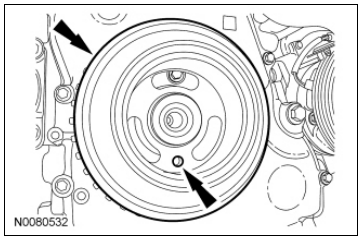
    NOTICE: **The crankshaft sprocket diamond washer may come off with the crankshaft pulley. The diamond washer must be replaced, remove and discard the diamond washer. If the diamond washer is not installed, engine damage may occur.**

    Using the Crankshaft Damper Holding Tool and an air impact wrench, remove the crankshaft pulley.

    - Remove and discard the crankshaft pulley bolt and washer.
    - Remove the crankshaft pulley.
    - Remove the diamond washer and discard.



Installation

1. Install a new diamond washer.

2. **NOTE:** Do not install the crankshaft pulley bolt at this time.

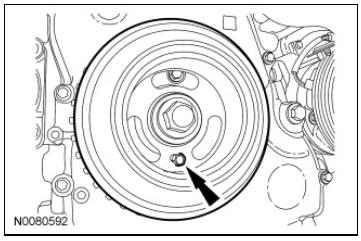
   NOTE: Apply clean engine oil on the seal area before installing.

   Position the crankshaft pulley onto the crankshaft with the hole in the pulley at the 6 o'clock position.

3. ***NOTICE:*** **Only hand-tighten the 6 mm bolt or damage to the front cover can occur.**

   NOTE: This step will correctly align the crankshaft pulley to the crankshaft.

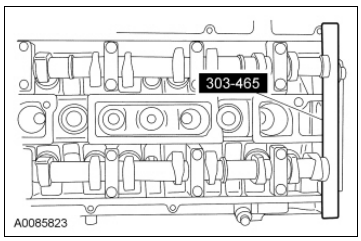
   Install a standard 6 mm x 18 mm bolt through the crankshaft pulley and thread it into the front cover.



4. ***NOTICE:*** **The crankshaft must remain in the Top Dead Center (TDC) position during installation of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Crankshaft Damper Holding Tool and the bolt should be installed using hand tools only.**

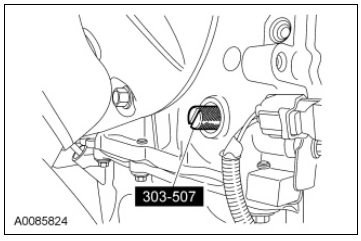
   NOTE: Do not reuse the crankshaft pulley bolt.

   - Install a new crankshaft pulley bolt. Using the Crankshaft Damper Holding Tool to hold the crankshaft pulley in place, tighten the crankshaft pulley bolt in 2 stages:
   - Stage 1: Tighten to 100 Nm (74 lb-ft).
   - Stage 2: Tighten an additional 90 degrees (one-fourth turn).



5. Remove the 6 mm x 18 mm bolt.

6. Remove the Crankshaft TDC Timing Peg.



7. Remove the Camshaft Alignment Plate.

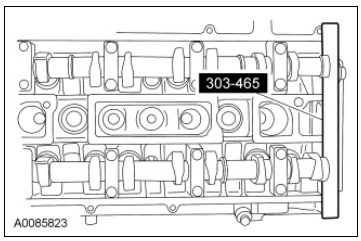
8. **NOTE:** Only turn the engine in the normal direction of rotation.

   Turn the crankshaft clockwise one and three-fourths turns.

9. Install the Crankshaft TDC Timing Peg.

10. **NOTE:** Only turn the engine in the normal direction of rotation.

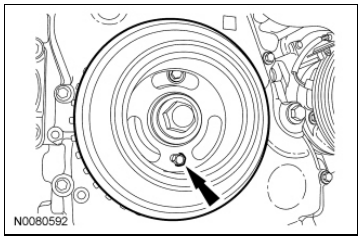
    Turn the crankshaft clockwise until the crankshaft contacts the Crankshaft TDC Timing Peg.



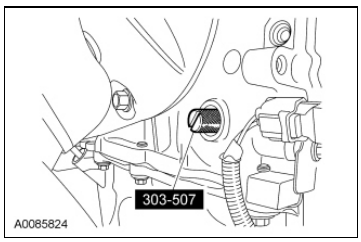
11. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

    Using the 6 mm x 18 mm bolt, check the position of the crankshaft pulley.

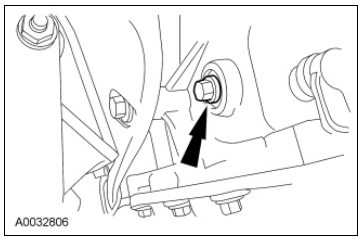
    - If it is not possible to install the bolt, the engine valve timing must be corrected by repeating this procedure.



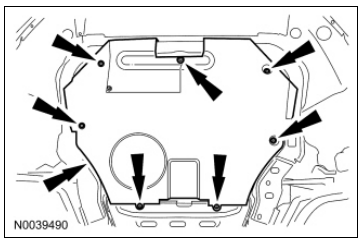
12. Install the Camshaft Alignment Plate to check the position of the camshafts.
    - If it is not possible to install the Camshaft Alignment Plate, the engine valve timing must be corrected by repeating this procedure.



13. Remove the Camshaft Alignment Plate.



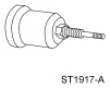
14. Remove the 6 mm x 18 mm bolt.



15. Remove the Crankshaft TDC Timing Peg.

16. Install the engine plug bolt.
    - To install, tighten to 20 Nm (177 lb-in).

17. If equipped, install the underbody cover and the 7 screws.



18. Install the accessory drive belt. For additional information, refer to Section 303-05A .

19. Install the valve cover. For additional information, refer to Valve Cover in this section.

20. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

Crankshaft Front Seal

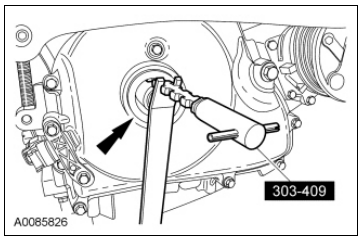
Special Tool(s)

 ST1917-A	Installer, Camshaft Front Oil Seal 303-096 (T74P-6150-A)
	Remover, Oil Seal 303-409 (T92C-6700-CH)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal



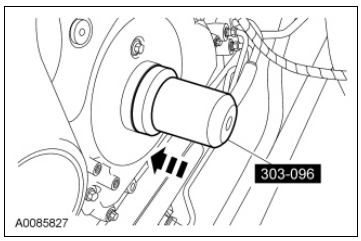
NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

2. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removi the seal.**

   Using the Oil Seal Remover, remove the crankshaft front oil seal.



Installation

1. **NOTE:** Remove the through bolt from the Camshaft Front Oil Seal Installer.

   NOTE: Lubricate the oil seal with clean engine oil.

   Using the Camshaft Front Oil Seal Installer, install the crankshaft front oil seal.

2. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

Flexplate or Flywheel and Crankshaft Rear Seal - Exploded View

Item	Part Number	Description			
1	6379	Flexplate or flywheel bolt (6 required)			
2	6K375/6K390	Flexplate or flywheel			
3	6730	Oil pan drain plug			
4	W500215	Engine front cover bolt (4 required)			
5	940604	Engine front cover stud bolt			
6	W706284	Oil pan bolt (2 required)			
7	W500224	Oil pan bolt (11 required)	8	6675	Oil pan
9	W500212	Crankshaft rear oil seal with retainer plate bolt (6 required)			
10	6K318	Crankshaft rear oil seal with retainer plate			

1. For additional information, refer to the procedures in this section.

Flexplate

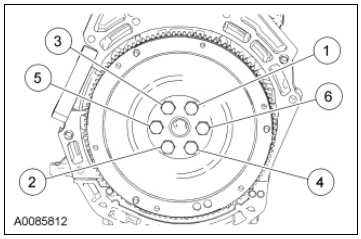
Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the automatic transaxle. For additional information, refer to the appropriate automatic transion section.



3. Remove the 6 bolts and the flexplate.

Installation

1. **NOTE:** Special bolts are used for installation. Do not use standard bolts.

   Install the flexplate and tighten the bolts in the sequence shown in 3 stages.

   - Stage 1: Tighten to 50 Nm (37 lb-ft).
   - Stage 2: Tighten to 80 Nm (59 lb-ft).
   - Stage 3: Tighten to 112 Nm (83 lb-ft).

2. Install the automatic transaxle. For additional information, refer to the appropriate automatic transmission section.

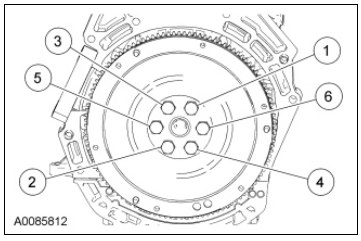
3. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Flywheel

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the clutch. For additional information, refer to Section 308-01 .
3. Remove the 6 bolts and the flywheel.

Installation

1. **NOTE:** Special bolts are used for installation. Do not use standard bolts.

   Install the flywheel and tighten the bolts in the sequence shown in 3 stages.

   - Stage 1: Tighten to 50 Nm (37 lb-ft).
   - Stage 2: Tighten to 80 Nm (59 lb-ft).
   - Stage 3: Tighten to 112 Nm (83 lb-ft).

2. Install the clutch and manual transaxle. For additional information, refer to Section 308-01 .
3. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Crankshaft Rear Seal

Special Tool(s)

 ST1506-A	Installer, Crankshaft Rear Main Oil Seal 303-328 (T88P-6701-B1)

Material

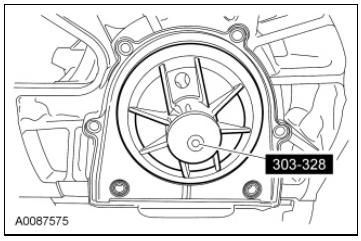
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blr Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

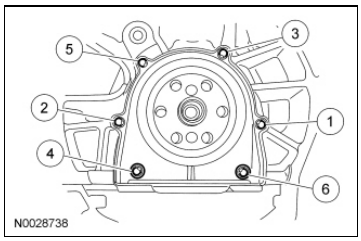
2. Remove the flexplate or flywheel. For additional information, refer to Flexplate or Flywheel in this section.

3. Drain the engine oil.
   - Install the drain plug.
   - Tighten to 28 Nm (21 lb-ft).



4. ***NOTICE:*** **If the oil pan is not removed, damage to the rear oil seal retainer joint can occur.**

   Remove the 16 bolts, stud bolt and the oil pan.

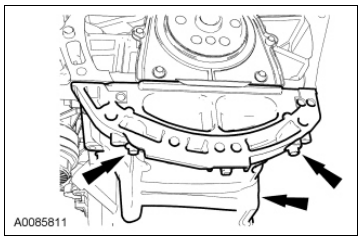


5. Remove the 6 bolts and the crankshaft rear oil seal with retainer plate.

Installation

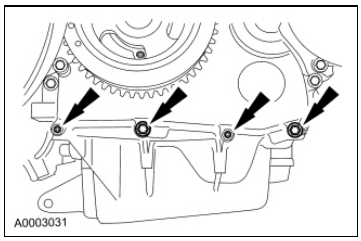
1. Using the Crankshaft Rear Main Oil Seal Installer, position the crankshaft rear oil seal with retainer plate onto the crankshaft.

2. Install the crankshaft rear oil seal with retainer plate and bolts.
    - To install, tighten in the sequence shown to 10 Nm (89 lb-in).



3. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.**

   Clean and inspect all the oil pan, engine front cover and cylinder block mating surfaces.



4. **NOTE:** If the oil pan is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow these instructions can cause future oil leakage.

   NOTE: The oil pan must be installed and the bolts tightened within 4 minutes of applying the silicone gasket and sealant.

   Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the oil pan. Install the oil pan. Install the 2 oil pan bolts finger-tight.

5. Install the 3 bolts and the stud bolt.
    - To install, tighten to 10 Nm (89 lb-in).

6. Install the remaining oil pan bolts and tighten the oil pan bolts in the sequence shown to 20 Nm (177 lb-in).

7. Install the flexplate or flywheel. For additional information, refer to Flexplate or Flywheel in this section.

8. Fill the engine with clean engine oil.

Engine Front Cover

Special Tool(s)

 ST3055A	Alignment Tool, Crank 303-1417
 ST1917-A	Installer, Camshaft Front Oil Seal 303-096 (T74P-6150-A)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)

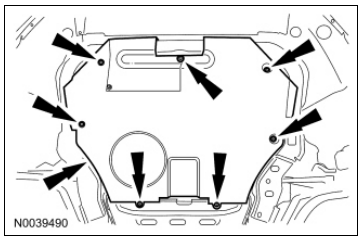
General Equipment

6 mm x 18 mm bolt

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

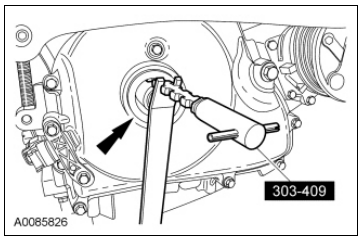
Item	Part Number	Description
1	W500224	Accessory drive belt idler pulley bolt (2 required)
2	19A216	Accessory drive belt idler pulley and bracket
3	6700	Crankshaft front seal
4	W500221	Coolant pump pulley bolt (3 required)
5	8509	Coolant pump pulley
6	14A464	Crankshaft Position (CKP) sensectrical connector (part of 12C508)
7	W701219	CKP sensor bolt (2 required)
8	6C315	CKP sensor
9	W500328	Engine front cover bolt (3 required)
10	W500320	Engine front cover bolt
11	W500300	Engine front cover bolt
12	W500215	Engine front cover bolt (16 required)
13	-	Engine front cover stud bolt
14	6019	Engine front cover



Removal

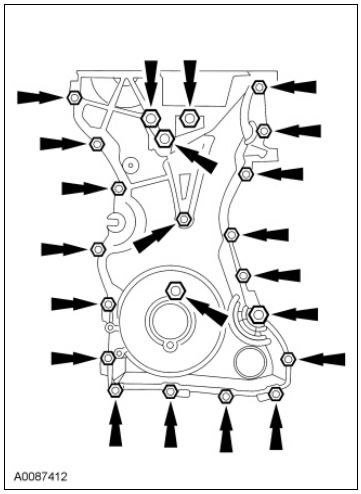
NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**



l start="1">
- With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Loosen the 3 coolant pump pulley bolts.
3. Remove the accessory drive belt and the accessory drive idler pulley. For additional information, refer to Section 303-05A .
4. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
5. If equipped, remove the 7 screws and the underbody cover.

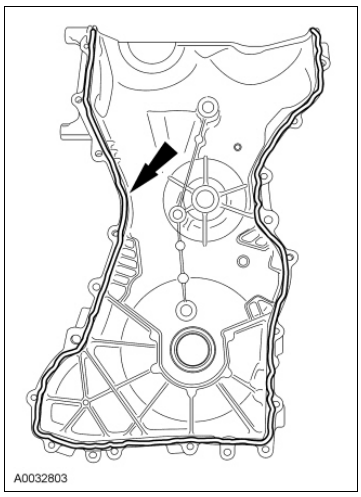


6. Remove the engine mount. For additional information, refer to Engine Mount in this section.
7. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

   Using the Oil Seal Remover, remove and discard the crankshaft front oil seal.

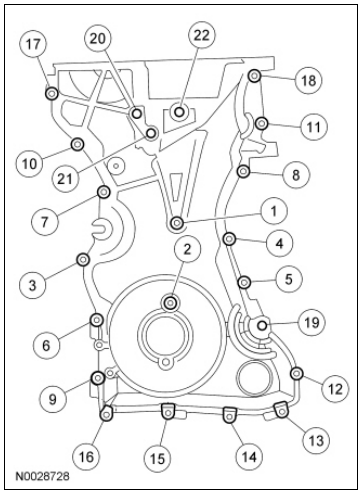
8. Remove the 3 bolts and the coolant pump pulley.
9. Remove the 2 bolts and the accessory drive belt idler pulley and bracket.
10. Disconnect the Crankshaft Position (CKP) sensor electrical connector.
11. Remove the 2 bolts and the CKP sensor.
12. Remove the 22 bolts and the engine front cover.

Installation



1. *NOTICE:* **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths.**

   Clean and inspect the mounting surfaces of the engine and the front cover.



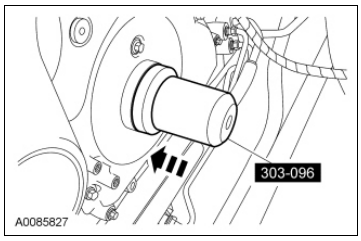
2. **NOTE:** The engine front cover must be installed and the bolts tightened within 4 minutes of applying the silicone gasket and sealant.

   NOTE: If the oil pan is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow these instructions can cause future oil leakage.

   Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the cylinder head and oil pan joint areas. Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the front cover.

3. Install the engine front cover. Tighten the bolts in the sequence shown, to the following specifications:
   - Tighten the 8-mm bolts to 10 Nm (89 lb-in).
   - Tighten the 13-mm bolts to 48 Nm (35 lb-ft).

4. Install the accessory drive belt idler pulley and bracket and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).



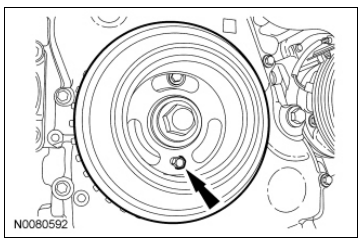
5. **NOTE:** The coolant pump pulley bolts should be tightened after the accessory drive belt is installed.

   Install the coolant pump pulley and bolts.

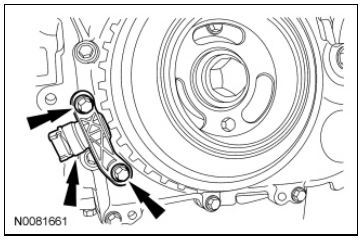
6. **NOTE:** Remove the through bolt from the Camshaft Front Oil Seal Installer.

   NOTE: Lubricate the oil seal with clean engine oil.

   Using the Camshaft Front Oil Seal Installer, install the crankshaft front oil seal.



7. Install the engine mount. For additional information, refer to Engine Mount in this section.

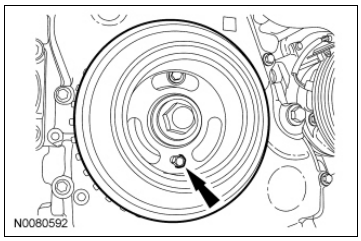


8. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

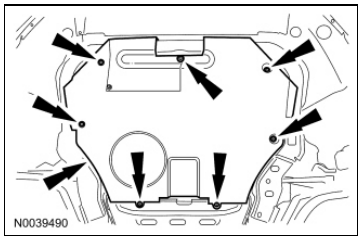
9. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

   Install a standard 6 mm x 18 mm bolt through the crankshaft pulley and thread it into the front cover.

10. Install the CKP sensor and the 2 bolts.
    - Do not tighten the bolts at this time.



11. Using the Crank Alignment Tool, adjust the CKP sensor.
    - Tighten the bolts to 7 Nm (62 lb-in).



12. Connect the CKP sensor electrical connector.

13. Remove the 6 mm x 18 mm bolt.

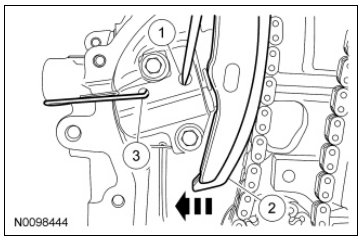
14. If equipped, install the underbody cover and the 7 screws.

15. Install the accessory drive belt and the accessory drive idler pulley. For additional information, refer to Section 303-05A .

16. Tighten the 3 coolant pump pulley bolts to 20 Nm (177 lb-in).

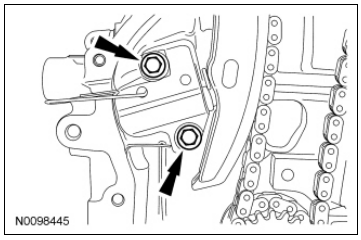
Timing Drive Components

Removal



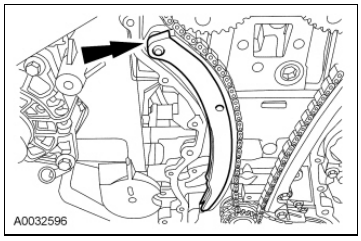
NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created whileaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

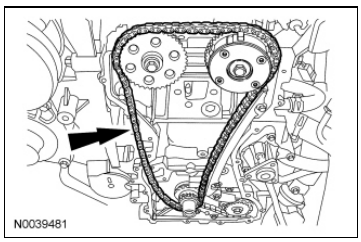


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

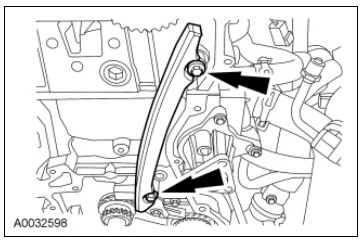
2. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.



3. Compress the timing chain tensioner in the following sequence.
    1. Using a small pick, release and hold the ratchet mechanism.
    2. While holding the ratchet mechanism in the released position, compress the tensioner by pushing the timing chain arm toward the tensioner.
    3. Insert a paper clip into the hole to retain the tensioner.

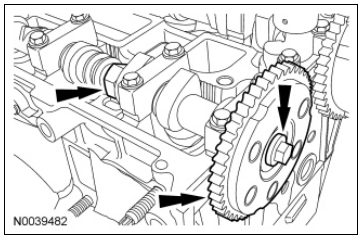


4. Remove the 2 bolts and timing chain tensioner.

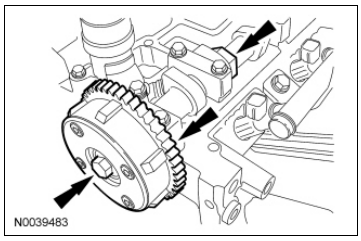


5. Remove the timing chain tensioner arm.

6. Remove the timing chain.

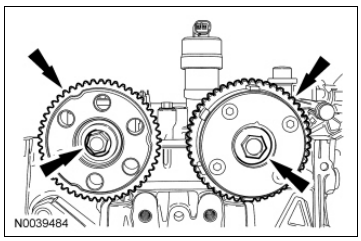


7. Remove the 2 bolts and the timing chain guide.



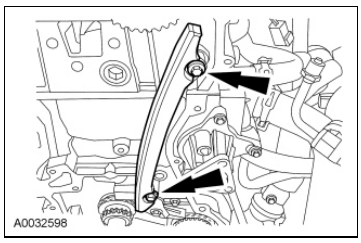
8. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

   Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the exhaust camshaft sprocket.

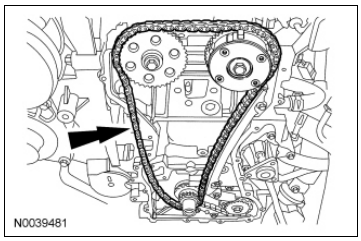


9. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

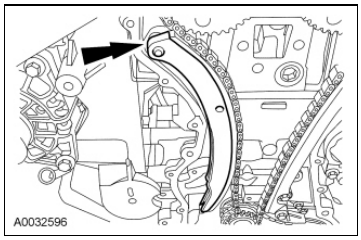
   Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the camshaft phaser and sprocket.



Installation

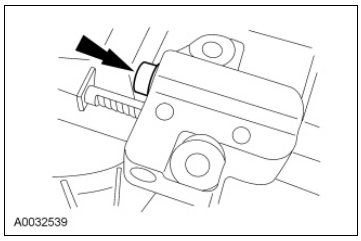


1. Install the camshaft sprockets and the bolts. Do not tighten the bolts at this time.

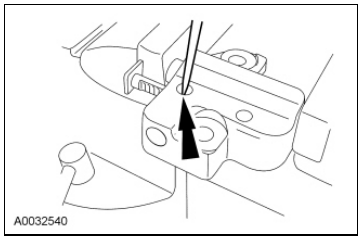


2. Install the timing chain guide and the 2 bolts.
   - To install, tighten to 10 Nm (89 lb-in).

3. Install the timing chain.



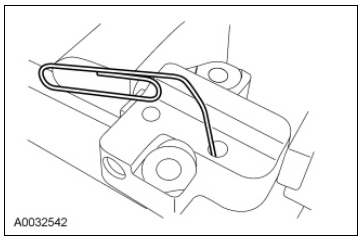
4. Install the timing chain tensioner arm.



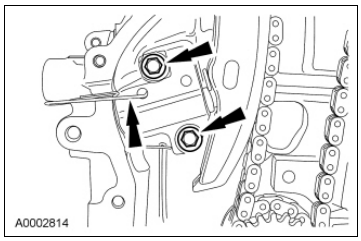
NOTE: If the timing chain tensioner plunger and ratchet assembly are not pinned in the compressed position, follow the next 4 steps.

5. ***NOTICE:*** **Do not compress the ratchet assembly. This will damage the ratchet assembly.**

   Using the edge of a vise, compress the timing chain tensioner plunger.

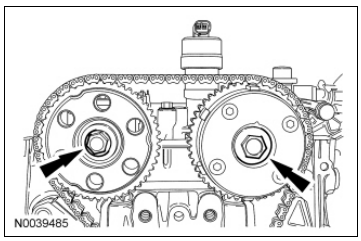


6. Using a small pick, push back and hold the ratchet mechanism.



7. While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

8. Install a paper clip into the hole in the tensioner housing to hold the ratchet assembly and the plunger in during installation.



9. Install the timing chain tensioner and the 2 bolts. Remove the paper clip to release the piston.
   - Tighten to 10 Nm (89 lb-in).

10. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    Using the flats on the camshafts to prevent camshaft rotation, tighten the bolts.

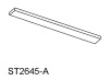
    - Tighten to 72 Nm (53 lb-ft).

11. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Variable Camshaft Timing (VCT) System Oil Filter

Item	Part Number	Description
1	W710451	Plug
2	6C683	Variable Camshaft Timing (VCT) system oil filter

Removal and Installation



1. Remove the Variable Camshaft Timing (VCT) solenoid. For additional information, refer to Section 303-14A .

2. Remove the plug and the VCT system oil filter from the intake camshaft thrust cap.
   - To install, tighten to 17 Nm (150 lb-in).

3. To install, reverse the removal procedure.

Camshafts

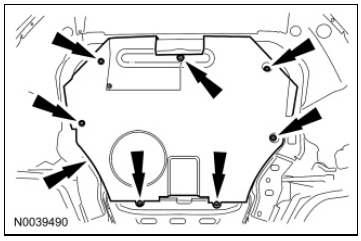
Special Tool(s)

 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

General Equipment

6 mm x 18 mm bolt
M6 x 30 mm bolt

Material



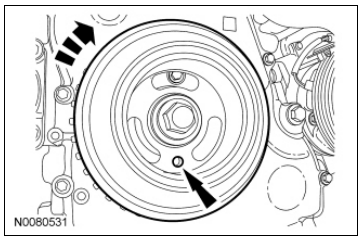
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

NOTICE: **Do not rotate the camshafts or crankshaft unless instructed to do so in this procedure. Rotating the camshafts or crankshaft with timing components loosened or removed can cause serious damage to the valves or pistons.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the accessory drive belt. For additional information, refer to Section 303-05A .
3. Remove the front RH wheel and tire. For additional information, refer to Section 204-04 .
4. If equipped, remove the 7 screws and the underbody cover.



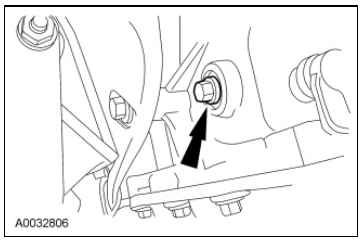
5. Remove the Variable Camshaft Timing (VCT) solenoid. For additional information, refer to Section 303-14A .

6. Check the valve clearance. For additional information, refer to Valve Clearance Check in this section.

7. ***NOTICE:*** **Failure to position the No. 1 piston at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

   Using the crankshaft pulley bolt, turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

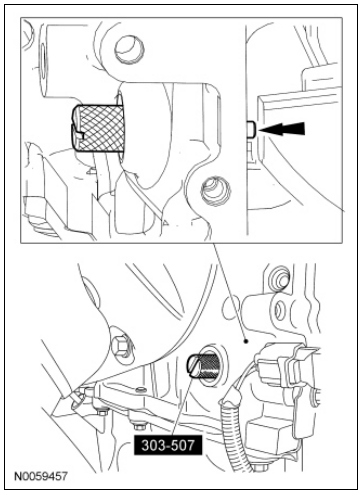
   - The hole in the crankshaft pulley should be in the 6 o'clock position.



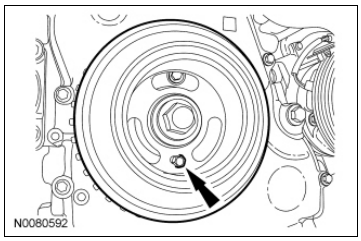
8. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

   NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Plate cannot be installed, rotate the crankshaft one complete revolution clockwise to correctly position the camshafts.

   Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.

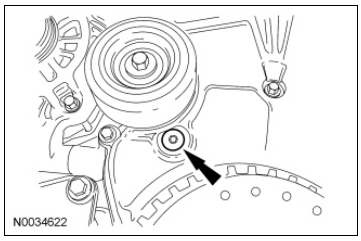


9. Remove the engine plug bolt.



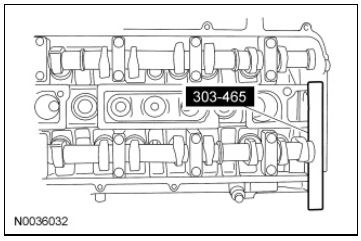
10. **NOTE:** The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the camshaft removal and installation.

    Install the Crankshaft TDC Timing Peg.



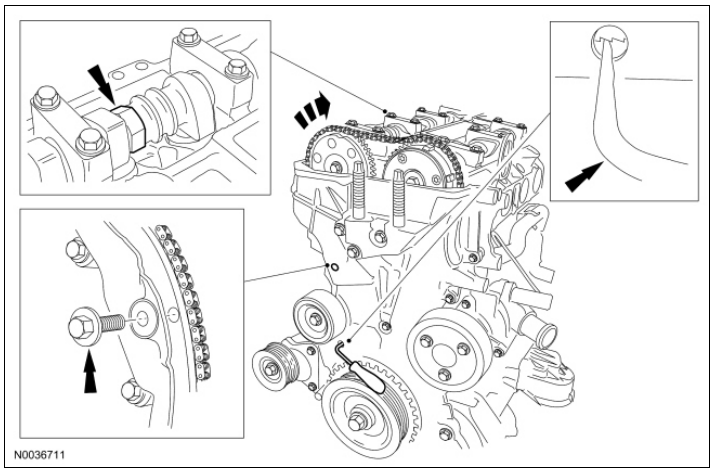
11. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

    Install a standard 6 mm x 18 mm bolt through the crankshaft pulley and thread it into the front cover.

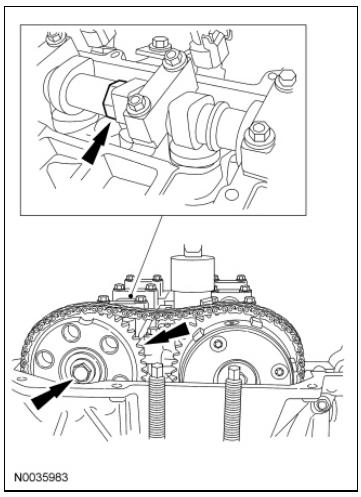


12. Remove the lower timing hole plug from the engine front cover.

13. Remove the upper timing hole plug from the engine front cover.



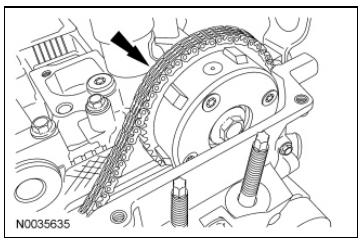
14. Reposition the Camshaft Alignment Plate to the slot on the rear of the intake camshaft only.



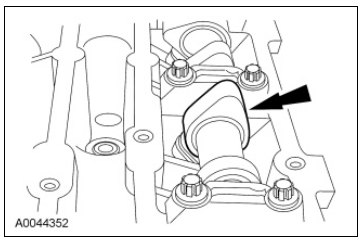
15. **NOTE:** Releasing the ratcheting mechanism in the timing chain tensioner allows the plunger to collapse and create slack in the timing chain. Installing the M6 x 30 mm bolt into the upper front cover timing hole will lock the tensioner arm in a retracted position and allow enough slack in the timing chain for removal of the exhaust camshaft gear.

    Using a small pick tool, release the timing chain tensioner ratchet through the lower front cover timing hole.

    - Have an assistant rotate the exhaust camshaft clockwise (using the flats of the camshaft) to collapse the timing chain tensioner plunger.
    - Insert the M6 x 30 mm bolt into the upper front cover timing hole to hold the tensioner arm in the retracted position.



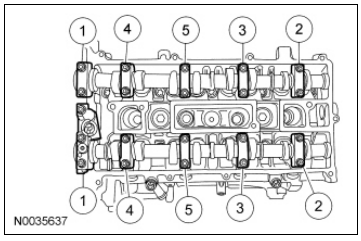
16. Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the exhaust camshaft drive gear.



17. Remove the Camshaft Alignment Plate.

18. Remove the timing chain from the intake camshaft drive gear.

19. Mark the position of the camshaft lobes on the No. 1 cylinder for installation reference.



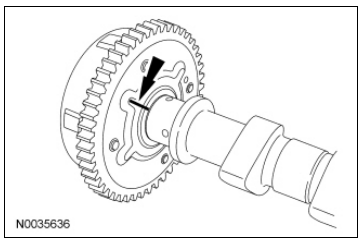
20. ***NOTICE:*** **Failure to follow the camshaft loosening procedure can result in damage to the camshafts.**

    NOTE: Mark the location and orientation of each camshaft bearing cap.

    Remove the camshafts from the engine.

    - Loosen the camshaft bearing cap bolts, in the sequence shown, one turn at a time until all tension is released from the camshaft bearing caps.
    - Remove the bolts and the camshaft bearing caps.
    - Remove the camshafts.

21. If removal of the camshaft phaser and sprocket is necessary, mark the sprocket and camshaft for reference during installation.
    - If necessary, place the camshaft in a soft-jawed vise. Remove the bolt and the camshaft phaser and sprocket.

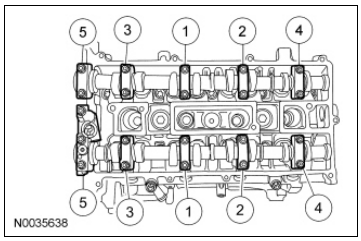


Installation

1. **NOTE:** If new parts are installed, transfer the reference marks made during disassembly to the new parts.

   If necessary, position the camshaft in a soft-jawed vise and install the camshaft phaser and sprocket and the bolt.

   - Align the reference marks on the camshaft phaser and sprocket and the camshaft. Tighten the bolt to 72 Nm (53 lb-ft).



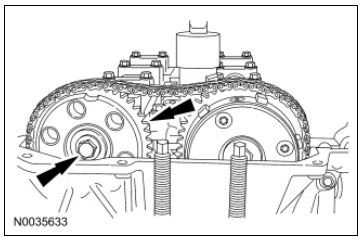
2. ***NOTICE:*** **Install the camshafts with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position can cause severe damage to the valves and pistons.**

   NOTE: Lubricate the camshaft journals and bearing caps with clean engine oil.

   Install the camshafts and bearing caps in their original locations and orientation. Tighten the bearing caps in the sequence shown in 3 stages:

   - Stage 1: Tighten the camshaft bearing cap bolts until finger-tight.
   - Stage 2: Tighten to 7 Nm (62 lb-in).
   - Stage 3: Tighten to 16 Nm (142 lb-in).

3. Install the Camshaft Alignment Plate.

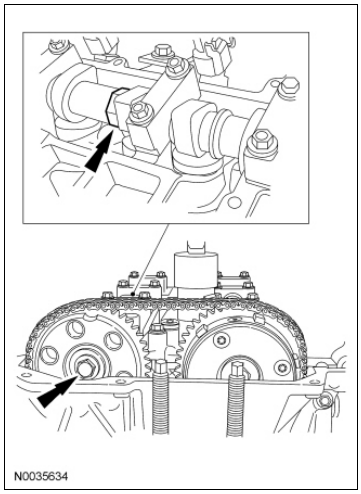


4. Install the timing chain on the intake camshaft drive gear.

5. **NOTE:** The timing chain must be correctly engaged on the teeth of the crankshaft timing sprocket and the intake camshaft drive gear in order to install the exhaust camshaft drive gear onto the exhaust camshaft.

   Position the exhaust camshaft drive gear in the timing chain and install the gear and bolt on the exhaust camshaft.

   - Hand-tighten the bolt.

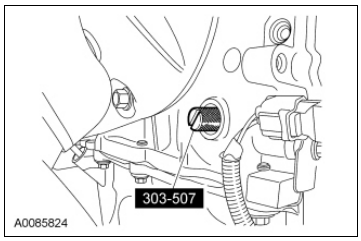


6. **NOTE:** Releasing the tensioner arm will remove the slack from the timing chain.

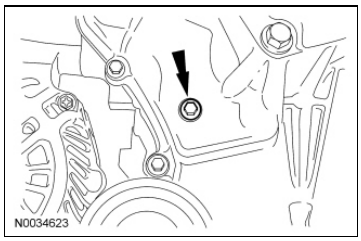
   Remove the M6 x 30 mm bolt from the upper front cover timing hole to release the tensioner arm.

7. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

   Using the flats on the camshaft to prevent camshaft rotation, tighten the exhaust camshaft drive gear bolt to 72 Nm (53 lb-ft).

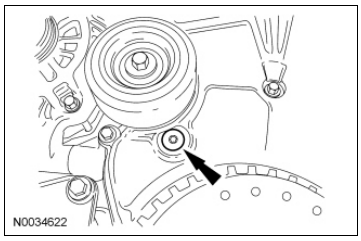


8. Remove the Camshaft Alignment Plate.

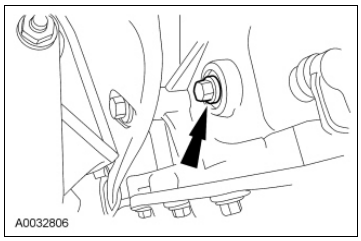


9. Remove the 6 mm x 18 mm bolt.

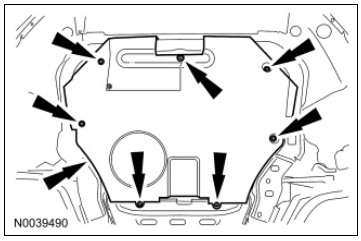
10. Remove the Crankshaft TDC Timing Peg.



11. Install the upper timing hole plug in the engine front cover.
    - Tighten to 10 Nm (89 lb-in).



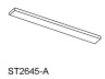
12. Apply silicone gasket and sealant to the threads of the lower timing hole plug.



- Install the lower timing hole plug in the engine front cover.
  - ♦ Tighten to 12 Nm (106 lb-in).

13. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).

14. If equipped, install the underbody cover and the 7 screws.



15. Install the front RH wheel and tire. For additional information, refer to Section 204-04 .

16. Install the accessory drive belt. For additional information, refer to Section 303-05A .

17. Install the VCT solenoid. For additional information, refer to Section 303-14A .

Camshaft Phaser and Sprocket

Special Tool(s)

 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

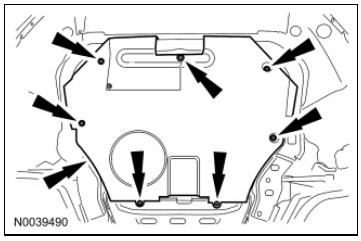
General Equipment

6 mm x 18 mm bolt
M6 x 30 mm bolt

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal



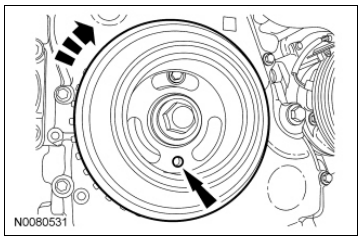
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

NOTICE: **Do not rotate the camshafts or crankshaft unless instructed to do so in this procedure. Rotating the camshafts or crankshaft with timing components loosened or removed can cause serious damage to the valves or pistons.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the accessory drive belt. For additional information, refer to Section 303-05A .

3. If equipped, remove the 7 screws and the undbody cover.



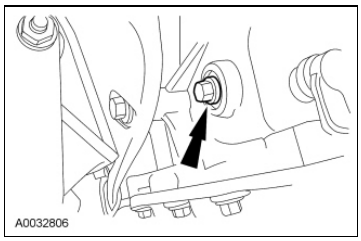
4. Remove the Variable Camshaft Timing (VCT) solenoid. For additional information, refer to Section 303-14A .

5. Check the valve clearance. For additional information, refer to Valve Clearance Check in this section.

6. ***NOTICE:*** **Failure to position the No. 1 piston at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

   Using the crankshaft pulley bolt, turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

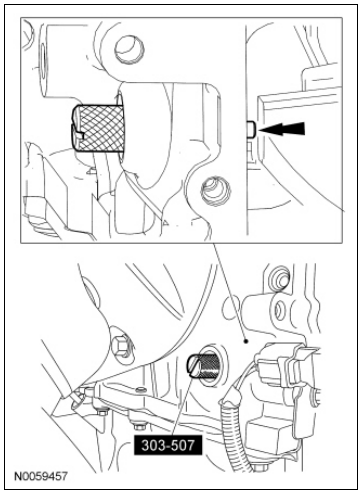
   - The hole in the crankshaft pulley should be in the 6 o'clock position.



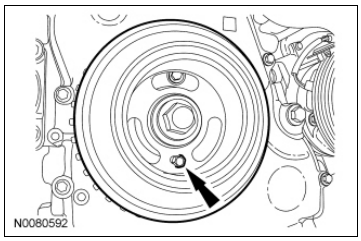
7. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

   NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Plate cannot be installed, rotate the crankshaft one complete revolution clockwise to correctly position the camshafts.

   Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.

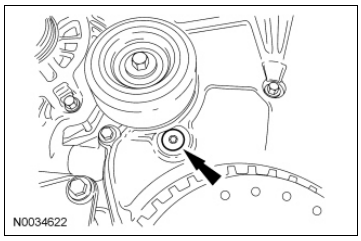


8. Remove the engine plug bolt.



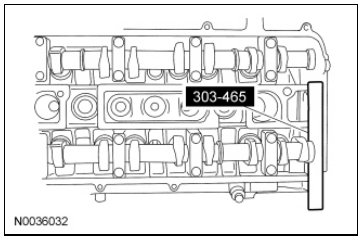
9. **NOTE:** The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the camshaft removal and installation.

   Install the Crankshaft TDC Timing Peg.



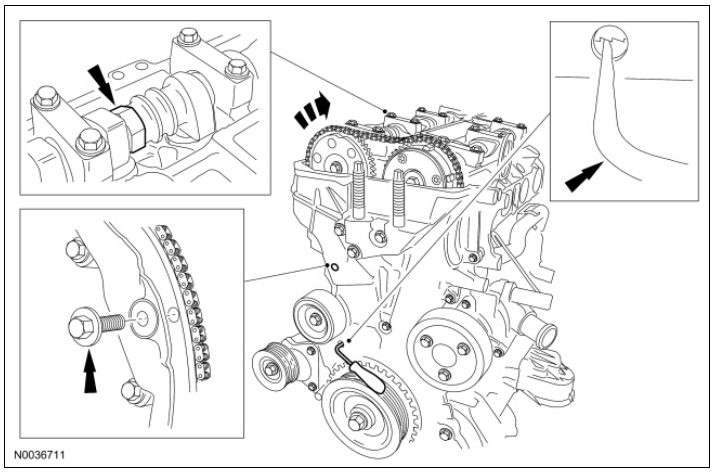
10. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

    Install a standard 6 mm x 18 mm bolt through the crankshaft pulley and thread it into the front cover.

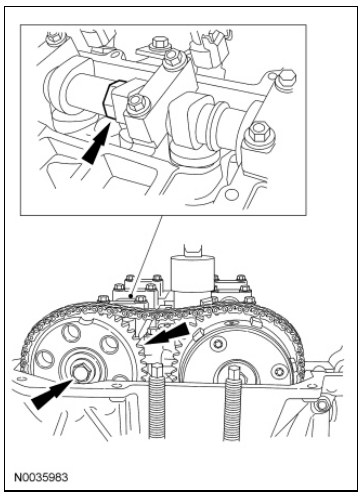


11. Remove the lower timing hole plug from the engine front cover.

12. Remove the upper timing hole plug from the engine front cover.



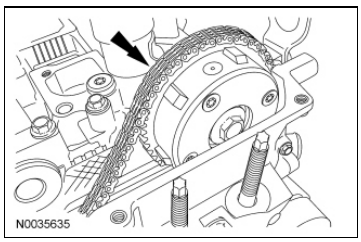
13. Reposition the Camshaft Alignment Plate to the slot on the rear of the intake camshaft only.



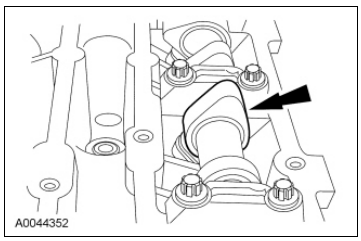
14. **NOTE:** Releasing the ratcheting mechanism in the timing chain tensioner allows the plunger to collapse and create slack in the timing chain. Installing the M6 x 30 mm bolt into the upper front cover timing hole will lock the tensioner arm in a retracted position and allow enough slack in the timing chain for removal of the exhaust camshaft gear.

    Using a small pick tool, release the timing chain tensioner ratchet through the lower front cover timing hole.

    - Have an assistant rotate the exhaust camshaft clockwise (using the flats of the camshaft) to collapse the timing chain tensioner plunger.
    - Insert the M6 x 30 mm bolt into the upper front cover timing hole to hold the tensioner arm in the retracted position.

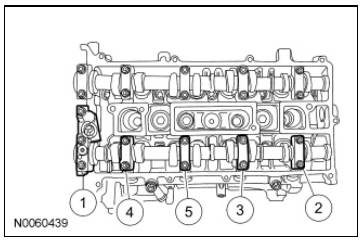


15. Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the exhaust camshaft drive gear.

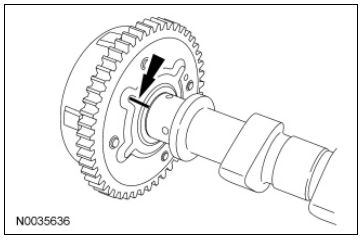


16. Remove the Camshaft Alignment Plate.

17. Remove the timing chain from the intake camshaft drive gear.



18. Mark the position of the camshaft lobes on the No. 1 cylinder for installation reference.

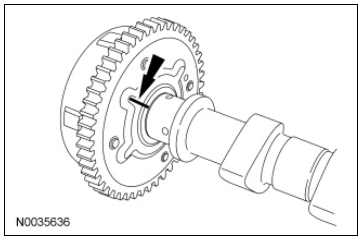


19. ***NOTICE:*** **Failure to follow the camshaft loosening procedure can result in damage to the intake camshaft.**

    Remove the intake camshaft from the engine.

    - Loosen the intake camshaft bearing cap bolts, in the sequence shown, one turn at a time until all tension is released from the camshaft bearing caps.
    - Remove the bolts and the camshaft bearing caps.
    - Remove the intake camshaft.

20. Mark the camshaft phaser and sprocket and the camshaft for reference during installation.



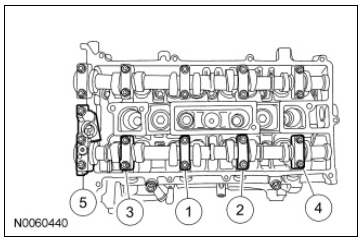
21. Place the camshaft in a soft-jawed vise. Remove the bolt and the camshaft phaser and sprocket.

Installation

1. **NOTE:** If new parts are installed, transfer the reference marks made during disassembly to the new parts.

   Position the camshaft in a soft-jawed vise. Install the camshaft phaser and sprocket and the bolt.

   - Align the reference marks on the camshaft phaser and sprocket and the camshaft. Tighten the bolt to 72 Nm (53 lb-ft).



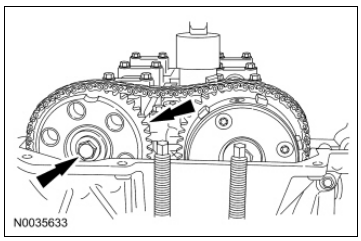
2. ***NOTICE:*** **Install the intake camshaft with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position can cause severe damage to the valves and pistons.**

   NOTE: Lubricate the intake camshaft journals and bearing caps with clean engine oil.

   Install the intake camshafts and bearing caps. Tighten the intake camshaft bearing caps in the sequence shown in 3 stages:

   - Stage 1: Tighten the intake camshaft bearing cap bolts until finger-tight.
   - Stage 2: Tighten to 7 Nm (62 lb-in).
   - Stage 3: Tighten to 16 Nm (142 lb-in).

3. Install the Camshaft Alignment Plate.

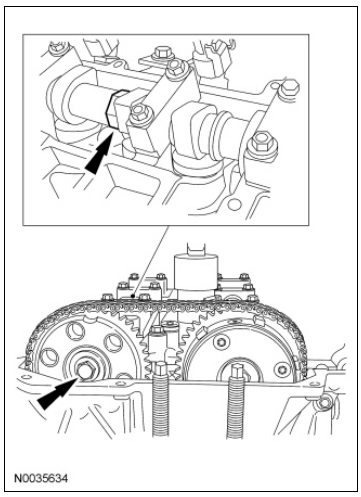


4. Install the timing chain on the intake camshaft drive gear.

5. **NOTE:** The timing chain must be correctly engaged on the teeth of the crankshaft timing sprocket and the intake camshaft drive gear in order to install the exhaust camshaft drive gear onto the exhaust camshaft.

   Position the exhaust camshaft drive gear in the timing chain and install the gear and bolt on the exhaust camshaft.

   - Hand-tighten the bolt.

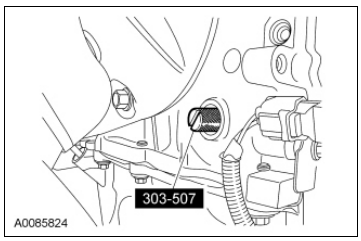


6. **NOTE:** Releasing the tensioner arm will remove the slack from the timing chain.

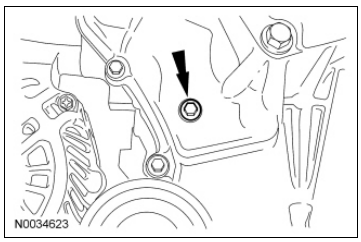
   Remove the M6 x 30 mm bolt from the upper front cover timing hole to release the tensioner arm.

7. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

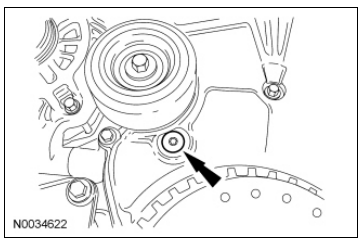
   Using the flats on the camshaft to prevent camshaft rotation, tighten the exhaust camshaft drive gear bolt to 72 Nm (53 lb-ft).



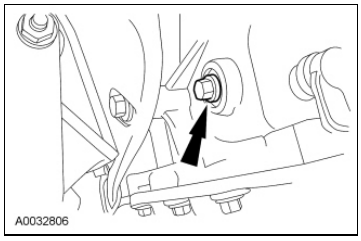
8. Remove the Camshaft Alignment Plate.



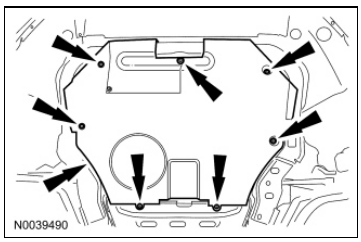
9. Remove the 6 mm x 18 mm bolt.



10. Remove the Crankshaft TDC Timing Peg.

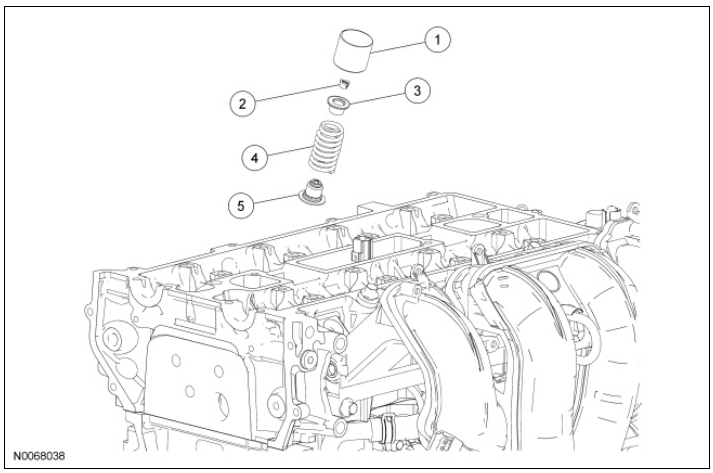


11. Install the upper timing hole plug in the engine front cover.
    - Tighten to 10 Nm (89 lb-in).



12. Apply silicone gasket and sealant to the threads of the lower timing hole plug.
    - Install the lower timing hole plug in the engine front cover.
        - ♦ Tighten to 12 Nm (106 lb-in).

13. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).

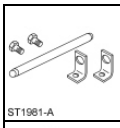


14. If equipped, install the underbody cover and the 7 screws.

15. Install the accessory drive belt. For additional information, refer to Section 303-05A .

16. Install the VCT solenoid. For additional information, refer to Section 303-14A .

Valve Train Components - Exploded View



Item	Part Number	Description
1	6500	Valve tappet (16 required)
2	6518	Valve collet (16 required)
3	6514	Valve spring retainer (16 required)
4	6513	Valve spring (16 required)
5	6517	Valve seal (16 required)

Valve Springs

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST1902-A	Compressor, Valve Spring 303-472 (T94P-6565-AH)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Multi-Purpose Grease Motorcraft® XL-5 (aerosol) and/or CRC® SL3151	ESB-M1C93-B

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

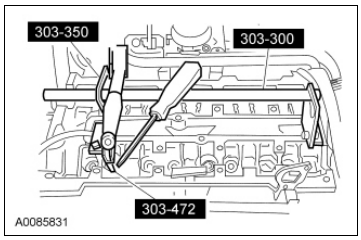
2. Remove the camshafts. For additional information, refer to Camshafts in this section.

3. **NOTE:** If the camshafts and valve tappets are to be reusmark the location of the valve tappets to make sure they are assembled in their original positions.

   NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

   Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

4. Remove the spark plugs. For additional information, refer to Section 303-07A .



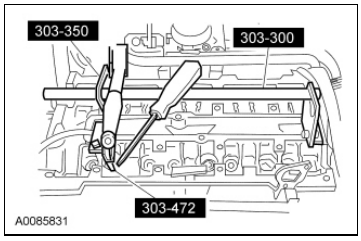
5. *NOTICE:* **Use compressed air at 7-10 bars (100-150 psi). Do not disconnect the compressed air from the cylinder until the valve spring, valve spring retainer and valve collet are installed. Any loss of air pressure will allow the valve to fall into the cylinder.**

   Connect compressed air supply to the No. 1 cylinder.

6. **NOTE:** Place all parts in order to one side.

   Apply compressed air to the cylinder and remove the valve spring.

   - Using the Valve Spring Compressors, compress the valve spring and remove the valve collet, using some grease and a small screwdriver.
   - Remove the valve spring retainer and the valve spring.



Installation

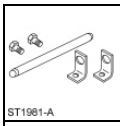
1. **NOTE:** Check the seating of the valve collet.

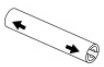
   Using the Valve Spring Compressors, install the valve spring.

   - Insert the valve spring and the valve spring retainer.
   - Compress the valve spring and install the valve collet using some grease and a small screwdriver.

2. Disconnect the compressed air supply.

3. Repeat the appropriate removal and installation steps for all of the other cylinders.





4. Install the spark plugs. For additional information, refer to Section 303-07A .

5. Coat the valve tappets with clean engine oil and insert them.

6. Install the camshafts. For additional information, refer to Camshafts in this section.

Valve Seals

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST1902-A	Compressor, Valve Spring 303-472 (T94P-6565-AH)
 ST1906-A	Installer, Valve Stem Oil Seal 303-470 (T94P-6510-CH)
 ST1904-A	Remover, Valve Stem Oil Seal 303-468 (T94P-6510-AH)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Multi-Purpose Grease Motorcraft® XL-5 (aerosol) and/or CRC® SL3151	ESB-M1C93-B

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

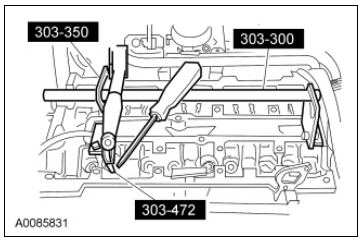
2. Remove the camshafts. For additional information, refer to Camshafts in this section.

3. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

   NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

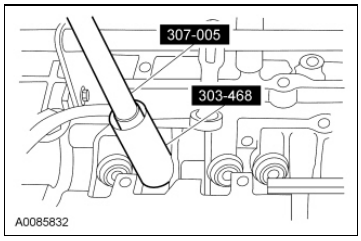
   Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

4. Remove the spark plugs. For additional information, refer to Section 303-07A .



5. ***NOTICE:*** **Use compressed air at 7-10 bars (100-150 psi). Do not disconnect the compressed air from the cylinder until the valve spring, valve spring retainer and valve collet are installed. Any loss of air pressure will allow the valve to fall into the cylinder.**

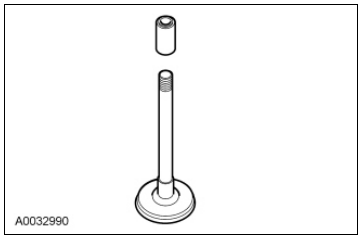
   Connect compressed air supply to the No. 1 cylinder.



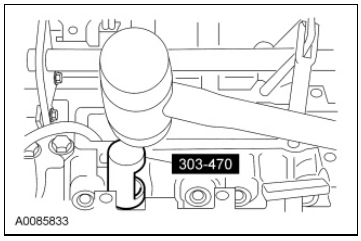
6. **NOTE:** Place all parts in order to one side.

   Apply compressed air to the cylinder and remove the valve spring.

   - Using the Valve Spring Compressors, compress the valve spring and remove the valve collet, using some grease and a small screwdriver.
   - Remove the valve spring retainer and the valve spring.

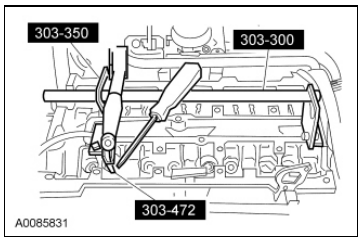


7. Using the Valve Stem Oil Seal Remover and Slide Hammer, remove and discard the valve seal.



Installation

1. Install the valve stem seal installation sleeve.



2. Using the Valve Stem Oil Seal Installer, install the valve seal.

3. **NOTE:** Check the seating of the valve collet.

   Using the Valve Spring Compressors, install the valve spring.

   - Insert the valve spring and the valve spring retainer.
   - Compress the valve spring and install the valve collet using some grease and a small screwdriver.

4. Disconnect the compressed air supply.

5. Repeat the appropriate removal and installation steps for all of the other cylinders.

6. Install the spark plugs. For additional information, refer to Section 303-07A .

7. Coat the valve tappets with clean engine oil and insert them.

8. Install the camshafts. For additional information, refer to Camshafts in this section.

Valve Tappets

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the camshafts. For additional information, refer to Camshafts in this section.

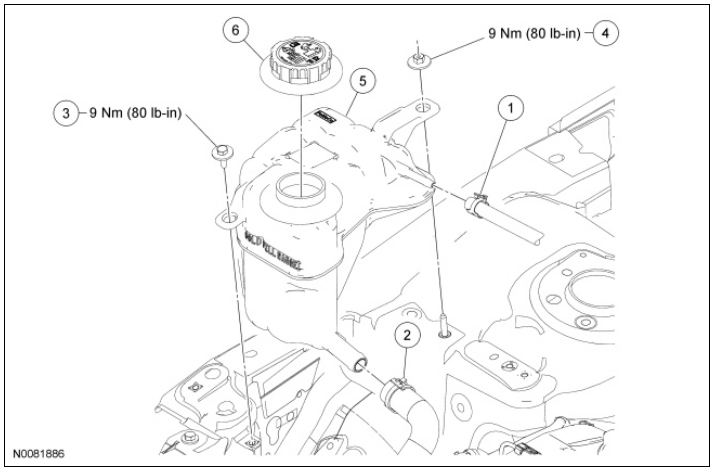
3. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

   NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

   Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

4. To install, reverse the removal procedure.
   - Coat the valve tappets with clean engine oil prior to installation.

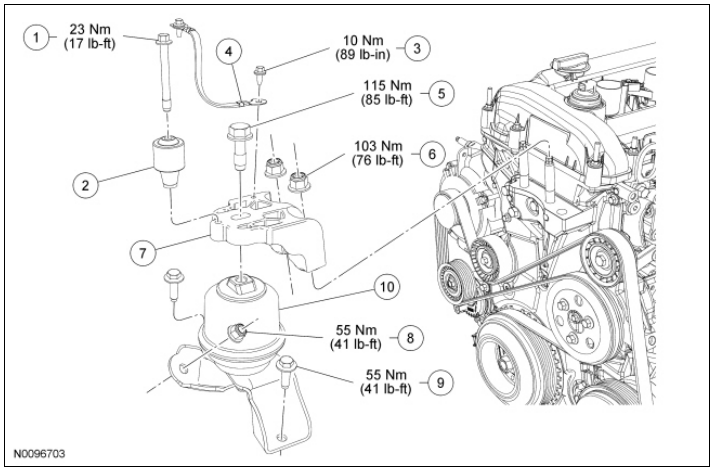
Cylinder Head



Special Tool(s)

 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST2425-A	Engine Support Bar 303-F072
 ST1595-A	Lifting Bracket, Engine 303-050 (T70P-6000)

Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

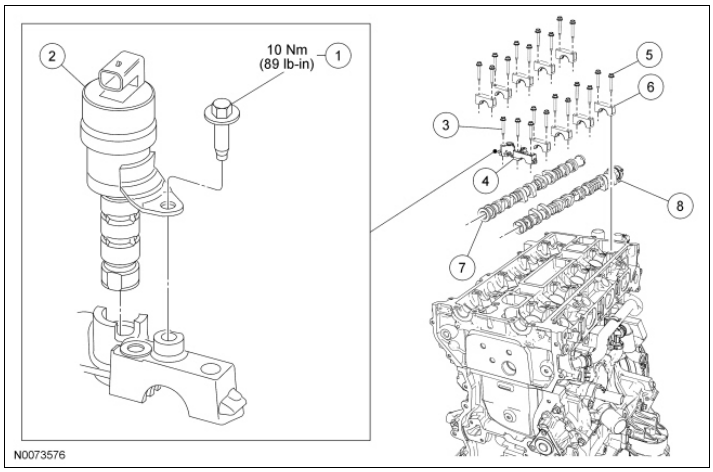
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

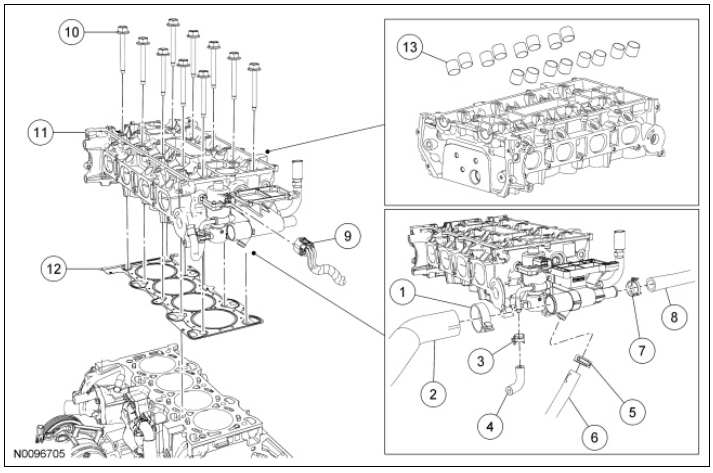
Degas Bottle

Item	Part Number	Description
1	8276	Degas bottle-to-radiator hose
2	8C351	Lower degas bottle hose
3	W707398	Degas bottle-to-fender bolt
4	W709603	Degas bottle-to-fender nut
5	8A080	Degas bottle
6	8100	Pressure relief cap



Engine Mount

Item	Part Number	Description
1	W711879	Damper bolt
2	7458	Damper
3	W705936	Ground wire bolt
4	19A095	Ground wire
5	W711684	Engine mount bracket bolt
6	W520214	Engine mount bracket nut (2 required)
7	6A094	Engine mount bracket
8	W711578	Engine mount nut
9	W706496	Engine mount bolt (2 required)



10	6F012	Engine mount

Camshafts

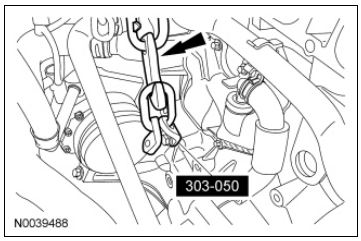
Item	Part Number	Description
1	W500211	Variable Camshaft Timing (VCT) oil control solenoid bolt
2	6M280	VCT oil control solenoid
3	W500301	Intake camshaft bearing cap bolt
4	6A258	Intake camshaft bearing cap
5	W703383	Camshaft bearing cap bolt (20 required)
6	6A284	Camshaft bearing cap (9 required)
7	6A272	Exhaust camshaft
8	6A267	Intake camshaft

Cylinder Head

Item	Part Number	Description
1	W527372	Upper radiator hose clamp

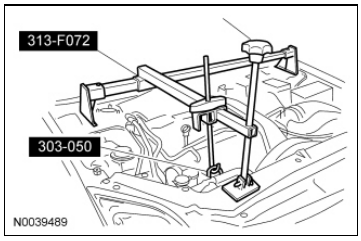
2	8B274	Upper radiator hose
3	15161	EGR coolant tube clamp
4	-	EGR coolant hose (part of 18C266)
5	W525958	Bypass hose clamp
6	8548	Bypass hose
7	-	Heater hose clamp (part of 18C266)
8	18C266	Heater hose
9	14A464	EGR valve electrical connector (part of 12B637)
10	6065	Cylinder head bolt (10 required)
11	6050	Cylinder head
12	6051	Cylinder head gasket
13	6500	Valve tappet (16 required)

Removal



NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

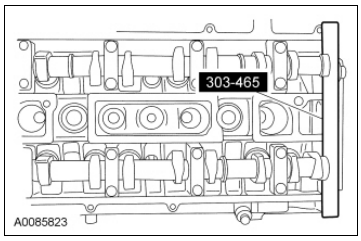


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Check the valve clearance. For additional information, refer to Valve Clearance Check in this section.
4. Drain the engine cooling system. For additional information, refer to Section 303-03A .
5. Disconnect the degas bottle-to-radiator hose from the degas bottle.
6. Remove the nut and bolt and position the degas bottle to access the lower degas bottle hose.
7. Disconnect the lower degas bottle hose and remove the degas bottle.
8. Remove the generator. For additional information, refer to Section 414-00 .
9. Remove the fuel supply rail. For additional information, refer to Section 303-04A .
10. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.
11. Remove the exhaust manifold. For additional information, refer to Exhaust Manifold in this section.
12. Remove the bolt and the engine mount damper from the engine mount bracket.
13. Remove the bolt and the ground wire from the engine mount bracket.

14. Remove the engine mount bracket bolt.

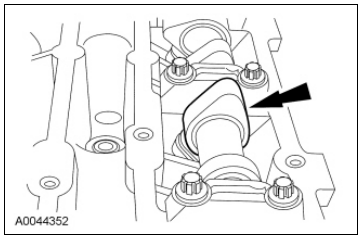
15. Install the Engine Lifting Brackets and a suitable length of chain to the threaded hole in the LH side of the engine block.

16. Using the Engine Support Bar and Engine Lifting Brackets, lift the engine 25 mm (0.98 in).



17. Remove the nut, 2 bolts and the engine mount.

18. Lower the engine 25 mm (0.98 in).

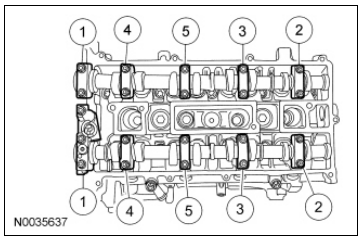


19. Remove the 2 nuts and the engine mount bracket.

20. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.

21. Remove the Camshaft Alignment Plate.

22. Mark the position of the camshaft lobes on the No. 1 cylinder for installation reference.



23. Remove the bolt and the Variable Camshaft Timing (VCT) solenoid.

24. **NOTE:** Failure to follow the camshaft loosening procedure can result in damage to the camshafts.

NOTE: Mark the location and orientation of each camshaft bearing cap.

Remove the camshafts from the engine.

- Loosen the camshaft bearing cap bolts, in the sequence shown, one turn at a time until all tension is released from the camshaft bearing caps.
- Remove the bolts and the camshaft bearing caps.
- Remove the camshafts.

25. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

    NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

    Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

26. Disconnect the upper radiator hose, coolant bypass hose and heater hose from the engine coolant outlet.

27. Disconnect the EGR valve electrical connector.

28. Disconnect the coolant hose from the EGR valve.

29. Remove the 10 bolts and the cylinder head.
    - Discard the bolts.
    - Discard the cylinder head gasket.

Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

   NOTICE: **Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.**

   NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

   Clean the cylinder head-to-cylinder block mating surface of both the cylinder head and the cylinder block in the following sequence.

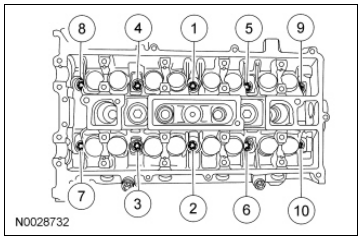
   1. Remove any large deposits of silicone or gasket material with a plastic scraper.
   2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.

3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

2. Clean the cylinder head bolt holes in the cylinder block. Make sure all coolant, oil or other foreign material is removed.

3. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

4. Apply silicone gasket and sealant to the locations shown.



5. Install a new cylinder head gasket.

6. **NOTE:** The cylinder head bolts are a torque-to-yield design and must not be reused. New cylinder head bolts must be installed.

   NOTE: Lubricate the bolts with clean engine oil prior to installation.

   Install the cylinder head and 10 new bolts. Tighten the bolts in the sequence shown in 5 stages:

   - Stage 1: Tighten to 7 Nm (62 lb-in).
   - Stage 2: Tighten to 15 Nm (133 lb-in).
   - Stage 3: Tighten to 45 Nm (33 lb-ft).
   - Stage 4: Turn 90 degrees.
   - Stage 5: Turn an additional 90 degrees.

7. Connect the coolant hose to the EGR valve.

8. Connect the EGR valve electrical connector.

9. Connect the upper radiator hose, coolant bypass hose and heater hose to the engine coolant outlet.

10. **NOTE:** Coat the valve tappets with clean engine oil prior to installation.

    Install the valve tappets.

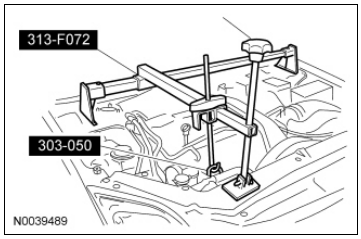
11. ***NOTICE:*** **Install the camshafts with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position can cause severe damage to the valves and pistons.**

    NOTE: Lubricate the camshaft journals and bearing caps with clean engine oil.

    Install the camshafts and bearing caps in their original locations and orientation. Tighten the bearing caps in the sequence shown in 3 stages:

    - Stages 1: Tighten the camshaft bearing cap bolts until finger-tight.
    - Stages 2: Tighten to 7 Nm (62 lb-in).
    - Stages 3: Tighten to 16 Nm (142 lb-in).

12. Install the Camshaft Alignment Plate.



13. Install the VCT solenoid and bolt.
    - Tighten to 10 Nm (89 lb-in).

14. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

15. Install the engine mount bracket and the 2 nuts.
    - Tighten to 103 Nm (76 lb-ft).

16. Using the Engine Support Bar and Engine Lifting Brackets, lift the engine 25 mm (0.98 in).

17. Install the engine mount, nut and 2 bolts.
    - Tighten to 55 Nm (41 lb-ft).

18. Lower the engine 25 mm (0.98 in).

19. Install the engine mount bracket bolt.
    - Tighten to 115 Nm (85 lb-ft).

20. Install the ground wire-to-engine mount bracket and bolt.
    - Tighten to 10 Nm (89 lb-in).

21. Install the engine mount damper and the bolt.
    - Tighten to 23 Nm (17 lb-ft).

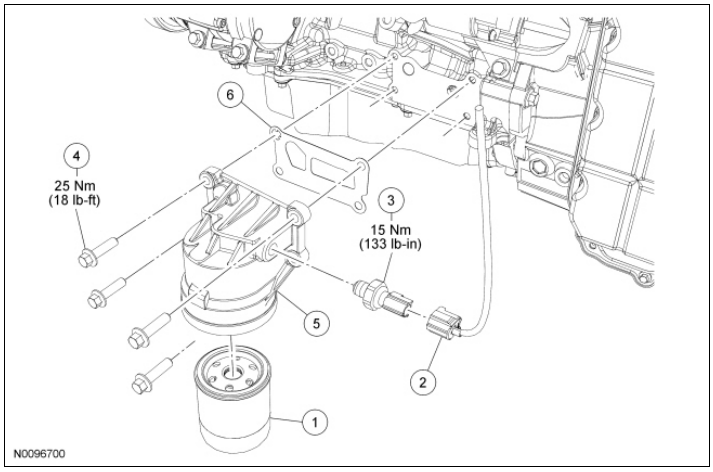
22. Install the exhaust manifold. For additional information, refer to Exhaust Manifold in this section.

23. Install the intake manifold. For additional information, refer to Intake Manifold in this section.

24. Install the fuel supply rail. For additional information, refer to Section 303-04A .

25. Install the generator. For additional information, refer to Section 414-00 .

26. Connect the lower degas bottle hose to the degas bottle.

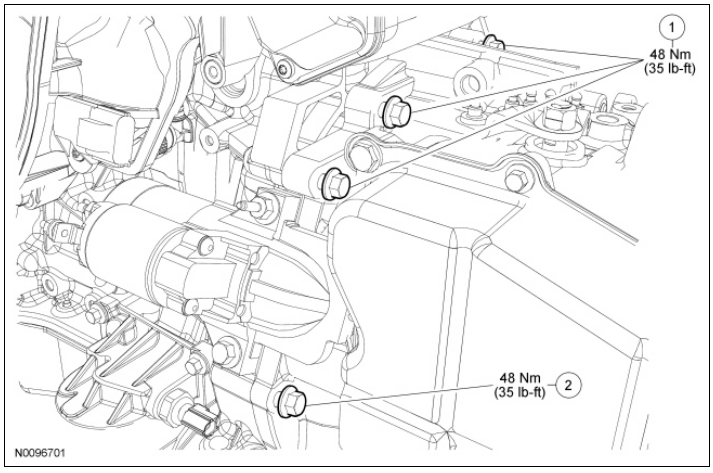


27. Install the degas bottle and the nut and bolt.
    - Tighten to 9 Nm (80 lb-in).

28. Connect the degas bottle-to-radiator hose.

29. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03A .

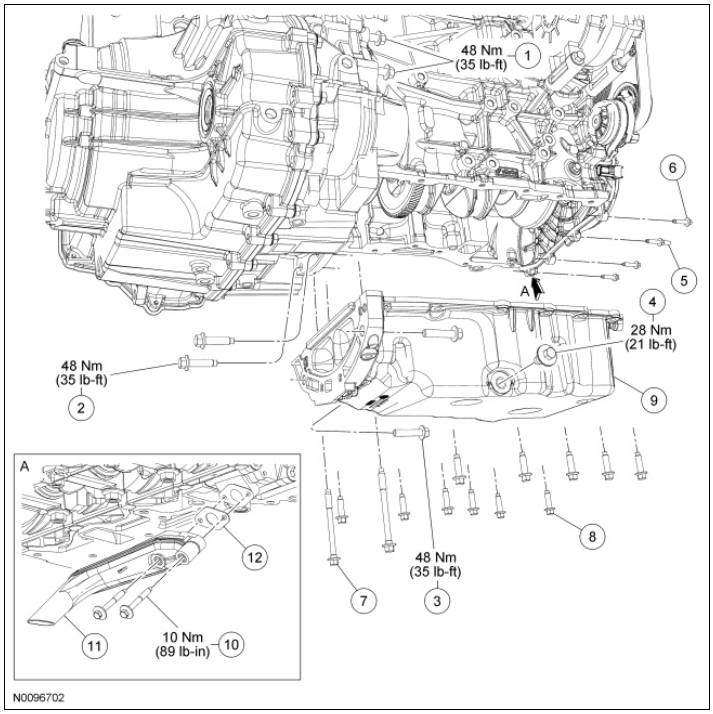
Engine Lubrication Components - Exploded View



Oil Filter Adapter, Oil Filter and Engine Oil Pressure (EOP) Switch

Item	Part Number	Description
1	6714	Oil filter
2	14A464	Engine Oil Pressure (EOP) switch electrical connector (part of 12C508)
3	9278	EOP switch
4	W500225	Oil filter adapter bolt (4 required)
5	6884	Oil filter adapter
6	6A636	Oil filter adapter gasket

Transmission Bolts for Oil Pan Removal



NOTE: Automatic transmission shown, manual transmission similar.

Item		Description

	Part Number	
1	W500121	Upper bellhousing-to-engine bolts
2	W500121	LH bellhousing-to-engine bolt (1 required for automatic transmission, 2 required for manual transmission)

Oil Pan, Oil Pump Screen and Pickup Tube

Item	Part Number	Description
1	W500121	RH engine-to-bellhousing bolts
2	W500235	Bellhousing-to-oil pan bolt (2 required)
3	W500121	Oil pan-to-bellhousing bolt (2 required)
4	6730	Oil pan drain plug
5	940604	Engine front cover-to-oil pan stud bolt
6	W500215	Engine front cover-to-oil pan bolt (3 required)
7	W706284	Oil pan bolt (2 required)
8	W500224	Oil pan bolt (11 required)
9	6675	Oil pan
10	W706282	Oil pump screen and pickup tube bolt (2 required)
11	6622	Oil pump screen and pickup tube
12	6625	Oil pump screen and pickup tube gasket

Oil Pump

Item	Part Number	Description
1	W703651	Oil pump drive chain tensioner shoulder bolt
2	6C271	Oil pump drive chain tensioner
3	6A895	Oil pump drive chain
4	W704397	Oil pump sprocket bolt
5	6652	Oil pump sprocket
6	W703647	Oil pump bolt (4 required)
7	6600	Oil pump

1. For additional information, refer to the procedures in this section.

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If equipped, remove the 7 screws and the underbody cover.

3. Remove the oil filter.
   - To install, lubricate the oil filter gasket with clean engine oil and tighten the oil filter three-fourths turn after the oil filter gasket makes contact with the oil filter adapter.

4. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

5. **NOTE:** Discard the gasket.

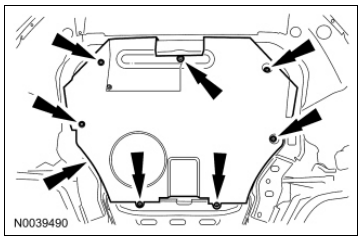
   Remove the 4 bolts and the oil filter adapter.

   - To install, tighten to 25 Nm (18 lb-ft).

6. To install, reverse the removal procedure.

Engine Oil Pressure (EOP) Switch

Material



Item	Specification
Thread Sealant with PTFE TA-24	WSK-M2G350-A2

Removal and Installation

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If equipped,ove the 7 screws and the underbody cover.

Vehicles equipped with manual transaxle

3. Remove the 2 bolts and position the clutch slave cylinder aside.
   - To install, tighten to 22 Nm (16 lb-ft).

All vehicles

4. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

5. Remove the EOP switch.
   - To install, tighten to 15 Nm (133 lb-in).

6. To install, reverse the removal procedure.
   - Apply thread sealant to the EOP switch threads.

Oil Pan

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

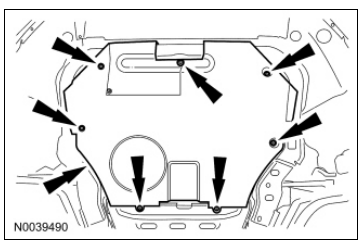
Removal

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the Ai (ACL). For additional information, refer to Section 303-12A .

Automatic transmission



3. Remove the battery tray. For additional information, refer to Section 414-01 .

All vehicles

4. ***NOTICE:*** **To prevent damage to the transmission, do not loosen the transmission-to-engine bolts more than 5 mm (0.19 in).**

   Loosen the 3 upper transaxle-to-engine bolts 5 mm (0.19 in).

5. If equipped, remove the 7 screws and the underbody cover.

6. Loosen the 1 (automatic transmission) or 2 (manual transmission) LH bellhousing-to-engine bolt(s) 5 mm (0.19 in).

7. Loosen the RH engine-to-bellhousing bolt and stud bolt 5 mm (0.19 in).

8. Remove the 2 oil pan-to-bellhousing bolts.

9. Remove the bellhousing-to-oil pan bolt.

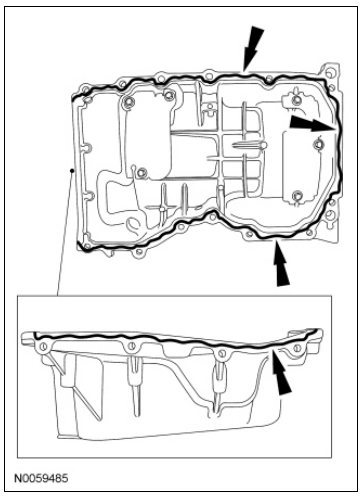
10. Slide the transmission rearward 5 mm (0.19 in).

11. Drain the engine oil.
    - Install the drain plug.
    - To install, tighten to 28 Nm (21 lb-ft).

12. Remove the 3 engine front cover-to-oil pan bolts and the stud bolt.

13. Remove the 13 bolts and the oil pan.

Installation



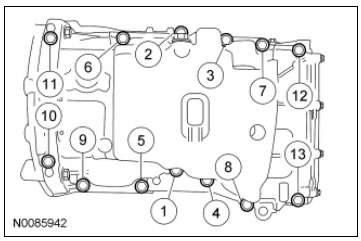
All vehicles

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.**

   Clean and inspect all mating surfaces.

2. **NOTE:** If the oil pan is not secured within 10 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 10 minutes, whichever is longer. Failure to follow these instructions can cause future oil leakage.

   Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the oil pan-to-engine block and to the oil pan-to-engine front cover mating surface.

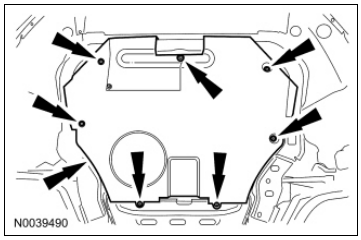


3. Position the oil pan onto the engine and install the oil pan bolts finger-tight.

4. Install the 3 engine front cover-to-oil pan bolts and the stud bolt.
    - Tighten to 10 Nm (89 lb-in).

5. Tighten the oil pan bolts in the sequence shown.

- Tighten to 25 Nm (18 lb-ft).



6. Alternate tightening the 1 LH and 1 RH lower bolts to slide the transmission and engine together.
   - Tighten to 48 Nm (35 lb-ft).

7. Tighten the remaining LH bolt (manual transmission) and RH stud bolt.
   - Tighten to 48 Nm (35 lb-ft).

8. Install the bellhousing-to-oil pan bolt.
   - Tighten to 48 Nm (35 lb-ft).

9. Install the 2 oil pan-to-bellhousing bolts.
   - Tighten to 48 Nm (35 lb-ft).

10. If equipped, install the underbody cover and the 7 screws.

11. Tighten the 3 top bellhousing-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

Automatic transmission

12. Install the battery tray. For additional information, refer to Section 414-01 .

All vehicles

13. Install the ACL assembly. For additional information, refer to Section 303-12A .

14. Fill the engine with clean engine oil.

Oil Pump Screen and Pickup Tube

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pan in this section.

3. **NOTE:** Discard the gasket and clean and inspect the gasket mating surfaces.

   Remove the 2 bolts and the oil pump screen and pickup tube.

   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

Oil Pump

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

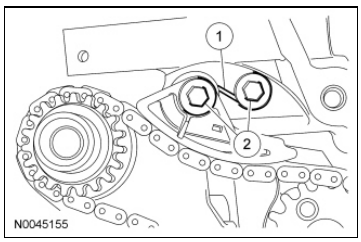
Removal

1. With the engine in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

3. Drain the engine oil, then install the drain plug.
   - To install, tighten to 28 Nm (21 lb-ft).

4. Remove the 3 oil pan-to-bellhousing bolts.



5. Remove the 13 bolts and the oil pan.

6. **NOTE:** Discard the gasket and clean and inspect the gasket mating surfaces.

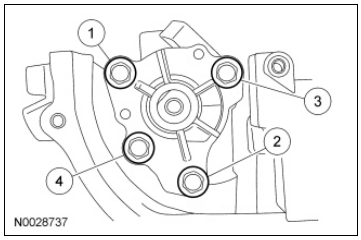
   Remove the 2 bolts and the oil pump screen and pickup tube.

   - To install, tighten to 10 Nm (89 lb-in).

7. Remove the oil pump drive chain tensioner.
   1. Release the tension on the tensioner spring.
   2. Remove the tensioner and the 2 shoulder bolts.

8. Remove the chain from the oil pump sprocket.

9. Remove the bolt and oil pump sprocket.



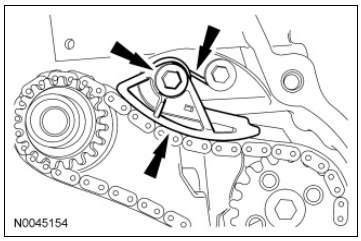
10. Remove the 4 bolts and the oil pump.

Installation

1. **NOTE:** Clean the oil pump and cylinder block mating surfaces with metal surface prep.

   Install the oil pump assembly. Tighten the 4 bolts in the sequence shown in 2 stages:

   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten to 20 Nm (177 lb-in).



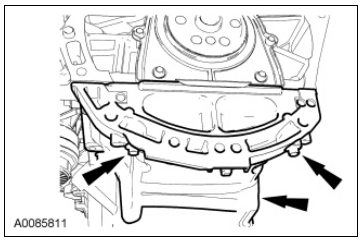
2. Install the oil pump sprocket and bolt.
   - Tighten to 25 Nm (18 lb-ft).

3. Install the chain onto the oil pump sprocket.

4. Install the oil pump drive chain tensioner shoulder bolt.
   - Tighten to 10 Nm (89 lb-in).

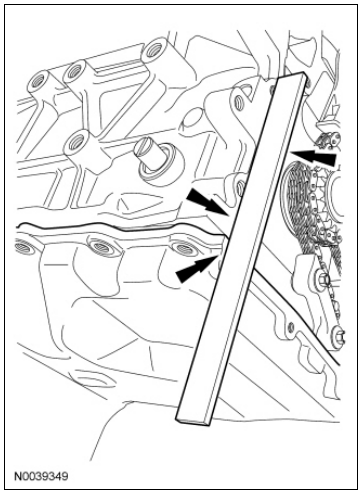
5. Install the oil pump chain tensioner and bolt. Hook the tensioner spring around the shoulder bolt.
   - Tighten to 10 Nm (89 lb-in).

6. Install the oil pump screen and pickup tube and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).



7. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces to sealant.**

Clean all mating surfaces with metal surface prep.



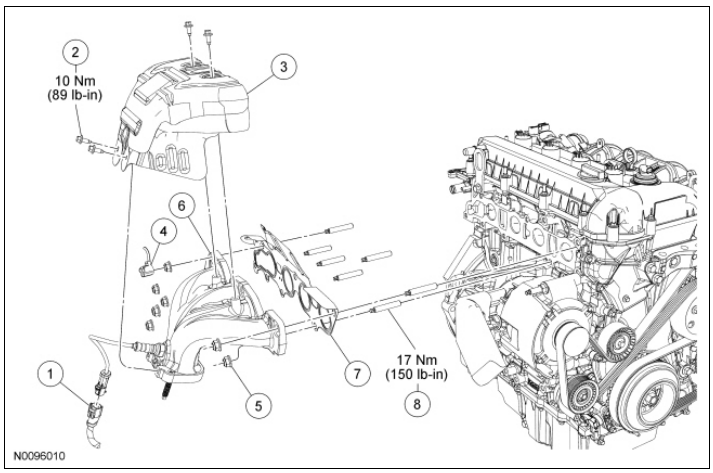
8. **NOTE:** If the oil pan is not secured within 10 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 10 minutes, whichever is longer. Failure to follow these instructions can cause future oil leakage.

   Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the oil pan.

   - Position the oil pan onto the engine and install the 2 rear oil pan bolts finger-tight.

9. Using a suitable straight edge, align the front surface of the oil pan flush with the front surface of the engine block.

10. Install the remaining oil pan bolts.
    - Tighten in the sequence shown to 25 Nm (18 lb-ft).



11. Install the 3 oil pan-to-bellhousing bolts.
    - Tighten to 48 Nm (35 lb-ft).

12. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

13. Fill the engine with clean engine oil.

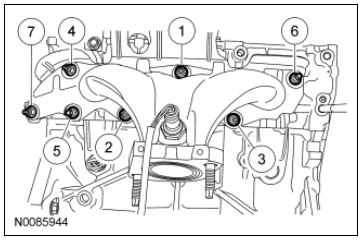
Exhaust Manifold

Item	Part Number	Description
1	14A464	Heated Oxygen Sensor (HO2S) electrical connector (part of 12C508)
2	W713299	Exhaust manifold heat shield bolt (4 required)
3	9N454	Exhaust manifold heat shield
4	-	Block heater wire harness retainer (if equipped)
5	W713652	Exhaust manifold nut (7 required)
6	9430	Exhaust manifold
7	9448	Exhausfold gasket
8	W704474	Cylinder head stud (7 required)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .
3. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector.
4. Remove the 4 exhaust manifold heat shield bolts and the heat shield.
5. If equipped, detach the block heater wire harness retainer from the exhaust manifold stud.
6. Remove and discard the 7 exhaust manifold nuts.
7. Remove the exhaust manifold and discard the exhaust manifold gasket.
8. Remove and discard the 7 cylinder head studs.
9. Clean and inspect the exhaust manifold. For additional information, refer to Section 303-00 .

Installation



1. Install the 7 new cylinder head studs.
    - Tighten to 17 Nm (150 lb-in).

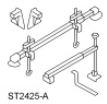
2. ***NOTICE:*** **Failure to tighten the catalytic converter nuts to specification before installing the converter bracket bolts will cause the converter to develop an exhaust leak.**

   NOTICE: **Failure to tighten the catalytic converter nuts to specification a second time will cause the converter to develop an exhaust leak.**

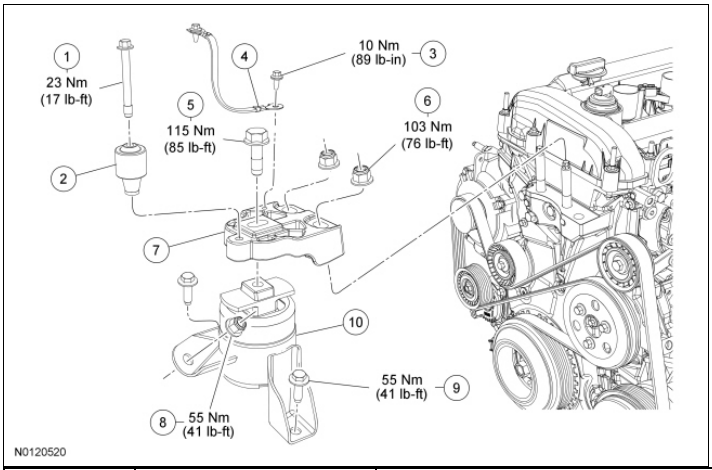
   Install a new exhaust manifold gasket, the exhaust manifold and 7 new nuts in the sequence shown in 2 stages:

    - Stage 1: Tighten to 48 Nm (35 lb-ft).
    - Stage 2: Tighten to 48 Nm (35 lb-ft).

3. If equipped, attach the block heater wire harness retainer to the exhaust manifold stud.



4. Install the exhaust manifold heat shield and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).



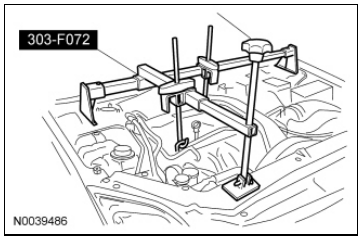
5. Connect the HO2S electrical connector.

6. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .

Engine Mount

Special Tool(s)

 ST2425-A	Engine Support Bar 303-F072



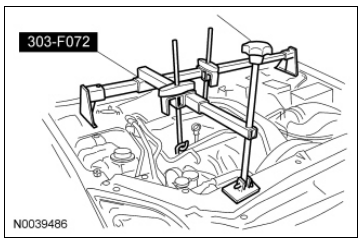
Item	Part Number	Description
1	W711879	Engine mount damper bolt
2	7458	Engmount damper
3	W705936	Ground wire bolt
4	19A095	Ground wire
5	W711684	Engine mount bracket bolt
6	W520214	Engine mount bracket nut (2 required)
7	6061	Engine mount bracket
8	W711578	Engine mount nut
9	W706496	Engine mount bolt (2 required)
10	6038	Engine mount

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the engine coolant degas bottle. For additional information, refer to Section 303-03A .

3. Install the Engine Support Bar to the front and rear engine lifting eyes.



4. Remove the bolt and the engine mount damper.
    - To install, tighten to 23 Nm (17 lb-ft).

5. Remove the bolt and the ground wire.
    - To install, tighten to 10 Nm (89 lb-in).

6. Remove the engine mount bracket bolt.
    - To install, tighten to 115 Nm (85 lb-ft).

7. Use the Engine Support Bar to raise the engine 25 mm (0.98 in).

8. Remove the 2 engine mount bracket nuts.
    - To install, tighten to 103 Nm (76 lb-ft).

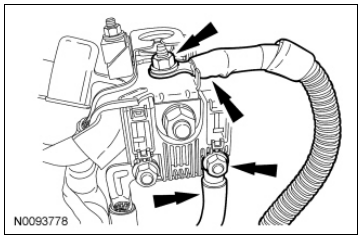
9. Remove the nut, 2 bolts and the engine mount.
    - To install, tighten to 55 Nm (41 lb-ft).

10. **NOTE:** If the engine mount bracket is to be removed, the engine must be lowered to avoid contact between the A/C tubes and the engine mount bracket.

    Use the Engine Support Bar to lower the engine 25 mm (0.98 in).

    - Remove the engine mount bracket.

11. To install, reverse the removal procedure.

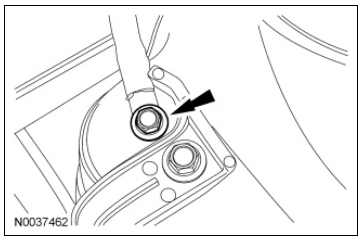


Engine - Automatic Transaxle

Special Tool(s)

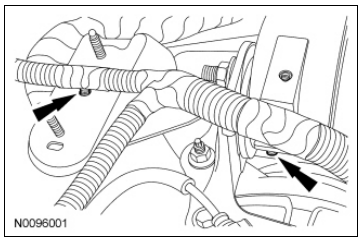
 ST2670-A	Disconnect Tool, Transmission Cooler Line 307-569
 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E or equivalent
 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent
 ST1408-A	Remover, Tie-Rod End 211-105
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent
 ST2743A	Adjustable Grip Arm, 1735A 014-00001 or equivalent

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

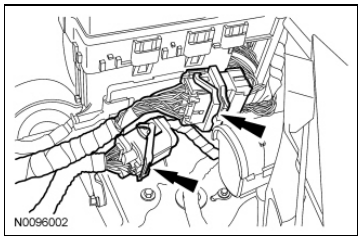


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Remove the engine Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12A .
4. Recover the A/C system. For additional information, refer to Section 412-00A .
5. Remove the battery tray. For additional information, refer to Section 414-01 .
6. Remove the 2 nuts and the battery cables from the positive battery cable.

N0093778

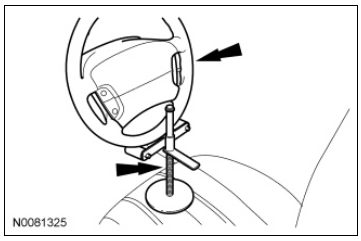


7. Disconnect the engine wiring harness electrical connector.

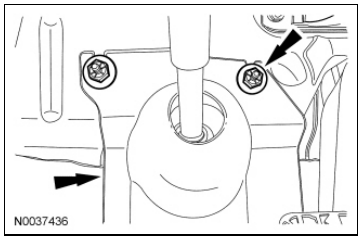


8. Remove the bolt and the ground wire from the body.

9. Detach the 2 negative battery cable pin-type retainers from the transaxle mount and battery tray bracket.

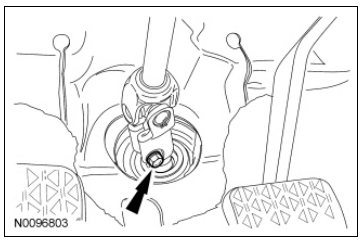


10. Disconnect the 2 engine harness electrical connectors.

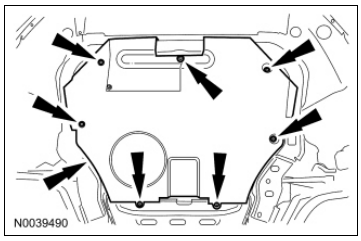


11. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

    Using a suitable holding device, hold the steering wheel in the straight-ahead position.



12. Remove the 2 nuts and the steering joint cover.

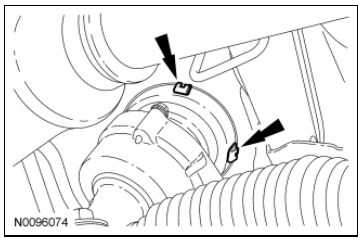


13. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

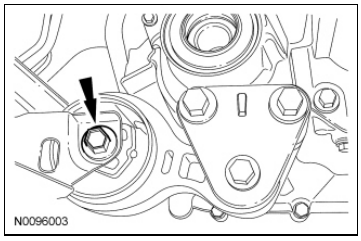
    Remove the bolt and disconnect the steering column shaft from the steering gear.

    - Discard the bolt.

14. If equipped, remove the 7 screws and the underbody cover.



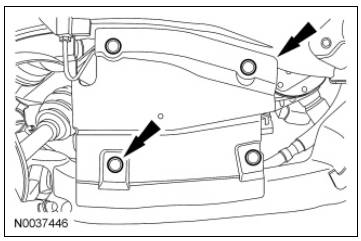
15. Drain the transaxle. For additional information, refer to Section 307-01A .



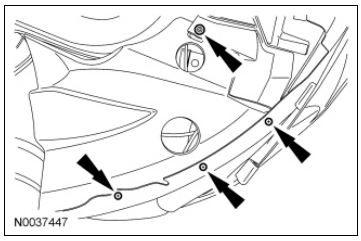
16. Drain the cooling system. For additional information, refer to Section 303-03A .

17. ***NOTICE:*** **The steering gear-to-dash seal must be removed or it will be damaged when lowering the subframe.**

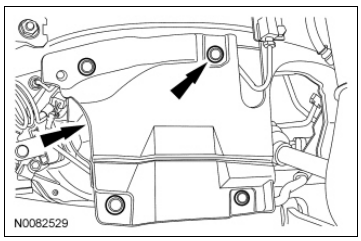
    Release the 4 clips (2 shown) and slide the steering gear-to-dash seal off of the steering gear and into the passenger compartment.



18. Remove the engine roll restrictor bolt.

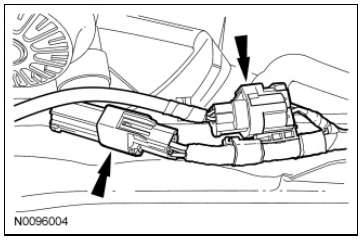


19. Remove the 4 screws and position the RH fender splash shield aside.

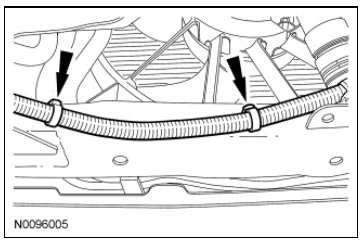


20. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

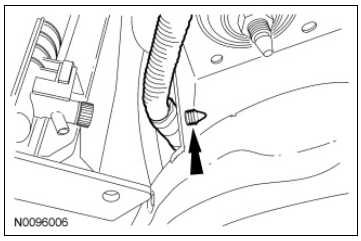
21. Remove the 4 screws and position the LH fender splash shield aside.



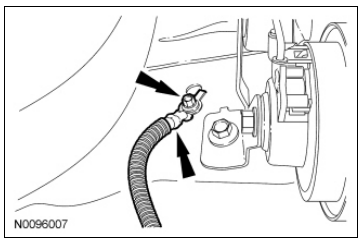
22. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.



23. Remove the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

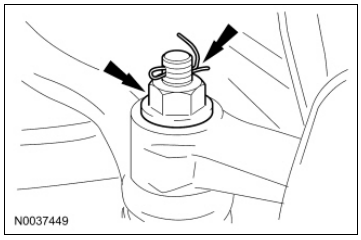


24. Disconnect the 2 Electronic Power Assist Steering (EPAS) system electrical connectors.

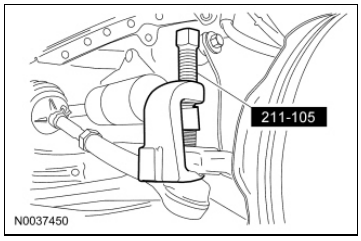


25. Detach the 2 EPAS system wiring harness pin-type retainers from the subframe.

26. Detach the EPAS system wiring harness pin-type retainer from the subframe under the LH fender splash shield.

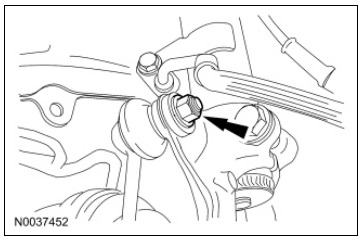


27. Remove the bolt and the EPAS system wiring harness ground.



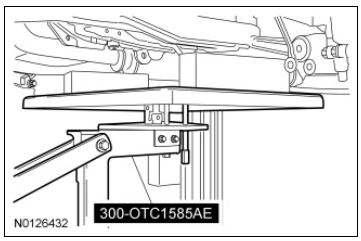
28. **NOTE:** LH shown, RH similar.

    Remove the cotter pins and nuts from the tie-rod ends.



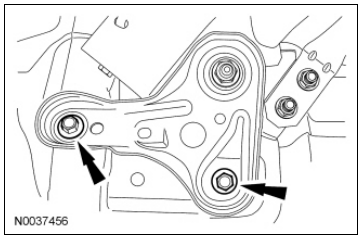
29. **NOTE:** LH shown, RH similar.

    Using the Tie-Rod End Remover, separate the tie-rod ends from the steering knuckles.

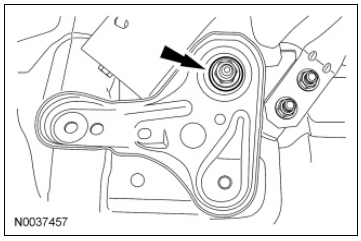


30. **NOTE:** LH shown, RH similar.

    Remove the nuts and separate the sway bar links from the struts.

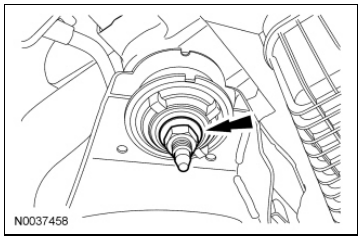


31. Position the Powertrain Lift under the subframe assembly.



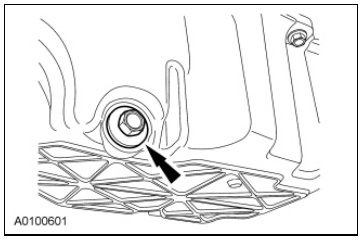
32. **NOTE:** LH shown, RH similar.

    Remove the subframe bracket-to-body bolts.



33. **NOTE:** LH shown, RH similar.

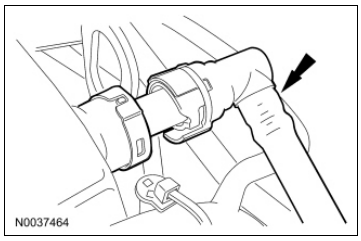
    Remove the subframe nuts and the subframe brackets.



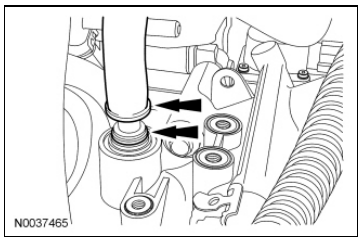
34. **NOTE:** LH shown, RH similar.

    Remove the front subframe nuts.

35. Lower the subframe assembly from the vehicle.

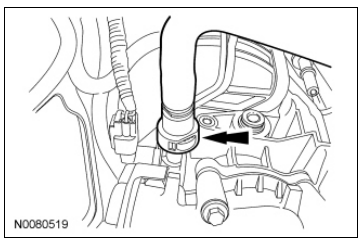


36. Remove the engine oil pan drain plug and drain the engine oil.
    - Install the drain plug and tighten to 28 Nm (21 lb-ft).

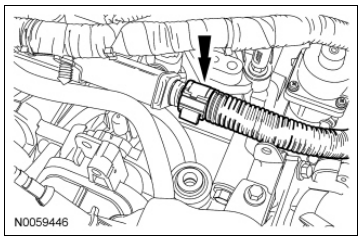


37. Remove the engine oil filter.

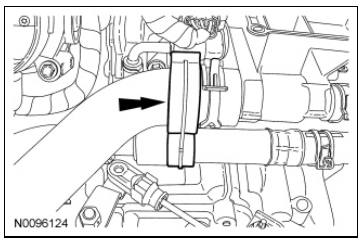
38. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .



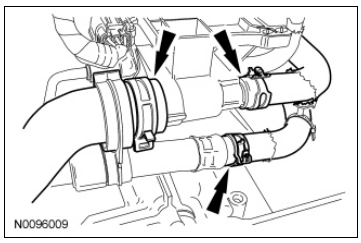
39. Disconnect the crankcase vent tube from the valve cover.



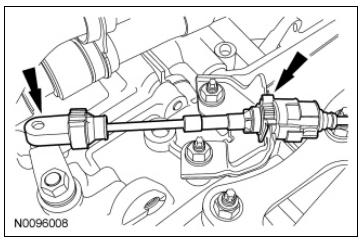
40. Depress the locking ring and disconnect the brake booster vacuum supply tube from the intake manifold.



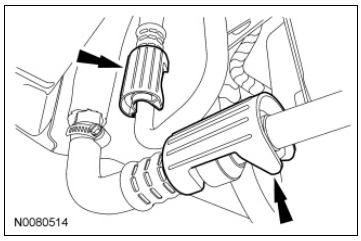
41. Disconnect the fuel vapor return tube.



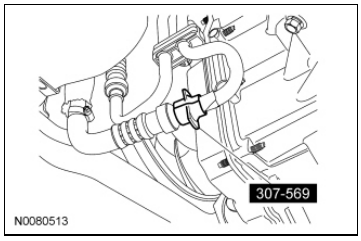
42. Disconnect the fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .



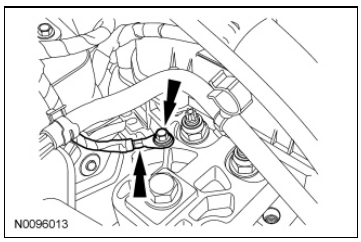
43. Detach the coolant hose retainer.



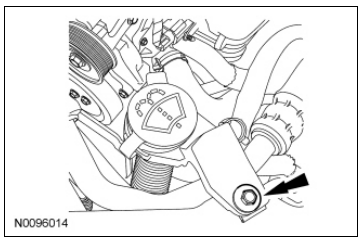
44. Disconnect the upper radiator and heater hoses from the coolant outlet and disconnect the heater hose in-line connector.



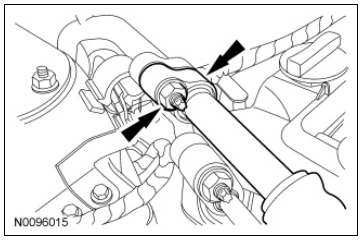
45. Disconnect the shift cable from the transaxle manual lever and remove the transaxle shift cable from the bracket.



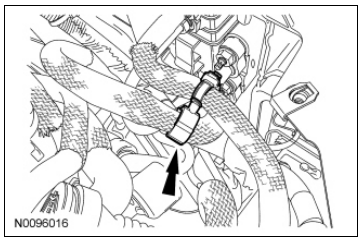
46. Remove the 2 secondary latches from the transaxle fluid cooler tubes.



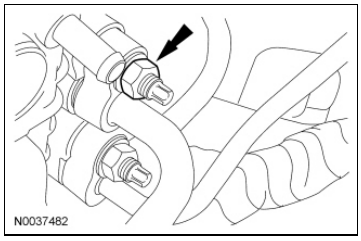
47. Using the Transmission Cooler Line Disconnect Tool, disconnect the 2 transaxle fluid cooler tubes (1 shown).



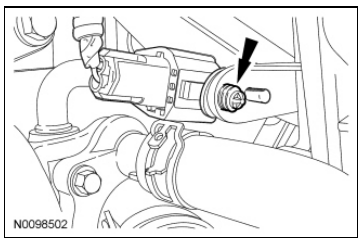
48. Remove the bolt and the ground wire from the engine mount.



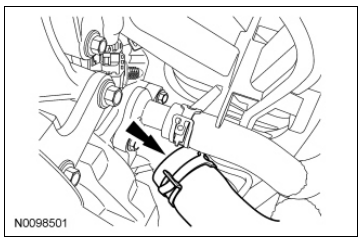
49. Remove the A/C tube/windshield washer reservoir bracket bolt.



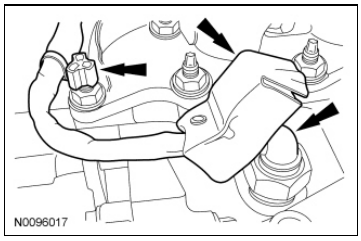
50. Remove the nut and disconnect the A/C tube.
    - Discard the O-ring seal.



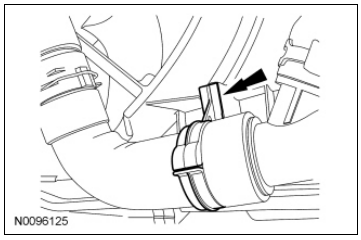
51. Detach the coolant vent hose retaining clip from the A/C tube.



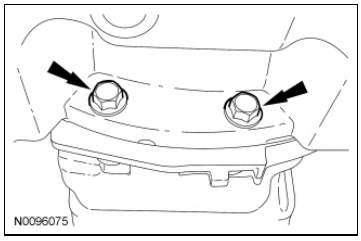
52. Remove the nut and disconnect the upper A/C tube from the condenser.
    - Discard the O-ring seal.



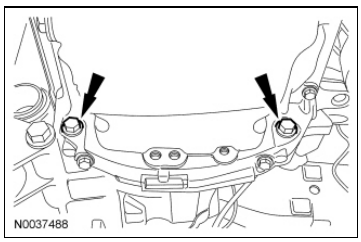
53. Detach the Knock Sensor (KS) electrical connector from the intake manifold.



54. Remove the lower radiator hose from the thermostat housing.

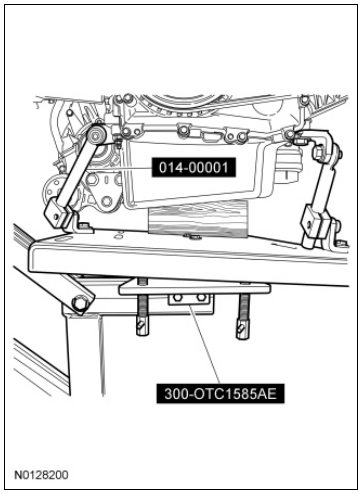


55. If equipped, position the block heater shield aside and disconnect the block heater electrical connector.
    - Detach the 8 block heater wiring harness retainers (1 shown) and remove the block heater wiring harness.

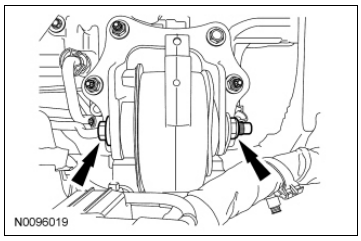


56. Detach the lower radiator hose pin-type retainer from the cooling fan shroud.

57. Remove the 2 bellhousing-to-oil pan bolts.



58. Remove the 2 oil pan-to-bellhousing bolts.

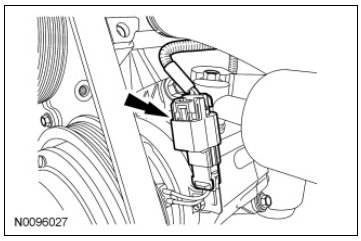


59. **NOTE:** Position a block of wood under the transaxle.

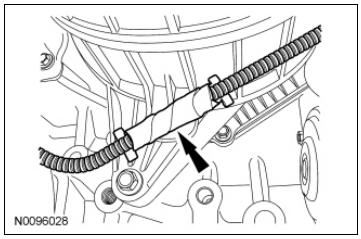
    Install the Powertrain Lift and Adjustable Grip Arm onto the engine.

    - Raise the engine and transaxle 25.4 mm (1 in) to neutralize the engine and transaxle mounts.

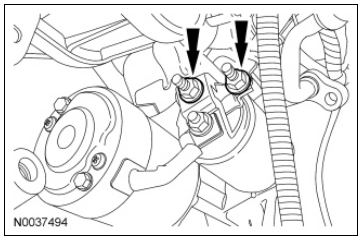
60. Remove the nut and the transaxle mount through bolt.



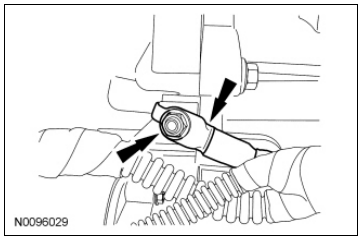
61. Remove the bolt, 2 nuts and the engine mount bracket.



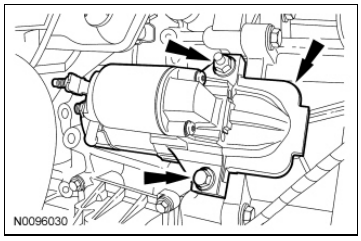
62. Lower the engine and transaxle from the vehicle.



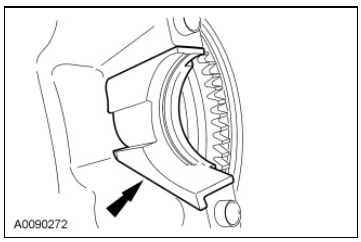
63. Disconnect the A/C compressor electrical connector.



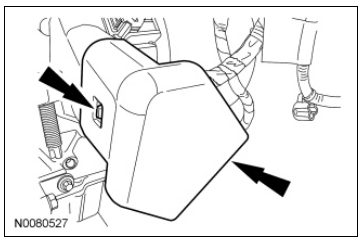
64. Detach the A/C compressor wiring harness pin-type retainer from the intake manifold.



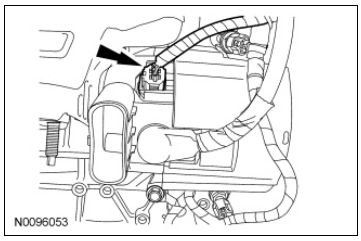
65. Remove the 2 nuts and disconnect the starter motor wires.



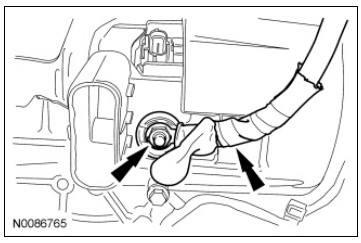
66. Remove the nut and the ground wire from the starter motor stud bolt.



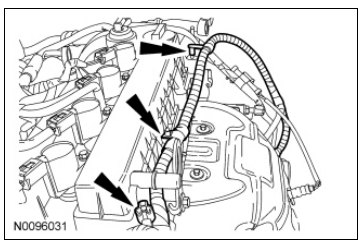
67. Remove the bolt, stud bolt and the starter motor.



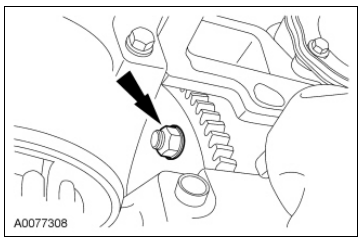
68. Remove the starter motor isolator.



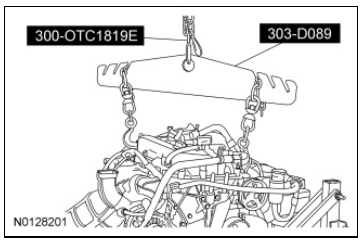
69. Press the locking tab to release the generator air duct and remove.



70. Disconnect the generator electrical connection.

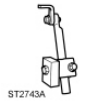


71. Remove the nut and the generator B+ wiring harness.



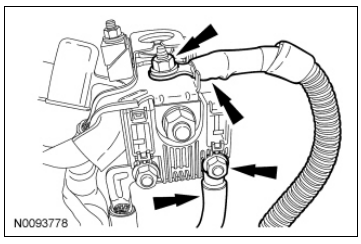
72. Detach the 4 wiring harness retainers (3 shown) from the valve cover stud bolts.

73. Remove the 4 torque converter nuts.



74. Install the Floor Crane and Spreader Bar and remove the engine and transaxle from the Powertrain Lift table.

75. Remove the remaining bellhousing-to-engine retainers.
    - Separate the engine and transaxle.



Engine - Manual Transaxle

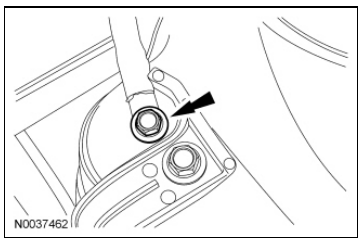
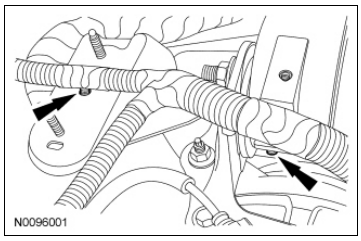
⚠ **WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

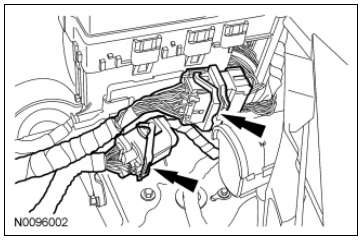


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Remove the engine Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12A .
4. Recover the A/C system. For additional information, refer to Section 412-00A .
5. Remove the battery tray. For additional information, refer to Section 414-01 .
6. Remove the 2 nuts and the battery cables from the positive battery cable.

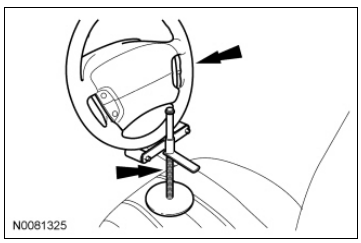
N0093778



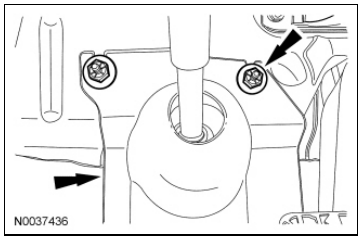
7. Disconnect the engine wiring harness electrical connector.



8. Remove the bolt and the ground wire from the body.

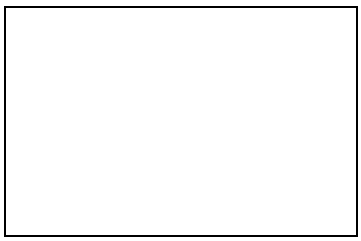


9. Detach the 2 negative battery cable pin-type retainers from the transaxle mount and battery tray bracket.

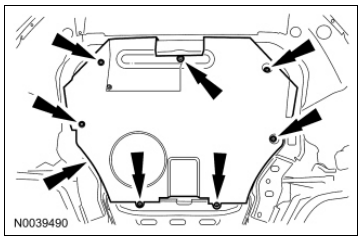


10. Disconnect the 2 engine harness electrical connector.

11. Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).
    - Using a suitable holding device, hold the steering wheel in the straight-ahead position.



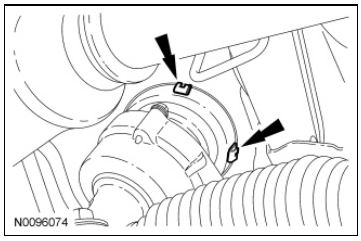
12. Remove the 2 nuts and the steering joint cover.



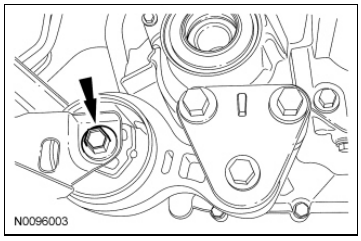
13. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    Remove the bolt and disconnect the steering column shaft from the steering gear.

    - Discard the bolt.



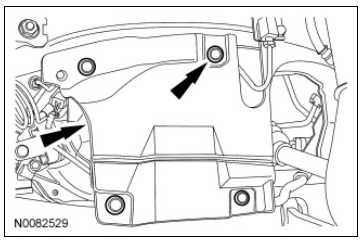
14. If equipped, remove the 7 screws and the underbody cover.



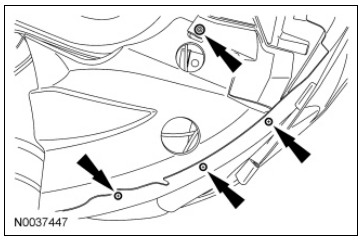
15. Drain the cooling system. For additional information, refer to Section 303-03A .

16. ***NOTICE:*** **The steering gear-to-dash seal must be removed or it will be damaged when lowering the subframe.**

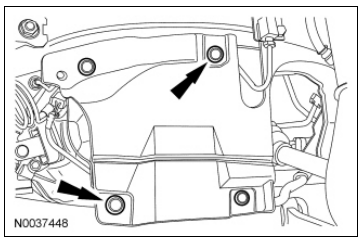
    Release the 4 clips (2 shown) and slide the steering gear-to-dash seal off of the steering gear and into the passenger compartment.



17. Remove the engine roll restrictor bolt.

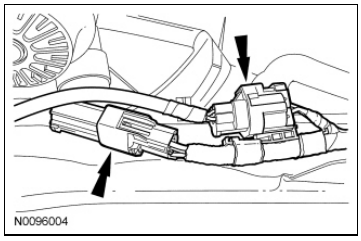


18. Remove the 4 screws and position the RH fender splash shield aside.

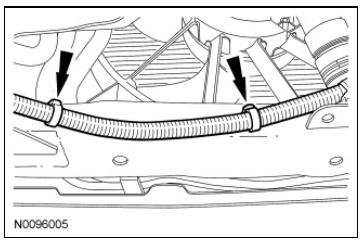


19. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

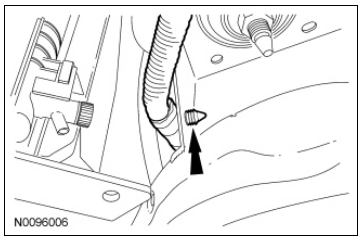
20. Remove the 4 screws and position the LH fender splash shield aside.



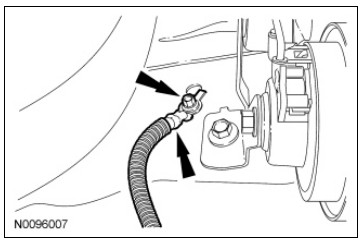
21. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.



22. Remove the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

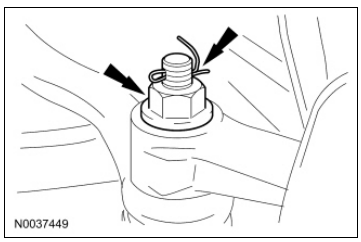


23. Disconnect the 2 Electronic Power Assist Steering (EPAS) system electrical connectors.

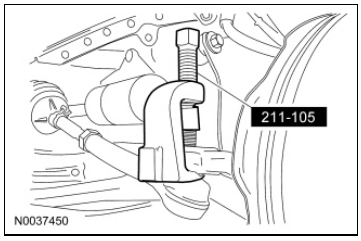


24. Detach the 2 EPAS system wiring harness pin-type retainers from the subframe.

25. Detach the EPAS system wiring harness pin-type retainer from the subframe under the LH fender splash shield.

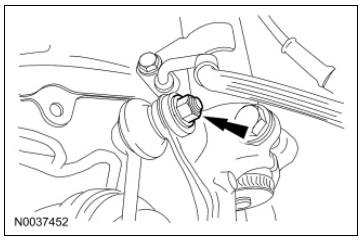


26. Remove the bolt and the EPAS system wiring harness ground.



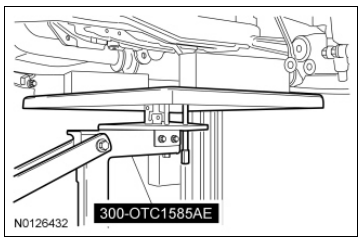
27. **NOTE:** LH shown, RH similar.

    Remove the cotter pins and nuts from the tie-rod ends.



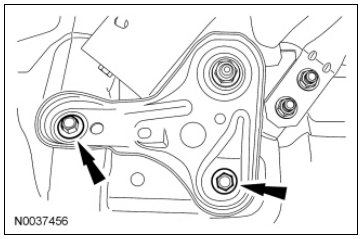
28. **NOTE:** LH shown, RH similar.

    Using the Tie-Rod End Remover, separate the tie-rod ends from the steering knuckles.

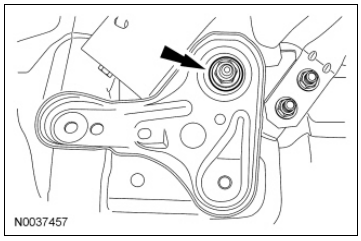


29. **NOTE:** LH shown, RH similar.

    Remove the nuts and separate the sway bar links from the struts.

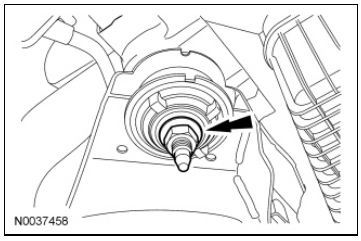


30. Position the Powertrain Lift under the subframe assembly.



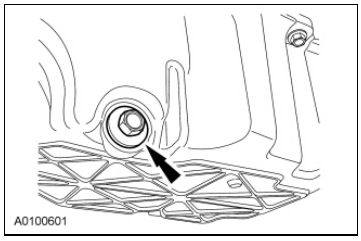
31. **NOTE:** LH shown, RH similar.

    Remove the subframe bracket-to-body bolts.



32. **NOTE:** LH shown, RH similar.

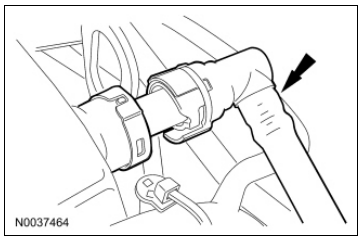
    Remove the rear subframe nuts and the subframe brackets.



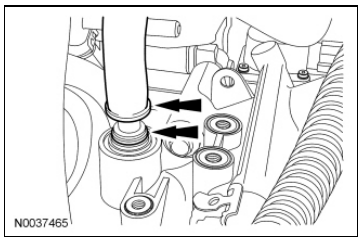
33. **NOTE:** LH shown, RH similar.

    Remove the front subframe nuts.

34. Lower the subframe assembly from the vehicle.

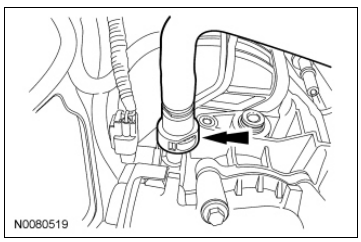


35. Remove the engine oil pan drain plug and drain the engine oil.
    - Install the drain plug and tighten to 28 Nm (21 lb-ft).

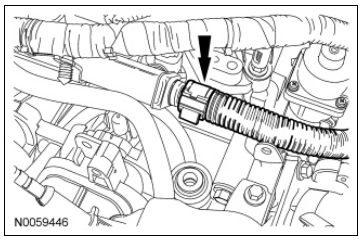


36. Remove the engine oil filter.

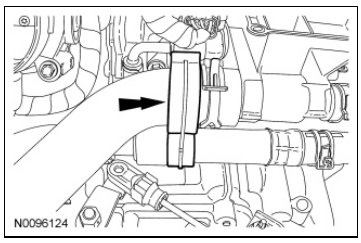
37. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .



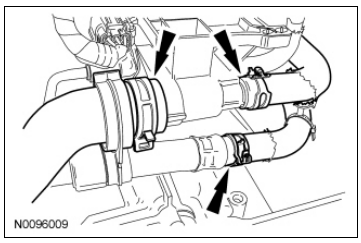
38. Disconnect the crankcase vent tube from the valve cover.



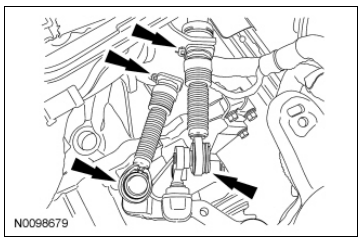
39. Depress the locking ring and disconnect the brake booster vacuum supply tube from the intake manifold.



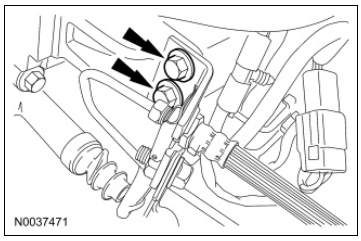
40. Disconnect the fuel vapor return tube.



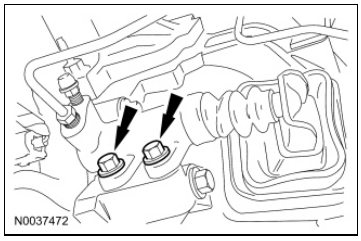
41. Disconnect the fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .



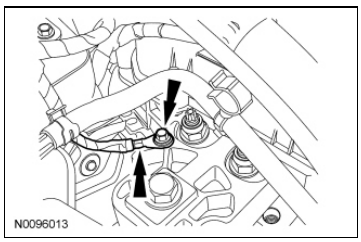
42. Detach the coolant hose retainer.



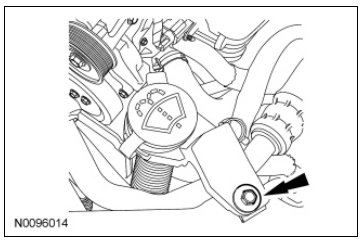
43. Disconnect the upper radiator and heater hoses from the coolant outlet and disconnect the heater hose in-line connector.



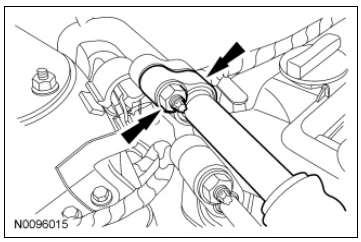
44. Disconnect the transaxle control cables from the control levers.
    - Detach the control cables from the bracket.



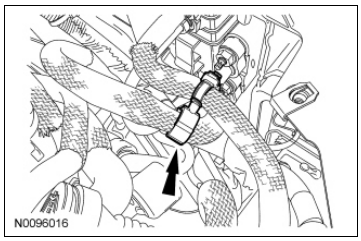
45. Remove the 2 clutch tube bracket bolts.



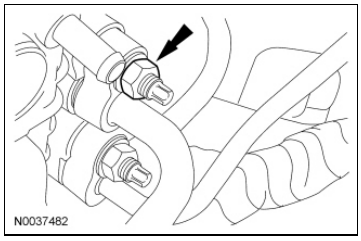
46. Remove the 2 bolts and position the clutch slave cylinder aside.



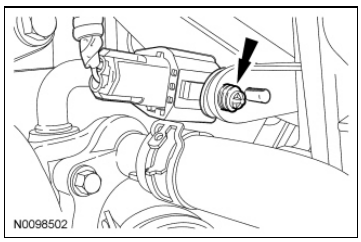
47. Remove the bolt and the ground wire from the engine mount.



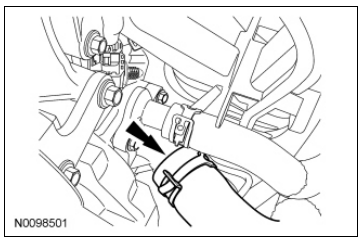
48. Remove the A/C tube/windshield washer reservoir bracket bolt.



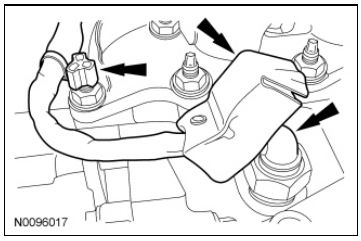
49. Remove the nut and disconnect the A/C tube.
    - Discard the O-ring seal.



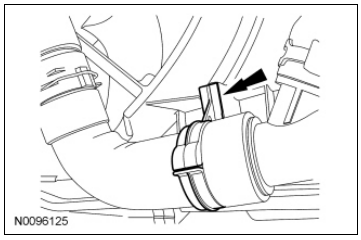
50. Detach the coolant vent hose retaining clip from the A/C tube.



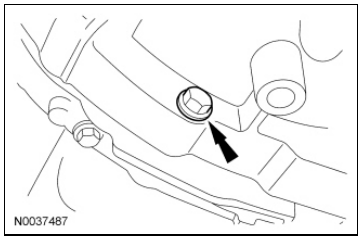
51. Remove the nut and disconnect the upper A/C tube from the condenser.
    - Discard the O-ring seal.



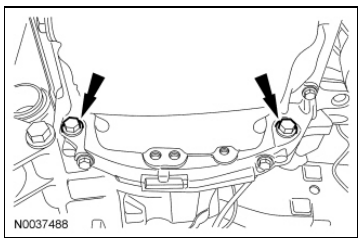
52. Detach the Knock Sensor (KS) electrical connector from the intake manifold.



53. Remove the lower radiator hose from the thermostat housing.

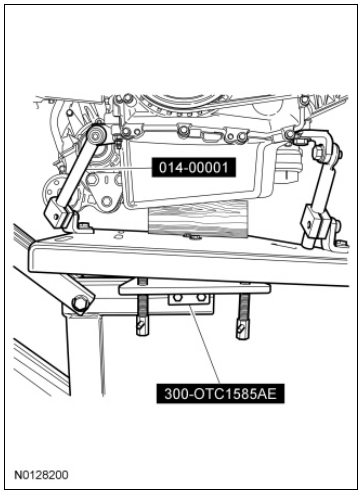


54. If equipped, position the block heater shield aside and disconnect the block heater electrical connector.
    - Detach the 8 block heater wiring harness retainers (1 shown) and remove the block heater wiring harness.

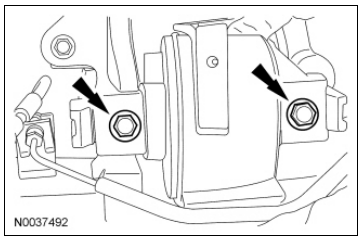


55. Detach the lower radiator hose pin-type retainer from the cooling fan shroud.

56. Remove the bellhousing-to-oil pan bolt.



57. Remove the 2 oil pan-to-bellhousing bolts.

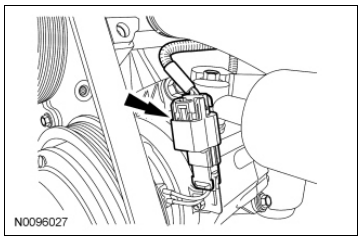


58. **NOTE:** Position a block of wood under the transaxle.

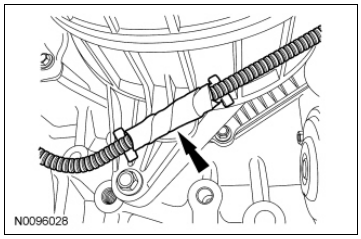
    Install the Powertrain Lift and Adjustable Grip Arm onto the engine.

    - Raise the engine and transaxle 25.4 mm (1 in) to neutralize the engine and transaxle mounts.

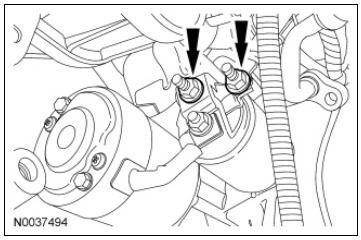
59. Remove the 2 transaxle mount bolts.



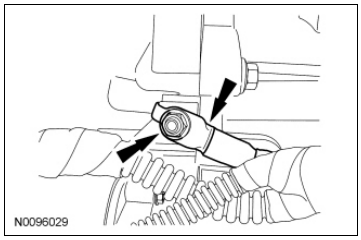
60. Remove the bolt, 2 nuts and the motor mount bracket.



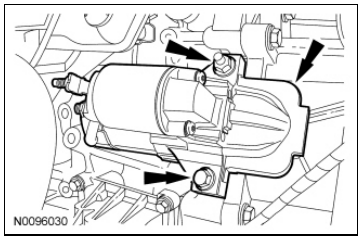
61. Lower the engine and transaxle from the vehicle.



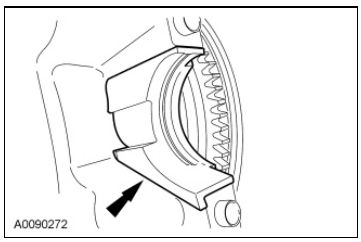
62. Disconnect the A/C compressor electrical connector.



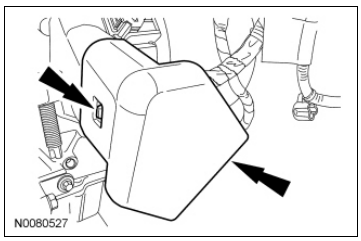
63. Detach the A/C compressor wiring harness pin-type retainer from the intake manifold.



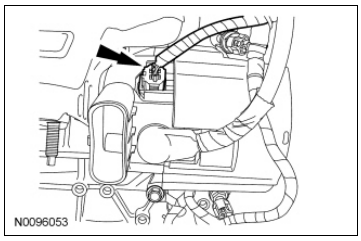
64. Remove the 2 nuts and disconnect the starter wires.



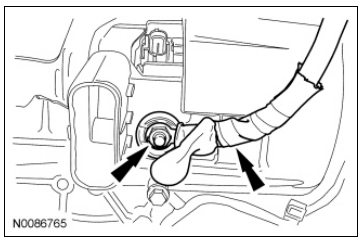
65. Remove the nut from the starter motor stud bolt.



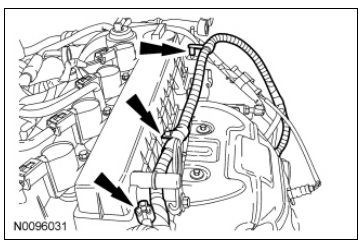
66. Remove the bolt, stud bolt and the starter.



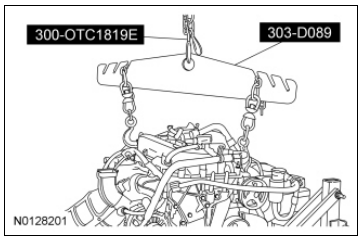
67. Remove the starter motor isolator.



68. Press the locking tab to release the generator air duct and remove.

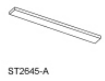


69. Disconnect the generator electrical connection.



70. Remove the nut and the generator wiring harness.

71. Detach the 4 wiring harness retainers (3 shown) from the valve cover stud bolts.



72. Install the Floor Crane and Spreader Bar and remove the engine and transaxle from the Powertrain Lift table.

73. Remove the bellhousing-to-engine retainers.
    - Separate the engine and transaxle.

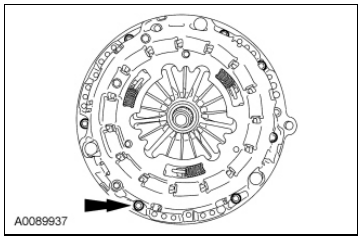
Engine

Special Tool(s)

 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST1910-A	Engine Stand 014-00232 or equivalent
 ST3054-A	Holding Tool, Crankshaft Damper 303-1416
 ST1982-A	Installer, Connecting Rod 303-462 (T94P-6136-AH)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

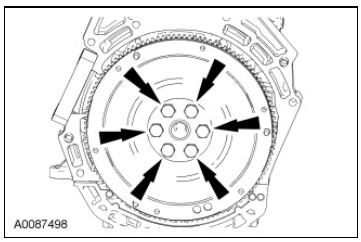
NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



NOTE: For additional information, refer to the exploded views under the Engine Assembly procedure in this section.

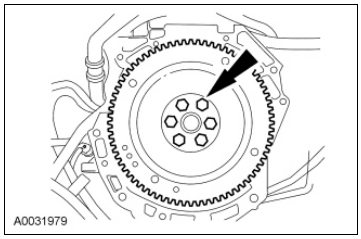
Vehicles with manual transaxle



1. ⚠ **WARNING: The clutch disc and clutch pressure plate are heavy and may fall if not held when the bolts are removed. Failure to follow this instruction may result in serious personal injury.**

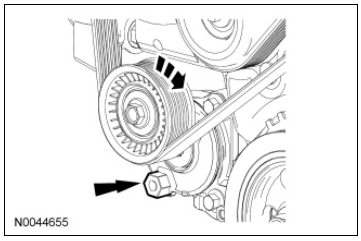
   NOTICE: **Loosen the 6 bolts evenly to prevent pressure plate damage.**

   Remove the 6 bolts, clutch pressure plate and clutch disc.

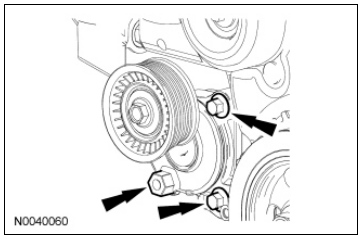


2. Remove the 6 bolts and the flywheel.

Vehicles with automatic transaxle

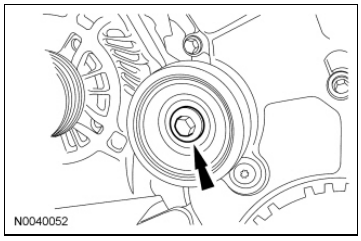


3. Remove the 6 bolts and the flexplate.

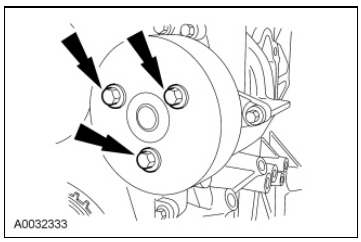


All vehicles

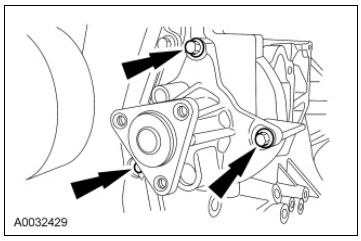
4. Mount the engine on a suitable Engine Stand.



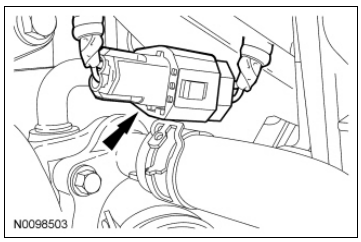
5. Using the hex feature, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the engine.



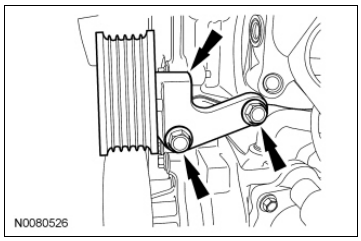
6. Remove the 2 bolts and the tensioner.



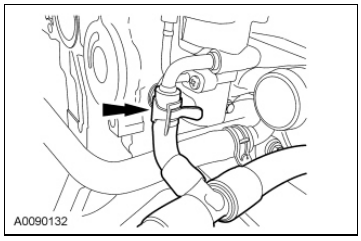
7. Remove the bolt and the accessory drive belt idler pulley.



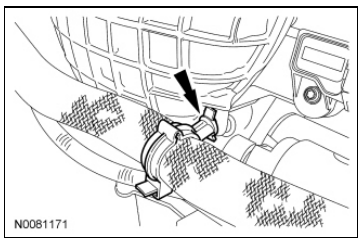
8. Remove the 3 bolts and the coolant pump pulley.



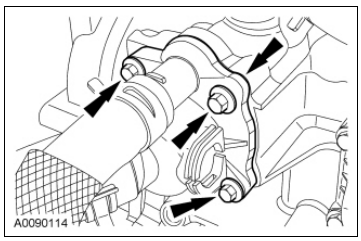
9. Remove the 3 bolts and the coolant pump.
    - Remove and discard the O-ring seal.



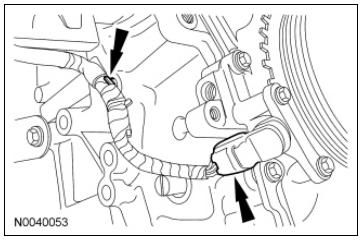
10. Disconnect the Knock Sensor (KS) electrical connector.



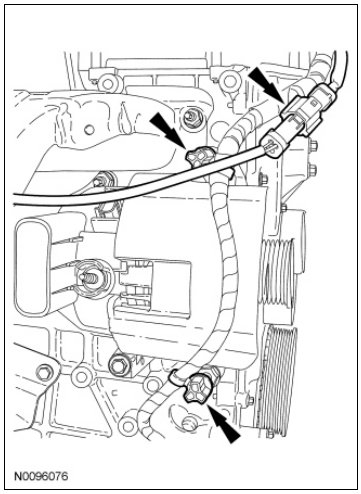
11. Remove the 2 bolts and the accessory drive belt idler pulley and bracket.



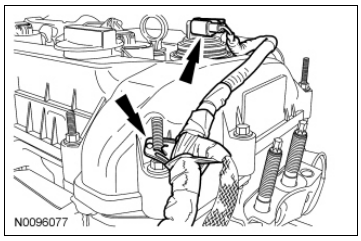
12. Disconnect the coolant hose from the EGR valve.



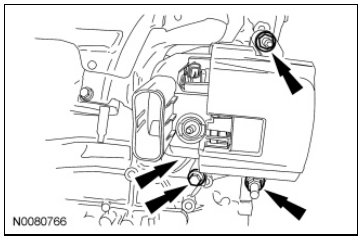
13. Remove the coolant tube retainer from the intake manifold.



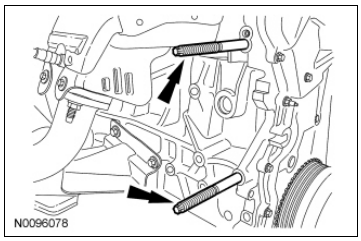
14. Remove the 3 bolts and the thermostat housing assembly.



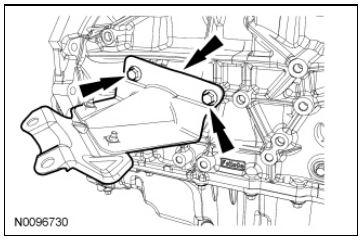
15. Disconnect the Crankshaft Position (CKP) sensor electrical connector and detach the wiring harness pin-type retainer.



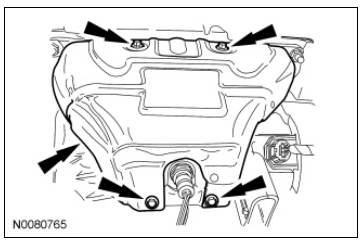
16. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector and detach the 2 wiring harness retainers from the generator stud bolts.



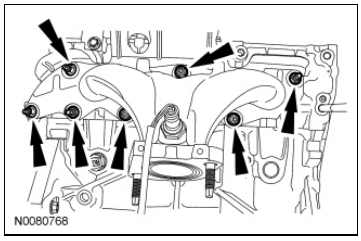
17. Disconnect the Variable Camshaft Timing (VCT) electrical connector and detach the wiring harness retainer from the valve cover stud bolt.



18. Remove the 2 nuts, 1 bolt and the generator.

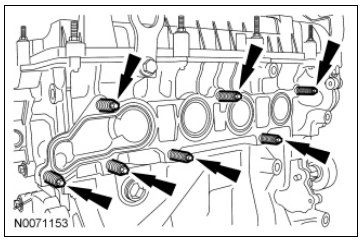


19. Remove the 2 generator studs.

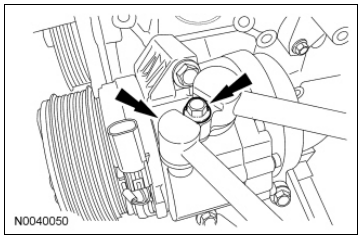


20. Remove the 2 bolts and the exhaust flexible pipe bracket.

21. Remove the 4 exhaust manifold heat shield bolts and the heat shield.

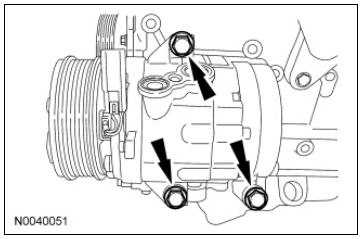


22. Remove and discard the 7 exhaust manifold nuts.

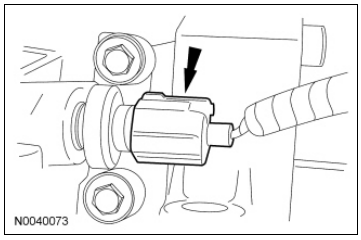


23. Remove the exhaust manifold and discard the exhaust manifold gasket.

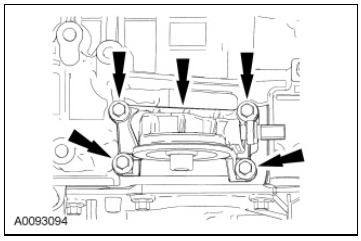
24. Clean and inspect the exhaust manifold. For additional information, refer to Section 303-00 .



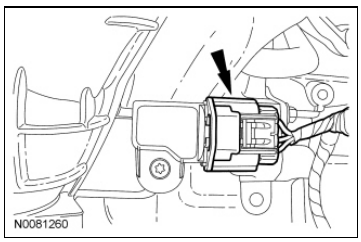
25. Remove and discard the 7 cylinder head studs.



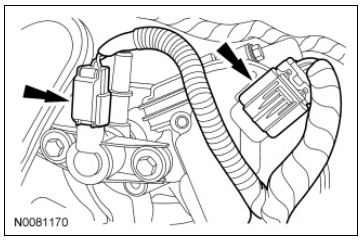
26. Remove the bolt and the A/C manifold tube.
    - Discard the 2 O-ring seals.



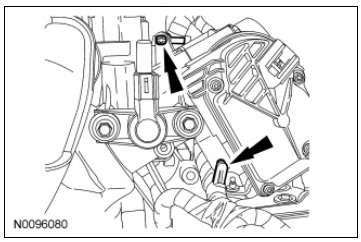
27. Remove the 3 bolts and the A/C compressor.



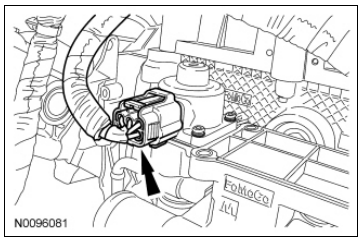
28. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.



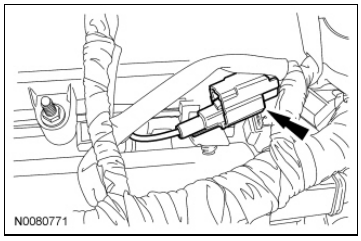
29. Remove the 4 bolts and the oil filter adapter.
    - Discard the gasket.



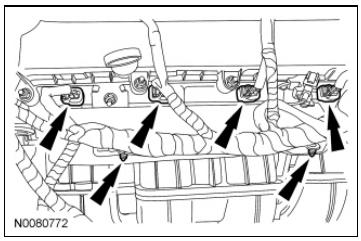
30. Disconnect the Manifold Absolute Pressure (MAP) sensor electrical connector.



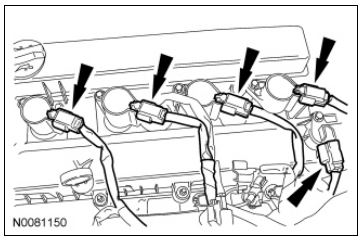
31. Disconnect the electronic throttle control and Evaporative Emission (EVAP) canister purge valve electrical connectors.



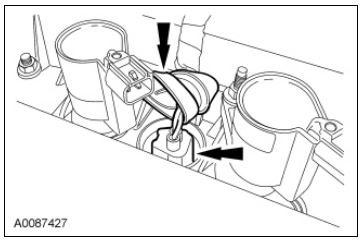
32. Detach the 2 wiring harness retainers from the intake manifold.



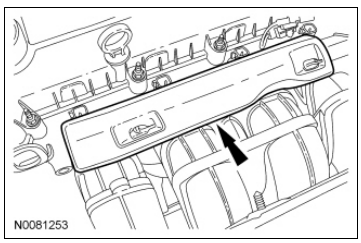
33. Disconnect the EGR valve electrical connector.



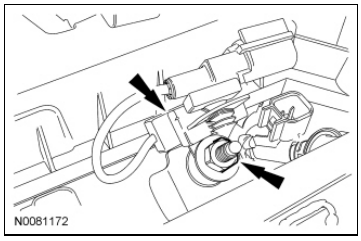
34. Disconnect the radio capacitor electrical connector.



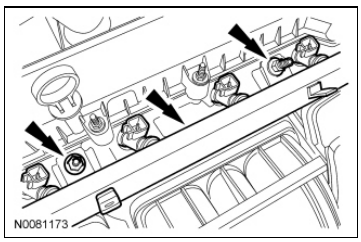
35. Disconnect the 4 fuel injector electrical connectors.
    - Detach the 2 wiring harness retainers and remove the wiring harness assembly.



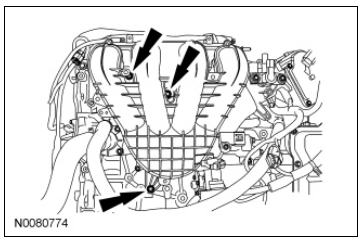
36. Disconnect the 4 ignition coil-on-plugs and Camshaft Position (CMP) sensor electrical connectors.



37. Position the rubber boot aside and disconnect the Cylinder Head Temperature (CHT) sensor electrical connector and remove the wiring harness.

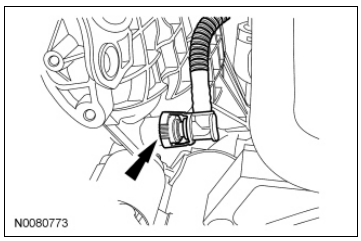


38. Remove the fuel rail insulator.

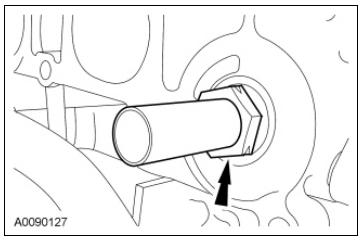


39. Remove the nut and the radio capacitor.

40. Remove the 2 stud bolts, fuel rail and fuel injectors as an assembly.

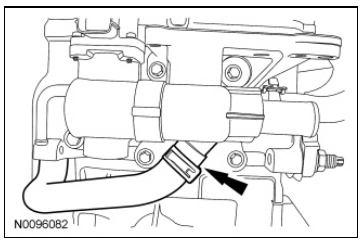


41. Remove the 7 bolts (3 shown) and position the intake manifold aside.

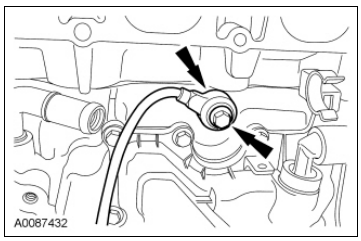


42. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

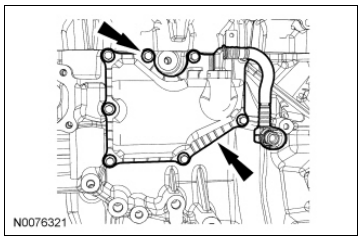
    Squeeze the 2 crankcase vent oil separator tube tabs and disconnect the tube from the intake manifold.



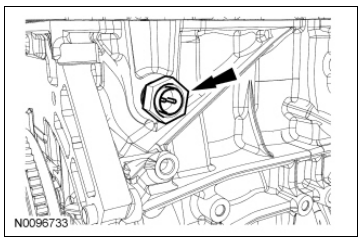
43. Remove the EGR tube.



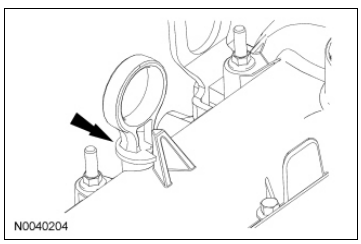
44. Disconnect the bypass hose.



45. Remove the bypass hose from the coolant outlet.

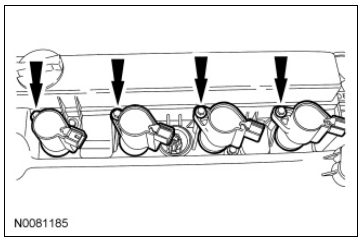


46. Remove the bolt and the KS .

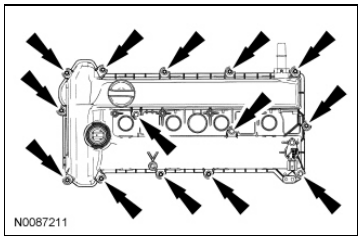


47. Remove the 8 bolts and the crankcase vent oil separator.

48. If equipped, remove the block heater.



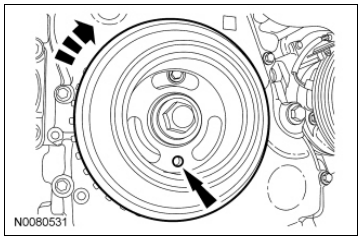
49. Remove the oil level indicator.



50. **NOTE:** When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.

    Remove the 4 bolts and the 4 coil-on-plugs.

51. Remove the 14 retainers and the valve cover.

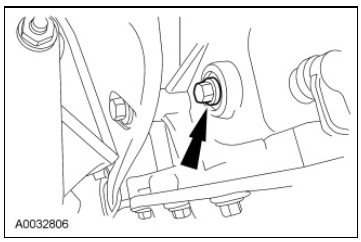


52. Remove the 2 bolts and the CKP sensor.

53. ***NOTICE:*** **Failure to position the No. 1 position at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

    Using the crankshaft pulley bolt, turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

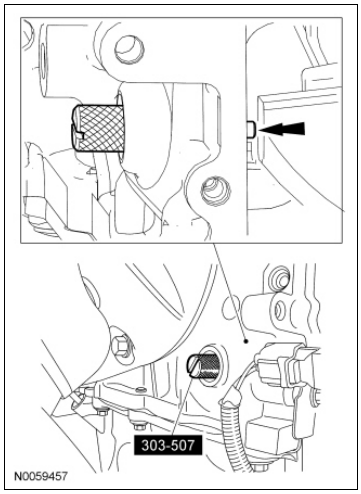
    - The hole in the crankshaft pulley should be in the 6 o'clock position.



54. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this to prevent engine rotation can result in engine damage.**

    NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Plate cannot be installed, rotate the crankshaft one complete revolution clockwise to correctly position the camshafts.

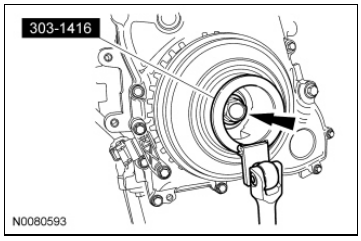
    Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.



55. Remove the engine plug bolt.

56. **NOTE:** The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during disassembly.

    Install the Crankshaft TDC Timing Peg.

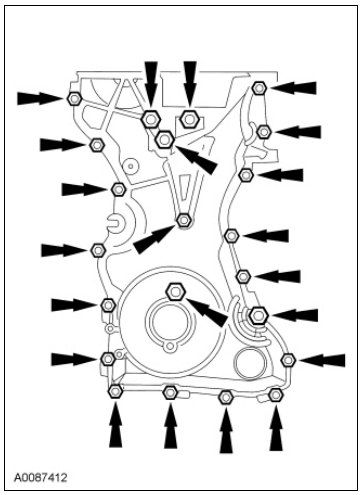


57. ***NOTICE:*** **The crankshaft must remain in the Top Dead Center (TDC) position during removal of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Crankshaft Damper Holding Tool and the bolt should be removed using an air impact wrench (1/2-in drive minimum).**

    NOTICE: **The crankshaft sprocket diamond washer may come off with the crankshaft pulley. The diamond washer must be replaced, remove and discard the diamond washer. If the diamond washer is not installed, engine damage may occur.**

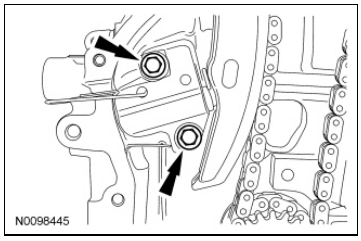
    Use the Crankshaft Damper Holding Tool and a suitable 1/2-in drive hand tool to hold the crankshaft pulley.
    Use an air impact wrench to remove the crankshaft pulley bolt.

    - Remove and discard the crankshaft pulley bolt and washer.
    - Remove the crankshaft pulley.
    - Remove the diamond washer and discard.

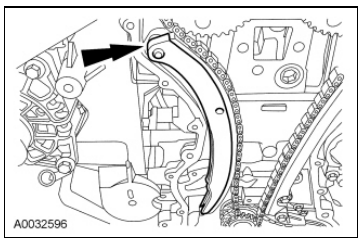


58. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

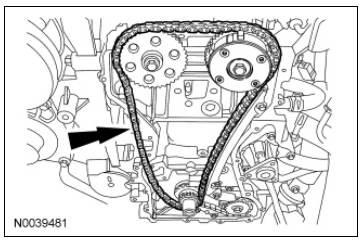
    Using the Oil Seal Remover, remove the crankshaft front oil seal.



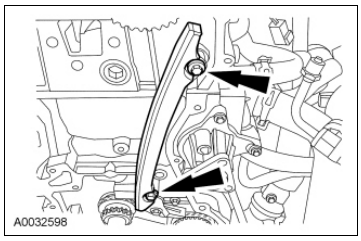
59. Remove the 22 bolts and the engine front cover.



60. Compress the timing chain tensioner in the following sequence.
    1. Using a small pick, release and hold the ratchet mechanism.
    2. While holding the ratchet mechanism in the released position, compress the tensioner by pushing the timing chain arm toward the tensioner.
    3. Insert a paper clip into the hole to retain the tensioner.

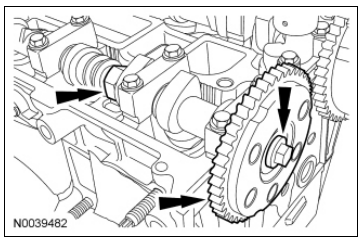


61. Remove the 2 bolts and timing chain tensioner.

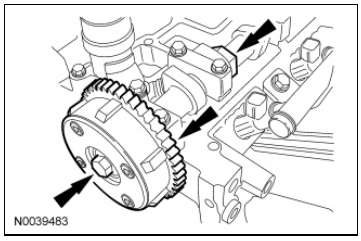


62. Remove the RH timing chain guide.

63. Remove the timing chain.

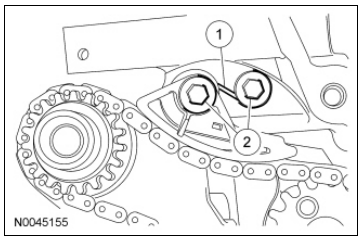


64. Remove the 2 bolts and the LH timing chain guide.



65. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

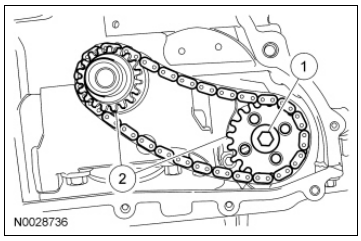
    Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the exhaust camshaft sprocket.



66. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the intake camshaft sprocket.

67. Remove the oil pump drive chain tensioner.
    1. Release the tension on the tensioner spring.
    2. Remove the tensioner and the 2 shoulder bolts.

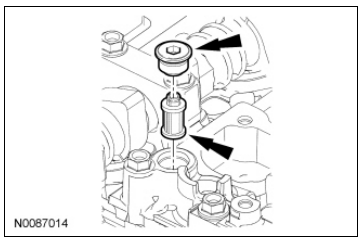


68. **NOTE:** Remove and discard the crankshaft sprocket diamond washer located behind the crankshaft sprocket.

    NOTE: The oil pump chain sprocket must be held in place.

    Remove the oil pump chain and sprockets.

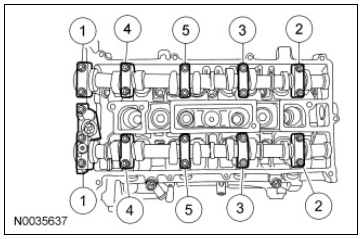
    1. Remove the bolt.
    2. Remove the chain and sprockets.



69. Mark the position of the camshaft lobes on the No. 1 cylinder for assembly reference.

70. Remove the bolt and the VCT solenoid.

71. Remove the plug and the VCT system oil filter from the intake camshaft thrust cap.

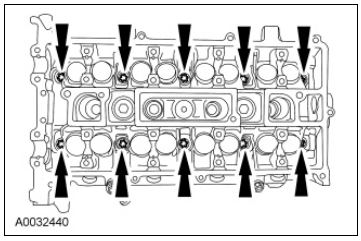


72. ***NOTICE:*** **Failure to follow the camshaft loosening procedure can result in damage to the camshafts.**

    NOTE: Mark the location and orientation of each camshaft bearing cap.

    Remove the camshafts from the engine.

    - Loosen the camshaft bearing cap bolts, in the sequence shown, one turn at a time until all tension is released from the camshaft bearing caps.
    - Remove the bolts and the camshaft bearing caps.
    - Remove the camshafts.

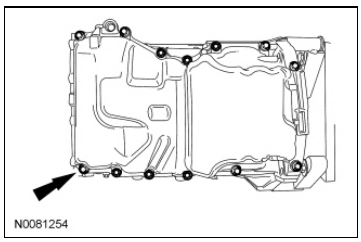


73. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

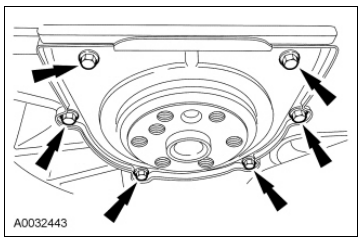
    NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

    Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

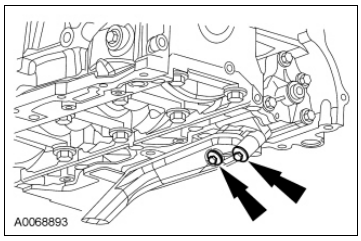
74. Remove the cylinder head.
    - Remove and discard the 10 cylinder head bolts.
    - Remove the cylinder head.
    - Remove and discard the cylinder head gasket.



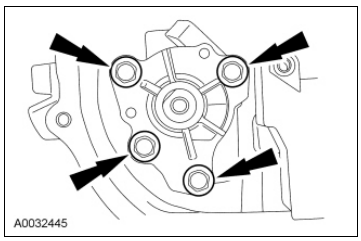
75. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .



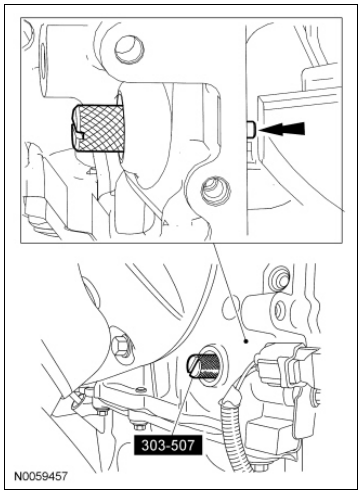
76. Remove the 2 cylinder head alignment dowels.



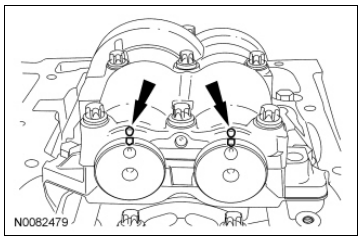
77. Remove the 13 bolts and the oil pan.



78. Remove the 6 bolts and the rear crankshaft seal.

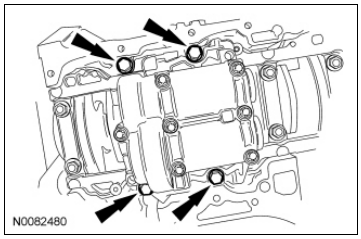


79. Remove the 2 bolts, oil pump pickup tube and gasket.

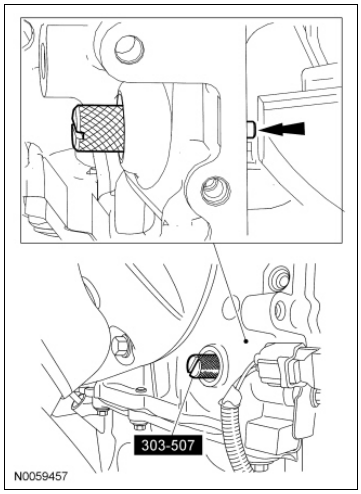


80. Remove the 4 bolts and the oil pump.

81. Make sure the Crankshaft TDC Timing Peg is still installed and the engine is still at Top Dead Center (TDC).
    - Rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg.

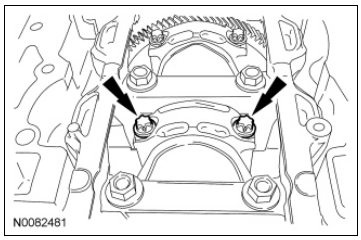


82. Mark the balancer unit and shafts on the top for reference that the balancer unit is at TDC .



83. ***NOTICE:*** **Due to the precision interior construction of the balancer unit, it should not be disassembled.**

    Remove the 4 bolts and the balancer unit.

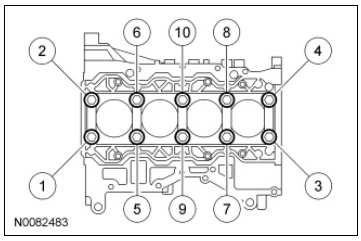


84. Remove the Crankshaft TDC Timing Peg.

85. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following manufacturer's instructions.

86. **NOTE:** Clearly mark the connecting rods, connecting rod caps and connecting rod bearings in numerical order for correct orientation for reassembly.

    Remove the connecting rod cap bolts and cap.

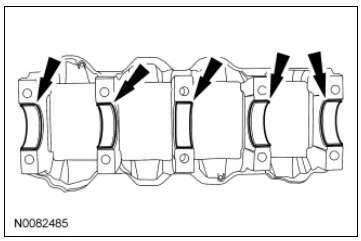


87. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

    Using the Connecting Rod Installer, remove the piston/rod assembly from the engine block.

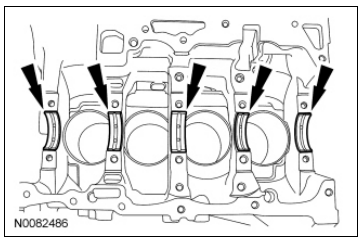
    - Repeat the previous 2 steps until all the piston/rod assemblies are removed from the engine block.

88. Remove the bolts in the sequence shown.
    - Remove the main bearing beam.
    - Discard the bolts.



89. Remove the crankshaft from the engine block.

90. **NOTE:** If the main bearings are being reused, mark them in order for correct orientation and reassembly.



Remove the main bearings from the main bearing beam.

91. **NOTE:** If the main bearings are being reused, mark them in order for correct orientation and reassembly.

    NOTE: The center bulkhead has the thrust bearing.

    Remove the main bearings from the cylinder block.

92. **NOTE:** If the oil squirters are being reused, mark them in order for correct location during reassembly.

    NOTE: The front bulkhead does not have an oil squirter.

    Remove the 4 oil squirters.

93. Inspect the cylinder block, main bearing beam, pistons and connecting rods. For additional information, refer to Section 303-00 .

Cylinder Head

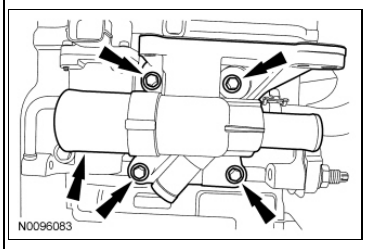
Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST1902-A	Compressor, Valve Spring 303-472 (T94P-6565-AH)
 ST1906-A	Installer, Valve Stem Oil Seal 303-470 (T94P-6510-CH)
 ST1904-A	Remover, Valve Stem Oil Seal 303-468 (T94P-6510-AH)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)

Material

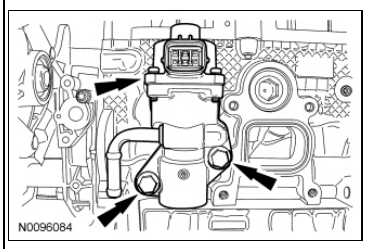
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Multi-Purpose Grease Motorcraft® XL-5 (aerosol) and/or CRC® SL3151	



Item	Part Number	Description
1	W500015	Coolant outlet bolt (4 required)
2	8K556	Coolant outlet
3	-	Coolant outlet gasket (part of 8K556)
4	W500225	EGR valve bolt (2 required)
5	9D475	EGR valve
6	9D476	EGR valve gasket
7	6G004	Cylinder Head Temperature (CHT) sensor
8	12405	Spark plug (4 required)
9	6518	Valve collet (16 required)
10	6514	Valve spring retainer (16 required)
11	6513	Valve spring (16 required)
12	6517	Valve seal (16 required)
13	6505	Intake valve (8 required)
14	6507	Exhaust valve (8 required)
15	6049	Cylinder head

Disassembly

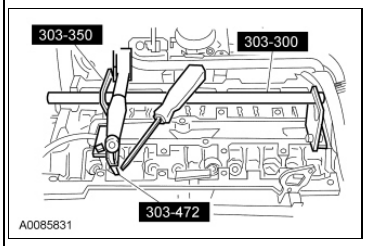


NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components removed for locations.

1. Remo the 4 bolts and the coolant outlet.

- Discard the gasket.

2. Remove the 2 bolts and the EGR valve.
   - Discard the gasket.



3. Remove the Cylinder Head Temperature (CHT) sensor.

4. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs, damage can occur to the cylinder head or spark plug.**

   Remove the spark plugs.

5. **NOTE:** Use a small screwdriver and grease to remove the valve collets.

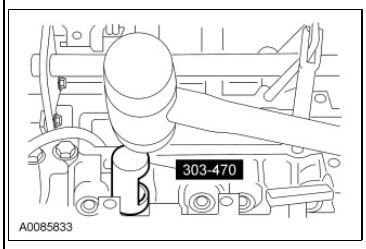
   Using the Valve Spring Compressors, compress the valve springs and remove the valve collets, valve spring retainers and the valve springs.

6. Inspect the components, if necessary. For additional information, refer to Section 303-00 .

7. Remove the valves.

8. Using the Valve Stem Oil Seal Remover and Slide Hammer, remove and discard the valve seals.

9. Inspect the valves. For additional information, refer to Section 303-00 . Install new parts, as necessary.



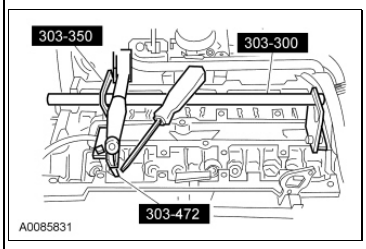
Assembly

1. **NOTE:** Coat the valve stems with clean engine oil.

   Install the valves.

2. **NOTE:** Use the protector provided with the replacement kit to prevent damage to the valve seals. Lubricate the valve stems and guides with clean engine oil.

   Using the Valve Stem Oil Seal Installer, install the valve seals.

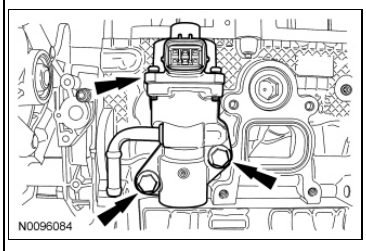


3. **NOTE:** Check the seating of the valve collets.

   Using the Valve Spring Compressors, install the valve springs.

   - Insert the valve springs and the valve spring retainers.

- Compress the valve springs and install the valve collets, using grease and a small screwdriver.



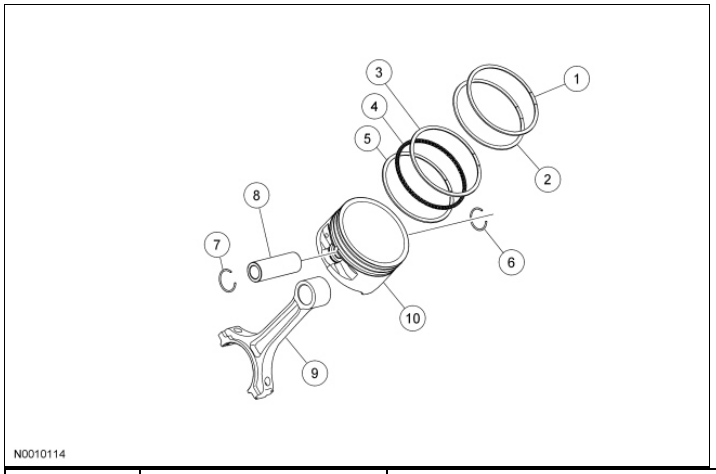
4. *NOTICE:* **Only use hand tools when removing or installing the spark plugs, damage can occur to the cylinder head or spark plug.**

   Install the spark plugs.

   - Tighten to 12 Nm (106 lb-in).

5. Install the CHT sensor.
   - Tighten to 12 Nm (106 lb-in).

6. Install the EGR valve, using a new gasket.
   - Tighten to 20 Nm (177 lb-in).



7. Using a new gasket, install the coolant outlet and bolts.
   - Tighten to 10 Nm (89 lb-in).

Piston

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	6150	Piston compression upper ring
2	6152	Piston compression lower ring
3	6159	Piston oil control upper segment ring
4	6161	Piston oil control spacer
5	6159	Piston oil control lower segment ring
6	6140	Piston pin retainer
7	6140	Piston pin retainer
8	6135	Piston pin
9	6200	Connecting rod
10	6110	Piston

Disassembly

1. Remove the piston rings from the piston.
   - Discard the piston rings.

2. Remove the 2 piston pin retainers and the piston pin.

3. **NOTE:** If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

   Separate the piston from the connecting rod.

4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

Assembly

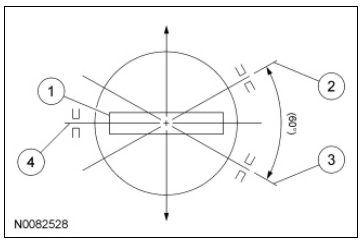
1. **NOTE:** The arrow on the top of the piston points towards the front of the engine.

   Align the piston-to-connecting rod orientation marks, and position the connecting rod in the piston.

2. Lubricate the piston pin and pin bore with clean engine oil.

3. Install the piston pin in the piston and connecting rod assembly.

4. Install the piston pin retaining clips in the piston.



5. Lubricate the piston and the new piston rings with clean engine oil.

6. **NOTE:** The piston compression upper and lower ring should be installed with the paint mark on the outside diameter circumference of the ring to be positioned on the right side of the ring gap. The lower compression ring needs to be installed with the undercut side downward.

   NOTE: The upper and lower compression ring gaps are not controlled for installation.

   Install the piston rings onto the piston as shown.

   1. Piston pin
   2. Upper oil control ring gap location
   3. Lower oil control ring gap location
   4. Center line of the piston pin bore and the expander gap

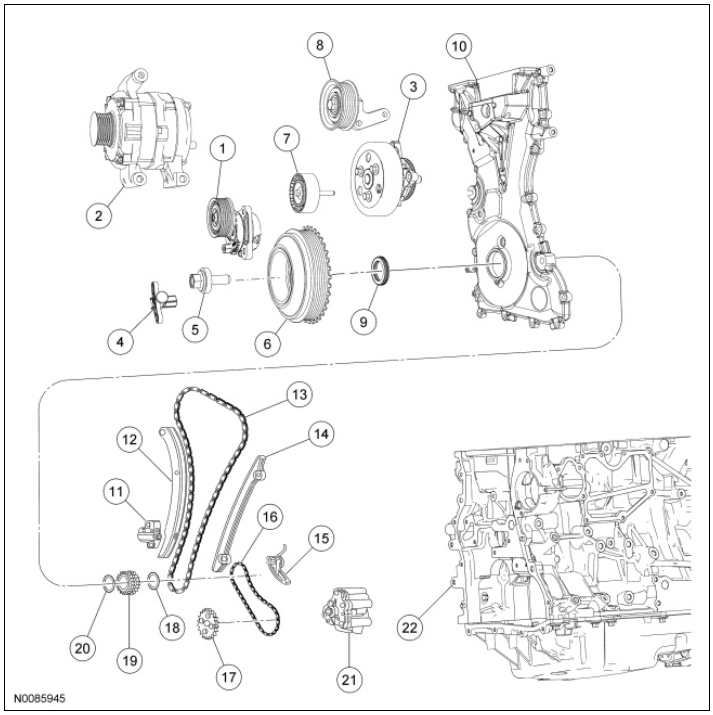
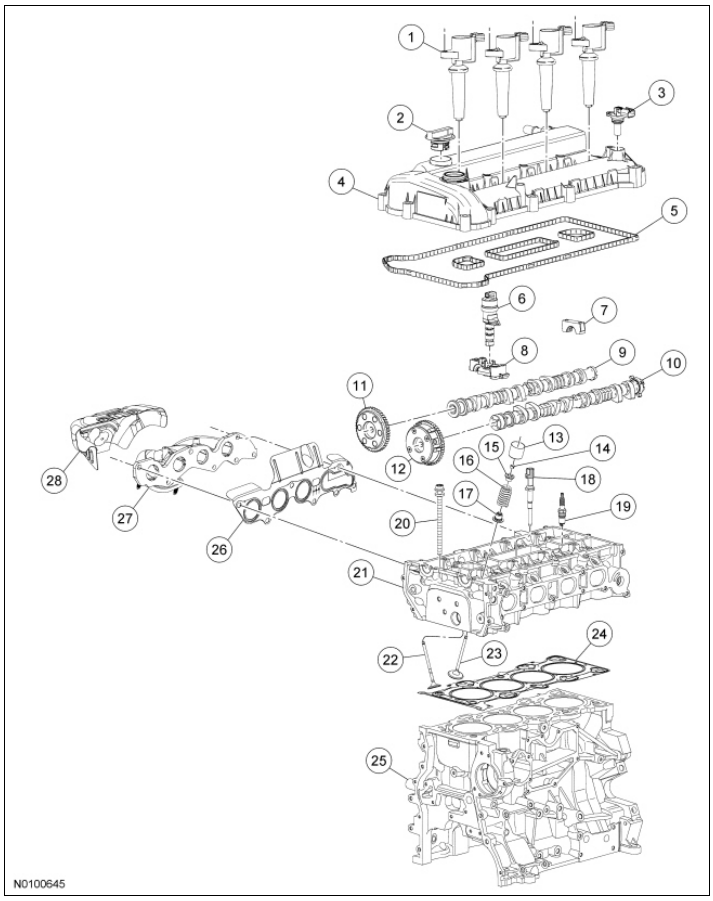
Lower Engine Block (View 1)



Item	Part Number	Description
1	6010	Cylinder block
2	6K318	Crankshaft rear oil seal and retainer
4	6675	Oil pan
5	6714	Engine oil filter
6	6884	Oil filter adapter
7	9278	Engine Oil Pressure (EOP) switch
8	6A636	Oil filter adapter gasket
9	6A785	Crankcase vent oil separator
10	8575	Thermostat assembly
11	6622	Oil pump screen and pickup tube

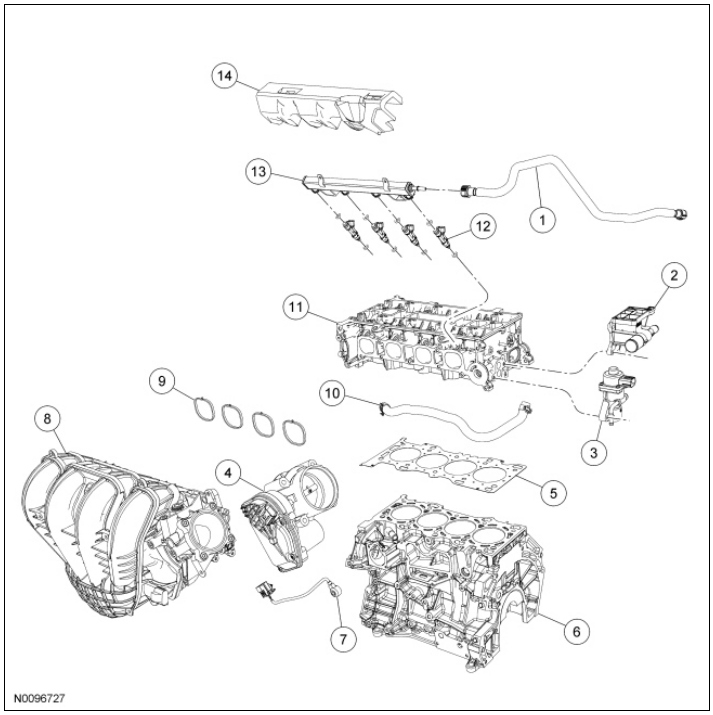
Lower Engine Block (View 2)



Item	Part Number	Description
1	6161	Piston oil control spacer (4 required)
2	6150	Piston compression upper ring (4 required)
3	6152	Piston compression lower ring (4 required)
4	6159	Piston oil control upper segment ring (4 required)
5	6159	Piston oil control lower segment ring (4 required)
6	6140	Piston pin retainer (8 required)
7	6135	Piston pin (4 required)
8	6200	Connecting rod (4 required)
9	6211	Connecting rod upper bearing (4 required)
10	6110	Piston (4 required)
11	6211	Connecting rod lower bearing (4 required)
12	6210	Connecting rod cap (4 required)
13	6010	Cylinder block
14	6333	Cylinder block crankshaft main bearing (5 required)
15	6303	Crankshaft
16	6333	Crankshaft main bearing beam bearing (5 required)
17	6F098	Main bearing beam
18	6K360	Balance shaft assembly

Front Engine Block

Item	Part Number	Description
1	6B209	Accessory drive belt tensioner
2	10300	Generator
3	8501	Coolant pump and pulley
4	6C315	Crankshaft Position (CKP) sensor
5	6A340	Crankshaft pulley bolt
6	6316	Crankshaft pulley
7	6C348	Smooth idler pulley
8	19A216	Idler pulley and bracket
9	6700	Crankshaft front seal
10	6019	Engine front cover
11	6K254	Timing chain tensioner
12	6K255	Timing chain tensioner arm
13	6268	Timing chain
14	6K297	Timing chain guide
15	6C271	Oil pump chain tensioner
16	6A895	Oil pump chain
17	6652	Oil pump drive gear
18	6378	Diamond washer
19	6306	Crankshaft sprocket
20	6378	Diamond washer
21	6600	Oil pump
22	6010	Cylinder block



Cylinder Head

Item	Part Number	Description
1	12A366	Coil-on-plug assembly (4 required)
2	6766	Oil filler cap
3	12K073	Camshaft Position (CMP) sensor
4	6M293	Valve cover
5	6K260	Valve cover gasket
6	6M280	Variable Camshaft Timing (VCT) solenoid
7	6A284	Camshaft bearing cap (9 required)
8	6A258	Camshaft bearing cap
9	6A272	Camshaft (exhaust)
10	6A271	Camshaft (intake)
11	6C251	Camshaft sprocket
12	6C525	VCT actuator
13	6500	Valve tappet (16 required)
14	6518	Valve collet (16 required)
15	6514	Valve spring retainer (16 required)
16	6513	Valve spring (16 required)
17	6A517	Valve stem seal (16 required)
18	6G004	Cylinder Head Temperature (CHT) sensor
19	12405	Spark plug (4 required)
20	6065	Cylinder head bolt (10 required)

21	6049	Cylinder head
22	6505	Exhaust valve (8 required)
23	6507	Intake valve (8 required)
24	6051	Head gasket
25	6010	Cylinder block
26	9448	Exhaust manifold gasket
27	9430	Exhaust manifold
28	9N454	Exhaust manifold heat shield

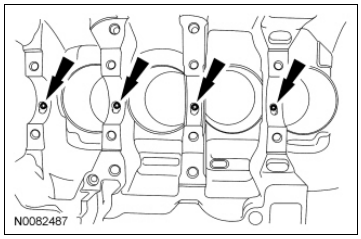
Intake Manifold

Item	Part Number	Description
1	9288	Fuel supply tube
2	8K556	Coolant outlet
3	9D475	EGR valve
4	9F991	Throttle Body (TB)
5	6051	Cylinder head gasket
6	6010	Cylinder block
7	12A699	Knock Sensor (KS)
8	9424	Intake manifold
9	9439	Intake manifold gasket
10	8A582	Coolant bypass hose
11	6049	Cylinder head
12	9F593	Fuel injector (4 required)
13	9H487	Fuel rail
14	-	Fuel rail insulator

NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools, otherwise severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. All parts must be thoroughly cleaned and any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: Assembly of the engine requires various inspections/measurements of the engine components (engine block, crankshaft, connecting rods, pistons and piston rings). These inspections/measurements will aid in determining if the engine components will require replacement. For additional information, refer to Section 303-00 .



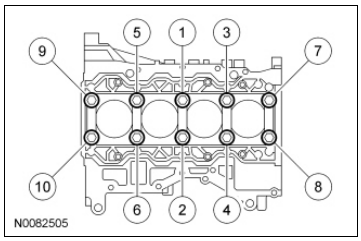
All vehicles

1. **NOTE:** If the oil squirters are being reused, they must be installed in the same location as marked during disassembly.

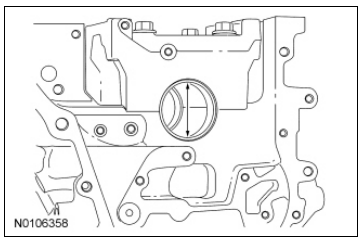
   NOTE: The front bulkhead does not have oil squirter.

   Install the 4 oil squirters.

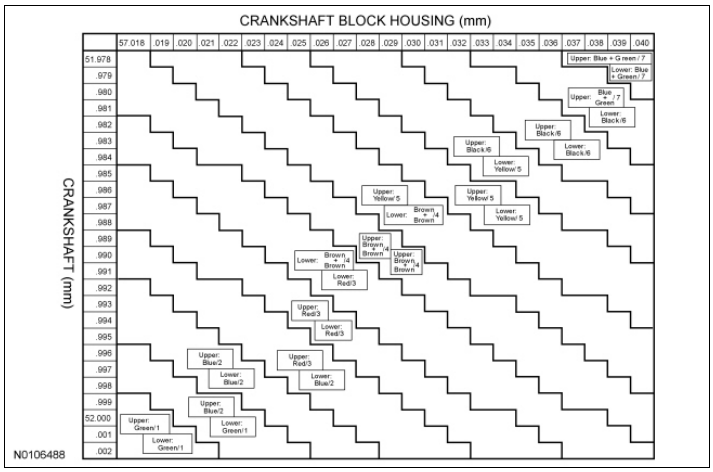
   - Tighten to 4 Nm (35 lb-in).



2. Measure each of the crankshaft main bearing journal diameters in at least 2 directions and record the smallest diameter for each journal.



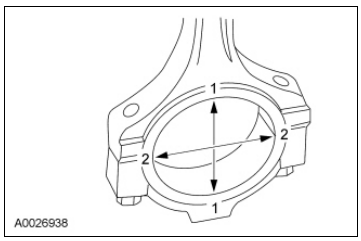
3. Position the main bearing beam in the engine block with the main bearing beam mounted flush with the rear face of the engine block.



4. Using the original main bearing beam bolts, install and tighten the 10 main bearing beam bolts.
    - Tighten the bolts in the sequence shown in 3 stages.
    - Stage 1: Tighten to 5 Nm (44 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.

5. Measure each crankshaft block main bearing bore diameter.
    - Remove the bolts and the main bearing beam.
    - Discard the main bearing beam bolts.

6. Using the chart, select the crankshaft main bearings.

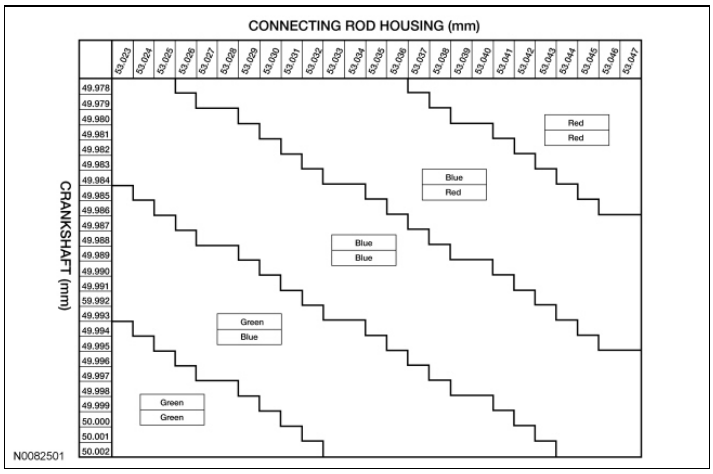


7. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

    Using the original connecting rod cap bolts, install the connecting caps and bolts.

    - Tighten the bolts in 2 stages.

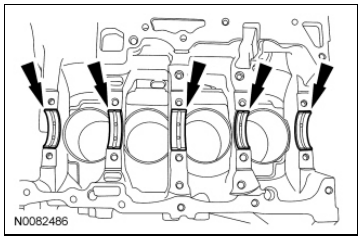
- Stage 1: Tighten to 29 Nm (21 lb-ft).
- Stage 2: Tighten an additional 90 degrees.



8. Measure the connecting rod large end bore in 2 directions. Record the smallest measurement for each connecting rod.
    - Remove the bolts and the connecting rod cap.
    - Discard the connecting rod cap bolts.

9. Measure each of the crankshaft connecting rod bearing journal diameters in at least 2 directions. Record the smallest measurement for each connecting rod journal.

10. Using the chart, select the correct connecting rod bearings for each crankshaft connecting rod journal.

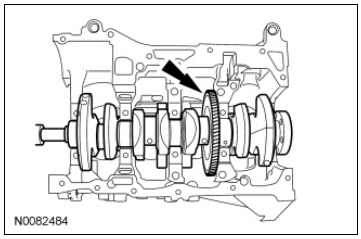


11. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

    NOTE: If reusing the crankshaft main bearings, install them in their original positions and orientation as noted during disassembly.

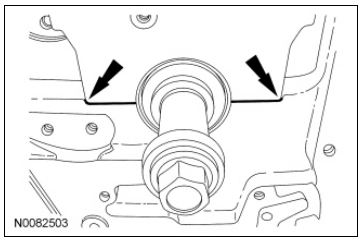
    NOTE: The center bulkhead is the thrust bearing.

    Lubricate the upper crankshaft main bearings with clean engine oil and install the 5 crankshaft main bearings in the cylinder block.

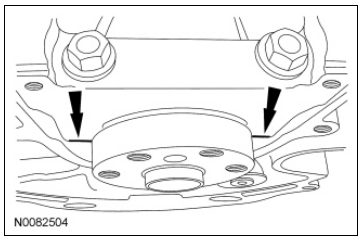


12. **NOTE:** If reusing the crankshaft main bearings, install them in their original positions and orientation as noted during disassembly.

    Lubricate the crankshaft main bearings with clean engine oil and install the 5 crankshaft main bearings in the main bearing beam.



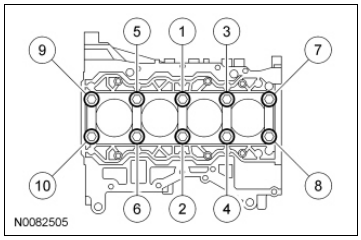
13. Lubricate journals on the crankshaft with clean engine oil.



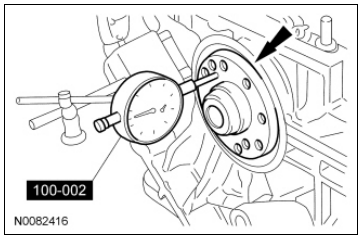
14. Position the crankshaft in the cylinder block.

15. Lubricate the 10 main bearing beam side fit surfaces (front 2 shown) with clean engine oil.

16. Lubricate the crankshaft bearing journals on the main bearing beam with clean engine oil. Then position the main bearing beam in the engine block with the main bearing beam mounted flush with the rear face of the engine block.



17. **NOTE:** Lubricate the main bearing beam bolts threads and under the bolt heads with clean engine oil.

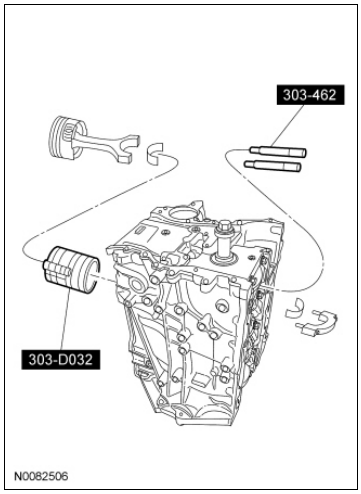


NOTE: Position the crankshaft to the rear of the cylinder block, then position the crankshaft to the front of the cylinder block before tightening the main bearing beam bolts.

Install and tighten the 10 new main bearing beam bolts.

- Tighten the bolts in the sequence shown in 3 stages.
- Stage 1: Tighten to 5 Nm (44 lb-in).
- Stage 2: Tighten to 25 Nm (18 lb-ft).
- Stage 3: Tighten an additional 90 degrees.

18. Using the Dial Indicator Gauge with Holding Fixture, measure crankshaft end play.
    - Position the crankshaft to the rear of the cylinder block.
    - Zero the Dial Indicator Gauge with Holding Fixture.
    - Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.
    - Acceptable crankshaft end play is 0.22-0.43 mm (0.008-0.016 in). If the crankshaft end play exceeds the specified range, install new parts as necessary.



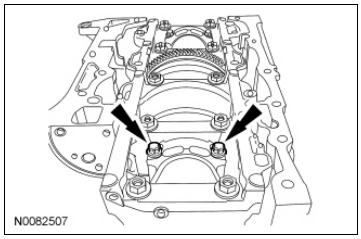
19. ***NOTICE:*** **Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.**

    NOTE: Lubricate the pistons, piston rings, connecting rod bearings and the entire cylinder bores with clean engine oil.

    NOTE: Make sure the piston arrow on top is facing toward the front of the engine.

    Using the Piston Ring Compressor and the Connecting Rod Installer, install the piston and connecting rod assemblies.

    - When installing the pistons and connecting rod assemblies, the oil ring gaps must be positioned 60 degrees apart from each other and a minimum of 90 degrees from the expander gap.
    - The position of the upper and lower compression ring gaps are not controlled for installation.



20. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

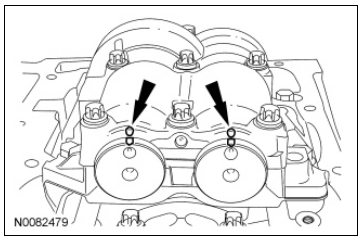
    NOTE: Install connecting rod caps and bolts on the connecting rods for cylinders 1 and 4 first and tighten. Then rotate crankshaft 180 degrees and install connecting rod caps and bolts on connecting rods for cylinders 2 and 3 and tighten.

    NOTE: After installation of each connecting rod cap, rotate the crankshaft to verify smooth operation.

    Install the connecting rod caps and the new bolts.

    - Tighten the bolts in 2 stages.
    - Stage 1: Tighten to 29 Nm (21 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

21. Install the Crankshaft TDC Timing Peg and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg. The engine is now at Top Dead Center (TDC).

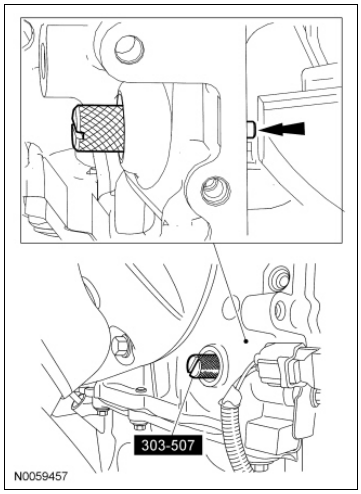


22. *NOTICE:* **Due to the precision interior construction of the balancer unit, it should not be disassembled.**

    NOTE: The original adjustment shims must be installed in their original position.

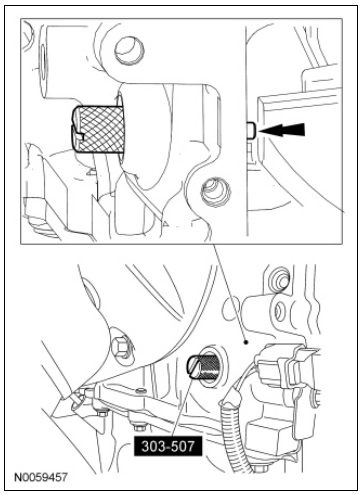
    NOTE: Confirm by visual inspection that there is no damage to the balancer unit gear and verify that the shaft turns smoothly. If there is any damage or malfunction, replace the balancer unit.

    Install the adjustment shims in their original position on the seat faces of the balancer unit.



23. With the balancer unit shaft marks in the TDC position, slowly install the balancer unit to the cylinder block to avoid interference between the crankshaft drive gear and the balancer unit driven gear.

24. Install the balancer unit bolts.
    - Tighten in the sequence shown in 2 stages.
        - ♦ Stage 1: Tighten to 25 Nm (18 lb-ft).
        - ♦ Stage 2: Tighten to 50 Nm (37 lb-ft).



25. Remove the Crankshaft TDC Timing Peg.

26. Rotate the crankshaft to confirm that there are no meshing problems between the balancer unit gear and the crankshaft gear.

27. Install the Crankshaft TDC Timing Peg and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg.
    - Remove the Crankshaft TDC Timing Peg.

28. **NOTE:** Measure the backlash and verify that it is within specified range at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees. It will be necessary to reset the measuring equipment between measurements.

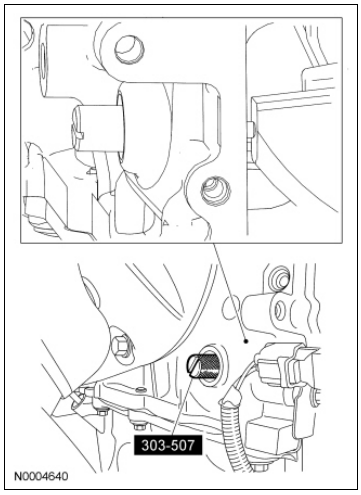
    NOTE: The measurement must be taken with the Dial Indicator Gauge with Holding Fixture, a 5-mm Allen wrench and worm clamp set up as shown. Mark the Allen wrench with a file 80 mm (3.149 in) above the driven gear shaft center. Make sure the worm clamp and Allen wrench are not touching the balance shaft housing.

    NOTE: For an accurate measurement while measuring the gear backlash, insert a screwdriver as shown into the crankshaft No. 1 crankweight area and set both the rotation and the thrust direction with the screwdriver, using a prying action as shown.

    Position the Dial Indicator Gauge with Holding Fixture as shown. Measure the gear backlash.

    - Position the Dial Indicator Gauge with Holding Fixture (1) on the Allen wrench 80 mm (3.149 in) above the driven gear shaft center (2) on the balancer unit.

- Rotate the crankshaft clockwise and measure the backlash at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees.
- Backlash specifications are 0.005 to 0.101 mm (0.00019 to 0.0039 in).
- If the backlash exceeds the specified range, carry out the balance shaft backlash procedure. For additional information, refer to the Balance Shaft Backlash procedure in this section.

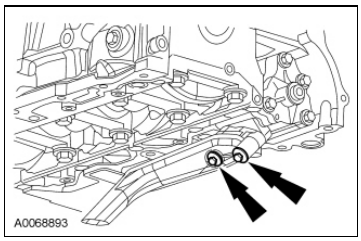


29. ***NOTICE:*** **Failure to position the No. 1 piston at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

    Turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

30. **NOTE:** The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position until the timing drive components and crankshaft pulley are installed.

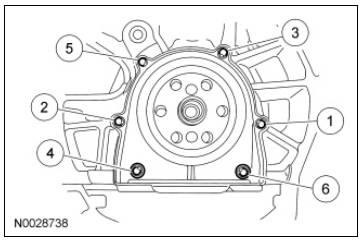
    Install the Crankshaft TDC Timing Peg.



31. **NOTE:** Clean the oil pump and cylinder block mating surfaces with metal surface prep.

    Install the oil pump assembly. Tighten the 4 bolts in the sequence shown in 2 stages:

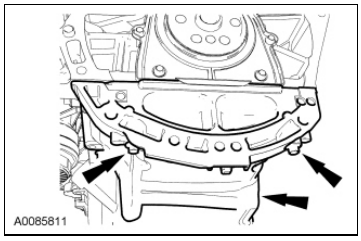
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).



32. Install a new gasket, oil pump pickup tube and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

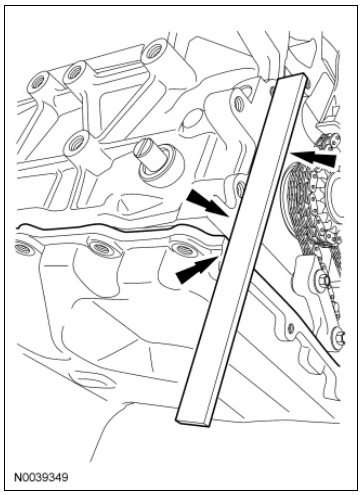
33. Using the Crankshaft Rear Main Oil Seal Installer, install the crankshaft rear main oil seal.

34. Tighten the 6 crankshaft rear main oil seal retainer plate bolts in the sequence shown.
    - To install, tighten to 10 Nm (89 lb-in).



35. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.**

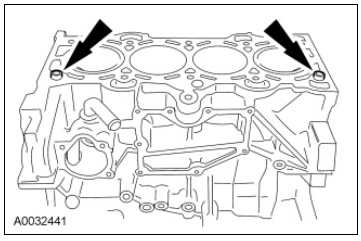
    Clean and inspect all mating surfaces.



36. **NOTE:** If the oil pan is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow these instructions can cause future oil leakage.

    Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the oil pan.

    - Position the oil pan onto the engine and install the 2 rear oil pan bolts finger-tight.



37. Using a suitable straight edge, align the front surface of the oil pan flush with the front surface of the engine block.

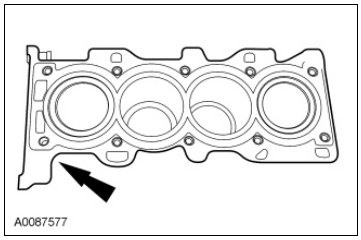
38. Install the remaining oil pan bolts.
    - Tighten in the sequence shown to 20 Nm (177 lb-in).

39. Install the 2 cylinder head alignment dowels. Dowels must be fully seated in the cylinder block.

40. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

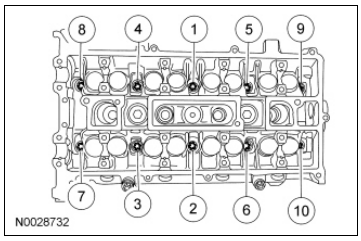


Clean the cylinder head-to-cylinder block mating surface of both the cylinder head and the cylinder block in the following sequence.

1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

41. Apply silicone gasket and sealant to the locations shown.

42. Install a new head gasket.



43. **NOTE:** The cylinder head bolts are a torque-to-yield design and must not be reused. New cylinder head bolts must be installed.

    NOTE: Lubricate the bolts with clean engine oil prior to installation.

    Install the cylinder head and 10 new bolts. Tighten the bolts in the sequence shown in 5 stages:

    - Stage 1: Tighten to 7 Nm (62 lb-in).
    - Stage 2: Tighten to 15 Nm (133 lb-in).
    - Stage 3: Tighten to 45 Nm (33 lb-ft).
    - Stage 4: Turn 90 degrees.
    - Stage 5: Turn an additional 90 degrees.

44. **NOTE:** Coat the valve tappets with clean engine oil prior to installation.

    Install the valve tappets.

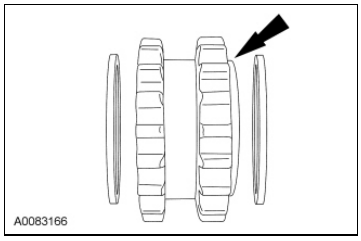
45. ***NOTICE:*** **Install the camshafts with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position can cause severe damage to the valves and pistons.**

    NOTE: Lubricate the camshaft journals and bearing caps with clean engine oil.

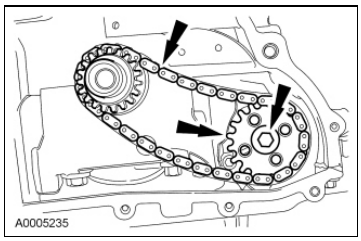
    Install the camshafts and bearing caps in their original locations and orientation. Tighten the bearing caps in the sequence shown in 3 stages:

    - Stage 1: Tighten the camshaft bearing cap bolts until finger-tight.
    - Stage 2: Tighten to 7 Nm (62 lb-in).
    - Stage 3: Tighten to 16 Nm (142 lb-in).

46. Install the Variable Camshaft Timing (VCT) system oil filter and the plug in the intake camshaft thrust cap.
    - Tighten to 17 Nm (150 lb-in).



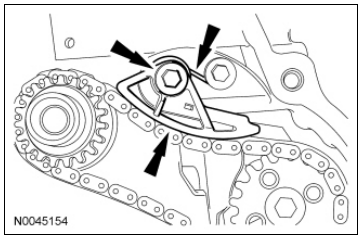
47. Install the Variable Camshaft Timing (VCT) solenoid and the bolt.
    - Tighten to 10 Nm (89 lb-in).



48. **NOTE:** Install a new crankshaft sprocket diamond washer on both sides of the crankshaft sprocket.

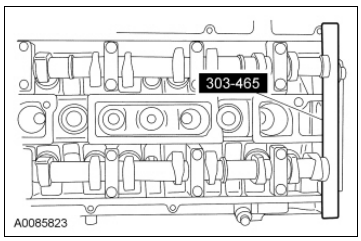
    Install the crankshaft sprocket and new crankshaft sprocket diamond washers.

    - The crankshaft sprocket flange must be facing away from the engine block.

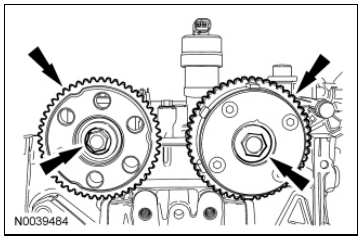


49. Install the oil pump drive chain, sprocket and bolt.
    - Tighten to 25 Nm (18 lb-ft).

50. Install the oil pump drive chain tensioner shoulder bolt.
    - Tighten to 10 Nm (89 lb-in).

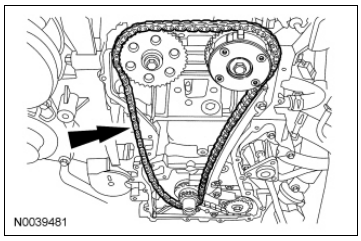


51. Install the oil pump drive chain tensioner and bolt. Hook the tensioner spring around the shoulder bolt.
    - Tighten to 10 Nm (89 lb-in).

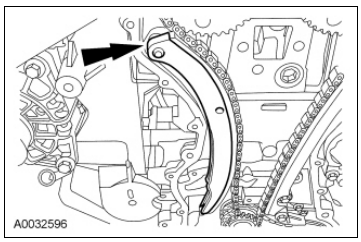


52. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.

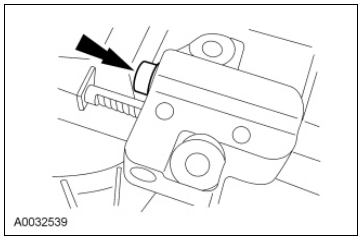


53. Install the camshaft sprockets and the bolts. Do not tighten the bolts at this time.

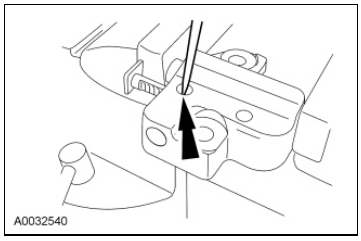


54. Install the timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

55. Install the timing chain.



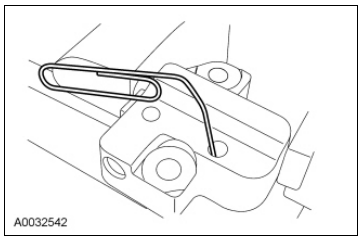
56. Install the timing chain tensioner arm.



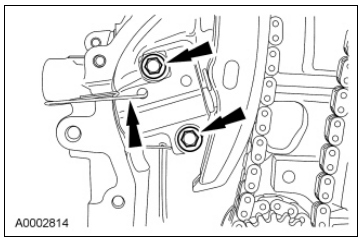
NOTE: If the timing chain tensioner plunger and ratchet assembly are not pinned in the compressed position, follow the next 4 steps.

57. ***NOTICE:*** **Do not compress the ratchet assembly. This will damage the ratchet assembly.**

    Using the edge of a vise, compress the timing chain tensioner plunger.

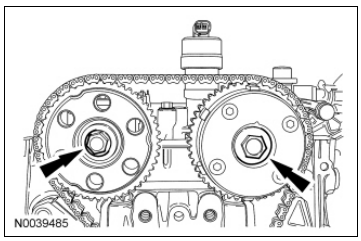


58. Using a small pick, push back and hold the ratchet mechanism.



59. While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

60. Install a paper clip into the hole in the tensioner housing to hold the ratchet assembly and the plunger in during installation.

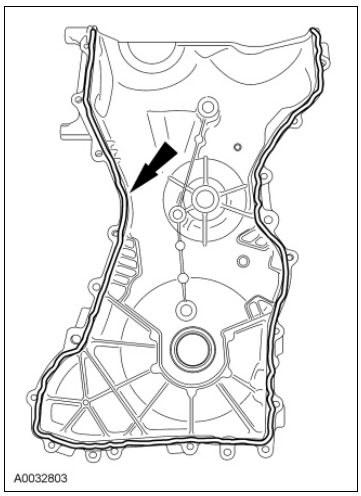


61. Install the timing chain tensioner and the 2 bolts. Remove the paper clip to release the piston.
    - Tighten to 10 Nm (89 lb-in).

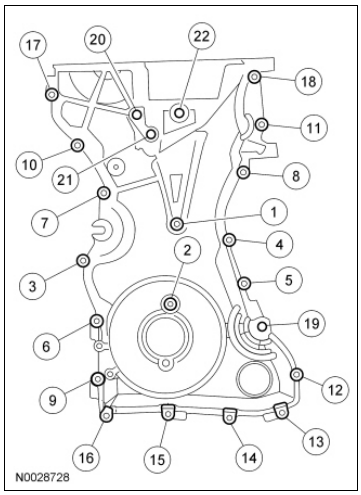
62. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    Using the flats on the camshafts to prevent camshaft rotation, tighten the camshaft sprocket bolts.

    - Tighten to 72 Nm (53 lb-ft).



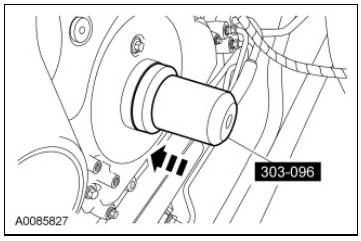
63. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths.**



Clean and inspect the mounting surfaces of the engine and the front cover.

64. **NOTE:** The engine front cover must be installed and the bolts tightened within 4 minutes of applying the silicone gasket and sealant.

    Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the cylinder head and oil pan joint areas. Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the front cover.



65. Install the engine front cover. Tighten the 22 bolts in the sequence shown, to the following specifications:
    - Tighten the 8-mm bolts to 10 Nm (89 lb-in).
    - Tighten the 13-mm bolts to 48 Nm (35 lb-ft).

66. **NOTE:** Remove the through bolt from the Camshaft Front Oil Seal Installer.

    NOTE: Lubricate the oil seal with clean engine oil.

    Using the Camshaft Front Oil Seal Installer, install a new crankshaft front oil seal.

67. **NOTE:** Do not install the crankshaft pulley bolt at this time.

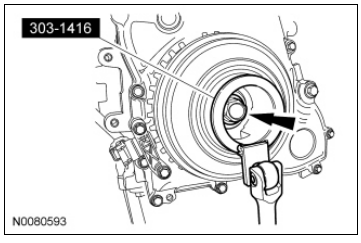
    NOTE: Apply clean engine oil on the seal area before installing.

    Position the crankshaft pulley onto the crankshaft with the hole in the pulley at the 6 o'clock position.

68. ***NOTICE:*** **Only hand-tighten the 6 mm bolt or damage to the front cover can occur.**

    NOTE: This step will correctly align the crankshaft pulley to the crankshaft.

    Install a standard 6 mm x 18 mm bolt through the crankshaft pulley and thread it into the front cover.

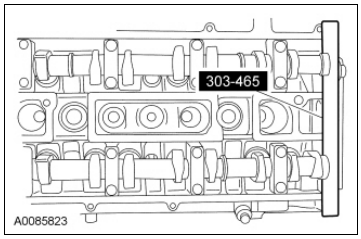


69. ***NOTICE:*** **The crankshaft must remain in the Top Dead Center (TDC) position during installation of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Crankshaft Damper Holding Tool and the bolt should be installed using hand tools only.**

    NOTE: Do not reuse the crankshaft pulley bolt.

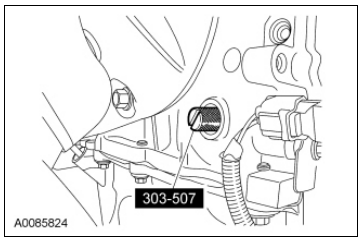
    Install a new crankshaft pulley bolt. Using the Crankshaft Damper Holding Tool to hold the crankshaft pulley in place, tighten the crankshaft pulley bolt in 2 stages:

    - Stage 1: Tighten to 100 Nm (74 lb-ft).
    - Stage 2: Tighten an additional 90 degrees (one-fourth turn).



70. Remove the 6 mm x 18 mm bolt.

71. Remove the Crankshaft TDC Timing Peg.



72. Remove the Camshaft Alignment Plate.

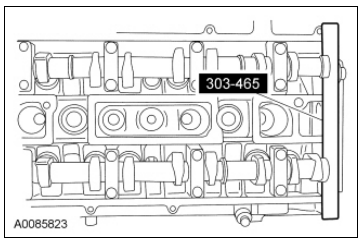
73. **NOTE:** Only turn the engine in the normal direction of rotation.

    Turn the crankshaft clockwise one and three-fourths turns.

74. Install the Crankshaft TDC Timing Peg.

75. **NOTE:** Only turn the engine in the normal direction of rotation.

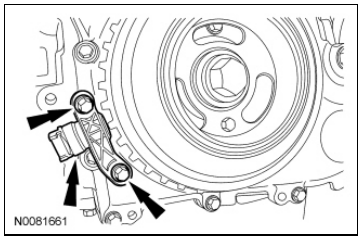
    Turn the crankshaft clockwise until the crankshaft contacts the Crankshaft TDC Timing Peg.



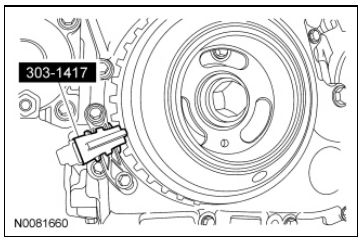
76. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

    Using the 6 mm x 18 mm bolt, check the position of the crankshaft pulley.

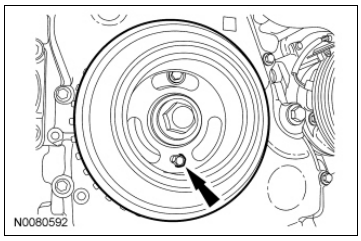
    - If it is not possible to install the bolt, the engine valve timing must be corrected.



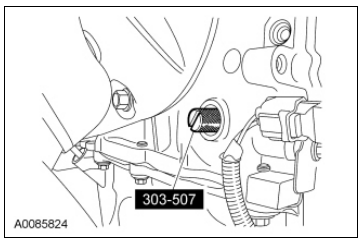
77. Install the Camshaft Alignment Plate to check the position of the camshafts.
    - If it is not possible to install the Camshaft Alignment Plate, the engine valve timing must be corrected.



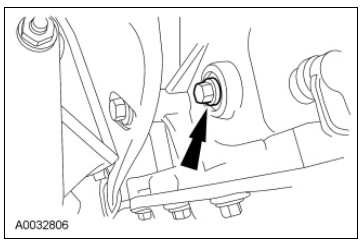
78. Remove the Camshaft Alignment Plate.



79. Install the Crankshaft Position (CKP) sensor and the 2 bolts.
    - Do not tighten the bolts at this time.



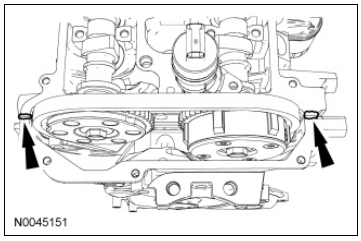
80. Using the Crankshaft Sensor Aligner, adjust the CKP sensor.
    - Tighten the 2 CKP bolts to 7 Nm (62 lb-in).



81. Remove the 6 mm x 18 mm bolt.

82. Remove the Crankshaft TDC Timing Peg.

83. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).

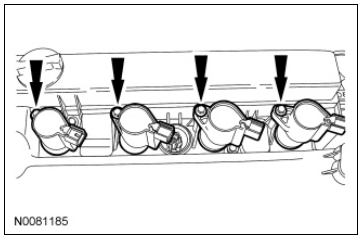


84. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

    Clean the valve cover gasket surface with metal surface prep.

85. **NOTE:** The valve cover must be secured within 4 minutes of silicone gasket application. If the valve cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep.

    Apply silicone gasket and sealant to the locations shown.

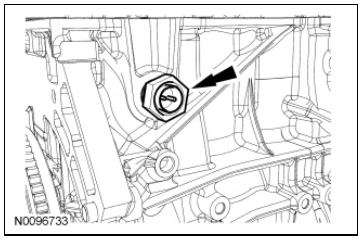


86. Install the valve cover.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).

87. **NOTE:** Apply dielectric compound to the inside of the coil-on-plug boots.

    Install the 4 coil-on-plugs and the 4 bolts.

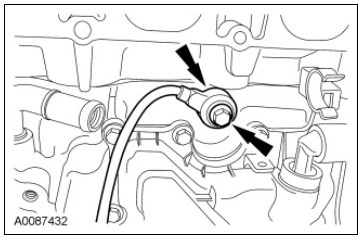
    - Tighten to 8 Nm (71 lb-in).



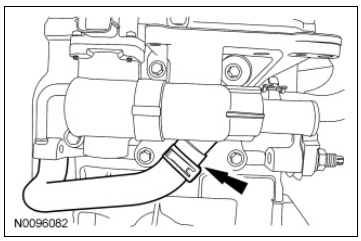
88. **NOTE:** Make sure the notch on the oil level indicator is aligned with the V-shaped boss on the valve cover and fully engaged into the valve cover.

    Install the oil level indicator.

89. If equipped, install the block heater.
    - Tighten to 40 Nm (30 lb-ft).



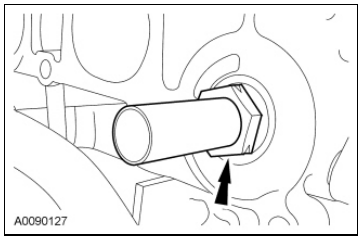
90. Install the crankcase vent oil separator and the 8 bolts.
    - Tighten to 10 Nm (89 lb-in).



91. **NOTE:** The Knock Sensor (KS) must not touch the crankcase vent oil separator.

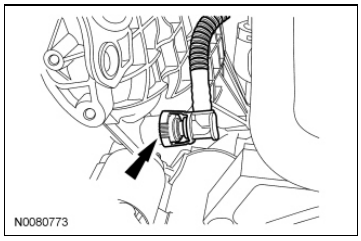
    Install the KS and the bolt.

    - Tighten to 20 Nm (177 lb-in).



92. Install the coolant bypass hose on the coolant outlet.

93. Connect the coolant bypass hose.



94. Install the EGR tube.
    - Tighten to 55 Nm (41 lb-ft).

95. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Position the intake manifold and connect the crankcase vent oil separator tube.

96. **NOTE:** Inspect and install new intake manifold gaskets, if necessary.

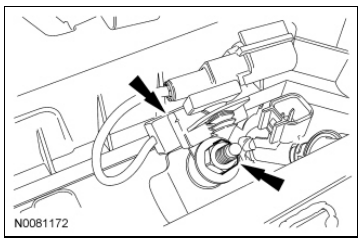
    Install the intake manifold gaskets, intake manifold and the 7 bolts (3 shown).

    - Tighten to 18 Nm (159 lb-in).

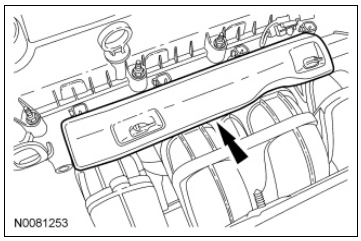
97. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.**

    Install new fuel injector O-rings.

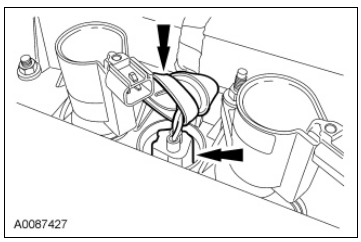
    - Separate the fuel injectors from the fuel rail.
    - Remove and discard the fuel injector O-rings.
    - Install new O-rings and lubricate with clean engine oil.
    - Install the fuel injectors onto the fuel rail.



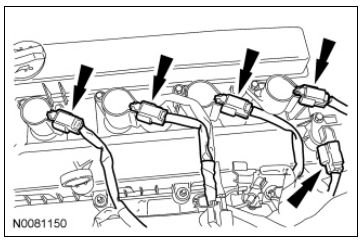
98. Install the fuel rail and injector assembly and the 2 stud bolts.



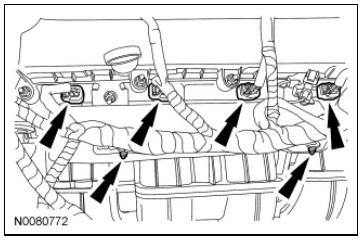
- Tighten to 23 Nm (17 lb-ft).



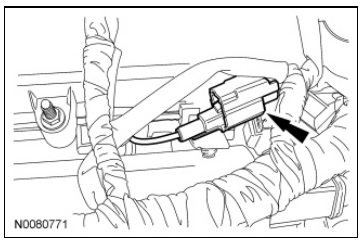
99. Install the radio capacitor and nut.
    - Tighten to 10 Nm (89 lb-in).



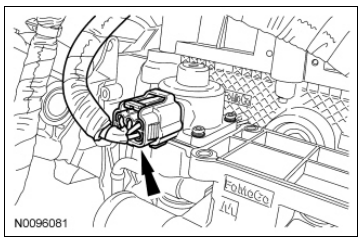
100. Install the fuel rail insulator.



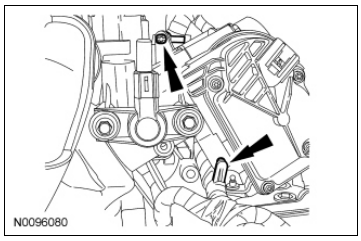
101. Position the engine control wiring harness on the engine and connect the CHT sensor and install the rubber boot.



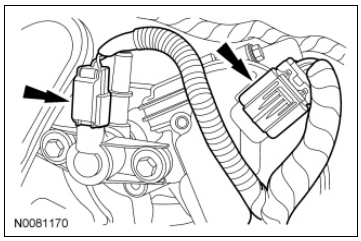
102. Connect the 4 ignition coil-on-plugs and Camshaft Position (CMP) sensor electrical connectors.



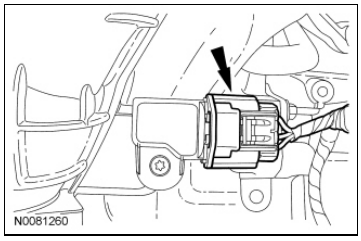
103. Connect the 4 fuel injector electrical connectors.
    - Attach the 2 wiring harness retainers.



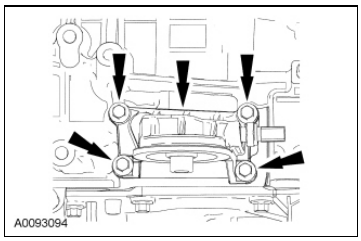
104. Connect the radio capacitor electrical connector.



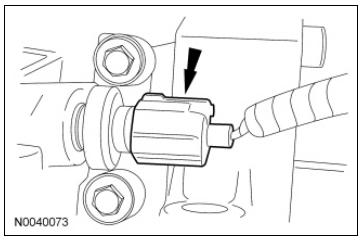
105. Connect the EGR valve electrical connector.



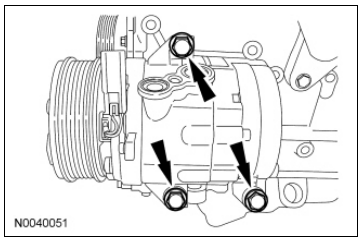
106. Attach the 2 wiring harness retainers to the intake manifold.



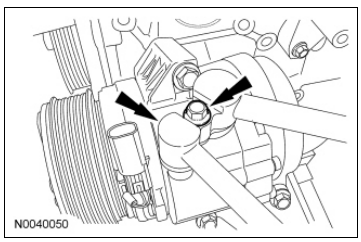
107. Connect the electronic throttle control and Evaporative Emission (EVAP) canister purge valve electrical connectors.



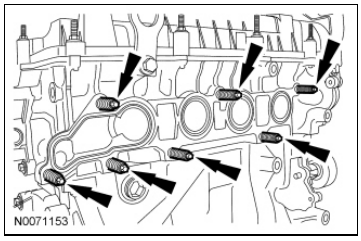
108. Connect the Manifold Absolute Pressure (MAP) sensor electrical connector.



109. Using a new gasket install the oil filter adapter and the 4 bolts.
    - Tighten to 25 Nm (18 lb-ft).



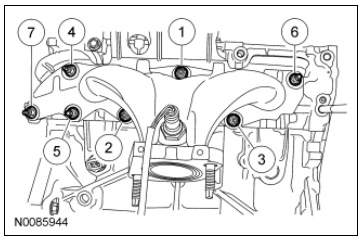
110. Connect the Engine Oil Pressure (EOP) switch electrical connector.



111. Install the A/C compressor and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

112. Using new O-ring seals, install the A/C manifold tube and the bolt.
    - Tighten to 25 Nm (18 lb-ft).

113. Install 7 new cylinder head studs.
    - Tighten to 17 Nm (150 lb-in).



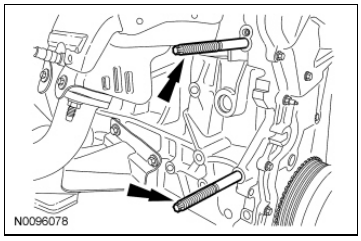
114. Install the new exhaust manifold gasket on the engine.

115. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

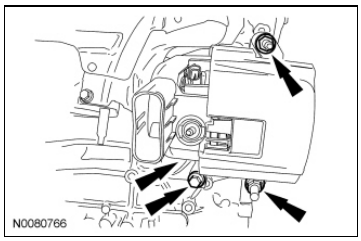
    NOTE: Make sure to tighten the nuts in the sequence in 2 stages.

    Position the exhaust manifold and tighten the 7 new exhaust manifold nuts in the sequence shown in 2 stages:

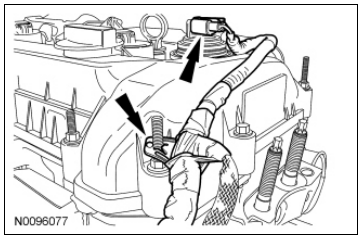
    - Stage 1: Tighten to 48 Nm (35 lb-ft).
    - Stage 2: Tighten to 48 Nm (35 lb-ft).



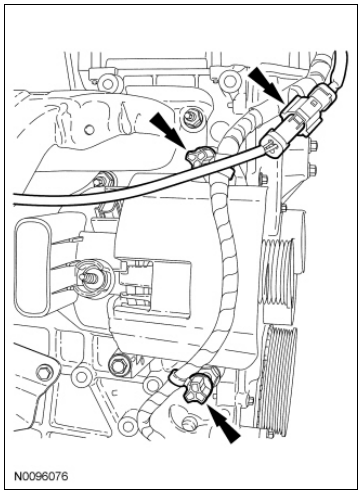
116. Install the exhaust manifold heat shield and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).



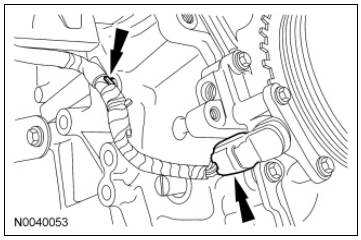
117. Install the exhaust flexible pipe bracket and the 2 bolts.
    - Tighten to 35 Nm (26 lb-ft).



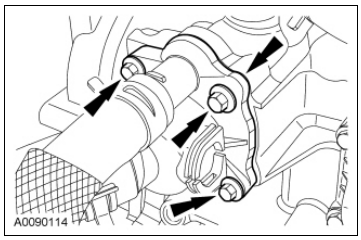
118. Install the 2 generator studs.
    - Tighten to 24 Nm (18 lb-ft).



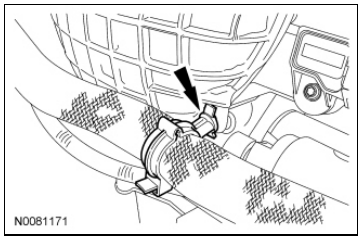
119. Install the generator, 2 nuts and 1 bolt.
    - Tighten to 47 Nm (35 lb-ft).



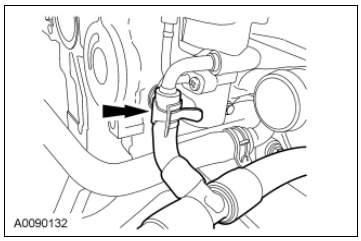
120. Connect the Variable Camshaft Timing (VCT) electrical connector and attach the wiring harness retainer to the valve cover stud bolt.



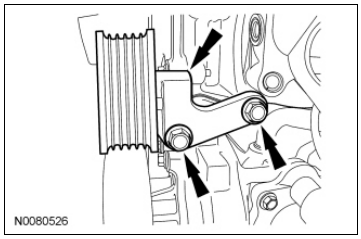
121. Connect the Heated Oxygen Sensor (HO2S) electrical connector and attach the 2 wiring harness retainers to the generator stud bolts.



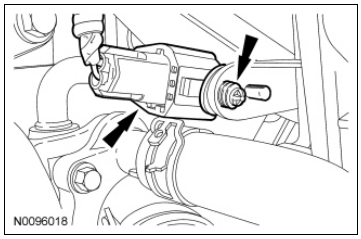
122. Connect the CKP sensor electrical connector and attach the wiring harness pin-type retainer.



123. Install the thermostat housing and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



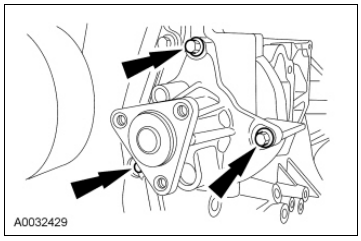
124. Install the coolant tube retainer to the intake manifold.



125. Connect the coolant hose to the EGR.

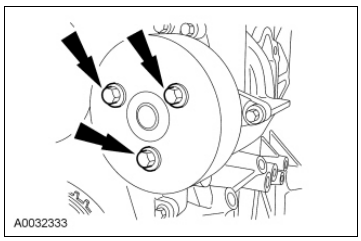
126. Install the accessory drive belt idler pulley and bracket and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

127. Connect the KS electrical connector and attach the wiring harness pin-type retainer.



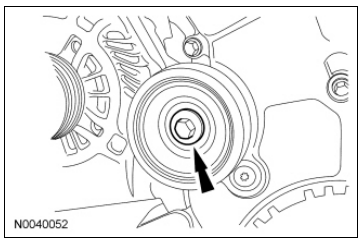
128. ***NOTICE:*** **Make sure the coolant pump is correctly seated to the engine block before installing and tightening the fasteners, or damage to the coolant pump may occur.**

    NOTE: Clean the coolant pump mating surface with metal surface prep.

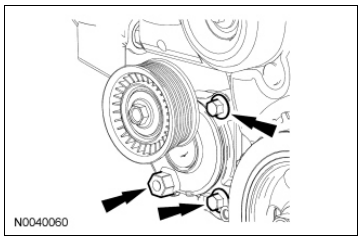


NOTE: Lubricate the new coolant pump O-ring with clean engine coolant.

Install the new O-ring, coolant pump and the 3 bolts.

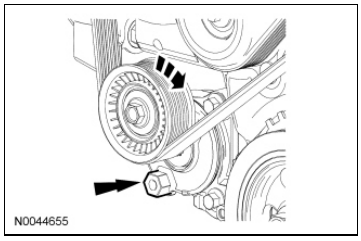


- Tighten to 10 Nm (89 lb-in).

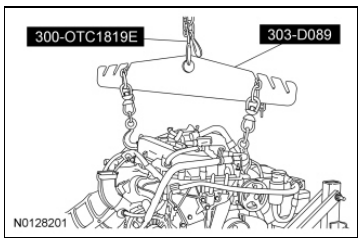


129. Install the coolant pump pulley and the 3 bolts.
    - Tighten to 20 Nm (177 lb-in).

130. Install the accessory drive belt idler pulley.
    - Tighten to 25 Nm (18 lb-ft).

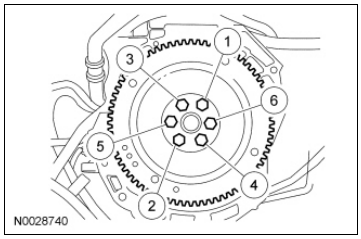


131. Install the accessory drive belt tensioner and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

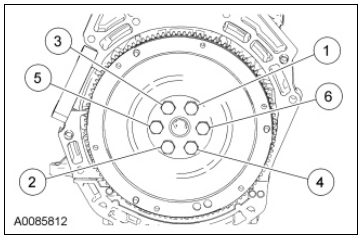


132. Position the accessory drive belt onto the tensioner and all of the accessory drive pulleys except the coolant pump pulley.

133. Using the hex feature, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt onto the coolant pump pulley.

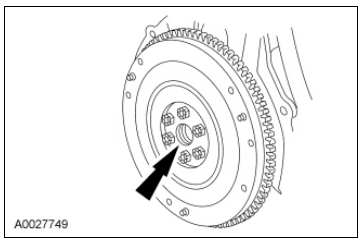


134. Using the Floor Crane and Spreader Bar, remove the engine from the engine stand.

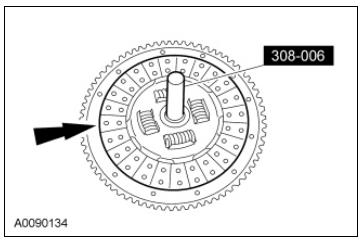


Vehicles with automatic transaxle

135. Install the flexplate and the 6 bolts. Tighten the 6 bolts in the sequence shown in 3 stages:
- Stage 1: Tighten to 50 Nm (37 lb-ft).
- Stage 2: Tighten to 80 Nm (59 lb-ft).
- Stage 3: Tighten to 112 Nm (83 lb-ft).



Vehicles with manual transaxle



136. Install the flywheel and the 6 bolts. Tighten the 6 bolts in the sequence shown in 3 stages:
- Stage 1: Tighten to 50 Nm (37 lb-ft).
- Stage 2: Tighten to 80 Nm (59 lb-ft).
- Stage 3: Tighten to 112 Nm (83 lb-ft).

137. Lubricate the transaxle input shaft pilot bearing with front axle grease.

138. Using the Clutch Disc Aligner, position the clutch disc on the flywheel.

139. **NOTE:** If reusing the clutch pressure plate and flywheel, align the marks made during removal.

    Position the clutch pressure plate and install the 6 bolts.

    - Tighten to 29 Nm (21 lb-ft) in a star pattern sequence.

Engine - Automatic Transaxle

Special Tool(s)

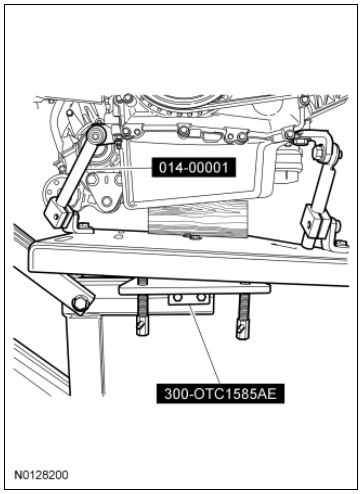
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



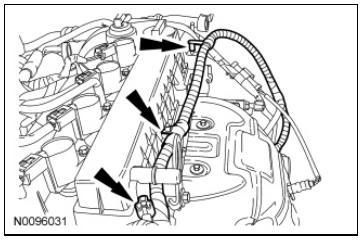
⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to flow these instructions may result in serious personal injury.

1. Using the Floor Crane and Spreader Bar, position the engine and transaxle together. Install the bellhousing-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).

2. Using the Floor Crane and Spreader Bar, position the engine and transaxle onto the Powertrain Lift table.

3. **NOTE:** Position a suitable block of wood under the transaxle.

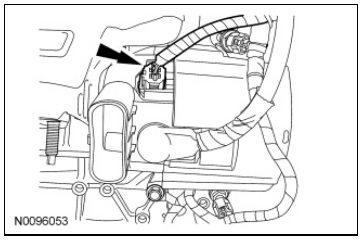
   Install the Powertrain Lift and Adjustable Grip Arm onto the engine.



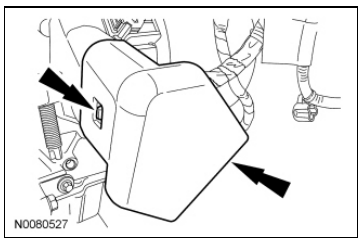
4. ***NOTICE:*** **Only rotate the engine in a clockwise direction or engine damage may occur.**

   Install the 4 new torque converter nuts.

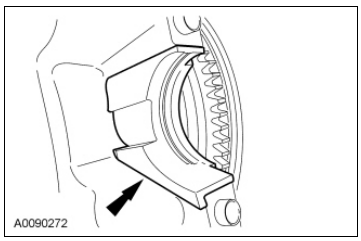
   - Tighten to 35 Nm (26 lb-ft).



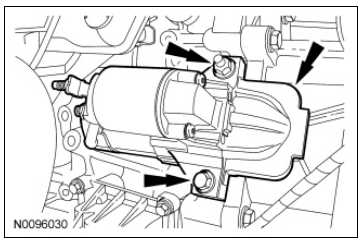
5. Position the generator wiring harness and attach the 4 wiring harness retainers (3 shown) to the valve cover stud bolts.



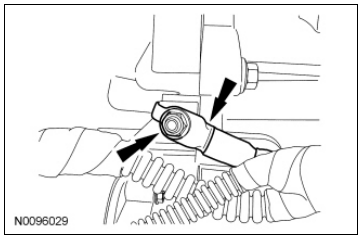
6. Connect the generator B+ wiring harness and install the nut.
   - Tighten to 12 Nm (106 lb-in).



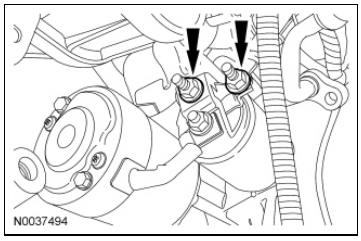
7. Connect the generator electrical connection.



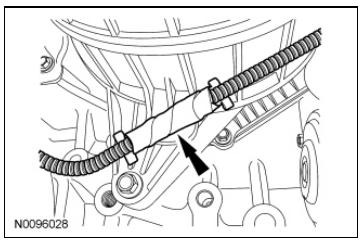
8. Install the generator air duct.



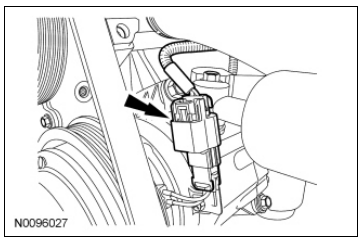
9. Install the starter motor isolator.



10. Install the starter, bolt and the stud bolt.
    - Tighten to 25 Nm (18 lb-ft).

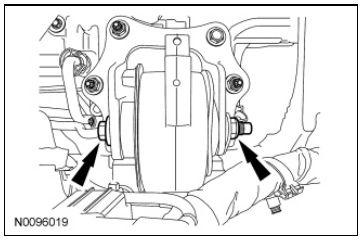


11. Position the wiring harness and install the ground wire to the starter motor stud bolt and install the nut.
    - Tighten to 18 Nm (159 lb-in).

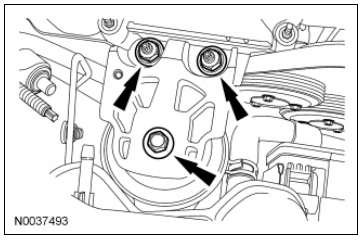


12. Connect the starter wires and install the 2 nuts.
    - Tighten the large starter motor B+ wire nut to 12 Nm (106 lb-in).
    - Tighten the small starter motor solenoid wire nut to 5 Nm (44 lb-in).

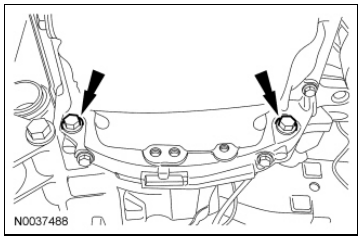
13. Attach the A/C compressor wiring harness pin-type retainer to the intake manifold.



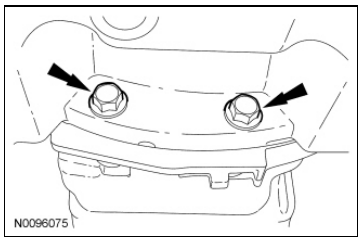
14. Connect the A/C compressor electrical connector.



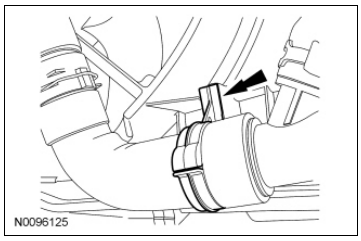
15. Raise the engine and transaxle into the vehicle.



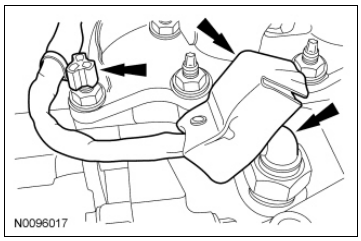
16. Install the transaxle mount through bolt and nut.
    - Tighten to 90 Nm (66 lb-ft).



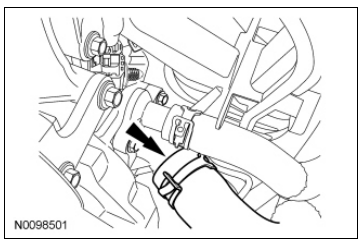
17. Install the engine mount bracket, 2 nuts and the bolt.
    - Tighten the nuts to 103 Nm (76 lb-ft).
    - Tighten the bolt to 115 Nm (85 lb-ft).



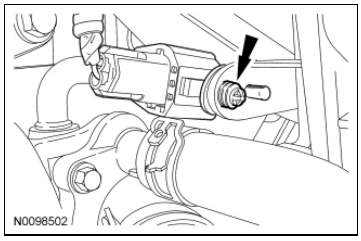
18. Install the 2 oil pan-to-bellhousing bolts.
    - Tighten to 48 Nm (35 lb-ft).



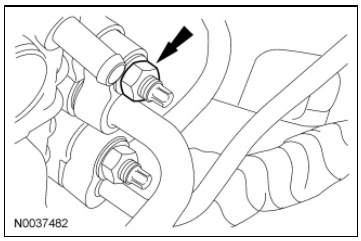
19. Install the 2 bellhousing-to-oil pan bolts.
    - Tighten to 48 Nm (35 lb-ft).



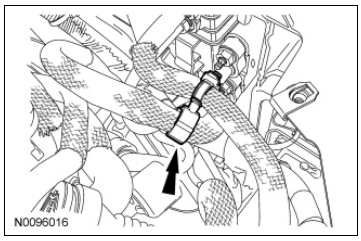
20. Attach the lower radiator hose pin-type retainer to the cooling fan shroud.



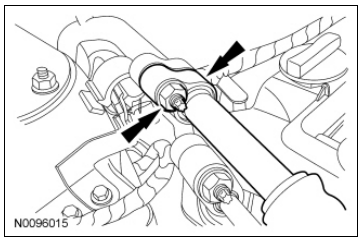
21. If equipped, connect the block heater electrical connector and position back the block heater shield.
    - Attach the 8 block heater wiring harness retainers (1 shown).



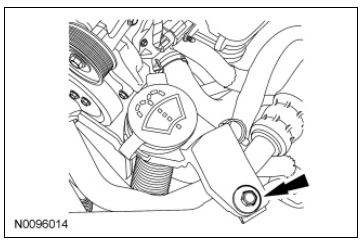
22. Install the lower radiator hose to the thermostat housing.



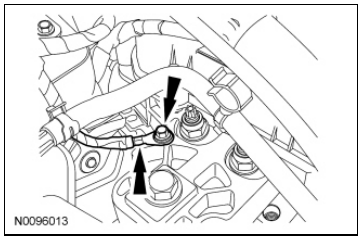
23. Attach the Knock Sensor (KS) electrical connector to the intake manifold.



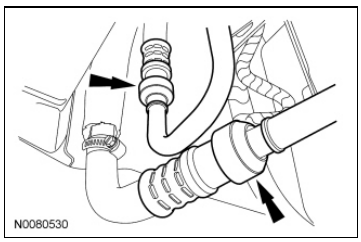
24. Install a new O-ring seal and connect the upper A/C tube to the condenser and install the nut.
    - Tighten to 8 Nm (71 lb-in).



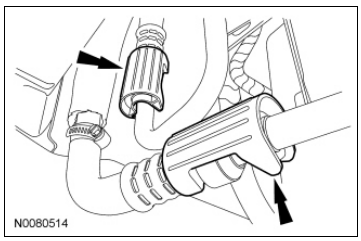
25. Attach the coolant vent hose retaining clip to the A/C tube.



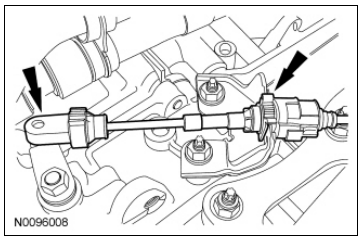
26. Install a new O-ring seal and connect the A/C tube and install the nut.
    - Tighten to 8 Nm (71 lb-in).



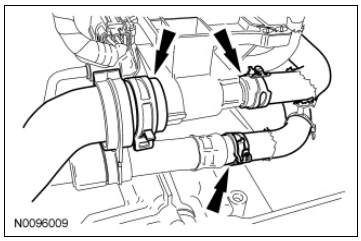
27. Install the windshield washer reservoir/A/C tube bracket bolt.
    - Tighten to 7 Nm (62 lb-in).



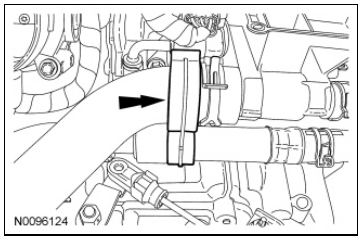
28. Install the ground wire on the engine mount and the bolt.
    - Tighten to 10 Nm (89 lb-in).



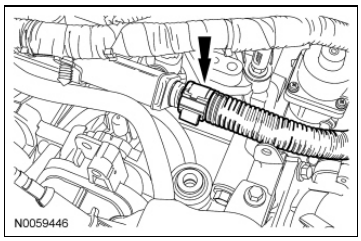
29. Connect the 2 transaxle fluid cooler tubes.



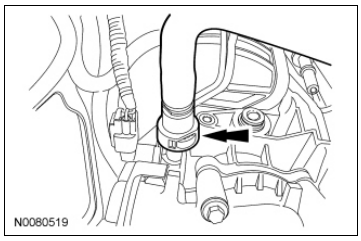
30. Install the 2 secondary latches to the transaxle fluid cooler tubes.



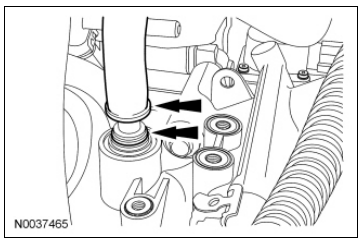
31. Connect the transaxle shift cable to the bracket and attach the shift cable to the transaxle manual lever.



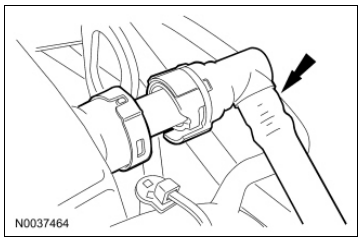
32. Connect the heater hose in-line connector and connect the upper radiator and heater hoses to the coolant outlet.



33. Attach the coolant hoses retainer.

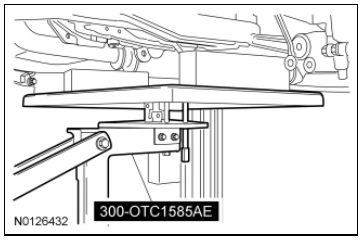


34. Connect the fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .



35. Connect the fuel vapor return tube.

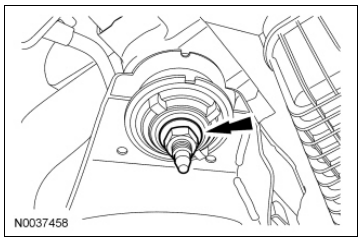
36. Insert the brake booster vacuum supply tube into the locking ring on the intake manifold.



37. Connect the crankcase vent tube to the valve cover.

38. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .

39. Install the engine oil filter.
    - Lubricate the engine oil filter gasket with clean engine oil and tighten the oil filter three-fourths turn after the oil filter gasket makes contact with the oil filter adapter.



40. Place the subframe assembly on the Powertrain Lift and raise the subframe into the installed position.

41. **NOTE:** LH shown, RH similar.

    Install the front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

42. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the bolts finger-tight.

43. **NOTE:** LH shown, RH similar.

    Install the subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

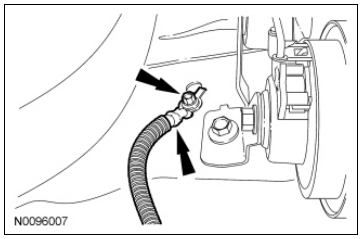
44. **NOTE:** LH shown, RH similar.

    Tighten the subframe bracket-to-body bolts to 103 Nm (76 lb-ft).

45. **NOTE:** LH shown, RH similar.

    Install the sway bar links and nuts to the struts.

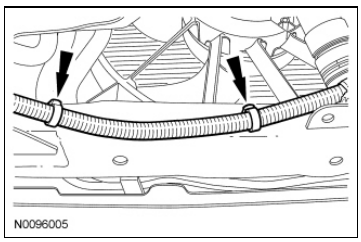
    - Tighten to 40 Nm (30 lb-ft).



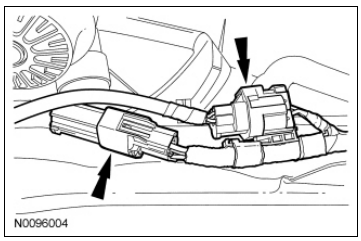
46. **NOTE:** LH shown, RH similar.

    Install tie-rod ends and nuts.

    - Tighten to 48 Nm (35 lb-ft).
    - Install the cotter pin.

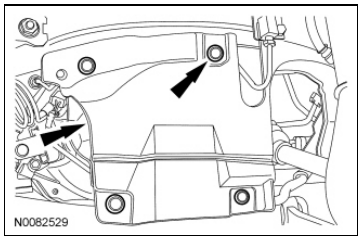


47. Install the Electronic Power Assist Steering (EPAS) system wiring harness ground and the bolt.
    - 12 Nm (106 lb-in).

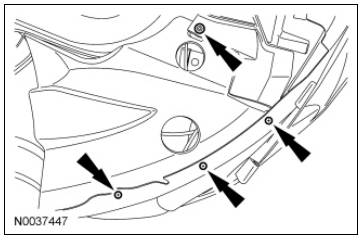


48. Attach the EPAS system wiring harness pin-type retainer to the subframe under the LH fender splash shield.

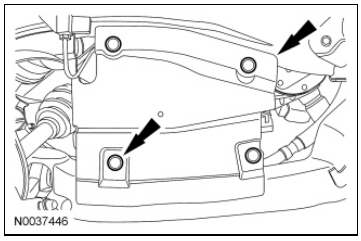
49. Attach the 2 EPAS system wiring harness pin-type retainers to the subframe.



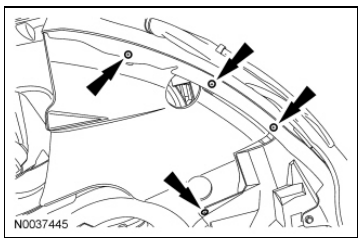
50. Connect the 2 EPAS system electrical connectors.



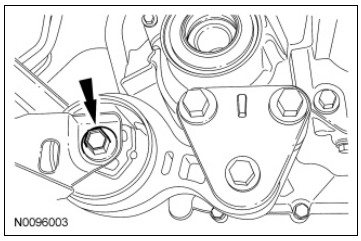
51. Install the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .



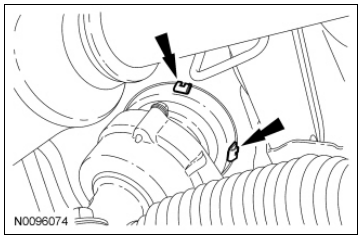
52. Install the LH splash shield and the 6 pin-type retainers (4 shown).



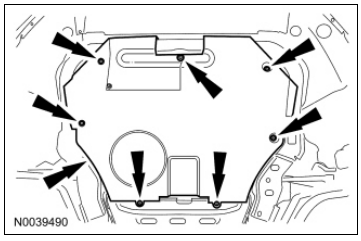
53. Position the LH fender splash shield and install the 4 screws.



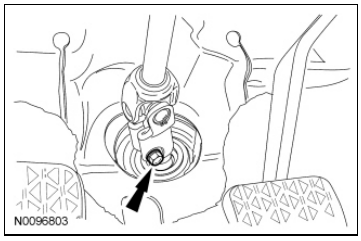
54. Install the RH splash shield and the 6 pin-type retainers (4 shown).



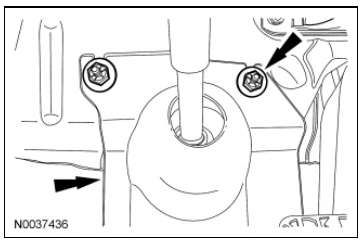
55. Position the RH fender splash shield and install the 4 screws.



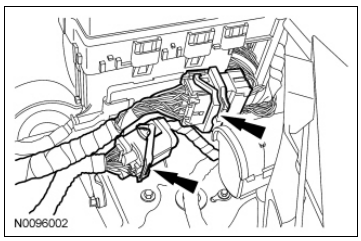
56. Install the engine roll restrictor bolt.
    - Tighten to 90 Nm (66 lb-ft).



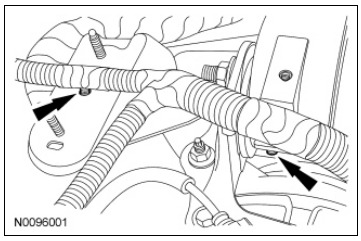
57. Slide the steering gear-to-dash seal onto the steering gear and engage the 4 retaining clips (2 shown) into the body.
    - From under the vehicle, verify that the seal is correctly installed on the steering gear and the retaining clips are fully engaged into the dash.



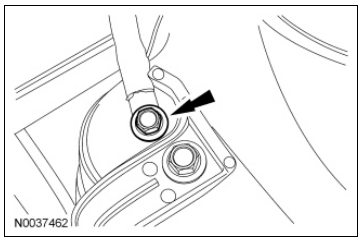
58. If equipped, install the 7 screws and the underbody cover.



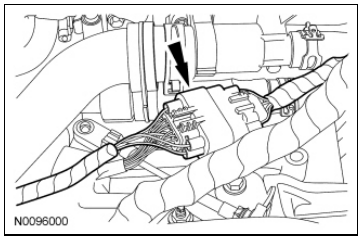
59. Install the steering column shaft onto the steering gear and install the bolt.
    - Tighten to 20 Nm (177 lb-in).



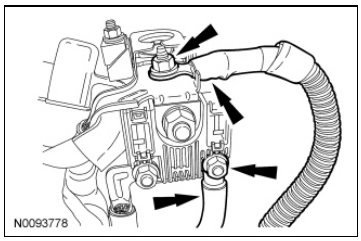
60. Install the steering joint cover and the 2 nuts.



61. Connect the 2 engine harness electrical connectors.



62. Attach the 2 negative battery cable pin-type retainers to the transaxle mount and battery tray bracket.



63. Install the ground wire-to-body and the bolt.
    - Tighten to 12 Nm (106 lb-in).

64. Connect the engine wiring harness electrical connector.

65. Install the 2 battery cables to the positive battery cable and the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).

66. Install the battery tray. For additional information, refer to Section 414-01 .

67. Install the engine Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12A .

68. Fill the engine with clean engine oil.

69. Fill and bleed the cooling system. For additional information, refer to Section 303-03A .

70. Fill the transaxle. For additional information, refer to Section 307-01A .

71. Recharge the A/C system. For additional information, refer to Section 412-00A .

72. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

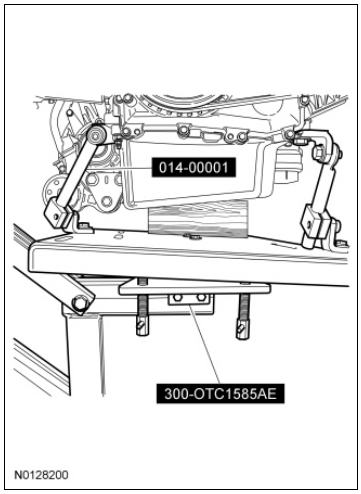
Engine - Manual Transaxle

Special Tool(s)

 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E or equivalent
 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent
 ST2743A	Adjustable Grip Arm, 1735A 014-00001 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

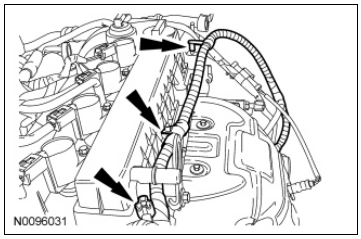
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



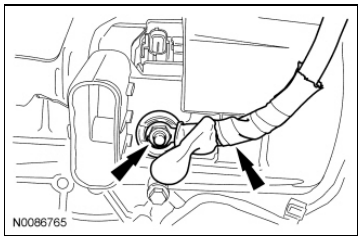
⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to llow these instructions may result in serious personal injury.

1. Using the Floor Crane and Spreader Bar, position the engine and transaxle together. Install the bellhousing-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).

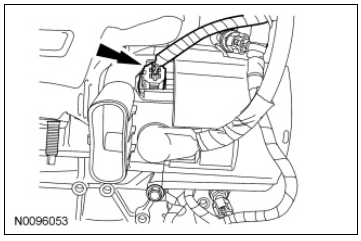


2. **NOTE:** Position a suitable block of wood under the transaxle.

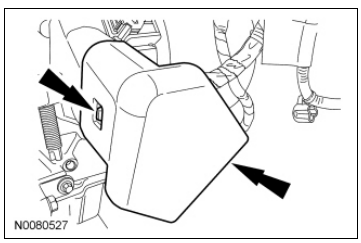
   Using the Floor Crane and Spreader Bar, position the engine and transaxle onto the Powertrain Lift table.



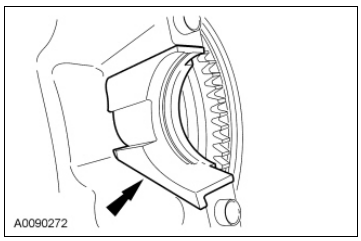
3. Install the Powertrain Lift and Adjustable Grip Arm onto the engine.



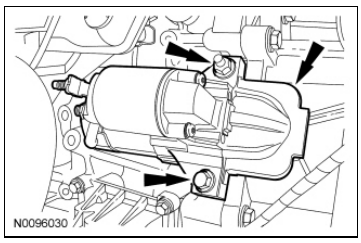
4. Position the generator wiring harness and attach the 4 wiring harness retainers (3 shown) to the valve cover stud bolts.



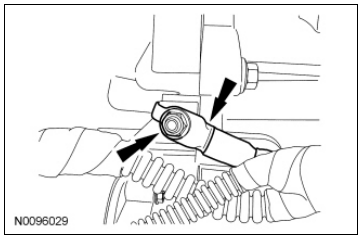
5. Connect the generator B+ wiring harness and install the nut.
   - Tighten to 12 Nm (106 lb-in).



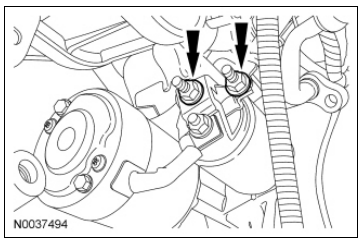
6. Connect the generator electrical connection.



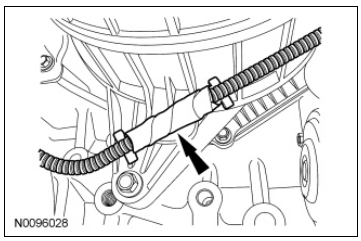
7. Install the generator air duct.



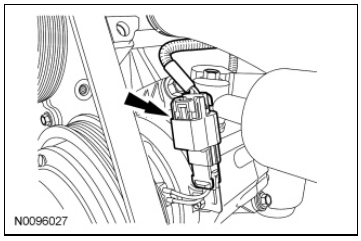
8. Install the starter motor isolator.



9. Install the starter, bolt and stud bolt.
   - Tighten to 25 Nm (18 lb-ft).

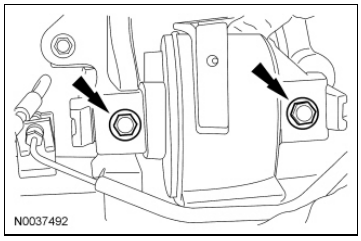


10. Position the wiring harness and install the ground wire to the starter motor stud bolt and install the nut.
    - Tighten to 18 Nm (159 lb-in).

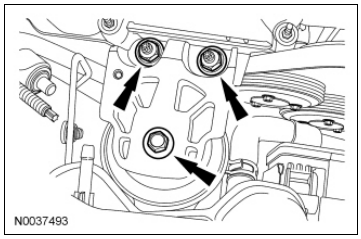


11. Connect the starter wires and install the 2 nuts.
    - Tighten the large starter motor B+ wire nut to 12 Nm (106 lb-in).
    - Tighten the small starter motor solenoid wire nut to 5 Nm (44 lb-in).

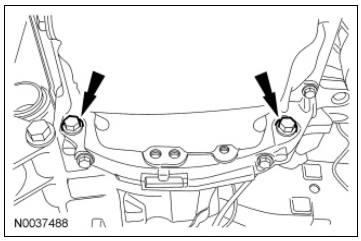
12. Attach the A/C compressor wiring harness pin-type retainer to the intake manifold.



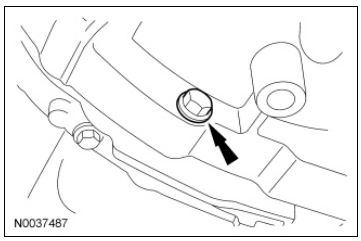
13. Connect the A/C compressor electrical connector.



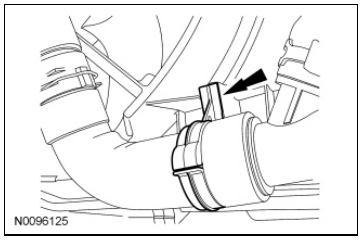
14. Raise the engine and transaxle into the vehicle.



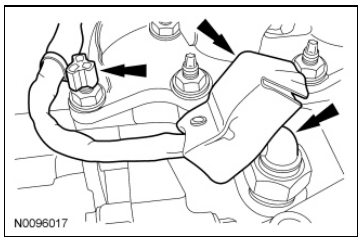
15. Install the 2 transaxle mount bolts.
    - Tighten to 90 Nm (66 lb-ft).



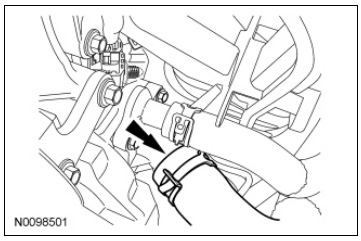
16. Install the engine mount bracket, 2 nuts and the bolt.
    - Tighten the nuts to 103 Nm (76 lb-ft).
    - Tighten the bolt to 115 Nm (85 lb-ft).



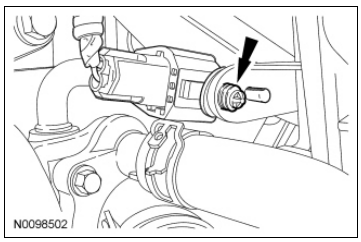
17. Install the 2 oil pan-to-bellhousing bolts.
    - Tighten to 48 Nm (35 lb-ft).



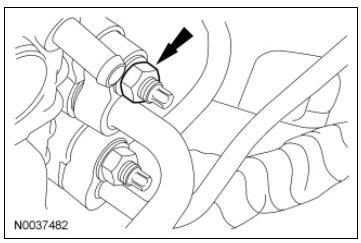
18. Install the bellhousing-to-oil pan bolt.
    - Tighten to 48 Nm (35 lb-ft).



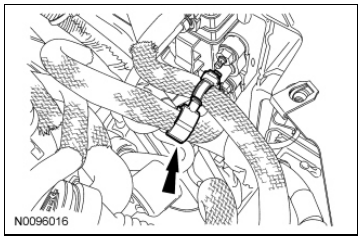
19. Attach the lower radiator hose pin-type retainer to the cooling fan shroud.



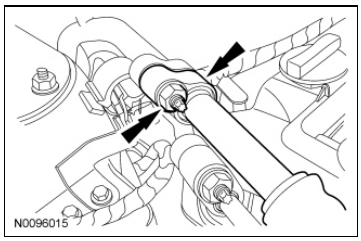
20. If equipped, connect the block heater electrical connector and position back the block heater shield.
    - Attach the 8 block heater wiring harness retainers (1 shown).



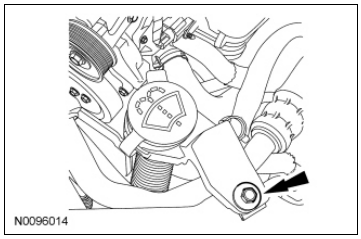
21. Install the lower radiator hose to the thermostat housing.



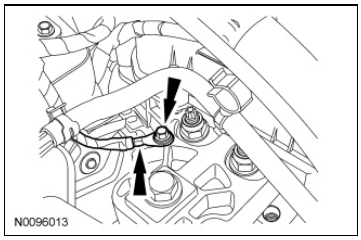
22. Attach the Knock Sensor (KS) electrical connector to the intake manifold.



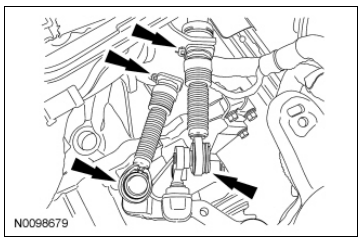
23. Install a new O-ring seal and connect the upper A/C tube to the condenser and install the nut.
    - Tighten to 8 Nm (71 lb-in).



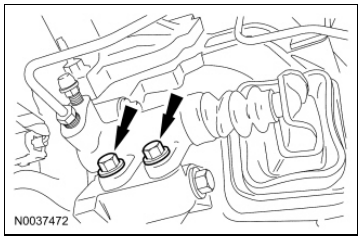
24. Attach the coolant vent hose retaining clip to the A/C tube.



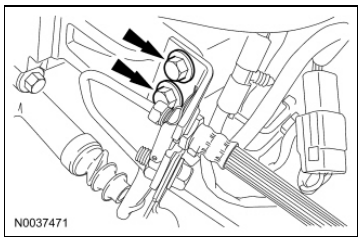
25. Install a new O-ring seal and connect the upper A/C tube and install the nut.
    - Tighten to 8 Nm (71 lb-in).



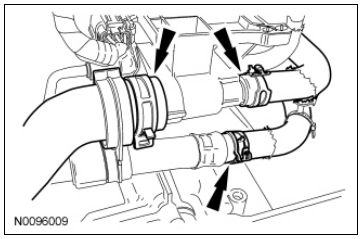
26. Install the A/C tube/windshield washer reservoir bracket bolt.
    - Tighten to 7 Nm (62 lb-in).



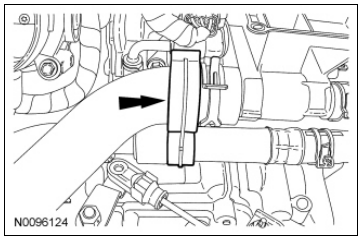
27. Install the ground wire on the engine mount and the bolt.
    - Tighten to 10 Nm (89 lb-in).



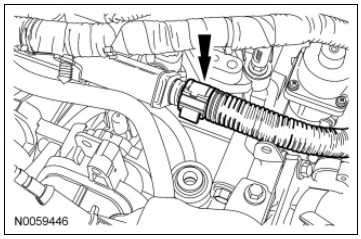
28. Attach the transaxle control cables to the bracket.
    - Connect the control cables to the control levers.



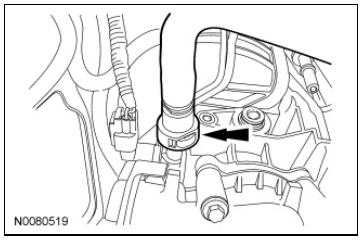
29. Install the clutch slave cylinder and the 2 bolts.
    - Tighten to 22 Nm (16 lb-ft).



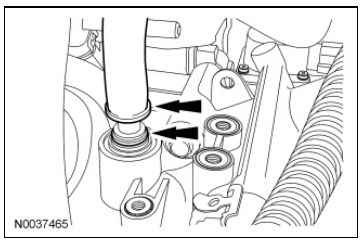
30. Install the 2 clutch tube bracket bolts.
    - Tighten to 22 Nm (16 lb-ft).



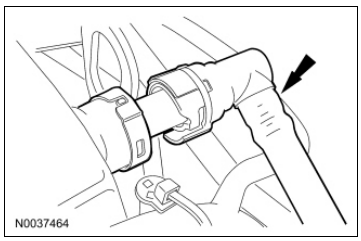
31. Connect the heater hose in-line connector and connect the upper radiator and heater hoses to the coolant outlet.



32. Attach the coolant hoses retainer.

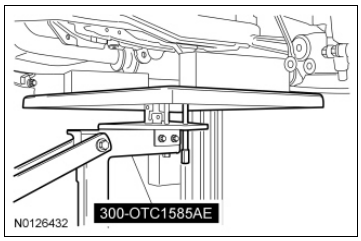


33. Connect the fuel supply tube quick connect coupling. For additional information, refer to Section 310-00 .



34. Connect the fuel vapor return tube.

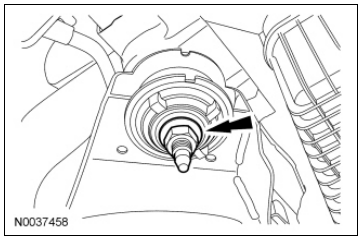
35. Insert the brake booster vacuum supply tube into the locking ring on the intake manifold.



36. Connect the crankcase vent tube to the valve cover.

37. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .

38. Install the engine oil filter.
    - Lubricate the engine oil filter gasket with clean engine oil and tighten the oil filter three-fourths turn after the oil filter gasket makes contact with the oil filter adapter.



39. Place the subframe assembly on the Powertrain Lift and raise the subframe into the installed position.

40. **NOTE:** LH shown, RH similar.

    Install the front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

41. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the bolts finger-tight.

42. **NOTE:** LH shown, RH similar.

    Install the subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

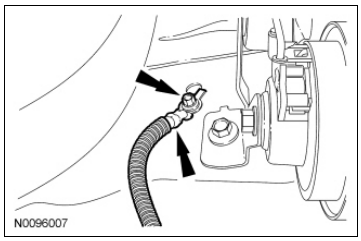
43. **NOTE:** LH shown, RH similar.

    Tighten the subframe bracket-to-body bolts to 103 Nm (76 lb-ft).

44. **NOTE:** LH shown, RH similar.

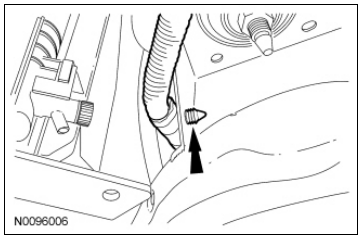
    Install the sway bar links and nuts to the struts.

    - Tighten to 40 Nm (30 lb-ft).

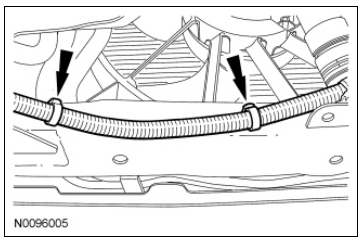


45. **NOTE:** LH shown, RH similar.

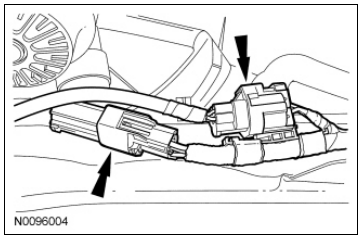
    Install tie-rod ends and nuts.



- Tighten to 48 Nm (35 lb-ft).
- Install the cotter pin.

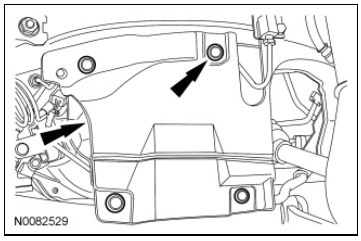


46. Install the Electronic Power Assist Steering (EPAS) system wiring harness ground and the bolt.
    - Tighten to 12 Nm (106 lb-in).

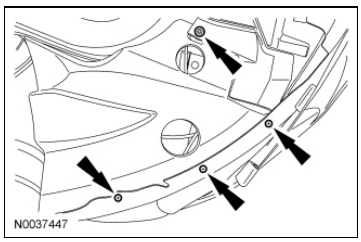


47. Attach the EPAS system wiring harness pin-type retainer to the subframe under the LH fender splash shield.

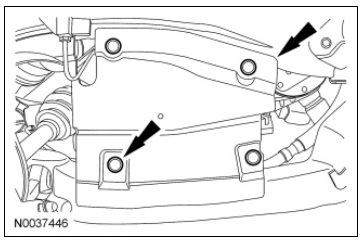
48. Attach the 2 EPAS system wiring harness pin-type retainers to the subframe.



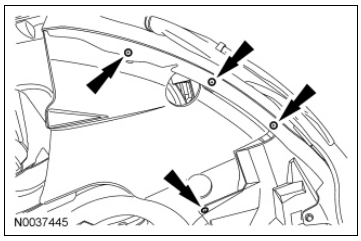
49. Connect the 2 EPAS system electrical connectors.



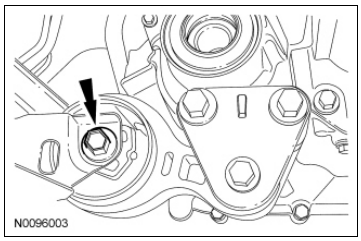
50. Install the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .



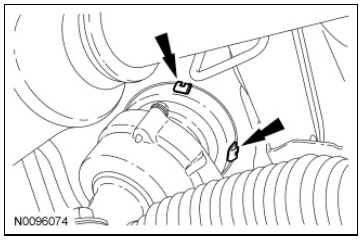
51. Install the LH splash shield and the 6 pin-type retainers (4 shown).



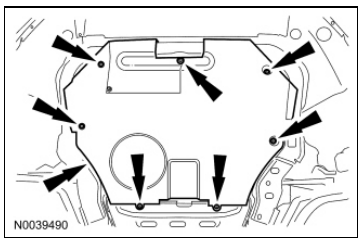
52. Position the LH fender splash shield and install the 4 screws.



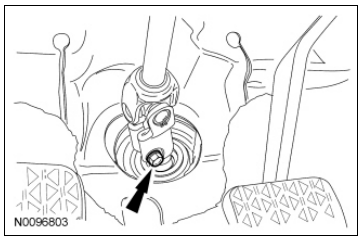
53. Install the RH splash shield and the 6 pin-type retainers (4 shown).



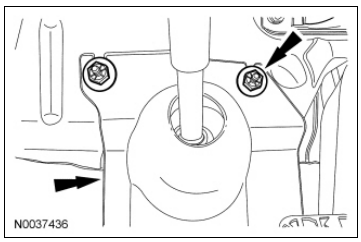
54. Position the RH fender splash shield and install the 4 screws.



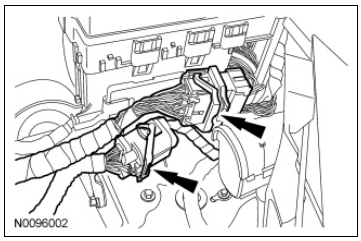
55. Install the engine roll restrictor bolt.
    - Tighten to 90 Nm (66 lb-ft).



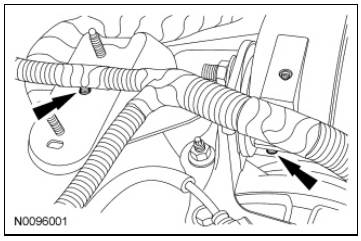
56. Slide the steering gear-to-dash seal onto the steering gear and engage the 4 retaining clips (2 shown) into the body.
    - From under the vehicle, verify that the seal is correctly installed on the steering gear and the retaining clips are fully engaged into the dash.



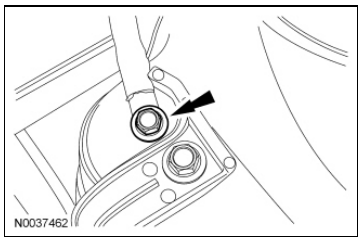
57. If equipped, install the 7 screws and the underbody cover.



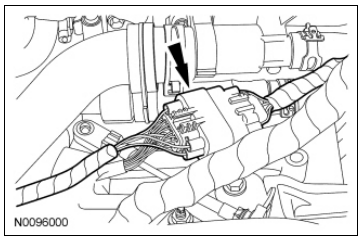
58. Install the steering column shaft onto the steering gear and install the bolt.
    - Tighten to 20 Nm (177 lb-in).



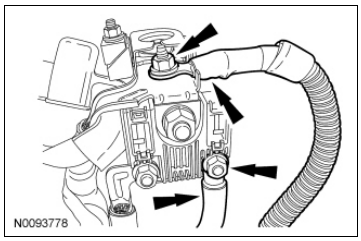
59. Install the steering joint cover and the 2 nuts.



60. Connect the 2 engine harness electrical connectors.



61. Attach the 2 negative battery cable pin-type retainers to the transaxle mount and battery tray bracket.



62. Install the ground wire-to-body and the bolt.
    - Tighten to 12 Nm (106 lb-in).

63. Connect the engine wiring harness electrical connector.

64. Install the 2 battery cables to the positive battery cable and the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).

65. Install the battery tray. For additional information, refer to Section 414-01 .

66. Install the engine Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12A .

67. Fill the engine with clean engine oil.

68. Fill and bleed the cooling system. For additional information, refer to Section 303-03A .

69. Recharge the A/C system. For additional information, refer to Section 412-00A .

70. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

General Specifications

Item	Specification
Engine	
Bore/stroke	89.0 x 79.5 mm (3.12 in)
Compression ratio	10.3:1
Displacement	3.0L (4V) (182 Cubic Inch Displacement (CID))
Engine and transaxle assembly weight (without accessory drive components)	234 kg (516 lb)
Engine weight (without accessory drive components and flexplate)	146 kg (322 lb)
Fire order	1-4-2-5-3-6
No. cylinders	6
Oil pressure (Minimum at 1,500 rpm with engine warmed up after 10 minutes of idling)	172 kPa (25 psi)
Spark plug	CGSF-22F Gap = 1.15-1.25 mm (0.045-0.049 in)
Cylinder Head and Valve Train	

Combustion chamber volume	51.2 cc +/- 1.5 cc
Cylinder head gasket surface flatness	0.025 mm (0.001 in) in any 25 mm (1 in) X 25 mm (1 in) area, 0.05 mm (0.002 in) in any 150 mm (6 in) area, 0.15 mm (0.005 in) overall
Roller follower ratio @ max. lift	2.0:1
Valve arrangement (front to rear)	LH intake I-I-I-I-I-I LH exhaust E-E-E-E-E-E RH intake I-I-I-I-I-I RH exhaust E-E-E-E-E-E
Valve face angle	45.5 degrees
Valve face runout	0.04 mm (0.001 in)
Valve guide bore diameter	6.015-6.044 mm (0.236-0.237 in)
Valve head diameter - exhaust	30 mm (1.18 in)
Valve head diameter - intake	35 mm (1.38 in)
Valve head diameter (exhaust) - gauge diameter	28.0 mm (1.10236 in)
Valve head diameter (intake) - gauge diameter	33.5 mm (1.3189 in)
Valve seat angle	44.75 degrees
Valve seat runout	0.04 mm (0.001 in)
Valve seat width - exhaust	1.4-1.7 mm (0.055-0.066 in)
Valve seat width - intake	1.1-1.4 mm (0.043-0.055 in)
Valve spring compression pressure (Nm @ spec. length)	780 Nm @ 32.29 mm (575 lb @ 1.27 in)
Valve spring free length (approx.)	50.52 mm (1.988 in)
Valve spring installed height (Nm @ spec. length)	42.61 mm (1.677 in)
Valve spring installed pressure	280 Nm @ 42.61 mm (206 lb @ 1.677 in)
Valve spring installed pressure - service limit	5% force loss @ specified height
Valve spring squareness	1.2 mm (0.047 in) from ID
Valve stem diameter - exhaust	5.950-5.970 mm (0.2343-0.2350 in)
Valve stem diameter - intake	5.975-5.995 mm (0.2350-0.2358 in)
Valve stem-to-guide clearance - exhaust	0.045-0.094 mm (0.0017-0.037 in)
Valve stem-to-guide clearance - intake	0.019-0.069 mm (0.0007-0.0027 in)
Hydraulic Lash Adjuster	
Clearance to bore	0.018-0.069 mm (0.0007-0.0027 in)
Collapsed lash adjuster gap	0.50-1.11 mm (0.019-0.043 in)

Diameter (standard)	15.988-16.000 mm (0.6294-0.6299 in)
Hydraulic leakdown rate	5-25 seconds
Camshaft	
Camshaft journal bore inside diameter	26.987-27.012 mm (1.062-1.063 in)
Camshaft journal-to-bearing clearance - service limit 0.121 mm (0.0047 in)	
Camshaft journal-to-bearing clearance - standard	0.025-0.076 mm (0.001-0.0029 in)
End play - service limit	0.241 mm (0.009 in)
Journal diameter (all)	26.936-26.962 mm (1.060-1.061 in)
Lobe lift (intake)	5.084 mm (0.2 in)
Lobe lift (exhaust)	5.084 mm (0.2 in)
Runout	-
Theoretical valve lift @ 0 lash	10.38 mm (0.408 in)
Cylinder Block	
Cylinder bore diameter - grade 1	89.000-89.010 mm (3.50393-3.504323 in)
Cylinder bore diameter - grade 2	89.011-89.020 mm (3.50437-3.50472 in)
Cylinder bore diameter - grade 3	89.021-82.030 mm (3.50476-3.50511 in)
Cylinder bore maximum out-of-round	0.015 mm (0.0005 in)
Cylinder bore maximum out-of-round - service limit	0.020 mm (0.0007 in)
Cylinder bore maximum taper	0.020 mm (0.0008 in)
Head gasket surface flatness	0.025 mm any 25 mm (1 in) X 25 mm (1 in) area, 0.05 mm (0.002 in) in any 150 mm (6 in) area, 0.15 mm (0.005 in) overall
Main bearing bore inside diameter	67.998-68.022 mm (2.677-2.6780 in)
Crankshaft	
Connecting rod journal diameter	49.969-49.991 mm (1.967-1.968 in)
Connecting rod journal maximum out-of-round	0.006 mm (0.0002 in)
Connecting rod journal maximum taper	0.008 mm (0.0003 in)
Crankshaft end play	0.100-0.255 mm (0.003-0.010 in)
Main bearing journal diameter	62.968-62.992 mm (2.467-2.479 in)
Main bearing journal maximum out-of-round	0.006 mm (0.0002 in)
Main bearing journal maximum taper	0.008 mm (0.0003 in)
Main bearing journal-to-cylinder block clearance	0.024-0.046 mm (0.0009-0.0018 in) (select fit bearings)
Piston and Connecting Rod	
Connecting rod bearing bore diameter	53.015-53.035 mm (2.0872-2.0879 in)
Connecting rod bearing-to-crankshaft clearance	0.028-0.066 mm (0.001-0.0025 in)
Connecting rod length (center-to-center)	138.06-138.14 mm (5.435-5.38 in)

Connecting rod maximum allowed bend	0.038 mm per 25 (0.0014 per 0.984 in)	
Connecting rod maximum allowed twist	0.050 mm per 25 (0.0019 per 0.984 in)	
Connecting rod pin bore diameter	21.017-21.031 mm (0.827-0.828 in)	
Connecting rod side clearance	0.100-0.30 mm (0.0039-0.0118 in)	
Connecting rod-to-pin clearance - service limit	0.035 mm (0.0013 in)	
Connecting rod-to-pin clearance - standard	0.004-0.02 mm (0.0001-0.0007 in)	
Piston diameter - coated, grade 1	88.980-88.995 mm (3.5031-3.5037 in)	
Piston diameter - coated, grade 2	88.78-89.007 mm (3.4952-3.5042 in)	
Piston diameter - coated, grade 3	89.00-89.015 mm (3.5039-3.5045 in)	
Piston diameter - uncoated, grade 1	88.970-88.980 mm (3.50275-3.50314 in)	
Piston diameter - uncoated, grade 2	88.978-88.992 mm (3.50306-3.50362 in)	
Piston diameter - uncoated, grade 3	88.990-89.000 mm (3.5035-3.5039 in)	
Piston pin bore diameter	21..8273-0.8275 in)	
Piston pin diameter	21.011-21.013 mm (0.8271-0.8273 in)	
Piston pin length	60.08-60.51 mm (2.365-2.382 in)	
Piston ring end gap - compression (bottom, gauge diameter)	0.27-0.42 mm (0.0106-0.0165 in)	
Piston ring end gap - compression (bottom, service limit)	0.65 mm (0.0255 in) max	
Piston ring end gap - compression (top, gauge diameter) [a]	0.100-0.250 mm (0.0039-0.0098 in)	
Piston ring end gap - compression (top, service limit)	0.50 mm (0.0196 in) max	
Piston ring end gap - oil ring (steel rail, gauge diameter)	0.15-0.65 mm (0.0059-0.0255 in)	
Piston ring end gap - oil ring (steel rail, service limit)	0.90 mm (0.0354 in) max	
Piston ring groove width - compression (bottom)	1.530-1.555 mm (0.0602-0.0612 in)	
Piston ring groove width - compression (top)	1.230-1.255 mm (0.0484-0.0494 in)	
Piston ring groove width - oil ring	2.53-2.555 mm (0.0996-0.1005 in)	
Piston ring-to-groove clearance	-	
Piston ring width	-	0.002 to 0.009 mm (0.00007-0.0003 in)
Piston-to-connecting rod clearance	-	
Piston-to-cylinder bore clearance (coated)	0.003 to 0.032 mm (0.0001-0.0012 in)	
Piston-to-cylinder bore clearance (uncoated)	0.012 to 0.022 mm (0.0005-0.0009 in)	

[a] Specification 82.4 mm (3.2441 in) diameter gauge.

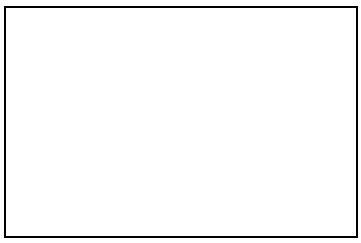
[a] Refer to the procedure in this section.

Engine

The 3.0L (4V) is a V-6 engine with the following features:

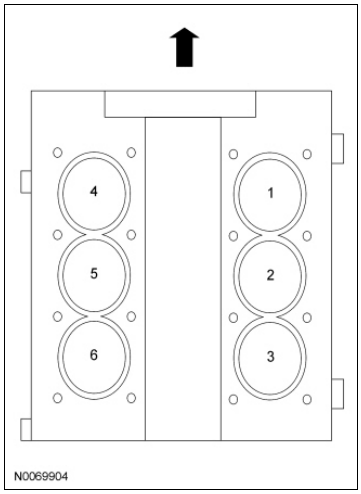
- Dual overhead camshafts
- Four valves per cylinder
- Sequential Multi-Port Fuel Injection (SFI)
- A composite lower intake manifold and a composite upper intake manifold
- Aluminum cylinder heads
- Two-piece design aluminum cylinder block
- Variable Camshaft Timing (VCT) system
- Electronic ignition system with 6 ignition coils



Engine Identification

For quick identification, refer to the safety certification decal.

- The decal is located on the LH front door lock face panel.



Engine Code Information Label

The engine code information label, located on the front side of the valve cover, contains the following:

Item	Description
1	Engine part number
2	Cleveland engine plant 2
3	Engine displacement
4	Bar code
5	Running number
6	Engine build date (DDMMYY)
7	Plant shift line
8	Bar code

Engine Cylinder Identification

Exhaust Emission Control System

Operation and required maintenance of the exhaust emission control devices used on this engine are covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 6 solenoid-operated fuel injectors:

- are mounted between the fuel rail and the intake manifold.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.

Valve Train

The camshafts are mounted in the cylinder heads and act against a roller follower to open and close the valves. A hydraulic lash adjuster is located on one side of the roller follower and the valve tip on the opposite end. The camshafts are driven off the front of each cylinder head by 2 chains (one each side). Both of the chains are driven by sprockets that are located on the crankshaft, just in front of the oil pump.

Variable Camshaft Timing (VCT) System

The VCT system changes intake camshaft timing dependent on engine speed, load and oil temperature. Oil pressure advances and retards camshaft timing to improve low-speed and high-speed engine performance, engine idle quality and exhaust emissions.

PCV System

All engines are equipped with a closed-type positive crankcase ventilation system recycling the crankcase vapors to the upper intake manifold.

Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the crankshaft, connecting rod bearings and timing chain tensioners. The flow of oil to the valve tappets and valve train is controlled by a restricting orifice located in the head gaskets.

Oil Pump

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range.

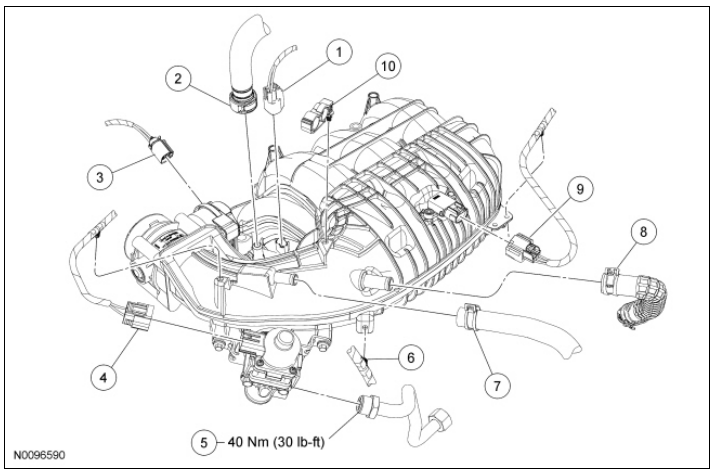
The heart of the system is a positive displacement internal gear oil pump.

Generically this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

Cooling System

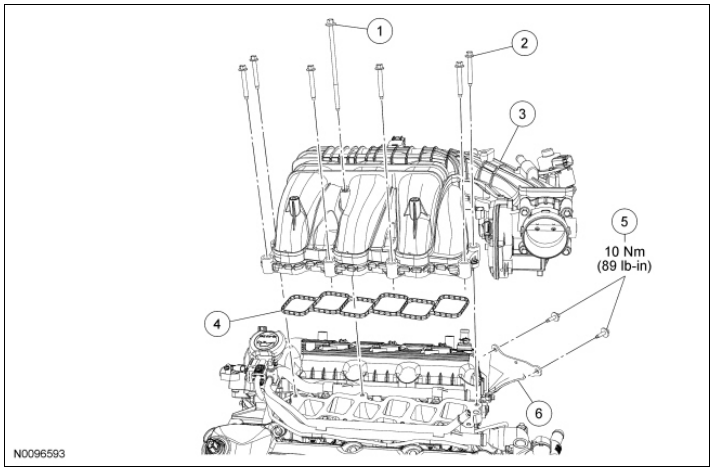
The engine cooling system includes the following components:



- Radiator
- Electric cooling fan motor
- Degas bottle (aids in maintaining the correct volume of engine coolant)
- Coolant thermostat
- Coolant hoses
- Coolant pump housing

Engine

For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



Upper Intake Manifold

Upper Intake Manifold (View 1 of 2)

Item	Part Number	Description
1	14A464	Evaporative Emission (EVAP) canister purge valve electrical connector (part of 12C508)
2	9D289	EVAP tube-to- EVAP canister purge valve quick connect coupling
3/td>	14A464	Electronic throttle control electrical connector (part of 12C508)
4	14A464	EGR valve electrical connector (part of 12C508)
5	-	EGR tube fitting (part of 9D477)
6	W700497	Engine control wiring harness retainer (part of 12C508)
7	-	Brake booster vacuum tube
8	6K817	PCV tube
9	14A464	Manifold Absolute Pressure (MAP) sensor electrical connector (part of 12C508)
10	-	Fuel tube and EVAP tube-to- EVAP canister purge valve tube retainer

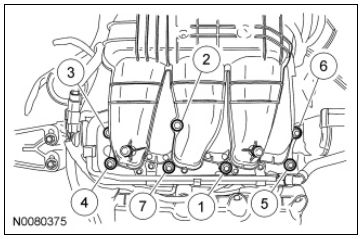
Upper Intake Manifold (View 2 of 2)

Item	Part Number	Description
1	W713391	Upper intake manifold bolt
2	9Y450	Upper intake manifold bolt (6 required)
3	9424	Upper intake manifold
4	-	Upper intaold gasket
5	W701775	Upper intake manifold support bracket bolts (2 required)
6	9J444	Upper intake manifold support bracket

Removal

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12B .
2. Remove the battery. For additional information, refer to Section 414-01 .
3. Remove the EGR tube fitting from the EGR valve.
4. Disconnect the electronic throttle control electrical connector.
5. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.
6. Disconnect the EGR valve electrical connector and detach the wiring retainer.
7. Disconnect the EVAP tube-to- EVAP canister purge valve quick connect coupling and the brake booster vacuum tube from the upper intake manifold.
    - Detach the fuel tube and EVAP tube-to- EVAP canister purge valve tube retainer from the upper intake manifold.
8. Detach the engine control wiring harness retainer from the upper intake manifold.
9. Disconnect the PCV tube from the upper intake manifold.
10. Disconnect the Manifold Absolute Pressure (MAP) sensor electrical connector and detach the wiring retainer.
11. Remove the 2 upper intake manifold support bracket bolts from the upper intake manifold.
12. Remove the 7 bolts and the upper intake manifold.
    - Remove and discard the gaskets.

Installation



1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Clean and inspect all of the sealing surfaces of the upper intake manifold.

2. **NOTE:** Install new upper intake manifold gaskets.

   Position the upper intake manifold and install the 7 bolts.

   - Tighten the bolts in 2 stages in the sequence shown.
     - ♦ Stage 1: Tighten to 10 Nm (89 lb-in).
     - ♦ Stage 2: Tighten an additional 45 degrees.

3. Install the 2 upper intake manifold support bracket bolts.
   - Tighten to 10 Nm (89 lb-in).

4. Connect the MAP sensor electrical connector and attach the wiring retainer.

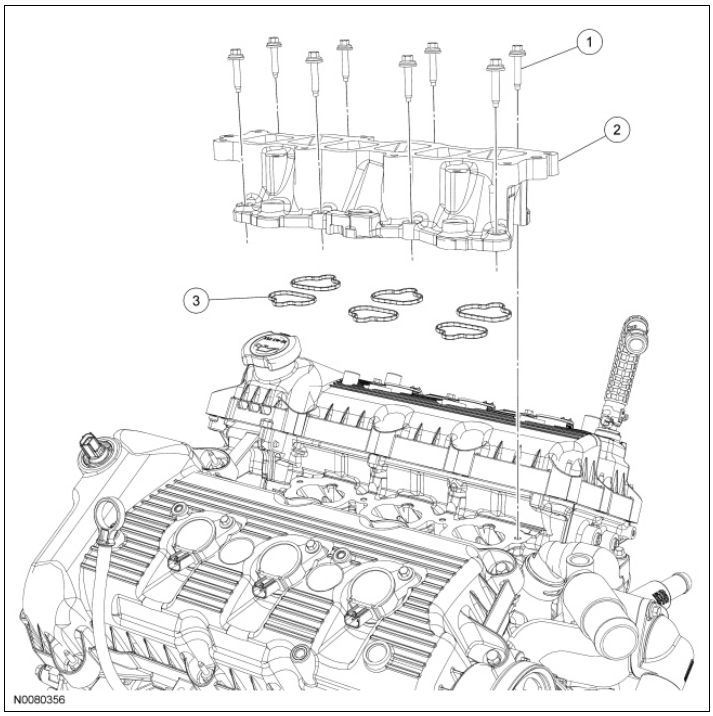
5. Connect the PCV tube to the upper intake manifold.

6. Attach the engine control wiring harness retainer to the upper intake manifold.

7. Connect the EVAP tube-to- EVAP canister purge valve quick connect coupling and the brake booster vacuum tube to the upper intake manifold.
   - Attach the fuel tube and EVAP tube-to- EVAP canister purge valve tube retainer to the upper intake manifold.

8. Connect the EGR valve electrical connector and attach the wiring retainer.

9. Connect the EVAP canister purge valve electrical connector.



10. Connect the electronic throttle control electrical connector.

11. Install the EGR tube fitting to the EGR valve.
    - Tighten to 40 Nm (30 lb-ft).

12. Install the battery. For additional information, refer to Section 414-01 .

13. Install the ACL outlet pipe. For additional information, refer to Section 303-12B .

Lower Intake Manifold

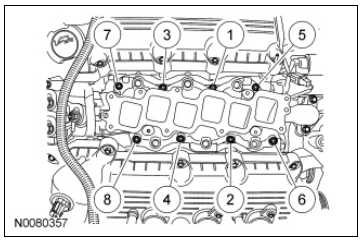
Item	Part Number	Description
1	W503279	Lower intake manifold bolt (8 required)
2	9K461	Lower intake manifold
3	9439	Lower intake manifold gasket (6 required)

Removal

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the fuel rail. For additional information, refer to Section 303-04B .
4. Remove the 8 lower intake manifold bolts and the lower intake manifold.
   - Remove and discard the gaskets.



Installation

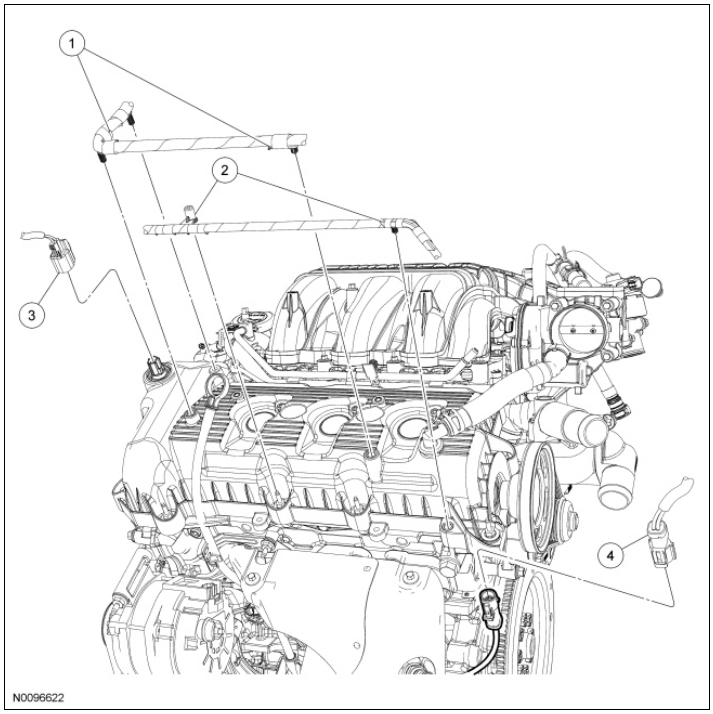
1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   NOTE: Clean and inspect all sealing surfaces. Install new gaskets.

   Position the lower intake manifold and install the 8 bolts.

   - Tighten in the sequence shown to 10 Nm (89 lb-in).

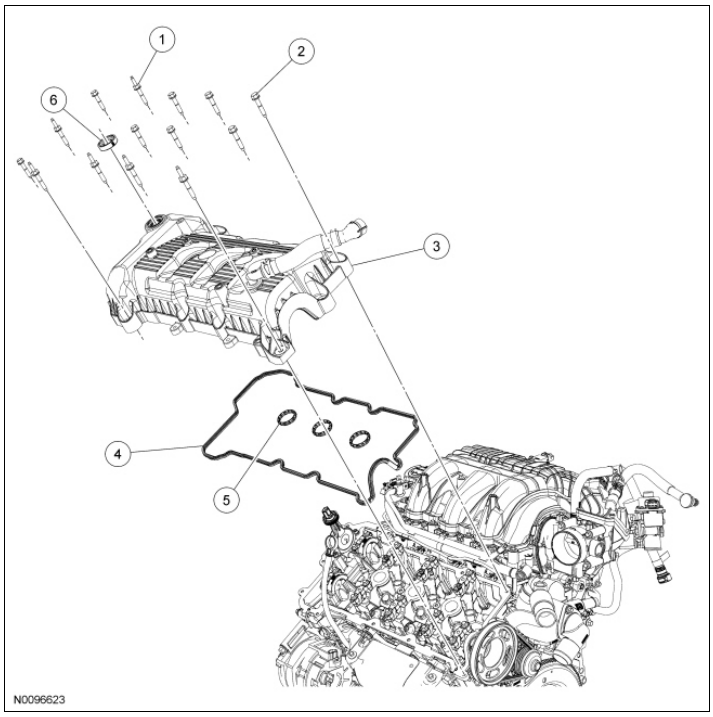
2. Install the fuel rail. For additional information, refer to Section 303-04B .



3. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Valve Cover - LH

Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

LH Valve Cover (View 1 of 2)

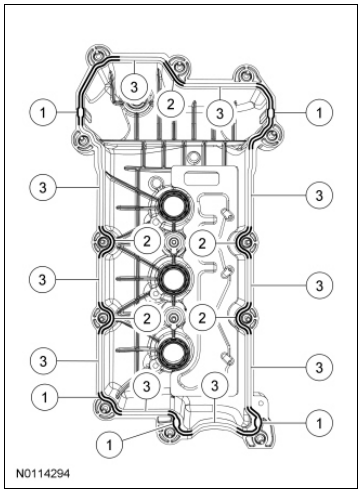
Item	Part Number	Description
1	-	Valve cover wiring retainers (part of 12A581)
2	-	B+ cable valve cover stud bolt wiring retainers (part of 14tr>
3	14A464	Variable Camshaft Timing (VCT) electrical connector (part of 12A581)
4	14A464	LH Heated Oxygen Sensor (HO2S) electrical connector (part of 12A581)

LH Valve Cover (View 2 of 2)

Item	Part Number	Description
1	6C519	Valve cover stud bolt (6 required)
2	6C519	Valve cover bolt (8 required)
3	6A505	Valve cover
4	6A559	Valve cover gasket
5	6C527	Valve cover spark plug gasket (3 required)
6	6C535	Variable Camshaft Timing (VCT) valve cover seal

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

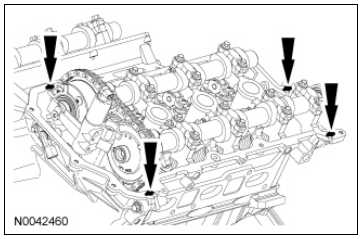


1. Remove the LH ignition coil-on-plugs. For additional information, refer to Section 303-07B .
2. Detach the 3 wiring retainers from the valve cover.
3. Detach the wiring retainer from the valve cover stud bolt and 1 retainer from the valve cover.
4. Disconnect the Variable Camshaft Timing (VCT) electrical connector.
5. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector.
6. **NOTE:** Inspect the crankcase ventilation tube and valve cover sealing area. If either a new valve cover or crankcase ventilation tube is required, both components must be installed new.

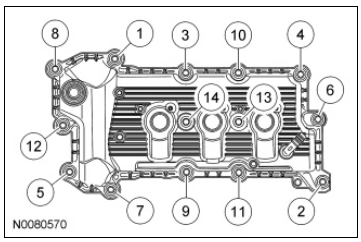
   Remove the 9 bolts, 5 stud bolts and the valve cover.

   - Remove and discard the gasket.

Installation



1. Install the new gasket in the valve cover in the following sequence.
    1. Install the gasket at waffle pads and then the corners.
    2. Install the gasket around bolt holes.
    3. Install the remaining part of the gasket.



2. **NOTE:** The valve cover must be installed and the bolts and studs tightened within 4 minutes of sealant application.

   NOTE: Clean cylinder head and front cover surface and the cam seal retainer-to-cylinder head surface using metal surface prep before applying silicone gasket and sealant.

   Apply an 8 mm (0.31 in) dot of silicone gasket and sealant at the cylinder block to front cover mating surface and the cam seal retainer-to-cylinder head joints.

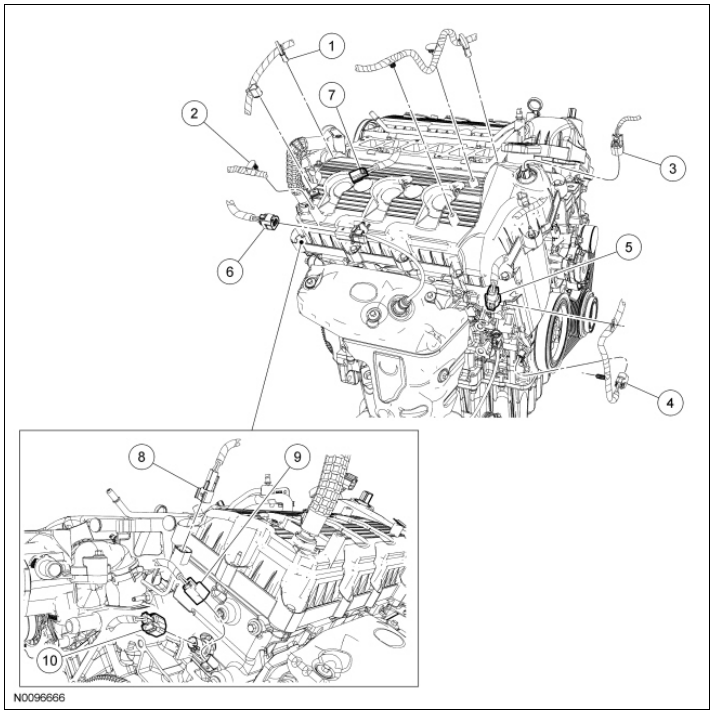
3. Position the valve cover and install the bolts and stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

4. Position the wire harness and connect the HO2S electrical connector.

5. Connect the VCT electrical connector.

6. Attach the wiring retainer to the valve cover stud bolt and attach the pin-type wiring retainer to the valve cover.

7. Attach the 3 wiring retainers to the valve cover.

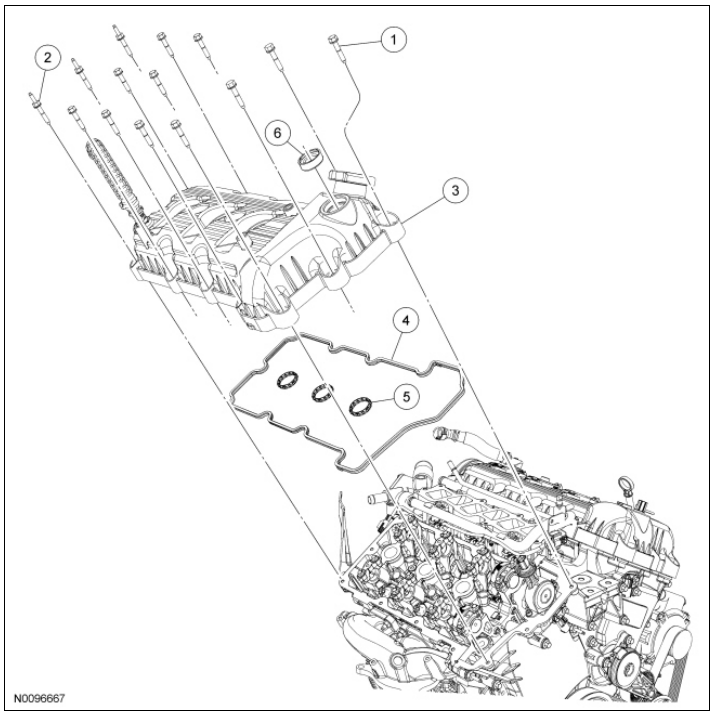


8. Install the LH ignition coil-on-plugs. For additional information, refer to Section 303-07B .

Valve Cover - RH

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



RH Valve Cover (View 1 of 2)

Item	Part Number	Description
1	-	Main engine control wiring harness valve cover stud bolt retainer (part of 12A581) (4 required)
2	-	Main enging harness valve cover retainer (part of 12A581) (3 required)
3	14A464	Variable Camshaft Timing (VCT) electrical connector (part of 12A581)
4	-	Crankshaft Position (CKP) electrical connector and wiring harness retainer (part of 12A581)
5	-	Catalyst Monitor Sensor (CMS) electrical connector (part of 12A581)

6	-	Heated Oxygen Sensor (HO2S) electrical connector (part of 12A581)
7	-	Heated PCV electrical connector (part of 12A581)
8	-	Cylinder head Knock Sensor (KS) electrical connector (part of 12A581)
9	-	Cylinder block KS electrical connector (part of 12A581)
10	-	Cylinder Head Temperature (CHT) electrical connector (part of 12A581)

RH Valve Cover (View 2 of 2)

Item	Part Number	Description
1	6C519	Valve cover stud bolt (11 required)
2	6C519	Valve cover bolt (3 required)
3	6582	Valve covertr valign="top">
4	6584	Valve cover gasket
5	6C527	Valve cover spark plug gasket (3 required)
6	6C535	Variable Camshaft Timing (VCT) valve cover seal

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. Remove the RH ignition coil-on-plugs. For additional information, refer to Section 303-07B .

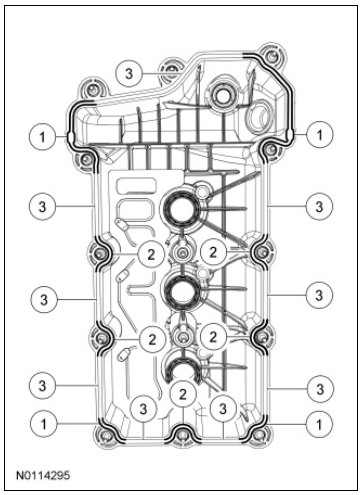
2. Detach the 3 main engine control wiring harness retainers from the valve cover and 4 retainers from the valve cover stud bolts.

3. Disconnect the Variable Camshaft Timing (VCT) electrical connector.

4. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector.

5. Disconnect the Crankshaft Position (CKP) electrical connector and detach the 2 wiring harness retainers.

6. Disconnect the Catalyst Monitor Sensor (CMS) electrical connector.

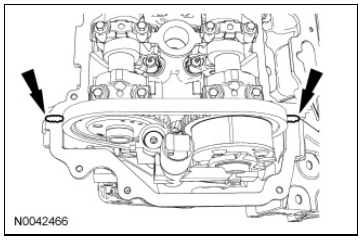


7. Disconnect the heated PCV electrical connector.

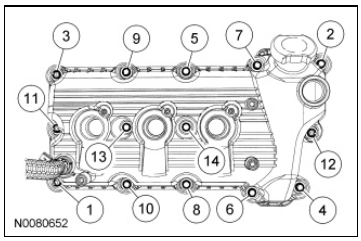
8. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector and the cylinder head and cylinder block Knock Sensor (KS) electrical connectors.

9. Remove the 11 bolts, 3 stud bolts and the valve cover.
    - Remove and discard the gasket.

Installation



1. Install the new gasket in the valve cover in the following sequence.
    1. Install the gasket at waffle pads and then corners.
    2. Install the gasket around bolt holes.
    3. Install the remaining part of the gasket.



2. **NOTE:** The valve cover must be installed and the bolts and stud bolts tightened within 4 minutes of sealant application.

   NOTE: Clean cylinder head and front cover surface using metal surface prep before applying silicone gasket and sealant.

   Apply an 8 mm (0.31 in) dot of silicone gasket sealant to the front cover-to-cylinder head joints.

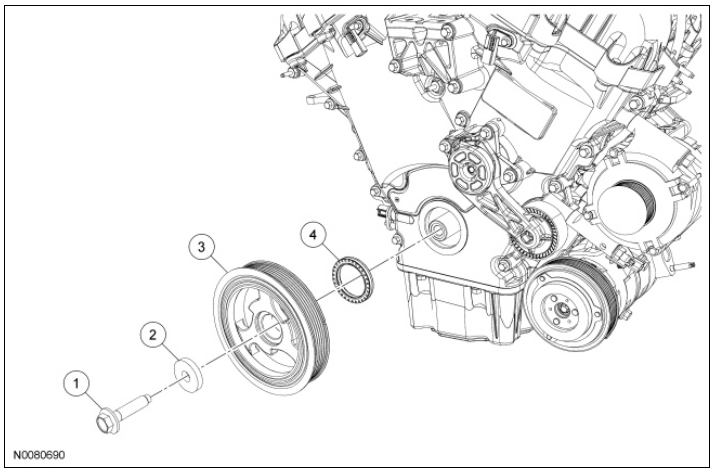
3. Position the valve cover and install the bolts and stud bolts.
   - Tighten in the sequence shown to 10 Nm (89 lb-in).

4. Connect the CHT sensor electrical connector and the cylinder head and cylinder block KS electrical connectors.

5. Connect the heated PCV electrical connector.

6. Connect the CMS electrical connector.

7. Connect the CKP electrical connector and attach the wiring harness retainer.



8. Connect the HO2S electrical connector.

9. Connect the VCT electrical connector.

10. Attach the 3 main engine control wiring harness retainers to the valve cover and the 4 retainers to the valve cover stud bolts.

11. Install the RH ignition coil-on-plugs. For additional information, refer to Section 303-07B .

Crankshaft Pulley and Crankshaft Front Seal - Exploded View

Item	Part Number	Description
1	W701512	Crankshaft pulley bolt
2	N806165	Washer
3	6316	Crankshaft pulley
4	6700	Crankshaft front seal

1. For additional information, refer to the procedures in this section.

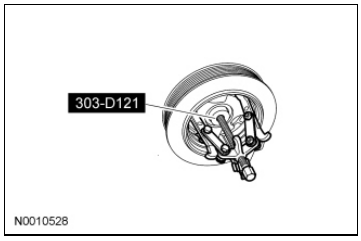
Crankshaft Pulley

Special Tool(s)

 ST1184-A	3 Jaw Puller 303-D121 (or equivalent)
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



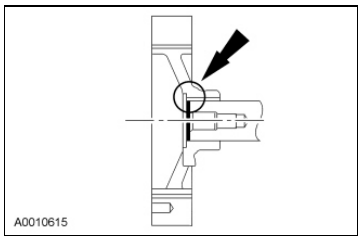
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the accessory drive belt. For additional information, refer to Section 303-05B .

3. Remove the crankshaft pulley bolt and washer.
   - Discard the crankshaft pulley bolt.

4. Using the 3 Jaw Puller, remove the crankshaft pulley.



Installation

1. Lubricate the crankshaft front seal inner lip with clean engine oil.

2. **NOTE:** Clean the keyway and slot using metal surface prep before applying silicone gasket and sealant.

   NOTE: The crankshaft pulley must be installed and the bolt tightened within 4 minutes of applying the silicone gasket and sealant.

   Apply silicone gasket and sealant to the end of the keyway slot.

3. **NOTE:** Lubricate the outside diameter sealing surface with clean engine oil.

   Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.

4. Install the bolt and washer. Tighten the bolt in 4 stages:
   - Stage 1: Tighten to 120 Nm (89 lb-ft).
   - Stage 2: Loosen one full turn.
   - Stage 3: Tighten to 50 Nm (37 lb-ft).
   - Stage 4: Tighten an additional 90 degrees.

5. Install the accessory drive belt. For additional information, refer to Section 303-05B .

6. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

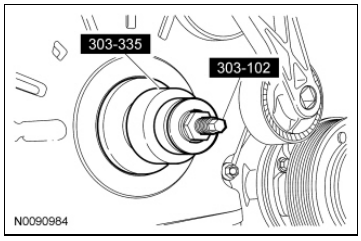
Crankshaft Front Seal

Special Tool(s)

 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST1328-A	
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700CH)

Material

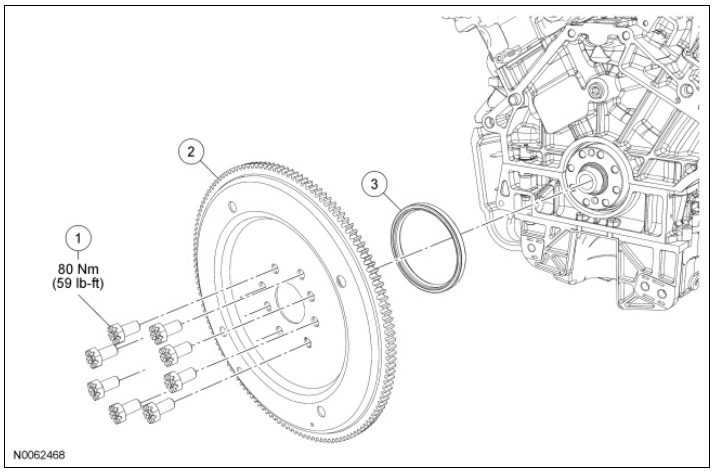
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
3. Using the Oil Seal Remover, remove and discard the crankshaft front seal.

Installation



1. **NOTE:** Clean all sealing surfaces with metal surface prep.

   Apply clean engine oil to the seal lip and seal bore before installing the seal.
2. Using the Front Cover Oil Seal Installer and the Crankshaft Vibration Damper Installer, install a new crankshaft front seal.

3. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

Flexplate or Flywheel and Crankshaft Rear Seal - Exploded View

Item	Part Number	Description
1	W701559	Flexplate bolt (8 required)
2	6375	Flexplate
3	6701	Crankshaft rear oil seal

1. For additional information, refer to the procedures in this section.

Flexplate

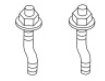
Special Tool(s)

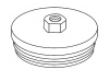
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transaxle. For additional information, refer to Section 307-01B .





3. Remove the bolts and the flexplate.
   - To install, tighten to 80 Nm (59 lb-ft).

4. To install, reverse the removal procedure.

5. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Crankshaft Rear Seal

Special Tool(s)

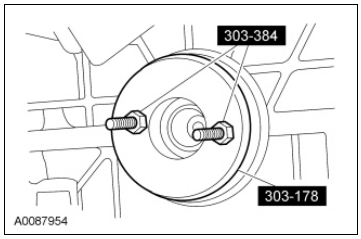
 ST1333-A	Inser Bolts, Crankshaft Rear Main Oil Seal 303-384 (T91P-6701-A)
 ST1327-A	Installer, Crankshaft Rear Main Oil Seal 303-178 (T82L-6701-A)
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the flexplate. For additional information, refer to Flexplate in this section.
3. Using the Slide Hammer and the Crankshaft Rear Oil Seal Remover, remove and discard the crankshaft rear oil seal.



Installation

1. **NOTE:** Clean all sealing surfaces with metal surface prep.

   NOTE: Apply clean engine oil to the seal lip and seal bore before installing the seal.

   Using the Crankshaft Rear Main Oil Seal Installer Bolts and the Crankshaft Rear Main Oil Seal Installer, install the crankshaft rear oil seal.

2. Install the flexplate. For additional information, refer to Flexplate in this section.

Engine Front Cover

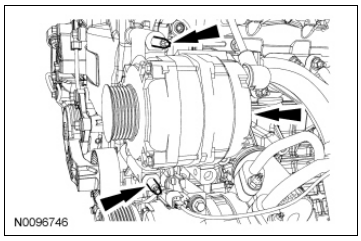
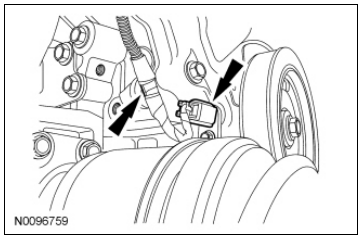
4	W701525	Engine front cover bolt (10 required)
5	6019	Engine front cover
6	6D081	Engine front cover gaskets
7	W709678	Oil pan-to-front cover bolts



Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.**



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refeto Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Remove the crankshaft front seal. For additional information, refer to Crankshaft Pulley and Crankshaft Front Seal - Exploded View and Crankshaft Front Se in this section.
5. Remove the generator bolt and the 2 nuts.

6. Remove the 2 studs and position the generator away from the engine.

7. Remove the 3 bolts and the accessory drive belt tensioner.
8. Detach the wiring harness retainer from the engine front cover stud bolt.
9. Disconnect the Crankshaft Position (CKP) electrical connector and detach the wiring harness retainer.

10. Disconnect the 2 Camshaft Position (CMP) sensor electrical connectors and detach the wiring harness retainer from the engine front cover stud bolt.

11. Remove the LH and RH Variable Camshaft Timing (VCT) oil control solenoids. For additional information, refer to Section 303-14B .

12. Remove the engine mount. For additional information, refer to Engine Mount in this section.

13. Remove the 2 oil pan-to-front cover bolts.

14. Remove the 14 bolts, 2 stud bolts and the engine front cover.
    - Remove and discard the gaskets.

Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

   NOTICE: **Do not damage the oil pan gasket while cleaning the sealant from the lower cylinder block-to-oil pan joint.**

   Use a plastic scraping tool to remove all traces of sealant.

   - Clean all sealing surfaces with metal surface prep and install new gaskets.

2. **NOTE:** The engine front cover must be installed and the bolts tightened within 4 minutes of applying sealant.

   Apply a 6 mm (0.23 in) diameter dot of silicone gasket and sealant to the cylinder block, lower cylinder block, cylinder head and oil pan mating surfaces.

3. Position the engine front cover and install the bolts. Tighten in the sequence shown to 25 Nm (18 lb-ft).

Item	Part Number	Description
1	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5
2	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5
3	W708222	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 64
4	W710030	Stud, Hex Flange Head Pilot, M6 x 1 x 20 / M8 x 1.25 x 47.5
5	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5
6	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5
7	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5
8	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5

9	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5
10	W708221	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 118
11	W708221	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 118
12	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5
13	W710030	Stud, Hex Flange Head Pilot, M6 x 1 x 20 / M8 x 1.25 x 47.5
14	W708222	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 64
15	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 118
16	W701525	Bolt, Hex Flange Head Pilot, M8 x 1.25 x 47.5

4. Install the 2 oil pan-to-front cover bolts.
   - Tighten to 25 Nm (18 lb-ft).

5. Remove the oil pan drain plug and drain the engine oil.
   - Install the plug and tighten to 26 Nm (19 lb-ft).

6. Install the engine mount. For additional information, refer to Engine Mount in this section.

7. Install the LH and RH VCT oil control solenoids. For additional information, refer to Section 303-14B .

8. Connect the 2 CMP sensor electrical connectors and attach the wiring harness retainer to the engine front cover stud bolt.

9. Connect the Crankshaft Position (CKP) electrical connector and attach the wiring harness retainer.

10. Attach the wiring harness retainer to the engine front cover stud bolt.

11. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

12. Position the generator and install the 2 studs.
    - Tighten to 8 Nm (71 lb-in).

13. Install the generator bolt and 2 nuts.
    - Tighten to 47 Nm (35 lb-ft).

14. Install the crankshaft front seal. For additional information, refer to Crankshaft Pulley and Crankshaft Front Seal - Exploded View and Crankshaft Front Seal in this section.

15. Fill the engine with clean engine oil.

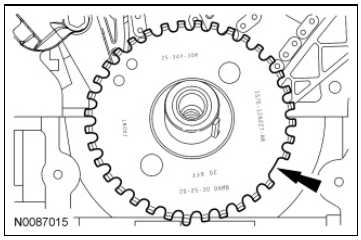
16. Connect the battery ground cable. For additional information, refer to Section 414-01 .

17. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Timing Drive Components

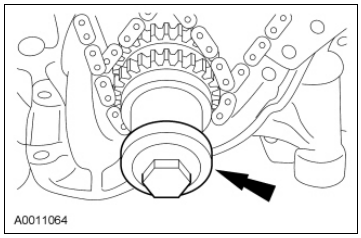
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan may cause engine failure.**



NOTICE: **Failure to verify correct timing drive component alignment will result in severe engine damage.**

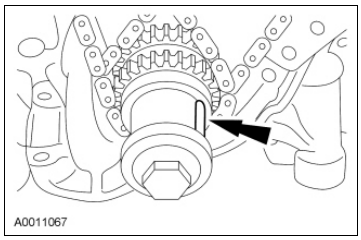
1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.



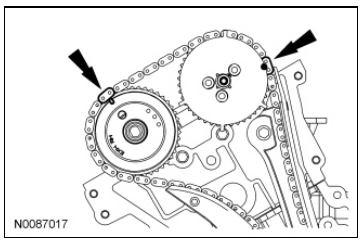
Section 303-07B .

3. **NOTE:** This pulse wheel is used in several different engines. Install the pulse wheel with the keyway in the slot stamped "30RFF" (orange in color).

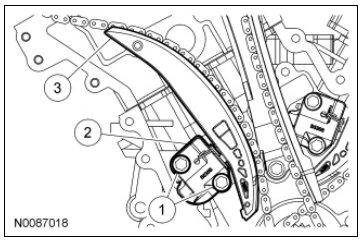
   Remove the ignition pulse wheel.



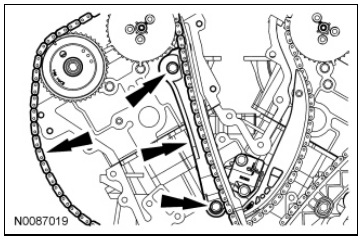
4. Install the crankshaft pulley bolt and washer.



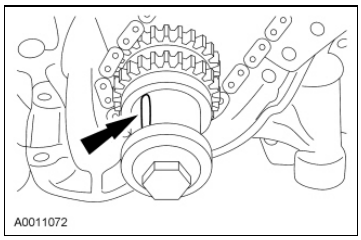
5. Rotate the crankshaft clockwise to position the crankshaft keyway in the 11 o'clock position and position the camshafts in the correct position. This will position the No. 1 cylinder at Top Dead Center (TDC).
   - Verify that the camshafts are correctly located. If not, rotate the crankshaft one additional turn and recheck.



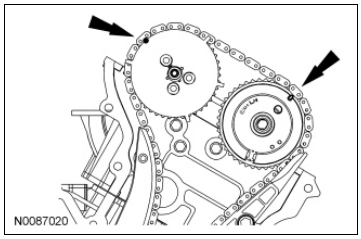
6. Rotate the crankshaft clockwise 120 degrees to the 3 o'clock position to position the RH camshafts in the neutral position.



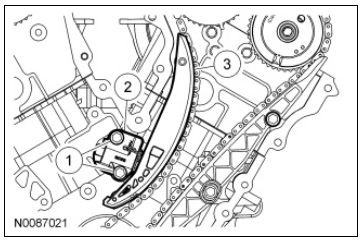
7. Verify that the RH camshafts are in the neutral position.



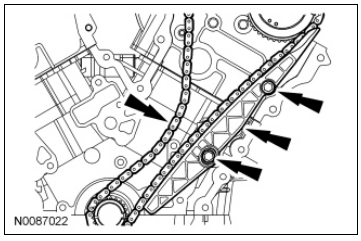
8. Remove the RH timing chain tensioner arm.
    1. Remove the 2 bolts.
    2. Remove the tensioner.
    3. Remove the tensioner arm.



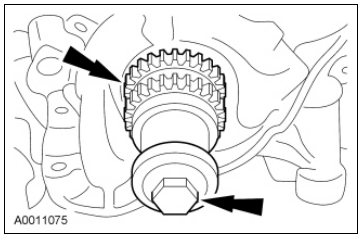
9. Remove the 2 bolts and the RH timing chain guide.
    - Remove the RH timing chain from the engine.



10. Rotate the crankcase clockwise 600 degrees (one and two-third turns) to position the crankcase keyway in the 11 o'clock position. This will position the LH camshafts in the neutral position.

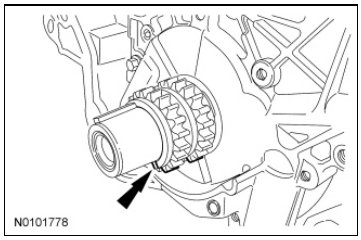


11. Verify the LH camshafts are in the neutral position.



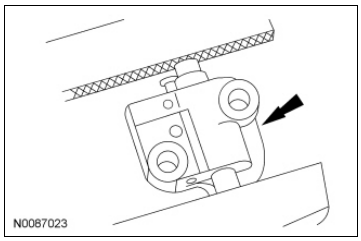
12. Remove the LH timing chain and tensioner arm.
    1. Remove the 2 bolts.
    2. Remove the tensioner.
    3. Remove the tensioner arm.

13. Remove the 2 bolts and the LH timing chain guide.
    - Remove the LH timing chain from the engine.



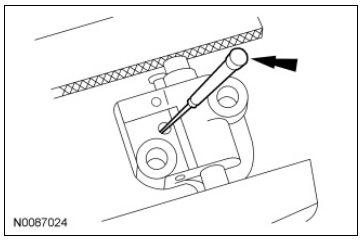
14. Remove the crankshaft pulley bolt and the crankshaft sprocket.

Installation



1. ***NOTICE:*** **Failure to verify correct timing drive component alignment will result in severe engine damage.**

   Install the crankshaft sprocket with the timing mark facing out. The timing mark on the LH and RH timing chains will be aligned to this mark during assembly.

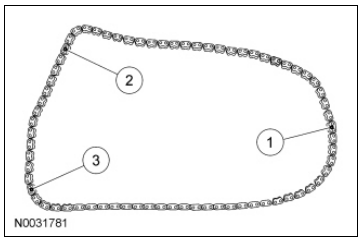


2. **NOTE:** LH shown, RH similar.

   Position the chain tensioner in a soft-jawed vise.

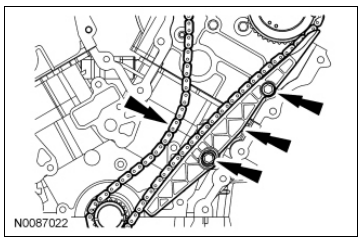
3. **NOTE:** LH shown, RH similar.

   Hold the chain tensioner ratchet lock mechanism away from the ratchet stem with a small pick.

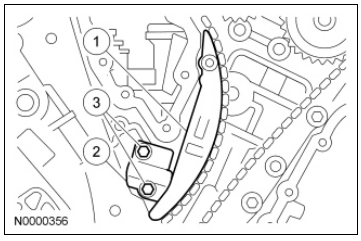


4. ***NOTICE:*** **During tensioner compression, do not release the ratchet stem until the tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.**

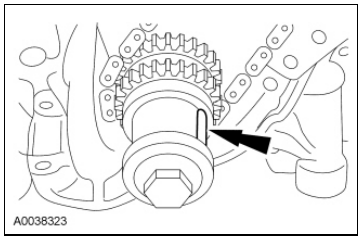
   Slowly compress the timing chain tensioner.



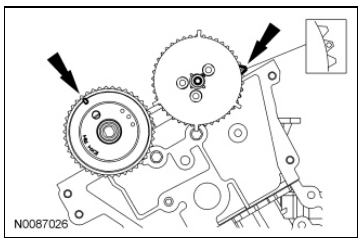
5. Retain the tensioner piston with a 1.5 mm (0.06 in) diameter wire or paper clip.



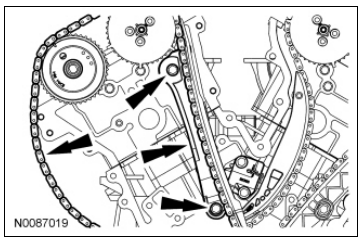
6. If timing marks in the timing chains are not evident, use a permanent-type marker to mark the crankshaft and camshaft timing marks on the LH and RH timing chains.
    1. Mark any link to use as the crankshaft timing mark.
    2. Starting with the crankshaft timing mark, count 29 links and mark the link.
    3. Continue counting to link 42 and mark the link.



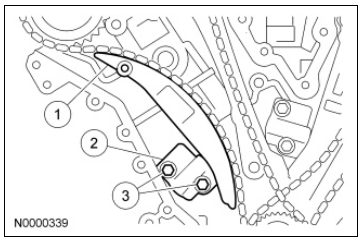
7. Position the LH timing chain and guide and install the bolts.
    - Tighten to 25 Nm (18 lb-ft).
    - Align the marks on the timing chain with the marks on the camshaft and crankshaft sprockets.



8. Install the LH timing chain tensioner arm and the LH timing chain tensioner.
    1. Install the tensioner arm.
    2. Position the tensioner.
    3. Install the bolts.
        - Tighten to 25 Nm (18 lb-ft).



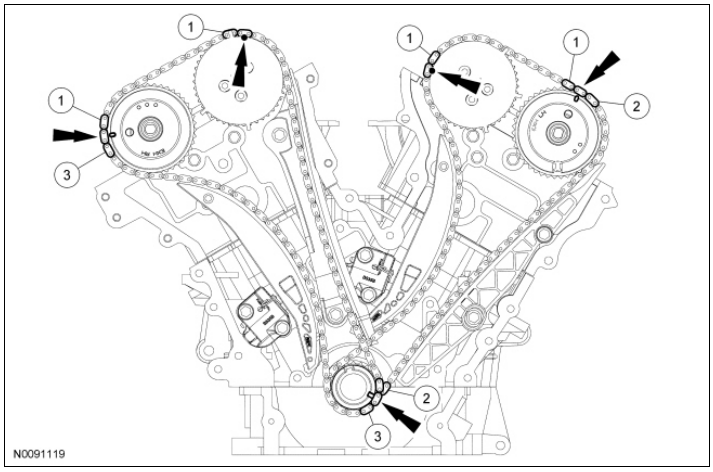
9. Install the crankshaft pulley bolt and rotate the crankshaft clockwise 120 degrees until the crankshaft keyway is in the 3 o'clock position.



10. Verify that the RH camshafts are correctly positioned.

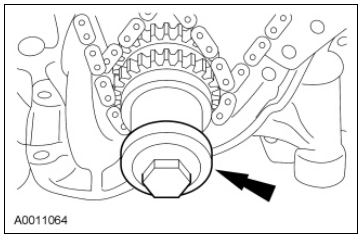
11. Install the RH timing chain and chain guide and install the bolts.
    - Tighten to 25 Nm (18 lb-ft).
    - Align the marks on the timing chain with the marks on the camshaft and crankshaft sprockets.

12. Install the RH timing chain tensioner and tensioner arm.
    1. Install the tensioner arm.
    2. Position the tensioner.
    3. Install the bolts.
    - Tighten to 25 Nm (18 lb-ft).



13. Remove the LH and RH timing chain tensioner piston retaining wires.

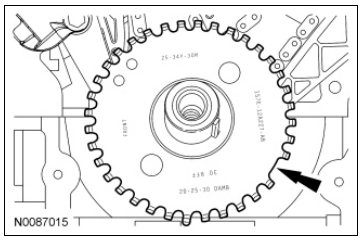
14. Rotate the crankshaft counterclockwise 120 degrees to TDC .



15. ***NOTICE:*** **Failure to verify correct timing drive component alignment will result in severe engine damage.**

    Verify the timing with the following steps.

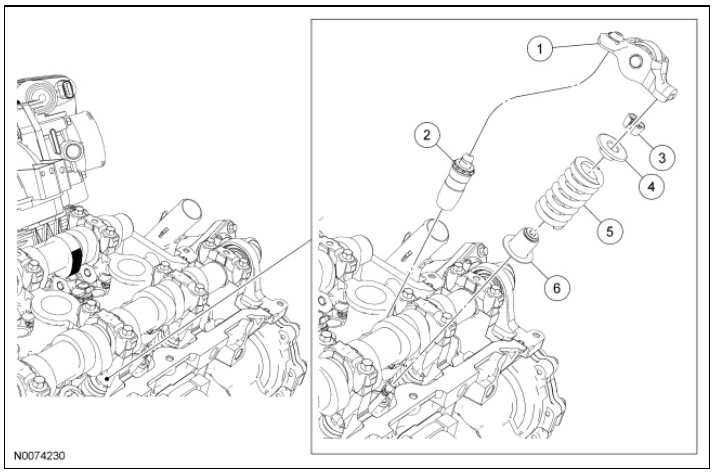
    1. There should be 12 chain links between the camshaft timing marks.
    2. There should be 27 chain links between the camshaft and the crankshaft timing marks.
    3. There should be 30 chain links between the camshaft and the crankshaft timing marks.



16. Remove the crankshaft pulley bolt and washer.

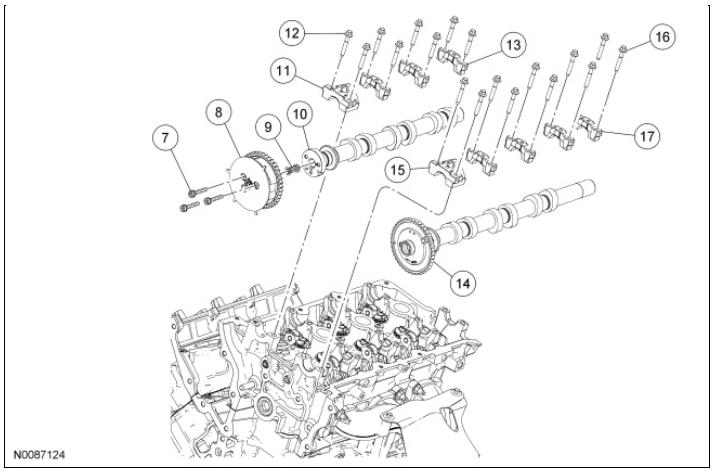
17. **NOTE:** This pulse wheel is used in several different engines. Install the pulse wheel with the keyway in the slot stamped "30RFF" only (orange in color).

    Install the ignition pulse wheel.



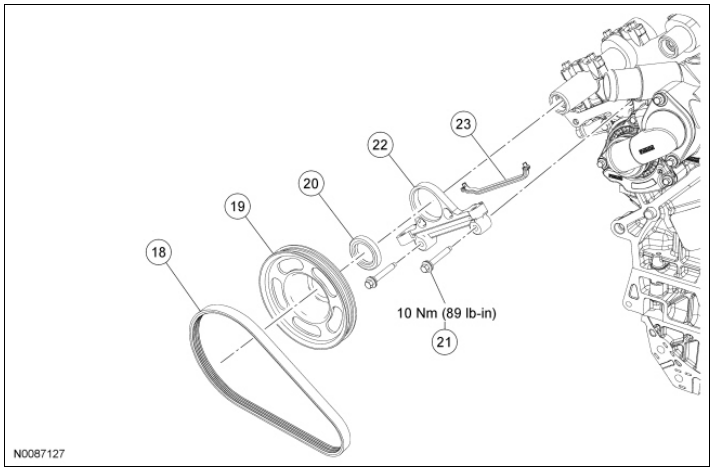
18. Install the LH and RH spark plugs. For additional information, refer to Section 303-07B .

19. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.



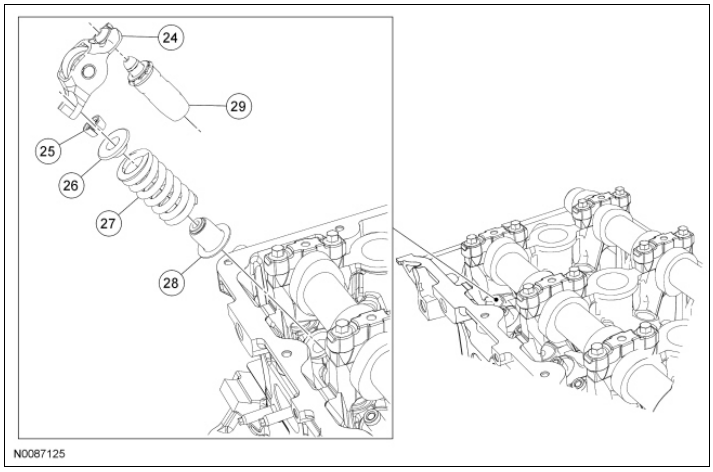
Valve Train Components - Exploded View

LH Side Roller Follower, Hydraulic Lash Adjuster and Valve Spring



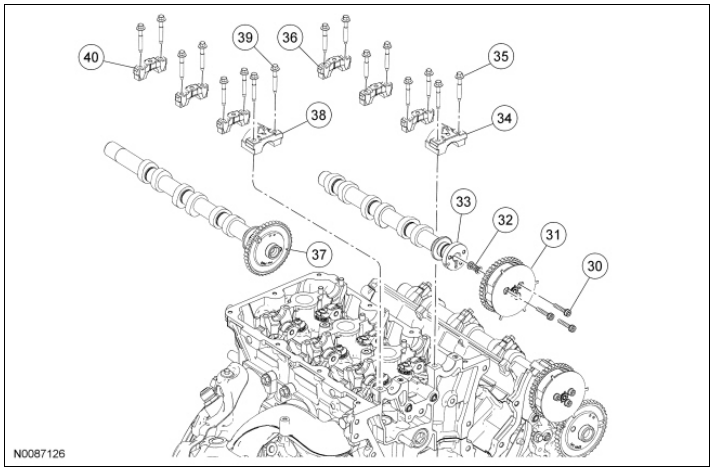
Item	Part Number	Description
1	6529	Roller follower (12 required)
2	6C501	Hydraulic lash adjuster (12 required)
3	Valve spring retainer key (24 required)	
4	6514	Valve spring retainer (12 required)
5	6513	Valve spring (12 required)
6	6A517	Valve stem seal (12 required)

LH Side Intake and Exhaust Camshafts



Item	Part Number	Description
7	W713106	Camshaft phaser and sprocket bolt (3 required)
8	6C524	Camshaft phaser and sprocket
9	6C683	Variable Camshaft Timing (VCT) system oil filter
10	6250	LH intake camshaft
11	6B280	Intake camshaft thrust bearing cap
12	W710702	Intake camshaft bearing cap bolt (8 required)
13	6B280	Intake camshaft bearing cap (3 required)
14	6250	LH exhaust camshaft
15	6B280	Exhaust camshaft thrust bearing cap
16	W710702	Exhaust camshaft bearing cap bolt (10 required)
17	6B280	Exhaust camshaft bearing cap (4 required)

Coolant Pump Belt and Pulley



Item	Part Number	Description
18	8K543	Coolant pump drive belt
19	6A359	Coolant pump drive pulley
20	-	Camshaft oil seal
21	W701242	Camshaft oil seal retainer bolt (2 required)
22	6B293	Camshaft oil seal retainer
23	6B295	Camshaft oil seal retainer gasket

RH Side Roller Follower, Hydraulic Lash Adjuster and Valve Spring

Item	Part Number	Description
24	6529	Roller follower (12 required)
25	6518	Valve spring retainer key (24 required)
27	6513	Valve spring (12 required)
28	6A517	Valve stem seal (12 required)
29	6C501	Hydraulic lash adjuster (12 required)

RH Side Intake and Exhaust Camshaft

Item	Part Number	Description
30	W713106	Camshaft phaser and sprocket bolt (3 required)
31	6C524	Camshaft phaser and sprocket
32	6C683	VCT system oil filter
33	6250	LH intake camshaft
34	6B280	Intake camshaft thrust bearing cap
35	W710702	Intake camshaft bearing cap bolt (8 required)
36	6B280	Intake camshaft bearing cap (3 required)
37	6250	LH exhaust camshaft
38	6B280	Exhaust camshaft thrust bearing cap
39	W710702	Exhaust camshaft bearing cap bolt (10 required)

40	6B280	Exhaust camshaft bearing cap (3 required)

1. For additional information, refer to the procedures in this section.

Camshaft Phaser and Sprocket

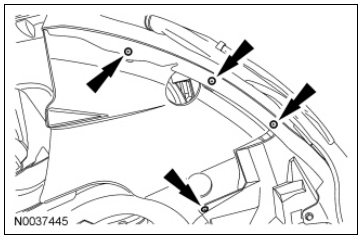
Special Tool(s)

 ST2969-A	Locking Tool, Timing Chain 303-1175

Material

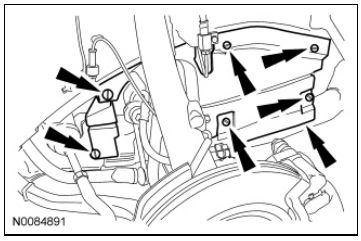
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal



LH camshaft phaser and sprocket

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 . Click here to view a video version of this procedure.

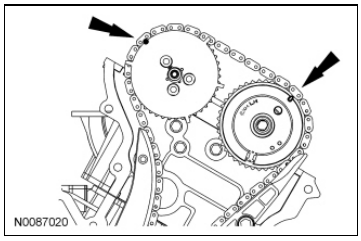


2. Remove the LH Variable Camshaft Timing (VCT) oil control solenoid. For additional information, refer to Section 303-14B .

3. Remove the LH Camshaft Position (CMP) sensor. For additional information, refer to Section 303-14B .

4. Remove the 4 screws and position the RH fender splash shield aside.

N0037445

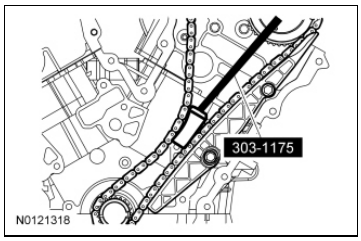


5. Remove the 6 pin-type retainers and the RH splash shield.

6. ***NOTICE:*** **The camshafts must be in the neutral position before removing the bearing caps or damage to the engine may occur.**

   NOTE: The engine front cover is removed for clarity.

   Rotate the crankshaft until the LH camshafts are in the neutral position as shown.

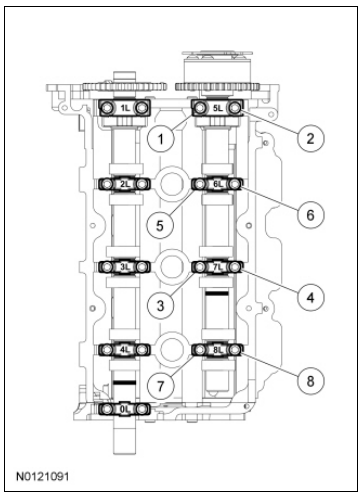


7. ***NOTICE:*** **The Timing Chain Locking Tool must be installed square to the timing chain and the engine block or damage may result.**

   NOTE: The Timing Chain Locking Tool will lock the timing chain in place.

   NOTE: The engine front cover is removed for clarity.

   Install the Timing Chain Locking Tool in the LH timing chain as shown.



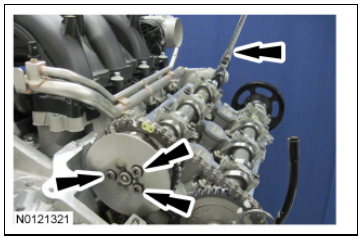
8. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during assembly. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

   NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket and exhaust camshaft using the marks, or damage to valves and pistons will result.**

   Mark the timing chain links and LH camshaft phaser and sprocket and exhaust camshaft gear as shown for installation.

9. Loosen the intake camshaft bolts evenly in the sequence shown.

10. Remove the 2 bolts and the intake camshaft bearing thrust cap.



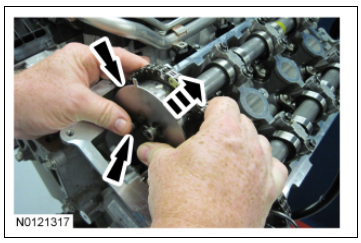
11. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while removing the camshaft phaser and sprocket or damage to the engine may occur.**

    NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket bolts or damage may occur to the camshaft or camshaft phaser and sprocket.**

    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the LH intake camshaft to hold the camshaft in place for removal of the camshaft phaser and sprocket bolts.

    Loosen the 3 bolts for the LH camshaft phaser and sprocket.

    - Tighten to 18 Nm (159 lb-in).

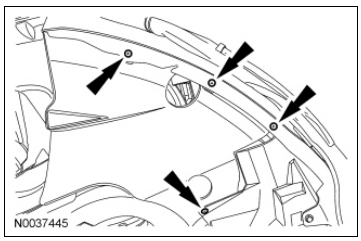


12. *NOTICE:* **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

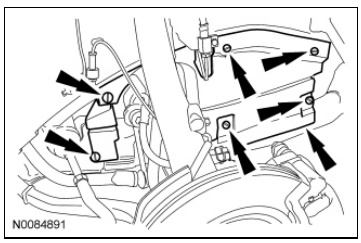
    NOTE: The camshaft will move and needs to be positioned towards the rear of the engine.

    Using your hands, press the LH camshaft phaser and sprocket bolts towards the rear of the engine while using a rocking motion to release the LH camshaft phaser and sprocket from the camshaft.

    - Once the LH camshaft phaser and sprocket has separated from the camshaft, remove the timing chain from the LH camshaft phaser and sprocket and remove.



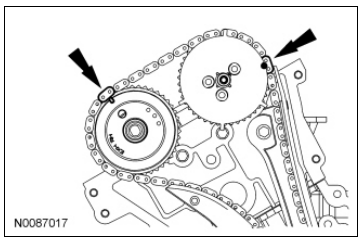
RH camshaft phaser and sprocket



13. Remove the RH VCT oil control solenoid. For additional information, refer to Section 303-14B .

14. Remove the RH CMP sensor. For additional information, refer to Section 303-14B .

15. Remove the 4 screws and position the RH fender splash shield aside.

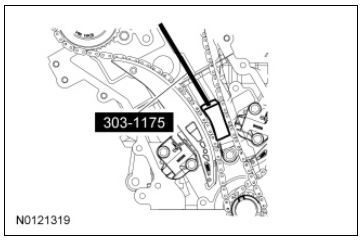


16. Remove the 6 pin-type retainers and the RH splash shield.

17. *NOTICE:* **The camshafts must be in the neutral position before removing the bearing caps or damage to the engine may occur.**

NOTE: The engine front cover is removed for clarity.

Rotate the crankshaft until the RH camshafts are in the neutral position as shown.

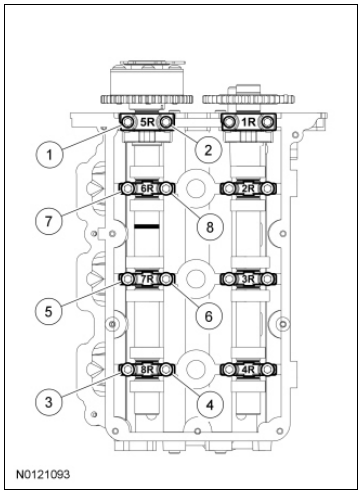


18. ***NOTICE:*** **The Timing Chain Locking Tool must be installed square to the timing chain and the engine block or damage may result.**

    NOTE: The Timing Chain Locking Tool will lock the timing chain in place.

    NOTE: The engine front cover is removed for clarity.

    Install the Timing Chain Locking Tool in the RH timing chain as shown.



19. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

    NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket and exhaust camshaft gear using the marks, or damage to valves and pistons will result.**

    Mark the timing chain links and RH camshaft phaser and sprocket and exhaust camshaft gear as shown for installation.

20. Loosen the intake camshaft bolts evenly in the sequence shown.

21. Remove the 2 bolts and the intake camshaft bearing thrust cap.

22. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while removing the camshaft phaser and sprocket or damage to the engine may occur.**

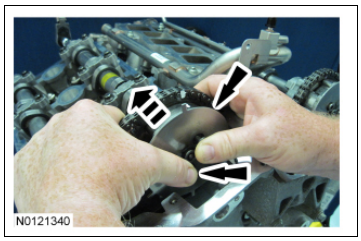
    NOTICE: **Only use hand tools to remove the camshaft phaser and sprocket bolt or damage may occur to the camshaft or camshaft phaser and sprocket.**

    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the RH intake camshaft to hold the camshaft in place for removal of the camshaft phaser and sprocket bolts.

    NOTE: The engine front cover is removed for clarity.

    Loosen the 3 bolts for the RH camshaft phaser and sprocket.

    - Tighten to 18 Nm (159 lb-in).



23. ***NOTICE:*** **Damage to the camshaft phaser and sprocket assembly will occur if mishandled or used as a lifting or leveraging device.**

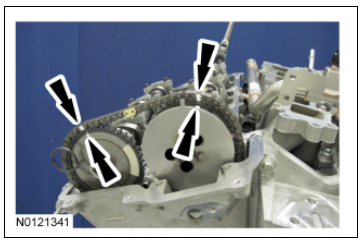
    NOTE: The camshaft will move and needs to be positioned towards the rear of the engine.

    Using your hands, press the RH camshaft phaser and sprocket bolts towards the rear of the engine while using a rocking motion to release the RH camshaft phaser and sprocket from the camshaft.

    - Once the RH camshaft phaser and sprocket has separated from the camshaft, remove the timing chain from the RH camshaft phaser and sprocket and remove.

Installation

RH camshaft phaser and sprocket



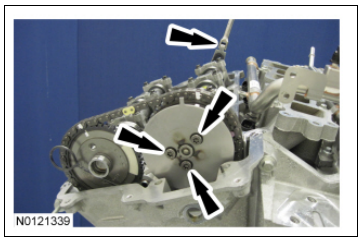
1. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during installation. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

   NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the marks, or damage to valves and pistons will result.**

   NOTE: If replacement of the camshaft phaser and sprocket is necessary, transfer the mark to the new camshaft phaser and sprocket.

   Position the RH camshaft phaser and sprocket into the timing chain with the alignment marks.

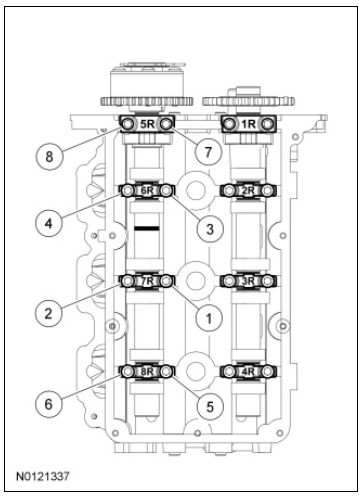
   - Make sure the timing chain mark is in alignment with the exhaust camshaft gear mark.



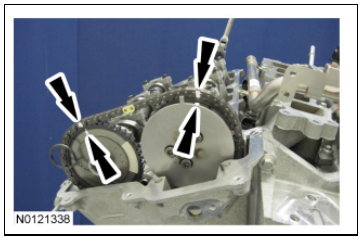
2. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while installing the camshaft phaser and sprocket or damage to the engine may occur.**

   NOTICE: **Only use hand tools to install the camshaft phaser and sprocket bolts or damage may occur to the camshaft or camshaft phaser and sprocket.**

   Using the 3/8-in ratchet and extension into the D-slot on the rear of the RH intake camshaft, align the RH camshaft phaser and sprocket with the camshaft and install the 3 bolts.

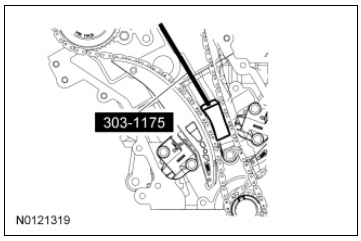


- Tighten the 3 bolts in a clockwise pattern until the RH camshaft phaser and sprocket is seated on the camshaft.
- Torque the 3 bolts to 18 Nm (159 lb-in), using the 3/8-in ratchet and extension to hold camshaft from turning.

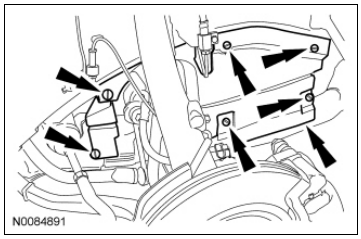


3. Lubricate the bearing surface of the RH intake camshaft bearing thrust cap with clean engine oil and install the camshaft bearing thrust cap and the 2 bolts.
    - Do not torque at this time.

4. Tighten the RH intake camshaft bearing cap bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Individually loosen and then tighten each camshaft bearing cap to 10 Nm (89 lb-in).



5. Verify the timing chain links and RH camshaft phaser and sprocket and exhaust camshaft gear are in alignment.



6. **NOTE:** The engine front cover is removed for clarity.

   Remove the Timing Chain Locking Tool from the RH timing chain.

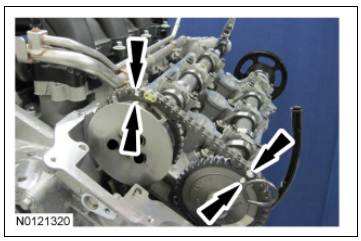
7. Install the RH splash shield and the 6 pin-type retainers.

8. Position the RH fender splash shield and install the 4 screws.

9. Install the RH CMP sensor. For additional information, refer to Section 303-14B .

10. Install the RH VCT oil control solenoid. For additional information, refer to Section 303-14B .

LH camshaft phaser and sprocket



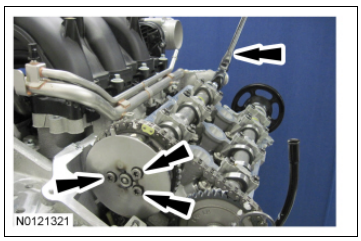
11. ***NOTICE:*** **Do not remove the Timing Chain Locking Tool at any time during installation. If the Timing Chain Locking Tool is removed or out of placement, the engine front cover must be removed and the engine must be retimed. For additional information, refer to Timing Drive Components in this section.**

    NOTICE: **The timing chain must be installed in its original position onto the camshaft phaser and sprocket using the marks, or damage to valves and pistons will result.**

    NOTE: If replacement of the camshaft phaser and sprocket is necessary, transfer the mark to the new camshaft phaser and sprocket.

Position the LH camshaft phaser and sprocket into the timing chain with the alignment marks.

- Make sure the timing chain mark is in alignment with the exhaust camshaft gear mark.

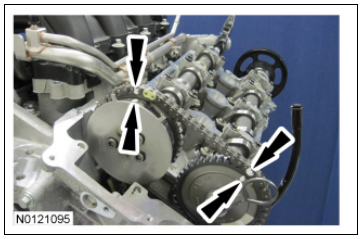


12. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while installing the camshaft phaser and sprocket or damage to the engine may occur.**

    NOTICE: **Only use hand tools to install the camshaft phaser and sprocket bolts or damage may occur to the camshaft or camshaft phaser and sprocket.**

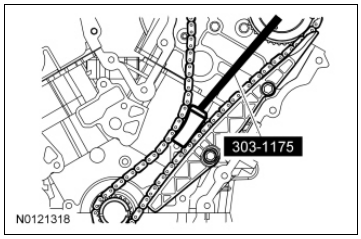
    Using the 3/8-in ratchet and extension into the D-slot on the rear of the LH intake camshaft, align the LH camshaft phaser and sprocket with the camshaft and install the 3 bolts.

    - Tighten the 3 bolts in a clockwise pattern until the LH camshaft phaser and sprocket is seated on the camshaft.
    - Torque the 3 bolts to 18 Nm (159 lb-in), using the 3/8-in ratchet and extension to hold camshaft from turning.

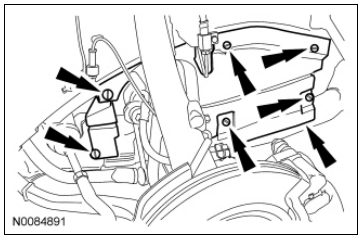


13. Lubricate the bearing surface of the LH intake camshaft bearing thrust cap with clean engine oil and install the camshaft bearing thrust cap and the 2 bolts.
    - Do not torque at this time.

14. Tighten the LH intake camshaft bearing cap bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Individually loosen and then tighten each camshaft bearing cap to 10 Nm (89 lb-in).



15. Verify the timing chain links and LH camshaft phaser and sprocket and exhaust camshaft gear are in alignment.



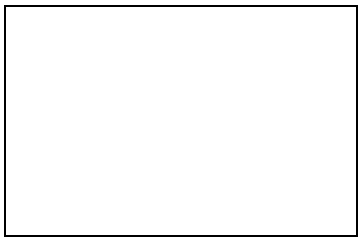
16. **NOTE:** The engine front cover is removed for clarity.

    Remove the Timing Chain Locking Tool from the LH timing chain.

17. Install the RH splash shield and the 6 pin-type retainers.

18. Position the RH fender splash shield and install the 4 screws.

19. Install the LH CMP sensor. For additional information, refer to Section 303-14B .
20. Install the LH VCT oil control solenoid. For additional information, refer to Section 303-14B .



Variable Camshaft Timing (VCT) System Oil Filter

Removal

1. Remove the camshaft phaser and sprocket. For additional information, refer to Camshaft Phaser and Sprocket in this section.

2. **NOTE:** RH Variable Camshaft Timing (VCT) system oil filter shown, LH similar.

   Remove and discard the VCT system oil filter from the camshaft.

Installation

1. **NOTE:** RH VCT system oil filter shown, LH similar.

   Install the new VCT system oil filter in the camshaft.

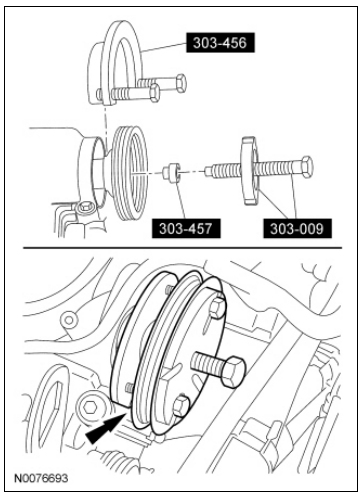
2. Install the camshaft phaser and sprocket. For additional information, refer to Camshaft Phaser and Sprocket in this section.

Camshafts - LH

Special Tool(s)

 ST1970-A	Installer, Camshaft Oil Seal 303-464 (T94P-6256-BH)
 ST3042-A	Installer, Camshaft Pulley 303-458 (T94P-6312-AH3), part of 303-S455
 ST1586-A	Installer, Power Steering Pump Pulley 211-185 (T91P-3A733-A)
 ST3044-A	Plate, Water Pump Pulley 303-456 (T94P-6312-AH1), part of 303-S455
 ST2060-A	Protector, Camshaft Oil Seal 303-463 (T94P-6256-AH)
 ST3045-A	Protector, Water Pump Shaft 303-457 (T94P-6312-AH2), part of 303-S455
 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)
 ST3043-A	Spacer, Water Pump Pulley 303-459 (T94P-6312-AH4), part of 303-S455

Material



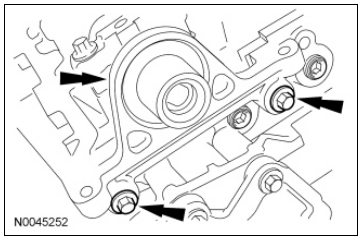
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

1. Remove the coolant pump belt. For additional information, refer to Section 303-05B .

2. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**

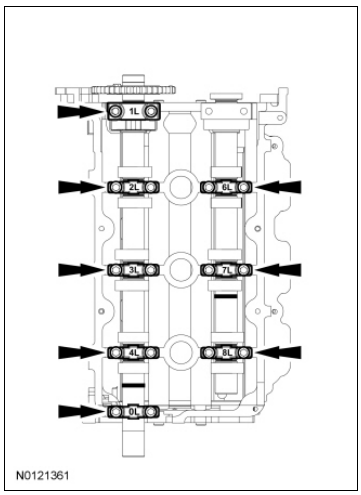
   Using the Water Pumpey Plate, Water Pump Shaft Protector and the Crankshaft Vibration Damper Remover, remove the coolant pump pulley.



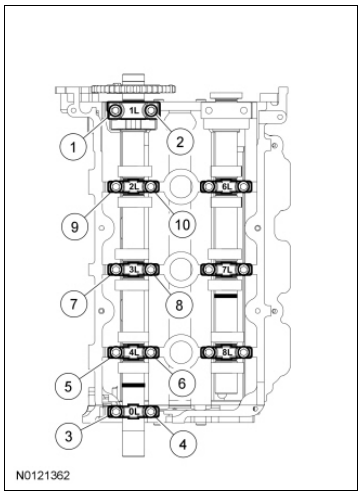
3. Remove the LH camshaft phaser and socket. For additional information, refer to Camshaft Phaser and Sprocket in this section.

4. ***NOTICE:*** **Do not scratch the camshaft sealing surface while removing the camshaft oil seal. If scratched, camshaft oil seal leakage may occur.**

   Using the Oil Seal Remover, remove and discard the camshaft oil seal.



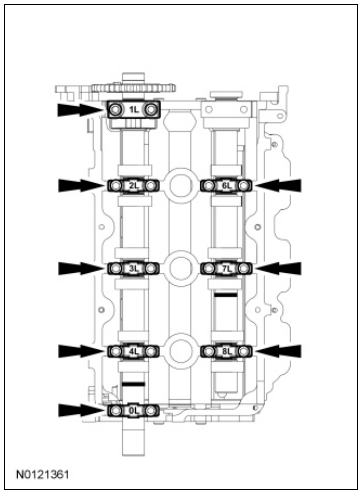
5. Remove the 2 bolts and the camshaft oil seal retainer.
   - Discard the press-in-place gasket.



6. ***NOTICE:*** **Cylinder head camshaft bearing caps must be assembled in their original positions. Some engines have factory markings on the camshaft bearing caps (as shown in illustration). Engines that do not have the factory markings must be marked for correct position and orientation prior to removal. Failure to install the camshaft bearing caps in their original positions may result in severe engine damage.**

If necessary, mark the camshaft bearing cap position and orientation as shown in the illustration.

7. Loosen the bolts evenly in the sequence shown.



8. ***NOTICE:*** **After loosening the camshaft bearing cap bolts, remove the camshaft bearing thrust cap (1L) first, or damage to the thrust cap may occur.**

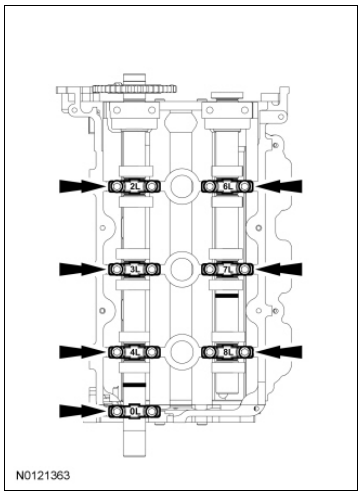
   NOTE: Make sure the camshaft bearing caps are marked as instructed in the previous step.

   Remove the camshaft cap bolts.

   1. Remove the camshaft bearing thrust cap (1L).
   2. Remove the remaining camshaft bearing caps.
   3. Remove the camshafts from the cylinder head.

Installation

1. Lubricate the LH camshafts with clean engine oil and carefully position the camshafts onto the cylinder head.
    - Align the LH camshafts as shown.

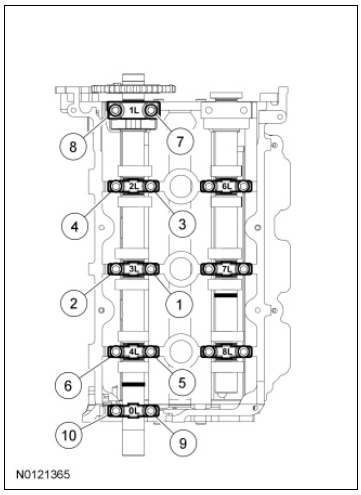


2. ***NOTICE:*** **Cylinder head camshaft journal caps and cylinder heads are numbered to verify that they are assembled in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

   NOTICE: **Do not install the camshaft journal thrust cap until all of the camshaft bearing caps have been installed or damage to the thrust cap can occur.**

   Lubricate the bearing surfaces of the LH camshaft bearing caps with clean engine oil and install the bearing caps.

    - Loosely install the bolts.



3. Lubricate the bearing surface of the LH exhaust camshaft bearing thrust cap with clean engine oil and install the bearing thrust cap.
    - Loosely install the bolts.

4. **NOTE:** Make sure to tighten the camshaft bearing cap bolts in sequence in 2 stages.

    Tighten the LH exhaust camshaft bearing cap bolts in the sequence shown in 2 stages.

    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Individually loosen and then tighten each camshaft bearing cap to 10 Nm (89 lb-in).

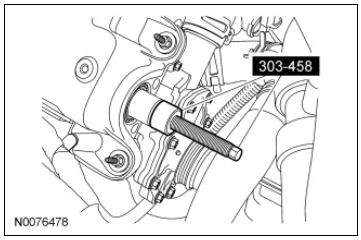
5. **NOTE:** Clean the sealing surfaces with metal surface prep before installing a new press-in-place gasket.

    Install the camshaft oil seal retainer and the 2 bolts.

    - Tighten to 10 Nm (89 lb-in).

6. **NOTE:** Lubricate the camshaft oil seal with clean engine oil.

   Using the Camshaft Oil Seal Installer, Camshaft Oil Seal Protector and the Power Steering Pump Pulley Installer, install the camshaft oil seal.

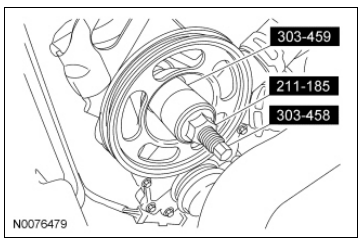


7. Install the LH camshaft phaser and socket. For additional information, refer to Camshaft Phaser and Sprocket in this section.

8. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**

   Install the Camshaft Pulley Installer in the camshaft as shown in the illustration.

   - Adjust the collar on the Camshaft Pulley Installer screw to get the best thread engagement in the rear of the camshaft.



9. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**

   NOTE: Only the roller collared nut from the Power Steering Pump Pulley Installer (211-185) is used on Camshaft Pulley Installer (303-458).

   Position the coolant pump pulley over the previously installed Camshaft Pulley Installer and on the end of the camshaft. Install the Camshaft Pulley Installer, Power Steering Pump Pulley Installer and the Water Pump Pulley Spacer as shown in the illustration.

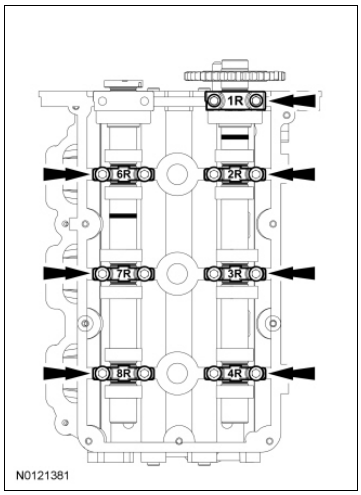
   - Using the Camshaft Pulley Installer, Power Steering Pump Pulley Installer and the Water Pump Pulley Spacer, install a new service coolant pump pulley flush with the end of the camshaft.

10. Install the coolant pump belt. For additional information, refer to Section 303-05B .

Camshafts - RH

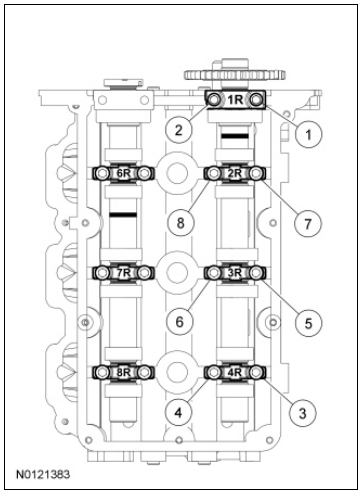
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

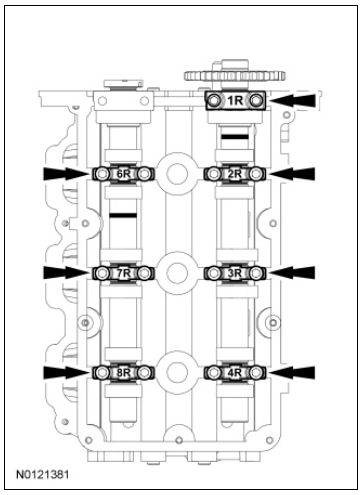


2. Remove the RH camshaft phaser and socket. For additional information, refer to Camshaft Phaser and Sprocket in this section.

3. ***NOTICE:*** **Cylinder head camshaft bearing caps must be assembled in their original positions. Some engines have factory markings on the camshaft bearing caps (as shown in illustration). Engines that do not have the factory markings must be marked for correct position and orientation prior to removal. Failure to install the camshaft bearing caps in their original positions may result in severe engine damage.**

   If necessary, mark the camshaft bearing cap position and orientation as shown in the illustration.

4. Loosen the bolts evenly in the sequence shown.



5. ***NOTICE:*** **After loosening the camshaft bearing cap bolts, remove the camshaft bearing thrust cap (1R) first, or damage to the thrust cap may occur.**

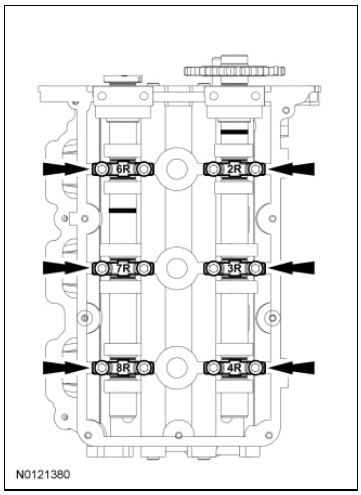
   NOTE: Make sure the camshaft bearing caps are marked as instructed in the previous step.

   Remove the camshaft cap bolts.

   1. Remove the camshaft bearing thrust cap (1R).
   2. Remove the remaining camshaft bearing caps.
   3. Remove the camshafts from the cylinder head.

Installation

1. Lubricate the RH camshafts with clean engine oil and carefully position the camshafts onto the cylinder head.
   - Align the RH camshafts as shown.

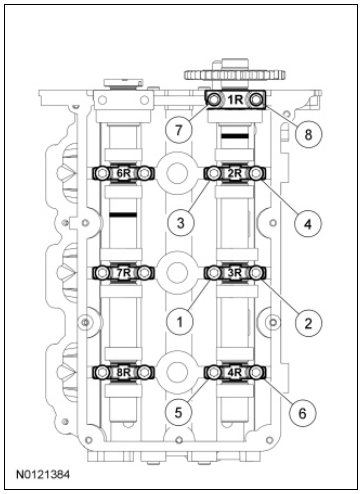


2. ***NOTICE:*** **Cylinder head camshaft journal caps and cylinder heads are numbered to verify that they are assembled in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

   NOTICE: **Do not install the camshaft journal thrust cap until all of the camshaft bearing caps have been installed or damage to the thrust cap can occur.**

   Lubricate the bearing surfaces of the RH camshaft bearing caps with clean engine oil and install the bearing caps.

   - Loosely install the bolts.



3. Lubricate the bearing surface of the RH exhaust camshaft bearing thrust cap with clean engine oil and install the bearing thrust cap.
   - Loosely install the bolts.

4. **NOTE:** Make sure to tighten the camshaft bearing cap bolts in sequence in 2 stages.

   Tighten the RH camshaft bearing cap bolts in the sequence shown in 2 stages.

   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Individually loosen and then tighten each camshaft bearing cap to 10 Nm (89 lb-in).

5. Install the RH camshaft phaser and socket. For additional information, refer to Camshaft Phaser and Sprocket in this section.

Camshaft Roller Follower

Special Tool(s)

 ST1975-A	Compressor, Valve Spring 303-473 (T94P-6565-BH)

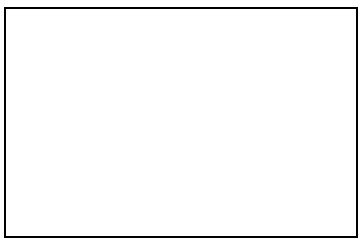
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXOLSP12 (Canada)	WSS-M2C945-A

Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



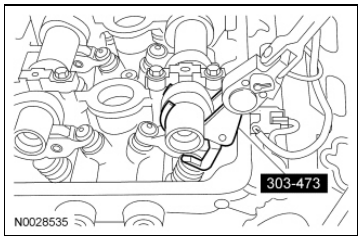
2. Remove the LH and RH valve covers. For additional information, refer to Valve Cover - LH and Valve Cover - RH in this section.

3. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

   Remove the 6 spark plugs.

   - To install, tighten to 15 Nm (133 lb-in).

4. Remove the 4 screws and position the RH fender splash shield aside.



5. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

6. Rotate the crankshaft until the camshaft lobe is pointing directly away from the roller follower.

7. **NOTE:** Mark the positions of the roller followers to make sure they are assembled in their original positions.

   Using the Valve Spring Compressor, remove the roller followers.

8. **NOTE:** Lubricate the roller followers with clean engine oil.

   To install, reverse the removal procedure.

Hydraulic Lash Adjuster

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

2. **NOTE:** Mark the positions of the hydraulic lash adjusters to make sure they are assembled in their original positions.

   Remove the hydraulic lash adjusters.

3. **NOTE:** Inspect the hydraulic lash adjusters for scoring marks and uneven wear in the bore. Install new lash adjusters if necessary.

   To install, reverse the removal procedure.

   - Lubricate the hydraulic lash adjusters with clean engine oil.

Valve Spring, Retainer, and Seal

Special Tool(s)

 ST1975-A	Compressor, Valve Spring 303-473 (T94P-6565-BH)
 ST1977-A	Installer, Valve Stem Oil Seal 303-470 (T94P-6510-CH)

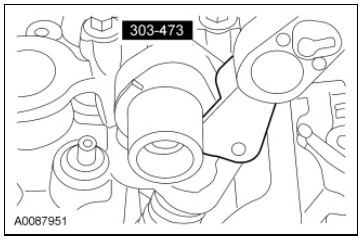
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

1. Remove the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.



2. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions or damage to the engine may occur. Mark the components for installation into their original locations.**

   NOTE: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve(s) to fall into the cylinder. A rubber band, tape or string wrapped around the end of the valve stem will prevent this from happening.

   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer Cylinder Head - RH or Cylinder Head - LH in this section.

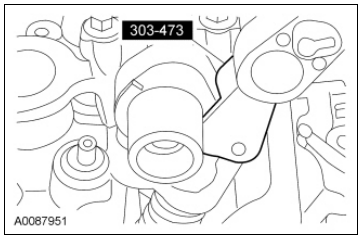
   Pressurize the cylinder using compressed air.

3. Using the Valve Spring Compressor, remove the key, retainer and the valve spring.

4. **NOTE:** Camshaft removed for clarity.

   Remove and discard the valve seal.

Installation

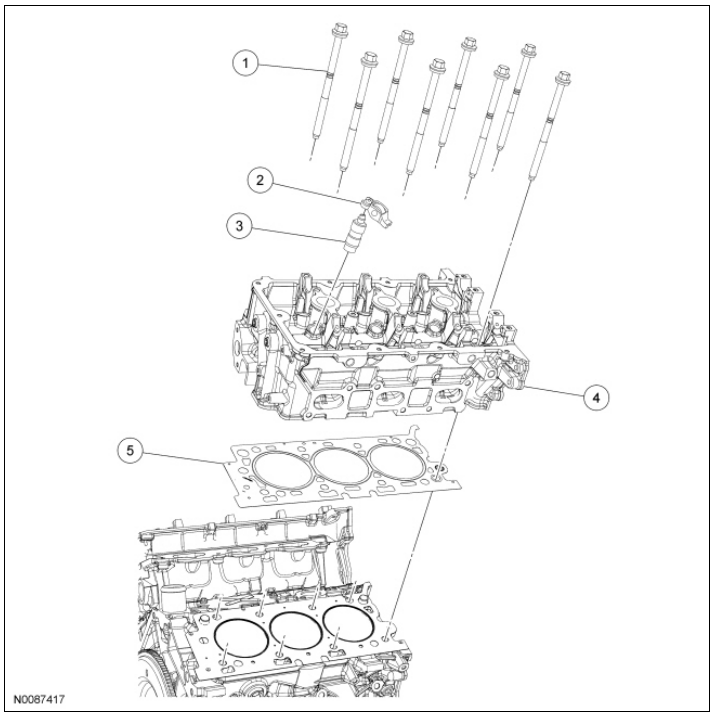


1. **NOTE:** Lubricate the valve guide with clean engine oil.

   Using the Valve Stem Oil Seal Installer, install the new valve seal.

2. ***NOTICE:*** **If the components are to be reinstalled, they must be installed in their original positions or damage to the engine may occur.**

   Using the Valve Spring Compressor, install the valve spring, retainer and key.



3. Install the camshaft roller followers. For additional information, refer to Camshaft Roller Follower in this section.

Cylinder Head - RH

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

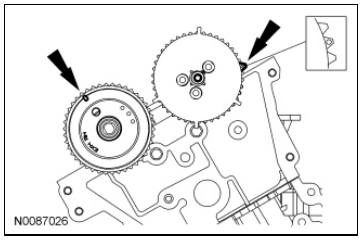
Part Number	Description	
1	6065	Cylinder head bolt (8 required)
2	6529	Camshaft roller follower (12 required)
3	6C501	Hydraulic lash adjuster (12 required)
4	6049	Cylinder head
5	6051	Cylinder head gasket

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.



3. Remove the RH exhaust manifold. For additional information, refer to Exhaust Manifold - RH in this section.

4. Remove the coolant pump housing. For additional information, refer to Section 303-03A .

5. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.

6. ***NOTICE:*** **The camshafts must be in the neutral position before removing the bearing caps or damage to the engine may occur.**

   Verify the RH camshafts are in the neutral position.

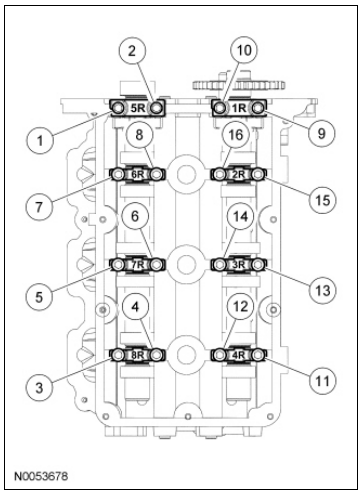
7. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while removing the camshaft phaser and sprocket or damage to the engine may occur.**

   NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the intake camshaft to hold the camshaft in place for removal of the camshaft phasernd sprocket bolts.

   Remove the 3 bolts and the RH camshaft phaser and sprocket.

8. ***NOTICE:*** **Cylinder head camshaft bearing caps must be assembled in their original positions. Some engines have factory markings on the camshaft bearing caps (as shown in illustration). Engines that do not have the factory markings must be marked for correct position and orientation prior to removal. Failure to install the camshaft bearing caps in their original positions may result in severe engine damage.**

   If necessary, mark the camshaft bearing cap position and orientation as shown in the illustration.



9. *NOTICE:* **After loosening all of the camshaft bearing cap bolts, remove the camshaft bearing thrust caps (5R and 1R) first, or damage to the thrust caps may occur.**

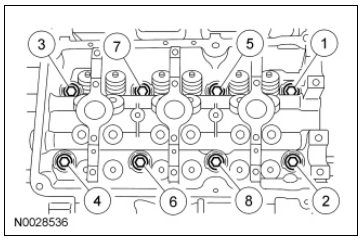
   NOTE: Make sure the camshaft bearing caps are marked as instructed in the previous step.

   Loosen the bolts evenly in the sequence shown.

   1. Remove the camshaft bearing thrust caps (5R and 1R).
   2. Remove the remaining camshaft bearing caps.
   3. Remove the camshafts from the cylinder head.

10. *NOTICE:* **The camshaft roller followers must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    Remove the camshaft roller followers.



11. *NOTICE:* **The hydraulic lash adjusters must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    Remove the hydraulic lash adjusters.

12. **NOTE:** New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

    Remove the bolts in the sequence shown.

- Remove the cylinder head.
- Discard the bolts and gasket.

13. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

   Use a plastic scraping tool to remove all traces of the head gasket.

   - Clean all surfaces with metal surface prep.

2. Position a new gasket and the cylinder head.

3. **NOTE:** New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

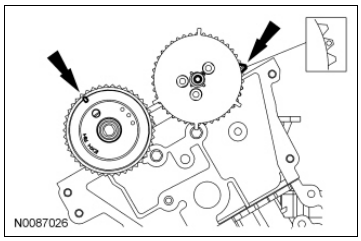
   Install the bolts and tighten in 6 stages in the sequence shown.

   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten 90 degrees.
   - Stage 3: Loosen one full turn.
   - Stage 4: Tighten to 40 Nm (30 lb-ft).
   - Stage 5: Tighten 90 degrees.
   - Stage 6: Tighten 90 degrees.

4. ***NOTICE:*** **The hydraulic lash adjusters must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

   Install the hydraulic lash adjusters.

   - Lubricate the hydraulic lash adjusters with clean engine oil.



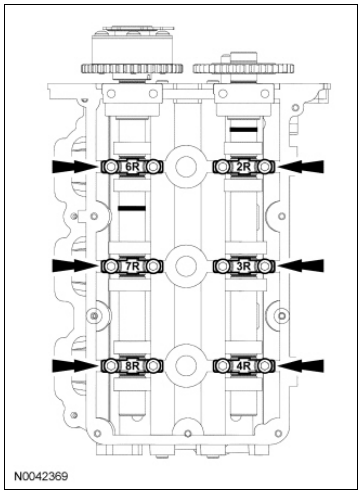
5. ***NOTICE:*** **The camshaft roller followers must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

Install the camshaft roller followers.

- Lubricate the camshaft roller followers with clean engine oil.

6. Position the RH camshaft phaser and sprocket onto the intake camshaft.
   - Install the 3 bolts finger-tight.

7. Lubricate the RH camshafts with clean engine oil and carefully position the camshafts onto the cylinder head.
   - Align the RH camshafts as shown.



8. *NOTICE:* **Cylinder head camshaft journal caps and cylinder heads are numbered to verify that they are assembled in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

   NOTICE: **Do not install the camshaft journal thrust caps until all of the camshaft bearing caps have been installed or damage to the thrust caps can occur.**

   NOTE: Lubricate the bearing surfaces of the RH camshaft bearing caps with clean engine oil.

   Install the camshaft bearing caps.

   - Loosely install the bolts.

9. **NOTE:** Lubricate the bearing surfaces of the RH camshaft bearing thrust caps with clean engine oil.

   Install the camshaft bearing thrust caps.

   - Loosely install the bolts.

10. **NOTE:** Make sure to tighten the camshaft bearing cap bolts in sequence in 2 stages.

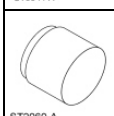
    Tighten the RH camshaft bearing cap bolts in the sequence shown in 2 stages.

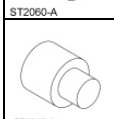
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Individually loosen and then tighten each camshaft bearing cap to 10 Nm (89 lb-in).

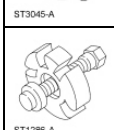
11. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while tightening the camshaft phaser and sprocket bolts or damage to the engine may occur.**

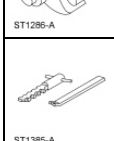
    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the intake camshaft to hold the camshaft in place for tightening of the camshaft phaser and sprocket bolts.

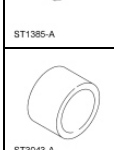
    Tighten the 3 RH camshaft phaser and sprocket bolts to 18 Nm (159 lb-in).







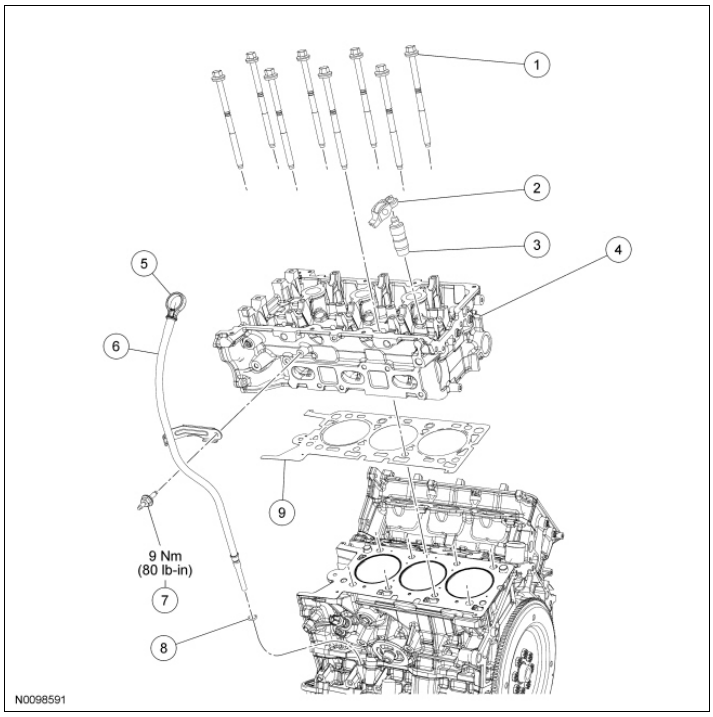




12. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

13. Install the coolant pump housing. For additional information, refer to Section 303-03A .
14. Install the RH exhaust manifold. For additional information, refer to Exhaust Manifold - RH in this section.
15. Install the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.

Cylinder Head - LH



Special Tool(s)

 ST1970-A	Installer, Camshaft Oil Seal 303-464 (T94P-6256-BH)
 ST3042-A	Installer, Camshaft Pulley 303-458 (T94P-6312-AH3), part of 303-S455
 ST1586-A	Installer, Power Steering Pump Pulley 211-185 (T91P-3A733-A)
 ST3044-A	Plate, Water Pump Pulley 303-456 (T94P-6312-AH1), part of 303-S455
 ST2060-A	Protector, Camshaft Oil Seal 303-463 (T94P-6256-AH)
 ST3045-A	Protector, Water Pump Shaft 303-457 (T94P-6312-AH2), part of 303-S455
 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)
 ST3043-A	Spacer, Water Pump Pulley 303-459 (T94P-6312-AH4), part of 303-S455

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

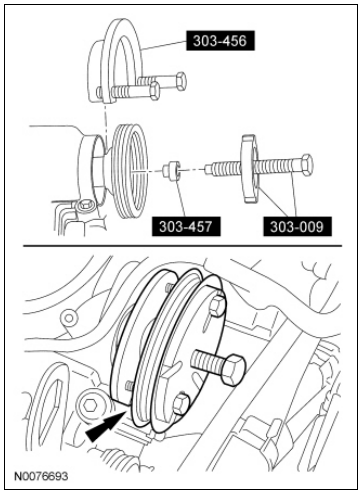
LH Cylinder Head

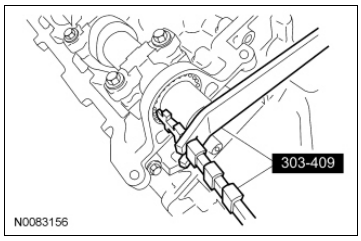
Item	Part Number	Description
1	6065	Cylinder head bolt (8 required)
2	6529	Camshaft rollerower (12 required)
3	6C501	Hydraulic lash adjuster (12 required)
4	6050	Cylinder head
5	6750	Oil level indicator
6	6754	Oil level indicator tube
7	W701822	Oil level indicator tube stud bolt
8	110282	Oil level indicator tube O-ring
9	6083	Cylinder head gasket



Removal

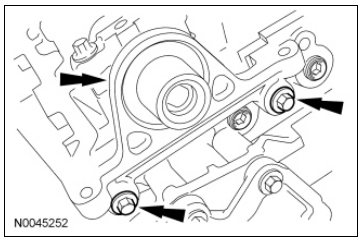
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.
3. Remove the LH catalytic converter. For additional information, refer to Section 309-00 .
4. Remove the coolant pump housing. For additional information, refer to Section 303-03A .
5. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.



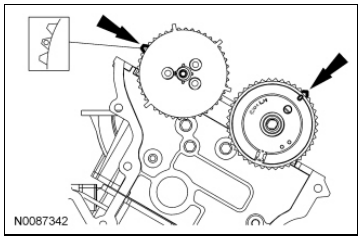
6. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**

   Using the Water Pump Pulley Plate, Water Pump Shaft Protector and the Crankshaft Vibration Damper Remover, remove the coolant pump pulley.



7. ***NOTICE:*** **Do not scratch the camshaft sealing surface while removing the camshaft oil seal. If scratched, camshaft oil seal leakage may occur.**

   Using the Oil Seal Remover, remove and discard the camshaft oil seal.



8. Remove the 2 bolts and the camshaft oil seal retainer.
   - Discard the press-in-place gasket.

9. ***NOTICE:*** **The camshafts must be in the neutral position before removing the bearing caps or damage to the engine may occur.**

   Verify the LH camshafts are in the neutral position.

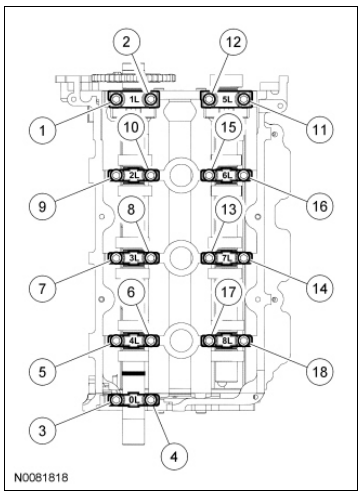
10. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while removing the camshaft phaser and sprocket or damage to the engine may occur.**

    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the intake camshaft to hold the camshaft in place for removal of the camshaft phaser and sprocket bolts.

    Remove the 3 bolts and the LH camshaft phaser and sprocket.

11. ***NOTICE:*** **Cylinder head camshaft bearing caps must be assembled in their original positions. Some engines have factory markings on the camshaft bearing caps (as shown in illustration). Engines that do not have the factory markings must be marked for correct position and orientation prior to removal. Failure to install the camshaft bearing caps in their original positions may result in severe engine damage.**

    If necessary, mark the camshaft bearing cap position and orientation as shown in the illustration.



12. ***NOTICE:*** **After loosening all of the camshaft bearing cap bolts, remove the camshaft bearing thrust caps (1L and 5L) first, or damage to the thrust caps may occur.**

    NOTE: Make sure the camshaft bearing caps are marked as instructed in the previous step.

    Loosen the bolts evenly in the sequence shown.

    1. Remove the camshaft bearing thrust caps (1L and 5L).
    2. Remove the remaining camshaft bearing caps.

3. Remove the camshafts from the cylinder head.

13. ***NOTICE:*** **The camshaft roller followers must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    Remove the camshaft roller followers.

14. ***NOTICE:*** **The hydraulic lash adjusters must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    Remove the hydraulic lash adjusters.

15. Remove the oil level indicator.

16. Remove the stud bolt and then remove the oil level indicator tube.
    - Remove and discard the O-ring seal.

17. **NOTE:** New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

    Remove the bolts in the sequence shown.

18. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

   Use a plastic scraping tool to remove all traces of the head gasket.

   - Clean all surfaces with metal surface prep.

2. Position a new gasket and the cylinder head.

3. **NOTE:** New cylinder head bolts must be installed. They are a torque-to-yield design and cannot be reused.

   Install the bolts and tighten in 6 stages in the sequence shown.

   - Stage 1: Tighten to 40 Nm (30 lb-ft).
   - Stage 2: Tighten 90 degrees.
   - Stage 3: Loosen one full turn.
   - Stage 4: Tighten to 40 Nm (30 lb-ft).
   - Stage 5: Tighten 90 degrees.
   - Stage 6: Tighten 90 degrees.

4. **NOTE:** Installation of the oil level indicator may require the assistance of a second technician to align the tube with the orifice.

   NOTE: Install a new O-ring seal and lubricate with clean engine oil.

   Install the oil level indicator tube and install the stud bolt.

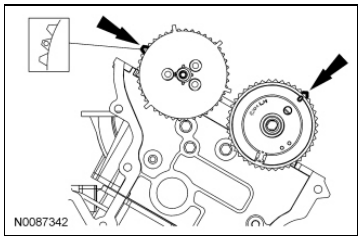
   - To install, tighten to 9 Nm (80 lb-in).

5. Install the oil level indicator.

6. ***NOTICE:*** **The hydraulic lash adjusters must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

   Install the hydraulic lash adjusters.

- Lubricate the hydraulic lash adjusters with clean engine oil.



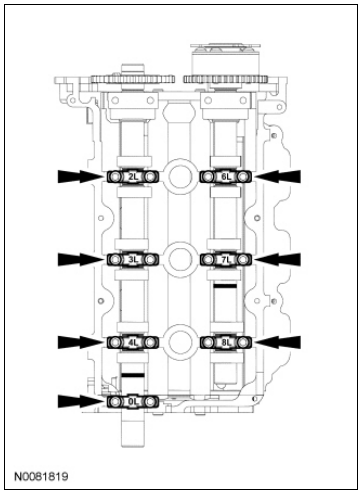
7. ***NOTICE:*** **The camshaft roller followers must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

   Install the camshaft roller followers.

   - Lubricate the camshaft roller followers with clean engine oil.

8. Position the camshaft phaser and sprocket onto the intake camshaft.
   - Install the 3 bolts finger-tight.

9. Lubricate the LH camshafts with clean engine oil and carefully position the camshafts onto the cylinder head.
   - Align the LH camshafts as shown.

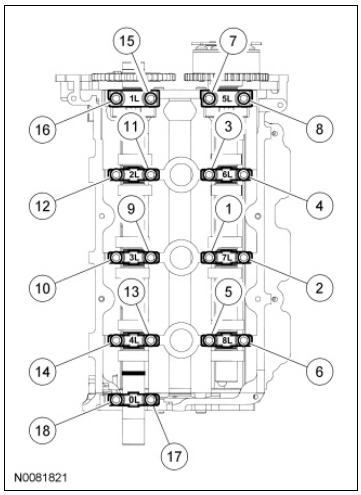


10. ***NOTICE:*** **Cylinder head camshaft journal caps and cylinder heads are numbered to verify that they are assembled in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    NOTICE: **Do not install the camshaft journal thrust caps until all of the camshaft bearing caps have been installed or damage to the thrust caps can occur.**

    Lubricate the bearing surfaces of the LH camshaft bearing caps with clean engine oil and install the bearing caps.

    - Loosely install the bolts.



11. Lubricate the bearing surfaces of the LH camshaft bearing thrust caps with clean engine oil and install the bearing thrust caps.
    - Loosely install the bolts.

12. **NOTE:** Make sure to tighten the camshaft bearing cap bolts in sequence in 2 stages.

    Tighten the LH camshaft bearing cap bolts in the sequence shown in 2 stages.

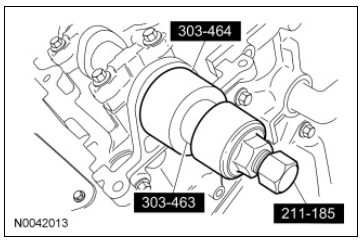
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Individually loosen and then tighten each camshaft bearing cap to 10 Nm (89 lb-in).

13. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while tightening the camshaft phaser and sprocket bolts or damage to the engine may occur.**

    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the intake camshaft to hold the camshaft in place for tightening of the camshaft phaser and sprocket bolts.

    Tighten the 3 LH camshaft phaser and sprocket bolts to 18 Nm (159 lb-in).

14. **NOTE:** Clean the sealing surfaces with metal surface prep before installing a new press-in-place gasket.



Install the camshaft oil seal retainer and the 2 bolts.

- Tighten to 10 Nm (89 lb-in).

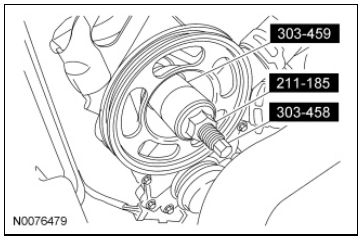
15. **NOTE:** Lubricate the camshaft oil seal with clean engine oil.

    Using the Camshaft Oil Seal Installer, Camshaft Oil Seal Protector and the Power Steering Pump Pulley Installer, install the camshaft oil seal.

16. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**

    Install the Camshaft Pulley Installer in the camshaft as shown in the illustration.

    - Adjust the collar on the Camshaft Pulley Installer screw to get the best thread engagement in the rear of the camshaft.



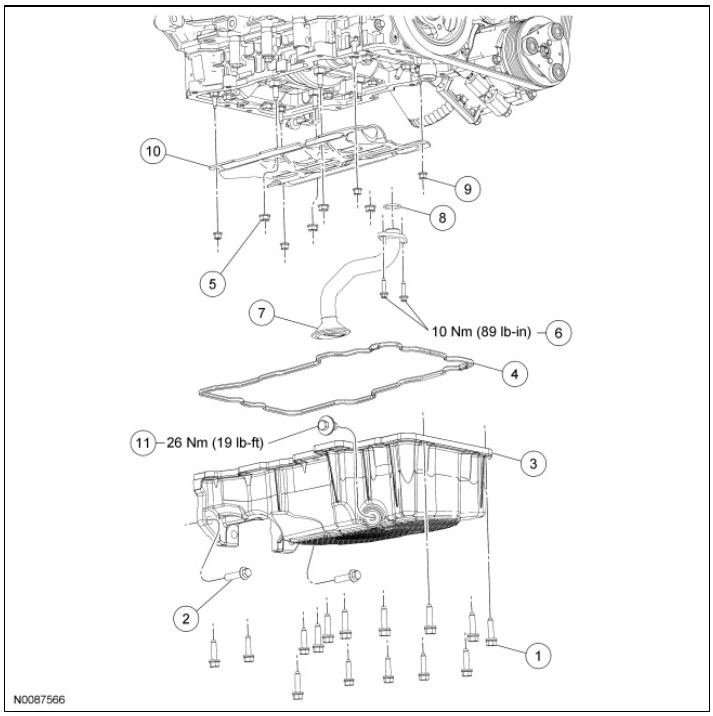
17. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**

    NOTE: Only the roller collared nut from the Power Steering Pump Pulley Installer (211-185) is used on Camshaft Pulley Installer (303-458).

    Position the coolant pump pulley over the previously installed Camshaft Pulley Installer and on the end of the camshaft. Install the Camshaft Pulley Installer, Power Steering Pump Pulley Installer and the Water Pump Pulley Spacer as shown in the illustration.

    - Using the Camshaft Pulley Installer, Power Steering Pump Pulley Installer and the Water Pump Pulley Spacer, install a new service coolant pump pulley flush with the end of the camshaft.

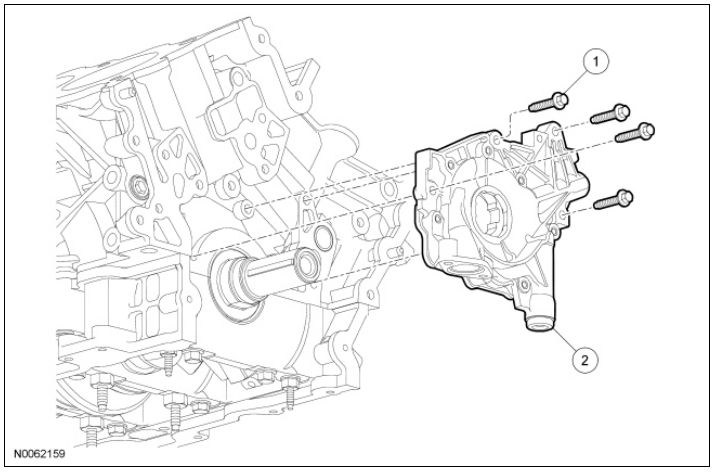
18. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.



19. Install the coolant pump housing. For additional information, refer to Section 303-03A .

20. Install the LH catalytic converter. For additional information, refer to Section 309-00 .

21. Install the lower intake manifold. For additional information, refer to Lower Intake Manifold in this section.



Engine Lubrication Components - Exploded View

Oil Pan, Oil Pan Baffle and Oil Pump Screen and Pickup Tube

Item	Part Number	Description
1	W709678	Oil pan-to-engine bolt (15 required)
2	W500120	Oil pan-to-transaxle bolt (2 required)
3	6675	Oil pan
4	6710	Oil pan gasket
5	W701582	Oil pan baffle nut (4 required)
6	W700005	Oil pump screen and pickup tube bolts (2 required)
7	6622	Oil pump screen and pickup tube
8	6625	Oil pump screen and pickup tube O-ring seal
9	W701542	Oil pan baffle nut (4 required)
10	6687	Oil pan baffle
11	6730	Oil pan drain plug

Oil Pump

Item	Part Number	Description
1	W500300	Oil pump bolt (4 required)
2	6621	Oil pump

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

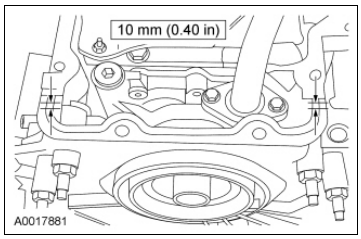
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the LH catalytic converter manifold. For additional information, refer to Section 309-00 .
3. Drain the engine oil and install the drain plug.
   - Tighten to 26 Nm (19 lb-ft).
4. Remove and discard the oil filter.
5. Remove the access cover.

6. Remove the 2 oil pan-to-transaxle bolts.
7. Remove the 15 bolts and the oil pan.
   - Remove and discard the oil pan gasket.

Installation



1. *NOTICE:* **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

   Use a plastic scraping tool to remove all traces of the oil pan gasket.

   - Clean all sealing surfaces with metal surface prep and install a new oil pan gasket.

2. **NOTE:** The oil pan must be installed and the bolts tightened within 4 minutes of sealant application.

   Apply a 10 mm (0.40 in) diameter dot of silicone sealant to the areas indicated.

3. Position the oil pan and loosely install the bolts.

4. Install the 2 oil pan-to-transaxle bolts.
   - Tighten to 40 Nm (30 lb-ft).

5. Tighten the oil pan-to-engine bolts in the sequence shown to 25 Nm (18 lb-ft).

6. Install the access cover.

7. **NOTE:** Lubricate the engine oil filter gasket with clean engine oil prior to installing.

   Install a new oil filter.

   - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

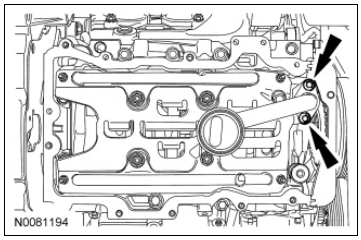
8. Install the LH catalytic converter manifold. For additional information, refer to Section 309-00 .

9. Fill the engine with clean engine oil.

Oil Pump Screen and Pickup Tube

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

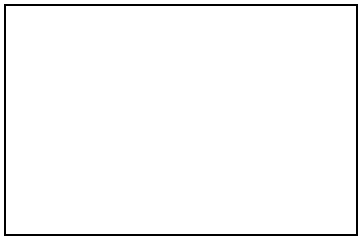


Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pan in this section.



3. Remove the bolts the oil pump screen and pickup tube.
   - Remove and discard the O-ring seal.

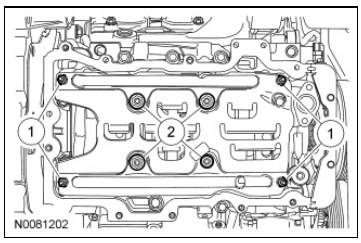
Installation

1. Install a new O-ring seal on the oil pump screen and pickup tube.
   - Lubricate the O-ring seal with clean engine oil.

2. Install the oil pump screen and pickup tube.
   1. Position the oil pump screen and pickup tube.
   2. Install the bolts and tighten to 10 Nm (89 lb-in).

3. Install the oil pan. For additional information, refer to Oil Pan in this section.

Oil Pan Baffle



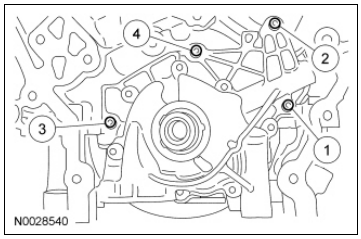
Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the oil pump screen and pickup tube. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pump Screen and Pickup Tube in this section.

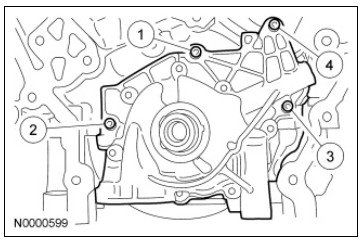
3. Remove the 8 nuts and the oil pan baffle in the following sequence.
    1. To install, tighten the 4 M6 oil pan baffle nuts in 2 stages.
        - Stage 1: Tighten to 5 Nm (44 lb-in).
        - Stage 2: Tighten an additional 45 degrees.
    2. Then install and tighten the 4 M8 oil pan baffle nuts in 2 stages.
        - Stage 1: Tighten to 15 Nm (133 lb-in).
        - Stage 2: Tighten an additional 45 degrees.



4. To install, reverse the removal procedure.

Oil Pump

Removal

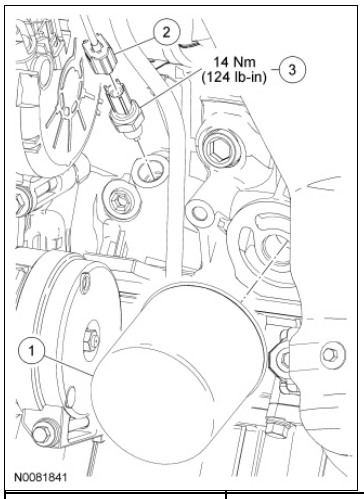


NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.
3. Remove the oil pump screen and pickup tube. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pump Screen and Pickup Tube in this section.
4. Remove the bolts in the sequence shown.

Installation

1. Position the oil pump aninstall the bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).



2. Install the oil pump screen and pickup tube. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pump Screen and Pickup Tube in this section.
3. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.

Engine Oil Pressure (EOP) Switch

Material

Item	Specification
Thread Sealant with PTFE TA-24	WSK-M2G350-A2

Item	Part Number	Description
1	6714	Engine oil filter
2	14A464	
3	9278	EOP

Removal and Installation

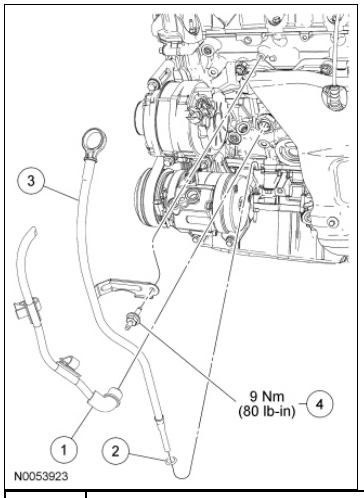
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Lubricate the engine oil filter gasket with clean engine oil prior to installing.

   Remove the engine oil filter.

   - To install, tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

3. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.



4. Remove the EOP switch.
   - To install, tighten to 14 Nm (124 lb-in).

5. To install, reverse the removal procedure.
   - Apply thread sealant with PTFE to the EOP switch threads.

Oil Level Indicator and Tube

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	-	Block heater wiring harness (if equipped)
2	110282	Oil level indicator O-ring seal
6754	Oil level indicator tube	
4	W701822	Oil level indicator tube stud bolt

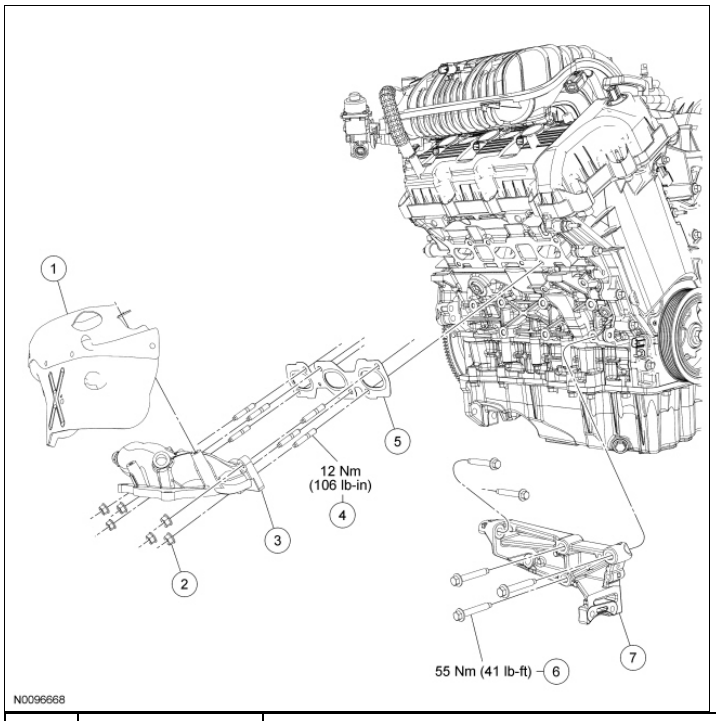
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the oil level indicator.

3. If equipped, disconnect the block heater electrical connector and wiring harness retainers.

4. Remove the stud bolt and the oil level indicator tube.
   - Discard the O-ring seal.
   - To install, tighten to 9 Nm (80 lb-in).



5. **NOTE:** Install a new O-ring seal and lubricate with clean engine oil.

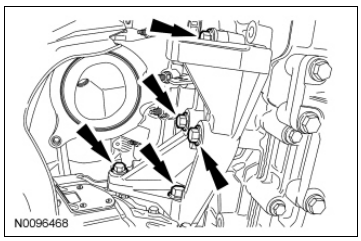
   To install, reverse the removal procedure.

Exhaust Manifold - RH

Material

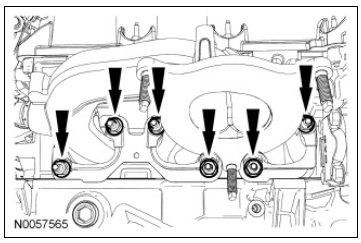
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

Item	Part Number	Description
1	5E258	RH catalytic converter heat shield
2	W701706	RH exhaust manifold nut (6 required)
3	9430	RH exhaust manifold
4	W701732	RH exhaust manifold sired)
5	9448	RH exhaust manifold gasket
6	W500724	Power Transfer Unit (PTU) bracket bolt (5 required)
7	7A444	PTU bracket



Removal

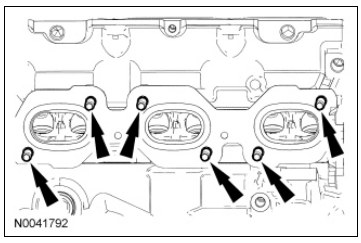
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the EGR tube. For additional information, refer to Section 303-08B .
3. Remove the RH catalytic converter. For additional information, refer to Section 309-00 .



4. **NOTE:** The heat shield that was unbolted from the exhaust manifold during removal of the RH catalytic converter cannot be removed from the vehicle until the Power Transfer Unit (PTU) bracket is removed.

   Remove the 5 bolts and the PTU bracket.

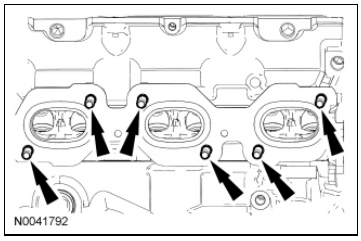
   - Remove the catalytic converter heat shield from the vehicle.



5. Remove the 6 nuts and the RH exhaust manifold.
   - Discard the gasket and nuts.

6. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

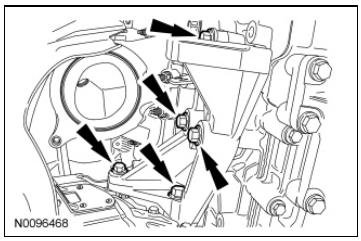
7. Remove and discard the 6 RH exhaust manifold studs.



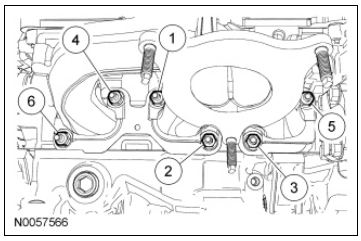
8. *NOTICE:* **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

   Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

Installation



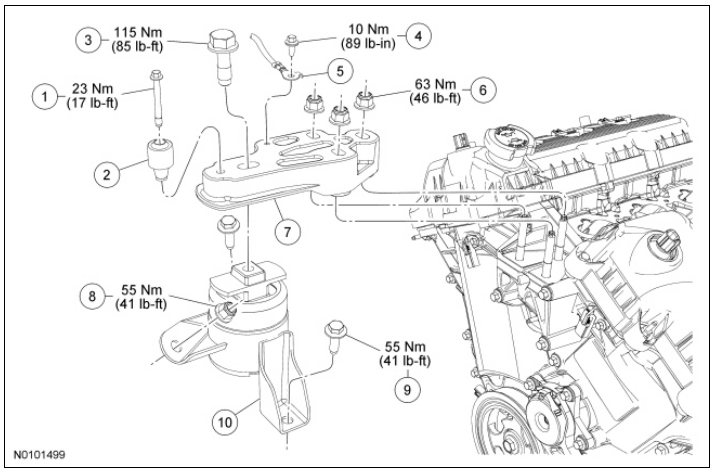
1. Install 6 new RH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).



2. **NOTE:** The catalytic converter heat shield must be positioned up into the engine compartment prior to installing the PTU bracket.

   Position the catalytic converter heat shield into the engine compartment.

3. Install the PTU bracket and the 5 bolts.
   - Tighten to 55 Nm (41 lb-in).



4. Install a new gasket, the RH exhaust manifold and 6 new nuts.
   - Tighten to 20 Nm (177 lb-in) in the sequence shown.

5. Install the RH catalytic converter. For additional information, refer to Section 309-00 .

6. Install the EGR tube. For additional information, refer to Section 303-08B .

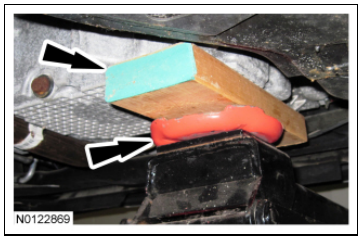
Engine Mount

Item	Part Number	Description
1	W711879	Damper bolt
2	7458	Damper
3	W711684	Engine mount bracket bolt
4	W705936	Ground wire bolt
5	19A095	Ground wire
6	W712334	Engine support insulator bracket nut (3 required)
7	6061	Engine mount bracket
8	W711578	Engine mount nut td>
9	W706496	Engine mount bolt (2 required)
10	6038	Engine mount

Removal and Installation

1. Remove the engine coolant degas bottle. For additional information, refer to Section 303-03A .

2. Remove the bolt and position aside the ground wire.
   - To install, tighten to 10 Nm (89 lb-in).



3. Remove the bolt and damper.
   - To install, tighten to 23 Nm (17 lb-ft).

4. Remove the engine support insulator bracket bolt.
   - To install, tighten to 115 Nm (85 lb-ft).

5. **NOTE:** Failure to position the wood block and floor jack as illustrated can result in damage to the oil pan.

   Position a floor jack with a block of wood under the front of the oil pan.

   - Using the floor jack, lift the engine 12 mm (0.47 in).

6. Remove the 3 nuts and the engine support insulator bracket.
    - To install, tighten to 63 Nm (46 lb-ft).

7. Remove the nut, 2 bolts and the engine mount.
    - To install, tighten to 55 Nm (41 lb-ft).

8. **NOTE:** If the engine mount bracket is to be removed, the engine must be lowered to avoid contact between the A/C tubes and the engine mount bracket.

   Use the floor jack to lower the engine 25 mm (0.98 in).

    - Remove the engine mount bracket.

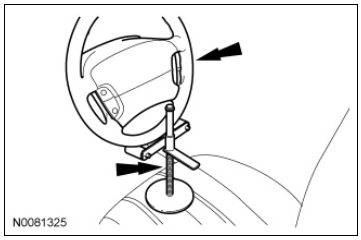
9. To install, reverse the removal procedure.

Engine

Special Tool(s)

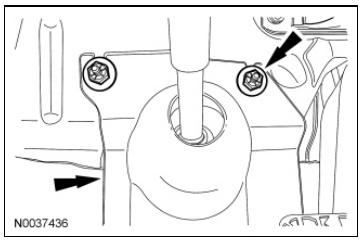
 ST2870-A	Disconnect Tool, Transmission Cooler Line 307-569
 ST2873-A	Engine Lifting Bracket Set 303-1140
 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E or equivalent
 ST2793-A	Lifting Bracket, Engine 303-050 (T70P-6000)
 ST2463-A	Lifting Brackets, Engine 134-00243 or equivalent
 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent
 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent
 ST1408-A	Tie-Rod End Remover 211-105 (T85M-3395-A)
 ST2743A	Adjustable Grip Arm, 1735A 014-00001 or equivalent

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



All vehicles

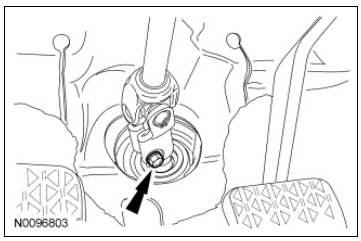
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



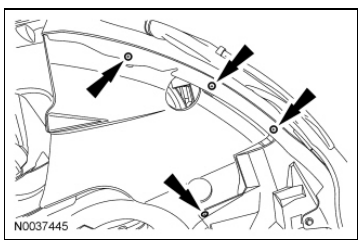
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .

3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Recover the A/C system. For additional information, refer to Section 412-00A .
5. Place the steering wheel in the straight-ahead position and the ignition key in the OFF position.
6. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Using a suitable holding device, hold the steering wheel in the straight-ahead position.

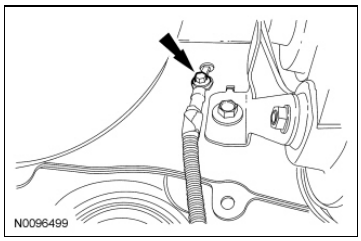


7. Remove the 2 nuts and the steering joint cover.

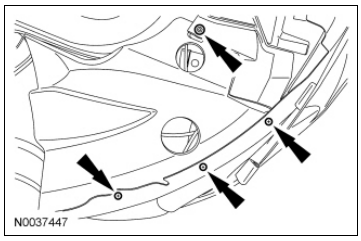


8. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

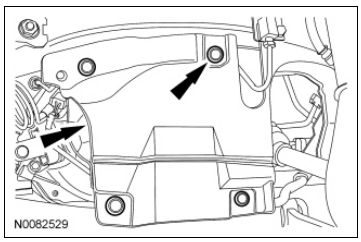
   Remove the bolt and disconnect the steering column shaft from the steering gear.



9. Drain the cooling system. For additional information, refer to Section 303-03A .
10. Remove the 4 screws and position the RH fender splash shield aside.



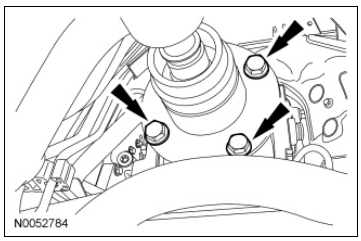
11. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.



12. Remove the bolt and the Electronic Power Assist Steering (EPAS) wiring ground wire from in the RH front wheel well.

13. Remove the 4 screws and position the LH fender splash shield aside.

14. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

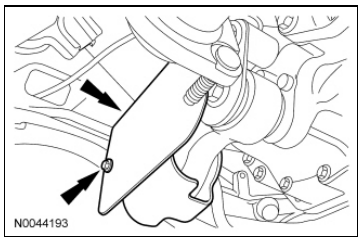


15. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .

All-Wheel Drive (AWD) vehicles

16. **NOTE:** Index-mark the driveshaft for installation.

    Remove the 4 bolts (3 shown) and support the driveshaft with a length of mechanic's wire.

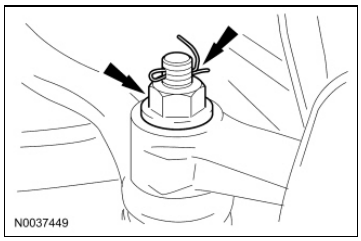


All vehicles

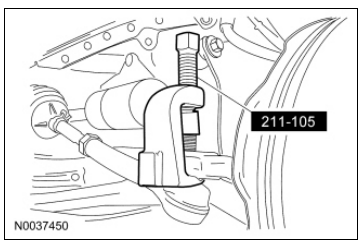
17. *NOTICE:* **The steering gear-to-dash seal must be removed or it will be damaged when lowering the subframe.**

    Release the 4 clips (2 shown) and slide the steering gear-to-dash seal off of the steering gear and into the passenger compartment.

18. If equipped, remove the 2 bolts and the heat shield.

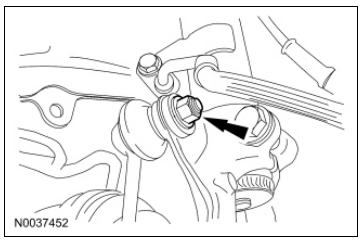


19. Remove the 2 bolts and the engine roll restrictor.



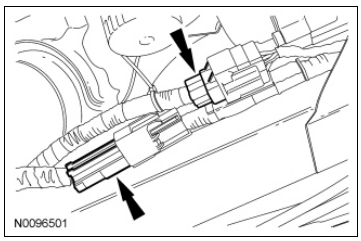
20. **NOTE:** RH shown, LH similar.

    Remove the cotter pins and nuts from the tie-rod ends.



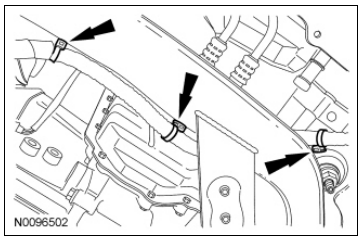
21. **NOTE:** LH shown, RH similar.

    Using the Tie-Rod End Remover, separate the tie-rod ends from the steering knuckles.

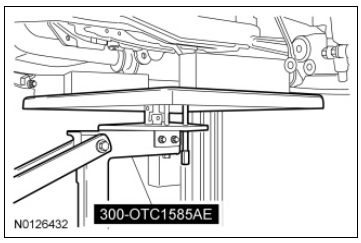


22. **NOTE:** RH shown, LH similar.

    Remove the nuts and separate the stabilizer bar links from the struts.

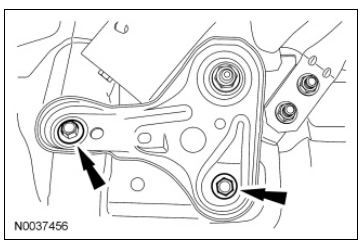


23. Remove the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

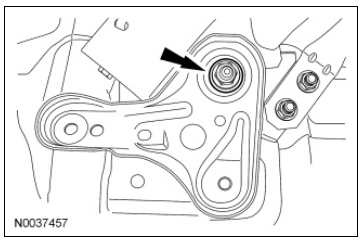


24. Disconnect the 2 EPAS electrical connectors near the front of the subframe.

25. Detach the 3 wiring harness retainers from the LH front of the subframe.

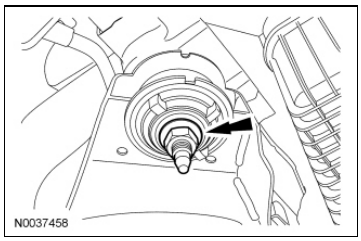


26. Position the Powertrain Lift under the subframe assembly.



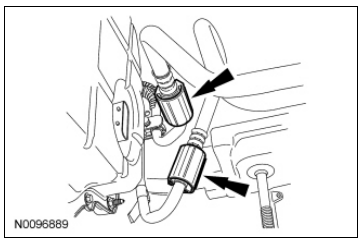
27. **NOTE:** LH shown, RH similar.

    Remove the subframe bracket-to-body bolts.



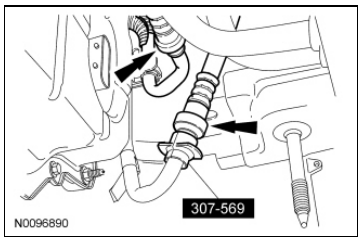
28. **NOTE:** LH shown, RH similar.

    Remove the subframe nuts and the subframe brackets.

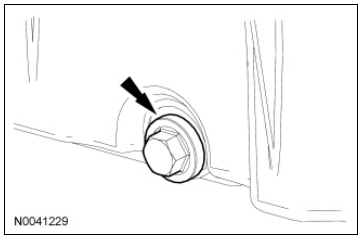


29. **NOTE:** LH shown, RH similar.

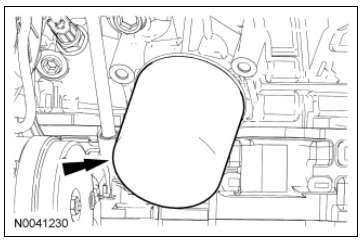
    Remove the front subframe nuts.



30. Lower the subframe assembly from the vehicle.

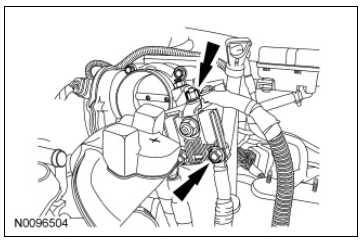


31. Remove the 2 transaxle fluid cooler tube secondary latches.

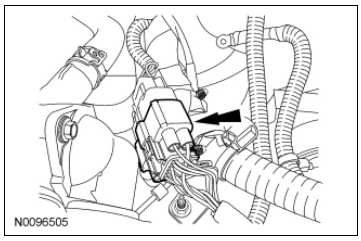


32. Using the Transmission Cooler Line Disconnect Tool, disconnect the 2 transaxle fluid cooler tubes.

33. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 26 Nm (19 lb-ft).

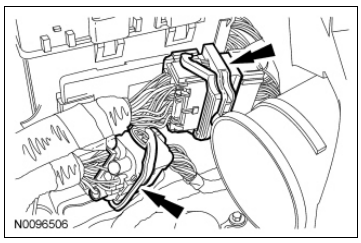


34. Remove and discard the engine oil filter.

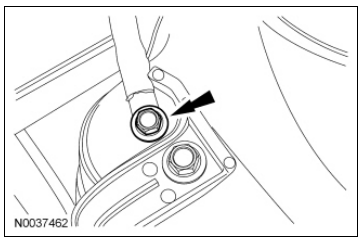


35. Remove the engine Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12B .

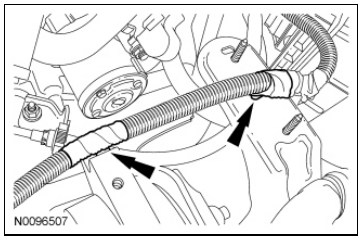
36. Remove the battery tray. For additional information, refer to Section 414-01 .



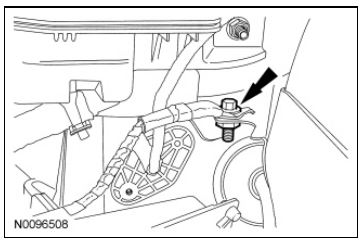
37. Remove the 2 nuts and disconnect the power feed wires from the battery terminal.



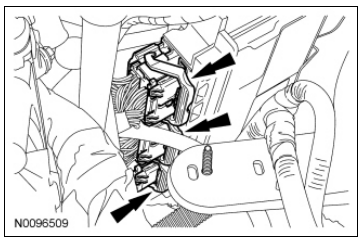
38. Disconnect the engine wiring harness electrical connector.



39. Disconnect the 2 engine wiring harness electrical connectors.

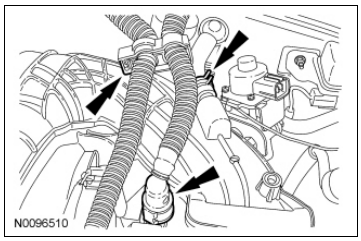


40. Remove the bolt and position aside the ground wire.

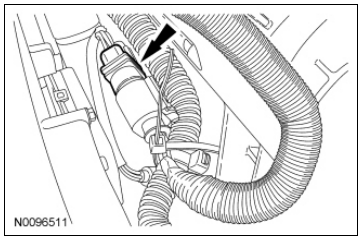


41. Detach the 2 wiring harness retainers from the battery tray bracket and transaxle mount.

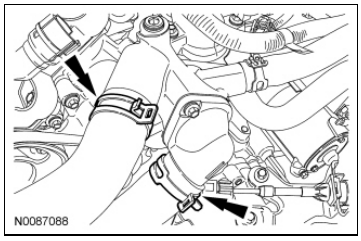
42. Remove the PCM ground bolt and position aside the ground wire.



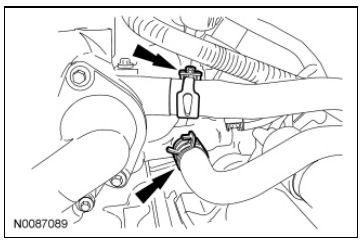
43. Disconnect the 3 PCM electrical connectors.



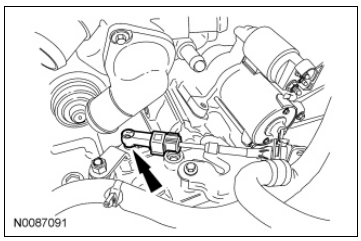
44. Disconnect the fuel supply tube from the fuel rail. For additional information, refer to Section 310-00 .



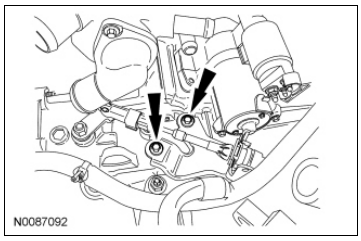
45. Disconnect the EVAP tube-to- EVAP canister purge valve quick connect coupling and the brake booster vacuum tube from the upper intake manifold.
    - Detach the fuel tube and EVAP tube-to- EVAP canister purge valve tube retainer from the upper intake manifold.



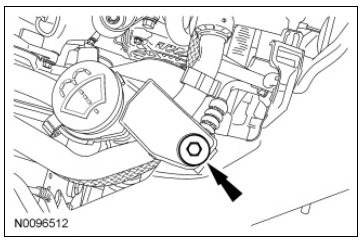
46. Disconnect the LH Heated Oxygen Sensor (HO2S) electrical connector.



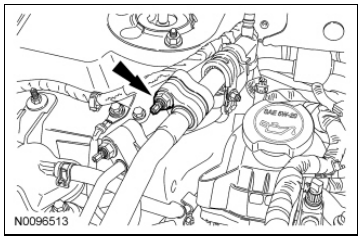
47. Disconnect the upper and lower radiator hoses.



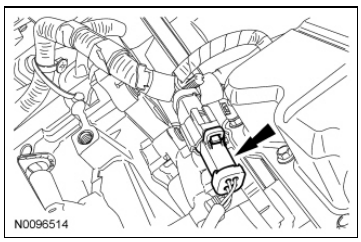
48. Disconnect the 2 heater hoses.



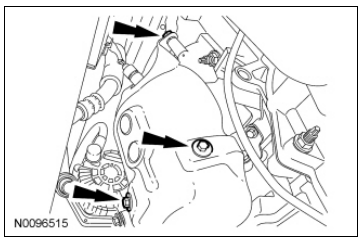
49. Disconnect the gearshift cable from the transaxle.



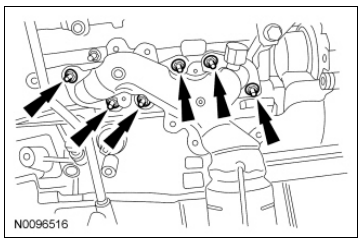
50. Remove the 2 shift cable bracket bolts, and position the cable and bracket aside.



51. Remove the A/C tube/windshield washer bottle bracket bolt.

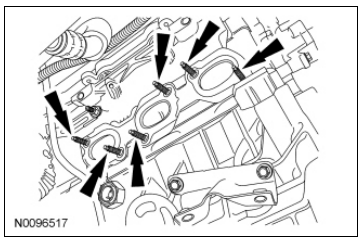


52. Remove the nut and disconnect the A/C tube.
    - Discard the gasket.

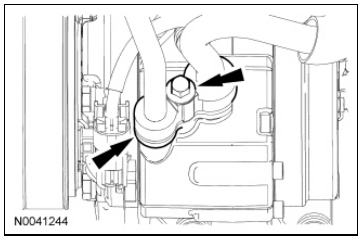


53. Disconnect the LH Catalyst Monitor Sensor (CMS) electrical connector.

54. Remove the 4 bolts (3 shown) and the LH catalytic converter heat shield.

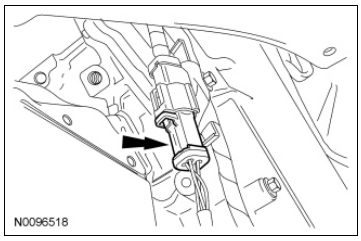


55. Remove the 6 nuts and the LH catalytic converter manifold.
    - Discard the 6 LH catalytic converter manifold nuts and gasket.

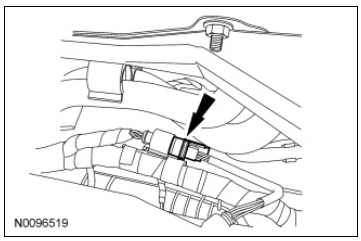


56. Clean and inspect the LH catalytic converter manifold. For additional information, refer to Section 303-00 .

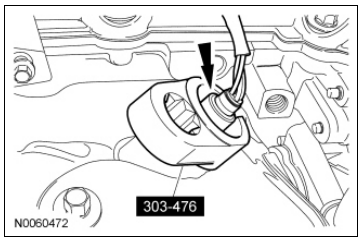
57. Remove and discard the 6 LH catalytic converter manifold studs.



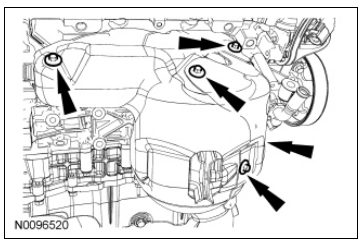
58. Remove the bolt and separate the A/C manifold from the A/C compressor.
    - Discard the gasket.



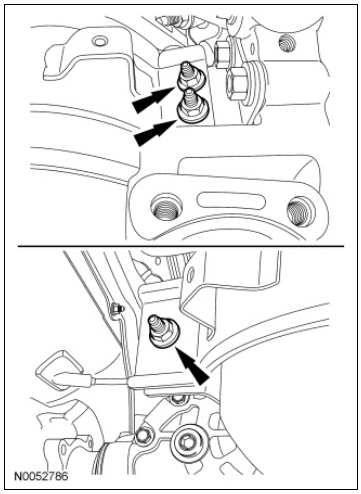
AWD vehicles



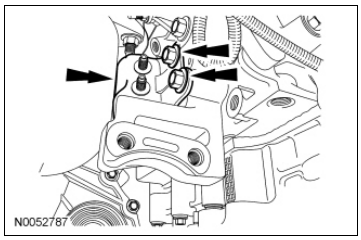
59. Disconnect the RH CMS electrical connector.



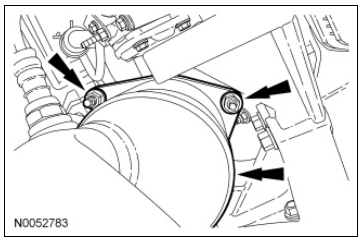
60. Disconnect the RH Heated Oxygen Sensor (HO2S) electrical connector.



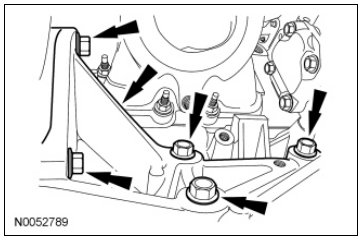
61. Using the Exhaust Gas Oxygen Sensor Socket, remove the RH HO2S .



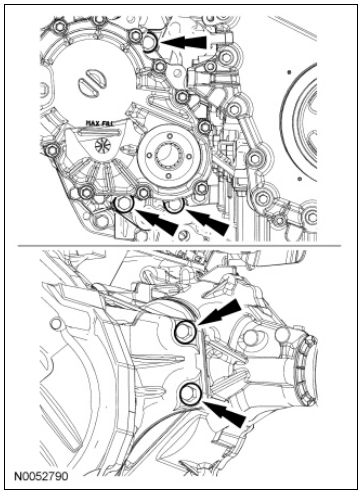
62. Remove the 5 bolts and the RH exhaust heat shield.



63. Remove the 3 nuts and the RH exhaust heat shield bracket (outboard half).

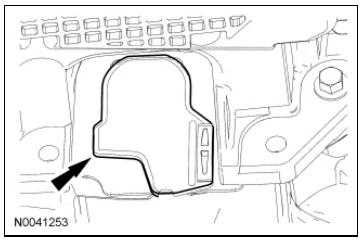


64. Remove the 2 bolts and the RH exhaust heat shield bracket (inboard half).

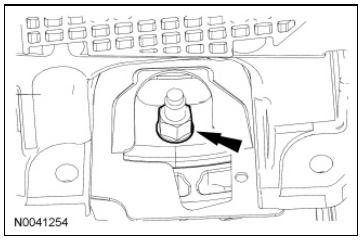


65. Remove the 3 nuts (2 shown) and the RH catalytic converter.
    - Discard the nuts and gasket.

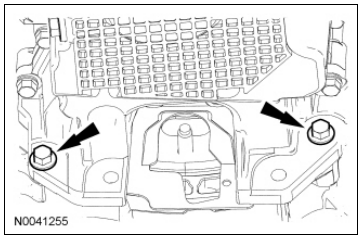
66. Remove the 5 bolts and the PTU support bracket.



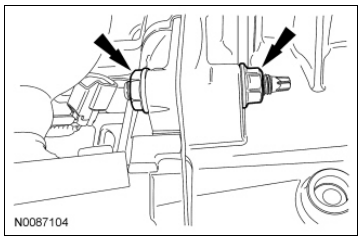
67. Remove the 5 bolts and the PTU .



All vehicles

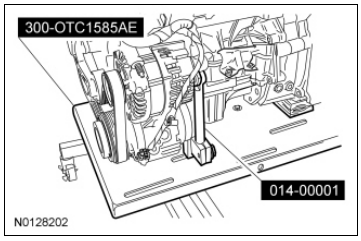


68. Remove the torque converter nut access plug.

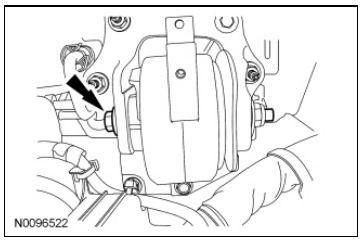


69. Remove the 4 torque converter nuts.

70. Remove the 2 oil pan-to-transaxle bolts.



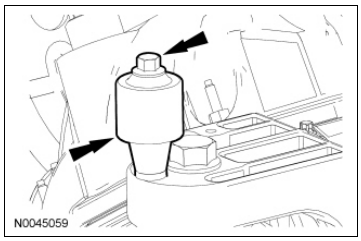
71. Remove the 2 nuts and the transaxle-to-engine stud.



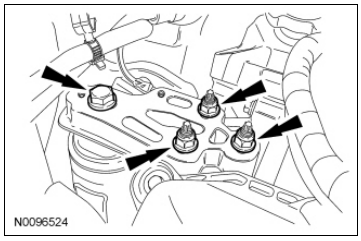
72. **NOTE:** Position a suitable block of wood under the transaxle.

    Install the Powertrain Lift and the Adjustable Grip Arm onto the engine.

    - Raise the engine and transaxle 25.4 mm (1 in) to neutralize the engine and transaxle mounts.

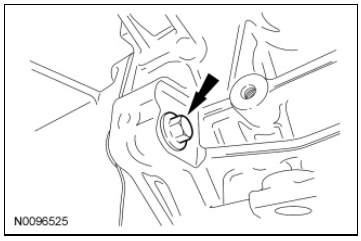


73. Remove the rear transaxle support through bolt.

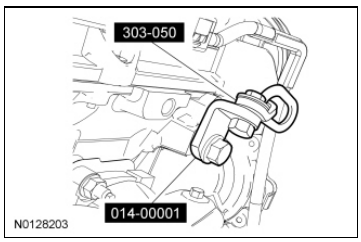


74. Remove the bolt and ground strap from the engine mount bracket.

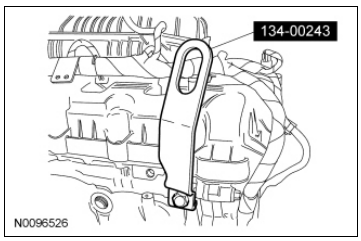
75. Remove the bolt and damper.



76. Remove the bolt, 3 nuts and the engine mount bracket.

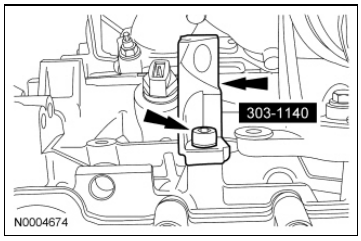


77. Lower the engine and transaxle from the vehicle.

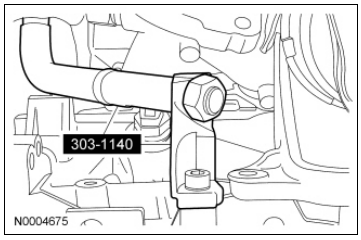


78. Remove the transaxle-to-engine bolt.

79. Install the Adjustable Grip Arm and the Engine Lifting Bracket.

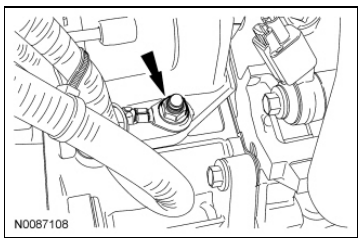


80. Install the Engine Lifting Bracket.

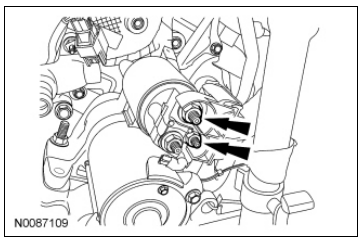


81. **NOTE:** When installing the lower half of the lifting bracket it will be easier to loosely install the upper bolt first then install the lower bolt.

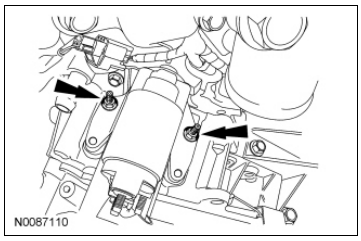
    Install the lower half of the Engine Lifting Bracket Set.



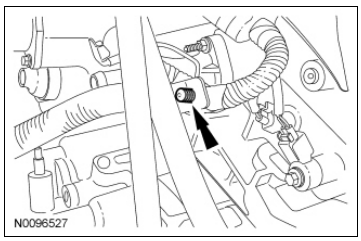
82. Install the upper half of the Engine Lifting Bracket Set.



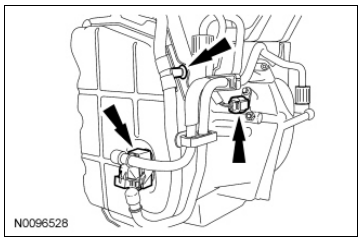
83. Using the Spreader Bar, Engine Lifting Brackets, Engine Lifting Bracket Set and a suitable engine crane, remove the engine and transaxle from the lift table.



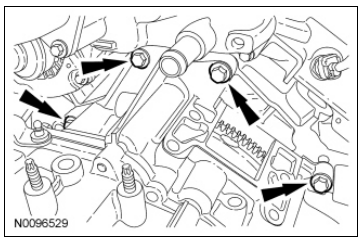
84. Remove the nut and the starter wiring ground.



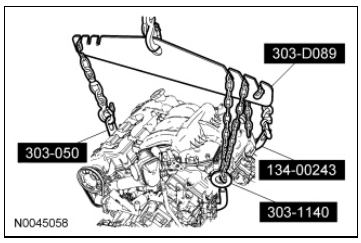
85. Remove the 2 nuts and the starter wiring.



86. Remove the 2 stud bolts and the starter.

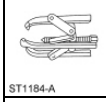


87. Detach the wiring harness retainer from the transmission indicator tube.



88. Disconnect the 2 transmission electrical connectors and detach the wiring retainer from the stud bolt.

89. Remove the 4 remaining transaxle-to-engine bolts.



90. Using the Spreader Bar, Engine Lifting Brackets, Engine Lifting Bracket Set and the Heavy Duty Floor Crane, separate the engine and transaxle.

Engine

Special Tool(s)

 ST1184-A	3 Jaw Puller 303-D121
 ST1982-A	Installer, Connecting Rod 303-462 (T94P-6136-AH)

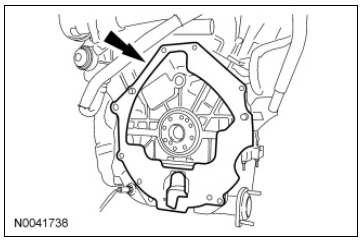
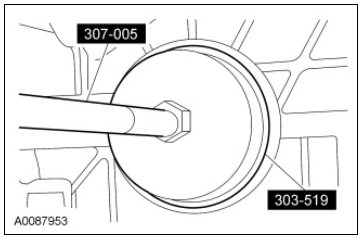
 ST3045-A	Protector, Water Pump Shaft 303-457 (T94P-6312-AH2), part of 303-S455
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700CH)
 ST3085-A	Remover, Stretchy Belt 303-1419
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



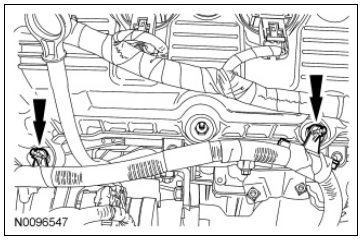
NOTE: For additional information, refer to the exploded view under the Assembly procedure in this section.

All engines

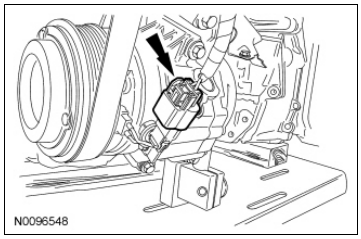


1. Remove the 8 bolts and the flexplate.

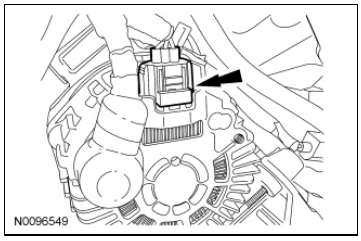
2. Remove the engine-to-transaxle separator plate.



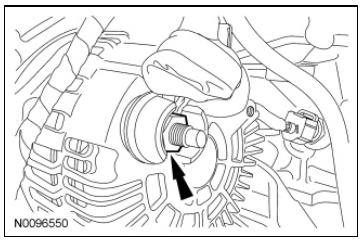
3. Using the Slide Hammer and the Crankshaft Rear Oil Seal Remover, remove and discard the crankshaft rear oil seal.



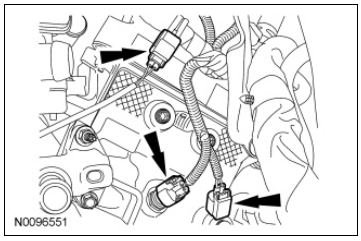
4. Mount the engine on a suitable stand.



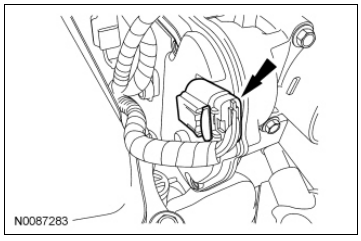
5. Detach the 2 B+ wiring harness retainers from the valve cover stud bolts.



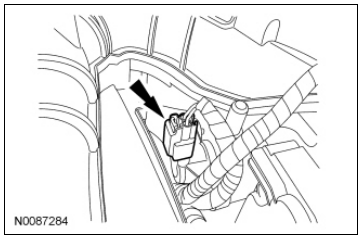
6. Disconnect the A/C compressor clutch electrical connector.



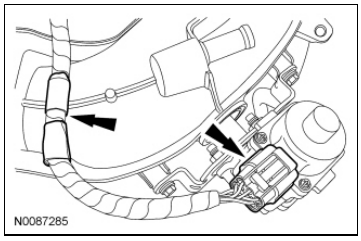
7. Disconnect the generator electrical connector.



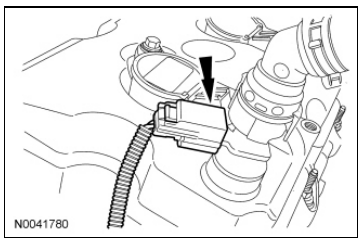
8. Remove the nut and the B+ wire from the generator.
    - Remove the B+ harness from the engine.



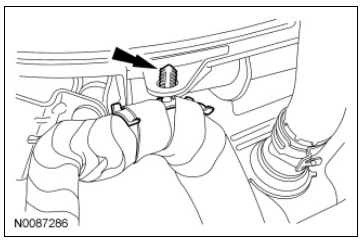
9. Disconnect the 3 engine wiring connectors.
    - Disconnect the engine block Knock Sensor (KS) electrical connector.
    - Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.
    - Disconnect the cylinder head KS electrical connector.



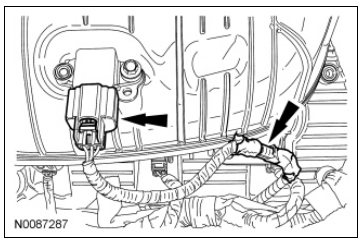
10. Disconnect the electronic throttle control electrical connector.



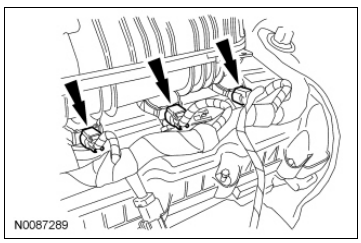
11. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.



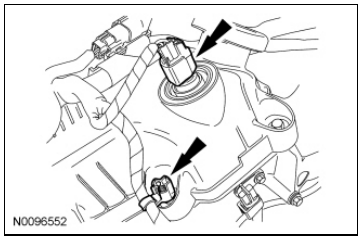
12. Disconnect the EGR regulator electrical connector and detach the wiring retainer.



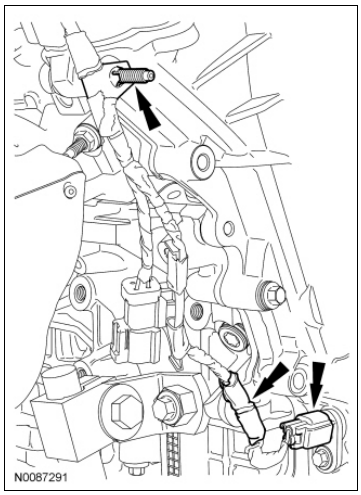
13. Disconnect the PCV valve electrical connector.



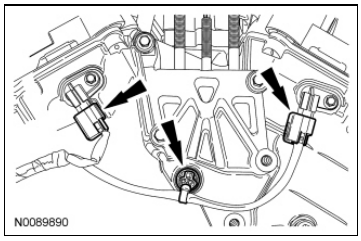
14. Detach the wiring harness retainer from the upper intake manifold.



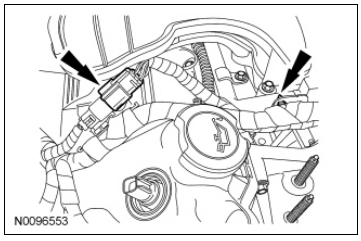
15. Disconnect the Manifold Absolute Pressure (MAP) electrical connector and detach the wiring retainer.



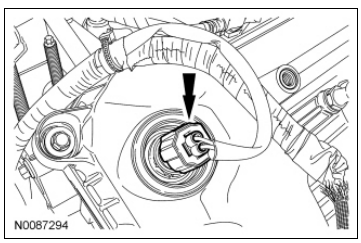
16. Disconnect the RH coil-on-plug electrical connectors.
    - Detach the 2 wiring harness retainers.



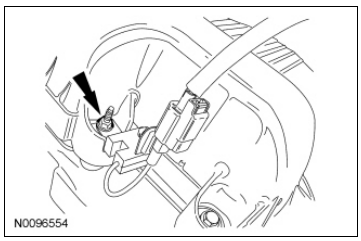
17. Disconnect the RH Variable Camshaft Timing (VCT) electrical connector and detach the wiring harness retainer from the valve cover stud bolt.



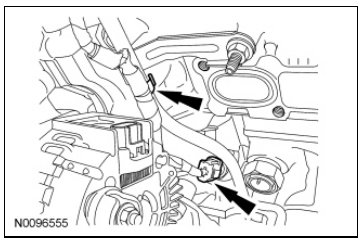
18. Disconnect the Crankshaft Position (CKP) sensor electrical connector and detach the 2 wiring harness retainers.



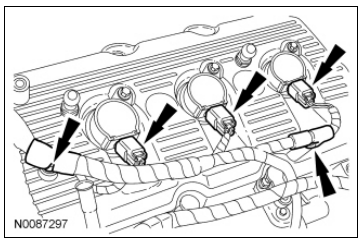
19. Disconnect the 2 Camshaft Position (CMP) sensor electrical connectors and detach the wiring harness retainer from the engine front cover stud bolt.



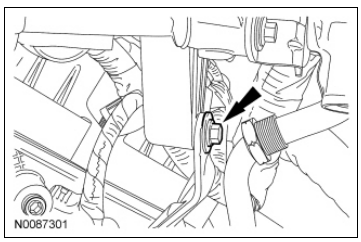
20. Disconnect the fuel injector wiring harness electrical connector and detach the wiring harness retainer.



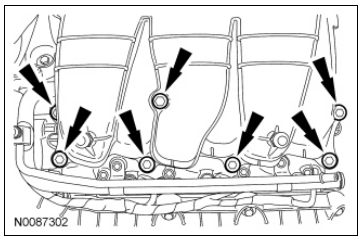
21. Disconnect the LH VCT electrical connector.



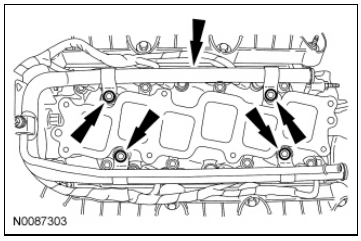
22. Remove the nut and the radio frequency interference capacitor.



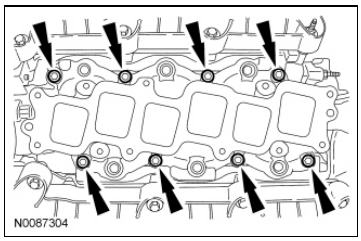
23. Disconnect the Engine Oil Pressure (EOP) switch electrical connector and detach the wiring retainer from the oil indicator tube.



24. Disconnect the 3 LH coil-on-plug electrical connectors.
    - Detach the 2 wiring harness retainers.

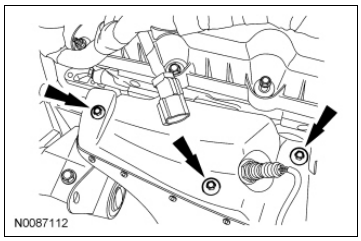


25. Remove the 2 upper intake manifold bracket bolts (1 shown).

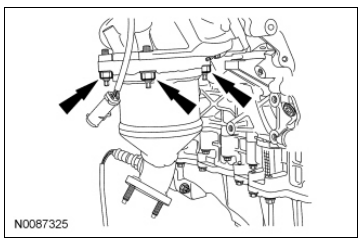


26. Remove the 7 bolts and the upper intake manifold.
    - Remove and discard the gaskets.

27. Remove the 4 bolts and the fuel rail and injectors as an assembly.

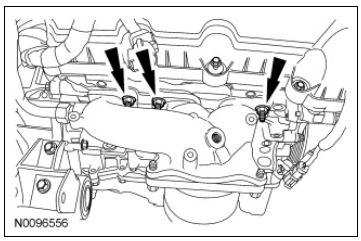


28. Remove the 8 lower intake manifold bolts and the lower intake manifold.
    - Remove and discard the gaskets.

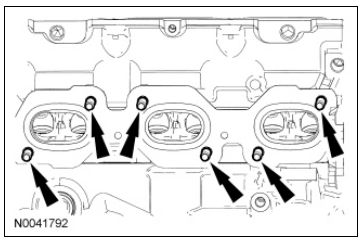


FWD vehicles

29. Remove the 3 bolts and the RH heat shield.

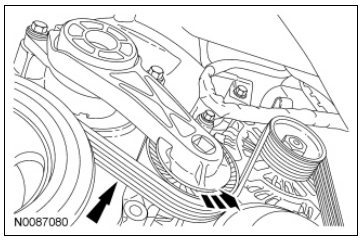


30. Remove the 3 nuts and the RH catalytic converter.
    - Discard the nuts and gasket.

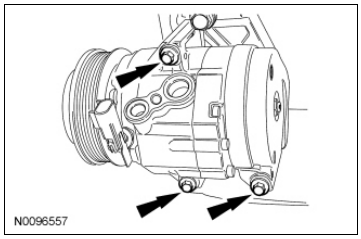


All engines

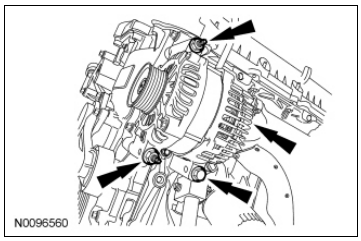
31. Remove the 6 RH exhaust manifold nuts and the manifold.
    - Discard the nuts and gasket.



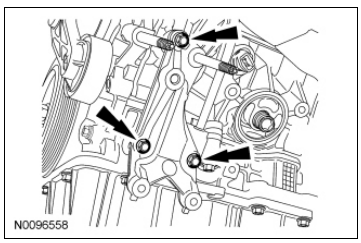
32. Clean and inspect the RH catalytic converter manifold. For additional information, refer to Section 303-00 .



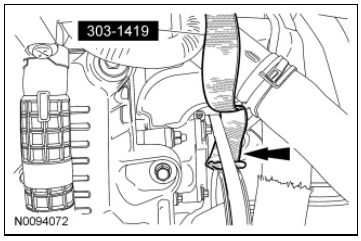
33. Remove and discard the 6 RH catalytic converter manifold studs.



34. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.

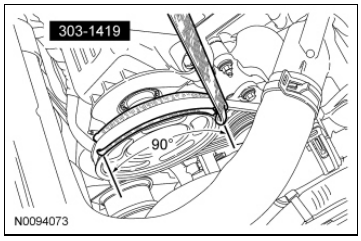


35. Remove the 3 bolts and the A/C compressor.

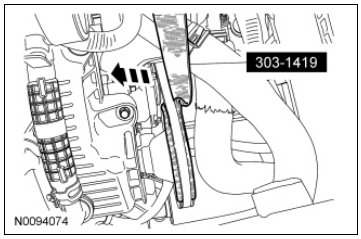


36. Remove the bolt, 2 nuts and the generator.

37. Remove the 3 bolts and the A/C compressor bracket.

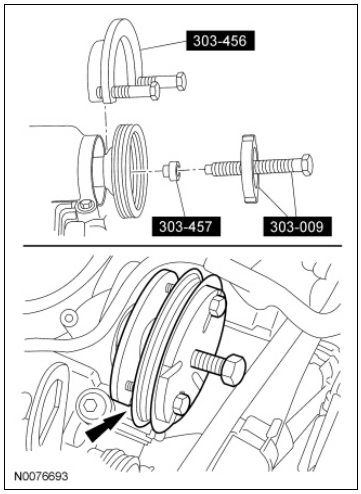


38. Position the Stretchy Belt Remover under the coolant pump belt as shown.

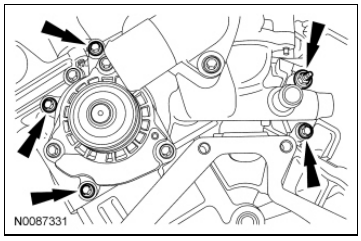


39. **NOTE:** Feed the Stretchy Belt Remover on to the camshaft coolant pump pulley 90 degrees.

    Turn the crankshaft clockwise and feed the Stretchy Belt Remover evenly on the camshaft coolant pump pulley as shown.

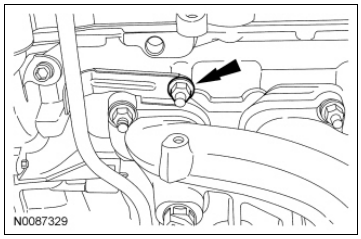


40. Remove the coolant pump belt.
    - Fold the Stretchy Belt Remover over the top of the coolant pump belt.
    - In one quick motion, pull the Stretchy Belt Remover up and toward the front of the engine removing the coolant pump belt.

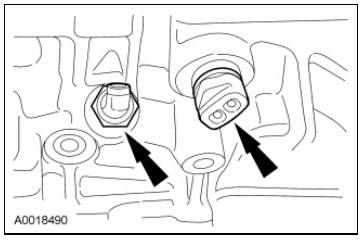


41. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**

    Using the Water Pump Pulley Plate, Water Pump Shaft Protector and the Crankshaft Vibration Damper Remover, remove the coolant pump pulley.

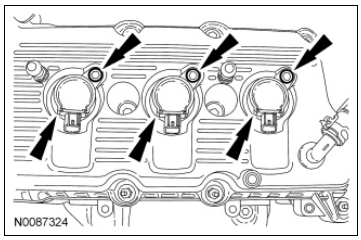


42. Remove the 5 coolant pump housing bolts.

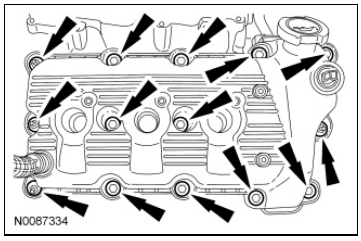


43. Loosen the clamp and detach the coolant hose.
    - Remove the coolant pump housing.

44. Remove the stud bolt and the oil level indicator and tube.
    - Remove and discard the O-ring seal.

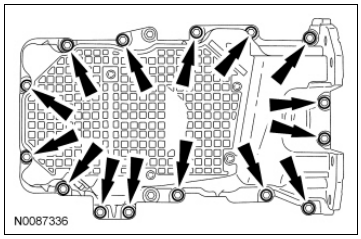


45. Remove the EOP switch and, if equipped, the block heater.

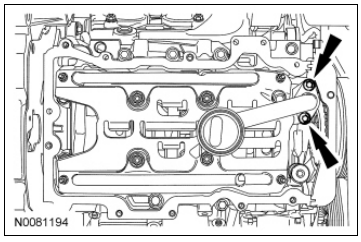


46. **NOTE:** LH shown, RH similar.

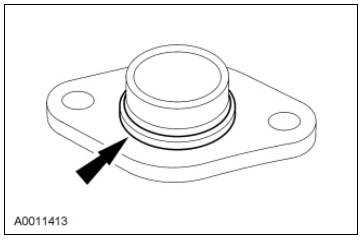
    Remove the bolts and the 6 coil-on-plugs.



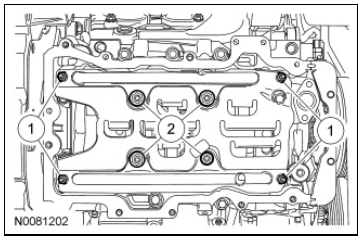
47. Remove the bolts and the RH valve cover.
    - Discard the gasket.



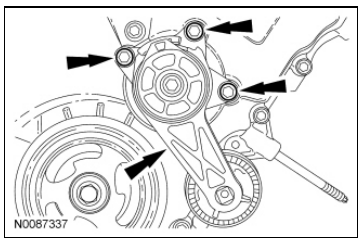
48. Remove the bolts and the LH valve cover.
    - Discard the gasket.



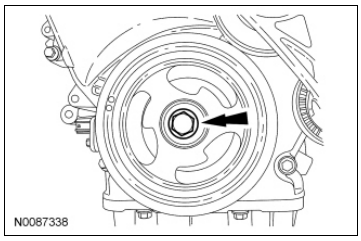
49. Remove the 15 bolts and the oil pan.
    - Discard the gasket.



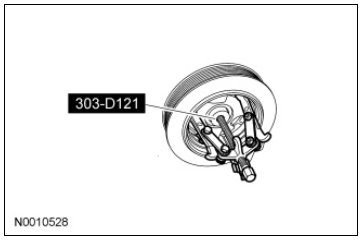
50. Remove the 2 bolts and the oil pump screen and pickup tube.



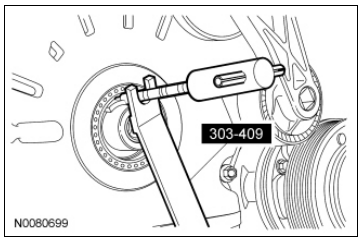
51. Remove and discard the O-ring seal.



52. Remove the oil pan baffle.
    1. Remove the 4 M6 oil pan baffle nuts.
    2. Remove the 4 M8 oil pan baffle nuts.

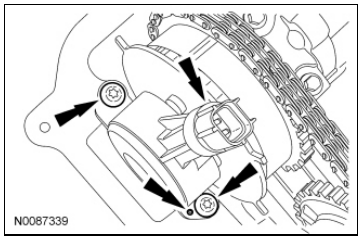


53. Remove the 3 bolts and the accessory drive belt tensioner.

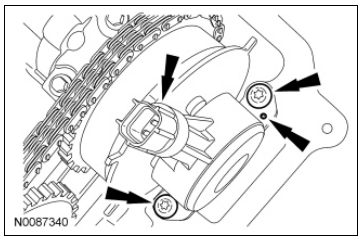


54. Remove the crankshaft pulley bolt and washer.
    - Discard the crankshaft pulley bolt.

55. Using the 3 Jaw Puller, remove the crankshaft pulley.



56. Using the Oil Seal Remover, remove and discard the crankshaft front seal.

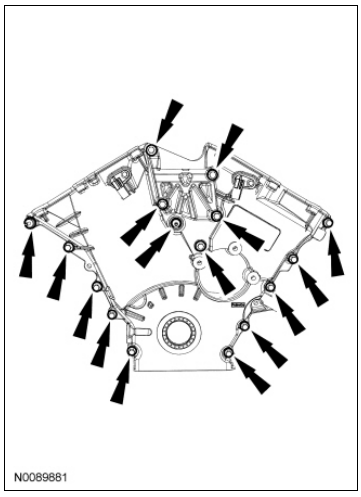


57. **NOTE:** Note the position of the alignment dowel on the engine front cover.

    Remove the 2 bolts and the LH VCT .

58. **NOTE:** Note the position of the alignment dowel on the engine front cover.

    Remove the 2 bolts and the RH VCT .



59. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surface. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.**

    NOTE: Note the location of all bolts and stud bolts for installation.

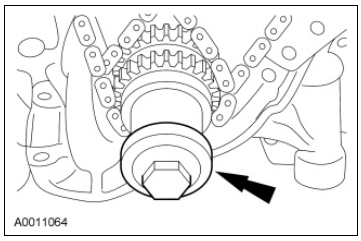
    Remove the 14 bolts, 2 stud bolts and the engine front cover.

    - Discard the gaskets.

60. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plug.**

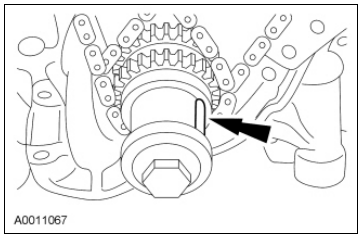
    NOTE: LH shown, RH similar.

    Remove the LH and RH spark plugs.

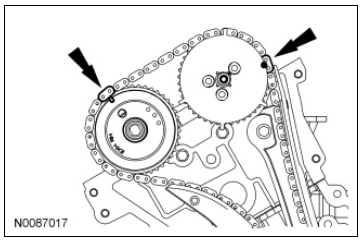


61. **NOTE:** This pulse wheel is used in several different engines. Install the pulse wheel with the keyway in the slot stamped "30RFF" (orange in color).

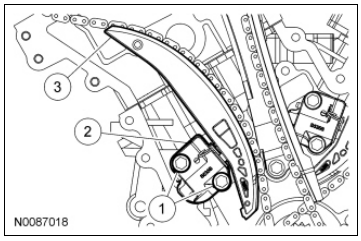
    Remove the ignition pulse wheel.



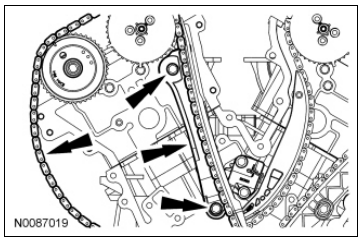
62. Install the crankshaft pulley bolt and washer.



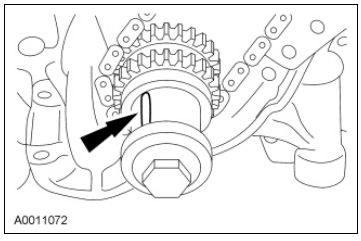
63. Rotate the crankshaft clockwise to position the crankshaft keyway in the 11 o'clock position and position the camshafts in the correct position. This will position the No. 1 cylinder at Top Dead Center (TDC).
    - Verify that the camshafts are correctly located. If not, rotate the crankshaft one additional turn and recheck.



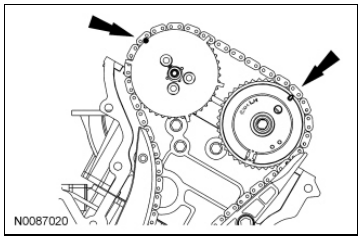
64. Rotate the crankshaft clockwise 120 degrees to the 3 o'clock position to position the RH camshafts in the neutral position.



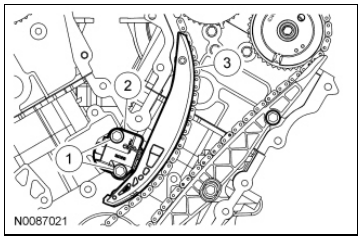
65. Verify that the RH camshafts are in the neutral position.



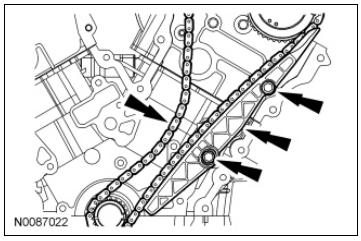
66. Remove the RH timing chain tensioner arm.
    1. Remove the 2 bolts.
    2. Remove the tensioner.
    3. Remove the tensioner arm.



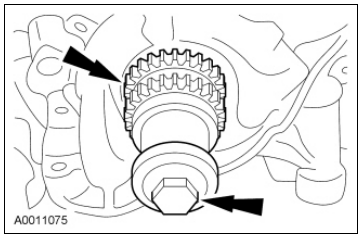
67. Remove the 2 bolts and the RH timing chain guide.
    - Remove the RH timing chain from the engine.



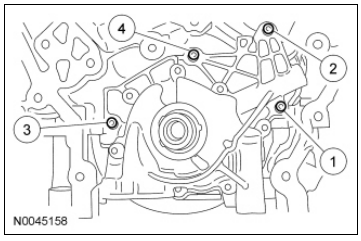
68. Rotate the crankcase clockwise 600 degrees (one and two-thirds turns) to position the crankcase keyway in the 11 o'clock position. This will position the LH camshafts in the neutral position.



69. Verify the LH camshafts are in the neutral position.

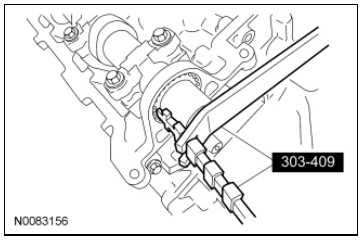


70. Remove the LH timing chain and tensioner arm.
    1. Remove the 2 bolts.
    2. Remove the tensioner.
    3. Remove the tensioner arm.

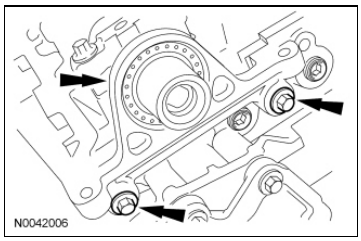


71. Remove the 2 bolts and the LH timing chain guide.
    - Remove the LH timing chain from the engine.

72. Remove the crankshaft pulley bolt and the crankshaft sprocket.

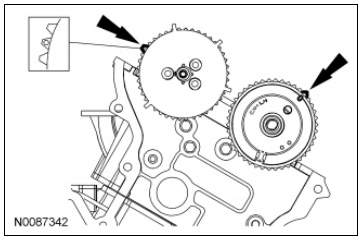


73. Remove the 4 bolts in the sequence shown.
    - Remove the oil pump.



74. ***NOTICE:*** **Do not scratch the camshaft sealing surface while removing the camshaft oil seal. If scratched, camshaft oil seal leakage may occur.**

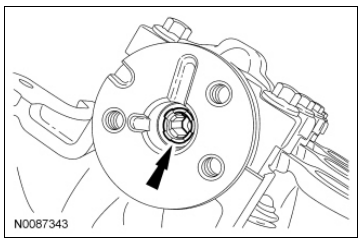
    Using the Oil Seal Remover, remove the camshaft oil seal and discard.



75. Remove the 2 bolts and the camshaft oil seal retainer.
    - Discard the press-in-place gasket.

76. ***NOTICE:*** **The camshafts must be in the neutral position before removing the bearing caps or damage to the engine may occur.**

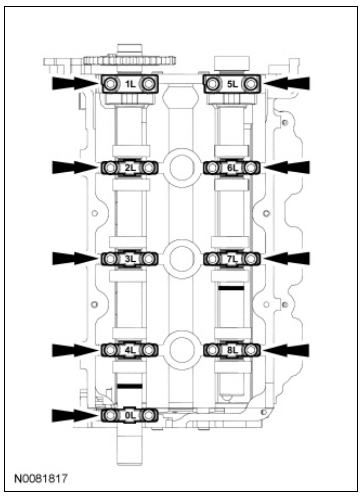
    Verify the LH camshafts are in the neutral position.



77. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while removing the camshaft phaser and sprocket or damage to the engine may occur.**

    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the intake camshaft to hold the camshaft in place for removal of the camshaft phaser and sprocket bolts.

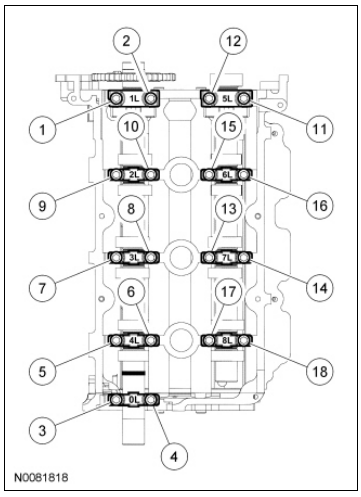
    Remove the 3 bolts and the LH camshaft phaser and sprocket.



78. Remove and discard the VCT system oil filter screen from the LH camshaft.

79. ***NOTICE:*** **Cylinder head camshaft bearing caps must be assembled in their original positions. Some engines have factory markings on the camshaft bearing caps (as shown in illustration). Engines that do not have the factory markings must be marked for correct position and orientation prior to removal. Failure to install the camshaft bearing caps in their original positions may result in severe engine damage.**

    If necessary, mark the camshaft bearing cap position and orientation as shown in the illustration.



80. ***NOTICE:*** **After loosening all of the camshaft bearing cap bolts, remove the camshaft bearing thrust caps (1L and 5L) first, or damage to the thrust caps may occur.**

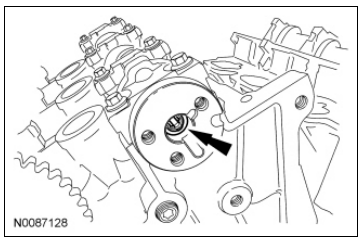
    NOTE: Make sure the camshaft bearing caps are marked as instructed in the previous step.

    Loosen the bolts evenly in the sequence shown.

    1. Remove the camshaft bearing thrust caps (1L and 5L).
    2. Remove the remaining camshaft bearing caps.
    3. Remove the camshafts from the cylinder head.

81. ***NOTICE:*** **The camshafts must be in the neutral position before removing the bearing caps or damage to the engine may occur.**

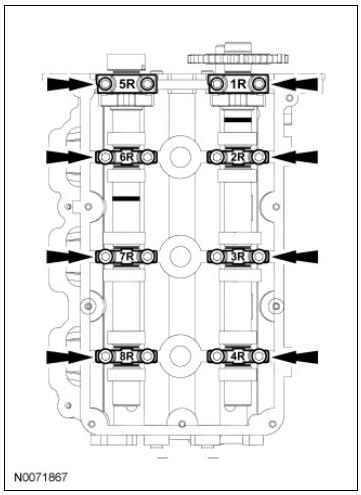
    Verify the RH camshafts are in the neutral position.



82. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while removing the camshaft phaser and sprocket or damage to the engine may occur.**

    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the intake camshaft to hold the camshaft in place for removal of the camshaft phaser and sprocket bolts.

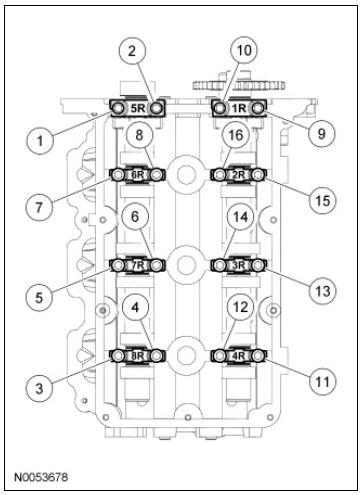
    Remove the 3 bolts and the RH camshaft phaser and sprocket.



83. Remove and discard the VCT system oil filter screen from the RH camshaft.

84. ***NOTICE:*** **Cylinder head camshaft bearing caps must be assembled in their original positions. Some engines have factory markings on the camshaft bearing caps (as shown in illustration). Engines that do not have the factory markings must be marked for correct position and orientation prior to removal. Failure to install the camshaft bearing caps in their original positions may result in severe engine damage.**

    If necessary, mark the camshaft bearing cap position and orientation as shown in the illustration.

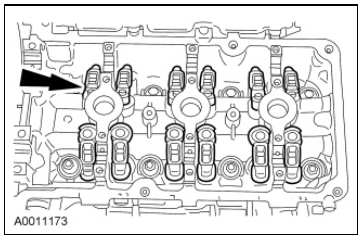


85. ***NOTICE:*** **After loosening all of the camshaft bearing cap bolts, remove the camshaft bearing thrust caps (5R and 1R) first, or damage to the thrust caps may occur.**

    NOTE: Make sure the camshaft bearing caps are marked as instructed in the previous step.

    Loosen the bolts evenly in the sequence shown.

    1. Remove the camshaft bearing thrust caps (5R and 1R).
    2. Remove the remaining camshaft bearing caps.
    3. Remove the camshafts from the cylinder head.

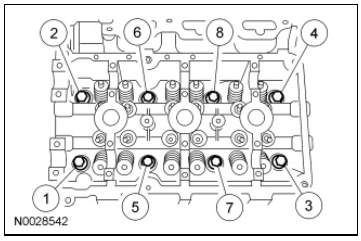


86. ***NOTICE:*** **The camshaft roller followers must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    NOTE: RH shown, LH similar.

    Remove the LH and RH camshaft roller followers.

    - Mark the location of the roller followers, using a permanent-type marker.



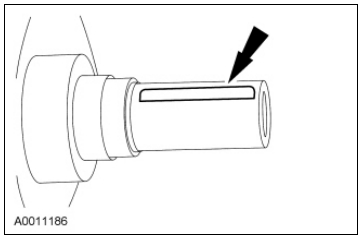
87. ***NOTICE:*** **The hydraulic lash adjusters must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    Remove the hydraulic lash adjusters.

88. **NOTE:** RH shown, LH similar.

    Loosen the bolts in the indicated sequence and remove the LH and RH cylinder heads.

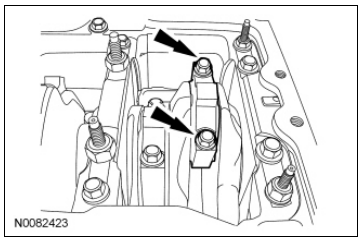
    - Discard the bolts and the gaskets.



89. Support the cylinder heads on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

90. Remove the bolts and the oil separator cover.
    - Discard the gasket.

91. Remove the crankshaft key.



92. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following manufacturer's instructions.

93. **NOTE:** Clearly mark the position and orientation of the pistons, connecting rods, connecting rod caps and connecting rod bearings for reassembly.

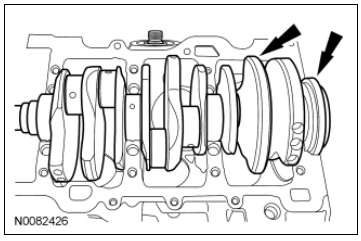
    Remove the connecting rod cap bolts and cap.

    - Discard the connecting rod cap bolts.

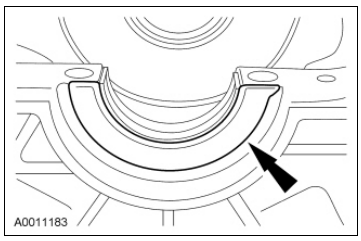
94. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

    Using the Connecting Rod Installer, remove the piston/rod assembly from the engine block.

    - Repeat these 2 steps until all the piston/rod assemblies are removed from the engine block.

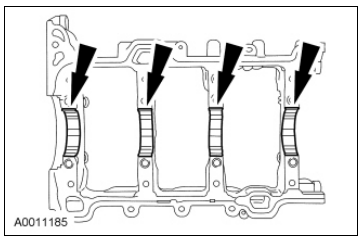


95. Remove the engine block from the stand and place on a workbench.

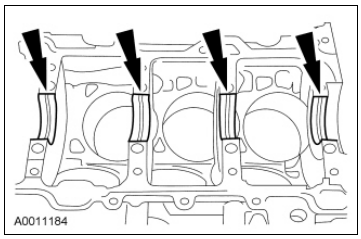


96. Remove the bolts and studs in the indicated sequence.
    - Discard the lower cylinder block bolts.
    - Remove the lower cylinder block.

97. Remove the crankshaft rear main seal.
    - Remove the crankshaft.



98. Remove the crankshaft thrust bearing from the cylinder block.

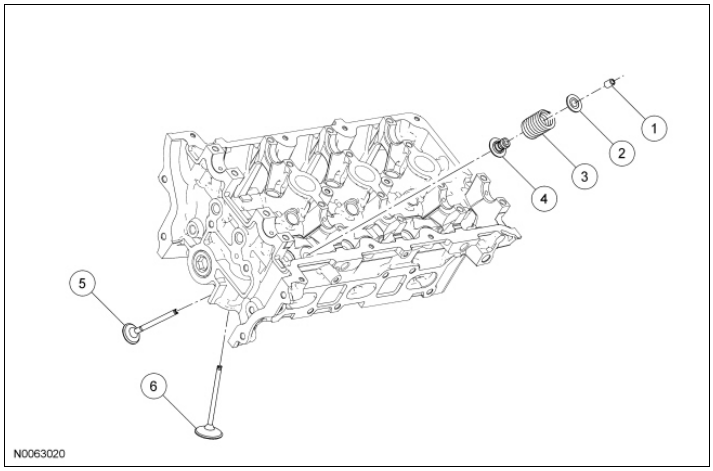


99. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

    Remove the bearings from the lower cylinder block.

100. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

     Remove the crankshaft main bearings from the cylinder block.



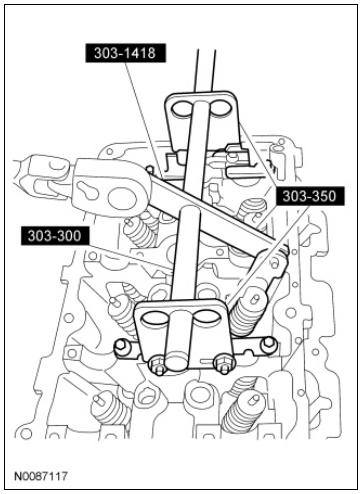
101. Inspect the cylinder block, lower cylinder block, pistons and connecting rods. For additional information, refer to Section 303-00 .

Cylinder Head

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST1902-A	Compressor, Valve Spring 303-1418
 ST1906-A	Installer, Valve Stem Oil Seal 303-470 (T94P-6510-CH)

Cylinder Head

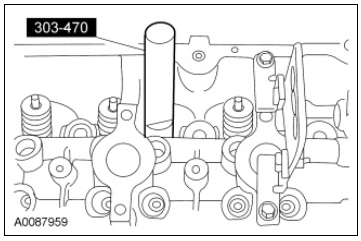


Item	Part Number	Description
1	6518	Valve spring retainer key (24 required)
2	6514	Valve spring retainer (12 required)
3	6513	Valve spring (12 required)
4	6A517	Valve stem seal (12 required)
5	6505	Intake valve (6 required)
6	6507	Exhaust valve (6 required)

Disassembly

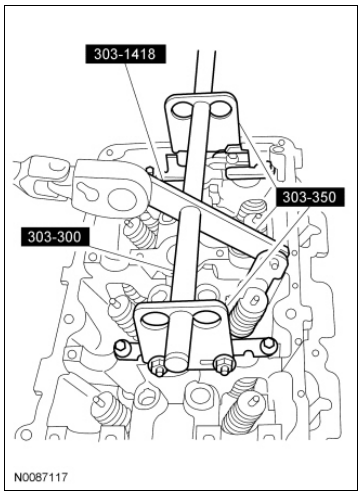
NOTICE: **If the components are to be reinstalled, they must be installed in the same positions. Mark the components removed for locations. If not reassembled in their original positions, severe engine damage may occur.**

1. Using the Valve Spring Compressors, remove the keys, retainer and spring.



2. Remove the valve from the cylinder head.

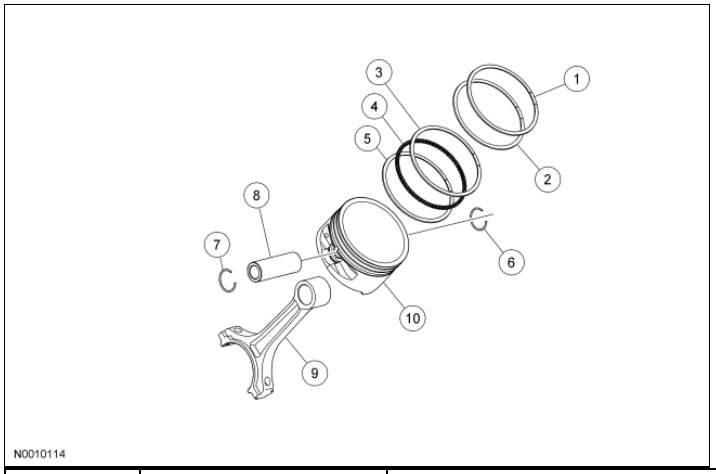
3. Remove the valve stem seal.



Assembly

1. Using the Valve Stem Oil Seal Installer, install the valve stem seal.

2. Install the valve.



3. Using the Valve Spring Compressors, install the valve spring, retainer and keys.

Piston

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canadr>XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	6150	Piston compression upper ring
2	6152	Piston compression lower ring
3	6159	Piston oil control upper segment ring
4	6161	Piston oil control spacer
5	6159	Piston oil control lower segment ring
6	6140	Piston pin retainer
7	6140	Piston pin retainer
8	6135	Piston pin
9	6200	Connecting rod
10	6110	Piston

Disassembly

1. Remove the piston rings from the piston.
   - Discard the piston rings.

2. Remove the 2 piston pin retainers and the piston pin.

3. **NOTE:** If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

   Separate the piston from the connecting rod.

4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

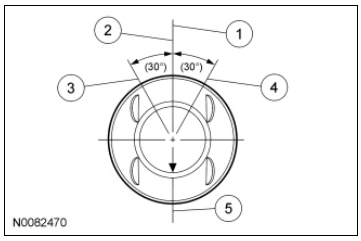
Assembly

1. Align the piston-to-connecting rod orientation marks and position the connecting rod in the piston.

2. Lubricate the piston pin and pin bore with clean engine oil.

3. Install the piston pin in the piston and connecting rod assembly.

4. Install the piston pin retaining clips in the piston.



5. Lubricate the piston and the new piston rings with clean engine oil.

6. **NOTE:** The piston compression lower ring should be installed with the "O" mark on the ring face pointing up toward the top of the piston.

   NOTE: When installing the piston oil control spacer, orient the gap such that the cut ends are pointed toward the top of the piston.

   Install the piston rings onto the piston as shown.

   1. Center line of the piston parallel to the wrist pin bore
   2. Upper compression ring gap location
   3. Upper oil control segment ring gap location
   4. Lower oil control segment ring gap location
   5. Expander ring and lower compression ring gap location

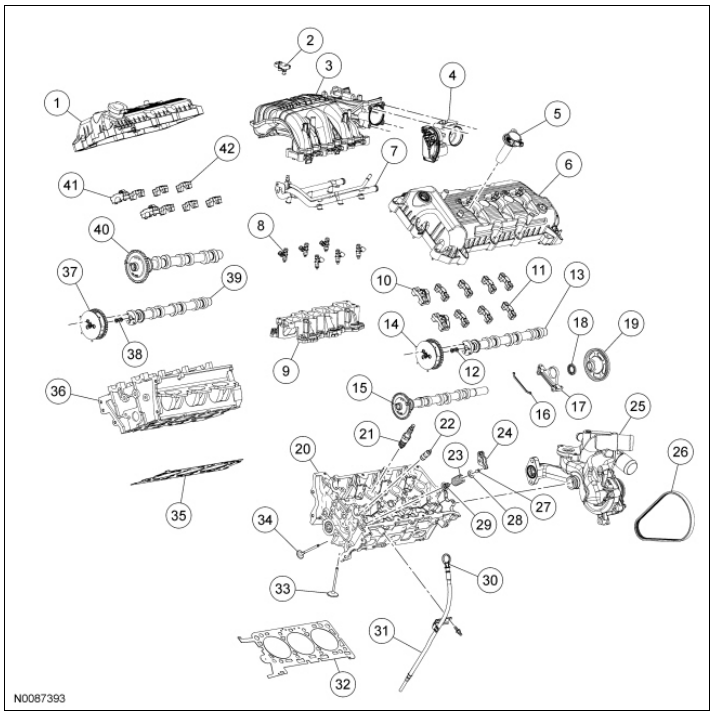
22	6687	Oil pan baffle

23	6714	Oil filter
24	6675	Oil pan
25	10300	Generator
26	6B209	Accessory drive belt tensioner
27	6700	Crankshaft front seal
28	6316	Crankshaft vibration damper
29	N806165	Crankshaft vibration damper washer
30	W701512	Crankshaft vibration damper bolt
31	6C315	Crankshaft Position (CKP) sensor
32	12K073	Camshaft Position (CMP) sensor (2 required)
33	6M280	Variable Camshaft Timing (VCT) solenoid (2 required)
34	6019	Front cover



Lower Engine Block (View 2)

Item	Part Number	Description
1	6150	Piston compression upper ring (6 required)
2	6152	Piston compression lower ring (6 required)
3	6159	Piston oil control upper segment ring (6 required)
4	6161	Piston oil control spacer (6 required)
5	6159	Piston oil control lower segment ring (6 required)
6	6140	Piston pin retainer (12 required)
7	6135	Piston pin (6 required)
8	6110	Piston (6 required)

9	6200	Connecting rod (6 required)
10	6211	Connecting rod upper bearing (6 required)
11	6211	Connecting rod lower bearing (6 required)
12	6210	Connecting rod cap (6 required)
13	6010	Cylinder block
14	6333	Cylinder block crankshaft main bearing (4 required)
15	6A341	Crankshaft upper thrust bearing
16	6303	Crankshaft
17	6333	Lower cylinder block crankshaft main bearings (3 required)
18	6337	Lower cylinder block crankshaft main thrust bearing
19	6F095	Lower cylinder block

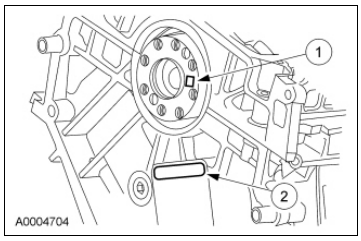
Cylinder Heads and Intake Manifolds

Item	Part Number	Description
1	6582	RH valve cover
2	9F479	Mass Air Flow (MAF) sensor
3	9424	Upper intake manifold
4	9F991	Throttle Body (TB)
5	12029	Coil-on-plug (6 required)
6	6A505	LH valve cover
7	9F792	Fuel rail
8	9F593	Fuel injector (6 required)
9	9424	Lower intake manifold
10	6B280	Camshaft thrust bearing cap

11	6B280	Camshaft bearing cap
12	6C683	LH Variable Camshaft Timing (VCT) system oil filter
13	6A267	LH intake camshaft
14	6C524	LH camshaft phaser and sprocket
15	6A269	LH exhaust camshaft
16	6B295	Camshaft oil seal retainer gasket
17	6B293	Camshaft oil seal retainer
18	-	Camshaft oil seal
19	6A359	Coolant pump drive pulley
20	6050	LH cylinder head
21	12405	Spark plug (6 required)
22	6C501	Hydraulic lash adjuster (24 required)
23	6513	Valve spring (24 required)
24	6529	Camshaft roller follower (24 required)
25	8501	Coolant pump housing
26	8K453	Coolant pump belt
27	6518	Valve spring retainer key (48 required)
28	6514	Valve spring retainer (24 required)
29	6A517	Valve stem seal (24 required)
30	-	Oil level indicator
31	6754	Oil leindicator tube
32	6083	LH cylinder head gasket
33	6507	Intake valve (24 required)
34	6505	Exhaust valve (24 required)
35	6051	RH cylinder head gasket
36	6050	RH cylinder head
37	6C524	RH camshaft phaser and sprocket
38	6C683	RH VCT system oil filter
39	6A266	RH intake camshaft
40	6A268	RH exhaust camshaft
41	6A268	Camshaft thrust bearing cap
42	6A258	Camshaft bearing cap

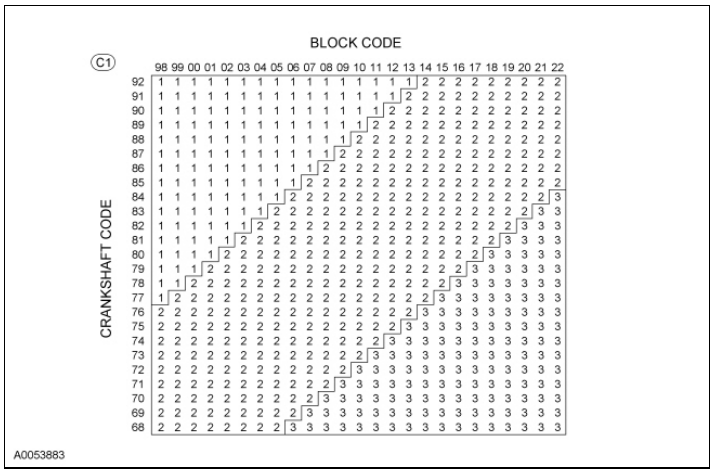
NOTICE: **During engine repair procedures, cleanliness is extremely important. All parts must be thoroughly cleaned and any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTICE: **If the oil pan was removed during engine disassembly, it must be installed after the engine and transaxle are assembled and the transaxle-to-engine bolts are installed. Failure to follow this assembly sequence can result in engine oil leaks.**



NOTE: Assembly of the engine requires various inspections/measurements of the engine components (engine block, crankshaft, connecting rods, pistons and piston rings). These inspections/measurements will aid in determining if the engine components will require replacement. For additional information, refer to Section 303-00 .

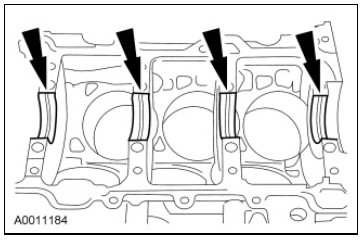
All engines



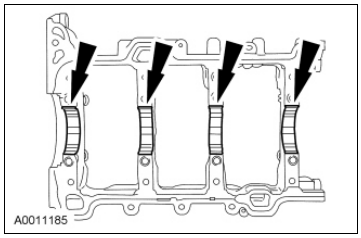
1. **NOTE:** This procedure is for selecting bearings using a new crankshaft.

   Select the crankshaft main bearings for each crankshaft journal.

   1. Read the code on the crankshaft flange.
   2. Read the code on the cylinder block rear face.
      - The first 2 numbers after the asterisk make up the code for main No. 1 and the next 2 numbers for main No. 2.
      - The first 2 numbers after the second asterisk make up the code for main No. 3 and the last 2 numbers for main No. 4.

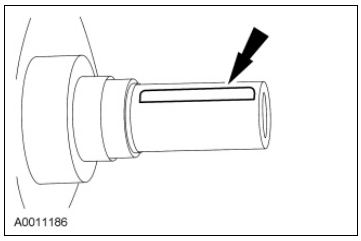


2. Using the chart, choose a bearing for each main. Match the block and crankshaft code with its corresponding column or row, by reading across the "crankshaft" row and down the "block" column.
   - For example: If the block code is *0609*0711* and the crankshaft code is *8580*8082*, main No. 1 should use grade 1 bearings, as determined by the intersection of the 06 block column and the 85 crankshaft row. Mains 2, 3 and 4 should all be grade 2.



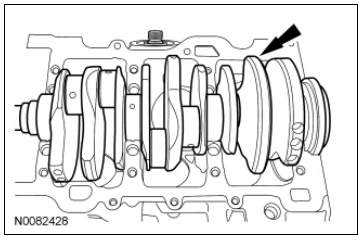
3. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

   Lubricate the upper crankshaft main bearings with clean engine oil and install the 4 crankshaft main bearings in the cylinder block.



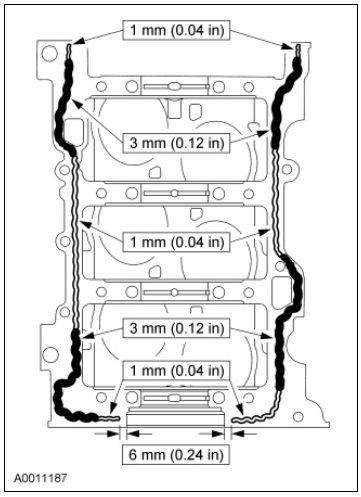
4. Lubricate the lower crankshaft main bearings with clean engine oil and install the 4 crankshaft main bearings in the lower cylinder block.

5. Lubricate the crankshaft thrust bearing with clean engine oil and install in the cylinder block.



6. Install the crankshaft key.

7. Apply clean engine oil to the crankshaft main and rod bearing journals.

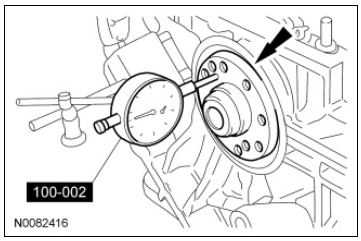


8. Position the crankshaft in the cylinder block.

9. ***NOTICE:*** **The lower cylinder block must be installed and the bolts tightened within 4 minutes of applying the sealant.**

   NOTE: Clean and degrease both surfaces using metal surface prep before applying sealant.

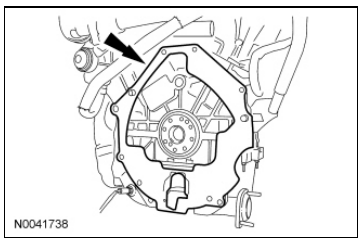
   Apply gasket and sealant to the cylinder block as shown.



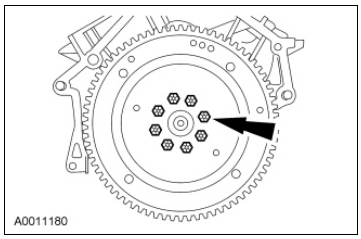
10. ***NOTICE:*** **Fasteners No. 5 through 8 are studs. Fasteners No. 18 through 22 are M8 x 1.25 mm x 79.3 mm (0.05 in x 3.12 in) bolts. Fasteners No. 1 through 4, 17 are M8 x 1.25 mm x 96 mm (0.05 in x 3.75 in) bolts. Fasteners 9 through 12 are M10 x 1.5 mm x 106.8 mm (0.06 in x 4.20 in) /M8 x 1.25 mm x 21.5 mm (0.05 in x 0.84 in) studs. Fasteners 13 through 16 are M10 x 1.5 mm x 106.5 mm (0.06 in x 4.17 in) bolts. The bolts and studs must be installed in the correct position or engine damage can result.**

    Position the lower cylinder block and install the new bolts and new studs.

    - Tighten the bolts and studs in the sequence shown in 4 stages.
    - Stage 1: Tighten fasteners 1 through 8 to 25 Nm (18 lb-ft).
    - Stage 2: Tighten fasteners 9 through 16 to 40 Nm (30 lb-ft).
    - Stage 3: Tighten fasteners 1 through 16 an additional 90 degrees.
    - Stage 4: Tighten fasteners 17 through 22 to 25 Nm (18 lb-ft).



11. Using the Dial Indicator Gauge with Holding Fixture, measure crankshaft end play.
    - Position the crankshaft to the rear of the cylinder block.
    - Zero the Dial Indicator Gauge with Holding Fixture.
    - Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.
    - Acceptable crankshaft end play is 0.100-0.255 mm (0.003-0.010 in). If the crankshaft end play exceeds the specified range, install new parts as necessary.



12. Using the Crankshaft Rear Main Oil Seal Installer and the Crankshaft Rear Main Oil Seal Installer Bolts, install the crankshaft rear oil seal.

13. Install the engine-to-transaxle separator plate.

14. Position the flexplate and install the bolts.
    - Tighten to 80 Nm (59 lb-ft).

15. Mount the engine on an engine stand.

16. Using the chart, select the correct piston grade size for the cylinder bores.
    - Measure the cylinder block bore diameter.
    - Mark the outside of the block with the appropriate number(s) to identify bore grade size.
    - Choose the correct piston grade size for the cylinder bore.

LITER	GRADE	CYLINDER BLOCK BORE DIAMETER	PISTON DIAMETER UNCOATED	PISTON DIAMETER COATED
3.0L	1	89.000-89.010	88.970-88.980	88.990-89.010
3.0L	2	89.010-89.020	88.978-88.992	88.998-89.022
3.0L	3	89.020-89.030	88.990-89.000	89.010-89.030
3.0L	1A	89.000-89.010	88.970-89.980	88.990-89.010
3.0L	2A	89.010-89.020	88.978-89.992	88.998-89.022
3.0L	3A	89.020-89.030	88.990-89.000	89.010-89.030

N0091569

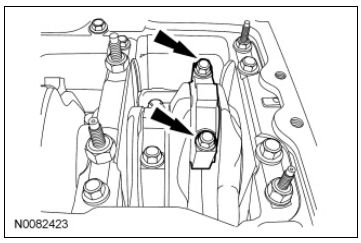
17. ***NOTICE:*** **Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.**

    NOTE: Lubricate the pistons, piston rings, connecting rod bearings and the entire cylinder bores with clean engine oil.

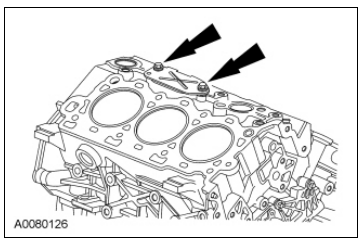
    NOTE: Make sure the piston rings are positioned to specifications for installation. For additional information, refer to Disassembly and Assembly of Subassemblies - Piston in this section.

    NOTE: Make sure the piston arrow on top is facing toward the front of the engine.

NOTE: After installation of each piston and connecting rod, rotate the crankshaft to verify smooth operation.



Using the Piston Ring Compressor and the Connecting Rod Installer, install the piston and connecting rod assemblies.

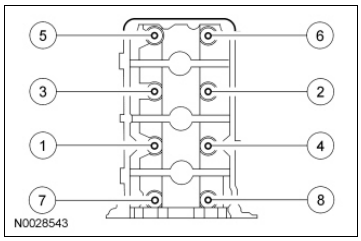


18. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

    Install the connecting rod caps and the new bolts.

    - Tighten the bolts in 2 stages.
    - Stage 1: Tighten to 23 Nm (17 lb-ft).
    - Stage 2: Tighten to 43 Nm (32 lb-ft).

19. Install the oil separator cover, a new gasket and the bolts.
    - Tighten to 10 Nm (89 lb-in).



20. **NOTE:** LH shown, RH similar.

    Position the new LH and RH cylinder heads and gaskets. Install new bolts and tighten in the sequence shown in 6 stages.

    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Tighten 90 degrees.

- Stage 3: Loosen one full turn.
- Stage 4: Tighten to 40 Nm (30 lb-ft).
- Stage 5: Tighten 90 degrees.
- Stage 6: Tighten 90 degrees.

21. Install the crankshaft pulley bolt and rotate the crankshaft keyway to the 11 o'clock position to locate Top Dead Center (TDC).

22. ***NOTICE:*** **The hydraulic lash adjusters must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    Install the hydraulic lash adjusters.

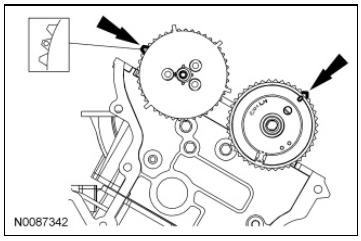
    - Lubricate the hydraulic lash adjusters with clean engine oil.

23. Apply clean engine oil to the LH and RH camshaft roller followers.

24. ***NOTICE:*** **The camshaft roller followers must be installed in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    NOTE: RH shown, LH similar.

    Install the LH and RH camshaft roller followers.

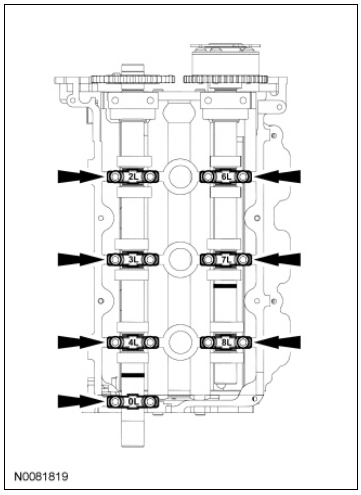


25. **NOTE:** LH shown, RH similar.

    Install the new LH and RH oil filter screens in the intake camshafts.

26. Position the camshaft phaser and sprockets onto the intake camshafts.
    - Install the 3 bolts finger-tight.

27. Lubricate the LH camshafts with clean engine oil and carefully position the camshafts onto the cylinder head.
    - Align the LH camshafts as shown.

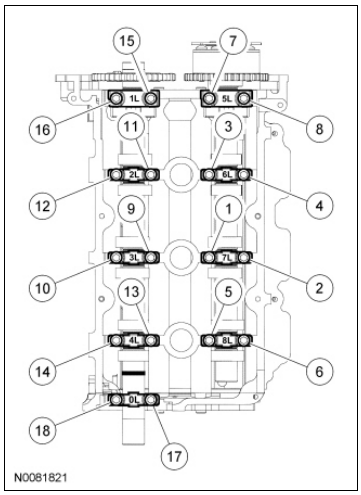


28. ***NOTICE:*** **Cylinder head camshaft journal caps and cylinder heads are numbered to verify that they are assembled in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    NOTICE: **Do not install the camshaft journal thrust caps until all of the camshaft bearing caps have been installed, or damage to the thrust caps can occur.**

    Lubricate the bearing surfaces of the LH camshaft bearing caps with clean engine oil and install the bearing caps.

    - Loosely install the bolts.



29. Lubricate the bearing surfaces of the LH camshaft bearing thrust caps with clean engine oil and install the bearing thrust caps.
    - Loosely install the bolts.

30. **NOTE:** Make sure to tighten the camshaft bearing cap bolts in sequence in 2 stages.

    Tighten the LH camshaft bearing cap bolts in the sequence shown in 2 stages.

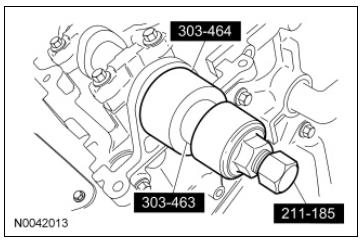
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Individually loosen and then tighten each camshaft bearing cap to 10 Nm (89 lb-in).

31. ***NOTICE:*** **Do not allow the camshaft to rotate from the neutral position while tightening the camshaft phaser and sprocket bolts or damage to the engine may occur.**

    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the intake camshaft to hold the camshaft in place for tightening of the camshaft phaser and sprocket bolts.

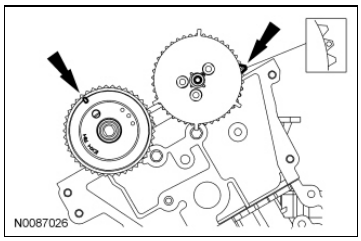
    Tighten the 3 LH camshaft phaser and sprocket bolts to 18 Nm (159 lb-in).

32. **NOTE:** Clean the sealing surface with metal surface prep before installing a new press-in-place gasket.



Install the camshaft oil seal retainer and the 2 bolts.

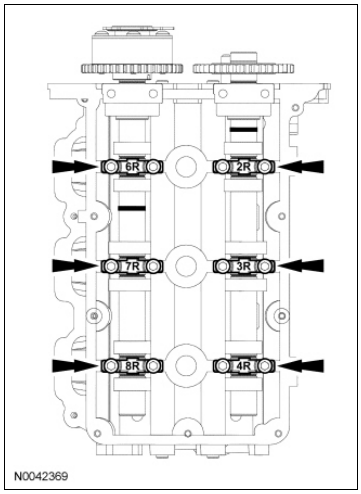
- Tighten to 10 Nm (89 lb-in).



33. **NOTE:** Apply clean engine oil to the seal lip and seal bore before installing the seal.

    Using the Power Steering Pump Pulley Installer, Camshaft Oil Seal Installer and the Camshaft Oil Seal Protector, install a new camshaft oil seal.

34. Lubricate the RH camshafts with clean engine oil and carefully position the camshafts onto the cylinder head.
    - Align the RH camshafts as shown.



35. ***NOTICE:*** **Cylinder head camshaft journal caps and cylinder heads are numbered to verify that they are assembled in their original positions. If not reassembled in their original positions, severe engine damage may occur.**

    NOTICE: **Do not install the camshaft journal thrust caps until all of the camshaft bearing caps have been installed or damage to the thrust caps can occur.**

    NOTE: Lubricate the bearing surfaces of the RH camshaft bearing caps with clean engine oil.

    Install the camshaft bearing caps.

    - Loosely install the bolts.

36. **NOTE:** Lubricate the bearing surfaces of the RH camshaft bearing thrust caps with clean engine oil.

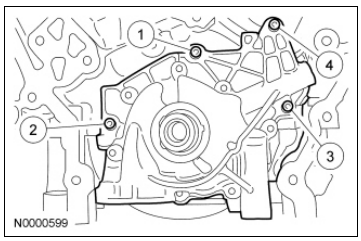
    Install the camshaft bearing thrust caps.

    - Loosely install the bolts.

37. **NOTE:** Make sure to tighten the camshaft bearing cap bolts in sequence in 2 stages.

    Tighten the RH camshaft bearing cap bolts in the sequence shown in 2 stages.

    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Individually loosen and then tighten each camshaft bearing cap to 10 Nm (89 lb-in).

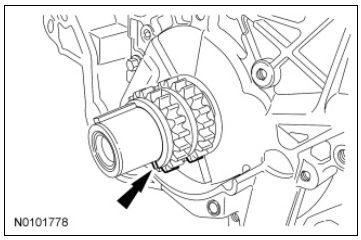


38. *NOTICE:* **Do not allow the camshaft to rotate from the neutral position while tightening the camshaft phaser and sprocket bolts or damage to the engine may occur.**

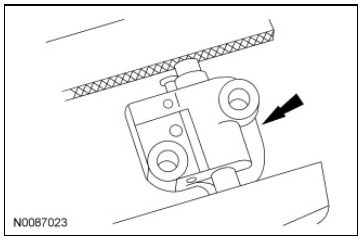
    NOTE: Install a 3/8-in ratchet and extension into the D-slot on the rear of the intake camshaft to hold the camshaft in place for tightening of the camshaft phaser and sprocket bolts.

    Tighten the 3 RH camshaft phaser and sprocket bolts to 18 Nm (159 lb-in).

39. Position the oil pump and install the bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

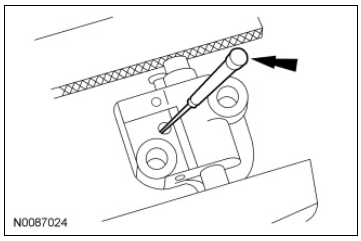


40. Remove the crankshaft pulley bolt.



41. *NOTICE:* **Failure to verify correct timing drive component alignment will result in severe engine damage.**

Install the crankshaft sprockets with the timing marks facing out. The timing mark on the LH and RH timing chains will be aligned to this mark during assembly.

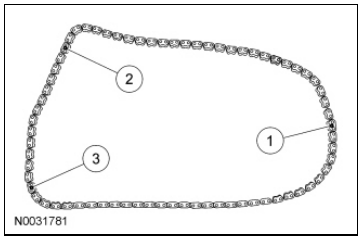


42. **NOTE:** LH shown, RH similar.

    Position the chain tensioner in a soft-jawed vise.

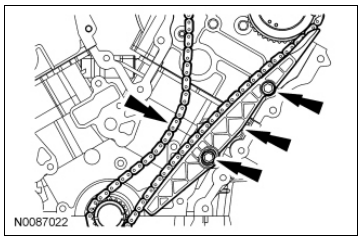
43. **NOTE:** LH shown, RH similar.

    Hold the chain tensioner ratchet lock mechanism away from the ratchet stem with a small pick.

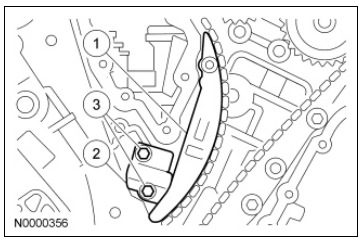


44. ***NOTICE:*** **During tensioner compression, do not release the ratchet stem until the tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.**

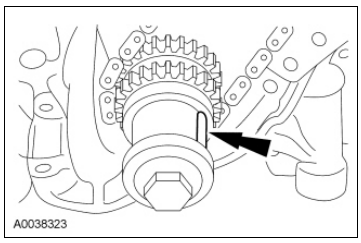
    Slowly compress the timing chain tensioner.



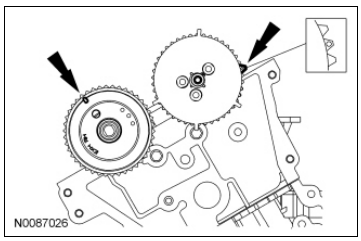
45. Retain the tensioner piston with a 1.5 mm (0.06 in) diameter wire or paper clip.



46. If timing marks in the timing chains are not evident, use a permanent-type marker to mark the crankshaft and camshaft timing marks on the LH and RH timing chains.
    1. Mark any link to use as the crankshaft timing mark.
    2. Starting with the crankshaft timing mark, count 29 links and mark the link.
    3. Continue counting to link 42 and mark the link.

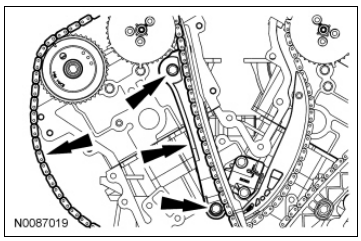


47. Position the LH timing chain and guide and install the bolts.
    - Tighten to 25 Nm (18 lb-ft).
    - Align the marks on the timing chain with the marks on the camshaft and crankshaft sprockets.

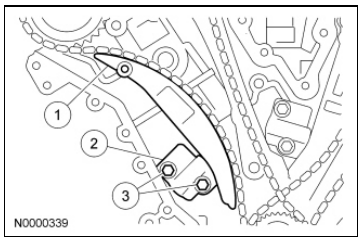


48. Install the LH timing chain tensioner arm and the LH timing chain tensioner.
    1. Install the tensioner arm.
    2. Position the tensioner.
    3. Install the bolts.
    - Tighten to 25 Nm (18 lb-ft).

49. Install the crankshaft pulley bolt and rotate the crankshaft clockwise 120 degrees until the crankshaft keyway is in the 3 o'clock position.



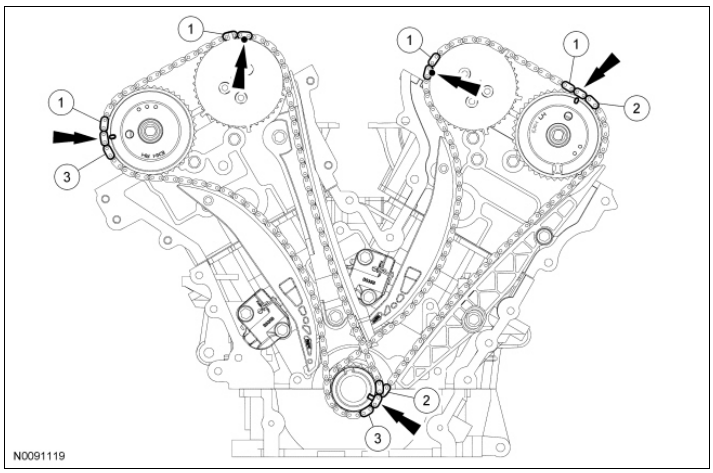
50. Verify that the RH camshafts are correctly positioned.



51. Install the RH timing chain and chain guide and install the bolts.
    - Tighten to 25 Nm (18 lb-ft).

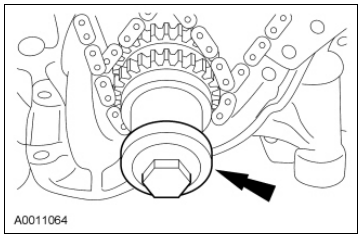
- Align the marks on the timing chain with the marks on the camshaft and crankshaft sprockets.

52. Install the RH timing chain tensioner and tensioner arm.
    1. Install the tensioner arm.
    2. Position the tensioner.
    3. Install the bolts.
    - Tighten to 25 Nm (18 lb-ft).



53. Remove the LH and RH timing chain tensioner piston retaining wires.

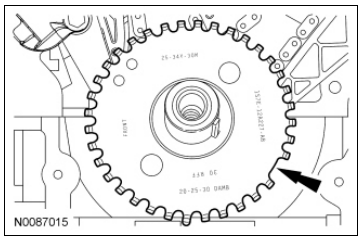
54. Rotate the crankshaft counterclockwise 120 degrees to TDC .



55. ***NOTICE:*** **Failure to verify correct timing drive component alignment will result in severe engine damage.**

    Verify the timing with the following steps.

    1. There should be 12 chain links between the camshaft timing marks.
    2. There should be 27 chain links between the camshaft and the crankshaft timing marks.
    3. There should be 30 chain links between the camshaft and the crankshaft timing marks.



56. Remove the crankshaft pulley bolt and washer.

57. **NOTE:** This pulse wheel is used in several different engines. Install the pulse wheel with the keyway in the slot stamped "30RFF" only (orange in color).

    Install the ignition pulse wheel.

58. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs, damage can occur to the cylinder head or spark plug.**

    Install the LH and RH spark plugs.

    - Tighten to 15 Nm (133 lb-in).

59. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

    NOTICE: **Do not damage the oil pan gasket while cleaning the sealant from the lower cylinder block-to-oil pan joint.**

    Use a plastic scraping tool to remove all traces of sealant.

    - Clean all sealing surfaces with metal surface prep and install new gaskets.

60. **NOTE:** Clean and degrease the sealing surfaces with metal surface prep before applying gasket and sealant.

    NOTE: The front cover must be installed and the bolts tightened within 4 minutes of sealant application.

    Apply a 6 mm (0.24 in) dot of silicone gasket and sealant to the cylinder block to lower cylinder block and cylinder head mating surfaces.

61. **NOTE:** Fasteners 4 and 13 are stud bolts.

    Position the front cover and install the bolts and stud bolts.

    - Tighten in the sequence shown to 25 Nm (18 lb-ft).

62. **NOTE:** Note the position of the alignment dowel on the engine front cover.

    Install the 2 bolts and the LH Variable Camshaft Timing (VCT) solenoid.

    - Tighten to 10 Nm (89 lb-in).

63. **NOTE:** Note the position of the alignment dowel on the engine front cover.

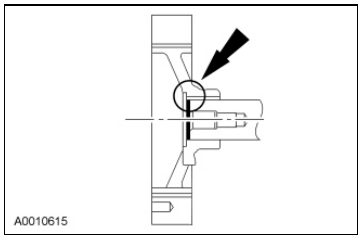
    Install the 2 bolts and the RH VCT solenoid.

    - Tighten to 10 Nm (89 lb-in).

64. **NOTE:** Clean all sealing surfaces with metal surface prep.

    Apply clean engine oil to the seal lip and seal bore before installing the seal.

65. Using the Front Cover Oil Seal Installer and the Crankshaft Vibration Damper Installer, install a new crankshaft front seal.

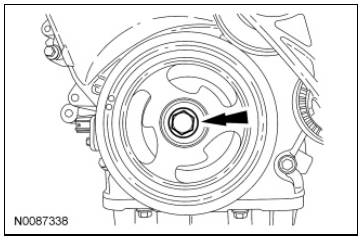


66. **NOTE:** Clean the keyway and slot using metal surface prep before applying silicone gasket and sealant.

    NOTE: Sealing surfaces must be free of dirt and oil.

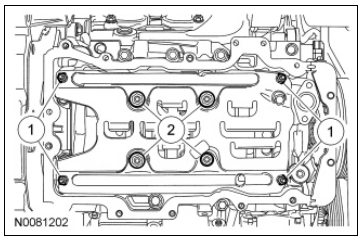
    NOTE: The crankshaft pulley must be installed and the bolt tightened within 4 minutes of sealant application.

    Apply silicone gasket and sealant to the end of the crankshaft pulley keyway slot.

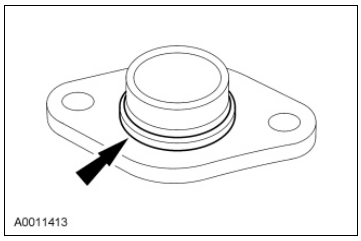


67. **NOTE:** Lubricate the outside diameter sealing surface with clean engine oil.

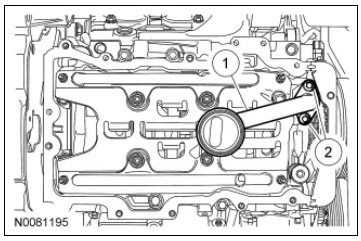
    Using the Crankshaft Vibration Damper Installer, install the crankshaft pulley.



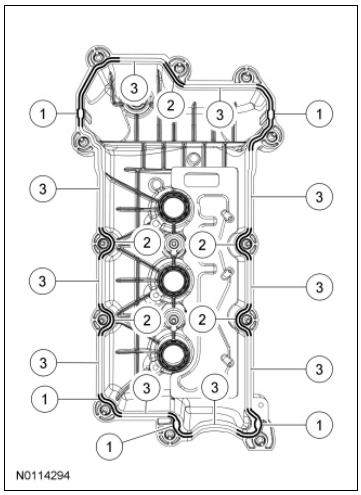
68. Install the bolt and washer. Tighten the bolt in 4 stages:
    - Stage 1: Tighten to 120 Nm (89 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.



69. Install the belt tensioner and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

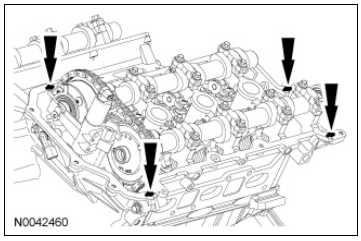


70. Install the 8 nuts and the oil pan baffle.
    1. Tighten the 4 M6 oil pan baffle nuts in 2 stages.
        - ♦ Stage 1: Tighten to 5 Nm (44 lb-in).
        - ♦ Stage 2: Tighten an additional 45 degrees.
    2. Then install and tighten the 4 M8 oil pan baffle nuts in 2 stages.
        - ♦ Stage 1: Tighten to 15 Nm (133 lb-in).
        - ♦ Stage 2: Tighten an additional 45 degrees.



71. Install a new O-ring seal on the oil pump screen and pickup tube.
    - Lubricate the O-ring seal with clean engine oil.

72. Install the oil pump screen and pickup tube.
    1. Position the oil pump screen and pickup tube.
    2. Install the 2 bolts and tighten to 10 Nm (89 lb-in).

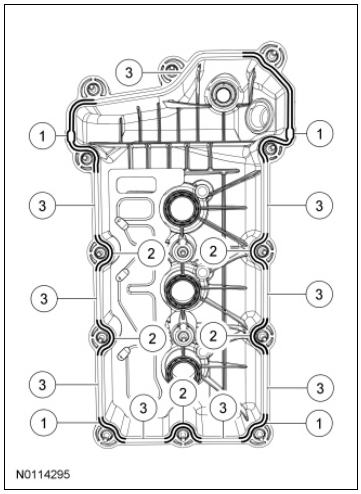


73. Install the new gasket in the LH valve cover in the following sequence.
    1. Install the gasket at waffle pads and then the corners.
    2. Install the gasket around bolt holes.
    3. Install the remaining part of the gasket.

74. **NOTE:** The valve cover must be installed and the bolts and studs tightened within 4 minutes of sealant application.

    NOTE: Clean cylinder head and front cover surface and the cam seal retainer-to-cylinder head surface using metal surface prep before applying silicone gasket and sealant.

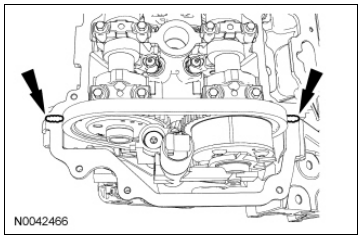
    Apply an 8 mm (0.31 in) dot of silicone gasket and sealant at the cylinder block to front cover mating surface and the cam seal retainer-to-cylinder head joints.



75. **NOTE:** Install a new valve cover gasket.

    Position the LH valve cover and install the bolts and stud bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

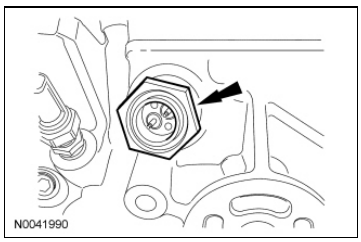


76. Install the new gasket in the RH valve cover in the following sequence.
    1. Install the gasket at waffle pads and then the corners.
    2. Install the gasket around bolt holes.
    3. Install the remaining part of the gasket.

77. **NOTE:** The valve cover must be installed and the bolts and stud bolts tightened within 4 minutes of sealant application.

    NOTE: Clean cylinder head and front cover surface using metal surface prep before applying silicone gasket and sealant.

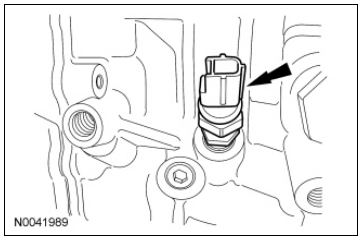
    Apply an 8 mm (0.31 in) dot of silicone gasket sealant to the front cover-to-cylinder head joints.



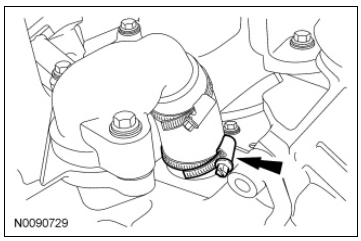
78. **NOTE:** Install a new valve cover gasket.

    Position the RH valve cover and install the bolts and stud bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).



79. If equipped, install the block heater.
    - Tighten to 21 Nm (15 lb-ft).

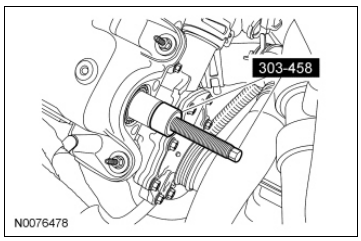


80. **NOTE:** Apply thread sealant with PTFE to the Engine Oil Pressure (EOP) switch threads.

    Install the EOP switch.

    - Tighten to 14 Nm (124 lb-in).

81. Position the coolant pump housing and attach the coolant hose.
    - Tighten the clamp to 7 Nm (62 lb-in).

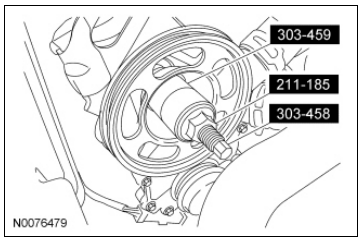


82. Install the 5 coolant pump housing bolts.
    - Tighten to 10 Nm (89 lb-in).

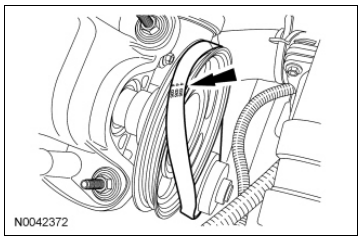
83. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**

    Install the Camshaft Pulley Installer in the camshaft as shown in the illustration.

    - Adjust the collar on the Camshaft Pulley Installer screw to get the best thread engagement in the rear of the camshaft.



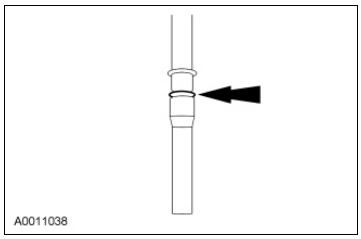
84. ***NOTICE:*** **Failure to use the correct special tools, assembled as shown in the illustration, will result in damage to the coolant pump pulley and/or special tools.**



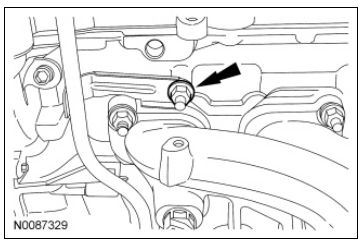
NOTE: Only the roller collared nut from the Power Steering Pump Pulley Installer (211-185) is used on Camshaft Pulley Installer (303-485).

Position the coolant pump pulley over the previously installed Camshaft Pulley Installer and on the end of the camshaft. Install the Camshaft Pulley Installer, Power Steering Pump Pulley Installer and the Water Pump Pulley Spacer as shown in the illustration.

- Using the Camshaft Pulley Installer, Power Steering Pump Pulley Installer and the Water Pump Pulley Spacer, install a new service coolant pump pulley flush with the end of the camshaft.



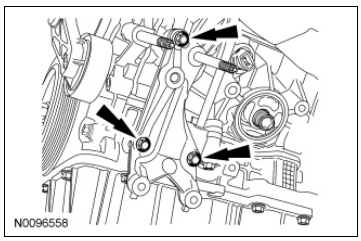
85. Install the coolant pump belt on the coolant pump pulley and position it on the camshaft pulley.



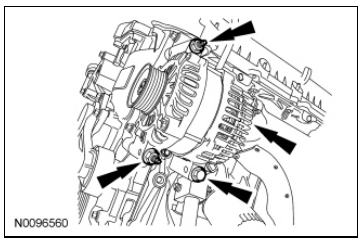
86. ***NOTICE:*** **Do not use any screwdrivers, pliers or other metal objects that could cause damage to the belt or camshaft pulley while installing the belt.**

    Rotate the crankshaft clockwise to seat the water pump belt on the camshaft pulley.

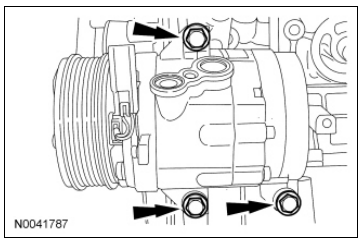
87. Install a new O-ring on the oil level indicator tube. Apply clean engine oil to the O-ring.



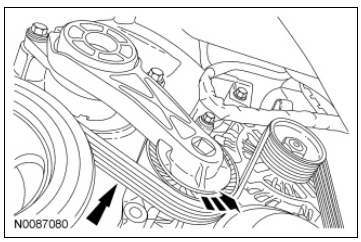
88. Position the oil level indicator and tube and install the stud bolt.
    - Tighten to 9 Nm (80 lb-in).



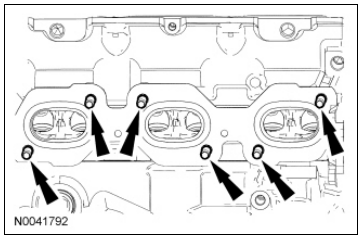
89. Install the 3 bolts and the A/C compressor bracket.



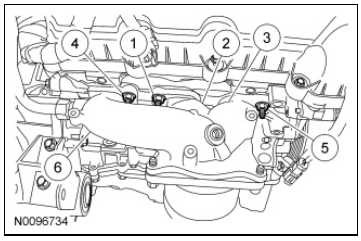
- Tighten to 25 Nm (18 lb-ft).



90. Position the generator and install the bolt and 2 nuts.
    - Tighten to 47 Nm (35 lb-ft).

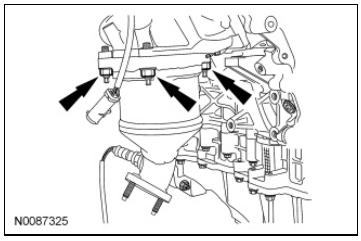


91. Install the A/C compressor and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

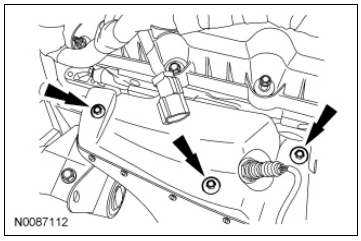


92. Rotate the accessory drive belt tensioner counterclockwise and install the accessory drive belt.

93. Install 6 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).



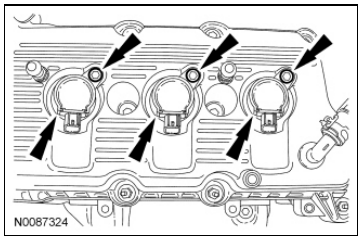
94. Install a new gasket and the RH exhaust manifold and new nuts.
    - Tighten the nuts in 2 stages in the sequence shown.
        - ♦ Stage 1: Tighten to 20 Nm (177 lb-in).
        - ♦ Stage 2: Tighten to 20 Nm (177 lb-in).



Front Wheel Drive (FWD)

95. Install a new gasket and the RH catalytic converter and the 3 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

96. Install the 3 bolts and the RH heat shield.
    - Tighten to 10 Nm (89 lb-in).



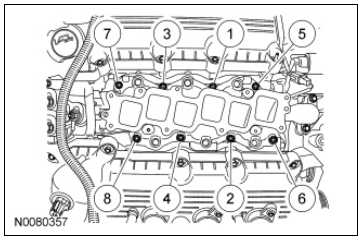
All engines

97. **NOTE:** LH shown, RH similar.

    Apply a light film of silicone brake caliper grease and dielectric compound to the interior of the spark plug boot prior to installation.

    Install the 6 coil-on-plugs and the bolts.

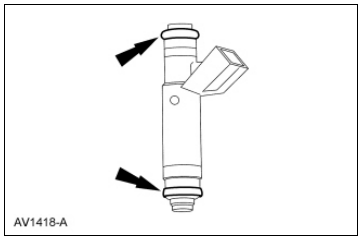
    - Tighten to 6 Nm (53 lb-in).



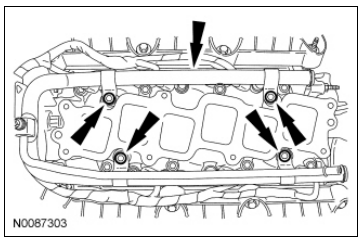
98. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

NOTE: Clean and inspect all sealing surfaces. Install new gaskets.

Position the lower intake manifold and install the 8 bolts.



- Tighten in the sequence shown to 10 Nm (89 lb-in).

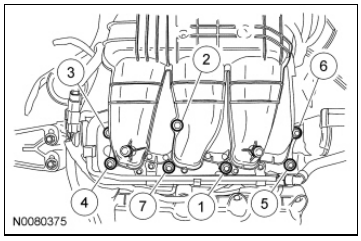


99. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.**

    Install new fuel injector O-rings.

    - Separate the fuel injectors from the fuel rail.
    - Remove and discard the fuel injector O-rings.
    - Install new O-rings and lubricate with clean engine oil.
    - Install the fuel injectors onto the fuel rail.

100. Install the 4 bolts and the fuel rail and injectors assembly.
    - Tighten to 10 Nm (89 lb-in).

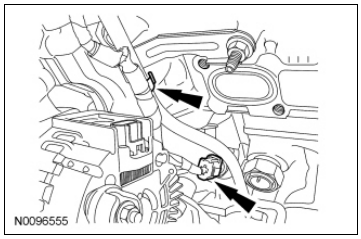


101. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

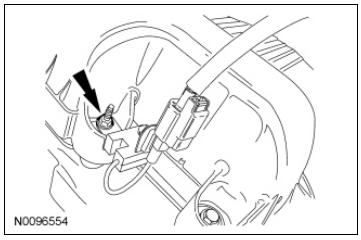
    NOTE: Clean and inspect all sealing surfaces. Install new gaskets.

    Position the upper intake manifold and install the 7 bolts.

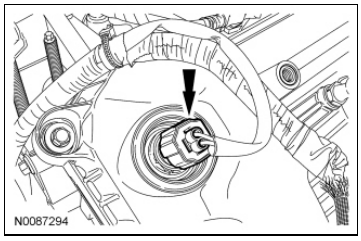
    - Tighten the bolts in 2 stages in the sequence shown.
        - ♦ Stage 1: Tighten to 10 Nm (89 lb-in).
        - ♦ Stage 2: Tighten an additional 45 degrees.



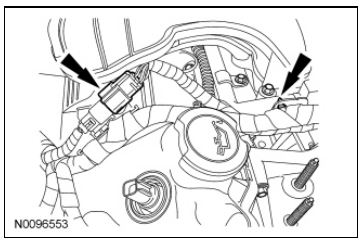
102. Loosen the upper intake manifold bracket lower bolt. Install the upper bolts (1 shown), then tighten all the bolts.
    - Tighten to 10 Nm (89 lb-in).



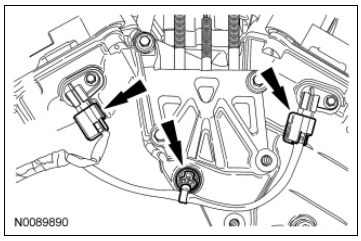
103. Connect the 3 LH coil-on-plug electrical connectors.
    - Attach the 2 wiring harness retainers.



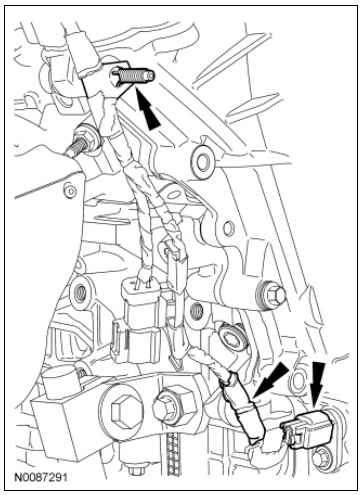
104. Connect the Engine Oil Pressure (EOP) switch electrical connector and attach the wiring retainer to the oil indicator tube.



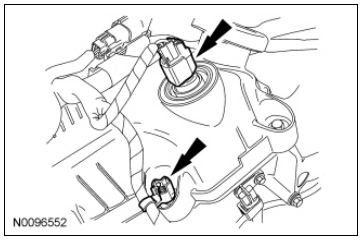
105. Install the radio interference capacitor and the nut.
    - Tighten to 6 Nm (53 lb-in).



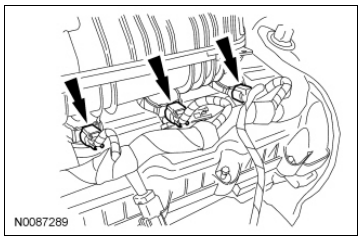
106. Connect the LH VCT electrical connector.



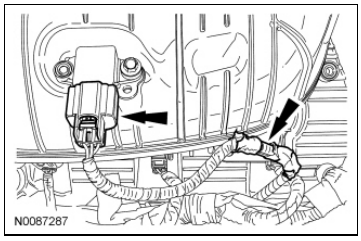
107. Connect the fuel injector wiring harness electrical connector and attach the wiring harness retainer.



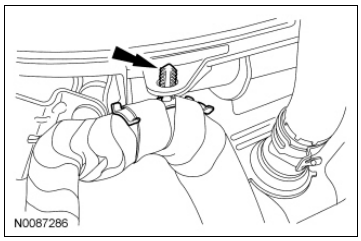
108. Connect the 2 Camshaft Position (CMP) sensor electrical connectors and attach the wiring harness retainer from the engine front cover stud bolt.



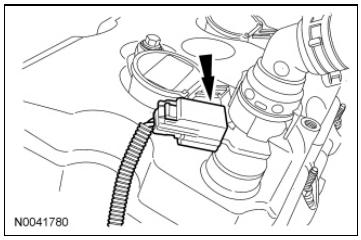
109. Connect the Crankshaft Position (CKP) sensor electrical connector and attach the 2 wiring harness retainers.



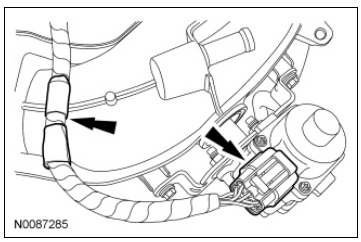
110. Connect the RH VCT electrical connector and attach the wiring harness retainer to the valve cover stud bolt.



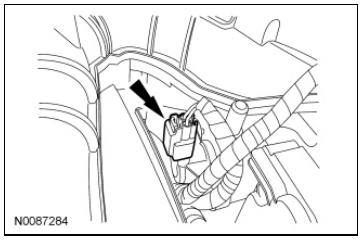
111. Connect the RH coil-on-plug electrical connectors.
    - Attach the 2 wiring harness retainers.



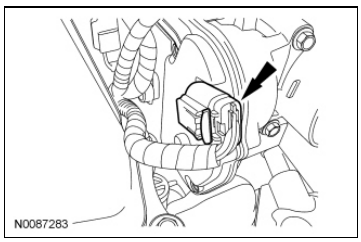
112. Connect the Manifold Absolute Pressure (MAP) electrical connector and attach the wiring retainer.



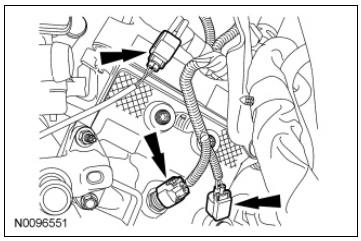
113. Attach the wiring harness retainer to the upper intake manifold.



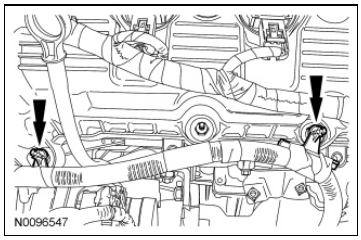
114. Connect the PCV valve electrical connector.



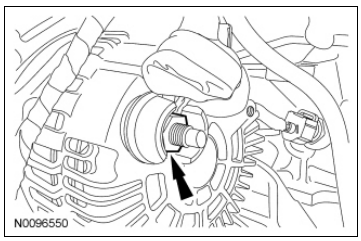
115. Connect the EGR regulator electrical connector and attach the wiring retainer.



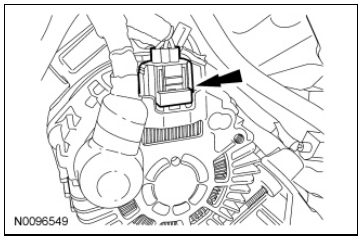
116. Connect the Evaporative Emission (EVAP) canister purge valve electrical connector.



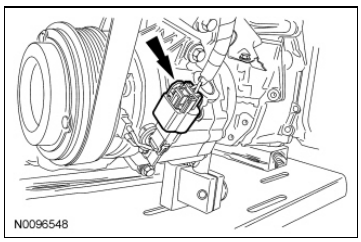
117. Connect the electronic throttle control electrical connector.



118. Connect the 3 engine wiring connectors.
    - Connect the engine block Knock Sensor (KS) electrical connector.
    - Connect the Cylinder Head Temperature (CHT) sensor electrical connector.
    - Connect the cylinder head KS electrical connector.

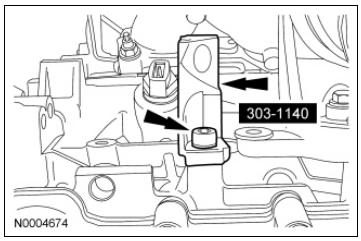


119. Position the B+ wiring harness and attach the 2 harness retainers to the valve cover stud bolts.

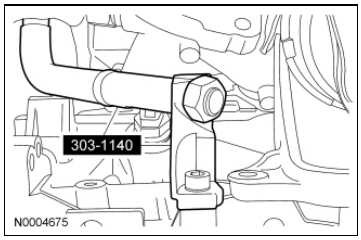


120. Install the B+ wire and nut on the generator.
    - Tighten to 8 Nm (71 lb-in).

121. Connect the generator electrical connector.

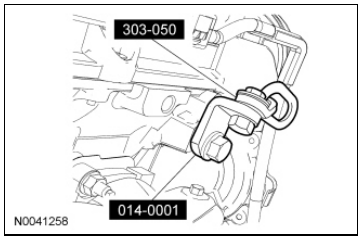


122. Connect the A/C compressor clutch electrical connector.

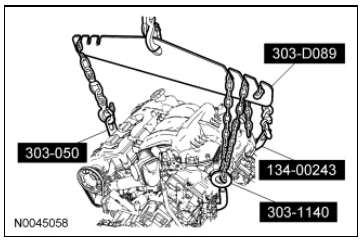


123. **NOTE:** When installing the lower half of the lifting bracket it will be easier to loosely install the upper bolt first then install the lower bolt.

    Install the lower half of the Engine Lifting Bracket Set.

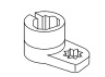


124. Install the upper half of the Engine Lifting Bracket Set.



125. Install the Engine Lifting Bracket.

126. Install the Engine Lifting Bracket and the Universal Adapter Bracket.



127. Using the Spreader Bar, Engine Lifting Brackets, Engine Lifting Bracket Set and a suitable engine crane, remove the engine from the engine stand.

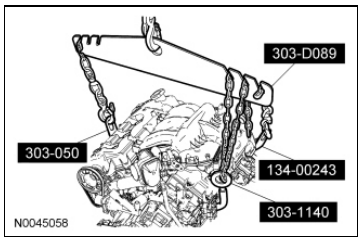
Engine

Special Tool(s)

 ST2873-A	Engine Lifting Bracket Set 303-1140
 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E or equivalent
 ST2793-A	Lifting Bracket, Engine 303-050 (T70P-6000)
 ST2463-A	Lifting Brackets, Engine 134-00243 or equivalent
 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent
 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent
 ST2743A	Adjustable Grip Arm, 1735A 014-00001 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

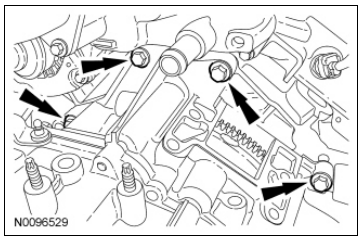
Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



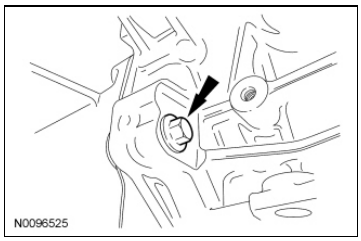
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Installation

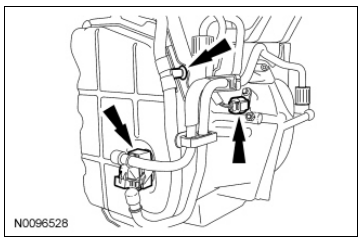


NOTICE: **If the oil pan was removed during engine disassembly, it must be installed after engine and transaxle are assembled and the transaxle-to-engine bolts are installed. Failure to follow this assembly sequence can result in engine oil leaks.**

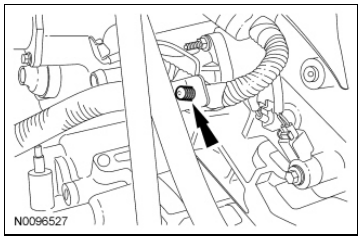
All vehicles



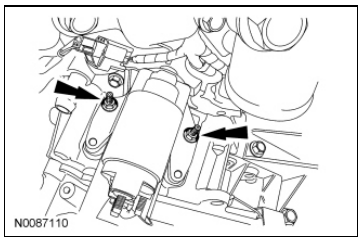
1. Using the Spreader Bar, Engine Lifting Brackets, Engine Lifting Bracket Set and a suitable engine crane, align the transaxle to the engine.



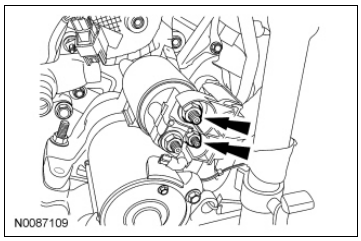
2. Install the 4 transaxle-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).



3. Install the transaxle-to-engine bolt.
   - Tighten to 48 Nm (35 lb-ft).



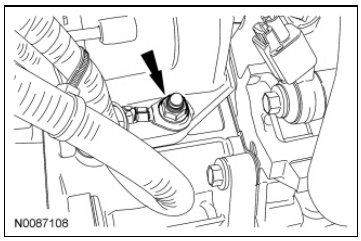
4. Connect the 2 transmission electrical connectors and attach the wiring harness retainer to the stud bolt.



5. Attach the wiring harness retainer to the transmission indicator tube.

6. Install the starter and the 2 stud bolts.
    - Tighten to 27 Nm (20 lb-ft).

7. Install the starter wiring and the 2 nuts.
    - Tighten the small starter motor solenoid wire nut to 5 Nm (44 lb-in).
    - Tighten the large starter motor solenoid battery cable nut to 12 Nm (106 lb-in).

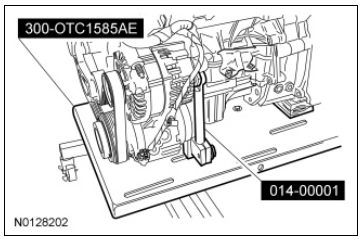


8. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

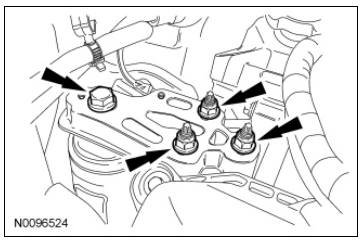
    Use a plastic scraping tool to remove all traces of the oil pan gasket.

    - Clean all sealing surfaces with metal surface prep and install a new oil pan gasket.

9. Install the starter wiring ground wire and nut.
    - Tighten to 18 Nm (159 lb-in).

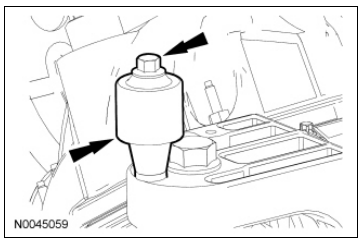


10. Using the Spreader Bar, Engine Lifting Brackets, Engine Lifting Bracket Set and a suitable engine crane, position the engine and transaxle onto the lift table.

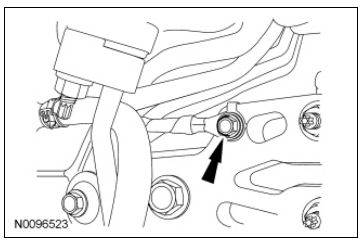


11. **NOTE:** Position a suitable block of wood under the transaxle.

    Install the Adjustable Grip Arm and the Powertrain Lift to the engine.

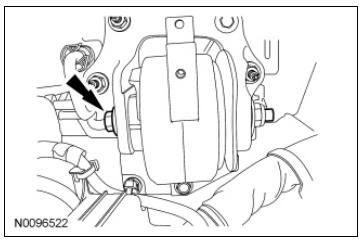


12. Raise the engine and transaxle up into the vehicle.

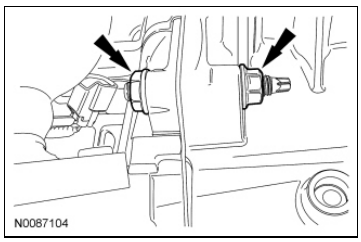


13. Install the engine support insulator bracket, 3 nuts and the bolt.
    - Tighten the nuts to 63 Nm (46 lb-ft).
    - Tighten the bolt to 115 Nm (85 lb-ft).

14. Install the damper and bolt.
    - Tighten to 23 Nm (17 lb-ft).

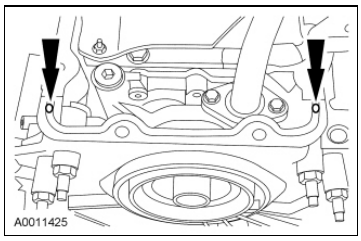


15. Install the ground strap and bolt on the engine mount bracket.
    - Tighten to 10 Nm (89 lb-in).



16. Install the rear transaxle support through bolt.

- Tighten to 103 Nm (76 lb-ft).

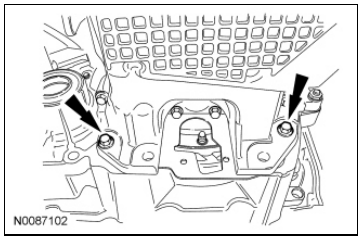


17. Install the transaxle-to-engine stud and 2 nuts.
    - Tighten to 48 Nm (35 lb-ft).

18. **NOTE:** Clean and degrease all sealing surfaces with metal surface prep.

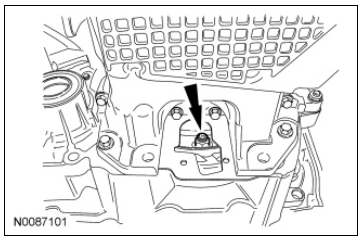
    NOTE: The oil pan must be installed and the bolts tightened within 4 minutes of the sealant application.

    Apply a 10 mm (0.39 in) dot of silicone gasket and sealant to the front cover-to-cylinder block sealing surface.

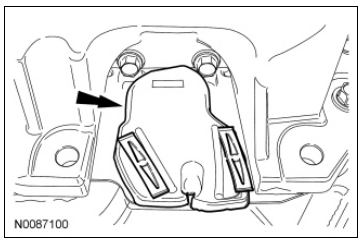


19. **NOTE:** Install a new oil pan gasket.

    Position the oil pan and gasket and loosely install the bolts and stud bolts.

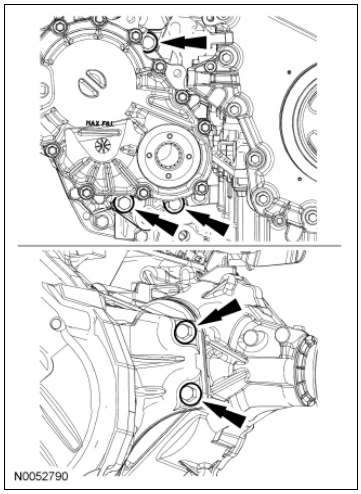


20. Install the 2 oil pan-to-transaxle bolts.
    - Tighten to 40 Nm (30 lb-ft).

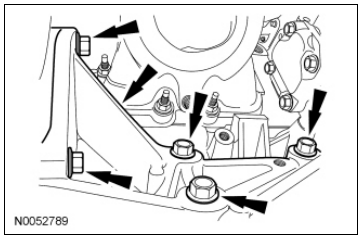


21. Tighten the oil pan bolts in the sequence shown to 25 Nm (18 lb-ft).

22. Install the 4 torque converter nuts.
    - Tighten to 40 Nm (30 lb-ft).

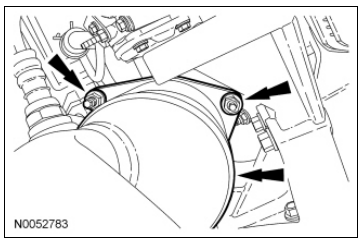


23. Install the access cover.

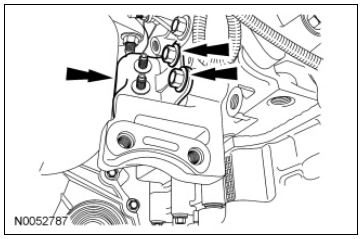


All-Wheel Drive (AWD) vehicles

24. Install the Power Transfer Unit (PTU) and the 5 bolts.
    - Tighten to 90 Nm (66 lb-ft).

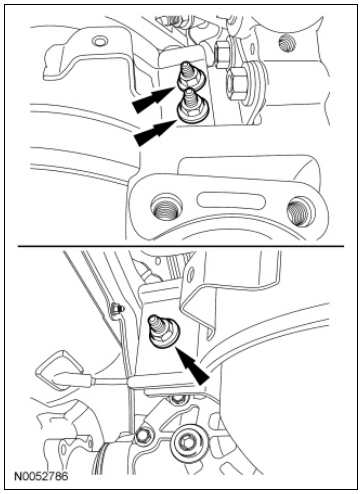


25. Install the PTU support bracket and the 5 bolts.
    - Tighten to 55 Nm (41 lb-ft).

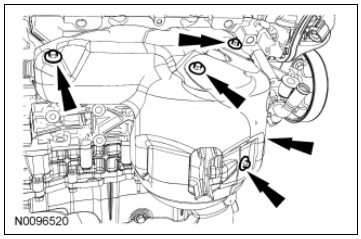


26. **NOTE:** A new PTU seal must be installed whenever the intermediate shaft is removed.

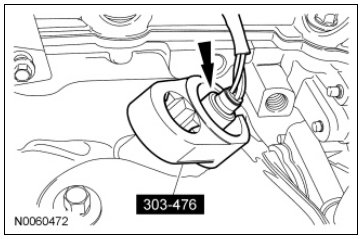
    Install a new PTU seal. For additional information, refer to Section 308-07B .



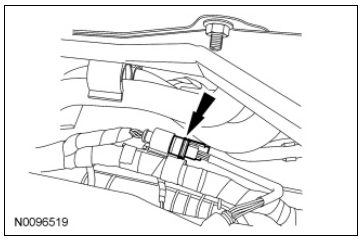
27. Using a new gasket, install the RH catalytic converter and 3 new nuts.
    - Tighten to 40 Nm (30 lb-ft).



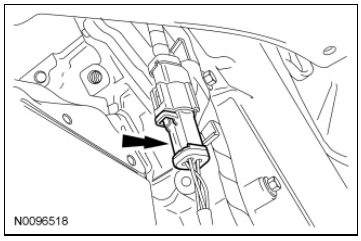
28. Install the RH exhaust heat shield bracket (inboard half) and the 2 bolts.
    - Tighten to 40 Nm (30 lb-ft).



29. Install the RH exhaust heat shield bracket (outboard half) and the 3 nuts.
    - Tighten to 20 Nm (177 lb-in).

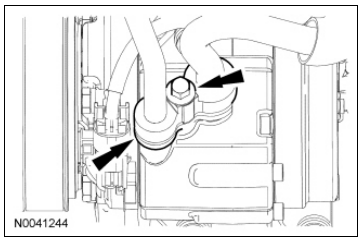


30. Install the RH exhaust heat shield and the 6 bolts.
    - Tighten to 10 Nm (89 lb-in).

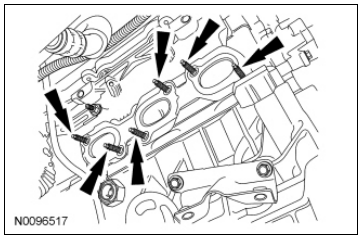


31. Using the Exhaust Gas Oxygen Sensor Socket, install the RH Heated Oxygen Sensor (HO2S).
    - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
    - To install, tighten to 48 Nm (35 lb-ft).

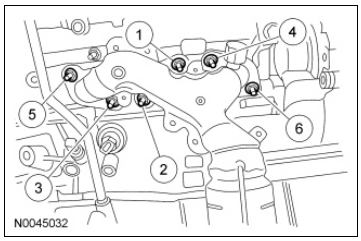
32. Connect the RH HO2S electrical connector.



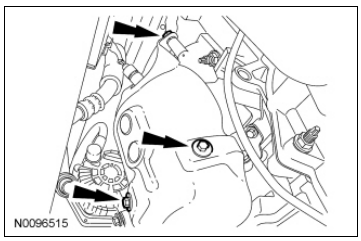
33. Connect the RH Catalyst Monitor Sensor (CMS) electrical connector.



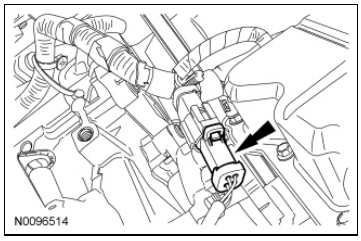
All vehicles



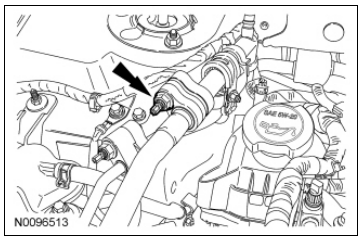
34. Position the A/C manifold onto the A/C compressor and install the bolt.
    - Install a new gasket.
    - Tighten to 15 Nm (133 lb-in).



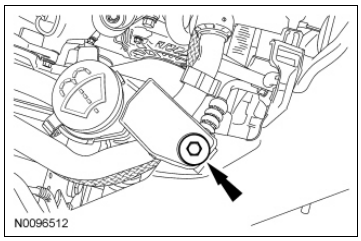
35. Install 6 new LH catalytic converter studs.
    - Tighten to 12 Nm (106 lb-in).



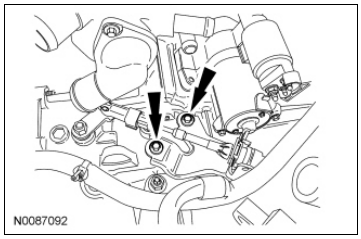
36. Install a new gasket, the LH catalytic converter and 6 new nuts.
    - Tighten to 20 Nm (177 lb-in) in the sequence shown.



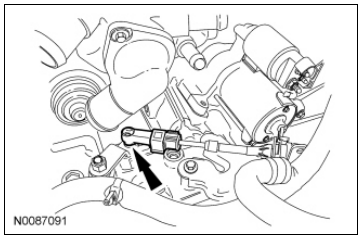
37. Install the heat shield and the 4 bolts (3 shown).
    - Tighten to 10 Nm (89 lb-in).



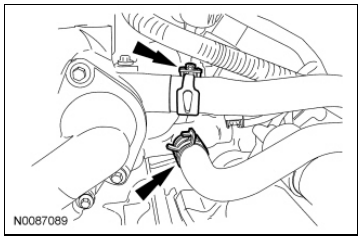
38. Connect the LH CMS electrical connector.



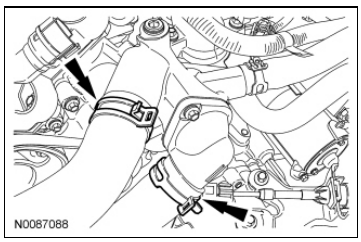
39. Connect the A/C tube and install the nut.
    - Install a new gasket.
    - Tighten to 8 Nm (71 lb-in).



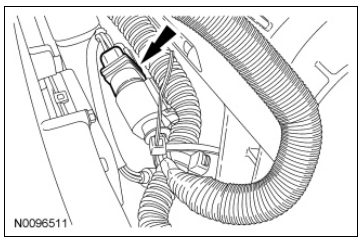
40. Install the A/C tube/windshield washer bottle bracket bolt.
    - Tighten to 10 Nm (89 lb-in).



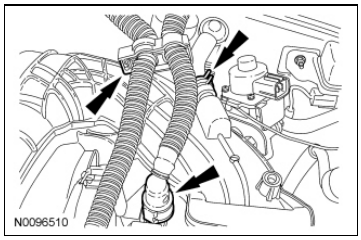
41. Position the transaxle control cable bracket in place, install the 2 bolts.
    - Tighten to 23 Nm (17 lb-ft).



42. Connect the gearshift cable to the transaxle.



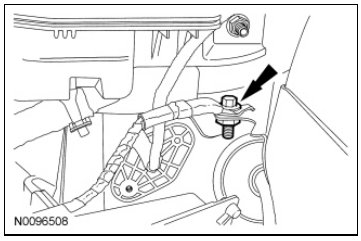
43. Connect the 2 heater hoses.



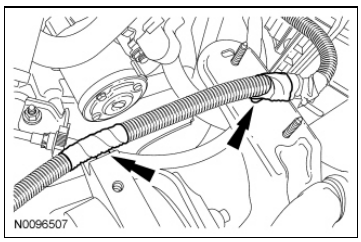
44. Connect the upper and lower radiator hoses.

45. Connect the LH HO2S electrical connector.

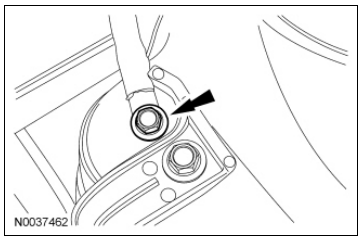
46. Connect the Evaporative Emission (EVAP) tube-to- EVAP canister purge valve quick connect coupling and the brake booster vacuum tube to the upper intake manifold.
    - Attach the fuel tube and EVAP tube-to- EVAP canister purge valve tube retainer to the upper intake manifold.



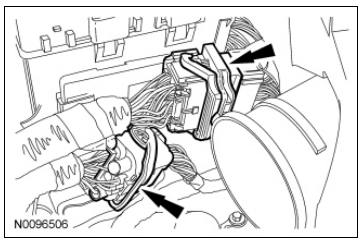
47. Connect the fuel supply tube to the fuel rail. For additional information, refer to Section 310-00 .



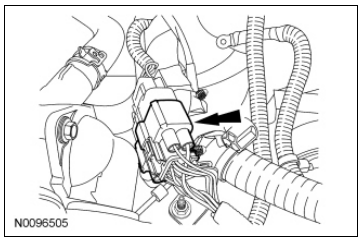
48. Connect the 3 PCM electrical connectors.



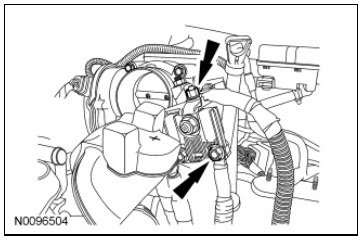
49. Position the PCM ground wire and install the bolt.
    - Tighten to 10 Nm (89 lb-in).



50. Attach the 2 wiring harness retainers to the battery tray bracket and transaxle mount.

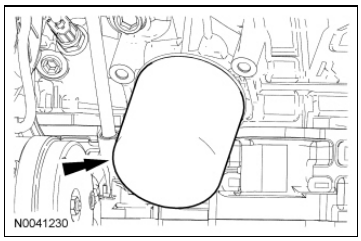


51. Install the ground wire-to-inner fender and bolt.
    - Tighten to 10 Nm (89 lb-in).

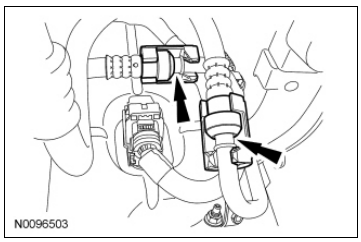


52. Connect the 2 engine wiring harness electrical connectors.

53. Connect the engine wiring harness electrical connector.

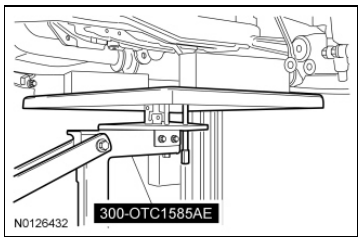


54. Connect the power feed wires to the battery terminal and install the 2 nuts.
    - Tighten to 6 Nm (53 lb-in).



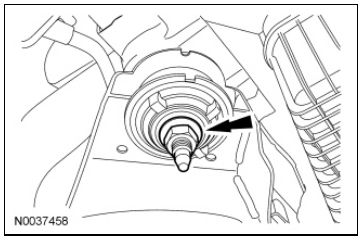
55. Install the battery tray. For additional information, refer to Section 414-01 .

56. Install the engine Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12B .



57. Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

58. Position the transmission fluid cooler tubes in place. Install the transmission fluid cooler tubes in the transaxle by inserting the tube into the fitting until a click is heard/felt. Pull back to confirm connection is secure and install the secondary latches.



59. Place the subframe assembly on the Powertrain Lift and raise the subframe into the installed position.

60. **NOTE:** LH shown, RH similar.

    Install the front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

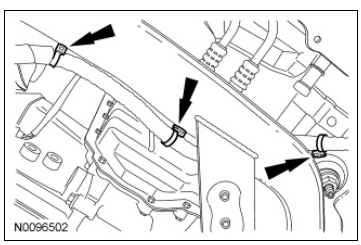
61. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the bolts finger-tight.

62. **NOTE:** LH shown, RH similar.

    Install the subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

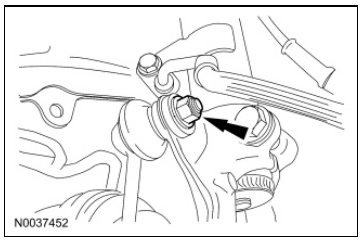


63. **NOTE:** LH shown, RH similar.

    Tighten the subframe bracket-to-body bolts to 103 Nm (76 lb-ft).

64. Attach the 3 wiring harness retainers to the LH front of the subframe.

65. Connect the 2 Electronic Power Assist Steering (EPAS) electrical connector on the front of the subframe.

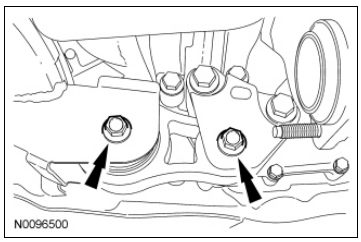


66. Install the intermediate shaft and the LH halfshaft. For additional information, refer to Section 205-04 .

67. **NOTE:** LH shown, RH similar.

    Install the stabilizer bar links and nuts to the struts.

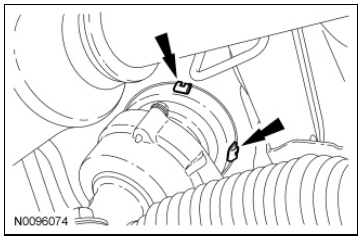
    - Tighten to 40 Nm (30 lb-ft).



68. **NOTE:** LH shown, RH similar.

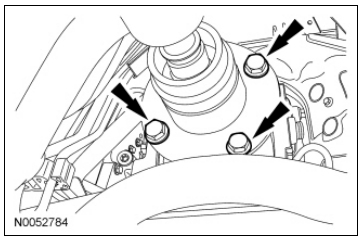
    Install the tie-rod ends and nuts.

    - Tighten to 48 Nm (35 lb-ft).
    - Install the cotter pin.



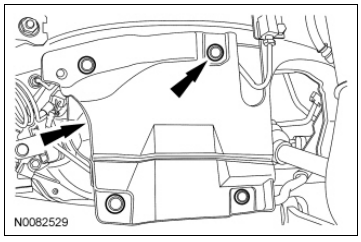
69. Install the engine roll restrictor and the 2 bolts.
    - Tighten to 90 Nm (66 lb-ft).

70. If equipped, install the heat shield and the 2 bolts.

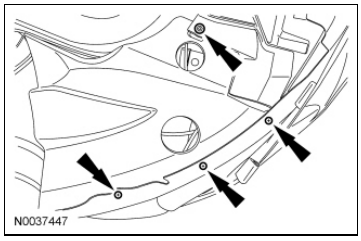


71. Slide the steering gear-to-dash seal onto the steering gear and engage the 4 retaining clips (2 shown) into the body.
    - From under the vehicle, verify that the seal is properly installed on the steering gear and the retaining clips are fully engaged into the body.

AWD vehicles

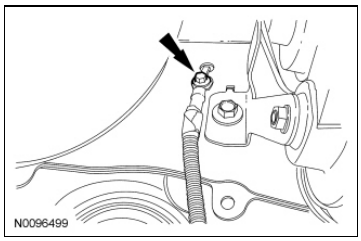


72. Line up the index marks on the rear driveshaft to the index marks on the PTU flange made during removal and install the 4 bolts (3 shown).
    - Tighten to 70 Nm (52 lb-ft).

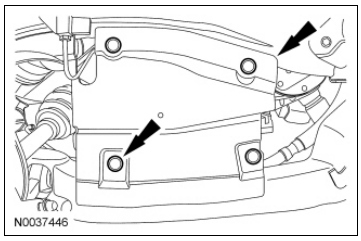


All vehicles

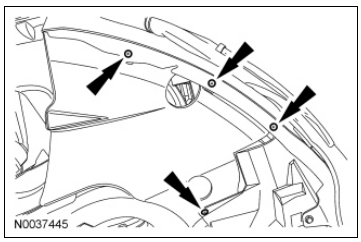
73. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .



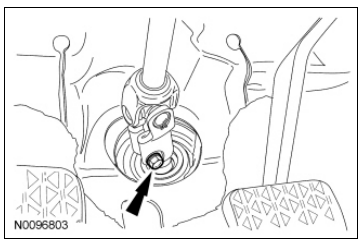
74. Install the LH splash shield and the 6 pin-type retainers (4 shown).



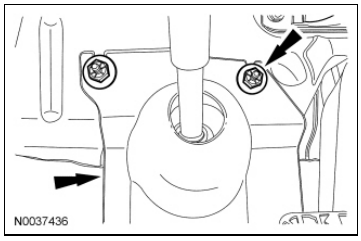
75. Position the LH fender splash shield and install the 4 screws.



76. Install the EPAS ground wire and bolt in the RH front wheel well.
    - Tighten to 10 Nm (89 lb-in).



77. Install the RH splash shield and the 6 pin-type retainers (4 shown).



78. Position the RH fender splash shield and install the 4 screws.

79. Install the steering intermediate shaft onto the steering gear and install the bolt.
    - Tighten to 20 Nm (177 lb-in).

80. Install the steering joint cover and the 2 nuts.

81. Fill the engine with clean engine oil.

82. Connect the battery ground cable. For additional information, refer to Section 414-01 .

83. Fill and bleed the cooling system. For additional information, refer to Section 303-03A .

84. Check the transaxle fluid and add fluid if necessary. For additional information, refer to the transmission fluid drain and refill procedure in Section 307-01A .

85. Recharge the A/C system. For additional information, refer to Section 412-00A .

86. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Material

Item	Specification	Fill Capacity
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6	-
Motorcraft® Metal Surface Prep ZC-31-A	-	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A	5.2L (5.5 qt) includes filter change
Motorcraft® Silicone Gasket Remover ZC-30	-	-
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A	[a]
Motorcraft® Orange Antifreeze/Coolant Concentrated VC-3-B (US); CVC-3-B2 (Canada)	WSS-M97B44-D	[a]
Thread Sealant with PTFE TA-24	WSK-M2G350-A2	-
Threadlock and Sealer TA-25	WSK-M2G351-A5	-

[a] Early build vehicle cooling systems are filled with Motorcraft® Specialty Green Engine Coolant and late build vehicle cooling systems are filled with Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.

General Specifications

Item	Specification
Engine	
Displacement	3.5L (4V) (214 CID)
No. cylinders	6
Bore/stroke	92.5/86.7 mm (3.641/3.413 in)
Fire order	1-4-2-5-3-6
Oil pressure	Minimum 30 psi @ 1,500 rpm with engine at normal operating temperature
Spark plug	AYSF-22FM Gap = 1.29-1.45 mm (0.051-0.057 in)
Compression ratio	10.3:1
Engine weight (without accessory drive components)	161 kg (355 lb)
Engine and transaxle weight (without accessory drive components)	260.8 kg (575 lb)
Cylinder head gasket surface flatness [a]	Flat within 0.08 mm (0.003 in) length end to end, area 150 mm (5.9 in) X 150 mm (5.9 in) (or full width) should be less than 0.05 mm (0.002 in)
Combustion chamber volume	55.84 cc (3.41 CI)
Valve tappet clearance intake	0.15-0.25 mm (0.006-0.01 in)
Valve tappet clearance - exhaust	0.360-0.460 mm (0.0142-0.0181 in) Engine must be at room temperature before measuring
Valve guide bore inner diameter	5.519-5.549 mm (0.217-0.218 in)
Valve stem diameter - intake	5.479-5.497 mm (0.2157-0.2164 in)
Valve stem diameter - exhaust	5.466-5.484 mm (0.2151-0.2159 in)
Valve stem-to-guide clearance - intake	0.022-0.070 mm (0.0008-0.0027 in)
Valve stem-to-guide clearance - exhaust	0.035-0.083 mm (0.0013-0.032 in)
Valve head diameter - intake	36.82-37.18 mm (1.44-1.46 in)

Valve head diameter - exhaust	30.82-31.18 mm (1.21-1.22 in)
Valve	0.05 mm (0.0001 in)
Valve face angle	44.5-45.5 degrees
Valve seat width - intake	1.3-1.5 mm (0.051-0.059 in)
Valve seat width - exhaust	1.7-2.0 mm (0.067-0.079 in)
Valve seat runout	0.04 mm (0.0001 in) MAX
Valve seat angle	44.5-45.5 degrees
Valve spring free length (approx.)	48.0 mm (1.889 in)
Valve spring compression pressure (N @ spec. length)	525 N @ 27.0 mm (114.7 lb @ 1.06 in)
Valve spring installed height	37.0 mm (1.45 in)
Valve spring installed height pressure (N @ spec. length)	235 N @ 37.0 mm (53 lb @ 1.45 in)
Valve spring installed pressure - service limit	10% force loss @ specified height
Camshaft	
Theoretical valve lift @ 0 lash	9.6798 mm (0.38 in)
Lobe lift - intake	9.6798 mm (0.38 in)
Lobe lift - exhaust	9.6798 mm (0.38 in)
Allowaift loss	0.062 mm (0.0024 in)
Camshaft journal bore inside diameter - 1st journal	31.0375-31.0625 mm (1.221-1.222 in)
Camshaft journal bore inside diameter - intermediate journals	25.9875-26.0125 mm (1.023-1.024 in)
Camshaft bearing outside diameter - 1st journal	30.993-31.013 mm (1.2202-1.2209 in)
Camshaft bearing outside diameter - intermediate journals	25.937-25.963 mm (1.021-1.022 in)
Camshaft journal-to-bearing clearance, 1st journal - service limit	0.0725 mm (0.0029 in) MAX
Camshaft journal-to-bearing clearance, intermediate journals - service limit	0.0755 mm (0.0029 in) MAX
Runout	0.040 mm (0.0015 in) MAX
End play - standard	0.032-0.170 mm

	(0.0012-0.0066 in)
End play - service limit	0.190 mm (0.00748 in) MAX
Cylinder Block	
Cylinder bore diameter - grade 1	92.500-92.520 mm (3.641-3.642 in)
Cylinder bore roundness	0.013 mm (0.0005 in)
Cylinder bore taper	
Block main bore roundness	0.008 mm (0.0003 in)
Main bearing bore inside diameter	72.400-72.424 mm (2.8503-2.8513 in)
Head gasket surface flatness	Flat within 0.150 mm (0.005 in) overall 0.050 mm (0.001 in) per 150 mm (5.905 in) x 150 mm (5.905 in) 0.025 mm (0.0009 in) per 25 mm (0.98 in) x 25 mm (0.98 in)
Crankshaft	
Main bearing journal diameter	67.5 mm (2.657 in)
Main bearing journal maximum taper	0.004 mm (0.00015 in)
Main bearing journal maximum out-of-round	0.006 mm (0.00023 in)
Main bearing journal-to-cylinder block clearance	0.026-0.041 mm (0.0010-0.0016 in)
Connecting rod journal diameter	55.983-56.003 mm (2.204-2.205 in)
Connecting rod journal maximum taper	0.004 mm (0.00015 in)
Connecting rod journal maximum out-of-round	0.006 mm (0.00023 in)
Crankshaft maximum end play	0.101-0.291 mm (0.0039-0.0114 in)
Piston and Connecting Rod	
Piston diameter - single grade	92.476-92.490 mm (3.6407-3.6413 in)
Piston-to-cylinder bore clearance	0.010 to 0.044 mm (0.0003-0.0017 in)
Piston ring end gap - compression (top, gauge diameter)	0.15-0.25 mm (0.0059-0.0098 in)
Piston ring end gap - compression (bottom, gauge diameter)	0.30-0.55 mm (0.0118-0.0216 in)
Piston ring end gap - oil ring (steel rail, gauge diameter)	0.15-0.45 mm (0.0059-0.0177 in)
Piston ring groove width - compression (top)	1.230-1.25 mm (0.0484-0.0492 in)
Piston ring groove width - compression (bottom)	1.530-1.55 mm (0.0602-0.0610 in)
Piston ring groove width - oil ring	2.53-2.55 mm

	(0.0996-0.1003 in)
Piston ring width - upper comp ring	1.17-1.19 mm (0.0460-0.0468 in)
Piston ring width - lower comp ring	1.47-1.49 mm (0.0578-0.0586 in)
Piston ring-to-groove clearance (upper and lower compression rings)	0.040-0.080 mm (0.0015-0.0031 in)
Piston pin bore diameter	23.004-23.008 mm (0.9056-0.9058 in)
Piston pin diameter 22.997-23.000 mm (0.9053-0.9055 in)	
Piston pin length	55.975 mm (2.203 in)
Piston pin-to-piston fit	0.004 to 0.011 mm (0.00015-0.00043 in)
Piston-to-connecting rod clearance	2.7 mm (0.1 in)
Connecting rod-to-pin clearance - standard	0.007-0.022 mm (0.0002-0.0009 in)
Connecting rod pin bore diameter	23.007-23.019 mm (0.905-0.906 in)
Connecting rod length (center-to-center)	152.68 mm (6.01 in)
Connecting rod maximum allowed bend	0.038 mm (0.0014 in)
Connecting rod maximum allowed twist	0.050 mm (0.0019 in)
Connecting rod bearing bore diameter - grade 1	59.866-59.872 mm (2.3569-2.3571 in)
Connecting rod bearing bore diameter - grade 2	59.873-59.879 mm (2.3572-2.3574 in)
Connecting rod bearing bore diameter - grade 3	59.880-59.886 mm (2.3574-2.3577 in)
Connecting rod bearing-to-crankshaft clearance	0.020-0.054 mm (0.0007-0.0021 in)
Connecting rod side clearance (assembled to crank) - s/TD>	0.175-0.425 mm (0.0068-0.0167 in)
Connecting rod side clearance (assembled to crank) - service limit	0.175-0.425 mm (0.0068-0.0167 in)

[a] Refer to the procedure in this section.

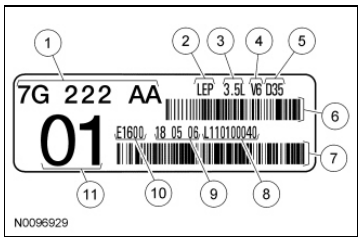
[a] Tighten to 10 Nm (89 lb-in) plus an additional 720 degrees.
[b] Tighten to 16 Nm (142 lb-in) plus an additional 180 degrees.
[c] Refer to the procedure in this section.
[d] Tighten to 5 Nm (44 lb-in) plus an additional 180 degrees.

Engine

The 3.5L (4V) is a V-6 engine with the following features:

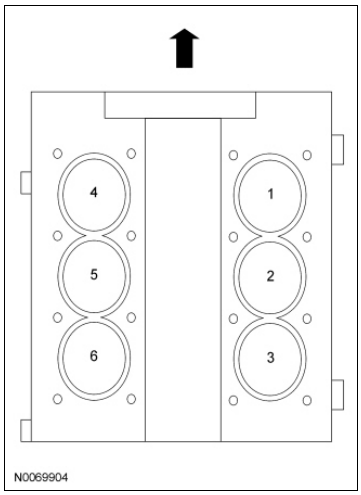
- Dual overhead camshafts
- Four valves per cylinder
- Sequential Multi-Port Fuel Injection (SFI)
- An aluminum lower intake manifold and a composite upper intake manifold
- Aluminum cylinder heads
- An aluminum, 60-degree V-cylinder block
- Timing chain driven coolant pump
- Variable Camshaft Timing (VCT) system
- The electronic ignition system with 6 ignition coils



Engine Identification

For quick identification, refer to the safety certification decal.

- The decal is located on the LH front door lock face panel.



Engine Code Information Label

The engine code information label, located on the front side of the valve cover, contains the following:

Item	Description
1	Engine part number
2	Engine plant (Lima)
3	Engine displacement
4	Engine configuration
5	Duratech 3.5L
6	Bar code
7	Bar code
8	Running number
9	Engine build date (DDMMYY)
10	Plant shift line
11	Derivative code

Engine Cylinder Identification

Exhaust Emission Control System

Operation and required maintenance of the exhaust emission control devices used on this engine is covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 6 solenoid-operated fuel injectors:

- are mounted between the fuel rail and the intake manifold.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.

Valve Train

The valve train uses Direct Acting Mechanical Buckets (DAMB). The camshaft lobes are positioned directly above mechanical buckets which are positioned on top of the valves.

Variable Camshaft Timing (VCT) System

The VCT system changes intake camshaft timing dependent on engine speed, load and oil temperature. Oil pressure advances and retards camshaft timing to improve low-speed and high-speed engine performance, engine idle quality and exhaust emissions.

PCV System

All engines are equipped with a closed-type PCV system recycling the crankcase vapors to the upper intake manifold.

Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the crankshaft, connecting rod bearings, timing chain tensioners and VCT solenoids. The flow of oil to the valve tappets and valve train is controlled by a restricting orifice located in the cylinder head, front camshaft cap.

Oil Pump

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range.

The heart of the system is a positive displacement internal gear oil pump.

Generically, this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high-viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

Cooling System

NOTICE: **Early build vehicle cooling systems are filled with Motorcraft® Specialty Green Engine Coolant and late build vehicle cooling systems are filled with Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

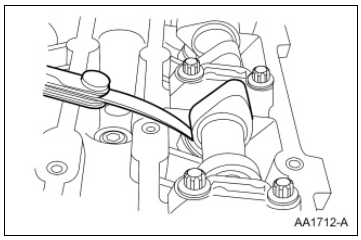
NOTE: ring normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

The engine cooling system includes the following:

- Radiator
- Timing chain driven coolant pump
- Electric fan assembly(s)
- Degas bottle (aids in maintaining the correct volume of engine coolant)
- Coolant thermostat
- Coolant hoses

Engine

For basic engine mechanical concerns, refer to Section 303-00 . For driveability concerns, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



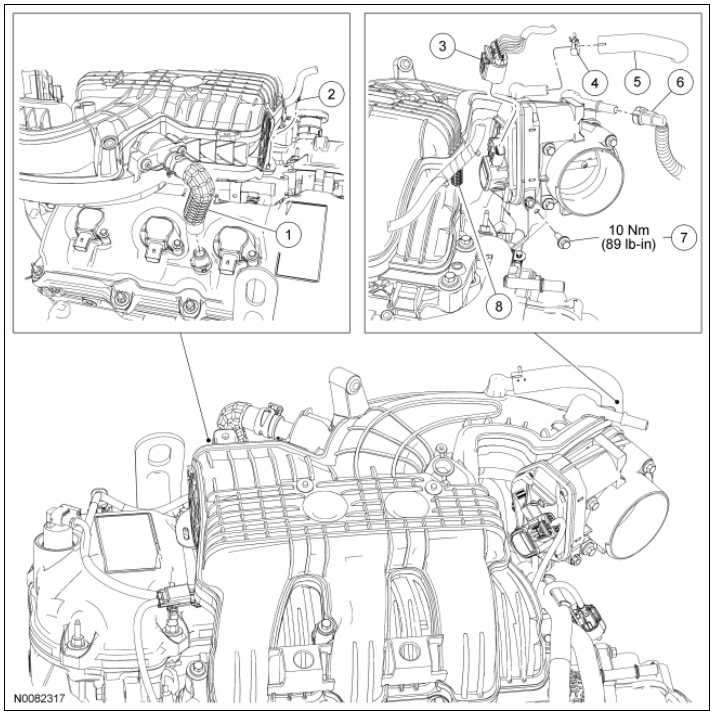
Valve Clearance Check

1. Remove the valve covers. For additional information, refer to Valve Cover - LH and Valve Cover - RH in this section.

2. **NOTE:** Engine must be at room temperature before measuring. The valve clearance must be measured with the camshaft at base circle. The engine will have to be rotated with the crankshaft pulley bolt to bring each valve to base circle.

   Use a feeler gauge to measure the clearance of each valve and record its location. A midrange clearance is thesirable:

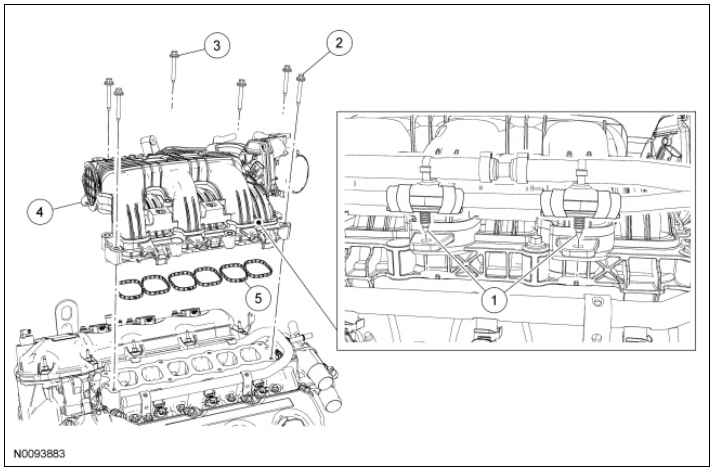
   - Intake: 0.15-0.25 mm (0.006-0.01 in)
   - Exhaust: 0.360-0.460 mm (0.0142-0.0181 in)



3. **NOTE:** The number on the valve tappet reflects the thickness of the valve tappet. For example, a tappet with the number 3.310 has the thickness of 3.31 mm (0.13 in).

   If any of the valve clearances are out of specification, select new tappets using this formula: tappet thickness = measured clearance + the base tappet thickness - most desirable thickness.
   Select the tappets and mark the installation location.

4. If required, install the new selected valve tappets in the marked locations. For additional information, refer to Valve Tappets in this section.



Upper Intake Manifold

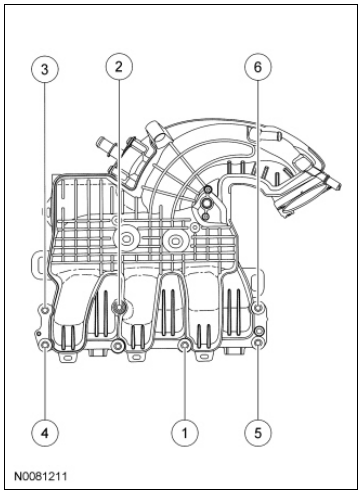
Upper Intake Manifold (View 1 of 2)

Item	Part Number	Description
1	6K817	PCV hose
2	13A506	Block heater wiring harness retainer (part of 6B018)
3	14A464	Throttle Body (TB) electrical connector (part of 12C508)
4	CS16140	Brake booster-to-intake manifold vacuum hose clamp
5	6K817	Brake booster-to-intake manifold vacuum hose
6	9D661	Evaporative Emission (EVAP)-to-intake manifold tube
7	W503274	Upper intake manifold support bracket bolt
8	-	Engine control wiring harness retainer (part of 12C508)

Upper Intake Manifold (View 2 of 2)

Item	Part Number	Description
1	13A506	Wire harness pin-type retainers (part of 14B060)
2	W503282	Upper intake manifold bolt (5 required)
3	W707083	Upper intake manifold bolt
4	9S455	Upper intake manifold
5	9H486	Upper intake manifold gasket (3 required)

Removal



1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12C .
2. Disconnect the Throttle Body (TB) electrical connector.
3. Disconnect the Evaporative Emission (EVAP)ube from the intake manifold. For additional information, refer to Section 310-00 .
4. Disconnect the brake booster vacuum hose from the intake manifold.
5. Disconnect the PCV tube from the PCV valve.
6. Detach all the wiring harness retainers from the upper intake manifold.
7. If equipped, detach the cylinder block heater wiring harness retainer from the upper intake manifold.
8. Remove the upper intake manifold support bracket bolt.
9. Remove the 6 bolts and the upper intake manifold.
    - Remove and discard the gaskets.
    - Clean and inspect all of the sealing surfaces of the upper and lower intake manifold.

Installation

1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Using new gaskets, install the upper intake manifold and the 6 bolts.

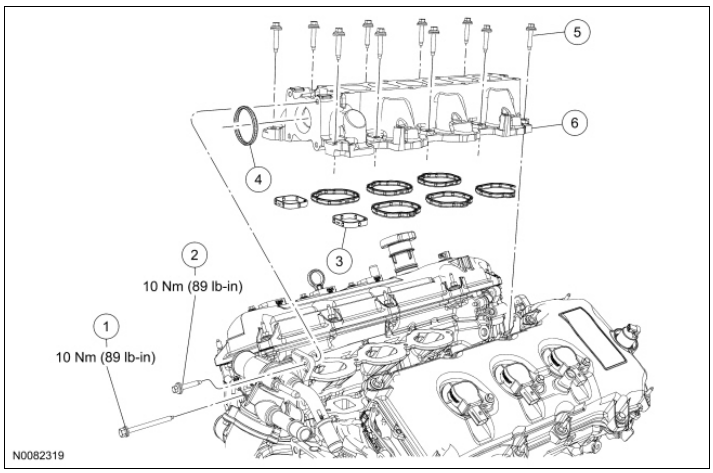
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

2. Install the upper intake manifold support bracket bolt.
    - Tighten to 10 Nm (89 lb-in).

3. If equipped, attach the cylinder block heater wiring harness retainer to the upper intake manifold.

4. Attach all the wiring harness retainers to the upper intake manifold.

5. Connect the PCV tube to the PCV valve.



6. Connect the brake booster vacuum hose to the intake manifold.

7. Connect the EVAP tube to the intake manifold. For additional information, refer to Section 310-00 .

8. Connect the TB electrical connector.

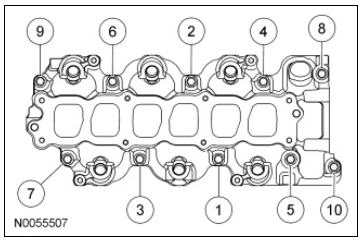
9. Install the ACL outlet pipe. For additional information, refer to Section 303-12C .

Lower Intake Manifold

Item	Part Number	Description
1	W708607	Thermostat housing-to-lower intake manifold bolt
2	W503279	Thermostat housing-to-lower intake manifold bolt
3	9439	Lower intake manifold gasket (8 required)
4	8A571	Thermostat housing gasket
5	W503279	Lower intake manifold bolt (10 required)
6	9K461	Lower ke manifold

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the fuel rail. For additional information, refer to Section 303-04C .
3. Drain the cooling system. For additional information, refer to Section 303-03A .
4. Remove the 2 thermostat housing-to-lower intake manifold bolts.
5. Remove the 10 bolts and the lower intake manifold.
   - Remove and discard the intake manifold and thermostat housing gaskets.
   - Clean and inspect all sealing surfaces.

Installation

1. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

Using new intake manifold and thermostat housing gaskets, install the lower intake manifold and the 10 bolts.

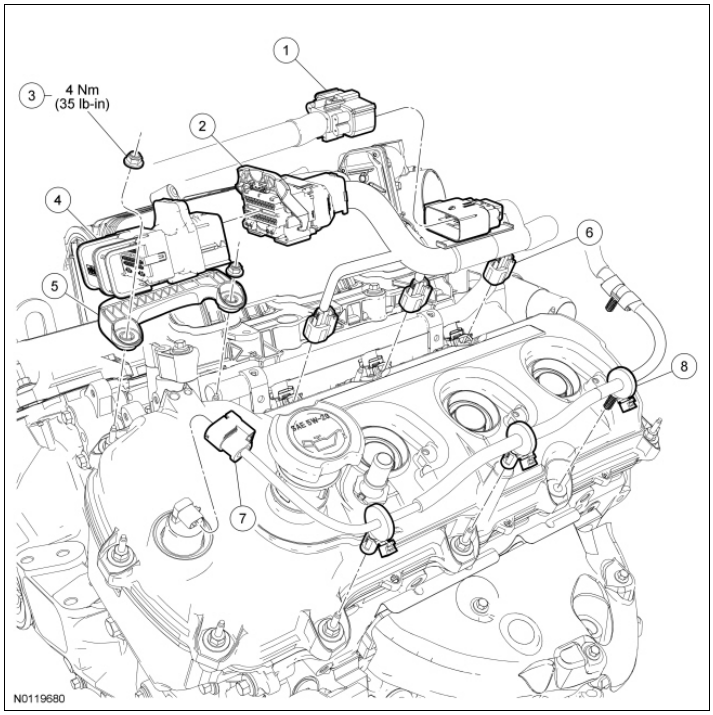
- Tighten in the sequence shown to 10 Nm (89 lb-in).

2. Install the 2 thermostat housing-to-lower intake manifold bolts.
   - Tighten to 10 Nm (89 lb-in).

3. Install the fuel rail. For additional information, refer to Section 303-04C .

4. Fill and bleed the cooling system. For additional information, refer to Section 303-03A .

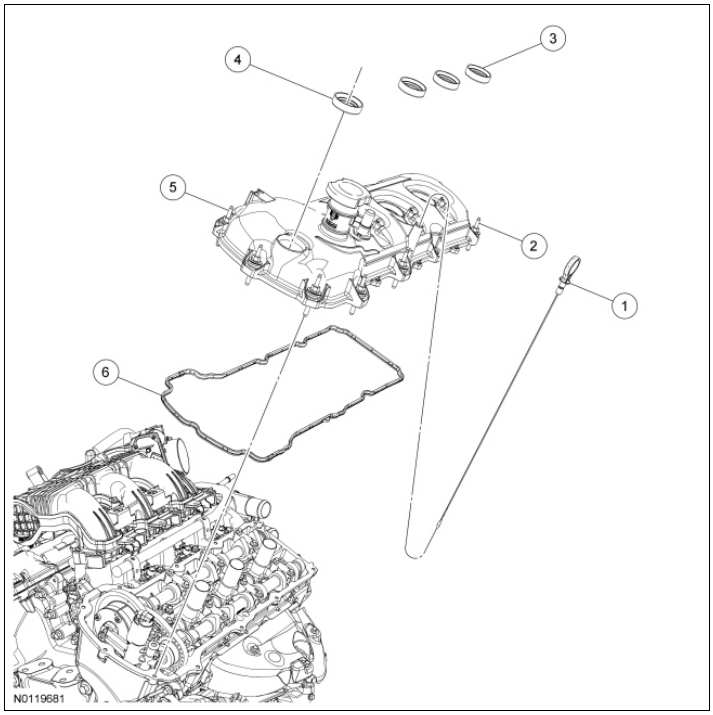
Valve Cover - LH



Special Tool(s)

 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2983-A	Installer, VCT Spark Plug Tube Seal 303-1247/2
 ST2982-A	Remover, VCT Spark Plug Tube Seal 303-1247/1

Material

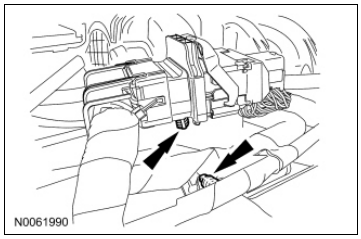


Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Silicone Gasket Remover ZC-30	-

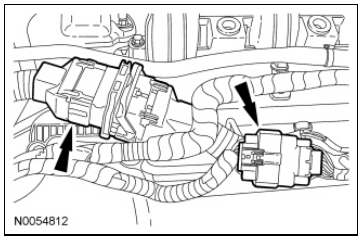
Valve Cover - LH (View 1 of 2)

Item	Part Number	Description
1	-	Engine control wiring harness electrical connector (part of 12C508)
2	-	Engine control wiring harness electrical connector (part of 12C508)
3	W520100	Wiring harness retaining bracket nut (2 required)
4	-	Engine control wiring harness electrical connector (part of 12C508)
5	-	Wiring harness retaining bracket (part of 12C508)
6	-	LH fuel injector electrical connector (3 required) (part of 12C508)
7	-	LH Variable Camshaft Timing (VCT) electrical connector (part of 12 valign="top">
8	W700497	Engine control wiring harness retainer (part of 12C508)

Valve Cover - LH (View 2 of 2)

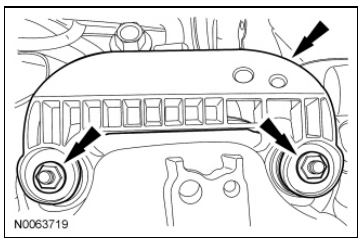


Item	Part Number	Description
1	6750	Oil level indicator
2	6C519	Valve cover stud bolt (9 required)
3	6C535	Spark plug tube seal (3 required)
4	6C535	Variable Camshaft Timing (VCT) solenoid seal
5	6A505	LH valve cover
6	6A559	LH valve cover gasket



Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

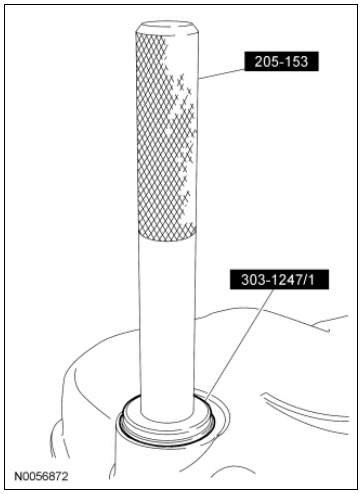


1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12C .
2. Remove the LH ignition coils.or additional information, refer to Section 303-07C .
3. Remove the oil level indicator.
4. Disconnect the LH Variable Camshaft Timing (VCT) solenoid electrical connector.
5. Detach the 2 wiring harness retainers.

6. Disconnect the 2 engine control wiring harness electrical connectors.

7. Remove the 2 nuts and the wiring harness retaining bracket.

8. Detach all of the wiring harness retainers from the valve cover and the stud bolts.



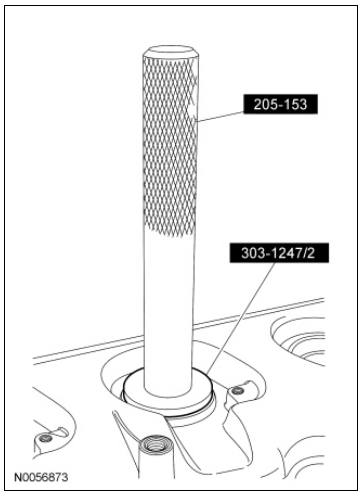
9. Disconnect the 3 LH fuel injector electrical connectors.

10. Loosen the 9 stud bolts and remove the LH valve cover.
    - Discard the gasket.

11. **NOTE:** VCT solenoid seal removal shown, spark plug tube seal removal similar.

    Inspect the VCT solenoid seals and the spark plug tube seals. Remove any damaged seals.

    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

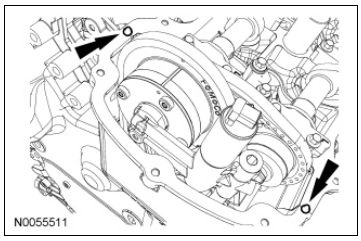


12. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

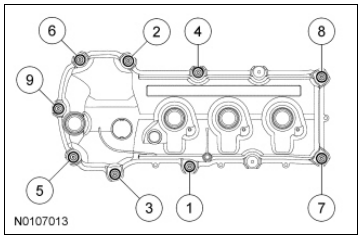
Installation

1. **NOTE:** Installation of new seals is only required if damaged seals were removed during disassembly of the engine.

   NOTE: Spark plug tube seal installation shown, VCT solenoid seal installation similar.



Using the VCT Spark Plug Tube Seal Installer and Handle, install new VCT solenoid and/or spark plug tube seals.



2. *NOTICE:* **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

3. Using a new gasket, install the LH valve cover and tighten the 9 stud bolts.
   - Tighten in the sequence shown to 10 Nm (89 lb-in).

4. Connect the 3 LH fuel injector electrical connectors.

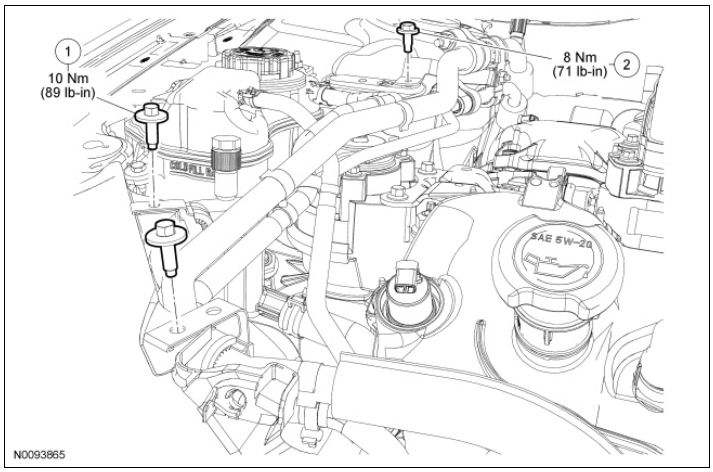
5. Attach all of the wiring harness retainers to the valve cover and the stud bolts.

6. Install the wiring harness retaining bracket and the 2 nuts.
   - Tighten to 4 Nm (35 lb-in).

7. Connect the 2 engine control wiring harness electrical connectors.

8. Attach the 2 wiring harness retainers.
9. Connect the LH VCT solenoid electrical connector.
10. Install the oil level indicator.
11. Install the LH ignition coils. For additional information, refer to Section 303-07C .
12. Install the ACL outlet pipe. For additional information, refer to Section 303-12C .

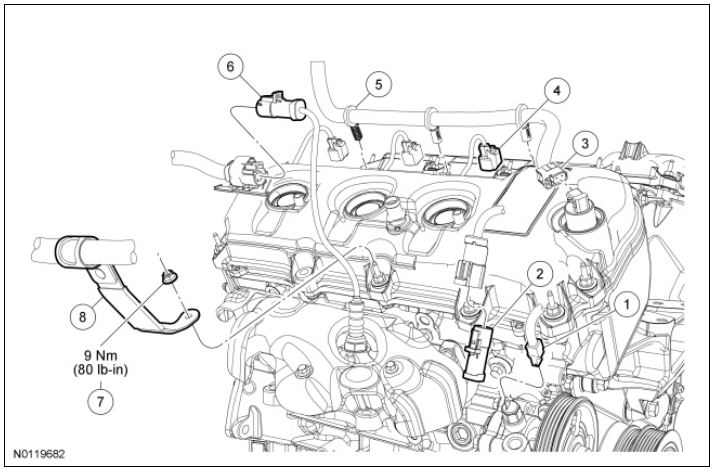
Valve Cover - RH



Special Tool(s)

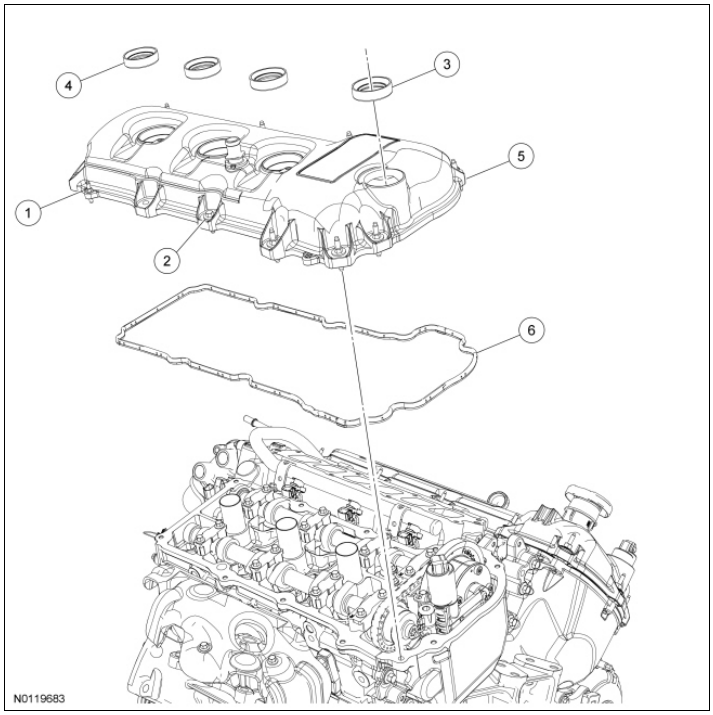
 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2983-A	Installer, VCT Spark Plug Tube Seal 303-1247/2
 ST2982-A	Remover, VCT Spark Plug Tube Seal 303-1247/1

Material



Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Silicone Gasket Remover ZC-30	-

Valve Cover - RH (View 1 of 3)

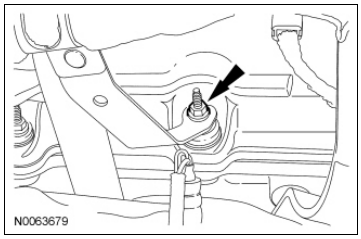


Item	Part Number	Description
1	W503924	A/C tube retaining clamp bolt (2 required)
2	W505422	A/C tube retaining clamp bolt

Valve Cover - RH (View 2 of 3)

Item	Part Number	Description
1	-	Power Steering Pressure (PSP) switcconnector (part of 12C508)
2	-	RH Catalyst Monitor Sensor (CMS) electrical connector (part of 12C508)
3	-	RH Variable Camshaft Timing (VCT) electrical connector (part of 12C508)
4	-	RH fuel injector electrical connector (3 required) (part of 12C508)
5	W700497	Engine control wiring harness retainer (part of 12C508)
6	-	RH Heated Oxygen Sensor (HO2S) electrical connector (part of 12C508)
7	W520100	PSP hose bracket nut
8	3A719	PSP hose bracket

Valve Cover - RH (View 3 of 3)



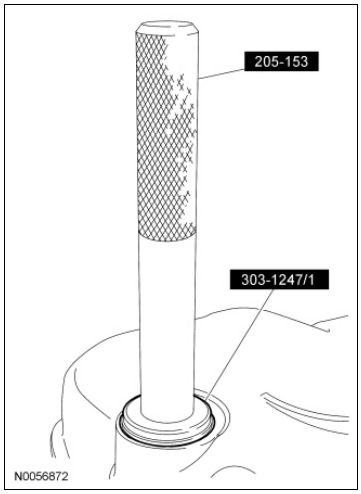
Item	Part Number	Description
1	6C519	Valve cover stud bolt (8 required)
2	6C520	Valve cover bolt
3	6C535	Variable Camshaft Timing (VCT) solenoid seal
4	6C535	Spark plug t3 required)
5	6582	RH valve cover
6	6584	RH valve cover gasket

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the RH ignition coils. For additional information, refer to Section 303-07C .
2. Remove the power steering fluid reservoir. For additional information, refer to Section 211-02 .
3. Disconnect the Power Steering Pressure (PSP) switch electrical connector.
4. Disconnect the RH Catalyst Monitor Sensor (CMS) electrical connector and retainer.
5. Remove the PSP hose bracket nut from the valve cover stud bolt and position the bracket aside.

6. Disconnect the RH Heated Oxygen Sensor (HO2S) electrical connector.



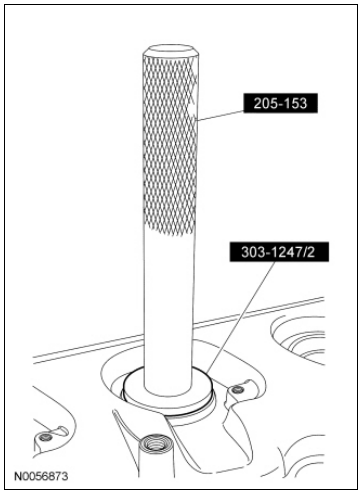
7. Disconnect the RH Variable Camshaft Timing (VCT) electrical connector.
8. Disconnect the 3 RH fuel injector electrical connectors.
9. Detach all of the wiring harness retainers from the valve cover and the stud bolts.
10. Remove the A/C tube retaining clamp bolt.
11. Remove the 2 A/C tube retaining clamp bolts.
12. **NOTE:** It is necessary to reposition the A/C tubes to remove the valve cover.

    Loosen the bolt and the 8 stud bolts and remove the RH valve cover.

    - Discard the gasket.
13. **NOTE:** VCT solenoid seal removal shown, spark plug tube seal removal similar.

    Inspect the VCT solenoid seals and the spark plug tube seals. Remove any damaged seals.

    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).



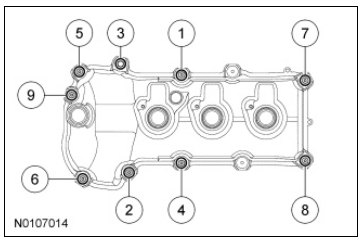
14. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

Installation

1. **NOTE:** Installation of new seals is only required if damaged seals were removed during disassembly of the engine.

   NOTE: Spark plug tube seal installation shown, VCT solenoid seal installation similar.

   Using the VCT Spark Plug Tube Seal Installer and Handle, install new VCT solenoid and/or spark plug tube seals.



2. *NOTICE:* **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.

3. Using a new gasket, install the RH valve cover, bolt and the 8 stud bolts.
   - Tighten in the sequence shown to 10 Nm (89 lb-in).

4. Position the A/C tubes and install the 2 retaining clamp bolts.
   - Tighten to 10 Nm (89 lb-in).

5. Install the A/C tube retaining clamp bolt.
   - Tighten to 8 Nm (71 lb-in).

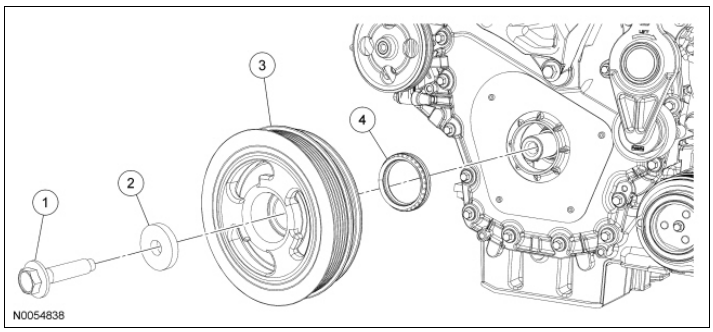
6. Attach all of the wiring harness retainers to the valve cover and the stud bolts.

7. Connect the 3 LH fuel injector electrical connectors.

8. Connect the LH VCT electrical connector.

9. Connect the RH HO2S electrical connector.

10. Install the PSP hose bracket and nut.
    - Tighten to 9 Nm (80 lb-in).



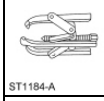
11. Connect the RH CMS electrical connector and retainer.

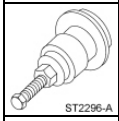
12. Connect the PSP switch electrical connector.

13. Install the power steering fluid reservoir. For additional information, refer to Section 211-02 .

14. Install the RH ignition coils. For additional information, refer to Section 303-07C .

Crankshaft Pulley and Crankshaft Front Seal - Exploded View





Item	Part Number	Description
1	W701512	Crankshaft pulley bolt
2	N806165	Washer
3	6316	Crankshaft pulley
4	6700	Crankshaft front seal

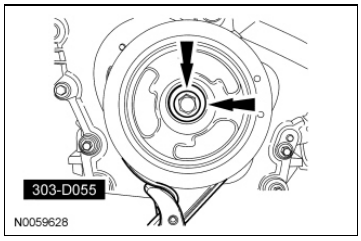
1. For additional information, refer to the procedures in this section.

Crankshaft Pulley

Special Tool(s)

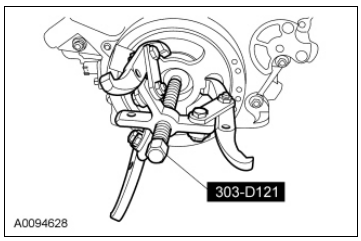
 ST1184-A	3 Jaw Puller 303-D121 or equivalent
 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST2296-A	Installer, Front Cover Oil Seal 303-335
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A) or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material



Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

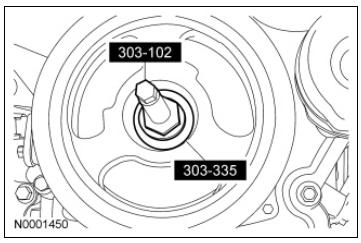


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

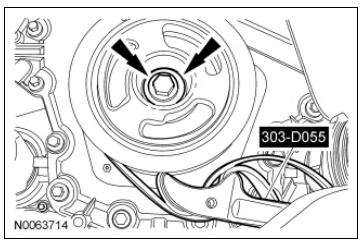
2. Remove the accessory drive belt and the powesteering belt. For additional information, refer to Section 303-05C .

3. Using the Strap Wrench, remove the crankshaft pulley bolt and washer.
   - Discard the bolt.

4. Using the 3 Jaw Puller, remove the crankshaft pulley.



Installation

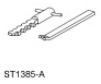


1. Lubricate the crankshaft front seal inner lip with clean engine oil.

2. **NOTE:** Lubricate the outside diameter sealing surfaces with clean engine oil.

   Using the Front Cover Oil Seal Installer and Crankshaft Vibration Damper Installer, install the crankshaft pulley.

3. Using the Strap Wrench, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
   - Stage 1: Tighten to 120 Nm (89 lb-ft).
   - Stage 2: Loosen one full turn.
   - Stage 3: Tighten to 50 Nm (37 lb-ft).
   - Stage 4: Tighten an additional 90 degrees.



4. Install the accessory drive belt and the power steering belt. For additional information, refer to Section 303-05C .

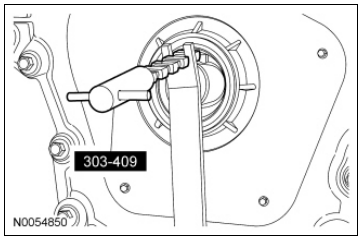
5. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Crankshaft Front Seal

Special Tool(s)

 ST1287-A	Installer, Crankshaft Vibration Damper 303-102 (T74P-6316-B)
 ST2981-A	Installer, Front Crankshaft Seal 303-1251
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700CH)

Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

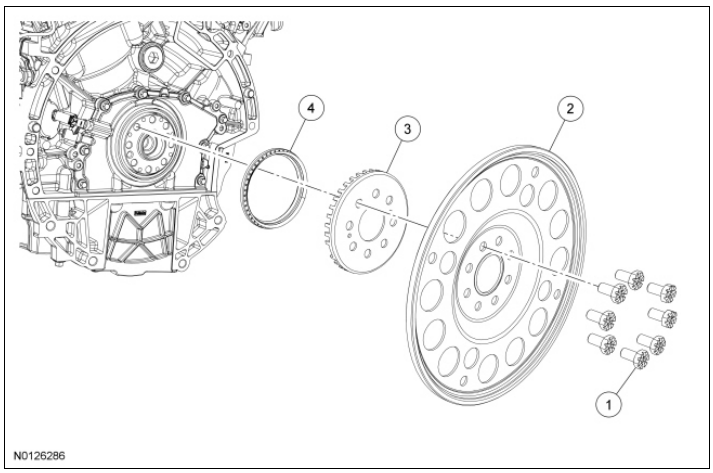
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

3. Using the Oil Seal Remover, remove and discard the crankshaft front seal.
   - Clean all sealing surfaces with metal surface prep.

Installation



1. **NOTE:** Apply clean engine oil to the crankshaft front seal bore in the engine front cover.

Using the Front Crankshaft Seal Installer and Crankshaft Vibration Damper Installer, install a new crankshaft front seal.

src="SCS~us~en~file=N0056874.jpg~gen~ref.jpg" height="211" width="325" border="1">

2. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.

Flexplate or Flywheel and Crankshaft Rear Seal - Exploded View

Item	Part Number	Description
1	W701559	Flexplate bolt (8 required)
2	6375	Flexplate
3	12A227	Crankshaft sensor ring
4	6701	Crankshaft rear seal

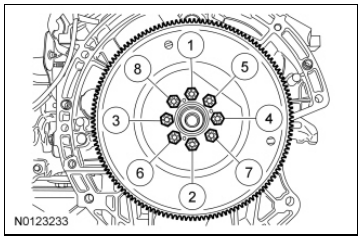
1. For additional information, refer to the procedures in this section.

Flexplate

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Removal



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the transaxle. For additional information, refer to Section 307-01A .
3. Remove the 8 bolts and the flexplate.

Installation

1. **NOTE:** One of the 8 flexplate holes are offset so the flexplate can only be installed in one position.

   Install the flexplate and the 8 bolts.

   - Tighten in the sequence shown to 80 Nm (59 lb-ft).

2. Install the transaxle. For additional information, refer to Section 307-01A .
3. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

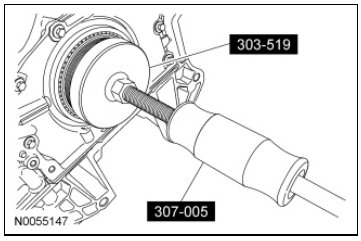
Crankshaft Rear Seal

Special Tool(s)

 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2980-A	Installer, Rear Main Seal 303-1250
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

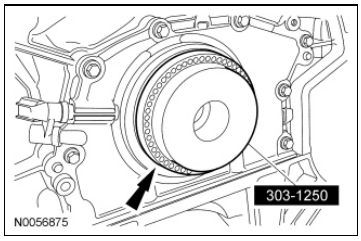


Removal

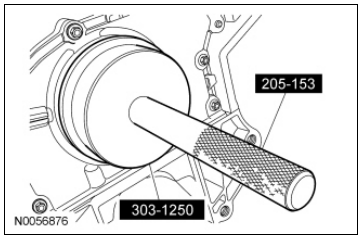
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the flexplate. For additional information, refer to Flexplate in this section.

start="3">
- Remove the crankshaft sensor ring.



4. Using the Crankshaft Rear Oil Seal Remover and Slide Hammer, remove and discard the crankshaft rear seal.
    - Clean all sealing surfaces with metal surface prep.

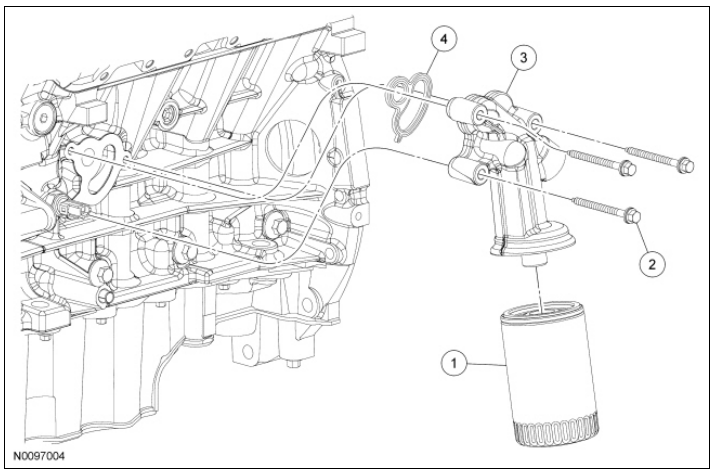


Installation

1. **NOTE:** Lubricate the seal lips and bore with clean engine oil prior to installation.

   Position the Rear Main Seal Installer onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.

2. Using the Rear Main Seal Installer and Handle, install the new crankshaft rear seal.

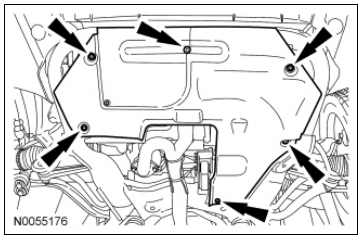


3. Install the crankshaft sensor ring.

4. Install the flexplate. For additional information, refer to Flexplate in this section.

5. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

Oil Filter Adapter



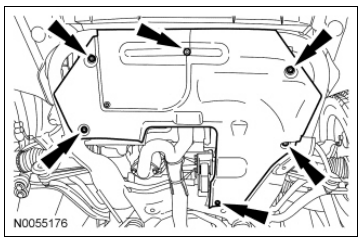
Item	Part Number	Description
1	6714	Engine oil filter
2	W503283	Oil filter adapter bolt (3 required)
3	6881	Oil filter adapter
4	6840	Oil filter adapter gasket

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If equipped, remove the 6 screws and the underbody shield.

3. Remove and discard the engine oil filter.

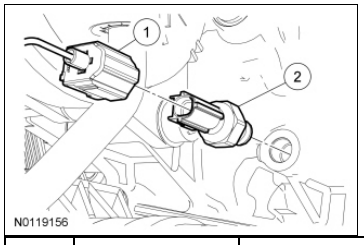


4. Remove the 3 bolts and the oil filter adapter.
   - Discard the gasket.
   - Clean and inspect all sealing surfaces.

Installation

1. Using a new gasket, install the oil filter adapter and the 3 bolts.
   - Tighten to 10 Nm (89 lb-in) plus an additional 45 degrees.

2. Install a new engine oil filter.
   - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

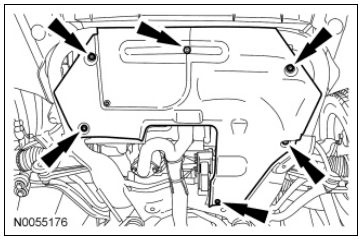


3. If equipped, install the 6 screws and the underbody shield.

Engine Oil Pressure (EOP) Switch

Material

Item	Specification
Thread Sealant with PTFE TA-24	WSK-M2G350-A2



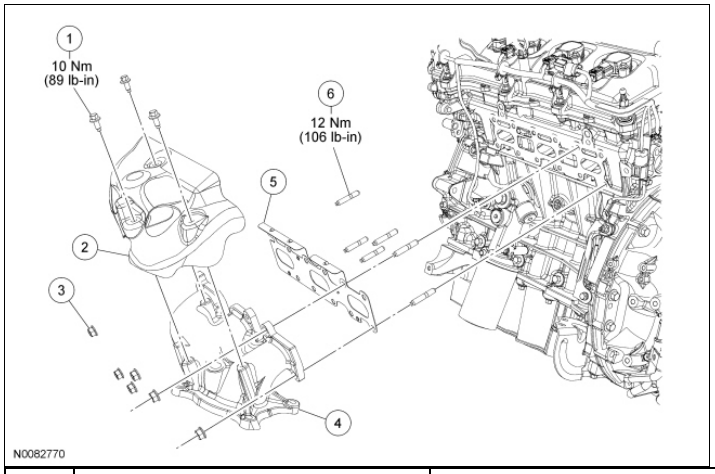
Item	Part Number	Description
1	14A464	Engine Oil Pressure (EOP) switch electrical connector (part of 12C508)
2	9278	EOP switch

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If equipped, remove the 6 screws and the underbody shield.

3. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

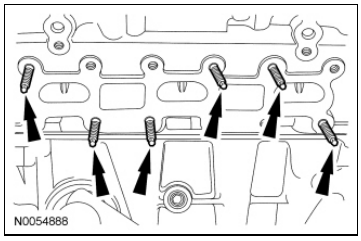


4. Remove the EOP switch.
   - To install, tighten to 14 Nm (124 lb-in) plus an additional 180 degrees.

5. To install, reverse the removal procedure.
   - Apply thread sealant with PTFE to the EOP switch threads prior to installation.

Exhaust Manifold - LH

Material



Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

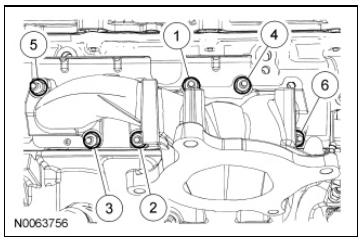
Item	Part Number	Description
1	W713299	LH exhaust manifold heat shield bolt (3 required)
2	9Y427 exhaust manifold heat shield	
3	W701706	LH exhaust manifold nut (6 required)
4	9431	LH exhaust manifold
5	9448	LH exhaust manifold gasket
6	W701732	LH exhaust manifold stud (6 required)

Removal

1. Remove the LH catalytic converter. For additional information, refer to Section 309-00 .
2. Remove the LH Heated Oxygen Sensor (HO2S). For additional information, refer to Section 303-14C .
3. Remove the 3 bolts and the LH exhaust manifold heat shield.
4. Remove the 6 nuts and the LH exhaust manifold.
   - Discard the nuts and gasket.
5. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .
6. Remove and discard the 6 LH exhaust manifold studs.

7. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

   Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.



Installation

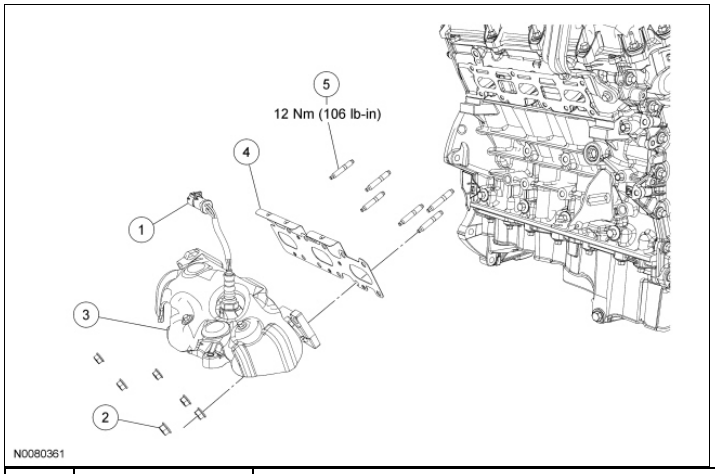
1. Install 6 new LH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

2. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

   Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:

   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten to 25 Nm (18 lb-ft).

3. Install the LH exhaust manifold heat shield and the 3 bolts.
   - Tighten to 10 Nm (89 lb-in).



4. Install the LH HO2S . For additional information, refer to Section 303-14C .

5. Install the LH catalytic converter. For additional information, refer to Section 309-00 .

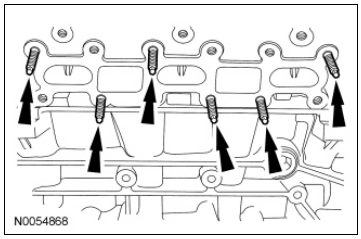
Exhaust Manifold - RH

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

Item	Part Number	Description
1	14A464	RH Heated Oxygen Sensor (HO2S) electrical connector
2	W701706	RH exhaust manifold nut (6 required)
3	9430	RH exhaust manifold
5	W701732	RH exhaust manifold stud (6 required)

Removal



1. Remove the RH catalytic converter. For additional information, refer to Section 309-00 .

2. Disconnect the RH Heated Oxygen Sensor (HO2S) electrical connector.

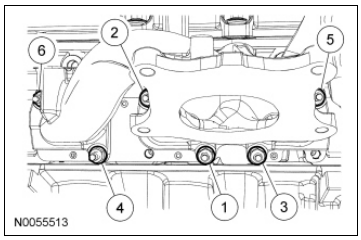
3. Remove the 6 nuts and the RH exhaust manifold.
   - Discard the nuts and gasket.

4. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

5. Remove and discard the 6 RH exhaust manifold studs.

6. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

   Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.



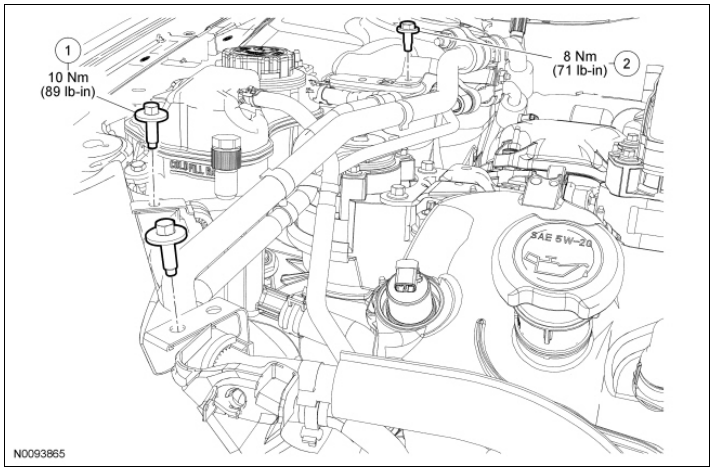
Installation

1. Install 6 new RH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

2. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

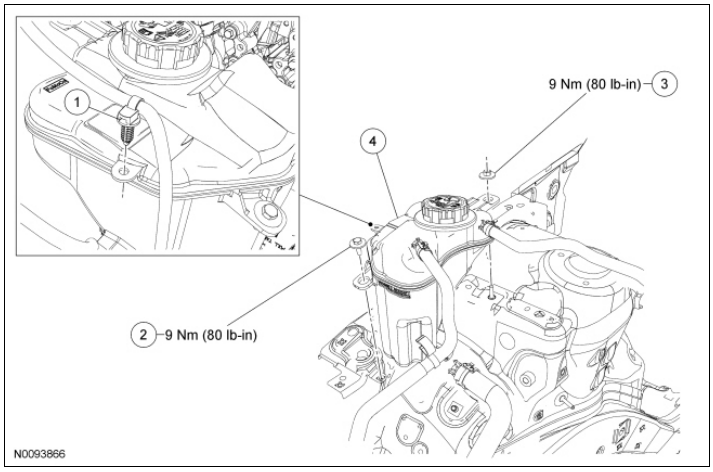
   Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:

   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten to 25 Nm (18 lb-ft).



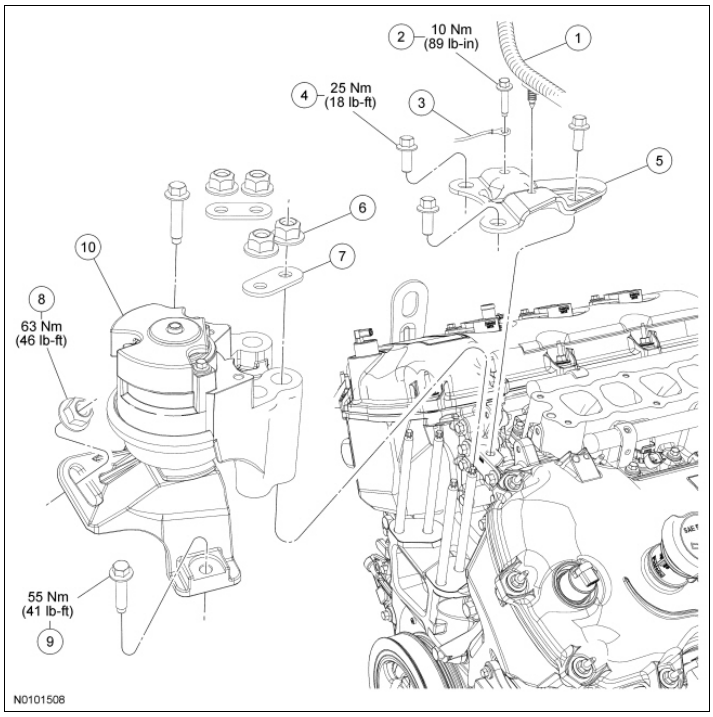
3. Connect the RH HO2S electrical connector.

4. Install the RH catalytic converter. For additional information, refer to Section 309-00 .



Engine Mount

Engine Mount (View 1 of 3)

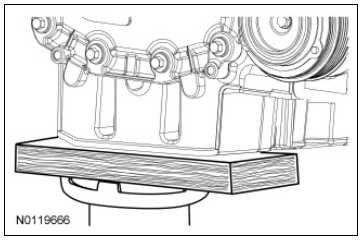


Item	Part Number	Description
1	W503924	A/C tube retaining clamp bolt (2 required)
2	W505422	A/C tube retaining clamp bolt

Engine Mount (View 2 of 3)

Item	Part Number	Description
1	14197	Wiring harness retainer
2	W707398	Engine coolant degas bottle-to-fender bolt
3	W709603	Engine coolant degas bottle-to-fender nut
4	8A080	Engine coolant degas bottle

Engine Mount (View 3 of 3)



Item	Part Number	Description
1	3493	Power steering hose retainer
2	W705936	Ground wire bolt
3	19A905	Ground wire
4	W708764	Engine mount brace bolt (3 required)
5	6K075	Engine mount brace
6	W705891	Engine mount-to-engine nut (4 required)
7	6B095	Engine mount spacer (2 required)
8	W705891	Engine mount-to-frame nut
9	W500720	Engine mount-to-frame bolt (2 required)
10	6038	Engine mount

Removal and Installation

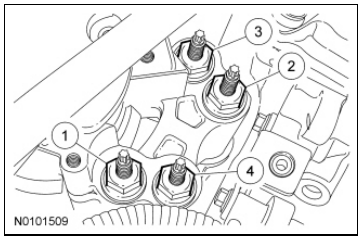
1. ***NOTICE:*** **Failure to position the wood block and floor jack as illustrated can result in damage to the oil pan.**

   Position a floor jack with a block of wood under the front of the oil pan.

2. Remove the A/C tube retaining clamp bolt.
   - To install, tighten to 8 Nm (71 lb-in).

3. Remove the 2 A/C tube retaining clamp bolts.
    - To install, tighten to 10 Nm (89 lb-in).

4. Detach the wiring harness retainer from the degas bottle.



5. Remove the nut, bolt and position the engine coolant degas bottle aside.
    - To install, tighten to 9 Nm (80 lb-in).

6. Detach the power steering hose retainer from the engine mount brace.

7. Remove the bolt and the ground wire from the engine mount brace.
    - To install, tighten to 10 Nm (89 lb-in).

8. Remove the 3 bolts and the engine mount brace.
    - To install, tighten to 25 Nm (18 lb-ft).

9. Remove the 4 engine mount-to-engine nuts.
    - To install, tighten in the sequence shown to 70 Nm (52 lb-ft).

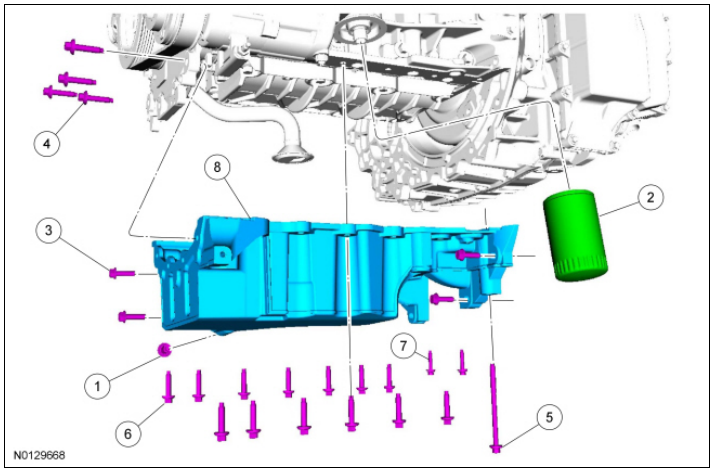
10. Remove the 2 engine mount spacers.

11. Using the floor jack, lower the engine 25 mm (1 in).

12. **NOTE:** It is necessary to reposition the A/C tubes to remove the engine mount.

    Remove the nut, the 2 bolts and the engine mount.

    - To install, tighten the bolts to 55 Nm (41 lb-ft) and the nut to 63 Nm (46 lb-ft).



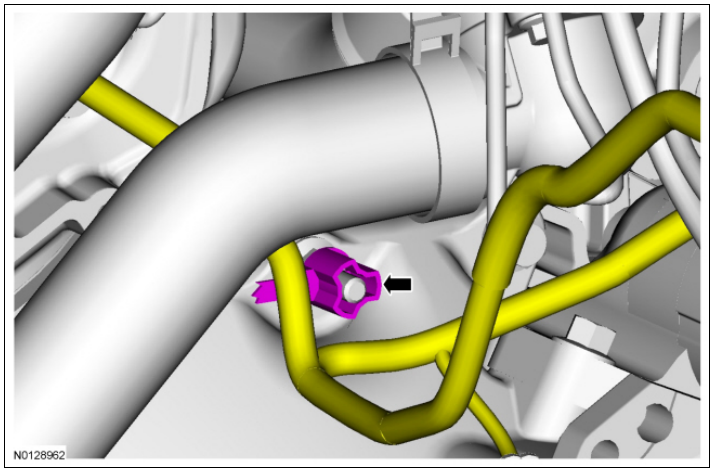
13. To install, reverse the removal procedure.

Oil Pan

Material

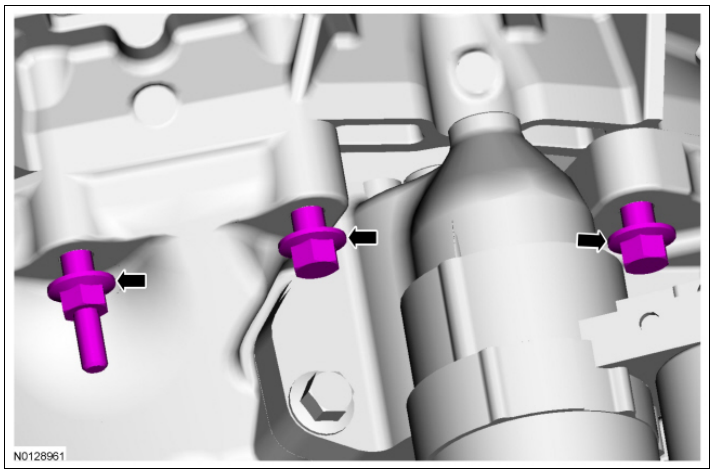
Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® Silicone Gasket Remover ZC-30	-

Removal



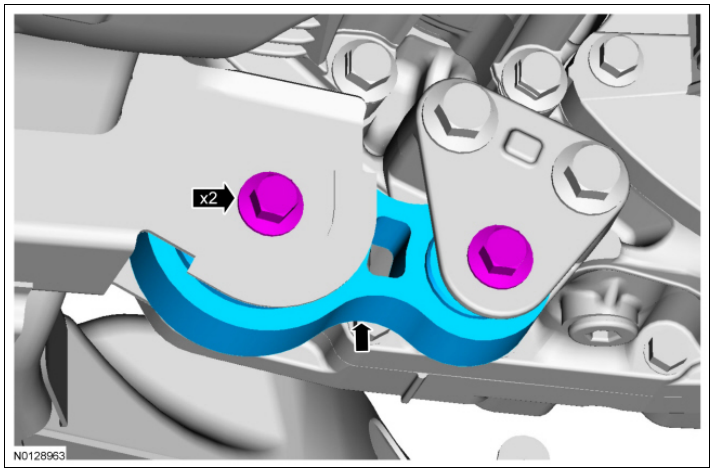
Item	Part Number	Description
1	6730ain plug - 27 Nm (20 lb-ft)	
2	6714	Engine oil filter
3	W714288	Oil pan-to-bellhousing bolt (4 required)
4	W503297	Engine front cover bolt (4 required)
5	W708221	Oil pan bolt
6	W712943	Oil pan bolt (13 required)
7	W503297	Oil pan bolt (2 required)

8	6675	Oil pan



NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

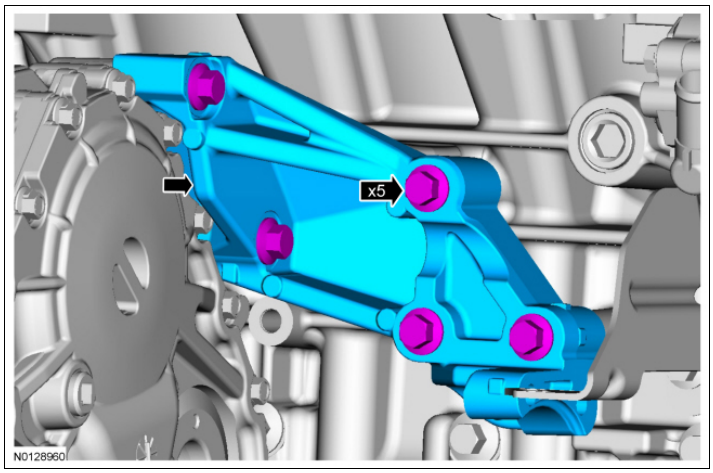
All Vehicles



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the Air Cleaner (ACL) and outlet pipe assembly. For additional information, refer to Section 303-12C .
3. Remove the battery tray. For additional information, refer to Section 414-01 .
4. Remove the oil level indicator.
5. Detach the wiring harness retainer from the upper bell housing-to-engine stud bolt.

6. Loosen the 2 upper bellhousing-to-engine bolts and stud bolt 5 mm (0.19 in).

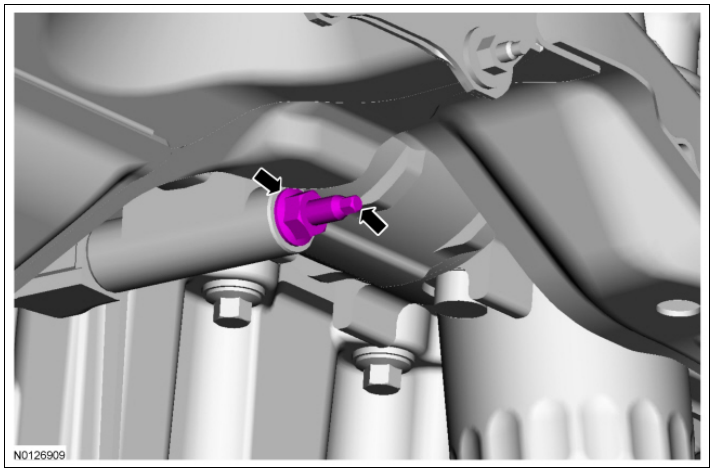
7. Remove the exhaust Y-pipe. For additional information, refer to Section 309-00 .
8. Remove the 2 bolts and the engine roll restrictor.



9. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).

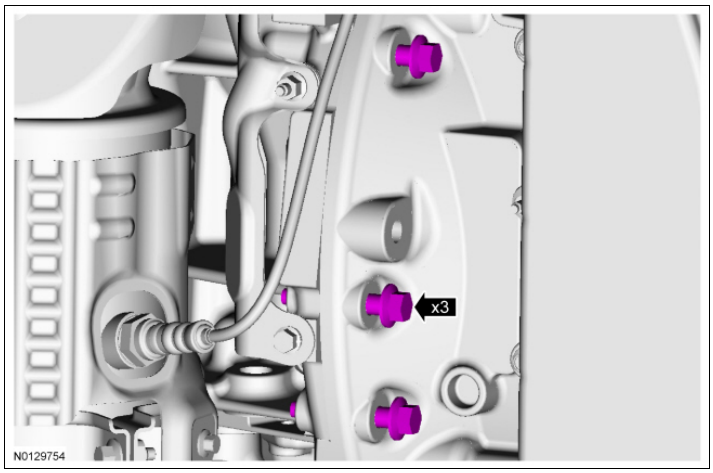
10. Remove and discard the engine oil filter.

All-Wheel Drive (AWD) vehicles



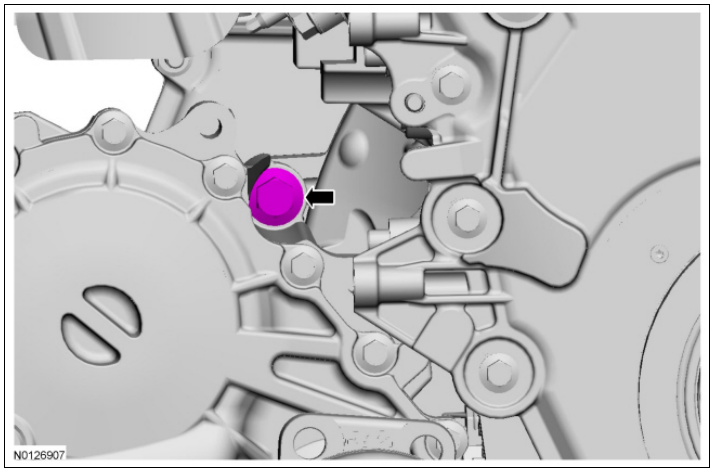
11. Remove the RH catalytic converter. For additional information, refer to Section 309-00 .

12. Remove the 5 bolts and the Power Transfer Unit (PTU) support bracket.

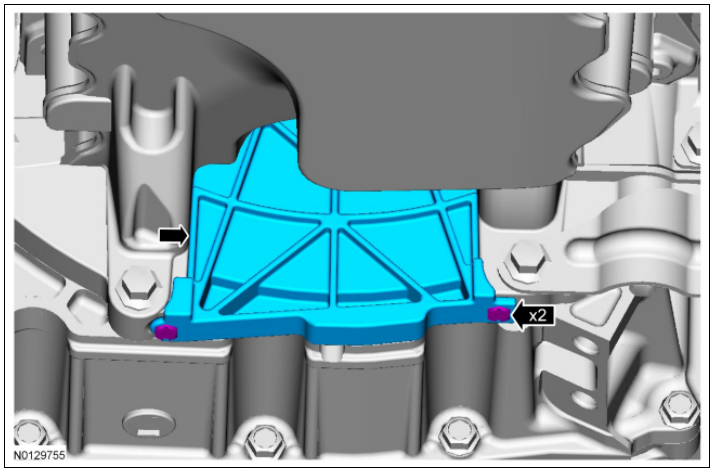


All vehicles

13. Remove the A/C compressor nut.
    - Remove the stud from the oil pan boss (stud will remain in compressor housing).

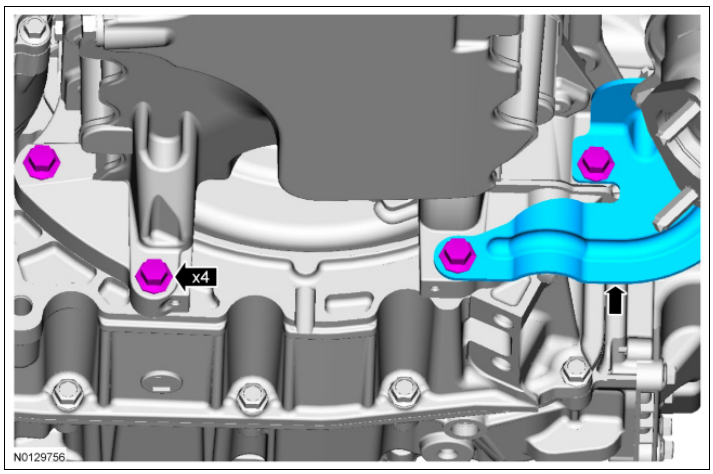


14. Loosen the 3 LH bellhousing-to-engine bolts 5 mm (0.19 in).

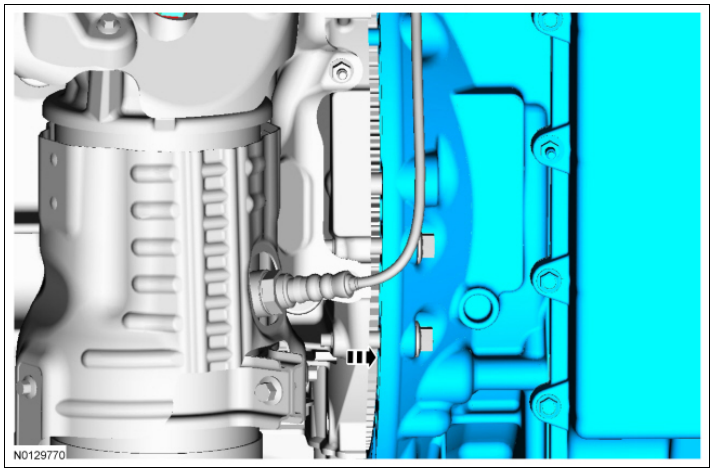


15. **NOTE:** All-Wheel Drive (AWD) vehicle shown, Front Wheel Drive (FWD) similar. Parts removed from graphic for clarity.

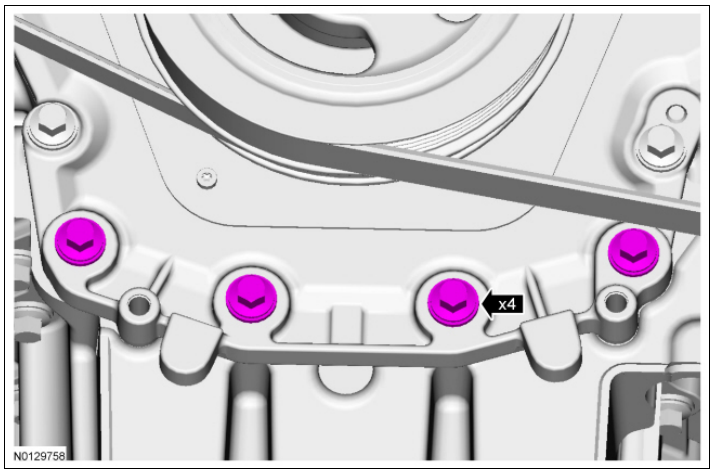
    Loosen the RH engine-to-bellhousing bolt 5 mm (0.19 in).



16. Remove the 2 fasteners and the inspection cover.

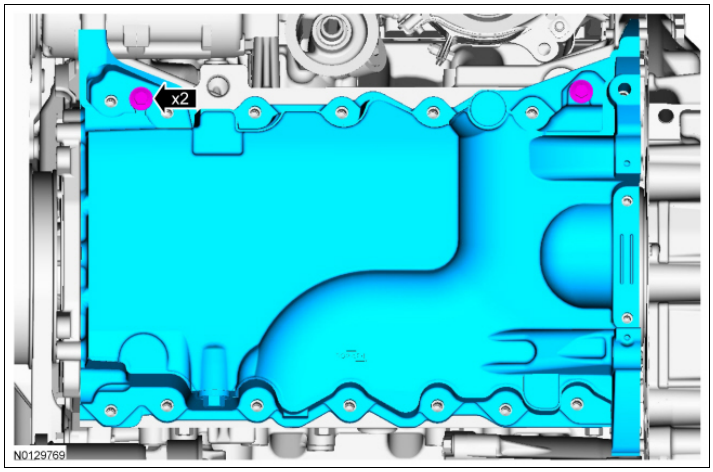


17. Remove the 2 LH catalytic converter bracket bolts.



18. Remove the 4 oil pan-to-bellhousing bolts and the LH catalytic converter bracket.

19. Separate the engine and transaxle 5 mm (0.19 in).



20. Remove the 4 lower engine front cover bolts.

21. Remove the 16 oil pan bolts.

22. Install 2 of the oil pan bolts (finger-tight) into the 2 threaded holes in the oil pan.
    - Alternately tighten the 2 bolts one turn at a time until the oil pan-to-cylinder block seal is released.
        - ♦ Remove the oil pan.

23. ***NOTICE:*** **Only use a 3MTM Roloc® Bristle Disk (2-in white, part number 07528) to clean the oil pan. Do not use metal scrapers, wire brushes or any other powerbrasive disk to clean. These tools cause scratches and gouges that make leak paths.**

Clean the engine oil pan using a 3MTM Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.

- Thoroughly wash the oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

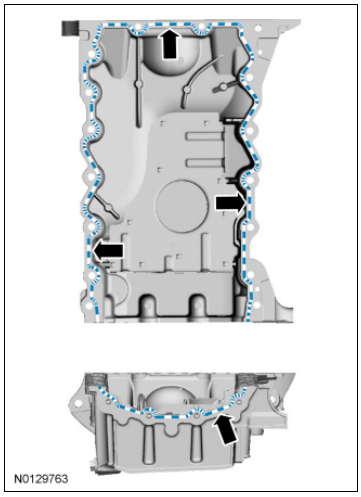
24. ***NOTICE:*** **Do not use wire brushes, power abrasive discs or 3MTM Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that causes premature engine failure. Remove all traces of the gasket.**

    Clean the sealing surfaces of the cylinder block and engine front cover in the following sequence.

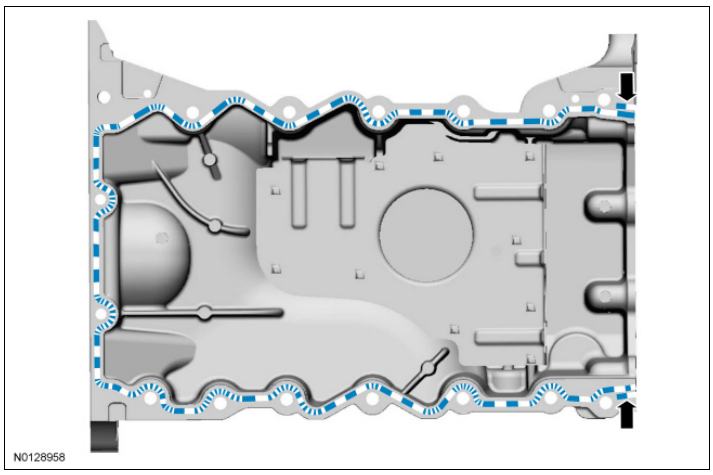
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

Installation

All vehicles



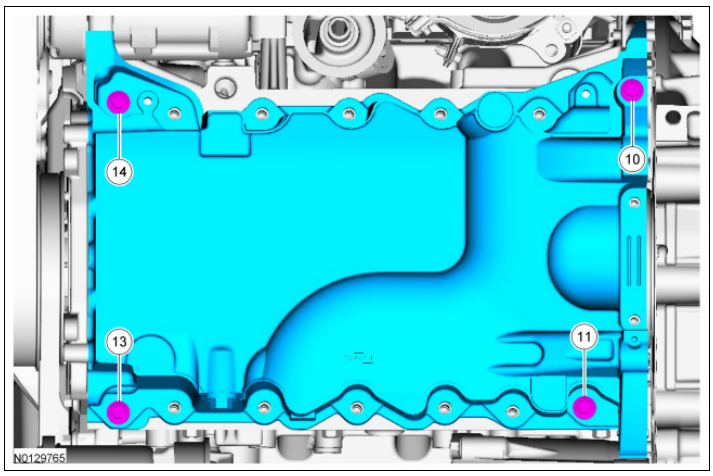
1. Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 engine front cover-to-cylinder block joint areas on the sealing surface of the oil pan.



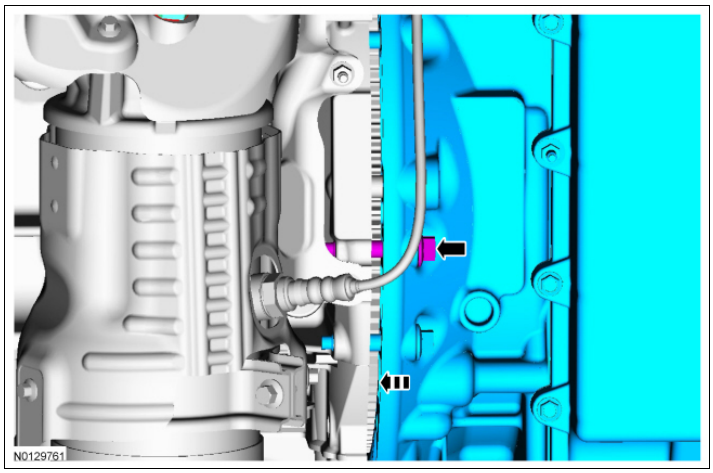
2. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: The oil pan and the 4 specified bolts must be installed and the oil pan aligned to the cylinder block within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

    Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the oil pan-to-engine block and to the oil pan-to-engine front cover mating surface.



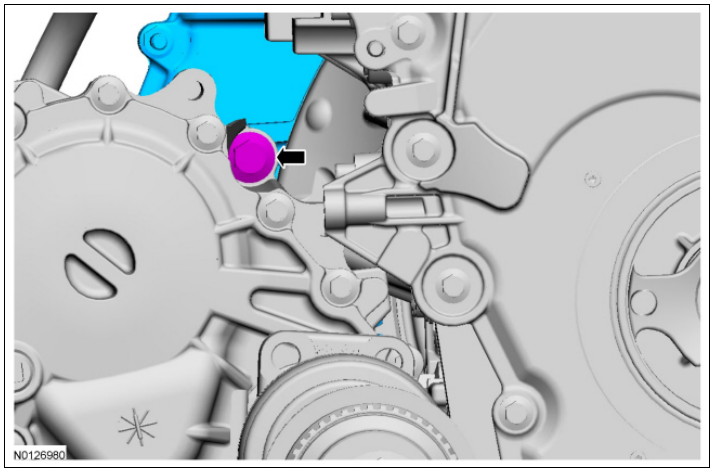
3. Apply a 5.5 mm (0.21 in) bead of Motorcraft® High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.



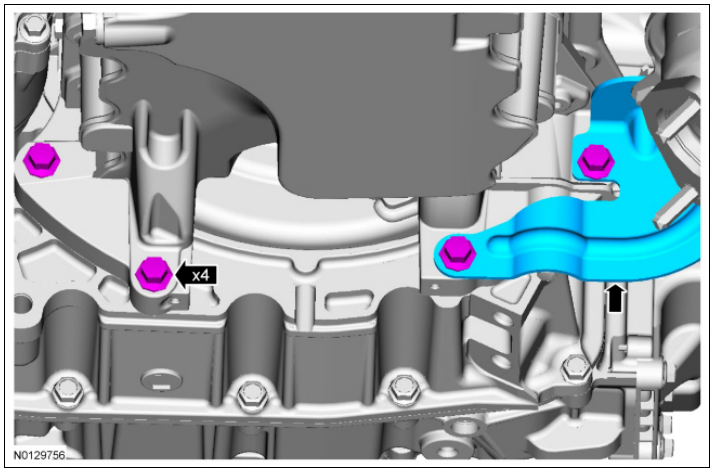
4. **NOTE:** The oil pan and the 4 specified bolts must be installed within 4 minutes of the start of sealant application.

   NOTE: Keep the oil pan as close as possible to the transmission while installing, then slide forward towards the engine front cover to prevent wiping off of the sealant.

   Install the oil pan and bolts 10, 11, 13 and 1inger tight.



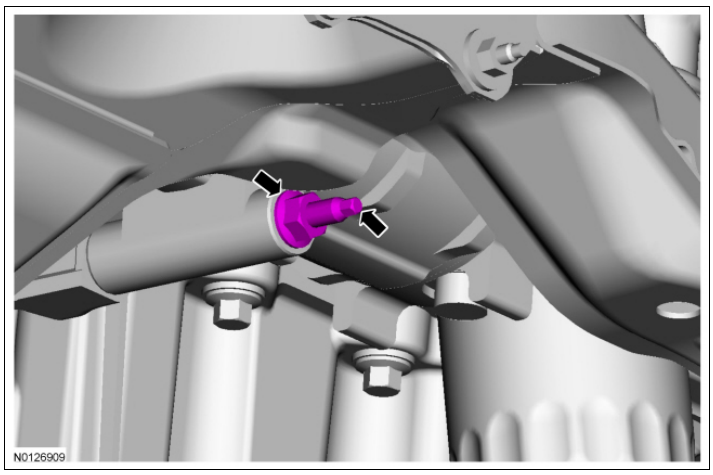
5. Draw the bellhousing up to the engine by tightening the LH bellhousing-to-engine bolt.
   - Do not torque at this time.



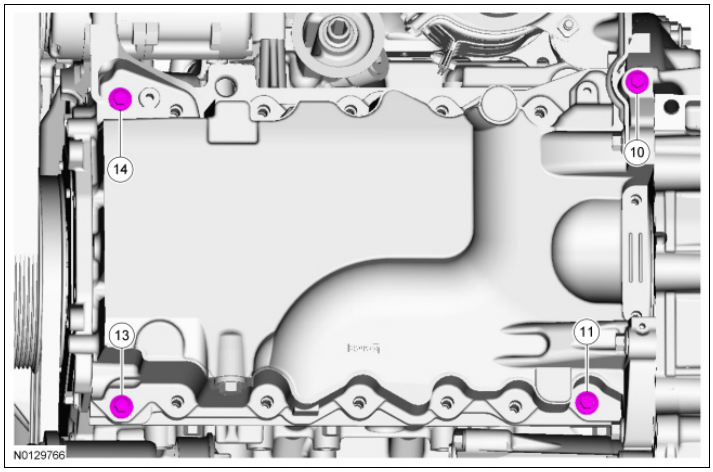
6. **NOTE:** All-Wheel Drive (AWD) vehicle shown, Front Wheel Drive (FWD) similar. Parts removed from graphic for clarity.

   Draw the bellhousing up to the engine by tightening the RH engine-to-bellhousing bolt.

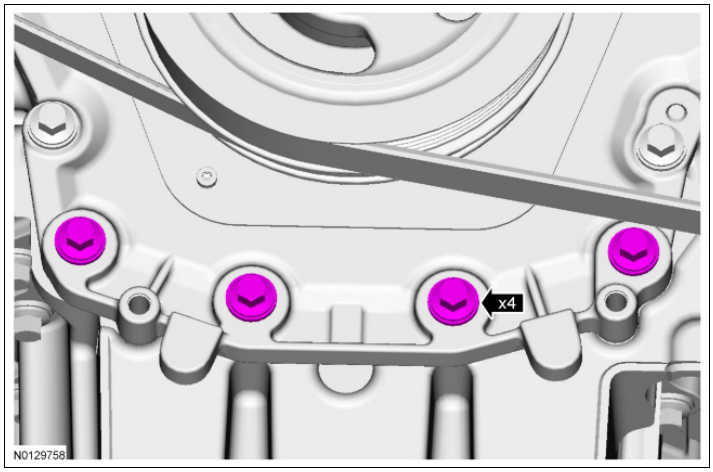
   - Do not torque at this time.



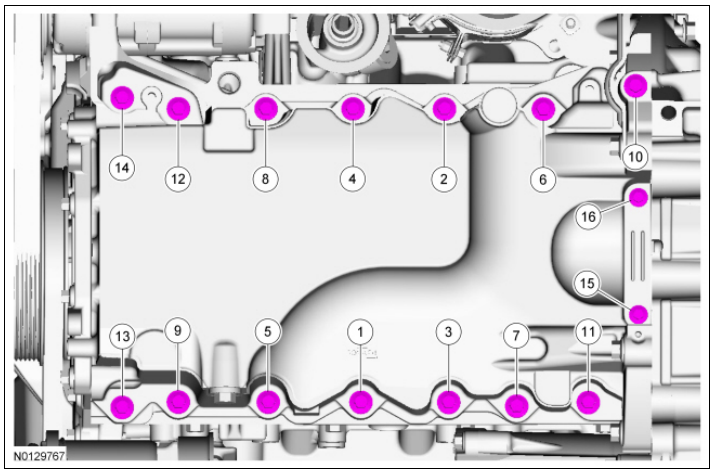
7. Install the LH catalytic converter bracket and the 4 oil pan-to-bellhousing bolts.
   - Do not torque at this time.



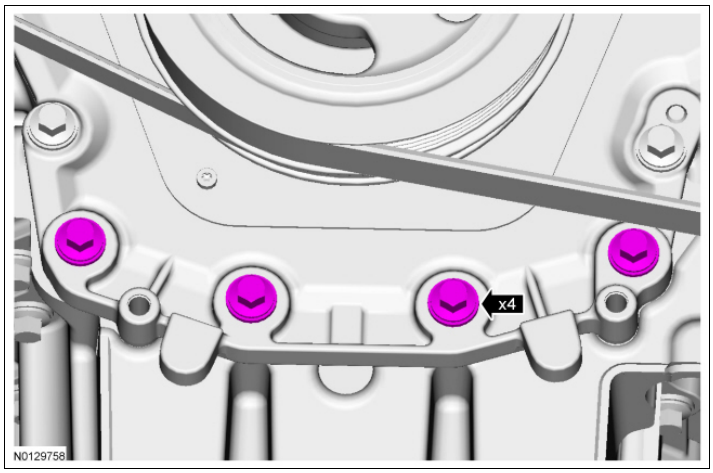
8. Install the 2 LH catalytic converter bracket bolts.
    - Tighten to 20 Nm (177 lb-in).



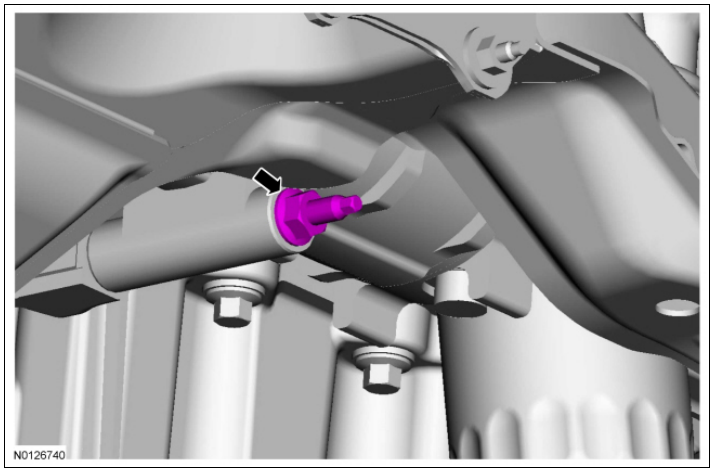
9. Install the A/C compressor stud and nut.
    - Tighten the stud to 9 Nm (80 lb-in).
    - Hand tighten the nut.



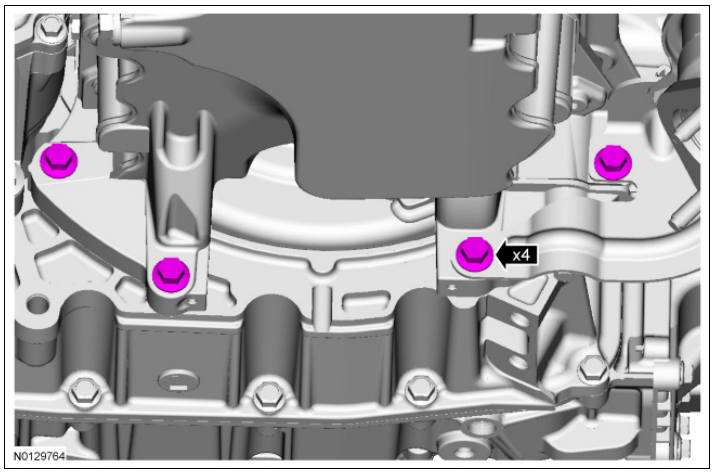
10. Tighten bolts 10, 11, 13 and 14 in the sequence shown to 3 Nm (27 lb-in).



11. Install the 4 lower engine front cover bolts.
    - Do not torque at this time.

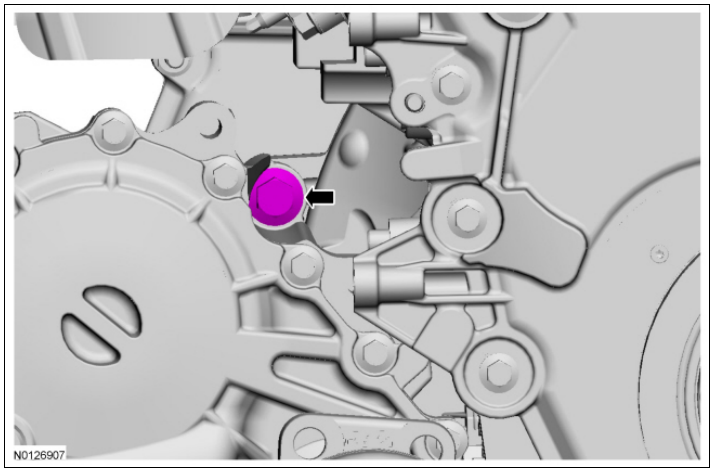


12. Install the remaining oil pan bolts and tighten in the sequence shown.
    - Tighten bolts 1 through 9 and 11 through 14 to 20 Nm (177 lb-in), then rotate an additional 45 degrees.
    - Tighten bolts 15 and 16 to 10 Nm (89 lb-in), then rotate an additional 45 degrees.
    - Tighten bolt 10 to 20 Nm (177 lb-in), then rotate an additional 90 degrees.

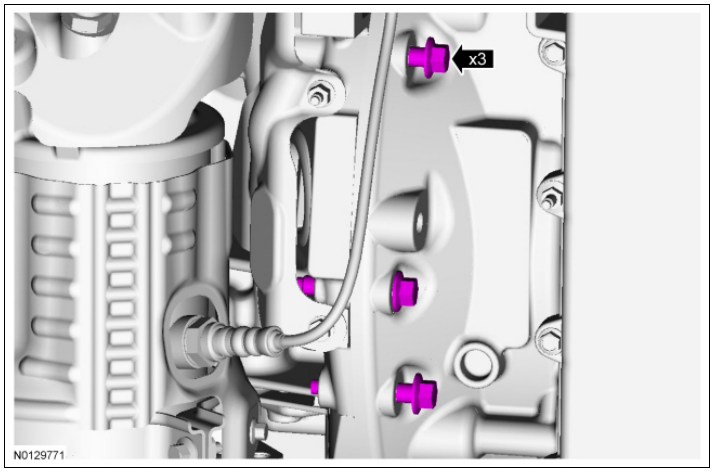


13. Tighten the 4 lower engine front cover bolts to 24 Nm (18 lb-ft).

14. Tighten the A/C compressor nut to 25 Nm (18 lb-ft).



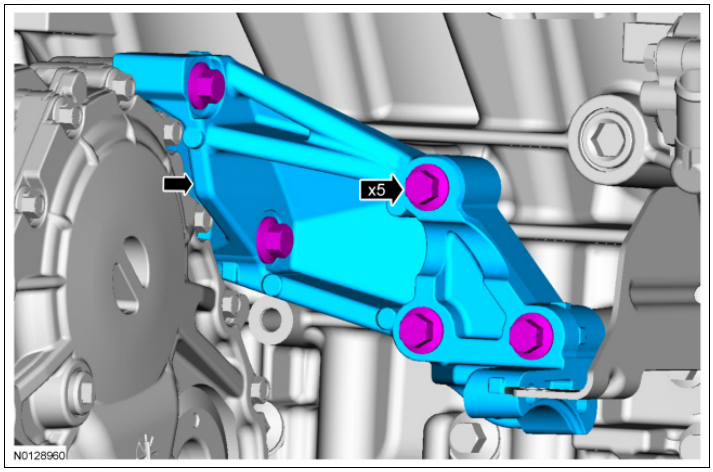
15. Tighten the 4 oil pan-to-bellhousing bolts to 48 Nm (35 lb-ft).



16. **NOTE:** All-Wheel Drive (AWD) vehicle shown, Front Wheel Drive (FWD) similar. Parts removed from graphic for clarity.

    Tighten the RH engine-to-bellhousing bolt to 48 Nm (35 lb-ft).

17. Tighten the 3 LH bellhousing-to-engine bolts to 48 Nm (35 lb-ft).

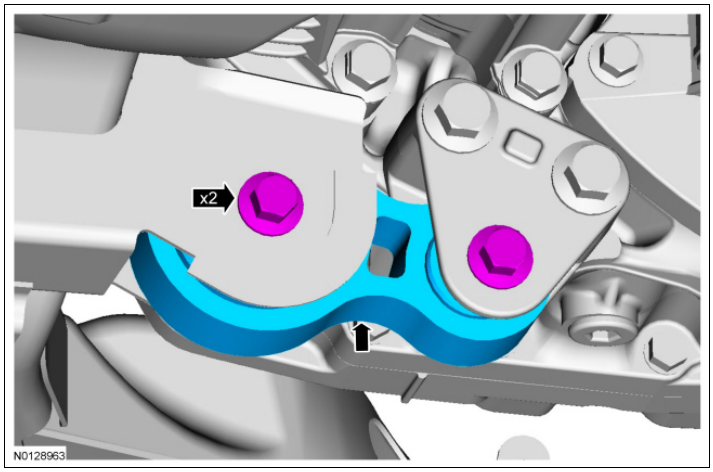


18. Install the inspection cover and the 2 fasteners.

All-Wheel Drive (AWD) vehicles

19. Install the Power Transfer Unit (PTU) support bracket and the 5 bolts.
    - Tighten to 48 Nm (35 lb-ft).

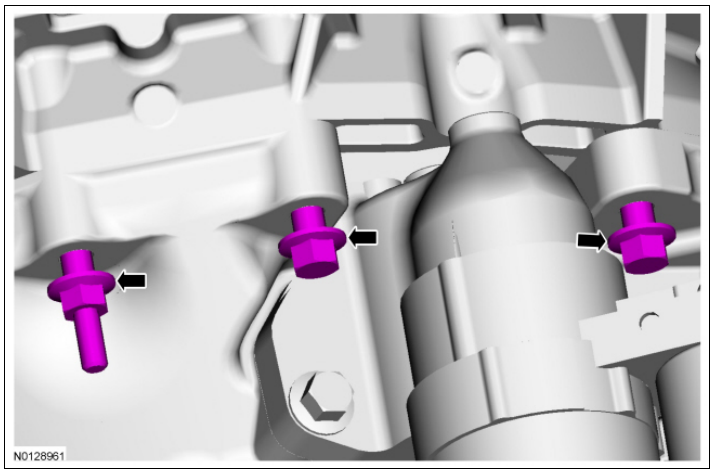
20. Install the RH catalytic converter. For additional information, refer to Section 309-00 .



All vehicles

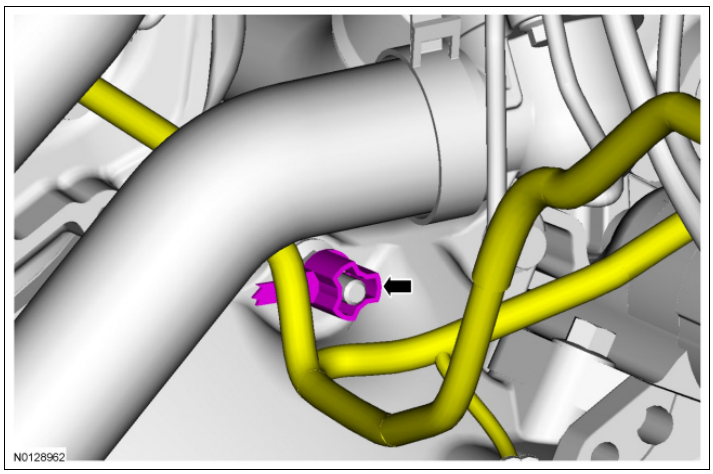
21. **NOTE:** Do not lubricate the engine oil filter gasket.

Install a new engine oil filter.



- Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

22. Install the engine roll restrictor and the 2 bolts.
    - Tighten to 90 Nm (66 lb-ft).



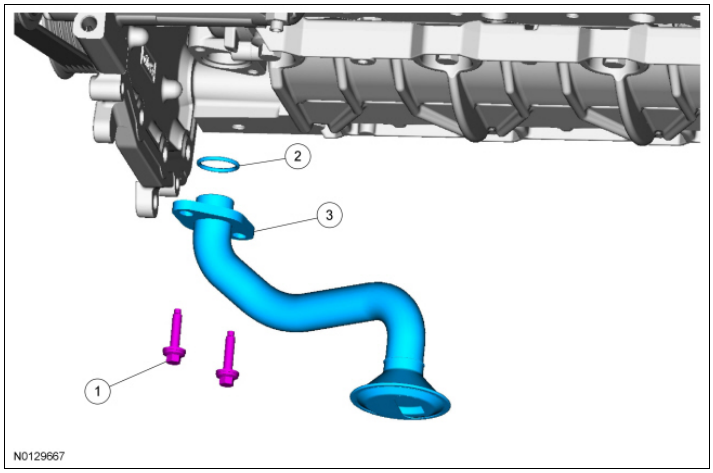
23. Install the exhaust Y-pipe. For additional information, refer to Section 309-00 .

24. Tighten the 3 upper bellhousing-to-engine bolts to 48 Nm (35 lb-ft).

25. Attach the wiring harness retainer to the upper bell housing-to-engine stud bolt.

26. Install the oil level indicator.

27. Install the battery tray. For additional information, refer to Section 414-01 .



28. Install the Air Cleaner (ACL) and outlet pipe assembly. For additional information, refer to Section 303-12C .

29. ***NOTICE:*** **Do not expose the Motorcraft® High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the oil pan. Failure to follow these nstructions may cause engine oil leakage.**

    Fill the engine with clean engine oil.

Oil Pump Screen and Pickup Tube

Removal

Item	Part Number	Description
1	W503278	Oil pump screen and pickup tube bolt (2 required) - 10 Nm (89 lb-in)
2	6625	O-ring seal
3	6622	Oil pump screen and pickup tube

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan may cause engine failure.**

1. Remove the oil pan. For additional information, refer to Oil Pan in this section.

2. Remove the 2 bolts and the oil pump screen and pickup tube.
   - Discard the O-ring seal.

Installation

1. Using a new O-ring seal, install the oil pump screen and pickup tube and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

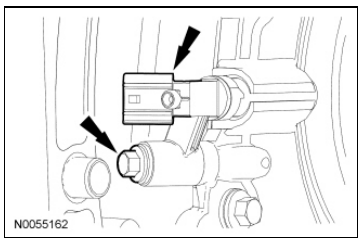
2. Install the oil pan. For additional information, refer to Oil Pan in this section.

Crankshaft Rear Seal with Retainer Plate

Special Tool(s)

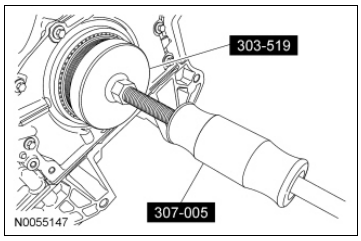
 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST2980-A	Installer, Rear Main Seal 303-1250
 ST1382-A	Remover, Crankshaft Rear Oil Seal 303-519 (T95P-6701-EH)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)

Material



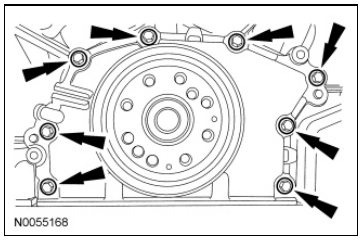
Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Motorcraft® Silicone Gasket Remover ZC-30	-

Removal

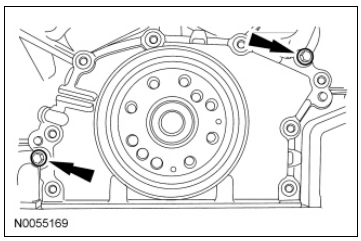


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the flexplate. For additional information, refer to Flexplate in this section.
3. Remove the crankshaft sensor ring.
4. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

5. Remove the bolt and the CKP sensor.



6. Using the Crankshaft Rear Oil Seal Remover and Slide Hammer, remove and discard the rear crankshaft seal.



7. Remove the 2 oil pan to crankshaft rear seal retainer bolts.

8. Remove the 8 crankshaft rear seal retainer bolts.

9. Install the 2 M6 oil pan bolts (finger-tight) into the 2 threaded holes in the crankshaft rear seal retainer.
    - Alternately tighten the 2 bolts one turn at a time until the crankshaft rear seal retainer-to-cylinder block seal is released.
        - ♦ Remove the crankshaft rear seal retainer.

10. ***NOTICE:*** **Only use a 3MTM Roloc® Bristle Disk (2-in white, part number 07528) to clean the crankshaft rear seal retainer plate. Do not use metal scrapers, wire brushes or any other power**

abrasive disk to clean the crankshaft rear seal retainer plate. These tools cause scratches and gouges that make leak paths.

Clean the crankshaft rear seal retainer plate using a 3MTM Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.

- Thoroughly wash the crankshaft rear seal retainer plate to remove any foreign material, including any abrasive particles created during the cleaning process.

11. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**

    NOTICE: **Do not use wireshes, power abrasive discs or 3MTM Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that will cause premature engine failure. Remove all traces of the gasket.**

    Clean the sealing surfaces of the cylinder block and oil pan flange in the following sequence.

    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil or coolant and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

Installation

1. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

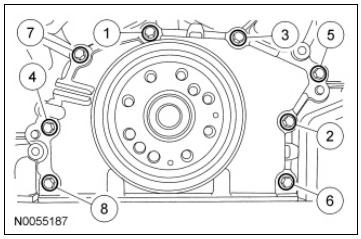
   NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

   Apply 5 mm (0.196 in) beads of Motorcraft® High Performance Engine RTV Silicone to the 2 cylinder block/oil pan joints.

2. ***NOTICE:*** **Failure to use Motorcraft® High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious e damage.**

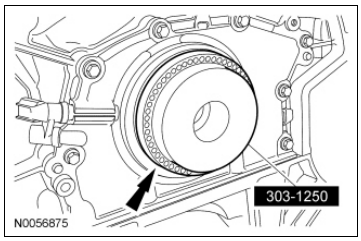
   NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 10 minutes of sealant application.

   Apply a 3 mm (0.11 in) bead of Motorcraft® High Performance Engine RTV Silicone to the sealing surface of the crankshaft rear seal retainer.

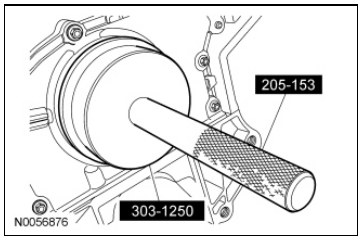


3. **NOTE:** Use the 2 oil pan bolts as handles during installation to avoid touching the sealant.

   Install the crankshaft rear seal retainer at an angle above the oil pan flange to avoid scraping off the sealer. Tilt the seal retainer up and onto the rear of the cylinder block.



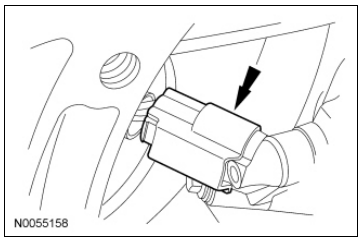
4. Install the 8 bolts and tighten in the sequence shown to 10 Nm (89 lb-in).



5. Install the 2 oil pan to crankshaft rear seal retainer bolts.
   - Tighten to 10 Nm (89 lb-in) plus an additional 45 degrees.

6. **NOTE:** Lubricate the seal lips and bore ith clean engine oil prior to installation.

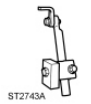
   Position the Rear Main Seal Installer onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.



7. Using the Rear Main Seal Installer and Handle, install the new crankshaft rear seal.

8. Install the Crankshaft Position (CKP) sensor and install the bolt.
   - Tighten to 10 Nm (89 lb-in).

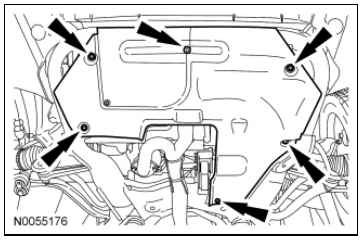
9. Connect the CKP sensor electrical connector.



10. Install the crankshaft sensor ring.

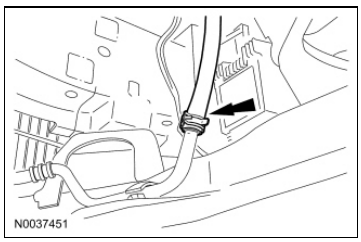
11. Install the flexplate. For additional information, refer to Flexplate in this section.

Engine



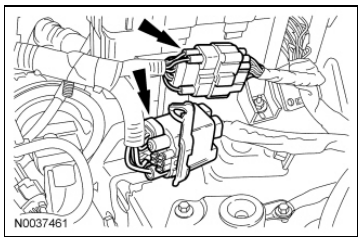
Special Tool(s)

 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E
 ST2743A	Adjustable Grip Arm, 1735A 014-00001 or equivalent
 ST2976A	Engine Lift Eye 303-1245
 ST1293-A	Powertrain Lift 300-OTC1585AE
 ST1408-A	Remover, Tie-Rod End 211-105
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent

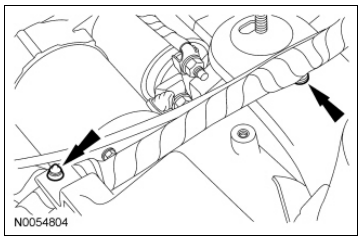


⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

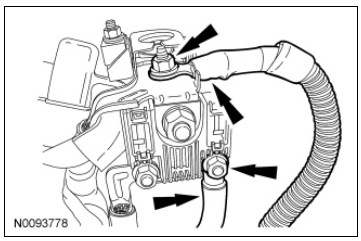
All vehicles



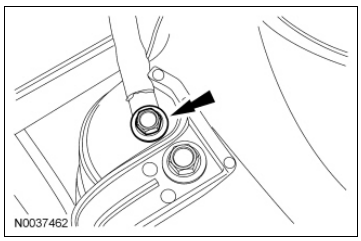
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Recover the A/C system. For additional information, refer to Section 412-00A .
4. Remove the accessory drive belt and the power steering belt. For additional information, refer to Section 303-05C .
5. Remove the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .
6. If equipped, remove the 6 screws and the underbody shield.



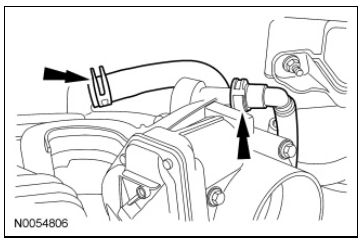
7. Disconnect the power steering cooler tube and drain the power steering fluid into a suitable drain pan.



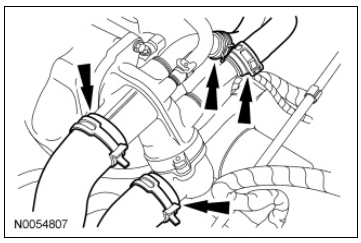
8. Drain the cooling system. For additional information, refer to Section 303-03A .
9. Remove the degas bottle. For additional information, refer to Section 303-03A .
10. Remove the engine Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12C .
11. Remove the battery tray. For additional information, refer to Section 414-01 .
12. Disconnect the 2 engine wiring harness electrical connectors.



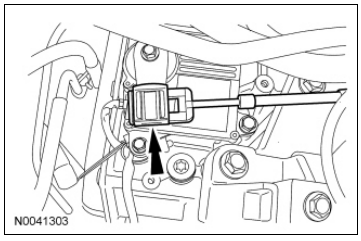
13. Detach the 2 wiring harness retainers from the transmission mount and the battery tray bracket.



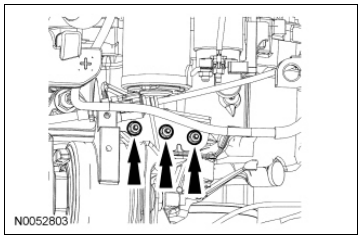
14. Remove the 2 nuts and the battery cables from the positive battery cable.



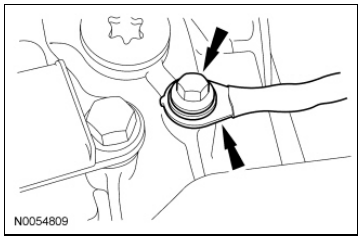
15. Remove the bolt and position aside the ground wire.



16. Disconnect the vacuum hose and the Evaporative Emission (EVAP) tube from the upper intake manifold.

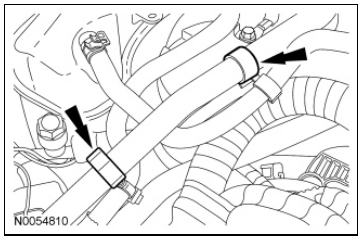


17. Disconnect the upper radiator hose, lower radiator hose and 2 heater hoses from the thermostat housing.

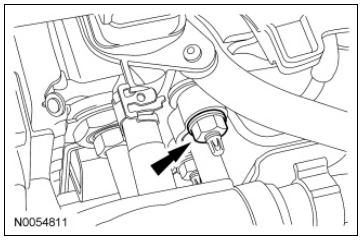


18. Disconnect the transaxle control cable from the control lever.

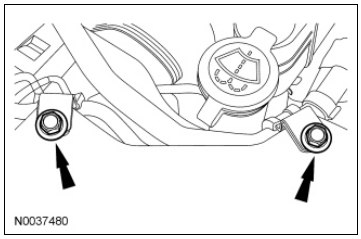
19. Remove the 3 nuts and position the transaxle control cable bracket aside.



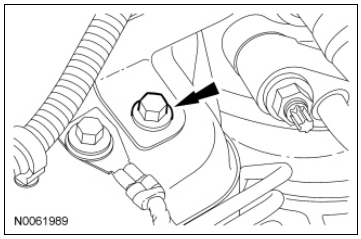
20. Remove the bolt and position the ground wire aside.



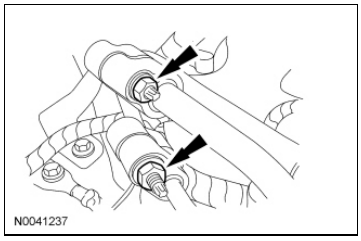
21. If equipped, detach the engine block heater harness from the radiator support, power steering hose, A/C tube and the engine wiring harness.



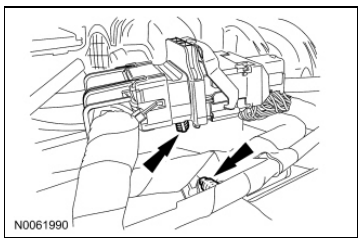
22. Detach the coolant tube retainer clips from the A/C tube.



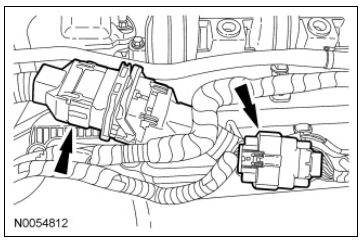
23. Remove the nut and disconnect the A/C tube from the condenser.
    - Discard the O-ring seal.



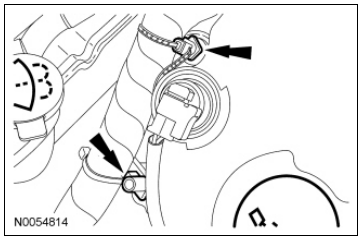
24. Remove the 2 A/C tube bracket bolts.



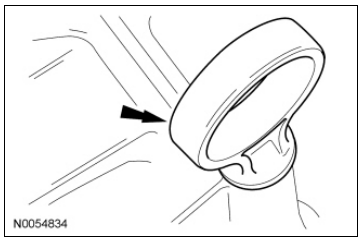
25. Remove the A/C tube bracket bolt.



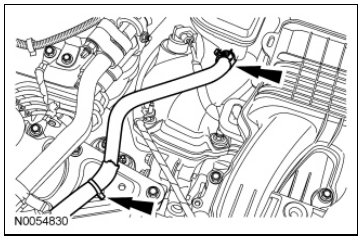
26. Remove the 2 nuts and disconnect the A/C tubes.
    - Discard the O-ring seal.



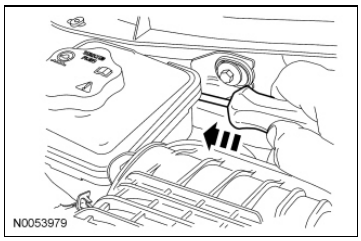
27. Detach the 2 wiring harness retainers.



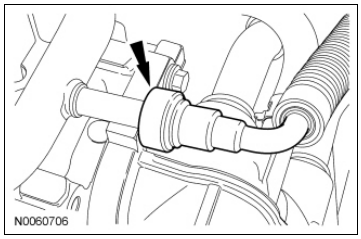
28. Disconnect the 2 engine wiring harness electrical connectors.



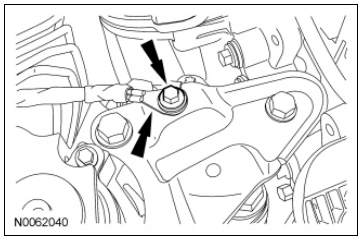
29. Remove the 2 wiring harness retainers from the LH valve cover stud bolts and position the wiring harness aside.



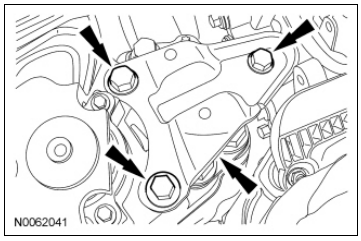
30. Remove the oil level indicator.



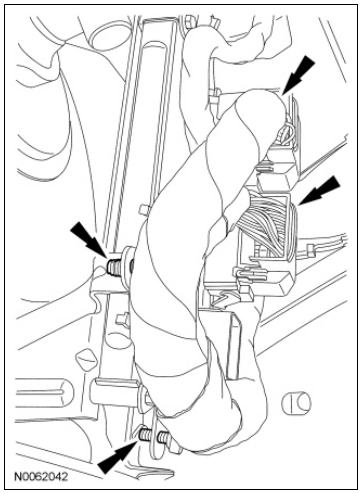
31. Disconnect the hose from the power steering reservoir.
    - Detach the pin-type retainer from the engine mount brace.



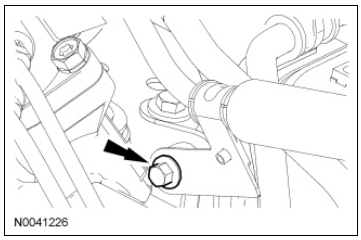
32. Using a small screwdriver, release the retaining clip and detach the power steering reservoir from the cowl.



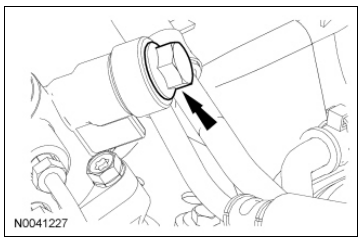
33. Disconnect the fuel supply tube from the fuel rail. For additional information, refer to Section 310-00 .



34. Remove the bolt and the ground wire from the engine mount brace.

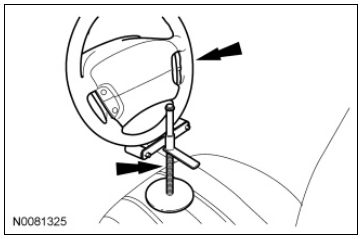


35. Remove the 3 bolts and the engine mount brace.

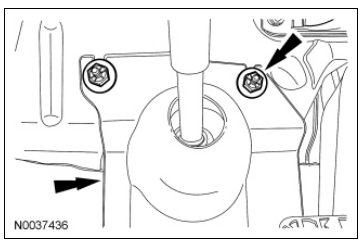


36. Disconnect the PCM electrical connectors and pin-type retainers.

37. Remove the Power Steering Pressure (PSP) hose bracket bolt.



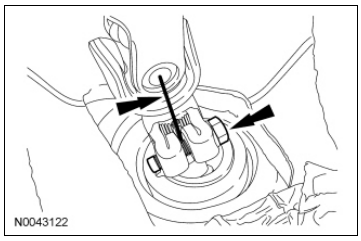
38. Remove and discard the PSP hose banjo bolt and the 2 seals from the steering gear.



39. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

Using a suitable holding device, hold the steering wheel in the straight-ahead position.

40. Remove the 2 nuts and the steering joint cover.



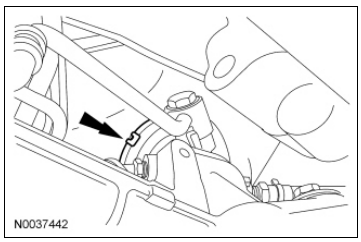
41. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    NOTE: Index-mark the steering column shaft position to the steering gear for reference during installation.

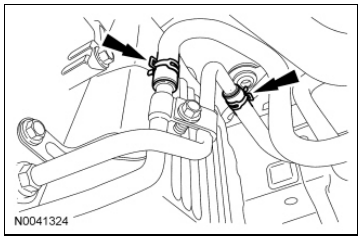
    Remove the bolt and disconnect the steering column shaft from the steering gear.

    - Discard the bolt.

42. Remove the 4 screws and position the LH fender splash shield aside.



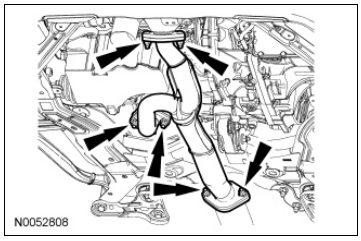
43. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.



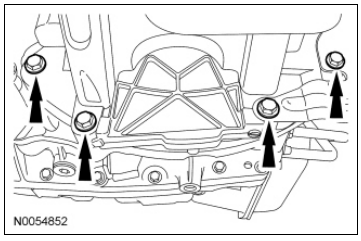
44. ***NOTICE:*** **The steering gear-to-dash seal must be removed or it will be damaged when lowering the subframe.**

    Release the 4 clips and slide the steering gear-to-dash seal off of the steering gear and into the passenger compartment.

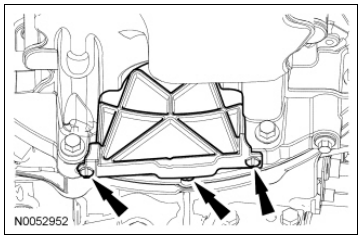
45. Disconnect the transaxle cooler hoses.



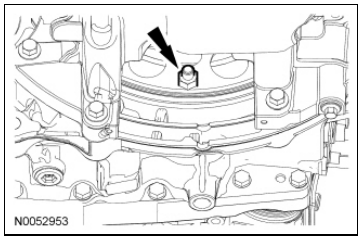
46. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).



47. Remove and discard the engine oil filter.

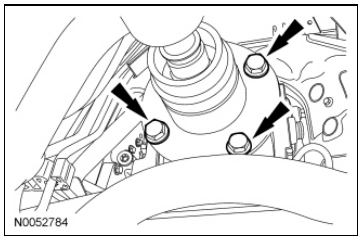


48. Remove the 6 nuts and the Y-pipe assembly.
    - Discard the gaskets and nuts.



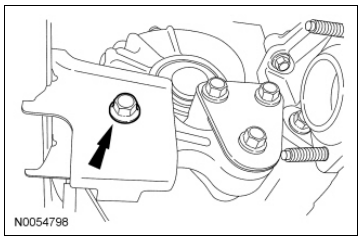
49. Remove the 4 oil pan-to-transaxle bolts.

50. Remove the 2 fasteners and the inspection cover.



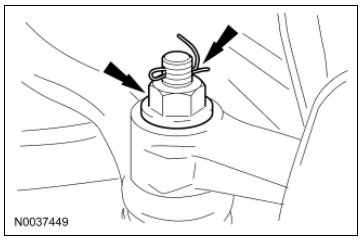
51. Remove and discard the 4 torque converter nuts.

All-Wheel Drive (AWD) vehicles



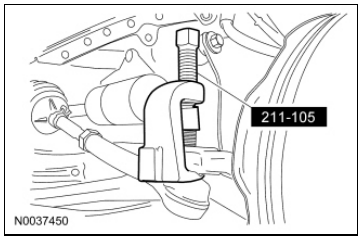
52. **NOTE:** Index-mark the driveshaft for installation.

    Remove and discard the 4 bolts (3 shown) and support the driveshaft with a length of mechanic's wire.



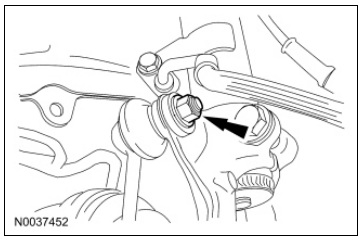
All vehicles

53. Remove the engine roll restrictor-to-subframe through bolt.



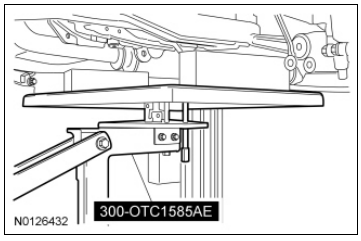
54. **NOTE:** LH shown, RH similar.

    Remove the cotter pins and nuts from the tie-rod ends.



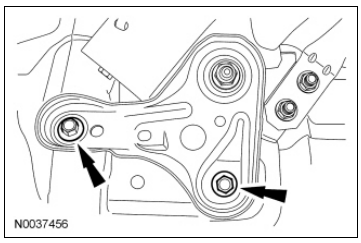
55. **NOTE:** LH shown, RH similar.

    Using the Tie-Rod End Remover, separate the tie-rod ends from the steering knuckles.



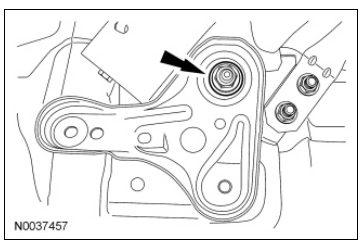
56. **NOTE:** LH shown, RH similar.

    Remove the nuts and separate the stabilizer bar links from the struts.



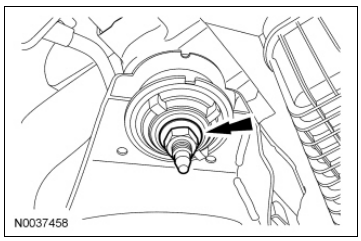
57. Using a wax pencil, mark the relationship of the front subframe to the underbody at the mounting locations.

58. Position the Powertrain Lift under the subframe assembly.



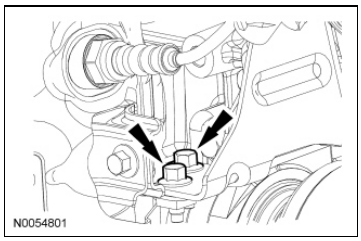
59. **NOTE:** LH shown, RH similar.

    Remove the 4 subframe bracket-to-body bolts.



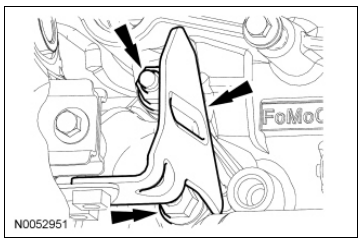
60. **NOTE:** LH shown, RH similar.

    Remove the 2 rear subframe nuts and the 2 subframe brackets.



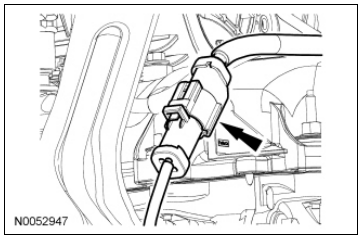
61. **NOTE:** LH shown, RH similar.

    Remove the 2 front subframe nuts.



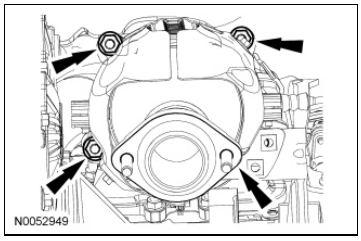
62. Lower the subframe assembly from the vehicle.

63. Remove the 2 RH catalytic converter bracket bolts.

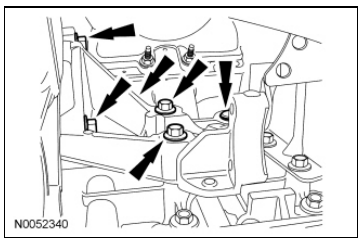


Front Wheel Drive (FWD) vehicles

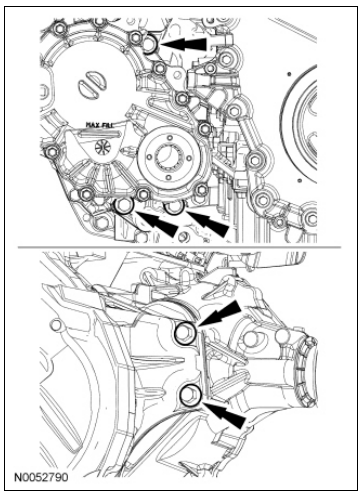
64. Remove the 2 nuts and remove the RH catalytic converter bracket.



All-Wheel Drive (AWD) vehicles

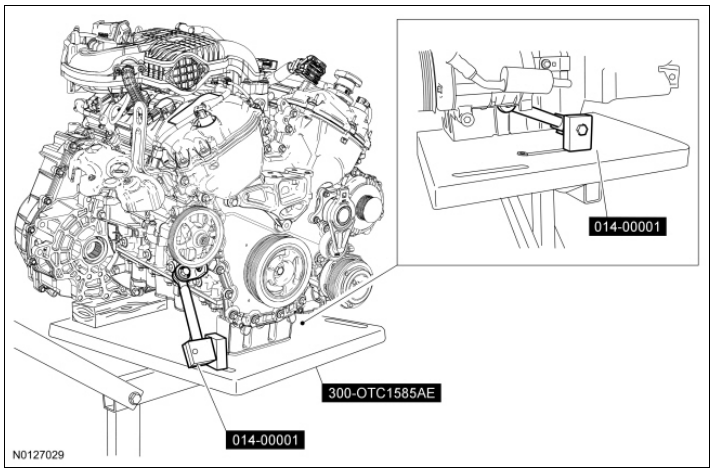


65. Disconnect the RH Catalyst Monitor Sensor (CMS) electrical connector.

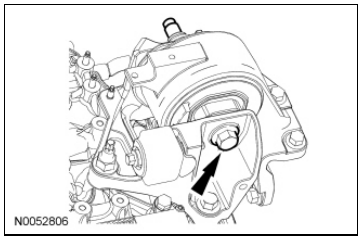


66. Remove the 4 nuts and the RH catalytic converter.
    - Discard the gasket.

67. Remove the 5 bolts and the Power Transfer Unit (PTU) support bracket.



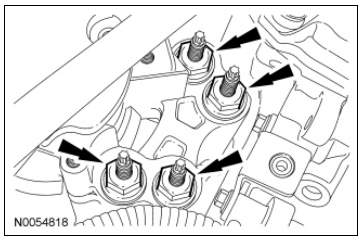
68. Remove the 5 bolts and the PTU .



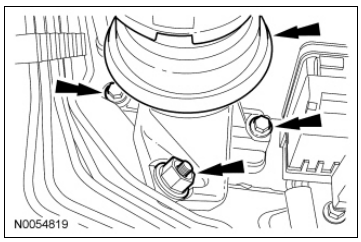
All vehicles

69. **NOTE:** Position a block of wood under the transaxle.

    Install the Powertrain Lift and Adjustable Grip Arms.

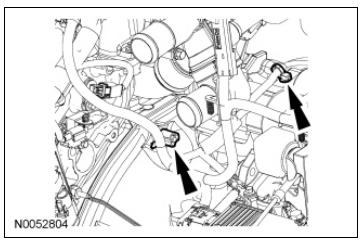


70. Remove the transaxle support insulator through bolt and nut.

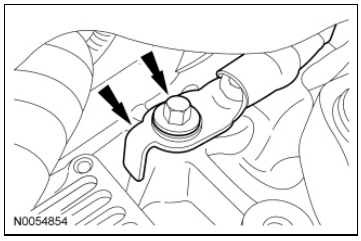


71. Remove the transaxle support insulator bracket bolt and the 2 nuts.

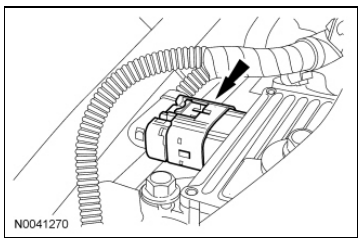
72. Remove the 4 engine mount nuts.
    - Remove the 2 engine mount spacers.



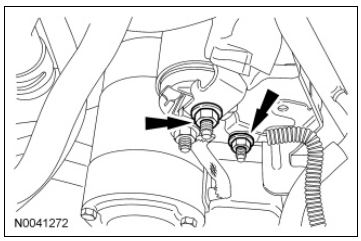
73. Remove the nut, 2 bolts and the engine mount.



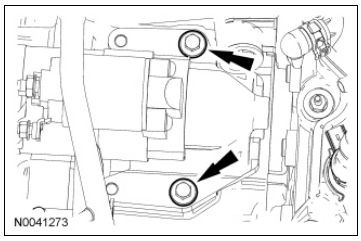
74. Lower the engine and transaxle assembly from the vehicle.



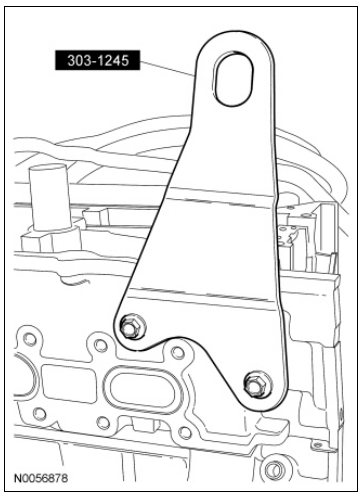
75. Disconnect the wiring harness fasteners from the transaxle-to-engine stud bolt and the starter.



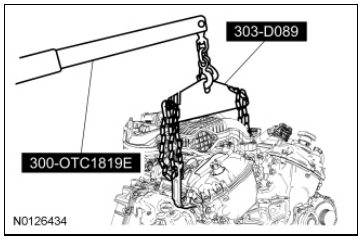
76. Remove the bolt and ground wire.



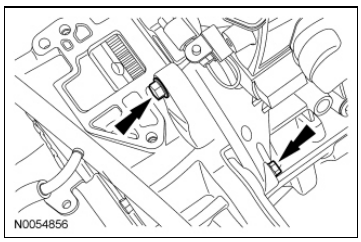
77. Disconnect the Transmission Control Module (TCM) electrical connector.



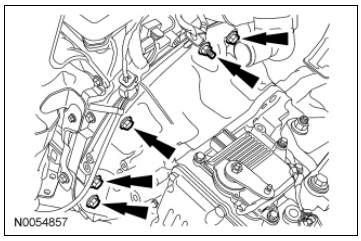
78. Remove the 2 nuts and the starter motor wiring.



79. Remove the 2 bolts and the starter.

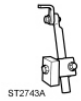


80. Install the Engine Lift Eye on the LH cylinder head.



81. Using the Floor Crane and Spreader Bar, remove the engine and transaxle from the lift table.

82. Remove the 2 engine-to-transaxle bolts.



83. Remove the transaxle-to-engine stud bolt and the 4 transaxle-to-engine bolts.
    - Separate the transaxle from the engine.

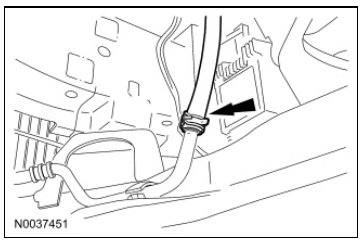
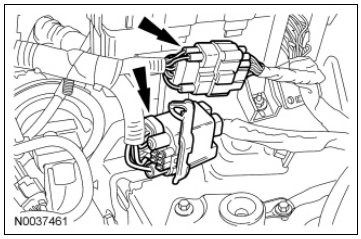
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Silicone Gasket Remover ZC-30	-

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

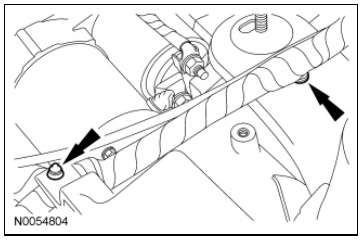


NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

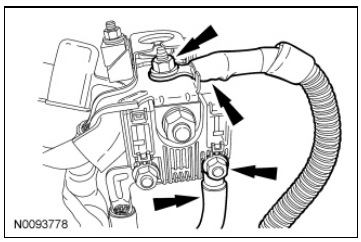
All vehicles



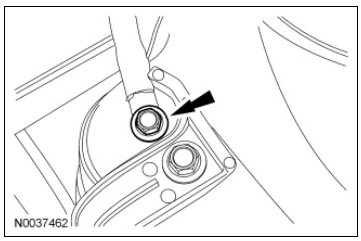
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Recover the A/C system. For additional information, refer to Section 412-00A .
4. Remove the accessory drive belt and the power steering belt. For additional information, refer to Section 303-05C .
5. Remove the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .
6. If equipped, remove the 6 screws and the underbody shield.



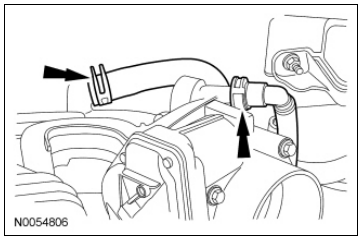
7. Disconnect the power steering cooler tube and drain the power steering fluid into a suitable drain pan.



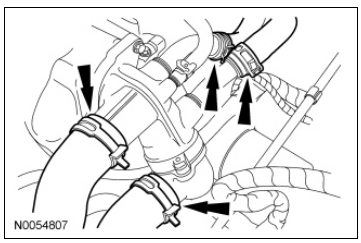
8. Drain the cooling system. For additional information, refer to Section 303-03A .
9. Remove the degas bottle. For additional information, refer to Section 303-03A .
10. Remove the engine Air Cleaner (ACL) and ACL outlet pipe. For additional information, refer to Section 303-12C .
11. Remove the battery tray. For additional information, refer to Section 414-01 .
12. Disconnect the 2 engine wiring harness electrical connectors.



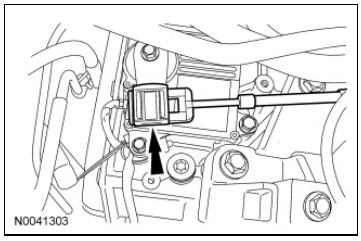
13. Detach the 2 wiring harness retainers from transmission mount and the battery tray bracket.



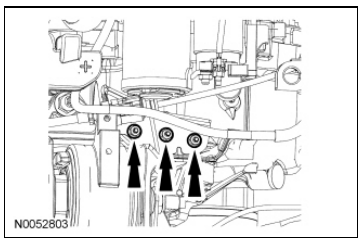
14. Remove the 2 nuts and the battery cables from the positive battery cable.



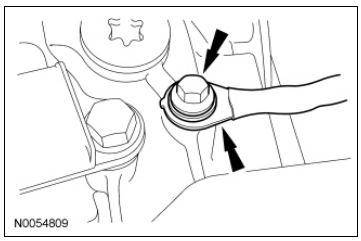
15. Remove the bolt and position aside the ground wire.



16. Disconnect the vacuum hose and the Evaporative Emission (EVAP) tube from the upper intake manifold.

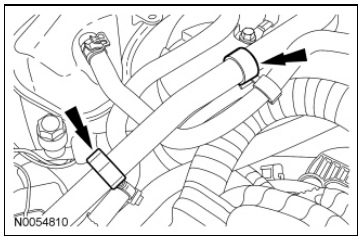


17. Disconnect the upper radiator hose, lower radiator hose and 2 heater hoses from the thermostat housing.

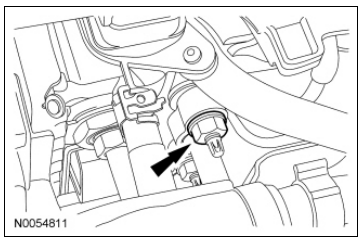


18. Disconnect the transaxle control cable from the control lever.

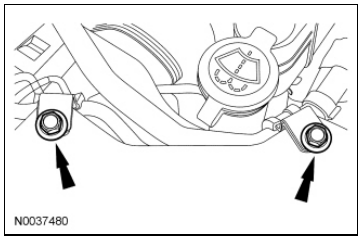
19. Remove the 3 nuts and position the transaxle control cable bracket aside.



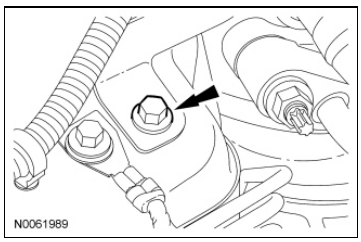
20. Remove the bolt and position the ground wire aside.



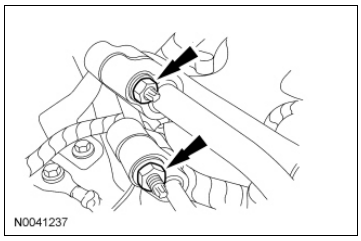
21. If equipped, detach the engine block heater harness from the radiator support, power steering hose, A/C tube and the engine wiring harness.



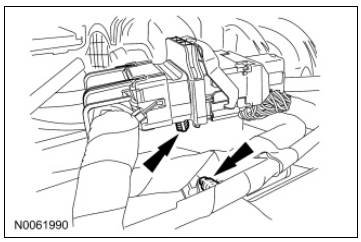
22. Detach the coolant tube retainer clips from the A/C tube.



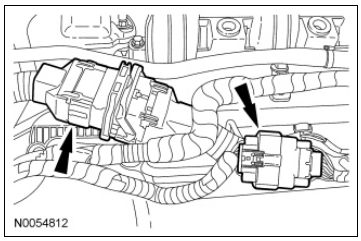
23. Remove the nut and disconnect the A/C tube from the condenser.
    - Discard the O-ring seals.



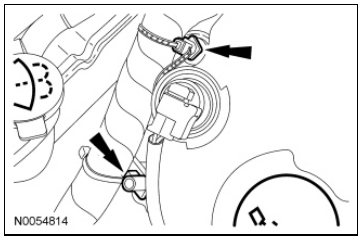
24. Remove the 2 A/C tube retaining clamp bolts.



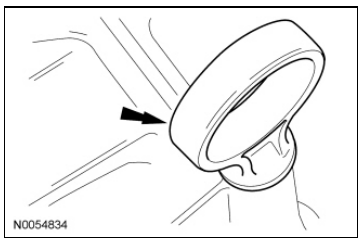
25. Remove the A/C tube bracket bolt.



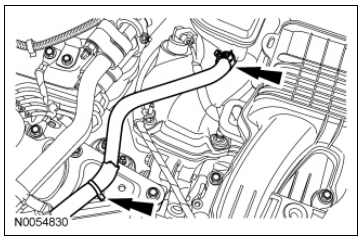
26. Remove the 2 nuts and disconnect the A/C tubes.
    - Discard the O-ring seals.



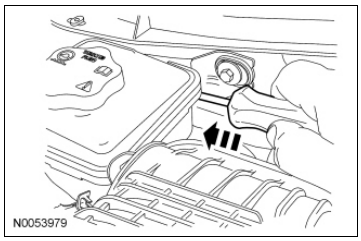
27. Detach the 2 wiring harness retainers.



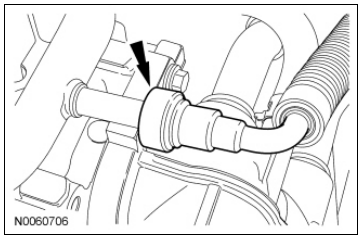
28. Disconnect the 2 engine wiring harness electrical connectors.



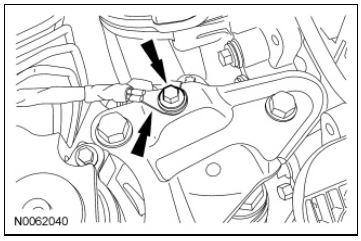
29. Remove the 2 wiring harness retainers from the LH valve cover stud bolts and position the wiring harness aside.



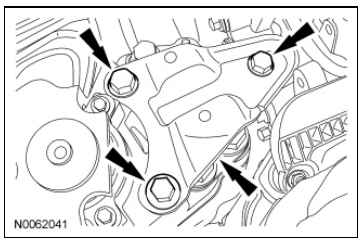
30. Remove the oil level indicator.



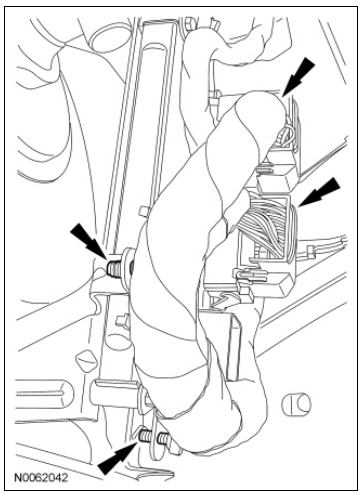
31. Disconnect the hose from the power steering reservoir.
    - Detach the pin-type retainer from the engine mount brace.



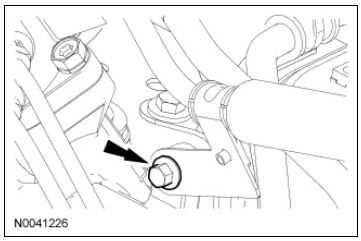
32. Using a small screwdriver, release the retaining clip and detach the power steering reservoir from the cowl.



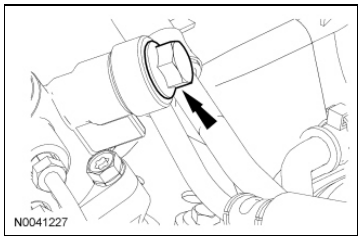
33. Disconnect the fuel supply tube from the fuel rail. For additional information, refer to Section 310-00 .



34. Remove the bolt and the ground wire from the engine mount brace.

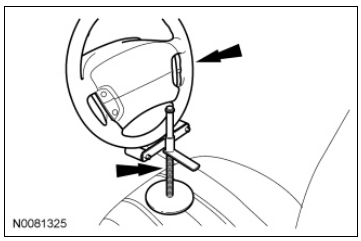


35. Remove the 3 bolts and the engine mount brace.

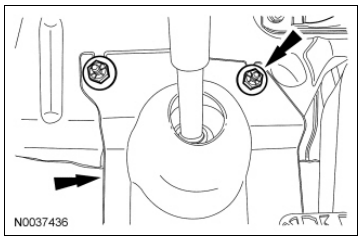


36. Disconnect the PCM electrical connectors and pin-type retainers.

37. Remove the Power Steering Pressure (PSP) hose bracket bolt.



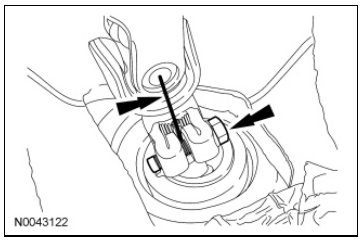
38. Remove and discard the PSP banjo bolt and the 2 seals from the steering gear.



39. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

Using a suitable holding device, hold the steering wheel in the straight-ahead position.

40. Remove the 2 nuts and the steering joint cover.



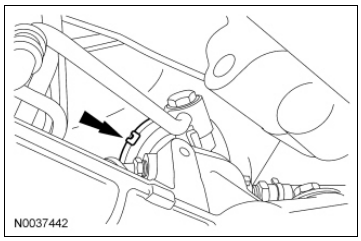
41. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring may occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

    NOTE: Index-mark the steering column shaft position to the steering gear for reference during installation.

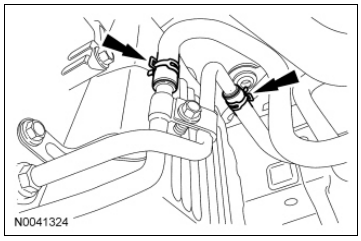
    Remove the bolt and disconnect the steering column shaft from the steering gear.

    - Discard the bolt.

42. Remove the 4 screws and position the LH fender splash shield aside.



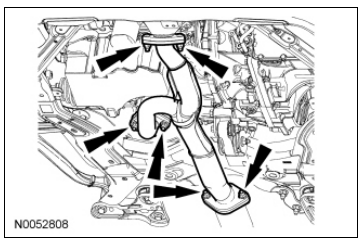
43. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.



44. ***NOTICE:*** **The steering gear-to-dash seal must be removed or it will be damaged when lowering the subframe.**

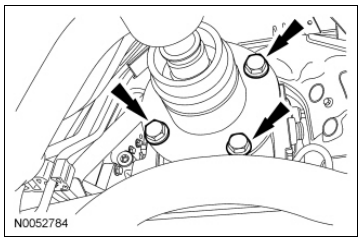
    Release the 4 clips and slide the steering gear-to-dash seal off of the steering gear and into the passenger compartment.

45. Disconnect the transaxle cooler hoses.



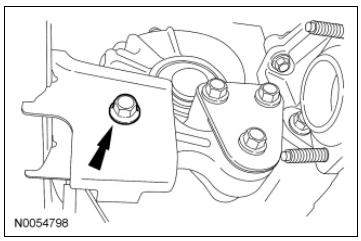
46. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).

47. Remove and discard the engine oil filter.



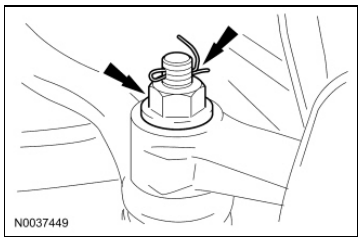
48. Remove the 6 nuts and the Y-pipe assembly.
    - Discard the gaskets and nuts.

All-Wheel Drive (AWD) vehicles



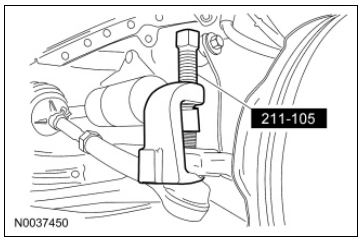
49. **NOTE:** Index-mark the driveshaft for installation.

    Remove and discard the 4 bolts (3 shown) and support the driveshaft with a length of mechanic's wire.



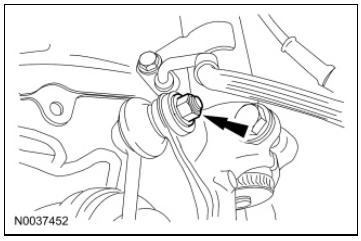
All vehicles

50. Remove the engine roll restrictor-to-subframe through bolt.



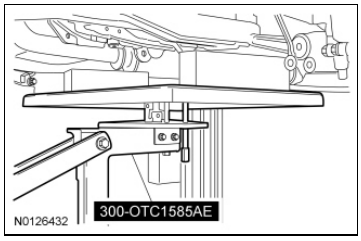
51. **NOTE:** LH shown, RH similar.

    Remove the cotter pins and nuts from the tie-rod ends.



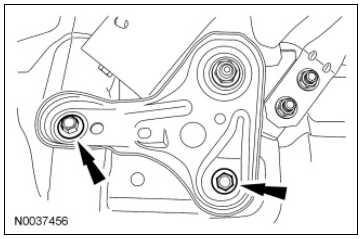
52. **NOTE:** LH shown, RH similar.

    Using the Tie-Rod End Remover, separate the tie-rod ends from the steering knuckles.



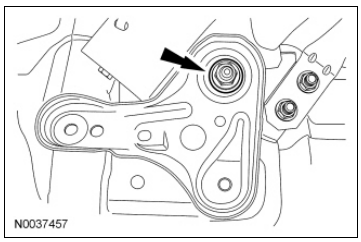
53. **NOTE:** LH shown, RH similar.

    Remove the nuts and separate the stabilizer bar links from the struts.



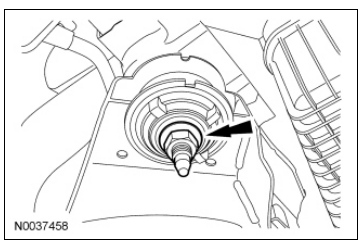
54. Using a wax pencil, mark the relationship of the front subframe to the underbody at the mounting locations.

55. Position the Powertrain Lift under the subframe assembly.



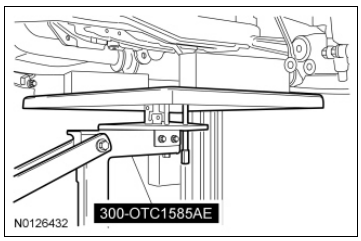
56. **NOTE:** LH shown, RH similar.

    Remove the 4 subframe bracket-to-body bolts.



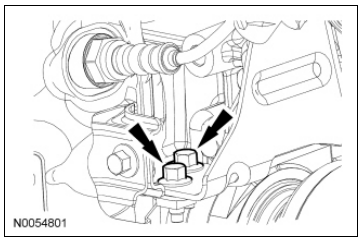
57. **NOTE:** LH shown, RH similar.

    Remove the 2 subframe nuts and the 2 subframe brackets.

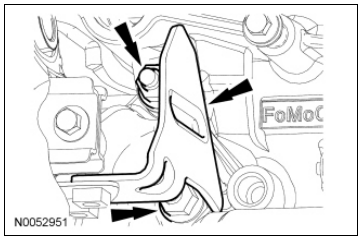


58. **NOTE:** LH shown, RH similar.

    Remove the 2 front subframe nuts.

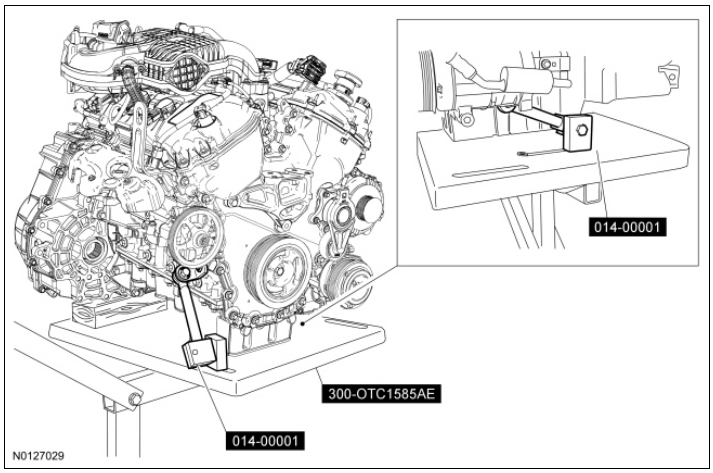


59. Using the Powertrain Lift, lower the subframe assembly from the vehicle.

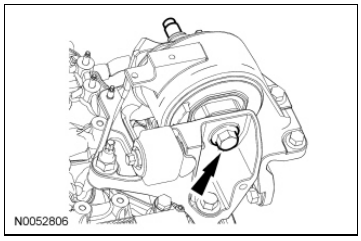


Front Wheel Drive (FWD) vehicles

60. Remove the 2 RH catalytic converter bracket bolts.



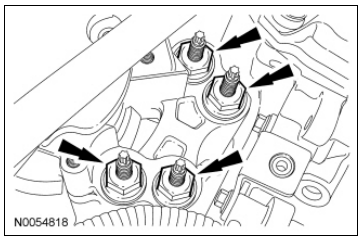
61. Remove the 2 nuts and remove the RH catalytic converter bracket.



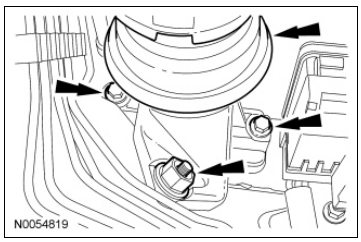
All vehicles

62. **NOTE:** Position a block of wood under the transaxle.

    Install the Powertrain Lift and Adjustable Grip Arms.

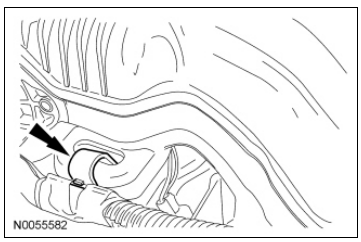


63. Remove the transaxle support insulator through bolt.

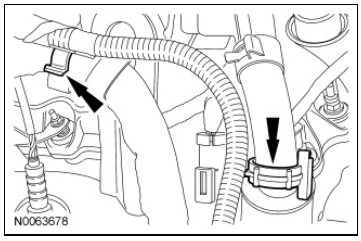


64. Remove the transaxle support insulator bracket bolt and the 2 nuts.

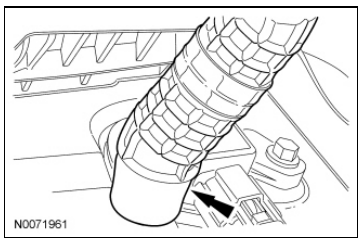
65. Remove the 4 engine mount nuts.
    - Remove the 2 engine mount spacers.



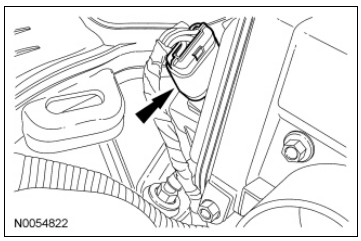
66. Remove the nut, 2 bolts and the engine mount.



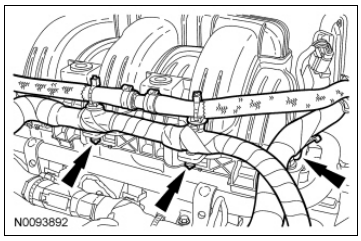
67. Lower the engine and transaxle assembly from the vehicle.



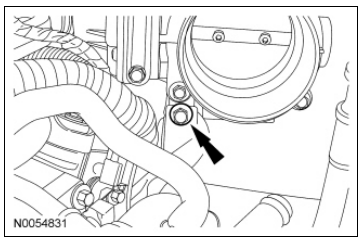
68. If equipped, detach the block heater wiring harness retainer from the upper intake manifold.



69. If equipped, detach the block heater wiring harness retainers from the PSP hose and the power steering reservoir hose.

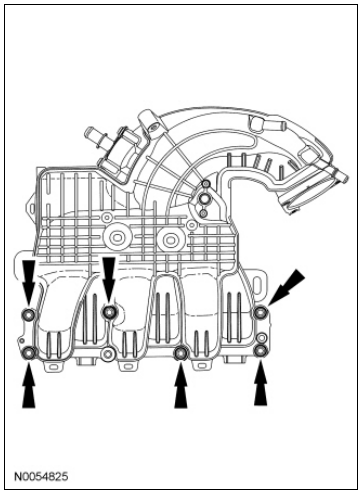


70. Disconnect the PCV hose from the PCV valve.

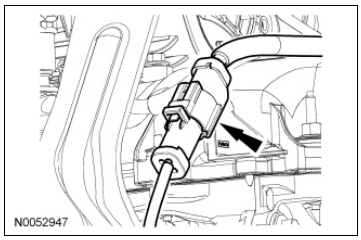


71. Disconnect the Throttle Body (TB) electrical connector.

72. Detach the wiring harness retainers from the upper intake manifold.



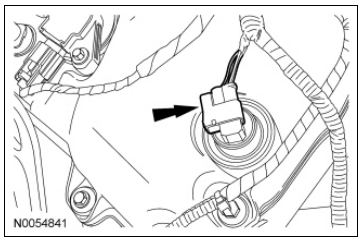
73. Remove the upper intake manifold support bracket bolt.



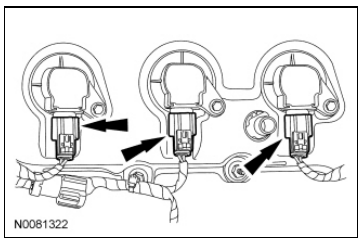
74. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Remove the 6 bolts and the upper intake manifold.

    - Discard the gaskets.

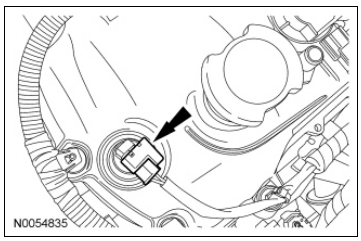


75. Disconnect the RH Catalyst Monitor Sensor (CMS) electrical connector.

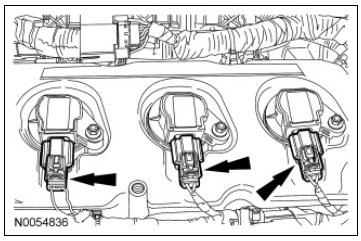


76. Disconnect the PSP switch electrical connector.

77. Disconnect the RH VCT solenoid electrical connector.

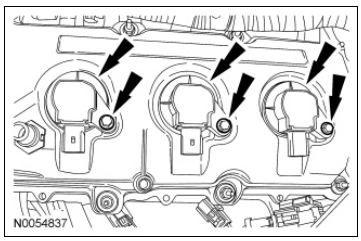


78. Disconnect the 3 RH coil-on-plug electrical connectors.

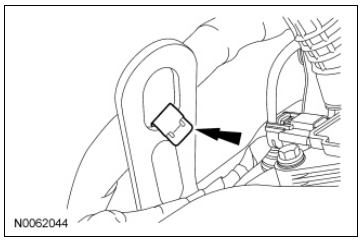


79. Detach all of the wiring harness retainers from the RH valve cover and stud bolts.

80. Disconnect the LH VCT solenoid electrical connector.

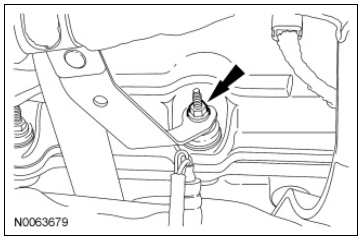


81. Disconnect the 3 LH coil-on-plug electrical connectors.

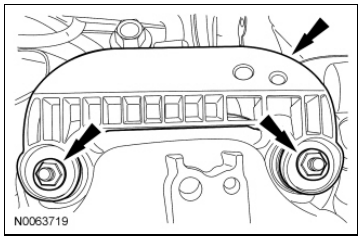


82. Detach all of the wiring harness retainers from the LH valve cover and stud bolts.

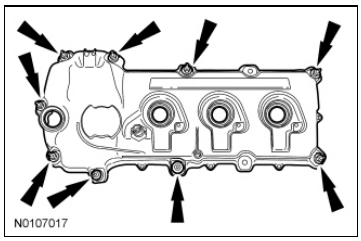
83. **NOTE:** LH shown, RH similar.



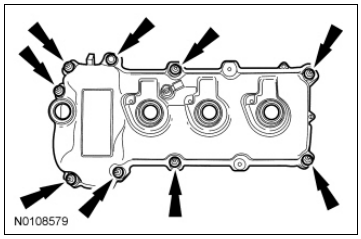
Remove the 6 bolts and the 6 coil-on-plugs.



84. Detach the PSP hose retainer from the engine lifting eye.

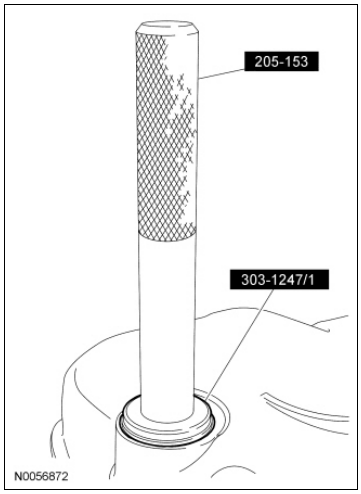


85. Remove the PSP hose bracket nut and position the PSP hose aside.

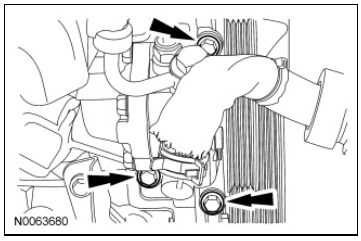


86. Remove the 2 nuts and the wiring harness retaining bracket.

87. Loosen the 9 stud bolts and remove the LH valve cover.
    - Discard the gasket.



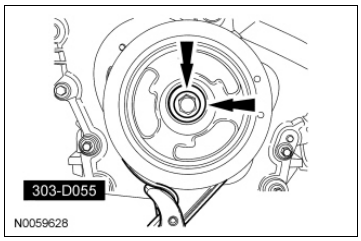
88. Loosen the bolt, the 8 stud bolts and remove the RH valve cover.
    - Discard the gasket.



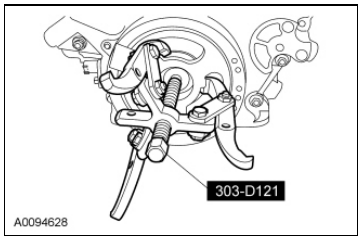
89. **NOTE:** VCT solenoid seal removal shown, spark plug tube seal removal similar.

    Inspect the VCT solenoid seals and the spark plug tube seals. Install new seals if damaged.

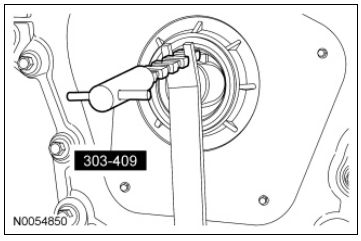
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).



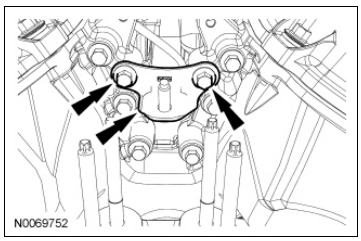
90. Remove the 3 bolts and position the power steering pump aside.



91. Remove the 3 bolts and the accessory drive belt tensioner.

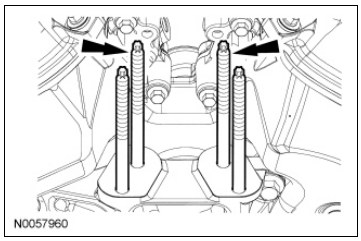


92. Using the Strap Wrench, remove the crankshaft pulley bolt and washer.
    - Discard the bolt.

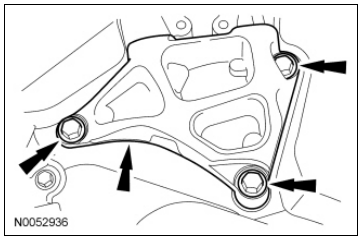


93. Using the 3 Jaw Puller, remove the crankshaft pulley.

94. Using the Oil Seal Remover, remove and discard the crankshaft front seal.

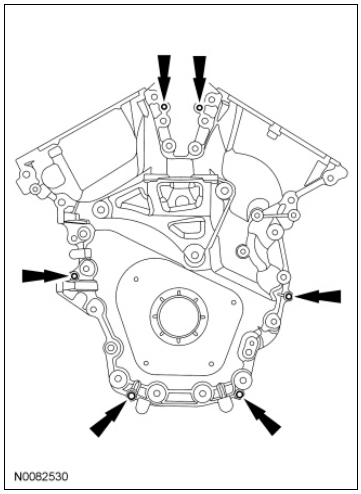


95. Remove the 2 bolts and the engine mount bracket.



96. **NOTE:** Only use hand tools to remove the studs.

    Remove the 2 engine mount studs.



97. Remove the 3 bolts and the engine mount bracket.

98. Remove the 22 engine front cover bolts.

99. Install 6 of the engine front cover bolts (finger-tight) into the 6 threaded holes in the engine front cover in the following sequence.
    1. Tighten the bolts one turn at a time in a crisscross pattern until the engine front cover-to-cylinder block seal is released.
    2. Remove the engine front cover.

100. ***NOTICE:*** **Only use a 3M Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean the engine front cover.**

     Clean the engine front cver using a 3M Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.

     - Thoroughly wash the engine front cover to remove any foreign material, including any abrasive particles created during the cleaning process.

101. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**

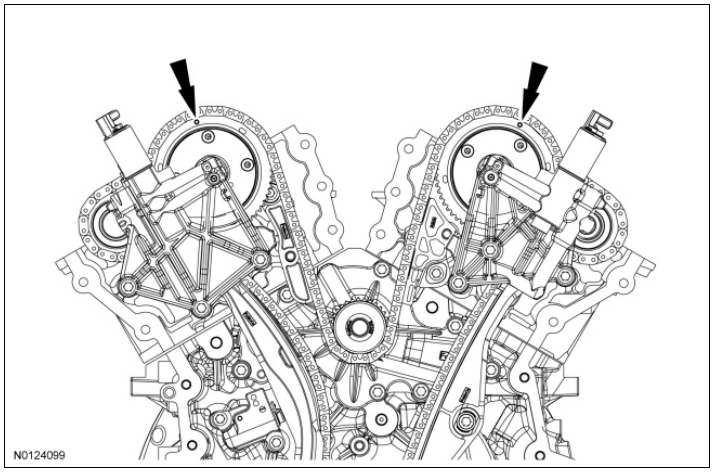
     NOTICE: **Do not use wire brushes, power abrasive discs or 3MTM Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces of the engine block, cylinder heads, and oil pan. These tools cause contamination that can cause premature engine failure. Remove all traces of sealant, including any sealant from the inner surface of the cylinder block and cylinder head.**

     Clean all engine sealing surfaces, including the cylinder heads, the oil pan and cylinder block in the following sequence.

     1. Remove any large deposits of silicone or gasket material.
     2. Apply silicone gasket remover and allow to set for several minutes.
     3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
     4. Apply metal surface prep to remove any remaining traces of oil or coolant and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
     5. Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

sp;

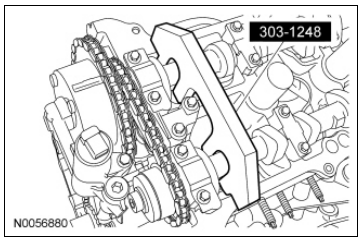
Timing Drive Components



Special Tool(s)

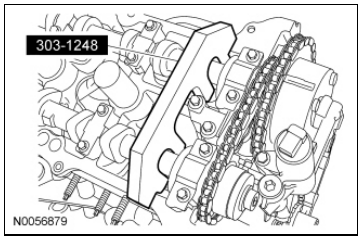
 ST2979-A	Tool, Camshaft Holding 303-1248

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**



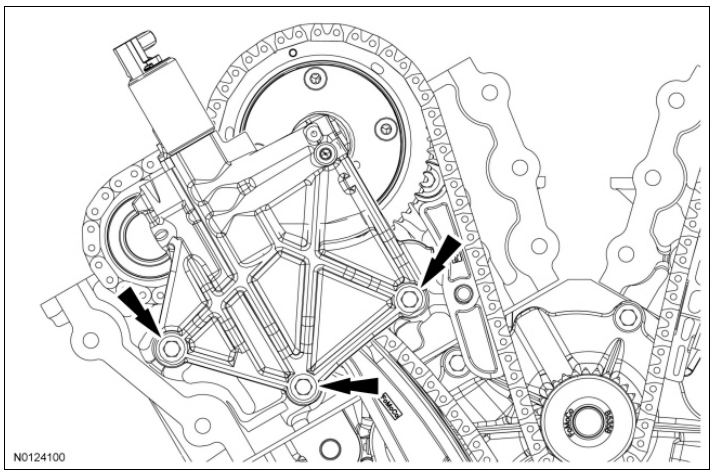
1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

2. Rotate the crankshaft clockwise and align timing marks on the Variable Camshaft Timing (VCT) assemblies as shown.



3. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

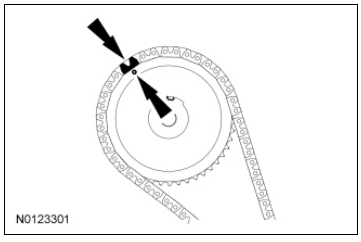
   Install the Camshaft Holding Tool onto the flats of the LH camshafts.



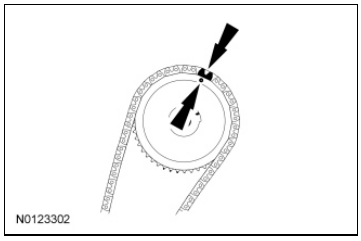
4. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

5. Remove the 3 bolts and the RH VCT housing.

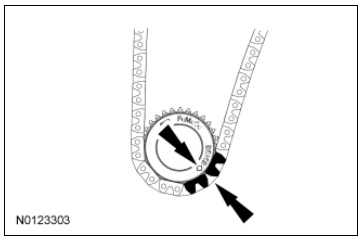


6. Remove the 3 bolts and the LH VCT housing.

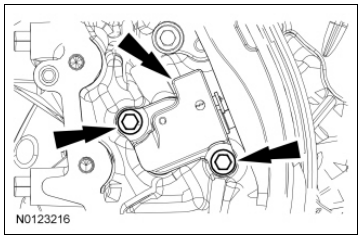


NOTE: The following 3 steps are for primary timing chains when the colored links are not visible.

7. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.

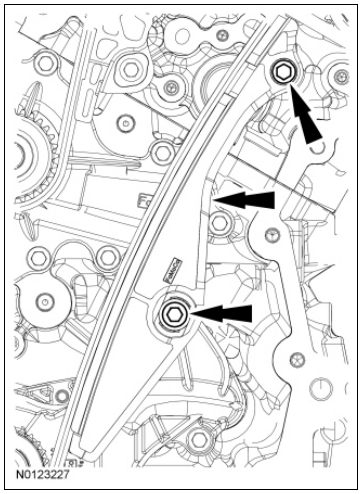


8. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.

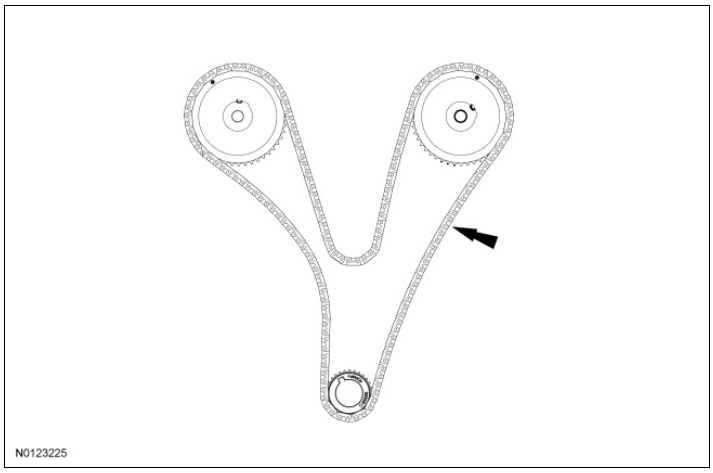


9. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

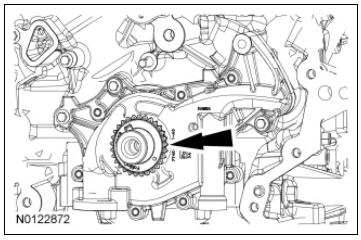
   Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.



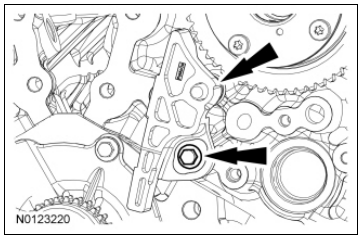
10. Remove the 2 bolts and the primary timing chain tensioner.



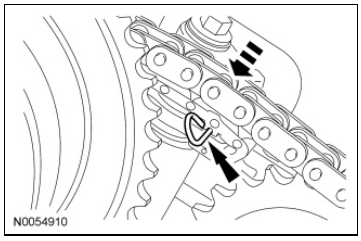
11. Remove the primary timing chain tensioner arm.



12. Remove the 2 bolts and the lower LH primary timing chain guide.

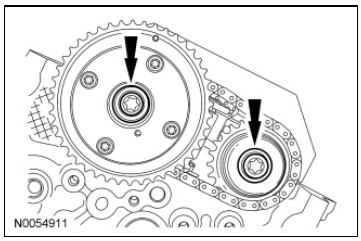


13. Remove the primary timing chain.



14. Remove the crankshaft timing chain sprocket.

15. Remove the bolt and the upper LH primary timing chain guide.

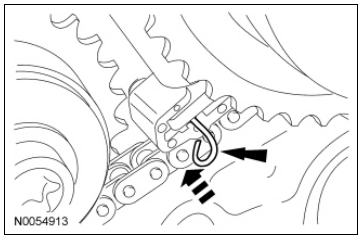


16. Compress the LH secondary timing chain tensioner and install a suitable lockpin to retain the tensioner in the collapsed position.

17. **NOTE:** The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.

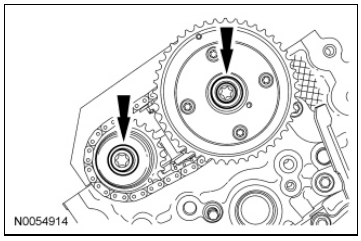
    Remove and discard the LH VCT assembly bolt and the LH exhaust camshaft sprocket bolt.

    - Remove the LH VCT assembly, secondary timing chain and the LH exhaust camshaft sprocket as an assembly.



18. **NOTE:** It is necessary to tilt the Camshaft Holding Tool toward the rear of the engine to access the rearmost secondary timing chain tensioner bolt.

    Remove the 2 bolts and the LH secondary timing chain tensioner.

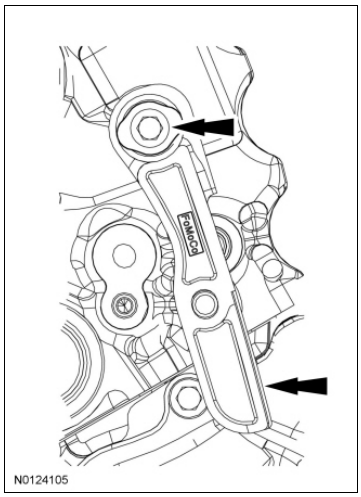


19. Compress the RH secondary timing chain tensioner and install a suitable lockpin to retain the tensioner in the collapsed position.

20. **NOTE:** The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.

    Remove and discard the RH VCT assembly bolt and the RH exhaust camshaft sprocket bolt.

    - Remove the RH VCT assembly, secondary timing chain and the RH exhaust camshaft sprocket as an assembly.



21. **NOTE:** It is necessary to tilt the Camshaft Holding Tool toward the rear of the engine to access the rearmost secondary timing chain tensioner bolt.

    Remove the 2 bolts and the RH secondary timing chain tensioner.

22. Remove the bolt and the RH timing chain guide.

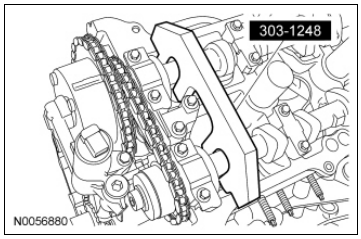
Camshaft

Special Tool(s)

 ST2979-A	Tool, Camshaft Holding 303-1248

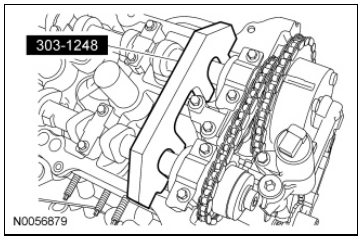
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

All camshafts



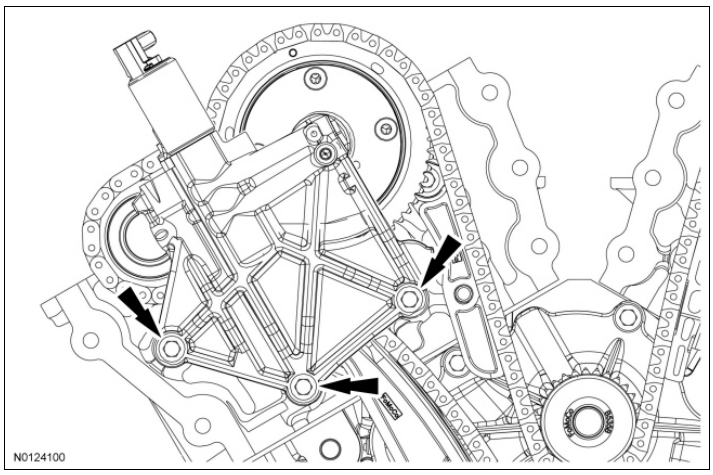
1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

2. Rotate the crankshaft clockwise and align thming marks on the Variable Camshaft Timing (VCT) assemblies as shown.



3. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

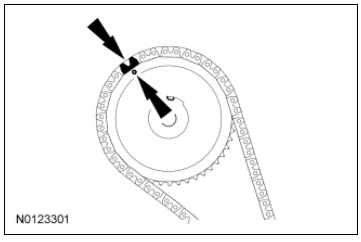
   Install the Camshaft Holding Tool onto the flats of the LH camshafts.



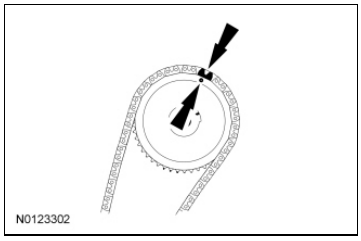
4. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

5. Remove the 3 bolts and the RH VCT housing.

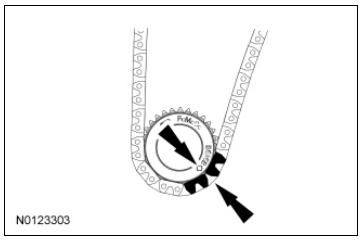


6. Remove the 3 bolts and the LH VCT housing.

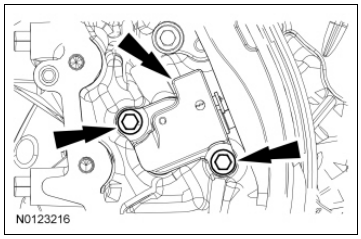


NOTE: The following 3 steps are for primary timing chains when the colored links are not visible.

7. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.

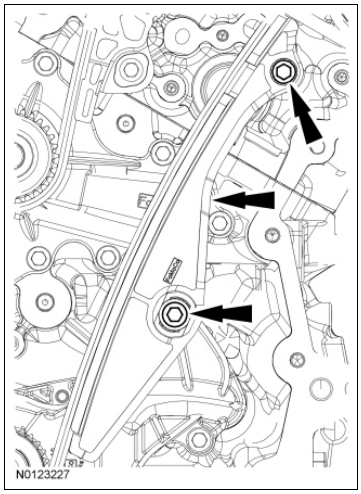


8. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.

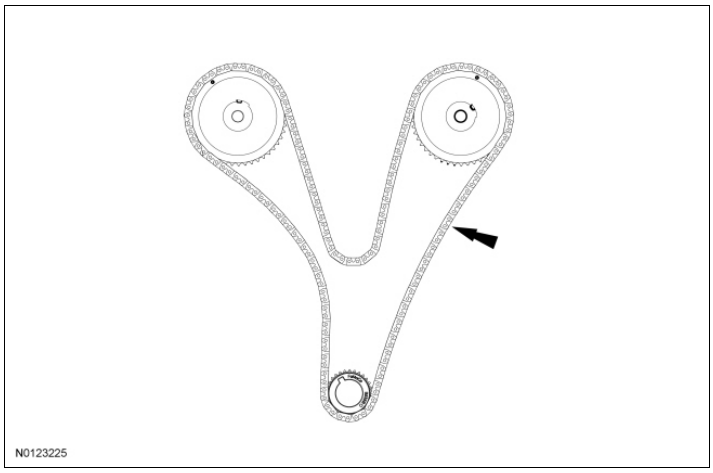


9. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

   Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.

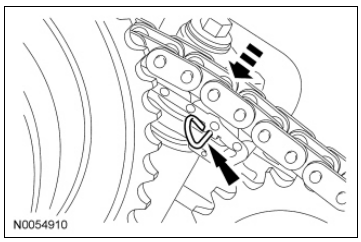


10. Remove the 2 bolts and the primary timing chain tensioner.



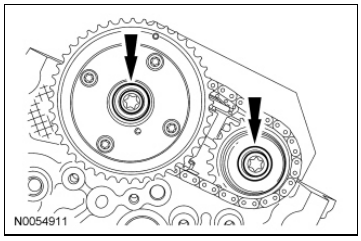
11. Remove the primary timing chain tensioner arm.

12. Remove the 2 bolts and the lower LH primary timing chain guide.



13. Remove the primary timing chain.

LH camshafts

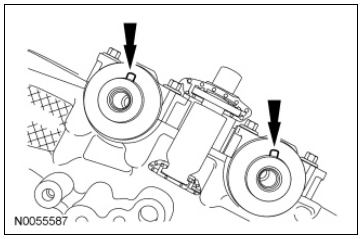


14. Compress the LH secondary timing chain tensioner and install a suitable lockpin to retain the tensioner in the collapsed position.

15. **NOTE:** The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.

    Remove and discard the LH VCT assembly bolt and the LH exhaust camshaft sprocket bolt.

    - Remove the LH VCT assembly, secondary timing chain and the LH exhaust camshaft sprocket as an assembly.



16. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure will rotate the LH camshafts approximately 3 degrees to a neutral position.

    Remove the Camshaft Holding Tool from the LH camshafts.

17. ***NOTICE:*** **The camshafts must remain in the neutral position during removal or engine damage may occur.**

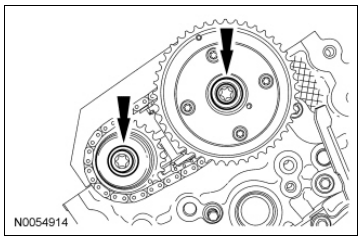
    Verify the LH camshafts are in the neutral position.

18. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

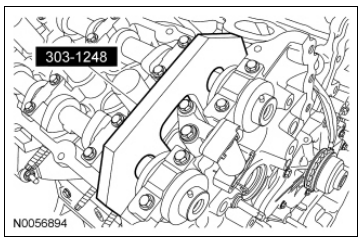
    Remove the bolts and the LH camshaft bearing caps.

    - Remove the LH camshafts.

RH camshafts



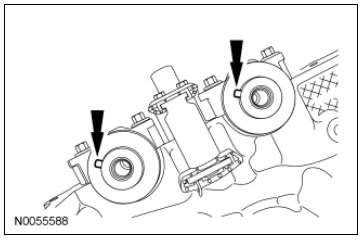
19. Compress the RH secondary timing chain tensioner and install a suitable lockpin to retain the tensioner in the collapsed position.



20. **NOTE:** The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.

    Remove and discard the RH VCT assembly bolt and the RH exhaust camshaft sprocket bolt.

    - Remove the RH VCT assembly, secondary timing chain and the RH exhaust camshaft sprocket as an assembly.



21. Remove the Camshaft Holding Tool from the RH camshafts.

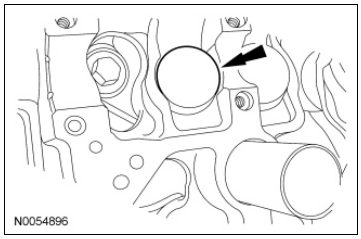
22. ***NOTICE:*** **The camshafts must remain in the neutral position during removal or engine damage may occur.**

    Rotate the RH camshafts counterclockwise to the neutral position.

23. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    Remove the bolts and the RH camshaft bearing caps.

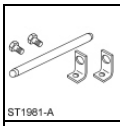
- Remove the RH camshafts.



Valve Tappets

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Depending on the valve tappets being serviced, remove the LH and/or the RH camshafts. For additional information, refer to Camshaft in this section.



2. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   Remove the valve tappets from the cylinder head.

Valve Spring, Retainer and Seal

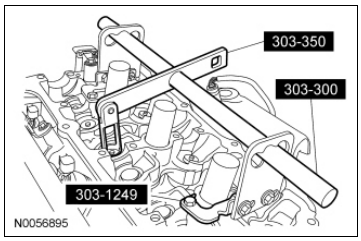
Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST3028-A	Compressor, Valve Spring 303-1249

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Remove the valve tappets from the cylinder being serviced. For additional information, refer to Valve Tappets in this section.

2. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke.



3. ***NOTICE:*** **If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal or engine damage may occur.**

   NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head - RH or Cylinder Head - LH in this section.

   Pressurize the cylinder using compressed air.

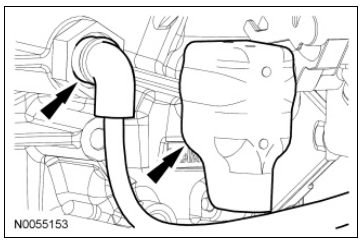
4. Using the Valve Spring Compressors, remove the keys, retainer and spring.

5. Remove and discard the valve stem seal.

N0056352

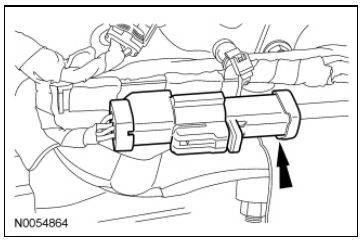
Cylinder Head - RH

Material



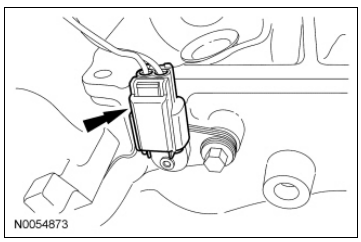
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Silicone Gasket Remover ZC-30	-

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

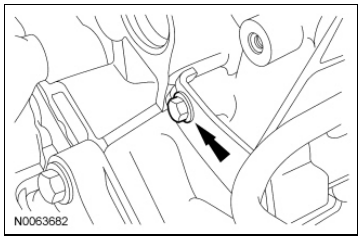


All vehicles

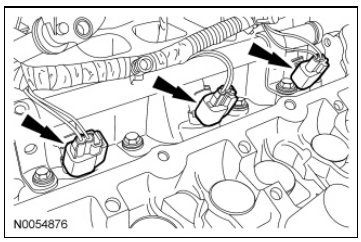
1. Remove the RH camshafts. For additional information, refer to Camshaft in this section.



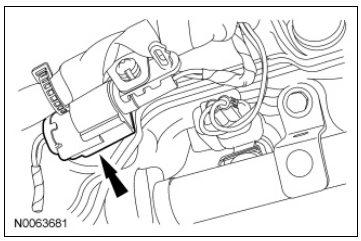
2. If equipped, remove the heat shield and disconnect the block heater electrical connector.
   - Remove the block heater wiring harness from the engine.li>



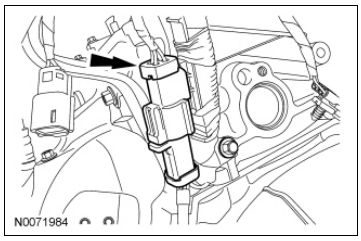
3. Disconnect the RH Heated Oxygen Sensor (HO2S) electrical connector.



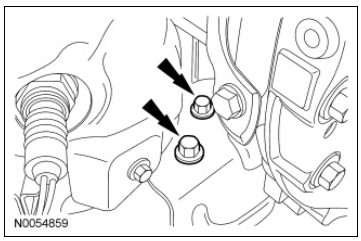
4. Disconnect the RH Camshaft Position (CMP) sensor electrical connector.



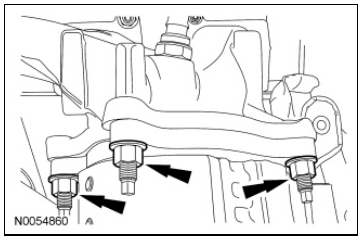
5. Remove the bolt and the Power Steering Pressure (PSP) tube and bracket assembly.



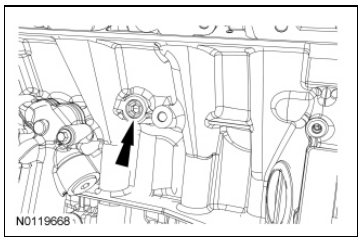
6. Disconnect the 6 fuel injector electrical connectors (3 shown).



7. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

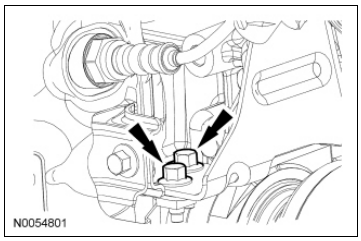


8. Disconnect the LH Catalyst Monitor Sensor (CMS) sensor electrical connector.

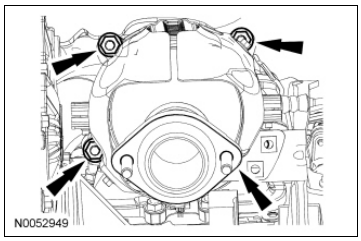


9. Remove the 2 LH catalytic converter bracket bolts.

10. Remove the 4 nuts (3 shown) and the LH catalytic converter.
    - Discard the nuts and the gasket.

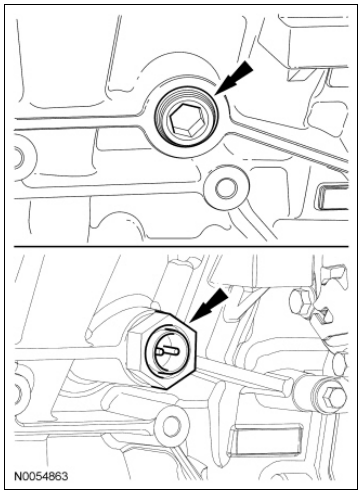


11. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

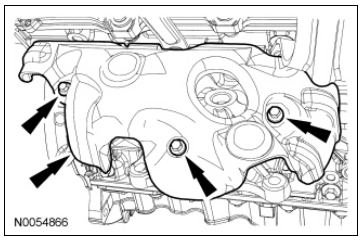


All-Wheel Drive (AWD) vehicles

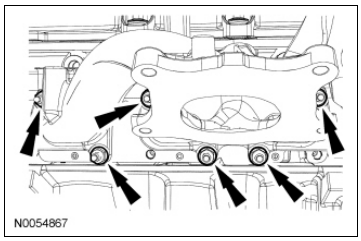
12. Remove the 2 RH catalytic converter bracket bolts.



All vehicles

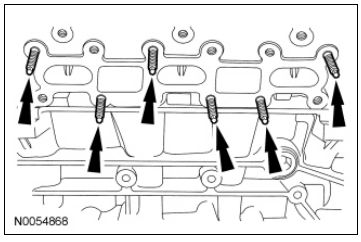


13. Remove the 4 nuts and the RH catalytic converter.
    - Discard the nuts and the gasket.

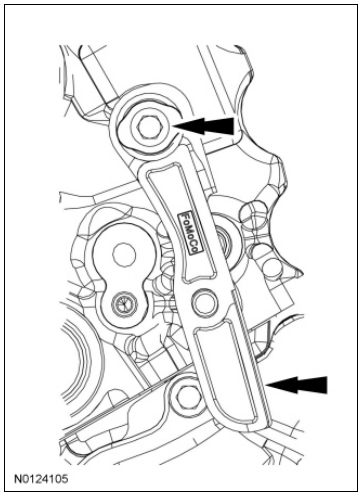


14. Remove the RH cylinder block drain plug or, if equipped, the block heater.
    - Allow coolant to drain from the cylinder block.

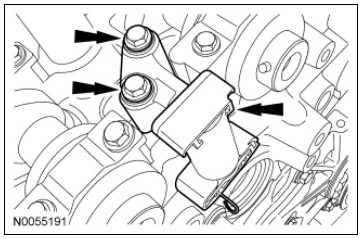
15. Remove the 3 bolts and the RH exhaust manifold heat shield.



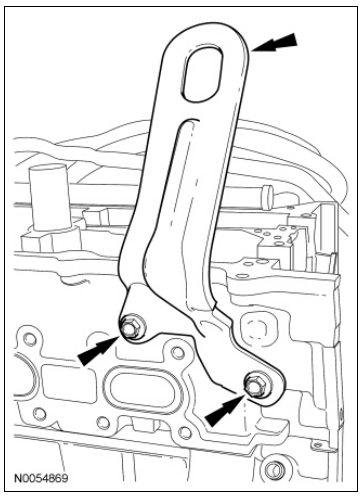
16. Remove the 6 nuts and the RH exhaust manifold.
    - Discard the nuts and exhaust manifold gaskets.



17. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .

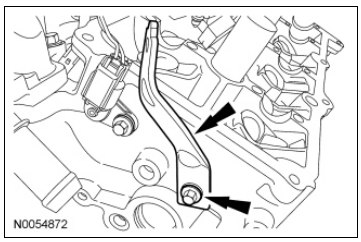


18. Remove and discard the 6 RH exhaust manifold studs.

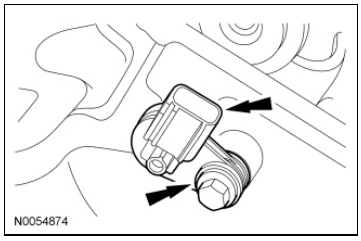


19. Remove the bolt and the RH timing chain guide.

20. Remove the 2 bolts and the RH secondary timing chain tensioner.

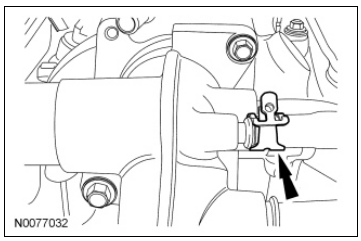


21. Remove the 2 bolts and the engine lifting eye.

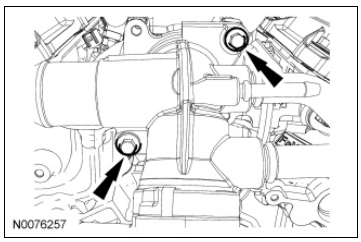


22. **NOTE:** Index-mark the location of the bracket on the cylinder head for installation.

    Remove the bolt and the upper intake manifold support bracket.

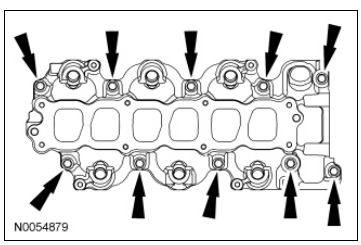


23. Remove the bolt and the RH CMP sensor.

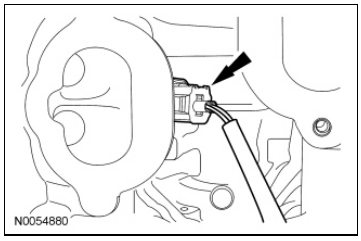


24. Remove the 4 bolts and the fuel rail and injectors as an assembly.

25. Disconnect the coolant bypass hose from the thermostat housing.



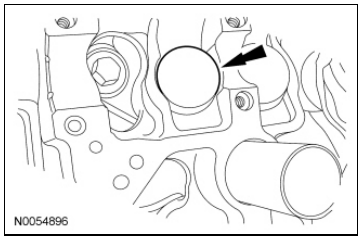
26. Remove the 2 thermostat housing-to-lower intake manifold bolts.
    - Remove the thermostat housing and discard the gasket and O-ring seal.



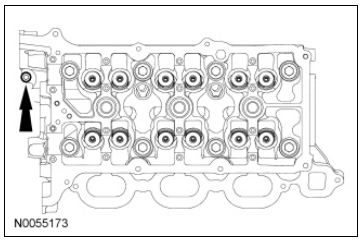
27. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Remove the 10 bolts and the lower intake manifold.

    - Discard the gaskets.



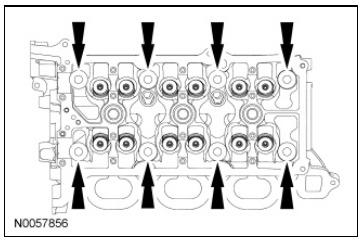
28. Disconnect and remove the CHT sensor jumper harness.



29. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove the valve tappets from the cylinder head.

30. Remove and discard the M6 bolt.



31. ***NOTICE:*** **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**

    NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

    NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    Remove and discard the 8 bolts from the cylinder head.

    - Remove the cylinder head.
    - Discard the cylinder head gasket.

32. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

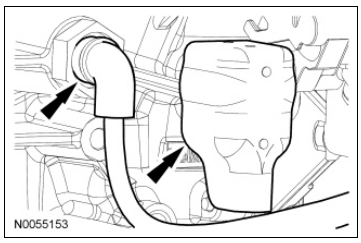
    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.

    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

33. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

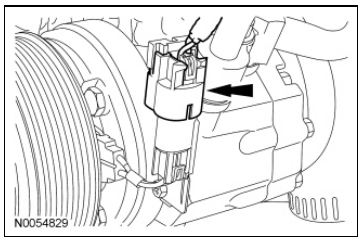
Cylinder Head - LH

Material



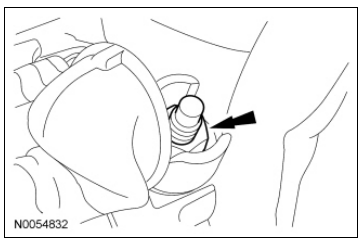
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® Silicone Gasket Remover ZC-30	-

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

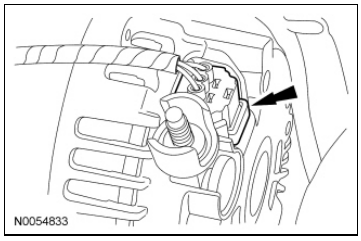


All vehicles

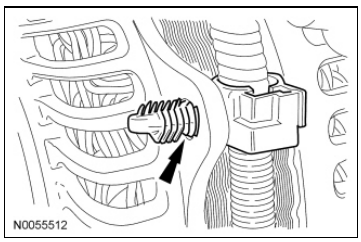
1. Remove the LH camshafts. For additional information, refer to Camshaft in this section.



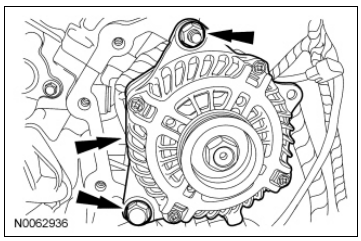
2. If equipped, remove the heat shield and disconnect the block heater electrical connector.
   - Remove the block heater wiring harness from the engine.li>



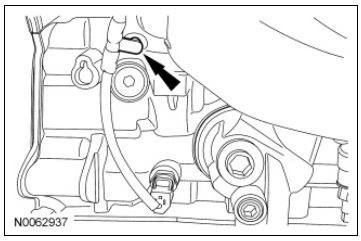
3. Disconnect the A/C compressor electrical connector.



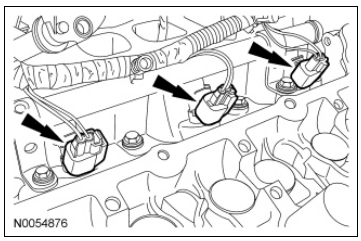
4. Remove the nut and disconnect the generator B+ cable.



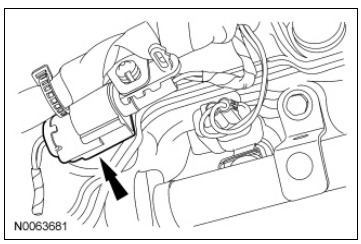
5. Disconnect the generator electrical connector.



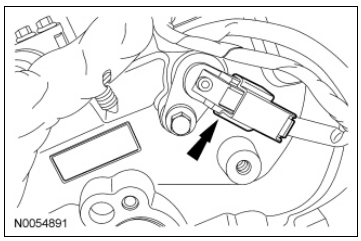
6. Detach the wiring harness retainer from the generator.



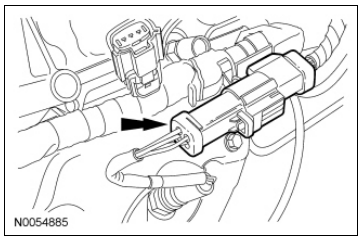
7. Remove the nut, bolt and the generator.



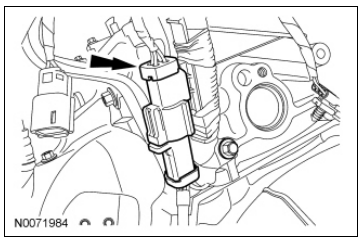
8. Detach the wiring harness pin-type retainer.



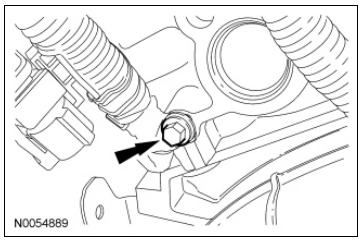
9. Disconnect the 6 fuel injector electrical connectors (3 shown).



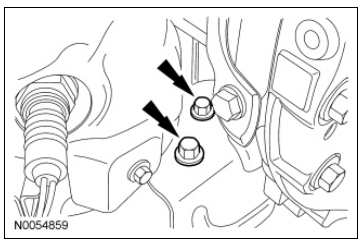
10. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.



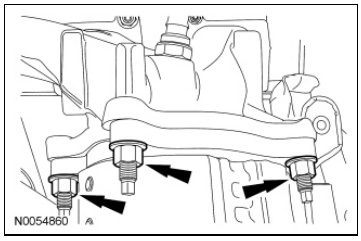
11. Disconnect the LH Camshaft Position (CMP) sensor electrical connector.



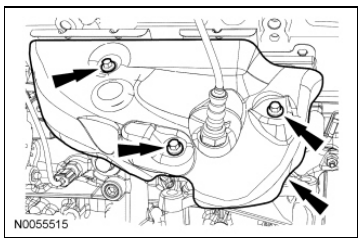
12. Disconnect the LH Heated Oxygen Sensor (HO2S) electrical connector.



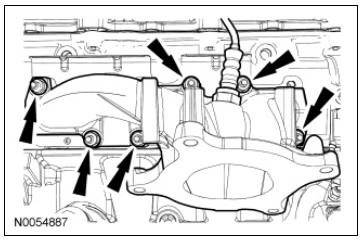
13. Disconnect the LH Catalyst Monitor Sensor (CMS) electrical connector.



14. Remove the wiring harness retainer bolt from the rear of the LH cylinder head.

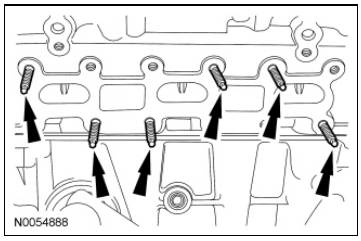


15. Remove the 2 LH catalytic converter bracket bolts.

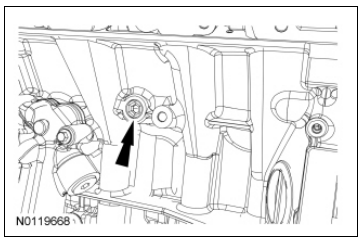


16. Remove the 4 nuts (3 shown) and the LH catalytic converter.
    - Discard the nuts and the gasket.

17. Remove the 3 bolts and the LH exhaust manifold heat shield.

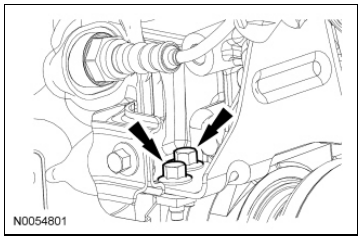


18. Remove the 6 nuts and the LH exhaust manifold.
    - Discard the nuts and the exhaust manifold gasket.

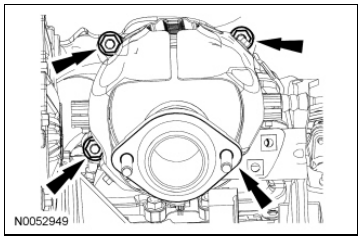


19. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .

20. Remove and discard the 6 LH exhaust manifold studs.

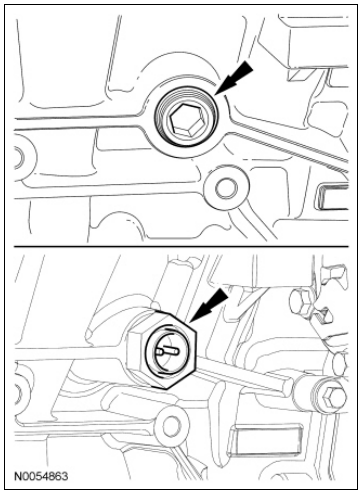


21. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

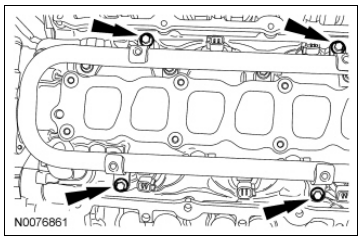


All-Wheel Drive (AWD) vehicles

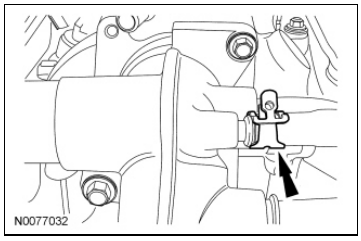
22. Remove the 2 RH catalytic converter bracket bolts.



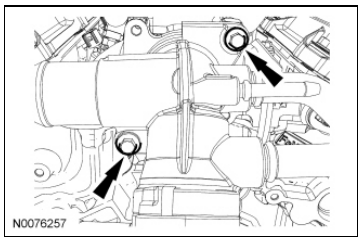
All vehicles



23. Remove the 4 nuts and the RH catalytic converter.
    - Discard the nuts and the gasket.

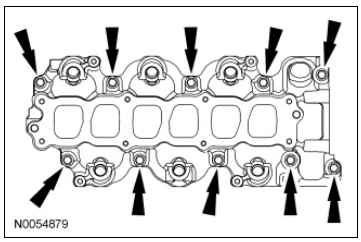


24. Remove the RH cylinder block drain plug or, if equipped, the block heater.
    - Allow coolant to drain from the cylinder block.

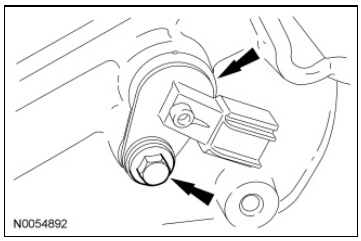


25. Remove the 4 bolts and the fuel rail and injectors as an assembly.

26. Disconnect the coolant bypass hose from the thermostat housing.



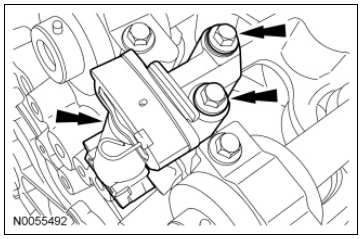
27. Remove the 2 thermostat housing-to-lower intake manifold bolts.
    - Remove the thermostat housing and discard the gasket and O-ring seal.



28. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

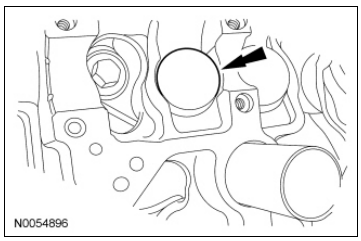
    Remove the 10 bolts and the lower intake manifold.

    - Discard the gaskets.

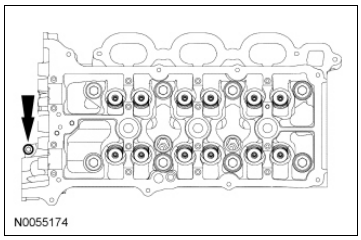


29. Remove the bolt and the LH CMP sensor.

30. Remove the bolt and the upper LH primary timing chain guide.



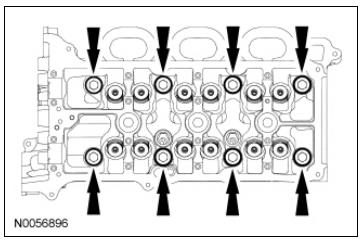
31. Remove the 2 bolts and the LH secondary timing chain tensioner.



32. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    Remove the valve tappets from the cylinder head.

33. Remove and discard the M6 bolt.



34. ***NOTICE:*** **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**

    NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

Remove and discard the 8 bolts from the cylinder head.

- Remove the cylinder head.
- Discard the cylinder head gasket.

35. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

    NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

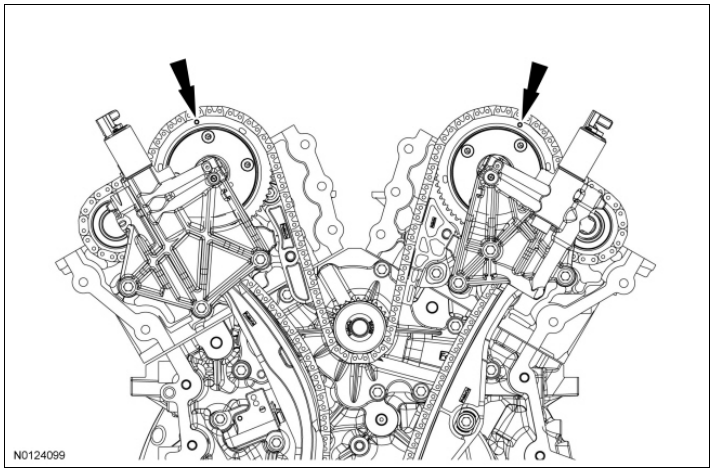
    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.

    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

36. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

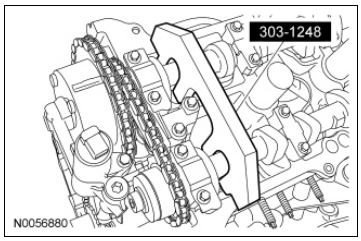
Oil Pump



Special Tool(s)

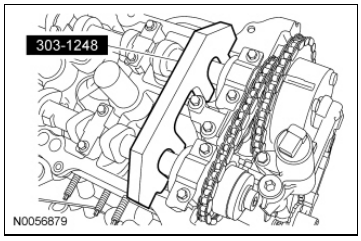
 ST2979-A	Tool, Camshaft Holding 303-1248

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**



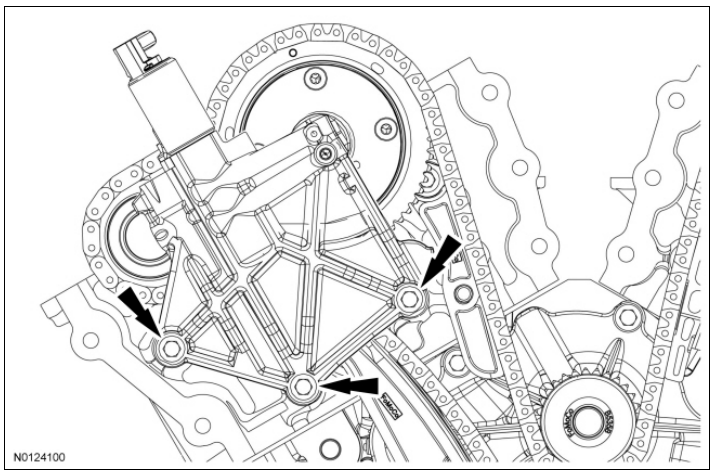
1. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

2. Rotate the crankshaft clockwise and align the timing marks on the Variableshaft Timing (VCT) assemblies as shown.



3. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

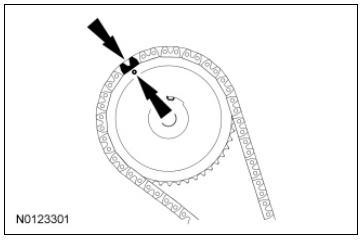
   Install the Camshaft Holding Tool onto the flats of the LH camshafts.



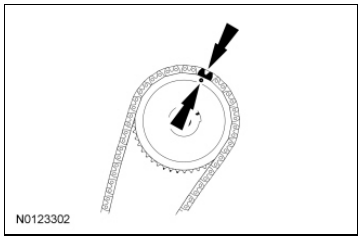
4. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

5. Remove the 3 bolts and the RH VCT housing.

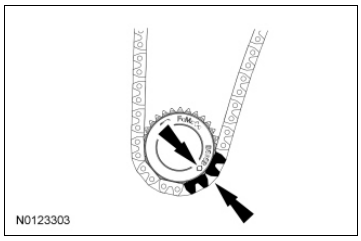


6. Remove the 3 bolts and the LH VCT housing.

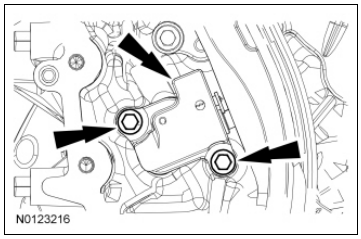


NOTE: The following 3 steps are for primary timing chains when the colored links are not visible.

7. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.

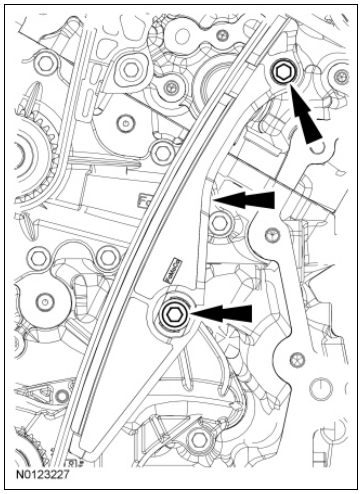


8. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.

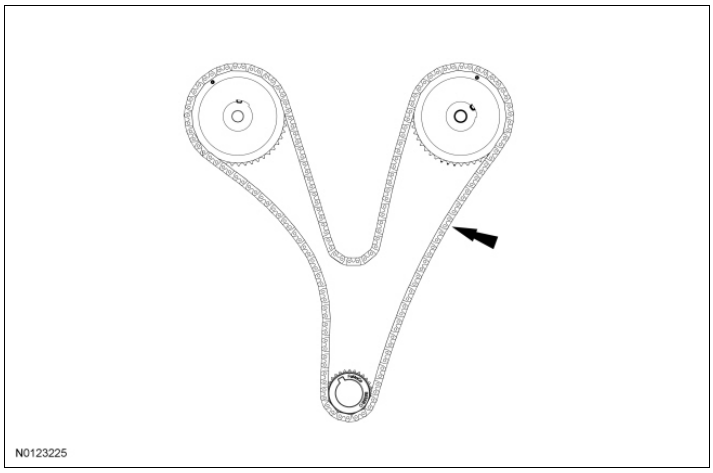


9. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

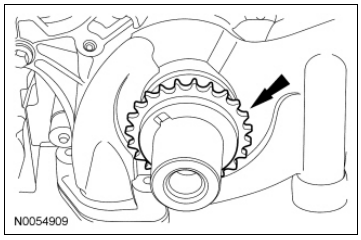
   Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.



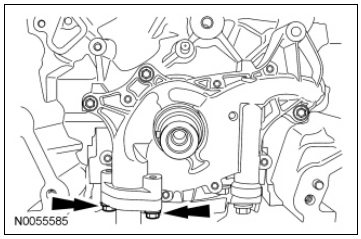
10. Remove the 2 bolts and the primary timing chain tensioner.



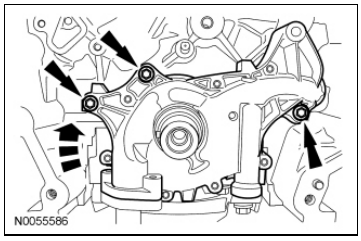
11. Remove the primary timing chain tensioner arm.



12. Remove the 2 bolts and the lower LH primary timing chain guide.



13. Remove the primary timing chain.



14. Remove the crankshaft timing chain sprocket.

15. Remove the 2 oil pump screen and pickup tube bolts.

16. Remove the 3 oil pump bolts.
    - Rotate the oil pump clockwise and separate the oil pump from the oil pump screen and pickup tube.
    - Remove the oil pump.
    - Discard the oil pump screen and pickup tube O-ring seal.

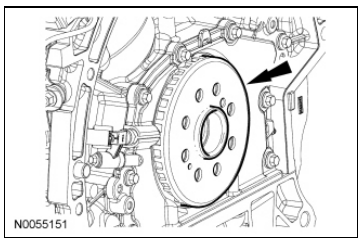
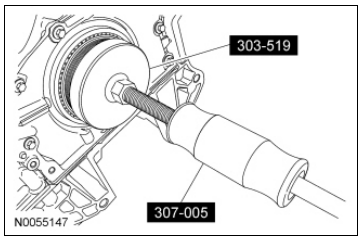
Motorcraft® Silicone Gasket Remover ZC-30	-

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



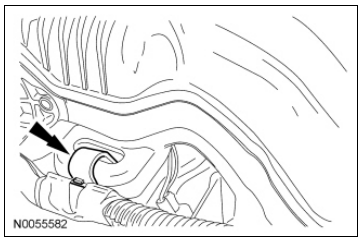
NOTE: For additional information, refer to the exploded view under the Assembly procedure in this section.

All engines

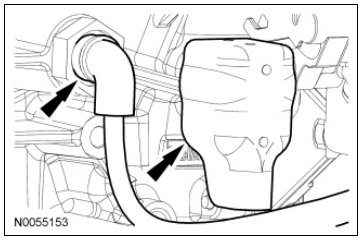


1. Remove the 8 bolts and the flexplate.

2. Remove the crankshaft sensor ring.

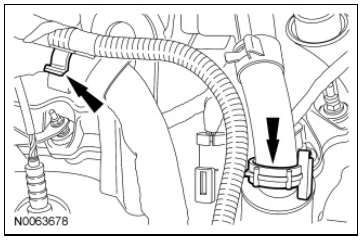


3. Using the Crankshaft Rear Oil Seal Remover and Slide Hammer, remove and discard the rear crankshaft seal.

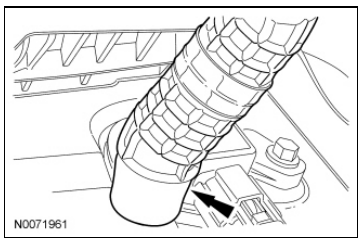


4. **NOTE:** Install the engine stand bolts into the cylinder block only. Do not install the bolts into the oil pan.

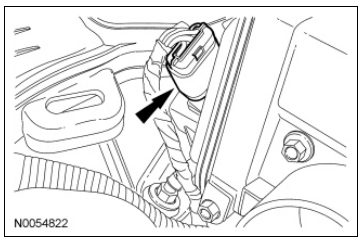
   Mount the engine on a suitable engine stand.



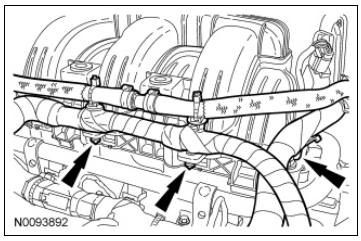
5. If equipped, detach the block heater wiring harness retainer from the upper intake manifold.



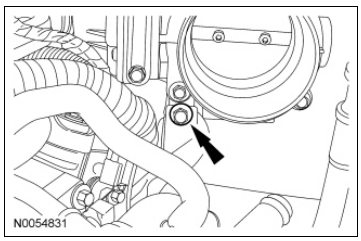
6. If equipped, remove the heat shield and disconnect the block heater electrical connector.



7. If equipped, detach the block heater wiring harness retainer from the power steering reservoir hose and the Power Steering Pressure (PSP) hose.
   - Remove the block heater wiring harness from the engine.

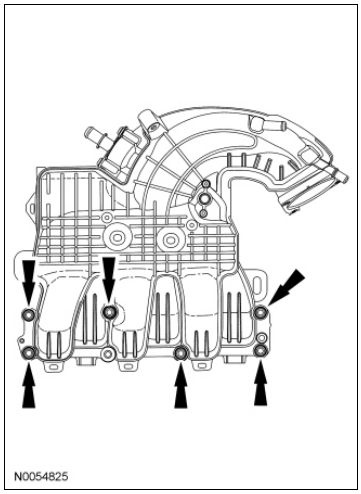


8. Disconnect the PCV hose from the PCV valve.

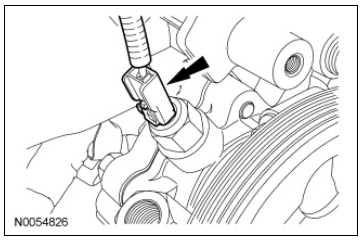


9. Disconnect the Throttle Body (TB) electrical connector.

10. Detach the wiring harness retainers from the upper intake manifold.



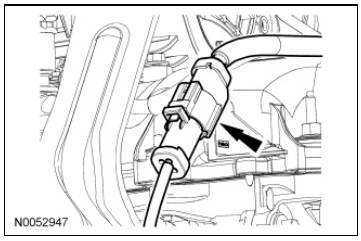
11. Remove the upper intake manifold support bracket bolt.



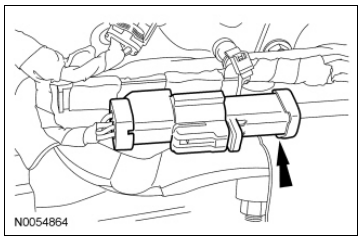
12. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Remove the 6 bolts and the upper intake manifold.

    - Discard the gaskets.

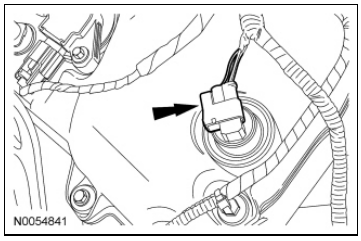


13. Disconnect the PSP switch electrical connector.

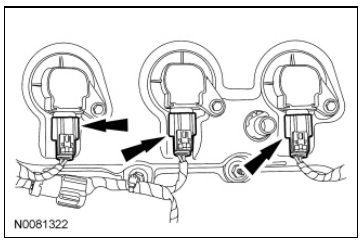


Front Wheel Drive (FWD) vehicles

14. Disconnect the RH Catalyst Monitor Sensor (CMS) sensor electrical connector.

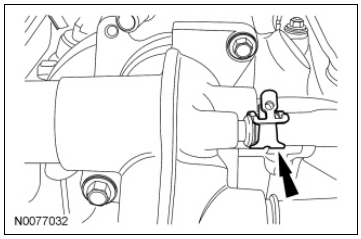


All engines

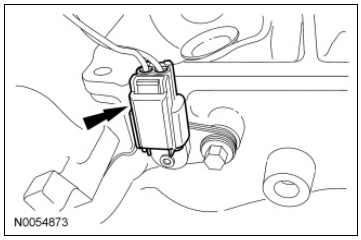


15. Disconnect the RH Heated Oxygen Sensor (HO2S) electrical connector.

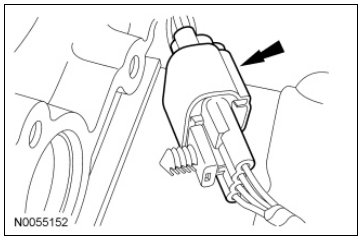
16. Disconnect the RH Variable Camshaft Timing (VCT) solenoid electrical connector.



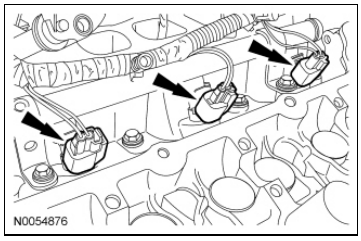
17. Disconnect the 3 RH coil-on-plug electrical connectors.



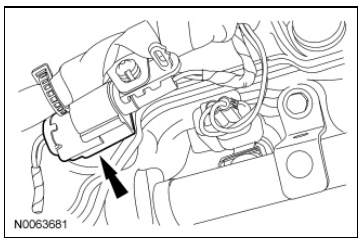
18. Detach all of the wiring harness retainers from the RH valve cover and stud bolts.



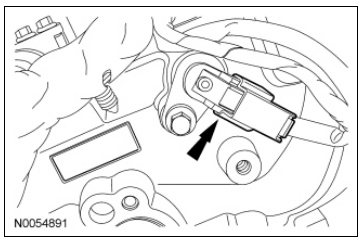
19. Disconnect the coolant bypass hose from the thermostat housing.



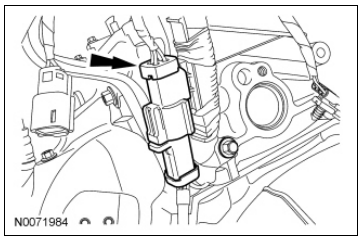
20. Disconnect the RH Camshaft Position (CMP) sensor electrical connector.



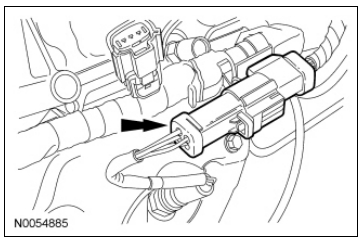
21. Disconnect the Knock Sensor (KS) electrical connector.



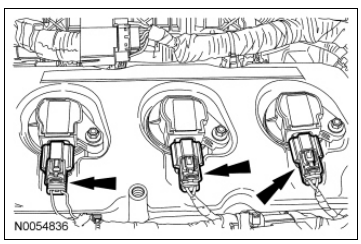
22. Disconnect the 6 fuel injector electrical connectors (3 shown).



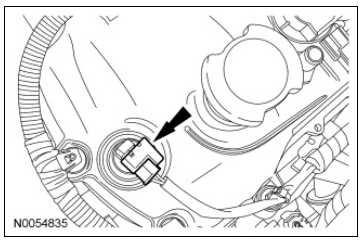
23. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.



24. Disconnect the LH CMP sensor electrical connector.

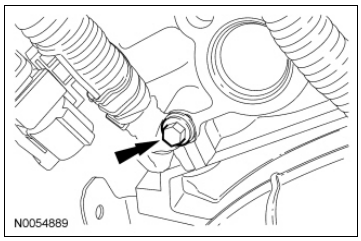


25. Disconnect the LH CMS sensor electrical connector.

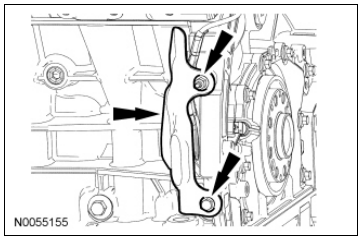


26. Disconnect the LH HO2S electrical connector.

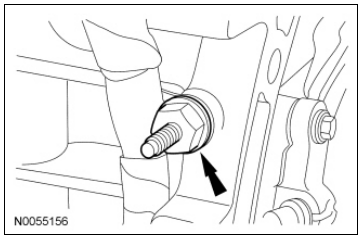
27. Disconnect the 3 LH coil-on-plug electrical connectors.



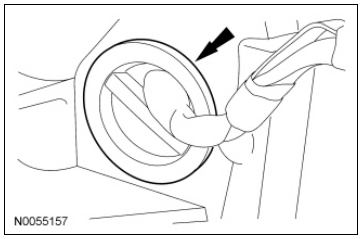
28. Disconnect the LH VCT solenoid electrical connector.



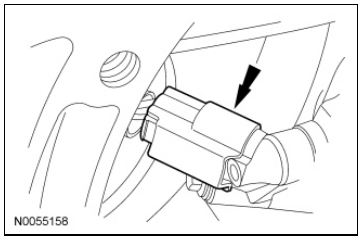
29. Detach all of the wiring harness retainers from the LH valve cover and stud bolts.



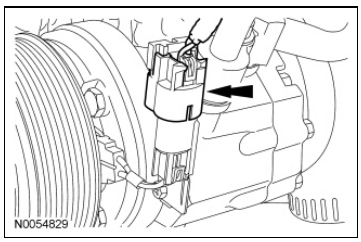
30. Remove the wiring harness retainer bolt from the rear of the LH cylinder head.



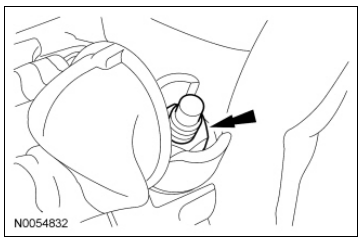
31. Remove the nut, the bolt and the heat shield.



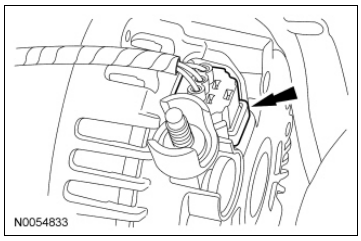
32. Remove the wiring harness retainer stud bolt.



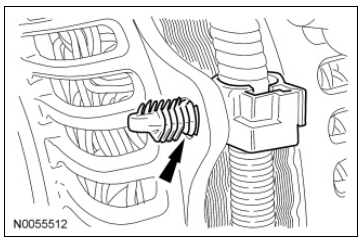
33. Remove the wiring harness grommet.



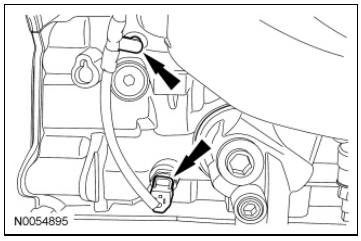
34. Disconnect the Crankshaft Position (CKP) sensor electrical connector.



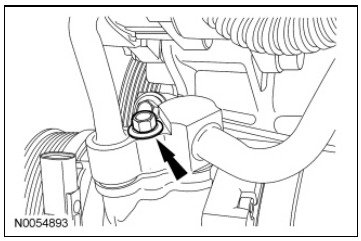
35. Disconnect the A/C compressor electrical connector.



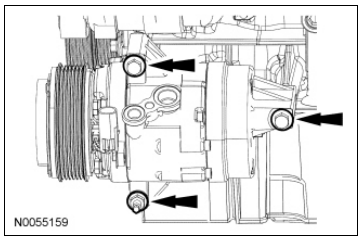
36. Remove the nut and disconnect the generator B+ cable.



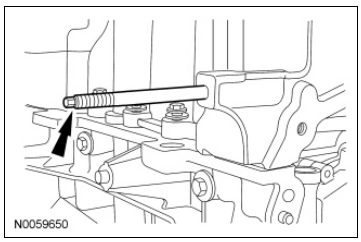
37. Disconnect the generator electrical connector.



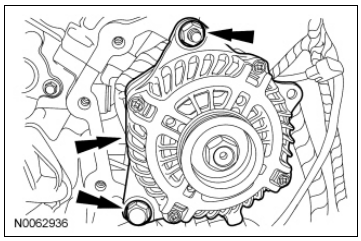
38. Detach the wiring harness retainer from the generator.



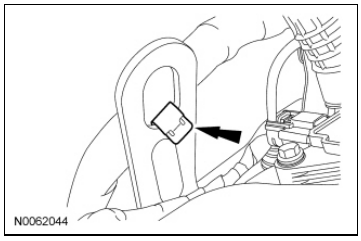
39. Disconnect the Engine Oil Pressure (EOP) switch electrical connector and the wiring harness pin-type retainer.
    - Remove the wiring harness from the engine.



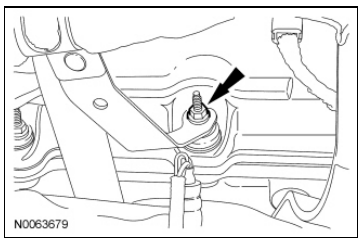
40. Remove the bolt and the A/C manifold.
    - Discard the O-ring seals.



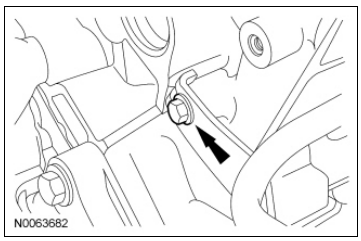
41. Remove the nut, 2 bolts and the A/C compressor.



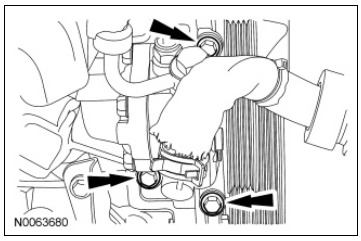
42. Remove the A/C compressor mounting stud from the oil pan.



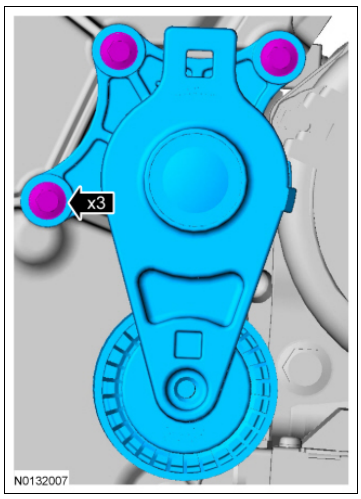
43. Remove the bolt, nut and the generator.



44. Detach the PSP hose retainer from the engine lifting eye.

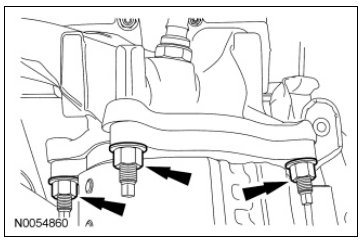


45. Remove the PSP hose bracket nut.

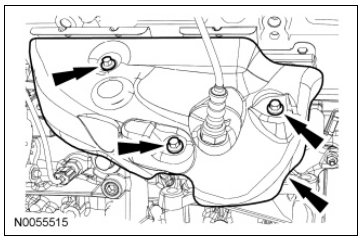


46. Remove the PSP tube bracket bolt from the RH cylinder head.

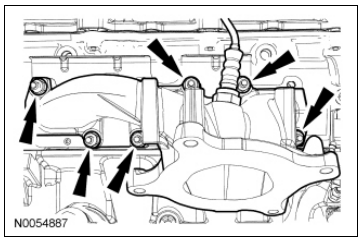
47. Remove the 3 bolts and the power steering pump.



48. Remove the 3 bolts and the accessory drive belt tensioner.

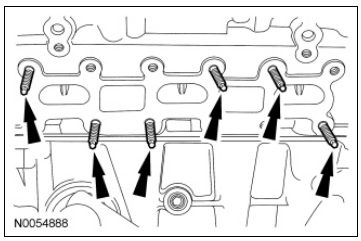


49. Remove the 4 nuts (3 shown) and the LH catalytic converter.

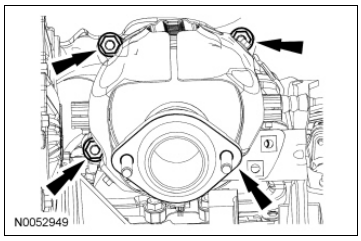


- Discard the nuts and the gasket.

50. Remove the 3 bolts and the LH exhaust manifold heat shield.

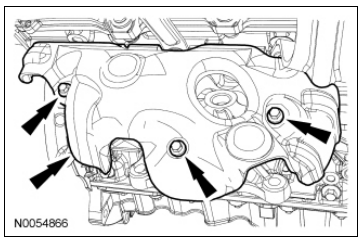


51. Remove the 6 nuts and the LH exhaust manifold.
    - Discard the nuts and the exhaust manifold gasket.



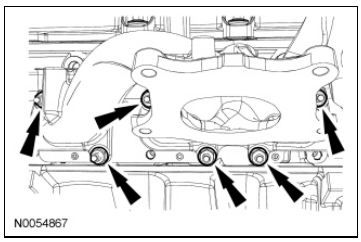
52. Clean and inspect the LH exhaust manifold. For additional information, refer to Section 303-00 .

53. Remove and discard the 6 LH exhaust manifold studs.



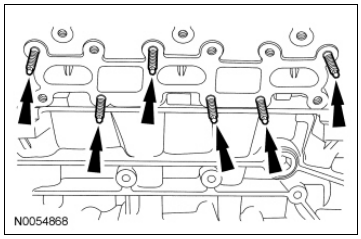
FWD vehicles

54. Remove the 4 nuts and the RH catalytic converter.
    - Discard the nuts and the gasket.

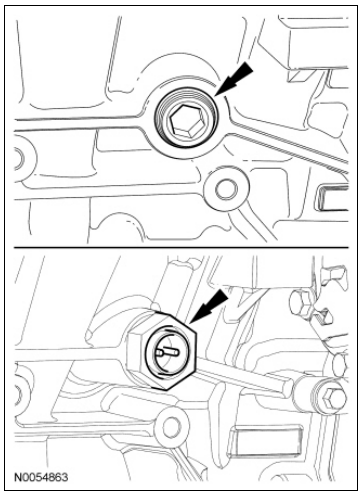


All engines

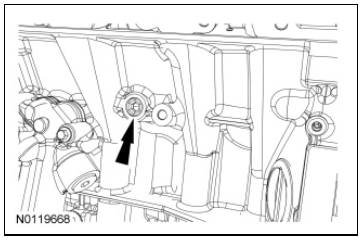
55. Remove the 3 bolts and the RH exhaust manifold heat shield.



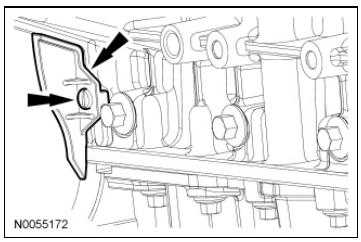
56. Remove the 6 nuts and the RH exhaust manifold.
    - Discard the nuts and the exhaust manifold gasket.



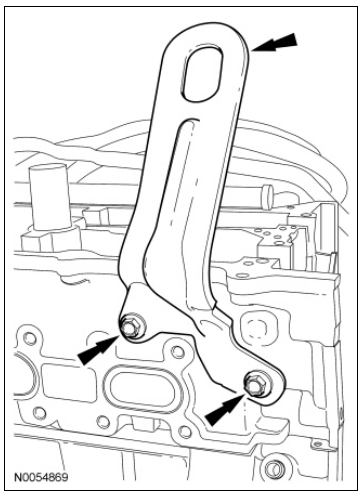
57. Clean and inspect the RH exhaust manifold. For additional information, refer to Section 303-00 .



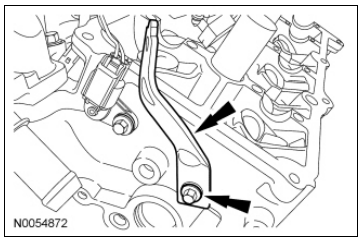
58. Remove and discard the 6 RH exhaust manifold studs.



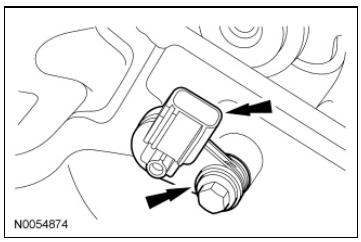
59. Remove the RH cylinder block drain plug or, if equipped, the block heater.
    - Allow coolant to drain from the cylinder block.



60. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

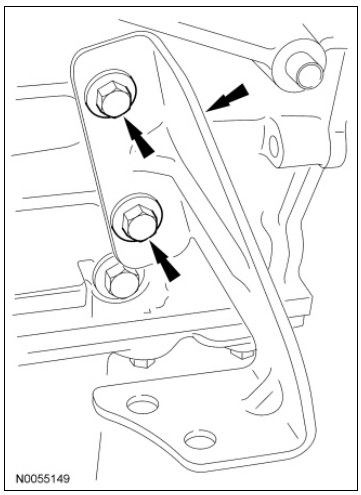


61. Remove the pin-type retainer and the cover.

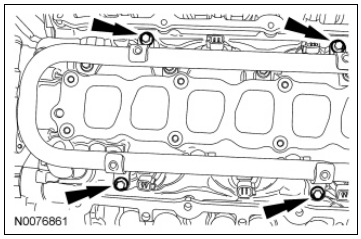


62. Remove the 2 bolts and the engine lifting eye.

63. Remove the bolt and the upper intake manifold support bracket.

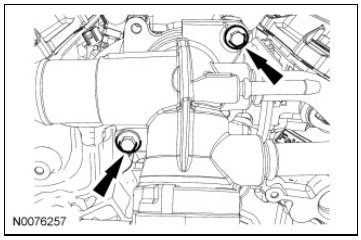


64. Remove the bolt and the RH CMP sensor.



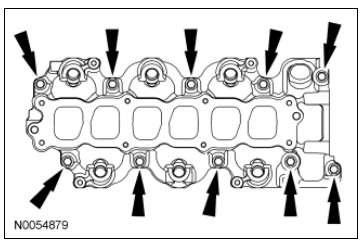
All-Wheel Drive (AWD) vehicles

65. Remove the 2 bolts and the catalytic converter bracket.

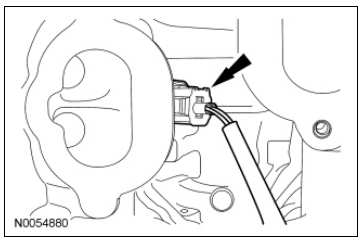


All engines

66. Remove the 4 bolts and the fuel rail and injectors as an assembly.



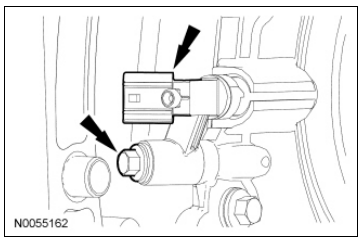
67. Remove the 2 thermostat housing-to-lower intake manifold bolts.
    - Remove the thermostat housing and discard the gasket.



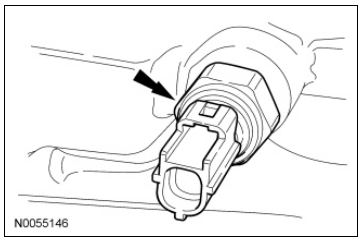
68. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Remove the 10 bolts and the lower intake manifold.

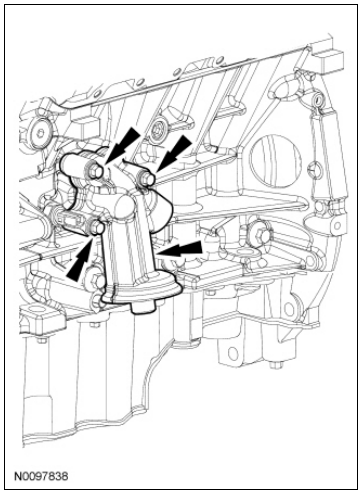
    - Discard the gaskets.



69. Disconnect and remove the CHT sensor jumper harness.

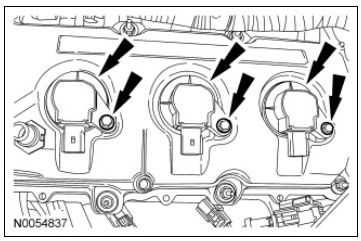


70. Remove the bolt and the LH CMP sensor.

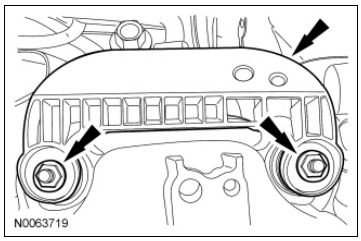


71. Remove the bolt and the CKP sensor.

72. Remove the EOP switch.

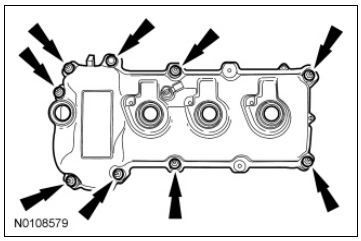


73. Remove the 3 bolts and the oil filter adapter.
    - Discard the gasket.



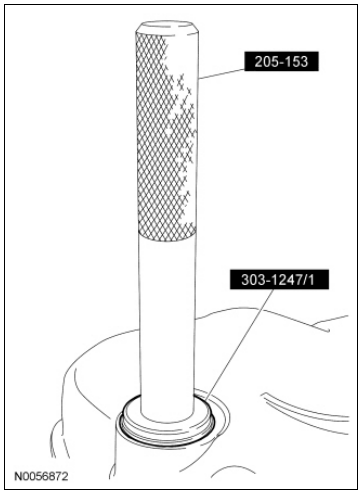
74. **NOTE:** LH shown, RH similar.

    Remove the 6 bolts and the 6 coil-on-plugs.

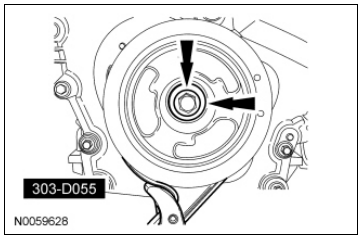


75. Remove the 2 nuts and the wiring harness retaining bracket.

76. Loosen the 9 stud bolts and remove the LH valve cover.
    - Discard the gasket.



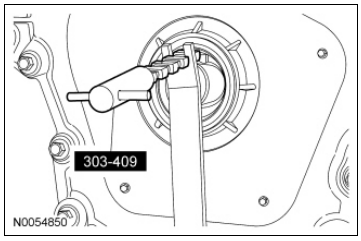
77. Loosen the bolt, 8 stud bolts and remove the RH valve cover.
    - Discard the gasket.



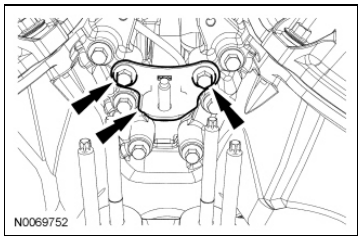
78. **NOTE:** VCT solenoid seal removal shown, spark plug tube seal removal similar.

    Inspect the VCT solenoid seals and the spark plug tube seals. Remove any damaged seals.

    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

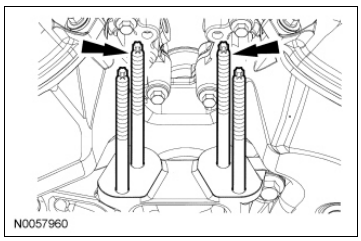


79. Using the Strap Wrench, remove the crankshaft pulley bolt and washer.
    - Discard the bolt.

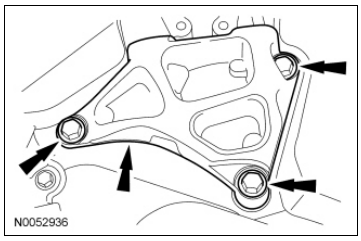


80. Using the 3 Jaw Puller, remove the crankshaft pulley.

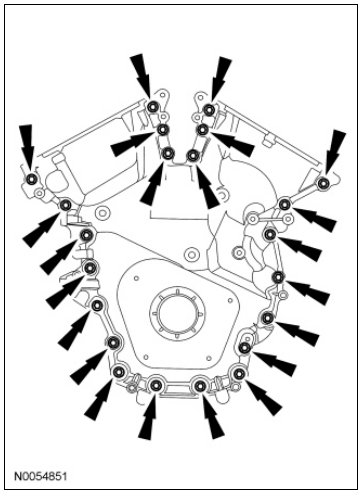
81. Using the Oil Seal Remover, remove and discard the crankshaft front seal.



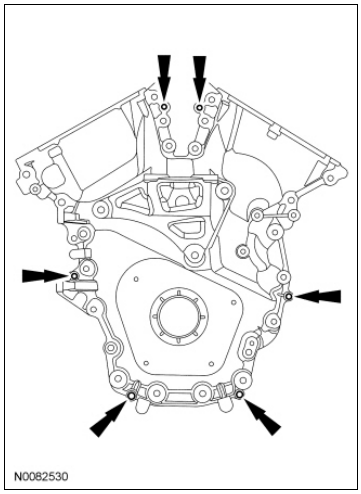
82. Remove the 2 bolts and the engine mount bracket.



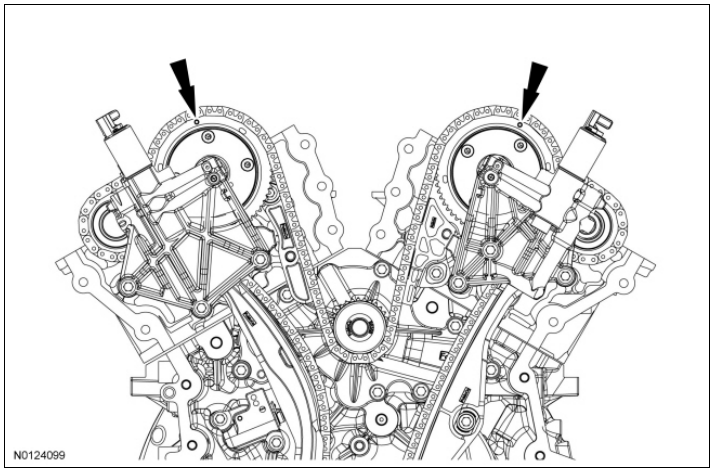
83. **NOTE:** Only use hand tools to remove the studs.



Remove the 2 engine mount studs.

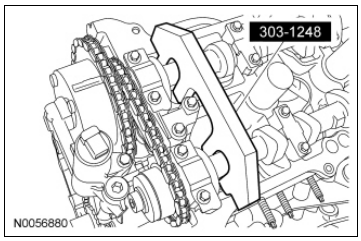


84. Remove the 3 bolts and the engine mount bracket.

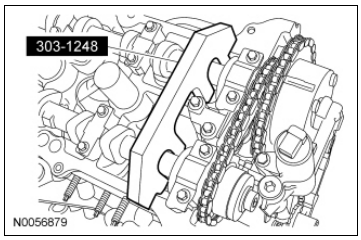


85. Remove the 22 engine front cover bolts.

86. Install 6 of the engine front cover bolts (finger-tight) into the 6 threaded holes in the engine front cover in the following sequence.
    1. Tighten the bolts one turn at a time in a crisscross pattern until the engine front cover-to-cylinder block seal is released.
    2. Remove the engine front cover.

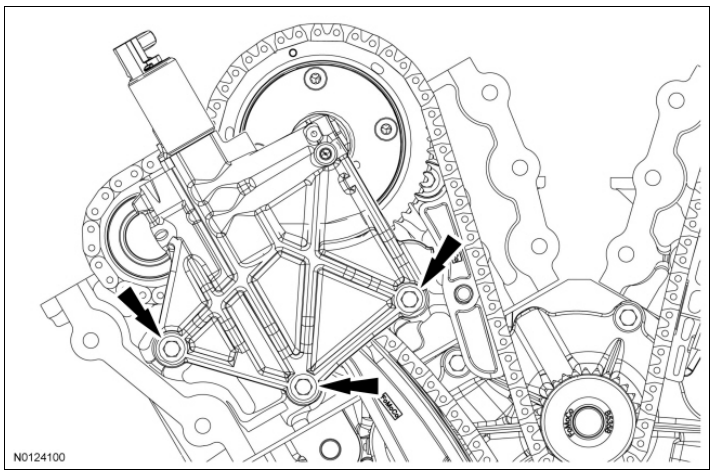


87. Rotate the crankshaft clockwise and align the timing marks on the Variable Camshaft Timing (VCT) assemblies as shown.



88. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

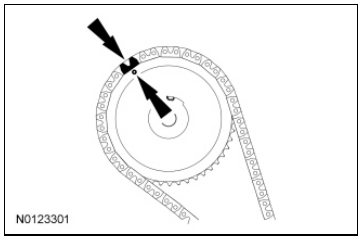
    Install the Camshaft Holding Tool onto the flats of the LH camshafts.



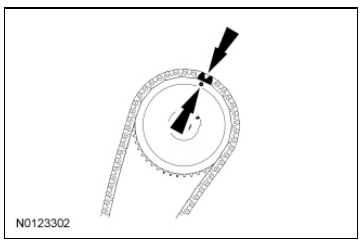
89. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC position.

    Install the Camshaft Holding Tool onto the flats of the RH camshafts.

90. Remove the 3 bolts and the RH VCT housing.

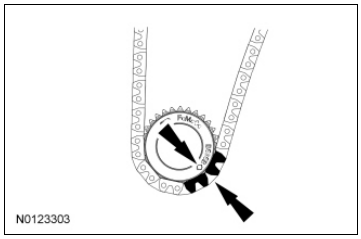


91. Remove the 3 bolts and the LH VCT housing.

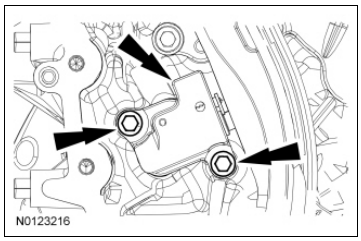


NOTE: The following 3 steps are for primary timing chains when the colored links are not visible.

92. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.

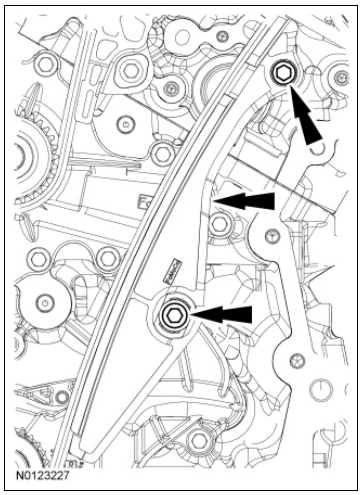


93. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.

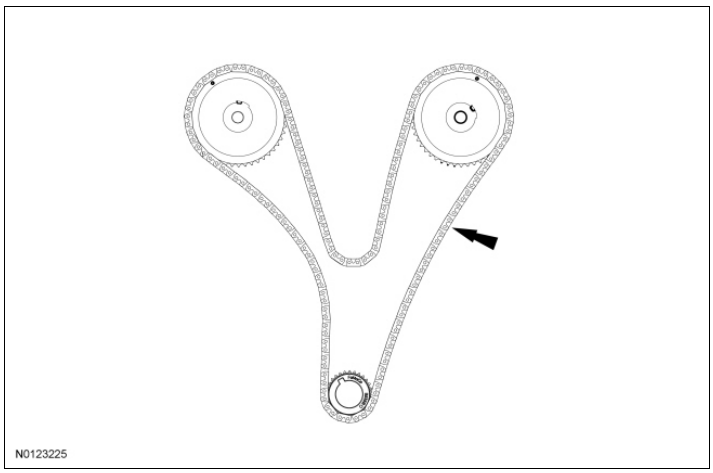


94. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

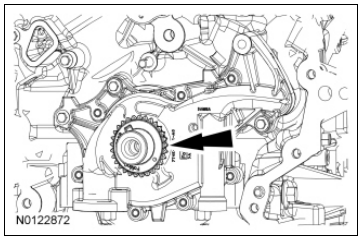
    Mark the 2 timing chain links that align with the timing mark on the crankshaft sprocket as shown.



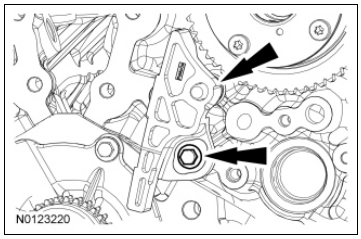
95. Remove the 2 bolts and the primary timing chain tensioner.



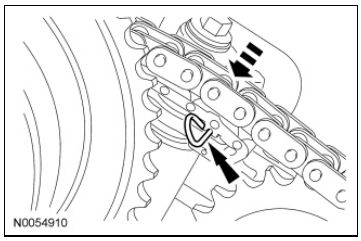
96. Remove the primary timing chain tensioner arm.



97. Remove the 2 bolts and the lower LH primary timing chain guide.

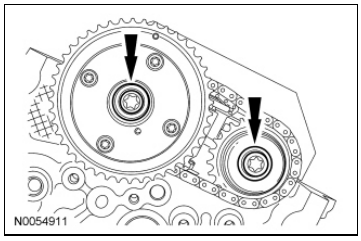


98. Remove the primary timing chain.



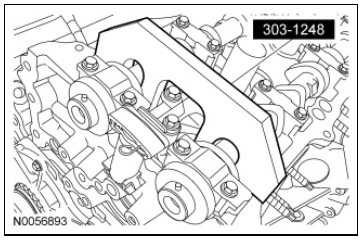
99. Remove the crankshaft timing chain sprocket.

100. Remove the bolt and the upper LH primary timing chain guide.



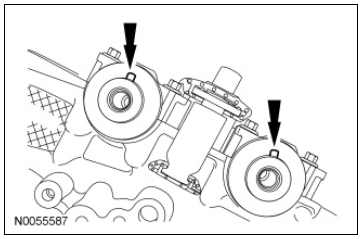
101. Compress the LH secondary timing chain tensioner and install a suitable lockpin to retain the tensioner in the collapsed position.

102. **NOTE:** The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.



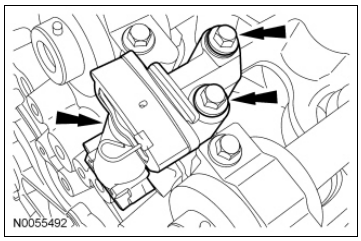
Remove and discard the LH VCT assembly bolt and the LH exhaust camshaft sprocket bolt.

- Remove the LH VCT assembly, secondary timing chain and the LH exhaust camshaft sprocket as an assembly.



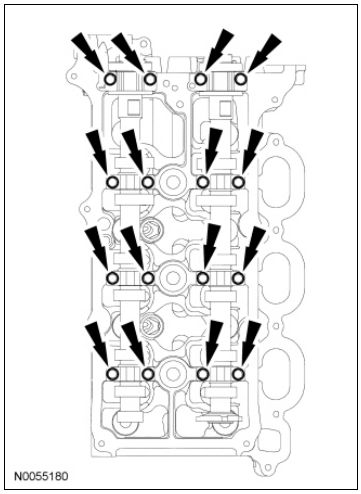
103. **NOTE:** When the Camshaft Holding Tool is removed, valve spring pressure will rotate the LH camshafts approximately 3 degrees to a neutral position.

    Remove the Camshaft Holding Tool from the LH camshafts.

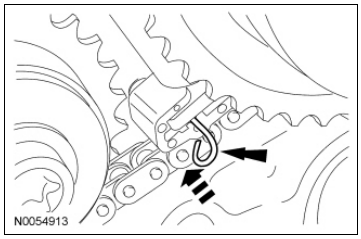


104. ***NOTICE:*** **The camshafts must remain in the neutral position during removal or engine damage may occur.**

    Verify the LH camshafts are in the neutral position.



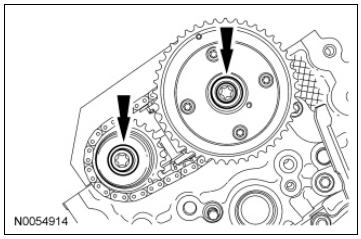
105. Remove the 2 bolts and the LH secondary timing chain tensioner.



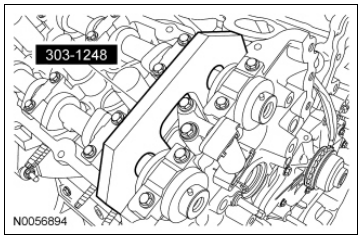
106. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    Remove the bolts and the LH camshaft bearing caps.

    - Remove the LH camshafts.



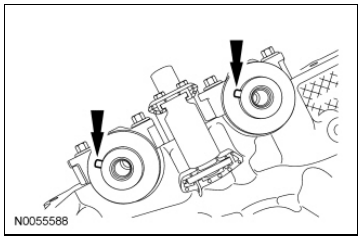
107. Compress the RH secondary timing chain tensioner and install a suitable lockpin to retain the tensioner in the collapsed position.



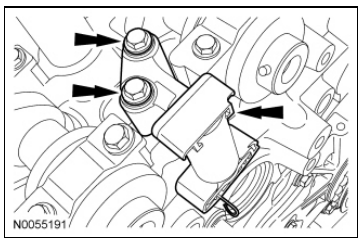
108. **NOTE:** The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.

    Remove and discard the RH VCT assembly bolt and the RH exhaust camshaft sprocket bolt.

    - Remove the RH VCT assembly, secondary timing chain and the RH exhaust camshaft sprocket as an assembly.



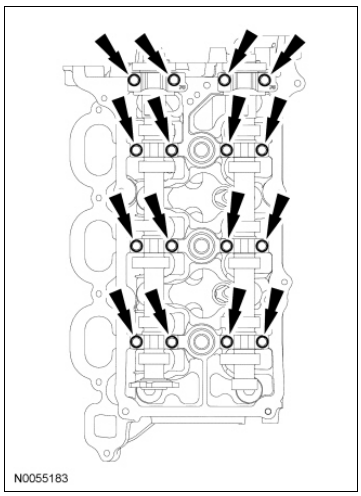
109. Remove the Camshaft Holding Tool from the RH camshafts.



110. ***NOTICE:*** **The camshafts must remain in the neutral position during removal or engine damage may occur.**

    Rotate the RH camshafts counterclockwise to the neutral position.

111. Remove the 2 bolts and the RH secondary timing chain tensioner.



112. Remove the bolt and the RH timing chain guide.

113. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    Remove the bolts and the RH camshaft bearing caps.

    - Remove the RH camshafts.

114. **NOTE:** If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

    NOTE: LH shown, RH similar.

    Remove the valve tappets from the cylinder heads.

115. **NOTE:** LH shown, RH similar.

    Remove and discard the M6 bolt from each cylinder head.

116. ***NOTICE:*** **Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**

    NOTICE: **Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**

    NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

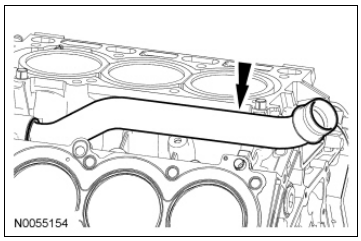
    NOTE: LH shown, RH similar.

    Remove and discard the 8 bolts from each cylinder head.

    - Remove the cylinder heads.
    - Discard the cylinder head gaskets.

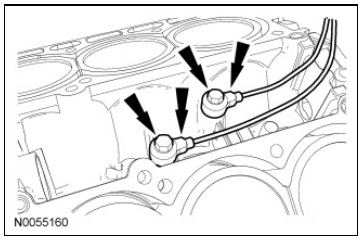
117. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the gasket.**

NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.



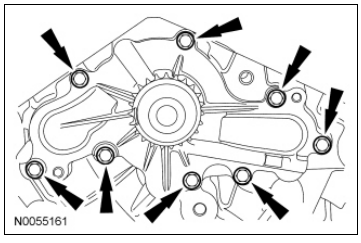
NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.

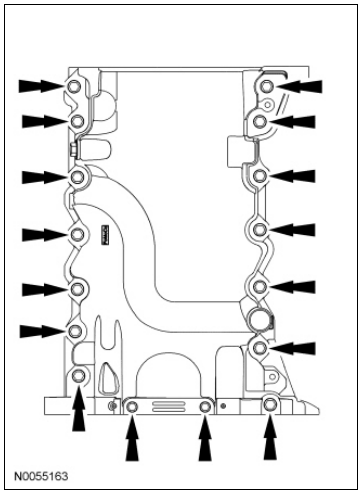


1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

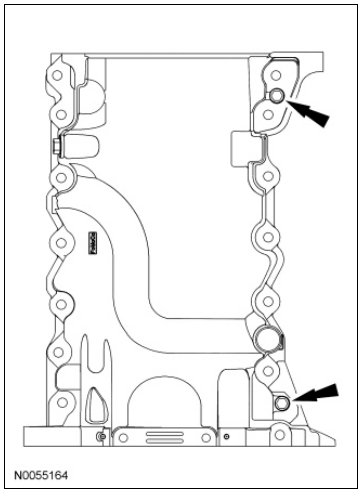
118. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .



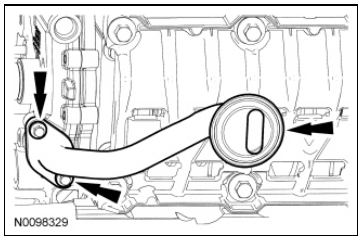
119. Remove the coolant inlet tube.
    - Remove and discard the O-ring seals.



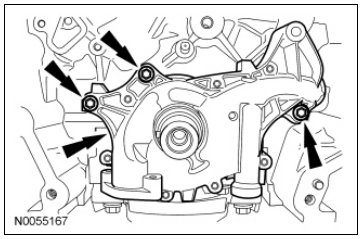
120. Remove the 2 bolts and the Knock Sensor (KS).



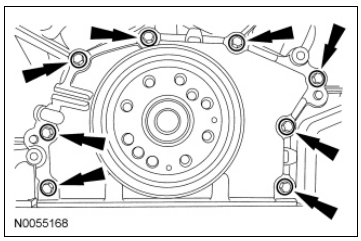
121. Remove the 8 bolts and the coolant pump.



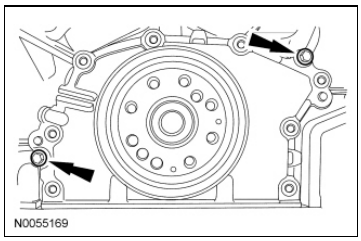
122. Remove the 16 oil pan bolts.



123. Install 2 of the oil pan bolts (finger-tight) into the 2 threaded holes in the oil pan in the following sequence.
    1. Alternately tighten the 2 bolts one turn at a time until the oil pan-to-cylinder block seal is released.
    2. Remove the oil pan.



124. Remove the 2 bolts and the oil pump screen and pickup tube.
    - Discard the O-ring seal.



125. Remove the 3 bolts and the oil pump.

126. Remove the 8 crankshaft rear seal retainer bolts.

127. Install the 2 M6 oil pan bolts (finger-tight) into the 2 threaded holes in the crankshaft rear seal retainer in the following sequence.
    1. Alternately tighten the 2 bolts one turn at a time until the crankshaft rear seal retainer-to-cylinder block seal is released.
    2. Remove the crankshaft rear seal retainer.

128. ***NOTICE:*** **Only use a 3M Roloc® Bristle Disk (2-in white, part number 0752) to clean the engine front cover, oil pan and crankshaft rear seal retainer plate. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean the engine front cover, oil pan and crankshaft rear seal retainer plate. These tools cause scratches and gouges that make leak paths.**

    Clean the engine front cover, oil pan and crankshaft rear seal retainer plate using a 3M Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 rpm.

    - Thoroughly wash the engine front cover, oil pan and crankshaft rear seal retainer plate to remove any foreign material, including any abrasive particles created during the cleaning process.

129. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following manufacturer's instructions.

130. **NOTE:** The main bearing cap support brace bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    Remove the bolts in the sequence shown.

    - Remove the main bearing cap support brace.
    - Discard the bolts.

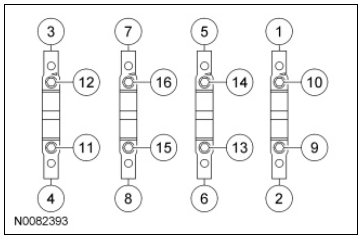
131. **NOTE:** The connecting rod cap bolts are torque to yield. The original connecting rod cap bolts will be used when measuring the connecting rod large end bore during assembly. The connecting rod cap bolts will be discarded after measurement.

    NOTE: Clearly mark the positin and orientation of the connecting rods, connecting rod caps and connecting rod bearings for reassembly.

    Remove the connecting rod cap bolts and cap.

132. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

    Remove the piston/rod assembly from the engine block.



133. Repeat the previous 2 steps until all the piston/rod assemblies are removed from the engine block.

134. **NOTE:** The 8 main bearing cap side bolts and the 8 main bearing cap bolts must be discarded and new bolts must be installed. They are a tighten-to-yield design and cannot be reused.

    NOTE: Clearly mark the position and orientation of the main bearing caps for reassembly.

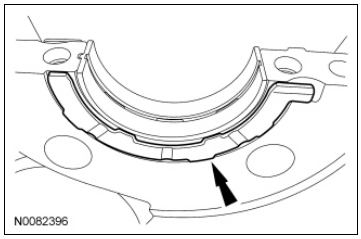
    Remove the 8 main bearing cap side bolts and the 8 main bearing cap bolts in the sequence shown.

    - Discard the bolts.

135. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

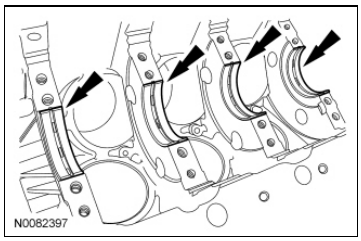
    NOTE: Note the position of the thrust washer on the outside of the No. 4 rear main bearing cap.

    Remove the 4 main bearing caps.



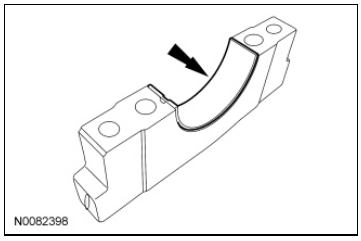
136. **NOTE:** Note the position of the 2 thrust washers on the inside and outside of the rear main bearing bulkhead.

    Remove the crankshaft.



137. **NOTE:** Inside shown, outside similar.

    Remove the 2 crankshaft thrust bearings from the rear main bearing bulkhead.



138. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

    Remove the 4 crankshaft main bearings from the cylinder block.

139. **NOTE:** If the main bearings are being reused, mark them for correct position and orientation for reassembly.

    Remove the 4 crankshaft main bearings from the main bearing caps.

140. Inspect the cylinder block, bearing cap support brace, pistons and connecting rods. For additional information, refer to Section 303-00 .

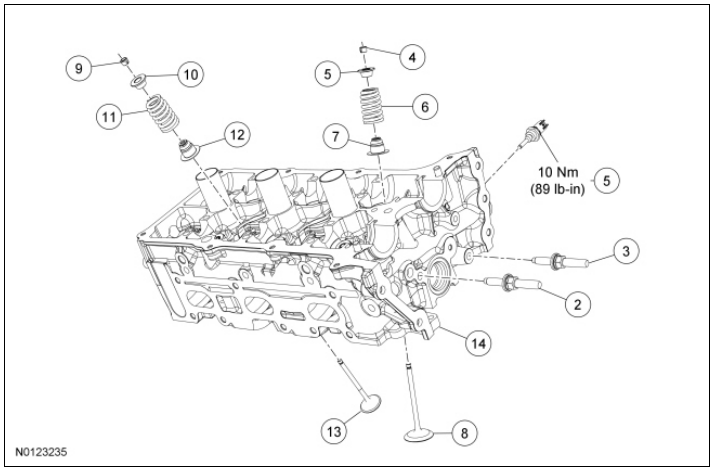
141. ***NOTICE:*** **Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**

    NOTICE: **Do not use wire brushes, power abrasive discs or 3M Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that will cause premature engine failure. Remove all traces of the gasket.**

    Clean all engine sealing surfaces of the cylinder block in the folowing sequence.

    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil or coolant and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
    5. Make sure the 2 engine front cover locating dowel pins are seated correctly in the cylinder block.

Cylinder Head

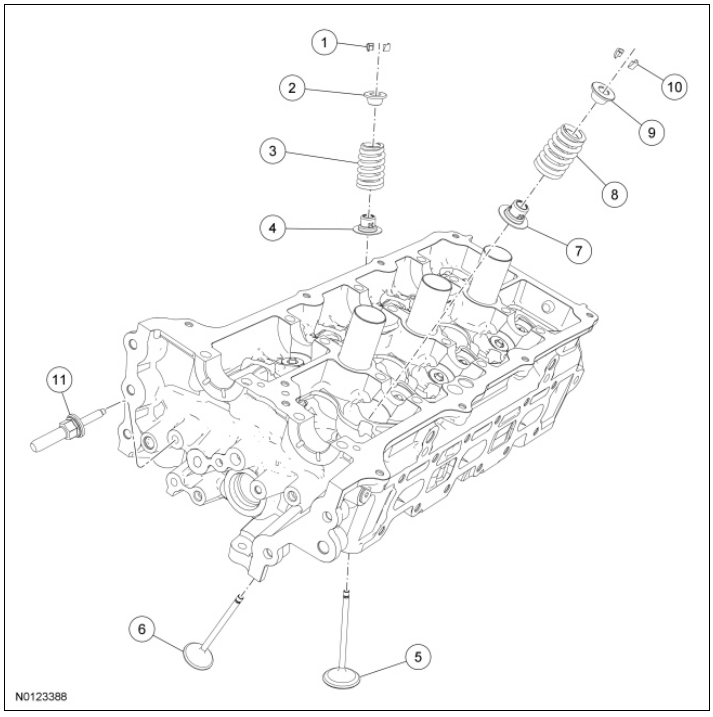


Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST3028-A	Compressor, Valve Spring 303-1249
 ST1906-A	Installer, Valve Stem Oil Seal 303-470 (T94P-6510-CH)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



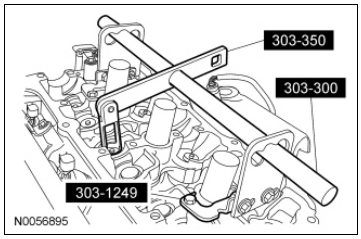
Cylinder Head - RH

Item	Part Number	Description

1	6G004	Cylinder Head Temperature (CHT) sensor
2	W714090	Timing chain tensioner arm pin
3	W714090	Timing chain guide pin
4	6518	Intake valve spring retainer key (12 required)
5	6514	Intake valve spring retainer (6 required)
6	6513	Intake valve spring (quired)
7	6A517	Intake valve stem seal (6 required)
8	6505	Intake valve (6 required)
9	6518	Exhaust valve spring retainer key (12 required)
10	6514	Exhaust valve spring retainer (6 required)
11	6513	Exhaust valve spring (6 required)
12	6A517	Exhaust valve stem seal (6 required)
13	6507	Exhaust valve (6 required)
14	6049	LH cylinder head

Cylinder Head - LH

Item	Part Number	Description
1	6518	Intake valve spring retainer key (12 required)
2	6514	Intake valve spring retainer (6 required)
3	6513	Intake valve spring (6 required)
4	6A517	Intake valve stem seal (6 required)
5	6505	Intake valve (6 required)
6	6507	Exhaust valve (6 required)
7	6A517	Exhaust valve stem seal (6 required)
8	13	Exhaust valve spring (6 required)



9	6514	Exhaust valve spring retainer (6 required)
10	6518	Exhaust valve spring retainer key (12 required)
11	W714090	Timing chain tensioner arm pin

Disassembly

All cylinder heads

NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

1. Using the Valve Spring Compressors, remove the keys, retainer and spring.

2. Remove the valve from the cylinder head.

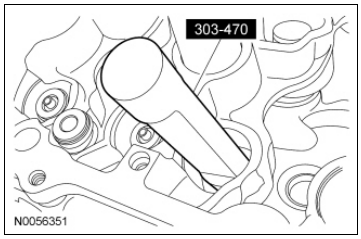
3. Remove and discard the valve stem seal.

4. Repeat the above steps for each valve.

5. Remove the timing chain guide pin.

RH cylinder head

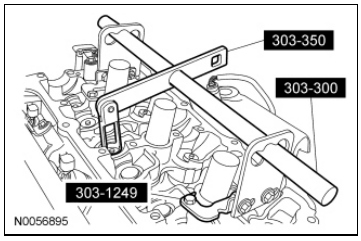
6. Remove the timing chain tensioner arm pin.



7. Remove and discard the Cylinder Head Temperature (CHT) sensor.

Assembly

All cylinder heads



1. **NOTE:** Lubricate the valve stem seal with clean engine oil prior to installation.

   Using the Valve Stem Oil Seal Installer, install a new valve stem seal.

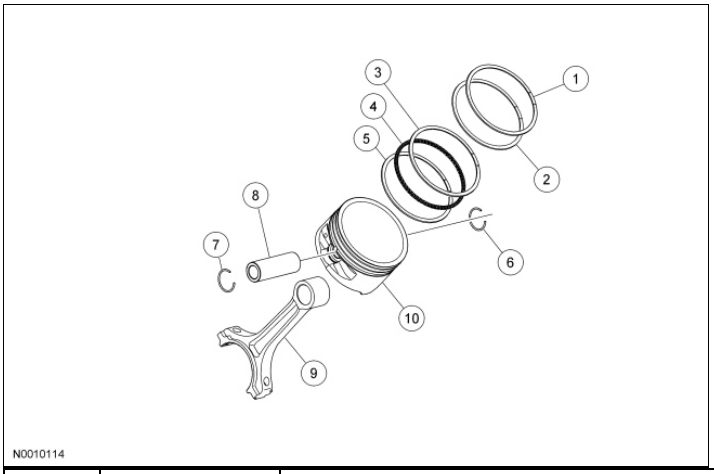
2. Install the valve.

3. Using the Valve Spring Compressors, install the valve spring, retainer and key.

4. Repeat the above steps for each valve.

5. Install the timing chain guide pin and tighten in 2 stages.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten an additional 60 degrees.

RH cylinder head



6. Install the timing chain tensioner arm pin and tighten in 2 stages.
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten an additional 60 degrees.

7. Install a new CHT sensor.
    - Tighten to 10 Nm (89 lb-in).

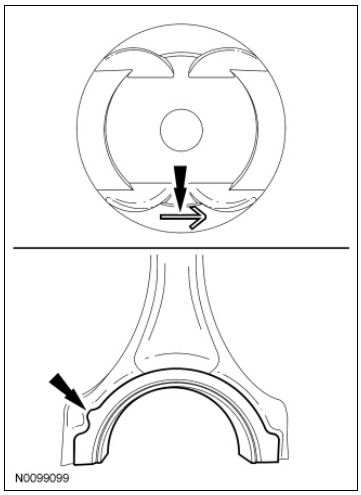
Piston

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item >	Part Number	Description
1	-	Piston compression upper ring (part of 6148)
2	-	Piston compression lower ring (part of 6148)
3	-	Piston oil control upper segment ring (part of 6148)
4	-	Piston oil control spacer (part of 6148)
5	-	Piston oil control lower segment ring (part of 6148)
6	6140	Piston pin retainer clip
7	6140	Piston pin retainer clip
8	6135	Piston pin
9	6200	Connecting rod
10	6110	Piston

Disassembly



1. Remove the piston rings from the piston.
   - Discard the piston rings.

2. Remove the 2 piston pin retainers and the piston pin.
   - Discard the 2 piston pin retainer clips.

3. **NOTE:** If the piston and/or connecting rod are being installed new, the piston rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

   NOTE: If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

   Separate the piston from the connecting rod.

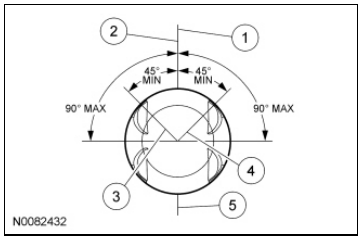
4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

Assembly

1. Align the piston-to-connecting rod orientation marks and position the connecting rod in the piston.

2. Lubricate the piston pin and pin bore with clean engine oil.

3. Install the piston pin in the piston and connecting rod assembly.



4. Install the new piston pin retaining clips in the piston.
   - The piston pin retaining clip gap orientation must be toward the top or dome of piston.

5. Lubricate the piston and the new piston rings with clean engine oil.

6. **NOTE:** The piston compression upper and lower ring should be installed with the "O" mark on the ring face pointing up toward the top of the piston.

   Install the piston rings onto the piston as shown.

   1. Center line of the piston parallel to the wrist pin bore
   2. Upper compression ring gap location
   3. Upper oil control segment ring gap location
   4. Lower oil control segment ring gap location
   5. Expander ring and lower compression ring gap location

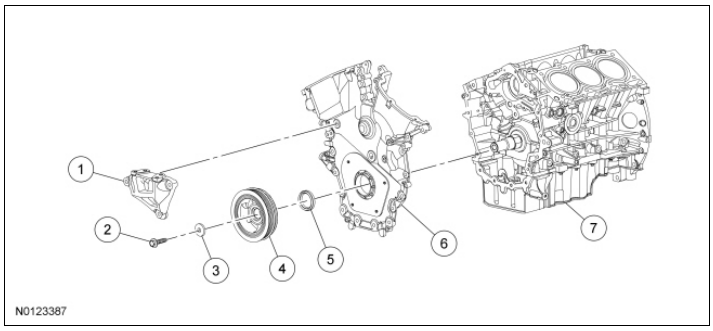
Engine Upper - LH Cylinder Head

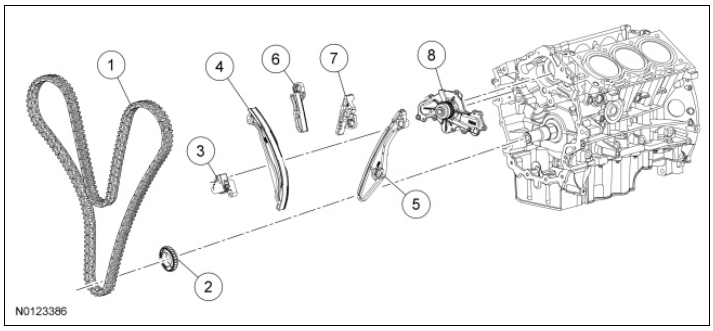
Item	Part Number	Description
1	6051	LH cylinder head gasket

2	6C261	LH Variable Camshaft Timing (VCT) housing
3	W712244	LH exhaust manifold stud (6 required)
4	6500	Valve tappet (24 quired)
5	6049	LH cylinder head
6	6279	LH camshaft bolt (2 required)
7	W710738	LH exhaust camshaft sprocket washer
8	6A257	LH VCT assembly
9	6256	LH exhaust camshaft sprocket
10	6268	LH secondary timing chain
11	6A258	LH camshaft cap (8 required)
12	6582	LH valve cover
13	6250	LH intake camshaft
14	6250	LH exhaust camshaft
15	6K254	LH secondary timing chain tensioner



Engine Upper - RH Cylinder Head

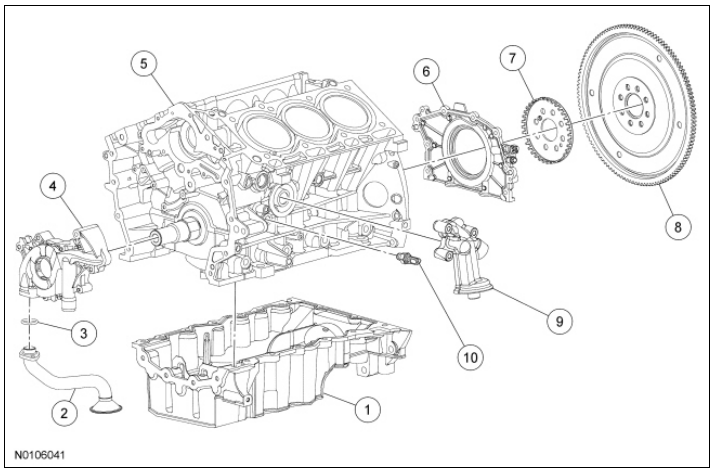
Item	Part Number	Description
1	W712244	RH exhaust manifold stud (6 required)
2	6051	RH cylinder head gasket
3	6G004	Cylinder Head Temperature (CHT) sensor
14A411	CHT sensor jumper harness	
5	6B288	Camshaft Position (CMP) sensor (2 required)
6	6049	RH cylinder head
7	17A084	Engine lift eye
8	6C260	RH Variable Camshaft Timing (VCT) housing
9	6279	RH camshaft bolt (2 required)
10	W710738	RH exhaust camshaft sprocket washer



11	6256	RH exhaust camshaft sprocket
12	6A257	RH VCT assembly
13	6268	RH secondary timing chain
14	6250	RH intake camshaft
15	6250	RH exhaust camshaft
16	12405	Spark plug (6 required)
17	6A258	RH camshaft cap (8 required)
18	6582	RH valve cover
19	12A375	Coil-on-plug (6 required)
20	6C270	RH secondary timing chain tensioner

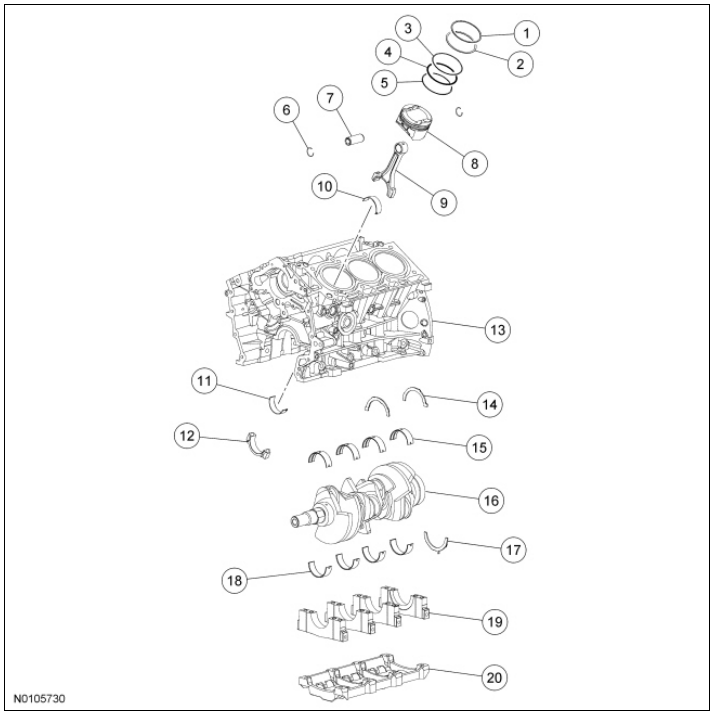
Engine Front

Item	Part Number	Description
1	6A0003	Engine mount bracket
2	W701512	Crankshaft pulley bolt
3	N806165	Crankshaft pulley washer
4	6316	Crankshaft pulley
5	6700	Crankshaft front seal
6	6C086	Engine front cover
7	6675	Oil pan



Timing Drive Components

Item	Part Number	Description
1	6268	Timing chain



2	6306	Crankshaft timing sprocket
3	6K254	Primary timing chain tensioner
4	6K255	Primary timing chain tensioner arm
5	6B274	LH lower primary timing chain guide
6	6M256	RH primary timing chain guide
7	6K297	LH upper primary timing chain guide
8	8501	Coolant pump

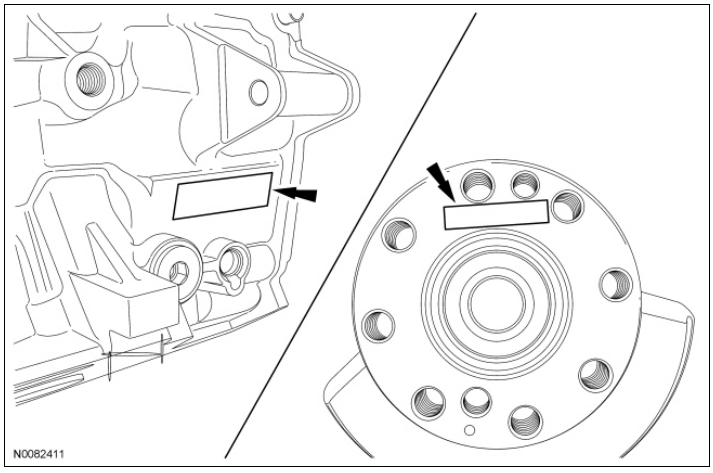
Engine Lower (View 1)

Item	Part Number	Description
1	6675	Oil pan
2	6622	Oil pump screen and pickup tube
3	6625	Oil pump screen and pickup tube O-ring seal
4	6600	Oil pump
5	6010	Cylinder block
6	6K301	Crankshaft rear seal retainer
7	12A227	Crankshaft sensor ring
8	6375	Flexplate
9	6881	Oil filter adapter
10	9278	Engine Oil Pressure (EOP) switch

Lower Engine Block (View 2)

Item	Part Number	Description
1	-	Piston compression upper ring (6 required) (part of 6148)
2	-	Piston compression lower ring (6 required) (part of 6148)
3	-	Piston oil control upper segment ring (6 required) (part of 6148)
4	-	Piston oil control spacer (6 required) (part of 6148)
5	-	Piston oil control lower segment ring (6 required) (part of 6148)
6	6140	Piston pin retainer (12 required)
7	6135	Piston pin (6 required)
8	6110	Piston (6 required)
9	6200	Connecting rod (6 required)
10	6211	Connecting rod upper bearing (6 required)
11	6211	Connecting rod lower bearing (6 required)
12	-	Connecting rod cap (part of 6200) (6 required)
13	6010	Cylinder block
14	6D309	Crankshaft upper thrust washer (2 required)
15	6D309	Cylinder block crankshaft main bearing (4 required)
16	6303	Crankshaft
17	6K302	Crankshaft lower thrust washer
18	6D309	Lower crankshaft main bearings (4 required)
20	6C364	Main bearing cap support brace

NOTICE: **During engine repair procedures, cleanliness is extremely important. All parts must be thoroughly cleaned and any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



NOTE: Assembly of the engine requires various inspections/measurements of the engine components (engine block, crankshaft, connecting rods, pistons and piston rings). These inspections/measurements will aid in determining if the engine components will require replacement. For additional information, refer to Section 303-00 .

All engines

1. **NOTE:** This procedure is for selecting bearings using a new crankshaft.

   Select the crankshaft main bearings for each crankshaft journal.

   - Read the code on the crankshaft flange.
   - Read the code on the cylinder block face.
     - The first letter after the first asterisk makes up the code for main No. 1 and the next letter for main No. 2. The first letter after the second asterisk makes up the code for main No. 3 and the last letter for main No. 4.

2. **NOTE:** This chart is for selecting main bearings 1 and 4 only, the remaining bearings will be selected using a different chart in the next step.

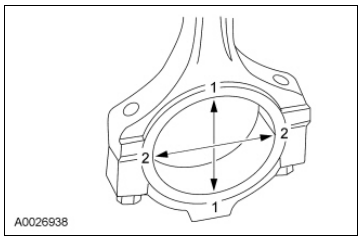
   Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 1 and 4.

   - Read the first letter of the engine block main bearing code and the first letter of the crankshaft main bearing code.
   - Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade(s) for the No. 1 crankshaft main bearing.
   - As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is a "1" for the upper bearing and a "2" for the lower bearing.
   - Repeat the above steps using the fourth letter of the block and crankshaft codes to select the No. 4 bearing.

3. **NOTE:** This chart is for selecting main bearings 2 and 3 only.

   Using the data recorded earlier and the Bearing Select Fit Chart, Standard Bearings, determine the required bearing grade for main bearings 2 and 3.

   - Read the second letter of the engine block main bearing code and the second letter of the crankshaft main bearing code.
   - Read down the column below the engine block main bearing code letter and across the row next to the crankshaft main bearing code letter, until the 2 intersect. This is the required bearing grade for the No. 2 crankshaft main bearing.
   - As an example, if the engine block code letter is "F" and the crankshaft code letter is "P", the correct bearing grade for this main bearing is "1".
   - Repeat the above steps using the third letter of the block and crankshaft codes to select the No. 3.

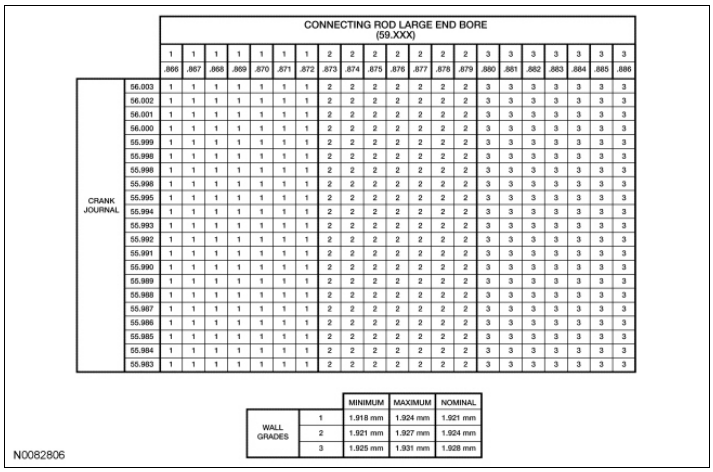


4. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

   Using the original connecting rod cap bolts, install the connecting rod caps and bolts.

   - Tighten the bolts in 3 stages.
   - Stage 1: Tighten to 23 Nm (17 lb-ft).
   - Stage 2: Tighten to 43 Nm (32 lb-ft).
   - Stage 3: Tighten an additional 90 degrees.

5. Measure the connecting rod large end bore in 2 directions.



- Remove the bolts and the rod cap.
  - ♦ Discard the connecting rod cap bolts.

6. Measure each of the crankshaft connecting rod bearing journal diameters in at least 2 directions.

7. Using the chart, select the correct connecting rod bearings for each crankshaft connecting rod journal.

	CONNECTING ROD LARGE END BORE (59.XXX)																			
	1	1	1	1	1	1	1	2	2	2	2	2	2	2	3	3	3	3	3	3	3

55.983	1	1	1	1	1	1	1	2	2	2	2	2	2	2	3	3	3	3	3	3	3

		MINIMUM	MAXIMUM	NOMINAL
WALL GRADES	1	1.918 mm	1.924 mm	1.921 mm
	2	1.921 mm	1.927 mm	1.924 mm
	3	1.925 mm	1.931 mm	1.928 mm

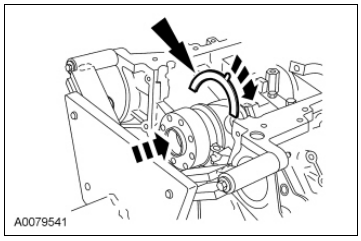
8. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

   Lubricate the upper crankshaft main bearings with clean engine oil and install the 4 crankshaft main bearings in the cylinder block.

9. **NOTE:** Do not install the upper thrust bearings until the crankshaft is installed.

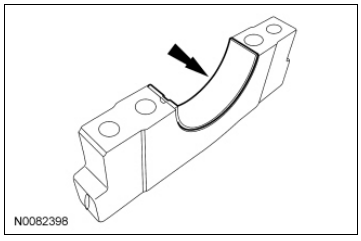
   NOTE: Lubricate the thrust surfaces of the crankshaft with clean engine oil.

   Install the crankshaft onto the upper main bearings.



10. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

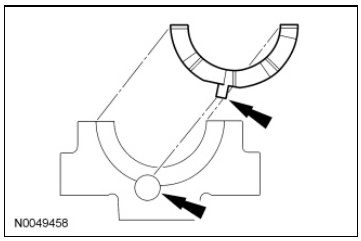
    Push the crankshaft rearward and install the rear crankshaft upper thrust washer at the back of the No. 4 rear bulkhead.



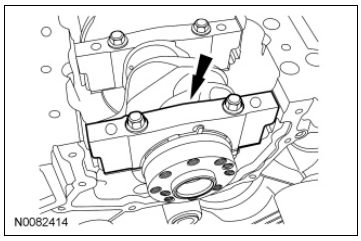
11. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

    Push the crankshaft forward and install the front crankshaft upper thrust washer at the front of the No. 4 rear bulkhead.

12. Lubricate the crankshaft lower main bearings with clean engine oil and install them into the main bearing caps. Visually check seating and squareness of the bearings to make sure of proper seating in caps.



13. Position the No. 1, No. 2 and No. 3 main bearing caps on the cylinder block and, keeping the caps as square as possible, alternately draw the caps down evenly using the new bolts until the main bearing caps are seated.

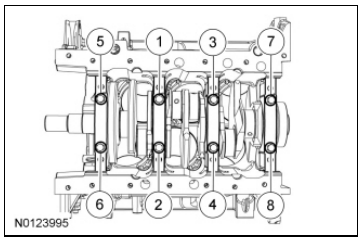


14. **NOTE:** Make sure the side of the thrust washer, with the wide oil grooves, faces the crankshaft thrust surface.

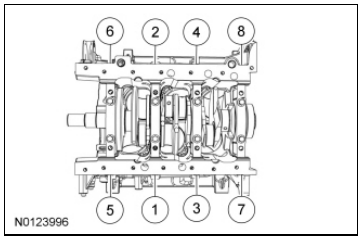
    NOTE: To aid in assembly, apply petroleum jelly to the back of the crankshaft thrust washer.

    Install the lower crankshaft thrust washer to the back side of the No. 4 rear main bearing cap, with the tab aligned with the cutout in the main bearing cap.

15. Position main bearing cap No. 4 on the cylinder block and keeping the cap as square as possible, alternately draw the cap down evenly using the new bolts until the main bearing cap is seated.



16. Loosen the No. 4 main bearing cap bolts.

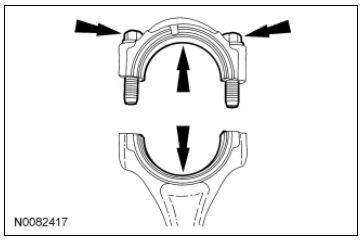


17. **NOTE:** While tightening the main bearing vertical bolts, push the crankshaft forward and the No. 4 main bearing cap rearward to seat the crankshaft thrust washers.

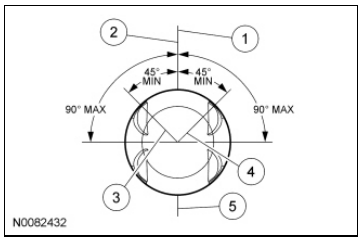
    Tighten the main bearing bolts in the sequence shown in 2 stages.

    - Stage 1: Tighten fasteners 1 through 8 to 33 Nm (24 lb-ft).
    - Stage 2: Tighten fasteners 1 through 8 an additional 135 degrees.

18. Install the new 8 main bearing cap side bolts. Tighten in the sequence shown in 2 stages.
    - Stage 1: Tighten fasteners 1 through 8 to 45 Nm (33 lb-ft).
    - Stage 2: Tighten fasteners 1 through 8 an additional 90 degrees.



19. Using the Dial Indicator Gauge with Holding Fixture, measure crankshaft end play.
    - Position the crankshaft to the rear of the cylinder block.
    - Zero the Dial Indicator Gauge.
    - Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.



20. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

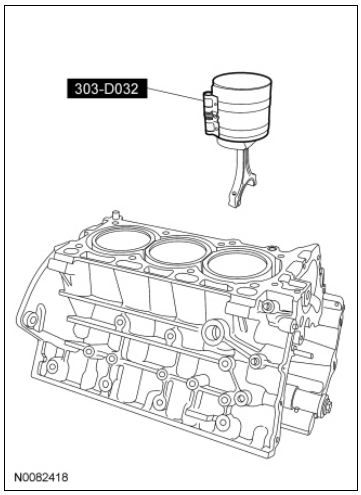
    Prepare the connecting rod and cap.

    - Insert the new bolts in the rod cap.
    - Insert the upper and lower rod bearings into the rod and cap.

21. Before installing the pistons into the cylinder block, verify proper ring gap location.
    1. Center line of the piston parallel to the wrist pin bore
    2. Upper compression ring gap location
    3. Upper oil control segment ring gap location
    4. Lower oil control segment ring gap location
    5. Expander ring and lower compression ring gap location

22. ***NOTICE:*** **Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.**

NOTE: The next 3 steps are for all 6 connecting rods, rod caps and pistons. Only 1 connecting rod, rod cap and piston is shown.



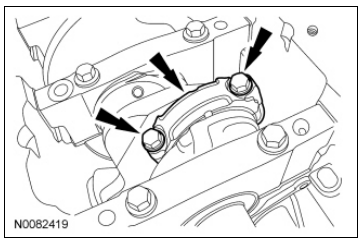
NOTE: Lubricate the pistons, piston rings, connecting rod bearings and the entire cylinder bores with clean engine oil.

NOTE: Make sure the piston rings are positioned to specifications for installation. For additional information, refer to Disassembly and Assembly of Subassemblies - Piston in this section.

NOTE: If the piston and or connecting rod are being installed new, the piston rod orientation marks and the arrow on the top of the dome of the piston should be facing toward the front of the engine block.

NOTE: If the piston and connecting rod are to be reinstalled, they must be installed in the same orientation as disassembled.

Using the Piston Ring Compressor, install the piston and connecting rod assemblies.



23. Seat the connecting rod on the crankshaft journal.

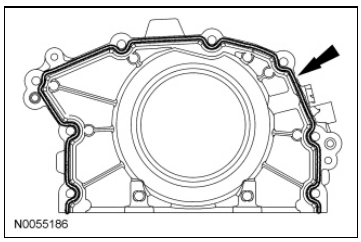
24. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

    NOTE: After installation of each piston, connecting rod, rod cap and bolts, rotate the crankshaft to verify smooth operation.

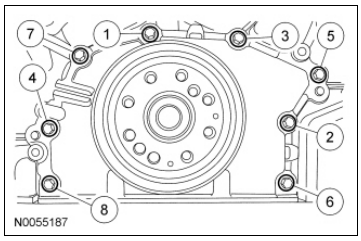
    Install the connecting rod cap and bolts.

    - Tighten the bolts in 3 stages.
    - Stage 1: Tighten to 23 Nm (17 lb-ft).
    - Stage 2: Tighten to 43 Nm (32 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.

25. Repeat the previous 3 steps until all 6 piston, connecting rod and connecting rod cap assemblies are installed.



26. Install the main bearing cap support brace and the new bolts. Tighten in the sequence shown in 2 steps.
    - Stage 1: Tighten fasteners to 24 Nm (18 lb-ft).
    - Stage 2: Tighten fasteners an additional 180 degrees.

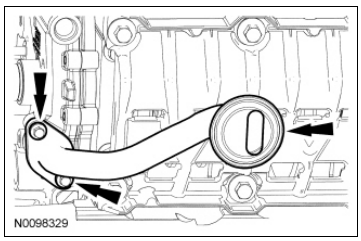


27. ***NOTICE:*** **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: The crankshaft rear seal retainer must be installed and the bolts tightened within 4 minutes of sealant application.

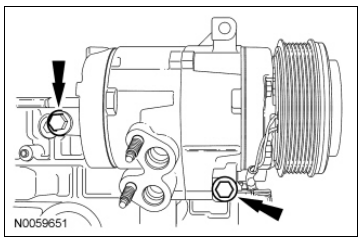
    Apply a 3 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the sealing surface of the crankshaft rear seal retainer.

28. Install the rear seal retainer and the 8 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).



29. Install the oil pump and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

30. Using a new O-ring seal, install the oil pump screen and pickup tube and the 2 bolts.

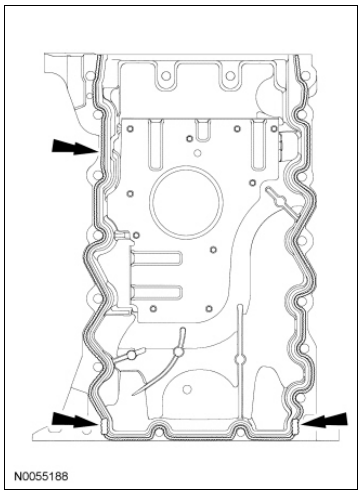


- Tighten to 10 Nm (89 lb-in).

31. **NOTE:** The A/C compressor must be installed on the cylinder block and the 2 bolts tightened prior to installing the oil pan.

    Install the A/C compressor and the 2 bolts.

    - Tighten to 25 Nm (18 lb-ft).

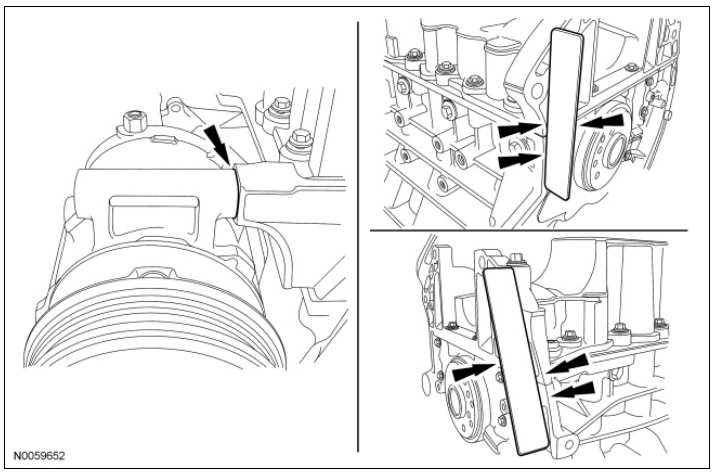


32. ***NOTICE:*** **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: The oil pan and the 4 specified bolts must be installed and the oil pan aligned to the cylinder block and A/C compressor within 4 minutes of sealant application. Final tightening of the oil pan bolts must be carried out within 60 minutes of sealant application.

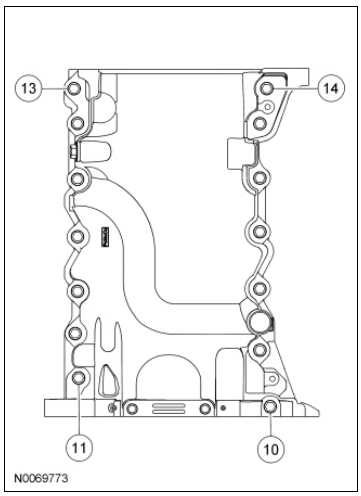
    Apply a 3 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the sealing surface of the oil pan.

    - Apply a 5.5 mm (0.21 in) bead of Motorcraft High Performance Engine RTV Silicone to the 2 crankshaft seal retainer plate-to-cylinder block joint areas on the sealing surface of the oil pan.

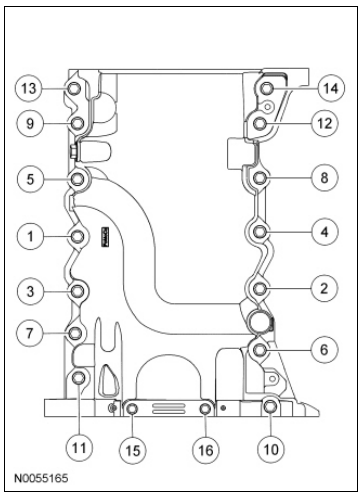


33. **NOTE:** The oil pan and the 4 specified bolts must be installed within 4 minutes of the start of sealant application.

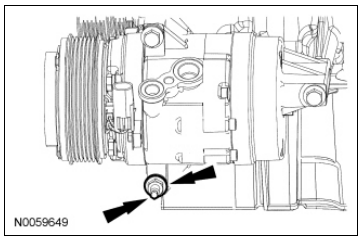
Install the oil pan and bolts 10, 11, 13 and 14.



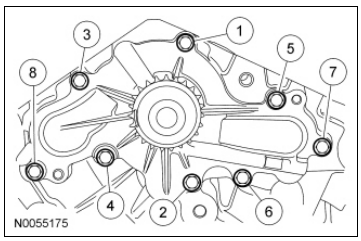
- Tighten the bolts in the sequence shown to 3 Nm (27 lb-in).
- Loosen the bolts 180 degrees.



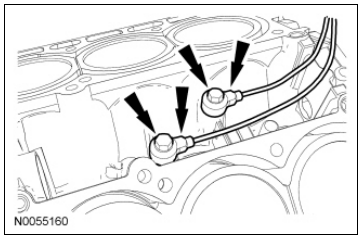
34. Align the oil pan to the cylinder block and A/C compressor.
    - Position the oil pan so the mounting boss is against the A/C compressor and using a straightedge, align the oil pan flush with the rear of the cylinder block at the 2 areas shown.



35. Tighten bolts 10, 11, 13 and 14 in the sequence shown, to 3 Nm (27 lb-in).

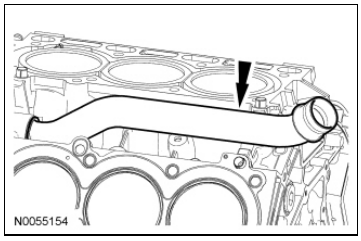


36. Install the remaining oil pan bolts. Tighten all the oil pan bolts in the sequence shown.
    - Tighten the large bolts (1-14) to 24 Nm (18 lb-ft).
    - Tighten the small bolts (15 and 16) to 10 Nm (89 lb-in).

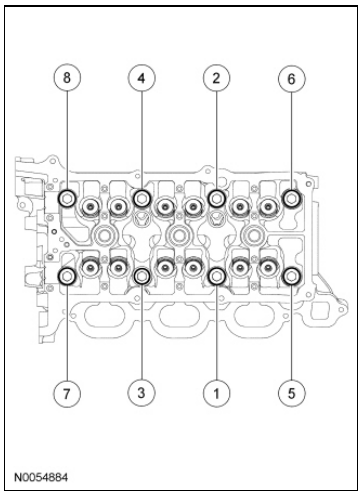


37. Install the A/C compressor mounting stud and nut.
    - Tighten the stud to 9 Nm (80 lb-in) and the nut to 25 Nm (18 lb-ft).

38. Install the coolant pump and the 8 bolts. Tighten in the sequence shown in 2 stages:
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten an additional 45 degrees.

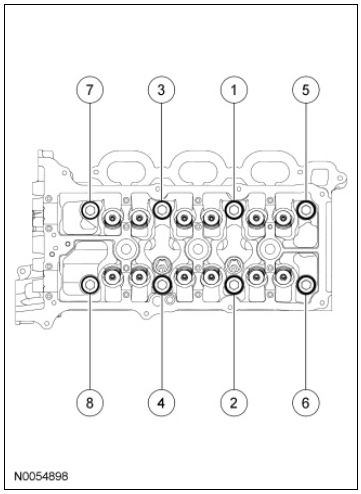


39. Install the Knock Sensor (KS) and the 2 bolts.
    - Tighten to 20 Nm (177 lb-in).

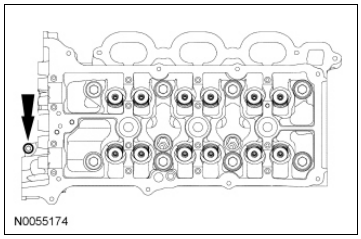


40. **NOTE:** Apply clean engine coolant to the O-ring seals prior to installation.

    Using new O-ring seals, install the coolant inlet tube.

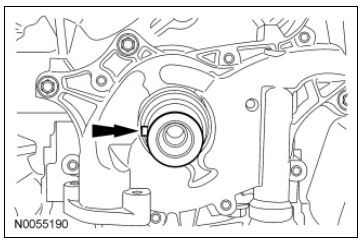


41. Install a new gasket, the RH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 45 degrees.



42. Install the new M6 bolt.
    - Tighten to 10 Nm (89 lb-in).

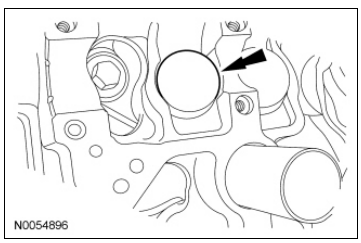
43. Install a new gasket, the LH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 45 degrees.



44. Install the new M6 bolt.
    - Tighten to 10 Nm (89 lb-in).

45. ***NOTICE:*** **The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

    Position the crankshaft dowel pin in the 9 o'clock position.



46. **NOTE:** The valve tappets must be installed in their original positions.

    NOTE: Coat the valve tappets with clean engine oil prior to installation.

    NOTE: LH shown, RH similar.

    Install the valve tappets.

47. ***NOTICE:*** **The camshafts must remain in the neutral position during installation or engine damage may occur.**

    NOTE: Coat the camshafts with clean engine oil prior to installation.

    Position the camshafts onto the RH cylinder head in the neutral position as shown.

48. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    Install the 8 camshaft caps and the 16 bolts. Tighten the bolts in the sequence shown in the following stages:

    - Stage 1: Tighten bolts 1, 2, 3 and 4 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 2: Tighten bolts 5 and 6 to 8 Nm (71 lb-in).
    - Stage 3: Tighten bolts 7 and 8 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 4: Loosen bolts 5 and 6.
        - ♦ Tighten bolts 5 and 6 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 5: Tighten bolts 9, 10, 11 and 12 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 6: Tighten bolts 13 and 14 to 8 Nm (71 lb-in).
    - Stage 7: Tighten bolts 15 and 16 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 8: Loosen bolts 13 and 14.
        - ♦ Tighten bolts 13 and 14 to 8 Nm (71 lb-in) then an additional 45 degrees.

49. ***NOTICE:*** **The camshafts must remain in the neutral position during installation or engine damage may occur.**

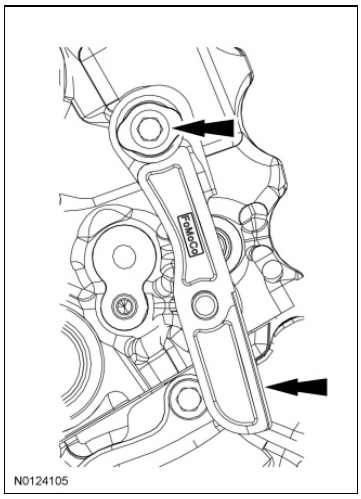
    NOTE: Coat the camshafts with clean engine oil prior to installation.

    Position the camshafts onto the LH cylinder head in the neutral position as shown.

50. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

    Install the 8 camshaft caps and the 16 bolts. Tighten the bolts in the sequence shown in the following stages:

    - Stage 1: Tighten bolts 1, 2, 3 and 4 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 2: Tighten bolts 5 and 6 to 8 Nm (71 lb-in).
    - Stage 3: Tighten bolts 7 and 8 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 4: Loosen bolts 5 and 6.
        - ♦ Tighten bolts 5 and 6 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 5: Tighten bolts 9, 10, 11 and 12 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 6: Tighten bolts 13 and 14 to 8 Nm (71 lb-in).
    - Stage 7: Tighten bolts 15 and 16 to 8 Nm (71 lb-in) then an additional 45 degrees.
    - Stage 8: Loosen bolts 13 and 14.
        - ♦ Tighten bolts 13 and 14 to 8 Nm (71 lb-in) then an additional 45 degrees.

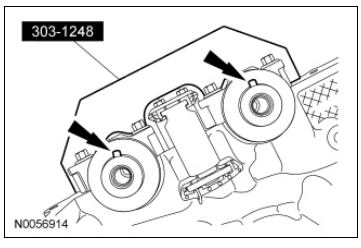


51. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage may occur.**

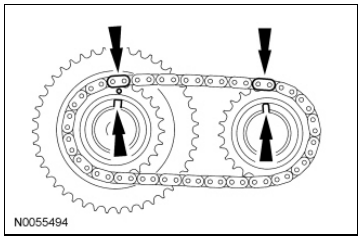
    NOTE: Use a camshaft sprocket bolt to turn the camshafts.

    Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet(s) of the correct size. For additional information, refer to Valve Clearance Check in this section.

52. Install the RH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).

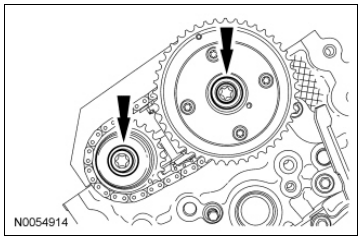


53. Install the RH secondary timing chain tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

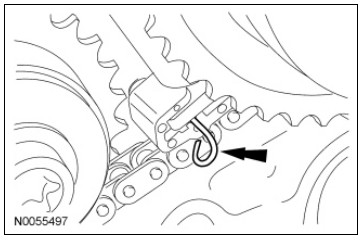


54. **NOTE:** Use a camshaft sprocket bolt to turn the camshafts.

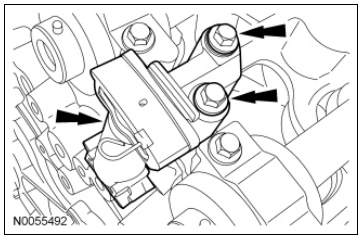
    Rotate the RH camshafts to the Top Dead Center (TDC) position and install the Camshaft Holding Tool on the flats of the camshafts.



55. Assemble the RH Variable Camshaft Timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.

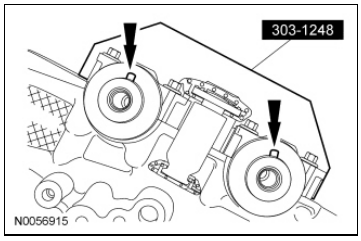


56. Position the RH secondary timing assembly onto the camshafts.

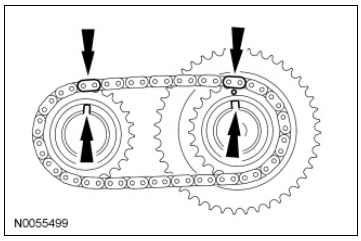


57. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.

58. Remove the lockpin from the RH secondary timing chain tensioner.

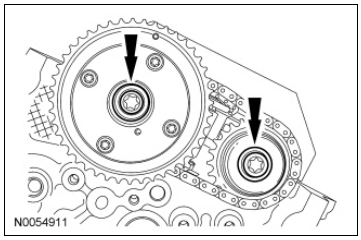


59. Install the LH secondary timing chain tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

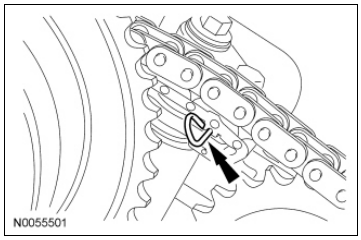


60. **NOTE:** Use a camshaft sprocket bolt to turn the camshafts.

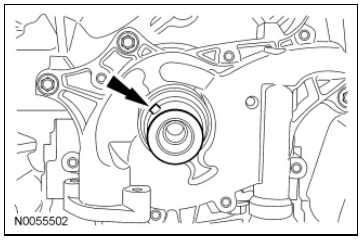
    Rotate the LH camshafts to the Top Dead Center (TDC) position and install the Camshaft Holding Tool on the flats of the camshafts.



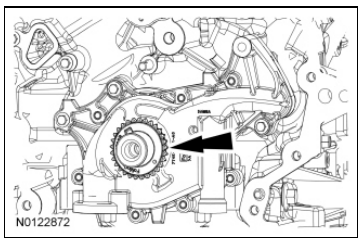
61. Assemble the LH VCT assembly, the LH exhaust camshaft sprocket and the LH secondary timing chain.
    - Align the colored links with the timing marks.



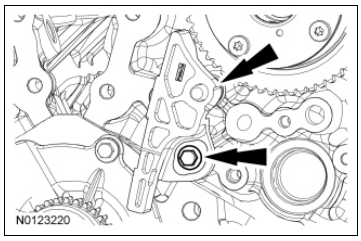
62. Position the LH secondary timing assembly onto the camshafts.



63. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.

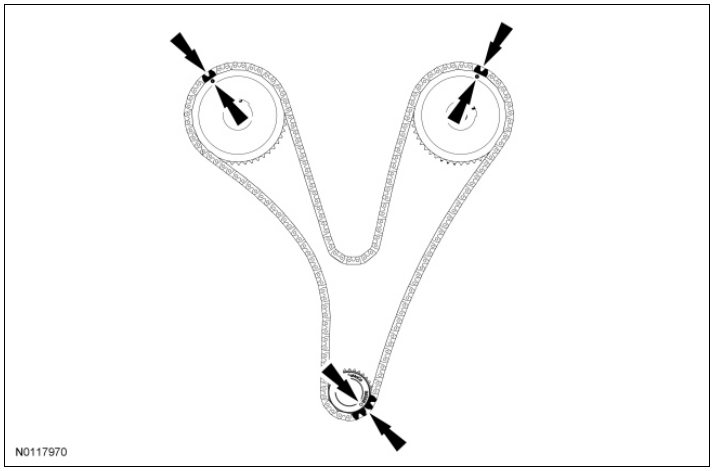


64. Remove the lockpin from the LH secondary timing chain tensioner.

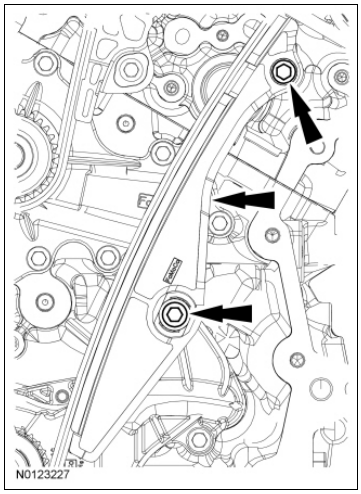


65. Rotate the crankshaft clockwise 60 degrees to the TDC position (crankshaft dowel pin at 11 o'clock).

66. Install the crankshaft timing chain sprocket.

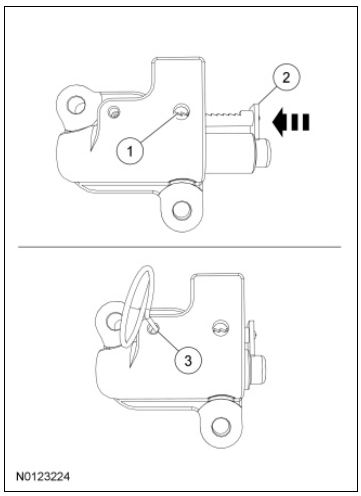


67. Install the upper LH primary timing chain guide and the bolt.
    - Tighten to 10 Nm (89 lb-in).



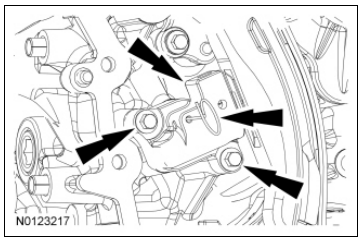
68. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

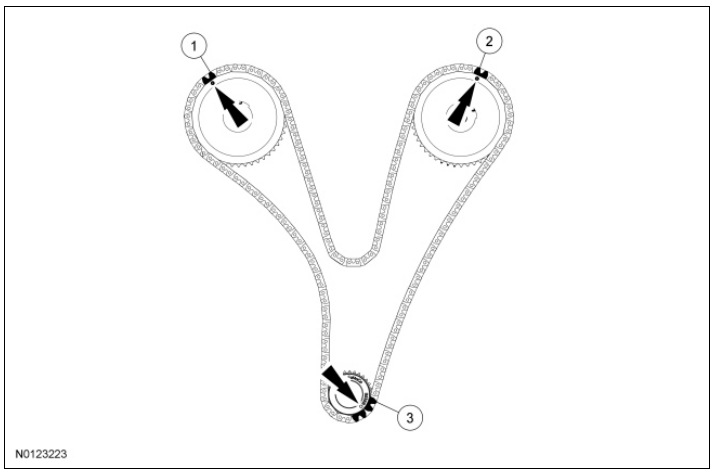


69. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

70. Install the primary timing chain tensioner arm.

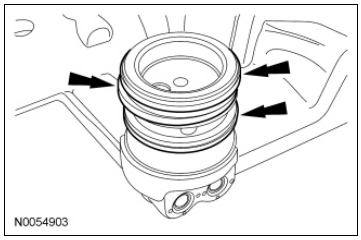


71. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and install a suitable lockpin.



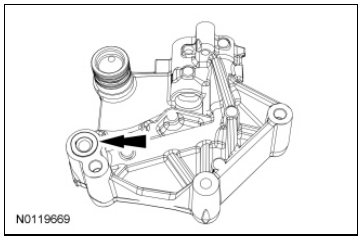
72. **NOTE:** It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

Install the primary tensioner and the 2 bolts.



- Tighten to 10 Nm (89 lb-in).
- Remove the lockpin.

73. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links between the LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket colored links (3).



74. Inspect the VCT housing seals for damage and replace as necessary.

75. **NOTE:** RH shown, LH similar.

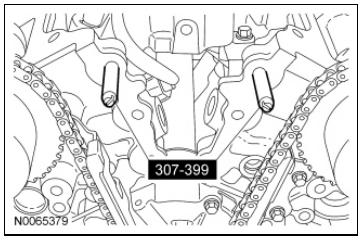
    NOTE: During removal, the O-ring seal may remain on the cylinder head. If so, remove the O-ring seal from the cylinder head, inspect the seal (replace as necessary) and install the O-ring seal on the VCT housing.

    Inspect the VCT housing-to-cylinder head O-ring seals for damage and replace as necessary.

76. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the LH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

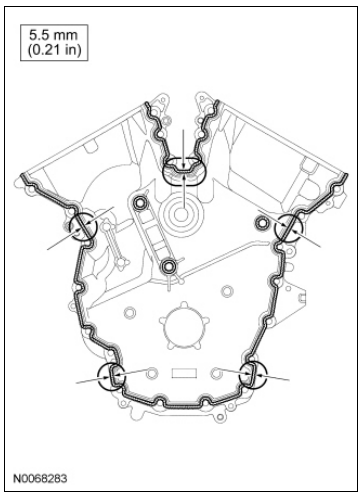


77. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the RH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

78. Install the Alignment Pins.

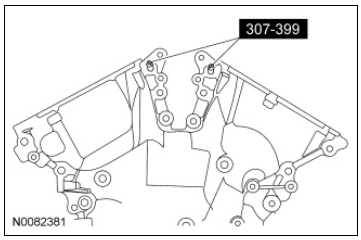


79. ***NOTICE:*** **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: The engine front cover and bolts 17, 18, 19 and 20 must be installed within 4 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

    Apply a 3.0 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover sealing surfaces including the 3 engine mount bracket bosses.

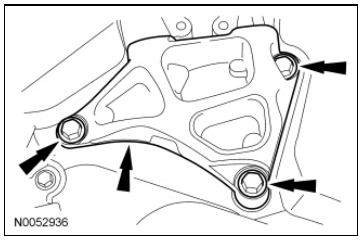
    - Apply a 5.5 mm (0.21 in) bead of Motorcraft High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.



80. **NOTE:** Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

    Install the engine front cover and bolts 17, 18, 19 and 20.

    - Tighten in sequence to 3 Nm (27 lb-in).



81. Remove the Alignment Pins.

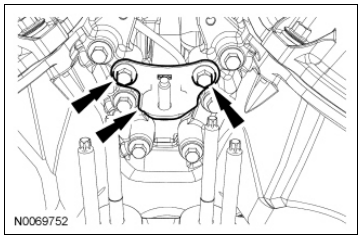
82. **NOTE:** Do not tighten the bolts at this time.

    Install the engine mount bracket and the 3 bolts.

83. ***NOTICE:*** **Do not expose the Motorcraft High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow this instruction may cause oil leakage.**

    Install the remaining engine front cover bolts. Tighten all of the engine front cover bolts and engine mount bracket bolts in the sequence shown in 2 stages:

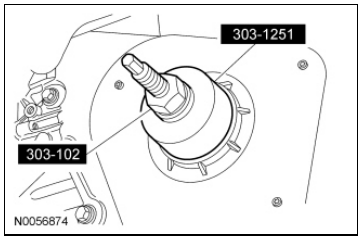
    - Stage 1: Tighten bolts 1 thru 22 to 10 Nm (89 lb-in) and bolts 23, 24 and 25 to 15 Nm (133 lb-in).
    - Stage 2: Tighten bolts 1 thru 22 to 24 Nm (18 lb-ft) and bolts 23, 24 and 25 to 75 Nm (55 lb-ft).



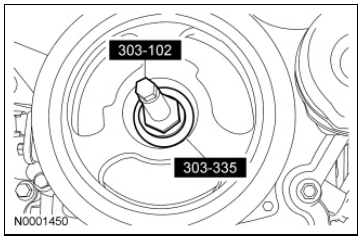
84. ***NOTICE:*** **The thread sealer on the engine mount studs (including new engine mount studs if applicable) must be cleaned off with a wire brush and new Threadlock and Sealer applied prior to installing the engine mount studs. Failure to follow this procedure may result in damage to the engine mount studs or engine.**

    Install the engine mount studs in the following sequence.

    1. Clean the front cover engine mount stud holes with pressurized air to remove any foreign material.
    2. Clean all the thread sealer from the engine mount studs (old and new studs).
    3. Apply new Threadlock and Sealer to the engine mount stud threads.
    4. Install the 2 engine mount studs.
        - Tighten to 20 Nm (177 lb-in).

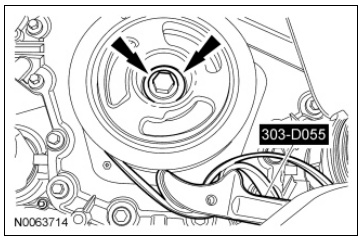


85. Install the engine mount bracket and the 2 bolts.
    - Tighten to 24 Nm (18 lb-ft).



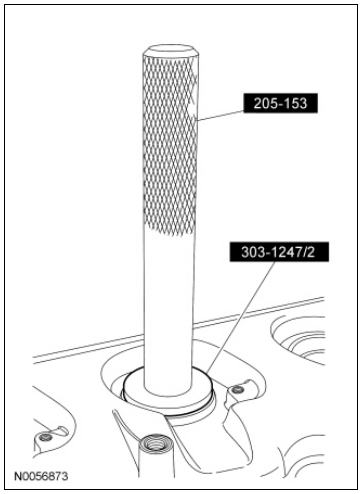
86. **NOTE:** Apply clean engine oil to the crankshaft front seal bore in the engine front cover.

    Using the Front Crankshaft Seal Installer and Crankshaft Vibration Damper Installer, install a new crankshaft front seal.



87. **NOTE:** Lubricate the outside diameter sealing surfaces with clean engine oil.

    Using the Front Cover Oil Seal Installer and Crankshaft Vibration Damper Installer, install the crankshaft pulley.

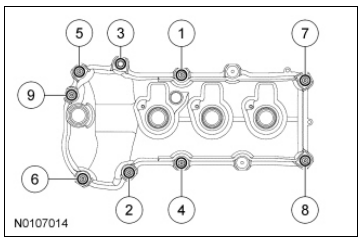


88. Using the Strap Wrench, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 (lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

89. **NOTE:** Installation of new seals is only required if damaged seals were removed during disassembly of the engine.

    NOTE: Spark plug tube seal installation shown, VCT solenoid seal installation similar.

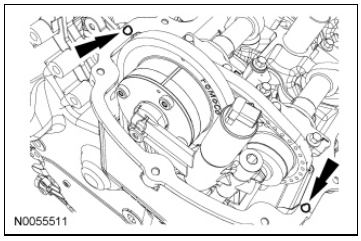
    Using the VCT Spark Plug Tube Seal Installer and Handle, install new VCT solenoid and/or spark plug tube seals.



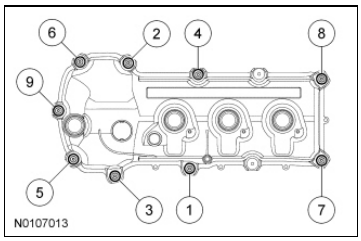
90. ***NOTICE:*** **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

    Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.



91. Using a new gasket, install the RH valve cover and tighten the bolt and 8 stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

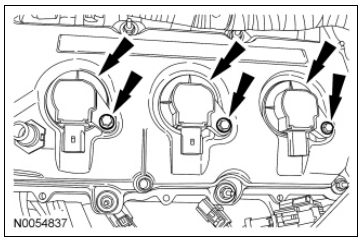


92. ***NOTICE:*** **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

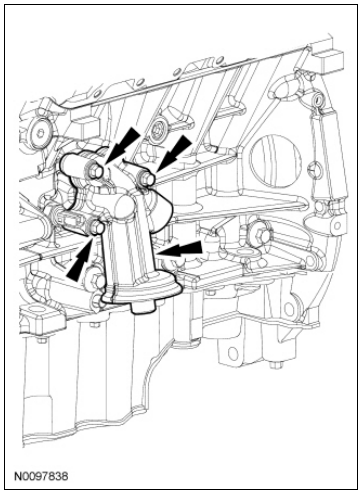
    NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

    Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

93. Using a new gasket, install the LH valve cover and tighten the 9 stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).



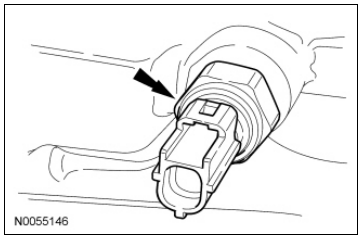
94. Install the wiring harness retaining bracket and the 2 nuts.
    - Tighten to 4 Nm (35 lb-in).



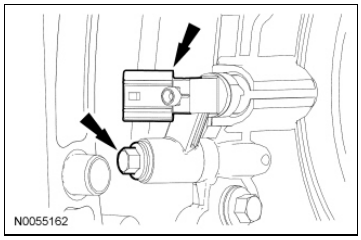
95. **NOTE:** LH shown, RH similar.

    Install the 6 coil-on-plug assemblies and the 6 bolts.

    - Tighten to 7 Nm (62 lb-in).



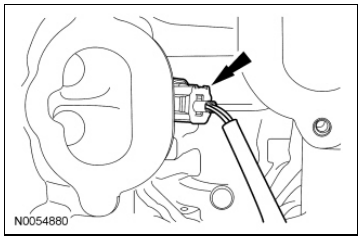
96. Using a new gasket, install the oil filter adapter and 3 bolts.
    - Tighten to 10 Nm (89 lb-in) plus an additional 45 degrees.



97. **NOTE:** Apply thread sealant with PTFE to the Engine Oil Pressure (EOP) switch threads.

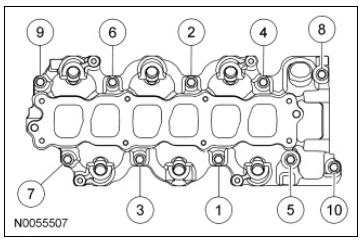
    Install the EOP switch.

    - Tighten to 14 Nm (124 lb-in) plus an additional 180 degrees.

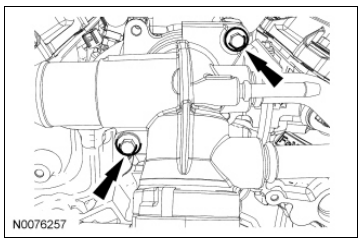


98. Install the Crankshaft Position (CKP) sensor and install the bolt.
    - Tighten to 10 Nm (89 lb-in).

99. Install LH Camshaft Position (CMP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



100. Install and connect the Cylinder Head Temperature (CHT) sensor jumper harness.

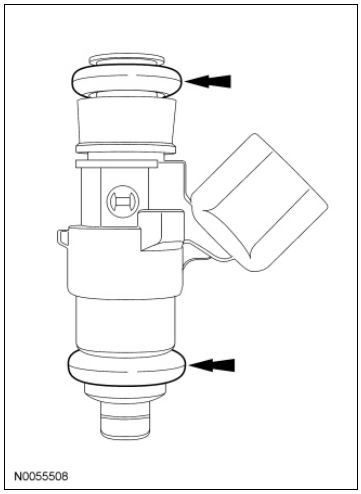


101. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Using new gaskets, install the lower intake manifold and the 10 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

102. Using a new gasket, install the thermostat housing and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

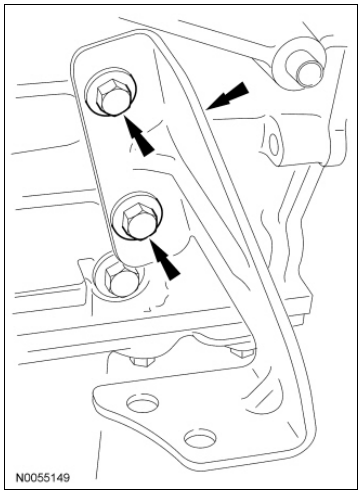


103. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings may cause the fuel system to leak. Do not reuse the O-ring seals.**

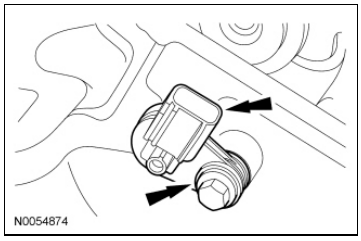
    NOTE: The upper and lower O-ring seals are not interchangeable.

    Install new fuel injector O-ring seals.

    - Remove the retaining clips and separate the fuel injectors from the fuel rail.
    - Remove and discard the O-ring seals.
    - Install new O-ring seals and lubricate with clean engine oil.
    - Install the fuel injectors and the retaining clips onto the fuel rail.

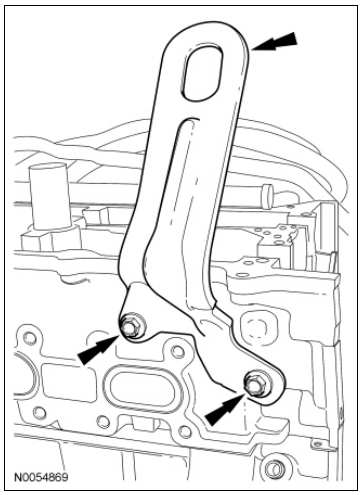


104. Install the fuel rail and injectors as an assembly and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

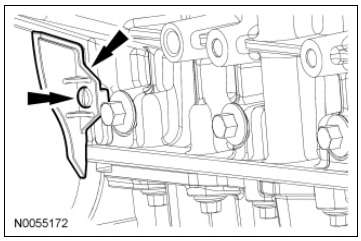


All-Wheel Drive (AWD) vehicles

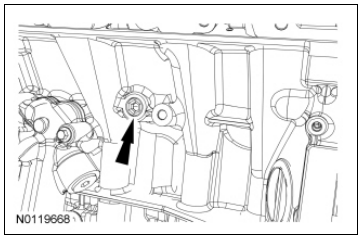
105. Install the catalytic converter bracket and the 2 bolts.
    - Tighten to 40 Nm (30 lb-ft).



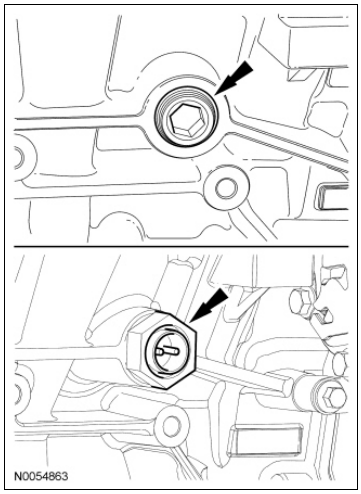
All engines



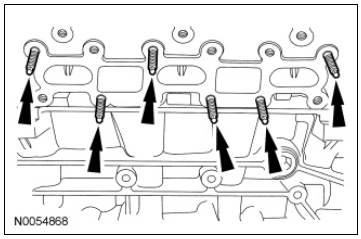
106. Install the RH CMP sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



107. Install the engine lifting eye and the 2 bolts.
    - Tighten to 24 Nm (18 lb-ft).

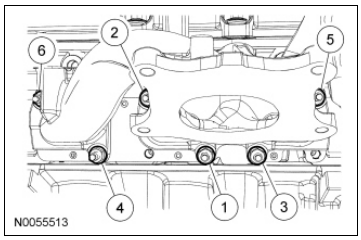


108. Install the cover and the pin-type retainer.



109. Install the LH cylinder block drain plug.
    - Tighten to 16 Nm (142 lb-in) plus an additional 180 degrees.

110. Install the RH cylinder block drain plug or, if equipped, the block heater.
    - Tighten the cylinder block drain plug to 10 Nm (89 lb-in) plus an additional 720 degrees.
    - Tighten the block heater to 40 Nm (30 lb-ft).

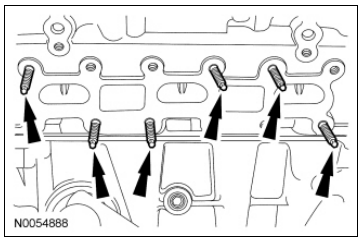


111. Install 6 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).

112. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

    Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:

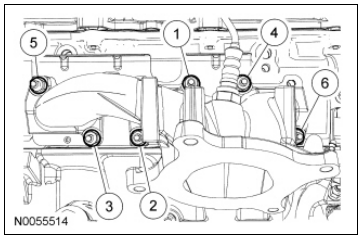
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).



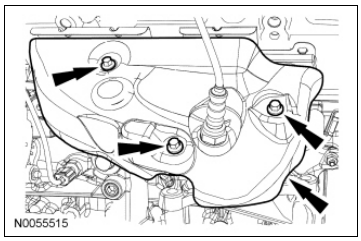
Front Wheel Drive (FWD) vehicles

113. Using a new gasket, install the RH catalytic converter and the 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

All engines



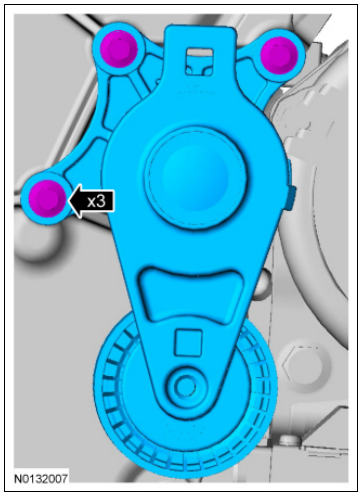
114. Install 6 new LH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).



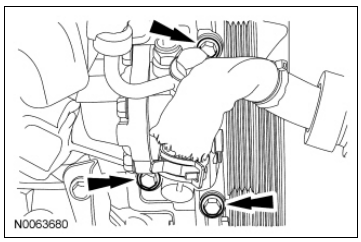
115. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

    Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:

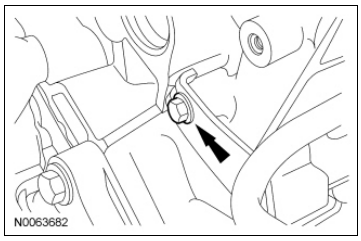
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).



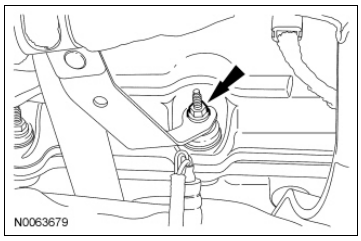
116. Install the LH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



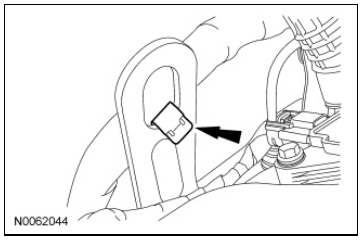
117. Using a new gasket, install the LH catalytic converter and the 4 new nuts (3 shown).
    - Tighten to 40 Nm (30 lb-ft).



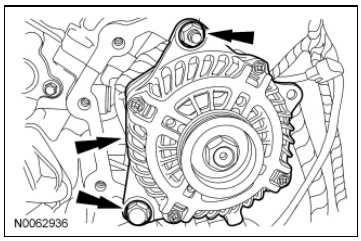
118. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 11 Nm (97 lb-in).



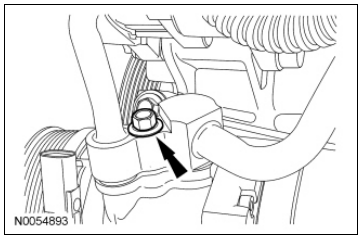
119. Install the power steering pump and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



120. Install the Power Steering Pressure (PSP) tube bracket and bolt to the RH cylinder head.
    - Tighten to 10 Nm (89 lb-in).

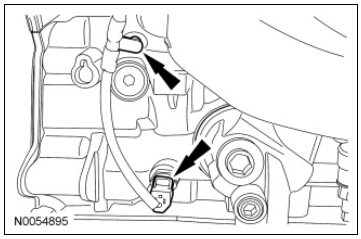


121. Install the PSP hose bracket nut.
    - Tighten to 9 Nm (80 lb-in).

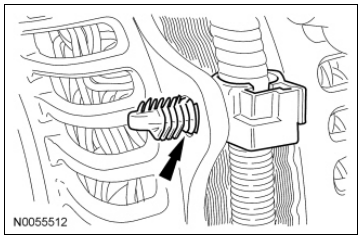


122. Attach the PSP hose retainer to the engine lifting eye.

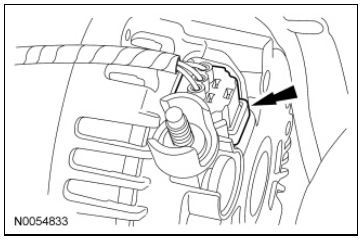
123. Install the generator, the nut and the bolt.
    - Tighten to 48 Nm (35 lb-ft).



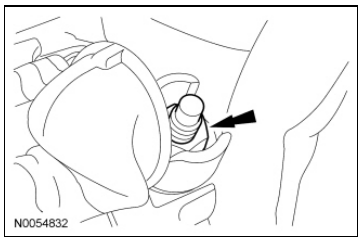
124. Using new O-ring seals, install the A/C manifold and the bolt.
    - Tighten to 25 Nm (18 lb-ft).



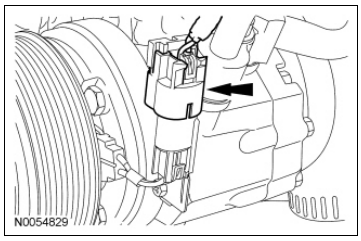
125. Position the wiring harness onto the engine.



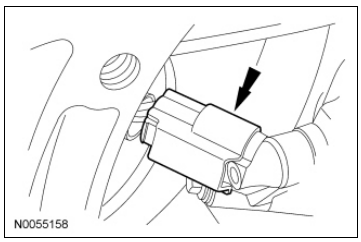
126. Connect the EOP switch electrical connector and the wiring harness pin-type retainer.



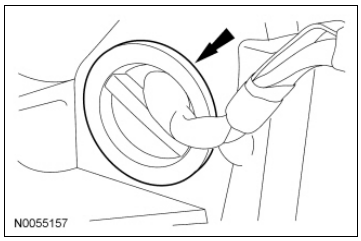
127. Attach the wiring harness retainer to the generator.



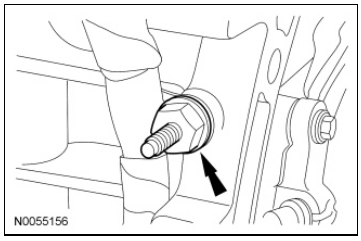
128. Connect the generator electrical connector.



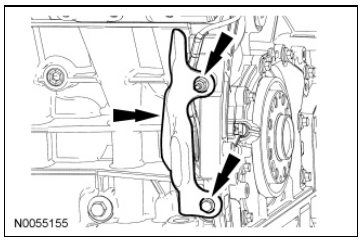
129. Connect the generator B+ cable and install the nut.
    - Tighten to 12 Nm (106 lb-in).



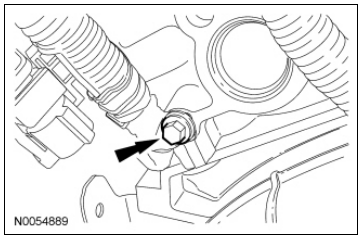
130. Connect the A/C compressor electrical connector.



131. Connect the CKP sensor electrical connector.

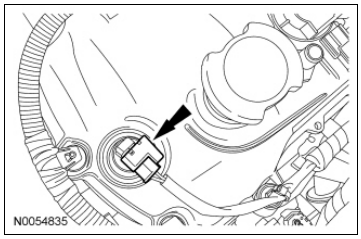


132. Install the wiring harness grommet.

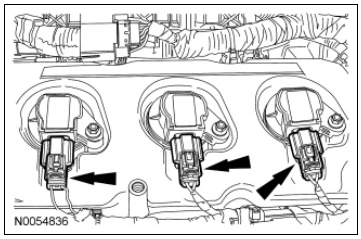


133. Install the wiring harness retainer stud bolt.
    - Tighten to 10 Nm (89 lb-in).

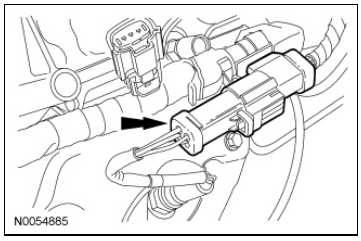
134. Install the heat shield, the nut and the bolt.
    - Tighten to 10 Nm (89 lb-in).



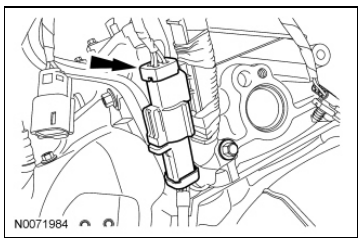
135. Install the wiring harness retainer bolt on the rear of the LH cylinder head.
    - Tighten to 10 Nm (89 lb-in).



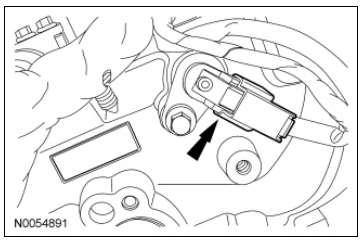
136. Attach all of the wiring harness retainers to the LH valve cover and stud bolts.



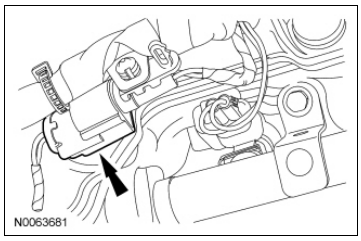
137. Connect the LH camshaft VCT solenoid electrical connector.



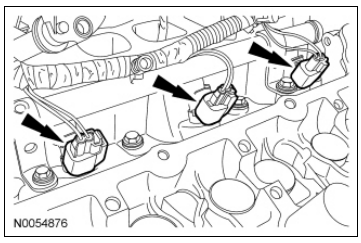
138. Connect the 3 LH coil-on-plug electrical connectors.



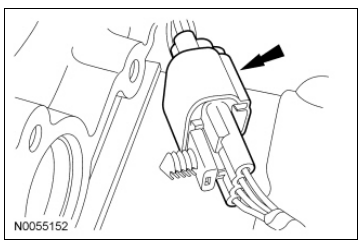
139. Connect the LH HO2S electrical connector.



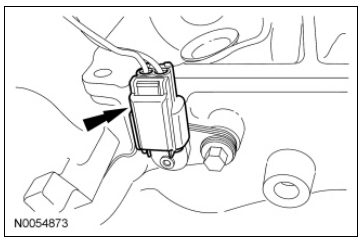
140. Connect the LH Catalyst Monitor Sensor (CMS) electrical connector.



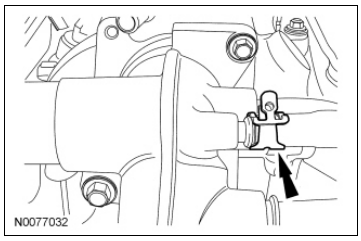
141. Connect the LH CMP sensor electrical connector.



142. Connect the CHT sensor electrical connector.

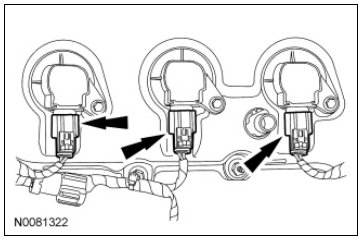


143. Connect the 6 fuel injector electrical connectors (3 shown).

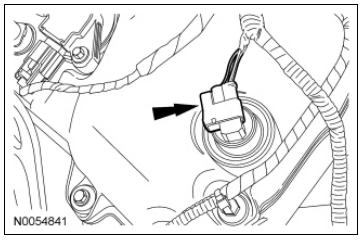


144. Connect the KS electrical connector.

145. Connect the RH CMP sensor electrical connector.

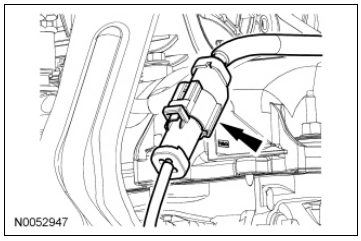


146. Connect the coolant bypass hose to the thermostat housing.

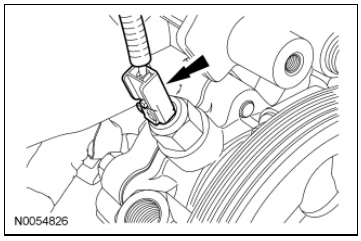


147. Attach all of the wiring harness retainers to the RH valve cover and stud bolts.

148. Connect the 3 RH coil-on-plug electrical connectors.



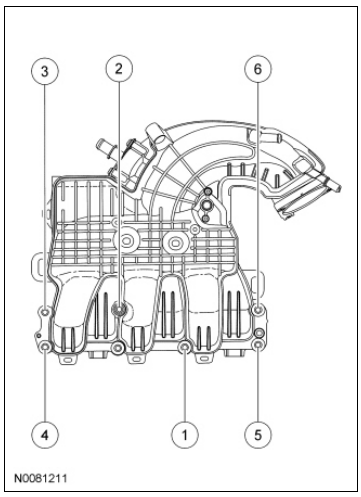
149. Connect the RH VCT solenoid electrical connector.



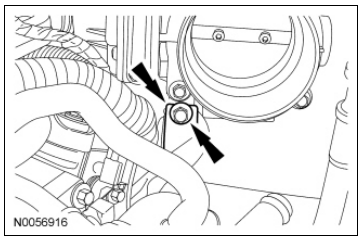
FWD vehicles

150. Connect the RH CMS electrical connector.

All engines



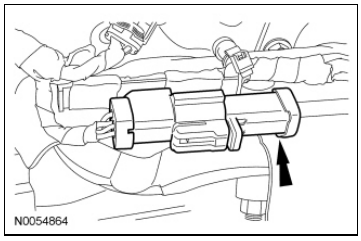
151. Connect the PSP switch electrical connector.



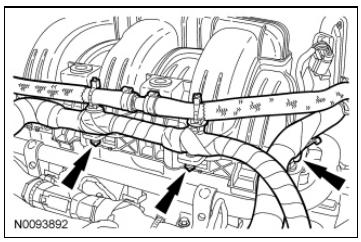
152. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

    Using new gaskets, install the upper intake manifold and the 6 bolts.

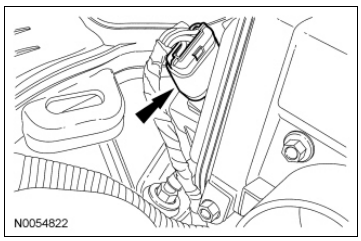
    - Tighten in the sequence shown to 10 Nm (89 lb-in).



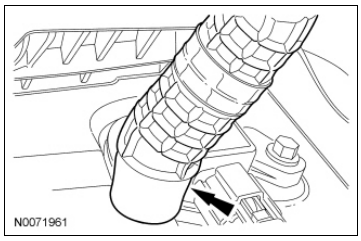
153. Install the upper intake manifold support bracket and the 2 bolts (one shown).
    - Tighten to 10 Nm (89 lb-in).



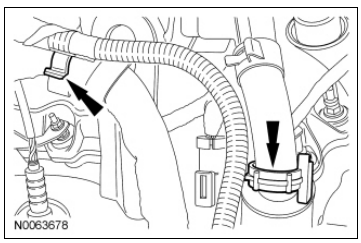
154. Install the RH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



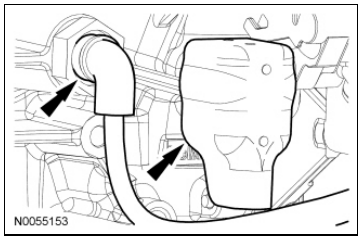
155. Connect the RH HO2S electrical connector.



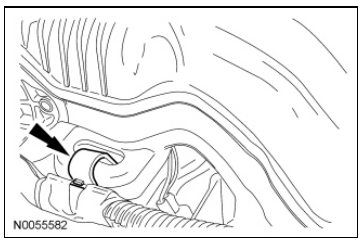
156. Attach the wiring harness retainers to the upper intake manifold.



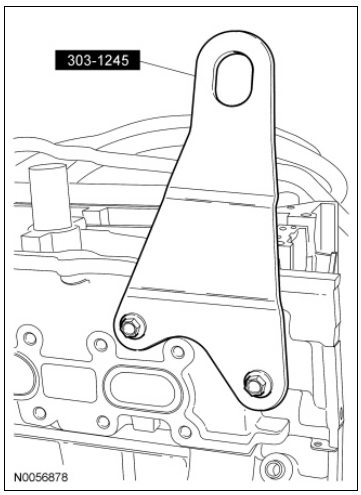
157. Connect the Throttle Body (TB) electrical connector.



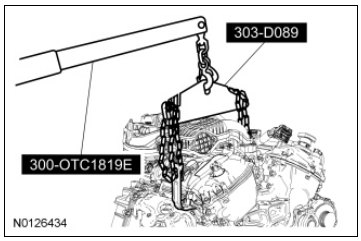
158. Connect the PCV hose to the PCV valve.



159. If equipped, position the block heater wiring harness onto the engine.
    - Attach the block heater wiring harness retainer to the power steering reservoir hose and the PSP hose.

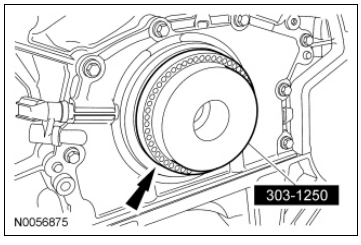


160. If equipped, connect the block heater electrical connector and install the heat shield.

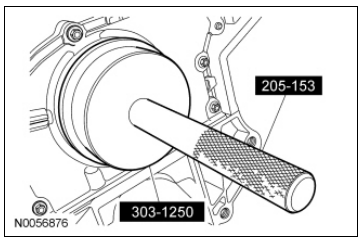


161. If equipped, attach the block heater wiring harness retainer to the upper intake manifold.

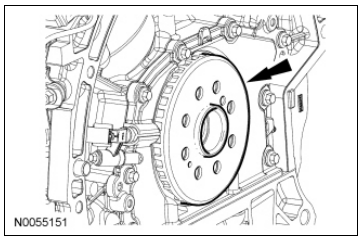
162. Install the Engine Lift Eye on the LH cylinder head.



163. Using the Floor Crane and Spreader Bar, remove the engine from the stand.

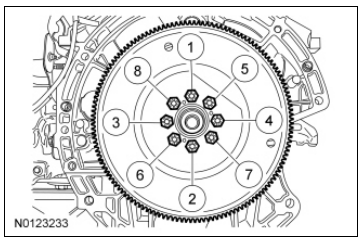


164. **NOTE:** Lubricate the seal lips and bore with clean engine oil prior to installation.



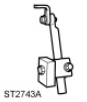
Position the Rear Main Seal Installer onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.

165. Using the Rear Main Seal Installer and Handle, install the new crankshaft rear seal.



166. Install the crankshaft sensor ring.

167. **NOTE:** One of the 8 flexplate holes are offset so the flexplate can only be installed in one position.



Install the flexplate and the 8 bolts.

- Tighten in the sequence shown to 80 Nm (59 lb-ft).

Engine

Special Tool(s)

 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E
 ST2743A	Adjustable Grip Arm, 1735A 014-00001 or equivalent

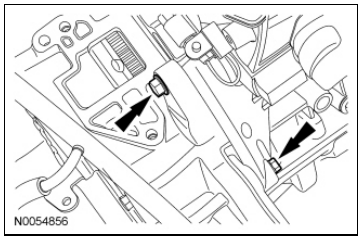
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

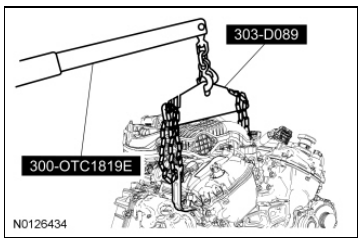
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



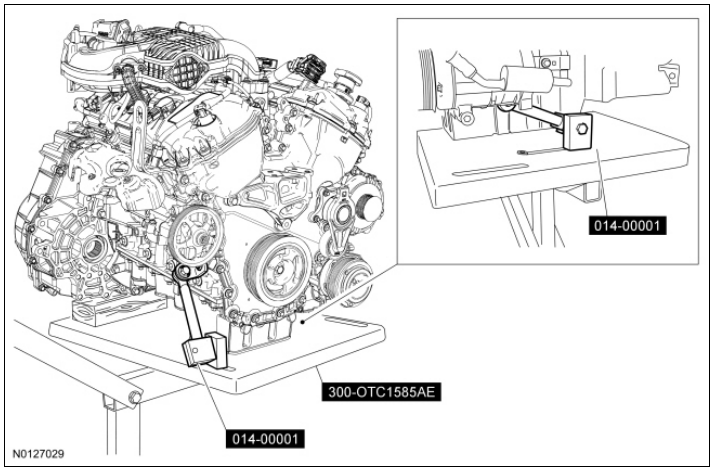
All vehicles

1. Align the transaxle to the engine.

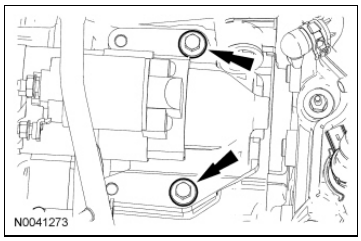


2. Install the 4 transaxle-to-engine bolts and the transaxle-to-engine stud bolt.
   - Tighten to 48 Nm (35 lb-ft).

3. Install the 2 engine-to-transaxle bolts.
   - Tighten to 48 Nm (35 lb-ft).

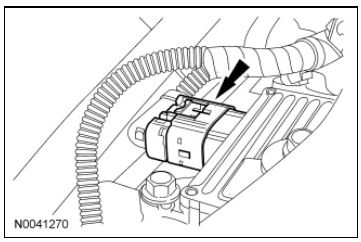


4. Using the Floor Crane and the Spreader Bar, position the engine and transaxle onto the lift table.

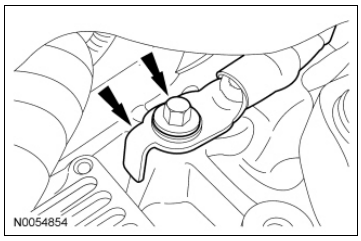


5. **NOTE:** Position a block of wood under the transaxle.

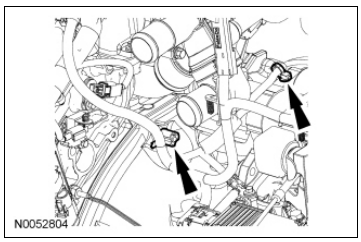
   Install the Powertrain Lift and Adjustable Grip Arms.



6. Install the starter and the 2 bolts.
   - Tighten to 26 Nm (19 lb-ft).

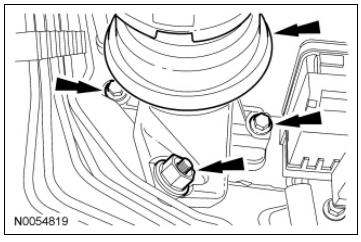


7. Attach the starter wire terminals and install the 2 nuts.
   1. Tighten to 12 Nm (106 lb-in).
   2. Tighten to 5 Nm (44 lb-in).
      - ♦ Position the starter terminal boot over the starter terminal.

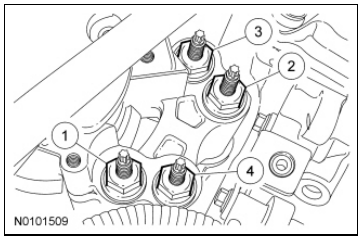


8. Connect the Transmission Control Module (TCM) electrical connector.

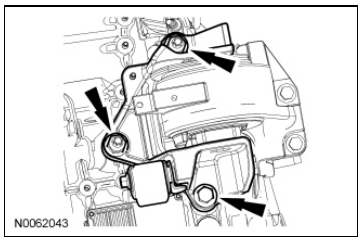
9. Install the ground wire and bolt.
   - Tighten to 12 Nm (106 lb-in).



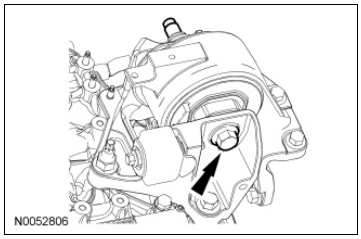
10. Connect the wiring harness fasteners to the transaxle-to-engine stud bolt and the starter.



11. Raise the engine and transaxle assembly into the vehicle.

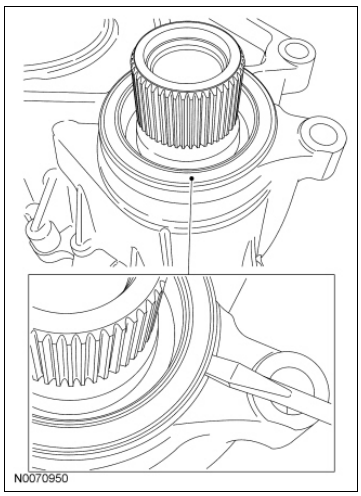


12. Install the engine mount, the nut and the 2 bolts.
    - Tighten the bolts to 55 Nm (41 lb-ft).
    - Tighten the nut to 63 Nm (46 lb-ft).

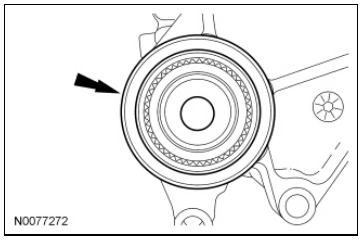


13. Install the 2 engine mount spacers and the 4 engine mount nuts.
    - Tighten in the sequence shown to 70 Nm (52 lb-ft).

14. Install the 2 transaxle support insulator bracket nuts and the bolt.
    - Tighten to 80 Nm (59 lb-ft).



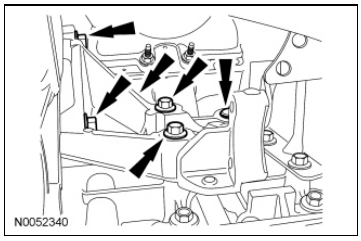
15. Install the transaxle support insulator through bolt and nut.
    - Tighten to 90 Nm (66 lb-ft).



All-Wheel Drive (AWD) vehicles

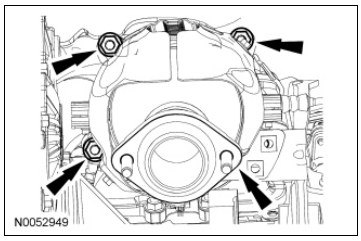
16. **NOTE:** A new compression seal must be installed whenever the Power Transfer Unit (PTU) is moved from the vehicle.

    Using a small screwdriver, remove the compression seal and discard.

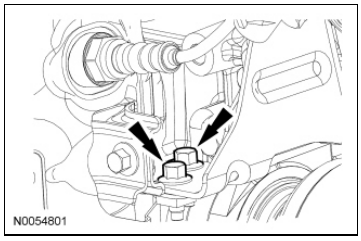


17. Using a soft face hammer, install the new compression seal.

18. Position the PTU in place and install the 5 bolts.
    - Tighten to 90 Nm (66 lb-ft).



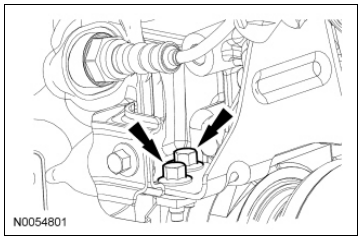
19. Position the PTU support bracket in place and install the 5 bolts.
    - Tighten to 70 Nm (52 lb-ft).



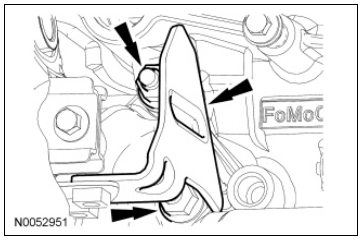
20. **NOTE:** Do not tighten the 4 catalytic converter nuts at this time.

    Using a new gasket, install the RH catalytic converter and 4 new nuts.

21. Install the 2 catalytic converter-to-bracket bolts.
    - Tighten the 4 catalytic converter nuts to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter-to-bracket bolts to 20 Nm (177 lb-in).



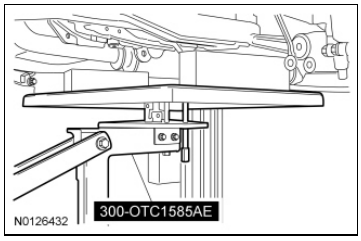
22. Connect the RH Catalyst Monitor Sensor (CMS) electrical connector.



Front Wheel Drive (FWD) vehicles

23. **NOTE:** Do not tighten the 2 catalytic converter support bracket bolts at this time.

    Install the RH catalytic converter support bracket and the 2 bolts.



24. Install the 2 catalytic converter support bracket nuts.
    - Tighten to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter support bracket bolts to 20 Nm (177 lb-in).

All vehicles

25. **NOTE:** Align the index marks on the subframe to the index marks on the underbody that were made during removal.

    Using the Powertrain Lift, raise the subframe into the installed position.

26. **NOTE:** LH shown, RH similar.

    Install the 2 front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

27. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the 4 bolts finger-tight.

28. **NOTE:** LH shown, RH similar.

    Install the 2 rear subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

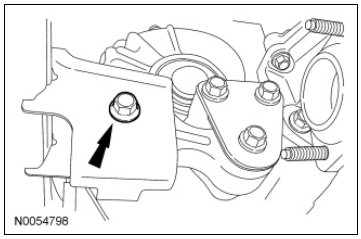
29. **NOTE:** LH shown, RH similar.

    Tighten the 4 subframe bracket-to-body bolts to 103 Nm (76 lb-ft).

30. **NOTE:** LH shown, RH similar.

    Install the stabilizer bar links and nuts to the struts.

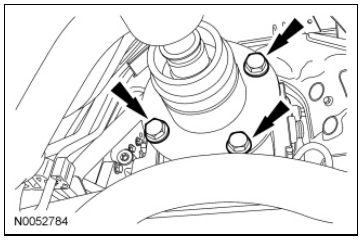
    - Tighten to 40 Nm (30 lb-ft).



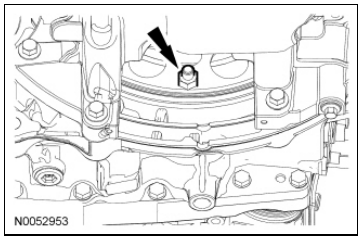
31. **NOTE:** LH shown, RH similar.

    Install the tie-rod ends and nuts.

    - Tighten to 48 Nm (35 lb-ft).
    - Install new cotter pins.

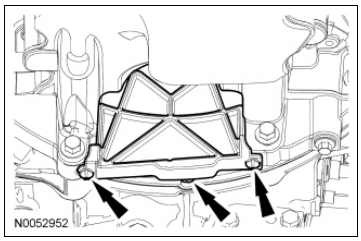


32. Install the engine roll restrictor-to-subframe through bolt.
    - Tighten to 90 Nm (66 lb-ft).

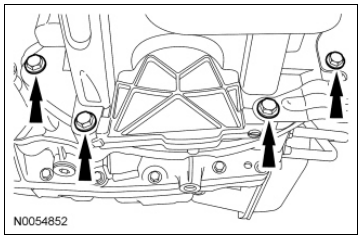


AWD vehicles

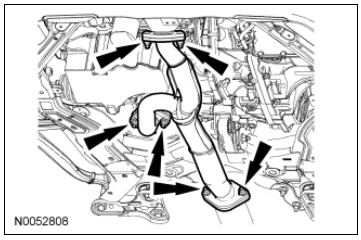
33. Line up the index marks on the rear driveshaft to the index marks on the PTU flange made during removal and install the 4 new bolts.
    - Tighten to 70 Nm (52 lb-ft).



All vehicles

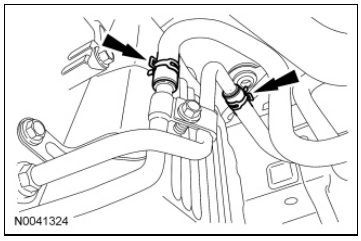


34. Install 4 new torque converter nuts.
    - Tighten to 36 Nm (27 lb-ft).

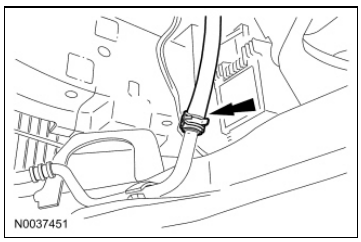


35. Install the inspection cover and the 2 fasteners.

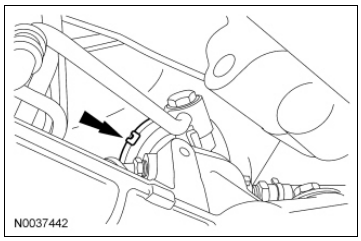
36. Install the 4 oil pan-to-transaxle bolts.
    - Tighten to 48 Nm (35 lb-ft).



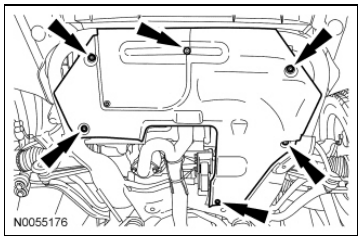
37. Using new gaskets, install the Y-pipe assembly and 6 new nuts.
    - Tighten to 40 Nm (30 lb-ft).



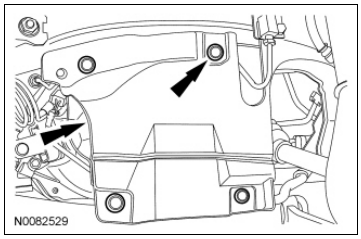
38. Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.



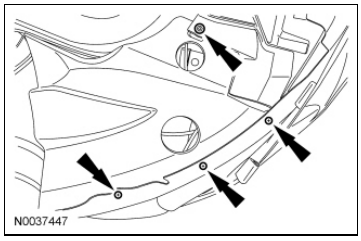
39. Connect the 2 transmission fluid cooler hoses.



40. Connect the power steering cooler tube.

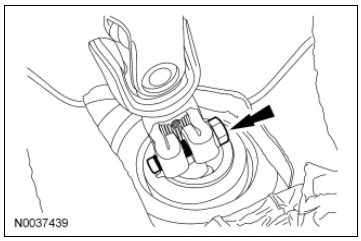


41. Slide the steering gear-to-dash seal onto the steering gear and engage the 4 retaining clips into the body.
    - From under the vehicle, verify that the seal is properly installed on the steering gear and the retaining clips are fully engaged into the body.

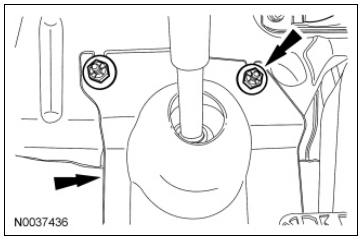


42. If equipped, install the underbody shield and the 6 screws.

43. Install the LH splash shield and the 6 pin-type retainers (4 shown).



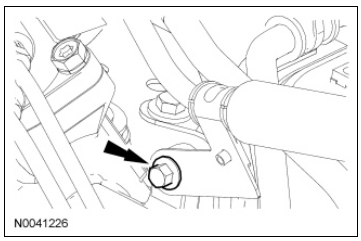
44. Position the LH fender splash shield and install the 4 screws.



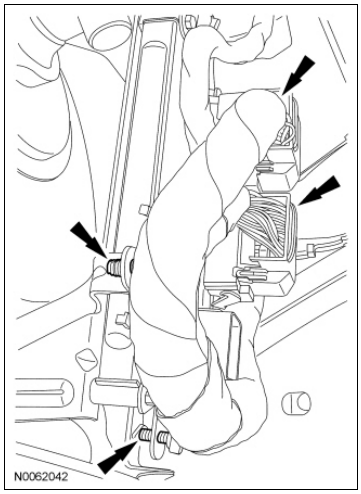
45. **NOTE:** Align the index marks made during removal.

    Install the steering intermediate shaft onto the steering gear and install a new bolt.

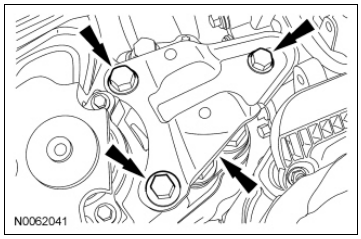
    - Tighten to 25 Nm (18 lb-ft).



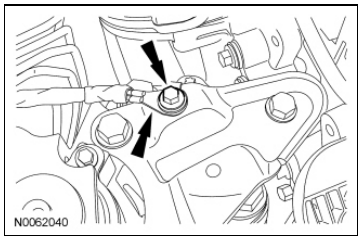
46. Install the steering joint cover and the 2 nuts.



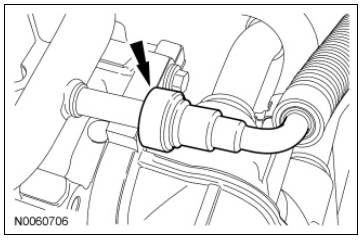
47. Using a new banjo bolt and 2 new seals, install the Power Steering Pressure (PSP) tube onto the steering gear.
    - Tighten to 37 Nm (27 lb-ft).



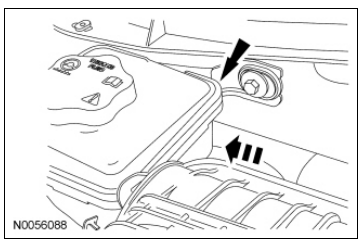
48. Install the PSP tube bracket and bolt.
    - Tighten to 10 Nm (89 lb-in).



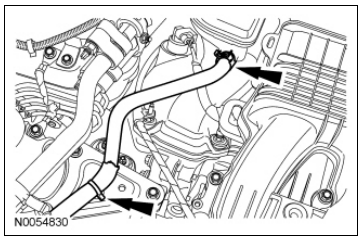
49. Connect the PCM electrical connectors and pin-type retainers.



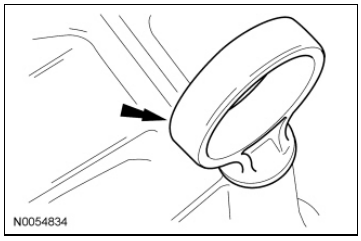
50. Install the engine mount brace and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



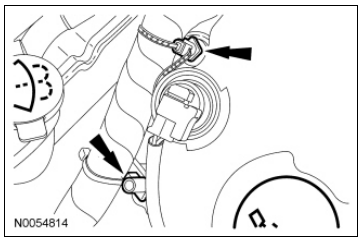
51. Install the ground wire and the bolt.
    - Tighten to 10 Nm (89 lb-in).



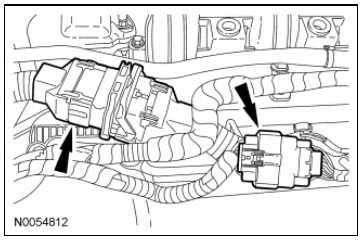
52. Connect the fuel supply tube from the fuel rail. For additional information, refer to Section 310-00 .



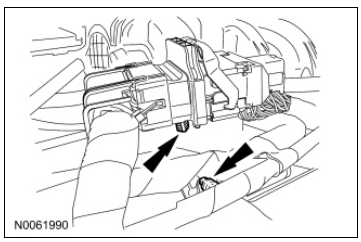
53. Attach the power steering reservoir onto the cowl.



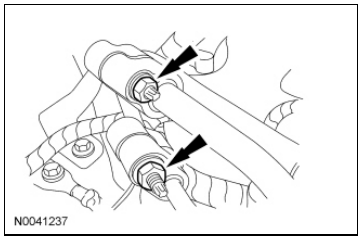
54. Connect the hose to the power steering reservoir.
    - Attach the pin-type retainer to the engine mount brace.



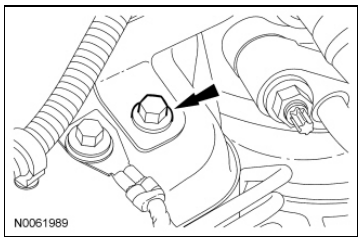
55. Install the oil level indicator.



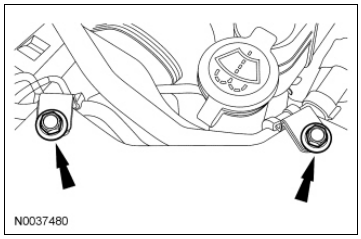
56. Attach the 2 wiring harness retainers to the LH valve cover stud bolts.



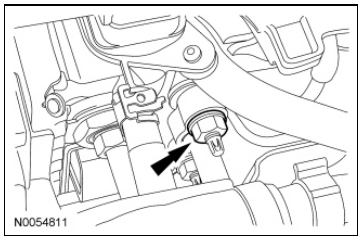
57. Connect the 2 engine wiring harness electrical connectors.



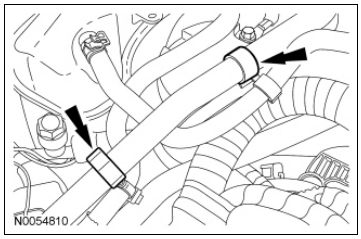
58. Attach the 2 wiring harness retainers.



59. Using new O-ring seals, connect the A/C tubes and install the 2 nuts.
    - Tighten to 8 Nm (71 lb-in).

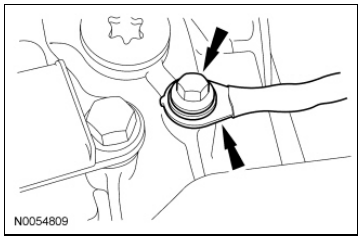


60. Install the A/C tube bracket bolt.
    - Tighten to 8 Nm (71 lb-in).

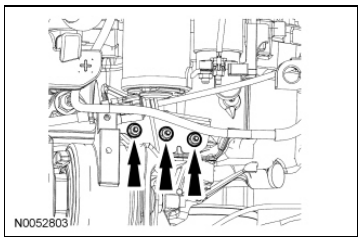


61. Install the 2 A/C tube bracket bolts.
    - Tighten to 10 Nm (89 lb-in).

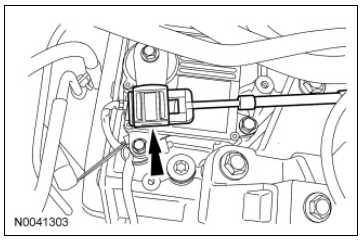
62. Using a new O-ring seal, connect the A/C tube to the condenser and install the nut.
    - Tighten to 8 Nm (71 lb-in).



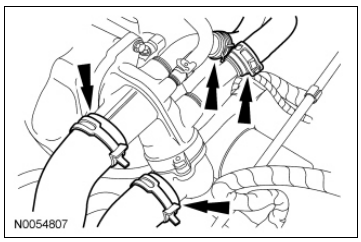
63. Attach the coolant tube retainer clips to the A/C tube.



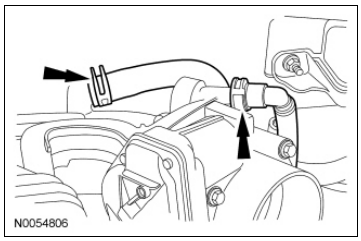
64. If equipped, attach the engine block heater harness to the radiator support, power steering hose, A/C tube and the engine wiring harness.



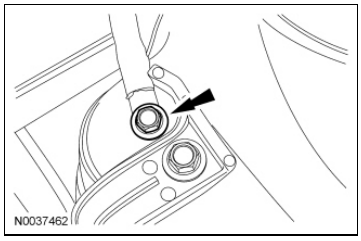
65. Install the ground wire and bolt.
    - Tighten to 12 Nm (106 lb-in).



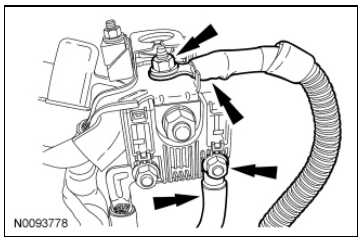
66. Position the transaxle control cable bracket in place and install the 3 nuts.
    - Tighten to 12 Nm (106 lb-in).



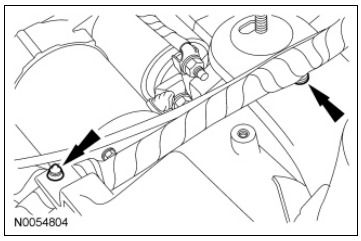
67. Connect the transaxle control cable to the control lever.



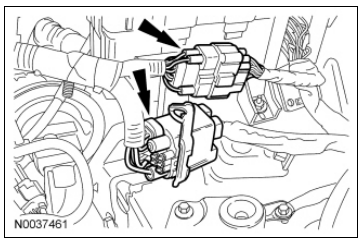
68. Connect the upper radiator hose, lower radiator hose and 2 heater hoses to the thermostat housing.



69. Connect the vacuum hose and the Evaporative Emission (EVAP) tube to the upper intake manifold.



70. Install the ground wire and the bolt.
    - Tighten to 12 Nm (106 lb-in).



71. Install the 2 battery cables to the positive battery cable and the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).

72. Attach the 2 wiring harness retainers to the transmission mount and the battery tray bracket.

73. Connect the 2 engine wiring harness electrical connectors.

74. Install the battery tray. For additional information, refer to Section 414-01 .

75. Install the engine Air Cleaner (ACL) and the ACL outlet pipe. For additional information, refer to Section 303-12C .

76. Install the degas bottle. For additional information, refer to Section 303-03A .

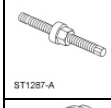
77. Install the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

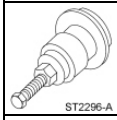
78. Install the accessory drive belt and the power steering belt. For additional information, refer to Section 303-05C .

79. Fill the engine with clean engine oil.

80. Fill and bleed the cooling system. For additional information, refer to Section 303-03A .

81. Fill the power steering system. For additional information, refer to Section 211-00B .





82. Check the transaxle fluid and add fluid if necessary. For additional information, refer to the Transmission Fluid Drain and Refill procedure in Section 307-01A .

83. Recharge the A/C system. For additional information, refer to Section 412-00A .

84. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Engine Front Cover

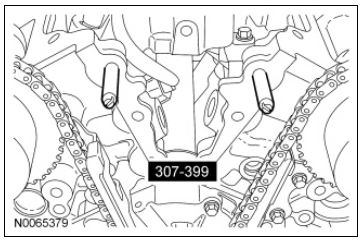
Material

Item	Specification
Motorcraft® High Performance Engine RTV Silicone TA-357	WSE-M4G323-A6
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada)	WSS-M2C945-A



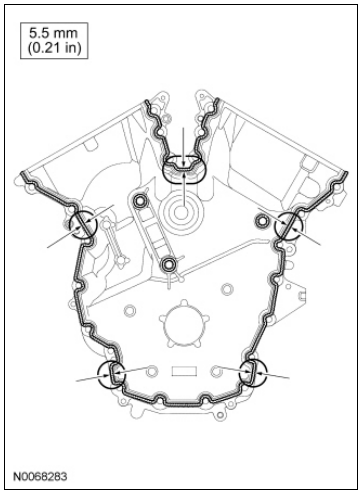
XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	
Motorcraft® Silicone Gasket Remover ZC-30	-
Threadlock and Sealer TA-25	WSK-M2G351-A5

⚠ **WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious persona**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

All vehicles

1. Install the Alignment Pins.

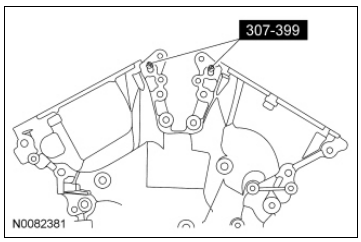


2. ***NOTICE:*** **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

   NOTE: The engine front cover and bolts 17, 18, 19 and 20 must be installed within 4 minutes of the initial sealant application. The remainder of the engine front cover bolts and the engine mount bracket bolts must be installed and tightened within 35 minutes of the initial sealant application. If the time limits are exceeded, the sealant must be removed, the sealing area cleaned and sealant reapplied. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

   Apply a 3.0 mm (0.11 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover sealing surfaces including the 3 engine mount bracket bosses.

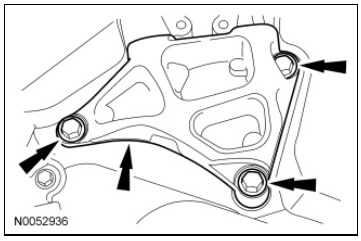
   - Apply a 5.5 mm (0.21 in) bead of Motorcraft High Performance Engine RTV Silicone to the oil pan-to-cylinder block joint and the cylinder head-to-cylinder block joint areas of the engine front cover in 5 places as indicated.



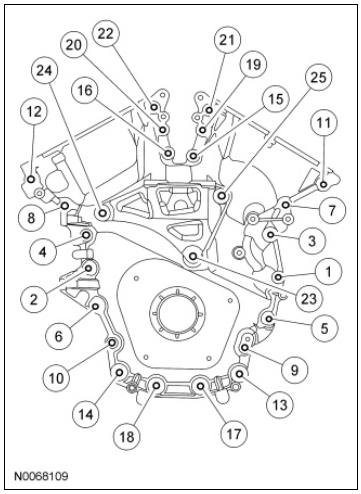
3. **NOTE:** Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

   Install the engine front cover and bolts 17, 18, 19 and 20.

   - Tighten in sequence to 3 Nm (27 lb-in).

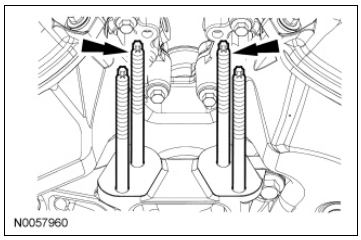


4. Remove the Alignment Pins.

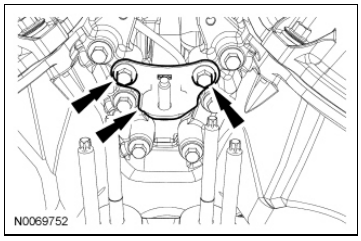


5. **NOTE:** Do not tighten the bolts at this time.

   Install the engine mount bracket and the 3 bolts.



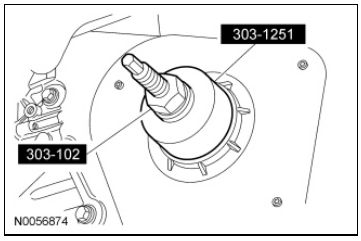
6. Install the remaining engine front cover bolts. Tighten all of the engine front cover bolts and engine mount bracket bolts in the sequence shown in 2 stages:
    - Stage 1: Tighten bolts 1 thru 22 to 10 Nm (89 lb-in) and bolts 23, 24 and 25 to 15 Nm (133 lb-in).
    - Stage 2: Tighten bolts 1 thru 22 to 24 Nm (18 lb-ft) and bolts 23, 24 and 25 to 75 Nm (55 lb-ft).



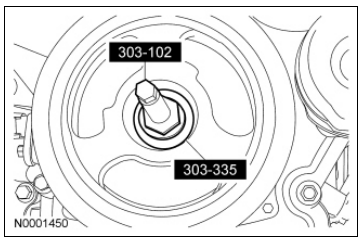
7. ***NOTICE:*** **The thread sealer on the engine mount studs (including new engine mount studs if applicable) must be cleaned off with a wire brush and new Threadlock and Sealer applied prior to installing the engine mount studs. Failure to follow this procedure may result in damage to the engine mount studs or engine.**

    Install the engine mount studs in the following sequence.

    1. Clean the front cover engine mount stud holes with pressurized air to remove any foreign material.
    2. Clean all the thread sealer from the engine mount studs (old and new studs).
    3. Apply new Threadlock and Sealer to the engine mount stud threads.
    4. Install the 2 engine mount studs.
        - ♦ Tighten to 20 Nm (177 lb-in).

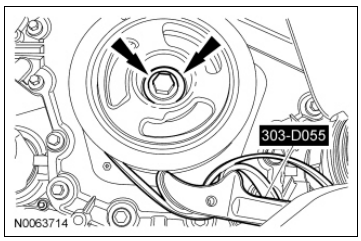


8. Install the engine mount bracket and the 2 bolts.
    - Tighten to 24 Nm (18 lb-ft).



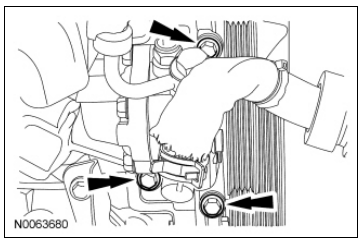
9. **NOTE:** Apply clean engine oil to the crankshaft front seal bore in the engine front cover.

   Using the Front Crankshaft Seal Installer and Crankshaft Vibration Damper Installer, install a new crankshaft front seal.



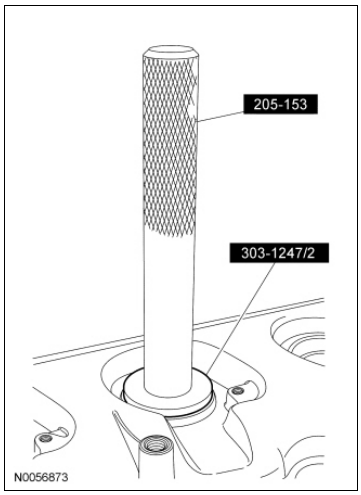
10. **NOTE:** Lubricate the outside diameter sealing surfaces with clean engine oil.

    Using the Front Cover Oil Seal Installer and Crankshaft Vibration Damper Installer, install the crankshaft pulley.



11. Using the Strap Wrench, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
    - Stage 1: Tighten to 120 Nm (89 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

12. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 11 Nm (97 lb-in).

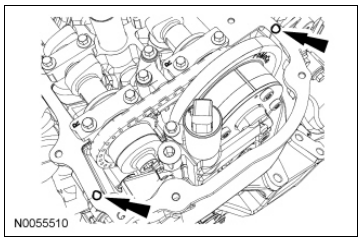


13. Install the power steering pump and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

14. **NOTE:** Installation of new seals is only required if damaged seals were removed during disassembly of the engine.

    NOTE: Spark plug tube seal installation shown, Variable Camshaft Timing (VCT) solenoid seal installation similar.

    Using the VCT Spark Plug Tube Seal Installer and Handle, install new VCT solenoid and/or spark plug tube seals.

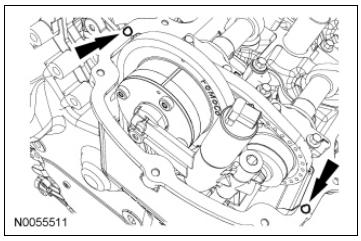


15. ***NOTICE:*** **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

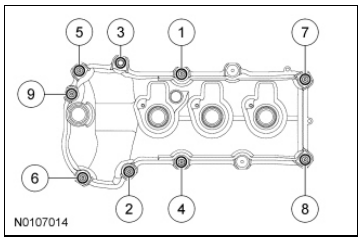
    NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover

and metal surface prep. Failure to follow this procedure can cause future oil leakage.

Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.



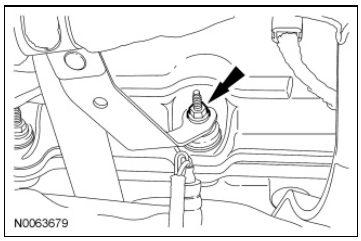
16. Using a new gasket, install the RH valve cover and tighten the bolt and 8 stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).



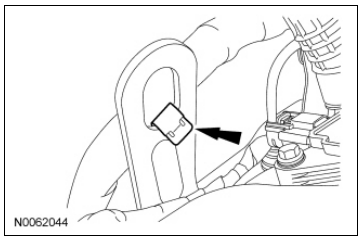
17. ***NOTICE:*** **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

    NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

    Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-LH cylinder head joints.

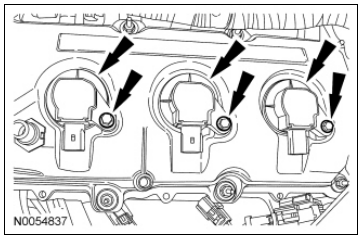


18. Using a new gasket, install the RH valve cover and tighten the 9 stud bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).



19. Install the wiring harness retaining bracket and the 2 nuts.
    - Tighten to 4 Nm (35 lb-in).

20. Install the Power Steering Pressure (PSP) hose bracket and nut.
    - Tighten to 9 Nm (80 lb-in).

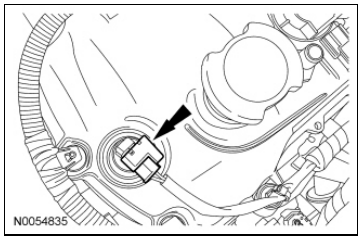


21. Attach the PSP hose retainer to the engine lifting eye.

22. **NOTE:** LH shown, RH similar.

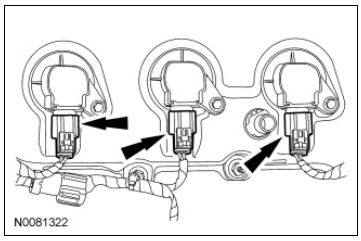
    Install the 6 coil-on-plug assemblies and the 6 bolts.

    - Tighten to 7 Nm (62 lb-in).

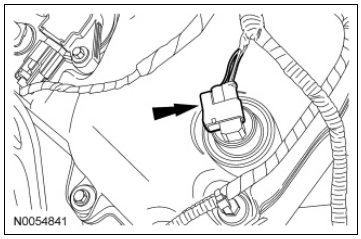


23. Attach all of the wiring harness retainers to the LH valve cover and stud bolts.

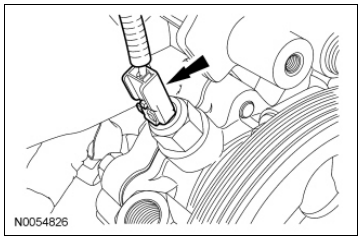
24. Connect the 3 LH coil-on-plug electrical connectors.



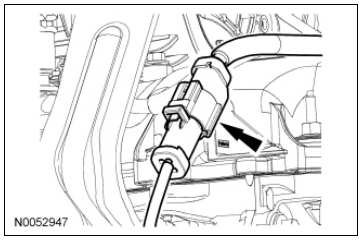
25. Connect the LH camshaft VCT solenoid electrical connector.



26. Attach all of the wiring harness retainers to the RH valve cover and stud bolts.

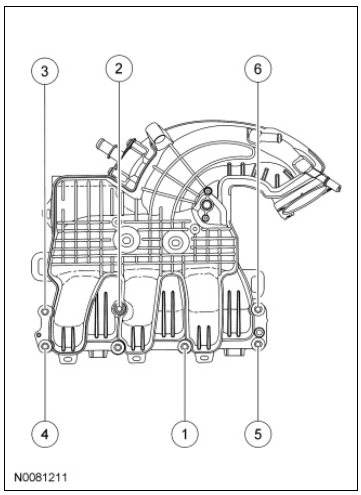


27. Connect the 3 RH coil-on-plug electrical connectors.

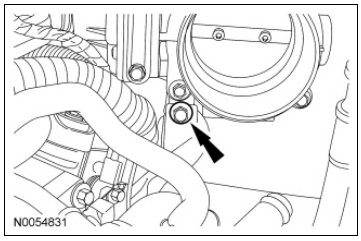


28. Connect the RH VCT solenoid electrical connector.

29. Connect the PSP switch electrical connector.

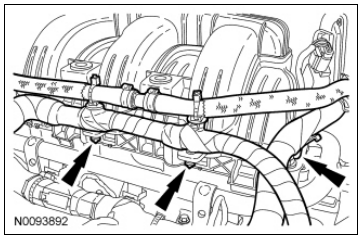


30. Connect the RH Catalyst Monitor Sensor (CMS) sensor electrical connector.

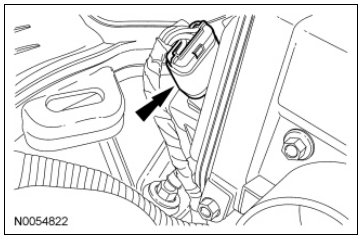


31. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

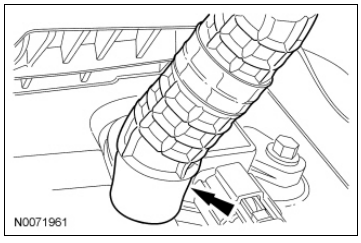
    Using new gaskets, install the upper intake manifold and the 6 bolts.



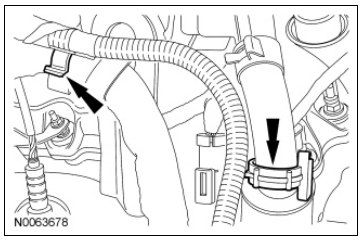
- Tighten in the sequence shown to 10 Nm (89 lb-in).



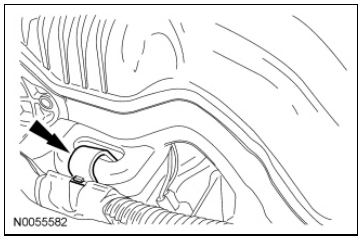
32. Install the upper intake manifold support bracket bolt.
    - Tighten to 10 Nm (89 lb-in).



33. Attach the wiring harness retainers to the upper intake manifold.

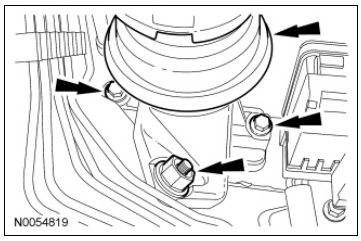


34. Connect the Throttle Body (TB) electrical connector.

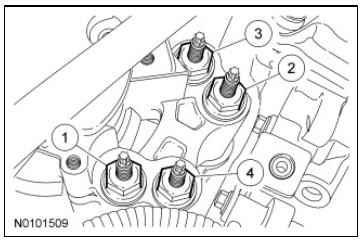


35. Connect the PCV hose to the PCV valve.

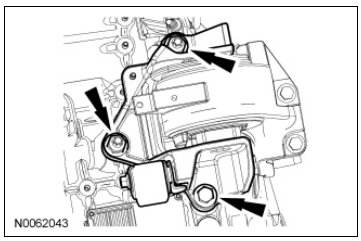
36. If equipped, attach the block heater wiring harness retainer to the PSP tube and the power steering reservoir hose.



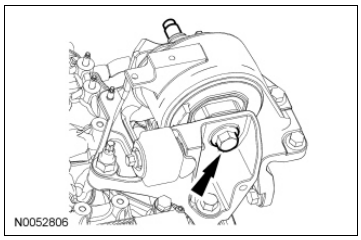
37. If equipped, attach the block heater wiring harness retainer to the upper intake manifold.



38. Raise the engine and transaxle assembly into the vehicle.

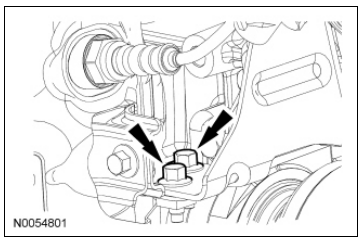


39. Install the engine mount, the nut and the 2 bolts.
    - Tighten the bolts to 55 Nm (41 lb-ft).
    - Tighten the nut to 63 Nm (46 lb-ft).

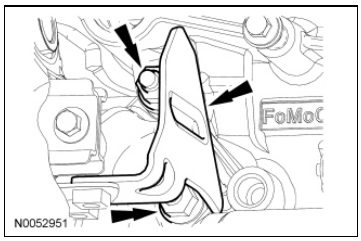


40. Install the 2 engine mount spacers and the 4 engine mount nuts.
    - Tighten in the sequence shown to 70 Nm (52 lb-ft).

41. Install the transaxle support insulator bracket, bolt and the 2 nuts.
    - Tighten to 80 Nm (59 lb-ft).



42. Install the transaxle support insulator through bolt and nut.
    - Tighten to 90 Nm (66 lb-ft).



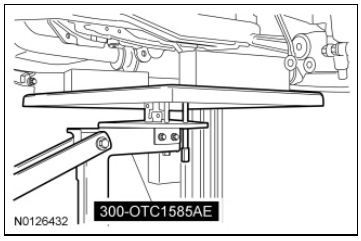
Front Wheel Drive (FWD) vehicles

43. **NOTE:** Do not tighten the 2 catalytic converter support bracket bolts at this time.

    Install the RH catalytic converter support bracket and the 2 bolts.

44. Install the 2 catalytic converter support bracket nuts.
    - Tighten to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter support bracket bolts to 20 Nm (177 lb-in).

All-Wheel Drive (AWD) vehicles



45. **NOTE:** A new Power Transfer Unit (PTU) seal must be installed whenever the intermediate shaft is removed.

    Install a new PTU seal. For additional information, refer to Section 303-07B .

All vehicles

46. **NOTE:** Align the index marks on the subframe to the index marks on the underbody that were made during removal.

    Using the Powertrain Lift, raise the subframe into the installed position.

47. **NOTE:** LH shown, RH similar.

    Install the 2 front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

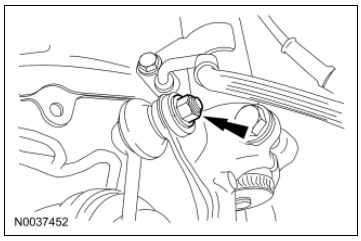
48. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the 4 bolts finger-tight.

49. **NOTE:** LH shown, RH similar.

    Install the 2 rear subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

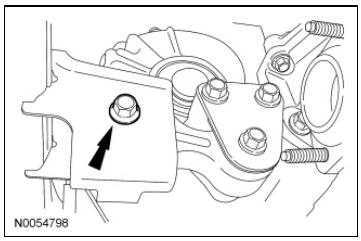


50. **NOTE:** LH shown, RH similar.

    Tighten the 2 subframe bracket-to-body bolts to 103 Nm (76 lb-ft).

51. **NOTE:** LH shown, RH similar.

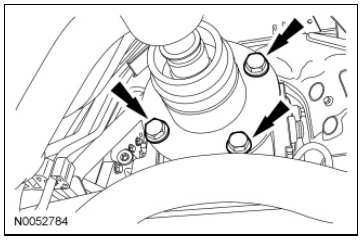
    Install the stabilizer bar links and nuts to the struts.



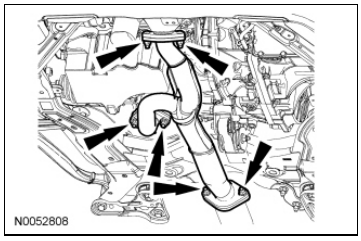
52. **NOTE:** LH shown, RH similar.

    Install the tie-rod ends and nuts.

    - Tighten to 48 Nm (35 lb-ft).
    - Install new cotter pins.

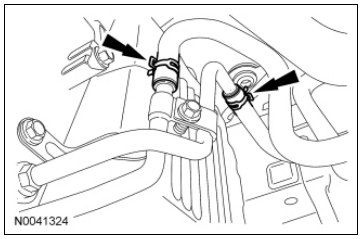


53. Install the engine roll restrictor-to-subframe through bolt.
    - Tighten to 90 Nm (66 lb-ft).



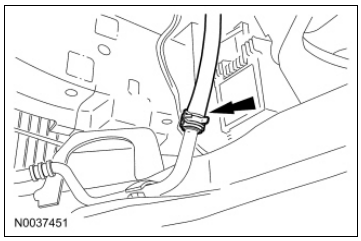
AWD vehicles

54. Line up the index marks on the rear driveshaft to the index marks on the PTU flange made during removal and install the 4 new bolts (3 shown).
    - Tighten to 70 Nm (52 lb-ft).

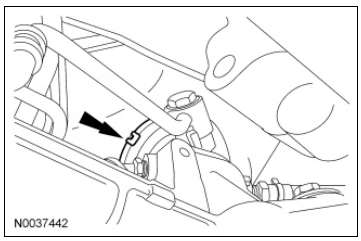


All vehicles

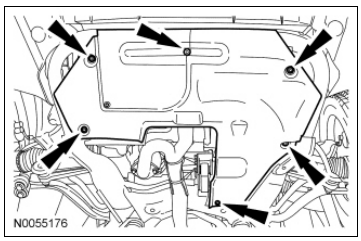
55. Using new gaskets, install the Y-pipe assembly and the 6 new nuts.
    - Tighten to 40 Nm (30 lb-ft).



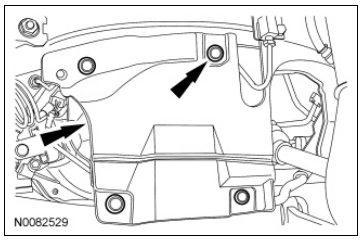
56. Install a new engine oil filter.
    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.



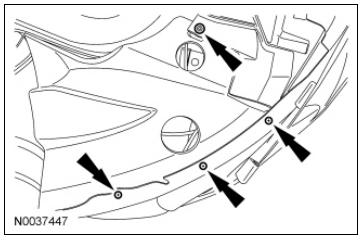
57. Connect the 2 transmission fluid cooler hoses.



58. Connect the power steering cooler tube.

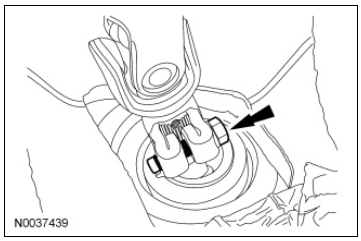


59. Slide the steering gear-to-dash seal onto the steering gear and engage the 4 retaining clips into the body.
    - From under the vehicle, verify that the seal is correctly installed on the steering gear and the retaining clips are fully engaged into the body.

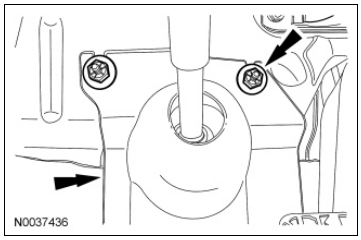


60. If equipped, install the underbody shield and the 6 screws.

61. Install the LH splash shield and the 6 pin-type retainers (4 shown).



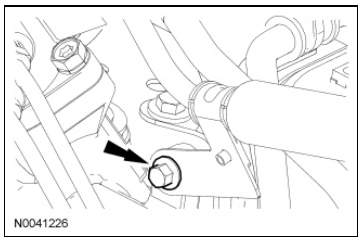
62. Position the LH fender splash shield and install the 4 screws.



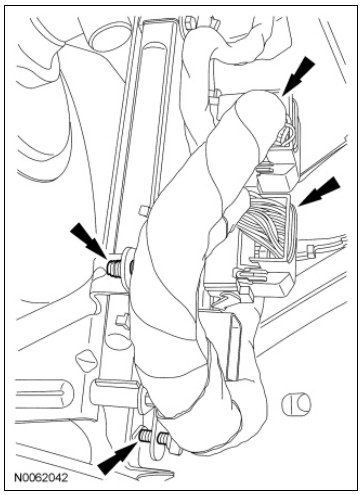
63. **NOTE:** Align the index marks made during removal.

    Install the steering intermediate shaft onto the steering gear and install a new bolt.

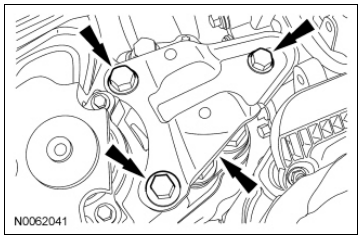
    - Tighten to 25 Nm (18 lb-ft).



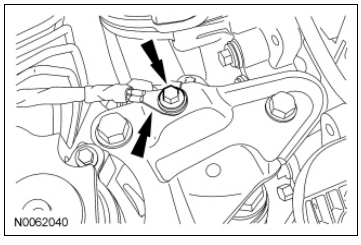
64. Install the steering joint cover and the 2 nuts.



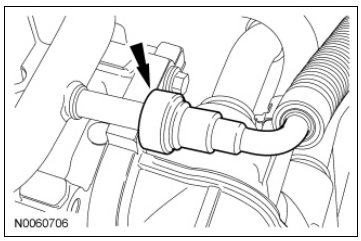
65. Using a new banjo bolt and 2 new seals, install the PSP tube onto the steering gear.
    - Tighten to 37 Nm (27 lb-ft).



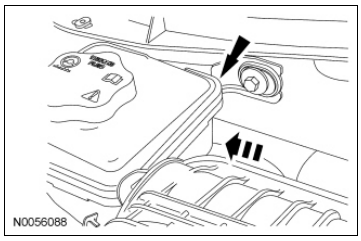
66. Install the PSP tube bracket and bolt.
    - Tighten to 10 Nm (89 lb-in).



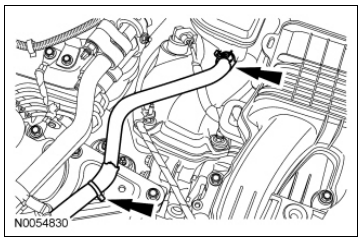
67. Connect the PCM connectors and pin-type retainers.



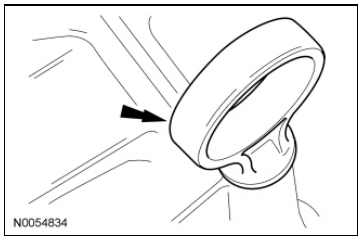
68. Install the engine mount brace and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



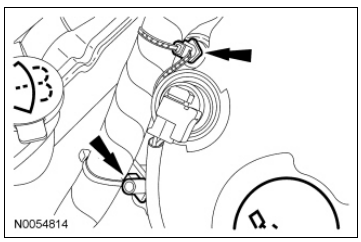
69. Install the ground wire and the bolt.
    - Tighten to 10 Nm (89 lb-in).



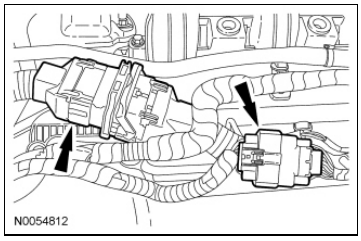
70. Connect the fuel supply tube to the fuel rail. For additional information, refer to Section 310-00 .



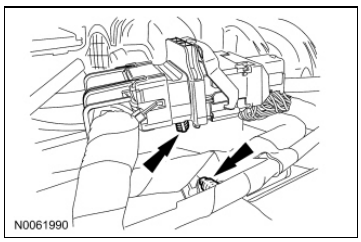
71. Attach the power steering reservoir onto the cowl.



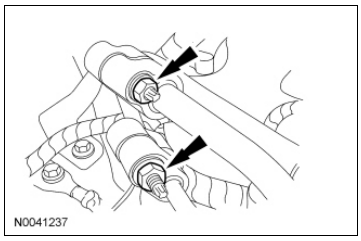
72. Connect the hose to the power steering reservoir.
    - Attach the pin-type retainer to the engine mount brace.



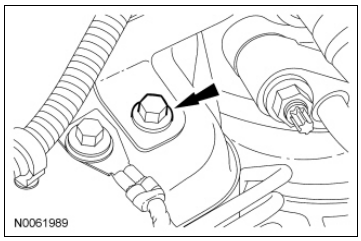
73. Install the oil level indicator.



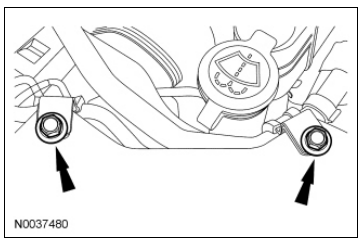
74. Attach the 2 wiring harness retainers to the LH valve cover stud bolts.



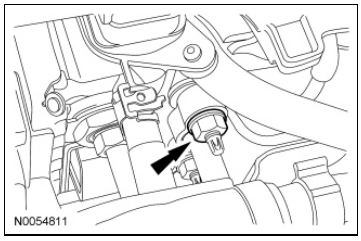
75. Connect the 2 engine wiring harness electrical connectors.



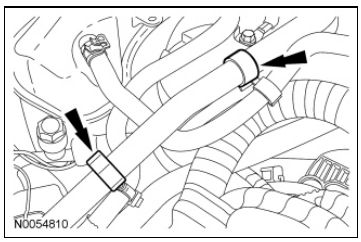
76. Attach the 2 wiring harness retainers.



77. Using new O-ring seals, connect the A/C tubes and install the 2 nuts.
    - Tighten to 8 Nm (71 lb-in).

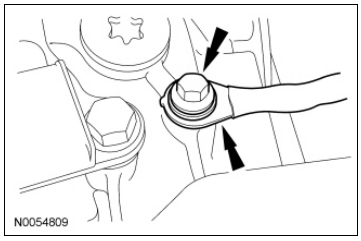


78. Install the A/C tube bracket bolt.
    - Tighten to 8 Nm (71 lb-in).

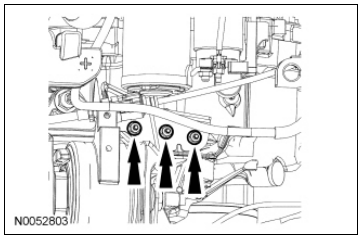


79. Install the 2 A/C tube retaining clamp bolts.
    - Tighten to 10 Nm (89 lb-in).

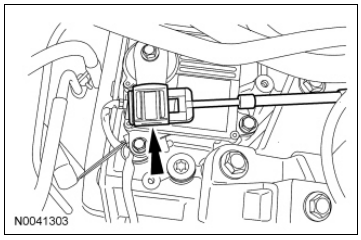
80. Using a new O-ring seal, connect the A/C tube to the condenser and install the nut.
    - Tighten to 8 Nm (71 lb-in).



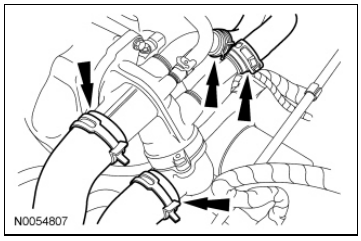
81. Attach the coolant tube retainer clips to the A/C tube.



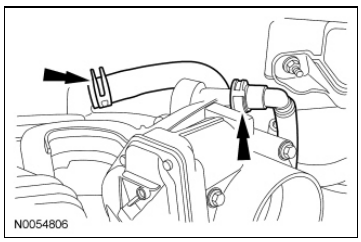
82. If equipped, attach the engine block heater harness to the radiator support, power steering hose, A/C tube and the engine wiring harness.



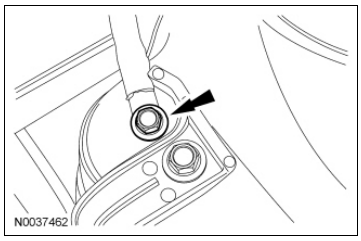
83. Install the ground wire and bolt.
    - Tighten to 12 Nm (106 lb-in).



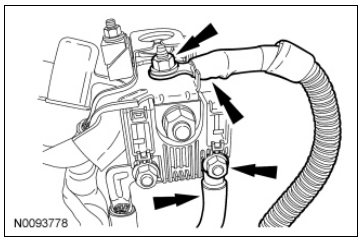
84. Position the transaxle control cable bracket in place and install the 3 nuts.
    - Tighten to 12 Nm (106 lb-in).



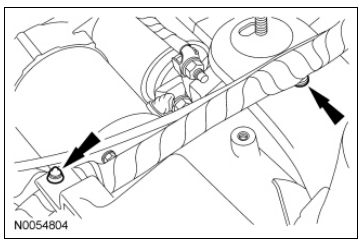
85. Connect the transaxle control cable to the control lever.



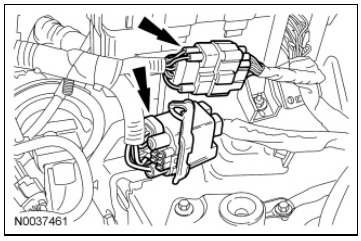
86. Connect the upper radiator hose, lower radiator hose and 2 heater hoses to the thermostat housing.



87. Connect the vacuum hose and the Evaporative Emission (EVAP) tube to the upper intake manifold.



88. Install the ground wire and the bolt.
    - Tighten to 12 Nm (106 lb-in).



89. Install the 2 battery cables to the positive battery cable and the 2 nuts.
    - Tighten to 9 Nm (80 lb-in).

90. Attach the 2 wiring harness retainers to the transmission mount and the battery tray bracket.

91. Connect the 2 engine wiring harness electrical connectors.

92. Install the battery tray. For additional information, refer to Section 414-01 .

93. Install the engine Air Cleaner (ACL) and the ACL outlet pipe. For additional information, refer to Section 303-12C .

94. Install the degas bottle. For additional information, refer to Section 303-03A .

95. Install the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

96. Install the accessory drive belt and the power steering belt. For additional information, refer to Section 303-05C .

97. ***NOTICE:*** **Do not expose the Motorcraft High Performance Engine RTV Silicone to engine oil for at least 90 minutes after installing the engine front cover. Failure to follow this instruction may cause oil leakage.**

    Fill the engine with clean engine oil.

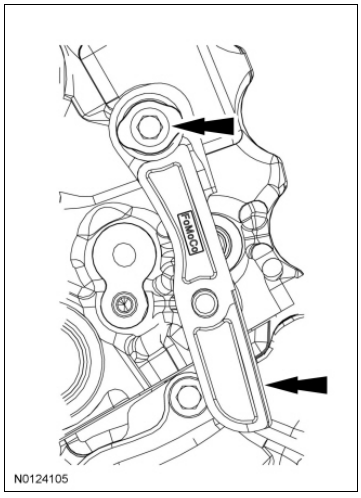
98. Fill and bleed the cooling system. For additional information, refer to Section 303-03A .

99. Fill the power steering system. For additional information, refer to Section 211-00B .

100. Check the transaxle fluid and add fluid if necessary. For additional information, refer to the Transmission Fluid Drain and Refill procedure in Section 307-01A .

101. Recharge the A/C system. For additional information, refer to Section 412-00A .

102. After completing the repairs, use the scan tool to perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

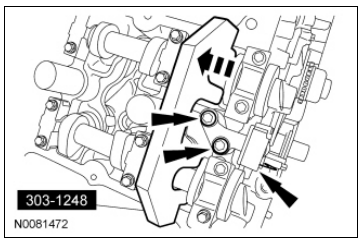


Timing Drive Components

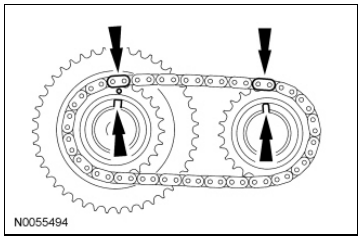
Special Tool(s)

 ST2979-A	Tool, Camshaft Holding 303-1248

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**



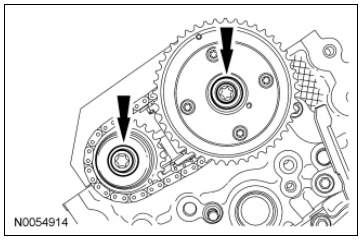
1. Install the RH timing chain guide and bolt.
   - Tighten to 10 Nm (89 lb-in).



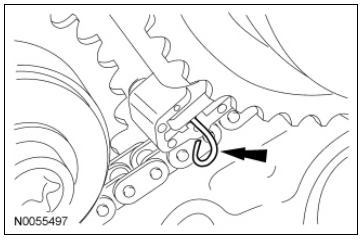
1. **NOTE:** It is necessary to tilt the Camshaft Holding Tool toward the rear of the engine to access the rearmost secondary timing chain tensioner bolt.

   Install the RH secondary timing chain tensioner and the 2 bolts.

   - Tighten to 10 Nm (89 lb-in).

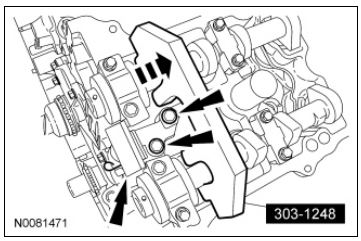


3. Assemble the RH Variable Camshaft Timing (VCT) assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
   - Align the colored links with the timing marks.

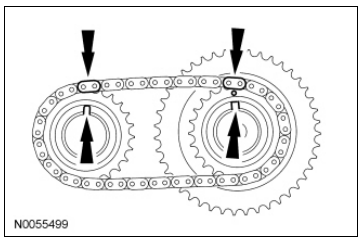


4. Position the RH secondary timing assembly onto the camshafts.

5. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.



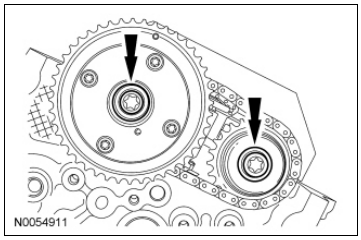
6. Remove the lockpin from the RH secondary timing chain tensioner.



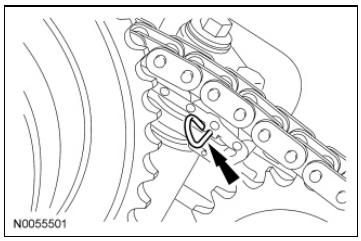
7. **NOTE:** It is necessary to tilt the Camshaft Holding Tool toward the rear of the engine to access the rearmost secondary timing chain tensioner bolt.

    Install the LH secondary timing chain tensioner and the 2 bolts.

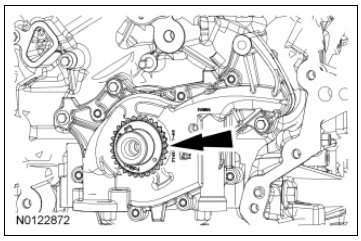
    - Tighten to 10 Nm (89 lb-in).



8. Assemble the LH VCT assembly, the LH exhaust camshaft sprocket and the LH secondary timing chain.
    - Align the colored links with the timing marks.

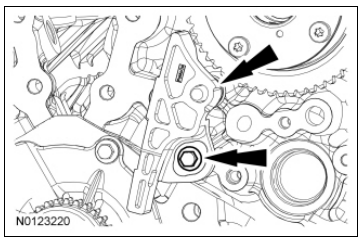


9. Position the LH secondary timing assembly onto the camshafts.

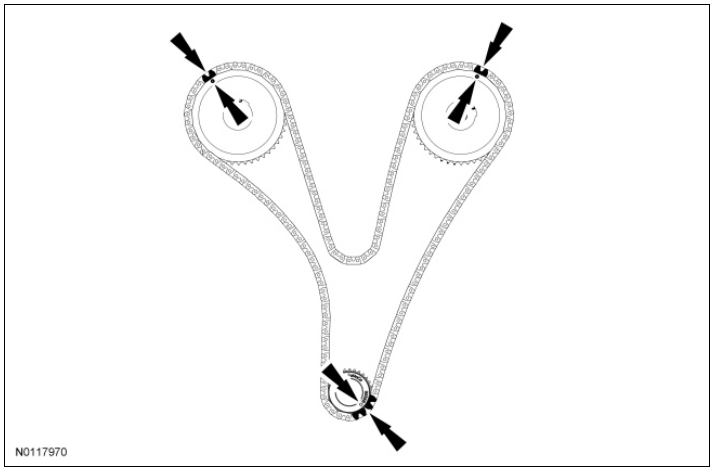


10. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.

11. Remove the lockpin from the LH secondary timing chain tensioner.

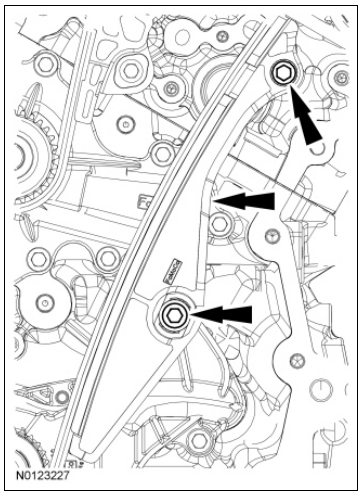


12. Install the crankshaft timing chain sprocket.



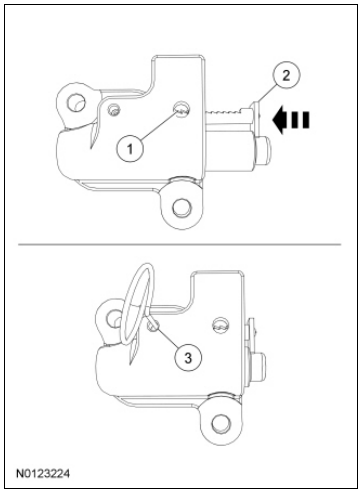
13. Install the upper LH primary timing chain guide and the bolt.

- Tighten to 10 Nm (89 lb-in).



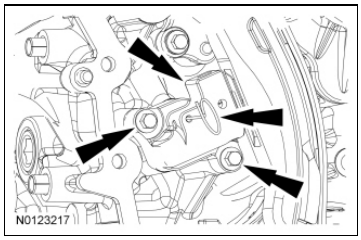
14. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.



15. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

16. Install the primary timing chain tensioner arm.

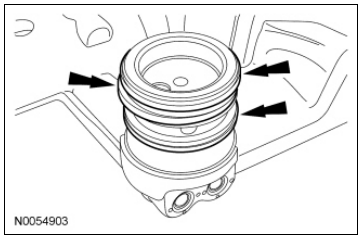


17. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and install a suitable lockpin.

18. **NOTE:** It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

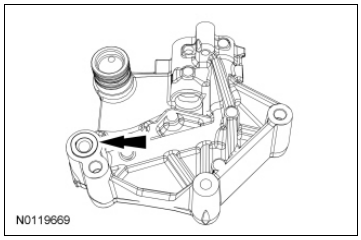
    Install the primary tensioner and the 2 bolts.

    - Tighten to 10 Nm (89 lb-in).
    - Remove the lockpin.



19. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).

- There are 35 links between the LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket colored links (3).



20. Inspect the VCT housing seals for damage and replace as necessary.

21. **NOTE:** RH shown, LH similar.

    NOTE: During removal, the O-ring seal may remain on the cylinder head. If so, remove the O-ring seal from the cylinder head, inspect the seal (replace as necessary) and install the O-ring seal on the VCT housing.

    Inspect the VCT housing-to-cylinder head O-ring seals for damage and replace as necessary.

22. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the LH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

23. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the RH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

24. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

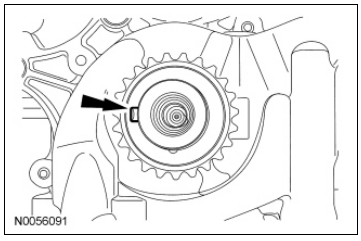
Camshaft

Special Tool(s)

 ST2979-A	Tool, Camshaft Holding 303-1248

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



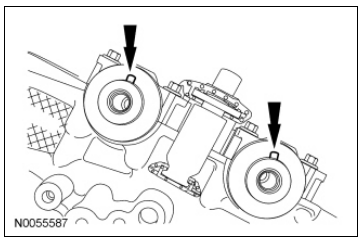
All camshafts

⚠ **WARNING: Do not smoke, carry lighted tobacco oran open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. ***NOTICE:*** **The crankshaft must remain in the freewheeling position (crankshaft dowel pin at 9 o'clock) until after the camshafts are installed and the valve clearance is checked/adjusted. Do not turn the crankshaft until instructed to do so. Failure to follow this process will result in severe engine damage.**

   Rotate the crankshaft counterclockwise until the crankshaft dowel pin is in the 9 o'clock position.

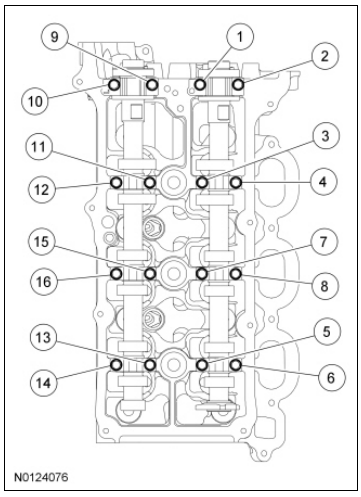


N0056091

LH camshafts

2. ***NOTICE:*** **The camshafts must remain in the neutral position during installation or engine damage may occur.**

   NOTE: Coat the camshafts with clean engine oil prior to installation.

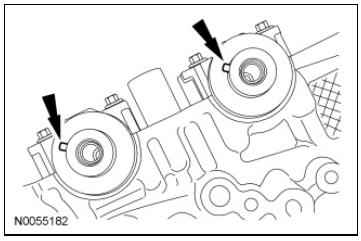


Position the camshafts onto the LH cylinder head in the neutral position as shown.

3. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

   Install the 8 camshaft caps and the 16 bolts. Tighten the bolts in the sequence shown in the following stages:

   - Stage 1: Tighten bolts 1, 2, 3 and 4 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 2: Tighten bolts 5 and 6 to 8 Nm (71 lb-in).
   - Stage 3: Tighten bolts 7 and 8 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 4: Loosen bolts 5 and 6.
     - ♦ Tighten bolts 5 and 6 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 5: Tighten bolts 9, 10, 11 and 12 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 6: Tighten bolts 13 and 14 to 8 Nm (71 lb-in).
   - Stage 7: Tighten bolts 15 and 16 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 8: Loosen bolts 13 and 14.
     - ♦ Tighten bolts 13 and 14 to 8 Nm (71 lb-in) then an additional 45 degrees.



RH camshafts

4. ***NOTICE:*** **The camshafts must remain in the neutral position during installation or engine damage may occur.**

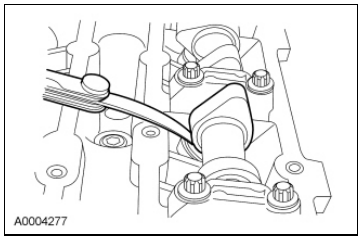
   NOTE: Coat the camshafts with clean engine oil prior to installation.

   Position the camshafts onto the RH cylinder head in the neutral position as shown.

5. **NOTE:** Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

   Install the 8 camshaft caps and the 16 bolts. Tighten the bolts in the sequence shown in the following stages:

   - Stage 1: Tighten bolts 1, 2, 3 and 4 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 2: Tighten bolts 5 and 6 to 8 Nm (71 lb-in).
   - Stage 3: Tighten bolts 7 and 8 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 4: Loosen bolts 5 and 6.
     - ♦ Tighten bolts 5 and 6 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 5: Tighten bolts 9, 10, 11 and 12 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 6: Tighten bolts 13 and 14 to 8 Nm (71 lb-in).
   - Stage 7: Tighten bolts 15 and 16 to 8 Nm (71 lb-in) then an additional 45 degrees.
   - Stage 8: Loosen bolts 13 and 14.
     - ♦ Tighten bolts 13 and 14 to 8 Nm (71 lb-in) then an additional 45 degrees.

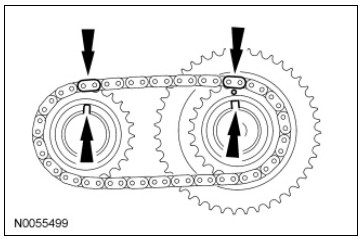


All camshafts

6. ***NOTICE:*** **If any components are installed new, the engine valve clearance must be checked/adjusted or engine damage can occur.**

   NOTE: Use a camshaft sprocket bolt to turn the camshafts.

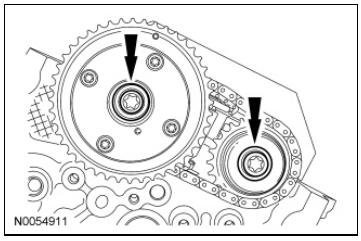
   Using a feeler gauge, confirm that the valve tappet clearances are within specification. If valve tappet clearances are not within specification, the clearance must be adjusted by installing new valve tappet(s) of the correct size. For additional information, refer to Valve Clearance Check in this section.



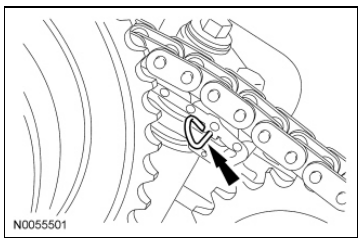
LH camshafts

7. **NOTE:** Use a camshaft sprocket bolt to turn the camshafts.

   Rotate the LH camshafts to the Top Dead Center (TDC) position and install the Camshaft Holding Tool on the flats of the camshafts.

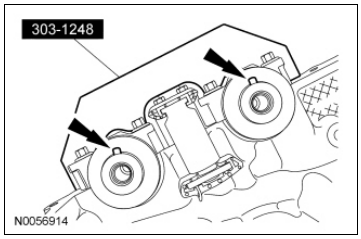


8. Assemble the LH Variable Camshaft Timing (VCT) assembly, the LH exhaust camshaft sprocket and the LH secondary timing chain.
   - Align the colored links with the timing marks.

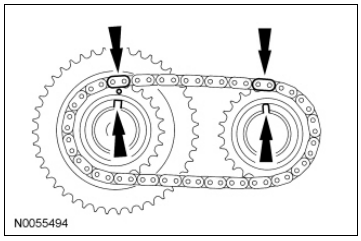


9. Position the LH secondary timing assembly onto the camshafts.

10. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).
    - Stage 2: Loosen one full turn.
    - Stage 3: Tighten to 10 Nm (89 lb-in).
    - Stage 4: Tighten 90 degrees.



11. Remove the lockpin from the LH secondary timing chain tensioner.

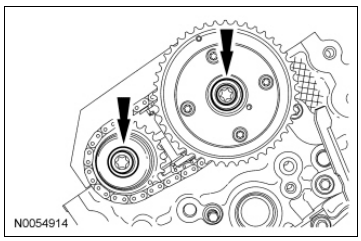


RH camshafts

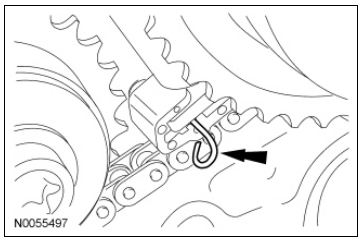
12. **NOTE:** Use a camshaft sprocket bolt to turn the camshafts.

    Rotate the RH camshafts to the TDC position and install the Camshaft Holding Tool on the flats of the camshafts.

13. Assemble the RH VCT assembly, the RH exhaust camshaft sprocket and the RH secondary timing chain.
    - Align the colored links with the timing marks.

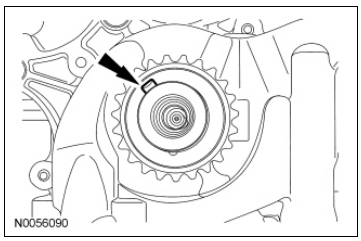


14. Position the RH secondary timing assembly onto the camshafts.

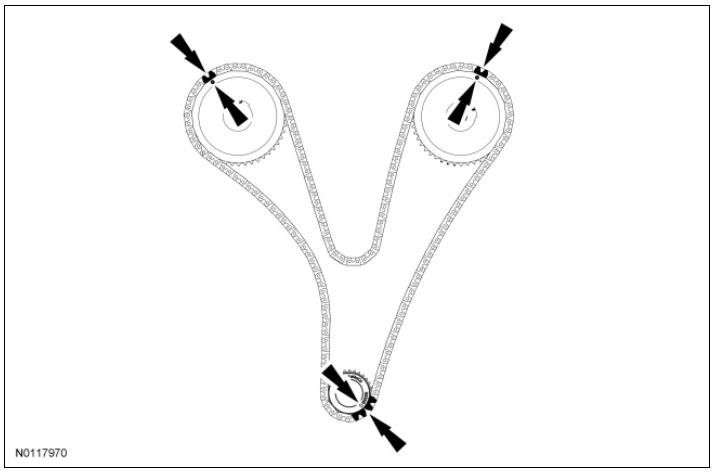


15. Install 2 new bolts and the original washer. Tighten in 4 stages.
    - Stage 1: Tighten to 40 Nm (30 lb-ft).

- Stage 2: Loosen one full turn.
- Stage 3: Tighten to 10 Nm (89 lb-in).
- Stage 4: Tighten 90 degrees.

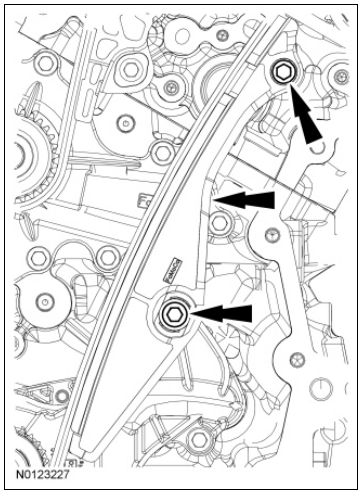


16. Remove the lockpin from the RH secondary timing chain tensioner.



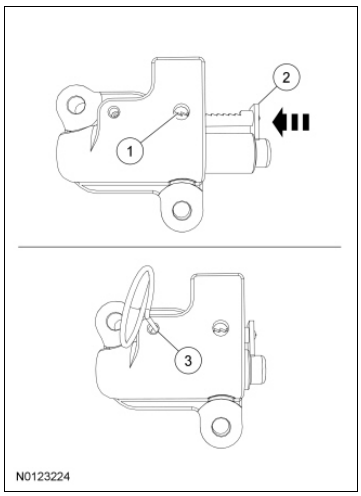
All camshafts

17. Rotate the crankshaft clockwise 60 degrees to the TDC position (crankshaft dowel pin at 11 o'clock).



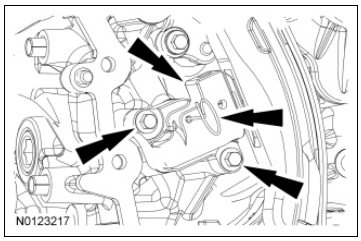
18. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

    Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

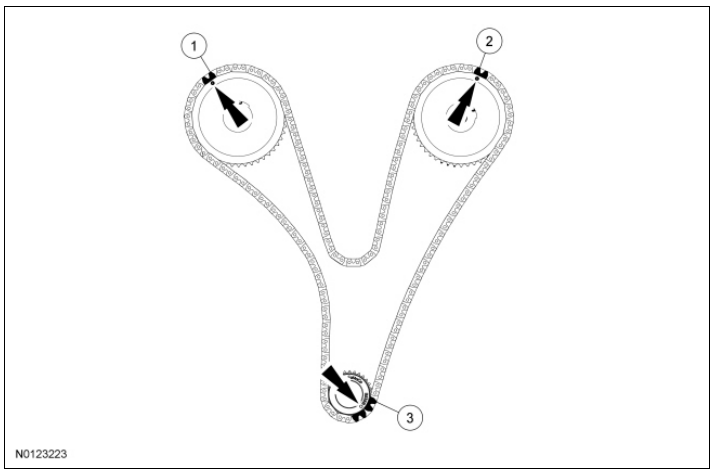


19. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

20. Install the primary timing chain tensioner arm.

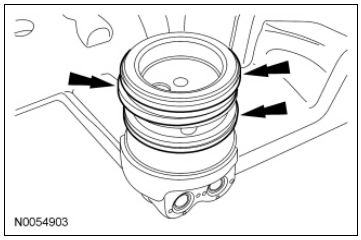


21. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and install a suitable lockpin.



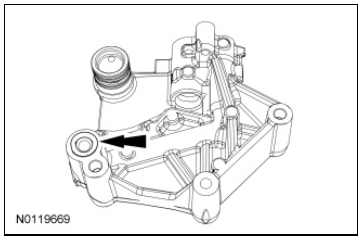
22. **NOTE:** It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

Install the primary tensioner and the 2 bolts.



- Tighten to 10 Nm (89 lb-in).
- Remove the lockpin.

23. As a post-check, verify correct alignment of all timing marks.
    - There are 48 links between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 35 links between the LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket colored links (3).



24. Inspect the VCT housing seals for damage and replace as necessary.

25. **NOTE:** RH shown, LH similar.

    NOTE: During removal, the O-ring seal may remain on the cylinder head. If so, remove the O-ring seal from the cylinder head, inspect the seal (replace as necessary) and install the O-ring seal on the VCT housing.

    Inspect the VCT housing-to-cylinder head O-ring seals for damage and replace as necessary.

26. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the LH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

27. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

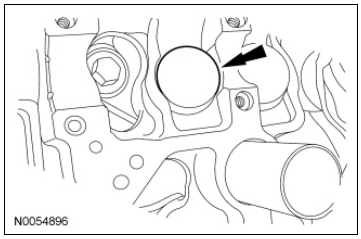
    Install the RH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

28. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Valve Tappets

Material



Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. **NOTE:** The valve tappets must be installed in their original positions.

   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   Install the valve tappets.

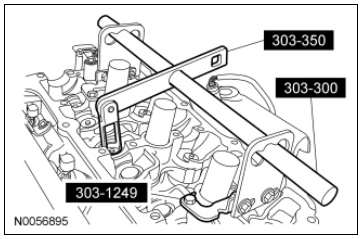
2. Depending on the valve tappets being serviced, install the LH and/or the RH camshafts. For addial information, refer to Camshaft in this section.

Valve Spring, Retainer and Seal

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Spring 303-350 (T89P-6565-A)
 ST3028-A	Compressor, Valve Spring
 ST1906-A	Installer, Valve Stem Oil Seal 303-470 (T94P-6510-CH)

Material



Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

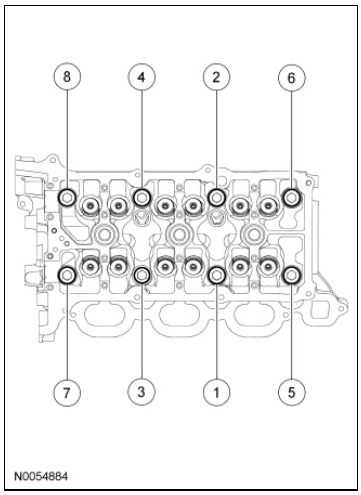
1. **NOTE:** Lubricate the valve stem seal with clean engine oil prior to installation.

   Using the Valve Stem Oil Seal Installer, install a new valve stem seal.

2. Using the Valve Spring Compressors, install the valve spring, retainer and key.

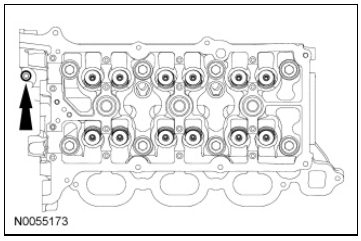
3. Install the valve tappets. For additional information, refer to Valve Tappets in this section.

Cylinder Head - RH



Material

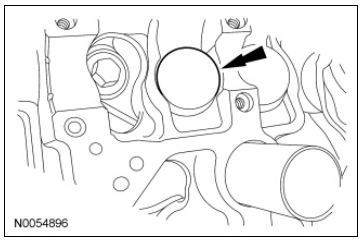
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



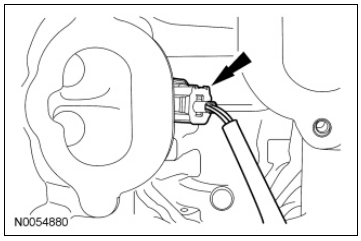
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

All engines

1. Install a new gasket, the RH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 45 degrees.



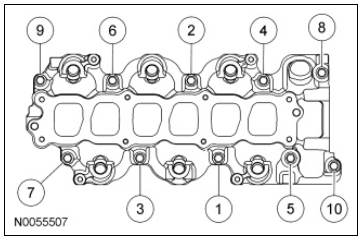
2. Install the new M6 bolt.
    - Tighten to 10 Nm (89 lb-in).



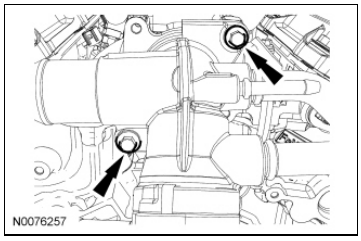
3. **NOTE:** The valve tappets must be installed in their original positions.

   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   Install the valve tappets.



4. Install and connect the Cylinder Head Temperature (CHT) sensor jumper harness.



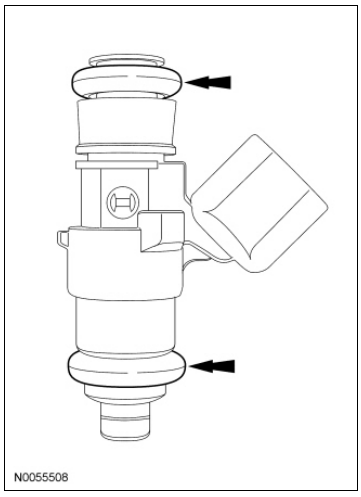
5. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Using new gaskets, install the lower intake manifold and the 10 bolts.

   - Tighten in the sequence shown to 10 Nm (89 lb-in).

6. Using a new gasket and O-ring seal, install the thermostat housing and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

7. Connect the coolant bypass hose to the thermostat housing.



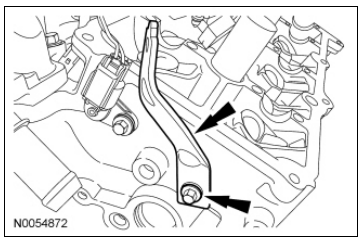
8. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.**

   NOTE: The upper and lower O-ring seals are not interchangeable.

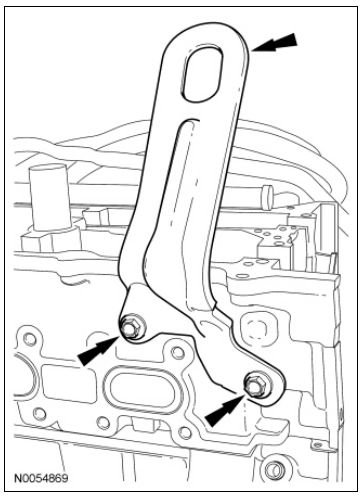
   Install new fuel injector O-ring seals.

   - Remove the retaining clips and separate the fuel injectors from the fuel rail.
   - Remove and discard the O-ring seals.
   - Install new O-ring seals and lubricate with clean engine oil.
   - Install the fuel injectors and the retaining clips onto the fuel rail.

9. Install the fuel rail and injectors as an assembly and install the 4 bolts.
   - Tighten to 10 Nm (89 lb-in).



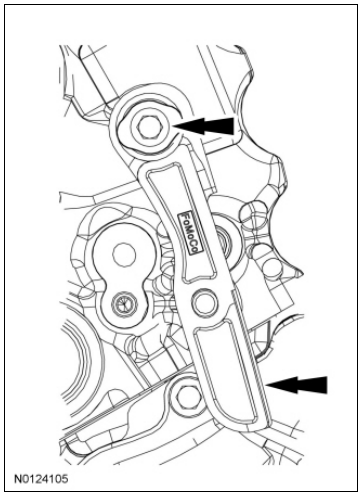
10. Install the RH Camshaft Position (CMP) sensor and the bolt.
    - Tighten to 10 Nm (89 lb-in).



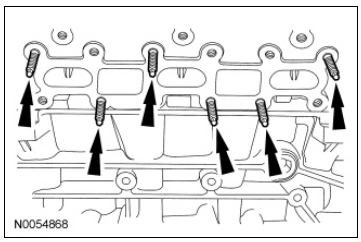
11. **NOTE:** Align the bracket with the index mark made during removal.

    Install the upper intake manifold support bracket and the bolt.

    - Tighten to 10 Nm (89 lb-in).

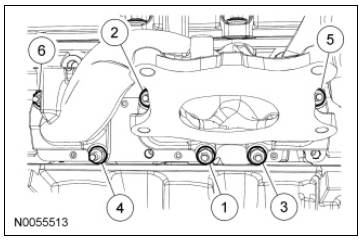


12. Install the engine lifting eye and the 2 bolts.
    - Tighten to 24 Nm (18 lb-ft).

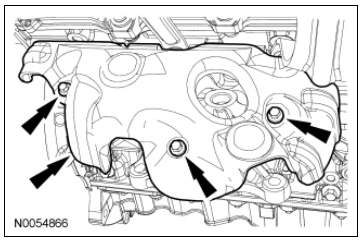


13. Install the RH secondary timing chain tensioner and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

14. Install the RH timing chain guide and bolt.
    - Tighten to 10 Nm (89 lb-in).



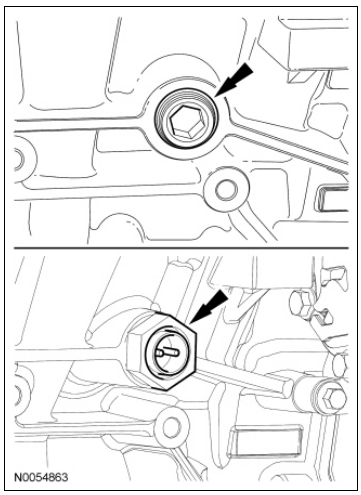
15. Install 6 new RH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).



16. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

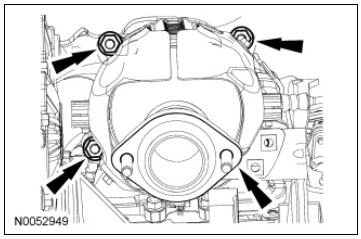
    Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:

    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).

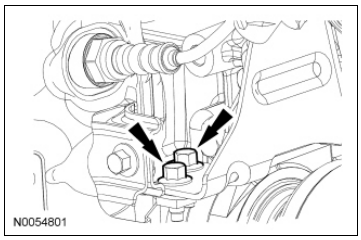


17. Install the RH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).

18. Install the RH cylinder block drain plug or, if equipped, the block heater.
    - Tighten the cylinder block drain plug to 10 Nm (89 lb-in) plus an additional 720 degrees.



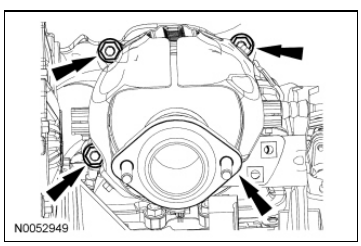
- Tighten the block heater to 40 Nm (30 lb-ft).



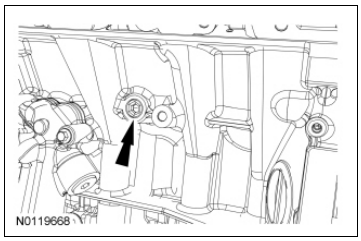
All-Wheel Drive (AWD) vehicles

19. **NOTE:** Do not tighten the 4 catalytic converter nuts at this time.

    Using a new gasket, install the RH catalytic converter and 4 new nuts.

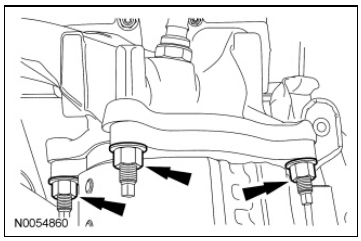


20. Install the 2 RH catalytic converter bracket bolts.
    - Tighten the 4 catalytic converter nuts to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter brackets to 20 Nm (177 lb-in).

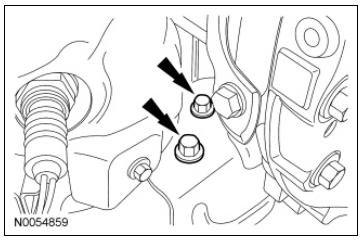


Front Wheel Drive (FWD) vehicles

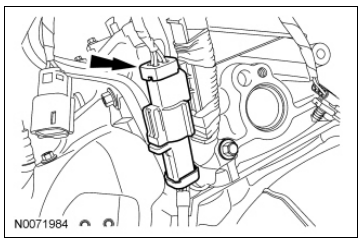
21. Using a new gasket, install the RH catalytic converter and 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).



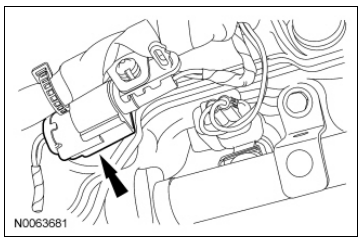
All engines



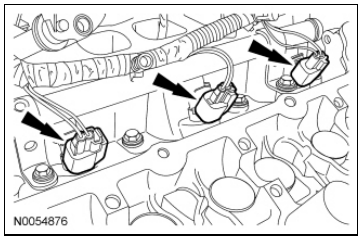
22. Install the LH cylinder block drain plug.
    - Tighten to 16 Nm (142 lb-in) plus an additional 180 degrees.



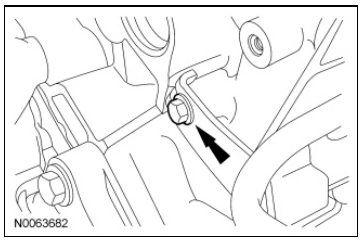
23. Using a new gasket, install the LH catalytic converter and 4 new nuts (3 shown).
    - Tighten to 40 Nm (30 lb-ft).



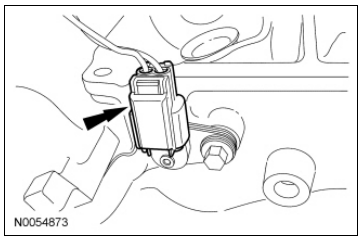
24. Install the 2 LH catalytic converter bracket bolts.
    - Tighten to 20 Nm (177 lb-in).



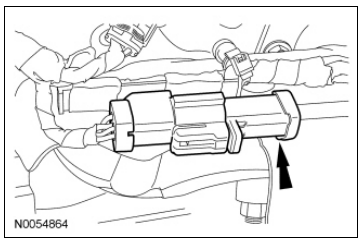
25. Connect the LH Catalyst Monitor Sensor (CMS) sensor electrical connector.



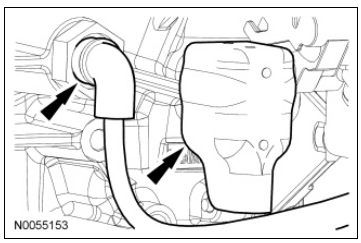
26. Connect the CHT sensor electrical connector.



27. Connect the 6 fuel injector electrical connectors (3 shown).



28. Install the Power Steering Pressure (PSP) tube bracket and bolt.
    - Tighten to 10 Nm (89 lb-in).



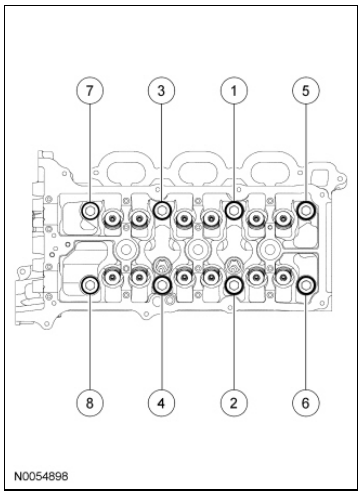
29. Connect the RH CMP sensor electrical connector.

30. Connect the RH HO2S electrical connector.

31. If equipped, install the block heater wiring harness onto the engine.
    - Connect the block heater electrical connector and install the heat shield.

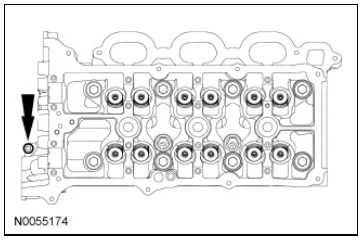
32. Install the RH camshafts. For additional information, refer to Camshaft in this section.

Cylinder Head - LH



Material

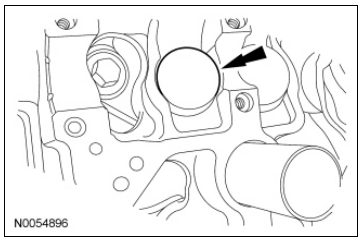
Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



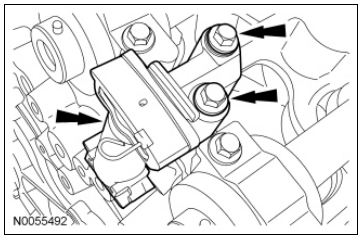
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

All vehicles

1. Install a new gasket, the LH cylinder head and 8 new bolts. Tighten in the sequence shown in 5 stages:
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 35 Nm (26 lb-ft).
    - Stage 3: Tighten 90 degrees.
    - Stage 4: Tighten 90 degrees.
    - Stage 5: Tighten 45 degrees.



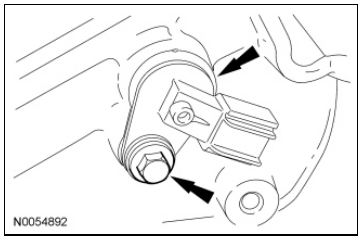
2. Install the new M6 bolt.
    - Tighten to 10 Nm (89 lb-in).



3. **NOTE:** The valve tappets must be installed in their original positions.

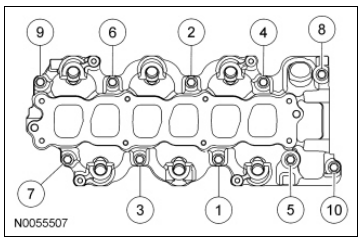
   NOTE: Coat the valve tappets with clean engine oil prior to installation.

   Install the valve tappets.

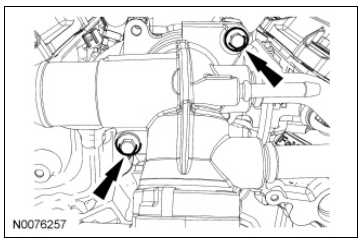


4. Install the LH secondary timing chain tensioner and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

5. Install the upper LH primary timing chain guide and the bolt.
   - Tighten to 10 Nm (89 lb-in).



6. Install LH Camshaft Position (CMP) sensor and the bolt.
   - Tighten to 10 Nm (89 lb-in).



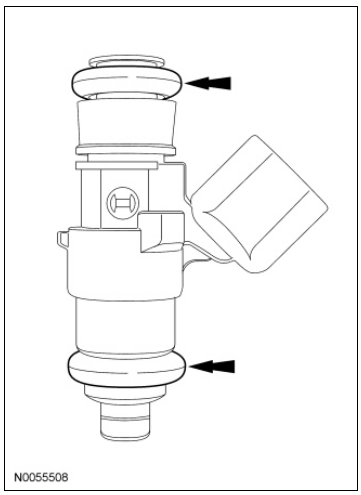
7. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

   Using new gaskets, install the lower intake manifold and the 10 bolts.

   - Tighten in the sequence shown to 10 Nm (89 lb-in).

8. Using a new gasket and O-ring seal, install the thermostat housing and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

9. Connect the coolant bypass hose to the thermostat housing.

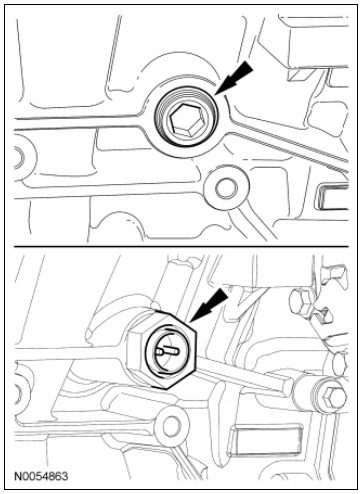


10. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.**

    NOTE: The upper and lower O-ring seals are not interchangeable.

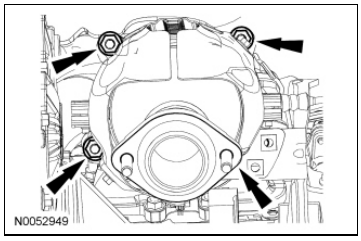
    Install new fuel injector O-ring seals.

    - Remove the retaining clips and separate the fuel injectors from the fuel rail.
    - Remove and discard the O-ring seals.
    - Install new O-ring seals and lubricate with clean engine oil.

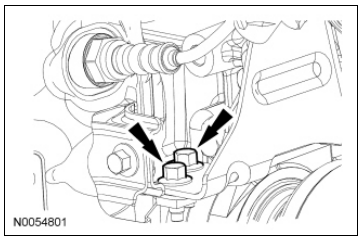


- Install the fuel injectors and the retaining clips onto the fuel rail.

11. Install the fuel rail and injectors as an assembly and install the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).



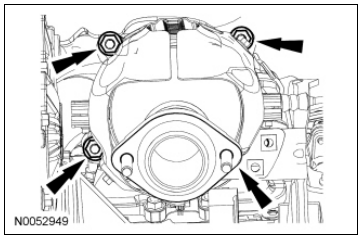
12. Install the RH cylinder block drain plug or, if equipped, the block heater.
    - Tighten the cylinder block drain plug to 10 Nm (89 lb-in) plus an additional 720 degrees.
    - Tighten the block heater to 40 Nm (30 lb-ft).



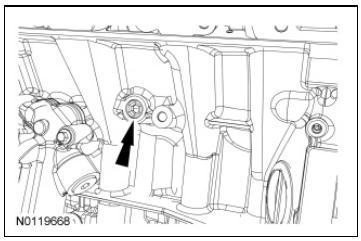
All-Wheel Drive (AWD) vehicles

13. **NOTE:** Do not tighten the 4 catalytic converter nuts at this time.

    Using a new gasket, install the RH catalytic converter and 4 new nuts.

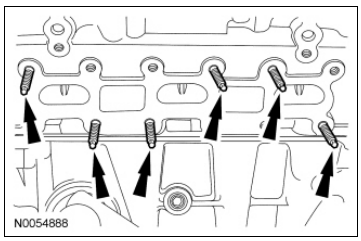


14. Install the 2 RH catalytic converter bracket bolts.
    - Tighten the 4 catalytic converter nuts to 40 Nm (30 lb-ft).
    - Tighten the 2 catalytic converter brackets to 20 Nm (177 lb-in).



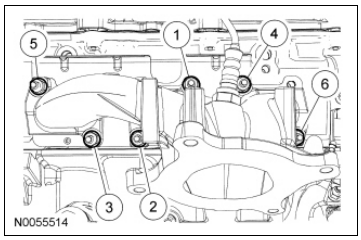
Front Wheel Drive (FWD) vehicles

15. Using a new gasket, install the RH catalytic converter and 4 new nuts.
    - Tighten to 40 Nm (30 lb-ft).

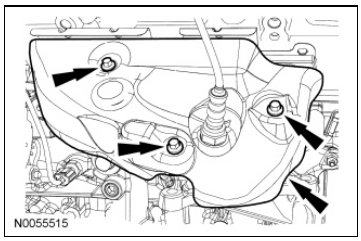


All vehicles

16. Install the LH cylinder block drain plug.
    - Tighten to 16 Nm (142 lb-in) plus an additional 180 degrees.



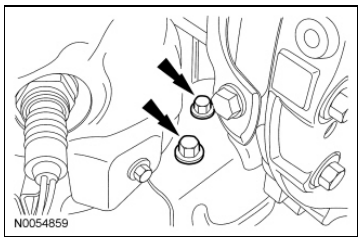
17. Install 6 new LH exhaust manifold studs.
    - Tighten to 12 Nm (106 lb-in).



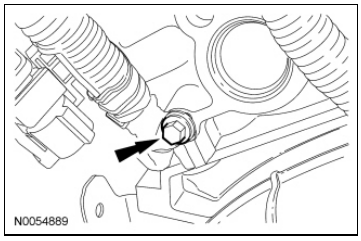
18. ***NOTICE:*** **Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.**

    Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:

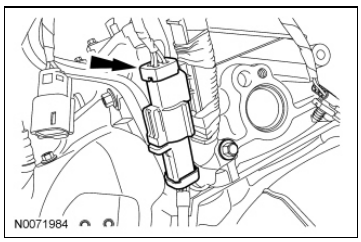
    - Stage 1: Tighten to 20 Nm (177 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).



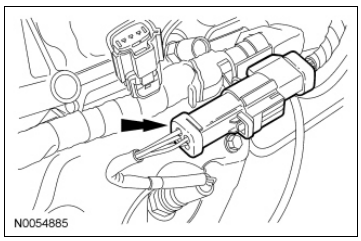
19. Install the LH exhaust manifold heat shield and the 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



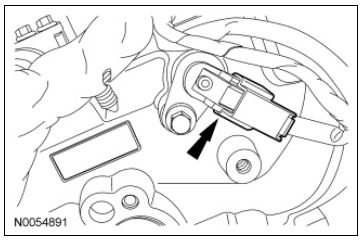
20. Using a new gasket, install the LH catalytic converter and 4 new nuts (3 shown).
    - Tighten to 40 Nm (30 lb-ft).



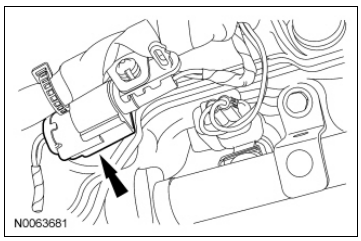
21. Install the 2 LH catalytic converter bracket bolts.
    - Tighten to 20 Nm (177 lb-in).



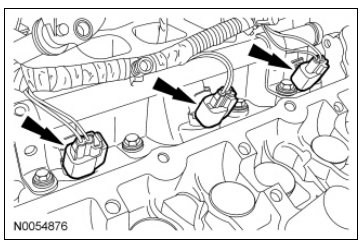
22. Install the wiring harness retainer bolt on the rear of the LH cylinder head.
    - Tighten to 10 Nm (89 lb-in).



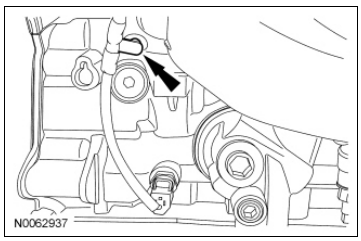
23. Connect the LH Catalyst Monitor Sensor (CMS) sensor electrical connector.



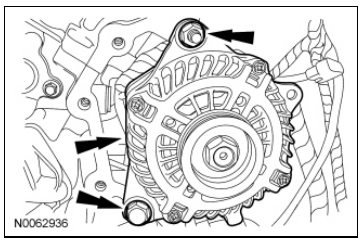
24. Connect the LH Heated Oxygen Sensor (HO2S) electrical connector.



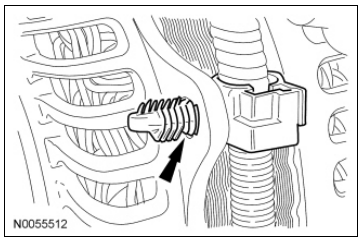
25. Connect the LH CMP sensor electrical connector.



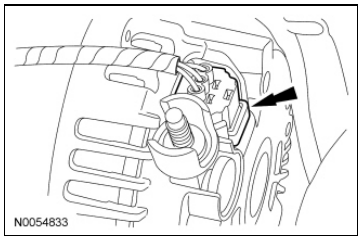
26. Connect the Cylinder Head Temperature (CHT) sensor electrical connector.



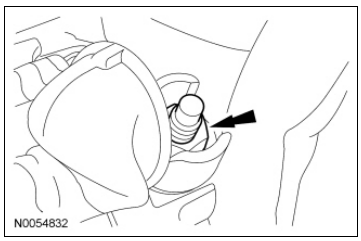
27. Connect the 6 fuel injector electrical connectors (3 shown).



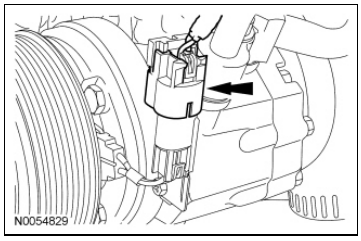
28. Attach the wiring harness pin-type retainer.



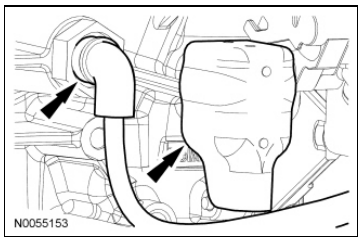
29. Install the generator, the bolt and the nut.
    - Tighten to 48 Nm (35 lb-ft).



30. Attach the wiring harness retainer to the generator.



31. Connect the generator electrical connector.

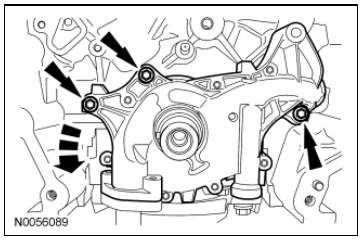


32. Connect the generator B+ cable and install the nut.
    - Tighten to 12 Nm (106 lb-in).

33. Connect the A/C compressor electrical connector.

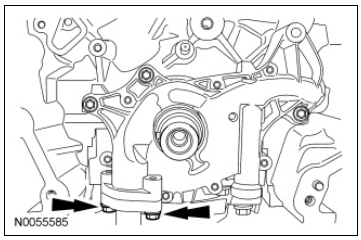
34. If equipped, install the block heater wiring harness onto the engine.
    - Connect the block heater electrical connector and install the heat shield.

35. Install the LH camshafts. For additional information, refer to Camshaft in this section.



Oil Pump

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

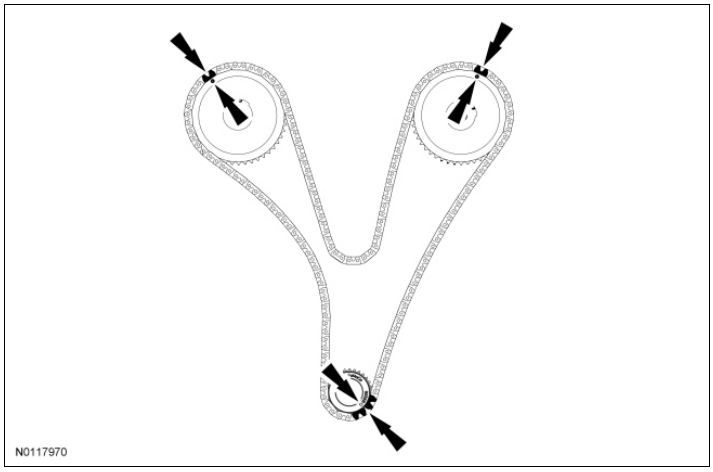


1. **NOTE:** Install a new oil pump screen and pickup tube O-ring seal prior to installing the oil pump.

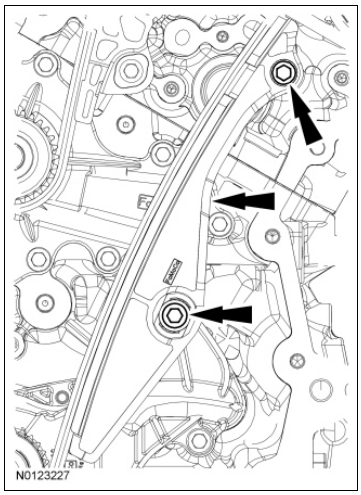
   Position the oil pump onto the crankshaft and rotate counterclockwise to position the pump onto the oil pump screen and pickup tube.

   - Install the 3 bolts and tighten to 10 Nm (89 lb-in).

2. Install the 2 oil pump screen and pickup tube bolts.
   - Tighten to 10 Nm (89 lb-in).

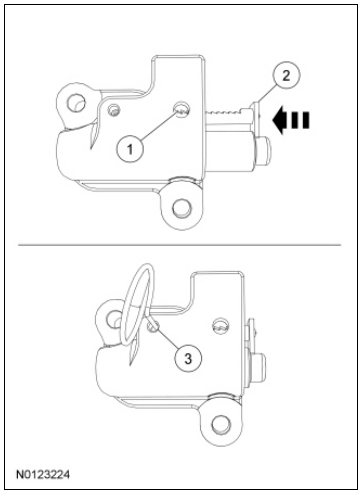


3. Install the crankshaft timing chain sprocket.



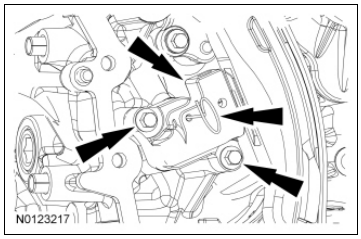
4. **NOTE:** The crankshaft sprocket timing mark should be between the 2 colored links.

   Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

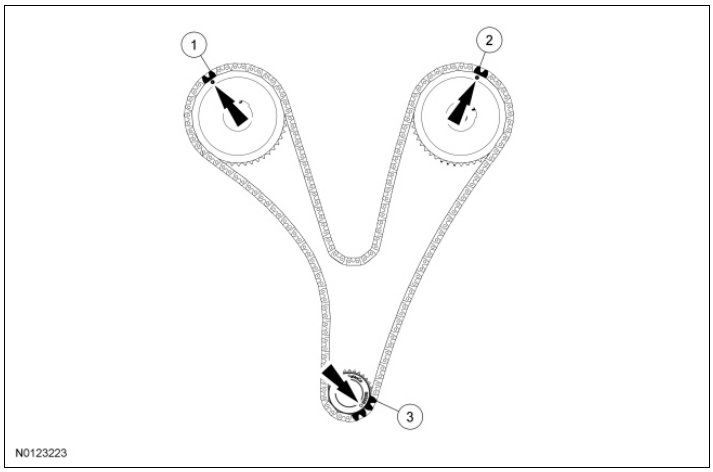


5. Install the lower LH primary timing chain guide and the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).

6. Install the primary timing chain tensioner arm.



7. Reset the primary timing chain tensioner.
    1. Release the ratchet detent.
    2. Using a soft-jawed vise, compress the ratchet plunger.
    3. Align the hole in the ratchet plunger with the hole in the tensioner housing and install a suitable lockpin.

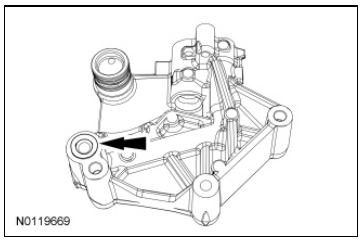


8. **NOTE:** It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

   Install the primary tensioner and the 2 bolts.

   - Tighten to 10 Nm (89 lb-in).
   - Remove the lockpin.

9. As a post-check, verify correct alignment of all timing marks.
   - There are 48 links between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
   - There are 35 links between the LH intake VCT assembly colored link (2) and the 2 crankshaft sprocket colored links (3).



10. Install new VCT housing seals.

11. **NOTE:** RH shown, LH similar.

    NOTE: During removal, the O-ring seal may remain on the cylinder head. If so, remove the O-ring seal from the cylinder head, inspect the seal (replace as necessary) and install the O-ring seal on the VCT housing.

    Inspect the VCT housing-to-cylinder head O-ring seals for damage and replace as necessary.

12. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the LH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

13. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the RH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

14. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Material

Item	Specification	Fill Capacity
Motorcraft® Metal Surface Prep ZC-31-A	-	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A	5.0L (5.3 qt) includes filter change
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A	[a]
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D	[a]
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B	-
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A	-
Silicone Gasket and Sealant TA-30	WSd>	-
Motorcraft® Silicone Gasket Remover ZC-30	-	-
Thread Sealant with PTFE TA-24	WSK-M2G350-A2	-

[a] Early build vehicle cooling systems are filled with Motorcraft® Specialty Green Engine Coolant and late build vehicle cooling systems are filled with Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.

General Specifications

Item	Specification
Displacement	2.5L
No. of cylinders	4

Bore/stroke	89/100
Firing order	1-3-4-2
Oil pressure (hot @ 2,000 rpm)	29-39 psi 200-268 kPa
Compression ratio	12.5:1
Engine weight (without accessory drive components)	121.3 kg (267.5 lb)
Engine and transaxle weight (without accessory drive components)	257.1 kg (567 lb)
Cylinder Block	
Cylinder bore diameter	89-89.3 mm (3.503-3.517 in)
Cylinder bore maximum out-of-round	0.008 mm (0.0003 in)
Main bearing bore diameter	57.018-57.040 mm (2.244-2.245 in)
Head gasket surface flatness	0.1 mm/general 0.05 mm/200 x 200 (0.003 in/general) (0.0019 in/7.87 x 7.87)
Piston	
Diameter (1)	88.965-88.975 mm (3.5025-3.5026 in)
Diameter (2)	88.975-88.985 mm (3.5026-3.5033 in)
Diameter (3)	88.985-88.995 mm (3.5033-3.5037 in)
Piston-to-bore clearance	0.025-0.045 mm (0.0009-0.0017 in)
Ring groove width - top	1.203-1.205 mm (0.0473-0.0474 in)
Ring groove width - 2nd	1.202-1.204 mm (0.0473-0.0474 in)
Ring groove width - oil	2.501-2.503 mm (0.0984-0.0985 in)
Piston skirt coating thickness	

	0.008-0.016 mm (0.0003-0.0006 in)
Piston Pin	
Diam	19.995-20 mm (0.7872-0.7874 in)
Length	54.7-55 mm (2.153-2.165 in)

	90	66	-
Engine timing plug bolt	20	-	177
Engine-to-transaxle bolts	48	35	-
Engine wiring harness connector bracket	15	-	133
Electronic Power Assist Steering (EPAS) ground wire bolt	10	-	89
Exhaust manifold studs	17	-	150
Flywheel bolt [a]	-	-	-
Fuel rail bolts	23	17	-
Intake manifold bolts	18	-	159
Knock Sensor (KS)	20	-	177

Lower front cover timing hole plug	12		
Main bearing beam bolts [a]	-	-	-
Master cylinder reservoir bolts	10	-	89
Motor Electronics Cooling System (MECS) coolant expansion tank nut and bolt	10	-	89
Oil drain plug	28	21	-
Oil filter adapter bolts	25	18	-
Oil filter [b]	-	-	-
Oil pan bolts [a]	-	-	-
Oil pan-to-bellhousing bolts	48	35	-
Oil pump drive chain tensioner shoulder bolts	10	-	89
Oil pump screen and pickup tube bolts	10	89	
Oil pump sprocket bolt	25	18	-
Oil pump-to-engine block bolts [a]	-	-	-
Oil squirters	4	-	35
Radio capacitor nut	10	-	89
Spark plug	12	-	106
Stabilizer bar link nuts	40	30	-
Steering column shaft-to-steering gear bolt	23	17	-
Subframe bracket-to-body bolts	103	76	-
Subframe nuts	150	111	-
Thermostat housing bolts	10	-	89
Tie-rod end nuts	35	-	
Timing chain guide bolts	10	-	89
Timing chain tensioner bolts	10	-	89
Transaxle selector lever cable bracket nuts	12	-	106
Transaxle damper bolts	29	21	-
Transaxle ground wire nut	10	-	89
Transaxle harness wiring retainer bolt	10	-	89
Transaxle-to-engine bolts	48	35	-
Upper transaxle insulator nuts	90	66	-
Upper front cover timing hole plug	10	-	89
Vacuum pump assembly bolts	25	18	-
Vacuum pump assembly nut	25	18	-
Valve cover bolts [a]	-	-	-
Variable Camshaft Timing (VCT) plug	17	-	150
VCT solenoid bolt	10	-	89

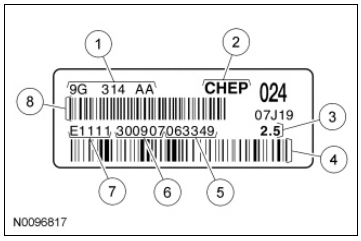
[a] Refer to the procedure in this section.

[b] Tighten the pin-on oil filter three-fourths of a turn after the oil filter gasket makes contact with the oil filter adapter.

Engine

The 2.5L (153 CID) 4-cylinder engine has the following features:

- Dual overhead camshaft
- Four valves per cylinder
- Sequential Multi-Port Fuel Injection (SFI)
- Aluminum cylinder head
- Aluminum cylinder block
- Electronic ignition system with 4 coil-on-plug ignition coils

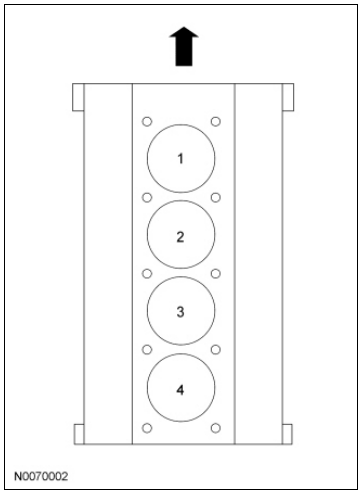


The 2.5L engine is a 4 valve-per-cylinder, dual overhead camshaft engine. The engine uses a coil-on-plug ignition system. The cylinder block is made of aluminum and the bearing caps are integrated into the ladder assembly. An aluminum oil pan bolts to the bottom of the lower cylinder block and to the transmission to provide greater strength. The camshafts are mounted in the cylinder heads and act against valve tappets to open and close the valves. The camshafts are driven off the front of the cylinder head by one timing chain. The chain isven by a sprocket that is located on the crankshaft. The piston assembly is an aluminum piston with a cast iron connecting rod. The oil pump is driven by the crankshaft via a dedicated chain that is driven by the same sprocket that drives the timing chain.

Engine Identification

Always refer to these labels when installation of new parts is necessary or when checking engine calibrations. The engine parts often differ within a CID family. Verification of the identification codes will make sure the correct parts are obtained. These codes contain all the pertinent information relating to the dates, optional equipment and revisions. The Ford Catalog AdvantageTM or equivalent contains a complete listing of the codes and their applications.

Engine Code Information Label



The engine code information label, located on the front side of the valve cover, contains the following:

Item	Description
1	Engine part number
2	Chihuahua engine plant
3	Engine displacement
4	Bar code
5	Running number

6	Engine build date (DDMMYY)
7	Plant shift line
8	Bar code

Engine Cylinder Identification

Exhaust Emission Control System

Operation and necessary maintenance of the exhaust emission control devices used on this engine are covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 4 solenoid-operated fuel injectors:

- are mounted in the intake manifold.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.
- are connected in series with the fuel pressure sensor.
- supply fuel from the fuel tank with a fuel pump mounted in the fuel tank.

A constant fuel pressure is maintained across the fuel injectors by the fuel pressure sensor. The fuel pressure sensor:

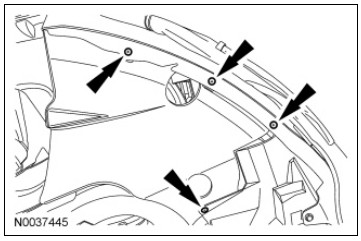
- is positioned upstream from the fuel injectors on the fuel injection supply manifold.

Lubrication System

The engine lubrication system operates as follows:

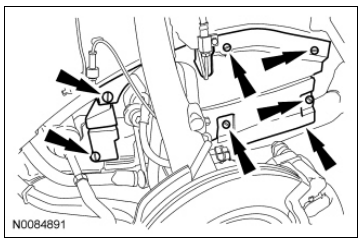
- Oil is drawn into the oil pump through the oil pump screen cover and tube in the sump of the oil pan.
- Oil is pumped through the oil filter on the left front side of the cylinder block.
- Oil enters the main galley where it is distributed to the crankshaft main journals and to the cylinder head.

- From the main journals, the oil is routed through cross-drilled passages in the crankshaft to lubricate the connecting rod bearings. Controlled leakage through the crankshaft main bearings and connecting rod bearings is slung radially outward to cool and lubricate the cylinder walls, as well as the entire connecting rod, piston and piston ring assembly.



Engine

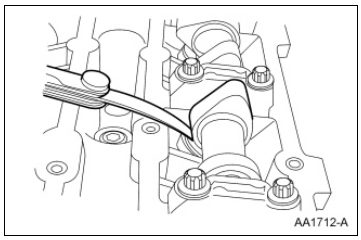
Refer to Section 303-00 for basic mechanical concerns or refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for driveability concerns.



Valve Clearance Check

1. Remove the valve cover. For additional information, refer to Valve Cover in this section.

2. Remove the 4 screws and position the RH fender splash shield aside.



3. Remove the 6 pin-type retainers and the RH splash shield.

4. **NOTE:** Turn the engine clockwise only, and only use the crankshaft bolt.

   NOTE: Before removing the camshafts, measure the clearance of each valve at base circle, with the lobe pointed away from the tappet. Failure to measure all clearances prior to removing the camshafts will necessitate repeated removal and installation and wasted labor time.

   Use a feeler gauge to measure the clearance of each valve and record its location.

5. **NOTE:** The number on the valve tappet only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

   NOTE: The nominal clearance is:

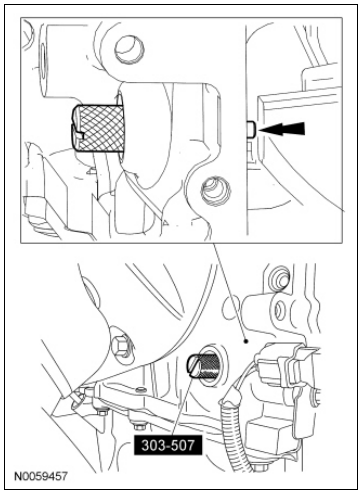
   - intake: 0.25 mm (0.0095 in).
   - exhaust: 0.30 mm (0.0115 in).

   The acceptable clearances after being fully installed are:

   - intake: 0.22-0.28 mm (0.008-0.011 in).
   - exhaust: 0.27-0.33 mm (0.010-0.013 in).

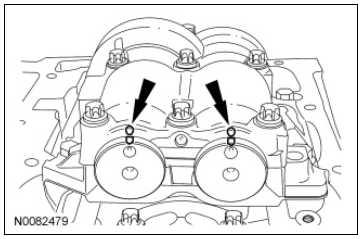
Select tappets using this formula: tappet thickness = measured clearance + the existing tappet thickness - nominal clearance.

Select the closest tappet size to the ideal tappet thickness available and mark the installation location.



6. If any tappets do not measure within specifications, install new tappets in these locations. For additional information, refer to Valve Train Components - Exploded View and Valve Tappets in this section.

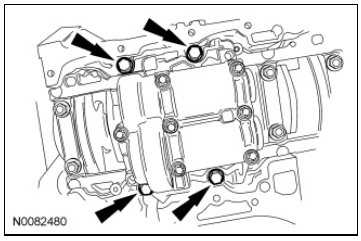
Balance Shaft Backlash



Special Tool(s)

 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C)
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

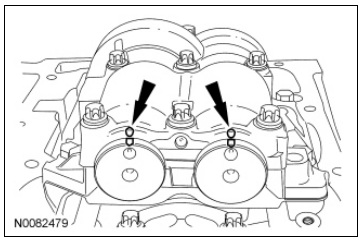
1. Install the Crankshaft TDC Timing Peg and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg. The engine is now at Top Dead Center (TDC).



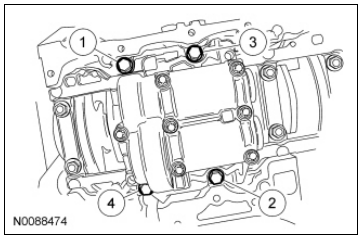
2. Mark the balancer unit and shafts on the top for reference that the balancer unit is at TDC .

3. **NOTE:** Due to the precision interior construction of the balancer unit, it should not be disassembled.

   Remove the 4 bolts and the balancer unit.

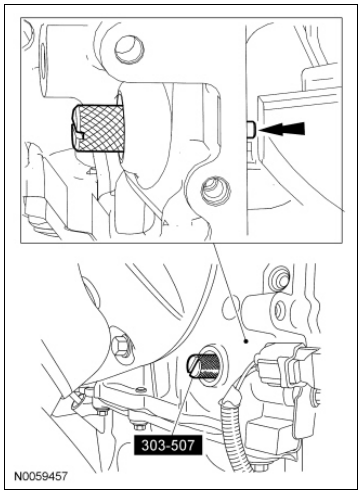


4. Remove the adjustment shims from the seat faces of the balancer unit.

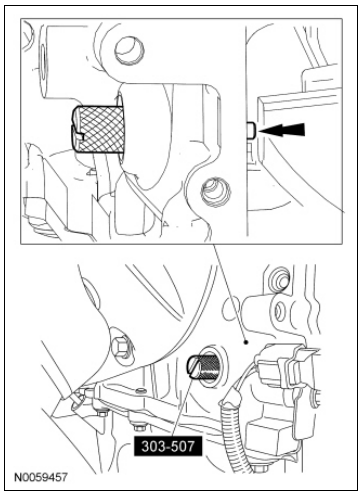


5. ***NOTICE:*** **Visually inspect the balancer unit gear for damage and verify that the shaft turns smoothly. If there is any damage or malfunction, replace the balancer unit.**

   Install the master adjustment shims (No. 50) on the seat faces of the balancer unit.



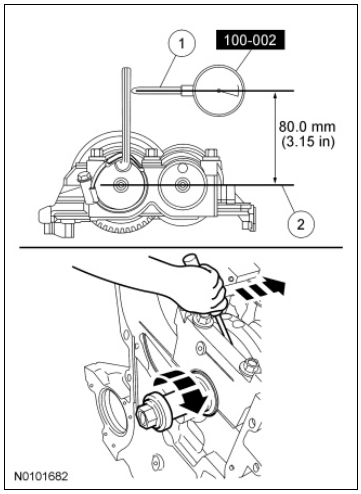
6. With the balancer unit shaft marks at the TDC position, slowly install the balancer unit to the cylinder block to avoid interference between the crankshaft drive gear and the balancer unit driven gear.



7. Install the balancer unit bolts.
   - Tighten in the sequence shown in 2 stages.
     - ♦ Stage 1: Tighten to 25 Nm (18 lb-ft).
     - ♦ Stage 2: Tighten to 50 Nm (37 lb-ft).

8. Remove the Crankshaft TDC Timing Peg.
   - Rotate the crankshaft to confirm that there are no meshing problems between the balancer unit gear and the crankshaft gear.

9. Install the Crankshaft TDC Timing Peg and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg.
    - Remove the Crankshaft TDC Timing Peg.



10. **NOTE:** Measure the backlash and verify that it is within specified range at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees. It will be necessary to reset the measuring equipment between measurements.

    NOTE: The measurement must be taken with the Dial Indicator Gauge with Holding Fixture, a 5-mm Allen wrench and worm clamp set up as shown. Mark the Allen wrench with a file 80 mm (3.149 in) above the driven gear shaft center. Make sure the worm clamp and Allen wrench are not touching the balance shaft housing.

    NOTE: For an accurate measurement while measuring the gear backlash, insert a screwdriver as shown into the crankshaft No. 1 crankweight area and set both the rotation and the thrust direction with the screwdriver, using a prying action as shown.

    Position the Dial Indicator Gauge with Holding Fixture as shown. Measure the gear backlash.

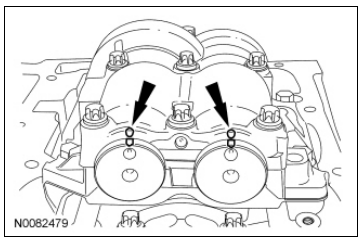
    - Position the Dial Indicator Gauge with Holding Fixture (1) on the Allen wrench 80 mm (3.149 in) above the driven gear shaft center (2) on the balancer unit.
    - Rotate the crankshaft clockwise and measure the backlash at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees.

11. **NOTE:** If maximum backlash exceeds 0.101 mm (0.003 in), install a new balancer unit.

    Using the backlash measurement, select the proper shims from the Adjustment Shim Selection Table.

    - Remove the balancer unit from the cylinder block.
    - Install the selected adjustment shims on the seat faces of the balancer unit.

ADJUSTMENT SHIM SELECTION TABLE



Backlash mm (in)	Selection shim (No.)	Shim thicness mm (in)	Backlash mm (in)	Selection shim (No.)	Shim thicness mm (in)

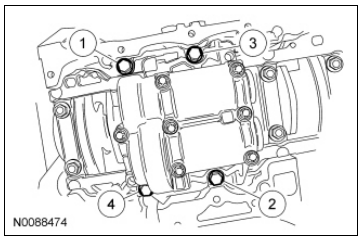
N0101731



12. Install the Crankshaft TDC Timing Peg and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg. The engine is now at TDC .

13. With the balancer unit shaft marks in the TDC position, slowly install the balancer unit to the cylinder block to avoid interference between the crankshaft drive gear and the balancer unit driven gear.

14. Install the balancer unit bolts.
    - Tighten in the sequence shown in 2 stages.
        - ♦ Stage 1: Tighten to 25 Nm (18 lb-ft).
        - ♦ Stage 2: Tighten to 50 Nm (37 lb-ft).

15. **NOTE:** Remeasure the backlash and verify that it is within specified range at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees. It will be necessary to reset the measuring equipment between measurements.

    NOTE: The measurement must be taken with the Dial Indicator Gauge with Holding Fixture, a 5-mm Allen wrench and worm clamp set up as shown. Mark the Allen wrench with a file 80 mm (3.149 in) above the driven gear shaft center. Make sure the worm clamp and Allen wrench are not touching the balance shaft housing.

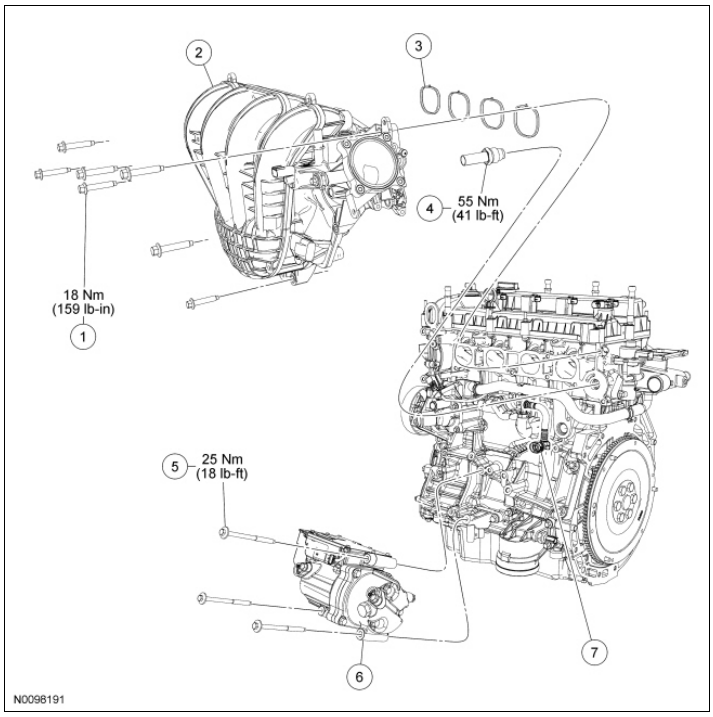
    NOTE: For an accurate measurement while measuring the gear backlash, insert a screwdriver as shown into the crankshaft No. 1 crankweight area and set both the rotation and the thrust direction with the screwdriver, using a prying action as shown.

    Position the Dial Indicator Gauge with Holding Fixture as shown. Measure the gear backlash.

    - Position the Dial Indicator Gauge with Holding Fixture (1) on the Allen wrench 80 mm (3.149 in) above the driven gear shaft center (2) on the balancer unit.

- Rotate the crankshaft clockwise and measure the backlash at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees.
- If the backlash exceeds the specified range of 0.005 to 0.101 mm (0.00019 to 0.0039 in), install a new balancer unit and repeat the procedure.

Intake Manifold



Intake Manifold (View 1 of 2)

Item	Part Number	Description
1	14A464	Engine Oil Pressure (EOP) switch electrical connector (part of 12A581)
2	14A464	Manifold Absolute Pressure (MAP) sensor electrical connector (part of 12A581)
3	-	Wiring harness retainer (3 required) (part of 12A581)
4	-	Vacuum tube
5	-	Evaporative Emission (EVAP) canister purge valve electrical connector (part of 12A581)
6	6C324	EVAP tube-to-EVAP canister purge valve quick connect coupling
7	-	Auxiliary coolant pump electrical connector

8	-	Auxiliary coolant pump wiring retainers (2 required)
9	-	Lower radiator hose retainer
10	-	Engine wiring harness retainer (part of 12A581)
11	-	Vehicle high voltage electrical system wire retainer
12	14A464	Knock Sensor (KS) electrical connector (male side, part of 12A581)
13	14A464	KS electrical connector (female side, part of 12A581)

Intake Manifold (View 2 of 2)

Item	Part Number	Description
1	W500311	Intake manifold bolt (7 required)
2	9424	Intake manifol/tr>
3	9441	Intake manifold gasket (4 required)
4	9E470	EGR tube
5	W500326	A/C compressor bolt (3 required)
6	19703	A/C compressor
7	6758	PCV hose connector

Removal and Installation

1. With vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. *NOTICE:* **Before removing the high voltage cables, the vehicle electrical system must be completely shut down for at least 5 minutes to allow for the high voltage capacitors to discharge.**

   Depower the vehicle high voltage electrical system. For additional information, refer to Section 414-03 .

3. Remove the fuel rail. For additional information, refer to Section 303-04D .

4. Remove the Throttle Body (TB). For additional information, refer to Section 303-04D .

5. Remove the accessory drive belt tensioner. For additional information, refer to Section 303-05D .

6. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

7. Disconnect the Manifold Absolute Pressure (MAP) sensor electrical connector.

8. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.

9. Disconnect the EVAP tube-to- EVAP canister purge valve quick connect coupling and the vacuum tube from the intake manifold.

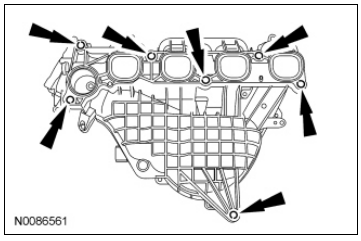
10. Detach the 3 wiring retainers from the intake manifold near the throttle body mounting area.

11. Disconnect the auxiliary coolant pump electrical connector and detach the 2 wiring retainers.

12. Detach the lower radiator hose retainer from the intake manifold.

13. Detach the engine wiring harness retainer and the vehicle high voltage electrical system wire retainer from the intake manifold.

14. Disconnect the Knock Sensor (KS) electrical connector and detach the retainer from the intake manifold.



15. Remove the cooling fan motor and shroud. For additional information, refer to Section 303-03B .

16. Remove the 3 A/C compressor bolts and position the compressor aside.
    - To install, tighten to 25 Nm (18 lb-ft).

17. **NOTE:** The cylinder head side of the intake manifold is showing the location of the 7 bolts.

    Remove the 7 bolts and position the intake manifold aside to access the PCV hose connector.

    - To install, tighten to 18 Nm (159 lb-in).

Intake Manifold (View 2 of 2)

18. Squeeze the 2 PCV hose connector tabs and disconnect the PCV hose from the intake manifold.

19. Remove the intake manifold and gaskets.

20. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

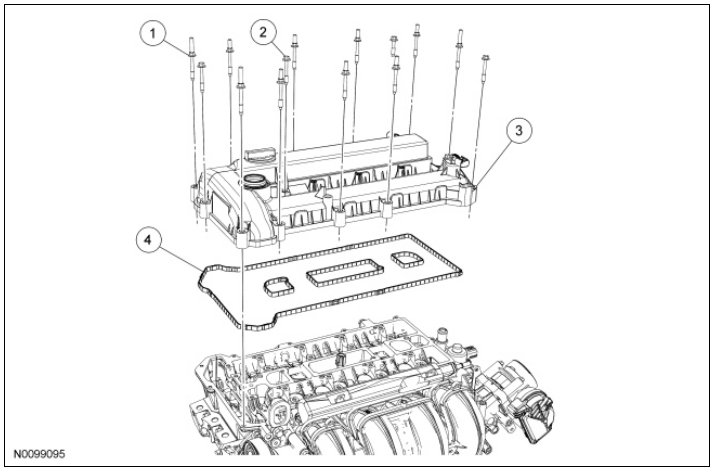
    To install, reverse the removal procedure.

    - Inspect and install new intake manifold gaskets if necessary.

Valve Cover

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



Valve Cover (View 1 of 2)

Item	Part Number	Description
1	6853	Crankcase vent hose
2	6A957	Engine cover stud (4 required)
3	14A163	
4	14A464	Camshaft Position (CMP) sensor electrical connector (part of 12A581)
5	14A464	Cylinder Head Temperature (CHT) sensor electrical connector (part of 12A581)
6	14A464	Variable Camshaft Timing (VCT) solenoid electrical connector (part of 12A581)
7	6750	Oil level indicator

8	18472	Heater hose tube assembly
9	-	Block heater wiring retainers (if equipped) (2 required)
10	-	High voltage wiring harness retainer (part of 14300)

Valve Cover (View 2 of 2)

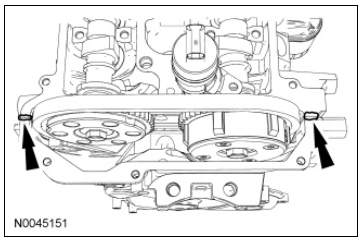
Item	Part Number	Description
1	6C293	Valve cover retainer (10 required)
2	6C295	Valve cover retainer (4 required)
3	6582	Valve cover
4	6584	Valve cover gasket

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the ignition coil-on-plugs. For additional information, refer to Section 303-07A .
3. Disconnect the crankcase vent hose from the valve cover.
4. Detach the 2 block heater wiring harness retainers (if equipped) and the 2 high voltage wiring harness retainers from the valve cover studs.
5. Remove the 4 engine cover studs.
6. Position the heater tube assembly off the valve cover stud bolts.
7. Detach the 3 wire harness retainers from the valve cover and stud bolts.
8. Disconnect the Camshaft Position (CMP) sensor electrical connector.
9. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

10. Disconnect the Variable Camshaft Timing (VCT) solenoid electrical connector.
11. Remove the oil level indicator.
12. Remove the 14 valve cover retainers, the valve cover and gasket.



Installation

1. *NOTICE:* **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

   Clean and inspect the sealing surfaces.

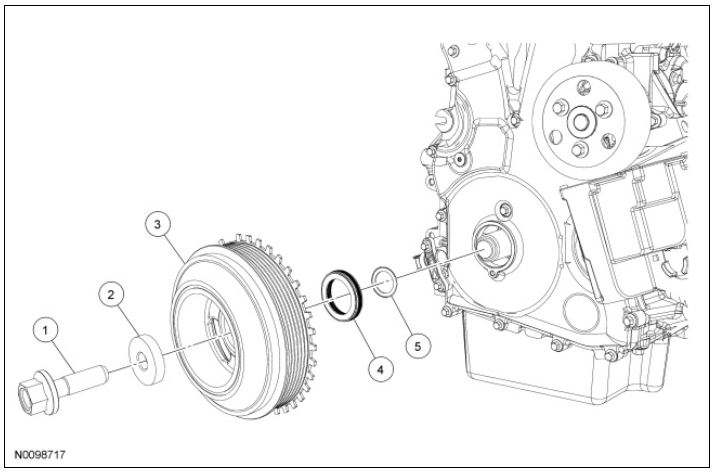
2. **NOTE:** The valve cover must be secured within 4 minutes of silicone gasket application. If the valve cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface prep.

   Apply silicone gasket and sealant to the locations shown.

3. **NOTE:** Clean and inspect the gasket. Install a new gasket, if necessary.

   Install the valve cover, gasket and retainers.

   - Tighten in the sequence shown to 10 Nm (89 lb-in).



4. Install the oil level indicator.
5. Connect the VCT solenoid electrical connector.
6. Connect the CHT sensor electrical connector.
7. Connect the CMP sensor electrical connector.
8. Attach the 3 wire harness retainers to the valve cover stud bolts.
9. Position the heater tube assembly on the valve cover stud bolts.
10. Install the 4 engine cover studs.

11. Attach the 2 block heater wiring harness retainers (if equipped) and the 2 high voltage wiring harness retainers to the valve cover studs.

12. Connect the crankcase vent hose to the valve cover.

13. Install the ignition coil-on-plugs. For additional information, refer to Section 303-07A .

Crankshaft Pulley and Crankshaft Front Seal - Exploded View

Item	Part Number	Description
1	6K340	Crankshaft pulley bolt
2	-	Crankshaft pulley washer (part of 6K340)
3	6316	Crankshaft pulley
4	6700	Crankshaft front seal
5	6378	Diamond washer

1. For additional information, refer to the procedures in this section.

>

Crankshaft Pulley

Special Tool(s)

 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST3054-A	Holding Tool, Crankshaft Damper 303-1416
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

General Equipment

6 mm x 18 mm bolt

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

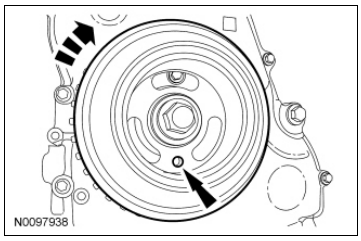
Removal

NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools or severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the RF wheel and tire. For additional information, refer to Section 204-04 .



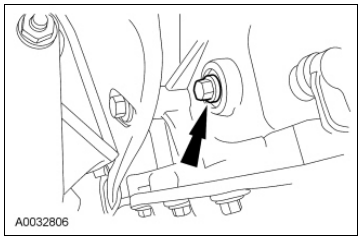
3. Remove the accessory drive belt. For additional information, refer to Section 303-05D .

4. Remove the valve cover. For additional information, refer to Valve Cover in this section.

5. ***NOTICE:*** **Failure to position the No. 1 piston at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

   Using the crankshaft pulley bolt, turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

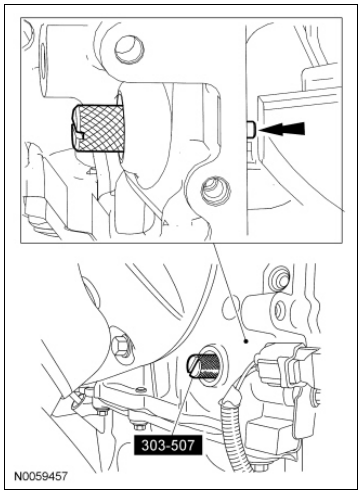
   - The hole in the crankshaft pulley should be in the 6 o'clock position.



6. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

   NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Plate cannot be installed, rotate the crankshaft one complete revolution clockwise to correctly position the camshafts.

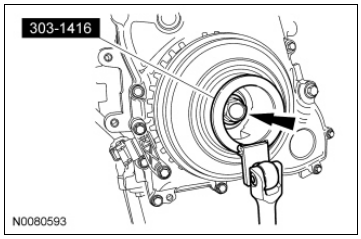
   Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.



7. Remove the engine plug bolt.

8. **NOTE:** The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the crankshaft pulley removal and installation.

   Install the Crankshaft TDC Timing Peg.

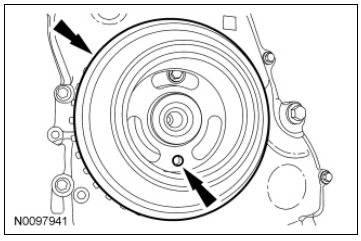


9. ***NOTICE:*** **The crankshaft must remain in the Top Dead Center (TDC) position during removal of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Crankshaft Damper Holding Tool, and the bolt should be removed using an air impact wrench (1/2-in drive minimum).**

   NOTICE: **The crankshaft sprocket diamond washer may come off with the crankshaft pulley. The diamond washer must be replaced. Remove and discard the diamond washer. If the diamond washer is not installed, engine damage may occur.**

   Use the Crankshaft Damper Holding Tool and a suitable 1/2-in drive hand tool to hold the crankshaft pulley. Use an air impact wrench to remove the crankshaft pulley bolt.

   - Remove and discard the crankshaft pulley bolt and washer.
   - Remove the crankshaft pulley.
   - Remove the diamond washer and discard.



Installation

1. Install a new diamond washer.

2. **NOTE:** Do not install the crankshaft pulley bolt at this time.

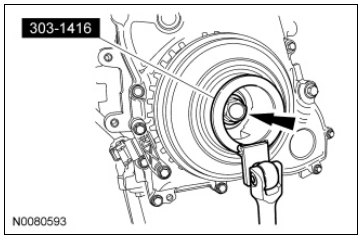
   NOTE: Apply clean engine oil on the seal area before installing.

   Position the crankshaft pulley onto the crankshaft with the hole in the pulley at the 6 o'clock position.

3. *NOTICE:* **Only hand-tighten the 6 mm x 18 mm bolt or damage to the front cover can occur.**

   NOTE: This step will correctly align the crankshaft pulley to the crankshaft.

   Install a 6 mm x 18 mm bolt through the crankshaft pulley and thread it into the front cover.

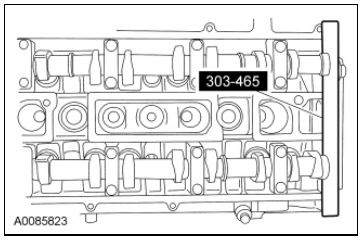


4. **NOTE:** The crankshaft must remain in the TDC position during installation of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Crankshaft Damper Holding Tool and the bolt should be installed using hand tools only.

   NOTE: Do not reuse the crankshaft pulley bolt.

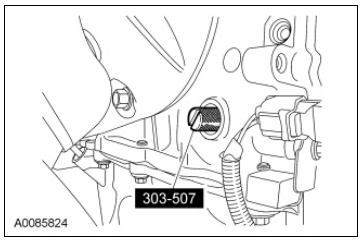
   Install a new crankshaft pulley bolt. Use the Crankshaft Damper Holding Tool and a suitable 1/2-in drive hand tool to hold the crankshaft pulley, tighten the crankshaft pulley bolt in 2 stages:

   - Stage 1: Tighten to 100 Nm (74 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.



5. Remove the 6 mm x 18 mm bolt.

6. Remove the Crankshaft TDC Timing Peg.



7. Remove the Camshaft Alignment Plate.

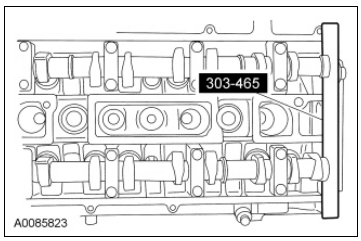
8. **NOTE:** Only turn the engine in the normal direction of rotation.

   Turn the crankshaft clockwise one and three-fourths turns.

9. Install the Crankshaft TDC Timing Peg.

10. **NOTE:** Only turn the engine in the normal direction of rotation.

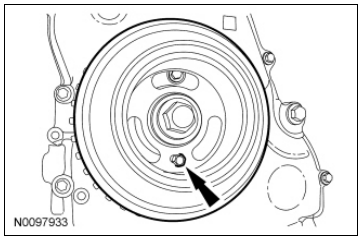
    Turn the crankshaft clockwise until the crankshaft contacts the Crankshaft TDC Timing Peg.



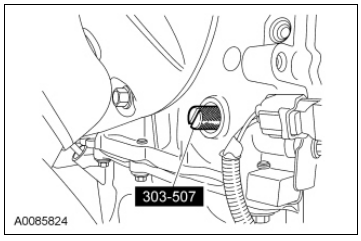
11. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

    Using the 6 mm x 18 mm bolt, check the position of the crankshaft pulley.

    - If it is not possible to install the bolt, the engine valve timing must be corrected by repeating this procedure.



12. Install the Camshaft Alignment Plate to check the position of the camshafts.
    - If it is not possible to install the Camshaft Alignment Plate, the engine valve timing must be corrected by repeating this procedure.

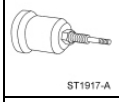


13. Remove the Camshaft Alignment Plate.

14. Remove the 6 mm x 18 mm bolt.

15. Remove the Crankshaft TDC Timing Peg.

16. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).



17. Install the accessory drive belt. For additional information, refer to Section 303-05D .

18. Install the RF wheel and tire. For additional information, refer to Section 204-04 .

19. Install the valve cover. For additional information, refer to Valve Cover in this section.

Crankshaft Front Seal

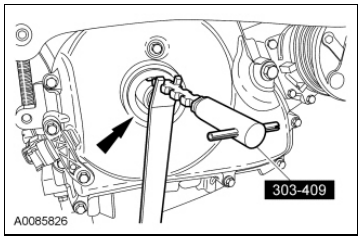
Special Tool(s)

 ST1917-A	Installer, Camshaft Front Oil Seal 303-096 (T74P-6150-A)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); craft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal



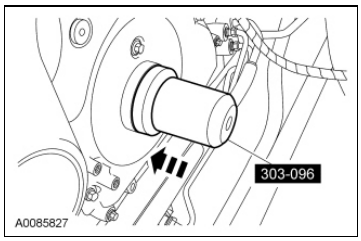
NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools or severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley and Crankshaft Front Seal - Exploded View and Crankshaft Pulley in this section.

2. ***NOTICE:*** **Use care not to damage the engine nt cover or the crankshaft when removing the seal.**

   Using the Oil Seal Remover, remove the crankshaft front seal.



Installation

1. **NOTE:** Remove the through bolt from the Camshaft Front Oil Seal Installer.

   NOTE: Lubricate the oil seal with clean engine oil.

   Using the Camshaft Front Oil Seal Installer, install the crankshaft front oil seal.

2. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley and Crankshaft Front Seal - Exploded View and Crankshaft Pulley in this section.

&nbs

Flexplate or Flywheel and Crankshaft Rear Seal - Exploded View

Item	Part Number	Description
1	6379	Flywheel bolt (6 required)
2	6477	Flywheel
3	6730	Oil pan drain plug
4	W500215	Engine front cover bolt (4 required)
5	W706284	Oil pan bolt (2 required)
6	W500224	Oil pan bolt (11 required)
7	6675	Oil pan
>	W500212	Crankshaft rear oil seal with retainer plate bolt (6 required)
9	6K318	Crankshaft rear oil seal with retainer plate

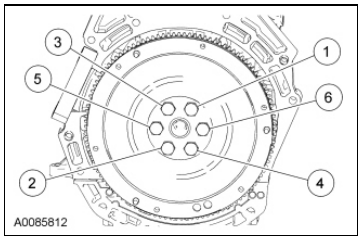
1. For additional information, refer to the procedures in this section.

Flywheel

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the engine. For additional information, refer to Engine in this section.



3. Remove the 6 bolts and the flywheel.

Installation

1. **NOTE:** Special bolts are used for installation. Do not use standard bolts.

   Install the flywheel and tighten the bolts in the sequence shown in the following 3 stages:

   - Stage 1: Tighten to 50 Nm (37 lb-ft).
   - Stage 2: Tighten to 80 Nm (59 lb-ft).
   - Stage 3: Tighten to 112 Nm (83 lb-ft).

2. Install the engine. For additional information, refer to Engine in this section.

Crankshaft Rear Seal

Special Tool(s)

 ST1506-A	Installer, Crankshaft Rear Main Oil Seal 303-328 (T88P-6701-B1)

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

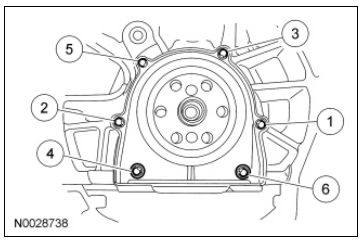
2. Remove the flywheel. For additional information, refer to Flywheel in this section.

3. Drain the engine oil.
   - Install the drain plug.
   - Tighten to 28 Nm (21 lb-ft).

4. ***NOTICE:*** **If the oil pan is not removed, damage to the rear oil seal retainer joint can occur.**

   Remove the 17 bolts and the oil pan.

5. Remove the 6 bolts and the crankshaft rear oil seal with retainer plate.



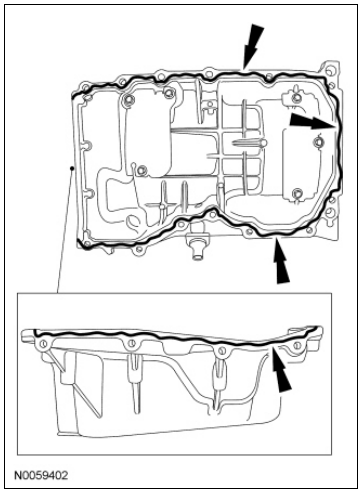
Installation

1. Using the Crankshaft Rear Main Oil Seal Installer, position the crankshaft rear oil seal with retainer plate onto the crankshaft.

src="SCS~us~en~file=A0087575.jpg~gen~ref.jpg" height="211" width="325" border="1">

2. Install the crankshaft rear oil seal with retainer plate and bolts.

- Tighten in the sequence shown to 10 Nm (89 lb-in).



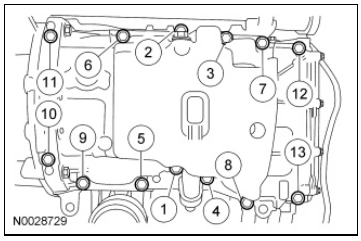
3. *NOTICE:* **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool and metal surface cleaner to remove traces of sealant.**

   Clean and inspect all the oil pan and cylinder block mating surfaces.

4. **NOTE:** If the oil pan is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   NOTE: The oil pan must be installed and the bolts tightened within 4 minutes of applying the silicone gasket and sealant.

   Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the oil pan.



5. Install the oil pan. Install the 2 oil pan bolts finger-tight.

6. Install the 4 bolts.
   - Tighten to 10 Nm (89 lb-in).

7. Install the remaining oil pan bolts and tighten the oil pan bolts in the sequence shown to 25 Nm (18 lb-ft).

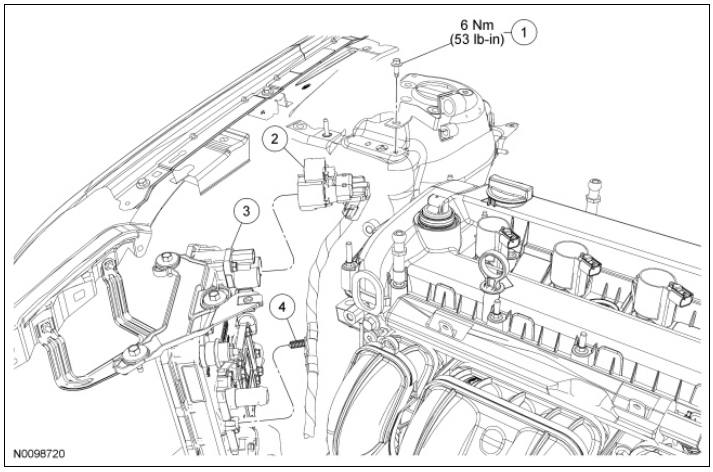
8. Install the flywheel. For additional information, refer to Flywheel in this section.

9. Fill the engine with clean engine oil.

Engine Front Cover

Special Tool(s)

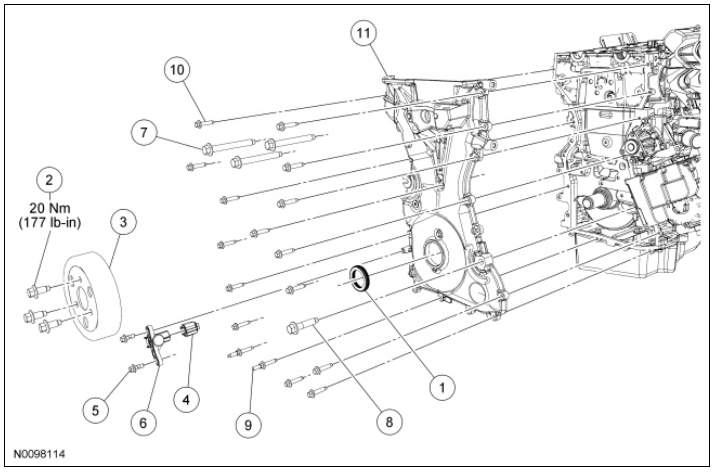
 ST3055A	Aligner, Crankshaft Sensor 303-1417
 ST1917-A	Installer, Camshaft Front Oil Seal 303-096 (T74P-6150-A)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)



General Equipment

6 mm x 18 mm bolt

Material



Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

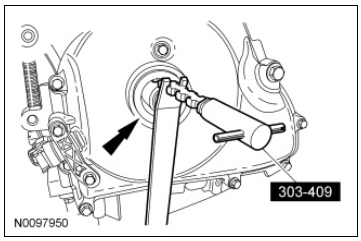
Engine Front Cover (View 1 of 2)

Item	Part Number	Description
1	W707399	A/C tube bracket bolt
2	-	Vehicle high voltage electrical connector (part of 14300)
3	14B227	DC/DC converter
4	-	Vehicle high voltage electrical wiring retainer (part of 14300)

Engine Front Cover (View 2 of 2)

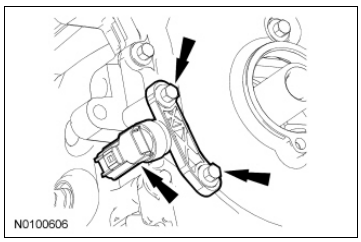
Item	Part Number	Description
1	6700	Crankshaft front seal
2	W500221	Coolant pump pulley bolt (3 required)
3	8509	Coolant pump pulley
4	14A464	Crankshaft Position (CKP) sensor electrical connector (part of 12B637)
5	W701219	CKP sensor bolt (2 required)
6	6C315	CKP sensor
7	W500328	Engine front cover bolt (3 required)
8	W705310	Engine front cover stud bolt (2 required)

9	W500300	Engine from cover bolt
10	W500215	Engine front cover bolt (15 required)
11	6019	Engine front cover



Removal

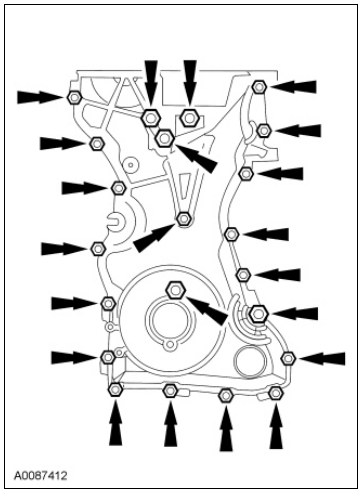
NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools or severe engine damage can occur.**



NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Depower the vehicle high voltage electrical system. For additional information, refer to Section 414-03 .
3. Remove the accessory drive belt and tensioner. For additional information, refer to Section 303-05D .
4. Remove the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.
5. Remove the engine mount. For additional information, refer to Engine Mount in this section.
6. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

   Using the Oil Seal Remover, remove the crankshaft front seal.

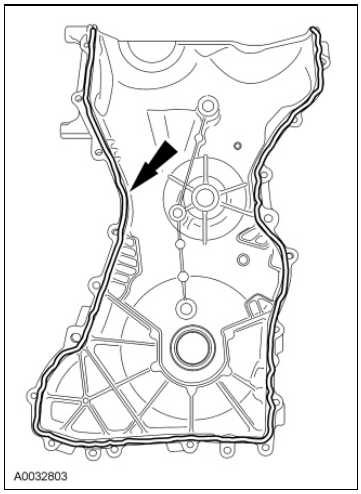


7. Remove the 3 bolts and the coolant pump pulley.
8. Disconnect the Crankshaft Position (CKP) sensor electrical connector.
9. Remove the 2 bolts and the CKP sensor.

10. Remove the A/C tube bracket bolt from the strut tower.

11. Disconnect the vehicle high voltage electrical connector from the DC/DC converter and detach the wiring retainer.

12. Remove the bolts and the engine front cover.



Installation

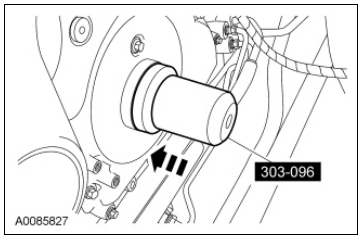
1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive disks or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths.**

   Clean and inspect the mounting surfaces of the engine and the front cover.

2. **NOTE:** The engine front cover must be installed and the bolts tightened within 4 minutes of applying the silicone gasket and sealant.

   Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the cylinder head and oil pan joint areas. Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the front cover.

3. Install the engine front cover. Tighten the bolts in the sequence shown, to the following specifications:
   - Tighten the 8-mm bolts to 10 Nm (89 lb-in).
   - Tighten the 13-mm bolts to 48 Nm (35 lb-ft).



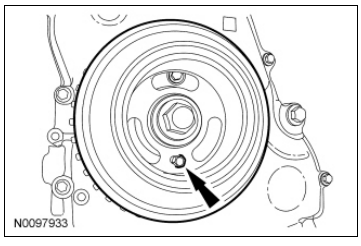
4. Connect the vehicle high voltage electrical connector to the DC/DC converter and attach the wiring retainer.

5. Install the A/C tube bracket bolt to the strut tower.
   - Tighten to 6 Nm (53 lb-in).

6. **NOTE:** Remove the through bolt from the Camshaft Front Oil Seal Installer.

   NOTE: Lubricate the oil seal with clean engine oil.

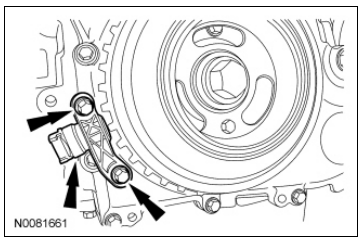
   Using the Camshaft Front Oil Seal Installer, install the crankshaft front seal.



7. Install the coolant pump pulley and the 3 bolts.
   - Tighten to 20 Nm (177 lb-in).

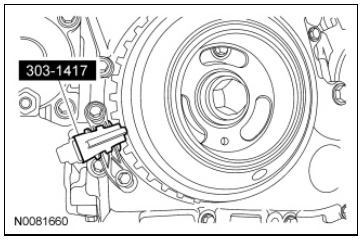
8. Install the engine mount. For additional information, refer to Engine Mount in this section.

9. Install the crankshaft pulley. For additional information, refer to Crankshaft Pulley in this section.



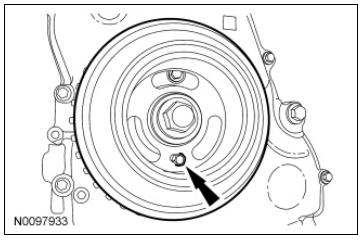
10. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

    Install a standard 6 mm (0.23 in) x 18 mm (0.7 in) bolt through the crankshaft pulley and thread it into the front cover.



11. Install the CKP sensor and the 2 bolts.

- Do not tighten the bolts at this time.



12. Using the Crankshaft Sensor Aligner, adjust the CKP sensor.
    - Tighten the 2 CKP bolts to 7 Nm (62 lb-in).

13. Connect the CKP sensor electrical connector.

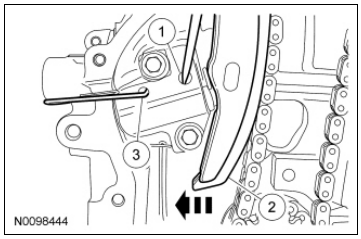
14. Remove the 6 mm x 18 mm bolt.

15. Install the accessory drive belt and tensioner. For additional information, refer to Section 303-05D .

16. Repower the vehicle high voltage electrical system. For additional information, refer to Section 414-03 .

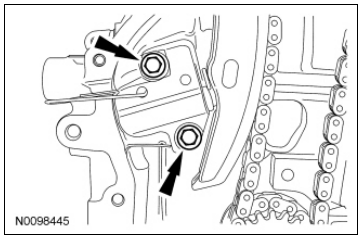
Timing Drive Components

Removal



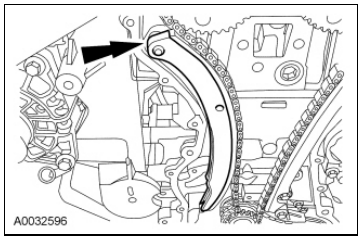
NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools or severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surf, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

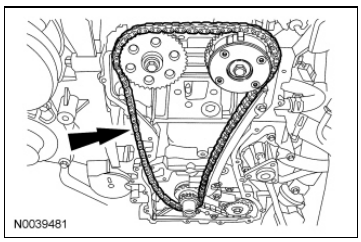


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

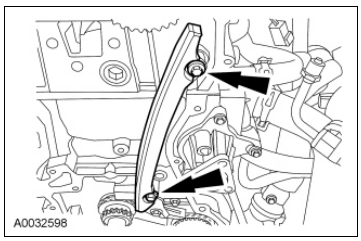
2. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.



3. Compress the timing chain tensioner in the following sequence.
    1. Using a small pick, release and hold the ratchet mechanism.
    2. While holding the ratchet mechanism in the released position, compress the tensioner by pushing the timing chain arm toward the tensioner.
    3. Insert a paper clip into the hole to retain the tensioner.

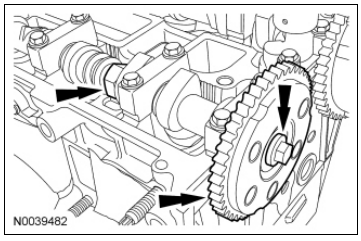


4. Remove the 2 bolts and timing chain tensioner.

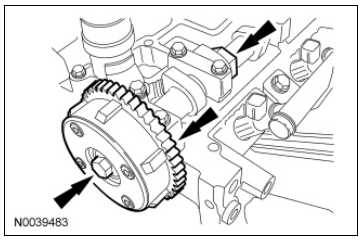


5. Remove the timing chain tensioner arm.

6. Remove the timing chain.

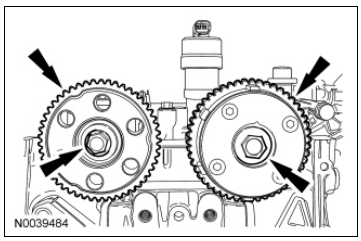


7. Remove the 2 bolts and the timing chain guide.



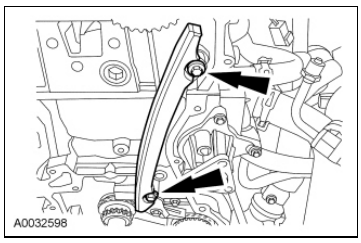
8. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

   Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the exhaust camshaft sprocket.

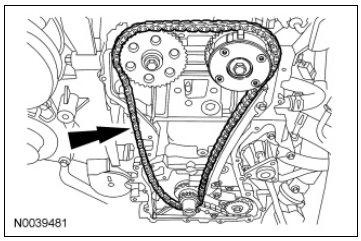


9. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

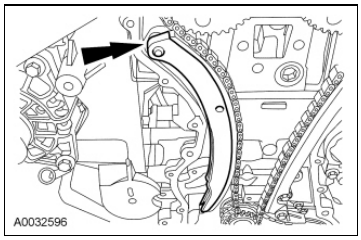
   Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the camshaft phaser and sprocket.



Installation

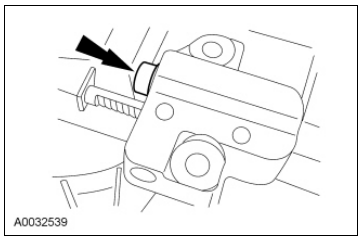


1. Install the camshaft sprockets and the bolts. Do not tighten the bolts at this time.

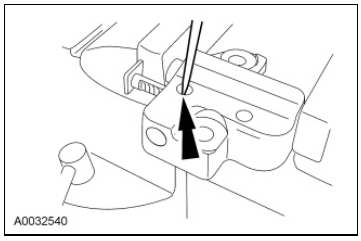


2. Install the timing chain guide and the 2 bolts.
   - To install, tighten to 10 Nm (89 lb-in).

3. Install the timing chain.



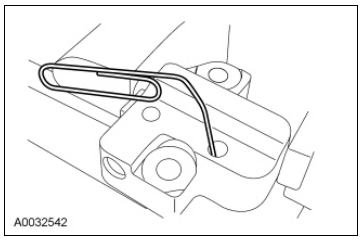
4. Install the timing chain tensioner arm.



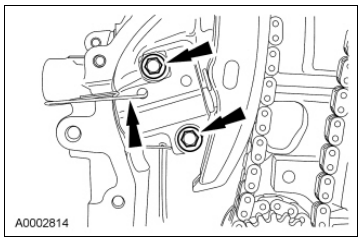
NOTE: If the timing chain tensioner plunger and ratchet assembly are not pinned in the compressed position, follow the next 4 steps.

5. ***NOTICE:*** **Do not compress the ratchet assembly. This will damage the ratchet assembly.**

   Using the edge of a vise, compress the timing chain tensioner plunger.

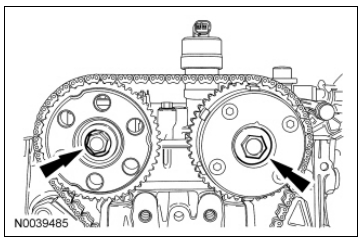


6. Using a small pick, push back and hold the ratchet mechanism.



7. While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

8. Install a paper clip into the hole in the tensioner housing to hold the ratchet assembly and the plunger in during installation.



9. Install the timing chain tensioner and the 2 bolts. Remove the paper clip to release the piston.
   - Tighten to 10 Nm (89 lb-in).

10. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    Using the flats on the camshafts to prevent camshaft rotation, tighten the bolts.

    - Tighten to 72 Nm (53 lb-ft).

11. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

Variable Camshaft Timing (VCT) System Oil Filter

Item	Part Number	Description
1	W710451	Plug
2	6731	Variable Camshaft Timing (VCT) system oil filter

Removal and Installation

1. Remove the Variable Camshaft Timing (VCT) solenoid. For additional information, refer to Section 303-14D .

2. Remove the plug and the VCT system oil filter from the intake camshaft thrust cap.
   - To install, tighten to 17 Nm (150 lb-in).

3. To install, reverse the removal procedure.

Camshafts

Special Tool(s)

 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

General Equipment

6 mm x 18 mm bolt
M6 x 30 mm bolt

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal

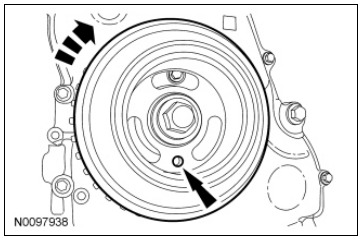
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

NOTICE: **Do not rotate the camshafts unless instructed to in this procedure. Rotating the camshafts or crankshaft with timing components loosened or removed can cause serious damage to the valves and pistons.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the degas bottle. For additional information, refer to Section 303-03B .

3. Remove the Variable Camshaft Timing (VCT) oil control solenoid. For additional informationrefer to Section 303-14D .



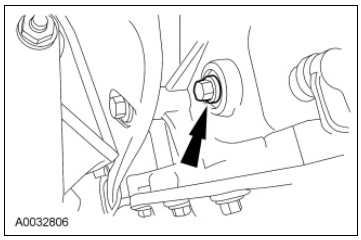
4. Check the valve clearance. For additional information, refer to Valve Clearance Check in this section.

5. Remove the accessory drive belt. For additional information, refer to Section 303-05D .

6. ***NOTICE:*** **Failure to position the No. 1 piston at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

   Using the crankshaft pulley bolt, turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

   - The hole in the crankshaft pulley should be in the 6 o'clock position.

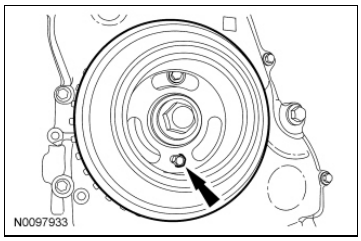


7. ***NOTICE:*** **The Camshaft Alignment Plate 303-465 is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

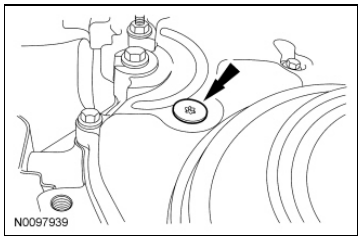
   NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Plate cannot be installed, rotate the crankshaft one complete revolution clockwise to correctly position the camshafts.

   Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.

8. Remove the engine plug bolt.

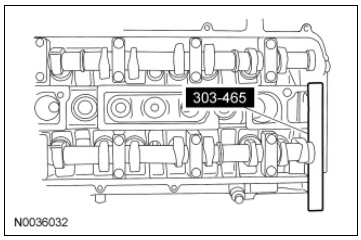


9. Install the Crankshaft TDC Timing Peg.



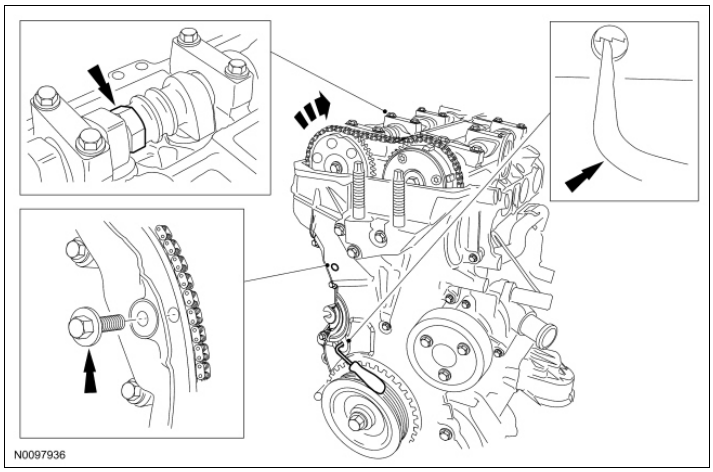
10. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

    Install a standard 6 mm x 18 mm bolt through the crankshaft pulley and thread it into the front cover.

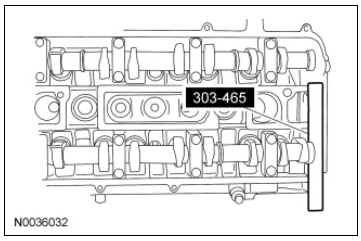


11. Remove the lower front cover timing hole plug from the engine front cover.

12. Remove the upper front cover timing hole plug from the engine front cover.



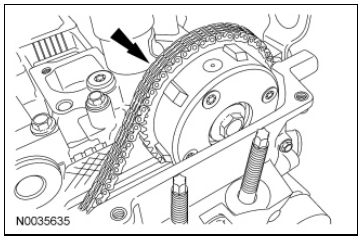
13. Reposition the Camshaft Alignment Plate to the slot on the rear of the intake camshaft only.



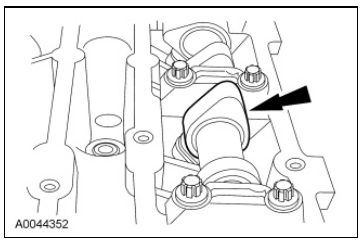
14. **NOTE:** Releasing the ratcheting mechanism in the timing chain tensioner allows the plunger to collapse and create slack in the timing chain. Installing an M6 x 30 mm (1.18 in) bolt into the upper front cover timing hole will hold the tensioner arm in a retracted position and allow enough slack in the timing chain for removal of the exhaust camshaft gear.

    Using a small pick tool, unlock the chain tensioner ratchet through the lower front cover timing hole.

    - Using the flats of the camshaft, have an assistant rotate the exhaust camshaft clockwise to collapse the timing chain tensioner plunger.
    - Insert an M6 x 30 mm (1.18 in) bolt into the upper front cover timing hole to hold the tensioner arm in the retracted position.



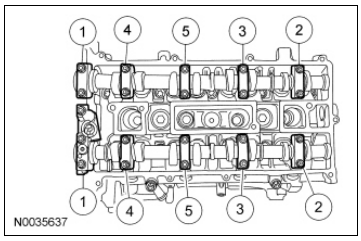
15. Remove the Camshaft Alignment Plate.



16. Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and exhaust camshaft drive gear.

17. Remove the timing chain from the camshaft phaser and sprocket.

18. Mark the position of the camshaft lobes on the No. 1 cylinder for installation reference.



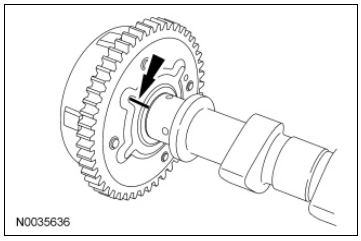
19. ***NOTICE:*** **Failure to follow the camshaft loosening procedure can result in damage to the camshafts.**

    NOTE: Mark the location and orientation of each camshaft bearing cap.

    Remove the camshafts from the engine.

    - Loosen the camshaft bearing cap bolts, in sequence, one turn at a time until all tension is released from the camshaft bearing caps.
    - Remove the bolts and the camshaft bearing caps.
    - Remove the camshafts.

20. If removal of the camshaft phaser and sprocket is necessary, mark the sprocket and camshaft for reference during installation.
    - If necessary, place the camshaft in a soft-jawed vise. Remove the bolt and the camshaft phaser and sprocket.

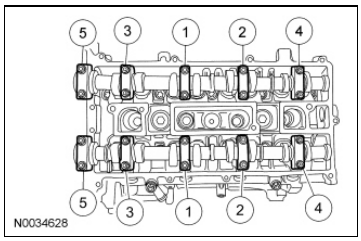


Installation

1. **NOTE:** If new parts are installed, transfer the reference marks made during disassembly to the new parts.

If necessary, position the camshaft in a soft-jawed vise and install the camshaft phaser and sprocket and the bolt.

- Align the reference marks on the camshaft phaser and sprocket and the camshaft. Tighten the bolt to 72 Nm (53 lb-ft).



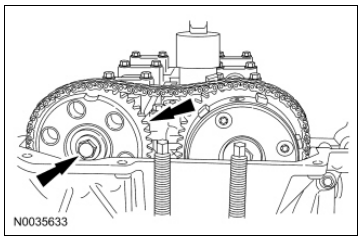
2. ***NOTICE:*** **Install the camshafts with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position can cause severe damage to the valves and pistons.**

   NOTE: Lubricate the camshaft journals and bearing caps with clean engine oil.

   Install the camshafts and bearing caps in their original location and orientation. Tighten the bearing caps in the sequence shown in 3 stages:

   - Stage 1: Tighten the camshaft bearing cap bolts one turn at a time, until finger-tight.
   - Stage 2: Tighten to 7 Nm (62 lb-in).
   - Stage 3: Tighten to 16 Nm (142 lb-in).

3. Install the Camshaft Alignment Plate.

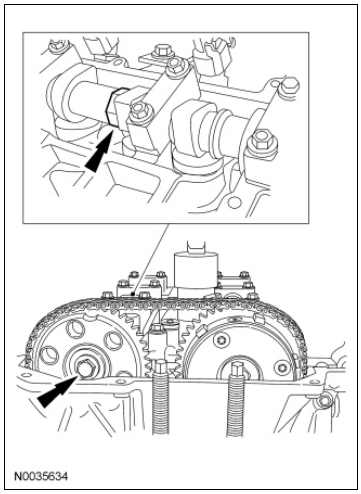


4. Install the timing chain on the camshaft phaser and sprocket.

5. **NOTE:** The timing chain must be correctly engaged on the teeth of the crankshaft timing sprocket and the intake camshaft drive gear in order to install the exhaust camshaft drive gear onto the exhaust camshaft.

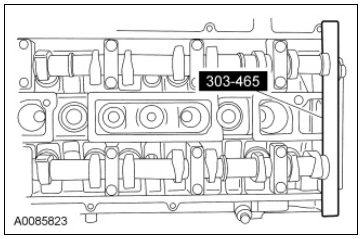
   Position the exhaust camshaft drive gear in the timing chain and install the gear and bolt on the exhaust camshaft.

   - Hand-tighten the bolt.



6. **NOTE:** Releasing the tensioner arm will remove the slack from the timing chain.

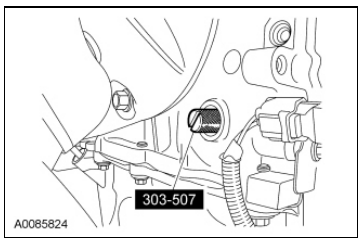
   Remove the M6 x 30 mm bolt from the upper front cover timing hole to release the tensioner arm.



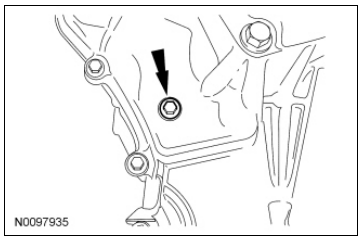
7. *NOTICE:* **The Camshaft Alignment Plate 303-465 is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

   Using the flats on the camshaft to prevent camshaft rotation, tighten the bolt.

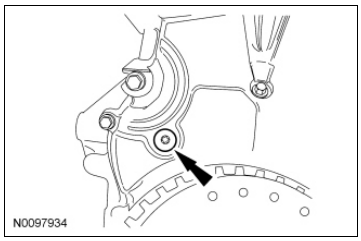
   - Tighten to 72 Nm (53 lb-ft).



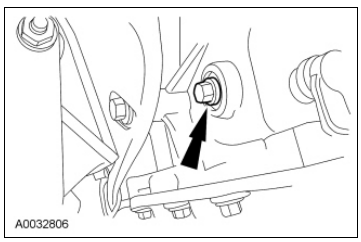
8. Remove the Camshaft Alignment Plate.



9. Remove the 6 mm x 18 mm bolt.



10. Remove the Crankshaft TDC Timing Peg.



11. Install the upper front cover timing hole plug.
    - Tighten to 10 Nm (89 lb-in).

12. Apply silicone gasket and sealant to the threads of the lower front cover timing hole plug.
    - Install the plug and tighten to 12 Nm (106 lb-in).

13. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).

14. Install the accessory drive belt. For additional information, refer to Section 303-05D .

15. Install the VCT oil control solenoid. For additional information, refer to Section 303-14D .

16. Install the valve cover. For additional information, refer to Valve Cover in this section.

17. Install the degas bottle. For additional information, refer to Section 303-03B .

Camshaft Phaser and Sprocket

Special Tool(s)

 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

General Equipment

6 mm (0.23 in) x 18 mm (0.7 in)
M6 x 30(1.18 in)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

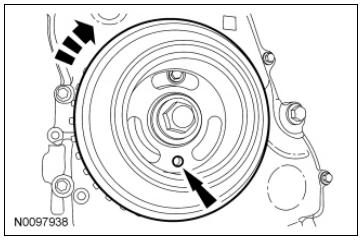
Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

NOTICE: **Do not rotate the camshafts or crankshaft unless instructed to do so in this procedure. Rotating the camshafts or crankshaft with timing components loosened or removed can cause serious damage to the valves or pistons.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the accessory drive belt. For additional information, refer to Section 303-05D .



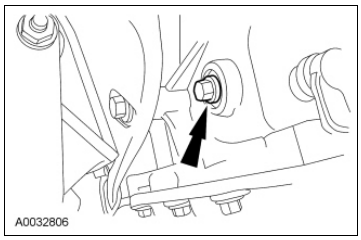
3. Reme the Variable Camshaft Timing (VCT) solenoid. For additional information, refer to Section 303-14D .

4. Check the valve clearance. For additional information, refer to Valve Clearance Check in this section.

5. ***NOTICE:*** **Failure to position the No. 1 piston at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

   Using the crankshaft pulley bolt, turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

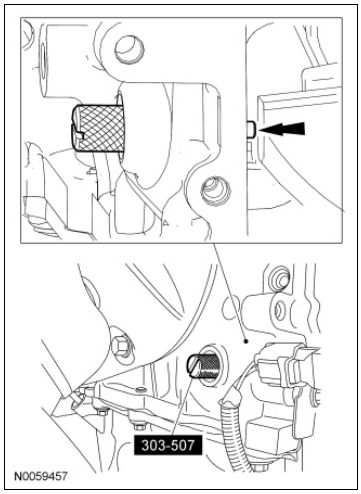
   - The hole in the crankshaft pulley should be in the 6 o'clock position.



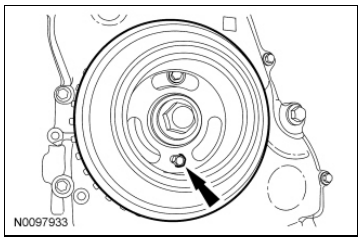
6. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

   NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Plate cannot be installed, rotate the crankshaft one complete revolution clockwise to correctly position the camshafts.

   Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.

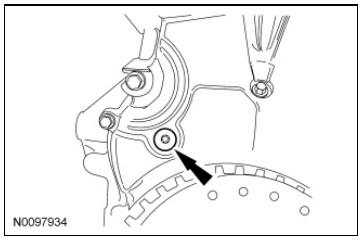


7. Remove the engine plug bolt.



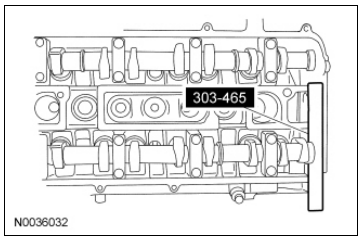
8. **NOTE:** The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the camshaft removal and installation.

   Install the Crankshaft TDC Timing Peg.



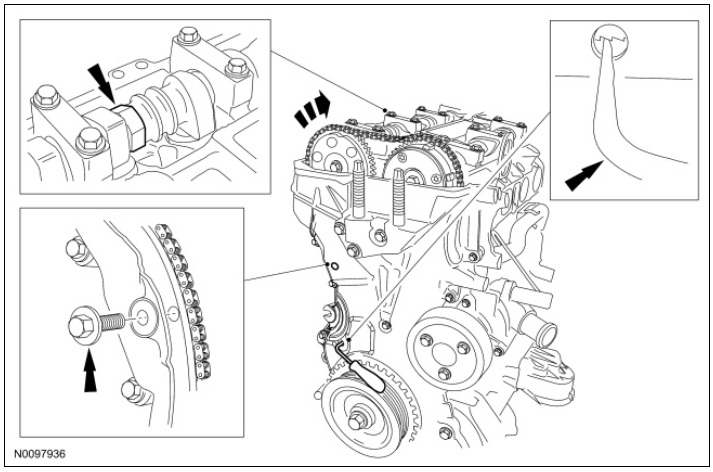
9. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

   Install a standard 6 mm x 18 mm bolt through the crankshaft pulley and thread it into the front cover.

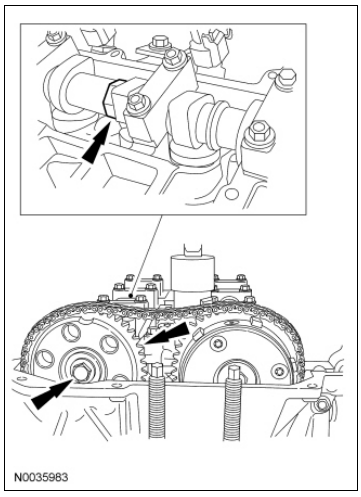


10. Remove the lower timing hole plug from the engine front cover.

11. Remove the upper timing hole plug from the engine front cover.



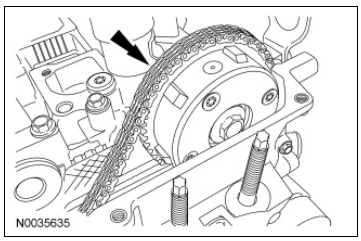
12. Reposition the Camshaft Alignment Plate to the slot on the rear of the intake camshaft only.



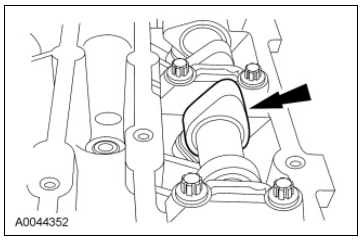
13. **NOTE:** Releasing the ratcheting mechanism in the timing chain tensioner allows the plunger to collapse and create slack in the timing chain. Installing the M6 x 30 mm (1.18 in) bolt into the upper front cover timing hole will lock the tensioner arm in a retracted position and allow enough slack in the timing chain for removal of the exhaust camshaft gear.

    Using a small pick tool, release the timing chain tensioner ratchet through the lower front cover timing hole.

    - Have an assistant rotate (using the flats of the camshaft) the exhaust camshaft clockwise to collapse the timing chain tensioner plunger.
    - Insert the M6 x 30 mm (1.18 in) bolt into the upper front cover timing hole to hold the tensioner arm in the retracted position.

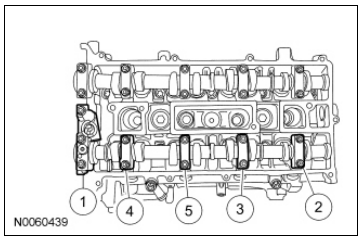


14. Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the exhaust camshaft drive gear.

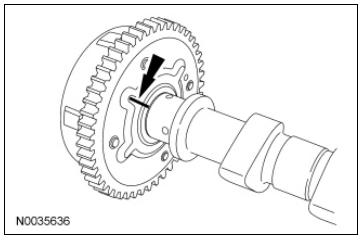


15. Remove the Camshaft Alignment Plate.

16. Remove the timing chain from the camshaft phaser and sprocket.



17. Mark the position of the camshaft lobes on the No. 1 cylinder for installation reference.

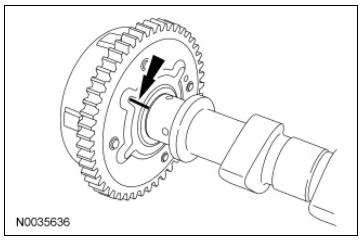


18. ***NOTICE:*** **Failure to follow the camshaft loosening procedure can result in damage to the intake camshaft.**

    Remove the intake camshaft from the engine.

    - Loosen the intake camshaft bearing cap bolts, in the sequence shown, one turn at a time until all tension is released from the camshaft bearing caps.
    - Remove the bolts and the camshaft bearing caps.
    - Remove the intake camshaft.

19. Mark the camshaft phaser and sprocket and the camshaft for reference during installation.



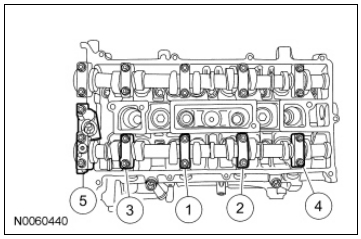
20. Place the camshaft in a soft-jawed vise. Remove the bolt and the camshaft phaser and sprocket.

Installation

1. **NOTE:** If new parts are installed, transfer the reference marks made during disassembly to the new parts.

   Position the camshaft in a soft-jawed vise. Install the camshaft phaser and sprocket and the bolt.

- Align the reference marks on the camshaft phaser and sprocket and the camshaft. Tighten the bolt to 72 Nm (53 lb-ft).



2. *NOTICE:* **Install the intake camshaft with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position can cause severe damage to the valves and pistons.**

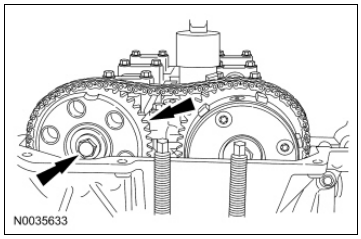
   NOTE: Lubricate the intake camshaft journals and bearing caps with clean engine oil.

   Install the intake camshafts and bearing caps. Tighten the intake camshaft bearing caps in the sequence shown in 3 stages:

   - Stage 1: Tighten the intake camshaft bearing cap bolts until finger-tight.
   - Stage 2: Tighten to 7 Nm (62 lb-in).
   - Stage 3: Tighten to 16 Nm (142 lb-in).

3. Install the Camshaft Alignment Plate.

4. Install the timing chain on the camshaft phaser and sprocket.

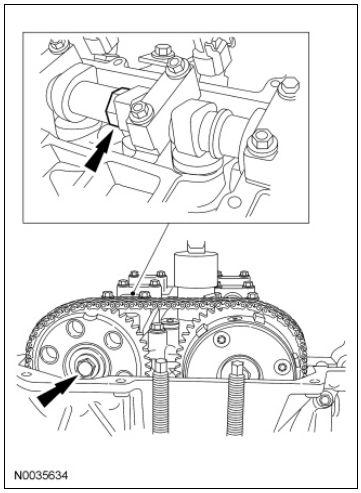


5. **NOTE:** The timing chain must be correctly engaged on the teeth of the crankshaft timing sprocket and the intake camshaft drive gear in order to install the exhaust camshaft drive gear onto the exhaust

camshaft.

Position the exhaust camshaft drive gear in the timing chain and install the gear and bolt on the exhaust camshaft.

- Hand-tighten the bolt.

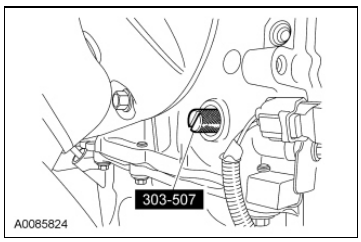


6. **NOTE:** Releasing the tensioner arm will remove the slack from the timing chain.

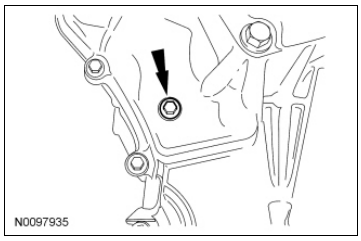
   Remove the M6 x 30 mm (1.18 in) bolt from the upper front cover timing hole to release the tensioner arm.

7. ***NOTICE:*** **The Camshaft Alignment Plate is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

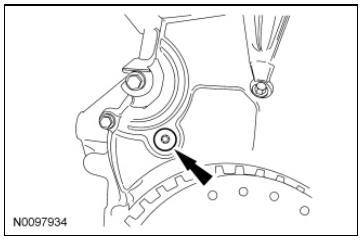
   Using the flats on the camshaft to prevent camshaft rotation, tighten the exhaust camshaft drive gear bolt to 72 Nm (53 lb-ft).



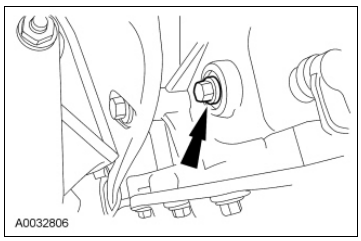
8. Remove the Camshaft Alignment Plate.



9. Remove the 6 mm x 18 mm bolt.

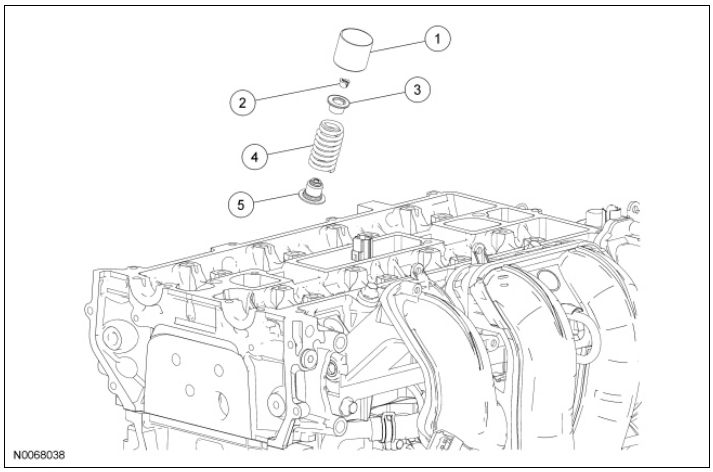


10. Remove the Crankshaft TDC Timing Peg.



11. Install the upper timing hole plug in the engine front cover.
    - Tighten to 10 Nm (89 lb-in).

12. Apply silicone gasket and sealant to the threads of the lower timing hole plug.
    - Install the lower timing hole plug in the engine front cover.
        - ♦ Tighten to 12 Nm (106 lb-in).

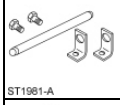


13. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).

14. Install the accessory drive belt. For additional information, refer to Section 303-05D .

15. Install the VCT solenoid. For additional information, refer to Section 303-14D .

Valve Train Components - Exploded View



Item	Part Number	Description
1	6500	Valve tappet (16 required)
2	6518	Valve collet (16 required)
3	6514	Valve spring retainer (16 required)
6513	Valve spring (16 required)	
5	6517	Valve seal (16 required)

1. For additional information, refer to the procedures in this section.

Valve Springs

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Sp 303-350 (T89P-6565-A)
 ST1902-A	Compressor, Valve Spring 303-472 (T94P-6565-AH)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

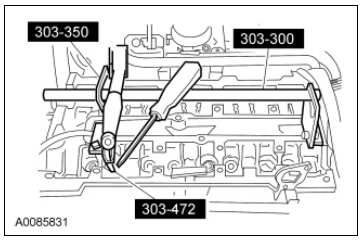
2. Remove the camshafts. For additional information, refer to Camshafts in this section.

3. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

   NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

   Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

4. Remove the spark plugs. For additional information, refer to Section 303-07A .



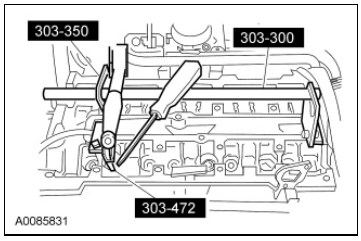
5. *NOTICE:* **Use compressed air at 7 to 10 bars (100-150 psi). Do not disconnect the compressed air from the cylinder until the valve spring, valve spring retainer and valve collet is installed. Any loss of air pressure will allow the valve to fall into the cylinder.**

   Connect the compressed air supply to the No. 1 cylinder.

6. **NOTE:** Place all parts in order to one side.

   Apply compressed air to the cylinder and remove the valve spring.

   - Using the Valve Spring Compressors, compress the valve spring and remove the valve collet, using some grease and a small screwdriver.
   - Remove the valve spring retainer and the valve spring.



Installation

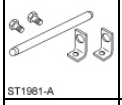
1. **NOTE:** Check the seating of the valve collet.

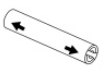
   Using the Valve Spring Compressors, install the valve spring.

   - Insert the valve spring and the valve spring retainer.
   - Compress the valve spring and install the valve collet using some grease and a small screwdriver.

2. Disconnect the compressed air supply.

3. Repeat the appropriate removal and installation steps for all of the other cylinders.





4. Install the spark plugs. For additional information, refer to Section 303-07A .

5. Coat the valve tappets with clean engine oil and insert them.

6. Install the camshafts. For additional information, refer to Camshafts in this section.

Valve Seals

Special Tool(s)

 ST1981-A	Compressor, Valve Spring 303-300 (T87C-6565-A)
 ST1907-A	Compressor, Valve Springbr>303-350 (T89P-6565-A)
 ST1902-A	Compressor, Valve Spring 303-472 (T94P-6565-AH)
 ST1906-A	Installer, Valve Stem Oil Seal 303-470 (T94P-6510-CH)
 ST1904-A	Remover, Valve Stem Oil Seal 303-468 (T94P-6510-AH)
 ST1187-A	Slide Hammer 307-005 (T59L-100-B)

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XOW20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B

Removal

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

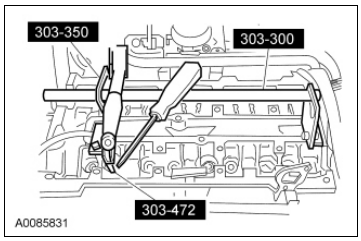
2. Remove the camshafts. For additional information, refer to Camshafts in this section.

3. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

   NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

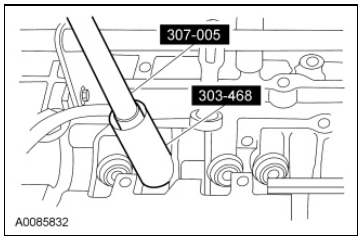
   Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

4. Remove the spark plugs. For additional information, refer to Section 303-07A .



5. ***NOTICE:*** **Use compressed air at 7 to 10 bars (100-150 psi). Do not disconnect the compressed air from the cylinder until the valve spring, valve spring retainer and valve collet is installed. Any loss of air pressure will allow the valve to fall into the cylinder.**

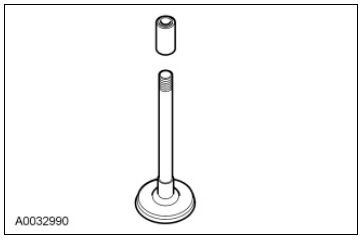
   Connect the compressed air supply to the No. 1 cylinder.



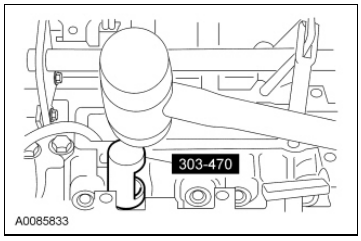
6. **NOTE:** Place all parts in order to one side.

   Apply compressed air to the cylinder and remove the valve spring.

   - Using the Valve Spring Compressors, compress the valve spring and remove the valve collet, using some grease and a small screwdriver.
   - Remove the valve spring retainer and the valve spring.

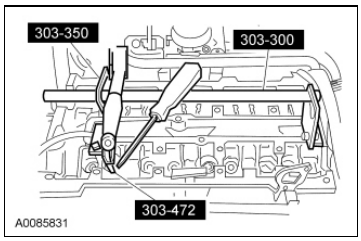


7. Using the Slide Hammer and the Valve Stem Oil Seal Remover, remove and discard the valve seal.



Installation

1. Install the valve stem seal installation sleeve.



2. Using the Valve Stem Oil Seal Installer, install the valve seal.

3. **NOTE:** Check the seating of the valve collet.

   Using the Valve Spring Compressors, install the valve spring.

   - Insert the valve spring and the valve spring retainer.
   - Compress the valve spring and install the valve collet using some grease and a small screwdriver.

4. Disconnect the compressed air supply.

5. Install the spark plugs. For additional information, refer to Section 303-07A .

6. Repeat the appropriate removal and installation steps for all of the other cylinders.

7. Coat the valve tappets with clean engine oil and insert them.

8. Install the camshafts. For additional information, refer to Camshafts in this section.

Valve Tappets

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal and Installation

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant es or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

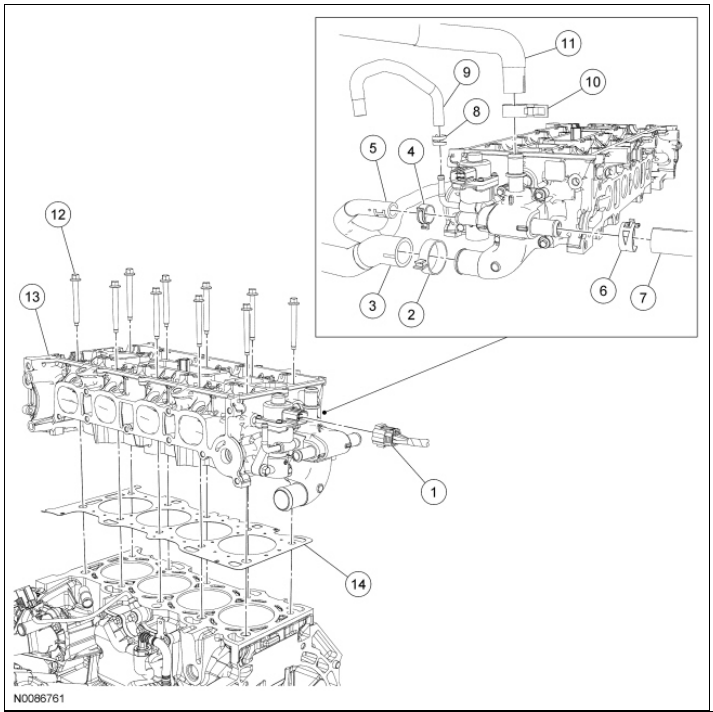
2. Remove the camshafts. For additional information, refer to Camshafts in this section.

3. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

   NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

   Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

4. To install, reverse the removal procedure.
   - Coat the valve tappets with clean engine oil prior to installation.



Cylinder Head

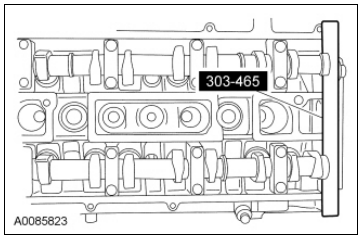
Special Tool(s)

 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)

Material

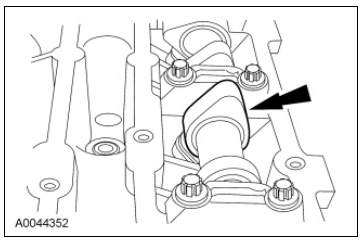
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-

Item	Part Number	Description



1	14A464	EGR valve electrical connector (part of 12A581)
2	W527372	Upper radiator hose clamp
3	8260	Upper radiator hose
4	W527212	Coolant bypass hose clamp
5	8075	Coolant bypass hose
6	W527362	Heater hose clamp
7	18472	Heater hose
8	W527302	EGR coolant hose clamp
9	18472	EGR coolant hose
10	W527362	Coolant vent hose clamp
11	18472	Coolant vent hose
12	6065	Cylinder head bolt (10 required)
13	6049	Cylinder head
14	6051	Cylinder head gasket

Removal

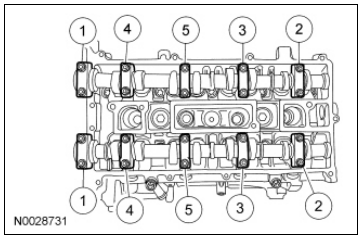


NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructin this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools or severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan can cause engine failure.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Drain the engine cooling system. For additional information, refer to Section 303-03B .
4. Remove the intake manifold. For additional information, refer to Intake Manifold in this section.
5. Remove the Variable Camshaft Timing (VCT) oil control solenoid. For additional information, refer to Section 303-14D .
6. Remove the timing drive components. For additional information, refer to Timing Drive Components in this section.
7. Remove the Camshaft Alignment Plate.

8. Mark the position of the camshaft lobes on the No. 1 cylinder for installation reference.



9. ***NOTICE:*** **Failure to follow the camshaft loosening procedure can result in damage to the camshafts.**

   NOTE: Mark the location and orientation of each camshaft bearing cap.

   Remove the camshafts from the engine.

   - Loosen the camshaft bearing cap bolts, in sequence, one turn at a time until all tension is released from the camshaft bearing caps.
   - Remove the bolts and the camshaft bearing caps.
   - Remove the camshafts.

10. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

    Remove the valve tappets.

11. Inspect the valve tappets. For additional information, refer to Section 303-00 .

12. Remove the catalytic converter. For additional information, refer to Section 309-00 .

13. Disconnect the EGR valve electrical connector.

14. Disconnect the upper radiator hose, coolant bypass hose, EGR coolant hose, heater hose and coolant vent hose from the engine coolant outlet and the EGR valve.

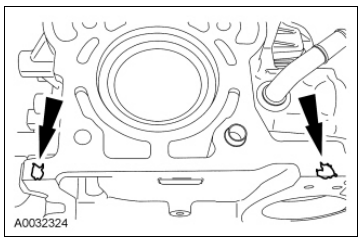
15. Remove the bolts and the cylinder head.
    - Discard the bolts and the cylinder head gasket.

Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

   NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.



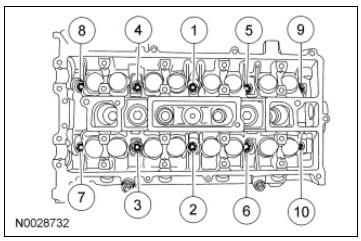
Clean the cylinder head-to-cylinder block mating surface of both the cylinder head and the cylinder block in the following sequence.

1. Remove any large deposits of silicone or gasket material with a plastic scraper.
2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep, following package directions, to remove any traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

2. Support the cylinder head on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .

3. Clean the cylinder head bolt holes in the cylinder block. Make sure all coolant, oil or other foreign material is removed.

4. Apply silicone gasket and sealant to the locations shown.

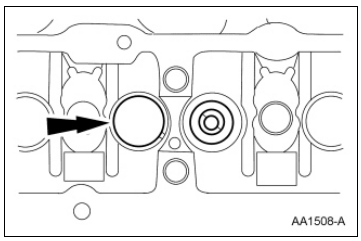


5. Install a new cylinder head gasket.

6. **NOTE:** The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

   Install the cylinder head and 10 new bolts. Tighten the bolts in the sequence shown in the following 5 stages:

   - Stage 1: Tighten to 5 Nm (44 lb-in).
   - Stage 2: Tighten to 15 Nm (133 lb-in).
   - Stage 3: Tighten to 45 Nm (33 lb-ft).
   - Stage 4: Turn 90 degrees.
   - Stage 5: Turn an additional 90 degrees.



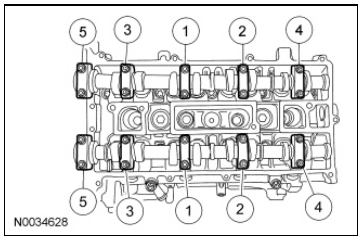
7. Connect the upper radiator hose, coolant bypass hose, EGR coolant hose, heater hose and coolant vent hose to the engine coolant outlet and the EGR valve.

8. Connect the EGR valve electrical connector.

9. Install the catalytic converter. For additional information, refer to Section 309-00 .

10. **NOTE:** Lubricate the valve tappets with clean engine oil.

    Install the valve tappets in their original positions.



11. *NOTICE:* **Install the camshafts with the alignment notches in the camshafts lined up so the camshaft alignment plate can be installed. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the removal procedure. Failure to follow this procedure can cause severe damage to the valves and pistons.**

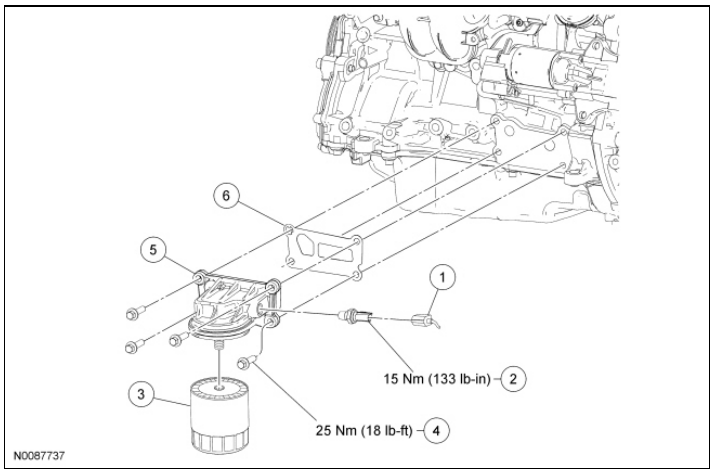
    NOTE: Lubricate the camshaft journals and bearing caps with clean engine oil.

    Install the camshafts and bearing caps in their original location and orientation. Tighten the bearing caps in the sequence shown in 3 stages:

    - Stage 1: Tighten the camshaft bearing cap bolts, one turn at a time, until finger-tight.
    - Stage 2: Tighten the bolts to 7 Nm (62 lb-in).
    - Stage 3: Tighten the bolts to 16 Nm (142 lb-in).

12. Install the Camshaft Alignment Plate.

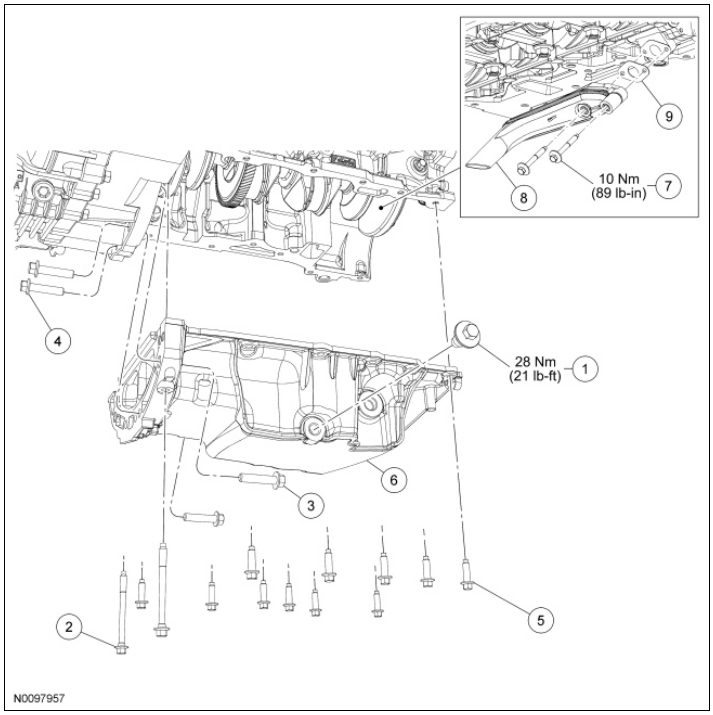
13. Install the timing drive components. For additional information, refer to Timing Drive Components in this section.



14. Install the VCT oil control solenoid. For additional information, refer to Section 303-14D .

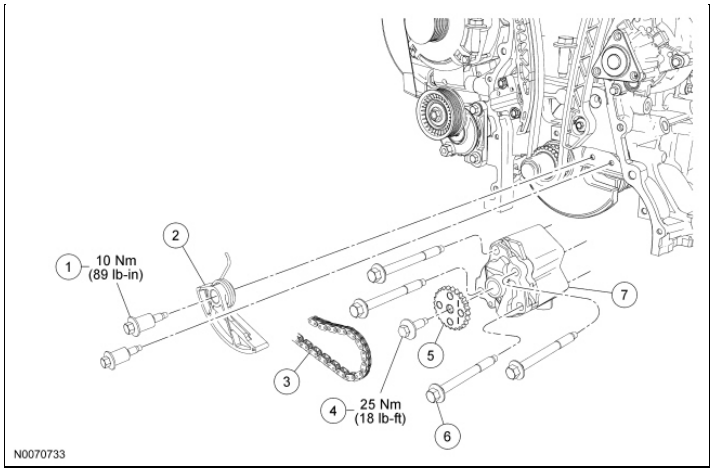
15. Install the intake manifold. For additional information, refer to Intake Manifold in this section.

16. Fill and bleed the engine cooling system. For additional information, refer to Section 303-03B .



Engine Lubrication Components - Exploded View

Oil Filter Adapter, Oil Filter and Engine Oil Pressure (EOP) Switch



Item	Part Number	Description
1	14A464	Engine Oil Pressure (EOP) switch electrical connector (part of 12C508)
2	9278	EOP switch
3	6731	Oil filter
5	6884	Oil filter adapter
6	6A636	Oil filter adapter gasket

Oil Pan, Oil Pump Screen and Pickup Tube

Item	Part Number	Description
1	6730	Drain plug
2	W706284	Oil pan bolt (2 required)
3	W500122	Oil pan-to-bellhousing bolt (2 required)
4	W500122	Bellhousing-to-oil pan bolt (2 required)
5	W500224	Oil pan bolt (11 required)
6	6675	Oil pan
7	W706282	Oil pump screen and pickup tube bolt (2 required)
8	6622	Oil pump screen and pickup tube
9	6625	Oil pump screen and pickup tube gasket

Oil Pump

Item	Part Number	Description
1	W703651	

		Oil pump drive chain tensioner shoulder bolt (2 required)
2	6C271	Oil pump drive chain tensioner
3	6A895	Oil pump drive chain
4	W704397	Oil pump sprocket bolt
5	6652	Oil pump sprocket
6	W703647	Oil pump bolt (4 required)
7	6600	Oil pump

1. For additional information, refer to the procedures in this section.

Oil Filter Adapter

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

3. Remove oil filter.
   - To install, lubricate the oil filter O-ring with clean eoil and then tighten the oil filter three-fourths turn after the oil filter gasket makes contact with the oil filter adapter.

4. **NOTE:** Discard the gasket.

   Remove the 4 bolts and the oil filter adapter.

   - To install, tighten to 25 Nm (18 lb-ft).

5. To install, reverse the removal procedure.

Engine Oil Pressure (EOP) Switch

Material

Item	Specification
Thread Sealant with PTFE TA-24	WSK-M2G350-A2

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.

3. Remove the EOP switch.
   - To inl, tighten to 15 Nm (133 lb-in).

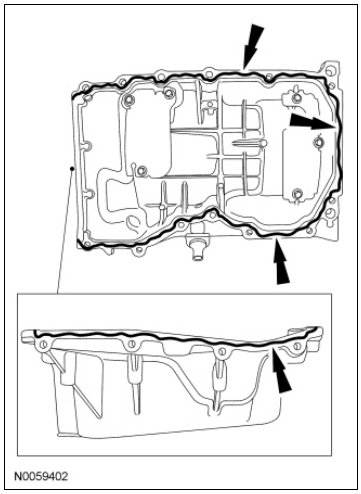
4. To install, reverse the removal procedure.
   - Apply thread sealant with PTFE to the EOP switch threads.

Oil Pan

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal



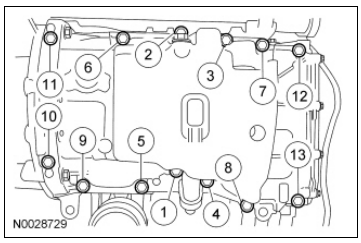
1. Witicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the engine oil, then install the drain plug.
   - Tighten to 28 Nm (21 lb-ft).
3. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.
4. Remove the 4 oil pan-to-bellhousing bolts.
5. Remove the 13 bolts and the oil pan.

Installation

1. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces of sealant.**

   Clean and inspect all mating surfaces.
2. **NOTE:** If the oil pan is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

   Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the oil pan.



3. Position the oil pan and install the 2 rear oil pan bolts finger-tight.

4. Using a suitable straightedge, align the front surface of the oil pan flush with the front surface of the engine block.

5. Install the remaining oil pan bolts.
   - Tighten in the sequence shown to 25 Nm (18 lb-ft).

6. Install the 4 oil pan-to-bellhousing bolts.
   - Tighten to 48 Nm (35 lb-ft).

7. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

8. Fill the engine with clean engine oil.

Oil Pump Screen and Pickup Tube

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the oil pan. For additional information, refer to Engine Lubrication Components - Exploded View and Oil Pan in this section.

3. **NOTE:** Discard the gasket and clean and inspect the gasket mating surfaces.

   Remove the 2 bolts and the oil pump screen and pickup tube.

   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

Oil Pump

Material

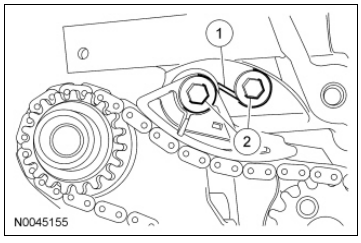
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Removal

1. With the engine in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the engine front cover. For additional information, refer to Engine Front Cover in this section.

3. Drain the engine oil, then install the drain plug.
   - To install, tighten to 28 Nm (21 lb-ft).



4. Remove the 4 oil pan-to-bellhousing bolts.

5. Remove the 13 bolts and the oil pan.

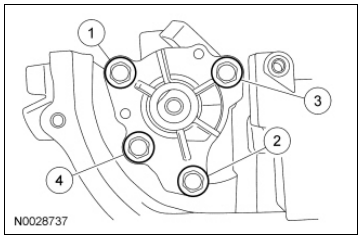
6. **NOTE:** Discard the gasket and clean and inspect the gasket mating surfaces.

   Remove the 2 bolts and the oil pump screen and pickup tube.

7. Remove the oil pump drive chain tensioner.
   1. Release the tension on the tensioner spring.
   2. Remove the 2 shoulder bolts and the tensioner.

8. Remove the chain from the oil pump sprocket.

9. Remove the bolt and oil pump sprocket.



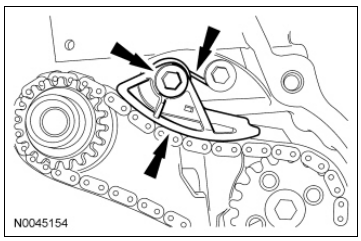
10. Remove the 4 bolts and the oil pump.

Installation

1. **NOTE:** Clean the oil pump and cylinder block mating surfaces with metal surface prep.

   Install the oil pump assembly. Tighten the 4 bolts in the sequence shown in 2 stages:

   - Stage 1: Tighten to 10 Nm (89 lb-in).
   - Stage 2: Tighten to 20 Nm (177 lb-in).

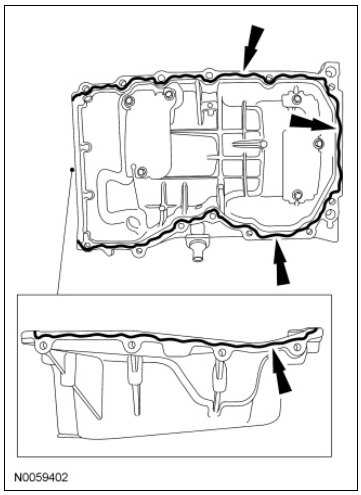


2. Install the oil pump sprocket and bolt.
   - Tighten to 25 Nm (18 lb-ft).

3. Install the chain onto the oil pump sprocket.

4. Install the oil pump drive chain tensioner shoulder bolt.
   - Tighten to 10 Nm (89 lb-in).

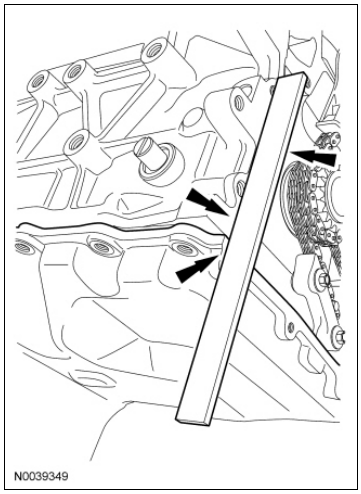
5. Install the oil pump drive chain tensioner and bolt. Hook the tensioner spring around the shoulder bolt.
   - Tighten to 10 Nm (89 lb-in).



6. Install the oil pump screen and pickup tube and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

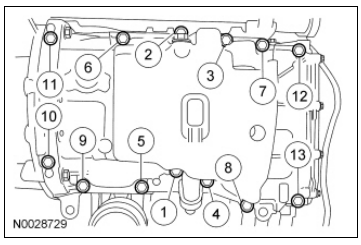
7. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove traces to sealant.**

Clean all mating surfaces with metal surface prep.



8. **NOTE:** If the oil pan is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

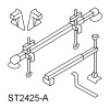
   Apply a 2.5 mm (0.09 in) bead of sealant gasket and sealant to the oil pan.



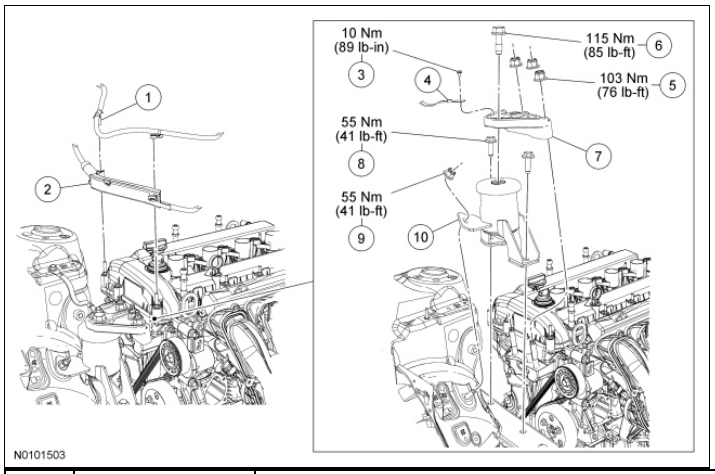
9. Position the oil pan onto the engine and install the 2 rear oil pan bolts finger-tight.

10. Using a suitable straight edge, align the front surface of the oil pan flush with the front surface of the engine block.

11. Install the remaining oil pan bolts.
    - Tighten in the sequence shown to 25 Nm (18 lb-ft).



12. Install the 4 oil pan-to-bellhousing bolts.
    - Tighten to 48 Nm (35 lb-ft).



13. Install the engine front cover. For additional information, refer to Engine Front Cover in this section.

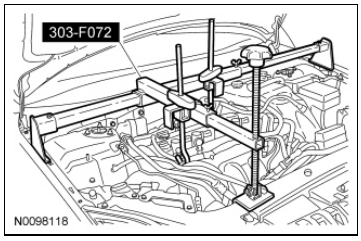
14. Fill the engine with clean engine oil.

Engine Mount

Special Tool(s)

 ST2425-A	Support Bar, Engine 303-F072

Item	Part Number	Description
1	-	Block heater wiring retainer (if equipped) (2 required)
2	-	High voltage wiring harness retainer (part of 14300)
3	-	Ground strap bolt
4	-	Ground strap
5	N807144	Engine mount bracket nut (3 required)
6	W710824	Engine mount bracket bolt
7	6061	Engine mount bracket
8	W500233	Engine mount bolt (2 required)
9	-	Engine mount nut
10	6038	Engine mount



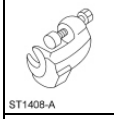
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the engine coolant degas bottle. For additional information, refer to Section 303-03B .
3. Install the Engine Support Bar to the front and rear engine lifting eyes.

4. Remove the engine mount bracket bolt.
    - To install, tighten to 115 Nm (85 lb-ft).

5. Use the Engine Support Bar to raise the engine 25 mm (0.98 in).

6. Remove the bolt and the ground strap from the engine mount bracket.
    - Tighten to 10 Nm (89 lb-in).



7. Remove the 3 nuts and the engine mount bracket.
    - To install, tighten to 103 Nm (76 lb-ft).

8. Remove the 2 bolts and nut and the engine mount.
    - To install, tighten to 55 Nm (41 lb-ft).

9. To install, reverse the removal procedure.

Engine

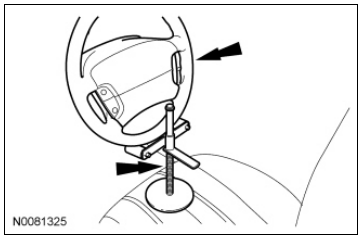
Special Tool(s)

 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E or equivalent
 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent
 ST1408-A	Remover, Tie-Rod End 211-105 (T85M-3395-A)
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) (part of 303-DS086) or equivalent
 ST2743A	Adjustable Grip Arm, 1735A 014-00001 or equivalent

⚠ **WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

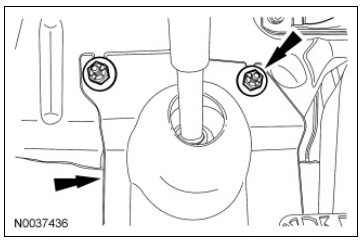
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Release the fuel system pressure. For additional information, refer to Section 310-00 .



3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

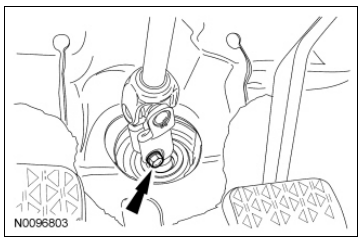
4. Depower the vehicle high voltage electrical system. For additional information, refer to Section 414-03 .



5. Recover the A/C system. For additional information, refer to Section 412-00B .

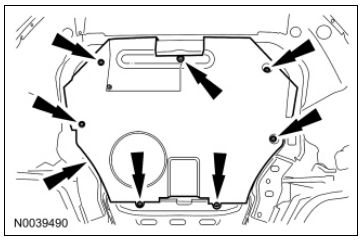
6. **NOTE:** Use a steering wheel holding device (such as Hunter® 28-75-1 or equivalent).

   Place the seering wheel in the straight-ahead position and the ignition key in the OFF position.



N0081325

7. Remove the 2 nuts and the steering joint cover.

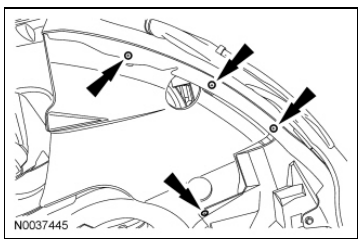


8. ***NOTICE:*** **Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Remove the bolt and disconnect the steering column shaft from the steering gear.

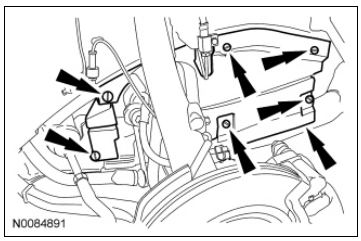
9. Remove the 7 screws and the underbody cover.

10. Drain the cooling system. For additional information, refer to Section 303-03B .



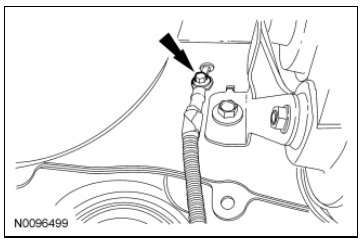
11. Drain the Motor Electronics Cooling System (MECS). For additional information, refer to Section 307-02B .

12. Remove the engine Air Cleaner (ACL) pipe. For additional information, refer to Section 303-12D .

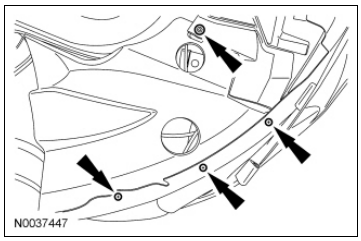


13. Remove the front wheels and tires. For additional information, refer to Section 204-04 .

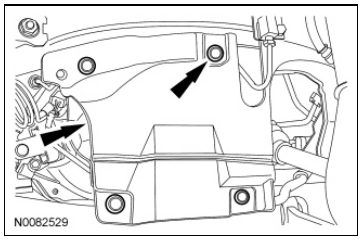
14. Remove the exhaust flexible pipe. For additional information, refer to Section 309-00 .



15. Remove the 4 screws and position the RH fender splash shield aside.

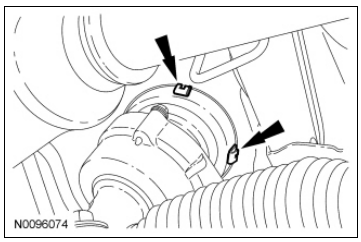


16. Remove the 6 pin-type retainers and the RH splash shield.

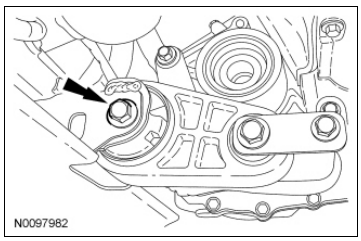


17. Remove the bolt and the Electronic Power Assist Steering (EPAS) wiring ground wire from in the RH front wheel well.

18. Remove the 4 screws and position the LH fender splash shield aside.



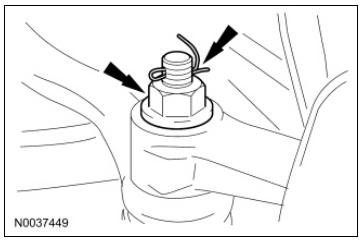
19. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.



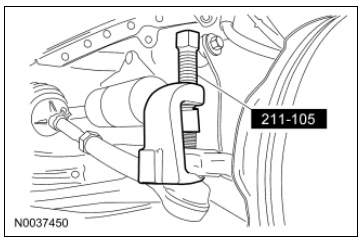
20. Remove the LH halfshaft and the intermediate shaft. For additional information, refer to Section 205-04 .

21. ***NOTICE:*** **The steering gear-to-dash seal must be removed or it will be damaged when lowering the subframe.**

    Release the 4 clips (2 shown) and slide the steering gear-to-dash seal off of the steering gear and into the passenger compartment.

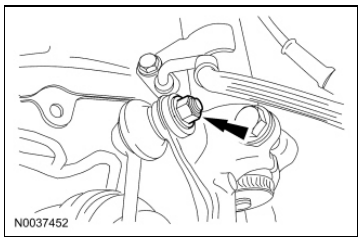


22. Remove the engine roll restrictor bolt.



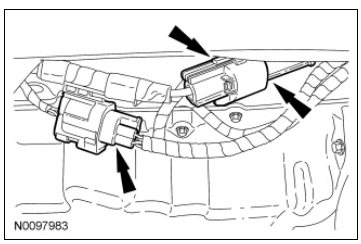
23. **NOTE:** RH shown, LH similar.

    Remove the cotter pins and nuts from the tie-rod ends.



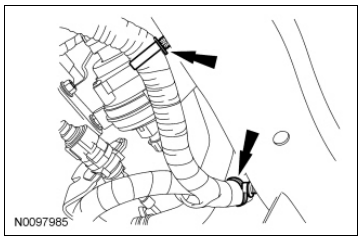
24. **NOTE:** RH shown, LH similar.

    Using the Tie-Rod End Remover, separate the tie-rod ends from the steering knuckles.

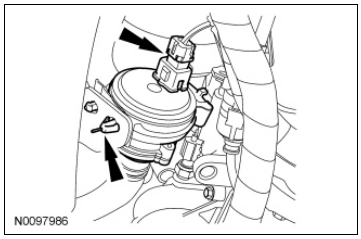


25. **NOTE:** RH shown, LH similar.

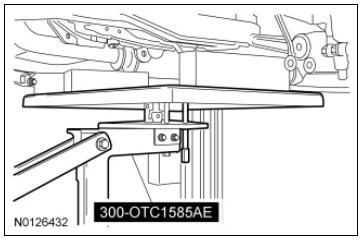
    Remove the nuts and separate the stabilizer bar links from the struts.



26. Disconnect the 2 EPAS electrical connectors near the front of the subframe.
    - Detach the connector retainer from the subframe.

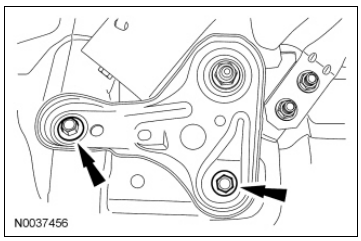


27. Detach the auxiliary coolant hose retainer from the subframe.

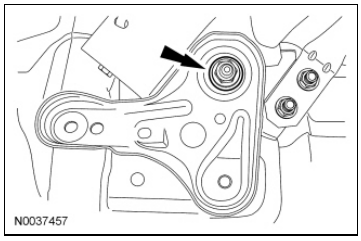


28. Detach the 3 wiring harness retainers (2 shown) from the LH front of the subframe.

29. Disconnect the MECS electrical connector and detach the pump from the bracket.

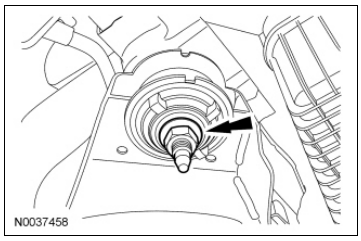


30. Position the Powertrain Lift under the subframe assembly.

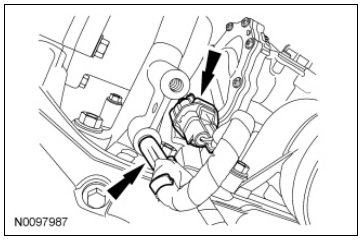


31. **NOTE:** LH shown, RH similar.

    Remove the subframe bracket-to-body bolts.

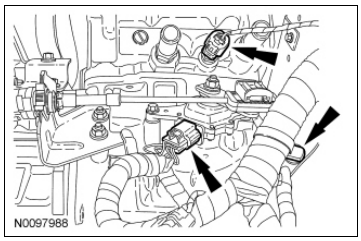


32. Remove the subframe nuts and the subframe brackets.

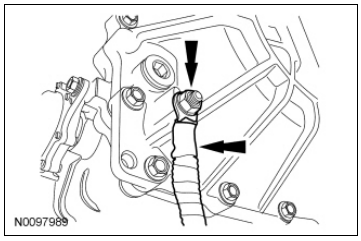


33. **NOTE:** LH shown, RH similar.

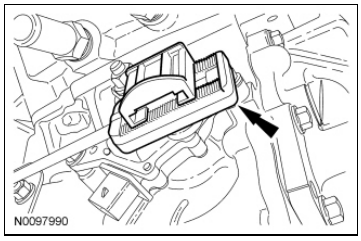
    Remove the front subframe nuts.



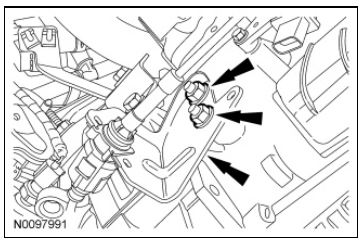
34. Lower the subframe assembly from the vehicle.



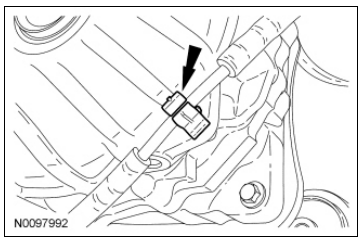
35. Disconnect the vacuum pump assembly electrical connector and detach the wiring retainer.



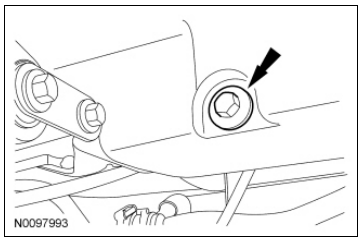
36. Disconnect the transaxle coolant temperature sensor and the Transmission Range (TR) sensor electrical connectors.
    - Detach the wiring harness retainer.



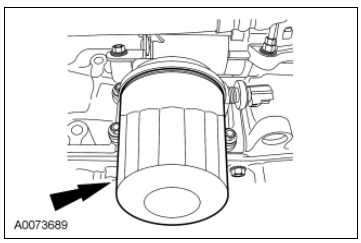
37. Remove the transaxle ground wire and nut.



38. Disconnect the transaxle shift cable from the transaxle.

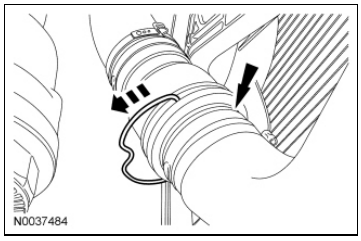


39. Remove the 2 nuts and the transaxle shift cable bracket.

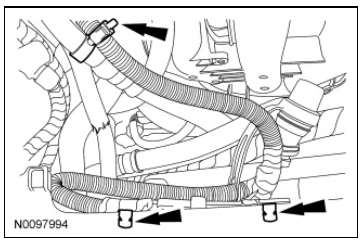


40. Detach the transaxle shift cable routing retainer from the transaxle.

41. Remove the drain plug and drain the engine oil.
    - Install the drain plug.
    - Tighten to 28 Nm (21 lb-ft).

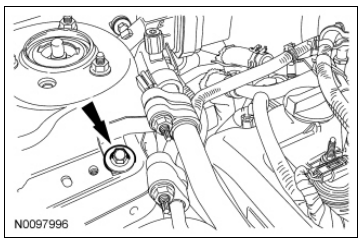


42. Remove the engine oil filter.

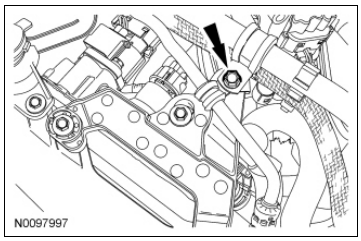


43. **NOTE:** Lower radiator hose shown, upper similar.

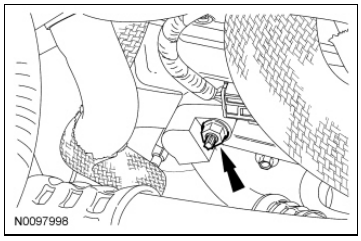
    Remove the retaining clips and disconnect the upper and the lower radiator hose.



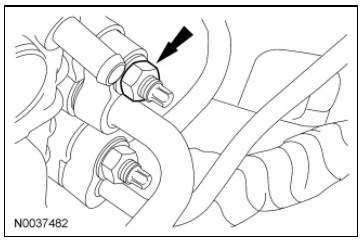
44. If equipped, detach the 3 block heater wiring retainers.



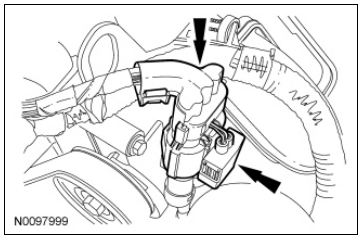
45. Remove the nut and disconnect the A/C tube.
    - Discard the gasket.



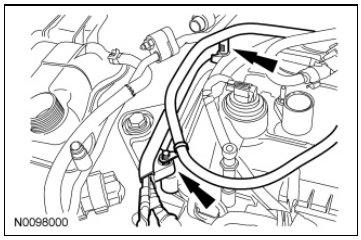
46. Remove the A/C tube bracket bolt from the strut tower.



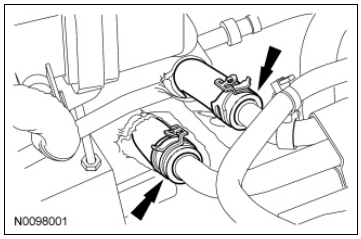
47. Remove the A/C tube bracket bolt.



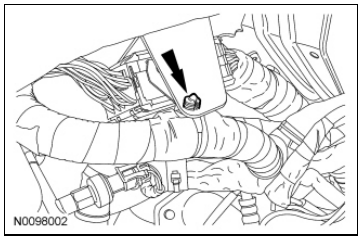
48. Remove the nut and disconnect the A/C tube from the A/C compressor.



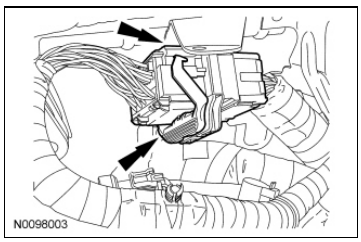
49. Remove the nut and disconnect the A/C tube from the A/C condenser.
    - Discard the gasket.



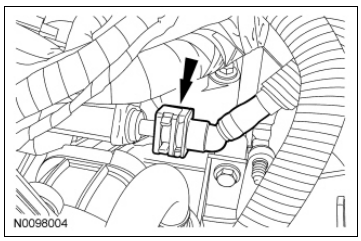
50. Disconnect the 2 vehicle high voltage electrical system electrical connectors.
    - Detach the wiring harness retainer.



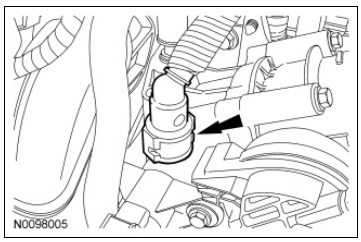
51. Detach the 2 block heaters (if equipped) and the high voltage electrical system wiring retainers from the valve cover stud bolts.



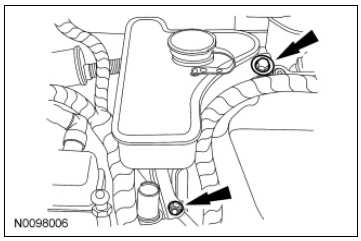
52. Disconnect the 2 heater hoses.



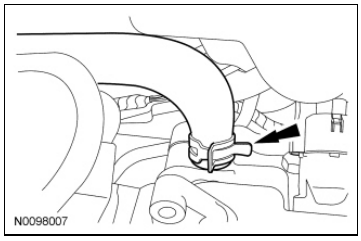
53. Detach the engine wiring harness retainer from the bracket.



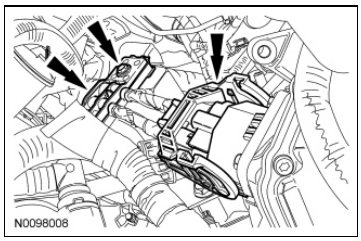
54. Disconnect the engine wiring harness connector and detach it from the bracket.



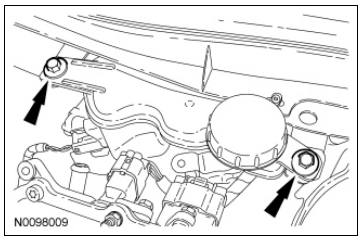
55. Disconnect the fuel supply tube. For additional information, refer to Section 310-00 .



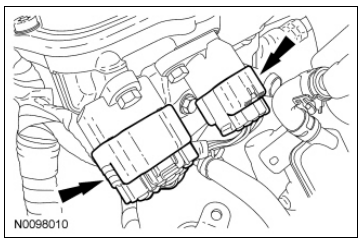
56. Disconnect the upper Evaporative Emission (EVAP) tube quick connect coupling from the purge valve. For additional information, refer to Section 310-00 .



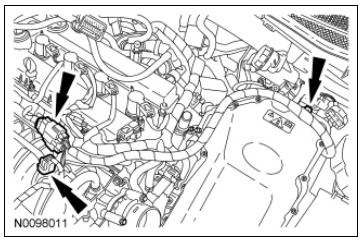
57. Remove the MECS coolant expansion tank nut and bolt.



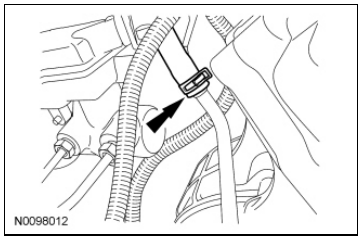
58. Disconnect the hose from the transaxle and remove the MECS coolant expansion tank.



59. Remove the bolt and detach the wiring retainer.
    - Disconnect the transaxle harness electrical connector.

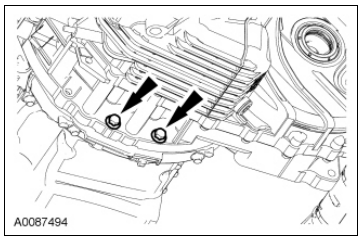


60. Remove the 2 bolts and position the master cylinder reservoir aside.

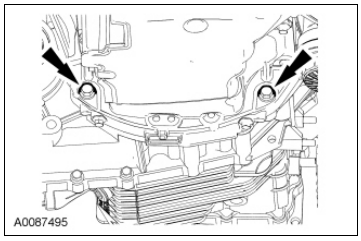


61. Disconnect the 2 transaxle electrical connectors.

62. Disconnect the 2 engine wiring harness connectors and detach the wiring retainer.

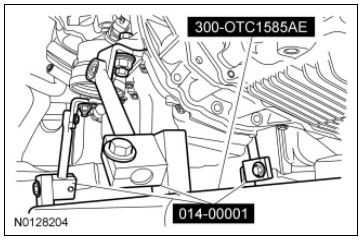


63. Disconnect the brake booster vacuum hose.



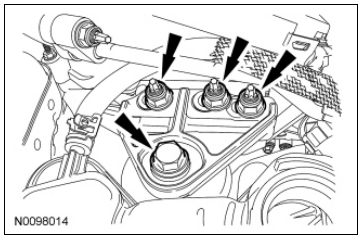
64. **NOTE:** The transaxle-to-engine bolts differ in length. Mark the bolts for correct installation.

    Remove the 2 transaxle-to-engine bolts.



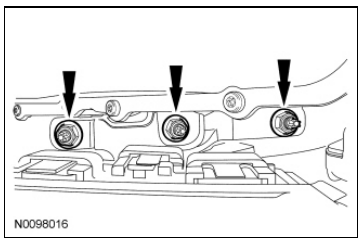
65. **NOTE:** The transaxle-to-engine bolts differ in length, mark the bolts for correct installation.

    Remove the 2 transaxle-to-engine bolts.



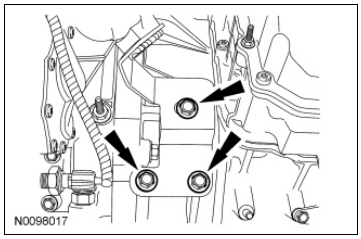
66. **NOTE:** Due to the weight of the transaxle, special care should be taken to mount the powertrain securely to the Powertrain Lift.

    Using the Powertrain Lift and Adjustable Grip Arm, secure the engine to the Powertrain Lift.

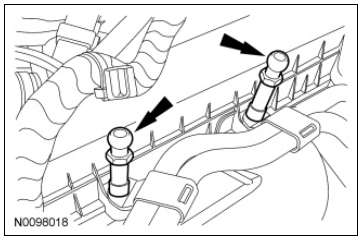


67. Remove the engine mount bracket bolt.

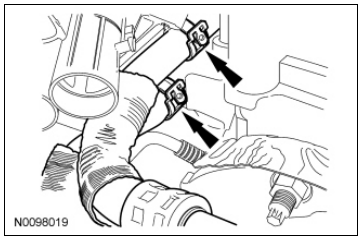
68. Remove the nuts and the engine mount bracket.



69. Remove the 3 nuts from the upper transaxle insulator.

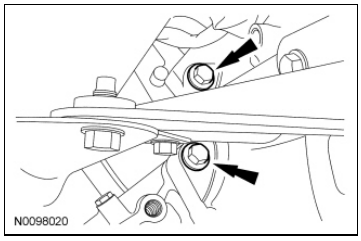


70. Lower the engine and transaxle from the vehicle.

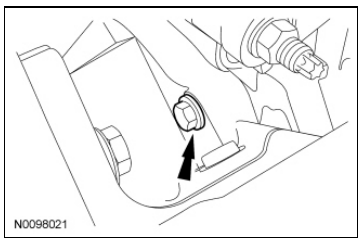


71. Remove the 3 bolts and position aside the auxiliary coolant pump and bracket.

72. Remove the 2 engine cover studs from the valve cover stud bolts..



73. Disconnect the 2 heater hoses from the coolant outlet.

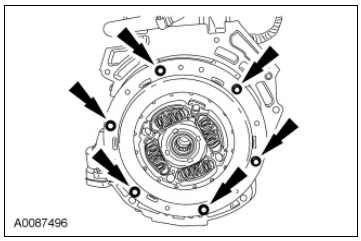


74. Using the Floor Crane and the Spreader Bar, remove the engine and transaxle from the Powertrain Lift.

75. **NOTE:** The transaxle-to-engine bolts differ in length, mark the bolts for correct installation.

    Remove the 2 transaxle bolts.

76. Remove the transaxle bolt.



77. Remove the 3 transaxle bolts and separate the engine and transaxle.

78. **NOTE:** Due to packaging requirements the correct bolt must be used at the damper locations.

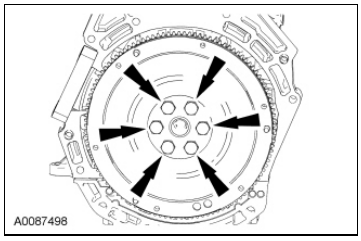
    NOTE: The damper contains a clutch which is designed to slip briefly during vehicle operation. It is essential that no grease, oil or cleaning solvents be allowed to contaminate the slip clutch. Do not use grease on transmission input shaft. Should the damper become contaminated, it must be replaced.

    Remove the bolts and the transaxle damper.

Engine

Special Tool(s)

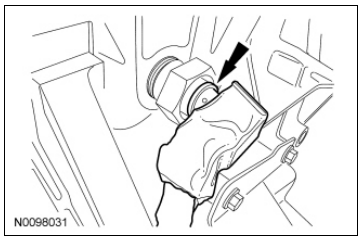
 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST1910-A	Engine Stand 014-00232 or equivalent
 ST1341-A	2,200# Floor Crane, Fold Away 300-OTC1819E or equivalent
 ST3054-A	Holding Tool, Crankshaft Damper 303-1416
 ST1982-A	Installer, Connecting Rod 303-462 (T94P-6136-AH)
 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent
 ST2638-A	Timing Peg, Crankshaft TDC 303-507



NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instructed in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools or severe engine damage may occur.**

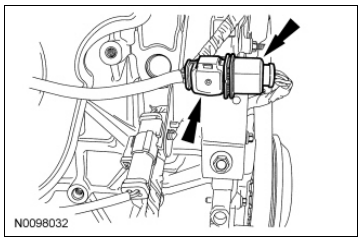
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**

NOTE: Due to the precision fit and timing of the balancer shaft assembly, it cannot be removed from the engine block.

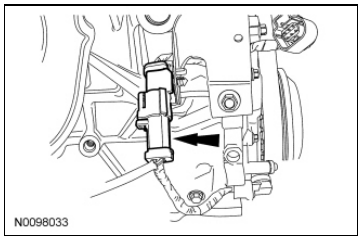


NOTE: For additional information, refer to the exploded views under engine Assembly in this section.

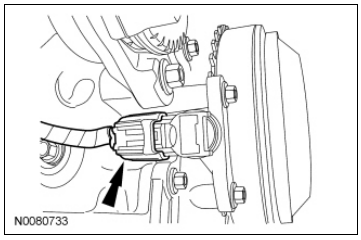
1. Remove the 6 bolts and the flywheel.



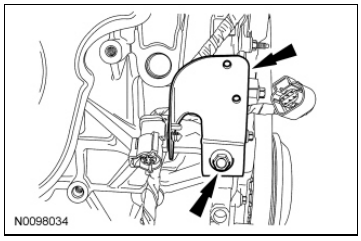
2. Mount the engine on a suitable engine stand.



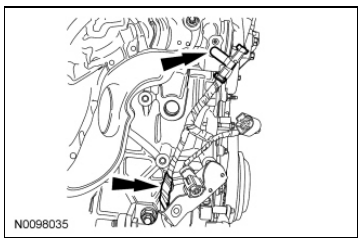
3. If equipped, disconnect the engine block heater.



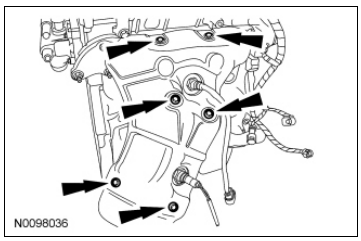
4. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector.
    - Detach the connector from the engine wiring harness connector bracket.



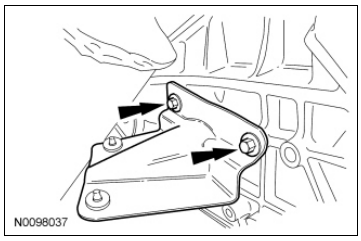
5. Disconnect the Catalyst Monitor Sensor (CMS) electrical connector.



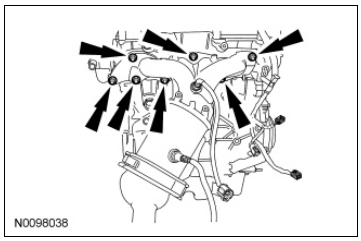
6. Disconnect the Crankshaft Position (CKP) sensor electrical connector.



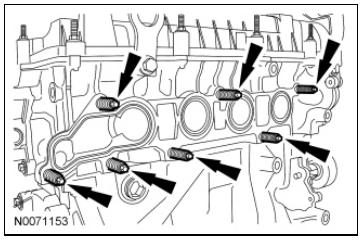
7. Remove the bolt and the engine wiring harness connector bracket.



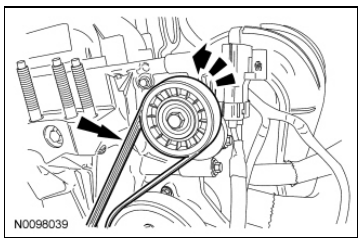
8. Detach the 2 engine wiring harness pin-type retainers.



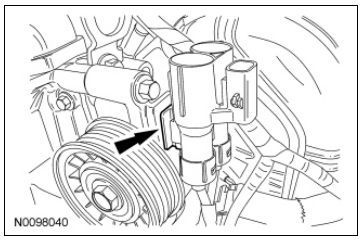
9. Remove the 6 bolts and the catalytic converter manifold heat shield.



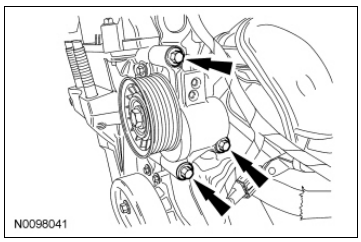
10. Remove the 2 catalytic converter manifold bracket-to-engine block bolts.



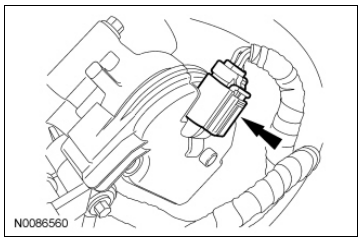
11. Remove the 7 nuts and the catalytic converter manifold.
    - Discard the nuts and the catalytic converter manifold gasket.



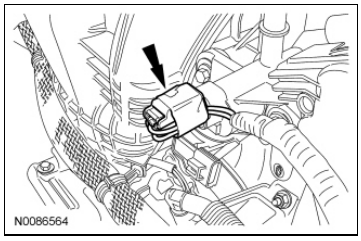
12. Remove and discard the 7 cylinder head studs.



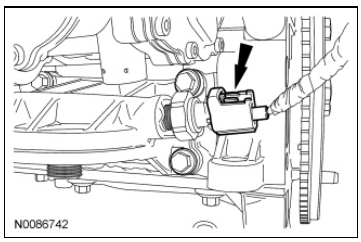
13. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.



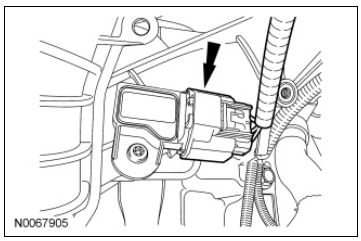
14. Detach the vehicle high voltage electrical system electrical connector retainer from the accessory drive belt tensioner.



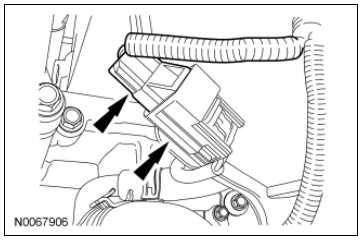
15. Remove the 3 bolts and the accessory drive belt tensioner.



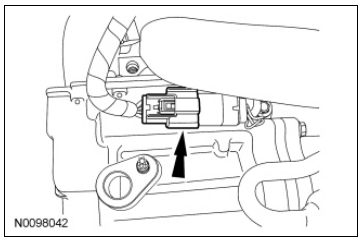
16. Disconnect the electronic throttle control electrical connector.



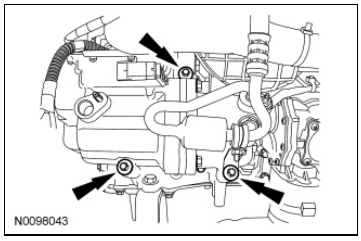
17. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.



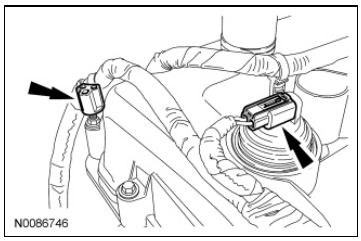
18. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.



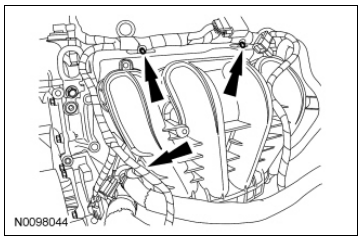
19. Disconnect the Manifold Absolute Pressure (MAP) sensor electrical connector.



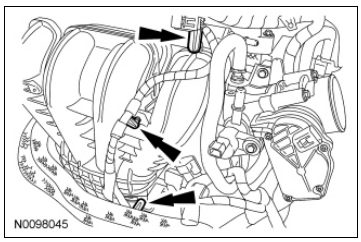
20. Disconnect the Knock Sensor (KS) electrical connector and detach the electrical connector pin-type retainer from the intake manifold.



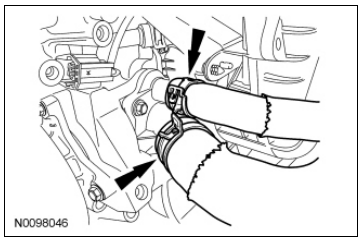
21. Disconnect the A/C compressor electrical connector.



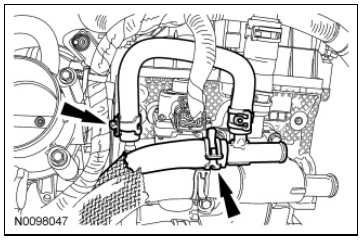
22. Remove the 3 bolts and the A/C compressor.



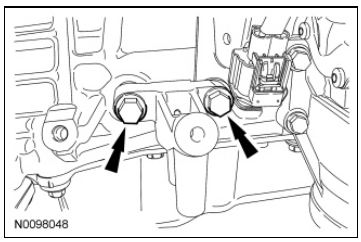
23. Disconnect the Variable Camshaft Timing (VCT) oil control solenoid electrical connector and detach the wiring harness retainer from the valve cover stud bolt.



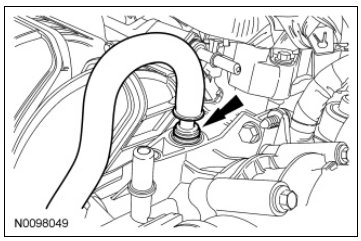
24. Detach the 3 wire harness pin-type retainers.



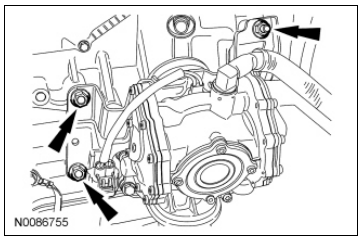
25. Detach the 2 auxiliary coolant pump wiring retainers and the lower radiator hose retainer.



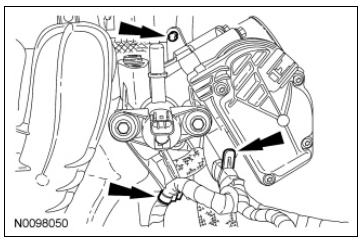
26. Disconnect the auxiliary coolant pump hose and the upper radiator hose.



27. Disconnect the EGR coolant hose and the auxiliary coolant pump hose.
    - Remove the upper radiator hose and the auxiliary coolant pump as an assembly.

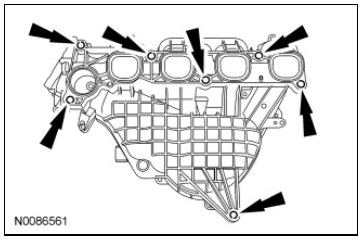


28. Remove the 2 bolts and the A/C compressor bracket.

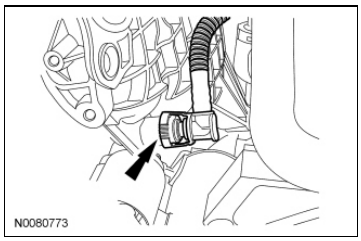


29. Disconnect the vacuum hose from the intake manifold.

30. Remove the 2 bolts, the nut and the vacuum pump assembly.

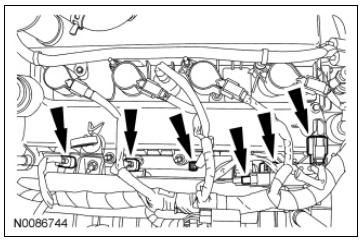


31. Detach the 3 wire harness pin-type retainers from the intake manifold.

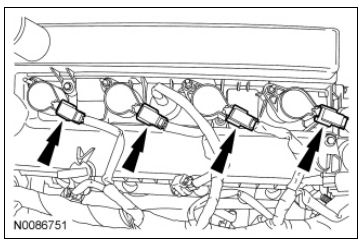


32. **NOTE:** The cylinder head side of the intake manifold is showing the location of the 7 bolts.

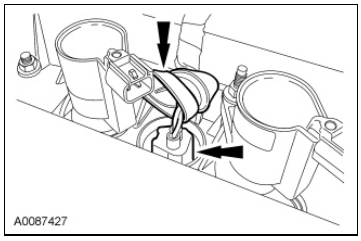
    Remove the 7 bolts and position the intake manifold aside to access the PCV hose connector.



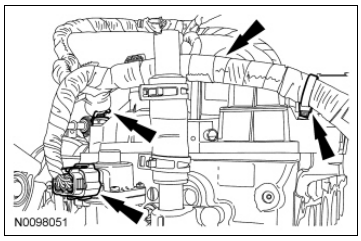
33. Squeeze the 2 PCV hose connector tabs and disconnect the PCV hose from the intake manifold.
    - Remove the intake manifold.



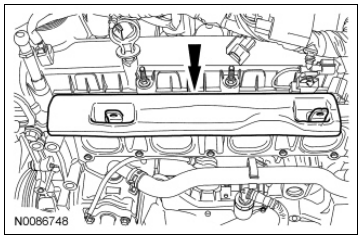
34. Remove the EGR tube.



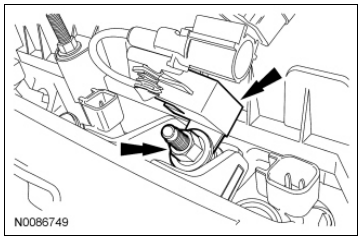
35. Disconnect the 4 fuel injector electrical connectors, radio capacitor electrical connector and the Camshaft Position (CMP) sensor electrical connector.



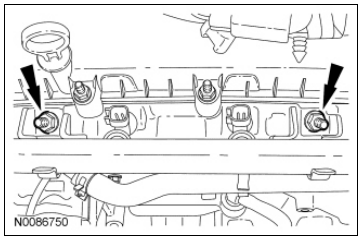
36. Disconnect the 4 coil-on-plug electrical connectors.



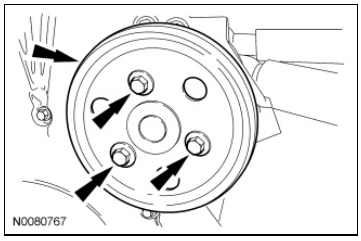
37. Position the rubber boot aside and disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.



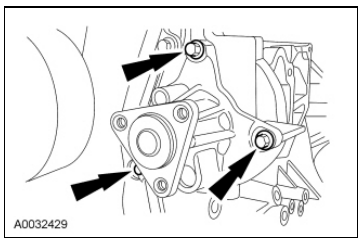
38. Disconnect the EGR valve electrical connector and detach the 2 wiring harness retainers from the valve cover and stud bolt.
    - Remove the engine control wiring harness from the engine.



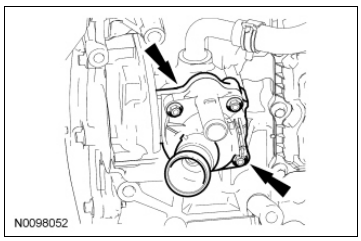
39. Remove the fuel rail insulator.



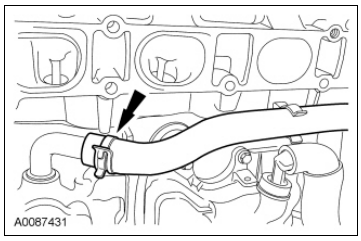
40. Remove the nut and the radio capacitor.



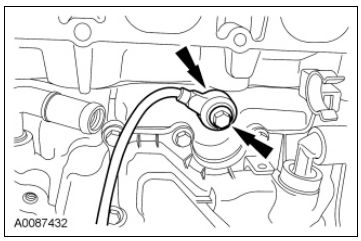
41. Remove the 2 stud bolts and the fuel rail with the fuel injectors.



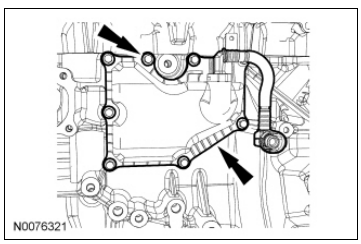
42. Remove the 3 bolts and the coolant pump pulley.



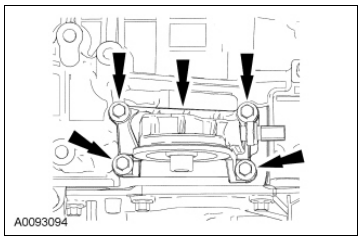
43. Remove the 3 bolts and the coolant pump.



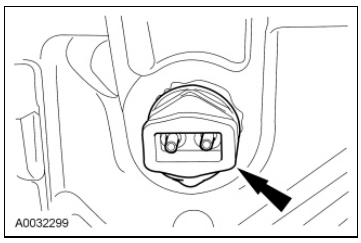
44. Remove the 3 bolts and the thermostat housing.



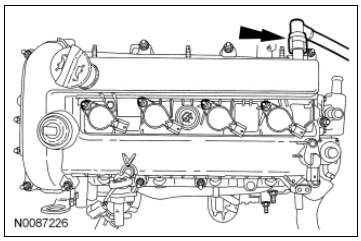
45. Disconnect the bypass hose.



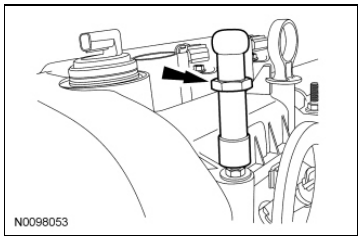
46. Remove the bolt and the KS .



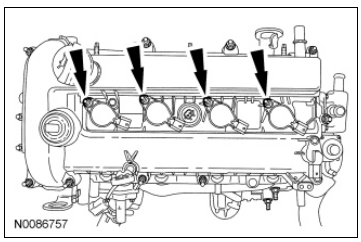
47. Remove the 8 bolts and the crankcase vent oil separator.



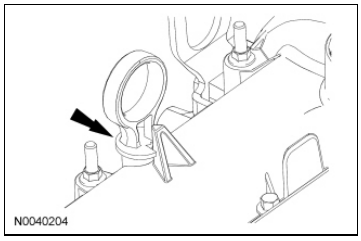
48. Remove the 4 bolts and the oil filter adapter.
    - Discard the gasket.



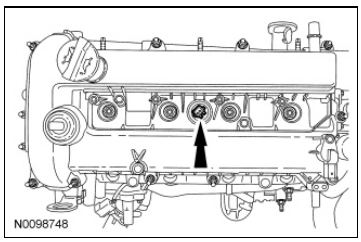
49. If equipped, remove the block heater.



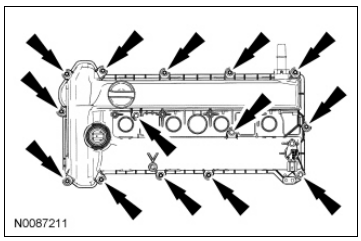
50. Remove the crankshaft vent tube.



51. Remove the 2 engine cover studs (one shown).

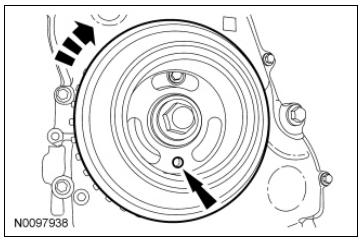


52. Remove the 4 stud bolts and the coil-on-plugs from the valve cover.



53. Remove the oil level indicator.

54. Remove the CHT sensor.

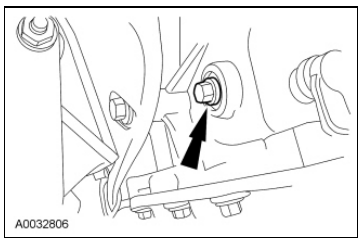


55. Remove the bolts and the valve cover.

56. ***NOTICE:*** **Failure to position the No. 1 piston at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

    Using the crankshaft pulley bolt, turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

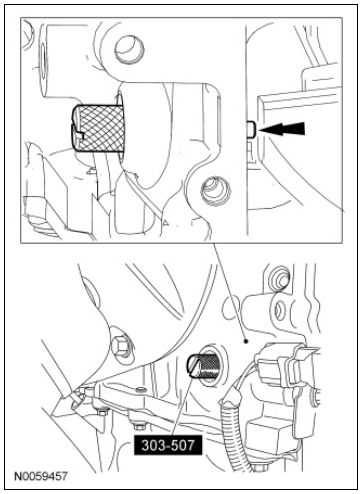
    - The hole in the crankshaft pulley should be in the 6 o'clock position.



57. ***NOTICE:*** **The Camshaft Alignment Plate 303-465 is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    NOTE: The camshaft timing slots are offset. If the Camshaft Alignment Plate 303-465 cannot be installed, rotate the crankshaft one complete revolution clockwise to correctly position the camshafts.

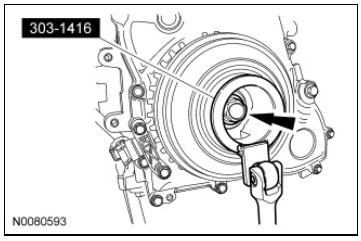
    Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.



58. Remove the engine plug bolt.

59. **NOTE:** The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position during the crankshaft pulley removal and installation.

    Install the Crankshaft TDC Timing Peg.

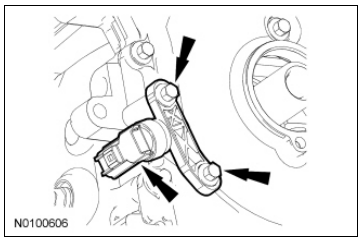


60. ***NOTICE:*** **The crankshaft must remain in the Top Dead Center (TDC) position during removal of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Crankshaft Damper Holding Tool and the bolt should be removed using an air impact wrench (1/2-in drive minimum).**

    NOTICE: **The crankshaft sprocket diamond washer may come off with the crankshaft pulley. The diamond washer must be replaced; remove and discard the diamond washer. If the diamond washer is not installed, engine damage may occur.**

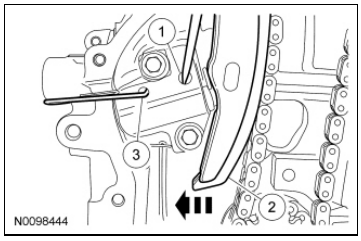
    Using the Crankshaft Damper Holding Tool and an air impact wrench, remove the crankshaft pulley.

    - Remove and discard the crankshaft pulley bolt and washer.
    - Remove the crankshaft pulley.
    - Remove the diamond washer and discard.

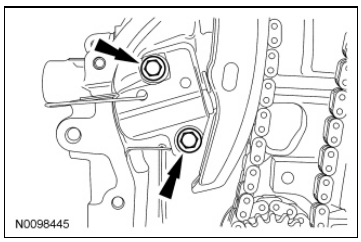


61. ***NOTICE:*** **Use care not to damage the engine front cover or the crankshaft when removing the seal.**

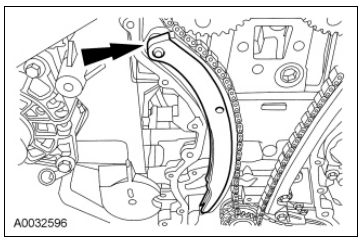
    Using the Oil Seal Remover, remove the crankshaft front oil seal.



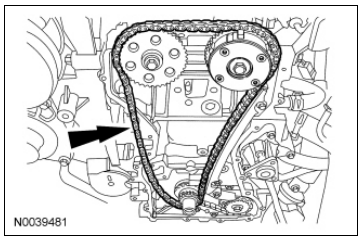
62. Remove the 2 bolts and the CKP sensor.



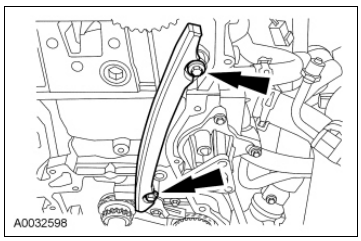
63. Remove the bolts and the engine front cover.



64. Compress the timing chain tensioner in the following sequence.
    1. Using a small pick, release and hold the ratchet mechanism.
    2. While holding the ratchet mechanism in the released position, compress the tensioner by pushing the timing chain arm toward the tensioner.
    3. Insert a paper clip into the hole to retain the tensioner.

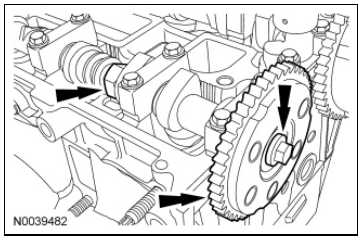


65. Remove the 2 bolts and timing chain tensioner.

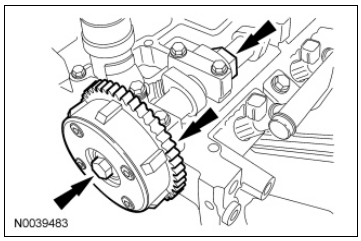


66. Remove the RH timing chain guide.

67. Remove the timing chain.

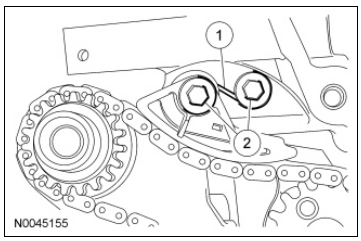


68. Remove the bolts and the LH timing chain guide.



69. ***NOTICE:*** **Do not rely on the Camshaft Alignment Plate to prevent camshaft rotation. Damage to the tool or the camshaft can occur.**

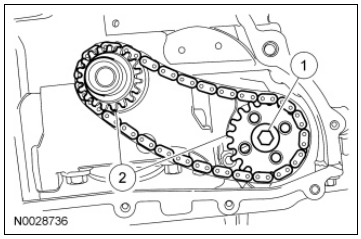
    Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the exhaust camshaft sprocket.



70. ***NOTICE:*** **The Camshaft Alignment Plate 303-465 is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    Using the flats on the camshaft to prevent camshaft rotation, remove the bolt and the intake camshaft phaser and sprocket.

71. Remove the oil pump chain tensioner.
    1. Release the tension on the tensioner spring.
    2. Remove the tensioner and the shoulder bolts.

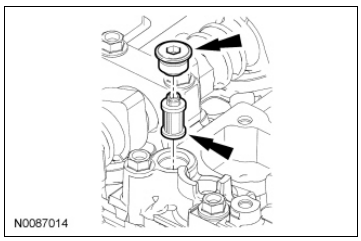


72. **NOTE:** Remove and discard the crankshaft sprocket diamond washer located behind the crankshaft sprocket.

    NOTE: The oil pump chain sprocket must be held in place.

    Remove the oil pump chain and sprockets.

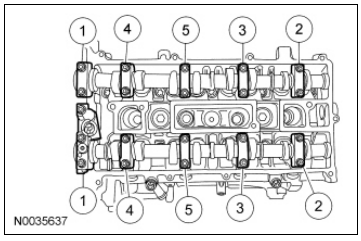
    1. Remove the bolt.
    2. Remove the chain and sprockets.



73. Mark the position of the camshaft lobes on the No. 1 cylinder for assembly reference.

74. Remove the bolt and the Variable Camshaft Timing (VCT) solenoid.

75. Remove the plug and the VCT system oil filter from the intake camshaft thrust cap.

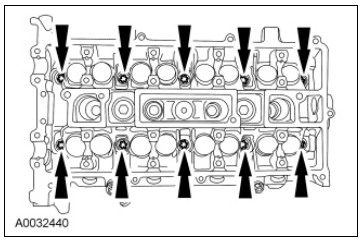


76. ***NOTICE:*** **Failure to follow the camshaft loosening procedure can result in damage to the camshafts.**

    NOTE: Mark the location and orientation of each camshaft bearing cap.

    Remove the camshafts from the engine.

    - Loosen the camshaft bearing bolts in the sequence shown, one turn at a time. Repeat until all the tension is released.
    - Remove the camshaft bearing caps.
    - Remove the camshafts.

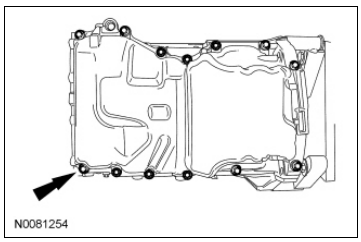


77. **NOTE:** If the camshafts and valve tappets are to be reused, mark the location of the valve tappets to make sure they are assembled in their original positions.

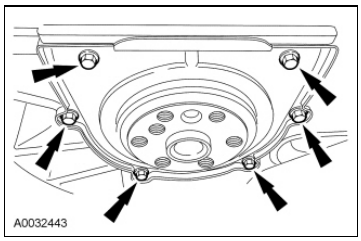
    NOTE: The number on the valve tappets only reflects the digits that follow the decimal. For example, a tappet with the number 0.650 has the thickness of 3.650 mm.

    Remove and inspect the valve tappets. For additional information, refer to Section 303-00 .

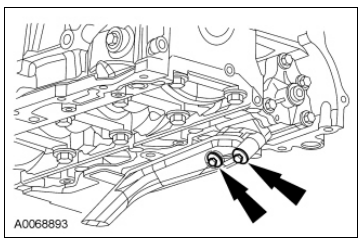
78. Remove the cylinder head.
    - Remove and discard the cylinder head bolts.
    - Remove the cylinder head.
    - Remove and discard the cylinder head gasket.



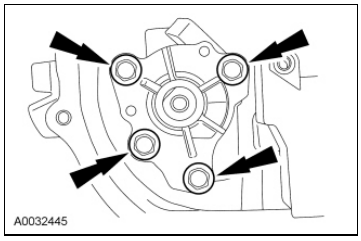
79. Support the cylinder heads on a bench with the head gasket side up. Check the cylinder head distortion and the cylinder block distortion. For additional information, refer to Section 303-00 .



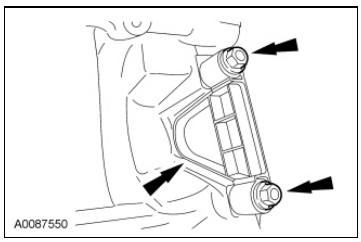
80. Remove the cylinder head alignment dowels.



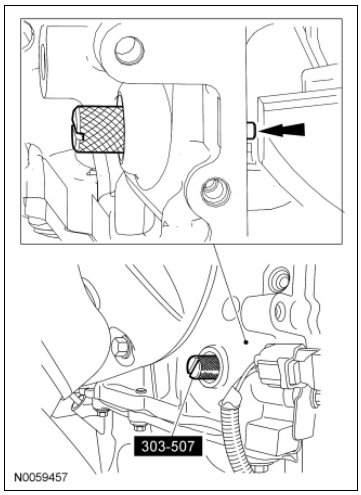
81. Remove the bolts and the oil pan.



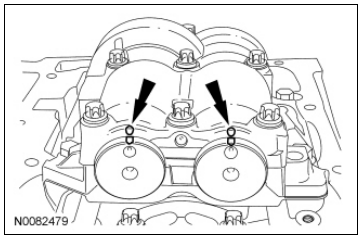
82. Remove the bolts and the crankshaft rear oil seal with retainer.



83. Remove the bolts, oil pump pickup tube and gasket.

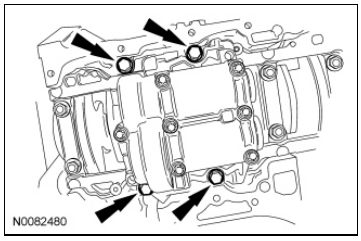


84. Remove the bolts and the oil pump.

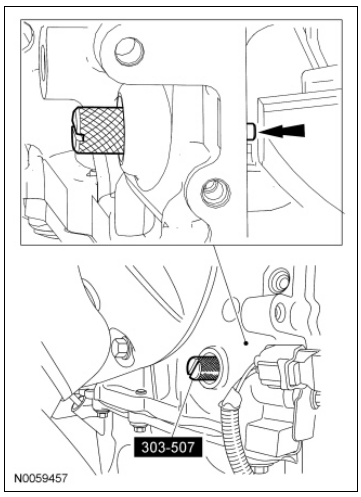


85. Remove the bolts and the block-off plate.

86. Make sure the Crankshaft TDC Timing Peg is still installed and the engine is still at Top Dead Center (TDC).
    - Rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg.

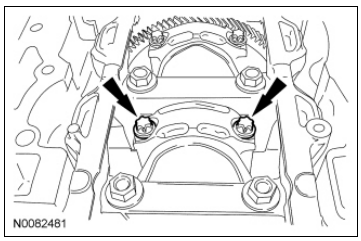


87. Mark the balancer unit front shafts on the top for reference that the balancer unit is at TDC .



88. ***NOTICE:*** **Due to the precision interior construction of the balancer unit, it should not be disassembled.**

    Remove the 4 bolts and the balancer unit.

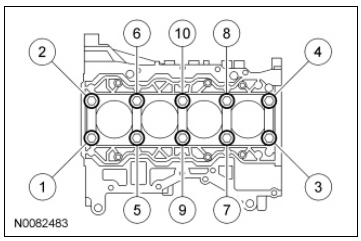


89. Remove the Crankshaft TDC Timing Peg.

90. Before removing the pistons, inspect the top of the cylinder bores. If necessary, remove the ridge or carbon deposits from each cylinder using an abrasive pad or equivalent, following manufacturer's instructions.

91. **NOTE:** Clearly mark the connecting rods, connecting rod caps and connecting rod bearings in numerical order for correct orientation for reassembly.

    Remove the connecting rod cap bolts and cap.

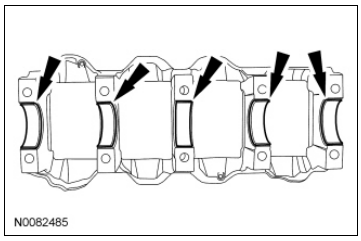


92. ***NOTICE:*** **Do not scratch the cylinder walls or crankshaft journals with the connecting rod.**

    Using the Connecting Rod Installer, remove the piston/rod assembly from the engine block.

    - Repeat the previous 2 steps until all the piston/rod assemblies are removed from the engine block.

93. Remove the bolts in the sequence shown.
    - Remove the main bearing beam.
    - Discard the bolts.



94. Remove the crankshaft from the engine block.

95. **NOTE:** If the main bearings are being reused, mark them in order for correct orientation and reassembly.

    Remove the main bearings from the main bearing beam.

96. **NOTE:** If the main bearings are being reused, mark them in order for correct orientation and reassembly.

    NOTE: The center bulkhead has the thrust bearing.

    Remove the main bearings from the cylinder block.

97. **NOTE:** If the oil squirters are being reused, mark them in order for correct location during reassembly.

    NOTE: The front bulkhead does not have an oil squirter.

    Remove the 4 oil squirters.

98. Inspect the cylinder block, main bearing beam, pistons and connecting rods. For additional information, refer to Section 303-00 .

8	6518	Valve collet (16 required)
9	6514	Valve spring retainer (16 required)
10	6513	Valve spring (16 required)
11	6A517	Valve seal (16 required)
12	6505	Intake valve (8 required)
13	6507	Exhaust valve (8 required)
14	6049	Cylinder head

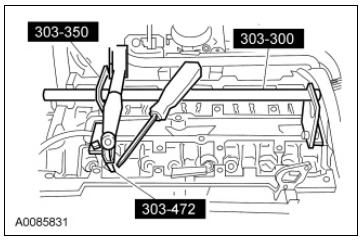
Disassembly

NOTE: If the components are to be reinstalled, mark the location of the components removed, they must be installed in the same location.

1. Remove the 2 bolts and the EGR valve.
   - Discard the gasket.

2. Remove the 4 bolts and the coolant outlet.
   - Discard the gasket.

3. Remove the Cylinder Head Temperature (CHT) sensor.

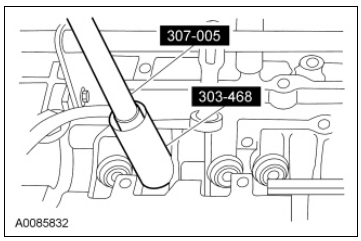


4. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plugs.**

   Remove the spark plugs.

5. Remove the valve tappets.

6. **NOTE:** Use a small screwdriver and grease to remove the valve collets.



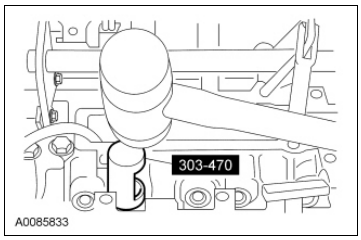
Using the Valve Spring Compressors, compress the valve springs and remove the valve collets, valve spring retainers and the valve springs.

7. Inspect the components, if necessary. For additional information, refer to Section 303-00 .

8. Remove the valves.

9. Using the Slide Hammer and the Valve Stem Oil Seal Remover, remove and discard the valve seals.

10. Inspect the valves. For additional information, refer to Section 303-00 . Install new parts, as necessary.



Assembly

1. **NOTE:** Coat the valve stems with clean engine oil.

   Install the valves.

2. **NOTE:** Use the protector provided with the replacement kit to prevent damage to the valve seals. Lubricate the valve stems and guides with clean engine oil.

   Using the Valve Stem Oil Seal Installer, install the valve seals.

3. **NOTE:** Check the seating of the valve collets.

   Using the Valve Spring Compressors, install the valve springs.

   - Insert the valve springs and the valve spring retainers.
   - Compress the valve springs and install the valve collets, using grease and a small screwdriver.

4. **NOTE:** Coat the valve tappets with clean engine oil.

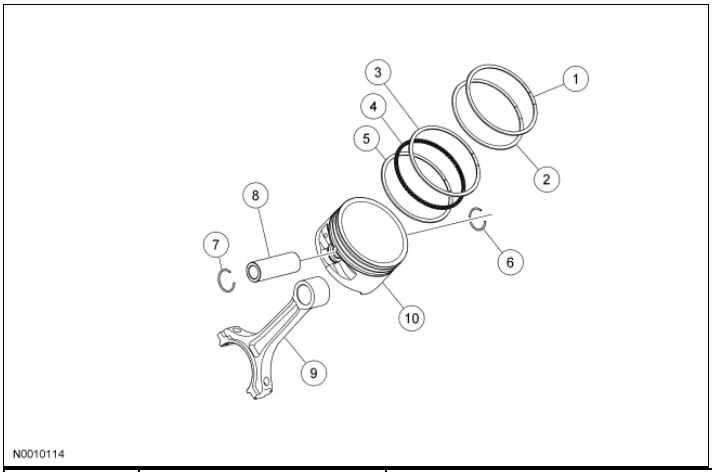
   Install the valve tappets.

5. ***NOTICE:*** **Only use hand tools when removing or installing the spark plugs or damage can occur to the cylinder head or spark plugs.**

   Install the spark plugs.

   - Tighten to 12 Nm (106 lb-in).

6. Install the CHT sensor.
   - Tighten to 12 Nm (106 lb-in).



7. Using a new gasket, install the coolant outlet and bolts.
   - Tighten to 10 Nm (89 lb-in).

8. Install the EGR valve, using a new gasket.
   - Tighten to 20 Nm (177 lb-in).

Piston

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Item	Part Number	Description
1	6150	Piston compression upper ring
2	6152	Piston compression lower ring
3	6159	Piston oil control upper segment ring
4	6161	Piston oil control spacer
5	6159	Piston oil control lower segment ring
6	6140	Piston pin retainer
7	6140	Piston pin retainer
8	6135	Piston pin
9	6200	Connecting rod
10	6110	Piston

Disassembly

1. Remove the piston rings from the piston.
   - Discard the piston rings.

2. Remove the 2 piston pin retainers and the piston pin.

3. **NOTE:** If the piston and connecting rod are to be reinstalled, they must be assembled in the same orientation. Mark the piston orientation to the connecting rod for reassembly.

Separate the piston from the connecting rod.

4. Clean and inspect the piston and connecting rod. For additional information, refer to Section 303-00 .

Assembly

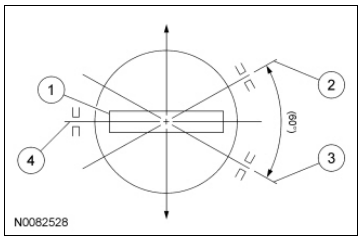
1. **NOTE:** The arrow on the top of the piston points towards the front of the engine.

   Align the piston-to-connecting rod orientation marks, and position the connecting rod in the piston.

2. Lubricate the piston pin and pin bore with clean engine oil.

3. Install the piston pin in the piston and connecting rod assembly.

4. Install the piston pin retaining clips in the piston.



5. Lubricate the piston and the new piston rings with clean engine oil.

6. **NOTE:** The piston compression upper and lower ring should be installed with the paint mark on the outside diameter circumference of the ring to be positioned on the right side of the ring gap. The lower compression ring needs to be installed with the undercut side downward.

   NOTE: The upper and lower compression ring gaps are not controlled for installation.

   Install the piston rings onto the piston as shown.

   1. Piston pin
   2. Upper oil control ring gap location
   3. Lower oil control ring gap location
   4. Center line of the piston pin bore and the expander gap

Engine

Special Tool(s)

 ST3055A	Aligner, Crankshaft Sensor 303-1417
 ST2645-A	Alignment Plate, Camshaft 303-465 (T94P-6256-CH)
 ST1376-A	Compressor, Pistong 303-D032 (D81L-6002-C)
 ST1214-A	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C)

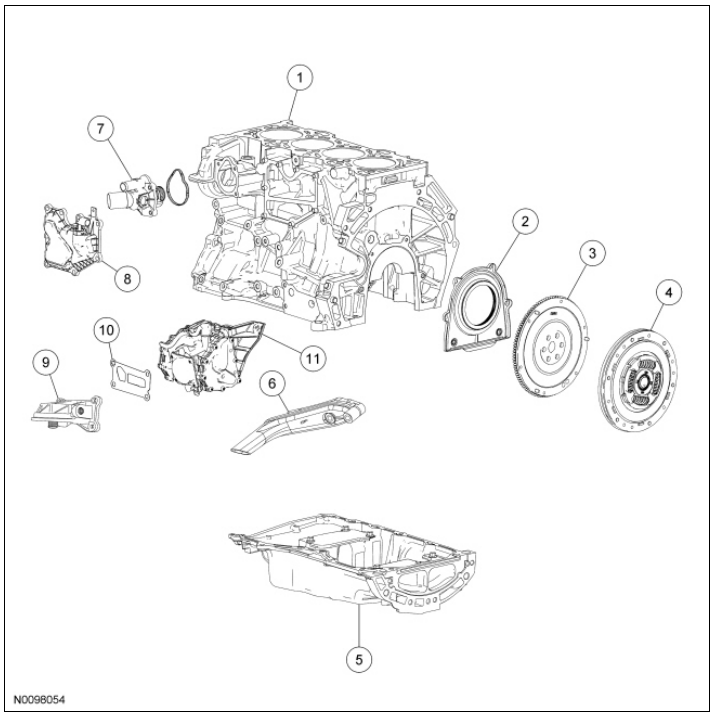
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3) or equivalent
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

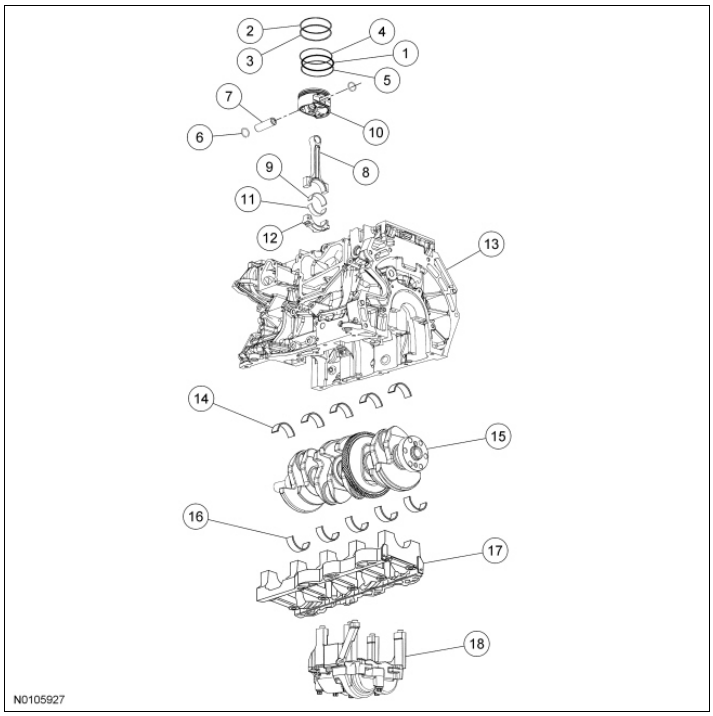
General Equipment



6 mm x 18 mm bolt

Material

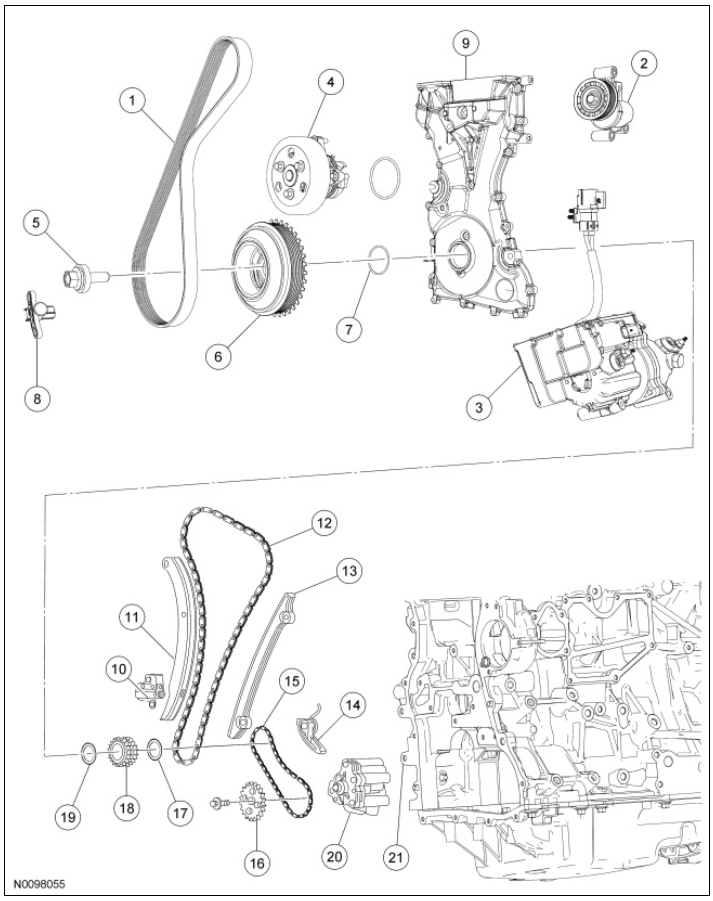
Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	
Motorcraft® Specialty Green Engine Coolant [a] VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant [a] VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft® Silicone Gasket Remover ZC-30	-



[a] Early build vehicle cooling systems are filled with Motorcraft® Specialty Green Engine Coolant and late build vehicle cooling systems are filled with Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.

Lower Engine Block (View 1)

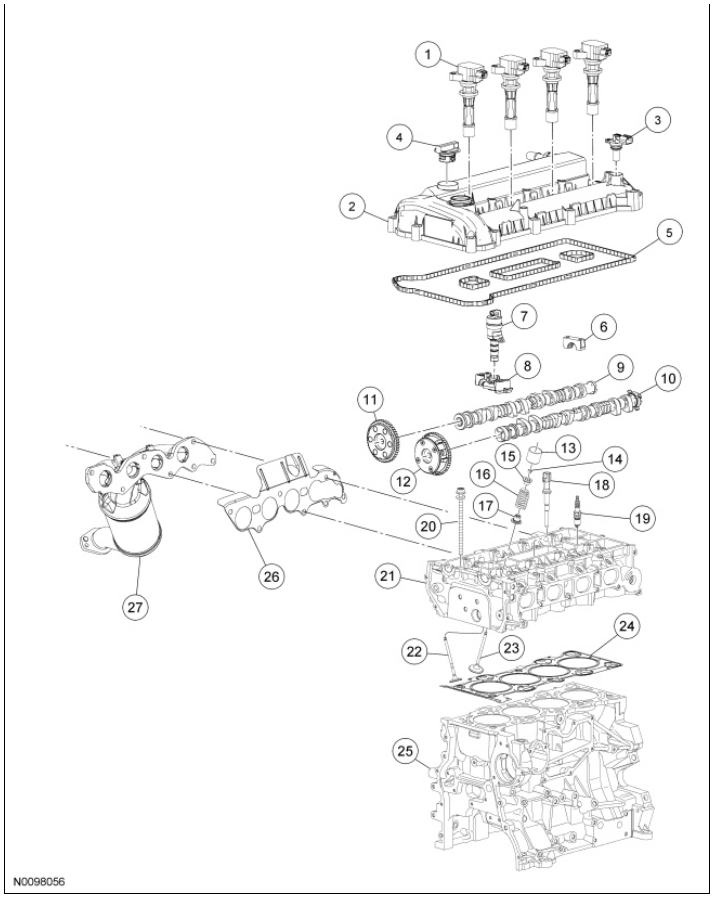
Item	Part Number	Description
1	6010	Cylinder block
2	6K318	Crankshaft rear oil seal and retainer
3	6K390	Flywheel
5	6675	Oil pan
6	6622	Oil pump screen and pickup tube
7	8575	Thermostat assembly
8	6A785	Crankcase vent oil separator
9	6884	Oil filter adapter
10	6A636	Oil filter adapter gasket
11	2A451	Vacuum pump and bracket



Lower Engine Block (View 2)

Item	Part Number	Description
1	6161	Piston oil control spacer (4 required)
2	6150	Piston compression upper ring (4 required)
3	6152	Piston compression lower ring (4 required)
4	6159	Piston oil control upper segment ring (4 required)
5	6159	Piston oil control lower segment ring (4 required)
6	6140	Piston pin retainer (8 required)
7	6135	Piston pin (4 required)
8	6200	Connecting rod (4 required)
9	6211	Connecting rod upper bearing (4 required)
10	6110	Piston (4 required)
11	6211	Connecting rod lower bearing (4 required)

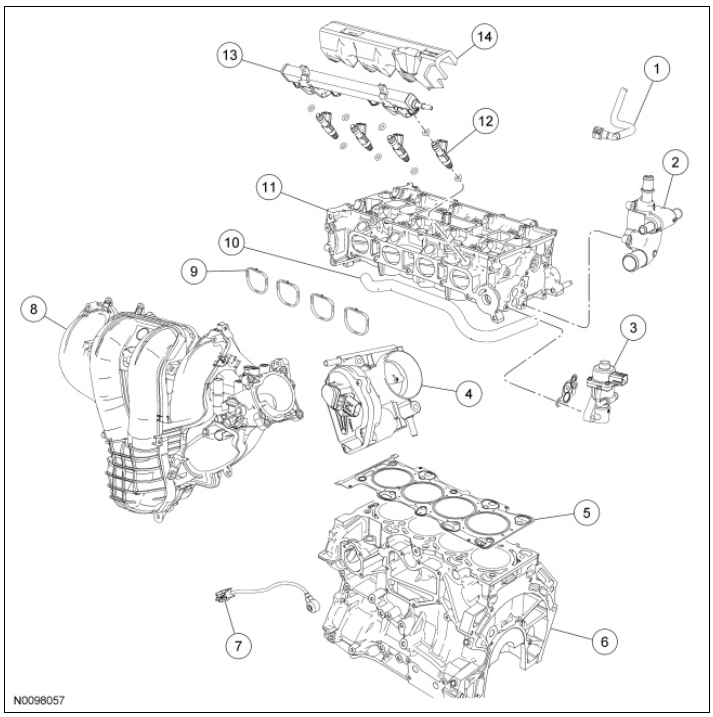
12	6210	Connecting rod cap (4 required)
13	6010	Cylinder block
14	6333	Cylinder block crankshaft main bearing (5 required)
15	6303	Crankshaft
16	6333	Crankshaft main bearing beam bearing (5 required)
17	6F098	Main bearing beam
18	6K360	Balance shaft assembly



Front Engine Block

Item	Part Number	Description
1	6C301	Accessory drive belt
2	6A228	Accessory drive belt tensioner
3	19D629	Electric A/C compressor
4	8501	Coolant pump
5	6K340	Crankshaft pulley bolt
6	6316	Crankshaft pulley
7	6700	Crankshaft front seal
8	6C315	Crankshaft Position (CKP) sensor
9	6019	Engine front cover
10	6K254	Timing chain tensioner
11	6K255	Timing chain tensioner arm

12	6268	Timing chain
13	6K297	Timing chain guide
14	6C271	Oil pump chain tensioner
15	6A895	Oil pump chain
16	6652	Oil pump drive gear
17	6378	Diamond washer
18	6306	Crankshaft sprocket
19	6378	Diamond washer
20	6600	Oil pump
21	6010	Cylinder block



Cylinder Head

Item	Part Number	Description
1	12A366	Coil-on-plug assembly
2	6M293	Valve cover
3	12K073	Camshaft Position (CMP) sensor
4	6766	Oil filler cap
5	6M293	Valve cover gasket
6	6A284	Camshaft bearing cap
7	6M280	Variable Camshaft Timing (VCT) solenoid
8	6A258	Camshaft bearing cap

9	6A272	Camshaft (exhaust)
10	6A271	Camshaft (intake)
11	6C251	Camshaft sprocket
12	6C525	VCT actuator
13	6500	Valve tappet (16 required)
14	6518	Valve collet (16 required)
15	6514	Valve spring retainer (16 required)
16	6513	Valve spring (16 required)
17	6A517	Valve stem seal (16 required)
18	6G004	Cylinder Head Temperature (CHT) sensor
19	12405	Spark plug (4 required)
20	6065	Cylinder head bolt (10 required)
21	6049	Cylinder head
22	6505	Exhaust valve (8 required)
23	6507	Intake valve (8 required)
24	6051	Head gasket
25	6010	Cylinder block
26	9448	Catalytic converter gasket
27	5E211	Catalytic converter

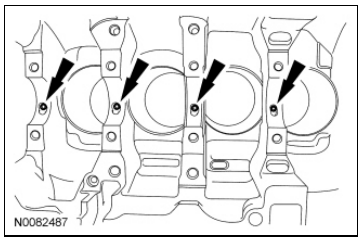
Intake Manifold

Item	Part Number	Description
1	9288	Fuel supply tube
2	8K556	Coolant outlet
3	9D475	EGR valve

4	9F991	Electronic Throttle Body (TB)
5	6051	Cylinder head gasket
6	6010	Cylinder block
7	12A699	Knock Sensor (KS)
8	9424	Intake manifold
9	9439	Intake manifold gasket (4 required)
10	8A582	Coolant hose
11	6049	Cylinder head
12	9F593	Fuel injector (4 required)
13	9H487	Fuel rail
14	-	Fuel rail insulator

NOTICE: **Do not loosen or remove the crankshaft pulley bolt without first installing the special tools as instrucd in this procedure. The crankshaft pulley and the crankshaft timing sprocket are not keyed to the crankshaft. The crankshaft, the crankshaft sprocket and the pulley are fitted together by friction, using diamond washers between the flange faces on each part. For that reason, the crankshaft sprocket is also unfastened if the pulley bolt is loosened. Before any repair requiring loosening or removal of the crankshaft pulley bolt, the crankshaft and camshafts must be locked in place by the special service tools or severe engine damage can occur.**

NOTICE: **During engine repair procedures, cleanliness is extremely important. All parts must be thoroughly cleaned and any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan, can cause engine failure.**



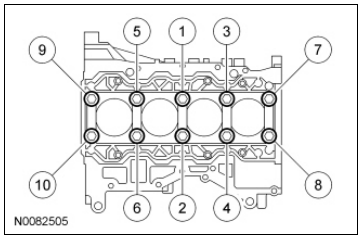
NOTE: Assembly of the engine requires various inspections/measurements of the engine components (engine block, crankshaft, connecting rods, pistons and piston rings). These inspections/measurements will aid in determining if the engine components will require replacement. For additional information, refer to Section 303-00 .

1. **NOTE:** If the oil squirters are being reused, they must be installed in the same location as marked during disassembly.

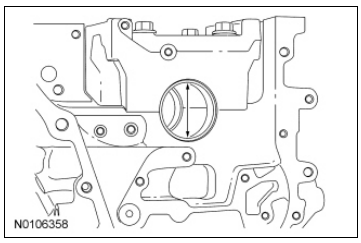
   NOTE: The front bulkhead does not have an oil squirter.

   Install the 4 oil squirters.

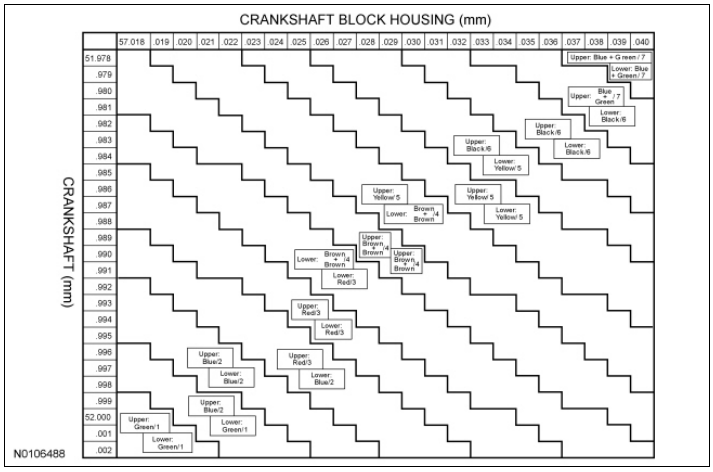
   - Tighten to 4 Nm (35 lb-in).



2. Measure each of the crankshaft main bearing journal diameters in at least 2 directions and record the smallest diameter for each journal.



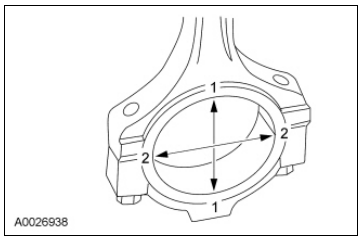
3. Position the main bearing beam in the engine block with the main bearing beam mounted flush with the rear face of the engine block.



4. Using the original main bearing beam bolts, install and tighten the 10 main bearing beam bolts.
   - Tighten the bolts in the sequence shown in 3 stages.
   - Stage 1: Tighten to 5 Nm (44 lb-in).
   - Stage 2: Tighten to 25 Nm (18 lb-ft).
   - Stage 3: Tighten an additional 90 degrees.

5. Measure each crankshaft block main bearing bore diameter.
   - Remove the bolts and the main bearing beam.
   - Discard the main bearing beam bolts.

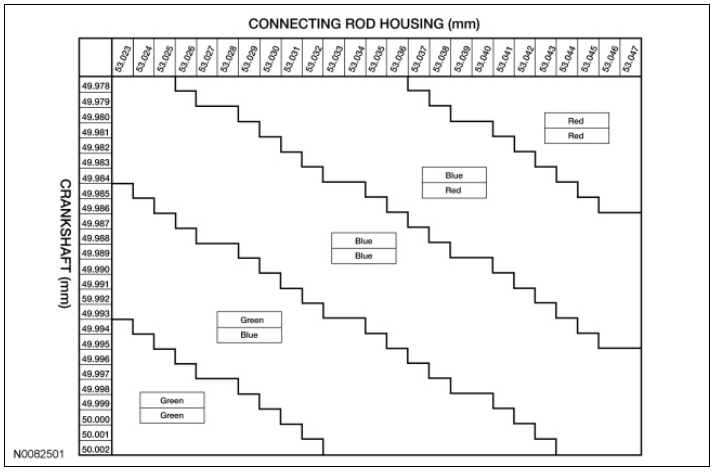
6. Using the chart, select the crankshaft main bearings.



7. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

   Using the original connecting rod cap bolts, install the connecting caps and bolts.

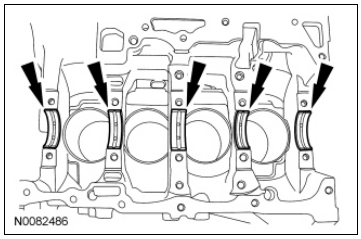
   - Tighten the bolts in 2 stages.
   - Stage 1: Tighten to 29 Nm (21 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.



8. Measure the connecting rod large end bore in 2 directions. Record the smallest measurement for each connecting rod.
   - Remove the bolts and the connecting rod cap.
   - Discard the connecting rod cap bolts.

9. Measure each of the crankshaft connecting rod bearing journal diameters in at least 2 directions. Record the smallest measurement for each connecting rod journal.

10. Using the chart, select the correct connecting rod bearings for each crankshaft connecting rod journal.

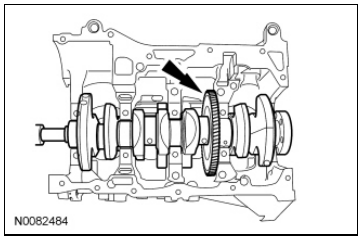


11. **NOTE:** Before assembling the cylinder block, all sealing surfaces must be free of chips, dirt, paint and foreign material. Also, make sure the coolant and oil passages are clear.

    NOTE: If reusing the crankshaft main bearings, install them in their original positions and orientation as noted during disassembly.

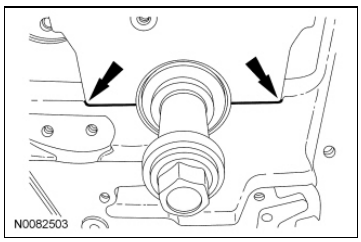
    NOTE: The center bulkhead is the thrust bearing.

    Lubricate the upper crankshaft main bearings with clean engine oil and install the 5 crankshaft main bearings in the cylinder block.

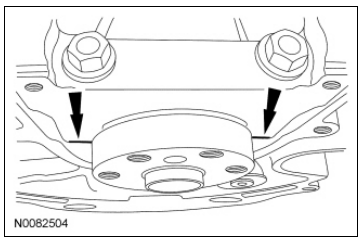


12. **NOTE:** If reusing the crankshaft main bearings, install them in their original positions and orientation as noted during disassembly.

    Lubricate the crankshaft main bearings with clean engine oil and install the 5 crankshaft main bearings in the main bearing beam.



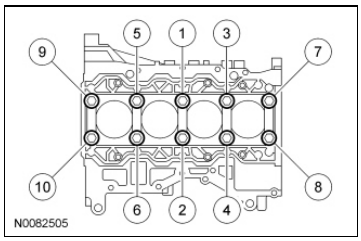
13. Lubricate journals on the crankshaft with clean engine oil.



14. Position the crankshaft in the cylinder block.

15. Lubricate the 10 main bearing beam side fit surfaces (front 2 shown) with clean engine oil.

16. Lubricate the crankshaft bearing journals on the main bearing beam with clean engine oil. Then position the main bearing beam in the engine block with the main bearing beam mounted flush with the rear face of the engine block.



17. **NOTE:** Lubricate the main bearing beam bolts threads and under the bolt heads with clean engine oil.

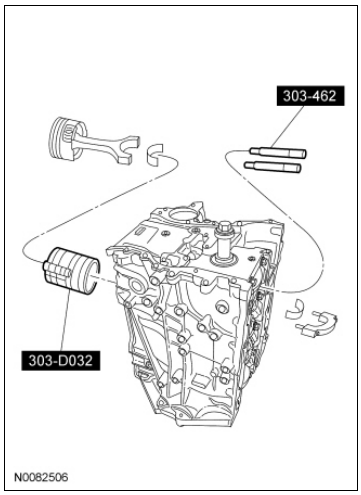
    NOTE: Position the crankshaft to the rear of the cylinder block, then position the crankshaft to the front of the cylinder block before tightening the main bearing beam bolts.

    Install and tighten the 10 new main bearing beam bolts.

    - Tighten the bolts in the sequence shown in 3 stages.
    - Stage 1: Tighten to 5 Nm (44 lb-in).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).
    - Stage 3: Tighten an additional 90 degrees.

18. Using the Dial Indicator Gauge with Holding Fixture, measure crankshaft end play.
    - Position the crankshaft to the rear of the cylinder block.
    - Zero the Dial Indicator Gauge with Holding Fixture.
    - Move the crankshaft to the front of the cylinder block. Note and record the crankshaft end play.

- Acceptable crankshaft end play is 0.22-0.43 mm (0.008-0.016 in). If the crankshaft end play exceeds the specified range, install new parts as necessary.



19. ***NOTICE:*** **Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.**

    NOTE: Lubricate the pistons, piston rings, connecting rod bearings and the entire cylinder bores with clean engine oil.

    NOTE: Make sure the piston arrow on top is facing toward the front of the engine.

    Using the Piston Ring Compressor and the Connecting Rod Installer, install the piston and connecting rod assemblies.

    - When installing the pistons and connecting rod assemblies, the oil ring gaps must be positioned 60 degrees apart from each other and a minimum of 90 degrees from the expander gap.
    - The position of the upper and lower compression ring gaps are not controlled for installation.

20. ***NOTICE:*** **The rod cap installation must keep the same orientation as marked during disassembly or engine damage may occur.**

    NOTE: Install connecting rod caps and bolts on the connecting rods for cylinders 1 and 4 first and tighten. Then rotate crankshaft 180 degrees and install connecting rod caps and bolts on connecting rods for cylinders 2 and 3 and tighten.

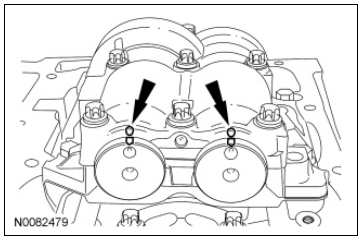
    NOTE: After installation of each connecting rod cap, rotate the crankshaft to verify smooth operation.

    Install the connecting rod caps and the new bolts.

    - Tighten the bolts in 2 stages.

- Stage 1: Tighten to 29 Nm (21 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

21. Install the Crankshaft TDC Timing Peg and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg. The engine is now at Top Dead Center (TDC).

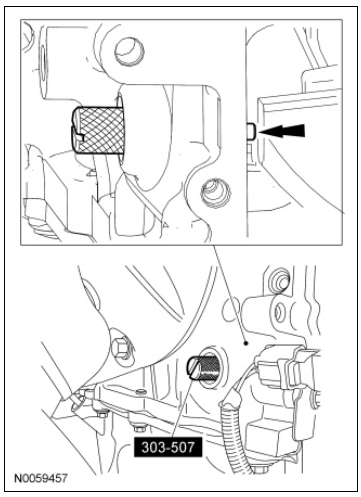


22. ***NOTICE:*** **Due to the precision interior construction of the balancer unit, it should not be disassembled.**

    NOTE: The original adjustment shims must be installed in their original position.

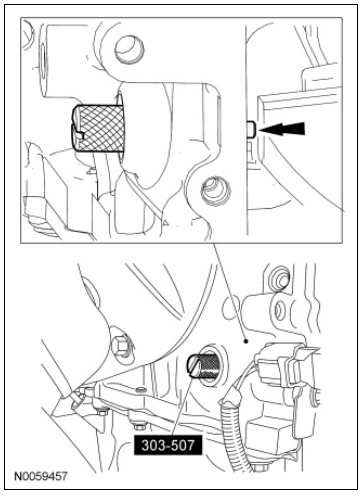
    NOTE: Confirm by visual inspection that there is no damage to the balancer unit gear and verify that the shaft turns smoothly. If there is any damage or malfunction, replace the balancer unit.

    Install the adjustment shims in their original position on the seat faces of the balancer unit.



23. With the balancer unit shaft marks in the TDC position, slowly install the balancer unit to the cylinder block to avoid interference between the crankshaft drive gear and the balancer unit driven gear.

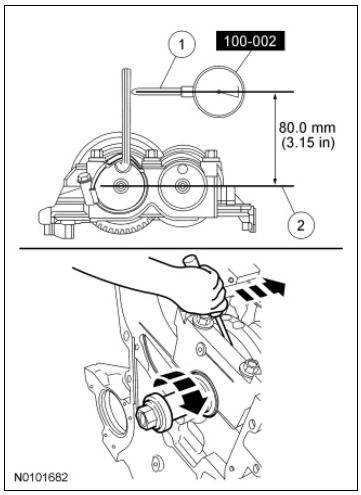
24. Install the balancer unit bolts.
    - Tighten in the sequence shown in 2 stages.
        - ♦ Stage 1: Tighten to 25 Nm (18 lb-ft).
        - ♦ Stage 2: Tighten to 50 Nm (37 lb-ft).



25. Remove the Crankshaft TDC Timing Peg.

26. Rotate the crankshaft to confirm that there are no meshing problems between the balancer unit gear and the crankshaft gear.

27. Install the Crankshaft TDC Timing Peg and rotate the crankshaft slowly clockwise until the crankshaft balance weight is up against the Crankshaft TDC Timing Peg.
    - Remove the Crankshaft TDC Timing Peg.



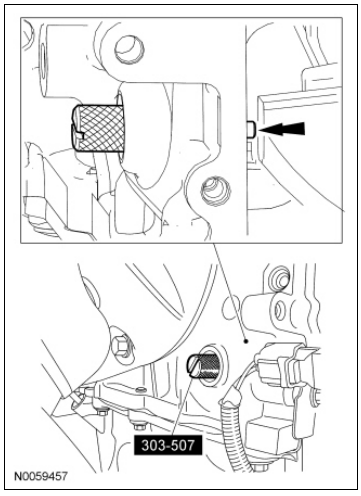
28. **NOTE:** Measure the backlash and verify that it is within specified range at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees. It will be necessary to reset the measuring equipment between measurements.

    NOTE: The measurement must be taken with the Dial Indicator Gauge with Holding Fixture, a 5-mm Allen wrench and worm clamp set up as shown. Mark the Allen wrench with a file 80 mm (3.149 in) above the driven gear shaft center. Make sure the worm clamp and Allen wrench are not touching the balance shaft housing.

NOTE: For an accurate measurement while measuring the gear backlash, insert a screwdriver as shown into the crankshaft No. 1 crankweight area and set both the rotation and the thrust direction with the screwdriver, using a prying action as shown.

Position the Dial Indicator Gauge with Holding Fixture as shown. Measure the gear backlash.

- Position the Dial Indicator Gauge with Holding Fixture (1) on the Allen wrench 80 mm (3.149 in) above the driven gear shaft center (2) on the balancer unit.
- Rotate the crankshaft clockwise and measure the backlash at all of the following 6 positions: 10 degrees, 30 degrees, 100 degrees, 190 degrees, 210 degrees and 280 degrees.
- Backlash specifications are 0.005 to 0.101 mm (0.00019 to 0.0039 in).
- If the backlash exceeds the specified range, carry out the balance shaft backlash procedure. For additional information, refer to the Balance Shaft Backlash procedure in this section.

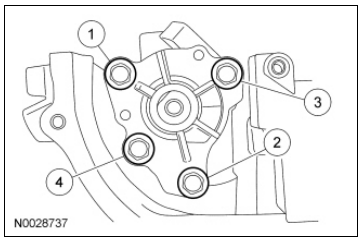


29. *NOTICE:* **Failure to position the No. 1 piston at Top Dead Center (TDC) can result in damage to the engine. Turn the engine in the normal direction of rotation only.**

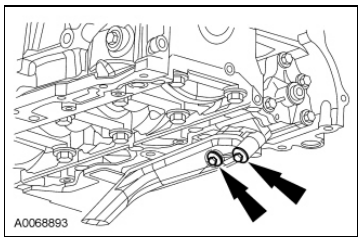
    Turn the crankshaft clockwise to position the No. 1 piston at Top Dead Center (TDC).

30. **NOTE:** The Crankshaft TDC Timing Peg will contact the crankshaft and prevent it from turning past TDC . However, the crankshaft can still be rotated in the counterclockwise direction. The crankshaft must remain at the TDC position until the timing drive components and crankshaft pulley are installed.

    Install the Crankshaft TDC Timing Peg.



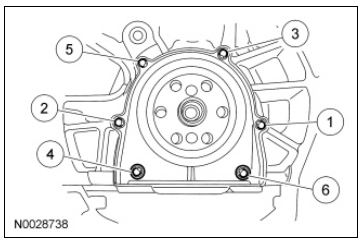
31. Install the block-off plate and bolts.
    - Tighten to 25 Nm (18 lb-ft).



32. **NOTE:** Clean the oil pump and cylinder block mating surfaces with metal surface prep.

    Install the oil pump assembly. Tighten the bolts in the sequence shown in the following 2 stages:

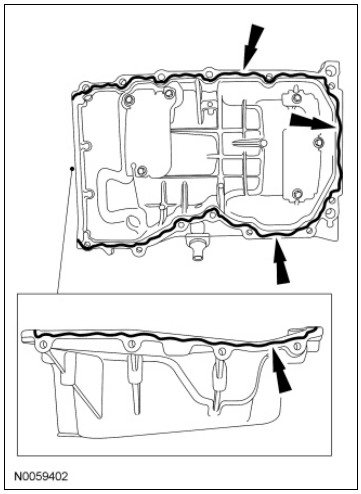
    - Stage 1: Tighten to 10 Nm (89 lb-in).
    - Stage 2: Tighten to 20 Nm (177 lb-in).



33. Install a new oil pump pickup tube gasket and the pickup tube.
    - Tighten to 10 Nm (89 lb-in).

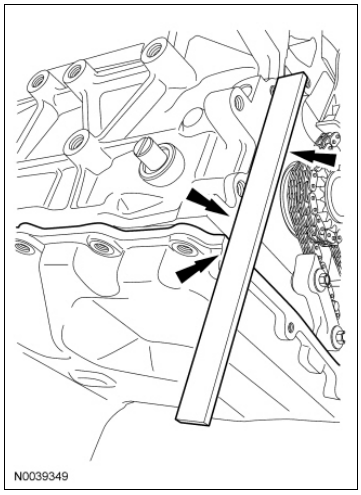
34. Using the Crankshaft Rear Main Oil Seal Installer, install the crankshaft rear oil seal with retainer.

35. Tighten the crankshaft rear oil seal with retainer bolts in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).



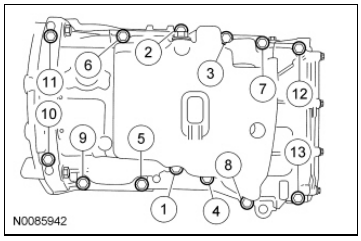
36. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool and metal surface cleaner to remove traces of sealant.**

    Clean and inspect all mating surfaces.

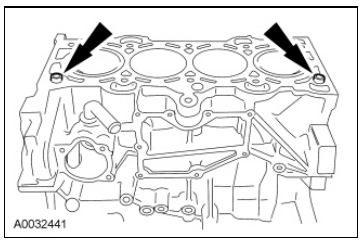


37. **NOTE:** If the oil pan is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface prep. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the oil pan.



38. Install the oil pan and install the 2 oil pan bolts finger-tight.



39. Using a suitable straightedge, align the front surface of the oil pan flush with the front surface of the engine block.

40. Install the remaining oil pan bolts and tighten the oil pan bolts in the sequence shown.
    - Tighten to 25 Nm (18 lb-ft).

41. Install the cylinder head alignment dowels. Dowels must be fully seated in the cylinder block.

42. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

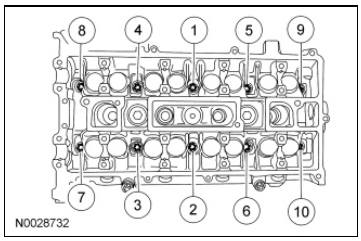
    NOTE: Observe all warnings and cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

    Clean the cylinder head-to-cylinder block mating surface of both the cylinder head and the cylinder block in the following sequence.

    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

43. Apply silicone gasket and sealant to the locations shown.



44. Install a new head gasket.

45. **NOTE:** The cylinder head bolts are torque-to-yield and must not be reused. New cylinder head bolts must be installed.

    Install the cylinder head and 10 new bolts. Tighten the bolts in the sequence shown in the following 5 stages:

    - Stage 1: Tighten to 5 Nm (44 lb-in).
    - Stage 2: Tighten to 15 Nm (133 lb-in).
    - Stage 3: Tighten to 45 Nm (33 lb-ft).
    - Stage 4: Turn 90 degrees.
    - Stage 5: Turn an additional 90 degrees.

46. **NOTE:** Coat the valve tappets with clean engine oil prior to installation.

    Install the valve tappets.

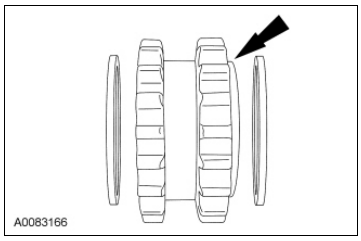
47. ***NOTICE:*** **Install the camshafts with the alignment slots in the camshafts lined up so the Camshaft Alignment Plate can be installed without rotating the camshafts. Make sure the lobes on the No. 1 cylinder are in the same position as noted in the disassembly procedure. Rotating the camshafts when the timing chain is removed, or installing the camshafts 180 degrees out of position, can cause severe damage to the valves and pistons.**

    NOTE: Lubricate the camshaft journals and bearing caps with clean engine oil.

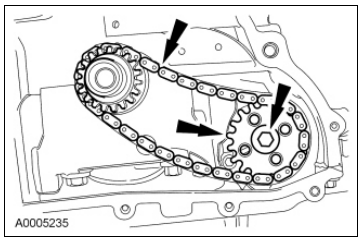
    Install the camshafts and bearing caps in their original location and orientation. Tighten the bearing caps in the sequence shown in 3 stages:

    - Stage 1: Tighten 1 turn at a time until tight.
    - Stage 2: Tighten to 7 Nm (62 lb-in).
    - Stage 3: Tighten to 16 Nm (142 lb-in).

48. Install the Variable Camshaft Timing (VCT) system oil filter and plug in the intake camshaft thrust cap.
    - Tighten to 17 Nm (150 lb-in).



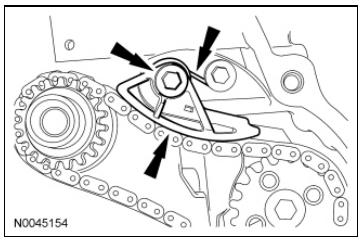
49. Install the VCT solenoid and the bolt.
    - Tighten to 10 Nm (89 lb-in).



50. **NOTE:** Install a new crankshaft sprocket diamond washer on both sides of the crankshaft sprocket.

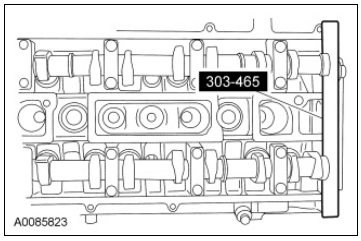
    Install the crankshaft sprocket, new crankshaft sprocket diamond washers, oil pump chain and oil pump sprocket.

    - The crankshaft sprocket flange must be facing away from the engine block.

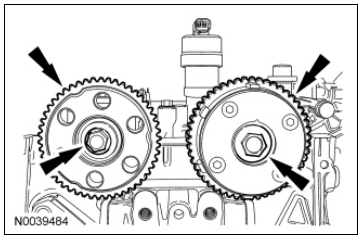


51. Install the oil pump chain, sprocket and bolt.
    - Tighten to 25 Nm (18 lb-ft).

52. Install the shoulder bolt.
    - Tighten to 10 Nm (89 lb-in).

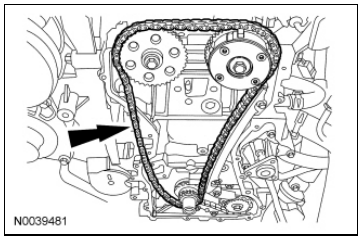


53. Install the oil pump chain tensioner and bolt. Hook the tensioner spring around the shoulder bolt.
    - Tighten to 10 Nm (89 lb-in).

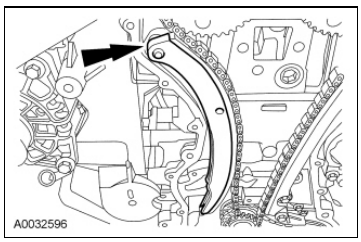


54. ***NOTICE:*** **The Camshaft Alignment Plate 303-465 is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    Install the Camshaft Alignment Plate in the slots on the rear of both camshafts.

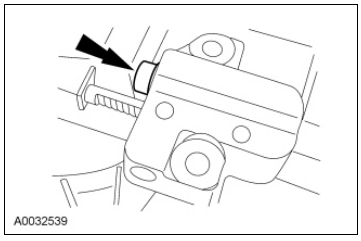


55. Install the camshaft sprockets and the bolts. Do not tighten the bolts at this time.

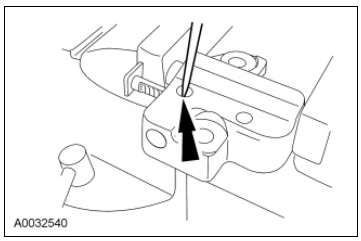


56. Install the LH timing chain guide and the bolts.
    - Tighten to 10 Nm (89 lb-in).

57. Install the timing chain.



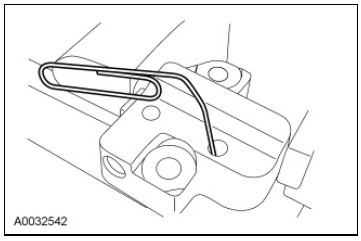
58. Install the RH timing chain guide.



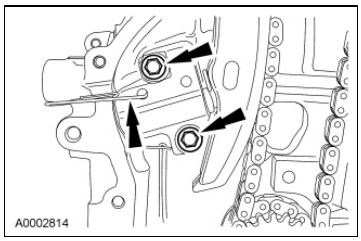
NOTE: If the timing chain tensioner plunger and ratchet assembly are not pinned in the compressed position, follow the next 4 steps.

59. ***NOTICE:*** **Do not compress the ratchet assembly. This will damage the ratchet assembly.**

    Using the edge of a vise, compress the timing chain tensioner plunger.

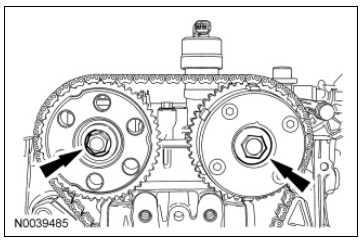


60. Using a small pick, push back and hold the ratchet mechanism.



61. While holding the ratchet mechanism, push the ratchet arm back into the tensioner housing.

62. Install a paper clip into the hole in the tensioner housing to hold the ratchet assembly and the plunger in during installation.

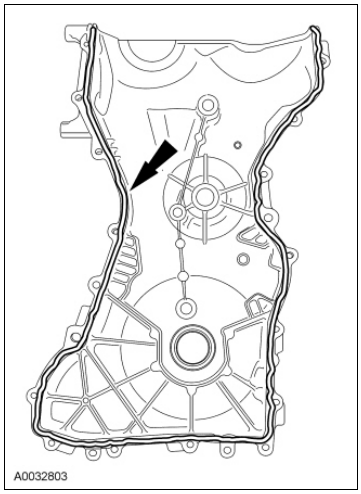


63. Install the timing chain tensioner and the 2 bolts. Remove the paper clip to release the piston.
    - Tighten to 10 Nm (89 lb-in).

64. ***NOTICE:*** **The Camshaft Alignment Plate 303-465 is for camshaft alignment only. Using this tool to prevent engine rotation can result in engine damage.**

    Using the flats on the camshafts to prevent camshaft rotation, tighten the bolts.

    - Tighten to 72 Nm (53 lb-ft).

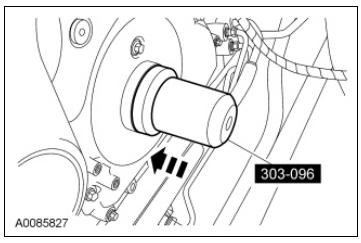


65. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive disks or other abrasive means to clean sealing surfaces. These tools cause scratches and gouges which make leak paths.**

    Clean and inspect the mounting surfaces of the engine and the front cover.

66. **NOTE:** The engine front cover must be installed and the bolts tightened within 4 minutes of applying the silicone gasket and sealant.

    Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the cylinder head and oil pan joint areas. Apply a 2.5 mm (0.09 in) bead of silicone gasket and sealant to the front cover.



67. Install the engine front cover. Tighten the bolts in the sequence shown, to the following specifications:
    - Tighten the 8-mm bolts to 10 Nm (89 lb-in).
    - Tighten the 13-mm bolts to 48 Nm (35 lb-ft).

68. **NOTE:** Remove the through bolt from the Camshaft Front Oil Seal Installer.

    NOTE: Lubricate the oil seal with clean engine oil.

    Using the Camshaft Front Oil Seal Installer, install the crankshaft front seal.

69. **NOTE:** Do not install the crankshaft pulley bolt at this time.

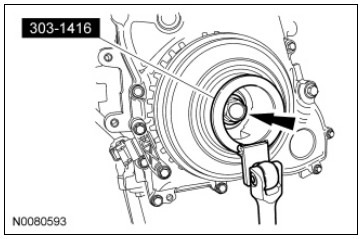
    NOTE: Apply clean engine oil on the seal area before installing.

    Position the crankshaft pulley onto the crankshaft with the hole in the pulley at the 6 o'clock position.

70. ***NOTICE:*** **Only hand-tighten the 6-mm bolt or damage to the front cover can occur.**

    NOTE: This step will correctly align the crankshaft pulley to the crankshaft.

    Install a standard 6-mm x 18-mm bolt through the crankshaft pulley and thread it into the front cover.

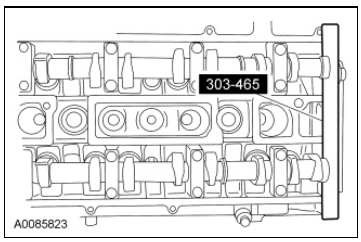


71. ***NOTICE:*** **The crankshaft must remain in the Top Dead Center (TDC) position during installation of the pulley bolt or damage to the engine can occur. Therefore, the crankshaft pulley must be held in place with the Crankshaft Damper Holding Tool and the bolt should be installed using hand tools only.**

    NOTE: Do not reuse the crankshaft pulley bolt.

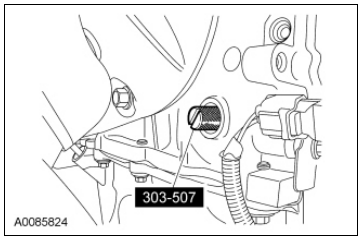
    Install a new crankshaft pulley bolt. Using the Crankshaft Damper Holding Tool to hold the crankshaft pulley in place, tighten the crankshaft pulley bolt in 2 stages:

    - Stage 1: Tighten to 100 Nm (74 lb-ft).
    - Stage 2: Tighten an additional 90 degrees (one-fourth turn).



72. Remove the 6-mm x 18-mm bolt.

73. Remove the Crankshaft TDC Timing Peg.



74. Remove the Camshaft Alignment Plate.

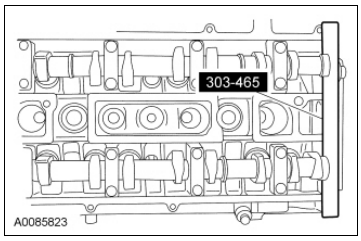
75. **NOTE:** Only turn the engine in the normal direction of rotation.

    Turn the crankshaft clockwise one and three-fourth turns.

76. Install the Crankshaft TDC Timing Peg.

77. **NOTE:** Only turn the engine in the normal direction of rotation.

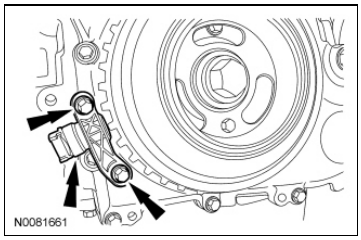
    Turn the crankshaft clockwise until the crankshaft contacts the Crankshaft TDC Timing Peg.



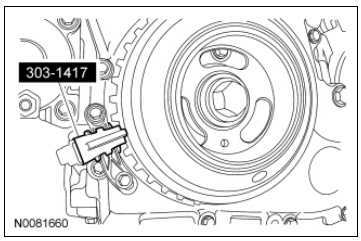
78. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

    Using the 6-mm x 18-mm bolt, check the position of the crankshaft pulley.

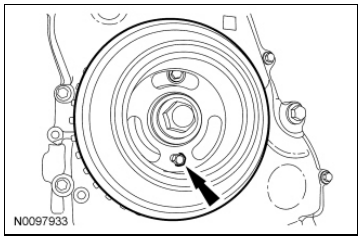
    - If it is not possible to install the bolt, the engine valve timing must be corrected.



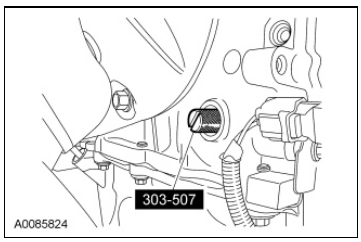
79. Install the Camshaft Alignment Plate to check the position of the camshafts.
    - If it is not possible to install the Camshaft Alignment Plate, the engine valve timing must be corrected.



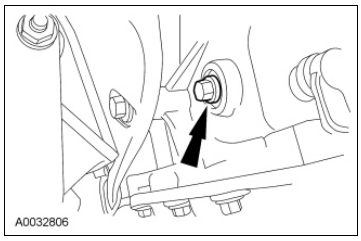
80. Remove the Camshaft Alignment Plate.



81. Install the Crankshaft Position (CKP) sensor and the 2 bolts.
    - Do not tighten the bolts at this time.

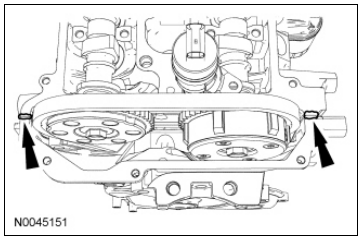


82. Using the Crankshaft Sensor Aligner, adjust the CKP sensor.
    - Tighten the 2 CKP bolts to 7 Nm (62 lb-in).



83. Remove the 6-mm x 18-mm bolt.

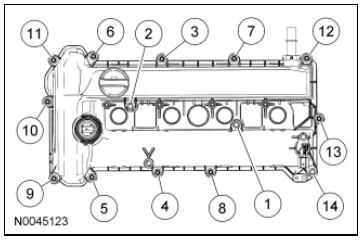
84. Remove the Crankshaft TDC Timing Peg.



85. Install the engine plug bolt.
    - Tighten to 20 Nm (177 lb-in).

86. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths.**

    Clean the valve cover gasket surface with metal surface prep.

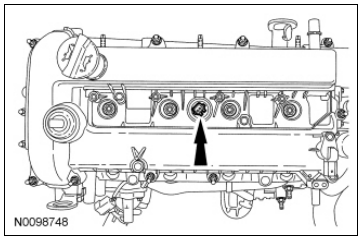


87. Apply silicone gasket and sealant to the locations shown.

88. **NOTE:** The valve cover must be secured within 4 minutes of silicone gasket application. If the valve cover is not secured within 4 minutes, the sealant must be removed and the sealing area cleaned with metal surface cleaner.

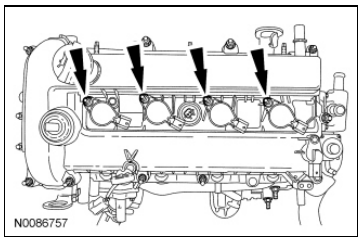
    Install the valve cover.

    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).

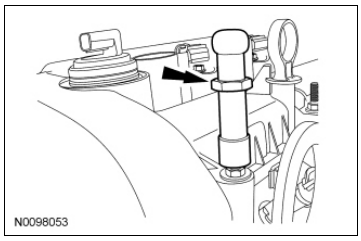


89. **NOTE:** Make sure the notch on the oil level indicator is aligned with the V-shaped boss on the valve cover and fully engaged into the valve cover.

    Install the oil level indicator.



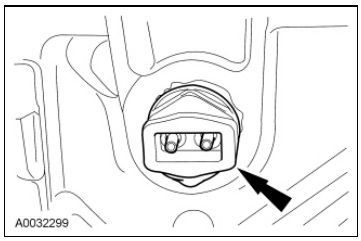
90. Install the Cylinder Head Temperature (CHT) sensor.
    - Tighten to 12 Nm (106 lb-in).



91. **NOTE:** Apply dielectric compound to the inside of the coil-on-plug boots.

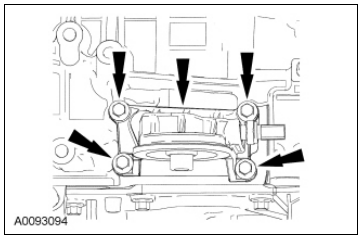
    Install the 4 coil-on-plugs and the 4 bolts. Install the crankshaft vent tube.

    - Tighten to 8 Nm (71 lb-in).

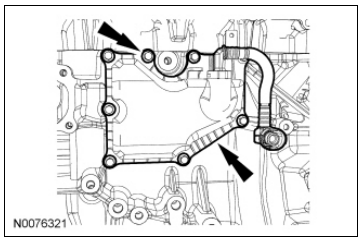


92. Install the engine cover studs (one shown).

93. Install the crankshaft vent tube.



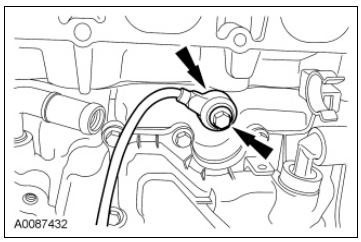
94. If equipped, install the block heater.
    - Tighten to 40 Nm (30 lb-ft).



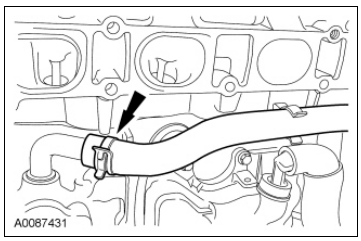
95. **NOTE:** Clean the gasket mating surfaces with metal surface prep.

    Install the oil filter adapter with a new gasket.

    - Tighten to 25 Nm (18 lb-ft).



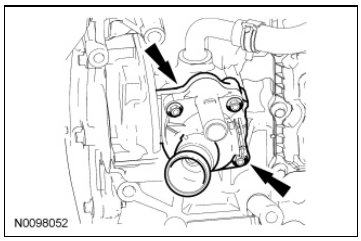
96. Install the crankcase vent oil separator and the 8 bolts.
    - Tighten to 10 Nm (89 lb-in).



97. **NOTE:** The Knock Sensor (KS) must not touch the crankcase vent oil separator.

    Install the KS and the bolt.

    - Tighten to 20 Nm (177 lb-in).

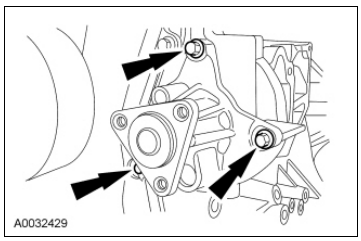


98. Install the coolant hose.

99. **NOTE:** Clean and inspect the thermostat housing gasket. Install a new gasket if necessary.

    Install the thermostat housing.

    - Tighten to 10 Nm (89 lb-in).



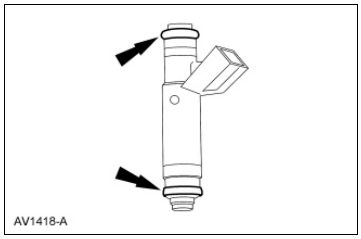
100. ***NOTICE:*** **Make sure the coolant pump is correctly seated to the engine block before installing and tightening the fasteners, or damage to the coolant pump may occur.**

     NOTE: Clean the coolant pump mating surface with metal surface cleaner.

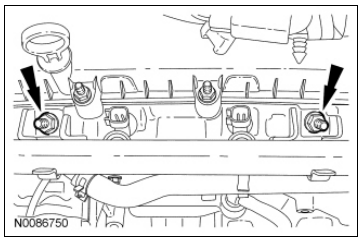
     NOTE: Lubricate the coolant pump O-ring with clean engine coolant.

     Install the new O-ring, coolant pump and the 3 bolts.

     - Tighten to 10 Nm (89 lb-in).

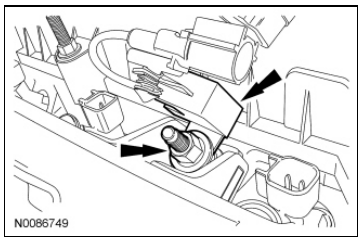


101. Install the coolant pump pulley and bolts.
     - Tighten to 20 Nm (177 lb-in).

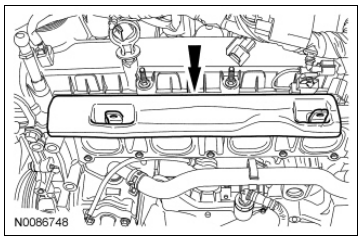


102. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.**

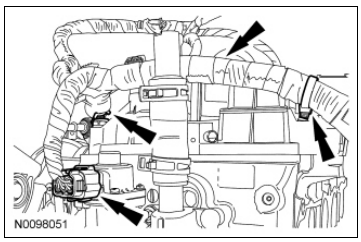
Install new fuel injector O-rings.



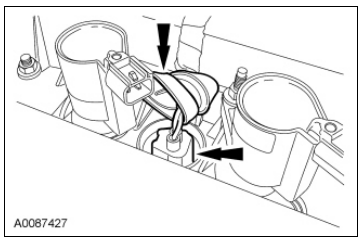
- Separate the fuel injectors from the fuel rail.
- Remove and discard the fuel injector O-rings.
- Install new O-rings and lubricate with clean engine oil.
- Install the fuel injectors onto the fuel rail.



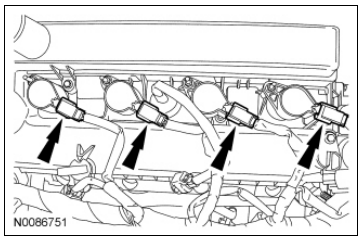
103. Install the fuel rail with the fuel injectors and stud bolts.
    - Tighten to 23 Nm (17 lb-ft).



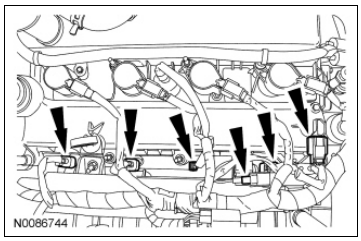
104. Install the radio capacitor and the nut.
    - Tighten to 10 Nm (89 lb-in).



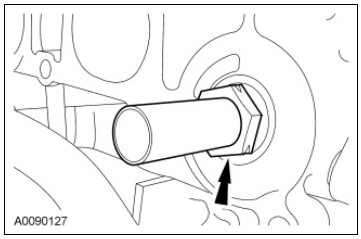
105. Install the fuel rail insulator.



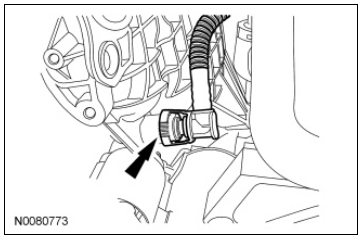
106. Attach the 2 wiring harness retainers to the valve cover and stud bolt.
    - Connect the EGR valve electrical connector.



107. Connect the CHT sensor and install the rubber boot.



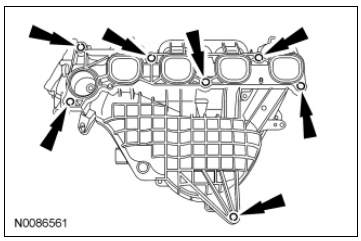
108. Connect the 4 coil-on-plug electrical connectors.



109. Connect the 4 fuel injector electrical connectors, radio capacitor electrical connector and the Camshaft Position (CMP) sensor electrical connector.

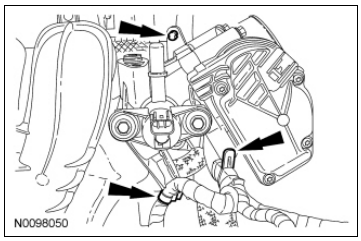
110. Install the EGR tube.
    - Tighten to 55 Nm (41 lb-ft).

111. Position the intake manifold and connect the PCV hose.



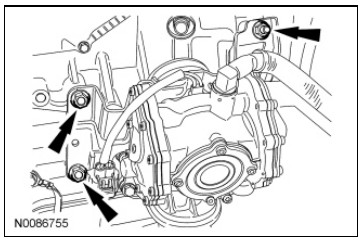
112. ***NOTICE:*** **If the engine is repaired or replaced because of upper engine failure, typically including valve or piston damage, check the intake manifold for metal debris. If metal debris is found, install a new intake manifold. Failure to follow these instructions can result in engine damage.**

NOTE: Inspect and install new intake manifold gaskets, if necessary.

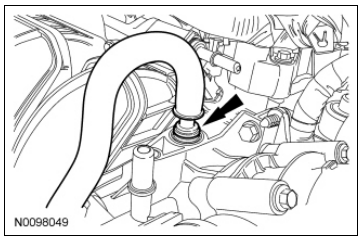


NOTE: The cylinder head side of the intake manifold is showing bolt location.

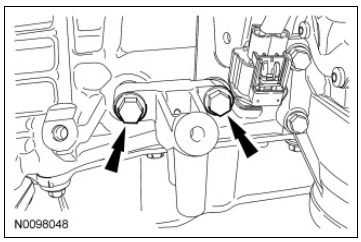
Install the intake manifold gasket, intake manifold and 7 bolts.



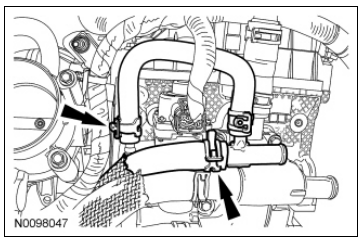
- Tighten to 18 Nm (159 lb-in).



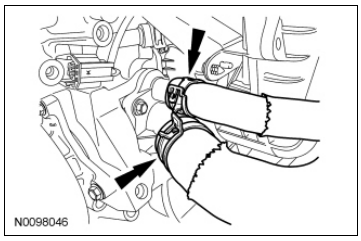
113. Attach the 3 wire harness pin-type retainers to the intake manifold.



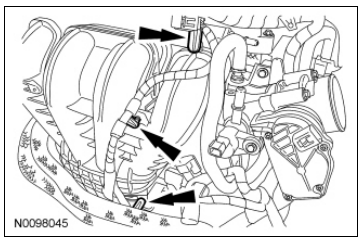
114. Install the vacuum pump assembly, the nut and the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).



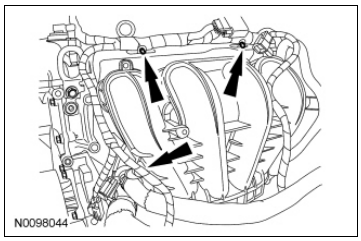
115. Connect the vacuum hose to the intake manifold.



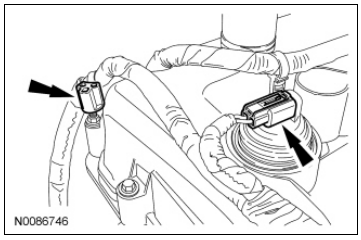
116. Install the A/C compressor bracket and 2 bolts.
    - Tighten to 48 Nm (35 lb-ft).



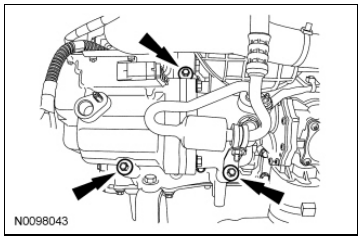
117. Connect the EGR coolant hose and the auxiliary coolant pump hose.



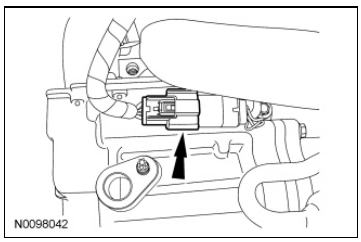
118. Connect the auxiliary coolant pump hose and the upper radiator hose.



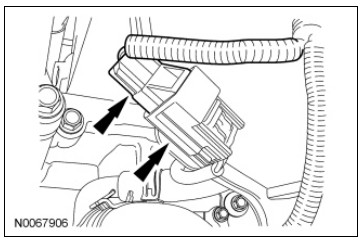
119. Attach the 2 auxiliary coolant pump wiring retainers and the lower radiator hose retainer.



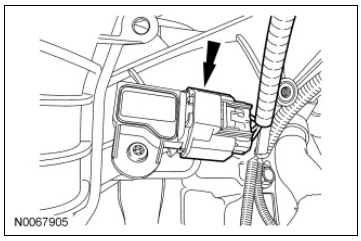
120. Attach the 3 wire harness pin-type retainers.



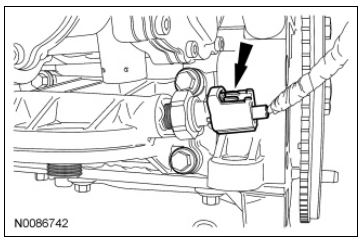
121. Connect the VCT electrical connector and attach the wiring harness retainer to the valve cover stud bolt.



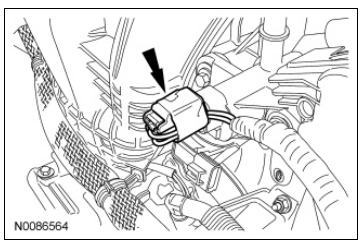
122. Install the A/C compressor and the 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).



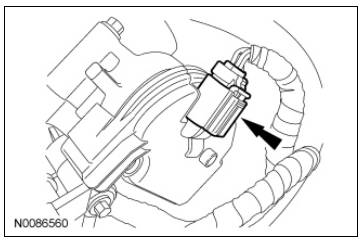
123. Connect the A/C compressor electrical connector.



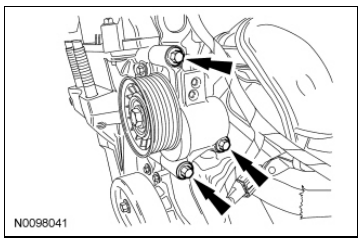
124. Attach the pin-type retainer to the intake manifold and connect the KS electrical connector.



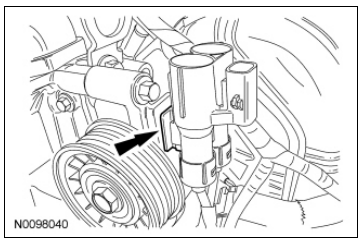
125. Connect the Manifold Absolute Pressure (MAP) sensor electrical connector.



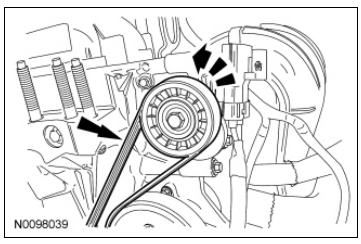
126. Connect the Engine Oil Pressure (EOP) switch electrical connector.



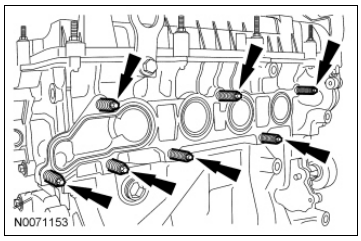
127. Connect the Evaporative Emission (EVAP) canister purge valve electrical connector.



128. Connect the electronic throttle control electrical connector.



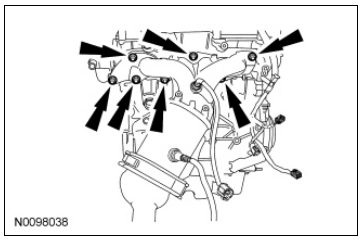
129. Install the accessory drive belt tensioner.
    - Tighten to 25 Nm (18 lb-ft).



130. Attach the vehicle high voltage electrical system electrical connector retainer to the accessory drive belt tensioner.

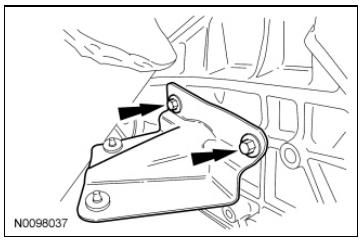
131. Rotate the accessory drive belt tensioner counterclockwise and install the accessory drive belt.

132. Install 7 new cylinder head studs in the cylinder head.
    - Tighten to 17 Nm (150 lb-in).



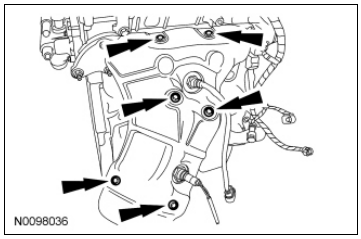
133. Install the new catalytic converter manifold gasket on the engine.

134. ***NOTICE:*** **Failure to tighten the catalytic converter nuts to specification before installing the converter bracket bolts will cause the converter to develop an exhaust leak.**

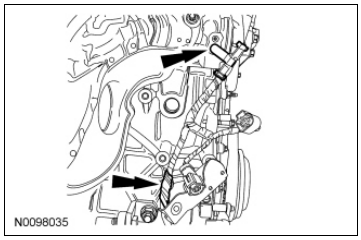


NOTICE: **Failure to tighten the catalytic converter nuts to specification a second time will cause the converter to develop an exhaust leak.**

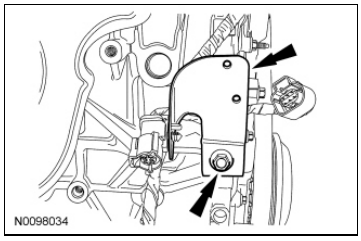
Position the catalytic converter manifold and tighten the 7 new nuts in the sequence shown in 2 stages:



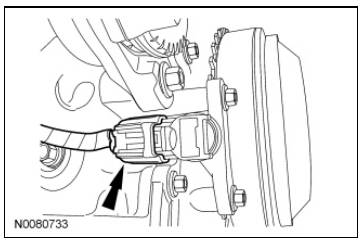
- Stage 1: Tighten to 48 Nm (35 lb-ft).
- Stage 2: Tighten to 48 Nm (35 lb-ft).



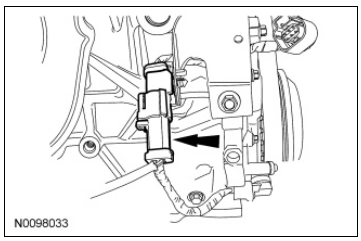
135. Install the 2 catalytic converter manifold bracket-to-engine block bolts.
    - Tighten to 35 Nm (26 lb-ft).



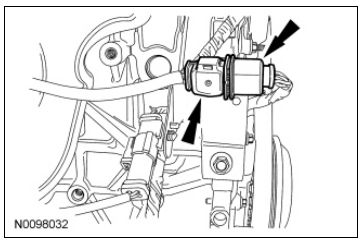
136. Install the catalytic converter manifold heat shield and the 6 bolts.
    - Tighten to 10 Nm (89 lb-in).



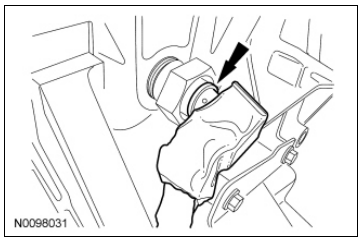
137. Attach the 2 engine wiring harness pin-type retainers.



138. Install the engine wiring harness connector bracket.
    - Tighten to 15 Nm (133 lb-in).



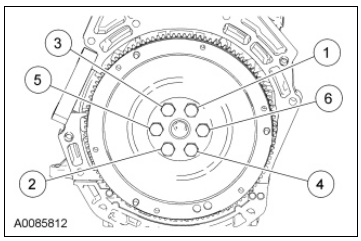
139. Connect the Crankshaft Position (CKP) sensor electrical connector.



140. Connect the Catalyst Monitor Sensor (CMS) electrical connector.

141. Connect the Heated Oxygen Sensor (HO2S) connector. Attach the connector to the engine wiring harness connector bracket.

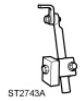
142. If equipped, connect the engine block heater.



143. Using the Floor Crane and the Spreader Bar, remove the engine from the engine stand.

144. **NOTE:** Special bolts are used for installation. Do not use standard bolts.

Install the flywheel and the bolts. Tighten the bolts in the sequence shown in the following 3 stages:



- Stage 1: Tighten to 50 Nm (37 lb-ft).
- Stage 2: Tighten to 80 Nm (59 lb-ft).

- Stage 3: Tighten to 112 Nm (83 lb-ft).

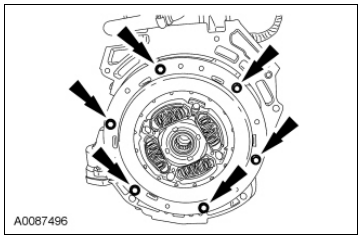
Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A



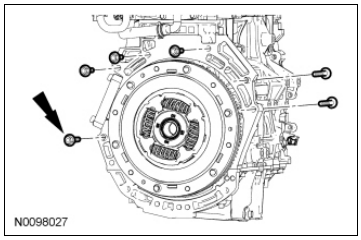
⚠ **WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

1. **NOTE:** Due to packaging requirements, the correct bolt must be used at the damper locations.

   NOTE: The damper contains a clutch which is designed to slip briefly during vehicle operation. It is essential that no grease, oil or cleaning solvents be allowed to contaminate the slip clutch. Do not use grease on transmission input sha. Should the damper become contaminated, it must be replaced.

   Install the transaxle damper.

   - Tighten to 29 Nm (21 lb-ft).



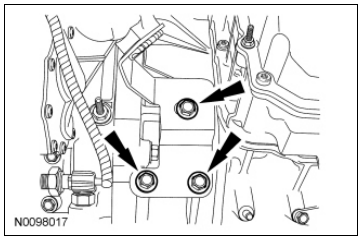
A0087496

2. **NOTE:** When positioning the engine to the transaxle, care must be taken to maintain alignment of the damper spline with the transaxle input shaft.

   NOTE: Transaxle removed from view for clarity.

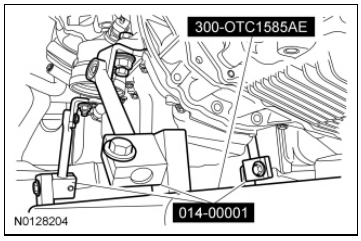
   Using the Floor Crane and Spreader Bar, position the engine and transaxle together. Install the 6 transaxle-to-engine bolts.

   - Tighten to 48 Nm (35 lb-ft).



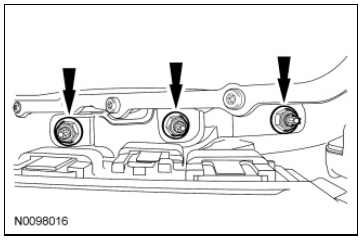
3. Connect the 2 heater hoses to the coolant outlet.

4. Install the 2 engine cover studs onto the valve cover studs.



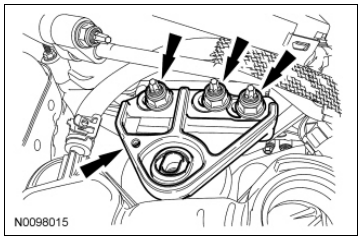
5. Position the auxiliary coolant pump and bracket and install the 3 bolts.
   - Tighten to 25 Nm (18 lb-ft).

6. Using the Floor Crane and Engine Lifting Bracket, position the engine and transaxle onto the Powertrain Lift.

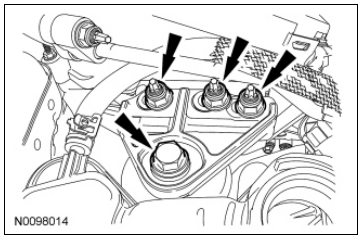


7. **NOTE:** Due to the weight of the transaxle, special care should be taken to mount the powertrain securely to the Powertrain Lift.

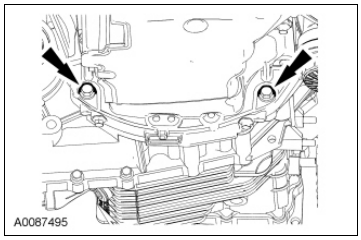
   Using the Adjustable Grip Arm, secure the engine to the Powertrain Lift.



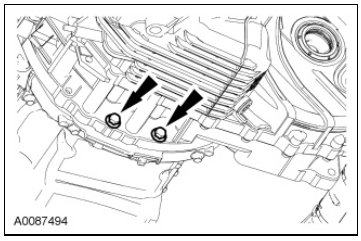
8. Raise the engine and transaxle into the vehicle.



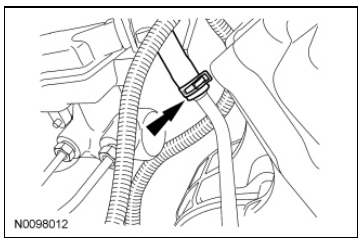
9. Install the 3 nuts on the upper transaxle insulator.
   - Tighten to 90 Nm (66 lb-ft).



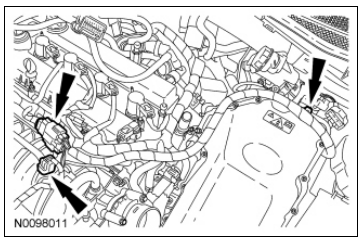
10. Install the engine mount bracket and 3 nuts.
    - Tighten to 103 Nm (76 lb-ft).



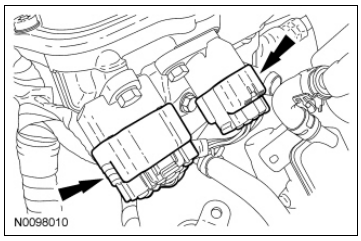
11. Install the engine mount bracket bolt.
    - Tighten to 115 Nm (85 lb-ft).



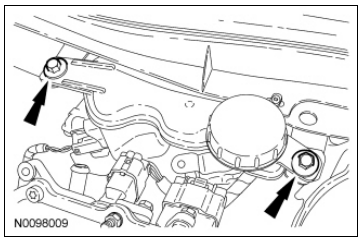
12. Install the 2 transaxle-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



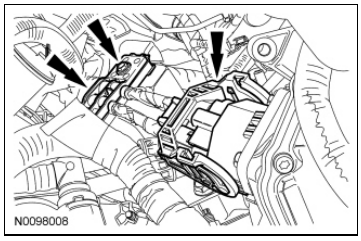
13. Install the 2 transaxle-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).



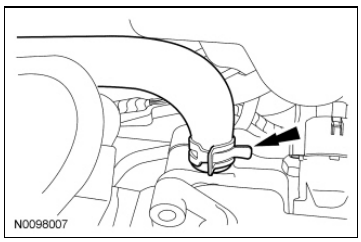
14. Connect the brake booster vacuum hose.



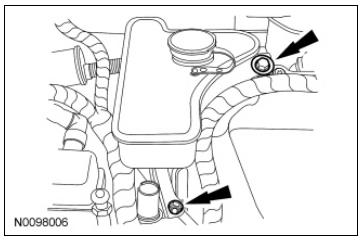
15. Connect the 2 engine wiring harness connectors and attach the wiring retainer.



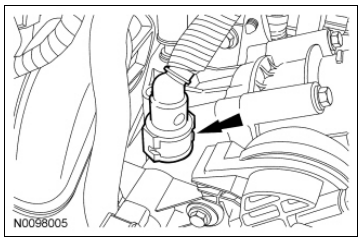
16. Connect the 2 transaxle electrical connectors.



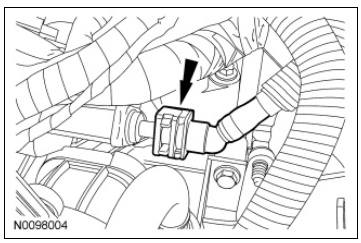
17. Position the master cylinder reservoir and install the 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



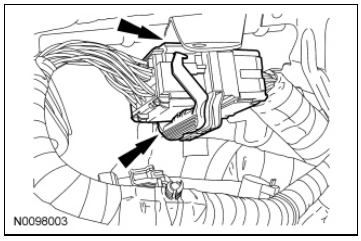
18. Connect the transaxle harness electrical connector, attach the wiring retainer and install the bolt.
    - Tighten to 10 Nm (89 lb-in).



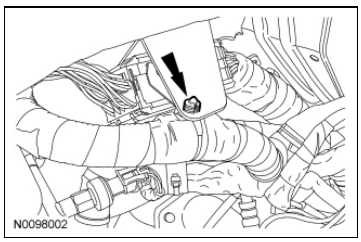
19. Connect the Motor Electronics Cooling System (MECS) coolant expansion tank hose.



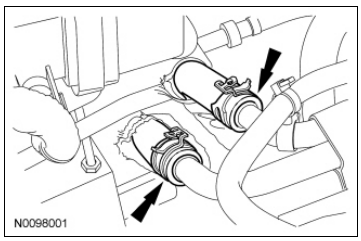
20. Install the MECS coolant expansion tank nut and bolt.
    - Tighten to 10 Nm (89 lb-in).



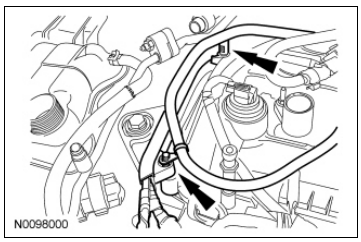
21. Connect the upper Evaporative Emission (EVAP) tube quick connect coupling to the purge valve. For additional information, refer to Section 310-00 .



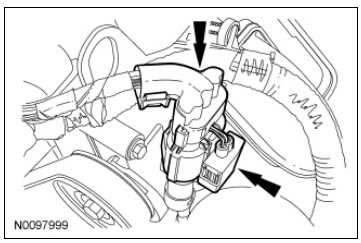
22. Connect the fuel supply tube. For additional information, refer to Section 310-00 .



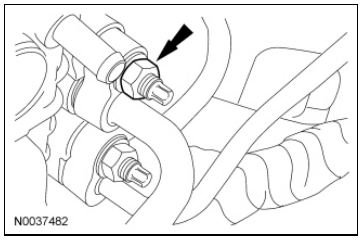
23. Connect the engine wiring harness connector and attach it to the bracket.



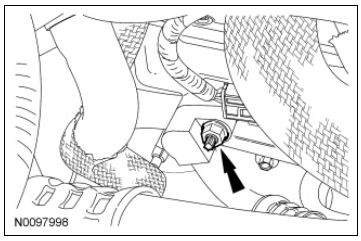
24. Attach the engine wiring harness retainer to the bracket.



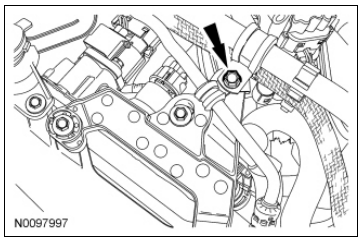
25. Connect the 2 heater hoses.



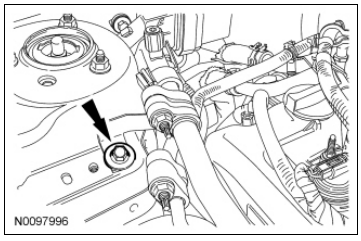
26. Attach the 2 block heater (if equipped) and the high voltage electrical system wiring retainers to the valve cover stud bolts.



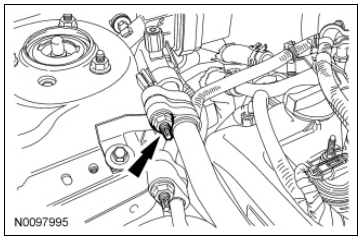
27. Connect the 2 vehicle high voltage electrical system electrical connectors.
    - Attach the wiring harness retainer.



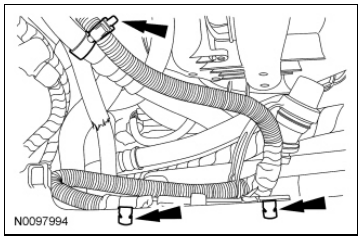
28. Install a new gasket and connect the A/C tube to the A/C condenser.
    - Install the nut.
    - Tighten to 15 Nm (133 lb-in).



29. Install a new gasket and connect the A/C tube to the A/C compressor.
    - Install the nut.
    - Tighten to 15 Nm (133 lb-in).

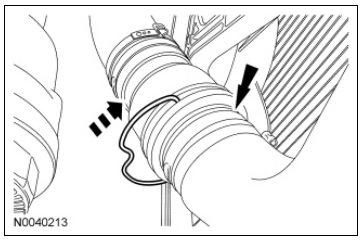


30. Install the A/C tube bracket bolt.
    - Tighten to 6 Nm (53 lb-in).

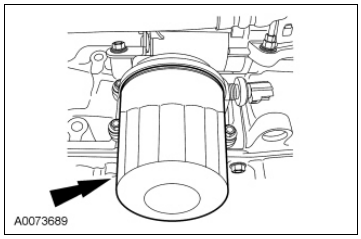


31. Install the A/C tube bracket bolt to the strut tower.
    - Tighten to 6 Nm (53 lb-in).

32. Install a new gasket and connect the A/C tube.
    - Install the nut.
    - Tighten to 15 Nm (133 lb-in).

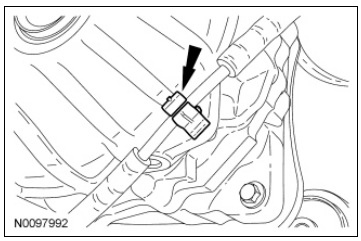


33. If equipped, attach the 3 block heater wiring retainers.



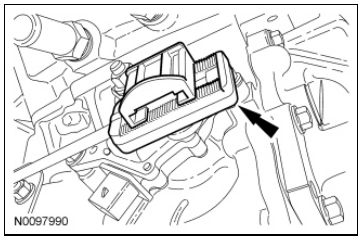
34. **NOTE:** Lower radiator hose shown, upper similar.

    Connect the upper and lower radiator hoses and install the retaining clips.

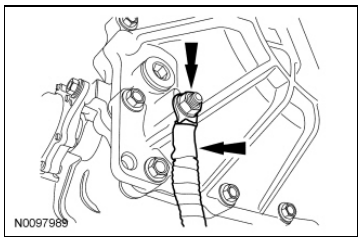


35. **NOTE:** Lubricate the oil filter O-ring with clean engine oil before installation.

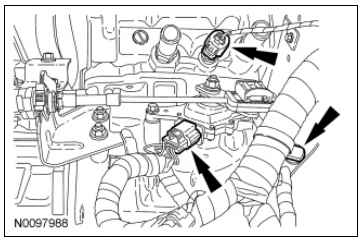
    Tighten the oil filter three-fourths of a turn after the oil filter gasket makes contact with the oil filter adapter.



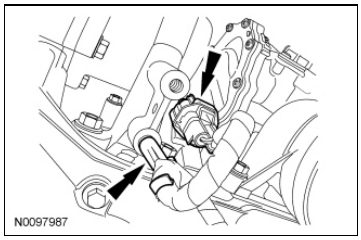
36. Attach the transaxle shift cable routing retainer to the transaxle.



37. Position the selector lever cable bracket in place and install the 2 nuts.
    - Tighten to 12 Nm (106 lb-in).



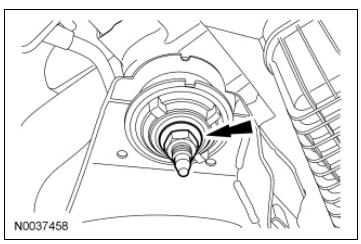
38. Connect the selector lever cable end to the manual control lever. Check selector lever cable adjustment. For additional information, refer to Section 307-05B .



39. Install the transaxle ground wire and nut.
    - Tighten to 10 Nm (89 lb-in).

40. Connect the transaxle coolant temperature sensor and the Transmission Range (TR) sensor electrical connectors.
    - Attach the wiring harness retainer.

41. Connect the vacuum pump assembly electrical connector and attach the wiring retainer.



42. Place the subframe assembly on the Powertrain Lift and raise the subframe into the installed position.

43. **NOTE:** LH shown, RH similar.

    Install the front subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

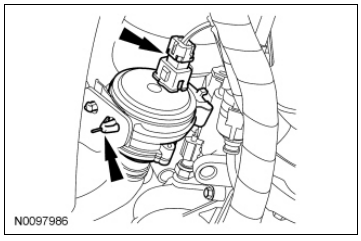
44. **NOTE:** LH shown, RH similar.

    Position the subframe brackets and install the bolts finger-tight.

45. **NOTE:** LH shown, RH similar.

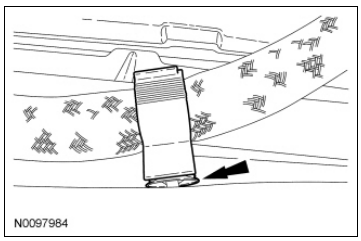
    Install the subframe nuts.

    - Tighten to 150 Nm (111 lb-ft).

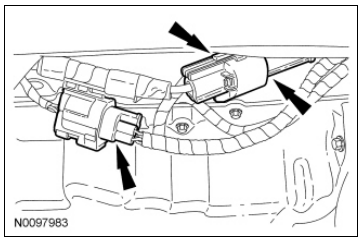


46. **NOTE:** LH shown, RH similar.

    Tighten the subframe bracket-to-body bolts to 103 Nm (76 lb-ft).

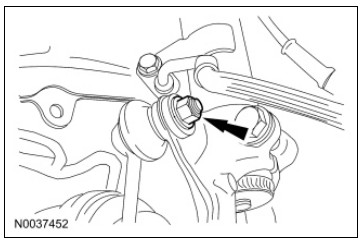


47. Connect the MECS electrical connector and attach the pump to the bracket.



48. Attach the 3 wiring harness retainers (2 shown) to the LH front of the subframe.

49. Attach the auxiliary coolant hose retainer to the subframe.

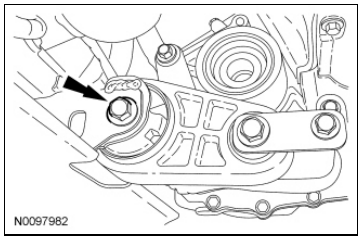


50. Connect the 2 Electronic Power Assist Steering (EPAS) electrical connectors near the front of the subframe.
    - Attach the connector retainer from the subframe.

51. **NOTE:** RH shown, LH similar.

    Install the stabilizer bar links and nuts to the struts.

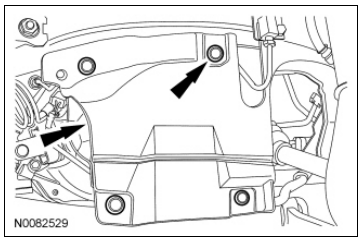
    - Tighten to 40 Nm (30 lb-ft).



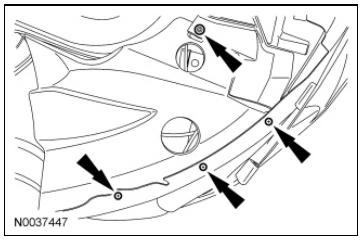
52. **NOTE:** RH shown, LH similar.

    Install tie-rod ends and nuts.

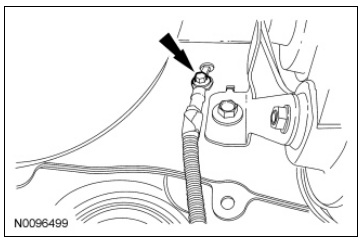
    - Tighten to 48 Nm (35 lb-ft).
    - Install the cotter pin.



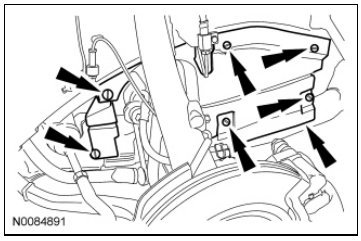
53. Install the engine roll restrictor bolt.
    - Tighten to 90 Nm (66 lb-ft).



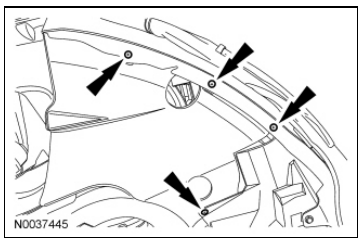
54. Slide the steering gear-to-dash seal onto the steering gear and engage the 4 retaining clips (2 shown) into the body.
    - From under the vehicle, verify that the seal is correctly installed on the steering gear and the 4 retaining clips are fully engaged into the dash.



55. Install the LH splash shield and the 6 pin-type retainers (4 shown).



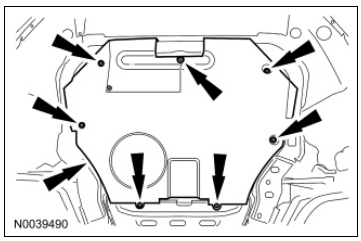
56. Position the LH fender splash shield and install the 4 screws.



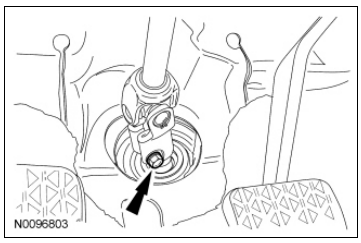
57. Install the EPAS wiring ground wire and bolt in the RH front wheel well.
    - Tighten to 10 Nm (89 lb-in).

58. Install the RH splash shield and the 6 pin-type retainers (4 shown).

59. Position the RH fender splash shield and install the 4 screws.

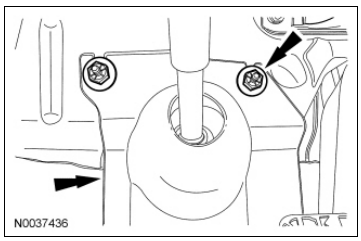


60. Install the exhaust flexible pipe. For additional information, refer to Section 309-00 .



61. Install the front wheels and tires. For additional information, refer to Section 204-04 .

62. Fill the engine with clean engine oil.



63. If equipped, install the underbody cover and 7 screws.

64. Connect the steering column shaft to the steering gear and install the bolt.
    - Tighten to 20 Nm (177 lb-in).

65. Install the steering joint cover and the 2 nuts.

66. Repower the vehicle high-voltage electrical system. For additional information, refer to Section 414-03 .

67. Connect the battery ground cable. For additional information, refer to Section 414-01 .
68. Install the engine Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12D .
69. Reset the Passive Anti-Theft System (PATS). For additional information, refer to Section 419-01B .
70. Fill and bleed the MECS . For additional information, refer to Section 307-02B .
71. Fill and bleed the cooling system. For additional information, refer to Section 303-03B .
72. Recharge the A/C system. For additional information, refer to Section 412-00B .

Material

Item	Specification	Fill Capacity
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A	-
Motorcraft® Specialty Green Engine Coolant [a] [b] [c] VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A	2.5L engine 8.1L (8.6 qt); 3.0L engine 9.2L (9.7 qt); 3.5L engine 9.5L (10.0 qt)
Motorcraft® Specialty Orange Engine Coolant [a] [b] [d] VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D	2.5L engine 8.1L (8.6 qt); 3.0L engine 9.2L (9.7 qt); 3.5L engine 9.5L (10.0 qt)

[a] The cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used.
[b] Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.
[c] Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.
[d] During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it requicoolant to be drained, the system to be flushed, or the engine coolant to be replaced.

General Specifications

Item	Specification
Pressure Tests	
Complete cooling system maximum pressure	124 kPa (18 psi)
Pressure relief cap	89-124 kPa (13-18 psi)
Radiator (out of vehicle)	138 kPa (20 psi)
Thermostat Opening Temperatures	
Thermostat starts to open (2.5L)	80-84°C (176-183°F)
Thermostat starts to open (3.0L)	84-88°C (183-190°F)
Thermostat starts to open (3.5L)	79.5-83.3°C (171.1-181.9°F)
Thermostat fully open (2.5L)	97°C (207°F)
Thermostat fully open (3.0L)	99°C (210°F)
Thermostat fully open (3.5L)	94.5°C (202.1°F)

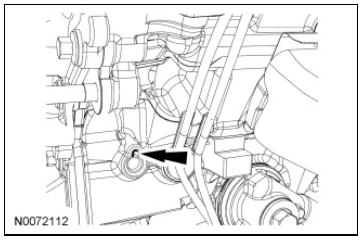
Engine Cooling

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has be used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**



NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.**

NOTE: During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

The cooling system components are the:

- block heater (if equipped).
- radiator.
- bypass tube.
- pressure relief cap.
- degas bottle.
- radiator draincock.
- coolant pump.
- thermostat (cold side).
- Engine Coolant Temperature (ECT) sr.
- variable speed fan motor assembly.
- fan control module.
- engine block coolant weep hole (3.5L only).

On 3.5L engines the coolant pump is located under the engine front cover mounted to the block. A weep hole is provided on the front left side of the engine behind the generator. It is adjacent to a 13.5 mm (0.531 in) cup plug. The plug and the weep hole create a reservoir for normal coolant seepage and evaporation. Every coolant pump will have some leakage past the dynamic mechanical seal. Dampness and crusting around the weep hole is acceptable and an expected result of normal engine operation. Coolant spray or leakage amounts great enough to puddle should be addressed.

Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water. A coolant concentration of 50% provides freeze point protection down to -37°C (-34°F).

To maintain the integrity of the coolant and the cooling system:

- add Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Mixing different coolant types degrades the corrosion protection of the original coolant. Do not mix any type of coolants.
- do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. T can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles.
- Used engine coolant should be disposed of in an appropriate manner. Follow the community's regulations and standards for recycling and disposing of automotive fluids.

Fail Safe Cooling

NOTE: If the driver is using a high percentage of throttle travel (for example, an overtaking maneuver) when the PCM starts, engine deactivation will be delayed for 10 seconds.

NOTE: After the cylinder deactivation operation has begun, the engine will not revert to operating on all cylinders, even if the temperature should fall, until the ignition is switched OFF and then ON again.

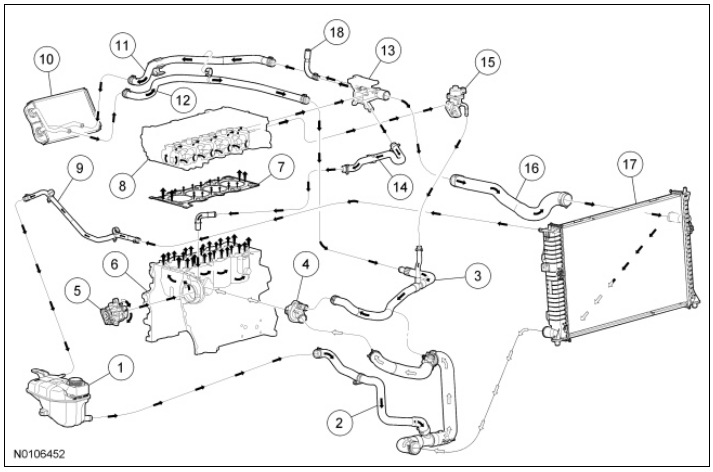
NOTE: The Malfunction Indicator Lamp (MIL) can only be extinguished by using a scan tool after the fault has been rectified and the DTC cleared.

The vehicle has a strategy built into the PCM that will control the engine if it starts to overheat.

Stage 1 of the strategy will commence if the engine starts to overheat. The Cylinder Head Temperature (CHT) sensor transmits a signal to the PCM, which then moves the temperature gauge pointer into the red zone.

If the engine is not switched OFF and the temperature continues to rise, the powertrain check lamp is illuminated. This indicates to the driver that the engine is approaching critical limits and should be stopped. At this point, DTC P1285 is set in the PCM and can be retrieved using a scan tool.

Stage 2 of the strategy will commence if the lamp and temperature gauge are ignored by the driver. The PCM will start to control the engine by cutting out cylinders and restricting the rpm to below 3,000 rpm. Simultaneously, the MIL will be illuminated. This indicates that long-term engine damage can occur and vehicle emissions will be affected. At this point, DTC 1299 is set in the PCM and can be retrieved using a scan tool.

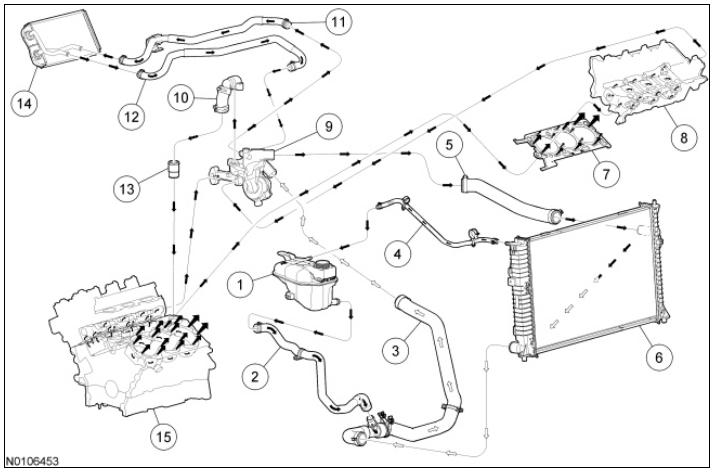


Air is then drawn into the deactivated cylinders. This helps to control the temperature of the engine internal components. The deactivated cylinders are alternated to allow even cooling of all the cylinders.

Stage 3 of the strategy will commence if the engine temperature still continues to rise. This will result in the engine being totally disabled before major engine damage or seizure occurs. The powertrain check lamp will begin to flash, indicating to the driver that the engine will be switched OFF after 30 seconds. This allows the driver time to choose a suitable parking place.

Coolant Flow Diagram

2.5L



NOTE: Black arrows indicate hot, white arrows indicate cold.

Item	Part Number	Description
1	8A080	Degas bottle
2	8B273	Lower radiator hose

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Principles of Operation

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The 2.5L engine coolant pump is operated by engine rotation through a pulley driven by the accessory drive belt. The 3.0L coolant pump is operated by a V-ribbed belt driven by a pulley attached to the camshaft. The 3.5L coolant pump is operated through a sprocket driven by the timing chain. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

The degas bottle holds surplus coolant and removes air from the cooling system, which reduces hot spots. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and serves as the locati for service fill.

The cooling fan draws air through the radiator to help cool the system coolant as it passes through the radiator.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor executes once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 is set, and the Malfunction Indicator Lamp (MIL) will be illuminated.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

Inspection and Verification

⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

NOTE: During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

NOTE: Vehicles have the pressure relief cap on the degas bottle and no radiator cap.

1. Verify the customer concern.

2. Visually check the engine coolant level at the degas bottle when the system is cold.

3. Make sure the pressure relief cap is installed correctly.

4. Record any cooling system DTCs retrieved. Refer to the PCM DTC Chart in this section for DTC descriptions.

5. **NOTE:** Take note of any coolant odor or steam coming from cooling system components.

   If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer's concern by operating the engine to duplicate the condition.

6. **NOTE:** For the coolant flow diagrams, refer to Engine Cooling in the Description and Operation portion of this section.

Visually inspect for obvious signs of any mechanical or electrical concerns damage.

Visual Inspection Chart

Mechanical	Electrical
• Leaks or weeps at: ♦ Hoses ♦ Tubes ♦ Clamp joints ♦ Gaskets ♦ O-rings ♦ Thermostat housing ♦ Radiator ♦ Pressure relief cap ♦ Coolant pump weep hole (LH side of block, 3.5L only) ♦ Heater core (wet floor or coolant odor in vehicle) ♦ Degas bottle ♦ Coolant pump housing ♦ Cylinder block core plugs ♦ Cylinder head core plugs ♦ Block heater (if equipped)	• Inoperative or damaged: ♦ Electric cooling fan ♦ Wiring, connectors, relays or modules ♦ Cylinder Head Temperature (CHT) sensor ♦ Vehicle Speed Sensor (VSS)
• Cracked or damaged: ♦ Hoses ♦ Tubes ♦ Hose clamps ♦ Thermostat housing ♦ Radiator ♦ Pressure relief cap ♦ Cooling fan ♦ Coolant pump ♦ Degas bottle ♦ Coolant pump housing ♦ Cylinder block core plugs ♦ Cylinder head core plugs ♦ Block heater (if equipped) • Restricted airflow through the A/C condenser/radiator • Excessive white or light gray exhaust smoke (may have burnt coolant odor) • Coolant in engine oil • Engine oil in coolant • Coolant in automatic transmission fluid (if equipped) • Automatic transmission fluid (if equipped) in coolant • Engine vent hose check valve installed correctly (3.5L only)	

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog mage the cooling system, resulting in degraded cooling system performance and/or failure.**

NOTE: NOTE: During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

Inspect the coolant condition in the following sequence:

1. Inspect the coolant color.
    - ♦ If the coolant has a clear or pale green color, this indicates higher water content than required. Test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range -50°C to -26°C (-58°F to -15°F). If the vehicle is driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 engine coolant to distilled water.
    - ♦ Discoloration of Motorcraft® Specialty Orange Engine Coolant may indicate that incorrect coolant may have been added to the system. Use of incorrect (green or yellow) coolant degrades the corrosion protection of Motorcraft® Specialty Orange Engine Coolant. Addition of Motorcraft® Specialty Green Engine Coolant may cause the color to appear to be a murky green-brown color. The addition of Motorcraft® Premium Gold Engine Coolant, however, may not change the color or appearance of the orange colored coolant. Detection of contamination with Motorcraft® Premium Gold Engine Coolant is determined by the presence of nitrite. If contamination with Motorcraft® Premium Gold Engine Coolant is suspected, test the coolant with the 3-Way HD Antifreeze Coolant Test Kit. Follow the directions in the kit with regard to nitrite testing. If nitrite is prese system and refill with the correct mixture of Motorcraft® Specialty Orange Engine Coolant and distilled water. Refer to Cooling System Flushing in this section.
    - ♦ A darker color with the presence of debris could indicate a commercially available stop-leak may have been used and could result in loss of coolant flow the critical parts of the engine. If sediment is present in the coolant sample, flush the system and refill with the correct mixture of distilled water and the correct engine coolant. Refer to Cooling System Flushing in this section.
    - ♦ A light or reddish brown color or reddish brown particles indicate that rust may be present in the cooling system. Flush the system and refill with the correct mixture of

8. distilled water and the correct engine coolant. Refer to Cooling System Flushing in this section.
   - An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For information on engine diagnosis, refer to Section 303-00 .
   - A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to Component Tests in this section. If engine oil is suspected, the cause of the leak may be internal to the engine. Refer to Section 303-00 . Flush the cooling system. Refer to Cooling System Flushing in this section.
2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range -50°C to -26°C (-50°F to -15°F). If the vehicle is driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 engine coolant to distilled water.
   - Maximum coolant concentration is 60/40 for cold weather areas.
   - Minimum coolant concentration is 40/60 for warm weather areas.
3. Adjust coolant ranglevel if necessary:
   - If coolant is low, add specified coolant mixture only.
   - If the engine coolant tests too weak, remove some of the engine coolant and add undiluted engine coolant until the readings are within acceptable levels.
   - If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9. If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

10. **NOTE:** Make sure to use the latest scan tool software release.

    If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

11. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

    If the scan tool does not communicate with the VCM :

    - check the VCM connection to the vehicle.
    - check the scan tool connection to the VCM .
    - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

12. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 to diagnose no response from the PCM.

13. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record continuous memory DTCs.

14. Clear the continuous DTCs and carry out the self-test diagnostics PCM.

15. If the DTCs recovered are related to the concern, go to the PCM DTC Chart. For all other PCM DTCs, refer to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L (4V) engines, or Section 303-14C for 3.5L engines.

16. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

PCM DTC Chart

DTC	Description	Action
P0125	Insufficient Coolant Temp For Closed Loop Fuel Control	GO to Pinpoint Test C .
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	GO to Pinpoint Test C .
P0217	Engine Coolant Overtemperature Condition	GO to Pinpoint Test B .
P0480 P0481 P0482	Fan 1, 2 or 3 Control Circuit, Respectively	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1285	Cylinder Head Overtemperature Condition	GO to Pinpoint Test B .
P1299	Cylinder Head Overtemperature Protection Active	GO to Pinpoint Test B .
All Other PCM DTCs	-	REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L (4V) engines or Section 303-14C for 3.5L engines.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: Loss of Coolant

Normal Operation

The engine cooling system is a closed system providing for coolant expansion and contraction and also changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Coolant loss can be attributed to either external or internal leaks anywhere within the cooling system.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

This pinpoint test is intended to diagnose the following:

- Coolant hoses or tubes
- Hose clamps
- Thermostat O-ring seal
- Thermostat housing O-ring seal
- Thermostat housing
- Coolant pump O-ring seal or gasket
- Coolant pump housing
- Coolant pump
- Radiator
- Transmission fluid cooler in radiator (if equipped)
- Pressure relief cap
- Coolant pump leaking from weep hole
- Heater core
- Engine gaskets
- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)

PINPOINT TEST A: LOSS OF COOLANT

⚠ WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to A2 .
A2 CHECK THE ENGINE COOLANT LEVEL	
NOTE: Allow the engine to cool before checking the engine coolant level. • Ignition OFF. • Visually inspect the engine coolant level at the degas bottle. • **Is the engine coolant level within specifications?**	**Yes** GO to A3 . **No** ADJUST the engine coolant level as necessary. GO to A3 .
A3 PRESSURE TEST THE ENGINE COOLING SYSTEM	

• Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK	
• Inspect the engine coolant in the degas bottle for signs of engine oil. • **Is engine oil evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. **No** GO to A5 .
A5 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT	
• Remove the oil level indicators from the engine and the transmission. • **Is coolant evident in the oil or transmission fluid?**	**Yes** If coolant is in the engine oil, GO to Section 303-00 . If coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. **No** GO to A6 .
A6 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	
• **NOTE:** Use UView® Combustion Leak Tester, part No. UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** The cooling system is operational.

Pinpoint Test B: The Engine Overheats

Normal Operation

The engine cooling system maintains engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperatue.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The 2.5L engine coolant pump is operated by engine rotation through a pulley driven by the accessory drive belt. The 3.0L coolant pump is operated by a V-ribbed belt driven by a pulley attached to the camshaft. The 3.5L coolant pump is operated through a sprocket driven by the timing chain. The coolant

thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit in order to transfer engine-generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine-generated heat to the outside air through the radiator.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

- DTC P0217 (Engine Coolant Overtemperature Condition) - Indicates an engine overheat condition was sensed by the Cylinder Head Temperature (CHT) sensor.
- DTC P1285 (Cylinder Head Overtemperature Condition) - Indicates an engine overheat condition was sensed by the CHT sensor.
- DTC P1299 (Cylinder Head Overtemperature Protection Active) - Indicates an engine overheat condition was detected by the CHT sensor. A failure mode effects management strategy called fail-safe cooling was activated to cool the engine.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components
- Electric cooling fan
- Engine Coolant Temperature (ECT) gauge
- Cylinder Head Temperature (CHT) sensor
- Heater core
- Coolant pump
- Coolant flow restriction
- Missing engine vent hose check valve or incorrect orientation of check valve (3.5L only)

PINPOINT TEST B: THE ENGINE OVERHEATS

⚠ WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructis may result in serious personal injury.

Test Step	Result / Action to Take
B1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to B2 .

B2 CHECK FOR DTCs	
• Check for DTC P0217, P1285 or P1299. • **Is DTC P0217, P1285 or P1299 present?**	**Yes** GO to B3 . **No** Actual engine overheating has not been verified. CHECK the ECT gauge operation. REFER to Section 413-01 . If any other PCM DTCs are retrieved, REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L (4V) engines or Section 303-14C for 3.5L engines.
B3 CHECK FOR AN AIRFLOW OBSTRUCTION	
• Check the radiator or A/C condenser for an external obstruction such as leaves or cardboard. • **Is an obstruction present?**	**Yes** REMOVE the obstruction. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK THE ENGINE COOLANT LEVEL	
NOTE: Allow the engine to cool before checking the coolant level. • Ignition OFF. • Visually check the engine coolant level in the degas bottle. • **Is the engine coolant level within specification?**	**Yes** GO to B5 . **No** ADJUST the engine coolant level as necessary. GO to B5 .
B5 PRESSURE TEST THE ENGINE COOLING SYSTEM	
• Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to B6 .
B6 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK	
• Inspect the engine coolant in the degas bottle for signs of engine oil. • **Is engine oil evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. **No** GO to B7 .
B7 CHECK THE ENGINE OIL AND TRANSMISSION FLUID FOR COOLANT	
	Yes If coolant is in the engine oil, GO to Section 303-00 . If

• Remove the oil level indicators from the engine and the transmission. • **Is coolant evident in the oil or transmission fluid?**	coolant is in the transmission fluid, INSTALL a new radiator. REPAIR the transmission as necessary. Refer to the appropriate section in Group 307 for the procedure. **No** GO to B8 .
B8 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	
• **NOTE:** Use UView® Combustion Leak Tester, part No. UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to B9 .
B9 CHECK COOLANT CONDITION	
• Check the coolant for dirt, rust or contamination and check the coolant concentration. • **Is the coolant condition OK?**	**Yes** GO to B10 . **No** FLUSH the engine cooling system. REFER to Cooling System Flushing in this section. TEST the system for normal operation.
B10 CHECK THE ELECTRIC COOLING FAN OPERATION	
• Start the engine. • Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position. • **Did the electric cooling fan operate?**	**Yes** GO to B11 . **No** DIAGNOSE the electric cooling fan operation. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B11 CHECK THE COOLANT PUMP OPERATION	
• Start the engine. • Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose. • **Is the heater outlet hose hot?**	**Yes** GO to B12 . **No** INSTALL a new coolant pump. TEST the system for normal operation.
B12 CHECK THE THERMOSTAT OPERATION	
• Start the engine.	**Yes** CHECK the ECT gauge operation. REFER to Section 413-01 .

• Allow the engine to run for 30 minutes. Feel the lower radiator hose. • **Is the lower radiator hose hot?**	**No** For 3.5L engines, GO to B13 . For 2.5L and 3.0L engines, GO to B14 .
B13 CHECK THE ENGINE VENT HOSE CHECK VALVE	
• Disconnect the engine vent hose from the engine and degas bottle. • Using a light, look inside the end of the vent hose that connects to the engine. A check valve should be installed 50 mm (1.96 in) from the end of the hose. • Using regulated compressed air, confirm air flows freely from the engine end to the degas bottle end. • Using regulated compressed air, confirm air does not flow from the degas bottle end to the engine end. • **Is the check valve installed in the vent hose and does air flow through in one direction and not the other?**	**Yes** GO to B14 . **No** INSTALL a new engine vent hose. TEST the system for normal operation.
B14 VISUALLY INSPECT THE THERMOSTAT	
• Carry out the Thermostat Visual Inspection in the Component Tests portion of this section. • **Is the thermostat damaged?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature

Normal Operation

The engine cooling system maintains engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The 2.5L engine coolant pump is operated by engine rotation through a pulley driven by the accessory drive belt. The 3.0L coolant pump is operated by a V-ribbed belt driven by a pulley attached to the camshaft. The 3.5L coolant pump is operated through a sprocket driven by the timing chain. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is

opened, coolant flows through the radiator circuit in order to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions, or when the electric cooling fans operate all the time. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

- DTC P0125 (Insufficient Coolant Temp for Closed Loop Fuel Control) - Indicates the Cylinder Head Temperature (CHT) sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
- DTC P0128 (Coolant Thermostat [Coolant Temp Below Thermostat Regulating Temperature]) - Indicates that the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- Thermostat
- Engine Coolant Temperature (ECT) gauge
- Engine cooling fan

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

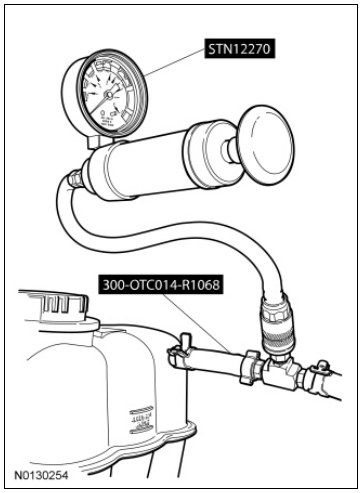
⚠ WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcly when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.

Test Step	Result / Action to Take
C1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to C2 .
C2 CHECK FOR DTC P0125 or P0128	
• Check for DTC P0125 or P0128. • **Is DTC P0125**	**Yes** GO to C3 . **No**

or P0128 present?	The cooling system is operational. If an inoperative engine coolant temperature gauge is suspected, CHECK the engine coolant temperature gauge operation. REFER to Section 413-01 . If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to Section 412-00A . If any other PCM DTCs are retrieved, REFER to Section 303-14A for 2.5L engines, Section 303-14B for 3.0L (4V) engines or Section 303-14C for 3.5L engines.
C3 CHECK THE ELECTRIC COOLING FAN OPERATION	
• Allow the engine to cool. • Make sure the A/C switch is OFF (if equipped). • Start the engine. • Check the electric cooling fan. • **Is the electric cooling fan on all the time?**	**Yes** DIAGNOSE the electric cooling fan operation. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to C4 .
C4 CHECK THE COOLANT LEVEL	
• **NOTE:** Allow the engine to cool before checking the coolant level. • Visually check the engine coolant level in the degas bottle. • **Is the engine coolant level within specification?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** GO to Pinpoint Test A to diagnose a coolant leak.

Component Tests

Cooling System Pressure Test



⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

NOTE: Vehicles have the pressure relief cap on the degas bottle and no radiator cap.

1. Turn the engine OFF.

2. Check the engine coolant level. Adjust the coolant level as necessary.

3. Attach the D-Gas Adapter to the degas bottle nipple and overflow hose. Install the Radiator Tester to the quick connect fitting of the D-Gas Adapter.

4. *NOTICE:* **Do not pressurize the cooling system beyond the maximum pressure listed in the specifications table in this section or cooling system components may be damaged.**

   NOTE: If the plunger of the pressure tester is pressed too fast, an erroneous pressure reading will result.

   Slowly press the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained. If the pressure reading exceeds the maximum cap pressure listed in the specifications table, install a new pressure relief cap.

5. If the system does not hold pressure, remove the pressure relief cap and wash in clean water to dislodge all the foreign material from the gasket. Check the sealing surface in the filler neck of the degas bottle for nicks or cuts. Install the pressure relief cap.

6. Pressurize the engine cooling system as described in Step 4. Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.

7. If no leaks are found and the pressure drops. the pressure relief cap may be leaking. Install a new pressure relief cap and retest the system.

8. If no leaks are found after a new pressure relief cap is installed, and the pressure drops, the leak may be internal to the radiator transmission cooler (if equipped). Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.

9. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to Section 303-00 to diagnose the engine.

10. Release the system pressure by loosening the pressure relief cap. Check the coolant level and adjust as necessary.

Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test A, B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1. Remove the thermostat.

2. Examine the thermostat for signs of damage including:
   - Valve not fully seated (light visible through the valve)
   - Foreign material lodged in the main valve
   - Bent or broken frame or flange
   - Bent or broken spring
   - Bent or broken valve or valve stem
   - Wax leaking from wax reservoir or a bulge in the reservoir
   - Any other damage or distortion

3. **NOTE:** If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

   If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.

4. If no damage is found during the inspection, continue troubleshooting the system concern. Go to the Symptom Chart for further instructions.

Radiator Leak Test, Removed From Vehicle

NOTICE: **Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.**

NOTE: Always install plugs in the oil cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

Leak test the radiator in clean water with air pressurized to the maximum pressure listed in the Specifications.

Cooling System Draining, Filling and Bleeding

Special Tool(s)

 ST2818-A	Airlift Cooling System Tester UVU550000 or equivalent

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Draining

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   NOTE: **The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated it must be recycled or disposed of correctly. Using contaminated coolant may result in damage to the engine or cooling system components.**

   NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

   NOTICE: **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure**

causes this product to degrade.

NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products may clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.**

NOTE: During normal vehicle operation, Motorcraft Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as thene coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

NOTE: Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

Release the pressure in the cooling system by slowly turning the pressure relief cap one-half turn counterclockwise. When the pressure is released, remove the pressure relief cap.

3. Place a suitable container below the radiator draincock.
    - Open the draincock and allow to drain.
    - Close the draincock after draining.

Filling and Bleeding with a Vacuum Cooling System Filler - 2.5L and 3.0L Engines

1. *NOTICE:* **The cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

   NOTICE: **Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.**

   To maintain the integrity of the coolant and the cooling system:

    - Add Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types.
    - Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.
    - Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
    - Ford Motor Company does NOT recommend the use of recycled engine coolant in v originally equipped with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant since a Ford-approved recycling process is not yet available.

   NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system resulting in degraded cooling system performance and/or failure.**

Install the vacuum cooling system filler and follow the manufacturer's instructions to fill and bleed the cooling system.

- Recommended coolant concentration is 50/50 engine coolant to distilled water.
- For extremely cold climates (less than -37°C [-34°F]):
  - ♦ It may be necessary to increase the coolant concentration above 50%.
  - ♦ NEVER increase the coolant concentration above 60%.
  - ♦ Maximum coolant concentration is 60/40 for cold weather areas.
  - ♦ A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
  - ♦ Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.
- For extremely hot climates:
  - ♦ It is still necessary to maintain the coolant concentration above 40%.
  - ♦ NEVER decrease the coolant concentration below 40%.
  - ♦ Minimum coolant concentration is 40/60 for warm weather areas.
  - ♦ A coolant concentration of 40% provides freeze point protection down to -26°C (-15°F).
  - ♦ Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine. l>
- Vehicles driven year-round in non-extreme climates should use a 50/50 mixture of engine coolant and distilled water for optimum cooling system and engine protection.

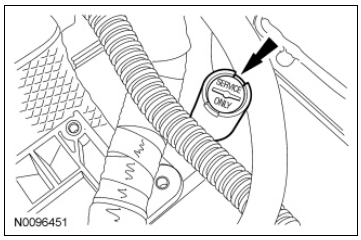
Filling and Bleeding without a Vacuum Cooling System Filler - 2.5L and 3.0L Engines

NOTICE: **The cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

NOTICE: **Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.**

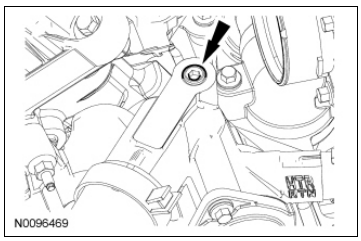
To maintain the integrity ofcoolant and the cooling system:



- Add Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types.
- Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.

- Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant since a Ford-approved recycling process is not yet available.

NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system resulting in degraded cooling system performance and/or failure.**



2.5L engine

1. Remove the degas bottle cap and the bleed valve on the back of the engine coolant outlet.

3.0L engine

2. Remove the degas bottle cap and the bleed valve on the top of the coolant pump housing.

2.5L and 3.0L engines

3. **NOTE:** Make sure the coolant flows from the radiator through the upper radiator hose and fills the engine. When full, coolant should flow from the bleed hole.

   Fill the degas bottle to the MAX fill line.

   - Recommended coolant concentration is 50/50 engine coolant to distilled water.
   - For extremely cold climates (less than -37°C [-34°F]):
     - ♦ It may be necessary to increase the coolant concentration above 50%.
     - ♦ NEVER increase the coolant concentration above 60%.
     - ♦ Maximum coolant concentration is 60/40 for cold weather areas.
     - ♦ A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
     - ♦ Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.
   - For extremely hot climates:
     - ♦ It is still necessary to maintain the coolant concentration above 40%.
     - ♦ NEVER decrease the coolant concentration below 40%.
     - ♦ Minimum coolant concentration is 40/60 for warm weather areas.
     - ♦ A coolant concentration of 40% provides freeze point protection down to -26°C

(-15°F).
- ♦ Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.

- Vehicles driven year-round in non-extreme climates should use a 50/50 mixture of engine coolant and distilled water for optimum cooling system and engine protection.

- Install the degas bottle cap and the bleed valve leaving both loose.

5. Start the engine and let it idle A mixture of air and coolant should escape from the open bleed valve.

6. After all of the air has escaped from the bleed valve turn off the engine and close the bleed valve and the degas bottle cap.

NOTICE: **If the engine overheats or the fluid level drops below the minimum fill line, shut off the engine and add fluid to the degas bottle maximum fill line once the engine cools. Failure to follow these instructions may result in damage to the engine.**

7. Start the engine and let it idle for 10 minutes (3.0L), 30 minutes (2.5L) or until the engine reaches normal operating temperature.

8. Carry out the following:
    1. Increase the engine speed to 3,000 rpm for 10 seconds.
    2. Idle engine for 50 seconds.
    3. Repeat Steps 1 and 2 a total of 15 times.

9. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

    Check the engine coolant level in degas bottle and fill as necessary.

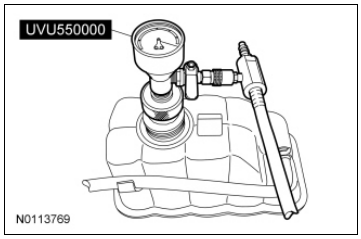
Filling and Bleeding - 3.5L Engine

Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

NOTICE: **Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.**

To maintain the integrity of the coolant and the cooling system:



- Add Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types.
- Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.

- Do notalcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant since a Ford-approved recycling process is not yet available.

NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system resulting in degraded cooling system performance and/or failure.**

Install the vacuum cooling system filler and follow the manufacturer's instructions to fill and bleed the cooling system.

- Recommended coolant concentration is 50/50 engine coolant to distilled water.
- For extremely cold climates (less than -37°C [-34°F]):
  - ♦ It may be necessary to increase the coolant concentration above 50%.
  - ♦ NEVER increase the coolant concentration above 60%.
  - ♦ Maximum coolant concentration is 60/40 for cold weather areas.
  - ♦ A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
  - ♦ Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.
- For extremely hot climates:
  - ♦ It is still necessary to maintain the coolant concentration above 40%.
  - ♦ NEVER decrease the coolant concentration below 40%.
  - ♦ Minimum coolant concentration is 40/60 for warm weather areas.
  - ♦ A coolant concentration of ovides freeze point protection down to -26°C (-15°F).
  - ♦ Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
- Vehicles driven year-round in non-extreme climates should use a 50/50 mixture of engine coolant and distilled water for optimum cooling system and engine protection.

2. Fill the degas bottle to 25 mm (0.984 in) above the COLD FILL line.

3. Install the degas bottle cap until at least 1 audible click is heard.

4. Turn the climate control system off.

5. Start the engine and increase the engine speed to 3,500 rpm and hold for 30 seconds.

6. Turn the engine off for and wait for 1 minute to purge any large air pockets from the cooling system.

7. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in seris personal injury.**

Check the engine coolant level in degas bottle and if necessary fill to 25 mm (0.984 in) above the top of the COLD FILL LEVEL on the degas bottle if the engine is warm or to the top of the COLD FILL LEVEL if the engine is cold.

8. Start the engine and let it idle until the engine reaches normal operating temperature and the thermostat is fully open. A fully open thermostat is verified by the cooling fan cycling on at least once.

9. Increase the engine speed to 3,500 rpm and hold for 30 seconds.

10. Allow the engine to idle for 30 seconds.

11. Turn the engine off for 1 minute.

12. Repeat steps 9 through 11 a total of 5 times to remove any remaining air trapped in the system.

13. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

    Check the engine coolant level in degas bottle and if necessary fill to 25 mm (0.984 in) above the top of the COLD FILL LEVEL on the degas bottle if the engine is warm or to the top of the COLD FILL LEVEL if the engine is cold.

14. Install the degas bottle cap until at least 1 audible click is heard.

Cooling System Flushing

Material

Item	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A

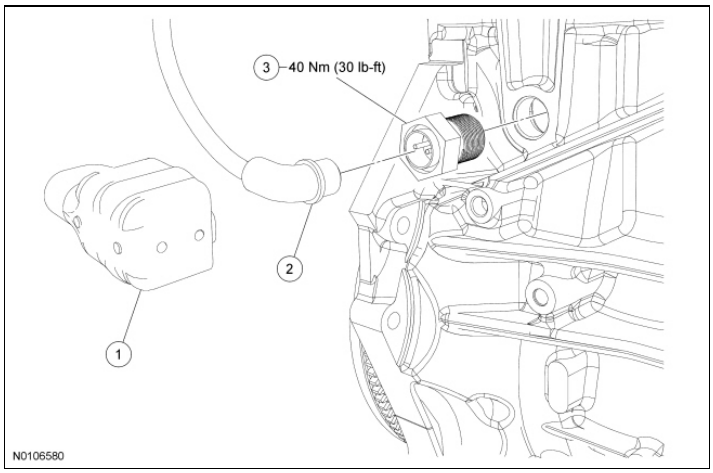
NOTE: To remove rust, sludge and other foreign material from the cooling system, use cooling system flush that is safe for use with aluminum radiators. For additional information, refer to Specifications in this section. This cleaning restores cooling system efficiency and helps prevent overheating. A pulsating or reversed direction of flushing water will loosen sediment more quickly than a steady flow in the normal coolant flow direction. In severe cases where cleaning solvents will not clean the cooling system efficiently, it will be necessary to use the pressure flushing method using cooling system flusher. Dispose of old coolant and flushing water contaminated with antifreeze and cleaning chemicals in accordance with local, state or federal laws.

1. Add Premium Cooling System Flush to the cooling system and follow the directions on the package.

2. Remove the radiator. For additional information, refer to Radiator - 2.5L, 3.0L (4V) or Radiator - 3.5L in this section.

3. ***NOTICE:*** **Radiator internal pressure must not exceed 138 kPa (20 psi). Damage to the radiator can result.**

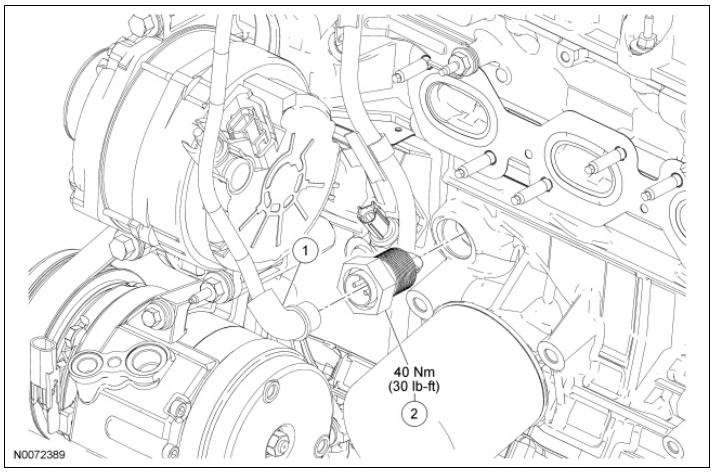
   Backflush the radiator with the radiator in an upside-down position with a high-pressure hose in the lower hose location and backflush.



4. **NOTE:** On 2.5L engines, the thermostat and housing are serviced as an assembly.

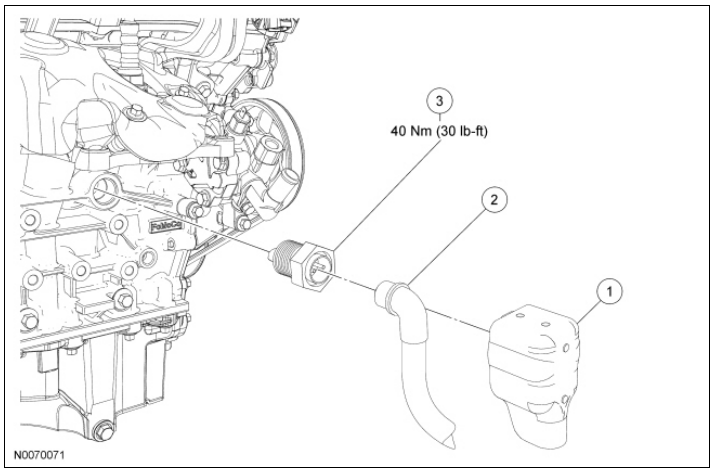
   Remove the thermostat. For additional information, refer to Thermostat Housing - 2.5L , Thermostat - 3.0L (4V) or Thermostat - 3.5L in this section.

5. Backflush the engine. Position the high-pressure water hose into the engine through the upper radiator hose and backflush the engine.



Block Heater

2.5L



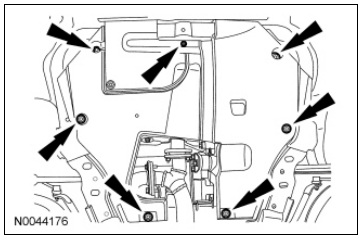
Item	Part Number	Description
1	-	Block heater electrical connector heat shield (part of 6B018)
2	6B018	Block heater electrical connector
3	6A051	Block heater

3.0L

Item	Part Number	Description
1	6B018	Block heater electrical connector
2	6A051	Block heater

3.5L

Item	Part Number	Description
1	030104	Block heater heat shield
2	6B018	Block heater electrical connector
3	6A051	Block heater



Removal and Installation

All engines

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. If equipped, remove the 7 screws and the underbody cover.

2.5L engine

4. Position the block heater heat shield aside.

3.5L engine

5. Remove the RH catalytic converter. For additional information, refer to Section 309-00 .

6. Remove the block heater heat shield.

All engines

7. ***NOTICE:*** **Make sure that the block heater wiring is routed and secured away from rotating or hot components, or damage to the wiring can occur.**

   Disconnect the block heater electrical connector.

8. Remove the block heater.
   - To install, tighten to 40 Nm (30 lb-ft).

9. To install, reverse the removal procedure.

10. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat Housing - 2.5L

Item	Part Number	Description
1	14A464	Knock Sensor (KS) electrical connector (part of 12C508)
2	14A624	KS electrical connector pin-type retainer (part of 12C508)
3	W527362	Heater hose clamp
4	18C266	Heater hose
5	W500015	Thermostat housing bolt (3 required)
6	8575	Thermostat housing
7	W527372	Lower radiator hose clamp
8	8B273	Lower radiator hose
9	8K530	Gasket

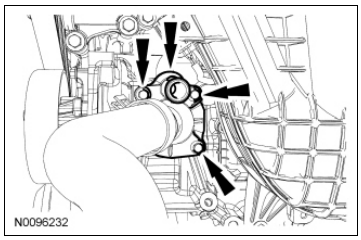
Removal and Installation

NOTE: The thermostat and thermostat housing are serviced as an assembly.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Disconnect the Knock Sensor (KS) electrical connector and detach the wiring harness pin-type retainer.



4. **NOTE:** Disconnecting the heater hose first will aid in the removal of the bottom thermostat housing bolt.

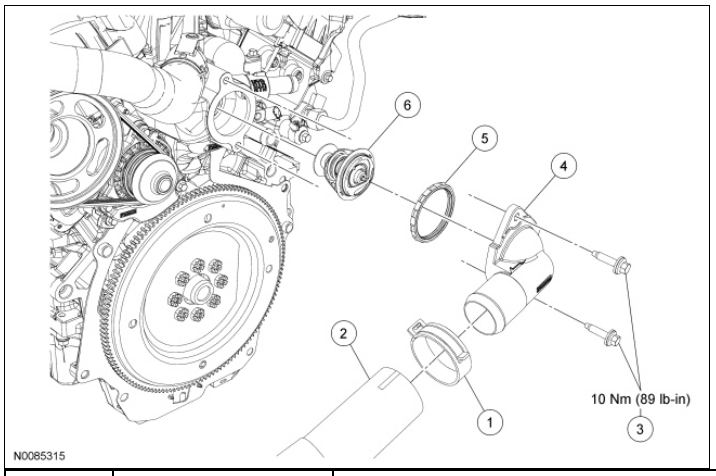
   Disconnect the heater hose at the thermostat housing.

5. **NOTE:** The view of the thermostat housing bolts is obstructed by A/C and engine components. However, the bolts can be removed using 1/4-in drive hand tools.

   Remove the 3 bolts and reposition the thermostat housing to gain access to the lower radiator hose clamp.

   - Remove and discard the gasket.
   - To install, tighten to 10 Nm (89 lb-in).

6. Disconnect the lower radiator hose at the thermostat housing.



7. To install, reverse the removal procedure.
   - Install a new gasket.

8. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat - 3.0L (4V)

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Item	Part Number	Description
1	W527375	Radiator hose clamp
2	8B273	Lower radiator hose
3	W500015	Thermostat housing cover bolts (2 required)
4	8K528	Thermostat housing cover
5	N806807	O-ring seal
6	8575	Thermostat

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
3. Disconnect the positive battery cable. For additional information, refer to Section 414-01 .
4. Disconnect the lower radiator hose from the thermostat housing.

5. Remove the 2 bolts, thermostat housing cover, O-ring seal and thermostat.
    - To install, tighten to 10 Nm (89 lb-in).

6. ***NOTICE:*** **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

   To install, reverse the removal procedure.

    - Clean and inspect the O-ring seal. Install a new seal if necessary.
    - Lubricate the thermostatring seal with clean engine coolant.

7. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat - 3.5L

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Item	Part Number	Description
1	8B273	Lower radiator-to-thermostat housing cover hose
2	W500014	Thermostat housing cover bolt (2 required)
3	8594	Thermostat housing cover
4	-	O-ring seal
5	8575	Thermostat

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Removr cleaner and outlet pipe. For additional information, refer to Section 303-12C .

3. Disconnect the lower radiator hose from the thermostat housing cover and position it aside.

4. Remove the 2 bolts, thermostat housing cover, O-ring seal and thermostat.
   - Clean and inspect the O-ring seal. Install a new seal if necessary.
   - To install, tighten to 10 Nm (89 lb-in).

5. ***NOTICE:*** **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

   To install, reverse the removal procedure.

   - Lubricate the thermostat O-ring seal with clean engine coolant.

6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in thisction.

Thermostat Housing - 3.5L

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Item	Part Number	Description
1	8B274	Upper radiator-to-thermostat housing hose
2	18C266	Heater outlet hose
3	18C266	Heater inlet hose
4	W503279	Thermostat housing bolt (2 required)
5	8A586	Thermostat housing
6	8565	O-ring seal
7	8A571	O-ring seal
8	8B541	Thermostat housing-to-degas bottle hose

Removal and Installation

1. Remove the thermostat. For additional information, refer to Thermostat - 3.5L in this section.

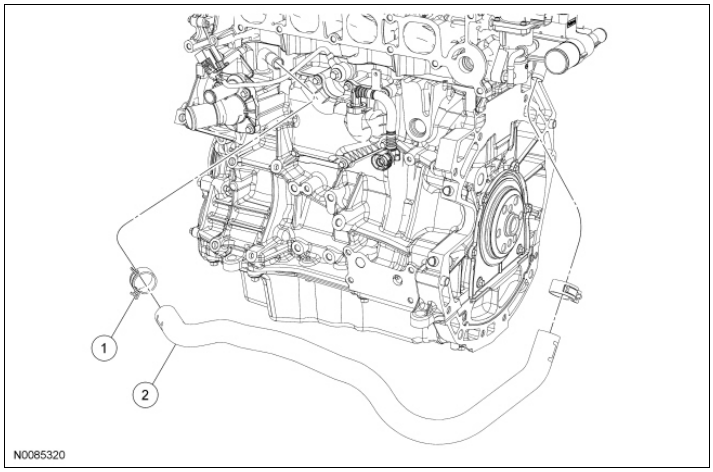
2. Disconnect the 4 coolant hoses from the thermostat housing and position them aside.

3. Remove the 2 thermostat housing bolts.
   - To install, tighten to 10 Nm (89 lb-in).

4. **NOTE:** Do not pull the other end of the coolant tube out of the engine block when separating the thermostat housing.

   Separate the thermostat housing from the coolant tube and remove the thermostat housing.

   - Remove and discard the O-ring seals.



5. ***NOTICE:*** **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

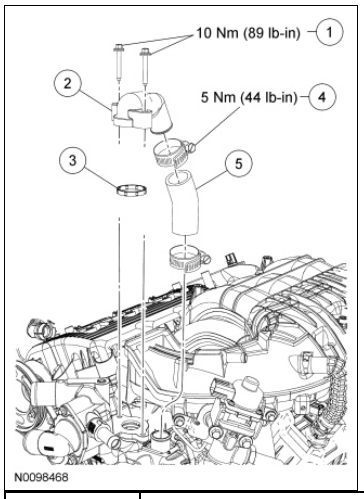
   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

   To install, reverse the removal procedure.

   - Lubricate the new O-ring seals with clean engine coolant.

Bypass Tube - 2.5L

Item	Part Number	Description
1	W525958	Hose clamp (2 required)
2	8548	Bypass tube



Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
3. Remove the intake manifold. For additional information, refer to Section 303-01A .
4. Disconnect and remove the coolant bypass tube from the engine.
5. To install, reverse the removal procedure.
6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Inlet Pipe - 3.0L (4V)

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Item	Part Number	Description
1	W503281	Coolant inlet pipe bolts
2	8594	Coolant inlet pipe
3	8255	O-ring seal
4	W527485	Coolant inlet pipe clamp (2 required)
5	8B573	Coolant inlet pipe hose

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remo Throttle Body (TB). For additional information, refer to Section 303-04B .

3. Remove the 2 coolant inlet pipe housing bolts.
   - To install, tighten to 10 Nm (89 lb-in).

4. Loosen the clamp and disconnect the coolant inlet pipe from the coolant inlet pipe hose.
   - To install, tighten to 5 Nm (44 lb-in).

5. Remove and inspect the O-ring seal, install a new seal if necessary.

6. ***NOTICE:*** **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

   To install, reverse the removal procedure.

   - Lubricate the O-ring seal with clean engine coolant.

7. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filg and Bleeding in this section.

Coolant Pump - 2.5L

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Item	Part Number	Description
1	W500221	Coolant pump pulley bolt (3 required)
2	8509	Coolant pump pulley
3	W500015	Coolant pump bolt (3 required)
4	8501	Coolant pump
5	8507	Coolant pump O-ring seal

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Loosen the 3nt pump pulley bolts.
   - To install, tighten to 20 Nm (177 lb-in).

3. Remove the accessory drive belt. For additional information, refer to Section 303-05A .

4. Remove the 3 bolts and the coolant pump pulley.

5. ***NOTICE:*** **Make sure the coolant pump is correctly seated to the engine block before installing and tightening the fasteners, or damage to the coolant pump may occur.**

   Remove the 3 bolts and the coolant pump.

   - Remove and discard the O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).

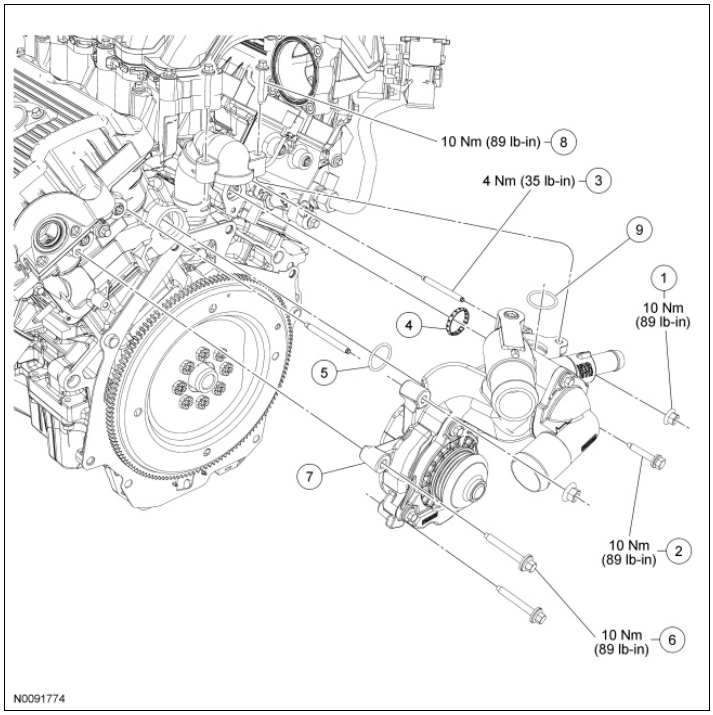
6. ***NOTICE:*** **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

   To install, reverse the removal procedure.

   - Lubricate the new O-ring seal with clean engine coolant.

7. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.



Coolant Pump Housing - 3.0L (4V)

Coolant Hoses

Item	Part Number	Description
1	W532958	Heater hose clamp
2	18K580	Heater outlet hose
3	W532958	Heater hose clamp
4	18K579	Heater inlet hose
5	W525871	Lower radiator hose clamp
6	8B273	Lower radiator hose
7	W525872	Upper radiator hose clamp
8	8B274	Upper radiator hose

Coolant Pump Housing

Item	Part Number	Description
1	W705764	Coolant pump housing nut (2 required)
2	W707643	Coolant pump housing bolt
3	W713511	Coolant pump housing stud (2 required)
4	8C387	Gasket
5	8565	O-ring seal
6	W503281	Coolant pump housing bolt (2 required)
7	8B858	Coolant pump housing
8	W503281	Coolant inlet pipe bolt (2 required)
9	8255	O-ring seal

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

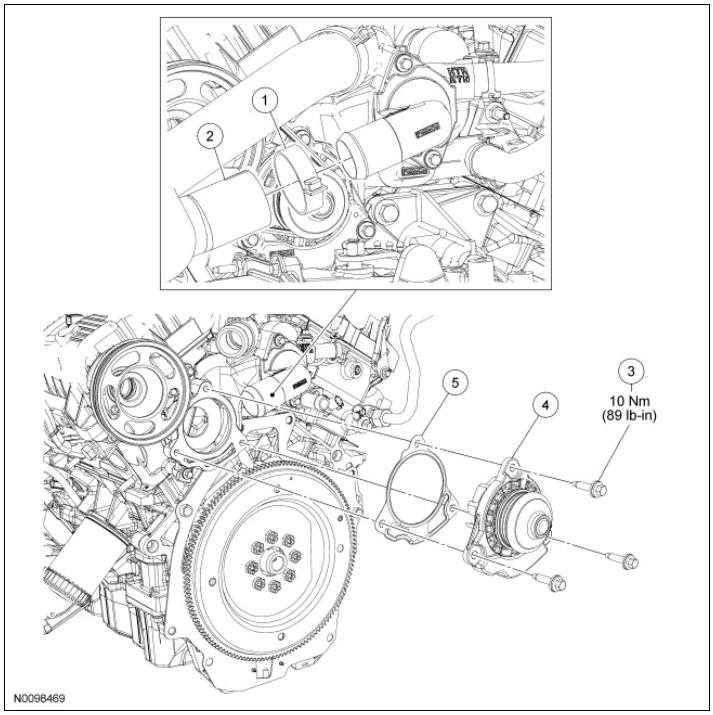
2. Remove the Throttle Body (TB). For additional information, refer to Section 303-04B .

3. Remove the coolant pump belt. For additional information, refer to Section 303-05B .

4. Disconnect the upper radiator hose from the coolant pump housing.

5. Disconnect the lower radiator hose from the thermostat housing.

6. Disconnect both heater hoses from the coolant pump housing.



7. Remove the 2 coolant inlet pipe bolts.
   - To install, tighten to 10 Nm (89 lb-in).

8. Remove the 3 bolts, 2 nuts and the coolant pump housing.
   - Remove and discard the O-ring seals and gasket.
   - To install, tighten to 10 Nm (89 lb-in).

9. To install, reverse the removal procedure.
    - Install new O-ring seals and gasket.

10. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Pump - 3.0L (4V)

Item	Part Number	Description
1	W527376	Lower radiator hose clamp
2	8B273	Lower radiator hose
3	W503276	Coolant pump assembly bolt (3 required)
4	8501	Coolant pump assembly
5	8507	Gasket

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12B .

3. Disconnect the lower radiator hfrom the thermostat housing.

4. Remove the coolant pump belt. For additional information, refer to Section 303-05B .

5. Remove the 3 bolts and the coolant pump.
   - Remove and discard the gasket.
   - To install, tighten to 10 Nm (89 lb-in).

6. To install, reverse the removal procedure.
   - Install a new gasket.

7. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Pump - 3.5L

Special Tool(s)

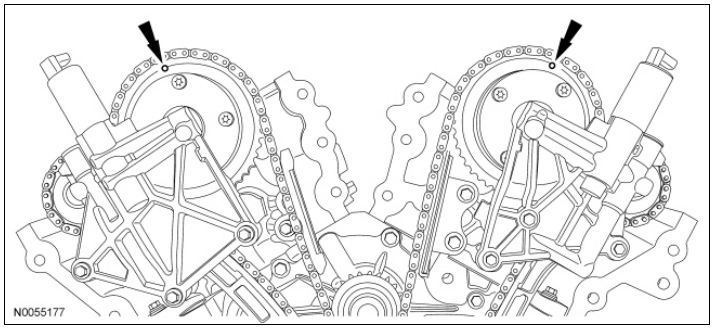
 ST2979-A	Camshaft Holding Tool 303-1248

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil (Canada) XO-5W20-QSP (US); CXO-5W20-LSP12 (Canada)	WSS-M2C945-A

Removal

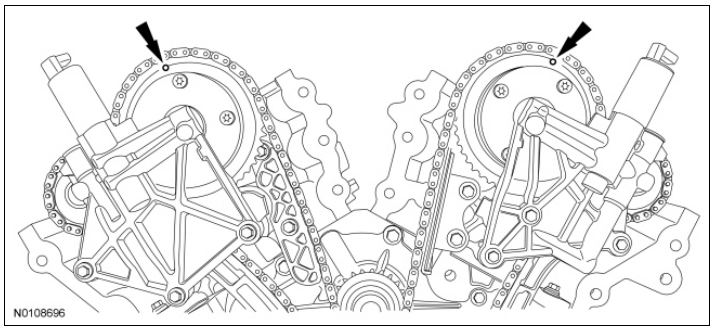
NOTICE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.**



NOTE: On early build engines, the timing chain rides on the inner side of the RH timing chain guide. Late build engines are equipped with a different design RH timing chain guide that requires the timing chain to ride on the outer side of the RH timing chain guide. For service, all replacement RH timing chain guides will be the late build design.

All vehicles

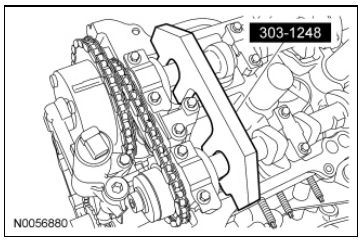
1. Remove the engine front cover. For additional information, refer to Section 303-01C .
2. Remove and discard the engine oil filter.



Engines equipped with early build RH timing chain guides

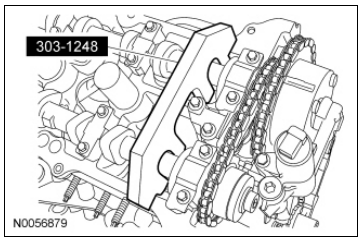
3. Rotate the crankshaft clockwise and align the timing marks on the Variable Camshaft Timing (VCT) assemblies as shown.

Engines equipped with late build/replacement RH timing chain guides



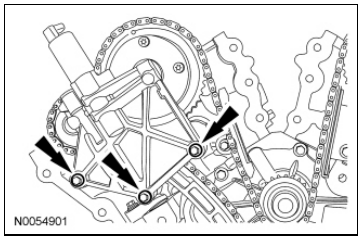
4. Rotate the crankshaft clockwise and align the timing marks on the VCT assemblies as shown.

All vehicles



5. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

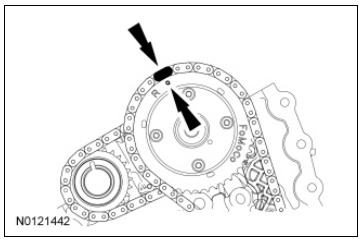
   Install the Camshaft Holding Tool onto the flats of the LH camshafts.



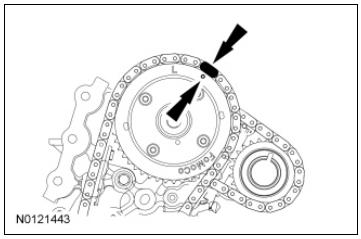
6. **NOTE:** The Camshaft Holding Tool will hold the camshafts in the TDC .

   Install the Camshaft Holding Tool onto the flats of the RH camshafts.

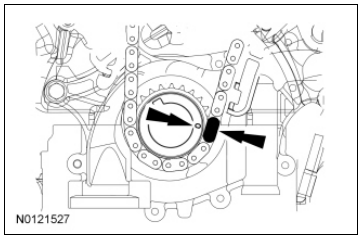
7. Remove the 3 bolts and the RH VCT housing.



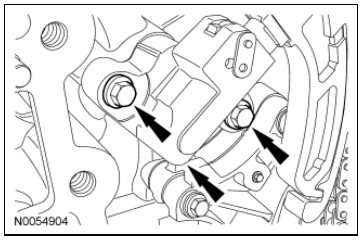
8. Remove the 3 bolts and the LH VCT housing.



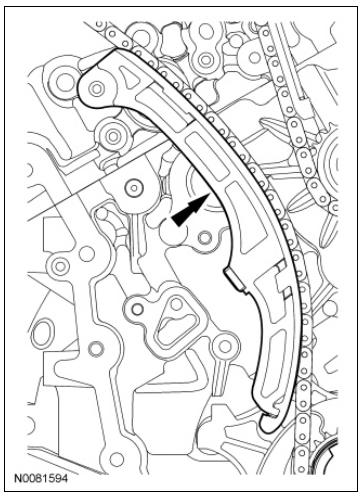
NOTE: The following 3 steps are for primary timing chains when the colored links are not visible.



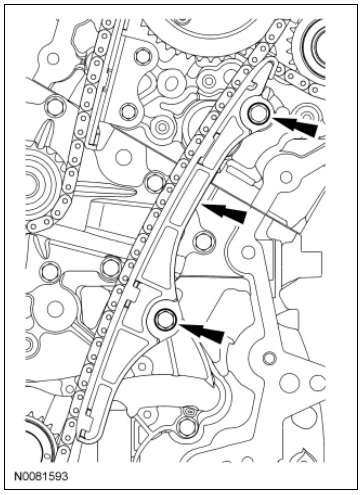
9. Mark the timing chain link that aligns with the timing mark on the RH intake VCT assembly as shown.



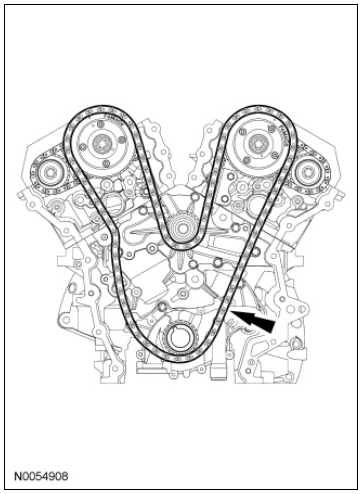
10. Mark the timing chain link that aligns with the timing mark on the LH intake VCT assembly as shown.



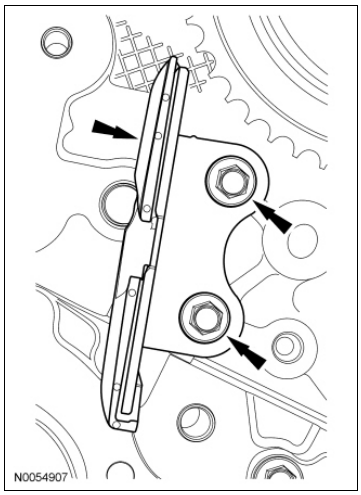
11. Mark the timing chain link that aligns with the timing mark on the crankshaft sprocket as shown.



12. Remove the 2 bolts and the primary timing chain tensioner.

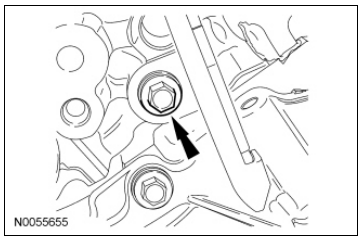


13. Remove the primary timing chain tensioner arm.



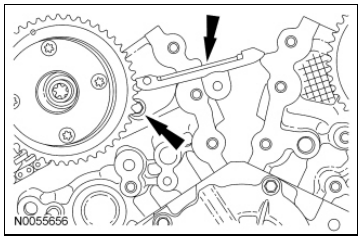
14. Remove the 2 bolts and the lower LH primary timing chain guide.

15. Remove the primary timing chain.



16. Remove the 2 bolts and the upper LH primary timing chain guide.

Engines equipped with early build RH timing chain guides



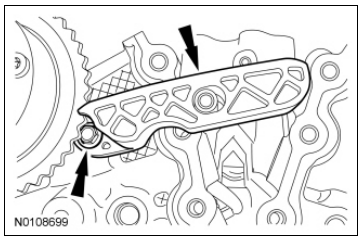
17. Remove the RH primary timing chain guide lower bolt.

18. **NOTE:** The RH primary timing chain guide must be repositioned to allow the coolant pump to be removed.

    Loosen the RH primary timing chain guide upper bolt.

    - Rotate the guide and tighten the bolt.

Engines equipped with late build/replacement RH timing chain guides



19. Remove the RH primary timing chain guide lower bolt.

20. **NOTE:** The RH primary timing chain guide must be repositioned to allow the coolant pump to be removed.

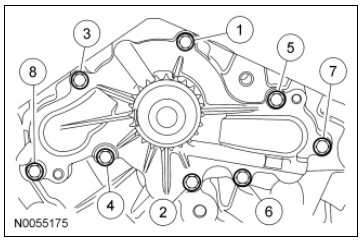
    Loosen the RH primary timing chain guide upper bolt.

    - Rotate the guide and tighten the bolt.

All vehicles

21. Place clean, lint-free shop towels in the oil pan opening to prevent coolant from entering the oil pan during coolant pump removal.

22. Remove the 8 bolts and the coolant pump.



Installation

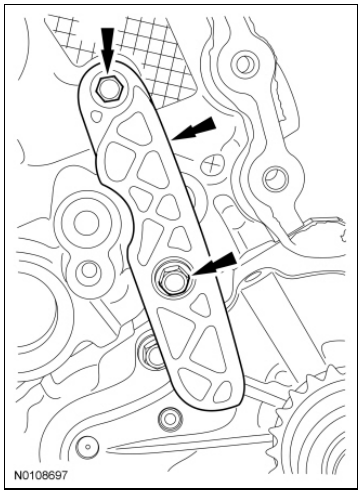
All vehicles

1. **NOTE:** Clean and inspect all sealing surfaces.

Install the coolant pump and the 8 bolts. Tighten in the sequence shown in 2 stages:

- Stage 1: Tighten to 10 Nm (89 lb-in).
- Stage 2: Tighten an additional 45 degrees.

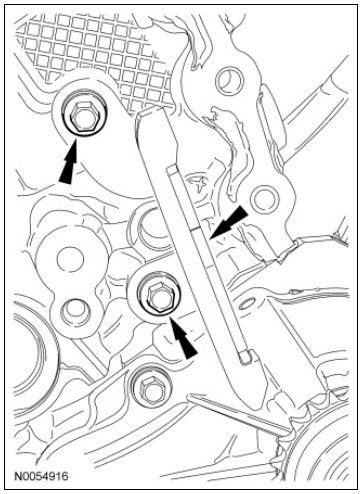
2. Remove all of the shop towels from the oil pan opening.



3. ***NOTICE:*** **Any coolant that has accumulated in the oil pan must be drained from the pan and any residual coolant cleaned from the front of the engine and oil pan. Failure to remove all traces of the coolant can result in oil contamination and severe engine damage.**

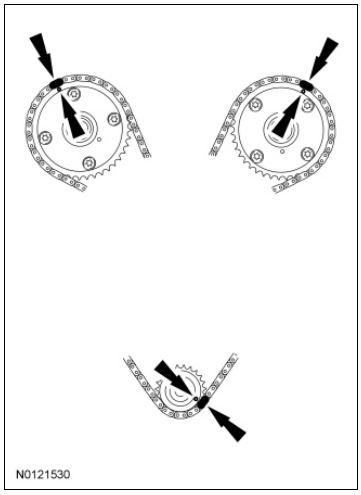
   Remove the oil pan drain plug and allow any accumulated coolant to drain.

   - Remove any residual coolant from the front of the engine and the oil pan using regulated, compressed air and clean, lint-free shop towels.
   - Install the oil pan drain plug and tighten to 27 Nm (20 lb-ft).



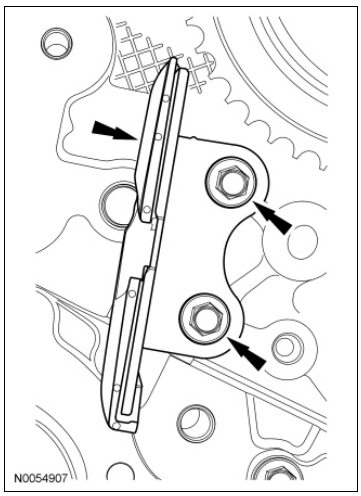
Engines equipped with late build/replacement RH timing chain guides

4. Loosen the RH primary timing chain guide upper bolt.
   - Position the RH primary timing chain guide and install the lower bolt.
   - Tighten the 2 bolts to 10 Nm (89 lb-in).

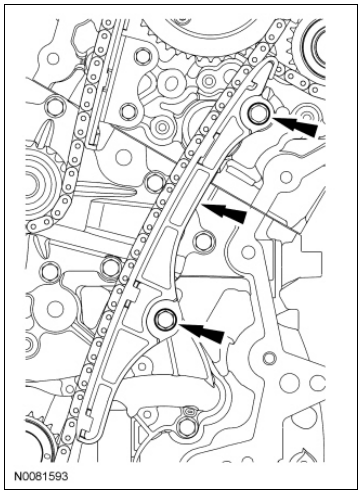


Engines equipped with early build RH timing chain guides

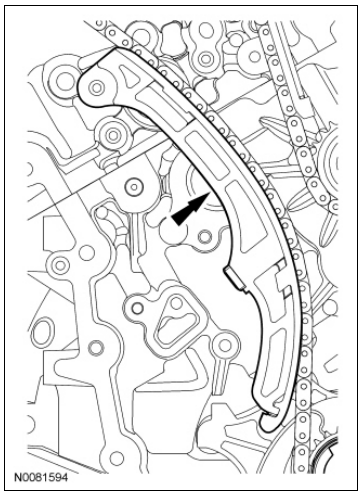
5. Loosen the RH primary timing chain guide upper bolt.
   - Position the RH primary timing chain guide and install the lower bolt.
   - Tighten the 2 bolts to 10 Nm (89 lb-in).



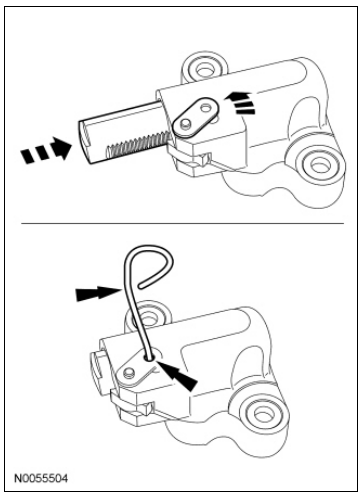
All vehicles



6. Install the primary timing chain with the colored links aligned with the timing marks on the VCT assemblies and the crankshaft sprocket.

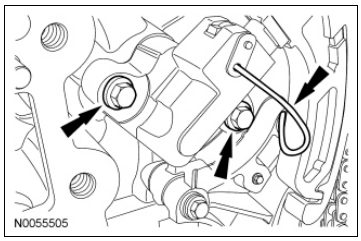


7. Install the upper LH primary timing chain guide and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).



8. Install the lower LH primary timing chain guide and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

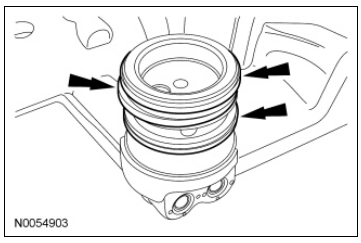
9. Install the primary timing chain tensioner arm.



10. Reset the primary timing chain tensioner.
    - Rotate the lever counterclockwise.
    - Using a soft-jawed vise, compress the plunger.
    - Align the hole in the lever with the hole in the tensioner housing.
    - Install a suitable lock pin.

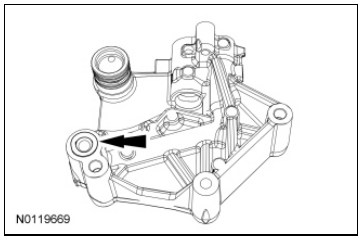
11. **NOTE:** It may be necessary to rotate the crankshaft slightly to remove slack from the timing chain and install the tensioner.

Install the primary tensioner and the 2 bolts.



- Tighten to 10 Nm (89 lb-in).
- Remove the lock pin.

12. As a post-check, verify correct alignment of all timing marks.
    - There are 38 links in between the RH intake VCT assembly colored link (1) and the LH intake VCT assembly colored link (2).
    - There are 27 links in between LH intake VCT assembly colored link (2) and the crankshaft sprocket link (3).



13. Inspect the VCT housing seals for damage and replace as necessary.

14. **NOTE:** RH shown, LH similar.

    NOTE: During removal, the O-ring seal may remain on the cylinder head. If so, remove the O-ring seal from the cylinder head, inspect the seal (replace as necessary) and install the O-ring seal on the VCT housing.

    Inspect the VCT housing-to-cylinder head O-ring seals for damage and replace as necessary.

15. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the LH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

16. ***NOTICE:*** **Make sure the dowels on the Variable Camshaft Timing (VCT) housing are fully engaged in the cylinder head prior to tightening the bolts. Failure to follow this process will result in severe engine damage.**

    Install the RH VCT housing and the 3 bolts.

    - Tighten in the sequence shown to 10 Nm (89 lb-in).

17. **NOTE:** Lubricate the engine oil filter gasket with clean engine oil prior to installing the oil filter.

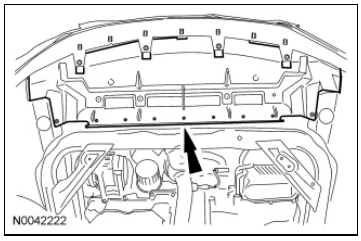
    Install a new engine oil filter.

    - Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

18. Install the engine front cover. For additional information, refer to Section 303-01C .

Cooling Fan Motor and Shroud - 2.5L, 3.0L (4V)

2.5L and 3.0L Engines



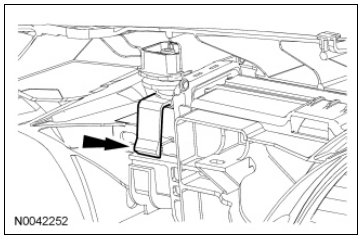
Item	Part Number	Description
1	13A506	Wiring harness retainers
2	14A163	Block heater retainers (part of 6B018)
3	-	RH lower radiator hose pin-type retainer (part of 8B273)
4	256844	Transmission fluid cooler tube retaining clips (automatic transmission only) (part of 7R081)
5	-	LH lower radiator hose pin-type retainer (3.0L only)
6	14A464	Cooling fan motor electrical connector
7	8C607	Cooling fan motor and shroud

1. Detach all the wiring harness retainers from the cooling fan and shroud.

2. If equipped, detach the 2 block heater wiring retainers from the cooling fan motor and shroud.

3. Remove the splash shield.

4. Detach the RH lower radiator hose pin-type retainer from the cooling fan motor and shroud.



5. If equipped, detach the 2 transmission cooler tube retainers from the cooling fan motor and shroud.

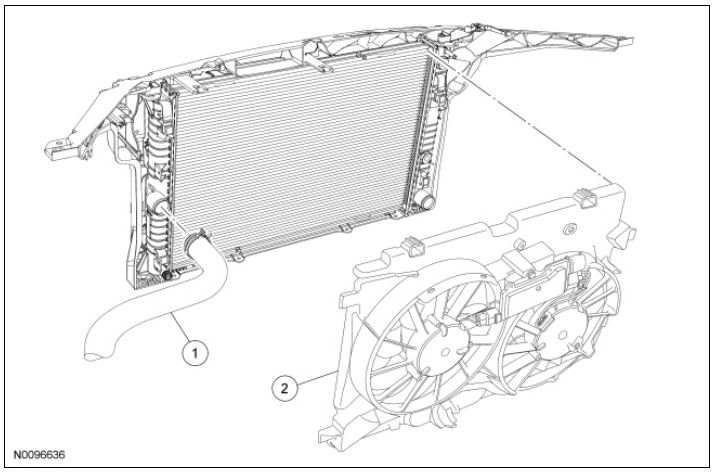
6. If equipped, detach the LH lower radiator hose pin-type retainer from the cooling fan motor and shroud.

7. Disconnect the cooling fan electrical connector.
    - Detach the pin-type retainer.

8. **NOTE:** LH shown, RH similar.

   Release the 2 tabs and remove the cooling fan motor and shroud.

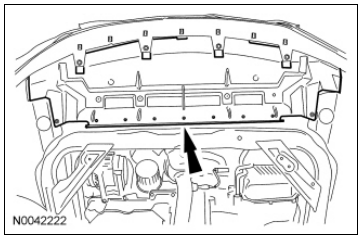
9. To install, reverse the removal procedure.



Cooling Fan Motor and Shroud - 3.5L

Cooling Fan Motor and Shroud (View 1 of 2)

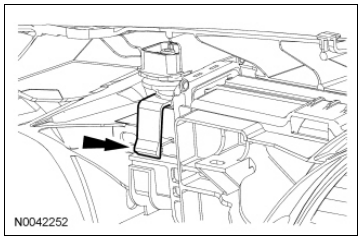
Item	Part Number	Description
1	-	RH lower radiator hose pin-type retainer (part of 8B273)
2	8B273	Lower radiator hose
3	256844	Transmission fluid cooler tube retaining clips (part of 7R081)
4	13A506	Block heater retainers (part of 6B018)
5	14A099	Wire harness retainers (part of 14290)
6	14A099	Wire harness retainer (part of 14290)
7	14A099	Wire harness shield retainers (part of 14290)
8	14A099	Wire harness shield retainer (part of 14290)
9	14A464	Cooling fan module electrical connector (part of 14290)
10	-	Cooling fan module electrical connectors (part of 8C607)
11	-	Cooling fan module bolt
12	-	Cooling fan module



Cooling Fan Motor and Shroud (View 2 of 2)

Item	Part Number	Description
1	8B274	Upper radiator hose
2	8C607	Cooling fan motor and shroud

Removal and Installation



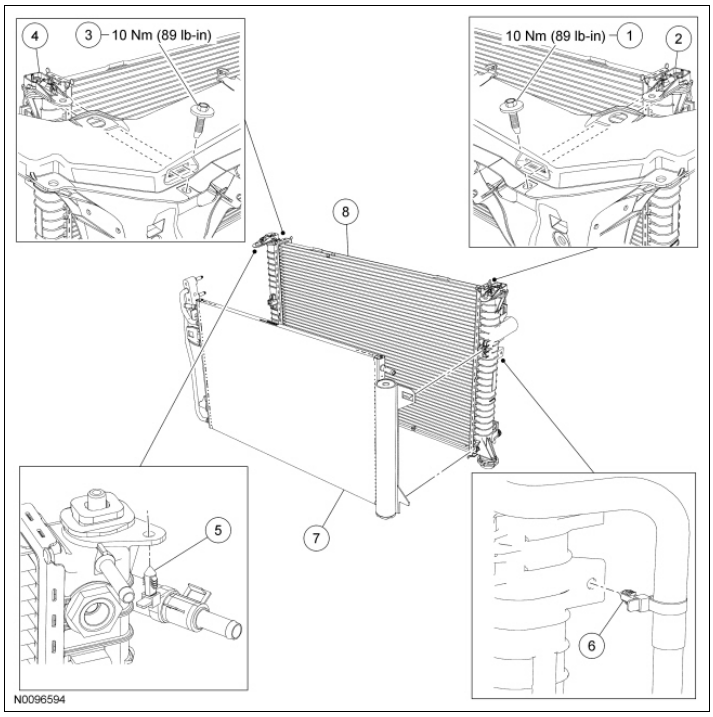
1. With vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the splash shield.

3. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
4. Detach the lower radiator hose pin-type retainer from the RH side of the cooling fan motor and shroud.
5. Detach the lower radiator hose from the LH side of the cooling fan motor and shroud.
6. Detach the transmission cooler tube retaining clips from the cooling fan motor and shroud.
7. Remove the Air Cleaner (ACL) and inlet air resonator. For additional information, refer to Section 303-12C .
8. If equipped, detach the 2 block heater wiring retainers from the cooling fan motor and shroud.
9. Disconnect the 3 cooling fan module electrical connectors.
10. Remove the bolt and the cooling fan module.
    - To install, tighten to 7 Nm (62 lb-in).

11. Detach the 5 pin-type retainers from the cooling fan and shroud.
12. Detach the wiring harness pin-type retainer from the frame rail.
13. Disconnect the upper radiator hose from the radiator.
14. **NOTE:** LH shown, RH similar.

    Release the 2 tabs and remove the cooling fan motor and shroud.

15. To install, reverse the removal procedure.
16. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

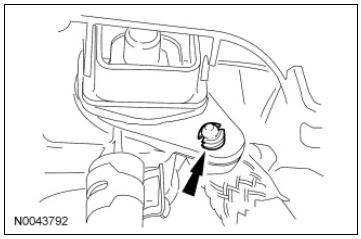


Radiator - 3.5L

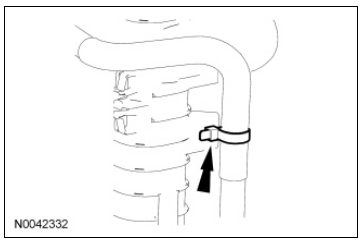
Radiator (View 1 of 2)

Item	Part Number	Description
1	8276	Radiator-to-degas bottle hose
2	7H420	Transmission cooler tubes (2 required)
3	19710	A/C condenser-to-radiator pin-type retainer
4	8B273	Lower radiator hose

Radiator (View 2 of 2)



Item	Part Number	Description
1	W500214	LH upper radiator support bracket bolt
2	8A194	LH upper radiator support bracket
3	W500214	RH upper radiator support bracket bolt
4	8A194	RH upper radiator support bracket
5	-	Power steering hose retainer
6	3493	Coolant hose retainer
7	19710	A/C condenser
8	8005	Radiator

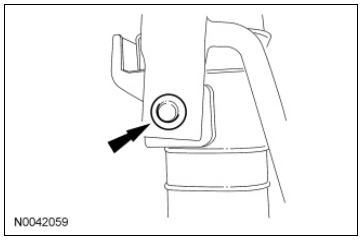


1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

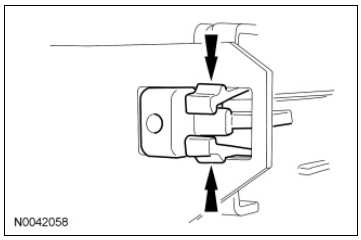
2. Remove the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud - 3.5L in this section.

3. Detach the power steering hose retainer from the radiator.

4. Detach the coolant hose retainer from the radiator.



-34. Disconnect the 2 transmission cooling tubes from the radiator.
- To install, tighten to 30 Nm (22 lb-ft).

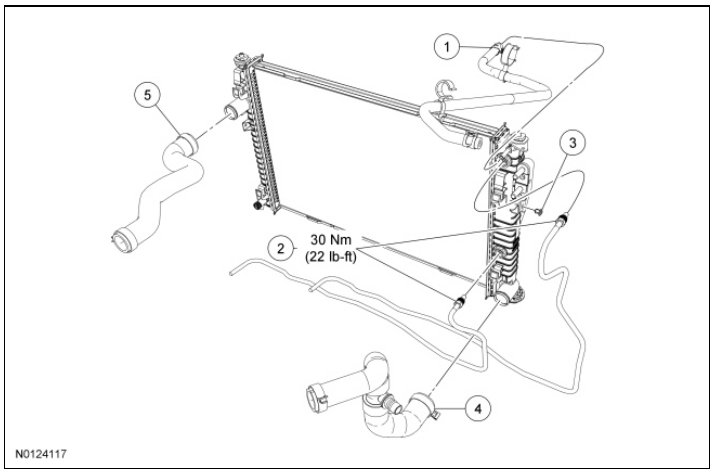


7. Disconnect the lower radiator hose from the radiator.

8. Remove the 2 bolts from the upper radiator support brackets and position the radiator towards the engine and remove the 2 upper radiator support brackets from the radiator.
- To install, tighten to 10 Nm (89 lb-in).

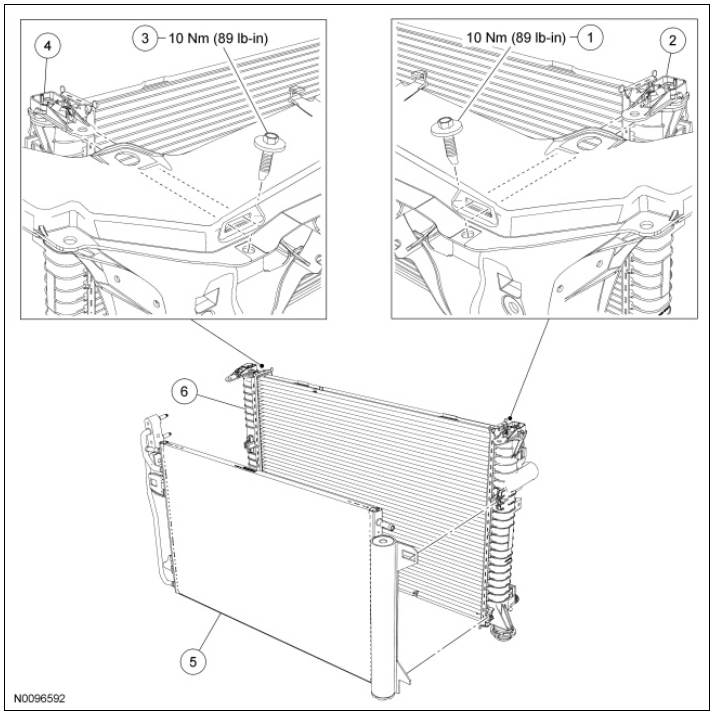
9. Remove the A/C condensor-to-radiator pin-type retainer.

10. Squeeze the tabs and separate the A/C condenser from the radiator.
    - Remove the radiator.



11. To install, reverse the removal procedure.

12. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.



Radiator - 2.5L, 3.0L (4V)

Radiator (View 1 of 2)

Item	Part Number	Description
1	8276	Radiator-to-degas bottle hose
2	7H420	Transmission cooler tubes (automatic transmissions) (2 required)
3	19710	A/C condenser-to-radiator pin-type retainer
4	8286	Lower radiator hose
5	8260	Upper radiator hose

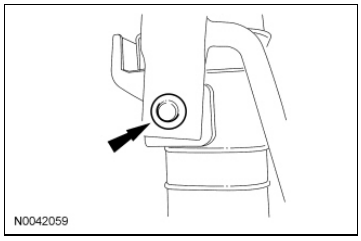
Radiator (View 2 of 2)

Item	Part Number	Description
1	W500214	LH upper radiator support bracket bolt
2	8A194	LH upper radiator support bracket
3	W500214	RH upper radiator support bracket bolt
4	8A194	RH upper radiatorport bracket
5	19710	A/C condenser
6	8005	Radiator

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

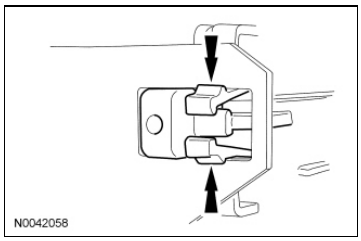
2. Remove the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud - 2.5L, 3.0L (4V) in this section.

3. Disconnect the upper radiator hose from the radiator.



4. Disconnect the radiator-to-degas bottle hose from the radiator.

5. If equipped, disconnect the 2 transmission cooling tubes from the radiator.
   - To install, tighten to 30 Nm (22 lb-ft).

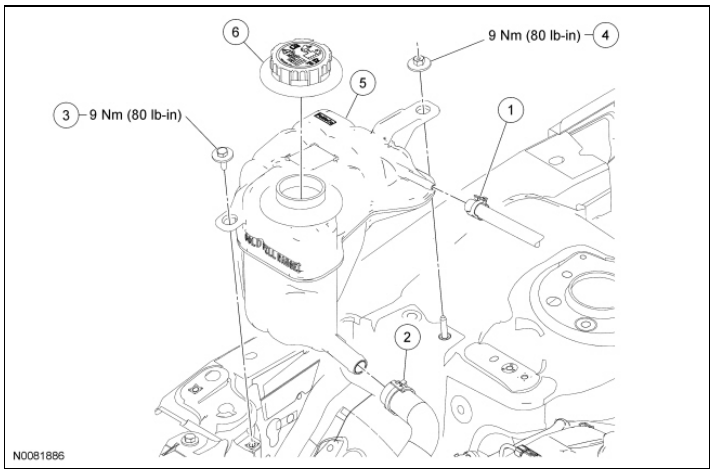


6. Disconnect the lower radiator hose from the radiator.

7. Remove the 2 bolts from the upper radiator support brackets, position the radiator towards the engine and remove the 2 upper radiator support brackets from the radiator.
   - To install, tighten to 10 Nm (89 lb-in).

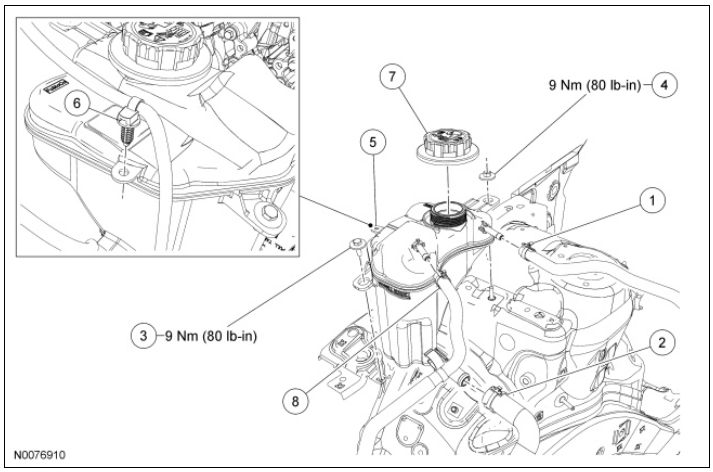
8. Remove the A/C condensor-to-radiator pin-type retainer.

9. Squeeze the tabs and separate the A/C condenser from the radiator.
    - Remove the radiator.



10. To install, reverse the removal procedure.

11. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.



Degas Bottle

2.5L and 3.0L Engines

Item	Part Number	Description
1	8276	Degas bottle-to-radiator hose
2	8C351	Lower degas bottle hose
3	W707398	Degas bottle-to-fender bolt
4	W709603	Degas bottle-to-fender nut
5	8A080	Degas bottle
6	8100	Pressure relief cap

3.5L Engines

Item	Part Number	Description
1	8B541	Degas bottle-to-thermostat housing hose
2	8C351	Lower degas bottle hose

3	W707398	Degas bottle-to-fender bolt
4	W709603	Degas bottle-to-fender nut
5	8A080	Degas bottle
6	14197	Wiring harness retainer (if equipped)
7	8100	Pressure relief cap
8	8276	Degas bottle-to-radiator hose

Removal and Installation

All vehicles

1. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   Release the pressure in the cooling system by slowly turning the pressure relief cap one-half turn counterclockwise. When the pressure is released, remove the pressure relief cap.

2. Using hose clamp pliers, clamp the lower degas bottle hose.

3. Using a suitable suction device, siphon the coolant from the degas bottle.

4. Disconnect the degas bottle-to-radiator hose.

3.5L engines

5. If equipped, detach the wiring harness retainer from the degas bottle.

6. Disconnect the degas bottle-to-thermostat housing hose.

All vehicles

7. Disconnect the lower degas bottle hose.

8. Remove the nut, bolt and the degas bottle.
   - To install, tighten to 9 Nm (80 lb-in).

9. To install, reverse the removal procedure.

10. Fill the degas bottle. Refer to Cooling System Draining, Filling and Bleeding in this section for the recommended coolant mixture and fill level.

Material

Item	Specification	Fill Capacity
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A	-
Motorcraft® Specialty Green Engine Coolant [a] [b] [c] VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A	9.0L (9.5 qt)
Motorcraft® Specialty Orange Engine Coolant [a] [b] [d] VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D	9.0L (9.5 qt)

[a] The cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used.
[b] Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant typee coolant corrosion protection and may damage the engine or cooling system.
[c] Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.
[d] During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

General Specifications

Item	Specification
Pressure Tests	
Complete cooling system maximum pressure	124 kPa (18 psi)
Pressure relief cap	89-124 kPa (13-18 psi)
Radiator (out of vehicle)	138 kPa (20 psi)
Thermostat Opening Temperatures	
Thermostat starts to open	80-84°C (176-183°F)
Thermostat fully open	97°C (207°F)

Torque Specifications

Description	Nm	lb-in
A/C tubes retainer bolt	7	62
Auxiliary relay box bolts	8	71
Block heater	20	177
Coolant pump bolts	10	89
Coolant pump pulley bolts	20	177
Degas bottle-to-fender bolt	9	80
Degas bottle-to-fender nut	9	80
Thermostat housing bolts	10	89
Upper radiator support bracket bolts	10	89

Engine Cooling

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or tded light exposure causes this product to degrade.**

NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.**

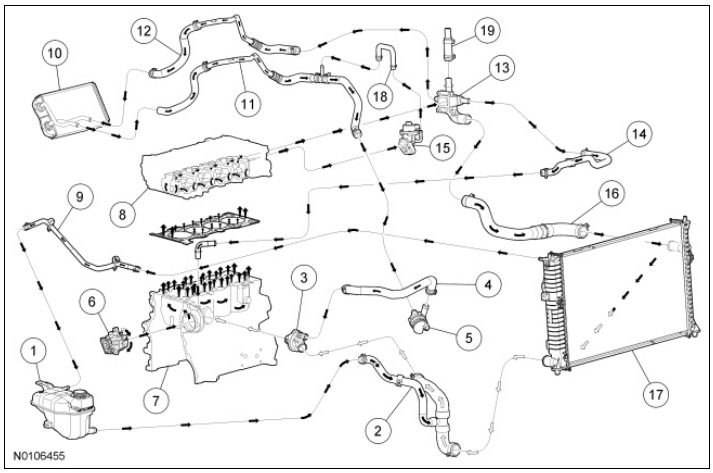
NOTE: During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

The cooling system components are the:

- block heater (if equipped).
- radiator.
- bypass tube.
- pressure relief cap.
- degas bottle.
- radiator draincock.
- coolant pump.
- thermostat housing.
- auxiliary coolant flow pump, refer to Section 412-01 for removal and installation and Section 412-00B for diagnostics.

Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correctconcentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and distilled water. A coolant concentration of 50% provides freeze point protection down to -37°C (-34°F).

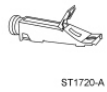


To maintain the integrity of the coolant and the cooling system:

- add the correct coolant type to the engine cooling system. The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use

the same type of coolant that was originally used to fill the cooling system. Mixing different coolant types degrades the corrosion protection of the original coolant. Do not mix any type of coolants.
- do not add alcohol, methanol or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles.

Coolant Flow Diagram



NOTE: Black arrows indicate hot, white arrows indicate cold.

Item	Part Number	Description
1	8A080	Degas bottle
2	8B273	Lower radiator hose
3	8575	Thermostat housing
4	18C266	Thermostat housing-to-auxiliary coolant pump hose
5	18D473	Auxiliary coolant flow pump
6	8501	Coolant pump
7	6010	Engine block
8	6049	Cylinder head
9	8276	Degas bottle-to-radiator hose
10	19B555	Heater core
11	18C266	Heater core outlet hose
12	18C266	Heater core inlet hose
13	8K556	Coolant outlet adapter
14	8A582	Coolant outlet adapter-to-engine bypass tube hose
15	9D475	EGR valve assembly
16	8B274	Upper radiator hose

 ST3254-A	UView® Combustion Leak Tester UVU560000-R
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware or equivalent scan tool

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Principles of Operation

Engine coolant flows primarily from thngine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core and turbochargers with coolant. The coolant pump, operated by engine rotation through a sprocket which is driven by the timing chain, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine-generated heat to the outside air.

The degas bottle holds surplus coolant and removes air from the cooling system, which reduces hot spots. It also allows for coolant expansion and system pressurization, replenishes coolant to the cooling system and

serves as the location for service fill.

The cooling fan draws air through the radiator to help cool the system coolant as it passes through the radiator.

The thermostat monitor is a function of the PCM and is designed to verify correct thermostat operation. The monitor executes once per drive cycle and has a monitor run duration of 300-800 seconds. If a malfunction occurs, DTC P0125 or P0128 is set, and the Malfunction Indicator Lamp (MIL) is illuminated.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

Inspection and Verification

⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

NOTE: During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

NOTE: Vehicles have the pressure relief cap on the degas bottle and no raor cap.

1. Verify the customer concern.

2. Visually check the engine coolant level at the degas bottle when the system is cold.

3. Make sure the pressure relief cap is installed correctly.

4. Record any cooling system DTCs retrieved. Refer to the PCM DTC Chart in this section for DTC descriptions.

5. **NOTE:** Take note of any coolant odor or steam coming from cooling system components.

   If the system coolant is filled correctly and no DTCs associated with fail-safe cooling are retrieved, verify the customer's concern by operating the engine to duplicate the condition.

6. **NOTE:** For the coolant flow diagram, refer to Engine Cooling in the Description and Operation portion of this section.

   Visually inspect for obvious signs of any mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Leaks or weeps at: ♦ Hoses ♦ Tubes ♦ Clamp joints ♦ Gaskets ♦ O-rings ♦ Thermostat housing ♦ Radiator ♦ Pressure relief cap ♦ Heater core (wet floor or coolant odor in vehicle) ♦ Degas bottle ♦ Coolant crossover ♦ Cylinder block core plugs ♦ Cylinder head core plugs ♦ Auxiliary coolant flow pump ♦ Block heater (if equipped)	• Inoperative or damaged: ♦ Electric cooling fan ♦ Wiring, connectors, relays or modules ♦ Cylinder Head Temperature (CHT) sensor
• Cracked or damaged: ♦ Hoses ♦ Tubes ♦ Hose clamps ♦ Thermostat housing ♦ Radiator ♦ Pressure relief cap ♦ Cooling fan ♦ Coolant pump ♦ Degas bottle ♦ Cylinder block core plugs ♦ Cylinder head core plugs ♦ Auxiliary coolant flow pump ♦ Block heater (if equipped) • Restricted airflow through the A/C condenser/radiator • Excessive white or light gray exhaust smoke (may have burnt coolant odor) • Coolant in engine oil • Engine oil in coolant	

7. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary. Test the system for normal operation.

8. ***NOTICE:*** **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolanse the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.**

NOTE: NOTE: During normal vehicle operation, Motorcraft® Specialty Orange Engine Coolant may change color from orange to pink or light red. As long as the engine coolant is clear and uncontaminated, this color change does not indicate the engine coolant has degraded nor does it require the engine coolant to be drained, the system to be flushed, or the engine coolant to be replaced.

Inspect the coolant condition in the following sequence:

1. Inspect the coolant color.
    - ♦ If the coolant has a clear or pale green color, this indicates higher water content than required. Test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range -50°C to -26°C (-58°F to -15°F). If the vehicle is driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 engine coolant to distilled water.
    - ♦ Discoloration of Motorcraft® Specialty Orange Engine Coolant may indicate that incorrect coolant may have been added to the system. Use of incorrect (green or yellow) coolant degrades the corrosion protectioncraft® Specialty Orange Engine Coolant. Addition of Motorcraft® Specialty Green Engine Coolant may cause the color to appear to be a murky green-brown color. The addition of Motorcraft® Premium Gold Engine Coolant, however, may not change the color or appearance of the orange colored coolant. Detection of contamination with Motorcraft® Premium Gold Engine Coolant is determined by the presence of nitrite. If contamination with Motorcraft® Premium Gold Engine Coolant is suspected, test the coolant with the 3-Way HD Antifreeze Coolant Test Kit. Follow the directions in the kit with regard to nitrite testing. If nitrite is present, flush the system and refill with the correct mixture of Motorcraft® Specialty Orange Engine Coolant and distilled water. Refer to Cooling System Flushing in this section.
    - ♦ A darker color with the presence of debris could indicate a commercially available stop-leak may have been used and could result in loss of coolant flow the critical parts of the engine. If sediment is present in the coolant sample, flush the system and refill with the correct mixture of distilled water and the correct engine coolant. Refer to Cooling System Flushing in this section.
    - ♦ A light or reddish brown color or reddish brown particles indicate that rust may be present in the cooling system. Flush the system and refill with the corrxture of distilled water and the correct engine coolant. Refer to Cooling System Flushing in this section.
    - ♦ An iridescent sheen on top of the coolant could indicate a trace of oil is entering the system. For information on engine diagnosis, refer to Section 303-00 .
    - ♦ A milky brown color may indicate that engine oil is entering the cooling system. Pressure test the cooling system. Refer to Component Tests in this section. If engine

oil is suspected, the cause of the leak may be internal to the engine. Refer to Section 303-00 . Flush the cooling system. Refer to Cooling System Flushing in this section.

2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Coolant/Battery Refractometer. The freezing point should be in the range -50°C to -26°C (-58°F to -15°F). If the vehicle is driven in cold climates less than -37°C (-34°F), it may be necessary to increase the coolant concentration to get adequate freeze protection. Recommended coolant concentration is 50/50 engine coolant to distilled water.
    - ♦ Maximum coolant concentration is 60/40 for cold weather areas.
    - ♦ Minimum coolant concentration is 40/60 for warm weather areas.
3. Adjust coolant range and level if necessary:
    - ♦ If coolant is low, add specified coolant mixture only.
    - ♦ If the engine coolant tests too weak, remove some of the engine coolant and add undiluted engine coolant until the readings are within acceptable levels.
    - ♦ If the engine coolant tests strong, remove some of the engine coolant and add distilled water until the readings are within acceptable levels.

9. If an obvious cause for an observed or reported concern is found, correct the cause and test the system for normal operation before proceeding to the next step.

10. **NOTE:** Make sure to use the latest scan tool software release.

    If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

11. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

    If the scan tool does not communiith the VCM :

    - check the VCM connection to the vehicle.
    - check the scan tool connection to the VCM .
    - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

12. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to Section 418-00 to diagnose no response from the PCM.

13. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record continuous memory DTCs.

14. Clear the continuous DTCs and carry out the self-test diagnostics PCM.

15. If the DTCs recovered are related to the concern, go to the PCM DTC Chart. For all other PCM DTCs, refer to Section 303-14D .

16. If no PCM DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

PCM DTC Chart

DTC	Description	Action
P0125	Insufficient Coolant Temp For Closed Loop Fuel Control	GO to Pinpoint Test C .
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	GO to Pinpoint Test C .
P0217	Engine Coolant Overtemperature Condition	GO to Pinpoint Test B .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: Loss of Coolant

Normal Operation

The engine cooling system is a closed system providing for coolant expansion and contraction and also changes in pressure as coolant warms and cools with engine operation. Various gaskets, seals, hoses and clamps contain coolant within the cooling system and keep other fluids and contaminants from entering the cooling system.

Coolant loss can be attributed to either external or internal leaks anywhere within the cooling system.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

This pinpoint test is intended to diagnose the following:

- Coolant hoses or tubes
- Hose clamps
- Thermostat housing gasket
- Coolant pump O-ring seal
- Thermostat housing
- Radiator
- Pressure relief cap
- Coolant pump leaking from weep hole
- Heater core
- Engine gaskets

- Degas bottle
- Cylinder block core plugs
- Cylinder head core plugs
- Block heater (if equipped)

PINPOINT TEST A: LOSS OF COOLANT

⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

Test Step	Result / Action to Take
A1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to A2 .
A2 CHECK THE ENGINE COOLANT LEVEL	
NOTE: Allow the engine to cool before checking the engine coolant level. • Ignition OFF. • Visually inspect the engine coolant level at the degas bottle. • **Is the engine coolant level within specifications?**	**Yes** GO to A3 . **No** ADJUST the engine coolant level as necessary. GO to A3 .
A3 PRESSURE TEST THE ENGINE COOLING SYSTEM	
• Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK	
• Inspect the engine coolant in the degas bottle for signs of engine oil. • **Is engine oil evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. **No** GO to A5 .
A5 CHECK THE ENGINE OIL FOR COOLANT	
• Remove the oil level indicator from the engine. • **Is coolant evident in the oil?**	**Yes** If coolant is in the engine oil, GO to Section 303-00 .

	No GO to A6 .
A6 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	
• **NOTE:** Use UView® Combustion Leak Tester, part No. UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** The cooling system is operational.

Pinpoint Test B: The Engine Overheats

Normal Operation

The engine cooling system maintains engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. Coolant is sent from the coolant pump through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump, operated by engine rotation through a sprocket driven by the timing chain, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant is allowed to flow through the radiator circuit in order to transfer engine-generated heat to the outside air.

Engine overheating generally occurs when there is a disruption in the ability to control either coolant flow at the correct rate, the inability to transfer heat from the engine through the coolant (including low coolant) or an inability to transfer engine-generated heat to the outside air through the radiator.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

- DTC P0217 (Engine Coolant Overtemperature Condition) - Indicates an engine overheat condition was sensed by the Cylinder Head Temperature (CHT) sensor.
- DTC P1285 (Cylinder Head Overtemperature Condition) - Indicates an engine overheat condition was sensed by the CHT sensor.
- DTC P1299 (Cylinder Head Overtemperature Protection Active) - Indicates an engine overheat condition was detected by the CHT sensor. A failure mode effects management strategy called fail-safe cooling was activated to cool the engine.

This pinpoint test is intended to diagnose the following:

- Low coolant level
- External engine coolant leak
- Airlock in system
- Pressure relief cap installation
- Restricted airflow through the A/C condenser/radiator
- Internal engine coolant leak
- Coolant condition/concentration
- Accessory drive components
- Non-OEM engine enhancement components

- Electric cooling fan
- Cylinder Head Temperature (CHT) sensor
- Heater core
- Coolant pump
- Coolant flow restriction

PINPOINT TEST B: THE ENGINE OVERHEATS

⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pr; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

Test Step	Result / Action to Take
B1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK FOR DTCs	
• Check for DTC P0217, P1285 or P1299. • **Is DTC P0217, P1285 or P1299 present?**	**Yes** GO to B3 . **No** Actual engine overheating has not been verified. CHECK the Engine Coolant Temperature (ECT) gauge operation. REFER to Section 413-01 . If any other PCM DTCs are retrieved, REFER to Section 303-14D .
B3 CHECK FOR AN AIRFLOW OBSTRUCTION	
• Check the radiator or A/C condenser for an external obstruction such as leaves or cardboard. • **Is an obstruction present?**	**Yes** REMOVE the obstruction. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK THE ENGINE COOLANT LEVEL	
NOTE: Allow the engine to cool before checking the coolant level. • Ignition OFF. • Visually check the engine coolant level in the degas bottle. • **Is the engine coolant level within specification?**	**Yes** GO to B5 . **No** ADJUST the engine coolant level as necessary. GO to B5 .

B5 PRESSURE TEST THE ENGINE COOLING SYSTEM	
• Pressure test the engine cooling system. Refer to Component Tests, Cooling System Pressure Test in this section. • **Does the engine cooling system leak externally?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** GO to B6 .
B6 CHECK THE ENGINE COOLANT FOR AN INTERNAL LEAK	
• Inspect the engine coolant in the degas bottle for signs of engine oil. • **Is engine oil evident in the coolant?**	**Yes** If engine oil is evident, GO to Section 303-00 for engine diagnosis. **No** GO to B7 .
B7 CHECK THE ENGINE OIL FOR COOLANT	
• Remove the oil level indicator from the engine. • **Is coolant evident in the oil?**	**Yes** If coolant is in the engine oil, GO to Section 303-00 . **No** GO to B8 .
B8 CHECK THE COOLING SYSTEM FOR COMBUSTION GASES	
• **NOTE:** Use UView® Combustion Leak Tester, part No. UVU560000-R or equivalent. • Using a cooling system combustion gas leak tester, following the instructions supplied with the tester, check the coolant for combustion gases. • **Are combustion gases present?**	**Yes** GO to Section 303-00 for engine diagnosis. **No** GO to B9 .
B9 CHECK COOLANT CONDITION	
• Check the coolant for dirt, rust or contamination and check the coolant concentration. • **Is the coolant condition OK?**	**Yes** GO to B10 . **No** FLUSH the engine cooling system. REFER to Cooling System Flushing in this section. TEST the system for normal operation.
B10 CHECK THE ELECTRIC COOLING FAN OPERATION	
• Start the engine. • Place the climate control function selector in the MAX A/C position and the blower motor switch in the HI position.	**Yes** GO to B11 . **No** DIAGNOSE the electric cooling fan operation. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

• **Did the electric cooling fan operate?**	
B11 CHECK THE COOLANT PUMP OPERATION	
• Start the engine. • Allow the engine to run for 30 minutes. Place the climate control function selector in the MAX HEAT position. Feel the heater outlet hose. • **Is the heater outlet hose hot?**	**Yes** GO to B12 . **No** INSTALL a new coolant pump. TEST the system for normal operation.
B12 CHECK THE THERMOSTAT OPERATION	
• Start the engine. • Allow the engine to run for 30 minutes. Feel the lower radiator hose. • **Is the lower radiator hose hot?**	**Yes** CHECK the engine coolant temperature gauge operation. REFER to Section 413-01 . **No** GO to B13 .
B13 VISUALLY INSPECT THE THERMOSTAT	
• Carry out the Thermostat Visual Inspection in the Component Tests portion of this section. • **Is the thermostat damaged?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** INSTALL a new thermostat. TEST the system for normal operation. If the engine still overheats, INSTALL a new radiator. TEST the system for normal operation.

Pinpoint Test C: The Engine Does Not Reach Normal Operating Temperature

Normal Operation

The engine cooling system maintains engine temperatures during operation. Correct coolant flow through the engine, radiator and remainder of cooling system passages and components is essential to maintaining a correct engine temperature.

Engine coolant flows primarily from the engine to the radiator circuit and back to the coolant pump. From the coolant pump, coolant is sent through the engine block and cylinder heads. A separate circuit from the engine also feeds the heater core with coolant. The coolant pump, operated by engine rotation through a sprocket which is driven by the timing chain, circulates the coolant. The coolant thermostat is a control valve actuated by coolant temperature. When the thermostat is closed, coolant flow bypasses the radiator circuit and returns to the coolant pump. When the thermostat is opened, coolant flows through the radiator circuit to transfer engine generated heat to the outside air.

Concerns of engine inability to reach normal operating temperature typically occur when the rate of coolant flow through some coolant circuits (radiator, heater core) is more than expected given the conditions, or when the electric cooling fans operate all the time. Heat is not allowed to build in the engine because a heat exchanger is removing too much heat, including the radiator, heater core and oil cooler. In addition, perceived concerns that the engine does not reach normal operating temperature can be related to a low coolant level or trapped air which does not allow for hot coolant to be available at the heater core, an inoperative climate

control system, or for concerns perceived or related to an incorrect engine temperature gauge indication.

For engine specific information, refer to Engine Cooling in the Description and Operation portion of this section.

- DTC P0125 (Insufficient Coolant Temp for Closed Loop Fuel Control) - Indicates the Cylinder Head Temperature (CHT) sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting the engine.
- DTC P0128 (Coolant Thermostat [Coolant Temp Below Thermostat Regulating Temperature]) - Indicates that the thermostat monitor has not achieved the required engine operating temperature within a specified amount of time after starting the engine.

This pinpoint test is intended to diagnthe following:

- Low coolant level
- Thermostat
- Engine Coolant Temperature (ECT) gauge
- Engine cooling fan

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

Test Step	Result / Action to Take
C1 CARRY OUT INSPECTION AND VERIFICATION	
• Carry out the Inspection and Verification procedure in this section. • **Were any concerns found?**	**Yes** REPAIR as needed. TEST the system for normal operation. **No** GO to C2 .
C2 CHECK FOR DTC P0125 or P0128	
• Check for DTC P0125 or P0128. • **Is DTC P0125 or P0128 present?**	**Yes** GO to C3 . **No** The cooling system is operational. If an inoperative engine coolant temperature gauge is suspected, CHECK the engine coolant temperature gauge operation. REFER to Section 413-01 . If an inoperative climate control system is suspected, CHECK the climate control system operation. REFER to Section 412-00B . If any other PCM DTCs are retrieved, REFER to Section 303-14D .
C3 CHECK THE ELECTRIC COOLING	

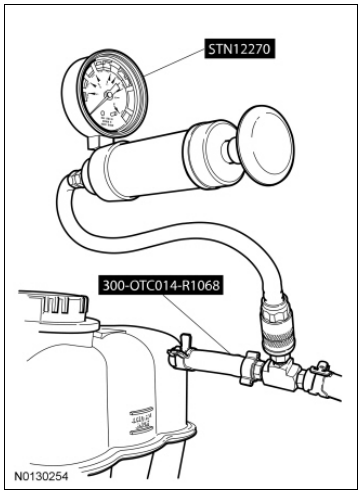
FAN OPERATION	
• Allow the engine to cool. • Make sure the A/C switch is OFF. • Start the engine. • Check the electric cooling fan. • **Is the electric cooling fan on all the time?**	**Yes** DIAGNOSE the electric cooling fan operation. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to C4 .
C4 CHECK THE COOLANT LEVEL	
• **NOTE:** Allow the engine to cool before checking the coolant level. • Visually check the engine coolant level in the degas bottle. • **Is the engine coolant level within specification?**	**Yes** INSTALL a new thermostat. TEST the system for normal operation. **No** GO to Pinpoint Test A to diagnose a coolant leak.

Component Tests

Cooling System Pressure Test

⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant. Do not mix coolant types. Mixing coolant types degrades the corrosion protection of the coolant. Failure to follow these instructions may result in engine or cooling system damage.**



NOTICE: **Genuine Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

NOTE: Vehicles have the pressure relief cap on the degas bottle and no radiator cap.

1. Turn the engine OFF.

2. Check the engine coolant level. Adjust the coolant level as necessary.

3. Attach the D-Gas Adapter to the degas bottle nipple and overflow hose. Install the Radiator Tester to the quick connect fitting of the D-Gas Adapter.

4. *NOTICE:* **Do not pressurize the cooling system beyond the maximum pressure listed in the specifications table in this section or cooling system components may be damaged.**

   NOTE: If the plunger of the pressure tester is pressed too fast, an erroneous pressure reading will sult.

   Slowly press the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained. If the pressure reading exceeds the maximum cap pressure listed in the specifications table, install a new pressure relief cap.

5. If the system does not hold pressure, remove the pressure relief cap and wash in clean water to dislodge all the foreign material from the gasket. Check the sealing surface in the filler neck of the degas bottle for nicks or cuts. Install the pressure relief cap.

6. Pressurize the engine cooling system as described in Step 4. Observe the gauge reading for approximately 2 minutes. Pressure should not drop during this time. If the pressure drops within this time, inspect for leaks and repair as necessary.

7. If no leaks are found and the pressure drops, the pressure relief cap may be leaking. Install a new pressure relief cap and retest the system.

8. If no leaks are found after a new pressure relief cap is installed and the pressure drops, the leak may be internal to the radiator transmission cooler (if equipped). Inspect the coolant for transmission fluid and the transmission fluid for coolant. Repair as necessary.

9. If there is no contamination of the coolant or transmission fluid, the leak may be internal to the engine. Inspect the coolant for engine oil and the engine oil for coolant. Refer to Section 303-00 to diagnose the engine.

10. Release the system pressure by loosening the pressure relief cap. Check the coolant level and adjust as necessary.

Thermostat

A new thermostat should be installed only after the following tests and checks have been carried out:

- Pinpoint Test A, B or C
- Thermostat Visual Inspection

Thermostat Visual Inspection

1. Remove the thermostat.

2. Examine the thermostat for signs of damage including:
   - Valve not fully seated (light visible through the valve)
   - Foreign material lodged in the main valve
   - Bent or broken frame or flange
   - Bent or broken spring
   - Bent or broken valve or valve stem
   - Wax leaking from wax reservoir or a bulge in the reservoir
   - Any other damage or distortion

3. **NOTE:** If no damage is found during the inspection, do not attempt to open the thermostat using hot water or other heat sources. This method is not an accurate means to test the function of the thermostat and may damage the thermostat.

   If damage is found during the inspection, remove any foreign material or broken pieces and install a new thermostat.

4. If no damage is found during the inspection, continue troubleshooting the system concern. Go to the Symptom Chart for further instructions.

Radiator Leak Test, Removed From Vehicle

NOTICE: **Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.**

NOTE: Always install plugs in the oil cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

Leak test the radiator in clean water with air pressurized to the maximum pressure listed in the Specifications.

Cooling System Draining, Filling and Bleeding

Special Tool(s)

 ST2818-A	Airlift Cooling System Tester UVU550000 or equivalent

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Draining

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   NOTICE: **The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated it must be recycled or disposed of correctly. Using contaminated coolant may result in damage to the engine or cooling system components.**

   NOTICE: **The engine cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage t engine or cooling system.**

   NOTICE: **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and may damage the engine or cooling system.**

   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure**

causes this product to degrade.

NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products may clog or damage the cooling system, resulting in degraded cooling system performance and/or failure.**

NOTE: Less than 80% of coolant capacity can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

Release the pressure in the cooling system by slowly turning the pressure relief cap one-half turn counterclockwise. When the pressure is released, remove the pressure relief cap.

3. Place a suitable container below the radiator draincock.
    - Open the draincock and allow to drain.
    - Close the draincock after draining.

Filling and Bleeding with a Vacuum Cooling System Filler

1. ***NOTICE:*** **The cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

   NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

   NOTICE: **Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.**

   To maintain the integrity of the coolant and the cooling system:

    - Add Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types.
    - Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.
    - Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
    - Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant since a Ford-approved recycling process is not yet available.

   NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system resulting in degraded cooling system performance and/failure.**

   Install the vacuum cooling system filler and follow the manufacturer's instructions to fill and bleed the cooling system.

    - Recommended coolant concentration is 50/50 engine coolant to distilled water.

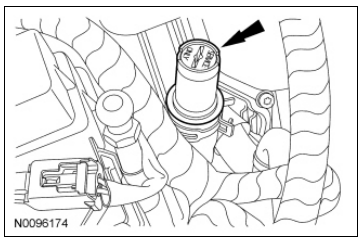
- For extremely cold climates (less than -37°C [-34°F]):
  - ♦ It may be necessary to increase the coolant concentration above 50%.
  - ♦ NEVER increase the coolant concentration above 60%.
  - ♦ Maximum coolant concentration is 60/40 for cold weather areas.
  - ♦ A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
  - ♦ Engine coolant concentration above 60% decreases the overheat protection characteristics of the engine coolant and may damage the engine.
- For extremely hot climates:
  - ♦ It is still necessary to maintain the coolant concentration above 40%.
  - ♦ NEVER decrease the coolant concentration below 40%.
  - ♦ Minimum coolant concentration is 40/60 for warm weather areas.
  - ♦ A coolant concentration of 40% provides freeze point protection down to -26°C (-15°F).
  - ♦ Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
- Vehicles driven year-round in non-extreme climates should use a 50/50 mixture of engine coolant and distilled water for optimum cooling system and engine protection.

Filling and Bleeding without a Vacuum Cooling System Filler

NOTICE: **The cooling system is filled with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Always fill the cooling system with the manufacturer's specified coolant. Chemically flush the cooling system if a non-specified coolant has been used. Refer to Cooling System Flushing in this section. Failure to follow these instructions may damage the engine or cooling system.**

NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow this product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**

NOTICE: **Engine coolant provides boil protection, corrosion protection, freeze protection, and cooling efficiency to the engine and cooling components. In order to obtain these protections, maintain the engine coolant at the correct concentration and fluid level in the degas bottle.**



To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types.
- Do not add or mix with any other type of engine coolant. Mixing coolants may degrade the coolant's corrosion protection.
- Do not add alcohol, methanol, or brine, or any engine coolants mixed with alcohol ohanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine

Coolant since a Ford-approved recycling process is not yet available.

NOTICE: **Stop-leak style pellets/products must not be used as an additive in this engine cooling system. The addition of stop-leak style pellets/products can clog or damage the cooling system resulting in degraded cooling system performance and/or failure.**

1. Remove the degas bottle cap and the bleed valve on the top of the engine coolant outlet.

2. **NOTE:** Make sure the coolant flows from the radiator through the upper radiator hose and fills the engine. When full, coolant should flow from the bleed hole.

   Fill the degas bottle to the COLD FILL RANGE line.

   - Recommended coolant concentration is 50/50 engine coolant to distilled water.
   - For extremely cold climates (less than -37°C [-34°F]):
     - It may be necessary to increase the coolant concentration above 50%.
     - NEVER increase the coolant concentration above 60%.
     - Maximum coolant concentration is 60/40 for cold weather areas.
     - A coolant concentration of 60% provides freeze point protection down to -50°C (-58°F).
     - Engine coolant concentration above 60eases the overheat protection characteristics of the engine coolant and may damage the engine.
   - For extremely hot climates:
     - It is still necessary to maintain the coolant concentration above 40%.
     - NEVER decrease the coolant concentration below 40%.
     - Minimum coolant concentration is 40/60 for warm weather areas.
     - A coolant concentration of 40% provides freeze point protection down to -26°C (-15°F).
     - Engine coolant concentration below 40% decreases the corrosion and freeze protection characteristics of the engine coolant and may damage the engine.
   - Vehicles driven year-round in non-extreme climates should use a 50/50 mixture of engine coolant and distilled water for optimum cooling system and engine protection.

3. Install the degas bottle cap and the bleed valve leaving both loose.

4. Start the engine and let it idle A mixture of air and coolant should escape from the open bleed valve.

5. After all of the air has escaped from the bleed valve turn off the engine and close the bleed valve and the degas bottle cap.

NOTICE: **If the engine overheats or the fluid level drops below the minimum fill line, shut off the engine and add fluid to the degas bottle to the cold fill range line once the engine cools. Failure to follow these instructions may result in damage to the engine.**

6. Start the engine and let it idle for 30 minutes or until the engine reaches normal operating temperature.

7. Turn the heater to the MAX position

8. Carry out the following:
    1. Increase the engine speed to 3,000 rpm for 10 seconds.

   Idle engine for 50 seconds.

3. Repeat Steps 1 and 2 a total of 15 times.

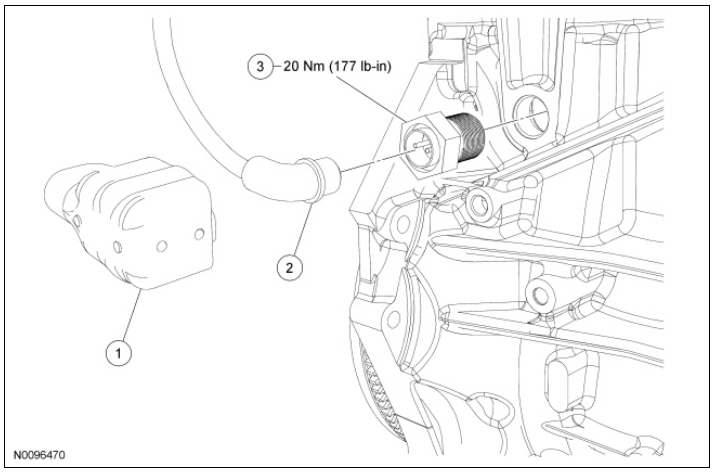
9. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   Check the engine coolant level in degas bottle and fill as necessary.

Cooling System Flushing

Material

Item	Specification
Motorcraft® Premium Cooling System Flush VC-1	ESR-M14P7-A



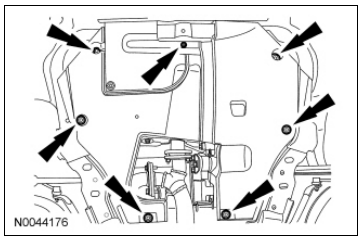
NOTE: To remove rust, sludge and other foreign material from the cooling system, use cooling system flush that is safe for use with aluminum radiators. For additional information, refer to Specifications in this section. This cleaning restores cooling system efficiency and helps prevent overheating. A pulsating or reversed direction of flushing water will loosen sediment more quickly than a steady flow in the normal coolant flow direction. In severe cases where cleaning solvents will not clean the cooling system efficiently, it will be necessary to use the pressure flushing method using cooling system flusher. Dispose of old coolant and flushing water contaminated with antifreeze and cleaning chemicals in accordance with local, state or federal laws.

1. Add Premium Cooling System Flu the cooling system and follow the directions on the package.
2. Remove the radiator. For additional information, refer to Radiator in this section.
3. ***NOTICE:*** **Radiator internal pressure must not exceed 138 kPa (20 psi). Damage to the radiator can result.**

   Backflush the radiator with the radiator in an upside-down position and a high-pressure hose in the lower hose location.
4. **NOTE:** Thermostat and housing are serviced as an assembly.

   Remove the thermostat housing. For additional information, refer to Thermostat Housing in this section.
5. Position a high-pressure water hose into the engine through the upper radiator hose and backflush the engine.

Block Heater



Item	Part Number	Description
1	-	Block heater electrical connector heat shield (part of 6B018)
2	6B018	Block heater electrical connector
3	6A051	Block heater

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. If equipped, remove the 7 screws and the underbody cover.

4. Position the block heater heat shield aside.

5. Remove the block heater heat shield.

6. ***NOTICE:*** **Make sure that the block heater wiring is routed and secured away from rotating or hot components, or damage to the wiring can occur.**

   Disconnect the block heater electrical connector.

7. Remove the block heater.
    - To install, tighten to 20 Nm (177 lb-in).

8. To install, reverse the removal procedure.

9. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat Housing

Item	Part Number	Description
1	14A464	Knock Sensor (KS) electrical connector (part of 12C508)
2	14A624	KS electrical connector pin-type retainer (part of 12C508)
3	W527362	Heater hose clamp
4	18C266	Heater hose
5	W500015	Thermostat housing bolt (3 required)
6	8575	Thermostat housing
7	W527372	Lower radiator hose clamp
8	8B273	Lower radiator hose
9	8K530	Gasket

Removal and Installation

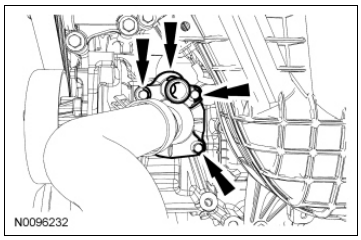
NOTE: The thermostat and thermostat housing are serviced as an assembly.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Remove the accessory drive belt tensioner. For additional information, refer to Section 303-05D .

4. Disconnect the Knock Sensor (KS) electrical connector and detach the wiring harness pin-type retainer.



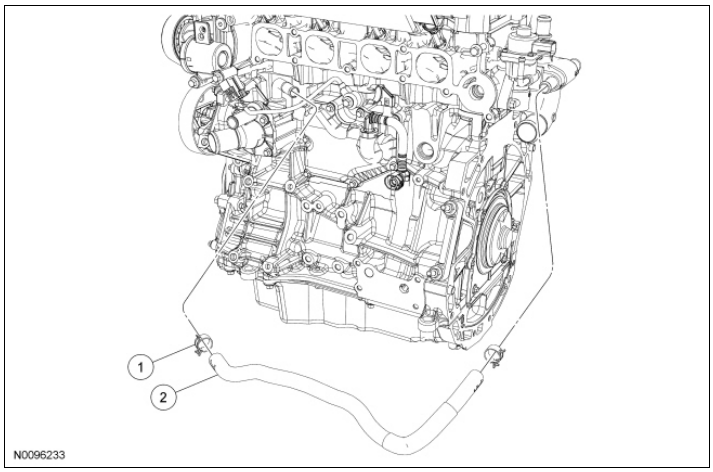
5. **NOTE:** Disconnecting the heater hose first will aid in the removal of the bottom thermostat housing bolt.

   Disconnect the heater hose at the thermostat housing.

6. **NOTE:** The view of the thermostat housing bolts is obstructed by A/C and engine components. However, the bolts can be removed using 1/4-in drive hand tools.

   Remove the 3 bolts and reposition the thermostat housing to gain access to the lower radiator hose clamp.

   - Remove and discard the gasket.
   - To install, tighten to 10 Nm (89 lb-in).



7. Disconnect the lower radiator hose at the thermostat housing.

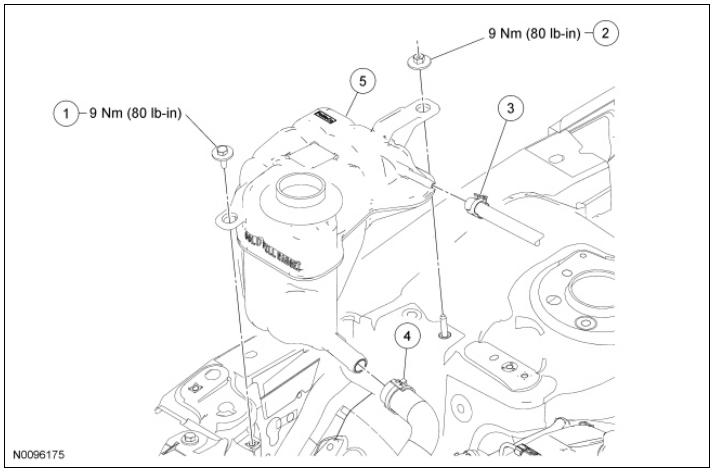
8. To install, reverse the removal procedure.
   - Install a new gasket.

9. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Bypass Tube

Item	Part Number	Description
1	W525958	Hose clamp (2 required)
2	8548	Bypass tube

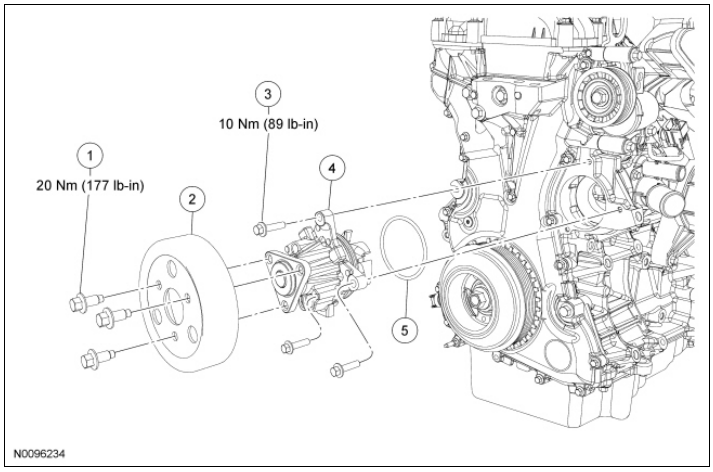
Removal and Installation



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to .
2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
3. Remove the intake manifold. For additional information, refer to Section 303-01D .
4. Disconnect the 2 hose clamps and remove the coolant bypass tube.
5. To install, reverse the removal procedure.
6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Pump

Material



Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A
Motorcraft® Specialty Orange Engine Coolant VC-3-B (US); CVC-3-B (Canada)	WSS-M97B44-D

Degas Bottle

Item	Part Number	Description
1	W707398	Degas bottle-to-fender bolt
2	W709603	Degas bottle-to-fender nut
3	8276	Degas bottle-to-radiator hose
4	8B273	Lower radiator hose
5	8A080	Degas bottle

Coolant Pump

Item	Part Number	Description
1	W500221	Coolant pump pulley bolt (3 required)
2	8509	Coolant pump pulley
3	W500015	Coolant pump bolt (3 required)
4	8501	Coolant pump
5	8507	Coolant pump O-ring seal

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Disconnect the degas bottle-to-radiator hose from the degas bottle.

4. Remove the nut, bolt and position the degas bottle for access to the lower degas bottle hose.
   - To install, tighten to 9 Nm (80 lb-in).

5. Disconnect the lower degas bottle hose and remove the degas bottle.

6. Loosen the 3 coolant pump pulley bolts.

7. Remove the accessory drive belt. For additional information, refer to Section 303-05D .

8. Remove the 3 bolts and the coolant pump pulley.
   - To install, tighten to 20 Nm (177 lb-in).

9. ***NOTICE:*** **Make sure the coolant pump is correctly seated to the engine block before installing and tightening the fasteners, or damage to the coolant pump may occur.**

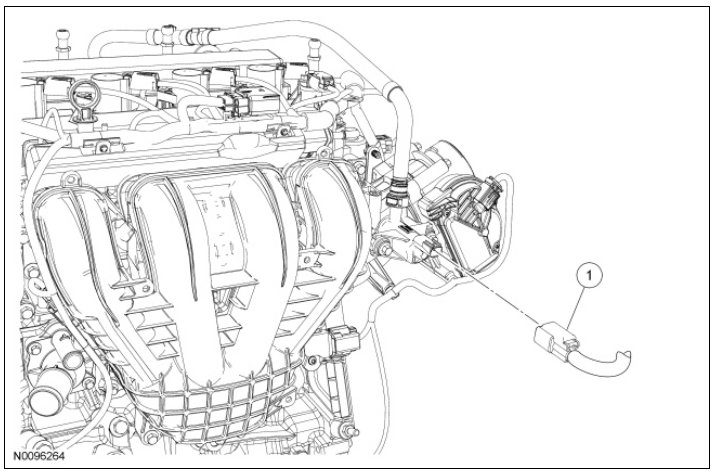
   Remove the 3 bolts and the coolant pump.

   - Remove and discard the O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).

10. ***NOTICE:*** **Use Motorcraft® Specialty Green Engine Coolant or Motorcraft® Specialty Orange Engine Coolant. Use the same type of coolant that was originally used to fill the cooling system. Do not mix coolant types. Mixing coolant types degrades the coolant corrosion protection and**

may damage the engine or cooling system.

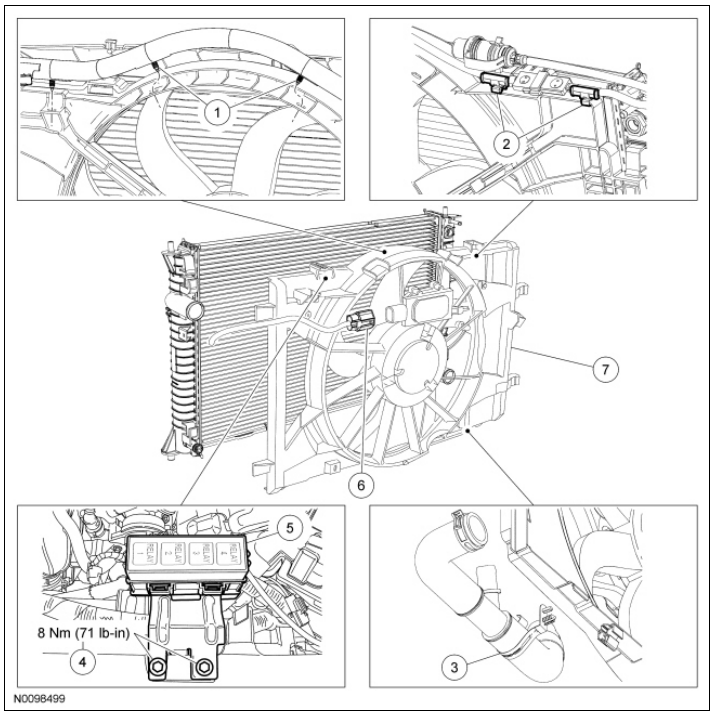
NOTICE: **Motorcraft® Specialty Green Engine Coolant is very sensitive to light. Do NOT allow t product to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes this product to degrade.**



To install, reverse the removal procedure.

- Lubricate the O-ring seal with clean engine coolant.

11. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.



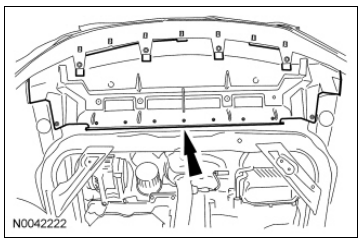
Cooling Fan Motor and Shroud

Cooling Fan and Shroud (View 1 of 2)

Item	Part Number	Description
1	14A464	Evaporative Emission (EVAP) canister purge valve electrical connector

Cooling Fan and Shroud (View 2 of 2)

Item	Part Number	Description
1	13A506	Wiring harness retainers



2	14A163	Block heater retainers (part of 6B018)
3	-	Lower radiator hose pin-type retainer
4	W500214	Auxiliary relay box bolts
5	14A464	Auxiliary relay box
6	14A464	Cooling fan motor electrical connector
7	8C607	Cooling fan motor and shroud

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

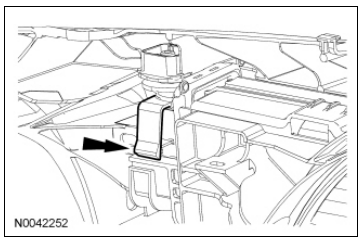
2. If equipped, detach the 2 block heater wiring retainers from the cooling fan motor and shroud.

3. Remove the splash shield.

4. Detach the lower radiator hose pin-type retainer from the cooling fan motor and shroud.

5. Remove the battery tray. For additional information, refer to Section 414-01 .

6. Remove the 2 bolts and position the auxiliary relay box aside.
   - To install, tighten to 8 Nm (71 lb-in).



7. Detach all the wiring harness retainers from the cooling fan and shroud.

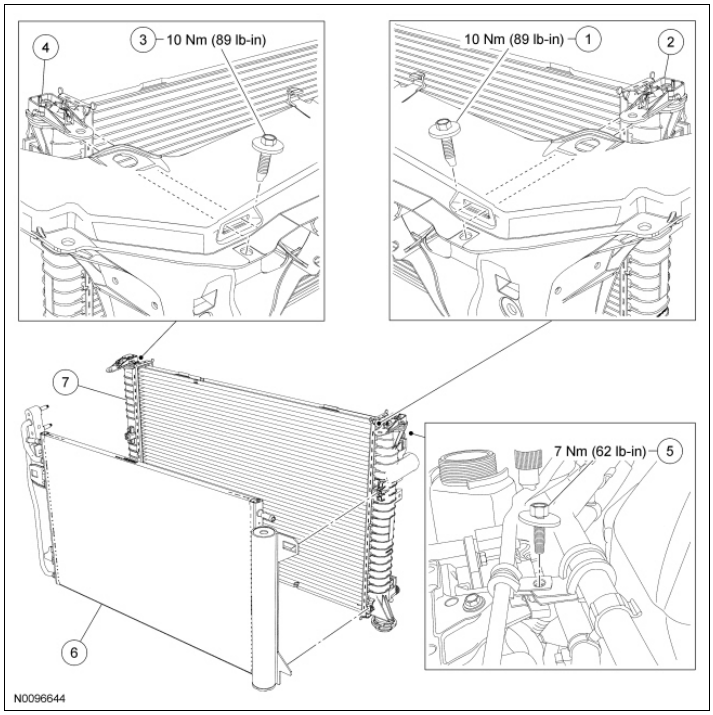
8. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.

9. Disconnect the cooling fan electrical connector.

10. **NOTE:** LH shown, RH similar.

    Release the 2 tabs and remove the cooling fan motor and shroud.

11. To install, reverse the removal procedure.



Radiator

Radiator (View 1 of 2)

Item	Part Number	Description
1	W527326	Upper radiator hose clamp
2	8B274	Upper radiator hose
3	W527351	Radiator-to-degas bottle hose clamp
4	8276	Radiator-to-degas bottle hose
5	W527326	Lower radiator hose clamp
6	8B273	Lower radiator hose
7	19710	A/C condenser-to-radiator pin-type reta

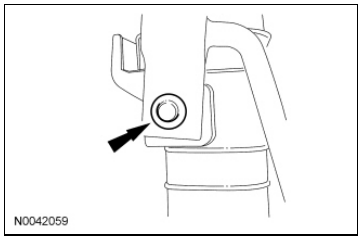
Radiator (View 2 of 2)

Item	Part Number	Description
1	W500214	LH upper radiator support bracket bolt
2	8A194	LH upper radiator support bracket
3	W500214	RH upper radiator support bracket bolt
4	8A194	RH upper radiator support bracket
5	W505422	A/C tubes retainer bolt
6	19710	A/C condenser
7	8005	Radiator

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

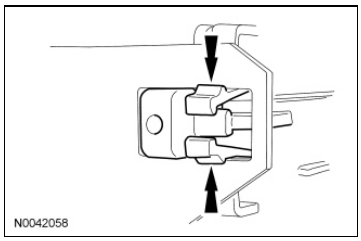
2. Remove the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud in this section.

3. Disconnect the upper radiator hose from the radiator.



4. Disconnect the radiator-to-degas bottle hose from the radiator.

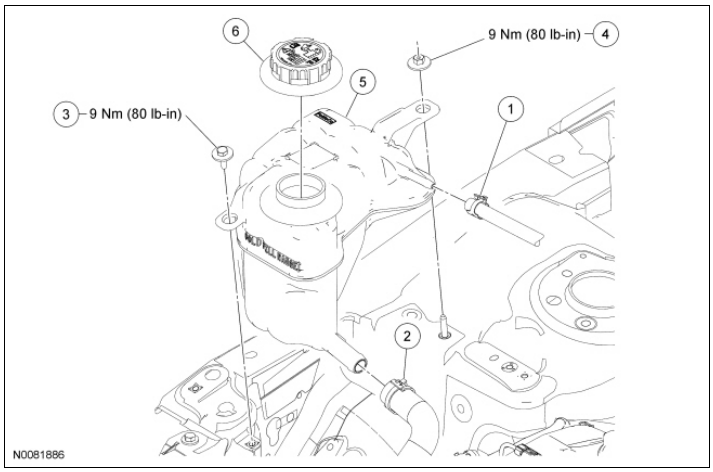
5. Disconnect the lower radiator hose from the radiator.



6. Remove the A/C tubes retainer bolt.
    - To install, tighten to 7 Nm (62 lb-in).

7. Remove the 2 bolts from the upper radiator support brackets and position the radiator towards the engine and remove the 2 upper radiator support bracket from the radiator.
    - To install, tighten to 10 Nm (89 lb-in).

8. Remove the A/C condensor-to-radiator pin-type retainer.



9. Squeeze the tabs and separate the A/C condenser from the radiator.
    - Remove the radiator.

10. To install, reverse the removal procedure.

11. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Degas Bottle

Item	Part Number	Description
1	8276	Degas bottle-to-radiator hose
2	8B273	Lower radiator hose
3	W707398	Degas bottle-to-fender bolt
4	W709603	Degas bottle-to-fender nut
5	8A080	Degas bottle
6	8100	Pressure relief cap

Removal and Installation

1. ⚠ **WARNING: Always allow the engine to cool before opening the cooling system. Do not unscrew the coolant pressure relief cap when the engine is operating or the cooling system is hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly. Failure to follow these instructions may result in serious personal injury.**

   Release the pressure in the cooling system by slowly turning the pressure relief cap one-half turn counterclockwise. When the pressure is released, remove the pressure relief cap.

2. Using hose clamp pliers, clamp the lower degas bottle hose.

3. Using a suction device, siphon the coolant from the degas bottle.

4. Disconnect the degas bottle-to-radiator hose from the degas bottle.

5. Remove the nut, bolt and position the degas bottle for access to the lower degas bottle hose.
   - To install, tighten to 9 Nm (80 lb-in).

6. Disconnect the lower radiator hose and remove the degas bottle.

7. To install, reverse the removal procedure.

8. Fill the degas bottle. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Material

Item	Specification	Fill Capacity
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-

Torque Specifications

Description	Nm	lb-ft	lb-in
Fuel rail stud bolts	23	17	-
Radio capacitor nut	10	-	89
Throttle Body (TB) bolts	10	-	89

Fuel Charging and Controls

Sequential Multi-Port Fuel Injection (SFI)

The fuel charging and controls system consists of the:

- Throttle Body (TB).
- fuel injectors.
- Fuel Pump (FP) control module.
- fuel rail.

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI) system.
- Pulse Width Modulated (PWM).
- Mass Air Flow (MAF) controlled.

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order in accordance with engine demand on a tuned intake manifold.

The basic fuel requirement of the engine is determined from the data supplied to the PCM by the MAF sensor, which measures the amount of air being drawn into the engine.

Other sensors are used to measure:

- air temperature.
- engine coolant temperature.
- engine speed.
- exhaust oxygen content.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Throttle Body (TB)

The TB :

- controls air supply to the upper intake manifold by electronically positioning the throttle plate.
- is not adjustable.
- cannot be cleaned.
- is serviced as a complete assembly only.

Fuel Injectors

The fuel injectors:

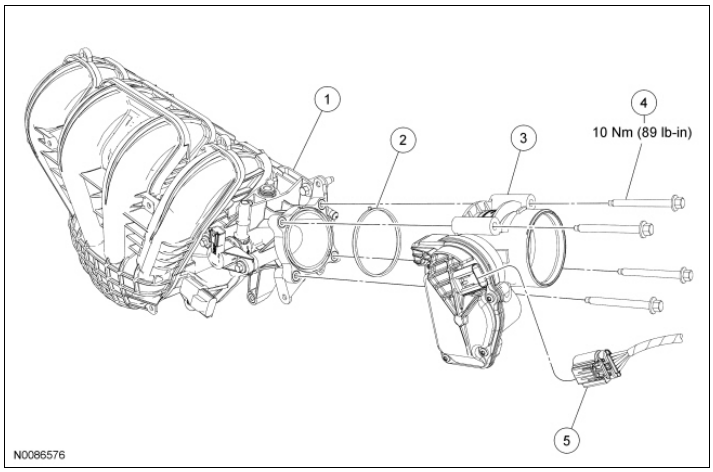
- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid that opens a needle valve, which injects fuel into the intake port in the cylinder head.
- are deposit resistant.

Fuel Rail

The fuel rail:

- receives fuel from the fuel supply tube.
- delivers fuel to the fuel injectors.

Fuel Pump (FP) Control Module



The FP control module:

- is electronically operated by the PCM.
- controls voltage (10 or 12 volts) to the FP module depending on load.

Fuel Charging and Controls

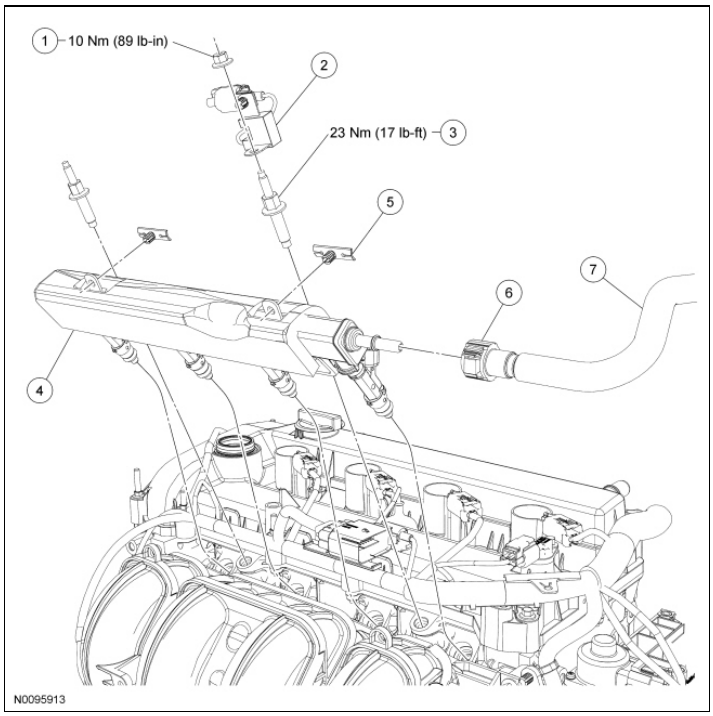
Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Throttle Body

Item	Part Number	Description
1	9424	Intake manifold
2	9E836	Throttle Body (TB) gasket
3	9E926	TB
4	W500305	TB bolt (4 required)
5	14A464	Elonic throttle control electrical connector

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12A .

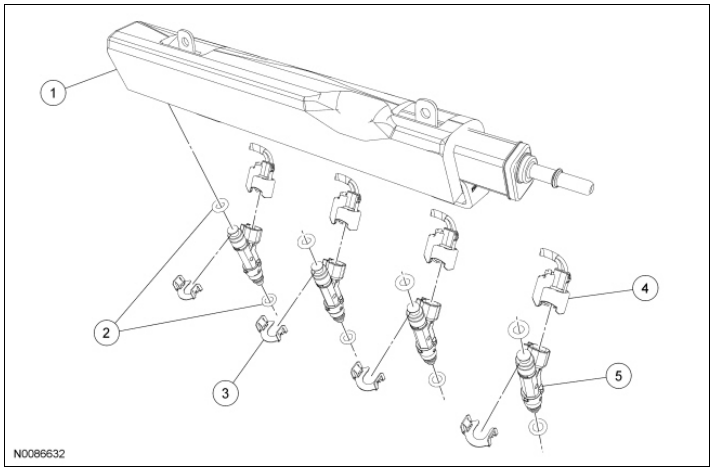
2. Disconnect the electronic throttle control electrical connector.



3. Remove the 4 bolts and the Throttle Body (TB).
   - Discard the TB gasket.
   - To install, tighten to 10 Nm (89 lb-in).

4. **NOTE:** Install a new TB gasket.

   To install, reverse the removal procedure.



Fuel Rail and Fuel Injector - Exploded View

Fuel Rail

Item	Part Number	Description
1	W705790	Radio capacitor nut
2	18801	Radio capacitor
3	W711061	Fuel rail stud bolt (2 required)
4 d>9H487	Fuel rail	
5	-	Wire harness pin-type retainer (part of 12B637) (2 required)
6	-	Fuel supply tube-to-fuel rail quick connect coupling (part of 9288)
7	9288	Fuel supply tube

Fuel Injectors

Item	Part Number	Description
1	9H487	Fuel rail
2	9U509	Fuel injector O-ring seals (2 required per injector)
3	9C995	Fuel injector clip (4 required)
4	14A464	Fuel injector electrical connector (4 required)
5	9F593	Fuel injector (4 required)

1. For additional information, refer to the procedures in this section.

Fuel Rail

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Removal

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may gnited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the fuel tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .
4. Detach the 2 wire harness pin-type retainers from the fuel rail.
5. Disconnect the 4 fuel injector electrical connectors.
6. Remove the nut and position the radio capacitor aside.
7. Remove the 2 fuel rail stud bolts.
8. Remove the fuel rail and fuel injectors as an assembly.
9. Remove the 4 fuel injector retainer clips and the fuel injectors.

- Remove and discard the 8 fuel injector O-ring seals.

Installation

1. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-ring seals can cause the fuel system to leak. Do not reuse the O-ring seals.**

   NOTE: Install new fuel injector O-ring seals and lubricate them with clean engine oil.

   NOTE: Make sure the fuel rail retainer clips snap back into place.

   Install the 4 fuel injectors and the retainer clips into the fuel rail.

2. Install the fuel rail and fuel injectors as an assembly.

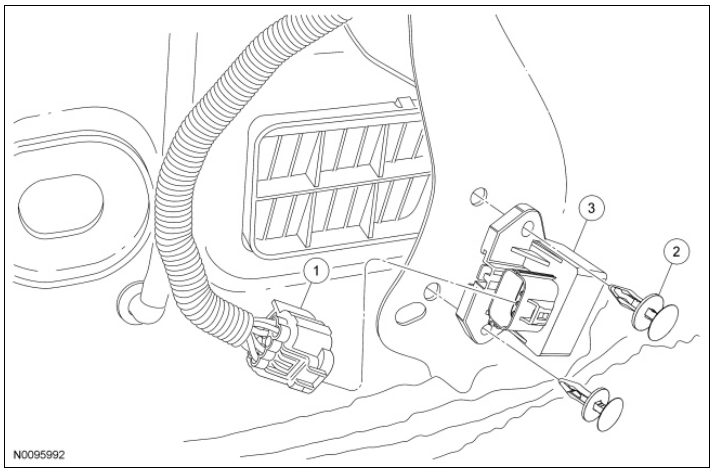
3. Install the 2 fuel rail stud bolts.
   - Tighten to 23 Nm (17 lb-ft).

4. Position the radio capacitor and install the nut.
   - Tighten to 10 Nm (89 lb-in).

5. Connect the 4 fuel injector electrical connectors.

6. Attach the 2 wire harness pin-type retainers.

7. Connect the fuel tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .



8. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Fuel Injectors

Removal and Installation

1. The fuel injectors are serviced with the fuel rail. For additional information, refer to Fuel Rail and Fuel Injector - Exploded View and Fuel Rail in this section.

Fuel Charging and Controls

Sequential Multi-Port Fuel Injection (SFI)

The fuel charging and controls system consists of the:

- Throttle Body (TB).
- fuel injectors.
- Fuel Pump (FP) control module.
- fuel rail.

The fuel charging and controls system is:

- a Sequential Multi-Port Fuel Injection (SFI) system.
- Pulse Width Modulated (PWM).
- Mass Air Flow (MAF) controlled.

Fuel is metered into each intake port in a sequential firing order. Fuel injectors pulse to follow engine firing order in accordance with engine demand on a tuned intake manifold.

The basic fuel requirement of the engine is determined from the data supplied to the PCM by the MAF sensor, which measures the amount of air being drawn into the engine.

Other sensors are used to measure:

- aimperature.
- engine coolant temperature.
- engine speed.
- exhaust oxygen content.

The various sensors detect any changes in the operating conditions and send signals to the PCM. This permits the PCM to control the opening duration (pulse width) of the fuel injectors and maintain optimum exhaust emission control and engine performance for all operating conditions.

Throttle Body (TB)

The TB :

- controls air supply to the upper intake manifold by electronically positioning the throttle plate.
- is not adjustable.
- cannot be cleaned.
- is serviced as a complete assembly only.

Fuel Injectors

The fuel injectors:

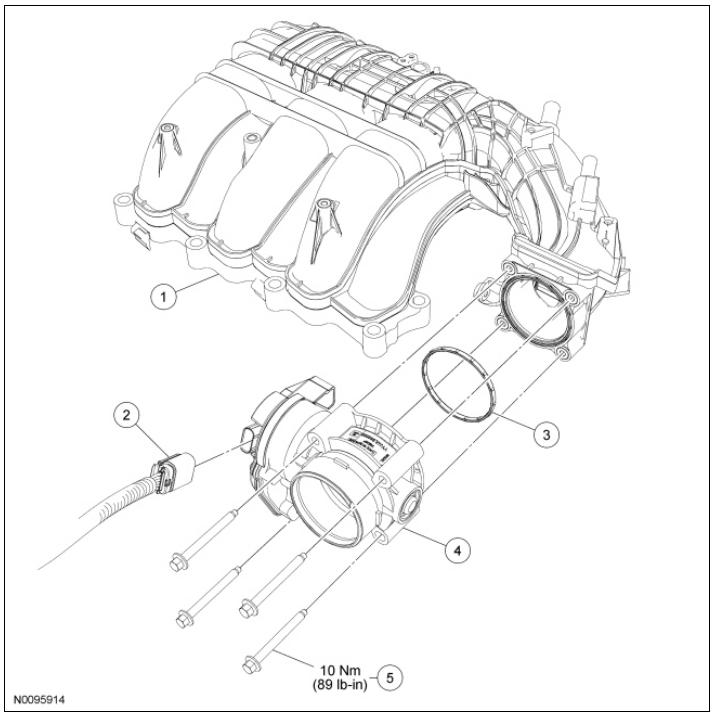
- are electronically operated by the PCM.
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid that opens a needle valve, which injects fuel into the intake port in the cylinder head.
- are deposit resistant.

Fuel Rail

The fuel rail:

- receives fuel from the fuel supply tube.
- delivers fuel to the fuel injectors.
- has a Schrader valve on early build vehicles.

Fuel Pump (FP) Control Module



The FP control module:

- is electronically operated by the PCM.
- controls voltage (10 or 12 volts) to the FP module depending on load.

Fuel Charging and Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

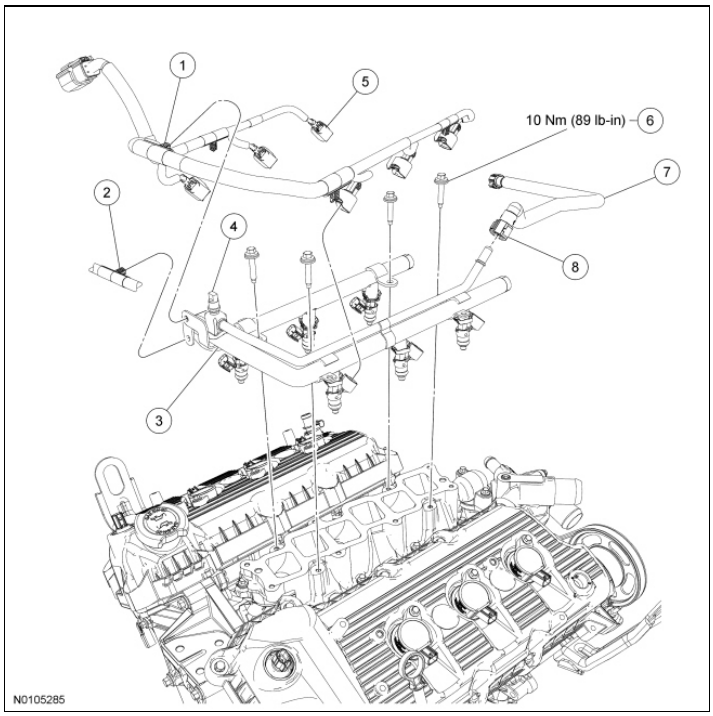
Throttle Body

Item	Part Number	Description
1	9424	Intake manifold
2	14A464	Electronic throttle control electrical connector
3	9E936	Throttle Body (TB) gasket
4	9E926	TB
5	W500305	TB bolt (4 required)

Removal and Installation

1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12B .

2. Disconnect the electronic throttle control electrical connector.



3. Remove the 4 bolts and the Throttle Body (TB).
   - Discard the TB gasket.
   - To install, tighten to 10 Nm (89 lb-in).

4. **NOTE:** Install a new TB gasket.

   To install, reverse the removal procedure.

Removal

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Clean all fuel residue from the engine compartment. If not removed, fuel residue may ignite when the engine is returned to operation. Failure to follow this instruction may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the upper intake manifold. For additional information, refer to Section 303-01B .
4. Disconnect the fuel tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .
5. Release the 5 fuel charging wire harness pin-type retainers from the fuel rail.
6. Release the engine wire harness pin-type retainer from the fuel rail.
7. Disconnect the 6 fuel injector electrical connectors.
8. Remove the 4 fuel rail bolts.
9. Remove the fuel rail and injectors as an assembly.

10. Remove the 6 fuel injector clips and the 6 fuel injectors.
    - Remove and discard the 12 fuel injector O-ring seals.

Installation

1. ***NOTICE:*** **Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals can cause the fuel system to leak. Do not reuse the O-ring seals.**

   NOTE: Install new fuel injector O-ring seals and lubricate them with clean engine oil.

   Install the 6 fuel injectors and the 6 fuel injector clips into the fuel rail.

2. Install the fuel rail and fuel injectors as an assembly.

3. Install the 4 fuel rail bolts.
   - Tighten to 10 Nm (89 lb-in).

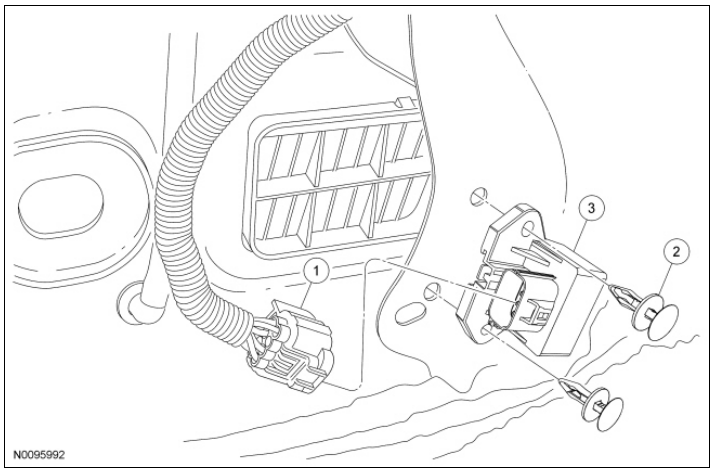
4. Connect the 6 fuel injector electrical connectors.

5. Attach the engine wire harness pin-retainer to the fuel rail.

6. Attach the 5 fuel charging wire harness pin-retainers to the fuel rail.

7. Connect the fuel tube-to-fuel rail quick connect coupling. For additional information, refer to Section 310-00 .

8. Install the upper intake manifold. For additional information, refer to Section 303-01B .



9. Connect the battery ground cable. For additional information, refer to Section 414-01 .

2. Disconnect the Fuel Pump (FP) control module electrical connector.
3. Remove the 2 pin-type retainers and the FP control module.
4. To install, reverse the removal procedure.

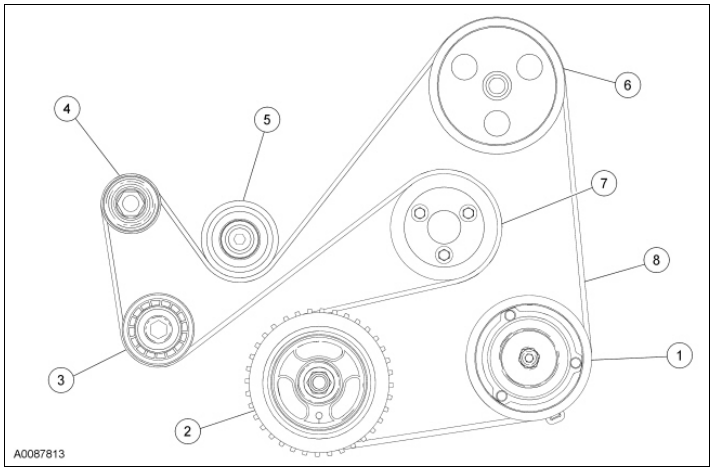
General Specifications

Item	Specification
Accessory drive belt	6 ribs

Torque Specifications

Description	Nm	lb-ft
Accessory drive belt idler pulley and bracket bolts	25	18
Accessory drive belt tensioner bolts	25	18
Accessory drive belt idler pulley bolt	25	18

p;



Accessory Drive

The accessory drive:

- has a single serpentine drive belt with 6 ribs.
- has automatic tensioning.
- is not adjustable.

The accessory drive system provides power to operate components which power other systems. These could include components such as the generator, power steering pump and A/C compressor. Each of these components is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. One or more idler pulleys may be provided to facilitate belt routing and alignment. The automatic belt tensioner maintains correct belt tension and compensates for component wear and changes in system load. System load changes can be caused by the A/C compressor clutch engaging or disengaging, or demand changes on other systems powered by the accessory drive belt. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be correctly aligned and kept clean.

Accessoryve Belt Routing

Item	Part Number	Description
1	19D784	A/C compressor pulley
2	6316	Crankshaft pulley
3	6A228	Belt tensioner
4	10300	Generator pulley
5	8678	Idler pulley
6	8678	Idler pulley
7	8509	Coolant pump pulley
8	8620	Accessory drive belt

Belt Tensioner

NOTE: The accessory drive belt tensioner must be replaced as a complete unit.

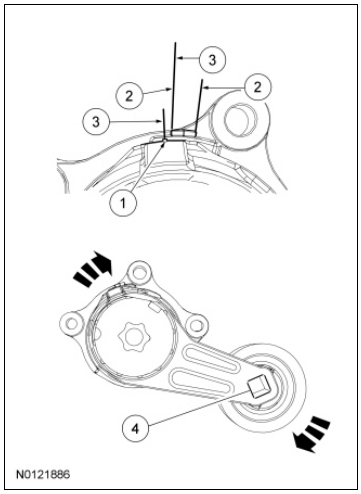
Automatic tensioners are calibrated to provide the correct amount of tension to the belt for a given accessory drive system. Unless a spring or damping band within the tensioner assembly breaks, or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

Accessory Drive

Inspection and Verification

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulls have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.



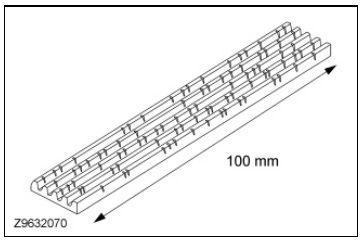
Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing) • Loose accessory drive belt • Damaged pulleys • Tensioner arm misalignment

Belt Tensioner With Belt Length Indicator

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

NOTE: 6.2L engine accessory drive belt tensioner shown, other accessory drive belt tensioners similar.

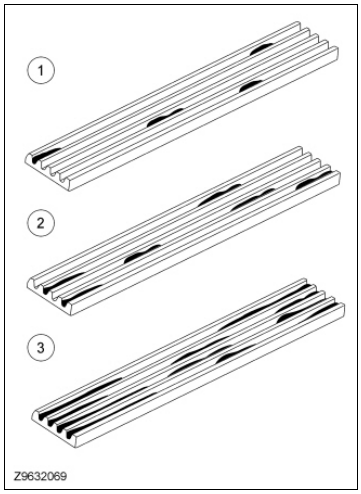


Item	Description
1	Belt length indicator
2	Acceptable belt installation and wear range
3	Belt replacement range
4	Belt tension relief point

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.

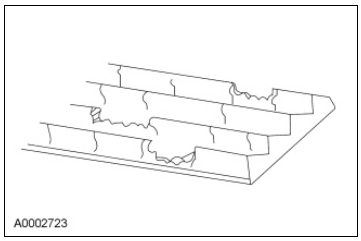
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures, Variable Camshaft Timing (VCT) tick or generator whine.

5. If a concern is found, correct the condition before proceeding to the next step.



V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.



V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability concern, but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

9. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Component Tests

Drive Belt - Noise/Flutter

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Chec of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

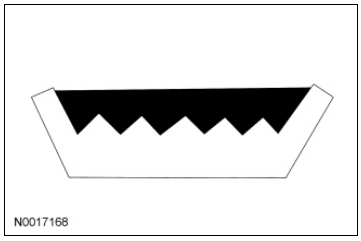
- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
  - ♦ the A/C system is overcharged.
  - ♦ the A/C condenser core airflow is blocked.
  - ♦ the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.
- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.
- **NOTE:** The accessory drive belt tensioner arm should rotate freely without binding.

  Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt - Incorrect Installation



NOTICE: **Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.**

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation

Correct Installation

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Accessory Drive in the Description and Operation portion of this section.

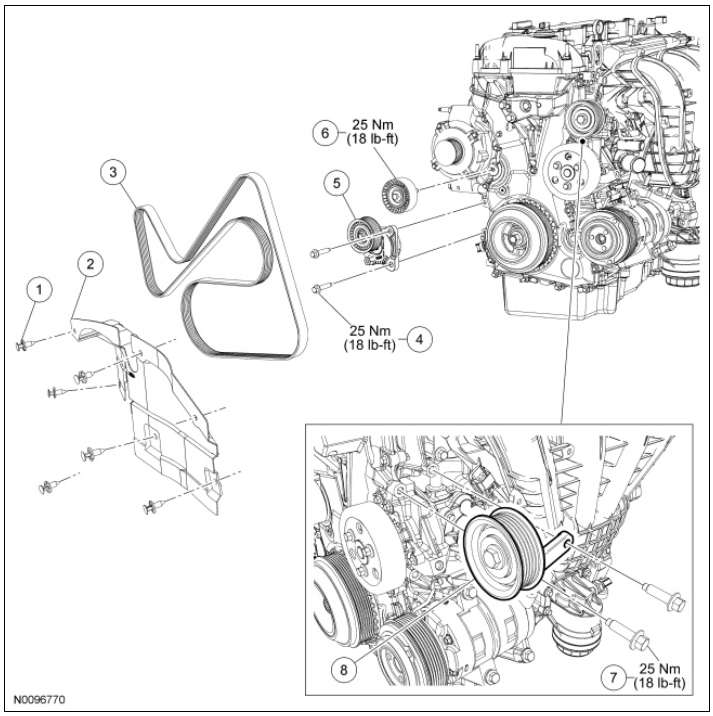
2. **NOTE:** The accessory drive belt tensioner spring is very strong and requires substantial force to release.

   Release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests:

   - Move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

- Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.
- Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.

3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner meets the criteria in the previous step, proceed to testing the tensioner dynamically.



4. If the tensioner is saturated with oil and grease internally, install a new tensioner.

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner mement still exists, install a new accessory drive belt tensioner.

Front End Accessory Drive (FEAD) - Exploded View

Item	Part Number	Description
1	N807389	Pin-type retainer (6 required)

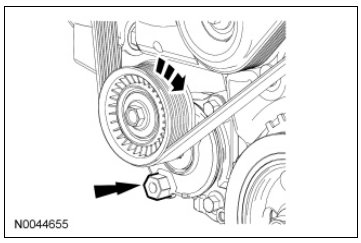
1. For additional information, refer to the procedures in this section.

Accessory Drive Belt



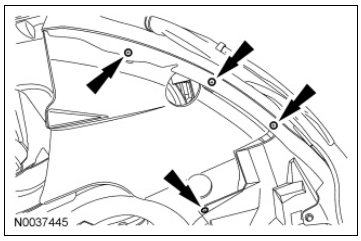
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 screws and position the RH fender splash shield aside.

3. Remove the 6 pin-type retainers and the RH splash shield.

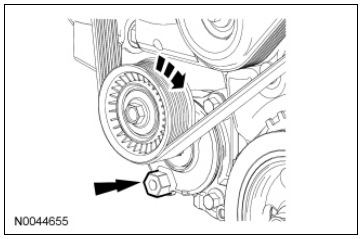
4. Using the hex feature, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the coolant pump pulley.
    - Remove the accessory drive belt from the engine.



5. To install, reverse the removal procedure.

Accessory Drive Belt Tensioner

Removal and Installation



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 screws and position the RH fender splash shield aside.

3. Remove the 6 pin-type retainers and the RH splash shield.

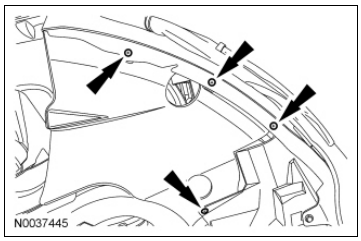
4. Using the hex feature, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the coolant pump pulley.

5. **NOTE:** The accessory drive belt tensioner must be replaced as a complete unit.

   Remove the 2 bolts and the accessory drive belt tensioner.

   - To install, tighten to 25 Nm (18 lb-ft).

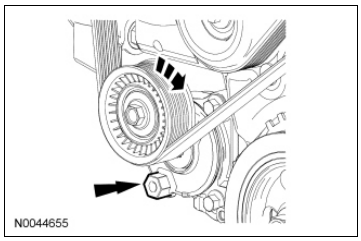
6. To install, reverse the removal procedure.



Accessory Drive Belt Idler Pulley

Removal and Installation

All idler pulleys



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 screws and position the RH fender splash shield aside.

3. Remove the 6 pin-type retainers and the RH splash shield.

Using the hex feature, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the idler pulley.

Smooth idler pulley

5. Loosen the bolt and remove the accessory drive belt idler pulley.
    - To install, tighten to 25 Nm (18 lb-ft).

Grooved idler pulley

6. **NOTE:** The grooved accessory drive belt idler pulley and bracket must be replaced as a complete unit.

   Remove the 2 bolts and the grooved accessory drive belt idler pulley and bracket.

    - To install, tighten to 25 Nm (18 lb-ft).

7. To install, reverse the removal procedure.

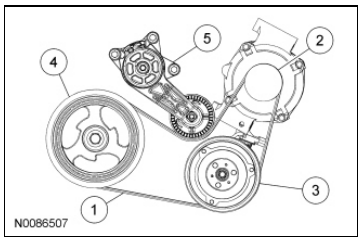
General Specifications

Item	Specification
Accessory drive belt	6 ribs
Coolant pump belt	3 ribs

Torque Specifications

Description	Nm	lb-ft
Accessory drive belt tensioner bolts	25	18

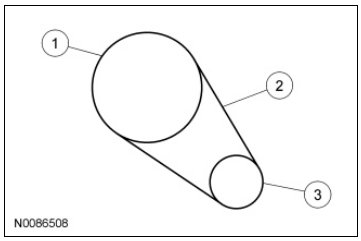
Accessory Drive



The accessory drive:

- has a single serpentine drive belt with 6 ribs.
- has an automatic drive belt tensioner.
- has a V-ribbed coolant pump belt.

The accessory drive system provides power to operate components which power other systems. These could include components such as the generator, power steering pump and A/C compressor. Each of these components is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. One or more idler pulleys may be provided to facilitate belt routing and alignment. The automatic belt tensioner maintains correct belt tension and compensates for component wear and changes in system load. System load changes can be caused by the A/C compressor clutch engaging or disengaging, or demand changes on other systpowered by the accessory drive belt. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be correctly aligned and kept clean.



Accessory Drive Belt Routing

Accessory Drive Belt

Item	Part Number	Description
1	8620	Accessory drive belt
2	10344	Generator pulley
3	19D784	A/C clutch pulley
4	6316	Crankshaft pulley
5	6B209	Accessory drive belt tensioner

Coolant Pump Drive Belt

Item	Part Number	Description
1	6A359	Camshaft drive pulley
2	8620	Coolant pump drive belt
3	8A528	Coolant pump pulley

Belt Tensioner

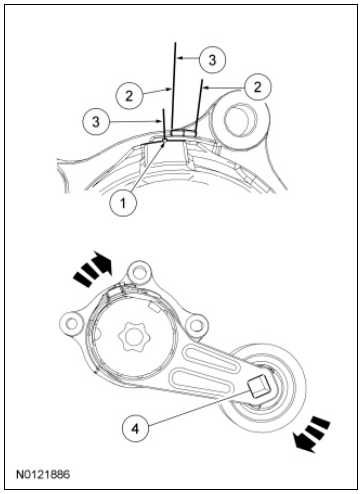
Automatic tensioners are calibrated to provide the correct amount of tension to the belt for a given accessory drive system. Unless a spring or damping band within the tensioner assembly breaks, or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

Accessory Drive

Inspection and Verification

NOTICE: **Under no circumstances should the accessory drive belt, tension or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.



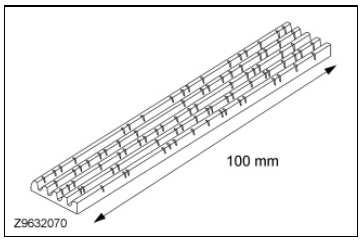
Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing) • Loose accessory drive belt • Damaged pulleys • Tensioner arm misalignment

Belt Tensioner With Belt Length Indicator

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

NOTE: 6.2L engine accessory drive belt tensioner shown, other accessory drive belt tensioners similar.

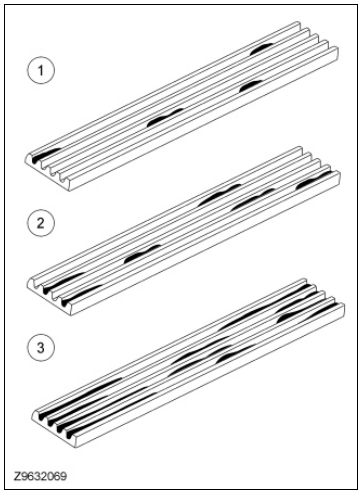


Item	Description
1	Belt length indicator
2	Acceptable belt installation and wear range
3	Belt replacement range
4	Belt tension relief point

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.

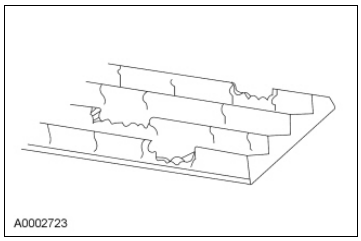
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures, Variable Camshaft Timing (VCT) tick or generator whine.

5. If a concern is found, correct the condition before proceeding to the next step.



V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.



V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability concern, but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

9. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Component Tests

Drive Belt - Noise/Flutter

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

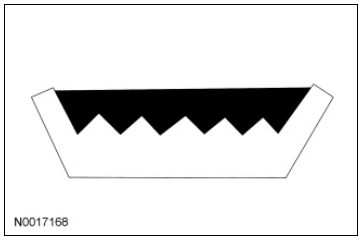
- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
  - ♦ the A/C system is overcharged.
  - ♦ the A/C condenser core airflow is blocked.
  - ♦ the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.
- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.
- **NOTE:** The accessory drive belt tensioner arm should rotate freely without binding.

  Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt - Incorrect Installation



NOTICE: **Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.**

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation

Correct Installation

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Accessory Drive in the Description and Operation portion of this section.

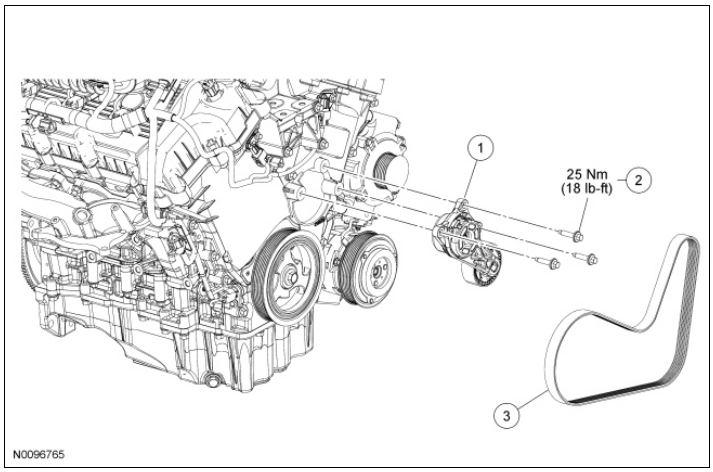
2. **NOTE:** The accessory drive belt tensioner spring is very strong and requires substantial force to release.

   Release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests:

   - Move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

- Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.
- Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.

3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner meets the criteria in the previous step, proceed to testing the tensioner dynamically.



4. If the tensioner is saturated with oil and grease internally, install a new tensioner.

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tsioner movement still exists, install a new accessory drive belt tensioner.

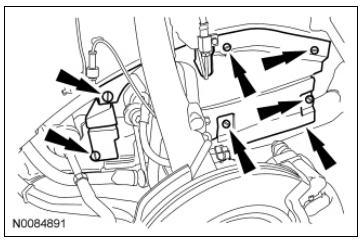
Accessory Drive Belt



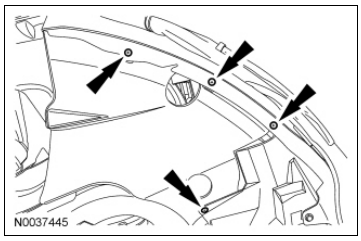
Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 screws and position the RH fender splash shield aside.

3. Remove the 6 pin-type retainers and the RH splash shield.

4. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.



5. To install, reverse the removal procedure.

Accessory Drive Belt Tensioner

Removal and Installation

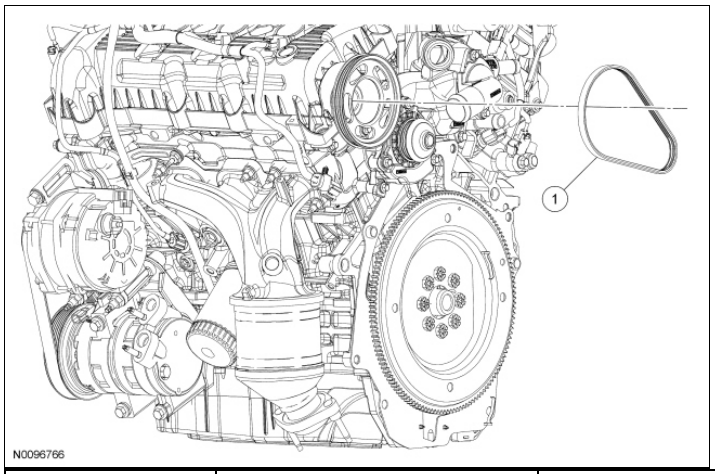
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 screws and position the RH fender splash shield aside.

3. Remove the 6 pin-type retainers and the RH splash shield.

.

4. Rotate the accessory drive belt tensioner counterclockwise and position the accessory drive belt off of the accessory drive belt tensioner.



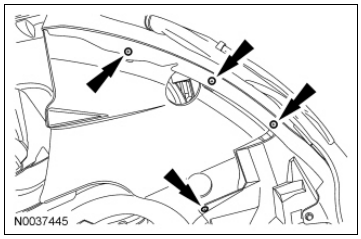
5. Remove the 3 bolts and the accessory drive belt tensioner.
   - To install, tighten to 25 Nm (18 lb-ft).

6. To install, reverse the removal procedure.

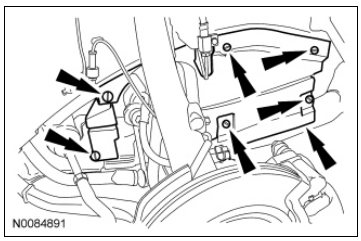
Coolant Pump Belt

Special Tool(s)

 ST3085-A	Remover, Stretchy Belt 303-1419

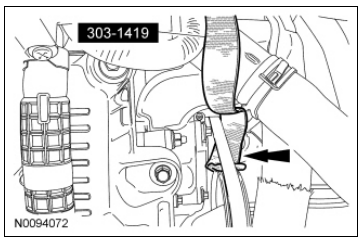


Item	Part Number	Description
1	8620	Coolant pump belt



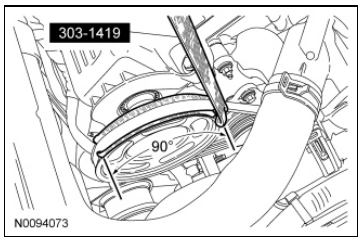
Ral

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

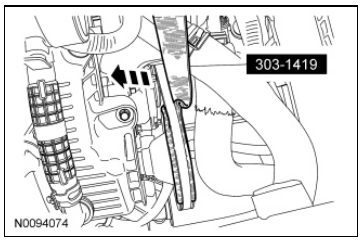


2. Remove the 4 screws and position the RH fender splash shield aside.

3. Remove the 6 pin-type retainers and the RH splash shield.

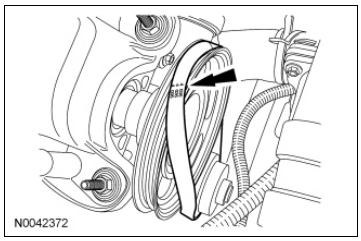


4. Position the Stretchy Belt Remover under the coolant pump belt as shown.



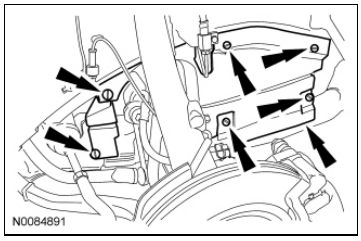
5. **NOTE:** Feed the Stretchy Belt Remover on to the camshaft coolant pump pulley approximately 90 degrees.

   With the help of an assistant, turn the crankshaft clockwise and feed the Stretchy Belt Remover evenly on the camshaft coolant pump pulley as shown.

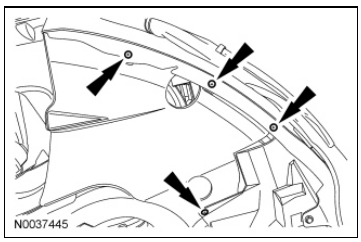


6. Remove the coolant pump belt.
   - Fold the Stretchy Belt Remover over the top of the coolant pump belt.
   - In one quick motion, pull the Stretchy Belt Remover up and toward the RH front of the vehicle removing the coolant pump belt.

Installation



1. Install the coolant pump belt on the coolant pump pulley and position it on the camshaft pulley.



2. *NOTICE:* **Do not use any screwdrivers, pliers or other metal objects that could cause damage to the belt or camshaft pulley while installing the belt.**

   Rotate the crankshaft clockwise to seat the coolant pump belt on the camshaft pulley.

3. Install the RH splash shield and the 6 pin-type retainers.

4. Position the RH fender splash shield and install the 4 screws.

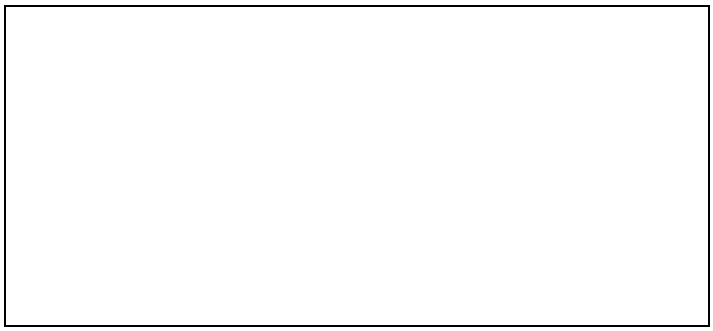
General Specifications

Item	Specification
Accessory drive belt	6 ribs
Power steering pump drive belt (if equipped)	4 ribs

Torque Specifications

Description	Nm	lb-in
Accessory drive belt tensioner bolts	11	97

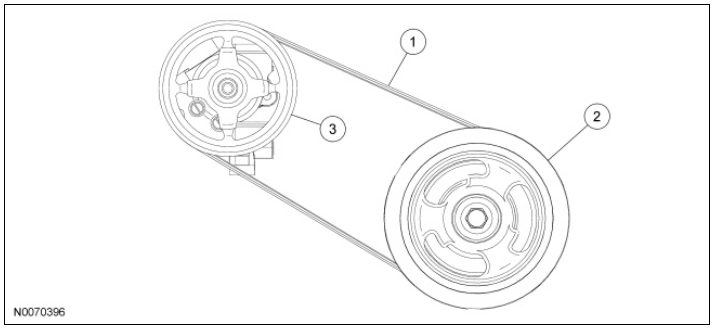
Accessory Drive



This vehicle is equipped with the following components:

- V-ribbed serpentine accessory drive belt
- Automatic drive belt tensioner
- V-ribbed power steering pump drive belt

The accessory drive system provides power to operate components which power other systems. These could include components such as the generator, power steering pump and A/C compressor. Each of these components is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. The automatic belt tensioner maintains correct belt tension and compensates for component wear and changes in system load. System load changes can be caused by the A/C compressor clutch engaging or disengaging or demand changes on other systems powered by the accessory drive belt. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be correctly aligned and kept clean.



Accessory Drive Belt Routing

Front End Accessory Drive (FEAD) Belt

Item	Part Number	Description
1	6B209	Accessory drive belt tensioner pulley
2	10300	Generator pulley
3	19D784	A/C clutch pulley
4	8620	Accessory drive belt
5	6316	Crankshaft pulley

Power Steering Pump Belt

Item	Part Number	Description
1	6C301	Power steering pump drive belt
2	6316	Crankshaft pulley
3	3D639	Power steering pump pulley

Belt Tensioner

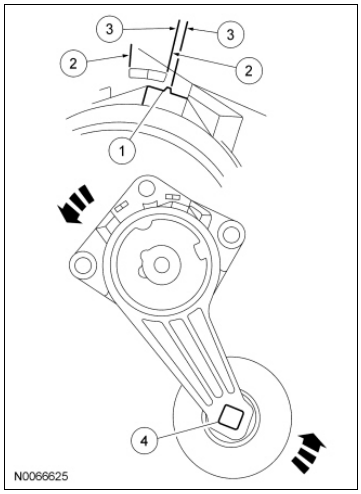
Automatic tensioners are calibrated to provide the correct amount of tension to the belt for a given accessory drive system. Unless a spring or damping band within the tensioner assembly breaks or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

Accessory Drive

Inspection and Verification

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.



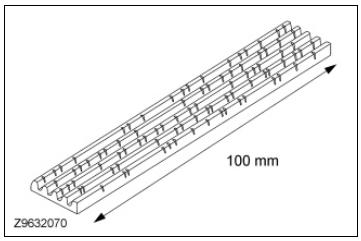
Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing) • Loose accessory drive belt • Damaged pulleys • Tensioner arm misalignment

Belt Tensioner With Belt Length Indicator

NOTE: Modular engine (without A/C) btensioner shown, others similar.

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

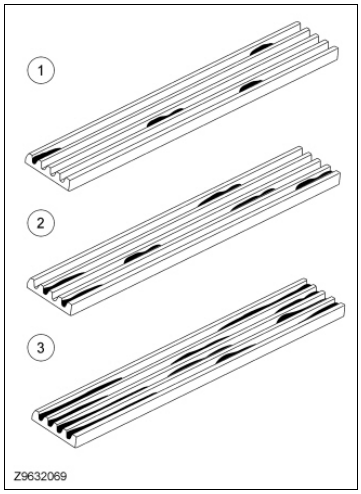


Item	Part Number	Description
1	-	Belt length indicator
2	-	Acceptable belt installation and wear range
3	-	Belt replacement range
4	-	Belt tension relief point

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.

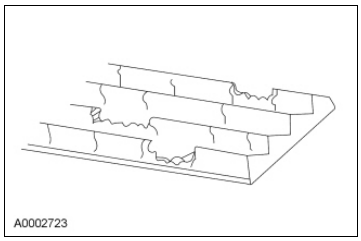
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures or generator whine.

5. If a concern is found, correct the condition before proceeding to the next step.



V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.



V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability concern, but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

9. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Component Tests

Drive Belt - Noise/Flutter

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

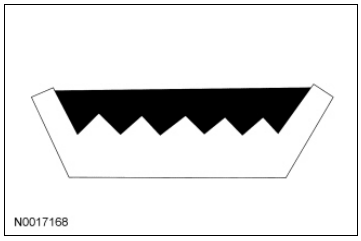
- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
    - ♦ the A/C system is overcharged.
    - ♦ the A/C condenser core airfw is blocked.
    - ♦ the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.
- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.
- **NOTE:** The accessory drive belt tensioner arm should rotate freely without binding.

  Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt - Incorrect Installation



NOTICE: **Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.**

Non-standard accessory drive belts can track differently or incorrectly. If an accessory dri belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation

Correct Installation

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Accessory Drive in the Description and Operation portion of this section.

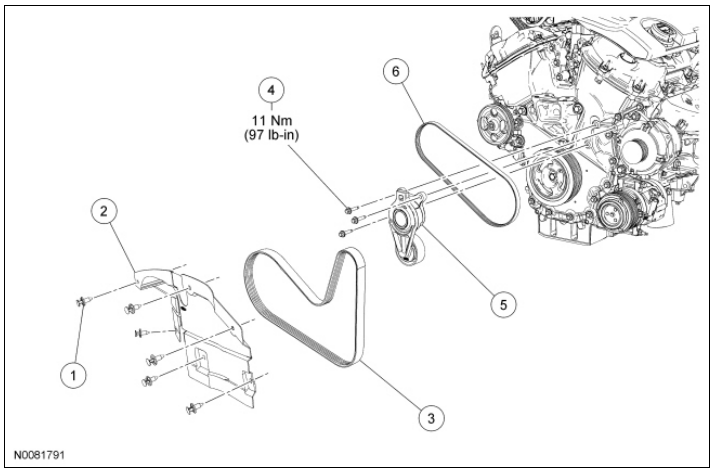
2. **NOTE:** The accessory drive belt tensioner spring is very strong and requires substantial force to release.

   Using a suitable, commercially available serpentine belt tensioner release tool, release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests:

   - Using the release tool, move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

- Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.
- Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.

3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner meets the criteria in the previous step, proceed to testing the tensioner dynamically.



- If the tensioner is saturated with oil and grease internally, install a new tensioner.

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

Front End Accessory Drive (FEAD) - Exploded View

Item	Part Number	Description

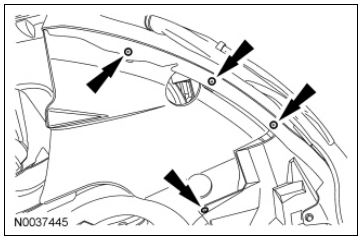
Accessory Drive Belt



Removal

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

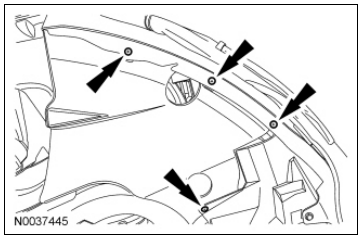
2. Working from the top of the vehicle, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.

3. Remove the 4 screws and position the RH fender splash shield aside.

4. Remove the 6 pin-type retainers and the RH splash shield.

5. Working from under the vehicle, remove the accessory drive belt.

Installation



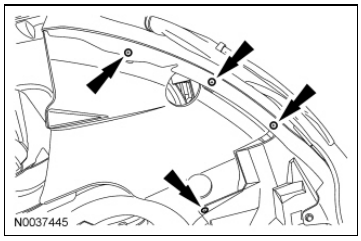
1. Working from under the vehicle, position the accessory drive belt on all pulleys, with the exception of the generator pulley.

2. **NOTE:** After installation, make sure the accessory drive belt is correctly seated on all pulleys.

   Working from the top of the vehicle, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt on the generator pulley.

3. Install the RH splash shield and the 6 pin-type retainers.

4. Position the RH fender splash shield and install the 4 screws.



Accessory Drive Belt Tensioner

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

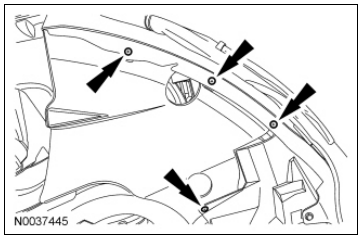
2. Working from the top of the vehicle, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.

3. Remove the 4 screws and position the RH fender splash shield aside.

4. Remove the 6 pin-type retainers and the RH splash shield.

5. Remove 3 bolts and the accessory drive belt tensioner.

Installation



1. Install the accessory drive belt tensioner and the 3 bolts.
    - Tighten to 11 Nm (97 lb-in).

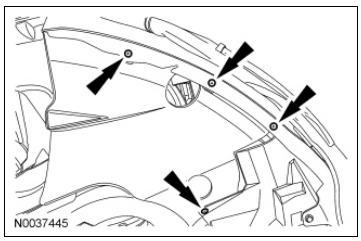
2. **NOTE:** After installation, make sure the accessory drive belt is correctly seated on all pulleys.

   Working from the top of the vehicle, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt on the generator pulley.

3. Install the RH splash shield and the 6 pin-type retainers.

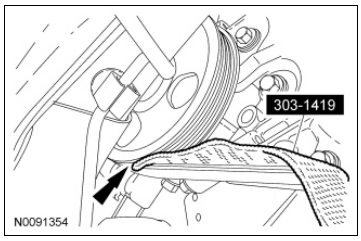
4. Position the RH fender splash shield and install the 4 screws.

Power Steering Pump Belt



Special Tool(s)

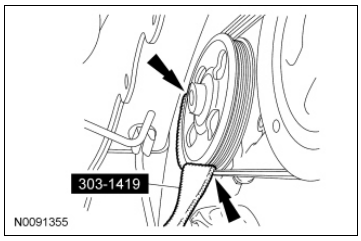
 ST3085-A	Remover, Stretchy Belt 303-1419
 ST2974-A	Tool, Stretchy Belt Installer 303-1252/2



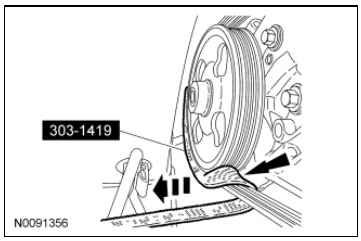
Removal

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Working from the top of the vehicle, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.
3. Remove the 4 screws and position the RH fender splash shield aside.



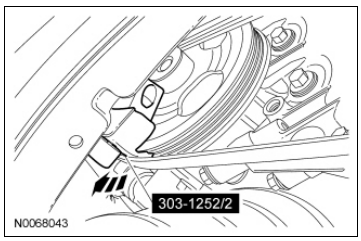
4. Remove the 6 pin-type retainers and the RH splash shield.
5. Position the accessory drive belt off the crankshaft pulley.
6. Position the Stretchy Belt Remover on the power steering pump pulley belt as shown.



7. **NOTE:** Feed the Stretchy Belt Remover onto the power steering pump pulley approximately 90 degrees.

Turn the crankshaft clockwise and feed the Stretchy Belt Remover evenly on the power steering pump pulley as shown.

8. Remove the power steering pump belt.
    - Fold the Stretchy Belt Remover under the inside of the power steering pump belt as shown.
    - In one quick motion, firmly pull the Stretchy Belt Remover out of the RH fender well, removing the power steering pump belt.

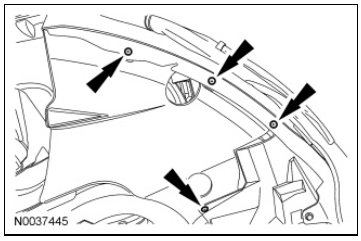


Installation

1. Install the power steering belt on the crankshaft pulley.

2. **NOTE:** After installation, make sure the belt is correctly seated on the crankshaft and power steering pulleys.

    Position the power steering belt around the Stretchy Belt Installer Tool and the power steering pulley. Make sure the belt is engaged with the power steering pulley and rotate the crankshaft clockwise to install the power steering belt.



3. Position the accessory drive belt on the crankshaft pulley.

4. **NOTE:** After installation, make sure the accessory drive belt is correctly seated on all pulleys.

    Working from the top of the vehicle, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt on the generator pulley.

5. Install the RH splash shield and the 6 pin-type retainers.

6. Position the RH fender splash shield and install the 4 screws.

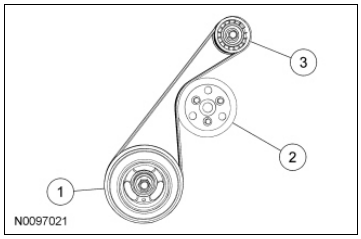
Torque Specifications

Description	Nm	lb-ft	lb-in
Accessory drive belt tensioner bolts	25	18	-
A/C hose retainer bracket bolt	6	-	53



Accessory Drive

The accessory drive:

- has a single serpentine drive belt with 6 ribs.
- has automatic tensioning.
- is not adjustable.

The accessory drive system provides power to operate components which power other systems. The accessory drive system provides power to operate the coolant pump. The coolant pump is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. The automatic belt tensioner maintains correct belt tension and compensates for component wear and changes in system load. System load changes can be caused by the demand changes on other systems powered by the accessory drive belt. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be properly aligned and kept clean.

Accessory Drive Belt Routing

Item	Part Number	Description
1	6316	Crankshaft pulley
2	8509	Coolant pump pulley
3	6A228	Belt tensioner

Belt Tensioner

NOTE: The accessory drive belt tensioner must be replaced as a complete unit.

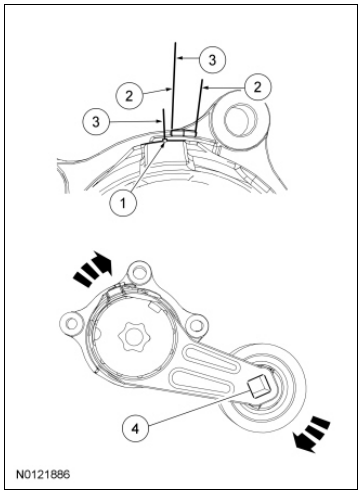
Automatic tensioners are calibrated to provide the correct amount of tension to the belt for a given accessory drive system. Unless a spring or damping band within the tensioner assembly breaks, or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

Accessory Drive

Inspection and Verification

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or lleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.



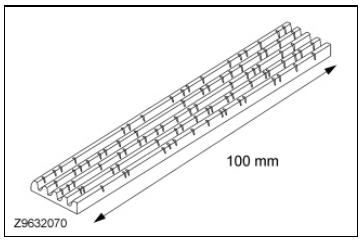
Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing) • Loose accessory drive belt • Damaged pulleys • Tensioner arm misalignment

Belt Tensioner With Belt Length Indicator

NOTE: Belt tensioner is shown in the free-state position against the arm travel stops.

NOTE: 6.2L engine accessory drive belt tensioner shown, other accessory drive belt tensioners similar.

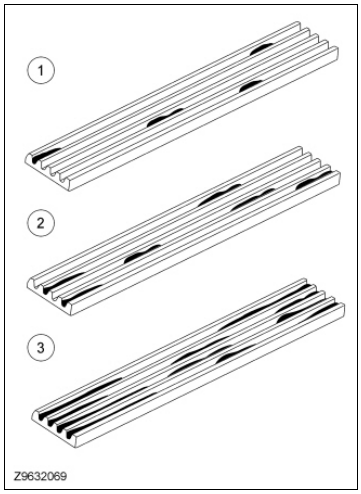


Item	Description
1	Belt length indicator
2	Acceptable belt installation and wear range
3	Belt replacement range
4	Belt tension relief point

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.

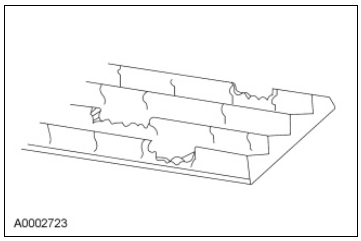
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures, Variable Camshaft Timing (VCT) tick or generator whine.

5. If a concern is found, correct the condition before proceeding to the next step.



V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.



V-Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability concern, but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

9. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Component Tests

Drive Belt - Noise/Flutter

NOTICE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

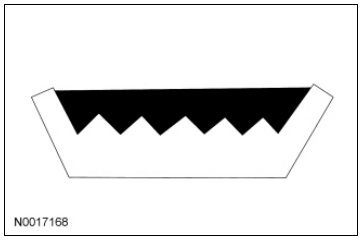
- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
    - ♦ the A/C system is overcharged.
    - ♦ the A/C condenser core airflow is blocked.
    - ♦ the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.
- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.
- **NOTE:** The accessory drive belt tensioner arm should rotate freely without binding.

  Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt - Incorrect Installation



NOTICE: **Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.**

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation

Correct Installation

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under Accessory Drive in the Description and Operation portion of this section.

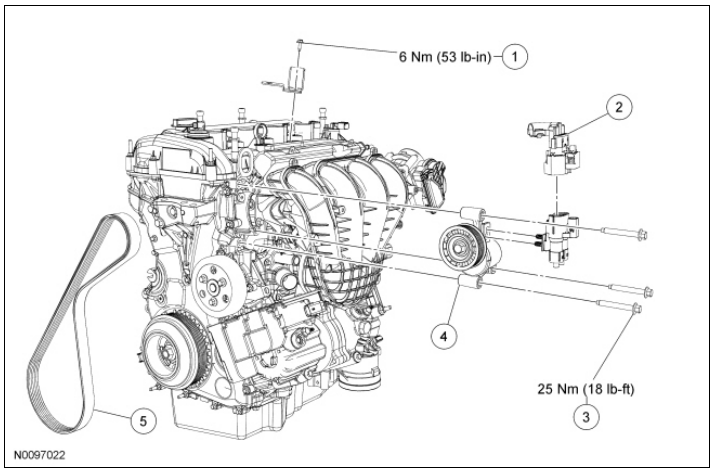
2. **NOTE:** The accessory drive belt tensioner spring is very strong and requires substantial force to release.

   Release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests:

   - Move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

- Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.
- Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.

3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner meets the criteria in the previous step, proceed to testing the tensioner dynamically.



4. If the tensioner is saturated with oil and grease internally, install a new tensioner.

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tension movement still exists, install a new accessory drive belt tensioner.

Front End Accessory Drive (FEAD) - Exploded View

Item	Part Number	Description
1	W503924	A/C hose retainer bracket bolt
2	-	Vehicle high voltage electrical system electrical connector

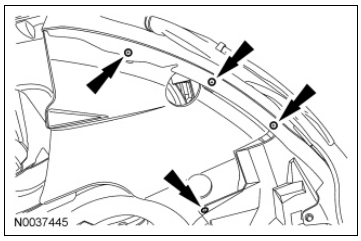
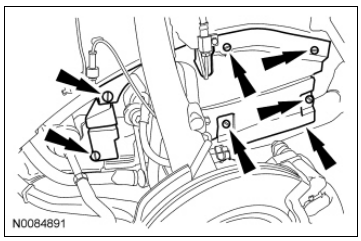
4	6A228	Accessory drive belt tensioner
5	6C301	Accessory drive belt



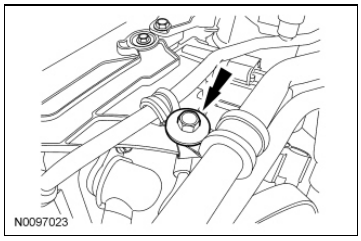
1. For additional information,the procedures in this section.

Accessory Drive Belt



Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

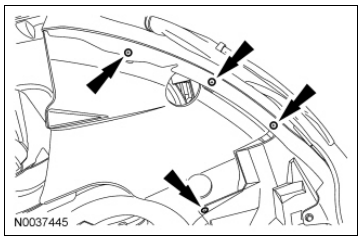


2. Remove the 4 screws and position the RH fender splash shield aside.

3. Remove the 6 pin-type retainers and the RH splash shield.

4. Remove the A/C hose retainer bracket bolt.
   - To install, tighten to 6 Nm (53 lb-in).

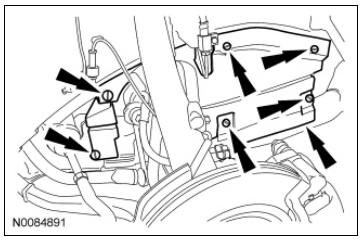
5. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt.



6. To install, reverse the removal procedure.

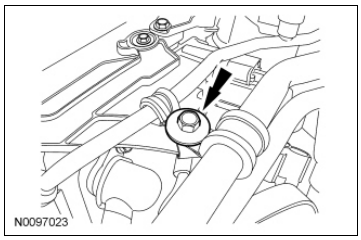
Accessory Drive Belt Tensioner

Removal and Installation



1. Depower the vehicle high voltage electrical system. For additional information, refer to Section 414-03 .

2. Remove the 4 screws and position the RH fender splash shield aside.



3. **NOTE:** RH front wheel and tire are removed for clarity.

   Remove the 6 pin-type retainers and the RH splash shi

4. Remove the A/C hose retainer bracket bolt.
   - To install, tighten to 6 Nm (53 lb-in).

5. Rotate the accessory drive belt tensioner counterclockwise and remove the accessory drive belt from the tensioner pulley.

6. Disconnect the 2 vehicle high voltage electrical system electrical connectors.

7. Detach the vehicle high voltage electrical system electrical connector retainer from the accessory drive belt tensioner.

8. **NOTE:** The accessory drive belt tensioner must be replaced as a complete unit.

   Remove the 3 bolts and the accessory drive belt tensioner.

- To install, tighten to 25 Nm (18 lb-ft).

9. To install, reverse the removal procedure.

General Specifications

Item	Specification
Normal engine cranking speed	200-250 rpm
Starting circuit maximum voltage drop (engine at normal operating temperature)	0.5 volt
Starter motor maximum load current draw	800 amps
Starter motor no-load current draw	60-80 amps
Starter motor normal load current draw	130-190 amps

Torque Specifications

Description	Nm	lb-ft	lb-in

Ground wire nut - 3.0L	18	-	159
Starter motor bolt and stud bolt (2.5L)	25	18	-
Starter motor bolts (3.5L)	27	20	-
Starter motor solenoid battery cable nut	12	-	106
Starter motor solenoid wire nut	5	-	44
Starter motor stud bolts (3.0L)	27	20	-

Starting System

The starting system consists of the following components:

- Starter motor
- Starter motor relay
- Transmission Range (TR) sensor - automatic transmission
- Clutch cutoff switch - manual transmission
- Battery
- Ignition switch
- PCM
- Start diode

When the key is placed in the START position, the starter relay is energized and this sends current to the starter motor, and the drive pinion gear cranks the flexplate/flywheel to start the engine. When current flows to the starter motor, the starter solenoid pull-in coil is bypassed and the hold-in coil keeps the drive pinion gear engaged with the flywheel until the ignition switch is released from the START position.

An overrunning clutch in the starter drive protects the starter motor from excessive speeds during the brief period before the driver releases the ignition switch from the START position as the engine starts.

Vehicles equipped with an automatic transmission have a TR sensor mounted in the transaxle. The TR sensor prevents operation of the starter motor unless NEUTRAL or PARK is selected.

Vehicles equipped with a manual transaxle have a clutch cutoff switch mounted on the clutch pedal bracket. The clutch cutoff switch prevents operation of the starter motor unless the clutch is fully depressed.

One-Touch Integrated Start (OTIS)

The vehicle has One-Touch Integrated Start (OTIS), a computer-assisted cranking system. This feature assists in starting the engine. If the ignition key is turned to the START position and released when the engine begins cranking, the engine may continue cranking for up to 10 seconds or until the vehicle starts.

Once the ignition is turned to the START position and the vehicle is in NEUTRAL or PARK or the clutch p is depressed, the PCM reads starter motor request from the ignition switch and gains control of the starter engagement. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on the following events:

- The engine is started (rpm threshold)
- A set time has been exceeded (calibrated)
- The ignition key has been turned to the OFF position

Starting System

Special Tool(s)

 ST2574-A	Flex Probe Kit 105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Hybrid

For hybrid starting system diagnostics, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Principles of Operation

Starting System - Anti-Theft Intervention

The starting system is electronically controlled by the Passive Anti-Theft System (PATS). The PATS recognizes the correct electronically coded ignition key and signals the PCM to provide a ground for the starter relay. The energized relay provides voltage to the starter solenoid with the key in the START position, thereby allowing the starter motor to activate.

Inspection and Verification

⚠ WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

NOTE: The anti-theft system must be functioning correctly before a logical starting system diagnosis can be carried out. Address anti-theft system concerns before continuing. Refer to Section 419-01B .

1. Verify the customer concern by operating the starting system to duplicate the conditions.

2. Remove the accessory drive belt. Refer to Section 303-05A for 2.3L engines, Section 303-05B for 3.0L (4V) or Section 303-05C for 3.5L engines. Verify the crankshaft and each of the components driven by the accessory drive belt rotate and are not seized or damaged.

3. Inspect to determine if any of the following mechanical or electrical concerns apply.

Visual Inspection Chart

Mechanical	Electrical
• Starter motor • Starter motor bolts • Flexplate • Flywheel	• Battery • Battery Junction Box (BJB) fuse 5 (30A) • Smart Junction Box (SJB) fuse 27 (20A) • Wiring harness • Starter motor relay • Anti-theft system • Loose or corroded connections

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

5. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

6. **NOTE:** The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record Continuous Memory Diagnostic Trouble Codes (CMDTCs).

9. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.

10. If the DTCs retrieved are related to the concern, refer to the PCM DTC Chart. For all other DTCs, refer to Section 419-10 .

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Chart

PCM DTC Chart

DTC	Description	Action
P0512	Starter Request Circuit - Circuit has Power With the Ignition in the OFF Position	CARRY OUT the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. If necessary, INSTALL a new ignition switch. If the ignition switch passed the component test, REPAIR circuit CDC35 (BU/WH) for a short to power.
P0706	TR Sensor A Circuit Range/Performance	Refer to the appropriate section in Group 307 for the procedure.
P0707	TR Sensor A Circuit Low	Refer to the appropriate section in Group 307 for the procedure.
P0708	TR Sensor A Circuit High	Refer to the appropriate section in Group 307 for the procedure.
P0830	Clutch Pedal Switch A Circuit	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0833	Clutch Pedal Switch B Circuit	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

NOTE: For hybrid starting system diagnostics, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

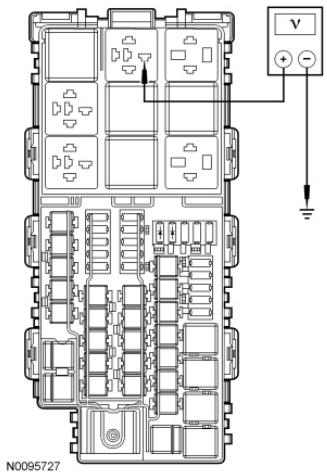
Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank

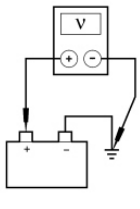
Refer to Wiring Diagrams Cell 20 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Starting System for schematic and connector information.

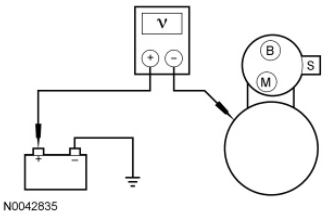
Normal Operation

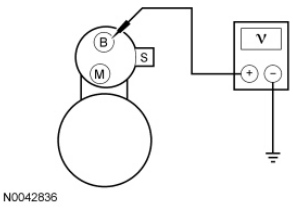
Under normal operation, constant power is supplied to the starter relay on circuit SBB05 (GY/RD), the starter on circuit SBB02 (RD) and to the ignition switch on circuit SBP27 (BU/RD). When the key is placed in the START position, with the vehicle in PARK or NEUTRAL or with the clutch pedal depressed, power flows to the starter motor relay through CE336 (GN/WH). Inputs from the Transmission Range (TR) sensor and clutch cutoff switch to the PCM provide a ground to the starter relay on circuit CDC12 (YE). When the coil of the relay is energized, it sends power to the starter motor on circuit CDC25 (BN/GN).



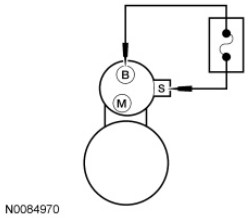
This pinpoint test is intended to diagnose the following:

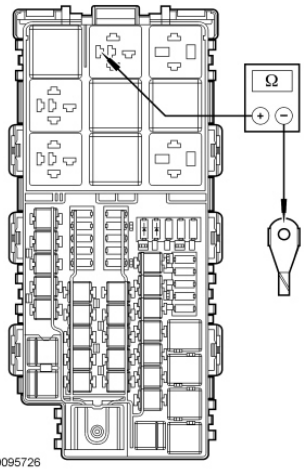




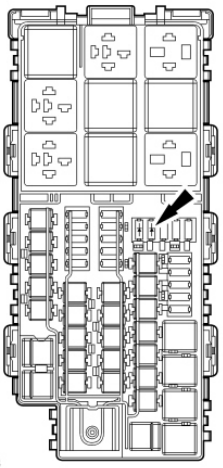


- Battery
- Fuse(s)
- Ignition switch
- Starter motor relay
- PCM
- TR sensor

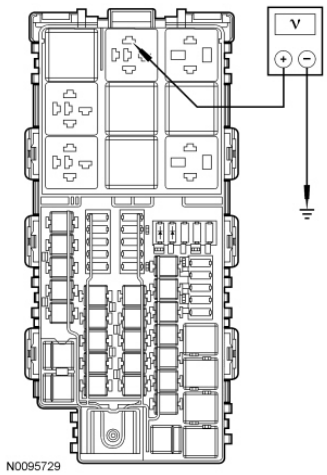


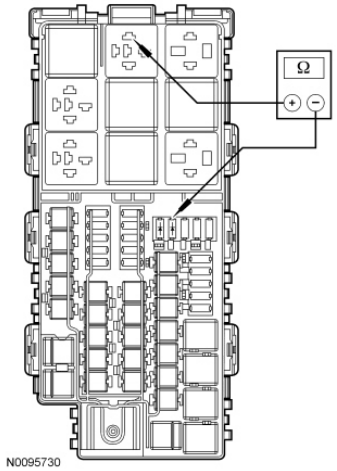


- Clutch cutoff switch
- Circuitry
- Start diode
- Anti-theft system

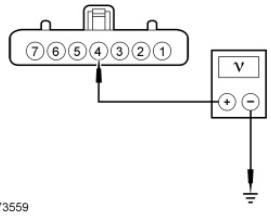


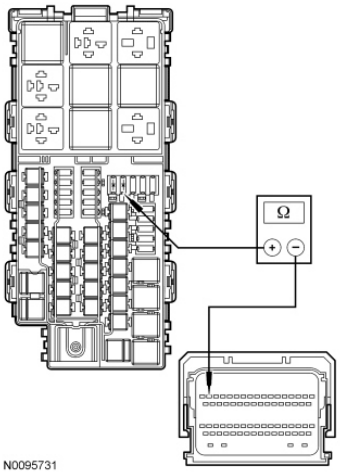
PINPOINT TEST A: THE ENGINE DOES NOT CRANK





Test Step	Result / Action to Take
A1 CHECK THE BATTERY	
• Check the battery condition and charge. Refer to Section 414-01 . • **Is the battery OK?**	**Yes** GO to A2 . **No** CHARGE or INSTALL a new battery as necessary. REFER to Section 414-01 . TEST the system for normal operation.
A2 CHECK THE PCM FOR DTCs	
• Check for PCM DTCs. • **Were any PCM DTCs retrieved?**	**Yes** If PCM DTC P1260 is retrieved, REFER to Section 419-01B . All other PCM DTCs, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** For automatic transmission, GO to A3 . For manual transmission, GO to A4 .
A3 CHECK THE AUTOMATIC TR SENSOR	
• Enter the following diagnostic mode on the scan tool: TCM DataLogger PID. • While observing the Transmission Control Module (TCM) TR sensor PID, place the vehicle in PARK and NEUTRAL. • **Does the PID match the gear selection?**	**Yes** GO to A5 . **No** GO to the appropriate automatic transmission section to diagnose the TR sensor.
A4 CHECK THE CLUTCH CUTOFF SWITCH (CPP_ BOT) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • While observing the CPP_ BOT PID, fully disengage the clutch. • **Does the PID change from NO to YES?**	**Yes** GO to A5 . **No** GO to A28 .
A5 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • **NOTE:** For manual transaxle, fully disengage the clutch.	**Yes** GO to A6 . **No** GO to A13 .

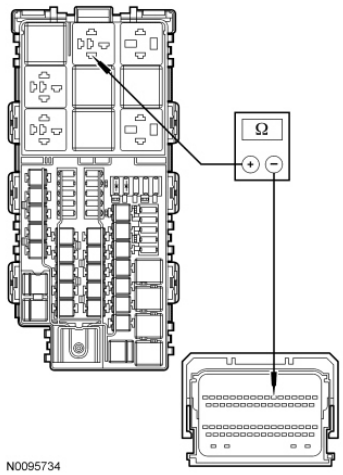




• Monitor the PCM PID SMC_MON with the ignition switch in the START position. • **Does the PID change from OFF to ON?**	
A6 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • **NOTE:** For manual transaxle, fully disengage the clutch. • Monitor the PCM PID STRT_RLY with the ignition switch in the START position. • **Does the PID change from DISABLED to ENABLED?**	**Yes** GO to A7 . **No** GO to A24 .
A7 CHECK STARTER MOTOR RELAY POWER	
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.** • Disconnect: Starter Motor Relay. • Measure the voltage between Battery Junction Box (BJB) starter motor relay pin 30, circuit SBB05 (GY/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A8 . **No** VERIFY BJB fuse 5 (30A) is OK. If OK, REPAIR circuit SBB05 (GY/RD). TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.
A8 CHECK THE BATTERY GROUND CABLE	
• Measure the voltage between the positive battery post and the battery ground cable connection at the engine.	**Yes** GO to A9 . **No** INSTALL a new battery ground cable. REFER to Section 414-01 . TEST the system for normal operation.

 AJ0280-A • **Is the voltage greater than 10 volts?**	
A9 CHECK THE STARTER MOTOR GROUND	
• Measure the voltage between the positive battery post and the starter motor case.  N0042835 • **Is the voltage greater than 10 volts?**	**Yes** GO to A10 . **No** CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.
A10 CHECK THE POWER SUPPLY TO THE STARTER MOTOR	
• Measure the voltage between starter motor C197A, circuit SDC02 (RD) and ground.  N0042836 • **Is the voltage greater than 10 volts?**	**Yes** GO to A11 . **No** INSTALL a new positive battery cable. REFER to Section 414-01 . TEST the system for normal operation.
A11 CHECK THE STARTER MOTOR B-PIN	
• Connect one end of a fused (30A) jumper wire to starter motor solenoid 197A, circuit SDC02 (RD). Momentarily connect the other end of the jumper to starter motor C197B, circuit CDC25 (BN/GN).	**Yes** GO to A12 . **No** INSTALL a new starter motor. REFER to Starter Motor - 2.5L , Starter Motor - 3.0L or Starter Motor - 3.5L in this section. TEST the system for normal operation.

 N0084970 • **Did the starter motor engage and the engine crank?**	
A12 CHECK THE CIRCUIT TO THE STARTER MOTOR	
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.** • Ignition OFF. • Disconnect: Starter Motor Relay. • Disconnect: Starter Motor Solenoid C197B. • Measure the resistance between starter motor solenoid S-terminal C197B, circuit CDC25 (BN/GN), harness side and the BJB starter motor relay pin 87, circuit CDC25 (BN/GN), harness side.  N0095726 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new starter motor relay. TEST the system for normal operation. **No** REPAIR circuit CDC25 (BN/GN). TEST the system for normal operation.
A13 CHECK STARTER MOTOR RELAY POWER	
Yes GO to A14 . **No** VERIFY BJB fuse 5 (30A) is OK. If OK, REPAIR circuit SBB05 (GY/RD). TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.	



A14 CHECK THE STARTER MOTOR RELAY	
• Carry out the Starter Motor Relay Component Test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the starter motor relay pass the component test?**	**Yes** GO to A15 . **No** INSTALL a new starter motor relay. TEST the system for normal operation.
A15 CHECK THE START DIODE	
• Disconnect: Start Diode. • Check the start diode for an open or shorted condition.  N0095728 • **Is the start diode OK?**	**Yes** GO to A16 . **No** INSTALL a new start diode. TEST the system for normal operation.
A16 CHECK THE START SIGNAL TO THE STARTER MOTOR RELAY	
• Connect: Start Diode. • **NOTE:** For manual transaxle, fully disengage the clutch. • Measure the voltage between the BJB starter motor relay pin 86, circuit CE336 (GN/WH), harness side and ground with the ignition switch in the START position.	**Yes** For 2.5L and 3.0L vehicles, GO to A20 . For 3.5L vehicles, GO to A22 . **No** GO to A17 .

 • **Is the voltage greater than 10 volts?**	
A17 CHECK CIRCUIT CE336 (GN/WH) FOR AN OPEN BETWEEN START DIODE AND STARTER RELAY	
• Disconnect: Start Diode. • Measure the resistance between the start diode, circuit CE336 (GN/WH), harness side and BJB starter motor relay pin 86, circuit CE336 (GN/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A18 . **No** REPAIR circuit CE336 (GN/WH) for an open. TEST the system for normal operation.
A18 CHECK CIRCUIT SBP27 (BU/RD) FOR VOLTAGE	
• Connect: Starter Motor Relay. • Connect: Start Diode. • Disconnect: Ignition Switch C250. • Measure the voltage between ignition switch C250-4, circuit SBP27 (BU/RD), harness side and ground.	**Yes** GO to A19 . **No** VERIFY SJB fuse 27 (20 A) is OK. If OK, REPAIR circuit SBP27 (BU/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

 • **Is the voltage greater than 10 volts?**	
A19 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the ignition switch pass the component test?**	**Yes** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation. **No** INSTALL a new ignition switch. REFER to Section 211-05 . TEST the system for normal operation.
A20 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN	
• Connect: Starter Motor Relay. • Disconnect: PCM C175B. • Disconnect: Start Diode. • Measure the resistance between the start diode cell, circuit CDC35 (BU/WH), harness side and PCM C175B-16, circuit CDC35 (BU/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A21 . **No** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.
A21 CHECK THE CIRCUIT CE336 (GN/WH) BETWEEN THE BJB AND THE PCM	

• Connect: Start Diode. • Ignition OFF. • Measure the resistance between the BJB starter motor relay pin 86, circuit CE336 (GN/WH), harness side and PCM C175B-37, circuit CE336 (GN/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPAIR circuit CE336 (GN/WH). TEST the system for normal operation.
A22 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN	
• Connect: Starter Motor Relay. • Disconnect: PCM C175B. • Disconnect: Start Diode. • Measure the resistance between the start diode cell, circuit CDC35 (BU/WH), harness side and PCM C175B-10, circuit CDC35 (BU/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A23 . **No** REPAIR circuit CDC35 (BU/WH) for an open. TEST the system for normal operation.
A23 CHECK CIRCUIT CE336 (GN/WH) BETWEEN THE BJB AND THE PCM	

• Ignition OFF. • Connect: Start Diode. • Measure the resistance between the BJB starter motor relay pin 86, circuit CE336 (GN/WH), harness side and PCM C175B-19, circuit CE336 (GN/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPAIR circuit CE336 (GN/WH). TEST the system for normal operation.
A24 CHECK STARTER MOTOR RELAY POWER	
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.** • Disconnect: Starter Motor Relay. • Measure the voltage between BJB starter motor relay pin 30, circuit SBB05 (GY/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A25 . **No** VERIFY BJB fuse 5 (30A) is OK. If OK, REPAIR circuit SBB05 (GY/RD). TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short.

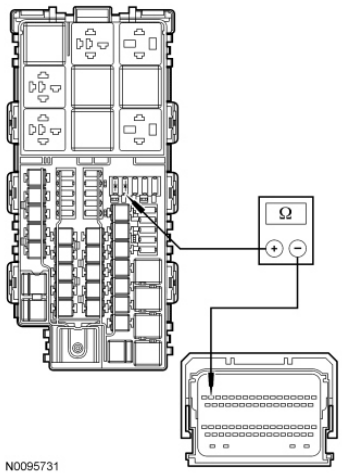
A25 CHECK THE STARTER MOTOR RELAY	
• Carry out the Starter Motor Relay Component Test. Refer to Wiring Diagrams Cell 149 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid) for component testing. • **Did the starter motor relay pass the component test?**	**Yes** For 2.5L and 3.0L vehicles, GO to A26 . For 3.5L vehicles, GO to A27 . **No** INSTALL a new starter motor relay. TEST the system for normal operation.
A26 CHECK CIRCUIT CDC12 (YE) FOR AN OPEN	
• Disconnect: PCM C175B. • Measure the resistance between the BJB starter relay pin 85, circuit CDC12 (YE), harness side and PCM C175B-7, circuit CDC12 (YE), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPAIR circuit CDC12 (YE). TEST the system for normal operation.
A27 CHECK CIRCUIT CDC12 (YE) FOR AN OPEN	
• Disconnect: PCM C175B. • Measure the resistance between the BJB starter relay pin 85, circuit CDC12 (YE), harness side and PCM C175B-34, circuit CDC12 (YE), harness side.	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPAIR circuit CDC12 (YE). TEST the system for normal operation.

 N0095735 • **Is the resistance less than 5 ohms?**	
A28 CHECK CIRCUIT GD120 (BK/GN) FOR AN OPEN	
• Ignition OFF. • Disconnect: Clutch Cutoff Switch C2072. • Measure the resistance between clutch cutoff switch C2072-2, circuit GD120 (BK/GN), harness side and ground.  N0095736 • **Is the resistance less than 5 ohms?**	**Yes** GO to A29 . **No** REPAIR circuit GD120 (BK/GN). TEST the system for normal operation.
A29 CHECK CIRCUIT CE903 (BU/OG) FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175T. • Measure the resistance between clutch cutoff switch C2072-1, circuit CE903 (BU/OG), harness side and PCM C175T-26, circuit CE903 (BU/OG), harness side.  N0095737 • **Is the resistance less than 5 ohms?**	**Yes** GO to A30 . **No** REPAIR circuit CE903 (BU/OG). TEST the system for normal operation.

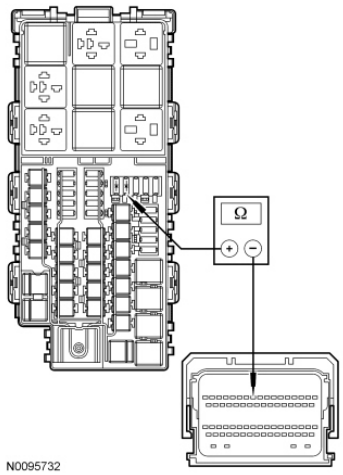
A30 CHECK CPP SWITCH FOR AN OPEN	
• Measure the resistance between clutch cutoff switch C2072-2 and C2072-1, component side, fully disengage the clutch.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPLACE the clutch cutoff switch. TEST the system for normal operation.

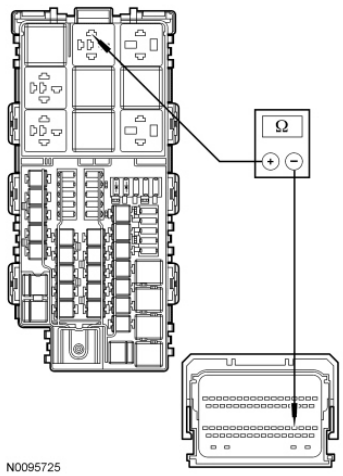
Pinpoint Test B: One-Touch Integrated Start (OTIS) Does Not Operate Correctly

Refer to Wiring Diagrams Cell 20 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Starting System for schematic and connector information.

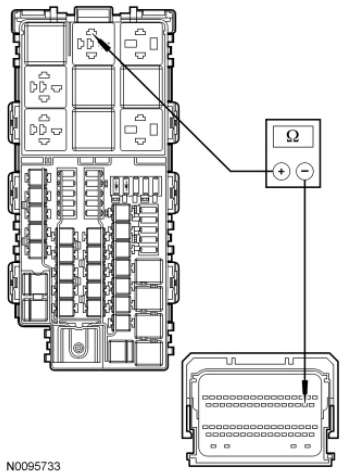


Normal Operation





When the ignition switch is turned to the START position and released, the PCM receives a starter motor request signal through circuit CDC35 (BU/WH). With the vehicle in PARK or NEUTRAL or with the clutch pedal depressed, power flows from the PCM to the starter motor relay through circuit CE336 (GN/WH). A ground is supplied through circuit CDC12 (YE) from the PCM causing the starter motor relay coil to energize and the relay contacts close. This allows power from starter motor relay through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is grounded at the starter motor. Energizing the starter solenoid will engage the starter drive into the ring gear and closes the solenoid contacts, allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on engine running (rpm threshold), a set crank time has been exceeded or the ignition switch has been turned to the OFF position.



This pinpoint test is intended to diagnose the following:
- Circuitry
- PCM

PINPOINT TEST B: ONE-TOUCH INTEGRATED START (OTIS) DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
B1 CHECK THE STATUS OF OTIS (OTS_STAT) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • Monitor the PCM PID OTS_STAT with the ignition switch in the RUN position. • **Is the OTIS PID enabled?**	**Yes** GO to B2 . **No** ENABLE One-Touch Integrated Start (OTIS). TEST the system for normal operation. If OTIS

	will not enable, INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation.
B2 CHECK THE KEY POSITION FOR START INDICATED (START_KEY) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • **NOTE:** For manual transaxle, fully disengage the clutch. • Monitor the PCM PID START_KEY with the ignition switch in the START position. • **Does the PID change from OFF to ON?**	**Yes** GO to B5 . **No** For 2.5L and 3.0L vehicles, GO to B3 . For 3.5L vehicles, GO to B4 .
B3 CHECK CIRCUIT CDC35 (BU/WH)	
• Disconnect: Start Diode. • Disconnect: PCM C175B. • Measure the restance between start diode cell, circuit CDC35 (BU/WH), harness side and PCM C175B-16, circuit CDC35 (BU/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.
B4 CHECK CIRCUIT CDC35 (BU/WH)	
• Disconnect: Start Diode. • Disconnect: PCM C175B. • Measure the resistance between start diode cell, circuit CDC35 (BU/WH), harness side and PCM C175B-10, circuit CDC35 (BU/WH), harness side.	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
B5 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger -CM. • **NOTE:** For manual transaxle, fully disengage the clutch. • Monitor the PCM PID SMC_MON with the ignition switch in the START position. • **Does the PID change from OFF to ON?**	**Yes** GO to B8 . **No** For 2.5L and 3.0L vehicles, GO to B6 . For 3.5L vehicles, GO to B7 .
B6 CHECK THE CIRCUIT CE336 (GN/WH) BETWEEN THE BJB AND THE PCM	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between the Battery Junction Box (BJB) starter motor relay pin 86, circuit CE336 (GN/WH), harness side and PCM C175B-37, circuit CE336 (GN/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPAIR circuit CE336 (GN/WH). TEST the system for normal operation.

B7 CHECK THE CIRCUIT CE336 (GN/WH) BETWEEN THE BJB AND THE PCM	
• Ignition OFF. • Disconnect: PCM C175B. • Measure the resistance between the BJB starter motor relay pin 86, circuit CE336 (GN/WH), harness side and PCM C175B-19, circuit CE336 (GN/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** REPAIR circuit CE336 (GN/WH). TEST the system for normal operation.
B8 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID	
• Enter the following diagnostic mode on the scan tool: DataLogger - PCM. • **NOTE:** For manual transaxle, fully disengage the clutch. • Monitor the PCM PID STRT_RLY with the ignition switch in the START position. • **Does the PID change from DISABLED TO ENABLED?**	**Yes** REPAIR circuit CDC12 (YE). TEST the system for normal operation. **No** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation.

Pinpoint Test C: Unusual Starter Noise

This pinpoint test is intended to diagnose the following:

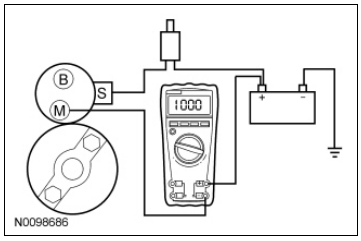
- Starter motor mounting
- Starter motor mounting bolts
- Starter motor drive
- Flywheel or flexplate ring gear
- Starter motor

PINPOINT TEST C: UNUSUAL STARTER NOISE

Test ep	Result / Action to Take
C1 CHECK THE STARTER MOUNTING	
• Inspect the starter motor mounting bolts for looseness. • **Is the starter motor mounted correctly?**	**Yes** GO to C2 . **No** INSTALL the starter motor correctly. REFER to Starter Motor - 2.5L , Starter Motor - 3.0L or Starter Motor - 3.5L in this section. TEST the system for normal operation.
C2 CHECK FOR ENGINE NOISE	
• Turn the ignition switch to the OFF position. • Connect a fused jumre from the B-terminal to the S-terminal of the starter motor. Engage the starter motor and verify that the noise is due to the starter operation. • **Is the noise due to the starter motor engagement?**	**Yes** GO to C3 . **No** REFER to Section 303-00 to continue the diagnosis.
C3 CHECK FOR UNUSUAL WEAR	
• Remove the starter motor. Refer to Starter Motor - 2.5L , Starter Motor - 3.0L or Starter Motor - 3.5L in this section. • Inspect the ring gear for damaged or worn teeth. • **Is the noise due to flexplate/flywheel ring gear tooth damage?**	**Yes** INSTALL a new flexplate/flywheel ring gear. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. REFER to Starter Motor - 2.5L , Starter Motor - 3.0L or Starter Motor - 3.5L in this section. TEST the system for normal operation. **No** INSTALL a new starter motor. REFER to Starter Motor - 2.5L , Starter Motor - 3.0L or Starter Motor - 3.5L in this section. TEST the system for normal operation.

Component Tests

⚠ WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.



Connect the Fluke 77-IV Digital Multimeter at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor - Motor Feed Circuit

1. Make sure the battery is fully charged. Carry out a battery load test. Refer to Section 414-01 .

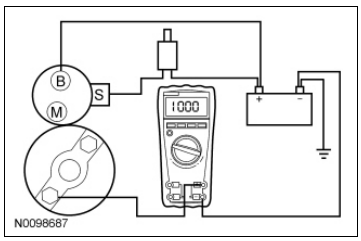
2. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.

3. Connect the Fluke 77-IV Digital Multimeter positive lead to the battery positive (+) post. Connect the negative lead to the M-terminal.

4. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.8 volt or less.

5. If the voltage reading is 0.8 volt or less, go to the Starter Motor - Ground Circuit Component Test.

6. If the voltage reading is greater than 0.8 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the Fluke 77-IV Digital Multimeter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.8 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.



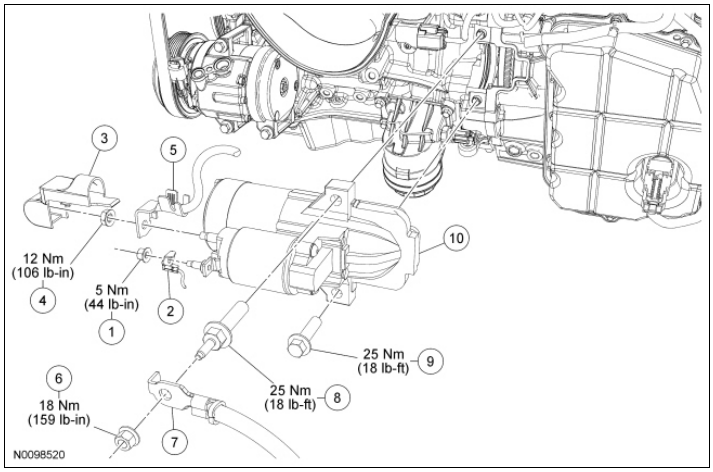
7. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.8 volt when checked at the M-terminal and less than 0.8 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor. Refer to Starter Motor - 2.5L , Starter Motor - 3.0L or Starter Motor - 3.5L in this section.

8. If the voltage reading taken at the solenoid B-terminal is still greater than 0.8 volt after cleaning the cables and the connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself. Clean the positive (+) battery cable connection. If this does not solve the problem, install a new positive battery cable. Refer to Section 414-01 .

Starter Motor - Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect the Fluke 77-IV Digital Multimeter positive lead to the starter motor housing (the connection clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.



2. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.

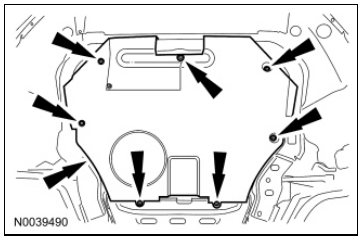
3. If the voltage is more than 0.5 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connections. Retest.

4. If the voltage is more than 0.5 volt, install a new cable. If the voltage reading is less than 0.5 volt and the engine still cranks slowly, install a new starter motor. Refer to Starter Motor - 2.5L , Starter Motor - 3.0L or Starter Motor - 3.5L in this section.

&nbP>

Starter Motor - 2.5L

Item	Part Number	Description
1	N805320	Starter motor solenoid wire nut
2	14463	Starter motor solenoid wire (part of 14B060)
3	14603	Starter motor solenoid battery cable terminal cover
4	W706414	Starter motor solenoid battery cable nut
5	14463	Starter motor solenoid battery cable (part of 14B060)
6	W705790	Ground wire nut
7	14463	Ground wire (part of 14B060)
8	W706194	Starter motor stud bolt
9	W705877	Starter motor bolt
10	11000	Starter motor



Removal and Installation

⚠ WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at ttarter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

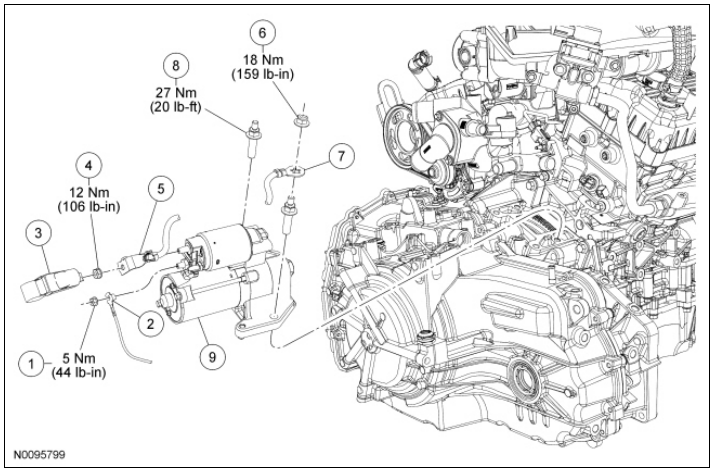
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. If equipped, remove the 7 screws and the underbody cover.

4. Remove the starter motor solenoid wire nut and position the wire aside.
    - To install, tighten to 5 Nm (44 lb-in).

5. Position the starter motor solenoid battery cable terminal cover aside.



6. Remove the starter motor solenoid battery cable nut and position the cable aside.
    - To install, tighten to 12 Nm (106 lb-in).

7. Remove the ground wire nut from the starter motor stud bolt and position the ground wire aside.
    - To install, tighten to 18 Nm (159 lb-in).

8. Remove the starter motor bolt, stud bolt and the starter motor.
    - To install, tighten to 25 Nm (18 lb-ft).

9. To install, reverse the removal procedure.

Starter Motor - 3.0L

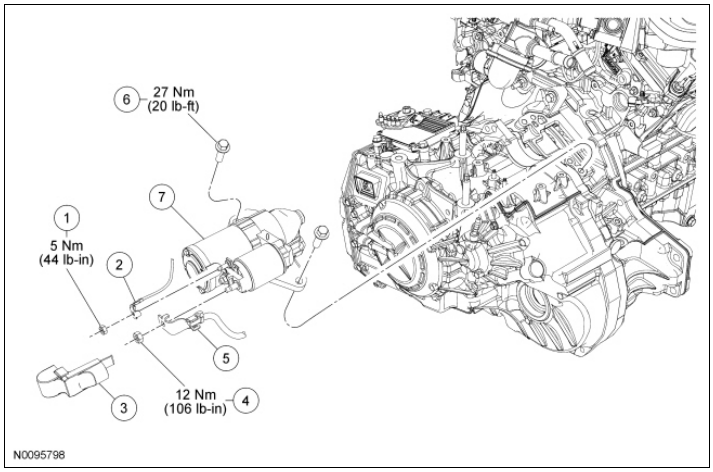
Item	Part Number	Description
1	N805320	Starter motor solenoid wire nut
2	14463	Starter motor solenoid wire (part of 12B637)
3	14603	Starter motor solenoid battery cable terminal cover
4	W706414	Starter motor solenoid battery cable nut
5	14463	Starter motor solenoid battery cable (part of 14B060)
6	-	Ground wire nut
7	14463	Ground wire (part of 14A280)
8	W503297	Starter motor stud bolt (2 required)
9	11000	Starter motor

⚠ WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this ction may result in serious personal injury.

1. Remove the battery tray. For additional information, refer to Section 414-01 .

2. Remove the starter motor solenoid wire nut and position the wire aside.
   - To install, tighten to 5 Nm (44 lb-in).

3. Position the starter motor solenoid terminal battery cable cover aside.



4. Remove the starter motor solenoid battery cable nut and position aside the cable.
   - To install, tighten to 12 Nm (106 lb-in).

5. Remove the ground wire nut from the starter motor stud bolt and position the ground wire aside.
   - To install, tighten to 18 Nm (159 lb-in).

6. Remove the 2 starter motor stud bolts and the starter motor.
   - To install, tighten to 27 Nm (20 lb-ft).

7. To install, reverse the removal procedure.

Starter Motor - 3.5L

Item	Part Number	Description
1	N805320	Starter motor solenoid wire nut
2	14463	Starter motor solenoid wire (part of 14B060)
3	14603	Starter motor solenoid battery cable terminal cover
4	W706414	Starter motor solenoid battery cable nut
5	14463	Starter motor solenoid battery cable (part of 14B060)
6	W503297	Starter motor bolt (2 required)
7	11000	Starter motor

⚠ WARNING: Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.

1. Remove the battery tray. For additional information, refer to Section 414-01 .

2. Remove the starter motor solenoid wire nut and position the wire aside.
   - To install, tighten to 5 Nm (44 lb-in).

3. Position the starter motor solenoid terminal battery cable cover aside.

4. Remove the starter motor solenoid battery cable nut and position aside the cable.
   - To install, tighten to 12 Nm (106 lb-in).

5. Remove the 2 starter motor bolts and the starter motor.
   - To install, tighten to 27 Nm (20 lb-ft).

6. To install, reverse the removal procedure.

Engine Ignition

The Electronic Ignition (EI) system is a coil-on-plug ignition system. The coil-on-plug ignition system consists of the:

- ignition coil-on-plugs.
- spark plugs.
- Crankshaft Position (CKP) sensor.
- Camshaft Position (CMP) sensor.

The ignition coil-on-plugs:

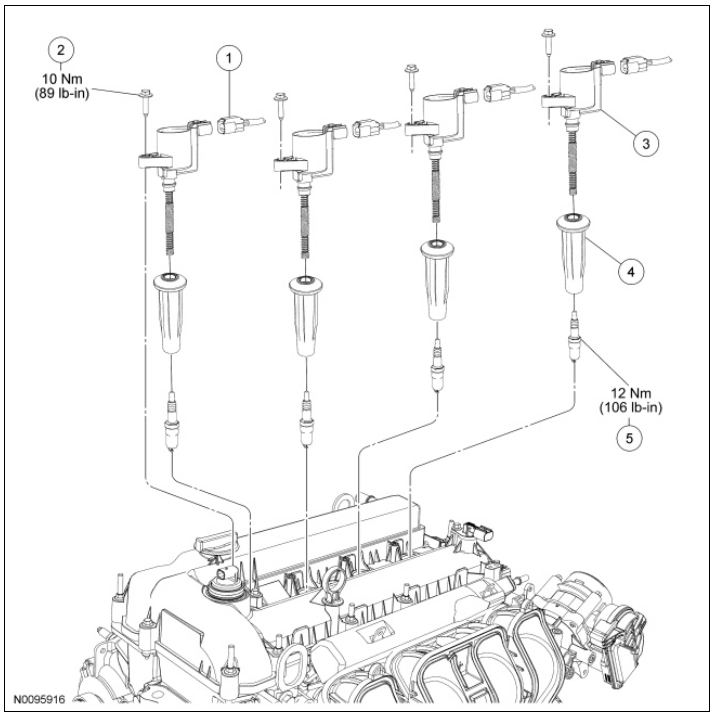
- change low voltage signals from the PCM to high voltage pulses.
- supply the high voltage pulses to the spark plugs.
- are connected directly to each spark plug.
- have replaceable coil boots.

The spark plugs:

- change high voltage pulses into a spark which ignites the fuel and air mixture.

The CKP sensor:

- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth trigger wheel mounted on the crankshaft.
- provides base timing and crankshaft speed (rpm) to the PCM.
- is essential for calculating spark ng.



The CMP sensor:

- is a Hall-effect sensor.
- provides camshaft rotational location information to the PCM.
- sends the PCM a signal indicating camshaft position used for fuel synchronization.

Engine Ignition

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Engine Ignition Components - Exploded View

Item	Part Number	Description
1	14A464	Ignition coil-on-plug electrical connector (part of 12B637) (4 required)

1. For additional inforrefer to the procedures in this section.

Ignition Coil-On-Plug

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal and Installation

1. Disconnect the 4 ignition coil-on-plug electrical connectors.

2. **NOTE:** When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.

   Remove the 4 bolts and the ignition coil-on-plugs.

   - To install, tighten to 10 Nm (89 lb-in).

3. Inspect the ignition coil-on-plug boots for rips, nicks or tears. Remove and discard any damaged ignition coil-on-plug boots.
   - To install, slide the new coil-on-boot onto the coil until fully seated at the top of the coil.

4. To install, reverse the removal procedure.
   - Apply a small amouf dielectric grease to the inside of the ignition coil-on-plug boots before attaching to the spark plugs.

Spark Plugs

Removal and Installation

1. Remove the 4 ignition coil-on-plugs. For additional information, refer to Ignition Coil-On-Plug in this section.

2. *NOTICE:* **Only use hand tools when removing or installing the spark plugs, or damage can occur to the cylinder head or spark plug.**

   NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.

   Remove the 4 spark plugs.

   - To install, tighten to 12 Nm (106 lb-in).

3. Inspect the 4 spark plugs. For additional information, refer to Section 303-00 .

4. To install, reverse the removal procedure.
   - Adjust the spark plug gap as necessary.

Engine Ignition

The Electronic Ignition (EI) system is a coil-on-plug ignition system. The coil-on-plug ignition system consists of the:

- Camshaft Position (CMP) sensor.
- Crankshaft Position (CKP) sensor.
- ignition coil-on-plugs.
- spark plugs.

The CMP sensor:

- is a Hall-effect sensor.
- is mounted in the front cover.
- is triggered by the high point mark on the LH exhaust camshaft.
- sends the PCM a signal indicating camshaft position used for fuel synchronization.

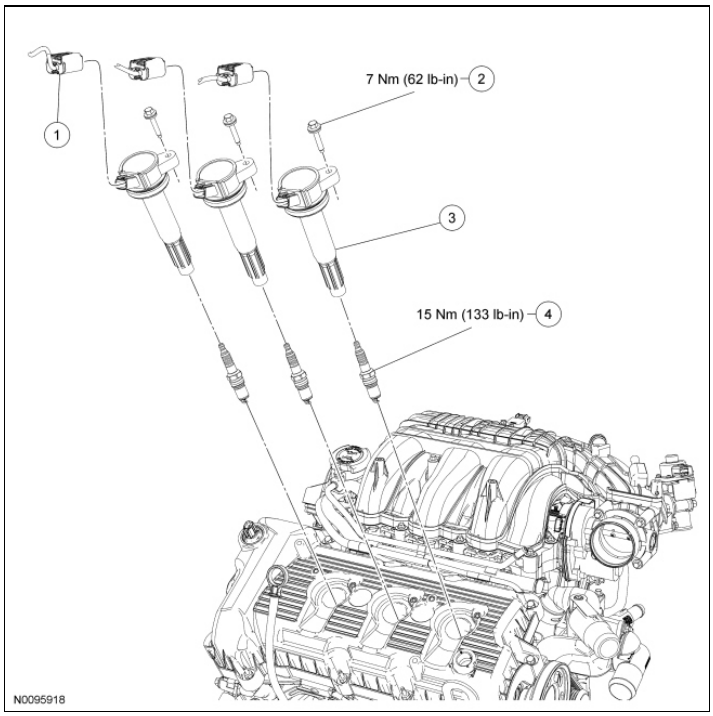
The CKP sensor:

- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth trigger wheel mounted on the crankshaft.
- provides base timing and crankshaft speed (rpm) to the PCM.
- is essential falculating spark timing.

The ignition coil-on-plugs:

- change low voltage signals from the PCM to high voltage pulses.
- produce the high voltage pulses to the spark plugs.
- are connected directly to each spark plug.

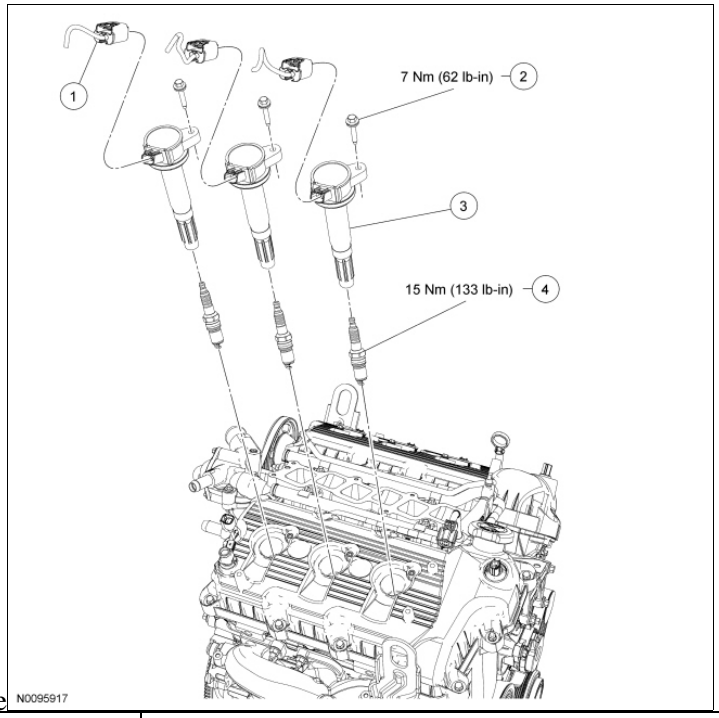
The spark plugs:



- change high voltage pulses into a spark which ignites the fuel and air mixture.
- originally equipped on the vehicle have a fine wire design platinum-enhanced active electrode for long life.

Engine Ignition

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.



Engine Ignition Components - Exploded View

LH Side

Item	Part Number	Description
1	14A464	LH ignition coil-on-plug electrical connector (part of 12B637) (3 required)

Ignition Coil-On-Plug

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Removal and Installation

RH side

1. **NOTE:** The upper intake manifold must be removed to access the RH ignition coil-on-plugs only.

   Remove the upper intake manifold. For additional information, refer to Section 303-01B .

Both sides

2. Disconnect the 6 ignition coil-on-plug electrical connectors.

3. **NOTE:** When removing the ignition coil-on-plugs, a slight twisting motion will break the seal and ease removal.

   Remove the 6 bolts and the 6 ignition coil-on-plugs.

   - To install, tighten to 7 Nm (62 lb-in).

4. To install, reverse the removal procedure.
   - Apply a small amount of dielectric grease to the inside of the ignition coil-on-plug boots before attaching to the spark plugs.

Spark Plugs

Removal and Installation

1. Remove the 6 ignition coil-on-plugs. For additional information, refer to Ignition Coil-On-Plug in this section.

2. *NOTICE:* **Only use hand tools when removing or installing the spark plugs, or damage can occur to the cylinder head or spark plug.**

   NOTE: Use compressed air to remove any foreign material in the spark plug well before removing the spark plugs.

   Remove the 6 spark plugs.

   - To install, tighten to 15 Nm (133 lb-in).

3. Inspect the 6 spark plugs. For additional information, refer to Section 303-00 .

4. To install, reverse the removal procedure.
   - Adjust the spark plug gap as necessary.

Engine Ignition

The Electronic Ignition (EI) system is a coil-on-plug ignition system. The coil-on-plug ignition system consists of:

- Camshaft Position (CMP) sensors.
- a Crankshaft Position (CKP) sensor.
- ignition coil-on-plugs.
- spark plugs.

The CMP ors:

- are variable reluctance sensors.
- are mounted in the rear of the cylinder head.
- are triggered by a 3-plus-1 timing wheel on each intake camshaft.
- provides camshaft rotational location information to the PCM.

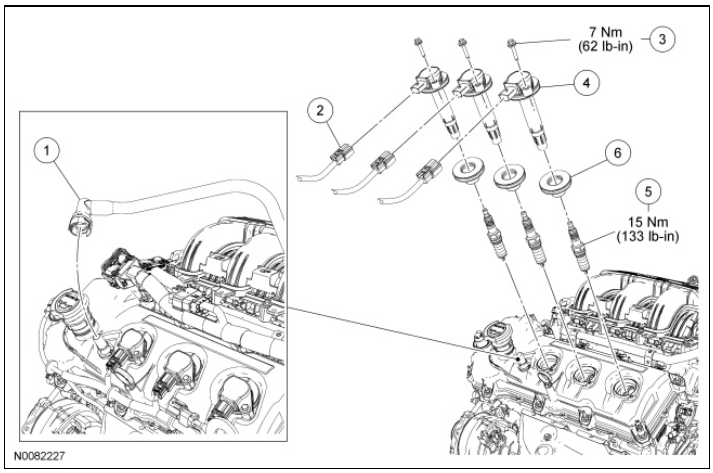
The CKP sensor:

- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth trigger wheel mounted on the crankshaft, at the rear of the engine.
- provides base timing and crankshaft speed (rpm) to the PCM.

The ignition coil-on-plugs:

- change low voltage signals from the PCM to high voltage pulses.
- produce the high voltage pulses to the spark plugs.
- are connected directly to each spark plug.
- have replaceable coil seals.

The spark plugs:



- change high voltage pulses into a spark which ignites the fuel and air mixture.
- originally equipped on the vehicle have a platinum-enhanced fine wire electrode for long life.

Engine Ignition

Motorcraft® Metal Surface Prep ZC-31-A	-	-

Torque Specifications

Description	Nm	lb-in
Crankcase vent oil separator bolts	10	89
EGR valve bolts	20	177

Engine Emission Control

NOTE: Do not permanently remove or render inoperative any part of the vehicle emission control system including related hardware. Failure to comply may violate applicable state and federal laws.

NOTE: The vehicle emission vacuum routing diagrams are contained in the Description and Operation subsection of the Engine Emissions Control section. For additional information, refer to Section 303-13A .

The engine emission control system consists of the:

- EGR system.
- PCV system.

EGR system

The EGR system returns a small amount of exhaust gas into the intake manifold. This reduces the overall combustion temperature. Cooler combustion temperatures provide a significant reduction of the Nitrogen Ox (NOx) in the exhaust emissions.

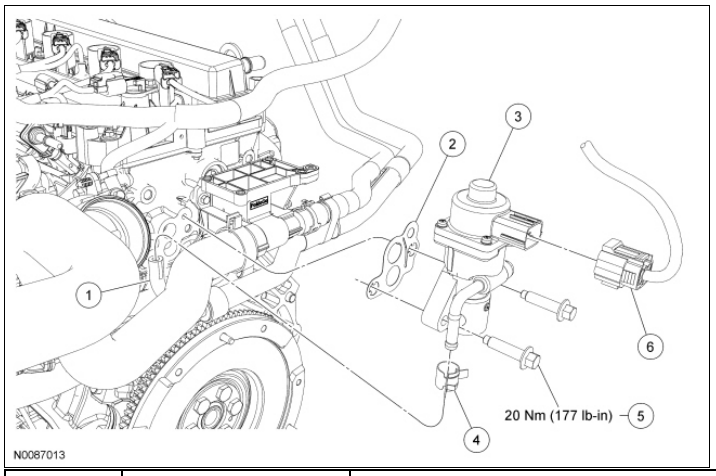
The engine incorporates a stepper motor-controlled EGR valve which receives its signal from the PCM. Engine coolant is used to cool the EGR valve. The EGR valve and stepper motor are serviced as an assembly.

The amount of recirculated exhaust gas depends on:

- engine rpm.
- intake manifold vacuum.
- exhaust backpressure.
- Engine Coolant Temperature (ECT).
- Throttle Position (TP).

PCV system

The PCV system uses intake manifold vacuum to ventilate blow-by vapors from the crankcase and return the vapors to the intake manifold for combustion. The PCV valve varies the amount of blow-by vapors returned to the intake manifold based on available engine vacuum. The PCV valve also prevents entry of combustion backfiring into the crankcase. The PCV valve is serviced as part of the crankcase vent oil separator.



Engine Emission Control

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Exhaust Gas Recirculation (EGR) Valve

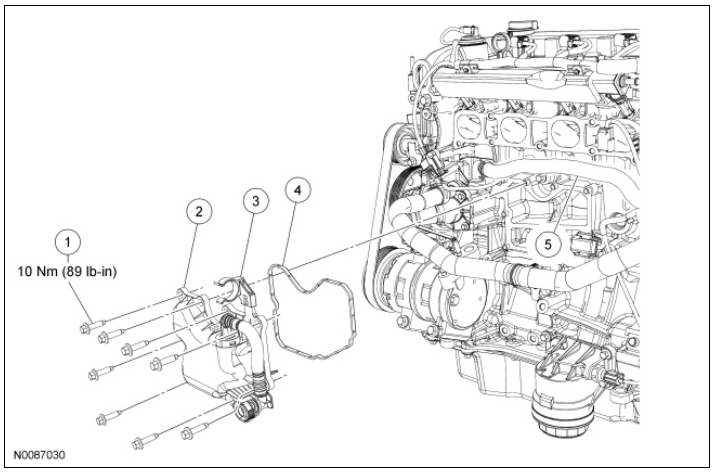
Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31-A	-

Item	Part Number	Description
1	-	EGR valve coolant hose (part of 18C266)
2	9D476	EGR valve gasket
3	9D475	EGR valve
4	W525952	EGR valve cose clamp
5	W500225	EGR valve bolt
6	14A464	EGR valve electrical connector

Removal and Installation

1. Drain the cooling system. For additional information, refer to Section 303-03A .
2. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12A .
3. Disconnect the EGR valve electrical connector.
4. Release the clamp and remove the EGR coolant outlet hose from the EGR valve.
5. Remove the 2 bolts and the EGR valve.
   - Discard the gasket.
   - To install, tighten to 20 Nm (177 lb-in).
6. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the Exhaust Gas Recirculation (EGR) valve gasket.**



NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the mating surfaces.

Clean the mating surfaces of any residual gasket material.

7. To install, reverse the removal procedure.

8. Fill and bleed the cooling system. For additional information, refer to Section 303-03A .

Crankcase Vent Oil Separator

Item	Part Number	Description

Engine Emission Control

NOTE: Do not permanently remove or render inoperative any part of the vehicle emission control system including related hardware. Failure to comply may violate applicable state and federal laws.

NOTE: The vehicle emission vacuum routing diagrams are contained in the Description and Operation subsection of the Engine Emissions Control section. For additional information, refer to Section 303-13A .

The engine emission control system consists of the:

- EGR system.
- PCV system.

EGR system

The EGR system returns a small amount of exhaust gas into the intake manifold. This reduces the overall combustion temperature. Cooler combustion temperatures provide a significant reduction of the Ngen Oxides (NOx) in the exhaust emissions.

The EGR valve:

- is electronically controlled by the PCM.
- is connected to the exhaust manifold by the EGR valve-to-exhaust manifold tube.
- controls recirculated exhaust gas flow to the intake manifold.
- monitors the flow of recirculated exhaust gases through the EGR valve-to-exhaust manifold tube.
- returns a signal to the PCM.

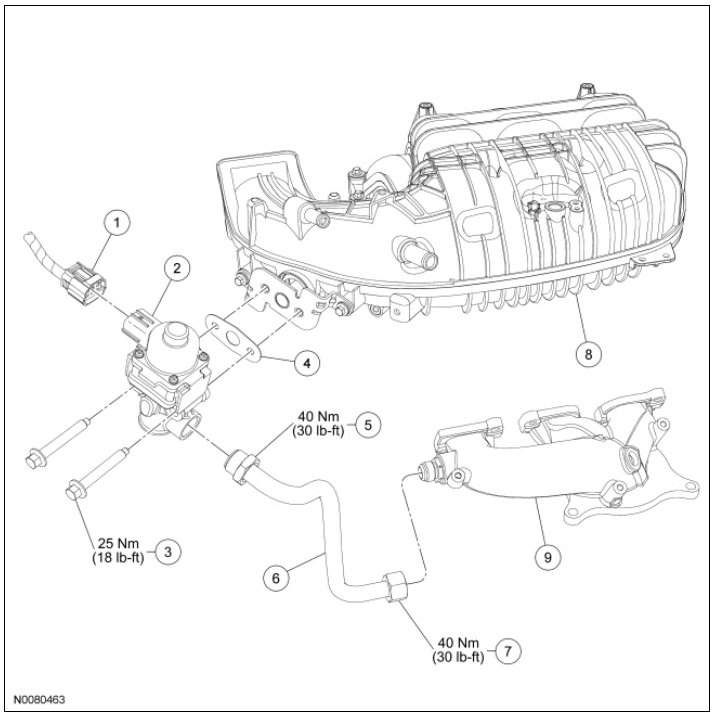
The amount of recirculated exhaust gas depends upon:

- engine rpm.
- intake manifold vacuum.
- exhaust back pressure.
- engine coolant temperature.
- Throttle Position (TP).

PCV system

The PCV system:

- uses intake manifold vacuum to ventilate blow-by vapors from the crankcase.
- returns the vapors to the intake manifold for combustion.



The PCV system consists of the:

- crankcase ventilation tube.
- PCV valve.

Engine Emission Control

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Material

Item	Specification
Motorcraft® Metal Surface Prep ZC-31-A	-

Removal and Installation

1. Disconnect the EGR valve electrical connector.

2. Disconnect the exhaust manifold-to-EGR valve tube fitting from the EGR valve.
   - To install, tighten to 40 Nm (30 lb-ft).

3. Remove the 2 bolts and the EGR valve.
   - Discard the gasket.
   - To install, tighten to 25 Nm (18 lb-ft).

4. i>NOTICE: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the Exhaust Gas Recirculation (EGR) system module gasket.

   NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

   Clean the mating surfaces of any residual gasket material.

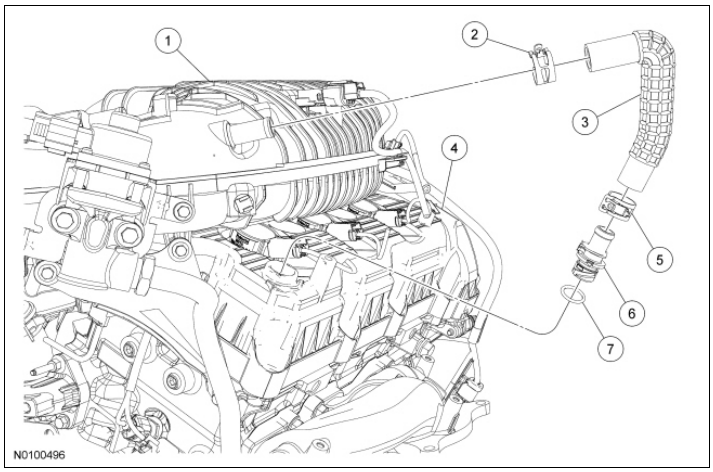
5. To install, reverse the removal procedure.
   - Install a new EGR valve gasket.

Exhaust Manifold to Exhaust Gas Recirculation (EGR) Valve Tube

Removal

All-Wheel Drive (AWD) vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



All vehicles

2. Disconnect the exhaust manifold-to-EGR valve tube fitting from the EGR valve.
3. Disconnect the exhaust manifold-to-EGR valve tube fitting from the exhaust manifold.
4. Remove the exhaust manifold-to-EGR valve tube.

Installation

1. Install the exhaust manifold-to-EGR valve tube.
2. Hand start txhaust manifold-to-EGR valve tube fitting to the exhaust manifold.
3. Hand start the exhaust manifold-to-EGR valve tube fitting to the EGR valve.
4. Tighten the exhaust manifold-to-EGR valve tube fittings to 40 Nm (30 lb-ft).

Positive Crankcase Ventilation (PCV) Valve

Item	Part Number	Description

Removal and Installation

1. Depower the High Voltage Traction Battery (HVTB) system. For additional information, refer to Section 414-03 .
2. Drain the cooling system. For additional information, refer to Section 303-03B .
3. Remove the Throttle Body (TB). For additional information, refer to Section 303-04D .
4. Release the clamp and separate the upper heater hose.
5. Release the clamp and remove the bypass hose from the coolant outlet adapter.
6. Release the clamp and remove the upper radiator hose from the coolant outlet adapter.
7. Release the clamp and remove the heater hose from the EGR valve.
8. Remove the bolt and the nut and position the Motor Electronics Cooling System (MECS) coolant expansion tank aside.
    - To install, tighten to 9 Nm (80 lb-in).
9. Disconnect the EGR valve electrical connector.
10. Release the engine wire harness retainer from the valve cover stud.
11. Remove the high-voltage wire harness bolt.
    - To install, tighten to 9 Nm (80 lb-in).
12. Disconnect the transaxle high-voltage electrical connector.
13. Carefully position the upper heater hose aside.
14. Release the clamp and remove the lower heater hose from the coolant outlet adapter.
15. Remove the 4 bolts and position the coolant outlet adapter aside.

- To install, tighten to 10 Nm (89 lb-in).

16. Remove the 2 bolts and the EGR valve.
    - To install, tighten to 20 Nm (177 lb-in).

17. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the coolant outlet adapter gasket.**

    Remove the coolant outlet adapter and discard the gasket.

    - Clean and inspect the coolant outlet adapter mating surfaces.

18. ***NOTICE:*** **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the Exhaust Gas Recirculation (EGR) valve gasket.**

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces

    NOTE: Do not reuse the EGR valve gasket.

    Remove and discard the EGR valve gasket.

    - Clean and inspect the EGR gasket mating surfaces.

19. To install, reverse the removal procedure.

20. Fill and bleed the cooling system. For additional information, refer to Section 303-03B .

Crankcase Vent Oil Separator

Item	Part Number	Description
1	W500214	Crankcase vent oil separator bolt (8 required)
2	6A785	Crankcase vent oil separator
3	-	Coolant bypass hose clip (part of 9A785)
4	6A785	Crankcase vent oil separator gasket
5	8A582	Coolant bypass hose

Removal and Installation

1. Remove the intake manifold. For additional informatifer to Section 303-01D .

2. Release the coolant bypass hose from the clip.

3. Remove the 8 bolts and the crankcase vent oil separator and gasket.
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.
   - Clean the engine block mating surface.

Torque Specifications

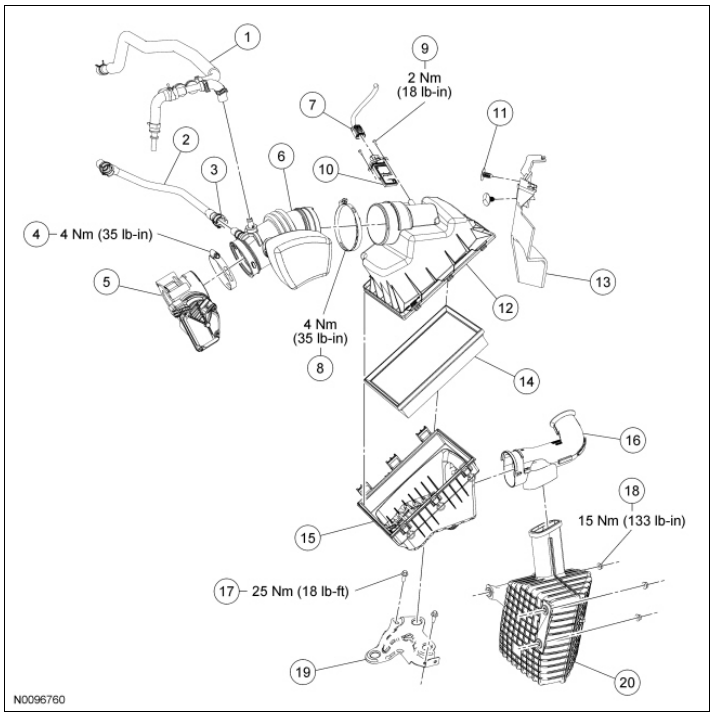
Description	Nm	lb-ft	lb-in
Air Cleaner (ACL) insulator support bracket bolt	25	18	-
ACL outlet pipe-to- ACL housing cover clamp	4	-	35
ACL outlet pipe-to-Throttle Body (TB) clamp	4	-	35
Intake air resonator nut	15	-	133
Mass Air Flow (MAF) sensor screw	2	-	18

Intake Air Distribution and Filtering

The air intake system consists of the:

- Air Cleaner (ACL) outlet pipe.
- ACL element.
- Mass Air Flow (MAF) sensor.
- ACL housing assembly.
- intake air resonator.

The air intake system:



- cleans intake air with a replaceable, dry-type ACL element.
- measures airflow and air temperatwith the MAF sensor.

The engine ACL contains an ACL element made of treated, pleated paper, which must be replaced periodically as scheduled. Engine performance and fuel economy are adversely affected when maximum restriction of the ACL element is reached.

Intake Air Distribution and Filtering

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Air Cleaner

Removal and Installation

1. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

2. Loosen the clamp and disconnect the Air Cleaner (ACL) outlet pipe from the ACL housing cover.
   - To install, tighten to 4 Nm (35 lb-in).

3. **NOTE:** No tools are needed to remove the ACL assembly. Removal should be carried out using hands only.

   Separate the 3 ACL feet from the rubber grommets and the ACL inlet pipe and remove the ACL assembly.

4. **NOTE:** Make sure that the 3 ACL feet are seated into the rubber grommets under the ACL assembly.

   NOTE: The ACL outlet pipe should be securely sealed to prevent unmetered air from entering the engine.

   To install, reverse the removal procedure.

Air Cleaner Outlet Pipe

Removal and Installation

1. Disconnect the crankcase ventilation tube-to-Air Cleaner (ACL) outlet pipe quick connect coupling. For additional information, refer to Section 310-00 .

2. Remove the vacuum tube to ACL outlet pipe.

3. Loosen the clamp and remove the ACL outlet pipe from the Throttle Body (TB).
   - To install, tighten to 4 Nm (35 lb-in).

1. Loosen the ACL outlet pipe-to- ACL housing cover clamp.
   - Remove the ACL outlet pipe.
   - To install, tighten to 4 Nm (35 lb-in).

5. **NOTE:** The ACL outlet pipe should be securely sealed to prevent unmetered air from entering the engine.

   To install, reverse the removal procedure.

Intake Air Resonator

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the LH fender splash shield. For additional information, refer to Section 501-02 .

3. Remove the 3 nuts and the intake air resonator.
   - To install, tighten to 15 Nm (133 lb-in).

4. **NOTE:** Make sure that the ACL inlet pipe is securely seated to the intake air resonator.

   To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Air Cleaner (ACL) insulator support bracket bolt	25	18	-
ACL outlet pipe-to- ACL housing cover clamp	4	-	35
ACL outlet pipe-to-Throttle Body (TB) clamp	4	-	35
Intake air resonator nuts	15	-	133

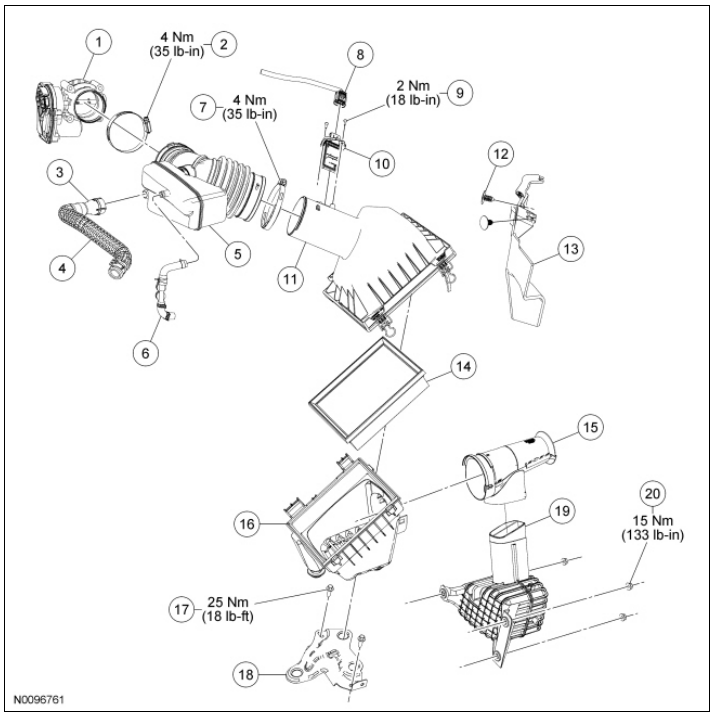
Intake Air Distribution and Filtering

The air intake system consists of the:

- Air Cleaner (ACL) outlet pipe.
- ACL element.
- Mass Air Flow (MAF) sensor.
- ACL housing assembly.
- intake air resonator.

The air intake system:



- cleans intake air with a replaceable, dry-type ACL element.
- measures airflow and air temperature with the MAF sensor.

The engine ACL contains an ACL element made of treated, pleated paper, which must be replaced periodically as scheduled. Engine performance and fuel economy are adversely affected when maximum restriction of the ACL element is reached.

Intake Air Distribution and Filtering

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

1. For additional information, refer to the procedures in this section.

Air Cleaner

Removal and Installation

1. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

2. Loosen the clamp and disconnect the Air Cleaner (ACL) outlet pipe-to- ACL housing cover.
   - To install, tighten to 4 Nm (35 lb-in).

3. **NOTE:** No tools are needed to remove the ACL assembly. Removal should be carried out using hands only.

   Separate the 3 ACL feet from the rubber grommets and the ACL inlet pipe and remove the n title="Air Cleaner" class="popup" onmouseover="this.className='popupnounderline';" onmouseout="this.className='popup';">ACL assembly.

4. **NOTE:** Make sure that the 3 ACL feet are seated into the rubber grommets under the ACL assembly.

   NOTE: The ACL outlet pipe should be securely sealed to prevent unmetered air from entering the engine.

   To install, reverse the removal procedure.

Air Cleaner Outlet Pipe

Removal and Installation

All-Wheel Drive (AWD) vehicles

1. Disconnect the vacuum hose from the Air Cleaner (ACL) outlet pipe.

All vehicles

2. Disconnect the crankcase ventilation tube-to- ACL outlet pipe quick connect coupling. For additional information, refer to Section 310-00 .

3. Loosen the ACL outlet pipe-to-Throttle Body (TB) clamp.
   To install, tighten to 4 Nm (35 lb-in).

4. Loosen the ACL outlet pipe-to- ACL housing cover clamp.
   - Remove the ACL outlet pipe.
   - To install, tighten to 4 Nm (35 lb-in).

5. **NOTE:** The ACL outlet pipe should be securely sealed to prevent unmetered air from entering the engine.

   To install, reverse the removal procedure.

Intake Air Resonator

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the LH fender splash shield. For additional information, refer to Section 501-02 .

3. Remove the 3 nuts and the air intake resonator.
   - To install, tighten to 15 Nm (133 lb-in)/li>

4. **NOTE:** Make sure that the Air Cleaner (ACL) inlet pipe is securely seated to the intake air resonator.

   To install, reverse the removal procedure.

1. For additional information, refer to the procedures in this section.

Air Cleaner

Removal and Installation

1. Disconnect the Mass Air Flow (MAF) sensor electrical connector and release the wiring harness pin-type retainer from the Air Cleaner (ACL) housing.

2. Loosen the clamp and disconnect the ACL outlet pipe from the ACL housing cover.
   - To install, tighten to 4 Nm (35 lb-in).

3. Remove the ACL housing bolt.
   - To install, tighten to 4 Nm (35 lb-in).

4. Remove the 2 AC/span> inlet pipe bolts.
   - To install, tighten to 4 Nm (35 lb-in).

5. **NOTE:** No tools are needed to remove the ACL assembly. Removal should be carried out using hands only.

   Separate the 2 ACL feet from the rubber grommets and remove the ACL and the ACL inlet pipe as an assembly.

6. **NOTE:** Make sure that the 2 ACL feet are seated into the rubber grommets under the ACL assembly.

   NOTE: The ACL outlet pipe should be securely sealed to prevent unmetered air from entering the engine.

   To install, reverse the removal procedure.

Air Cleaner Outlet Pipe

Removal and Installation

1. Disconnect the crankcase ventilation tube-to-Air Cleaner (ACL) outlet pipe quick connect coupling. For additional information, refer to Section 310-00 .

2. Release the clamp and disconnect the vacuum hose from the ACL outlet pipe.

3. Loosen the ACL outlet pipe-to- ACL housing cover clamp.
   - To install, tighten to 4 Nm (35 lb-in).

4. Loosen the ACL outlet pipe-to-Throttle Body (TB) clamp.
   - Remove the ACL outlet pipe.
   - To install, tighten to 4 Nm (35 lb-in).

5. **NOTE:** The ACL outlet pipe should be securely sealed to prevent unmetered air from entering the engine.

   To install, reverse the removal procedure.

Intake Air Resonator

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the LH fender splash shield. For additional information, refer to Section 501-02 .

3. Remove the 2 nuts and the air intake resonator.
   - To install, tighten to 15 Nm (133 lb-in).

4. **NOTE:** Make sure that the Air Cleaner (ACL) inlet pipe is securely seated to the intake air resonator.

   To install, reverse the removal procedure.

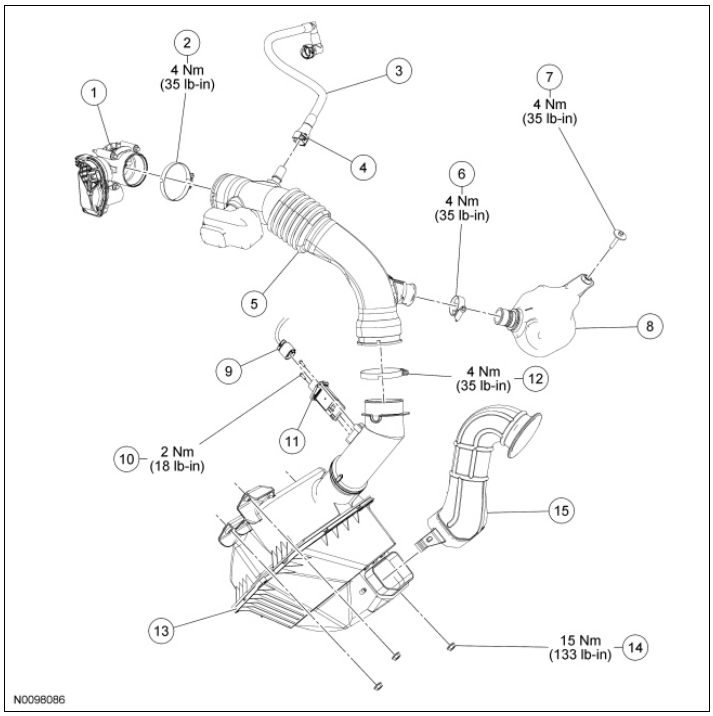
Intake Air Distribution and Filtering

The air intake system consists of the:

- Air Cleaner (ACL) outlet pipe.
- ACL assembly.
- Mass Air Flow (MAF) sensor.
- intake air resonator assembly.

The air intake system:



- cleans intake air with a long life ACL assembly.
- measures airflow and air temperature with the MAF sensor.

The vehicle utilizes a long life ACL assembly designed to last the life of the vehicle. The ACL is serviced as a complete ACL assembly.

Intake Air Distribution and Filtering

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

15	-	ACL intake pipe (part of 9600)

1. For additional information, refer to the procedures in this section.

Air Cleaner

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the LH fender splash shield. For additional information, refer to Section 501-02 .

3. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

4. Loosen the clamp and disconnect the Aieaner (ACL) outlet pipe from the ACL assembly.
   - To install, tighten to 4 Nm (35 lb-in).

5. Remove the 3 nuts, release the ACL intake pipe and remove the ACL assembly.
   - To install, tighten to 15 Nm (133 lb-in).

6. To install, reverse the removal procedure.

Air Cleaner Outlet Pipe

Removal and Installation

1. Disconnect the crankcase ventilation tube -to-Air Cleaner (ACL) outlet pipe quick connect coupling. For additional information, refer to Section 310-00 .

2. Loosen the ACL outlet pipe-to-Throttle Body (TB) clamp.
   - To install, tighten to 4 Nm (35 lb-in).

3. Loosen the ACL outlet pipe-to- ACL assembly clamp.
   - Remove the ACL outlet pipe.
   - To install, tighten to 4 Nm (35 lb-in).

4. **NOTE:** The ACL outlet pipe should be securely sealed to prevent unmetered air from entering the engine.

   To install, reverse the removal procedure.

Intake Air Resonator

Removal and Installation

1. Loosen the Air Cleaner (ACL) outlet pipe-to-intake air resonator clamp.
   - To install, tighten to 4 Nm (35 lb-in).

2. Remove the bolt and the air intake resonator.
   - To install, tighten to 4 Nm (35 lb-in).

3. **NOTE:** Make sure that the intake air resonator is securely seated to the ACL outlet pipe.

   To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Evaporative Emission (EVAP) canister bolts	6	-	53
EVAP canister nuts	6	-	53
EVAP canister purge valve bolts	10	-	89
Fuel tank filler pipe heat shield nuts	10	-	89
Fuel tank filler pipe hose clamp	4	-	35
Fuel tank strap bolts	40	30	-

Evaporative Emissions

The Evaporative Emission (EVAP) system consists of the:

- EVAP canister purge valve.
- EVAP canister (includes the dust separator and the vent solenoid).
- fuel vapor tube assembly (includes the Fuel Tank Pressure (FTP) sensor).
- Easy FuelTM (capless) fuel tank filler pipe.

The EVAP system:

- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister, that are generated during vehicle operation or hot soak, until they can be consumed by the engine during normal engine operation.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the PCM which, using various sensor inputs, calculates the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the EVAP canister purge valve.

The fuel vapors are routed:

- from the fuel tank through the fuel vapor vent valve.
- to the EVAP canisters through a vapor tube.
- from the EVAP canister to the engine when the EVAP canister purge valve is opened by the PCM.

The FTP sensor (part of fuel vapor tube assembl):

- monitors the pressure levels in the fuel tank.
- communicates the pressure reading to the PCM during the OBD II leak test.

The fuel vapor tube assembly:

- is located under the rear of the vehicle.
- is used to control the flow of fuel vapors entering the EVAP system.
- includes the FTP sensor.

The EVAP canister:

- is located under the rear of the vehicle.
- includes the dust separator and vent solenoid.
- contains activated carbon.
- stores fuel vapors.

The Easy Fuel TM capless fuel tank filler pipe:

- relieves system vacuum below -3.5 kPa (-16.00 in H_2O).

The EVAP canister vent solenoid:

- is normally open.

- seals the EVAP system for the inspection and maintenance (I/M 240) test and OBD II leak and pressure tests.
- is serviced as part of the EVAP canister.

The EVAP canister purge valve:

- is normally closed.
- regulates the purging of the EVAP canister.
- is controlled by the PCM.
- is repaired as a separate item.
- is mounted to the intake manifold on the 2.5L and 3.0L.
- is mounted below the lower cowl panel on the 3.5L.

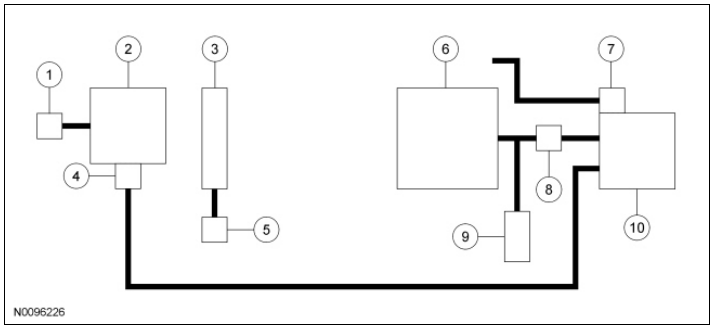
The dust separator:

- is attached to the EVAP canister vent solenoid.
- prevents suspended dust and dirt particles from entering the EVAP system.
- is serviced as part of the EVAP canister.

The EVAP system monitor:

- is a self-test strategy within the PCM which tests the integrity of the EVAP system.
- monitors the EVAP system for leaks.
- monitors electronic EVAP components for irrationally high or low voltages.
- monitors for correct EVAP system operation.
- uses negative and positive leak test methods to test and activate the EVAP system.

The engine ON EVAP leak-check monitor:



- is executed by the individual components of the enhanced EVAP system. Intake manifold vacuum is utilized to reach a target vacuum on the EVAP system. The FTP sensor is used by the engine ON EVAP leak-check monitor to determine if the target vacuum necessary to carry out the leak-check on the EVAP system has been reached. Once target vacuum on the EVAP system is achieved, the change in EVAP system vacuum over a calibrated period of time determines if a leak exists.

The Engine Off Natural Vacuum (EONV) EVAP leak-check monitor is executed:

- once the engine ON EVAP leak-check monitor is completed and the key is turned OFF. The EONV EVAP leak-check monitor determines if a leak is present when the naturally occurring change in the fuel tank pressure or vacuum does not exceed a calibrated limit during a calibrated amount of time. A separate, low-power consuming microprocessor in the PCM manages the EONV leak-check. The engine OFF EVAP leak-check monitor is executed by the individual components of the enhanced EVAP system.

Evaporative Emissions

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Evaporative Emission System Leak Test

Special Tool(s)

 ST2817-A	VACUTEC Smoke Machine Fuel Evaporative Emission System Tester 218-0002 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Phase 1 - Leak Verification

All vehicles

1. Run the EVAP Test with the scan tool.
2. **NOTE:** Some small leaks may not be detected using the EVAP Test. If the system has passed the test but a leak is still suspected, then proceed to Phase 2.

   If the Evaporative Emission (EVAP) system failed the EVAP Test, then proceed to Phase 2.

Phase 2 - System Leak Check

2.5L and 3.0L vehicles

1. Disconnect the fuel vapor tube-to- EVAP canister purge valve quick connect coupling. For additional information, refer to Section 310-00 .
2. Connect the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to the fuel vapor tube quick connect coupling. For additional information, refer to the manufacturer's instructions.

3.5L vehicle

1. Disconnect the upper vapor tube-to- EVAP canister purge valve quick connect coupling. For additional information, refer to Section 310-00 .
2. Connect the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to the upper EVAP canister purge valve fitting. For additional information, refer to the manufacturer's instructions.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** The battery ground cable was previously disconnected in the vapor tube quick connect coupling disconnect procedure.

   Connect the battery ground cable. For additional information, refer to Section 414-01 .

3.5L vehicle

1. **NOTE:** In the scan tool, the EVAP canister purge valve is referred to as the EVAP vapor management valve.

   Open the EVAP canister purge valve with the scan tool.

All vehicles

1. Close the canister vent solenoid with the scan tool.

2. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Install the supplemental refueling adapter into the Easy Fuel ™ (capless) fuel tank filler pipe assembly.

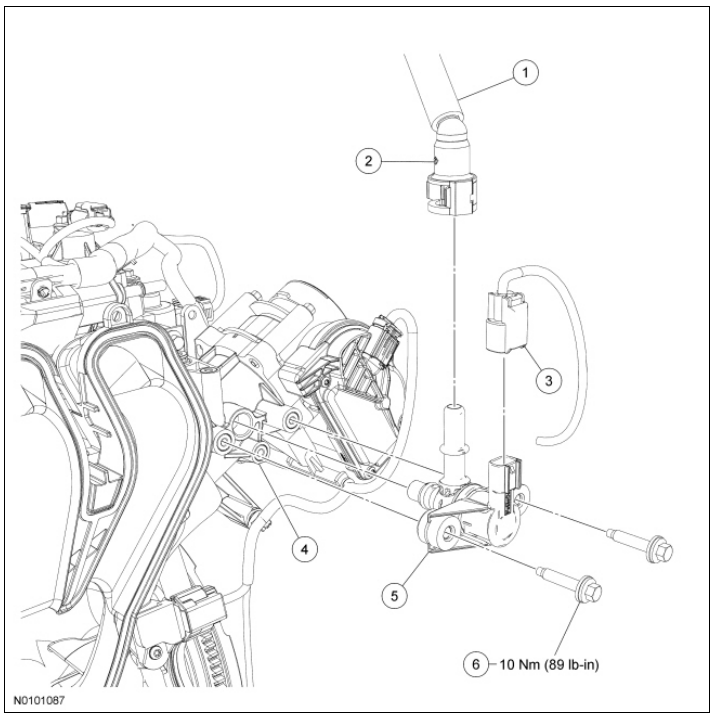
3. **NOTE:** If smoke does not exit the fuel tank filler pipe neck area after the system is pressurized, open the canister vent solenoid with the scan tool to allow the air to purge. Once smoke is seen at the canister vent solenoid, close the canister vent solenoid with the scan tool.

   Introduce smoke from the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester into the EVAP system and verify that smoke is exiting the fuel tank filler pipe neck area. For additional information, refer to the manufacturer's instructions.

4. Remove the supplemental refueling adapter once smoke is observed exiting the fuel tank filler pipe neck area.

5. Continue to enter smoke into the system for 60 seconds to obtain pressure.

6. Press and release the remote start button in intervals of 15 seconds ON and 15 seconds OFF while checking for exiting smoke.



7. Use the halogen light provided with the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to follow the EVAP system path and look for smoke exiting at the source of the leak(s).

8. Repair any leaks as necessary.

9. Repeat the leak test until the system passes.

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

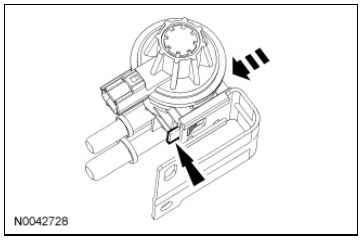
2.5L and 3.0L vehicles

2. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.

3. Disconnect the vapor tube-to- EVAP canister purge valve quick connect coupling. For additional information, refer to Section 310-00 .

4. Remove the 2 bolts and the EVAP canister purge valve.
   - To install, tighten to 10 Nm (89 lb-in).

3.5L vehicles

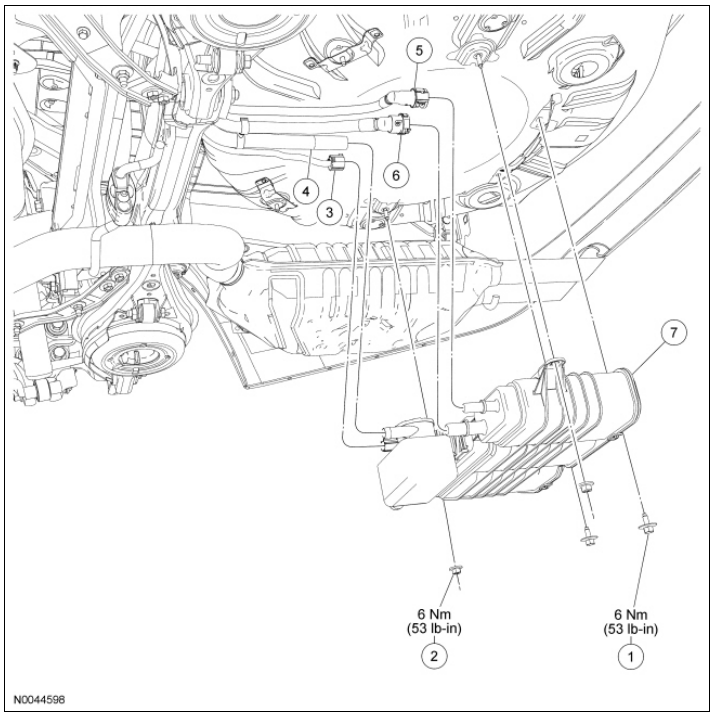


5. **NOTE:** The lower cowl panel grille must be removed to access the EVAP canister purge valve.

   Remove the lower cowl panel grille. For additional information, refer to the Cowl Panel Grille procedure in Section 501-02 .

6. Disconnect the EVAP canister purge valve electrical connector.

7. Disconnect the 2 vapor tube-to- EVAP canister purge valve quick connect couplings. For additional information, refer to Section 310-00 .



8. Depress the tab and remove the EVAP canister purge valve from the bracket.

All vehicles

9. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Evaporative Emission Canister

Item	Part Number	Description
1	W708029	Evaporative Emission (EVAP) canister bolt (2 required)

4	-	Fresh air hose (part of 9034)
5	-	Vapor tube-to- EVAP canister quick connect coupling (part of 9J279)
6	-	Fuel vapor tube assembly-to- EVAP canister quick connect coupling (part of 9A228)
7	9E857	EVAP canister assembly

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failurollow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always

present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

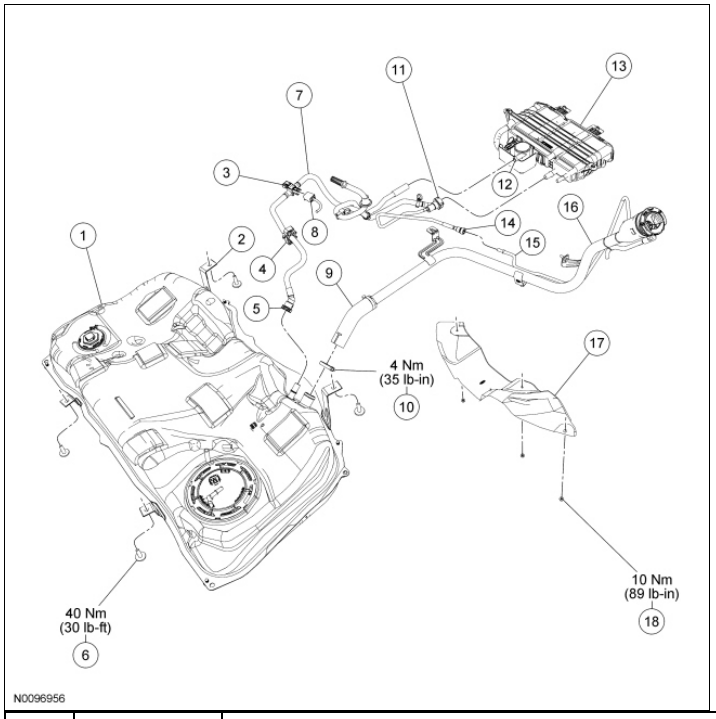
3. **NOTE:** Clean the Evaporative Emission (EVAP) canister vent solenoid electrical connector and the immediate surrounding area of any dirt or foreign material.

   Disconnect the EVAP canister vent solenoid electrical connector.

4. Disconnect the fresh air hose from the dust separator.

5. Disconnect the fuel vapor tube assembly-to- EVAP canister quick connect couplings. For additional information, refer to Section 310-00 .

6. Disconnect the vapor tube-to- EVAP canister quick connect couplings. For additional information, refer to Section 310-00 .



7. Remove the 2 nuts, 2 bolts and the EVAP canister assembly.
   - To install, tighten to 6 Nm (53 lb-in).

8. To install, reverse the removal procedure.
   - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Fuel Vapor Tube Assembly - All Wheel Drive (AWD)

Special Tool(s)

 ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
 ST1293-A	Powertrain Lift 300-OTC1585AE or equivalent

Item	Part Number	Description
1	9002	Fuel tank
2	9092	Fuel tank strap (2 required)
3	9C052	Fuel Tank Pressure (FTP) sensor (part of 9A228)
4	-	Retainer clip (part of 9A228) (3 required)
5	-	Fuel vapor tube assembly-to-fuel tankonnect coupling (part of 9A228)
6	W505444	Fuel tank strap bolt (4 required)
7	9A228	Fuel vapor tube assembly
8	14A464	FTP sensor electrical connector
9	-	Fuel tank filler pipe hose (part of 9034)
10	W525937	Fuel tank filler pipe hose clamp
11	-	

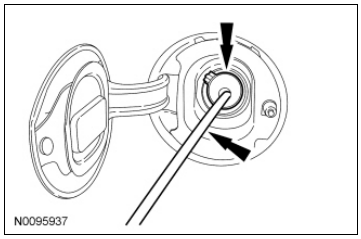
		Fuel vapor tube assembly-to-Evaporative Emission (EVAP) canister quick connect coupling (part of 9A228)
12	9G676	Fuel vapor separator and solenoid assembly (part of 9E857)
13	9E857	EVAP canister assembly
14	-	Fuel vapor tube assembly-to-recirculation tube quick connect coupling (part of 9A228)
15	-	Fuel tank filler pipe recirculation tube (part of 9034)
16	9034	Fuel tank filler pipe
17	5411268	Fuel tank filler pipe heat shield
18	W707142	Fuel tank filler pipe heat shield nut (3 required)

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.



⚠ WARNING: Before working on or disconnecting any of the fuel tubes or fuel system components, relieve the fuel system pressure to prevent accidental spraying of fuel. Fuel in the fuel system remains under high pressure, even when the engine is not running. Failure to follow this instruction may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. **NOTE:** The supplemental refueling adapter is located in the luggage compartment.

   Using the supplemental refueling adapter and the Fuel Storage Tanker, drain any residual fuel from the fuel tank filler pipe.

4. Remove the 3 nuts and the fuel tank filler pipe heat shield.
   - To install, tighten to 10 Nm (89 lb-in).

5. Disconnect the fuel vapor tube assembly-to-Evaporative Emission (EVAP) canister quick connect coupling. For additional information, refer to Section 310-00 .

6. Disconnect the fuel vapor tube assembly from the fuel vapor separator and solenoid assembly.

7. Disconnect the fuel vapor tube assembly-to-recirculation tube quick connect coupling. For additional information, refer to Section 310-00 .

8. Release the 3 retainer clips.

9. Install the Powertrain Lift under the fuel tank.

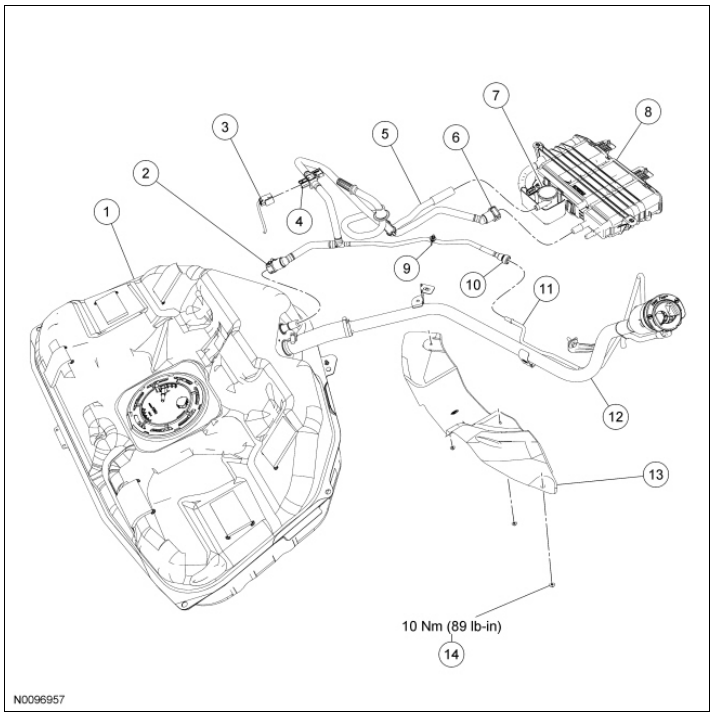
10. Remove the 4 bolts and the fuel tank straps.
    - To install, tighten to 40 Nm (30 lb-ft).

11. Partially lower the fuel tank enough to access the fuel tank filler pipe hose clamp.

12. **NOTE:** Some residual fuel may remain in the fuel tank filler pipe. When removing the filler pipe, carefully drain the fuel into a suitable container.

    Release the clamp and disconnect the fuel tank filler pipe hose from the fuel tank.

    - To install, tighten to 4 Nm (35 lb-in).



13. Disconnect the Fuel Tank Pressure (FTP) sensor electrical connector.

14. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to Section 310-00 .

15. Remove the fuel vapor tube assembly.

16. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Fuel Vapor Tube Assembly â Front Wheel Drive (FWD)

Item	Part Number	Description
1	9002	Fuel tank
2	â	Fuel vapor tube assembly-to-fuel tank quick connect coupling (part of 9A228)
3	14A464	Fuel Tank Pressure (FTP) sensor electrical connector
4	9C052	FTP sensor (part of 9A228)
5	9A228	Fuel vapor tube assembly
6	â	Fuel vapor tube assembly-to-Evaporative Emission (EVAP) canister quick connect coupling (part of 9A228)
7	9G676	Fuel vapor solenoid and separator assembly (part of 9E857)
8	9E857	EVAP canister assembly
9	â	Fuel vapor tube assembly pin-type retainer (part of 9A228)
10	â	Fuel vapor tube-to-recirculation tube quick connect coupling (part of 9A228)
11	â	Fuel tank filler pipe recirculation tube (part of 9034)
12	9034	Fuel tank filler pipe
13	5411268	Fuel tank filler pipe heat shield
14	W707142	Fuel tank filler pipe heat shield nut (3 required)

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the 3 nuts and the fuel tank filler pipe heat shield.
   - To install, tighten to 10 Nm (89 lb-in).

4. Disconnect the Fuel Tank Pressure (FTP) sensor electrical connector.

5. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to Section 310-00 .

6. Disconnect the fuel vapor tube assembly-to-Evaporative Emission (EVAP) canister quick connect coupling. For additional information, refer to Section 310-00 .

7. Disconnect the fuel vapor tube assembly from the fuel vapor separator and solenoid assembly.

8. Release the pin-type retainer.

9. Disconnect the fuel vapor tube assembly-to-recirculation tube quick connect coupling. For additional information, refer to Section 310-00 .

10. Remove the fuel vapor tube assembly.

11. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Torque Specifications

Description	Nm	lb-in
Evaporative Emission (EVAP) canister bolts	6	53
EVAP canister nuts	6	53
EVAP canister purge valve bolts	10	89
Fuel tank filler pipe heat shield nuts	10	89

Evaporative Emissions

The Evaporative Emission (EVAP) system consists of the:

- EVAP canister purge valve.
- EVAP canister (includes the dust separator and the vent solenoid).
- fuel vapor tube assembly (includes the Fuel Tank Pressure (FTP) sensor and the vapor blocking valve).
- Easy FuelTM (capless) fuel tank filler pipe.

The EVAP system:

- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister, that are generated during vehicle operation or hot soak, until they can be consuy the engine during normal engine operation.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the PCM which, using various sensor inputs, calculates the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the EVAP canister purge valve.

The fuel vapors are routed:

- from the fuel tank through the fuel vapor vent valve.
- to the EVAP canisters through a vapor tube.
- from the EVAP canister to the engine when the EVAP canister purge valve is opened by the PCM.

The FTP sensor (part of fuel vapor tube assembly):

- monitors the pressure levels in the fuel tank.
- communicates the pressure reading to the PCM during the OBD II leak test.

The fuel vapor tube assembly:

- is located under the rear of the vehicle.
- is used to monitor fuel pressure and relay information to the PCM.
- includes the FTP sensor and the vapor blocking valve.

The EVAP canister:

- is located under the rear of the vehicle.
- includes the dust separator and vent solenoid.
- contains activated carbon.
- stores fuel vapors.

The Easy FuelTM (capless) fuel tank filler pipe:

- relieves system vacuum below -3.5 kPa (-16.00 in H_2O).

The EVAP canister vent solenoid:

- is normally open.
- seals the EVAP system for the inspection and maintenance (I/M 240) test and OBD II leak and pressure tests.
- is serviced as part of the EVAP canister.

The EVAP canister purge valve:

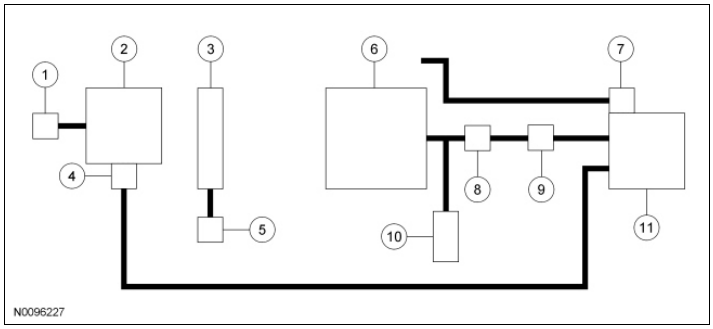
- is normally closed.
- regulates the purging of the EVAP canisters.
- is controlled by the PCM.
- is repaired as a separate item.
- is mounted to the intake manifld.

The dust separator:

- is attached to the EVAP canister vent solenoid.
- prevents suspended dust and dirt particles from entering the EVAP system.
- is serviced as part of the EVAP canister.

The EVAP system monitor:

- is a self-test strategy within the PCM which tests the integrity of the EVAP system.
- monitors the EVAP system for leaks.
- monitors electronic EVAP components for irrationally high or low voltages.
- monitors for correct EVAP system operation.
- uses negative and positive leak test methods to test and activate the EVAP system.



The engine ON EVAP leak-check monitor:

- is executed by the individual components of the enhanced EVAP system. Intake manifold vacuum is utilized to reach a target vacuum on the EVAP system. The FTP sensor is used by the engine ON EVAP leak-check monitor to determine if the target vacuum necessary to carry out the leak-check on the EVAP system has been reached. Once target vacuum on the EVAP system is achieved, the change in EVAP system vacuum over a calibrated period of time determines if a leak exists.

The Engine Off Natural Vacuum (EONV) EVAP leak-check monitor is executed:

- once the engine ON EVAP leak-check monitor is completed and the key is turned OFF. The EONV EVAP leak-check monitor determines if a leak is present when the naturally occurring change in the fuel tank pressure or vacuum does not exceed a calibrated limit during a calibrated amount of time. A separate, low-power consuming microprocessor in the PCM manages the EONV leak-check. The engine OFF EVAP leak-check monitor is executed by the individual components of the enhanced EVAP system.

Vehicle Emission Vacuum Routing

Item	Part Number	Description
1	-	PCV valve (part of 6A785)
2	9424	Intake manifold
6582	Valve cover	
4	9C915	Evaporative Emission (EVAP) canister purge valve
5	9B659	Air Cleaner (ACL) outlet pipe
6	9002	Fuel tank
7	-	Fuel vapor solenoid separator assembly (part of 9E857)
8	-	Fuel Tank Pressure (FTP) sensor (part of 9A228)
9	9G712	Fuel vapor vent valve
10	9034	Fuel tank filler pipe
11	9E857	EVAP canister

Evaporative Emissions

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Evaporative Emission System Leak Test

Special Tool(s)

 ST2817-A	VACUTEC Smoke Machine Fuel Evaporative Emission System Tester 218-0002 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Phase 1 â Leak Verification

1. Run the EVAP Test with the scan tool.

2. **NOTE:** Some small leaks may not be detected using the EVAP Test. If the system has passed the test but a leak is still suspected, then proceed to Phase 2.

   If the Evaporative Emission (EVAP) system failed the EVAP Test, then proceed to Phase 2.

Phase 2 â System Leak Check

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the fuel vapor tube-to- EVAP canister purge valve quick connect coupling. For additional information, refer to Section 310-00 .

3. Connect the VACUTEC Smoke Machine Fuel Evaporative Emissions System Tester to the fuel vapor tube quick connect coupling. For additional information, refer to the manufacturer's instructions.

4. **NOTE:** The battery ground cable was previously disconnected in the vapor tube quick connect coupling disconnect procedure.

   Connect the battery ground cable. For additional information, refer to Section 414-01 .

5. Close the canister vent solenoid with the scan tool.

6. **NOTE:** The supplemental refueling adapter is located in the luggage compartment

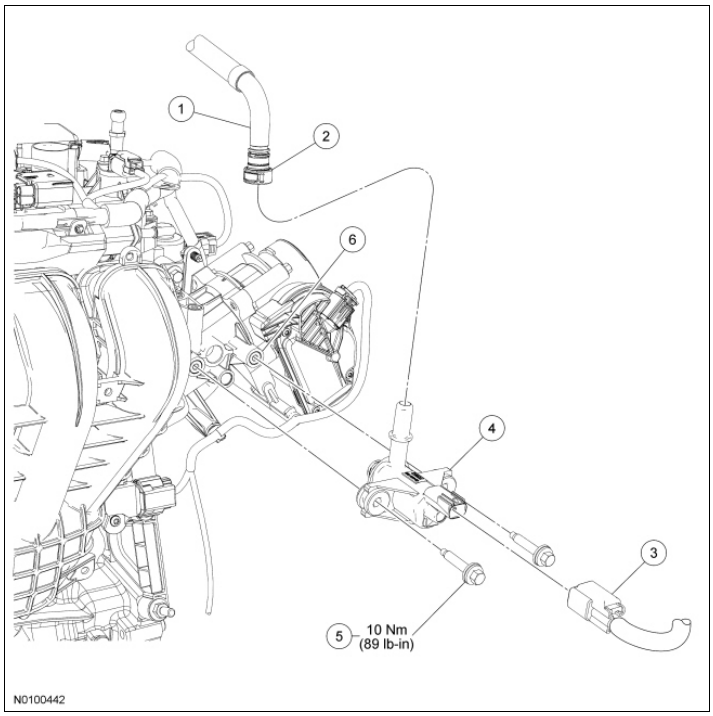
   Install the supplemental refueling adapter into the Easy Fuel ™ (capless) fuel tank filler pipe assembly.

7. **NOTE:** If smoke does not exit the fuel tank filler pipe neck area after the system is pressurized, open the canister vent solenoid with the scan tool to allow the air to purge. Once smoke is seen at the canister vent solenoid, close the canister vent solenoid with the scan tool.

Introduce smoke from the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester into the EVAP system and verify that smoke is exiting the fuel tank filler pipe neck area. For additional information, refer to the manufacturer's instructions.

8. Remove the supplemental refueling adapter once smoke is observed exiting the fuel tank filler pipe neck area.

9. Continue to enter smoke into the system for 60 seconds to obtain pressure.



10. Press and release the remote start button in intervals of 15 seconds ON and 15 seconds OFF while checking for exiting smoke.

11. Use the halogen light provided with the VACUTEC Smoke Machine Fuel Evaporative Emission System Tester to follow the EVAP system path and look for smoke exiting at the source of the leak(s).

12. Repair any leaks as necessary.

13. Repeat the leak test until the system passes.

Evaporative Emission Canister Purge Valve

Item	Part Number	Description
1	9G271	Vapor tube
2	-	Vapor tube-to-Evaporative Emission (EVAP) canister purge valve quick connect coupling (part of 9G271)
3	14A464	EVAP canister purge valve electrical connector
4	9G866	EVAP canister purge valve
5	W503278	EVAP canister purge valve bolt (2 required)
6	9424	Intake manifold

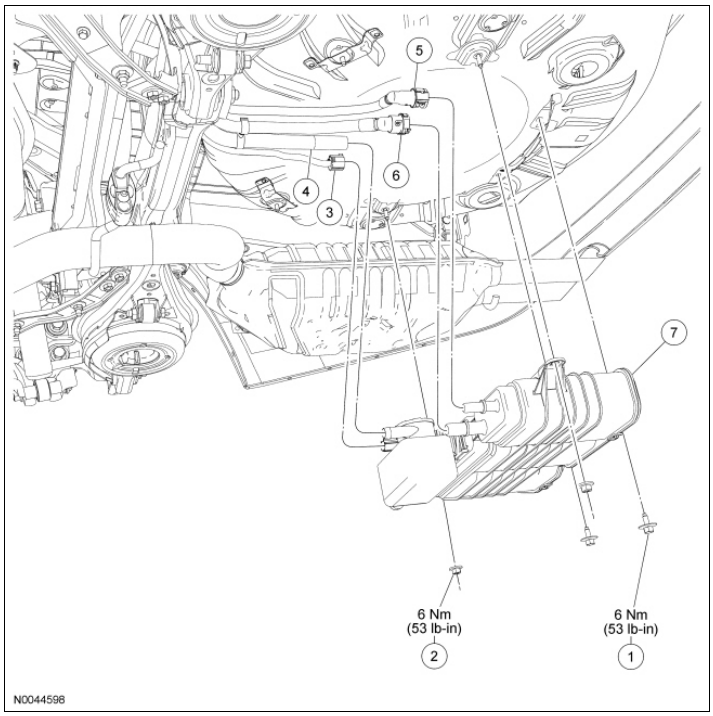
Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .



2. Disconnect the Evaporative Emission (EVAP) canister purge valve electrical connector.

3. Disconnect the vapor tube-to- EVAP canister purge valve quick connect coupling. For additional information, refer to Section 310-00 .

4. Remove the 2 bolts and the EVAP canister purge valve.
    - To install, tighten to 10 Nm (89 lb-in).

5. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Evaporative Emission Canister

Item	Part Number	Description
1	W708029	Evaporative Emission (EVAP) canister bolt (2 required)
2	W713475	EVAP canister nut (2 required)
3	14A464	EVAP canister vent solenoid electrical connector >
4	-	Fresh air tube (part of 9034)
5	-	Vapor tube-to- EVAP canister quick connect coupling (part of 9J279)
6	-	Vapor tube-to- EVAP canister quick connect coupling (part of 9A228)
7	9E857	EVAP canister

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may beed. Failure to follow these instructions may result in serious personal injury.

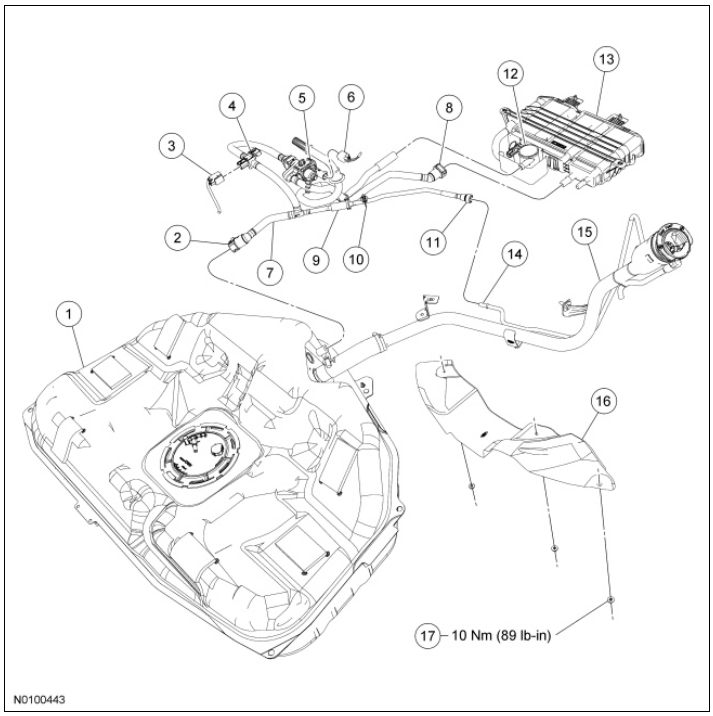
⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. **NOTE:** Clean the Evaporative Emission (EVAP) canister vent solenoid electrical connector and the immediate surrounding area of any dirt or foreign material.

   Disconnect the EVAP canister vent solenoid electrical connector.



4. Disconnect the fresh air tube from the EVAP canister.

5. Disconnect the vapor tube assembly-to- EVAP canister quick connect couplings. For additional information, refer to Section 310-00 .

6. Remove the 2 nuts, 2 bolts and the EVAP canister assembly.
   - To install, tighten to 6 Nm (53 lb-in).

7. To install, reverse the removal procedure.
   - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

Fuel Vapor Tube Assembly

Item	Part Number	Description
1	9002	Fuel tank
2	-	Fuel vapor tube assembly-to-fuel tank quick connect coupling (part of 9A228)
3	14A464	Fuel Tank Pressure (FTP) sensor electrical connector
4	9C052	FTP sensor (part of 9A228)
5	9G712	Vapor blockive (part of 9A228)
6	14A464	Vapor blocking valve electrical connector
7	9A228	Fuel vapor tube assembly
8	-	Fuel vapor tube assembly-to-Evaporative Emission (EVAP) canister quick connect coupling (part of 9A228)
9	-	Two-stage recirculation orifice (part of 9A228)
10	-	Fuel vapor tube assembly pin-type retainer (part of 9A228)
11	-	Fuel vapor tube-to-recirculation tube quick connect coupling (part of 9A228)
12	9G676	Fuel vapor solenoid and separator assembly (part of 9E857)
13	9E857	EVAP canister assembly
14	-	Fuel tank filler pipe recirculation tube (part of 9034)
15	9034	Fuel tank filler pipe
16	5411268	Fuel tank filler pipe heat shield

17	W707142	Fuel tank filler pipe heat shield nut (3 required)

Removal and Installation

⚠ WARNING: Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present aignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

⚠ WARNING: Always disconnect the battery ground cable at the battery when working on an evaporative emission (EVAP) system or fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the 3 nuts and the fuel tank filler pipe heat shield.
   - To install, tighten to 10 Nm (89 lb-in).
4. Disconnect the Fuel Tank Pressure (FTP) sensor electrical connector.
5. Disconnect the vapor blocking valve electrical connector.
6. Disconnect the fuel vapor tube assembly-to-fuel tank quick connect coupling. For additional information, refer to Section 310-00 .
7. Disconnect the fuel vapor tube assembly-to-Evaporative Emission (EVAP) canister quick connect coupling. For additional information, refer to Section 310-00 .
8. Disconnect the fresh air tube (part of the fuel vapor tube assembly) from the fuel vapor separator and solenoid assembly.
9. Release the pin-type retainer.
10. Disconnect the fuel vapor tube assembly-to-recirculation tube quick connect coupling. For additional information, refer to Section 310-00 .
11. Remove the fuel vapor tube assembly.
12. To install, reverse the removal procedure.
    - Carry out the Evaporative Emission System Leak Test. For additional information, refer to Evaporative Emission System Leak Test in this section.

[a] Refer to the procedure in this section.

Electronic Engine Controls

The electronic engine controls consist of the following:

- PCM
- Camshaft Position (CMP) sensor
- Crankshaft Position (CKP) sensor
- Mass Air Flow (MAF) sensor
- Heated Oxygen Sensor (HO2S)
- Catalyst Monitor Sensor (CMS)
- Cylinder Head Temperature (CHT) sensor
- Knock Sensor (KS)
- Variable Camshaft Timing (VCT) oil control solenoid
- Manifold Absolute Pressure (MAP) sensor

The PCM:

- accepts input from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operational range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool.

The HO2S :

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The CMS :

- monitors oxygen content after it flows through the catalytic converter.
- provides feedback information to the PCM used to calculate fuel delivery.

The CHT sensor:

- sends the PCM a signal indicating cylinder head temperature.
- resistance decreases as coolant temperature increases.

The KS :

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

The VCT oil control solenoid:

- is an electrically controlled hydraulic valve that directs engine oil to the variable camshaft. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

The MAP sensor:

- measures manifold vacuum and converts it to an electrical signal. This provides the PCM information on engine load.

Electronic Engine Controls

Camshaft Position (CMP) Sensor

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number				
			1	14A464	Camshaft Position (CMP) sensor electrical connector (part of 12B637)
2	W701219	CMP sensor bolt			
3	12K073	CMP			
4	-	CMP O-ring seal			

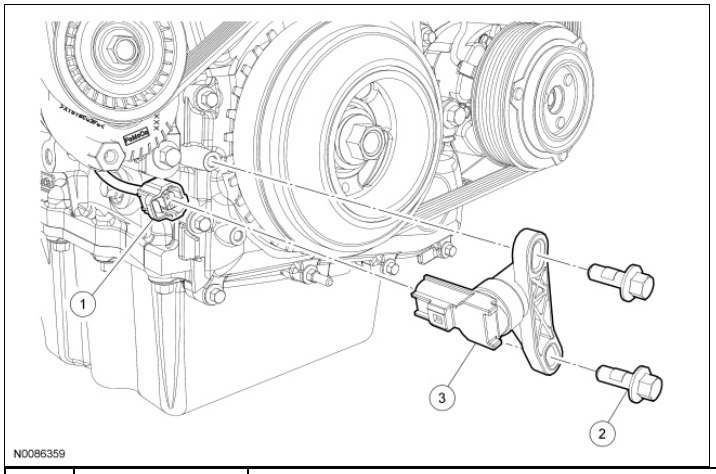
Removal and Installation

1. Disconnect the Camshaft Position (CMP) sensor electrical connector.

2. Remove the bolt and the CMP .
   - To install, tighten to 7 Nm (62 lb-in).

3. **NOTE:** Lubricate the CMP O-ring seal with clean engine oil.

   To install, reverse the removal procedure.



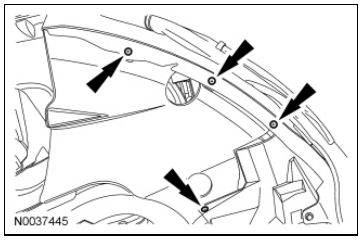
Crankshaft Position (CKP) Sensor

Special Tool(s)

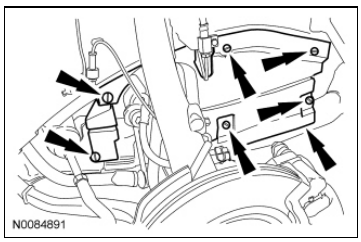
 ST3055A	Aligner, Crankshaft Sensor 303-1417
 ST2638-A	Timing Peg, Crankshaft TDC 303-507
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

General Equipment

6 mm x 18 mm bolt

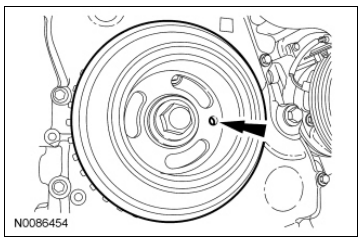


Item	Part Number	Description
1	14A464	Crankshaft Position (CKP) sensor electrical connector (part of 12B637)
2	W701219-S	CKP sensor bolt (2 required)
3	6C315	CKP sensor

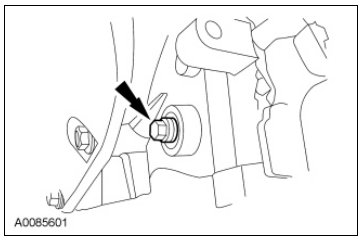


Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

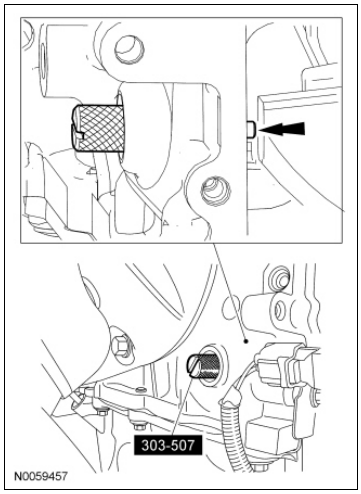


2. Remove the 4 screws and position the RH fender splash shield aside.



3. Remove the 6 pin-type retainers and the RH splash shield.

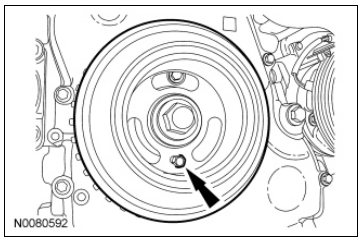
4. Turn the crankshaft clockwise until the hole in the crankshaft pulley is in the 3 o'clock position.



5. Remove the cylinder block plug.

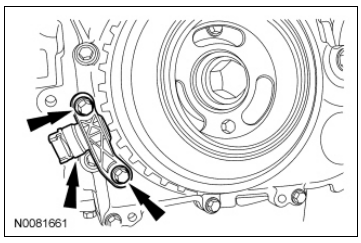
6. **NOTE:** When the crankshaft contacts the Crankshaft TDC Timing Peg, the No. 1 cylinder will be at Top Dead Center (TDC).

   Install the Crankshaft TDC Timing Peg and turn the crankshaft clockwise until the crankshaft contacts the Crankshaft TDC Timing Peg.



7. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

8. Remove the bolts and discard the CKP sensor.



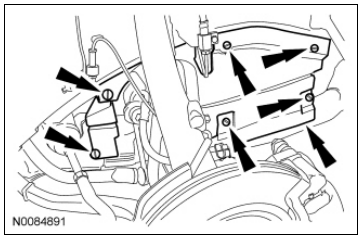
Installation

1. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

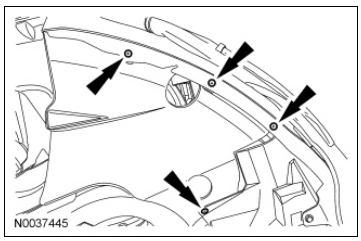
   Install a 6 mm (0.23 in) x 18 mm (0.7 in) standard bolt in the crankshaft pulley.

2. Install the CKP sensor and the 2 bolts.
   - Do not tighten the bolts at this time.

3. Adjust the CKP sensor with the Crankshaft Sensor Aligner.
   - Tighten the 2 CKP bolts to 7 Nm (62 lb-in).



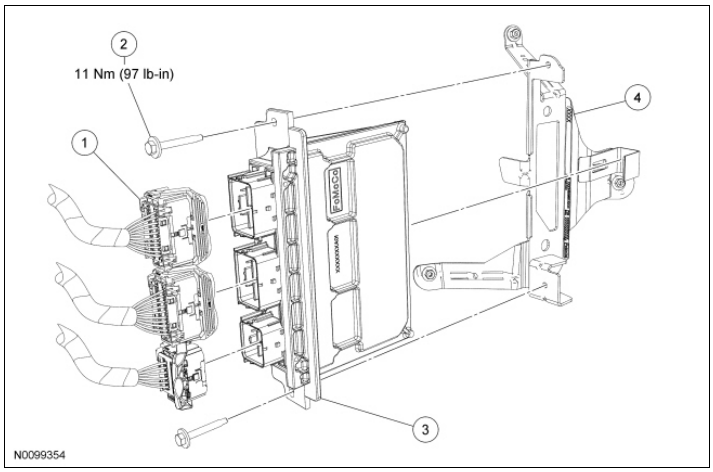
4. Connect the CKP sensor electrical connector.



5. Remove the 6 mm (0.23 in) bolt from the crankshaft pulley.

6. Install the cylinder block plug.
   - Tighten to 20 Nm (177 lb-in).

7. Install the 6 pin-type retainers and the RH splash shield.



8. Install the 4 screws and position the RH fender splash shield aside.

9. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Powertrain Control Module (PCM)

Item	Part Number	Description
1	14A464	PCM electrical connector (3 required)
2	W505428	PCM bolt (2 required)
3	12A650	PCM
4	12A659	PCM bracket

Removal

1. **NOTE:** PCM replacement DOES NOT require new keys or programming of keys.

   Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

2. Remove the battery tray. For additional information, refer to Section 414-01 .

3. Disconnect the 3 PCM electrical connectors.

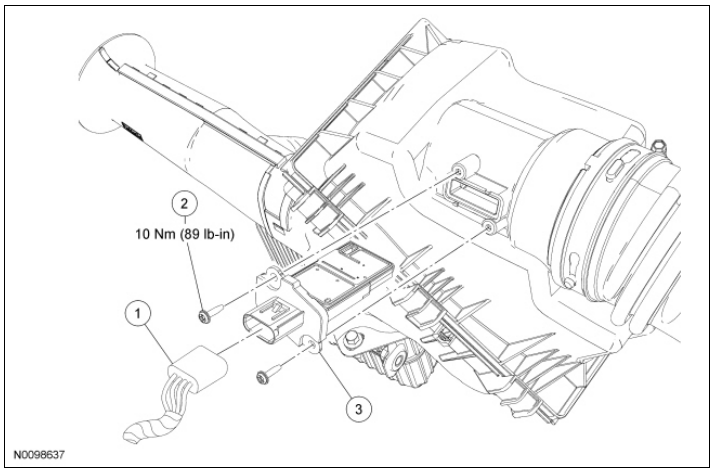
4. Remove the 2 bolts and the PCM.

Installation

1. Install the PCM and the 2 bolts.
   - Tighten to 11 Nm (97 lb-in).

2. Connect the 3 PCM electrical connectors.

3. Install the battery tray. For additional information, refer to Section 414-01 .



4. **NOTE:** If the Programmable Module Installation (PMI) procedure was not successful in downloading the data from the vehicles original PCM, then the oil life data of the vehicle is lost. If this occurs, and the oil life cannot be determined through service history or customer interview, it is recommended the vehicle engine oil and filter be changed and the oil change minder reset.

Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

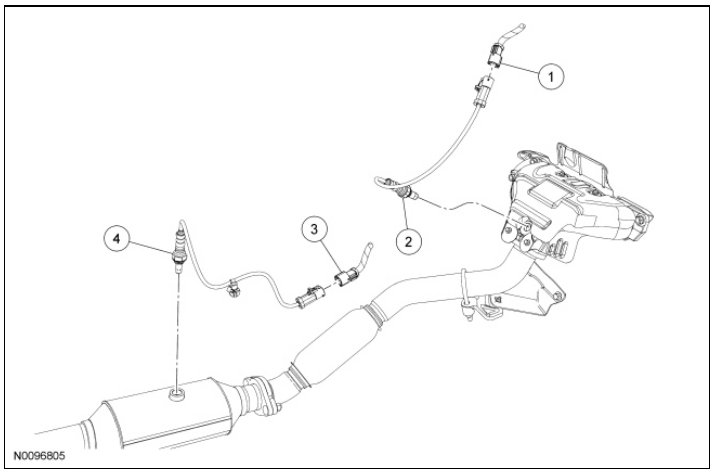
5. Reprogram the Passive Anti-Theft System (PATS). Carry out the Parameter Reset procedure. For additional information, refer to Section 419-01B .

6. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

Mass Air Flow (MAF) Sensor

Item	Part Number	Description
1	14A464	Mass Air Flow (MAF) sensor electrical connector (part of 12B637)
2	W709287-S	MAF sensor sc(2 required)
3	12B579	MAF sensor

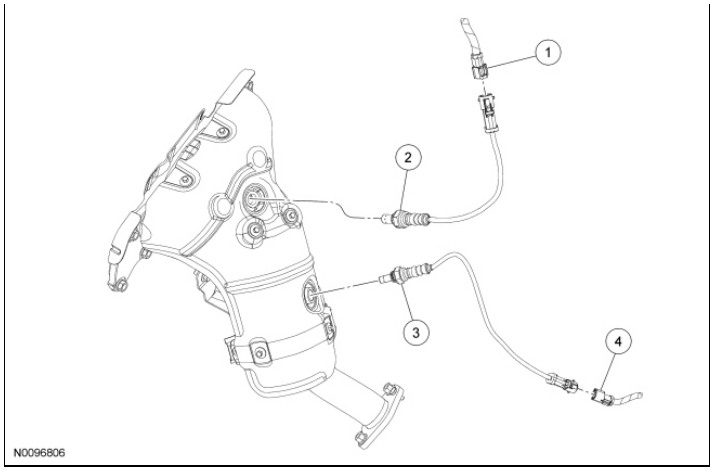
Removal and Installation



1. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

2. Remove the 2 screws and the MAF sensor.
   - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.

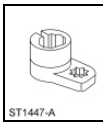


Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor - Exploded View

Non-Partial Zero Emissions Vehicle (PZEV)

Item	Part Number	Description
1	14A64	Heated Oxygen Sensor (HO2S) electical connector (part of 12B637)
2	9F472	HO2S sensor
3	14A464	Cataitor Sensor (CMS) electrical connector
4	9G444	CMS sensor

Partial Zero Emissions Vehicle (PZEV)



Item	Part Number	Description
1	14A64	Heated Oxygen Sensor (HO2S) electical connector (part

		of 12B637)
2	9F472	HO2S sensor
3	14A464	Catalyst Monitor Sensor (CMS) electrical connector
4	9G444	CMS sensor

1. For additional information, refer to the procedures in this section.

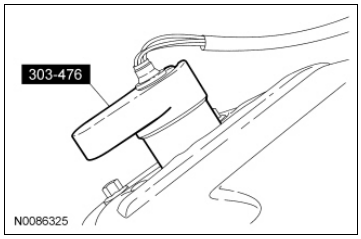
Heated Oxygen Sensor (HO2S)

Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-



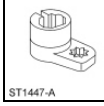
Removal and Installation

1. Disconnect the Heated Oxygen Sensor (HO2S) electconnector.

2. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the HO2S .

   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix .
   - To install, tighten to 48 Nm (35 lb-ft).



3. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the HO2S .

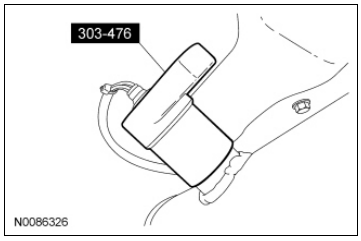
   To install, reverse the removal procedure.

Catalyst Monitor Sensor

Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material



Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. Fotional information, refer to Section 100-02 .
2. Disconnect the Catalyst Monitor Sensor (CMS) electrical connector.
3. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the CMS .

   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix .
   - To install, tighten to 48 Nm (35 lb-ft).

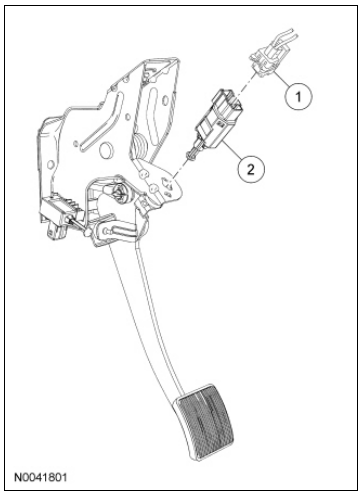
4. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the CMS .

   To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor

Item	Part Number	Description
1	14603	Cylinder Head Temperature (CHT) sensor cover (part of 12C508)
2	14A464	CHT sensor electrical connector (part of 12C508)
3	6G004	CHT sensor

Removal and Installation

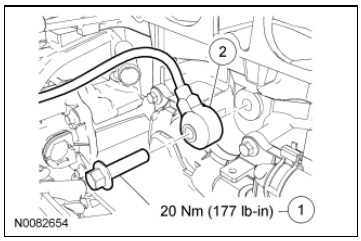


1. Detach the Cylinder Head Temperature (CHT) sensor cover and position aside.

2. Disconnect the CHT sensor electrical connector.

3. Remove the CHT sensor.
   - To install, tighten to 12 Nm (106 lb-in).

4. To install, reverse the removal procedure.



Clutch Pedal Position (CPP) Switch

Item	Part Number	Description
1	-	Clutch Pedal Position (CPP) switch electrical connector (part of 14290)
2	7C534	

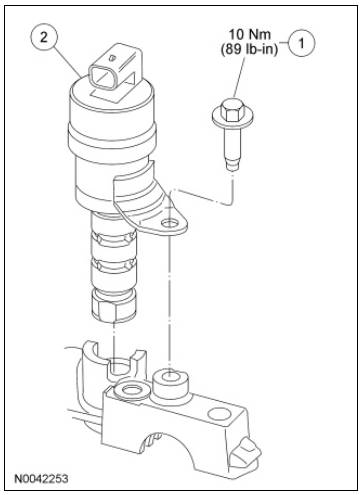
1. Disconnect the Clutch Pedal Position (CPP) switch electrical connector.
2. Rotate the CPP switch clockwise and remove the CPP switch.
3. To install, reverse the removal procedure.

Knock Sensor (KS)

Item	Part Number	Description
1	W5000025	Knock Sensor (KS) bolt
2	12A699	KS

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the intake manifold. For additional information, refer to Section 303-01A .

3. Remove the bolt and the Knock Sensor (KS).
   - To install, tighten to 20 Nm (177 lb-in).

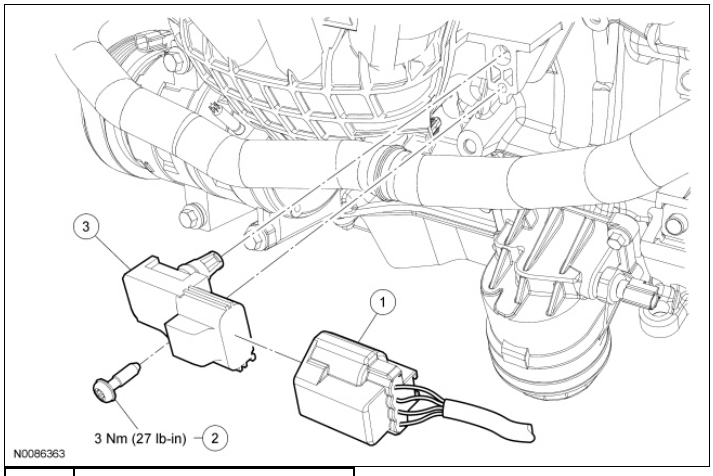
4. **NOTE:** The KS must not touch the crankcase vent oil separator.

   To install, reverse the removal procedure.

Variable Camshaft Timing (VCT) Oil Control Solenoid

Item	Part Number	Description
1	W500211	Variable Camshaft Timing (VCT) oil control solenoid bolt
2	6M280	VCT oil control solenoid

Removal and Installation



1. Remove the valve cover. For additional information, refer to
2. Remove the bolt and the Variable Camshaft Timing (VCT) oil control solenoid.
    - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.

Manifold Absolute Pressure (MAP) Sensor

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number Description	
1	14A464	Manifold Absolute Pressure (MAP) sensor electrical connector
2	W701459	MAP sensor screw
3	9F479	MAP sensor

Removal and Installation

1. Disconnect the Manifold Absolute Pressure (MAP) sensor electrical connector.

2. Remove the screw and the MAP sensor.
   - To install, tighten to 3 Nm (27 lb-in).

3. **NOTE:** Lubricate the MAP sensor O-ring seal with clean engine oil.

   To install, reverse the removal procedure.

Material

Item	Specification	Fill Capacity
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A	-
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A	-
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-	-

Torque Specifications

Description	Nm	lb-ft	lb-in
Camshaft Position (CMP) sensor bolt	10	-	89
Catalyst Monitor Sensor (CMS) [a]	-	-	-
Crankshaft Position (CKP) sensor bolt	10	-	89
Cylinder Head Temperature (CHT) sensor	11	-	97
Heated Oxygen Sensor (HO2S) [a]	-	-	-
Knock Sensor (KS) bolt (cylinder-block mounted)	25	18	-
Knock Sensor (KS) bolt (cylinder-head mounted)	25	18	-
Manifold Absolute Pressure (MAP) sensor bolt	6	-	53

PCM bolts	8	-	71
Radio frequency interference capacitor 6	-	53	
Variable Camshaft Timing (VCT) oil control solenoid bolt	10	-	89

[a] Refer to the procedure in this section.

Electronic Engine Controls

The electronic engine controls consist of the:

- PCM.
- Camshaft Position (CMP) sensor.
- Crankshaft Position (CKP) sensor.
- Mass Air Flow (MAF) sensor.
- Cylinder Head Temperature (CHT) sensor.
- Heated Oxygen Sensor (HO2S).
- Catalyst Monitor Sensor (CMS).
- Variable Camshaft Timing (VCT) oil control solenoid.
- Knock Sensor (KS) (cylinder-block mounted).
- KS (cylinder-head mounted).
- Manifold Absolute Pressure (MAP) sensor.

The PCM carries out the following functions:

- accepts input from various engine sensors to compute the fuel flow rate necessary to mainta prescribed air/fuel ratio throughout the entire engine operational range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool.

The CHT sensor:

NOTE: If the cylinder head is being replaced, the CHT must be replaced.

- sends the PCM a signal indicating engine temperature.
- resistance decreases as coolant temperature increases.

The HO2S :

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The CMS :

- monitors oxygen content after it flows through the catalytic converter.
- provides a voltage to the PCM used to calculate catalytic converter integrity.

The VCT oil control solenoid:

- is an electrically controlled hydraulic valve that directs engine oil to the variable camshaft. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

The KS :

NOTE: There are 2 KS , one is located on the RH cylinder head and one is mounted on the engine block in the intake manifold valley.

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

The MAP sensor:

- measures manifold vacuum and converts it to an electrical signal. This provides the PCM information on engine load.

Electronic Engine Controls

DTC Charts

Camshaft Position (CMP) Sensor

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

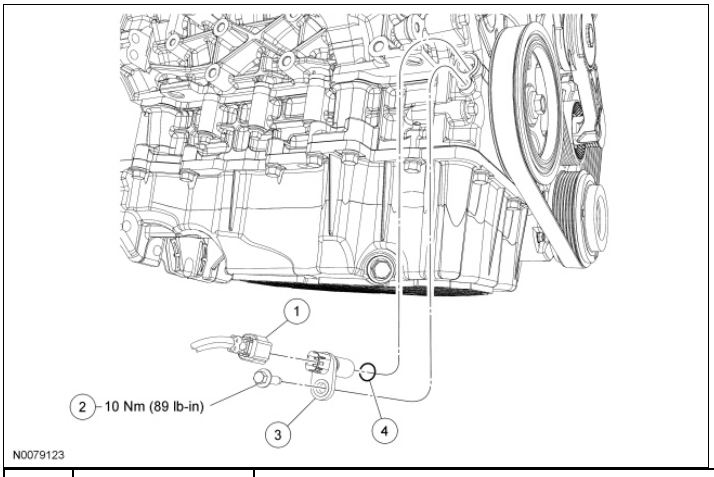
Item	Part Number	Description
1	14A464	LH Camshaft Position (CMP) sensor electrical connector (part of 12C508)
2	W500214 LH CMP sensor bolt	
3	12K073	LH CMP sensor
4	-	LH CMP sensor O-ring seal
5	14A464	RH CMP sensor electrical connector (part of 12C508)
6	W500214	RH CMP sensor bolt
7	12K073	RH CMP sensor
8	-	RH CMP sensor O-ring seal

1. Disconnect the Camshaft Position (CMP) electrical connector.

2. Remove the bolt and the CMP sensor.
   - To install, tighten to 10 Nm (89 lb-in).

3. **NOTE:** Lubricate the CMP O-ring seal with clean engine oil.

To install, reverse the removal procedure.



Crankshaft Position (CKP) Sensor

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

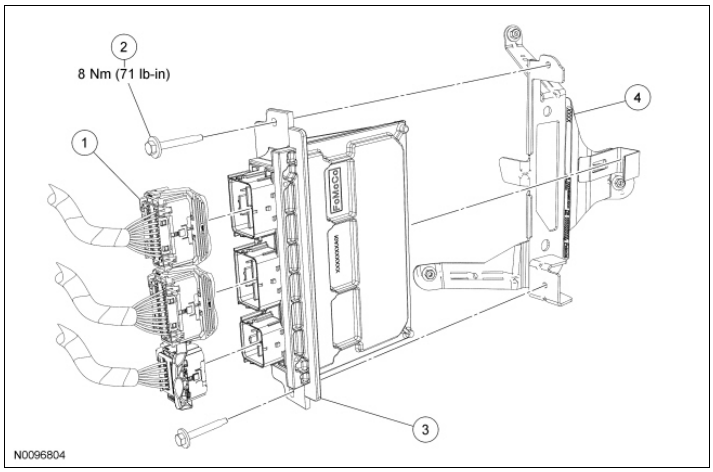
Item	Part Number	Description
1	14A464	Crankshaft Position (CKP) sensor electrical connector
2	W500214	CKP sensor bolt
3	6C315	CKP sensor
4	-	CKP sensor O-ring seal

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

3. Remove the bolt and the CKP .
   - ♦ To install, tighten to 10 Nm (89 lb-in).



- Inspect the O-ring seal and install new as necessary.

4. **NOTE:** Lubricate the CKP O-ring seal with clean engine oil.

   To install, reverse the removal procedure.

5. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Powertrain Control Module (PCM)

Item	Part Number	Description
1	14A464	PCM electrical connector (3 required)
2	W505428	PCM bolt (2 required)
3	12A650	PCM
4	12A659	PCM bracket

Removal

1. **NOTE:** PCM replacement DOES NOT require new keys or programming of keys.

   Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer Section 418-01 .

2. Remove the battery tray. For additional information, refer to Section 414-01 .

3. Disconnect the 3 PCM electrical connectors.

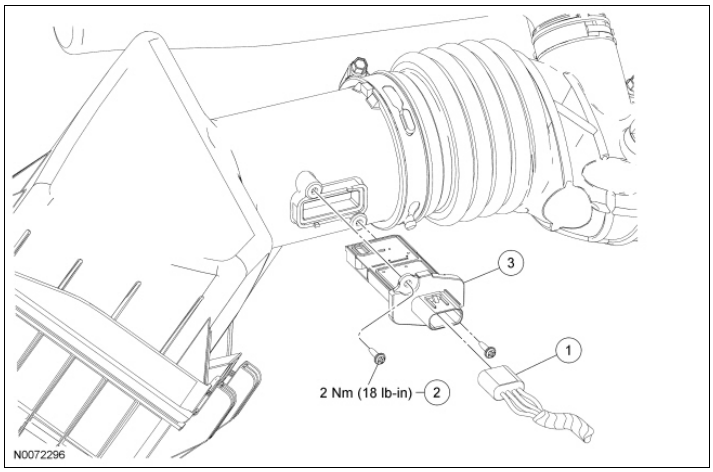
4. Remove the 2 bolts and the PCM.

Installation

1. Install the PCM and the 2 bolts.
   - Tighten to 8 Nm (71 lb-in).

2. Connect the 3 PCM electrical connectors.

3. Install the battery tray. For additional information, refer to Section 414-01 .



4. **NOTE:** If the Programmable Module Installation (PMI) procedure was not successful in downloading the data from the vehicles original PCM, then the oil life data of the vehicle is lost. If this occurs, and the oil life cannot be determined through service history or customer interview, it is recommended the vehicle engine oil and filter be changed and the oil change minder reset.

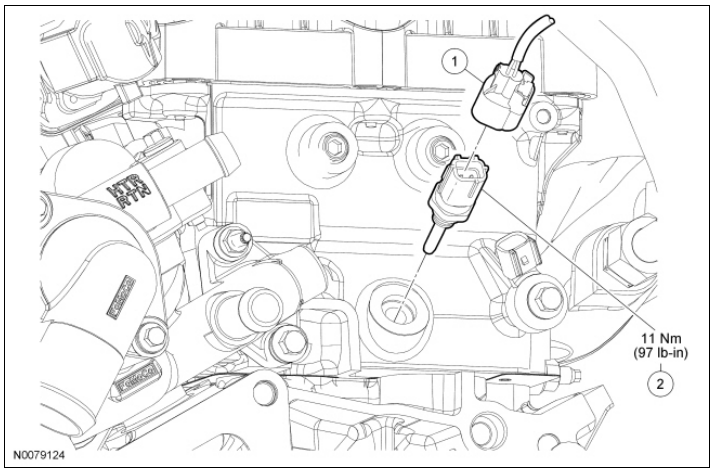
Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

5. Reprogram the Passive Anti-Theft System (PATS). Carry out the Parameter Reset procedure. For additional information, refer to Section 419-01B .

6. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure, following the on-screen instructions.

Mass Air Flow (MAF) Sensor

Item	Part Number	Description
1	14A464	Mass Air Flow (MAF) sensor electrical connector
2	W709287	MAF sensor screw (2 reed)
3	12B579	MAF sensor



Removal and Installation

1. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

2. Remove the 2 screws and the MAF sensor.
   - To install, tighten to 2 Nm (18 lb-in).

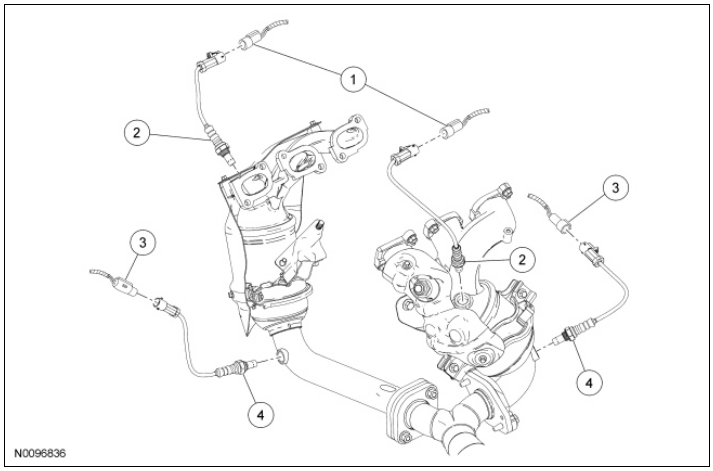
3. To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor

Item	Part Number	Description
1	14A464	Cylinder Head Temperature (CHT) sensor electrical connector (part of 12C508)
2	6G004	CHT sensor

NOTE: If the cylinder head is being replaced, the Cylinder Head Temperature (CHT) sensor must be replaced.

1. Remove the battery tray. For additional informationfer to Section 414-01 .



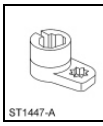
2. Disconnect the CHT sensor electrical connector.

3. Remove the CHT sensor.
   - To install, tighten to 11 Nm (97 lb-in).

4. To install, reverse the removal procedure.

Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor - Exploded View

NOTE: Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.



Item	Part Number	Description
1	14A464	Heated Oxygen Sensor (HO2S) electrical connectors
2	9F472	HO2S
3	14A464	Catalyst Monitor Sensor (CMS) eleconnectors
4	9G444	CMS

1. For additional information, refer to the procedures in this section.

Heated Oxygen Sensor (HO2S)

Special Tool(s)

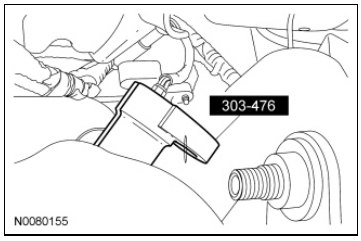
 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Removal and Installation

Rear sensor



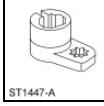
1. With the e in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Both sensors

2. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector.
3. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the HO2S .

   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
   - To install, tighten to 48 Nm (35 lb-ft).



4. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the HO2S .

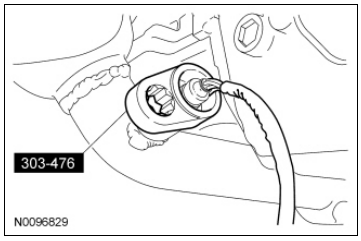
   To install, reverse the removal procedure.

Catalyst Monitor Sensor

Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material



Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a. For additional information, refer to Section 100-02 .
2. Disconnect the Catalyst Monitor Sensor (CMS) electrical connector.
3. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the CMS sensor.

   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
   - To install, tighten to 48 Nm (35 lb-ft).

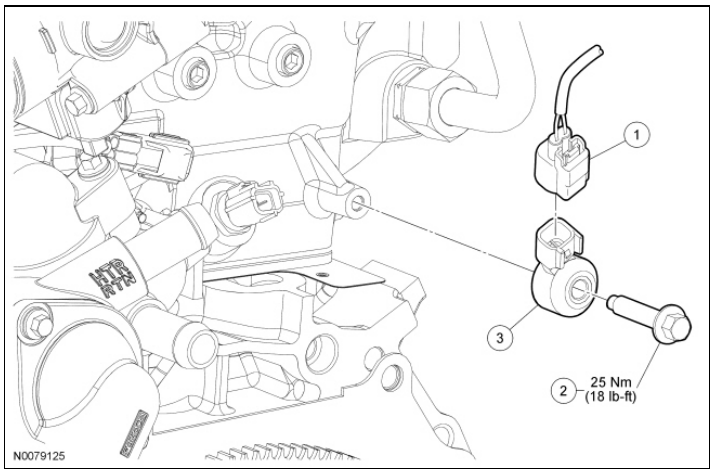
4. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the CMS sensor.

   To install, reverse the removal procedure.

Variable Camshaft Timing (VCT) Oil Control Solenoid

Item	Part Number	Description
1	W713305	Variable Camshaft Timing (VCT) oil control solenoid bolt (2 required) (part of 6B297)
2	6B297	VCT oil control solenoid
3	W713305	VCT oil control solenoid bolt (2 required) (part of 6B297)
4	6B297	VCT oil control solenoid

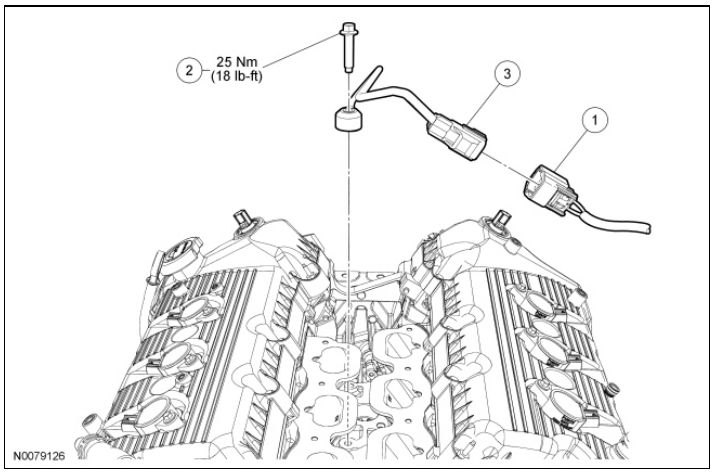
Removal and Installation



1. Remove the LH or RH valve cover. For additional information, refer to Section 303-01B .

2. Remove the 2 bolts and the Variable Camshaft Timing (VCT) oil control solenoid.
   - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.



Knock Sensor (KS)

Cylinder-Head Mounted Knock Sensor (KS)

Item	Part Number	Description
1	14A464	Knock Sensor (KS) electrical connector
2	W500310	KS bolt
3	12A699	KS

Cylinder-Block Mounted Knock Sensor (KS)

Item	Part Number	Description
1	14A464	Knock Sensor (KS) electrical connector
2	W500310	KS bolt
3	12A699	KS

Removal

Cylinder head-mounted

1. Disconnect the Knock Sensor (KS) electrical connector.

2. Remove the bolt and the KS .

Engine block-mounted

3. Remove the lower intake manifold. For additional information, refer to Section 303-01B .

4. Disconnect the KS electrical connector.

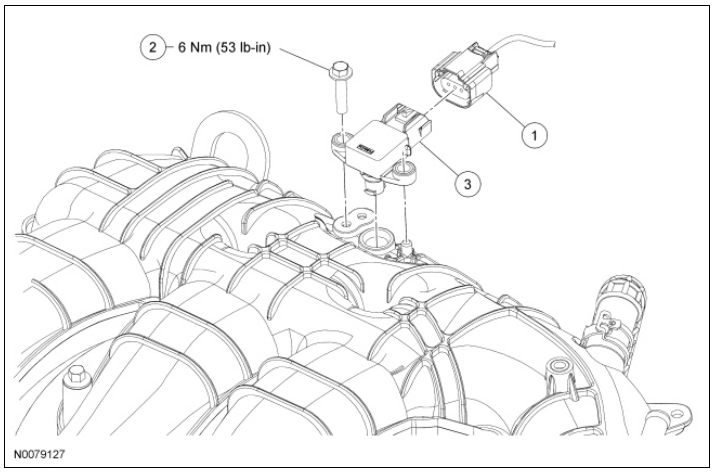
5. Remove the bolt and the KS .

Installation

Engine block-mounted

1. Install the KS and the bolt.
   - To install, tighten to 25 Nm (18 lb-ft).

2. Connect the KS electrical connector.



3. Install the lower intake manifold. For additional information, refer to Section 303-01B .

Cylinder head-mounted

4. Install the KS and the bolt.
   - To install, tighten to 25 Nm (18 lb-ft).

5. Connect the KS electrical connector.

Manifold Absolute Pressure (MAP) Sensor

Item	Part Number	Description
1	14A464	Manifold Absolute Pressure (MAP) sensor electrical connector (part of 12C508)
2	W710652	MAP sensor bolt
3	9F479	MAP

Removal and Installation

1. Disconnect the Manifold Absolute Pressure (MAP) sensor electrical connector.

2. Remove the bolt and the MAP sensor.
   - To install, tighten to 6 Nm (53 lb-in).
   - When installing the sensor, if the bolt fails to hold specified torque, relocate the sensor and retain, using the auxiliary bolt hole in the intake manifold.

3. **NOTE:** Clean and inspect the sealing surface.

   To install, reverse the removal procedure.

p;

Electronic Engine Controls

The electronic engine controls consist of the:

- PCM.
- Cylinder Head Temperature (CHT) sensor.
- Camshaft Position (CMP) sensor.
- Crankshaft Position (CKP) sensor.
- Mass Air Flow (MAF) sensor.
- Heated Oxygen Sensor (HO2S).
- Catalyst Monitor Sensor (CMS).
- Variable Camshaft Timing (VCT) oil control solenoid.
- Knock Sr (KS).

The PCM:

- accepts input from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operational range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The CHT sensor:

- sends the PCM a signal indicating cylinder head temperature.
- resistance decreases as cylinder head temperature increases.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool.

The HO2S :

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The CMS :

- monitors oxygen content after it flows through the catalytic converter.
- provides a voltage to the PCM used to calculate catalytic converter integrity.

The VCT oil control solenoid:

- is an electrically controlled hydraulic valve that directs engine oil to the variable camshaft. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

The KS :

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

Electronic Engine Controls

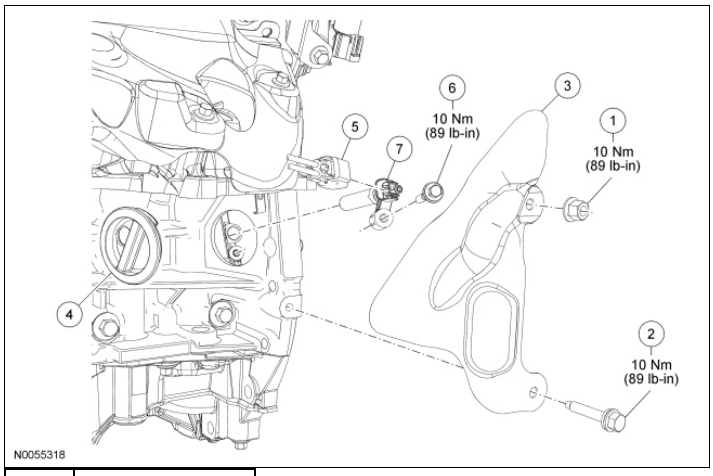
Camshaft Position (CMP) Sensor

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number	Destion
1	14A464	RH Camshaft Position (CMP) sensor electrical connector
2	W503279	RH CMP sensor bolt
3	6B288	RH CMP sensor
4	14A464	LH CMP sensor electrical connector
5	W503279	LH CMP sensor bolt
6	6B288	LH CMP sensor

Removal and Installation



1. Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12C .
2. Disconnect the Camshaft Position (CMP) sensor electrical connector.
3. Remove the bolt and the CMP sensor.
   - To install, tighten to 10 Nm (89 lb-in).
4. **NOTE:** Lubricate the CMP sensor O-ring seal with clean engine oil.

   To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Item	Part Number	
1	W701542	Heat shield nut
2	W701669	Heat shield bolt
3	6K342	Heat shield
4	6C070	Rubber grommet cover
5	14A464	Crankshaft Position (CKP) sensor electrical connector
6	6D327	CKP sensor bolt
7	6C315	CKP sensor

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

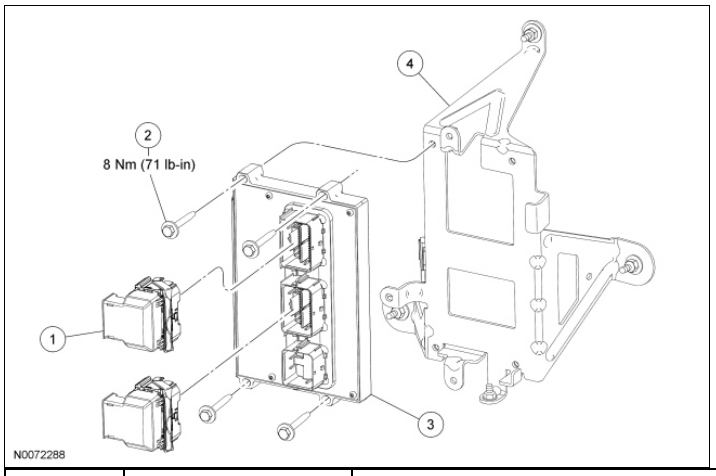
2. Remove the LH catalytic converter. For additional information, refer to Section 309-00 .

3. Remove the bolt, nut and the heat shield.
   - To install, tighten to 10 Nm (89 lb-in).

4. Remove the rubber grommet cover.

5. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

6. Remove the bolt and the CKP sensor.
   - To install, tighten to 10 Nm (89 lb-in).



7. To install, reverse the removal procedure.

8. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Powertrain Control Module (PCM)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Item	Part Number	Description
1	14A464	PCM electrical connector (part of 12B637) (2 required)
2	W505428	PCM bolt (4 required)
3	12A650	PCM
4	12A659	PCM bracket

Removal

1. **NOTE:** PCM replacement DOES NOT require new keys or programming of keys.

   Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

2. Remove the battery tray. For additional information, refer to Section 414-01 .

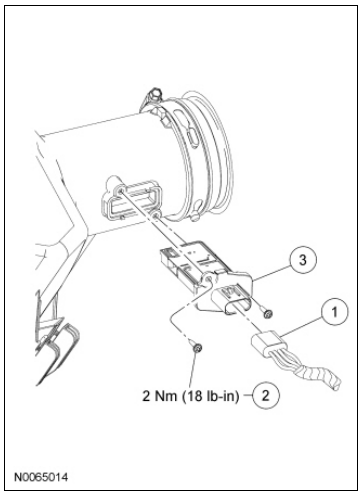
3. Disconnect the 2 PCM electrical connectors.

4. Remove the 4 bolts and the PCM.

Installation

1. Install the PCM and the bolts.
   - Tighten to 8 Nm (71 lb-in).

2. Connect the 2 PCM electrical connectors.



3. Install the battery tray. For additional information, refer to Section 414-01 .

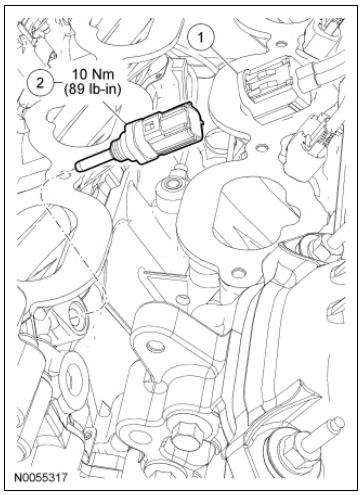
4. Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

5. Reprogram the Passive Anti-Theft System (PATS). Carry out the Parameter Reset procedure. For additional information, refer to Section 419-01B .

6. Using the scan tool, perform the Misfire Monitor Neutral Profile Correction procedure following the on-screen instructions.

Mass Air Flow (MAF) Sensor

Item	Part Number	Description
1	14A464	Mass Air Flow (MAF) sensor electrical connector
2	W709287	MAF sensor screw (2 required)
3	12B579	MAF sensor



Removal and Installation

1. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

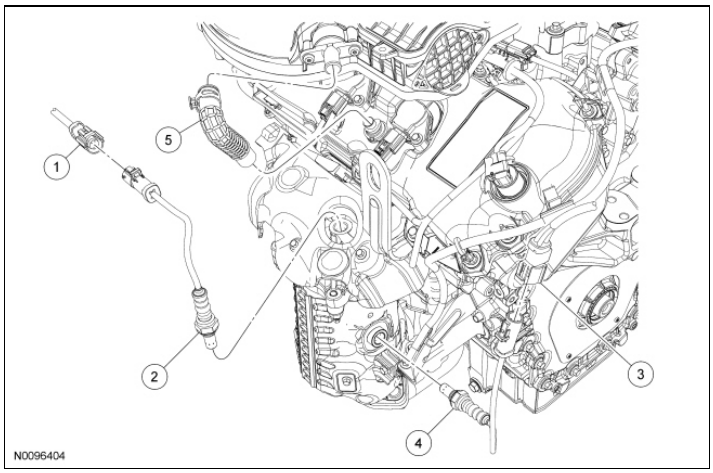
2. Remove the 2 screws and the MAF span> sensor.
   - To install, tighten to 2 Nm (18 lb-in).

3. To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor

Item	Part Number	Description
1	14A464	Cylinder Head Temperature (CHT) sensor electrical connector
2	6G004	CHT sensor

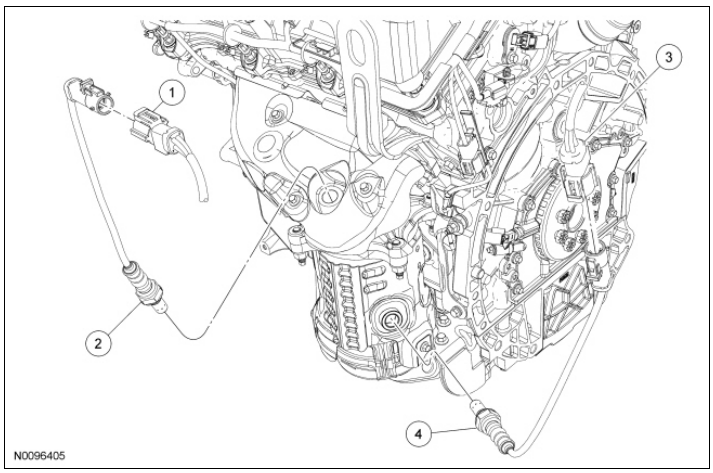
Section 303-01C .



2. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

3. Remove and discard the CHT sensor.
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.
   - Do not reuse the CHT sensor, install a new sensor.

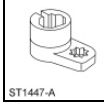


Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor - Exploded View

RH Sensors

Item	Part Number	Description
1	14A464	Heated Oxygen Sensor (HO2S) electrical connector
2	9F472	
3	14A464	Catalyst Monitor Sensor (CMS) electrical connector
4	9G444	CMS
5	6A664	PCV hose

LH Sensors



Item	Part Number	Description
1	14A464	Heated Oxygen Sensor (HO2S) electrical connector
2	9F472	HO2S
3	14A464	Catalyst Monitor Sensor (CMS) electrical connector

4	9G444	CMS

1. For additional information, refer to the procedures in this section.

Heated Oxygen Sensor (HO2S)

Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

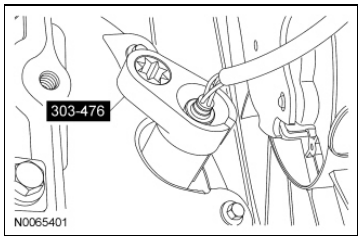
Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A

Removal and Installation

RH sensor

1. Remove the PCV hose.



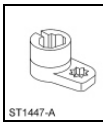
Both sensors

2. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector.

3. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the HO2S .

   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
   - To install, tighten to 48 Nm (35 lb-ft).



4. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the HO2S .

   To install, reverse the removal procedure.

&nbs

Catalyst Monitor Sensor

Special Tool(s)

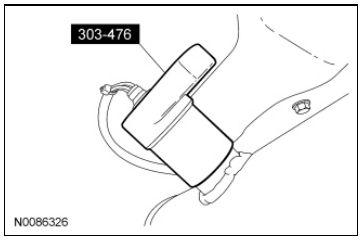
 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Disconnect the Catalyst Monitor Sensor (CMS) electrical connector.

3. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the CMS .

   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.

   To install, tighten to 48 Nm (35 lb-ft).

4. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the CMS .

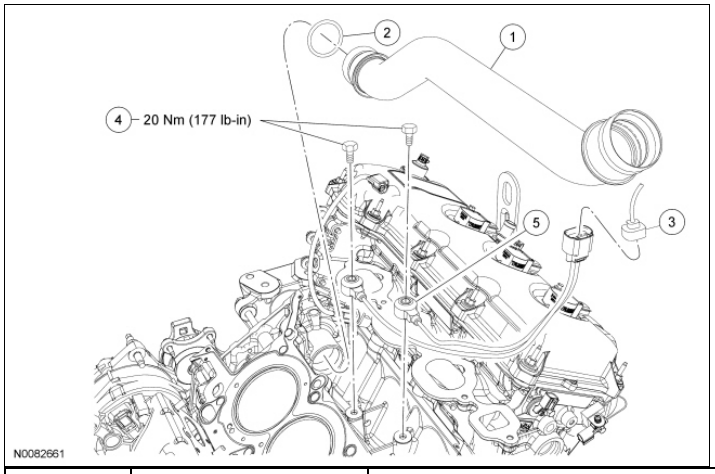
   To install, reverse the removal procedure.

Variable Camshaft Timing (VCT) Oil Control Solenoid

Item	Part Number	Description
1	W500215	Variable Camshaft Timing (VCT) oil control solenoid bolt
2	6B297	VCT oil control solenoid

Removal and Installation

1. Remove the LH or RH valve cover. For additional information, refer to Section 303-01C .



2. Remove the bolt and the Variable Camshaft Timing (VCT) oil control solenoid.
   - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.

Knock Sensor (KS)

Material

Item	Specification
Motorcraft® Specialty Green Engine Coolant VC-10-A2 (US); CVC-10-A (Canada)	WSS-M97B55-A

Item	Part Number	Description
1	9N271	Coolant tube
2	8565	O-ring seal
3	14A464	Knock Sensor (KS) electrical connector
4	W704749	KS bolts (2 required)
5	12A699	KS

Removal and Installation

1. Remove the thermostat housing. For additional information, refer to Section 303-03A .

2. Remove the lower intake manifold. For additional information, refer to Section 303-01C .

3. Remove the coolant tube.
   - Discard the O-ring seal.

4. Disconnect the Knock Sensor (KS) electrical connector.

5. ***NOTICE:*** **Only use hand tools when removing or installing the Knock Sensor (KS) or damage to the KS can occur.**

   Remove the 2 bolts and the KS .

   - To install, tighten to 20 Nm (177 lb-in).

6. To install, reverse the removal procedure.
    - **NOTE:** Genuine Mazda® Extended Life Coolant and Motorcraft® Specialty Green Engine Coolant are very sensitive to light. Do NOT allow these products to be exposed to ANY LIGHT for more than a day or two. Extended light exposure causes these products to degrade.

      Lubricate the new O-ring seal with clean engine coolant.

P>

Electronic Engine Controls

The electronic engine controls consist of the following:

- PCM
- Camshaft Position (CMP) sensor
- Crankshaft Position (CKP) sensor
- Mass Air Flow (MAF) sensor
- Heated Oxygen Sensor (HO2S)
- Catalyst Monitor Sensor (CMS)
- Cylinder Head Temperature (CHT) sensor
- Knock Sensor (KS)
- Variable Camshaft Timing (VCT) oil control solenoid
- Manifold Absolute Pressure (MAP) sensor

The PCM:

- accepts input from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operating range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The CMP sensor:

- provides camshaft position information which is used by the PCM for fuel synchronization. Refer to Section 303-14A .

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine.
- sends the PCM a signal to determine the intake air mass. The PCM will then calculate the required fuel injector pulse width in order to provide the desired air/fuel ratio.

The HO2S :

- has the ability to create a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The CMS :

- monitors oxygen content after it flows through the catalytic converter.
- provides feedback information to the PCM used to calculate fuel delivery.

The CHT sensor:

- sends the PCM a signal indicating cylinder head temperature.

- resistance decreases as coolant temperature increases. Refer to Section 303-14A .

The KS :

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

The VCT oil control solenoid:

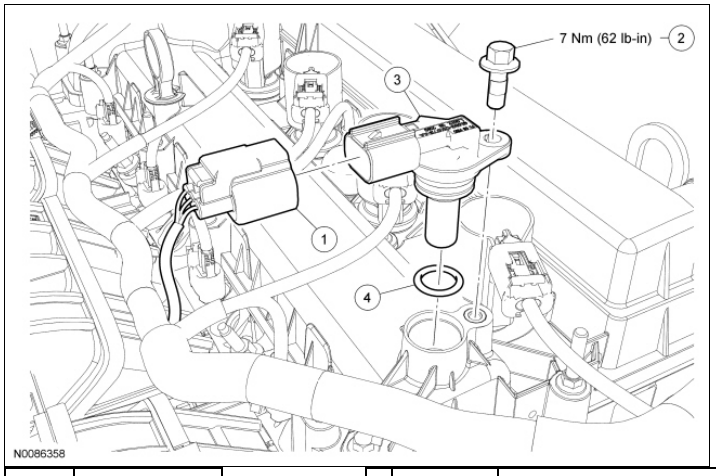
- is an electrically controlled hydraulic valve that directs engine oil to the variable camshaft. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

The MAP sensor:

- measures manifold vacuum and converts it to an electrical signal. This provides the PCM information on engine load.

Electronic Engine Controls

DTC Charts



PCM DTC Chart

Camshaft Position (CMP) Sensor

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number				
			1	14A464	Camshaft Position (CMP) sensor electrical connector (part of 12B637)
2	W701219	CMP sensor bolt			
3	12K073	CMP			
4	-	CMP O-ring seal			

Removal and Installation

1. Disconnect the Camshaft Position (CMP) sensor electrical connector.

2. Remove the bolt and the CMP .
   - To install, tighten to 7 Nm (62 lb-in).

3. **NOTE:** Lubricate the CMP O-ring seal with clean engine oil.

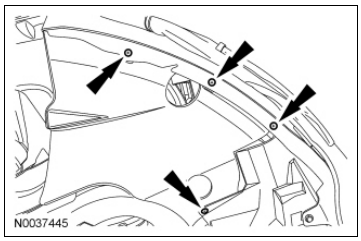
   To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor

Special Tool(s)

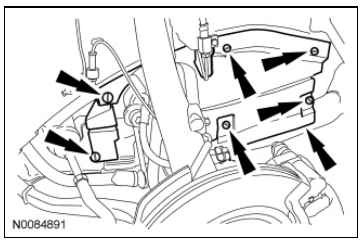
 ST3055A	Aligner, Crankshaft Sensor 303-1417
 ST2638-A	Timing Peg, Crankshaft TDC 303-507

General Equipment



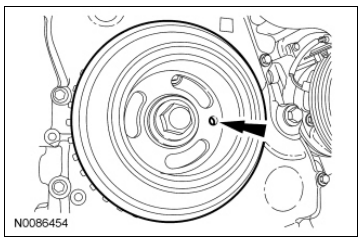
6 mm x 18 mm bolt

Item	Part Number	Description
1	14A464	Crankshaft Position (CKP) sensor electrical connector (part of 12B637)
2	W701219-S	CKP sensor bolt (2 required)
3	6C315	CKP sensor



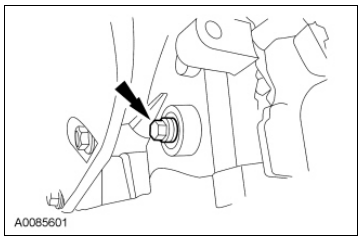
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .



2. Remove the 4 screws and position the RH fender splash shield aside.

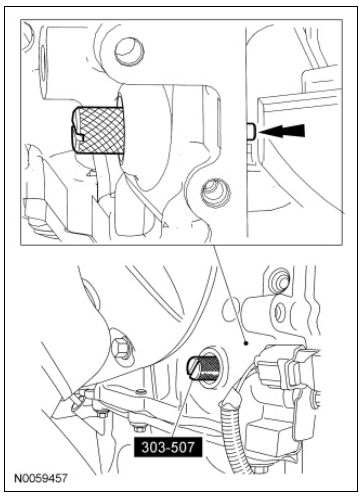
N0037445



3. Remove the 6 pin-type retainers and the RH splash shield.

N0084891

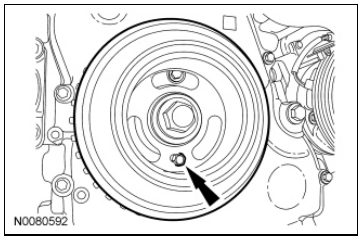
4. Turn the crankshaft clockwise until the hole in the crankshaft pulley is in the 3 o'clock position.



5. Remove the cylinder block plug.

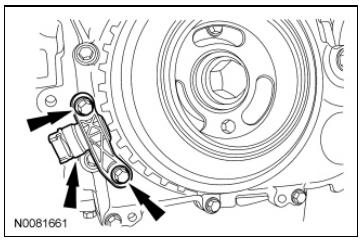
6. **NOTE:** When the crankshaft contacts the Crankshaft TDC Timing Peg, the No. 1 cylinder will be at Top Dead Center (TDC).

   Install the Crankshaft TDC Timing Peg and turn the crankshaft clockwise until the crankshaft contacts the Crankshaft TDC Timing Peg.



7. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

8. Remove the bolts and discard the CKP sensor.



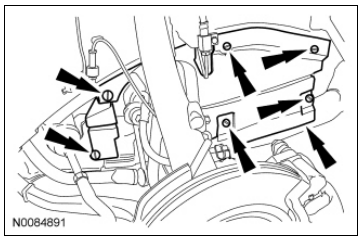
Installation

1. ***NOTICE:*** **Only hand-tighten the bolt or damage to the front cover can occur.**

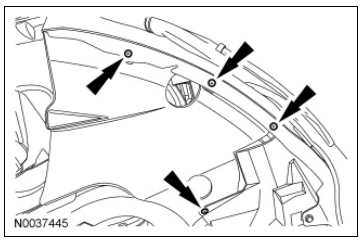
   Install a 6 mm (0.23 in) x 18 mm (0.7 in) standard bolt in the crankshaft pulley.

2. Install the CKP sensor and the 2 bolts.
    - Do not tighten the bolts at this time.

3. Adjust the CKP sensor with the Crankshaft Sensor Aligner.
    - Tighten the 2 CKP bolts to 7 Nm (62 lb-in).

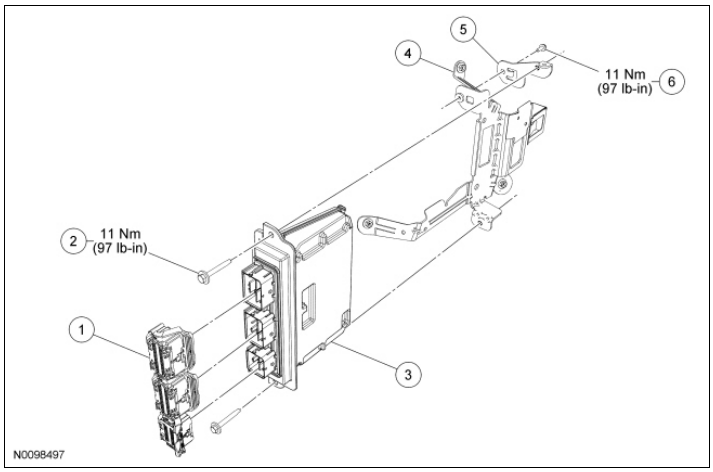


4. Connect the CKP sensor electrical connector.



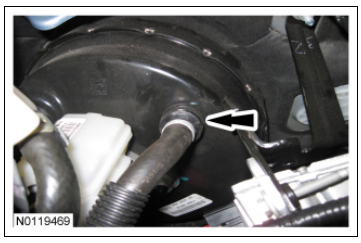
5. Remove the 6 mm (0.23 in) bolt from the crankshaft pulley.

6. Install the cylinder block plug.
    - Tighten to 20 Nm (177 lb-in).

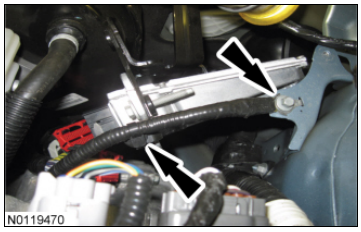


7. Install the 6 pin-type retainers and the RH splash shield.

8. Install the 4 screws and position the RH fender splash shield aside.



Powertrain Control Module (PCM)



Item	Part Number	Description
1	14A464	PCM electrical connector (3 required)
2	W5505428	PCM bolt (2 required)
3	12A650	PCM
4	12A692	PCM bracket
5	-	Upper PCM bracket (part of 12A692)
6	-	Upper PCM bracket bolt (part of 12A692)

Removal

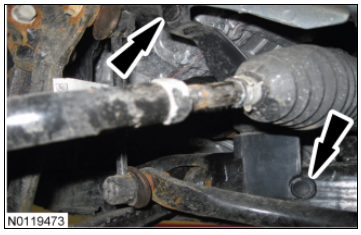
1. With the in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .
2. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .
3. Remove the cowl panel grille. For additional information, refer to Section 501-02 .
4. Disconnect the vacuum hose from the vacuum brake booster.

5. Disconnect the 3 PCM electrical connectors.
6. Remove the ground strap bolt and disconnect the ground strap retainer.

7. Remove the two LH splash shield pin-type retainers and position the LH splash shield aside.

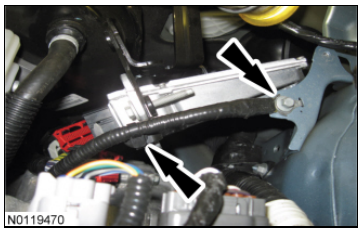
8. Remove the lower PCM bolt and the upper PCM bracket bolt.
    - Remove the PCM.

9. Remove the upper PCM bolt and the PCM bracket from the PCM.



Installation

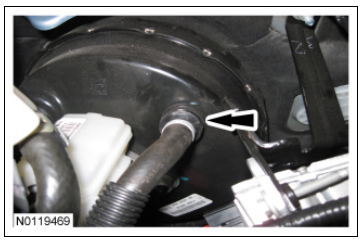
1. Install the PCM bracket and the upper PCM bolt to the PCM.
    - Tighten to 11 Nm (97 lb-in).



2. Install the PCM and the lower PCM bolt.
    - Tighten to 11 Nm (97 lb-in).

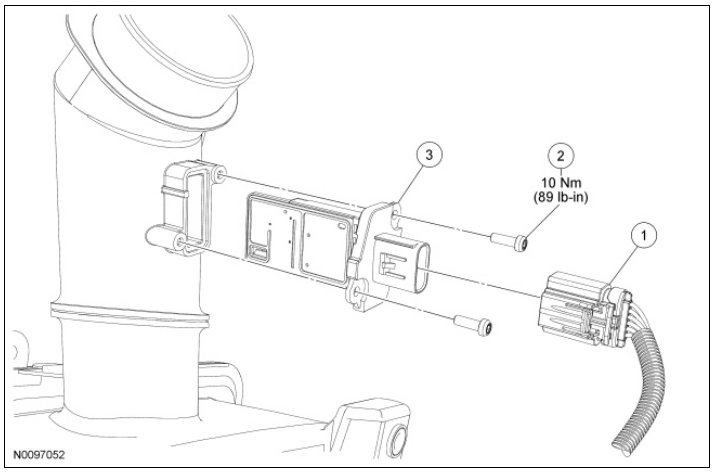
3. Install the upper PCM bracket bolt.
    - Tighten to 11 Nm (97 lb-in).

4. Position the LH splash shield and install the two LH splash shield pin-type retainers.



5. Connect the ground strap retainer and install the ground strap bolt .
    - Tighten to 10 Nm (89 lb-in)

6. Connect the 3 PCM electrical connectors.



7. Connect the vacuum hose to the vacuum brake booster.

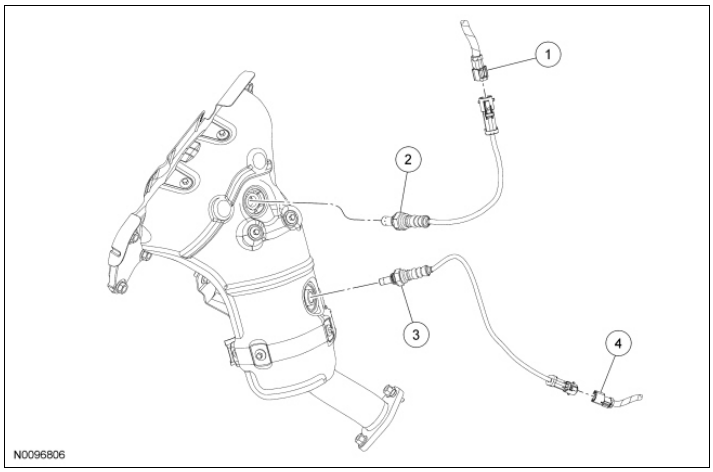
8. Install the cowl panel grille. For additional information, refer to Section 501-02 .

9. Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

Mass Air Flow (MAF) Sensor

Item	Part Number	Description
1	14A464	Mass Air Flow (MAF) sensor electrical connector
2	W709287	MAF sensor screw (2 required)
3	12B579	MAF sensor

Removal and Installation



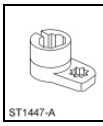
ol start="1">
- Remove the Air Cleaner (ACL) outlet pipe. For additional information, refer to Section 303-12D .

2. Disconnect the Mass Air Flow (MAF) sensor electrical connector.

3. Remove the 2 screws and the MAF sensor.
   - To install, tighten to 10 Nm (89 lb-in).

4. To install, reverse the removal procedure.

Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor - Exploded View



Item	Part Number	Description
1	14A464	Heated Oxygen Sensor (HO2S) electrical connector (part of 12C508)
2	9F472	HO2S
3	9G444	Catalyst Monitor Sensor (CMS)
4	14A464	CMS electrical connector (part of 12C508)

1. For additional information, refer to the procedures in this section.

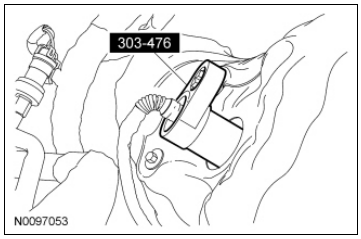
Heated Oxygen Sensor (HO2S)

Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-



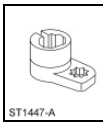
Removal and Installation

1. Disconnect the Heated Oxygen Sensor (HO2S) ecal connector.

2. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the HO2S .

   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
   - To install, tighten to 48 Nm (35 lb-ft).



3. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the HO2S .

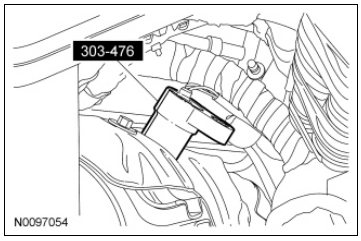
   To install, reverse the removal procedure.

Catalyst Monitor Sensor

Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material



Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Penetrating and Lock Lubricant (US); Penetrating Fluid (Canada) XL-1 (US); CXC-51-A (Canada)	-

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoistadditional information, refer to Section 100-02 .
2. Disconnect the Catalyst Monitor Sensor (CMS) electrical connector.
3. **NOTE:** If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

   Using the Exhaust Gas Oxygen Sensor Socket, remove the CMS .

   - Calculate the correct torque wrench setting for the following torque. Refer to the Torque Wrench Adapter Formulas in the Appendix.
   - To install, tighten to 48 Nm (35 lb-ft).

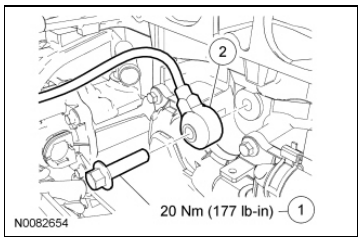
4. **NOTE:** Apply a light coat of anti-seize lubricant to the threads of the CMS .

   To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor

Item	Part Number	Description
1	14603	Cylinder Head Temperature (CHT) sensor cover (part of 12C508)
2	14A464	CHT sensor electrical connector (part of 12C508)td>
3	6G004	CHT sensor

Removal and Installation



1. Detach the Cylinder Head Temperature (CHT) sensor cover and position aside.

2. Disconnect the CHT sensor electrical connector.

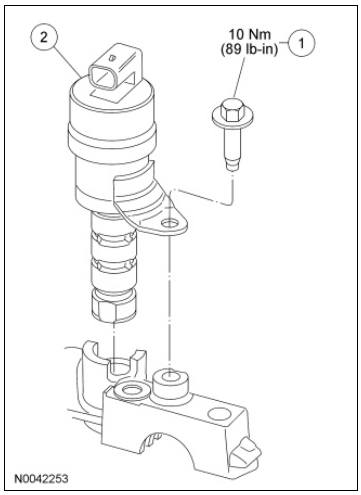
3. Remove the CHT sensor.
   - To install, tighten to 12 Nm (106 lb-in).

4. To install, reverse the removal procedure.

Knock Sensor (KS)

Item	Part Number	Description
1	W5000025	Knock Sensor (KS) bolt
2	12A699	KS

Removal and Installation



1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the intake manifold. For additional information, refer to Section 303-01D .

3. Remove the bolt and the Knock Sensor (KS).
   - To install, tighten to 20 Nm (177 lb-in).

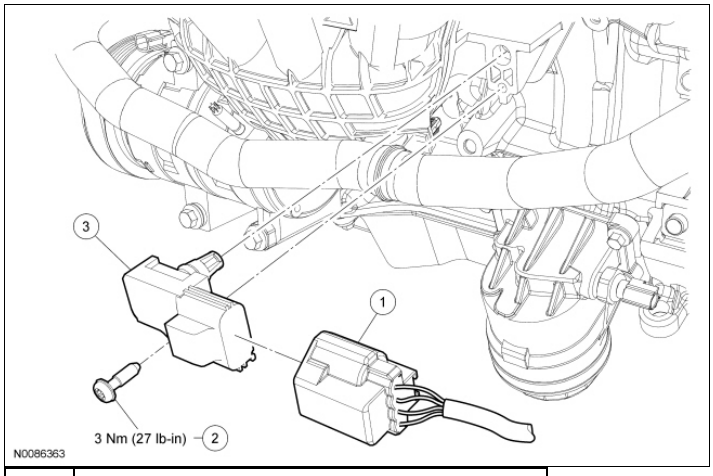
4. To install, reverse the removal procedure.

Variable Camshaft Timing (VCT) Oil Control Solenoid

Item	Part Number	Description
1	W500211	Variable Camshaft Timing (VCT) oil control solenoid bolt
2	6M280	VCT oil control solenoid

Removal and Installation

1. Remove the valve cover. For additional information, refer to Section 303-01D .



2. Remove the bolt and the Variable Camshaft Timing (VCT) oil control solenoid.
   - To install, tighten to 10 Nm (89 lb-in).

3. To install, reverse the removal procedure.

Manifold Absolute Pressure (MAP) Sensor

Material

Item	Specification
Motorcraft® SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft® SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

Item	Part Number th valign="bottom">Description	
1	14A464	Manifold Absolute Pressure (MAP) sensor electrical connector
2	W701459	MAP sensor screw
3	9F479	MAP sensor

Removal and Installation

1. Disconnect the Manifold Absolute Pressure (MAP) sensor electrical connector.

2. Remove the screw and the MAP sensor.
   - To install, tighten to 3 Nm (27 lb-in).

3. **NOTE:** Lubricate the MAP sensor O-ring seal with clean engine oil.

   To install, reverse the removal procedure.

Alignment Specifications

Item	LH	RH	Total/Split

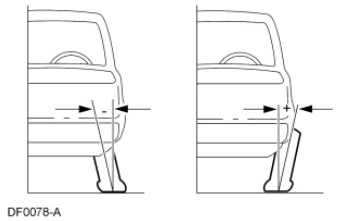
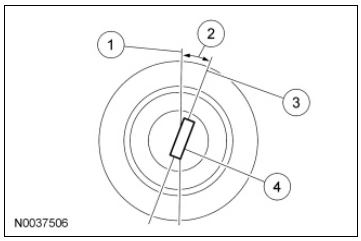
Torque Specifications



Description	Nm	lb-ft
Front tie-rod jam nuts	80	59
Rear camber adjustment nuts	101	74
Rear toe link jam nuts	102	75

Wheel Alignment Angles

Front toe is adjusted through the use of adjustable tie-rod ends. Front caster is adjusted by installing new upper control arms with offset bushings. The upper arms can adjust caster angles ± 0.4 degrees and have separate part numbers. Front camber is not adjustable on the vehicle. Rear toe is adjusted through the use of adjustable toe links. Rear caster is not adjustable on the vehicle. Rear camber is adjusted through the use of a cam bolt that attaches the rear lower control arm to the rear subframe.

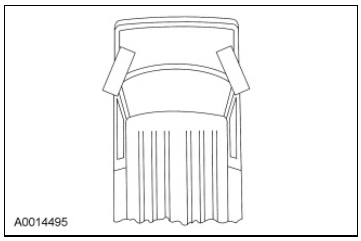


Camber

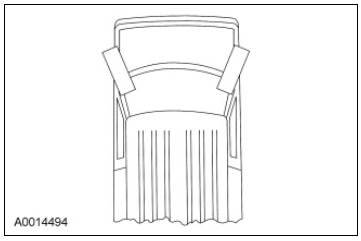
Negative and Positive Camber

Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct affect on tire wear.

Caster



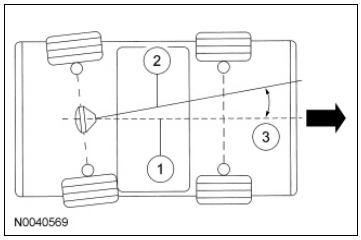
Item	Description
1	True vertical
2	Positive caster angle
3	Shock-to-ball joint centerline
4	Pivot centerline



Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

Positive Toe (Toe In)



Negative Toe (Toe Out)

The vehicle toe setting affects tire wear and directional stability.

Incorrect Thrust Angle (Dogtracking)

Item	Description
1	Vehicle centerline
2	Axle centerline
3	Thrust angle

Incorrect thrust angle (also known as dogtracking) is the condition in which the rear axle is not square to the chassis. Heavily crowned roads can give the illusion of dogtracking.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel. For wheel and tire diagnosis, refer to Section 204-04 .

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe poor return of the steering wheel to center after a turn or steering correction.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (for example, wind, road crown).
- A drift or pull condition may exist even if the front alignment is within specifications. To aid in correcting this condition, there are 4 additional upper control arms available with off-set bushings (2 for LH, 2 for RH). These upper control arms will allow the caster to be adjusted ±0.4 degrees. Refer to Caster Adjustment - Front in this section.

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center".

- Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear. In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.
- In the diagnosis of a roadability problem, it is important to understand the difference between wander and poor groove feel.

Suspension System

Inspection and Verification

1. Road test the vehicle.
   - If any suspension alignment or ride height concerns are present, GO to Symptom Chart - Suspension System .
   - Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are present, GO to Symptom Chart - NVH .
2. Inspect the tires.
3. Check the tire pressures with all normal loads in the vehicle and the tires cold. Refer to the Vehicle Certification (VC) label.
   - Verify that all tires are sized to specification. Refer to the VC label.
   - Inspect the tires for incorrect wear and damage. Install new tires as necessary.
3. Inspect the chassis and underbody.
   - Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.
4. Inspect for aftermarket equipment.
   - Check for aftermarket changes to the steering, suspension, and wheel and tire components (such as competition or heavy duty). The specifications shown in this manual do not apply to vehicles equipped with aftermarket equipment.

Visual Inspection Chart

Mechanical
• Front or rear suspension components • Suspension fastener(s) • Incorrect spring usage • Spring(s) • Shock absorber(s) • Strut(s) • Suspension bushing(s) • Steering system components • Wheel bearing(s) • Non-OEM parts or modifications

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.

6. If the fault is not visually evident, GO to Symptom Chart - Suspension System or GO to Symptom Chart - NVH .

Symptom Chart - Suspension System

Symptom Chart - Suspension System

Symptom Chart - NVH

Symptom Chart - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to Section 100-04 . Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to Section 100-04 for the next likely system and continue diagnosis.

ConditionPossible SourcesAction

- Squeak or grunt - noise from the front suspension, occurs more in cold ambient temperatures. More noticeable over rough roads or when turning
- Front stabilizer bar insulators
- Under these conditions, the noise is accepta
- Clunk - noise from the front suspension, occurs in and out of turns
- Loose front suspension
- INSPECT for loose nuts or bolts. TIGHTEN to specifications. REFER to Section 204-01 for front suspension and Section 204-02 for rear suspension.
- Clunk - noise from the rear suspension, occurs when shifting from REVERSE to drive
- Loose rear suspension components
- INSPECT for loose or damaged rear suspension components. REPAIR or INSTALL new components as necessary. REFER to Section 204-02 .
- Click or pop - noise from the front suspension. More noticeable over rough roads or over bumps
- Worn or damaged ball joint(s) /ul>
- CARRY OUT a ball joint inspection. INSTALL new ball joint(s) or control arm(s) as necessary. REFER to Ball Joint Inspection in this section.
- Front suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads
- Shock absorber jounce bumper(s)

- LUBRICATE shock absorber jounce bumper(s). REFER to Disassembly and Assembly - Shock Absorber and Spring Assembly in Section 204-01 .

- Loose or damaged front struts, shock absorber(s) or shock absorber bushing(s)
- Damaged spring or spring mount(s)
- Damaged or worn control/radius arm bushing(s)
- Worn or damaged stabilizer bar bushings or link(s)

- INSPECT the front suspension. INSTALL new components as necessary. REFER to Section 204-01 .

- Rear suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads

- Loose or damaged rear shock absorber(s) or shock absorber bushing(s)
- Damaged spring or sprint(s)
- Damaged or worn control arm bushing(s)
- Worn or damaged stabilizer bar bushing(s) or link(s)

- INSPECT the rear suspension. INSTALL new components as necessary. REFER to Section 204-02 .

- Shudder - occurs during acceleration from a slow speed or stop

- Incorrect ride height causing incorrect driveline angle

- REFER to Section 205-00 for driveline angle diagnosis.

- Shimmy

- Loose wheel nut(s)

- TIGHTEN the nut(s) to specification. REFER to Section 204-04 .

- Loose front suspension fastener(s)

- TIGHTEN the fastener(s) to specification. REFER to Section 204-01 .

- Loose front wheel bearing(s)

- INSPECT the front wheel bearing(s). INSTALL new bearing(s) as necessary. REFER to Section 204-01 .

- Strut(s) or shock absorber(s)

- INSTALL new struts or shock absorbers as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.

- Shimmy - most noticeable on coast/deceleration. Also hard steering condition

- Excessive positive caster

- CHECK the wheel alignment. REFER to Caster Adjustment - Front in this section. ADJUST as necessary.

- Rough/harsh ride

- Incorrect tire pressure
- ADJUST the tire pressure. REFER to the Vehicle Certification (VC) label.
- Strut(s) or shock absorber(s)
- INSTALL new struts or shock absorbers as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
- Spring(s)
- MEASURE the ride height. REFER to Ride Height Measurement in this section. INSTALL new springs as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.
- Loose, worn or damaged suspension component(s)
- INSTALL new suspension component(s) as necessary. REFER to Section 204-01 for front suspension or Section 204-02 for rear suspension.

Pinpoint Tests

Pinpoint Test A: Vehicle Drifts/Pulls

This pinpoint test is intended to diagnose the following:
- Unevenly loaded vehicle
- Tire pressure
- Tire forces
- Brake drag
- Incorrect vehicle alignment
- Steering system

PINPOINT TEST A: VEHICLE DRIFTS/PULLS

Test Step	Result / Action to Take
A1 CHECK FOR UNEVENLY LOADED VEHICLE	
• Visually check the vehicle for an uneven loading condition. • **Is the vehicle unevenly loaded?**	**Yes** ADVISE the customer of uneven loading condition. **No** GO to A2 .
A2 CHECK THE TIRE PRESSURES AND TIRE CONDITIONS	
• Check the tire pressures. Refer to the Vehicle Certification (VC) label located on the driver door jamb. Check the tires for	**Yes** GO to A3 . **No**

uneven/abnormal wear. Refer to Diagnosis and Testing - Wheels and Tires in Section 204-04 . • **Are the tire pressures and tire conditions OK?**	ADJUST the tire pressures to the specified pressure or INSTALL new tires as necessary.
A3 ISOLATE TIRE DRIFT/PULL CONDITION	
• Cross the front wheel and tire assemblies from left-to-right. Refer to Section 204-04 . • **Does the vehicle drift/pull?**	**Yes** If the vehicle drifts/pulls in the opposite direction, tire forces are causing the drift/pull. REFER to Section 204-04 to diagnose the tire drift/pull. If the vehicle drifts/pulls in the same direction, GO to A4 . **No** Tire forces were causing the drift/pull and the concern has been corrected.
A4 CHECK FOR BRAKE DRAG	
• Spin all 4 wheel and tire assemblies by hand and check for brake drag. • **Do the wheels spin freely?**	**Yes** GO to A5 . **No** REFER to Section 206-00 to diagnose brake drag condition.
A5 CHECK THE WHEEL ALIGNMENT	
• Using alignment equipment and the manufacturer's instructions, check the wheel alignment. • **Is the wheel alignment out of specification?**	**Yes** ADJUST the alignment as necessary. REFER to General Procedures in this section. **No** REFER to Section 211-00A or Section 211-00B to diagnose steering system drift/pull/wander condition. For Electronic Power Assist Steering (EPAS) vehicles, refer to Section 211-00B to diagnose steering system drift/pull/wander condition. For Hydraulic Power Assist Steering (HPAS) vehicles, refer to Section 211-00A to diagnose steering system drift/pull/wander condition.

Component Tests

Ball Joint Inspection

1. Prior to inspecting the ball joints for wear, inspect the wheel bearings. Install a new wheel bearing as necessary. Refer to Section 204-01 .

2. **NOTE:** In order to obtain accurate measurements, the suspension must be in full rebound with the weight of the vehicle supported by the frame.

   Raise and support the vehicle by the frame to allow the wheels to hang in the rebound position.

3. Inspect the ball joint and ball joint boot for damage.

- If the ball joint or ball joint boot is damaged, install a new ball joint as necessary. Refer to Section 204-01 .

4. ***NOTICE:*** **Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage may occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.**

   NOTE: To avoid lateral movement of the steering linkage and steering components, make sure to apply hand force only at the 12 o'clock and 6 o'clock positions of the wheel and tire assembly.

   Inspect the ball joint for relative movement by alternately pulling outward and pushing inward on the wheel and tire assembly, at the 12 o'clock and 6 o'clock positions, by hand. Note any relative movement between the wheel knuckle and both lower arms at the lower ball joints.

   - If relative movement is not felt or seen, the ball joints are OK. Do not install new ball joints.
   - If relative movement is found, continue with Step 5.

5. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the center line of the forward front lower ball joint.

   To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the forward front lower arm and the wheel knuckle at the forward front lower ball joint.

6. Measure the ball joint deflection while an assistant alternately pulls outward and pushes inward on the wheel and tire assembly, at the 12 o'clock and 6 o'clock positions, by hand.
   - If the deflection exceeds the specification, install a new forward and rearward lower ball joint. Refer to Section 204-01 .
   - If the deflection meets the specification, continue with the procedure.

7. ***NOTICE:*** **Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage can occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.**

   Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the upper arm by hand. Note any relative vertical movement between the wheel knuckle and upper arm at the upper ball joint.

   - If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.

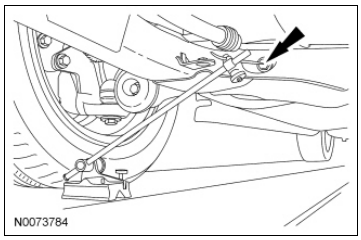
- If relative movement is found, continue with Step 8.

8. **NOTE:** In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis of the ball joint.

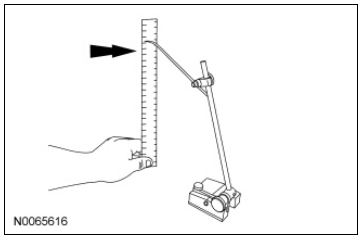
   To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the upper arm and the wheel knuckle or ball joint stud.

9. Measure the ball joint deflection while an assistant pushes up and then pulls down on the upper arm, by hand.
   - If the deflection exceeds the specification, a new ball joint must be installed. Refer to Section 204-01 .
   - If the deflection meets the specification, no further action is required.

Ride Height Measurement



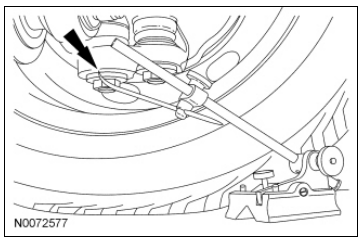
Front Ride Height Measurement



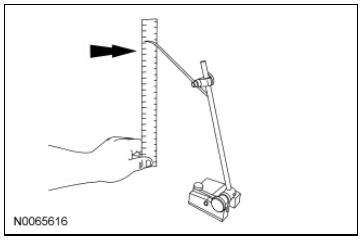
Item	Description
1	Ride height = 2 - 3
2	Measurement 2
3	Measurement 3

NOTE: Make sure that the vehicle is posied on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Position a suitable surface gauge (such as Starrett 57D Surface Gauge), on a flat, level surface and adjust the arm of the gauge until the scriber point is located in the center of the front lower arm-to-subframe bolt.
    - Lock the surface gauge in this position.

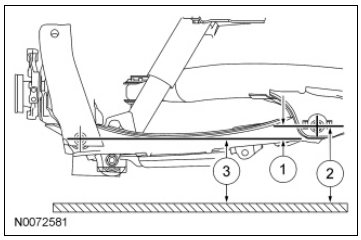


2. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 2).



3. Position the surface gauge on the same flat, level surface as used in Step 1, adjust the gauge's arm until the scriber point is located at the lowest part of the wheel knuckle, next to the front lower arm ball joint nut.

- Lock the surface gauge in this position.



4. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement 3).

5. Subtract measurement 3 from measurement 2 to obtain the front ride height.
   - Refer to Specifications in this section.

Rear Ride Height Measurement

Item	Description
1	Ride height = 2 - 3
2	Measurement 2
3	Measurement 3

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Measure the distance between the flat level surface and center of the lower arm inboard cam bolt (measurement 2).

2. Measure the distance between the flat level surface and the center of the lower arm outboard bolt (measurement 3).

3. Subtract measurement 3 from measurement 2 to obtain the rear ride height.

Caster Adjustment - Front

NOTE: If caster adjustment is necessary to resolve a vehicle alignment issue, then installing a revised upper control arm(s) is an acceptable method. This procedure should not be routinely performed with all alignments and only after all other possible sources have been inspected and corrected as necessary.

1. Using alignment equipment and the manufacturer's instructions, measure the caster.

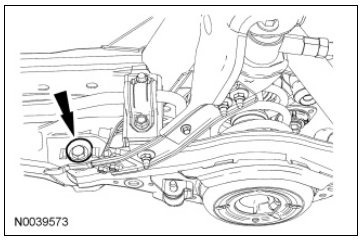
2. **NOTE:** The revised upper control arms have the same base part number, but they are identified by the amount of caster they change (for example: + 0.4 degrees or - 0.4 degrees).

   Use the following table and the measurements taken in Step 1 to determine which front upper control arm should be installed.

Part Number	Degree of Change
3084 RH	+ 0.4 degree
3084 RH	- 0.4 degree
3091 LH	+ 0.4 degree
3091 LH	- 0.4 degree

3. Install a revised front upper control arm(s) as necessary. For additional information, refer to Section 204-01 .

4. Recheck the front caster settings and adjust as necessary.



5. Check and, if necessary, adjust the front toe. For additional information, refer to Toe Adjustment - Front in this section.

Camber Adjustment - Rear

NOTE: Before carrying out a camber adjustment, check the tires for the correct pressure. Inspect the tires for incorrect wear or damage. Inspect the front suspension components for wear or damage.

1. Using alignment equipment and the manufacturer's instructions, measure the rear camber.

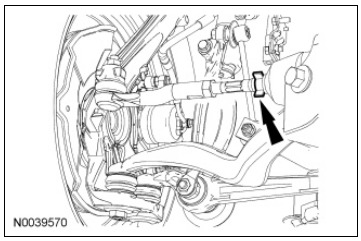
2. Loosen the rear camber adjustment nut.

3. Rotate the camber adjustment bolt until the camber setting is within specifications.

NOTE: Do not allow the camber adjustment bolt to rotate while tightening the nut.

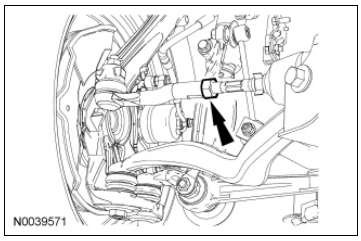
Tighten the camber adjustment nut to 101 Nm (74 lb-ft).

5. Recheck the rear camber and adjust as necessary.



Toe Adjustment - Front

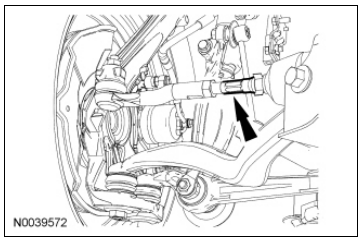
1. Start the engine and center the steering wheel.



2. Turn the engine OFF and, using a suitable steering wheel holding device, lock the steering wheel in the straight ahead position.

3. Using alignment equipment and the manufacturer's instructions, measure the front toe.

4. Remove the steering gear bellows clamps.

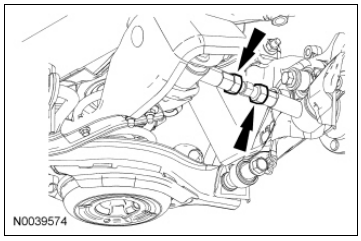


5. Loosen the tie-ruts.

6. **NOTE:** Do not allow the steering gear bellows to twist when the tie rod is rotated.

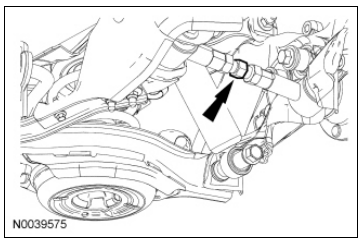
   Rotate the tie rods until the toe setting is within specifications.

7. Tighten the jam nuts to 80 Nm (59 lb-ft).



8. Install the steering gear bellows clamps.

9. Recheck the front toe settings and adjust as necessary.



Toe Adjustment - Rear

1. Using alignment equipment and the manufacturer's instructions, measure the rear toe.

2. Loosen the toe link jam nuts.

3. Rotate the toe link adjusting rod until the toe setting is within specifications.

4. **NOTE:** llow the adjusting rod to rotate while tightening the jam nuts.

   Tighten the toe link jam nuts to 102 Nm (75 lb-ft).

5. Recheck the rear toe and adjust as necessary.

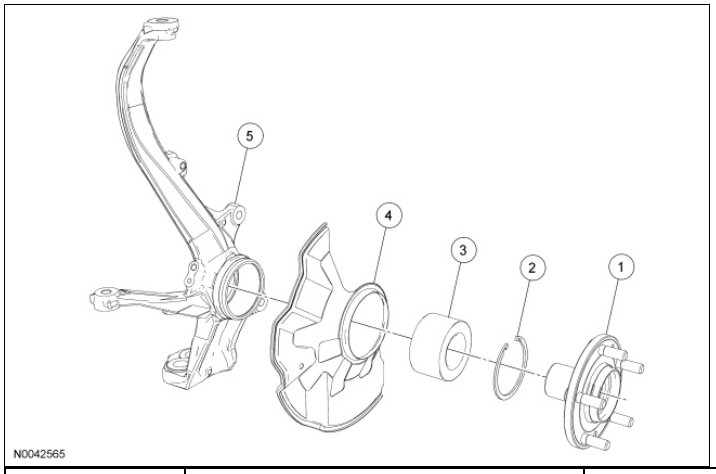
[a] Refer to the procedure in this section.

Front Suspension

The front suspension consists of the following components:

- Wheel bearings
- Wheel hubs
- Wheel studs
- Front and rear lower arms
- Upper arms
- Stabilizer bar
- Stabilizer bar bushings
- Stabilizer bar links
- Shock and spring assemblies
- Wheel knuckles

The front suspension is an independent suspension design. This front suspension uses 3 parallel arms (one upper arm and 2 lower arms). Each arm has a mounting position to the chassis and a ball joint attachment at the wheel knuckle. The shock absorber mounts to the lower arm and along with the spring, controls vertical movement. A stabilizer bar and links are included to control suspension lean/sway during turns. The multiple arm design allows for carefully controlled motion of the wheel throughout suspension travel, controlling such parameters as camber angle, caster angle and toe.



Front Suspension

Refer to Section 204-00 .

Wheel Bearing and Wheel Hub

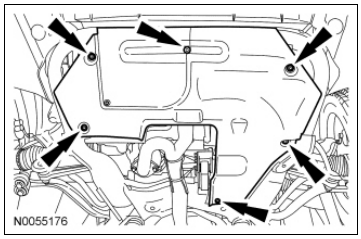
Special Tool(s)

 ST2330-A	Remover, Front Hub 205-D070 (D93P-1175-B) or equivalent
 ST2138-A	Installer, Halfshaft 204-161 (T97P-1175-A)
 ST2945-A	Ball Joint Separator 204-592
 ST2446-A	Installer, Wheel Hub Bearing Cup 205-147
 ST1895-A	Remover, Drive Pinion Bearing Cone 205-D002 (D79L-4621-A) or equivalent
 ST2446-A	Remover/Installer, Wheel Hub Cup 204-020
 ST2446-A	Step Plate 205-117
 ST3272-A	Installer, Axle Bearing Cup. 205-225
 ST3273-A	Remover/Installer, Drive Pinion Oil Seal 205-440

Item	Part Number	Description
1	1104	Wheel hub
2	3B625	Snap ring
3	1215	Wheel bearing
4	2K005 LH/ 2K004 RH	Disc brake shield
5	3K171 LH/ 3K170 RH	Wheel knuckle

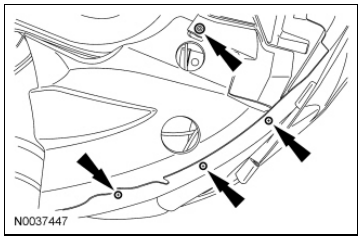
Removal

NOTICE: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**



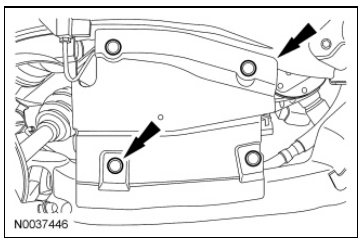
NOTE: This procedure is shown for the LH side, the RH side is similar.

NOTE: If removing the wheel hub, a new wheel bearing must be installed.

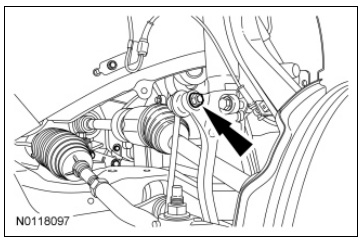


1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

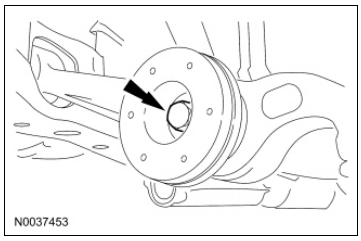
2. Remove the wheel and tire. For additional information, refer to Section 204-04 .



3. Remove the bolts and the underbody shield, if equipped.

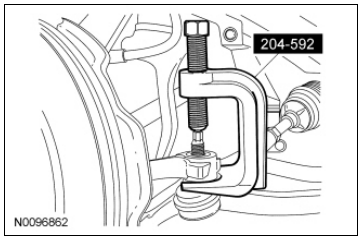


4. Remove the 4 screws position the fender splash shield aside.

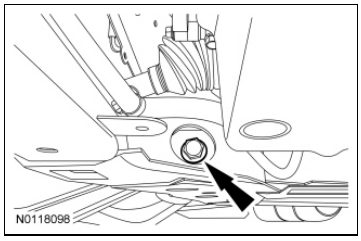


5. Remove the 6 pin-type retainers (4 shown) from the splash shield.

6. Remove the upper stabilizer bar link nut and separate from the stabilizer bar.



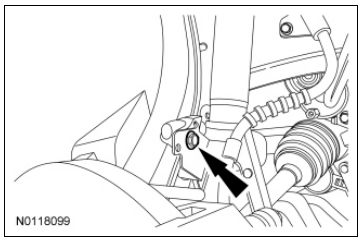
7. Remove the lower control arm-to-strut through bolt and flagnut.



8. Remove the outer tie-rod end cotter pin and nut.
   - Discard the cotter pin.

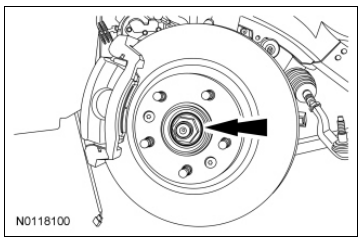
9. ***NOTICE:*** **Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.**

   Using the Ball Joint Separator, separate the outer tie-rod end from the knuckle.



10. Remove the front lower arm-to-subframe bolt.
    - Discard the bolt.

11. If equipped, remove the wheel speed sensor bolt.



12. If equipped, remove the wheel speed sensor harness bolt and position the wheel speed sensor aside.

13. Remove the brake flexible hose bracket-to wheel knuckle bolt and position the hose and bracket aside.

14. **NOTE:** Apply the brake to keep the halfshaft from rotating.

    Remove and discard the wheel hub nut.

15. ***NOTICE:*** **Do not allow the caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.**

    Remove the bolts and position the caliper and anchor plate assembly aside.

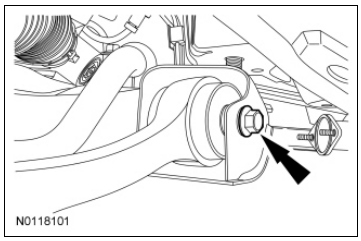
    - Support the caliper and anchor plate assembly using mechanic's wire.

16. Remove the 2 brake disc bolts and the brake disc.

17. Using a wax pencil (or equivalent) apply witness marks to the vehicle and subframe to aid in installation.

18. Position a suitable jackstand under the subframe.

19. Remove the 4 front subframe support bracket bolts.



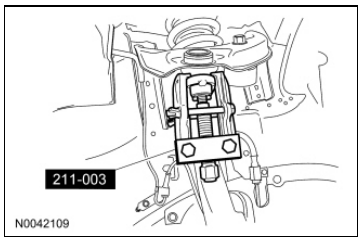
20. Remove the 2 front subframe rear nuts and remove the front subframe support bracket.

21. **NOTE:** Do not remove the front subframe forward bolts, loosen to allow the front subframe to be lowered.

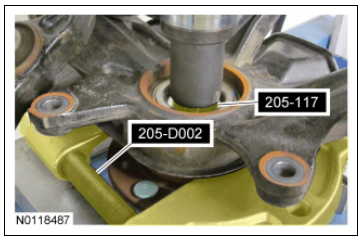
    Loosen the 2 front subframe forward nuts

22. Partially lower the subframe, to allow removal of the rear lower arm-to subframe bolt.

23. Remove the rear lower arm-to subframe bolt.
    - Discard the bolt and washer.

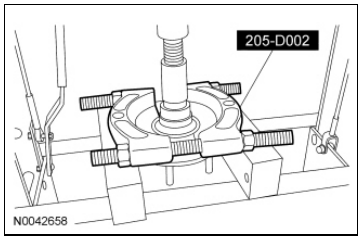


24. Using the Front Hub Remover, separate the halfshaft from the wheel hub.
    - Using mechanics wire or equivalent, support the halfshaft.

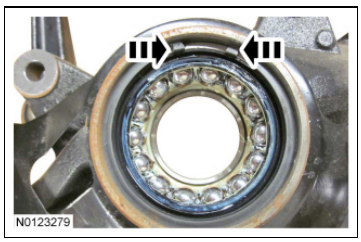


25. Remove and discard the upper ball joint nut.

26. Using the Steering Arm Remover, separate the upper ball joint from the wheel knuckle and remove the wheel knuckle assembly.



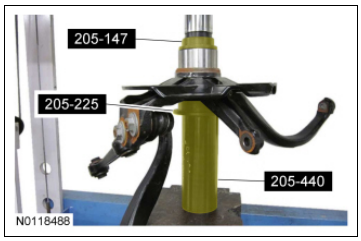
27. Using the Step Plate, press the wheel hub from the wheel bearing.



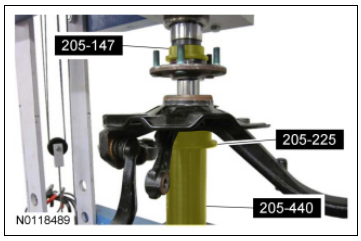
28. **NOTE:** This step may not be necessary if the inner wheel bearing race remains on the wheel bearing after removing the wheel hub.

    If necessary, using the Drive Pinion Bearing Cone Remover, press the inner wheel bearing race from the wheel hub.

29. Remove the snap ring.



30. Using the Wheel Hub Cup Remover/Installer, press the wheel bearing from the wheel knuckle.



Installation

1. Using the Wheel Hub Bearing Cup Installer, press the wheel bearing into the wheel knuckle.

2. Install the snap ring.

3. Using the Step Plate and Wheel Hub Bearing Cup Installer, press the wheel hub into the wheel bearing.

4. Position the wheel knuckle and install the new upper ball joint nut.
   - Tighten to 48 Nm (35 lb-ft).

5. Partially raise the subframe.

6. Position the halfshaft to the wheel hub.

7. Position the lower control arms to the subframe.
   - Loosely install a new rear lower arm-to-subframe bolt.
   - Loosely install a new front lower arm-to-subframe bolt.

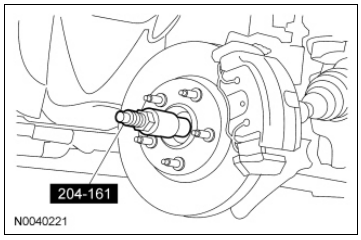
8. Raise the subframe and align to the witness marks made during removal.

9. Position the front subframe support bracket and tighten the 2 new front subframe rear nuts.
   - Tighten to 150 Nm (111 lb-ft).

10. Tighten the 4 front subframe bracket bolts.
    - Tighten to 103 Nm 76 lb-ft).

11. Tighten the 2 new front subframe forward nuts.
    - Tighten to 150 Nm (111 lb-ft).

12. Remove the jackstand.



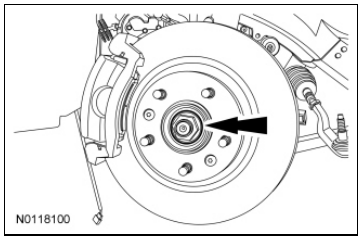
13. If equipped, position the wheel speed sensor and install the bolt.
    - Tighten to 23 Nm (17 lb-ft).

14. If equipped, install the wheel speed sensor harness bolt.
    - Tighten to 23 Nm (17 lb-ft).

15. Install the brake disc and the 2 brake disc bolts.
    - Tighten to 20 Nm (177 lb-in).

16. Position the brake caliper and anchor plate assembly and install the 2 bolts.
    - Tighten to 90 Nm (66 lb-ft).

17. Using the Halfshaft Installer, in the halfshaft Into the wheel hub.

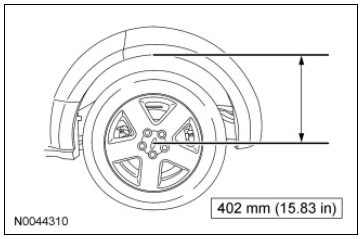


18. ***NOTICE:*** **Do not tighten the halfshaft nut with the vehicle on the ground. The nuts must be tightened to specification before the vehicle Is lowered onto the wheels. Wheel bearing damage will occur If the wheel bearing Is loaded with the weight of the vehicle applied.**

    NOTE: Apply the brake to keep the halfshaft from rotating.

    Install the wheel hub nut.

    - Tighten to 255 Nm (189 lb-ft).

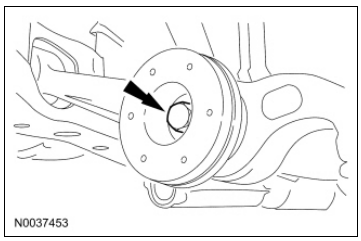


19. Stake the new nut in line with the keyway to a recommended minimum depth of 1 mm (0.039 in) below the keyway diameter to engage the locking feature.

20. Position the brake flexible hose and bracket and install the bolt.
    - Tighten to 23 Nm (17 lb-ft).

21. Before tightening any suspension busing fasteners, the suspension must be at 402 mm (15.826 in) between the center of the hub and the lip of the fender. This will prevent incorrect clamp load and bushing damage.
    - Use a suitable jack to raise the suspension to specification.

22. Tighten the front lower arm-to-subframe bolt.
    1. Tighten to 110 Nm (81 lb-ft).
    2. Tighten an additional 90° with the suspension at the bushing fastener tightening position.

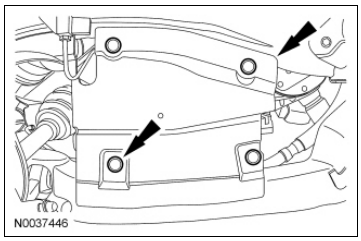


23. Tighten the rear lower arm-to-subframe bolts to 110 Nm (81 lb-ft).

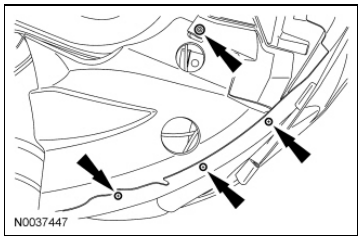
24. Install the outer tie-rod end to the control arm.
    1. Position to the wheel hub.
    2. Install the nut.
    3. Tighten to 48 Nm (35 lb-ft).

    li>Install new cotter pin.

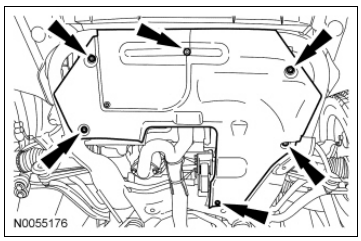
25. Install the lower control arm-to-strut through bolt and flagnut.



- Tighten to 103 Nm (76 lb-ft).

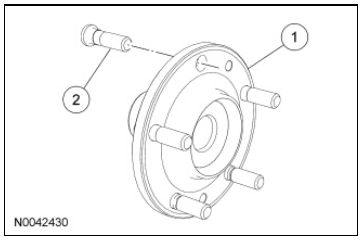


26. Position the stabilizer bar link and install the nut.
    - Tighten to 42 Nm (31 lb-ft).



27. Install the splash shield and 6 pin-type retainers, (4 shown).

28. Position the fender splash shield and Install the screws.



29. Install the underbody shield and bolts (if equipped).
    - Tighten to 7 Nm (62 lb-in).

30. Install the wheel and tire. For additional information, refer to Section 204-04 .
