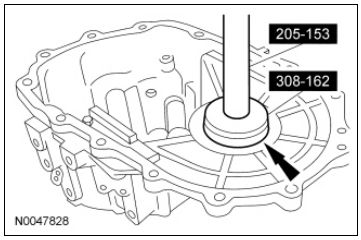
33. Measure the gap in the Shim Selector Set.

34. ***NOTICE:*** **Do not use more than 2 differential shims.**

    Add 0.15 mm (0.005 in) to the measurement to achieve the final clearance.

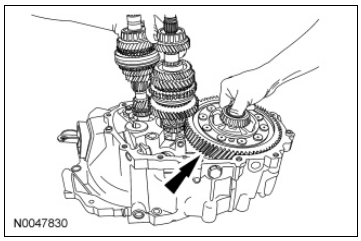
    - Using the following chart, select the differential bearing shims that are closest to (or slightly larger than) the final shim size.

Shim Thickness
0.10 mm (0.003 in)
0.15 mm (0.005 in)
0.20 mm (0.007 in)
0.25 mm (0.009 in)
0.30 mm (0.011 in)
0.35 mm (0.013 in)
0.40 mm (0.015 in)
0.45 mm (0.017 in)
0.50 mm (0.019 in)
0.55 mm (0.021 in)
0.60 mm (0.023 in)
0.65 mm (0.025 in)
0.70 mm (0.027 in)
0.75 mm (0.029 in)
0.80 mm (0.031 in)

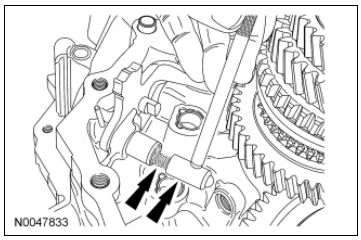


0.85 mm (0.033 in)
0.90 mm (0.035 in)
0.95 mm (0.037 in)
1.00 mm (0.039 in)
1.05 mm (0.041 in)
1.10 mm (0.043 in)
1.15 mm (0.045 in)
1.20 mm (0.047 in)

35. Remove the transaxle case, Shim Selection Set, differential and bearing cup.

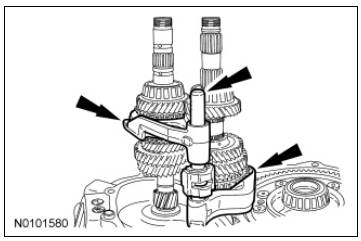


36. Install the differential bearing cup shim(s) into the transaxle case.

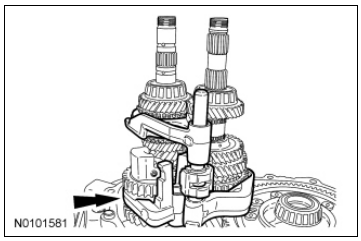


37. Using the Differential Bearing Cup Installer and Handle, install the differential bearing cup into the transaxle case.

38. Install the output shaft, the input shaft and the differential together.

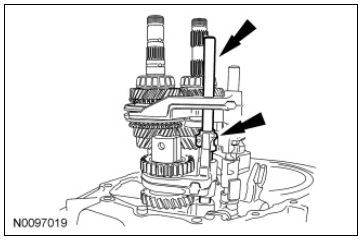


39. Install the spring and the shift detent.



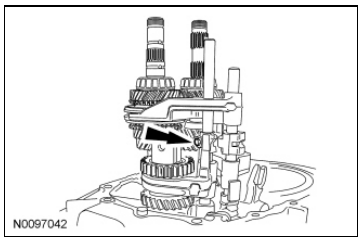
40. Shift the synchronizers into the 2nd and 4th gear positions.

41. Install the main shift control shaft assembly, shift forks.



42. **NOTE:** Align the reverse idler shaft anchor bolt hole for installation of the bolt through the case.

    Install the reverse idler gear and shift fork.

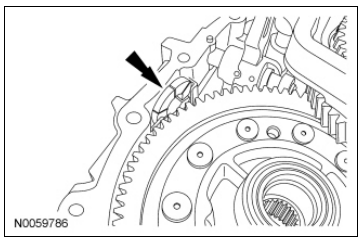


43. Install the shift control shaft and the shift gate.

44. **NOTE:** Make sure to align the shift gate at the bottom and the shift gate with the main shift control.

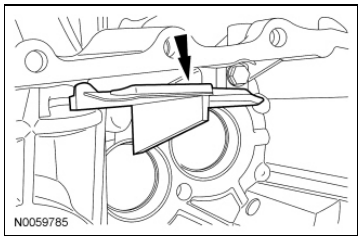
    Install the shift gate bolt.

    - Tighten to 13 Nm (115 lb-in).



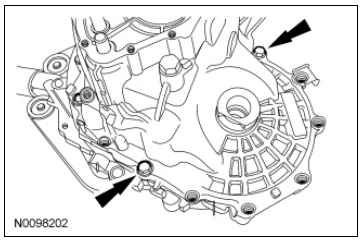
45. **NOTE:** Shift lever shaft uses a solid pin.

    Install the shift lever shaft, shift fork selector lever and shift shaft pin.

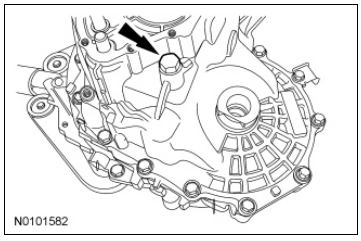


46. Install the magnet.

47. Position the 2nd and 4th gear synchronizers into neutral, then shift the 1st/2nd gear synchronizer into neutral.



48. Install the oil funnel.

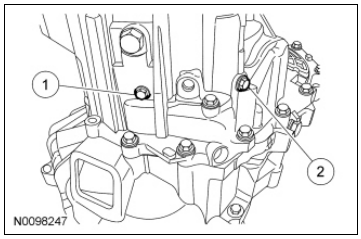


49. **NOTE:** The transaxle case must be installed within 4 minutes after applying silicone gasket and sealant.

    Apply a small bead of silicone gasket and sealant to the transaxle mating surface.
    Install the transaxle case and the 2 transaxle case bolts.

    - Make sure to align the shift lever to the shift lever shaft. Do not move the shaft outward to the stop. The washer can slide off of the shaft into the case.
    - Tighten to 45 Nm (33 lb-ft).

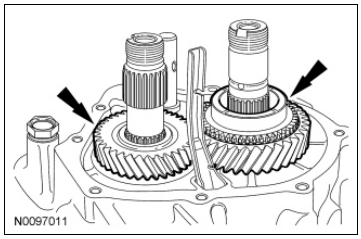
50. Install the shift detent ball, spring and bolt.
    - Tighten to 18 Nm (159 lb-in).



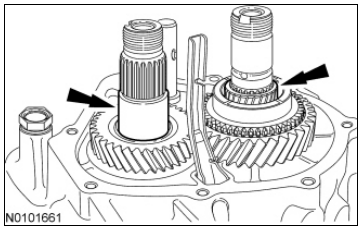
51. **NOTE:** Make sure that the shift rail guide bolt is in the groove of the shift rail.

    NOTE: Do not shift the transaxle until the reverse idler shaft lock bolt and the shift rail guide bolt are installed.

Install the reverse idler shaft lock bolt and the shift rail guide bolt.

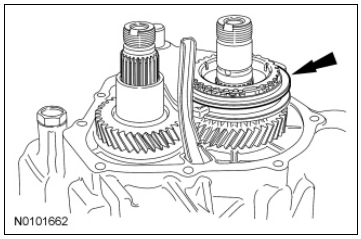


1. Install the reverse idler shaft lock bolt.
   - ♦ Tighten the reverse idler shaft lock bolt to 22 Nm (16 lb-ft).
2. Install the shift rail guide bolt.
   - ♦ Tighten the shift rail guide bolt to 12 Nm (106 lb-in).

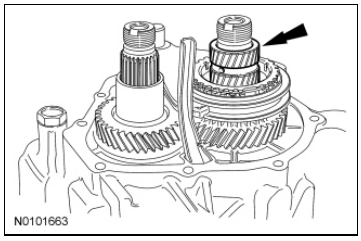


52. Check the shift function.

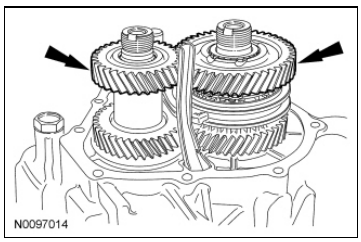
53. Install the remaining 13 transaxle case bolts.
    - • Tighten to 45 Nm (33 lb-ft).



54. Install the primary and secondary 5th gears.

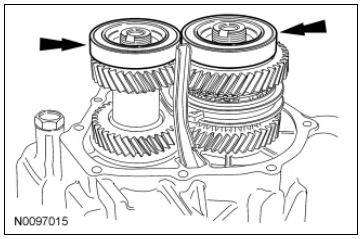


55. Install the spacer and the gear sleeve.

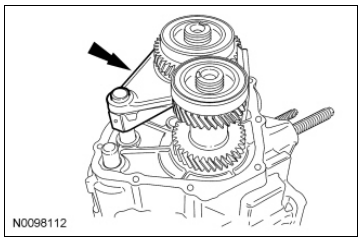


56. Install the 5th/6th shift fork and synchronizer assembly.

57. Install the gear spacer.

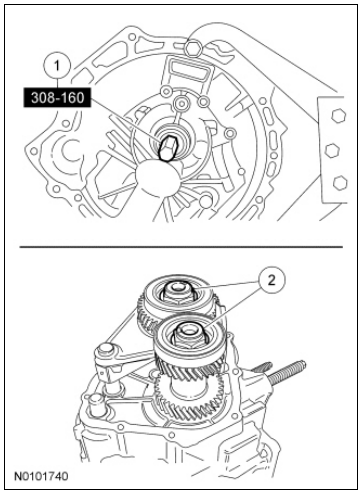


58. Install the primary and secondary 6th gears.



59. **NOTE:** When the locknuts are tightened to specifications they will seat the bearings.

    Install the 6th gear bearings onto the primary and secondary shafts.



60. Shift the 5th/6th gear shift fork to 5th.

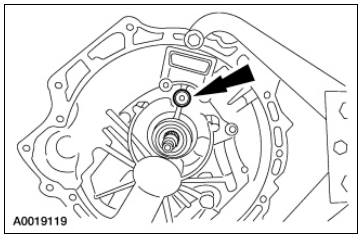
61. **NOTE:** Do not reuse locknuts.

    Install the new primary and secondary shaft locknuts.

    1. Shifting into 5th/6th gears and using the Transmission Turning Torque Socket will keep the primary shaft from turning.
    2. Install the new primary and secondary shaft locknuts. Using a punch, stake the locknuts to the shafts.
        - Tighten to 160 Nm (118 lb-ft).

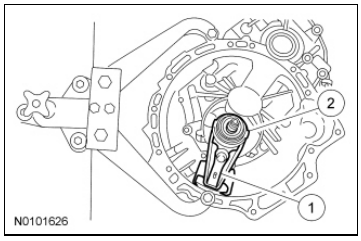
62. **NOTE:** Shift 5th/6th into neutral.

    Install a new 5th/6th shift fork roll pin.

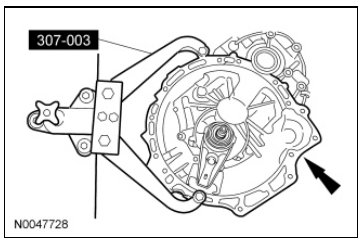


63. **NOTE:** The case cover must be installed within 4 minutes after applying silicone gasket and sealant.

    Apply a small bead of silicone gasket and sealant to the case and case cover mating surface.

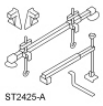


64. Install the case cover and the 9 case cover bolts.
    - Tighten to 45 Nm (33 lb-ft).



65. If removed, install the anchor bolt.
    - Tighten to 10 Nm (89 lb-in).

66. Install the clutch release fork and bearing.
    1. Install the clutch release fork and diaphragm.
    2. Install the clutch release bearing.



67. Remove the transaxle from the Holding Fixture.

Transaxle

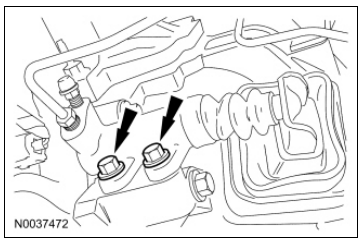
⚠ **WARNING: Do not breathe dust or use compressed air to blow dust from storage containers or friction components. Remove dust using government-approved techniques. Friction component dust may be a cancer and lung disease hazard. Exposure to potentially hazardous components may occur if dusts are created during repair of friction components, such as brake pads and clutch discs. Exposure may also cause irritation to skin, eyes and respiratory tract, and may cause allergic reactions and/or may lead to other chronic health effects. If irritation persists, seek medical attention or advice. Failure to follow these instructions may result in serious personal injury.**

1. **NOTE:** Wipe off excess grease. The splines should have a thin film of grease only. Excess grease can contaminate the clutch facing and affect clutch function.

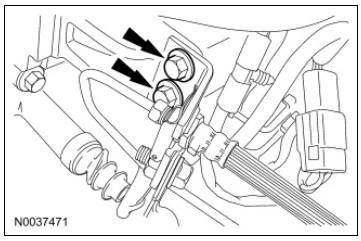
   Apply a very small amount of grease on the input shaft splines.

2. Secure the transaxle to a suitable transmission jack with a safety strap. Raise and position the transaxle behind the engine.

3. Install the clutch housing-to-oil pan bolt.
   - Tighten to 48 Nm (35 lb-ft).



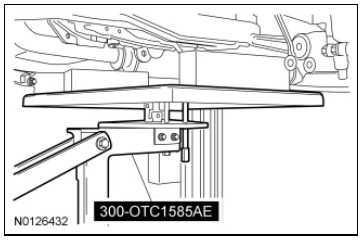
4. Install the 2 oil pan-to-clutch housing bolts.
    - Tighten to 48 Nm (35 lb-ft).



5. Install the 4 lower transaxle-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

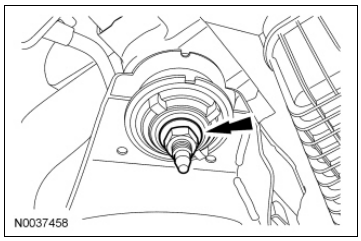
6. Apply threadlock and sealer to the threads and install the 2 transmission lower mount nuts and bolt to the transaxle. Do not tighten the fasteners at this time.

7. Position the clutch slave cylinder to the clutch release arm and install the bolts.
    - Tighten to 20 Nm (177 lb-in).



8. Install the clutch tube hydraulic line bracket bolts.
    - Tighten to 22 Nm (16 lb-ft).

9. Install the starter motor. For additional information, refer to Section 303-06 .



10. Place the subframe assembly on the Powertrain Lift and raise the subframe into the installed position.

11. **NOTE:** LH shown, RH similar.

    Install the front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

12. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the bolts finger-tight.

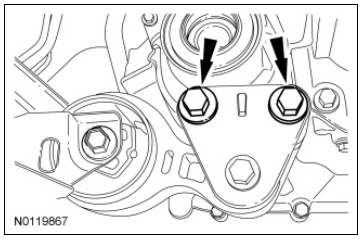
13. **NOTE:** LH shown, RH similar.

    Install the subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

14. **NOTE:** LH shown, RH similar.

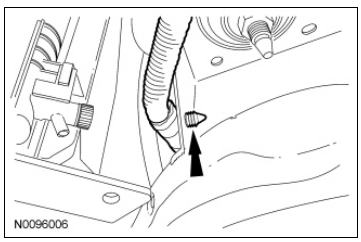
    Tighten the subframe bracket-to-body bolts to 103 Nm (76 lb-ft).



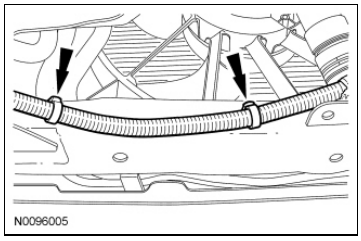
15. **NOTE:** LH shown, RH similar.

    Install the stabilizer bar links and nuts on the struts.

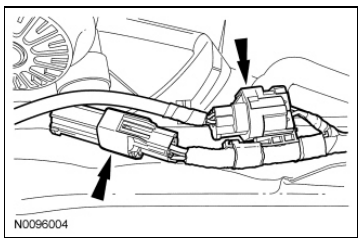
    - Tighten to 40 Nm (30 lb-ft).



16. Install the 2 roll restrictor bracket bolts.
    - Tighten to 90 Nm (66 lb-ft).

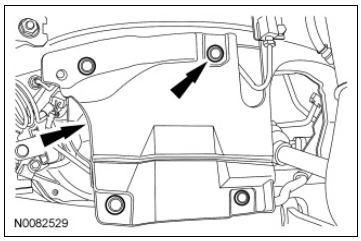


17. Install the Electronic Power Assist Steering (EPAS) system wiring harness ground and the bolt behind the RH splash shield.
    - Tighten to 12 Nm (106 lb-in).

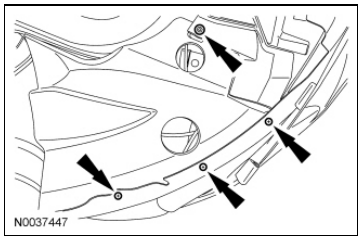


18. Attach the EPAS system wiring harness pin-type retainer to the subframe under the LH fender splash shield.

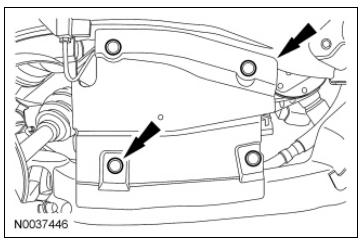
19. Attach the 2 EPAS system wiring harness pin-type retainers to the subframe.



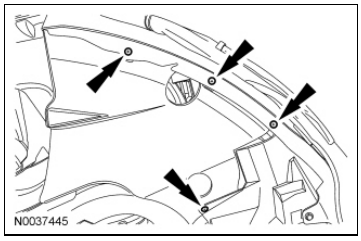
20. Connect the 2 in-line EPAS system electrical connectors at the front of the subframe.



21. Install the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

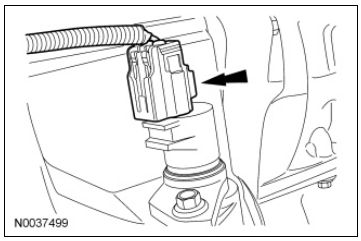


22. Install the LH splash shield and the 6 pin-type retainers (4 shown).



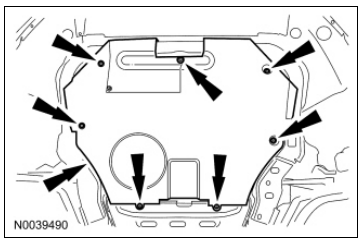
23. Position the LH fender splash shield and install the 4 screws.

24. Install the RH splash shield and the 6 pin-type retainers (4 shown).



25. Position the RH fender splash shield and install the 4 screws.

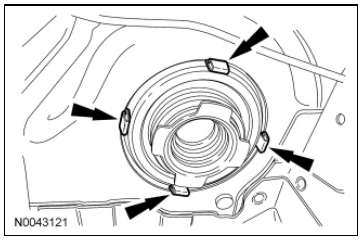
26. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .



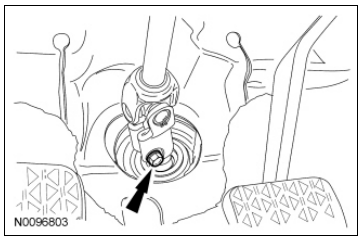
27. Connect the reverse lamp switch electrical connector.

28. Connect the Output Shaft Speed (OSS) sensor electrical connector.

29. Fill the transaxle with clean gear oil. For additional information, refer to Transaxle Draining and Filling in this section.



30. Install the splash shield and the 7 bolts.
    - Tighten to 9 Nm (80 lb-in).



31. ***NOTICE:*** **The steering gear/dash seal must be fully seated in the steering valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment and damage the vehicle interior can occur.**

    Install the steering gear/dash seal.

    - Apply hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.

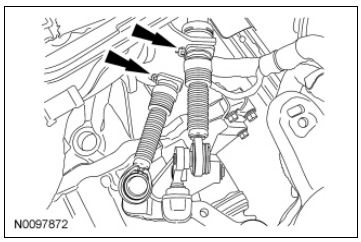
32. Install the steering column shaft onto the steering gear and install a new bolt.
    - Tighten to 20 Nm (177 lb-in).

33. Install the steering joint cover and the 2 nuts.

34. **NOTE:** If one or both of the mount studs were removed or came out, do not reinstall the old stud(s). Install a new stud(s). Make sure they are properly seated in the case.

    Tighten the transaxle rear support insulator nuts and bolt to specification.

    - Tighten to 80 Nm (59 lb-ft).



35. Install the 3 upper transaxle-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

36. Attach the wire harness to the transaxle.

37. Remove the Engine Support Bar.

38. Install the gearshift and shift cables onto the transaxle bracket and gearshift control assembly. Make sure the cables are engaged in the shift bracket and fully installed on the gearshift control assembly.

39. Install the battery tray and battery. For additional information, refer to Section 414-01 .

40. Install the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A .

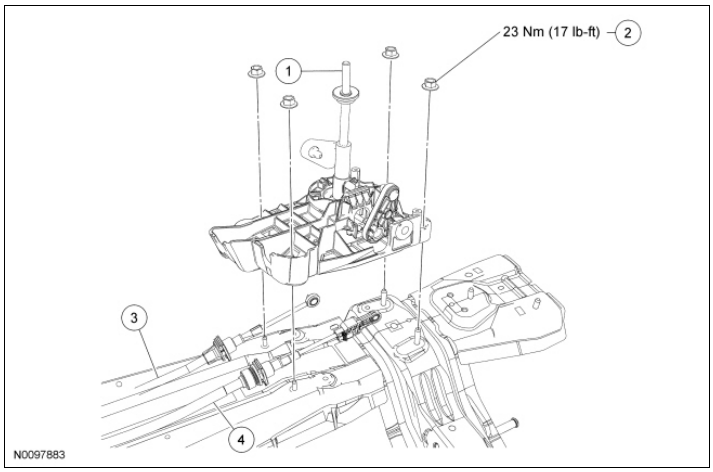
41. If the input shaft was replaced, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

42. Check the vehicle for normal operation.

Torque Specifications

Description	Nm	lb-ft	lb-in
Gearshift cable grommet nuts	8	-	71
Gearshift lever nuts	23	17	-

External Controls

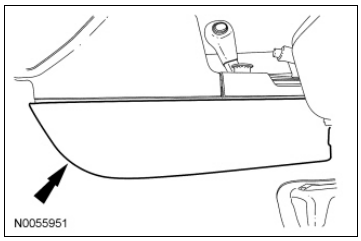


The manual transaxle external controls consist of the following:

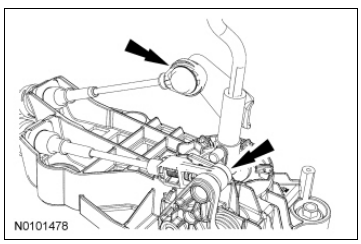
- Gearshift lever
- Gearshift lever knob and boot
- Gearshift cables

The manual transaxle is controlled by a floor-mounted gearshift lever located in the floor console. Connection between the floor mounted gearshift lever and the manual transaxle gearshift control assembly is made through 2 gearshift cables.

When the operator moves the floor mounted gearshift lever, that movement is transmitted through 2 gearshift cables routed through the body to the transaxle. The 2 gearshift cables are attached to the transaxle at the gearshift control assembly. The gearshift control assembly transfers the movement of the gearshift cables to the shift rods and shift forks located inside the transaxle. Removal and installation of the gearshift cables requires specific adjustments for correct shifting of the transaxle. For information regarding gearshift cable adjustments, refer to Section 308-00 .



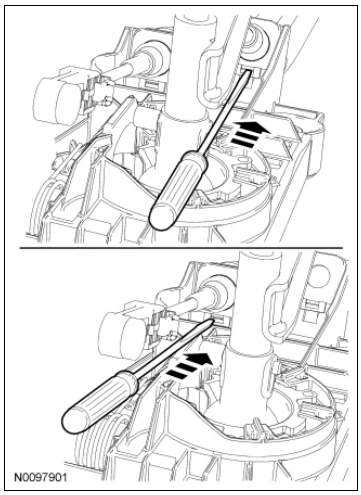
Gearshift Lever



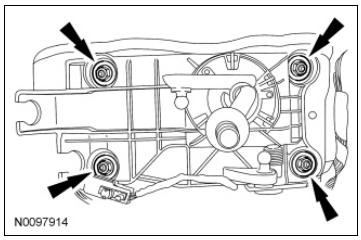
Item	Part Number	Description
1	7210	Gearshift lever assembly
2	-	Gearshift lever nut (4 required)
3	7E395	Shift cable
4	7E395	Select cable

Removal

1. Remove the gearshift knob.
2. Open the storage compartment door.
3. Remove the floor console finish panel. Disconnect the electrical connectors.
4. Remove the LH floor console trim panel. For additional information, refer to Section 501-12 .



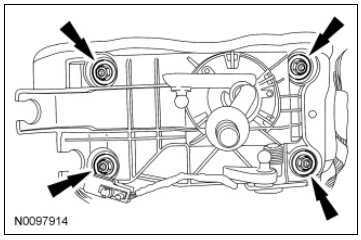
5. Disconnect the shift cable and the select cable from the gearshift lever.



6. ***NOTICE:*** **Carefully disconnect the gearshift cables from the gearshift lever base. Do not damage the gearshift cable retainers.**

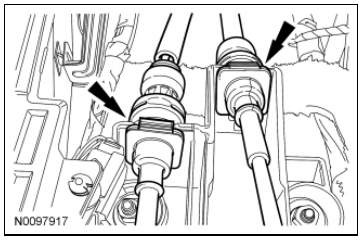
   Disconnect the gearshift cables from the gearshift lever base.

7. Remove the 4 gearshift lever nuts.



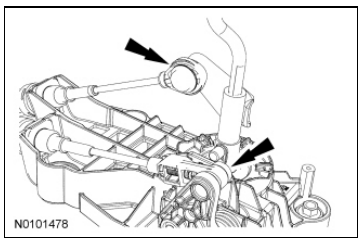
8. Remove the gearshift lever assembly.

Installation



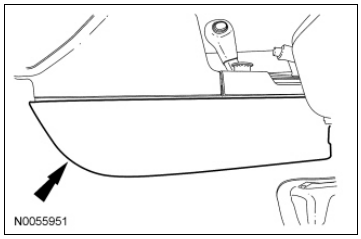
1. Position the gearshift lever assembly in the vehicle.

2. Install the 4 gearshift lever nuts.
   - Tighten to 23 Nm (17 lb-ft).



3. ***NOTICE:*** **Make sure the gearshift cables are fully seated into the gearshift lever base or damage may occur.**

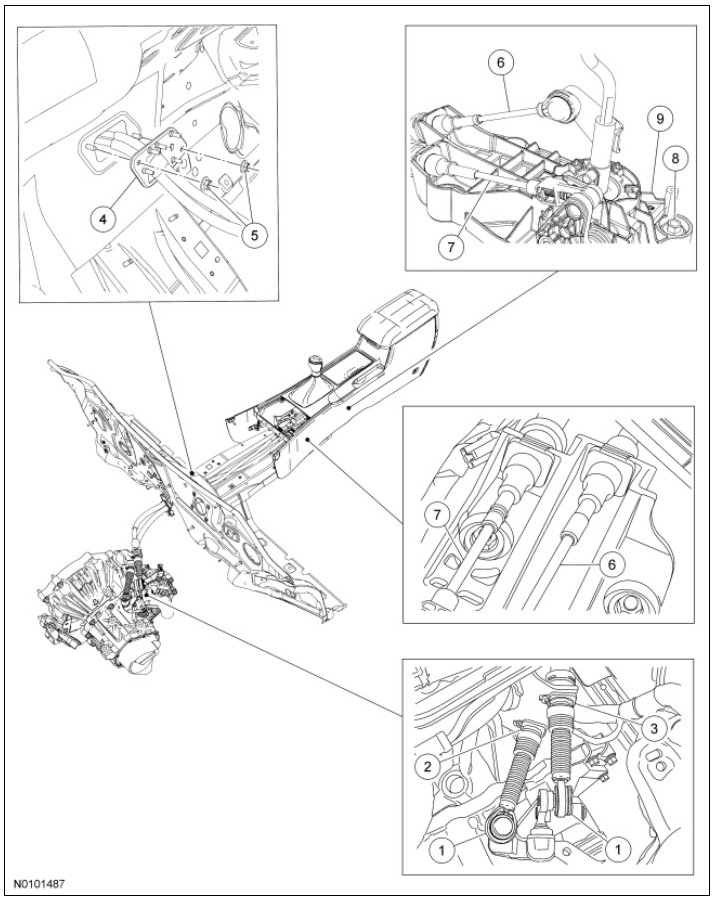
   Connect the gearshift cables to the gearshift lever base.



4. Connect the select cable and the shift cable to the gearshift lever.

5. Adjust the gearshift cables. For additional information, refer to Section 308-00 .

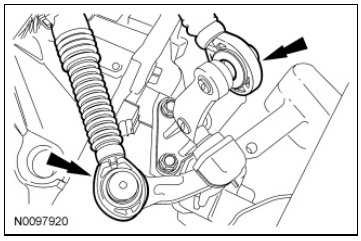
6. Install the LH floor console trim panel. For additional information, refer to Section 501-12 .



7. Install the floor console finish panel and connect the electrical connectors.

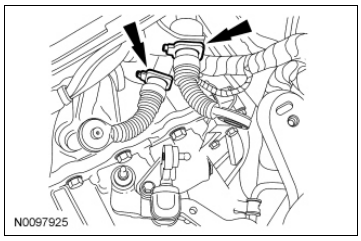
8. Close the storage compartment door.

9. Install the gearshift knob.



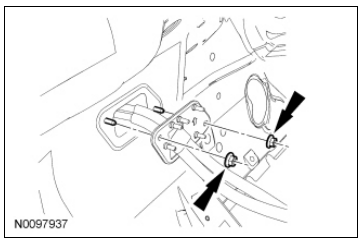
Gearshift Cables

Item	Part Number	Description
1	7K391	Gearshift cable ends
2	7E395	Shift cable
3	7E395	Select cable
4	-	Gearshift cable grommet (part of 7E395)
5	W707142-S439	Gearshift cable grommet nuts
6	7E395	Shift cable
7	7E395	Select cable
8	-	Gearshift lever nut (4 required)
9	7210	Gearshift lever assembly



Removal

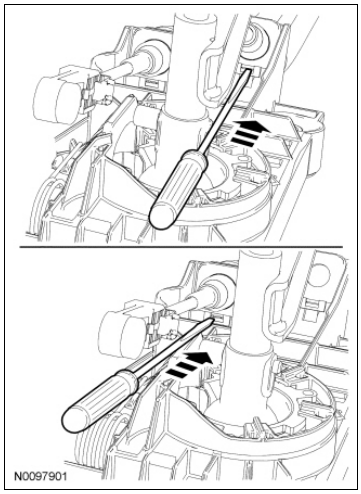
1. Remove the heater core and evaporator core housing. For additional information, refer to Section 412-01 .
2. Remove the battery tray. For additional information, refer to Section 414-01 .
3. Disconnect the gearshift cables from the transaxle shift control lever.



4. **NOTE:** Carefully pry the retainer on the gearshift cables. Do not damage the gearshift cable retainers.

   Disconnect the gearshift cs from the transaxle bracket.

5. Remove the Restraints Control Module (RCM). For additional information, refer to Section 501-20B .
6. Position the insulation blanket aside.
7. Remove the wiring harness from the studs.
8. Remove the 2 gearshift cable grommet nuts and detach the gearshift cables from the floor.

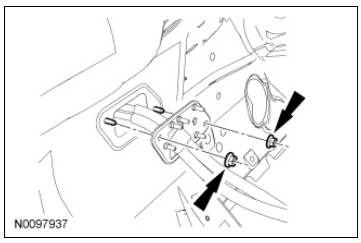


9. Disconnect the shift cable and select cable from the gearshift lever.

10. ***NOTICE:*** **Carefully disconnect the gearshift cables from the gearshift lever base. Do not damage the gearshift cable retainers.**

    Disconnect the gearshift cables from the gearshift lever base.

11. Pull the gearshift cables through the bulkhead into the interior.

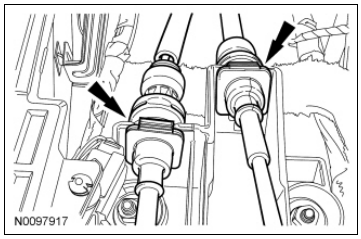


Installation

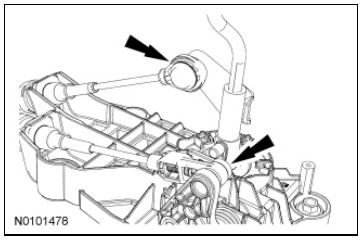
1. ***NOTICE:*** **When inserting the gearshift cables through the bulkhead, use care and do not damage the heat shielding.**

   NOTE: When inserting the gearshift cables through the bulkhead, make sure the arrow on the grommet is pointing upward.

   Pull the gearshift cables through the bulkhead into the exterior.



2. Install the 2 gearshift cable grommet nuts and attach the gearshift cables to the floor.
   - Tighten to 8 Nm (71 lb-in).



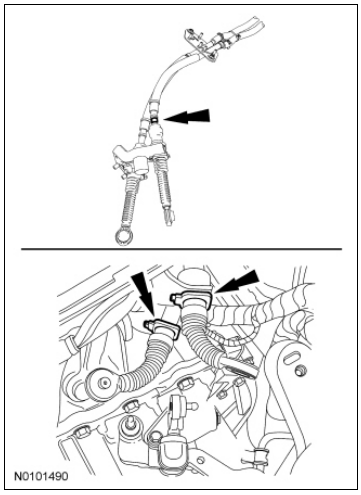
3. Install the wiring harness onto the studs.

4. ***NOTICE:*** **Make sure the gearshift cables are fully seated into the gearshift lever base or damage may occur.**

   Connect the gearshift cables to the gearshift lever base.

5. Connect the select cable and the shift cable to the gearshift lever.

6. Position the insulation blanket into place.



7. Install the RCM . For additional information, refer to Section 501-20B .

8. ***NOTICE:*** **Make sure the gearshift cables are fully seated into the transaxle bracket or damage may occur.**

   NOTE: The gearshift cable ends and transaxle bracket slots are unique. They can only be fully seated in the correct slot.

   NOTE: The top cable will have id tape.

   Connect the gearshift cables to the transaxle bracket.

9. Connect the gearshift cables to the transaxle shift control lever.

10. Adjust the gearshift cables. For additional information, refer to Section 308-00 .

11. Install the battery tray. For additional information, refer to Section 414-01 .

12. Install the heater core and evaporator core housing. For additional information, refer to Section 412-01 .

Torque Specifications

Description	Nm	lb-in
4X4 control module nuts	9	80

Four Wheel Drive (4WD) Systems

The All-Wheel Drive (AWD) system consists of the following:

- Power Transfer Unit (PTU)
- Rear driveshaft
- AWD relay module
- Rear axle with coupling device

Torque from the engine is transferred through the transaxle to the PTU . This torque is transferred from the driveshaft to the rear axle, which drives the rear halfshafts. The AWD system, also referred to as an Active Torque Coupling (ATC) system, is always active and requires no driver input.

The AWD system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is delivered to the front wheels. If wheel slip between the front and rear wheels is detected, or if the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels to prevent or control wheel slip. When the AWD system is functioning properly, there should be no perceived speed difference between the front and rear axles when launching or driving the vehicle on any uniform surface. Traction should be similar to a part time Four-Wheel Drive (4WD) system in 4H (4X4 HIGH), but have no binding in turns.

Serviceable components of the PTU are limited to the output shaft seal and flange, intermediate shaft seal and deflector, and the PTU transaxle compression seal. No internal components are serviced. There should be no need to remove the PTU cover. If any of the internal geared components, bearings, case cover or shafts are worn or damaged, a new PTU must be installed.

Four Wheel Drive (4WD) Systems

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The vehicle is equipped with an All-Wheel Drive (AWD) system, also referred to as Active Torque Coupling (ATC), that is always active and requires no driver input. The system has no Mode Select Switch (MSS).

Two transmissions are used with AWD . Vehicles with a 3.0L engine have the 6F35 transmission, controlled by the PCM. Vehicles with the 3.5L engine use the Aisin AW21, which is controlled by a stand-alone Transmission Control Module (TCM).

The system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected or if the vehicle is under heavy acceleration (high-throttle position), the AWD system increases torque to the rear wheels to prevent or control wheel slip.

AWD faults may be indicated in the message center by the wrench lamp as well as the CHECK AWD message.

The system consists of a Power Transfer Unit (PTU), 4X4 control module, rear axle and a solenoid actuated ATC device. Based on the amount of current sent to the clutch, the module varies the torque sent to the rear wheels by sending a duty cycle to the ATC device, located inside the rear axle. For concerns with the PTU , refer to Section 308-07B .

The 4X4 control module also provides the brake system with its current clutch duty cycle and determines whether or not the brake system may take command of the clutch duty cycle.

NOTE: The ATC solenoid is not repairable. If a new component is required, the ATC solenoid and rear axle are installed as an assembly. Refer to Section 205-02 .

The active, on-demand AWD system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate amount of current to send to the ATC solenoid that delivers the desired torque to the rear wheels. Specific inputs to the 4X4 control module are:

- Accelerator pedal position via the High Speed Controller Area Network (HS-CAN)
- Transaxle range from the TCM or PCM via the HS-CAN
- Brake system status from the ABS module via the HS-CAN
- Wheel speed from all 4 wheels from the ABS module via the HS-CAN

4X4 control module outputs are:

- Solid-state clutch (Pulse-Width Modulation (PWM) signal) to the ATC solenoid
- Percent of torque transfer commanded signal to the ABS module via the HS-CAN
- Torque request available signal to the ABS module via the HS-CAN

Heat Protection Mode

During very extreme off-road operation, the AWD system utilizes a heat protection mode to protect the ATC solenoid (part of rear axle) from damage. If the system detects an overheat condition, it enters a locked mode. If the heat in the system continues to rise once in the locked mode, the 4X4 control module disables the ATC solenoid. Allow the system to cool down at least 10 minutes with the ignition switch in the ON position.

Inspection and Verification

1. Verify the customer concern.

2. Inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Active Torque Coupling (ATC) solenoid (part of rear axle) • Power Transfer Unit (PTU) • Rear Drive Unit (RDU) • Halfshafts and CV joints • Driveshaft and U-joints • Fluid leaks • Wheel/tire size and brand • Matching tire size and brand • Tire pressure	• Smart Junction Box (SJB) fuse(s): ♦ 11 (10A) ♦ 35 (10A) • 4X4 control module • Wiring harness • Connector(s) • Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

If the scan tool does not communicate with the VCM :

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM .
- refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is in the ON position.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the DTCs and carry out the self-test diagnostics for the 4X4 control module.

9. If the DTCs retrieved are related to the concern, go to the 4X4 Control Module DTC Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

4X4 Control Module DTC Chart

DTC	Description	Action
B1317	Battery Voltage High	GO to Pinpoint Test B .
B1318	Battery Voltage Low	GO to Pinpoint Test B .
B1342	Electronic Control Unit (ECU) is Faulted	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section.
B2900	Vehicle Identification Number (VIN) Mismatch	CHECK the PCM configuration. REFER to Section 418-01 .
P1635	Tire/Axle Out of Acceptable Range	GO to Pinpoint Test F .
P1824	Four-Wheel Drive (4WD) Clutch Relay Circuit Failure	GO to Pinpoint Test D .
P1825	4WD Clutch Relay Open Circuit	Check for a possible open fuse (B+) . GO to Pinpoint Test D .
U0100	Lost Communication with PCM or Transmission Control Module (TCM) (3.5L only)	REFER to Section 418-00 to diagnose the lost communication with the PCM or TCM (3.5L only).
U0121	Lost Communication with Anti-lock Brake System (ABS) Control Module	REFER to Section 418-00 to diagnose the lost communication with the ABS control module.
U0155	Lost Communication with IC Control Module	REFER to Section 418-00 to diagnose the lost communication with the IC .
U0401	Invalid Data Received From PCM or TCM (3.5L only)	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the accelerator position, engine coolant or keep alive memory fault.
U0415		GO to Pinpoint Test C .

	Invalid Data Received From Anti-lock Brake System (ABS) Control Module	
U2050	No Application Present	REPLACE the 4X4 control module. REFER to 4X4 Control Module in this section. REPEAT the self-test.
U2051	One or More Calibration Files Missing/Corrupt	REPLACE the 4X4 control module. REFER to 4X4 Control Module in this section. REPEAT the self-test.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: All-Wheel Drive (AWD) System Functional Test

Refer to Wiring Diagrams Cell 34 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is delivered to the front wheels. If wheel slip between the front and rear wheels is detected, or if the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels to prevent or control wheel slip.

This pinpoint test is intended to diagnose the following:

- AWD system concern without on-demand or continuous DTCs

PINPOINT TEST A: ALL-WHEEL DRIVE (AWD) SYSTEM FUNCTIONAL TEST

⚠ WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

NOTE: Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.

Test Step	Result / Action to Take
A1 CHECK FOR WRENCH LIGHT PROVE-OUT	
• Turn the ignition to the ON position and observe the wrench light. • **Does the wrench light illuminate for 3 seconds and then turn OFF?**	**Yes** GO to A2 . **No** REFER to Section 413-01 for further diagnosis of

	the Instrument Cluster (IC).
A2 CHECK FOR ATC SOLENOID (PART OF REAR AXLE) LOCK	
• Drive the vehicle on a dry, hard surface in turns while applying the accelerator pedal. • **Is driveline wind-up present in turns?**	**Yes** With the ignition switch in ON position, allow the Active Torque Coupling (ATC) solenoid to cool down for at least 10 minutes and repeat the test. CHECK for wind-up again. If no wind-up is found, GO to A3 . If still present, GO to Pinpoint Test E . **No** GO to A3 .
A3 CHECK FOR VALID ACCELERATOR PEDAL POSITION MONITORING THE ACCELERATOR PEDAL POSITION (AP) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • Monitor the AP PID while pressing the accelerator pedal. • **Does the accelerator pedal position match the AP PID percent value?**	**Yes** GO to A4 . **No** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the accelerator pedal position sensor concern.
A4 CHECK 4X4 CONTROL MODULE WHEEL SPEED SENSOR PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **Are all 4 wheel speeds within 2 km/h (1.2 mph) of each other?**	**Yes** GO to A5 . **No** GO to Pinpoint Test F .
A5 CHECK VEHICLE ACCELERATION IN A STRAIGHT LINE	
• Carry out 3 accelerations from 0-48 km/h (0-30 mph) in a straight line (one each with low, medium and full accelerator pedal application). • **Does the vehicle pulsate or shudder while accelerating?**	**Yes** GO to Pinpoint Test E . **No** GO to A6 .

A6 CHECK VEHICLE TURNING ABILITY	
• Drive the vehicle in a fully locked turn, on dry pavement, at 8 km/h (5 mph). • **Does the vehicle bind in the turn or resist turning?**	**Yes** GO to Pinpoint Test E . **No** GO to A7 .
A7 CHECK FOR TORQUE AT REAR WHEELS USING PWM OUTPUT CONTROL COMMAND #1 (CLCH_SOL) ACTIVE COMMAND	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • Using the scan tool, command CLCH_ SOL to energize the ATC solenoid to a constant 100% applied. • Drive the vehicle in a fully locked turn, on dry pavement, at 8 km/h (5 mph). • **Does the vehicle bind in the turn or resist turning?**	**Yes** END the active command. The concern cannot be duplicated at this time. RETURN the vehicle to the customer. **No** END the active command. CHECK that the driveshaft rotates when the transaxle is in gear. If yes, GO to Pinpoint Test D . If no, CHECK the Power Transfer Unit (PTU). REFER to Section 308-07B .

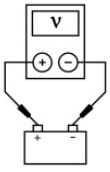
npoint Test B: DTCs B1317 and B1318

Refer to Wiring Diagrams Cell 34 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), All Wheel Drive (AWD) for schematic and connector information.

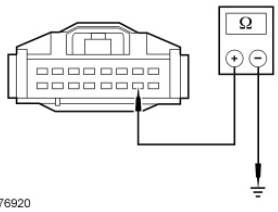
Normal Operation

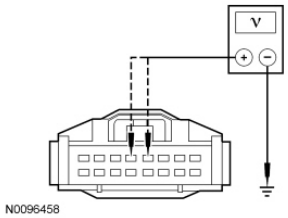
If the 4X4 control module observes an overpower or underpower voltage condition, DTCs are set and the 4X4 control module may not allow Four-Wheel Drive (4WD) operation.

- DTC B1317 Battery Voltage High - When the 4X4 control module detects battery voltage greater than 16 volts for at least 10 seconds, this DTC is set.
- DTC B1318 Battery Voltage Low - When the 4X4 control module detects battery voltage less than 9 volts for at least 10 seconds, with the engine running at 1,500 rpm or greater, this DTC is set.



This pinpoint test is intended to diagnose the following:





- Fuses
- Vehicle battery
- Charging system
- Wiring, terminals or connectors
- 4X4 control module

PINPOINT TEST B: DTCs B1317 AND B1318

NOTE: DTC B1or B1318 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Test Step	Result / Action to Take
B1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Enter the following diagnostic mode on the scan tool: Self Test - All CMDTCs . • **Is DTC B1317 or B1318 present in more than one module AND P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** GO to B2 .
B2 CHECK BATTERY CONDITION	
• Refer to Section 414-01 and carry out the Battery - Condition Test. • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to B3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
&sp; **B3 CHECK THE CHARGING SYSTEM VOLTAGE**	
NOTE: Do not allow the engine rpm to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine rpm has gone above 2,000 rpm, shut the vehicle off and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery. ♦ For DTC B1317, turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes. ♦ For DTC B1318, turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes.  AJ0210-A	**Yes** GO to B4 . **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.

• **Is the battery voltage between 13-15.2 volts?**	
B4 CHECK FOR VOLTAGE BY MONITORING THE MODULE SUPPLY VOLTAGE (VBAT_4X4) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • With the engine running, monitor the battery voltage VBAT_4X4 PID. • **Is the battery voltage less than 9 or greater than 15.5 volts?**	**Yes** If voltage is less than 9 volts, GO to B5 . If voltage is greater than 15.5 volts, INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR all CMDTCs . REPEAT the self-test. **No** GO to B7
B5 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN	
• Ignition OFF. • Disconnect: 4X4 Control Module C3253 . • Measure the resistance between 4X4 control module C3253-15, circuit GD126 (BK/WH), harness side and ground. • Repeat this measurement while wiggling the harness.  N0076920 • **Is the resistance less than 5 ohms?**	**Yes** GO to B6 . **No** REPAIR the circuit. CLEAR all CMDTCs . REPEAT the self-test.
B6 CHECK POWER TO 4X4 CONTROL MODULE	
• Ignition ON. • Measure the voltage between 4X4 control module C3253-4, circuit CBP35 (YE/GY), harness side and ground; and between 4X4 control module C3253-5, circuit SBP11 (BU/RD), harness side and ground.  N0096458	**Yes** GO to B7 . **No** VERIFY the Smart Junction Box (SJB) fuse(s) 11 (10A) and 35 (10A) are OK. If fuse(s) are OK, REPAIR the circuit in question. If SJB fuse(s) are not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR all CMDTCs . REPEAT the self-test.

• **Is the voltage greater than 10 volts?**	
B7 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Disconnect the 4X4 control module. • Check the harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the 4X4 control module and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the CMDTCs . REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all CMDTCs . REPEAT the self-test.

Pinpoint Test C: DTC U0415

Refer to Wiring Diagrams Cell 34 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate duty cycle to send to the Active Torque Coupling (ATC) solenoid (part of rear axle) that delivers the desired torque to the rear wheels. Specific inputs to the 4X4 control module are: accelerator pedal position output from the PCM, transmission range from the PCM or Transmission Control Module (TCM) (3.5L only), brake system status and all 4 wheel speeds from the ABS module. Communication between the 4X4 control module and other modules is obtained through the High Speed Controller Area Network (HS-CAN). If the 4X4 control module loses communication with, or receives invalid data from any of the necessary modules, DTCs are set and the 4X4 control module may not allow Four-Wheel Drive (4WD) operation.

- DTC U0415 Invalid Data Received from Anti-lock Brake System (ABS) Control Module - When the 4X4 control module receives invalid HS-CAN bus data or invalid wheel speed(s) from the ABS module for more than 5 seconds, this DTC is set.

This pinpoint test is intended to diagnose the following:

- ABS module

PINPOINT TEST C: DTC U0415

⚠ WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.

NOTE: Carry out a thorough inspection and verification as outlined before carrying out this pinpoint st.

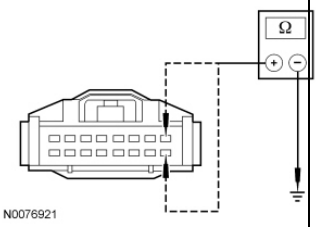
Test Step	Result / Action to Take
C1 CHECK FOR ABS MODULE DTCs	
	Yes

• Ignition ON. • Carry out the ABS module self-test. • Review the results of the ABS module self-test. • **Are any DTCs present?**	REFER to Section 206-09 for further diagnosis of the ABS. **No** GO to C2 .
C2 CHECK WHEEL SPEED SENSORS PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **Do the 4 wheel speed sensors match the speedometer and are they within 2 km/h (1.2 mph) of each other?**	**Yes** The system is operating correctly athis time. CLEAR the DTCs. REPEAT the self-test. **No** INSPECT for proper tire size and tire inflation. If no concerns with the tires are found, REFER to Section 206-09 for further diagnosis of the ABS.

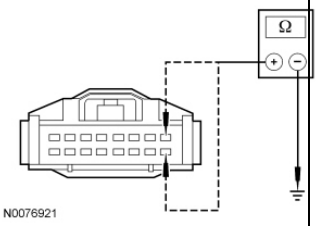
Pinpoint Test D: DTCs P1824 and P1825

Refer to Wiring Diagrams Cell 34 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), All Wheel Drive (AWD) for schematic and connector information.

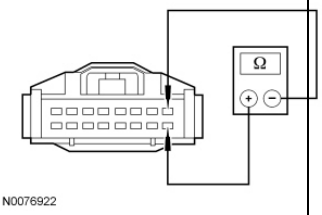
Normal Operation

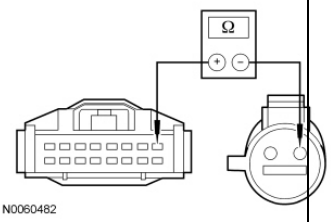


The All-Wheel Drive (AWD) system uses data from other systems as inputs to the 4X4 control module. The 4X4 control module uses the inputs to determine the appropriate duty cycle to send to the Active Torque Coupling (ATC) solenoid (part of rear axle) that delivers the desired torque to the rear wheels. If the 4X4 control module loses communication with, or receives invalid data from any of the necessary modules, DTCs are set and the 4X4 control module may not allow Four-Wheel Drive (4WD) operation.

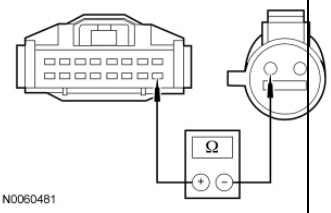


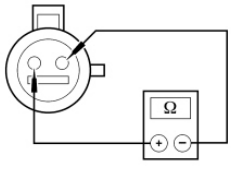
- DTC P1824 4-Wheel Drive Clutch Relay Circuit Failure - When the 4X4 control module detects a short to ground on the ATC solenoid feedback circuit, this DTC is set.
- DTC P1825 4-Wheel Drive Clutch Relay Open Circuit - When the 4X4 control module detects an open or short to ground on the ATC solenoid command or feedback circuit for more than 2 seconds, this DTC is set.



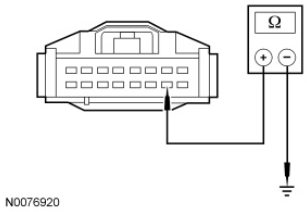


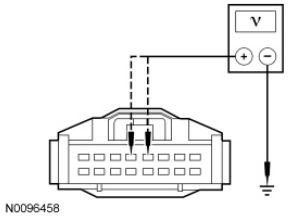
This pinpoint test is intended to diagnose the following:
- Tire/axle out of range
- Wiring, terminals or connectors
- ATC solenoid (part of rear axle)
- 4X4 control module
- Power Transfer Unit (PTU)





PINPOINT TEST D: DTCs P1824 AND P1825





NOTE: Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.

Test Step	Result / Action to Take
D1 CHECK FOR 4X4 CONTROL MODULE DTCs	
• Ignition ON. • Carry out the 4X4 control module self-test. • **Are any DTCs received?**	**Yes** For DTC P1824 or P1825, GO toa href="SCS~us~en~file=SCS87A03.HTM~gen~ref.HTM#D2" >D2 . For all other DTCs, REFER to the 4X4 Control Module DTC Chart in this section. **No** GO to D2 .
D2 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR A SHORT TO GROUND WITH ATC SOLENOID (PART OF REAR AXLE) CONNECTED	
• Ignition OFF. • Disconnect: 4X4 Control Module C3253 . • Measure the resistance between 4X4 control module C3253-8, circuit CCF21 (VT/WH), harness side and ground; and between 4X4 control module C3253-16, circuit RCF21 (WH/VT), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D5 . **No** GO to D3 .
D3 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR A SHORT TO GROUND WITH C3051 DISCONNECTED	

• Disconnect: ATC Solenoid Jumper Harness C3051 . • Measure the resistance between 4X4 control module C3253-8, circuit CCF21 (VT/WH), harness side and ground; and between 4X4 control module C3253-16, circuit RCF21 (WH/VT), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D4 . **No** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test.
D4 CHECKING THE ATC SOLENOID JUMPER HARNESS	
NOTICE: **The Active Torque Coupling (ATC) solenoid jumper harness must be secured to prevent damage to the wiring.** • Disconnect: ATC Solenoid C3254 . • Inspect the ATC solenoid jumper harness for damage. • **Is the ATC solenoid jumper harness damaged?**	**Yes** REPAIR or INSTALL a new ATC solenoid jumper harness. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new rear axle assembly. REFER to Section 205-02 . CLEAR the DTCs. REPEAT the self-test.
D5 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR AN OPEN WITH ATC SOLENOID CONNECTED	

• Connect: ATC Solenoid C3254 and ATC Solenoid Jumper Harness C3051 . • Measure the resistance between 4X4 control module C3253-8, circuit CCF21 (VT/WH), harness side and 4X4 control module C3253-16, circuit RCF21 (WH/VT), harness side.  • **Is the resistance less than 10 ohms?**	**Yes** GO to D8 . **No** GO to D6 .
D6 CHECK CIRCUITS CCF21 (VT/WH) AND RCF21 (WH/VT) FOR AN OPEN AT C3051	
• Disconnect: ATC Solenoid Jumper Harness C3051 . • Measure the resistance between 4X4 control module C3253-8, circuit CCF21 (VT/WH), harness side and ATC solenoid jumper harness C3051-1, circuit CCF21 (VT/WH).  • Repeat this measurement while wiggling the harness. • Measure the resistance between 4X4 control module C3253-16, circuit	**Yes** GO to D7 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

RCF21 (WH/VT), harness side and ATC solenoid jumper harness C3051-2, circuit RCF21 (WH/VT), harness side.  N0060481 • Repeat this measurement while wiggling the harness. • **Are the resistances less than 5 ohms?**	
D7 CHECK THE ATC SOLENOID CIRCUIT FOR AN INTERNAL OPEN	
***NOTICE:* The Active Torque Coupling (ATC) solenoid jumper harness must be secured to prevent damage to the wiring.** • Disconnect: ATC Solenoid C3254 . • Measure the resistance between ATC solenoid C3254-1, circuit CCF21 (VT/WH), component side, and ATC solenoid C3254-2, circuit RCF21 (WH/VT), component side.  N0076923 • Repeat this measurement while wiggling the harness.	**Yes** REPAIR or INSTALL a new ATC solenoid jumper harness. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new rear axle assembly. REFER to Section 205-02 . CLEAR the DTCs. REPEAT the self-test.

• **Is the resistance less than 10 ohms?**	
D8 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN	
• Measure the resistance between 4X4 control module C3253-15, circuit GD126 (BK/WH), harness side and ground.  • Repeat this measurement while wiggling the harness. • **Is the resistance less than 5 ohms?**	**Yes** GO to D9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D9 CHECK THE 4X4 CONTROL MODULE POWER CIRCUITS	
• Ignition ON. • Measure the voltage between 4X4 control module C3253-4, circuit CBP35 (YE/GY), harness side and ground; and between 4X4 control module C3253-5, circuit SBP11 (BU/RD), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to D10 . **No** VERIFY the Smart Junction Box (SJB) fuse(s) 11 (10A) and 35 (10A) are OK. If fuse(s) are OK, REPAIR the circuit in question. If SJB fuse(s) are not OK, REFER to the Wiring Diagrams manual to identify possible causes of the circuit short. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). REPEAT the self-test.
D10 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	

• Disconnect: 4X4 Control Module C3253 . • Check the harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Check the ATC solenoid jumper harness between the 4X4 control module and the ATC solenoid, located on the rear subframe. • Connect the 4X4 control module and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: Vehicle Binds in a Turn or Resists Turning/Pulsates or Shudders in a Straight Line

Refer to Wiring Diagrams Cell 34 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected or the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Rear axle
- Wheels/tires
- PCM
- ABS module
- 4X4 control module

PINPOINT TEST E: VEHICLE BINDS IN A TURN OR RESISTS TURNING/PULSATES OR SHUDDERS IN A STRAIGHT LINE

NOTE: Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.

Test Step	Result / Action to Take
E1 CHECK FOR TORQUE AT THE REAR WHEELS	

• Ignition OFF. • Disconnect: Active Torque Coupling (ATC) Solenoid (part of rear axle) C3254 . • Drive the vehicle in a straight line on dry pavement. • **Is a pulsation or shudder still present?**	**Yes** REFER to Section 205-00 for additional axle diagnosis. **No** GO to E2 .
E2 CHECK TO SEE IF THE ATC SOLENOID IS BEING COMMANDED ON MONITORING 4WD CLUTCH PWM STATUS (4WDCPWMST) PID	
• Ignition OFF. • Connect: ATC Solenoid C3254 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • Monitor the 4WDCPWMST PID. • Drive the vehicle no faster than 8 km/h (5 mph) in tight turns on dry pavement while monitoring the ATC solenoid duty cycle. • **Is the duty cycle greater than 20%?**	**Yes** GO to E3 . **No** GO to Pinpoint Test F .
E3 CHECK FOR THE CORRECT WHEEL SPEEDS USING THE WHEEL SPEED SENSORS PIDs	
• Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **Are all 4 wheel speeds within 2 km/h (1.2 mph) of each other?**	**Yes** GO to E4 . **No** GO to Pinpoint Test F .
E4 CHECK FOR VALID ACCELERATOR PEDAL POSITION MONITORING ACCELERATOR PEDAL POSITION (AP) PID	
• Key ON Engine OF(KOEO). • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • Monitor AP PID while pressing/releasing the accelerator pedal.	**Yes** GO to E5 . **No** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the engine control system.

• **Does the accelerator position match the PID percent value?**	
E5 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Disconnect the 4X4 control module. • Check the harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Check the ATC solenoid jumper harness between the 4X4 control module and the ATC solenoid, located on the rear subframe. • Connect the 4X4 control module and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC P1635

Refer to Wiring Diagrams Cell 34 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), All Wheel Drive (AWD) for schematic and connector information.

Normal Operation

The All-Wheel Drive (AWD) system continuously monitors vehicle conditions and automatically adjusts the torque distribution between the front and rear wheels. During normal operation, most of the torque is sent to the front wheels. If wheel slip between the front and rear wheels is detected or the vehicle is under heavy acceleration, the AWD system increases torque to the rear wheels.

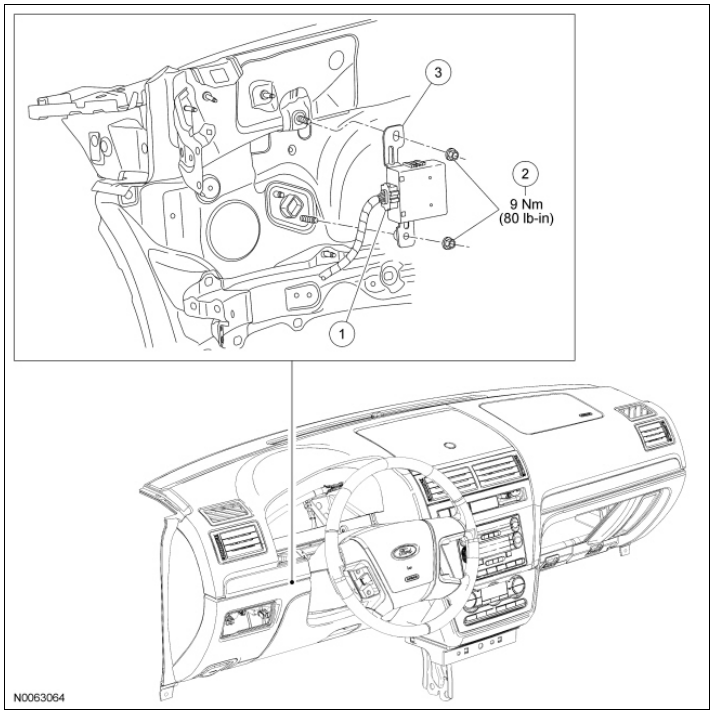
- DTC P1635 Tire/Axle Out of Acceptable Range - When the 4X4 control module detects inappropriate mini spare or road wheels/tires (greater than 7% across the front and rear axle or 14% at one wheel) installed, this DTC is set.

This pinpoint test is intended to diagnose the following:
- Wheels/tires
- Wheel speed sensors
- ABS module
- 4X4 control module

PINPOINT TEST F: DTC P1635

⚠ **WARNING: When directed to drive the vehicle as part of this test, drive the vehicle on a hard surface in an area without traffic to prevent a crash. Failure to follow these instructions may result in personal injury.**

NOTE: Carry out a thorough inspection and verification as outlined before carrying out this pinpoint test.



Test Step	Result / Action to Take
F1 CHECK THE RECENT TIRE USAGE	

• Check with customer about recent tire usage or installation. • **Has a tire been installed on the vehicle recently that was not originally supplied with the vehicle?**	**Yes** INFORM the customer to only use tires of the type supplied with the vehicle. CLEAR the DTCs. REPEAT the self-test. **No** GO to F2 .
F2 CHECK TIRE SIZE AND BRAND	
• Check the tire size and the brand of tire. • **Are all 4 tires the same size and brand?**	**Yes** GO to F3 . **No** INSTALL tires that are the same size and brand. INFORM the customer to only use the same size tires and brand. CLEAR the DTCs. REPEAT the self-test.
F3 CHECK TIRE AIR PRESSURES	
• Check the air pressure in all 4 tires. • **Are all 4 tires at the recommended air pressure?**	**Yes** GO to F4 . **No** ADJUST the tire air pressures. CLEAR the DTCs. REPEAT the self-test. INFORM the customer to maintain the correct tire air pressure.
F4 CHECK FOR CORRECT WHEEL SPEEDS	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - 4X4 Control Module . • While driving the vehicle at 48 km/h (30 mph), monitor the following wheel speed sensor PIDs: ♦ Left Front Wheel Speed Sensor (LF_WSPD) ♦ Left Rear Wheel Speed Sensor (LR_WSPD) ♦ Right Front Wheel Speed Sensor (RF_WSPD) ♦ Right Rear Wheel Speed Sensor (RR_WSPD) • **Are all 4 wheel speeds within 2 km/h (1.2 mph) of each other?**	**Yes** GO to F5 . **No** The ABS module is sending invalid wheel speed data to the 4X4 control module. REFER to Section 206-09 for additional ABS diagnosis.
F5 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Disconnect: 4X4 Control Module C3253 . • Check for: ♦ corrosion. ♦ pushed-out pins. • Connect the 4X4 control module and make sure it seats correctly.	**Yes** INSTALL a new 4X4 control module. REFER to 4X4 Control Module in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The

• Operate the system and determine if the concern is still present. • **Is the concern still present?**	concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

4X4 Control Module

Removal and Installation

Item	Part Number	Description
1	-	Electrical connector (part of 14A005)
2	W706840	4X4 control module nuts and washers (2 required)
3	7E453	4X4 control module and bracket assembly

1. From below the LH side instrument panel, disconnect the 4X4 control module harness connector.

2. Remove the two 4X4 control module nuts.
   - To install, tighten to 9 Nm (80 lb-in).

3. Remove the 4X4 control module and bracket.

4. To install, reverse the removal procedure.

Material

Power Transfer Unit (PTU) support bracket bolts	48	35	-
PTU -to-transaxle bolts	90	66	-

[a] Refer to the procedure in this section.

Power Transfer Unit (PTU)

The AWD system consists of the following:

- PTU
- Rear driveshaft
- 4X4 control module
- Rear axle with coupling device

The PTU is a mechanical device attached to the transaxle. It supplies torque to the rear axle through the rear driveshaft. The 4X4 control module is an electronic device which controls the rear axle coupling to apply the torque generated from the PTU to the rear wheels when required.

Power Transfer Unit (PTU)

Principles of Operation

The Power Transfer Unit (PTU) is a gearbox that attaches to the transaxle. Vehicles equipped with the 3.0L engine have the 6F35 transaxle and those with the 3.5L engine have the Aisin AW21 transaxle. The PTU design is similar between the two. The RH intermediate shaft passes through the PTU and engages the differential side gear as in normal Front Wheel Drive (FWD) applications. The PTU directs power to the rear driveshaft through a helical gear spline coupled to the transaxle differential case, a helical gear drop (idler gear) and hypoid/helical riear assembly and pinion set. The PTU is sealed from the transaxle and has its own oil sump.

Serviceable components of the PTU are limited to the output shaft seal and flange, intermediate shaft seal and deflector, cover seal and the PTU -transaxle compression seal. The internal components are not serviced. Do not remove the cover of the PTU . If any of the geared components, bearings, case cover or internal shafts are worn or damaged, a new PTU must be installed.

Heat Protection Mode

During very extreme off-road operation, the All-Wheel Drive (AWD) system utilizes a heat protection mode to protect the Active Torque Coupling (ATC) solenoid (part of rear axle) from damage. If the system detects an overheat condition, it enters a locked mode. If the heat in the system continues to rise once in the locked mode, the 4X4 control module disables the ATC solenoid. Allow the system to cool down at least 10 minutes with the ignition switch in the ON position.

For concerns with the 4X4 control module or ATC , refer to Section 308-07A .

Inspection and Verification

1. Verify the customer concern.
2. Inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• Power Transfer Unit (PTU) • Halfshafts and CV joints • Driveshaft and U-joints • Wheel/tire size and brand

- Matching tire size and brand
- Tire pressure

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - Power Transfer Unit (PTU) .

Symptom Chart - Power Transfer Unit (PTU)

Symptom Chart - Power Transfer Unit (PTU)

Analysis of Leakage

NOTE: There are 2 different PTU configurations used depending on the transaxle. The repairs made for leakage on these 2 different PTU s may vary depending upon the type and location of the leakage. The specified tools called out in this section will allow seal replacement without causing damage to the PTU case and drive gear.

NOTE: Inspection of the seal's mating journal should be performed every time a seal is replaced. The mating part/journal should be replaced if it has any of the following conditions: Radial wear groove that can be felt by running a finger nail across it where seal lip runs. Scratches, pitting, galling, nicks or other shaft damage under or near where the seal lip runs. Discoloration or coked oil on the shaft where the seal lip runs. Shaft corrosion under or near where the seal lip runs. Sharp edges or burrs on the shaft lead in chamfer. NEVER use emery cloth on journal finishes, replace the part.

The PTU may leak different color fluids, red ATF or tan/brown/black gear lube. The PTU and transaxle seals prevent these types of fluids from leaking. It is important to note which color of fluid is leaking to determine the most appropriate service procedure. The residue of red ATF should be cleaned from the PTU to prevent a inaccurate diagnosis of a red ATF leak following the repair.

PTU Leaks From the RH Side

Vehicles Equipped with Aisin AW21 Transaxle

NOTE: The intermediate shaft seal functions as a dust seal and is not a source of a red ATF leak.

If the leak is red ATF , this indicates the transaxle seal is leaking and needs to be replaced. For additional information, refer to Section 307-01A .

If the leak is tan/brown/black gear lube, the PTU cover seal is leaking and needs to be replaced. This cover seal is located on the PTU cover, behind the deflector. For additional information, refer to Cover Seal procedure in this section.

Vehicles Equipped with 6F35 Transaxle

If the leak is red ATF , this indicates the intermediate shaft seal is leaking and needs to be replaced. For additional information, refer to Intermediate Shaft Seal - 6F35 procedure in this section.

If the leak is tan/brown/black gear lube, the PTU cover seal is leaking and needs to be replaced. The cover seal is located on the PTU cover, behind the deflector. For additional information, refer to Cover Seal procedure in this section.

PTU Leaks From the LH Side

Vehicles Equipped with Aisin AW21 Transaxle

NOTE: The compression seal functions as a dust seal and is not the main source of the red ATF leak.

If the leak is red ATF , this indicates the transaxle seal is leaking and needs to be replaced. For additional information, refer to Section 307-01A .

If the leak is tan/brown/black gear lube and not at the vent, check the non-serviceable PTU inboard seal for leakage. If the PTU inboard seal is leaking, the PTU must be replaced. If the leak is from the vent, the PTU may be overfilled. Determine if the red ATF has entered the PTU . If red ATF has entered the PTU , the transaxle seal and PTU must be replaced. For additional information, refer to Section 307-01A and Power Transfer Unit (PTU) in this section.

Vehicles Equipped with 6F35 Transaxle

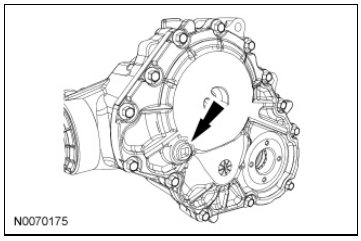
If the leak is red ATF , this indicates the transaxle seal is leaking and needs to be replaced. For additional information, refer to Section 307-01B .

If the leak is tan/brown/black gear lube, the PTU may be overfilled and leaking from the vent. If the PTU is overfilled, adjust the level as necessary. If the leak is not at the vent, the non-serviceable PTU inboard seal is leaking and the PTU must be replaced. For additional information, refer to Power Transfer Unit (PTU) in this section.

Power Transfer Unit (PTU) Draining and Filling

Material

Item	Specification
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5



NOTICE: **A new Power Transfer Unit (PTU) must be installed any time the PTU has been submerged in water.**

NOTE: The Power Transfer Unit (PTU) is not to be drained unless contamination is suspected. To drain the PTU fluid, the PTU must be removed from the vehicle. The fluid that is drained may appear black and have a pungent odor. Do not mistake this for contaminated fluid. For additional information, refer to Power Transfer Unit (PTU) in the Removal portion of this section.

NOTE: Fill level checks are done in-vehicle only. Let the vehicle sit 10 minutes after the road test before checking the fluid level.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Clean the area around the filler plug before removing.

3. Remove and discard the filler plug.

4. With the vehicle on a flat, level surface, fill the PTU with lubricant. The fluid must be even with the bottom of the fill opening.
    - Fluid capacity is 0.53L (18 oz).

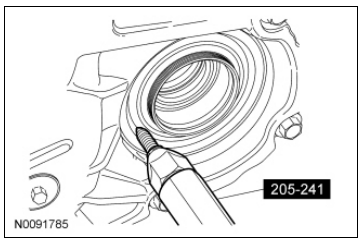
5. Install a new filler plug.
    - Tighten to 20 Nm (177 lb-in).

Cover Seal

Special Tool(s)

 ST3082-A	Handle, Driver (32 in) 205-907
 ST2572-A	Installer, Halfshaft Oil Seal 308-431td>
 ST1164-A	Installer, Shaft Bearing Cup 308-221 (T94P-7025-BH)
 ST1582-A	Remover, Halfshaft 205-241
 ST1605-A	Slide Hammer 100-01 (T50T-100-A)

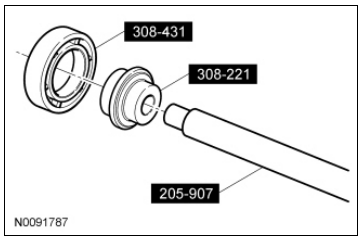
Removal



NOTE: The Power Transfer Unit (PTU) may leak different color fluids, red Automatic Transmission Fluid (ATF) and tan/brown/black gear lube for PTU fluid. The PTU seals prevent these types of fluids from leaking. It is important to note which color fluid is leaking to determine the most appropriate service procedure. This procedure will correct a tan/brown/black (gear lube) leak from the RH side of the PTU . For additional information, refer to Analysis of Leakage in this section.

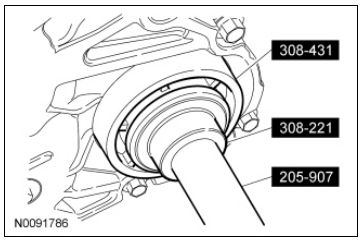
NOTE: This procedure is to be performed through the RH wheel opening. It is not necessary to remove the exhaust components to complete this repair.

1. Remove the intermediate shaft seal deflector. For additional information, refer to Intermediate Shaft Seal Deflector in this section.



2. **NOTE:** There is a bearing inside the PTU directly behind the cover seal. The bearing is not serviced.

   Remove the cover seal using the Slide Hammer, the extension from the Halfshaft Remover and a suitable seal puller inserted into the groove of the seal.

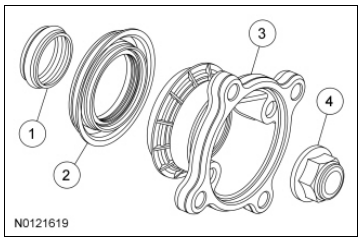


Installation

1. Assemble the Driver Handle, the Halfshaft Oil Seal Installer and the Shaft Bearing Cup Installer as shown.

2. Using the Driver Handle, the Halfshaft Oil Seal Installer and the Shaft Bearing Cup Installer, install the cover seal in the PTU .

3. Install the intermediate shaft seal deflector. For additional information, refer to Intermediate Shaft Seal Deflector in this section.



4. Fill the PTU as necessary. For additional information, refer to Power Transfer Unit (PTU) Draining and Filling in this section.

Output Shaft Seal

Special Tool(s)

 ST1257-A	Holding Fixture, Drive Pinion Flange 205-126 (T78P-4851-A)
 ST2571-A	Installer, PTU Drive Gear Outer Oil Seal 308-430
 ST2937A	Remover, Output Flange 307-523

Output Shaft Seal and Flange

Item	Description
1	Collapsible spacer (part of 7275 kit)
2	Output shaft seal (part of 7275 kit)
3	Output pinion flange (part of 7275 kit)
4	Pinion flange nut (part of 7275 kit)

Removal

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 .

All vehicles except GTDI

2. Remove the 2 exhaust Y-pipe-to-muffler and tail pipe flange nuts.
   - Discard the nuts and gasket.

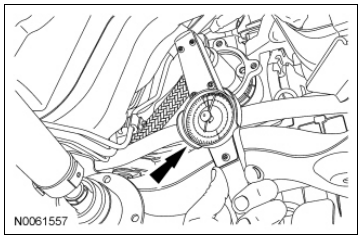
3. ***NOTICE:*** **The resonator must be supported to prevent damage to the flexible pipe.**

Using a length of mechanic's wire, support the resonator.

GTDI vehicles

4. Remove the 4 LH and RH exhaust flexible pipes-to-underbody catalytic converter nuts.
   - Discard the nuts and gasket.

All vehicles



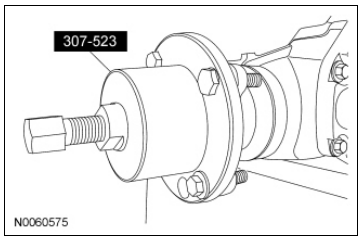
5. **NOTE:** Index-mark both the driveshaft flanges for installation.

   Remove the 4 driveshaft-to- PTU output flange bolts. Disconnect the driveshaft from the PTU and position it aside.

   - Using mechanic's wire, support the driveshaft.

6. **NOTE:** Rotational torque of the PTU rear output shaft flange must be measured and recorded using a Nm (lb-in) torque wrench for correct pinion bearing preload when reassembled. This will be the torque-to-turn measurement.

   Using a suitable torque wrench, measure and record the rotational torque of the PTU output shaft.

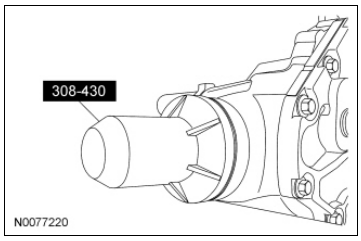


7. Using the Drive Pinion Flange Holding Fixture, hold the output pinion flange. Remove and discard the pinion nut.

8. **NOTE:** Index-mark the output pinion flange to the pinion shaft.

   Using the Output Flange Remover, remove the output pinion flange.

9. Remove and discard the output shaft seal.



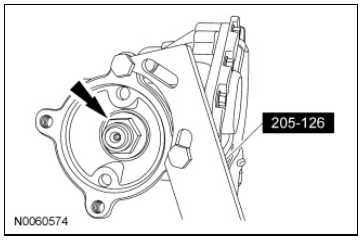
10. Remove the bearing from the output shaft.

11. Remove and discard the collapsible spacer.

Installation

All vehicles

1. Install the new collapsible spacer.
2. Install the bearing onto the output shaft.
3. Using the PTU Drive Gear Outer Oil Seal Installer, install the output shaft seal.



4. **NOTE:** Install the output pinion flange to engage the spline as previously marked.

   Install the output pinion flange.

5. ***NOTICE:*** **Refer to the rotational torque previously recorded with the Nm (lb-in) torque wrench. Tighten the pinion nut in small increments until it is within 0.3 Nm (3 lb-in) of the reference measurement. If 0.3 Nm (3 lb-in) is exceeded, then the collapsible spacer will be damaged and a new collapsible spacer will be required.**

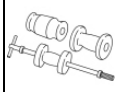
   Using the Drive Pinion Flange Holding Fixture to hold the output pinion flange, install and tighten the new pinion flange nut.

6. Using the index mark, position the driveshaft and install the 4 driveshaft-to- PTU output flange bolts.
   - Tighten to 70 Nm (52 lb-ft).

GTDI vehicles

7. Install the new LH and RH exhaust flexible pipe-to-underbody catalytic converter gaskets and nuts.
   - Tighten to 40 Nm (30 lb-ft).

All vehicles except GTDI



8. Install the new exhaust Y-pipe-to-muffler and tail pipe flange gasket and nuts.
   - Tighten to 40 Nm (30 lb-ft).

All vehicles

9. Fill the PTU as necessary. Refer to Power Transfer Unit (PTU) Draining and Filling .

Intermediate Shaft Seal Deflector

Special Tool(s)

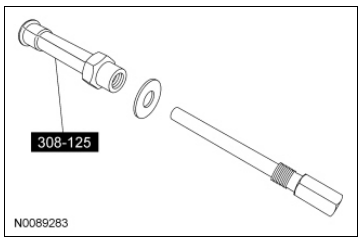
 ST3082-A	Handle, Driver 32 in 205-907
 ST3053-A	
 ST1582-A	Remover, Halfshaft 205-241
 ST3084-A	Remover, Transfer Case Bearing Cup 308-125 (T87P-7120-D)
 ST3248A	Slide Hammer Master Set 100-D112 or equivalent

General Equipment

16 mm (5/8 in) washer (used with 308-125)

Material

Item	Specification
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada) WSS-M2C924-A	
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A



Removal

NOTE: This procedure is to be performed through the RH wheel opening. It is not necessary to remove the exhaust components to complete this repair.

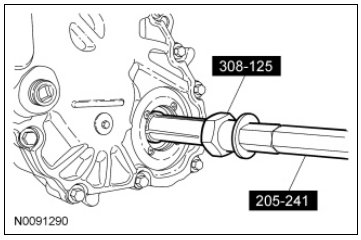
1. Remove the intermediate shaft. For additional information, refer to Section 205-04 .

2. **NOTE:** The following instruction will prevent the Transfer Case Bearing Cup Remover from opening too far which would make removing the intermediate shaft seal deflector difficult.

   Place a 16 mm (5/8 in) washer between the components of the Transfer Case Bearing Cup Remover as shown.

NOTICE: **Failure to utilize the recommended tools may result in serious damage to the Power Transfer Unit (PTU).**

3. Assemble the special tools as indicated in the following table and illustration:



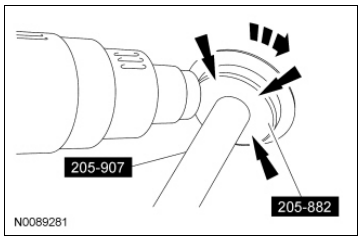
Item	Description
1	308-125
2	Extension from 205-241
3	100-D112 Slide Hammer Master Set

4. **NOTE:** Using a Slide Hammer Master Set eases the removal of the seal deflector.

   Using the Bearing Cup Remover, the extension from the Halfshaft Remover and a suitable slide hammer, remove the seal deflector.

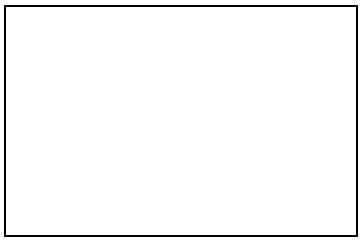
   - The seal deflector will have been damaged during removal. Remove all foreign material from the PTU before continuing with the repair.

Installation



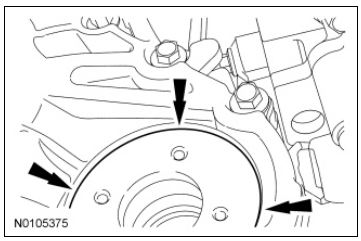
1. ***NOTICE:*** **Do not overheat (melt) the seal deflector. Monitor the temperature of the deflector with a suitable temperature measuring device, such as a digital temperature laser or infrared**

thermometer, while heating. Do not allow the temperature to exceed 100°C (212°F). Overheating will damage the deflector. If the deflector is damaged, a new deflector must be used.

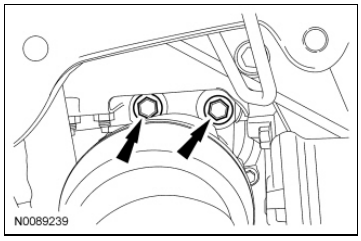


NOTE: Apply a small amount of silicone brake caliper grease and dielectric compound to the inner lip of the deflecr where it installs on the tube inside the PTU before heating. This will ease the installation of the deflector.

Position the deflector on the PTU Linkshaft Seal Dust Shield Installer using silicone brake caliper grease and dielectric compound to retain it to the installer. Using a suitable heat gun, heat the deflector to a minimum of 71°C (160°F) and a maximum of 93°C (200°F) by concentrating the heat across the back of the installer while rotating the tool. Once the optimum temperature is achieved on the tool, move the heat gun to the front of the tool and heat the inside of the deflector where it snaps onto the PTU shaft until the temperature of the deflector is a minimum of 100°C (212°F).



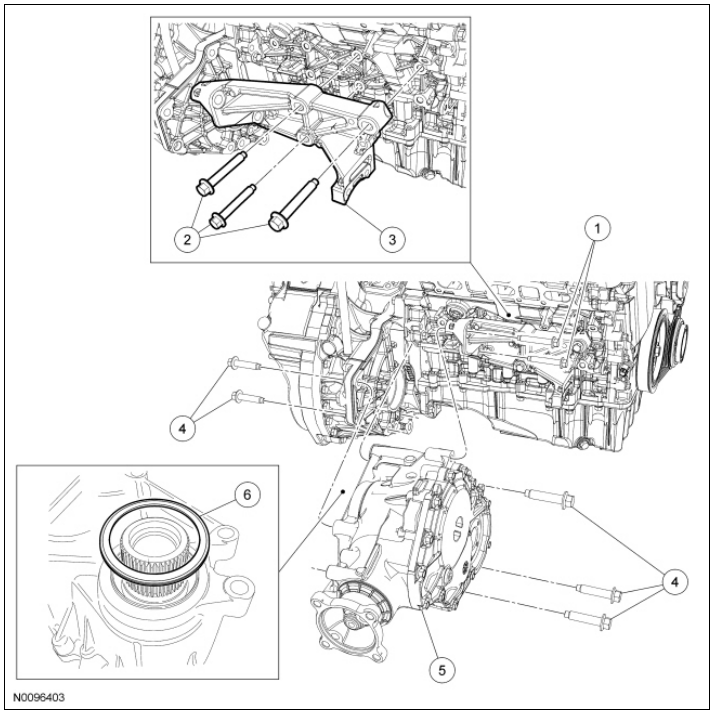
- As an alternative method to heating the seal deflector, place the deflector in boiling water for 3 to 5 minutes. Dry off the deflector and install.



2. Using a 5-pound or larger dead blow hammer, install the seal deflector immediately after heating using the PTU Linkshaft Seal Dust Shield Installer and Driver Handle.

3. Make sure the deflector is completely seated all the way around and there are no cracks on the face. The deflector is correctly installed when the face of the deflector is recessed 3-5 mm (0.12-0.20 in) into the pocket all the way around.

4. Fully install the intermediate and halfshaft assembly and the 2 bolts.
   - Tighten to 40 Nm (30 lb-ft).



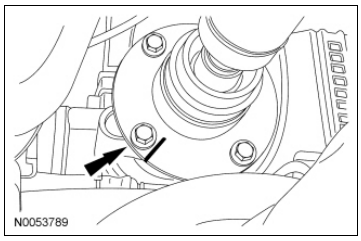
5. **NOTE:** A significant amount of residual fluid will collect between the seal and deflector during this repair. This is a normal condition and should not be misinterpreted as a leak after the repair is complete.

   Using metal brake parts cleaner, thoroughly clean the deflector and intermediate shaft area of any residual fluid that may have accumulated during the repair.

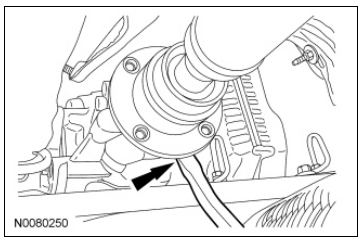
6. Fill the transaxle to the correct fluid level.

Power Transfer Unit (PTU)

NOTE: 3.5L with Aisin AW21 transaxle shown, 3.0L with 6F35 transaxle similar.



Item	Part Number	Description
1	W500324	Power Transfer Unit (PTU)-to-support bracket bolts (2 required)
2	W500324	PTU support bracket-to-engine block bolts (3 required)
3	7A444	PTU support bracket
4	W500741	PTU -to-transaxle bolts (5 required)
5	7251	PTU
6	7087	Compression seal (vehicles equipped with Aisin AW21 transaxle)

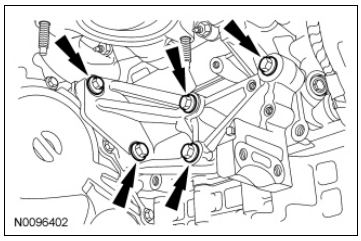


All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

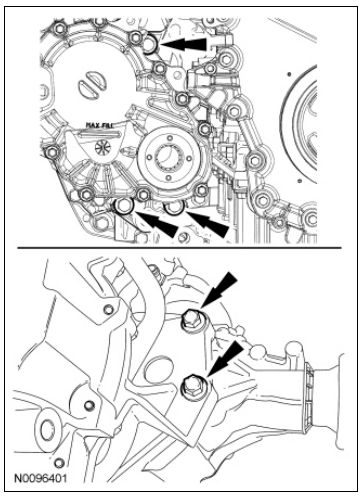
2. Remove and discard the 4 front driveshaft-to-Power Transfer Unit (PTU) flange bolts.

3. Using a suitable pry bar as shown, separate the driveshaft flange from the PTU flange.



4. Remove the RH catalytic converter. For additional information, refer to Section 309-00 .

3.0L vehicles

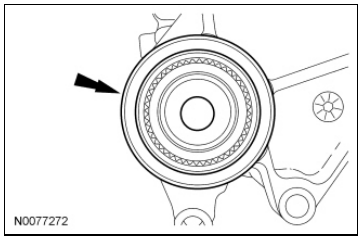


5. Remove the intermediate shaft. For additional information, refer to Section 205-04 .

All vehicles

6. Remove the 2 PTU -to-support bracket bolts, then remove the 3 PTU support bracket bolts and the PTU support bracket.

7. Remove the 5 PTU -to-transaxle bolts.



8. Separate the PTU from the transaxle. Remove the PTU from the vehicle.

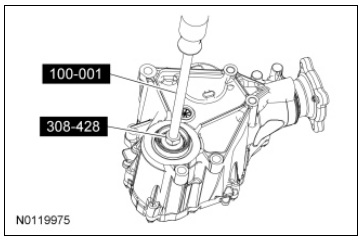
Vehicles equipped with Aisin AW21 transaxle

9. ***NOTICE:*** **A new compression seal must be installed whenever the PTU is removed from the vehicle. Failure to replace the compression seal may allow debris to enter the area around the transaxle seal and cause the transaxle seal to fail.**

   Using a suitable tool, remove the compression seal and discard.

N0077272

Intermediate Shaft Seal - 6F35



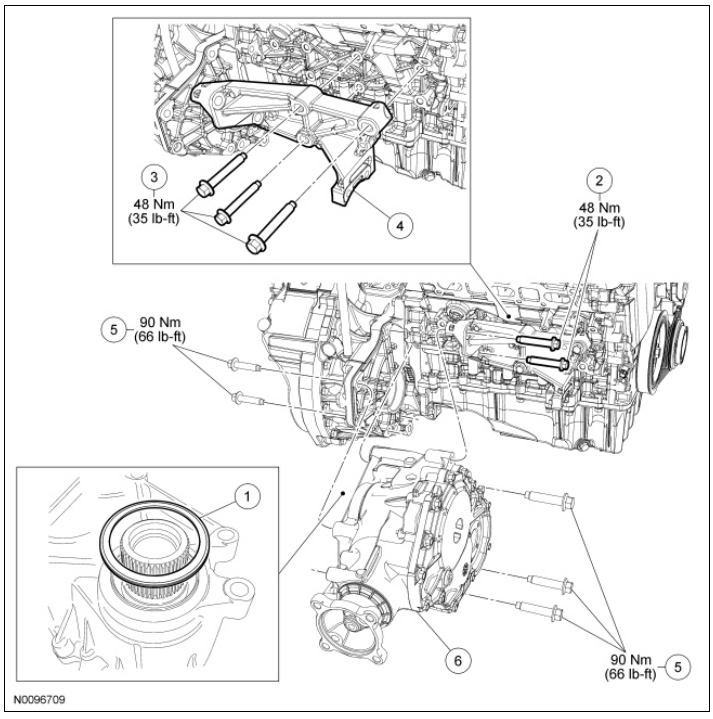
Special Tool(s)

 ST2569-A	Remover, PTO Driven Gear Oil Seal 308-428
 ST1605-A	Slide Hammer 100-001 (T50T-100-A)

1. **NOTE:** Red Automatic Transmission Fluid (ATF) leaking from the RH side of the Power Transfer Unit (PTU) indicates a ntermediate shaft seal. For additional information, refer to Analysis of Leakage in this section.

   Remove the PTU . For additional information, refer to Power Transfer Unit (PTU) in the section.

2. Using the PTO Driven Gear Oil Seal Remover and Slide Hammer, remove the intermediate shaft seal.

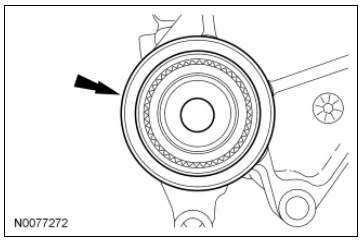


Power Transfer Unit (PTU)

Material

Item	Specification
Motorcraft® MERCON® LV Automatic Transmission Fluid XT-10-QLVC	MERCON® LV
Motorcraft® Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A
Motorcraft® SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A and GL-5

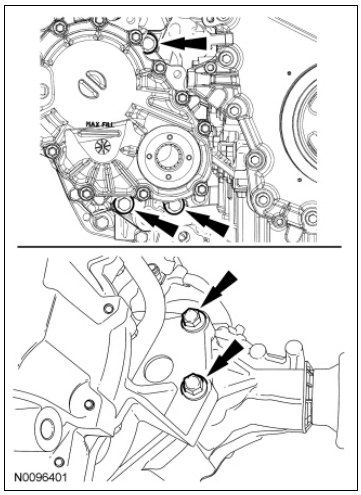
NOTE: 3.5L with Aisin AW21 transaxle shown, 3.0L with 6F35 transaxle similar.



Item	Part Number	Description
1	7087	Compression seal (vehicles with Aisin AW21 transaxle)

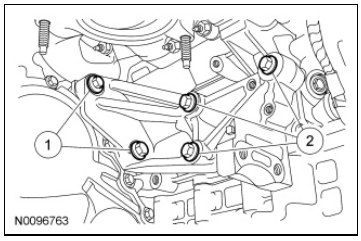
2	W500324	Power Transfer Unit (PTU)-to-support bracket bolts (2 required)
3	W500324	PTU support bracket-to-engine block bolts (3 required)
4	7A444	PTU support bracket
5	W500741	PTU -to-transaxle bolts (5 required)
6	7251	PTU

Vehicles equipped with Aisin AW21 transaxle

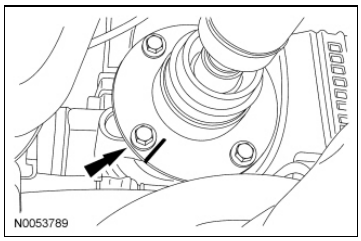


1. ***NOTICE:*** **A new compression seal must be installed whenever the Power Transfer Unit (PTU) is removed from the vehicle. Failure to replace the compression seal may allow debris to enter the area around the transaxle seal and cause the transaxle seal to fail.**

   Using a suitable tool, install the new compression seal.



All vehicles



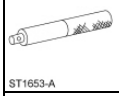
2. Position the Power Transfer Unit (PTU) to the transaxle. Install the 5 PTU -to-transaxle bolts.
   - Tighten to 90 Nm (66 lb-ft).

3. Position the PTU support bracket into place and install the 5 PTU support bracket bolts.
   1. Tighten the bolts to the PTU to 48 Nm (35 lb-ft).
   2. Tighten the bolts to the engine to 48 Nm (35 lb-ft).

4. Position the driveshaft and install 4 new driveshaft-to- PTU flange bolts.
    - Tighten to 70 Nm (52 lb-ft).

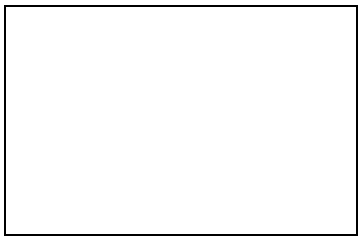
3.0L vehicles

5. Install the intermediate shaft. For additional information, refer to Section 205-04 .



All vehicles

6. Install the RH catalytic converter. For additional information, refer to Section 309-00 .



7. Fill the transaxle and/or PTU as necessary.

Intermediate Shaft Seal - 6F35

Special Tool(s)

 ST1653-A	Handle 205-153 (T80T-4000-W)
 ST2570-A	Installer, PTO Driven Gear Oil Seal 308-429

1. Using the Handle and PTO Driven Gear Oil Seal Installer, install the intermediate shaft seal.

2. Install the Power Transfer Unit (PTU). For additional information, refer to Power Transfer Unit (PTU) in this section.

Torque Specifications

[a] Refer to the procedure in this section.

&nb

Exhaust System

The 2.5L exhaust system consists of:

- a one-piece catalytic converter manifold (hybrid only).
- an exhaust manifold (except hybrid).
- an exhaust flexible pipe.
- an underbody catalytic converter.
- a Catalyst Monitor Sensor (CMS) mounted to the underbody catalytic converter.
- a production muffler and tail pipe assembly.
- isolators installed on the body and muffler hangers.

The 3.0L exhaust system consists of:

- a one-piece catalytic converter manifold.
- a RH exhaust manifold-mounted catalytic converter.
- an exhaust flexible pipe.
- an underbody catalytic converter.
- a production muffler and tail pipe assembly.
- isolators installed on the body and muffler hangers.

The 3.5L exhaust system consists of:

- two exhaust manifold-mounted catalytic converters.
- an exhaust Y-pipe.
- a resonator and flex assembly.
- a production muffler and tail pipe assembly.
- isolators installed on the body and muffler hangers.

The exhaust system provides an exit for exhaust gases and reduces engine noise by passing exhaust gases through the catalytic converters, a muffler assembly and resonator. Rubber exhaust hanger isolators attach the exhaust system to the hangers welded on the body.

Catalytic Converter

The catalytic converter plays a major role in the emission control system. The catalytic converter operates as a gas reactor. Its catalytic function is to speed the heat-producing chemical reaction of components in the exhaust gases in order to reduce air pollutants.

The catalyst material inside the catalytic converter consists of a ceramic substrate.

The catalytic converter is designed to provide a long life. No maintenance is necessary for the catalytic converter.

Precautions

NOTICE: **Do not use leaded fuel in a vehicle equipped with a catalytic converter. In a vehicle that is continually misfueled, the lead in the fuel will be deposited in the catalytic converter and completely blanket the catalyst. Lead reacts with platinum to "poison" the catalyst. Continuous use of leaded fuel**

can destroy the catalyst and render the catalytic converter useless. The addition of lead to the catalytic converter can also solidify the catalyst, causing excessive back pressure in the exhaust system and possibly causing engine damage.

NOTICE: **Extremely high temperatures of 1,100°C (2,012°F) or above due to misfiring or an over-rich fuel/air mixture will cause the ceramic substrate to sinter or burn, destroying the catalytic converter. Do not continue to operate the vehicle if the engine is misfiring, there is a power loss or other unusual operating conditions, such as engine overheating and backfiring.**

Some exhaust fasteners must be discarded and new ones installed as indicated in the procedures. Also, any damaged or heavily corroded fasteners should be discarded and new ones installed. Some exhaust fasteners are of a prevailing torque design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

Sound Insulators and Shields

Sound insulators and shields, attached to the underbody, protect the vehicle from exhaust system heat and should be inspected at regular intervals to make sure they are not dented or out of position. If a sound insulator and shield is damaged or shows evidence of deterioration, install a new insulator and shield. The sound insulators and shields for the muffler, muffler pipe, resonator and catalytic converter pipe are installed separately.

Exhaust System

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the components of the exhaust system and related controls that may affect exhaust gas quality or loss of power.
3. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Exhaust pipe pinched or crushed • Damaged muffler • Broken or damaged exhaust hanger brackets or isolators • Damaged catalytic converter • Cracked exhaust manifold • Loose or damaged heat shields

4. Verify that the exhaust system is installed correctly, with clamps correctly located and tightened to specification.
5. If the fault is not visually evident, determine the symptom. GO to Symptom Chart - Exhaust System or GO to Symptom Chart - NVH .

Symptom Chart - Exhaust System

Symptom Chart - Exhaust System

Symptom Chart - NVH

Symptom Chart - NVH
NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for

the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

Condition	Possible Sources	Action
• Rattle, squeaks or buzz type noise - from the bottom of the vehicle	• Loose or damaged heat shield	• INSPECT the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system components. If any heat shields are loose, INSTALL worm gear clamp 7L5Z-5A231-AA and tighten to 7 Nm (62 lb-in). If the heat shields are missing, INSTALL new heat shields or exhaust system components as necessary. If a rattle, noise or buzz condition persists, INSTALL a new heat shield or component as necessary. TEST the system for normal operation after the repair.
	• Loose or damaged exhaust isolators	• VERIFY that the exhaust isolators are correctly installed. INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Damaged exhaust isolator hanger bracket	• INSPECT the exhaust system components for damage or broken hangers. INSTALL new components as necessary. CHECK for loose or damaged exhaust hanger brackets. INSTALL new components as necessary. TEST the system for normal operation after the repair.
	• Loose or damaged catalytic converter or muffler	
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.
• Drone or clunk type noise - from the bottom of the vehicle	• Loose or damaged exhaust isolators	• INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.
	• Exhaust grounded to chassis	• INSPECT for signs of exhaust components-to-body contact. If necessary, CARRY OUT the Exhaust System Alignment in this section.
• Whistles, boom, hum or ticking type noise - noise tends to change as the engine warms. The noises are often accompanied by exhaust fumes	• Exhaust system leak	• INSPECT the entire exhaust system for leaks. CHECK for punctures, loose or damaged clamps/fasteners, gaskets, sensors or broken welds. EXAMINE the chassis for grayish-white or black exhaust soot, which indicates exhaust leakage at that point. To magnify a small leak, have an assistant hold a rag over the tail pipe outlet while listening for a leak. REPAIR or INSTALL new components

as necessary. TEST the system for normal operation after the repair.

- Catalytic converter

- MOVE the exhaust system to simulate the bouncing action of the vehicle, checking for exhaust-to-body contact while moving the exhaust system. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Exhaust muffler/resonator drain hole enlarged due to corrosion

- CONFIRM the drain holes are the noise source. INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Hissing or rushing noise - high frequency sound. Vehicle performance is unaffected

♦ Exhaust system. Exhaust flow through pipes

- CHECK the exhaust system for leaks. Using a rubber mallet, TAP on the exhaust components to duplicate the noise concern. Lightly TAP on the muffler and the catalytic converter. DETERMINE if there are loose or broken baffles in the muffler, or a loose or broken element in the catalytic converter. REPAIR or INSTALL new components as necessary. TEST the system for normal operation after the repair.

- Pinging noise - occurs when exhaust system is hot, engine turned off

- Catalytic converter/exhaust system

- Cool down pinging is a result of the exhaust system expanding and contracting during heating and cooling. This is a normal condition.

- Vibration - occurs at idle and at low speeds. Also accompanied by a clunk or buzz type noise

- Loose or damaged exhaust isolator

- INSPECT the exhaust isolators for wear or damage. INSTALL new isolators as necessary. TEST the system for normal operation after the repair.

- Loose or damaged exhaust isolator hanger brackets

- INSPECT the exhaust isolator hanger brackets for wear or damage. INSTALL or REPAIR as necessary. TEST the system for normal operation after the repair.

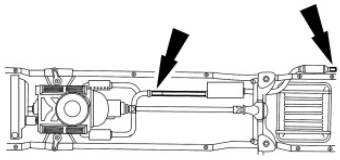
- Exhaust system grounded to chassis

- CARRY OUT the Exhaust System Alignment in this section.

- Engine drumming noise - normally accompanied by vibration

- Damaged or misaligned exhaust system

- INSPECT the exhaust system for loose or damaged fasteners, Torca® clamps or isolators. CARRY



OUT the Exhaust System Alignment in this section.

- Sputter type noise - noise worse when cold, lessens or disappears when the vehicle is at operating temperature
- Damaged or worn exhaust system
- INSPECT the exhaust system for leaks or damage. REPAIR as necessary. TEST the system for normal operation after the repair.
- Thumping noise - from the bottom of the vehicle, worse at acceleration
- Misaligned exhaust system
- CHECK the exhaust system to chassis clearance. CHECK the exhaust system isolators for damage. REPAIR as necessary. TEST the system for normal operation after the repair.
- Loose or damaged body shield
- CHECK the body shield for damaged, loose or missing fasteners. REPAIR or REPLACE as necessary. TEST the system for normal operation after the repair.
- Engine vibration - is felt with increases and decreases in engine rpm
- Strain on exhaust system isolators
- CARRY OUT the Exhaust System Alignment in this section. REPAIR as necessary. TEST the system for normal operation after the repair.
- Drumming noise - occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent
- Exhaust system vibration excites the body resonances inducing interior noise
- GO to Pinpoint Test A .

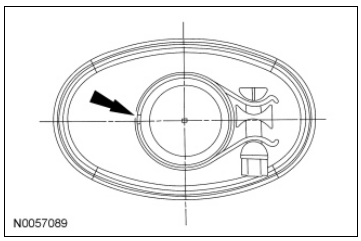
Pinpoint Test

PINPOINT TEST A: DRUMMING NOISE

Test Step	Result / Action to Take
A1 CHECK THE EXHAUST SYSTEM	
• Start the engine. • Increase the engine rpm until the noise is the loudest. Note the engine rpm. • Ignition OFF. • Add approximately 9 kg (20 lb) of weight to the exhaust system.st place the weight at the tail pipe and test, then at the	**Yes** REFER to Exhaust System Alignment in this section. TEST the system for normal operation. **No** CONDUCT a diagnosis on other

front pipe.  DF1768-A • Start the engine. • Increase the engine rpm and listen for the drumming noise. Note the engine rpm if the noise occurs. • Ignition OFF. • Remove the weight from the exhaust system. • **Is the noise/vibration reduced or eliminated, or does the noise/vibration occur at a different rpm?**	suspect systems. REFER to Section 100-04 .

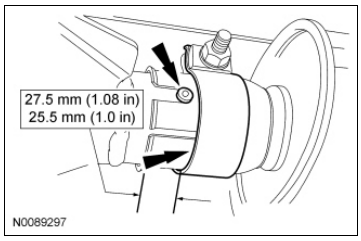
Exhaust System Alignment



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Loosen all fasteners joining the exhaust system components.
3. Beginning at the front of the vehicle, align the exhaust system to establish the maximum clearance. Make sure all fit pipes are pushed all the way into the preceding pipe and the notches are correctly lined up with the tabs.
4. Beginning at the front of the vehicle, tighten all fasteners and clamps to specification. For additional information, refer to Specifications in this section.
5. Start the engine and check the exhaust system for leaks.

Torca® Clamp

1. Remove the nut from the Torca® clamp.

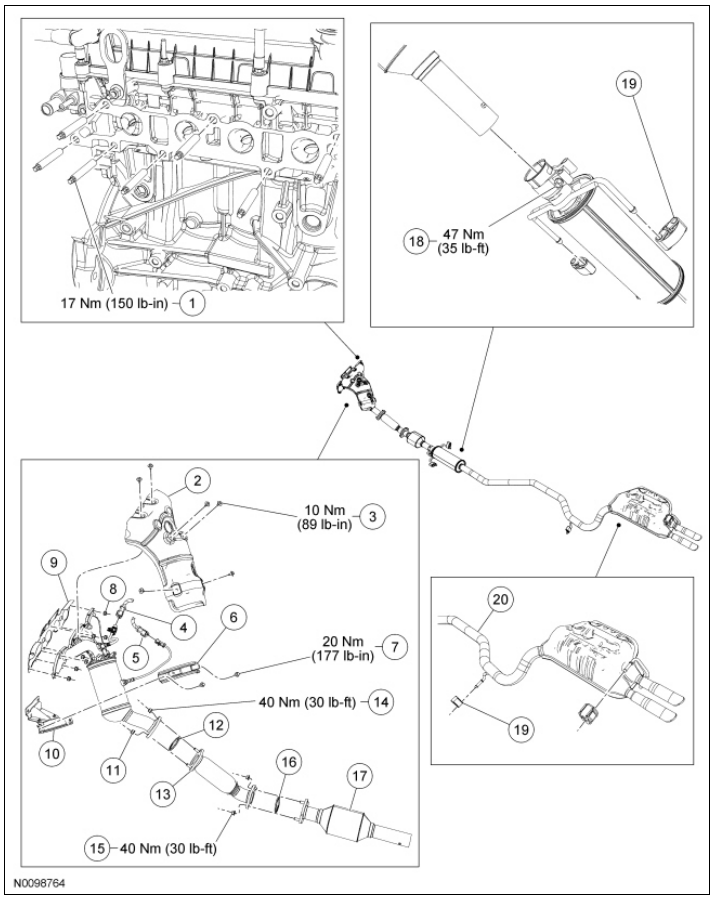


2. Grind the spot weld from the Torca® clamp and remove the clamp.

3. Clean the uneven surface area and position a Torca® clamp.

4. **NOTE:** Make sure the clamp position is no more than 27.5 mm (1.08 in) or less than 25.5 mm (1 in) from the inlet of the resonator pipe.

   Make sure the back of the slot is covered by the clamp and the button is fully seated inside the notch.



5. **NOTE:** Do not tighten the clamp until the exhaust system has been aligned.

   Tighten the Torca® clamp.

   - Tighten to 47 Nm (35 lb-ft).

1. For additional information, refer to the procedures in this section.

Catalytic Converter - Manifold, Hybrid

Removal

1. **NOTE:** Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the Heated Oxygen Sensor (HO2S) and the Catalyst Monitor Sensor (CMS) electrical connectors.

3. Remove the 2 catalytic converter manifold-to-exhaust flexible pipe nuts.
   - Discard the gasket and the 2 nuts.

4. Remove the 6 catalytic converter manifold shield bolts and the heat shield.

5. Remove the 2 catalytic converter manifold shield bracket bolts and the bracket.

6. Loosen the 2 catalytic converter manifold bracket bolts.

7. Remove the 7 catalytic converter manifold nuts and remove the converter from the vehicle.
   - Discard the 7 nuts and the gasket.

8. Remove and discard the 7 catalytic converter manifold studs.

9. Clean and inspect the catalytic converter manifold. For additional information, refer to Section 303-00 .

Installation

1. Install the 7 new catalytic converter manifold studs.
   - Tighten to 17 Nm (150 lb-in).

2. Position a new catalytic converter manifold gasket on the studs.

3. ***NOTICE:*** **Failure to tighten the catalytic converter manifold nuts to specification before installing the converter bracket bolts will cause the converter to develop an exhaust leak.**

   NOTICE: **Failure to tighten the catalytic converter manifold nuts to specification a second time will cause the converter to develop an exhaust leak.**

   NOTE: Make sure to tighten the nuts in the following sequence in 2 stages.

   Position the catalytic converter manifold and tighten the 7 new nuts in the sequence shown, in 2 stages.

   - Stage 1: Tighten to 55 Nm (41 lb-ft).

- Stage 2: Tighten to 55 Nm (41 lb-ft).

4. Tighten the 2 catalytic converter manifold bracket bolts.
   - Tighten to 20 Nm (177 lb-in).

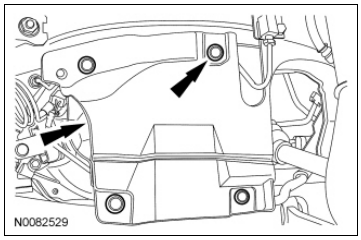
5. Install the 2 catalytic converter manifold shield bracket bolts and the bracket.
   - Tighten to 20 Nm (177 lb-in).

6. Position the catalytic converter manifold shield and install the 6 heat shield bolts.
   - Tighten to 10 Nm (89 lb-in).

7. Install the exhaust flexible pipe to the catalytic converter.
   - Install a new gasket and nuts.
   - Tighten to 40 Nm (30 lb-ft).

8. Connect the HO2S and the CMS electrical connectors.

Catalytic Converter - 3.0L RH



Removal

NOTE: Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the RH front wheel and tire. For additional information, refer to Section 204-04 .

3. Remove the pin-type retainers and position the splash shield aside.

4. Remove the exhaust flexible pipe. For additional information, refer to Exhausexible Pipe - 2.5L, 3.0L in this section.

5. Remove the Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor (CMS). For additional information, refer to Section 303-14B.

6. Remove the roll restrictor bolt and rotate the engine forward.

7. Remove the 5 bolts and position aside the catalytic converter manifold shield.

8. Remove the bolt, 2 nuts and the RH catalytic converter manifold brackets.

9. Remove the 3 nuts and the RH catalytic converter.
    - Rotate the RH catalytic converter so the flex-pipe flange opening is facing toward the front of the vehicle to remove.
    - Discard the 3 RH catalytic converter nuts and gasket. Click here to view a video version of this procedure.

Installation

1. **NOTE:** Do not tighten the 3 new RH catalytic converter nuts at this time.

   Install the RH catalytic converter and a new gasket.

    - Loosely install the 3 new nuts.

2. **NOTE:** Do not tighten the catalytic converter manifold brackets bolt and 2 nuts at this time.

Install the RH catalytic converter manifold brackets.

- ♦ Tighten the 3 RH catalytic converter nuts.
  - Tighten to 40 Nm (30 lb-ft).

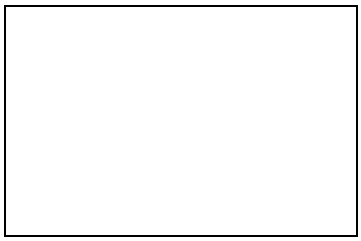
4. **NOTE:** Do not tighten the 5 catalytic converter manifold shield bolts at this time.

   Install the catalytic converter manifold shield.

   - Loosely install the 5 bolts.

5. Tighten the RH catalytic converter manifold brackets bolt and 2 nuts.
   - Tighten to 20 Nm (177 lb-in).

6. Tighten the catalytic converter manifold shield 5 bolts.
   - Tighten to 10 Nm (89 lb-in).



7. Install the roll restrictor bolt.
   - Tighten to 90 Nm (66 lb-ft).

8. ***NOTICE:*** **Prior to installation, inspect the Heated Oxygen Sensor (HO2S) and the Catalyst Monitor Sensor (CMS) wiring harness for damage.**

   Install the HO2S and CMS . For additional information, refer to Section 303-14B.

9. Install the exhaust flexible pipe. For additional information, refer to Exhaust Flexible Pipe - 2.5L, 3.0L in this section.

10. Install the splash shield and the pin-type retainers.

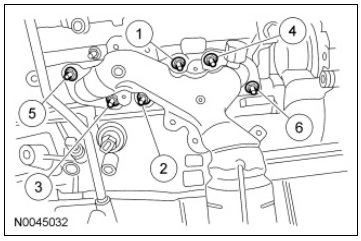
11. Install the RH front wheel and tire. For additional information, refer to Section 204-04 .

Catalytic Converter - 3.0L LH Manifold

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the oil level indicator and tube. For additional information, refer to Section 303-01B .
3. Disconnect the Heated Oxygen Sensor (HO2S) and the Catalyst Monitor Sensor (CMS) electrical connectors.
4. Remove the 2 LH catalytic converter-to-exhaust flexible pipe nuts.
    - Discard the gasket and the 2 nuts.
5. Remove the 4 bolts and the LH catalytic converter manifold shield.
6. Remove the 2 LH catalytic converter manifold shield bracket bolts and the shield bracket.
7. Remove the 2 LH catalytic converter manifold bracket bolts and bracket.
8. Remove the 6 nuts and the LH catalytic converter manifold.
    - Discard the 6 LH catalytic converter manifold nuts and the gasket.
9. Remove and discard the 6 LH catalytic converter manifold studs.
10. Clean and inspect the catalytic crter manifold. For additional information, refer to Section 303-00 .

Installation



1. Install the 6 new LH catalytic converter manifold studs.
    - Tighten to 11 Nm (97 lb-in).
2. Position a new LH catalytic converter manifold gasket on the studs.
3. Position the LH catalytic converter manifold and finger-tighten the 6 new nuts.
4. Install a new gasket and finger-tighten 2 new nuts at the LH catalytic converter-to-exhaust flexible pipe.
5. ***NOTICE:*** **Failure to tighten the catalytic converter manifold nuts to specification before installing the converter bracket bolts will cause the converter to develop an exhaust leak.**

   NOTICE: **Failure to tighten the catalytic converter manifold nuts to specification a second time will cause the converter to develop an exhaust leak.**

   NOTE: Make sure to tighten the nuts in the sequence shown in 2 stages.

Position the LH catalytic converter manifold and tighten the 6 new nuts in the sequence shown, in 2 stages.

- Stage 1: Tighten to 20 Nm (177 lb-in).
- Stage 2: Tighten to 20 Nm (177 lb-in).

6. Install the shield bracket and the 2 LH catalytic converter manifold shield bracket bolts.
   - Tighten to 20 Nm (177 lb-in).
7. Install the LH catalytic converter manifold bracket and 2 bolts.
   - To install, tighten to 20 Nm (177 lb-in).
8. Position the LH catalytic converter manifold shield and install the 4 bolts.
   - Tighten to 10 Nm (89 lb-in).
9. Tighten the 2 new LH catalytic converter-to-exhaust flexible pipe nuts.
   - Tighten to 40 Nm (30 lb-ft).
10. Connect the HO2S and the CMS electrical connectors.
11. Install the oil level indicator and tube. For additional information, refer to Section 303-01B .

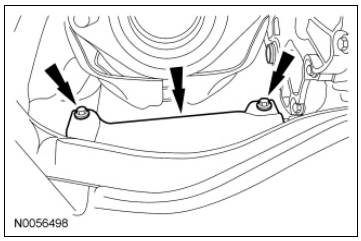
Catalytic Converter - 3.5L RH

Removal and Installation

All vehicles

1. **NOTE:** Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the exhaust Y-pipe. For additional information, refer to Exhaust Y-Pipe - 3.5L in this section.

All-Wheel Drive (AWD) vehicles

3. Remove the intermediate shaft. For additional information, refer to Section 205-04 .

All vehicles

4. Remove the 2 bolts and the power steering gear shield.
   - To install, tighten to 15 Nm (133 lb-in).

5. Remove the roll restrictor bolt and rotate the engine forward.
   - To install, tighten to 90 Nm (66 lb-ft).

6. Disconnect the Catalyst Monitor Sensor (CMS) electrical connector.

7. Remove the 2 bracket-to-RH catalytic converter bolts.
   - To install, tighten to 20 Nm (177 lb-in).

8. Remove the 4 nuts and the RH catalytic converter.
   - Discard the 4 RH catalytic converter-to-exhaust manifold nuts and gasket.
   - To install, tighten to 40 Nm (30 lb-ft).

9. ***NOTICE:*** **Prior to Installation, Inspect the CMS wiring harness for damage.**

   To install, reverse the removal procedure.

   - Install a new gasket, nuts and studs as indicated.

Catalytic Converter â 3.5L LH

Removal and Installation

1. **NOTE:** Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the Catalyst Monitor Sensor (CMS) electrical connector.

3. Remove the exhaust Y-pipe. For additional information, refer to Exhaust Y-Pipe â 3.5L in this section.

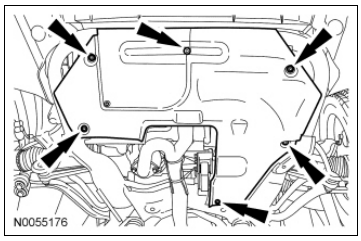
4. Remove the 2 catalytic converter support bracket-to-transmission bolts.
   - To install, tighten to 48 Nm (35 lb-ft).

5. Remove the 4 nuts and the LH catalytic converter.
   - Discard the 4 LH catalytic converter-to-exhaust manifold nuts and gasket.
   - To install, tighten to 40 Nm (30 lb-ft).

6. To install, reverse the removal procedure.
   - Install a new gasket, nuts and studs as indicated.

Exhaust Flexible Pipe - 2.5L, 3.0L

Removal



NOTICE: **Do not excessively bend, twist or allow the exhaust to hang from the flexible pipe or damage to the exhaust system may occur.**

All vehicles

1. **NOTE:** Always install new fasteners and gaskets as indicated. Clean flange faces prior to new gasket installation to make sure of proper sealing.

   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If equipped, remove the 6 screws and the underbody shield.

3. Remove and discard the 2 exhaust flexible pipe-to-catalytic converter nuts.
   - Discard the gasket.

3.0L vehicles

4. Remove and discard the 2 RH catalytic converter-to-exhaust flexible pipe nuts.
   - Discard the gasket.

5. Remove and discard the 2 LH catalytic converter-to-exhaust flexible pipe nuts and remove the exhaust flexible pipe.
   - Discard the gasket.

2.5L vehicles

6. Remove and discard the 2 catalytic converter manifto-exhaust flexible pipe nuts and remove the exhaust flexible pipe.
   - Discard the gasket.

Installation

2.5L vehicles

1. Using a new gasket, install the exhaust flexible pipe and 2 new catalytic converter manifold-to-exhaust flexible pipe nuts.
   - Tighten to 40 Nm (30 lb-ft).

3.0L vehicles

2. Using a new gasket, install the exhaust flexible pipe and 2 new LH catalytic converter-to-exhaust flexible pipe nuts.
    - Tighten to 40 Nm (30 lb-ft).

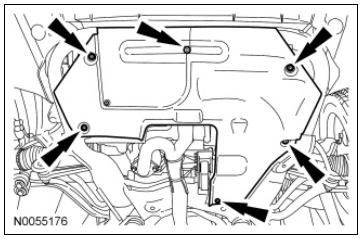
3. Using a new gasket, install the 2 new exhaust flexible pipe-to-catalytic converter nuts.
    - Tighten to 40 Nm (30 lb-ft).

All vehicles

4. Using a new gasket, install 2 new exhaust flexible pipe-to-catalytic converter nuts.
    - Tighten to 40 Nm (30 lb-ft).

5. If equipped, install the underbody shield and the 6 screws.

6. Start the engine and check for exhaust leaks.



Exhaust Y-Pipe - 3.5L

Removal and Installation

1. **NOTE:** Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.

   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If equipped, remove the 6 screws and the underbody shield.

3. Remove and discard the 2 exhaust Y-pipe-to-resonator nuts.
   - Discard the gasket.
   - To install, tighten to 40 Nm (30 lb-ft).

4. Remove and discard the 2 RH catalytic converter-to-exhaust Y-pipe nuts.
   - To install, tighten to 40 Nm (30 lb-ft).

5. Remove and discard the 2 exhaust Y-pipe-to-LH catalytic converter nuts and remove the exhaust Y-pipe.
   - Discard the gasket.
   - To install, tighten to 40 Nm (30 lb-ft).

6. To install, reverse the removal procedure.
   - Install new gaskets and nuts.

7. Start the engine and check for exhaust leaks/li>

Catalytic Converter - Underbody

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove and discard the 2 exhaust flexible pipe-to-catalytic converter nuts.
   - Discard the gasket.
   - To install, tighten to 40 Nm (30 lb-ft).

3. Remove the Torca® clamp. For additional information, refer to Torca® Clamp in this section.

4. Separate the catalytic converter from the muffler and tail pipe.
   - Remove the catalytic converter.

5. To install, reverse the removal procedure.
   - Install a new gasket and nuts.

6. Start the engine and check for exhaust leaks.

Resonator - 3.5L

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove and discard the 2 exhaust Y-pipe-to-resonator nuts.
   - Discard the gasket.
   - To install, tighten to 40 Nm (30 lb-ft).

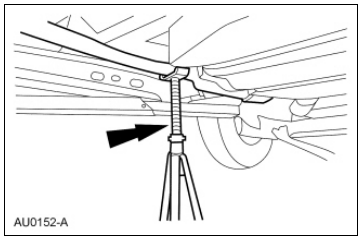
3. Loosen Torca® clamp nut.
   - To install, tighten to 47 Nm (35 lb-ft).

4. Separate the resonator from the muffler and tail pipe and remove the resonator.

5. To install, reverse the removal procedure.
   - Install a new gasket and nuts.

6. Start the engine and check for exhaust leaks.

Muffler and Tailpipe

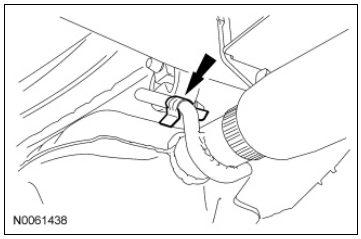


Removal and Installation

NOTICE: **Do not use oil or grease-based lubricants on the isolators. They may cause deterioration of the rubber.**

NOTICE: **Oil or grease-based lubricants on the isolators may cause the exhaust hanger isolator to separate from the exhaust hanger bracket during vehicle operation.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Support the muffler and tail pipe with a suitable jackstand.

3. ***NOTICE:*** **Do not excessively bend, twist or allow the exhaust to hang from the flexible pipe or damage to the exhaust system may occur.**

   Support the catalytic converter with a suitable jackstand.

4. Disconnect the ground clip from the exhaust hanger.

5. Loosen Torca® clamp nut.
   - To install, tighten to 47 Nm (35 lb-ft).

6. **NOTE:** Do not damage or tear the isolators during removal.

   Using soapy water, separate the 4 or 5 muffler and tail pipe isolators from the vehicle.

7. Separate the muffler and tail pipe from the catalytic converter and remove the muffler and tail pipe.

8. To install, reverse the removal procedure.
   - Inspect and replace any isolators damaged or torn during the removal process.

9. Start the engine and check for exhaust leaks.

Material

Item	Specification	Fill Capacity
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-

General Specifications

Item	Specification
Fuel tank capacity (All-Wheel Drive (AWD) vehicles)	62.46L (16.5 gal)
Fuel tank capacity (Front Wheel Drive (FWD) vehicles)	66.24L (17.5 gal)
Fuel Pressure	
2.5L and 3.0L engine running fuel pressure	379-399 kPa (55-58 psi)
3.5L engine running fuel pressure	441-461 kPa (64-67 psi)

Torque Specifications

Description	Nm	lb-in
Fuel tank filler pipe hose clamp	4	35

Fuel System

Fuel System

The fuel system consists of the:

- All-Wheel Drive (AWD) saddle-type or Front Wheel Drive (FWD) L-shaped fuel tank.
- Fuel Pump (FP) module.
- fuel level sensor assembly (saddle-type fuel tank).
- fuel level sender (mounted on the FP module and, if equipped, on the fuel level sensor assembly).
- Easy Fuel ™ (capless) fuel tank filler pipe assembly.
- FP control module on 2.5L and 3.0L vehicles.
- Inertia Fuel Shutoff (IFS) switch on 3.5L vehicles.
- fuel tubes.
- fuel injectors.
- fuel rail.
- Fuel Tank Pressure (FTP) sensor (part of the fuel vapor tube assembly).

The vehicle

- has a single speed Mechanical Retess Fuel System (MRFS) on 3.5L vehicles.
- has a 2-speed MRFS on 2.5L and 3.0L vehicles.
- has either a single container (L-shaped) (FWD) or a dual container (saddle-type) (AWD) fuel tank.
- has a FP module containing:
  - ♦ an electric FP , which provides pressurized fuel to the fuel rail.
  - ♦ a serviceable fuel level sender.
  - ♦ a check valve, which maintains system pressure after the FP is shut off.
  - ♦ a pressure relief valve for overpressure protection in the event of restricted fuel flow.
  - ♦ a lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.
- has an individual fuel level sensor, AWD vehicles only.
- has a fuel rail-mounted Schrader valve on early build 3.0L vehicles.
- has fuel, vapor and brake tubes in an integrated bundle assembly attached to the underside of the vehicle by retaining clips.
- has an Easy Fuel ™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way.
- has a supplemental refueling adapter located in the luggage compartment.
- has a FTP sensor (part of the fuel vapor tube assembly).
- is equipped with a sequential Multi-Port Fuel Injection (MFI) system.
- uses separately controlled fuel injectors for each cylinder. The fuel injectors are mounted to the intake manifold.
- fuel injectors are supplied with pressurized fuel from the FP module to the fuel rail.

Fuel System Shutoff Feature

2.5L and 3.0L vehicles

In event of a moderate to severe collision, the vehicle is equipped with a FP shutoff feature that is initiated by the event notification signal. The event notification signal is provided by the Restraints Control Module (RCM) to the FP control module. Signal communication between the RCM and the FP control module allows

the PCM to shutoff the FP module. Should the vehicle shut off after a collision due to this feature, restart the vehicle by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances, the vehicle may not restart the first time and may take an additional attempt.

3.5L vehicles

The FP module is controlled by the PCM. Electrical power to the FP module is provided through the IFS switch that will de-energize the fuel delivery secondary circuit in the event of a moderate to severe collision. The IFS switch is a safety device, located under the RH front door scuff plate. Should the vehicle shutoff after a collision due to this feature, restart the vehicle by first turning the ignition OFF, push the reset button on the IFS switch, then turn the ignition to the ON position.

Fuel System

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The following procedure diagnoses a slow to fill concern only. For all other concerns refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

The fuel tank filler pipe assembly is used to refuel the vehicle. The fuel tank inlet check valve prevents spitback of fuel during and after refueling. The fuel tank stores the fuel. The fuel tank contains a Fuel Pump (FP) module. The FP module consists of a fuel level sensor and a FP . The fuel level sender sends a signal to the fuel gauge informing the driver of how much fuel is in the fuel tank. The FP provides fuel to the fuel tubes which supply the fuel rail.

During refueling, the fuel tank vents to the atmosphere through the vent and filler pipes, on vehicles without On-Board Refueling Vapor Recovery (ORVR) systems. In vehicles equipped with ORVR , the fuel tank and filler pipe are designed so that when the vehicle is being refueled, fuel vapors in the fuel tank travel to the Evaporative Emission (EVAP) canister, which absorbs the fuel vapors and vents the pressure from the fuel tank during refueling.

Inspection and Verification

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Verify the customer's concern by refueling the vehicle and observe the fuel fill rate.

2. Inspect to determine if any of the following mechanical concerns apply.

Visual Inspection Chart

Mechanical

- Bent, kinked or damaged fuel tank filler pipe
- Bent, kinked or damaged fuel tank filler pipe vent tube (if equipped)
- Incorrect routing of the fuel tank filler pipe
- Incorrect routing of the fuel tank filler pipe vent tube (if equipped)
- Incorrect position of fuel tank filler pipe clamps
- Incorrect position of fuel tank filler pipe vent tube clamps (if equipped)
- Fuel tank mounted vapor tubes bent or damaged
- Evaporative Emission (EVAP) system tubes or hoses bent or damaged
- Accident damage to the fuel tank
- Accident damage to the vehicle effecting the fuel tank filler pipe-to-body connection
- Unauthorized modifications and/or alterations to the vehicle
- EVAP system fresh air tube plugged (dirt, spider webbing)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the EVAP system.

9. If the DTCs retrieved are related to the concern, go to Evaporative Emission (EVAP) System DTC Chart. For PCM-related DTCs, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

Evaporative Emission (EVAP) System DTC Chart

DTC	Description	Action
P0446	Evaporative Emission System Vent Control Circuit	GO to Pinpoint Test A .
P0451	Evaporative Emission System Pressure Sensor/Switch Range/Performance	GO to Pinpoint Test A .
P0452	Evaporative Emission System Pressure Sensor/Switch Low	GO to Pinpoint Test A .
P0453	Evaporative Emission System Pressure Sensor/Switch High	GO to Pinpoint Test A .
P0454	Evaporative Emission System Pressure Sensor/Switch Intermittent	GO to Pinpoint Test A .
P1450	Unable to Bleed up Fuel Tank Vacuum	GO to Pinpoint Test A .
P1451	Evaporative Emission System Vent Control Circuit	GO to Pinpoint Test A .
P260F	Emission System Monitoring Processor Performance	GO to Pinpoint Test A .

Symptom Chart

Symptom Chart

Pinpoint Test

Pinpoint Test A: Slow to Fill

Normal Operation

Under normal operation, fuel should flow at a steady rate through the fuel tank filler pipe into the fuel tank. As fuel enters the fuel tank, air is vented through the filler pipe or the On-Board Refueling Vapor Recovery (ORVR) system.

This pinpoint test is intended to diagnose the following:

- Fuel tank filler pipe vent tube, if equipped
- Fuel tank filler pipe
- Evaporative Emission (EVAP) system
- Fuel tank inlet check valve (part of the fuel tank)
- Fuel level vent valve (part of the fuel tank)

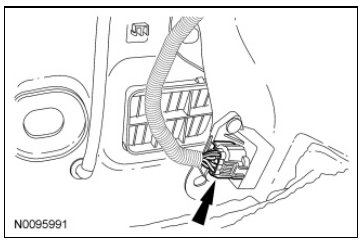
PINPOINT TEST A: SLOW TO FILL

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out inspection and verification. • **Was the cause of the concern found?**	**Yes** REPAIR or INSTALL new components to correct the concern. **No** GO to A2 .
A2 CHECK THE SYSTEM FOR ANY EVAP DTCs	

• Connect the scan tool. • Check the system for any of the following EVAP DTCs: P0446, P0451, P0452, P0453, P0454, P1450, P1451 and P260F. • **Are any of these DTCs present?**	**Yes** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the EVAP system. **No** GO to A3 .
A3 MONITOR THE FTP WHILE FILLING THE FUEL TANK	
• Monitor the Fuel Tank Pressure (FTP) reference value while filling the fuel tank. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is FTP within specification?**	**Yes** GO to A5 . **No** GO to A4 .
A4 MONITOR THE FTP WHILE FILLING THE FUEL TANK WITH THE EVAP SYSTEM DISCONNECTED	
• Disconnect the fuel tank-to- EVAP canister quick connect coupling at the EVAP canister. Refer to Quick Connect Coupling in this section. • Monitor the FTP reference value while filling the fuel tank. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual. • **Is FTP within specification?**	**Yes** INSPECT the EVAP system for blockage or restrictions. REPAIR the blockage or restriction. If the restriction or blockage cannot be repaired, INSTALL new EVAP system components. **No** GO to A5 .
A5 CHECK THE FUEL TANK FILLER PIPE ASSEMBLY FOR BLOCKAGE OR RESTRICTION	
• Remove the fuel tank filler pipe assembly. Refer to Section 310-01A . • Inspect the fuel tank filler pipe and fuel tank filler pipe vent tube (if equipped) for a blockage or restriction. • **Is the fuel tank filler pipe or fuel tank filler pipe vent tube (if equipped) blocked or restricted?**	**Yes** If possible, REPAIR the blockage or restriction. If the blockage or restriction cannot be repaired, INSTALL a new fuel tank filler pipe or fuel tank filler pipe vent tube. **No** GO to A6 .
A6 CHECK THE FUEL TANK INLET CHECK VALVE	
• Inspect the fuel tank inlet check valve for restriction or sticking. • **Is the fuel tank filler pipe inlet check valve restricted or sticking?**	**Yes** If possible, REPAIR the restriction. If the restriction cannot be repaired, INSTALL a new fuel tank. REFER to Section 310-01A . **No** INSTALL a new fuel tank. REFER to Section 310-01A .

Fuel System Pressure Release

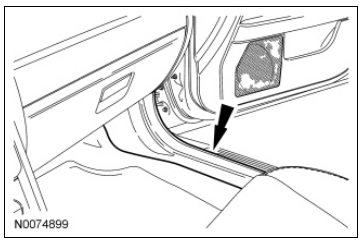
⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammamixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

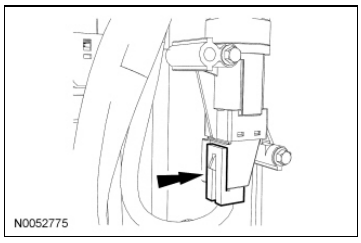
⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

2.5L and 3.0L vehicles



1. Position aside the LR quarter panel luggage compartment trim.

2. Disconnect the Fuel Pump (FP) control module electrical connector.



3.5L vehicles

3. Remove the RF door scuff plate.

4. Disconnect the Inertia Fuel Shutoff (IFS) switch.

All vehicles

5. Start the engine and allow it to idle until it stalls.

6. After the engine stalls, crank the engine for approximately 5 seconds to make sure the fuel system pressure has been released.

7. Turn the ignition switch to the OFF position.

2.5L and 3.0L vehicles

8. When fuel system service is complete, reconnect the FP control module electrical connector.

9. Position the LR quarter panel luggage compartment trim.

3.5L vehicles

10. When fuel system service is complete, reconnect the IFS switch electrical connector.

11. Install the RF door scuff plate.

All vehicles

12. **NOTE:** It may take more than one key cycle to pressurize the fuel system.

    Cycle the ignition key and wait 3 seconds to pressurize the fuel system.

13. **NOTE:** Carry out a Key ON Engine OFF (KOEO) visual inspection for fuel leaks prior to starting the engine.

    Start the vehicle and check the fuel system for leaks.

Fuel System Pressure Test

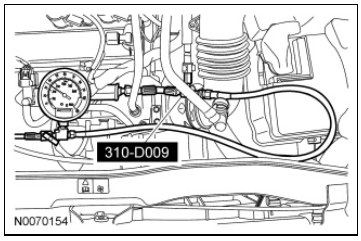
Special Tool(s)

 ST3047-A	Adapter, Fuel Pressure Test 310-180
 ST3038-A	Fuel Pressure Test Kit 310-D009 (D95L-7211A)

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.



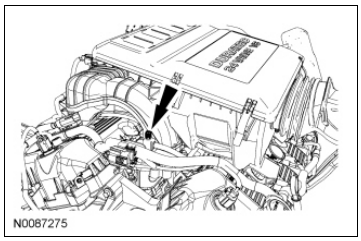
⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

NOTE: Early build 3.0L engines are equipped with a Schrader valve on the fuel rail. Late build 3.0L engines do not have a Schrader valve.

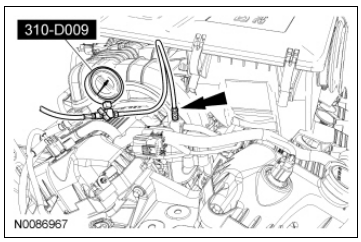
2.5L engine

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the fuel jumper tube-to-fuel rail quick connect coupling. For additional information, refer to Quick Connect Coupling in this section.
4. Install the Fuel Pressure Test Kit between the fuel jumper tube and the fuel rail.



5. **NOTE:** The Fuel Pump (FP) control module was disconnected in the fuel system pressure release.

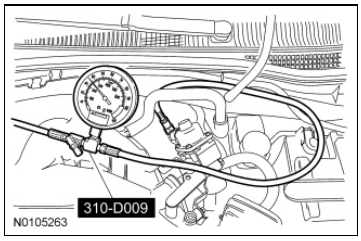
   Connect the FP control module electrical connector.



6. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Early build 3.0L engine

7. Remove the fuel rail Schrader valve cap.



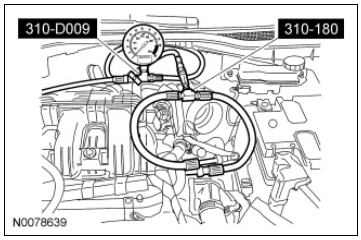
8. Install the Fuel Pressure Test Kit to the fuel rail Schrader valve.

Late build 3.0L engine

9. Disconnect the fuel jumper tube-to-fuel tube quick connect coupling. For additional information, refer to Quick Connect Coupling in this section.

10. Install the Fuel Pressure Test Kit between the fuel jumper tube and the fuel tube.

3.5L engine



11. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

12. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

13. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12C .

14. Disconnect the fuel tube-to-fuel rail spring lock coupling. For additional information, refer to Spring Lock Couplings in this section.

15. Install the Fuel Pressure Test Adapter and Fuel Pressure Test Kit between the fuel tube and the fuel rail.

16. **NOTE:** The ACL outlet pipe must be installed prior to completing the fuel system pressure test.

    Install the ACL outlet pipe. For additional information, refer to Section 303-12C .

17. **NOTE:** The Inertia Fuel Shutoff (IFS) switch was disconnected in the fuel system pressure release.

    Connect the IFS switch electrical connector.

18. Connect the battery ground cable. For additional information, refer to Section 414-01 .

All engines

19. **NOTE:** Carry out a Key ON Engine OFF (KOEO) visual inspection for fuel leaks prior to completing the fuel system pressure test.

    NOTE: After completion of the fuel system pressure test, open the drain valve on the Fuel Pressure Test Kit and release any residual fuel into a suitable container prior to removing the tool.

    Test the fuel system pressure to make sure it is within the specified range. For additional information, refer to Specifications in this section.

Fuel Tank Draining - 2.5L

Special Tool(s)

 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
 ST2803-A	Fuel Tank Sender Unit Wrench 310-123

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

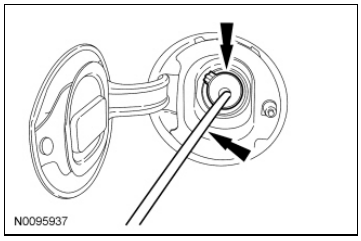
⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: For vehicles with an inaccurate or inoperable fuel gauge, follow the instructions for draining a fuel tank with more than three-fourths of a tank of fuel.

All vehicles



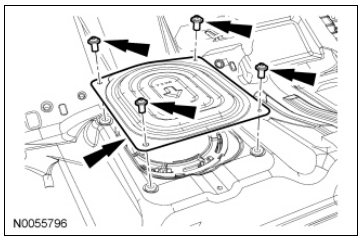
1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

Vehicles with more than three-fourths of a tank of fuel

3. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

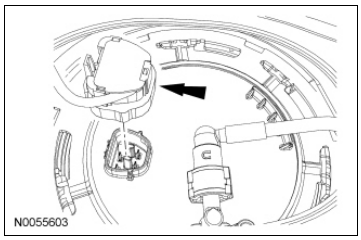
   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe until the tube enters the fuel tank.



4. **NOTE:** This step will remove approximately one-fourth tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump (FP) module mounting flange.

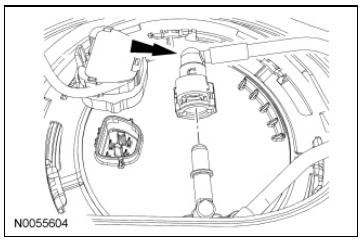
   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-fourth (approximately 4 gallons) of fuel from the tank.

All vehicles



5. Remove the rear seat lower cushion. For additional information, refer to Section 501-10 .

6. Remove the 4 screws and the FP module access cover.



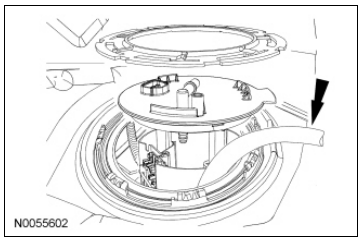
7. **NOTE:** Clean the FP module connections, couplings, flange surfaces and the immediate surrounding area of any dirt or foreign material.

   Disconnect the FP module electrical connector.

8. **NOTE:** Place absorbent toweling in the immediate surrounding area in case of fuel spillage.

   Disconnect the fuel tube-to- FP module quick connect coupling. For additional information, refer to Section 310-00 .

9. **NOTE:** Make sure to install a new FP module O-ring seal.



Install the Fuel Tank Sender Unit Wrench, remove the FP module lock ring.

- Discard the FP module O-ring seal.

10. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

    Position the FP module aside and insert the tube from the Fuel Storage Tanker into the FP module aperture and drain as much fuel from the fuel tank as possible.

Fuel Tank Draining - 3.0L Front Wheel Drive (FWD)

Special Tool(s)

 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
 ST2803-A	Fuel Tank Sender Unit Wrench 310-123

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

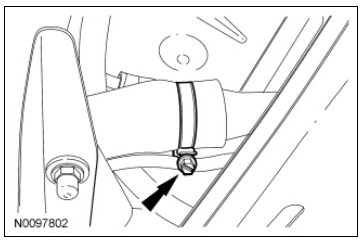
NOTE: For vehicles with an inaccurate or inoperable fuel gauge, follow the instructions for draining a fuel tank with more than three-fourths of a tank of fuel.

All vehicles

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

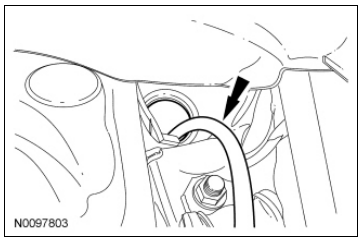
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

Vehicles with more than three-fourths of a tank of fuel



NOTE: The Easy Fuel ™ (capless) fuel tank filler pipe on 3.0L vehicles have an anti-siphon grate that will not allow a fuel drain tube to penetrate the fuel tank and requires the following steps to drain the fuel.

3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

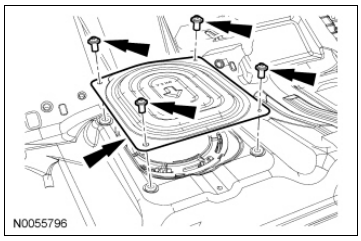


4. **NOTE:** Index-mark the fuel tank filler pipe hose and the clamp prior to removal for correct installation.

Release the clamp and disconnect the hose from the fuel tank filler pipe.

- To install, tighten to 4 Nm (35 lb-in).

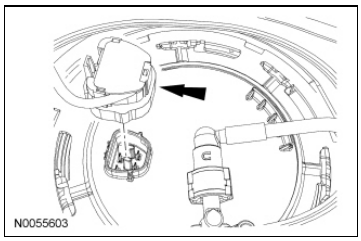
5. Insert a semi-rigid fuel drain tube into the fuel tank filler pipe hose until it enters the fuel tank.



6. **NOTE:** This step is to remove approximately one-fourth tank of the fuel from a completely full fuel tank, lowering the fuel level below the Fuel Pump (FP) module mounting flange.

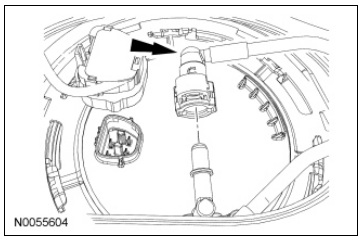
   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-fourth (approximately 4 gallons) of fuel from the tank.

All vehicles



7. Remove the rear seat lower cushion. For additional information, refer to Section 501-10 .

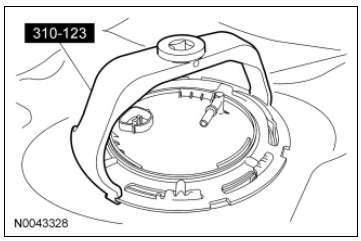
8. Remove the 4 screws and the FP module access cover.



9. **NOTE:** Clean the FP module connections, couplings, flange surfaces and the immediate surrounding area of any dirt or foreign material.

   Disconnect the FP module electrical connector.

10. **NOTE:** Place absorbent toweling in the immediate surrounding area in case of fuel spillage.



Disconnect the fuel tube-to- FP module quick connect coupling. For additional information, refer to Section 310-00 .

11. **NOTE:** Make sure to install a new FP module O-ring seal.

    Install the Fuel Tank Sender Unit Wrench and remove the FP module lock ring.

    - Discard the FP module O-ring seal.

12. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

    Position the FP module aside and insert the tube from the Fuel Storage Tanker into the FP module aperture and drain as much fuel from the fuel tank as possible.

Fuel Tank Draining - 3.0L All Wheel Drive (AWD)

Special Tool(s)

 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
 ST2803-A	Fuel Tank Sender Unit Wrench 310-123

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

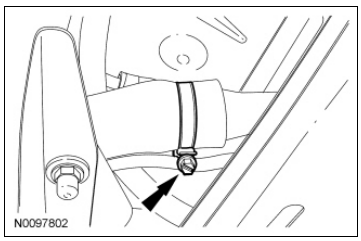
NOTE: For vehicles with an inaccurate or inoperable fuel gauge, follow the instructions for draining a fuel tank with more than one-half of a tank of fuel.

All vehicles

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

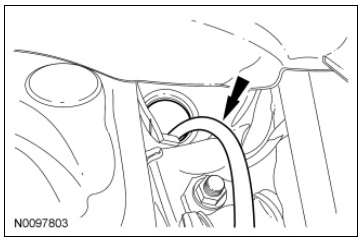
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

Vehicles with more than one-half of a tank of fuel



NOTE: The Easy Fuel ™ (capless) fuel tank filler pipe on 3.0L vehicles have an anti-siphon grate that will not allow a fuel drain tube to penetrate the fuel tank and requires the following steps to drain the fuel.

3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

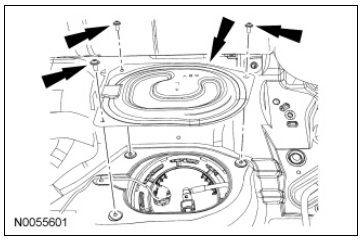


4. **NOTE:** Index-mark the fuel tank filler pipe hose and the clamp prior to removal for correct installation.

Release the clamp and disconnect the hose from the fuel tank filler pipe.

- To install, tighten to 4 Nm (35 lb-in).

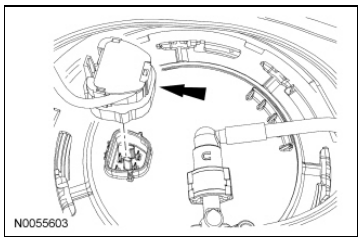
5. Insert a semi-rigid fuel drain tube into the fuel tank filler pipe hose until it enters the fuel tank.



6. **NOTE:** This step is to remove approximately one-half tank of the fuel from a completely full fuel tank, lowering the fuel level below the Fuel Pump (FP) module mounting flange.

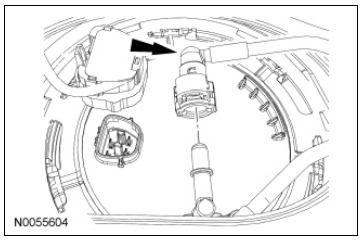
   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-half (approximately 9 gallons) of fuel from the tank.

All vehicles



7. Remove the rear seat lower cushion. For additional information, refer to Section 501-10 .

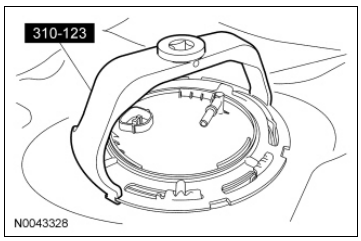
8. Remove the 3 screws and the FP module access cover.



9. **NOTE:** Clean the FP module connections, couplings, flange surfaces and the immediate surrounding area of any dirt or foreign material.

   Disconnect the FP module electrical connector.

10. **NOTE:** Place absorbent toweling in the immediate surrounding area in case of fuel spillage.

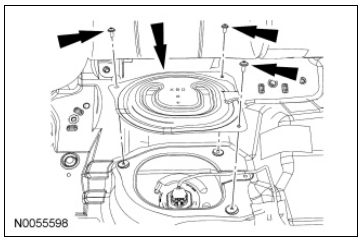


Disconnect the fuel tube-to- FP module quick connect coupling. For additional information, refer to Section 310-00 .

11. **NOTE:** Make sure to install a new FP module O-ring seal.

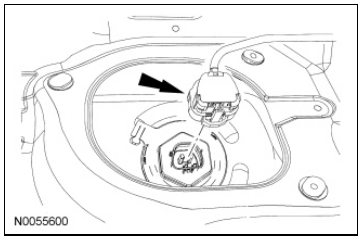
    Install the Fuel Tank Sender Unit Wrench and remove the FP module lock ring.

    - Discard the FP module O-ring seal.

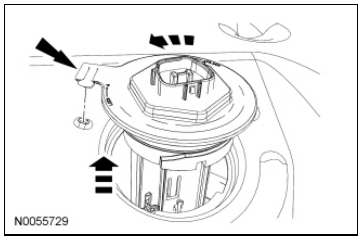


12. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

    Position the FP module aside and insert the tube from the Fuel Storage Tanker into the FP module aperture and drain as much fuel from the fuel tank as possible.

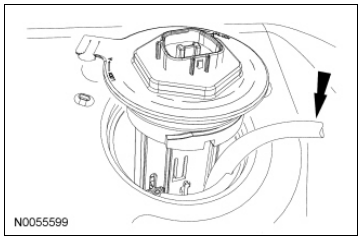


13. Remove the 3 screws and the fuel level sensor access cover.



14. **NOTE:** Clean the fuel level sensor electrical connector, flange surface and the immediate surrounding area of any dirt or foreign material.

    Disconnect the fuel level sensor electrical connector.



15. **NOTE:** Place absorbent toweling in the immediate surrounding area in case of fuel spillage.

    Release the lock tab and rotate the fuel level sensor counterclockwise approximately one-fourth turn, lift and position aside.

16. Insert the tube from the Fuel Storage Tanker into the fuel level sensor aperture and drain the remainder of the fuel from the fuel tank.

Fuel Tank Draining - 3.5L

Special Tool(s)

 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
 ST2803-A	Fuel Tank Sender Unit Wrench 310-123

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

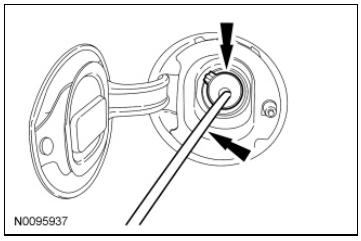
⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: For (Front Wheel Drive (FWD)) vehicles with an inaccurate or inoperable fuel gauge, follow the instructions for draining a fuel tank with more than three-fourths of a tank of fuel.

NOTE: For (All-Wheel Drive (AWD)) vehicles with an inaccurate or inoperable fuel gauge, follow the instructions for draining a fuel tank with more than one-half of a tank of fuel.

All vehicles

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.



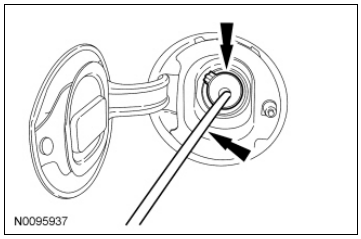
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the rear seat lower cushion. For additional information, refer to Section 501-10 .

Front Wheel Drive (FWD) vehicles with more than three-fourths tank of fuel

4. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe until the tube enters the fuel tank.



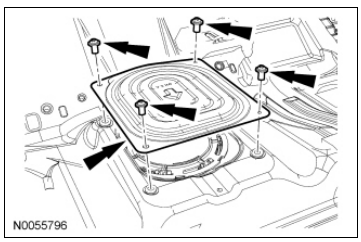
5. **NOTE:** This step will remove approximately one-fourth tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump (FP) module mounting flange.

   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-fourth (approximately 4 gallons) of fuel from the tank.

All-Wheel Drive (AWD) vehicles with more than one-half tank of fuel

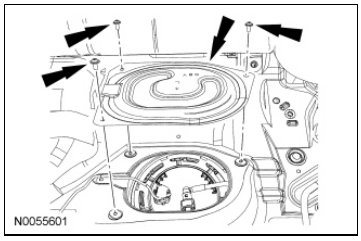
6. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe until the tube enters the fuel tank.



7. **NOTE:** This step is to remove approximately one-half tank of the fuel from a completely full fuel tank, lowering the fuel level below the FP module mounting flange.

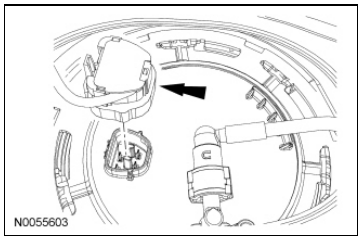
   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-half (approximately 9 gallons) of fuel from the tank.



FWD vehicles

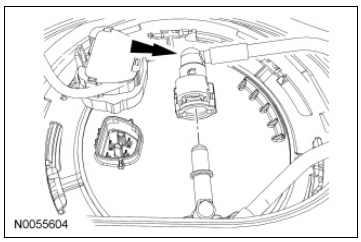
8. Remove the 4 screws and the FP module access cover.

AWD vehicles



9. Remove the 3 screws and the FP module access cover.

All vehicles



10. **NOTE:** Clean the FP module connections, couplings, flange surfaces and the immediate surrounding area of any dirt or foreign material.

    Disconnect the FP module electrical connector.

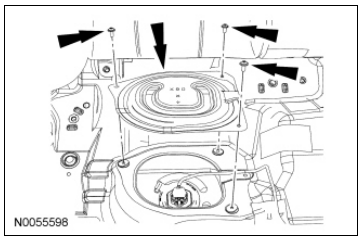
11. **NOTE:** Place absorbent toweling in the immediate surrounding area in case of fuel spillage.

    Disconnect the fuel tube-to- FP module quick connect coupling. For additional information, refer to Section 310-00 .

12. **NOTE:** Make sure to install a new FP module O-ring seal.

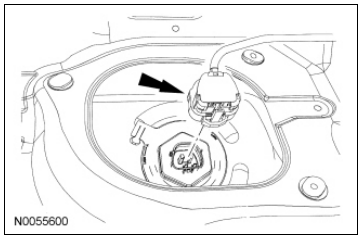
    Install the Fuel Tank Sender Unit Wrench, remove the FP module lock ring.

    - Discard the FP module O-ring seal.



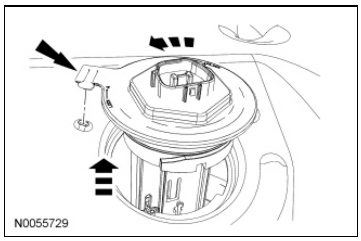
13. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

    Position the FP module aside and insert the tube from the fuel storage tanker into the FP module aperture and drain as much fuel from the fuel tank as possible.



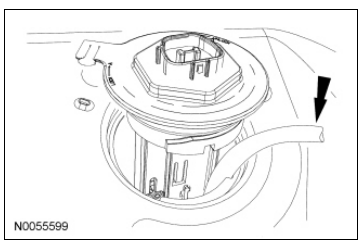
AWD vehicles

14. Remove the 3 screws and the fuel level sensor access cover.



15. **NOTE:** Clean the fuel level sensor electrical connector, flange surface and the immediate surrounding area of any dirt or foreign material.

    Disconnect the fuel level sensor electrical connector.



16. **NOTE:** Place absorbent toweling in the immediate surrounding area in case of fuel spillage.

    Release the lock tab and rotate the fuel level sensor counterclockwise approximately one-fourth turn, lift and position aside.

17. Insert the tube from the Fuel Storage Tanker into the fuel level sensor aperture and drain the remainder of the fuel from the fuel tank.

Quick Connect Coupling

Special Tool(s)

 ST2583-A	Disconnect Tool, Fuel Pipe (5/16") 310-040

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Disconnect - Type I

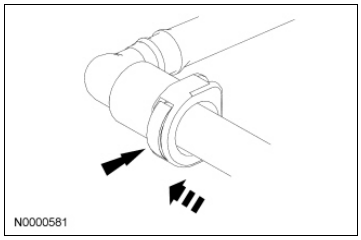
⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**

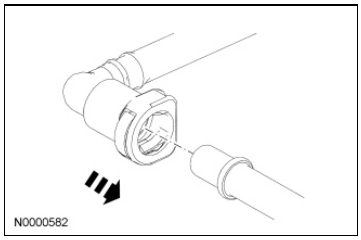


NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

NOTICE: **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



3. Depress the locking tab and release the quick connect coupling from the tube.

Connect - Type I

1. **NOTE:** Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

   Install the quick connect coupling onto the tube until it is fully seated.

2. Connect the battery ground cable. For additional information, refer to Section 414-01 .

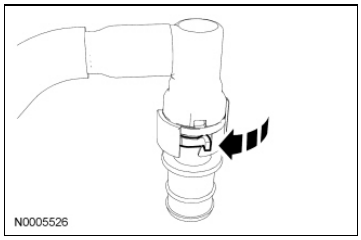
Disconnect - Type II

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near auel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

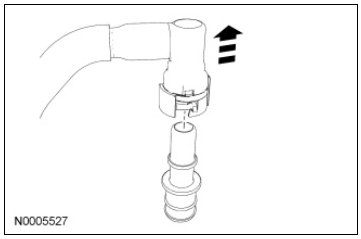
⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**

NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

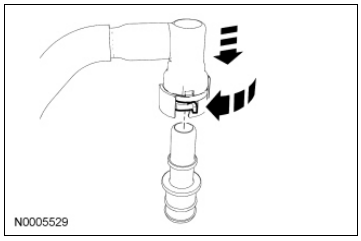


NOTICE: **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

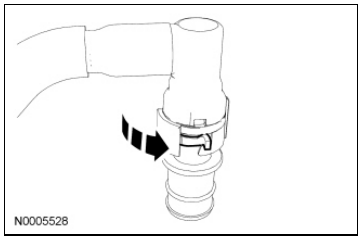
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Release the lock tab on the quick connect coupling.

3. Separate the quick connect coupling from the fitting.



Connect - Type II



1. **NOTE:** Apply clean engine oil to the O-ring seals.

   NOTE: Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

   Release the lock tab and install the quick connect coupling onto the fitting.

2. Apply the lock tab into the latched position.

3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect - Type III

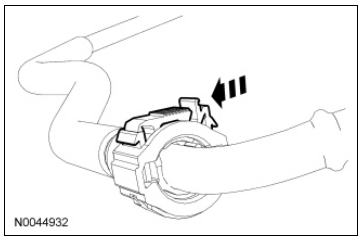
⚠

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

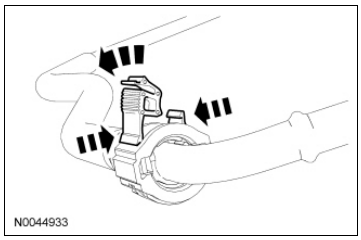
⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**



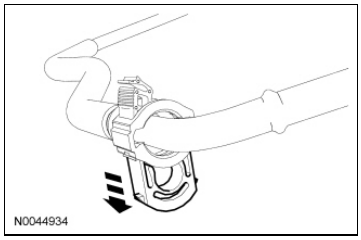
NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

NOTICE: **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**

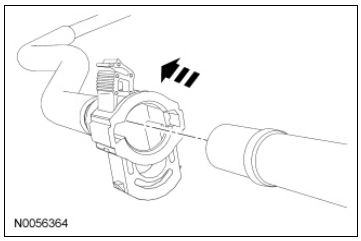


1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

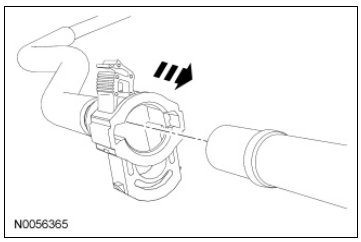


3. Release the quick connect coupling lock tab.

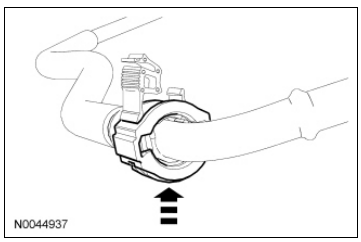


4. Rotate the primary locking tab to the fully opened position and squeeze the secondary locking tabs to release the locking mechanism.

5. Push the locking mechanism outward and release the tube.



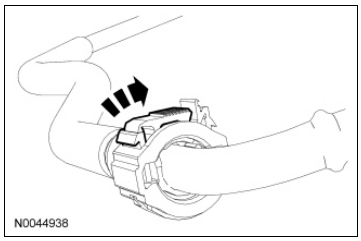
6. Remove the quick connect coupling from the tube.



Connect - Type III

1. **NOTE:** Apply clean engine oil to the O-ring seals.

   Install the quick connect coupling onto the tube until it is fully seated.



2. Depress the retainer clip until it is flush with the quick connect coupler housing and is fully seated on the tube.

3. **NOTE:** Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

   Rotate the primary locking tab on the retainer clip to the closed position.

4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect - Type IV

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**

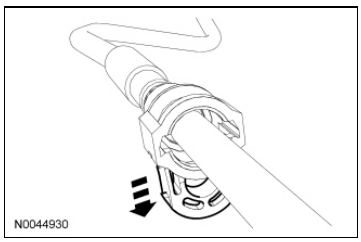
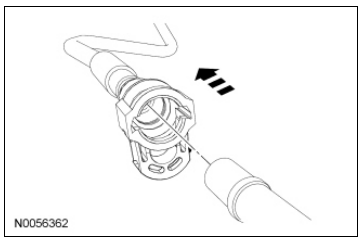
NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

NOTICE: **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**



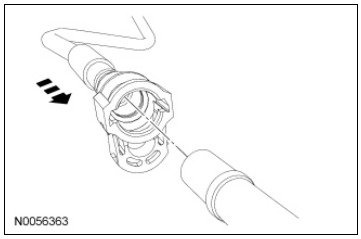
1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

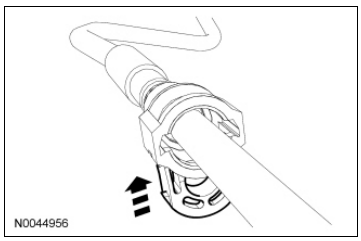


3. Squeeze the quick connect coupling retainer clip tabs to release the locking mechanism.

4. Push the locking mechanism outward to release the tube.



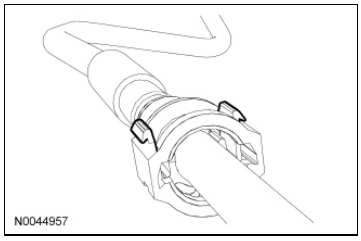
5. Remove the quick connect coupling from the tube.



Connect - Type IV

1. **NOTE:** Apply clean engine oil to the O-ring seals.

   Install the quick connect coupling onto the tube.



2. Depress the quick connect coupling locking mechanism into the locked position.

3. **NOTE:** Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

   Visually inspect and verify that the locking mechanism is flush with the quick connect coupling housing and that the tabs are locked in place.

4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect - Type V

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

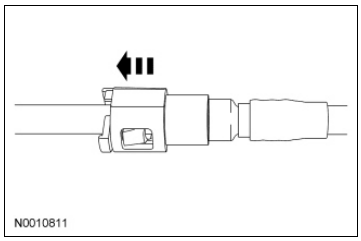
1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Install the Fuel Pipe Disconnect Tool on the tube and push into the quick connect coupling locking clip to release.



4. Remove the quick connect coupling from the tube.

Connect - Type V

1. **NOTE:** Apply ean engine oil to the O-ring seals.

   NOTE: Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

   Install the quick connect coupling onto the tube until it is fully seated.

2. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect - Type VI

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry persal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**

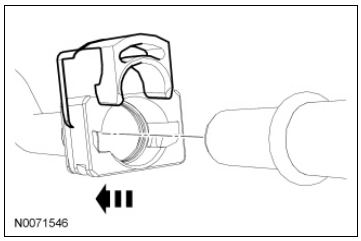
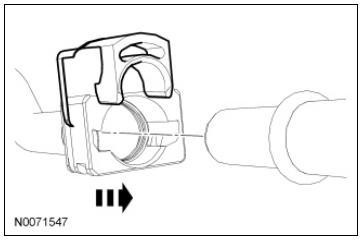
NOTICE: **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**



1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

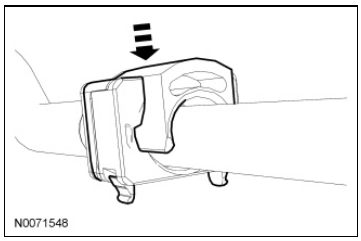
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Depress the legs of the retainer clip and position the clip in an outward position.



4. Disconnect the quick connect coupling from the tube.

Connect - Type VI



1. **NOTE:** Apply clean engine oil to the end of the tube and quick connect coupling O-ring seals.

   Install the quick connect coupling onto the tube until fully seated.

2. **NOTE:** Make sure the retainer clip is fully seated and locked onto the tube by pulling on the quick connect coupling.

   Press the retainer clip into the quick connect coupling body until flush and the legs are locked in place.

3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Disconnect - Type VII

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be

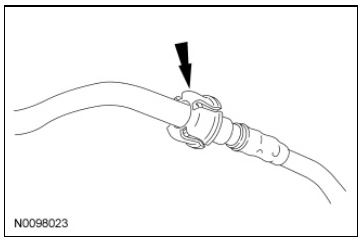
ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

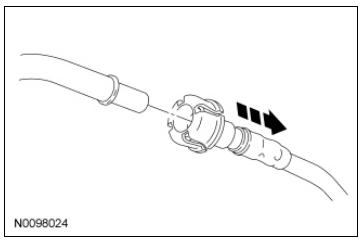
⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**



NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**

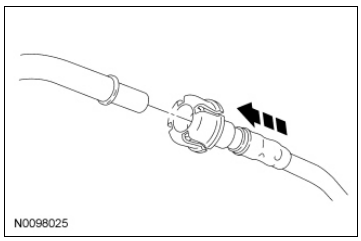
NOTICE: **Do not use any tools. The use of tools may cause a deformity in the clip components which may cause fuel leaks.**



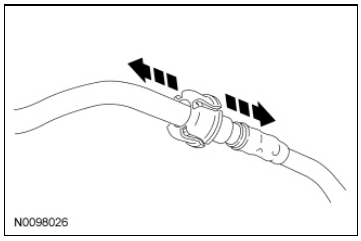
1. If servicing a liquid fuel tube quick connect coupling, release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Push the tube into the quick connect coupling and depress the release mechanism.



4. Disconnect the quick connect coupling from the tube.



Connect - Type VII

1. **NOTE:** Apply clean engine oil to the end of the tube and quick connect coupling O-ring seals.

   Install the quick connect coupling onto the tube until fully seated.

2. Pull the tube and the coupling in separate directions to ensure the quick connect coupling is secured on the tube.

3. Connect the battery ground cable. For additiol information, refer to Section 414-01 .

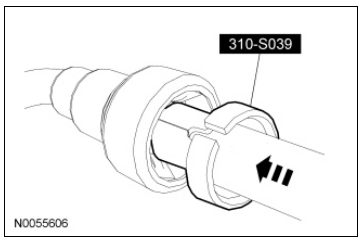
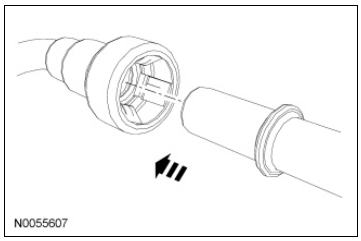
Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



NOTICE: **When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube or damage to the tube or connector retaining clip can occur. Apply clean engine oil to the end of the tube before inserting the tube into the connector.**

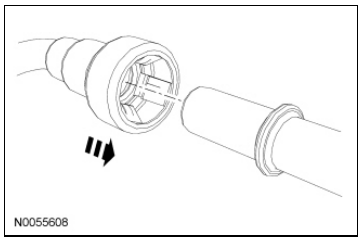
NOTICE: **Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is essential that absolute cleanliness is observed when working with these components or component damage can occur. Always install plugs to any open orifices or tubes.**



1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Install the Spring Lock Coupling Disconnect Tool on the tube and push into the spring lock coupling to release.



4. Separate the spring lock coupling from the tube.

Connect

1. **NOTE:** Lubricate the fuel tube with clean engine oil.

   Align and push the spring lock coupling onto the tube until a click is heard.

2. Pull on the coupling to make sure it is fully engaged.

3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Lower crossover support brace nuts	76	56	-

Fuel Tank and Lines

Fuel System

The fuel system consists of:

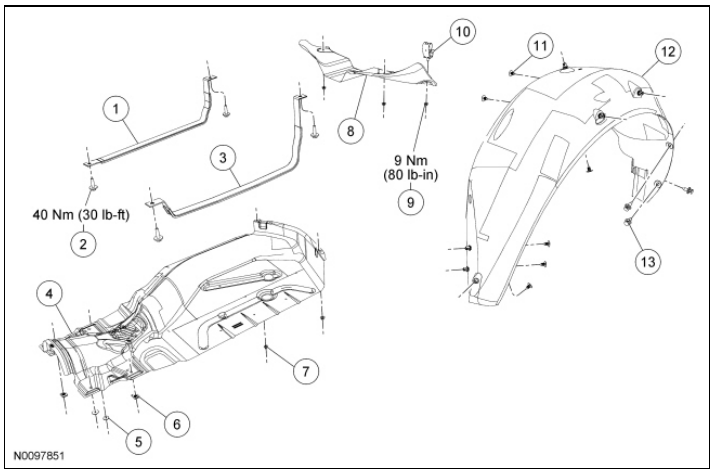
- a single-speed Mechanical Returnless Fuel System (MRFS) (3.5L vehicles).
- a 2-speed MRFS (2.5L and 3.0L vehicles).
- an All-Wheel Drive (AWD) saddle-type or Front Wheel Drive (FWD) L-shaped fuel tank.
- an Easy Fuel ™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way.
- a Fuel Pump (FP) module containing:
    - ♦ an electric FP , which provides pressurized fuel to the fuel rail.
    - ♦ a serviceable fuel level sender.
    - ♦ a check valve, which maintains system pressure after the FP is shut off.
    - ♦ a pressure relief valve for overpressure protection in the event of restricted fuel flow.
    - ♦ a lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.
- fuel, vapor and brake tubes in an integrated bundle assembly attached to the underside of the vehicle by retaining clips.
- has a supplemental refueling adapter located in the luggage compartment.
- an Inertia Fuel Shutoff (IFS) switch (3.5L vehicles).
- a FP control module (2.5L and 3.0L vehicles).
- an individual fuel level sensor, AWD vehicles only.

Fuel System Shutoff Feature

2.5L and 3.0L vehicles

In event of a moderate to severe collision, the vehicle is equipped with a FP shutoff feature that is initiated by the event notification signal. The event notification signal is provided by the Restraints Control Module (RCM) to the FP control module. Signal communication between the RCM and the FP control module allows the PCM to shutoff the FP module. Should the vehicle shut off after a collision due to this feature, restart the vehicle by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances, the vehicle may not restart the first time and may take an additional attempt.

3.5L vehicles

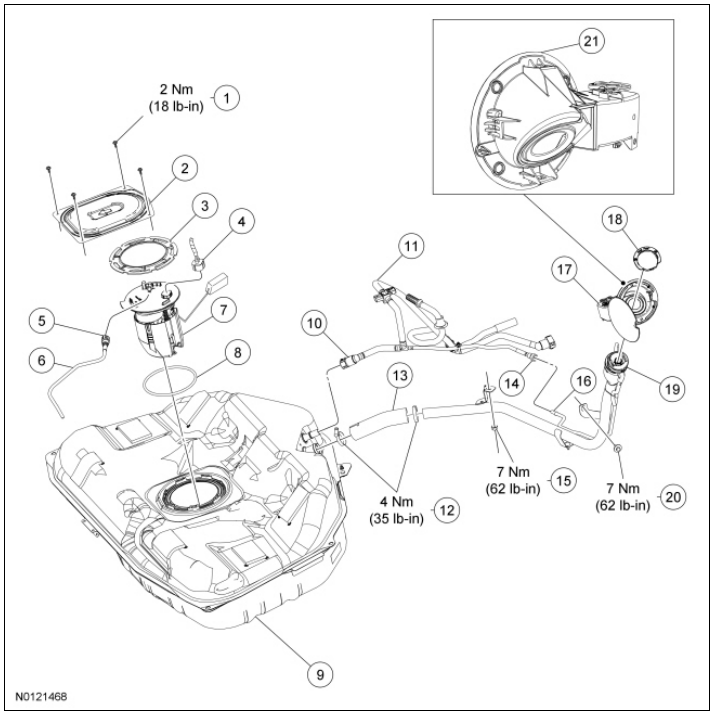


The FP module is controlled by the PCM. Electrical power to the FP module is provided through the IFS switch that will de-energize the fuel delivery secondary circuit in the event of a moderate to severe collision. The IFS switch is a safety device, located under the RH front door scuff plate. Should the vehicle shutoff after a collision due to this feature, restart the vehicle by first turning the ignition OFF, push the reset button on the IFS switch, then turn the ignition to the ON position.

Fuel Tank and Lines

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Fuel Tank and Filler Pipe - Exploded View



Fuel Tank Supports and Shields (Front Wheel Drive (FWD) Vehicles)

1. For additional information, refer to the procedures in this section.

Fuel Tank - Front Wheel Drive (FWD)

Special Tool(s)

 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the fuel tank. For additional information, refer to Section 310-00 .

3. Remove the muffler and tailpipe. For additional information, refer to Section 309-00 .

4. **NOTE:** Some residual fuel may remain in the fuel tank filler pipe after draining the fuel tank. Carefully drain any remaining fuel into a suitable container.

   Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.

   - To install, tighten to 4 Nm (35 lb-in).

5. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to Section 310-00 .

6. Remove the 4 nuts, 2 clips and release the heat shield from the fuel tank.

7. Install the Powertrain Lift under the fuel tank.

8. Remove the 4 bolts and the 2 fuel tank straps.
    - To install, tighten to 40 Nm (30 lb-ft).

9. Carefully lower and remove the fuel tank from the vehicle.

10. To install, reverse the removal procedure.

Fuel Tank - All Wheel Drive (AWD)

Special Tool(s)

 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. 1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the fuel tank. For additional information, refer to Section 310-00 .

3. Remove the muffler and tailpipe. For additional information, refer to Section 309-00 .

4. Remove the driveshaft. For additional information, refer to Section 205-01 .

5. Install the Powertrain Lift under the fuel tank.

6. Remove the 4 bolts and the 2 fuel tank straps.
   - To install, tighten to 40 Nm (30 lb-ft).

7. Partially lower the fuel tank enough to access the fuel tank filler pipe hose clamp.

8. **NOTE:** Some residual fuel may remain in the fuel tank filler pipe after draining the fuel tank. Carefully drain any remaining fuel into a suitable container.

   Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.

   - To install, tighten to 4 Nm (35 lb-in).

9. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to Section 310-00 .

10. Carefully lower and remove the fuel tank from the vehicle.

11. To install, reverse the removal procedure.

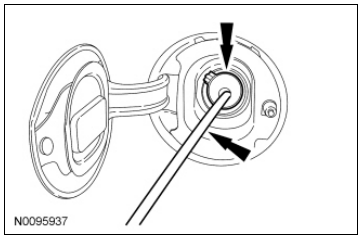
Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. If the vehicle is equipped with a dual exhaust system, remove the muffler and tailpipe. For additional information, refer to Section 309-00 .

4. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe.

N0095937

5. Attach the Fuel Storage Tanker to the fuel drain tube and remove any residual fuel in the fuel tank filler pipe.

6. Remove the LR wheel and tire. For additional information, refer to Section 204-04 .

7. Remove the 3 rivets, 6 pin-type retainers and the LR splash shield.

8. Remove the 3 nuts and the fuel tank filler pipe heat shield.
   - To install, tighten to 9 Nm (80 lb-in).

9. Remove the fuel tank filler pipe bolt and nut.
   - To install, tighten to 7 Nm (62 lb-in).

10. Disconnect the fuel vapor tube assembly-to-fuel tank filler pipe recirculation tube quick connect coupling. For additional information, refer to Section 310-00 .

11. Remove the information bezel.

12. Release the 3 retainers and remove the fuel tank filler pipe housing.

13. **NOTE:** Some fuel may remain in the fuel tank filler pipe after the initial drain. Carefully drain any residual fuel into a suitable container.

    Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.

    - To install, tighten to 4 Nm (35 lb-in).

14. **NOTE:** The fuel tank filler pipe assembly has to be directed upward and partially out of the fuel door opening, then it can be lowered and removed from the vehicle.

    Remove the fuel tank filler pipe assembly from the vehicle.

15. To install, reverse the removal procedure.

Fuel Tank Filler Pipe - All Wheel Drive (AWD)

Special Tool(s)

 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent

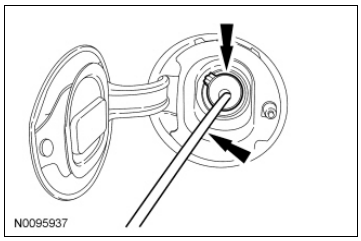
Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARN Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the muffler and tailpipe. For additional information, refer to Section 309-00 .

4. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe.

N0095937

5. Attach the Fuel Storage Tanker to the fuel drain tube and remove any residual fuel in the fuel tank filler pipe.

6. Remove the LR wheel and tire. For additional information, refer to Section 204-04 .

7. Remove the 3 rivets, 6 pin-type retainers and the LR splash shield.

8. Remove the 3 nuts and the fuel tank filler pipe heat shield.
   - To install, tighten to 9 Nm (80 lb-in).

9. Remove the fuel tank filler pipe bolt and nut.
   - To install, tighten to 7 Nm (62 lb-in).

10. Disconnect the fuel vapor tube assembly-to-fuel tank filler pipe recirculation tube quick connect coupling. For additional information, refer to Section 310-00 .

11. Remove the information bezel.

12. Release the 3 retainers and remove the fuel tank filler pipe housing.

13. Install the Powertrain Lift under the fuel tank.

14. Remove the 4 bolts and the 2 fuel tank straps.
   - To install, tighten to 40 Nm (30 lb-ft).

15. Partially lower the fuel tank enough to access the fuel tank filler pipe hose clamp.

16. **NOTE:** Some residual fuel may remain in the fuel tank filler pipe after draining the fuel tank. Carefully drain any remaining fuel into a suitable container.

    Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.

    - To install, tighten to 4 Nm (35 lb-in).

17. **NOTE:** The fuel tank filler pipe assembly has to be directed upward and partially out of the fuel door opening, then it can be lowered and removed from the vehicle.

    Remove the fuel tank filler pipe assembly from the vehicle.

18. To install, reverse the removal procedure.

Fuel Pump Module - Front Wheel Drive (FWD)

Special Tool(s)

 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
 ST2803-A	Fuel Tank Sender Unit Wrench 310-123

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow tnstructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

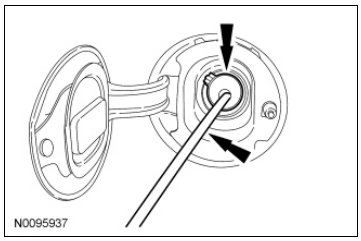
⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles with an inaccurate or inoperable fuel gauge, follow the instructions for draining a fuel tank with more than three-fourths of a tank of fuel.

All vehicles

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .



2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the rear seat lower cushion. For additional information, refer to Section 501-10 .

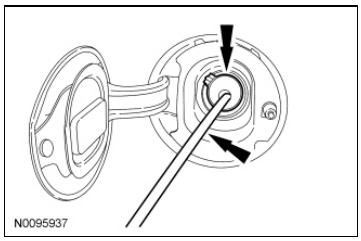
2.5L and 3.5L vehicles with more than three-fourths of a tank of fuel

4. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

5. **NOTE:** This step is to remove approximately one-fourth tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump (FP) module mounting flange.

   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-fourth (approximately 4 gallons) of fuel from the tank.



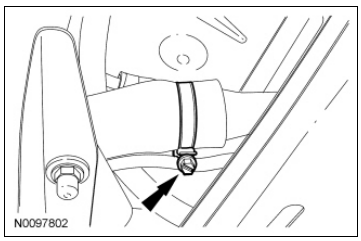
3.0L vehicles with more than three-fourths of a tank of fuel

NOTE: The Easy Fuel ™ (capless) fuel tank filler pipe on 3.0L vehicles have an anti-siphon grate that will not allow a fuel drain tube to penetrate the fuel tank and requires the following steps to drain the fuel.

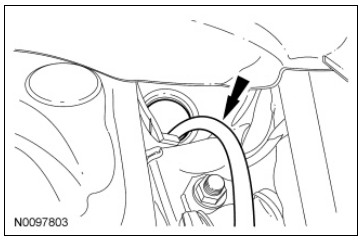
6. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

7. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe.



8. Attach the Fuel Storage Tanker to the fuel drain tube and remove any residual fuel in the fuel tank filler pipe.



9. **NOTE:** Index-mark the fuel tank filler pipe hose and the clamp prior to removal for correct installation.

   Release the clamp and disconnect the hose from the fuel tank filler pipe.

- To install, tighten to 4 Nm (35 lb-in).

10. Insert a semi-rigid fuel drain tube into the fuel tank filler pipe hose until it enters the fuel tank.

11. **NOTE:** This step is to remove approximately one-fourth tank of the fuel from a completely full fuel tank, lowering the fuel level below the FP module mounting flange.

    Attach the Fuel Storage Tanker to the fuel drain tube and remove one-fourth (approximately 4 gallons) of fuel from the tank.

All vehicles

12. Remove the 4 screws and the FP module access cover.
    - To install, tighten to 2 Nm (18 lb-in).

13. **NOTE:** Clean the FP module connections, couplings, flange surfaces and the immediate surrounding area of any dirt or foreign material.

    Disconnect the FP module electrical connector.

14. Disconnect the fuel tube-to- FP module quick connect coupling. For additional information, refer to Section 310-00 .

15. **NOTE:** Place absorbent pads on the floor pan in the immediate area in case of fuel spills. Carefully remove the FP module from the vehicle to avoid fuel spillage inside the vehicle.

    NOTE: Make sure to install a new FP module O-ring seal.

    Install the Fuel Tank Sender Unit Wrench and remove the FP module lock ring.

16. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

NOTE: The FP module will have residual fuel remaining internally, drain into a suitable container.

Carefully remove the FP module from the fuel tank.

17. ***NOTICE:*** **Inspect the mating surfaces of the Fuel Pump (FP) module flange and the fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new FP module or fuel tank if the O-ring seal contact area is bent, scratched or corroded.**

    NOTE: To install, apply clean engine oil to the new O-ring seal.

    Remove and discard the FP module O-ring seal.

18. To install, reverse the removal procedure.
    - Make sure the alignment tab on the FP module and the fuel tank meet before tightening the FP module lock ring.

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow theseuctions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

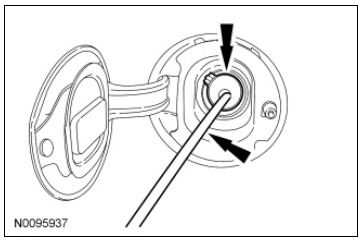
⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: Vehicles with an inaccurate or inoperable fuel gauge, follow the instructions for draining a fuel tank with more than one-half of a tank of fuel.

All vehicles

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .



2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the rear seat lower cushion. For additional information, refer to Section 501-10 .

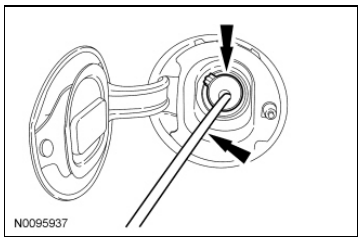
2.5L and 3.5L vehicles with more than one-half of a tank of fuel

4. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

5. **NOTE:** This step is to remove approximately one-half tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump (FP) module mounting flange.

   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-half (approximately 8 gallons) of fuel from the tank.



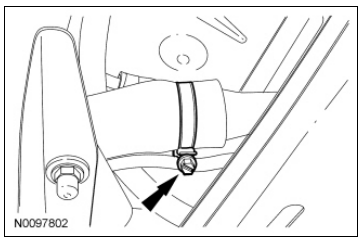
3.0L vehicles with more than one-half of a tank of fuel

NOTE: The Easy Fuel ™ (capless) fuel tank filler pipe on 3.0L vehicles have an anti-siphon grate that will not allow a fuel drain tube to penetrate the fuel tank and requires the following steps to drain the fuel.

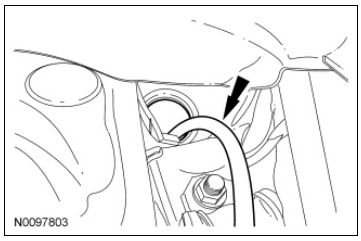
6. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

7. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe.



8. Attach the Fuel Storage Tanker to the fuel drain tube and remove any residual fuel in the fuel tank filler pipe.



9. **NOTE:** Index-mark the fuel tank filler pipe hose and the clamp prior to removal for correct installation.

   Release the clamp and disconnect the hose from the fuel tank filler pipe.

- To install, tighten to 4 Nm (35 lb-in).

10. Insert a semi-rigid fuel drain tube into the fuel tank filler pipe hose until it enters the fuel tank.

11. **NOTE:** This step is to remove approximately one-half tank of the fuel from a completely full fuel tank, lowering the fuel level below the FP module mounting flange.

    Attach the Fuel Storage Tanker to the fuel drain tube and remove one-half (approximately 8 gallons) of fuel from the tank.

All vehicles

12. Remove the 3 screws and the FP module access cover.
    - To install, tighten to 2 Nm (18 lb-in).

13. **NOTE:** Clean the FP module connections, couplings, flange surfaces and the immediate surrounding area of any dirt or foreign material.

    Disconnect the FP module electrical connector.

14. Disconnect the fuel tube-to- FP module quick connect coupling. For additional information, refer to Section 310-00 .

15. **NOTE:** Place absorbent pads on the floor pan in the immediate area in case of fuel spills. Carefully remove the FP module from the vehicle to avoid fuel spillage inside the vehicle.

    NOTE: Make sure to install a new FP module O-ring seal.

    Install the Fuel Tank Sender Unit Wrench and remove the FP module lock ring.

16. Carefully lift the FP module out of the fuel tank enough to access and release the internal fuel tube-to-FP module quick connect coupling. For additional information, refer to Section 310-00 .

17. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

    NOTE: The FP module will have residual fuel remaining internally, drain into a suitable container.

    Carefully remove the FP module from the fuel tank.

18. ***NOTICE:*** **Inspect the mating surfaces of the Fuel Pump (FP) module flange and the fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new FP module or fuel tank if the O-ring seal contact area is bent, scratched or corroded.**

    NOTE: To install, apply clean engine oil to the new O-ring seal.

    Remove and discard the FP module O-ring seal.

19. To install, reverse the removal procedure.
    - Make sure the alignment tab on the FP module and the fuel tank meet before tightening the FP module lock ring.

Fuel Level Sensor

Special Tool(s)

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal inry.

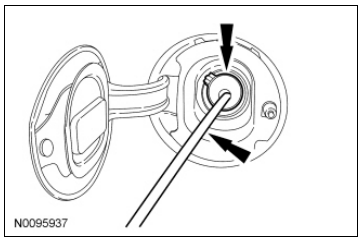
⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

NOTE: Only All-Wheel Drive (AWD) vehicles are equipped with a fuel level sensor (sub-side module) in the RH side of the saddle-type tank.

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the rear seat lower cushion. For additional information, refer to Section 501-10 .



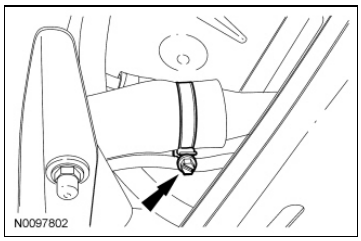
3.0L vehicles with more than one-half of a tank of fuel

NOTE: The Easy Fuel ™ (capless) fuel tank filler pipe on 3.0L vehicles have an anti-siphon grate that will not allow a fuel drain tube to penetrate the fuel tank and requires the following steps to drain the fuel.

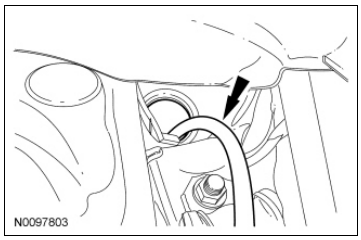
3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

4. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe.



5. Attach the Fuel Storage Tanker to the fuel drain tube and remove any residual fuel in the fuel tank filler pipe.

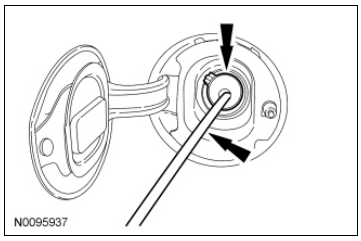


6. **NOTE:** Index-mark the fuel tank filler pipe hose and the clamp prior to removal for correct installation.

   Release the clamp and disconnect the hose from the fuel tank filler pipe.

   - To install, tighten to 4 Nm (35 lb-in).

7. Insert a semi-rigid fuel drain tube into the fuel tank filler pipe hose until it enters the fuel tank.



8. **NOTE:** This step is to remove approximately one-half tank of the fuel from a completely full fuel tank, lowering the fuel level below the fuel level sensor mounting flange.

   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-half (approximately 8 gallons) of fuel from the tank.

3.5L vehicles with more than one-half of a tank of fuel

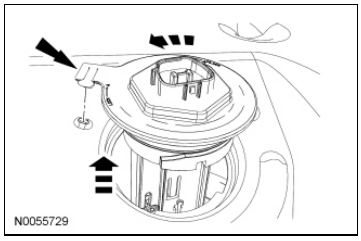
9. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

10. **NOTE:** This step is to remove approximately one-half tank of the fuel from a completely full fuel tank, lowering the fuel level below the fuel level sensor mounting flange.

    Attach the Fuel Storage Tanker to the fuel drain tube and remove one-half (approximately 8 gallons) of fuel from the tank.

All vehicles



11. Remove the 3 screws and the fuel level sensor access cover.
    - To install, tighten to 2 Nm (18 lb-in).

12. **NOTE:** Clean the fuel level sensor connections, flange surfaces and the immediate surrounding area of any dirt or foreign material.

    Disconnect the fuel level sensor electrical connector.

13. **NOTE:** Place absorbent pads in the general work area in case of fuel spillage.

    Release the lock tab, rotate the fuel level sensor counterclockwise approximately one-fourth turn and lift upward.

14. ***NOTICE:*** **Inspect the mating surfaces of the fuel level sensor flange and the fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new fuel level sensor or fuel tank if the O-ring seal contact area is bent, scratched or corroded.**

    NOTICE: **The fuel level sensor must be handled carefully to avoid damage to the float arm.**

    NOTE: Carefully remove the fuel level sensor from the fuel tank to avoid fuel spillage inside the vehicle.

    Carefully lift and remove the fuel level sensor from the fuel tank.

15. To install, reverse the removal procedure.
    - Make sure the fuel level sensor locking tab is correctly positioned.

Fuel Level Sender

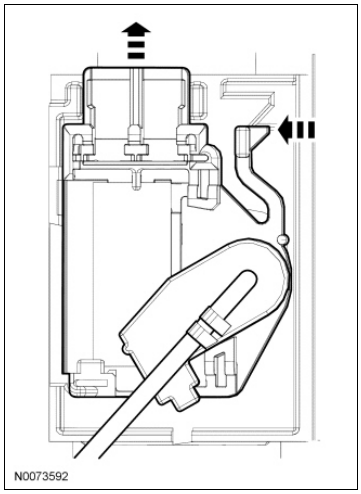
Item	Part Number	Description
1	9H307	Fuel Pump (FP) module
2	9A299	Fuel level sender
3	-	Fuel level sender electrical connector (part of 9A299)

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

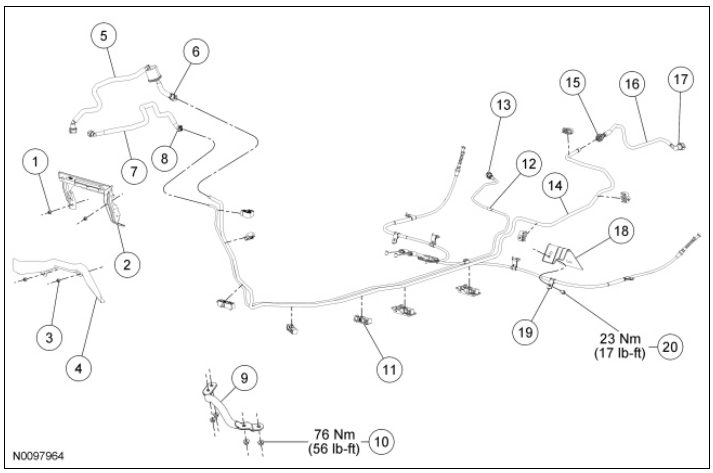


⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: The fuel level sender is serviced as part of a kit (9A299).

1. Remove the Fuel Pump (FP) module. For additional information, refer to Fuel Pump Module - Front Wheel Drive (FWD) or Fuel Pump Module - All Wheel Drive (AWD) in this section.

2. Disconnect the fuel level sender electrical connector.



3. Depress the lock tab and slide the fuel level sender upwards and remove.

4. To install, reverse the removal edure.

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the fuel system pressure. For additional information, refer to Section 310-00 .

3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3.5L vehicles

4. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12C .

5. **NOTE:** The lower cowl panel must be removed to access the fuel and vapor tube quick connect couplings.

   Remove the lower cowl panel. For additional information, refer to the Cowl Panel Grille procedure in Section 501-02 .

All vehicles

6. Remove the 4 nuts and the 2 heat shields.

7. **NOTE:** Some residual fuel may remain in the fuel tubes after releasing the fuel system pressure. When disconnecting or removing any fuel tubes, carefully drain any residual fuel into a suitable container.

Disconnect the fuel jumper tube-to-fuel tube quick connect coupling. For additional information, refer to Section 310-00 .

8. Disconnect the vapor jumper tube-to-vapor tube quick connect coupling. For additional information, refer to Section 310-00 .

9. Remove the 4 nuts and the lower crossover support brace.
    - To install, tighten to 76 Nm (56 lb-ft).

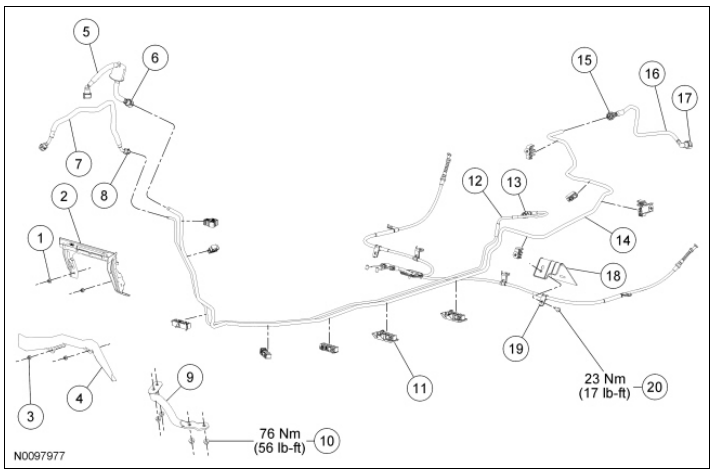
10. Remove the fuel tank. For additional information, refer to Fuel Tank - Front Wheel Drive (FWD) in this section.

11. **NOTE:** The LR parking brake cable bolt also retains a stone shield. Position the cable and shield aside.

    Remove the bolt and position the LR parking brake cable assembly aside.

    - To install, tighten to 23 Nm (17 lb-ft).

12. Disconnect the vapor jumper tube-to-vapor tube quick connect coupling. For additional information, refer to Section 310-00 .



13. Release the 9 fuel tube bundle retaining clips and remove the fuel and vapor tubes.

14. Disconnect the vapor jumper tube-to-Evaporative Emission (EVAP) canister quick connect coupling and remove the vapor jumper tube. For additional information, refer to Section 310-00 .

15. To install, reverse the removal procedure.

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electres such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the fuel system pressure. For additional information, refer to Section 310-00 .

3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3.5L vehicles

4. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12C .

5. **NOTE:** The lower cowl panel must be removed to access the fuel and vapor tube quick connect couplings.

   Remove the lower cowl panel. For additional information, refer to the Cowl Panel Grille procedure in Section 501-02 .

All vehicles

6. Remove the 4 nuts and the 2 heat shields.

7. **NOTE:** Some residual fuel may remain in the fuel tubes after releasing the fuel system pressure. When disconnecting or removing any fuel tubes, carefully drain any residual fuel into a suitable container.

   Disconnect the fuel jumper tube-to-fuel tube quick connect coupling. For additional information, refer to Section 310-00 .

8. Disconnect the vapor jumper tube-to-vapor tube quick connect coupling. For additional information, refer to Section 310-00 .

9. Remove the 4 nuts and the lower crossover support brace.
    - To install, tighten to 76 Nm (56 lb-ft).

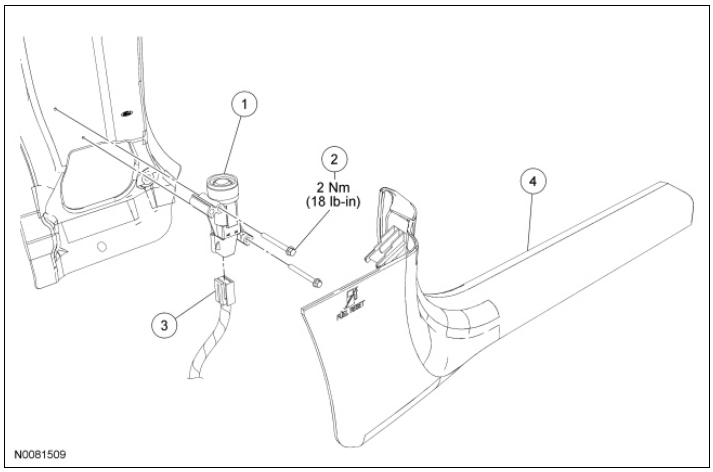
10. Remove the fuel tank. For additional information, refer to Fuel Tank - All Wheel Drive (AWD) in this section.

11. **NOTE:** The LR parking brake cable bolt also retains a stone shield. Position the cable and shield aside.

    Remove the bolt and position the LR parking brake cable assembly aside.

    - To install, tighten to 23 Nm (17 lb-ft).

12. Disconnect the vapor jumper tube-to-vapor tube quick connect coupling. For additional information, refer to Section 310-00 .



13. Release the 9 fuel tube bundle retaining clips and remove the fuel and vapor tubes.

14. Disconnect the vapor jumper tube-to-Evaporative Emission (EVAP) canister quick connect coupling and remove the vapor jumper tube. For additional information, refer to Section 310-00 .

15. To install, reverse the removal procedure.

Inertia Fuel Shutoff (IFS) Switch - 3.5L

Item	Part Number	Description
1	9341	Inertia Fuel Shutoff (IFS) switch
2	W504148	IFS bolt (2 required)
3	14489A	IFS switch electrical connector
4	5413200	RH front door scuff plate

Removal and Installation

1. Remove the RH front door scuff plate.
2. Disconnect the Inertia Fuel Shutoff (IFS) switch electrical connector.
3. ***NOTICE:*** **Do not overtighten the fasteners or damage to the switch will occur.**

   Remove the 2 bolts and the IFS switch.

   - To install, tighten to 2 Nm (18 lb-in).
4. To install, reverse the removal procedure.

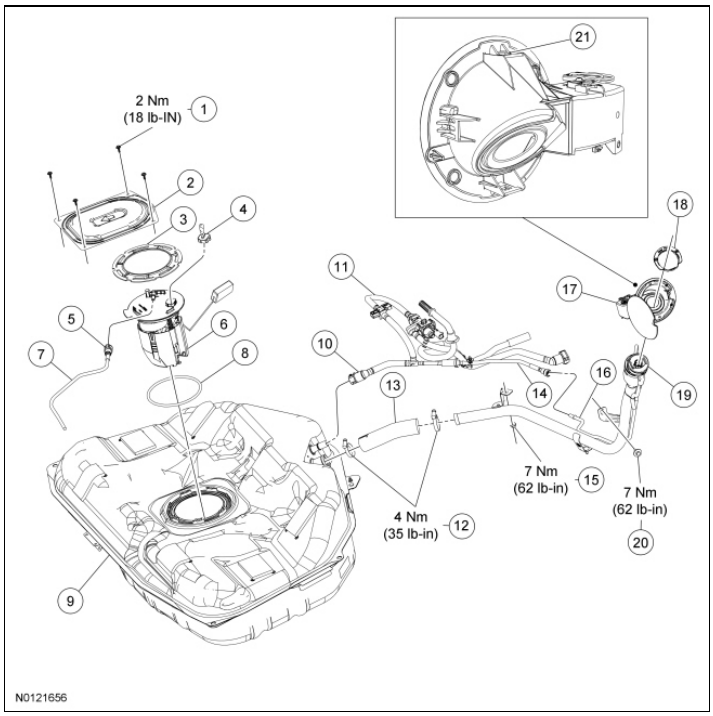
Fuel Tank and Lines

Fuel System

The fuel system consists of:

- a 2-speed Mechanical Returnless Fuel System (MRFS).
- a standard L-shaped fuel tank.
- an Easy Fuel ™ (capless) fuel tank filler pipe assembly, which cannot be modified in any way.
- a Fuel Pump (FP) module containing:
  - an electric FP , which provides pressurized fuel to the fuel rail.
  - a serviceable fuel level sender.
  - a check valve, which maintains system pressure after the FP is shut off.
  - a pressure relief valve for overpressure protection in the event of restricted fuel flow.
  - a lifetime fuel filter providing filtration to protect the fuel injectors from foreign material.
- fuel, vapor anake tubes in an integrated bundle assembly attached to the underside of the vehicle by retaining clips.
- has a supplemental refueling adapter located in the luggage compartment.
- a FP control module.

Fuel System Shutoff Feature

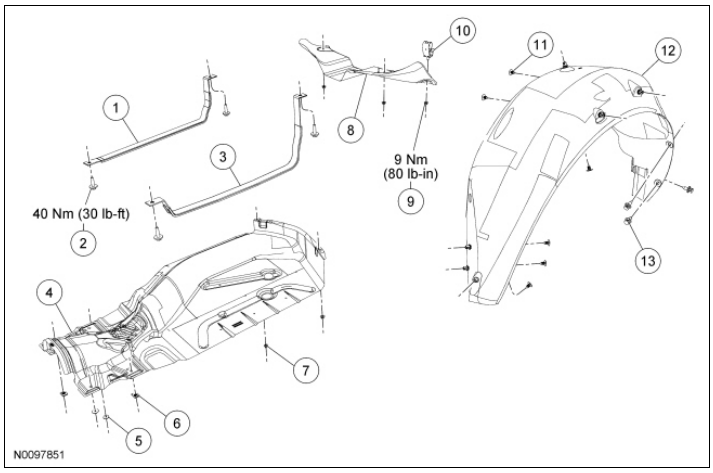


The vehicle is equipped with a FP shutoff feature that is initiated by theRestraints Control Module (RCM). The FP control module receives an event notification signal from the RCM to disable the FP . The event notification signal is sent on a dedicated circuit between the FP control module and the RCM . Should the vehicle shut-off after a collision due to this feature, restart the vehicle by first turning the ignition to the OFF position and then turn the ignition to the ON position. In some instances, the vehicle may not restart the first time and may take an additional attempt.

Fuel Tank and Lines

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Fuel Tank and Filler Pipe - Exploded View



Fuel Tank and Filler Pipe

Item	Part Number	Description
1	W807011	Fuel Pump (FP) module access cover screw (4 required)
2	54111	FP module access cover
3	9C385	FP module lock ring

11	W701259	Splash shield pin-type retainer (6 required)
12	5428371	LH splash shield
13	N807379	Splash shield rivet (3 required)

1. For additional information, refer to the procedures in this section.

Fuel Tank

Special Tool(s)

 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result erious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the fuel tank. For additional information, refer to Section 310-00 .

3. Remove the muffler and tailpipe. For additional information, refer to Section 309-00 .

4. **NOTE:** Some residual fuel may remain in the fuel tank filler pipe after draining the fuel tank. Carefully drain any remaining fuel into a suitable container.

   Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.

   - To install, tighten to 4 Nm (35 lb-in).

5. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to Section 310-00 .

6. Remove the 4 nuts, 2 clips and release the heat shield from the fuel tank.

7. Install the Powertrain Lift under the fuel tank.

8. Remove the 4 bolts and the 2 fuel tank straps.
    - To install, tighten to 40 Nm (30 lb-ft).

9. Carefully lower and remove the fuel tank from the vehicle.

10. To install, reverse the removal procedure.

Fuel Tank Filler Pipe

Special Tool(s)

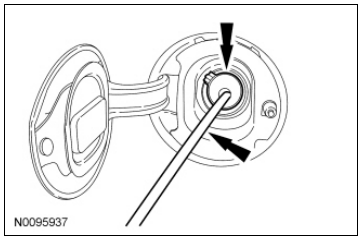
 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these ructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.



⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

N0095937

4. **NOTE:** This step is to remove approximately one-fourth tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the fuel tank inlet.

Attach the Fuel Storage Tanker to the fuel drain tube and remove one-fourth (approximately 4 gallons) of fuel from the tank.

5. Remove the LR wheel and tire. For additional information, refer to Section 204-04 .

6. Remove the 3 rivets, 6 pin-type retainers and the LR wheel splash shield.

7. Remove the 3 nuts and the fuel tank filler pipe heat shield.
   - To install, tighten to 9 Nm (80 lb-in).

8. Remove the fuel tank filler pipe bracket nut.
   - To install, tighten to 7 Nm (62 lb-in).

9. Remove the fuel tank filler pipe bracket bolt.
   - To install, tighten to 7 Nm (62 lb-in).

10. Disconnect the fuel vapor tube assembly-to-fuel tank filler pipe recirculation tube quick connect coupling. For additional information, refer to Section 310-00 .

11. Remove the information bezel.

12. Release the 3 retainers and remove the fuel tank filler pipe housing.

13. **NOTE:** Some fuel may remain in the fuel tank filler pipe after the initial drain. Carefully drain any residual fuel into a suitable container.

    Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.

    - To install, tighten to 4 Nm (35 lb-in).

14. Remove the fuel tank filler pipe assembly from the vehicle.

15. To install, reverse the removal procedure.

Fuel Pump Module

Special Tool(s)

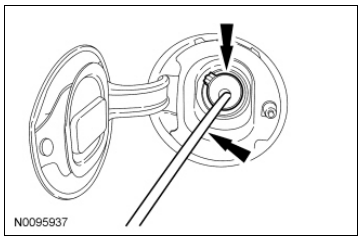
 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
 ST2803-A	Fuel Tank Sender Unit Wrench 310-123

Material

Item	Specification
Motorc® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when thengine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

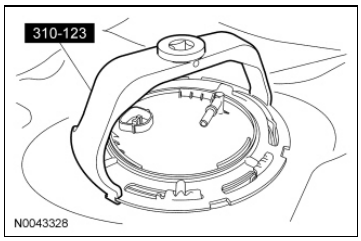
Install the supplemental refueling adapter and a length of semi-rigid fuel drain tube into the Easy Fuel ™ (capless) fuel tank filler pipe until the tube enters the fuel tank.

4. **NOTE:** This step is to remove approximately one-fourth tank of the fuel from a completely full fuel tank and the majority of any residual fuel in the fuel tank filler pipe, lowering the fuel level below the Fuel Pump (FP) module flange.

   Attach the Fuel Storage Tanker to the fuel drain tube and remove one-fourth (approximately 4 gallons) of fuel from the tank.

5. Remove the rear seat lower cushion. For additional information, refer to Section 501-10 .

6. Remove the 4 screws and the FP module access cover.
   - To install, tighten to 2 Nm (18 lb-in).



7. Disconnect the FP module electrical connector.

8. Disconnect the fuel tube-to- FP module quick connect coupling. For additional information, refer to Section 310-00 .

9. **NOTE:** Place absorbent pads on the floor pan in the immediate area in case of fuel spills. Carefully remove the FP module from the vehicle to avoid fuel spillage inside the vehicle.

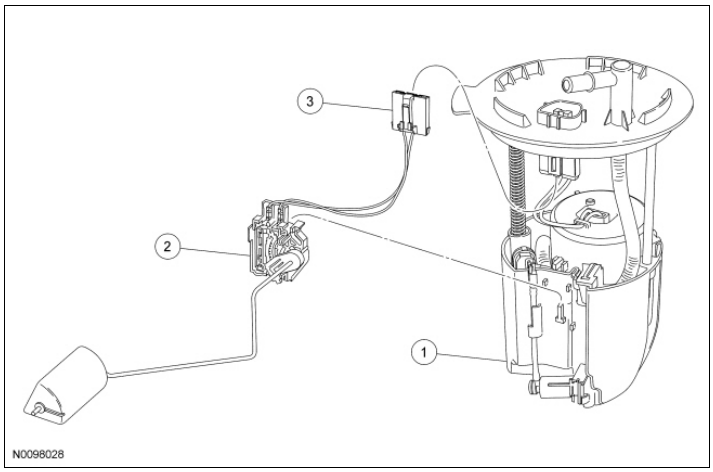
   NOTE: Make sure to install a new FP module O-ring seal.

   Install the Fuel Tank Sender Unit Wrench and remove the FP module lock ring.

10. ***NOTICE:*** **The Fuel Pump (FP) module must be handled carefully to avoid damage to the float arm.**

    NOTE: The FP module will have residual fuel remaining internally, drain into a suitable container.

    Completely remove the FP module from the fuel tank.



11. ***NOTICE:*** **Inspect the mating surfaces of the Fuel Pump (FP) module flange and the fuel tank O-ring seal contact surfaces. Do not polish or adjust the O-ring seal contact area of the fuel tank flange or the fuel tank. Install a new FP module or fuel tank if the O-ring seal contact area is bent, scratched or corroded.**

NOTE: To install, apply clean engine oil to the new O-ring seal.

Remove and discard the FP module O-ring seal.

12. To install, reverse the removal procedure.
    - Make sure the alignment tab on the FP module and the fuel tank meet before tightening the FP module lock ring.

Fuel Level Sender

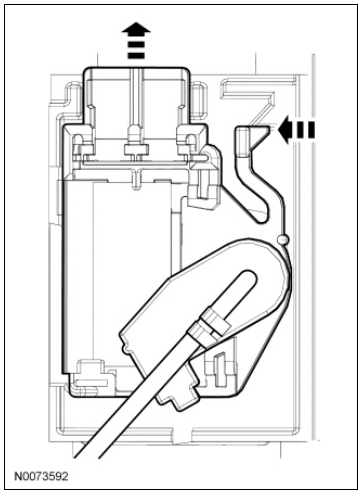
Item	Part Number	Description
1	9H307	Fuel Pump (FP) module
2	9A299	Fuel level sender
3	-	Fuel level sender electrical connector (part of 9A299)

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

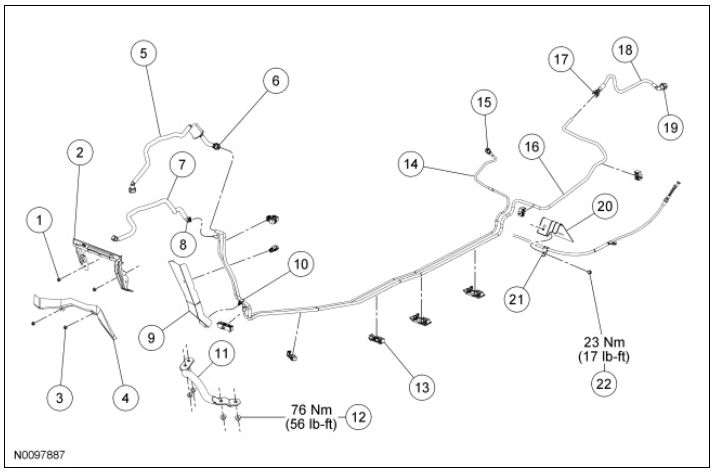
⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

NOTE: The fuel level sender is serviced as part of a kit (9A299).

1. Remove the Fuel Pump (FP) module. For additional information, refer to Fuel Pump Module in this section.



2. Disconnect the fuel level sender electrical connector.

3. Depress the lock tab and slide the fuel level sender upwards and remove.

4. To install, reverse the removal procedure.

20	-	Stone shield (part of 2A815)
21	2A815	LR parking brake cable assembly
22	W505263	Rear parking brake cable assembly bolt

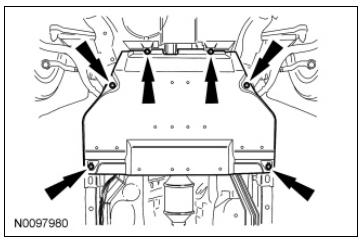
Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near anymponent. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: When handling fuel, always observe fuel handling precautions and be prepared in the event of fuel spillage. Spilled fuel may be ignited by hot vehicle components or other ignition sources. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Remove the 4 nuts and 2 heat shields.
5. Release the pin-type retainer and remove the hybrid fuel tube bundle shield.
6. **NOTE:** Some residual fuel may remain in the fuel tubes after releasing the fuel system pressure. When disconnecting or removing any fuel tubes, carefully drain any residual fuel into a suitable container.

Disconnect the fuel jumper tube-to-fuel tube quick connect coupling. For additional information, refer to Section 310-00 .

7. Disconnect the vapor jumper tube-to-vapor tube quick connect coupling. For additional information, refer to Section 310-00 .

8. If equipped, remove the 6 bolts and the underbody shield.

9. Remove the 4 nuts and the lower crossover support brace.
    - To install, tighten to 76 Nm (56 lb-ft).

10. Remove the fuel tank. For additional information, refer to Fuel Tank in this section.

11. **NOTE:** The LR parking brake cable bolt also retains a stone shield. Position the cable and shield aside.

    Remove the bolt, stone shield and position the LR parking brake cable assembly aside.

    - To install, tighten to 23 Nm (17 lb-ft).

12. Disconnect the vapor jumper tube-to-vapor tube quick connect coupling. For additional information, refer to Section 310-00 .

13. Release the 9 fuel tube bundle retaining clips and remove the fuel and vapor tubes.

14. Disconnect the vapor jumper tube-to-Evaporative Emission (EVAP) canister quick connect coupling and remove the vapor jumper tube. For additional information, refer to Section 310-00 .

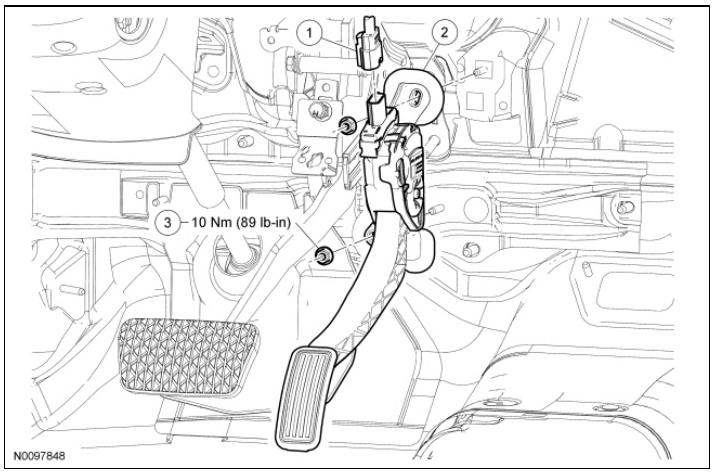
15. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Accelerator pedal and sensor assembly nuts	10	89

Acceleration Control

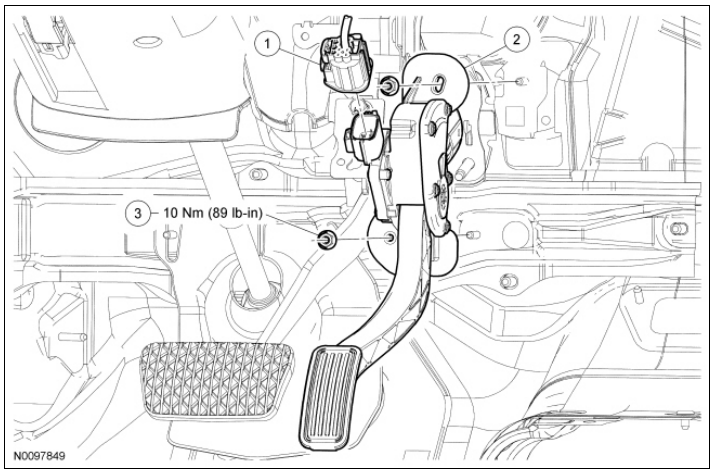
The acceleration controls consist of an accelerator pedal and sensor assembly.



The engine management system electronically operates the accelerator of the engine in response to accelerator pedal movements initiated by the driver. In the event of a system failure, the engine management system provides a "limp home" mode which allows the vehicle to be driven with limited performance.

Acceleration Control

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



Accelerator Pedal and Bracket

2.5L, 2.5L Hybrid and 3.0L Vehicles

Item	Part Number	Description
1	14A464	Accelerator pedal sensor electrical connector
2	9F836	Accelerator pedal and sensor assembly
3	W706131	Accelerator pedal and sensor assembly nut (2 required)

3.5L Vehicles

Item	Part Number	Description
1	14A464	Accelerator pedal sensor electrical connector
2	9F836	Accelerator pedal and sensor assembly
3	W706131	Accelerator pedal and sensor assembly nut (2 required)

Removal and Installation

NOTE: The sport metallic accelerator pedal pad is not to be re-used. If the sport metallic accelerator pedal pad is removed it should be discarded and replaced with a new sport metallic accelerator pedal pad.

1. Disconnect the accelerator pedal sensor electrical connector.

2. Remove the 2 nuts and the accelerator pedal and sensor assembly.
    - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.

BCM - Body Control Module

BCM-HVTB - Battery Control Module - High Voltage Traction Battery

BEC - Bussed Electrical Center

BECM - Battery Energy Control Module

BJB - Battery Junction Box

BLIS® - Blind Spot Information System

BLISTM - Blind Spot Information System

BPP - Brake Pedal Position

BPSM - Battery Pack Sensor Module

BSIA - Brake Shift Interlock Actuator

BTS - Belt Tension Sensor

CAN - Controller Area Network

CAN2 - Controller Area Network 2

CASS - Compressor Anti-Slugging Strategy

CCA - Cold Cranking Amps

CHT - Cylinder Head Temperature

CID - Cubic Inch Displacement

CIP - Consumer Interface Processor

CKP - Crankshaft Position

CMDTC - Continuous Memory Diagnostic Trouble Code

CMDTCs - Continuous Memory Diagnostic Trouble Codes

CMP - Camshaft Position

CMS - Catalyst Monitor Sensor

CPA - Connector Position Assurance

CPP - Clutch Pedal Position

CTA - Cross Traffic Alert

CVT - Continuously Variable Transaxle

D/A - Dual Action

DAMB - Direct Acting Mechanical Buckets

DATC - Dual Automatic Temperature Control

DC/DC - DC to DC Converter Control Module

DCSM - Dual Climate Controlled Seat Module

DDM - Driver Door Module

DERU - Drive Engine Run-Up

DLC - Data Link Connector

DMM - Digital Multimeter

DOHC - Dual Overhead Camshaft

DP - Dual Phase Steel

DRL - Daytime Running Lamps

DRM - Digital Rights Management

DSM - Driver Seat Module

DSO - District Special Order

DSP - Digital Signal Processing

DTC - Diagnostic Trouble Code

DTE - Distance To Empty

EATC - Electronic Automatic Temperature Control

EBD - Electronic Brake Distribution

ECM - Engine Control Module

ECT - Engine Coolant Temperature

ECU - Electronic Control Unit

eCVT - Electronically Controlled Continuously Variable Transmission

EEPROM - Electrically Erasable Programmable Read-Only Memory

EGR - Exhaust Gas Recirculation

EI - Electronic Ignition

ELR - Emergency Locking Retractor

EMTC - Electronic Manual emperature Control

EONV - Engine Off Natural Vacuum

EOP - Engine Oil Pressure

EPAS - Electronic Power Assist Steering

EPC - Electronic Pressure Control

ESC - Electronic Stability Control

ESN - Electronic Serial Number

ETC - Electronic Throttle Control

EVA - Electronic Vibration Analyzer

EVAP - Evaporative Emission

FC - Fan Control

FCIM - Front Controls Interface Module

FDIM - Front Display Interface Module

FEAD - Front End Accessory Drive

FET - Field-Effect Transistor

FF - Flexible Fuel

FP - Fuel Pump

FTP - Fuel Tank Pressure

FWD - Front Wheel Drive

GEM - Generic Electronic Module

GPS - Global Positioning System

GPSM - Global Positioning System Module

GTDI - Gasoline Turbocharged Direct Injection

GVW - Gross Vehicle Weight

GVWR - Gross Vehicle Weight Rating

HCM - Headlamp Control Module

HCM-2 - Headlamp Control Module 2

HCU - Hydraulic Control Unit

HEV - Hybrid Electric Vehicle

HID - High Intensity Discharge

HO2S - Heated Oxygen Sensor

HPAS - Hydraulic Power Assist Steering

HS-CAN - High Speed Controller Area Network

HSLA - High-Strength Low Alloy

HSS - High-Strength Steel

HVAC - Heating Ventilation Air Conditioning

HVTB - High Voltage Traction Battery

IAT - Intake Air Temperature

IC - Instrument Cluster

IDS - Integrated Diagnostic System

IFS - Inertia Fuel Shutoff

IKT - Integrated Keyhead Transmitter

IKTs - Integrated Keyhead Transmitters

ILCM - Interior Lighting Control Module

IPC - Instrument Panel Cluster

IPM-A - Image Processing Module - A

ISC - Idle Speed Control

KAM - Keep Alive Memory

KOEO - Key ON Engine OFF

KOER - Key ON Engine Running

KS - Knock Sensor

LCD - Liquid Crystal Display

LPC - Line Pressure Control

MACS - Mobile Air Conditioning Society

MAF - Mass Air Flow

MAP - Manifold Absolute Pressure

MECS - Motor Electronics Cooling System

MFI - Multi-Port Fuel Injection

MIG - Metal Inert Gas

MIL - Malfunction Indicator Lamp

MRFS - Mechanical Returnless Fuel System

MS-CAN - Medium Speed Controller Area Network

MSS - Mode Select Switch

NERU - Neutral Engine Run-Up

NOx - Nitrogen Oxides

NVM - Non-Volatile Memory

O/D - Overdrive

OASIS - On-Line Automotive Service Information System

OBD - On-Board Diagnostic

OCS - Occupant Classification Sensor

OCS - Occupant Classification System

OCSM - Occupant Classification System Module

OHC - Overhead Camshaft

ORVR - On-Board Refueling Vapor Recovery

OSS - Output Shaft Speed

OTIS - One-Touch Integrated Start

OWC - One-Way Clutch

PAD - Passenger Air Bag Deactivation

PAM - Parking Aid Module

PATS - Passive Anti-Theft System

PC/ED - Powertrain Control/Emissions Diagnosis

PCM - Powertrain Control Module

PDB - Power Distribution Box

PIN - Personal Identification Number

PMI - Programmable Module Installation

PSCM - Power Steering Control Module

PSP - Power Steering Pressure

PTS - Professional Technician Society

PTU - Power Transfer Unit

PVC - Polyvinyl Chloride

PWM - Pulse Width Modulated

PWM - Pulse-Width Modulation

PZEV - Partial Zero Emissions Vehicle

RAM - Random Access Memory

RCM - Restraints Control Module

RCU - Rear Control Unit

RDU - Rear Drive Unit

READ - Rear End Accessory Drive

RFI - Radio Frequency Interference

RKE - Remote Keyless Entry

ROM - Read-Only Memory

ROW - Rest Of World

RSC® - Roll Stability Control

SDARS - Satellite Digital Audio Receiver System

SFI - Sequential Multi-Port Fuel Injection

SJB - Smart Junction Box

SMC - Sheet-Molded Composite

SOD-L - Side Obstacle Detection Control Module - Left

SOD-R - Side Obstacle Detection Control Module - Right

SRS - Supplemental Restraint System

SSA - Shift Solenoid A

SSB - Shift Solenoid B

SSC - Shift Solenoid C

SSD - Shift Solenoid D

SSE - Shift Solenoid E

SSF - Shift Solenoid F

SSPCC - Shift Solenoid Pressure Control C

SSPCD - Shift Solenoid Pressure Control D

SSPCE - Shift Solenoid Pressure Control E

SSPCF - Shift Solenoid Pressure Control F

STRW - Squeeze-Type Resistance Spot Welding

TB - Throttle Body

TCC - Torque Converter Clutch

TCIL - Transmission Control Indicator Lamp

TCM - Transmission Control Module

TCS - Transmission Control Switch

TDC - Top Dead Center

TED - Thermo-Electric Device

TEDs - Thermo-Electric Devices

TFT - Transmission Fluid Temperature

TIC - Transmitter Identification Code

TICs - Transmitter Identification Codes

TP - Throttle Position

TPM - Tire Pressure Monitor

TPMS - Tire Pressure Monitoring System

TPO - Thermoplastic Olefin

TR - Transmission Range

TRIP - Transformation Induced Plasticity Steel

TSB - Technical Service Bulletin

TSBs - Technical Service Bulletins

TSS - Turbine Shaft Speed

TTS - Text-To-Speech

TXV - Thermostatic Expansion Valve

UHSS - Ultra High Strength Steel

USB - Universal Serial Bus

VC - Vehicle Certification

VCM - Vehicle Communication Module

VCT - Variable Camshaft Timing

VFS - Variable Force Solenoid

VID - Vehicle Identification

VIN - Vehicle Identification Number

VIP - Vehicle Interface Processor

VSS - Vehicle Speed Sensor

WMI - World Manufacturer Identifier

WOT - Wide Open Throttle

4

4X4 Control Module (REMOVAL AND INSTALLATION, Four Wheel Drive (4WD) Systems)

5

5th/6th Gear (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Manual Transaxle/Transmission)

A

A-Pillar Trim Panel (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Acceleration Control (DESCRIPTION AND OPERATION)

Acceleration Control (DIAGNOSIS AND TESTING)

Acceleration Control (Section Table of Contents)

Acceleration Control (SPECIFICATIONS)

Accelerator Pedal and Bracket (REMOVAL AND INSTALLATION, Acceleration Control)

Accessory Drive (DESCRIPTION AND OPERATION, Accessory Drive - 2.5L)

Accessory Drive (DESCRIPTION AND OPERATION, Accessory Drive - 3.0L (4V))

Accessory Drive (DESCRIPTION AND OPERATION, Accessory Drive - 3.5L)

Accessory Drive (DESCRIPTION AND OPERATION, Accessory Drive - Hybrid)

Accessory Drive (DIAGNOSIS AND TESTING, Accessory Drive - 2.5L)

Accessory Drive (DIAGNOSIS AND TESTsory Drive - 3.0L (4V))

Accessory Drive (DIAGNOSIS AND TESTING, Accessory Drive - 3.5L)

Accessory Drive (DIAGNOSIS AND TESTING, Accessory Drive - Hybrid)

Accessory Drive Belt (REMOVAL AND INSTALLATION, Accessory Drive - 2.5L)

Accessory Drive Belt (REMOVAL AND INSTALLATION, Accessory Drive - 3.0L (4V))

Accessory DriveOVAL AND INSTALLATION, Accessory Drive - 3.5L)

Accessory Drive Belt (REMOVAL AND INSTALLATION, Accessory Drive - Hybrid)

Accessory Drive Belt Idler Pulley (REMOVAL AND INSTALLATION, Accessory Drive - 2.5L)

Accessory Drive Belt Tensioner (REMOVAL AND INSTALLATION, Accessory Drive - 2.5L)

Accessory Drive Belt Tensioner (REMOVAL AND INSTALLATION, Accessory Drive - 3.0L (4V))

Accessory Drive Belt Tensioner (REMOVAL AND INSTALLATION, Accessory Drive - 3.5L)

Accessory Drive Belt Tensioner (REMOVAL AND INSTALLATION, Accessory Drive - Hybrid)

Accessory Drive - 2.5L (Section Table of Contents)

Accessory Drive - 2.5L (SPECIFICATIONS)

Accessory Drive - 3.0L (4V) (Section Table of Contents)

Accessory Drive - 3.0L (4V) (SPECIFICATIONS)

Accessory Drive - 3.5L (Section Table of Contents)

Accessory Drive - 3.5L (SPECIFICATIONS)

Accessory Drive - Hybrid (Section Table of Contents)

Accessory Drive - Hybrid (SPECIFICATIONS)

Accessory Protocol Interface Mo) (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Accessory Protocol Interface Module (APIM) Programming (GENERAL PROCEDURES, Module Configuration)

Accessory Protocol Interface Module (APIM) Software Level Check (GENERAL PROCEDURES, Information and Entertainment Systems)

Adaptive Headlighting (DIAGNOSIS AND TESTING, Exterior Lighting)

Adhesives (DESCRIPTION AND OPERATION, Body Repairs)

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (DESCRIPTION AND OPERATION, Supplemental Restraint System)

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) (DIAGNOSIS AND TESTING, Supplemental Restraint System)

Air Cleaner (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering - 2.5L)

Air Cleaner (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering - 3.0L (4V))

Air Cleaner (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering - 3.5L)

Air Cleaner (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering - Hybrid)

Air Cleaner Outlet Pipe (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering - 2.5L)

Air Cleaner Outlet Pipe (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering - 3.0L (4V))

Air Cleaner Outlet Pipe (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering - 3.5L)

Air Cleane Pipe (REMOVAL AND INSTALLATION, Intake Air Distribution and Filtering - Hybrid)

Air Conditioning (DESCRIPTION AND OPERATION, Climate Control)

Air Conditioning (A/C) Clutch Air Gap Adjustment (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Air Conditioning (A/C) Compressor - 2.5L (REMOVAL AND INSTALLATION, Climate Control)

Air Conditioning (A/C) Compressor - 3.0L, 3.5L (REMOVAL AND INSTALLATION, Climate Control)

Air Conditioning (A/C) Compressor - Hybrid (REMOVAL AND INSTALLATION, Climate Control)

Air Conditioning (A/C) Evaporator Discharge Air Temperature Sensor (REMOVAL AND INSTALLATION, Climate Control)

Air Conditioning (A/C) Odor Treatment (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Air Conditioning (A/C) Pressure Relief Valve (REMOVAL AND INSTALLATION, Climate Control)

Air Conditioning (A/C) Pressure Transducer (REMOVAL AND INSTALLATION, Climate Control)

Air Conditioning (A/C) System Flushing (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Air Conditioning (A/C) System Recovery, Evacuation and Charging (GENERAL PROCEDURES, Climate Control System - General Information and Diagnostics)

Air Deflector (REMOVAL AND INSTALLATION, Roof Opening Panel)

Air Distribution and Filtering (DESCRIPTION AND OPERATION, Climate Control)

Alternating Current (AC) Powerpoint (REMOVAL AND INSTALLATION, High Voltage Converter/Inverter)

Ambient Air Temperature Sensor (REMOVAL AND INSTALLATION, Climate Control)

Ambient Lighting Module (REMOVAL AND INSTALLATION, Interior Lighting)

Ambient Lighting Switch (REMOVAL AND INSTALLATION, Interior Lighting)

Antenna Cable - AM/FM (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Antenna Cable - Satellite Radio (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Antenna Module (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Antenna - AM/FM (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Antenna - AM/FM/Satellite Radio/Navigation (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Antenna - Satellite Radio (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Anti-Lock Brake System (ABS) and Stability Control (Section Table of Contents)

Anti-Lock Brake System (ABS) and Stability Control (SPECIFICATIONS)

Anti-Lock Brake System (ABS) Module (REMOVAL AND INSTALLATION, Anti-Lock Brake System (ABS) and Stability Control)

Anti-Lock Brake System (ABS) Module - Hybrid (REMOVAL AND INSTALLATION, Anti-Lock Brake System (ABS) and Stability Control)

Anti-Lock Control (DESCRIPTION AND OPERATION, An-Lock Brake System (ABS) and Stability Control)

Anti-Lock Control - Hybrid (DIAGNOSIS AND TESTING, Anti-Lock Brake System (ABS) and Stability Control)

Anti-Lock Control - Non-Hybrid (DIAGNOSIS AND TESTING, Anti-Lock Brake System (ABS) and Stability Control)

Anti-Theft (DESCRIPTION AND OPERATION, Anti-Theft - Passive Anti-Theft System (PATS))

Anti-Theft (DESCRIPTION AND OPERATION, Anti-Theft - Passive Anti-Theft System (PATS) - Hybrid)

Anti-Theft (DESCRIPTION AND OPERATION, Anti-Theft - Perimeter)

Anti-Theft (DIAGNOSIS AND TESTING, Anti-Theft - Passive Anti-Theft System (PATS))

Anti-Theft (DIAGNOSIS AND TESTING, Anti-Theft - Passive Anti-Theft System (PATS) - Hybrid)

Anti-Theft (DIAGNOSIS AND TESTING, Anti-Theft - Perimeter)

Anti-Theft Inhibit Switch - Luggage Compartment (REMOVAL AND INSTALLATION, Anti-Theft - Perimeter)

Anti-Theft Security Access (GENERAL PROCEDURES, Anti-Theft - Passive Anti-Theft System (PATS))

Anti-Theft Security Access (GENERAL PROCEDURES, Anti-Theft - Passive Anti-Theft System (PATS) - Hybrid)

Anti-Theft - Passive Anti-Theft System (PATS) (Section Table of Contents)

Anti-Theft - Passive Anti-Theft System (PATS) - Hybrid (Section Table of Contents)

Anti-Theft - Perimeter (Section Table of Contents)

Applique - Luggage Compartment Lid (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Apply Components (DESCRIPTION AND OPERATION, Automatic Transaxle/Transmission - Aisin AW21)

Audio Amplifier (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Audio Control Module (ACM) Self-Diagnostic Mode (GENERAL PROCEDURES, Information and Entertainment Systems)

Audio Control Mod(ACM) - Fusion (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Audio Control Module (ACM) - MKZ (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Audio Digital Signal Processing (DSP) Module (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Audio Input Jack (REMOVAL AND INSTALLATION, Information and Entertainment Systems)

Autolamps (DIAGNOSIS AND TESTING, Exterior Lighting)

Autolamps Time Delay Adjustment (GENERAL PROCEDURES, Exterior Lighting)

Autolock and Auto-Unlock Programming (GENERAL PROCEDURES, Handles, Locks, Latches and Entry Systems)

Automatic Transaxle/Transmission External Controls - Aisin AW21/6F35 (Section Table of Contents)

Automatic Transaxle/Transmission External Controls - Aisin AW21/6F35 (SPECIFICATIONS)

Automatic Transaxle/Transmission External Controls - Hybrid (Section Table of Contents)

Automatic Transaxle/Transmission External Controls - Hybrid (SPECIFICATIONS)

Automatic Transaxle/Transmission - 6F35 (Section Table of Contents)

Automatic Transaxle/Transmission - 6F35 (SPECIFICATIONS)

Automatic Transaxle/Transmission - Aisin AW21 (Section Table of Contents)

Automatic Transaxle/Transmission - Aisin AW21 (SPECIFICATIONS)

Automatic Transaxle/Transmission - Electronically Controlled Continuously Variable Transmission (eCVT) (SPECIFICATIONS)

Auxiliary Coolant Flow Pump (REMOVAL AND INSTALLATION, Climate Control)

Axle Assembly (REMOVAL AND INSTALLATION, Rear Drive Axle/Differential)

Azimuth System CheGENERAL PROCEDURES, Parking Aid)

B

B-Pillar Trim Panel (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Balance Shaft Backlash (GENERAL PROCEDURES, Engine - 2.5L)

Balance Shaft Backlash (GENERAL PROCEDURES, Engine - 2.5L Hybrid)

Ballast (REMOVAL AND INSTALLATION, Exterior Lighting)

Battery (REMOVAL AND INSTALLATION, Battery, Mounting and Cables)

Battery and Battery Tray - Exploded View (REMOVAL AND INSTALLATION, Battery, Mounting and Cables)

Battery and Cables (DESCRIPTION AND OPERATION, Battery, Mounting and Cables)

Battery Cables - 2.5L (REMOVAL AND INSTALLATION, Battery, Mounting and Cables)

Battery Cables - 3.0L (REMOVAL AND INSTALLATION, Battery, Mounting and Cables)

Battery Cables - 3.5L (REMOVAL AND INSTALLATION, Battery, Mounting and Cables)

Battery Disconnect (GENERAL PROCEDURES, Battery, Mounting and Cables)

Battery Energy Control Module (BECM) (REMOVAL AND INSTALLATION, High Voltage Traction Battery)

Battery Pack Sensor Module (BPSM) (REMOVAL AND INSTALLATION, High Voltage Traction Battery)

Battery Tray (REMOVAL AND INSTALLATION, Battery, Mounting and Cables)

Battery, Mounting and Cables (Section Table of Contents)

Battery, Mounting and Cables (SPECIFICATIONS)

Bearing Inspection (GENERAL PROCEDURES, Engine System - General Information)

Belt-Minder® Deactivating/Activating (GENERAL PROCEDURES, Instrumentation, Message Center, and Warning Chimes)

Beltline Moulding - Front Door (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Beltline Moulding - Rear Door (REMOVAL AND INSTALLATION, Exterior Trim and Ornamentation)

Blind Spot Monitoring (DESCRIPTION AND OPERATION, Side And Rear Vision)

Blind Spot Monitoring (DIAGNOSIS AND TESTING, Side And Rear Vision)

Block Heater (REMOVAL AND INSTALLATION, Engine Cooling)

Block Heater (REMOVAL AND INSTALLATION, Engine Cooling - Hybrid)

Blower Motor (REMOVAL AND INSTALLATION, Climate Control)

Blower Motor Resistor (REMOVAL AND INSTALLATION, Climate Control)

Blower Motor Speed Control (REMOVAL AND INSTALLATION, Climate Control)

Body (DESCRIPTION AND OPERATION, Body Repairs)

Body Closures (Section Table of Contents)

Body Closures (SPECIFICATIONS)

Body Repairs (Section Table of Contents)

Body Repairs (SPECIFICATIONS)

Body Sealer Types And Applications (DESCRIPTION AND OPERATION, Body System - General Information)

Body System (DIAGNOSIS AND TESTING, Body System - General Information)

Body System - General Information (Section Table of Contents)

Body System - General Information (SPECIFICATIONS)

Brake Booster (DESCRIPTION AND OPERATION, Power Brake Actuation)

Brake Booster Travel Sensor - Hybrid (REMOVAL AND INSTALLATION, Power Brake Actuation)

Brake Booster Vacuum Sensor - Hybrid (REMOVAL AND INSTALLATION, Power Brake Actuation)

Brake Booster Vacuum Sensor - Non-Hybrid (REMOVAL AND INSTALLATION, Power Brake Actuation)

Brake Booster - Exploded View (REMOVAL AND INSTALLATION, Power Brake Actuation)

Brake Booster - Hybrid (REMOVAL AND INSTALLATION, Power Brake Actuation)

Brake Booster - Non-Hybrid (REMOVAL AND INSTALLATION, Power Brake Actuation)

Brake Caliper (REMOVAL AND INSTALLATION, Front Disc Brake)

Brake Caliper (REMOVAL AND INSTALLATION, Rear Disc Brake)

Brake Caliper Anchor Plate (REMOVAL AND INSTALLATION, Front Disc Brake)

Brake Disc (REMOVAL AND INSTALLATION, Front Disc Brake)

Brake Disc (REMOVAL AND INSTALLATION, Rear Disc Brake)

Brake Disc Machining (GENERAL PROCEDURES, Brake System - General Information)

Brake Disc Shield - All Wheel Drive (AWD) (REMOVAL AND INSTALLATION, Rear Disc Brake)

Brake Disc Shield - Front Wheel Drive (FWD) (REMOVAL AND INSTALLATION, Rear Disc Brake)

Brake Flexible Hose (REMOVAL AND INSTALLATION, Front Disc Brake)

Brake Flexible Hose (REMOVAL AND INSTALLATION, Rear Disc Brake)

Brake Fluid Reservoir (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Master Cylinder (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Pads (REMOVAL AND INSTALLATION, Front Disc Brake)

Brake Pads (REMOVAL AND INSTALLATION, Rear Disc Brake)

Brake Pedal and Bracket - Hybrid (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Pedal and Bracket - Non-Hybrid (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Pedal Angle Sensor (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Pressure Control Valve (REMOVAL AND INSTALLATION, Hydraulic Brake Actuation)

Brake Shift Interlock Override (GENERAL PROCEDURES, Automatic Transaxle/Transmission External Controls - Aisin AW21/6F35)

Brake Shift Interlock Override (GENERAL PROCEDURES, Automatic Transaxle/Transmission External Controls - Hybrid)

Brake System (DESCRIPTION AND OPERATION, Brake System - General Information)

Brake System Bleeding (GENERAL PROCEDURES, Brake System - General Information)

Brake System Inspection (GENERAL PROCEDURES, Brake System - General Information)

Brake System - General Information (Section Table of Contents)

Brake System - General Information (SPECIFICATIONS)

Brake Vacuum Pump (REMOVAL AND INSTALLATION, Power Brake Actuation)

Bumper Cover - Front (REMOVAL AND INSTALLATION, Bumpers)

Bumper Cover - Rear (REMOVAL AND INSTALLATION, Bumpers)

Bumper - Exploded View, Front (REMOVAL AND INSTALLATION, Bumpers)

Bumper - Exploded View, Rear (REMOVAL AND INSTALLATION, Bumpers)

Bumper - Front (REMOVAL AND INSTALLATION, Bumpers)

Bumper - Rear (REMOVAL AND INSTALLATION, Bumpers)

Bumpers (Section Table of Contents)

Bumpers (SPECIFICATIONS)

Bypass Tube (REMOVAL AND INSTALLATION, Engine Cooling - Hybrid)

Bypass Tube - 2.5L (REMOVASTALLATION, Engine Cooling)

C

C-Pillar Trim Panel (REMOVAL AND INSTALLATION, Interior Trim and Ornamentation)

Cabin Air Filter (REMOVAL AND INSTALLATION, Climate Control)

Camber Adjustment - Rear (GENERAL PROCEDURES, Suspension System - General Information)

Camshaft (INSTALLATION, Engine - 3.5L)

Camshaft (REMOVAL, Engine - 3.5L)

Camshaft Bearing Journal Diameter (GENERAL PROCEDURES, Engine System - General Information)

Camshaft End Play - OHC Engines (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Journal to Bearing Clearance - OHC Engines (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Lobe Lift (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Phaser and Sprocket (IN-VEHICLE REPAIR, Engine - 2.5L)

Camshaft Phaser and Sprocket (IN-VEHICLE REPAIR, Engine - 2.5L Hybrid)

Camshaft Phaser and Sprocket (IN-VEHICLE REPAIR, Engine - 3.0L (4V))

Camshaft Position (CMP) Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 2.5L)

Camshaft Position (CMP) Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 3.0L (4V))

Camshaft Position (CMP) Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 3.5L)

Camshaft Position (CMP) Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - Hybrid)

Camshaft Roller Follower (IN-VEHICLE REPAIR, Engine - 3.0L (4V))

Camshaft Runout (GENERAL PROCEDURES, Engine System - General Information)

Camshaft Surface Inspection (GENERAL PROCEDURES, Engine System - General Information)

Camshafts (IN-VEHICLE REPAIR, Engine - 2.5L)

Camshafts (IN-VEHICLE REPAIR, Engine - 2.5L Hybrid)

Camshafts - LH (IN-VEHICLE REPAIR, Engine - 3.0L (4V))

Camshafts - RH (IN-VEHICLE REPAIR, Engine - 3.0L (4V))

Caster Adjustment - Front (GENERAL PROCEDURES, Suspension System - General Information)

Catalyst Monitor Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 2.5L)

Catalyst Monitor Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 3.0L (4V))

Catalyst Monitor Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 3.5L)

Catalyst Monitor Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - Hybrid)

Catalytic Converter - 3.0L LH Manifold (REMOVAL AND INSTALLATION, Exhaust System)

Catalytic Converter - 3.0L RH (REMOVAL AND INSTALLATION, Exhaust System)

Catalytic Converter - 3.5L LH (REMOVAL AND INSTALLATION, Exhaust System)

Catalytic Converter - 3.5L RH (REMOVAL AND INSTALLATION, Exhaust System)

Catalytic Converter - Manifold, Hybrid (REMOVAL AND INSTALLATION, Exhaust System)

Catalytic Converter - Underbody (REMOVTALLATION, Exhaust System)

Center Support (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6F35)

Charging System (DESCRIPTION AND OPERATION)

Charging System (Section Table of Contents)

Charging System (SPECIFICATIONS)

Child Safety Seat Tether Anchor (REMOVAL AND INSTALLATION, Safety Belt Stem)

Climate Control (Section Table of Contents)

Climate Control (SPECIFICATIONS)

Climate Control System (DESCRIPTION AND OPERATION, Climate Control System - General Information and Diagnostics)

Climate Control System (DESCRIPTION AND OPERATION, Climate Control System - General Information and Diagnostics - Hybrid)

Climate Control System (DIAGNOSIS AND TESTING, Climate Control System - General Information and Diagnostics - Hybrid)

Climate Control System - General Information and Diagnostics (Section Table of Contents)

Climate Control System - General Information and Diagnostics (SPECIFICATIONS)

Climate Control System - General Information and Diagnostics - Hybrid (Section Table of Contents)

Climate Control System - General Information and Diagnostics - Hybrid (SPECIFICATIONS)

Clockspring (REMOVAL AND INSTALLATION, Supplemental Restraint System)

Clutch (DESCRIPTION AND OPERATION)

Clutch (DIAGNOSIS AND TESTING)

Clutch (Section Table of Contents)

Clutch (SPECIFICATIONS)

Clutch and Clutch Field Coil (REMOVAL AND INSTALLATION, Climate Control)

Clutch Controls (DESCRIPTION AND OPERATION)

Clutch Controls (DIAGNOSIS AND TESTING)

Clutch Controls (Section Table of Contents)

Clutch Controls (SPECIFICATIONS)

Clutch Disc and Pressure Plate (REMOVAL AND INSTALLATION, Clutch)

Clutch Disc Check (GENERAL PROCEDURES, Manual Transaxle/Transmission and Clutch - General Information)

Clutch Master Cylinder (REMOVAL AND INSTALLATION, Clutch Controls)

Clutch Pedal (REMOVAL AND INSTALLATION, Clutch Controls)

Clutch Pedal Freeplay Adjustment (GENERAL PROCEDURES, Manual Transaxle/Transmission and Clutch - General Information)

Clutch Pedal Position (CPP) Switch (REMOVAL AND INSTALLATION, Electronic Engine Controls - 2.5L)

Clutch Pressure Plate Check (GENERAL PROCEDURES, Manual Transaxle/Transmission and Clutch - General Information)

Clutch Slave Cylinder (REMOVAL AND INSTALLATION, Clutch Controls)

Clutch Support Tower (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Automatic Transaxle/Transmission - 6F35)

Clutch System Bleeding (GENERAL PROCEDURES, Manual Transaxle/Transmission and Clutch - General Information)

Communications Network (DESCRIPTION AND OPERATION, Module Communications Network)

Communications Network (DIAGNOSIS AND TESTING, Module Communications Network)

Communications Network - Hybrid (DESCRIPTION AND OPERATION, Module Communications Network)

Compass Calibration (GENERAL PROCEDURES, Instrumentation, Message Center, and Warning Chimes)

Compass Zone Adjustment (GENERAL PROCEDURES, Instrumentation, Message Center, and Warning Chimes)

Component Bleeding (GENERAL PROCEDURES, Brake System - General Information)

Component Test (DIAGNOSIS AND TESTING, Battery, Mounting and Cables)

Component Tests (DIAGNOSIS AND TESTING, Brake System - General Information)

Compressor Manifold and Tube Assembly - 2.MOVAL AND INSTALLATION, Climate Control)

Compressor Manifold and Tube Assembly - 3.0L, 3.5L (REMOVAL AND INSTALLATION, Climate Control)

Compressor to Condenser Discharge Line - Hybrid (REMOVAL AND INSTALLATION, Climate Control)

Condenser Core - 2.5L, 3.0L, Hybrid (REMOVAL AND INSTALLATION, Climate Control)

Condenser Core - 3.5L (REMOVAL AND INSTALLATION, Climate Control)

Connecting Rod Bearing Journal Taper and Out-of-Round (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Bearing Journal-to-Bearing Clearance (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Bend (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Bushing Diameter (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Cleaning (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Large End Bore (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod to Crankshaft Side Clearance (GENERAL PROCEDURES, Engine System - General Information)

Connecting Rod Twist (GENERAL PROCEDURES, Engine System - General Information)

Console - Floor, Fusion (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Console - Floor, MKZ (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Console - Overhead (REMOVAL AND INSTALLATION, Instrument Panel and Console)

Control Components (DESCRIPTION AND OPERATION, Climate Control)

Coolant Inlet Pipe - 3.0L (4V) (REMOVAL AND INSTALLATION, Engine Cooling)

Coolant Pump (REMOVAL AND INSTALLATION, Engine Cooling - Hybrid)

Coolant Pump Belt (REMOVAL AND INSTALLATION, Accessory Drive - 3.0L (4V))

Coolant Pump Housing - 3.0L (4V) (REMOVAL AND INSTALLATION, Engine Cooling)

Coolant Pump - 2.5L (REMOVAL AND INSTALLATION, Engine Cooling)

Coolant Pump - 3.0L (4V) (REMOVAL AND INSTALLATION, Engine Cooling)

Coolant Pump - 3.5L (REMOVAL AND INSTALLATION, Engine Cooling)

Cooling Fan Motor and Shroud (REMOVAL AND INSTALLATION, Engine Cooling - Hyb

Cooling Fan Motor and Shroud - 2.5L, 3.0L (4V) (REMOVAL AND INSTALLATION, Engine Cooling)

Cooling Fan Motor and Shroud - 3.5L (REMOVAL AND INSTALLATION, Engine Cooling)

Cooling System Draining, Filling and Bleeding (GENERAL PROCEDURES, Engine Cooling)

Cooling System Draining, Filling and Bleeding (GENERAL PROCEDURES, Engine Cooling - Hybrid)

Cooling System Flushing (GENERAL PROCEDURES, Engine Cooling)

Cooling System Flushing (GENERAL PROCEDURES, Engine Cooling - Hybrid)

Core Plug Replacement (GENERAL PROCEDURES, Engine System - General Information)

Cover Seal (IN-VEHICLE REPAIR, Transfer Case - Power Transfer Unit (PTU))

Cowl Panel Grille (REMOVAL AND INSTALLATION, Front End Body Panels)

Crankcase Vent Oil Separator (REMOVAL AND INSTALLATION, Engine Emission Control - 2.5L)

Crankcase Vent Oil Separator (REMOVAL AND INSTALLATION, Engine Emission Control - Hybrid)

Crankshaft End Play (GENERAL PROCEDURES, Engine System - General Information)

Crankshaft Front Seal (IN-VEHICLE REPAIR, Engine - 2.5L)

Crankshaft Front Seal (IN-VEHICLE REPAIR, Engine - 2.5L Hybrid)

Crankshaft Front Seal (IN-VEHICLE REPAIR, Engine - 3.0L (4V))

Crankshaft Front Seal (IN-VEHICLE REPAIR, Engine - 3.5L)

Crankshaft Main Bearing Journal Diameter (GENERAL PROCEDURES, Engine System - General Information)

Crankshaft Main Bearing Journal Taper and Out-of-Round (GENERAL PROCEDURES, Engine System - General Information)

Crankshaft Main Bearing Journal-to-Bearing Clearance (GENERAL PROCEDURES, Engine System - General Information)

Crankshaft Position (CKP) Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 2.5L)

Crankshaft Position (CKP) Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 3.0L (4V))

Crankshaft Position (CKP) Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - 3.5L)

Crankshaft Position (CKP) Sensor (REMOVAL AND INSTALLATION, Electronic Engine Controls - Hybrid)

Crankshaft Pulley (IN-VEHICLE REPAIR, Engine - 2.5L)

Crankshaft Pulley (IN-VEHICLE REPAIR, Engine - 2.5L Hybrid)

Crankshaft Pulley (IN-VEHICLE REPAIR, Engine - 3.0L (4V))

Crankshaft Pulley (IN-VEHICLE REPAIR, Engine - 3.5L)

Crankshaft Pulley and Crankshaft Front Seal - Exploded View (IN-VEHICLE REPAIR, Engine - 2.5L)

Crankshaft Pulley and Crankshaft Front Seal - Exploded View (IN-VEHICLE REPAIR, Eng Hybrid)

Crankshaft Pulley and Crankshaft Front Seal - Exploded View (IN-VEHICLE REPAIR, Engine - 3.0L (4V))

Crankshaft Pulley and Crankshaft Front Seal - Exploded View (IN-VEHICLE REPAIR, Engine - 3.5L)

Crankshaft Rear Seal (IN-VEHICLE REPAIR, Engine - 2.5L)

Crankshaft Rear Seal (IN-VEHICLE REPAIR, Engine - 2.5L Hybrid)

Crankshaft Rear Seal (IN-VEHICLE REPAIR, Engine - 3.5L)

Crankshaft Rear Seal with Retainer Plate (IN-VEHICLE REPAIR, Engine - 3.5L)

Cruise Control (DESCRIPTION AND OPERATION)

Cruise Control (DIAGNOSIS AND TESTING)

Cruise Control (Section Table of Contents)

Cruise Control Deactivator Switch (REMOVAL AND INSTALLATION, Cruise Control)

Cruise Control Switch (REMOVAL AND INSTALLATION, Cruise Control)

Cylinder Block Distortion (GENERAL PROCEDURES, Engine System - General Information)

Cylinder Bore Cleaning (GENERAL PROCEDURES, Engine System - General Information)

Cylinder Bore Out-of-RoundNERAL PROCEDURES, Engine System - General Information)

Cylinder Bore Taper (GENERAL PROCEDURES, Engine System - General Information)

Cylinder Head (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Engine - 2.5L)

Cylinder Head (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Engine - 2.5L Hybrid)

Cylinder Head (DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES, Engine - 3.0L (4V))

Steering System

Electronic Power Assist Steering (EPAS) System

The Electronic Power Assist Steering (EPAS) system consists of the following components:

- Power Steering Control Module (PSCM) - the PSCM controls the functions of the EPAS system and communicates with other modules that are on the High Speed Controller Area Network (HS-CAN) bus. The PSCM is attached to the RH side of the EPAS gear assembly and is not available separately for service.
- Motor - the EPAS gear uses a 12-volt reversible motor to control the steering effort. The motor is connected to the steering rack by a toothed belt and a pulley/bearing assembly. The motor is used by the PSCM to move the rack inside the gear housing. Motor position is used to determine steering wheel angle/position instead of using a separate sensor. The motor is attached to the RH side of the EPAS gear assembly and is not available separately for service.
- Steering shaft torque sensor - the steering shaft torque sensor is used by the PSCM to determine how much force the steering wheel is being turned. The sensor sends out 2 signals, one for left and one for right. When the steering wheel is turned to the left, the left signal increases while the right signal decreases, likewise when the steering wheel is turned to the right, the right signal increases while the left signal decreases. This allows the PSCM EPAS gear assembly and is not available separately for service.
- Inner tie rod - one inner tie rod is located at each end of the EPAS gear assembly and is available separately for service. Refer to Section 211-02 .
- Outer tie rod - one outer tie rod is located at each end of the EPAS gear assembly and is available separately for service. Refer to Section 211-02 .
- EPAS gear bellows boot - one bellows boot is located on each side of the EPAS gear assembly. Each boot is held in place with 2 boot clamps. The boots and clamps are available for service, refer to Section 211-02 .
- EPAS gear isolators - there are several rubber isolators (one at each attaching point) on the EPAS gear assembly. These isolators aid in reducing NVH concerns and not available separately for service.

The EPAS system utilizes a rack-and-pinion type steering gear. Power assist is provided by a motor that is connected to the steering rack by a belt and a pulley and bearing assembly. The steering gear and motor/module are serviced as an assembly. A new steering gear includes inner tie rods, however, the inner and outer tie rods can also be serviced separately. For information on tie-rod end service, refer to Section 211-02 .

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Electronic Power Assist Steering (EPAS) System

The Electronic Power Assist Steering (EPAS) system provides power steering assist to the driver by replacing the conventional hydraulic valve system with an electric motor coupled to the steering rack by a toothed belt. The motor is controlled by the Power Steering Control Module (PSCM) that senses steering effort/use through the use of a torque sensor which is mounted near the input shaft of the steering gear. Steering assist is provided in proportion to the steering input effort and vehicle speed.

The EPAS system requires a 12-volt, hot at all times feed for system operation. The PSCM is activated when power is applied to the hard-wired ignition/run input. After activation, the PSCM monitors the High Speed Controller Area Network (HS-CAN) bus to determine if the vehicle is operating in a manner capable of supporting the EPAS system.

Once this is determined, vehicle speed sent by the PCM over the HS-CAN bus, steering shaft speed and direction sent by the torque sensor and steering wheel angle/position determined by the motor position all provide the necessary information for the PSCM to determine the amount or level of assist provided by the EPAS system.

Assist is primarily based off of vehicle speed. As vehicle speed increases, the amount of assist provided by the system is decreased to improve and enhance road feel at the steering wheel. As vehicle speed decreases, the amount of assist provided by the system is increased to ease vehicle maneuvering. If the vehicle speed is missing or out of range, the PSCM defaults to a safe level of assist for all driving conditions. If the vehicle speed returns to the correct in-range values, the PSCM will adjust the level of assist accordingly. Steering wheel/shaft torque, speed and direction information will allow the PSCM to determine how much assist is needed to turn the wheels right and left.

The PSCM is self-monitoring and has the capability of setting and storing DTCs. Depending on the DTC set, the control module will enter into a "safe mode" of manual steering. In addition, the PSCM may send a request to the Instrument Panel Cluster (IPC) module over the HS-CAN bus to display a message in the

message center to alert the driver of a potential EPAS concern.

Interactive Diagnostics

For diagnosing and testing please refer to the on-line Workshop Manual. If you do not have an on-line subscription, go to www.motorcraftservice.com.

Material

Item	Specification	Fill Capacity
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-	-

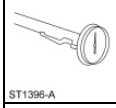
Pressure	689 kPa (50 psi) Fluid @ 74°-80°C (165°-175°F) Engine @ 2,000 rpm	
Relief pressure	9,720-10,170 kPa (1,409-1,475 psi)	
Power Steering Purge Vacuum		
Air purge vacuum	68-85 kPa (20-25 in-Hg)	

Steering System

The power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Steering gear
- Power steering fluid cooler
- Power steering lines
- Steering column
- Steering column shaft



The power steering system transfers driver inputs at the steering wheel to the front wheels of the vehicle. The steering column, hydraulic system and linkages that transfer these driver inputs make up the steering system. Gearing and hydraulic assist are used to significantly reduce steering efforts.

For information on the power steering fluid reservoir, power steering pump, power steering lines and steering gear, refer to Section 211-02 .

For information on the steering wheel, steering column and steering column shaft, refer to Section 211-04 .

Principles of Operation

Power Steering

The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engin driven by the engine accessory drive belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is then trapped between the pump vanes and moved to the high-pressure side of the pump creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high-pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid

before returning it to the pump.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
• Fluid level • Tire pressure • Tires • Drive belt • Drive belt tensioner • Steering column alignment • Tie-rod ends • Suspension components • Steering column shaft U-joints • Intermediate shaft bolts • Power steering reservoir baffle • Power steering reservoir screen • Power steering pressure lines, fittings or O-rings • Power steering return hoses and clamps • Steering gear • Power steering pump • Power steering pressure switch

3. Inspect the power steering fluid for the following conditions:
   - Aeration or foam: Purge the power steering system. Refer to Power Steering System Purging in this section.
   - Overheating or contamination: Flush the power steering system. Refer to Power Steering System Flushing in this section.

4. **NOTE:** It may be necessary to add power steering fluid to achieve the correct level.

   Check the fluid level and clean the power steering components.
   With the ignition OFF:

   - check the power steering fluid level and add fluid as necessary.
   - wipe off any visible signs of fluid or residue build up.
   - ***NOTICE:*** **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

     Start the engine and turn the steering wheel from stop-to-stop several times.

5. Visually inspect the power steering hydraulic line/hose connections for leaks.
    - If a leak is detected at a threaded fitting or clamp plate joint, tighten to specification. If the leak is still evident, visually inspect the O-rings or Teflon® seals. Install new O-rings or Teflon® seals as necessary. Refer to
    - If a leak is detected at a constant tension spring clamp, verify that the hose is not damaged and fully installed on the hose fitting. Make sure that the constant tension spring clamp is positioned 2 mm (0.078 in) from the end of the hose. If the leak remains, install a new constant tension spring clamp.
    - If a leak is detected at a screw clamp joint, verify that the hose is fully installed on the hose fitting and the clamp is positioned 2 mm (0.078 in) from the end of the hose before tightening the screw clamp. If the leak remains, install a new screw clamp. Refer to Section 211-02 .
    - If a leak is detected at the power steering pressure switch, install a new switch. Refer to the appropriate section in Group 303 for the procedure.

6. Visually inspect the power steering components for leaks.
    - If a leak is detected in the power steering pressure line or return hose, install a new hose. Refer to Section 211-02 .
    - If a leak is detected in the power steering pump, install a new power steering pump. Refer to Section 211-02 .
    - **NOTE:** On vehicles with rack-and-pinion steering gear, it may be necessary to remove the bellows boot clamp from the steering gear bellows boot to inspect for internal steering gear leaks.

      If a leak is detected in the steering gear, repair or install a new steering gear. Refer to Section 211-02 .
    - If a leak is detected in the power steering reservoir, install a new reservoir. Refer to Section 211-02 .

7. For information on power steering leak detection, refer to Component Tests in this section.

8. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.

9. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - Steering System or GO to Symptom Chart - NVH .

Steering System Symptom Definitions

Drift/Pull

Pull is described as a tugging sensation felt by the hands on the steering wheel that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with the hands off the steering wheel.

- A vehicle-related drift/pull on a flat road can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle, such as wind or road camber.

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel free play is considered normal.

Lack of Assist or Inconsistent Assist

Lack of assist or inconsistent assist is experienced when the steering wheel effort is higher than normal. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and poor returnability/sticky steering.

Hard steering or lack of assist can result from either hydraulic or mechanical conditions. It is extremely important to know if this concern occurs during driving or during high-effort parking maneuvers.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or steering correction is completed.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Power Steering System Flushing

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTICE: **Do not mix fluid types. Any mixture or any unapproved fluid may lead to seal deterioration and leaks. A leak may ultimately cause loss of fluid, which may result in a loss of power steering assist.**

1. Remove the power steering fluid reservoir cap.

2. Using a sule suction device, remove the power steering fluid from the reservoir.

3. Release the clamp and disconnect the return hose from the reservoir.
   - Remove the clamp from the hose and allow the remaining fluid to drain out of the reservoir.

4. Plug the power steering fluid reservoir inlet port.

5. Attach an extension hose to the return hose.

6. **NOTE:** Do not reuse the power steering fluid that has been flushed from the power steering system.

   Place the open end of the extension hose into a suitable container.

7. If equipped with Hydro-Boost®, apply the brake pedal 4 times.

8. **NOTE:** Do not overfill the reservoir.

   Fill the reservoir as needed with the specified fluid.

9. ***NOTICE:*** **Do not allow the power steering pump to run completely dry of power steering fluid. Damage to the power steering pump may occur.**

   Start the engine while simultaneously turning the steering wheel to lock and then immediately turn the ignition switch to the OFF position.

10. **NOTE:** Avoid turning the steering wheel without the engine running as this may cause air to be pulled into the steering gear.

    NOTE: Do not overfill the reservoir.

    Fill the reservoir as needed with the specified fluid.

11. Repeat Steps 8 and 9, turning the steering wheel in the opposite direction each time, until the fluid exiting the power steering fluid return hose is clean and clear of foreign material.

12. Remove the extension hose from the return hose.

13. Remove the plug from the fluid reservoir inlet port.

14. Install the clamp and connect the power steering return hose to the resevoir.

15. **NOTE:** It is necessary to correctly fill the power steering system to remove any trapped air and completely fill the power steering system components.

    If, after correctly filling the power steering system, there is power steering noise accompanied by evidence of aerated fluid and there are no fluid leaks, it may be necessary to purge the power steering system. For additional information, refer to Power Steering System Purging in this section.

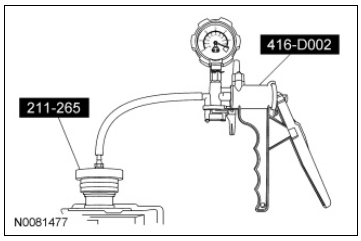
    Fill the power steering system. For additional information, refer to Power Steering System Filling in this section.

Power Steering System Purging

Special Tool(s)

 ST2670-A	Evacuation Cap, Power Steering 211-265
 ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent

Material**ItemSpecification**MERCON® V Automatic Transmission Fluid
XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)MERCON® V



NOTICE: **If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition may occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.**

1. **NOTE:** A whine heard from the power steering pump can be caused by air in the system. The power steering purge procedure must be carried out prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.

   Remove the power steering reservoir cap. Check the fluid.

2. Raise the front wheels off the floor. Refer to the appropriate section in Group 100 for the procedure.

3. Tightly insert the Power Steering Evacuation Cap into the reservoir and connect the Vacuum Pump Kit.

4. Start the engine.

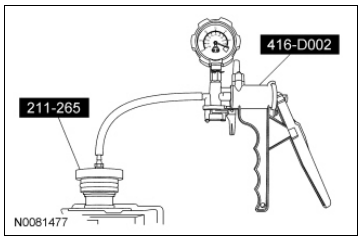
5. Using the Vacuum Pump Kit, apply vacuum and intain the maximum vacuum of 68-85 kPa (20-25 in-Hg).
   - If the Vacuum Pump Kit does not maintain vacuum, check the power steering system for leaks before proceeding. For additional information, refer to Power Steering Fluid Leak Test in this section.

6. If equipped with Hydro-Boost®, apply the brake pedal 4 times.

7. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

   Cycle the steering wheel fully from stop-to-stop 10 times.

8. Stop the engine.



9. Release the vacuum and remove the Vacuum Pump Kit and the Power Steering Evacuation Cap.

10. **NOTE:** Do not overfill the reservoir.

    Fill the reservoir as needed with the specified fluid.

11. Start the engine.

12. Install the Power Steering Evacuation Cap and the Vacuum Pump Kit. Apply and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).

13. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

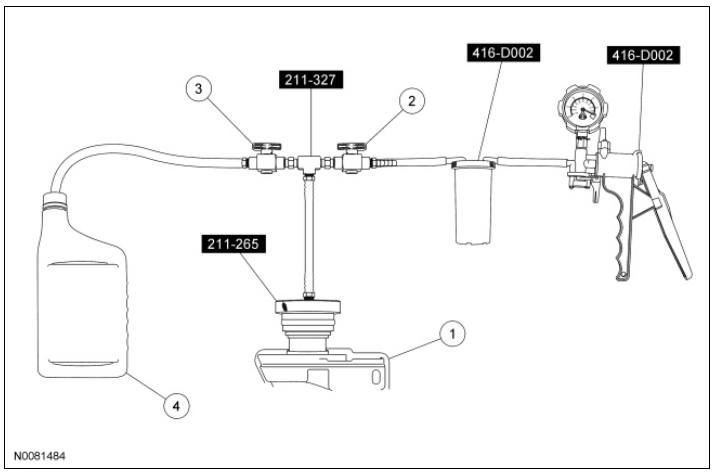
    Cycle the steering wheel fully from stop-to-stop 10 times.

14. Stop the engine, release the vacuum and remove the Vacuum Pump Kit and the Power Steering Evacuation Cap.

15. **NOTE:** Do not overfill the reservoir.

    Fill the reservoir as needed with the specifie fluid and install the reservoir cap.

16. Visually inspect the power steering system for leaks.



Power Steering System Filling

Special Tool(s)

 ST2670-A	Evacuation Cap, Power Steering 211-265
 ST2826-A	Fill Adapter Manifold, Power Steering 211-327
 ST1176-A	Vacuum Pump Kit 416-D002 (D95L-7559-A) or equivalent

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Item	Description
1	Power steering fluid reservoir
2	Control valve (vacuum side)
3	Control valve (fluid container side)
4	Fluid container

1. ***NOTICE:*** **If the air is not purged from the power steering system correctly, prature power steering pump failure may result. The condition can occur on pre-delivery vehicles with**

evidence of aerated fluid or on vehicles that have had steering component repairs.

Remove the power steering fluid reservoir cap.

2. Install the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit as shown in the illustration.

3. **NOTE:** The Power Steering Fill Adapter Manifold control valves are in the OPEN position when the points of the handles face the center of the Power Steering Fill Adapter Manifold.

   Close the Power Steering Fill Adapter Manifold control valve (fluid side).

4. Open the Power Steering Fill Adapter Manifold control valve (vacuum side).

5. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

6. Observe the Vacuum Pump Kit gauge for 30 seconds.

7. If the Vacuum Pump Kit gauge reading drops more than 3 kPa (0.88 in-Hg), correct any leaks in the power steering system or the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit before proceeding.

8. **NOTE:** The Vacuum Pump Kit gauge reading will drop slightly during this step.

   Slowly open the Power Steering Fill Adapter Manifold control valve (fluid side) until power steering fluid completely fills the hose and then close the control valve.

9. Using the Vacuum Pump Kit, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

10. Close the Power Steering Fill Adapter Manifold control valve (vacuum side).

11. Slowly open the Power Steering Fill Adapter Manifold control valve (fluid side).

12. Once power steering fluid enters the fluid reservoir and reaches the minimum fluid level indicator line on the reservoir, close the Power Steering Fill Adapter Manifold control valve (fluid side).

13. Remove the Power Steering Evacuation Cap, Power Steering Fill Adapter Manifold and Vacuum Pump Kit.

14. Install the reservoir cap.

15. ***NOTICE:*** **Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.**

    NOTE: There will be a slight drop in the power steering fluid level in the reservoir when the engine is started.

    Start the engine and turn the steering wheel from stop-to-stop.

16. Turn the ignition switch to the OFF position.

17. **NOTE:** Do not overfill the reservoir.

    Remove the reservoir cap and fill the reservoir with the specified fluid.

18. Install the reservoir cap.

Power Steering

Hydraulic Power Assist Steering (HPAS)

The hydraulic power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Power steering pressure and return lines/hoses
- Power steering fluid cooler
- Steering gear
- Inner tie rod
- Outer tie rod

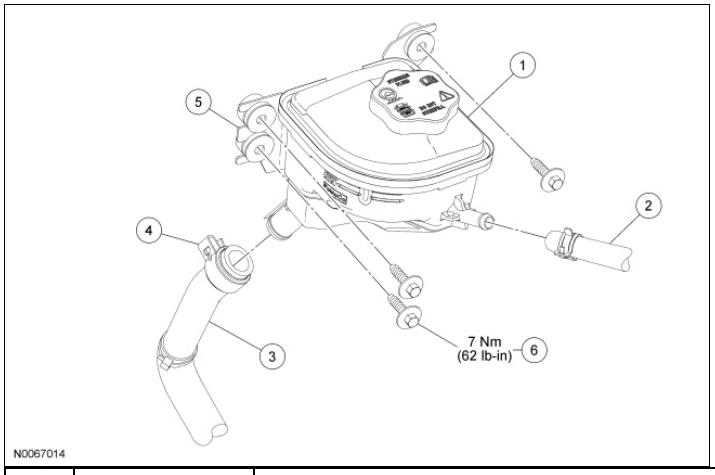
The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by a non-adjustable (stretchy) belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is then trapped between the pump vanes and moved to the high-pressure side of the pump creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high-pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid before returning it to the pump.

Electronic Power Assist Steering (EPAS)

The Electronic Power Assist Steering (EPAS) consists of the following components:

- Steering gear
- Outer tie rod
- Inner tie rod

The EPAS system utilizes a rack-and-pinion type steering gear. Power assist is provided by a motor that is connected to the steering rack by a belt and a pulley and bearing assembly. The steering gear and motor/module are serviced as an assembly. A new steering gear includes inner tie rods, however, the inner and outer tie rods can also be serviced separately.



Power Steering

Refer to Section 211-00A or Section 211-00B .

Power Steering Fluid Reservoir - 3.5L

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Item	Part Number	Description
1	3A697	Power steering fluid reservoir
2	3A713A	Power steering return hose and clamp
3	3691	Power steering pump supply hose
4	-	Power steering pump supply hose clamp (part of 3691)
5	3490	Power steering fluid reservoir bracket
6	W712963	Power steering fluid reservoir bracket bolt (3 required)

Removal and Installation

NOTICE: **When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

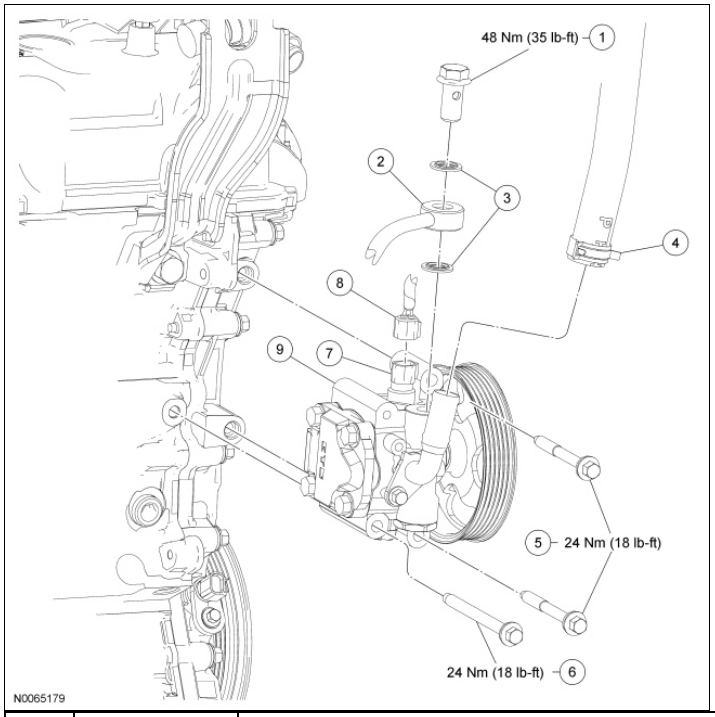
1. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.

2. Release the clamp and disconnect the power steering return hose from the power steering fluid reservoir.
3. Remove the 3 power steering fluid reservoir bracket bolts.
    - To install, tighten to 7 Nm (62 lb-in).

4. Release the power steering pump supply hose clamp and disconnect the supply hose from the reservoir.

5. **NOTE:** If a new power steering fluid reservoir is being installed, a new reservoir mounting bracket must also be installed.

   Remove the power steering fluid reservoir and bracket as an assembly.



6. To install, reverse removal procedure.

7. Fill the power steering system. For additional information, refer to Section 211-00B .

Power Steering Pump - 3.5L

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Item	Part Number	Description
1	-	Pressure line-to-power steering pump banjo bolt (part of 3A705 service kit)
2	-	Power steering pressure line (part of 3A719 service kit)
3	-	Power steering pressure line seals (part of 3A705 service kit)
4	3691	Power steering pump supply hose
5	W701526	Power steering pump bolts (2 required)
6	W701234	Power steering pump bolt
7	-	Power Steering Pressure (PSP) switch electrical connector
8	3N824	PSP switch
9	3A696	Power steering pump

Removal and Installation

NWhen repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

1. Remove the power steering fluid reservoir. For additional information, refer to Power Steering Fluid Reservoir - 3.5L in this section.

2. Remove the power steering pump belt. For additional information, refer to Section 303-05C .

3. Disconnect the Power Steering Pressure (PSP) switch electrical connector.

4. If equipped, detach the engine block heater electrical harness from the power steering pressure line.

5. Remove the pressure line-to-power steering pump banjo bolt and disconnect the line from the power steering pump.
    - Discard the bolt and 2 seals.
    - To install, tighten the new bolt to 48 Nm (35 lb-ft).

6. Remove the 3 bolts and the power steering pump.
    - To install, tighten to 24 Nm (18 lb-ft).

7. ***NOTICE:*** **A new banjo bolt and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump or a fluid leak may occur.**

   To install, reverse the removal ocedure.

8. Fill the power steering system. For additional information, refer to Section 211-00B .

Power Steering Pump to Steering Gear Pressure Line

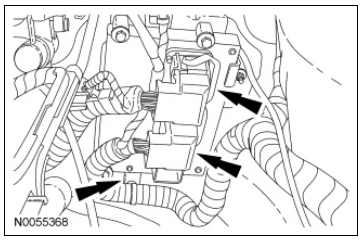
Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (orXT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Item	Part Number	Description
1	W703836	Pressure line bracket-to-RH valve cover stud nut
2	-	Power steering pressure line (part of 3A719 service kit)
3	-	Pressure line-to-power steering pump banjo bolt (part of 3A719 service kit)
4	-	Power steering pressure line seals (part of 3A719 service kit)
5	-	Pressure line-to-steering gear banjo bolt (part of 3A719 service kit)
6	W712115	Pressure line bracket-to-steering gear bolt
7	-	Power steering pressure line seals (part of 3A719 service kit)

Removal and Installation

NOTICE: **When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the battery and battery tray. For additional information, refer to Section 414-01 .

3. **NOTE:** Battery mounting bracket removed for clarity.

   Disconnect the electrical connectors from the PCM.

   - Detach harness retainer from the PCM bracket, and position the harness aside.

4. Remove the lower cowl panel grille. For additional information, refer to Section 501-02 .

5. Remove the pressure line bracket-to-RH valve cover stud nut.
   - Detach the electrical harness retainer from the pressure line bracket.
   - To install, tighten to 9 Nm (80 lb-in).

6. If equipped, detach the engine block heater harness from the power steering pressure line.

7. Remove the pressure line bracket-to-steering gear bolt.
   - To install, tighten to 15 Nm (133 lb-in).

8. Remove the pressure line-to-power steering pump banjo bolt.
   - Discard the bolt and the 2 seals.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).

9. Remove the pressure line-to-steering gear banjo bolt and remove the power steering pressure line.
   - Discard the bolt and the 2 seals.
   - To install, tighten the new bolt to 55 Nm (41 lb-ft).

10. ***NOTICE:*** **New banjo bolts and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump and/or the power steering gear or a fluid leak may occur.**

    To install, reverse removal procedure.

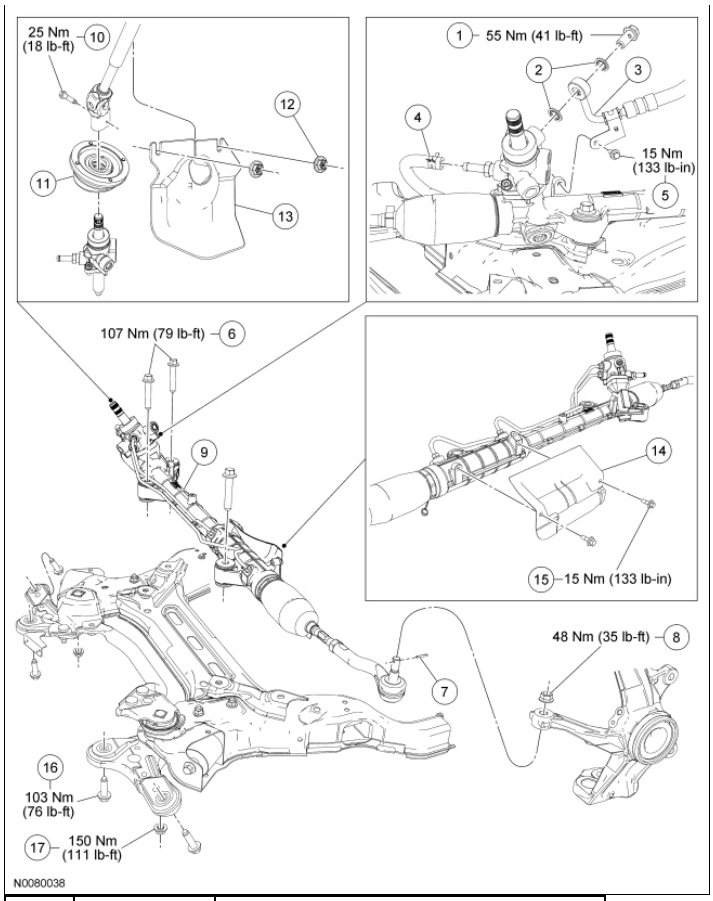
11. Fill the power steering system. For additional information, refer to Section 211-00B .

Power Steering Fluid Cooler - 3.5L

Removal and Installation

NOTE: The power steering fluid cooler is integral to the A/C condenser core.

For additional information, refer to Section 412-01 .



Steering Gear - 3.5L Front Wheel Drive (FWD)

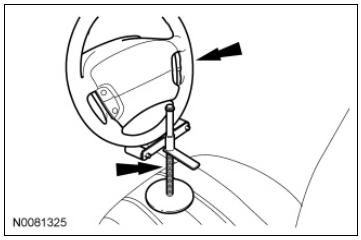
Special Tool(s)

 ST2945-A	Ball Joint Separator 204-592

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Item	Part Number	Description
1	-	Pressure line-to-steering gear banjo bolt (part of 3A705 service kit)



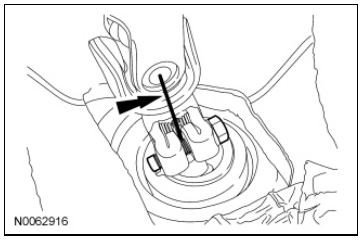
2	-	Power steering pressure line seals (part of 3A705 service kit)			
3	-	Power steering pressure line (part of 3A719 service kit)			
4	3A713	Steering gear-to-fluid cooler return hose			
5	712155	Pressure line bracket-to-steering gear bolt	6	3C497	Steering gear bolts (3 required)
7	99221	Cotter pin (2 required)			
8	6E5C	Outer tie-rod end nut (2 required)			
9	3504	Steering gear			
10	3R827	Steering column shaft-to-steering gear bolt			
11	3611B	Steering gear/dash seal			
12	W704904	Lower steering column shaft joint cover nut (2 required)			
13	3611A	Lower steering column shaft joint cover			
14	391727	Steering gear heat shield			
15	3530B	Steering gear heat shield bolt (2 required)			
16	3C496	Subframe bolt (4 required)			
17	W520416	Subframe nut (2 required)			

Removal

NOTICE: **When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.



2. Remove the wheels and tires. For additional information, refer to Section 204-04 .

3. Remove the 2 lower steering column shaft joint cover nuts and the cover.

4. ***NOTICE:*** **Make sure to correctly index-mark the steering gear-to-steering column shaft position or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage.**

   Index-mark the steering column shaft-to-steering gear position for reference during installation.

5. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

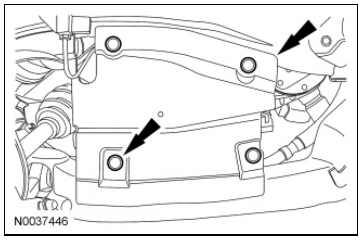
   Remove the bolt and disconnect the steering column shaft from the steering gear.

   - Discard the bolt.

6. ***NOTICE:*** **Remove the steering gear/dash seal or damage to the seal may occur.**

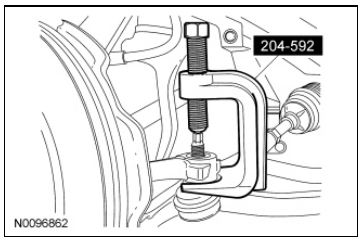
   Pulling upward, remove the steering gear/dash seal.

7. If equipped, remove the 7 screws and the underbody cover.



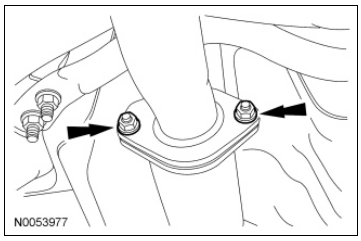
8. **NOTE:** RH side shown, LH side similar.

   Remove the 4 screws from each side and position the RH and LH fender splash shield aside.



9. Remove the 6 pin-type retainers (4 shown) from the LH and RH splash shield.

10. Remove the 2 outer tie-rod end cotter pins and nuts.
    - Discard the cotter pins.



11. ***NOTICE:*** **Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.**

    Using the Ball Joint Separator, separate the outer tie-rod ends from the knuckle.

12. **NOTE:** Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.

    Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.

13. Remove the 2 bolts and the steering gear heat shield.

14. Remove the pressure line bracket-to-steering gear bolt.

15. Remove the pressure line-to-steering gear banjo bolt.
    - Discard the bolt and 2 seals.

16. Support the rear of the subframe with a suitable jack and remove the 4 rear subframe bolts and 2 rear subframe nuts.

17. Lower the rear of the front subframe 76.2 mm (3 in) with the support of the jack.

18. Release the clamp and disconnect the steering gear-to-fluid cooler return hose.

19. Remove the 3 steering gear bolts.

20. Remove the steering gear from the LH side of the vehicle.

Installation

1. From the LH side of the vehicle, install the steering gear.

2. Install the 3 steering gear bolts.
   - Tighten to 107 Nm (79 lb-ft).

3. Release the clamp and connect the steering gear-to-fluid cooler return hose.

4. Using a suitable jack, raise the rear of the front subframe.

5. Install the subframe support bracket, 4 rear subframe bolts and 2 rear subframe nuts.
   - To install, tighten the bolts and nuts in 2 stages.
     - ♦ Stage 1: Tighten the nuts to 150 Nm (111 lb-ft).
     - ♦ Stage 2: Tighten the bolts to 103 Nm (76 lb-ft).

6. ***NOTICE:*** **New banjo bolts and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump and/or the steering gear or a fluid leak may occur.**

   Install the new pressure line-to-steering gear banjo bolt.

   - Install 2 new seals.
   - Tighten to 55 Nm (41 lb-ft).

7. Install the pressure line bracket-to-steering gear bolt.
   - Tighten to 15 Nm (133 lb-in).

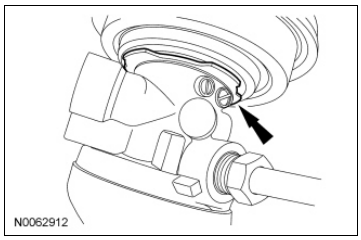
8. Install the steering gear heat shield and the 2 bolts.
   - Tighten to 15 Nm (133 lb-in).

9. **NOTE:** Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.

   Position the exhaust flexible pipe and install 2 new catalytic converter-to-exhaust flexible pipe nuts.

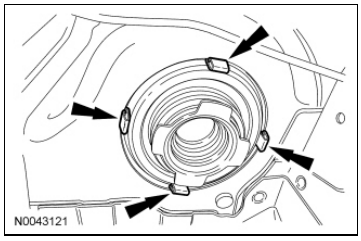
   - Tighten to 40 Nm (30 lb-ft).

10. Install the 2 outer tie-rod end nuts.
    - Tighten to 48 Nm (35 lb-ft).
    - Install 2 new cotter pins.



11. Install the LH and RH splash shield and the 6 pin-type retainers.

12. Install the RH and LH fender splash shield and the 4 screws from each side.

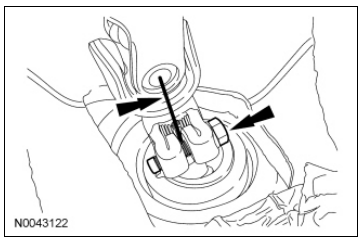


13. If equipped, install the underbody splash shield and the 7 screws.
    - Tighten to 7 Nm (62 lb-in).

14. ***NOTICE:*** **The steering gear/dash seal must be fully seated in the steering gear valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment and damage the vehicle interior.**

Applying hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove.

15. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.



16. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    NOTICE: **Make sure to correctly align the index marks when installing the steering gear-to-steering column shaft or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage.**

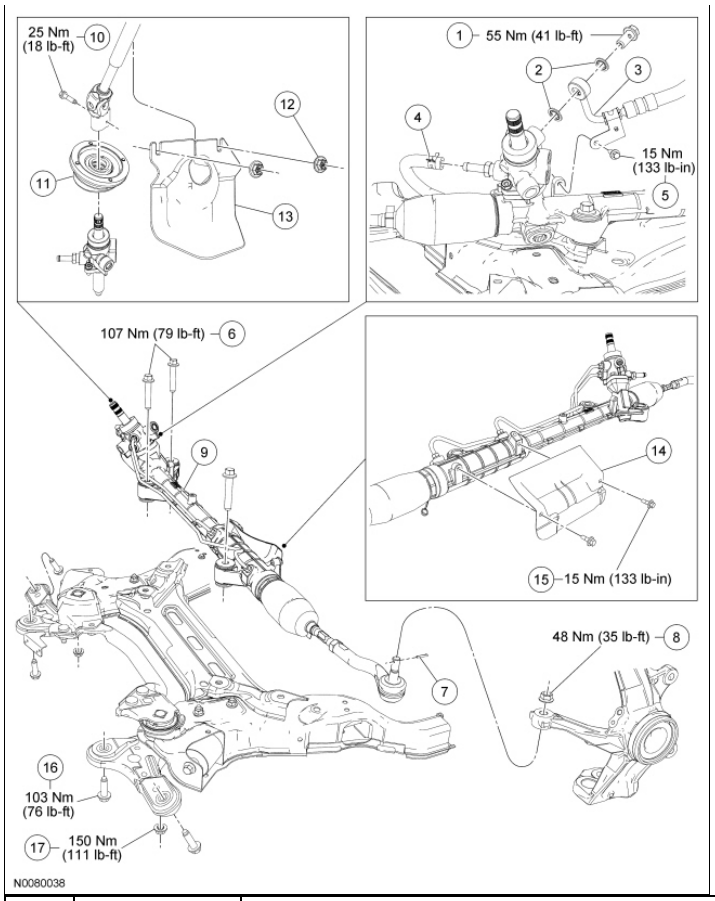
    With the index marks properly aligned, connect the steering column shaft to the steering gear and install the new bolt.

    - Tighten to 25 Nm (18 lb-ft).

17. Install the lower steering column shaft joint cover and the 2 nuts.

18. Fill the power steering system. For additional information, refer to Section 211-00B .

19. Check and, if necessary, adjust the front toe. For additional information, refer to Section 204-00 .



Steering Gear - 3.5L All Wheel Drive (AWD)

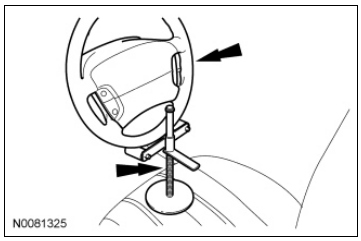
Special Tool(s)

 ST2945-A	Ball Joint Separator 204-592

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Item	Part Number	Description
1	-	Pressure line-to-steering gear banjo bolt (part of 3A705 service kit)



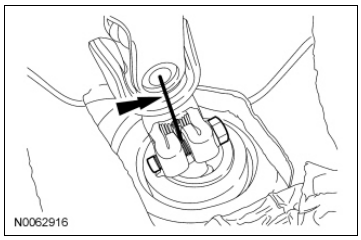
2	-	Power steering pressure line seals (part of 3A705 service kit)
3	-	Power steering pressure line (part of 3A719 service kit)
4	3A713	Steering gear-to-fluid cooler return hose
5	W712155	Pressure line bracket-to-steering gear bolt
6	3C497	Steering gear bolts (3 required)
7	99221	Cotter pin (2 required)
8	6E5C	Outer tie-rod end nut (2 required)
9	3504	Steering gear
10	3R827	Steering column shaft-to-steering gear bolt
11	3611B	Steering gear/dash seal
12	W704904	Lower steering column shaft joint cover nut (2 required)
13	3611A	Lower steering column shaft joint cover
14	391727	Steering gear heat shield
15	3530B	Steering gear heat shield bolt (2 required)
16	3C496	Subframe bolt (4 required)
17	W520416	Subframe nut (2 required)

Removal

NOTICE: **When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.



2. Remove the wheels and tires. For additional information, refer to Section 204-04 .

3. Remove the 2 lower steering column shaft joint cover nuts and the cover.

4. ***NOTICE:*** **Make sure to correctly index-mark the steering gear-to-steering column shaft position or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage.**

   Index-mark the steering column shaft-to-steering gear position for reference during installation.

5. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Remove the bolt and disconnect the steering column shaft from the steering gear.

   - Discard the bolt.

6. ***NOTICE:*** **Remove the steering gear/dash seal or damage to the seal may occur.**

   Pulling upward, remove the steering gear/dash seal.

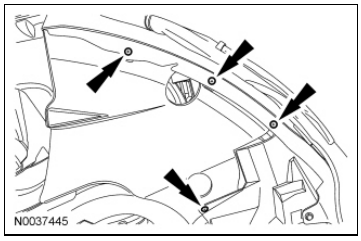
7. Remove the battery and battery tray. For additional information, refer to Section 414-01 .

8. **NOTE:** Battery mounting bracket removed for clarity.

   Disconnect the electrical connectors from the PCM.

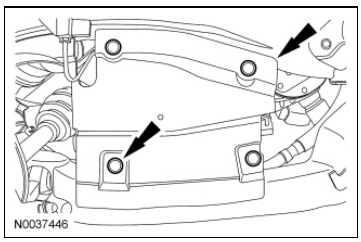
   - Detach the wiring harness retainer from the PCM bracket and position the harness aside.

9. Remove the pressure line-to-steering gear banjo bolt.
   - Discard the bolt and 2 seals.



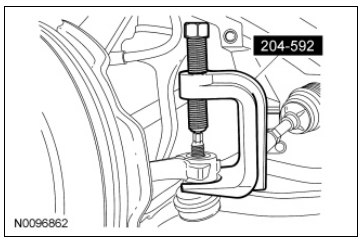
10. Remove the pressure line bracket-to-steering gear bolt.

11. If equipped, remove the 7 screws and the underbody cover.



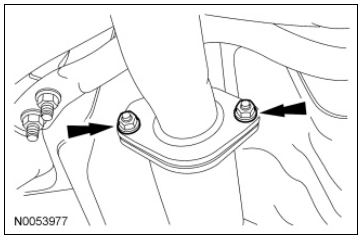
12. **NOTE:** RH side shown, LH side similar.

    Remove the 4 screws from each side and position the RH and LH fender splash shield aside.



13. Remove the 6 pin-type retainers (4 shown) from the LH and RH splash shield.

14. Remove the 2 outer tie-rod end cotter pins and nuts.
    - Discard the cotter pins.



15. ***NOTICE:*** **Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.**

    Using the Ball Joint Separator, separate the outer tie-rod ends from the knuckle.

16. **NOTE:** Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.

    Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.

17. Remove the 2 bolts and the steering gear heat shield.

18. Support the rear of the subframe with a suitable jack and remove the 4 rear subframe bolts and 2 rear subframe nuts.

19. Lower the rear of the front subframe 76.2 mm (3 in) with the support of the jack.

20. Remove the pressure line bracket-to-steering gear bolt.

21. Release the clamp and disconnect the steering gear-to-fluid cooler return hose.

22. Remove the 3 steering gear bolts.

23. Remove the steering gear from the LH side of the vehicle.

Installation

1. From the LH side of the vehicle, install the steering gear.

2. Install the 3 steering gear bolts.
   - Tighten to 107 Nm (79 lb-ft).

3. Release the clamp and connect the steering gear-to-fluid cooler return hose.

4. Using a suitable jack, raise the rear of the front subframe.

5. Install the subframe support bracket, 4 rear subframe bolts and 2 rear subframe nuts.
   - To install, tighten the bolts and nuts in 2 stages.
     - Stage 1: Tighten the nuts to 150 Nm (111 lb-ft).
     - Stage 2: Tighten the bolts to 103 Nm (76 lb-ft).

6. Install the steering gear heat shield and the 2 bolts.
   - Tighten to 15 Nm (133 lb-in).

7. **NOTE:** Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.

   Position the exhaust flexible pipe and install 2 new catalytic converter-to-exhaust flexible pipe nuts.

   - Tighten to 40 Nm (30 lb-ft).

8. Install the 2 outer tie-rod end nuts.
   - Tighten to 48 Nm (35 lb-ft).
   - Install 2 new cotter pins.

9. Install the LH and RH splash shield and the 6 pin-type retainers.

10. Install the RH and LH fender splash shield and the 4 screws from each side.

11. If equipped, install the underbody splash shield and bolts.
    - Tighten to 7 Nm (62 lb-in).

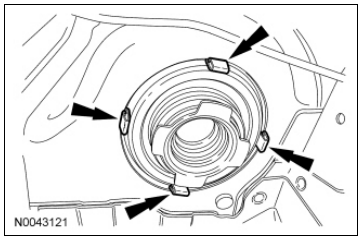
12. Install the pressure line bracket-to-steering gear bolt.
    - Tighten to 15 Nm (133 lb-in).

13. ***NOTICE:*** **New banjo bolts and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump and/or the steering gear or a fluid leak may occur.**

    Install the new pressure line-to-steering gear banjo bolt.

    - Install 2 new seals.
    - Tighten to 55 Nm (41 lb-ft).

14. Connect the electrical connectors to the PCM.
    - Attach the wiring harness retainer to the PCM bracket.

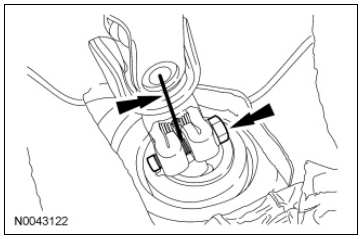


15. Install the battery tray and battery. For additional information, refer to Section 414-01 .

16. ***NOTICE:*** **The steering gear/dash seal must be fully seated in the steering gear valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment and damage the vehicle interior.**

    Applying hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove.

17. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.



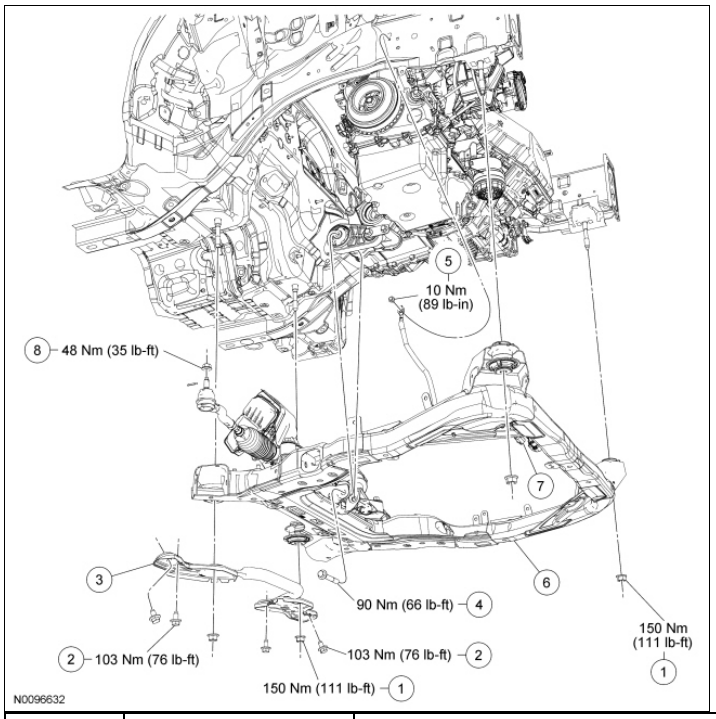
18. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    NOTICE: **Make sure to correctly align the index marks when installing the steering gear-to-steering column shaft or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage.**

    With the index marks properly aligned, connect the steering column shaft to the steering gear and install the new bolt.

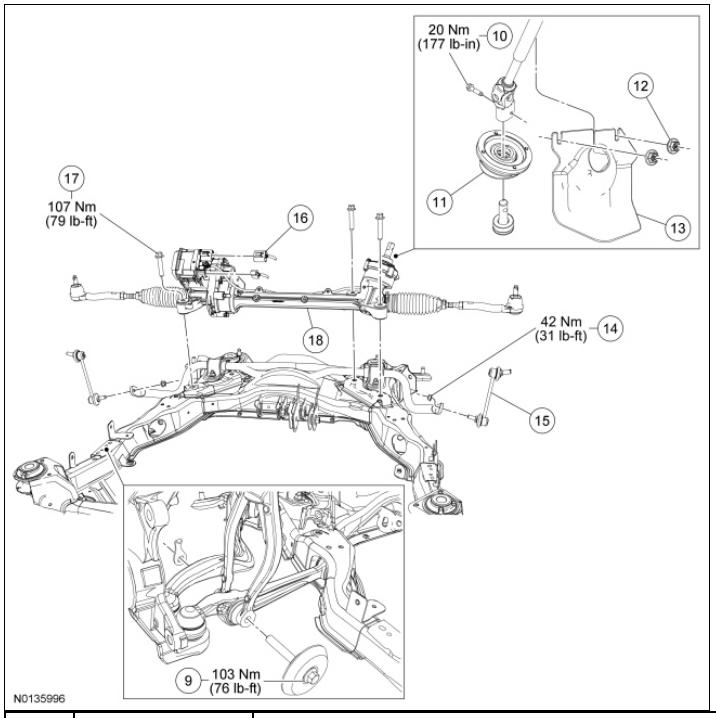
    - Tighten to 25 Nm (18 lb-ft).

19. Install the lower steering column shaft joint cover and the 2 nuts.



20. Fill the power steering system. For additional information, refer to Section 211-00B .

21. Check and, if necessary, adjust the front toe. For additional information, refer to Section 204-00 .

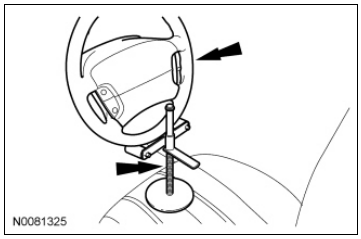


Steering Gear - 2.5L Hybrid and 3.0L All Wheel Drive (AWD)

Special Tool(s)

 ST2945-A	Ball Joint Separator 204-592
 ST1682-A	Powertrain Lift 300-OTC1585AE or equivalent

Item	Part Number	Description
1	W520416	Front subframe nuts (4 required)
2	3C496	Front subframe support bracket bolts (4 required)
3	5884	Subframe support bracket
4	W500545	Roll restrictor bolt
5	W506410	Electronic P Assist Steering (EPAS) ground wire bolt
6	5C145	Front subframe
7	-	EPAS jumper harness connector (2 required)
8	6E5C	Tie-rod end nut (2 required)



Item	Part Number	Description
9	W500550	Damper fork-to-front lower arm bolt (2 required)
10	3R827	Steering column shaft-to-steering gear bolt
11	3611B	Steering gear/dash seal
12	W704904	Lower steering column shaft joint cover nut (2 required)
13	3611A	Lower steering column shaft joint cover
14	3C494	Lower stabilizer bar link nut (2 required)
15	3053/3052	Stabilizer bar link (2 required)
16	-	EPAS electrical connector (part of 3F720) (2 required)
17	3	Steering gear bolt (3 required)
18	3504	Steering gear

Removal

1. If installing a new steering gear, connect the scan tool and upload the module configuration information from the Power Steering Control Module (PSCM). For additional information, refer to Section 418-01 .

2. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

3. Remove the 2 lower steering column shaft joint cover nuts and the cover.

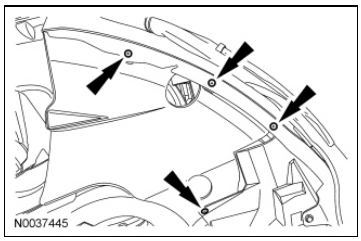
4. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Remove the bolt and disconnect the steering column shaft from the steering gear.

   - Discard the bolt.

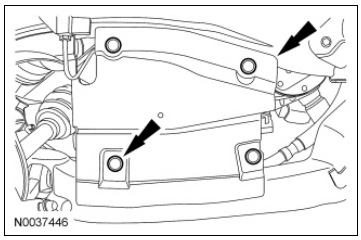
5. ***NOTICE:*** **Remove the steering gear/dash seal or damage to the seal may occur.**

   Pulling upward, remove the steering gear/dash seal.



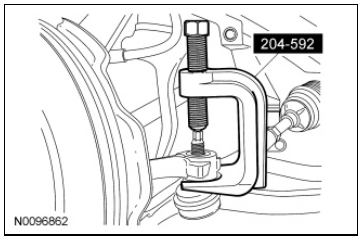
6. Remove the wheels and tires. For additional information, refer to Section 204-04 .

7. If equipped, remove the 7 screws and the underbody cover.

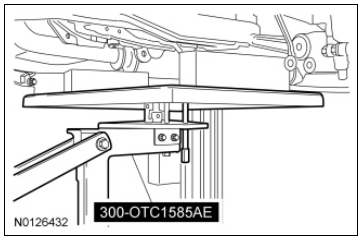


8. **NOTE:** RH side shown, LH side similar.

   Remove the 4 screws from each side and position the RH and LH fender splash shields aside.



9. Remove the 6 pin-type retainers (4 shown) from the LH and RH splash shield.



10. Remove the 2 outer tie-rod end cotter pins and nuts.
    - Discard the cotter pins.

11. ***NOTICE:*** **Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.**

    Using the Ball Joint Separator, separate the outer tie-rod ends from the wheel knuckles.

12. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .
13. Remove the engine roll restrictor bolt.
14. Disconnect the 2 Electronic Power Assist Steering (EPAS) jumper harness electrical connectors and detach the 3 wiring harness retainers.
15. Remove the bolt and position the ground wire aside.
16. Remove the 2 (one on each side) lower stabilizer bar link nuts and separate the links from the stabilizer bar.
17. Remove the 2 damper fork-to-front lower arm bolts and flagnuts.
18. Position the Powertrain Lift under the subframe.

19. Remove the 2 rear mounting nuts and washers from the front subframe.
20. Remove the 4 bolts and the subframe support bracket.
21. Remove the 2 front mounting nuts and washers from the front subframe.
22. Lower the subframe to gain access to the steering gear.
23. Disconnect the 2 EPAS electrical connectors and the wiring retainer.
24. Remove the 3 bolts and the steering gear.

Installation

1. Position the steering gear and install the 3 bolts.
    - Tighten to 107 Nm (79 lb-ft).
2. Connect the 2 EPAS electrical connectors and the wiring retainer.
3. Raise the subframe.
4. Install the 2 front subframe nuts and washers.
    - Tighten to 150 Nm (111 lb-ft).

5. Install the subframe support bracket, 4 rear subframe bolts and 2 rear subframe nuts.
    - To install, tighten the bolts and nuts in 2 stages.
        - ♦ Stage 1: Tighten the nuts to 150 Nm (111 lb-ft).
        - ♦ Stage 2: Tighten the bolts to 103 Nm (76 lb-ft).

6. Install the 2 damper fork-to-front lower arm bolts and flagnuts.
    - Tighten to 103 Nm (76 lb-ft).

7. Connect the stabilizer bar links and install the 2 nuts.
    - Tighten to 42 Nm (31 lb-ft).

8. Position the ground wire and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

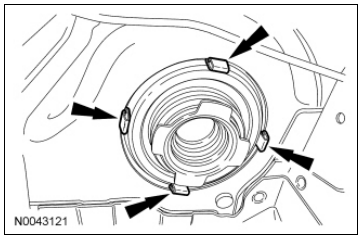
9. Connect the 2 EPAS jumper harness electrical connectors and attach the 3 wiring harness retainers.

10. Install the engine roll restrictor bolt.
    - Tighten to 90 Nm (66 lb-ft).

11. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .

12. Position the 2 outer tie-rod ends and install the nuts.
    - Tighten to 48 Nm (35 lb-ft).
    - Install 2 new cotter pins.

13. Install the LH and RH splash shield and the 6 pin-type retainers.



14. Install the RH and LH fender splash shields and the 4 screws from each side.

15. If equipped, install the underbody cover and the 7 screws.

16. ***NOTICE:*** **The steering gear/dash seal must be fully seated in the steering gear valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment, and damage the vehicle interior.**

    Applying hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove.

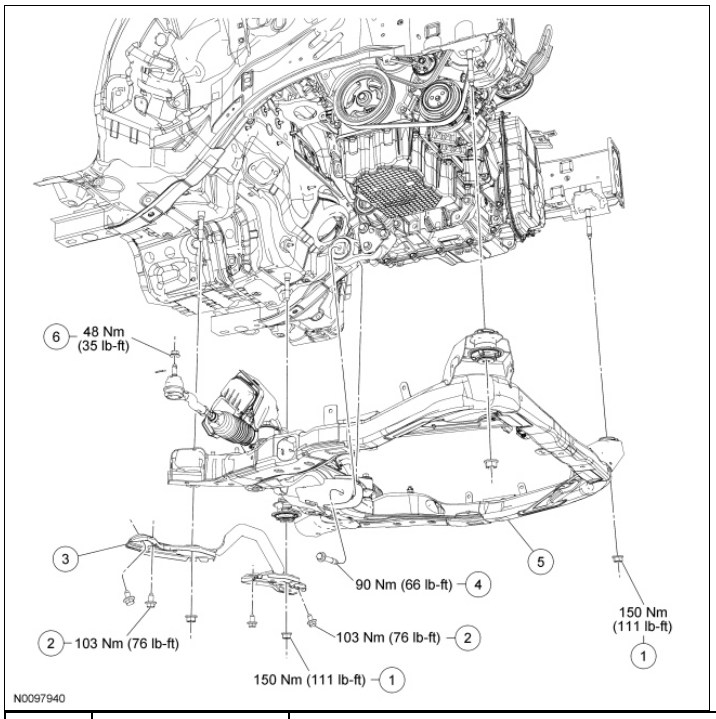
17. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.

18. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

With the locator on the input shaft correctly aligned, connect the steering column shaft to the steering gear and install the new bolt.

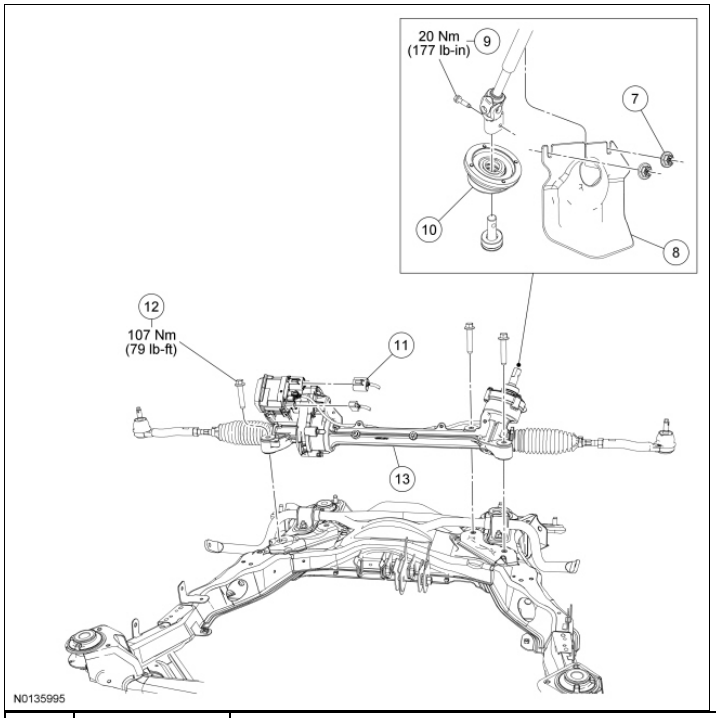
- Tighten to 20 Nm (177 lb-in).

19. Install the lower steering column shaft joint cover and the 2 nuts.



20. When installing a new steering gear, it must be configured (using vehicle as-built data or module configuration information retrieved earlier in this procedure). For additional information on configuration, refer to Programmable Module Installation (PMI) in Section 418-01 .

21. Check, and If necessary, adjust the front toe. Refer to Section 204-00 .



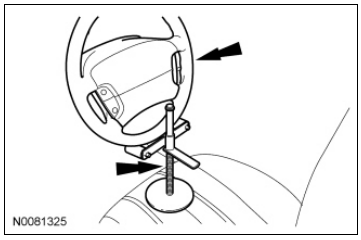
Steering Gear - 2.5L Non-Hybrid and 3.0L Front Wheel Drive (FWD)

Special Tool(s)

 ST2945-A	Ball Joint Separator 204-592

Item	Part Number	Description
1	W520416	Front subframe nuts (4 required)
2	3C496	Front subframe support bracket bolts (4 required)
3	5884	Subframe support bracket
4	W500545	Roll restrictor bolt
5	5C145	Front subframe
6	6E5C	Tie-rod end nut (2 required)

Item	Part Number	Description
7	W704904	Lower steering column shaft joint cover nut (2 required)
8	3611A	Lower steering column shaft joint cover
9	3R827	Steering column shaft-to-steering gear bolt
10	3611B	Steering gear/dash seal
11	-	Electronic Power Assist Steering (EPAS) electrical connector (part of 3F720) (2 required)
12	3C497	Steering gear bolt (3 required)
13	3504	Steering gear



Removal

All vehicles

1. If installing a new steering gear, connect the scan tool and upload the module configuration information from the Power Steering Control Module (PSCM). For additional information, refer to Section 418-01 .

2. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

3. Remove the 2 lower steering column shaft joint cover nuts and the cover.

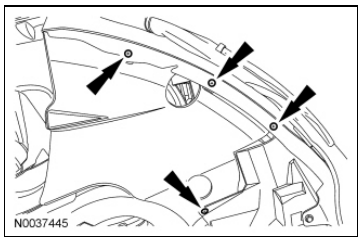
4. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Remove the bolt and disconnect the steering column shaft from the steering gear.

   - Discard the bolt.

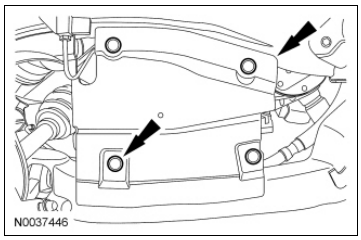
5. ***NOTICE:*** **Remove the steering gear/dash seal or damage to the seal may occur.**

   Pulling upward, remove the steering gear/dash seal.



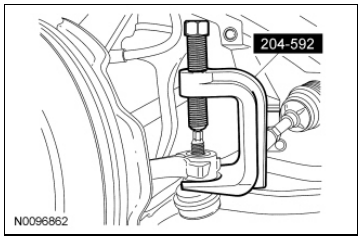
6. Remove the wheels and tires. For additional information, refer to Section 204-04 .

7. If equipped, remove the 7 screws and the underbody cover.



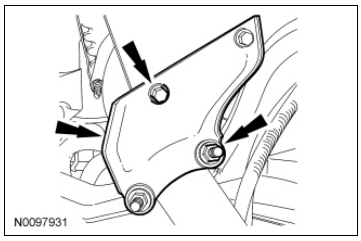
8. **NOTE:** RH side shown, LH side similar.

   Remove the 4 screws from each side and position the RH and LH fender splash shields aside.



9. Remove the 6 pin-type retainers (4 shown) from the LH and RH splash shields.

10. Remove the 2 outer tie-rod end cotter pins and nuts.
    - Discard the cotter pins.



11. ***NOTICE:*** **Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.**

    Using the Ball Joint Separator, separate the outer tie-rod ends from the knuckle.

Vehicles equipped with 2.5L engines

12. Remove the 2 bolts, 2 nuts and the exhaust bracket with U-clamp.

Vehicles equipped with 3.0L engines

13. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .

All vehicles

14. Disconnect the 2 EPAS electrical connectors and the wiring retainer.

15. Remove the engine roll restrictor bolt.

16. Support the rear of the subframe with a suitable jack, remove the 4 rear subframe bolts and 2 rear subframe nuts and the subframe support bracket.
    - Loosen the 2 front subframe nuts.

17. Using the jack, lower the rear of the front subframe 76.2 mm (3 in).

18. Remove the 3 steering gear bolts.

19. Remove the steering gear from the vehicle.

Installation

All vehicles

1. Install the steering gear.

2. Install the 3 steering gear bolts.
    - Tighten to 107 Nm (79 lb-ft).

3. Using the jack, raise the rear of the front subframe.

4. Tighten the 2 front subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

5. Install the subframe support bracket, the 4 rear subframe bolts and the 2 rear subframe nuts.

- To install, tighten the bolts and nuts in 2 stages.
  - ♦ Stage 1: Tighten the nuts to 150 Nm (111 lb-ft).
  - ♦ Stage 2: Tighten the bolts to 103 Nm (76 lb-ft).

6. Install the engine roll restrictor bolt.
   - Tighten to 90 Nm (66 lb-ft).

7. Connect the 2 EPAS electrical connectors and the wiring retainer.

Vehicles equipped with 3.0L engines

8. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .

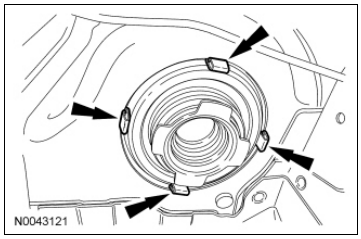
Vehicles equipped with 2.5L engines

9. Install the 2 bolts, 2 nuts and the exhaust bracket with U-clamp.
   - Tighten to 30 Nm (22 lb-ft).

All vehicles

10. Position the outer tie-rod ends and install the 2 nuts.
    - Tighten to 48 Nm (35 lb-ft).
    - Install 2 new cotter pins.

11. Install the LH and RH splash shield and the 6 pin-type retainers.



12. Install the RH and LH fender splash shields and the 4 screws from each side.

13. If equipped, install the underbody splash shield and bolts.
    - Tighten to 7 Nm (62 lb-in).

14. ***NOTICE:*** **The steering gear/dash seal must be fully seated in the steering gear valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment and damage the vehicle interior.**

    Applying hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove.

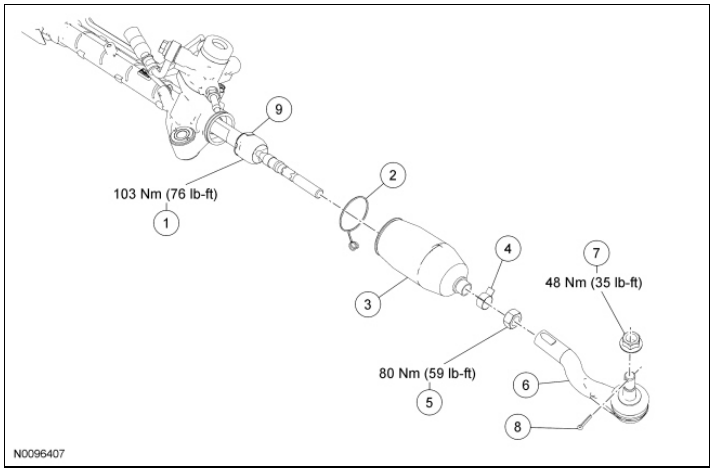
15. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.

16. ***NOTICE:*** **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

With the locator on the input shaft properly aligned, connect the steering column shaft to the steering gear and install the new bolt.

- Tighten to 20 Nm (177 lb-in).

17. Install the lower steering column shaft joint cover and the 2 nuts.



18. When installing a new steering gear, it must be configured (using vehicle as-built data or module configuration information retrieved earlier in this procedure). For additional information on configuration, refer to Programmable Module Installation (PMI) in Section 418-01 .

Tie Rod - Inner

Material

Item	Specification
Premium Long-Life Grease XG-1-C or XG-1-K (US); CXG-1-C (Canada)	ESA-M1C75-B

NOTE: Hydraulic Power Assist Steering (HPAS) shown, Electronic Power Assist Steering (EPAS) similar.

Item	Part Number	Description
1	3280	Hydraulic Power Assist Steering (HPAS) inner tie-rod end (also part of 3332B service kit)
1	-	Electronic Power Assist Steering (EPAS) inner tie-rod end (part of 3280 service kit)
2	3K745	HPAS inner bellows boot clamp (also part of 3332B service kit)
2	-	EPAS inner bellows boot clamp (part of 3280 service kit)
3	3K661	HPAn> bellows boot (also part of 3332B service kit)
3	-	EPAS bellows boot (part of 3280 service kit)
4	3C650	HPAS outer bellows boot clamp (also part of 3332B service kit)
4	-	EPAS outer bellows boot clamp (part of 3280 service kit)
5	W713882	Tie-rod jam nut (all)
6	3A130	Outer tie-rod end (all)
7	W302124	Outer tie-rod end nut (all)

8	W302420	Cotter pin (all)
9	-	Retaining washer (Hydraulic Power Assist Steering (HPAS) only) (part of 3280 and 3332B service kit)

Removal and Installation

NOTICE: **When servicing inner tie rods, a new bellows boot and clamps must be installed or a leak may occur causing steering gear damage.**

1. Remove the steering gear. For additional information, refer to Steering Gear - 3.5L Front Wheel Drive (FWD) , Steering Gear - 3.5L All Wheel Drive (AWD) , Steering Gear - 2.5L Non-Hybrid and 3.0L Front Wheel Drive (FWD) or Steering Gear - 2.5L Hybrid and 3.0L All Wheel Drive (AWD) in this section.

2. ***NOTICE:*** **Position the steering gear in a soft-jaw vise or damage to the steering gear may occur.**

   Loosen the tie-rod jam nut and remove the outer tie-rod end.

   - To install, tighten to 80 Nm (59 lb-ft).

3. **NOTE:** It will be necessary to partially remove the LH bellows boot to hold the rack piston when servicing the RH inner tie rod.

   If servicing the RH inner tie rod, remove the LH inner bellows boot clamp and slide the bellows boot away from the steering gear housing.

   - Discard the clamp.

4. Remove and discard the 2 bellows boot clamps and the bellows boot for the inner tie rod being serviced.

5. On Hydraulic Power Assist Steering (HPAS) steering gears, bend back the crimped edges of the retaining washer.

6. *NOTICE:* The steering gear rack piston must be held while loosening or tightening the inner tie rod or damage to the steering gear may occur.Using a suitable wrench, hold the piston shaft.

7. Using a suitable wrench, remove the inner tie-rod end.
   - To install, tighten to 103 Nm (76 lb-ft).

8. ***NOTICE:*** **When installing the bellows boot(s), grease must be applied to the bellows boot-to-steering gear housing mating surfaces or a leak may occur causing steering gear damage.**

   NOTE: On HPAS steering gears, the inner tie-rod retaining washer must be crimped after the inner tie rod has been tightened.

   To install, reverse the removal procedure.

   - When installing, apply grease to the bellows boot-to-steering gear mating surfaces.
   - Make sure that the steering gear is in the centered position prior to installing the steering gear.

Torque Specifications

Description	Nm	lb-ft	lb-in
Steering column opening trim panel reinforcement bolts	5	-	44
Steering column shaft-to-steering gear bolt	23	-	204
Steering column support bracket nut	21	15	-
Steering wheel nut	35	26	-

Steering Column

The steering column consists of the following:

- Steering wheel
- Steering column
- Upper and lower steering column shafts
- Steering column switches
- Ignition lock cylinder

The steering column is the mechanical linkage between the steering wheel and the steering gear. The steering wheel is mounted to a shaft which passes through the center of the steering column. The shaft is centered by roller ball bearings within the steering column. The steering column shaft then connects the steering column to the steering gear. The upper and lower steering column shaft connections utilize U-joint type couplings. The tilt and telescopic functions of the steering column are controlled by a mechanical lever on the underside of the steering column, which uses a cam to lock and unlock the steering column. When the tilt/telescopic column lever is unlocked, the steering column can then be adjusted to various positions. The steering column switches (multifunction and ignition) are mounted to the steering column. These switches are covered by the upper and lower steering column shrouds.

For steering column switch service information, refer to Section 211-05 .

For ignition lock cylinder service information, refer to Section 501-14 .

Steering Column

For Electronic Power Assist Steering (EPAS), refer to Section 211-00A .

For Hydraulic Power Assist Steering (HPAS), refer to Section 211-00B .

Steering Wheel Wrap Bonding

Material

Item	Specification
Instant Gel Adhesive TA-19	WSK-M2G402-A4

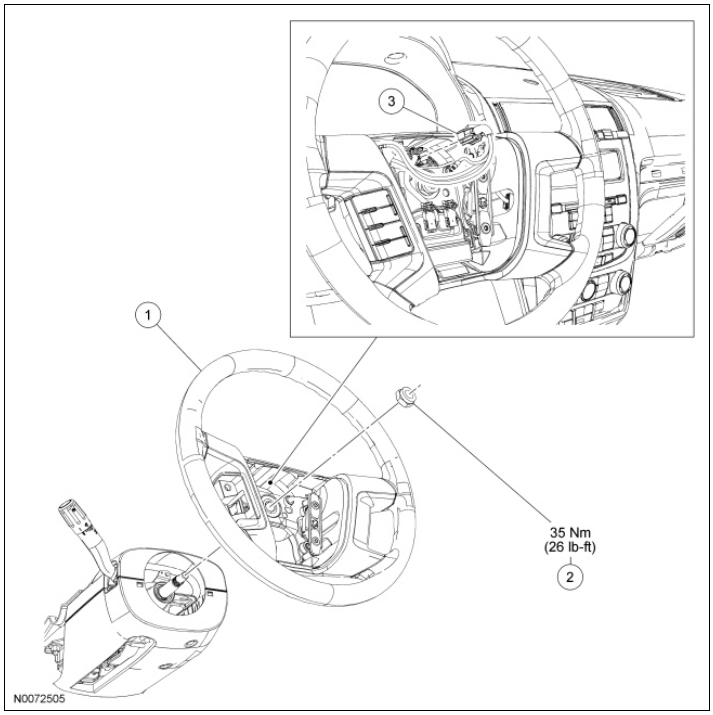
1. **NOTE:** If re-adhering leather to the front side of the steering wheel only, it will not be necessary to remove the steering wheel. Steering wheel removal is necessary only when repairing loose leather on the backside of the steering wheel.

   If necessary remove the steering wheel. For additional information, refer to Steering Wheel in this section.

2. Position the loose leather out of the way.

3. Apply the specificed adhesive evenly over the wheel spoke.

4. Position the loose leather back into the original position.



5. **NOTE:** The adhesive should be completely set after 5 minutes. Do not pull on the repair area.

   Smooth the leather and tuck in for neat appearance.

   - Apply pressure (for at least 30 seconds) until the leather is bonded to the wheel spoke.

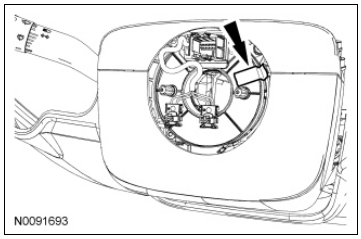
6. If removed, Install the steering wheel. For additional information, refer to Steering Wheel in this section.

Steering Wheel

Item	Part Number	Description
1	3600/ 3F563	Steering wheel (urethane/leather)
2	W711835	Steering wheel nut
3	-	Steering wheel switches electrical connector (part of 3600/3F563)

Removal and Installation

NOTICE: **Do not allow the clockspring to rotate while the steering wheel is disconnected or damage to the clockspring may result. If there is evidence that the clockspring has rotated, the clockspring must be recentered. For additional information, refer to Section 501-20B .**

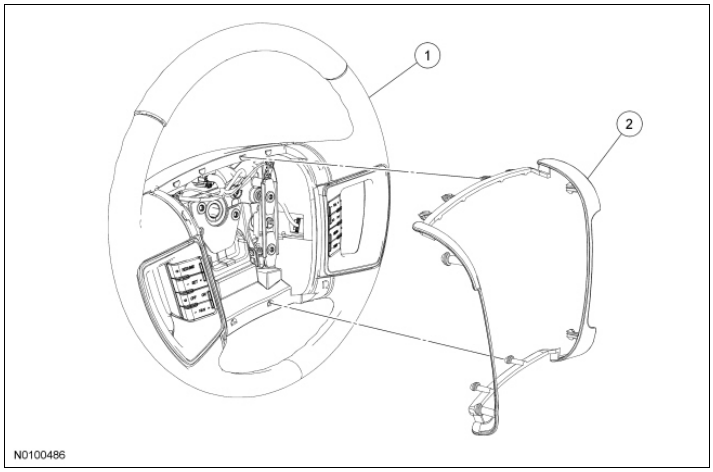


1. Position the steering wheel in the straight-ahead position and turn the ignition switch to the OFF position.
   - Remove the key.
2. Remove the driver air bag module. For additional information, refer to Section 501-20B .
3. **NOTE:** Mark the steering wheel and column shaft for reference during installation.

   Remove the steering wheel nut.
   - To install, tighten to 35 Nm (26 lb-ft).
4. ***NOTICE:*** **Do not remove the steering wheel by hitting the shaft with a hammer. Damage to the column may occur.**

Using a suitable puller, remove the steering wheel.

- Disconnect the steering wheel switches electrical connector from the clockspring.
- Route the 2 driver air bag module electricalonnectors and harness through the steering wheel.



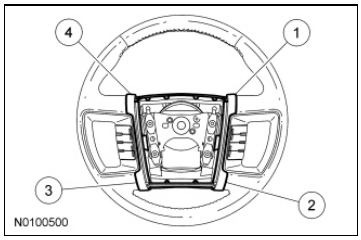
5. Tape the clockspring center rotor to the outer housing to keep it from rotating.

6. To install, reverse the removal procedure.
   - Align the steering wheel using the reference mark.

7. Install the driver air bag module. For additional information, refer to Section 501-20B .

Steering Wheel Bezel

Item	Part Number	Description
1	3600	Steering wheel
2	3F910	Center steering wheel bezel

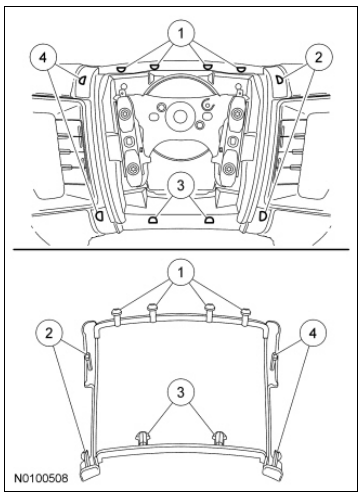


Removal

NOTICE: **The center steering wheel bezel is manufactured using plastic wrapped with aluminium and is very fragile. The removal and installation procedure must be followed exactly as outlined or damage to the bezel can occur.**

NOTICE: **Use a plastic trim removal tool or a plastic-coated tool when removing the bezel to avoid damaging the steering wheel.**

1. Remove the driver air bag module. For additional information, refer to Section 501-20B .



2. Using a plastic trim removal tool, carefully separate the bezel from the steering wheel in the following order:
    1. Upper RH corner
    2. Lower RH corner
    3. Lower LH corner
    4. Upper LH corner

3. **NOTE:** There are a total of 10 pins that secure the bezel to the steering wheel, 4 along the top of the bezel, 2 along the bottom and 2 on each side in the corners.

Using a plastic trim removal tool, carefully remove the bezel from the steering wheel in the following order:

1. Top 4 pins
2. RH side 2 pins
3. Bottom 2 pins
4. LH side 2 pins

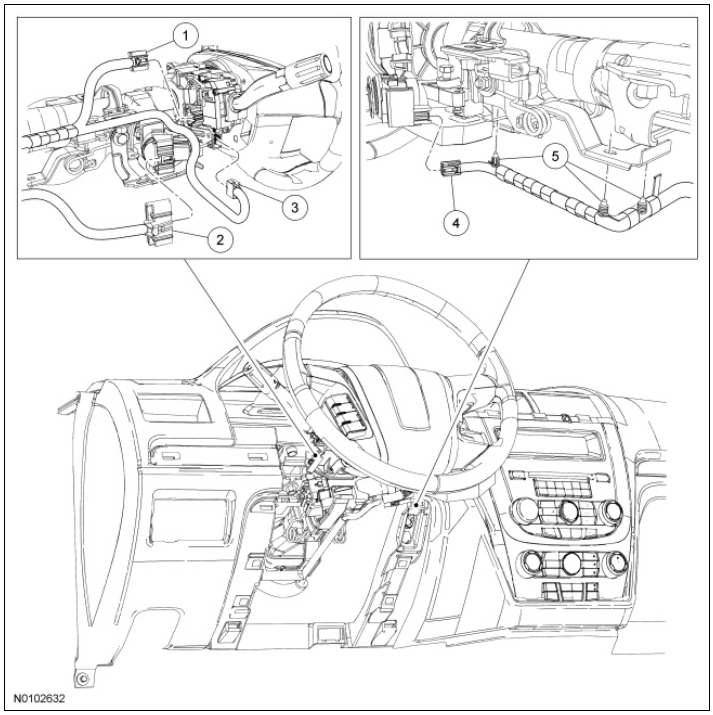
Installation

NOTICE: **Carefully install the bezel onto the steering wheel as instructed or damage to the bezel can occur.**

1. Position the bezel onto the steering wheel and align the 10 pins with their respective holes.

2. **NOTE:** The bezel is installed in 2 stages. Stage 1 seats the 10 pins into the steering wheel approximately half-way. Stage 2 fully seats the 10 pins into the steering wheel.

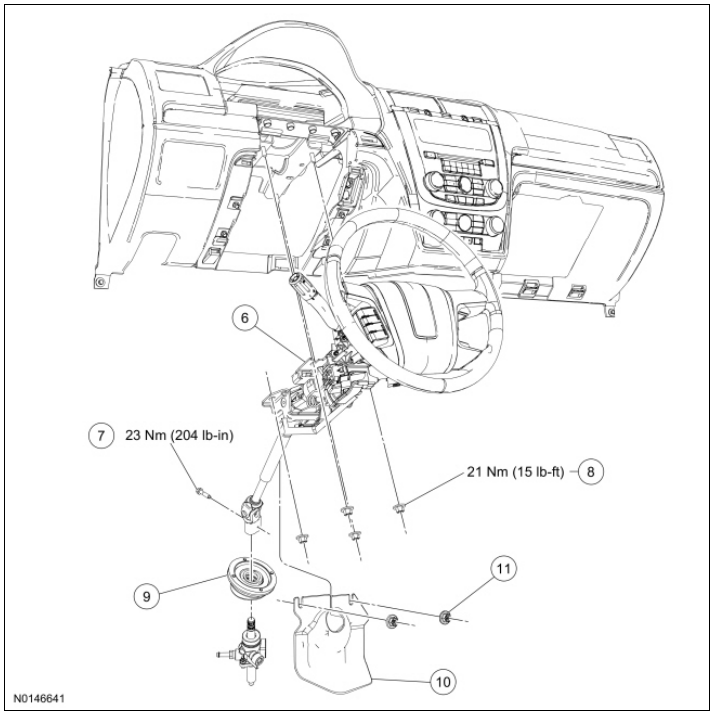
   Beginning with the upper RH corner and continuing in a clockwise direction, push the bezel onto the steering wheel until the pins are seated approximately half-way into the holes.



3. Beginning with the upper RH corner and continuing in a clockwise direction, push the bezel onto the steering wheel until the pins are fully seated into the holes.

4. Install the driver air bag module. For additional information, refer to Section 501-20B .

Steering Column



Steering Column Wire Harness

NOTE: 2.5L/3.0L shown, 3.5L similar.

Item	Part Number	Description
1	-	Multifunction switch electrical connector (part of 14401)
2	-	Ignition switch electrical connector (part of 14401)
3	-	Clockspring electrical connector (part of 14401)
4	-	Passive Anti-Theft System (PATS) electrical connector (part of 14401)
5	-	Wiring harness retainers (3 required) (part of 14401)

Steering Column Assembly

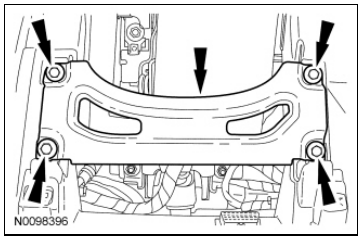
Item	Part Number	Description
6	3C529	Steering column
7	3R827	Steering column shaft-to-steering gear bolt
8	N806423	Steering column support bracket nut (4 required)
9	3C611B	Steering gear/dash seal
10	3C611A	Steering column shaft joint cover
11	W704904	Steering column shaft joint cover nut (2 required)

Removal and Installation

All vehicles

1. Remove the steering wheel. For additional information, refer to Steering Wheel in this section.

Hybrid vehicles



2. Remove the driver knee air bag module. For additional information, refer to Section 501-20B .

Non-Hybrid vehicles

3. Remove the steering column shroud. For additional information, refer to Steering Column Shroud .

All vehicles

4. Remove the 4 steering column opening trim panel reinforcement bolts and the steering column opening trim panel reinforcement.
    - To install, tighten to 5 Nm (44 lb-in).

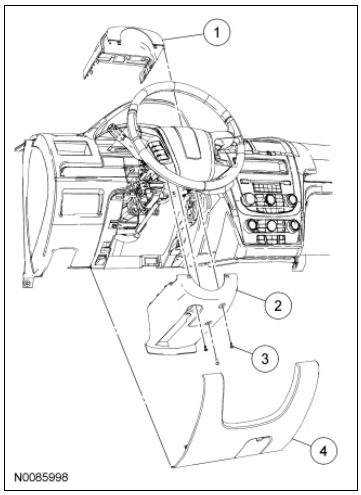
5. Disconnect the Passive Anti-Theft System (PATS), multifunction switch, ignition switch, clockspring and steering wheel rotation sensor (3.5L only) electrical connectors.

6. Detach the wiring harness pin-type retainers and position the wiring harness aside.

7. Remove the 2 steering column shaft joint cover nuts.

8. Remove the steering column shaft joint cover.

9. Remove and discard the steering column shaft-to-steering gear bolt.
    - To install, tighten the new bolt to 23 Nm (204 lb-in).



10. Disconnect the steering column shaft from the steering gear.

11. Remove the 4 steering column support bracket nuts and the steering column.
    - Detach the wire harness pin-type retainer.
    - To install, tighten to 21 Nm (15 lb-ft).

12. To install, reverse the removal procedure.
    - If installing a new steering column, transfer parts as necessary.

Steering Column Shroud

NOTE: Non-Hybrid vehicle shown, Hybrid vehicle similar.

Item	Part Number	Description
1	3530	Upper steering column shroud
2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw (3 required)
4	04459	Steering column opening trim panel

Removal and Installation

Hybrid vehicles

1. Remove the 2 steering column opening trim panel screws.

All vehicles

2. **NOTE:** The steering column opening trim panel is held in place by retaining clips that clip into the instrument panel.

   Remove the steering column opening trim panel.

   - Pull the steering column opening trim panel outward to release the retaining clips.

Fusion and Milan only

3. **NOTE:** Release the upper steering column shroud by pressing inward on the sides of the shroud and lifting upwards.

   Remove the upper steering column shroud.

4. From the underside of the upper steering column shroud, detach the upper steering column shroud from the instrument cluster finish panel.

MKZ

5. **NOTE:** Release the upper steering column shroud by pressing inward on the sides of the shroud and lifting upwards.

   Remove the upper steering column shroud.

All vehicles

6. Release the tilt lever, remove the 3 lower steering column shroud screws and then the shroud.

7. To install, reverse the removal procedure.

Steering Column Switches

The steering column switches consist of the following:

- Multifunction switch
- Ignition switch

The steering column switches receive driver inputs and send signals to various components. The multifunction switch controls the windshield wipers, hazard flasher, turn signal, headlamp low/high beam and headlamp dimmer/flash-to-pass. The ignition switch is used in conjunction with the lock cylinder key to start the vehicle. When the lock cylinder key is switched to different positions, it moves linkages which enable the ignition switch to send battery voltage to various components.

Steering Column Switches

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) may also be identified as the Generic Electronic Module (GEM).

The steering column switches include the ignition switch and the multifunction switch (high beam/low beam, flash-to-pass, turn signal and windshield wiper).

Ignition Switch

The ignition switch is controlled by the ignition lock cylinder with a key. When the ignition cylinder is turned using the key, a mechanical connection positions the ignition switch to the selected position and allows the ignition switch to send voltage to specific components. The ignition switch is contained in the steering column lock module.

Key Removal Inhibit Solenoid

The key removal inhibit solenoid (also known as the key release interlock actuator) is an electronically controlled solenoid that prevents the ignition lock cylinder from being turned to the OFF position unless the selector lever is in the PARK position. The key removal inhibit solenoid is part of the ignition switch.

Multifunction Switch

The multifunction switch controls the various components electrically. The multifunction switch is hardwired to the SJB and controls a ground signal for the high beam, flash-to-pass and turn signal functions. The multifunction switch is also hardwired to the wiper module and controls a ground signal for the various wiper and washer functions.

For headlamp and turn signal concerns, refer to Section 417-01 . For wiper and washer concerns, refer to Section 501-16 .

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch • Ignition key • Ignition lock cylinder • Ignition switch • Steering column lock module • Steering column shrouds	• Smart Junction Box (SJB) fuse 27 (20A) • Wiring, terminals or connectors • Ignition switch • One-Touch Integrated Start (OTIS) diode • SJB • PCM • Park range switch (part of the selector lever)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to Smart Junction Box (SJB) DTC Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B2A20	Ignition stuck in START	GO to Pinpoint Test F .
B2844	Ignition fault	GO to Pinpoint Test G .
U2472	Unexpected Ignition State	GO to Pinpoint Test G .
-	All Other DTCs	REFER to the Master DTC Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

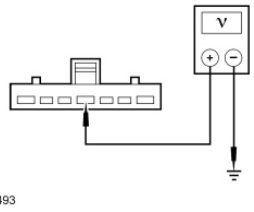
Pinpoint Test A: No Power in All Ignition Switch Positions

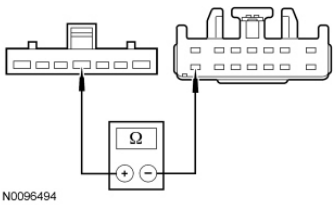
Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch receives fused battery voltage from Smart Junction Box (SJB) fuse 27 (20A) through circuit SBP27 (BU/RD). The ignition switch then sends voltage to various systems depending on ignition switch position. The ignition switch has 4 possible positions:

- OFF - No power on any circuits
- ACC - Power on circuit CDC33 (VT/GN)
- RUN - Power on circuit CDC34 (WH/OG)
- START - Power on circuit CDC35 (BU/WH)





This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST A: NO POWER IN ALL IGNITION SWITCH POSITIONS

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.**

NOTE: Verify that battery voltage is 10 volts or greater.

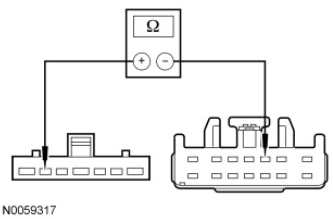
Test Step	Result / Action to Take
A1 CHECK AT THE IGNITION SWITCH FOR VOLTAGE	tr>
• Ignition OFF. • Disconnect: Ignition Switch C250. • Measure the voltage between ignition switch C250-4, circuit SBP27 (BU/RD), harness side and ground.  N0096493 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** VERIFY SJB fuse 27 (20A) is OK. If OK, GO to A2 . If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
A2 CHECK THE IGNITION SWITCH INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280A. • Measure the resistance between ignition switch C250-4, circuit SBP27 (BU/RD), harness side and SJB C2280A-14, circuit SBP27 (BU/RD), harness side.  N0096494 • **Is the resistance less than 5 ohms?**	**Yes** GO to A3 . **No** REPAIR circuit SBP27 (BU/RD). TEST the system for normal operation.
A3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect: All SJB connectors. • Check the SJB connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All SJB connectors and make sure the connectors seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: No Power in ACC

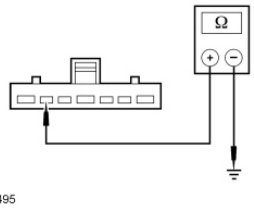
Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

Normal Operation

When the ignition switch is placed in the ACC position, fused ignition voltage is sent to the Smart Junction Box (SJB) through circuit CDC33 (VT/GN).



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST B: NO POWER IN ACC

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.**

NOTE: Verify that battery voltage is 10 volts or greater.

Test Step	Result / Action to Take
B1 CHECK THE IGNITION SWITCH	
• Ignition OFF. • Disconnect: Ignition Switch C250. • Carry out the Ignition Switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the ignition switch pass the component test?**	**Yes** GO to B2 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
B2 CHECK THE IGNITION ACC CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280A. • Measure the resistance between ignition switch C250-6, circuit CDC33 (VT/GN), harness side and SJB C2280A-3, circuit CDC33 (VT/GN), harness side.  N0059317 • **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation.
B3 CHECK THE IGNITION ACC CIRCUIT FOR A SHORT TO GROUND	

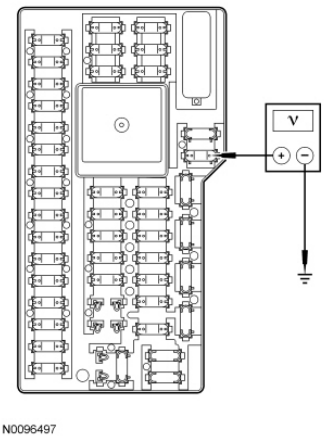
• Measure the resistance between ignition switch C250-6, circuit CDC33 (VT/GN), harness side and ground.  N0096495 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR circuit CDC33 (VT/GN). TEST the system for normal operation.
B4 CHECK FOR CORRECT SJB OPERATION	
• Check SJB C2208A for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: SJB C2280A and make sure the connector is seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

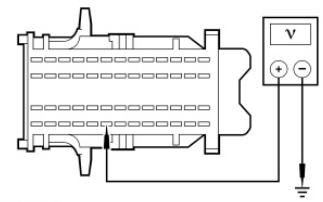
Pinpoint Test C: No Power in RUN

Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

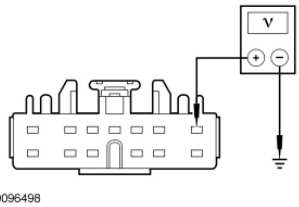
Normal Operation

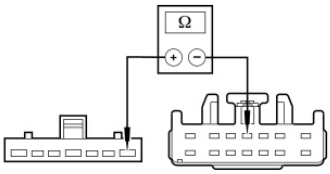
When the ignition switch is placed in the RUN position, fused ignition voltage is sent to the Smart Junction Box (SJB) along circuit CDC34 (WH/OG).

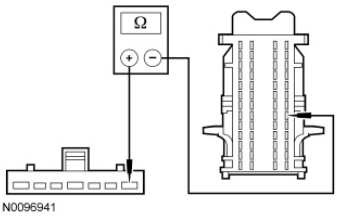




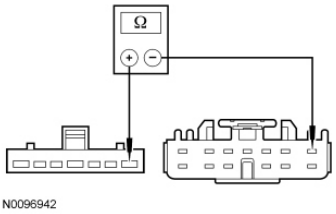
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ignition switch
- SJB

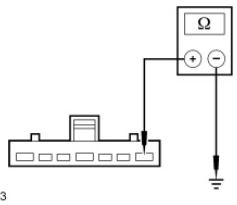






PINPOINT TEST C: NO POWER IN RUN





NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.**

NOTE: Verify that battery voltage is greater than 10 volts.

Test Step	Result / Action to Take
C1 CHECK FOR VOLTAGE ON THE IGNITION RUN CIRCUIT	

• Ignition OFF. • Disconnect: SJB Fuse 42 (10A) (if equipped). • Ignition ON. • Measure the voltage between SJB fuse 42 (10A), circuit CDC34 (WH/OG), input side and ground.  N0096497 • **Is the voltage greater than 10 volts?**	**Yes** GO to C2 . **No** GO to C4 .
C2 CHECK FOR VOLTAGE AT THE SJB	
• Ignition OFF. • Disconnect: SJB C2280B. • Ignition ON. • Measure the voltage between SJB C2280B-45, circuit CDC34 (WH/OG), harness side and ground.  N0096496 • **Is the voltage greater than 10 volts?**	**Yes** GO to C3 . **No** GO to C5 .
C3 CHECK THE SJB IGNITION SWITCH INPUT CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280E. • Ignition ON. • Measure the voltage between SJB C2280E-1, circuit CDC34 (WH/OG), harness side and ground.	**Yes** GO to C10 . **No** GO to C6 .

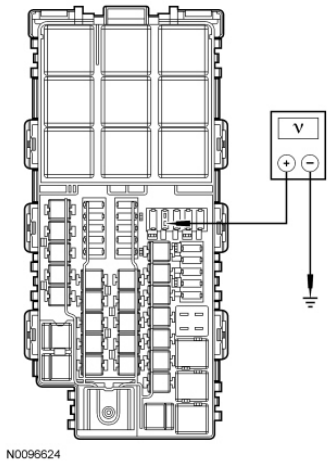
 N0096498 • **Is the voltage greater than 10 volts?**	
C4 CHECK THE SJB IGNITION SWITCH INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280A. • Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280A-4, circuit CDC34 (WH/OG), harness side.  N0096940 • **Is the resistance less than 5 ohms?**	**Yes** GO to C7 . **No** REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation.
C5 CHECK THE IGNITION RUN CIRCUIT FOR AN OPEN	
• Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280B-45, circuit CDC34 (WH/OG), harness side.  N0096941 • **Is the resistance less than 5 ohms?**	**Yes** GO to C9 . **No** REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation.
C6 CHECK THE IGNITION SWITCH OUTPUT CIRCUIT FOR AN OPEN	
• Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280E-1, circuit CDC34 (WH/OG), harness side.	**Yes** GO to C9 . **No** REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation.

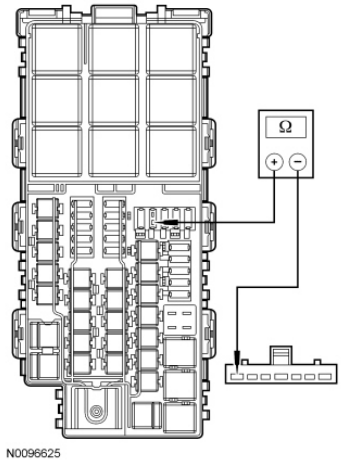
 N0096942 • **Is the resistance less than 5 ohms?**	
C7 CHECK THE IGNITION RUN CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: SJB C2280B. • Disconnect: SJB C2280E. • Measure the resistance between ignition switch C250-1, circuit CDC34 (WH/OG), harness side and ground.  N0096943 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C8 . **No** REPAIR circuit CDC34 (WH/OG). TEST the system for normal operation.
C8 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the ignition switch pass the component test?**	**Yes** GO to C10 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
C9 CHECK FOR CORRECT IGNITION SWITCH OPERATION	
• Carry out the Ignition Switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the ignition switch pass the component test?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
C10 CHECK FOR CORRECT SJB OPERATION	
• Disconnect: All SJB connectors.	**Yes** INSTALL a new SJB . REFER to

• Check the SJB connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All SJB connectors and make sure the connectors are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

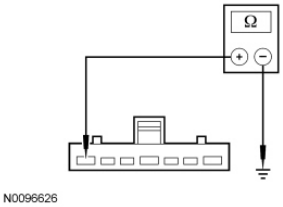
Pinpoint Test D: No Power in START - Non-Hybrid

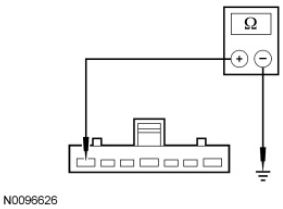
Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

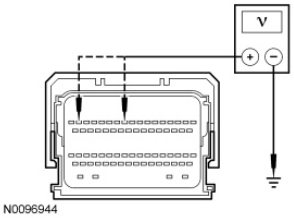




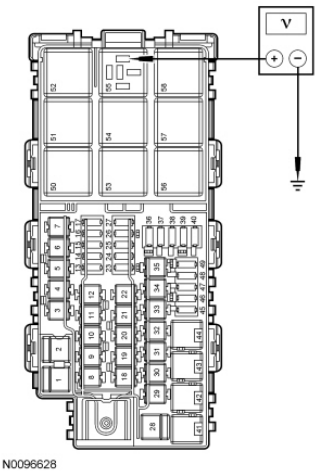
Normal eration

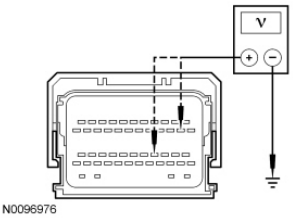




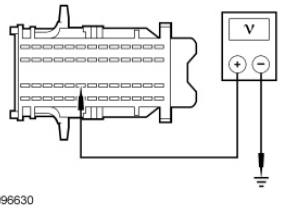


When the ignition switch is placed in the START position, fused ignition voltage is sent to the PCM and the One-Touch Integrated Start (OTIS) diode through circuit CDC35 (BU/WH). The voltage passes through the Battery Junction Box (BJB) OTIS diode and continues to the PCM, starter relay coil and the Smart Junction Box (SJB) through circuit CE336 (GN/WH).





This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ignition switch
- OTIS diode
- SJB
- PCM



PINPOINT TEST D: NO POWER IN START - NON-HYBRID

Test Step	Result / Action to Take
D1 CHECK FOR VOLTAGE TO THE BJB	
• Disconnect: BJB OTIS Diode. • With the ignition in the START position, measure the voltage between BJB OTIS diode, circuit CDC35 (BU/WH), input side and ground.	**Yes** GO to D5 . **No** GO to D2 .

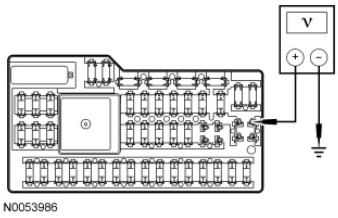
 N0096624 • **Is the voltage greater than 10 volts?**	
D2 CHECK THE IGNITION START CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Ignition Switch C250. • Measure the resistance between BJB OTIS diode, circuit CDC35 (BU/WH), input side and ignition switch C250-7, circuit CDC35 (BU/WH), harness side.  N0096625 • **Is the resistance less than 5 ohms?**	**Yes** GO to D3 . **No** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.
D3 CHECK THE IGNITION START CIRCUIT FOR A SHORT TO GROUND	
• Measure the resistance between ignition switch C250-7, circuit CDC35 (BU/WH), harness side and ground.	**Yes** GO to D10 . **No** GO to D4 .

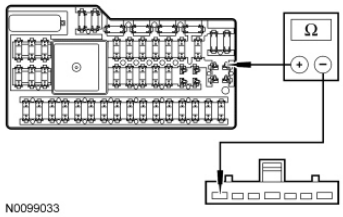
 N0096626 • **Is the resistance greater than 10,000 ohms?**	
D4 ISOLATE THE PCM FOR A SHORT TO GROUND	
• Disconnect: PCM C175B. • Measure the resistance between ignition switch C250-7, circuit CDC35 (BU/WH), harness side and ground.  N0096626 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D12 . **No** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.
D5 CHECK THE OTIS DIODE	
• Test the OTIS diode. • **Is the OTIS diode OK?**	**Yes** GO to D6 . **No** INSTALL a new OTIS diode. TEST the system for normal operation.
D6 CHECK FOR START CIRCUIT VOLTAGE AT THE PCM	
• Ignition OFF. • Connect: BJB OTIS Diode. • Disconnect: PCM C175B. • With the ignition in the START position, measure the voltage between ground and: ♦ **2.5L and 3.0L:** PCM C175B-16, circuit CDC35 (BU/WH), harness side. ♦ **3.5L:** PCM C175B-10, circuit CDC35 (BU/WH), harness side.  N0096944	**Yes** GO to D7 . **No** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

• **Is the voltage greater than 10 volts?**	
D7 CHECK FOR START CIRCUIT VOLTAGE AT THE STARTER RELAY	
• Disconnect: BJB Starter Relay. • With the ignition in the START position, measure the voltage between BJB starter relay socket 86, circuit CE336 (GN/WH), harness side and ground.  N0096628 • **Is the voltage greater than 10 volts?**	**Yes** GO to D8 . **No** REPAIR circuit CE336 (GN/WH). TEST the system for normal operation.
D8 CHECK FOR START CIRCUIT VOLTAGE AT THE PCM	
• With the ignition in the START position, measure the voltage between ground and: ♦ **2.5L and 3.0L:** PCM C175B-37, circuit CE336 (GN/WH), harness side. ♦ **3.5L:** PCM C175B-19, circuit CE336 (GN/WH), harness side.  N0096976 • **Is the voltage greater than 10 volts?**	**Yes** GO to D9 . **No** REPAIR circuit CE336 (GN/WH). TEST the system for normal operation.
D9 CHECK FOR VOLTAGE TO THE SJB	
• Ignition OFF. • Disconnect: SJB C2280B. • With the ignition in the START position, measure the voltage between SJB C2280B-32, circuit CE336 (GN/WH), harness side and ground.	**Yes** GO to D11 . **No** REPAIR circuit CE336 (GN/WH). TEST the system for normal operation.

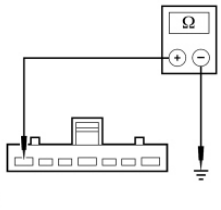
 • **Is the voltage greater than 10 volts?**	
D10 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the ignition switch pass the component test?**	**Yes** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation. **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation.
D11 CHECK FOR CORRECT SJB OPERATION	
• Disconnect: All SJB connectors. • Check all SJB connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All SJB connectors making sure that all connectors are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.
D12 CHECK FOR CORRECT PCM OPERATION	
• Disconnect: All PCM connectors. • Check all PCM connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All PCM connectors making sure that all connectors are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test E: No Power in START - Hybrid





Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.



Normal Operation

When the ignition switch is placed in the START position, fused ignition voltage is sent to the Smart Junction Box (SJB) through circuit CDC35 (BU/WH).

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST E: NO POWER IN START - HYBRID

Test Step	Result / Action to Take
E1 CHECK FOR VOLTAGE TO SJB FUSE 28 (5A)	
• Disconnect: SJB Fuse 28 (5A). • With the ignition in the START position, measure the voltage between SJB fuse 28 (5A), circuit CDC35 (BU/WH), input side and ground.  N0053986 • **Is the voltage greater than 10 volts?**	**Yes** GO to E4 . **No** GO to E2 .
E2 CHECK THE IGNITION START CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Ignition Switch C250. • Measure the resistance between SJB fuse 28 (5A), circuit CDC35 (BU/WH), input side and ignition switch C250-7, circuit CDC35 (BU/WH), harness side.  N0099033 • **Is the resistance less than 5 ohms?**	**Yes** GO to E3 . **No** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.
E3 CHECK THE IGNITION START CIRCUIT FOR A SHORT TO GROUND	

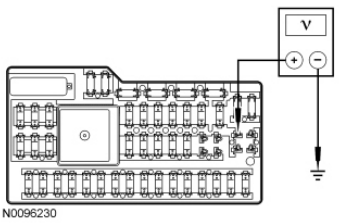
• Measure the resistance between ignition switch C250-7, circuit CDC35 (BU/WH), harness side and ground.  N0096626 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.
E4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect: All SJB connectors. • Check all SJB connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All SJB connectors making sure that all connectors are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test F: DTC B2A20

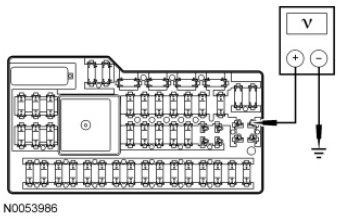
Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

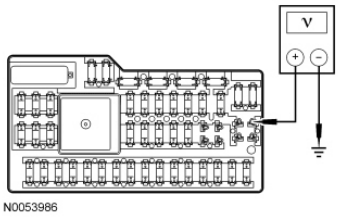
Normal Operation

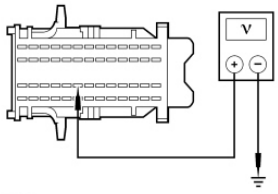
The ignition switch is spring loaded to automatically return to the RUN position after being placed in the START position. A microprocessor in the Smart Junction Box (SJB) monitors the voltage output from the ignition switch while the switch is in the START position. This microprocessor is also connected to the Audio Control Module (ACM) start circuit, so a short to voltage on the ignition switch output circuit or on the ACM start circuit could cause DTC B2A20 to set.



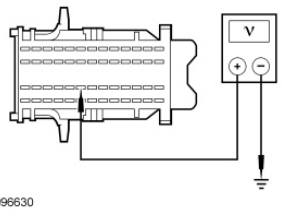
- B2A20 (Ignition Stuck in START) - The SJB continuously monitors the ignition switch state, if the SJB receives a START signal for more than 30 seconds, DTC B2A20 will be set.

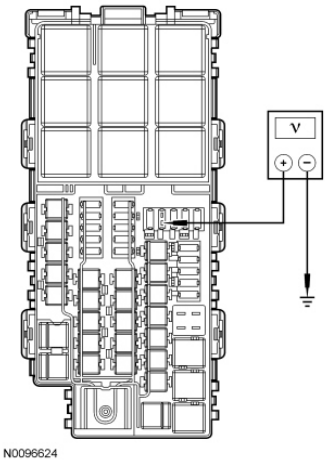




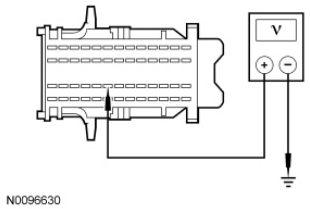


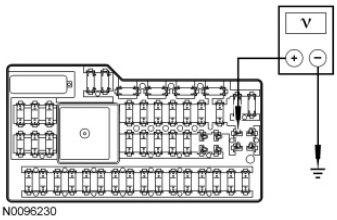
This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ignition switch
- SJB
- PCM
- ACM

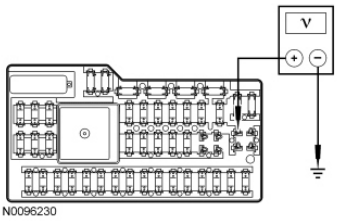




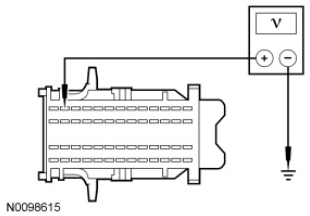
PINPOINT TEST F: DTC B2A20







NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.**



NOTE: Verify that battery voltage is 10 volts or greater.

Test Step	Result / Action to Take
F1 CHECK THE IGNITION SWITCH MECHANICAL FUNCTION	
• Inspect the ignition switch for correct mechanical function. Refer to t Ignition Switch - Mechanical Component Test in this section. • **Did the ignition switch pass the component test?**	**Yes** GO to F2 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. CLEAR the DTCs. REPEAT the self-test.
F2 CHECK THE IGNITION SWITCH ELECTRICAL FUNCTION	
• Ignition OFF. • Disconnect: Ignition Switch C250. • Carry out the Ignition Switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the ignition switch pass the component test?**	**Yes** GO to F3 . **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. CLEAR the DTCs. REPEAT the self-test.
F3 CHECK THE SJB START POWER OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Connect: Ignition Switch C250. • Disconnect: SJB Fuse 28 (5A). • Ignition ON. • Measure the voltage between SJB fuse 28 (5A), circuit CBP28 (GY/VT), output side and ground.  • **Is any voltage present?**	**Yes** GO to F10 . **No** For **non-hybrid vehicles,** GO to F4 . For **hybrid vehicles,** GO to F9 .
F4 CHECK THE SJB START POWER INPUT CIRCUIT FOR A SHORT TO VOLTAGE	

• Measure the voltage between SJB fuse 28 (5A), circuit CE336 (GN/WH), input side and ground.  N0053986 • **Is any voltage present?**	**Yes** GO to F5 . **No** GO to F13 .
F5 ISOLATE THE SJB START POWER CIRCUIT	
• Ignition OFF. • Disconnect: BJB One-Touch Integrated Start (OTIS) Diode. • Ignition ON. • Measure the voltage between SJB fuse 28 (5A), circuit CE336 (GN/WH), input side and ground.  N0053986 • **Is any voltage present?**	**Yes** GO to F6 . **No** GO to F8 .
F6 CHECK THE PCM IGNITION SWITCH INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280B. • Ignition ON. • Measure the voltage between SJB C2280B-32, circuit CE336 (GN/WH), harness side and ground.  N0096630 • **Is any voltage present?**	**Yes** GO to F7 . **No** GO to F13 .
F7 CHECK THE PCM FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between SJB C2280B-32, circuit CE336 (GN/WH), harness side and ground.  N0096630 • **Is any voltage present?**	**Yes** REPAIR circuit CE336 (GN/WH). CLEAR the DTCs. REPEAT the self-test. **No** GO to F15 .
F8 CHECK THE IGNITION SWITCH START POWER OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between BJB OTIS diode, circuit CDC35 (BU/WH), input side and ground.  N0096624 • **Is any voltage present?**	**Yes** REPAIR circuit CDC35 (BU/WH). CLEAR the DTCs. REPEAT the self-test. **No** GO to F15 .
F9 CHECK THE SJB IGNITION SWITCH INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280B. • Ignition ON. • Measure the voltage between SJB C2280B-32, circuit CDC35 (BU/WH), harness side and ground.	**Yes** REPAIR circuit CDC35 (BU/WH). CLEAR the DTCs. REPEAT the self-test. **No** GO to F13 .

 N0096630 • **Is any voltage present?**	
F10 ISOLATE THE ACM	
• Ignition OFF. • Disconnect: ACM C240A. • Ignition ON. • Measure the voltage between SJB fuse 28 (5A), circuit CBP28 (GY/VT), output side and ground.  N0096230 • **Is any voltage present?**	**Yes** GO to F11 . **No** GO to F14 .
F11 ISOLATE THE PCM	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between SJB fuse 28 (5A), circuit CBP28 (GY/VT), output side and ground.  N0096230 • **Is any voltage present?**	**Yes** GO to F12 . **No** GO to F15 .
F12 ISOLATE THE SJB	
• Ignition OFF. • Disconnect: SJB C2280B. • Ignition ON. • Measure the voltage between SJB C2280B-2, circuit CBP28 (GY/VT), harness side and ground.	**Yes** REPAIR circuit CBP28 (GY/VT). CLEAR the DTCs. REPEAT the self-test. **No** GO to F13 .

 • **Is any voltage present?**	
F13 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect: All SJB connectors. • Check the SJB connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All SJB connectors making sure that they are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
F14 CHECK FOR CORRECT ACM OPERATION	
• Disconnect: All ACM connectors. • Check all ACM connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All ACM connectors making sure that all connectors are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
F15 CHECK FOR CORRECT PCM OPERATION	
• Disconnect: All PCM connectors. • Check all PCM connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All PCM connectors making sure that all connectors are seated correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B , Section 303-14C or Section 303-14D . CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTCs B2844 and U2472

Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) contains several inputs that monitor the voltage outputs from the ignition switch. The SJB uses these inputs to determine the ignition switch position and then sends that information to various modules over the High Speed Controller Area Network (HS-CAN) bus. The ignition switch is designed so that only one output (ACC, RUN or START) is sent to the SJB at a time.

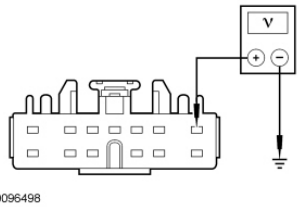
- DTC B2844 (Ignition Fault) - If the SJB receives an invalid ignition RUN input or cannot receive the ignition RUN input during normal operation, DTC B2844 is set.
- DTC U2472 (Unexpected Ignition State) - If the SJB does not receive the ignition RUN signal or receives conflicting ignition switch signals while performing an on-demand self test, DTC U2472 is set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST G: DTCs B2844 AND U2472

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.**



NOTE: Verify that battery voltage is 10 volts or greater.

Test Step	Result / Action to Take
G1 CHECK THE SJB DTCs	
• Use the recorded SJB DTCs from the continuous and on-demand self tests. • **Is DTC B2A20 present?**	**Yes** GO to Pinpoint Test F . **No** GO to G2 .
G2 CHECK THE IGNITION SWITCH PIDs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the following ignition switch PIDs while cycling the ignition switch through each position: ♦ ECU Derived Ignition State-OFF (IGN_O_ECU) ♦ ECU Derived Ignition State-ACC (IGN_A_ECU) ♦ ECU Derived Ignition State-RUN (IGN_R_ECU) ♦ ECU Derived Ignition State-START (IGN_S_ECU) • **Does each PID display YES when the ignition switch is moved into the corresponding position and NO when the**	**Yes** The condition is not present at this time. INSPECT SJB connectors C2280A and C2280B for corrosion, spread terminals and/or pushed-out pins. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. **No** If IGN_A_ECU is displayed YES at all times, **Non-Hybri** GO to G3 . **Hybrid:** GO to G4 . If IGN_R_ECU is displayed YES at all times, GO to G6 . If IGN_S_ECU displayed YES at all times, GO to Pinpoint Test F . If IGN_O_ECU displayed YES at all times, GO to Pinpoint Test A .

switch is moved to another position?	If IGN_A_ECU displayed NO at all times, GO to Pinpoint Test B . If IGN_R_ECU displayed NO at all times, GO to Pinpoint Test C . If IGN_S_ECU displayed NO at all times, **Non-Hybrid:** GO to Pinpoint Test D . **Hybrid:** GO to Pinpoint Test E .
G3 CHECK SJB FUSE 43 (10A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 43 (10A). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch ACC position PID IGN_A_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition switch is moved through all switch positions?**	**Yes** GO to G4 . **No** REPAIR circuit CBP43 (GY). CLEAR the DTCs. REPEAT the self-test.
G4 CHECK SJB FUSE 45 (5A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 45 (5A). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch ACC position PID IGN_A_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition switch is moved through all switch positions?**	**Yes** GO to G5 . **No** REPAIR circuit CBP45 (YE). CLEAR the DTCs. REPEAT the self-test.
G5 CHECK THE IGNITION SWITCH	
• Ignition OFF. • Disconnect: Ignition Switch C250. • Carry out the Ignition Switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the ignition switch pass the component test?**	**Yes** REPAIR circuit CDC33 (VT/GN). CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. CLEAR the DTCs. REPEAT the self-test.
G6 CHECK SJB FUSE 44 (10A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: SJB Fuse 44 (10A). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch RUN position PID IGN_R_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition switch is moved through all switch positions?**	**Yes** GO to G7 . **No** REPAIR circuit CBP44 (VT). CLEAR the DTCs. REPEAT the self-test.
G7 CHECK SJB FUSE 42 (10A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 42 (10A). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch RUN position PID IGN_R_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition switch is moved through all switch positions?**	**Yes** GO to G8 . **No** REPAIR circuit CBP42 (GN). CLEAR the DTCs. REPEAT the self-test.
G8 CHECK SJB FUSE 29 (5A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 29 (5A). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch RUN position PID IGN_R_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition ch is moved through all switch positions?**	**Yes** GO to G9 . **No** REPAIR circuit CBP29 (WH/VT). CLEAR the DTCs. REPEAT the self-test.
G9 CHECK SJB FUSE 46 (7.5A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 46 (7.5A). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch RUN position PID IGN_R_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition switch is moved through all switch positions?**	**Yes** GO to G10 . **No** REPAIR circuit CBP46 (WH/BU). CLEAR the DTCs. REPEAT the self-test.

G10 CHECK SJB FUSE 36 (5A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 36 (5A). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch RUN position PID IGN_R_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition switch is moved through all switch positions?**	**Yes** GO to G11 . **No** REPAIR circuit CBP36 (BU/BN). CLEAR the DTCs. REPEAT the self-test.
G11 CHECK SJB FUSE 35 (10A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 35 (10A). • Ignition ON. Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch RUN position PID IGN_R_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition switch is moved through all switch positions?**	**Yes** GO to G12 . **No** REPAIR circuit CBP35 (YE/GY). CLEAR the DTCs. REPEAT the self-test.
G12 CHECK SJB FUSE 32 (10A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 32 (10A). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch RUN position PID IGN_R_ECU while cycling the ignition switch through each position. • **Does the PID display YES when the ignition switch is moved through all switch positions?**	**Yes** For **hybrid vehicles,** GO G13 . For **non-hybrid vehicles,** GO to G14 . **No** REPAIR circuit CBP32 (GN/VT). CLEAR the DTCs. REPEAT the self-test.
G13 CHECK SJB FUSE 37 (10A) OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB Fuse 37 (10A) (if equipped). • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - SJB . • Monitor the ignition switch RUN position PID IGN_R_ECU while cycling the ignition switch through each position.	**Yes** GO to G14 . **No** REPAIR circuit SBP37 (WH). CLEAR the DTCs. REPEAT the self-test.

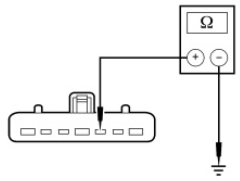
• **Does the PID display YES when the ignition switch is moved through all switch positions?**	
G14 CHECK THE IGNITION SWITCH RUN OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280B. • Disconnect: SJB C2280E. • Ignition ON. • Measure the voltage between SJB C2280E-1, circuit CDC34 (WH/OG), harness side and ground while moving the ignition switch through all switch positions.  N0096498 • **Is voltage present when the ignition switch is moved through all switch positions?**	**Yes** GO to G15 . **No** GO to G16 .
G15 CHECK THE IGNITION SWITCH	
• Ignition OFF. • Disconnect: Ignition Switch C250. • Carry out the Ignition Switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the ignition switch pass the component test?**	**Yes** REPAIR circuit CDC34 (WH/OG). CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new ignition switch. REFER to Ignition Switch in this section. CLEAR the DTCs. REPEAT the self-test.
G16 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect: All SJB connectors. • Check the SJB connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ spread terminals. • Connect: All SJB connectors making sure that they are seated correctly. • Make sure the connectors are seated correctly, then operate the system and verify the concern is still present.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTC. REPEAT the self-test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

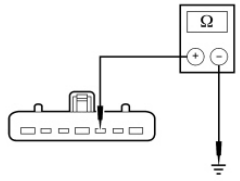
• **Is the concern still present?**	

Pinpoint Test H: The Ignition Key Cannot Be Returned to the OFF Position

Refer to Wiring Diagrams Cell 37 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Shift Interlock for schematic and connector information.

Normal Operation





The key removal inhibit solenoid (part of the ignition switch) receives battery voltage from Smart Junction Box (SJB) fuse 27 (20A) through circuit SBP27 (BU/RD). When the selector lever is moved out of the PARK position, the park range switch (part of the selector lever) closes and connects circuit CET22 (GY/BN) to circuit GD116 (BK/VT), providing ground to the key removal inhibit solenoid. The key removal inhibit solenoid activates and prevents the ignition lock cylinder from being turned to the OFF position and the key removed.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ignition switch
- Ignition lock cylinder
- Selector lever
- Steering column lock module

PINPOINT TEST H: THE IGNITION KEY CANNOT BE RETURNED TO THE OFF POSITION

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

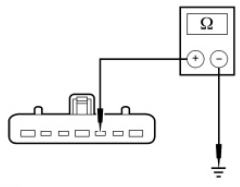
Test Step	Result / Action to Take
H1 CHECK FOR AN ENERGIZED KEY REMOVAL INHIBIT SOLENOID	
• Remove SJB fuse 27 (20A). • Attempt to turn the ignition lock cylinder to the RUN position and then back to the OFF position and remove the key. • **Does the ignition lock cylinder turn to the OFF position and can the key be removed?**	**Yes** GO to H4 . **No** GO to H2 .
H2 CHECK THE IGNITION SWITCH FOR MECHANICAL DAMAGE	
• Remove the ignition switch. Refer to Ignition Switch in this section. • Attempt to turn the ignition lock cylinder to the OFF position and remove the ignition key. • **Does the ignition lock cylinder turn to the OFF position and can the key be removed?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** GO to H3 .
H3 CHECK THE IGNITION LOCK CYLINDER FOR MECHANICAL DAMAGE	

• Remove the ignition lock cylinder. Refer to Section 501-14 . • Rotate the ignition lock cylinder through all positions using the key. • **Does the ignition lock cylinder freely rotate through all positions and can the key be removed from the lock cylinder?**	**Yes** INSTALL a new steering column lock module. REFER to Steering Column Lock Module in this section. TEST the system for normal operation. **No** INSTALL a new ignition lock cylinder. REFER to Section 501-14 . TEST the system for normal operation.
H4 CHECK THE KEY REMOVAL INHIBIT SOLENOID CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Select PARK. • Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-3, circuit CET22 (GY/BN), harness side and ground.  N0065439 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** GO to H5 .
H5 ISOLATE THE SHORT TO GROUND IN THE KEY REMOVAL INHIBIT SOLENOID CIRCUIT	
• Disconnect: Floor Shifter C3233. • Measure the resistance between ignition switch C250-3, circuit CET22 (GY/BN), harness side and ground.  N0065439 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new selector lever. REFER to Section 307-05A or Section 307-05B . TEST the system for normal operation. **No** REPAIR circuit CET22 (GY/BN). TEST the system for normal operation.

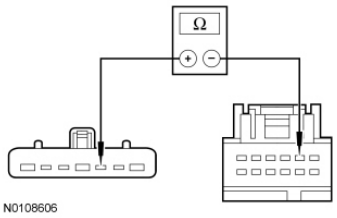
Pinpoint Test I: The Ignition Key Can Be Turned to the OFF Position When the Selector Lever is Not in PARK

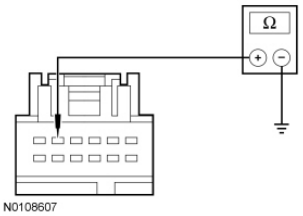
Refer to Wiring Diagrams Cell 37 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Shift Interlock for schematic and connector information.

Normal Operation



The key removal inhibit solenoid (part of the ignition switch) receives battery voltage from Smart Junction Box (SJB) fuse 27 (20A) through circuit SBP27 (BU/RD). When the selector lever is moved out of the PARK position, the park range switch (part of the selector lever) closes and connects circuit CET22 (GY/BN) to circuit GD116 (BK/VT), providing ground to the key removal inhibit solenoid. The key removal inhibit solenoid activates and prevents the ignition lock cylinder from being turned to the OFF position and the key removed.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch
- Selector lever

PINPOINT TEST I: THE IGNITION KEY CAN BE TURNED TO THE OFF POSITION WHEN THE SELECTOR LEVER IS NOT IN PARK

NOTICE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

Test Step	Result / Action to Take
I1 CHECK THE KEY REMOVAL INHIBIT SOLENOID CIRCUIT FOR GROUND	
• Select NEUTRAL. • Disconnect: Ignition Switch C250. • Measure the resistance between ignition switch C250-3, circuit CET22 (GY/BN), harness side and ground.  N0065439 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new ignition switch. REFER to Ignition Switch in this section. TEST the system for normal operation. **No** GO to I2 .
I2 CHECK THE KEY REMOVAL INHIBIT SOLENOID CIRCUIT FOR AN OPEN	
• Disconnect: Floor Shifter C3233. • Measure the resistance between ignition switch C250-3, circuit CET22 (GY/BN), harness side and floor shifter C3233-2, circuit CET22 (GY/BN), harness side.	**Yes** GO to I3 . **No** REPAIR circuit CET22 (GY/BN). TEST the system for normal operation.

 N0108606 • **Is the resistance less than 5 ohms?**	
I3 CHECK THE FLOOR SHIFTER GROUND CIRCUIT FOR AN OPEN	
• Measure the resistance between floor shifter C3233-5, circuit GD116 (BK/VT), harness side and ground.  N0108607 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new selector lever. REFER to Section 307-05A or Section 307-05B . TEST the system for normal operation. **No** REPAIR circuit GD116 (BK/VT). TEST the system for normal operation.

Component Tests

Ignition Switch - Mechanical

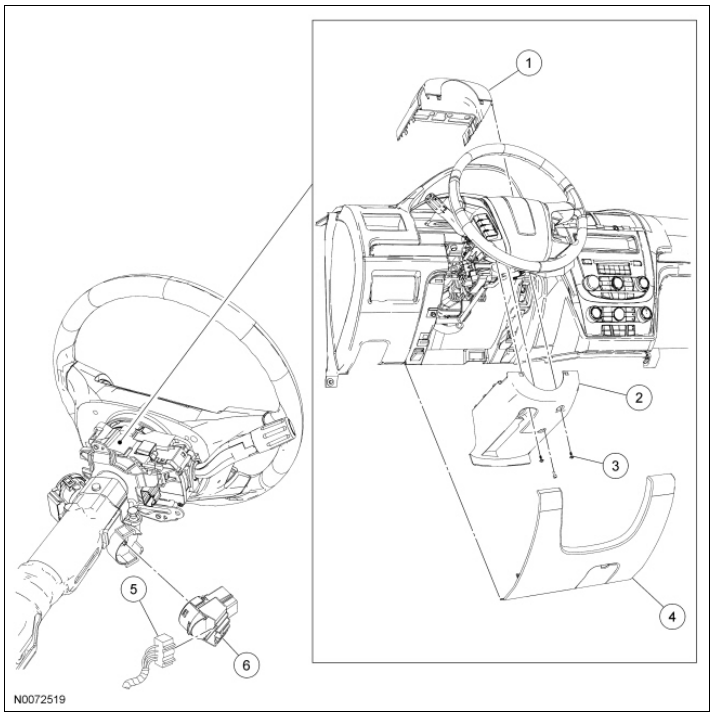
The following conditions can cause difficulty in operating the ignition switch and lock cylinder:

- Damaged or incorrectly cut ignition key
- Binding ignition lock cylinder
- Binding ignition switch
- Binding or damaged steering column lock module

Carry out the following test to determine if the ignition key/lock cylinder, ignition switch and the steering column lock module are operating correctly.

1. Inspect the ignition key for any burrs, damage or incorrect cut. Have a new ignition key made as necessary. If the key is OK, continue with Step 2.

2. Remove the ignition lock cylinder. Refer to Section 501-14 .



3. Rotate the ignition lock cylinder through all of the switch positions.
   - If the lock cylinder operates correctly, install the lock cylinder and continue with Step 4.
   - If the lock cylinder does not operate correctly, install a new ignition lock cylinder.

4. Remove the ignition switch. Refer to Ignition Switch in this section.

5. Rotate the ignition lock cylinder through all of the switch positions.
   - If the lock cylinder operates correctly, install a new ignition switch.

- If the lock cylinder does not operate correctly, install a new steering column lock module. Refer to Steering Column Lock Module in this section.

Ignition Switch

Item	Part Number	Description
1	3530	Upper steering column shroud
2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw (3 required)
4	5404459	Steering column opening cover
5	-	Ignition switch electrical connector (part of 14401)
6	11572	Ignition switch

Removal and Installation

NOTICE: **Do not remove the ignition lock cylinder and the ignition switch at the same time or damage to the column may result.**

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to Section 501-20B .

2. **NOTE:** The steering column opening cover is held in place by tabs that clip to the instrument panel.

   Remove the steering column opening cover by pulling straight outward.

3. **NOTE:** Release the upper steering column shroud, by pressing inward on the sides of the shroud and lifting upwards.

   Remove the upper steering column shroud.

4. Release the tilt lever, remove the 3 lower steering column shroud screws and then the shroud.

5. **NOTE:** Lower the steering column to the lowest tilt position.

   Disconnect the ignition switch electrical connector.

6. Press the 2 tabs and remove the ignition switch.

7. To install, reverse the removal procedure.

8. Repower the SRS . For additional information, refer to Section 501-20B .

Steering Column Multifunction Switch

Item	Part Number	Description
1	3530	Upper steering column shroud
2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw (3 required)
4	5404459	Steering column opening cover
5	14K147	Multifunction switch
6	-	Multifunction switch electrical connector (part of 14401)
7	W503521	Multifunction switch screws (2 required)

Removal and Installation

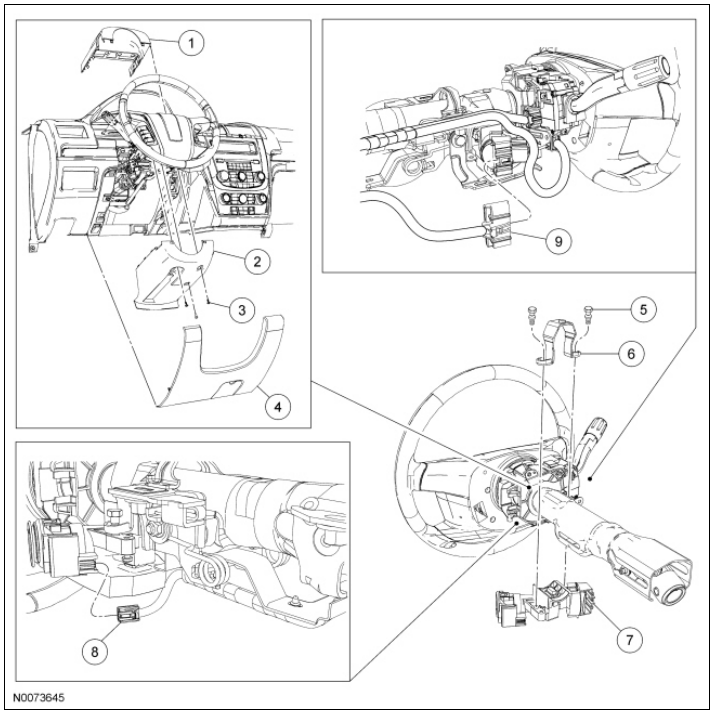
1. **NOTE:** The steering column opening cover is held in place by tabs that clip to the instrument panel.

   Remove the steering column opening cover by pulling straight outward.

2. **NOTE:** Release the upper steering column shroud, by pressing inward on the sides of the shroud and lifting upwards.

   Remove the upper steering column shroud.

3. Release the tilt lever, remove the 3 lower steering column shroud screws and then the shroud.



4. Disconnect the multifunction switch electrical connector.

5. Remove the 2 multifunction switch screws and the switch.

6. To install, reverse the removal procedure.

Steering Column Lock Module

Removal and Installation

Item	Part Number	Description
1	3530	Upper steering column shroud
2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw (3 required)
4	5404459	Steering column opening cover
5	12049	Steering column lock module bolt (2 required)
6	-	Steering column lock module clamp (part of 3K772)
7	3K772	Steering column lock module assembly
8	-	Passive Anti-Theft System (PATS) electrical connector (part of 14401)
9	-	Ignition switch electrical connector (part of 14401)

1. **NOTE:** The steering column opening cover is held in place by tabs that clip to the instrument panel.

   Remove the steering column opening cover by pulling straight outward.

2. **NOTE:** Release the upper steering column shroud, by pressing inward on the sides of the shroud and lifting upwards.

   Remove the upper steering column shroud.

3. Release the tilt lever, remove the 3 lower steering column shroud screws and then the shroud.

4. Disconnect the Passive Anti-Theft System (PATS) and ignition switch electrical connectors.

5. Disconnect the multifunction switch electrical connector.

6. **NOTE:** After cutting slots in the lock module bolts, clean all metal shavings and foreign material from the steering column.

   Using a suitable tool, cut slots into the heads of the 2 steering column lock module bolts.

7. **NOTE:** The lock module bolts are designed to sheer off when tightened.

   Remove the 2 steering column lock module bolts using a screwdriver.

   - Discard the bolts.
   - To install, use new steering column lock module bolts and tighten until the heads of the bolts shear off.

8. Remove the steering column lock module clamp and the steering column lock module assembly.

9. **NOTE:** Align the locating tab on the steeriumn lock module with the window of the steering column tube. Verify that the lock module operates correctly.

   To install, reverse the removal procedure.

Material

Item	Specification	Fill Capacity
A/C Cooling Coil Coating YN-29	-	-
A/C System Flushing Solvent YN-23	-	-
Motorcraft® Electric A/C Compressor Oil YN-32	-	Hybrid vehicles only 130 ml (4.4 fl oz)
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B	Non-hybrid vehicles only 177 ml (6 fl oz)
R-134a Refrigerant YN-19 (US); CYN-16-P or CYN-16-R (Canada)	WSH-M17B19-A	0.62 kg (22 oz) (1.38 lb)

General Specifications

	Specification
A/C Compressor (Non-Hybrid)	
Type	SP17
A/C Compressor Magnetic Clutch	
Air gap clearance	0.3-0.6 mm (0.012-0.024 in)
A/C Pressure Relief Valve [a]	
Close pressure	3103 kPa (450 psi)
Open pressure	3,792-4,137 kPa (550-600 psi)
Evaporator Discharge Air Temperature Sensor	
OFF temperature	2°C (36°F)
ON temperature	3°C (37°F)
Refrigerant System Dye	
R-134a Leak Detection Dye 164-R6060 or 164-R6081	-

[a] Manifold gauge set pressures may vary slightly depending on the distance between the service gauge port valve and the A/C pressure relief valve, the A/C cycling switch or the pressure cutoff switch location.

Climate Control System

⚠ WARNING: Take the following precautions when repairing an air conditioning system containing R-134a:

- ♦ Always wear safety goggles.
- ♦ Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13°F) under atmospheric pressure and will freeze skin tissue.
- ♦ Never allow refrigerant R-134a gas to escape in quantity in an occupied space. It will displace the oxygen needed to support life.
- ♦ Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but it decomposes when exposed to high temperatures such as a torch flame. During decomposition it releases irritating and toxic gasses (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water.

Failure to follow theseuctions may result in serious personal injury.

NOTICE: **To avoid damaging the vehicle or Air Conditioning (A/C) components, the following precautions must be observed.**

- The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant charging. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.
- Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These 2 types of refrigerant must never be mixed. Doing so can damage the A/C system.
- Charge the A/C system with R-134a refrigerant gas while the engine is running only at the low-pressure side to prevent refrigerant slugging from damaging the A/C compressor.
- Use only R-134a refrigerant. Due to environmental concerns, when the A/C system is drained, the refrigerant must be collected using refrigerant recovery/recycling equipment. Federal, State/Provincial and/or local laws REQUIRE that R-134a be recovered into appropriate recovery equipment and the process be conducted by qualified technicians who have been certified by an approved organization, such as Automotive Service Excellence (ASE) or Mobile Air Conditioning Society (MACS). Use of a recovery machine dedicated to R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the instructions provided by the equipment manufacturer when removing refrigerant from or charging the A/C system.
- Refrigerant R-134a must not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.
- A number of manufacturers are producing refrigerant products that are described as direct substitutes for refrigerant R-134a. The use of any unauthorized substitute refrigerant can severely damage the A/C components. If repair is required, use only new or recycled refrigerant R-134a.

NOTICE: **To avoid contamination of the Air Conditioning (A/C) system, the following precautions must be observed.**

- Never open or loosen a connection before recovering the refrigerant.
- When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.
- Evacuate a system that has been opened to install a new component or one that has discharged through leakage before charging.
- Seal open fittings with a cap or plug immediately after disconnecting a component from the system.

- Clean the outside of the fittings thoroughly before disconnecting a component from the system.
- Do not remove the sealing caps from a new component until ready to install.
- Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use and install the cap immediately after using. Store the oil in a clean, moisture-free container.
- Install a new O-ring seal before connecting an open fitting. Coat the fitting and O-ring seal with PAG oil before connecting.
- When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that can chafe the line.
- Tighten threaded fittings only to specifications. The steel and aluminum fittings used in the refrigerant system will not tolerate overtightening.
- When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.
- Do not open a refrigerant system or uncap a new component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component that is cooler than the surrounding air.

The Electronic Manual Temperature Control (EMTC) system heats or cools the vehicle depending on the HVAC module - control panel selection.

- The control panel selectiondetermine heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the air temperature.
- The blower motor switch varies the blower motor speed.
- During A/C operation, the system also reduces the relative humidity of the air.

The Dual Automatic Temperature Control (DATC) system maintains the selected vehicle interior temperature by heating and/or cooling the air.

- During A/C operation, the system also reduces the relative humidity of the air.
- The driver may override the automatic mode of operation.
- The temperature control setting determines the air temperature.
- The blower motor control override buttons vary the blower motor speed.
- The driver side and passenger side temperature settings can be individually controlled.

The system consists of the following components:

- A/C compressor
- A/C compressor clutch assembly
- A/C condenser core
- A/C evaporator core
- Receiver/drier
- Connecting refrigerant lines
- Thermostatic Expansion Valve (TXV)
- A/C pressure transducer
- Heater core and evaporator core housing
- HVAC module
- Front Controls Interface Module (FCIM) (Fusion with navigation and all MKZ)
- Audio Control Module (ACM) (all vehicles equipped with navigation systems)
- Temperature blend door actuators
- Defrost/panel/floor mode door actuator
- Air inlet mode door actuator
- Blower motor resistor (EMTC systems only)
- Blower motor speed control (DATC systems only)

- Blower motor
- Ambient air temperature sensor
- In-vehicle temperature sensor (DATC systems only)
- Sunload sensor (DATC systems only)
- Evaporator temperature sensor

Electronic Manual Temperature Control (EMTC) System

The EMTC system heats or cools the vehicle depending on the control panel selection.

- The control panel selections determine heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the air temperature.
- The blower motor switch varies the blower motor speed.
- During A/C operation the system also reduces the relative humidity of the air.

The EMTC system operation is determined by the settings on the climate controls. To control the various functions, the EMTC system is composed of the following:

- HVAC module
- Blower motor resistor
- Defrost/panel/floor mode door actuator
- Air inlet mode door actuator
- Temperature blend door actuator
- Evaporator temperature sensor
- Ambient air temperature sensor

The blower motor switch:

- sets the blower motor speed.
- is serviced only with the HVAC module.

The A/C request button:

- can command the A/C compressor ON when the function selector switch is in PANEL, FLOOR/PANEL, FLOOR/DEFROST and FLOOR when the A/C request switch is pressed. Indicator illuminates when A/C request switch is toggled ON.
- indicator illuminates when the function selector switch is in MAX A/C and cannot be toggled.
- is serviced only with the HVAC module.

The function selector:

- selects airflow direction.
- is serviced only with the HVAC module.

The temperature selector:

- selects full warm and full cool as well as blended outlet temperatures.
- is serviced only with the HVAC module.

The air recirculation button:

- selects either recirculated or outside air source.

- recirculates air in any mode except DEFROST, if requested.
- is disabled in MAX A/C or OFF mode where recirculated air only is used.
- is disabled in DEFROST mode where outside air only is used.
- is serviced only with the HVAC module.

Dual Automatic Temperature Control (DATC) System

NOTE: For the passenger side temperature setting on hybrid vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) and a Front Controls Interface Module (FCIM) built on or after 04/08/2009 to be functional, a passenger must be seated in the front passenger seat. If the front passenger seat is not occupied, the HVAC module will control the system based only on the driver side temperature setting. The HVAC module receives a Medium Speed Controller Area Network (MS-CAN) signal from the FCIM to indicate if the front passenger seat is occupied.

The DATC system maintains the selected vehicle interior temperature by heating and/or cooling the air.

- During A/C operation, the system also reduces the relative humidity of the air.
- The driver may override the automatic mode of operation.
- The temperature control setting determines the desired air temperature.
- The blower motor control override button varies the blower motor speed.
- The driver side and passenger side temperature settings can be individually controlled.

The DATC system operation is determined by the settings on the climate controls. The HVAC system automatically maintains a selected temperature for vehicle interior comfort. To control the various functions, the DATC system is composed of the following:

- HVAC module
- Front Controls Interface Module (FCIM) (Fusion with navigation and all MKZ)
- Audio Control Module (ACM) (all vehicles equipped with navigation systems)
- Blower motor speed control
- Defrost/panel/floor mode door actuator
- Air inlet mode door actuator
- LH and RH temperature blend door actuators
- In-vehicle temperature sensor
- Ambient air temperature sensor
- Sunload sensor
- Evaporator temperature sensor

When the DATC system is set to AUTO:

- the air distribution direction, blower motor speed and A/C compressor operation are automatically controlled based on the temperature(s) selected.

The DATC system manual override settings:

- allow the air distribution direction to be manually selected.
- allow the blower motor speed to be manually selected.
- allow recirculation mode to be manually selected in all modes except DEFROST. The A/C request can be cancelled by pressing the A/C request switch, turning the indicator OFF.
- allow A/C compressor operation to be manually selected except in DEFROST.

External Temperature Display

While the actual external temperature can vary continuously, the value that is displayed will update at a specific rate depending on whether or not the engine is "hot" and whether or not the vehicle is moving.

When the external temperature is rising, the display will update slowly.

Updates (when the actual external temperature is higher than currently displayed value) will be limited to 0.6°C (1°F) every 20 seconds while the vehicle is moving at greater than 40 km/h (25 mph) for more than 90 seconds or 0.6°C (1°F) every 20 minutes if the vehicle is not moving at this speed. This is to prevent the heat from the engine compartment from affecting the accuracy of the display.

When the external temperature is dropping, the display will update quickly.

Updates (when the actual external temperature is lower than currently displayed value) will only be limited to 0.6°C (1°F) every 2 seconds (regardless of vehicle speed). Consequently the display will essentially follow the drop ienced by the external temperature thermistor.

System Airflow Description - Electronic Manual Temperature Control (EMTC)

Max A/C

When MAX A/C is selected:

- the air inlet mode door actuator closes off outside air and admits only recirculated air.
- the RECIRC button is disabled and the indicator is illuminated.
- the defrost/panel/floor mode door directs airflow to the instrument panel A/C registers.
- blended air temperature is available.
- the A/C request button is illuminated and will be disabled.
- the A/C compressor will operate if the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL

When PANEL is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator OFF), the air inlet mode door actuator admits only outside air into the passenger compartment.
- the defrost/panel/floor mode door directs airflow to the instrument panel A/C registers.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator OFF), the air inlet mode door actuator admits only outside air into the passenger compartment. the defrost/panel/floor mode door directs airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters

and defrost duct will be present.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

OFF

When OFF is selected:

- the air inlet door actuator closes off outside air and admits only recirculated air.
- the blower motor is OFF.

FLOOR

When FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator OFF), the air inlet mode door actuator admits only outside air into the passenger compartment.
- the defrost/panel/floor mode door directs airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters will be present.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR/DEFROST

When the FLOOR/DEFROST is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator ON), the air inlet mode door actuator closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator OFF), the air inlet mode door actuator admits only outside air into the passenger compartment.
- therost/panel/floor mode door directs airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available.
- the A/C request button will indicate the last status and the indicator can be toggled. To reduce fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

DEFROST

When DEFROST is selected:

- the air inlet mode door actuator opens, admitting only outside air into the passenger compartment.
- the defrost/panel/floor mode door directs airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct will be present.
- blended air temperature is available.
- the A/C request button will indicate the last status and the indicator can be toggled. To reduce fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside

temperature is above approximately 6°C (43°F).
- the blower motor is ON.

System Airflow Description - Dual Automatic Temperature Control (DATC)

AUTO

When AUTO is selected:

- the temperature control setting is manually set to the desired setting.
- the air inlet mode door actuator is automatically controlled by the HVAC module, based on the temperature setting.
- the door actuators are automatically controlled by the HVAC module, based on the temperature setting.
- the A/C compressor is automatically controlled by the HVAC module, based on the temperature setting. The A/C compressor will not operate if the outside temperature is below approximately 6°C (43°F).
- the A/C request button or the RECIRC request button, if pressed, will transfer the system to semi-auto operation.
- the blower motor he blower motor speed is automatically controlled by the HVAC module, based on the temperature setting, but can be manually overridden.

OFF

When OFF is selected:

- the air inlet door actuator closes off outside air and admits only recirculated air.
- the blower motor is OFF.

PANEL

When PANEL is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator ON), the air inlet mode door actuator closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator OFF), the air inlet mode door actuator admits only outside air into the passenger compartment.
- the defrost/panel/floor mode door directs airflow to the instrument panel A/C registers.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator ON), the air inlet mode door actuator closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator OFF), the air inlet mode door actuator admits only outside air into the passenger compartment.

- the defrost/panel/floor mode door directs airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters and defrost duct will be present.
- blended air temperature is available. Only when A/C mpressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR

When FLOOR is selected:

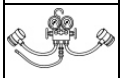
- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator ON), the air inlet mode door actuator closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator OFF), the air inlet mode door actuator admits only outside air into the passenger compartment.
- the defrost/panel/floor mode door directs airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters will be present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR/DEFROST

When the FLOOR/DEFROST is selected:

- the RECIRC request button is enabled. If the RECIRC request button is selected (indicator ON), the air inlet mode door actuator closes off outside air from entering the passenger compartment. If the RECIRC request button is not selected (indicator OFF), the air inlet mode door actuator admits only outside air into the passenger compartment.
- the defrost/panel/floor mode door directs airflow to the floor duct, the defroster duct and the side window sters.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor will operate automatically and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

DEFROST



When DEFROST is selected:

- the RECIRC request button and indicator is disabled. Regardless of button and indicator status, the air inlet mode door actuator admits only outside air into the passenger compartment.
- the defrost/panel/floor mode door directs airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct will be present.
- blended air temperature is available.
- the A/C request button will indicate the last status and the indicator can be toggled. To reduce fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 6°C (43°F).

- the blower motor is ON.

Principles of Operation

There are 4 main principles involved with the basic theory of operation:

- Heat transfer
- Latent heat of vaporization
- Relative humidity
- Effects of pressure

Heat Transfer

If 2 substances of different temperature are placed near each other, the heat in the warmer substance will transfer to the colder substance.

Latent Heat of Vaporization

When a liquid boils (converts to gas), it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (converts back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

Relative Humidity

The amount of moisture (water vapor content) that the air can hold is directly related to the air temperature. The more heat there is in the air, the more moisture the air can hold. The lower the moisture content in the air, the more comfortable occupants feel. Removing the moisture from the air lowers its relative humidity and improves personal comfort.

Effects of Pressure on Boiling or Condensation

As the pressure is increased on a liquid, the temperature at which the liquid boils (converts to gas) also increases. Conversely, when the pressure on a liquid is reduced, its boiling point is also reduced. When in the gas state, an increase in pressure causes an increase in temperature, while a decrease in pressure will decrease the temperature of the gas.

Compressor Anti-Slugging Strategy (CASS)

Liquid refrigerant may accumulate in the A/C compressor under certain conditions. To alleviate damage to the A/C compressor, Compressor Anti-Slugging Strategy (CASS) is utilized.

CASS is initiated only under specific conditions:

- The ignition is off for more than 8 hours
- The ambient temperature is above -4Â°C (25Â°F)
- Battery voltage is above 8.5 volts during engine cranking

When these conditions are present, the PCM will activate the A/C control relay prior to cranking of the engine. The A/C control relay engages the A/C compressor for approximately 4-15 A/C compressor revolutions or a maximum of 2 seconds (depending upon vehicle application), allowing the liquid refrigerant to be pushed from the A/C compressor. CASS is initiated by the PCM regardless of the system settings.

The Refrigerant Cycle

During stabilized conditions (A/C system shutdown), the refrigerant pressures are equal throughout the system. When the A/C compressor is in operation, it increases pressure on the refrigerant vapor, raising its temperature. The high-pressure and high-temperature vapor is then released into the top of the A/C condenser core.

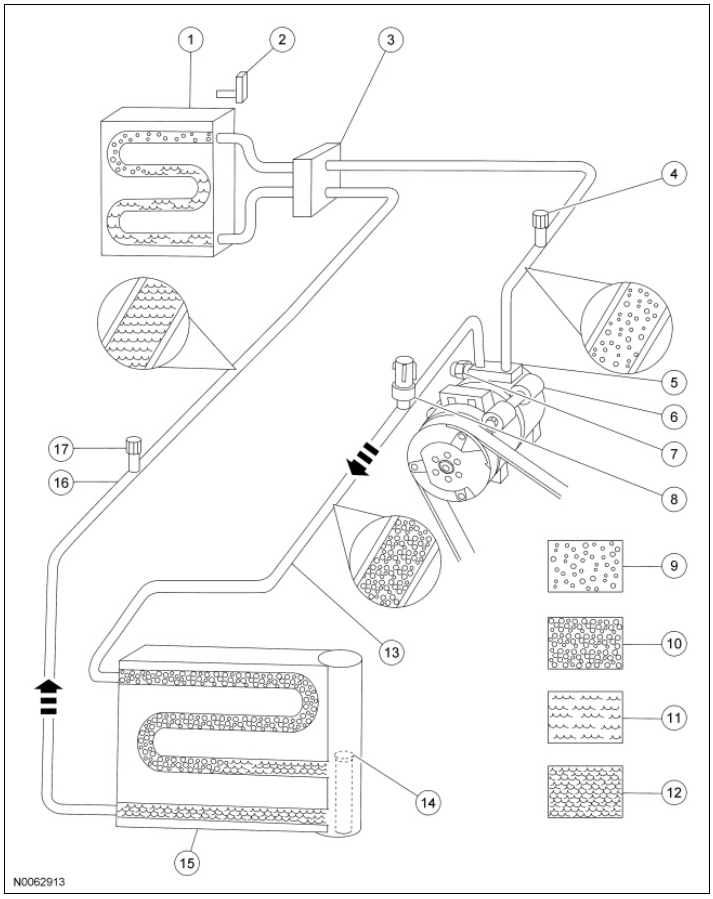
The A/C condenser, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The now liquid refrigerant, still at high pressure, exits from the bottom of the A/C condenser and enters the inlet side of the A/C receiver/drier. The receiver/drier is designed to remove moisture from the refrigerant.

The outlet of the receiver/drier is connected to the Thermostatic Expansion Valve (TXV). The TXV provides the orifice which is the restriction in the refrigerant system and separates the high and low pressure sides of the A/C system. As the liquid refrigerant passes across this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the A/C evaporator,

it absorbs heat from the airflow passing over the plate/fin sections of the A/C evaporator. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

The refrigerant cycle is now repeated with the A/C compressor again increasing the pressure and temperature of the refrigerant.



A thermistor which monitors the temperature of the air that has passed through the evaporator core controls A/C clutch cycling. If the temperature of the evaporator core discharge air is low enough to cause the condensed water vapor to freeze, the A/C clutch is disengaged by the vehicle PCM.

The high-side line pressure is also monitored so that A/C compressor operation will be interrupted if the system pressure becomes too high or is determined to be too low (low charge condition).

The A/C compressor thermal protection switch will interrupt compressor operation if the compressor housing exceeds temperature limits.

The A/C compressor relief valve will open and vent refrigerant to relieve unusually high system pressure.

Thermostatic Expansion Valve (TXV) Type Refrigerant System

Item	Description
1	A/C evaporator core
2	A/C evaporator core temperature sensor

3	Thermostatic Expansion Valve (TXV)
4	A/C charge valve port (low side)
5	A/C suction line
6	A/C compressor
7	A/C pressure relief valve
8	A/C pressure transducer
9	Low-pressure vapor
10	High-pressure vapor
11	Low-pressure liquid
12	High-pressure liquid
13	Compressor discharge line
14	A/C desiccant cartridge
15	A/C condenser core with A/C receiver/drier
16	Condenser-to-evaporator line
17	A/C charge valve port (high side)

Inspection and Verification

1. Verify the customer's concern by operating the climate control system to duplicate the condition.
2. Inspect to determine if one of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
• Loose, missing or damaged A/C compressor drive belt • Loose or disconnected A/C clutch • Broken or binding door/actuator • Broken or leaking refrigerant lines • Obstructed in-vehicle temperature sensor • Disconnected in-vehicle temperature aspirator hose	• Battery Junction Box (BJB) fuse: ♦ 25 (10A) ♦ 35 (40A) ♦ 47 (10A) • Smart Junction Box (SJB) fuse: ♦ 15 (10A) ♦ 45 (5A) • Blower motor inoperative • A/C compressor inoperative • Circuitry open/shorted • Disconnected electrical connectors • Cooling fan inoperative

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM, HVAC module.

7. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the continuous DTCs and carry out the self-test diagnostics from the PCM or HVAC module.

9. **NOTE:** Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

   If the HVAC DTCs retrieved are related to the concern, go to the HVAC Module DTC Chart. If the PCM DTCs retrieved are related to the concern, go to the PCM DTC Chart. For all other DTCs, refer to Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Climate Control Systems or GO to Symptom Chart - NVH .

DTC Charts

PCM DTC Chart

DTC	Description	Action to Take
P0532	A/C Pressure Refrigerant Sensor A Circuit Low	GO to Pinpoint Test A .
P0533	A/C Refrigerant Pressure Sensor A Circuit High	GO to Pinpoint Test A .
P0645	Air Conditioning Clutch Relay (A/CCR) Control Circuit	GO to Pinpoint Test B .
P1464	A/C Demand Out Of Self Test Range	If the HVAC selector was not in the OFF position, place it in the OFF position, CLEAR the DTCs and REPEAT the self-test. If the DTC does not return, ignore the DTC and continue diagnostics. If the DTC returns, INSTALL a new HVAC module. CLEAR the DTCs and REPEAT the

		self-test.
All Other DTCs	â	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

HVAC Module DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

Symptom Chart â Climate Control Systems

Symptom Chart â Climate Control Systems
NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

ConditionPossible SourcesAction

- No communication with the HVAC module

- Fuse(s)
- Circuitry open
- HVAC module communication network

- REFER to Section 418-00 .

- Unable to duplicate the customer concern and no DTCs present

- HVAC system and/or related components

- GO to Pinpoint Test I .

- Reduced outlet airflow

- Circuitry short
- A/C compressor clutch air gap
- A/C cycling switch
- A/C clutch relay
- Blower motor
- Blower motor control
- Blower motor resistor
- Blower motor switch
- PCM

- If the A/C compressor does not cycle, GO to Pinpoint Test N .
- For Electronic Manual Temperature Control (EMTC) systems, if the A/C compressor cycles normally, GO to Pinpoint Test R .
- For Dual Automatic Temperature Control (DATC) systems, if the A/C compressor cycles normally, GO to Pinpoint Test T .

- The air inlet door is inoperative

- Circuitry open/shorted
- Door actuator
- Air inlet door binding or stuck
- HVAC module

- GO to Pinpoint Test J .

- Incorrect/erratic direction of airflow from outlets

- Circuitry open/shorted
- Door actuator
- Mode door binding or stuck
- HVAC module

- GO to Pinpoint Test K .

- Insufficient, erratic or no heat

- Low engine coolant level
- Engine overheating
- Plugged or partially plugged heater core
- Temperature blend door is binding or stuck
- Temperature blend door actuator
- Heater hose is kinked or binding

- GO to Pinpoint Test L .

- The air conditioning (A/C) is inoperative

- Fuse(s)
- Circuitry open
- A/C system discharged/low charge
- PCM
- HVAC module
- A/C clutch relay
- A/C compressor clutch air gap
- A/C pressure transducer
- Evaporator discharge temperature sensor
- A/C clutch field coil

- GO to Pinpoint Test M .

- The air conditioning (A/C) is always on â A/C compressor does not cycle

- Circuitry shorted
- PCM
- A/C clutch relay
- A/C compressor clutch air gap
- A/C pressure transducer
- A/C clutch field coil

- GO to Pinpoint Test N .

- The air conditioning (A/C) is always on â A/C mode always commanded ON

- Circuitry shorted
- PCM
- HVAC module

- GO to Pinpoint Test O .

- Temperature control is inoperative/does not operate correctly

- Circuitry open/shorted
- HVAC module
- Temperature blend door is binding or stuck
- Temperature blend door actuator

- GO to Pinpoint Test P .

- The blower motor is inoperative â EMTC

- Fuse(s)
- Circuitry open
- Blower motor relay
- A/C blower motor
- HVAC module â EMTC

- GO to Pinpoint Test Q .

- The blower motor does not operate correctly â EMTC

- Circuitry open/shorted
- A/C blower motor resistor
- HVAC module â EMTC

- GO to Pinpoint Test R .

- The blower motor is inoperative â DATC

- Fuse(s)
- Circuitry short/open
- Blower motor relay
- A/C blower motor
- HVAC module
- A/C blower motor speed control

- GO to Pinpoint Test S .

- The blower motor does not operate correctly â DATC

- Circuitry open/shorted
- A/C blower motor speed control
- HVAC module

- GO to Pinpoint Test T .

- The temperature set point does not repeat after turning the ignition switch OFF

- Fuse
- Circuitry short/open
- HVAC module

- CARRY OUT the HVAC Module Cold Boot Process. If the condition returns, INSTALL a new HVAC module.

- The temperature display will not switch between Celsius and Fahrenheit

- HVAC module

- INSTALL a new HVAC module. REFER to Section 412-01 .

- The dual temperature control is inoperative/does not operate correctly

- Temperature blend door/actuator broken/binding
- HVAC module â Electronic Automatic Temperature Control (EATC)
- Low A/C refrigerant charge

- **NOTE:** For the passenger side temperature setting on hybrid vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) and a Front Controls Interface Module (FCIM) built on or after 04/08/2009 to be functional, a passenger must be seated in the front passenger seat. If the front passenger seat is not occupied, the HVAC module will control the system based only on the driver side temperature setting. The HVAC module receives a Medium Speed Controller Area Network (MS-CAN) signal from the FCIM to indicate if the front passenger seat is occupied.

  CHECK that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42

psi), REFER to Fluorescent Dye Leak Detection in this section. CHECK the temperature blend doors/actuators for a binding or broken condition. If no condition is found, INSTALL a new HVAC module.

- Inaccurate external temperature display

- HVAC module
- Ambient temperature sensor

- REFER to description and operation of the HVAC module external temperature display. If the external temperature display is not operating as described and no DTC is present, CARRY OUT the Ambient Temperature Sensor component test in this section. If the sensor tests OK, INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.

- A/C pressure relief valve discharging

- High system pressure
- A/C pressure relief valve

- CHECK the high side system pressure. If the pressure is below the A/C pressure relief valve open pressure, REPLACE the A/C pressure relief valve. If the system pressure is above the A/C pressure relief valve open pressure, REPAIR the system for a restriction.

Symptom Chart â NVH

Symptom Chart â NVH
NOTE: NVH symptoms will be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Noisy A/C compressor clutch

- A/C compressor clutch air gap out of specification

- CHECK and ADJUST the A/C compressor clutch gap if necessary. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation.
- If the A/C compressor clutch gap is OK, INSTALL an A/C compressor clutch. REFER to Section 412-01 . TEST the system for normal operation.

Pinpoint Tests

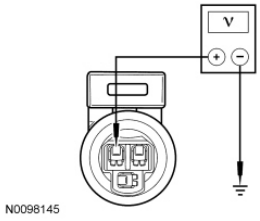
Pinpoint Test A: DTC P0532 or P0533

Refer to Wiring Diagrams Cell 23 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Electronic Engine Controls

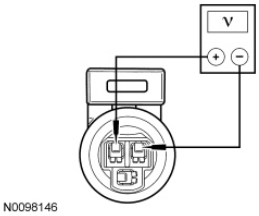
â 2.3L for schematic and connector information.

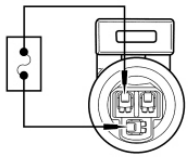
Refer to Wiring Diagrams Cell 24 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Electronic Engine Controls
â 3.0L for schematic and connector information.

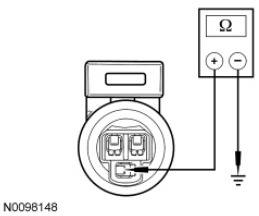
Refer to Wiring Diagrams Cell 25 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Electronic Engine Controls
â 3.5L for schematic and connector information.



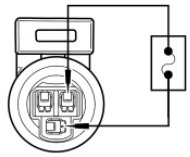
Normal Operation

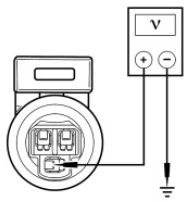




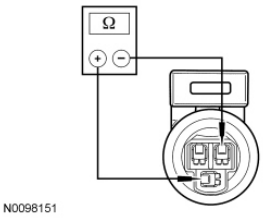


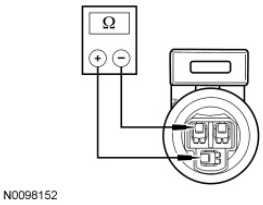
Under normal operation, the A/C pressure transducer receives a ground from the PCM through circuit RE407 (YE/VT). A 5-volt reference voltage is supplied to the A/C pressure transducer from the PCM through circuit LE424 (YE/GN). The A/C pressure transducer sends voltage to the PCM through circuit VH433 (VT/OG) to indicate the A/C pressure.

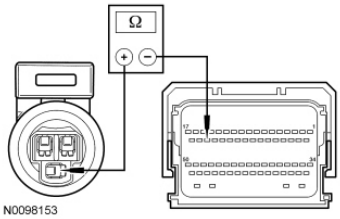


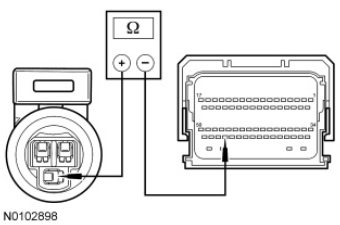


- DTC P0532 (A/C Pressure Refrigerant Sensor A Circuit Low) â The A/C pressure transducer inputs a voltage to the PCM. If the voltage is below the calibrated level, this DTC sets.
- DTC P0533 (A/C Pressure Refrigerant Sensor A Circuit High) â The A/C pressure transducer inputs a voltage to the PCM. If the voltage is above the calibrated level, this DTC sets.









This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- A/C pressure transducer
- PCM

PINPOINT TEST A: DTC P0532 OR P0533

Test Step	Result / Action to Take
A1 CHECK THE PCM OUTPUT VOLTAGE	
• Ignition OFF. • Disconnect: A/C Pressure Transducer C1260. • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1260-2, circuit LE424 (YE/GN), harness side.  N0098145 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** GO to A2 . **No** REPAIR circuit LE424 (YE/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A2 CHECK THE PCM SENSOR GROUND	

• Measure the voltage between A/C pressure transducer C1260-1, circuit RE407 (YE/VT), harness side and A/C pressure transducer C1260-2, circuit LE424 (YE/GN), harness side.  N0098146 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** If diagnosing **DTC P0532** , GO to A3 . If diagnosing **DTC P0533** , GO to A5 . **No** REPAIR circuit RE407 (YE/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A3 CHECK THE A/C PRESSURE TRANSDUCER HIGH	
• Enter the following diagnostic mode on the scan tool: A/C Pressure (ACP_PRESS) PCM PID. • While observing the ACP_PRESS PCM PID, connect a fused jumper between A/C pressure transducer C2160-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1260-2, circuit LE424 (YE/GN), harness side.  N0098147 • **Does the ACP_PRESS PCM PID voltage read greater than 4 volts?**	**Yes** INSTALL a new A/C pressure transducer. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between ground and A/C pressure transducer C1260-3, circuit VH433 (VT/OG), harness side.  N0098148	**Yes** GO to A7 . **No** REPAIR circuit VH433 (VT/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• **Is the resistance greater than 10,000 ohms?**	
A5 CHECK THE A/C PRESSURE TRANSDUCER HIGH	
• Enter the following diagnostic mode on the scan tool: A/C Pressure (ACP_PRESS) PCM PID. • While observing the ACP_PRESS PCM PID, connect a fused jumper between A/C pressure transducer C1260-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1260-1, circuit RE407 (YE/VT), harness side.  N0098149 • **Does the ACP_PRESS PCM PID voltage read less than 4.9 volts?**	**Yes** INSTALL a new A/C pressure transducer. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A6 .
A6 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • Measure the voltage between ground and A/C pressure transducer C1260-3, circuit VH433 (VT/OG), harness side.  N0098150 • **Is any voltage present?**	**Yes** REPAIR circuit VH433 (VT/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A7 .
A7 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO CIRCUIT LE424 (YE/GN) OR RE407 (YE/VT)	
• Ignition OFF. • **NOTE: For DTC P0532 only.** • Measure the resistance between A/C pressure transducer C1260-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1260-1, circuit RE407 (YE/VT), harness side.	**Yes** GO to A8 . **No** REPAIR circuit VH433 (VT/OG) for a short to circuit LE424 (YE/GN) or RE407 (YE/VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0098151 • **NOTE: For DTC P0533 only.** • Measure the resistance between A/C pressure transducer C1260-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C1260-2, circuit LE424 (YE/GN), harness side.  N0098152 • **Is the resistance greater than 10,000 ohms?**	
A8 CHECK CIRCUIT VH433 (VT/OG) FOR AN OPEN	
• **For 2.5L and 3.0L only** , measure the resistance between A/C pressure transducer C1260-3, circuit VH433 (VT/OG), harness side and PCM C175B-31, circuit VH433 (VT/OG), harness side.  N0098153 • **For 3.5L only** , measure the resistance between A/C pressure transducer C1260-3, circuit VH433 (VT/OG), harness side and PCM C175B-63, circuit VH433 (VT/OG), harness side.  N0102898 • **Is the resistance less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR circuit VH433 (VT/OG)Â for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

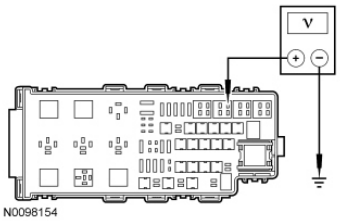
A9 CHECK THE PCM CONNECTION	
• Disconnect all the PCM connectors. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the PCM connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

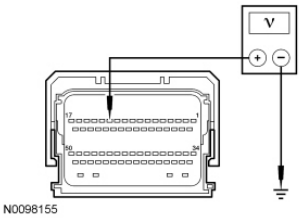
Pinpoint Test B: DTC P0645

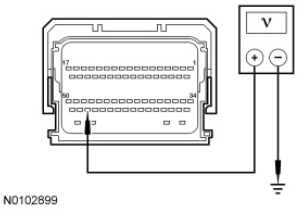
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

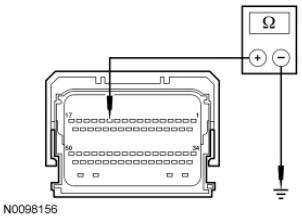
Normal Operation

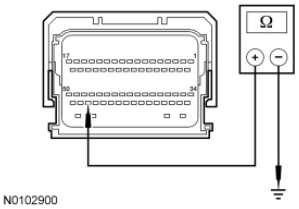


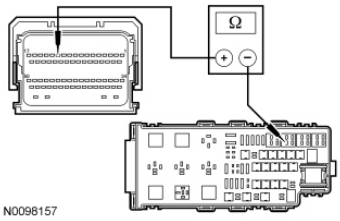


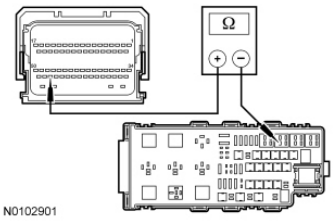


Under normal operation, voltage is provided to the A/C clutch relay coil through circuit CBK03 (GY). When A/C is requested, and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM through circuit CH302 (WH/BN), energizing the A/C clutch relay.









- DTC P0645 (A/C Clutch Relay Control Circuit) â The DTC sets when the PCM grounds the relay circuit and excessive current draw is detected on the relay circuit. The DTC also sets when the relay circuit is OFF and no voltage is detected on the relay circuit. The PCM expects to detect voltage coming through the relay coil to the relay circuit when it is not grounding it.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- A/C clutch relay
- PCM

PINPOINT TEST B: DTC P0645

Test Step	Result / Action to Take
B1 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY	
• Ignition OFF. • Disconnect: A/C Clutch Relay. • Ignition ON. • Measure the voltage between ground and the A/C clutch relay socket, circuit CBK03 (GY).	**Yes** CARRY OUT the A/C clutch relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing.

 N0098154 • **Is the voltage greater than 10 volts?**	If the relay tests OK, GO to B2 . **No** REPAIR circuit CBK03 (GY) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B2 CHECK CIRCUIT CH302 (WH/BN) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B. • Ignition ON. • **For 2.5L and 3.0L only** , measure the voltage between ground and PCM C175B-12, circuit CH302 (WH/BN), harness side.  N0098155 • **For 3.5L only** , measure the voltage between ground and PCM C175B-64, circuit CH302 (WH/BN), harness side.  N0102899 • **Is any voltage present?**	**Yes** REPAIR circuit CH302 (WH/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B3 .
B3 CHECK CIRCUIT CH302 (WH/BN) FOR A SHORT TO GROUND	
• Ignition OFF. • **For 2.5L and 3.0L only** , measure the resistance between ground and PCM C175B-12, circuit CH302 (WH/BN), harness side.	**Yes** GO to B4 . **No** REPAIR circuit CH302 (WH/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0098156 • **For 3.5L only** , measure the resistance between ground and PCM C175B-64, circuit CH302 (WH/BN), harness side.  N0102900 • **Is the resistance greater than 10,000 ohms?**	
B4 CHECK CIRCUIT CH302 (WH/BN) FOR AN OPEN	
• **For 2.5L and 3.0L only** , measure the resistance between A/C clutch relay socket, circuit CH302 (WH/BN) and PCM C175B-12, circuit CH302 (WH/BN), harness side.  N0098157 • **For 3.5L only** , measure the resistance between A/C clutch relay socket, circuit CH302 (WH/BN) and PCM C175B-64, circuit CH302 (WH/BN), harness side.  N0102901 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR circuit CH302 (WH/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B5 CHECK THE PCM CONNECTION	

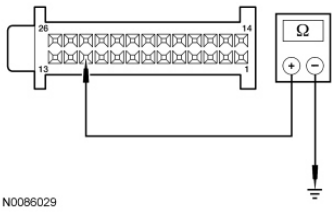
• Disconnect all the PCM connectors. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the PCM connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

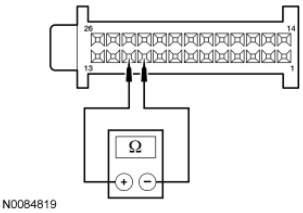
Pinpoint Test C: DTCs C1B14:11 and 12

Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

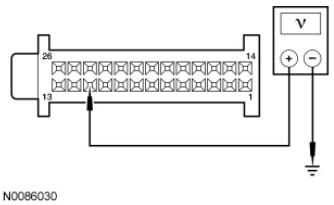
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation





Under normal operation, a 5-volt reference voltage is supplied to the sensors and actuators from the HVAC module through circuit LH111 (BN/WH).



- DTC C1B14:11 (Sensor Supply Voltage A: Circuit Short to Ground) â The module senses less than 0.1 volt on the sensor reference voltage circuit, indicating a short directly to ground.
- DTC C1B14:12 (Sensor Supply Voltage A: Circuit Short to Battery) â The module senses greater than 4.9 volts on the sensor reference voltage circuit, indicating a short directly to voltage.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- HVAC module

PINPOINT TEST C: DTCs C1B14:11 AND 12

Test Step	Result / Action to Take
C1 CHECK THE SENSOR RESISTANCE	
• Check for HVAC DTCs. • **Is DTC C1B14:11 present?**	**Yes** GO to C2 . **No** GO to C4 .
C2 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module â Electronic Manual Temperature Control (EMTC) C2357a. • Disconnect: HVAC Module â Dual Automatic Temperature Control (DATC) C2356a.	**Yes** GO to C3 . **No** REPAIR circuit LH111 (BN/WH) for a short to ground. CLEAR the DTCs.

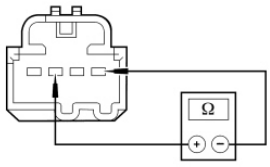
• Disconnect: HVAC Module â DATC C2356b. • Measure the resistance between ground and HVAC module â EMTC C2357a-11 or HVAC module â DATC C2356a-11, circuit LH111 (BN/WH), harness side.  N0086029 • **Is the resistance greater than 10,000 ohms?**	REPEAT the self-test. TEST the system for normal operation.
C3 CHECK CIRCUITS LH111 (BN/WH) AND RH111 (GY/BU) FOR A SHORT TOGETHER	
• Measure the resistance between HVAC module â EMTC C2357a-11 or HVAC module â DATC C2356a-11, circuit LH111 (BN/WH), harness side and HVAC module â EMTC C2357a-10 or HVAC module C2356a-10, circuit RH111 (GY/BU), harness side.  N0084819 • **Is the resistance greater than 200 ohms?**	**Yes** GO to C5 . **No** REPAIR circuits LH111 (BN/WH) and RH111 (GY/BU) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C4 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Ignition ON. • Measure the voltage between ground and HVAC module â EMTC C2357a-11 or HVAC module â DATC C2356a-11, circuit LH111 (BN/WH), harness side.	**Yes** REPAIR circuit LH111 (BN/WH) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to C5 .

 • **Is any voltage present?**	
C5 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: DTCs B1A61:11 and 15

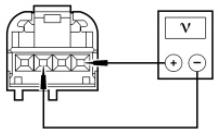
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation



Under normal operation, the in-vehicle air temperature sensor receives a ground from the HVAC module through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the in-vehicle air temperature sensor from the HVAC module through circuit VH414 (GN/BU).

- DTC B1A61:11 (Cabin Temperature Sensor: Circuit Short to Ground) â The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
- DTC B1A61:15 (Cabin Temperature Sensor: Circuit Short to Battery or Open) â The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit.



This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- In-vehicle air temperature sensor
- HVAC module

PINPOINT TEST D: DTCs B1A61:11 AND 15

Test Step	Result / Action to Take
D1 CHECK THE SENSOR RESISTANCE

TEST the system for normal operation.
D8 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

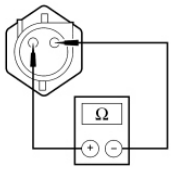
Pinpoint Test E: DTCs B1A68:11 and 15

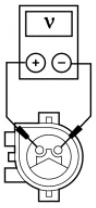
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

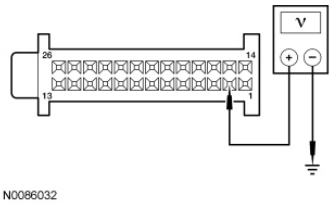
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

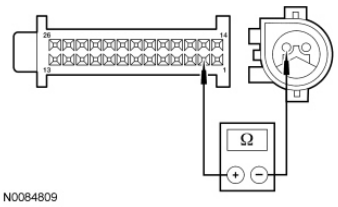
Under normal operation, the ambient air temperature sensor receives a ground from the HVAC module through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the ambient air temperature sensor from the HVAC module through circuit VH407 (YE/GN).

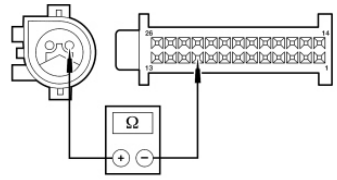


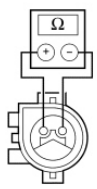




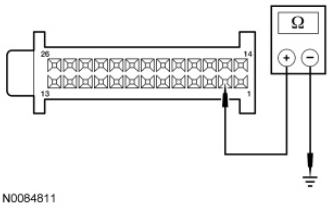
- DTC B1A68:11 (Ambient Temperature Sensor: Circuit Short to Ground) â The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
- DTC B1A68:15 (Ambient Temperature Sensor: Circuit Short to Battery or Open) â The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit.







This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Ambient air temperature sensor
- HVAC module



PINPOINT TEST E: DTCs B1A68:11 AND 15

Test Step	Result / Action to Take
E1 CHECK THE SENSOR RESISTANCE	
• Ignition OFF. • Disconnect: Ambient Air Temperature Sensor C132. • Measure the resistance between the ambient air temperature sensor C132 terminals and compare to the table below.	**Yes** GO to E2 . **No** INSTALL a new ambient air temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Ambient Temperature	Resistance
-40Â°C (-40Â°F)	832,519-1,017,523 ohms
-15Â°C (5Â°F)	199,325-220,307 ohms
0Â°C (32Â°F)	91,058-100,644 ohms

TEST the system for normal operation.
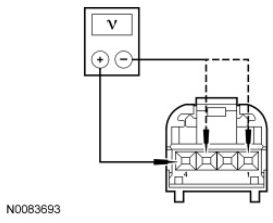
E8 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

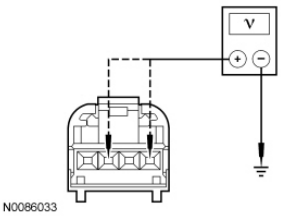
Pinpoint Test F: DTCs B1A63:11 and 15 or DTCs B1A64:11 and 15

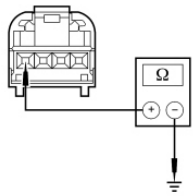
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

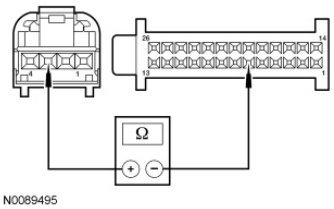
Normal Operation



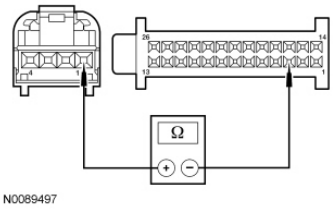
Under normal operation, the sunload sensor receives a ground from the HVAC module through circuit GD116 (BK/VT). A 5-volt reference voltage is supplied to the sunload sensor from the HVAC module through circuit VH417 (YE/OG) (RH) and circuit VH416 (VT/GY) (LH).

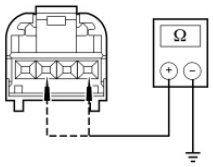






DTC Description	Fault Trigger Conditions
• B1A63:11 â Right Solar Sensor: Circuit Short to Ground	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
• B1A63:15 â Right Solar Sensor: Circuit Short to Battery or Open	The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit.
	The module senses excessive voltage drop on the sensor reference





• B1A64:11 â Left Solar Sensor: Circuit Short to Ground	voltage circuit, indicating a short directly to ground.
• B1A64:15 â Left Solar Sensor: Circuit Short to Battery or Open	The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Sunload sensor
- HVAC module

PINPOINT TEST F: DTCs B1A63:11 AND 15 OR DTCs B1A64:11 AND 15

Test Step	Result / Action to Take
F1 CHECK THE SUNLOAD SENSOR REFERENCE VOLTAGE	
• Ignition OFF. • Disconnect: Sunload Sensor C286. • Ignition ON. • Press the AUTO button. • Measure the voltage between sunload sensor C266-4, circuit GD116 (BK/VT), harness side and sunload sensor: ♦ **For DTC B1A63** , C286-1, circuit VH417 (YE/OG), harness side. ♦ **For DTC B1A64** , C286-3, circuit VH416 (VT/GY), harness side.  N0083693 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new sunload sensor. CLEAR the DTCs. REPEAT the self-test. REPEAT the self-test. TEST the system for normal operation.
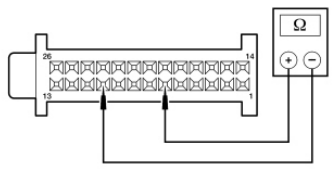
F6 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

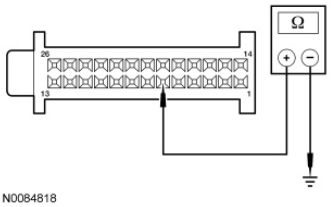
Pinpoint Test G: DTCs B1B71:11 and 15

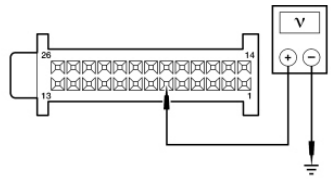
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

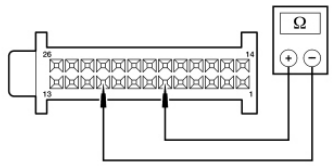


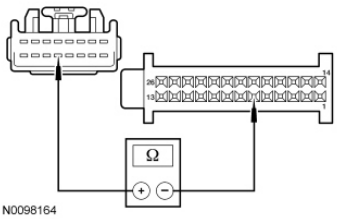
Normal Operation

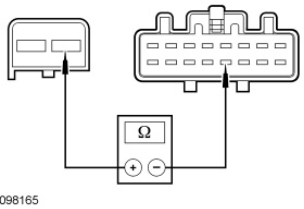




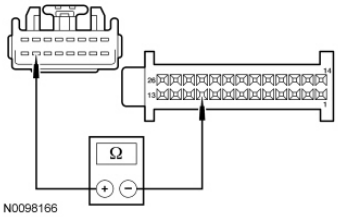
Under normal operation, the evaporator discharge air temperature sensor receives a ground from the HVAC module through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the evaporator discharge air temperature sensor from the HVAC module through circuit VH406 (VT/BN).

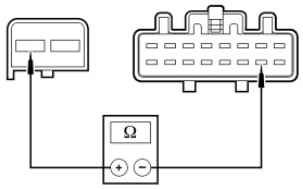






- DTC B1B71:11 (Evaporator Temperature Sensor: Circuit Short to Ground) â The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
- DTC B1B71:15 (Evaporator Temperature Sensor: Circuit Short to Battery or Open) â The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit.





This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Evaporator discharge air temperature sensor
- HVAC module

PINPOINT TEST G: DTCs B1B71:11 AND 15

Test Step	Result / Action to Take
G1 CHECK THE SENSOR RESISTANCE	
• Ignition OFF. • Disconnect: HVAC Module â Electronic Manual Temperature Control (EMTC) C2357a. • Disconnect: HVAC Module â Dual Automatic Temperature Control (DATC) C2356a. • Measure the resistance between HVAC module â EMTC C2357a-6 or HVAC module â DATC C2356a-6, circuit VH406 (VT/BN), harness side and HVAC module â EMTC C2357a-10 or HVAC module â DATC C2356a-10, circuit RH111 (GY/BU), harness side .  N0098163 • Compare the measurement to the chart and table of the Evaporator Discharge Air Temperature Sensor component test in this section. • **Is the resistance within the specified values for the temperatures?**	**Yes** **For DTC B1B71:11** , GO to G2 . **For DTC B1B71:15** , GO to G3 . **No** **For DTC B1B71:11** , GO to G4 . **For DTC B1B71:15** , GO to G5 .
G2 CHECK CIRCUIT VH406 (VT/BN) FOR A SHORT TO GROUND	

• Measure the resistance between HVAC module â EMTC C2357a-6 or HVAC module â DATC C2356a-6, circuit VH406 (VT/BN), harness side and ground.  N0084818 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G7 . **No** REPAIR circuit VH406 (VT/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G3 CHECK CIRCUIT VH406 (VT/BN) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and HVAC module â EMTC C2357a-6 or HVAC module â DATC C2356a-6, circuit VH406 (VT/BN), harness side and ground.  N0086034 • **Is any voltage present?**	**Yes** REPAIR circuit VH406 (VT/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to G7 .
G4 CHECK CIRCUIT VH406 (VT/BN) FOR A SHORT TO CIRCUIT RH111 (GY/BU)	
NOTE: Instrument panel removal is required to disconnect the sensor. Before carrying out this test step, visually inspect the wiring between the HVAC module and sensor for shorts. If no damage is visually evident, proceed with the test. • Ignition OFF. • Disconnect: Evaporator Discharge Air Temperature Sensor C2295. • Measure the resistance between HVAC module â EMTC C2357a-6 or HVAC module â DATC C2356a-6, circuit VH406 (VT/BN), harness side and HVAC module â EMTC C2357a-10 or HVAC module â DATC C2356a-10, circuit RH111 (GY/BU), harness side.	**Yes** INSTALL a new evaporator discharge air temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit VH406 (VT/BN) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0098163 • **Is the resistance greater than 10,000 ohms?**	
G5 CHECK CIRCUITS VH406 (VT/BN) FOR AN OPEN	
NOTE: Instrument panel removal is required to disconnect the sensor. Before carrying out this test step, visually inspect the wiring between the HVAC module and sensor for opens. If no damage is visually evident, proceed with the test. • Ignition OFF. • Disconnect: Evaporator Discharge Air Temperature Sensor C2295. • Measure the resistance between HVAC module â EMTC C2357a-6 or HVAC module â DATC C2356a-6, circuit VH406 (VT/BN), harness side and inline (EMTC) C211-13 or (DATC) inline C213-13, circuit VH406 (VT/BN), instrument panel harness side.  N0098164 • Measure the resistance between inline (EMTC) C211-13 or (DATC) inline C213-13, circuit VH406 (VT/BN), HVAC case harness side and evaporator discharge air temperature sensor C2295-1, circuit VH406 (VT/BN), harness side.  N0098165 • **Is the resistance less than 5 ohms?**	**Yes** GO to G6 . **No** REPAIR circuit VH406 (VT/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G6 CHECK CIRCUITS RH111 (GY/BU) FOR AN OPEN	

• Measure the resistance between HVAC module â EMTC C2357a-10 or HVAC module â DATC C2356a-10, circuit RH111 (GY/BU), harness side and inline (EMTC) C211-15 or (DATC) inline C213-15, circuit RH111 (GY/BU), instrument panel harness side.  N0098166 • Measure the resistance between inline (EMTC) C211-15 or (DATC) inline C213-15, circuit RH111 (GY/BU), HVAC case harness side and evaporator discharge air temperature sensor C2295-2, circuit RH111 (GY/BU), harness side.  N0098167 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new evaporator discharge air temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G7 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test H: DTCs U3003:16 and 17

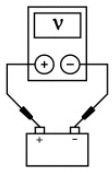
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

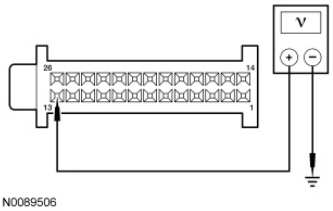
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

NOTE: DTC U3003 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if the battery has been left unattended with the accessories on.

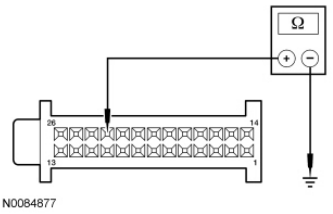
NOTE: Carry out a thorough inspection and verification before proceeding with the pinpoint test. Refer to Inspection and Verification in this section.

Normal Operation





Under normal operation, the HVAC module receives a ground through circuit GD116 (BK/VT). The HVAC module is supplied constant battery voltage through circuit SBP15 (WH/RD).



- DTC U3003:16 (Control Module Input Power "A": Circuit Voltage Below Threshold) â The module senses when battery voltage is greater than 16 volts.
- DTC U3003:17 (Control Module Input Power "A": Circuit Voltage Above Threshold) â The module senses when battery voltage is less than 9 volts.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- HVAC module

PINPOINT TEST H: DTCs U3003:16 AND 17

Test Step	Result / Action to Take
H1 RETRIEVE ALL CMDTCs IN ALL MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test â All CMDTCs . • **Is DTC B1317, B1318 or B1676 present in one or more modules and DTC P0563, P0620, P0625, P0626 or P065B present in the PCM?**	**Yes** REFER to Section 414-00 for diagnosis of the battery and charging system. **No** GO to H2 .
H2 CHECK BATTERY CONDITION	
• Ignition OFF. • Refer to Section 414-01 and carry out the Battery â Condition Test • **Does the battery pass the condition test?**	**Yes** If the battery passed the condition test but required a recharge, REFER to Section 414-00 to diagnose the charging system. CLEAR all Continuous Memory Diagnostic Trouble Codes (CMDTCs). TEST the system for normal operation. If the battery passed the condition test and did not require a recharge, GO to H3 . **No** INSTALL a new battery. CLEAR all CMDTCs . TEST the system for normal operation.
H3 CHECK THE CHARGING SYSTEM VOLTAGE	

NOTE: Do not allow the engine rpm to increase above 2,000 rpm while performing this step or the generator may self excite and result in default charging system output voltage. If engine rpm has gone above 2,000 rpm, shut the vehicle OFF and restart the engine before performing this step. • Start the engine. • Measure the voltage of the battery: ♦ **For DTC U3003:17** , turn off all accessories and run the engine at 1,500 rpm for a minimum of 2 minutes. ♦ **For DTC U3003:16** , turn on headlights and HVAC fan on high and run engine at 1,500 rpm for a minimum of 2 minutes.  AJ0210-A • **Is the battery voltage between 13-15.2 volts?**	**Yes** **For DTC U3003:17** , GO to H4 . **For DTC U3003:16** , INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR all CMDTCs . REPEAT the self-test. **No** REFER to Section 414-00 to diagnose the charging system. CLEAR all CMDTCs . TEST the system for normal operation.
H4 CHECK CIRCUITS SBP15 (WH/RD) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module â Electronic Manual Temperature Control (EMTC) C2357a. • Disconnect: HVAC Module â Dual Automatic Temperature Control (DATC) C2356a. • Ignition ON. • With the engine running, measure the voltage between HVAC module â EMTC C2357a-13 or HVAC module â DATC C2356a-13, circuit SBP15 (WH/RD), harness side and ground.  N0089506 • **Is the voltage greater than 10 volts?**	**Yes** GO to H5 . **No** VERIFY Smart Junction Box (SJB) fuse 15 (10A) is OK. If OK, REPAIR circuit SBP15 (WH/RD) for an open. CLEAR all CMDTCs . REPEAT the self-test. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
H5 CHECK CIRCUIT GD133 (BK) FOR AN OPEN	

• Ignition OFF. • Measure the resistance between HVAC module â EMTC C2357a-23 or HVAC module â DATC C2356a-23, circuit GD116 (BK/VT), harness side and ground. ♦ Repeat this measurement while wiggling the harness.  N0084877 • **Is the resistance less than 5 ohms?**	**Yes** GO to H6 . **No** REPAIR circuit GD116 (BK/VT) for an open. TEST the system for normal operation.
H6 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test I: Unable to Duplicate the Customer Concern and No DTCs Present

This pinpoint test is intended to diagnose the following:
- Incorrect functioning of the HVAC system

PINPOINT TEST I: UNABLE TO DUPLICATE CUSTOMER CONCERN AND NO DTCs PRESENT

NOTE: Diagnose any HVAC module DTCs before carrying out the following pinpoint test.

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to PCM DTC Chart.

Test Step	Result / Action to Take
I1 CHECK THE BLOWER MOTOR OPERATION	
• Ignition ON. • Select PANEL mode. • Observe blower motor operation and select each blower motor speed.	**Yes** GO to I2 . **No** For Electronic Manual Temperature Control (EMTC) systems, if the blower motor does not

• **Does the blower motor operate in all selections and change speed in each?**	operate in any setting, GO to Pinpoint Test Q . For Dual Automatic Temperature Control (DATC) systems, if the blower motor does not operate in any setting, GO to Pinpoint Test S . For EMTC systems if the blower motor does not properly change speeds or shut OFF, GO to Pinpoint Test R . For DATC systems if the blower motor does not properly change speeds or shut OFF, GO to Pinpoint Test T .
I2 CHECK AIRFLOW OPERATION	
• Select the highest blower motor setting. • **NOTE:** Refer to Description and Operation in this section for proper airflow descriptions. • While observing the airflow, select each of the airflow positions (PANEL, PANEL/FLOOR, FLOOR, FLOOR/DEFROST, DEFROST). • **Is the airflow directed to the proper outlets?**	**Yes** GO to I3 . **No** GO to Pinpoint Test K .
I3 VERIFY TEMPERATURE CONTROL OPERATION	
• Start the vehicle and allow it to reach normal operating temperature. • With the A/C OFF, select PANEL mode. • Change the temperature setting from the coldest to the warmest and back to the coldest. • **Does the temperature change between very warm to cool?**	**Yes** GO to I4 . **No** If the temperature does not get very warm, GO to Pinpoint Test L . If the temperature does not change at all, GO to Pinpoint Test P .
I4 VERIFY THE A/C CLUTCH DOES NOT ENGAGE WITH A/C OFF	
• With the A/C OFF, select PANEL mode. • Select the coldest temperature setting. • **Is the outlet temperature close to ambient temperature?**	**Yes** GO to I5 . **No** If the temperature is warmer than ambient temperature, GO to Pinpoint Test P and diagnose for inoperative blend door. If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch cycles normally, GO to Pinpoint Test O . If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch does not cycle, GO to Pinpoint Test N .

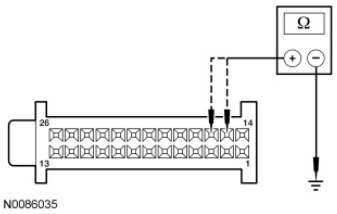
I5 VERIFY A/C CLUTCH ENGAGEMENT IN THE A/C MODE	
• Make sure the ambient air temperature is above 2Â°C (35Â°F). • Select PANEL mode. • Press the A/C button (indicator ON). • **Does the A/C clutch engage when the PANEL and A/C button (indicator ON) is pressed?**	**Yes** GO to I6 . **No** GO to Pinpoint Test M .
I6 CHECK THE RECIRC OPERATION	
• Press the RECIRC button (indicator OFF). • Select PANEL mode. • Select the highest blower motor setting. • Observe airflow noise. • Press the RECIRC button (indicator ON). • **Does the airflow noise increase when the RECIRC mode is selected (indicator ON)?**	**Yes** The system is operating normally. **No** GO to Pinpoint Test J .

Pinpoint Test J: The Air Inlet Door is Inoperative

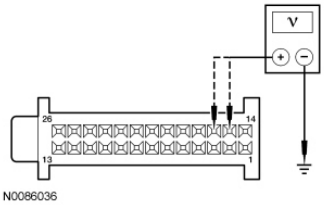
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

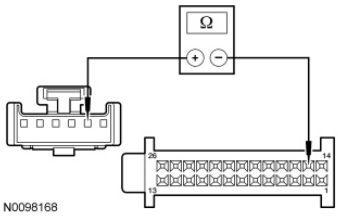
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

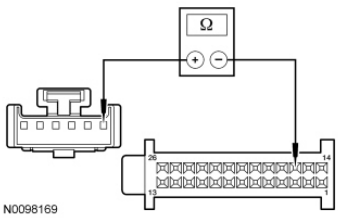
Normal Operation



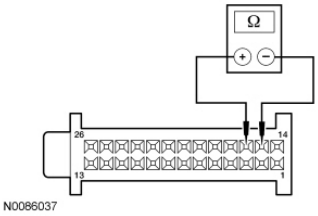
Under normal operation, to rotate the air inlet mode door actuator, the HVAC module supplies voltage or ground to the air inlet mode door actuator through the circuit CH207 (BU/GY), and supplies ground or voltage through circuit CH208 (GN/OG) depending on desired rotation direction.







- DTC B1083:11 (Recirculation Damper Motor: Circuit Short to Ground) â The module senses excessive voltage drop on the actuator motor circuit, indicating a short directly to ground.
- DTC B1083:12 (Recirculation Damper Motor: Circuit Short to Battery) â The module senses no voltage drop on the actuator motor circuit, indicating a short directly to voltage.
- DTC B1083:13 (Recirculation Damper Motor: Circuit Open) â The module senses no voltage drop on the actuator motor circuit, indicating an open.



This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Air inlet mode door actuator
- HVAC module
- Stuck or bound linkage or door

PINPOINT TEST J: THE AIR INLET DOOR IS INOPERATIVE

Test Step	Result / Action to Take

J1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition OFF. • Disconnect: HVAC Module â Electronic Manual Temperature Control (EMTC) C2357a. • Disconnect: HVAC Module â Dual Automatic Temperature Control (DATC) C2356a. • Disconnect: HVAC Module â DATC C2356b. • Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** **For DTC B1083:11** , GO to J2 . **For DTC B1083:12** , GO to J3 . **For DTC B1083:13** , GO to J4 . **No** INSPECT for broken/binding linkage or door. REPAIR as necessary. If no condition is found, GO to J6 .
J2 CHECK CIRCUITS CH207 (BU/GY) AND CH208 (GN/OG) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Measure the resistance between ground and: ♦ HVAC module â EMTC C2357a-16 or HVAC module â DATC C2356a-16, circuit CH208 (GN/OG), harness side. ♦ HVAC module â EMTC C2357a-15 or HVAC module â DATC C2356a-15, circuit CH207 (BU/GY), harness side.  N0086035 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J5 . **No** REPAIR circuit CH207 (BU/GY) or circuit CH208 (GN/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
J3 CHECK CIRCUITS CH207 (BU/GY) AND CH208 (GN/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Ignition ON. • Measure the voltage between ground and: ♦ HVAC module â EMTC C2357a-16 or HVAC module â DATC C2356a-16, circuit CH208 (GN/OG), harness side. ♦ HVAC module â EMTC C2357a-15 or HVAC module â DATC C2356a-15, circuit CH207 (BU/GY), harness side.	**Yes** REPAIR circuit CH207 (BU/GY) or circuit CH208 (GN/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to J5 .

 N0086036 • **Is any voltage present?**	
J4 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Disconnect: Air Inlet Mode Door Actuator C289. • Measure the resistance between HVAC module â EMTC C2357a-15 or HVAC module â DATC C2356a-15, circuit CH207 (BU/GY), harness side and air inlet mode door actuator C289-6, circuit CH207 (BU/GY), harness side.  N0098168 • Measure the resistance between HVAC module â EMTC C2357a-16 or HVAC module â DATC C2356a-16, circuit CH208 (GN/OG), harness side and air inlet mode door actuator C289-5, circuit CH208 (GN/OG), harness side.  N0098169 • **Are the resistances less than 5 ohms?**	**Yes** GO to J6 . **No** REPAIR the circuit(s) for an open. TEST the system for normal operation.
J5 CHECK CIRCUIT CH207 (BU/GY) FOR A SHORT TO CIRCUIT CH208 (GN/OG)	

• Ignition OFF. • Measure the resistance between HVAC module â EMTC C2357a-15 or HVAC module â DATC C2356a-15, circuit CH207 (BU/GY), harness side and HVAC module â EMTC C2357a-16 or HVAC module â DATC C2356a-16, circuit CH208 (GN/OG), harness side.  N0086037 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to J6 . **No** REPAIR circuit CH208 (GN/OG) for a short to circuit CH207 (BU/GY). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
J6 CHECK THE ACTUATOR CONNECTION	
• Disconnect the actuator connector. • Check for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat the actuator connector. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** CARRY OUT the Air Inlet Mode Door Actuator component test in this section. If the actuator tests OK, GO to J7 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
J7 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test K: Incorrect/Erratic Direction of Airflow From Outlets

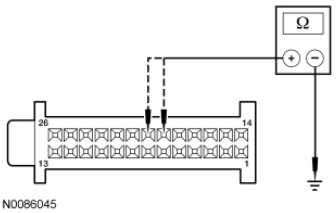
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

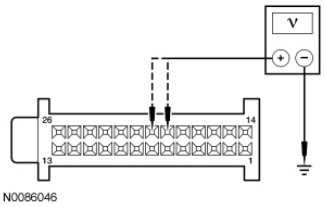
Normal Operation

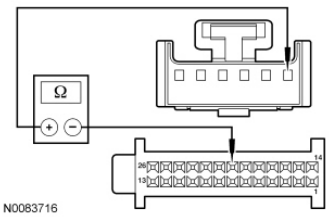
Under normal operation, to rotate the mode door actuator, the HVAC module supplies voltage or ground to the DEFROST/PANEL/FLOOR mode door actuator motor through circuit CH228 (YE/GY), and supplies ground or voltage through circuit CH229 (WH/BU) depending on desired rotation direction.

The mode door actuator feedback resistor is supplied a ground from the HVAC module through circuit RH111 (GY/BU) and a 5-volt reference voltage on circuit LH111 (BN/WH). The HVAC module reads the voltage on the mode door actuator feedback circuit VH436 (YE/VT) to determine the mode door actuator position by the position of the actuator feedback resistor wiper arm.

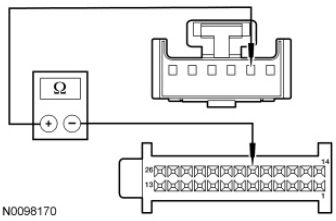


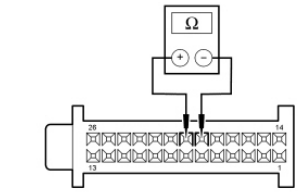
DTC Description	Fault Trigger Conditions
• B1086:07 â Air Distribution Damper Motor: Mechanical Failures	The module senses no changes in the feedback circuit when motor movement is commanded and no motor DTCs are present.
• B1086:11 â Air Distribution Damper Motor: Circuit Short to Ground	The module senses excessive voltage drop on the actuator motor circuit, indicating a short directly to ground.
• B1086:12 â Air Distribution Damper Motor: Circuit Short to Battery	The module senses no voltage drop on the actuator motor circuit, indicating a short directly to voltage.
• B1086:13 â Air Distribution Damper Motor: Circuit Open	The module senses no voltage drop on the actuator motor circuit, indicating an open.
• B11E7:11 â Air Distribution Damper Position Sensor: Circuit Short to Ground	The module senses excessive voltage drop on the actuator feedback circuit, indicating a short directly to ground.
• B11E7:15 â Air Distribution Damper Position Sensor: Circuit Short to Battery or Open	The module senses no voltage drop on the actuator feedback circuit, indicating an open circuit or a short directly to voltage.

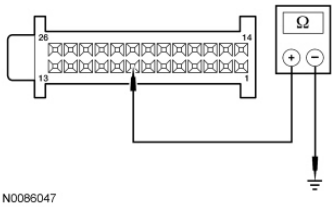




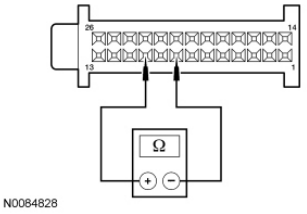
This pinpoint test is intended to diagnose the following:

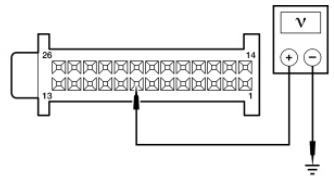




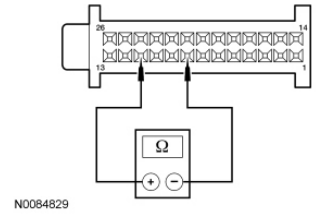


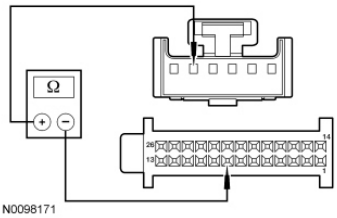
- Wiring, terminals or connectors
- Defrost/panel/floor mode door actuator
- HVAC module
- Stuck or bound linkage or door

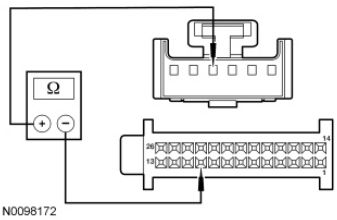




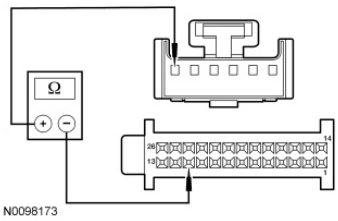
PINPOINT TEST K: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS







Test Step	Result / Action to Take
K1 CHECK THE HVAC MODULE FOR DTCs	
	Yes



• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**For DTC B1086:07** , INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, INSTALL a new defrost/panel/floor door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For DTC B1086:11** , GO to K2 . **For DTC B1086:12** , GO to K3 . **For DTC B1086:13** , GO to K4 . **For DTC B11E7:11** , GO to K6 . **For DTC B11E7:15** , GO to K8 . **No** INSPECT for broken linkage or door. REPAIR as necessary. If no condition is found, GO to K13 .
K2 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module â Electronic Manual Temperature Control (EMTC) C2357a. • Disconnect: HVAC Module â Dual Automatic Temperature Control (DATC) C2356a. • Disconnect: HVAC Module â DATC C2356b. • Disconnect: Defrost/Panel/Floor Mode Door Actuator C2278. • Measure the resistance between ground and: ♦ HVAC module â EMTC C2357a-19 or HVAC module â DATC C2356a-19, circuit CH229 (WH/BU), harness side. ♦ HVAC module â EMTC C2357a-20 or HVAC module â DATC C2356a-20, circuit CH228 (YE/GY), harness side.  N0086045 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to K5 . **No** REPAIR the circuit CH228 (YE/GY) or CH229 (WH/BU) for a short to ground. TEST the system for normal operation.
K3 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Disconnect: Defrost/Panel/Floor Mode Door Actuator C2278. • Ignition ON. • Measure the voltage between ground and: ♦ HVAC module â EMTC C2357a-19 or HVAC module â DATC C2356a-19, circuit CH229 (WH/BU), harness side. ♦ HVAC module â EMTC C2357a-20 or HVAC module â DATC C2356a-20, circuit CH228 (YE/GY), harness side.  N0086046 • **Is any voltage present?**	**Yes** REPAIR the circuit CH228 (YE/GY) or CH229 (WH/BU) for a short to voltage. TEST the system for normal operation. **No** GO to K5 .
K4 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Disconnect: Defrost/Panel/Floor Mode Door Actuator C2278. • Measure the resistance between defrost/panel/floor door actuator C2278-5, circuit CH228 (YE/GY), harness side and HVAC module â EMTC C2357a-20 or HVAC module â DATC C2356a-20, circuit CH228 (YE/GY), harness side.  N0083716 • Measure the resistance between defrost/panel/floor door actuator C2278-6, circuit CH229 (WH/BU), harness side and HVAC module â EMTC C2357a-19 or HVAC module â DATC C2356a-19, circuit CH229 (WH/BU), harness side.	**Yes** GO to K13 . **No** REPAIR the circuit CH228 (YE/GY) or CH229 (WH/BU) for an open. TEST the system for normal operation.

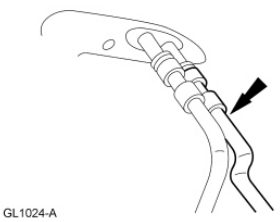
 N0098170 • **Are the resistances less than 5 ohms?**	
K5 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Measure the resistance between HVAC module â EMTC C2357a-20 or HVAC module â DATC C2356a-20, circuit CH228 (YE/GY), harness side and HVAC module â EMTC C2357a-19 or HVAC module â DATC C2356a-19, circuit CH229 (WH/BU), harness side.  A0072918 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K13 . **No** REPAIR circuits CH228 (YE/GY) and CH229 (WH/BU) for a short together. TEST the system for normal operation.
K6 CHECK CIRCUIT VH436 (YE/VT) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Measure the resistance between ground and HVAC module â EMTC C2357a-8 or HVAC module â DATC C2356a-8, circuit VH436 (YE/VT), harness side.  N0086047 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K7 . **No** REPAIR circuit VH436 (YE/VT) for a short to ground. TEST the system for normal operation.
K7 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO CIRCUIT VH436 (YE/VT)	

• Disconnect: Defrost/Panel/Floor Mode Door Actuator C2278. • Measure the resistance between HVAC module â EMTC C2357a-10 or HVAC module â DATC C2356a-10, circuit RH111 (GY/BU), harness side and HVAC module â EMTC C2357a-8 or HVAC module â DATC C2356a-8, circuit VH436 (YE/VT), harness side.  N0084828 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K13 . **No** REPAIR circuits RH111 (GY/BU) and VH436 (YE/VT) for a short together. TEST the system for normal operation.
K8 CHECK CIRCUIT VH436 (YE/VT) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Ignition ON. • Measure the voltage between ground and HVAC module â EMTC C2357a-8 or HVAC module â DATC C2356a-8, circuit VH436 (YE/VT), harness side.  N0086048 • **Is any voltage present?**	**Yes** REPAIR circuit VH436 (YE/VT) for a short to voltage. TEST the system for normal operation. **No** GO to K9 .
K9 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO CIRCUIT VH436 (YE/VT)	
• Ignition OFF. • Disconnect: Defrost/Panel/Floor Mode Door Actuator C2278. • Measure the resistance between HVAC module â EMTC C2357a-11 or HVAC module â DATC C2356a-11, circuit LH111 (BN/WH), harness side and HVAC module â EMTC C2357a-8 or HVAC module â DATC C2356a-8, circuit VH436 (YE/VT), harness side.	**Yes** GO to K10 . **No** REPAIR circuits LH111 (BN/WH) and VH436 (YE/VT) for a short together. TEST the system for normal operation.

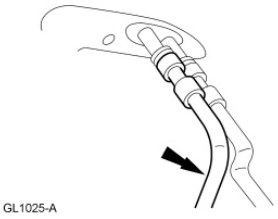
 N0084829 • **Is the resistance greater than 10,000 ohms?**	
K10 CHECK CIRCUIT VH436 (YE/VT) FOR AN OPEN	
• Measure the resistance between HVAC module â EMTC C2357a-8 or HVAC module â DATC C2356a-8, circuit VH436 (YE/VT), harness side and defrost/panel/floor mode door actuator C2278-9, circuit VH436 (YE/VT), harness side.  N0098171 • **Is the resistance less than 5 ohms?**	**Yes** GO to K11 . **No** REPAIR circuit VH436 (YE/VT) for an open. TEST the system for normal operation.
K11 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between HVAC module â EMTC C2357a-10 or HVAC module â DATC C2356a-10, circuit RH111 (GY/BU), harness side and defrost/panel/floor mode door actuator C2278-8, circuit RH111 (GY/BU), harness side.  N0098172 • **Is the resistance less than 5 ohms?**	**Yes** GO to K12 . **No** REPAIR circuit RH111 (GY/BU) for an open. TEST the system for normal operation.
K12 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN	
• Measure the resistance between HVAC module â EMTC C2357a-11 or HVAC module â DATC C2356a-11, circuit LH111 (BN/WH), harness side and defrost/panel/floor mode door actuator C2278-10, circuit LH111 (BN/WH), harness side.	**Yes** GO to K13 . **No** REPAIR circuit LH111 (BN/WH) for an open. TEST the system for normal

 • **Is the resistance less than 5 ohms?**	operation.
K13 CHECK THE ACTUATOR CONNECTION	
• Inspect the connector for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat the actuator connector. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** CARRY OUT the Defrost/Panel/Floor Mode Door Actuator component test in this section. If the actuator tests OK, GO to K14 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
K14 MODULE ACTUATOR POSITION CALIBRATION	
NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below. • Ignition OFF. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Ignition ON. • Clear the DTCs. • Select any position except OFF. • **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

Pinpoint Test L: Insufficient, Erratic or No Heat



Normal Operation



Under normal operation, warm coolant flows from the engine through the heater core and back to the engine.

This pinpoint test is intended to diagnose the following:

- Plugged heater core
- Coolant level
- Temperature blend door

PINPOINT TEST L: INSUFFICIENT, ERRATIC OR NO HEAT

Test Step	Result / Action to Take
L1 CHECK FOR CORRECT ENGINE COOLANT LEVEL	
• Ignition OFF. • Check the engine coolant level when hot and cold. • **Is the engine coolant at the correct level (hot/cold) as indicated on the engine coolant recovery reservoir?**	**Yes** GO to L3 . **No** GO to L2 .
L2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS	
• Pressure test the cooling system for leaks. Refer to Section 303-03A or Section 303-03B . • **Does the engine cooling system leak?**	**Yes** REPAIR the engine coolant leak. TEST the system for normal operation. **No** GO to L3 .
L3 CHECK FOR COOLANT FLOW TO THE HEATER CORE	
• Run the engine until it reaches normal operation temperature. Select the FLOOR position on the control assembly. Set the temperature control to full warm and the blower to the lowest setting. • Using a suitable temperature measuring device, check the heater core inlet hose to see if it is hot.  GL1024-A • **Is the heater core inlet hose hot?**	**Yes** GO to L4 . **No** REFER to Section 303-03A or Section 303-03B to check cooling system function.
L4 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE	

• Using a suitable temperature measuring device, measure the heater core outlet hose temperature.  GL1025-A • **Is the heater core outlet hose temperature similar to the inlet hose temperature (within approximately 6-17Â°C [10-30Â°F])?**	**Yes** For EMTC systems, GO to Pinpoint Test P and diagnose for a temperature blend door actuator. For DATC systems, GO to Pinpoint Test Q and diagnose for a temperature blend door actuator. **No** INSTALL a new heater core. TEST the system for normal operation.

Pinpoint Test M: The Air Conditioning (A/C) is Inoperative

Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, for **Fusion equipped with navigation** and **all MKZ** vehicles, when A/C button is pressed, a message is sent from the Front Controls Interface Module (FCIM) over the Medium Speed Controller Area Network (MS-CAN) bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.

For **all vehicles equipped with navigation** , when MAX A/C is selected on the touch screen, the Audio Control Module (ACM) sends a message over the MS-CAN bus to the HVAC module that MAX A/C has been selected.

For **Fusion not equipped with navigation** , when A/C is requested, a message is sent over the MS-CAN bus to the IC , then from the IC through the HS-CAN bus to the PCM.

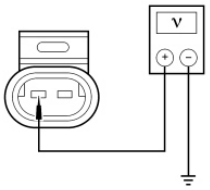
Ignition voltage is provided to the A/C clutch relay switch through circuit SBB25 (RD). When the PCM energizes the relay, ignition voltage is supplied to the A/C clutch through circuit CH401 (VT/WH). Ground is supplied for the A/C clutch through circuit GD121 (BK/YE).

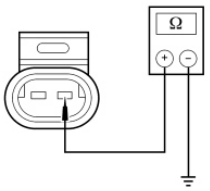
When an A/C request is received by the PCM, the A/C compressor clutch will only be engaged through the A/C clutch relay if all of the following conditions are met:

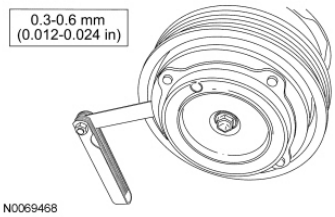
- The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer.
- The PCM does not detect excessively high engine coolant temperature.
- The PCM does not detect an ambient air temperature below -1Â°C (30Â°F).
- The PCM has not detected a Wide Open Throttle (WOT) condition.
- The HVAC module does not detect an evaporator discharge air temperature below 2Â°C (36Â°F).

This pinpoint test is intended to diagnose the following:

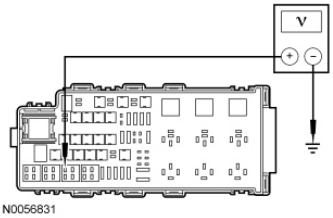
- Fuse(s)
- Wiring, terminals or connectors
- PCM
- HVAC module
- FCIM
- ACM
- A/C evaporator discharge temperature sensor
- A/C pressure transducer
- A/C compressor clutch field coil
- A/C control relay
- A/C clutch air gap

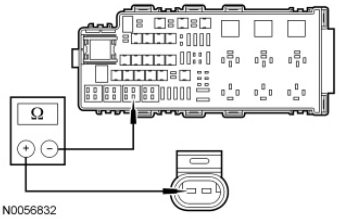






PINPOINT TEST M: THE AIR CONDITIONING (A/C) IS INOPERATIVE





NOTE: Before carrying out the following test, diagnose any HVAC, PCM or Instrument Cluster (IC) DTCs.

NOTE: Before carrying out the following test, check that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), refer to Fluorescent Dye Leak Detection in this section.

Test Step	Result / Action to Take
M1 CHECK THE A/C PRESSURE SENSOR (ACP_PRESS) PCM PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: ACP_PRESS PCM PID. • With the manifold gauge set connected, compare the pressure readings of the manifold gauge set and the ACP_PRESS PID. • **Are the pressure values of the manifold gauge set and the ACP_PRESS PID similar?**	**Yes** GO to M2 . **No** INSTALL a new A/C pressure transducer. TEST the system for normal operation.
M2 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) HVAC PID	
• Allow the vehicle exterior and interior to stabilize to an ambient temperature above 16Â°C (60Â°F). • Enter the following diagnostic mode on the scan tool: EVAP_TEMP HVAC PID. • **Does the EVAP_TEMP HVAC PID read similar to the ambient temperature?**	**Yes** For **Fusion equipped with navigation** and **all MKZ** vehicles, GO to M4 . For **Fusion not equipped with navigation** , GO to M3 . **No** INSTALL a new A/C evaporator discharge temperature sensor. TEST the system for normal operation.
M3 CHECK THE (A/C) SWITCH (CC_SW_AC) HVAC PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: CC_SW_AC HVAC PID.	**Yes** GO to M6 . **No**

• Select PANEL press the A/C button (indicator on) on the HVAC module. • **Does the CC_SW_AC HVAC PID read Active?**	GO to M12 .
M4 CHECK THE A/C INDICATOR WITH THE A/C ON	
NOTE: Before carrying out this test step, be sure all other FCIM button functions are operational. If all other buttons operate correctly, continue with this test step. If multiple buttons are inoperative and DTC U0256:00 is not present, install a new FCIM . Test the system for normal operation. If DTC U0256:00 is present, diagnose the DTC first. • Select PANEL press the A/C button on the HVAC module. • **Does the A/C indicator illuminate when the A/C button is pressed?**	**Yes** GO to M6 . **No** GO to M5 .
M5 CHECK THE MAX A/C OPERATION	
NOTE: Before carrying out this test step, be sure all other ACM touch screen functions are operational. If all other touch screen functions operate correctly, continue with this test step. If multiple touch screen functions are inoperative and DTC U0163:00 is not present, install a new ACM . Test the system for normal operation. If DTC U0163:00 is present, diagnose the DTC first. • Select MAX A/C on the next generation navigation screen. • **Does the A/C operate when MAX A/C is selected?**	**Yes** INSTALL a new FCIM . TEST the system for normal operation. **No** GO to M12 .
M6 CHECK THE AIR CONDITIONING COMPRESSOR COMMANDED STATE (ACC_CMD) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: ACC_CMD PCM PID. • **Does the ACC_CMD PCM PID read ON?**	**Yes** GO to M7 . **No** GO to M13 .
M7 CHECK THE VOLTAGE AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Disconnect: A/C Compressor Clutch Field Coil C100. • Ignition ON. • Select PANEL and A/C on the HVAC module. • Measure the voltage between A/C compressor clutch field coil C100-B, circuit CH401 (VT/WH), harness side and ground.	**Yes** GO to M8 . **No** GO to M10 .

 N0041898 • **Is the voltage greater than 10 volts?**	
M8 CHECK THE GROUND AT THE A/C COMPRESSOR CLUTCH FIELD COIL	
• Ignition OFF. • Measure the resistance between A/C compressor clutch field coil C100-A, circuit GD121 (BK/YE), harness side and ground.  N0041899 • **Is the resistance less than 5 ohms?**	**Yes** GO to M9 . **No** REPAIR circuit GD121 (BK/YE) for an open. TEST the system for normal operation.
M9 CHECK THE A/C COMPRESSOR CLUTCH AIR GAP	
• Measure the A/C compressor clutch air gap at 3 equally spaced locations between the clutch hub and the A/C compressor clutch pulley.  N0069468 • **Is the A/C compressor clutch air gap greater than 0.6 mm (0.024 in)?**	**Yes** ADJUST the A/C compressor clutch gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. TEST the system for normal operation.
M10 CHECK THE A/C CLUTCH RELAY FOR VOLTAGE	
• Ignition OFF. • Disconnect: A/C Clutch Relay. • Ignition ON. • Measure the voltage between A/C clutch relay socket, circuit SBB25 (RD) and ground.	**Yes** GO to M11 . **No** VERIFY Battery Junction Box (BJB) fuse 25 (10A) is OK. If OK, REPAIR circuit SBB25 (RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify

 • **Is the voltage greater than 10 volts?**	the possible causes of the circuit short.
M11 CHECK CIRCUIT CH401 (VT/WH) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between A/C clutch relay socket, circuit CH401 (VT/WH) and A/C compressor clutch field coil C100-B, circuit CH401 (VT/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** CARRY OUT the A/C clutch relay component test. If the relay tests OK, GO to M13 . **No** REPAIR circuit CH401 (VT/WH) for an open. TEST the system for normal operation.
M12 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
M13 CHECK THE PCM CONNECTION	
• Disconnect all the PCM connectors. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the PCM connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The Air Conditioning (A/C) is Always On â A/C Compressor Does Not Cycle

Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

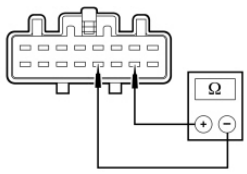
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

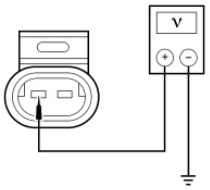
Under normal operation, for **Fusion equipped with navigation** and **all MKZ** vehicles, when A/C button is pressed, a message is sent from the Front Controls Interface Module (FCIM) over the Medium Speed Controller Area Network (MS-CAN) bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.

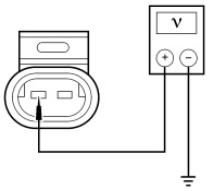
For **all vehicles equipped with navigation** , when MAX A/C is selected on the touch screen, the Audio Control Module (ACM) sends a message over the MS-CAN bus to the HVAC module that MAX A/C has been selected.

For **Fusion not equipped with navigation** , when A/C is requested, a message is sent over the MS-CAN bus to the IC , then from the IC through the HS-CAN bus to the PCM.



Ignition voltage is provided to the A/C clutch relay switch through circuit SBB25 (RD). When the PCM energizes the relay, ignition voltage is supplied to the A/C clutch through circuit CH401 (VT/WH). Ground is supplied for the A/C clutch through circuit GD121 (BK/YE).





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM
- evaporator discharge air temperature sensor
- A/C control relay
- A/C clutch air gap
- Evaporator core seals

PINPOINT TEST N: THE AIR CONDITIONING (A/C) IS ALWAYS ON â A/C COMPRESSOR DOES NOT CYCLE

Test Step	Result / Action to Take
N1 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) HVAC PID	
NOTE: Before carrying out the following test, diagnose any HVAC, PCM or Instrument Cluster (IC) DTCs. **NOTE:** CHECK On-Line Automotive Service Information System (OASIS) for any applicable Technical Service Bulletins (TSBs). If a Technical Service Bulletin (TSB) exists for this concern, discontinue this test and follow the TSB instructions. If no TSBs address this concern, continue with this test. • Ignition ON.	**Yes** GO to N3 . **No** GO to N2 .

• Allow the vehicle exterior and interior to stabilize to an ambient temperature between 15Â°C (60Â°F) and 32Â°C (90Â°F). • Enter the following diagnostic mode on the scan tool: EVAP_TEMP HVAC PID. • **Does the EVAP_TEMP HVAC PID read similar to the ambient temperature?**	
N2 CHECK THE EVAPORATOR DISCHARGE AIR TEMPERATURE SENSOR RESISTANCE	
• Ignition OFF. • Disconnect: For Electronic Manual Temperature Control (EMTC) Systems, Inline C211. • Disconnect: For Dual Automatic Temperature Control (DATC) Systems, Inline C213. • Measure the resistance between: ♦ For EMTC Systems, inline C211-13, circuit VH406 (VT/BN), HVAC case harness side and inline C211-15, circuit RH111 (GY/BU), HVAC case harness side. ♦ For DATC Systems, inline C213-13, circuit VH406 (VT/BN), HVAC case harness side and inline C213-15, circuit RH111 (GY/BU), HVAC case harness side.  N0122725 • Compare the measurement to the chart and table of the Evaporator Discharge Air Temperature Sensor component test in this section. • **Is the resistance within the specified values for the temperatures?**	**Yes** GO to N9 . **No** INSTALL a new evaporator discharge air temperature sensor. TEST the system for normal operation.
N3 CHECK THE AIR CONDITIONING COMPRESSOR COMMANDED STATE (ACC_CMD) PCM PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: ACC_CMD PCM PID. • **Does the ACC_CMD PCM PID read ON?**	**Yes** GO to N8 . **No** GO to N4 .
N4 CHECK FOR VOLTAGE TO THE A/C COMPRESSOR CLUTCH FIELD COIL	

• Ignition OFF. • Disconnect: A/C Compressor Clutch Field Coil C100. • Ignition ON. • Select the OFF position on the HVAC module. • Measure the voltage between A/C compressor clutch field coil C100-B, circuit CH401 (VT/WH), harness side and ground.  N0041898 • **Is the voltage greater than 10 volts?**	**Yes** GO to N5 . **No** ADJUST the A/C compressor clutch gap. REFER to Air Conditioning (A/C) Clutch Air Gap Adjustment in this section. TEST the system for normal operation.
N5 CHECK CIRCUIT CH401 (VT/WH) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: A/C Clutch Relay. • Ignition ON. • Measure the voltage between A/C compressor clutch field coil C100-B, circuit CH401 (VT/WH), harness side and ground.  N0041898 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CH401 (VT/WH) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new A/C clutch relay. TEST the system for normal operation. If the concern is still present, GO to N6 .
N6 CHECK THE EVAPORATOR DISCHARGE AIR TEMPERATURE SENSOR MOUNTING	
• Remove the instrument panel. For additional information, refer to Section 501-12 . • Inspect the evaporator discharge air temperature sensor for: ♦ damage. ♦ correct mounting. ♦ damaged mounting tabs. • **Is the sensor and mounting correct and free of damage?**	**Yes** GO to N7 . **No** INSTALL a new evaporator discharge air temperature sensor. TEST the system for normal operation.
N7 CHECK THE EVAPORATOR CORE SEALS	
• Remove the heater core and evaporator core housing. For additional information, refer to Section 412-01 . • Remove the evaporator core. For additional information, refer to Section 412-01 .	**Yes** GO to N9 . **No** CORRECT the evaporator core

• Inspect the evaporator core seals for: ♦ misalignment. ♦ damage. ♦ loose fit. • **Is the evaporator seal mounting tight, correct and free of damage?**	seal alignment or INSTALL a new evaporator core. REFER to Section 412-01 . TEST the system for normal operation.
N8 CHECK THE PCM CONNECTION	
• Disconnect all the PCM connectors. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the PCM connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
N9 CHECK THE HVAC MODULE CONNECTION	
• Inspect the HVACmodule connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Air Conditioning (A/C) is Always On â A/C Mode Always Commanded ON

Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, for **Fusion equipped with navigation** and **all MKZ** vehicles, when A/C button is pressed, a message is sent from the Front Controls Interface Module (FCIM) over the Medium Speed Controller Area Network (MS-CAN) bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.

For **all vehicles equipped with navigation** , when MAX A/C is selected on the touch screen, the Audio Control Module (ACM) sends a message over the MS-CAN bus to the HVAC module that MAX A/C has been selected.

For **Fusion not equipped with navigation** , when A/C is requested, a message is sent over the MS-CAN bus to the IC , then from the IC through the HS-CAN bus to the PCM.

Ignition voltage is provided to the A/C clutch relay switch through circuit SBB25 (RD). When the PCM energizes the relay, ignition voltage is supplied to the A/C clutch through circuit CH401 (VT/WH). Ground is supplied for the A/C clutch through circuit GD121 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM
- HVAC module

PINPOINT TEST O: THE AIR CONDITIONING (A/C) IS ALWAYS ON â A/C MODE ALWAYS COMMANDED ON

NOTE: Before carrying out the following test, diagnose any HVAC, PCM or Instrument Cluster (IC) DTCs.

Test Step	Result / Action to Take
O1 CHECK THE AIR CONDITIONING REQUEST SIGNAL (AC_REQ) PCM PID WITH THE A/C OFF	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: AC_REQ PCM PID. • Select PANEL press the A/C button (indicator off) on the HVAC module. • **Does the AC_REQ PCM PID read YES?**	**Yes** If the vehicle **is** equipped with navigation, GO to O3 . If the vehicle **is not** equipped with navigation, GO to O2 . **No** GO to O6 .
O2 CHECK THE AIR CONDITIONING SWITCH STATUS (CC_SW_AC) HVAC PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: CC_SW_AC HVAC PID. • Select PANEL press the A/C button (indicator off) on the HVAC module. • **Does the CC_SW_AC HVAC PID read Inactive?**	**Yes** GO to O6 . **No** GO to O5 .
O3 CHECK THE A/C INDICATOR WITH THE A/C OFF	
NOTE: Before carrying out this test step, be sure all other FCIM button functions are operational. If all other buttons operate correctly, continue with this test step. If multiple buttons are inoperative and DTC U0256:00 is not present, install a new FCIM . Test the system for normal operation. If DTC U0256:00 is present, diagnose the DTC first. • Select PANEL press the A/C button (indicator off) on the HVAC module. • **Does the A/C indicator turn off when the A/C button is pressed?**	**Yes** GO to O5 . **No** GO to O4 .
O4 CHECK THE MAX A/C OPERATION	
NOTE: Before carrying out this test step, be sure all other ACM touch screen functions are operational. If all other touch screen	**Yes** INSTALL a new FCIM . TEST the system for normal

functions operate correctly, continue with this test step. If multiple touch screen functions are inoperative and DTC U0163:00 is not present, install a new ACM . Test the system for normal operation. If DTC U0163:00 is present, diagnose the DTC first. • Select MAX A/C on the next generation navigation screen. • **Does the A/C turn off when MAX A/C is selected?**	operation. **No** GO to O5 .
O5 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
O6 CHECK THE PCM CONNECTION	
• Disconnect all the PCM connectors. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the PCM connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: Temperature Control is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the temperature blend door actuator clockwise, the HVAC module supplies voltage to the temperature blend door actuators through the door actuator feed A circuits, and supplies ground through the door actuator feed B circuits. To rotate the temperature blend door actuator counterclockwise, the HVAC module reverses the voltage and ground circuits.

The temperature blend door actuator feedback resistors are supplied a ground from the HVAC module by the temperature blend door actuator return circuits and a 5-volt reference voltage on the temperature blend door actuator reference circuits. The HVAC module reads the voltage on the temperature blend door actuator

feedback circuits to determine the temperature blend door actuator position by the position of the actuator feedback resistor wiper arm.

NOTE: For the passenger side temperature setting on hybrid vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) and a Front Controls Interface Module (FCIM) built on or after 04/08/2009 to be functional, a passenger must be seated in the front passenger seat. If the front passenger seat is not occupied, the HVAC module will control the system based only on the driver side temperature setting. The HVAC module receives a Medium Speed Controller Area Network (MS-CAN) signal from the FCIM to indicate if the front passenger seat is occupied.

Door actuator feed A circuits
- LH blend â CH238 (YE/OG)
- RH blend â CH212 (BU/OG)

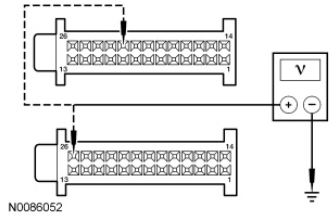
Door actuator feed B circuits
- LH blend â CH239 (BU/WH)
- RH blend â CH213 (BN/GN)

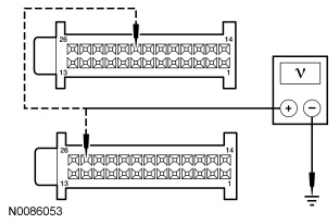
Door actuator return circuits
- LH blend â RH111 (GY/BU)
- RH blend â RH111 (GY/BU)

Door actuator reference circuits
- LH blend â LH111 (BN/WH)
- RH blend â LH111 (BN/WH)

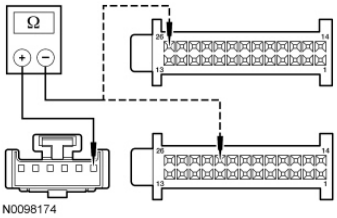
Door actuator feedback circuits
- LH blend â VH440 (BU/BN)
- RH blend â VH411 (VT/GN)

DTC Description	Fault Trigger Conditions
• B1081:07 â Left Temperature Damper Motor: Mechanical Failures	The module senses no changes in the feedback circuit when motor movement is commanded and no motor DTCs are present.
• B1081:11 â Left Temperature Damper Motor: Circuit Short to Ground	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
• B1081:12 â Left Temperature Damper Motor: Circuit Short to Battery	The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
• B1081:13 â Left Temperature Damper Motor: Circuit Open	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
• B1082:07 â Right Temperature Damper Motor: Mechanical Failures	The module senses no changes in the feedback circuit when motor movement is commanded and no motor DTCs are present.
• B1082:11 â Right Temperature Damper Motor: Circuit Short to Ground	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.

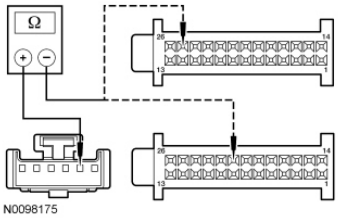


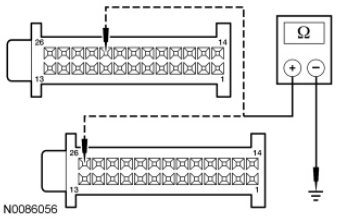


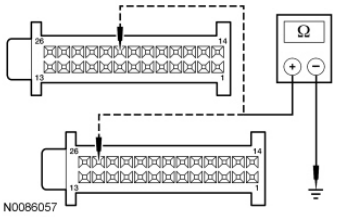
• B1082:12 â Right Temperature Damper Motor: Circuit Short to Battery	The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
• B1082:13 â Right Temperature Damper Motor: Circuit Open	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
• B11E5:11 â Left HVAC Damper Position Sensor: Circuit Short to Ground	The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
• B11E5:15 â Left HVAC Damper Position Sensor: Circuit Short to Battery or Open	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
• B11E6:11 â Right HVAC Damper Position Sensor: Circuit Short to Ground	The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
• B11E6:15 â Right HVAC Damper Position Sensor: Circuit Short to Battery or Open	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.



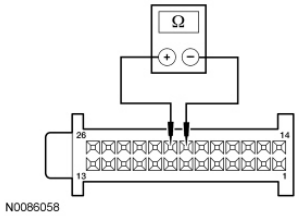
This pinpoint test is intended to diagnose the following:

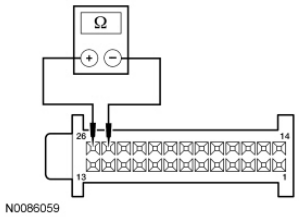




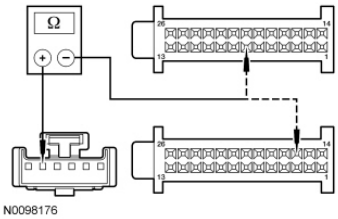


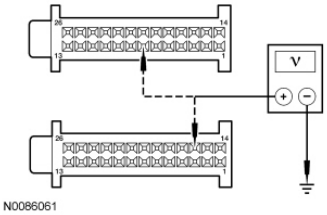
- Wiring, terminals or connectors
- Temperature blend door actuator
- HVAC module
- Stuck or bound linkage or door





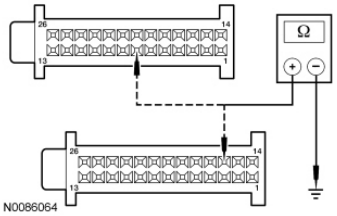
PINPOINT TEST P: TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

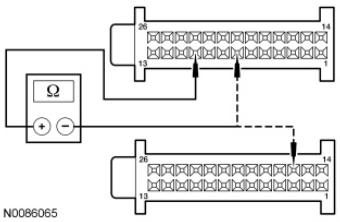




Test Step	Result / Action to Take
P1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** **For DTC B1081:07 or B1082:07** , INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For DTC B1081:12 or B1082:12** , GO to P2 . **For DTC B1081:13 or B1082:13** , GO to P3 . **For DTC B1081:11 or B1082:11** , GO to P4 . **For DTC B11E5:15 or B11E6:15** , GO to P6 .

	For DTC B11E5:11 or B11E6:11 , GO to P10 . **No** INSPECT for broken linkage or door. REPAIR as necessary. If no condition is found, GO to P13 .
P2 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO POWER	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â Dual Automatic Temperature Control (DATC) C2356a. • Disconnect: HVAC Module â DATC C2356b. • Ignition ON. • Measure the voltage between ground and: ♦ **For DTC B1081:12** , HVAC module â EMTC C2357a-22 or HVAC module â DATC C2356a-22, circuit CH238 (YE/OG), harness side. ♦ **For DTC B1082:12** , HVAC module â DATC C2356b-26, circuit CH212 (BU/OG), harness side.  N0086052 • Measure the voltage between ground and: ♦ **For DTC B1081:12** , HVAC module â EMTC C2357a-21 or HVAC module â DATC C2356a-21, circuit CH239 (BU/WH), harness side. ♦ **For DTC B1082:12** , HVAC module â DATC C2356b-25, circuit CH213 (BN/GN), harness side.  N0086053 • **Are any voltages present?**	**Yes** REPAIR the circuit(s) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to P5 .
P3 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN	





NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test. • Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Disconnect: **For DTC B1081:00** , LH Temperature Blend Door Actuator C2091. • Disconnect: **For DTC B1082:00** , RH Temperature Blend Door Actuator C2092 . • Measure the resistance between: ♦ **For DTC B1081:00** , HVAC module â EMTC C2357a-22 or HVAC module â DATC C2356a-22, circuit CH238 (YE/OG), harness side and LH temperature blend door actuator C2091-5, circuit CH238 (YE/OG), harness side. ♦ **For DTC B1082:00** , HVAC module â DATC C2356b-26, circuit CH212 (BU/OG), harness side and RH temperature blend door actuator C2092-5, circuit CH212 (BU/OG), harness side.  N0098174 • Measure the resistance between: ♦ **For DTC B1081:00** , HVAC module â EMTC C2357a-21 or HVAC module â DATC C2356a-21, circuit CH239 (BU/WH), harness side and LH temperature blend door actuator C2091-6, circuit CH239 (BU/WH), harness side. ♦ **For DTC B1082:00** , HVAC module â DATC C2356b-25, circuit CH213 (BN/GN), harness side and RH temperature blend door actuator C2092-6, circuit CH213 (BN/GN), harness side.	**Yes** GO to <u>P13</u> . **No** REPAIR the circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0098175 • **Are the resistances less than 5 ohms?**	
P4 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Measure the resistance between ground and: ♦ **For DTC B1081:11** , HVAC module â EMTC C2357a-22 or HVAC module â DATC C2356a-22, circuit CH238 (YE/OG), harness side. ♦ **For DTC B1082:11** , HVAC module â DATC C2356b-26, circuit CH212 (BU/OG), harness side.  N0086056 • Measure the resistance between ground and: ♦ **For DTC B1081:11** , HVAC module â EMTC C2357a-21 or HVAC module â DATC C2356a-21, circuit CH239 (BU/WH), harness side. ♦ **For DTC B1082:11** , HVAC module â DATC C2356b-25, circuit CH213 (BN/GN), harness side.  N0086057 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to P5 . **No** REPAIR the circuit(s) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P5 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR A SHORT TOGETHER	

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test. • Ignition OFF. • Disconnect: **For DTC B1081:11** , LH Temperature Blend Door Actuator C2091. • Disconnect: **For DTC B1082:11** , RH Temperature Blend Door Actuator C2092 . **For DTC B1081:11.**  N0086058 • **NOTE: For DTC B1081:11** . • Measure the resistance between HVAC module â EMTC C2357a-21 or HVAC module â DATC C2356a-21, circuit CH239 (BU/WH), harness side and HVAC module â EMTC C2357a-22 or HVAC module â DATC C2356a-22, circuit CH238 (YE/OG), harness side. **For DTC B1082:11.**  N0086059 • **NOTE: For DTC B1082:11** . • Measure the resistance between HVAC module â DATC C2356b-25, circuit CH213 (BN/GN), harness side and HVAC module â DATC C2356b-26, circuit CH212 (BU/OG), harness side. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P13 . **No** REPAIR circuit(s) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P6 CHECK CIRCUIT VH441 (WH/BN) OR VH440 (BU/BN) FOR AN OPEN	
NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test. • Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a.	**Yes** GO to P7 . **No** REPAIR circuit VH441 (WH/BN) or VH440 (BU/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Disconnect: **For DTC B11E5:15** , LH Temperature Blend Door Actuator C2091. • Disconnect: **For DTC B11E6:15** , RH Temperature Blend Door Actuator C2092 . • Measure the resistance between the following: ♦ **For DTC B11E5:15** , HVAC module â EMTC C2357a-7 or HVAC module â DATC C2356a-7, circuit VH440 (BU/BN), harness side and LH temperature blend door actuator C2091-9, circuit VH440 (BU/BN), harness side. ♦ **For DTC B11E6:15** , HVAC module â DATC C2356b-16, circuit VH441 (WH/BN), harness side and RH temperature blend door actuator C2092-9, circuit VH441 (WH/BN), harness side.  N0098176 • **Is the resistance less than 5 ohms?**	
P7 CHECK CIRCUIT VH440 (BU/BN) OR VH441 (WH/BN) FOR A SHORT TO POWER	
• Ignition ON. • Measure the voltage between ground and the following: ♦ **For DTC B11E5:15** , HVAC module â EMTC C2357a-7 or HVAC module â DATC C2356a-7, circuit VH440 (BU/BN), harness side. ♦ **For DTC B11E6:15** , HVAC module â DATC C2356b-16, circuit VH441 (WH/BN), harness side.  N0086061 • **Is any voltage present?**	**Yes** REPAIR circuits VH441 (WH/BN) or VH440 (BU/BN) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to P8 .
P8 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO CIRCUIT VH441 (WH/BN) OR VH440 (BU/BN)	

• Ignition OFF. • Measure the resistance between HVAC module â EMTC C2357a-11 or HVAC module â DATC C2356a-11, circuit LH111 (BN/WH) and the following: ♦ **For DTC B11E5:15** , HVAC module â EMTC C2357a-7 or HVAC module â DATC C2356a-7, circuit VH440 (BU/BN), harness side. ♦ **For DTC B11E6:15** , HVAC module â DATC C2356b-16, circuit VH441 (WH/BN), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P9 . **No** REPAIR circuits LH111 (BN/WH) and VH441 (WH/BN) or VH440 (BU/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P9 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between HVAC module â EMTC C2357a-10 or HVAC module â DATC C2356a-10, circuit RH111 (GY/BU) and the following: ♦ **For DTC B11E5:15** , LH temperature blend door actuator C2091-8, circuit RH111 (GY/BU), harness side. ♦ **For DTC B11E6:15** , RH temperature blend door actuator C2092-8, circuit RH111 (GY/BU), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to P13 . **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P10 CHECK CIRCUIT VH440 (BU/BN) OR VH441 (WH/BN) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357a. • Disconnect: HVAC Module â DATC C2356a. • Disconnect: HVAC Module â DATC C2356b. • Measure the resistance between ground and the following:	**Yes** GO to P11 . **No** REPAIR circuit VH441 (WH/BN) or VH440 (BU/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test.

♦ **For DTC B11E5:11** , HVAC module â EMTC C2357a-7 or HVAC module â DATC C2356a-7, circuit VH440 (BU/BN), harness side. ♦ **For DTC B11E6:11** , HVAC module â DATC C2356b-16, circuit VH441 (WH/BN), harness side.  • **Are the resistances greater than 10,000 ohms?**	TEST the system for normal operation.
P11 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO CIRCUIT VH441 (WH/BN) OR VH440 (BU/BN)	
NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test. • Disconnect: **For DTC B11E5:11** , LH Temperature Blend Door Actuator C2091. • Disconnect: **For DTC B11E6:11** , RH Temperature Blend Door Actuator C2092 . • Measure the resistance between HVAC module â EMTC C2357a-10 or HVAC module â DATC C2356a-10, circuit RH111 (GY/BU) and the following: ♦ **For DTC B11E5:11** , HVAC module â EMTC C2357a-7 or HVAC module â DATC C2356a-7, circuit VH440 (BU/BN), harness side. ♦ **For DTC B11E6:11** , HVAC module â DATC C2356b-16, circuit VH441 (WH/BN), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P12 . **No** REPAIR circuits RH111 (GY/BU) and VH441 (WH/BN) or VH440 (BU/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P12 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN	

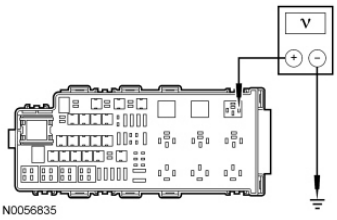
• Measure the resistance between HVAC module â EMTC C2357a-11 or HVAC module â DATC C2356a-11, circuit LH111 (BN/WH) and the following: ♦ **For DTC B11E5:11** , LH temperature blend door actuator C2091-10, circuit LH111 (BN/WH), harness side. ♦ **For DTC B11E6:11** , RH temperature blend door actuator C2092-10, circuit LH111 (BN/WH), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** GO to P13 . **No** REPAIR circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P13 CHECK THE ACTUATOR CONNECTION	
• Disconnect the actuator connector. • Check for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat the actuator connector. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** CARRY OUT the Temperature Blend Door Actuator component test in this section. If the actuator tests OK, GO to P14 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
P14 MODULE ACTUATOR POSITION CALIBRATION	
NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below. • Ignition OFF. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Ignition ON. • Clear the DTCs. • Select any position except OFF. • **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds.	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

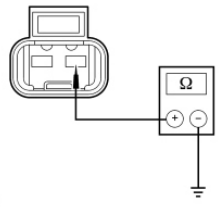
• Operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test Q: The Blower Motor is Inoperative â EMTC

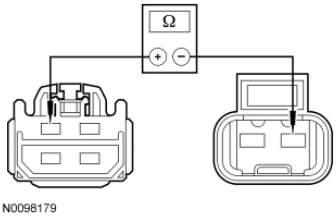
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

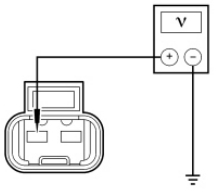
Normal Operation

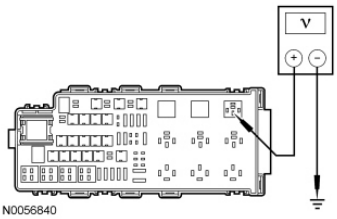




Under normal operation, the blower motor relay coil receives ignition voltage through circuit CBP45 (YE). The coil receives ground from the HVAC module â Electronic Manual Temperature Control (EMTC) through circuit CH123 (VT/GN) if any function selector position but OFF is selected. Voltage is supplied to the relay switch contact through circuit SBB06 (BN/RD). When the relay coil is energized, voltage is delivered to the blower motor through circuit CH402 (YE/GN). Ground for the blower motor is provided through circuit CH426 (YE/OG) from the blower resistor or the blower switch (HI). The blower resistor and blower switch is grounded through circuit GD115 (BK/GY).







- DTC B10AF:12 (Blower Fan Relay: Circuit Short to Battery) â The module senses excessive voltage on the relay coil ground circuit, indicating a short directly to voltage.
- DTC B10AF:14 (Blower Fan Relay: Circuit Short to Ground or Open) â The module senses no voltage on the relay coil ground circuit, indicating an open or a short directly to ground.

This pinpoint test is intended to diagnose the following:
- Fuse(s)
- Wiring, terminals or connectors
- Blower motor
- Blower motor relay
- HVAC module â EMTC

PINPOINT TEST Q: THE BLOWER MOTOR IS INOPERATIVE â EMTC

Test Step	Result / Action to Take
Q1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** **For B10AF:12** , REPAIR circuit CH123 (VT/GN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For B10AF:14** , CARRY OUT the blower motor relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If the relay tests OK, GO to Q2 . **No**

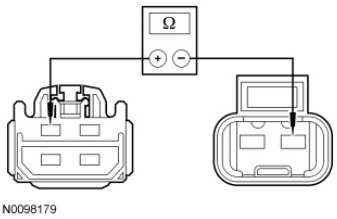
	GO to Q3 .
Q2 CHECK THE RELAY COIL SUPPLY VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Relay. • Ignition ON. • Measure the voltage between blower motor relay socket pin 86, circuit CBP45 (YE) and ground.  • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CH123 (VT/GN) for an open. TEST the system for normal operation. **No** VERIFY Smart Junction Box (SJB) fuse 45 (5A) is OK. If OK, REPAIR circuit CBP45 (YE) for an open. TEST the system for normal operation.
Q3 CHECK CIRCUIT CH426 (YE/OG) FOR GROUND	
• Ignition OFF. • Disconnect: Blower Motor C288. • Turn the function selector switch to the PANEL position. • Turn the blower motor switch to the HI position. • Measure the resistance between blower motor connector C288-B, circuit CH426 (YE/OG), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to Q5 . **No** GO to Q4 .
Q4 CHECK CIRCUIT CH426 (YE/OG) FOR AN OPEN	
• Disconnect: HVAC Module â EMTC C2357b. • Measure the resistance between HVAC module â EMTC C2357b-2, circuit CH426 (YE/OG), harness side and blower motor C288-B, circuit CH426 (YE/OG), harness side.	**Yes** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation. **No** REPAIR circuit CH426 (YE/OG) for an open. TEST the system for normal operation.

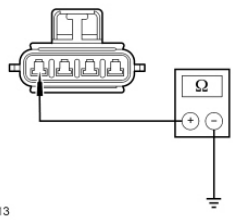
 N0098179 • **Is the resistance less than 5 ohms?**	
Q5 CHECK BLOWER MOTOR CIRCUIT CH402 (YE/GN) FOR VOLTAGE	
• Ignition ON. • Measure the voltage between blower motor C288-A, circuit CH402 (YE/GN), harness side and ground.  N0041907 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new blower motor. REFER to Section 412-01 . TEST the system for normal operation. **No** GO to Q6 .
Q6 CHECK CIRCUIT SBB35 (BU/RD) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Relay. • Ignition ON. • Measure the voltage between blower motor relay socket pin 30, circuit SBB35 (BU/RD) and ground.  N0056840 • **Is the voltage greater than 10 volts?**	**Yes** CARRY OUT the blower motor relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If the relay tests OK, REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation. **No** VERIFY Battery Junction Box (BJB) fuse 35 (40A) is OK. If OK, REPAIR circuit SBB35 (BU/RD) for an open. TEST the system for normal operation.

Pinpoint Test R: The Blower Motor Does Not Operate Correctly â EMTC

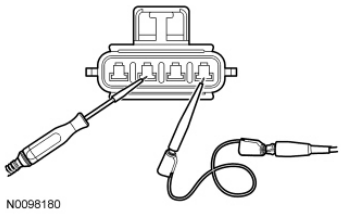
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control System for schematic and connector information.

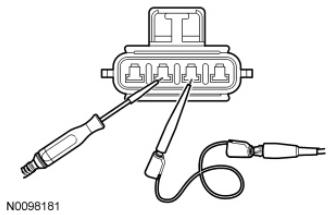
Normal Operation

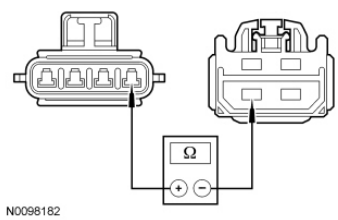




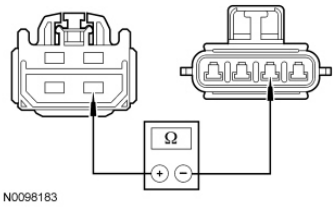
Under normal operation, the blower motor is provided ground from the blower resistor through circuit CH426 (YE/OG). The resistor gets a ground from circuit GD115 (BK/GY) in the lowest blower setting. In MED-LO and MED-HI the resistor gets ground from the blower motor switch through circuit CH428 (GN/WH) or CH429 (GY/BN), depending on selected speed. In HI, the blower motor is grounded directly through the blower motor switch from circuit CH426 (YE/OG) to circuit GD115 (BK/GY). The blower switch receives its ground from circuit GD115 (BK/GY).

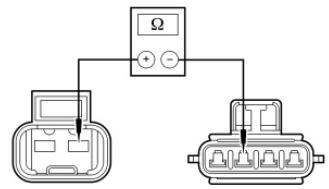


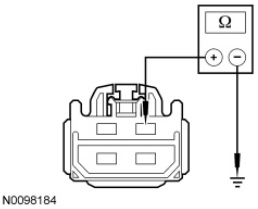




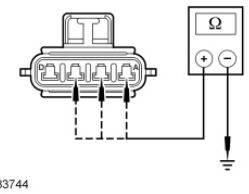
- DTC B10AF:14 (Blower Fan Relay: Circuit Short to Ground or Open) â The module senses no voltage on the relay coil ground circuit, indicating an open or a short directly to ground.

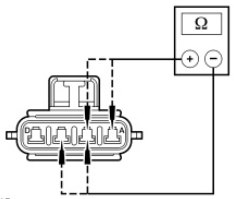






This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Blower motor resistor
- HVAC module â Electronic Manual Temperature Control (EMTC)





PINPOINT TEST R: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY â EMTC

Test Step	Result / Action to Take
R1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Is DTC B10AF:14 present?**	**Yes** REPAIR circuit CH123 (VT/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to R2 .
R2 CHECK THE BLOWER MOTOR OPERATION	
• Ignition ON. • Turn the function selector switch to the FLOOR position. • Select all blower speed positions. • **Does the blower motor operate in any position?**	**Yes** If the blower motor does not operate in HI setting only, GO to R3 . If the blower motor does not operate in LO setting only, GO to R4 . If the blower motor does not operate in MED-LO or MED-HI setting only, GO to R5 . If the blower motor

	operates in HI setting only, GO to R7 . If the blower motor operates in LO setting only, GO to R8 . For all other symptoms, GO to R9 . **No** GO to Pinpoint Test Q .
R3 CHECK CIRCUIT CH426 (YE/OG) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357b. • Disconnect: Blower Motor C288. • Measure the resistance between HVAC module â EMTC C2357b-2, circuit CH426 (YE/OG), harness side and blower motor C288-B, circuit CH426 (YE/OG), harness side.  N0098179 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new HVAC module. TEST the system for normal operation. **No** REPAIR circuit CH426 (YE/OG) for an open. TEST the system for normal operation.
R4 CHECK BLOWER MOTOR RESISTOR GROUND CIRCUIT GD115 (BK/GY) FOR AN OPEN	
• Ignition OFF. • Disconnect: Blower Motor Resistor C1228. • Measure the resistance between blower motor resistor C1228-D, circuit GD115 (BK/GY), harness side and ground.  N0041913 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor resistor. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.
R5 CHECK CIRCUIT CH428 (GN/WH) OR CH429 (GY/BN) FOR GROUND	

NOTICE: **The following step uses a test light to stimulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition OFF. • Disconnect: Blower Motor Resistor C1228. • Ignition ON. **For MED-LO inoperative.**  N0098180 • **For MED-LO inoperative** : With the blower motor switch in the MED-LO speed position, connect a 12-volt test lamp between blower motor resistor C1228-C, circuit CH426 (YE/OG), harness side and blower motor resistor C1228-A, circuit CH428 (GN/WH), harness side. **For MED-HI inoperative.**  N0098181 • **For MED-HI inoperative** : With the blower motor switch in the MED-HI speed position, connect a 12-volt test lamp between blower motor resistor C1228-C, circuit CH426 (YE/OG), harness side and blower motor resistor C1228-B, circuit CH429 (GY/BN), harness side. • **Does the test lamp illuminate?**	**Yes** INSTALL a new blower motor resistor. TEST the system for normal operation. **No** GO to R6 .
R6 CHECK CIRCUIT CH428 (GN/WH) OR CH429 (GY/BN) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module â EMTC C2357b. **For MED-LO inoperative.**  N0098182 • **For MED-LO inoperative** , measure the resistance between HVAC module â EMTC C2357b-4, circuit CH428 (GN/WH), harness side	**Yes** CARRY OUT the Blower Motor Resistor component test in this section. If the resistor tests OK, INSTALL a new blower motor switch. TEST the system for normal operation. **No** REPAIR circuit CH428 (GN/WH) or

and blower motor resistor C1228-A, circuit CH428 (GN/WH), harness side. **For MED-HI inoperative.**  N0098183 • **For MED-HI inoperative** , measure the resistance between HVAC module â EMTC C2357b-3, circuit CH429 (GY/BN), harness side and blower motor resistor C1228-B, circuit CH429 (GY/BN), harness side. • **Is the resistance less than 5 ohms?**	CH429 (GY/BN) for an open. TEST the system for normal operation.
R7 CHECK CIRCUIT CH426 (YE/OG) FOR AN OPEN	
• Ignition OFF. • Disconnect: Blower Motor Resistor C1228. • Disconnect: Blower Motor C288. • Measure the resistance between blower motor resister C1228-C, circuit CH426 (YE/OG), harness side and blower motor C288-B, circuit CH426 (YE/OG), harness side.  N0041914 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor resistor. TEST the system for normal operation. **No** REPAIR circuit CH426 (YE/OG) for an open. TEST the system for normal operation.
R8 CHECK THE BLOWER MOTOR SWITCH CIRCUIT GD115 (BK/GY) FOR AN OPEN	
• Measure the resistance between HVAC Module â EMTC C2357b-1, circuit GD115 (BK/GY), harness side and ground.  N0098184 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new HVAC module. TEST the system for normal operation. **No** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.
R9 CHECK CIRCUITS CH426 (YE/OG), CH428 (GN/WH) AND CH429 (GY/BN) FOR A SHORT TO GROUND	

• Ignition OFF. • Disconnect: Blower Motor C288. • Disconnect: Blower Motor Resistor C1228. • Disconnect: HVAC Module â EMTC C2357b. • Measure the resistance between ground and blower motor resistor: ♦ C1228-A, circuit CH428 (GN/WH), harness side. ♦ C1228-C, circuit CH426 (YE/OG), harness side. ♦ C1228-B, circuit CH429 (GY/BN), harness side.  N0083744 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to R10 . **No** REPAIR the affected circuit for a short to ground. TEST the system for normal operation.
R10 CHECK THE BLOWER MOTOR CIRCUITS FOR SHORTS TOGETHER	
• Measure the resistance between blower motor resistor: ♦ C1228-A, circuit CH428 (GN/WH), harness side and C1228-C, circuit CH426 (YE/OG), harness side. ♦ C1228-A, circuit CH428 (GN/WH), harness side and C1228-B, circuit CH429 (GY/BN), harness side. ♦ C1228-C, circuit CH426 (YE/OG), harness side and C1228-B, circuit CH429 (GY/BN), harness side.  N0083745 • **Are the resistances greater than 10,000 ohms?**	**Yes** CARRY OUT the Blower Motor Resistor component test in this section. If the resistor tests OK, INSTALL a new HVAC module. TEST the system for normal operation. **No** REPAIR the affected circuits. TEST the system for normal operation.

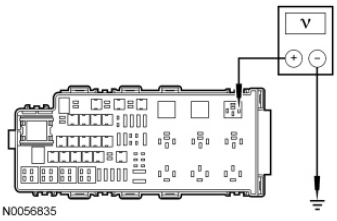
Pinpoint Test S: The Blower Motor is Inoperative â DATC

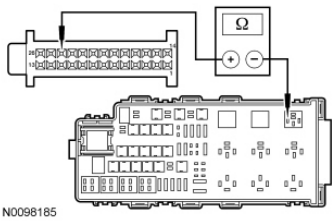
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

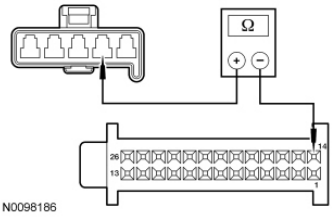
Normal Operation

Under normal operation, the blower motor relay coil receives a ground from the HVAC module through circuit CH123 (VT/GN). The coil receives ignition voltage through circuit CBP45 (YE). Voltage is supplied to the relay switch contact through circuit SBB06 (BN/RD). When the relay coil is energized, voltage is delivered to the blower motor speed control through circuit CH402 (YE/GN). Ground for the blower motor speed control is provided by circuit GD115 (BK/GY). Voltage for the motor is provided through circuit VH301 (YE/BU) from the blower motor speed control. Ground for the motor is provided through circuit VH219 (GY) from the blower motor speed control. The HVAC module sends a Pulse-Width Modulation (PWM) signal to the blower motor speed control through circuit VH101 (WH/VT) to control the blower

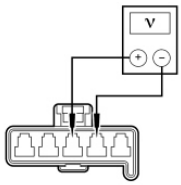
speed.

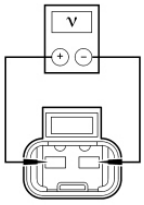




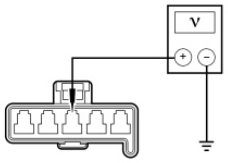


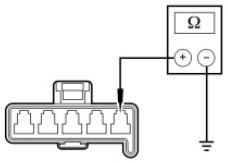
- DTC B10AF:12 (Blower Fan Relay: Circuit Short to Battery) â The module senses excessive voltage on the relay coil ground circuit, indicating a short directly to voltage.
- DTC B10AF:14 (Blower Fan Relay: Circuit Short to Ground or Open) â The module senses no voltage on the relay coil ground circuit, indicating an open or a short directly to ground.
- DTC B10B9:12 (Blower Control: Circuit Short to Battery) â The module senses excessive voltage on the blower motor control PWM circuit, indicating a short directly to voltage.
- DTC B10B9:14 (Blower Control: Circuit Short to Ground or Open) â The module senses no voltage on the blower motor control PWM circuit, indicating an open or a short directly to ground.

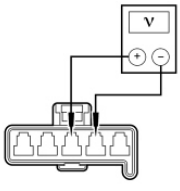




This pinpoint test is intended to diagnose the following:







- Fuse(s)
- Wiring, terminals or connectors
- Blower motor relay
- Blower motor speed control
- HVAC module â Dual Automatic Temperature Control (DATC)
- Blower motor

PINPOINT TEST S: THE BLOWER MOTOR IS INOPERATIVE â DATC

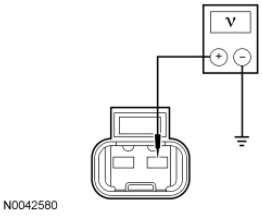
Test Step	Result / Action to Take
S1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** **For DTC B10AF:12** , REPAIR circuit CH123 (VT/GN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For DTC B10AF:14** , CARRY OUT the Blower Motor Relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If the relay tests OK, GO to S2 . **For DTC B10B9:14** , GO to S4 . **No** GO to S6 .
S2 CHECK THE RELAY COIL SUPPLY VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Relay. • Ignition ON. • Measure the voltage between blower motor relay socket pin 86, circuit CBP45 (YE) and ground.	**Yes** GO to S3 . **No** VERIFY Smart Junction Box (SJB) fuse 45 (5A) is OK. If OK, REPAIR

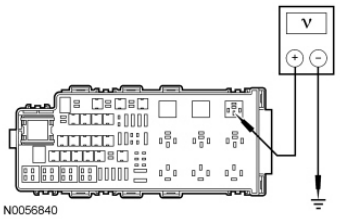
 N0056835 • **Is the voltage greater than 10 volts?**	circuit CBP45 (YE) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
S3 CHECK CIRCUIT CH123 (VT/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module â DATC C2356a. • Measure the resistance between blower motor relay socket pin 85, circuit CH123 (VT/GN) and HVAC module â DATC C2356a-24, circuit CH123 (VT/GN), harness side.  N0098185 • **Is the resistance less than 5 ohms?**	**Yes** GO to S17 . **No** REPAIR circuit CH123 (VT/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
S4 CHECK CIRCUIT VH101 (WH/VT) FOR AN OPEN	
• Ignition OFF. • Disconnect: Blower Motor Speed Control C271. • Disconnect: HVAC Module â DATC C2356a. • Measure the resistance between blower motor control C271-B, circuit VH101 (WH/VT), harness side and HVAC module â DATC C2356a-14, circuit VH101 (WH/VT), harness side.  N0098186 • **Is the resistance less than 5 ohms?**	**Yes** GO to S5 . **No** REPAIR circuit VH101 (WH/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
S5 CHECK CIRCUIT VH101 (WH/VT) FOR GROUND SIGNAL	

• Connect: HVAC Module â DATC C2356a. • Ignition ON. • Press the PANEL button on the HVAC module. Adjust the blower motor setting to HI. • Measure the voltage between blower motor speed control C271-B, circuit VH101 (WH/VT), harness side and blower motor speed control C271-C, circuit CH402 (YE/GN), harness side.  N0042577 • **Is the voltage greater than 10 volts?**	**Yes** GO to S16 . **No** GO to S17 .
S6 CHECK FOR VOLTAGE TO THE BLOWER MOTOR	
• Ignition OFF. • Disconnect: Blower Motor C288. • Ignition ON. • Measure the voltage between blower motor C288-A, circuit VH219 (GY), harness side and blower motor C288-B, circuit VH301 (YE/BU), harness side.  N0042576 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new blower motor. TEST the system for normal operation. **No** GO to S7 .
S7 CHECK FOR VOLTAGE TO THE BLOWER MOTOR CONTROLLER	
• Ignition OFF. • Disconnect: Blower Motor Speed Control C271. • Ignition ON. • Press the PANEL button on the HVAC module. • Measure the voltage between blower motor speed control C271-C, circuit CH402 (YE/GN), harness side and ground.	**Yes** GO to S8 . **No** GO to S14 .

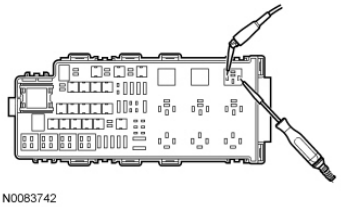
 N0041919 • **Is the voltage greater than 10 volts?**	
S8 CHECK CIRCUIT GD115 (BK/GY) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between blower motor speed control C271-A, circuit GD115 (BK/GY), harness side and ground.  N0041918 • **Is the resistance less than 5 ohms?**	**Yes** GO to S9 . **No** REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.
S9 CHECK CIRCUIT VH101 (WH/VT) FOR GROUND SIGNAL	
• Ignition ON. • Press the PANEL button on the HVAC module. Adjust the blower motor setting to HI. • Measure the voltage between blower motor speed control C271-2, circuit VH101 (WH/VT), harness side and blower motor speed control C271-3, circuit CH402 (YE/GN), harness side.  N0042577 • **Is the voltage greater than 10 volts?**	**Yes** GO to S10 . **No** GO to S17 .
S10 CHECK CIRCUITS VH219 (GY) AND VH301 (YE/BU) FOR AN OPEN	
• Measure the resistance between the blower motor connector, harness side and blower motor speed control, harness side using the following chart.	**Yes** GO to S11 . **No** REPAIR circuit VH219 (GY) or VH301 (YE/BU) for an open. TEST

	the system for normal operation.





Blower Motor Connector	Circuit	Blower Motor Speed Control Connector
C288-A	VH219 (GY)	C271-E
C288-B	VH301 (YE/BU)	C271-D



N0102902

- **Are the resistances less than 5 ohms?**

S11 CHECK CIRCUITS VH219 (GY) AND VH301 (YE/BU) FOR A SHORT TOGETHER	
• Measure the resistance between blower motor C288-A, circuit VH219 (GY), harness side and blower motor C288-B, circuit VH301 (YE/BU), harness side.  N0042578 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S12 . **No** REPAIR circuits VH219 (GY) and VH301 (YE/BU) for a short together. TEST the system for normal operation.
S12 CHECK CIRCUIT VH219 (GY) FOR A SHORT TO GROUND	
• Measure the resistance between ground and blower motor C288-A, circuit VH219 (GY), harness side.  N0042579 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S13 . **No** REPAIR circuit VH219 (GY) for a short to ground. TEST the system for normal operation.

S13 CHECK CIRCUIT VH301 (YE/BU) FOR A SHORT TO VOLTAGE	
• Ignition ON. • Measure the voltage between ground and blower motor C288-B, circuit VH301 (YE/BU), harness side.  • **Is any voltage present?**	**Yes** REPAIR circuit VH301 (YE/BU) for a short to voltage. TEST the system for normal operation. **No** GO to S16 .
S14 CHECK THE RELAY SWITCH POWER CIRCUIT FOR AN OPEN	
• Measure the voltage between blower motor relay socket pin 30, circuit SBB35 (BU/RD) and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to S15 . **No** VERIFY Battery Junction Box (BJB) fuse 35 (40A) is OK. If OK, REPAIR circuit SBB35 (BU/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
S15 CHECK THE MODULE OUTPUT	
NOTICE: **The following step use a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** • Ignition ON. • With the engine running, connect a 12-volt test lamp between blower motor relay socket pin 85, circuit CH123 (VT/GN) and socket pin 86, circuit CBP45 (YE).	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation. **No** GO to S17 .

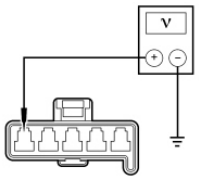
 N0083742 • **Does the test lamp illuminate?**	
S16 CHECK THE BLOWER MOTOR SPEED CONTROL CONNECTION	
• Clear the DTCs. • Disconnect the blower motor speed control connector. • Check for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat the connector. • Carry out the HVAC On-Demand Self Test. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new blower motor speed control. REFER to Section 412-01 . CLEAR the DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
S17 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

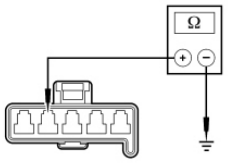
Pinpoint Test T: The Blower Motor Does Not Operate Correctly â DATC

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor relay coil receives a ground from the HVAC module through circuit CH123 (VT/GN). The coil receives ignition voltage through circuit CBP45 (YE). Voltage is supplied to the relay switch contact through circuit SBB06 (BN/RD). When the relay coil is energized, voltage is delivered to the blower motor speed control through circuit CH402 (YE/GN). Ground for the blower motor speed control is provided by circuit GD115 (BK/GY). Voltage for the motor is provided through circuit VH301 (YE/BU) from the blower motor speed control. Ground for the motor is provided through circuit VH219 (GY) from the blower motor speed control. The HVAC module sends a Pulse-Width Modulation (PWM) signal to the blower motor speed control through circuit VH101 (WH/VT) to control the blower speed.

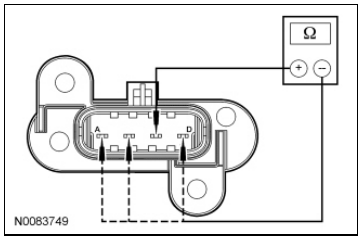




- DTC B10AF:14 (Blower Fan Relay: Circuit Short to Ground or Open) â The module senses no voltage on the relay coil ground circuit, indicating an open or a short directly to ground.
- DTC B10B9:14 (Blower Control: Circuit Short to Ground or Open) â The module senses no voltage on the blower motor control PWM circuit, indicating an open or a short directly to ground.

This pinpoint test is intended to diagnose the following:

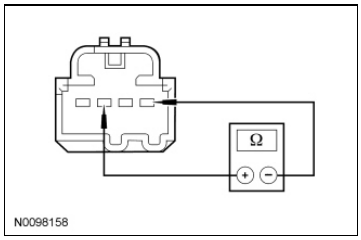
- Fuse(s)
- Wiring, terminals or connectors
- Blower motor speed control
- HVAC module â Dual Automatic Temperature Control (DATC)



PINPOINT TEST T: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY â DATC

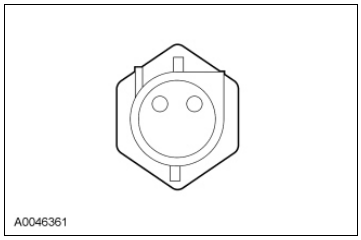
Test Step	Result / Action to Take
T1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** **For DTC B10AF:14** , REPAIR circuit CH123 (VT/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For DTC B10B9:14** , REPAIR circuit VH101 (WH/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to T2 .
T2 VERIFY THE BLOWER MOTOR OPERATION	
• Ignition ON. • Press the panel button on the HVAC module. Adjust the blower motor setting to LO and then to HI. • **Does the blower motor operate at any setting?**	**Yes** If the blower motor operates always in HI, GO to T3 . If the blower motor is always ON, CARRY OUT the blower motor relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If the relay tests OK, GO to T5 . **No** GO to Pinpoint Test S .
T3 CHECK CIRCUIT VH301 (YE/BU) FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: Blower Motor Speed Control C271. • Disconnect: Blower Motor C288. • Ignition ON. • Measure the voltage between ground and blower motor speed control C271-E, circuit VH301 (YE/BU), harness side.  N0042582 • **Is any voltage present?**	**Yes** REPAIR circuit VH301 (YE/BU) for a short to voltage. TEST the system for normal operation. **No** GO to T4 .
T4 CHECK CIRCUIT VH219 (GY) FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and blower motor speed control C271-D, circuit VH219 (GY), harness side.  N0098188 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new blower control. TEST the system for normal operation. If the condition returns, GO to T5 . **No** REPAIR circuit VH219 (GY) for a short to voltage. TEST the system for normal operation.
T5 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



Component Tests

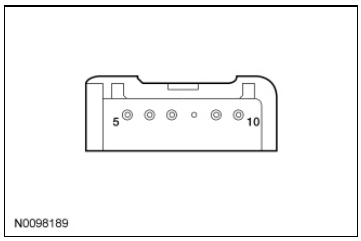
Blower Motor Resistor



Blower Motor Resistor Pins	Approx. Resistance
C and B	1.27 ohms
C and A	2.45 ohms
C and D	4.5 ohms

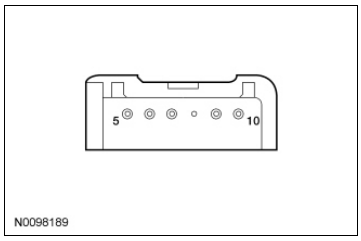
Temperature Sensor â In-Vehicle

Ambient Temperature	Resistance
-40Â°C (-40Â°F)	869,073-1,061,986 ohms
-15Â°C (5Â°F)	196,465-231,213 ohms
0Â°C (32Â°F)	89,982-102,514 ohms
15Â°C (59Â°F)	44,261-49,503 ohms
25Â°C (77Â°F)	28,500-31,500 ohms
35Â°C (95Â°F)	18,563-20,751 ohms
60Â°C (140Â°F)	6,971-8,001 ohms
85Â°C (185Â°F)	2,959-3,474 ohms



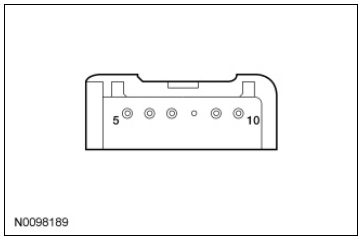
Temperature Sensor â Ambient

Ambient Temperature	Resistance
-40Â°C (-40Â°F)	832,519-1,017,523 ohms
-15Â°C (5Â°F)	199,325-220,307 ohms
0Â°C (32Â°F)	91,058-100,644 ohms



15Â°C (59Â°F)	44,435-49,113 ohms
25Â°C (77Â°F)	28,500-31,500 ohms
35Â°C (95Â°F)	18,730-20,701 ohms
60Â°C (140Â°F)	7,171-7,925 ohms
85Â°C (185Â°F)	3,110-3,438 ohms

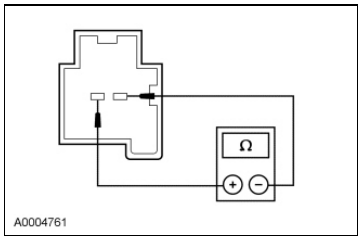
Air Inlet Mode Door Actuator



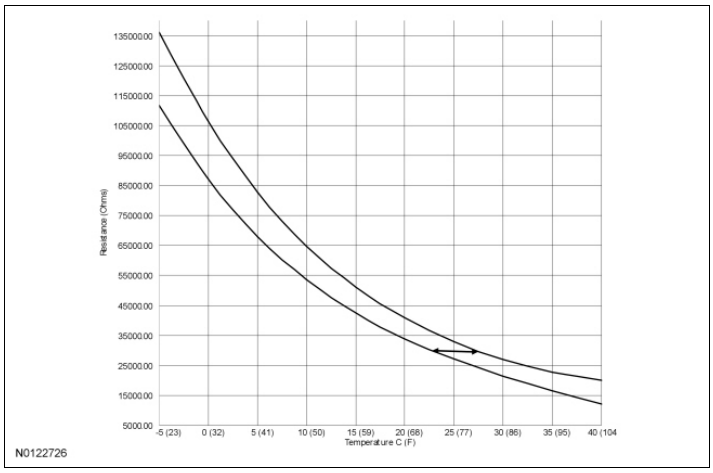
Actuator Pins	Approx. Resistance
51 and 6	71-85 ohms

Defrost/Panel/Floor Door Actuator

Actuator Pins	Approx. Resistance
8 and 10	8,000-12,000 ohms
8 and 9	1-10,000 ohms
9 and 10	1-10,000 ohms
5 and 6	38-48 ohms



Temperature Blend Door Actuator



Actuator Pins	Approx. Resistance

8 and 10	8,000-12,000 ohms
8 and 9	1-10,000 ohms
9 and 10	1-10,000 ohms
5 and 6	59-73 ohms

Evaporator Discharge Air Temperature Sensor

Ambient Temperature	Resistance
-5Â°C (23Â°F)	111,677-136,089 ohms
0Â°C (32Â°F)	87,028-106,252 ohms
5Â°C (41Â°F)	67,969-82,801 ohms
10Â°C (50Â°F)	53,505-64,741 ohms
15Â°C (59Â°F)	42,389-51,206 ohms
20Â°C (68Â°F)	33,860-40,844 ohms
25Â°C (77Â°F)	27,058-32,942 ohms
30Â°C (86Â°F)	21,443-27,036 ohms
35Â°C (95Â°F)	16,583-22,808 ohms
40Â°C (104Â°F)	12,177-20,007 ohms

Heater Core

1. **NOTE:** If a heater core leak is suspected, the heater core must be tested by following the Plugged Heater Core Component Test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

Inspect for evidence of coolant leakage at the heater hose to heater core attachments. A coolant leak in the heater hose could follow the heater core tube to the heater core and appear as a leak in the heater core.

2. **NOTE:** Spring-type clamps are installed as original equipment. Installation and overtightening of non-specified clamps can cause leakage at the heater hose connection and damage the heater core.

   Check the integrity of the heater hose clamps.

Heater Core â Plugged

1. Check to see that the engine coolant is at the correct level.

2. Start the engine and turn on the heater.

3. When the engine coolant reaches operating temperature, using a suitable temperature measuring device, check the core inlet and outlet hoses to see if they are hot.

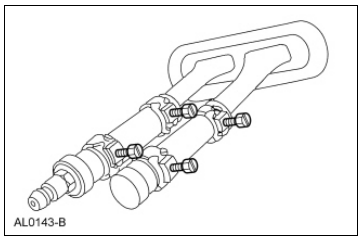
4. If the outlet only is not hot:
   - the heater core may have an air pocket.
   - the heater core may be plugged.

5. If the inlet only is not hot:
   - the thermostat may not be working correctly.

Heater Core â Pressure Test

⚠ **WARNING: Before disconnecting any heater water hoses, shut OFF the engine and wait until engine is fully cool. Failure to comply with this warning may result in serious injury or burns from hot liquid escaping from the engine cooling system.**

Use the Pressure Test Kit to carry out the pressure test.



1. **NOTE:** Due to space limitations, a bench test may be necessary for pressure testing.

   Drain the coolant from the cooling system.

2. Disconnect the heater hoses from the heater core.

3. Install a short piece of heater hose, approximately 101 mm (4 in) long on each heater core tube.

4. Fill the heater core and heater hoses with water and install the plug BT-7422-B and the adapter BT-7422-A from the Pressure Test Kit. Secure the heater hoses, plug and adapter with hose clamps.

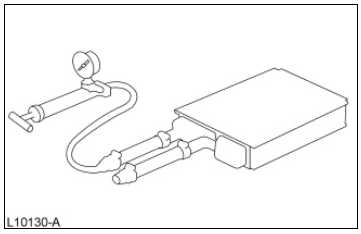
5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter.

6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core.

7. Observe the pressure gauge for a minimum of 3 minutes.

8. If the pressure drops, check the heater hose connections to the core tubes for leaks. If the heater hoses do not leak, remove the heater core from the vehicle and carry out the bench test.

Heater Core â Bench Test



1. Remove the heater core from the vehicle.

2. Drain all of the coolant from the heater core.

3. Connect the 101 mm (4 in) test heater hoses with plug and adapter to the core tubes. Then connect the Pressure Test Kit to the adapter.

4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water.

5. If a leak is observed, install a new heater core.

Evaporator/Condenser Core â On-Vehicle Leak Test

1. Discharge and recover the refrigerant. Refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the suspect evaporator core or condenser core from the A/C system.

3. Clean the manifold fittings.

4. Connect the appropriate test fittings from the A/C Flush Adapter Kit to the condenser or evaporator core tube connections.

5. **NOTE:** The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter that will activate the valve. The test is not valid if the shut-off valve does not open.

   Connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the evaporator core or condenser core. Connect the yellow hose to a known good vacuum pump.

6. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low-pressure gauge indicates 101 kPa (30 in-Hg). The 45-minute evacuation is necessary to remove any refrigerant from oil left in the evaporator core or condenser core. If the refrigerant is not completely removed from the oil, outgassing will degrade the

vacuum and appear as a refrigerant leak.

7. If the low-pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum pump is operating, close the gauge set valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before installing a new evaporator core or condenser core.

8. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low-pressure gauge; it should remain at the 101 kPa (30 in-Hg) mark.
    - If the low-pressure gauge reading rises 34 or more kPa (10 or more in-Hg) of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.
    - If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.
    - If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the evaporator core or condenser core. Then recheck for loss of vacuum.
    - If a very small leak is suspected, allow the system to sit overnight with vacuum applied and check for vacuum loss.

9. If the evaporator core or condenser core does leak, as verified by the above procedure, install a new evaporator core or condenser core.

A/C Compressor â External Leak Test

1. Install the appropriate adapter from the A/C Flush Adapter Kit on the port of the A/C compressor, using the existing manifold retaining bolt.

2. Connect the high- and low-pressure lines of a manifold gauge set or a refrigerant recovery/recycling station to the corresponding fittings on the adapter.

3. Attach the center hose of a manifold gauge set to a refrigerant container standing in an upright position.

4. Open the low-pressure gauge valve, the high-pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.

5. Using the Refrigerant Leak Detector, check for leaks at the compressor shaft.

6. If a shaft seal leak is found, install a new compressor shaft seal. If an external leak is found, install a new A/C compressor.

7. When the leak test is complete, recover the refrigerant from the compressor.

Refrigerant System Tests

Special Tool(s)

 ST1928-A	R-134a Manifold Gauge Set 023-00047 or equivalent
 ST3079A	R-134a Refrigerant Management Machine (SAE J2788 Compliant) 023-00181 or equivalent
 ST3081-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 199-00067 or equivalent
 ST3080-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 265-00012 or equivalent

Procedure 1 - Ambient Temperature at or Below 38°C (100°F)

NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

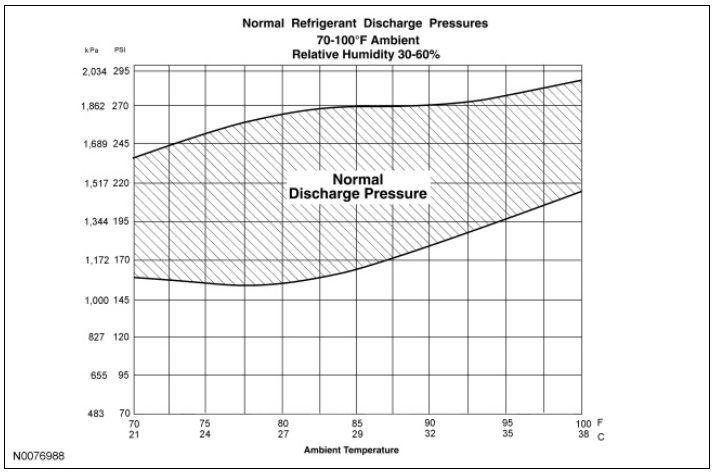
NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

NOTE: If the A/C compressor cycles at any time during this test, refer to the diagnostic table.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.

2. Connect a R-134a Manifold Gauge Set or R-134a Refrigerant Management Machine with high-pressure and low-pressure gauges to the refrigerant system.

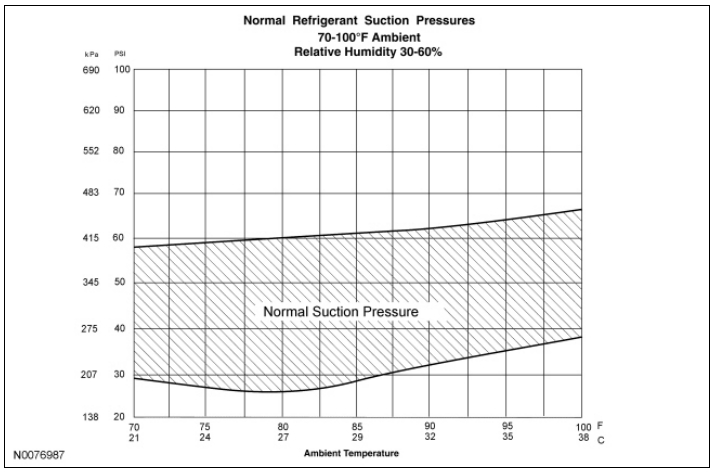
3. Set the climate controls.
   - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature,ir, HI blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If equipped with Electronic Automatic Temperature Control (EATC) or Dual Automatic Temperature Control (DATC), set temperature to 15°C (60°F) (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.



4. Open all vehicle windows and leave the hood open for the test. Open the rear doors.

5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6. Record the ambient (shop) temperature.



7. Record the discharge pressure. If the pressure is fluctuating, record the average value.

8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.

9. Record the suction pressure. If the pressure is fluctuating, record the average value.

10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.

11. Proceed to the Diagnostic Table.

Procedure 2 - Ambient Temperature Above 38°C (100°F)

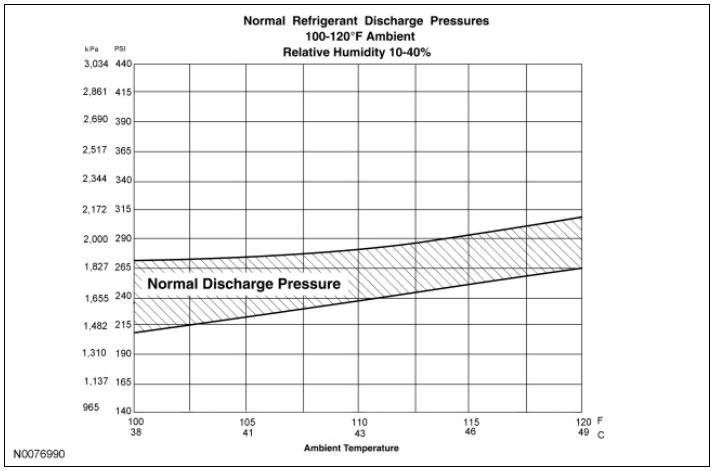
NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.

2. Connect a R-134a Manifold Gauge Set or R-134a Refrigerant Management Machine with high-pressure and low-pressure gauges to the refrigerant system.

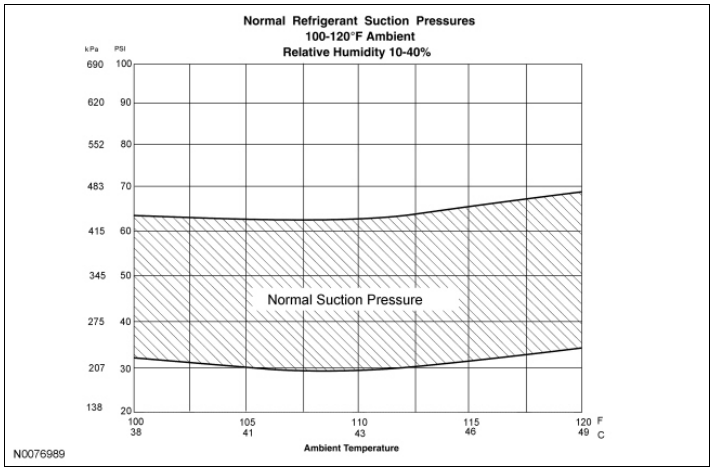
3. Set the climate controls.
   - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, MED-LO blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If equipped with Electronic Automatic Temperature Control (EATC) or Dual Automatic Temperature Control (DATC), set temperature to 15°C (60°F) (lowest possible temp setting). Manually set blower to MED-LO (3 to 4 bars). If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.



4. Open all vehicle windows the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6. Record the ambient (shop) temperature.



7. Record the discharge pressure. If the pressure is fluctuating, record the average value.

8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.

9. Record the suction pressure. If the pressure is fluctuating, record the average value.

10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.

11. Proceed to the Diagnostic Table.

Diagnostic Table

1. **NOTE:** The following table is used to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

   Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High or Clutch Cycling	High	Condenser - inadequate airflow.
High	Normal to High	Engine - overheating.
Normal to High	Normal	Refrigerant overcharge - air in refrigerant.
Normal to Low	Normal to High	A/C suction line - partially restricted or plugged. [a]
Normal to Low	Low or Clutch Cycling	Low refrigerant charge, A/C suction line - partially restricted or plugged A/C evaporator discharge air temperature sensor - reading erratic or low (if equipped). [b]
Erratic Operation or Compressor Not Running		A/C evaporator discharge air temperature sensor - poor connection at A/C clutch connector or A/C evaporator discharge air temperature sensor connector. A/C electrical circuit erratic - see A/C Electrical Circuit Wiring Diagram.
Normal to Low	High	Compressor - low performance.
Additional Possible Cause Components Associated With Inadequate Compressor Operation		
Additional Possible Cause Components Associated With a Damaged Compressor		
• Incorrect Clutch Air-gap • Refrigerant Leaks		

[a] Low pressure reading will be normal to high if restriction is downstream of service access valve.
[b] Low pressure reading will be low if pressure is taken near the compressor and restriction is upstream of service access valve.

Air Conditioning (A/C) Clutch Air Gap Adjustment

1. Check the A/C clutch air gap at 3 equally spaced places between the clutch plate and the A/C clutch pulley.

2. If the A/C clutch air gap is out of range, remove the clutch plate. Add or remove spacers between the clutch plate hub and the compressor shaft until the clearance is within specification.

Fluorescent Dye Leak Detection

Special Tool(s)

 ST3073-A	Cordless/Rechargable True UV LED Light ES 023-00182 or equivalent

Fluorescent Dye Injection - Using an R-134a Refrigerant Management Center and Dye/Lubricant Injector (Non-Hybrid Only)

NOTICE: **Do not add liquid-based R-134a Leak Detection Dye to the refrigerant system on hybrid vehicles equipped with an electric Air Conditioning (A/C) compressor. Liquid-based dyes are mixed with PAG oil, and will contaminate and damage the hybrid refrigerant system. Dye can only be added to hybrid vehicles by installing a new received/drier desiccant cartridge which includes a fluorescent dye "wafer" which will dissolve after approximately 30 minutes of continued A/C operation.**

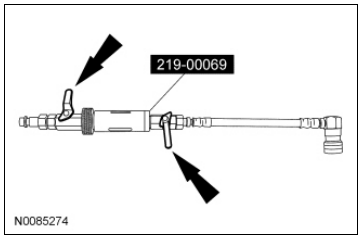
NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement receiver/drier desiccant cartridges are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new receiver/drier desiccant cartridge is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

NOTE: This method of fluorescent dye injection requires the addition of R-134a from a R-134a Refrigerant

Management Machine or R-134a Manifold Gauge Set hooked to an external tank to charge the dye into the refrigerant system. If adding fluorescent dye to a refrigert system that is already fully charged, the R-134a Loop/Add On Injector Kit-Set method should be used.

NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the manufacturer's instructions on evacuation of any non-condensable gases from the hoses.

NOTE: Only connect the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set when fluorescent dye is to be injected. The dye/lubricant injector has a one-way check valve that will prevent refrigerant system recovery and evacuation.



NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

1. **NOTE:** If no R-134a pressure is present in the refrigerant system, the system should be evacuated before carrying out the injection procedure. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

   Connect a R-134a Refrigerant Center or a R-134a Manifold Gauge Set to the refrigerant system service port valves.

2. **NOTE:** The dye/lubricant injector is included as part of the 219-00069 R-134a Loop/Add On Injector Kit-Set.

   Verify that the valves on the dye/lubricant injector are closed.

3. Fill the fluorescent e injector reservoir with 7 ml (0.25 oz) of fluorescent dye.

4. Install the dye/lubricant injector between the low-pressure service gauge port valve and the R-134a Refrigerant Center or R-134a Manifold Gauge Set.

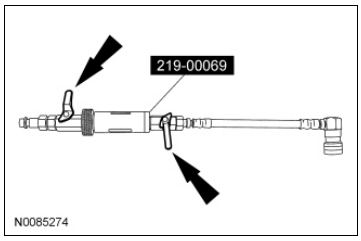
5. Open all valves and inject the fluorescent dye into the refrigerant system.

6. When fluorescent dye injection is complete, close all valves.

7. Recover the refrigerant from the dye/lubricant injector.

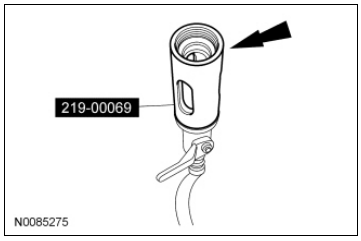
8. Remove the dye/lubricant injector from the low-pressure service gauge port valve and the R-134a Refrigerant Center or R-134a Manifold Gauge Set.

Fluorescent Dye Injection - Using an R-134a Loop/Add On Injector Kit-Set (Non-Hybrid Only)



NOTICE: **Do not add liquid-based R-134a Leak Detection Dye to the refrigerant system on hybrid vehicles equipped with an electric Air Conditioning (A/C) compressor. Liquid-based dyes are mixed with PAG oil, and will contaminate and damage the hybrid refrigerant system. Dye can only be added to hybrid vehicles by installing a new received/drier desiccant cartridge which includes a fluorescent dye "wafer" which will dissolve after approximately 30 minutes of continued A/C operation.**

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a signicant amount of refrigerant has been removed from the system. Replacement receiver/drier desiccant cartridges are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new receiver/drier desiccant cartridge is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

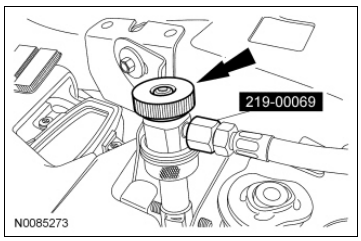


NOTE: Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gases from the hoses.

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off and cool.

1. Verify that the valves on the deluxe injector loop kit are closed.

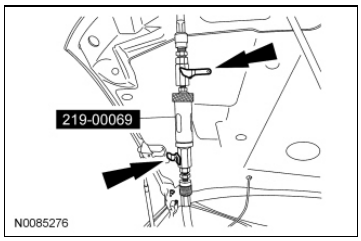
2. Fill the R-134a Loop/Add On Injector Kit-Set reservoir with 7 ml (0.25 oz) of fluorescent dye.



3. Install the R-134a Loop/Add On Injector Kit-Set between the high-pressure and low-pressure service gauge po valves.

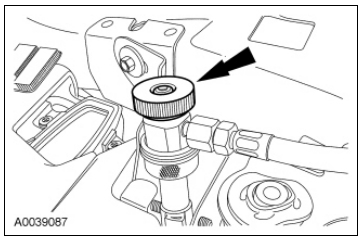
4. ***NOTICE:*** **Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine.**

   Start the engine.



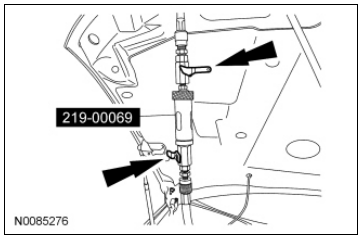
5. Set the A/C to the ON position.

6. Open the high-pressure service valve.



7. **NOTE:** To prevent pressure spike/liquid slug, crack the R-134a Loop/Add On Injector Kit-Set valves and slowly open to inject the fluorescent dye into the refrigerant system.

   Open the R-134a Loop/Add On Injector Kit-Set valves and inject the fluorescent dye into the refrigerant system.



8. Close the high-pressure service valve to allow the pressure inside the R-134a Loop/Add On Injector Kit-Set to equalize with the suction side of the refrigerant system.

9. **NOTE:** Close the valves on the R-134a Loop/Add On Injector Kit-Set while the A/C compressor is operating.

   Close the valves on the R-134a Loop/Add On Injector Kit-Set.

10. **NOTE:** Leave all valves on the R-134a Loop/Add On Injector Kit-Set closed when not in use.

    Disconnect the high-pressure and low-pressure service valves and remove the R-134a Loop/Add On Injector Kit-Set from the vehicle.

Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the fluorescent dye under a UV lamp. Since more than one leak can exist, make sure to inspect each component, line and fitting in the refrigerant system for a leak.

1. Check for leaks using a Rotunda-approved UV lamp.
    - Inspect all components, lines and fittings of the refrigerant system.

2. If a leak is found, recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

3. Repair the refrigerant system leak(s).

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. After the leak(s) is repaired, remove any traces of fluorescent dye with a general purpose oil solvent.

6. Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with a Rotunda-approved UV lamp.

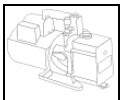
Electronic Leak Detection

Special Tool(s)

	Heated Pentode Halogen Leak Detector 023-00178 or equivalent

NOTE: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the Heated Pentode Halogen Leak Detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner or other cleaning solvents can cause the same problem. Using a fan to ventilate the area to be tested before proceeding with the leak detection procedure is helpful in removing small traces of contamination from the air, but the fan should be turned off during actual testing.

NOTE: R-134a is heavier than air, and will tend to move downward from the source of the leak if present. It is possible that a leak may not be detected if the leak detector tip is held above the leaking fitting, line or component. Always be sure to thoroughly leak test below the fitting, line or component for the presence of R-134a as well as leak testing above and around.



1. **NOTE:** The system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off and cool. The pressure reading may be higher if the engine is hot.

   Leak test the refrigerant system using the Heated Pentode Halogen Leak Detector. Follow the instructions included with the Heated Pentode Halogen Leak Detector for handling and operation techniques.

Air Conditioning (A/C) System Recovery, Evacuation and Charging

Special Tool(s)

 ST1686-A	6.0 CFM Vacuum Pump 300-R0B15600E or equivalent

 ST3080-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant) 265-00012 or equivalent

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B
R-134a Refrigerant YN-19 (US); CYN-16-P or CYN-16-R (Canada)	WSH-M17B19-A

Refrigerant System Recovery

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. For additinal information, refer to Refrigerant Oil Adding in this section.**

NOTICE: **Do not use the R-134a Refrigerant Management Machine built-in oil injection system to inject Motorcraft Electric A/C Compressor Oil to the refrigerant system on hybrid vehicles equipped**

with an electric Air Conditioning (A/C) compressor if it has been previously used to inject PAG oil. For hybrid vehicles, use only clean manual injection tools. Injection of Motorcraft Electric A/C Compressor Oil into a hybrid vehicle with equipment previously used with PAG oil will contaminate and damage the hybrid A/C system.

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTE: Ford Motor Company recommends the use of R-134a refrigerant management equipment that meets the requirements of the SAE J2788 standard.

NOTE: Ford Motor Company recommends use of a R-134a Refrigerant Management Machine to carry out recovery. If a R-134a Refrigerant Management Machine is not available, refrigerant system recovery may be accomplished using a separate recovery station.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Prior to recovering, the purity of the refrigerant must be verified. For additional information, refer to Refrigerant Identification Testing in this section.

2. Connect a R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Recover the refrigerant from the system following the operating instructions provided by the equipment manufacturer. Note the amount of oil removed during the refrigerant recovery (if any). Add that same amount back into the system once repairs are complete.

4. Once the R-134a Refrigerant Management Machine has recovered the refrigerant, switch OFF the power supply.

5. Allow the system to set for about 2 minutes, and observe the system vacuum reading. If the vacuum is not lost, disconnect the recovery equipment.

6. If the system does lose vacuum, repeat Steps 3 through 5 until the vacuum level remains stable for 2 minutes.

7. Carry out the required repairs.

Refrigerant System Evacuation Using a R-134a Refrigerant Management Machine

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. For additional information, refer to Refrigerant Oil Adding in this section.**

NOTICE: **Do not use the R-134a Refrigerant Management Machine built-in oil injection system to inject Motorcraft Electric A/C Compressor Oil to the refrigerant system on hybrid vehicles equipped with an electric Air Conditioning (A/C) compressor if it has been previously used to inject PAG oil. For hybrid vehicles, use only clean manual injection tools. Injection of Motorcraft Electric A/C Compressor Oiinto a hybrid vehicle with equipment previously used with PAG oil will contaminate and damage the hybrid A/C system.**

NOTE: Ford Motor Company recommends use of a R-134a Refrigerant Management Machine to carry out recovery, evacuation and charging of the refrigerant system. If a R-134a Refrigerant Management Machine is not available, evacuation may be accomplished using a separate Vacuum Pump and R-134a Manifold Gauge Set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect a R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

2. Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.

3. Turn OFF the Vacuum Pump. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Evacuation Using a R-134a Manifold Gauge Set and Vacuum Pump

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. For additional information, refer to Refrigerant Oil Adding in this section.**

NOTE: Ford Motor Company recommends use of a R-134a Refrigerant Management Machine to carry out evacuation of the refrigerant system. If a R-134a Refrigerant Management Machine is not available, refrigerant system evacuation may be accomplished using a separate Vacuum Pump and R-134a Manifold Gauge Set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect the R-134a Manifold Gauge Set to the low-side and high-side service gauge port valves.

2. Connect the center (yellow) hose from the R-134a Manifold Gauge Set to the suction port on the Vacuum Pump.

3. Open all valves on the R-134a Manifold Gauge Set and both service gauge port valves.

4. Turn on the Vacuum Pump and evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the

Vacuum Pump for a minimum of 45 minutes.

5. Close the high-side and low-side valves on the R-134a Manifold Gauge Set (not the service gauge port valves) and turn OFF the Vacuum Pump.

6. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Charging Using a R-134a Refrigerant Management Machine

NOTE: Ford Motor Company recommends use of a R-134a Refrigerant Management Machine to carry out charging of the refrigerant system. If a R-134a Refrigerant Management Machine is not available, refrigerant system charging may be accomplished using a separate Automatic Refrigerant Charging Meter and R-134a Manifold Gauge Set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. For additional information, refer to Refrigerant Oil Adding in this section.**

   NOTICE: **Do not use the R-134a Refrigerant Management Machine built-in oil injection system to inject Motorcraft Electric A/C Compressor Oil to the refrigerant system on hybrid vehicles equipped with an electric Air Conditioning (A/C) compressor if it has been previously used to inject PAG oil. For hybrid vehicles, use only clean manual injection tools. Injection of Motorcraft Electric A/C Compressor Oil into a hybrid hicle with equipment previously used with PAG oil will contaminate and damage the hybrid A/C system.**

   Lubricate the refrigerant system with the correct amount of clean PAG oil (non-hybrid vehicles) or electric A/C compressor oil (hybrid vehicles). For additional information, refer to Refrigerant Oil Adding in this section.

2. Connect a R-134a Refrigerant Management Machine to the low-side and high-side service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Set the refrigerant charge amount, and charge the refrigerant system following the instructions provided by the equipment manufacturer.

Refrigerant System Charging Using a R-134a Manifold Gauge Set and Automatic Refrigerant Charging Meter

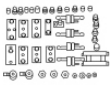
NOTE: Ford Motor Company recommends use of a R-134a Refrigerant Management Machine to carry out charging of the refrigerant system. If a R-134a Refrigerant Management Machine is not available, refrigerant system charging may be accomplished using a separate Automatic Refrigerant Charging Meter and R-134a Manifold Gauge Set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant

system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition o any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. For additional information, refer to Refrigerant Oil Adding in this section.**

   Lubricate the refrigerant system with the correct amount of clean PAG oil (non-hybrid vehicles) or electric A/C compressor oil (hybrid vehicles). For additional information, refer to Refrigerant Oil Adding in this section.



2. Assemble the R-134a Manifold Gauge Set, Automatic Refrigerant Charging Meter and R-134a supply tank following the Automatic Refrigerant Charging Meter operating instructions.

3. Charge the refrigerant system following the Automatic Refrigerant Charging Meter operating instructions.

4. If the refrigerant flow stops before the refrigerant charge is complete, start the engine, select MAX A/C operation and allow the refrigerant charge to complete.

Air Conditioning (A/C) System Flushing

Special Tool(s)

 ST2985-A	A/C Flush Adapter Kit 219-00074 or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 or equivalent
 ST2466-A	A/C Flush and Purge Machine 219-00022 (part of 219-00023) or equivalent

Material

Item	Specification
A/C System Flushing Solvent YN-23	-
Motorcraft® Electric A/C Compressor Oil YN-32	-
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

⚠ WARNING: Take the following precautions when repairing an air conditioning system containing R-134a:

- Always wear safety goggles.
- Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13°F) under atmospheric pressure and will freeze skin tissue.
- Never allow refrigerant R-134a gas to escape in quantity in an occupied space. It will displace the oxygen needed to support life.
- Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but it decomposes when exposed to high temperatures such as a torch flame. During decomposition it releases irritating and toxic gasses (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water. ul>Failure to follow these instructions may result in serious personal injury.

  NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to Refrigerant Oil Adding in this section.**

NOTICE: **An Air Conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTICE: **Receiver/drier cartridge, Thermostatic Expansion Valve (TXV), and hoses with mufflers should be removed when flushing the Air Conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The 3.785L (1 gal) of A/C System Flushing Solvent YN-23 and FL1-A filter used in A/C Flush and Purge Machine 219-00022 are intended fouse on one vehicle only. They may be used to flush both the A/C condenser core and the A/C evaporator core on an individual vehicle, but under no circumstances should they be used on more than one vehicle.**

NOTICE: **Only the A/C Flush and Purge Machine 219-00022 and A/C Systems Flushing Solvent, is approved for use on Ford vehicles. No other flushing device or solvent is approved for flushing heat exchangers (Air Conditioning [A/C] condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.**

NOTE: Prior to using the A/C Flush and Purge Machine 219-00022 for the first time, review the operating instructions.

NOTE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers. The procedure allows the specific components to be cleaned and flushed while installed in their normal in-vehicle location. The types of contamination flushed include particle matter that results from A/C compressor or desiccant failure and gummy residue that can form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a 2-step procedure that involves the use of an A/C Flush and Purge Machine 219-00022 to:

- circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.
- remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) is used to push and evaporate any remaining flush solvent from the heat exchanger.

1. Remove the receiver/drier cartridge. For additional information, refer to Section 412-01 .
2. **NOTE:** The condenser core must be flushed with the receiver/drier cartridge removed. Do not install a new receiver/drier cartridge at this time.

   With the receiver/drier cartridge removed, reinstall the receiver/drier plug and snap ring into the condenser core.
3. Remove the condenser inlet and outlet fitting nuts and disconnect the fittings.
4. Connect the A/C Flush and Purge Machine to the condenser inlet and outlet fittings using the correct adapters from the A/C Flush Adapter Kit.
5. Flush the condenser core for a minimum of 30 minutes.
6. Turn the A/C Flush and Purge machine to the PURGE mode and run for a minimum of 20 minutes.
7. Disconnect the A/C Flush and Purge machine and adapters from the condenser core.
8. Install new gasket seals and connect the A/C condenser inlet and outlet fittings.

9. Remove the snap ring and receiver/drier plug.
10. **NOTE:** Do not charge the refrigerant system after the condenser core is installed.

    Install a new receiver/drier cartridge. For additional information, refer to Section 412-01 .
11. Remove the Thermostatic Expansion Valve (TXV). For additional information, refer to Section 412-00A .
12. Connect the A/C Flush and Purge Machine to the evaporator core fitting using the correct adapter from the A/C Flush and Purge Fitting Kit.
13. Flush the evaporator core for a minimum of 20 minutes.
14. Turn the A/C Flush and Purge Machine to the PURGE mode and run for a minimum of 20 minutes.
15. Disconnect the A/C Flush and Purge Machine and adapter from the evaporator core fitting.
16. Install a new front TXV . For additional information, refer to Section 412-01 .
17. **NOTE:** It is necessary to evacuate the refrigerant system for a minimum of one hour to evaporate any traces of flush solvent that may remain in the system.

    Evacuate the refrigerant system for one hour. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.
18. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to Refrigerant Oil Adding in this section.**

    If a new A/C compressor is not to be installed, lubricate the refrigerant system with the correct amount of clean PAG oil (non-hybrid vehicles) or electric A/C compressor oil (hybrid vehicles). For additional information, refer to Refrigerant Oil Adding in this section.
19. If a new A/C compressor is not to be installed, evacuate, leak test and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant System Filtering Following Air Conditioning (A/C) Compressor Installation

Special Tool(s)

 ST2985-A	A/C Flush Adapter Kit 219-00074 or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 or equent

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to Refrigerant Oil Adding in this section.**

NOTICE: **On vehicles being serviced for an internal compressor or desiccant failure, a new Thermostatic Expansion Valve (TXV) and any hoses containing mufflers must be installed prior to filtering the Air Conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any foreign material/debris. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The F8VZ-19E773-AB filter is intended for use on one vehicle only.**

All vehicles

1. Remove the receiver/drier cartridge. For additional information, refer to Section 412-01 .

2. **NOTE:** The refrigerant system must be filtered with the receiver/drier cartridge removed. Do not install a new receiver/drier cartridge at this time.

   With the receiver/drier cartridge removed, reinstall the receiver/drier plug and snap ring into the condenser core.

3. Remove the condenser outlet fitting nut and disconnect the fitting.
   - Discard the gasket seal.

4. ***NOTICE:*** **The flexible extension adapters included in the A/C Flush Adapter Kit (219-00074) are designed for low-pressure flushing and are not designed for use with a charged refrigerant**

system. Do not make the condenser fitting connections using the flexible extension adapters or damage to the adapters and loss of refrigerant will occur.

NOTE: Use flexible refrigerant hose of 17,238 kPa (2,500 psi) burst rating.

Using the correct adapters and service hoses, install the pancake filter between the condenser and the condenser outlet fitting.

5. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to Refrigerant Oil Adding in this section.**

   Lubricate the refrigerant systemith the correct amount of clean PAG oil (non-hybrid vehicles) or electric A/C compressor oil (hybrid vehicles). For additional information, refer to Refrigerant Oil Adding in this section.

6. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Non-hybrid vehicles

7. Provide adequate airflow to the front of the vehicle (with a fan, if necessary). Start the engine and allow it to idle briefly. Select A/C operation and set the blower speed to HI. Verify that the A/C is operating correctly.

8. Gradually bring the engine up to 1,200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1,000 rpm). Set the engine at 1,200 rpm and run it for one hour with the A/C system operating.

9. Stop the engine.

Hybrid vehicles

10. Start the vehicle and select A/C operation. Verify that the A/C is operating correctly.

11. Run the A/C system for one hour.

All vehicles

12. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

13. Remove the pancake filter, hoses and adapters from the vehicle.

14. Install a new gasket seal and connect the condenser outlet fitting.

15. Remove and discard the receiver/drier plug snap ring and the receiver/drier plug.

16. Install a new receiver/drier cartridge. For additional information, refer to Section 412-01 .

17. Evacuate, leak test and charge the refrigerant system. For additional information refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Oil Adding

Special Tool(s)

 ST3057-A	R-134a Loop/Add On Injector Kit-Set 219-00069 or equivalent

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Refrigerant Oil Adding

NOTICE: **Motorcraft® Electric A/C Compressor Oil only used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system.**

NOTICE: **Do not use the R-134a Refrigerant Management Machine built-in oil injection system to inject Motorcraft Electric A/C Compressor Oil to the refrigerant system on hybrid vehicles equipped with an electric Air Conditioning (A/C) compressor if it has been previously used to inject PAG oil. For hybrid vehicles, use only clean manual injection tools. Injection of Motorcraft Electric A/C Compressor Oil into a hybrid vehicle with equipment previously used with PAG oil will contaminate and damage the hybrid A/C system.**

NOTICE: **During normal Air Conditioning (A/C) operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.**

1. Refer to the chart below for refrigerant oil adding amounts and methods of installation.

Component	Oil Amount	Method of Adding
A/C Compressor - Non-Hybrid	Refer to Adding Refrigerant Oil After A/C Compressor Replacement - Non-Hybrid	Add directly to A/C compressor before installation
Electric A/C Compressor - Hybrid	Refer to Adding Refrigerant Oil After A/C Compressocement - Hybrid	Inject to low-side service port during system charging
Receiver/Drier Desiccant Cartridge	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging

Evaporator Core	45 ml (1.5 fl oz) added to the amount collected during refrigerant recovery	Add directly to evaporator core inlet tube or inject to low-side service port during system charging
Condenser Core	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Add directly to condenser core inlet or inject to low-side service port during system charging
Thermostatic Expansion Valve (TXV)	The amount collected during refrigerant recovery	Inject to low-side service port during system charging
A/C Pressure Relief Valve	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging
Refrigerant Hose/Line	60 ml (2 fl oz) added to the amount collected during refrigerant recovery [a]	Inject to low-side service port during system charging
O-ring Leak Repair	60 ml (2 fl oz) added to the amount collected during refrigerant recovery [b]	Inject to lowide service port during system charging
Service Port Leak Repair	60 ml (2 fl oz) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging

[a] If an excessive amount of refrigerant oil is lost due to a hose rupture/separation or other damage, the total system refrigerant oil capacity must be added.
[b] The amount specified may be used for one or multiple O-ring leak repairs. Do not multiply the refrigerant oil amount by the number of O-ring leaks being repaired.

Adding Refrigerant Oil After A/C Compressor Replacement - Non-Hybrid

NOTE: Service A/C compressors are shipped without refrigerant oil.

1. Rotate the old A/C compressor shaft 8 to 10 full rotations (clockwise) while collecting the PAG oil in a clean measuring cup.
    - Add the same amount plus the amount collected during refrigerant recovery.

Adding Refrigerant Oil After Electric A/C Compressor Replacement - Hybrid

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system.**

NOTICE: **Do not use the R-134a Refrigerant Management Machine built-in oil injection system to inject Motorcraft Electric A/C Compressor Oil to the refrigerant system on hybrid vehicles equipped with an electric Air Conditioning (A/C) compressor if it has been previously used to inject PAG oil. For hybrid vehicles, us clean manual injection tools. Injection of Motorcraft Electric A/C Compressor Oil into a hybrid vehicle with equipment previously used with PAG oil will contaminate and damage the hybrid A/C system.**

NOTE: Service electric A/C compressors are shipped with 60 ml (2 fl oz) of electric A/C compressor oil already installed.

1. Drain the oil from the old electric compressor into a clean measuring cup.
    - If the amount of oil drained is less than or equal to 60 ml (2 fl oz), add the amount of oil collected by the R-134a Refrigerant Management Machine during refrigerant recovery to the low-side service port after the new electric A/C compressor is installed and the system has

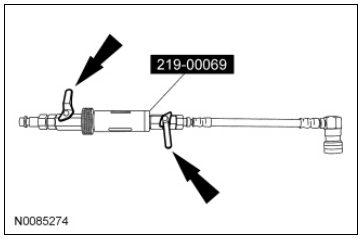
been evacuated.

- If the amount of oil drained is greater than 60 ml (2 fl oz), add the difference between the amount collected and 60 ml (2 fl oz), plus the amount collected by the R-134a Refrigerant Management Machine during refrigerant recovery, to the low-side service port after the new electric A/C compressor is installed and the system has been evacuated.

Oil Injection Using a Dye/Lubricant Injector

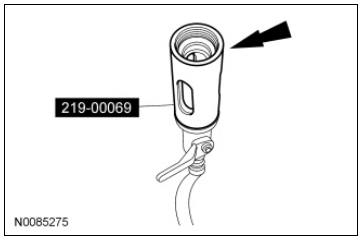
NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system.**

NOTICE: **Do not add liquid based R-134a Leak Detection Dye to the refrigerant system on hybrid vehicles equipped with an electric A/C compressor. Liquid based dyes are mixed with PAG oil, and will contaminate and damage the hybrid refrigerant system. Dye can only be added to hybrid vehicles by installing a new received/drier desiccant cartridge which includes a fluorescent dye "wafer" which ll dissolve after approximately 30 minutes of continued A/C operation.**



NOTE: The dye/lubricant injector is included as part of the 219-00069 R-134a Loop/Add On Injector Kit-Set.

NOTE: If fluorescent leak detection dye is also to be added during A/C charging, the dye may be added to the dye/lubricant injector along with the refrigerant oil.



1. Evacuate the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Assemble the dye/lubricant injector using the correct adapters to match the amount of refrigerant compressor oil to be injected.

3. Verify that all the valves on the dye/lubricant injector are closed.

4. Fill the dye/lubricant injector with the correct amount of new refrigerant compressor oil.

5. Install the dye/lubricant injector between the low-side service gauge port valve and the refrigerant service station or manifold gauge set.

6. Open all valves and charge the refrigerant system. For additional information, refer to Air

Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Air Conditioning (A/C) Odor Treatment

Special Tool(s)

 ST2940-A	Flexible Applicator Tool 258-00005

Material

Item	Specification
Motorcraft® A/C Cooling Coil Coating YN-29	-

⚠ **WARNING: Carry out this procedure in a well-ventilated area with all vehicle windows and doors opened. Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION, seek medical advice. On Ford/Motorcraft products in the USA or Canada call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS), if available. Failure to follow these instructions may result in serious personal injury.**

NOTE: There are typically 4 types of objectionable odors found in a vehicle:

- Chemical odors
- Environmental odors
- Human and other interior-generated odors
- Microbiological odors

Before determining that A/C odor treatment is required, the sourcnd the circumstances under which the odor occurs must be determined.

NOTE: Chemical odors are usually constant regardless of the climate control system setting although they may be enhanced by A/C operation. Most chemical odors are caused by fluid leaks or incorrectly cured adhesives. Chemical odors can be eliminated by repairing the leaking component and removing any residue.

NOTE: Environmental odors usually occur for a short time and diminish after the vehicle passes through the affected area. These odors are typically only detected when the vehicle windows are open, or when the climate control system is operating in a mode that allows for fresh air. Environmental odors cannot be eliminated because they are external in source, but they may be minimized by switching to a climate control setting that uses recirculated air.

NOTE: Human and other interior-generated odors occur while the source is present and may linger for a short time after. These odors may be more noticeable during A/C operation. Human odors may be eliminated by removing the source and cleaning the affected area.

NOTE: Microbiological odors, if in the A/C system, usually last for about 30 seconds after the system is turned on. They will be detected while the A/C is turned on and using either outside or recirculated air. Microbiological odors that occur in areas other than the A/C system (for example, water in doors or wet carpeting) may last indefinitely and will be more intense when recirculated air is used. Microbiological odors

will not be present at temperatures at or below 10°C (50°F).

Microbiological odors can be eliminated by removing the source and treating the affected area. Standing water must be allowed to drain and dry out. A/C systems may be treated by using A/C cooling coil coating as described in the service procedure below.

Microbiological odors result from microbial growth supported by warm temperatures and moisture. Microbiolocal odors are described as musty/mildew type smells and may occur on/in:

- foam seals
- rubber seals
- adhesives
- standing water
- water soaked carpet/trim

1. Identify the type of odor present in the vehicle. Do not proceed with A/C odor treatment if the odor source is found to be outside of the A/C system. Refer to the following chart for examples.

Odor Source	Odor Description
Chemical Odors	
Coolant	Sweet smell
Fuel	Gasoline or diesel fuel smell
Oil	Oil type or burning smell
Power Steering Fluid	Oil type or burning smell
Transmission Fluid	Oil type or burning smell
Washer Fluid	Alcohol type smell
Gear Lube	Garlic/sulfur smell
Refrigerant Oil	Ether type smell
Carpet/trim Adhesives	Fishy, urine or sweet smell
Evaporator Core Coating	Wet cement type smell
Environmental Odors	
Exhaust	Exhaust, fuel or burning type smell
Industrial Pollutants	Various smells
Dust	Musty, mildew or wet cement type smell
Pollen	Sweet smell
Tobacco	Burning, tar smell
Human and Other Interior Generated Odors	
Body Secretions	Body odor
Perfuming Agents	Sweet or fragrance smell
Clothing	Musty, mildew or body odors
Food/Beverage	Sweet, musty, mildew or fishy smell
Microbiological Odors	
Microbiological Odors Occurring Inside of A/C System	Musty, mildew smell lasting about 30 seconds after A/C is turned on
Microbiological Odors Occurring Outside of A/C System	Musty, mildew smell lasting indefinitely and possibly more pronounced when using recirculated air

2. Identify the source of the odor.
    - Check the evaporator core drain tube for restriction.
    - Check the passenger and driver side carpet for moisture. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.
    - Check the blower motor and blower motor cover (if equipped) for moisture resulting from water bypassing the cowl baffling system. If moisture is found, A/C odor treatment is not necessary. Diagnose for a water leak as needed.
    - Check the cowl top panel and air inlet screen for standing water or foreign material. If possible, remove any standing water and clean the air inlet screen using a wet/dry vacuum.

3. Open all vehicle windows and doors.

4. Make sure that the A/C is off.

5. Set the following.
    - Select PANEL mode (A/C off).
    - Adjust the temperature setting to full warm.
    - Adjust the blower motor speed to HI.

6. Run the engine for 25 minutes to dry out the A/C system.

7. Turn the ignition OFF.

8. Remove the blower motor.

9. **NOTE:** Blower motor speed controls that are mounted outside of the evaporator core housing and not exposed to the blower motor airflow do not need to be removed.

   Remove the blower motor resistor (if equipped) or blower motor speed control (if equipped and exposed to the inside of the evaporator core housing).

10. ***NOTICE:*** **To avoid damage to the vehicle interior, do not spill or spray this product on any interior surface.**

    Add one full bottle of A/C cooling coil coating to the Flexible Applicator Tool.

11. Insert the nozzle into the evaporator housing and direct the spray toward the evaporator core face. Spray the entire evaporator core face until empty.

12. Install the blower motor and blower motor resistor (if equipped) or blower motor speed control (if equipped).

13. Repeat Steps 4 through 6 to cure the evaporator core coating.

General Specifications

Item	Specification
A/C Compressor Oil	
NOTICE: Use of any Air Conditioning (A/C) compressor oil other than what is specified for the specific vehicle configuration will damage the A/C compressor and contaminate the refrigerant system. For non-hybrid vehicles with a pulley driven (conventional) A/C compressor, PAG Refrigerant Compressor Oil only must be used. For hybrid vehicles with an electric A/C compressor, Motorcraft® Electric A/C Compressor Oil must be used.	
A/C Pressure Relief Valve [a]	
Close pressure	3,103 kPa (450 psi)
Open pressure 3,792-4,137 kPa (550-600 psi)	

[a] Manifold gauge set pressures may vary slightly depending on the distance between the service gauge port valve and the A/C pressure relief valve, the A/C cycling switch or the pressure cutoff switch location.

NOTE: The specifications apply to hybrid vehicles only. For non-hybrid specifications, refer to Section 412-00A .

Material

Item	Specification	Fill Capacity
Motorcraft® Electric A/C Compressor Oil YN-32	-	Hybrid vehicles only 130 ml (4.4 fl oz)
Motorcraft® R-134a Refrigerant YN-19 (US); CYN-16-R (Canada)	WSH-M17B19-A	0.62 kg (22 oz) (1.38 lb)

Climate Control System

The system consists of the following components:

- Air Conditioning Compressor Module (ACCM)
- A/C condenser core
- A/C evaporator core
- Receiver/drier
- Connecting refrigerant lines
- Thermostatic Expansion Valve (TXV)
- A/C pressure transducer
- Heater core and evaporator core housing
- HVAC module
- Front Controls Interface Module (FCIM) (all vehicles equipped with navigation systems)
- Audio Control Module (ACM) (all vehicles equipped with navigation systems)
- Temperature blend door actuators
- Defrost/panel/floor mode door actuator
- Air inlet mode door actuator
- Blower motor speed control
- Blower motor
- Ambient air temperature sensor
- In-vehicle temperature/humidity sensor
- Sunload sensor
- Evaporator temperature sensor

Humidity Sensor

The humidity sensed by the HVAC module to optimize the Air Conditioning Compressor Module (ACCM) operation for reduced electrical system load while maintaining passenger comfort.

When the relative humidity inside the vehicle is low, passengers are comfortable at a higher air temperature. The ACCM can decrease the compressor rpm before the commanded temperature is reached to reduce compressor electrical load while maintaining passenger comfort.

Hybrid Climate Control System Operation

NOTE: For the passenger side temperature setting on hybrid vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) and a Front Controls Interface Module (FCIM) built on or after 4/08/2009 to be functional, a passenger must be seated in the front passenger seat. If the front passenger seat is not occupied, the HVAC module will control the system based only on the driver side temperature setting. The HVAC module receives a Medium Speed Controller Area Network (MS-CAN) signal from the FCIM to indicate if the front passenger seat is occupied.

When an A/C request is made by the HVAC module, a message is sent from the HVAC module over the Medium Speed Controller Area Network (MS-CAN) bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.

When an A/C request is received from the HVAC module, an A/C demand message is sent from the PCM over the HS-CAN bus to the Air Conditioning Compressor Module (ACCM) if all of the following conditions are met:

- The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer.
- The PCM does not detect excessively high engine coolant temperature.
- The PCM does not detect an ambient air temperature below -1°C (30°F).
- The PCM has not detected a Wide Open Throttle (WOT) condition.
- The HVAC module does not detect an evaporator discharge air temperature below 2°C (36°F).

When the ACCM receives the A/C demand message, it will engage. Instead of cycling ON and OFF like a traditional A/C compressor, the PCM monitors the evaporator discharge temperature from the HVAC module to raise or lower the electric A/C compressor speed as required. When the HVAC module is OFF or not requiring A/C operation, the electric A/C compressor will be OFF.

Auxiliary Coolant Flow Pump

An auxiliary coolant flow pump is used only on hybrid vehicles to improve engine coolant circulation, for heater operation, at low engine speeds or when the engine is OFF.

For a complete explanation of the auxiliary coolant flow pump refer to heating and ventilation in the Description and Operation portion of Section 412-01 .

Climate Control System

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3094-A	Test Light SGT27000 or equivalent 250-300 mA incandescent bulb test lamp
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

The Refrigerant Cycle

During stabilized conditions (A/C system shutdown), the refrigerant pressures are equal throughout the system. When the electric A/C compressor is in operation, it increases pressure on the refrigerant vapor, raising its temperature. The high-pressure and high-temperature vapor is then released into the top of the A/C condenser core.

The A/C condenser, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The now liquid refrigerant, still at high pressure, exits from the bottom of the A/C condenser and enters the inlet side of the A/C receiver/drier. The receiver/drier is designed to remove moisture from the refrigerant.

The outlet of the receiver/drier is connected to the Thermostatic Expansion Valve (TXV). The TXV provides the orifice which is the restriction in the refrigerant system and separates the high and low pressure sides of the A/C system. As the liquid refrigerant passes across this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the A/C evaporator, it absorbs heat from the airflow passing over the plate/fin sections of the A/C evaporator. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

The refrigerant cycle is now repeated with the electric A/C compressor again increasing the pressure and temperature of the refrigerant.

A thermistor which monitors the temperature of the air that has passed through the evaporator core controls electric A/C compressor speed. If the temperature of the evaporator core discharge air is low enough to cause the condensed water vapor to freeze, the electric A/C compressor reduces it speed.

The high-side line pressure is also monitored so that electric A/C compressor operation will be interrupted if the system pressure becomes too high or is determined to be too low (low charge condition).

The electric A/C compressor thermal protection switch will interrupt compressor operation if the compressor housing exceeds temperature limits.

The electric A/C compressor relief valve will open and vent refrigerant to relieve unusually high system pressure.

Inspection and Verification

NOTE: Verify the service disconnect plug is correctly inserted and locked into the LOCK position.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• A/C compressor	• Battery Junction Box (BJB) fuse: ♦ 13 (15A) ♦ 35 (40A) ♦ 47 (10A) • Smart Junction Box (SJB) fuse: ♦ 15 (10A) ♦ 37 (10A) ♦ 45 (5A) • Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communication with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the VCM .

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.

- refer to Section 418-00 to diagnose no response from the HVAC module, Air Conditioning Compressor Module (ACCM), Instrument Panel Cluster (IPC) or PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Clear the CMDTCs and carry out the self-test diagnostics for the HVAC, ACCM , IPC or PCM.

9. If the HVAC DTCs retrieved are related to the concern, go to the HVAC Module DTC Chart. If the ACCM DTCs retrieved are related to the concern, go to the Air Conditioning Compressor Module (ACCM) DTC Chart. If the PCM DTCs retrieved are related to the concern, go to the PCM DTC Chart. For all other DTCs, refer to Section 419-10 .

NOTE: If no DTCs are present, GO to Symptom Chart - Climate Control Systems for the appropriate diagnostic action.

HVAC Module and A/C Compressor Self-Test

During the self-test, the HVAC module will do the following:

- command airflow to PANEL vents
- command temperature blend door actuator to full cold
- set blower speed to level 4 and the 4th level will be displayed on the display
- illuminate the POWER, A/C and RECIRC button indicators
- flash the DEFROST, AUTO and rear window defrost button indicators
- command the A/C compressor to between 1,900 and 2,000 rpm

1. Start the engine.

2. Observe the Electric A/C Compressor Speed (ACCM_ECS) Air Conditioning Compressor Module (ACCM) PID.

3. At the same time, press and release the POWER and DEFROST buttons then, within 2 seconds, press the RECIRC button.

4. Observe the HVAC module actions and A/C compressor speed.

5. To exit the self-test, press any climate control button or turn the ignition OFF.
   - If the airflow is incorrect, refer to Section 412-00A .
   - If the panel outlet temperature is incorrect, refer to Section 412-00A .
   - If the blower is inoperative, GO to Pinpoint Test K .
   - If the blower speed is incorrect, GO to Pinpoint Test L .
   - If one or more indicators do not illuminate but the HVAC and A/C compressor operate correctly, INSTALL a new Front Controls Interface Module (FCIM). Refer to Section 415-00 .
   - If the ACCM_ECS PID reads 0 RPM, GO to Pinpoint Test I .
   - If the ACCM_ECS PID reads between 1 and 1,899 rpm or greater than 2,000 rpm, INSTALL a new electric A/C compressor. REFER to Section 412-01 . TEST the system for normal operation.
   - If all modes in the self-test are achieved, GO to Pinpoint Test E .

DTC Charts

PCM DTC Chart

DTC	Description	Action to Take
P0532	A/C Pressure Refrigerant Sensor A Circuit Low	REFER to Section 412-00A .
P0533	A/C Refrigerant Pressure Sensor A Circuit High	REFER to Section 412-00A .
P2600	Coolant Pump A Control Circuit / Open	GO to Pinpoint Test A .
All Other DTCs	-	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Air Conditioning Compressor Module (ACCM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

DTC	Description	Action to Take
P0AFA:16	Hybrid Battery System Voltage Low: Circuit Voltage Below Threshold	GO to Pinpoint Test D .
P0AFB:17	Hybridattery System Voltage High: Circuit Voltage Above Threshold	GO to Pinpoint Test D .
B11EE:19	A/C Compressor: Current Above Threshold	INSTALL a new electric A/C compressor. REFER to Section 412-01 . TEST the system for normal operation.
B11EE:49	A/C Compressor: Internal Electronic Failure	INSTALL a new electric A/C compressor. REFER to Section 412-01 . TEST the system for normal operation.
B11EE:4B	A/C Compressor: Over Temperature	VERIFY the refrigerant charge level. REFER to Specifications in this section. If the charge level is low, RECHARGE the system, CLEAR the DTCs and REPEAT the self-test. TEST the system for normal operation. If the DTC returns, INSTALL a new electric A/C compressor. REFER to Section 412-01 . TEST the system for normal operation.
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	REFER to Section 418-00 to diagnose lost communication with the ECM/PCM "A".
U0155:00		

	Lost Communication With Instrument Panel Cluster (IPC) Module: No Sub Type Information	REFER to Section 418-00 to diagnose lost communication with the IPC module.
U0401:68	Invalid Data Received From ECM/PCM "A": Event Information	This DTC can set due to a fault in the PCM or because the PCM is unable to communicate over the Controller Area Network (CAN) bus. CARRY OUT a self-test of the PCM. If the scan tool indicates that the PCM is not responding, REFER to Section 418-00 to diagnose the network communication concern. If PCM DTCs are present, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U0423:68	Invalid Data Received From Instrument Panel Cluster Control Module: Event Information	This DTC can set due to a fault in the Instrument Panel Cluster (IPC) or because the IPC is unable to communicate over the CAN bus. CARRY OUT a self-test of the IPC . If the scan tool indicates that the IPC is not responding, REFER to Section 418-00 to diagnose the network communication concern. If IPC DTCs are present, REFER to Section 413-01 to diagnose the IPC system fault.
U3000:49	Control Module: Internal Electronic Failure	INSTALL a new electric A/C compressor. REFER to Section 412-01 . TEST the system for normal operation.

HVAC Module DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

C1B14:12	Sensor Supply Voltage A: Circuit Short to Battery	REFER to Section 412-00A .
U0140:00	Lost Communication With Body Control Module: No Sub Type Information	REFER to Section 418-00 to diagnose lost communication with the Smart Junction Box (SJB).
U0155:00	Lost Communication With Instrument Panel Cluster (IPC) Module: No Sub Type Information	REFER to Section 418-00 to diagnose lost communication with the IPC module.

U0163:00	Lost Communication With navigation Control Module: No Sub Type Information	REFER to Section 418-00 to diagnose lost communication with the Audio Control Module (ACM).
U0256:00	Lost Communication With Front Controls Interface Module (FCIM) "A": No Sub Type Information	REFER to Section 418-00 to diagnose lost communication with the FCIM .
U0422:68	Invalid Data Received From Body Control Module: Event Information	This DTC can set due to a fault in the SJB or because the SJB is unable to communicate over the Controller Area Network (CAN) bus. CARRY OUT a self-test of the SJB . If the scan tool indicates that the SJB is not responding, REFER to Section 418-00 to diagnose the network communication concern. If SJB DTCs are present, REFER to Section 419-10 .
U0423:68	Invalid Data Received From Instrument Panel Cluster Control Module: Event Information	This DTC can set due to a fault in the IPC or because the IPC is unable to communicate over the CAN bus. CARRY OUT a self-test of the IPC . If the scan tool indicates that the IPC is not responding, REFER to Section 418-00 to diagnose the network communication concern. If IPC DTCs are present, REFER to Section 413-01 to diagnose the IPC system fault.
U0464:68	Invalid Data Received From Navigation Control Module: Event Information	This DTC can set due to a fault in the Audio Control Module (ACM) or because the ACM is unable to communicate over the CAN bus. CARRY OUT a self-test of the ACM . If the scan tool indicates that the ACM is not responding, REFER to Section 418-00 to diagnose the network communication concern. If ACM DTCs are present, REFER to Section 415-00 to diagnose the ACM system fault
U0557:68	Invalid Data Received From Front Controls Interface Module (FCIM) "A": Event Information	This DTC can set due to a fault in the FCIM or because the FCIM is unable to communicate over the CAN bus. CARRY OUT a self-test of the FCIM . If the scan tool indicates that the FCIM is not responding, REFER to Section 418-00 to diagnose the network communication concern. If FCIM DTCs are present, REFER to Section 415-00 to diagnose the FCIM fault.
U1000:00	Solid State Driver Protection Activated-Driver Disabled: No Sub Type Information	INSTALL a new HVAC module. REFER to Section 412-01 .
U2100:00	Initial Configuration Not Complete: No Sub Type Information	INSTALL a new HVAC module. REFER to Section 412-01 .
U3000:41	Control Module: General Checksum Failure	INSTALL a new HVAC module. REFER to Section 412-01 .

All Other DTCs		

Symptom Chart - Climate Control Systems

Symptom Chart - Climate Control Systems
NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

ConditionPossible SourcesAction

- No communication with the HVAC module

- Fuse(s)
- Circuitry open
- HVAC module communication network

- REFER to Section 418-00 .

- Unable to duplicate the customer concern and no DTCs present

- HVAC system and/or related components

- GO to Pinpoint Test E .

- Incorrect/erratic function in AUTO mode

- Circuitry open/shorted
- In-vehicle temperature/humidity sensor
- HVAC module

- GO to Pinpoint Test F .

- Reduced outlet airflow

- Cabin air filter
- Air Conditioning Compressor Module (ACCM)
- Evaporator discharge air temperature sensor
- Blower motor
- Blower motor control
- PCM

- If the airflow is reduced only when in AUTO, A/C, MAX A/C, defrost or defrost/floor modes, GO to Pinpoint Test J .
- If the airflow is reduced in all modes, INSPECT the cabin air filter. If the cabin air filter is clean and free of damage and debris, GO to Pinpoint Test L .

- The air inlet door is inoperative

- Circuitry open/shorted
- Door actuator

- Air inlet door binding or stuck
- HVAC module

- GO to Pinpoint Test G .

- Incorrect/erratic direction of airflow from outlets

- Circuitry open/shorted
- Door actuator
- Mode door binding or stuck
- HVAC module

- REFER to Section 412-00A .

- Insufficient, erratic or no heat

- Low engine coolant level
- Engine overheating
- Plugged or partially plugged heater core
- Temperature blend door is binding or stuck
- Temperature blend door actuator
- Heater hose is kinked or binding

- GO to Pinpoint Test H .

- The air conditioning (A/C) is inoperative

- A/C pressure transducer
- Evaporator discharge temperature sensor
- HVAC module
- PCM
- FCIM
- ACM
- ACCM

- GO to Pinpoint Test I .

- The air conditioning (A/C) is always on

- Evaporator discharge temperature sensor
- HVAC module
- PCM
- FCIM
- ACM
- ACCM

- GO to Pinpoint Test J .

- Temperature control is inoperative/does not operate correctly

- Circuitry open/shorted
- HVAC module
- Temperature blend door is binding or stuck
- Temperature blend door actuator

- REFER to Section 412-00A .

- The blower motor is inoperative

- Fuse(s)
- Circuitry short/open
- Blower motor relay
- A/C blower motor
- HVAC module
- A/C blower motor speed control

- GO to Pinpoint Test K .

- The blower motor does not operate correctly

- Circuitry open/shorted
- A/C blower motor speed control
- HVAC module

- GO to Pinpoint Test L .

- The dual temperature control is inoperative/does not operate correctly

- Temperature blend door/actuator broken/binding
- HVAC module - Electronic Automatic Temperature Control (EATC)
- Low A/C refrigerant charge

- **NOTE:** For the passenger side temperature setting on hybrid vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) and a Front Controls Interface Module (FCIM) built on or after 4/08/2009 to be functional, a passenger must be seated in the front passenger seat. If the front passenger seat is not occupied, the HVAC module will control the system based only on the driver side temperature setting. The HVAC module receives a Medium Speed Controller Area Network (MS-CAN) signal from the FCIM to indicate if the front passenger seat is occupied.

  CHECK that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), REFER to Section 412-00A . CHECK the temperature blend doors/actuators for a binding or broken condition. If no condition is found, INSTALL a new HVAC dule.

- The temperature display will not switch between Celsius and Fahrenheit

- HVAC module

- INSTALL a new HVAC module. REFER to Section 412-01 .

- Inaccurate external temperature display

- HVAC module
- Ambient temperature sensor

- REFER to Section 412-00A .

Pinpoint Tests

Pinpoint Test A: DTC P2600

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

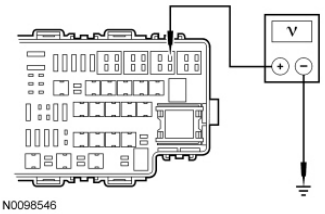
Normal Operation

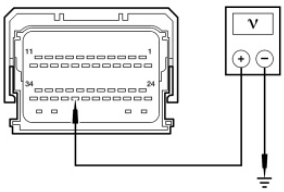
Under normal operation, voltage is provided to the auxiliary coolant flow pump relay coil through circuit CBK03 (GY). When the HVAC module is ON, a message is sent over the Controller Area Network (CAN) to the PCM. When the PCM receives the message, a ground is provided to the auxiliary coolant flow pump relay coil from the PCM through circuit CH307 (GY/BU), energizing the auxiliary coolant flow pump relay.

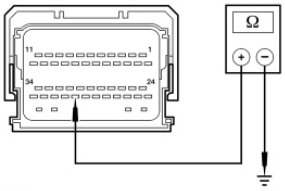
An auxiliary coolant flow pump is used only on hybrid vehicles to improve engine coolant circulation at low engine speeds or when the engine is OFF.

The auxiliary coolant flow pump will be disabled when any of the following conditions are present:

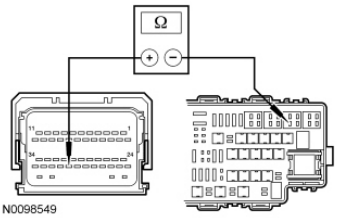
- The climate control module is set to the OFF position.
- The ambient temperature is above 32°C (90°F).
- The coolant temperature is less than -10°C (14°F).
- The engine speed is above 4,000 rpm.







For a complete explanation of the auxiliary coolant flow pump refer to heating and ventilation in the Description and Operation portion of Section 412-01 .



- DTC P2600 (Coolant Pump A Control Circuit / Open) - The DTC sets when the PCM grounds the relay circd excessive current draw is detected on the relay circuit. The DTC also sets when the relay circuit is OFF and no voltage is detected on the relay control circuit. The PCM expects to detect voltage coming through the relay coil to the relay circuit when it is not grounding it.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Heater pump relay
- PCM

PINPOINT TEST A: DTC P2600

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE RELAY	
• Ignition OFF. • Disconnect: Auxiliary Coolant Flow Pump Relay. • Ignition ON. • Measure the voltage between ground and the auxiliary coolant flow pump relay socket, circuit CBK03 (GY).	**Yes** CARRY OUT the auxiliary coolant flow pump relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If the relay tests OK, GO to A2 . **No**

 N0098546 • **Is the voltage greater than 10 volts?**	REPAIR circuit CBK03 (GY) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A2 CHECK CIRCUIT CH307 (GY/BU) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175t. • Ignition ON. • Measure the voltage between ground and PCM C175t-42, circuit CH307 (GY/BU), harness side.  N0098547 • **Is any voltage present?**	**Yes** REPAIR circuit CH307 (GY/BU) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A3 .
A3 CHECK CIRCUIT CH307 (GY/BU) FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and PCM C175t-42, circuit CH307 (GY/BU), harness side.  N0098548 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A4 . **No** REPAIR circuit CH307 (GY/BU) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A4 CHECK CIRCUIT CH307 (GY/BU) FOR AN OPEN	
• Measure the resistance between auxiliary coolant flow pump relay socket, circuit CH307 (GY/BU) and PCM C175t-42, circuit CH307 (GY/BU), harness side.	**Yes** GO to A5 . **No** REPAIR circuit CH307 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

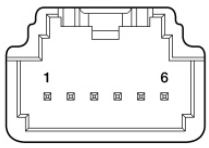
 • **Is the resistance less than 5 ohms?**	
A5 CHECK THE PCM CONNECTION	
• Clear the DTCs. • Disconnect all the PCM connectors. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out pins. ♦ incorrectly seated connector. • Connect and correctly seat all the PCM connectors. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

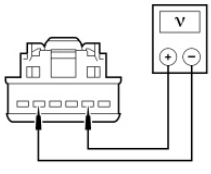
Pinpoint Test B: DTC B1A61:11 and 15

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

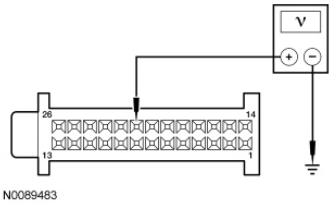
Normal Operation

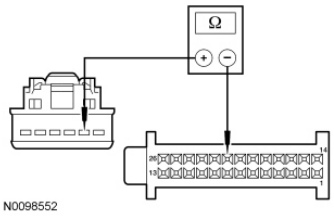
Under normal operation, the in-vehicle air temperature sensor receives a ground from the HVAC module through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the in-vehicle air temperature sensor from the HVAC module through circuit VH414 (GN/BU).



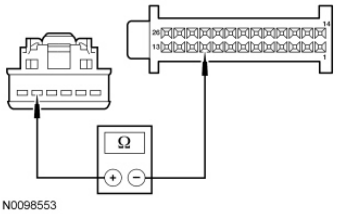


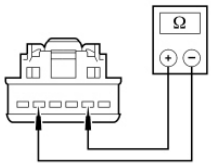
- DTC B1A61:11 (Cabin Temperature Sensor: Circuit Short to Ground) - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
- DTC B1A61:15 (Cabin Temperature Sensor: Circuit Short to Battery or Open) - The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit.

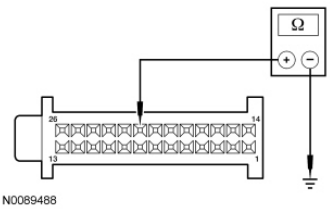




This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- In-vehicle air temperature sensor
- HVAC module

PINPOINT TEST B: DTC B1A61:11 AND 15

Test Step	Result / Action to Take
B1 CHECK THE SENSOR RESISTANCE	

• Ignition OFF. • Disconnect: In-Vehicle Temperature/Humidity Sensor C2247. • Measure the resistance ben the in-vehicle temperature/humidity sensor C2247-2, component side and C2247-5, component side and compare to the table below. **Ambient Temperature** / **Resistance** -40°C (-40°F) — 862,600-942,000 ohms -15°C (5°F) — 202,400-214,700 ohms 0°C (32°F) — 93,510-97,640 ohms 15°C (59°F) — 46,060-47,430 ohms 25°C (77°F) — 29,700-30,300 ohms 35°C (95°F) — 19,400-20,000 ohms 60°C (140°F) — 7,414-7,774 ohms 85°C (185°F) — 3,182-3,393 ohms  N0098550 • **Is the resistance within the specified values for the temperatures?**	**Yes** GO to B2 . **No** INSTALL a new in-vehicle temperature/humidity sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B2 CHECK THE SENSOR OUTPUT VOLTAGE	
• Ignition ON. • Measure the voltage between in-vehicle temperature/humidity sensor C2247-2, circuit VH414 (GN/BU), harness side and C2247-5, circuit RH111 (GY/BU), harness side.  N0098551 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new in-vehicle temperature/humidity sensor. CLEAR the DTCs. REPEAT the self-test. If code returns, GO to B8 . **No** **For DTC B1A68:15** , GO to B3 . **For DTC B1A68:11** , GO to B6 .

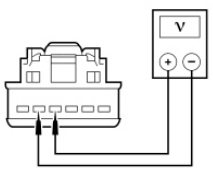
B3 CHECK CIRCUIT VH414 (GN/BU) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module - Dual Automatic Temperature Control (DATC) C2356a. • Disconnect: HVAC Module - DATC C2356b. • Ignition ON. • Measure the voltage between ground and HVAC module - DATC C2356b-21, circuit VH414 (GN/BU), harness side.  N0089483 • **Is any voltage present?**	**Yes** REPAIR circuit VH414 (GN/BU) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK CIRCUIT VH414 (GN/BU) FOR AN OPEN	
• Ignition OFF. • Measure the resi between HVAC module - DATC C2356b-21, circuit VH414 (GN/BU), harness side and in-vehicle temperature/humidity sensor C2247-2, circuit VH414 (GN/BU), harness side.  N0098552 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR circuit VH414 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B5 CHECK CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between HVAC module C2356a-10, circuit RH111 (GY/BU), harness side and in-vehicle temperature/humidity sensor C2247-5, circuit RH111 (GY/BU), harness side.	**s** GO to B8 . **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0098553 • **Is the resistance less than 5 ohms?**	
B6 CHECK CIRCUIT VH414 (GN/BU) FOR A SHORT TO CIRCUIT RH111 (GY/BU)	
• Ignition OFF. • Disconnect: HVAC Module - DATC C2356b. • Measure the resistance between in-vehicle temperature/humidity sensor C2247-2, circuit VH414 (GN/BU), harness side and C2247-5, circuit RH111 (GY/BU), harness side.  N0098554 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B7 . **No** REPAIR circuit VH414 (GN/BU) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
• Measure the resistance between HVAC module - DATC C2356b-21, circuit VH414 (GN/BU), harness side and ground.  N0089488 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B8 . **No** REPAIR circuit VH414 (GN/BU) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B8 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs.	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs.

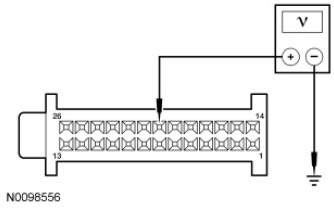
• Operate the system and verify the concern is still present. • **Is the concern still present?**	REPEAT the self-test. TEST the system for normal operation.

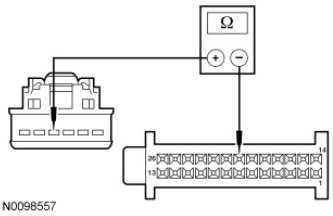
Pinpoint Test C: DTC B1A69:11 or 15

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

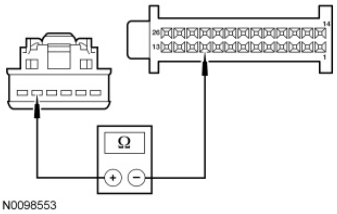


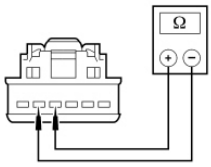
Normal Operation

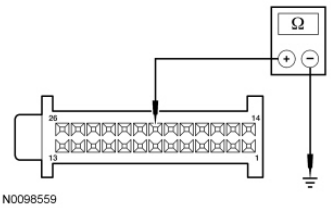




Under normal operation, the in-vehicle temperature/humidity sensor is grounded through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the in-vehicle temperature/humidity sensor from the HVAC module through circuit LH111 (BN/WH). The HVAC module receives the humidity value through circuit VH413 (WH/BU).







- DTC B1A61:11 (Humidity Sensor: Circuit Short to Ground) - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
- DTC B1A61:15 (Humidity Sensor: Circuit Short to Battery or Open) - The module senses no voltage drop on the sensor reference voltage circuit, indicating a short directly to voltage or an open circuit.

This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- In-vehicle temperature/humidity sensor
- HVAC module

PINPOINT TEST C: DTC B1A69:11 OR 15

Test Step	Result / Action to Take
C1 CHECK THE SENSOR OUTPUT VOLTAGE	
• Ignition OFF. • Disconnect: In-Vehicle Temperature/Humidity Sensor C2247. • Ignition ON. • Measure the voltage between in-vehicle temperature/humidity sensor C2247-4, circuit VH413 (WH/BU), harness side and C2247-5, circuit RH111 (GY/BU), harness side.  N0098555 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new in-vehicle temperature/humidity sensor. CLEAR the DTCs. REPEAT the self-test. If code returns, GO to C7 . **No** **For DTC B1A69:15** , GO to C2 . **For DTC B1A69:11** , GO to C5 .

C2 CHECK CIRCUIT VH413 (WH/BU) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module - Dual Automatic Temperature Control (DATC) C2356a. • Disconnect: HVAC Module - DATC C2356b. • Ignition ON. • Measure the voltage between ground and HVAC module - DATC C2356b-20, circuit VH413 (WH/BU), harness side.  N0098556 **Yes** REPAIR circuit VH413 (WH/BU) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to C3 .	
C3 CHECK CIRCUIT VH413 (WH/BU) FOR AN OPEN	
• Ignition OFF. • Measure the resistance between HVAC module - DATC C2356b-20, circuit VH413 (WH/BU), harness side and in-vehicle temperature/humidity sensor C2247-4, circuit VH413 (WH/BU), harness side.  N0098557 • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** REPAIR circuit VH413 (WH/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C4 CHECK CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between HVAC module C2356a-10, circuit RH111 (GY/BU), harness side and in-vehicle temperature/humidity sensor C2247-5, circuit RH111 (GY/BU), harness side.	**Yes** GO to C7 . **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0098553 • **Is the resistance less than 5 ohms?**	
C5 CHECK CIRCUIT VH413 (WH/BU) FOR A SHORT TO CIRCUIT RH111 (GY/BU)	
• Ignition OFF. • Disconnect: HVAC Module - DATC C2356b. • Measure the resistance between in-vehicle temperature/humidity sensor C2247-4, circuit VH413 (WH/BU), harness side and C2247-5, circuit RH111 (GY/BU), harness side.  N0098558 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C6 . **No** REPAIR circuit VH413 (WH/BU) for a short to circuit RH111 (GY/BU). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C6 CHECK CIRCUIT VH413 (WH/BU) FOR A SHORT TO GROUND	
• Measure the resistance between HVAC module - DATC C2356b-20, circuit VH413 (WH/BU), harness side and ground.  N0098559 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C7 . **No** RAIR circuit VH413 (WH/BU) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C7 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs.	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have

• Operate the system and verify the concern is still present. • **Is the concern still present?**	been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

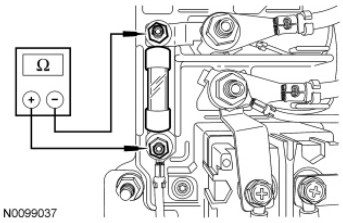
Pinpoint Test D: DTC P0AFA:16 or P0AFB:17

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

The Air Conditioning Compressor Module (ACCM) receives hybrid battery system voltage through circuit HYT03 (OG/WH). The ACCM is grounded through circuit HYT04 (OG/BK).

- DTC P0AFA:16 (Hybrid Battery System Voltage Low: Circuit Voltage Below Threshold) - The module senses when hybrid battery system voltage is less than 165 volts.
- DTC P0AFB:17 (Hybrid Battery System Voltage High: Circuit Voltage Above Threshold) - The module senses when hybrid battery system voltage is greater than 450 volts.



This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- ACCM

PINPOINT TEST D: DTC P0AFA:16 OR P0AFB:17

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service ructions, including instructions to depower the system. The high-voltage hybrid system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

NOTE: Before carrying out the following test, diagnose any PCM or Battery Energy Control Module (BECM) DTCs.

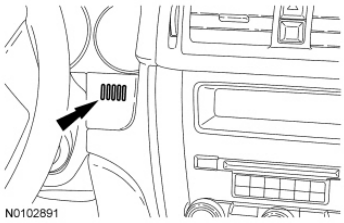
Test Step	Result / Action to Take
D1 CHECK THE DTCs FROM THE SELF-TEST	
• Review the DTCs retrieved and recorded during Inspection and Verification. • **Are there any other Battery Energy Control Module (BECM), PCM or Transmission Control Module (TCM) DTCs present along with BECM DTCs P0AFA:16 and P0AFB:17?**	**Yes** DIAGNOSE all other BECM , PCM or TCM DTCs before diagnosing BECM DTCs P0AFA:16 and P0AFB:17. For BECM DTCs, REFER to Section 414-03 . For PCM DTCs, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For TCM DTCs, REFER to Section 307-01A

	or Section 307-01B . **No** GO to D2 .
D2 CHECK THE HIGH-VOLTAGE BEC HIGH-VOLTAGE LOW-CURRENT FUSE	
⚠ WARNING: Never install the service disconnect plug with the high-voltage bussed electrical center (BEC) cover removed. Always install the cover prior to connecting the service disconnect plug. The high-voltage BEC cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB . Refer to Section 414-03 . • Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the High-Voltage Low-Current Fuse procedure in Section 414-03 . • Inspect and measure the resistance of the high-voltage low-current fuse.  • **Is the fuse undamaged and the resistance less than 5 ohms?**	**Yes** GO to D3 . **No** INSTALL a new high-voltage, low-current fuse. INSPECT the high-voltage BEC for signs of an obvious short condition. INSTALL a new high-voltage BEC as needed. If an obvious short condition is not identified, CARRY OUT self-test of the Battery Energy Control Module (BECM). REFER to Section 414-03 to diagnose BECM DTCs. CLEAR the DTCs from all modules. REPEAT self-test.
D3 COMPARE THE ACCM HIGH VOLTAGE PID WITH THE BECM HIGH VOLTAGE PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Hybrid Battery Pack Voltage (BATPACKVOLT) Battery Energy Control Module (BECM) PID. • Enter the following diagnostic mode on the scan tool: Electric A/C Compressor High Voltage Supply (ACCM_CHVS) Air Conditioning Compressor Module (ACCM) PID. • Compare the BATPACKVOLT BECM PID voltage with the ACCM_CHVS ACCM PID voltage. • **Are both voltages approximately the same?**	**Yes** CLEAR the DTCs from all modules. REPEAT the self-test. TEST the system for normal operation. If the **DTCs return** , INSTALL a new ACCM . REFER to Section 412-01 . TEST the system for normal operation. If the **DTCs do not return** , the system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. **No** INSPECT the ACCM for loose or corroded connections. If OK, INSTALL a new ACCM . REFER to Section 412-01 . TEST the

	system for normal operation.

Pinpoint Test E: Unable to Duplicate Customer Concern and No DTCs Present

This pinpoint test is intended to diagnose the following:



- Incorrect functioning of the HVAC system

PINPOINT TEST E: UNABLE TO DUPLICATE CUSTOMER CONCERN AND NO DTCs PRESENT

NOTE: Diagnose any PCM, HVAC module or Air Conditioning Compressor Module (ACCM) DTCs before carrying out the following pinpoint test.

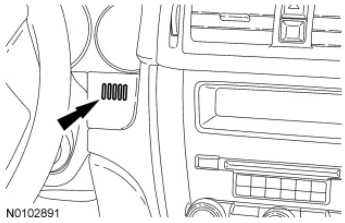
Test Step	Result / Action to Take
E1 HVAC MODULE AND A/C COMPRESSOR SELF-TEST	
NOTE: If sent to this pinpoint test from the HVAC Module and A/C Compressor Self-Test, **GO to step E2** . • Carry out the HVAC Module and A/C Compressor Self-Test in this section. • **Were all modes in the self-test achieved?**	**Yes** GO to E2 . **No** Follow the actions within the HVAC Module and A/C Compressor Self-Test.
E2 CHECK THE BLOWER MOTOR OPERATION	
• Ignition ON. • Select PANEL mode. • Observe blower motor operation and select each blower motor speed. • **Does the blower motor operate in all selections and change speed in each?**	**Yes** GO to E3 . **No** If the blower motor does not operate in any setting, GO to Pinpoint Test K . If the blower motor does not properly change speeds or shut OFF, GO to Pinpoint Test L .
E3 CHECK AIRFLOW OPERATION	
• Select the highest blower motor setting. • **NOTE:** Refer to Description and Operation in this section for proper airflow descriptions. • While observing the airflow, select each of the airflow positions (PANEL, PANEL/FLOOR, FLOOR, FLOOR/DEFROST, DEFROST). • **Is the airflow directed to the proper outlets?**	**Yes** GO to E4 . **No** REFER to Section 412-00A and DIAGNOSE for incorrect/erratic direction of airflow from outlets.
E4 VERIFY TEMPERATURE CONTROL OPERATION	

• Start the vehicle and allow it to reach normal operating temperature. • With the A/C OFF, select PANEL mode. • Change the temperature setting from the coldest to the warmest and back to the coldest. • **Does the temperature change between very warm to cool?**	**Yes** GO to E5 . **No** If the temperature does not get very warm or heat is erratic, GO to Pinpoint Test H . If the temperature does not change at all, REFER to Section 412-00A and DIAGNOSE for temperature control is inoperative/does not operate correctly.
E5 VERIFY NO A/C COMPRESSOR OPERATION WITH A/C OFF	
• With the A/C OFF, select PANEL mode. • Select the coldest temperature setting. • **Is the outlet temperature close to ambient temperature?**	**Yes** GO to E6 . **No** If the temperature is warmer than ambient temperature, REFER to Section 412-00A and DIAGNOSE for temperature control is inoperative/does not operate correctly. If the outlet temperature is significantly colder than ambient temperature, GO to Pinpoint Test J .
E6 VERIFY A/C OPERATION IN THE A/C MODE	
• Make sure the ambient air temperature is above 2°C (35°F). • Select PANEL mode. • Press the A/C button (indicator ON). • **Does the A/C operate when the PANEL and A/C button (indicator ON) is pressed?**	**Yes** GO to E7 . **No** GO to Pinpoint Test I .
E7 CHECK THE RECIRC OPERATION	
• Press the RECIRC button (indicator OFF). • Select PANEL mode. • Select the highest blower motor setting. • Observe airflow noise. • **Does the airflow noise increase when the RECIRC mode is selected (indicator ON)?**	**Yes** GO to E8 . **No** GO to Pinpoint Test G .
E8 CHECK IN-VEHICLE TEMPERATURE/HUMIDITY SENSOR FAN OPERATION	

• Make sure the ambient air temperature is above 2°C (35°F). • Select PANEL mode. • Press the A/C button (indicator ON). • Place a piece of tissue within 25 mm (1 in) of the in-vehicle temperature/humidity sensor opening.  N0102891 • **Is the tissue drawn to the sensor opening?**	**Yes** GO to E9 . **No** GO to Pinpoint Test F .
E9 CHECK AUXILIARY COOLANT FLOW PUMP OPERATION	
• Allow the vehicle to cool to ambient temperature. • Start the engine and let the engine idle until it shuts down automatically, • Select FLOOR mode. • Set the temperature to the warmest setting. • Select the highest blower motor setting. • **Does the discharge air temperature closely maintain its warm temperature for an extended period of time?**	**Yes** The system is operating normally. If sent here for reduced airflow, CHECK the cabin air filter. If the cabin air filter is dirty, INSTALL a new cabin air filter. TEST the system for normal operation. If reduced airflow is still observed or the cabin air filter is clean, GO to Pinpoint Test L . **No** GO to Pinpoint Test H .

Pinpoint Test F: Incorrect/Erratic Function in AUTO Mode

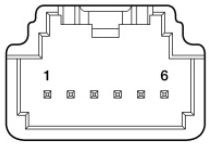
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

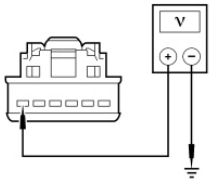


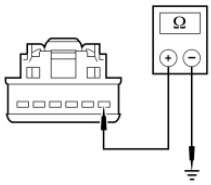
Normal Operation

Under normal operation, the in-vehicle air temperature sensor receives a ground from the HVAC module through circuit RH111 (GY/BU). A 5-volt reference voltage is supplied to the in-vehicle air temperature sensor from the HVAC module through circuit VH414 (GN/BU). To accurately monitor the cabin air temperature, the in-vehicle air temperature sensor uses an integral fan to draw cabin air to the sensor, inside the instrument panel. The fan is supplied voltage through circuit CBP37 (WH) and ground from circuit GD116 (BK/VT)

This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- In-vehicle temperature/humidity sensor
- HVAC module

PINPOINT TEST F: INCORRECT/ERRATIC FUNCTION IN AUTO MODE

TEST the system for normal operation.
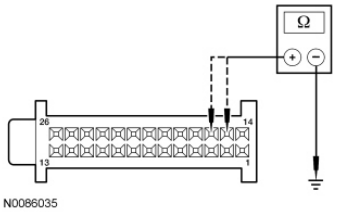
F5 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present.	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the

• **Is the concern still present?**	self-test. TEST the system for normal operation.

Pinpoint Test G: The Air Inlet Door is Inoperative

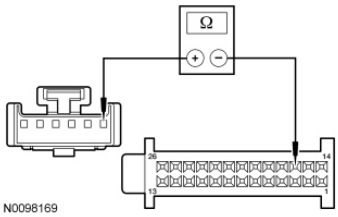
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

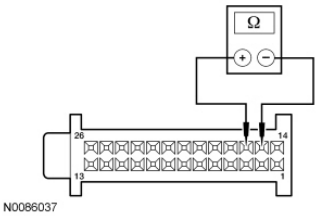
Normal Operation



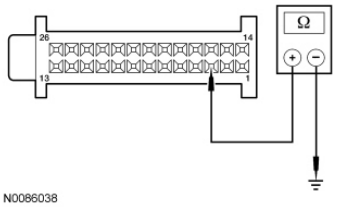
Under normal operation, to rotate the air inlet door actuator, the HVAC module - Dual Automatic Temperature Control (DATC) supplies voltage to the air inlet door actuator motor through the circuit CH207 (BU/GY) or through circuit CH208 (GN/OG). To rotate the air inlet door actuator in the reverse direction, the HVAC module - DATC reverses the voltage and ground circuits.

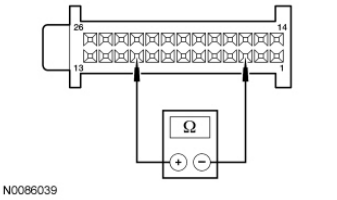
The air inlet door actuator feedback resistor is supplied a ground from the HVAC module - DATC through circuit RH111 (GY/BU) and a 5-volt reference voltage on circuit LH111 (BN/WH). The HVAC module - DATC reads the voltage on the air inlet door actuator feedback circuit VH438 (GN/VT) to determine the air inlet door actuator position by the position of the actedback resistor wiper arm.



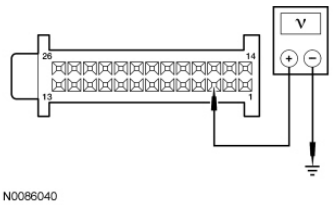


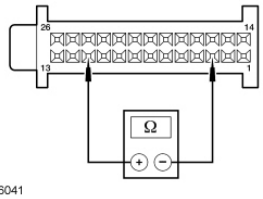
DTC Description	Fault Trigger Conditions
• B1083:07 - Recirculation Damper Motor: Mechanical Failures	The module senses no changes in the feedback circuit when motor movement is commanded and no motor DTCs are present.
• B1083:11 - Recirculation Damper Motor: Circuit Short to Ground	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
• B1083:12 - Recirculation Damper Motor: Circuit Short to Battery	The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
• B1083:13 - Recirculation Damper Motor: Circuit Open	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
• B11F0:11 - Air Intake Damper Position Sensor: Circuit Short to Ground	The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
• B11F0:15 - Air Intake Damper Position Sensor: Circuit Short to Battery or Open	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.

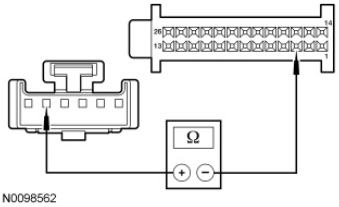




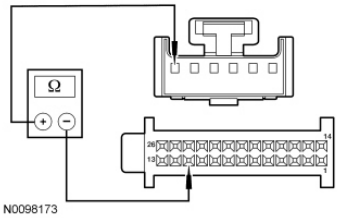
This pinpoint test is intended to diagnose t:
- Wiring, terminals or connectors
- Air inlet door actuator motor
- HVAC module
- Stuck or bound linkage or door

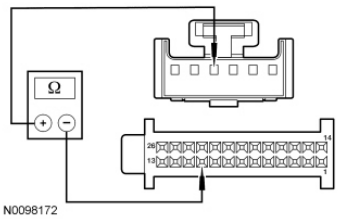






PINPOINT TEST G: THE AIR INLET DOOR IS INOPERATIVE





Test Step	Result / Action to Take
G1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are DTCs present?**	**Yes** **For DTC B1083:07** , INSPECT for binding/damaged linkage or door. REPAIR as necessary. If no condition is found, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For DTC B1083:11** , GO to G2 . **For DTC B1083:12** , GO to G3 . **For DTC B1083:13** , GO to G4 . **For DTC B11F0:11** , GO to G6 . **For DTC B11F0:15** , GO to G8 . **No** INSPECT for broken/binding linkage or door. REPAIR as necessary. If no condition is found, GO to G13 .
G2 CHECK CIRCUITS CH207 (BU/GY) AND CH208 (GN/OG) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module - DATC C2356a. • Measure the resistance between ground and: ♦ HVAC module - DATC C2356a-16, circuit CH208 (GN/OG), harness side. ♦ HVAC module - DATC C2356a-1cuit CH207 (BU/GY), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G5 . **No** REPAIR circuit CH207 (BU/GY) or CH208 (GN/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G3 CHECK CIRCUITS CH207 (BU/GY) AND CH208 (GN/OG) FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HVAC Module - DATC C2356a. • Ignition ON. • Measure the voltage between ground and: ♦ HVAC module - DATC C2356a-16, circuit CH208 (GN/OG), harness side. ♦ HVAC module - DATC C2356a-15, circuit CH207 (BU/GY), harness side. • **Is any voltage present?**	**Yes** REPAIR circuit CH207 (BU/GY) or CH208 (GN/OG) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to G5 .
G4 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN	
NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test. • Ignition OFF. • Disconnect: HVAC Module - DATC C2356a. • Disconnect: Air Inlet Door Actuator C289. • Measure the resistance between HVAC module - DATC C2356a-15, circuit CH207 (BU/GY), harness side and air inlet mode door actuator C289-6, circuit CH207 (BU/GY), harness side.	**Yes** GO to G13 . **No** REPAIR the circuit(s) for an open. TEST the system for normal operation.

• Measure the resistance between HVAC module - DATC C2356a-16, circuit CH208 (GN/OG), harness side and air inlet mode door actuator C289-5, circuit CH208 (GN/OG), harness side.  N0098169 • **Are the resistances less than 5 ohms?**	
G5 CHECK CIRCUIT CH207 (BU/GY) FOR A SHORT TO CIRCUIT CH208 (GN/OG)	
• Ignition OFF. • Disconnect: Air Inlet Door Actuator C289. • Measure the resistance between HVAC module - DATC C2356a-15, circuit CH207 (BU/GY), harness sidd HVAC module - DATC C2356a-16, circuit CH208 (GN/OG), harness side.  N0086037 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G13 . **No** REPAIR circuit CH208 (GN/OG) for a short to circuit CH207 (BU/GY). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G6 CHECK CIRCUIT VH438 (GN/VT) FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: HVAC Module - DATC C2356a. • Measure the resistance between ground and HVAC module - DATC C2356a-3, circuit VH438 (GN/VT), harness side.	**Yes** GO to G7 . **No** REPAIR circuit VH438 (GN/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0086038 • **Is the resistance greater than 10,000 ohms?**	
G7 CHECK CIRCUITS RH111 (GY/BU) AND VH438 (GN/VT) FOR A SHORT TOGETHER	
NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test. • Disconnect: Air Inlet Door Actuator C289. • Measure the resistance between HVAC module - DATC C2356a-10, circuit RH111 (GY/BU), harness side and HVAC module C2356a-3, circuit VH438 (GN/VT), harness side.  N0086039 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G13 . **No** REPAIR circuits VH438 (GN/VT) and RH111 (GY/BU) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G8 CHECK CIRCUIT VH438 (GN/VT) FOR A SHORT TO POWER	
• Ignition OFF. • Disconnect: HVAC Module - DATC C2356a. • Ignition ON. • Measure the voltage between ground and HVAC module - DATC C2356a-3, circuit VH438 (GN/VT), harness side.	**Yes** REPAIR circuit VH438 (GN/VT) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to G9 .

 N0086040 • **Is any voltage present?**	
G9 CHECK CIRCUITS LH111 (BN/WH) AND VH438 (GN/VT) FOR A SHORT TOGETHER	
NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test. • Disconnect: Air Inlet Door Actuator C289. • Measure the resistance between HVAC module - DATC C2356a-11, circuit LH111 (BN/WH), harness side and HVAC module - DATC C2356a-3, circuit VH438 (GN/VT), harness side.  N0086041 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G10 . **No** REPAIR circuits VH438 (GN/VT) and LH111 (BN/WH) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST thetem for normal operation.
G10 CHECK CIRCUIT VH438 (GN/VT) FOR AN OPEN	
• Measure the resistance between HVAC module - DATC C2356a-3, circuit VH438 (GN/VT), harness side and air inlet door actuator C289-9, circuit VH438 (GN/VT), harness side.  N0098562	**Yes** GO to G11 . **No** REPAIR circuit VH438 (GN/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	
G11 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN	
• Measure the resistance between HVAC module - DATC C2356a-11, circuit LH111 (BN/WH), harness side and air inlet door actuator C289-10, circuit LH111 (BN/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to G12 . **No** REPAIR circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G12 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN	
• Measure the resistance between HVAC module - DATC C2356a-10, circuit RH111 (GY/BU), harness side and air inlet door actuator C289-8, circuit RH111 (GY/BU), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to G13 . **No** REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
G13 CHECK THE ACTUATOR CONNECTION	
• Inspect the connector for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat the actuator connector. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** CARRY OUT the Air Inlet Mode Door Actuator component test in this section. If the actuator tests OK, GO to G14 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
G14 MODULE ACTUATOR POSITION CALIBRATION	

NOTE: The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out the calibration, follow the steps below. • Ignition OFF. • Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Ignition ON. • Clear the DTCs. • Select any position except OFF • **NOTE:** The HVAC module will now initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is now operating correctly at this time. The concern may have been caused by a foreign object in the HVAC case or temporary binding that restricted actuator door travel. CHECK any actuator external linkage. If condition recurs, INSPECT actuator linkage and door for binding and CHECK HVAC case for foreign objects.

Pinpoint Test H: Insufficient, Erratic or No Heat

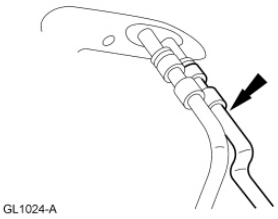
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

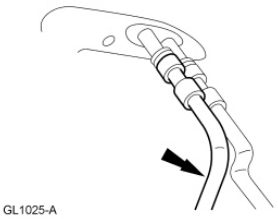
Under normal operation, warm coolant flows from the engine through the auxiliary coolant flow pump to the heater core and back to the engine. The auxiliary coolant flow pump relay (switch side) is supplied voltage through circuit SBB13 (GY/RD). When the relay is energized by the PCM, the voltage is sent from the relay to the auxiliary coolant flow pump through circuit CHC01 (BN/YE). The auxiliary coolant flow pump is grounded through circuit GD112 (BK/YE). When the HVAC module is ON, a message is sent over the Controller Area Network (CAN) to the PCM. When the PCM receives the message, the PCM energizes the auxiliary coolant flow pump relay.

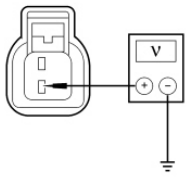
An auxiliary coolant flow pump is used only on hybrid vehicles to improve engine coolant circulation for heater operation at low engine speeds or when the engine is OFF.

The auxiliary coolant flow pump will be disabled when any of the following conditions are present:

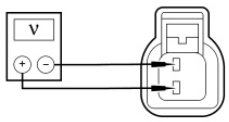


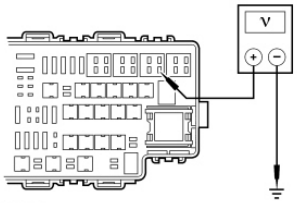
- The climate control module is set to the OFF position.
- The ambient temperature is above 32°C (90°F).
- The coolant temperature is less than -10°C (14°F).
- The engine speed is above 4,000 rpm.





For a complete explanation of the auxiliary coolant flow pump, refer to heating and ventilation in the Description and Operation portion of Section 412-01 .





This pinpoint test is intended to diagnose the following:

- Plugged heater core
- Coolant level
- Temperature blend door
- Auxiliary coolant flow pump
- PCM
- HVAC module

PINPOINT TEST H: INSUFFICIENT, ERRATIC OR NO HEAT

Test Step	Result / Action to Take
H1 CHECK FOR CORRECT ENGINE COOLANT LEVEL	
• Ignition OFF. • Check the engine coolant level when hot and cold. • **Is the engine coolant at the correct level (hot/cold) as indicated on the engine coolant recovery reservoir?**	**Yes** GO to H3 . **No** GO to H2 .
H2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS	
• Pressure test the cooling system for leaks. Refer to Section 303-03A . • **Does the engine cooling system leak?**	**Yes** REPAIR the engine coolant leak. TEST the system for normal operation. **No** FILL and BLEED the cooling system. REFER to Section 303-03A . After filling and bleeding the cooling system, GO to H3 .
H3 CHECK FOR COOLANT FLOW TO THE HEATER CORE	
• Start the engine and let the engine idle until it shuts down automatically, • Select FLOOR mode. • Set the temperature to the warmest setting. • Select the lowest blower motor setting. • Using a suitable temperature measuring device, check the heater core inlet hose to see if it is hot.  GL1024-A • **Is the heater core inlet hose hot?**	**Yes** GO to H4 . **No** GO to H5 .

H4 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE	
• Using a suitable temperature measuring device, measure the heater core outlet hose temperature.  GL1025-A • **Is the heater core outlet hose temperature similar to the inlet hose temperature (within approximately 6-17°C [10-30°F])?**	**Yes** REFER to Section 412-00A and diagnose for temperature control is inoperative/does not operate correctly. **No** INSTALL a new heater core. TEST the system forormal operation.
H5 CHECK FOR COOLANT FLOW TO THE AUXILIARY COOLANT FLOW PUMP	
• Using a suitable temperature measuring device, check the auxiliary coolant flow pump inlet hose to see if it is hot. • **Is the auxiliary coolant flow pump inlet hose hot?**	**Yes** GO to H6 . **No** REFER to Section 303-03B to check cooling system function.
H6 CHECK CIRCUIT CHC01 (BN/YE) FOR VOLTAGE	
• Ignition OFF. • Disconnect: Auxiliary Coolant Flow Pump C1450. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • Toggle the Heater Pump Commanded (HPUMP) output command ON. • Measure the voltage between auxiliary coolant flow pump C1450-2, circuit CHC01 (BN/YE), harness side and ground.  A0034114 • **Is the voltage greater than 10 volts?**	**Yes** GO to H7 . **No** CARRY OUT the auxiliary coolant flow pump relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If the relay tests OK, GO to H8 .
H7 CHECK CIRCUIT GD121 (BK/YE) FOR GROUND	

• Ignition OFF. • Measure the voltage between auxiliary coolant flow pump C1450-1, circuit GD121 (BK/YE), harness side and auxiliary coolant flow pump C1450-2, circuit CHC01 (BN/YE), harness side.  A0034113 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new auxiliary coolant flow pump. REFER to Section 412-01 . TEST the system for normal operation. **No** REPAIR circuit GD121 (BK/YE) for an open. TEST the system for normal operation.
H8 CHECK THE AUXILIARY COOLANT FLOW PUMP RELAY VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: Auxiliary Coolant Flow Pump Relay. • Ignition ON. • Measure the voltage between ground and auxiliary coolant flow pump relay socket, circuit SBB13 (GY/RD).  N0098563 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit CHC01 (BN/YE) for an open. TEST the system for normal operation. **No** VERIFY Battery Junction Box (BJB) fuse 13 (15A) is OK. If OK, REPAIR circuit SBB13 (GY/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

Pinpoint Test I: The Air Conditioning (A/C) is Inoperative

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, for vehicles **equipped** with navigation, when the A/C button is pressed, a message is sent from the Front Controls Interface Module (FCIM) over the Medium Speed Controller Area Network (MS-CAN) bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.

For vehicles **equipped** with navigation, when MAX A/C is selected on the touch screen, the Audio Control Module (ACM) sends a message over the MS-CAN bus to the HVAC module that MAX A/C has been

selected.

For vehicles **not equipped** with navigation, when A/C is requested, a message is sent from the HVAC module over the MS-CAN bus to the IC , then from the IC through the HS-CAN bus to the PCM.

When an A/C request is received from the HVAC module, an A/C demand message is sent from the PCM over the HS-CAN bus to the Air Conditioning Compressor Module (ACCM) if all of the following conditions are met:

- The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer.
- The PCM does not detect excessively high engine coolant temperature.
- The PCM does not detect an ambient air temperature below -1°C (30°F).
- The PCM has not detected a Wide Open Throttle (WOT) condition.
- The HVAC module does not detect an evaporator discharge air temperature below 2°C (36°F).

When the ACCM receives the A/C demand message, it will engage. Instead of cycling ON and OFF like a traditional A/C compressor, the PCM monitors the evaporator discharge temperature from the HVAC module to raise or lower the electric A/C compressor speed as required.

This pinpoint test is intended to diagnose the following:

- HVAC module
- PCM
- FCIM
- ACM
- Electric A/C compressor
- A/C evaporator discharge temperature sensor
- A/C pressure transducer

PINPOINT TEST I: THE AIR CONDITIONING (A/C) IS INOPERATIVE

NOTE: Diagnose any PCM, HVAC module or ACCM DTCs before carrying out the following pinpoint test.

NOTE: Before carrying out the following test, check that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), refer to Section 412-00A in this section.

Test Step	Result / Action to Take
I1 CHECK THE A/C PRESSURE SENSOR (ACP_PRESS) PCM PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: ACP_PRESS PCM PID. • With the manifold gauge set connected, compare the pressure readings of the manifold gauge set and the ACP_PRESS PID. • **Are the pressure values of the manifold gauge set and the ACP_PRESS PID similar?**	**Yes** GO to I2 . **No** INSTALL a new A/C pressure transducer. TEST the system for normal operation.
I2 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) HVAC PID	
• Allow the vehicle exterior and interior to stabilize to an	**Yes** For vehicles **not equipped** with

ambient temperature. • Enter the following diagnostic mode on the scan tool: EVAP_TEMP HVAC PID. • **Does the EVAP_TEMP HVAC PID read similar to the ambient temperature?**	navigation, GO to I3 . For vehicles **equipped** with navigation, GO to I4 . **No** INSTALL a new A/C evaporator discharge temperature sensor. TEST the system for normal operation.
I3 CHECK THE (A/C) SWITCH (CC_SW_AC) HVAC PID WITH THE A/C ON	
• Start the engine. • Enter the following diagnostic mode on the scan tool: CC_SW_AC HVAC PID. • Select PANEL and press the A/C button (indicator OFF). • **Does the CC_SW_AC HVAC PID read Active?**	**Yes** GO to I5 . **No** GO to I6 .
I4 CHECK THE (A/C) SWITCH (CC_SW_AC) FCIM PID WITH THE A/C ON	
NOTE: Before carrying out this test step, be sure all other FCIM button functions are operational. If all other buttons operate correctly, continue with this test step. If multiple buttons are inoperative and DTC U0256:00 is not present, install a new FCIM . Test the system for normal operation. If DTC U0256:00 is present, diagnose the DTC first. • Start the engine. • Enter the following diagnostic mode on the scan tool: CC_SW_AC FCIM PID. • Select PANEL and press the A/C button (indicator on). • **Does the CC_SW_AC FCIM PID read Active?**	**Yes** GO to I5 . **No** INSTALL a new FCIM . REFER to Section 415-00 . TEST the system for normal operation.
I5 CHECK THE AIR CONDITIONING COMPRESSOR COMMANDED STATE (ACC_CMD) PCM PID WITH THE A/C ON	
• Enter the following diagnostic mode on the scan tool: ACC_CMD PCM PID. • **Does the ACC_CMD PCM PID read ON?**	**Yes** GO to I8 . **No** GO to I7 .
I6 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused

	by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I7 CHECK THE PCM CONNECTION	
• Clear the DTCs. • Disconnect all of the PCM connectors. • Check for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all of the PCM connectors. • Operate the system. • **Does the concern return?**	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
I8 CHECK ACCM OPERATING CONDITIONS	
• Make sure the following conditions are met: ♦ The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer. ♦ The PCM does not detect excessively high engine coolant temperature. ♦ The PCM does not detect an ambient air temperature below -1°C (30°F). ♦ The PCM has not detected a Wide Open Throttle (WOT) condition. ♦ The HVAC module does not detect an evaporator discharge air temperature below 2°C (36°F). • Start the engine. • Select PANEL and press the A/C button (indicator on). • **Does the A/C operate?**	**Yes** The system is operating correctly at this time. The concern may have been caused by attempting to operate the A/C outside of operating conditions. **No** INSTALL a new electric A/C compressor. REFER to Section 412-01 . TEST the system for normal operation.

Pinpoint Test J: The Air Conditioning (A/C) is Always On

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, for vehicles **equipped** with navigation, when the A/C button is pressed, a message is sent from the Front Controls Interface Module (FCIM) over the Medium Speed Controller Area Network (MS-CAN) bus to the HVAC module. The HVAC module then sends an A/C request message over the MS-CAN bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM.

For vehicles **equipped** with navigation, when MAX A/C is selected on the touch screen, the Audio Control Module (ACM) sends a message over the MS-CAN bus to the HVAC module that MAX A/C has been selected.

For vehicles **not equipped** with navigation, when A/C is requested, a message is sent from the HVAC module

over the MS-CAN bus to the IC , then from the IC through the HS-CAN bus to the PCM.

When an A/C request is received from the HVAC module, an A/C demand message is sent from the PCM over the HS-CAN bus to the Air Conditioning Compressor Module (ACCM) if all of the following conditions are met:

- The PCM does not detect excessively high or low refrigerant pressure from the A/C pressure transducer.
- The PCM does not detect excessively high engine coolant temperature.
- The PCM does not detect an ambient air temperature below -1°C (30°F).
- The PCM has not detected a Wide Open Throttle (WOT) condition.
- The HVAC module does not detect an evaporator discharge air temperature below 2°C (36°F).

When the ACCM receives the A/C demand message, it will engage. Instead of cycling ON and OFF like a traditional A/C compressor, the PCM monitors the evaporator discharge temperature from the HVAC module to raise or lower the electric A/C compressor speed as required.

This pinpoint test is intended to diagnose the following:

- HVAC module
- FCIM
- ACM
- Electric A/C compressor
- A/C evaporator discharge temperature sensor
- A/C pressure transducer

PINPOINT TEST J: THE AIR CONDITIONING (A/C) IS ALWAYS ON

NOTE: Diagnose any PCM, HVAC module or ACCM DTCs before carrying out the following pinpoint test.

Test Step	Result / Action to Take
J1 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) HVAC PID	
• Allow the vehicle exterior and interior to stabilize to an ambient temperature. • Ignition ON. • Enter the following diagnostic mode on the scan tool: EVAP_TEMP HVAC PID. • **Does the EVAP_TEMP HVAC PID read similar to the ambient temperature?**	**Yes** For vehicles **not equipped** with navigation, GO to J2 . For vehicles **equipped** with navigation, GO to J3 . **No** INSTALL a new A/C evaporator discharge temperature sensor. TEST the system for normal operation.
J2 CHECK THE (A/C) SWITCH (CC_SW_AC) HVAC PID WITH THE A/C OFF	
• Start the engine. • Enter the following diagnostic mode on the scan tool: CC_SW_AC HVAC PID. • Select PANEL and make sure the A/C indicator is OFF.	**Yes** GO to J4 . **No** INSTALL a new HVAC

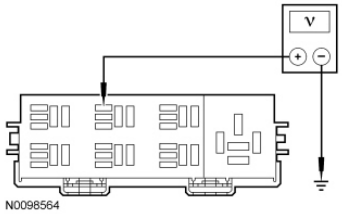
• **Does the CC_SW_AC HVAC PID read Inactive?**	module. REFER to Section 412-01 . TEST the system for normal operation.
J3 CHECK THE (A/C) SWITCH (CC_SW_AC) FCIM PID WITH THE A/C OFF	
NOTE: Before carrying out this test step, be sure all other FCIM button functions are functioning correctly. If all other buttons operate correctly, continue with this test step. If multiple buttons are incorrectly functioning and DTC U0256:00 is not present, install a new FCIM . Test the system for normal operation. If DTC U0256:00 is present, diagnose the DTC first. • Start the engine. • Enter the following diagnostic mode on the scan tool: CC_SW_AC FCIM PID. • Select PANEL and make sure the A/C indicator is OFF. • **Does the CC_SW_AC FCIM PID read Inactive?**	**Yes** GO to J4 . **No** INSTALL a new FCIM . REFER to Section 415-00 . TEST the system for normal operation.
J4 CHECK THE AIR CONDITIONING COMPRESSOR COMMANDED STATE (ACC_CMD) PCM PID WITH THE A/C OFF	
• Enter the following diagnostic mode on the scan tool: ACC_CMD PCM PID. • Select PANEL and make sure the A/C indicator is OFF. • **Does the ACC_CMD PCM PID read OFF?**	**Yes** INSTALL a new electric A/C compressor. REFER to Section 412-01 . TEST the system for normal operation. **No** INSTALL a new PCM. TEST the system for normal operation.

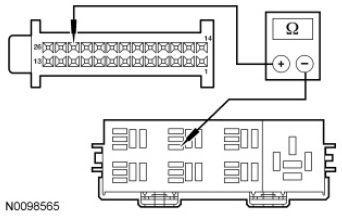
Pinpoint Test K: The Blower Motor is Inoperative

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor relay coil receives a ground from the HVAC module through circuit CH123 (VT/GN). The coil receives ignition voltage through circuit CBP45 (YE). Voltage is supplied to the relay switch contact through circuit SBB35 (BU/RD). When the relay coil is energized, voltage is delivered to the blower motor speed control through circuit CH402 (YE/GN). Ground for the blower motor speed control is provided by circuit GD115 (BK/GY). Voltage for the motor is provided through circuit VH301 (YE/BU) from the blower motor speed control. Ground for the motor is provided through circuit VH219 (GY) from the blower motor speed control. The HVAC module sends a Pulse-Width Modulation (PWM) signal to the blower motor speed control through circuit VH101 (WH/VT) to control the blower speed.





DTC Description	Fault Trigger Conditions
• B10AF:12 - Blower Fan Relay: Circuit Short to Battery	The module senses excessive voltage on the relay coil ground circuit, indicating a short directly to voltage.
• B10AF:14 - Blower Fan Relay: Circuit Short to Ground or Open	The module senses no voltage on the relay coil ground circuit, indicating an open or a short directly to ground.
• B10B9:12 - Blower Control: Circuit Short to Battery	The module senses excessive voltage on the blower motor control PWM circuit, indicating a short directly to voltage.
• B10B9:14 - Blower Control: Circuit Short to Ground or Open	The module senses no voltage on the blower motor control PWM circuit, indicating an open or a short directly to ground.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Blower motor relay
- Blower motor speed control
- HVAC module - Dual Automatic Temperature Control (DATC)
- Blower motor

PINPOINT TEST K: THE BLOWER MOTOR IS INOPERATIVE

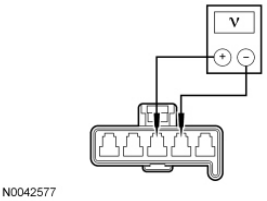
Test Step	Result / Action to Take
K1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** **For DTC B10AF:12** , REPAIR circuit CH123 (VT/GN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For DTC B10AF:14** , CARRY OUT the Blower Motor Relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If the relay tests OK, GO to K2 . **For DTC B10B9:14** , GO to K4 . **For DTC B10B9:12,** REPAIR circuit VH101 (VT/WH) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

	No GO to K6 .
K2 CHECK THE RELAY COIL SUPPLY VOLTAGE	
• Ignition OFF. • Disconnect: Blower Motor Relay. • Ignition ON. • Measure the voltage between blower motor relay socket pin 1, circuit CBP45 (YE) and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to K3 . **No** VERIFY Smart Junction Box (SJB) fuse 45 (5A) is OK. If OK, REPAIR circuit CBP45 (YE) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
K3 CHECK CIRCUIT CH123 (VT/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module - DATC C2356a. • Measure the resistance between blower motor relay socket pin 2, circuit CH123 (VT/GN) and HVAC module - DATC C2356a-24, circuit CH123 (VT/GN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes K17**

.

No
REPAIR circuit CH123 (VT/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **K4 CHECK CIRCUIT VH101 (WH/VT) FOR AN OPEN**

- Ignition OFF.
- Disconnect: Blower Motor Speed Control C271.
- Disconnect: HVAC Module - DATC C2356a.

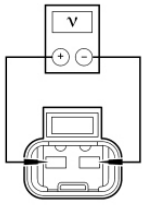


- Measure the resistance between blower motor control C271-B, circuit VH101 (WH/VT), harness side and HVAC module - DATC C2356a-14, circuit VH101 (WH/VT), harness side.

- **Is the resistance less than 5 ohms?**

Yes
GO to K5 .
No
REPAIR circuit VH101 (WH/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **K5 CHECK CIRCUIT VH101 (WH/VT) FOR GROUND SIGNAL**

- Connect: HVAC Module - DATC C2356a.
- Ignition ON.
- Press the PANEL button on the HVAC module. Adjust the blower motor setting to HI.
- Measure the voltage between blower motor speed control C271-B, circuit VH101 (WH/VT), harness side and blower motor speed control C271-C, circuit CH402 (YE/GN), harness side.

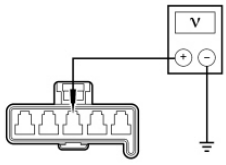


- **Is the voltage greater than 10 volts?**

Yes
GO to K16 .

No
GO to K17 . **K6 CHECK FOR VOLTAGE TO THE BLOWER MOTOR**

- Ignition OFF.
- Disconnect: Blower Motor C288.
- Ignition ON.
- Measure the voltage between blower motor C288-A, circuit VH219 (GY), harness side and blower motor C288-B, circuit VH301 (YE/BU), harness side.



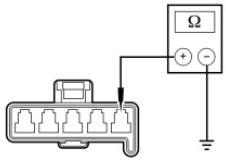
N0042576

- **Is the voltage greater than 10 volts?**

Yes
INSTALL a new blower motor. TEST the system for normal operation.

No
GO to K7 . **K7 CHECK FOR VOLTAGE TO THE BLOWER MOTOR CONTROLLER**

- Ignition OFF.
- Disconnect: Blower Motor Speed Control C271.
- Ignition ON.
- Press the PANEL button on the HVAC module.
- Measure the voltage between blower motor speed control C271-C, circuit CH402 (YE/GN), harness side and ground.



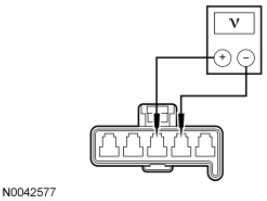
N0041919

- **Is the voltage greater than 10 volts?**

Yes
GO to K8 .

No
GO to K14 . **K8 CHECK CIRCUIT GD115 (BK/GY) FOR AN OPEN**

- Ignition OFF.
- Measure the resistance between blower motor speed control C271-A, circuit GD115 (BK/GY), harness side and ground.



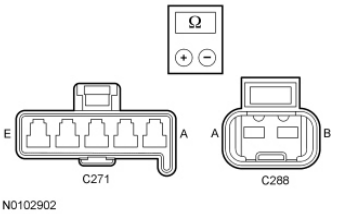
N0041918

- **Is the resistance less than 5 ohms?**

Yes
GO to K9 .

No
REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation. **K9 CHECK CIRCUIT VH101 (WH/VT) FOR GROUND SIGNAL**

- Ignition ON.
- Press the PANEL button on the HVAC module. Adjust the blower motor setting to HI.
- Measure the voltage between blower motor speed control C271-B, circuit VH101 (WH/VT), harness side and blower motor speed control C271-C, circuit CH402 (YE/GN), harness side.



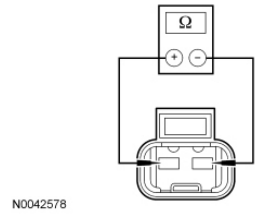
- **Is the voltage greater than 10 volts?**

Yes
GO to K10 .

No
GO to K17 . **K10 CHECK CIRCUITS VH219 (GY) AND VH301 (YE/BU) FOR AN OPEN**

- Measure the resistance between the blower motor connector, harness side and blower motor speed control, harness side using the following chart.

Blower Motor Connector	Circuit	Blower Motor Speed Control Connector
C288-A	VH219 (GY)	C271-E
C288-B	VH301 (YE/BU)	C271-D

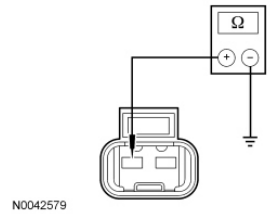


- **Are the resistances less than 5 ohms?**

Yes
GO to K11 .

No
REPAIR circuit VH219 (GY) or VH301 (YE/BU) for an open. TEST the system for normal operation. **K11 CHECK CIRCUITS VH219 (GY) AND VH301 (YE/BU) FOR A SHORT TOGETHER**

- Measure the resistance between blower motor C288-A, circuit VH219 (GY), harness side and blower motor C288-B, circuit VH301 (YE/BU), harness side.

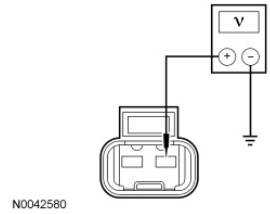


- **Is the resistance greater than 10,000 ohms?**

Yes
GO to K12 .

No
REPAIR circuits VH219 (GY) and VH301 (YE/BU) for a short together. TEST the system for normal operation. **K12 CHECK CIRCUIT VH219 (GY) FOR A SHORT TO GROUND**

- Measure the resistance between ground and blower motor C288-A, circuit VH219 (GY), harness side.

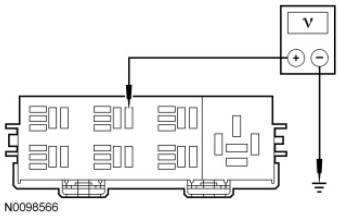


- **Is the resistance greater than 10,000 ohms?**

Yes
GO to K13 .

No
REPAIR circuit VH219 (GY) for a short to ground. TEST the system for normal operation. **K13 CHECK CIRCUIT VH301 (YE/BU) FOR A SHORT TO VOLTAGE**

- Ignition ON.
- Measure the voltage between ground and blower motor C288-B, circuit VH301 (YE/BU), harness side.

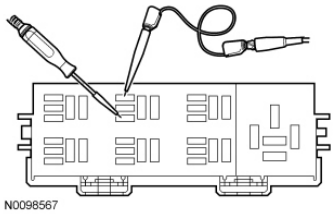


- **Is any voltage present?**

Yes
REPAIR circuit VH301 (YE/BU) for a short to voltage. TEST the system for normal operation.

No
GO to K16 . **K14 CHECK THE RELAY SWITCH POWER CIRCUIT FOR AN OPEN**

- Measure the voltage between blower motor relay socket pin 3, circuit SBB35 (BU/RD) and ground.



- **Is the voltage greater than 10 volts?**

Yes
GO to K15 .

No
VERIFY Battery Junction Box (BJB) fuse 35 (40A) is OK. If OK, REPAIR circuit SBB35 (BU/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. **K15 CHECK THE MODULE OUTPUT**

> ***NOTICE:*** **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section or equivalent. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.**

- Ignition ON.
- With the engine running, connect a 12-volt test lamp between blower motor relay socket pin 2, circuit CH123 (VT/GN) and socket pin 1, circuit CBP45 (YE).

- **Does the test lamp illuminate?**

Yes
CARRY OUT the blower motor relay component test.

Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing.

If the relay tests OK, REPAIR circuit CH402 (YE/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

No

GO to K17 . **K16 CHECK THE BLOWER MOTOR SPEED CONTROL CONNECTION**

- Clear the DTCs.
- Disconnect the blower motor speed control connector.
- Check for:
  - ♦ corrosion.
  - ♦ pushed-out terminals.
  - ♦ damaged terminals.
- Connect and correctly seat the connector.
- Carry out the HVAC On-Demand Self Test.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new blower motor speed control. REFER to Section 412-01 . CLEAR the DTCs. TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation. **K17 CHECK THE MODULE CONNECTION**

- Inspect the module connectors for:
  - ♦ corrosion.
  - ♦ pushed-out terminals.
  - ♦ damaged terminals.
- Connect and correctly seat all the HVAC module connectors.
- Clear the DTCs.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation.

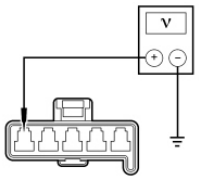
No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

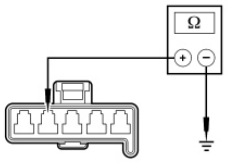
Pinpoint Test L: The Blower Motor Does Not Operate Correctly - DATC

Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor relay coil receives a ground from the HVAC module through circuit CH123 (VT/GN). The coil receives ignition voltage through circuit CBP45 (YE). Voltage is supplied to the relay switch contact through circuit SBB06 (BN/RD). When the relay coil is energized, voltage is delivered to the blower motor speed control through circuit CH402 (YE/GN). Ground for the blower motor speed control is provided by circuit GD115 (BK/GY). Voltage for the motor is provided through circuit VH301 (YE/BU) from the blower motor speed control. Ground for the motor is provided through circuit VH219 (GY) from the blower motor speed control. The HVAC module sends a Pulse-Width Modulation (PWM) signal to the blower motor speed control through circuit VH101 (WH/VT) to control the blower speed.

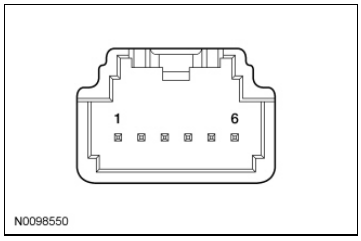




- DTC B10AF:14 (Blower Fan Relay: Circuit Short to Ground or Open) - The module senses no voltage on the relay coil ground circuit, indicating an open or a short directly to ground.
- DTC B10B9:14 (Blower Control: Circuit Short to Ground or Open) - The module senses no voltage on the blower motor control PWM circuit, indicating an open or a short directly round.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Blower motor speed control
- HVAC module - Dual Automatic Temperature Control (DATC)



PINPOINT TEST L: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY - DATC

Test Step	Result / Action to Take
L1 CHECK THE HVAC MODULE FOR DTCs	
• Ignition ON. • Check the HVAC module for DTCs. • **Are any DTCs present?**	**Yes** **For DTC B10AF:14** , REPAIR circuit CH123 (VT/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **For DTC B10B9:14** , REPAIR circuit VH101 (WH/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to L2 .
L2 VERIFY THE BLOWER MOTOR OPERATION	
• Ignition ON. • Press the panel button on the HVAC module. Adjust the blower motor setting to LO and then to HI. • **Does the blower motor operate at any setting?**	If the blower motor operates always in HI, GO to L4 . If the blower motor is always ON, CARRY OUT the blower motor relay component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If the relay tests OK, GO to L3 . **No** GO to Pinpoint Test K .
L3 CHECK CIRCUIT VH301 (YE/BU) FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: Blower Motor Speed Control C271. • Disconnect: Blower Motor C288. • Ignition ON. • Measure the voltage between ground and blower motor speed control C271-E, circuit VH301 (YE/BU), harness side.  N0042582 • **Is any voltage present?**	**Yes** REPAIR circuit VH301 (YE/BU) for a short to voltage. TEST the system for normal operation. **No** GO to L5 .
L4 CHECK CIRCUIT VH219 (GY) FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between ground and blower motor speed control C271-D, circuit VH219 (GY), harness side.  N0098188 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new blower control. TEST the system for normal operation. If the condition returns, GO to L5 . **No** REPAIR circuit VH219 (GY) for a short to voltage. TEST the system for normal operation.
L5 CHECK THE MODULE CONNECTION	
• Inspect the module connectors for: ♦ corrosion. ♦ pushed-out terminals. ♦ damaged terminals. • Connect and correctly seat all the HVAC module connectors. • Clear the DTCs. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Air Conditioning

The refrigerant system components include the following:

- Pulley-driven A/C compressor (non-hybrid)
- Electric A/C compressor (hybrid)
- A/C clutch assembly (non-hybrid)
- A/C condenser core
- A/C evaporator core
- Receiver/drier cartridge
- Connecting refrigerant lines
- Thermostatic Expansion Valve (TXV)

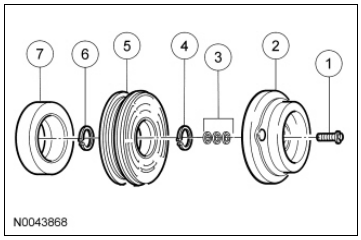
The refrigerant system incorporates an A/C compressor controlled by the PCM through an A/C clutch relay. The HVAC module sends an A/C request signal to the Instrument Cluster (IC), which relays the request to the PCM. An evaporator discharge air temperature sensor is used to disengage the A/C compressor clutch when the evaporator core temperature falls below an acceptable temperature.

The A/C compressor clutch will only be engaged by the PCM if all of the following conditions are met:

- The HVAC module is set to a mode which provides an A/C request to the PCM via the IC .
- The evaporator discharge air temperature sensor is reading an acceptable temperature.
- The A/C pressure transducer is reading an acceptable pressure in the high side of the refrigerant system.
- The A/C compressor relay is switched to the closed position by the PCM.
- The engine coolant temperature is not excessively high.
- The PCM has not detected a Wide Open Throttle (WOT) condition.

NOTE: To prevent erroneous readings that can result from underhood heat sources, the PCM uses data from several sources to calculate ambient temperature. The vehicle must be driven for a sufficient time, speed and distance after startup before the calculated ambient temperature is updated in the PCM. If a vehicle is moved from a below-freezing environment to a warm environment (such as being moved from outside into a garage or when delivered from a cold climate to a warm climate), the minimal amount of driving may not be sufficient for the calculated ambient temperature to be updated. In this event, the PCM will believe the ambient temperature is too low for A/C operation and, to prevent an increased risk of compressor slugging or damage, will not engage the A/C compressor in any mode. To manually reset the PCM calculated ambient temperature to the current temperature, run the vehicle until the thermostat opens and then clear the PCM Keep Alive Memory (KAM). For the KAM resetting procedure, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual. When the PCM KAM is reset, the ambient temperature will reset to the current higher value (a value closer to actual surrounding conditions) and the A/C compressor will operate normally.

An A/C pressure relief valve is installed in the A/C compressor to protect the refrigerant system against excessively high refrigerant pressures.



Refrigerant flow into the evaporator core is metered by a TXV .

A/C Compressor and Clutch Assembly - Non-Hybrid

NOTE: Internal A/C compressor components are not serviced separately. The A/C compressor is serviced only as an assembly. The clutch disc and hub, A/C compressor pulley and bearing and clutch field coil are serviceable.

The A/C compressor has the following characteristics:

- A non-serviceable shaft seal
- A pressure relief valve is installed in the rear of the compressor to protect the refrigerant system against excessively high refrigerant pressures
- The A/C compressor uses PAG oil or equivalent. This oil contains special additives required for the A/C compressor
- The A/C compressor oil may have some slightly dark-colored streaks while maintaining normal oil viscosity. This is normal for this A/C compressor because of break-in wear that can discolor the oil
- Use standard oil matching procedures when installing new compressors

Item	Part Number	Description
1	W712303	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19D648	A/C clutch disc and hub spacers
4	W712302	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W712301	A/C clutch field coil snap ring
7	1998	A/C clutch field coil

When battery voltage is applied to the A/C compressor clutch field coil, the clutch plate and hub assembly is drawn toward the A/C clutch pulley. The magnetic force locks the clutch plate and hub assembly and the A/C clutch pulley together as one unit, causing the compressor shaft to rotate. When battery voltage is removed from the A/C compressor clutch field coil, springs in the clutch plate and hub assembly move the clutch plate away from the A/C clutch pulley.

Electric A/C Compressor - Hybrid

NOTICE: **Motorcraft® Electric Compressor Oil YN-32 only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric Compressor Oil YN-32 to the refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. For the Refrigerant Oil Adding procedure, refer to Section 412-00A .**

Hybrid vehicles are equipped with a variable-speed electric A/C compressor that is powered by the high-voltage traction battery system. The electric A/C compressor allows for A/C operation to continue even when the vehicle is in full electric mode and the gasoline engine is not running. The Air Conditioning Compressor Module (ACCM) is an integral part of the electric A/C compressor and cannot be removed from the compressor.

A/C Pressure Relief Valve

NOTE: If the A/C compressor is operating within limits and the A/C pressure relief valve is venting, or if the A/C pressrelief valve is leaking around the threads, replace the A/C pressure relief valve and O-ring. If the A/C pressure relief valve still vents after it is replaced, diagnose the refrigerant system for a restriction.

An A/C pressure relief valve is incorporated in the A/C compressor to prevent damage to the A/C compressor and other system components by relieving unusually high system discharge pressure buildups. For specifications regarding operating pressure(s), refer to Section 412-00A .

The A/C pressure relief valve is a separate component and can be replaced separately from the A/C compressor. It is necessary to recover the refrigerant before removing the A/C pressure relief valve.

A/C Condenser

The A/C condenser is an aluminum fin-and-tube design heat exchanger located in front of the vehicle radiator. It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat and by condensing gas to liquid refrigerant as it is cooled.

The receiver/drier is incorporated onto the LH side of the condenser core. The receiver/drier (desiccant) cartridge is a separate component and can be removed and installed separately from the condenser core.

On 3.5L vehicles only, the top portion of the condenser/power steering combo cooler is partitioned from the refrigerant system and is used for power steering fluid cooling.

Receiver/Drier Cartridge

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.

The receiver/drier is integral to the A/C condenser. It stores high-pressure liquid after it leaves the condenser core. A receiver/drier (desiccant) cartridge mounted inside the receiver/drier removes any retained moisture from the refrigerant. The receiver/drier cartridge is a separate component and can be removed and installed separately from the A/C condenser.

Evaporator Core

The evaporator core is an aluminum plate/fin type and is located in the heater core and evaporator core housing. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and continues out of the evaporator core through the evaporator core outlet tube as a vapor. Air from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

Thermostatic Expansion Valve (TXV)

The TXV is located between the evaporator core inlet and outlet tubes and the TXV manifold and tube

assembly at the rear of the engine compartment. The TXV provides a restriction to the flow of refrigerant from the high-pressure side of the refrigerant system and separates the low-pressure and high-pressure sides of the refrigerant system. Refrigerant entering and exiting the evaporator core passes through the TXV through 2 separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

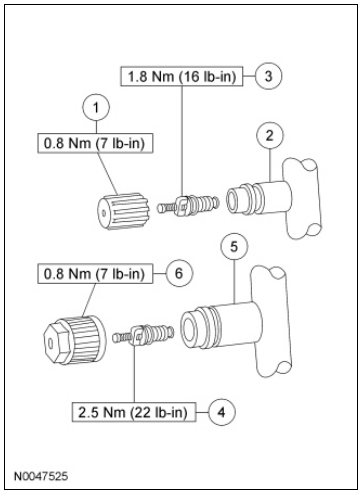
Evaporator Discharge Air Temperature Sensor

The evaporator discharge air temperature sensor contains a thermistor which receives a reference voltage from the PCM. The thermistor then varies the resistance to the reference voltage based on the evaporator discharge air temperature. The resulting voltage is returned to the PCM where it is interpreted as an evaporator discharge air temperature reading.

The PCM maintains evaporator core temperature and prevents icing of the evaporator core, by disengaging the A/C compressor clutch (non-hybrid) or decreasing the electric A/C compressor speed (hybrid) when the evaporator discharge air temperature sensor reading falls below acceptable levels, and by engaging the A/C compressor clutch (non-hybrid) or increasing the electric A/C compressor speed (hybrid) when the discharge air temperature rises above acceptable levels.

The evaporator discharge air temperature sensor is located inside of the heater core and evaporator core housing in the air-stream leaving the evaporator core.

A/C Pressure Transducer



The A/C pressure transducer monitors the compressor discharge pressure and sends a variable voltage signal representing the pressure to the PCM. The PCM will interrupt A/C compressor operation (non-hybrid), or decrease the electric A/C compressor speed (hybrid) in the event that the A/C pressure transducer indicates high system discharge pressures. It is also used to sense low charge conditions. If the pressure is below a predetermined value for a given ambient temperature, the PCM will not allow the A/C compressor to operate.

The A/C pressure transducer is located on the high-pressure side of the TXV manifold and tube assembly near the TXV fitting.

Service Gauge Port Valves

The high-pressure service gauge port valve is located on the condenser-to-evaporator line.

The low-pressure service gauge port valve is located on the TXV manifold and tube assembly.

Item	Part Number	Description
1	19D702	Low-pressure service gauge port valve cap
2	-	Low-pressure service gauge port valve
3	19D701	Low-pressure Schrader-type valve
4	19D701	High-pressure Schrader-type valve
5	-	High-pressure service gauge port valve
6	19D702	High-pressure service gauge port valve cap

The fitting is an integral part of the refrigeration line or component.

- Special couplings are required for both the high-side and low-side service gauge ports.
- A very small amount of leakage will always be detectable around the Schrader-type valve with the service gauge port valve cap removed, and is considered normal. A new Schrader-type valve core can be installed if the seal leaks excessively.
- The service gauge port valve caps are used as primary seals in the refrigerant system to prevent leakage through the Schrader-type valves from reaching the atmosphere. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.

Refrigerant System Dye

NOTICE: **Fluorescent refrigerant system dye mixed with PAG oil should never be added to hybrid vehicle Air Conditioning (A/C) systems equipped with an electric A/C compressor. Addition of fluorescent refrigerant system dye containing PAG oil will damage the electric A/C compressor and contaminate the refrigerant system.**

Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved UV blacklight. It is not necessary to add additional dy the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation or hose rupture. Refer to Section 412-00A .

For hybrid vehicles equipped with an electric compressor, additional refrigerant system dye should only be added by installing a new receiver/drier cartridge. Replacement receiver/drier cartridges include a fluorescent dye "wafer" which will dissolve after approximately one hour of continued A/C operation. Fluorescent refrigerant system dye mixed with PAG oil should never be used in hybrid vehicles with an electric A/C compressor.

Air Distribution and Filtering

NOTE: This vehicle is equipped from the factory with a cabin air filter. For filter maintenance intervals, refer to Section 100-03 .

There are 2 sources of air available to the air distribution system:

- Outside air
- Recirculated air

Recirculated air is always used when the HVAC module is set to the MAX A/C mode on vehicles equipped with Electronic Manual Temperature Control (EMTC). Vehicles equipped with Electronic Automatic Temperature Control (EATC) use recirculated air when the RECIRC function is selected in any mode other than DEFROST, or when required by the HVAC module in the AUTOMATIC mode. On hybrid vehicles only, the air inlet door may stop in a mid-position if required for increased cooling performance as determined by the HVAC module.

Air distribution within the vehicle is determined by the EMTC system settings or the EATC system in the AUTOMATIC mode. The air distribution mode on vehicles equipped with EATC can be overridden by the driver if desired. Airflow mode control doors are used to direct airflow within the heater core and evaporator core housing. Electric mode door actuators are used to position these airflow mode doors.

NOTE: For the passenger side temperature setting on hybrid vehicles equipped with a dual-zone Electronic Automatic Temperature Control (EATC) and a Front Controls Interface Module (FCIM) built on or after 4/08/2009 to be functional, a passenger must be seated in the front passenger seat. If the front passenger seat is not occupied, the HVAC module will control the system based only on the driver side temperature setting. The HVAC module receives a Medium Speed Controller Area Network (MS-CAN) signal from the FCIM to indicate if the front passenger seat is occupied.

Vehicles equipped with dual-zone EATC use 2 separate temperature blend doors. This allows individual temperature settings to be selected for the RH and LH air outlets. The airflow mode doors are not partitioned for separate RH and LH airflow positions. Therefore, the airflow mode will always remain similar for the RH and LH sides of the vehicle regardless of the temperatures selected.

Air enters the passenger compartment from the:

- instrument panel registers.
- floor duct.
- windshield defroster.
- side window demisters.
- rear footwell duct.

Passenger compartment air is exhausted from the vehicle through open windows or body air vents.

Control Components

Electronic Manual Temperature Control (EMTC)

The Electronic Manual Temperature Control (EMTC) components are used to select:

- air inlet source (outside or recirculated).
- blower motor speed.
- discharge air temperature (temperature blend).
- discharge air location (defrost, panel, floor).
- A/C compressor operation.

Control System Inputs

HVAC Module

The HVAC module integrates the temperature control, blower motor switch, airflow mode selection, A/C request button, recirculated air request button and rear defog switch into a single unit.

The temperature control switch setting determines air temperature. Movement of the temperature display from COOL (blue) to WARM (red) causes a corresponding movement of the temperature blend door and determines the air discharge temperature that the air distribution system will maintain. The temperature control switch is an integral part of the HVAC module and cannot be installed separately.

The blower motor speed switch is mounted in the HVAC module and controls blower motor speed by adding or bypassing resistors in the blower motor resistor in all modes except OFF. The blower motor speed switch is an integral part of the HVAC module and cannot be installed separately.

The airflow mode setting determines air discharge location. Depressing each airflow mode selector button causes a corresponding movement of the airflow mode doors and determines the air discharge location. The airflow mode selector buttons are an integral part of the HVAC module and cannot be installed separately.

The A/C request button determines A/C compressor operation, except when the function selected is OFF, MAX or DEFROST. The A/C request button is an integral part of the HVAC module and cannot be installed separately.

The recirculated air request button can select recirculated air in any mode except DEFROST, and fresh air in any mode except MAX A/C or OFF.

The rear defog button signals activation of the heated backlight. The rear defog button is an integral part of the HVAC module and cannot be installed separately.

Control System Outputs

The EMTC system has 3 system outputs.

Blower Motor Speed

The blower motor speed switch varies the blower motor ground circuit resistance by adding or bypassing series resistance in the blower motor resistor. Increased resistance will lower the blower motor speed, and lowered resistance will increase blower motor speed. When the blower motor is in the HI (4) position, the blower motor resistor is bypassed.

The blower motor resistor is located on the heater core and evaporator core housing near the blower motor.

Temperature Blend Door Position

The temperature blend door actuator moves the temperature blend door on command from the HVAC module.

The temperature blend door actuator contains a reversible electric motor and a potentiometer. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the temperature blend door. The HVAC module powers the actuator motor to move the temperature blend door to the desired position. The desired position is set by the vehicle occupants using the temperature selector knob.

Airflow Mode Door Position

The airflow mode door actuator uses a cam and lever assembly to position the airflow mode doors on command from the HVAC module. The mode door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the HVAC module to monitor the position of the airflow mode doors. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the airflow mode doors. The HVAC module powers the actuator motor to move the airflow mode doors to the desired position. The desired position is set by the vehicle occupants using the mode selector buttons.

The airflow (defrost/panel/floor) mode door actuator is located on the heater core and evaporator core housing to the right of the steering column.

Air Inlet Mode Door Position

The air inlet mode door actuator moves the air inlet door between the fresh and RECIRC positions on command from the HVAC module. The air inlet mode door actuator is driven to, and will automatically stop at, the full RECIRC or full fresh air inlet position and does not require a potentiometer circuit to monitor its position. The air inlet mode door does not stop at any point between the RECIRC or fresh air inlet position.

The air inlet mode door actuator is located on the air inlet duct near the RH cowl side panel.

Electronic Automatic Temperature Control (EATC)

The HVAC module analyzes input from the following major sources:

- Temperature, airflow direction, blower, A/C and RECIRC selection (made by the vehicle occupants)
- In-vehicle temperature sensor (non-hybrid)
- In-vehicle temperature and humidity sensor (hybrid)
- Ambient air temperature sensor
- Solar radiation sensor (sunload sensor)

- Vehicle speed
- Engine coolant temperature
- Occupant Classification Sensor (OCS) (hybrid only)

Using these inputs, the HVAC module determines the correct conditions for the following outputs:

- A/C compressor operation
- Blower motor speed
- RH and LH temperature blend door positions
- DEFROST/PANEL/FLOOR airflow mode door position
- Air inlet mode door position

Control System Inputs

The EATC system has 4 control system inputs.

HVAC Module - Without Navigation System

The HVAC module on vehicles not equipped with the navigation system provides an interface for the vehicle occupants to control the climate control system, or automatically controls the system in the AUTO mode. The Front Display Interface Module (FDIM) displays set temperature, airflow direction and blower speed.

The HVAC module is mounted to the center instrument panel finish panel below the Front Controls Interface Module (FCIM).

HVAC Module - With Navigation System

Vehicles equipped with the navigation system use a remote HVAC module that is separate from the control interface. The FCIM provides the interface for the vehicle occupants to control the climate control system. When selections are made, the FCIM communicates the selections to the HVAC module over the Medium Speed Controller Area Network (MS-CAN). The remote HVAC module controls the climate control system based on the FCIM selections or will automatically control the climate control system in the AUTO mode.

The HVAC module is mounted to the instrument panel support behind the FCIM .

In-Vehicle Temperature Sensor - Non-Hybrid

The in-vehicle temperature sensor contains a thermistor, which measures the in-vehicle air temperature and sends that reading to the HVAC module. An aspirator hose is connected between the heater core and evaporate housing and the in-vehicle temperature sensor. The aspirator hose uses airflow through the heater core and evaporator core housing to create a Venturi-type suction in the hose to draw in-vehicle air through the in-vehicle temperature sensor (across the thermistor).

The in-vehicle temperature sensor is mounted to the instrument panel to the right of the steering column with the aspirator hose connected to the heater core and evaporator core housing near the LH temperature blend door actuator.

In-Vehicle Temperature and Humidity Sensor - Hybrid

The in-vehicle temperature and humidity sensor contains 2 thermistors, which separately measure the in-vehicle air temperature and humidity and send those readings to the HVAC module. The in-vehicle temperature sensor has an integral electric fan within the sensor that draws in-vehicle air across the thermistors.

The in-vehicle temperature and humidity sensor is mounted to the instrument panel to the right of the steering column.

Solar Radiation Sensor (Sunload Sensor)

The solar radiation sensor supplies information to the HVAC module indicating sunload.

Ambient Temperature Sensor

The ambient temperature sensor signal is received by the HVAC module and indicates the outside air temperature. The ambient temperature sensor is located in front of the radiator on the radiator support.

Control System Outputs

The EATC system has 3 control system outputs.

NOTE: For the passenger side temperature setting on hybrid vehicles equipped with a dual-zone Electronic Automatic Temperature Control (EATC) and a Front Controls Interface Module (FCIM) built on or after 4/08/2009 to be functional, a passenger must be seated in the front passenger seat. If the frontassenger seat is not occupied, the HVAC module will control the system based only on the driver side temperature setting. The HVAC module receives a Medium Speed Controller Area Network (MS-CAN) signal from the FCIM to indicate if the front passenger seat is occupied.

Blower Motor Speed

The blower motor speed control controls the blower motor speed by converting low power signals from the HVAC module to a high-current, variable ground feed for the blower motor. The HVAC module adjusts blower motor speed based on the difference between the in-vehicle temperature sensor signal and set temperature. A delay function is used to provide a gradual increase or decrease in blower motor speed under all conditions.

The blower motor speed control is located on the heater core and evaporator core housing near the blower motor.

Temperature Blend Door Positions

The dual-zone EATC system uses 2 temperature blend door actuators to control 2 separate temperature blend doors. The temperature blend doors independently vary the LH side and RH side temperature settings, as desired. The temperature blend door actuators each contain a reversible electric motor and a potentiometer. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the temperature blend door. The HVAC module powers the actuator motors to move the temperature blend doors to the desired positions. The desired temperature blend door positions are calculated by the HVAC module based on the set temperature, in-vehicle temperature, ambient temperature and sunload.

The LH temperature blend door actuator is located on the heater core and evaporator core housing near the accelerator pedal. The RH temperature blend door actuator is located on the heater core and evaporator core housing to the left of the glove compartment.

Airflow Mode Door Position

The airflow mode door actuator uses a cam and lever assembly to position the airflow mode doors on command from the HVAC module. The mode door actuator contains a reversible electric motor and

potentiometer. The potentiometer allows the HVAC module to monitor the position of the airflow mode doors. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the airflow mode doors. The HVAC module powers the actuator motor to move the airflow mode doors to the desired position. The HVAC module determines the desired airflow mode door position based on the calculated outlet temperature.

The airflow mode door actuator is located on the heater core and evaporator core housing to the right of the accelerator pedal.

Air Inlet Mode Door Actuator - Non-hybrid

The air inlet mode door actuator moves the air inlet door between the fresh and RECIRC positions on command from the HVAC module. The air inlet mode door actuator is driven to, and will automatically stop at, the full RECIRC or full fresh air inlet position and does not require a potentiometer circuit to monitor its position. The air inlet mode door does not stop at any point between the RECIRC or fresh air inlet position.

The air inlet mode door actuator is located on the airnlet duct near the RH cowl side panel.

Air Inlet Mode Door Actuator - Hybrid

The air inlet mode door actuator moves the air inlet door between the fresh and RECIRC positions on command from the HVAC module. The airflow mode door actuator contains a reversible electric motor and potentiometer. The potentiometer allows the HVAC module to monitor the position of the air inlet mode door. The potentiometer circuit consists of a 5-volt reference signal connected to one end of a variable resistor, and a signal ground connected to the other. A signal circuit is connected to a contact wiper, which is driven along the variable resistor by the actuator shaft. The signal to the HVAC module from the contact wiper indicates the position of the air inlet mode door. The HVAC module powers the actuator motor to move the air inlet mode door to the desired position. The HVAC module determines the desired air inlet mode door position based on the calculated outlet temperature.

The air inlet mode door actuator is located on the air inlet duct near the RH cowl side panel.

Heating and Ventilation

The heating and ventilation system has the following features:

- Controls the temperature and, during A/C operation, reduces the relative humidity of the air inside the vehicle
- Delivers heated or cooled air to maintain the vehicle interior temperature and comfort level
- Cooling or heating can be adjusted to maintain the desired temperature
- Uses a reheat method to provide conditioned air to the passenger compartment
- All airflow from the blower motor passes through the A/C evaporator core
- Temperature blending is controlled by the temperature blend door(s), which regulate(s) the amount of air that flows through and around the heater core, where it is then mixed and distributed

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer the heat to air passing through the plenum.

Blower Motor

The blower motor pulls air from the air inlet and forces it into the heater core and evaporator core housing where it is mixed and distributed.

Heater Core and Evaporator Core Housing

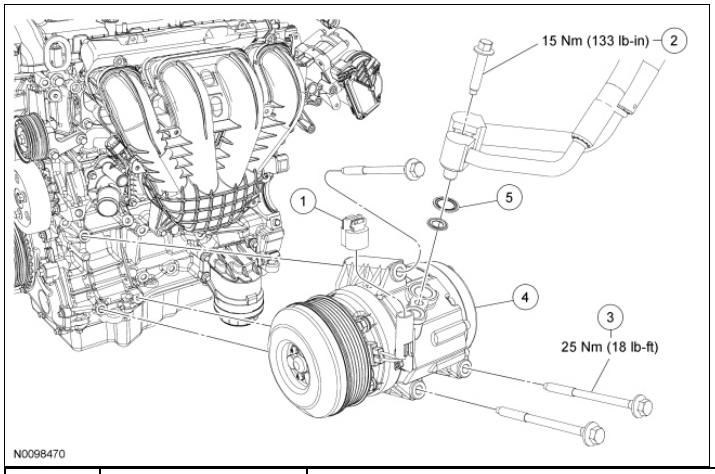
The heater core and evaporator core housing directs airflow from the blower motor through the evaporator core and heater core. All airflow from the blower motor passes through the evaporator core. The airflow is then directed through or around the heater core by the temperature blend door(s). Vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) use a partitioned heater core and evaporator core housing with 2 electric actuator-positioned temperature blend doors. This allows for separate temperatures to be selected for the driver and passenger sides of the passenger compartment. Manual systems and single-zone EATC systems use a single electric actuator-positioned temperature blend door to direct airflow through or around the heater core.

Auxiliary Coolant Flow Pump

An auxiliary coolant flow pump is used only on hybrid vehicles to improve engine coolant circulation at low engine speeds or when the engine is OFF.

The auxiliary coolant flow pump will be disabled when any of the following conditions are present:

- The climate control module is set to the OFF position.
- The ambient temperature is above 32°C (90°F).
- The coolant temperature is less than -10°C (14°F).
- The engine speed is above 4,000 rpm.



When none of the listed conditions are present, the auxiliary coolant flow pump is controlled by a strategy included in the PCM software. The control strategy monitors the ambient temperature, coolant temperature and engine rpm. As the ambient temperature and/or coolant temperature increase, the auxiliary coolant flow pump will shut down at lower engine speeds. For example, when both the ambient temperature is above 16°C (60°F) and the engine coolant temperature is above 66°C (150°F), the control strategy will shut off the auxiliary coolant flow pump at 2,000 rpm. When both the ambient temperature is above 24°C (75°F) and the engine coolant temperature is above 66°C (150°F), the control strategy will shut off the auxiliary coolant flow pump regardless of engine speed.

To verify auxiliary coolant flow pump operation, allow the vehicle to cool in a cool location. Start the engine and let the engine idle until it shuts down automatically. Select the FLOOR mode on the HVAC module at the highest temperature setting and HI blower speed. If the auxiliary coolant flow pump is inoperative or is not producing adequate coolant flow, the passenger compartment air discharge temperature will quickly decrease and further diagnosis is required. Refer to Section 412-00B . If the auxiliary coolant flow pump is operating normally, the passenger compartment air discharge temperature will remain steady, or slowly decrease.

Air Conditioning (A/C) Compressor - 2.5L

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	-	Field coil electrical connector (part of 12B637)
2	W701625	A/C compressor manifold bolt
3	W711824	A/C compressor bolt (3 required)
4	19703	A/C compressor
5	19B596	Gasket seal (2 pieces from kit required)

Removal and Installation

NOTICE: **If installing a new Air Conditioning (A/C) compressor due to an internal failure of the old unit, the following procedures must be carried out to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.**

- If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressor. For additional information, refer to Section 412-00A .
- If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to Section 412-00A .
- Install a new Thermostatic Expansion Valve (TXV), as directed by the A/C flushing or filtering procedure.
- Install a new receiver/drier cartridge as directed by the A/C flushing or filtering procedure.

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate**

and damage the A/C system.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.

1. If flushing of the A/C system has not been carried out, recover the refrigerant. For additional information, refer to Section 412-00A .

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Disconnect the field coil electrical connector.

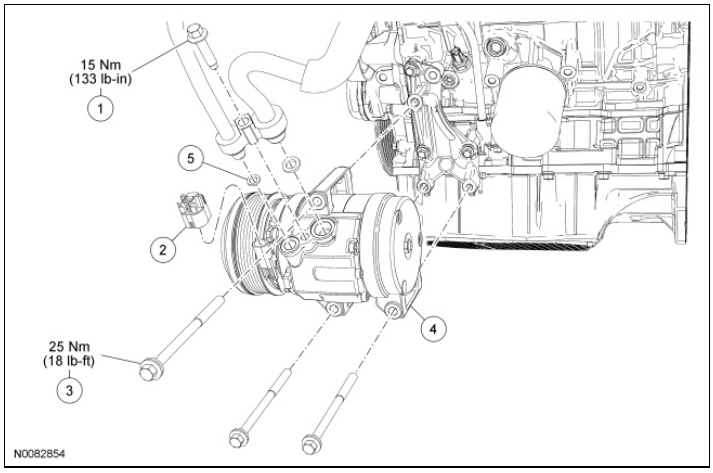
4. Remove the A/C compressor manifold bolt.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).

5. Remove the drive belt from the A/C compressor pulley.

6. Remove the 3 A/C compressor bolts.
   - To install, tighten to 25 Nm (18 lb-ft).

7. Remove the A/C compressor.

8. To install, reverse the removal procedure.
   - Install new gasket seals.
   - If filtering of the A/C system is not to be carried out, add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .



9. If filtering of the A/C system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Air Conditioning (A/C) Compressor - 3.0L, 3.5L

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

NOTE: 3.0L shown, 3.5L similar.

Item	Part Number	Description
1	W701625	A/C compressor manifold bolt
2	-	Field coil electrical connector (part of 12B637)
3	W710649	A/C compressor bolt (3 required for 3.0L) (2 required for 3.5L)
4	19703	A/C compressor
5	19B596	Gasket seal (2 pieces from kit required)

Removal and Installation

NOTICE: **If installing a new Air Conditioning (A/C) compressor due to an internal failure of the old unit, the following procedures must be carried out to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.**

- If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressoadditional information, refer to Section 412-00A .
- If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to Section 412-00A .

- Install a new Thermostatic Expansion Valve (TXV), as directed by the A/C flushing or filtering procedure.
- Install a new receiver/drier cartridge as directed by the A/C flushing or filtering procedure.

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.

All vehicles

1. If flushing of the A/C system has not been carried out, recover the refrigerant. For additional information, refer to Section 412-00A .

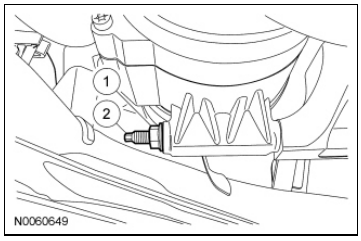
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the lower engine splash shield (if equipped).

4. Remove the drive belt from the A/C compressor pulley.

5. Remove the A/C compressor manifold bolt.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).

6. Disconnect the field coil electrical connector.



3.0L vehicles

7. Remove the 3 A/C compressor bolts.
   - To install, tighten to 25 Nm (18 lb-ft).

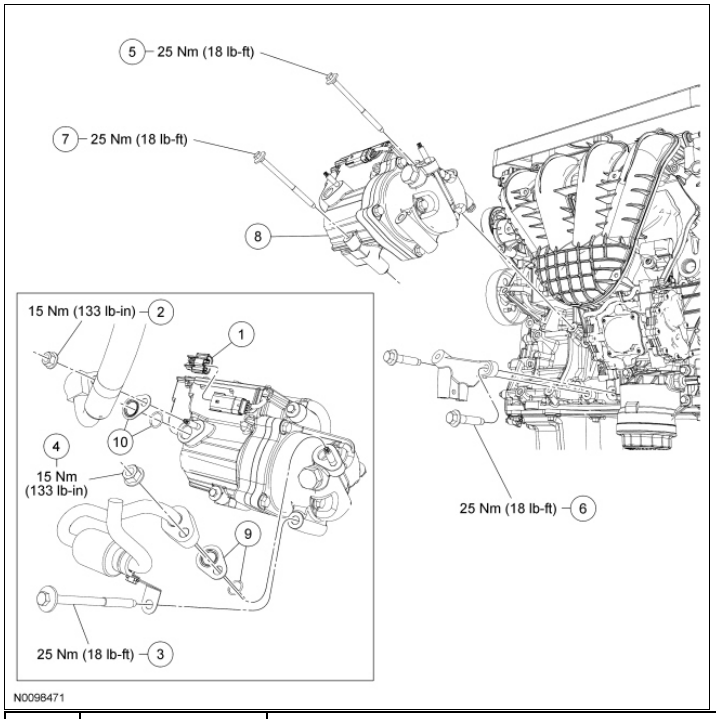
3.5L vehicles

8. Remove the 2 A/C compressor bolts.
   - To install, tighten to 25 Nm (18 lb-ft).

9. Remove the A/C compressor stud.
   1. Remove the A/C compressor nut.
   2. Remove the A/C compressor stud.
      - ♦ To install, tighten the stud to 9 Nm (80 lb-in).
      - ♦ To install, tighten the nut to 25 Nm (18 lb-ft).

All vehicles

10. Remove the A/C compressor.



11. To install, reverse the removal procedure.
    - Install new gasket seals.
    - If filtering of the A/C system is not to be carried out, add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

12. If filtering of the A/C system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Air Conditioning (A/C) Compressor - Hybrid

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-

Item	Part Number	Description
1	-	A/C compressor electrical connector (part of 14290)
2	W520413	A/C compressor suction fitting nut
3	W701626	Lower rear A/C compressor bolt
4	W520413	A/C compressor discharge fitting nut
5	W701626	Upper A/C compressor bolt
6	W500320	A/C compressor bracket bolt (2 required)
7	W701626	Lower front A/C compressor bolt
8	19703	A/C compressor
9	19B596	O-ring seal and gasket seal kit
10	19B596	O-ring seal and gasket seal kit

Removal and Installation

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehition of any oil other than Motorcraft® Electric A/C Compressor Oil to the**

hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .

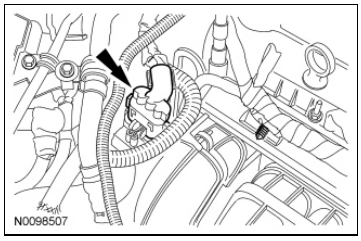
NOTICE: **Service electric Air Conditioning (A/C) compressors are shipped with a small amount of electric compressor oil already installed which may not match the nominal amount required by the refrigerant system. Before installing a new service electric A/C compressor, the correct electric compressor oil level must be determined based on the amount of oil removed along with the old electric A/C compressor. Refer to the Refrigerant Oil Adding procedure in Section 412-00A . Failure to correctly match the electric compressor oil amount will result in damage to the electric A/C compressor and other refrigerant system components.**

NOTICE: **If installing a new Air Conditioning (A/C) compressor due to an internal failure of the old unit, the following procedures must be carried out to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.**

- If A/C flushing equipment is available, cary out flushing of the A/C system prior to installing a new A/C compressor. For additional information, refer to Section 412-00A .
- If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to Section 412-00A .
- Install a new Thermostatic Expansion Valve (TXV), as directed by the A/C flushing or filtering procedure.
- Install a new receiver/drier cartridge as directed by the A/C flushing or filtering procedure.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Depower the high-voltage traction battery system. For additional information, refer to Section 414-03 .

3. Recover the refrigerant. For additional information, refer to Section 412-00A .

4. *NOTICE:* **Failure to disconnect high-voltage cable connectors as instructed may result in damage to the connectors.**

   Release the clips and locking tabs and disconnect the interlock connector and the high-voltage cable connector at the Air Conditioning Compressor Module (ACCM).

   - Press the locking clip in the white interlock connector and disengage the white connector before releasing the locking clip on the orange portion of the high-voltage connector. The white interlock connector will not come completely apart until the orange portion is released.

5. Detach the A/C compressor high-voltage electrical connector pin-type retainer and reposition the compressor high-voltage electrical connector below the coolant hoses.

6. Remove the condenser inlet fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

7. Disconnect the A/C compressor electrical connector.

8. Remove the A/C compressor suction fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

9. Detach the wire harness pin-type retainers from the vacuum pump bracket and A/C compressor bracket.

10. Detach the wire harness pin-type retainer from the front subframe.

11. Remove the lower rear A/C compressor bolt.
    - To install, tighten to 25 Nm (18 lb-ft).

12. Remove the A/C compressor discharge fitting nut and remove the compressor-to-condenser discharge line.
    - Discard the O-ring seal and gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

13. Remove the upper A/C compressor bolt.
    - To install, tighten to 25 Nm (18 lb-ft).

14. Remove the 2 A/C compressor bracket bolts and remove the A/C compressor bracket.
    - To install, tighten to 25 Nm (18 lb-ft).

15. Remove the lower front A/C compressor bolt.
    - To install, tighten to 25 Nm (18 lb-ft).

16. Remove the A/C compressor.

17. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

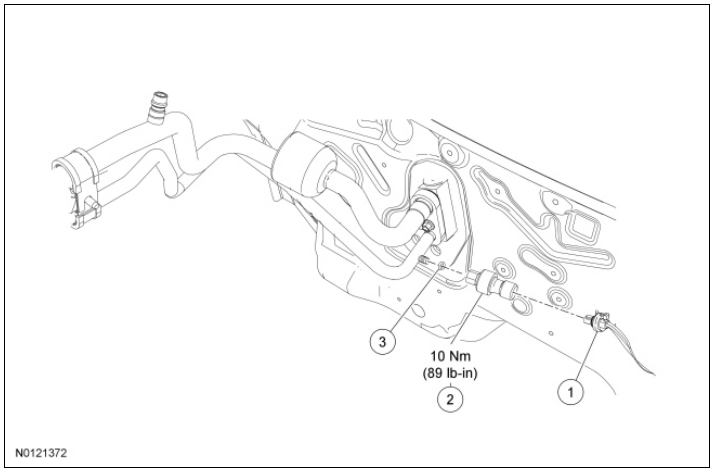
    To install, reverse the removal procedure.

    - Install new O-ring seals and gasket seals.

- Add the correct amount of clean electric A/C compressor oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

18. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Air Conditioning (A/C) Evaporator Discharge Air Temperature Sensor



Item	Part Number	Description
1	-	A/C evaporator discharge air temperature sensor electrical connector (part of 19D887)
2	19C734	A/C evaporator discharge air temperature sensor

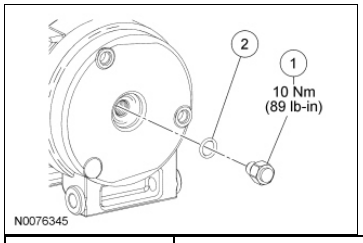
Removal and Installation

1. Remove the instrument panel. For additional information, refer to Section 501-12 .
2. Rotate the A/C evaporator discharge air temperature sensor counterclockwise and pull upward to detach it from the heater core and evaporator core housing.
3. Disconnect the A/C evaporator discharge air temperature sensor electrical connector.
4. Remove the evaporator discharge air temperature sensor.
5. To install, reverse the removal procedure.

Air Conditioning (A/C) Pressure Transducer

Item	Part Number	Description
1	-	A/C pressure transducer electrical connector (part of 14290)
2	19D594	A/C pressure transducer
3	19E889	O-ring seal

1. Disconnect the A/C pressure transducer electrical connector.



2. Remove the A/C pressure transducer.
   - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.
   - Install a new O-ring seal.

Air Conditioning (A/C) Pressure Relief Valve

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

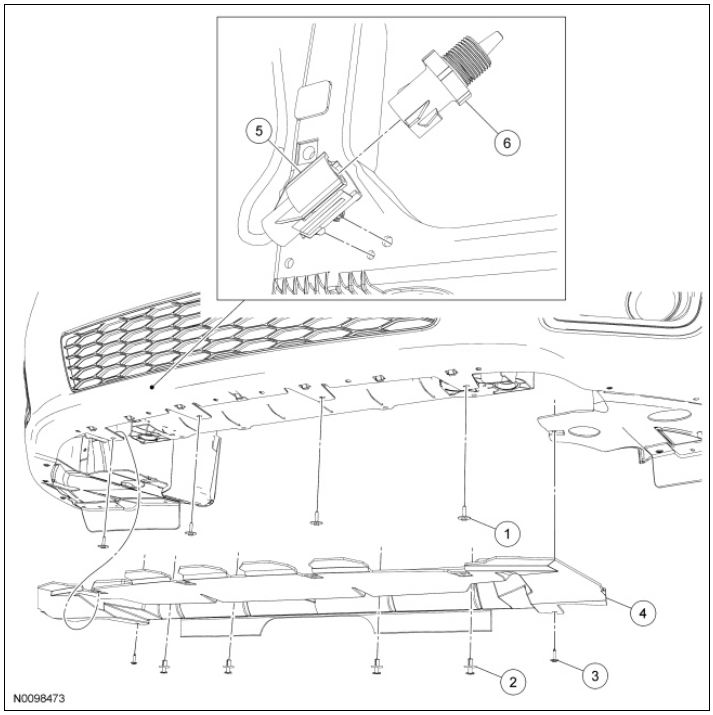
Item	Part Number	Description
1	19D644	A/C pressure relief valve
2	-	O-ring seal (part of 19D644)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00A .

3. Remove the A/C pressure relief valve and O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).



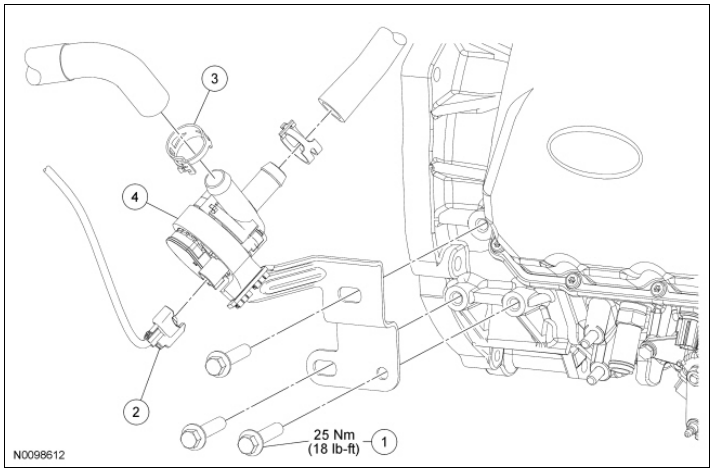
4. **NOTE:** A new O-ring seal will already be installed on the new A/C pressure relief valve service part.

   To install, reverse the removal procedure.

   - Add the correct amount of clean PAG refrigerant oil to the refrigerant system. For additional information, refer to Section 412-00A .

5. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Ambient Air Temperature Sensor



Item	Part Number	Description
1	W709976	Lower radiator air deflector front screw (4 required)
2	N807389	Lower radiator air deflector pin-type retainer (4 required)
3	W706805	Lower radiator air deflector rear screw (2 required)
4	8327	Lower radiator air deflector
5	-	Ambient air temperature sensor electrical connector (part of 14290)
6	19E642	Ambient air temperature sensor

Removal and Installation

1. Remove the 4 lower radiator air deflector front screws.
2. Remove the 4 lower radiator air deflector pin-type retainers.
3. Remove the 2 lower radiator air deflector rear screws.
4. Remove the lower radiator air deflector.
5. Detach and disconnect the ambient air temperature sensor electrical connector.
6. Remove the ambient air temperature sensor.

7. To install, reverse the removal procedure.

Auxiliary Coolant Flow Pump

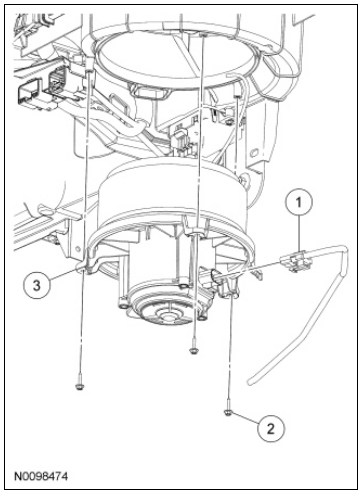
Item	Part Number	Description
1	W500233	Auxiliary coolant flow pump bracket bolt (3 required)
2	-	Auxiliary coolant flow pump electrical connector (part of 19D649)
3	8287	Heater hose clamp (2 required)
4	18D473	Auxiliary coolant flow pump

Removal and Installation

1. Drain the engine coolant. For additional information, refer to Section 303-03B .

2. Remove the 3 auxiliary coolant flow pump bolts.
   - To install, tighten to 25 Nm (18 lb-ft).

3. Disconnect the auxiliary coolant flow pump electrical connector.



4. Release the 2 heater hose clamps and disconnect the 2 heater hoses from the auxiliary coolant flow pump.

5. Remove the auxiliary coolant flow pump.

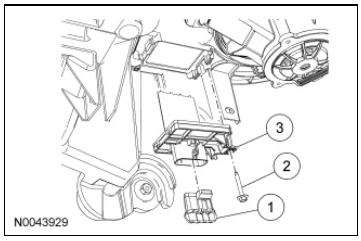
6. To install, reverse the removal procedure.

7. Fill the engine coolant level. For additional information, refer to Section 303-03B .

Blower Motor

Item	Part Number	Description
1	-	Blower motor electrical connector (part of 19D887)
2	W712320	Blower motor screw (3 required)
3	19805	Blower motor

Removal and Installation



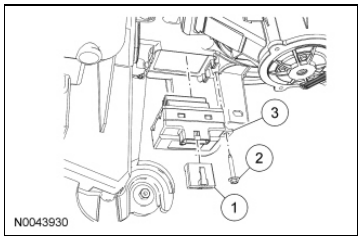
MKZ vehicles

1. Remove the RH lower instrument panel insulator.

All vehicles

2. Disconnect the blower motor electrical connector.
3. Remove the 3 blower motor screws.
4. Remove the blower motor.
5. To install, reverse the removal procedure.

Blower Motor Resistor



Item	Part Number	Description
1	-	Blower motor resistor electrical connector (part of 19D887)
2	-	Blower motor resistor screw
3	18591	Blower motor resistor

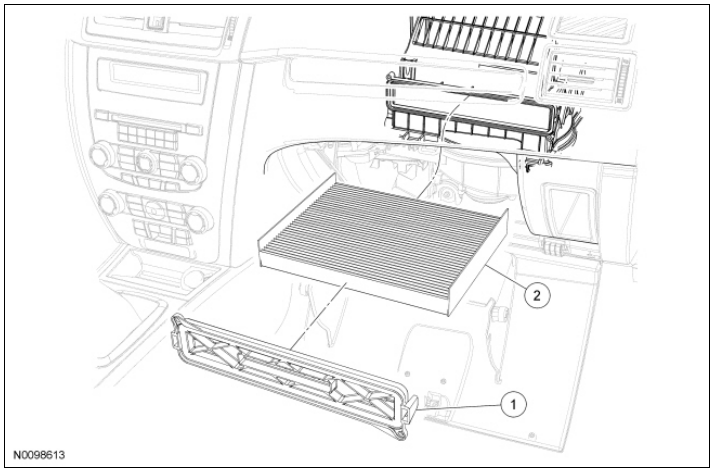
Removal and Installation

1. Disconnect the blower motor resistor electrical connector.
2. Remove the blower motor resistor screw.
3. Remove the blower motor resistor.
4. To install, reverse the removal procedure.

Blower Motor Speed Control

Item	Part Number	Description
1	-	Blower motor speed control electrical connector (part of 19D887)
2	-	Blower motor speed control screw
3	19E624	Blower motor speed control

Removal and Installation



MKZ vehicles

1. Remove the RH lower instrument panel insulator.

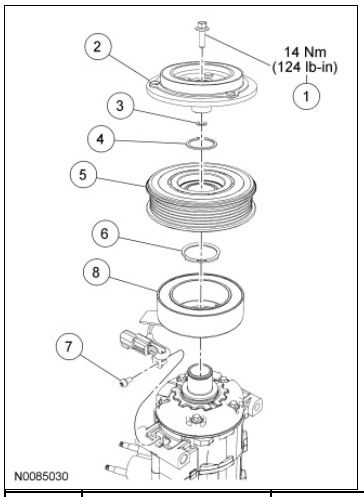
All vehicles

2. Disconnect the blower motor speed control electrical connector.
3. Remove the blower motor speed control screw.
4. Remove the blower motor speed control.
5. To install, reverse the removal procedure.

Cabin Air Filter

Item	Part Number	Description
1	99020C34	Cabin air filter access door
2	19N619	Cabin air filter

Removal and Installation



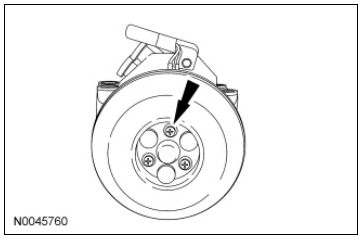
1. Remove the glove compartment.
2. Detach and remove the cabin air filter access door.
3. **NOTE:** The RH flap on the cabin air filter must be deflected downward to clear the glove compartment damper when removing and installing the filter.

   Remove the cabin air filter.
4. To install, reverse the removal procedure.

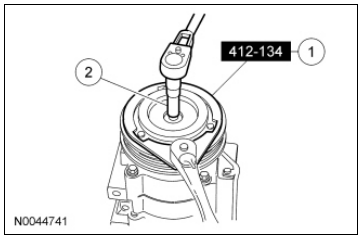
Clutch and Clutch Field Coil

Special Tool(s)

 ST2946-A	Holding Fixture, Compressor Clutch Disc and Hub 412-134



Item	Part Number	Description
1	W712303	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19D648	A/C clutch disc and hub spacers
4	W712302	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W712301	A/C clutch field coil snap ring
7	W712300	A/C clutch field coil electrical connector clip screw
8	19D798	A/C clutch field coil

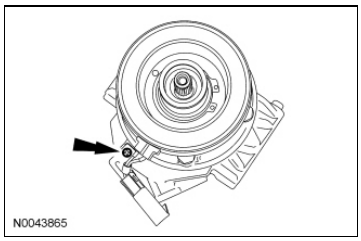


Removal

1. Remove the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor - 2.5L or Air Conditioning (A/C) Compressor - 3.0L, 3.5L in this section.

2. Remove the 3 screws and the A/C clutch shield (if equipped).

3. Remove the A/C clutch disc and hub bolt.
    1. Hold the A/C clutch disc and hub with the Compressor Clutch Disc and Hub Holding Fixture.
    2. Remove the A/C clutch disc and hub bolt.



4. Remove the A/C clutch disc and hub.

5. Remove the A/C compressor pulley snap ring.

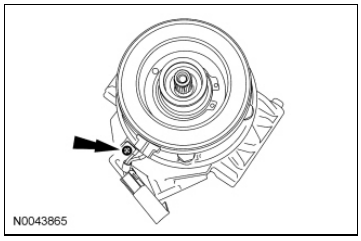
6. Remove the A/C compressor pulley.

7. Remove the A/C clutch field coil electrical connector clip screw.

8. Remove the A/C clutch field coil snap ring.

9. Remove the A/C clutch field coil.

Installation



1. Visually inspect the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil for damage.
    - Inspect for physical damage, including cracked or melted components or discoloration due to excessive heat.
    - Inspect for excessive wear, including grooving in the A/C clutch disc and hub or A/C compressor pulley that is more than fingernail depth.
    - Inspect for roughness in the A/C compressor pulley bearing.

2. Clean the A/C clutch field coil and pulley mounting surfaces.

3. Install the A/C clutch field coil.

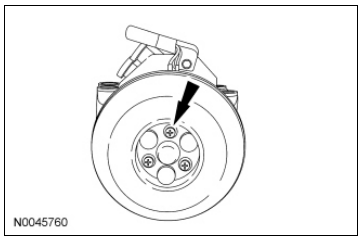
4. Install the A/C clutch field coil snap ring.

5. Install the A/C clutch field coil electrical connector clip screw.

6. **NOTE:** The A/C clutch pulley is a tight fit on the A/C compressor head. It must be correctly aligned during installation.

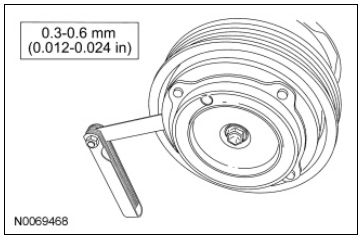
   Install the A/C clutch pulley.

7. Install the A/C clutch pulley snap ring.



8. Place one nominal thickness A/C clutch disc and hub spacer inside the clutch hub spline opening.

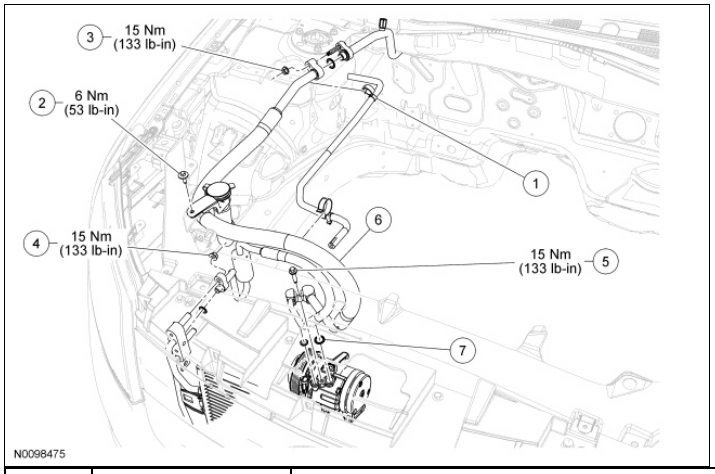
9. Install the A/C clutch disc and hub assembly.



10. Install the A/C clutch disc and hub bolt.
    1. Hold the A/C clutch disc and hub with the Compressor Clutch Disc and Hub Holding Fixture.
    2. Install the A/C clutch disc and hub bolt.
    - Tighten to 14 Nm (124 lb-in).

11. Install the A/C clutch shield and the 3 screws (if equipped).

12. Measure and adjust the clutch air gap by removing or adding A/C clutch hub spacers.



13. Install the A/C compressor. For additional information, refer to Air Conditioning (A/C) Compressor - 2.5L or Air Conditioning (A/C) Compressor - 3.0L, 3.5L in this section.

Compressor Manifold and Tube Assembly - 2.5L

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	-	Coolant reservoir hose retainer (part of 8276)
2	W503924	Washer reservoir filler neck bolt
3	W520413	Compressor manifold and tube suction fitting nut
4	W520413	Condenser inlet fitting nut
5	W701625	Compressor manifold bolt
6	19D734	Compressor manifold and tube assembly
7	19B596	Gasket seal (4 pieces from kit required)

Removal and Installation

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

1. Recover the refrigerant. For additional information, refer to Section 412-00A .

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Detach the coolant reservoir hose retainers from the compressor manifold and tube assembly.

4. Remove the washer reservoir filler neck bolt.
   - To install, tighten to 6 Nm (53 lb-in).

5. Remove the compressor manifold and tube suction fitting nut and disconnect the fitting.
    - Discard the gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

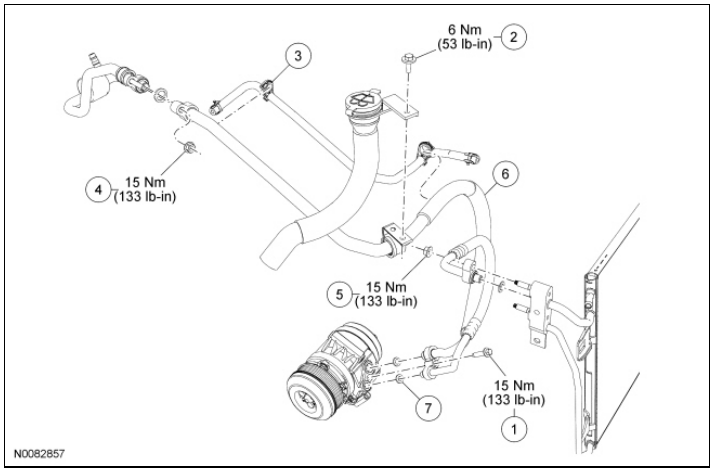
6. Remove the condenser inlet fitting nut and disconnect the fitting.
    - Discard the gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

7. Remove the lower engine splash shield (if equipped).

8. Remove the compressor manifold bolt and detach the manifold from the A/C compressor.
    - Discard the gasket seals.
    - To install, tighten to 15 Nm (133 lb-in).

9. Remove the compressor manifold and tube assembly.

10. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .



11. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Compressor Manifold and Tube Assembly - 3.0L, 3.5L

Material

Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

NOTE: 3.0L shown, 3.5L similar.

Item	Part Number	Description
1	W701625	Compressor manifold bolt
2	W503924	Washer reservoir filler neck bolt
3	-	Coolant reservoir hose retainer (2 required)
4	W520413	Compressor manifold and tube suction fitting nut
5	W520413	Condenser inlet fitting nut
6	19D734	Compressor manifold and tube assembly
7	19B596	Gasket seal (4 pieces from kit required)

Removal and Installation

NOTICE: **Do not stress or bend the aluminum lines on the compressor manifold and tube assembly to facilitate removal. Bending or squeezing the lines together may damage the welds and lead to premature failure of the line.**

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compoil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

All vehicles

1. Recover the refrigerant. For additional information, refer to Section 412-00A .

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

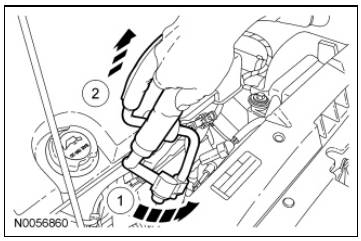
3. Remove the lower engine splash shield (if equipped).

4. Remove the compressor manifold bolt and detach the manifold from the A/C compressor.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).

5. Detach the 2 coolant reservoir hose retainers from the compressor manifold and tube assembly.

6. Remove the washer reservoir filler neck bolt.
   - To install, tighten to 6 Nm (53 lb-in).

7. Remove the compressor manifold and tube suction fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).



8. Remove the condenser inlet fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

3.5L vehicles

9. **NOTE:** Be sure not to strike the A/C lines against any hard object such as the exhaust manifold when removing the compressor manifold and tube assembly.

   Remove the compressor manifold and tube assembly.

   1. Rotate the compressor manifold and tube counterclockwise enough to allow it to be lifted between the exhaust manifold shield and alternator.
   2. Remove the compressor manifold and tube assembly.

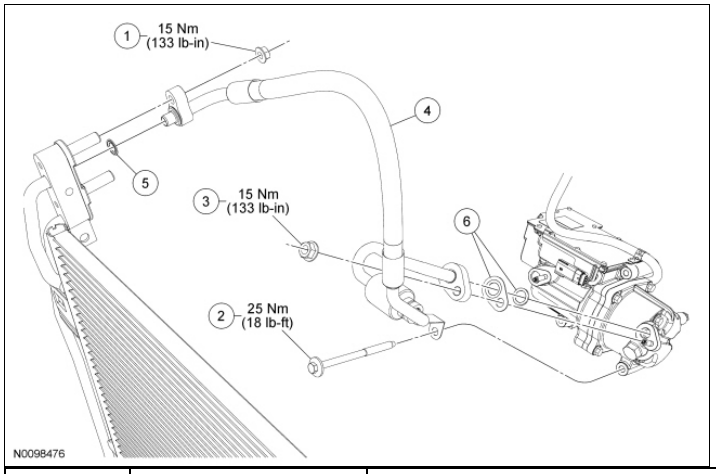
3.0L vehicles

10. **NOTE:** Be sure not to strike the A/C lines against any hard object such as the exhaust manifold when removing the compressor manifold and tube assembly.

    Remove the compressor manifold and tube assembly.

All vehicles

11. To install, reverse the removal procedure.
    - Install new gasket seals.



- Add the correct amount of clean PAG oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Compressor to Condenser Discharge Line - Hybrid

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-

Item	Part Number	Description
1	W520413	Condenser inlet fitting nut
2	W701626	Lower rear A/C compressor bolt
3	W520413	A/C compressor discharge fitting nut
4	19D734	Compressor-to-condenser discharge line
5	19B596	Gasket seal (1 piece from kit required)
6	19B596	O-ring seal and gasket seal kit

Removal and Installation

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Recover the refrigerant. For additional information, refer to Section 412-00A .

3. Disconnect the condenser inlet fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

4. Remove the lower rear A/C compressor bolt.
    - To install, tighten to 25 Nm (18 lb-ft).

5. Remove the A/C compressor discharge fitting nut and remove the compressor-to-condenser discharge line.
    - Discard the gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

6. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil tthe hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

   To install, reverse the removal procedure.

    - Install a new O-ring seal and new gasket seals.
    - Add the correct amount of clean electric A/C compressor oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Condenser Core - 2.5L, 3.0L, Hybrid

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W503924	Washer reservoir filler neck bolt
2	W500214	Radiator bracket bolt (2 required)
3	8A193	Radiator bracket (2 required)
4	W520413	Condenser fitting nut (2 required)
5	W711622	Condenser manifold pin-type retainer
6	19712	Condenser core
7	19B596	Gasket seal (2 pieces from kit required)

Removal and Installation

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil**

to the hybrid vehicle refrigerant system will damage the electric Air Conditioning ressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

All vehicles

1. Recover the refrigerant. For additional information, refer to Section 412-00A .

2.5L or 3.0L vehicles

2. Remove the Air Cleaner (ACL). For additional information, refer to Section 303-12A or Section 303-12B .

All vehicles

3. Remove the engine cooling fan. For additional information, refer to Section 303-03A or Section 303-03B .

4. Remove the washer reservoir filler neck bolt.
    - To install, tighten to 6 Nm (53 lb-in).

3.0L vehicles

5. Remove the Thermostatic Expansion Valve (TXV) suction fitting nut and disconnect the fitting.
    - Discard the gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

All vehicles

6. Remove the 2 condenser fitting nuts and disconnect the fittings.
    - Discard the gasket seals.
    - To install, tighten to 15 Nm (133 lb-in).

7. Remove the 2 radiator bracket bolts and remove the 2 radiator brackets.
    - To install, tighten to 10 Nm (89 lb-in).

8. Remove the condenser manifold pin-type retainer.

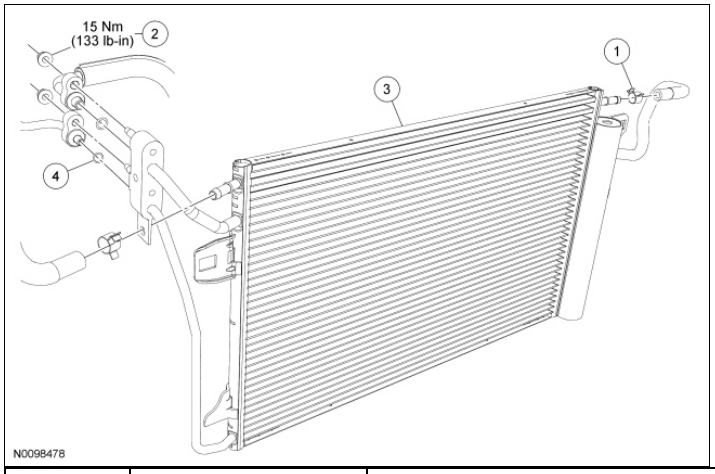
9. Detach the 2 condenser core retaining clips and detach the condenser core from the radiator.

10. Remove the condenser core.

11. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must b used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

    To install, reverse the removal procedure.

    - Install new gasket seals.



- Add the correct amount of clean PAG oil (non-hybrid vehicles) or electric A/C compressor oil (hybrid vehicles) to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Condenser Core - 3.5L

Material

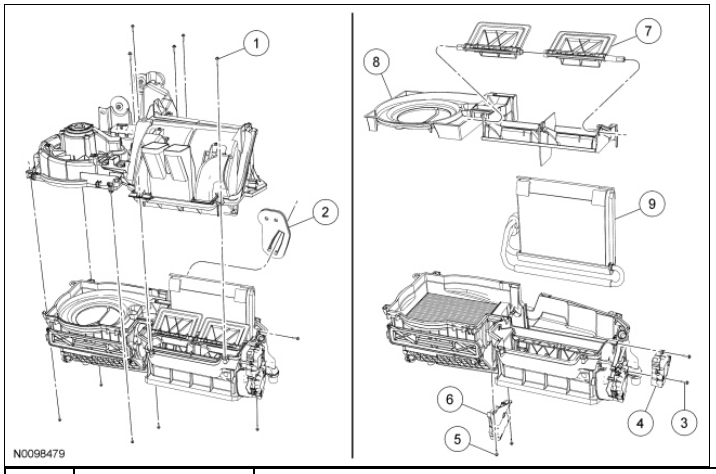
Item	Specification
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W525884	Power steering hose clamp (2 required)
2	W520413	Condenser fitting nut (2 required)
3	19712	Condenser core
4	19B596	Gasket seal (2 pieces from kit required)

Removal and Installation

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

1. Recover the refrigerant. For additional information, refer to Section 412-00A .
2. Remove adiator. For additional information, refer to Section 303-03A .
3. Release the 2 power steering cooler hose clamps and disconnect the power steering cooler hoses from the condenser core.
4. Remove the 2 condenser fitting nuts and disconnect the fittings.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).
5. Remove the condenser core.



6. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Add the correct amount of clean PAG oil. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Evaporator Core

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W712320	Evaporator core cover screw (11 required)
2	19W700	Dash panel seal
3	W712320	LH temperature blend door actuator screw (2 required)
4	19E616	LH temperature blend door actuator
5	W712320	RH temperature blend door actuator screw (2 required)
6	19E616	RH temperature blend door actuator
7	18B545	Temperature blend door (2 required)
8	19930	Heater core and evaporator core housing divider
9	19860	Evaporator core

Removal and Installation

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

NOTE: If an evaporator core leak is suspected, the evaporator core must be leak tested before it is removed from the vehicle.

All vehicles

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Detach the wire harness from the heater core and evaporator core housing.
3. Remove the 11 evaporator core cover screws.
4. Separate the 2 halves of the heater core and evaporator core housing.
5. Remove the dash panel seal.
6. Remove the 2 LH temperature blend door actuator screws and detach the actuator.

Dual-zone Electronic Automatic Temperature Control (EATC) vehicles

7. Remove the 2 RH temperature blend door actuator screws and detach the actuator.
8. Remove the 2 temperature blend doors.

Electronic Manual Temperature Control (EMTC) vehicles

9. Remove the temperature blend door.

All vehicles

10. Remove the heater core and evaporator core housing divider from the heater core and evaporator core housing.
11. Remove the evaporator core.
12. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

    To install, reverse the removal procedure.

    - Add the correct amount of clean PAG oil (non-hybrid) or electric A/C compressor oil (hybrid) to the refrigerant system. For additional information, refer to Section 412-00A .

Evaporator to Compressor Suction Line - Hybrid

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-

Item	Part Number	Description
1	W712963	Evaporator-to-compressor suction line bracket bolt
2	W520413	Evaporator outlet line fitting nut
3	W520413	A/C compressor suction fitting nut
4	19D734	Evaporator-to-compressor suction line
5	19B596	Gasket seal
6	19B596	O-ring seal and gasket seal kit

Removal and Installation

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

1. Recover the refrigerant. For additional information, refer to Section 412-00A .

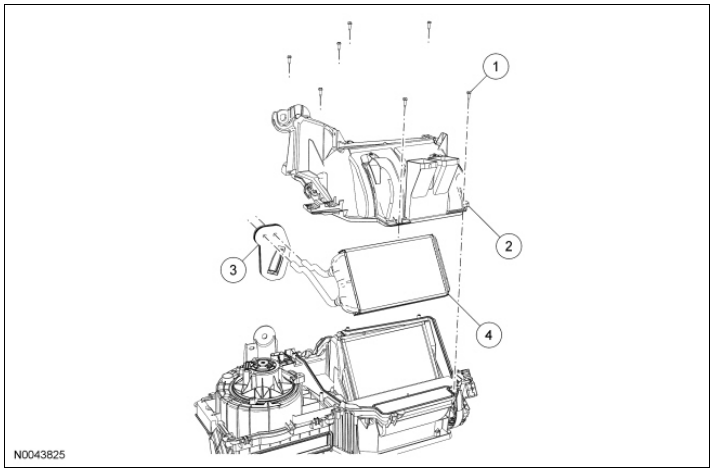
2. Detach the block heater wire harness clip from the evaporator-to-compressor suction line (if equipped).

3. Remove the evaporator-to-compressor suction line bracket bolt.
   - To install, tighten to 6 Nm (53 lb-in).

4. Remove the evaporator outlet line fitting nut and disconnect the fitting.
    - Discard the gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

5. Remove the A/C compressor suction fitting nut and disconnect the fitting.
    - Discard the gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

6. Remove the evaporator-to-compressor suction line.



7. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

   To install, reverse the removal procedure.

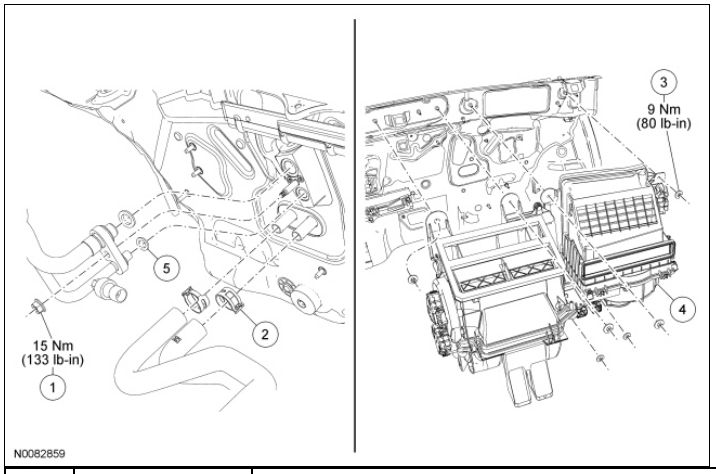
    - Install a new O-ring seal and new gasket seals.
    - Add the correct amount of clean electric A/C compressor oil to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

8. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Heater Core

Item	Part Number	Description
1	W712320	Heater core cover screw (8 required)
2	18B300	Heater core cover
3	19C593	Dash panel seal
4	18476	Heater core

Removal and Installation



NOTE: If a heater core leak is suspected, the heater core must be pressure leak tested before it is removed from the vehicle. For additional information, refer to Section 412-00A .

1. Remove the heater core and evaporator core housing. For additional information, refer to Heater Core And Evaporator Core Housing in this section.
2. Detach the wire harness from the heater core cover.
3. Remove the 8 heater core cover screws.
4. Remove the heater core cover.
5. Remove the dash panel seal from the heater core tubes.
6. Remove the heater core.
7. To install, reverse the removal procedure.

Heater Core And Evaporator Core Housing

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520413	Thermostatic Expansion Valve (TXV) fitting nut
2	8287	Heater hose clamp (2 required)
3	N621907	Heater core and evaporator core housing nut (6 required)
4	-	Heater core and evaporator core housing
5	19B596	Gasket seal (2 pieces from kit required)

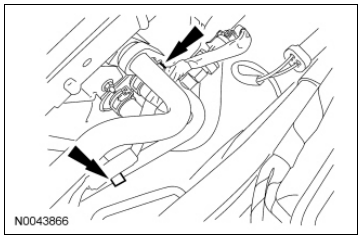
Removal and Installation

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

NOTICE: **Use only the Air Condg (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

3.5L vehicles

1. Remove the lower cowl panel grille. For additional information, refer to Section 501-02 .



All vehicles

2. Recover the refrigerant. For additional information, refer to Section 412-00A .

3. Drain the engine coolant. For additional information, refer to Section 303-03A .

4. Remove the instrument panel. For additional information, refer to Section 501-12 .

5. Disconnect the A/C pressure transducer electrical connector and detach the wire harness from the Thermostatic Expansion Valve (TXV) stud.

6. Remove the TXV fitting nut and disconnect the fitting.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).

7. Release the 2 heater hoses clamps and disconnect the hoses from the heater core.

8. Remove the 6 heater core and evaporator core housing nuts.
   - To install, tighten to 9 Nm (80 lb-in).

9. Remove the heater core and evaporator core housing.

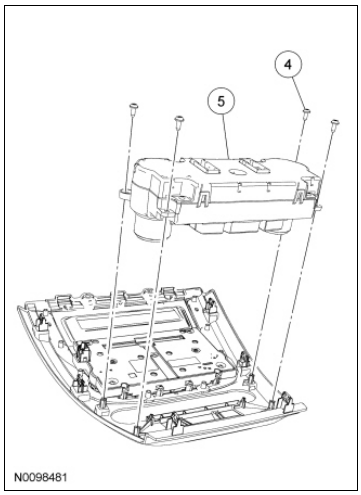
10. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

    To instl, reverse the removal procedure.

    - Install new gasket seals.
    - Add the correct amount of clean PAG oil (non-hybrid) or electric A/C compressor oil (hybrid) to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

11. Fill the engine coolant level. For additional information, refer to Section 303-03A .

12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .



Heating Ventilation Air Conditioning (HVAC) Module - Fusion, Milan

With Navigation System

Item	Part Number	Description
1	W707628	HVAC module screw (2 required)
2	-	HVAC module electrical connector (2 required) (part of 14401)
3	19980	HVAC module

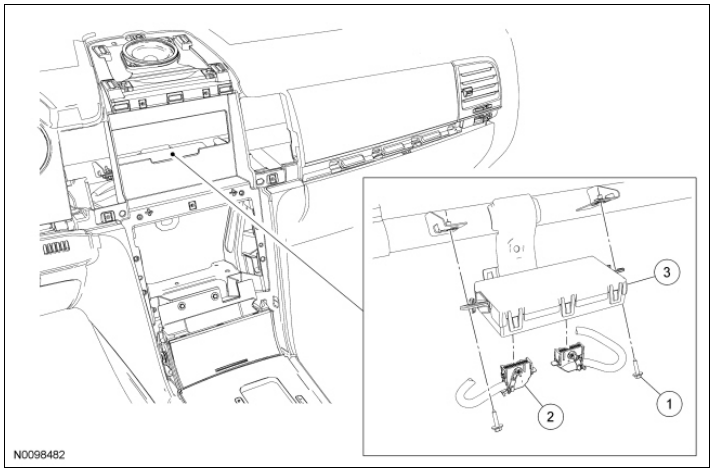
Without Navigation System

Item	Part Number	Description
4	W506942	HVAC module screw (4 required)
5	19980	HVAC module

Removal and Installation

Vehicles equipped with navigation system

1. Remove the Front Display Interface Module (FDIM). For additional information, refer to Section 415-00 .
2. Remove the 2 HVAC module screws.
3. Disconnect the 2 HVAC module electrical connectors and remove the HVAC module.



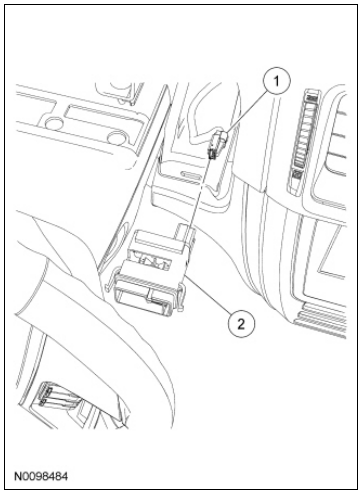
Vehicles without navigation system

4. Remove the center instrument panel finish panel. For additional information, refer to Section 501-12 .
5. Remove the 4 HVAC module screws and remove the HVAC module.

All vehicles

6. To install, reverse the removal procedure.

Heating Ventilation Air Conditioning (HVAC) Module - MKZ

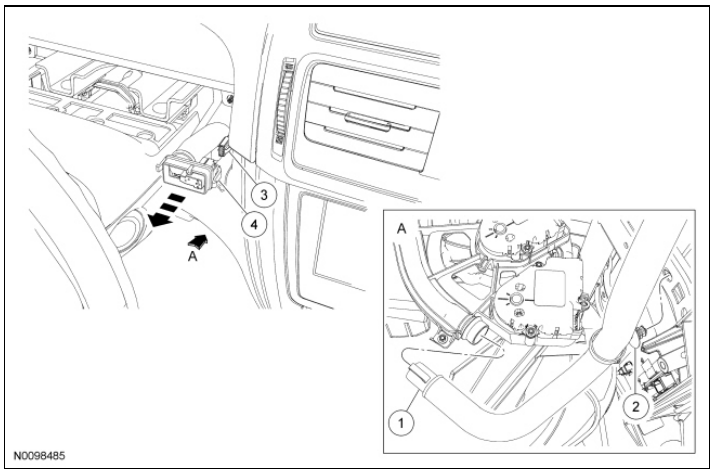


Item	Part Number	Description
1	W707628	HVAC module screw (2 required)
2	-	HVAC module electrical connector (part of 14401)
3	19980	HVAC module

Removal and Installation

1. Remove the Front Display Interface Module (FDIM). For additional information, refer to Section 415-00 .
2. Remove the 2 HVAC module screws.
3. Disconnect the 2 HVAC module electrical connectors.
4. Remove the HVAC module.
5. To install, reverse the removal procedure.

In-Vehicle Temperature and Humidity Sensor - Hybrid



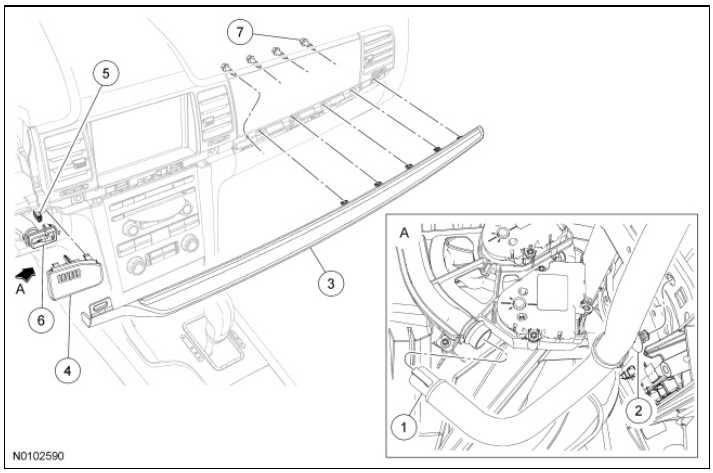
Item	Part Number	Description
1	-	In-vehicle temperature and humidity sensor electrical connector (part of 14401)
2	19C734	In-vehicle temperature and humidity sensor

Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Disconnect the in-vehicle temperature and humidity sensor electrical connector.
3. Remove the in-vehicle temperature and humidity sensor.
4. To install, reverse the removal procedure.

In-Vehicle Temperature Sensor - Fusion, Milan

Fusion, Milan



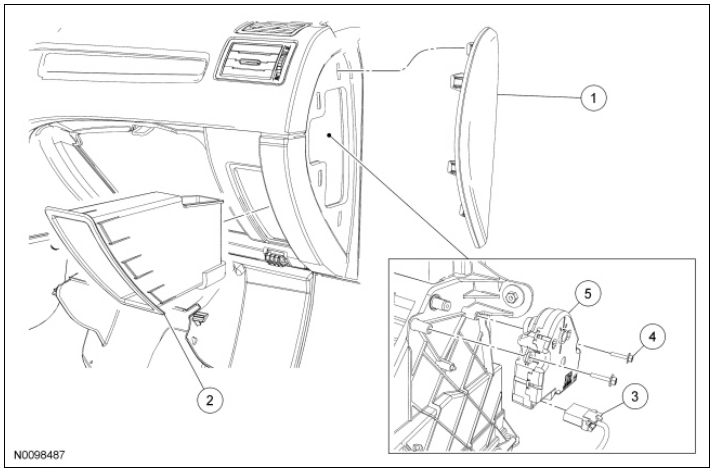
Item	Part Number	Description
1	-	In-vehicle temperature sensor aspirator hose connection (part of 19C734)
2	-	In-vehicle temperature sensor aspirator hose pin-type retainer (part of 19C734)
3	-	In-vehicle temperature sensor electrical connector (part of 14401)
4	19C734	In-vehicle temperature sensor

Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Disconnect the in-vehicle temperature sensor aspirator hose connection at the heater core and evaporator core housing.
3. Detach the in-vehicle temperature sensor aspirator hose pin-type retainer.
4. Disconnect the in-vehicle temperature sensor electrical connector.
5. Remove the itemperature sensor and aspirator hose assembly.
6. To install, reverse the removal procedure.

In-Vehicle Temperature Sensor - MKZ

MKZ



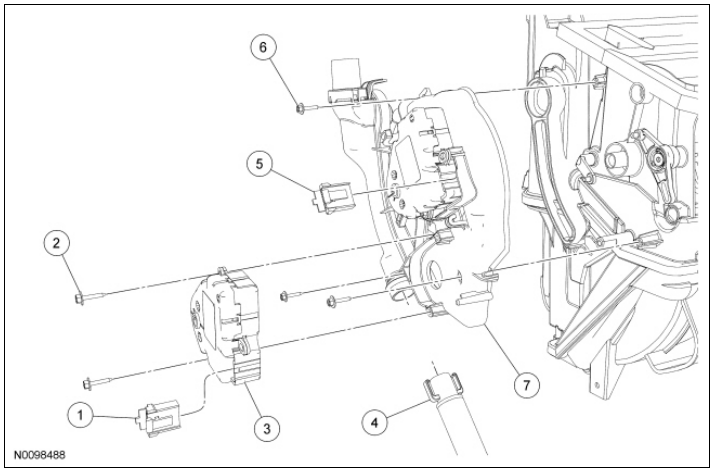
Item	Part Number	Description
1	-	In-vehicle temperature sensor aspirator hose connection (part of 19C734)
2	-	In-vehicle temperature sensor aspirator hose pin-type retainer (part of 19C734)
3	54044A90	RH instrument panel finish moulding
4	54046A76	In-vehicle temperature sensor grille
5	-	In-vehicle temperature sensor electrical connector (part of 14401)
6	19C734	In-vehicle temperature sensor
7	W707607	RH instrument panel finish moulding screw (4 required)

Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Disconnect the in-vehicle temperature sensor aspirator hose connection at the heate evaporator core housing.
3. Detach the in-vehicle temperature sensor aspirator hose pin-type retainer.
4. Lower the glove compartment.
5. Remove the 4 RH instrument panel finish moulding screws.
6. Remove the RH instrument panel finish moulding.
7. Detach the in-vehicle temperature sensor grille from the instrument panel.

8. Detach the in-vehicle temperature sensor grille from the in-vehicle temperature sensor.
9. Disconnect the in-vehicle temperature sensor electrical connector.
10. Remove the in-vehicle temperature sensor and aspirator hose assembly.
11. To install, reverse the removal procedure.

Mode Door Actuator - Air Inlet Door



Item	Part Number	Description
1	04480	Instrument panel side finish panel
2	5406010	Glove compartment storage bin
3	-	Air inlet mode door actuator electrical connector (part of 19D887)
4	W712320	Air inlet mode door actuator screw (2 required)
5	19E616	Air inlet mode door actuator

Removal and Installation

1. Lower the glove compartment.
2. Remove the RH instrument panel end panel.
3. Remove the glove compartment storage bin.
4. Disconnect the air inlet mode door actuator electrical connector.
5. Remove the 2 air inlet mode door actuator screws.
6. Remove the air inlet mode door actuator.
7. To install, reverse the removal procedure.

Mode Door Actuator - Defrost/Panel/Floor Door

Item	Part Number	Description
1	-	LH temperature blend door actuator electrical connector (part of 19D887)
2	W712320	LH temperature blend door actuator screw (2 required)
3	19E616	LH temperature blend door actuator
4	-	In-vehicle temperature sensor aspirator hose connection (part of 19C734)
5	-	DEFROST/PANEL/FLOOR mode door actuator electrical connector (part of 19D887)
6	W712320	DEFROST/PANEL/FLOOR mode door actuator and cam assembly screw
7	19C772	DEFROST/PANEL/FLOOR mode door actuator and cam assembly

Removal and Installation

1. Remove the instrument panel. For additional information, refer to Section 501-12 .
2. Disconnect the LH temperature blend dor electrical connector.
3. Remove the 2 LH temperature blend door actuator screws.
4. Remove the LH temperature blend door actuator.
5. Disconnect the in-vehicle temperature sensor aspirator hose connection.
6. Disconnect the DEFROST/PANEL/FLOOR mode door actuator electrical connector.
7. Remove the 3 DEFROST/PANEL/FLOOR mode door actuator and cam assembly screws.
8. Remove the DEFROST/PANEL/FLOOR mode door actuator and cam assembly.

9. To install, reverse the removal procedure.

10. **NOTE:** The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out calibration, carry out the following steps.

    Remove the Smart Junction Box (SJB) fuse 15 for at least one minute.

11. **NOTE:** When the ignition switch is switched to the ON position, the HVAC module will initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds.

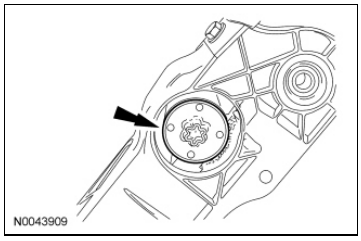
    Reinstall SJB fuse 15. Turn the ignition switch to the ON position and wait 30 seconds before verifying correct DEFROST/PANEL/FLOOR operation.

Receiver Drier Cartridge

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Removal and Installation

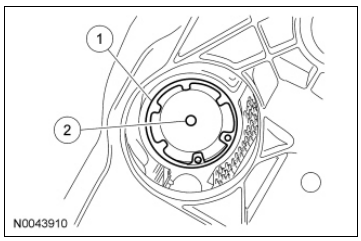


NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

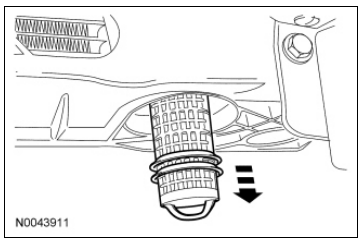
NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

NOTICE: **Care must be taken to minimize exposure of the receiver/drier cartridge to outside air. If multiple Air Conditioning (A/C) system components are being removed and installed, the receiver/drier cartridge should be installed last. The new receiver/drier cartridge should not be removed from its packaging until it is ready to be installed. Evacuation of the A/C system must be started as soon as the receiver/drier cartridge is installed. Excessive exposure of the receiver/drier cartridge to outside air will result in moisture contamination of the receiver/drier cartridge desiccant.**

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the rec/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.



1. Recover the refrigerant. For additional information, refer to Section 412-00A .
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer Section 100-02 .
3. Remove the lower radiator air deflector.
4. Unscrew and remove the plastic receiver/drier cap.

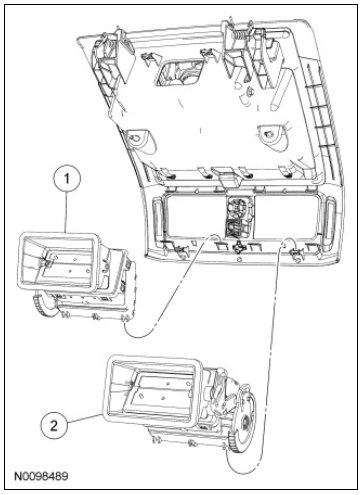


5. **NOTE:** If the receiver/drier plug is difficult to remove, open a refrigerant system fitting to relieve any vacuum created during refrigerant recovery, and attempt to remove the plug again.

   Remove the receiver/drier plug.

   1. Push the receiver/drier plug upwards and remove the snap ring.
   2. Install the bolt included with the A/C desiccant cartridge service kit in the center of the receiver drier plug and remove the plug.

6. Using a suitable tool, grasp the receiver/drier cartridge grab handle and remove the receiver/drier cartridge.



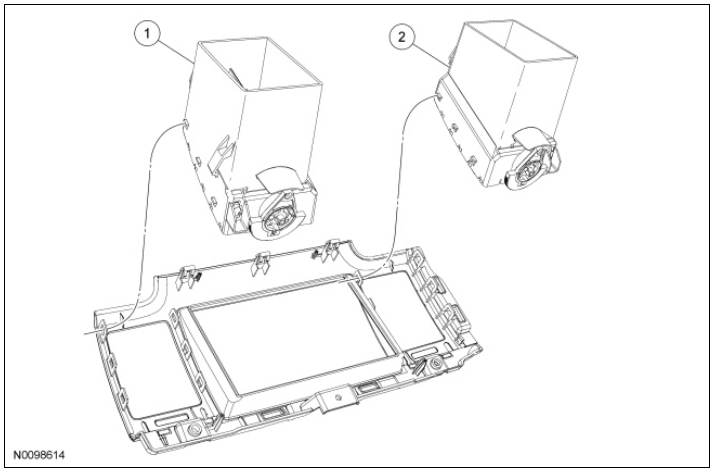
7. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

   To install, reverse the removal procedu.

   - Lubricate the receiver/drier plug O-ring seals using residual refrigerant oil from inside the receiver/drier.
   - Add the correct amount of clean PAG oil (non-hybrid) or electric A/C compressor oil (hybrid) to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

8. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Register - Center, Fusion/Milan

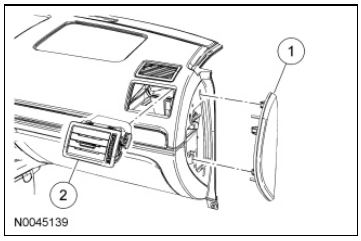


Item	Part Number	Description
1	19893	RH center instrument panel register
2	19893	LH center instrument panel register

Removal and Installation

1. Remove the instrument panel upper storage compartment. For additional information, refer to Section 501-12 .
2. Release the clips on each register and remove the 2 center instrument panel registers.
3. To install, reverse the removal procedure.

Register - Center, MKZ

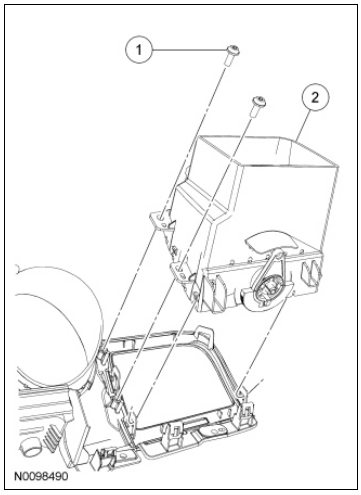


Item	Part Number	Description
1	19893	RH center register
2	19893	LH center register

Removal and Installation

1. Remove the center instrument panel finish panel. For additional information, refer to Section 501-12 .
2. Detach the RH and LH center register clips and remove the RH and LH center registers.
3. To install, reverse the removal procedure.

Register - Driver and Passenger Side, Fusion/Milan



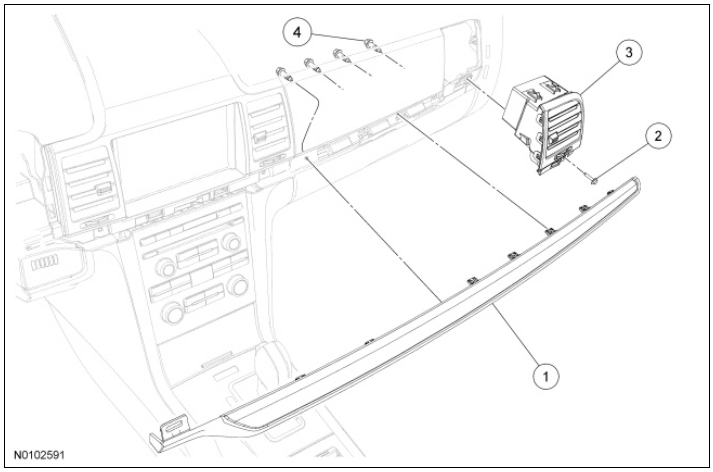
Item	Part Number	Description
1	04480 RH/ 04481 LH	Instrument panel side finish panel
2	19893	Register

Removal and Installation

NOTE: Passenger side register shown, driver side similar.

1. Remove the instrument panel end panel.
2. Working through the instrument panel end panel opening, release the 2 lower register clips and remove the driver or passenger side instrument panel register.
3. To install, reverse the removal procedure.

Register - LH, MKZ

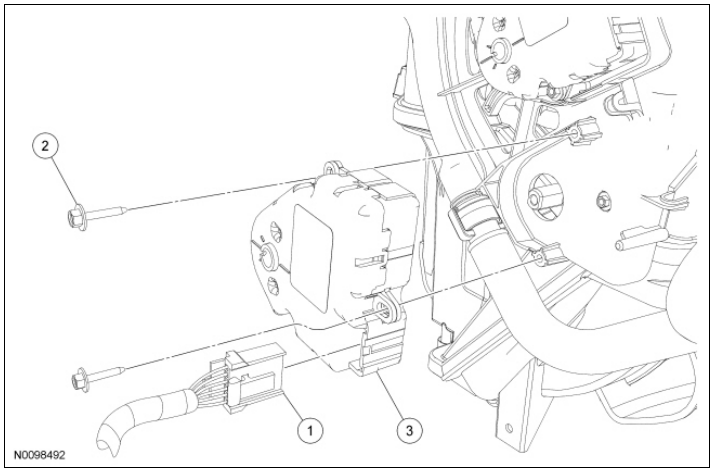


Item	Part Number	Description
1	-	LH instrument panel register screw (2 required)
2	19893	LH instrument panel register

Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Remove the 2 LH instrument panel register screws.
3. Remove the LH register.
4. To install, reverse the removal procedure.

Register - RH, MKZ



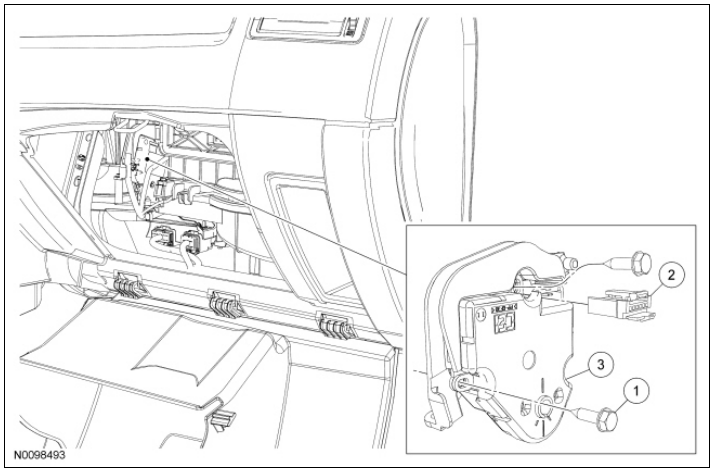
Item	Part Number	Description
1	54044A90	RH instrument panel finish moulding
2	-	RH register screw
3	19893	RH register
4	W707607	RH instrument panel finish moulding screw (4 required)

Removal and Installation

1. Remove the instrument cluster finish panel. For additional information, refer to Section 501-12 .
2. Lower the glove compartment.
3. Remove the 4 RH instrument panel finish moulding screws.
4. Remove the RH instrument panel finish moulding.
5. Remove the RH register screw.
6. Remove the RH register.
7. To install, reverse the removal procedure.

Temperature Blend Door Actuator - LH

Item	Part Number	Description
1	-	LH temperature blend door actuator electrical connector (part of 19D887)
2	W712320	LH temperature blend door actuator screw (2 required)
3	19E616	LH temperature blend door actuator



Removal and Installation

NOTE: The LH temperature blend door actuator can be accessed from below the LH side of the instrument panel to the right of the accelerator pedal.

1. Disconnect the LH temperature blend door actuator.
2. Remove the 2 LH temperature blend door actuator screws.
3. Remove the LH temperature blend door actuator.
4. To install, reverse the removal procedure.
5. **NOTE:** The purpose of the module actuator position calibration is to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out calibration, carry out the following steps.

   Remove the Smart Junction Box (SJB) fuse 15 for at least one minute.
6. **NOTE:** When the ignition switch is switched to the ON position, the HVAC module will initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds. SJB fuse 15. Turn the ignition switch to the ON position and wait 30 seconds before verifying correct DEFROST/PANEL/FLOOR operation.

Temperature Blend Door Actuator - RH, Dual-Zone EATC

Item	Part Number	Description
1	W712320	RH temperature blend door actuator screw (2 required)
2	-	RH temperature blend door actuator electrical connector (part of 19D887)
3	19E616	RH temperature blend door actuator

Removal and Installation

1. Remove the passenger air bag module. For additional information, refer to Section 501-20B .
2. Disconnect the RH temperature blend door actuator electrical connector.
3. Remove the 2 RH temperature blend door actuator bracket screws.
4. Detach the wire harness from the RH temperature blend door actuator bracket.
5. Remove the RH temperature blend door actuator.
6. To install, reverse the removal procedure.
7. **NOTE:** The purpose of the module actuator position calibris to allow the HVAC module to reinitialize and calibrate the actuator stop points. To carry out calibration, carry out the following steps.

   Remove the Smart Junction Box (SJB) fuse 15 for at least one minute.
8. **NOTE:** When the ignition switch is switched to the ON position, the HVAC module will initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds.

   Reinstall SJB fuse 15. Turn the ignition switch to the ON position and wait 30 seconds before verifying correct DEFROST/PANEL/FLOOR operation.

Thermostatic Expansion Valve

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	-	A/C pressure transducer electrical connector (part of 14290)
2	W520413	Thermostatic Expansion Valve (TXV) fitting nut
3	W712321	TXV bolt (2 required)
4	19849	TXV
5	19B596	Gasket seal (4 pieces from kit required)

Removal and Installation

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate and damage the A/C system.**

1. Recover the refrigerant. For additional information, refer to Section 412-00A .
2. Disconnect the A/C pressure transducer electrical connector and detach the wire harness from the Thermostatic Expansion Valve (TXV) stud.
3. Remove the TXV fitting nut and disconnect the fitting.

- Discard the gasket seals.
- To install, tighten to 15 Nm (133 lb-in).

4. Remove the 2 TXV bolts.

5. Remove the TXV .
   - Discard the gasket seals.

6. ***NOTICE:*** **Motorcraft® Electric A/C Compressor Oil only must be used as a refrierant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

   To install, reverse the removal procedure.

   - Install new gasket seals.
   - Add the correct amount of clean PAG oil (non-hybrid) or electric A/C compressor oil (hybrid) to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Thermostatic Expansion Valve Manifold and Tube Assembly

Material

Item	Specification
Motorcraft® Electric A/C Compressor Oil YN-32	-
Motorcraft® PAG Refrigerant Compressor Oil YN-12-D	WSH-M1C231-B

Item	Part Number	Description
1	W520413	Condenser-to-evaporator line fitting nut
2	W520413	Compressor manifold and tube suction fitting nut
3	W707399	Thermostatic Expansion Valve (TXV) manifold and tube bracket bolt
4	14290	A/C pressure transducer electrical connector
5	W520413	TXV fitting nut
6	19835	TXV manifold and tube assembly
7	19B596	Gasket seal (4 pieces from kit required)

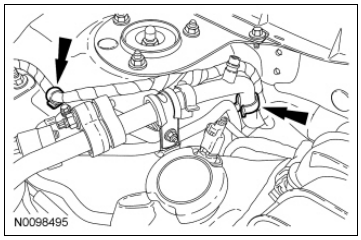
Removal and Installation

NOTICE: **Motorcraft® Electric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

NOTICE: **Use only the Air Conditioning (A/C) refrigerant compressor oil specified for this vehicle configuration. Use of any A/C refrigerant compressor oil other than what is specified will contaminate**

and damage the A/C system.

All vehicles



1. Recover the refrigerant. For additional information, refer to Section 412-00A .

3.5L vehicles

2. Remove the lower cowl panel grille. For additional information, refer to Section 501-02 .

Non-hybrid vehicles

3. Detach the wire harness pin-type retainer at the front of the RH shock tower and detach the 2 wire harness clips from the Thermostatic Expansion Valve (TXV) manifold and tube assembly.

All vehicles

4. Remove the condenser-to-evaporator line fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

5. Remove the compressor manifold and tube suction fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (133 lb-in).

6. Remove the TXV manifold and tube bracket bolt.
   - To install, tighten to 8 Nm (71 lb-in).

7. Disconnect the A/C pressure transducer electrical connector and detach the wire harness from the TXV manifold and tube assembly.

8. Remove the TXV fitting nut and disconnect the fitting.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (133 lb-in).

9. Remove the TXV manifold and tube assembly.

10. ***NOTICE:*** **Motorcraft® Elecric A/C Compressor Oil only must be used as a refrigerant system lubricant for hybrid vehicles. Addition of any oil other than Motorcraft® Electric A/C Compressor Oil to the hybrid vehicle refrigerant system will damage the electric Air Conditioning (A/C) compressor and contaminate the refrigerant system. Refer to the Refrigerant Oil Adding procedure in Section 412-00A .**

    To install, reverse the removal procedure.

    - Install new O-ring seals and new gasket seals.

- Add the correct amount of clean PAG oil (non-hybrid) or electric A/C compressor oil (hybrid) to the refrigerant system. For additional information, refer to the Refrigerant Oil Adding procedure in Section 412-00A .

11. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Section 412-00A .

Instrument Cluster and Panel Illumination

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Illumination is used to provide backlighting to the dimmable and non-dimmable switches and control components.

If the exterior lamps are activated during daytime sunload conditions by the autolamp system, the Instrument Panel Cluster (IPC) message center (non-Hybrid) or the Liquid Crystal Display (LCD) (Hybrid), Audio Control Module (ACM), Front Controls Interface Module (FCIM), Front Display Interface Module (FDIM), the HVAC module and switch illumination remain at full intensity and do not dim from the instrument panel dimmer switch during this condition. If the vehicle travels under a bridge or a tunnel, the low level of ambient light causes the illumination level of the IPC message center (non-Hybrid) or the LCD (Hybrid), the ACM , the FCIM , the FDIM , the HVAC module and switches to change to the level set by the instrument panel dimmer switch. The IPC message center (non-Hybrid) or the LCD (Hybrid), the ACM , the FCIM , the FDIM , the HVAC module and switch illumination change back to full intensity when the intense ambient light is restored.

Dimmable Backlighting

The dimmable switches and components are illuminated when the parking lamps are ON. The digital dimmer switch is a double detent rocker switch used to control all dimmable interior illuminated components, and to control the courtesy lamps. The first up detent increases dimmable backlighting intensity. The first down detent decreases dimmable backlighting intensity.

The second up detent turns on the courtesy lamps. The second down detent turns the courtesy lamps off unless other features are still requesting the courtesy lamps on.

The dimmable switches and components consist of:

- Ambient lighting/traction control switch (if equipped) (Fusion)
- Ambient lighting select switch (if equipped) (MKZ)
- Ambient lighting dimmer switch (if equipped) (MKZ)
- Audio Control Module (ACM)
- Luggage compartment lid release switch
- Door lock control switches (MKZ)
- Front Controls Interface Module (FCIM)
- Front Display Interface Module (FDIM)
- Hazard flasher lamp switch (Fusion)
- Headlamp switch
- HVAC module
- Instrument Panel Cluster (IPC)
- Instrument panel dimmer switch
- Memory set switch (MKZ)
- Message center switch (Fusion)
- Speed control switches
- Steering wheel audio control switches
- Floor shifter
- Window control switches (MKZ)

Non-Dimmable Backlighting

The non-dimmable lighting switches and components are illuminated when the accessory delay relay is energized. The non-dimmable switches and components are illuminated at full lamp intensity. The non-dimmable lighting switches and components consist of:

- Cigar lighter (MKZ)
- Door lock control switches (Fusion)
- Roof opening panel switch (if equipped)
- Window control switches (Fusion)

Instrument Cluster and Panel Illumination

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025D or equivalent

Principles of Operation

Dimmable Backlighting

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

When the parking lamps are on, the SJB sends a pulse-width modulated voltage to the hardwired dimmable components and switches based on input received from the instrument panel dimmer switch.

The SJB also sends a message over the network to the Audio Control Module (ACM), Front Controls Interface Module (FCIM), Front Display Interface Module (FDIM), the HVAC module, and the Instrument Panel Cluster (IPC) to indicate the backlighting intensity level. If the receiving module receives invalid backlighting data from the SJB for 5 seconds or less, the receiving module defaults the backlighting to the last setting.

If the receiving module does not receive the backlighting status message from the SJB or if the data received is deemed invalid for more than 5 seconds, the receiving module sets a DTC in continuous memory and defaults the backlighting to full nighttime intensity.

Fixed Backlighting

For Fusion, when the accessory delay relay is energized, switched voltage is supplied to the window control and door lock control switches.

For MKZ, when the accessory delay relay is energized, switched voltage is supplied to the roof opening panel switch and the cigar lighter.

Field-Effect Transistor (FET) Protection

Field-Effect Transistor (FET) is a type of transistor that when used with module software can be used to monitor and control current flow on module outputs. The FET protection strategy is used to prevent module damage in the event of excessive current flow.

The SJB utilizes a FET protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), DTC B106E and the associated continuous DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

The SJB FET protected output circuit for the instrument panel illumination system is the backlighting output circuit.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Smart Junction Box (SJB) fuse(s): ♦ 10 (15A) (dimmable illumination) ♦ 41 (15A) (non-dimmable illumination) • Wiring, terminals or connectors • Illuminated components

- SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B106E	Solid State Driver Disabled Due to Short Circuit	The module has temporarily disabled an output because an excessive current draw exists (such as a short to ground). The SJB cannot enable the output until the cause of the short is corrected. ADDRESS all other DTCs first. After the cause of the concern is corrected, CLEAR the DTCs. REPEAT the self-test.
B106F	Module Disabled Due to External Fault	The module has permanently disabled an output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed. ADDRESS all other DTCs first. After the cause of the concern is corrected, INSTALL a new SJB . TEST the system for normal operation.
B213A		GO to Pinpoint Test A .

	Digital Dimmer Switch Input Circuit Failure	
B29B7	White Lighting Output Circuit Open	If the backlighting components are inoperative, GO to Pinpoint Test B . If the backlighting components are always on, GO to Pinpoint Test C .
B29B8	White Lighting Output Circuit Short to Ground	GO to Pinpoint Test C .
B2A32	LED Backlighting Output Circuit Open	If the backlighting components are inoperative, GO to Pinpoint Test B . If the hardwired backlighting components are always on, GO to Pinpoint Test C .
B2A33	LED Backlighting Output Circuit Short to Ground	GO to Pinpoint Test B .
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: All Dimmable Illumination Does Not Dim/Increase Brightness

Refer to Wiring Diagrams Cell 71 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Cluster and Panel Illumination for schematic and connector information.

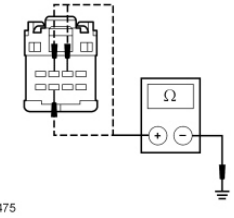
Normal Operation

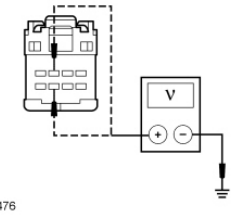
The Smart Junction Box (SJB) sends voltage signals to the instrument panel dimmer switch to monitor a request to turn up the dimmable lighting, turn down the dimmable lighting and to turn the courtesy lamps on or off. When the instrument panel dimmer switch is placed in the first detent up or down, the corresponding input signal is routed to ground indicating a request to turn the dimmable lighting up or down. When the instrument panel dimmer switch is pressed to the second detent, the dome lamp request input circuit is routed to ground in addition to the dimmer up or dimmer down input circuit. The SJB needs a dimmer up/down input circuit and the dome lamp request input circuit to turn the courtesy lamps on or off from the instrument panel dimmer switch.

When the parking lamps or headlamps are ON, the Smart Junction Box (SJB) monitors the input from the instrument panel dimmer switch to increase or decrease the dimmable lighting intensity.

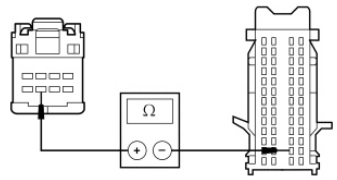
If the dim up/dim down or the dome lamp request input circuit is shorted to ground for longer than 17 seconds, the SJB defaults the backlighting to full nighttime brightness.

- DTC B213A (Digital Dimmer Switch Input Circuit Failure) - a continuous and on-demand DTC that sets when the SJB detects a short to ground from the dimmer up, dimmer down or dome lamp on/off request input circuit.





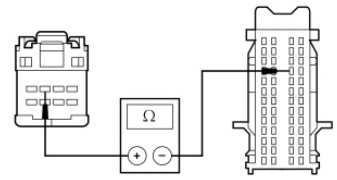
This pinpoint test is intended to diagnose the following:



- Wiring, terminals, or connectors
- Instrument panel dimmer switch
- SJB

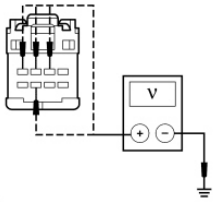
PINPOINT TEST A: ALL DIMMABLE ILLUMINATION DOES NOT DIM/INCREASE BRIGHTNESS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

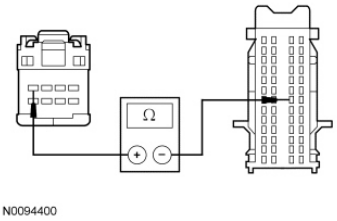


Test Step	Result / Action to Take
A1 CHECK FOR RECORDED DTCs FROM THE SJB SELF-TEST	
• Ignition OFF. • Check the recorded DTCs from the SJB on-demand self-test. • **Is DTC B213A present?**	**s** GO to A2 . **No** GO to A4 .
A2 REPEAT THE SJB SELF-TEST WITH THE INSTRUMENT PANEL DIMMER SWITCH DISCONNECTED	
• Disconnect: Instrument Panel Dimmer Switch C2065. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the SJB on-demand self-test. • **Is on-demand DTC B213A still present?**	**Yes** GO to A3 . **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.
A3 CHECK THE INSTRUMENT PANEL DIMMER SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b. • Measure the resistance between the instrument panel dimmer switch , harness side and ground as follows: **Connector-Pin** / **Circuit** C2065-2 / CLN28 (GN/BU) C2065-3 / CLN27 (WH/BN) C2065-7 / CLN12 (YE)	**Yes** GO to A9 . **No** REPAIR the circuit in question for a short to ground. CLEAR the DTCs. REPEAT the self-test.

 N0102475 • **Are the resistances greater than 10,000 ohms?**	
A4 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Disconnect: Instrument Panel Dimmer Switch C2065. • Carry out the instrument panel dimmer switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Is the instrument panel dimmer switch OK?**	**Yes** GO to A5 . **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Panel Dimmer Switch in this section. TEST the system for normal operation.
A5 CHECK THE INSTRUMENT PANEL DIMMER SWITCH DIM UP AND DIM DOWN INPUT CIRCUITS FOR VOLTAGE	
• Ignition ON. • Measure the voltage between the instrument panel dimmer switch C2065-7, circuit CLN12 (YE), harness side and ground; and between the instrument panel dimmer switch C2065-3, circuit CLN27 (WH/BN), harness side and ground.  N0102476 • **Are the voltages greater than 10 volts?**	**Yes** GO to A7 . **No** GO to A6 .
A6 CHECK THE INSTRUMENT PANEL DIMMER SWITCH DIM UP AND DIM DOWN CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280b. • Measure the resistance between the instrument panel dimmer switch C2065-7, circuit CLN12 (YE), harness side and the SJB C2280b-28, circuit CLN12 (YE), harness side.	**Yes** GO to A9 . **No** REPAIR the circuit in question for an open. TEST the system for normal operation.



N0099755



- Measure the resistance between the instrument panel dimmer switch C2065-3, circuit CLN27 (WH/BN), harness side and the SJB C2280b-36, circuit CLN27 (WH/BN), harness side.

N0099756

- **Are the resistances less than 5 ohms?**

A7 CHECK THE INSTRUMENT PANEL DIMMER SWITCH INPUT AND RETURN CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280b. • Ignition ON. • Measure the voltage between the instrument panel dimmer switch , harness side and ground as follows: **Connector-Pin / Circuit** C2065-2 — CLN28 (GN/BU) C2065-3 — CLN27 (WH/BN) C2065-4 — RLN29 (WH/OG) C2065-7 — CLN12 (YE)  N0102477 • **Is any voltage present?**	**Yes** REPAIR the circuit in question for a short to voltage. TEST the system for normal operation. **No** GO to A8 .

A8 CHECK THE INSTRUMENT PANEL DIMMER SWITCH RETURN CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the instrument panel dimmer switch C2065-4, circuit RLN29 (WH/OG), harness side and the SJB C2280b-33, circuit RLN29 (WH/OG), harness side.  N0094400 • **Is the resistance less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR circuit CLN27 (WH/BN) for an open. TEST the system for normal operation.
A9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: All Dimmable Switch Illumination Is Inoperative

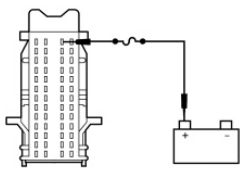
Refer to Wiring Diagrams Cell 71 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Cluster and Panel Illumination for schematic and connector information.

Normal Operation

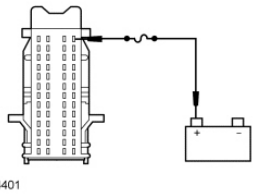
When the parking lamps are on, the Smart Junction Box (SJB) sends a Pulse Width Modulated (PWM) voltage to the hardwired dimmable illumination sources based on the input received from the instrument panel dimmer switch.

DTC Description	Fault Trigger Conditions
• B106E - Solid State Driver Disabled Due to Short Circuit	A continuous DTC that sets when the SJB has temporarily shut down the output driver. The module has temporarily disabled the backlighting output because an excessive current draw exists (such as a short to ground). The SJB cannot enable the backlighting output until the cause of the short is corrected, the DTCs have been cleared and a successful self-test is run.

• B106F - Module Disabled Due to External Fault	A continuous DTC that seten the SJB has permanently shut down the output driver. The module has permanently disabled the backlighting output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed.
• B2A32 - LED Backlighting Output Circuit Open	An on-demand DTC that sets when the SJB detects an open from the backlighting output circuit.
• B2A33 - LED Backlighting Output Circuit Short To Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the backlighting output circuit. The DTC also sets when fuse 10 (15A) has failed or is removed.
• B29B7 - White Lighting Output Circuit Open	An on-demand DTC that sets when the SJB detects an open from the white lighting (backlighting) circuit.
• B29B8 - White Lighting Output Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the white lighting (backlighting) output circuit. This DTC also sets when fuse 10 (15A) has failed or is removed.



This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST B: ALL DIMMABLE SWITCH ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK FOR RECORDED SJB DTCs FROM THE SELF-TEST	
• Use the recorded results from the SJB self-test. • **Is DTC B2A33 or DTC B29B8 present?**	**Yes** VERIFY the SJB fuse 10 (15A) is OK. IfK, GO to B2 . If not OK, REFER to the Wiring Diagrams Manual to identify the

	possible causes of the circuit short. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the backlighting output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** GO to B2 .
B2 BYPASS THE SJB	
NOTE: If the jumper wire fails, refer to the Wiring Diagrams Manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, test the system for normal operation. If DTC B106E is present, Clear the DTCs **and** repeat the self-test **(required to enable the backlighting output driver if DTC B106E is present).** TEST the system for normal operation. If DTC B106F is present, install a new SJB . Refer to Section 419-10 . TEST the system for normal operation. • Ignition OFF. • Disconnect: SJB C2280b. • For Fusion, connect a fused jumper wire between the SJB C2280b-39, circuit VLN04 (VT/GY), harness side and battery positive.  N0064547 • For MKZ, connect a fused jumper wire between the SJB C2280b-52, circuit VLN37 (BU/WH), harness side and battery positive.	**Yes** REMOVE the jumper wire. GO to B3 . **No** REMOVE the jumper wire. REPAIR circuit VLN04 (VT/GY) (Fusion) or circuit VLN37 (BU/WH) (MKZ) for an open. CLEAR the DTCs. REPEAT the self-test.

 N0094401 • **Do the backlighting components illuminate?**	
B3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: All Dimmable Switch Illumination Is Always On

Refer to Wiring Diagrams Cell 71 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Cluster and Panel Illumination for schematic and connector information.

Normal Operation

When the parking lamps are on, the Smart Junction Box (SJB) sends a Pulse Width Modulated (PWM) voltage to the hardwired dimmable illumination sources based on the input received from the instrument panel dimmer switch.

- DTC B2A32 (LED Backlighting Output Circuit Open) - an on-demand DTC that sets when the SJB detects a short to voltage from the backlighting output circuit.
- DTC B29B7 (White Lighting Output Circuit Open) - an on-demand DTC that sets when the SJB detects a short to voltage from the white lighting (backlighting) output circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST C: ALL DIMMABLE SWITCH ILLUMINATION IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

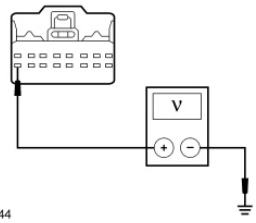
Test Step	Result / Action to Take
C1 CHECK THE EXTERIOR LIGHTING	

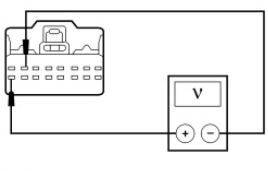
• Ignition ON. • Observe the exterior lighting components. • **Are any exterior lighting components illuminated?**	**Yes** REFER to Section 417-01 . **No** GO to C2 .
C2 CHECK THE SJB BACKLIGHTING OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280b. • Ignition ON. • **Do the dimmable backlighted components continue to illuminate?**	**Yes** REPAIR circuit VLN04 (VT/GY) (Fusion) or circuit VLN37 (BU/WH) (MKZ) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to C3 .
C3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: The Steering Wheel Control Illumination Is Inoperative

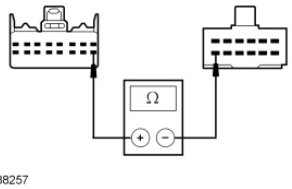
Refer to Wiring Diagrams Cell 71 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Cluster and Panel Illumination for schematic and connector information.

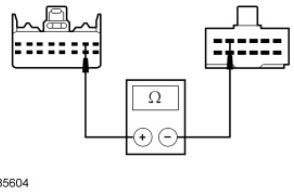
Normal Operation

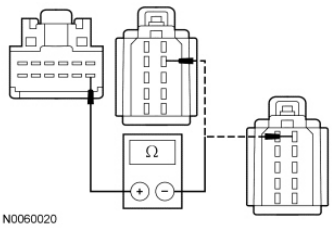




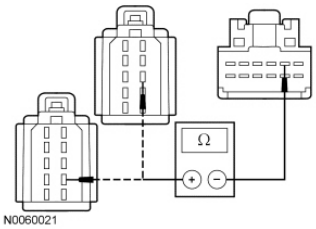
The Smart Junction Box (SJB) sends a Pulse Width Modulated (PWM) voltage to the steering wheel controls through the clockspring. The voltage passes through the clockspring to the steering wheel control switches.







This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Steering wheel control switch(es)
- Steering wheel harness
- Clockspring

PINPOINT TEST D: THE STEERING WHEEL CONTROL ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE OTHER DIMMABLE LIGHTING SWITCHES	
• Ignition OFF. • Place the headlamp switch in the PARKING LAMPS ON position. • Increase the backlighting brightness to the highest setting. • **Are all the dimmable switches inoperative?**	**Yes** GO to Pinpoint Test B . **No** GO to D2 .
D2 CHECK FOR VOLTAGE TO THE CLOCKSPRING	
• Place the headlamp switch in the OFF position. • Depower the Supplemental Restraint System (SRS). Refer to Section 501-20B . • Disconnect: Clockspring C218a. • Connect: Negative Battery Cable. • Place the headlamp switch in the PARKING LAMPS ON position. • Rotate the instrument panel dimmer switch to the full illumination position. • Measure the voltage between the clockspring C218a-16, circuit VLN04 (VT/GY) (Fusion) or circuit VLN37 (BU/WH) (MKZ), harness side and ground.  N0026444 • **Is the voltage greater than 10 volts?**	**Yes** GO to D3 . **No** REPAIR circuit VLN04 (VT/GY) (Fusion) or circuit VLN37 (BU/WH) (MKZ). REPOWER the SRS . REFER to Section 501-20B . TEST the system for normal operation.
D3 CHECK FOR VOLTAGE TO THE CLOCKSPRING USING THE CONNECTOR GROUND	
• Measure the voltage between the clockspring C218a-16, circuit VLN04 (VT/GY) (Fusion) or circuit VLN37 (BU/WH) (MKZ), harness side and the clockspring C218a-7, circuit GD116 (BK/VT), harness side.  N0090351 • **Is the voltage greater than 10 volts?**	**Yes** GO to D4 . **No** REPAIR circuit GD116 (BK/VT) for an open. REPOWER the SRS . REFER to Section 501-20B . TEST the system for normal operation.
D4 CHECK THE CLOCKSPRING FOR AN OPEN	

• Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring C218b. • Measure the resistance between the clockspring C218a pin 16, component side and the upper clockspring C218b pin 7, component side.  N0088257 • Measure the resistance between the clockspring C218a pin 7, component side and the upper clockspring C218b pin 2, component side.  N0085604 • **Are the resistances less than 5 ohms?**	**Yes** GO to D5 . **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.
D5 CHECK THE STEERING WHEEL HARNESS VOLTAGE CIRCUIT FOR AN OPEN	
• Disconnect: Steering Wheel Switches C2997 and C2998. • Measure the resistance between the upper clockspring C218b-7, circuit VLN04 (VT/GY), harness side and the LH steering wheel switch C2998-2, circuit VLN04 (VT/GY), harness side; and between the upper clockspring C218b-7, circuit VLN04 (VT/GY), harness side and the RH steering wheel switch C2997-1, circuit VLN04 (VT/GY), harness side.  N0060020 • **Are the resistances less than 5 ohms?**	**Yes** GO to D6 . **No** REPAIR or INSTALL a new steering wheel harness. INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.
D6 CHECK THE STEERING WHEEL HARNESS GROUND CIRCUIT FOR AN OPEN	

• Measure the resistance between the LH steering wheel switch C2998-4, circuit GD165 (BK), harness side and the clockspring C218b-2, circuit GD165 (BK), harness side; and between the RH steering wheel switch C2997-3, circuit GD165 (BK), harness side and the clockspring C218b-2, circuit GD165 (BK), harness side.  • **Are the resistances less than 5 ohms?**	**Yes** INSTALL new steering wheel controls as necessary. REFER to Section 419-03 or Section 415-00 . TEST the system for normal operation. **No** REPAIR or INSTALL a new steering wheel harness. INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Test E: One or More Switch Illumination Is Inoperative

Refer to Wiring Diagrams Cell 71 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Cluster and Panel Illumination for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends a Pulse Width Modulated (PWM) voltage to the dimmable components. When the accessory delay relay is energized, voltage is supplied to the door lock control switches (Fusion), roof opening panel switch and the cigar lighter.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ambient lighting/traction control switch (Fusion)
- Cigar lighter (MKZ)
- Luggage compartment lid release switch
- Door lock control switches (MKZ)
- Floor shifter
- Hazard flasher lamp switch (Fusion)
- Headlamp switch
- Instrument panel dimmer switch
- Memory set switch (MKZ)
- Message center switch (Fusion)
- Roof opening panel switch (if equipped)
- Window control switches (MKZ)
- Floor shifter
- SJB

PINPOINT TEST E: ONE OR MORE SWITCH ILLUMINATION IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE VOLTAGE TO THE SINGLE ILLUMINATION SOURCE	
NOTE: If the headlamp switch is the inoperative source, unplug the headlamp switch connector to measure the illumination circuit voltage. Unplugging the connector causes the SJB to turn the exterior lights on by default for 10 minutes, so it is unnecessary to turn the headlamp switch on. • Ignition OFF. • Disconnect: Inoperative Illumination Source. • Ignition ON. • Place the headlamp switch in the PARKING LAMPS ON position. • Increase the backlighting brightness to the highest setting. • Measure the voltage between the inoperative illumination source, harness side and ground as follows: **Fusion**	**Yes** For the instrument panel dimmer switch, window control switch, cigar lighter, door lock control switch, roof opening panel switch, luggage compartment lid release switch, ambient lighting/traction control switch, hazard flasher lamp switch, or floor shifter, INSTALL a new component in question. TEST the system for normal operation. For all others, GO to E2 . **No** REPAIR the voltage supply circuit in question for an open. TEST the system for normal operation.

Component	Connector-Pin	Circuit
Ambient lighting/traction control switch (Fusion)	C2304-6	VLN04 (VT/GY)
Luggage compartment lid release switch	C2269-3	VLN04 (VT/GY)
Floor shifter	C3233-4	VLN04 (VT/GY)
Hazard flasher lamp switch	C2039-3	VLN04 (VT/GY)
Headlamp switch	C205-1	VLN04 (VT/GY)
Instrument panel dimmer switch	C2065-1	VLN04 (VT/GY)
Message center switch	C253-3	VLN04 (VT/GY)
Roof opening panel switch	C912-1	CBP41 (BU)

Cigar lighter	C370-2	CBP41 (BU)
Roof opening panel switch	C912-1	CBP41 (BU)

- **Is the voltage greater than 10 volts?**

E2 CHECK THE VOLTAGE TO THE SINGLE ILLUMINATION SOURCE USING THE CONNECTOR GROUND

- Measure the voltage between the inoperative illumination source connector, harness side as follows:

Yes
INSTALL a new component in question. TEST the system for normal operation.

No
REPAIR the ground circuit in question for an open. TEST the system for normal operation.

Fusion

Component	Connector-Pin/ Circuit	Connector-Pin/ Circuit

24	-	Message center indicator display area

MyKey®

The MyKey® feature allows the customer to program a restricted driving mode that is tied to one or more keys known as a MyKey®. When a MyKey® is in use, the IPC provides the following functions:

- The IPC continuously provides a periodical Belt-Minder® warning chime until the driver and passenger safety belts are buckled. When the Belt-Minder® is issued, the ACM is muted and the

message center displays BUCKLE UP TO UNMUTE RADIO.
- If the MyKey® speed limiter feature is turned on and the vehicle speed approaches 130 km/h (80 mph), the message center displays VEHICLE NEAR TOP SPEED along with a chime.
- If the MyKey® speed limiter feature is turned on and the vehicle speed reaches 130 km/h (80 mph), the message center displays TOP SPEED MYKEY SETTING along with a chime.
- If the speed warning is selected at one of the pre-set values (75, 90, 105 km/h [45, 55, 65 mph]) and the vehicle approaches the pre-set speed, the message center displays CHECK SPEED DRIVE SAFELY along with a chime.
- If the traction control always on feature is turned on and the MyKey® driver presses the traction control switch to disable traction control, the message center displays ADVDTAC ON MYKEY SETTING.
- At 120 km (75 miles) of remaining fuel, the IPC illuminates the low fuel indicator (if equipped) and the message center displays the appropriate Distance To Empty (DTE) along with a chime.
- MyKey® miles driven by the MyKey® user can be found in the information d
- The number of MyKey® programmed and administrator keys can be found in the information and system check displays.
- The parking aid, Blind Spot Information System (BLIS®) Cross Traffic Alert (CTA) and collision avoidance warning menus are disabled in the message center to force these features always on.

When an administrator key is in use, the IPC provides the following functions:

- The message center provides a menu that guides the user to create a MyKey® programmed key. When the maximum MyKey® limit is reached, the MyKey® creation menu is no longer available.
- The message center provides menus for setting 4 optional MyKey® features:
    - MyKey® 80 MPH speed limiter
    - MyKey® pre-selected speed warning
    - MyKey® radio volume limiter
    - Traction control on/off
- The message center provides a menu to clear all MyKey® programmed keys at once.
- MyKey® mileages driven by the MyKey® user can be found in system check function of the message center.
- The number of MyKey® and administrator keys can be found in the system check function of the message center.

Refer to Section 419-01B for additional information on the MyKey® features.

Non-Hybrid

The Instrument Panel Cluster (IPC) contains gauges, informational indicators, warning indicators, message center and message center indicators (MKZ only) that are designed to provide the driver with a system status and to er that certain conditions exist in the vehicle.

The IPC uses a message center display area for basic informational items such as the odometer, trip odometer, text-based messages and for message center warning indicator displays.

Startup (Welcome) Mode

The IPC provides a startup mode also known as a welcome strategy. When the vehicle receives a Remote Keyless Entry (RKE) request, the IPC illuminates the gauge pointers and graduation bars. When the key is inserted into the ignition switch, the IPC illuminates only the graduation bars. When the ignition is placed into the RUN or START position, the IPC begins its prove-out stage.

During the prove-out stage, the IPC sweeps then zeros all gauges while illuminating all LED indicators for a predetermined time.

Gauges

Gauges provide information to the driver indicating the status of systems. The systems that use gauges are as follows:

- Engine coolant temperature
- Engine rpm
- Fuel level
- Vehicle speed

Informational Indicators

Informational indicators provide information to the driver of conditions that exist in the vehicle. The informational indicators are grouped into the following systems/subsystems:

- Engine/powertrain control
    - ♦ All-Wheel Drive (AWD)
    - ♦ Electronic Throttle Control (ETC)
    - ♦ Fuel level
    - ♦ Malfunction Indicator Lamp (MIL)
    - ♦ Transaxle
- Lighting
    - ♦ High beam
    - ♦ Turn signal
- Vehicle control
    - ♦ Anti-theft
    - ♦ Cruise control
    - ♦ Traction control

Warning Indicators

Warning indicators provide information to the driver of conditions that could potentially cause personal injury or alter vehicle performance. The warning indicators are grouped into the following systems/subsystems:

- Engine/powertrain control
    - ♦ Charging system
    - ♦ Low engine oil pressure
- Occupant/driver safety
    - ♦ Door/hood ajar
    - ♦ Safety belt
    - ♦ Tire Pressure Monitoring System (TPMS)
    - ♦ Supplemental Restraint System (SRS) (air bag)
- Vehicle control
    - ♦ ABS
    - ♦ Brake system

Message Center Warning Indicators (MKZ Only)

Message center warning indicators illuminate in the message center and replace the typical indicator and warning lamps using the same iconic representation that are typically used as indicators or warning indicators in the IPC . When multiple warnings exist, the message center warning indicators rotate through each display until each condition has been corrected. The systems that use message center warning indicators include:

- Engine/powertrain control

    - Charging system
    - Low engine oil pressure
    - Low fuel
- Occupant/driver safety
    - Door/Hood ajar

Hardwired Inputs

The hardwired inputs are provided from the following systems or components:

- Compass
- Engine oil pressure switch
- Fuel level
- Message center switch
- Park detect
- Passive Anti-Theft System (PATS) transceiver
- Traction control disable switch

Network Messaged Inputs

Module messaging is becoming the standard for sending and receiving information required to operate the IPC . For a complete list of module messages with the message origination sources, refer to Section 418-00 .

The status and information messages that the IPC requires from other vehicle inputs are grouped into the following systems/subsystems:

- ABS
    - Anti-lock braking
    - Traction control
- Base brake system
    - Brake fluid level status
    - Parking brake status
- Lighting system
    - LH/RH turn
    - High beam
- Powertrain
    - Charging
    - Engine emission system
    - Engine rpm
    - Engine temperature
    - Grade assist (without select shift)
    - Transmission range
    - Vehicle speed
- SRS
- TPMS

Hybrid

The hybrid Instrument Panel Cluster (IPC) contains gauges, informational indicators, warning indicators, message center and message center indicators that are designed to provide the driver with a system status and to alert the driver that certain conditions exist in the vehicle. The instrument cluster uses digital displays for all non-text information except the speedometer. The speedometer is the only analog gauge used.

The IPC uses a message center display area for basic informational items such as the odometer, trip odometer,

text-based messages and message center warning indicator displays.

Startup (Welcome) Mode

The IPC provides a startup mode also known as a welcome strategy. When the vehicle receives a Remote Keyless Entry (RKE) request, the IPC begins the wake up sequence by illuminating the display areas on the RH and LH sides of the speedometer in ice blue followed by the grass and cloud image on each display area when the driver door is opened.

When the key is placed into the ignition, the speedometer pointer illuminates for approximately 30 seconds or until the key is transitioned to the RUN position.

Once the key is transitioned to the RUN position, the IPC continues the startup sequence through a series of stages that sweep and zero the speedometer, while illuminating the remaining gauges and digital displays starting at the center and moving outward. During this phase, the digital gauges sweep from zero or the lowest position to the highest position then return to display the current input value. The IPC also carries out the bulb prove-out during this phase of the startup mode.

As part of the startup mode, the IPC displays the **Press Info to View Demo** for the first 800 km (500 miles). From 800 km (500 miles) to 1,600 km (1,000 miles), the IPC displays **Demo and Tutorial Can Be Started Within SETUP Mode** . After 1,600 km (1,000 miles), the text disappears from the startup mode but the demo mode remains selectable through the setup menu.

Gauges

All gauges are digital displays except the speedometer which uses an analog gauge. Gauges provide information to the driver indicating the status of systems. The systems that use gauges are as follows:

- Electric vehicle
- Engine coolant temperature
- Engine rpm
- Fuel efficiency
- Fuel level
- High voltage battery
- Vehicle speed

Informational Indicators

Informational indicators provide information to the driver of conditions that exist in the vehicle. The informational indicators are grouped into the following systems/subsystems:

- Engine/powertrain control
    - ♦ Malfunction Indicator Lamp (MIL)
    - ♦ Hybrid ready
- Lighting
    - ♦ High beam
    - ♦ Turn signal
- Vehicle control
    - ♦ Anti-theft
    - ♦ Cruise control
    - ♦ Traction control

Warning Indicators

Warning indicators provide information to the driver of conditions that could potentially cause personal injury or alter vehicle performance. The warning indicators are grouped into the following systems/subsystems:

- Occupant/driver safety
  - ♦ Safety belt
  - ♦ Tire Pressure Monitoring System (TPMS)
  - ♦ Supplemental Restraint System (SRS) (air bag)
- Vehicle control
  - ♦ ABS
  - ♦ Brake system

Message Center Warning Indicators

Message center warning indicators illuminate in the message center and replace the typical indicator and warning lamps using the same iconic representation that are typically used as indicators or warning indicators in the IPC . When multiple warnings exist, the message center warning indicators rotate through each display until each condition has been corrected. The systems that use message center warning indicators include:

- Engine/powertrain control
  - ♦ Charging system
  - ♦ Electronic Throttle Control (ETC)
  - ♦ Engine temperature
  - ♦ High voltage battery
  - ♦ Fuel level
  - ♦ Motor temperature
  - ♦ Oil pressure
  - ♦ Transaxle
- Occupant/driver safety
  - ♦ Door ajar
  - ♦ Trunk ajar

Hardwired Inputs

The hardwired inputs are provided from the following systems or components:

- Compass
- Engine oil pressure switch
- Fuel level
- Message center switch
- Park detect
- Passive Anti-Theft System (PATS) transceiver
- Traction control disable switch

Network Messaged Inputs

Module messaging is becoming the standard for sending and receiving information required to operate the IPC . For a complete list of module messages with the message origination sources, refer to Section 418-00 .

The status and information messages that the IPC requires from other vehicle inputs are grouped into the following systems/subsystems:

- ABS
  - ♦ Anti-lock braking
  - ♦ Traction control

- Base brake system
    - ♦ Brake fluid level status
    - ♦ Parking brake status
- Lighting system
    - ♦ LH/RH turn
    - ♦ High beam
- Powertrain
    - ♦ Charging system
    - ♦ ETC
    - ♦ High voltage battery
    - ♦ Engine emission system
    - ♦ Engine rpm
    - ♦ Engine temperature
    - ♦ Motor temperature
    - ♦ Transaxle
    - ♦ Vehicle speed
- SRS
- TPMS

Information And Message Center

The message center is a fixed format display, integrated into the Instrument Panel Cluster (IPC). The message center functions are controlled by the message center switch. The message center displays important vehicle information by constantly monitoring different vehicle systems and informs the driver of vehicle operations, notifying the driver of potential vehicle problems by displaying a warning message pertaining to the system in which a fault has been detected.

The message center switch is located as follows:

- For MKZ, in the Front Controls Interface Module (FCIM).
- For hybrid and Fusion non-hybrid, on the LH side of the steering wheel incorporated into the steering wheel switch.

The message center provides the following features:

- Information displays
- Setup displays
- System check messages
- System warning messages

The message center information is selected through a set of 3 buttons:

- INFO
- SETUP
- RESET

Message Center Configuration

The message center has the capability to configure items such as units (English or metric), autolamp delay, to enable/disable a variety of options such as autolock, auto-unlock and easy entry/easy exit (if equipped).

On configurable items such as autolock, auto-unlock or easy entry/easy exit, the message center indicates the appropriate selection (ON/OFF) by bracketing the selection. For example, if the driver selects the autolock feature on, the message would display as follows: AUTOLOCK â ©ON> OFF. If the driver selects the autolock off, the message would display as follows: AUTOLOCK ON â ©OFF>.

Oil Change Minder

NOTE: On early build vehicles, the PCM uses time and distance calculations stored in Keep Alive Memory (KAM) in the PCM to help determine the oil change minder status. If the PCM KAM is reset or lost for any reason (battery disconnect, PCM disconnect or dead battery), the oil change minder is disabled and the oil life reset procedure needs to be carried out through the message center to re-enable the oil minder function.

The message center provides an oil change minder to inform the driver that an oil change is required. The duration of the interval between oil changes is calculated in the PCM based an a maximum mileage of 16,093 km (10,000 miles) or 1 year for normal driving. The PCM calculates and provides an oil life status message to the IPC . The IPC further converts the remaining oil life using the driver's configured oil life start value and displays the oil life percentage, indicating the remaining oil life. The oil change minder can be reset at any time by the driver. Refer to Message Center Configuration in this section.

Oil Life and Oil Life Start Value

The oil life is displayed in percentages. The oil life start value is used to increase or decrease the starting point of the oil life. The oil life start value can be changed back to the maximum of approximately 16,093 km (10,000 miles) if the value was previously changed or to lower the value by 10% increments down to 10%. Each 10% reduction lowers the oil life in both mileage and time (days).

Compass Display

Vehicles Without Navigation

The compass signal originates from the compass module, which is integrated into the auto-dimming interior mirror.

The compass reading is incorporated into the Front Display Interface Module (FDIM).

The vehicle heading is displayed as a 1 or 2 character display located in the upper RH side of the FDIM and indicates the current direction of the vehicle (N, NE, E, SE, S, SW, W, or NW). The compass continuously re-calibrates due to changes in the magnetic field and remains accurate during most driving conditions.

On Fusion, the Front Controls Interface Module (FCIM) buttons that allow the driver to operate (change) the calibration and zone setting procedures are located below the FDIM .

On MKZ, the buttons that allow the driver to operate (change) the calibration and zone setting procedures are located on the FDIM .

The compass display is on with the ignition in the ON or START position. When the ignition is first turned to the ON or START position, there is a momentary delay of approximately 6 seconds before the compass display illuminates. If the battery saver has been activated and the ignition is turned to ON or START, the momentary delay before the compass display illuminates is approximately 3 seconds. The compass display turns off as soon as the ignition is turned to the OFF or ACC position.

Vehicles With Navigation

The compass signal originates from the Global Positioning System (GPS) antenna. No calibration or zone adjustment is available, as the compass heading is based on the GPS signal. Refer to Section 415-00 for information on the GPS signal.

Compass Accuracy (Without Navigation)

Driving near power lines, or driving in the area of large iron or steel structures can temporarily change the compass heading. If the compass remains inaccurate after driving near such objects, calibrate the compass. Refer to Compass Calibration in this section.

Most geographic areas (zones) have a magnetic north compass point that varies slightly from the northerly direction on maps. This variation is 4 degrees between the adjacent zones and becomes noticeable as the vehicle crosses multiple zones. A correct zone setting eliminates the error. Refer to Compass Zone Adjustment in this section.

Fusion and MKZ (Non-Hybrid)

Information Displays (INFO button)

The information displays are non-timed modes. The selected mode remains on until the driver presses a message center button to change the mode or it is overridden by another mode. The information display

modes are:

- Odometer
- Trip odometer A or B
- MyKeyÂ® miles
- Distance To Empty (DTE)
- Average fuel economy
- Instantaneous fuel economy
- Trip elapsed drive time A or B
- Blank display

Setup Displays (SETUP button)

The setup displays are timed modes and terminate after a finite interval. The setup display modes are:

- System check
- Oil life
- Units (English/metric)
- Autolamp
- Autolock
- Auto-unlock
- Blind Spot Information System (BLISÂ®) (if equipped)
- Cross Traffic Alert (CTA) system (if equipped)
- Easy entry/easy exit (MKZ only)
- Create MyKeyÂ®
- MyKeyÂ® setup
- Clear MyKeyÂ®
- Parking aid (reverse sensing) (if equipped)
- Language

System Check Displays (RESET button)

By pressing the RESET button on the message center switch, the message center cycles through each of the system check displays being monitored. For each of the monitored systems, the message center indicates either an OK message or a warning message for 2-4 seconds.

The system check provides a check of the following systems:

- XXX% oil life
- All doors closed
- Trunk closed
- BLISÂ® (if equipped)
- CTA system (if equipped)
- Brake system
- Fuel level

System Warning Messages

The system warning messages alert the driver to possible problems or malfunctions in the vehicle operating systems. The message center displays the last selected feature if there are no additional warning messages. Once a warning message has been displayed, the message must be acknowledged to allow full functionality of the message center. Press the RESET button (base message center) or the OK button (optional message center) to acknowledge and clear the warning message.

The warning messages are divided into 3 basic categories:

- Cannot be cleared until the condition is corrected.
- Reappears 10 minutes after pressing the select/reset button.
- Reappears if the condition clears then reoccurs within the same ignition ON-OFF cycle.

When the IPC receives a request to display an informational warning message or a fault condition warning message, the message center may display one of the following warning messages:

Body

- BLIND SPOT NOT AVAILABLE (if equipped)
- BLIND SPOT SYSTEM FAULT (if equipped)
- CROSS TRAFFIC NOT AVAILABLE (if equipped)
- CROSS TRAFFIC SYSTEM FAULT (if equipped)
- DRIVER DOOR AJAR
- INTKEY COULD NOT PROGRAM (displayed when an attempt is made to program an invalid key or more than the maximum number of keys allowed by the Remote Keyless Entry (RKE) system).
- PASSENGER DOOR AJAR
- REAR LEFT DOOR AJAR
- REAR RIGHT DOOR AJAR
- REMOVE OBJECTS NEAR PASS SEAT
- SENSOR BLOCKED SEE MANUAL (if equipped)
- TO STOP ALARM START VEHICLE
- TRUNK AJAR
- VEHICLE COMING FROM LEFT (if equipped)
- VEHICLE COMING FROM RIGHT (if equipped)

Chassis

- BRAKE FLUID LEVEL LOW
- CHECK BRAKE SYSTEM
- CHECK PARK AID (if equipped)
- LOW TIRE PRESSURE
- PARK BRAKE ENGAGED
- POWER STEERING ASSIST FAULT (2.5L and 3.0L only)
- SERVICE ADVANCETRAC
- SERVICE POWER STEERING (2.5L and 3.0L only)
- SERVICE POWER STEERING NOW (2.5L and 3.0L only)
- TIRE PRESSURE MONITOR FAULT
- TIRE PRESSURE SENSOR FAULT

MyKeyÂ®

- KEY COULD NOT PROGRAM
- VEHICLE SPEED 130 KM/H (80 MPH) MAX
- MYKEY ACTIVE DRIVE SAFELY
- SPEED LIMITED TO 130 KM/H (80 MPH)
- CHECK SPEED DRIVE SAFELY
- VEHICLE NEAR TOP SPEED
- TOP SPEED MYKEY SETTING
- BUCKLE UP TO UNMUTE AUDIO
- ADVTRAC ON MYKEY SETTING

Powertrain

- CHECK AWD (if equipped)
- CHECK FUEL FILL INLET
- FUEL LEVEL LOW
- OIL LIFE CHANGE SOON
- OIL CHANGE REQUIRED

Service Procedure Displays

In addition to the warning messages, the message center provides messages that are displayed during repair procedures to indicate certain states of a procedure. The following are the service repair procedures displayed in the message center:

Tire Pressure Monitoring System (TPMS) Tire Training

- TIRES NOT TRAINED-REPEAT
- TRAIN LEFT FRONT TIRE
- TRAIN LEFT REAR TIRE
- TRAIN RIGHT FRONT TIRE
- TRAIN RIGHT REAR TIRE
- TRAINING COMPLETE

Hybrid

There are two basic viewing areas used for control and dissemination of the information related to the message center functions. The LH side of the Instrument Panel Cluster (IPC) displays the primary navigation and selections available. The RH side of the IPC displays instructions that assist the operator with controlling, selecting and maneuvering through the message center functions. The RH side only displays the instructions when the vehicle is stopped and returns to the IPC indication mode while the vehicle is in motion.

Information Displays (INFO button)

The information displays are non-timed modes. The selected mode remains on until the driver presses the INFO button to change the display. The information display modes are:

- Trip odometer A or B
- Average fuel economy
- Trip elapsed drive time A or B
- MyKeyÂ® miles
- Blank display

Setup Displays (SETUP button)

The setup displays are timed modes and terminate after a finite interval. To enter the setup menu, press the SETUP button once then repeatedly press the SETUP button to scroll through and select an item in the setup menu. The message center highlights the selected item in the LH side of the setup menu.

With the desired item highlighted, press the RESET button to select the item and move to the RH side of the setup menu. A check mark is displayed next to the current selection.

The setup displays are as follows:

- Display settings
- Vehicle settings

- System check
- Demo
- Tutorials
- Resets

Display Settings

With the display settings selection highlighted, press the RESET button to move to the RH side of the display settings selection of the setup menu (a check mark is displayed next to the current selection). Press the SETUP button to scroll through and select the item in the RH menu then press the RESET button to select the item.

The display settings are as follows:

- Display mode
  - Inform
  - Enlighten
  - Engage
  - Empower
- Fuel economy
  - On
  - Off
- Efficiency gauge
  - Efficiency leaves
  - FE history graph
  - None
- FE History Length
  - 10 minutes
  - 20 minutes
  - 60 minutes
- Language
  - English
  - French
  - Spanish
- Units
  - English
  - Metric

Efficiency Leaves

The 2 fuel efficiency display modes for the efficiency gauge provide similar information but in an entirely different format. Both display modes provide the average miles per gallon at the top of the display and the distance to empty at the bottom of the display. The efficiency leaves displays a leaf and vine display that changes as the vehicle driving efficiency changes. As driving efficiency increases, the efficiency leaves display adds more leaves and vines. The history graph can be displayed using 10, 20 or 60 minute intervals and is updated every 1, 2 or 6 minutes respectively. Each new average is added to the left side of the graph shifting the last update to the right.

Vehicle Settings

With the vehicle settings selection highlighted, press the RESET button to move to the RH side of the vehicle settings selection of the setup menu (a check mark is displayed next to the current selection). Press the SETUP button to scroll through and select the item in the RH menu then press the RESET button to select the item.

The vehicle settings are as follows:

- Autolamp
  - 0 seconds
  - 10 seconds
  - 20 seconds
  - 30 seconds
  - 60 seconds
  - 90 seconds
  - 120 seconds
  - 180 seconds
- Auto unlock
  - On
  - Off
- Autolock
  - On
  - Off
- Blind Spot (if equipped)
  - On
  - Off
- Cross Traffic Alert (if equipped)
  - On
  - Off
- Oil Life
  - Set to 100%
  - Set to 90%
  - Set to 80%
  - Set to 70%
  - Set to 60%
  - Set to 50%
  - Set to 40%
  - Set to 30%
  - Set to 20%
  - Set to 10%
- Rear Park Aid (if equipped)
  - On
  - Off

MyKeyÂ® Settings

- Create MyKeyÂ®
- MyKeyÂ® AdvTrac
  - Manual
  - Always on
- MyKeyÂ® speed
  - 130 km/h/80 mph
  - Off
- MyKeyÂ® chimes
  - Off
  - 75 km/h/45 mph
  - 90 km/h/55 mph
  - 105 km/h/65 mph
- MyKeyÂ® volume
  - Limited
  - Not limited
- Clear MyKeyÂ®

System Check

With the system check selection highlighted, press the RESET button to move to the RH side of the system check selection of the setup menu. Press RESET to start the system check.

The system check menu is as follows:

- Oil life
- Electric drive
- Charging system
- Door ajar
- Trunk ajar
- Electronic Power Assist Steering (EPAS)
- Blind spot (if equipped)
- Cross traffic alert (if equipped)
- Brake system
- Brake fluid
- Parking brake
- Tire pressure
- Passenger seat
- Parking aid
- Fuel fill inlet
- Fuel level (mi/km)
- MyKeyÂ® used
- MyKeyÂ®(s) programmed
- Admin key(s) programmed

System Warning Messages

System warnings alert the operator to possible problems or malfunctions in the vehicle operating system. When multiple warnings are displayed, the message center cycles all the warnings by displaying each one for several seconds. The system warning messages are displayed in the LH side of the IPC .

All warning messages are considered as active or non-active. Active warnings are those where the monitored system detects a current fault condition. Once the fault condition is corrected, the warning then becomes non-active. Both active and non-active warnings can be reset but if the warning is active, it continues to be displayed once it is reset.

All new warnings along with any associated message center warning indicators are displayed in a large format for 2 seconds and cannot be reset until the 2 second time has elapsed. Once the 2 seconds has elapsed, the warning can be reset by pressing the RESET button. Once the RESET button is pressed, the warning is considered an old warning and is displayed in a smaller format. If there are multiple warnings present, each warning displays (2 seconds for new warnings and 4 seconds for old warnings) in the order the message center received the warnings.

The message center displays the temperature gauge and PRNDL once all messages are reset and there are no more new warning messages. This allows full functionality of the message center by pressing the message center switch RESET button to clear the warning message. Warning messages that have been reset are divided into 2 categories where the message:

- Returns every 10 minutes
- Returns every key cycle

When the IPC receives a request to display an informational warning message or a fault condition warning

message, the message center may display one of the following warning messages:

Body

- BLIND SPOT NOT AVAILABLE (if equipped)
- BLIND SPOT SYSTEM FAULT (if equipped)
- CROSS TRAFFIC NOT AVAILABLE (if equipped)
- CROSS TRAFFIC SYSTEM FAULT (if equipped)
- DRIVER DOOR AJAR
- INTKEY COULD NOT PROGRAM (displayed when an attempt is made to program an invalid key or more than the maximum number of keys allowed by the Remote Keyless Entry (RKE) system).
- PASSENGER DOOR AJAR
- REAR LEFT DOOR AJAR
- REAR RIGHT DOOR AJAR
- REMOVE OBJECTS NEAR PASS SEAT
- SENSOR BLOCKED SEE MANUAL (if equipped)
- TO STOP ALARM START VEHICLE
- TRUNK AJAR
- VEHICLE COMING FROM LEFT (if equipped)
- VEHICLE COMING FROM RIGHT (if equipped)

Chassis

- BRAKE FLUID LEVEL LOW
- CHECK BRAKE SYSTEM
- CHECK PARK AID (if equipped)
- LOW TIRE PRESSURE
- PARK BRAKE ENGAGED
- POWER STEERING ASSIST FAULT
- SERVICE ADVANCETRAC
- SERVICE POWER STEERING
- SERVICE POWER STEERING NOW
- TIRE PRESSURE MONITOR FAULT
- TIRE PRESSURE SENSOR FAULT

MyKeyÂ®

- KEY COULD NOT PROGRAM
- VEHICLE SPEED 130 KM/H (80 MPH) MAX
- MYKEY ACTIVE DRIVE SAFELY
- SPEED LIMITED TO 130 KM/H (80 MPH)
- CHECK SPEED DRIVE SAFELY
- VEHICLE NEAR TOP SPEED
- TOP SPEED MYKEY SETTING
- BUCKLE UP TO UNMUTE AUDIO
- ADVTRAC ON MYKEY SETTING

Powertrain

- STOP SAFELY NOW
- HIGH ENGINE TEMPERATURE
- HIGH MOTOR TEMPERATURE
- CHECK AWD (if equipped)
- CHECK FUEL FILL INLET

- FUEL LEVEL LOW
- OIL LIFE CHANGE SOON
- OIL CHANGE REQUIRED

Service Procedure Displays

In addition to the warning messages, the message center provides messages that are displayed during repair procedures to indicate certain states of a procedure. The following are the service repair procedures displayed in the message center:

Tire Pressure Monitoring System (TPMS) Tire Training

- TIRES NOT TRAINED-REPEAT
- TRAIN LEFT FRONT TIRE
- TRAIN LEFT REAR TIRE
- TRAIN RIGHT FRONT TIRE
- TRAIN RIGHT REAR TIRE
- TRAINING COMPLETE

Warning Chimes

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The warning chimes are designed to provide the driver with an audible warning that acts as a supplemental alert. The only deviation from this strategy is the air bag chime which is used to alert the driver that the primary alerting system (air bag warning indicator) does not operate. The Instrument Panel Cluster (IPC) controls all warning chimes based on messages received from external modules.

The warning chime system consists of the following:

- IPC
- Key-in-ignition warning switch (part of the ignition switch)
- Restraints Control Module (RCM)
- SJB

The following chimes are controlled by the IPC :

- Air bag warning
- Belt-Minder®
- Door ajar
- Headlamps on
- Hybrid electric vehicle engine off reminder
- Key-in-ignition

Instrumentation, Message Center and Warning Chimes

Special Tool(s)

 ST3093-A	Fluke 77-1V Digital Multimeter FLU77-4 or equivalent
 ST1473-A	Instrument Gauge System Tester 014-R1063 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

NOTE: When installing a new Instrument Panel Cluster (IPC), it is necessary to upload the module configuration to the scan tool. Following installation of the IPC , download the module configuration from the scan tool into the new IPC . Refer to Section 418-01 to carry out the Programmable Module Installation (PMI). It is also necessary to carry out a parameter reset procedure whenever a new IPC or PCM (non-hybrid) or Transmission Control Module (TCM) (hybrid) is installed. Refer to Section 419-01B .

The IPC utilizes a microprocessor to control the gauge, indicator, message center and warning chime functions. Data is sent to the IPC over the Medium Speed Controller Area Network (MS-CAN) and the High Speed Controller Area Network (HS-CAN) bus lines and through hardwired circuitry from individual components. The IPC uses each input to output an action to the gauges or indicators.

It is very important to understand:

- where the input originates.
- all the information necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- does the module which received the input control the output of the feature, or does it output a message over the communication network to another module.
- which module controls the output of the feature.

Instrument Panel Cluster (IPC)

IPC Gateway Function

The IPC acts as a gateway module by receiving information in one format and transmitting it to other modules using another format. For example, the IPC receives the vehicle speed data from the PCM over the HS-CAN , converts the data into an MS-CAN message and sends (gateways) the message to other network modules such as the HVAC module, the Audio Front Control Module (ACM) and the SJB . This enables network communication between modules that do not communicate using the same network (HS-CAN or the MS-CAN).

IPC Network Messages

The IPC uses input messages from other modules to control the gauges, informational indicators and warning indicators over the communication networks. If a required message is missing or invalid for less than 5 seconds, the gauge or indicator that requires the message remains at the last commanded state based upon the last known good message. For example, if the brake status message is missing for less than 5 seconds and the brake warning indicator was on, the indicator remains in the on state until the next good message is received. If the message remains missing or invalid for greater than 5 seconds, the IPC sets a U-code DTC and the output becomes a default action for the indicator or gauge. Each indicator or gauge utilizes a different default strategy depending on the nature of the indication. Refer to the normal operation descriptions located before each individual pinpoint test for further description of the default action specific to each indicator or gauge. If the messaged input to the cluster returns at any time, the normal function of the gauge or indicator resumes.

NOTE: Whenever a network message is suspected as missing and confirmed by a missing message DTC (U-code), it is important to look for other symptoms that may also be present in the IPC and throughout the vehicle. Once a DTC is set in the IPC , it may be helpful to review the complete message list available in Section 418-00 to see what other modules also rely on the same message and run the self-test for those modules. If the message is missing from other modules, the same DTC may also be set in those modules. Confirmation of missing messages common to multiple modules may indicate that the originating module is the source of the concern or the communication network may be experiencing some problems.

IPC Configuration

The IPC contains items that are configurable. Configurable items include customer preference items, which can also be set with a scan tool. The remaining configurable items can be set only through the PMI procedure or by using As-Built data. Refer to Section 418-01 .

IPC Configuration Parameters

Customer Preference Parameter	As-Built Parameter
-	ABS
-	Adaptive headlamps
-	Average fuel economy metric display type
-	Autolamp delay
-	Autolock
-	Auto-unlock
-	Belt-Minder®
-	Cluster plant mode
-	Compass
-	Cross traffic

-	Default oil life
-	Easy entry/easy exit
-	Engineering test mode
-	Electronic Power Assist Steering (EPAS)
-	English/metric default (Units)
-	Flex-fuel
-	Fuel tank size
-	Gallon display type
-	
-	Key-in-ignition warning chime
-	Language
-	MyKey®
-	Navigation
-	Number of fuel senders
-	Number of fuel tanks
-	Overspeed warning chime (gulf coast countries)
-	Rear park aid
-	Reverse mirror
-	Roll Stability Control (RSC®) chime
-	Transmission Control Module (TCM) (stand alone/integrated TCM -PCM
-	Select shift
-	Side detect
-	Speedometer calibration (Europe/North America)
-	Traction control/interactive vehicle dynamics/ RSC®
Tire Pressure Monitoring System (TPMS)	
-	Welcome
-	2-Wheel Drive (2WD)/Four-Wheel Drive (4WD)/All-Wheel Drive (AWD)

IPC Configuration Parameters - Hybrid

Customer Preference Parameter	As-Built Parameter
-	ABS
-	Average fuel economy metric display type
-	Autolamp delay
-	Autolock
-	Auto-unlock
-	Belt-Minder®
-	Cluster plant mode
-	Compass

-	Cross traffic
-	Daytime illumination
-	Default oil life
-	Electronic stability control/Roll Stability Control (RSC®) warning
English/metric default (Units)	
-	Flex-fuel
-	Fuel tank size
-	Gallon display type
-	IKT
-	Key-in-ignition warning chime
-	Language
-	MyKey®
-	Navigation
-	Number of fuel senders
-	Number of fuel tanks
-	Overspeed warning chime (gulf coast countries)
-	Park aid front
-	Park aid rear
-	Side detect
-	Speedometer calibration
-	Traction control/interactive vehicle dynamics/
-	Transmission Control Module (TCM)
-	Tire Pressure Monitoring System (TPMS)
-	Transmission type (manual/automatic)
-	Vehicle brand (Ford/Mercury/Lincoln)
-	2-Wheel Drive (2WD)/Four-Wheel Drive (4WD)/All-Wheel Drive (AWD)

IPC Software Flashing

The IPC is capable of receiving updated software after the end of line production. This software updating is called software flashing and is only carried out when a Technical Service Bulletin (TSB) provides the direction to do so. Follow all instructions on the TSB when flashing the IPC .

IPC Prove-Out

The IPC carries out a display prove-out to verify that all module controlled warning/indicator lamps and monitored systems are g correctly within the IPC . When the ignition is in the ON mode with the engine off, the indicators illuminate to prove-out according to the following table:

Non-Hybrid

Indicator	Indicator Type	Prove-Out Duration

ABS	Warning	3 seconds
Air bag	Warning	6 seconds
Anti-theft indicator	Informational	3 seconds
Brake	Warning	3 seconds
Charging system	Informational	Engine start up
Door/hood ajar	Informational	No prove-out
Grade assist (without select shift)	Informational	No prove-out
High beam	Informational	No prove-out
Low engine oil pressure	Warning	Engine startup
Malfunction Indicator Lamp (MIL)	Warning	Engine startup
Powertrain malfunction (wrench)	Warning	3 seconds
RH/LH turn signals	Informational	No prove-out
Safety belt	Warning	65 seconds if the safety belt is unbuckled, turns off when the safety belt is buckled
Cruise control engaged	Informational	No prove-out
Cruise control on	Informational	No prove-out
Tire Pressure Monitoring System (TPMS)	Warning	3 seconds
Traction control	Informational	3 seconds
Traction control disabled	Informational	3 seconds

Hybrid

Indicator	Indicator Type	Prove-Out Duration
ABS	Warning	3 seconds
Air bag	Warning	6 seconds
Anti-theft indicator	Informational	3 seconds
Brake	Warning	3 seconds
High beam	Informational	No prove-out
Malfunction Indicator Lamp (MIL)	Warning	Engine startup
Ready to drive	Informational	No prove-out
RH/LH turn signals	Informational	No prove-out
Safety belt	Warning	65 seconds if the safety belt is unbuckled, turns off when the safety belt is buckled
Cruise control	Informational	No prove-out
Tire Pressure Monitoring System (TPMS)	Warning	3 seconds
Traction control	Informational	3 seconds
Traction control disabled	Informational	3 seconds

Information And Message Center

The message center is an integral part of the IPC that receives and acts upon much of the same information that is input and used to operate the IPC gauges, informational indicators, warning indicators and warning chimes. For all vehicles except hybrid, the message center is a 2-line display located in the center of the IPC . On hybrid vehicles, the message center is split between the LH and RH side of the IPC with the controls displayed on the LH side and instructions displayed on the RH side. The hybrid message center also uses message center indicators either as stand alone indications or combined with text messages and are displayed in the LH display area.

All message center functions are controlled by a 3-button message center switch, which is hardwired to the IPC . The message center switch consists of 3 buttons and a resistor ladder with a different resistor associated with each switch button. The IPC sends out a reference voltage to the message center switch and monitors the voltage drop that results from the voltage flowing through the resistor when a message center button is pressed. The voltage drop will vary depending upon the resistance of each button, providing a specific indication to the IPC which switch is pressed.

NOTE: Compass zone adjustment and calibration proceedures are only applicable to vehicles without navigation. For vehicles with navigation, refer to Section 415-00 .

Compass

The compass display (located in the Front Display Interface Module (FDIM)) receives battery voltage from the SJB . The compass module (integral to the auto-dimming interior mirror) provides hardwired vehicle directional inputs to the Instrument Panel Cluster (IPC), which sends the compass information to the FDIM over the Medium Speed Controller Area Network (MS-CAN). The compass is capable of self-calibrating. This decreases the need to manually set the compass. If the compass is displaying a heading (and not displaying the C or CAL indicator), the compass is in auto-calibration mode. In this mode, the compass automatically calibrates for changes in vehicle magnetics over the life of the vehicle. This auto-calibration mode makes sure the compass heading is always accurate. If the compass displays the C or CAL indicator for an extended period of time (longer than 5 seconds), this indicates the compass has been placed in the manual calibration mode and therefore, requires manual calibration. Refer to Compass Calibration in this section.

Warning Chimes

The IPC uses inputs that are hardwired to individual components and messages that are sent from the other modules over the HS-CAN or MS-CAN to control the warning chime functions.

Warning Chime Characteristics

Each warning chime has unique characteristics to identify and differentiate each warning chime. The warning chimes use volume, chime frequency, length of time the chime sounds and the number of chime tones to identify which chime is sounding. The IPC prioritizes the chimes according to a preset hierarchy programmed into the IPC software. When more than one chime request is received by the IPC , the most important chime sounds. If a lower priority chime is currently sounding, the higher priority request takes over and replaces the lower priority chime.

There are 3 different chimes as listed below:

- Repetitive
- Single tone
- Tick-tock

The following table provides a summary of the chime characteristics.

Instrument Panel Cluster (IPC) Chime Characteristics

Chime Name	Chime Type	Condition/Description
Air bag	Repetitive	Consists of five sets of chime sequences that make up a chime cycle. Each chime sequence consists of 5 1-second chime tones followed by a 5 second delay. The IPC sounds 5 chime sequences then turns off the air bag chime for approximately 30 minutes. If the condition still exists, the air bag chime repeats the chime cycle.
Belt-Minder® A/B	Repetitive	The chime sounds 6 chime tones/safety belt warning indicator flash sequences for as long as the IPC receives the Belt-Minder® chime request.
Door ajar	Repetitive	The chime sounds repetitive tones for as long as the IPC receives a dooajar chime command.
Headlamps on	Repetitive	The chime sounds repetitive tones for as long as the headlamps or the parking lamps are on and the IPC receives the chime on command.
Hybrid Electric Vehicle (HEV) engine off	Repetitive	The chime sounds 5 chime tones with the ignition in RUN, the transaxle in PARK (P) and the driver door open or ajar.
Key-in-ignition	Repetitive	The chime sounds repetitive tones for as long as the key is in the ignition with the ignition in OFF or ACC and the driver door is ajar.
Memory feedback	Single	This is a single tone chime that sounds when the IPC receives a chime command as confirmation that the memory seat has been successfully set.
Message center	Single	This is a single tone chime that sounds once per ignition cycle whenever the IPC receives a new message commanding on one of the message center warnings.
Parking brake on	Repetitive	The chime sounds repetitive tones for as long as the parking brake is applied and the IPC receives the chime on command.
Perimeter alarm	Repetitive	The chime sounds 3 sequences of chime tones. The first sequence sounds 12 tones when the driver door is opened using a key and the alarm is armed. The second sequence sounds 9 chime tones followed by the third sequence of 12 tones.
Safety belt	Repetitive	The chime sounds 6 times or as long as the safety belt is unbuckled and the IPC receives the chime on command.
Service Roll Stability Control (RSC®)	Repetitive	The chime sounds 3 tones for as long as the IPC receives a chime on command from the ABS module following an initial 8-second delay.
Turn signal left on	Repetitive	Repetitive chime tone for as long as the RH or LH turn signal is on, the vehicle has travelled 3.2 km (2.0 miles) and the IPC receives the chime on command.
Turn signal	Tick-tock	Repetitive tick-tock tones for as long as the RH or LH turn signal command is received by the IPC .

Air Bag Secondary Warning Chime

The air bag secondary warning chime warns that the air bag warning indicator light does not work correctly and that a Supplemental Restraint System (SRS) fault condition exists. The IPC monitors the air bag warning indicator status internally. When a fault is present in the air bag warning indicator and the IPC receives an air bag warning indicator on request from the Restraints Control Module (RCM), the air bag secondary warning chime sounds.

The air bag secondary warning chime sounds for 1 second on then 1 second off for 5 seconds (5 1-second chime tones) then pauses for 5 seconds and repeats the chime on/off sequence for 5 minutes. The IPC then turns off the air bag chime for approximately 30 minutes and repeats the cycle if the condition still exists.

The air bag secondary warning chime inputs are:

- Ignition state.
- Air bag warning indicator chime request communicated by the RCM to the IPC .

Belt-Minder®

The Belt-Minder® is configurable. To configure without using a scan tool, refer to Belt-Minder® Deactivating/Activating in this section.

The Belt-Minder® feature supplements the current safety belt warning function and is enabled after the current safety belt warning is complete. The Belt-Minder® reminds the driver that the driver or passenger safety belt is unbuckled by intermittently and simultaneously sounding a chime and illuminating the safety belt warning indicator in the IPC once the vehicle speed has exceeded 9.7 km/h (6 mph). The Belt-Minder® remains active for 5 minutes from the time it is started.

While activated, the Belt-Minder® chime provides a series of 6 chime/safety belt warning indicator flash sequences that when combined, make up a chime cycle. Each chime/safety belt warning indicator sequence consists of a 1-second chime tone and safety belt warning indicator on/off state. The Belt-Minder® chime and the safety belt warning indicator sound and flash for 6 seconds, then the chime stops and the safety belt warning indicator remains on for 30 seconds. The IPC repeats the chime cycle for 5 minutes.

If the vehicle speed drops below 5 km/h (3 mph) once the Belt-Minder® chime has activated, the chime turns off and the safety belt warning indicator remains on. When the vehicle speed exceeds (6 mph) again, the Belt-Minder® chime resumes.

The IPC also provides a toll booth feature which allows the driver or passenger to unbuckle their safety belt after the safety belts were initially buckled, providing 1 minute without warnings after the vehicle exceeds 9.7 km/h (6 mph) again with a safety belt unbuckled.

NOTE: Whenever the vehicle is operated using MyKey®, the RCM enables the Belt-Minder®.

When MyKey® is in use, the driver cannot configure the Belt-Minder® off. Once the Belt-Minder® is activated, the Belt-Minder® continues to chime periodically (does not time out after 5 minutes) and the audio system is muted until the driver and passenger safety belts are fastened. Refer to Section 419-01B for more information on the MyKey® feature.

The Belt-Minder® warning chime inputs are the:

- Ignition state.
- Driver or passenger safety belt warning chime request communicated by the RCM to the IPC through the HS-CAN .
- Safety belt warning indicator request communicated by the RCM to the IPC through the HS-CAN .

Door Ajar Warning Chime

The door ajar warning chime warns that a door is ajar. The door ajar warning chime is a single chime with a 1 second duration. The door ajar chime sounds when the driver or passenger doors become ajar while the ignition switch is in the RUN position.

The door ajar warning chime inputs are the:

- Ignition state.
- Door ajar, liftgate or liftgate glass message from the SJB .

Headlamps On Warning Chime

The headlamps on warning chime warns that the headlamps or parking lamps are on when the driver door is ajar and the key is removed from the ignition lock cylinder. The headlamps on warning chime sounds if the driver door is ajar and the headlamp switch is in the PARK or HEADLAMP position and the ignition is OFF with the key out.

The headlamps on warning chime stops sounding when any one of the above conditions are removed.

The headlamps on warning chime inputs are:

- Ignition state.
- Key-in-ignition status to the SJB .
- Door ajar input from the driver door ajar switch to the SJB .
- Headlamp switch input to the SJB .
- Headlamps on chime request communicated by the SJB to the IPC through the MS-CAN .

Hybrid Electric Vehicle (HEV) Engine Off Chime

The HEV engine off chime sounds to remind the driver that the engine is not running and the vehicle is ready to drive. The HEV warning chime sounds when the key is in RUN, the driver door is ajar and the transaxle is in PARK (P).

The HEV warning chime inputs are:

- Ignition state.
- Door ajar input from the driver door ajar switch to the SJB .
- Door ajar status communicated from the SJB to the IPC through the MS-CAN .
- Transaxle park status communicated by the PCM to the IPC through the HS-CAN .

Key-In-Ignition Warning Chime

The key-in-ignition warning chime warns that the key is still in the ignition lock cylinder when the driver door is ajar. The key-in-ignition warning chime sounds when the driver door is ajar, the key is in the ignition lock cylinder and in the OFF or ACC position.

The key-in-ignition warning chime stops sounding when the driver door is closed, the key is removed from the ignition lock cylinder, or if the ignition switch is turned to the ON position.

The key-in-ignition warning chime inputs are:

- Ignition state.
- Key-in-ignition switch position to the SJB .
- Door ajar input from the driver door ajar switch to the SJB .

- Key-in-ignition chime request communicated by the SJB to the IPC through the MS-CAN .

Message Center Warning Chime

The message center warning chime feature is used to draw the driver's attention to the message center display to view a new warning message or message center warning indicator displayed. The IPC provides a single one-second tone whenever a new warning message is displayed in the message center. If multiple warning messages are present, the IPC sounds a chime for each of the warning messages that are present.

Memory Feedback Feature Chime

The purpose of the memory feedback feature chime is to inform the driver that their preferences have been successfully programmed through the memory set procedure.

The memory feature chime inputs are:

- Ignition RUN/START status.
- Memory feedback chime request communicated by the Driver Seat Module (DSM) to the IPC over the MS-CAN .

Parking Brake Warning Chime

The parking brake warning chime warns that the parking brake is engaged when the vehicle is in motion. The parking brake warning chime sounds if the ignition is in RUN mode, the parking brake is engaged, and the vehicle speed is greater than 5 km/h (3 mph).

The parking brake warning chime stops sounding if the parking brake is released, the ignition is not in the RUN mode, if the vehicle speed is less than 5 km/h (3 mph), or after 90 seconds from the time the chime is activated.

The parking brake warning chime inputs are:

- Ignition state.
- Parking brake switch status communicated by the SJB to the IPC through the MS-CAN .
- Vehicle speed data communicated by the PCM to the SJB through the MS-CAN .
- Parking brake warning chime request communicated by the SJB to the IPC .

Perimeter Alarm Chime

The perimeter alarm chime warning is used to alert the driver that the perimeter alarm is armed when the driver door is unlocked with a key. The perimeter alarm warning chime is only functional when a key is used to unlock the driver door. If the key fob or keypad (if equipped) is used to unlock the door, the perimeter alarm is disarmed and the perimeter alarm warning chime does not sound. The perimeter alarm warning chime sounds for 12 seconds when the driver door is opened and turns off when the perimeter alarm is disarmed (either by using the key fob, keypad or turning the key to the ON position). After the 12 second chime duration, the chime stops sounding and the perimeter alarm activates, sounding the horn and flashing the turn signal lights.

The perimeter alarm chime inputs are:

- Ignition state.
- Passive Anti-Theft System (PATS) armed/disarmed status.
- Driver door ajar input to the SJB .
- Perimeter alarm chime request from the SJB to the IPC through the MS-CAN .

Safety Belt Warning Chime

The safety belt warning chime warns that the safety belt is not fastened. The safety belt warning chime sounds for 6 seconds when the driver safety belt is not fastened and the ignition switch is transitioned from the OFF or ACC position to the ON or START position.

The safety belt warning chime stops sounding when the safety belt is fastened, when the ignition is switched from the ON or START position to the OFF or ACC position, or when the chime has sounded for approximately 6 seconds.

The safety belt warning chime inputs are:

- Ignition state.
- Driver or passenger safety belt warning chime request communicated by the RCM to the IPC through the HS-CAN .

Service Roll Stability Control (RSC®) Warning Chime

The service RSC® warning chime warns that the ABS module has detected a fault condition in the RSC® system. The SERVICE ADVANCETRAC message is also displayed along with the chime.

The service RSC® chime sounds for approximately 3 seconds following an initial delay of 8 seconds following key ON. The RSC® chime stops sounding when the ignition switch is turned from the RUN/START position to the OFF/LOCK or ACC position or when fault condition is repaired.

The service RSC® warning chime inputs are:

- Ignition state.
- Service RSC® chime request communicated by the ABS module to the IPC through the HS-CAN .

Turn Signal Left On Warning Chime

The turn signal left on warning chime warns that the turn signal has not been cancelled. The turn signal left on warning chime sounds if the left or right turn signal is on and the vehicle has traveled more than 3.2 km (2.0 miles).

The turn signal left on warning chime stops sounding if the turn signal is turned off, or if the ignition is switched to the OFF or ACC position.

The turn signal left on warning chime inputs are:

- Ignition state.
- Turn signal on data communicated by the SJB to the IPC through the MS-CAN .
- Odometer rolling count data communicated by the PCM to the IPC through the HS-CAN .

Turn/Hazard On Tone

Since the turn/hazard flasher is an electronic funcion of the SJB , the on/off sound that used to be present with standard bi-metal flashers is no longer present. To provide an audible sound and indicate that the RH/LH turn or hazard indicators are on, the IPC provides a tick-tock tone along with the visual turn signal indicators.

The turn/hazard on tone inputs are:

- Left turn indicator signal from the SJB to the IPC through the MS-CAN .
- Right turn indicator signal from the SJB to the IPC through the MS-CAN .

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Accessory drive belt • Brake fluid level • Compass module (integral to the auto-dimming interior mirror) • Engine oil level • Engine coolant level • Front Display Interface Module (FDIM) • Fuel tank • Fuel evaporative system • Tire pressure • Tire size	• Smart Junction Box (SJB) fuse(s): ♦ 14 (7.5A) (FDIM) (compass display) ♦ 26 (10A) ♦ 29 (5A) ♦ 41 (15A) (compass module) • Wiring, terminals or connectors • Instrument Panel Cluster (IPC)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the IPC , SJB , PCM, ABS module and Restraints Control Module (RCM).

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - Instrument Panel Cluster (IPC) , GO to Symptom Chart - Information And Message Center , or GO to Symptom Chart - Warning Chimes .

Instrument Panel Cluster (IPC) Dealer Test Mode - Non-Hybrid

To enter the IPC self-diagnostic mode, begin with the ignition key in the OFF position. Press and hold the message center SETUP and RESET buttons. Turn the key to the RUN position and hold the buttons until the display indicates ENGINEERING TEST MODE at the top of the right hand display (usually within 3 to 5 seconds) then release both buttons. Press the RESET button once to advance through each stage of the self-test. To exit the IPC self-test mode, turn the ignition to the OFF position.

NOTE: If the message center detects a non-resettable fault condition that it is reporting out on such as door ajar, the dealer test mode session cannot be entered until the fault condition has been corrected and the message removed. If the dealer test mode session is interrupted by the fault condition display (such as door ajar), the session can be resumed by pressing the RESET button.

NOTE: Some of the displays listed in the table below use xxx's to represent a numeric or alpha-numeric value. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display. For example: VEHICLE SPEED xxxx.x MPH may display VEHICLE SPEED 25 MPH. Note that there were 4 x's in the display description but only 2 digits in the actual display.

Fusion

First Line Display	Second Line Display	Description
ENGINEERING	TEST MODE	Initial entry display into the self-test mode.
GAUGE	TEST	Carries out the gauge sweep of all gauges, then displays the present gauge values. Also carries out the checksum test on Read-Only Memory (ROM).
All VF segments illuminated	-	Carries out the prove-out of all dot matrix pixels in all characters.
TELLTALE	TEST	Illuminates all the microprocessor-controlled lamps and LEDs.
PART NUMBER	xxxx-xx	Return to normal operation of all microprocessor-controlled lamps/LEDs and displays the alpha-numeric prefix and suffix of the IPC part number.
ROM LEVEL	$xxxx	Displays the hexadecimal ROM level and type.
$xxxx	Displays the hexadecimal EEPROM level and type.	
SW RELEASE	xx/xx/xx	

		Displays the software release date in mm/dd/yy format stored in Non-Volatile Memory (NVM).
ROM CHECKSUM	$xxxxxxxx	Shows the ROM checksum data. $xxxxxxxx PASS = passed. $xxxxxxxx FAIL = failed. $--- CALC = calculating the checksum.
MANUFACTURE	DATE $xxxx	Displays hexadecimal coding of the final manufacturing test date.
MANUF CONFIG	BYTE 1 $xx	Displays hexadecimal coding of vehicle options NVM for line 1 of As-Built data for ABS/traction control/interactive vehicle dynamics, oil life threshold, Tire Pressure Monitoring System (TPMS) and Belt-Minder®.
B&A CONFIG	BYTE 1-6 $xx	Displays hexadecimal coding of vehicle options NVM for lines 1 through 6 of As-Built data.
CONTINUOUS	DTC $xxxxxx	Displays DTCs in 16-bit hexadecimal format. DTCs displayed are those detected in continuous operation not during self-test. If no DTCs are present, the DTC: None is displayed.
VEHICLE SPEED	xxx.x MPH	Displays the English speed value being inputs in tenths of mph to the Instrument Panel Cluster (IPC), the speedometer indicates the present filtered speed. If the High Speed Controller Area Network (HS-CAN) message is missing, the second line displays ---.- MPH. If the HS-CAN message is invalid, the second line displays INV MPH. If the vehicle speed input is an unknown value, UNKNOWN MPH is displayed.
VEHICLE SPEED	xxx.x km/h	Displays the metric speed value being inputs in tenths of km/h to the IPC , the speedometer indicates the present filtered speed. If the HS-CAN message is missing, the second line displays ---.- km/h. If the HS-CAN message is invalid, the second line displays INVALID km/h. If the vehicle speed input is an unknown value, UNKNOWN km/h is displayed.
TACHOMETER	xxxx RPM	Displays the tachometer value being input in rpm to the IPC . The tachometer indicates the present filtered rpm. If the HS-CAN message is missing, the second line displays ---.- RPM. If the HS-CAN message is invalid, the second line displays INV RPM.

		If the engine speed input is an unknown value, UNKNOWN RPM is displayed.
FUEL 1 LEVEL	xxx INSTANT	Displays the present primary (fuel pump module) unfiltered fuel level. 000-009 = short circuit. 010-254 = normal range. 255 = open. INV = invalid input.
FUEL 2 LEVEL	xxx INSTANT	Displays the present secondary (fuel level sender) unfiltered fuel level. 000-009 = short circuit. 010-254 = normal range. 255 = open. INV = invalid input.
FUEL 1 LEVEL %	STATUS xxx	Display present filtered primary (fuel pump module) input for fuel level percent status. 000-254 = normal range. 0255= open or short circuit detected. INV = invalid input.
FUEL 2 LEVEL %	STATUS xxx	Display present filtered secondary (fuel level sender) input for fuel level percent status. 000-254 = normal range. 0255= open or short circuit detected. INV = invalid input.
INSTANT DTE	xxx MILES	**NOTE:** This display may differ from the DTE displayed in the INFO menu of the message center due to the use of the unfiltered DTE calculation. Displays the calculated (unfiltered) Distance To Empty (DTE) in miles. --- = invalid input.
RAFE DTE	xx.x MPG	Displays the running fuel economy in decimal. If the fuel raw average fuel economy message is missing, the second line displays ---.- MPG. If the fuel raw average fuel economy message is invalid, the second line displays INVALID MPG.

FUEL 1 ON/OF/SZ	xxx xxx	Displays the key on, key off, and zero speed samples for the fuel pump module. If the input is invalid, the message center displays--- ---.
FUEL 2 ON/OF/SZ	xxx xxx xxx	Displays the key on, key off, and zero speed samples for the secondary fuel level input (fuel level sender). If the input is invalid, the message center displays --- --- ---.
F1 #S ON/OFF/SZ	xxx xxx xxx	Displays the number of valid samples used for key on, key off, and zero speed samples for the primary fuel level input (fuel pump module).
F2 #S ON/OFF/SZ	xxx xxx xxx	Displays the number of valid samples used for key on, key off, and zero speed samples for the secondary fuel level input (fuel level sender).
COOLANT TEMP	xxx C	Displays the last temperature gauge input value from the PCM over the HS-CAN in degrees C, temperature gauge indicates the present filtered temperature. If the temperature message is missing, the second line displays --- C. If the temperature message is invalid, the second line displays INV C.
ODOMETER	xxx COUNTS	Displays the unfiltered odometer rolling count input received over the HS-CAN from the PCM, in decimal. If the odometer rolling count data is missing, the second line displays --- COUNTS. If the odometer rolling count data is invalid, the second line displays INV counts.
COMPASS TX=$xx	CLUSTER RX=$xx	Display data received from the compass module and transmitted by the IPC to the compass module. If there is a communication concern with the compass module, the message center displays $--. If the compass is configured off, the message center displays, COMPASS CONFIGURED OFF.
BATTERY	xxx.x VOLTS	Displays the present battery reading in volts at the IPC input pin.
DIMMING CMD	xxx	Displays the dimming command message in percentage from the SJB over the MS-CAN . If the dimming command message is missing, the second line displays ---. If the dimming command message is invalid, the second line displays INV.
DIMVAL $xx	LITVAL $xx	Displays the dimming and lighting values from the SJB over the MS-CAN . 0-21 = normal range with 0 indicating off.

		22-253 = out of range. 254 = unknown value. 255 = invalid value. If the dimming and lighting value messages are missing, the line displays ---. If the dimming and lighting value messages are invalid, the line displays INV. If the dimming value is OK and the lighting value is unknown, DIMVAL xxx LITVAL UN is displayed. If the dimming value is invalid and the lighting value is unknown, DIMVAL INV LITVAL UN is displayed.
MC SWITCH	xxx A/D CNTS	Displays current message center switch input analog/digital counts in decimal (0-255).
LOW WASHER	SWITCH xxxx	Display the hardwired low washer fluid status received from the washer fluid level switch. The message center displays HIGH or LOW depending upon the state of the low washer fluid switch.
OIL PRESSURE	SWITCH xxx	Display the hardwired engine oil pressure status received from the engine oil pressure switch. The message center displays HIGH or LOW depending upon the state of the engine oil pressure switch.
LAST CHIME	SOUNDED xxxxxx	Displays the last chime that sounded. STBELT = safety belt, AIRBAG = air bag secondary, KEYIN = key in ignition, TRNSIG = turn signal reminder, DOOR = door ajar, HDLMPS = headlamps on, MSGCTR = message center warning tone, PRKBRK = park brake warning, BLTMDR = Belt-Minder® and MEMORY = memory feedback. If the input is unknown, the message center displays ---.
DIGITAL PORT 0-9, A, B, C, E or F	$xx	Displays 8 bit hexadecimal value of the digital port readings.
ANALOG PORT 0-9	$xx	Displays 10 bit hexadecimal value of the analog port readings.
GAUGE	TEST	Repeats the test display cycle.

Instrument Panel Cluster (IPC) Dealer Test Mode - Hybrid

To enter the IPC self-diagnostic mode, begin with the ignition key in the OFF position. Press and hold the message center SETUP and RESET buttons. Turn the key to the RUN position and hold the buttons until the display indicates ENGINEERING TEST MODE at the top of the right hand display (usually within 3 to 5 seconds) then release both buttons. Press the RESET button once to advance through each stage of the self-test. To exit the IPC self-test mode, turn the ignition to the OFF position.

The dealer test mode displays multiple items in a viewing window on the RH side of the IPC . Each button press advances the viewing window to the next set of items.

NOTE: If the message center detects a non-resettable fault condition that it is reting out on such as door ajar, the dealer test mode session cannot be entered until the fault condition has been corrected and the message removed. If the dealer test mode session is interrupted by the fault condition display (such as door ajar), the session can be resumed by pressing the RESET button.

NOTE: Some of the displays listed in the table below use xxx's to represent a numeric or alpha-numeric value. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display. For example: DTC HIST CURR xxxxxx x x may display DTC HIST CURR C10000 X. Note that there were 8 x's in the display description but only 7 digits in the actual display.

Button Press	Viewing Window Display	Description
1	ENGINEERING TEST MODE	Initial entry display into the self-test mode.
2	ANALOG GAUGE TEST	Carries out the gauge sweep of the speedometer, then displays the present gauge value. Also carries out the checksum test on Read-Only Memory (ROM).
3	TELLTALE TEST	Illuminates all the microprocessor-controlled lamps and LEDs.
4	PartNo: xxxx-xx VIP sw: xxxx-xx GIP sw: xx.xx.xxx eeprom sw: xx.xx Man Date: xxxxxx B&A ConfigByte: xx xx xx xx xx xx	Displays the IPC part number, manufacturing date, Electrically Erasable Programmable Read-Only Memory (EEPROM) and the end of line configuration.
5	Inst Fuel xx/xxxx Fuel Level % xx.xx State % #Sample OFF x x ON x x SZ x x	Displays the fuel level inputs used to indicate fuel level.
6	Vehicle Speed x.x km/h	Displays the current vehicle speed and engine rpm inputs received over the HS-CAN .

	x.x mph Tachometer x rpm	
7	DTE xxx km xxx mi RAFE xx.xx kml xx.xx MPG x-xx l/100 km	Displays the instantaneous fuel economy inputs received from the PCM over the HS-CAN .
8	Odo cnts: x Trip A: xxx.x km Trip A: xxx.x mi Trip B: xxx.x km Trip B: xxx.x mi Battery: x.x v	Displays the odometer values received from the PCM over the HS-CAN and the battery voltage input.
9	Dim Step: xx/xx Dim Gauge: xxx Dim Pointer: xxx Dim Display: xxxx	Displays the illumination dimming input and current dimming settings.
10	MC A2D SW1: xx MC A2D SW1: xx Oil Press SW: xx Coolant Temp: xx Compass: xx x Last Chime: xxxxxxxx	Displays the current message center switch button state, oil pressure switch state, coolant temperature, compass and the last chime sounded.
11	DTC HIST CURR xxxxxx x x	Displays any stored DTC information as a historical code, current code or both.
12	ENGINEERING TEST MODE	Initial entry display into the self-test mode.

DTC Charts

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

Instrument Panel Cluster (IPC) DTC Chart

DTC	Description	Action
B109E:42	Remote Keyless Entry: General Memory Failure	REFER to Section 501-14 .
B109E:51	Remote Keyless Entry: Not Programmed	REFER to Section 501-14 .
B109E:86	Remote Keyless Entry: Signal Invalid	REFER to Section 501-14 .
B10D5:13	PATS Antenna: Circuit Open	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10D7:05	PATS Key: System Programming Failure	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10D7:51	PATS Key: Not Programmed	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10D7:87	PATS Key: Missing Message	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10D7:8F	PATS Key: Erratic	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10D8:00	PATS Key Less Than Minimum Programmed: No Sub-Type Information	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10D9:87	PATS Transponder: Missing Message	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10DA:51	PATS PCM Identifier: Not Programmed	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10DA:61	PATS PCM Identifier: Signal Calculation Failure	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B10DA:86	PATS PCM Identifier: Signal Invalid	REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).
B1A82:09	External Trip Switch: Component Failure	CLEAR the DTCs. REPEAT the self-test. If DTC B1A82:09 returns on Fusion, INSTALL a new cruise control switch. REFER to Section 419-03 . CLEAR the DTCs. REPEAT the self-test. If DTC B1A82:09 returns on MKZ, INSTALL a new Front Controls Interface Module (FCIM). REFER to Section 415-00 . CLEAR the DTCs. REPEAT the self-test.

		If DTC B1A82:09 returns on hybrid vehicles, INSTALL a new LH steering wheel switch. REFER to Section 419-03 . CLEAR the DTCs. REPEAT the self-test.
B1A82:11	External Trip Switch: Circuit Short to Ground	GO to Pinpoint Test AU .
B1A82:13	External Trip Switch: Circuit Open	GO to Pinpoint Test AU .

U0233:00	Lost Communication With Side Obstacle Detection Control Module Right: No Sub-Type Information	GO to Pinpoint Test BV .
U0298:00	Lost Communication With DC to DC Control Module "A":	GO to Pinpoint Test BW .

	No Sub-Type Information	
U0401:68	Invalid Data Received from ECM /PCM A: Event Information	DTC U0401:68 is set when the IPC receives invalid network data from the PCM. RETRIEVE and REPAIR all non-network DTCs in the other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U0402:68	Invalid Data Received from TCM : Event Information	DTC U0402:68 is set when the IPC receives invalid network data from the Transmission Control Module (TCM). RETRIEVE and REPAIR all non-network DTCs in the TCM and other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U040A:68	Invalid Data Received from Air Conditioning Control Module: Event Information	DTC U040A:68 is set when the IPC receives invalid network data from the HVAC module. RETRIEVE and REPAIR all non-network DTCs in the HVAC and other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U0412:68	Invalid Data Received from Battery Energy Control Module A: Event Information	DTC U0412:68 is set when the IPC receives invalid network data from the Battery Pack Sensor Module (BPSM). RETRIEVE and REPAIR all non-network DTCs in the BCM-HVTB and other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U0415:68	Invalid Data Received from Anti-Lock Brake System (ABS) Control Module: Event Information	DTC U0415:68 is set when the IPC receives invalid network data from the ABS module. RETRIEVE and REPAIR all non-network DTCs in the ABS module and other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U0422:68	Invalid Data Received from Body Control Module: Event Information	**NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. DTC U0422:68 is set when the IPC receives invalid network data from the Smart Junction Box (SJB) for backlighting, brake fluid level or Tire Pressure Monitoring System (TPMS). RETRIEVE and REPAIR all non-network DTCs in the SJB and other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U0430:68	Invalid Data Received from Tire Pressure Monitor Module: Event Information	DTC U0430:68 is set when the IPC receives invalid network data from the SJB for TPMS . RETRIEVE and REPAIR all non-network DTCs in the SJB and other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U0452:68	Invalid Data Received from Restraints Control Module: Event Information	DTC U0452:68 is set when the IPC receives invalid network data from the Restraints Control Module (RCM). RETRIEVE and REPAIR all non-network DTCs in the RCM and other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U0462:00	Invalid Data Received from Compass Module: No Sub Type Information	GO to Pinpoint Test CA .
U0462:68	Invalid Data Received from Compass Module: Event Information	REFER to Section 419-10 for a list of all DTCs
U0533:68	Invalid Data Received from Side Obstacle Detection Control Module-Left: Event Information	REFER to Section 419-04 for a list of all DTCs.
U0534:68		REFER to Section 419-04 for a list of all DTCs.

	Invalid Data Received from Side Obstacle Detection Control Module-Right: Event Information	
U0599:68	Invalid Data Received from DC to DC Converter Control Module "A": Event Information	DTC U0599:68 is set when the IPC receives invalid network data from the DC to DC Converter Control Module (DC/DC). RETRIEVE and REPAIR all non-network DTCs in the DC/DC and other modules on the network. REFER to Section 419-10 for a list of all DTCs.
U2100:00	Initial Configuration Not Complete: No Sub-Type Information	CARRY OUT the PMI procedure for the IPC . REFER to Section 418-01 .
U3000:41	Control Module: General Checksum Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:41 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U3000:42	Control Module: General Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:42 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U3000:43	Control Module: Special Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:43 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U3000:44	Control Module: Data Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:44 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U3000:45	Control Module: Program Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:45 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U3000:46	Control Module: Calibration/Parameter Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC U3000:46 returns, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test BX .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test BY .
U300A:62	Ignition Switch: Signal Compare Failure	GO to Pinpoint Test BZ .
U300A:64	Ignition Switch: Signal Plausibility Failure	GO to Pinpoint Test BZ .

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B2479	Brake Park Switch Circuit Short to Ground	GO to Pinpoint Test T .
B1352	Ignition Key-In Circuit Failure	If the chime sounds with the door ajar and no key in the ignition, GO to Pinpoint Test AY . If the key-in-ignition chime is inoperative, GO to Pinpoint Test AZ .
C1125	Brake Fluid Level Sensor Input Circuit Failure	GO to Pinpoint Test T .
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

PCM DTC Chart

DTC	Description	Action
P0460	Fuel Level Sensor A Circuit	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B for single sender L-shaped fuel tank or GO to Pinpoint Test C for dual sender saddle-type fuel tank.
P0461	Fuel Level Sensor A Circuit Range/Performance	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B for single sender L-shaped fuel tank or GO to Pinpoint Test C for dual sender saddle-type fuel tank.
P0462	Fuel Level Sensor A Circuit Low	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B for single sender L-shaped fuel tank or GO to Pinpoint Test C for dual sender saddle-type fuel tank.
P0463	Fuel Level Sensor A Circuit High	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual first. If sent here from the PC/ED manual, GO to Pinpoint Test B for single sender L-shaped fuel tank or GO to Pinpoint Test C for dual sender saddle-type fuel tank.

Symptom Chart - Instrument Panel Cluster (IPC)

Symptom Chart - Information And Message Center

Symptom Chart - Warning Chimes

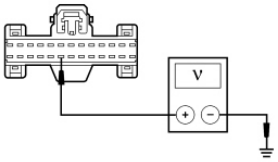
Pinpoint Tests

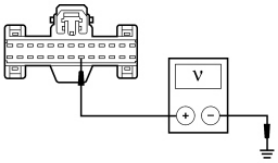
Pinpoint Test A: The Instrument Panel Cluster (IPC) Is Inoperative

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

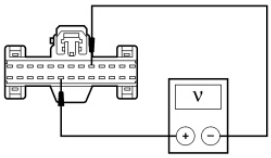
Normal Operation

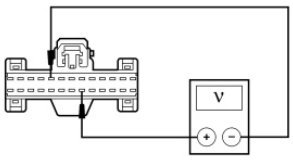
With the ignition in the START or RUN mode, the Instrument Panel Cluster (IPC) receives voltage from the Smart Junction Box (SJB) fuse 29 (5A). With the ignition in the OFF mode, the IPC receives its keep-alive voltage from the SJB fuse 26 (10A). The IPC grounding is through a single ground. The IPC sets DTC U300A:62 in continuous memory and on-demand if the RUN/START input is open or if the SJB fuse 29 (5A) has failed.





This pinpoint test is intended to diagnose the following:





- Fuse(s)
- Wiring, terminals or connectors
- IPC

PINPOINT TEST A: THE IPC IS INOPERATIVE

NOTICE: **Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

A1 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test. • **Is DTC U300A:62 recorded?**	**Yes** VERIFY SJB fuse 29 (5A) is OK. If OK, GO to Pinpoint Test BZ . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. **No** GO to A2 .
A2 CHECK THE IPC VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: IPC C220 . • For the non-hybrid, measure the voltage between the IPC C220-21, circuit SBP26 (YE/RD), harness side and ground.  N0094461 • For the hybrid, measure the voltage between the IPC C220-19, circuit SBP26 (YE/RD), harness side and ground.  N0094462 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** VERIFY SJB fuse 26 (10A) is OK. If OK, REPAIR the circuit for an open. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. TEST the system for normal operation.
A3 CHECK THE IPC GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • For the non-hybrid, measure the voltage between the IPC C220-21, circuit SBP26 (YE/RD), harness side and the IPC C220-5, circuit GD116 (BK/VT), harness side.	**Yes** GO to A4 . **No** REPAIR circuit GD116 (BK/VT) for an open. TEST the system for normal operation.

 N0099813 • For the hybrid, measure the voltage between the IPC C220-19, circuit SBP26 (YE/RD), harness side and the IPC C220-9, circuit GD116 (BK/VT), harness side.  N0094464 • **Is the voltage greater than 10 volts?**	
A4 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: Incorrect Fuel Gauge Indication - Single Sender L-Shaped Fuel Tank

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

The fuel pump module is hardwired to the Instrument Panel Cluster (IPC) between the signal circuit and the signal return circuit, which is grounded internally within the IPC . The fuel level sender (float and card) is a variable resistor attached to the fuel pump module that ranges from 180 ohms ± 4 ohms at empty (E) and 10 ohms ± 2 ohms at full (F). The IPC provides a reference voltage to the fuel pump module on the signal circuit. Ae fuel level changes, a float actuates a variable resistor on the fuel level sender (float and card), raising or lowering the fuel level signal voltage depending on the resistance of the fuel level sender. The IPC monitors the changes in voltage and commands the fuel gauge with a corresponding movement of the pointer.

On flex-fuel vehicles, basic fuel level indication is the same as gasoline vehicles, except that the flex-fuel vehicles require a DC-AC interface (internal to the IPC), used to prevent chemical reactions created by the interaction of A/C current with the fuel.

The IPC uses 4 different operating modes to calculate the fuel level:

- Anti-slosh (default mode)
- Ignition OFF fueling
- Ignition ON fueling
- Recovery

After a fuel fill up, the time for the fuel gauge to move from empty (E) to full (F) ranges from 2 seconds to 55 minutes depending on which operating mode the fuel gauge is in.

Anti-Slosh Mode

The default fuel gauge mode is called the anti-slosh mode. To prevent fuel gauge changes from fuel slosh (gauge instability due to changes in fuel sensor readings caused by fuel moving around in the tank), the fuel gauge takes approximately 55 minutes to go from empty (E) to full (F).

Key OFF Fueling Mode

The ignition OFF fueling mode (2 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The ignition must be in the OFF mode when refueling the vehicle.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.
- The IPC must receive a valid ignition ON fuel sensor reading within one second of the ignition being put into the RUN mode. The key ON sample readings are considered valid if the fuel sensor reading is between 10 ohms ± 2 ohms and 180 ohms ± 4 ohms.

If these conditions are not met, the fuel gauge stays in the anti-slosh mode, which results in a slow to read full (F) event.

Key ON Fueling Mode

The ignition ON fueling mode (approximately 60 seconds to read empty [E] to full [F]) requires the following conditions be met:

- Engine speed greater than 0 rpm.
- The transaxle is in PARK (P) or NEUTRAL (N).
- The ignition is in the RUN mode.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.

In ignition ON fueling mode, a 30-second timer activates after the transaxle is put into the PARK (P) or NEUTRAL (N) position. When the 30-second time has elapsed and at least 15% of the vehicle's fuel capacity has been added, the fuel gauge response time is 60 seconds to read from empty (E) to full (F). When the transaxle is shifted out of PARK (P) or NEUTRAL (N), the fuel gauge strategy reverts to the anti-slosh mode. The ignition ON fueling mode prevents slow to read full events from happening if the customer refuels the vehicle with the ignition in the RUN mode.

Recovery Mode

Recovery mode is incorporated into the IPC strategy to recover from a missing fuel level input after a refueling event. Missing fuel level inputs result from intermittent opens in the fuel sensor or its circuits. Recovery mode (empty [E] to full [F] approximately 20 minutes) is initiatewhen the following 2 conditions are met:

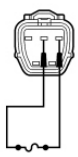
- The IPC is in the anti-slosh (default) mode.
- The actual fuel level in the tank is greater than what is being displayed by the fuel gauge.

Instrument Panel Cluster (IPC) DTCs

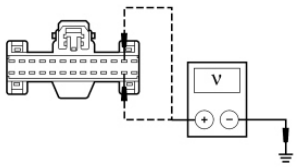
DTC Description	Fault Trigger Conditions
• P0460:11 - Fuel Level Sensor A Circuit: Circuit Short to Ground	A continuous and on-demand DTC that sets in the IPC if the IPC detects that the fuel pump module is out of range on the input circuit with a short to ground for 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault and sets DTC P0460:11.
• P0460:13 - Fuel Level Sensor A Circuit: Circuit Open	A continuous and on-demand DTC that sets in the IPC he IPC detects that the fuel pump module is out of range on the input circuit with an open or short to voltage on the input or return circuits for 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault and sets DTC P0460:13.

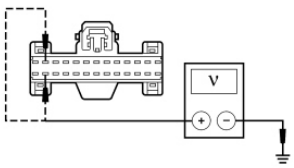
PCM DTCs

DTC Description	Fault Trigger Conditions
• P0460 - Fuel Level Sensor A Circuit	Sets when the PCM determines the value of the fuel level input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage.
• P0461 - Fuel Level Sensor A Circuit Range/Performance	Sets when the PCM determines the fuel level input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
• P0462 - Fuel Level Sensor A Circuit Low	Sets in the PCM when the PCM detects a short to ground on the fuel pump module signal circuit based on the messaged input received from the IPC .
• P0463 - Fuel Level Sensor A Circuit High	Sets in the PCM when the PCM detects an open or a short to voltage on the fuel pump module signal circuit based on the messaged input received from the IPC .

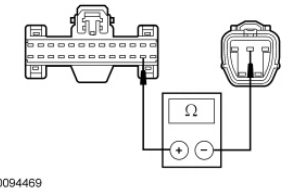


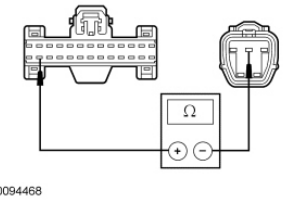
This pinpoint test is intended to diagnose the following:

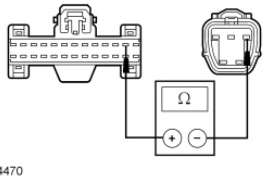


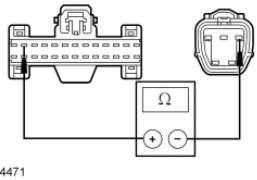


- Wiring, terminals or connectors
- Fuel pump module
- Fuel level sender (float and card)
- Fuel tank
- IPC

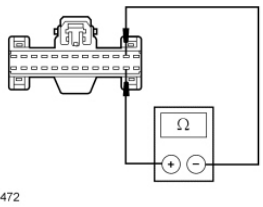


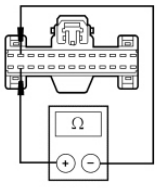




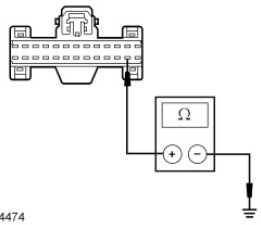


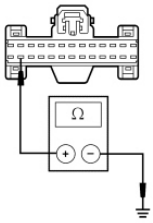
PINPOINT TEST B: INCORRECT FUEL GAUGE INDICATION - SINGLE SENDER L-SHAPED FUEL TANK

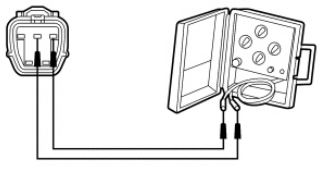




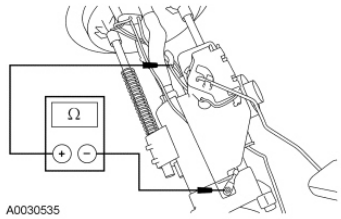
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**







NOTE: Following any fuel gauge repairs, remove fuse 26 (10A) for one minute then reinstall to reset the fuel gauge timers.



Test Step	Result / Action to Take
B1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs rded?**	**Yes** For DTC P0460:13, GO to B3 . For DTC P0460:11, GO to B7 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to B2 .
B2 CARRY OUT THE IPC FUEL GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • **NOTE:** Make sure to set the scan tool to empty or 0% before beginning this test. • Select the IPC fuel gauge (FUELLEVEL) active command. Command the fuel gauge from 0% to 25%, 50%, 75% and 100% while observing the fuel gauge. • **Does the fuel gauge begin at E (empty), move to approximately 1/8-1/4, just under 1/2, 3/4 and F (full)?**	**Yes** GO to B10 . **No** GO to B13 .
B3 CHECK THE FUEL PUMP MODULE FOR AN OPEN	
• Ignition OFF. • Disconnect: Fuel Pump Module C433 . • Connect a fused jumper wire between the fuel pump module C433-1, circuit RMC32 (GN/BU), harness side and the fuel pump module C433-2, circuit VMC11 (YE/VT), harness side.  N0053609 • Ignition ON. • Wait one minute.	**Yes** REMOVE the jumper wire. GO to B12 . **No** REMOVE the jumper wire. GO to B4 .

• Enter the following diagnostic mode on the scan tool: IPC Self-Test . • **NOTE:** DTC P0460:13 may also be present when carrying out this step and should be ignored at this time. • Repeat the IPC self-test. • Retrieve the IPC continuous DTCs. • **Is DTC P0460:11 retrieved?**	
B4 CHECK THE FUEL LEVEL SIGNAL AND RETURN CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220 . • Ignition ON. • For non-hybrid, measure the voltage between the IPC C220-15, circuit VMC11 (YE/VT), harness side and ground; and between the IPC C220-2, circuit RMC32 (GN/BU), harness side and ground.  N0094467 • For hybrid, measure the voltage between the IPC C220-25, circuit VMC11 (YE/VT), harness side and ground; and between the IPC C220-12, circuit RMC32 (GN/BU), harness side and ground.  N0094466 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to B5 .
B5 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • For non-hybrid, measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and the fuel pump module assembly C433-2, circuit VMC11 (YE/VT), harness side.	**Yes** GO to B6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0094469 • For hybrid, measure the resistance between the IPC C220-25, circuit VMC11 (YE/VT), harness side and the fuel pump module assembly C433-2, circuit VMC11 (YE/VT), harness side.  N0094468 • **Is the resistance less than 5 ohms?**	
B6 CHECK THE FUEL LEVEL RETURN CIRCUIT FOR AN OPEN	
• For non-hybrid, measure the resistance between the IPC C220-2, circuit RMC32 (GN/BU), harness side and the fuel pump module assembly C433-1, circuit RMC32 (GN/BU), harness side.  N0094470 • For hybrid, measure the resistance between the IPC C220-12, circuit RMC32 (GN/BU), harness side and the fuel pump module assembly C433-1, circuit RMC32 (GN/BU), harness side.  N0094471 • **Is the resistance less than 5 ohms?**	**Yes** GO to B13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B7 CHECK THE FUEL PUMP MODULE FOR A SHORT TO GROUND	

• Disconnect: Fuel Pump Module C433 . • Ignition ON. • Wait one minute. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • **NOTE:** DTC P0460:11 may also be present when carrying out this step and should be ignored at this time. • Repeat the IPC self-test. • Retrieve the IPC continuous DTCs. • **Is DTC P0640:13 retrieved?**	**Yes** GO to B12 . **No** GO to B8 .
B8 CHECK THE FUEL LEVEL SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER	
• Ignition OFF. • Disconnect: IPC C220 . • On non-hybrid, measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and the IPC C220-2, circuit RMC32 (GN/BU), harness side.  N0094472 • On hybrid, measure the resistance between the IPC C220-25, circuit VMC11 (YE/VT), harness side and the IPC C220-12, circuit RMC32 (GN/BU), harness side.  N0094473 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B9 . **No** REPAIR the circuits. CLEAR the DTCs. REPEAT the self-test.
B9 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR A SHORT TO GROUND	
• For non-hybrid, measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and ground.	**Yes** GO to B13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0094474 • For hybrid, measure the resistance between the IPC C220-25, circuit VMC11 (YE/VT), harness side and ground.  N0094475 • **Is the resistance greater than 10,000 ohms?**	
B10 CHECK THE FUEL LEVEL INPUT TO THE IPC	
NOTE: Since the IPC may be in anti-slosh fuel indication mode, the self-test and tester values may not match the fuel gauge readings. The actual gauge indication should be disregarded during this test step. • Ignition OFF. • Disconnect: Fuel Pump Module Assembly C433 . • Connect one lead of the instrument gauge system tester to the fuel pump module assembly C433-2, circuit VMC11 (YE/VT), harness side and the other lead to the fuel pump module assembly C433-1, circuit RMC32 (GN/BU), harness side.  N0026539 • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC PIDs . • **NOTE:** It is extremely important to confirm the gauge tester settings with an ohmmeter to make sure that the gauge tester is in the correct position. Failure to follow this check may result in inaccurate test results.	**Yes** DISCONNECT the instrument gauge system tester. GO to B11 . **No** DISCONNECT the instrument gauge system tester. GO to B13 .

• Monitor the IPC fuel level (FLI) PID, with the gauge tester set at 180 ohms, 90 ohms, 55 ohms, 30 ohms and 10 ohms. • **Does the PID begin at approximately 0%, move to 25%, 50%, 75% then 100%?**	
B11 CHECK THE FUEL TANK	
• Check the fuel tank for any damage or deformation. • **Is the fuel tank OK?**	**Yes** GO to B12 . **No** VERIFY the fuel level sensor and fuel pump module are OK. INSTALL a new fuel tank. REFER to Section 310-01A (non-hybrid) or Section 310-01B (hybrid). CLEAR the DTCs. REPEAT the self-test.
B12 CHECK THE FUEL LEVEL SENDER (FLOAT AND CARD)	
NOTE: The fuel level sender (float and card) resistance measures between 180 ohms ± 4 ohms at the lower stop position and 10 ohms ± 2 ohms at the upper stop position. • Remove the fuel pump module. Refer to Section 310-01A (non-hybrid) or Section 310-01B (hybrid). • **NOTE:** Disconnect the fuel level sender (float and card) input wire from the fuel pump module for this measurement. • Measure the resistance between the fuel level sender (float and card) input wire and the fuel level sender (float and card) ground while slowly moving the float arm between the lower and upper stop position.  • **Does the resistance slowly decrease from approximately 180 ohms at the lower stop to 10 ohms at the upper stop?**	**Yes** INSTALL a new fuel pump module. REFER to Section 310-01A (non-hybrid) or Section 310-01B (hybrid). CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new fuel level sender (float and card). REFER to Section 310-01A (non-hybrid) or Section 310-01B (hybrid). CLEAR the DTCs. REPEAT the self-test.
B13 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

• Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: Incorrect Fuel Gauge Indication - Dual Sender Saddle-Type Fuel Tank

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

The fuel tank is a saddle tank design with 2 variable resistance senders, driven by floats, that provide resistances related to fuel level in each side of the fuel tank to the Instrument Panel Cluster (IPC). The fuel level is determined using variable resistance fuel sender units, with an approximate resistance range between 180 ohms ± 4 ohms at empty (E) and 10 ohms ± 2 ohms at full (F). The IPC provides a reference voltage to the fuel pump module (LH side) and fuel level sensor (RH side) through individual signal circuits and receives a return through the signal return circuits from both the fuel pump module and fuel level sensor. As the fuel level changes, a float actuates a variable resistor on the fuel pump module and fuel level sensor, raising or lowering the fuel level signal voltage depending on the resistance of the fuel level sender (flt and card). The IPC monitors the changes in voltage from both senders and commands the fuel gauge with a corresponding movement of the pointer. If the IPC detects the fuel level sensor circuitry is open, the fuel gauge defaults to the fuel pump module value only and the fuel gauge indicates empty (E). If the IPC detects the fuel pump module circuitry is open, the fuel gauge defaults to the empty position.

On flex-fuel vehicles, basic fuel level indication is the same as gasoline vehicles, except that the flex-fuel vehicles require a DC-AC interface (internal to the IPC), used to prevent chemical reactions created by the interaction of A/C current with the fuel.

The IPC uses 4 different operating modes to calculate the fuel level:

- Anti-slosh (default mode)
- Ignition OFF fueling
- Ignition ON fueling
- Recovery

After a fuel fill up, the time for the fuel gauge to move from empty (E) to full (F) ranges from 2 seconds to 55 minutes depending on which operating mode the fuel gauge is in.

Anti-Slosh Mode

The default fuel gauge mode is called the anti-slosh mode. To prevent fuel gauge changes from fuel slosh (gauge instability due to changes in fuel sensor readings caused by fuel moving around in the tank), the fuel gauge takes approximately 55 minutes to go from empty (E) to full (F).

Key OFF Fueling Mode

The ignition OFF fueling mode (2 seconds to read empty [E] to full [F]) requires 3 conditions be met:

- The ignition must be in the OFF mode when refueling the vehicle.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.
- The IPC must receive a valid ignition ON fuel sensor reading within one second of the ignition being put into the RUN mode. The key ON sample readings are considered valid if the fuel sensor reading is

between 10 ohms ± 2 ohms and 180 ohms ± 4 ohms.

If these conditions are not met, the fuel gauge stays in the anti-slosh mode, which results in a slow to read full (F) event.

Key ON Fueling Mode

The ignition ON fueling mode (approximately 60 seconds to read empty [E] to full [F]) requires the following conditions be met:

- Engine speed greater than 0 rpm.
- The transaxle is in PARK (P) or NEUTRAL (N).
- The ignition is in the RUN mode.
- At least 15% of the vehicle's fuel capacity must be added to the fuel tank.

In ignition ON fueling mode, a 30-second timer activates after the transaxle is put into the PARK (P) or NEUTRAL (N) position. When the 30-second time has elapsed and at least 15% of the vehicle's fuel capacity has been added, the fuel gauge response time is 60 seconds to read from empty (E) to full (F). When the transaxle is shifted out of PARK (P) or NEUTRAL (N), the fuel gauge strategy reverts to the anti-slosh mode. The ignition ON fueling mode prevents slow to read full events from happening if the customer refuels the vehicle with the ignition in the RUN mode.

Recovery Mode

Recovery mode is incorporated into the IPC strategy to recover from a missing fuel level input after a refueling event. Missing fuel level inputs result from intermittent opens in the fuel sensor or its circuits. Recovery mode (empty [E] to full [F] approximately 20 minutes) is initiated when the following 2 conditions are met:

- The IPC is in the anti-slosh (default) mode.
- The actual fuel level in the tank is greater than what is being displayed by the fuel gauge.

Instrument Panel Cluster (IPC) DTCs

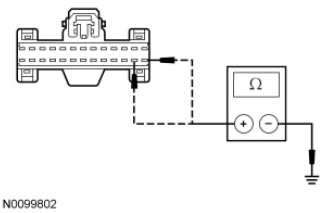
DTC Description	Fault Trigger Conditions
• P0460:11 - Fuel Level Sensor A Circuit: Circuit Short to Ground	A continuous and on-demand DTC that sets in the IPC if the IPC detects that the fuel pump module is out of range on the signal circuit with a short to ground for 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault d sets DTC P0460:11.
• P0460:13 - Fuel Level Sensor A Circuit: Circuit Open	A continuous and on-demand DTC that sets in the IPC if the IPC detects that the fuel pump module is out of range on the signal circuit with an open or short to voltage for 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault and sets DTC P0460:13.
• P1346:11 - Fuel Level Sensor B Circuit: Circuit Short to Ground	A continuous and on-demand DTC that sets in the IPC if the IPC detects that the fuel level sensor is out of range on the signal circuit with a short to ground for 33 seconds. The IPC defaults the fuel

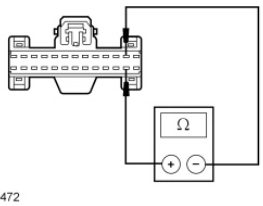
	gauge to empty (E), once the IPC detects a fault and sets DTC P1346:11.
• P1346:13 - Fuel Level Sensor B Circuit: Circuit Open	A continuous and on-demand DTC that sets in the IPC if the IPC detects that the fuel level sensor is out of range on the signal circuit with an open or short to voltage for 33 seconds. The IPC defaults the fuel gauge to empty (E), once the IPC detects a fault and sets DTC P1346:13.
NOTE: Normal operation of the fuel delivery system allows the fuel sensor side of the fuel tank (RH side) to have less fuel than the side with the fuel pump module (LH side). P1243:06 - Second Fuel Pump Fault or Ground Fault: Algorithm Based Failure	Sets when the IPC detects a large discrepancy in the amount of fuel (based on input from both fuel sensors) between both sides of the fuel tank.

PCM DTCs

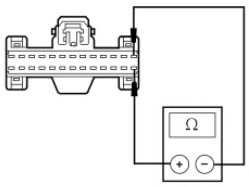
DTC Description	Fault Trigger Conditions
• P0460 - Fuel Level Sensor A Circuit	Sets when the PCM determines the value of the fuel level input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage.
• P0461 - Fuel Level Sensor A Circuit Range/Performance	Sets when the PCM determines the fuel level input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
• P0462 - Fuel Level Sensor A Circuit Low	Sets in the PCM when the PCM detects a short to ground on the fuel pump module signal circuit based on the messaged input received from the IPC .
• P0463 - Fuel Level Sensor A Circuit High	Sets in the PCM when the PCM detects an open or a short to voltage on the fuel pump module signal circuit based on the messaged input received from the IPC .
• P2065 - Fuel Level Sensor B Circuit	Sets when the PCM determines the value of the fuel level sensor input signal is stuck, that the fuel level input signal does not change or does not correspond with the calculated fuel usage.
• P2066 - Fuel Level Sensor B Circuit Range/Performance /TD>	Sets when the PCM determines the fuel level sensor input signal repeatedly moves in and out of range, exceeding the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.
• P2067 - Fuel Level Sensor B Circuit Low	Sets in the PCM when the PCM detects a short to ground on the fuel level sensor signal circuit based on the messaged input received from the IPC .
• P2068 - Fuel Level Sensor B Circuit High	Sets in the PCM when the PCM detects an open or short to voltage on the fuel level sensor signal circuit on the messaged input received from the IPC .

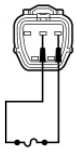
This pinpoint test is intended to diagnose the following:



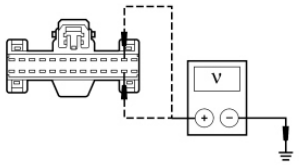


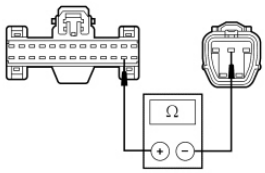
- Wiring, terminals or connectors
- Fuel tank transfer tube
- Fuel pump module (LH side)
- Fuel level sensor (RH side)
- Fuel level sender (float and card)
- Fuel lines
- Fuel tank
- IPC

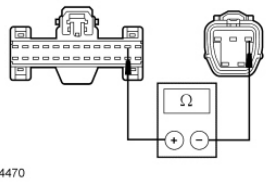




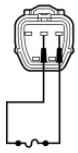
PINPOINT TEST C: INCORRECT FUEL GAUGE INDICATION - DUAL SENDER SADDLE-TYPE FUEL TANK

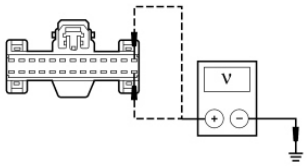




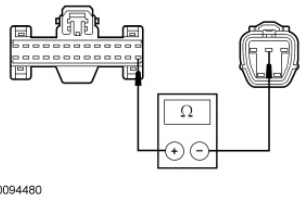


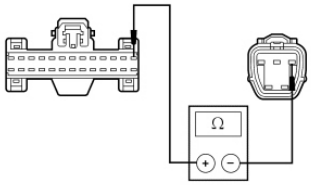
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

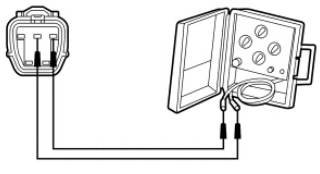




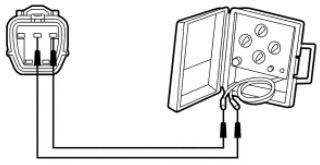
NOTE: Following any fuel gauge repairs, remove fuse 26 (10A) for one minun reinstall to reset the fuel gauge timers.







Test Step	Result / Action to Take
C1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Ignition OFF. • Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC P0460:11 or P1346:11, GO to C3 . For DTC P0460:13, GO to C7 . For DTC P1346:13, GO to C11 . For DTC P1243:06, GO to C15 . **No** GO to C2 .
C2 CARRY OUT THE IPC FUEL GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • **NOTE:** Make sure to set the scan tool to empty or 0% before beginning this test. • Select the IPC fuel gauge (FUELLEVEL) active command. Command the fuel gauge from 0% to 25%, 50%, 75% and 100% while observing the fuel gauge. • **Does the fuel gauge begin at E (empty), move to approximately 1/8-1/4, just under 1/2, 3/4 and F (full)?**	**Yes** GO to C15 . **No** GO to C21 .
C3 CHECK THE FUEL SENSOR FOR A SHORT TO GROUND	
• Disconnect: Fuel Pump Module C433 (DTC P0460:11) or Fuel Level Sensor C3270 (DTC P1346:11) .	**Yes** INSTALL a new fuel pump module (DTC P0460:11) or fuel level sensor



• Ignition ON. • Wait one minute. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • **NOTE:** DTC P0460:11 or P1346:11 may also be present. • Repeat the IPC on-demand self-test. • **Is DTC P0460:13 or P1346:13 retrieved?**	(DTC P1346:11). REFER to Section 310-01A . CLEAR the DTCs. REPEAT the self-test. **No** GO to C4 .
C4 CHECK THE FUEL LEVEL SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220 . • Measure the resistance between the IPC C220-15 (DTC P0460:11), circuit VMC11 (YE/VT), harness side and ground; or between the IPC C220-14 (DTC P1346:11), circuit VMC23 (GN/OG), harness side and ground.  N0099802 • **Is the resistance greater than 10,000 ohms?**	**Yes** For DTC P0460:11, GO to C5 . For DTC P1346:11, GO to C6 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK THE FUEL PUMP MODULE SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and between the IPC C220-2, circuit RMC32 (GN/BU), harness side.  N0094472 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C21 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
C6 CHECK THE FUEL LEVEL SENSOR SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the IPC C220-14, circuit VMC23 (GN/OG), harness side and the IPC C220-1, circuit RMC33 (WH/VT), harness side.	**Yes** GO to C21 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

 N0094477 • **Is the resistance greater than 10,000 ohms?**	
C7 CHECK THE FUEL PUMP MODULE FOR AN OPEN	
• Ignition OFF. • Disconnect: Fuel Pump Module C433 . • Connect a fused jumper wire between the fuel pump module C433-1, circuit RMC32 (GN/BU), harness side and the fuel pump module C433-2, circuit VMC11 (YE/VT), harness side.  N0053609 • Ignition ON. • Wait one minute. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • **NOTE:** DTC P0460:13 may also be present when carrying out this step and should be ignored at this time. • Repeat the IPC self-test. • Retrieve the IPC continuous DTCs. • **Is DTC P0460:11 retrieved?**	**Yes** REMOVE the jumper wire. GO to C20 . **No** REMOVE the jumper wire. GO to C8 .
C8 CHECK THE FUEL LEVEL SIGNAL AND RETURN CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220 . • Ignition ON. • Measure the voltage between the IPC C220-15, circuit VMC11 (YE/VT), harness side and ground; and between the IPC C220-2, circuit RMC32 (GN/BU), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to C9 .

 N0094467 • **Is any voltage present?**	
C9 CHECK THE FUEL LEVEL SIGNAL CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between the IPC C220-15, circuit VMC11 (YE/VT), harness side and the fuel pump module assembly C433-2, circuit VMC11 (YE/VT), harness side.  N0094469 • **Is the resistance less than 5 ohms?**	**Yes** GO to C10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C10 CHECK THE FUEL LEVEL RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between the IPC C220-2, circuit RMC32 (GN/BU), harness side and the fuel pump module assembly C433-1, circuit RMC32 (GN/BU), harness side.  N0094470 • **Is the resistance less than 5 ohms?**	**Yes** GO to C21 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C11 CHECK THE FUEL LEVEL SENSOR CIRCUITRY FOR AN OPEN	
• Connect a fused jumper wire between the fuel level sensor C3270-2, circuit VMC23 (GN/OG), harness side and the fuel level sensor C3270-1, circuit RMC33 (WH/VT), harness side.	**Yes** REMOVE the jumper wire. INSTALL a new fuel level sensor. REFER to Section 310-01A . CLEAR the DTCs. REPEAT the self-test. **No**

 N0053609 • Ignition ON. • Wait one minute. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • **NOTE:** DTC P1346:13 may also be present when carrying out this step and should be ignored at this time. • Repeat the IPC self-test. • Retrieve the IPC continuous DTCs. • **Is DTC P1346:11 retrieved?**	REMOVE the jumper wire. GO to C12 .
C12 CHECK THE FUEL LEVEL SENSOR CIRCUITRY FOR A SHORT TO VOLTAGE	
• Disconnect: IPC C220 . • Ignition ON. • Measure the voltage between the IPC C220-14, circuit VMC23 (GN/OG), harness side and ground; and between the IPC C220-1, circuit RMC33 (WH/VT), harness side and ground.  N0094478 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to C13 .
C13 CHECK THE FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN	
• Measure the resistance between the IPC C220-14, circuit VMC23 (GN/OG), harness side and the fuel level sensor C3270-2, circuit VMC23 (GN/OG), harness side.	**Yes** GO to C14 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 N0094480 • **Is the resistance less than 5 ohms?**	
C14 CHECK THE FUEL LEVEL SENSOR RETURN CIRCUIT FOR AN OPEN	
• Measure the resistance between the IPC C220-1, circuit RMC33 (WH/VT), harness side and the fuel level sensor C3270-1, circuit RMC33 (WH/VT), harness side.  N0094479 • **Is the resistance less than 5 ohms?**	**Yes** GO to C21 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C15 CHECK THE FUEL LEVEL INPUT TO THE IPC	
NOTE: Since the IPC may be in anti-slosh fuel indication mode, the self-test and tester values may not match the fuel gauge readings. The actual gauge indication should be disregarded during this test step. • Ignition OFF. • Disconnect: Fuel Pump Module Assembly C433 . • Connect one lead of the instrument gauge system tester to the fuel pump module assembly C433-2, circuit VMC11 (YE/VT), harness side and the other lead to the fuel pump module assembly C433-1, circuit RMC32 (GN/BU), harness side.  N0026539 • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC PIDs . • **NOTE:** It is extremely important to confirm the gauge tester settings with an ohmmeter to make sure that the	**Yes** DISCONNECT the instrument gauge system tester. GO to C16 . **No** DISCONNECT the instrument gauge system tester. GO to C21 .

gauge tester is in the correct position. Failure to follow this check may result in inaccurate test results. • Monitor the IPC fuel level (FUELLVL1) PID, with the gauge tester set at 180 ohms, 90 ohms, 55 ohms, 30 ohms and 10 ohms. • **Does the PID begin at approximately 3%, move to 70%, 127%, 185% then 251%?**	
C16 CHECK THE FUEL LEVEL INPUT TO THE IPC	
NOTE: Since the IPC may be in anti-slosh fuel indication mode, the self-test and tester values may not match the fuel gauge readings. The actual gauge indication should be disregarded during this test step. • Ignition OFF. • Disconnect: Fuel Level Sensor C3270 . • Connect one lead of the instrument gauge system tester to the fuel pump module assembly C3270-2, circuit VMC23 (GN/OG), harness side and the other lead to the fuel pump module assembly C3270-1, circuit RMC33 (WH/VT), harness side.  N0026539 • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC PIDs . • **NOTE:** It is extremely important to confirm the gauge tester settings with an ohmmeter to make sure that the gauge tester is in the correct position. Failure to follow this check may result in inaccurate test results. • Monitor the IPC fuel level (FUELLVL2) PID, with the gauge tester set at 180 ohms, 90 ohms, 55 ohms, 30 ohms and 10 ohms. • **Does the PID begin at approximately 3%, move to 70%, 127%, 185% then 251%?**	**Yes** DISCONNECT the instrument gauge system tester. GO to C17 . **No** DISCONNECT the instrument gauge system tester. GO to C21 .
C17 INSPECT THE FUEL TANK	
• Visually inspect the fuel tank for any damage or deformation. • **Is the fuel tank OK?**	**Yes** GO to C18 . **No** INSTALL a new fuel tank. REFER to Section 310-01A . CLEAR the DTCs. REPEAT the self test.
C18 INSPECT THE FUEL TANK TRANSFER TUBE CONNECTIONS	

• Remove the fuel pump module and the fuel level sensor. Refer to Section 310-01A . • Inspect the fuel tank transfer tube, connections, the fuel pump module and the fuel level sensor for any damage or deformation. • **Are the fuel tank transfer tube, connections, the fuel pump module and the fuel level sensor OK?**	**Yes** GO to C19 . **No** INSTALL a new fuel tank transfer tube, fuel pump module or fuel level sensor as necessary. REFER to Section 310-01A . CLEAR the DTCs. REPEAT the self test.
C19 CHECK THE FUEL PUMP MODULE AND THE FUEL LEVEL SENSOR FOR CORRECT OPERATION	
NOTE: The resistance varies from 180 ± 4 ohms when empty (E) to 10 ± 2 ohms when full (F). • For the fuel pump module, measure the resistance between the fuel pump module C433 pin 1, component side and the fuel pump module C433 pin 2, component side while slowly moving the float arm from the bottom to the top of travel.  N0068798 • For the fuel level sensor, measure the resistance between the fuel level sensor C3270 pin 1, component side and the fuel level sensor C3270 pin 2, component side while slowly moving the float arm from the bottom to the top of travel.  N0068801 • **Does the resistance start at approximately 180 ohms with the float at the bottom of travel and slowly increase to approximately 10 ohms at the top of travel?**	**Yes** For DTC P1243:06, INSTALL a new fuel tank transfer tube or fuel level sensor as required. REFER to Section 310-01A . CLEAR the DTCs. REPEAT the self test. For no DTCs, the concern may have been caused by an intermittent input to the IPC most likely caused by corrosion on one of the fuel level senders (float and card). **No** For the fuel pump module, GO to C20 . For the fuel level sensor, INSTALL a new fuel level sensor. REFER to Section 310-01A . CLEAR the DTCs. REPEAT the self-test.
C20 CHECK THE FUEL LEVEL SENDER (FLOAT AND CARD)	

NOTE: The fuel level sender (float and card) resistance measures between 180 ohms ± 4 ohms at the lower stop position and 10 ohms ± 2 ohms at the upper stop position. • Remove the fuel pump module or fuel level sensor. Refer to Section 310-01A . • **NOTE:** Disconnect the fuel level sender (float and card) input wire from the fuel pump module for this measurement. • Measure the resistance between the fuel level sender (float and card) input wire and the fuel level sender (float and card) ground while slowly moving the float arm between the lower and upper stop position.  • **Does the resistance slowly decrease from approximately 180 ohms at the lower stop to 10 ohms at the upper stop?**	**Yes** INSTALL a new fuel pump module or fuel level sensor as necessary. REFER to Section 310-01A . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new fuel level sender (float and card). REFER to Section 310-01A . CLEAR the DTCs. REPEAT the self-test.
C21 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Temperature Gauge Is Inoperative

Normal Operation

The PCM uses the Cylinder Head Temperature (CHT) sensor to measure the engine temperature. The Instrument Panel Cluster (IPC) receives the engine temperature data from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. The IPC monitors the engine temperature data received from the PCM and commands the temperature gauge indication with a corresponding movement of the pointer.

The non-hybrid and hybrid temperature gauges appear differently but essentially function the same. The non-hybrid gauge is an analog gauge with a needle that points to a specified area of the gauge depending on

the data received from the PCM. The hybrid gauge is a digital display that appears as a thermometer. The fill color of the thermometer is blue when the temperature is between the cold and normal ranges. When the temperature indicates an overheating condition, the fill color turns to red.

If the engine temperature data is missing for 5 seconds or less or if the IPC receives invalid engine temperature data for 5 seconds or less, the IPC defaults the temperature gauge to the last setting, based upon the last known good temperature status message. If the IPC does not receive the engine temperature status message for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the temperature gauge to cold (C). If the engine temperature data is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the temperature gauge to cold (C).

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative tachometer, speedometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST D: THE TEMPERATURE GAUGE IS INOPERATIVE

Test Step	Result / Action to Take
D1 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to D2 .
D2 CARRY OUT THE TEMPERATURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • **NOTE:** The coolant temperature should range between 0-59°C (32-138°F) with the gauge in the cold (C) range, between 60-120°C (140-248°F) with the gauge in the normal or mid-range and above 123°C (253°F) with uge in the hot (H) range. • Select the IPC temperature gauge (ENGCOOLNT) active command. Command the temperature gauge according to the following table:	**Yes** GO to D3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

<table><tr><th>Temperature Command</th><th>Gauge Position</th></tr><tr><td>0%</td><td>Full cold (C)</td></tr><tr><td>50%</td><td>Just under the center of the gauge (mid-range) (non-hybrid) Just above the center of the gauge (mid-range) (hybrid)</td></tr><tr><td>100%</td><td>Full hot (H)</td></tr></table> • **Does the temperature gauge start at cold (C), move to the mid-range and end at full hot (H)?**	
D3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0401:68, RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs. For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

Pinpoint Test E: Incorrect Temperature Gauge Indication

Normal Operation

The PCM uses the Cylinder Head Temperature (CHT) sensor to measure the engine temperature. The Instrument Panel Cluster (IPC) receives the engine temperature data from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. The IPC monitors the engine temperature data received from the PCM and commands the temperature gauge indication with a corresponding movement of the pointer.

The non-hybrid and hybrid temperature gauges appear differently but essentially function the same. The non-hybrid gauge is an analog gauge with a needle that points to a specified area of the gauge depending on the data received from the PCM. The hybrid gauge is a digital display that appears as a thermometer. The fill color of the thermometer is blue when the temperature is between the cold and normal ranges. When the temperature indicates an overheating condition, the fill color turns to red.

If the engine temperature data is missing for 5 seconds or less or if the IPC receives invalid engine temperature data for 5 seconds or less, the IPC defaults the temperature gauge to the last setting, based upon the last known good temperature status message. If the IPC does not receive the engine temperature status message for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the temperature gauge to cold (C). If the engine temperature data is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the temperature gauge to cold (C).

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative tachometer, speedometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM concern
- IPC

PINPOINT TEST E: INCORRECT TEMPERATURE GAUGE INDICATION

Test Step	Result / Action to Take
E1 CHECK FOR CORRECT OPERATION OF THE COOLING SYSTEM	
• Verify that the engine cooling system and thermostat are functioning correctly. • **Does the engine cooling system and thermostat operate correctly?**	**Yes** GO to E2 . **No** REFER to Section 303-03A (non-hybrid) or Section 303-03B (hybrid).
E2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to E3 .
E3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0401:68, RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs.

	For all other DTCs, REFER to DTC Charts in this section. **No** GO to E4 .
E4 CARRY OUT THE TEMPERATURE GAUGE ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • **NOTE:** The coolant temperature should range between 0-59°C (32-138°F) with the gauge in the cold (C) range, between 60-120°C (140-248°F) with the gauge in the normal or mid-range and above 123°C (253°F) with the gauge in the hot (H) range. • Select the IPC temperature gauge (ENGCOOLNT) active command. Command the temperature gauge according to the following table: **Temperature Command** / **Gauge Position** 0% / Full cold (C) 20% / Beginning of the normal band 50% / Just under the center of the gauge (mid-range) (non-hybrid) Just above the center of the gauge (mid-range) (hybrid) 90% / Beginning of the hot (H) band 100% / Full hot (H) • **Does the temperature gauge indicate the correct temperature according to the above specifications?**	**Yes** GO to E5 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
E5 CHECK THE COOLANT TEMPERATURE INPUT USING THE DEALER TEST MODE	
• Ignition ON. • Enter the IPC dealer test mode. • **NOTE:** The display below uses xxx's to represent a numeric or alpha-numeric value. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display and that the minus symbol in parenthesis only appears if the temperature is below 0°C. For example: COOLANT TEMP xxx C (non-hybrid) or Coolant Temp: xx (hybrid) may display COOLANT TEMP 20 C	**Yes** The temperature gauge is operating correctly at this time. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

(non-hybrid). • Scroll through the displays to COOLANT TEMP xxx C (non-hybrid) or Coolant Temp: xx (hybrid). • Start the engine and run the engine through a variety of engine temperatures. • **NOTE:** The coolant temperature should range between 0-59°C (32-138°F) with the gauge in the cold (C) range, between 60-120°C (140-248°F) with the gauge in the normal or mid-range and above 123°C (253°F) with the gauge in the hot (H) range. • Monitor the engine temperature input to the IPC and the coolant temperature gauge indication. • **Does the engine input agree with the position of the temperature gauge indication?**	

Pinpoint Test F: The Speedometer Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the Vehicle Speed Sensor (VSS) signal from the PCM (non-hybrid) or from the Transmission Control Module (TCM) (hybrid) over the High Speed Controller Area Network (HS-CAN) communication bus. The PCM or TCM receives the VSS input from the Output Shaft Speed (OSS). The IPC monitors the VSS input from the PCM or TCM and commands the speedometer with a corresponding movement of the pointer.

If the vehicle speed data is missing for 5 seconds or less or if the IPC receives invalid vehicle speed data for 5 seconds or less, the IPC defaults the speedometer to the last setting, based upon the last known good vehicle speed message. If the IPC does not receive the vehicle speed data for more than 5 seconds, the IPC sets DTC U0100:00 (non-hybrid) or U0101:00 (hybrid) in continuous memory and defaults the speedometer to 0 km/h (0 mph). If the vehicle speed data received is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 (non-hybrid) or U0402:68 and defaults the speedometer to 0 km/h (0 mph).

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative tachometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- PCM (non-hybrid)
- TCM (hybrid)
- IPC

PINPOINT TEST F: THE SPEEDOMETER IS INOPERATIVE

Test Step	Result / Action to Take
F1 RETRIEVE THE RECORDED DTCs FROM THE PCM AND TCM KOEO SELF-TEST	
• Check for recorded PCM and TCM DTCs from the Key ON Engine OFF (KOEO) self-test.	**Yes** DIAGNOSE all PCM and TCM DTCs first. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

<table>
<tr><td>

- **Are any DTCs recorded?**

For DTC U0100:00 (non-hybrid), GO to Pinpoint Test BF .

For DTC U0101:00 (hybrid), GO to Pinpoint Test BG .

For DTC U0401:68 (non-hybrid) or U0402:68 (hybrid), RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs.

For all other DTCs, REFER to DTC Charts in this section.

No
For non-hybrid vehicles, INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

For hybrid vehicles, INSTALL a new transaxle (TCM).

</td></tr>
</table>

	REFER to Section 307-01C . TEST the system for normal operation.

Pinpoint Test G: Incorrect Speedometer Indication

Normal Operation

The Instrument Panel Cluster (IPC) receives the Vehicle Speed Sensor (VSS) signal from the PCM (non-hybrid) or from the Transmission Control Module (TCM) (hybrid) over the High Speed Controller Area Network (HS-CAN) communication bus. The PCM or TCM receives the VSS input from the Output Shaft Speed (OSS). The IPC monitors the VSS input from the PCM or TCM and commands the speedometer with a corresponding movement of the pointer.

The IPC provides a tolerance which biases the speed indication and displays between 3% below and 7% higher than actual vehicle speed. This means that with an actual vehicle speed of 96.6 km/h (60 mph), the speedometer may indicate between 93.7-103.3 km/h (58.2-64.2 mph). Other factors that could potentially affect the speedometer accuracy are incorrect tire size, tire size configuration and axle ratio configuration.

If the vehicle speed data is missing for 5 seconds or less or if the IPC receives invalid vehicle speed data for 5 seconds or less, the IPC defaults the speedometer to the last setting, based upon the last known good vehicle speed message. If the IPC does not receive the vehicle speed data for more than 5 seconds, the IPC sets DTC U0100:00 (non-hybrid) or U0101:00 (hybrid) in continuous memory and defaults the speedometer to 0 km/h (0 mph). If the vehicle speed data received is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 (non-hybrid) or U0402:68 and defaults the speedometer to 0 km/h (0 mph).

Factors that could potentially affect the accuracy of the speedometer are configurable items such as axle ratio and tire size.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative tachometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- Tire size configuration
- Axle ratio or driveline type configuration
- PCM concern
- IPC

PINPOINT TEST G: INCORRECT SPEEDOMETER INDICATION

Test Step	Result / Action to Take
G1 OBSERVE THE SPEEDOMETER OPERATION	
• Ignition ON. • Observe the speedometer while driving the vehicle at various speeds and stopping frequently. • **Does the speedometer begin at 0 km/h (0 mph), indicate the different vehicle speeds and fully return to**	**Yes** GO to G2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

the 0 km/h (0 mph) position when the vehicle is stopped?	
G2 CHECK THE TIRE SIZE CONFIGURATION	
• Enter the following diagnostic mode on the scan tool: Module Programming . • **NOTE:** The correct tire size can be found on the vehicle certification label on the LH B-pillar. Refer to Section 100-01 . • Select programmable parameters and verify that the vehicle has the correct tire size according to the certification label and the tire size is correctly configured in the PCM. • **Is the tire size correct and is the tire size parameter correctly configured?**	**Yes** GO to G3 . **No** CONFIGURE the tire size. TEST the system for normal operation.
G3 CHECK THE AXLE RATIO OR DRIVELINE TYPE CONFIGURATION	
• Enter the following diagnostic mode on the scan tool: Module Programming . • Select programmable parameters and verify that the axle ratio or driveline type is correctly configured in the PCM. • **Is the axle ratio or driveline type parameter correctly configured?**	**Yes** GO to G4 . **No** CONFIGURE the axle ratio or driveline type. TEST the system for normal operation.
G4 RETRIEVE THE RECORDED DTCs FROM THE PCM AND TCM KOEO SELF-TEST	
• Check for recorded PCM and TCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM and TCM DTCs first. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to G5 .
G5 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00 (non-hybrid), GO to Pinpoint Test BF . For DTC U0100:01 (hybrid), GO to Pinpoint Test BG . For DTC U0401:68 (non-hybrid) or U0402:68 (hybrid), RETRIEVE and REPAIR all non-network DTCs in the

	PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs. For all other DTCs, REFER to DTC Charts in this section. **No** GO to G6 .
G6 CARRY OUT THE IPC SPEEDOMETER ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC speedometer (SPDOMETER) active command. Command the speedometer according to the following table while monitoring the speedometer. • **Does the speedometer indicate the approximate speed according to the**	**Yes** GO to G7 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Speedometer Command	Gauge Position
0%	0 km/h (0 mph)
10%	19 km/h (12 mph)
20%	39 km/h (24 mph)
30%	58 km/h (36 mph)
40%	77 km/h (48 mph)
50%	97 km/h (60 mph)
60%	116 km/h (72 mph)
70%	135 km/h (84 mph)
80%	154 km/h (96 mph)
90%	174 km/h (108 mph)
100%	193 km/h (120 mph)

above specifications?	
G7 CHECK THE PCM VSS PIDs	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger . • Select the PCM vehicle speed (VSS) PID and monitor the PID while driving the vehicle at 32 km/h (20 mph), 64 km/h (40 mph) and 97 km/h (60 mph). • **Does the speedometer indicate between 31-34 km/h (19-21 mph), 63-69 km/h (39-43 mph) and 93-103 km/h (58-64 mph) at the 3 PCM PID values?**	**Yes** The speedometer is operating correctly at this time. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test H: The Odometer Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the odometer rolling count data from the PCM (non-hybrid) or the Transmission Control Module (TCM) (hybrid) over the High Speed Controller Area Network (HS-CAN) communication bus. The IPC monitors the odometer rolling count input and commands the odometer with a display in the message center display area.

If the IPC does not receive the odometer rolling count data or if the rolling count data is deemed invalid for less than 5 seconds, the IPC displays the mileage based upon the last known good input.

If the IPC does not receive the odometer rolling count data or if the rolling count data is deemed invalid from the PCM for 5 seconds, the IPC sets DTC U0100:00 (non-hybrid) or U0101:00 (hybrid) in continuous memory and defaults the odometer display to all dashes (-----).

If the Non-Volatile Memory (NVM) is corrupted, the message center displays ERROR.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer, temperature gauge.

This pinpoint test is intended to diagnose the following:

- PCM (non-hybrid)
- TCM (hybrid)
- IPC

PINPOINT TEST H: THE ODOMETER IS INOPERATIVE

Test Step	Result / Action to Take
H1 CHECK FOR CORRUPTED NVM	
• Ignition ON.	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in

• Observe the message center display area. • **Does the odometer display ERROR?**	this section. TEST the system for normal operation. **No** GO to H2 .
H2 RETRIEVE THE RECORDED DTCs FROM THE PCM AND TCM KOEO SELF-TEST	
• Check for recorded PCM and TCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM and TCM DTCs first. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to H3 .
H3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00 (non-hybrid), GO to Pinpoint Test BF . For DTC U0101:00 (hybrid), GO to Pinpoint Test BG . For DTC U0401:68 (non-hybrid) or U0402:68 (hybrid), RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs. For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test I: The Tachometer Is Inoperative

Normal Operation

The PCM uses the Crankshaft Position (CKP) sensor to measure the engine rpm. The PCM sends the Instrument Panel Cluster (IPC) the data over the High Speed Controller Area Network (HS-CAN) communication bus, to command the tachometer gauge according to the data.

The non-hybrid and hybrid tachometers appear differently but function essentially the same. The non-hybrid gauge is an analog gauge with a needle that points to a specified area of the gauge depending on the data received from the PCM. The hybrid gauge is a digital display that provides a bar, which indicates engine rpm when the gas engine is running. When the vehicle transitions into electric vehicle mode, the EV gauge replaces the tachometer. The hybrid tachometer is only displayed in the enlighten display mode.

If the engine rpm data is invalid for 5 seconds or less or if the IPC does not receive the engine rpm data for 5 seconds or less, the IPC defaults the tachometer to the last setting, based upon the last known good rpm message. If the IPC does not receive the engine rpm data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the tachometer to 0 rpm. If the engine rpm data is deemed

invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the tachometer to 0 rpm.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST I: THE TACHOMETER IS INOPERATIVE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>I1 CARRY OUT THE TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL</td><td></td></tr>
<tr><td>
NOTE: On hybrid vehicles, verify that the IPC display mode is set to the enlighten mode setting before beginning diagnostics.

• Ignition ON.
• Enter the following diagnostic mode on the scan tool: IPC DataLogger .
• Start the engine.
• NOTE: On hybrid, make sure to set the scan tool to 0 rpm before beginning this test.
• Select the IPC tachometer (TACH_IND) active command. Command the tachometer according to the following table while monitoring the tachometer.

<table>
<tr><th>Tachometer Command</th><th>Gauge Position</th></tr>
<tr><td>0%</td><td>0 rpm</td></tr>
<tr><td>50%</td><td>3,500 rpm (non-hybrid)

I2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to I3 .
I3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0401:68, RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs. For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

Pinpoint Test J: Incorrect Tachometer Indication

Normal Operation

The PCM uses the Crankshaft Position (CKP) sensor to measure the engine rpm. The PCM sends the Instrument Panel Cluster (IPC) the data over the High Speed Controller Area Network (HS-CAN) communication bus, to command the tachometer according to the data.

The non-hybrid and hybrid tachometers appear differently but function essentially the same. The non-hybrid gauge is an analog gauge with a needle that points to a specified area of the gauge depending on the data received from the PCM. The hybrid gauge is a digital display that provides a bar, which indicates engine rpm when the gas engine is running. When the vehicle transitions into electric vehicle mode, the EV gauge replaces the tachometer. The hybrid tachometer is only displayed in the enlighten display mode.

The hybrid requires two messages sent from the PCM to operate the tachometer. The first message is an engine active message indicating that the vehicle is in the gas engine operating mode. The second message required for the tachometer is the actual engine rpm data.

If the engine rpm data is invalid for 5 seconds or less or if the IPC does not receive the engine rpm data for 5 seconds or less, the IPC defaults the tachometer to the last setting, based upon the last known good rpm message. If the IPC does not receive the engine rpm data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the tachometer to 0 rpm. If the engine rpm data is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the tachometer to 0 rpm.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- PCM concern
- IPC

PINPOINT TEST J: INCORRECT TACHOMETER INDICATION

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>J1 CARRY OUT THE TACHOMETER ACTIVE COMMAND USING THE SCAN TOOL</td><td></td></tr>
<tr><td>

NOTE: On hybrid vehicles, verify that the IPC display mode is set to the enlighten mode setting before beginning diagnostics.

- Ignition ON.
- Enter the following diagnostic mode on the scan tool: IPC DataLogger .
- Start the engine.
- **NOTE:** On hybrid, make sure to set the scan tool to 0 rpm before beginning this test.
- Select the IPC tachometer (TACH_IND) active command. Command the tachometer according to the following table while monitoring the tachometer.

<table>
<tr><th>Tachometer Command</th><th>Non-Hybrid Gauge Position</th><th>Hybrid Gauge Position</th></tr>
<tr><td>0%</td><td>0 rpm</td><td>0 rpm</td></tr>
<tr><td>10%</td><td>700 rpm</td><td>600 rpm</td></tr>
<tr><td>20%</td><td>1,400 rpm</td><td>1,200 rpm</td></tr>
<tr><td>30%</td><td>2,100 rpm</td><td>1,800 rpm</td></tr>
<tr><td>40%</td><td>2,800 rpm</td><td>2,400 rpm</td></tr>
<tr><td>50%</td><td>3,500 rpm</td><td>3,000 rpm</td></tr>
<tr><td>60%</td><td>4,200 rpm</td><td>3,600 rpm</td></tr>
<tr><td>70%</td><td>4,900 rpm</td><td>4,200 rpm</td></tr>
<tr><td>80%</td><td>5,600 rpm</td><td>4,800 rpm</td></tr>
<tr><td>90%</td><td>6,300 rpm</td><td>5,400 rpm</td></tr>
<tr><td>100%</td><td>7,000 rpm</td><td>6,000 rpm</td></tr>
</table>

- **Does the tachometer indicate the approximate rpm according to the above specification?**

</td><td>

Yes
GO to J2 .

No
INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

</td></tr>
<tr><td>J2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST</td><td></td></tr>
</table>

• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to J3 .
J3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0401:68, RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs. For all other DTCs, REFER to DTC Charts in this section. **No** GO to J4 .
J4 CHECK THE ENGINE RPM INPUT USING THE IPC DEALER TEST MODE	
• Ignition ON. • Enter the IPC dealer test mode. • **NOTE:** The display below uses xxx's to represent a numeric or alpha-numeric value. The value may display the same amount of characters represented by the xxx's or there may be more/less depending on the type of display. For example: TACHOMETER xxx RPM (non-hybrid) or Tachometer x rpm (hybrid) may display TACHOMETER 650 RPM (non-hybrid) or Tachometer 650 rpm (hybrid). • Scroll through the displays to TACHOMETER xxx RPM (non-hybrid) or Tachometer x rpm (hybrid). • Start the engine and operate the engine at 1,000, 1,500 and 2,000 rpm while monitoring both the tachometer and the engine rpm input in the dealer test mode. • **Does the engine rpm input agree approximately with the position of the tachometer indication?**	**Yes** The tachometer is operating correctly at this time. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test K: The EV Gauge Is Inoperative (Hybrid)

Normal Operation

The EV gauge is an extension of the tachometer display. When the vehicle shifts into electric vehicle mode or the ignition is in the RUN position with the engine off, the EV gauge replaces the tachometer display in the Instrument Panel Cluster (IPC). The IPC receives the EV gauge data from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus, and engages and commands the EV gauge according to the data received. The EV gauge is only available in the enlighten display mode.

For the IPC to switch to the EV gauge, the PCM first stops providing the message indicating that the vehicle is in engine active mode and begins sending electric power flow data to the IPC .

If the electric motor data is invalid for 5 seconds or less or if the IPC does not receive the electric motor data for 5 seconds or less, the IPC defaults the EV gauge to the last setting, based upon the last known good electric motor message. If the IPC does not receive the electric motor data from the PCM for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the EV gauge to 0 rpm. If the electric motor data is deemed invalid by the IPC for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the EV gauge to 0.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, temperature gauge or odometer.

This pinpoint test is intended to diagnose the following:

- PCM concern
- IPC

PINPOINT TEST K: THE EV GAUGE IS INOPERATIVE (HYBRID)

NOTE: The gas engine must be off with the vehicle operating in electric vehicle mode for the EV gauge to operate.

Test Step	Result / Action to Take
K1 VERIFY THAT THE IPC IS IN THE CORRECT DISPLAY SETTING	
• Ignition ON. • Using the setup menu, verify that the IPC is in the enlighten display mode. • **Is the IPC in the enlighten display mode?**	**Yes** GO to K2 . **No** SET the display setting to enlighten mode.
K2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

(KOEO) self-test. • **Are any DTCs recorded?**	**No** GO to K3 .
K3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0401:68, RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs. For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test L: The High Voltage Battery Gauge Is Inoperative (Hybrid)

Normal Operation

The Instrument Panel Cluster (IPC) provides 4 indication modes for the high voltage battery gauge depending upon which display mode the IPC is set to display. Each display mode incrementally adds additional functional indications. The first indication mode displays the current state of charge of the Battery Pack Sensor Module (BPSM). The second and third indication modes indicate whether the BPSM is in the charge or assist mode. When in charge mode, an up arrow is displayed at the top of the gauge. When in assist mode, a down arrow is displayed at the bottom of the gauge. The fourth indication mode displays a circular set of arrows around the battery and a brighter green arrow at the top of the gauge to indicate that the vehicle is in regenerative braking mode.

The IPC requires multiple operational messages from 3 separate modules sent over the High Speed Controller Area Network (HS-CAN) communication bus to control the high voltage battery gauge. The following table provides a summary of the messages and the originating module.

Operational Message	Originating Module	High Voltage Battery Gauge Indication Mode
• Measured state of charge	BPSM	Current state of charge mode
• Current	BPSM	Charge and assist mode
• Voltage	BPSM	Charge and assist mode
• Motor speed slow	Transmission Control Module (TCM)	Regenerative braking mode
	ABS module	Regenerative braking mode

• Hybrid electric vehicle torque modification		

If the state of charge data is missing or invalid for less than 5 seconds, the IPC defaults the state of charge indicator to the last state, based upon the last known good state of charge data received. If the state of charge data is invalid for 5 seconds or more, the IPC sets DTC U0412:68 and defaults the state of charge indicator to the full low position. If the state of charge data is missing for 5 seconds or more, the IPC sets DTC U0111:00 and defaults the state of charge indicator to the full low position.

If the current/voltage data is missing or invalid for less than 5 seconds, the IPC defaults the charge and assist arrows to the last state, based upon the last known good current/voltage data received. If the current/voltage data is invalid for 5 seconds or more, the IPC sets DTC U0412:68 and defaults the charge and assist arrows off. If the current/voltage data is missing for 5 seconds or more, the IPC sets DTC U0111:00 and defaults the charge and assist arrows off.

If the motor speed data is missing or invalid for less than 5 seconds, the IPC defaults the regenerative braking symbol and up arrow to the last state, based upon the last known good motor speed slow message received. If the motor speed data is invalid for 5 seconds or more, the IPC sets DTC U0402:68 and defaults the regenerative braking symbol and up arrow off. If the motor speed data is missing for 5 seconds or more, the IPC sets DTC U0101:00 and defaults the regenerative braking symbol and up arrow off.

If the torque modification data is missing or invalid for 5 seconds or more, the IPC defaults the regenerative braking symbol and up arrow off. If the motor speed data is invalid for 5 seconds or more, the IPC sets DTC U0415:68 and defaults the regenerative braking symbol and up arrow off. If the motor speed data is missing for 5 seconds or more, the IPC sets DTC U0121:00 and defaults the regenerative braking symbol and up arrow off.

This pinpoint test is intended to diagnose the following:

- High voltage battery concern
- Transaxle concern
- ABS concern
- IPC

PINPOINT TEST L: THE HIGH VOLTAGE BATTERY GAUGE IS INOPERATIVE (HYBRID)

Test Step	Result / Action to Take
L1 RETRIEVE THE RECORDED DTCs FROM THE BPSM SELF-TEST	
• Check for recorded BPSM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all BPSM DTCs first. REFER to Section 414-03 . **No** GO to L2 .
L2 RETRIEVE THE RECORDED DTCs FROM THE TCM SELF-TEST	
• Check for recorded TCM DTCs from the self-test.	**Yes** DIAGNOSE all TCM DTCs first. REFER to Section 307-01C .

• **Are any DTCs recorded?**	**No** GO to L3 .
L3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded ABS module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all ABS module DTCs first. REFER to Section 206-09 . **No** GO to L4 .
L4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test M: The Fuel Efficiency Gauge Is Inoperative (Hybrid)

Normal Operation

The Instrument Panel Cluster (IPC) receives the fuel usage data from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. The IPC monitors the fuel usage inputs and provides an instantaneous display of the miles per gallon.

This pinpoint test is intended to diagnose the following:

- PCM concern
- Transmission Control Module (TCM) concern
- IPC

PINPOINT TEST M: THE FUEL EFFICIENCY GAUGE IS INOPERATIVE (HYBRID)

Test Step	Result / Action to Take
M1 VERIFY THAT THE IPC IS IN THE CORRECT DISPLAY SETTING	
• Ignition ON. • Using the setup menu, verify that the IPC is in the enlighten, engage or empower display mode. • **Is the IPC in the enlighten, engage or empower display mode?**	**Yes** GO to M2 . **No** SET the display setting to the enlighten, engage or empower mode.
M2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	

• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to M3 .
M3 RETRIEVE THE RECORDED DTCs FROM THE TCM SELF-TEST	
• Check for recorded TCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all TCM DTCs first. REFER to Section 307-01C . **No** GO to M4 .
M4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0101:00, GO to Pinpoint Test BG . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test N: The Accessory Power Gauge Is Inoperative (Hybrid)

Normal Operation

The accessory power gauge indicates the amount of non-propulsion electrical demands that the vehicle accessories are placing on the electrical system. Examples of non-propulsion accessories are air conditioning, lighting, audio and the rear window defroster. The accessory power gauge is only displayed in the empower display mode. When in use, these accessories use up electrical power that reduces the overall stored energy that could be used to drive the electric motor. The accessory power gauge indicates the amount of power the accessories are using up. Thus a rising gauge indicates that there is an increasing demand on the available power and a falling gauge indication indicates that the demand from the accessories is reduced.

The Instrument Panel Cluster (IPC) receives the accessory power data from the air conditioning control module and the DC to DC Converter Control Module (DC/DC) over the High Speed Controller Area Network (HS-CAN) communication bus.

The IPC requires multiple operational messages to control the accessory power gauge. The following table provides a summary of the messages and the originating module.

Operational Message	Originating Module
	Air conditioning control module

• Actual power consumption	
• DC to DC high voltage current	DC/DC
• DC to DC high voltage	DC/DC

If the actual power consumption data is missing or invalid for less than 5 seconds, the IPC defaults the accessory power gauge to the last state, based upon the last known good actual power consumption data received. If the actual power consumption data is invalid for 5 seconds or more, the IPC sets DTC U040A:68 and defaults the accessory power gauge to the full low position. If the actual power consumption data is missing for 5 seconds or more, the IPC sets DTC U010F:00 and defaults the accessory power gauge to the full low position.

If the DC to DC current/voltage data is missing or invalid for less than 5 seconds, the IPC defaults the accessory power gauge to the last state, based upon the last known good DC to DC current/voltage data received. If the DC to DC current/voltage data is invalid for 5 seconds or more, the IPC sets DTC U0599:68 and defaults the accessory power gauge to the full low position. If the DC to DC current/voltage data is missing for 5 seconds or more, the IPC sets DTC U0298:00 and defaults the accessory power gauge to the full low position.

This pinpoint test is intended to diagnose the following:

- Air conditioning control module
- DC/DC
- IPC

PINPOINT TEST N: THE ACCESSORY POWER GAUGE IS INOPERATIVE (HYBRID)

Test Step	Result / Action to Take
N1 VERIFY THAT THE IPC IS IN THE CORRECT DISPLAY SETTING	
• Ignition ON. • Using the setup menu, verify that the IPC is in the empower display mode. • **Is the IPC in the empower display mode?**	**Yes** GO to N2 . **No** SET the display setting to empower mode.
N2 RETRIEVE THE RECORDED DTCs FROM THE AIR CONDITIONING CONTROL MODULE SELF-TEST	
• Check for recorded air conditioning control module DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all air conditioning control module DTCs first. REFER to Section 307-01C . **No** GO to N3 .
N3 RETRIEVE THE RECORDED DTCs FROM THE	

DC/DC SELF-TEST	
• Check for recorded DC/DC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all DC/DC DTCs first. REFER to Section 414-05 . **No** GO to N4 .
N4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test O: The Vehicle Power Gauge Is Inoperative (Hybrid)

Normal Operation

The vehicle power gauge indicates the power demand when the transaxle is in DRIVE (D) range. The vehicle power gauge is only displayed in the empower display mode. The vehicle power gauge display provides the gasoline engine on/off threshold using a green box on the lower end of the gauge and a gauge display indicating the amount of acceleration demand through the accelerator pedal. As the accelerator is pressed during normal driving, the gauge display increases until the acceleration or power demand is great enough to require the assistance of the gasoline engine.

When the power demand is low and the vehicle is in the electric vehicle mode, the EV display at the bottom of the gauge illuminates. Under certain circumstances such as system warm up or battery charging, the gasoline engine runs regardless of how low the power demand is from the driver. In this case, the green box on the lower portion of the gauge indicating the gasoline engine on/off threshold is not displayed.

The Instrument Panel Cluster (IPC) receives the vehicle power data from the PCM and Battery Pack Sensor Module (BPSM) over the High Speed Controller Area Network (HS-CAN) communication bus.

If the PCM data is missing or invalid for less than 5 seconds, the IPC defaults the vehicle power gauge to the last state, based upon the last known good actual power consumption data received. If the PCM data is invalid for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the vehicle power gauge to the full low position. If the PCM data is missing for 5 seconds or more, the IPC sets DTC U0100:00 and defaults the vehicle power gauge to the full low position.

If the current/voltage data is missing or invalid for less than 5 seconds, the IPC defaults the vehicle power gauge to the last state, based upon the last known good current/voltage data received. If the current/voltage data is invalid for 5 seconds or more, the IPC sets DTC U0412:68 and defaults the vehicle power gauge to the full low position. If the current/voltage data is missing for 5 seconds or more, the IPC sets DTC U0111:00 and defaults the vehicle power gauge to the full low position.

This pinpoint test is intended to diagnose the following:

- PCM
- BPSM

- IPC

PINPOINT TEST O: THE VEHICLE POWER GAUGE IS INOPERATIVE (HYBRID)

Test Step	Result / Action to Take
O1 VERIFY THAT THE IPC IS IN THE CORRECT DISPLAY SETTING	
• Ignition ON. • Using the setup menu, verify that the IPC is in the empower display mode. • **Is the IPC in the empower display mode?**	**Yes** GO to O2 . **No** SET the display setting to empower mode.
O2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to O3 .
O3 RETRIEVE THE RECORDED DTCs FROM THE BPSM SELF-TEST	
• Check for recorded BPSM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all BPSM DTCs first. REFER to Section 414-03 . **No** GO to O4 .
O4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test P: The Split Power Gauge Is Inoperative (Hybrid)

Normal Operation

The split power gauge is actually a dual gauge indication. The LH side of the gauge provides the propulsion power supplied by the electric motor in the electric vehicle mode. The RH side of the gauge provides the propulsion power supplied by the gasoline engine. When the vehicle is powered by the electric motor in electric vehicle mode, the gauge illuminates the EV icon at the bottom of the gauge. The split power gauge is only displayed in the engage display mode.

The Instrument Panel Cluster (IPC) receives the split power gauge data from the PCM and the Battery Pack Sensor Module (BPSM) over the High Speed Controller Area Network (HS-CAN) communication bus.

The IPC requires multiple operational messages to control the split power gauge. The following table provides a summary of the messages and the originating module.

Operational Message	Originating Module
• Engine active	PCM
• Engine speed	PCM
• Hybrid Electric Vehicle (HEV) estimated engine torque	PCM
• Current	BPSM
• Voltage	BPSM

If the PCM data is missing or invalid for less than 5 seconds, the IPC defaults the split power gauge to the last state, based upon the last known good actual power consumption data received. If the PCM data is invalid for 5 seconds or more, the IPC sets DTC U0401:68 and defaults the split power gauge to the full low position. If the PCM data is missing for 5 seconds or more, the IPC sets DTC U0100:00 and defaults the split power gauge to the full low position.

If the current/voltage data is missing or invalid for less than 5 seconds, the IPC defaults the split power gauge to the last state, based upon the last known good current/voltage data received. If the current/voltage data is invalid for 5 seconds or more, the IPC sets DTC U0412:68 and defaults the split power gauge to the full low position. If the current/voltage data is missing for 5 seconds or more, the IPC sets DTC U0111:00 and defaults the split power gauge to the full low position.

This pinpoint test is intended to diagnose the following:

- PCM concern
- High voltage battery concern
- IPC

PINPOINT TEST P: THE SPLIT POWER GAUGE IS INOPERATIVE (HYBRID)

Test Step	Result / Action to Take
P1 VERIFY THAT THE IPC IS IN THE CORRECT DISPLAY SETTING	
• Ignition ON. • Using the setup menu, verify that the IPC is in the engage display	**Yes** GO to P2 . **No**

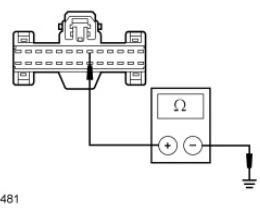
mode. • **Is the IPC in the engage display mode?**	SET the display setting to engage mode.
P2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to P3 .
P3 RETRIEVE THE RECORDED DTCs FROM THE BPSM SELF-TEST	
• Check for recorded BPSM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all BPSM DTCs first. REFER to Section 414-03 . **No** GO to P4 .
P4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test R: The Low Oil Pressure Warning Indicator Is Never/Always On (Non-Hybrid)

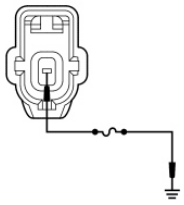
Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

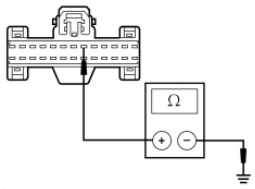
Normal Operation

The Instrument Panel Cluster (IPC) provides a reference voltage to the engine oil pressure switch. When the oil pressure is within normal ranges, the engine oil pressure switch closes to ground, pulling the reference voltage low in the IPC . The IPC senses the low reference voltage and turns off the low oil pressure warning indicator. When the engine oil pressure is low, the engine oil pressure switch opens, sending the reference voltage high in the IPC . The IPC senses the high voltage and turns the low oil pressure warning indicator on.



This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Engine oil pressure switch
- Base engine oil pressure concern
- IPC

PINPOINT TEST R: THE LOW OIL PRESSURE WARNING INDICATOR IS NEVER/ALWAYS ON (NON-HYBRID)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
R1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC low oil pressure warning indicator (OIL_P_LOW) active command. Command the low oil pressure warning indicator on and off while observing the low oil pressure warning indicator. • **Does the low oil pressure warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** If the original symptom is the low oil pressure warning indicator is always on, GO to R4 . If the original symptom is the low oil pressure warning indicator is never on, GO to R2 . **No** GO to R7 .
R2 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103 . • Ignition ON. • Observe the low oil pressure warning indicator. • **Does the low oil pressure warning indicator turn on?**	**Yes** INSTALL a new Engine Oil Pressure (EOP) switch. REFER to Section 303-01A (2.5L), Section 303-01B (3.0L) or Section 303-01C (3.5L). TEST the system for normal operation. **No** GO to R3 .
R3 CHECK OIL PRESSURE INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220 . • Measure the resistance between the IPC C220-6, circuit CMC24 (GY), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R7 . **No** REPAIR the circuit. TEST the system for normal operation.

R4 CHECK FOR A STUCK OPEN ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103 . • Connect a fused jumper wire between the engine oil pressure switch, C103-1, circuit CMC24 (GY), harness side and ground.  N0002760 • Ignition ON. • Observe the low oil pressure warning indicator. • **Does the low oil pressure warning indicator turn off?**	**Yes** REMOVE the jumper wire. GO to R6 . **No** LEAVE the jumper wire connected. GO to R5 .
R5 CHECK OIL PRESSURE INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Disconnect: IPC C220 . • With the jumper wire in place, measure the resistance between the IPC C220-6, circuit CMC24 (GY), harness side and ground.  N0094481 • **Is the resistance less than 5 ohms?**	**Yes** REMOVE the jumper wire. GO to R7 . **No** REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.
R6 CHECK THE OIL PRESSURE	
• Carry out the oil pressure test. Refer to Section 303-00 . • **Is the oil pressure within specification?**	**Yes** INSTALL a new Engine Oil Pressure (EOP) switch. REFER to Section 303-01A (2.5L), Section 303-01B (3.0L) or Section 303-01C (3.5L). TEST the system for normal operation. **No** REFER to Section 303-00 to continue diagnosis of the low engine oil pressure concern.

R7 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

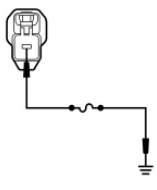
Pinpoint Test S: The Brake Warning Indicator is Never On

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

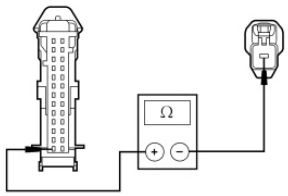
Normal Operation

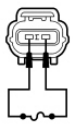
The Instrument Panel Cluster (IPC) uses 3 basic messaged inputs to control the brake warning indicator. The first 2 are the parking brake warning indicator switch and brake fluid level switch. The third is for the Electronic Brake Distribution (EBD) and the brake booster vacuum sensor, controlled by the ABS module. The parking brake warning indicator switch and the brake fluid level switch status are sent from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus. The EBD message is sent from the ABS module over the High Speed Controller Area Network (HS-CAN) communication bus lines. The parking brake warning indicator switch and brake fluid level switch are both hardwired to the SJB . The parking brake warning indicator switch is case grounded and the brake fluid level uses an external ground circuit.

The SJB provides a reference voltage to both the parking brake warning indicator switch and the brake fluid level switch. When the parking brake is applied, the parking brake warning indicator switch closes to ground, providing a ground to the SJB and pulling the parking brake input circuit low. When a low brake fluid level condition exists, the low brake fluid level switch closes to ground through the ground circuit, pulling the brake fluid level input circuit low. The SJB monitors the parking brake and the brake fluid level inputs sending the IPC a message to turn the brake warning indicator on or when the parking brake is applied. When the ABS module detects a base brake system concern or other ABS-related concerns that affect the EBD function, the ABS module sends a message to the IPC to illuminate both the ABS warning indicator and the brake warning indicator.

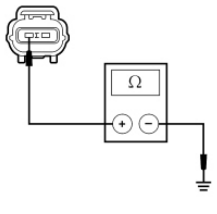


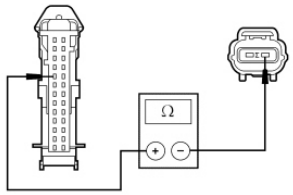
This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Parking brake warning indicator switch
- Brake fluid level switch
- SJB
- IPC





PINPOINT TEST S: THE BRAKE WARNING INDICATOR IS NEVER ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
S1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC brake warning indicator (PBA_LMP) active command. Command the brake warning indicator on while observing the brake warning indicator. • **Does the brake warning indicator illuminate when commanded on?**	**Yes** GO to S2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
S2 DETERMINE IF THE BRAKE WARNING INDICATOR OPERATES WITH THE PARKING BRAKE	
• Apply the parking brake while monitoring the brake warning indicator. • **Does the brake warning indicator illuminate with the parking brake applied?**	**Yes** GO to S6 . **No** GO to S3 .
S3 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH PID	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Select the SJB parking brake PID (PRK_BRK). Monitor the parking brake PID while applying the parking brake. • **Does the PID agree with the parking brake position?**	**Yes** GO to S9 . **No** GO to S4 .
S4 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH	
• Disconnect: Parking Brake Warning Indicator Switch C306 . • Connect a fused jumper wire between the parking brake warning indicator switch C306-1, circuit CMC25 (WH/VT), harness side and ground.  N0026569 • **Does the brake warning indicator illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new parking brake warning indicator switch. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to S5 .

S5 CHECK THE PARKING BRAKE SIGNAL CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280c . • Measure the resistance between the SJB C2280c-1, circuit CMC25 (WH/VT), harness side and the parking brake warning indicator switch C306-1, circuit CMC25 (WH/VT), harness side and ground.  N0094482 • **Is the resistance less than 5 ohms?**	**Yes** GO to S9 . **No** REPAIR the circuit. TEST the system for normal operation.
S6 CHECK THE BRAKE FLUID LEVEL SWITCH OPERATION	
• Ignition OFF. • Disconnect: Brake Fluid Level Switch C124 . • Ignition ON. • Connect a fused jumper wire between the brake fluid level switch C124-1, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-2, circuit GD121 (BK/YE), harness side.  N0026571 • **Does the brake warning indicator illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new brake fluid level switch. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to S7 .
S7 CHECK THE BRAKE FLUID LEVEL SWITCH GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the brake fluid level switch C124-2, circuit GD121 (BK/YE), harness side and ground.	**Yes** GO to S8 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0026575 • **Is the resistance less than 5 ohms?**	
S8 CHECK THE BRAKE FLUID LEVEL INPUT CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280f . • Measure the resistance between the SJB C2280f-9, circuit CMC19 (GY/VT), harness side and the brake fluid level switch C124-1, circuit CMC19 (GY/VT), harness side.  N0094483 • **Is the resistance less than 5 ohms?**	**Yes** GO to S9 . **No** REPAIR the circuit. TEST the system for normal operation.
S9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test T: The Brake Warning Indicator is Always On

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) uses 3 basic messaged inputs to control the brake warning indicator. The first 2 are the parking brake warning indicator switch and brake fluid level switch. The third is for the Electronic Brake Distribution (EBD) and the brake booster vacuum sensor, controlled by the ABS module. The parking brake warning indicator switch and the brake fluid level switch status are sent from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus. The EBD message is sent from the ABS module over the High Speed Controller Area Network (HS-CAN) communication bus lines. The parking brake warning indicator switch and brake fluid level switch are both hardwired to the SJB . The parking brake warning indicator switch is case grounded and the brake fluid level

uses an external ground circuit.

The SJB provides a reference voltage to both the parking brake warning indicator switch and the brake fluid level switch. When the parking brake is applied, the parking brake warning indicator switch closes to ground, providing a ground to the SJB and pulling the parking brake input circuit low. When a low brake fluid level condition exists, the low brake fluid level switch closes to ground through the ground circuit, pulling the brake fluid level input circuit low. The SJB monitors the parking brake and the brake fluid level inputs sending the IPC a message to turn the brake warning indicator on or when the parking brake is applied. When the ABS module detects a base brake system concern or other ABS-related concerns that affect the EBD function, the ABS module sends a message to the IPC to illuminate both the ABS warning indicator and the brake warning indicator.

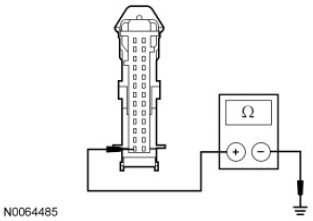
If the brake fluid level or parking brake status messages are missing for more than 5 seconds, the IPC sets DTC U0140:00 and defaults the brake warning indicator on. If the IPC does not receive the ABS status message or the EBD message from the ABS module for more than 5 seconds, the IPC sets DTC U0121:00 and defaults the ABS warning indicator on.

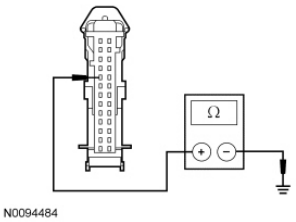
- DTC B2479 (Park Brake Switch Circuit Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground on the parking brake warning indicator switch input circuit.
- DTC C1125 (Brake Fluid Level Sensor Input Circuit Failure) - a continuous and on-demand DTC that sets in the SJB if the SJB detects a short to ground on the brake fluid level input circuit.

NOTE: If DTC U0140:00 is set in the IPC , other symptoms may also be present such as Tire Pressure Monitoring System (TPMS), instrument panel backlighting, and door ajar indication.

NOTE: Whenever the IPC receives an EBD message from the ABS module, the IPC illuminates both the brake warning indicator and the ABS warning indicator simultaneously.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Parking brake warning indicator switch
- Brake fluid level switch
- ABS concern
- SJB
- IPC

PINPOINT TEST T: THE BRAKE WARNING INDICATOR IS ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
T1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC brake warning indicator (PBA_LMP) active command. Command brake warning indicator on and off while observing the brake warning indicator.	**Yes** GO to T2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for

• **Does the brake warning indicator turn off when commanded off?**	normal operation.
T2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140:00, GO to Pinpoint Test BM . For DTC U0121:00, GO to Pinpoint Test BK . For all other DTCs, REFER to DTC Charts in this section. **No** GO to T3 .
T3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded DTCs from the ABS module self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** GO to T4 .
T4 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check for recorded DTCs from the SJB self-test. • **Is DTC B2479 recorded?**	**Yes** GO to T5 . **No** GO to T8 .
T5 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH PID	
• Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Select the SJB parking brake PID (PRK_BRAKE). Monitor the parking brake PID while applying and releasing the parking brake. • **Does the PID agree with the parking brake position?**	**Yes** GO to T10 . **No** GO to T6 .
T6 CHECK THE PARKING BRAKE WARNING INDICATOR SWITCH	
• Disconnect: Parking Brake Warning Indicator Switch C306 . • Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Select the SJB parking brake PID (PRK_BRAKE). Monitor the parking brake PID. • **Does the PID indicate the parking brake is released or off?**	**Yes** INSTALL a new parking brake warning indicator switch. CLEAR the DTCs. REPEAT the self-test. **No** GO to T7 .
T7 CHECK CIRCUIT CMC25 (WH/VT) FOR A SHORT TO GROUND	

• Ignition OFF. • Disconnect: SJB C2280c . • Measure the resistance between the SJB C2280c-1, circuit CMC25 (WH/VT), harness side and ground.  N0064485 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to T10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
T8 CHECK THE BRAKE WARNING INDICATOR USING THE BRAKE FLUID LEVEL SWITCH	
• Ignition OFF. • Disconnect: Brake Fluid Level Switch C124 . • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test . • Clear the SJB DTCs. Repeat the self-test. • **Is DTC C1125 still present?**	**Yes** GO to T9 . **No** INSTALL a new brake fluid level switch. CLEAR the DTCs. REPEAT the self-test.
T9 CHECK THE BRAKE FLUID LEVEL INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280f . • Measure the resistance between the SJB C2280f-9, circuit CMC19 (GY/VT), harness side and ground.  N0094484 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to T10 . **No** REPAIR the circuit. TEST the system for normal operation.
T10 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify that the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test U: The ABS Warning Indicator Is Never/Always On

Normal Operation

The ABS module provides the ABS status to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) communication bus. If a fault condition exists in the ABS, the ABS module sends the IPC a command to turn on the ABS warning indicator.

If the ABS status message is missing for less than 5 seconds, the ABS warning indicator remains in the last indication mode (on or off) based upon the last known good message received. If the ABS status message is missing for more than 5 seconds, the IPC sets DTC U0121:00 and defaults the ABS warning indicator on.

This pinpoint test is intended to diagnose the following:

- ABS module
- IPC

PINPOINT TEST U: THE ABS WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
U1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC ABS warning indicator (ABS_LAMP) active command. Command the ABS warning indicator on then off. Observe the ABS warning indicator. • **Does the ABS warning indicator turn on when commanded on and turn off when commanded off?**	**Yes** GO to U2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
U2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0121:00, GO to Pinpoint Test BK . For all other DTCs, REFER to DTC Charts in this section. **No** GO to U3 .
U3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
	Yes REFER to Section 206-09 .

• Check for recorded DTCs from the ABS module self-test. • **Are any DTCs recorded?**	**No** INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.

Pinpoint Test V: The Stability/Traction Control Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the stability/traction control data from the ABS module over the High Speed Controller Area Network (HS-CAN) communication bus. The stability/traction control indicator flashes when the vehicle stability/traction control is in active mode or is being controlled by the ABS module. The stability/traction control indicator turns on steady if a fault condition exists in the stability/traction control system. The IPC monitors the stability/traction control message from the ABS module and either flashes the stability/traction control indicator or turns it on steady depending on the condition.

Whenever a fault is detected in the ABS module and the ABS warning indicator is illuminated, the stability/traction control indicator also illuminates and stability/traction control is disabled.

If the stability/traction control status message is missing for less than 5 seconds, the stability/traction control indicator remains in the last indication mode (on or off) based upon the last known good message received. If the stability/traction control message is missing for more than 5 seconds, the IPC sets DTC U0121:00 in continuous memory and defaults the stability/traction control indicator on.

This pinpoint test is intended to diagnose the following:

- Stability/traction control concern
- ABS module
- IPC

PINPOINT TEST V: THE STABILITY/TRACTION CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
V1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Enter the IPC active command mode and select the stability/traction control indicator (TC/IVD/RSCLMP) active command. Command the stability/traction control indicator on and off while observing the stability/traction control indicator. • **Does the stability/traction control indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to V2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
V2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test.	**Yes** For DTC U0121:00, GO to

• **Are any DTCs recorded?**	Pinpoint Test BK . For all other DTCs, REFER to DTC Charts in this section. **No** GO to V3 .
V3 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded DTCs from the ABS module self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.

Pinpoint Test W: The Stability/Traction Control Disabled Indicator Is Never/Always On

Normal Operation

The traction control switch is hardwired to the Instrument Panel Cluster (IPC). When the traction control switch is pressed, the IPC sends a message to the ABS module over the High Speed Controller Area Network (HS-CAN) communication bus indicating that the traction control switch has been pressed. The ABS module either disables or enables the stability/traction control system and sends a message back to the IPC to turn on or off the stability/traction control disabled indicator based upon the system state.

When a MyKey® programmed key is in use and the AdvanceTrac® on feature is configured always on, the stability/traction control system cannot be disabled and the stability/traction control indicator does not turn on when the traction control disable button is pressed. The stability/traction control indicator still functions normally to indicate a stability/traction control system fault and a stability/traction control active event.

If the traction control switch state message is missing for less than 5 seconds, the stability/traction control disabled indicator remains in the last indication mode (on or off) based upon the last known good message received. If the traction control switch state message is missing for more than 5 seconds, the IPC sets DTC U0121:00 in continuous memory and defaults the stability/traction control disabled indicator off.

This pinpoint test is intended to diagnose the following:

- A MyKey® programmed key is in use
- Stability/traction control cannot be disabled
- ABS module
- IPC

PINPOINT TEST W: THE STABILITY/TRACTION CONTROL DISABLED INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take		
W1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE			**Yes** GO to W2

SCAN TOOL		• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Enter the IPC active command mode and select the stability/traction control disabled indicator (STAB_TC_LMP) active command. Command the stability/traction control disabled indicator on and off while observing the stability/traction control disabled indicator. • **Does the stability/traction control disabled indicator illuminate when commanded on and turn off when commanded off?**	. **No** INSTALL a new IPC. REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
W2 CHECK FOR THE KEY TYPE			
• Check if the key is a MyKey® programmed key or an administrator key. Refer to a target="_parent"	**Yes** GO to W3. **No**		

href="SCS~us~en~file=SCSSJ1BL.HTM~gen~ref.HTM" >Section 419-01B . • **Is the key an administrator key?**	If the MyKey® AdvanceTrac® on feature is configured always on, the system is normal. The stability/traction control system cannot be disabled when the AdvanceTrac® on feature is configured always on. If the MyKey® AdvanceTrac® on feature is not configured always on, GO to W3 .
W3 CHECK THE TRACTION CONTROL INPUT TO THE IPC	
• Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC stability/traction control indicator PID (STAB_CTRL_SW). • Monitor the traction control PID while pressing and releasing the traction control disable switch. • **Does the stability/traction control PID read RELEASED when the button is released and DEPRESSED when the button is pressed?**	**Yes** GO to W4 . **No** REFER to Section 206-09 to diagnose the traction control system cannot be disabled.
W4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC C0089:11, REFER to Section 206-09 . For DTC U0121:00, GO to Pinpoint Test BK . For all other DTCs, REFER to DTC Charts in this section. **No**

	GO to W5 .
W5 RETRIEVE THE RECORDED DTCs FROM THE ABS MODULE SELF-TEST	
• Check for recorded DTCs from the ABS module self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 . **No** INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.

Pinpoint Test X: The Safety Belt Warning Indicator Is Never/Always On

Normal Operation

The Restraints Control Module (RCM) monitors the safety belt position through the safety belt buckle switch. The RCM provides the safety belt buckle status to the Instrument Panel Cluster (IPC) over the High Speed Controller Area Network (HS-CAN) communication bus.

If the safety belt status message is missing for less than 5 seconds, the safety belt warning indicator remains in the last indication mode (on or off) based upon the last known good message received. If the safety belt status message is missing for 5 seconds or more, the IPC sets DTC U0151:00 and defaults the safety belt warning indicator off.

This pinpoint test is intended to diagnose the following:

- RCM
- IPC

PINPOINT TEST X: THE SAFETY BELT WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
X1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC safety belt warning indicator (SBLT_LAMP) active command. Command the safety belt warning indicator on and off while observing the safety belt warning indicator. • **Does the safety belt warning indicator illuminate when commanded on, and turn off when**	**Yes** GO to X2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

commanded off?	
X2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U0151:00 recorded?**	**Yes** GO to Pinpoint Test BN . **No** GO to X3 .
X3 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST	
• Check for recorded DTCs from the RCM self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Test Y: The Air Bag Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the Supplemental Restraint System (SRS) status from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN) communication bus. If an SRS concern is detected, the RCM sets a DTC and sends a message to the IPC to turn on the air bag warning indicator.

If the SRS status message is missing for less than 5 seconds, the air bag warning indicator remains in the last indication mode (on or off) based upon the last known good message received. If the SRS status message is missing for more than 5 seconds, the IPC sets DTC U0151:00 and defaults the air bag warning indicator on.

This pinpoint test is intended to diagnose the following:

- RCM
- IPC

PINPOINT TEST Y: THE AIR BAG WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Y1 CARRY OUT THE IPC AIR BAG WARNING INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC air bag warning indicator (AIRBAG_LMP) active command. Command the air bag warning indicator on and off while observing the air bag warning indicator.	**Yes** GO to Y2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

• **Does the air bag warning indicator illuminate when commanded on, and turn off when commanded off?**	
Y2 RETRIEVE THE RECORDED DTCs FROM THE RCM SELF-TEST	
• Check for recorded DTCs from the RCM self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B . **No** GO to Y3 .
Y3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0151:00, GO to Pinpoint Test BN . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation.

Pinpoint Test Z: The Anti-Theft Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) interacts with the PCM (non-hybrid) or Transmission Control Module (TCM) (hybrid) and controls the Passive Anti-Theft System (PATS) function. The IPC controls the anti-theft indicator based upon the status of the PATS .

The anti-theft indicator proves out for 3 seconds when the key is turned to the ON or START position. If there is a PATS concern, the anti-theft indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the ignition is switched to the ON or START mode. The PATS also flashes the anti-theft indicator every 2 seconds at ignition off to act as a visual theft deterrent for all vehicles.

This pinpoint test is intended to diagnose the following:

- PATS concern
- IPC

PINPOINT TEST Z: THE ANTI-THEFT INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Z1 CHECK THE ANTI-THEFT INDICATOR OPERATION	
• Ignition ON.	**Yes** GO to Z2 .

• Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Select the IPC anti-theft indicator (THEFT_LMP) active command. Command the anti-theft indicator on and off while observing the anti-theft indicator. • **Does the anti-theft indicator illuminate when commanded on and turn off when commanded off?**	**No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
Z2 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test. • **Are any PATS -related DTCs recorded?**	**Yes** REFER to Section 419-01B (non-hybrid) or Section 419-01C (hybrid). **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AA: The Door/Hood Ajar Warning Indicator Is Never/Always On (Fusion Non-Hybrid)

Normal Operation

The Instrument Panel Cluster (IPC) receives the door/hood ajar status for the LH front door, RH front door, LH rear door, the RH rear door and hood from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus. When the IPC receives a message from the SJB that the hood or one or more doors is open or ajar, the IPC turns on the door/hood ajar warning indicator.

If the door/hood ajar status message is missing for less than 5 seconds, the door/hood ajar warning indicator remains in the last indication mode (on or off) based upon the last known good message received. If the door/hood ajar status message is missing for more than 5 seconds, the IPC sets DTC U0140:00 and defaults the door/hood ajar warning indicator on.

NOTE: If DTC U0140:00 is set in the SJB , other symptoms may also be present in the IPC such as high beam indicator, RH/LH turn indicators, instrument panel backlighting and Tire Pressure Monitoring System (TPMS).

This pinpoint test is intended to diagnose the following:

- Interior lighting concern
- SJB
- IPC

PINPOINT TEST AA: THE DOOR/HOOD AJAR WARNING INDICATOR IS NEVER/ALWAYS ON (FUSION NON-HYBRID)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

AA1 CHECK THE INTERIOR LIGHTING OPERATION	
• Open and close each door while monitoring the courtesy lamps. • **Do the courtesy lamps operate correctly with each door?**	**Yes** GO to AA2 . **No** REFER to Section 417-02 .
AA2 CHECK THE HOOD AJAR SWITCH STATUS PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Select the SJB hood ajar switch PID (HOOD_SW). Monitor the PID with the hood closed and open. • **Does the PID agree with the status of the hood?**	**Yes** GO to AA3 **No** REFER to Section 419-01A to diagnose the hood ajar switch circuit.
AA3 CARRY OUT THE IPC DOOR/HOOD AJAR WARNING INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC door ajar warning indicator (DOOR_AJAR) active command. Command the door ajar warning indicator on and off while observing the door ajar warning indicator. • **Does the door ajar warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to AA4 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AA4 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test. • **Is DTC U0140:00 recorded?**	**Yes** GO to Pinpoint Test BM . **No** GO to AA5 .
AA5 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check for recorded DTCs from the SJB self-test. • **Are any SJB DTCs recorded?**	**Yes** REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . **No** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test AB: The LH/RH Turn Or High Beam Indicator Is Never/Always On

Normal Operation

When the multifunction switch is in the LH or RH TURN position or if the high beams are on, a message is sent to the Instrument Panel Cluster (IPC) from the Smart Junction Box (SJB) over the Medium Speed

Controller Area Network (MS-CAN) communication bus. The IPC upon receipt of the LH/RH turn or high beam on message, flashes the LH or RH turn signal indicator on and off or illuminates the high beam indicator.

This pinpoint test is intended to diagnose the following:

- Turn signal concern
- High beam concern
- SJB
- IPC

PINPOINT TEST AB: THE LH/RH TURN OR HIGH BEAM INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AB1 DETERMINE THE FAULT CONDITION	
• Place the headlamps in the HIGH BEAM position. • Ignition ON. • Observe the high beam indicator. • **Does the high beam indicator illuminate?**	**Yes** GO to AB4 . **No** LEAVE the headlamps in the HIGH BEAM position. GO to AB2 .
AB2 CHECK THE HIGH BEAM HEADLAMPS OPERATION	
• Observe the high beam headlamps. • **Do the high beam headlamps operate correctly?**	**Yes** GO to AB3 . **No** REFER to Section 417-01 .
AB3 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Turn off the headlamps. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC high beam indicator (HIGH_BEAM). Command the high beam indicator on and off while observing the high beam indicator. • **Does the high beam indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to AB6 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AB4 CHECK THE LH OR RH TURN SIGNAL LAMPS OPERATION	
• Ignition ON. • Operate the LH or RH turn signal. Observe the exterior LH or RH turn lamps. • **Do the turn signal lamps operate correctly?**	**Yes** GO to AB5 . **No** REFER to Section 417-01 .
AB5 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
	Yes GO to AB6 .

• Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC RH or LH turn signal indicator (RH_TURN_L) or (LH_TURN_L) active command. Command the RH or LH turn signal indicator on and off while observing the LH or RH turn signal indicator. • **Does the LH or RH turn signal indicator illuminate when commanded on, and turn off when commanded off?**	**No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AB6 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0140:00, GO to Pinpoint Test BM . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test AC: The Tire Pressure Monitoring System (TPMS) Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the Tire Pressure Monitoring System (TPMS) messages from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus. If the SJB determines that the tire pressure has exceeded the low tire pressure limits, a message is sent to the IPC to turn the TPMS warning indicator on. If a TPMS fault condition exists, the SJB sends a message to the IPC to flash the TPMS warning indicator for 75 seconds then the IPC turns the indicator on steady. If the TPMS is in the TPMS sensor training mode, the SJB sends a command to the IPC to flash the TPMS warning indicator throughout the procedure.

If the TPMS status message is missing or invalid for less than 5 seconds, the IPC defaults the TPMS warning indicator to the last setting (on or off), based upon the last known good message received. If the TPMS status message is missing for more than 5 seconds, DTC U0140:00 sets and the TPMS warning indicator flashes for approximately 75 seconds then turns the indicator on steady. If the message is invalid for more than 5 seconds, the IPC sets DTC U0430:068 (non-hybrid) or U0422:68 (hybrid) and flashes the TPMS warning indicator for approximately 75 seconds then turns the indicator on steady.

NOTE: If DTC U0140:00 is set in the SJB , other symptoms may also be present such as high beam indicator, RH/LH turn indicators, instrument panel backlighting, and door ajar indicator.

This pinpoint test is intended to diagnose the following:

- Tire pressure
- TPMS concern
- SJB
- IPC

PINPOINT TEST AC: THE TPMS WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AC1 CHECK THE TIRE PRESSURE	
• Verify that the tire pressure in all tires meets the recommended tire pressures on the vehicle certification label. Refer to Section 100-01 . • **Do all the tires meet the recommended tire pressures?**	**Yes** GO to AC2 . **No** CORRECT the tire pressures. TEST the system for normal operation.
AC2 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the TPMS warning indicator (TPMWARN_LMP) active command. Command the TPMS warning indicator on and off while observing the TPMS warning indicator. • **Does the TPMS warning indicator illuminate when commanded on and turn off when commanded off?**	**Yes** GO to AC3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AC3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0430:68 or DTC U0422:68, RETRIEVE and REPAIR all non-network DTCs in the SJB and all other modules on the network. REFER to Section 419-10 for a list of all DTCs. For all other DTCs, REFER to DTC Charts in this section. **No** GO to AC4 .
AC4 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check for recorded DTCs from the SJB self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 for correct navigation of the DTC. **No** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test AD: The Charging System Warning Indicator Is Never/Always On (Fusion Non-Hybrid)

Normal Operation

The charging system indicator is controlled by the Instrument Panel Cluster (IPC) based upon data received from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus.

If the charging system message is missing for less than 5 seconds, the charging system indicator remains in the last indication mode (on or off). If the charging system message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the charging system warning indicator on.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- PCM
- IPC

PINPOINT TEST AD: THE CHARGING SYSTEM WARNING INDICATOR IS NEVER/ALWAYS ON (FUSION NON-HYBRID)

Test Step	Result / Action to Take
AD1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC charging system warning indicator (CHARGE_LMP) active command. Command the charging system warning indicator on and off while observing the charging system warning indicator. • **Does the charging system warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to AD2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AD2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any charging system DTCs recorded?**	**Yes** REFER to Section 414-00 . **No** GO to AD3 .
AD3 CHECK THE CHARGING SYSTEM OPERATION	
• Check the charging system operation. Refer to Section 414-00 . • **Does the charging system operate correctly?**	**Yes** GO to AD4 . **No** REFER to Section 414-00 .

AD4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test BF . **No** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

Pinpoint Test AE: The Malfunction Indicator Lamp (MIL) Is Never/Always On

Normal Operation

The Malfunction Indicator Lamp (MIL) is controlled by the Instrument Panel Cluster (IPC) using data sent from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. If the MIL status message is missing for less than 5 seconds, the MIL remains in the last indication mode (on or off).

If the MIL status message is missing for less than 5 seconds, the MIL remains in the last indication mode (on or off). If the MIL status message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the MIL on. If the MIL message is invalid for more than 5 seconds, the IPC defaults the MIL on.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST AE: THE MIL IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AE1 CARRY OUT THE IPC WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC MIL (MIL_LAMP) active command. Command the MIL on and off while observing the MIL . • **Does the MIL illuminate when selected on, and turn off when selected off?**	**Yes** GO to AE2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AE2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	

• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to AE3 .
AE3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

Pinpoint Test AF: The Powertrain Malfunction (Wrench) Warning Indicator Is Never/Always On (Fusion Non-Hybrid)

Normal Operation

The Instrument Panel Cluster (IPC) receives the powertrain malfunction data from the PCM for the Electronic Throttle Control (ETC) status, from the Transmission Control Module (TCM) for the transaxle status and from the 4X4 control module for the All-Wheel Drive (AWD) status over the High Speed Controller Area Network (HS-CAN) communication bus.

When a fault condition exists in the ETC system, the PCM provides the IPC with a message to turn the powertrain malfunction (wrench) warning indicator on. When a fault condition exists in the transaxle, the TCM provides the IPC with a message to turn on the powertrain malfunction (wrench) indicator. When an AWD fault condition exists, the 4X4 control module sends the IPC a message to turn the powertrain malfunction (wrench) warning indicator on.

If the ETC status message is missing for less than 5 seconds, the powertrain malfunction (wrench) indicator remains in the last indication mode (on or off). If the ETC message is missing for greater than 5 seconds, the IPC sets DTC U0100:00 and defaults the powertrain malfunction (wrench) warning indicator on.

If the transaxle status message is missing for less than 5 seconds, the powertrain malfunction (wrench) indicator remains in the last indication mode (on or off). If the transaxle message is missing for greater than 5 seconds, the IPC sets DTC U0101:00 and defaults the powertrain malfunction (wrench) warning indicator on.

If the AWD status message is missing for less than 5 seconds, the powertrain malfunction (wrench) indicator remains in the last indication mode (on or off). If the AWD status message is missing for greater than 5 seconds, the IPC sets DTC U0102:00 and defaults the powertrain malfunction (wrench) warning indicator on.

This pinpoint test is intended to diagnose the following:

- ETC concern
- AWD concern

- Transaxle concern
- IPC

PINPOINT TEST AF: THE POWERTRAIN MALFUNCTION (WRENCH) WARNING INDICATOR IS NEVER/ALWAYS ON (FUSION NON-HYBRID)

Test Step	Result / Action to Take
AF1 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC powertrain malfunction (wrench) warning indicator (TRANSA_LMP) active command. Command the powertrain malfunction (wrench) warning indicator on and off while observing the powertrain malfunction (wrench) warning indicator. • **Does the powertrain malfunction (wrench) warning indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to AF2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AF2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0101:00, GO to Pinpoint Test BG . For DTC U0102:00, GO to Pinpoint Test BH . For all other DTCs, REFER to DTC Charts in this section. **No** GO to AF3 .
AF3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to AF4 .
AF4 RETRIEVE THE RECORDED DTCs FROM THE TCM SELF-TEST	

• Check for recorded TCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all TCM DTCs. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** DIAGNOSE all 4X4 control module DTCs. REFER to Section 308-07A .

Pinpoint Test AG: The Cruise Control Engaged Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the cruise control engaged signal from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. When the cruise control is engaged, the PCM sends a message to the IPC to illuminate the cruise control engaged indicator.

If the cruise control engaged message is missing for less than 5 seconds, the cruise control engaged indicator remains in the last indication mode (on or off) based upon the last known good message received. If the cruise control engaged message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the cruise control engaged indicator off.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST AG: THE CRUISE CONTROL ENGAGED INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AG1 CHECK THE CRUISE CONTROL OPERATION	
• Check the cruise control system for correct operation. • **Does the cruise control operate correctly?**	**Yes** GO to AG2 . **No** REFER to Section 419-03 .
AG2 CARRY OUT THE IPC INDICATOR LAMP CONTROL ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC cruise control engaged indicator (CRUISE) active command. Command the cruise control engaged indicator on and off while	**Yes** GO to AG3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal

observing the cruise control engaged indicator. • **Does the cruise control engaged indicator illuminate when commanded on, and turn off when commanded off?**	operation.
AG3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test BF . **No** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

Pinpoint Test AH: The Cruise Control On Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the cruise control on signal from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. When the cruise control is turned on but not engaged, the PCM sends a message to the IPC to illuminate the cruise control on indicator.

If the cruise control on message is missing for less than 5 seconds, the cruise control on indicator remains in the last indication mode (on or off) based upon the last known good message received. If the cruise control on message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the cruise control on indicator off.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST AH: THE CRUISE CONTROL ON INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AH1 CHECK THE SPEED CONTROL OPERATION	
• Check the cruise control system for correct operation. • **Does the cruise control operate correctly?**	**Yes** GO to AH2 . **No** REFER to Section 419-03 .
AH2 CARRY OUT THE IPC DEALER TEST MODE	
• Ignition ON.	**Yes** GO to AH3 .

• Enter the IPC dealer test mode. • Scroll through the displays to TELLTALE TEST and monitor the cruise control on (amber) indicator. • **Does the cruise control on (amber) indicator illuminate when in the dealer test mode and turn off when in normal operation mode?**	**No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AH3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test BF . **No** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

Pinpoint Test AI: The Grade Assist Indicator Is Never/Always On (Without Select Shift)

Normal Operation

The Instrument Panel Cluster (IPC) receives the grade assist on/off status from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. When the grade assist function is selected off, the PCM sends a message to the IPC to illuminate the grade assist indicator.

If the grade assist on/off message is missing for less than 5 seconds, the grade assist indicator remains in the last state (on or off) based upon the last known good message. If the grade assist on/off message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the grade assist indicator off.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- Transaxle concern
- PCM
- Instrument Panel Cluster (IPC)

PINPOINT TEST AI: THE GRADE ASSIST INDICATOR IS NEVER/ALWAYS ON (WITHOUT SELECT SHIFT)

Test Step	Result / Action to Take
AI1 CHECK THE OPERATION OF THE GRADE ASSIST FUNCTION	
• Verify that the grade assist function operates when engaged and turns off when disengaged. • **Does the grade assist function operate correctly?**	**Yes** GO to AI2 . **No** REFER to Section 307-05A .

AI2 CARRY OUT THE IPC GRADE ASSIST INDICATOR ACTIVE COMMAND USING THE SCAN TOOL	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC grade assist indicator (TRAILER_LMP) active command. Command the grade assist indicator on and off while observing the grade assist indicator. • **Does the grade assist indicator illuminate when commanded on, and turn off when commanded off?**	**Yes** GO to AI3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AI3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test BF . **No** GO to AI4 .
AI4 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

Pinpoint Test AJ: The PRNDL Indicator is Never/Always On

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) receives the transaxle range status and vehicle speed data from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. On hybrid vehicles, the vehicle speed data is sent to the IPC from the Transmission Control Module (TCM) over the HS-CAN communication bus.

For all ranges other than PARK (P), the IPC displays the selected gear matching the input from the PCM.

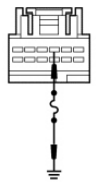
For PARK (P), the IPC uses a park detect switch (part of the brake shift interlock) to signal the IPC that the shift lever is fully seated in the PARK position. The IPC compares the park detect switch input with the transaxle range status sent from the PCM. The IPC provides a reference voltage to the brake shift interlock on the park detect input circuit. When the gearshift is in PARK (P), the brake shift indicator routes the reference voltage to ground, pulling the circuit low. When the gearshift is moved out of PARK (P), the brake shift

interlock opens the ground sending the reference voltage high.

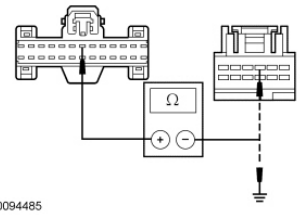
If the transaxle range status information is missing from the PCM for less than 5 seconds, the PRNDL displays the last selected range based upon the last good known message. If the transaxle range status information is missing from the PCM for 5 seconds or more, the IPC sets DTC U0100:00 and the PRNDL display is blank. If the park detect input is open, the PARK (P) display is blank when the transaxle is in PARK (P) but all other ranges are still displayed according to the selected range status. If the park detect input is shorted to ground and the messaged input indicates any range other than park, the PARK (P) display is blank once a fault is detected by the IPC (all other ranges are still displayed according to the selected range status).

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer, temperature gauge or odometer.

- DTC P1706:00 (High Vehicle Speed Observed in Park: No Sub-Type Information) (non-hybrid) - a continuous memory DTC that sets if the IPC detects a short to ground on the park detect input circuit with a Vehicle Speed Sensor (VSS) input over 16 km/h (10 mph), indicating that the vehicle is in motion.
- DTC P1706:62 (High Vehicle Speed Observed in Park: Signal Compare Failure) (hybrid) - a continuous memory DTC that sets if the IPC detects a short to ground on the park detect input circuit with a Vehicle Speed Sensor (VSS) input over 16 km/h (10 mph), indicating that the vehicle is in motion.



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Park detect switch (part of the selector lever)
- PCM
- IPC

PINPOINT TEST AJ: THE PRNDL INDICATOR IS NEVER/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AJ1 CHECK THE PRNDL DISPLAY PARK OPERATION	
• Ignition ON. • Shift the selector lever through the different gear positions while observing the PRNDL display. • Place the selector lever in the PARK (P) position. • Observe the PRNDL display. • **Does the PRNDL display the difnt ranges according to the selector lever position including PARK (P)?**	**Yes** The system is functioning correctly at this time. **No** GO to AJ2 .
AJ2 RETRIEVE THE RECORD DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For all DTCs, CLEAR the DTCs. DRIVE the vehicle above 16 km/h (10 mph) for more than 5 seconds.

	REPEAT the self-test. If DTC U0100:00 is present, GO to Pinpoint Test BF . If DTC P1706:00 (non-hybrid) or P1706:62 (hybrid) is present, GO to AJ5 . **No** GO to AJ3 .
AJ3 RETRIEVE AND RECORD THE DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to AJ4 .
AJ4 CHECK THE PARK DETECT INPUT TO THE IPC	
• Ignition OFF. • Disconnect: Selector Lever C3233 . • Install a fused jumper wire between the selector lever C3233-3, circuit CET52 (GN), harness side and ground.  N0099614 • Ignition ON. • Monitor the PRNDL indicator with the jumper wire installed and with the jumper wire removed. • **Does the PRNDL display P with the jumper wire installed and blank with the jumper wire removed?**	**Yes** INSTALL a new selector lever. REFER to Section 307-05A (non-hybrid) or Section 307-05B (hybrid). TEST the system for normal operation. **No** GO to AJ5 .
AJ5 CHECK THE PARK DETECT INPUT CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220 . • Measure the resistance between the IPC C220-7, circuit CET52 (GN), harness side and the selector lever C3233-3, circuit CET52 (GN), harness side; and between the IPC C220-7, circuit CET52 (GN), harness side and ground.	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

 • **Is the resistance less than 5 ohms between the IPC and the selector lever, and greater than 10,000 ohms between the IPC and ground?**	

Pinpoint Test AK: The Ready To Drive Indicator Is Never/Always On (Hybrid)

Normal Operation

The purpose of the ready to drive indicator is to inform the driver that the hybrid electric drivetrain is ready to operate. Since the engine can start and stop at different times while the vehicle is driven and operated in the electric vehicle mode, the ready to drive indicator is used so that the customer doesn't interpret the engine turning off as a stalled condition. The Instrument Panel Cluster (IPC) receives the electric vehicle ready to drive on/off command from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus.

If the electric vehicle ready to drive on/off command is missing for less than 5 seconds, the ready to drive indicator remains in the last indication mode (on or off) based upon the last known good message received. If the electric vehicle ready to drive on/off command is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the ready to drive indicator off.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST AK: THE READY TO DRIVE INDICATOR IS NEVER/ALWAYS ON (HYBRID ONLY)

Test Step	Result / Action to Take
AK1 CARRY OUT THE READY TO DRIVE INDICATOR OPERATION	
• Ignition ON. • Monitor the ready to drive indicator. • Place the ignition in the START position then allow the key to return to the ON position and monitor the ready to drive indicator. • **Does the ready to drive indicator remain off in the ON position and illuminate after moving to the**	**Yes** The system is operating correctly at this time. The ready to drive indicator illuminates whenever the ignition is turned to the START position then returns to the RUN or ON position. **No** GO to AK2 .

START position?	
AK2 CARRY OUT THE IPC DEALER TEST MODE	
• Ignition ON. • Enter the IPC dealer test mode. • Scroll through the displays to display TELLTALE TEST and monitor the ready to drive indicator. • **Does the ready to drive indicator illuminate when in the dealer test mode and turn off when in normal operation mode?**	**Yes** GO to AK3 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AK3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to AK4 .
AK4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test BF . **No** INSTALL a new PCM. REFER to Section 303-14D . TEST the system for normal operation.

Pinpoint Test AL: The Stop Safely Hazard Message Center Warning Indicator Is Never/Always On (Hybrid)

Normal Operation

The stop safely hazard message center warning indicator informs the driver that a transaxle fault condition exists or a powertrain shutdown is about to occur and service on the vehicle is required. The PCM, the Transmission Control Module (TCM) and the Battery Pack Sensor Module (BPSM) provide the Instrument Panel Cluster (IPC) the stop safely hazard message center indicator request over the High Speed Controller Area Network (HS-CAN) communication bus.

If the stop safely hazard message center indicator request is missing or invalid for less than 5 seconds from any of the source modules (PCM, TCM or BPSM), the stop safely hazard message center warning indicator remains in the last indication mode (on or off) based upon the last known good message received.

If the stop safely hazard message center indicator request is missing for more than 5 seconds from the PCM, the IPC sets DTC U0100:00 in continuous memory and defaults the stop safely hazard message center warning indicator on.

If the stop safely hazard message center indicator request is missing for more than 5 seconds from the TCM , the IPC sets DTC U0101:00 in continuous memory and defaults the stop safely hazard message center

warning indicator on.

If the stop safely hazard message center indicator request is missing for more than 5 seconds from the BPSM , the IPC sets DTC U0111:00 in continuous memory and defaults the stop safely hazard message center warning indicator on.

This pinpoint test is intended to diagnose the following:

- Powertrain concern
- Traction battery concern
- Transaxle concern
- IPC

PINPOINT TEST AL: THE STOP SAFELY HAZARD MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON (HYBRID ONLY)

Test Step	Result / Action to Take
AL1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display the door ajar message center warning indicator along with the DRIVER DOOR AJAR text?**	**Yes** GO to AL2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AL2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to AL3 .
AL3 RETRIEVE THE RECORDED DTCs FROM THE TCM SELF-TESTS	
• Check for recorded TCM DTCs from the continuous and on-demand self-tests. • **Are any TCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to AL4 .
AL4 RETRIEVE THE RECORDED DTCs FROM THE BPSM SELF-TEST	
• Check for recorded BPSM DTCs from the continuous and on-demand self-tests. • **Are any BPSM DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** GO to AL5 .

AL5 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test AM: The Powertrain Malfunction (Wrench) Message Center Warning Indicator Is Never/Always On (Non-Hybrid)

Normal Operation

The Instrument Panel Cluster (IPC) receives the powertrain malfunction data from the PCM for the Electronic Throttle Control (ETC) status and the transaxle status and from the 4X4 control module for the All-Wheel Drive (AWD) status over the High Speed Controller Area Network (HS-CAN) communication bus. When a fault condition exists in the ETC system or in the transaxle, the PCM provides the IPC with a message to turn the powertrain malfunction (wrench) warning indicator on. When a AWD fault condition exists, the 4X4 control module sends the IPC a message to turn the powertrain malfunction (wrench) warning indicator on.

If the ETC or transaxle message is missing for greater than 5 seconds, the IPC sets DTC U0100:00 and defaults the powertrain malfunction (wrench) warning indicator on.

If the AWD status message is missing for greater than 5 seconds, the IPC sets DTC U0102:00 and defaults the powertrain malfunction (wrench) warning indicator on.

NOTE: If U0100:00 is set in the IPC , other symptoms may also be present such as an inoperative speedometer, tachometer or temperature gauge.

This pinpoint test is intended to diagnose the following:

- ETC concern
- AWD concern
- Transaxle concern
- IPC

PINPOINT TEST AM: THE POWERTRAIN MALFUNCTION (WRENCH) MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON (NON-HYBRID)

Test Step	Result / Action to Take
AM1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display the door ajar message center warning indicator along with the**	**Yes** GO to AM2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal

DRIVER DOOR AJAR text?	operation.
AM2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0102:00, GO to Pinpoint Test BH . For all other DTCs, REFER to DTC Charts in this section. **No** GO to AM3 .
AM3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** REPAIR all 4x4 module DTCs. TEST the system for normal operation.

Pinpoint Test AN: The Powertrain Malfunction (Wrench) Message Center Warning Indicator Is Never/Always On (Hybrid)

Normal Operation

The Instrument Panel Cluster (IPC) receives the powertrain malfunction data from the PCM for the Electronic Throttle Control (ETC) status, the Transmission Control Module (TCM) for the transaxle status and the Battery Pack Sensor Module (BPSM) for the traction battery status over the High Speed Controller Area Network (HS-CAN) communication bus.

When a fault condition exists in the ETC system, the transaxle, or the traction battery system, the controlling module (PCM, BPSM or TCM) provides the IPC with a message to turn the powertrain malfunction (wrench) message center warning indicator on.

If the ETC status is missing for less than 5 seconds, the powertrain malfunction (wrench) message center warning indicator remains in the last indication mode (on or off) based upon the last known good message received. If the ETC status is missing for greater than 5 seconds, the IPC sets DTC U0100:00 and defaults the powertrain malfunction (wrench) message center warning indicator on.

If the transaxle status is missing for less than 5 seconds, the powertrain malfunction (wrench) message center warning indicator remains in the last indication mode (on or off) based upon the last known good message received. If the transaxle status is missing for greater than 5 seconds, the IPC sets DTC U0101:00 and defaults the powertrain malfunction (wrench) message center warning indicator on.

If the traction battery status is missing for less than 5 seconds, the powertrain malfunction (wrench) message center warning indicator remains in the last indication mode (on or off) based upon the last known good

message received. If the traction battery status is missing for greater than 5 seconds, the IPC sets DTC U0111:00 and defaults the powertrain malfunction (wrench) message center warning indicator on.

NOTE: If U0100:00 is set in the IPC , other symptoms may also be present such as an inoperative speedometer, tachometer or temperature gauge.

This pinpoint test is intended to diagnose the following:

- ETC concern
- Transaxle concern
- Traction battery concern
- IPC

PINPOINT TEST AN: THE POWERTRAIN MALFUNCTION (WRENCH) MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON (HYBRID)

Test Step	Result / Action to Take
AN1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display the door ajar message center warning indicator along with the DRIVER DOOR AJAR text?**	**Yes** GO to AN2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AN2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to AN3 .
AN3 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all PCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to AN4 .
AN4 RETRIEVE THE RECORDED DTCs FROM THE TCM SELF-TEST	
• Check for recorded TCM DTCs from the self-test. • **Are any DTCs recorded?**	**Yes** DIAGNOSE all TCM DTCs first. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No**

	REPAIR all BPSM DTCs. REFER to Section 414-03 .

Pinpoint Test AO: The Engine Or Motor Over-Temperature Message Center Warning Indicator Is Never/Always On (Hybrid)

Normal Operation

The Instrument Panel Cluster (IPC) receives the engine and motor over-temperature status from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus. If the PCM detects an engine or motor over-temperature condition, the PCM sends a command to the IPC to turn the engine or motor over-temperature message center warning indicator on. If the PCM determines that the engine is sufficiently overheated to enter into the fail-safe cooling mode, the PCM sends a command to the IPC to flash the engine or motor over-temperature message center warning indicator.

If the engine or motor over-temperature message is missing or invalid for less than 5 seconds, the engine or motor over-temperature message center warning indicator remains in the last state (on or off) based upon the last known good message received. If the engine over-temperature message is invalid for more than 5 seconds, the IPC sets DTC U0401:68 in continuous memory and defaults the engine or motor over-temperature message center warning indicator on. If the motor over-temperature message is invalid for more than 5 seconds, the IPC sets DTC U0401:68 in continuous memory and defaults the engine or motor over-temperature message center indicator off. If the engine over-temperature message is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and defaults the engine or motor over-temperature message center warning indicator on.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST AO: THE ENGINE OR MOTOR OVER-TEMPERATURE MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON (HYBRID)

Test Step	Result / Action to Take
AO1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display the door ajar message center warning indicator along with the DRIVER DOOR AJAR text?**	**Yes** GO to AO2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

AO2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any PCM DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to AO3 .
AO3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0401:68, RETRIEVE and REPAIR all non-network DTCs in the PCM and other modules on the network. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 419-10 for a list of all DTCs. For all other DTCs, REFER to DTC Charts in this section. **No** INSTALL a new PCM. REFER to Section 303-14D . TEST the system for normal operation.

Pinpoint Test AP: The Low Fuel Message Center Warning Indicator Is Never On

Normal Operation

The low fuel message center indicator illuminates when the Distance To Empty (DTE) display is above 120 km (75 miles) (with a MyKey® programmed key) or 80 km (50 miles) (with an administrator key) to empty, the system is operating correctly. The low fuel warning is turned on when the DTE display is 120 km (75 miles) (with a MyKey® programmed key) or 80 km (50 miles) (with an administrator key) to empty or less.

This pinpoint test is intended to diagnose the following:

- IPC

PINPOINT TEST AP: THE LOW FUEL MESSAGE CENTER WARNING INDICATOR IS NEVER ON

Test Step	Result / Action to Take
AP1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON.	**Yes** GO to AP2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in

• Open the driver door while monitoring the message cenr displays. • **Does the message center display the door ajar message center warning indicator along with the DRIVER DOOR AJAR text?**	this section. TEST the system for normal operation.
AP2 CHECK THE FUEL GAUGE OPERATION	
• Verify the fuel gauge is operating correctly and is not registering empty (E) or full (F) all the time. • **Does the fuel gauge operate correctly?**	**Yes** GO to AP3 **No** GO to Pinpoint Test B .
AP3 CHECK THE DTE	
• Scroll through the information displays in the message center to the DTE display. • **Does the DTE display indicate 120 km (75 miles) (with a MyKey® programmed key) or 80 km (50 miles) (with an administrator key) or less?**	**Yes** If the low fuel message center indicator is never on, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. If the low fuel message center warning indicator is always on, the system is operating correctly at this time. **No** If the low fuel message center warning indicator is always on, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. If the low fuel message center warning indicator is never on, the system is operating correctly at this time. The low fuel message center indicator turns on when the fuel level is at or below 120 km (75 miles) (with a MyKey® programmed key) or 80 km (50 miles) (with an administrator key).

Pinpoint Test AQ: The Low Oil Pressure Message Center Warning Indicator Is Never/Always On

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

The oil pressure switch is hardwired to the Instrument Panel Cluster (IPC) and is a normally open switch. With egine oil pressure, the oil pressure switch closes to ground and opens without oil pressure.

Non-Hybrid

The IPC provides a reference voltage to the engine oil pressure switch. When the oil pressure is within normal ranges, the engine oil pressure switch closes to ground, pulling the reference voltage low in the IPC . With the oil pressure switch closed, the IPC senses the low reference voltage and turns off the low oil pressure message center warning indicator. When the engine oil pressure is low, the engine oil pressure switch opens, sending

the reference voltage high in the IPC . The IPC senses the high voltage and turns on the low oil pressure message center warning indicator.

Hybrid

Due to the need to turn the internal combustion engine on and off during operation with the key in the RUN position, the low oil pressure message center warning indicator requires two inputs. The first input is engine rpm and the second input is oil pressure switch state. When the IPC detects engine oil pressure and receives an rpm state over 500 rpm from the internal combustion engine, the IPC turns off the low oil pressure warning indicator. If the oil pressure switch indicates low oil pressure and the rpm is less than 500 rpm, the low oil pressure message center warning indicator remains off.

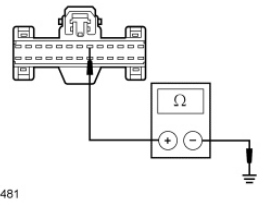
With the oil pressure switch closed, the IPC senses the low reference voltage and turns off the low oil pressure warning indicator, provided engine rpm is greater than 500 rpm. When the engine oil pressure is low, the engine oil pressure switch opens, sending the reference voltage high. The IPC senses the reference voltage has moved high and turns the low oil pressure warning indicator on.

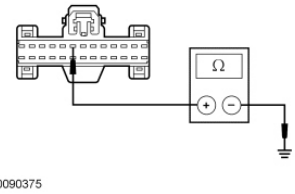
The IPC receives the engine rpm status from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus.

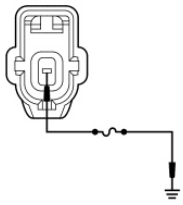
If the engine rpm status is missing or invalid for less than 5 seconds, the IPC controls the low oil pressure message center warning based upon current oil pressure switch state and using the last known good rpm message received. If the engine rpm status is invalid for more than 5 seconds, the IPC assumes that the rpm is greater than 500 rpm and defaults full control of the low oil pressure message center warning indicator to the actual oil pressure switch state. If the engine rpm status is missing for more than 5 seconds, the IPC sets DTC U0100:00 in continuous memory and assumes that the rpm is greater than 500 rpm, defaulting full control of the low oil pressure message center warning indicator to the actual oil pressure switch state.

This pinpoint test is intended to diagnose the following:

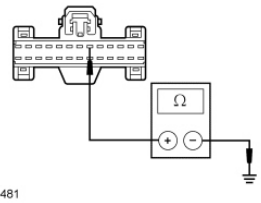
- Wiring, terminals or connectors
- Engine oil pressure switch
- Base engine oil pressure concern
- IPC

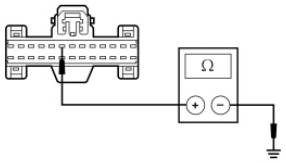






PINPOINT TEST AQ: THE LOW OIL PRESSURE MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AQ1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON.	**Yes** For hybrid, GO to AQ2 . For non-hybrid, if the original symptom is the low oil pressure warning indicator is never on,

• Open the driver door while monitoring the message center displays. • **Does the message center display the door ajar message center warning indicator along with the DRIVER DOOR AJAR text?**	GO to AQ4 . For non-hybrid, if the original symptom is the low oil pressure warning indicator is always on, GO to AQ6 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AQ2 CHECK THE TACHOMETER	
• Set the message center to enlighten display mode. • Start the engine and observe the tachometer. • **Is rpm present and above 500 rpm on the tachometer?**	**Yes** If the original symptom is the low oil pressure indicator is on with the engine off and the vehicle in electric vehicle mode, GO to AQ3 . If the original symptom is the low oil pressure warning indicator is always on, GO to AQ6 . If the original symptom is the low oil pressure warning indicator is never on, GO to AQ4 . **No** GO to Pinpoint Test I .
AQ3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U0100:00 recorded?**	**Yes** GO to Pinpoint Test BF . **No** INSTALL a new IC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AQ4 CHECK FOR A STUCK CLOSED ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103 . • Start the engine. • Observe the low oil pressure warning indicator. • **Does the low oil pressure warning indicator turn on?**	**Yes** INSTALL a new Engine Oil Pressure (EOP) switch. REFER to Section 303-01C (3.5L) or Section 303-01D (hybrid). TEST the system for normal operation. **No** GO to AQ5 .
AQ5 CHECK OIL PRESSURE INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220 . • For non-hybrid, measure the resistance between the IPC C220-6, circuit CMC24 (GY), harness side and ground.	**Yes** GO to AQ9 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0094481 • For hybrid, measure the resistance between the IPC C220-8, circuit CMC24 (GY), harness side and ground.  N0090375 • **Is the resistance greater than 10,000 ohms?**	
AQ6 CHECK FOR A STUCK OPEN ENGINE OIL PRESSURE SWITCH	
• Ignition OFF. • Disconnect: Engine Oil Pressure Switch C103 . • Connect a fused jumper wire between the engine oil pressure switch, C103-1, circuit CMC24 (GY), harness side and ground.  N0002760 • Start the engine. • Observe the low oil pressure warning indicator. • **Does the low oil pressure warning indicator turn off?**	**Yes** REMOVE the jumper wire. GO to AQ8 . **No** LEAVE the jumper wire connected. GO to AQ7 .
AQ7 CHECK OIL PRESSURE INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Disconnect: IPC C220 . • For non-hybrid, measure the resistance between the IPC C220-6, circuit CMC24 (GY), harness side and ground.	**Yes** REMOVE the jumper wire. GO to AQ9 . **No** REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.

 N0094481 • For hybrid, measure the resistance between the IPC C220-8, circuit CMC24 (GY), harness side and ground.  N0090375 • **Is the resistance less than 5 ohms?**	
AQ8 CHECK THE OIL PRESSURE	
• Carry out the oil pressure test. Refer to Section 303-00 . • **Is the oil pressure within specification?**	**Yes** INSTALL a new Engine Oil Pressure (EOP) switch. REFER to Section 303-01C (3.5L) or Section 303-01D (hybrid). TEST the system for normal operation. **No** REFER to Section 303-00 to continue diagnosis of the low engine oil pressure concern.
AQ9 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AR: The Door/hood Ajar Message Center Warning Indicator Is Never/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the door ajar status for the LH front door, RH front door, LH rear door, the RH rear door, the hood and the decklid (non-hybrid only) ajar switch status from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus. When the IPC

receives a message from the SJB that one or more doors, the hood or the decklid (non-hybrid only) are open or ajar, the IPC turns on the door/hood ajar message center warning indicator.

If the door/hood ajar status message is missing for less than 5 seconds, the door/hood ajar message center warning indicator remains in the last state (on or off) based upon the last known good message received for each of the door ajar states. If the door/hood ajar status message is missing for greater than 5 seconds, the IPC sets DTC U0140:00 and defaults the door/hood ajar message center warning indicator on.

NOTE: If DTC U0140:00 is set in the SJB , other symptoms may also be present in the IPC such as high beam indicator, RH/LH turn indicators, instrument panel backlighting and Tire Pressure Monitoring System (TPMS).

This pinpoint test is intended to diagnose the following:

- Interior lighting concern
- SJB
- IPC

PINPOINT TEST AR: THE DOOR/HOOD AJAR MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AR1 CHECK THE INTERIOR LIGHTING OPERATION	
• Open and close each door while monitoring the courtesy lamps. • **Do the courtesy lamps operate correctly with each door?**	**Yes** GO to AR2 . **No** REFER to Section 417-02 .
AR2 CHECK THE HOOD AJAR SWITCH STATUS PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Select the SJB hood ajar switch PID (HOOD_SW). Monitor the PID with the hood closed and open. • **Does the PID agree with the status of the hood?**	**Yes** GO to AR3 . **No** REFER to Section 419-01A to diagnose the hood ajar switch circuit.
AR3 CHECK THE MESSAGE CENTER OPERATION	
• Ignition OFF. • Disconnect: PCM C175b . • Ignition ON. • Monitor the message center display area with the PCM disconnected. • **Does the message center display the powertrain malfunction (wrench) message center warning indicator?**	**Yes** GO to AR4 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

AR4 RETRIEVE THE RECORDED DTCs FROM THE CONTINUOUS IPC SELF-TEST	
• Check for recorded IPC DTCs from the continuous self-test. • **Is DTC U0140:00 recorded?**	**Yes** GO to Pinpoint Test BM . **No** GO to AR5 .
AR5 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check for recorded DTCs from the SJB self-test. • **Are any SJB DTCs recorded?**	**Yes** REFER to Section 419-10 for correct navigation of the DTC. **No** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test AS: The Charging System Message Center Warning Indicator Is Never/Always On

Normal Operation

The charging system indicator is controlled by the Instrument Panel Cluster (IPC) based upon data received from the PCM (non-hybrid) or the DC to DC Converter Control Module (DC/DC) (hybrid) over the High Speed Controller Area Network (HS-CAN) communication bus.

If the charging system message is missing for less than 5 seconds, the charging system message center warning indicator remains in the last state (on or off) based upon the last known good message received. If the charging system message is missing for more than 5 seconds, the IPC sets DTC U0100:00 (non-hybrid) or DTC U0298:00 (hybrid) in continuous memory and defaults the charging system warning indicator on.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, tachometer or odometer.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- PCM (non-hybrid)
- DC/DC (hybrid)
- IPC

PINPOINT TEST AS: THE CHARGING SYSTEM MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AS1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON.	**Yes** For non-hybrid, GO to AS2 . For hybrid, GO to AS4 .

• Open the driver door while monitoring the message center displays. • **Does the message center display the door ajar message center warning indicator along with the DRIVER DOOR AJAR text?**	**No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AS2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Are any charging system DTCs recorded?**	**Yes** REFER to Section 414-00 . **No** GO to AS3 .
AS3 CHECK THE CHARGING SYSTEM OPERATION	
• Check the charging system operation. Refer to Section 414-00 . • **Does the charging system operate correctly?**	**Yes** GO to AS4 . **No** REFER to Section 414-00 .
AS4 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** For DTC U0100:00, GO to Pinpoint Test BF . For DTC U0298:00, GO to Pinpoint Test BW . REFER to DTC Charts in this section. **No** If the charging system warning indicator is never on, the system is operating correctly at this time. If the charging system warning indicator is always on for non-hybrid vehicles, INSTALL a new PCM. REFER to Section 303-14C . TEST the system for normal operation. If the charging system warning indicator is always on for hybrid vehicles, REFER to Section 414-05 to diagnose the DC/DC charging system. TEST the system for normal operation.

Pinpoint Test AT: The Trunk Ajar Message Center Warning Indicator Is Never/Always On (Hybrid)

Refer to Wiring Diagrams Cell 113 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Luggage Compartment for schematic and connector information.

Normal Operation

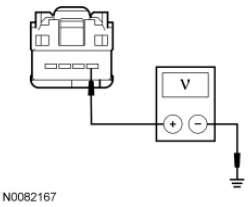
The Instrument Panel Cluster (IPC) receives the trunk ajar status from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus. The luggage compartment lid ajar switch (part of the luggage compartment lid latch) is hardwired to the SJB through the decklid ajar input circuit. The luggage compartment lid ajar switch is grounded through an external ground circuit. When the luggage compartment lid is ajar, the luggage compartment lid latch removes the ground to the luggage compartment lid ajar switch input. When the luggage compartment lid is closed, the luggage compartment lid release grounds the luggage compartment lid ajar switch.

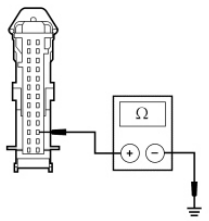
When the SJB detects an open on the decklid ajar input circuit, the SJB sends a message to the IPC to turn on the trunk ajar message center indicator.

If the decklid ajar status message is missing for less than 5 seconds, the trunk ajar message center warning indicator remains in the last state (on or off) based upon the last known good message received. If the decklid ajar status message is missing for greater than 5 seconds, the IPC sets DTC U0140:00 and defaults the decklid ajar message center warning indicator on.

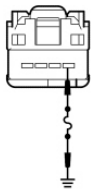
NOTE: If DTC U0140:00 is set in the SJB , other symptoms may also be present in the IPC such as high beam indicator, RH/LH turn indicators, instrument panel backlighting and Tire Pressure Monitoring System (TPMS).

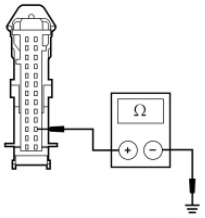
This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Luggage compartment lid ajar switch (part of the luggage compartment lid latch)
- SJB
- IPC





PINPOINT TEST AT: THE TRUNK AJAR MESSAGE CENTER WARNING INDICATOR IS NEVER/ALWAYS ON (HYBRID)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AT1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors, hood and luggage compartment lid. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the door ajar message center warning indicator turn on?**	**Yes** GO to AT2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AT2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Retrieve the recorded DTCs from the IPC self-test.	**Yes** GO to Pinpoint Test BM .

• **Is DTC U0140:00 recorded?**	**No** GO to AT3 .
AT3 CHECK THE LUGGAGE COMPARTMENT LID LATCH OPERATION	
• Press the luggage compartment lid release switch. • **Does the luggage compartment lid release function operate?**	**Yes** GO to AT4 . **No** REFER to Section 501-14 .
AT4 CHECK THE LUGGAGE COMPARTMENT LID AJAR SWITCH	
• Ignition OFF. • Disconnect: Luggage Compartment Lid Latch C429 . • Ignition ON. • Measure the voltage between the luggage compartment lid latch C429-1, circuit CPL58 (GY/OG), harness side and ground.  N0082167 • **Is the voltage greater then 10 volts?**	**Yes** INSTALL a new luggage compartment lid latch. REFER to Section 501-14 . TEST the system for normal operation. **No** GO to AT5 .
AT5 CHECK THE DECKLID AJAR INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280c . • Measure the resistance between the SJB C2280c-16, circuit CPL58 (GY/OG), harness side and ground.  N0085708 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AT6 . **No** REPAIR the circuit. TEST the system for normal operation.
AT6 CHECK THE DECKLID AJAR INPUT CIRCUIT FOR AN OPEN	

• Disconnect: Negative Battery Cable . • Connect a fused jumper wire between the luggage compartment lid latch C429-1, circuit CPL58 (GY/OG), harness side and ground.  N0082169 • Measure the resistance between the SJB C2280c-16, circuit CPL58 (GY/OG), harness side and ground.  N0085708 • **Is the resistance less than 5 ohms?**	**Yes** GO to AT7 . **No** REPAIR the circuit. TEST the system for normal operation.
AT7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

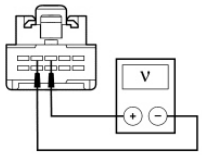
Pinpoint Test AU: The Message Center Is Not Operating Correctly

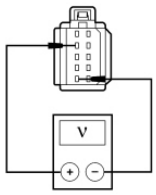
Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

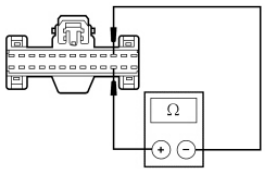
The message center shares the Instrument Panel Cluster (IPC) RUN/START voltage, keep alive memory voltage and the IPC logic ground to operate. The message center functionality is controlled through the message center switch and is hardwired to the IPC through separate signal and return circuits.

- DTC B1A82:11 (External Trip Switch: Circuit Short to Ground) - a continuous DTC that sets in the IPC if the IPC detects a short to ground on the message center signal circuit.
- DTC B1A82:13 (External Trip Switch: Circuit Open) - a continuous DTC that sets in the IPC if the IPC detects an open on the message center signal circuit.





This pinpoint test is intended to diagnose the following:

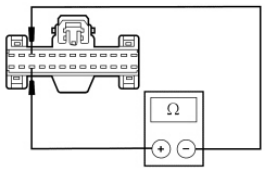


- Wiring, terminals or connectors
- Clockspring
- Front Controls Interface Module (FCIM) (MKZ only)
- Steering wheel switch (part of the cruise control switch)
- IPC

PINPOINT TEST AU: THE MESSAGE CENTER IS NOT OPERATING CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AU1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC B1A82:11 or DTC B1A82:13 recorded?**	**Yes** GO to AU6 . **No** GO to AU2 .
AU2 CHECK THE IPC ODOMETER DISPLAY	
• Ignition ON. • Observe the odometer display in the message center. • **Is the odometer displayed?**	**Yes** For non-hybrid, GO to AU3 . For hybrid, GO to AU4 . **No** If the display is blank, PRESS the INFO button to see if the message center was previously set to the blank display. If the display remains blank, GO to Pinpoint Test A .
AU3 CARRY OUT THE IPC DEALER TEST MODE ALL SEGMENTS DISPLAY	
• **NOTE:** The all segments display is the second button press after entering the dealer test mode immediately following the gauge test. • Enter the IPC dealer test mode. Scroll through the displays until the message center displays all the segments. • **Does the message center display all the illuminate segments?**	**Yes** GO to AU4 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AU4 CHECK FOR VOLTAGE FROM THE IPC	



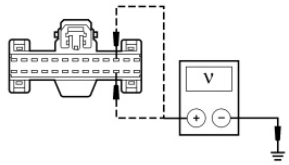
• Ignition OFF. • Disconnect: FCIM C2402 (MKZ) . • Disconnect: LH Steering Wheel Switch C2998 (Fusion). • Ignition ON. • For MKZ, measure the voltage between the FCIM C2402-3, circuit CMC29 (GN/VT), harness side and the FCIM C2402-4, circuit RMC27 (WH/BN), harness side.  N0082166 • For Fusion, measure the voltage between the LH steering wheel switch C2998-7, circuit CMC29 (GN/VT), harness side and the LH steering wheel switch C2998-10, circuit RMC27 (WH/BN), harness side.  N0094486 • **Is the voltage approximately 5 volts?**	**Yes** GO to AU5 . **No** GO to AU18 .
AU5 CHECK FOR THE MESSAGE CENTER SWITCH OPERATION	
• Ignition OFF. • Disconnect: IPC C220 . • Connect: FCIM C2402 (MKZ) . • Connect: LH Steering Wheel Switch C2998 (Fusion) . • For non-hybrid, measure the resistance between the IPC C220-16, circuit CMC29 (GN/VT), harness side and the IPC C220-3, circuit RMC27 (WH/BN), harness side while pressing the message center buttons according to the following table. **Message Center Button Press** / **Resistance** No button press — 7,200-7,800 ohms INFO — 123-133 ohms SETUP — 1,381-1,496 ohms RESET — 599-649 ohms	**Yes** GO to AU18 . **No** For MKZ, GO to AU17 . For Fusion, INSTALL a new cruise control switch. REFER to Section 419-03 . TEST the system for normal operation.

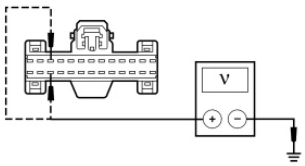
N0094487

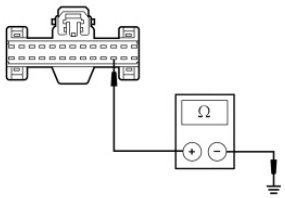
- For hybrid, measure the resistance between the IPC C220-24, circuit CMC29 (GN/VT), harness side and the IPC C220-11, circuit RMC27 (WH/BN), harness side while pressing the message center buttons according to the following table.

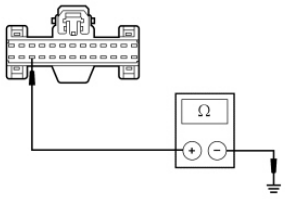
Message Center Button Press	Resistance
No button press	7,200-7,800 ohms
INFO	123-133 ohms
SETUP	1,381-1,496 ohms
RESET	599-649 ohms

N0094488

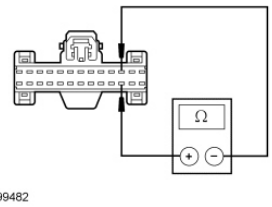


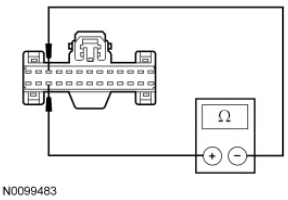


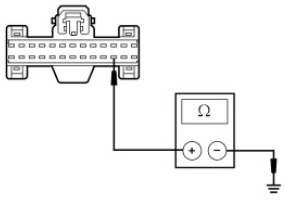




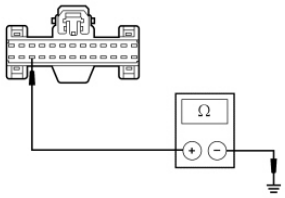
- **Is the resistance within the specifications for all positions?**

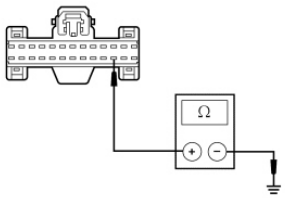


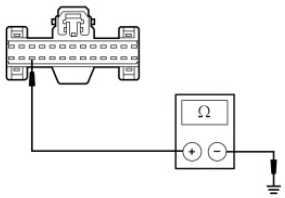




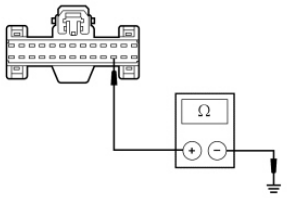
AU6 CHECK THE MESSAGE CENTER SIGNAL AND RETURN CIRCUITS FOR A SHORT TO VOLTAGE

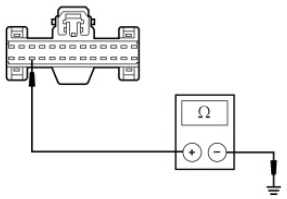


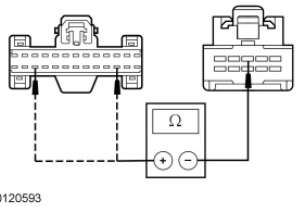


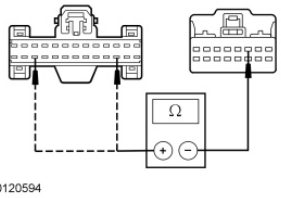


- Ignition OFF.
- Disconnect: IPC C220 .
- Ignition ON.
- For non-hybrid, measure the voltage between the IPC C220-16, circuit CMC29 (GN/VT), harness side and ground; and between the IPC C220-3, circuit RMC27 (WH/BN), harness side and ground.

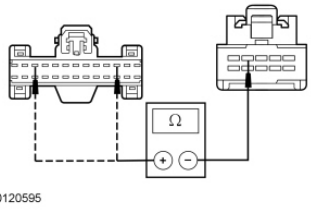


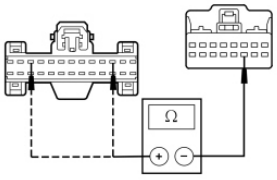


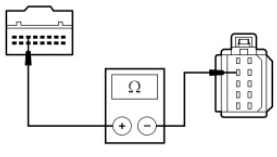




Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.







No
GO to AU7 .

 N0094489 • For hybrid, measure the voltage between the IPC C220-24, circuit CMC29 (GN/VT), harness side and ground; and between the IPC C220-11, circuit RMC27 (WH/BN), harness side and ground.  N0094490 • **Is any voltage present?**	
AU7 CHECK THE MESSAGE CENTER SIGNAL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • For non-hybrid, measure the resistance between the IPC C220-16, circuit CMC29 (GN/VT), harness side and ground.  N0094491 • For hybrid, measure the resistance between the IPC C220-24, circuit CMC29 (GN/VT), harness side and ground.  N0094492 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AU8 . **No** GO to AU9 .
AU8 CHECK THE MESSAGE CENTER SIGNAL AND RETURN CIRCUITS FOR A SHORT TOGETHER	

• Ignition OFF. • For non-hybrid, measure the resistance between the IPC C220-16, circuit CMC29 (GN/VT), harness side and the IPC C220-3, circuit RMC27 (WH/BN), harness side.  N0099482 • For hybrid, measure the resistance between the IPC C220-24, circuit CMC29 (GN/VT), harness side and the IPC C220-11, circuit RMC27 (WH/BN), harness side.  N0099483 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AU12 . **No** REPAIR the circuit. Clear the DTCs. REPEAT the self-test.
AU9 CHECK THE MESSAGE CENTER SWITCH FOR A SHORT TO GROUND	
• Disconnect: FCIM C2402 (MKZ). • Disconnect: LH Steering Wheel Switch C2998 (Fusion). • For non-hybrid, measure the resistance between the IPC C220-16, circuit CMC29 (GN/VT), harness side and ground.  N0094491 • For hybrid, measure the resistance between the IPC C220-24, circuit CMC29 (GN/VT), harness side and ground.	**Yes** For Fusion, INSTALL a new cruise control switch. REFER to Section 419-03 . CLEAR the DTCs. REPEAT the self-test. For MKZ, GO to AU17 . **No** For Fusion, GO to AU10 . For MKZ, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

 N0094492 • **Is the resistance greater than 10,000 ohms?**	
AU10 CHECK THE STEERING WHEEL HARNESS FOR A SHORT TO GROUND	
• Remove the driver air bag. Refer to Section 501-20B . • Disconnect: Clockspring C218b . • For non-hybrid, measure the resistance between the IPC C220-16, circuit CMC29 (GN/VT), harness side and ground.  N0094491 • For hybrid, measure the resistance between the IPC C220-24, circuit CMC29 (GN/VT), harness side and ground.  N0094492 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR or INSTALL a new steering wheel switch harness. CLEAR the DTCs. REPEAT the self-test. **No** GO to AU11 .
AU11 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND	
• Disconnect: Clockspring C218a . • For non-hybrid, measure the resistance between the IPC C220-16, circuit CMC29 (GN/VT), harness side and ground.	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit CMC29 (GN/VT) for a short to ground. INSTALL the driver air bag. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.

 N0094491 • For hybrid, measure the resistance between the IPC C220-24, circuit CMC29 (GN/VT), harness side and ground.  N0094492 • **Is the resistance greater than 10,000 ohms?**	
AU12 CHECK THE MESSAGE CENTER SIGNAL CIRCUIT FOR AN OPEN	
• Disconnect: FCIM C2402 (MKZ) . • Disconnect: Clockspring C218a (Fusion) . • For MKZ, measure the resistance between the IPC C220-16 (non-hybrid) or C220-24 (hybrid), circuit CMC29 (GN/VT), harness side and the FCIM C2402-3, circuit CMC29 (GN/VT), harness side.  N0120593 • For Fusion, measure the resistance between the IPC C220-24 (non-hybrid) or C220-24 (hybrid), circuit CMC29 (GN/VT), harness side and the clockspring C218a-3, circuit CMC29 (GN/VT), harness side.  N0120594 • **Are the resistances less than 5 ohms?**	**Yes** GO to AU13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

AU13 CHECK THE MESSAGE CENTER RETURN CIRCUIT FOR AN OPEN	
• For MKZ, measure the resistance between the IPC C220-3 (non-hybrid) or C220-11 (hybrid), circuit RMC27 (WH/BN), harness side and the FCIM C2402-4, circuit RMC27 (WH/BN), harness side.  N0120595 • For Fusion, measure the resistance between the C220-3 (non-hybrid) or C220-11 (hybrid), circuit RMC27 (WH/BN), harness side and the clockspring C218a-11, circuit RMC27 (WH/BN), harness side.  N0120596 • **Are the resistances less than 5 ohms?**	**Yes** For MKZ, GO to AU17 . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the self-test. For Fusion, GO to AU14 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
AU14 CHECK THE MESSAGE CENTER SWITCH SIGNAL CIRCUIT FOR AN OPEN AT THE LH STEERING WHEEL SWITCH	
• Disconnect: LH Steering Wheel Switch C2998 . • Measure the resistance between the lower clockspring C218a pin 3, component side and the LH steering wheel switch C2998-7, circuit CMC29 (GN/VT), harness side.  N0099475 • **Is the resistance less than 5 ohms?**	**Yes** GO to AU15 . **No** GO to AU16 .
AU15 CHECK THE MESSAGE CENTER SWITCH RETURN CIRCUIT FOR AN OPEN AT THE LH STEERING WHEEL SWITCH	

• Measure the resistance between the lower clockspring C218a pin 11, component side and the LH steering wheel switch C2998-10, circuit RMC27 (WH/BN), harness side.  N0099476 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new cruise control switch. REFER to Section 419-03 . CLEAR the DTCs. REPEAT the self-test. **No** GO to AU16 .
AU16 CHECK THE CLOCKSPRING FOR AN OPEN	
• Remove the driver air bag. Refer to Section 501-20B . • Disconnect: Clockspring C218b . • Measure the resistance between the lower clockspring C218a pin 3, circuit component side and the upper clockspring C218b pin 6, component side; and between the lower clockspring C218a pin 11, component side and the upper clockspring C218b pin 12, component side.  N0099799 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR or INSTALL a new steering wheel switch harness. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
AU17 CHECK FOR CORRECT FCIM OPERATION	
• Disconnect the FCIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FCIM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new FCIM . REFER to Section 415-00 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
AU18 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly.	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No**

• Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AV: The CHECK FUEL FILL INLET Message Is Inoperative/Always On

Normal Operation

The PCM monitors the fuel tank evaporative emission system for significant leaks that occur following refueling of the vehicle. Once the PCM detects a fuel vapor leak, the PCM sends the Instrument Panel Cluster (IPC) a message over the High Speed Controller Area Network (HS-CAN) communication bus to turn on the CHECK FUEL FILL INLET message. DTC P0457 sets in the PCM following a successful cruise test, which is initiated when the vehicle is driven at a steady speed above 64 km/h (40 mph) for a duration of approximately 4-5 minutes. If the PCM is unable to successfully run the cruise test, the IPC does not receive the message from the PCM and the CHECK FUEL FILL INLET message remains off.

If the IPC does not receive the fuel cap off data from the PCM for 5 seconds or less, the IPC defaults the CHECK FUEL FILL INLET message to the last setting, based upon the last known good data message. If the IPC does not receive the fuel cap off data from the PCM for more than 5 seconds or if the data received is deemed invalid, the IPC sets DTC U0100:00 in continuous memory and defaults the CHECK FUEL FILL INLET message off.

NOTE: If DTC U0100:00 is set in the IPC , other observable symptoms may be an inoperative speedometer, temperature gauge (except hybrid) or odometer.

- DTC P0457 (Evaporative Emission System Leak Detected) (fuel cap loose/off) - sets in the PCM if a fuel tank pressure change greater than -23.7 kPa (-7 in-Hg) of vacuum within 30 seconds after refueling occurs, or there is an excessive purge (fuel vapor) flow of greater than 454 g (1.0 lb) per minute.

This pinpoint test is intended to diagnose the following:

- Evaporative emissions concern
- PCM
- IPC

PINPOINT TEST AV: THE CHECK FUEL FILL INLET MESSAGE IS INOPERATIVE/ALWAYS ON

Test Step	Result / Action to Take
AV1 CHECK THE MESSAGE CENTER DISPLAY OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON. • Open the driver door and observe	**Yes** GO to AV2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

the message center. • **Does the message center display DRIVER DOOR AJAR?**	
AV2 RETRIEVE THE RECORDED DTCs FROM THE PCM KOEO SELF-TEST	
• Check for recorded PCM DTCs from the Key ON Engine OFF (KOEO) self-test. • **Is DTC P0457 recorded?**	**Yes** If the CHECK FUEL FILL INLET message is displayed, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. If the CHECK FUEL FILL INLET message is not displayed, GO to AV3 . **No** If the CHECK FUEL FILL INLET message is always displayed, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. If the CHECK FUEL FILL INLET message is not displayed, the system is operating normally at this time. If the capless fuel fill inlet was open and the CHECK FUEL FILL INLET message did not turn on, driving conditions may not have allowed for the PCM to run the cruise test and message the IPC to turn on the CHECK FUEL FILL INLET message.
AV3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded IPC DTCs from the self-test. • **Is DTC U0100 recorded?**	**Yes** GO to Pinpoint Test BF . **No** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

Pinpoint Test AW: The SERVICE STEERING Message Is Inoperative/Always On

Normal Operation

The Instrument Panel Cluster (IPC) receives the Electronic Power Assist Steering (EPAS) system status from the Power Steering Control Module (PSCM) (part of the steering gear) through the High Speed Controller Area Network (HS-CAN) communication bus. When the PSCM detects a fault in the EPAS system, the PSCM sends a message to the IPC to turn on the SERVICE STEERING message in the message center.

This pinpoint test is intended to diagnose the following:

- EPAS system concern
- PSCM (part of the steering gear)
- IPC

PINPOINT TEST AW: THE SERVICE STEERING MESSAGE IS INOPERATIVE/ALWAYS ON

Test Step	Result / Action to Take
AW1 CHECK THE MESSAGE CENTER DISPLAY OPERATION	
• Close all doors and the luggage compartment lid. • Ignition ON. • Open the driver door and observe the message center. • **Does the message center display DRIVER DOOR AJAR?**	**Yes** GO to AW2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AW2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U0131:00 recorded?**	**Yes** GO to Pinpoint Test BL . **No** GO to AW3 .
AW3 RETRIEVE THE RECORDED DTCs FROM THE PSCM SELF-TEST	
• Check for recorded DTCs from the PSCM self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 211-00A . **No** INSTALL a new steering gear. REFER to Section 211-02 . TEST the system for normal operation.

Pinpoint Test AX: The TRUNK AJAR Message Is Inoperative/Always On

Refer to Wiring Diagrams Cell 113 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Luggage Compartment for schematic and connector information.

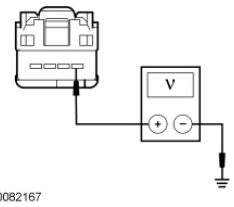
Normal Operation

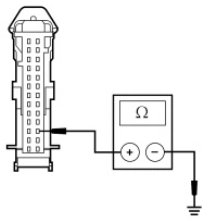
The Instrument Panel Cluster (IPC) receives the trunk ajar status from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus. The luggage compartment lid ajar switch (part of the luggage compartment lid latch) is hardwired to the SJB through the trunk ajar input circuit. The luggage compartment lid ajar switch is grounded externally. When the luggage compartment lid is ajar, the luggage compartment lid latch removes the ground to the luggage compartment lid ajar switch input to the SJB . When the luggage compartment lid is closed, the luggage compartment lid release grounds the luggage compartment lid ajar switch.

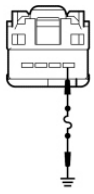
When the SJB detects an open on the trunk ajar input circuit, the SJB sends a message to the IPC to turn on the TRUNK AJAR message in the message center.

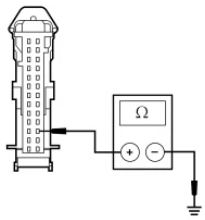
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Luggage compartment lid ajar switch (part of the luggage compartment lid latch)
- SJB









- IPC

PINPOINT TEST AX: THE TRUNK AJAR MESSAGE IS INOPERATIVE/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AX1 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors, hood and luggage compartment lid. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display DRIVER DOOR AJAR?**	**Yes** GO to AX2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AX2 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Retrieve the recorded DTCs from the IPC self-test. • **Is DTC U0140:00 recorded?**	**Yes** GO to Pinpoint Test BM . **No** GO to AX3 .
AX3 CHECK THE LUGGAGE COMPARTMENT LID LATCH OPERATION	
• Press the luggage compartment lid release switch on the instrument panel. • **Does the luggage compartment lid release function operate?**	**Yes** GO to AX4 . **No** REFER to Section 501-14 .
AX4 CHECK THE LUGGAGE COMPARTMENT LID AJAR SWITCH	
• Ignition OFF. • Disconnect: Luggage Compartment Lid Latch C429 . • Ignition ON. • Measure the voltage between the luggage compartment lid latch C429-1, circuit CPL58 (GY/OG), harness side and ground.	**Yes** INSTALL a new luggage compartment lid latch. REFER to Section 501-14 . TEST the system for normal operation. **No** GO to AX5 .

 N0082167 • **Is the voltage greater then 10 volts?**	
AX5 CHECK THE TRUNK AJAR INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280c . • Measure the resistance between the SJB C2280c-16, circuit CPL58 (GY/OG), harness side and ground.  N0085708 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AX6 . **No** REPAIR the circuit. TEST the system for normal operation.
AX6 CHECK THE TRUNK AJAR INPUT CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable . • Connect a fused jumper wire between the luggage compartment lid latch C429-1, circuit CPL58 (GY/OG), harness side and ground.  N0082169 • Measure the resistance between the SJB C2280c-16, circuit CPL58 (GY/OG), harness side and ground.  N0085708	**Yes** GO to AX7 . **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	
AX7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AY: The Chime Sounds When The Driver Door Is Ajar (No Key In Ignition And Headlamps Off)

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

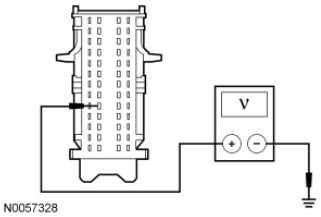
Normal Operation

The Instrument Panel Cluster (IPC) receives the key-in-ignition warning status from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus.

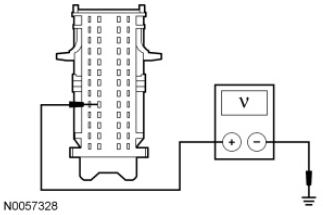
The key-in-ignition warning switch (part of the ignition switch) is hardwired to the SJB through the key-in-ignition input circuit. When the key is inserted into the ignition lock cylinder, the key-in-ignition switch closes and supplies voltage to the SJB .

The SJB monitors the door ajar input from the LH front door and the key-in-ignition switch status. When the SJB detects a key-in-ignition voltage and the LH front door is open or ajar, the SJB sends the IPC a chime request message to sound the key-in-ignition warning chime.

- DTC B1352 (Ignition Key-In Circuit Failure) - an on-demand DTC that sets in the SJB if the SJB detects a short to voltage on the key-in-ignition switch input circuit or if the SJB detects ignition START, RUN/START or RUN/ACC inputs without the key-in-ignition input.



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Key-in-ignition warning switch (part of the ignition switch)
- SJB

PINPOINT TEST AY: THE CHIME SOUNDS WHEN THE DRIVER DOOR IS AJAR (NO KEY IN IGNITION AND HEADLAMPS OFF)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AY1 CHECK THE IPC ILLUMINATION	

• Verify the IPC is not illuminated with the headlamp switch off. • **Does the IPC illumination operate correctly?**	**Yes** GO to AY2 . **No** REFER to Section 413-00 .
AY2 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check for recorded DTCs from the SJB self-test. • **Is DTC B1352 present?**	**Yes** GO to AY3 . **No** GO to AY4 .
AY3 CHECK THE SJB IGNITION INPUT PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Select and monitor the SJB PIDs ignition ACC (IGN_A_ECU), ignition OFF (IGN_O_ECU), ignition RUN (IGN_R_ECU), and ignition START (IGN_S_ECU) while cycling the ignition from ACC, OFF, RUN and START. • **Do the SJB PIDs match the ignition mode?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** REFER to Section 211-05 to diagnose the ignition outputs to the SJB .
AY4 CHECK THE KEY-IN-IGNITION INPUT CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280b . • Measure the voltage between the SJB C2280b-35, circuit CDC30 (BU/GY), harness side and ground.  • **Is any voltage present?**	**Yes** GO to AY5 . **No** GO to AY6 .
AY5 CHECK THE KEY-IN-IGNITION INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Ignition Switch C250 . • Measure the voltage between the SJB C2280b-35, circuit CDC30 (BU/GY), harness side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new ignition switch. REFER to Section 211-05 . TEST the system for normal operation.

 • **Is any voltage present?**	
AY6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AZ: The Key-In-Ignition Warning Chime Is Inoperative

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

The Instrument Panel Cluster (IPC) receives the key-in-ignition warning status from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) communication bus.

The key-in-ignition warning switch (part of the ignition switch) is hardwired to the SJB through the key-in-ignition input circuit. When the key is inserted into the ignition lock cylinder, the key-in-ignition switch closes and supplies voltage to the SJB .

The SJB monitors the door ajar input from the LH front door and the key-in-ignition switch status. When the SJB detects a key-in-ignition voltage and the LH front door is open or ajar, the SJB sends the IPC a chime request message to sound the key-in-ignition warning chime.

- DTC B1352 (Ignition Key-In Circuit Failure) - an on-demand DTC that sets in the SJB if the SJB detects an open on the key-in-ignition switch input circuit or if the SJB detects ignition START, RUN/START or RUN/ACC inputs without the key-in-ignition input.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key-in-ignition switch (part of the ignition switch)
- SJB
- IPC

PINPOINT TEST AZ: THE KEY-IN-IGNITION WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
AZ1 CHECK THE SAFETBELT WARNING CHIME OPERATION	
• Ignition OFF. • Ignition ON. • Monitor the safety belt warning chime when the ignition is transitioned from OFF to RUN for 6 seconds. • **Does the safety belt warning chime operate for approximately 6 seconds?**	**Yes** GO to AZ2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
AZ2 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors, hood and luggage compartment lid. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display DRIVER DOOR AJAR?**	**Yes** GO to AZ3 . **No** GO to Pinpoint Test AA to diagnose the door/hood ajar warning indicator (non-hybrid) or GO to Pinpoint Test AR to diagnose the door ajar message center warning indicator (MKZ or hybrid).
AZ3 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check for recorded DTCs from the SJB self-test. • **Is DTC B1352 present?**	**Yes** GO to AZ4 . **No** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
AZ4 CHECK THE IGNITION SWITCH	
• Ignition OFF. • Disconnect: Ignition Switch C250 . • Carry out the ignition switch component test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Is the ignition switch OK?**	**Yes** REPAIR circuit CDC30 (BU/GY) for an open. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new ignition switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test BA: The Headlamps On Warning Chime Is Inoperative

Normal Operation

The Smart Junction Box (SJB) receives the headlamp switch status from the headlamp switch. The SJB receives the LH front door ajar status from the LH front door ajar switch through hardwired circuitry.

The headlamps on warning chime sounds when the LH front door is opened with the ignition switch in the OFF position, no key-in-ignition input, and the headlamp switch is in the PARK or HEADLAMP ON position. The SJB communicates the headlamp on chime request to the Instrument Panel Cluster (IPC) over the Medium Speed Controller Area Network (MS-CAN) communication bus. The autolamps feature must not be selected for the headlamps on warning chime to operate.

This pinpoint test is intended to diagnose the following:

- Door ajar indication
- SJB
- IPC

PINPOINT TEST BA: THE HEADLAMPS ON WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
BA1 CHECK THE SAFETY BELT WARNING CHIME OPERATION	
• Ignition OFF. • Ignition ON. • Monitor the safety belt warning chime when the ignition switch is transitioned from OFF to RUN for 6 seconds. • **Does the safety belt warning chime operate for approximately 6 seconds?**	**Yes** GO to BA2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
BA2 CHECK THE EXTERIOR LAMPS OPERATION	
• Ignition OFF. • Place the headlamp switch in the PARK position. • **Do the parking lamps operate?**	**Yes** GO to BA3 . **No** REFER to Section 417-01 .
BA3 CHECK THE MESSAGE CENTER OPERATION	
• Close all doors, hood and luggage compartment lid. • Ignition ON. • Open the driver door while monitoring the message center displays. • **Does the message center display DRIVER DOOR AJAR?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** GO to Pinpoint Test AA to diagnose the door/hood ajar warning indicator (non-hybrid) or GO to Pinpoint Test AR to diagnose the door ajar message center warning indicator (MKZ or hybrid).

Pinpoint Test BB: The Turn Signal On Warning Chime Is Inoperative

Normal Operation

The turn signal on warning chime sounds when the vehicle travels more than 3.2 km (2.0 miles) with the turn signal on. The Smart Junction Box (SJB) communicates the turn signal switch status to the Instrument Panel Cluster (IPC) over the Medium Speed Controller Area Network (MS-CAN). The IPC receives the odometer rolling count data from the PCM over the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

- Odometer operation
- IPC

PINPOINT TEST BB: THE TURN SIGNAL ON WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
BB1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION	
• Ignition OFF. • Insert the key into the ignition lock cylinder. • Open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime operate correctly?**	**Yes** GO to BB2 . **No** GO to Pinpoint Test AY (chime is always on) or GO to Pinpoint Test AZ (chime is inoperative).
BB2 CHECK THE TURN SIGNAL INDICATORS OPERATION	
• Ignition ON. • Verify the turn signal indicators operation. • **Do the turn signal indicators operate correctly?**	**Yes** GO to BB3 . **No** GO to Pinpoint Test AB .
BB3 CHECK THE ODOMETER FOR CORRECT OPERATION	
• Drive the vehicle and observe the odometer for correct operation. • **Does the odometer operate correctly?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** GO to Pinpoint Test H .

Pinpoint Test BC: The Safety Belt Warning Chime Does Not Operate Correctly/The Belt-Minder® Feature Does Not Operate Correctly

Normal Operation

The Instrument Panel Cluster (IPC) receives the safety belt and Belt-Minder® requests from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN). The safety belt warning

chime sounds for approximately 6 seconds when the driver safety belt is not fastened and the ignition is switched from the OFF or ACC to the RUN position.

The Belt-Minder® feature supplements the safety belt warning function and is enabled after the safety belt warning is complete. The Belt-Minder® simultaneously sounds the chime and illuminates the safeelt warning lamp in the IPC once the vehicle speed has exceeded 9.7 km/h (6 mph), and remains active for 5 minutes from the time it is started.

There are 2 Belt-Minder® strategies that are used and implemented by the IPC as commanded by the RCM . The 2 strategies are designed to provide an increased chime tone safety belt warning indicator flash activity. Belt-Minder® A provides 6 one-second sequences for the first minute of the Belt-Minder® warning. Belt-Minder® B provides 6 one-second sequences of 3 chime tones in rapid succession for the remainder of the Belt-Minder® warning.

NOTE: Whenever the vehicle is operated using MyKey®, the RCM enables the Belt-Minder®.

If the Belt-Minder® is deactivated using an administrator key and driven using a MyKey® key, the MyKey® system overrides the deactivation of Belt-Minder®. When MyKey® is in use, the driver cannot configure the Belt-Minder® off. Once the Belt-Minder® is activated, the Belt-Minder® continues to chime periodically (does not time out after 5 minutes) and the audio system is muted until the driver safety belt is fastened. Refer to Section 419-01B for more information on the MyKey® feature.

NOTE: Make sure that the Belt-Minder® chime operation is verified with the vehicle moving at least 9.7 km/h (6 mph).

This pinpoint test is intended to diagnose the following:

- Safety belt warning indication concern
- Belt-Minder® deactivated
- Speedometer concern
- IPC

PINPOINT TEST BC: THE SAFETY BELT WARNING CHIME IS INOPERATIVE/THE BELT-MINDER® FEATURE DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
BC1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION	
• Ignition OFF. • Insert the key into the ignition lock cylinder. • Open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime operate correctly?**	**Yes** GO to BC2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
BC2 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: RCM PIDs.	**Yes** GO to BC3 . **No**

• Monitor the RCM driver safety belt buckle PID (SBELT_D_ST) while buckling and unbuckling the driver safety belt. • **Does the PID display BUCKLED with the safety belt buckled and UNBUCKLED with the safety belt unbuckled?**	REFER to Section 501-20B .
BC3 CHECK THE SAFETY BELT WARNING INDICATOR FOR CORRECT OPERATION	
• Ignition ON. • Within one minute, buckle the LH front safety belt. • With the engine running, verify the safety belt warning indicator illuminates with the safety belt unbuckled and turns off when buckled. • **Does the safety belt warning indicator operate correctly?**	**Yes** GO to BC4 . **No** GO to Pinpoint Test X .
BC4 CHECK THE SPEEDOMETER OPERATION	
• Verify that the speedometer is operating correctly. • **Does the speedometer operate correctly?**	**Yes** GO to BC5 . **No** GO to Pinpoint Test F .
BC5 CHECK THE BELT-MINDER® CONFIGURATION	
NOTE: Verify that an administrator key is used for this test and **not** a MyKey® programmed key. When a MyKey® programmed key is used, the Belt-Minder® is automatically turned on and cannot be disabled (if previously disabled by an administrator, the Belt-Minder® remains disabled when an administrator key is used). • Verify that the Belt-Minder® is activated or configured on for the seating position in question. Refer to Belt-Minder® Deactivating/Activating in this section to configure without a scan tool. • **Is the Belt-Minder® activated for the seating position in question?**	**Yes** If the Belt-Minder® is always on above 5 km/h (3 mph) with the safety belt unfastened, the system is operating normally. If the Belt-Minder® is always on with the safety belt fastened or never on with the safety belt unfastened above 9.7 km/h (6 mph), INSTALL a new RCM . REFER to Section 501-20B . TEST the system for normal operation. **No** ACTIVATE the Belt-Minder® for thesition in question. REFER to Belt-Minder® Deactivating/Activating in this section. TEST the system for normal operation.

Pinpoint Test BD: The Parking Brake Warning Chime Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) uses vehicle speed data sent from the PCM over the High Speed Controller Area Network (HS-CAN) communication bus and the parking brake switch status sent from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) to determine when to turn on the parking brake warning chime.

The SJB monitors and uses the ignition ON position, the parking brake on status, and vehicle speed that is greater than 5 km/h (3 mph). The parking brake warning chime stops sounding and resets if the parking brake is released, the ignition is not in the ON position, if the vehicle speed is below 5 km/h (3 mph), or after 90 seconds from the time the chime is activated.

NOTE: Make sure that the brake warning chime operation is verified with the vehicle moving at least 5 km/h (3 mph) with the parking brake slightly applied (just enough to turn the brake warning indicator on).

This pinpoint test is intended to diagnose the following:

- Brake warning indication concern
- Speedometer concern
- IPC

PINPOINT EST BD: THE PARKING BRAKE WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
BD1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION	
• Ignition OFF. • Insert the key into the ignition lock cylinder. • Open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime operate correctly?**	**Yes** GO to BD2 . **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.
BD2 CHECK THE BRAKE WARNING INDICATOR FOR CORRECT OPERATION	
• Ignition ON. • Apply and release the parking brake. • **Does the brake warning indicator turn on when applied and turn off when released?**	**Yes** GO to BD3 . **No** GO to Pinpoint Test S (never on) or GO to Pinpoint Test T (always on).
BD3 CHECK THE SPEEDOMETER FOR CORRECT OPERATION	
• Ignition ON. • Drive the vehicle and verify that the speedometer is operating correctly. • **Does the speedometer operate correctly?**	**Yes** GO to BD4 . **No** GO to Pinpoint Test F .
BD4 RETRIEVE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check for recorded DTCs from the SJB self-test. • **Are any DTCs recorded?**	**Yes** REFER to Section 419-10 . **No** INSTALL a new IPC . REFER to Instrument Panel

	Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BE: The Memory Feedback Warning Chime Is Inoperative

Normal Operation

The Instrument Panel Cluster (IPC) receives the memory feedback chime request from the Driver Seat Module (DSM) over the Medium Speed Controller Area Network (MS-CAN) communication bus. When a successful memory set procedure is carried out, the DSM sends a chime request to the IPC to sound the memory feedback chime.

This pinpoint test is intended to diagnose the following:

- DSM
- IPC

PINPOINT TEST BE: THE MEMORY FEEDBACK WARNING CHIME IS INOPERATIVE

Test Step	Result / Action to Take
BE1 CHECK THE KEY-IN-IGNITION WARNING CHIME OPERATION	
• Ignition OFF. • Insert the key into the ignition lock cylinder. • Open the LH front door and observe the key-in-ignition warning chime operation. • **Does the key-in-ignition warning chime operate correctly?**	**Yes** GO to BE2 . **No** GO to Pinpoint Test AZ .
BE2 CHECK THE MEMORY SET FEATURE	
• Verify that the memory set procedure can successfully change the memory preferences. • **Does the memory set procedure successfully change the memory preferences?**	**Yes** GO to BE3 . **No** REFER to Section 501-10 .
BE3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Are any DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new DSM . REFER to Section 419-10 . TEST the system for normal operation.

Pinpoint Test BF: DTC U0100:00

Normal Operation

- DTC U0100:00 (Lost Communication With ECM /PCM "A": No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the PCM over the High Speed Controller Area Network (HS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

NOTE: Once the IPC sets DTC U0100:00, multiple gauges or indicators are likely to be inoperative in the IPC . Other modules that require data from the IPC all set communication DTCs and may also exhibit system function concer.

This pinpoint test is intended to diagnose the following:

- PCM
- IPC

PINPOINT TEST BF: DTC U0100:00

Test Step	Result / Action to Take
BF1 VERIFY THAT THE SCAN TOOL CAN COMMUNICATE WITH THE PCM	
• Connect the scan tool. • Check that a vehicle session can be established using the scan tool. • **Can a vehicle session be established?**	**Yes** GO to BF2 . **No** REFER to Section 418-00 to diagnose no communication with the PCM.
BF2 CHECK THE IPC CONTINUOUS MEMORY DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0100:00 retrieved again?**	**Yes** GO to BF3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BF3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BF4 .
BF4 CHECK FOR DTC U0100:00 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory	**Yes** INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. TEST the system for normal operation.

DTCs from all modules. • **Is DTC U0100:00 set in the Restraints Control Module (RCM)?**	**No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BG: DTC U0101:00

Normal Operation

- DTC U0101:00 (Lost Communication With TCM : No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Transmission Control Module (TCM) over the High Speed Controller Area Network (HS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- TCM
- IPC

PINPOINT TEST BG: DTC U0101:00

Test Step	Result / Action to Take
BG1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BG2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BG2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the TCM pass the network test?**	**Yes** GO to BG3 . **No** REFER to Section 418-00 .
BG3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BG4 .
BG4 RECHECK THE IPC DTCs	
• Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0101:00 still present?**	**Yes** GO to BG5 .

	No The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BG5 CHECK FOR DTC U0101 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0101 set in the PCM?**	**Yes** For Aisin AW21 transaxle, INSTALL a new TCM . REFER to Section 307-01A . CLEAR the DTCs. REPEAT the self-test. For the 6F35 transaxle, INSTALL a new PCM. REFER to Refer to the appropriate section in Group 303 for the procedure.. For the eCVT transaxle, INSTALL a new transaxle. REFER to Section 307-01C . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BH: DTC U0102:00

Normal Operation

- DTC U0102:00 (Lost Communication With Transfer Case Control Module: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the 4X4 control module over the High Speed Controller Area Network (HS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- 4X4 control module
- IPC

PINPOINT TEST BH: DTC U0102:00

Test Step	Result / Action to Take
BH1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BH2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BH2 CHECK THE COMMUNICATION NETWORK	

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the 4X4 control module pass the network test?**	**Yes** GO to BH3 . **No** REFER to Section 418-00 .
BH3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BH4 .
BH4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0102:00 still present?**	**Yes** GO to BH5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BH5 CHECK FOR DTC U0114, U0114:00 or U1900 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0114, U0114:00 or U1900 set in the ABS?**	**Yes** INSTALL a new 4X4 control module. REFER to Section 308-07A . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) . TEST the system for normal operation.

Pinpoint Test BI: DTC U010F:00

Normal Operation

- DTC U010F:00 (Lost Communication With Air Conditioning Control Module: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the HVAC module over the Medium Speed Controller Area Network (MS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- HVAC module
- IPC

PINPOINT TEST BI: DTC U010F:0

Test Step	Result / Action to Take
BI1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BI2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BI2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the HVAC module pass the network test?**	**Yes** GO to BI3 . **No** REFER to Section 418-00 .
BI3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BI4 .
BI4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U010F:00 still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U010F:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BJ: DTC U0111:00

Normal Operation

- DTC U0111:00 (Lost Communication With Battery Energy Control Module "A": No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Battery Pack Sensor Module (BPSM) over the High Speed Controller Area Network (HS-CAN) are missing

for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- BPSM
- IPC

PINPOINT TEST BJ: DTC U0111:00

Test Step	Result / Action to Take
BJ1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BJ2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BJ2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the BPSM pass the network test?**	**Yes** GO to BJ3 . **No** REFER to Section 418-00 .
BJ3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BJ4 .
BJ4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0111:00 still present?**	**Yes** GO to BJ5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BJ5 CHECK FOR DTC U0111 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds.	**Yes** INSTALL a new BPSM . REFER to Section 414-03 . CLEAR the DTCs. REPEAT the self-test.

• Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0111 set in the PCM?**	**No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BK: DTC U0121:00

Normal Operation

- DTC U0121:00 (Lost Communication With Anti-Lock Brake System [ABS] Control Module: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the ABS module over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- ABS module
- IPC

PINPOINT TEST BK: DTC U0121:00

Test Step	Result / Action to Take
BK1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BK2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BK2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the ABS module pass the network test?**	**Yes** GO to BK3 . **No** REFER to Section 418-00 .
BK3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BK4 .
BK4 RECHECK THE IPC DTCs	

• Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0121:00 still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0121:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BL: DTC U0131:00

Normal Operation

- DTC U0131:00 (Lost Communication With Power Steering Control Module: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Power Steering Control Module (PSCM) over the High Speed Controller Area Network (HS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- PSCM
- IPC

PINPOINT TEST BL: DTC U0131:00

Test Step	Result / Action to Take
BL1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BL2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BL2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the PSCM pass the network test?**	**Yes** GO to BL3 . **No** REFER to Section 418-00 .
BL3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	

• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BL4 .
BL4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0131:00 still present?**	**Yes** GO to BL5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BL5 CHECK FOR DTC U0131:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0131:00 set in the ABS module?**	**Yes** INSTALL a new PSCM (part of the steering gear). REFER to Section 211-02 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BM: DTC U0140:00

Normal Operation

- DTC U0140:00 (Lost Communication With Body Control Module: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Smart Junction Box (SJB) over the Medium Speed Controller Area Network (MS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- SJB
- IPC

PINPOINT TEST BM: DTC U0140:00

Test Step	Result / Action to Take
BM1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present.	**Yes** GO to BM2 . **No**

• **Is an observable symptom present?**	The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BM2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the SJB pass the network test?**	**Yes** GO to BM3 . **No** REFER to Section 418-00 .
BM3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BM4 .
BM4 RECHECK THE IPC DTCs	
• Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0140:00 still present?**	**Yes** GO to BM5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BM5 CHECK FOR DTC U0140 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 set in the Driver Seat Module (DSM) or the Driver Door Module (DDM)?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BN: DTC U0151:00

Normal Operation

- DTC U0151:00 (Lost Communication With Restraints Control Module: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Restraints Control Module (RCM) over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

Ts pinpoint test is intended to diagnose the following:

- RCM
- IPC

PINPOINT TEST BN: DTC U0151:00

Test Step	Result / Action to Take
BN1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BN2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BN2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the RCM pass the network test?**	**Yes** GO to BN3 . **No** REFER to Section 418-00 .
BN3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BN4 .
BN4 RECHECK THE IPC DTCs	
• Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0151:00 still present?**	**Yes** GO to BN5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BN5 CHECK FOR DTC U0151:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules.	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

• **Is DTC U0151:00 set in the Occupant Classification System Module (OCSM)?**	

Pinpoint Test BO: DTC U0154:00

Normal Operation

- DTC U0154:00 (Lost Communication With Occupant Classification Sensor [OCS]: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Occupant Classification System Module (OCSM) over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- OCSM
- IPC

PINPOINT TEST BO: DTC U0154:00

Test Step	Result / Action to Take
BO1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BO2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BO2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the OCSM pass the network test?**	**Yes** GO to BO3 . **No** REFER to Section 418-00 .
BO3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BO4 .
BO4 RECHECK THE IPC DTCs	
• Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0154:00 still present?**	**Yes** GO to BO5 . **No** The system is operating correctly at this time. The

	DTC may have been set due to high network traffic or an intermittent fault condition.
BO5 CHECK FOR DTC U0154:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0154:00 set in the Restraints Control Module (RCM) module?**	**Yes** INSTALL a new OCSM . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation.

Pinpoint Test BP: DTC U0159:00

Normal Operation

- DTC U0159:00 (Lost Communication With Parking Assist Control Module "A": No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Parking Aid Module (PAM) over the Medium Speed Controller Area Network (MS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose e following:

- PAM
- IPC

PINPOINT TEST BP: DTC U0159:00

Test Step	Result / Action to Take
BP1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BP2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BP2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the PAM pass the network test?**	**Yes** GO to BP3 . **No** REFER to Section 418-00 .
BP3 RETRIEVE THE RECORDED DTCs FROM THE IPC	

SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BP4 .
BP4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0159:00 still present?**	**Yes** INSTALL a new PAM . REFER to Section 413-13 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0159:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BQ: DTC U0163:00

Normal Operation

- DTC U0163:00 (Lost Communication With Navigation Control Module: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Audio Front Control Module (ACM) over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- ACM
- IPC

PINPOINT TEST BQ: DTC U0163:00

Test Step	Result / Action to Take
BQ1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BQ2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

BQ2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the ACM pass the network test?**	**Yes** GO to BQ3 . **No** REFER to Section 418-00 .
BQ3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BQ4 .
BQ4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0163:00 still present?**	**Yes** INSTALL a new ACM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0163:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BR: DTC U0164:00

Normal Operation

- DTC U0164:00 (Lost Communication With HVAC Control Module: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the HVAC module over the Medium Speed Controller Area Network (MS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- HVAC module
- IPC

PINPOINT TEST BR: DTC U0164:00

Test Step	Result / Action to Take
BR1 VERIFY THE CUSTOMER CONCERN	

• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BR2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BR2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the HVAC module pass the network test?**	**Yes** GO to BR3 . **No** REFER to Section 418-00 .
BR3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BR4 .
BR4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0164:00 still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0164:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BS: DTC U0184:00

Normal Operation

- DTC U0184:00 (Lost Communication With Radio: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Audio Front Control Module (ACM) over the High Speed Controller Area Network (HS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- ACM
- IPC

PINPOINT TEST BS: DTC U0184:00

Test Step	Result / Action to Take
BS1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BS2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BS2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the ACM pass the network test?**	**Yes** GO to BS3 . **No** REFER to Section 418-00 .
BS3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BS4 .
BS4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0184:00 still present?**	**Yes** INSTALL a new ACM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0184:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BT: DTC U0208:00

Normal Operation

- DTC U0208:00 (Lost Communication With "Seat Control Module A": No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Driver Seat Module (DSM) over the Medium Speed Controller Area Network (MS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- DSM

i>IPC

PINPOINT TEST BT: DTC U0208:00

Test Step	Result / Action to Take
BT1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BT2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BT2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the DSM pass the network test?**	**Yes** GO to BT3 . **No** REFER to Section 418-00 .
BT3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BT4 .
BT4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0208:00 still present?**	**Yes** INSTALL a new DSM . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0208:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for

	normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BU: DTC U0232:00

Normal Operation

- DTC U0232:00 (Lost Communication With Side Obstacle Detection Control Module Left: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Side Obstacle Detection Control Module - Left (SOD-L) over the High Speed Controller Area Network (HS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- SOD-L
- IPC

PINPOINT TEST BU: DTC U0232:00

Test Step	Result / Action to Take
BU1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BU2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BU2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the SOD-L pass the network test?**	**Yes** GO to BU3 . **No** REFER to Section 418-00 .
BU3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BU4 .

BU4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0232:00 still present?**	**Yes** INSTALL a new SOD-L . REFER to Section 419-04 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0232:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BV: DTC U0233:00

Normal Operation

- DTC U0233:00 (Lost Communication With Side Obstacle Detection Control Module Right: No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the Side Obstacle Detection Control Module - Right (SOD-R) over the High Speed Controller Area Network (HS-CAN) are missing for greater than 5 seconds. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- SOD-R
- IPC

PINPOINT TEST BV: DTC U0233:00

Test Step	Result / Action to Take
BV1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BV2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
BV2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test.	**Yes** GO to BV3 . **No** REFER to Section 418-00 .

• **Does the SOD-R pass the network test?**	
BV3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BV4 .
BV4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0233:00 still present?**	**Yes** INSTALL a new SOD-R . REFER to Section 419-04 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0232:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test BW: DTC U0298:00

Normal Operation

- DTC U0298:00 (Lost Communication With DC to DC Control Module "A": No Sub-Type Information) - sets in the Instrument Panel Cluster (IPC) if data messages received from the DC to DC Converter Control Module (DC/DC) over the Medium Speed Controller Area Network (MS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- DC to DC Converter Control Module (DC/DC)
- IPC

PINPOINT TEST BW: DTC U0298:00

Test Step	Result / Action to Take
BW1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to BW2 . **No** The system is operating normally at this

	time. The DTC may have been set due to high network traffic or an intermittent faulcondition.
BW2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the DC/DC pass the network test?**	**Yes** GO to BW3 . **No** REFER to Section 418-00 .
BW3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** GO to Pinpoint Test BX (U3003:16) or GO to Pinpoint Test BY (U3003:17). **No** GO to BW4 .
BW4 RECHECK THE IPC DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0298:00 still present?**	**Yes** INSTALL a new DC/DC . REFER to Section 414-05 . CLEAR the DTCs. REPEAT the IPC self-test. If DTC U0298:00 is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

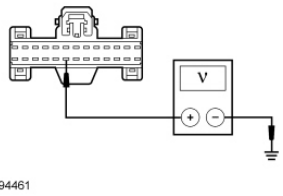
Pinpoint Test BX: DTC U3003:16

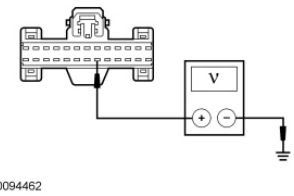
Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

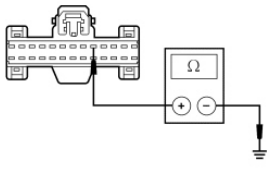
Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) - sets in the Instrument Panel Cluster (IPC) in continuous memory if the IPC detects battery voltage below 9 volts on the voltage input circuit.

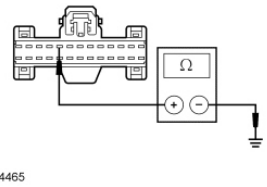
This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- High circuit resistance
- IPC



PINPOINT TEST BX: DTC U3003:16

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
BX1 RECHECK THE IPC DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC Self-Test . • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to BX2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
BX2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test . • Carry out the PCM Key ON Engine OFF (KOEO) self-test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC P0620, P0622, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to BX3 .
BX3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to BX4 . **No** REFER to Section 414-01 .
BX4 CHECK THE IPC VOLTAGE INPUT	
• Measure and record the voltage at the battery. • Enter the following diagnostic mode on the scan tool: IPC DataLogger . • Select the IPC voltage input PID (MODULE_VOLT). Monitor the voltage PID and compare the reading with the recorded battery voltage. • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to BX7 . **No** GO to BX5 .
BX5 CHECK THE IPC VOLTAGE SUPPLY	

• Ignition OFF. • Disconnect: IPC C220 . • Ignition ON. • For non-hybrid, measure the voltage between the IPC C220-21, circuit SBP26 (YE/RD), harness side and ground.  N0094461 • For hybrid, measure the voltage between the IPC C220-19, circuit SBP26 (YE/RD), harness side and ground.  N0094462 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to BX6 . **No** REPAIR circuit SBP26 (YE/RD) for high resistance. CLEAR the DTC. REPEAT the self-test.
BX6 CHECK THE IPC GROUND CIRCUIT	
• Ignition OFF. • Disconnect: Negative Battery Cable . • On non-hybrid, measure the resistance between the IPC C220-5, circuit GD116 (BK/VT), harness side and ground.  N0099635 • On hybrid, measure the resistance between the IPC C220-9, circuit GD116 (BK/VT), harness side and ground.	**Yes** GO to BX7 . **No** REPAIR circuit GD116 (BK/VT) for high resistance. CLEAR the DTCs. REPEAT the self-test.

 • **Is the resistance less than 5 ohms?**	
BX7 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test BY: DTC U3003:17

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) - sets in the Instrument Panel Cluster (IPC) in continuous memory if the IPC detects battery voltage above 16 volts on the voltage input circuit.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- IPC

PINPOINT TEST BY: DTC U3003:17

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

BY1 CHECK FOR DTC B1317, B1676, P0563 (PCM) OR U3003:17 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test .	**Yes** REFER to Section 414-00 to diagnose an overcharging condition.

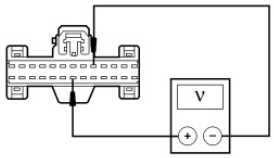
• Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676, P0563 (PCM) or U3003:17 set in more than one module?**	**No** GO to BY2 .
BY2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to BY3 .
BY3 RECHECK FOR DTC U3003:17	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test . • Clear the continuous memory DTCs. • Carry out the IPC self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

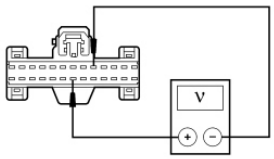
Pinpoint Test BZ: DTC U300A:62 Or U300A:64

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

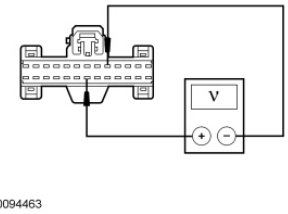
Normal Operation

With the ignition switch in the START or RUN position, the Instrument Panel Cluster (IPC) receives a RUN/START voltage input from the Smart Junction Box (SJB). The IPC also receives a networked ignition status from the SJB over the Medium Speed Controller Area Network (MS-CAN) communication bus.





- DTC U300A:62 (Ignition Switch: Signal Compare Failure) - the IPC compares the networked input with the hardwired input and sets DTC U300A:62 in continuous memory and on-demand if a discrepancy is detected.
- DTC U300A:64 (Ignition Switch: Signal Plausibility Failure) - the IPC monitors the messaged START status and sets DTC U300A:64 in continuous memory and on-demand if the IPC detects a START input for 15 seconds. Once the fault condition is detected, the IPC retains limited functionality for 15 seconds then returns to full functionality.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB
- IPC

PINPOINT TEST BZ: DTC U300A:62 OR U300A:64

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
BZ1 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U300A:62 recorded?**	**Yes** GO to BZ2 . **No** GO to BZ3 .
BZ2 CHECK THE IPC VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: IPC C220 . • Measure the voltage between the IPC C220-20, circuit CBP29 (WH/VT), harness side and the IPC C220-5, circuit GD116 (BK/VT), harness side.  N0094463 • Ignition ON. • Measure the voltage between the IPC C220-20, circuit CBP29 (WH/VT), harness side and the IPC C220-5, circuit GD116 (BK/VT), harness side.  N0094463 • Place the ignition in the START position. • Measure the voltage between the IPC C220-20, circuit CBP29 (WH/VT), harness side and the IPC C220-5, circuit GD116 (BK/VT), harness side.	**Yes** GO to BZ3 . **No** VERIFY the SJB fuse 29 (5A) is OK. If OK, REPAIR the circuit for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

 N0094463 • **Is the voltage 0 volts in the OFF position and greater than 10 volts in the RUN and START positions?**	
BZ3 CHECK THE SJB INPUT PIDs FROM THE IGNITION SWITCH	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger . • Select the SJB PIDs ignition ACC (IGN_A_ECU), ignition OFF (IGN_O_ECU), ignition RUN (IGN_R_ECU), and ignition START (IGN_S_ECU). Monitor the ignition PIDs while switching the ignition from ACC, OFF, RUN and START. • **Do the SJB PIDs match the ignition mode?**	**Yes** GO to BZ4 . **No** REFER to Section 211-05 to diagnose the ignition outputs to the SJB .
BZ4 CHECK THE IPC DTCs	
• Enter the following diagnostic mode on the scan tool: IPC Self-Test . • Repeat the IPC self-test. Clear the DTCs. • **Is DTC U300A:62 or DTC U300A:64 still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. If the DTC is still present, INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test CA: The Compass Is Inoperative

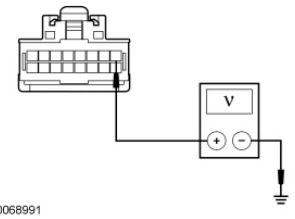
Refer to Wiring Diagrams Cell 124 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Mirrors for schematic and connector information.

NOTE: This procedure is only applicable to vehicles without navigation. For vehicles with navigation, refer to Section 415-00 .

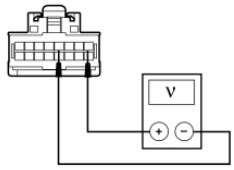
Normal Operation

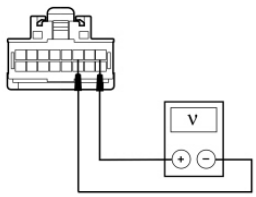
The compass module (integral to the auto-dimming interior mirror) provides vehicle directional inputs over the compass communication circuits to the Instrument Panel Cluster (IPC), which sends the compass information to the FDIM over the Medium Speed Controller Area Network (MS-CAN). The FDIM displays the compass direction according to the information that has been provided by the compass module to the IPC .

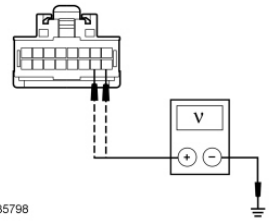
- DTC U0161:00 (Lost Communication With Compass Module: No Sub Type Information) - sets when the IPC does not receive any communication from the compass module for 5 seconds or longer.
- DTC U0462:68 (Invalid Data Received From Compass Module: Event Information) - sets when the IPC attempts a self-test of the compass module and its associated circuits and a failure results.



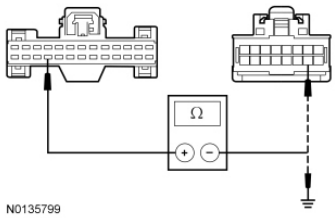
This pinpoint test is intended to diagnose thelowing:

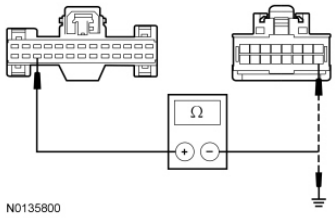






- Fuse(s)
- Wiring, terminals or connectors
- Compass module (integral to the auto-dimming interior mirror)
- FDIM (compass display)
- IPC





PINPOINT TEST CA: THE COMPASS IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Always set the zone and calibrate the compass before replacing an inaccurate compass module.

Test Step	Result / Action to Take
CA1 CHECK THE AUTO-DIMMING INTERIOR MIRROR VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror C911 or C9039 (Camera Display Mirror). • Ignition ON. • Measure the voltage between the auto-dimming interior mirror C911-1 or C9039-1 (camera display mirror), circuit CBP41 (BU), harness side and ground.  N0068991 • **Is the voltage greater than 10 volts?**	**Yes** GO to CA2 . **No** VERIFY the BCM fuse 32 (15A). If OK, REPAIR circuit CBP32 (GN/VT) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
CA2 CHECK THE COMPASS MODULE GROUND CIRCUIT FOR AN OPEN	
• If **not** equipped with a camera display mirror, measure the voltage between the auto-dimming interior mirror C911-1, circuit CBP41 (BU), harness side and auto-dimming interior mirror C911-4, circuit GD139 (BK/YE), harness side and ground.	**Yes** GO to CA3 . **No** REPAIR circuit GD133 (BK) for an open. CLEAR the DTCs. REPEAT the self-test.

 N0115951 • If equipped with a camera display mirror, measure the voltage between the auto-dimming interior mirror C9039-1, circuit CBP41 (BU), harness side and auto-dimming interior mirror C9039-3, circuit GD139 (BK/YE), harness side and ground.  N0135385 • **Is the voltage greater than 10 volts?**	
CA3 CHECK THE COMPASS COMMUNICATION CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Ignition ON. • Measure the voltage between the auto-dimming interior mirror C911-9 or C9039-9 (camera display mirror), circuit VMC31 (GY/BU), harness side and ground; and between the auto-dimming interior mirror C911-10 or C9039-10 (camera display mirror), circuit VMC30 (BU/GY), harness side and ground.  N0135798 • **Is any voltage present?**	**Yes** REPAIR the circuit in question for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to CA4 .
CA4 CHECK THE COMPASS COMMUNICATION PLUS (+) CIRCUIT FOR AN OPEN AND SHORT TO GROUND	

• Ignition OFF. • Measure the resistance between the IPC C220-23, circuit VMC30 (BU/GY), harness side and the auto-dimming interior mirror C911-10 or C9039-10 (camera display mirror), VMC30 (BU/GY), harness side; and between the IPC C220-23, circuit VMC30 (BU/GY), harness side and ground.  N0135799 • **Is the resistance less than 5 ohms between the IPC and the auto-dimming interior mirror, and greater than 10,000 ohms between the IPC and ground?**	**Yes** GO to CA5 . **No** REPAIR the circuit for an open or short to ground. CLEAR the DTCs. REPEAT the self-test.
CA5 CHECK THE COMPASS COMMUNICATION MINUS (-) CIRCUIT FOR AN OPEN AND SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the IPC C220-24, circuit VMC31 (GY/BU), harness side and the auto-dimming interior mirror C911-9 or C9039-9 (camera display mirror), VMC31 (GY/BU), harness side; and between the IPC C220-24, circuit VMC31 (GY/BU), harness side and ground.  N0135800 • **Is the resistance less than 5 ohms between the IPC and the auto-dimming interior mirror, and greater than 10,000 ohms between the IPC and ground?**	**Yes** GO to CA6 . **No** REPAIR the circuit for an open or short to ground. CLEAR the DTCs. REPEAT the self-test.
CA6 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly.	**Yes** INSTALL a new IPC . REFER to Instrument Panel Cluster (IPC) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been

• Operate the system and verify the concern is still present. • **Is the concern still present?**	caused by a loose or corroded connector.

Pinpoint Test CB: The Compass Is Inaccurate

NOTE: This procedure is only applicable to vehicles without navigation. For vehicles with navigation, there is no compass zone adjustment.

Normal Operation

The compass module (integral to the auto-dimming interior mirror) provides vehicle directional inputs over the communication circuits to the Instrument Panel Cluster (IPC), which sends the compass information to the Front Display Interface Module (FDIM) (compass display) over the Medium Speed Controller Area Network (MS-CAN). The FDIM displays the compass direction according to the information that has been provided by the compass module to the IPC . The compass display may provide inaccurate readings only if there is a concern with the compass module or the compass zone setting is incorrect or the compass is out of calibration.

This pinpoint test is intended to diagnose the following:

- Compass zone setting
- Compass calibration
- Compass module (integral to the auto-dimming interior mirror)

PINPOINT TEST CB: THE COMPASS IS INACCURATE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Always set the zone and calibrate the compass before replacing an inaccurate compass.

Test Step	Result / Action to Take
CB1 CHECK THE COMPASS ACCURACY	
• Position the vehicle and observe the compass display as follows: **Direction** / **Compass Display** North — N Northeast — NE East — E Southeast — SE	**Yes** The compass is OK. The concern may have been caused by an incorrect zone setting, or the compass was out of calibration. **No** INSTALL a new compass module. REFER to Auto-Dimming Interior Mirror in Section 501-09 . SET the zone. REFER to Compass Zone Adjustment in this section. CALIBRATE the compass. REFER to Compass Calibration in this section. TEST the system for normal operation.

Southwest	SW
West	W
Northwest	NW

- **Does the compass display as indicated?**

Message Center Configuration

Oil Life Reset - Non-Hybrid

NOTE: The oil life calculation is set at a maximum of approximately 12,070 km (7,500 miles) or 180 days (non-hybrid) or 16,093 km (10,000 miles) (hybrid).

1. Press and release the SETUP button 2 times to display OIL LIFE XXX% HOLD RESET = NEW.
2. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.

Oil Life Start Value - Non-Hybrid

NOTE: The oil life start value is used to reset the oil life value back to the maximum of approximately 12,070 km (7,500 miles) or 180 days if the value was previously changed, or to lower the value from the maximum (12,070 km [7,500 miles] or 180 days) in 10% increments down to 10%.

1. Press and release the SETUP button 2 times to display OIL LIFE = XXX% HOLD RESET = NEW.
2. Press and hold the RESET button for 2 seconds and release to reset the oil life to 100%.
3. Release the RESET button then press and release the RESET button to lower the percentage by 10% (down to 10%) for each button press or return the value to 100%.

Oil Life Reset And Oil Life Start Value - Hybrid

NOTE: The oil life calculation is set at a maximum of approximately 16,093 km (10,000 miles) or 12 months.

NOTE: The message center is displayed on the LH side of the speedometer and is split into several different viewing panes.

1. Press and release the SETUP button to display VEHICLE SETTINGS in the LH viewing pane of the message center.
2. Press and release the RESET button to display the next viewing pane.
3. Press and release the SETUP button to select and highlight OIL LIFE in the LH viewing pane of the message center.>
4. **NOTE:** Once the RESET button is pressed, the message center highlights the currently selected oil life start value. This value can be changed or left as currently selected.

   Press and release the RESET button to display the move to the RH viewing pane of the message center and highlight SET TO xxx%.
5. Press and release the SETUP button to highlight the desired oil life start value.

6. **NOTE:** A pop-up window appears stating HOLD RESET FOR 2 SECONDS TO CONFIRM. PRESS INFO TO CANCEL.

   Press and release the RESET button.

7. Press and hold the RESET button for approximately 2 seconds to select and confirm the desired oil life start value.

Belt-Minder® Deactivating/Activating

Preration

NOTE: The driver and front passenger Belt-Minder® are deactivated/activated independently. When deactivating/activating one seating position, do not buckle the other position as this terminates the process.

1. Before deactivating/activating the Belt-Minder®, set the parking brake.
2. On automatic transaxles, place the selector lever in PARK (P).
3. On manual transaxles, place the shifter in NEUTRAL (N).
4. Place the ignition in the OFF mode.
5. Unbuckle the driver and front passenger safety belts.

Deactivating/Activating

1. Place the ignition in the RUN mode (do not start the engine).
2. Wait approximately 1 minute until the safety belt warning indicator turns off.
3. **NOTE:** Step 3 must be completed within 30 seconds after the safety belt warning indicator turns off.

   To disable the seating position, buckle then unbuckle the safety belt 3 times, ending in the unbuckled state.

   - After Step 3, the safety belt warning indicator illuminates for 3 seconds.

4. Within 10 seconds of the safety belt warning indicator turning on, buckle then unbuckle the safety belt. This enables the Belt-Minder® if disabled and disables the Belt-Minder® if enabled.
   - This disables the Belt-Minder® feature for that seating position, if it is currently enabled. As confirmation, the safety belt warning indicator flashes 4 times per second for 3 seconds.
   - This enables the Belt-Minder® feature for that seating position, if it is currently disabled. As confirmation, the safety belt warning indicator flashes 4 times per second for 3 seconds, followed by 3 seconds with the light off followed by the safety belt warning indicator flashing 4 times per second for 3 seconds again.
5. The safety belt warning indicator flashing 4 times per second for 3 seconds provides confirmation that the Belt-Minder® is disabled.
6. The following sequence of events confirms the Belt-Minder® is enabled:
   - flashing of the safety belt warning indicator 4 times per second for 3 seconds
   - 3 seconds with the safety belt warning indicator off
   - flashing of the safety belt warning indicator 4 times per second for 3 seconds again
7. After confirmation, the deactivation/activation procedure is complete.

Compass Zone Adjustment

NOTE: This procedure is only applicable to vehicles without navigation.

1. Refer to the compass calibration zone map to select the correct compass zone setting for the geographic location of the vehicle.

2. With the ignition in the ON position, press and hold the Front Controls Interface Module (FCIM) (Fusion/Milan) or Front Display Interface Module (FDIM) (MKZ) 7 and 9 buttons (for approximately 5 seconds) until the compass display shows the current zone setting (ZONE XX). Release the 7 and 9 buttons.

3. **NOTE:** After the 7 and 9 buttons have been released for approximately 5 seconds, the compass display exits the zone setting mode.

   Before the zone setting mode turns off (within 5 seconds), momentarily press and release the 7 and 9 buttons to increase the zone increment by one. Set the zone display number to match the vehicle geographical location on the compass calibration zone map.

4. Release the 7 and 9 buttons for 5 seconds to exit the zone setting mode.

Compass Calibration

NOTE: This procedure is only applicable to vehicles without navigation.

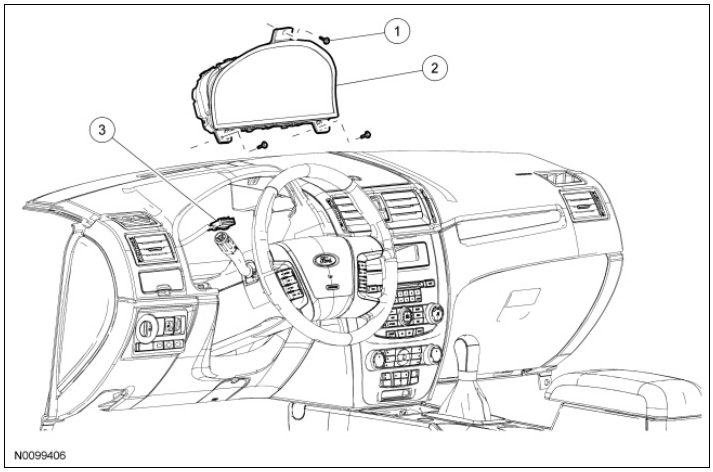
1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (heated rear window, heater fan, A/C, map lamps, and wipers) and make sure all doors are closed.

   Start the vehicle.

2. **NOTE:** The vehicle remains in the CAL mode until the compass has been successfully calibrated.

   NOTE: While holding the Front Controls Interface Module (FCIM) (Fusion/Milan) or Front Display Interface Module (FDIM) (MKZ) 7 and 9 buttons down, the compass display first enters the ZONE setting mode (after 5 seconds) and then after another 5 seconds (10 seconds total), the compass display enters the CAL mode.

   Press and hold (for approximately 10 seconds) the 7 and 9 buttons until the CAL indicator appears in the display, then release the buttons.



3. **NOTE:** If the CAL indicator does not turn off after the vehicle is driven in a circle at least 5 times, repeat the procedure.

   Drive the vehicle slowly at less than 5 km/h (3 mph) in a continuous circle until the CAL indicator disappears from the display and the compass heading is shown.

4. If the CAL indicator does not turn off after driving in a circle at least 5 times (and the procedure has been repeated at least once), install a new compass module (integral to the auto-dimming interior mirror). For additional information, refer to Auto-Dimming Interior Mirror in Section 501-09 .

Instrument Panel Cluster (IPC)

NOTE: Fusion shown, other vehicles similar.

Item	Part Number	Description
1	W707628	Screws (3 required)
2	10849	Instrument Panel Cluster (IPC)
3	-	Electrical connector (part of 14401)

Removal

NOTE: If installing a new Instrument Panel Cluster (IPC), all vehicle keys are erased during the parameter reset procedure. Verify at least 2 of the vehicle keys are available prior to carrying out this procedure.

1. If installing a new IPC , upload the module configuration to the scan tool. For additional information, refer to Section 418-01 , Programmable Module Installation (PMI).

2. Remove the IPC finish panel. For additional information, refer to Section 501-12 .

3. Remove the 3 screws and the IPC .
   - Disconnect the electrical connector.

Installation

1. Position the IPC in the instrument panel and connect the electrical connector.

2. Install the 3 screws.

3. Install the IPC finish panel. Refer to Section 501-12 .

4. **NOTE:** If a new IPC is installed, updated, or re-configured, the IPC and the PCM (non-hybrid) or Transmission Control Module (TCM) (hybrid) require a parameter reset to allow the IPC and the PCM or TCM to recognize each other. Failure to carry out the parameter reset to the IPC and the PCM or TCM can result in a no start condition.

If a new IPC was installed, updated or reconfigured, carry out the parameter reset procedure. For additional information, refer to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).

5. **NOTE:** The vehicles integrated keys (or standard Passive Anti-Theft System (PATS) keys) must be programmed to the new IPC .

   If a new IPC was installed, program the integrated keys. For additional information, refer to Section 419-01B (non-hybrid) or Section 419-01C (hybrid).

6. If a new IPC was installed, download the IPC configuration information from the scan tool into the new IPC . For additional information, refer to Section 418-01 , PMI .

Torque Specifications

Description	Nm	lb-in
Horn bolt	10	89

Horn

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The horn system consists of the following components:

- Horn switches (part of the steering wheel)
- Clockspring
- Horn relay (part of the SJB)
- Horn

The horn can be operated by pressing the switch on the steering wheel. It is also controlled by the SJB when it is utilized for the panic function, or during a perimeter anti-theft alarm event.

Horn Location

The horn is mounted on the RH side of the front subframe in the RH wheel well behind the front fender splash shield.

Horn

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB supplies the control and switched voltage to the horn relay (part of the SJB). When the driver air bag is pressed, ground is supplied through the steering wheel to the horn relay. The horn relay is then energized, directing voltage to the horn and enabling the horn to sound.

The horn switch is comprised of 2 sets of contacts separated by springs. The lower set is connected to ground and the upper set is connected to the horn signal circuit. When the driver air bag module is pressed, it pushes down on the upper set of contacts, collapsing the springs and allowing the contacts to touch. When the contacts touch, it completes the circuit.

The SJB provides ground to the horn relay control side to sound the horn when the vehicle security system is armed, an intrusion is detected, or the panic alarm is activated.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Horn • Steering wheel harness	• Smart Junction Box (SJB) fuse 24 (20A) • Wiring, terminals or connectors

• Horn switches (part of the steering wheel)	• Clockspring • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, verify the symptom. GO to Symptom Chart .

Symptom Chart

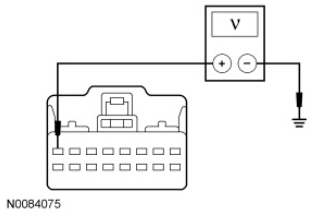
Symptom Chart

Pinpoint Tests

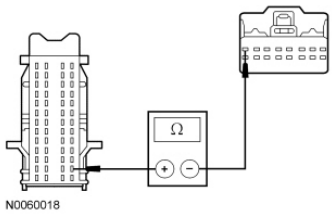
Pinpoint Test A: The Horn Is Inoperative

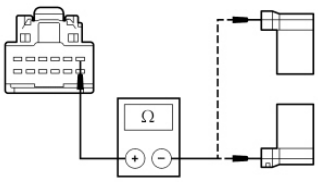
Refer to Wiring Diagrams Cell 44 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Horn/Cigar Lighter for schematic and connector information.

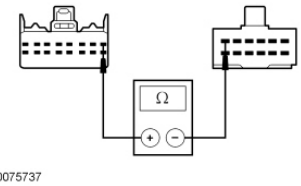
Normal Operation



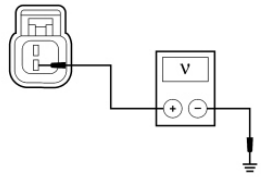
The Smart Junction Box (SJB) supplies the switched and control voltage to the horn relay (part of the SJB). When the horn switches (part of the steering wheel) are pressed, the switches are grounded to the steering wheel. Ground is then supplied to the horn relay, energizing the horn relay. The horn relay then sends voltage to the horn, enabling the horn to sound. The horn assembly has its own ground.

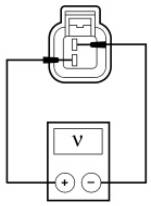


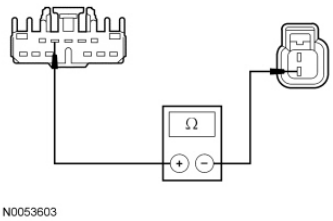




This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- Horn
- Clockspring
- Steering wheel harness
- Horn switches (part of the steering wheel)
- SJB

PINPOINT TEST A: THE HORN IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE SJB OUTPUT	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Select the SJB horn PID (HORN). Active command the horn on and then off. • **Does the horn sound when commanded on?**	**Yes** GO to A2 . **No** VERIFY the SJB fuse 24 (20A) is OK. If OK, GO to A6 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
A2 CHECK FOR VOLTAGE TO THE CLOCKSPRING	
• Connect: Negative Battery Cable. • Measure the voltage between the clockspring C218a-8, circuit CRH02 (BU/WH), harness side and ground.  N0084075 • **Is the voltage greater than 10 volts?**	**Yes** GO to A4 . **No** GO to A3 .
A3 CHECK THE HORN RELAY COIL GROUND CONTROL CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280b. • Measure the resistance between the SJB C2280b-41, circuit CRH02 (BU/WH), harness side and the clockspring C218a-8, circuit CRH02 (BU/WH), harness side.	**Yes** GO to A9 . **No** REPAIR circuit CRH02 (BU/WH) for an open. REPOWER the SRS .

 N0060018 • **Is the resistance less than 5 ohms?**	REFER to Section 501-20B . TEST the system for normal operation.
A4 CHECK THE STEERING WHEEL HARNESS FOR AN OPEN	
• Disconnect: Horn Switch C2996 and C2997. • Measure the resistance between the upper clockspring C218b-1, circuit CRH02 (BU/WH), harness side and the horn switch C2996-1, circuit CRH02 (BU/WH), harness side; and between the upper clockspring C218b-1, circuit CRH02 (BU/WH), harness side and the horn switch C2997-1, circuit CRH02 (BU/WH), harness side.  N0026922 • **Are the resistances less than 5 ohms?**	**Yes** GO to A5 . **No** REPAIR circuit CRH02 (BU/WH) for an open. INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.
A5 CHECK THE CLOCKSPRING FOR AN OPEN	
• Measure the resistance between the clockspring C218a pin 8, component side and the clockspring C218b pin 1, component side.  N0075737 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation. **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.
A6 CHECK FOR VOLTAGE TO THE HORN	
• Disconnect: Horn C131. • While pressing the horn switch, measure the voltage between the horn C131-2, circuit SRH01 (YE/RD), harness side and ground.	**Yes** GO to A7 . **No** GO to A8 .

 N0090544 • **Is the voltage greater than 10 volts?**	
A7 CHECK FOR VOLTAGE TO THE HORN USING THE CONNECTOR GROUND	
• While pressing the horn switch, measure the voltage between the horn C131-2, circuit SRH01 (YE/RD), harness side and the horn C131-1, circuit GD123 (BK/GY), harness side.  N0013171 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new horn. REFER to Horn in this section. TEST the system for normal operation. **No** REPAIR circuit GD123 (BK/GY) for an open. TEST the system for normal operation.
A8 CHECK THE HORN VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280e. • Measure the resistance between the SJB C2280e-5, circuit SRH01 (YE/RD), harness side and the horn C131-2, circuit SRH01 (YE/RD), harness side.  N0053603 • **Is the resistance less than 5 ohms?**	**Yes** GO to A9 . **No** REPAIR circuit SRH01 (YE/RD) for an open. TEST the system for normal operation.
A9 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . REPOWER the SRS . REFER to Section 501-20B . TEST the system for normal operation. **No** The system is operating

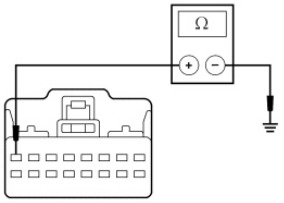
	correctly at this time. The concern may have been caused by a loose or corroded connector. REPOWER the SRS . REFER to Section 501-20B .

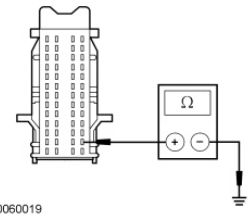
Pinpoint Test B: The Horn Is Always On

Refer to Wiring Diagrams Cell 44 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Horn/Cigar Lighter for schematic and connector information.

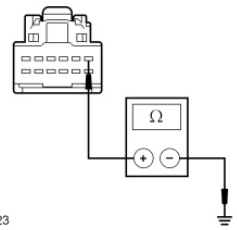
Normal Operation

The Smart Junction Box (SJB) supplies the switched and control voltage to the horn relay (part of the SJB). When the horn switches (part of the steering wheel) are pressed, the switches are grounded to the steering wheel. Ground is then supplied to the horn relay, energizing the horn relay. The horn relay then sends voltage to the horn, enabling the horn to sound.



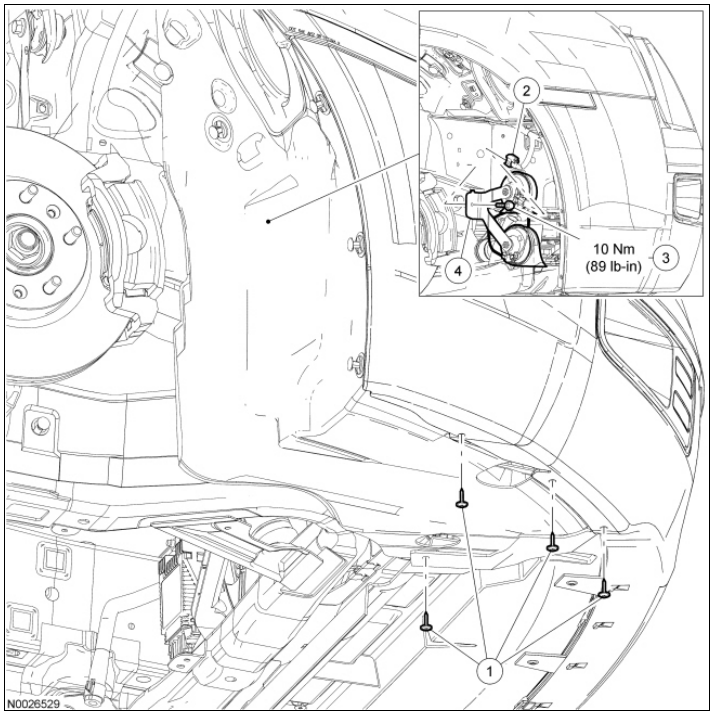


This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Clockspring
- Steering wheel harness
- Horn switches (part of the steering wheel)
- SJB

PINPOINT TEST B: THE HORN IS ALWAYS ON



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE HORN POWER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280e. • **Does the horn continue to sound?**	**Yes** REPAIR circuit SRH01 (YE/RD) for a short to voltage. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK THE HORN SWITCH INPUT	
• Disconnect: SJB C2280b. • Connect: SJB C2280e. • **Does the horn continue to sound?**	**Yes** GO to B6 . **No** GO to B3 .
B3 CHECK THE HORN RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO GROUND	

• Depower the Supplemental Restraint System (SRS). Refer to Section 501-20B . • Disconnect: Clockspring C218a. • Measure the resistance between the clockspring C218a-8, circuit CRH02 (BU/WH), harness side and ground.  N0026775 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR circuit CRH02 (BU/WH) for a short to ground. REPOWER the SRS . REFER to Section 501-20B . TEST the system for normal operation.
B4 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND	
• Remove the driver air bag module. Refer to Section 501-20B . • Connect: Clockspring C218a. • Disconnect: Upper Clockspring C218b. • Measure the resistance between the SJB C2280b-41, circuit CRH02 (BU/WH), harness side and ground.  N0060019 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B5 . **No** INSTALL a new clockspring. REFER to Section 501-20B . TEST the system for normal operation.
B5 CHECK THE STEERING WHEEL HARNESS FOR A SHORT TO GROUND	
• Disconnect: Horn Switch C2996 and C2997. • Measure the resistance between the upper clockspring 218b-1, circuit CRH02 (BU/WH), harness side and ground.	**Yes** INSTALL a new steering wheel. REFER to Section 211-04 . TEST the system for normal operation. **No** REPAIR or INSTALL a new steering wheel harness. INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation.

 • **Is the resistance greater than 10,000 ohms?**	
B6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Horn

Item	Part Number	Description
1	W706805	RH front fender splash shield screws (4 required)
2	-	Horn electrical connector (part of 14290)
3	W605784	Horn bolt
4	13832	Horn

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 RH front fender splash shield screws.
   - Pull the RH front fender splash shield downward to access the horn.

3. Disconnect the electrical connector.

4. Remove the bolt and the horn.
   - To install, tighten to 10 Nm (89 lb-in).

5. To install, reverse the removal procedure.

General Specifications

Item	Specification
Azimuth system check object position 1 (P1) and position 3 (P3) distance from sensor	30 cm (12 in) rear
Azimuth system check object position 2 (P2) distance from sensor	152 cm (60 in) rear

Parking Aid

The parking aid system consists of:

- Parking aid sensors (located in the rear bumper cover)
- Parking Aid Module (PAM) (located behind the LH rear seat trim panel)
- Parking aid speaker (located under the left side of the parcel shelf)
- Parking aid disable feature (integral to the Instrument Panel Cluster (IPC) message center)

The parking aid system calculates the distance to an object around the rear of the vehicle by the use of 3 ultrasonic sensors. The parking aid system detects objects behind the vehicle when the REVERSE (R) gear is selected.

Video (If Equipped)

The rear video camera system consists of the following:

- Video camera located in:
  - the license lamp housing (Fusion)
  - the luggage compartment lid (MKZ)
- Auto-dimming interior mirror (without navigation)
- Front Display Interface Module (FDIM) (with navigation)

The video camera is activated when REVERSE (R) is selected. The image from the rear video camera is displayed in the LH side of the auto-dimming interior mirror (without navigation) or the FDIM (with navigation).

Parking Aid

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The parking aid sensors detect objects approximately 152 cm (60 in) from the rear of the vehicle, 50 cm (1.6 ft) from the rear side of the vehicle, and 30 cm (12 in) above the ground. The Parking Aid Module (PAM) calculates the distance to an object within the 170 degree semicircular area around the rear of the vehicle. A variable warning tone is generated from a parking aid speaker. The parking aid speaker increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 25 cm (10 in) of the sensors, the warning tone becomes continuous.

The parking aid speaker has a dual function for vehicles equipped with the parking aid system and cross traffic alert system. The parking aid speaker will emit an audible warning tone to notify the driver of impeding traffic from the side of the vehicle when backing out of parking spaces. Refer to Section 419-04 for cross traffic alert information.

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The parking aid system is disabled if a fault is detected in 1 of the 3 sensors, the parking aid speaker, or the PAM . This is indicated by a warning and the message center will display the message "CHECK PARK AID".

The PAM is on the Medium Speed Controller Area Network (MS-CAN) and can be diagnosed with a scan tool. The PAM communicates with the scan tool, the Audio Control Module (ACM), the SOD-L , the SOD-R and the Instrument Panel Cluster (IPC). The following chart describes network messages used by the PAM :

NOTE: Both the MS-CAN and the High Speed Controller Area Network (HS-CAN) are used for intermodule communication. A gateway message is transferred from one network to another network through the IPC . Refer to Section 418-00 for network communication information.

PAM Network Communication Messages

Broadcast Message	Originating Module	Network Type	Receiving Module
Ignition switch position	IPC	MS-CAN	PAM
Parking aid sounder volume cutback request	PAM	MS-CAN	ACM
Parking aid enabled status	IPC	MS-CAN	PAM
Parking aid system status	PAM	MS-CAN	IPC
Transmission selector (PRNDL) range (gateway)	IPC	MS-CAN	PAM
Side obstacle detection cross traffic alert	SOD-L and SOD-R	MS-CAN	PAM
Vehicle speed (gateway)	IPC	MS-CAN	PAM

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Smart Junction Box (SJB) fuse 35 (10A) • Parking aid sensors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PAM .

9. **NOTE:** Follow the non-network DTC diagnostics (B-codes, C-codes, P-codes) prior to the network DTC diagnostics (U-codes).

   If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

PID Chart

PID	Description
IGN_V	Ignition voltage
LRO_DIST	Left rear outer sensor distance to object
RC_DIST	Rear center sensor distance to object
RRO_DIST	Right rear outer sensor distance to object
LRO_ATTEN	Left rear outer sensor attenuation
RC_ATTEN	Rear center sensor attenuation
RRO_ATTEN	Right rear outer sensor attenuation
TRANSGR	Transmission gear position

DTC Charts

Parking Aid Module (PAM) DTC Chart

DTC	Description	Action
B1299	Power Supply Sensor Circuit Short to Ground	GO to Pinpoint Test E .
B1342	ECU is Faulted	CLEAR the DTCs. REPEAT the Parking Aid Module (PAM) self-test. If DTC B1342 is retrieved again, INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. CLEAR all DTCs. Test the system for normal operation.
B2477	Module Configuration Failure	The PAM is not configured. REFER to Section 418-01 Programmable Module Installation (PMI) to configure the PAM . CLEAR all DTCs. Test the system for normal operation.
C1699	Left Rear Sensor Circuit Short to Vbat	GO to Pinpoint Test C .
C1700	Left Rear Sensor Circuit Failure or Blockage	GO to Pinpoint Test B .
C1701	Left Rear Sensor Circuit Fault	GO to Pinpoint Test D .
C1702	Right Rear Sensor Circuit Short to Vbatt	GO to Pinpoint Test C .
C1703	Right Rear Sensor Circuit Failure or Blockage	GO to Pinpoint Test B .
C1704	Right Rear Sensor Circuit Fault	GO to Pinpoint Test D .
C1705		GO to Pinpoint Test C .

	Rear Center Sensor Circuit Short to Vbat	
C1706	Rear Center Sensor Circuit Failure	GO to Pinpoint Test B .
C1707	Rear Center Sensor Circuit Fault	GO to Pinpoint Test D .
C1742	Rear Sounder Circuit Failure	GO to Pinpoint Test F .
C1743	Rear Sounder Circuit Short to Vbat	GO to Pinpoint Test F .
U0140	Lost Communication With Body Control Module (GEM)	GO to Pinpoint Test G .
U0155	Lost Communication With Instrument Panel Cluster (IPC) Control Module	GO to Pinpoint Test H .
U2051	One or More Calibration Files Missing/Corrupt	The PAM calibration data is corrupt or the module is not calibrated. REFER to Section 418-01 Programmable Module Installation (PMI) to configure the PAM . CLEAR all DTCs. Test the system for normal operation.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Parking Aid Is Inoperative/Does Not Operate Correctly

Normal Operation

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The Parking Aid Module (PAM) receives a reverse gear input from the Instrument Panel Cluster (IPC) through the Medium Speed Controller Area Network (MS-CAN). A reference voltage and signal return is supplied to the parking aid sensors from the PAM . The PAM receives an input signal from each individual parking aid sensor. The system can be disabled through the message center which is part of the IPC .

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensors alignment
- Parking aid sensors
- PAM
- Rear bumper cover

PINPOINT TEST A: THE PARKING AID IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS	
• Check the PAM DTCs from the continuous and on-demand self-tests. • **Are any PAM DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to A2 .
A2 CHECK THE MESSAGE CENTER FOR PARKING AID DISABLE OPERATION	
• While observing the IPC message center, disable and enable the parking aid system. • **Does the message center display PARK AID OFF when the parking aid system is disabled, and display PARK AID ON when the parking aid system is enabled?**	**Yes** GO to A3 . **No** REFER to Section 413-01 .
A3 CHECK FOR CORRECT REVERSE GEAR INPUT	
• Apply the parking brake. • Ignition ON. • Select REVERSE. • Enter the following diagnostic mode on the scan tool: PAM DataLogger. • Monitor the PAM PID (TRANSGR). • **Does the PID read REVERSE?**	**Yes** GO to A4 . **No** GO to A5 .
A4 CHECK THE PARKING AID SENSORS FOR CORRECT ALIGNMENT	
NOTE: If the vehicle was in a rear end collision, the parking aid sensors may not be aligned correctly. • Check the bumper for correct alignment. • Carry out the azimuth system check. Refer to Azimuth System Check in this section. • Carry out the elevation system check. Refer to Elevation System Check in this section. • **Does the parking aid system pass both system checks?**	**Yes** GO to A6 . **No** REALIGN or INSTALL a new bumper cover. REFER to Section 501-19 . If the vehicle was in a rear end collision, further body work may be required to bring the parking aid sensors into correct alignment.
A5 CHECK THE PCM FOR DIGITAL TR SENSOR DTCs	
• Check the PCM for DTCs P0705, P0706, P0708 and P0709.	**Yes** REFER to Section 307-01A , Section 307-01B , or Section 307-01C to continue diagnosis of the

<table>
<tr><td>• Are any of these DTCs present?</td><td>digital TR sensor.

No
GO to A7 .</td></tr>
<tr><td>A6 MONITOR THE PAM DISTANCE PIDs</td><td></td></tr>
<tr><td>• Enter the following diagnostic mode on the scan tool: PAM DataLogger.
• Monitor the PAM distance PIDs while moving a test object into and out of the azimuth field directly behind each of the rear sensors:

<table><tr><th>PID</th><th>Description</th></tr><tr><td>LRO_DIST</td><td>Left rear outer parking aid sensor distance</td></tr><tr><td>RC_DIST</td><td>Rear center parking aid sensor distance</td></tr><tr><td>RRO_DIST</td><td>Right rear outer parking aid sensor distance</td></tr></table>
• Do the PID readings correspond to the approximate distance between sensor and test object?</td><td>Yes
GO to A7 .

No
INSTALL a new sensor(s) for the one in question. REFER to Parking Aid Sensor in this section. TEST the system for normal operation.</td></tr>
<tr><td>A7 CHECK FOR CORRECT PAM OPERATION</td><td></td></tr>
<tr><td>• Disconnect the PAM connector.
• Check for:
♦ corrosion
♦ damaged pins
♦ pushed-out pins
• Connect the PAM connector and make sure it seats correctly.
• Operate the system and determine if the concern is still present.
• Is the concern still present?</td><td>Yes
INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.</td></tr>
</table>

Pinpoint Test B: DTCs C1700, C1703 And C1706

Refer to Wiring Diagrams Cell 131 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking Aid for schematic and connector information.

Normal Operation

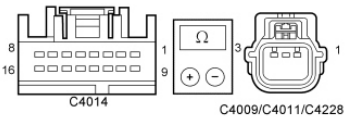
The Parking Aid Module (PAM) supplies a reference voltage and signal return to the parking aid sensors. Each of the parking aid sensors has an individual input signal to the PAM . When an object is present behind the vehicle, the PAM receives an input signal from the sensors and determines the distance of the object to the

vehicle. A fault condition occurs when the PAM detects an open in the parking aid sensor circuits or the parking aid sensor input signal is shorted to ground.

- DTC C1700 (Left Rear Sensor Circuit Failure or Blockage) - a continuous and on-demand DTC that sets when any of the left rear parking aid sensor circuits are open or the sensor signal line is shorted to ground.
- DTC C1703 (Right Rear Sensor Circuit Failure or Blockage) - a continuous and on-demand DTC that sets when any of the right rear parking aid sensor circuits are open or the sensor signal line is shorted to ground.
- DTC C1706 (Rear Center Sensor Circuit Failure) - a continuous and on-demand DTC that sets when any of the rear center parking aid sensor circuits are open or the sensor signal line is shorted to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness
- PAM



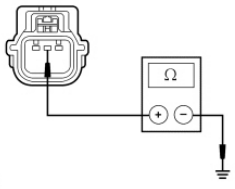
PINPOINT TEST B: DTCs C1700, C1703 AND C1706

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 RETRIEVE THE DTCs FROM THE PAM SELF-TEST	
• Check the PAM DTCs from the continuous and on-demand self-tests. • **Are multiple DTCs recorded?**	**Yes** GO to B2 . **No** For DTC C1700, C1703 or C1706 GO to B3 . For all other DTCs, REFER to DTC Charts in this section.
B2 CHECK THE BUMPER WIRING HARNESS	
• Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion. • **Is the bumper wiring harness OK?**	**Yes** GO to B3 . **No** REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. TEST the system for normal operation.
B3 CHECK THE SENSOR CIRCUITRY FOR OPENS	

• Ignition OFF. • Disconnect: Suspect Parking Aid Sensor C4009, C4011 or C4228. • Disconnect: PAM C4014. • Measure the resistance between the PAM C4014, harness side and the suspect parking aid sensor, harness side as follows:	**Yes** GO to B4 . **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.

DTC	Rear Sensor	PAM Connector-Pin	Sensor Connector-Pin	Circuit
C1700	LH outer	C4014-9	C4009-1	LMP07 (BU/WH)
C1700	LH outer	C4014-15	C4009-2	VMP15 (YE/GN)
C1700	LH outer	C4014-12	C4009-3	RMP07 (GN/WH)
C1703	RH outer	C4014-9	C4011-1	LMP07 (BU/WH)
C1703	RH outer	C4014-16	C4011-2	VMP17 (YE/OG)
C1703	RH outer	C4014-12	C4011-3	RMP07 (GN/WH)
C1706	Center	C4014-9	C4228-1	LMP07 (BU/WH)
C1706	Center	C4014-14	C4228-2	VMP14 (WH/OG)
C1706	Center	C4014-12	C4228-3	RMP07 (GN/WH)



N0099409

- **Are the resistances less than 5 ohms?**

B4 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO GROUND	
• Measure the resistance between the suspect parking aid sensor, harness side and ground as follows:	**Yes** If all of the parking aid sensors recorded DTCs, GO to B5 . If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question.

	REFER to Parking Aid Sensor in this section. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.

DTC	Rear Sensor	Connector-Pin	Circuit
C1700	LH outer	C4009-2	VMP15 (YE/GN)
C1703	RH outer	C4011-2	VMP17 (YE/OG)
C1706	Center	C4228-2	VMP14 (WH/OG)

- **Is the resistance greater than 10,000 ohms?**

B5 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTCs C1699, C1702 And C1705

Refer to Wiring Diagrams Cell 131 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking Aid for schematic and connector information.

Normal Operation

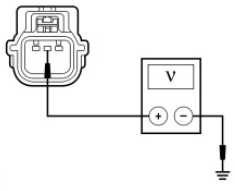
The Parking Aid Module (PAM) supplies a reference voltage and signal return to the parking aid sensors. Each of the parking aid sensors has an individual input signal to the PAM . When an object is present behind the vehicle, the PAM receives an input signal from the sensors and determines the distance of the object to the vehicle. A fault condition occurs when the PAM detects a short to voltage on the parking aid sensor signal circuit.

- DTC C1699 (Left Rear Sensor Circuit Short to Vbat) - a continuous and on-demand DTC that sets when the left rear parking aid sensor signal line is shorted to voltage.
- DTC C1702 (Right Rear Sensor Circuit Short to Vbat) - a continuous and on-demand DTC that sets when the right rear parking aid sensor signal line is shorted to voltage.
- DTC C1705 (Rear Center Sensor Circuit Short to Vbat) - a continuous and on-demand DTC that sets when the left rear center parking aid sensor signal line is shorted to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Parking aid sensor(s)
- Parking aid bumper harness
- PAM



PINPOINT TEST C: DTCs C1699, C1702 AND C1705

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 RETRIEVE THE DTCs FROM THE PAM SELF-TESTS	
• Check the PAM DTCs from the continuous and on-demand self-tests. • **Are multiple DTCs recorded?**	**Yes** GO to C2 . **No** For DTC C1699, C1702 or C1705 GO to C3 . For all other DTCs, REFER to DTC Charts in this section.
C2 CHECK THE BUMPER WIRING HARNESS	
• Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion. • **Is the bumper wiring harness OK?**	**Yes** GO to C3 . **No** REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. TEST the system for normal operation.
C3 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO VOLTAGE	
• Ignition OFF. • Disconnect: Suspect Parking Aid Sensor C4009, C4011 or C4228. • Disconnect: PAM C4014. • Ignition ON. • Measure the voltage between the suspect parking aid sensor, harness side and ground as follows:	**Yes** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation. **No** GO to C4 .

DTC	Rear Sensor	Connector-Pin	Circuit
C1699	LH outer	C4009-2	VMP15 (YE/GN)
C1702	RH outer	C4011-2	VMP17 (YE/OG)

C1705	LH inner	C4228-2	VMP14 (WH/OG)

- **Is any voltage present?**

C4 CHECK THE PARKING AID SENSORS	
• Install a known good parking aid sensor(s) for each of the suspect parking aid sensor(s). • Clear the DTCs. Repeat the self-test. • Test the system for normal operation. • **Is the concern still present?**	**Yes** If all of the parking aid sensors recorded DTCs, GO to C5 . If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.
C5 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTCs C1701, C1704 And C1707

Normal Operation

The Parking Aid Module (PAM) supplies a reference voltage and signal return to the parking aid sensors. Each of the parking aid sensors has an individual input signal to the PAM . When an object is present behind the vehicle, the PAM receives an input signal from the sensors and determines the distance of the object to the vehicle. A fault condition occurs when the PAM detects an open in the parking aid sensor circuits or the parking aid sensor input signal is shorted to ground.

The attenuation time for the rear parking aid sensors is the time required for a sensor to detect the distance to an object expressed in milliseconds (ms).

- DTC C1701 (Left Rear Sensor Circuit Fault) - a continuous and on-demand DTC that sets when the left rear parking aid sensor has internally failed or has an incorrect attenuation time.
- DTC C1704 (Right Rear Sensor Circuit Fault) - a continuous and on-demand DTC that sets when the right rear parking aid sensor has internally failed or has an incorrect attenuation time.
- DTC C1707 (Rear Center Sensor Circuit Fault) - a continuous and on-demand DTC that sets when the left rear center parking aid sensor has internally failed or has an incorrect attenuation time.

This pinpoint test is intended to diagnose the following:

- Dirty or obstructed parking aid sensor
- Parking aid sensor
- Parking aid bumper harness
- PAM

PINPOINT TEST D: DTCs C1701, C1704 AND C1707

Test Step	Result / Action to Take
D1 CHECK THE DTCs FROM THE PAM SELF-TESTS	
• Check the PAM DTCs from the continuous and on-demand self-tests. • **Are parking aid DTCs other than C1701, C1704 or C1707 recorded?**	**Yes** DIAGNOSE the other DTCs first. REFER to DTC Charts in this section. **No** GO to D2 .
D2 CHECK THE PARKING AID SENSOR OPERATION	
NOTE: Make sure the area around the vehicle is clear of anything that can activate the parking aid system. • Clean the rear bumper and sensors with high-pressure water. • Carry out the azimuth system check. Refer to Azimuth System Check in this section. • Carry out the elevation system check. Refer to Elevation System Check in this section. • **Does the parking aid system pass both system checks?**	**Yes** The system is operating correctly at this time. The concern may have been caused by a dirty or blocked parking aid sensor. CLEAR the DTCs. REPEAT the self-test. **No** GO to D3 .
D3 CHECK THE PARKING AID SENSOR DISTANCE PIDs	
• Make sure the suspect parking aid sensor(s) is flush-mounted in the bezel. • Ignition ON. • Enter the following diagnostic mode on the scan tool: PAM DataLogger. • With the brake pedal applied, shift the transmission into REVERSE (R) and monitor the parking aid sensor distance PID. The PID	**Yes** GO to D4 . **No** GO to D5 .

will read 255 cm (8.4 ft) on a correctly functioning sensor. • **Does the PID read 255 cm (8.4 ft)?**	
D4 CHECK THE PARKING AID SENSOR ATTENUATION PIDs	
• Check the parking aid sensor attenuation PIDs. • **Do the attenuation PIDs read between 0 and 16 ms?**	**Yes** GO to D6 . **No** GO to D5 .
D5 CHECK THE PARKING AID SENSORS	
• Install a new sensor for the suspect parking aid sensor. • Ignition ON. • Clear the DTCs. Repeat the self-test. Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** GO to D6 . **No** The cause of the concern was an inoperative parking aid sensor. The system is now operating correctly.
D6 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: DTC B1299

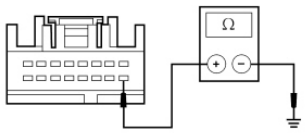
Refer to Wiring Diagrams Cell 131 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking Aid for schematic and connector information.

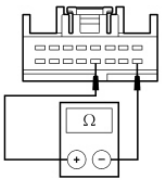
Normal Operation

The Parking Aid Module (PAM) supplies a reference voltage and signal return to the parking aid sensors. Each of the parking aid sensors has an individual input signal to the PAM . When an object is present behind the vehicle, the PAM receives an input signal from the sensors and determines the distance of the object to the vehicle. A fault condition occurs when the PAM detects a short to ground or signal return circuit on the parking aid sensor voltage circuit.

- DTC B1299 (Power Supply Sensor Circuit Short to Ground) - sets when the sensor power supply circuit is shorted to ground or to the signal return circuit.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness

- PAM

PINPOINT TEST E: DTC B1299

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 CHECK THE BUMPER WIRING HARNESS	
• Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion. • **Is the bumper wiring harness OK?**	**Yes** GO to E2 . **No** REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. TEST the system for normal operation.
E2 CHECK THE LH OUTER SENSOR FOR AN INTERNAL SHORT	
• Ignition OFF. • Disconnect: Parking Aid Sensor C4009. • Ignition ON. • Clear the DTCs. Repeat the on-demand self-test. • **Is DTC B1299 still present?**	**Yes** GO to E3 . **No** INSTALL a new LH outer parking aid sensor. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. TEST the system for normal operation.
E3 CHECK THE RH OUTER SENSOR FOR AN INTERNAL SHORT	
• Ignition OFF. • Disconnect: Parking Aid Sensor C4011. • Ignition ON. • Clear the DTCs. Repeat the on-demand self-test. • **Is DTC B1299 still present?**	**Yes** GO to E4 . **No** INSTALL a new RH outer parking aid sensor. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. TEST the system for normal operation.
E4 CHECK THE CENTER SENSOR FOR AN INTERNAL SHORT	
• Ignition OFF. • Disconnect: Parking Aid Sensor C4228. • Ignition ON. • Clear the DTCs. Repeat the on-demand self-test. • **Is DTC B1299 still present?**	**Yes** GO to E5 . **No** INSTALL a new center parking aid sensor. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. TEST the system for normal operation.
E5 CHECK PARKING AID SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO GROUND	

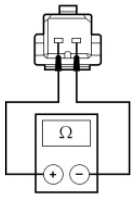
• Ignition OFF. • Disconnect: PAM C4014. • **NOTE:** The parking aid sensors should remain disconnected in this step. • Measure the resistance between the PAM C4014-9, circuit LMP07 (BU/WH), harness side and ground.  N0057381 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E6 . **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.
E6 CHECK THE PARKING AID SENSOR VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO THE PARKING AID SENSOR GROUND CIRCUIT	
• Ignition OFF. • Measure the resistance between the PAM C4014-9, circuit LMP07 (BU/WH), harness side and the PAM C4014-12, circuit RMP07 (GN/WH).  N0058809 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E7 . **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.
E7 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC C1742 or DTC C1743

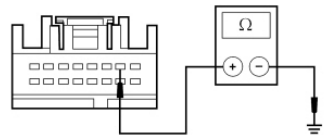
Refer to Wiring Diagrams Cell 131 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking Aid for schematic and connector information.

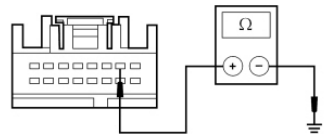
Normal Operation

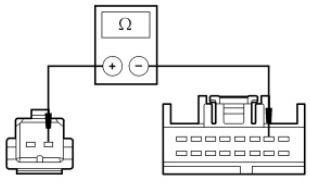
When the parking aid sensors detect obstructions in the path behind the vehicle a variable rate warning tone is generated from a parking aid speaker. The parking aid speaker increases the warning tone rate as the vehicle gets closer to an obstacle. A fault condition occurs when the PAM detects an open, short to ground or short to voltage on the parking aid speaker circuits.



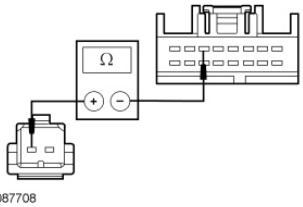
- DTC C1742 (Rear Sounder Circuit Failure) - sets when the sounder circuit is open or shorted to ground.
- DTC C1743 (Rear Sounder Circuit Short to Vbat) - sets when the sounder circuit is shorted to voltage.

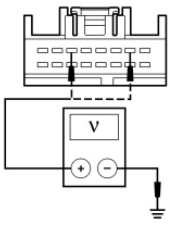






This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- PAM
- Parking aid speaker

PINPOINT TEST F: DTC C1742 OR DTC C1743

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 CHECK THE DTCs FROM THE PAM SELF-TESTS	
• Ignition ON. • Retrieve the PAM DTCs from the continuous and on-demand self-tests. • **Are parking aid DTCs other than C1742 or C1743 present?**	**Yes** Diagnose other DTCs first. REFER to DTC Charts in this section. **No** GO to F2 .
F2 MEASURE THE PARKING AID SPEAKER RESISTANCE	
• Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the parking aid speaker pin 1, component side and the parking aid speaker pin 2, component side.  A0084828 • **Is the resistance between 40 and 60 ohms?**	**Yes** If DTC C1742 was recorded, GO to F3 . If DTC C1743 was recorded, GO to F7 . **No** INSTALL a new parking aid speaker. REFER to Parking Aid Speaker in this section. CLEAR the DTCs. REPEAT the self-test.
F3 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND	

• Connect: Parking Aid Speaker C4015. • Disconnect: PAM C4014. • Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground.  A0087706 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F5 . **No** GO to F4 .
F4 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND WITH THE PARKING AID SPEAKER DISCONNECTED	
• Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground.  A0087706 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR circuit RMP09 (BU/GN). CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR circuit CMP09 (BN/BU). CLEAR the DTCs. TEST the system for normal operation.
F5 CHECK THE PARKING AID SPEAKER (+) CIRCUIT FOR AN OPEN	
• Disconnect: Parking Aid Speaker C4015. • Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and the parking aid speaker C4015-2, circuit CMP09 (BN/BU), harness side.  A0087707 • **Is the resistance less than 5 ohms?**	**Yes** GO to F6 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
F6 CHECK THE PARKING AID SPEAKER (-) CIRCUIT FOR AN OPEN	

• Measure the resistance between the PAM C4014-6, circuit RMP09 (BU/GN), harness side and the parking aid speaker C4015-1, circuit RMP09 (BU/GN), harness side.  A0087708 • **Is the resistance less than 5 ohms?**	**Yes** GO to F8 . **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.
F7 CHECK THE PARKING AID SPEAKER CIRCUITRY FOR SHORTS TO VOLTAGE	
• Ignition ON. • Measure the voltage between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground; and between the PAM C4014-6, circuit RMP09 (BU/GN), harness side and ground.  A0087727 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation. **No** GO to F8 .
F8 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. CLEAR the DTCs. REPEAT the self-test. CARRY OUT the scan tool data link test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTC U0140

Normal Operation

Several modules receive network messages from the Smart Junction Box (SJB) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- ♦ Ignition switch position

All modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0140 (Lost Communication With Body Control Module (GEM)) - set by the Parking Aid Module (PAM) when network messages are missing from the SJB for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Module communication
- PAM
- SJB

PINPOINT TEST G: DTC U0140

Test Step	Result / Action to Take
G1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to G2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
G2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the SJB pass the network test?**	**Yes** GO to G3 . **No** REFER to Section 418-00 .
G3 RECHECK THE PAM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the PAM self-test. • **Is DTC U0140 still present?**	**Yes** GO to G4 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
G4 CHECK FOR DTC U0140 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool:	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No**

Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 set in any module?**	INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation.

Pinpoint Test H: DTC U0155

Normal Operation

Several modules receive network messages from the Instrument Panel Cluster (IPC) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- ♦ Transmission gear selected
- ♦ Vehicle speed
- ♦ Parking aid disable switch status

All modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0155 (Lost Communication With Instrument Panel Cluster (IPC) Control Panel) - set by the Parking Aid Module (PAM) when network messages are missing from the IC for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Module communication
- PAM
- IPC

name="H">

PINPOINT TEST H: DTC U0155

Test Step	Result / Action to Take
H1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to H2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
H2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the IPC pass the network test?**	**Yes** GO to H3 . **No** REFER to Section 418-00 .
H3 RECHECK THE PAM DTCs	

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the PAM self-test. • **Is DTC U0155 still present?**	**Yes** GO to H4 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic.
H4 CHECK FOR DTC U0155 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155 set in any module?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation. **No** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation.

Pinpoint Test I: The Audio Volume Cutback Command Is Inoperative

Normal Operation

A variable rate warning tone is generated by the parking aid sounder. While the sounder is active, the sounder increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 46 cm (18 in) of the vehicle, the warning tone becomes continuous. A volume cutback request message is sent to the Audio Control Module (ACM) from the Parking Aid Module (PAM) over the Medium Speed Controller Area Network (MS-CAN) to decrease the volume of the ACM .

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAM
- ACM

PINPOINT TEST I: THE AUDIO VOLUME CUTBACK COMMAND IS INOPERATIVE

Test Step	Result / Action to Take
I1 VERIFY THE PAM COMMUNICATES WITH THE IC MESSAGE CENTER DISPLAY.	
• Apply the parking brake. • Ignition ON. • Apply the brake pedal and place the gear selector in REVERSE (R). • Disable/enable the parking aid system by pressing the reset button on the message center switch. • **Can the PAM be disabled/enabled in the IPC message center display?**	**Yes** GO to I3 . **No** GO to I2 .

I2 CHECK THE SCAN TOOL COMMUNICATION	
• **NOTE:** If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Carry out the network test using the scan tool. • **Does the ACM pass the network test?**	**Yes** GO to I3 . **No** REFER to Section 418-00 to diagnose network communication.
I3 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Parking Aid Module (PAM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time.

Parking Aid - Video

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2574-A	Flex Probe Kit 105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

NOTE: The Luggage Compartment lid must be closed for correct operation of the video camera system.

The rear video camera system is used to assist the driver while reversing or parking the vehicle. For vehicles without navigation, the image of the area behind the vehicle is displayed in the LH side of the auto-dimming interior mirror assembly. For vehicles with navigation, the image of the area behind the vehicle is displayed in the Front Display Interface Module (FDIM). A dashed line on the displayed image represents the center of the vehicle and 3 color-coded lines (red, yellow, green) identify different zones between the rear of the vehicle and objects.

NOTICE: **The color-coded lines may not indicate accurate or consistent distances between objects located be the vehicle and the rear of the vehicle. This normal condition is due to variances in vehicle ride height, including, but not limited to, vehicle loading.**

For vehicles without navigation, the signal from the rear video camera is sent to the auto-dimming interior mirror display on a pair of shielded video circuits. For vehicles with navigation, the signal from the rear video camera is sent to the FDIM on a pair of shielded video circuits. The displayed video image is horizontally inverted and is viewed from the video camera perspective to mimic a conventional mirror image. The rear video camera system is active with the ignition in RUN and the transmission selector in the REVERSE (R) position.

For vehicles without navigation, the system remains active for approximately 3 seconds after the transmission selector is moved from the REVERSE (R) position. The rear video camera system cannot be disabled during these conditions.

For vehicles with navigation, the video system has a delay feature that keeps the image displayed on the FDIM until the vehicle reaches 8km/h (5 mph) when the vehicle is shifted out of REVERSE (R). The operator has the ability to turn the delay feature on or off with the on screen options in the FDIM . The image is not displayed if the vehicle is shifted into PARK (P).

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Luggage Compartment lid and video camera	• Smart Junction Box (SJB) fuse(s): ♦ 41 (15A) (without navigation) ♦ 35 (10A) • Wiring, terminals and connectors • Video camera • Auto-dimming interior mirror (without navigation) • Front Display Interface Module (FDIM) (with navigation)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the fault is not visually evident, verify the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test J: The Rear Video Is Inoperative

Normal Operation

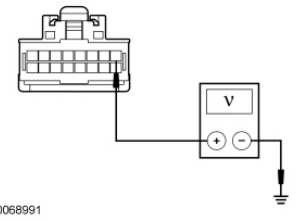
With the ignition switch in the RUN position, voltage is supplied to the rear video camera.

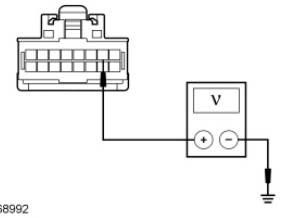
For vehicles without navigation, with the gear selector in REVERSE (R) position, a reverse voltage signal is sent to the auto-dimming interior mirror supplying power to the display in the mirror. The video camera signal is sent to the auto-dimming interior mirror. The video signal from the video camera displays an image on the LH side of the auto-dimming interior mirror.

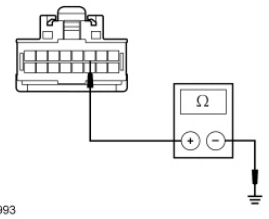
For vehicles with navigation, with the gear selector in the REVERSE (R) position, a reverse signal is sent from the IPC to the Audio Control Module (ACM) over the Medium Speed Controller Area Network (MS-CAN), enabling the system. The video signal from the video camera displays an image on the Front Display Interface Module (FDIM).

This pinpoint test is intended to diagnose the following:

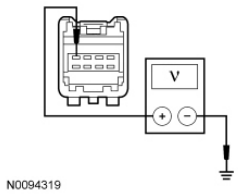
- Fuse
- Wiring, terminals or connectors
- Video camera

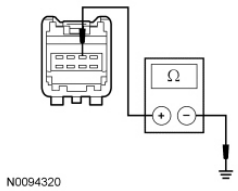




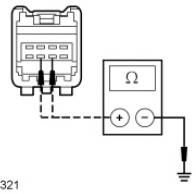


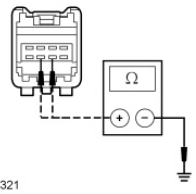
- Auto-dimming interior mirror (without navigation)
- FDIM (with navigation)

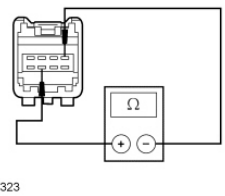




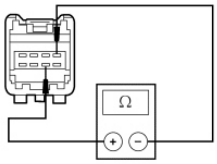
PINPOINT TEST J: THE REAR VIDEO IS INOPERATIVE

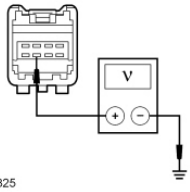


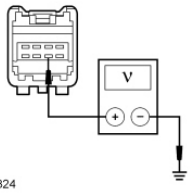




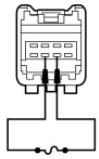
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**







NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .



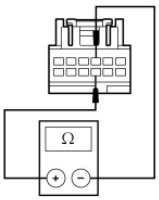
Test Step	Result / Action to Take
J1 VERIFY VEHICLE EQUIPMENT - NAVIGATION	
• **Is the vehicle equipped with navigation?**	**Yes** GO to J7 . **No** GO to J2 .
J2 CHECK THE REVERSING LAMPS OPERATION	
• Check the operation of the reversing lamps. • **Do the reversing lamps operate correctly?**	**Yes** GO to J3 . **No** REFER to Section 417-01 .
J3 CHECK FOR VIDEO CAMERA SIGNAL	
• Ignition OFF. • Apply the parking brake. • Ignition ON. • Select REVERSE. • Observe the auto-dimming interior mirror. • **Does the auto-dimming interior mirror momentarily display a blue screen?**	**Yes** GO to J9 . **No** GO to J4 .
J4 CHECK THE AUTO-DIMMING INTERIOR MIRROR VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror C9039. • Ignition ON. • Measure the voltage between the auto-dimming interior mirror C9039-1, circuit CBP41 (BU), harness side and ground.	**Yes** GO to J5 . **No** VERIFY the Smart Junction Box (SJB) fuse 41 (15A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. TEST the system for normal operation.

 N0068991 • **Is the voltage greater than 10 volts?**	
J5 CHECK THE AUTO-DIMMING INTERIOR MIRROR REVERSE INPUT CIRCUIT	
• Apply the parking brake. • Select REVERSE. • Measure the voltage between the auto-dimming interior mirror C9039-2, circuit CLS10 (GN/BN), harness side and ground.  N0068992 • **Is the voltage greater than 10 volts?**	**Yes** GO to J6 . **No** REPAIR the circuit. TEST the system for normal operation.
J6 CHECK THE AUTO-DIMMING INTERIOR MIRROR GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the auto-dimming interior mirror C9039-3, circuit GD139 (BK/YE), harness side and ground.  N0068993 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new auto-dimming interior mirror. REFER to Section 501-09 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
J7 VERIFY THE REVERSE SIGNAL INPUT	
• Apply the parking brake. • Ignition ON. • Select REVERSE. • Check the IPC message center PRNDL indicator. • **Does REVERSE (R) appear in the message center?**	**Yes** GO to J8 . **No** REFER to Section 307-01A , Section 307-01B or Section 307-01C to diagnose the PRNDL.

J8 CHECK THE FDIM DISPLAY	
• Select REVERSE. • Observe the FDIM display. • **Does the FDIM display "PLEASE CHECK SURROUNDINGS FOR SAFETY" at the top of the display screen?**	**Yes** GO to J9 . **No** INSTALL a new FDIM . REFER to Section 415-00 . TEST the system for normal operation.
J9 CHECK THE VIDEO CAMERA VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: Video Camera C4357. • Ignition ON. • Measure the voltage between the video camera C4357-1, circuit CBP35 (YE/GY), harness side and ground.  N0094319 • **Is the voltage greater than 10 volts?**	**Yes** GO to J10 . **No** VERIFY that the SJB fuse 35 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
J10 CHECK THE VIDEO CAMERA GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the video camera C4357-3, circuit GD171 (BK/GY), harness side and ground.  N0094320 • **Is the resistance less than 5 ohms?**	**Yes** GO to J11 . **No** REPAIR the circuit. TEST the system for normal operation.
J11 CHECK THE VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and ground and the video camera C4357-7, circuit RMP19 (BN/VT), harness side and ground.	**Yes** GO to J13 . **No** GO to J12 .

 N0094321 • **Are the resistances greater than 10,000 ohms?**	
J12 CHECK THE AUTO-DIMMING INTERIOR MIRROR (WITHOUT NAVIGATION) OR FDIM (WITH NAVIGATION) FOR AN INTERNAL SHORT	
• Disconnect: Auto-Dimming Interior Mirror C9039 (Without Navigation) or FDIM C2410 (With Navigation). • Measure the resistance between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and ground and the video camera C4357-7, circuit RMP19 (BN/VT), harness side and ground.  N0094321 • **Are the resistances greater than 10,000 ohms?**	**Yes** For vehicles without navigation, INSTALL a new auto-dimming interior mirror. REFER to Section 501-09 . For vehicles with navigation, INSTALL a new FDIM . REFER to Section 415-00 . TEST the system for normal operation. **No** REPAIR the circuit in question. TEST the system for normal operation.
J13 CHECK THE VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	
• Measure the resistance between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and the video camera C4357-4, circuit DMP19 (BK), harness side.  N0094323 • Measure the resistance between the video camera C4357-7, circuit RMP19 (BN/VT), harness side and the video camera C4357-4, circuit DMP19 (BK), harness side.	**Yes** GO to J14 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 N0094322 • **Is the resistance greater than 10,000 ohms?**	
J14 CHECK THE VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect: Negative Battery Cable. • Ignition ON. • Measure the voltage between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and ground.  N0094325 • Measure the voltage between the video camera C4357-7, circuit RMP19 (BN/VT), harness side and ground.  N0094324 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to J15 .
J15 CHECK VIDEO SIGNAL CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror (Without Navigation) C9039. • Disconnect: FDIM C2410 (With Navigation) . • Connect a fused jumper wire between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and the video camera C4357-7, circuit RMP19 (BN/VT), harness side.	**Yes** REMOVE the jumper wire. CARRY OUT the video camera component test. If the camera is inoperative, INSTALL a new video camera. REFER to Video Camera in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to J16 .



N0094326

- For vehicles without navigation, measure the resistance between the auto-dimming interior mirror C9039-8, circuit VMP19 (WH/GN), harness side and the auto-dimming interior mirror C9039-16, circuit RMP19 (BN/VT), harness side.

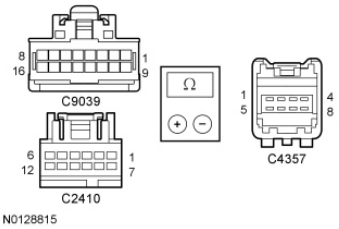
N0069002

- For vehicles with navigation, measure the resistance between the FDIM C2410-3, circuit VMP19 (WH/GN), harness side and the FDIM C2410-9, circuit RMP19 (BN/VT), harness side.

N0082111

- **Are the resistances less than 5 ohms?**

J16 CHECK VIDEO SIGNAL CIRCUIT (+) FOR AN OPEN



- Measure the resistance between the auto-dimming interior mirror (without navigation) or the FDIM (with navigation), harness side and the video camera, harness side.

Vehicle	Positive Meter Lead	Negative Meter Lead	Circuit
Fusion (without navigation)	C9039-8	C4357-6	VMP19 (WH/GN)
Fusion (with navigation)	C2410-3	C4357-6	VMP19 (WH/GN)

Yes
REPAIR circuit RMP19 (BN/VT).
TEST the system for normal operation.

No
REPAIR circuit VMP19 (WH/GN).
TEST the system for normal operation.

MKZ	C2410-3	C4357-6	VMP19 (WH/GN)

- **Is the resistance less than 5 ohms?**

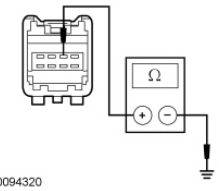
Pinpoint Test K: Poor Image Quality

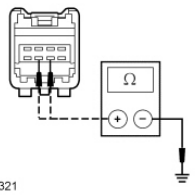
Normal Operation

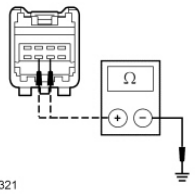
For vehicles without navigation, with the gear selector in REVERSE (R) position, a reverse voltage signal is sent to the auto-dimming interior mirror supplying power to the display in the mirror. The video camera signal is sent to the auto-dimming interior mirror. The video signal from the video camera displays an image on the LH side of the auto-dimming interior mirror.

For vehicles with navigation, with the gear selector in the REVERSE (R) position, a reverse signal is sent from the IPC to the Audio Control Module (ACM) over the Medium Speed Controller Area Network (MS-CAN), enabling the system. The video signal from the video camera displays an image on the Front Display Interface Module (FDIM).

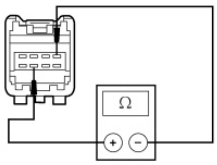
Poor image quality may be due to a loose ground or shield circuit in the camera wiring.

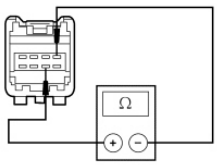


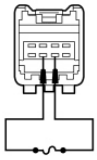




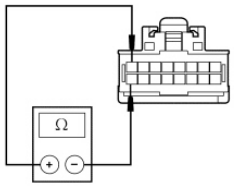
This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Video camera



PINPOINT TEST K: POOR IMAGE QUALITY

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

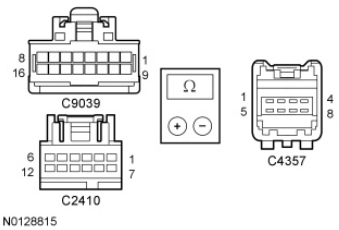
Test Step	Result / Action to Take
K1 CHECK THE VIDEO CAMERA GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the video camera C4357-3, circuit GD171 (BK/GY), harness side and ground.	**Yes** GO to K2 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0094320 • **Is the resistance less than 5 ohms?**	
K2 CHECK THE VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and ground and the video camera C4357-7, circuit RMP19 (BN/VT), harness side and ground.  N0094321 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to K4 . **No** GO to K3 .
K3 CHECK THE AUTO-DIMMING INTERIOR MIRROR (WITHOUT NAVIGATION) OR FDIM (WITH NAVIGATION) FOR AN INTERNAL SHORT	
• Disconnect: Auto-Dimming Interior Mirror C9039 (Without Navigation) or FDIM C2410 (With Navigation). • Measure the resistance between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and ground and the video camera C4357-7, circuit RMP19 (BN/VT), harness side and ground.  N0094321 • **Are the resistances greater than 10,000 ohms?**	**Yes** For vehicles without navigation, INSTALL a new auto-dimming interior mirror. REFER to Section 501-09 . For vehicles with navigation, INSTALL a new FDIM . REFER to Section 415-00 . TEST the system for normal operation. **No** REPAIR the circuit in question. TEST the system for normal operation.
K4 CHECK THE VIDEO CAMERA VIDEO SIGNAL CIRCUITS FOR A SHORT TO VIDEO SHIELD	

• Measure the resistance between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and the video camera C4357-4, circuit DMP19 (BK), harness side.  N0094323 • Measure the resistance between the video camera C4357-7, circuit RMP19 (BN/VT), harness side and the video camera C4357-4, circuit DMP19 (BK), harness side.  N0094322 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to K5 . **No** REPAIR the circuit in question. TEST the system for normal operation.
K5 CHECK VIDEO SIGNAL CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror (Without Navigation) C9039. • Disconnect: FDIM C2410 (With Navigation) . • Connect a fused jumper wire between the video camera C4357-6, circuit VMP19 (WH/GN), harness side and the video camera C4357-7, circuit RMP19 (BN/VT), harness side.  N0094326 • For vehicles without navigation, measure the resistance between the auto-dimming interior mirror C9039-8, circuit VMP19 (WH/GN), harness side and the auto-dimming interior mirror C9039-16, circuit RMP19 (BN/VT), harness side.	**Yes** REMOVE the jumper wire. CARRY OUT the video camera component test. If the camera is inoperative, INSTALL a new video camera. REFER to Video Camera in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. GO to K6 .

N0069002

- For vehicles with navigation, measure the resistance between the FDIM C2410-3, circuit VMP19 (WH/GN), harness side and the FDIM C2410-9, circuit RMP19 (BN/VT), harness side.



N0082111

- **Are the resistances less than 5 ohms?**

K6 CHECK VIDEO SIGNAL CIRCUIT (+) FOR AN OPEN

- Measure the resistance between the auto-dimming interior mirror (without navigation) or the FDIM (with navigation), harness side and the video camera, harness side.

Vehicle	Positive Meter Lead	Negative Meter Lead	Circuit
Fusion (without navigation)	C9039-8	C4357-6	VMP19 (WH/GN)
Fusion (with navigation)	C2410-3	C4357-6	VMP19 (WH/GN)
MKZ	C2410-3	C4357-6	VMP19 (WH/GN)

N0128815

- **Is the resistance less than 5 ohms?**

Yes
REPAIR circuit RMP19 (BN/VT). TEST the system for normal operation.

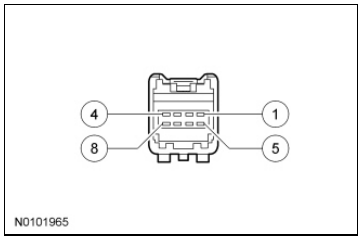
No
REPAIR circuit VMP19 (WH/GN). TEST the system for normal operation.

Pinpoint Test L: The Rear Video Mirror Display Is Always On (Vehicles Without Navigation)

Normal Operation

The video camera receives a supply voltage, with the ignition switch in the RUN position. When the gear selector is in the REVERSE (R) position, a reverse voltage signal is sent to the auto-dimming interior mirror supplying power to the display in the mirror. The video camera signal is sent to the auto-dimming interior mirror. The video signal from the video camera displays an image on the LH side of the auto-dimming interior mirror.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Auto-dimming interior mirror

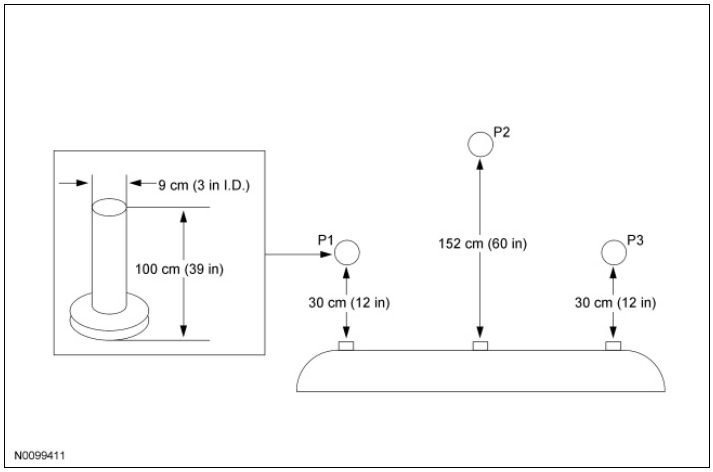
PINPOINT TEST L: THE REAR VIDEO MIRROR DISPLAY ALWAYS ON (VEHICLES WITHOUT NAVIGATION)

Test Step	Result / Action to Take
L1 CHECK THE REVERSING LAMPS OPERATION	
• Check the operation of the reversing lamps • **Do the reversing lamps operate correctly?**	**Yes** GO to X2 . **No** REFER to Section 417-01 .
L2 CHECK FOR CORRECT AUTO-DIMMING INTERIOR MIRROR OPERATION	
• Disconnect the auto-dimming interior mirror connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the auto-dimming interior mirror connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new auto-dimming interior mirror. REFER to Section 501-09 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Component Test - Video Camera

Fusion/MKZ

Measure the resistance between the video camera pins, component side, as follows:



Video Camera Pins	Resistance		
3 and 6	38-49 ohms	3 and 7	39-48 ohms
6 and 7	74-101 ohms		
4 and 6	38-49 ohms		

If the resistance values for the video camera are within the specifications listed, the video camera is functional at this time.

If the resistance values for the video camera are not within the specifications listed, the video camera is inoperative at this time. Install a new video camera. Refer to Video Camera in this section. Test the system for normal operation.

Azimuth System Check

Minimum Detectable Object Locations

NOTE: The object used in this system check can be fabricated from 9 cm O.D. (3 in I.D) plastic pipe 100 cm (39 in) in length (available as Polyvinyl Chloride (PVC) pipe, or similar from a hardware or plumbing supply).

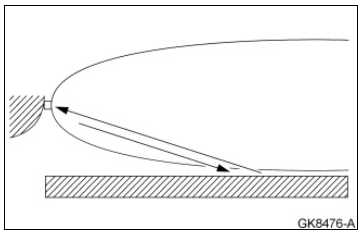
NOTE: The following Parking Aid Module (PAM) system check should be carried out with the vehicle on a level surface. The specified object locations are approximate, not absolute.

NOTE: The parking aid system will default to on when the ignition key is cycled from off to on.

NOTE: The scan tool may be used to monitor distance PIDs. The distance PIDs read between 0 and 255 cm (0 and 8 ft) on a correctly functioning system.

1. Turn the ignition to the ON position, engine off.

2. Set the parking brake on.



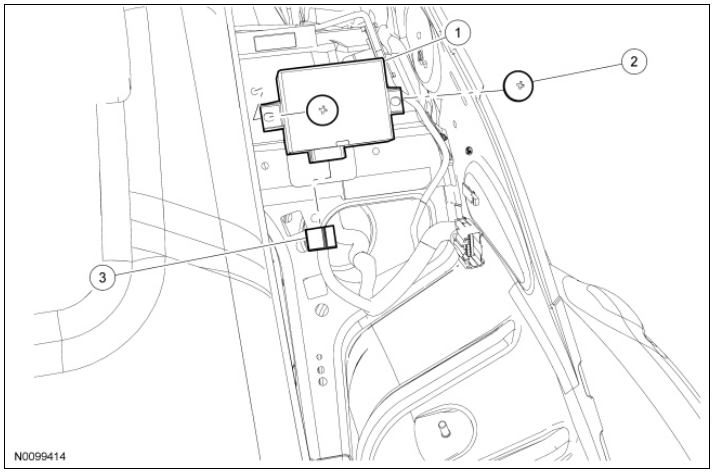
3. Place the gear shift in REVERSE (R).

4. Verify that the parking aid system detects the specified object when placed within the 3 specified locations (P1, P2, P3). The pipe should be inside of these locations.
   - The speaker should beep slowly when objects are detected on the outer edges of the detection zone, and increase as the object is moved closer to the vehicle.
     When the object is within 25 cm (10 in) of the rear bumper, the sounder should be on continuously.
   - If the Parking Aid Module (PAM) does not detect the object above, refer to Parking Aid in the Diagnosis and Testing portion of this section.

Elevation System Check

1. **NOTE:** The following system check should be carried out with the vehicle on a 3.0 m wide by 4.5 m deep (10 ft wide by 15 ft deep) smooth concrete surface, free of all obstacles and noise from fan and pneumatic tools.

   Turn the ignition to the ON position, engine off.



2. Set the parking brake.

3. Place the gear shift in REVERSE (R).

4. Verify that no audible alerts are heard. If audible alerts are heard, check to make sure the bumper is correctly installed and is not tilted downward so that the sensor is pointing at the ground.
   - If the audible warning tone is heard, refer to Parking Aid in the Diagnosis and Testing portion of this section.

Parking Aid Module (PAM)

Item	Part Number	Description
1	15K866	Parking Aid Module (PAM)
2	W706350	PAM screws (2 required)
3	-	PAM electrical connectors (part of 13A412)

Removal and Installation

1. **NOTE:** Module configuration is only required if a new Parking Aid Module (PAM) is being installed.

   Upload the PAM configuration information to the scan tool. For additional information, refer to PMI in Section 418-01 .

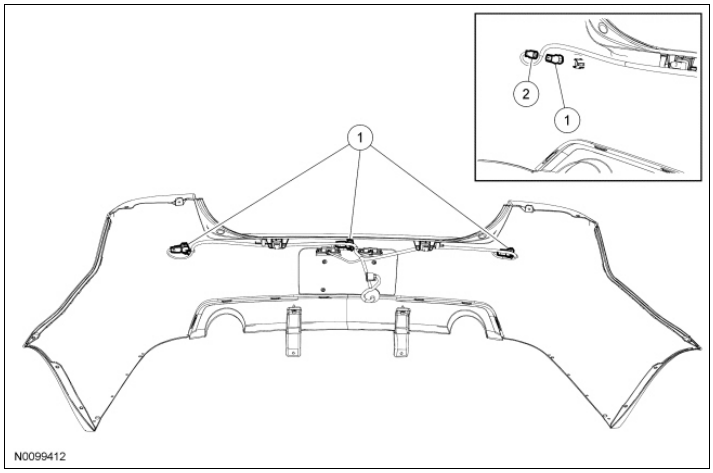
2. Remove the LH rear seat bolster. For additional information, refer to Section 501-10 .

3. Remove the 2 screws and the PAM .
   - Disconnect the electrical connectors.

4. To install, reverse the removal procedure.
   - Download the PAM configuration information. For additional information, refer to Section 418-01 .

Parking Aid Speaker

Item	Part Number	Description
1	W713167	Parking aid speaker push pins (2 required)
2	15K864	Parking aid speaker
3	-	Parking aid speaker electrical connector (part of 13A412)



Removal and Installation

1. Remove the parcel shelf. For additional information, refer to Section 501-05 .

2. Remove the 2 push pins and the parking aid speaker.
   - Disconnect the electrical connector.

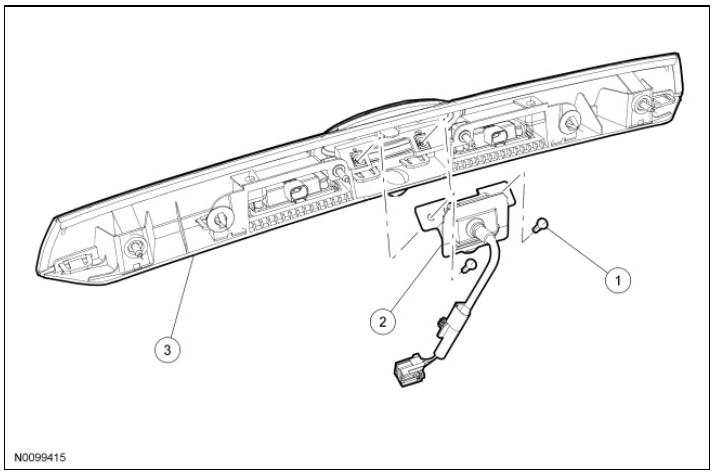
3. To install, reverse the removal procedure.

Parking Aid Sensor

Item	Part Number	Description
1	15K859	Parking aid sensor(s)
2	-	Parking aid sensor electrical connectors (part of 14N139)

Removal and Installation

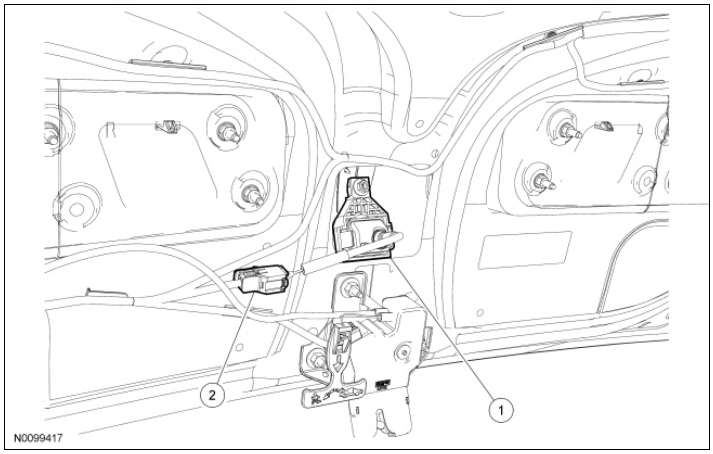
1. Remove the rear bumper cover. For additional information, refer to Section 501-19 .



2. Disconnect the parking aid sensor(s) electrical connector(s).

3. Pry the retaining tabs with a suitable tool, such as a flat bladed screwdriver and remove the parking aid sensor(s).

4. To install, reverse the removal procedure.
   - Carry out the azimuth and elevation system check. For additional information, refer to Azimuth System Check and Elevation System Check in this section.



Video Camera

Fusion

Item	Part Number	Description
1	W506842	Video camera screws (2 required)
2	19G490	Video camera
3	-	Luggage compartment lid applique

MKZ

Item	Part Number	Description
1	19G490	Video camera
2	-	Video camera electrical connector (part of 13A412)

Removal and Installation

All vehicles

1. Remove the liftgate trim panel. For additional information, refer to Section 501-08 .
    - Position the water shield aside.

Fusion

2. Remove the luggage compartment lid panel applique. For additional information, refer to Section 501-08 .
    - Disconnect the electrical connector.

3. Remove the 2 screws and the video camera and bracket assembly.

MK

4. Remove the video camera by prying on the two outer retaining tabs with a suitable tool, such as a flat bladed screwdriver.
    - Disconnect the electrical connector.

All vehicles

5. To install, reverse the removal procedure.

Material

Item	Specification	Fill Capacity
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-

General Specifications

Item	Specification
Generator - 2.5L	
Generator pulley ratio	2.45:1
Rating	90 amps @ 700 rpm (min) to 150 amps @ 2,500 rpm (max)

Generator upper air duct screws (2.5L)	4	-	35
Radial arm adapter nut	9	-	80

RH wheel splash shield screws	8	-	71

Charging System

The charging system is a negative ground system consisting of:

- a generator with an internal voltage regulator.
- a charging system warning indicator.
- a battery.
- circuitry and cables.
- a PCM.
- a radial arm adapter (if equipped, serviceable separately from the generator)

The generator is driven by the accessory drive belt. When the engine is started, the generator begins to generate AC which is internally converted to DC. The DC is controlled by the voltage regulator (located on the rear of the generator) and supplied to the battery. The PCM controls the voltage regulation set point, working with the generator internal voltage regulator over 2 control and communication circuits.

Principles of Operation

The PCM-controlled charging system, or "Smart Charge" charging system, determines the optimal voltage set point for the charging system and communicates this information to the voltage regulator. The "Smart Charge" charging system is designed to set 1 of 6 DTCs any time a charging system fault is present. All of the DTCs can set continuous faults, but not all DTCs will set as on-demand faults.

DTC	KOEO	KOER	Continuous
P0562	X	X	X
P0563		X [a]	X [a]
P0620			X
P0625		X	X
P0626		X	X
P065B			X

[a] Requires vehicle speed above 8 mph.

This system uses 2 communication lines between the PCM and the generator/voltage regulator. Both of these communication lines use Pulse-Width Modulation (PWM). The generator communication (GENCOM) line communicates the desired set point from the PCM to the voltage regulator. The generator monitor (GENMON) line communicates the generator load and error conditions to the PCM. The GENCOM command is only sent by the PCM when it is necessary to adjust the voltage set point. If the set point does not need to be changed, several seconds may elapse between PCM GENCOM commands. This normal operation will appear in the PID as occasional "bursts" of pulse-width commands. The third pin on the voltage regulator, the A circuit pin, is a circuit dedicated to monitor or sense battery voltage.

The PCM simultaneously controls and monitors the output of the generator. When the current consumption is high or the battery is discharged, the PCM will raise engine speed as needed to increase generator output. The generator charges the battery and at the same time supplies power for all of the electrical loads that are required. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm. The PCM is able to adjust the charging voltage according to the battery temperature by using a signal from the Intake Air Temperature (IAT) sensor. The PCM also uses other inputs to control charging system voltage such as the Vehicle Speed Sensor (VSS) and Engine Coolant Temperature (ECT). The voltage set point is calculated by the PCM and communicated to the voltage regulator by the GENCOM circuit based on the needs of the vehicle and the conditions.

The PCM turns off the generator during cranking to reduce the generator load and improve cranking speed. Once the engine starts, the PCM slowly increases generator output to desired voltage.

The PCM controls the charging system warning indicator by sending a message over the High Speed Controller Area Network (HS-CAN) to the Instrument Cluster (IC) or Instrument Panel Cluster (IPC). The IC / IPC will then control charging system warning indication based on the message from the PCM. The status of the PCM charging system warning indicator and/or message can be confirmed by viewing PCM PID generator fault indicator lamp (GENFIL). Any charging system fault detected by the PCM will result in 1 or more DTCs being set and the PID GENFIL having a status of On. If equipped with a charging system warning indicator, the IC / IPC will turn the indicator ON or OFF. If equipped with a message center, the IC / IPC will

display a CHECK CHARGING SYSTEM message. When the ignition is ON and the engine is OFF on vehicles equipped with a message center, the CHECK CHARGING SYSTEM message may not be displayed. For information regarding the IC / IPC and message center, refer to Section 413-01 .

Under certain circumstances, the charging system may have a concern, but will still keep the battery charged and the vehicle running. GENCOM is normally used to initiate charging, but the generator may charge with a fault in this circuit. If the engine is operated at greater than 2,000 rpm momentarily, the generator may "self-excite" or start charging on its own. The charging system warning indicator is illuminated and/or CHECK CHARGING SYSTEM message is displayed, and the generator operates in a default mode (approximately 13.5 volts) until the engine is turned off. When the engine is restarted and the engine is operated at greater than 2,000 rpm momentarily, the generator may again self-excite and again the charging system warning indicator is illuminated and/or CHECK CHARGING SYSTEM message is displayed.

The PIDs and their associated descriptions used in the charging system diagnosis are listed below:

PID Chart

PID	Description	Normal Display	Associated Circuit Name	Connector, Circuit
GENMON	Generator Monitor	Constant fluctuating percentage 3%-98%	Generator monitor (GENMON)	C102A-1, CDC15 (VT)
GENCMD	Generator Command	Fluctuating percentage or small intermittent bursts 3%-98%	Generator communication (GENCOM)	C102A-2, CDC10 (BU/OG)
GENVDSD	Generator Voltage Desired	Voltage varies by vehicle needs - May be controlled by an output state control	-	-
GENFIL	Generator Fault Indicator Lamp	OFF if charging system is OK	-	-
GENCMD_LF	Generator Command Line Fault	NO FAULT if GENCOM circuit (GENCMD PID) is OK	-	-
GENMON_HZ	Generator Monitor Frequency	Frequency value	-	-
VPWR	Module Supply Voltage	Within 0.5 volt of battery voltage	-	-
RPM	Engine Revolutions Per Minute	Engine rpm - May be controlled by an output state control	-	-

Inspection And Verification

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

⚠ WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

NOTICE: **Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals or fuses.**

NOTICE: **Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.**

NOTE: While carrying out any pinpoint test, disregard any DTCs set while following a specific pinpoint test. After the completion of a test, be sure to clear all DTCs in the PCM.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Front End Accessory Drive (FEAD) belt • Generator pulley	• Wiring, terminals or connectors • Cables • Battery • Generator • Fuses

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. Verify the battery condition. Refer to Section 414-01 .

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
     - The air bag warning indicator prove-out (other indicators may NOT prove ignition is on) confirms ignition on. If ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
   - refer to Section 418-00 , Inspection and Verification, to establish a scan tool session (without the ignition on).
   - verify the scan tool operation with a known good vehicle.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .

NOTE: Use the Integrated Diagnostic System (IDS) feature that retrieves all Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules at one time.

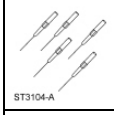
9. Retrieve CMDTCs from all modules.

10. **NOTE:** If no charging system DTCs are present, the charging system is operating correctly. If the charging system has a concern, it usually sets a charging system DTC.

    If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Master DTC Chart in Section 419-10 or Powertrain Control/Emissions Diagnosis (PC/ED) manual.

11. If no DTCs related to the concern are retrieved, go to the Symptom Chart in this section.

Diagnostic Trouble Code (DTC) Chart



DTCs	Description	Source	Action

Pinpoint Test

Special Tool(s)

 ST3104-A	Backprobe Pins POM 6411
 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST3094-A	Test Light SGT27000 or equivalent 250-350 mA incandescent bulb test lamp SGT27000
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Pinpoint Test A: System Voltage High

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

NOTE: DTC P0563, B1317 or B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged. The battery may become discharged due to excessive load(s) on the charging system from aftermarket accessories or if vehicle accessories have been operating for an extended period of time without the engine running.

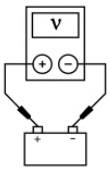
Normal Operation

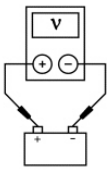
With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The voltage that is supplied to the vehicle electrical system is used for the operation of the various vehicle systems and modules. Many modules monitor this voltage and if it rises above their calibrated set point, a DTC will be set.

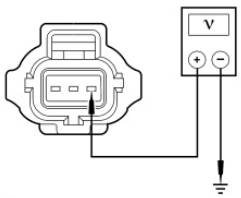
- DTC P0563 (System Voltage High) - If the PCM detects a voltage from the charging system higher than 15.2 volts with vehicle speed above 8 km/h (5 mph), this DTC will be set.

This pinpoint test is intended to diagnose the following:

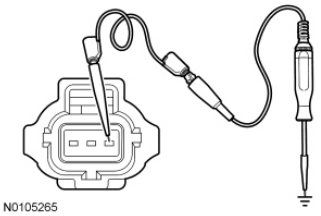
- Fuse
- Wiring, terminals or connectors
- Engine, generator and battery grounds
- Battery

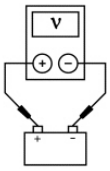


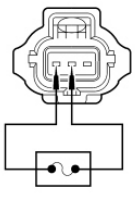




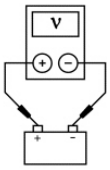
- Generator
- PCM



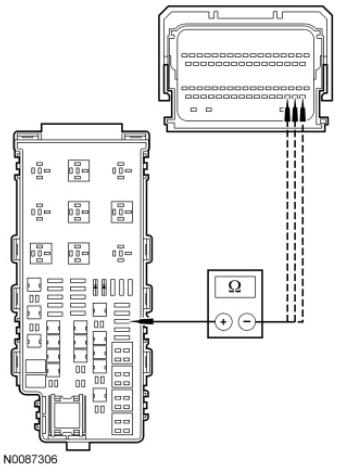


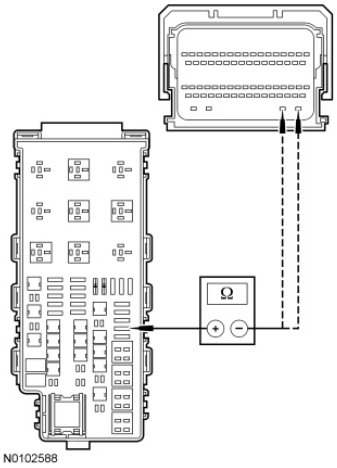


PINPOINT TEST A: SYSTEM VOLTAGE HIGH



NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.





NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
A1 CHECK BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to A2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A2 CHECK FOR DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: Self Test - PCM. • **Is DTC P0620, P0625, P0626 or P065B present?**	**Yes** REFER to the DTC Chart in this section for the correct pinpoint test and DIAGNOSE those DTCs first. **No** GO to A3 .
A3 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD)	
• Start the engine. • **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test. • Select and monitor the following PCM PIDs: ♦ Generator Monitor (GENMON) ♦ Generator Command (GENCMD) ♦ Generator Voltage Desired (GENVDSD) ♦ Module Supply Voltage (VPWR) • Monitor the GENVDSD PID. • **Does the GENVDSD PID indicate 15.1 volts or less?**	**Yes** GO to A4 . **No** GO to A11 .
A4 MONITOR PCM PID GENERATOR VOLTAGE DESIRED (GENVDSD)	
• With the engine still running at idle, measure battery voltage and record.	**Yes** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent

 AJ0210-A • Monitor the GENVDSD PID. • **Is battery voltage within ±0.6 volt of the PID GENVDSD?**	terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A5 .
A5 MEASURE THE SENSE VOLTAGE	
• Ignition OFF. • Disconnect: Generator C102A. • Ignition ON. • Measure battery voltage and record.  AJ0210-A • Measure the voltage between generator C102A-3, circuit SBB17 (RD), harness side and ground.  N0105264 • **Is the A sense voltage equal to battery voltage?**	**Yes** GO to A6 . **No** VERIFY Battery Junction Box (BJB) fuse 17 (10A) is OK. If OK, REPAIR circuit SBB17 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A6 A SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be	**Yes** GO to A7 . **No** REPAIR resistance due to corroded or loose connection on circuit SBB17 (RD). INSPECT generator C102A-3, circuit SBB17 (RD) for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

loaded properly using an LED-style test lamp. • Using a 12-volt test lamp connected to ground, check for voltage at generator C102A-3, circuit SBB17 (RD), harness side.  N0105265 • **Does the test lamp illuminate?**	
A7 CHECK THE GENERATOR OUTPUT	
• Start the engine. • Increase engine rpm until generator starts to generate output. • With the engine running, measure battery voltage and record.  AJ0210-A • **Is the voltage above 14.5 volts?**	**Yes** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A8 .
A8 MONITOR PCM PIDs GENERATOR COMMAND (GENCMD), GENERATOR MONITOR (GENMON) AND GENERATOR VOLTAGE DESGENVDSD)	
• Ignition OFF. • Connect a fused jumper wire between generator C102A-1, CDC15 (VT), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine.	**Yes** GO to A9 . **No** INSTALL a new PCM. REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L engines or Section 303-14C for 3.5L engines. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• Monitor the GENVDSD, GENMON and GENCMD PIDs. • Using the active command, set GENVDSD PID to 14 volts. • **Does the GENCMD PID read within 5% of GENMON PID?**	
A9 COMPARE PCM SUPPLY VOLTAGE (VPWR) PID TO BATTERY VOLTAGE	
• With the engine still running at idle, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does PCM VPWR PID accurately display battery voltage within ±0.5 volt?**	**Yes** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A10 .
A10 CHECK PCM SUPPLY VOLTAGE CIRCUITS	
• Ignition OFF. • Disconnect: Fused Jumper Wire. • Disconnect: PCM C175B (2.5L and 3.0L). • Disconnect: PCM C175E (3.5L). • For 2.5L and 3.0L vehicles, inspect the connector pins for damage. Measure resistance between BJB fuse 47 (15A), output side and: ♦ PCM C175B-51, circuit CBB47 (GN/BU), harness side. ♦ PCM C175B-52, circuit CBB47 (GN/BU), harness side. ♦ PCM C175B-53, circuit CBB47 (GN/BU), harness side.	**Yes** GO to A11 . **No** REPAIR high resistance or loose connections in the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0087306 • For 3.5L engines, measure the resistance between BJB Fuse 47 (15A) output side and: ♦ PCM C175E-67, circuit CBB46 (WH/BU) hness side. ♦ PCM C175E-68, circuit CBB46 (WH/BU) harness side.  N0102588 • **Are the resistances less than 0.5 ohm?**	
A11 CHECK FOR CORRECT PCM OPERATION	
• Ignition OFF. • Check the PCM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the PCM and generator, make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L engines or Section 303-14C for 3.5L engines. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

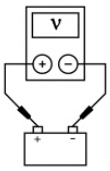
Pinpoint Test B: System Voltage Low or Battery is Discharged

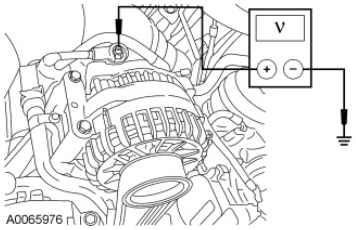
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

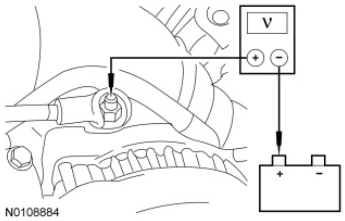
With the engine running, the charging system supplies voltage to the battery and the vehicle electrical system through the battery B+ cable. The PCM monitors this voltage through the battery positive post through the Battery Junction Box (BJB). If this voltage drops 1.5 volts or more below the generator voltage desired, this DTC will be set after 30 seconds.

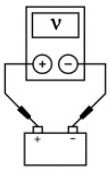
- DTC P0562 (System Voltage Low) - If the PCM detects a voltage from the charging system that is 1.5 volts lower than the generator voltage desired, this DTC will be set.

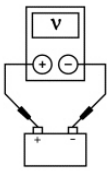




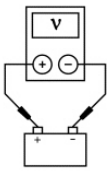
This pinpoint test is intended to diagnose the following:
- Fusible link
- Wiring, terminals or connectors
- Radial arm adapter
- Battery
- Generator
- PCM

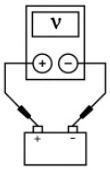






PINPOINT TEST B: SYSTEM VOLTAGE LOW OR BATTERY IS DISCHARGED





NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
B1 CHECK FOR OTHER PCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - PCM. • **Is DTC P0620, P0625, P0626 or P065B present?**	**Yes** REFER to the DTC Chart in this section for the correct pinpoint test and DIAGNOSE those DTCs first. **No** GO to B2 .
B2 CHECK BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to B3 . **No** INSTALL a new battery. REFER to Section 414-01 . TEST the system for normal operation.
B3 CHECK THE GENERATOR CONNECTIONS	

• Ignition OFF. • Inspect generator C102A connection. Connector should be installed correctly and tight. • Disconnect: Generator C102A. • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C102B, B+ circuit SDC14 (RD) and radial arm adapter connection(s). Connection should be tight. • Measure the battery voltage.  AJ0210-A • Measure the voltage between generator C102B, B+ circuit SDC14 (RD) and ground.  A0065976 • **Are the generator C102B and radial arm adapter connections tight and does the generator B+ measure battery voltage?**	**Yes** GO to B4 . **No** TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B4 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	
• Connect: Generator C102A. • Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C102B, circuit SDC14 (RD) and the positive battery terminal.	**Yes** GO to B5 . **No** INSPECT circuit SDC14 (RD), radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion. REPAIR as required. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0108884 • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	
B5 COMPARE PCM MODULE SUPPLY VOLTAGE (VPWR) PID	
• With the engine still running at idle, headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does PCM VPWR PID display battery voltage within ±0.5 volt?**	**Yes** GO to B6 . **No** REPAIR high resistance or loose connections in the affected PCM power circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B6 CHECK PCM GROUND FOR HIGH RESISTANCE	
• Monitor PCM VPWR PID. • With the engine still running at idle, turn off all accessory loads, measure the battery voltage at the battery and note the PCM VPWR PID.  AJ0210-A • With the engine still running at idle, turn headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.	**Yes b> GO to B7 .** **No** **REPAIR the affected PCM ground circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.**

 AJ0210-A • **Does the VPWR PID read within ±0.5 volt with accessory loads on as compared to accessory loads off?**	
B7 MONITOR PID VPWR AT WOT	
• With the engine still running at idle, turn off all accessory loads, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • Monitor the VPWR PID and momentarily accelerate the engine to Wide Open Throttle (WOT) and release. Repeat this step 4-5 times while continuing to monitor the VPWR PID. • **Does the VPWR PID stay within 0.5 volt of battery voltage when the engine rpms are increased?**	**Yes** GO to B8 . **No** INSTALL a new PCM. REFER to Section 303-14A for 2.5L, Section 303-14B for 3.0L and Section 303-14C for 3.5L engines.
B8 CHECK FOR DISCHARGED BATTERY	
• With the engine still running at idle, measure the battery voltage at the battery. • Monitor PCM PIDs generator voltage desired (GENVDSD) and generator monitor (GENMON). • **Does GENMON PID frequently rise above 90% and battery voltage drop below GENVDSD PID by 0.5 volt or more?**	**Yes** CARRY OUT the Component Test, Battery - Drain Test. REFER to Section 414-01 . **No** VERIFY BJB fuse 17 (10A) is OK. If OK, REPAIR circuit SBB17 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: DTC P0620

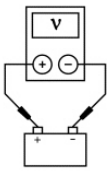
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

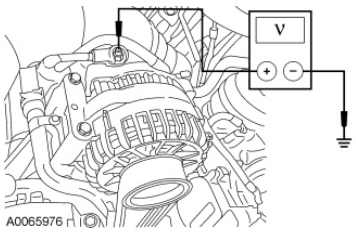
Normal Operation

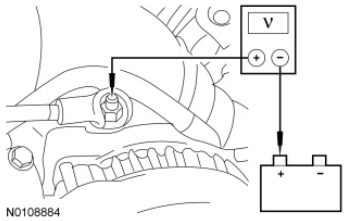
The PCM monitors the generator output via the GENMON circuit. The PCM uses the GENCOM circuit to command the generator to either increase or decrease output. If the GENCOM circuit (generator control circuit) or the A sense circuit are open or shorted to ground, the PCM will be unable to control the generator output. When the engine speed rises above approximately 2,000 rpm, the generator will default to a steady voltage output of approximately 13.5 volts and the PCM will send a request to the Instrument Cluster (IC) to illuminate the charging system warning indicator. A GENCOM circuit fault can be confirmed by viewing the PCM PID generator command line fault (GENCMD_LF) (YES status indicator fault).

- DTC P0620 (Generator Control Circuit) - If the GENCOM circuit or A sense circuit are open or shorted to ground, the PCM will set this DTC.

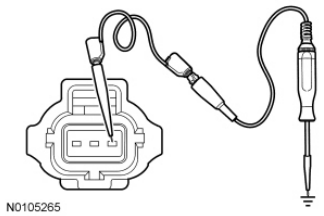
This pinpoint test is intended to diagnose the following:



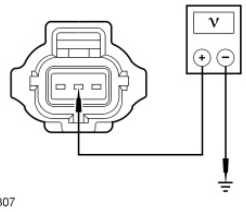


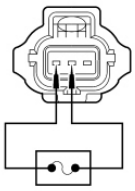


- Fuse
- Wiring, terminals or connectors
- Radial arm adapter
- Generator
- PCM

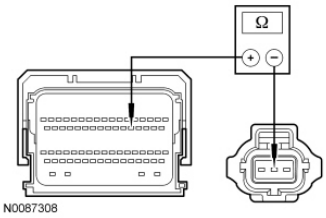


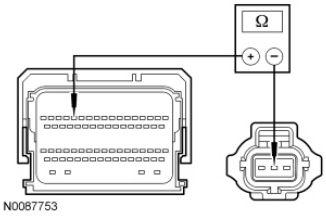
PINPOINT TEST C: DTC P0620

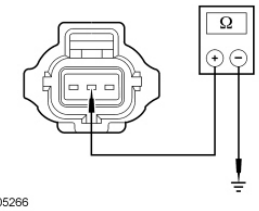




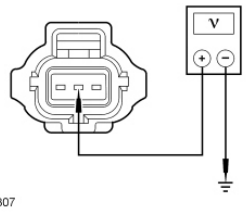
NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.







NOTE: Do not have a battery charger attached during vehicle testing.



Test Step	Result / Action to Take
C1 CHECK THE BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to C2 . br> **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C2 CHECK THE GENERATOR CONNECTIONS	
• Ignition OFF. • Inspect generator C102A connection. Connector should be installed correctly and tight. • Disconnect: Generator C102A. • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C102B, B+ circuit SDC14 (RD) and radial arm connection(s). Connection should be tight. • Measure the battery voltage.	**Yes** GO to C3 . **No** TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal

 AJ0210-A • Measure the voltage between generator C102B, B+ circuit SDC14 (RD) and ground.  A0065976 • **Are the generator C102B and radial arm adapter connections tight and does the generator B+ measure battery voltage?**	operation.
C3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	
• Connect: Generator C102A. • Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C102B, circuit SDC14 (RD) and the positive battery terminal.  N0108884 • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	**Yes** GO to C4 . **No** INSPECT circuit SDC14 (RD), radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C4 A SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe**	**Yes** GO to C5 . **No** VERIFY Battery Junction Box (BJB) fuse 17 (10A) is OK. If OK, REPAIR circuit SBB17 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible

directly on any connector. **NOTE:** This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp. • Ignition OFF. • Disconnect: Generator C102A. • Ignition ON. • Using a 12-volt test lamp connected to ground, check for voltage at generator C102A-3, circuit SBB17 (RD), harness side.  N0105265 • **Does the test lamp illuminate?**	causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C5 CHECK THE GENERATOR COMMAND LINE FAULT (GENCMD_LF) PID	
• Ignition OFF. • Connect: Generator C102A. • Start the engine. • **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test. • Select and monitor the following PCM PIDs: ♦ Generator Monitor (GENMON) ♦ Generator Command (GENCMD) ♦ Generator Command Line Fault (GENCMD_LF) • With the engine running at idle, monitor the GENCMD_LF PID. • **Does the GENMON_LF PID indicate FAULT?**	**Yes** GO to C6 . **No** GO to C9 .
C6 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO POWER	
• Ignition OFF. • Disconnect: Generator C102A. • Ignition ON. • Measure the voltage between generator C102A-2, circuit CDC10 (BU/OG), harness side and ground.	**Yes** GO to C7 . **No** GO to C11 .

 N0087307 • **Does voltage read 1 volt or less?**	
C7 COMPARE THE PCM PIDs GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD)	
• Ignition OFF. • Connect a fused jumper wire between generator C102A-1, circuit CDC15 (VT), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • Monitor the GENMON and GENCMD PIDs while performing a wiggle test on the generator harness. • **Does the GENMON PID read within 5% of the GENCMD PID?**	**Yes** GO to C8 . **No** GO to C12 .
C8 CHECK THE GENERATOR COMMAND CIRCUIT FOR DAMAGE OR AN OPEN	
• Ignition OFF. • Disconnect: Fused Jumper Wire. • Disconnect: PCM C175B (2.5L or 3.0L). • Disconnect: PCM C175E (3.5L). • Inspect the following harness connectors for damaged or pushed-out pins: ♦ PCM C175B-53, circuit CDC10 (BU/OG) (2.5L or 3.0L) ♦ PCM C175E-13, circuit CDC10 (BU/OG) (3.5L) ♦ Generator C102B-2, circuit CDC10 (BU/OG) • For 2.5L or 3.0L engines, measure the resistance between PCM C175B-53, circuit CDC10 (BU/OG), harness side and generator C102A-2, circuit CDC10 (BU/OG, harness side.	**Yes** GO to C9 . **No** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0087308 • For 3.5L engines, measure the resistance between PCM C175E-13, circuit CDC10 (BU/OG), harness side and generator C102A-2, circuit CDC10 (BU/OG) harness side.  N0087753 • **Are the connectors and pins free of damage and is the resistance less than 5 ohms?**	
C9 CHECK THE GENERATOR COMMAND CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Generator C102A (if not previously disconnected). • Disconnect: PCM C175B (2.5L or 3.0L). • Disconnect: PCM C175E (3.5L). • Measure the resistance between the generator C102A-2, circuit CDC10 (BU/OG), harness side and ground.  N0105266 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C10 . **No** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C10 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS	
• Connect: Generator C102A. • Connect: PCM C175B (2.5L or 3.0L). • Connect: PCM C175E (3.5L). • Ignition ON. • Clear all DTCs.	**Yes** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• Start the engine and let the engine run for 5 minutes. • Retrieve Continuous Memory Diagnostic Trouble Codes (CMDTCs) from all modules. • **Did any charging system DTC get stored into memory?**	**No** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C11 CHECK THE GENERATOR COMMAND AND PCM FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175B (2.5L or 3.0L). • Disconnect: PCM C175E (3.5L). • Ignition ON. • Measure the voltage between generator C102A-2, circuit CDC10 (BU/OG), harness side and ground.  N0087307 • **Does voltage read 0 volt?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L engines or Section 303-14C for 3.5L engines. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR circuit CDC10 (BU/OG). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C12 INSPECT GENERATOR CONNECTORS AND CIRCUITS	
• Ignition OFF. • Disconnect: PCM C175B. • Inspect the following connector pins for damage and/or corrosion: ♦ PCM C175B-66, circuit GD113 (BK/YE) ♦ Generator C102A-1, circuit CDC15 (VT) ♦ Generator C102A-2, circuit CDC10 (BU/OG) • **Are the connectors and circuits OK?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L engines or Section 303-14C for 3.5L engines. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR high resistance or loose connections in the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: DTC P0625 or P0626

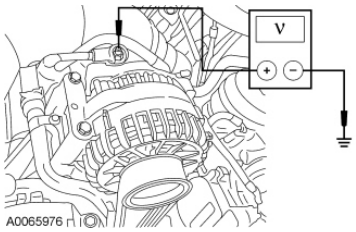
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

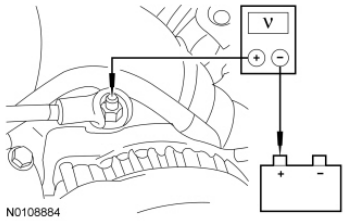
Normal Operation

The PCM monitors the generator output via the GENMON circuit (generator field terminal circuit). If the PCM cannot read the GENMON circuit due to an open or short to ground, when the engine rises above approximately 2,000 rpm, the generator will default to a steady voltage of approximately 13.5 volts and the PCM will send a request to the Instrument Cluster (IC) to illuminate the charging system warning indicator. A GENMON duty cycle of 3% or less indicates a short to ground fault is present and will result in DTC P0625 setting in the PCM. A GENMON duty cycle of 98% or more indicates an open or short to voltage fault is present and will result in DTC P0626 setting in the PCM.

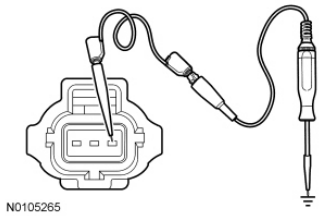
- DTC P0625 (Generator Field Terminal Circuit Low) - If the GENMON circuit is shorted to ground, the A sense circuit is open or the B+ circuit is open, the PCM will set this DTC. This DTC can also be set by a faulted PCM or generator.
- DTC P0626 (Generator Field Terminal Circuit High) - If the GENMON circuit is open or shorted to power, the PCM will set this DTC. This DTC can also be set by a faulted PCM or generator.

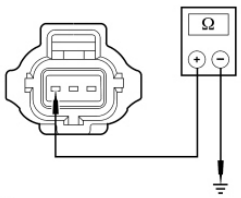
This pinpoint test is intended to diagnose the following:



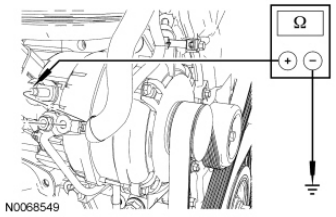


- Fuse
- Wiring, terminals or connectors
- Radial arm adapter
- Engine, generator and battery grounds
- Battery
- Generator
- PCM

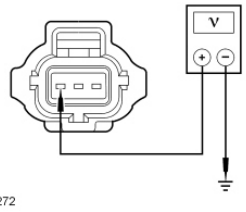


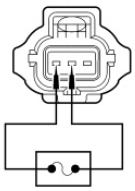


PINPOINT TEST D: DTC P0625 OR P0626



NOTE: Make sure battery voltage is greater than 12.2 volts prior to and during this pinpoint test.





NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Result / Action to Take
D1 CHECK THE BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to D2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D2 CHECK THE GENERATOR B+ CONNECTION	
• Ignition OFF. • Inspect generator C102B, circuit SDC14 (RD), harness side. Connection should be tight. • Inspect generator radial adapter connection on rear of generator. Connection should be tight. • Measure the voltage between generator C102B, circuit SDC14 (RD) and ground.	**Yes** GO to D3 . **No** TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC14 (RD). If

 • **Are the generator C102B and radial arm adapter connections tight and does the generator B+ measure battery voltage?**	not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT	
• Start the engine. • With the engine running at idle, headlamps on and blower on high, measure the voltage drop between generator B+ C102B, circuit SDC14 (RD) and the positive battery terminal.  • Carry out a wiggle test of the generator wiring and connections while measuring voltage drop. • **Is the voltage drop less than 0.5 volt?**	**Yes** For DTC P0625, GO to D4 . For DTC P0626, GO to D6 . **No** INSPECT circuit SDC14 (RD), radial arm adapter and the positive battery cable for loose connections, physical damage or wire corrosion. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D4 A SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp. • Ignition OFF. • Disconnect: Generator C102A .	**Yes** GO to D5 . **No** VERIFY Battery Junction Box (BJB) fuse 17 (10A) is OK. If OK, REPAIR circuit SBB17 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• Ignition ON. • Using a 12-volt test lamp connected to ground, check for voltage at C102A-3, circuit SBB17 (RD), harness side.  N0105265 • **Does the test lamp illuminate?**	
D5 CHECK CIRCUIT CDC15 (VT) FOR DAMAGE OR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: PCM C175B (2.5L or 3.0L). • Disconnect: PCM C175E (3.5L). • Inspect the following harness connectors for damaged or pushed-out pins: ♦ PCM C175B-14, circuit CDC15 (VT) (2.5L or 3.0L) ♦ PCM C175E-26, circuit CDC15 (VT) (3.5L) ♦ Generator C102A-1, circuit CDC15 (VT) • Measure the resistance between generator C102A-1, circuit CDC15 (VT), harness side and ground.  N0105271 • **Are the connectors and pins free of damage and is the resistance greater than 10,000 ohms?**	**Yes** GO to D10 . **No** REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D6 CHECK THE GENERATOR B+ RESISTANCE	
• Ignition OFF. • **NOTE:** Failure to disconnect the battery will result in false resistance readings. • Disconnect the battery. Refer to Section 414-01 . • Disconnect: Generator C102B. • Measure the resistance between generator C102B, component side and the generator	**Yes** GO to D7 . **No** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the

housing.  • **Is the resistance greater than 25K ohms?**	system for normal operation.
D7 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS TO GROUND	
• Disconnect: Generator C102A. • Measure the resistance between generator C102A, component side and ground. Refer to the following table. **Pin** / **Expected Resistance** 1 / Greater than 10K ohms 2 / Greater than 10K ohms 3 / Greater than 10K ohms • **Are the resistance values as indicated?**	D8 . **No** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D8 CHECK CIRCUIT CDC15 (VT) FOR DAMAGE OR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175B (2.5L or 3.0L). • Disconnect: PCM C175E (3.5L). • Inspect the following harness connectors for damaged or pushed-out pins: ♦ PCM C175B-14 (2.5L or 3.0L), circuit CDC15 (VT) ♦ PCM C175E-26 (3.5L), circuit CDC15 (VT) ♦ Generator C102A-1, cirDC15 (VT) • For 2.5L or 3.0L engines, measure the resistance between PCM C175B-14, circuit CDC15 (VT), harness side and generator C102A-1, circuit CDC15 (VT), harness side. • For 3.5L engines, measure the resistance between PCM C175E-26, circuit CDC15 (VT), harness side and generator C102A-1, circuit CDC15 (VT), harness side. • **Are the connectors and pins free of damage and is the resistance less than 5 ohms?**	**Yes** GO to D9 . **No** REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D9 CHECK CIRCUIT CDC15 (VT) FOR A SHORT TO POWER	
• Connect the battery. Refer to Section 414-01 . • Ignition ON. • Measure the voltage between generator C102A-1, circuit CDC15 (VT), harness side and ground.  N0105272 • **Is there any voltage present?**	**Yes** REPAIR the connector(s) and/or circuit CDC15 (VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D10 .
D10 COMPARE THE PCM PIDs GENERATOR MONITOR (GENMON) AND GENERATOR COMMAND (GENCMD)	
• Ignition OFF. • Connect: PCM C175B (2.5L or 3.0L). • Connect: PCM C175E (3.5L). • Connect a fused jumper wire between generator C102A-1, circuit CDC15 (VT), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • Using the active command, set the GENVDSD PID to 14.0 volts. • Monitor the GENMON and GENCMD PIDs while carrying out a wiggle test on the generator wiring harness. • **Does the GENMON PID read within 2% of the GENCMD PID?**	**Yes** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to D11 .
D11 CHECK FOR CORRECT PCM OPERATION	
• Ignition OFF. • Disconnect: Fused Jumper Wire. • Check the PCM harness, generator harness, PCM component side and generator component side	**Yes** INSTALL a new PCM. REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L engines or Section 303-14C for 3.5L engines. CLEAR the DTCs. REPEAT the

connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the PCM and/or generator connectors. Make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

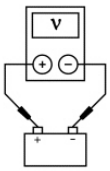
Pinpoint Test E: DTC P065B

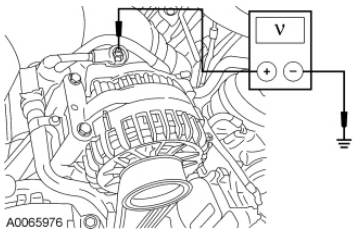
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

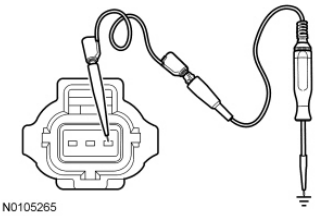
With the engine running, the PCM expects to receive a valid generator monitor (GENMON) signal with a duty cycle greater than 5% and less than 98%. The PCM also monitors the state of the generator command (GENCMD) signal line to make sure it is not stuck high or stuck low. If the GENMON or GENCMD signal fluctuates between out-of-valid range, or stuck high, or stuck low, or some combination and normal, a DTC will be set. When engine speed rises above approximately 2,000 rpm, the generator will default to a steady voltage of approximately 13.5 volts and the PCM will send a request to the Instrument Cluster (IC) to illuminate the charging system warning indicator lamp.

- DTC P065B (Generator Control Circuit Range/Performance) - If the input frequency was continuously less than 80 Hz or more than 200 Hz the PCM will set this DTC. Additionally, if the signal shows a faulted condition that is happening in a fluctuating manner, the PCM will track the fluctuations between faulted and normal conditions. If the fluctuations occur frequently within a short amount of time, this DTC will also be set.

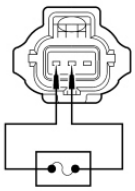




This pinpoint test is intended to diagnose the following:
- Wiring, terminals or connectors
- Radial arm adapter
- Generator
- PCM



PINPOINT TEST E: DTC P065B



NOTE: Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

Test Step	Resul/ Action to Take
E1 CHECK THE BATTERY CONDITION	
• Refer to Section 414-01 and carry out Pinpoint Test A: Battery Condition Test to determine if the battery can hold a charge and is OK for use. • **Does the battery pass the condition test?**	**Yes** GO to E2 . **No** INSTALL a new battery. REFER to Section 414-01 . CLEAR the DTCs.

	REPEAT the self-test. TEST the system for normal operation.
E2 CHECK THE GENERATOR CONNECTIONS	
• Ignition OFF. • Inspect generator C102A connection. Connector should be installed correctly and tight. • Disconnect: Generator C102A. • Inspect generator C102A for bent and/or pushed-out pins. • Inspect generator C102B, B+ circuit SDC14 (RD) and radial arm connection(s). Connection should be tight. • Measure the battery voltage.  AJ0210-A • Measure the voltage between generator C102B, B+ circuit SDC14 (RD) and ground.  A0065976 • **Are the generator C102B and radial arm adapter connections tight and does the generator B+ measure battery voltage?**	**Yes** GO to E3 . **No** TIGHTEN or INSTALL a new C102B (B+ nut) and/or radial arm adapter as needed. REFER to Specifications in this section. VERIFY the fusible link is OK. If the fusible link is OK, REPAIR circuit SDC14 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E3 A SENSE CIRCUIT LOAD TEST	
NOTICE: **The following step uses a test light to simulate normal circuit loads. Use only the test light recommended in the Special Tools table at the beginning of this section. To avoid connector terminal damage, use the Flex Probe Kit for the test light probe connection to the vehicle. Do not use the test light probe directly on any connector.** **NOTE:** This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault. A 250-350 mA incandescent 12-volt test lamp is required for this step. This circuit will not be loaded properly using an LED-style test lamp.	**Yes** GO to E4 . **No** VERIFY Battery Junction Box (BJB) fuse 17 (10A) is OK. If OK, REPAIR circuit SBB17 (RD). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• Ignition ON. • Using a 12-volt test lamp connected to ground, check for voltage at C102A-3, circuit SBB17 (RD), harness side.  N0105265 • **Does the test lamp illuminate?**	
E4 CHECK THE PCM GENERATOR MONITOR FREQUENCY (GENMON_HZ) PID	
• Ignition OFF. • Connect: Generator C102A. • Start the engine. • **NOTE:** Many of the PCM PIDs selected will be monitored later in this pinpoint test. • Select and monitor the following PCM PIDs: ♦ Generator Voltage Desired (GENVDSD) ♦ Generator Monitor Frequency (GENMON_HZ) • Monitor the GENMON_HZ PID. • **Does the PID read between 80-200 Hz?**	**Yes** GO to E8 . **No** GO to E5 .
E5 CHECK THE PCM GENERATOR MONITOR FREQUENCY (GENMON_HZ) PID WITH GENERATOR C102A DISCONNECTED	
• Ignition OFF. • Disconnect: Generator C102A. • Start the engine. • Monitor the GENMON_HZ PID. • **Does the PID read between 0-2 Hz?**	**Yes** GO to E7 . **No** GO to E6 .
E6 CHECK GENERATOR CIRCUITRY	
• Ignition OFF. • ***NOTICE:*** **This pinpoint test step directs testing circuits using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while making sure that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.**	**Yes** INSPECT the harness for wire to wire shorts or insulation chaffing, mis-pinned connectors and correct wire colors and REPAIR generator circuit CDC15 (VT) as needed. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new PCM. REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L engines or Section 303-14C for 3.5L engines.

• With PCM C175B (2.5L or 3.0L) or C175E (3.5L) connected, connect a fused jumper wire between PCM C175B-14 (2.5L or 3.0L) or C175E-26 (3.5L), circuit CDC15 (VT) and ground by carefully back probing the connector. • Start the engine. • Monitor the GENMON_HZ PID. • **Does the PID read 0 Hz?**	CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E7 MONITOR THE PCM PID GENERATOR MONITOR FREQUENCY (GENMON_HZ) WHILE ACTIVATING THE GENERATOR VOLTAGE DESIRED (GENVDSD) PID	
• Ignition OFF. • Connect a fused jumper wire between generator C102A-1, circuit CDC15 (VT), harness side and generator C102A-2, circuit CDC10 (BU/OG), harness side.  N0074142 • Start the engine. • With the engine running at idle, set the active command GENVDSD PID to 14 volts. • Monitor the GENMON_HZ PID. • **Does the GENMON_HZ PID read between 120-130 Hz?**	**Yes** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new PCM. REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L engines or Section 303-14C for 3.5L engines. CLEAR the DTCs. REPEAT the self-test. TEST them for normal operation.
E8 CHECK THE PCM GENERATOR COMMAND LINE FAULT (GENCMD_LF) PID	
• With the engine running and all selectable loads OFF, monitor the PCM PID GENCMD_LF. • **Does the PCM PID GENCMD_LF fluctuate from YES FAULT to NO FAULT?**	**Yes** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The fault is not present at this time. This may indicate an intermittent fault. CARRY OUT a wiggle test on the charging system circuits to try and RECREATE the concern. CHECK generator connections for corrosion, loose connections and/or bent terminals. REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test F: The Generator is Noisy

Ro Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The generator is belt-driven by the engine accessory drive system. There are several sources of generator noise which include: bearing noise, electrical fault noise, generator or belt pulley misalignment. A generator with certain types of diode or stator failures may also produce an audible noise.

This pinpoint test is intended to diagnose the following:

- Accessory drive belt
- Loose bolts/brackets
- Generator/pulley

PINPOINT TEST F: THE GENERATOR IS NOISY

Test Step	Result / Action to Take
F1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS	
• Ignition OFF. • Check the accessory drive belt and tensioner for damage and correct installation. Refer to the appropriate section in Group 303 for the procedure.. • Check the accessory mounting brackets and generator pulley for looseness or misalignment. • **Is the accessory drive OK?**	**Yes** GO to F2 . **No** REPAIR as necessary. Refer to the appropriate section in Group 303 for the procedure. for diagnosis and testing of the accessory drive system. TEST the system for normal operation.
F2 CHECK THE GENERATOR MOUNTING	
• Check the generator mounting for loose bolts or misalignment. • **Is the generator mounted correctly?**	**Yes** GO to F3 . **No** REPAIR as necessary. TEST the system for normal operation.
F3 CHECK THE GENERATOR FOR NOISE	
• With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise. • **Is the generator the noise source?**	**Yes** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No**

	REFER to Section 303-00 to diagnose the source of the engine noise.

Pinpoint Test G: Radio Interference

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

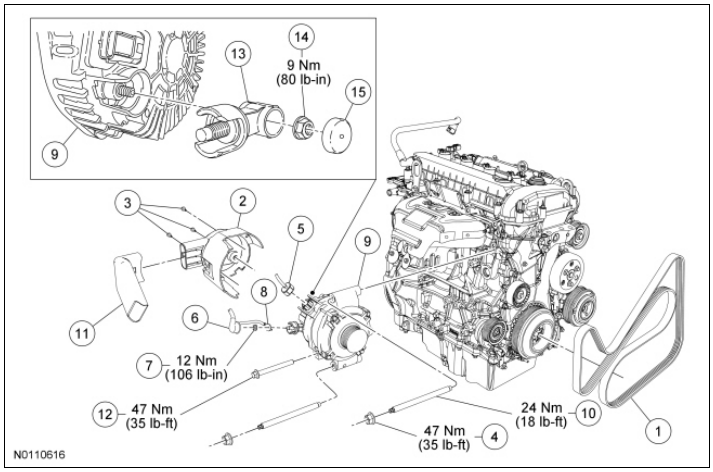
Normal Operation

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- Wiring, terminals or connectors
- In-vehicle entertainment system

PINPOINT TEST G: RADIO INTERFERENCE



NOTE: If the OEM audio unit has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to OEM condition before following this pinpoint test.

NOTE: If the engine is operated at greater than 2,000 rpm momentarily, the generator will self-excite. Make sure when the generator is disconnected the engine rpm stays below 2,000 rpm. If it does rise above 2,000 rpm, turn the ignition to the off position and start the test over again.

NOTE: Inspect for any after market accessories that have been added to the vehicle. Check the wiring for these accessories and be sure they have not been attached to the generator circuits and are positioned away from the generator wiring.

Test Step	Result / Action to Take
G1 VERIFY THE GENERATOR IS THE SOURCE OF THE RADIO INTERFERENCE	
• Start the engine and allow the engine to idle. • Tune the audio unit to a station where the interference is present. • Ignition OFF. • Disconnect: Generator C102B. • Start the engine and allow the engine to idle, determine if the interference is still present. • **Is the interference present with the generator disconnected?**	**Yes** REFER to Section 415-00 for diagnosis and testing of the in-vehicle entertainment system. **No** INSTALL a new generator. REFER to Generator - 2.5L , Generator - 3.0L or Generator - 3.5L in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Generator - 2.5L

Item	Part Number	Description
1	8620	Front End Accessory Drive (FEAD) belt
2	10C392	Generator upper air duct
3	W500004	Generator upper air duct screws (3 required)
4	W520414	Generator stud nut (2 required)
5	-	Generator electrical connector (part of 12B637)
6	-	B+ protective cover (part of 14A280)
7	W705790-S	Generator B+ terminal nut
8	-	Generator B+ cable (part of 14A280)
9	10300	Generator
10	W709489	Generator stud (2 required)
11	10C392	Generator lower air duct
12	W500130	Generator bolt
13	10329	Radial arm adapter
14	-	Radial arm adapter nut (part of 10329)
15	-	Radial arm adapter cap (part of 10329)

Removal

NOTICE: **Do not allow any metal object to come i the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes. Failure to follow this instruction may result in component damage.**

NOTE: The radial arm adapter is a serviceable item. Do not replace the generator if the radial arm adapter is the only concern.

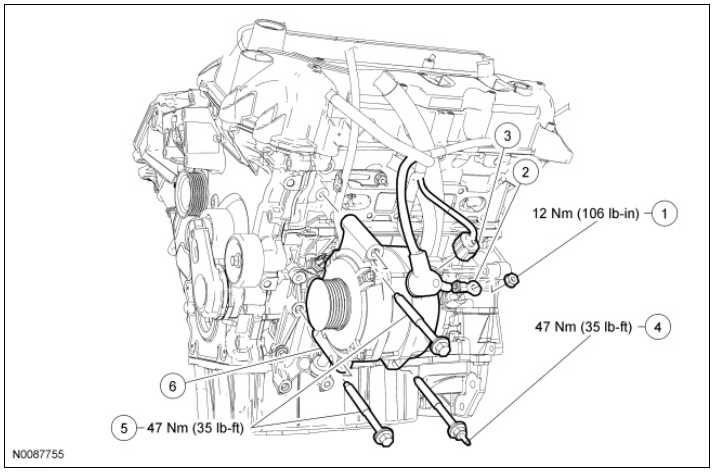
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery. For additional information, refer to Section 414-01 .

3. Remove the 4 RH lower splash shield screws.
4. Remove the 6 pushpins and the RH lower splash shield.
5. Rotate the Front End Accessory Drive (FEAD) belt tensioner clockwise and position the accessory drive belt aside.
6. Working from the top of the vehicle, press the locking tab to release the generator lower air duct from the generator and remove the lower air duct.
7. Remove the battery harness locator from the lower generator stud bolt.
8. Remove the lower generator bolt.
9. Remove the 2 generator stud nuts.
10. Position the generator B+ protective cover aside and remove the generator B+ terminal nut.
11. Position the generator B+ cable aside.
12. Disconnect the generator electrical connector.
13. Remove the 2 generator studs and remove the generator.
14. Remove the 3 screws and the generator upper air duct.

Installation

1. Position the generator upper air duct and install the 3 screws.
    - Tighten to 4 Nm (35 lb-in).
2. Working from the top of the vehicle, position the generator and install the generator upper stud hand-tight.
3. Install the generator lower stud hand-tight.
4. Install the generator B+ cable and install the generator B+ terminal nut.
    - Tighten to 12 Nm (106 lb-in).
5. Connect the generator electrical connector.
6. Position the generator B+ protective cover on the B+ terminal.
7. Working from under the vehicle, install the lower generator bolt hand-tight.
8. Working from the top of the vehicle, tighten the 2 generator studs to 24 Nm (18 lb-ft).
9. Tighten the 2 generator stud nuts to 47 Nm (35 lb-ft).
10. Tighten the generator bolt to 47 Nm (35 lb-ft).
11. Push the lower air duct onto the upper air duct until the locking tab is engaged.
12. Position the RH lower splash shield and install the 6 pushpins.



13. Position the RH wheel splash shield and install the 4 screws.
    - Tighten to 8 Nm (71 lb-in).

14. Position the harness locator on the generator stud.

15. Connect the battery. For additional information, refer to Section 414-01 .

16. Rotate the FEAD belt tensioner clockwise and position the accessory drive belt on the pulley.

Generator - 3.0L

Item	Part Number	Description
1	W706414	Generator B+ terminal nut
2	-	Generator B+ terminal (part of 14B060)
3	-	Generator electrical connector (part of 12B637)
4	W707669	Generator stud bolt
5	W704747	Generator bolts (2 required)
6	10300	Generator

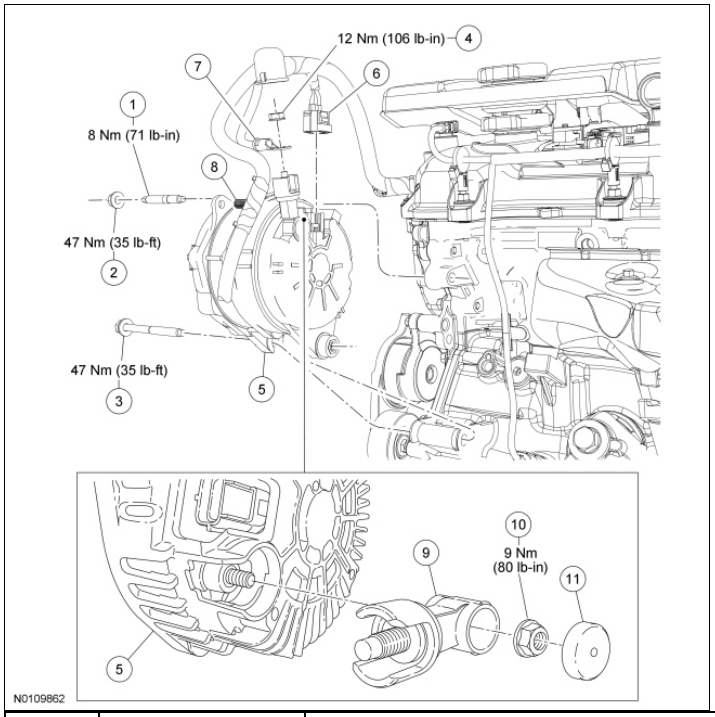
Removal and Installation

1. Remove the A/C compressor. For additional information, refer to Section 412-01 .

2. Disconnect the battery. For additional information, refer to Section 414-01 .

start="3">
- Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).

4. Disconnect the generator electrical connector.



5. Remove the 3 bolts and the generator.
    - To install, tighten to 47 Nm (35 lb-ft).

6. To install, reverse the removal procedure.

Generator - 3.5L

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number	Description
1	W712609	Generator stud
2	W520414	Generator stud nut
3	W709986	Generator bolt
4	W706414	Generator B+ terminal nut
5	10300	Generator
6	-	Generator electrical connector (part of 14B060)
7	-	Generator B+ terminal (part of 14B060)
8	-	Pin-type retainer, wiring harness
9	10329	Radial arm adapter
10	-	Radial arm adapter nut (part of 10329)
11	-	Radial arm adapter cap (part of 10329)

Removal and Installation

NOTE: The radial arm adapter is em. Do not replace the generator if the radial arm adapter is the only concern.

1. Remove the A/C compressor. For additional information, refer to Section 412-01 .

2. Disconnect the battery. For additional information, refer to Section 414-01 .

3. Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).

4. Disconnect the generator electrical connector.
    - Detach the pin-type retainer and wiring harness.

5. Remove the oil filter.
    - Lubricate the oil filter seal with clean engine oil before installation.

6. Position the engine wiring harness aside.

7. Remove the generator stud nut.
    - To install, tighten to 47 Nm (35 lb-ft).

8. Remove the generator bolt and the generator.

9. To install, reverse the removal procedure.

General Specifications

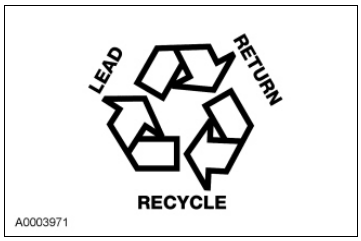
Battery and Cables

Vehicles are equipped with a 12-volt, maintenance-free battery.



The battery and cable system consists of the following components:

- Battery
- Battery cable assembly
- Battery tray

The battery is a 12V DC source connected in a negative ground system. The battery case is sealed with 2 vent holes to release gases. The battery has 3 major functions:

- Engine cranking power source
- Voltage stabilizer for the electrical system
- Temporary power source when electrical loads exceed the generator output current

Ford Motor Company strongly recommends that lead-acid batteries be returned to an authorized recycling facility for disposal.

Principles of Operation

Battery Eye Operation

The battery eye indicates the state-of-charge of the battery by responding to the specific gravity of a single battery cell electrolyte. The battery eye has a viewing plate, 2 colored balls of different specific gravity and a small passage. As the state-of-charge and specific gravity changes, the balls change their position in the passageway and subsequently display a different color in the viewing eye. The primary purpose of the battery is to be a quick indicator of state-of-charge for assembly plants and dealership pre-delivery processes.

The color of the battery eye indicates the approximate state-of-charge.

- Red - indicates low state-of-charge.
- Yellow/Black - indicates between high and low state-of-charge.
- Green - indicates high state-of-charge.
- No color can occur after the battery has been in service for several years and some of the plate material has coated the balls.
- A clear battery eye can occur if the battery case becomes damaged and the electrolyte has fallen below the plates.

NOTE: The battery eye may remain red for a period of time (up to several days), even after the battery is fully charged, because the acid is not yet fully mixed.

Do not install a new battery based solely on the indication of the battery eye. The battery eye color simply indicates the battery state-of-charge, not its condition. For example, a red or yellow/black battery eye usually indicates the battery is discharged, not defective. If the battery eye indicates the battery may be discharged, it is necessary to recharge the battery before testing its condition.

Charging a Battery

Batteries discharge while the vehicle is on the dealer lot or parked by the customer for an extended period of time due to normal parasitic key-off loads. Also, vehicles still in dealer inventory or in long-term storage may be driven short distances with heavy electrical loads. Over a period of time (30 days or more), this could result in vehicles having shallow or deeply discharged batteries.

- Deeply discharged - A battery that is drained over a prolonged period of time, such as an unsold vehicle or a vehicle in storage, to the point the battery is dead.
- Shallow discharge - A battery that is drained by leaving an accessory on for several hours or a few days and has a very low charge.

The vehicle charging system is designed to supply the electrical power needed to maintain the battery near full charge during normal vehicle use. The charging system is not capable of bringing a deeply discharged battery back to near fuln a short amount of time such as allowing the vehicle to idle for 15 minutes to "recharge the battery". Discharged batteries should be charged using an external charger.

NOTE: Battery chargers have improved greatly with the addition of the new generation pulse chargers. These chargers pulse current into the battery, breaking down the sulfation layer on the battery plates and generally reduce charging times to less than an hour.

NOTE: Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm to approximately 5°C (41°F) before charging. This may require 4 to 8 hours at room temperature.

The following chart summarizes 2 recommended methods of charging.

Type of Battery Discharge	Pulse Charger	Standard Charger
Deeply discharged	Follow directions supplied with the pulse charger	2 to 8 hours and may take up to an hour to accept initial charge
Shallow discharge	45 minutes to an hour charge	2 hours below (40A) on manual setting or medium automatic setting

Inspection And Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery posts

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the fault is not visually evident, GO to Pinpoint Test A in the Pinpoint Test procedure.

Pinpoint Test

Special Tool(s)

 ST3285-A	GR 1 190 V3.0 Intelligent Diagnostic Charger 162-00036 or equivalent

Pinpoint Test A: Battery Condition Test

Normal Operation

Battery condition is determined by measuring battery terminal voltage after a specific discharge current is applied for a specified time period.

This pinpoint test is intended to diagnose the following:

- Battery charge
- Battery

PINPOINT TEST A: BATTERY CONDITION TEST

Test Step	Result / Action to Take
A1 TEST THE BATTERY CONDITION	
NOTE: A red test-eye indicates the battery is discharged, not necessarily defective. **NOTE:** Failure to fully charge the battery before retesting may cause false readings. • Verify the battery condition using the Intelligent Diagnostic Charger. • **Is the battery OK?**	**Yes** RETURN the battery to service. **No** If the analyzer reads REPLACE BATTERY or REPLACE-BAD CELL, INSTALL a new battery. REFER to Battery in this section.

Component Test

Battery - Drain Tests

⚠ WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

NOTICE: **To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.**

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

Check for current drains on the battery in excess of 50 mA (0.050 amp) with all the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure.

NOTE: Many electronic modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Typically, a drain of approximately 1 amp is attributed to an engine compartment lamp, glove compartment lamp or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level. If the drain is still not located after checking all the fuses, it may be due to the generator. Disconnect the generator and retest.

NOTE: To curately test the drain on a battery, an in-line ammeter must be used between the negative battery post and its respective cable. Use of a test lamp or voltmeter is not an accurate method.

1. Drive the vehicle at least 5 minutes and over 48 km/h (30 mph) to turn on and activate the vehicle systems.

2. After driving the vehicle and before testing, make sure the junction box(es)/fuse panel(s) is accessible without turning on the interior lights or the underhood lights.

3. Allow the vehicle to sit with the key out of the ignition for at least 40 minutes to allow the modules to time out/power down.

4. Connect a fused jumper wire (30A) between the negative battery cable and the negative battery post to prevent modules from resetting.

5. Disconnect the negative battery cable from the negative battery post without breaking the connection of the jumper wire.

6. **NOTE:** It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, the entire 40-minute procedure must be repeated.

Connect the battery tester between the negative battery cable and the post. The meter must be capable of reading milliamps and should have a 10-amp capability.

7. **NOTE:** If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

   Remove the jumper wire.

8. Note the amperage draw. Draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

NOTE: If the vehicle sits for an extended period of time and the battery drains, there is the possibility of a control module staying alive and not going into sleep mode. If a module does stay alive, it can also result in battery drain. If a module is suspect, isolate individual modules by disconnecting each module one at a time and note if the excessive draw goes away.

NOTE: For vehicles equipped with aftermarket bodies or boxes which contain electrical connections, disconnect the aftermarket to factory connections to isolate the body from the chassis.

9. If the current draw is excessive, remove the fuses from the Battery Junction Box (BJB) one at a time and note the current drop. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located. The excessive draw can be isolated by continuing to pull sub system fuses. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.
   - Once the main circuit is identified, continue to remove the fuses from the Smart Junction Box (SJB) one at a time and note the current reading. Do not reinstall the fuses until testing is finished. To correctly isolate each of the circuits, all of the fuses may need to be removed, then install one fuse and note the amperage draw, remove the fuse and install the next fuse. Continue this process with each fuse.

10. Check the wiring diagrams for any circuits that run from the battery without passing through the BJB or the SJB . If the current draw is still excessive, disconnect these circuits until the draw is found. Also, disconnect the generator electrical connections and retest if the draw cannot be located. The generator may be internally shorted, causing the current drain.

Battery Disconnect

⚠ WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches. Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s). To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

⚠ WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

⚠ WARNING: Battery posts, terminals and related accessories contain lead and lead components. Wash hands after handling. Failure to follow these instructions may result in serious personal injury.

NOTE: When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system set point may also vary. The vehicle may need to be driven to relearn its strategy.

1. On hybrid vehicles, remove the Air Cleaner (ACL) assembly. For additional information, refer to Section 303-12A .

2. **NOTE:** When disconnecting the battery ground cable to interrupt power to the vehicle electrical system, disconnect the battery ground cable only. It is not necessary to disconnect the positive battery cable.

   Disconnect the battery ground terminal.

   - To connect, tighten to 7 Nm (62 lb-in).

3. Disconnect the positive battery terminal.
   - To connect, tighten to 7 Nm (62 lb-in).

4. To connect, reverse the disconnect procedure.

Battery

Removal and Installation

⚠ WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches. Refer to the Description and Operation portion of Section 501-20B for location of the RCM and impact sensor(s). To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

⚠ WARNING: Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.

NOTE: When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system set point may also vary. The vehicle may need to be driven to relearn its strategy.

1. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.

2. Remove the bolt and the battery hold-down bracket.
   - To install, tighten to 10 Nm (89 lb-in).

3. If equipped, remove the battery heat shield.

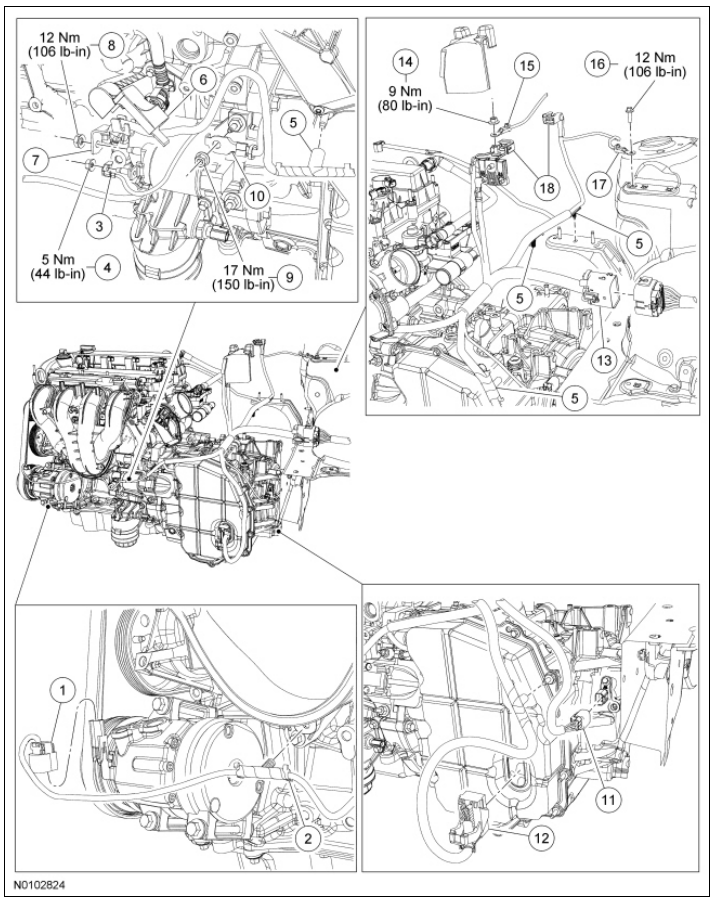
4. Remove the battery.

5. To install, reverse the removal procedure.

Battery Tray

Removal and Installation

1. Remove the battery. For additional information, refer to Battery in this section.



2. Remove the battery tray fasteners.
   - Hybrid vehicles use 4 nuts.
   - All other vehicles use 1 bolt and 2 nuts.
   - To install, tighten to 9 Nm (80 lb-in).

3. Remove the battery tray.

4. To install, reverse the removal procedure.

Removal and Installation

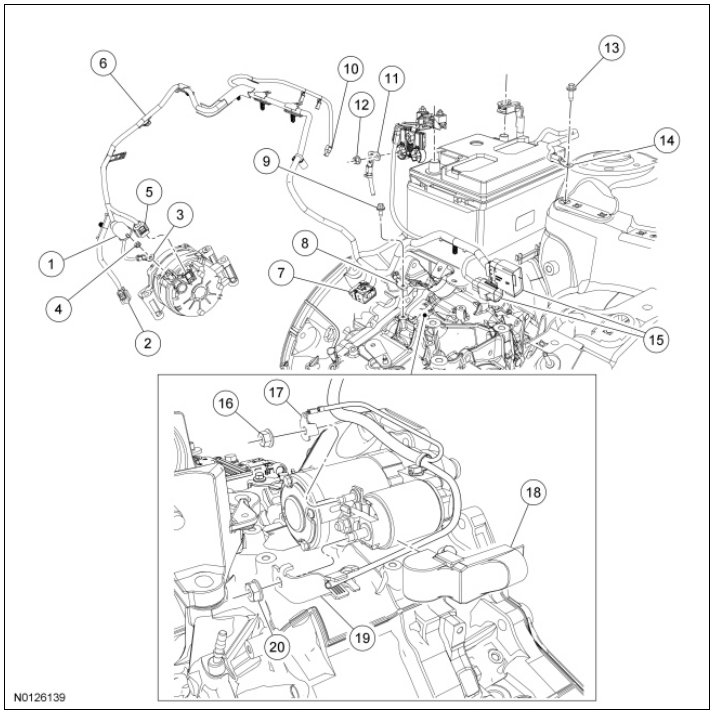
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Sec2 .

2. Remove the battery tray. For additional information, refer to Battery Tray in this section.

3. Remove the bolt and position the battery cable body ground terminal aside.
   - To install, tighten to 12 Nm (106 lb-in).



4. Remove the nut and position the Battery Junction Box (BJB) cable terminal aside.
    - To install, tighten to 9 Nm (80 lb-in).
5. Disconnect the battery cable in-line harness connector from the engine compartment wiring harness and position aside.
6. Release the 2 battery cable retainers from the body.
7. Disconnect the A/C compressor clutch field electrical connector and position aside.
8. Release the wiring harness locator from the generator mounting stud.
9. Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).
10. Disconnect the generator electrical connector and position aside.
11. Release the wiring harness locators from the valve cover.
12. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector electrical connector and position aside.
13. Release the wiring harness locator from the transaxle stud bolt.
14. Disconnect the transaxle electrical connector and position aside.
15. Release the wiring harness locator from the transaxle stud bolt.
16. Disconnect the turbine speed sensor electrical connector and position aside.
17. Remove the starter solenoid terminal cover.
18. Release the battery cable retainer from the transaxle.
19. Remove the nut and position the battery cable starter solenoid terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).
20. Remove the nut and position the starter motor solenoid wire terminal aside.
    - To install, tighten to 5 Nm (44 lb-in).
21. Remove the nut and position the battery cable engine ground terminal aside.
    - To install, tighten to 17 Nm (150 lb-in).
22. Remove the battery cables.
23. To install, reverse the removal procedure.

High-Voltage Traction Battery

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **The High Voltage Traction Battery (HVTB) in a Hybrid Electric Vehicle (HEV) can be affected and damaged by excessively high temperatures. The temperature in some body shop paint booths can exceed 60°C (140°F). Therefore, during refinishing operations, the paint booth temperature must be set at or below 60°C (140°F) with a bake time of 45 minutes or less. Temperatures in excess of 60°C (140°F) or bake durations longer than 45 minutes will require the HVTB be removed from the vehicle prior to placing in the paint booth.**

The vehicle is principally powered by an internal combustion engine, much like any ordinary vehicle. However, it also transforms the energy that is normally wasted during stop and go operation (when coasting and braking) into electricity, which is stored in the High Voltage Traction Battery (HVTB) until the moment it is needed by the Electronically Controlled Continuously Variable Transmission (eCVT) traction motor or the 12-volt system. The traction motor is used to support the engine during acceleration and uphill drivn low-speed driving situations, the vehicle may move under only battery power, without the internal combustion engine running. The internal combustion engine may automatically shut off when the vehicle is stopped/idling or when coasting under 75 km/h (47 mph) and will restart when the accelerator is depressed, when the traction motor needs assistance, or if the HVTB state-of-charge is low. This avoids using excess fuel when the vehicle is not in motion. The vehicle does not need to be plugged into an external source of electricity to be recharged. The energy provided by the engine and the regenerative braking, via the eCVT traction motor and generator motor, charges the HVTB .

The HVTB assembly, located behind the rear seat backrest, consists of the following components:

- HVTB
- HVTB service disconnect plug
- Battery Energy Control Module (BECM)
- High-voltage Bussed Electrical Center (BEC)
- HVTB connector and bracket (mounted to the high-voltage BEC)
- Battery Pack Sensor Module (BPSM)
- High-voltage low-current fuse (mounted in the high-voltage BEC)
- HVTB system wire harness
- HVTB cooling fan and jumper harness (accessed from the trunk area)
- HVTB cooling inlet duct
- HVTB cooling outlet duct (accessed from the trunk area)
- HVTB inlet air temperature sensor
- HVTB cooling inlet duct plate
- HVTB ground strap
- High-voltage BEC cover

All of the HVTB assembly components listed above can be individually serviced except the HVTB and the HVTB system wire harness. The HVTB and HVTB system wire harness are serviced as part of the entire HVTB assembly which includes all of the components in the list above except the HVTB cooling inlet duct

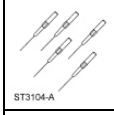

plate.

The high-voltage system also includes of the following components:

- High-voltage cable assembly
- eCVT , including motor generators and regenerative braking. For information on the eCVT , refer to Section 307-01C and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
- DC to DC Converter Control Module (DC/DC) located on the RH frame rail, behind the radiator support. For information on the DC/DC , refer to Section 414-05 .
- Air Conditioning Compressor Module (ACCM) and A/C compressor assembly located on lower LH side of the engine block. For information on the ACCM and A/C compressor assembly, refer to Section 412-01 .

 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

The High Voltage Traction Battery (HVTB) consists of D-cell type batteries packaged into modules which deliver approximately 275 volts DC to the high-voltage system. The HVTB provides cranking power to the high-voltage generator motor inside the Electronically Controlled Continuously Variable Transmission (eCVT). The HVTB also supplies electrical energy to the traction motor (also internal to the eCVT) to propel the vehicle when it is operating in electric mode only or to assist the gasoline engine (heavy acceleration). When the engine is operating or the vehicle is moving, the high-voltage generator motor generates high-voltage AC electricity. High-voltage AC generated by the generator motor can be used by the traction motor or to re-charge the HVTB .

When the HVTB is being charged, high-voltage is converted from high-voltage AC to high-voltage DC electrical power inside the eCVT and transmitted through the high-voltage cables to the HVTB .

The high-voltage DC electrical power is converted to low-voltage DC electrical power through the DC to DC Converter Control Module (DC/DC). This low-voltage high-current DC electrical power is then supplied to the 12-volt battery through the low-voltage battery cables.

The high-voltage system has a floating ground. The floating ground is designed to completely isolate the high-voltage system from the vehicle chassis. The high-voltage cables are fully insulated (isolated) from all vehicle components and circuits. There are no common connections (such as body grounds) used to conduct the high-voltage power. The Battery Energy Control Module (BECM) monitors this system for any leakage of current to the normal electrical system (similar to a household ground fault interrupter).

Battery Energy Control Module (BECM)

The BECM manages the condition of the HVTB to control its charging and discharging. The BECM also manages the cooling of the HVTB by controlling a fan attached to the HVTB cooling outlet duct. The BECM communicates with other vehicle modules on the High Speed Controller Area Network (HS-CAN) bus.

The BECM receives the following hard-wired inputs:

- HVTB interlock status
- Battery Pack Sensor Module (BPSM) information and status, via a dedicated (not accessible by a scan tool) CAN between the BECM and BPSM
- Immediate shutdown request from the Transmission Control Module (TCM)
- Event notification status from the Restraints Control Module (RCM)
- Vehicle HS-CAN
- BPSM power, ground and control circuits
- HVTB inlet air temperature sensor
- HVTB cooling fan feedback

The BECM provides the following outputs:

- HVTB cooling fan Pulse Width Modulated (PWM) supply voltage
- Vehicle HS-CAN information

The BECM receives HS-CAN messages from the following modules:

- PCM
- TCM
- Instrument Panel Cluster (IPC)
- RCM
- DC/DC

The PCM HS-CAN messages received by the BECM include:

- Gas engine status (running or off)
- Contactor control request status
- Current vehicle mode (power up, engine wait, shutdown, etc.)
- Ready light request
- Battery estimated current
- Transaxle gear position
- R-Mode Rebalance enable request
- Engine speed
- Throttle plate position
- Engine coolant temperature
- Ambient air inlet temperature

The TCM HS-CAN messages received by the BECM include:

- Vehicle speed, via the TCM
- TCM high-voltage input, via the TCM

The DC/DC HS-CAN messages received by the BECM include:

- DC/DC high-voltage input
- DC/DC high-voltage current
- DC/DC low-voltage input
- DC/DC over-temperature status
- DC/DC operation status

Battery Pack Sensor Module (BPSM)

The BPSM communicates with the BECM over a dedicated (not accessible by a scan tool) CAN bus. The BPSM provides the current, voltage and temperature status of the HVTB to the BECM . This information is needed by the BECM to control the HVTB and to determine the HVTB ability to receive and provide power to the vehicle.

DC to DC Converter Control Module (DC/DC)

The DC/DC converter is a liquid-cooled component that converts high-voltage (179-343 volt) DC power to low-voltage (12 volt) DC power. The converter provides power to the vehicle 12-volt battery and low-voltage electrical systems. The PCM controls the operation of the DC/DC through an enable message from the PCM to the DC/DC . For information on the DC/DC , refer to Section 414-05 .

Electronically Controlled Continuously Variable Transmission (eCVT)

The eCVT includes an internal generator motor and an internal traction motor. For information on the eCVT and its operation, refer to Section 307-01C and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

The eCVT generator motor generates high-voltage electricity for charging of the HVTB and/or providing power to the traction motor. The generator motor is also used to start the gas engine. The generator motor is an internal part of the eCVT and it cannot be repaired, only installed new as an assembly.

The eCVT traction motor is used to accelerate the vehicle from a stop when driving under electric power. The traction motor is also used to recover energy during regenerative braking. The traction motor receives power from the HVTB and/or from the eCVT generator motor. The traction motor is an internal part of the eCVT and it cannot be repaired, only installed new as an assembly.

The regenerative braking system is designed to recapture some of the energy from braking and deceleration events. It accomplishes this through the use of the traction motor and generator motor. This recaptured energy is used to charge the HVTB . If the HVTB is adequately charged, the recaptured energy is used for gas engine braking to slow the vehicle. The regenerative brake system is a series system. A series system is one in which powertrain braking is used first, up to the limits of the powertrain torque capacity and battery capacity. After optimum regeneration is used, the friction brakes are applied to supplement braking demands. For information on regenerative braking, refer to Section 206-09 .

High-Voltage Bussed Electrical Center (BEC)

The high-voltage Bussed Electrical Center (BEC) acts as an interface between the high-voltage cables and the HVTB . The high-voltage BEC houses the 3 contactors (precharge, positive and negative) which, when commanded closed by the BECM , connect the HVTB to various components for high-voltage consumption and/or charging of the HVTB . The high-voltage BEC design enables distribution of high-voltage to the high-current side (eCVT) and low-current side (DC/DC and Air Conditioning Compressor Module (ACCM)). The low-current side is protected by a high-voltage/low-current 40A fuse. Any fault resulting in excessive current on the low-current side will open the fuse, but will not affect operation of the high-current side. The high-voltage BEC contains the contactors, the current sensor and the high-voltage/low-current 40 amp fuse.

The high-voltage BEC also interfaces with the BECM for monitoring of the high-voltage cable interlock circuit and control of the contactors. The high-voltage BEC also houses the current sensor which is monitored by the BPSM . The current sensor is used to help determine the load or rate of charge of the HVTB by sensing current flow into or out of the HVTB .

High-Voltage Cable Assembly

All cables that carry high voltage are integrated into one high-voltage cable assembly that runs between the

DC/DC , the eCVT , the ACCM and the HVTB (via the high-voltage BEC). Within the high-voltage cable assembly are 4 basic circuits:

- The high-voltage/high-current cables between the HVTB and the eCVT .
- The high-voltage/low-current cables from the HVTB to the DC/DC and the ACCM .
- The interlock circuit consists of small-gauge wiring wrapped around the high-voltage cables. The interlock circuit connectors are built in with the high-voltage cable connectors, and are either disconnected simultaneously with the high-voltage cable or must be disconnected before disconnecting the high-voltage cable, depending upon the type of connector being serviced.
- The LED and high-voltage AC wiring between the DC/AC inverter and AC power point. For information on the DC/AC inverter system, refer to Section 414-05 .

High Voltage Traction Battery (HVTB)

The HVTB is a nominal 275 volts (actual operating range of 179-343 volts) DC energy source that receives high-voltage electrical power when required from the eCVT . The HVTB also supplies high-voltage electrical power when required to the eCVT , DC/DC and/or the ACCM .

The HVTB system is connected to a floating ground system that keeps it isolated from the vehicle's 12-volt system. All charging and maintenance of the HVTB is managed by the BECM . Sensing of the HVTB (battery state-of-charge, internal temperature, battery load) is done by the BPSM .

HVTB Service Disconnect Plug

The HVTB uses a service disconnect plug which connects directly to the HVTB . The service disconnect plug has an internal circuit which includes a fuse. When the service disconnect plug is removed from the HVTB , high voltage is no longer supplied to the high-voltage BEC , although there is still high voltage available on 2 circuits monitored by the BPSM .

R-Mode Rebalance

Individual cells can deviate over the life of the HVTB . The purpose of the R-Mode Rebalance is to equalize the individual cell charges. By rebalancing the cells the HVTB will maintain top efficiency. The rebalance process charges the battery pack to near a full state of charge and keeps each individual cell charge within a prescribed range of each other. The R-Mode Rebalance is sometimes run during vehicle operation as needed and is controlled by the BECM . In some situations the BECM may not be able to properly adjust the cell levels on its own and a DTC may be set. The DTC would direct the technician to perform a service R-Mode Rebalance. This is done with the use of a scan tool by following the directions within the service function.

Vehicle Shut Down

A vehicle shut down signal is sent when the battery is about to open the contactors due to an internal fault or has just opened the contactors due to an external input (external module commanding contactors to be opened such as a crash event, interlock circuit failure, etc.). When vehicle shut down occurs, the Stop Safely warning indicator will be illuminated warning that the vehicle will be shut down within a matter of seconds and that the operator should pull off the road as soon as possible. Depending on the fault condition that lead to the shut down, the vehicle may or may not re-start if the condition has corrected itself. If the fault condition is severe enough, the fault will have to be repaired and DTCs cleared before the vehicle will re-start.

Inspection and Verification

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes

approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

NOTE: Verify the service disconnect plug is properly inserted and locked into the lock position.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• High-voltage cables • Electronically Controlled Continuously Variable Transmission (eCVT) • Air inlet grille and duct • Air outlet duct • High Voltage Traction Battery (HVTB) cooling fan	• Battery Junction Box (BJB) fuse(s): ♦ 17 (10A) ♦ 47 (10A) ♦ 48 (20A) • Smart Junction Box (SJB) fuse 3 (15A) • Power sustain relay • Circuitry • Air inlet thermistor • HVTB cooling fan • DC to DC Converter Control Module (DC/DC) • eCVT • HVTB • High-voltage Bussed Electrical Center (BEC) • Service disconnect plug • 12-volt battery

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the VCM .

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

8. Carry out the self-test diagnostics for the PCM and the BECM .

9. If the PCM DTCs retrieved are related to a driveability concern, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual before proceeding to the next step.

10. If the BECM DTCs retrieved are related to the concern, go to the Battery Energy Control Module (BECM) DTC Chart to continue diagnosis.

DTC Charts

Battery Energy Control Module (BECM) DTC Chart

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

NOTE: Network DTCs (U-codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, vehicle service procedures such as module reprogramming often set network DTCs. Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery condition, refer to Section 414-01 .

DTC	Description	Action
B10A2:16	Crash Input: Circuit Voltage Below Threshold	MEASURE voltage at Battery Energy Control Module (BECM) C4237A-41, circuit CBB48 (GY/YE), harness side and C4237A-42, circuit CBB48 (GY/YE), harness side. If less than 12 volts, INSPECT Battery Junction Box (BJB) fuse 48 (20A). If the fuse is OK, REPAIR the circuit. If 12 volts is present, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B11D5:68	Restraint Event Notification: Vehicle Disabled: Event Information	**NOTE:** This DTC indicates the Restraints Control Module (RCM) is outputting a fuel cutoff/crash event. RETRIEVE DTCs from the RCM and REFER to Section 501-20B for further diagnosis.
B11D8:11	Restraint Event Notification: Circuit Short To Ground	GO to Pinpoint Test AC .

B11D8:15	Restraint Event Notification: Circuit Short To Battery Or Open	GO to Pinpoint Test AD .
B11D8:31	Restraint Event Notification: No Signal	With the ignition in the ON position, MEASURE frequency at BECM C4237A-46, circuit CR167 (YE/VT) by back-probing the connector. If frequency is 9-11 Hz, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. If frequency is not 9-11 Hz, CHECK RCM and PCM for DTCs. REFER to Section 501-20B or the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If no DTCs are present, INSTALL a new RCM . REFER to Section 501-20B .
B11D8:36	Restraint Event Notification: Signal Frequency Too Low	With the ignition in the ON position, MEASURE frequency at BECM C4237A-46, circuit CR167 (YE/VT) by back-probing the connector. If frequency is 9-11 Hz, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. If frequency is not 9-11 Hz, CHECK RCM and PCM for DTCs. REFER to Section 501-20B or the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If no DTCs are present, INSTALL a new RCM . REFER to Section 501-20B .
B11D8:37	Restraint Event Notification: Signal Frequency Too High	With the ignition in the ON position, MEASURE frequency at BECM C4237A-46, circuit CR167 (YE/VT) by back-probing the connector. If frequency is 9-11 Hz, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. If frequency is not 9-11 Hz, CHECK RCM and PCM for DTCs. REFER to Section 501-20B or the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If no DTCs are present, INSTALL a new RCM . REFER to Section 501-20B .
B11D8:38	Restraint Event Notification: Signal Frequency Incorrect	With the ignition in the ON position, MEASURE frequency at BECM C4237A-46, circuit CR167 (YE/VT) by back-probing the

	Or Open	
U0074:00	Control Module Communication Bus "B" Off: No Sub Type Information	GO to Pinpoint Test AE .
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	**NOTE:** DTC U0100:00 indicates lost communication with the PCM. REFER to Section 418-00 to diagnose the lost communication with the PCM.
U0101:00	Lost Communication with Transmission Control Module (TCM): No Sub Type Information	**NOTE:** DTC U0101:00 indicates lost communication with the TCM . REFER to Section 418-00 to diagnose the lost communication with the TCM .
U0151:00	Lost Communication Restraints Control Module: No Sub Type Information	**NOTE:** DTC U0151:00 indicates lost communication with the RCM . REFER to Section 418-00 to diagnose the lost communication with the RCM .
U0155:00	Lost Communication Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	**NOTE:** DTC U0155:00 indicates lost communication with the IPC module. REFER to Section 418-00 to diagnose the lost communication with the IPC module.
U0298:00	Lost Communication to DC to DC Converter Control Module "A": No Sub Type Information	**NOTE:** DTC U0298:00 indicates lost communication with the DC/DC . REFER to Section 418-00 to diagnose the lost communication with the DC/DC .
U029A:00	Lost Communication with Hybrid Battery Pack Sensor Module: No Sub Type Information	**NOTE:** DTC U029A:00 indicates lost communication with the BPSM . Diagnose any other BECM DTCs first. If no other BECM DTCs are present, check the dedicated CAN circuits BECM C4237B-2, circuit J1-A02, harness side and BPSM C4238B-23, circuit J1-A02, harness side; and between BECM C4237B-18, circuit J1-A18, harness side and BPSM C4238B-22, circuit J1-A18, harness side for faults. If OK, INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U0300:05	Internal Control Module Software Incompatibility: System Programming Failure	CONFIGURE the BECM . REFER to Section 418-01 to CARRY OUT Programmable Module Installation (PMI). If the concern is still present, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U0335:00	Software Incompatibility with Hybrid Battery Pack Sensor Module: No Sub Type Information	CONFIGURE the BECM and BPSM . REFER to Section 418-01 to CARRY OUT Programmable Module Installation (PMI). CLEAR the DTCs. REPEAT the self-test. If the concern is still present, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs.

		REPEAT the self-test. If the concern is still present, INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U0336:00	Software Incompatibility with Restraints Control Module: No Sub Type Information	**NOTE:** DTC U0336:00 indicates the BECM received an undetermined value from the RCM fuel pump cutoff request message. RETRIEVE RCM DTCs. REFER to Section 501-20B for further diagnosis of the RCM .
U0401:66 [a]	Invalid Data Received From ECM/PCM A: Signal Has Too Many Transitions/Events	CARRY OUT PCM self-test. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for further diagnosis of the PCM DTCs.
U0401:68	Invalid Data Received From ECM/PCM A: Event Information	**NOTE:** DTC U0401:68 indicates a High Speed Controller Area Network (HS-CAN) message from the PCM is outside normal limits due to a faulty PCM input. RETRIEVE the PCM DTCs related to engine speed or ambient air temperature. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for further diagnosis of the PCM DTCs.
U0402:68	Invalid Data Received From TCM : Event Information	**NOTE:** DTC U0402:68 indicates a HS-CAN message from the TCM is outside normal limits due to a faulty TCM input. RETRIEVE TCM DTCs related to vehicle speed or high-voltage input. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for further diagnosis of the TCM .
U0424:68	Invalid Data Received From HVAC Control Module: Event Information	**NOTE:** DTC U0424:68 indicates a HS-CAN message from the IC module (gateway message, originates from HVAC control module on Medium Speed Controller Area Network (MS-CAN) is outside normal limits due to a faulty HVAC control module input. RETRIEVE HVAC control module DTCs related to recirculation door, airflow or blower motor operation. REFER to Section 412-00B for further diagnosis of the HVAC control module.
U0452:00	Invalid Data Received From Restraints Control Module: No Sub Type Information	**NOTE:** DTC U0452:00 indicates a HS-CAN message from the RCM is outside normal limits. The BECM received an invalid fuel pump cutoff request message. RETRIEVE RCM DTCs. REFER to Section 501-20B for further diagnosis of the RCM .
U0599:68	Invalid Data Received From DC to DC Converter Control Module "A": Event Information	**NOTE:** DTC U0599:68 indicates a HS-CAN message from the DC/DC is outside normal limits. The BECM received an invalid low-voltage or high-voltage message. RETRIEVE DC/DC DTCs. REFER to Section 414-05 for further diagnosis of the DC/DC .
U1003:49	System Clock: Internal Electronic Failure	CLEAR DTCs and REPEAT self test. If the DTC is still present, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U1006:00		GO to Pinpoint Test AE .

	Sub Network Controller Area Network (CAN) Initialization Failure: No Sub Type Information	
U200D:12	Control Module Output Power A: Circuit Short To Battery	MEASURE voltage at the BECM C4237B-51, circuit J1-A51, harness side with ignition in the OFF position. If no voltage is present, INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. If voltage is present, INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U200D:13	Control Module Output Power A: Circuit Open	MEASURE voltage at the BECM C4237B-51, circuit J1-A51, harness side with ignition in the ON position. If voltage is less than 10 volts, REPAIR the circuit. If voltage is greater than 10 volts, INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U3000:04	Control Module: System Internal Failure	CLEAR DTCs and VERIFY the 12-volt battery is in good condition and fully charged. Let vehicle sit a minimum of 7 hours without an ignition cycle. REPEAT the self-test. If DTC returns, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If DTC does not return, return the vehicle to the customer. Concern is not present at this time.
U3000:41 [a]	Control Module: General Checksum Failure	CLEAR the DTCs. REPEAT the self-test. If DTC returns, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If DTC does not return, return the vehicle to the customer. Concern is not present at this time.
U3000:46	Control Module: Calibration/Parameter Memory Failure	CLEAR the DTCs. REPEAT the self-test. If DTC returns, INSTALL a new BECM and run R-Mode Rebalance using a scan tool. REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If DTC does not return, return the vehicle to the customer. Concern is not present at this time.
U3001:00 [a]	Control Module Improper Shutdown: No Sub Type Information	GO to Pinpoint Test AF .

U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test AF .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test AF .
U3003:62	Battery Voltage: Signal Compare Failure	GO to Pinpoint Test AG .

[a] Reports as a continuous memory (historical) DTC only.

Transmission Control Module (TCM) DTC Chart

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

DTC	Description	Action
P0A0A:00	High Voltage System Interlock Circuit: No Sub Type Information	GO to Pinpoint Test A .
All other DTCs	-	REFER to the Transmission Control Module (TCM) DTC chart in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

Symptom Chart

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

ConditionPossible SourcesAction

- The High Voltage Traction Battery (HVTB) is noisy

- HVTB cooling fan
- Obstructions

- With the ignition in the ON position and the engine ON or OFF, listen in the HVTB area for unusl or excessive noise. COMPARE the noise to a similar vehicle. If noise from the fan is excessive, INSPECT the inlet and outlet air ducts for obstructions. If no obstructions are found and the fan is still noisy, INSTALL a new fan. REFER to High-Voltage Traction Battery Cooling Fan in this section.

- The low-voltage battery is discharged or voltage is low

- 12-volt battery
- DC/DC
- 12-volt battery cables

- REFER to Section 414-05 to diagnose the DC to DC Converter Control Module (DC/DC).

Pinpoint Tests

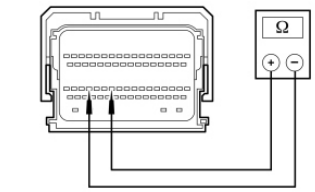
Pinpoint Test A: DTC P0A0A:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The Battery Energy Control Module (BECM) checks for continuity of the high-voltage system interlock circuit. The interlock circuit must have continuity before high-voltage will be supplied to the vehicle. The interlock circuit voltage travels through each of the high-voltage components and high-voltage cables and back to the BECM . This fault will illuminate the stop safely hazard (red triangle) warning indicator and shut down the vehicle.

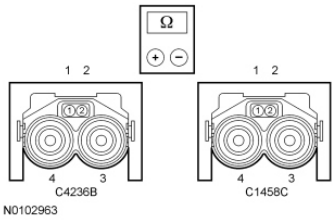
- DTC P0A0A:00 (High Voltage System Interlock Circuit: No Sub Type Information) - Fault sets when the BECM does not sense interlock circuit continuity. This indicates the interlock circuit is open.



This pinpoint test is intended to diagnose the following:
- Air Conditioning Compressor Module (ACCM)
- BECM
- DC to DC Converter ControModule (DC/DC)
- Transmission Control Module (TCM) (part of Electronically Controlled Continuously Variable Transmission (eCVT))
- High-voltage cables

PINPOINT TEST A: DTC P0A0A:00

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take

A1 CHECK BECM PID HIGH VOLTAGE INTERLOCK INPUT STATUS (VOLTINTINP)	
• Ignition ON. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Monitor the BECM PID VOLTINTINP. • **Does the PID VOLTINTINP read closed?**	**Yes** Concern is not present at this time and may be intermittent. INSPECT all high-voltage connections. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A2 .
A2 MEASURE RESISTANCE OF INTERLOCK CIRCUIT	
• Ignition OFF. • Disconnect: BECM C4237B. • Measure the resistance between BECM C4237B-44, circuit J1-A44 harness side and BECM C4237B-47, circuit J1-A47 harness side.  N0108918 • Repeat the measurement between BECM C4237B-44, circuit J1-A44 harness side and BECM C4237B-47, circuit J1-A47 harness side while wiggling the connectors and flexing the wire harness, where accessible. • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A3 .
A3 CHECK INTERLOCK CIRCUIT TO TCM	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the High Voltage Traction Battery (HVTB) system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Disconnect: High-voltage Bussed Electrical Center (BEC) C4236B. • Disconnect: TCM C1458C.	**Yes** GO to A4 . **No** INSTALL new high-voltage cables. REFER to High-Voltage Cables in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

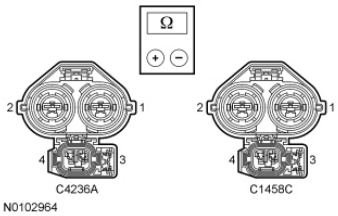
- Measure the resistance between high-voltage BEC C4236B, harness side and TCM C1458C, harness side as follows:

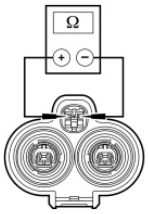
BEC C4236B	Circuit	TCM C1458C
C4236B-1	CYB04 (VT/BN)	C1458C-1
C4236B-2	CYB03 (BN/YE)	C1458C-2

- Repeat the measurement between BEC C4236B, harness side and TCM C1458C, harness side while wiggling the connectors and flexing the wire harness, where accessible.
- **Are the resistances less than 5 ohms?**

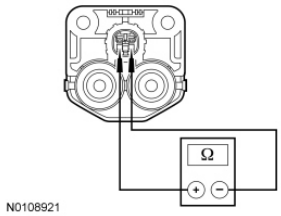
A4 CHECK INTERLOCK CIRCUIT TO ACCM AND DC/DC

- Disconnect: BEC C4236A.
- Disconnect: ACCM C1469B.
- Disconnect: DC/DC C1457A.
- Measure the resistance between high-voltage BEC C4236A, harness side, ACCM C1469B, harness side and DC/DC C1457A, harness side as follows:





BEC C4236A	Circuit	DC/DC C1457A
C4236A-3	CYD02 (WH/BN)	C1457A-3



BEC C4236A	Circuit	ACCM C1469B
C4236A-4	CYB03 (BN/YE)	C1469B-4

ACCM C1469B	Circuit	DC/DC C1457A
C1469B-3	CYD01 (BN/WH)	C1457A-4

Yes
GO to A5 .

No
INSTALL new high-voltage cables. REFER to High-Voltage Cables in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0102964 • Repeat the measurements between BEC C4236A, harness side, ACCM C1469B, and DC/DC C1457A, harness side while wiggling the connectors and flexing the wire harness, where accessible. • **Are the resistances less than 5 ohms?**	
A5 CHECK DC/DC INTERLOCK RESISTANCE	
• Measure the resistance between DC/DC C1457A pin 3 and pin 4, component side.  N0108919 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** INSTALL a new DC/DC . REFER to Section 414-05 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A6 CHECK ACCM INTERLOCK RESISTANCE	
• Measure the resistance between ACCM C1469B, pin 3 and pin 4, component side.  N0108920 • **Is the resistance less than 5 ohms?**	**Yes** GO to A7 . **No** INSTALL a new ACCM and A/C compressor assembly. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
A7 CHECK TCM INTERLOCK RESISTANCE	
• Measure the resistance between TCM C1458C, pin 1 and pin 2, component side.	**Yes** GO to A8 . **No** INSTALL a eCVT . REFER to Section 307-01C . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
A8 CHECK THE HIGH-VOLTAGE CABLES USING BECM PID HIGH VOLTAGE INTERLOCK INPUT STATUS (VOLTINTINP)	
• Install new high-voltage cables. Refer to High-Voltage Cables in this section. • Connect the 12-volt battery. Refer to Section 414-01 . • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Monitor the BECM PID VOLTINTINP. • **Does the PID VOLTINTINP read closed?**	**Yes** Repair is complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to A9 .
A9 CHECK THE DC/DC USING BECM PID HIGH VOLTAGE INTERLOCK INPUT STATUS (VOLTINTINP)	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Install a new DC/DC . Refer to Section 414-05 . • Connect the 12-volt battery. Refer to Section 414-01 . • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Monitor the BECM PID VOLTINTINP. • **Does the PID VOLTINTINP read closed?**	**Yes** Repair is complete. CLEAR the DTCs. REPEAT the self-test. TEST the systefor normal operation. **No** GO to A10 .
A10 CHECK THE ACCM USING BECM PID HIGH VOLTAGE INTERLOCK INPUT STATUS (VOLTINTINP)	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal**	**Yes** Repair is complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No**

injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Install a new ACCM . Refer to Section 412-01 . • Connect the 12-volt battery. Refer to Section 414-01 . • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Monitor the BECM PID VOLTINTINP. • **Does the PID VOLTINTINP readlosed?**	GO to A11 .
A11 CHECK THE HVTB USING BECM PID HIGH VOLTAGE INTERLOCK INPUT STATUS (VOLTINTINP)	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Install a new HVTB (includes HVTB system wire harness). Refer to High-Voltage Traction Battery in this section. • Connect the 12-volt battery. Refer to Section 414-01 . • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Monitor the BECM PID VOLTINTINP. • **Does the PID VOLTINTINP read closed?**	**Yes** Repair is complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new eCVT . REFER to Section 307-01C . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: DTC P0A7D:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The Battery Energy Control Module (BECM) monitors the High Voltage Traction Battery (HVTB) state-of-charge. When voltage drops to a low level, the vehicle will shut down and/or will not start/re-start until the voltage level has been increased to a nominal level. This condition may occur if the vehicle has been stored for an extended period of time. The stop safely hazard (red triangle) warning indicator will illuminate and the vehicle will shut down and not re-start.

- P0A7D:00 (Hybrid Battery Pack State Of Charge Low: No Sub Type Information) - Fault sets when the ignition switch is first turned to the ON position, or when the ignition switch is in the START position and battery pack voltage falls below a threshold. Reports as a continous memory (historical) DTC only.

This pinpoint test is intended to diagnose the following:

- HVTB

PINPOINT TEST B: DTC P0A7D:00

Test Step	Result / Action to Take
B1 RETRIEVE ALL BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Do any DTCs other than P0A7D:00 exist?**	**Yes** REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to B2 .
B2 MONITOR BECM PIDs HYBRID BATTERY MINIMUM BATTERY MODULE VOLTAGE (HEVMINVOLT) AND HYBRID BATTERY PACK VOLTAGE (BATPACKVOLT)	
• Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Monitor BECM PIDs HEVMINVOLT and BATPACKVOLT. • **Is HEVMINVOLT above 4.8 volts and/or BATPACKVOLT above 158 volts?**	**Yes** Concern not present at this time. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: DTC P0A7E:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

With the ignition in the ON position and the engine running or OFF, the Battery Energy Control Module (BECM) monitors and maintains the High Voltage Traction Battery (HVTB) temperature within a specific range. The HVTB has an external fan that circulates air within the HVTB so a specific temperature range is maintained. A thermistor is mounted to the inlet air duct which monitors inlet air temperature along with 5 thermistors inside the HVTB which all monitor HVTB temperature. The ideal HVTB temperature is 25°C

(77°F) with a desired range of 20°C (68°F) to 30°C (86°F). The BECM will shut the vehicle down and the powertrain malfunction (wrench) warning indicator will illuminate when the fault condition is present.

- DTC P0A7E:00 (Hybrid Battery Pack Over Temperature: No Sub Type Information) - Fault sets if the HVTB temperature exceeds 60°C (140°F).

This pinpoint test is intended to diagnose the following:

- HVTB fan
- HVTB inlet air duct
- BECM

PINPOINT TEST C: DTC P0A7E:00

Test Step	Result / Action to Take
C1 CHECK BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0A81:00 or P0A82:00 retrieved?**	**Yes** For DTC P0A81:00, GO to Pinpoint Test D . For DTC P0A82:00, GO to Pinpoint Test E . **No** GO to C2 .
C2 VERIFY THE HVTB FAN IS OPERATIONAL	
• Carry out the self-test of the BECM while noting the HVTB cooling fan operation. • **Did the HVTB cooling fan operate during self-test?**	**Yes** GO to C3 . **No** GO to Pinpoint Test D .
C3 VERIFY THE VEHICLE INLET AND OUTLET AIR DUCTS ARE CLEAR	
• Ignition OFF. • Open the trunk and fold down the rear seat back to gain access to the HVTB . • Check the outlet air duct in the trunk on the side of the battery and air inlet duct at the bottom of the battery in the passenger compartment for any debris or obstruction. • **Are the inlet and outlet air ducts free of debris or obstructions?**	**Yes** GO to C4 . **No** REMOVE the debris or obstruction from air inlet or outlet duct. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C4 CHECK THE HVTB FAN OPERATION	
• Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Monitor the BECM PIDs Fan Speed Demanded (FAN_DEM) and Fan Speed Indicated (FAN_IND). • Using the output state control FAN_DEM,	**Yes** GO to C5 . **No** INSTALL a new HVTB cooling fan. REFER to High-Voltage Traction Battery Cooling Fan in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

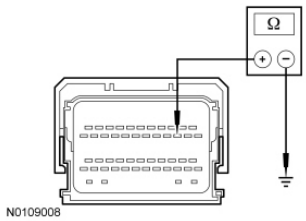
set the fan speed to 3,000 rpm. • Monitor the PID FAN_IND. • **Does the PID FAN_IND read between 2,400 and 3,150?**	
C5 CHECK BECM PID HYBRID BATTERY TEMPERATURE (BATT_TEMP)	
• Drive the vehicle while monitoring the BECM PIDs FAN_IND and BATT_TEMP. • When PID BATT_TEMP reaches 35°C (95°F) monitor PID FAN_IND. • **Does PID FAN_IND read at least 1,500 rpm?**	**Yes** GO to C6 . **No** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
C6 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: DTC P0A81:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

With the ignition in the ON position and the engine running or OFF (the engine must have started at least once after the ignition was cycled to ON), the external fan for the High Voltage Traction Battery (HVTB) circulates air to maintain a specific temperature range. The fan operation is controlled by the Battery Energy Control Module (BECM) based upon information received from thermistors located inside the HVTB . The stop safely hazard (red triangle) warning indicator or powertrain malfunction (wrench) warning indicator will illuminate when a fault condition is present.



- P0A81:00 (Hybrid Battery Pack Cooling Fan 1 Control Circuit Open: No Sub Type Information) - Fault sets if the BECM fan control output circuit indicates a fault for 5 seconds or more.

This pinpoint test is intended to diagnose the following:

- BECM
- Cooling fan
- HVTB

PINPOINT TEST D: DTC P0A81:00

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 RETRIEVE ALL BECM DTCs	
• Ignition OFF. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: lf-Test - BECM . • **Is DTC P0A81:00 or P0A82:00 present?**	**Yes** GO to D2 . **No** INSPECT inline C4013 and HVTB cooling fan C4232 for pushed-out or corroded pins and REPAIR as necessary. WIGGLE the wiring harness. REPEAT the self-test. If DTC P0A81:00 or DTC P0A82:00 is retrieved, GO to D2 . If no DTCs are retrieved, The concern may have been caused by pushed-out or corroded pins. RETURN the vehicle to the customer.
D2 CHECK FOR A SHORT TO GROUND IN THE FAN CONTROL CIRCUIT	
• Ignition OFF. • Disconnect: HVTB Cooling Fan C4232. • Disconnect: BECM C4237A. • Measure the resistance between BECM C4237A-14, circuit VYB18 (WH/GN), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D3 CHECK HVTB COOLING FAN GROUND CIRCUIT	
• Connect: BECM C4237A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM (fan still disconnected).	**Yes** INSTALL a new fan. REFER to High-Voltage Traction Battery Cooling Fan in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• **Is DTC P0A82:00 present?**	**No** GO to D4 .
D4 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test E: DTC P0A82:00

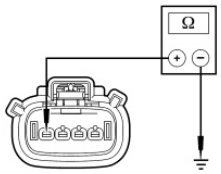
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

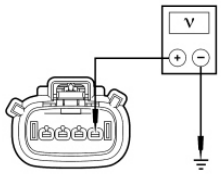
Normal Operation

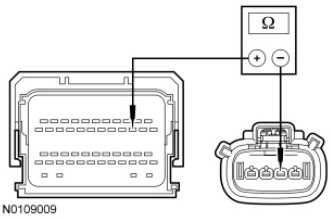
With the ignition in the ON position and the engine running or OFF (the engine must have started at least once after the ignition was cycled to ON), the external fan for the High Voltage Traction Battery (HVTB) circulates air to maintain a specific temperature range. The fan operation is controlled by the Battery Energy Control Module (BECM) based upon information received from thermistors located inside the HVTB . The BECM monitors the frequency returned to the BECM from the fan to determine actual fan speed. This signal may be incorrect if the fan or wiring are at fault. Powertrain malfunction (wrench) warning indicator will illuminate.

- P0A82:00 (Hybrid Battery Pack Cooling Fan 1 Performance/Stuck Off: No Sub Type Information) - Fault sets when cooling fan speed does not match what was commanded by the BECM for 8 seconds.

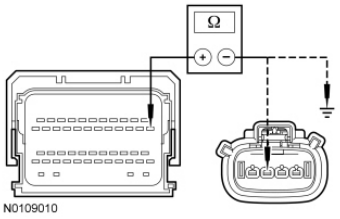
This pinpoint test is intended to diagnose the following:

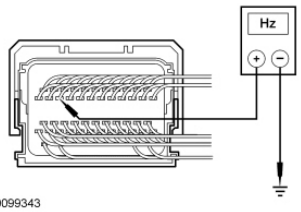




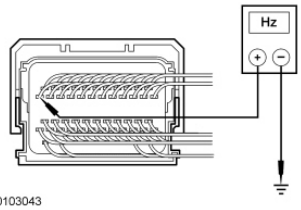


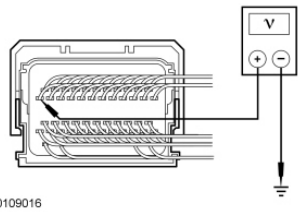
- Fuse
- Wiring, terminals or connectors
- HVTB cooling fan
- BECM





PINPOINT TEST E: DTC P0A82:00





NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 RETRIEVE ALL BECM DTCs	
• Ignition OFF. • Connect the scan tool.	**Yes** GO to E2 .

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self-Test - BECM . • **Is DTC P0A81:00 or P0A82:00 present?**	**No** INSPECT inline C4013 and HVTB cooling fan C4232 for pushed-out or corroded pins and REPAIR as necessary. WIGGLE the wiring harness. REPEAT the self-test. If DTC P0A81:00 or DTC P0A82:00 is retrieved, GO to E2 . If no DTCs are retrieved, The concern may have been caused by pushed-out or corroded pins. RETURN the vehicle to the customer.
E2 VERIFY THE VEHICLE INLET AND OUTLET AIR DUCTS ARE CLEAR	
• Ignition OFF. • Open the trunk and fold down the rear seat back to gain access to the HVTB . • Check the outlet air duct in the trunk on the side of the battery and air inlet duct at the bottom of the battery in the passenger compartment for any debris or obstruction. • **Are the inlet and outlet air ducts free of debris or obstructions?**	**Yes** GO to E3 . **No** REMOVE the debris or obstruction from air inlet or outlet duct. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E3 CHECK HVTB COOLING FAN SPEED	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Ignition in the ON position. • Using the output state control PID Fan Speed Demanded (FAN_DEM), set the HVTB cooling fan speed to approximately 3,000 rpm. • Monitor the PID Fan Speed Indicated (FAN_IND). • **Does the PID FAN_IND read between 2,700 and 3,300?**	**Yes** END output state control. GO to E8 . **No** END output state control. GO to E4 .
E4 CHECK HVTB COOLING FAN GROUND CIRCUIT	
• Ignition OFF. • Disconnect: HVTB Cooling Fan C4232. • Measure the resistance between HVTB cooling fan C4232-4, circuit GD128 (BK/GN), harness side and ground.	**Yes** GO to E5 . **No** REPAIR high resistance or an open in the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0099345 • **Is the resistance less than 5 ohms?**	
E5 CHECK HVTB COOLING FAN POWER CIRCUIT	
• Ignition ON. • Measure the voltage between HVTB cooling fan C4232-1, circuit SBP03 (BU/RD), harness side and ground.  N0099344 • **Is the voltage greater than 10 volts?**	**Yes** GO to E6 . **No** VERIFY the Smart Junction Box (SJB) fuse 3 (15A) is OK. If the fuse is OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E6 CHECK FOR AN OPEN FAN CONTROL CIRCUIT	
• Ignition OFF. • Disconnect: BECM C4237A. • Measure the resistance between BECM C4237A-14, circuit VYB18 (WH/GN), harness side and HVTB cooling fan C4232-2, circuit VYB18 (WH/GN), harness side .  N0109009 • **Is the resistance less than 5 ohms?**	**Yes** GO to E7 . **No** REPAIR high resistance or an open in the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E7 CHECK FOR AN OPEN OR A SHORT TO GROUND IN THE FAN FEEDBACK CIRCUIT	
• Measure the resistance between BECM C4237A-12, circuit VYB19 (GY/VT), harness side and HVTB cooling fan C4232-3, circuit VYB19 (GY/VT), harness side.	**Yes** GO to E8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for

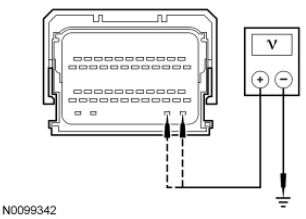
• Measure the resistance between BECM C4237A-12, circuit VYB19 (GY/VT), harness side and ground.  • **Is the resistance of the circuit less than 5 ohms and greater than 10,000 ohms to ground?**	normal operation.
E8 MEASURE SIGNAL FROM BECM FOR FAN CONTROL CIRCUIT	
• Connect: BECM C4237A (leave fan disconnected). • Ignition ON. • Using the output state control PID Fan Speed Demanded (FAN_DEM), set the HVTB cooling fan speed to approximately 3,000 rpm. • Measure the frequency by back-probing between BECM C4237A-14, circuit VYB18 (WH/GN), harness side and ground.  • **Is the frequency approximately 90-110 Hz?**	**Yes** GO to E9 . **No** GO to E11 .
E9 MEASURE SIGNAL FROM BECM FOR FAN FEEDBACK CIRCUIT	
• With the ignition still in the ON position and the HVTB cooling fan still commanded to 3,000 rpm, measure the frequency by back-probing between BECM C4237A-12, circuit VYB19 (GY/VT), harness side and ground.	**Yes** GO to E11 . **No** GO to E10 .

 • **Is the frequency approximately 205-245 Hz?**	
E10 MEASURE VOLTAGE FROM BECM FOR FAN FEEDBACK CIRCUIT	
• With the ignition still in the ON position and the HVTB cooling fan still commanded to 3,000 rpm, measure the voltage by back-probing between BECM C4237A-12, circuit VYB19 (GY/VT), harness side and ground.  • **Is the voltage approximately 3 to 7 volts?**	**Yes** GO to E11 . **No** INSTALL a new HVTB cooling fan. REFER to High-Voltage Traction Battery Cooling Fan in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
E11 CHECK FOR CORRECT BECM OPERATION	
• Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self-Test - BECM . • Operate the system and determine if the concern is still present. • **Is the original DTC stilesent?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

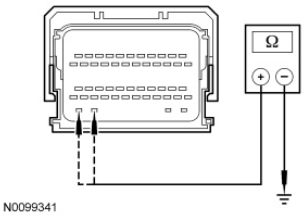
Pinpoint Test F: DTCs P0A8B:64

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation



With the ignition in the ON position and the engine running or OFF (the engine must have started at least once after the ignition was cycled to ON), the Electronically Controlled Continuously Variable Transmission (eCVT) engages the generator (also in the eCVT), which charges the High Voltage Traction Battery (HVTB) and supplies high-voltage to the DC to DC Converter Control Module (DC/DC). The DC/DC charges the low-voltage battery which is used to power the PCM and low voltage components. The DC/DC steps the high voltage down to 12 volts (operating range of 13.3-14.7 volts). This DTC may indicate a low state-of-charge in the 12-volt battery or a Battery Energy Control Module (BECM) fault. If the 12-volt battery has recently had the terminals disconnected/cleaned or if a new 12-volt battery has been recently installed, this DTC will also be set. When a fault is present, the system will attempt to continue normal operation. There is no warning indicator for this fault.



- DTC P0A8B:64 (14 Volt Power Module System Voltage: Signal Plausibility) - Fault sets when voltage less than 2.5 volts or greater than 25 volts on the BECM input circuit is detected.

This pinpoint test is intended to diagnose the following:
- 12-volt battery
- Circuitry
- BECM

PINPOINT TEST F: DTC P0A8B:64

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 CHECK FOR 12-VOLT INPUT	
• Ignition OFF. • Disconnect: BECM C4237A. • Ignition ON. • Measure the voltage between BECM C4237A-47, circuit SBB17 (RD), harness side and ground; and between BECM C4237A-48, circuit SBB17 (RD), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to F2 . **No** VERIFY the Smart Junction Box (SJB) fuse 17 (10A) is OK. If the fuse is OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
F2 CHECK FOR GROUND CIRCUIT	

• Ignition OFF. • Measure the resistance between BECM C4237A-49, circuit GD126 (BK/WH), harness side and ground; and between BECM C4237A-50, circuit GD126 (BK/WH), harness side and ground.  • **Are the resistances less than 5 ohms?**	**Yes** GO to F3 . **No** REPAIR the circuit(s) as necessary. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
F3 CHECK FOR CORRECT BECM OPERATION	
• Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test G: DTC P0A9D:00 or P0A9E:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

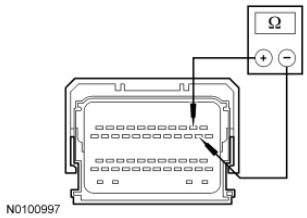
With the ignition in the ON position and the engine running or OFF, the Battery Pack Sensor Module (BPSM) monitors the High Voltage Traction Battery (HVTB) internal temperature. The BPSM communicates the HVTB temperature (in addition to other information) to the Battery Energy Control Module (BECM) through a dedicated Controller Area Network (CAN). There is also a HVTB inlet air temperature sensor mounted to the inlet air duct which monitors inlet air temperature to the HVTB . The BECM uses the information from the various temperature sensors to control and maintain HVTB temperature by controlling the HVTB cooling fan. The ideal HVTB temperature is 25°C (77°F) with a desired range of 20°C (68°F) to 30°C (86°F).

- P0A9D:00 (Hybrid Battery Temperature Sensor A Circuit Low: No Sub Type Information) - Fault sets if BECM senses an open or short to ground in the thermistor circuitry.
- P0A9E:00 (Hybrid Battery Temperature Sensor A Circuit High: No Sub Type Information) - Fault sets if BECM senses a short to power in the thermistor circuitry.

This pinpoint test is intended to diagnose the following:
- HVTB

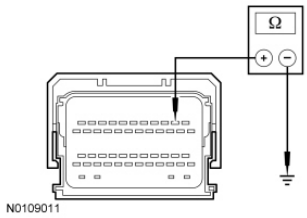
- BPSM

PINPOINT TEST G: DTCs P0A9D:00 OR P0A9E:00



⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 MEASURE THERMISTOR RESISTANCE FROM BPSM	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: BPSM C4238B. • Measure the resistance between BPSM C4238B-2, circuit J2-B2, harness side and BPSM C4238B-13, circuit J2-B13, harness side. Use the following table to determine if the resistance values are correct.	**Yes** GO to G2 . **No** INSTALL a HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Temperature Range	Resistance Range
-30°C (-22°F) to -21°C (-5°F)	132,571 ohms - 76,491 ohms
-20°C (-4°F) to -11°C (13°F)	77,380 ohms - 46,573 ohms
-10°C (14°F) - 0°C (32°F)	46,762 ohms - 27,965 ohms
0°C (32°F) - 10°C (51°F)	29,164 ohms - 18,115 ohms
11°C (52°F) - 20°C (68°F)	17,931 ohms - 12,037 ohms
21°C (69°F) - 30°C (86°F)	11,842 ohms - 8,155 ohms
31°C (87°F) - 40°C (104°F)	7,850 ohms - 5,624 ohms
41°C (105°F) - 50°C (122°F)	5,602 ohms - 3,957 ohms

- **Is the resistance value correct for the temperature?**

G2 CHECK THERMISTOR FOR A SHORT TO GROUND	
• Measure the resistance between BPSM C4238B-2, circuit J2-B2, harness side and the battery case.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

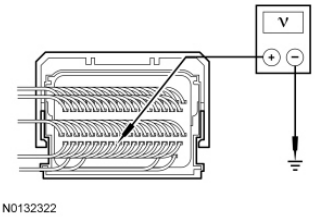
Pinpoint Test H: DTC P0AA1:00 or P0AA2:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

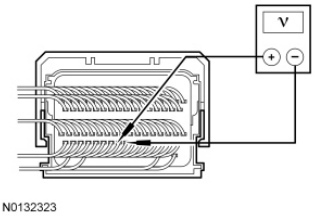
Normal Operation

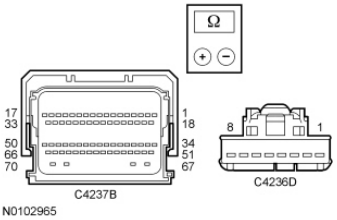
When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close and supply high-voltage power to the vehicle. The stop safely hazard (red triangle) warning indicator will illuminate for both DTCs. For DTC P0AA1:00, the vehicle will not start at next ignition cycle. For P0AA2:00, the vehicle is shut down.

- DTC P0AA1:00 (Hybrid Battery Positive Contactor Circuit Stuck Closed: No Sub Type Information) - If the contactor is stuck closed, this DTC will be set.
- DTC P0AA2:00 (Hybrid Battery Positive Contactor Circuit Stuck Open: No Sub Type Information) - If the contactor is stuck open for 2 seconds, this DTC will be set. Reports as a continuous memory (historical) DTC only.



This pinpoint test is intended to diagnose the following:





- High-voltage Bussed Electrical Center (BEC)
- BECM
- High Voltage Traction Battery (HVTB)

PINPOINT TEST H: DTC P0AA1:00 OR P0AA2:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 MEASURE VOLTAGE AT THE BECM CONNECTOR	
• Ignition ON. • Measure the voltage between BECM C4237B-58, circuit J1-A58, harness side and ground by back-probing the BECM connector.  N0132322 • **Is the voltage between 5-6 volts?**	**Yes** GO to H2 . **No** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H2 MEASURE VOLTAGE AT THE BECM CONNECTOR	

• Measure the voltage between BECM C4237B-58, circuit J1-A58, harness side and BECM C4237B-59, circuit J1-A59, harness side by back-probing the BECM connector.  N0132323 • **Is the voltage between 5-6 volts?**	**Yes** GO to H3 . **No** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H3 CHECK CONTACTOR WIRING	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: BECM C4237B. • Disconnect: High-voltage BEC C4236D. • Measure the resistance between high-voltage BEC C4236D-1, circuit J1-A58, harness side and BECM C4237B-58, circuit J1-A58, harness side; and between high-voltage BEC C4236D-2, circuit J1-A59 harness side and BECM C4237B-59, circuit J1-A59, harness side.  N0102965 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

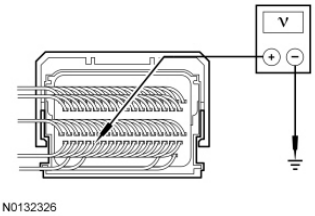
Pinpoint Test I: DTC P0AA4:00 or P0AA5:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

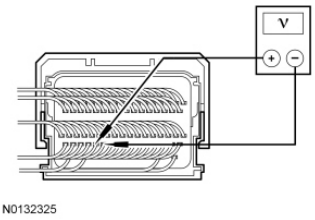
Normal Operation

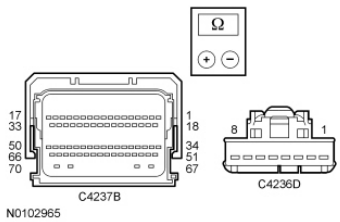
When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close which will supply power to the vehicle. The stop safely hazard (red triangle) warning indicator will illuminate for both DTCs. For DTC P0AA4:00, the vehicle will not start at the next ignition cycle. For P0AA5:00, the vehicle is shut down.

- DTC P0AA4:00 (Hybrid Battery Negative Contactor Circuit Stuck Closed: No Sub Type Information) - If the contactor is stuck closed, this DTC will be set. Reports as a continous memory (historical) DTC only.
- DTC P0AA5:00 (Hybrid Battery Negative Contactor Circuit Stuck Open: No Sub Type Information) - If the contactor is stuck open for 2 seconds, this DTC will be set.



This pinpoint test is intended to diagnose the following:





- BECM
- High-voltage Bussed Electrical Center (BEC)
- High Voltage Traction Battery (HVTB)

PINPOINT TEST I: DTC P0AA4:00 OR P0AA5:00

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orangee covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
I1 MEASURE VOLTAGE AT THE BECM CONNECTOR	
• Ignition ON. • Measure voltage between BECM C4237B-55, circuit J1-A55 harness side and ground, by back-probing the BECM connector.  N0132326 • **Is the voltage between 5-6 volts?**	**Yes** GO to I2 . **No** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I2 MEASURE VOLTAGE AT THE BECM CONNECTOR	

• Ignition ON. • Measure voltage between BECM C4237B-55, circuit J1-A55, harness side, and BECM C4237B-56, circuit J1-A56, harness side, by back-probing the BECM connector.  N0132325 • **Is the voltage between 5-6 volts?**	**Yes** GO to I3 . **No** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
I3 CHECK CONTACTOR WIRING	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery Refer to Section 414-01 . • Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: BECM C4237B. • Disconnect: High-voltage BEC C4236D. • Measure the resistance between high-voltage BEC C4236D-7, circuit J1-A55, harness side and BECM C4237B-55, circuit J1-A55, harness side; and between high-voltage BEC C4236D-8, circuit J1-A56, harness side and BECM C4237B-56, circuit J1-A56, harness side.  N0102965 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test J: DTC P0AA6:00

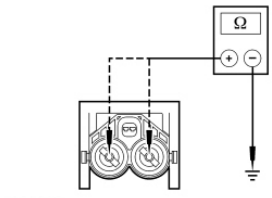
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

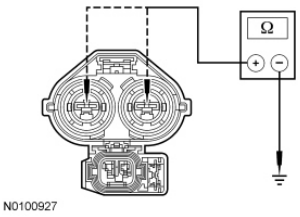
With the ignition in the ON position and the engine running or OFF (the engine must have run at least once after the ignition was cycled to ON), the Battery Energy Control Module (BECM) monitors the electrical isolation (leakage resistance) between the high-voltage system and the vehicle chassis. A resistance value of less than 147,000 ohms is a failure. There are 2 types of failures. A mild fault will only illuminate the powertrain malfunction (wrench) warning indicator. A severe fault will illuminate the stop safely hazard (red triangle) warning indicator and the vehicle will not start at the next ignition cycle. The normal resistance value is between 950,000-1,330,000+ ohms.

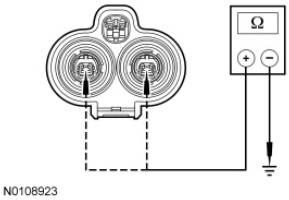
- DTC P0AA6:00 (Hybrid Battery Voltage System Isolation Fault: No Sub Type Information) - If the BECM detects a high-voltage system leakage this DTC will be set. If the BECM detects a high-voltage system severe leakage, the vehicle will not restart and the BECM will set this DTC.

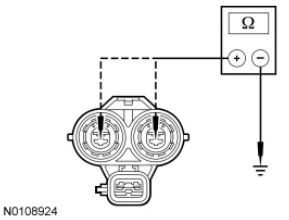
This pinpoint is intended to diagnose the following:
- DC to DC Converter Control Module (DC/DC)
- High-voltage cables
- High Voltage Traction Battery (HVTB)
- Electronically Controlled Continuously Variable Transmission (eCVT)
- Moisture/water penetration of high-voltage connectors
- A/C compressor



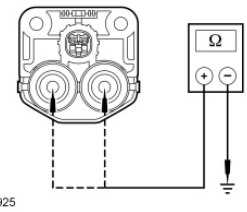
PINPOINT TEST J: DTC P0AA6:00







⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. Theigh-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: If DTC P0A78 or DTC P0A7A is present in the Transmission Control Module (TCM), diagnose those DTCs first. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Test Step	Result / Action to Take
J1 MONITOR THE LEAKAGE RESISTANCE PIDs	
• Ignition ON. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • **NOTE:** Clear the BECM DTCs or the vehicle may not start. • Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • With the engine running, monitor the following BECM PIDs:	**Yes** CLEAR the DTCs. REPEAT the self-test. If the DTC is not present at this time, INSPECT the high-voltage system for any physical damage. With the service plug disconnected, INSPECT the high-voltage cables between the HVTB and eCVT and between HVTB and DC/DC or A/C compressor for chafing or damaged insulation. If damage is found, INSTALL new-high voltage cables. REFER to High-Voltage Cables in this section. If no damage was found,

♦ Leakage Resistance (Bus+) PID (LEAKRESPOS) ♦ Leakage Resistance (Bus-) PID (LEAKRESNEG) ♦ Leakage Resistance (Overall) PID (LEAKRESALL) • **Do the PIDs read greater than 147,000 ohms for at least 10 seconds?**	RETURN the vehicle to the customer. **No** GO to J2 .
J2 CHECK THE HVTB TO TCM HIGH-VOLTAGE CABLES	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Disconnect: High-Voltage Bussed Electrical Center (BEC) C4236B. • Disconnect: TCM C1458C. • Measure the resistance between high-voltage BEC C4236B-3, circuit HYT04 (OG/BK), harness side and ground; and between high-voltage BEC C4236B-4, circuit HYT03 (OG/BK), harness side and ground while performing a wiggle test of the high-voltage cables.  N0100926 • **Are the resistances greater than 147,000 ohms?**	**Yes** GO to J3 **No** INSTALL new high-voltage cables. REFER to High-Voltage Cables in this section.
J3 CHECK THE ACCM AND DC/DC HIGH VOLTAGE CABLES	
• Disconnect: ACCM C1469B. • Disconnect: High-Voltage BEC C4236A. • Disconnect: DC/DC C1457A. • Measure the resistance between DC/DC C1457A-2, circuit HYT03 (OG/WH), harness side and ground; and between DC/DC C1457A-1, circuit HYT04	**Yes** GO to J4 . **No** INSTALL new high-voltage cables. REFER to High-Voltage Cables in this section. CLEAR the DTCs. REPEAT the

(OG/BK), harness side and ground while performing a wiggle test of the high-voltage cables.  N0100927 • **Are the resistances greater than 147,000 ohms?**	self-test. TEST the system for normal operation.
J4 CHECK THE DC/DC	
• Measure the resistance between DC/DC C1457 pin 1, component side and ground; and between DC/DC C1457 pin 2, component side and ground.  N0108923 • **Are the resistances greater than 147,000 ohms?**	**Yes** GO to J5 . **No** INSTALL a new DC/DC . REFER to DC/DC in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
J5 CHECK THE ACCM	
• Measure the resistance between Air Conditioning Compressor Module (ACCM) C1469B pin 1, component side and ground; and between ACCM C1469B pin 2, component side and ground.  N0108924 • **Are the resistances greater than 147,000 ohms?**	**Yes** GO to J6 . **No** INSTALL a new ACCM and A/C compressor assembly. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
J6 CHECK THE TCM	
• Measure the resistance between Transmission Control Module (TCM) C1458C pin 3, component side and ground; and between TCM C1458C pin 4, component side and ground.	**Yes** GO to J7 . **No** INSTALL a new Electronically Controlled Continuously Variable Transmission (eCVT). REFER to Section

 • **Are the resistances greater than 147,000 ohms?**	307-01C . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
J7 CHECK THE HIGH-VOLTAGE CABLES	
• Install new high-voltage cables. Refer to High-Voltage Cables in this section. • Connect the 12-volt battery. Refer to Section 414-01 . • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • **NOTE:** Clear the BECM DTCs or the vehicle may not start. • Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • With the engine running, monitor the following BECM PIDs: ♦ Leakage Resistance (Bus+) PID (LEAKRESPOS) ♦ Leakage Resistance (Bus-) PID (LEAKRESNEG) ♦ Leakage Resistance (Overall) PID (LEAKRESALL) • **Do the PIDs read greater than 147,000 ohms for at least 10 seconds?**	**Yes** Repair is complete. TEST the system for normal operation. **No** GO to J8 .
J8 CHECK THE DC/DC	
WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Install a new DC/DC . Refer to Section 414-05 . • Connect the 12-volt battery. Refer to Section 414-01 . • Connect: Service Disconnect Plug. • Ignition ON.	**Yes** Repair is complete. TEST the system for normal operation. **No** GO to J9 .

• Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • **NOTE:** Clear the BECM DTCs or the vehicle may not start. • Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • With the engine running, monitor the following BECM PIDs: ♦ Leakage Resistance (Bus+) PID (LEAKRESPOS) ♦ Leakage Resistance (Bus-) PID (LEAKRESNEG) ♦ Leakage Resistance (Overall) PID (LEAKRESALL) • **Do the PIDs read greater than 147,000 ohms for at least 10 seconds?**	
J9 CHECK THE ACCM	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Install a new ACCM . Refer to Section 412-01 . • Connect the 12-volt battery. Refer to Section 414-01 . • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • **NOTE:** Clear the BECM DTCs or the vehicle may not start. • Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • With the engine running, monitor the foing BECM PIDs: ♦ Leakage Resistance (Bus+) PID (LEAKRESPOS) ♦ Leakage Resistance (Bus-) PID (LEAKRESNEG) ♦ Leakage Resistance (Overall) PID (LEAKRESALL) • **Do the PIDs read greater than 147,000 ohms for at least 10 seconds?**	**Yes** Repair is complete. TEST the system for normal operation. **No** GO to J10 .

J10 CHECK THE HVTB	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect the 12-volt battery. Refer to Section 414-01 . • Install a new HVTB . Refer to High-Voltage Traction Battery in this section. • Connect the 12-volt battery. Refer to Section 414-01 . • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • **NOTE:** Clear the BECM DTCs or the vehicle may not start. • Start the engine. • Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • With the engine running, monitor the following BECM PIDs: ♦ Leakage Resistance (Bus+) PID (LEAKRESPOS) ♦ Leakage Resistance (Bus-) PID (LEAKRESNEG) ♦ Leakage Resistance (Overall) PID (LEAKRESALL) • **Do the PIDs read greater than 147,000 ohms for at least 10 seconds?**	**Yes** Repair is complete. TEST the system for normal operation. **No** INSTALL a new eCVT . REFER to Section 307-01C . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test K: DTC P0AAE:00 or P0AAF:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

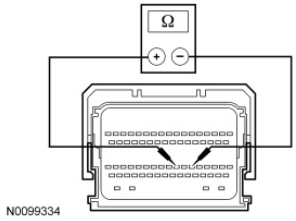
With the ignition in the ON position and the engine running or OFF, the Battery Pack Sensor Module (BPSM) monitors the High Voltage Traction Battery (HVTB) internal temperature. The BPSM communicates the HVTB temperature (in addition to other information) to the Battery Energy Control Module (BECM) through a dedicated Controller Area Network (CAN). There is also a HVTB inlet air temperature sensor mounted to the inlet air duct which monitors inlet air temperature to the HVTB . The BECM uses the information from the various temperature sensors to control and maintain HVTB temperature by controlling the HVTB cooling fan. The ideal HVTB temperature is 25°C (77°F) with a desired range of 20°C (68°F) to 30°C (86°F).

- P0AAE:00 (Hybrid Battery Pack Air Temperature Sensor A Circuit Low: No Sub Type Information) - Fault sets if the BECM senses greater than 90°C (194°F) from the HVTB inlet air temperature sensor for 10 seconds or more. Extreme ambient temperatures could also set this DTC.
- P0AAF:00 (Hybrid Battery Pack Air Temperature Sensor A Circuit High: No Sub Type Information) - Fault sets if the BECM senses less than -45°C (-49°F) from the HVTB inlet airensor for 10 seconds or more. Extreme ambient temperatures could also set this DTC.

This pinpoint test is intended to diagnose the following:
- HVTB inlet air temperature sensor
- BECM
- HVTB

PINPOINT TEST K: DTC P0AAE:00 OR P0AAF:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.



NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>K1 MEASURE THERMISTOR RESISTANCE FROM BECM</td><td></td></tr>
<tr><td>
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.

• Ignition OFF.
• Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section.
• Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section.
• Disconnect: Battery Energy Control Module (BECM) C4237B.
• Measure the resistance between BECM C4237B-39, circuit J1-A39, harness side and BECM C4237B-41, circuit J1-A41, harness side. Use the following table to determine if the resistance values are correct.

<table>
<tr><th>Temperature Range</th><th>Resistance Range</th></tr>
<tr><td>-30°C (-22°F) to -20°C (-5°F)</td><td>52,594 ohms - 28,582 ohms</td></tr>

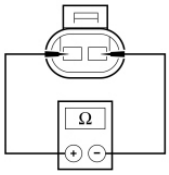
10°C (52°F) - 20°C (68°F)	5,685 ohms - 3,511 ohms
20°C (69°F) - 30°C (86°F)	3,511 ohms - 2,240 ohms
30°C (87°F) - 40°C (104°F)	2,240 ohms - 1,465 ohms
40°C (105°F) - 50°C (122°F)	1,465 ohms - 980 ohms
50°C (122°F) - 60°C (140°F)	980 ohms - 671 ohms



- **Is the resistance value correct for the temperature?**

Yes
GO to K3 .

No
GO to K2 . **K2 MEASURE THERMISTOR RESISTANCE AT THE THERMISTOR**

- Disconnect: HVTB Inlet Air Temperature Sensor C4253.
- Measure the resistance between HVTB inlet air temperature sensor C4253 pin 1 and pin 2, component side. Use the following table to determine if the resistance values are correct.

Resistance Range	
-30°C (-22°F) to -20°C (-5°F)	52,594 ohms - 28,582 ohms
-20°C (-4°F) to -10°C (13°F)	28,582 ohms - 16,120 ohms
-10°C (14°F) - 0°C (32°F)	16,120 ohms - 9,399 ohms
0°C (32°F) - 10°C (51°F)	9,399 ohms - 5,685 ohms
10°C (52°F) - 20°C (68°F)	5,685 ohms - 3,511 ohms
20°C (69°F) - 30°C (86°F)	3,511 ohms - 2,240 ohms
30°C (87°F) - 40°C (104°F)	2,240 ohms - 1,465 ohms
40°C (105°F) - 50°C (122°F)	1,465 ohms - 980 ohms
50°C (122°F) - 60°C (140°F)	980 ohms - 671 ohms
60°C (140°F) - 70°C (158°F)	671 ohms - 469 ohms

N0108926

- **Is the resistance value correct for the temperature?**

Yes
INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

No
INSTALL a new HVTB inlet air temperature thermistor. REFER to High-Voltage Traction Battery Inlet Air Temperature Sensor in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **K3 CHECK FOR CORRECT BECM OPERATION**

- Ignition OFF.
- Check the BECM harness and component side connectors for:
  - ♦ corrosion.
  - ♦ pushed-out/bent pins.
- Connect the BECM and make sure the connectors seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test L: DTC P0ABC:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The Battery Pack Sensor Module (BPSM) monitors battery pack voltage using voltage sensors within the High Voltage Traction Battery (HVTB). The BPSM communicates normal pack voltage to the Battery Energy Control Module (BECM) via a dedicated Controller Area Network (CAN). Nominal voltage should be between 179-343 volts.

- P0ABC:00 (Hybrid Battery Pack Voltage Sense A Circuit Low: No Sub Type Information) - Fault is set when BPSM senses voltage less than 172 volts for 1 second or more.

This pinpoint test is intended to diagnose the following:
- BPSM
- HVTB

PINPOINT TEST I: DTC P0ABC:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

Test Step	Result / Action to Take
I1 RETRIEVE ALL BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Do any DTCs other than P0ABC:00 exist?**	**Yes** REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to I2 .
I2 INSTALL A NEW BPSM	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service itructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Install a new BPSM . Refer to Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs -	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The repair is now complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0ABC:00 retrieved?**	

Pinpoint Test M: DTC P0ABD:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The Battery Pack Sensor Module (BPSM) monitors battery pack voltage using voltage sensors within the High Voltage Traction Battery (HVTB). The BPSM communicates normal pack voltage which should be between 179-343 volts.

- P0ABD:00 (Hybrid Battery Pack Voltage Sense A Circuit High: No Sub Type Information) - Fault is set when BPSM senses voltage greater than 350 volts.

This pinpoint test is intended to diagnose the following:
- BPSM
- HVTB

PINPOINT TEST M: DTC P0ABD:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

Test Step	Result / Action to Take
M1 RETRIEVE ALL BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Do any DTCs other than P0ABD:00 exist?**	**Yes** REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to M2 .
M2 INSTALL A NEW BPSM	
	Yes

⚠ **WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering t system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.** ⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Install a new BPSM . Refer to Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0ABD:00 retrieved?**	INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The repair is now complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test N: DTC P0AC7:00 or P0AC8:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

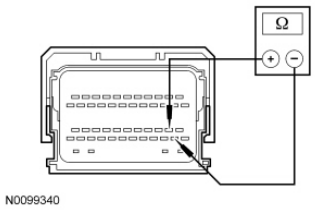
Normal Operation

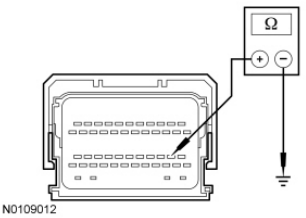
With the ignition in the ON position and the engine running or OFF, the Battery Pack Sensor Module (BPSM) monitors the High Voltage Traction Battery (HVTB) internal temperature. The BPSM communicates the HVTB temperature (in addition to other information) to the Battery Energy Control Module (BECM) through a dedicated Controller Area Network (CAN). There is also a HVTB inlet air temperature sensor mounted to the inlet air duct which monitors inlet air temperature to the HVTB . The BECM uses the information from the various temperature sensors to control and maintain HVTB temperature by controlling the HVTB cooling fan. The ideal HVTB temperature is 25°C (77°F) with a desired range of 20°C (68°F) to 30°C (86°F).

- P0AC7:00 (Hybrid Battery Temperature Sensor B Circuit Low: No Sub Type Information) - Fault sets if BECM senses an open or short to ground in the thermistor circuitry.
- P0AC8:00 (Hybrid Battery Temperature Sensor B Circuit High) - Fault sets if BECM senses an short to power in the thermistor circuitry.

This pinpoint test is intended to diagnose the following:

- HVTB
- BPSM





PINPOINT TEST N: DTCs P0A7:00 OR P0AC8:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
N1 MEASURE THERMISTOR RESISTANCE FROM BPSM	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: BPSM C4238B. • Measure the resistance between BPSM C4238B-25, circuit J2-B25, harness side and BPSM C4238B-36, circuit J2-B36, harness side.	**Yes** GO to N2 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Use the following table to determine if the resistance values are correct. **Temperature Range** / **Resistance Range** -30°C (-22°F) to -21°C (-5°F) — 132,571 ohms - 76 ohms -20°C (-4°F) to -11°C (13°F) — 77,380 ohms - 46,573 ohms -10°C (14°F) - 0°C (32°F) — 46,762 ohms - 27,965 ohms 0°C (32°F) - 10°C (51°F) — 29,164 ohms - 18,115 ohms 11°C (52°F) - 20°C (68°F) — 17,931 ohms - 12,037 ohms 21°C (69°F) - 30°C (86°F) — 11,842 ohms - 8,155 ohms 31°C (87°F) - 40°C (104°F) — 7,850 ohms - 5,624 ohms 41°C (105°F) - 50°C (122°F) — 5,602 ohms - 3,957 ohms  N0099340 • **Is the resistance value correct for the temperature?**	
N2 CHECK THERMISTOR FOR A SHORT TO GROUND	
• Measure the resistance between BPSM C4238B-25, circuit J2-B25, harness side and the battery case.  N0109012 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test O: DTC P0ACC:00 or P0ACD:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

With the ignition in the ON position and the engine running or OFF, the Battery Pack Sensor Module (BPSM) monitors the High Voltage Traction Battery (HVTB) internal temperature. The BPSM communicates the HVTB temperature (in addition to other information) to the Battery Energy Control Module (BECM) through a dedicated Controller Area Network (CAN). There is also a HVTB inlet air temperature sensor mounted to the inlet air duct which monitors inlet air temperature to the HVTB . The BECM uses the information from the various temperature sensors to control and maintain HVTB temperature by controlling the HVTB cooling fan. The ideal HVTB temperature is 25°C (77°F) with a desired range of 20°C (68°F) to 30°C (86°F).

- P0ACC:00 (Hybrid Battery Temperature Sensor C Circu: No Sub Type Information) - Fault sets if BECM senses an open or short to ground in the thermistor circuitry.
- P0ACD:00 (Hybrid Battery Temperature Sensor C Circuit High: No Sub Type Information) - Fault sets if BECM senses an short to power in the thermistor circuitry.

This pinpoint test is intended to diagnose the following:
- BPSM
- HVTB

PINPOINT TEST O: DTC P0ACC:00 OR P0ACD:00

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules.
