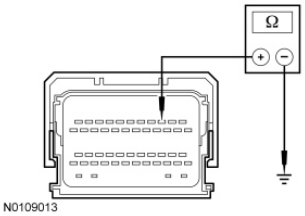
⚠ **WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.**	**Yes** GO to O2 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.

- Ignition OFF.
- Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section.
- Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section.
- Disconnect: BPSM C4238B.
- Measure the resistance between BPSM C4238B-3, circuit J2-B3, harness side and BPSM C4238B-14, circuit J2-B14, harness side. Use the following table to determine if the resistance values are correct.

Temperature Range	Resistance Range
-30°C (-22°F) to -21°C (-5°F)	132,571 ohms - 76,491 ohms
-20°C (-4°F) to -11°C (13°F)	77,380 ohms - 46,573 ohms
-10°C (14°F) - 0°C (32°F)	46,762 ohms - 27,965 ohms
0°C (32°F) - 10°C (51°F)	29,164 ohms - 18,115 ohms
11°C (52°F) - 20°C (68°F)	17,931 ohms - 12,037 ohms
21°C (69°F) - 30°C (86°F)	11,842 ohms - 8,155 ohms
	7,850 ohms - 5,624 ohms
41°C (105°F) - 50°C (122°F)	5,602 ohms - 3,957 ohms



N0103038

- **Is the resistance value correct for the temperature?**

O2 CHECK THERMISTOR FOR A SHORT TO GROUND

- the resistance between BPSM C4238B-3, circuit J2-B3, harness side and the battery case.

Yes
INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 • **Is the resistance greater than 10,000 ohms?**	**No** INSTALL a HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

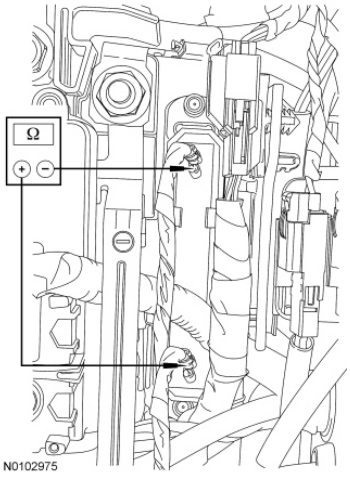
Pinpoint Test P: DTC P0AD9:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

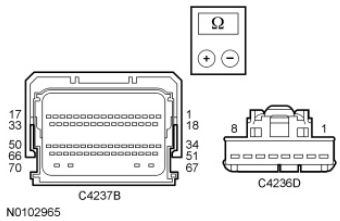
Normal Operation

When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close which will supply power to the high-voltage vehicle systems. The Battery Pack Sensor Module (BPSM) monitors the battery voltage from inside the High Voltage Traction Battery (HVTB) and the high-voltage Bussed Electrical Center (BEC). If there is no high voltage to the positive contactor, the BECM will set the DTC and shut down the vehicle. The stop safely hazard (red triangle) warning indicator will illuminate.

- P0AD9:00 (Hybrid Battery Positive Contactor Control Circuit Open/GM: No Sub Type Information) - If there is no high voltage to the positive contactor, this DTC will be set.



This pinpoint test is intended to diagnose the following:
- BECM
- High-voltage BEC
- HVTB



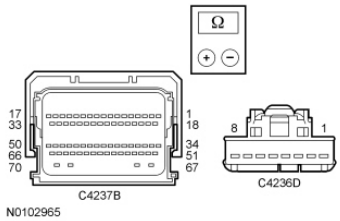
PINPOINT TEST P: DTC P0AD9:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Flure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
P1 MEASURE CONTACTOR RESISTANCE	
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always	**Yes** GO to P2 .

install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: High-voltage BEC C4236D. • Measure the resistance between the: ♦ BEC C4236D pin 1 and pin 2, component side. ♦ BEC C4236D pin 4 and pin 5, component side. • **Are the resistances between 5-50 ohms?**	**No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P2 CHECK CONTACTOR RESISTOR	
• With the service disconnect plug removed, measure the resistance of the precharge resistor in the BEC .  • **Is the resistance between 6-10 ohms?**	**Yes** GO to P3 . **No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
P3 MEASURE CIRCUIT RESISTANCE	
• Disconnect: BECM C4237B. • Measure the resistance between the high-voltage BEC C4236D-1, circuit J1-A58, harness side and BECM C4237B-58, circuit J1-A58, harness side. • Measure the resistance between the high-voltage BEC C4236D-2, circuit J1-A59, harness side, and BECM C4237B-59, circuit J1-A59, harness side.	**Yes** GO to P4 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



- **Are the resistances less than 5 ohms?**

P4 CHECK FOR OPEN IN CIRCUIT

- Measure the resistance between high-voltage BEC C4236D, harness side and BECM C4237B, harness side as follows:

High-Voltage BEC	Circuit	BECM
C4236D-4	J1-A61	C4237B-61
C4236D-5	J1-A62	C4237B-62

- **Are the resistances less than 5 ohms?**

Yes
GO to P5 .

No
INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

P5 CHECK FOR CORRECT BECM OPERATION

- Ignition OFF.
- Check the BECM harness and component side connectors for:
  - ♦ corrosion.
  - ♦ pushed-out/bent pins.
- Connect the BECM and make sure the connectors seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

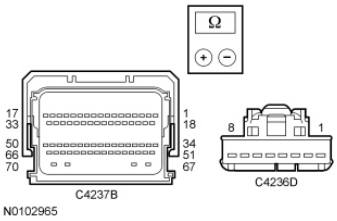
Pinpoint Test Q: DTC P0ADD:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close which will supply power to the high-voltage vehicle systems. The Battery Pack Sensor Module (BPSM) monitors the battery voltage from inside the High Voltage Traction Battery (HVTB) and compares it to voltage on the high-voltage Bussed Electrical Center (BEC) contactors. If there is no high voltage to the negative contactor, the BECM will set the DTC and shut down the vehicle. The stop safely hazard (red triangle) warning indicator will illuminate and the vehicle will shut down.

- P0ADD:00 (Hybrid Battery Negative Contactor Control Circuit Open: No Sub Type Information) - If there is no high voltage to the negative contactor, this DTC will be set.



This pinpoint test is intended to diagnose the following:
- BECM
- High-voltage BEC
- HVTB

PINPOINT TEST Q: DTC P0ADD:00

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Q1 MEASURE CONTACTOR RESISTANCE	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: High-voltage BEC C4236D. • Measure the resistance between high-voltage BEC C4236D pin 7 and pin 8, component side. • **Is the resistance between 5-50 ohms?**	**Yes** GO to Q2 . **No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
Q2 MEASURE CIRCUIT RESISTANCE	

• Disconnect: BECM C4237B. • Measure the resistance between: ♦ high-voltage BEC C4236D-7, circuit J1-A55, harness side and BECM C4237B-55, circuit J1-A55, harness side. ♦ high-voltage BEC C4236D-8, circuit J1-A56, harness side and BECM C4237B-56, circuit J1-A56, harness side.  • **Are the resistances less than 5 ohms?**	**Yes** GO to Q3 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
Q3 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test R: DTC P0ADA:00 or P0ADE:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close which will supply power to the high-voltage vehicle systems. The Battery Pack Sensor Module (BPSM) monitors the battery voltage from inside the High Voltage Traction Battery (HVTB) and the high-voltage Bussed Electrical Center (BEC). The powertrain malfunction (wrench) warning indicator will be illuminated when a fault is present.

- P0ADA:00 (Hybrid Battery Positive Contactor Control Circuit Range/Performance: No Sub Type Information) - This DTC will set if positive contactor voltage is below or above 179-343 volts for 1 second or more.
- P0ADE:00 (Hybrid Battery Negative Contactor Control Circuit Range/Performance: No Sub Type

Information) - This DTC will set if voltage at the negative contactor is below or above 179-343 volts for 1 second or more.

This pinpoint test is inte to diagnose the following:

- BPSM
- High-voltage BEC
- HVTB

PINPOINT TEST R: DTC P0ADA:00 OR P0ADE:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

Test Step	Result / Action to Take
R1 RETRIEVE ALL BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Do any DTCs other than P0ADA:00 or P0ADE:00 exist?**	**Yes** REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to R2 .
R2 INSTALL A NEW HIGH-VOLTAGE BEC	
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Install a new high-voltage BEC . Refer to High-Voltage Bussed Electrical Center in this section. • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Did DTC P0ADA:00 or P0ADE:00 return?**	**Yes** GO to R3 . **No** The repair is now complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
R3 INSTALL A NEW BPSM	

⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Install a new BPSM . Refer to Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug. • Ignition ON. • Using the scan tool, clear any BECM DTCs. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Did DTC P0ADA:00 or P0ADE:00 return?**	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The repair is now complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test S: DTC P0AEA:00 or P0AEB:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

With the ignition in the ON position and the engine running or OFF, the Battery Pack Sensor Module (BPSM) monitors the High Voltage Traction Battery (HVTB) internal temperature. The BPSM communicates the HVTB temperature (in addition to other information) to the Battery Energy Control Module (BECM) through a dedicated Controller Area Network (CAN). There is also a HVTB inlet air temperature sensor mounted to the inlet air duct which monitors inlet air temperature to the HVTB . The BECM uses the information from the various temperature sensors to control and maintain HVTB temperature by controlling the HVTB cooling fan. The ideal HVTB temperature is 25°C (77°F) with a desired range of 20°C (68°F) to 30°C (86°F).

- P0AEA:00 (Hybrid Battery Temperature Sensor D Circuit Low: No Sub Type Information) - Fault sets if BECM senses an open or short to ground in the thermistor circuitry.
- P0AEB:00 (Hybrid Battery Temperature Sensor D Circuit High: No Sub Type Information) - Fault sets if the BECM senses a short to power in the thermistor circuitry.

This pinpoint test is intended to diagnose the following:
- BPSM
- HVTB

PINPOINT TEST S: DTC P0AEA:00 OR P0AEB:00

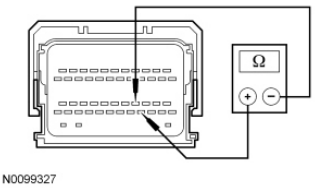
⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The

high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

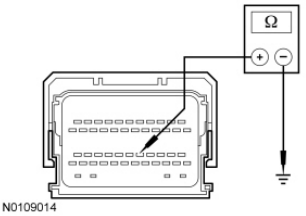
NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>S1 MEASURE THERMISTOR RESISTANCE FROM BPSM</td><td></td></tr>
<tr><td>
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.



⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.

• Ignition OFF.
• Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section.
• Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section.
• Disconnect: BPSM C4238B.
• Measure the resistance between BPSM C4238B-27, circuit J2-B27, harness side and BPSM C4238B-38, circuit J2-B38, harness side. Use the following table to determine if the resistance values are correct.



<table>
<tr><th>Temperature Range</th><th>Resistance Range</th></tr>
<tr><td>-30°C (-22°F) to -21°C (-5°F)</td><td>132,571 ohms - 76,491 ohms</td></tr>

</table>
</td><td>
Yes
GO to S2 .

No
INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section.
CLEAR the DTCs.
REPEAT the self-test.
TEST the system for normal operation.
</td></tr>
</table>

-10°C (14°F) - 0°C (32°F)	46,762 ohms - 27,965 ohms
0°C (32°F) - 10°C (51°F)	29,164 ohms - 18,115 ohms
11°C (52°F) - 20°C (68°F)	17,931 ohms - 12,037 ohms
21°C (69°F) - 30°C (86°F)	11,842 ohms - 8,155 ohms
31°C (87°F) - 40°C (104°F)	7,850 ohms - 5,624 ohms
41°C (105°F) - 50°C (122°F)	5,602 ohms - 3,957 ohms

- **Is the resistance value correct for the temperature?**

S2 CHECK THERMISTOR FOR A SHORT TO GROUND	
• Measure the resistance between BPSM C4238B-27, circuit J2-B27, harness side and the battery case.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test T: DTC P0AC0:00, P0AC1:00 or P0AC2:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

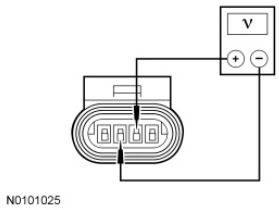
Normal Operation

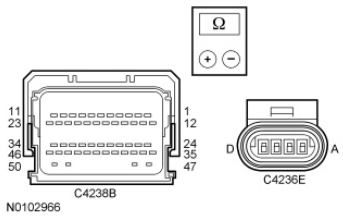
The Battery Pack Sensor Module (BPSM) measures current flow through the contactors using current sensors mounted within the Bussed Electrical Center (BEC). The BPSM uses a 5-volt reference to the current sensors and measures the return voltage. This return voltage is translated into current flow by the BPSM . This information is communicated to the Battery Energy Control Module (BECM) via a dedicated Controller Area Network (CAN).

- P0AC0:00 (Hybrid Battery Pack Current Sensor A Circuit Range/Performance: No Sub Type Information) - Fault is set when the reference voltage offset is outside the normal range.
- P0AC1:00 (Hybrid Battery Pack Current Sensor A Circuit Low: No Sub Type Information) - Fault is set when the reference voltage is below 0.25 volt.
- P0AC2:00 (Hybrid Battery Pack Current Sensor A Circuit High: No Sub Type Information) - Fault is set when the reference voltage is above 4.75 volt.

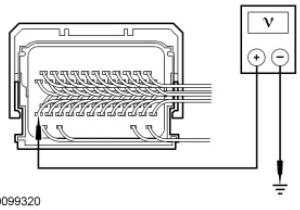
This pinpoint test is intended to diagnose the following:

- High-voltage BEC
- BECM
- BPSM
- High Voltage Traction Battery (HVTB)

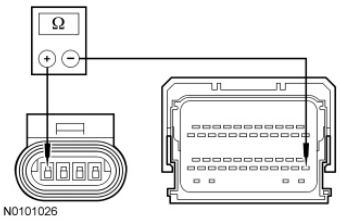




PINPOINT TEST T: DTC P0AC0:00, P0AC1:00 OR P0AC2:00



⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.



⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
T1 RETRIEVE ALL BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0B10:00 present?**	**Yes** GO to T2 **No** GO to T4 .
T2 MEASURE VOLTAGE AT CURRENT SENSOR CONNECTOR	
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section.	**Yes** GO to T4 . **No** GO to T3 .

• Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: High-voltage BEC C4236E. • Ignition ON. • Measure the voltage between high-voltage BEC C4236E-B, circuit J2-B12, harness side and high-voltage BEC C4236E-C, circuit J2-B1, harness side.  N0101025 • **Is the voltage between 4.5 and 5.5 volts?**	
T3 CHECK CURRENT SENSOR CIRCUITS	
⚠ **WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Disconnect: BPSM C4238B. • With the service disconnect plug removed, measure the resistance between high-voltage BEC C4236E-B, circuit J2-B12, harness side and BPSM C4238B-12, circuit J2-B27, harness side; and between high-voltage BEC C4236E-C, circuit J2-B1, harness side and BPSM C4238B-1, circuit J2-B1, harness side.  N0102966 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
T4 MEASURE VOLTAGE AT BPSM CONNECTOR	

⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • If not previously removed, remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Connect: BEC C4236E (if previously disconnected). • Ignition ON. • With the service disconnect plug removed, measure the voltage between BPSM C4238B-35, circuit J2-B35, harness side and ground by back-probing the BPSM connector.  N0099320 • **Is the voltage between 2.25 and 2.75 volts?**	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to T5 .
T5 CHECK CURRENT SENSOR SIGNAL CIRCUIT	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Disconnect: BPSM C4238B. • With the service disconnect plug removed, measure the resistance between high voltage BEC C4236E-D, circuit J2-B35, harness side and	**Yes** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new HVTB (includes

BPSM C4238B-35, circuit J2-B35, harness side.  • **Is the resistance less than 5 ohms?**	HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test U: DTC P0ADC:00

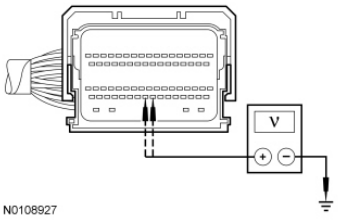
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close which will supply high-voltage power to the vehicle. If an overcurrent condition is sensed by the BECM , the stop safely hazard (red triangle) warning indicator is illuminated and the vehicle will shut down and/or not start.

- P0ADC:00 (Hybrid Battery Positive Contactor Control Circuit High: No Sub Type Information) - If the BECM detects overcurrent on the contactor control circuit for 1 second or more, this DTC will be set. Reports as a continuous memory (historical) DTC only.

This pinpoint test is intended to diagnose the following:



- BECM
- High-voltage Bussed Electrical Center (BEC)
- High Voltage Traction Battery (HVTB)

PINPOINT TEST U: DTC P0ADC:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may relt in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
U1 CHECK FOR SHORT IN CIRCUIT	
• Ignition OFF. • Disconnect: BECM C4237B. • Ignition ON. • Measure the voltage between BECM C4237B-58, circuit J1-A58, harness side and ground; and between BECM C4237B-59, circuit J1-A59, harness side and ground.  • **Is any voltage present?**	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to U2 .
U2 MEASURE CONTACTOR COIL RESISTANCE	
⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: High-voltage BEC C4236D. • Measure the resistance between high-voltage BEC C4236D pin 1 and pin 2, component side. • **Is the resistance between 5-50 ohms?**	**Yes** GO to U3 . **No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
U3 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion.	**Yes** INSTALL a new BECM . REFER to Battery Energy Control

♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Connect: High-Voltage BEC C4236D. • Install the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test V: DTC P0AFB:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

During vehicle operation, the High Voltage Traction Battery (HVTB) normal operating voltage range is between 179-343 volts. The electrical system is monitored by the Battery Energy Control Module (BECM) and Battery Pack Sensor Module (BPSM). As the voltage is used in the HVTB , a request to charge the battery is sent on the High Speed Controller Area Network (HS-CAN) to the Electronically Controlled Continuously Variable Transmission (eCVT) to send voltage to the battery to charge the battery and bring the operating voltage back to peak operating conditions. If battery voltage becomes too high, an over-charge condition is indicated. When battery voltage is too high, the stop safely hazard (red triangle) warning indicator is illuminated and the vehicle will shut down.

- P0AFB:00 (Hybrid Battery System Voltage High: No Sub Type Information) - Fault sets if the HVTB voltage is high for 10 seconds or more.

This pinpoint test is intended to diagnose the following:
- BECM
- BPSM

PINPOINT TEST V: DTC P0AFB:00

Test Step	Result / Action to Take
V1 RETRIEVE ALL BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM .	**Yes** REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to V2 .

• **Do any DTCs other than P0AFB:00 exist?**	
V2 MONITOR BECM PID HYBRID BATTERY PACK VOLTAGE (BATPACKVOLT)	
• Monitor BECM PID BATPACKVOLT. • **Is PIDs BATPACKVOLT below 344 volts?**	**Yes** INSTALL a new BPSM span>. REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test W: DTC P0AFD:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

With the ignition in the ON position and the engine ON or OFF, the Battery Pack Sensor Module (BPSM) monitors and maintains the High Voltage Traction Battery (HVTB) temperature in a specific range. A thermistor is mounted to the inlet air duct which monitors inlet air temperature along with thermistors inside the HVTB which monitor HVTB temperature. The ideal HVTB temperature is 25°C (77°F) with a desired range of 20°C (68°F) to 30°C (86°F). The HVTB is not designed to operate in temperatures below -40°C (-40°F). The Battery Energy Control Module (BECM) controls the temperature by adjusting the HVTB cooling fan speed. The BPSM communicates the HVTB and inlet air temperature to the BECM through a dedicated Controller Area Network (CAN).

- P0AFD:00 (Hybrid Battery Pack Temperature Too Low: No Sub Type Information) - Fault code sets if a thermistor within the battery senses temperature inside the battery was -40°C (-40°F).

This pinpoint test is intended to diagnose the following:

- BPSM
- HVTB

PINPOINT TEST W: DTC P0AFD:00

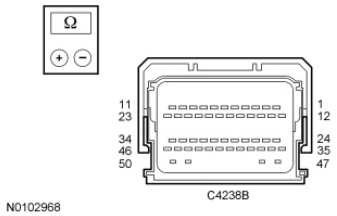
⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this

vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
W1 MEASURE THERMISTOR RESISTANCE FROM BPSM	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: BPSM C4238B.	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new ge Traction Battery" class="popup" onmouseover="this.className='popupnounderline';" onmouseout="this.className='popup';">HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.



- Measure the resistance of each of the thermistors located within the HVTB . Use the following charts to determine pin location and expected resistance values.

Connector Pins

Thermistor	Connector	Pins
Thermistor A	C4238B	2 and 13
Thermistor B	C4238B	25 and 36
Thermistor C	C4238B	3 and 14
Thermistor D	C4238B	27 and 38
Thermistor E	C4238B	26 and 37

Temperature Range	Resistance Range
-30°C (-22°F) to -21°C (-5°F)	132,571 ohms - 76,491 ohms
-20°C (-4°F) to -11°C (13°F) 77,380 ohms - 46,573 ohms	
-10°C (14°F) - 0°C (32°F)	46,762 ohms - 27,965 ohms
0°C (32°F) - 10°C (51°F)	29,164 ohms - 18,115 ohms
11°C (52°F) - 20°C (68°F)	17,931 ohms - 12,037 ohms
21°C (69°F) - 30°C (86°F)	11,842 ohms - 8,155 ohms
31°C (87°F) - 40°C (104°F)	7,850 ohms - 5,624 ohms

41°C (105°F) - 50°C (122°F)	5,602 ohms - 3,957 ohms

- **Are the resistance values correct for the temperature?**

Pinpoint Test X: DTC P0B10:00 or P0B12:00

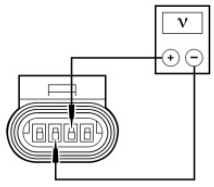
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

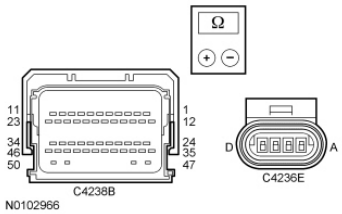
The Battery Pack Sensor Module (BPSM) measures current flow through the contactors using current sensors mounted within the Bussed Electrical Center (BEC). The BPSM uses a 5-volt reference to the current sensors and measures the return voltage. This return voltage is translated into current flow by the BPSM .

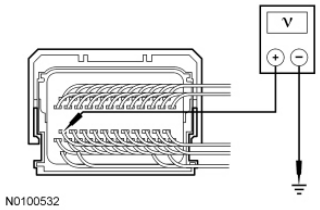
- P0B10:00 (Hybrid Battery Pack Current Sensor B Circuit Low: No Sub Type Information) - Fault is set when the reference voltage is below 0.25 volt.
- P0B12:00 (Hybrid Battery Pack Current Sensor B Circuit Intermittent/Erratic: No Sub Type Information) - Fault is set when the reference voltage is outside of the normal 0.25-4.75 volt range.

This pinpoint test is intended to diagnose the following:

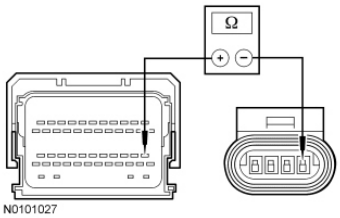


- High-voltage BEC
- BPSM
- High Voltage Traction Battery (HVTB)





PINPOINT TEST X: DTC P0B10:00 OR P0B12:00



⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided throhigh-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
X1 RETRIEVE ALL BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0B10:00 present?**	**Yes** GO to X2 . **No** GO to X4 .
X2 MEASURE VOLTAGE AT CURRENT SENSOR CONNECTOR	
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: High-voltage BEC C4236E. • Ignition ON. • Measure the voltage between high-voltage BEC C4236E-B, circuit J2-B12, harness side and high-voltage BEC C4236E-C, circuit J2-B1, harness side.  N0101025 • **Is the voltage between 4.5 and 5.5 volts?**	**Yes** GO to X4 . **No** GO to X3 .
X3 CHECK CURRENT SENSOR CIRCUITS	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• Disconnect: BPSM C4238B. • With the service disconnect plug removed, measure the resistance between high-voltage BEC C4236E-B, circuit J2-B12, harness side and BPSM C4238B-12, circuit J2-B12, harness side; and between high-voltage BEC C4236E-C, circuit J2-B1, harness side and BPSM C4238B-1, circuit J2-B1, harness side.  • **Are the resistances less than 5 ohms?**	**No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
X4 MEASURE VOLTAGE AT BPSM CONNECTOR	
⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • If not previously removed, remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Connect: High-voltage BEC C4236E (if previously disconnected). • Ignition ON. • With the service disconnect plug removed, measure the voltage between BPSM C4238B-24, circuit J2-B24, harness side and ground by back-probing the Battery Energy Control Module (BECM) connector.  	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to X5 .

• **Is the voltage between 2.25 and 2.75 volts?**	
X5 CHECK CURRENT SENSOR SIGNAL CIRCUIT	
• Ignition OFF. • Disconnect: BPSM C4238B. • With the service disconnect plug removed, measure the resistance between high-voltage BEC C4236E-A, circuit J2-B24, harness side and BPSM C4238B-24, circuit J2-B24, harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test Y: DTC P0B1B:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The Battery Pack Sensor Module (BPSM) monitors battery pack voltage by measuring voltage within the High Voltage Traction Battery (HVTB). The BPSM then broadcasts the voltage value via the dedicated Controller Area Network (CAN) to the BECM . Normal pack voltage should be between 179-343 volts.

- P0B1B:00 (Hybrid Battery Pack Voltage Sense C Circuit Low: No Sub Type Information) - Fault is set when BPSM senses low voltage.

This pinpoint test is intended to diagnose the following:

- HVTB
- BPSM

PINPOINT TEST Y: DTC P0B1B:00

Test Step	Result / Action to Take
Y1 RETRIEVE THE BECM DTCs	
	Yes

• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Are any DTCs other than P0B1B:00 retrieved?**	REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to Y2 .
Y2 INSTALL A NEW BPSM	
• Ignition OFF. • Install a new BPSM . Refer to Battery Pack Sensor Module (BPSM) in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0B1B:00 retrieve**	**Yes** GO to Y3 . **No** REPAIR is complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
Y3 INSTALL A NEW BECM	
• Ignition OFF. • Install a new BECM . Refer to Battery Energy Control Module (BECM) in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0B1B:00 retrieved?**	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR is complete. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test Z: DTC P0BC4:00 or P0BC5:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

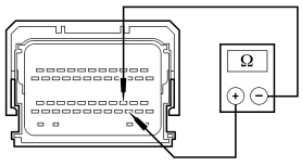
With the ignition in the ON position and the engine running or OFF, the Battery Pack Sensor Module (BPSM) monitors the High Voltage Traction Battery (HVTB) internal temperature. The BPSM communicates the HVTB temperature (in addition to other information) to the Battery Energy Control Module (BECM) through a dedicated Controller Area Network (CAN). There is also a HVTB inlet air temperature sensor mounted to the inlet air duct which monitors inlet air temperature to the HVTB . The BECM uses the information from the various temperature sensors to control and maintain HVTB temperature by controlling the HVTB cooling

fan. The ideal HVTB temperature is 25°C (77°F) with a desired range of 20°C (68°F) to 30°C (86°F).

- P0BC4:00 (Hybrid Battererature Sensor E Circuit Low: No Sup Type Information) - Fault sets if the BECM senses an open or short to ground in the thermistor circuitry.
- P0BC5:00 (Hybrid Battery Temperature Sensor E Circuit High: No Sub Type Information) - Fault sets if the BECM senses an short to power in the thermistor circuitry.

This pinpoint test is intended to diagnose the following:
- BPSM
- HVTB

PINPOINT TEST Z: DTC P0BC4:00 OR P0BC5:00



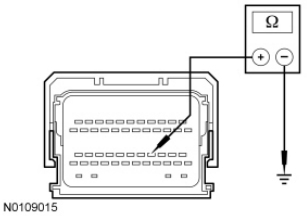
⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death. ⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Z1 MEASURE THERMISTOR RESISTANCE FROM BPSM	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section.	**Yes** GO to Z2 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

- Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section.
- Disconnect: BPSM C4238B.
- Measure the resistance between BPSM C4238B-26, circuit J2-B26, harness side and BPSM C4238B-37, circuit J2-B37, harness side. Use the following table to determine if the resistance values are correct.

Temperature Range	Resistance Range	
-30°C (-22°F) to -21°C (-5°F)	132,571 ohms - 76,491 ohms	
-20°C (-4°F) to -11°C (13°F)	77,380 ohms - 46,573 ohms	
-10°C (14°F) - 0°C (32°F)	46,762 ohms - 27,965 ohms	
0°C (32°F) - 10°C (51°F)	29,164 ohms - 18,115 ohms	
11°C (52°F) - 20°C (68°F)	17,931 ohms - 12,037 ohms	
21°C (69°F) - 30°C (86°F)	11,842 ohms - 8,15D valign="top" align="center">31°C (87°F) - 40°C (104°F)	7,850 ohms - 5,624 ohms
41°C (105°F) - 50°C (122°F)	5,602 ohms - 3,957 ohms	



N0099328

- **Is the resistance value correct for the temperature?**

Z2 CHECK THERMISTOR FOR A SHORT TO GROUND | r>

- Measure the resistance between BPSM C4238B-26, circuit J2-B26, harness side and the battery case.

N0109015

- **Is the resistance greater than 10,000 ohms?**

Yes
INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

No

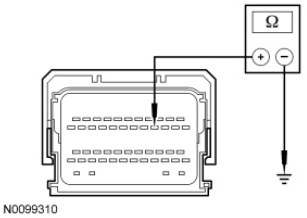
	INSTALL a HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in the section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

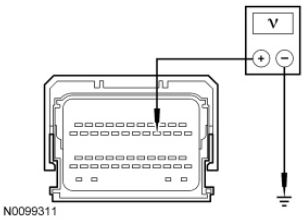
Pinpoint Test AA: DTC P1A0A:11, P1A0A:12 or P1A0A:15

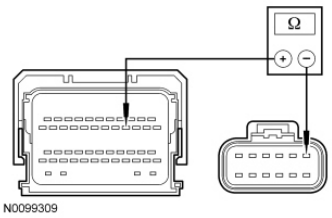
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

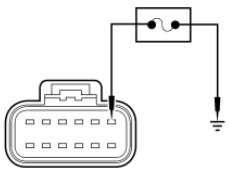
The Transmission Control Module (TCM) monitors immediate shutdown inputs from the Battery Energy Control Module (BECM). When the TCM detects an input out of the expected range, the BECM will set this DTC.







- P1A0A:11 (Immediate Shutdown Signal A: Circuit Short to Ground) - This DTC is set when the rapid shutdown circuit A is shorted to ground for 2 secos or more.
- P1A0A:12 (Immediate Shutdown Signal A: Circuit Short to Battery) - This DTC is set when the rapid shutdown circuit is shorted to battery for 1 second or more. This DTC sets during vehicle shutdown and reports as a continuous memory (historical) DTC only.
- P1A0A:15 (Immediate Shutdown Signal A: Circuit Short to Battery or Open) - This DTC is set when the circuit is shorted to battery or open for 2 seconds or more.



This pinpoint test is intended to diagnose the following:
- BECM
- TCM

PINPOINT TEST AA: DTCs P1A0A:11, P1A0A:12 OR P1A0A:15

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AA1 CHECK CIRCUIT FOR SHORT TO GROUND	
• Ignition OFF. • Disconnect: BECM C4237A. • Disconnect: TCM C1458A. • Measure the resistance of BECM C4215, circuit CYB16 (BN/VT), harness side and ground.	**Yes** GO to AA2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

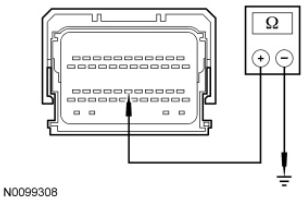
 N0099310 • **Is the resistance greater than 10,000 ohms?**	
AA2 CHECK CIRCUIT FOR SHORT TO BATTERY	
• Ignition ON. • Measure the voltage between BECM C4237A-15, circuit CYB16 (BN/VT), harness side and ground.  N0099311 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to AA3 .
AA3 CHECK CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between BECM C4237A-15, circuit CYB16 (BN/VT), harness side and TCM C1458A-6 circuit CYB16 (BN/VT), harness side.  N0099309 • **Is the resistance less than 5 ohms?**	**Yes** For DTC P1A0A:11 and P1A0A:12, GO to AA4 . For DTC P1A0A:15, GO to AA5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AA4 RETRIEVE BECM DTCs	
• Connect: BECM C4237A (leave TCM C1458A disconnected). • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **NOTE:** When retrieving DTCs with TCM C1458A disconnected, DTC P1A0A:15 would normally be present.	**Yes** GO to AA6 . **No** CARRY OUT self-test of the TCM and REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of TCM DTCs.

• **Is DTC P1A0A:11 or P1A0A:12 retrieved?**	
AA5 RETRIEVE BECM DTCs WHILE GROUNDING CIRCUIT	
• Connect: BECM C4237A. • Connect a fused jumper wire between TCM C1458A-6, circuit CYB16 (BN/VT), harness side and ground.  N0102969 • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **NOTE:** When retrieving DTCs with TCM C1458A -6 shorted to ground, DTC P1A0A:11 would normally be present. • **Is DTC P1A0A:15 retrieved?**	**Yes** GO to AA6 . **No** CARRY OUT self-test of the TCM and REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of TCM DTCs. If no DTCs are retrieved, INSTALL a new Electronically Controlled Continuously Variable Transmission (eCVT). REFER to Section 307-01C .
AA6 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Connect: TCM C1458A. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

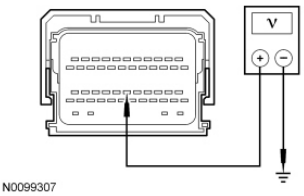
Pinpoint Test AB: DTC P1A15:11, P1A15:12 or P1A15:15

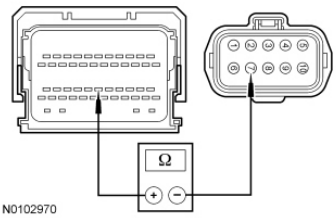
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

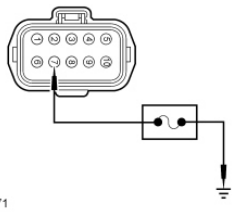


The Transmission Control Module (TCM) monitors immediate shutdown inputs from the Battery Energy Control Module (BECM). When the TCM detects an input out of the expected range, the BECM will set this DTC.





- P1A15:11 (Immediate Shutdown Signal B: Circuit Short to Ground) - This DTC is set when the circuit is shorted to ground.
- P1A15:12 (Immediate Shutdown Signal B: Circuit Short to Battery) - This DTC is set when the circuit is shorted to battery. This DTC sets during vehicle shutdown and reports as a continuous memory (historical) DTC only.
- P1A15:15 (Immediate Shutdown Signal B: Circuit Short to Battery or Open) - This DTC is set when the circuit is shorted to battery or open.



This pinpoint test is intended to diagnose the following: span title="Battery Energy Control Module" class="popup" onmouseover="this.className='popupnounderline';" onmouseout="this.className='popup';">BECM
- Electronically Controlled Continuously Variable Transmission (eCVT)

PINPOINT TEST AB: DTCs P1A15:11, P1A15:12 OR P1A15:15

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AB1 CHECK CIRCUIT FOR SHORT TO GROUND	
• Ignition OFF. • Disconnect: BECM C4237A. • Disconnect: TCM C1458B. • Measure the resistance of BECM C4237A-29, circuit CYB17 (BU/GY), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AB2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AB2 CHECK CIRCUIT FOR SHORT TO BATTERY	
• Ignition ON. • Measure the voltage between BECM C4237A-29, circuit CYB17 (BU/GY), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to AB3 .

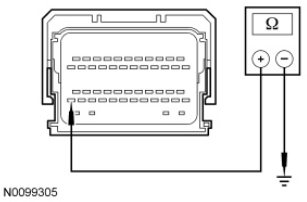
 • **Is any voltage present?**	
AB3 CHECK CIRCUIT FOR AN OPEN	
• Ignition OFF. • Measure the resistance between BECM C4237A-29, circuit CYB17 (BU/GY), harness side and TCM C1458B-7, circuit CYB17 (BU/GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** For DTC P1A15:11 and P1A15:12, GO to AB4 . For DTC P1A15A:15, GO to AB5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AB4 RETRIEVE BECM DTCs	
• Connect: BECM C4237A (leave TCM C1458B disconnected). • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **NOTE:** When retrieving DTCs with TCM C1458AB disconnected, DTC P1A15:15 would normally be present. • **Is DTC P1A15:11 or P1A15:12 retrieved?**	**Yes** GO to AB6 . **No** CARRY OUT self-test of the TCM and REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of TCM DTCs. If no DTCs are retrieved, INSTALL a new eCVT . REFER to Section 307-01C .
AB5 RETRIEVE BECM DTCs	
• Connect: BECM C4237A. • Connect a fused jumper wire between TCM C1458B-7, circuit CYB17 (BU/GY), harness side and ground.	**Yes** GO to AB6 . **No** CARRY OUT self-test of the TCM and REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of TCM DTCs.

 N0102971 • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM • **NOTE:** When retrieving DTCs with TCM C1458AB-7 shorted to ground, DTC P1A15:11 would normally be present. • **Is DTC P1A15:15 retrieved?**	
AB6 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Connect: TCM C1458B. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test AC: DTC B11D8:11

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation



The Battery Energy Control Module (BECM) monitors the impact notification output from the Restraints Control Module (RCM). The RCM outputs a Pulse-Width Modulation (PWM) voltage on the circuit based on status. If an event is indicated, the BECM will initiate shutdown of the High Voltage Traction Battery (HVTB) system. If the BECM senses a fault on the circuit, it will illuminate the powertrain malfunction (wrench) warning indicator and set a DTC.

- B11D8:11 (Restraint Event Notification: Circuit Short to Ground) - This DTC sets when the BECM detects a short to ground on the event notification signal circuit for 5 seconds or more.

This pinpoint test is intended to diagnose the following:
- Fuel Pump (FP) control module
- RCM
- BECM

PINPOINT TEST AC: DTC B11D8:11

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AC1 CHECK CIRCUIT FOR SHORT TO GROUND	
• Ignition OFF. • Disconnect: BECM C4237A. • Disconnect: RCM C310A. • Disconnect: FP Control Module C446. • Measure the resistance of BECM C4237A-46, circuit CR167 (YE/VT), harness side to ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AC2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AC2 CHECK BECM DTCs	
• Connect: BECM C4237A. • Connect: RCM C310A. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC B11D8:11 retrieved?**	**Yes** GO to AC3 . **No** INSTALL a new FP control module. REFER to Section 303-04D . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AC3 RETRIEVE BECM DTCs	
• Ignition OFF. • Disconnect: RCM C310A. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM .	**Yes** GO to AC4 . **No** INSTALL a new RCM . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

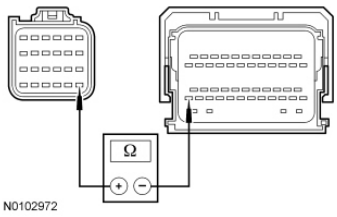
• **Is DTC B11D8:11 retrieved?**	
AC4 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Connect: RCM C310A. • Connect: Fuel Pump (FP) C446. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

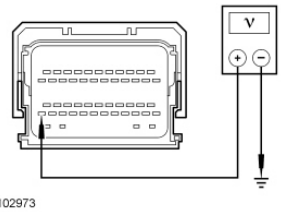
Pinpoint Test AD: DTC B11D8:15

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

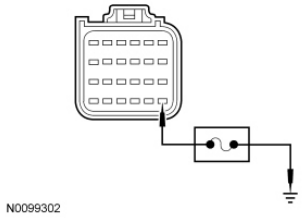
Normal Operation

The Battery Energy Control Module (BECM) monitors the impact notification output from the Restraints Control Module (RCM). The RCM outputs a Pulse-Width Modulation (PWM) voltage on the circuit based on status. If an impact notification is indicated, the BECM will initiate shutdown of the High Voltage Traction Battery (HVTB) system. If the BECM senses a fault on the circuit, it will illuminate the powertrain malfunction (wrench) warning indicator and set a DTC.





- B11D8:15 (Restraint Event Notification: Circuit Short to Battery or Open) - The DTC sets when the BECM detects an open or short to voltage on the event notification signal circuit for 5 seconds or more.



This pinpoint test is intended to diagnose the following:
- Circuitry
- Fuel Pump (FP) control module
- RCM
- BECM

PINPOINT TEST AD: DTC B11D8:15

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AD1 CHECK CIRCUIT FOR AN OPEN	&nb;

• Ignition OFF. • Disconnect: BECM C4237A. • Disconnect: RCM C310A. • Disconnect: FP Control Module C446. • Ignition ON. • Measure the resistance between BECM C4237A-46, circuit CR167 (YE/VT), harness side and RCM C310A-19, circuit CR167 (YE/VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to AD2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AD2 CHECK CIRCUIT FOR SHORT TO POWER	
• Ignition OFF. • Measure the voltage between BECM C4237A-46, circuit CR167 (YE/VT), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to AD3 .
AD3 CHECK BECM DTCs	
• Connect: BECM C4237A. • Connect: RCM C310A. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC B11D8:15 retrieved?**	**Yes** GO to AD4 . **No** INSTALL a new FP control module. REFER to Section 303-04D . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AD4 RETRIEVE BECM DTCs WITH RCM GROUNDED	

• Ignition OFF. • Disconnect: RCM C310A. • Connect a fused jumper wire between RCM C310A-19, circuit CR167 (YE/VT), harness side and ground.  N0099302 • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **NOTE:** When retrieving DTCs with RCM C310A-19 shorted to ground, DTC B11D8:36 would normally be present. • **Does DTC B11D8:15 appear?**	**Yes** GO to AD5 . **No** INSTALL a new RCM . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AD5 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Connect: RCM C310A. • Connect: FP Control Module C446. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test AE: DTC U0074:00 or U1006:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

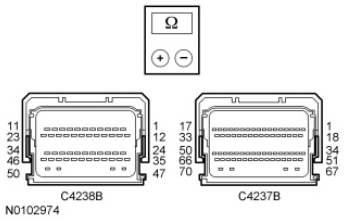
Normal Operation

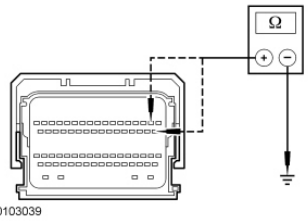
During normal vehicle operation the Battery Energy Control Module (BECM) and Battery Pack Sensor Module (BPSM) communicate with each other providing information each module needs to properly monitor and control the high-voltage system This communication is done over a dedicated Controller Area Network (CAN).

- U0074:00 (Control Module Communication Bus "B" Off: No Sub Type Information) - Fault sets if

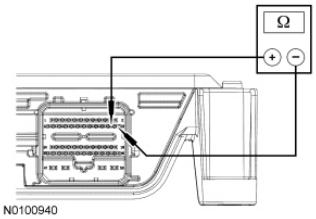
the BECM detects the dedicated CAN is off.
- U1006:00 (Sub Network CAN Initialization Failure: No Sub Type Information) - Fault sets if the BECM detects the dedicated CAN hardware does not initialize for 1 second or more.

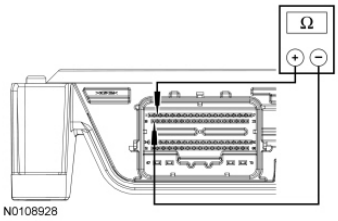
This pinpoint test is intended to diagnose the following:
- BECM
- BPSM
- High Voltage Traction Battery (HVTB)





PINPOINT TEST AE: DTC U0074:00 OR U1006:00





⚠ WAR: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AE1 CHECK CAN CIRCUITS	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section.	**Yes** GO to AE2 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

• Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: BPSM C4238B. • Disconnect: BECM C4237B. • Measure the resistance between BECM C4237B-2, circuit J1-A02, harness side and BPSM C4238B-23, circuit J1-A02, harness side; and between BECM C4237B-18, circuit J1-A18, harness side and BPSM C4238B-22, circuit J1-A18, harness side.  • **Are the resistances less than 5 ohms?**	
AE2 CHECK CIRCUITS FOR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between BECM C4237B-2, circuit J1-A02, harness side and ground; and between BECM C4237B-18, circuit J1-A18, harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AE3 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AE3 MEASURE BPSM TERMINATION RESISTANCE	
⚠ **WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Measure the resistance between BPSM C4238B pin 22 and pin 23, component side.	**Yes** GO to AE4 . **No** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

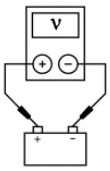
 • **Is the resistance between 108 and 132 ohms?**	
AE4 MEASURE BECM TERMINATION RESISTANCE	
• Measure the resistance between BECM C4237B pin 2 and pin 18, component side.  • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to AE5 . **No** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AE5 RETEST AND ISOLATE MODULES	
• Connect: BECM C4237B (leave BPSM C4238B disconnected). • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC U0074:00 or U1006:00 retrieved?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

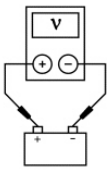
Pinpoint Test AF: DTCs U3001:00, U3003:16 and U3003:17

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

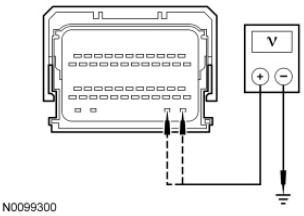
Normal Operation

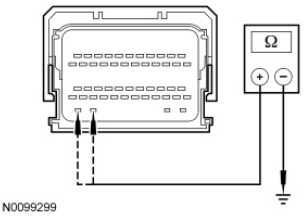
During normal vehicle operation, the 12-volt battery supplies voltage to the Battery Energy Control Module (BECM) in order for the BECM to operate. If this voltage is low or not available, the BECM cannot function correctly.





- U3001:00 (Control Module Improper Shutdown: No Sub Type Information) - Fault sets if the BECM loses its 12-volt power source unexpectedly and shuts down improperly. Reports as a continuous memory (historical) DTC only.
- U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) - Fault sets if the BECM 12-volt power source falls below 8 volts for at least 5 seconds.
- U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) - Fault sets if the BECM 12-volt power source goes above 16 volts for at least 5 seconds.





This pinpoint test is intended to diagnose the following:
- 12-volt battery
- Circuitry
- DC to DC Converter Control Module (DC/DC)
- BECM

PINPOINT TEST AF: DTCs U3001:00, U3003:16 AND U3003:17

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AF1 RETRIEVE ALL CMDTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - All CMDTCs . • **Is DTC B1316, B1318, B1676, P0562, P0563, U3001:00, U3003:16 or U3003:17 present in more than 1 module?**	**Yes** REFER to Section 414-05 to diagnose the DC/DC . **No** GO to AF2 .
AF2 CHECK 12-VOLT BATTERY	
• Carry out the 12-volt battery condition test. Refer to Section 414-01 . • **Did the 12-volt battery pass the condition test?**	**Yes** GO to AF3 . **No** INSTALL a new battery. REFER to Section 414-01 for further information. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AF3 MEASURE DC/DC OUTPUT VOLTAGE	
• Start the engine. • For DTC U3003:17, turn off all accessories for a minimum of 2 minutes. • For DTCs U3001:00 and U3001:16, turn on the headlamps and HVAC fan for a minimum of 2	**Yes** GO to AF4 . **No** CARRY OUT self-test of the DC/DC and REFER to Section 414-05 to diagnose the

minutes. • Measure 12-volt battery voltage.  AJ0210-A • **Is the voltage 13-15.2 volts?**	DC/DC .
AF4 COMPARE BATTERY VOLTAGE BECM PID MAIN ECU VOLTAGE SUPPLY (MAINBECMV)	
• Enter the following diagnostic mode on the scan tool: DataLogger - BECM . • Monitor the BECM PID MAINBECMV. • **Does the PID read 8-16 volts?**	**Yes** GO to AF7 . **No** If the PID reads less than 8 volts, GO to AF5 . If the PID reads at least 16 volts, INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAthe self-test. TEST the system for normal operation.
AF5 MEASURE BECM INPUT VOLTAGE	
• Ignition OFF. • Disconnect: BECM C4237A. • Measure 12-volt battery voltage.  AJ0210-A • Measure the voltage between BECM C4237A-47, SBB17 (RD), harness side and ground and BECM C4237A-48, SBB17 (RD), harness side and ground.	**Yes** GO to AF6 . **No** VERIFY Battery Junction Box (BJB) fuse 47 (15A) is OK. If the fuse is OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0099300 • **Are the BECM circuit voltages equal to 12-volt battery voltage?**	
AF6 CHECK BECM GROUND	
• Measure the resistance between BECM C4237A-49, GD126 (BK/WH), harness side and ground; and BECM C4237A-50, GD126 (BK/WH), harness side and ground.  N0099299 • **Are the resistances less than 5 ohms?**	**Yes** GO to AF7 . **No** REPAIR high resistance or open in the affected circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AF7 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test AG: DTC U3003:62

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

During normal vehicle operation the 12-volt battery supplies voltage to the Battery Energy Control Module (BECM) in order for the BECM to operate. The BECM compares the voltage of the DC to DC Converter Control Module (DC/DC) which is communicated via the High Speed Controller Area Network (HS-CAN).

- U3003:62 (Battery Voltage: Signal Compare Failure) - Fault sets wn the BECM does a compare with the DC to DC Converter Control Module (DC/DC) and the input voltages to both modules do not match.

This pinpoint test is intended to diagnose the following:
- DC/DC
- BECM

PINPOINT TEST AG: DTCs U3003:62

Test Step	Result / Action to Take
AG1 RETRIEVE BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Are any DTCs other than U3003:62 retrieved?**	**Yes** REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to AG2 .
AG2 RETRIEVE DC/DC DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Are any DTCs retrieved?**	**Yes** REFER to Section 414-05 to diagnose DC/DC DTCs. **No** GO to AG3 .
AG3 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

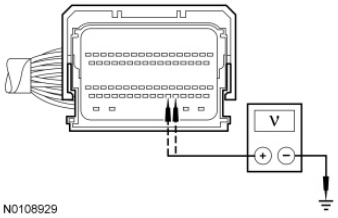
Pinpoint Test AH: DTC P0AE0:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close, which will supply high-voltage power to the vehicle. If an overcurrent condition is sensed by the BECM , the stop safely hazard (red triangle) warning indicator is illuminated and the vehicle will shut down and/or not start.

- P0AE0:00 (Hybrid Battery Negative Contactor Control Circuit High: No Sub Type Information) - If the BECM detects overcurrent on the contactor control circuit for 16 milliseconds or more, this DTC will be set. Reports as a continuous memory (historical) DTC only.



This pinpoint test is intended to diagnose the following:

- Circuitry
- High Voltage Traction Battery (HVTB)
- BECM /span>
- High-Voltage Bussed Electrical Center (BEC)

PINPOINT TEST AH: DTC P0AE0:00

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AH1 CHECK FOR SHORT IN CIRCUIT	
• Ignition OFF. • Disconnect: BECM C4237B. • Ignition ON. • Measure the voltage between BECM C4237B-55, circuit J1-A55, harness side and ground; and between BECM C4237B-56, circuit J1-A56, harness side and ground.  • **Is any voltage present?**	**Yes** GO to AH2 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AH2 MEASURE CONTACTOR COIL RESISTANCE	
	Yes GO to AH3 .

⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: High-voltage BEC C4236D. • With the service disconnect plug removed, measure the resistance between high-voltage BEC C4236 pin 7 and pin 8, component side. • **Is the resistance between 5-50 ohms?**	**No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AH3 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Connect: High-voltage BEC C4236D. • Install the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AI: DTC P0AE1:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

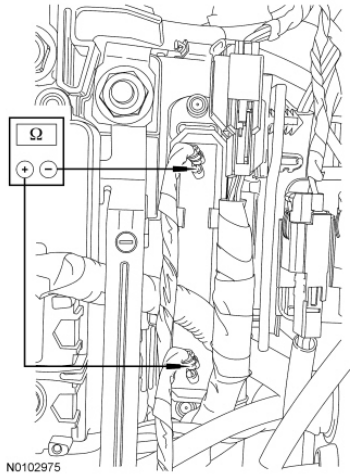
Normal Operation

When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close, which will supply high-voltage power to the vehicle. If a precharge contactor overcurrent condition is sensed by the BECM , the stop safely hazard (red triangle) warning indicator is illuminated and the vehicle will shut down and/or not start.

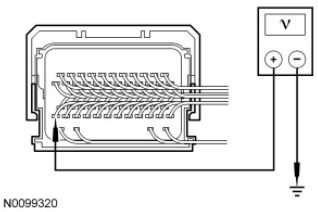
- DTC P0AE1:00 (High Voltage Battery Precharge Contactor Circuit: No Sub Type Information) - Fault sets when the precharge contactor attempts to close and current flow exceeds set values. This could indicate a short in the high-volta system. Reports as a continuous memory (historical) DTC only.

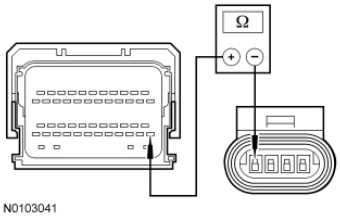
This pinpoint test is intended to diagnose the following:

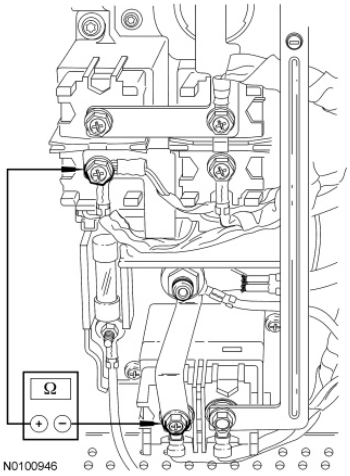
- High-voltage cables
- DC to DC Converter Control Module (DC/DC)
- BECM
- High Voltage Traction Battery (HVTB)
- Transmission Control Module (TCM)



PINPOINT TEST AI: DTC P0AE1:00







⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

⚠ **WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.**

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AI1 CHECK BECM DTCs	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0AA6:00 retrieved?**	**Yes** For DTC P0AA6:00, GO to Pinpoint Test J . **No** GO to AI2 .
AI2 RETRIEVE TCM DTCs	
• Enter the following diagnostic mode on the scan tool: Self Test - TCM . • **Are any TCM DTCs retrieved?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual and diagnose those DTCs first. **No** GO to AI3 .
AI3 CHECK CONTACTOR RESISTOR	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install t cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.**	**Yes** GO to AI4 . **No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center

• Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • With the service disconnect plug removed, measure the resistance of the precharge resistor in the high-voltage BEC .  • **Is the resistance between 6 and 10 ohms?**	in this section. CLEAR the DTCs. REPEAT the self-test.
AI4 MEASURE VOLTAGE AT BPSM CONNECTOR	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition ON. • With the service disconnect plug removed, measure the voltage between BPSM C4238B-35, circuit J2-B35, harness side and ground by back-probing at C4238B-35.	**Yes** GO to AI7 . **No** GO to AI5 .

 N0099320 • **Is the voltage between 2.25 and 2.75 volts?**	
AI5 CHECK CONTACTOR CIRCUIT FOR AN OPEN	
• Ignition OFF. • With the service disconnect plug removed, measure the resistance between high-voltage BEC C4236E-D, circuit J2-B35, harness side and BPSM C4238B-35, circuit J2-B35, harness side.  N0103041 • **Is the resistance less than 5 ohms?**	**Yes** GO to AI6 . **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AI6 CHECK FOR OPEN CONTACTOR	
• With the service disconnect plug removed, measure the resistance between the 2 points of the high-voltage BEC as shown.  N0100946 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new BPSM . REFER to Battery Pack Sensor Module (BPSM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AI7 CHECK THE HIGH-VOLTAGE CABLES	
• Install new high-voltage cables. Refer to High-Voltage Cables in this section. • Install the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug.	**Yes** GO to AI8 . **No** Repair is complete.

• Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0AE1:00 retrieved?**	
AI8 CHECK THE DC/DC	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Install a new DC/DC . Refer to Section 414-05 . • Connect: Service Disconnect Plug. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0AE1:00 retrieved?**	**Yes** INSTALL a new ACCM and A/C compressor assembly. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. **No** Repair is complete.

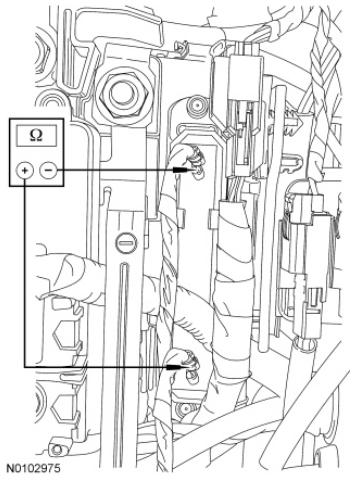
Pinpoint Test AJ: DTC P0AE5:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

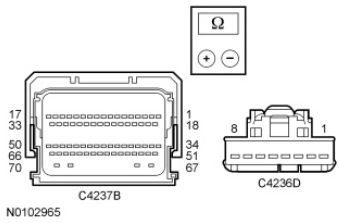
When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close, which will supply high-voltage power to the vehicle. If the BECM senses the precharge contactor fails to close the stop safely hazard (red triangle) warning indicator is illuminated and the vehicle will shut down and/or not start.

- P0AE5:00 (Hybrid Battery Precharge Contactor Control Circuit Range/Performance: No Sub Type Information) - If the BECM signal to close the contactor fails, this DTC will be set. Reports as a continuous memory (historical) DTC only.



This pinpoint test is intended to diagnose the following:

- BECM
- High-voltage Bussed Electrical Center (BEC)
- High Voltage Traction Battery (HVTB)



PINPOINT TEST AJ: DTC P0AE5:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AJ1 CHECK CONTACTOR RESISTOR	
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • With the service disconnect plug removed, measure the resistance of the precharge resistor in the BEC .  • **Is the resistance between 6-10 ohms?**	**Yes** GO to AJ2 . **No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AJ2 MEASURE CONTACTOR COIL RESISTANCE	
• Disconnect: High-voltage BEC C4236D. • With the service disconnect plug removed, measure the resistance between high-voltage BEC C4236D pin 4 and pin 5, component side.	**Yes** GO to AJ3 . **No** INSTALL a new high-voltage

<table>
<tr><td>• Is the resistance between 5-50 ohms?</td><td>BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.</td></tr>
<tr><td>AJ3 CHECK FOR OPEN IN CIRCUIT</td><td></td></tr>
<tr><td>• Measure the resistance between high-voltage BEC C4236D, harness side and BECM C4237B, harness side as follows:

<table><tr><th>High-Voltage BEC</th><th>Circuit</th><th>BECM</th></tr><tr><td>C4236D-4</td><td>J1-A61</td><td>C4237B-61</td></tr><tr><td>C4236D-5</td><td>J1-A62</td><td>C4237B-62</td></tr></table>

</table>

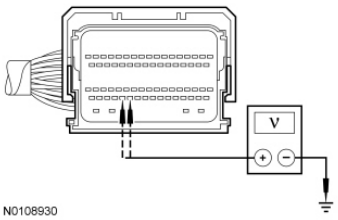
Pinpoint Test AK: DTC P0AE7:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

When the ignition is turned on, the Battery Energy Control Module (BECM) makes various vehicle checks. If these checks are normal, the BECM sends a signal to the contactor to close, which will supply power to the vehicle. If an overcurrent condition is sensed by the BECM , the stop safely hazard (red triangle) warning indicator is illuminated and the vehicle will shut down and/or not start.

- P0AE7:00 (Hybrid Battery Precharge Contactor Control Circuit High: No Sub Type Information) - If the BECM detects overcurrent on the contactor control circuit for 16 milliseconds or more, this DTC will be set. Reports as a continuous memory (historical) DTC only.



This pinpoint test is intended to diagnose the following:

- BECM
- High-voltage Bussed Electrical Center (BEC)
- Circuitry

PINPOINT TEST AK: DTC P0AE7:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire coveri. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AK1 CHECK FOR SHORT IN CIRCUIT	
• Measure the voltage between BECM C4237B-61, circuit J1-A61, harness side and ground; and between BECM C4237B-62, circuit J1-A62, harness side and ground.  • **Is any voltage present?**	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to AK2 .
AK2 MEASURE CONTACTOR COIL RESISTANCE	
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect: High-voltage BEC C4236D. • With the service disconnect removed, measure the resistance between high-voltage BEC C4236D pin 4 and pin 5, component side. • **Is the resistance between 5-50 ohms?**	**Yes** GO to AK3 . **No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AK3 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion.	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test.

♦ pushed-out/bent pins. • Connect the BECM and make sure the connectors seat correctly. • Connect: High-voltage BEC C4236D. • Install the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

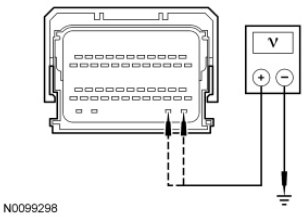
Pinpoint Test AL: DTC P0AFC:67

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

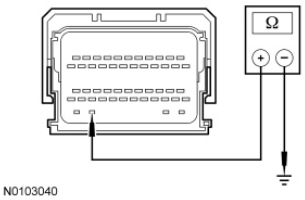
Normal Operation

During normal vehicle operation the Battery Energy Control Module (BECM) and Battery Pack Sensor Module (BPSM) communicate with each other providing information each module needs to properly monitor and control the high-voltage system. This communication is done over a dedicated Controller Area Network (CAN). If the BECM senses a fault with leakage and/or contactor monitoring, BECM functions do not operate correctly, the powertrain malfunction (wrench) warning indicator illuminates and the DTC is set.

- P0AFC:67 (Hybrid Battery Pack Sensor Module: Signal Incorrect After Event) - Fault sets if a BECM leakage and/or contactor monitoring fault is present and BECM functions do not operate as commanded.



This pinpoint test is intended to diagnose the following:
- BECM
- BPSM
- High Voltage Traction Battery (HVTB)



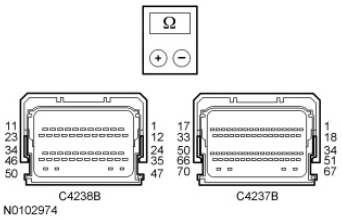
PINPOINT TEST AL: DTC P0AFC:67

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness taper orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

⚠ **WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.**

NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AL1 CHECK BPSM CIRCUITS FOR VOLTAGE	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Remove the high-voltage Bussed Electrical Center (BEC) cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: BPSM C4238B. • Ignition ON. • With the service disconnect plug removed, measure the voltage between BPSM C4238B-47, circuit J1-A66, harness side and ground; and between BPSM C4238B-48, circuit J1-A65, harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to AL2 . **No** GO to AL8 .
AL2 CHECK BPSM GROUND CIRCUIT FOR OPEN	
• Ignition OFF. • With the service disconnect plug removed, measure the resistance between BPSM C4238B-49, circuit J1-A70, harness side and ground.	**Yes** GO to AL3 . **No** GO to AL8 .



- **Is the resistance less than 5 ohms?**

AL3 CHECK DEDICATED CAN CIRCUITS

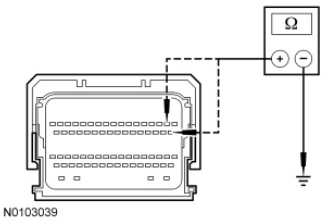
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.

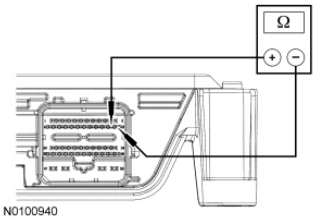
- Disconnect: BECM C4237B.
- With the service disconnect plug removed, measure the resistance between BPSM C4238B, harness side and BECM C4237B, harness side as follows:

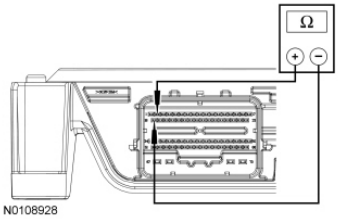
BPSM	Circuit	BECM
C4238B-23	J1-A02	C4237B-2
C4238B-22	J1-A18	C4237B-18

- **Are the resistances less than 5 ohms?**

Yes
GO to AL4 .







No
INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

AL4 CHECK CIRCUITS FOR SHORT TO GROUND

- With the service disconnect plug removed, measure the resistance between BECM C4237B-2, circuit J1-A02, harness side and ground; and between BECM C4237B-18, circuit J1-A18, harness side and ground.

Yes
GO to AL5 .

No
INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT

 N0103039 • **Are the resistances greater than 10,000 ohms?**	the self-test. TEST the system for normal operation.

• Measure the resistance between BECM C4237B pin 2 and pin 18, component side.  N0108928 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to AL7 . **No** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AL7 CHECK THE BPSM	
⚠ **WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is**	**Yes** GO to AL8 . **No** Repair is complete.

present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. • Install a new BPSM and the previously removed high-voltage BEC cover. Refer to Battery Pack Sensor Module (BPSM) in this section. • Connect: BECM C4237B. • Connect: Service Disconnect Plug. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0AFC:67 ieved?**	TEST the system for normal operation.
AL8 CHECK THE BECM	
⚠ **WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Install a new BECM . Refer to Battery Energy Control Module (BECM) in this section. • Connect: BPSM C4238B (if previously disconnected). • Install the high-voltage BEC cover (if previously removed). Refer to Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug (if previously disconnected). • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0AFC:67 retrieved?**	**Yes** INSTALL a new HVTB (includes HV system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** Repair is complete. TEST the system for normal operation.

Pinpoint Test AM: DTC P0B1C:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The Battery Pack Sensor Module (BPSM) monitors battery pack voltage of the High Voltage Traction Battery (HVTB). Normal pack voltage should be between 179-343 volts.

- P0B1C:00 (Hybrid Battery Pack Voltage Sense C Circuit High: No Sub Type Information) - Fault is sewhen BPSM sensed higher than normal voltage.

This pinpoint test is intended to diagnose the following:

- HVTB
- BPSM

PINPOINT TEST AM: DTC P0B1C:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

Test Step	Result / Action to Take
AM1 RETRIEVE BECM DTCs	
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Are any DTCs other than P0B1C:00 retrieved?**	**Yes** REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to AM2 .
AM2 CHECK THE BPSM	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

may result in serious personal injury or death. • Ignition OFF. • Install a new BPSM . Refer to Battery Pack Sensor Module (BPSM) in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0B1C:00 retrieved?**	**No** Repair is complete. TEST the system for normal operation.

Pinpoint Test AN: DTC P0B36:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The service disconnect plug completes the high-voltage circuit. It has a non-serviceable fuse to protect the high-voltage components in the event current raises above the normal operating range. The service disconnect plug also shuts off the high-voltage to the system so service to the system can be completed safely. If the service disconnect voltage becomes too high, the powertrain malfunction (wrench) warning indicator illuminates and the DTC is set.

- P0B36:00 (High Voltage Service Disconnect Circuit High: No Sub Type Information) - This fault is set when the service disconnect voltage is high for 1 second or more.

This pinpoint test is intended to diagnose the following:
- Service disconnect plug
- Battery Pack Sensor Module (BPSM)
- High Voltage Traction Battery (HVTB)

PINPOINT TEST AN: DTC P0B36:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. gh-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

Test Step	Result / Action to Take
AN1 RETRIEVE BECM DTCs	

• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Are any DTCs other than P0B36:00 retrieved?**	**Yes** REFER to the Battery Energy Control Module (BECM) DTC Chart and diagnose all other DTCs first. **No** GO to AN2 .
AN2 CHECK SERVICE DISCONNECT PLUG	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Install a new BPSM . Refer to Battery Pack Sensor Module (BPSM) in this section. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0B36:00 retrieved?**	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** Repair is complete. TEST the system for normal operation.

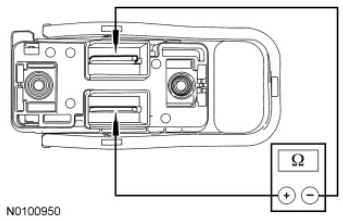
Pinpoint Test AO: DTC P0B37:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The service disconnect plug completes the high-voltage circuit. It is fused to protect the high-voltage components in the event current raises above the normal operating range. The service disconnect plug also shuts off the high-voltage to the system so service to the system can be completed safely. When the service disconnect plug is open, the stop safely hazard (red triangle) warning indicator is illuminated and the vehicle will shut down and/or not start.

- P0B37:00 (High Voltage Service Disconnect Open: No Sup Type Information) - This DTC is set when the service disconnect is open for 1 second or more while the service disconnect plug is still inserted in the High Voltage Traction Battery (HVTB).



This pinpoint test is intended to diagnose the following:

- Service disconnect plug
- HVTB
- Battery Pack Sensor Module (BPSM)

PINPOINT TEST AO: DTC P0B37:00

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

Test Step	Result / Action to Take
AO1 CHECK SERVICE DISCONNECT PLUG POSITION	
• Ignition OFF. • Make sure service disconnect plug is inserted correctly and securely. • **Is the service disconnect plug seated correctly?**	**Yes** GO to AO2 . **No** REPOSITION service disconnect plug correctly. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AO2 CHECK SERVICE DISCONNECT PLUG	
⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Measure the resistance between the 2 service disconnect plug terminals, component side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to AO3 . **No** INSTALL a new service disconnect plug. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AO3 CHECK THE BPSM	
	Yes

⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Install a new BPSM . Refer to Battery Pack Sensor Module (BPSM) in this section. • Connect: Service Disconnect Plug. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . /li> • Enter the following diagnostic mode on the scan tool: Self Test - BECM . • **Is DTC P0B37:00 retrieved?**	INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** Repair is complete. TEST the system for normal operation.

Pinpoint Test AP: P0BXX:00 Hybrid Battery Voltage Sense Circuit X Low/High

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The Battery Pack Sensor Module (BPSM) monitors battery pack voltage of the High Voltage Traction Battery (HVTB). The BPSM also measures each of the 26 individual battery modules (identified as A through Z in DTC descriptions) within the battery. The BPSM communicates normal pack voltage to the Battery Energy Control Module (BECM) via a dedicated Controller Area Network (CAN).

NOTE: There are a total of 52 voltage sense circuit DTCs, 26 which indicate voltage circuit sense high and 26 which indicate voltage circuit sense low. The "X" in both the DTCs and DTC descriptions below will vary using other letters and/or numbers (DTCs) or letters only (DTC description) depending on the actual DTC that is present. Refer to the Battery Energy Control Module (BECM) DTC Chart in this section for the actual listing of all 52 DTCs.

- P0BXX:00 (Hybrid Battery Voltage Sense Circuit X High: No Sub Type Information) - Fault is set when BPSM monitors voltage in one individual battery module is more than 13.5 volts.
- P0BXX:00 (Hybrid Battery Voltage Sense Circuit X Low: No Sub Type Information) - Fault is set wh BPSM monitors voltage in one individual battery module is less than 6.8 volts.

This pinpoint test is intended to diagnose the following:

- BPSM
- HVTB

PINPOINT TEST AP: P0BXX:00 HYBRID BATTERY VOLTAGE SENSE CIRCUIT X LOW/HIGH

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

Test Step	Result / Action to Take
AP1 CHECK THE BPSM	
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Depower the HVTB system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Install a new BPSM . Refer to Battery Pack Sensor Module (BPSM) in this section. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Clear DTCs - BECM . • Enter the following diagnostic mode on the scan tool: Self Test - BECM .	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** Repair is complete. TEST the system for normal operation.

• **Is a Hybrid Battery Voltage Sense Circuit X High or Hybrid Battery Voltage Sense Circuit X Low DTC retrieved?**	

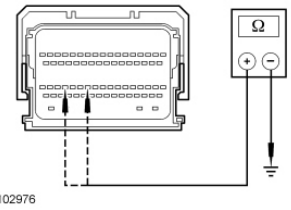
Pinpoint Test AQ: DTC P0A0C:00

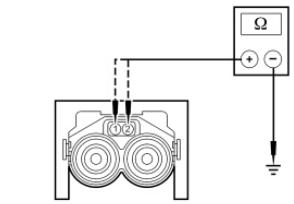
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

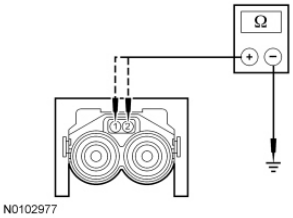
The Battery Energy Control Module (BECM) checks for continuity of the high-voltage system interlock circuit. The interlock circuit must have continuity before high-voltage will be supplied to the vehicle. The interlock circuit voltage travels through each of the high-voltage components and high-voltage cables and back to the BECM . This fault will illuminate the stop safely hazard (red triangle) warning indicator and shut down the vehicle.

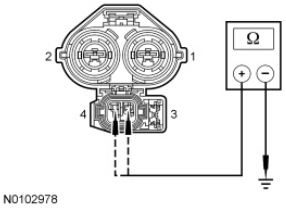
- DTC P0A0C:00 (High Voltage System Interlock Circuit Low: No Sub Type Information) - Fault sets when the BECM senses the interlock circuit is open or shorted to power for 5 seconds or more.

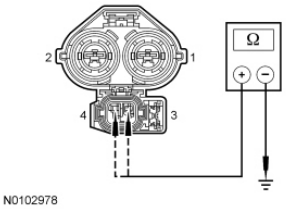




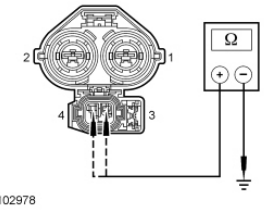
This pinpoint test is intended to diagnose the following:
- Air Conditioning Compressor Module (ACCM)
- BECM
- DC to DC Converter Control Module (DC/DC)
- Transmission Control Module (TCM) (part of Electronically Controlled Continuously Variable Transmissio(eCVT))
- High-voltage cables

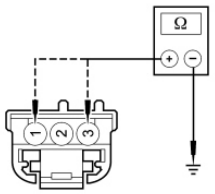


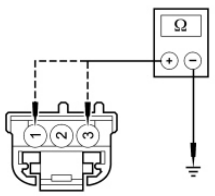




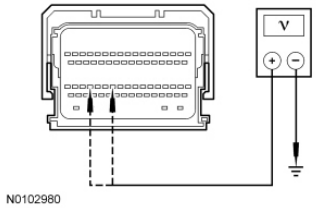
PINPOINT TEST AQ: DTC P0A0C:00

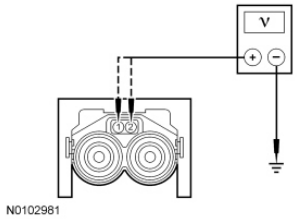


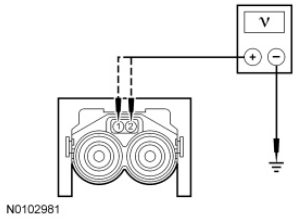




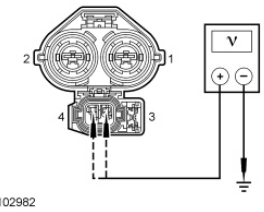
⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

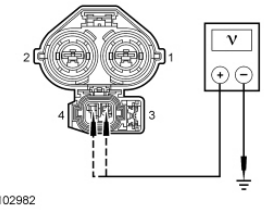


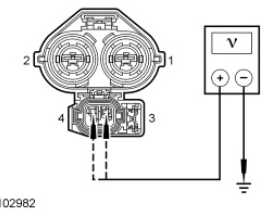




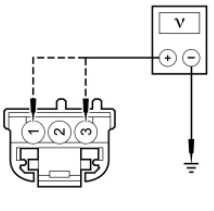
NOTICE: **Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.**

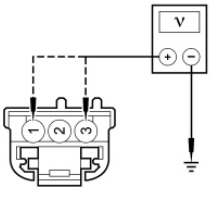






Test Step	Result / Action to Take
AQ1 CHECK FOR SHORT TO GROUND IN INTERLOCK CIRCUIT	
⚠ **WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.**	**Yes** GO to AQ8 . **No** GO to AQ2 .





• Ignition OFF. • Depower the High Voltage Traction Battery (HVTB) system. Refer to High-Voltage Traction Battery Systems Depowering in this section. • Disconnect: BECM C4237B. • Measure the resistance between BECM C4237B-44, circuit J1-A44, harness side and ground; and between BECM C4237B-47, circuit J1-A47, harness side and ground.  N0102976 • **Are the resistances greater than 10,000 ohms?**	
AQ2 CHECK FOR SHORT TO GROUND IN HIGH-VOLTAGE CABLES IN INTERLOCK CIRCUIT	
• Disconnect: High-voltage BEC C4236B. • Measure the resistance between high-voltage BEC C4236B-1, circuit CYB04 (VT/BN), harness side and ground; and between high-voltage BEC C4236B-2, circuit CYB03 (BN/YE), harness side and ground.  N0102977 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AQ4 . **No** GO to AQ3 .
AQ3 CHECK FOR SHORT TO GROUND IN INTERLOCK CIRCUIT TO TCM	
• Disconnect: TCM C1458C. • Measure the resistance between high-voltage BEC C4236B-1, circuit CYB04 (VT/BN), harness side and ground; and between high-voltage BEC C4236B-2, circuit CYB03 (BN/YE), harness side and ground.	**Yes** INSTALL a eCVT . REFER to Section 307-01C . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL new high-voltage cables. REFER to High-Voltage Cables in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0102977 • **Are the resistances greater than 10,000 ohms?**	
AQ4 CHECK FOR SHORT TO GROUND IN INTERLOCK CIRCUIT TO ACCM AND DC/DC	
• Disconnect: High-voltage BEC C4236A. • Measure the resistance between high-voltage BEC C4236A-3, circuit CYB02 (WH/BN), harness side and ground; and between high-voltage BEC C4236A-4, circuit CYB03 (BN/YE), harness side and ground.  N0102978 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to AQ7 . **No** GO to AQ5 .
AQ5 CHECK FOR SHORT TO GROUND IN INTERLOCK CIRCUIT TO DC/DC	
• Disconnect: DC/DC C1457A. • Measure the resistance between high-voltage BEC C4236A-3, circuit CYB02 (WH/BN), harness side and ground; and between high-voltage BEC C4236A-4, circuit CYB03 (BN/YE), harness side and ground.  N0102978 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new DC/DC . REFER to Section 414-05 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** GO to AQ6 .
AQ6 CHECK FOR SHORT TO GROUND IN INTERLOCK CIRCUIT TO ACCM	
• Connect: DC/DC C1457A. • Disconnect: ACCM C1469B. • Measure the resistance between high-voltage BEC C4236A-3, circuit CYB02 (WH/BN), harness side and ground; and between high-voltage BEC C4236A-4, circuit	**Yes** INSTALL a new ACCM and A/C compressor assembly. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal

CYB03 (BN/YE), harness side and ground.  N0102978 • **Are the resistances greater than 10,000 ohms?**	operation. **No** INSTALL new high-voltage cables. REFER to High-Voltage Cables in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AQ7 CHECK FOR SHORT TO GROUND AT HIGH-VOLTAGE BEC	
• Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: High-voltage BEC C4001. • Disconnect: High-voltage BEC C4002. • Measure the resistance between high-voltage BEC C4001-1, circuit J12-1, harness side and ground; and between high-voltage BEC C4001-3, circuit J1-A44, harness side and ground.  N0102979 • Measure the resistance between high-voltage BEC C4002-1, circuit J12-1, harness side and ground; and between high-voltage BEC C4002-3, circuit J12-A47, harness side and ground.  N0102979 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AQ8 CHECK FOR SHORT TO VOLTAGE IN INTERLOCK CIRCUIT	

• Ignition ON. • Measure the voltage between BECM C4237B-44, circuit J1-A44, harness side and ground; and between BECM C4237B-47, circuit J1-A47, harness side and ground.  N0102980 • **Is any voltage present?**	**Yes** GO to AQ9 . **No** GO to AQ15 .
AQ9 CHECK FOR VOLTAGE IN HIGH-VOLTAGE CABLES IN INTERLOCK CIRCUIT	
• Disconnect: High-voltage BEC C4236B. • Measure the voltage between high-voltage BEC C4236B-1, circuit CYB04 (VT/BN), harness side and ground; and between high-voltage BEC C4236B-2, circuit CYB03 (BN/YE), harness side and ground.  N0102981 • **Is any voltage present?**	**Yes** GO to AQ10 . **No** GO to AQ11 .
AQ10 CHECK FOR VOLTAGE IN INTERLOCK CIRCUIT TO TCM	
• Disconnect: TCM C1458C. • Measure the voltage between high-voltage BEC C4236B-1, circuit CYB04 (VT/BN), harness side and ground; and between high-voltage BEC C4236B-2, circuit CYB03 (BN/YE), harness side and ground.  N0102981 • **Is any voltage present?**	**Yes** INSTALL new high-voltage cables. REFER to High-Voltage Cables in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a eCVT . REFER to Section 307-01C . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AQ11 CHECK FOR VOLTAGE IN INTERLOCK CIRCUIT TO ACCM AND DC/DC	

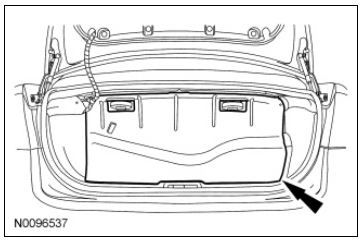
• Disconnect: High-voltage BEC C4236A. • Measure the voltage between high-voltage BEC C4236A-3, circuit CYB02 (WH/BN), harness side and ground; and between high-voltage BEC C4236A-4, circuit CYB03 (BN/YE), harness side and ground.  N0102982 • **Is any voltage present?**	**Yes** GO to AQ12 . **No** GO to AQ14 .
AQ12 CHECK FOR VOLTAGE IN INTERLOCK CIRCUIT TO DC/DC	
• Disconnect: DC/DC C1457A. • Measure the voltage between high-voltage BEC C4236A-3, circuit CYB02 (WH/BN), harness side and ground; and between high-voltage BEC C4236A-4, circuit CYB03 (BN/YE), harness side and ground.  N0102982 • **Is any voltage present?**	**Yes** GO to AQ13 . **No** INSTALL a new DC/DC . REFER to Section 414-05 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AQ13 CHECK FOR VOLTAGE IN INTERLOCK CIRCUIT TO ACCM	
• Connect: DC/DC C1457A. • Disconnect: ACCM C1469B. • Measure the voltage between high-voltage BEC C4236A-3, circuit CYB02 (WH/BN), harness side and ground; and between high-voltage BEC C4236A-4, circuit CYB03 (BN/YE), harness side and ground  N0102982 • **Is any voltage present?**	**Yes** INSTALL new high-voltage cables. REFER to High-Voltage Cables in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new ACCM and A/C compressor assembly. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

AQ14 CHECK FOR VOLTAGE AT HIGH-VOLTAGE BEC	
• Remove the high-voltage BEC cover. Refer to the exploded view in Battery Pack Sensor Module (BPSM) in this section. • Disconnect: High-voltage BEC C4001. • Disconnect: High-voltage BEC C4002. • Measure the voltage between high-voltage BEC C4001-1, circuit J12-1, harness side and ground; and between high-voltage BEC C4001-3, circuit J1-A44, harness side and ground.  N0102983 • Measure the voltage between high-voltage BEC C4002-1, circuit J12-1, harness side and ground; and between high-voltage BEC C4002-3, circuit J1-A47, harness side and ground.  N0102983 • **Is any voltage present?**	**Yes** INSTALL a new HVTB (includes HVTB system wire harness). REFER to High-Voltage Traction Battery in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new high-voltage BEC . REFER to High-Voltage Bussed Electrical Center in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
AQ15 CHECK FOR CORRECT BECM OPERATION	
• Ignition OFF. • Check the BECM harness and component side connectors for: ♦ corrosion. ♦ pushed-out/bent pins. • Connect: BECM C4237B . • Connect: Service Disconnect Plug. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Battery Energy Control Module (BECM) in this section. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Rubber Insulating Gloves Testing

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

NOTE: The high-voltage insulated safety gloves must be recertified every 6 months to remain within OSHA guidelines.

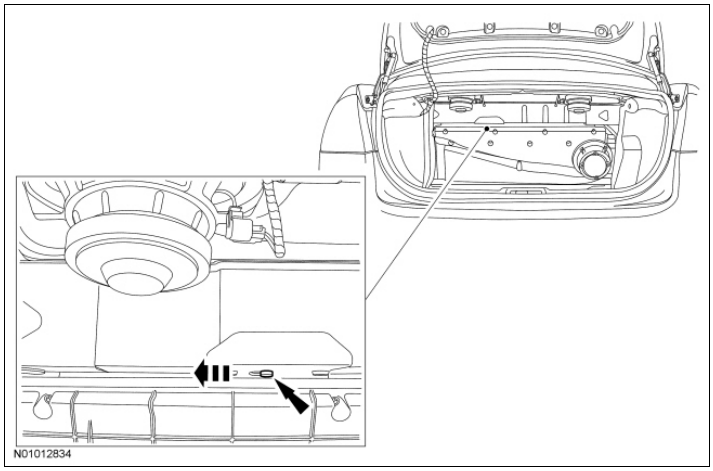


1. Leather gloves must always be worn over the rubber insulating gloves in order to protect them.
2. The gloves should not be used if they show any signs of wear and tear.
3. Roll the glove up from the open end until the lower portion of the glove begins to balloon from the resulting air pressure. If the glove leaks any air, it must not be used.
4. Rubber insulating gloves must be class "00" and meet all of the American Society for Testing and Materials standards.

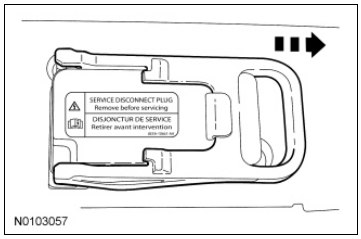
High-Voltage Traction Battery Systems Depowering

⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.

1. Turn the ignition off.



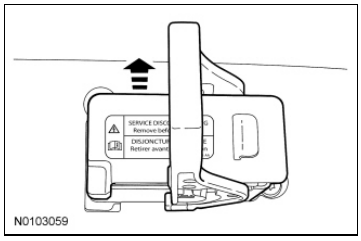
2. Remove the 4 pin-type retainers and the trunk front cover.



3. **NOTE:** If the center safety belt retractor locks and the safety belt webbing prevents the 60 percent backrest from lowering, raise the backrest upward to release the safety belt retractor and belt webbing.

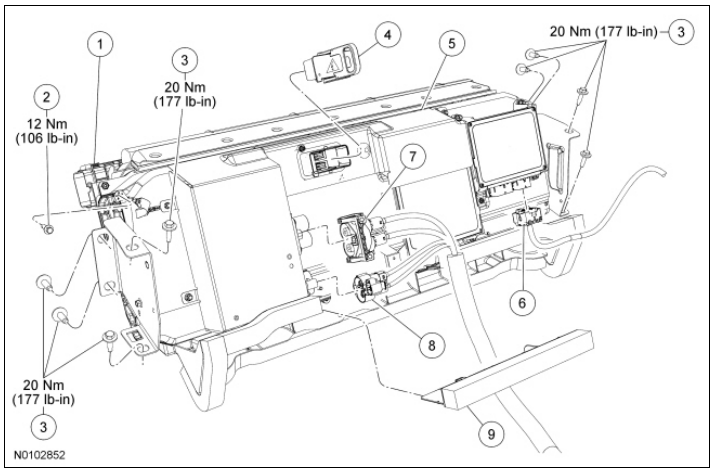
   Fold the LH backrest down.

   - Between the High Voltage Traction Battery (HVTB) and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.



4. Slide the handle of the service disconnect plug toward the LH side of the vehicle.

5. Rotate the handle upward.

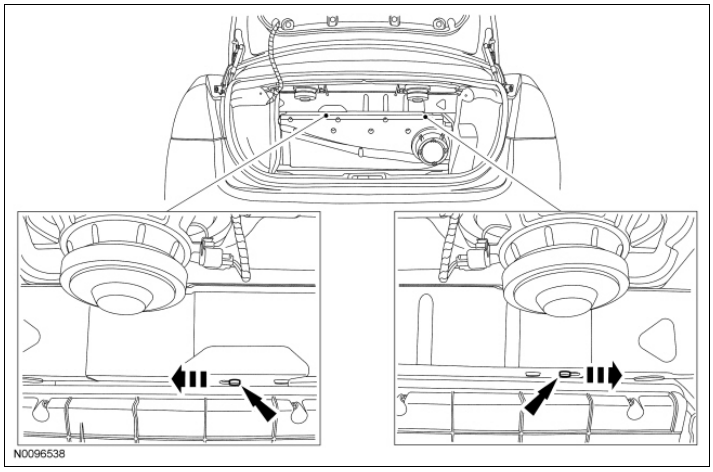


6. Pull the service disconnect plug out and away from the HVTB . Be sure to store the plug in a place where it cannot be accidentally re-installed while the vehicle is being serviced.

7. Wait 5 minutes after the service disconnect plug is removed before continuing service. This allows any residual voltage in the high-voltage system to dissipate.

8. To install, reverse the removal procedure.

High-Voltage Traction Battery



Item	Part Number	Description
1	10C665	High Voltage Traction Battery (HVTB) cooling outlet duct
2	W712524	HVTB ground strap-to-chassis bolt
3	W505435	HVTB mounting bolts (8 required)
4	10A757	HVTB service disconnect plug
5	10B759	HVTB assembly
6	-	Battery Energy Control Module (BECM) 50-pin connector (part of 14A005)
7	-	High-voltage/high-current electrical connector (part of 14300)
8	-	High-voltage/low-current electrical connector (part of 14300)
9	19B680	HVTB cooling inlet duct plate

Removal and Installation

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

1. Depower the High Voltage Traction Battery (HVTB). For additional information, refer to High-Voltage Traction Battery Systems Depowering in this section.

- Between the HVTB and the sheet metal, locate the seat backrest latch release lever.
  - Push the release lever toward the outboard side of the vehicle and fold the backrest down.

3. Remove the RH rear seat bolster. For additional information, refer to Section 501-10 .

4. Disconnect the cooling fan jumper harness electrical connector, then remove the wiring connector pushpin from the HVTB handle bracket.

5. Remove the HVTB cooling inlet duct. For additional information, refer to High-Voltage Traction Battery Cooling Inlet Duct in this section.

6. Disconnect the 50-pin connector at the Battery Energy Control Module (BECM).

7. Remove the ground strap-to-chassis bolt and position the ground strap aside.
   - To install, tighten to 12 Nm (106 lb-in).

8. Remove the 2 plastic bumpers from the back of the rear seat back by releasing the 2 pushpins.

9. **NOTE:** The attaching bolts have a conductive coating on them and are serrated under the head flange. These features ground the HVTB to the vehicle, which is required for electro-magnetic compatibility. If a bolt(s) is lost or damaged, a new identical bolt(s) must be installed.

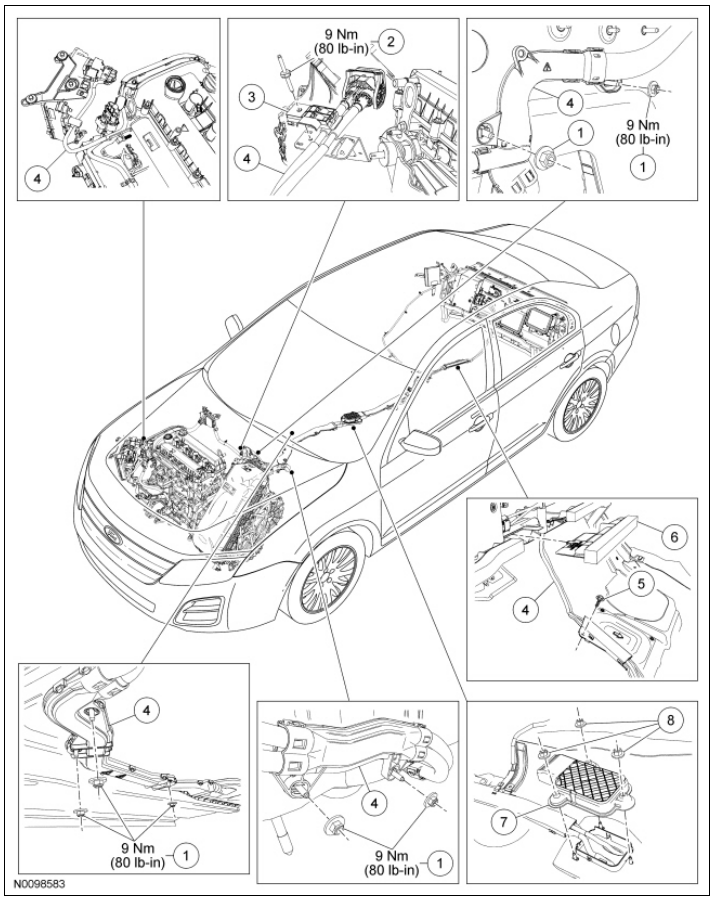
   Remove the 4 HVTB mounting bolts from the trunk area that secure the HVTB to the brackets.

   - To install, tighten to 20 Nm (177 lb-in).

10. **NOTE:** The attaching bolts have a conductive coating on them and are serrated under the head flange. These features ground the HVTB to the vehicle, which is required for electro-magnetic compatibility. If a bolt(s) is lost or damaged, a new identical bolt(s) must be installed.

    From each rear door opening, remove the 2 HVTB mounting bolts (total of 4 bolts) that secure the HVTB to the brackets.

    - To install, tighten to 20 Nm (177 lb-in).



11. ***NOTICE:*** **Lay a fender cover or other protective material over the seat backs to reduce the possibility of damage when removing the battery.**

    NOTICE: **Make certain the High Voltage Traction Battery (HVTB) does not mar or damage the interior panels or seating during removal. There is very little clearance on each side.**

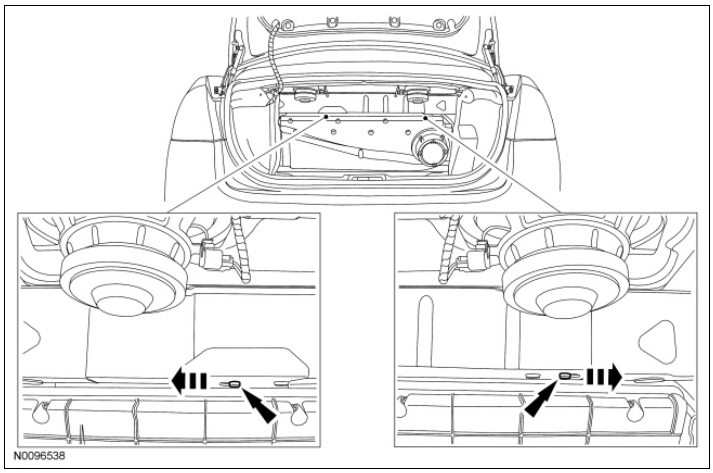
    With the help of an assistant inside the vehicle, grasp the handles on each side of the battery and slide the battery forward and out of the vehicle.

12. To install, reverse the removal procedure.

High-Voltage Cables

Item	Part Number	Description
1	W713475	High-voltage cable shield nuts (7 required)
2	W704683	High-voltage cable strain relief bolt
3	-	High-voltage cable strain relief clamp (part of 14300)
4	14300	High-voltage cable assembly
5	N807011	High-voltage cable shield screw
6	19B680	High Voltage Traction Battery (HVTB) cooling inlet duct plate
7	-	High-voltage cable floor pan grommet cover (part of 14300)
8	W713475	High-voltage cable floor pan grommet nuts (3 required)

Removal and Installation



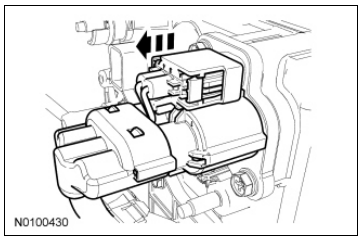
⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

1. Discharge the A/C system. For additional information, refer to Section 412-00A .

2. Discot the 12-volt battery. For additional information, refer to Section 414-01 .

3. Depower the High Voltage Traction Battery (HVTB). For additional information, refer to High-Voltage Traction Battery Systems Depowering in this section.

4. Fold the RH backrest down.
   - Between the HVTB and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.



5. Remove the RH rear seat bolster. For additional information, refer to Section 501-10 .

6. ***NOTICE:*** **Failure to disconnect high-voltage cable connectors as instructed may result in damage to the connectors.**

   NOTE: DC to DC Converter Control Module (DC/DC) connector shown, high-voltage/low-current connector at high-voltage Bussed Electrical Center (BEC) similar.

   Release the locking lever and locking tabs and disconnect the interlock connector and the 2 high voltage cables at the high-voltage BEC .

   - Press the locking clip on the white interlock connector and disengage the white connector before releasing the locking clip on the orange portion of the high-voltage connector. The white interlock connector will not come completely apart until the orange portion is released.

7. Remove the HVTB cooling inlet duct plate.

8. Remove the pushpin that retains the high-voltage cables to the bracket on the HVTB case.

9. Remove the passenger side front seat. For additional information, refer to Section 501-10 .

10. Remove the front door scuff plate trim panel.

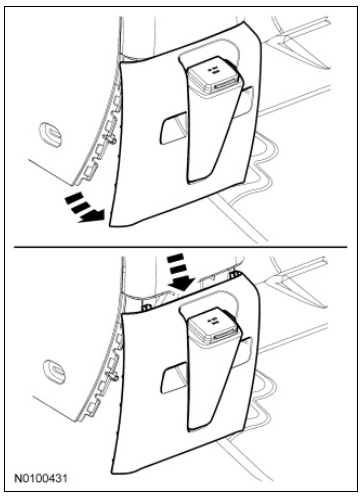
11. Remove the rear door scuff plate trim panel.

12. Remove the lower B-pillar trim panel.
    - Slide the lower B-pillar trim panel down to disengage it from the upper B-pillar trim panel.

13. Remove the rear seat cushion. For additional information, refer to Section 501-10 .

14. Remove the high-voltage cable shield retaining screw.

15. Partially raise the LR seat back and pull the high-voltage cables out from under the rear seat backrest, then position both rear seat backrests in the upright position.



16. **NOTE:** The high-voltage cables are routed under the passenger side rear carpet.

    Disconnect the high-voltage cable from the DC/AC inverter and remove the 5 retaining clips. Position the cable aside.

17. ***NOTICE:*** **Make sure that the rear of the floor console is lifted away from the floor as specified. Failure to follow this procedure will result in damage to the floor console and the tabs at the top of the floor console end cover.**

    Remove the floor console end cover in the following sequence.

    1. Remove the floor console rear screws.
    2. Lift the floor console about 25 mm (0.984 in) away from the floor.
    3. Remove the floor console end cover by pulling the cover away at the bottom and rotating out. Lower the cover 7-13 mm (0.275-0.511 in) to clear the tabs on the top of the floor console end cover.

18. Disconnect the AC power point connector.

19. Release the 2 pushpins that hold the high-voltage cables to the floor pan and pull the high-voltage cable out from underneath the carpet and floor console.

20. Remove the 3 nuts at the floor pan grommet cover.

21. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

22. Remove the 5 nuts that retain the high-voltage cable shield to the floor pan and remove the cables from the studs.
    - To install, tighten to 9 Nm (80 lb-in).

23. Remove the 2 nuts that retain the high-voltage cable shield to the bulkhead and remove the cables from the studs.
    - To install, tighten to 9 Nm (80 lb-in).

24. Remove the pushpin that retains the high-voltage harness to the bulkhead.

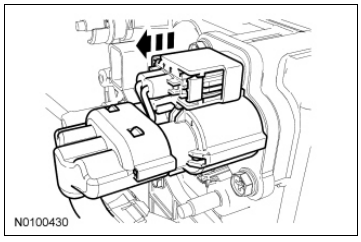
25. Push the high-voltage cables through the opening of the vehicle floor pan.

26. Remove the engine cover.

27. Remove the high-voltage cable strain relief bolt and remove the strain relief clamp from the bracket.
    - To install, tighten to 9 Nm (80 lb-in).

28. Disconnect the high-voltage electrical connector from the transmission and position the cable aside.

29. Using a screwdriver or other suitable tool, release the clip that locks the high-voltage junction block to the bracket by pushing the tool between the high-voltage junction block and the bracket from the LH side. Remove the cable from the retainer on the bulkhead and position the cable aside.



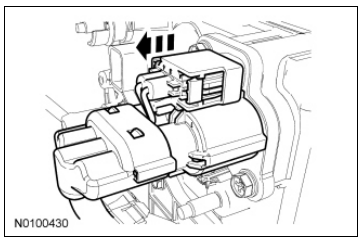
30. Lift the high-voltage cables from the 2 studs on the front of the engine and disengage the pushpin at the intake manifold.

31. ***NOTICE:*** **Failure to disconnect high-voltage cable connectors as instructed may result in damage to the connectors.**

    NOTE: DC/DC connector shown, high-voltage/low-current connector at Air Conditioning Compressor Module (ACCM) similar.

    Release the clips and locking tabs and disconnect the interlock connector and the high-voltage cable connector at the ACCM .

    - Press the locking clip on the white interlock connector and disengage the white connector before releasing the locking clip on the orange portion of the high-voltage connector. The white interlock connector will not come completely apart until the orange portion is released.



32. ***NOTICE:*** **Failure to disconnect high-voltage cable connectors as instructed may result in damage to the connectors.**

    Release the clips and locking tabs and disconnect the interlock connector and the high-voltage cable connector at the DC/DC .

    - Press the locking clip on the white interlock connector and disengage the white connector before releasing the locking clip on the orange portion of the high-voltage connector. The

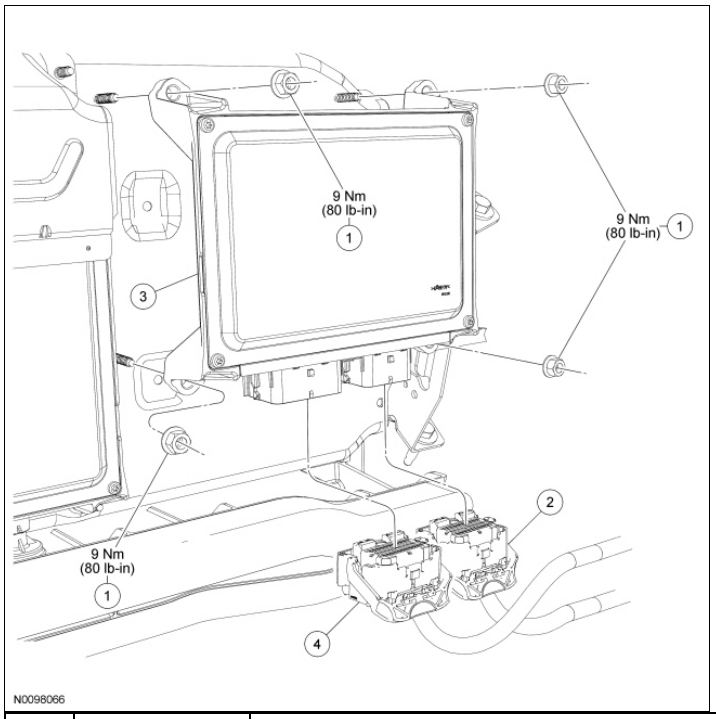
white interlock connector will not come completely apart until the orange portion is released.

33. Remove the A/C evaporator inlet fitting nut from the low side and disconnect the fitting nut. Discard the gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

34. Remove the A/C compressor manifold and suction tube fitting nut (low side) and disconnect the fitting. Remove the tube and discard the gasket seal.
    - To install, tighten to 15 Nm (133 lb-in).

35. Wrap mechanic's wire around the Hydraulic Control Unit (HCU) motor from above and support the HCU .

36. Remove the 3 bolts that retain the HCU bracket to the frame.
    - To install, tighten to 23 Nm (17 lb-ft).



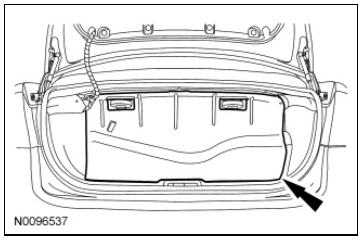
37. An assistant is needed to help feed the cable down through the engine compartment and remove the high-voltage cable assembly from the bottom of the vehicle.

38. To install, reverse removal procedure.

Battery Energy Control Module (BECM)

Special Tool(s)

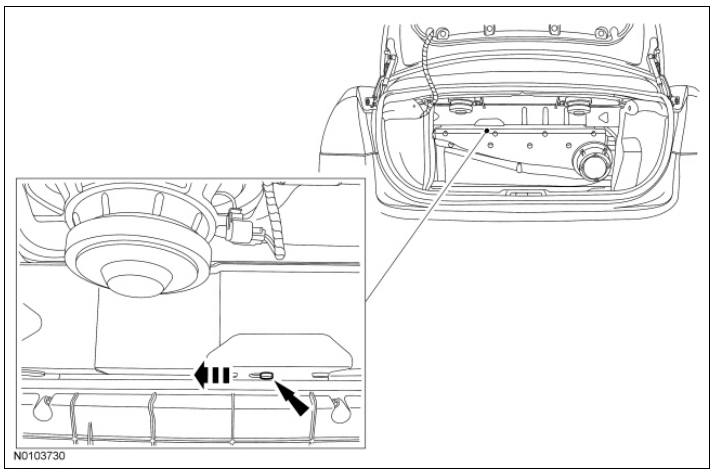
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool



Item	Part Number	Description
1	W705790	Battery Energy Control Module (BECM) nuts (4 required)
2	-	BECM connector (part of 14A005)
3	10B687	BECM
4	-	BECM connector (part of 10B759)

Removal and Installation

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation (PMI) procedure. For additional information, refer to Section 418-01 .

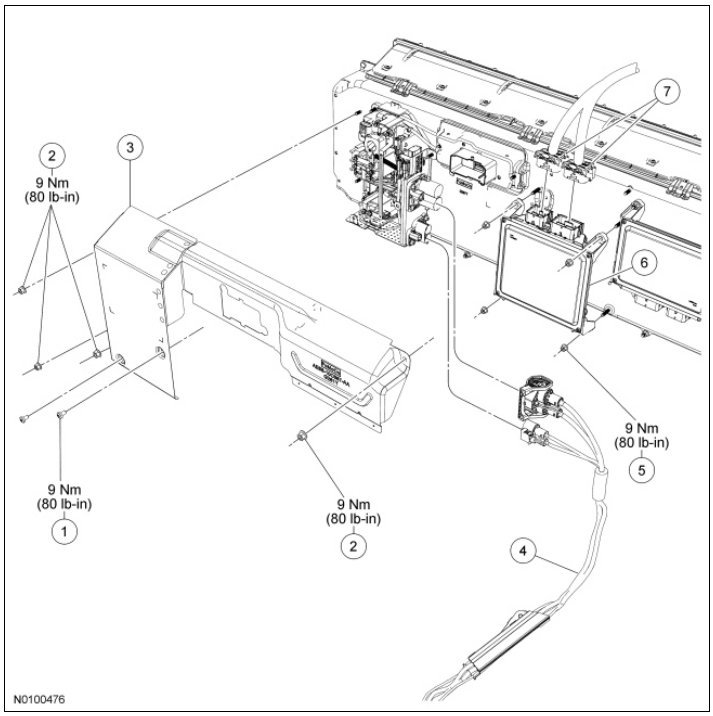


2. Remove the 4 pin-type retainers and the trunk front cover.

3. **NOTE:** If the center safety belt retractor locks and the safety belt webbing prevents the 60 percent backrest from lowering, raise the backrest upward to release the safety belt retractor and belt webbing.

   Fold the LH backrest down.

   - Between the High Voltage Tractiattery (HVTB) and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.



4. Release the locking levers and disconnect the 2 electrical connectors at the Battery Energy Control Module (BECM).

5. Remove the 4 nuts and the BECM .
   - To install, tighten to 9 Nm (80 lb-in).

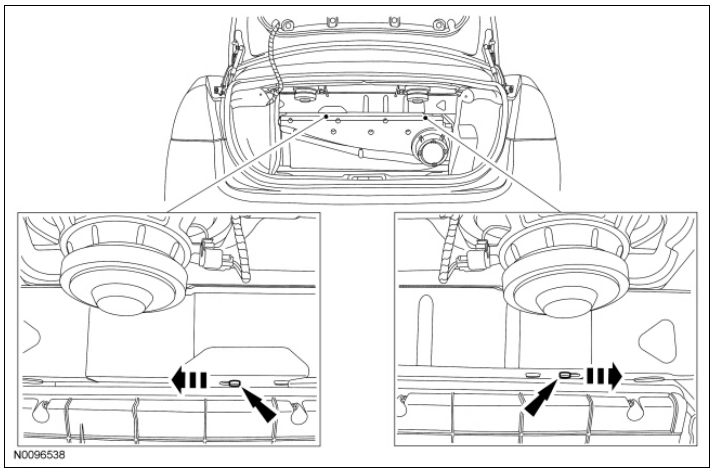
6. To install, reverse the removal procedure.
   - When installing a new BECM , carry out the steps necessary to complete Programmable Module Installation (PMI). For additional information, refer to Section 418-01 .

Battery Pack Sensor Module (BPSM)

Item	Part Number	Description
1	W500010	High-voltage Bussed Electrical Center (BEC) cover screw (2 required)
2	W705790	High-voltage BEC cover nuts (4 required)
3	10A687	High-voltage BEC cover
4	14300	High-voltage cable assembly
5	W705790	Battery Pack Sensor Module (BPSM) nut (4 required)
6	10B830	BPSM
7	-	BPSM connectors (part of 10B759)

Removal and Installation

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.



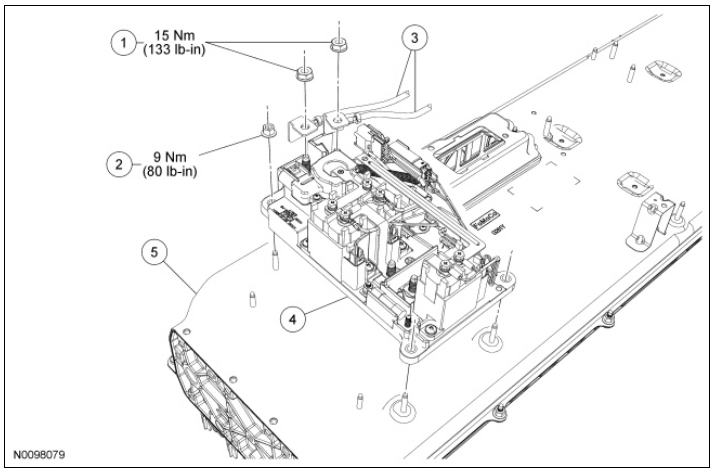
⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injuryr death.

⚠ WARNING: Always inspect gloves before each use to prevent high-voltage shock. High-voltage insulated safety gloves with a leather outer glove are required to service some components of this vehicle where specified in the service procedures. All high-voltage insulated safety gloves must meet or exceed ANSI/ASTM class 00. Refer to Rubber Insulating Gloves Testing in this section. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.

1. Depower the High Voltage Traction Battery (HVTB). For additional information, refer to High-Voltage Traction Battery Systems Depowering in this section.

2. Fold the RH backrest down.
   - Between the HVTB and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.



3. Remove the 4 high-voltage Bussed Electrical Center (BEC) cover nuts, the 2 high-voltage BEC cover screws and the high-voltage BEC cover.
   - To install, tighten to 9 Nm (80 lb-in).

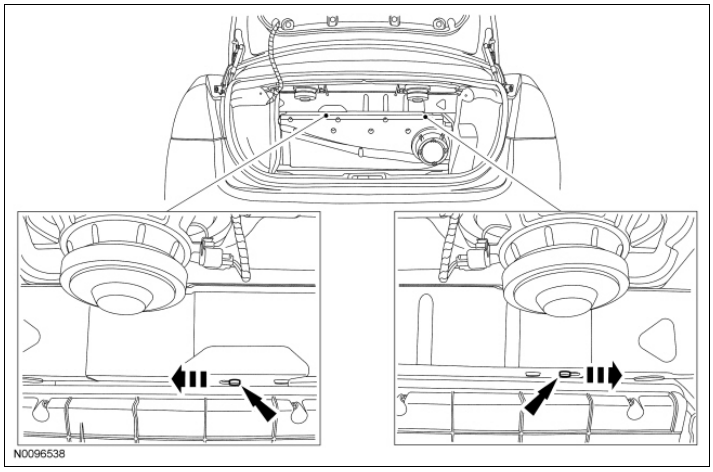
4. Release the locking levers and disconnect the 2 connectors at the Battery Pack Sensor Module (BPSM).

5. Remove the 4 nuts and the BPSM .
   - To install, tighten to 9 Nm (80 lb-in).

6. To install, reverse the removal procedure.

High-Voltage Bussed Electrical Center

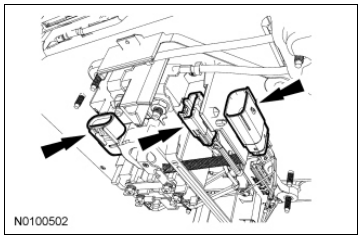
Item	Part Number	Description
1	W701596	High Voltage Traction Battery (HVTB) cable nuts (2 required)
2	W705790	High-voltage Bussed Electrical Center (BEC) nut
3	-	HVTB B+ and B- cables (part of 10B759)
4	10C666	High-voltage BEC
5	10B759	HVTB



Removal and Installation

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always insta the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.

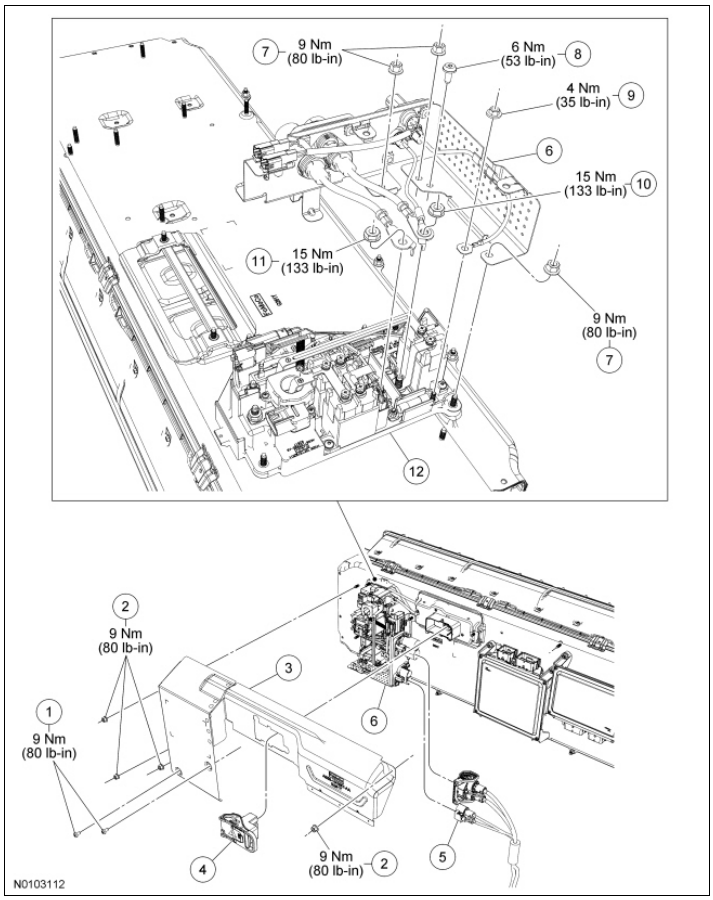


1. Depower the High Voltage Traction Battery (HVTB). For additional information, refer to High-Voltage Traction Battery Systems Depowering in this section.

2. Fold the RH backrest down.
   - Between the HVTB and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.

3. Remove the high-voltage cable connector and bracket. For additional information, refer to High-Voltage Traction Battery Connector and Bracket in this section.

4. Release the locking tabs and disconnect the 3 connectors.



5. Remove the 2 HVTB cable nuts and detach the cables from the high-voltage Bussed Electrical Center (BEC).
    - To install, tighten to 15 Nm (133 lb-in).

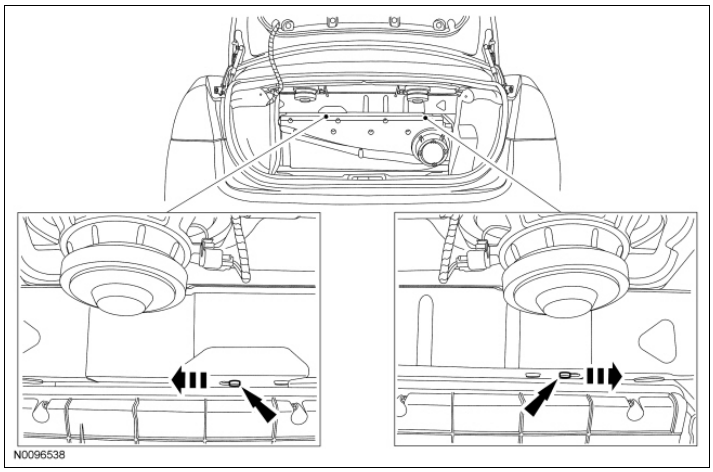
6. Remove the nut at the upper LH corner and remove the high-voltage BEC .
    - To install, tighten to 9 Nm (80 lb-in).

7. To install, reverse the removal procedure.

High-Voltage Traction Battery Connector and Bracket

Item	Part Number	Description
1	W505530	High-voltage Bussed Electrical Center (BEC) cover screws (2 required)
2	W705790	High-voltage BEC cover nuts (4 required)
3	10A687	High-voltage BEC cover
4	10A757	High Voltage Traction Battery (HVTB) service disconnect plug
5	14300	High-voltage cable
6	14E049	High-voltage cable connector and bracket assembly
7	W705790	High-voltage cable connector and bracket assembly nuts (3 required)
8	W506973	High-voltage cable connector and bracket assembly screw
9	W702841	High-voltage/low-current positive cable nut
10	W701596	High-voltage/high-current and low-current negative cable nut

11	W701596	High-voltage/high-current positive cable nut
12	10C666	High-voltage BEC



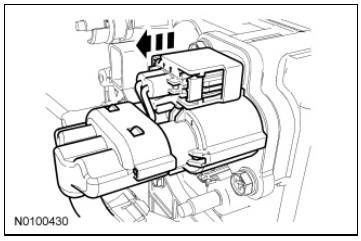
Removal and Installation

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.

1. Depower the High Voltage Traction Battery (HVTB). For additional information, refer to High-Voltage Traction Battery Systems Depowering in this section.

2. Fold the RH backrest down.
   - Between the HVTB and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.



3. ***NOTICE:*** **Failure to disconnect high-voltage cable connectors as instructed may result in damage to the connectors.**

   NOTE: DC to DC Converter Control Module (DC/DC) connector shown, high-voltage/low-current connector at HVTB similar.

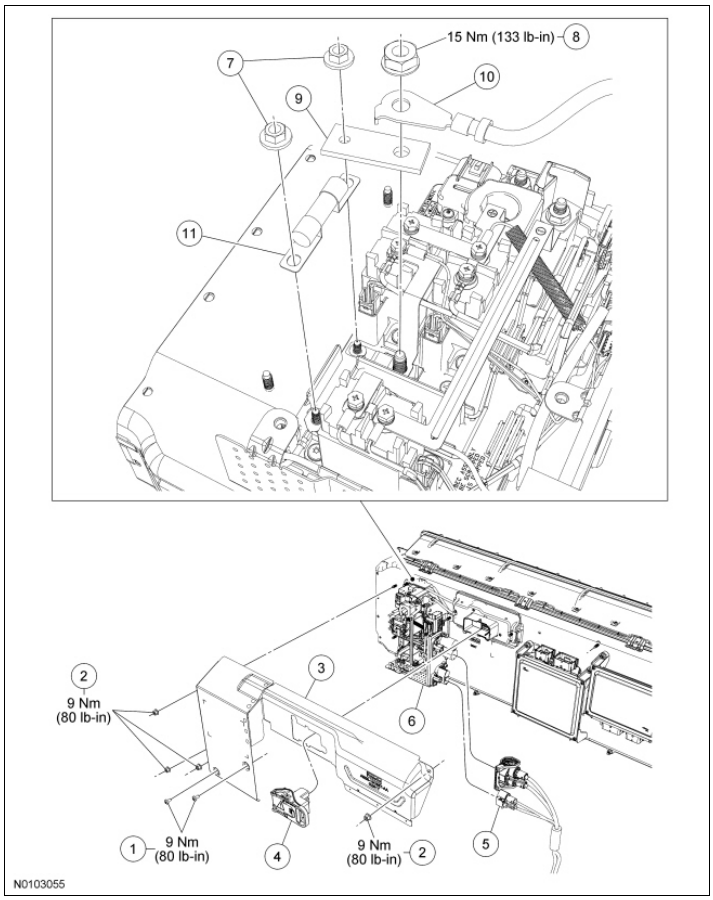
   Release the locking lever and locking tabs and disconnect the interlock connector and the 2 high-voltage cables.

   - Press the locking clip on the white interlock connector and disengage the white connector before releasing the locking clip on the orange portion of the high-voltage connector. The white interlock connector will not come completely apart until the orange portion is released.

4. Remove the 4 nuts and 2 screws at the HVTB Bussed Electrical Center (BEC) cover and remove the cover.
    - To install, tighten to 9 Nm (80 lb-in).

5. Disconnect the 2 interlock circuit connectors on the high-voltage cable connector and bracket.

6. Remove the high-voltage/high-current positive cable nut.
    - To install, tighten to 15 Nm (133 lb-in).



7. Remove the high-voltage/high and low-current negative cable nut.
    - To install, tighten to 15 Nm (133 lb-in).

8. Remove the high-voltage/low-current positive cable nut at the 40A fuse.
    - To install, tighten to 4 Nm (35 lb-in).

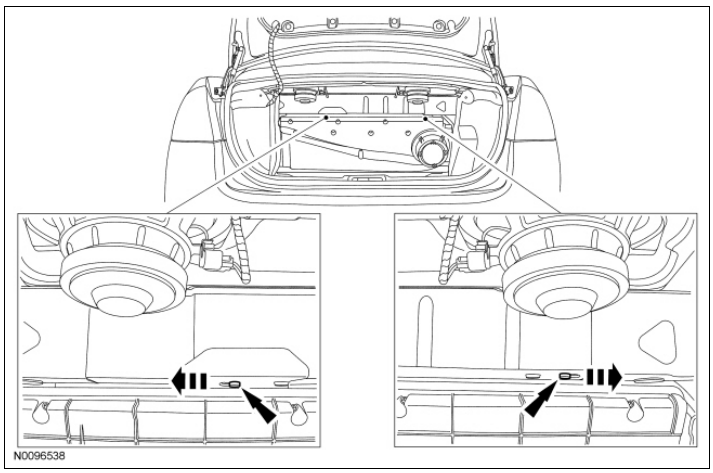
9. Remove the 3 nuts, 1 bolt and the high-voltage cable connector and bracket assembly.
    - To install, tighten the 3 nuts to 9 Nm (80 lb-in).
    - To install, tighten the bolt to 6 Nm (53 lb-in).

10. To install, reverse the removal procedure.

High-Voltage Low-Current Fuse

Item	Part Number	Description
1	W505530	High-voltage Bussed Electrical Center (BEC) cover screws (2 required)
2	W705790	High-voltage BEC cover nuts (4 required)
3	10A687	High-voltage BEC cover
4	10A757	High Voltage Traction Battery (HVTB) service disconnect plug
5	14300	High-voltage cable
6	14E049	High-voltage cable connector and bracket assembly
7	W702841	High-voltage/low-current fuse nuts (2 required)
8	W701596	High-voltage/high-current positive cable nut
9	-	High-voltage/low-current circuit bus bar (part of 10C666)
10	-	High-voltage/high-current positive cable (part of 14E049)

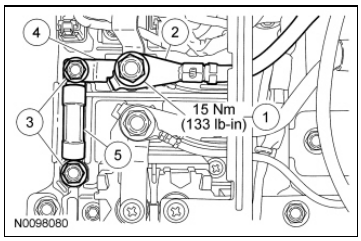
11	14526	High-voltage/low-current fuse (40A)



Removal and Installation

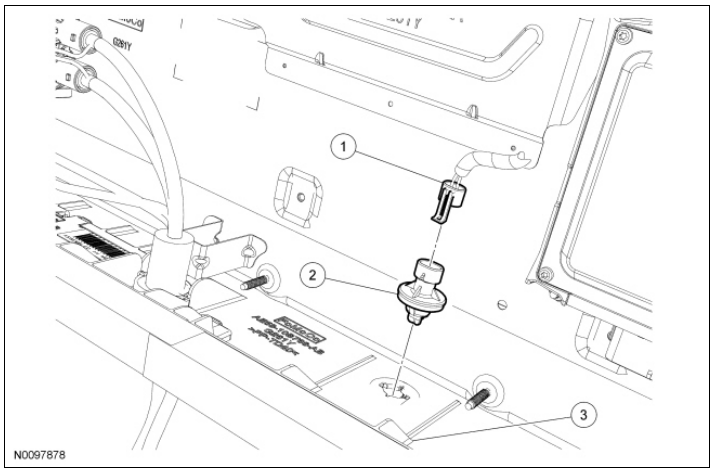
⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

⚠ WARNING: Never install the service disconnect plug when a high-voltage service cover is removed. Always install the cover prior to connecting the service disconnect plug. The cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death.



1. Depower the High Voltage Traction Battery (HVTB). For additional informn, refer to High-Voltage Traction Battery Systems Depowering in this section.

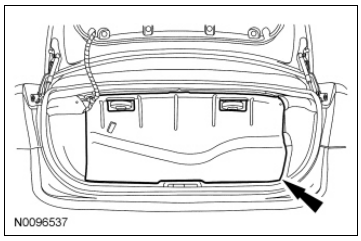
2. Fold the RH backrest down.
   - Between the HVTB and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.



3. Remove the 4 nuts, 2 bolts and the high-voltage BEC cover.
   - To install, tighten to 9 Nm (80 lb-in).

4. Remove the high-voltage/high-current fuse.
   1. Remove the high-voltage/high-current positive cable nut.
      - ♦ To install, tighten to 15 Nm (133 lb-in).
   2. Position the high-voltage/high-current positive cable aside.
   3. Remove the 2 high-voltage/low-current fuse nuts on each end of the fuse.
      - ♦ To install, tighten to 4 Nm (35 lb-in).
   4. Remove the high-voltage/low-current circuit bus bar.
   5. Remove the high-voltage/low-current fuse (40A).

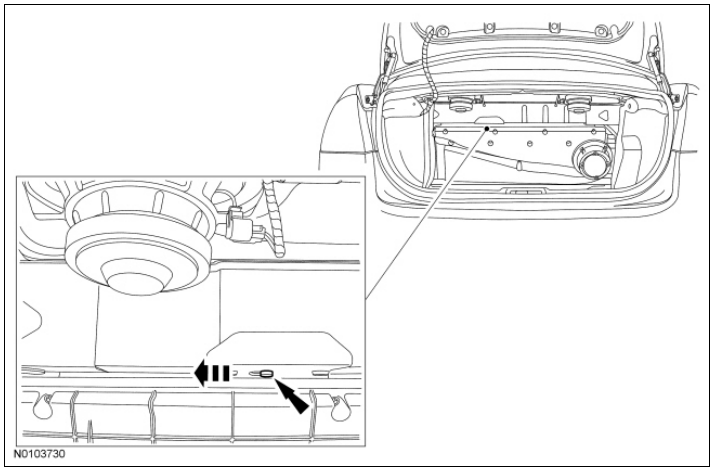
5. To install, reverse the removal procedure.



High-Voltage Traction Battery Inlet Air Temperature Sensor

Item	Part Number	Description
1	-	High Voltage Traction Battery (HVTB) inlet air temperature sensor connector (part of 10B759)
2	14A606	HVTB inlet air temperature sensor
3	10B768	HVTB inlet air duct

Removal and Installation

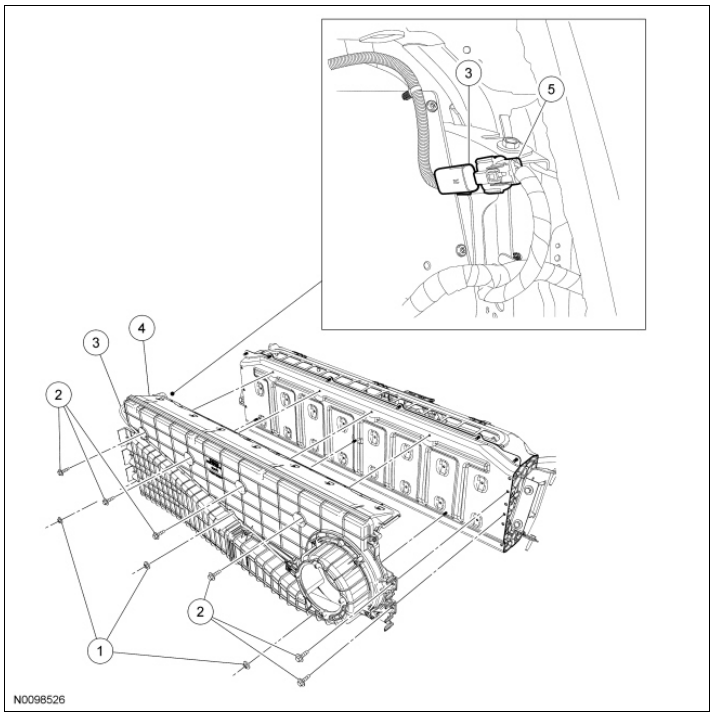


1. Remove the 4 pin-type retainers and the trunk front cover.

2. **NOTE:** If the center safety belt retractor locks and the safety belt webbing prevents the 60 percent backrest from lowering, raise the backrest upward to release the safety belt retractor and belt webbing.

   Fold the LH backrest down.

   - Between the High Voltage Traction Battery (HVTB) and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.



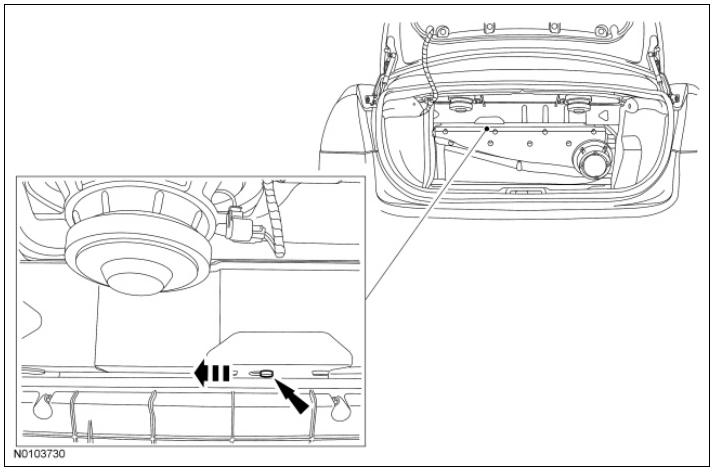
3. Release the locking tab and removthe connector from the HVTB inlet air temperature sensor.

4. Remove the HVTB inlet air temperature sensor.
    - Turn the sensor counterclockwise to unlock and release it from the plenum.

5. To install, reverse the removal procedure.

High-Voltage Traction Battery Cooling Outlet Duct

Item	Part Number	Description
1	W713475	High Voltage Traction Battery (HVTB) cooling outlet duct nuts (3 required)
2	W708703	HVTB cooling outlet duct screws (6 required)
3	14D641	HVTB cooling fan jumper wiring harness
4	10C665	HVTB cooling outlet duct
5	-	HVTB cooling fan connector (part of 14A005)



Removal and Installation

1. Remove the High Voltage Traction Battery (HVTB) cooling fan. For additional information, refer to High-Voltage Traction Battery Cooling Fan in this section.

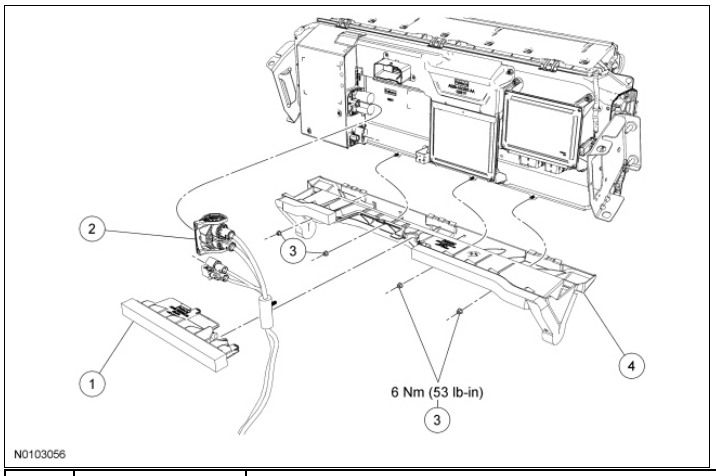
2. **NOTE:** If the center safety belt retractor locks and the safety belt webbing prevents the 60 percent backrest from lowering, raise the backrest upward to release the safety belt retractor and belt webbing.

   Fold the LH backrest down.

   - Between the HVTB and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down

3. Release the locking tab and disconnect the HVTB cooling fan jumper harness. Rove the clips holding the harness to the HVTB mounting bracket and HVTB case.

4. Release the clips that hold the HVTB cooling fan jumper harness to the HVTB cooling outlet duct and remove the harness from the duct.



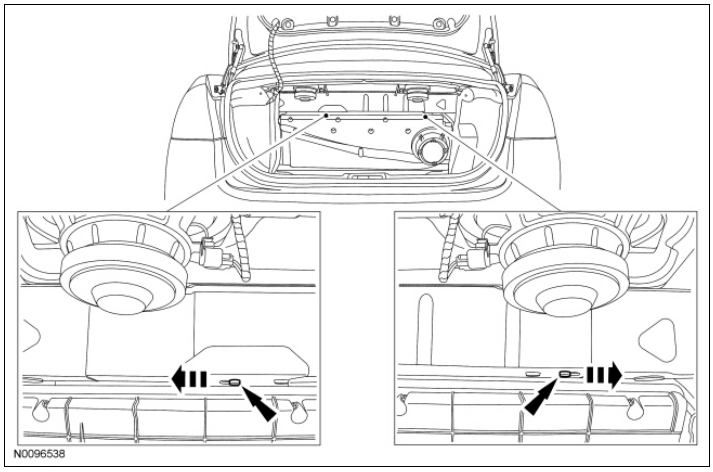
5. Remove the 6 bolts and 3 nuts and remove the HVTB cooling outlet duct.

6. To install, reverse the removal procedure.

High-Voltage Traction Battery Cooling Inlet Duct

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5



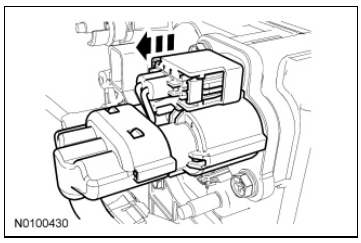
Item	Part Number	Description
1	19B680	High Voltage Traction Battery (HVTB) cooling inlet duct plate
2	14300	High-voltage cable assembly
3	W705790	HVTB cooling inlet duct nuts (4 required)
4	10B768	HVTB cooling inlet duct

Removal and Installation

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

1. Depower the High Voltage Traction Battery (HVTB). For additional information, refer to High-Voltage Traction Battery Systems Depowering in this section.

2. Fold the RH backrest down.
   - Between the HVTB and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.

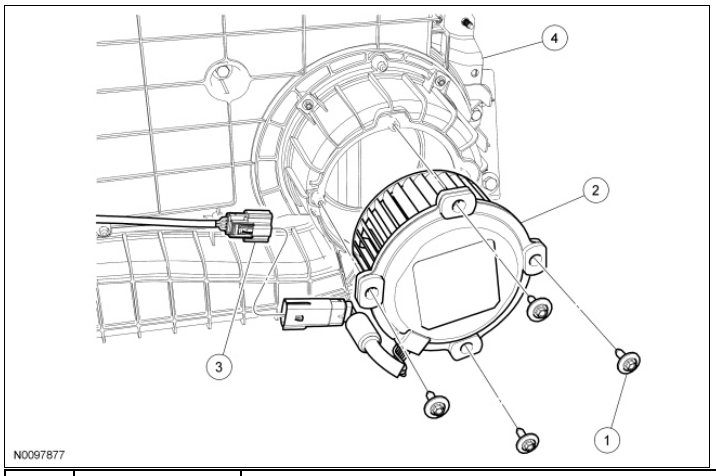


3. Pull loose and remove the cooling inlet duct plate in front of the high-voltage cables.

4. ***NOTICE:*** **Failure to disconnect high-voltage cable connectors as instructed may result in damage to the connectors.**

   Disconnect the high-voltage/high-current, high-voltage/low-current and interlock connectors.

   - Press the locking clip on the white interlock connector and disengage the white connector before releasing the locking clip on the orange portion of the high-voltage/low-current connector. The white interlock connector will not come completely apart until the orange portion is released.

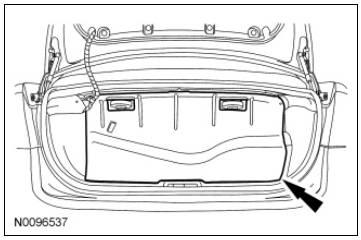


5. Remove the 4 HVTB cooling inlet duct nuts and the inlet duct.
   - To install, apply a small amount of threadlock and sealer and tighten to 6 Nm (53 lb-in).

6. To install, reverse the removal procedure.

High-Voltage Traction Battery Cooling Fan

Material



Item	Specification
Instant Gel Adhesive TA-19	WSK-M2G402-A4

Item	Part Number	Description
1	W790165	High Voltage Traction Battery (HVTB) cooling fan screw (4 required)
2	10C659	HVTB cooling fan
3	14D641	HVTB cooling fan jumper harness
4	10C665	HVTB outlet air duct

Removal and Installation

1. Open the trunk, remove the 4 pin-type retainers and the front trunk cover.

2. Release the locking tab and separate the High Voltage Traction Battery (HVTB) cooling fan connector.

3. Remove the 4 HVTB cooling fan screws.

4. Remove the HVTB cooling fan.

5. To install, add a small amount of instant gel adhesive to the HVTB cooling fan screws and reverse the removal procedure.

General Specifications

Item	Specification
DC to DC Converter Control Module (DC/DC) voltage output	13.3-14.7 volts
DC/DC output current capacity	100-145 amps

Torque Specifications

Description	Nm	lb-ft	lb-in
A/C tube bracket bolt	6	-	53
DC/AC inverter nuts	9	-	80
DC to DC Converter Control Module (DC/DC) low-voltage battery cable nuts	17	-	150
DC/DC lower LH bracket bolts	5	-	44
DC/DC lower RH bracket nut	22	16	-
DC/DC top bracket bolts	9	-	80

High-Voltage Converter/Inverter

DC to DC Converter Control Module (DC/DC)

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage hybrid system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

The DC to DC Converter Control Module (DC/DC) is a liquid-cooled component that converts high-voltage (179-343 volts) DC power from the High Voltage Traction Battery (HVTB) to low-voltage (12 volts) DC power. This charges the 12-volt battery through the low-voltage battery cables and powers the low-voltage electrical systems, eliminating the need for a conventional engine-driven generator. It utilizes a dedicated control module, which is part of the DC/DC . The DC/DC communicates with other modules over the High Speed Controller Area Network (HS-CAN) bus, and is located on the RH frame rail, behind the radiator support.

High-Voltage Cable Assembly

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage hybrid system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

All cables that carry high voltage are integrated into a single high-voltage cable assembly that runs between the DC/DC , the Electronically Controlled Continuously Variable Transmission (eCVT), the Air Conditioning Compressor Module (ACCM) and the HVTB . The high-voltage cable assembly can be serviced separately from the rest of the high-voltage system.

DC/AC Inverter and AC Power Point

The DC/AC inverter converts low voltage (12 volts) DC to 110 volts AC to power a device that uses AC power with a rating of less than 150 watts. The DC/AC inverter is located behind the RH rear seat bolster, and is a serviceable part. The AC power point is located in the rear of the floor console and can be serviced separately from the floor console.

High-Voltage Converter/Inverter

Special Tool(s)

 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation - DC to DC Converter Control Module (DC/DC)

The DC to DC Converter Control Module (DC/DC) is a liquid-cooled component that converts high voltage (179-343 volts) DC power to low voltage (12 volts) DC power, while maintaining electrical isolation between the 2 systems. The DC/DC is enabled when the High Voltage Traction Battery (HVTB) contactors have closed, providing high-voltage power to the DC/DC (for information on the HVTB system, refer to Section 414-03). The DC/DC steps the high voltage down to a low-voltage (between 12 and 15 volts, depending on vehicle needs), providing power to the vehicle low-voltage battery systems. The DC/DC also charges the 12-volt battery through the low-voltage battery cables as necessary, eliminating the need for a conventional engine-driven generator. Depending on vehicle and environmental conditions, the DC/DC is capable of outputting as many as 145 amps to the 12-volt battery.

The DC/DC is liquid-cooled and is part of the Motor Electronics Cooling System (MECS). In addition to the DC/DC , the MECS also provides cooling of the Electronically Controlled Continuously Variable Transmission (eCVT). For information on the MECS , refer to Section 307-02B .

The DC/DC communicates on the High Speed Controller Area Network (HS-CAN). When a fault is sensed by the DC/DC , a DTC is set and can be retrieved using a scan tool connected to the Data Link Connector (DLC). The PCM communicates charging needs of the 12-volt system to the DC/DC over the HS-CAN , enabling the DC/DC to control low-voltage charging operations.

The DC/DC receives the following HS-CAN messages:

- Transmission Control Module (TCM) high-voltage input, via the TCM
- Ignition status, via the Instrument Panel Cluster (IPC)
- MECS coolant temperature, via the PCM
- "Ready Indicator Light" illumination request, via the PCM
- Transaxle gear mode, via the PCM
- DC/DC enable and low-voltage set point request, via the PCM

Faults with the DC/DC system that cause low or excessively high 12-volt battery voltage will result in the DC/DC sending a HS-CAN message to the IPC requesting the CHECK CHARGING SYSTEM message be

displayed in the message center.

Principles of Operation - High-Voltage Cable Assembly

The high-voltage cable assembly contains 4 basic circuits:

- The high-voltage/high-amperage cables run between the HVTB and the eCVT .
- The high-voltage/low-amperage cables run from the HVTB to the DC/DC and the Air Conditioning Compressor Module (ACCM).
- The interlock circuit consists of small-gauge wiring wrapped around the high-voltage cables. It is a continuous, single circuit used to monitor the integrity of the high-voltage connections. The interlock connectors are part of the high-voltage cable connectors and are either disconnected at the same time as the high-voltage cable, or must be disconnecd before the high-voltage cable depending upon the type of connection being serviced.
- The AC power point high-voltage wiring and LED indicator circuits between the DC/AC inverter and the AC power point.

All high-voltage wiring utilizes orange insulation as well as orange tape and/or harness tubing.

Principles of Operation - DC/AC Inverter and AC Power Point

The DC/AC inverter converts 12 volts DC to 110 volts AC to power a device that uses AC electricity with a rating of less than 150 watts. The 110 volts AC created by the inverter will measure differently than a conventional AC outlet (utility-generated) with some multi-meters. The AC power point will automatically shut off if the load exceeds 150 watts, to help prevent damage to the inverter or load. The inverter supplies 110 volts AC power only when the ignition is in the ON/START position. This reduces the draw on the 12-volt system when the vehicle is not running. The AC power point is equipped with a green LED that indicates the system integrity.

- Green LED illuminates continuously - ignition in ON/START and system is operating normally.
- Green LED flashes continuously - ignition in ON/START and a fault is detected.
- Green LED does not illuminate - ignition is not in ON/START, fault on the RUN/START circuit input to the DC/AC inverter or the DC/AC inverter is not powered (fault with DC/AC inverter B+ or ground circuits).

Short circuits, overloads or overheating of the inverter will cause the green LED to flash and the power to be cut off to the outlet. If the LED is flashing, the problem must be corrected (short circuit or excessive load). If the DC/AC inverter is overheated, it must be allowed time to cool off (without the load connected). Refer to the Owner's Literature for a list of appropriate electrical loads/devices that can be used.

nspection and Verification - DC to DC Converter Control Module (DC/DC) System

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage hybrid system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Electrical
• Battery Junction Box (BJB) fuse 47 (10A) • B+ cable fuse (200A) • B+ terminal at DC to DC Converter Control Module (DC/DC) converter control module • 12-volt battery • Wiring, terminals or connectors • High-voltage cables • DC/DC

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the DLC .

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground to the VCM .

   If the scan tool does not communicate with the VCM :

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power to the Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.
   - verify the scan tool operation with a known good vehicle.
   - refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the Network Test.
   - If the scan tool responds with no communication with one or more modules, refer to Section 418-00 .
   - If the Network Test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous memory DTCs and carry out the self-test diagnostics for the DC/DC and PCM.

9. If the DTCs retrieved are related to this concern, go to the DC to DC Converter Control Module (DC/DC) DTC Chart or the PCM DTC Chart.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart - DC/DC Converter Control Module (DC/DC) System .

Inspection and Verification - DC/AC Inverter System

1. Verify the customer concern.

1. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Electrical
• Smart Junction Box (SJB) fuse(s): ♦ 4 (30A) ♦ 35 (10A) • Wiring, terminals or connectors • AC power point • DC/AC inverter

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart - DC/AC Inverter System .

DTC Charts

DC to DC Converter Control Module (DC/DC) DTC Chart

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage hybrid system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.**

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure type code. The failure type code provides information about specific fault conditions such as opens or shorts to ground. Continuous Memory Diagnostic Trouble Codes (CMDTCs) have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
P0A12:16	DC/DC Converter Enable Circuit Low: Circuit Voltage Below Threshold	GO to Pinpoint Test A .

P0A94:4B	DC/DC Converter Performance: Over Temperature	GO to Pinpoint Test B .
P0AF7:00	14 Volt Power Module Internal Temperature Too High: No Sub Type Information	GO to Pinpoint Test C .
P0AFA:13	Hybrid Battery System Voltage Low: Circuit Open	GO to Pinpoint Test D .
P0AFA:16	Hybrid Battery System Voltage Low: Circuit Voltage Below Threshold	GO to Pinpoint Test E .
P0AFB:17	Hybrid Battery System Voltage High: Circuit Voltage Above Threshold	GO to Pinpoint Test F .
U0001:88	High Speed Controller Area Network (HS-CAN) Communication Bus: Bus Off	The DC to DC Converter Control Module (DC/DC) could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the Network Test with the scan tool. REFER to Section 418-00 for further diagnosis as needed.
U0100:00	Lost Communication With ECM/PCM "A": No Sub Type Information	REFER to Section 418-00 to diagnose lost PCM communication.
U0101:00	Lost Communication With TCM : No Sub Type Information	REFER to Section 418-00 to diagnose lost Transmission Control Module (TCM) communication.
U0155:00	Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	REFER to Section 418-00 to diagnose lost IPC module communication.
U0300:00	Internal Control Module Software Incompatibility: No Sub Type Information	DIAGNOSE any other DC/DC DTCs first. If no other DC/DC DTCs are present, GO to Pinpoint Test G .
U0401:68	Invalid Data Received From ECM/PCM A: Event Information	**NOTE:** DTC U0401:68 indicates a HS-CAN message from the PCM is outside normal limits due to a faulty PCM input. REVIEW freeze frame data for DTC U0401:68 to determine if the fault pertains to the Motor Electronics Cooling System (MECS) coolant temperature sensor, ambient air temperature or vehicle voltage. RETRIEVE PCM DTCs and DIAGNOSE any DTCs related to MECS coolant temperature sensor, ambient air temperature or vehicle voltage. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for further diagnosis.
U0402:68	Invalid Data Received From TCM : Event Information	**NOTE:** DTC U0402:68 indicates a HS-CAN message from the TCM is outside normal limits due to a faulty TCM input.

		RETRIEVE TCM DTCs and DIAGNOSE any DTCs related to high-voltage input. REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for further diagnosis.
U3000:04	Control Module: System Internal Failure	CLEAR the DTC. REPEAT the self-test. If the DTC is still present, INSTALL a new DC/DC .
U3000:41	Control Module: General Checksum Failure	DIAGNOSE any other DC/DC DTCs first. If no other DTCs are present, CLEAR the DTC. REPEAT the self-test. If the DTC is still present, INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section.
U3000:42	Control Module: General Memory Failure	DIAGNOSE any other DC/DC DTCs first. If no other DTCs are present, CLEAR the DTC. REPEAT the self-test. If the DTC is still present, INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section.
U3000:45	Control Module: Program Memory Failure	DIAGNOSE any other DC/DC DTCs first. If no other DTCs are present, CLEAR the DTC. REPEAT the self-test. If the DTC is still present, INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section.
U3000:49	Control Module: Internal Electronic Failure	If the 12V battery is on a charger, REMOVE the charger. CLEAR the DTC. REPEAT the self-test. If DTC U3003:49 returns, INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section.
U3000:96	Control Module: Component Internal Failure	CLEAR the DTC. REPEAT the self-test. REFER to Direct Current/Direct Current (DC/DC) Converter in this section. If the DTC is still present, INSTALL a new DC/DC .
U3003:16	Battery Voltage: Circuit Voltage Below Threshold	GO to Pinpoint Test H .
U3003:17	Battery Voltage: Circuit Voltage Above Threshold	GO to Pinpoint Test I .
U3003:62	Battery Voltage: Signal Compare Failure	GO to Pinpoint Test J .

PCM DTC Chart

DTC	Description	Action
P0562	System Voltage Low	GO to Pinpoint Test H .
P0563	System Voltage High	GO to Pinpoint Test I .

Symptom Chart - DC to DC Converter Control Module (DC/DC) System

Symptom Chart - DC to DC Converter Control Module (DC/DC) System

⚠ **WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage hybrid system**

utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

Symptom Chart - DC/AC Inverter System

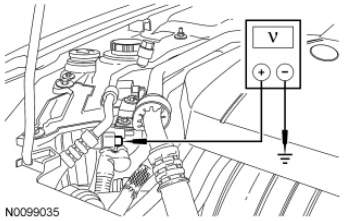
Symptom Chart - DC/AC Inverter System

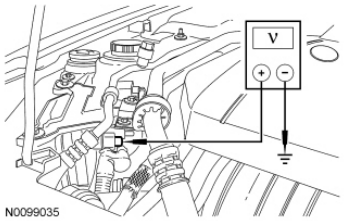
Pinpoint Tests

Pinpoint Test A: DTC P0A12:16

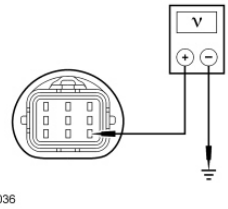
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation





The DC to DC Converter Control Module (DC/DC) monitors the PCM relay control circuit voltage. If the PCM relay control circuit to the DC/DC becomes open or voltage is low, DTC P0A12:16 sets and the DC/DC maintains standard operation of the charging system, though a delay in vehicle start-up time may occur.



- DTC P1A12:16 (DC/DC Converter Enable Circuit Low: Circuit Voltage Below Threshold) - Sets when the PCM relay control circuit provides less than 7 volts to DC/DC C1457D-7.

This pinpoint test is intended to diagnose the following:
- Fuse
- Wiring, terminals or connectors
- 12-volt battery cables
- DC/DC

PINPOINT TEST A: DTC P0A12:16

Test Step	Result / Action to Take

A1 CHECK THE BATTERY POSITIVE CIRCUIT VOLTAGE	
• Ignition OFF. • Measure the voltage between DC/DC C1457B, B+ terminal and ground.  • START the vehicle (Ready Indicator light ON). • Measure the voltage between DC/DC C1457B, B+ terminal and ground.  • **Did the voltage increase with the ignition ON?**	**Yes** GO to A3 . **No** GO to A2 .
A2 CHECK THE DC TO DC VOLTAGE CONVERTER STATUS (EnableStat) PID	
• Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - DC/DC . • Monitor the EnableStat PID. • **Does the PID read Enable?**	**Yes** GO to A4 . **No** CARRY OUT self-test of the PCM and Battery Energy Control Module (BECM). REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual and Section 414-03 for further diagnosis.
A3 CHECK THE PCM RELAY CONTROL INPUT TO THE DC/DC	
• Ignition OFF. • Disconnect: DC/DC C1457D. • START the vehicle (Ready Indicator light ON). • Measure the voltage between DC/DC C1457D-7, circuit CBK03 (GY), harness side and ground.	**Yes** GO to A4 . **No** VERIFY the Battery Junction Box (BJB) fuse 47 (10A) is OK. If OK, REPAIR circuit CBK03 (GY). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.

 • **Is the voltage greater than 10 volts?**	
A4 CLEAR DTCs AND CARRY OUT SELF-TEST OF THE DC/DC	
• Using the scan tool, clear the DC/DC DTCs. • Wait a minimum of 65 seconds before carrying out the next step. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC P0A12:16 reported?**	**Yes** INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section. REPEAT the self-test. TEST the system for normal operation. **No** Concern is not present at this time. INSPECT the PCM relay control input to DC/DC C1457D-7, circuit CBK03 (GY) for intermittent faults. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: DTC P0A94:4B

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The DC to DC Converter Control Module (DC/DC) provides power for the low-voltage vehicle systems and charging of the 12-volt battery. The DC/DC can receive a High Speed Controller Area Network (HS-CAN) message from the PCM indicating that the Motor Electronics Cooling System (MECS) temperature exceeds 80°C (176°F). Because of this, the DC/DC may limit current output to 100 amps (maximum output is normally greater than 100 amps). When either condition is present, DTC P0A94:4B sets and the DC/DC will continue limiting current until the over-temperature condition clears. Periodic or constant heavy electrical loads of the 12-volt system may cause the 12-volt battery to become drained. Reduced functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.

- DTC P0A94:4B (DC/DC Performance: Over Temperature) - Sets when the MECS temperature exceeds 80°C (176°F) and/or the DC/DC is limiting current output to 100 amps.

This pinpoint test is intended to diagnose the following:
- MECS
- DC/DC

PINPOINT TEST B: DTC P0A94:4B

Test Step	Result / Action to Take		
B1 CARRY OUT SELF-TEST OF THE PCM		• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - PCM. • **Is PCM DTC P0A7C:00 reported?**	**Yes** REFER to Section 307-02B to inspect and diagnose the MECS cooling loop circuit. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation. **No** GO to B2 .
B2 CHECK FOR DC/DC DTC P0AF7:00			
• Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC P0AF7:00 reported?**	**Yes** GO to Pinpoint Test C . **No** GO to B3 .		
B3 CLEAR DTCs AND CARRY OUT SELF-TEST OF THE DC/DC			
• Using the scan tool, clear the DC/DC DTCs. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC .	**Yes** INSTALL a new DC/DC . REPEAT the self-test. TEST the system for normal operation. **No** Concern is not present at this time. CHECK the MECS coolant level. REFER to Section 307-02B . CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.		

• **Is DTC P0A94:4B reported?**	

Pinpoint Test C: DTC P0AF7:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The DC to DC Converter Control Module (DC/DC) is cooled by the Motor Electronics Cooling System (MECS). The DC/DC monitors its temperature internally. If the internal temperature becomes excessive, DTC P0AF7:00 sets and the DC/DC will be in standby mode (DC/DC disabled) until the over-temperature condition clears. Presence of this DTC will result in CHECK CHARGING SYSTEM being displayed in the message center and the 12-volt battery eventually becoming drained. Reduced or no functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.

- DTC P0AF7:00 14 (Volt Power Module Internal Temperature Too High: No Sub Type Information) - Sets when the DC/DC senses high internal temperature.

This pinpoint test is intended to diagnose the following:
- MECS
- DC/DC

PINPOINT TEST C: DTC P0AF7:00

Test Step	Result / Action to Take
C1 CHECK FOR DC/DC DTC P0A94:4B	
• Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC P0A94:4B reported?**	**Yes** REFER to Section 307-02B to inspect and diagnose the MECS cooling loop circuit. **No** GO to C2 .
C2 CLEAR DTCs AND CARRY OUT SELF-TEST OF THE DC/DC	
• Using the scan tool, clear the DC/DC DTCs. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC P0AF7:00 reported?**	**Yes** INSTALL a new DC/DC . CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation. **No** Concern is not present at this time. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: DTC P0AFA:13

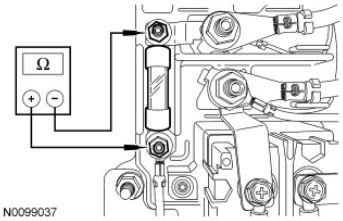
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for

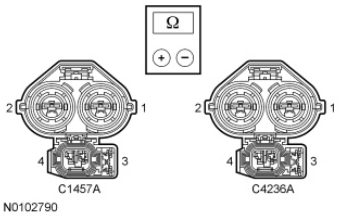
schematic and connector information.

Normal Operation

The DC to DC Converter Control Module (DC/DC) monitors the high voltage available from the High Voltage Traction Battery (HVTB). The DC/DC compares that high-voltage reading with the high voltage available to the Transmission Control Module (TCM), which is communicated via a High Speed Controller Area Network (HS-CAN) message. When the DC/DC compares its available high voltage to that available to the TCM and determines the difference to be 150 volts or more, it will set DTC P0AFA:13 and request the CHECK CHARGING SYSTEM message be displayed in the message center. The DC/DC will attempt to maintain operation. An open high-voltage, low-current fuse (located in the high-voltage Bussed Electrical Center (BEC)) may cause the DC/DC and Air Conditioning Compressor Module (ACCM) to be non-functional, resulting in the 12-volt battery eventually becoming drained. Reduced or no functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.

- DTC P0AFA:13 (Hybrid Battery System Voltage Low: Circuit Open) - Sets when the difference in high voltage between the TCM and DC/DC is greater than 150 volts.





This pinpoint test is intended to diagnose the following:

- High-voltage BEC
- High-voltage low-cuent fuse
- High-voltage cables
- DC/DC

PINPOINT TEST D: DTC P0AFA:13

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage hybrid system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

Test Step	Result / Action to Take
D1 CHECK THE HIGH-VOLTAGE BEC HIGH-VOLTAGE LOW-CURRENT FUSE	
⚠ WARNING: Never install the service disconnect plug with the high-voltage bussed electrical center (BEC) cover removed. Always install the cover prior to connecting the service disconnect plug. The high-voltage BEC cover prevents inadvertent contact with the high voltage which is present at several points under the cover. Failure to follow these instructions may result in serious personal injury or death. • Ignition OFF. • Depower the HVTB . Refer to Section 414-03 . • Remove the high-voltage BEC cover. Refer to the High-Voltage Low-Current Fuse procedure in Section 414-03 .	**Yes** GO to D2 . **No** INSTALL a new high-voltage, low-current fuse. INSPECT the high-voltage BEC for signs of an obvious short condition. INSTALL a new high-voltage BEC as needed. If an obvious short condition is not identified, CARRY OUT self-test of the Battery Energy Control Module (BECM). REFER to Section 414-03 to diagnose BECM DTCs.

• Inspect and measure the resistance of the high-voltage low-current fuse.  • **Is the fuse undamaged and the resistance less than 5 ohms?**	
D2 CARRY OUT TESTING OF THE HIGH-VOLTAGE CABLES	
• Disconnect: DC/DC C1457A. • Disconnect: High-Voltage BEC C4236A. • Measure the resistance between DC/DC C1457A, harness side and high-voltage BEC C4236A, harness side as follows: **DC/DC** / **Circuit** / **High-Voltage BEC** C1457A-2 / HYT03 (OG/WH) / C4236A-2 C1457A-1 / HYT04 (OG/BK) / C4236A-1  • **Are the resistances less than 5 ohms?**	**Yes** GO to D3 . **No** INSTALL new high-voltage cables. REFER to Section 414-03 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D3 CHECK HIGH VOLTAGE TO THE TCM USING PID BATTERY VOLTAGE (TCM) RECEIVED (HVBAT_V)	
• Connect: DC/DC C1457A. • Connect: High-Voltage BEC C4236A. • Install the HVTB service disconnect. Refer to Section 414-03 . • Ignition ON. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: DataLogger - TCM . • Monitor the TCM PID HVBAT_V. • **Does the PID read greater than 150 volts?**	**Yes** GO to D4 . **No** GO to D5 .

D4 CHECK HIGH VOLTAGE TO THE DC/DC USING PID HEV HIGH VOLTAGE BUS-MEASURED (HEVHiVolt)	
• Enter the following diagnostic mode on the scan tool: DataLogger - DC/DC . • Monitor the DC/DC PID HEVHiVolt. • **Does t read greater than 150 volts?**	**Yes** GO to D5 . **No** INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section. REPEAT the self-test. TEST the system for normal operation.
D5 CLEAR DTCs AND CARRY OUT SELF-TEST OF THE DC/DC	
• Using the scan tool, clear the DC/DC DTCs. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC P0AFA:13 reported?**	**Yes** INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section. REPEAT the self-test. TEST the system for normal operation. **No** Concern is not present at this time. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test E: DTC P0AFA:16

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The DC to DC Converter Control Module (DC/DC) monitors the high voltage available from the High Voltage Traction Battery (HVTB). If the DC/DC senses high voltage of less than 150 volts, it will set DTC P0AFA:16 and request the CHECK CHARGING SYSTEM message be displayed in the message center. The DC/DC will be in standby mode (DC/DC disabled) until the low-voltage condition clears, resulting in the 12-volt battery eventually becoming drained. Reduced or no functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.

- DTC P0AFA:16 (Hybrid Battery System Voltage Low: Circuit Voltage Below Threshold) - Sets when the DC/DC senses HVTB voltage of less than 150 volts.

This pinpoint test is intended to diagnose the following:
- Identify subsystem which is source of HVTB system fault

PINPOINT TEST E: DTC P0AFA:16

Test Step	Result / Action to Take

E1 CHECK FOR DC/DC DTC P0AFA:13	
• Ignition ON. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC P0AFA:13 reported?**	**Yes** GO to Pinpoint Test D . **No** GO to E2 .
E2 CHECK HIGH VOLTAGE TO THE TCM USING PID BATTERY VOLTAGE (TCM) RECEIVED (HVBAT_V)	
• Enter the following diagnostic mode on the scan tool: DataLogger - TCM . • Monitor the TCM PID HVBAT_V. • **Does the PID read greater than 150 volts?**	**Yes** GO to Pinpoint Test D . **No** CARRY OUT self-test of the Battery Energy Control Module (BECM). REFER to Section 414-03 for diagnosis of the BECM DTCs. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test F: DTC P0AFB:17

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The DC to DC Converter Control Module (DC/DC) monitors the high voltage available from the High Voltage Traction Battery (HVTB). If the DC/DC senses high voltage of greater than 360 volts, it will set DTC P0AFB:17 and request the CHECK CHARGING SYSTEM message be displayed in the message center. The DC/DC will be in standby mode (DC/DC disabled) until the high voltage condition clears, resulting in the 12-volt battery eventually becoming drained. Reduced or no functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.

- DTC P0AFB:17 (Hybrid Battery System Voltage High: Circuit Voltage Above Threshold) - Sets when the DC/DC senses HVTB voltage of greater than 360 volts.

This pinpoint test is intended to diagnose the following: li>HVTB system fault
- High-voltage cables

PINPOINT TEST F: DTC P0AFB:17

Test Step	Result / Action to Take
F1 CHECK THE TCM AND AIR CONDITIONING COMPRESSOR MODULE FOR HIGH VOLTAGE OVER-VOLTAGE DTCs	

• Ignition ON. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: Self Test - TCM , and record the results. • Enter the following diagnostic mode on the scan tool: Self Test - ACCM . • **Is Transmission Control Module (TCM) DTC P0A78:17, P0A7A:17, P1A07:16, P0A07:62 and/or Air Conditioning Compressor Module (ACCM) DTC P0AFB:17 present?**	**Yes** GO to F2 . **No** DEPOWER the HVTB . REFER to Section 414-03 . INSPECT the high-voltage cable ends for arcing or terminal pull out. REPAIR as necessary. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.
F2 CHECK HIGH VOLTAGE TO THE DC/DC USING PID HEV HIGH VOLTAGE BUS-MEASURED (HEVHiVolt)	
• Enter the following diagnostic mode on the scan tool: DataLogger - DC/DC . • Monitor the DC/DC PID HEVHiVolt. • **Does the PID read less than 360 volts?**	**Yes** CARRY OUT self-test of the Battery Energy Control Module (BECM). REFER to Section 414-03 for further diagnosis of the BECM DTCs. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation. **No** DEPOWER the HVTB . REFER to Section 414-03 . INSPECT the high-voltage cable ends for arcing or terminal pull out. REPAIR as necessary. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test G: DTC U0300:00

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The DC to DC Converter Control Module (DC/DC) communicates with various modules over the High Speed Controller Area Network (HS-CAN). If the DC/DC determines a software incompatibility fault is present, it sets DTC U0300:00 and operates in offline mode (low-voltage set point and current limits at default settings). Periodic or constant heavy electrical loads of the 12-volt system may cause the 12-volt battery to become drained. Reduced functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.

- DTC U0300:00 (Internal Control Module Software Incompatibility: No Sub Type Information) - Sets due to a HS-CAN configuration error.

This pinpoint test is intended to diagnose the following:

- HS-CAN fault
- DC/DC

PINPOINT TEST G: DTC U0300:00

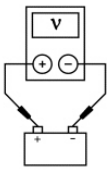
Test Step	Result / Action to Take
G1 CARRY OUT NETWORK TEST	
• Ignition ON. • Connect the scan tool. • Enter the following diagnostic mode on the scan tool: Network Test. • **Were any concerns identified by the Network Test?**	**Yes** REFER to Section 418-00 to diagnose the network concern. **No** GO to G2 .
G2 CLEAR DTCs AND CARRY OUT SELF-TEST OF THE DC/DC	
• Using the scan tool, clear the DC/DC DTCs. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC U0300:00 reported?**	**Yes** INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation. **No** Concern is not present at this time. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.

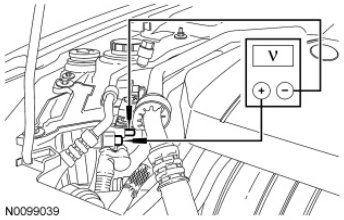
Pinpoint Test H: DTC P0562 and U3003:16

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

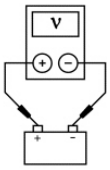
Normal Operation

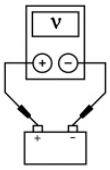
The DC to DC Converter Control Module (DC/DC) monitors the 12-volt battery system voltage internally at the B+ terminal of the DC/DC . If the voltage drops below 10.5 volts while the ignition is ON, the DC/DC sets DTC U3003:16 and requests CHECK CHARGING SYSTEM be displayed in the message center. The DC/DC will be in standby mode (DC/DC disabled) and the 12-volt battery will eventually be drained. Reduced or no functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.

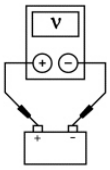




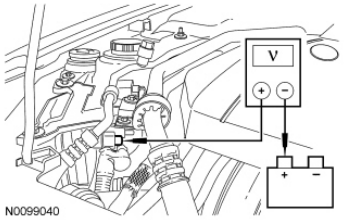
The PCM monitors the system voltage through the Battery Junction Box (BJB). If this voltage drops 1.5 volts or more below the generator voltage desired, this DTC will be set after 30 seconds.







- DTC P0562 (System Voltage Low) - If the PCM detects a voltage from the charging system that is 1.5 volts lower than the DC/DC voltage desired, this DTC will be set.
- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) - Sets if the 12-volt battery system voltage is less than 10.5 volts.



This pinpoint test is intended to diagnose the following:

- 12-volt battery
- 12-volt battery cables
- DC/DC
- Wiring, terminals or connectors

PINPOINT TEST H: DTC P0562 AND U3003:16

Test Step	Result / Action to Take
H1 CHECK THE DC/DC DTCs	
• Review the DC/DC DTCs recorded during Inspection and Verification. • **Are any DC/DC DTCs other than U3003:16 present?**	**Yes** REPAIR all other DC/DC DTCs before repairing U3003:16. GO to the DC to DC Converter Control Module (DC/DC) DTC Chart in this section. **No** GO to H2 .
H2 TEST BATTERY CONDITION	
• Ignition OFF. • Carry out the battery condition test. Refer to Section 414-01 . • **Did the battery pass the condition test?**	**Yes** GO to H3 . **No** INSTALL a new battery. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.
H3 CHECK VOLTAGE AT THE DC/DC	
• START the vehicle (Ready Indicator light ON). • Turn the headlamps on and the blower on high. • Measure the voltage of the battery.  AJ0210-A • Measure the voltage between DC/DC C1457B, circuit SDC02 (RD), harness side and DC/DC C1457C, circuit GD108 (BK/VT), harness side.  N0099039 • **Does the DC/DC voltage match battery voltage?**	**Yes** For DTC P0562, GO to H4 . For DTC U3003:16, GO to H7 . **No** GO to H6 .
H4 COMPARE PCM MODULE SUPPLY VOLTAGE (VPWR) PID	

• With the engine still running at idle, headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does PCM VPWR PID display battery voltage within ±0.5 volt?**	**Yes** GO to H5 . **No** REPAIR high resistance or loose connections in the affected PCM power circuit(s). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H5 CHECK PCM GROUND FOR HIGH RESISTANCE	
• Monitor PCM VPWR PID. • With the engine still running at idle, turn off all accessory loads, measure the battery voltage at the battery and note the PCM VPWR PID.  AJ0210-A • With the engine still running at idle, turn headlamps on and blower on high, measure the battery voltage at the battery and monitor the PCM VPWR PID.  AJ0210-A • **Does the VPWR PID read within ±0.5 volt with accessory loads on as compared to accessory loads off?**	**Yes** GO to H7 . **No** REPAIR the affected PCM ground circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
H6 MEASURE VOLTAGE DROP OF DC/DC B+ CIRCUIT	

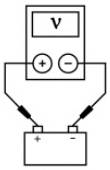
• Measure the voltage between DC/DC C1457B, circuit SDC02 (RD), harness side and the positive battery terminal.  • **Is the voltage drop less than 0.5 volt?**	**Yes** REPAIR DC/DC B- circuit GD108 (BK/VT) or INSTALL a new cable, if necessary. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation. **No** REPAIR DC/DC B+ circuit SDC02 (RD) or INSTALL a new cable, if necessary. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.
H7 CLEAR DTCs AND CARRY OUT SELF-TEST OF THE DC/DC	
• Connect the scan tool. • Using the scan tool, clear the DC/DC DTCs. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC U3003:16 reported?**	**Yes** INSTALL a new DC/DC . REFER to Section 414-03 . CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a discharged battery. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test I: DTC P0563 and U3003:17

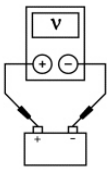
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

Normal Operation

The DC to DC Converter Control Module (DC/DC) monitors the 12-volt battery system voltage internally at the B+ terminal of the DC/DC . If the voltage is greater than 16 volts, the DC/DC sets DTC U3003:17 and requests CHECK CHARGING SYSTEM be displayed in the message center. The DC/DC will be in standby mode (DC/DC disabled) and the 12-volt battery will eventually be drained. Reduced or no functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.



The PCM also monitors system voltage and will set a DTC if the system voltage rises above a set threshold.



- DTC P0563 (System Voltage High) - If the PCM detects a voltage from the charging system higher than 15.2 volts with vehicle speed above 8 km/h (5 mph), this DTC will be set.
- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) - Sets if the 12-volt battery system voltage is greater than 16 volts.

This pinpoint test is intended to diagnose the following:

- 12-volt battery jump started or incorrectly charged
- Customer-installed accessory
- DC/DC

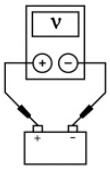
PINPOINT TEST I: DTC P0563 AND U3003:17

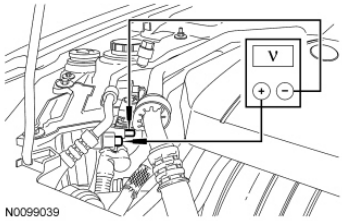
Test Step	Result / Action to Take
I1 CHECK VOLTAGE AT THE DC/DC	
• START the vehicle (Ready Indicator light ON). • Turn off the headlamps, blower and any other accessories. • Measure the voltage of the battery.  AJ0210-A • **Is the voltage less than 16 volts?**	**Yes** GO to I3 .
I2 TEST BATTERY CONDITION	
• Ignition OFF. • Carry out the battery condition test. Refer to Section 414-01 . • **Did the battery pass the condition test?**	**Yes** GO to I4 . **No** DTC U3003:17 or P0563 was most likely set due to the 12-volt battery being recently jump started or incorrectly charged using a battery charger. INSTALL a new battery. CLEAR the DTC. REPEAT the self-tests. TEST the system for normal operation. If DTC U3003:17 or P0563 is still present, GO to I3 .
I3 INSPECT VEHICLE ACCESSORIES	
• Ignition OFF. • Inspect the vehicle and disable any customer installed accessories. • START the vehicle (Ready Indicator light ON). • Measure the voltage of the battery.	**Yes** COMMUNICATE the accessory concern to the customer. CLEAR the DTC. REPEAT the self-tests. TEST the system for normal operation. **No** GO to I4 .

 AJ0210-A • **Is the voltage less than 16 volts?**	
I4 CLEAR DTCs AND CARRY OUT SELF-TEST OF THE DC/DC AND PCM	
• Ignition ON. • Connect the scan tool. • Using the scan tool, clear the DC/DC and PCM DTCs. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • Enter the following diagnostic mode on the scan tool: Self Test - PCM. • **Is DTC U3003:17 reported in the DC/DC or is DTC P0563 reported in the PCM?**	**Yes** INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section. REPEAT the self-tests. TEST the system for normal operation. **No** Concern is not present at this time. DTC U3003:17 or P0563 was most likely set due to the 12-volt battery being recently jump started or incorrectly charged using a battery charger. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.

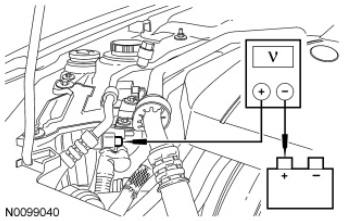
Pinpoint Test J: DTC U3003:62

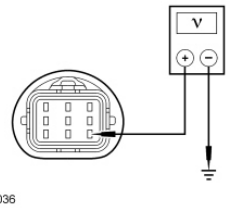
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.





Normal Operation





The DC to DC Converter Control Module (DC/DC) monitors the 12-volt battery system voltage internally at the B+ terminal of the DC/DC . The DC/DC also monitors the PCM relay control circuit voltage and compares that voltage to the voltage sensed internally at the B+ terminal. If the 2 voltages vary by greater than 4.3 volts, the DC/DC sets DTC U3003:62 and requests CHECK CHARGING SYSTEM be displayed in the message center. The DC/DC will be in standby mode (DC/DC disabled) and the 12-volt battery will be drained. Reduced or no functionality of 12-volt systems (headlamps, HVAC blower motor, etc.) may also be noticed.

- DTC U3003:62 (Battery Voltage: Signal Compare Failure) - Sets when the DC/DC senses greater than 4.3 volts difference between the DC/DC B+ terminal and the PCM relay control circuit.

This pinpoint test is intended to diagnose the following:
- DC/DC B+ cable mounting
- B+ cable fuse (200A)
- 12-volt battery cables
- Wiring, terminals or connectors
- DC/DC

PINPOINT TEST J: DTC U3003:62

Test Step	Result / Action to Take
J1 CHECK THE PCM MODULE SUPPLY VOLTAGE (VPWR) PID	
• Measure and record the voltage of the battery.  AJ0210-A • Connect the scan tool. • Entethe following diagnostic mode on the scan tool: DataLogger - PCM. • Monitor the VPWR PID. • **Does the VPWR PID match battery voltage?**	**Yes** GO to J2 . **No** CARRY OUT a self-test of the PCM. RECORD any DTCs and REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
J2 CHECK THE B+ CABLE	
• Measure the voltage between DC/DC C1457B, circuit SDC02 (RD), and DC/DC C1457C, circuit GD108 (BK/VT), harness side.  N0099039 • **Does the DC/DC voltage match battery voltage?**	**Yes** GO to J3 . **No** VERIFY the B+ cable fuse (200A) is OK. If OK, REPAIR the affected circuit(s). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.
J3 MEASURE VOLTAGE DROP OF DC/DC B+ CIRCUIT	
• Ignition ON. • With the headlamps ON and the blower on high, measure the voltage between DC/DC C1457B, circuit SDC02 (RD), harness side and the positive battery terminal.	**Yes** GO to J4 . **No** REPAIR DC/DC B+ circuit SDC02 (RD) or INSTALL a new cable, if necessary. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.

 • **Is the voltage drop less 0.5 volt?**	
J4 CHECK THE PCM RELAY CONTROL INPUT TO THE DC/DC	
• Ignition OFF. • Disconnect: DC/DC C1457D. • Ignition ON. • Measure the voltage between DC/DC C1457D-7, circuit CBK03 (GY), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to J5 . **No** VERIFY the Battery Junction Box (BJB) fuse 47 (10A) is OK. If OK, REPAIR circuit CBK03 (GY). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation.
J5 CLEAR DTCs AND CARRY OUT SELF-TEST OF THE DC/DC	
• Connect the scan tool. • Using the scan tool, clear the DC/DC DTCs. • Enter the following diagnostic mode on the scan tool: Self Test - DC/DC . • **Is DTC U3003:62 reported?**	**Yes** INSTALL a new DC/DC . REFER to Direct Current/Direct Current (DC/DC) Converter in this section. CLEAR the DTC. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connection. REPEAT the self-test. TEST the system for normal operation.

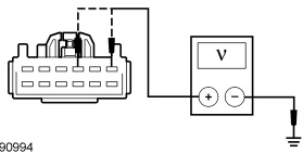
Pinpoint Test K: The DC/AC Inverter Does Not Operate Correctly - No Power at the AC Power Point or the AC Power Point LED Indicator Flashes With the Key in ON Position

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

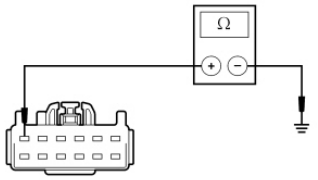
Normal Operation

The DC/AC inverter receives 12 volts DC at C2293A-1 and C2293A-3 and is grounded at C2293A-6. The incoming DC power is internally converted to 60 Hz, 110 volt AC power that is output to the AC power point

from C2293B-1 (power) and C2293B-5 (neutral).



NOTE: The electrical device that is powered by the AC power point must not exceed 150 watts.



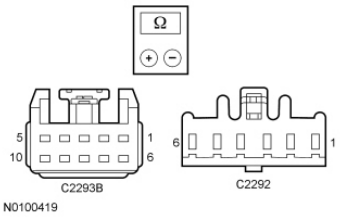
NOTE: If the green LED is flashing, the AC power point may be overloaded, overheated or shorted. Unplug the electrical device from the AC power point and cycle the key. Refer to the Owner's Literature to determine if the electrical device is appropriate for the AC power point.

This pinpoint test is intended to diagnose the following:

- Fuses
- Wiring, terminals or connectors
- DC/AC inverter
- AC power point

PINPOINT TEST K: THE DC/AC INVERTER DOES NOT OPERATE CORRECTLY - NO POWER AT THE AC POWER POINT OR THE AC POWER POINT LED INDICATOR FLASHES WITH THE KEY IN THE ON POSITION

Test Step	Result / Action to Take
K1 CHECK THE DC/AC INVERTER VOLTAGE CIRCUITS	
• Ignition OFF. • Disconnect: DC/AC Inverter C2293A. • Ignition ON. • Measure the voltage between DC/AC inverter C2293A-1, circuit SBP04 (GN/RD), harness side and ground; and between DC/AC inverter C2293A-3, circuit CBP35 (YE/GY), harness side and ground.  A0090994 • **Are the voltages greater than 10 volts?**	**Yes** GO to K2 . **No** VERIFY the Smart Junction Box (SJB) fuses 4 (30A) and 35 (10A) are OK. If OK, REPAIR the affected circuit(s). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
K2 CHECK THE DC/AC INVERTER GROUND CIRCUIT	
• Ignition OFF. • Measure the resistance between DC/AC inverter C22936, circuit GD139 (BK/YE), harness side and ground.	**Yes** GO to K3 . **No** REPAIR circuit GD139 (BK/YE). TEST the system for normal operation.



- **Is the resistance less than 5 ohms?**

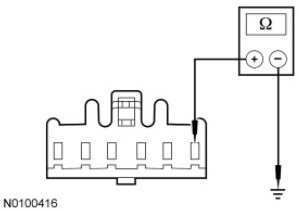
K3 CHECK THE AC POWER POINT CIRCUITS FOR AN OPEN

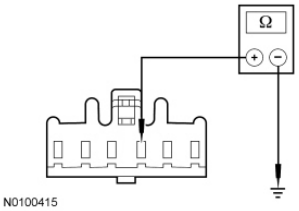
- Disconnect: SJB Fuse 4 (30A).
- Disconnect: SJB Fuse 35 (10A).
- Disconnect: AC Power Point C2292.
- Disconnect: DC/AC Inverter C2293B.
- Measure the resistance between DC/AC inverter C2293B, harness side and AC power point C2292, harness side as follows:

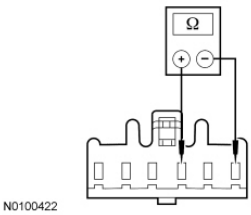
DC/AC Inverter	Circuit	AC Power Point
C2293B-1	HYA01 (OG/GN)	C2292-1
C2293B-5	HYA02 (OG/WH)	C2292-3

- **Are the resistances less than 5 ohms?**

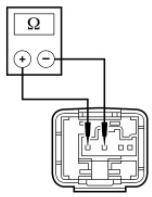
Yes
GO to K4 .

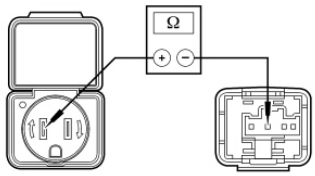


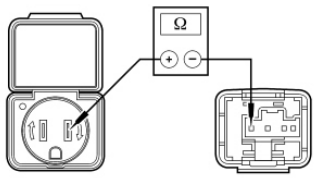




No
REPAIR the affected circuit(s). TEST the system for normal operation.







K4 CHECK THE AC POWER POINT CIRCUITS FOR A SHORT TO GROUND

- Measure the resistance between AC power point C2292-1, circuit HYA01 (OG/GN), harness side and ground.

Yes
GO to K5 .

No
REPAIR the affected circuit(s). TEST the system for normal operation.

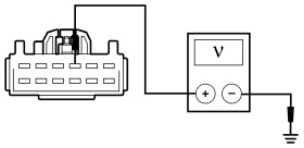
 N0100416 • Measure the resistance between AC power point C2292-3, circuit HYA02 (OG/WH), harness side and ground.  N0100415 • **Are the resistances greater than 10,000 ohms?**	
K5 CHECK THE AC POWER POINT CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between AC power point C2292-1, circuit HYA01 (OG/GN), harness side and C2292-3, circuit HYA02 (OG/WH), harness side.  N0100422 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to K6 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.
K6 CHECK THE AC POWER POINT FOR A SHORT TOGETHER	
• Measure the resistance between AC power point C2292-1, circuit HYA01 (OG/GN), component side and C2292-3, circuit HYA02 (OG/WH), harness side.	**Yes** GO to K7 . **No** INSTALL a new AC power point. TEST the system for normal operation.

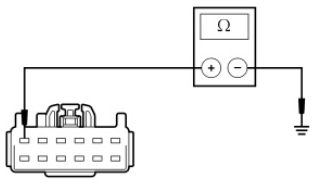
 N0100423 • **Is the resistance greater than 10,000 ohms?**	
K7 CHECK THE AC POWER POINT FOR AN OPEN	
• Measure the resistance between AC power point outlet side, pin 1 and AC power point C2292, pin-3, component side.  N0100418 • Measure the resistance between AC power point outlet side, pin 2 and AC power point C2292, pin-1, component side.  N0100417 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new DC/AC inverter. REFER to Direct Current/Alternating Current (DC/AC) Inverter in this section. TEST the system for normal operation. **No** INSTALL a new AC power point. REFER to Alternating Current (AC) Powerpoint in this section. TEST the system for normal operation.

Pinpoint Test L: The DC/AC Inverter Does Not Operate Correctly - The AC Power Point LED Indicator is Never On

Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connectoinformation.

Normal Operation

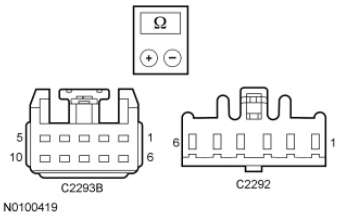




The DC/AC inverter receives 12 volts DC at C2293A-1 and C2293A-3 and is grounded at C2293A-6. The incoming DC power is internally converted to 60 Hz, 110 volt AC power that is output to the AC power point from C2293B-1 (power) and C2293B-5 (neutral). If a fault in the system is detected, the LED flashes or is off when the key is in the ON position. The LED continuously illuminates if the system is operating correctly when the key is in the ON position.

This pinpoint test is intended to diagnose the following:

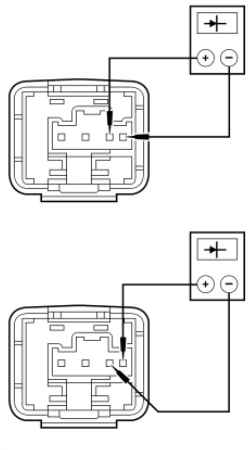
- Fuses
- Wiring, terminals or connectors
- DC/AC inverter
- AC power point



PINPOINT TEST L: THE DC/AC INVERTER DOES NOT OPERATE CORRECTLY - THE AC POWER POINT LED INDICATOR IS NEVER ON

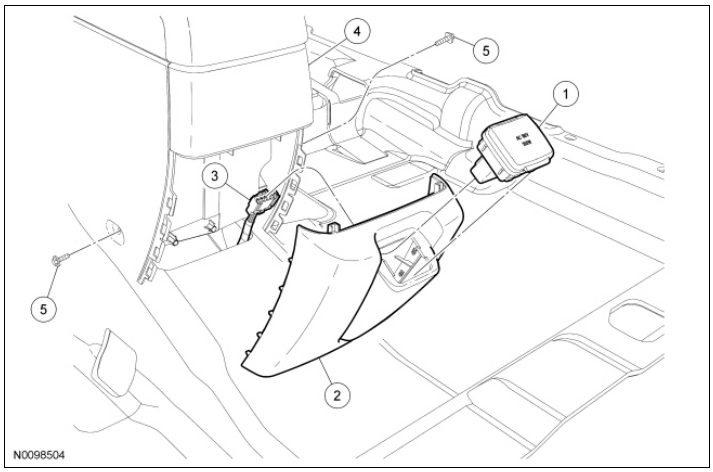
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
L1 CHECK DC/AC INVERTER VOLTAGE CIRCUIT	
• Ignition OFF. • Disconnect: DC/AC Inverter C2293A. • Ignition ON. • Measure the voltage between DC/AC inverter C2293A-3, circuit CBP35 (YE/GY), harness side and ground.  A0091492 • **Is the voltage greater than 10 volts?**	**Yes** GO to L2 . **No** VERIFY Smart Junction Box (SJB) fuse 35 (10A). If OK, REPAIR circuit CBP35 (YE/GY). If not OK, REFER to the Wiring Diagrams manual to identify the possible causes of the circuit short. TEST the system for normal operation.
L2 CHECK DC/AC INVERTER GROUND CIRCUIT	
• Ignition OFF. • Measure the resistance between DC/AC inverter C2293A-6, circuit GD139 (BK/YE), harness side and ground.  A0096456 • **Is the resistance less than 5 ohms?**	**Yes** GO to L3 . **No** REPAIR circuit GD139 (BK/YE). TEST the system for normal operation.
L3 CHECK AC POWER POINT LED INDICATOR CIRCUITS FOR AN OPEN	



• Disconnect: SJB Fuse 4 (30A). • Disconnect: SJB Fuse 35 (10A). • Disconnect: DC/AC Inverter C2293B. • Disconnect: AC Power Point C2292. • Measure the resistance between DC/AC inverter C2293B, harness side and AC power point C2292 as follows:	**Yes** GO to L4 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.

DC/AC Inverter	Circuit	AC Power Point
C2293B-9	LYA03 (YE/VT)	C2292-6
C2293B-8	RYA03 (BU/BN)	C2292-5



• **Are the resistances less than 5 ohms?**

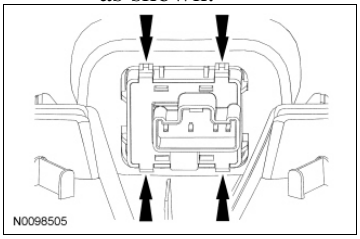
L4 CHECK THE AC POWER POINT LED	
• Using the digital multimeter diode check function, test the diode between AC power point C2292, pin-5 and pin-6, component side in both directions.	**Yes** INSTALL a new DC/AC inverter. REFER to Direct Current/Alternating Current (DC/AC) Inverter in this section. TEST the system for normal operation. **No** INSTALL a new AC power point. REFER to Alternating Current (AC) Powerpoint in this section. TEST the system for normal operation.

• **Is the diode OK?**

Alternating Current (AC) Powerpoint

Item	Part Number	Description
1	19N236	AC power point
2	-	Floor console end cover
3	-	AC power point electrical connector (part of 14300)
4	-	Floor console
5	W711401	Floor console rear screws (2 required)

Removal and Installation



⚠ WARNING: Disconnect the battery before servicing the direct current/alternating (DC-AC) inverter or alternating current (AC) powerpoint to prevent the risk of high voltage shock. Failure to follow this instruction may result in serious personal injury.

1. Disconnect the 12-volt battery. For additional information, refer to Section 414-01 .

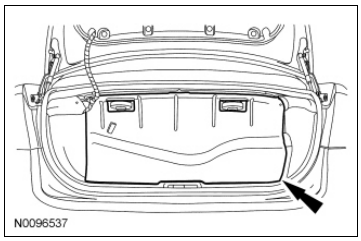
2. ***NOTICE:*** **Make sure that the rear of the floor console is lifted away from the floor as specified. Failure to follow this procedure will result in damage to the floor console and the tabs at the top of the floor console end cover.**

   Remove the floor console rear screws and lift the floor console about 25 mm (0.984 in) away from the floor.

3. Remove the floor console end cover by pulling the cover away at the bottom and rotating out. Lower the cover 7-13 mm (0.275-0.511 in) to clear the tabs on the top of the floor console end cover.
4. Disconnect the electrical connector and remove the AC power point by depressing the 4 tabs as shown.

5. To install, reverse the removal procedure.

Direct Current/Alternating Current (DC/AC) Inverter

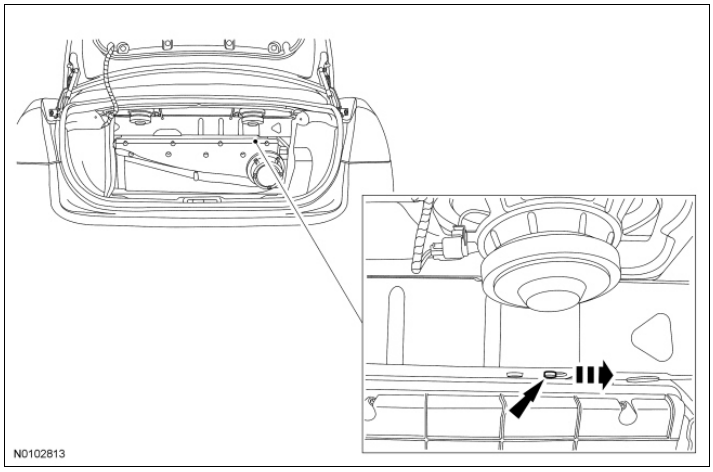


Item	Part Number	Description
1	-	DC/AC inverter wiring connector (part of 14300)
2	-	DC/AC inverter wiring connector (part of 14A005)
3	19G317	DC/AC inverter
4	W707142	DC/AC inverter nuts (3 required)

Removal and Installation

⚠ WARNING: Disconnect the battery before servicing the direct current/alternating (DC-AC) inverter or alternating current (AC) powerpoint to prevent the risk of high voltage shock. Failure to follow this instruction may result in serious personal injury.

1. Disconnect the 12-volt battery. For additional information, refer to Section 414-01 .

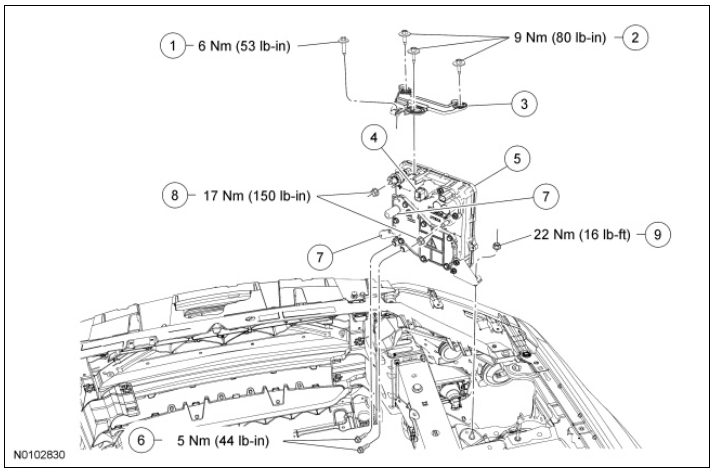


2. Remove 4 pin-type retainers and the front trunk cover.

3. **NOTE:** If the center safety belt retractor locks and the safety belt webbing prevents the 60 percent backrest from lowering, raise thekrest upward to release the safety belt retractor and belt webbing.

   Fold the RH backrest down.

   - Between the High Voltage Traction Battery (HVTB) and the sheet metal, locate the seat backrest latch release lever.
   - Push the release lever toward the outboard side of the vehicle and fold the backrest down.



4. Remove the RH rear seat bolster. For additional information, refer to Section 501-10 .

5. Disconnect the 2 electrical connectors at the DC/AC inverter.

6. Remove the 3 nuts and the DC/AC inverter.
   - To install, tighten to 9 Nm (80 lb-in).

7. To install, reverse the removal procedure.

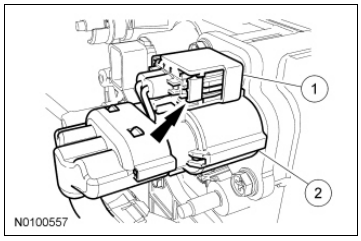
Direct Current/Direct Current (DC/DC) Converter

Item	Part Number	Description
1	W503924	A/C tube bracket bolt
2	W713417	DC to DC Converter Control Module (DC/DC) top bracket bolts (3 required)
3	14B303	DC/DC top bracket
4	-	DC/DC low-voltage electrical connector
5	14B227	DC/DC assembly
6	W712524	DC/DC lower LH bracket bolts (2 required)
7	-	DC/DC coolant inlet/ outlet tubes
8	W520513	DC/DC low-voltage battery cable nuts (2 required)
9	W520102	DC/DC lower RH bracket nut

Removal and Installation

⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage hybrid system utes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death.

1. Depower the High Voltage Traction Battery (HVTB). For additional information, refer to Section 414-03 .



2. Disconnect the 12-volt battery. For additional information, refer to Section 414-01 .

3. Remove the A/C tube bracket bolt and the 3 DC to DC Converter Control Module (DC/DC) top bracket bolts. Remove the bracket.
   - To install, tighten the 3 DC/DC top bracket bolts to 9 Nm (80 lb-in).
   - To install, tighten the A/C tube bracket bolt to 6 Nm (53 lb-in).

4. ***NOTICE:*** **Failure to disconnect high-voltage cable connectors as instructed may result in damage to the connectors.**

   Disconnect the DC/DC high-voltage and interlock connector as follows:

   1. Press the locking tab on the white interlock connector and partially disconnect the connector from the DC/DC .
   2. Press the locking tab on the orange high-voltage connector and fully disconnect **both** connectors from the DC/DC .

5. Disconnect the DC/DC low-voltage connector.

6. ⚠ **WARNING: Always tighten the DC/DC converter low-voltage battery cable fasteners to specification. Loose connections may result in electrical arcing, which increases both the risk of fires and serious personal injury.**

   Remove the 2 DC/DC low-voltage battery cable nuts and position the low-voltage battery cables aside.

   - To install, tighten to 17 Nm (150 lb-in).

7. Clamp the Motor Electronics Cooling System (MECS) hoses to prevent coolant from leaking from the hoses during the repair.

8. Loosen the hose clamps and remove the MECS hoses from the DC/DC .

9. Remove the DC/DC lower RH bracket nut.
   - To install, tighten to 22 Nm (16 lb-ft).

10. Detach the wire harness from the lower LH side of the DC/DC .

11. ***NOTICE:*** **Do not remove the DC to DC Converter Control Module (DC/DC) LH lower bracket from the vehicle rail, as this may degrade the vehicle ground attachment and DC/DC alignment.**

    NOTE: If a new DC/DC is being installed, the new DC/DC will come with a new LH lower bracket attached. Remove the LH lower bracket from the new DC/DC and discard. Whenever possible, re-use the LH lower bracket which has been left attached to the vehicle. If the a new bracket is being installed, make sure the surfaces between the bracket and side rails are clean and free of grease, dirt and debris.

    Remove the 2 lower LH DC/DC bracket bolts and remove the DC/DC .

    - To install, tighten to 5 Nm (44 lb-in).

12. To install, reverse the removal procedure.

13. Refill the MECS after installation. Bleed any air from the system. For additional information, refer to Section 307-02B .

Torque Specifications

Description	Nm	lb-in
Antenna cable bolt	8	71
Antenna module bolt	12	106
Audio Digital Signal Processing (DSP) module bolts	9	80
Engine ground strap	9	80
Radio interference capacitor (body)	7	62
Speaker enclosure mounting bolts	8	71
Subwoofer amplifier screws	5	44

Information and Entertainment System

Functional Components

The functional components of the audio system are:

- Audio Front Control Module (ACM)
- Front Controls Interface Module (FCIM)
- Front Display Interface Module (FDIM)
- Accessory Protocol Interface Module (APIM), located toward the rear end of the floor console
- Audio Digital Signal Processing (DSP) module, located in the RH side of the luggage compartment
- Subwoofer amplifier, located in the RH side of the luggage compartment
- Audio amplifier, located in the RH side of the luggage compartment
- Global Positioning System Module (GPSM), located in the instrument panel
- Speakers (see Audio Line-Up for locations)
- AM/FM antenna (Fusion) located at the rear of the roof
- Antenna module (MKZ), located at the RH C-pillar
- AM/FM/satellite radio combination antenna (Fusion), located at the rear of the roof
- Satellite radio antenna (MKZ), located at the rear of the roof
- Global Positioning System (GPS) antenna (integral to the AM/FM/satellite radio antenna (Fusion) or the satellite radio antenna (MKZ))
- AM/FM antenna cable (must be overlaid on harness)
- Satellite radio antenna cable (must be overlaid on harness)
- Steering wheel controls
- Universal Serial Bus (USB) port and cable, located in the floor console stowage bin
- Audio input jack, located in the floor console stowage bin (vehicles with the SYNC® system) or at the front of the floor console (vehicles without the SYNC® system)
- Clockspring
- Microphone

Audio Line-Up

The vehicle is equipped with one of the following audio systems:

- Base - Fusion
  - ♦ AM/FM/CD ACM with MP3
  - ♦ Four speakers (1 in each door)
- Mid-Level - Fusion
  - ♦ AM/FM/CD with MP3
  - ♦ Six speakers (1 in each door, 1 sail-mounted tweeter in each front door)
- Premium Sound - MKZ
  - ♦ AM/FM/CD ACM with MP3 (standard)
  - ♦ Navigation ACM with HD Radio® and built-in single CD/DVD drive (optional)
  - ♦ Nine speakers (one1 speaker in each front door, 1 speaker in each rear door, 1 tweeter in each front door, 1 instrument panel speaker, 2 parcel shelf-mounted subwoofers)
  - ♦ Audio amplifier and subwoofer amplifier
- Sony® Sound - Fusion
  - ♦ AM/FM/CD ACM with MP3 (standard)
  - ♦ Navigation ACM with HD Radio® and built-in single CD/DVD drive (optional)

        - Twelve speakers (1 speaker in each front door, one 2-way speaker in each rear door, 1 tweeter in each front door, 1 instrument panel speaker, 1 parcel shelf speaker, 2 parcel shelf-mounted subwoofers)
        - Audio DSP module
    - THX® A
        - AM/FM/CD ACM with MP3 (standard)
        - Navigation ACM with HD Radio® and built-in single CD/DVD drive (optional)
        - Fourteen speakers (1 speaker in each front door, one 2-way speaker in each rear door, 1 tweeter in each front door, one 3-way instrument panel speaker, 1 parcel shelf speaker, 2 parcel shelf-mounted subwoofers)
        - Audio DSP module

All audio systems include the following features:

- Speed sensitive volume
- Accessory delay
- MP3 capability
- Audio input jack

The following options are also available:

- Steering wheel controls
- Satellite radio
    - Provides satellite broadcast audio channels
- SYNC® System
    - Provides mobile phone and media device functionality with the vehicle audio system

AM/FM Antenna - Fusion

The antenna can be either an AM/FM antenna or a combination AM/FM/satellite radio antenna if the vehicle is equipped with satellite radio.

AM/FM Antenna - MKZ

The AM/FM antenna is located in the rear glass. It cannot be replaced separate from the rear glass.

Satellite Radio

The satellite radio system is comprised of the following:

- Satellite radio receiver built-in to the ACpan>
- Combination AM/FM/satellite radio antenna (Fusion)
- Standalone satellite radio antenna (MKZ)
- Satellite radio antenna cable

The satellite radio antenna is a stand-alone antenna on the MKZ, or is a combination AM/FM/satellite antenna on the Fusion. The satellite radio antenna cable connects the satellite radio antenna to the ACM .

The satellite radio antenna cable is not removable from the wiring harnesses.

Navigation System with HD Radio®

The navigation system consists of the following:

- Navigation ACM
- GPS antenna
- Satellite radio/ GPS splitter cable (part of the front satellite radio antenna cable)
- Microphone

The ACM controls the operation of the navigation system and the audio system. The system uses a GPS antenna, a vehicle speed input, and other sensor information to accurately establish the vehicle position.

SYNC® System

The SYNC® system consists of the following:

- APIM
- SYNC®-specific steering wheel controls
- Microphone
- USB port and cable
- Audio input jack

SYNC® is a hands-free communications and entertainment system that allows the following interactions:

- Send and receive phone calls via a Bluetooth-enabled phone
- Send and receive text messages via a Bluetooth-enabled phone
- Connect media devices (such as an iPod® or USB flash device) in order to play audio files
- Play media files via a Bluetooth-enabled audio device
- Produce vehicle health reports
- Initiate an emergency call (eCall) when the air bags deploy
- Provide hands-free access to traffic reports, turn-by-turn driving directions, business listings, news, sports, and weather

The GPSM works with the SYNC® system to provide vehicle location on vehicles not equipped with navigation, as the vehicle location must be known for the traffic, directions, and information features to operate correctly.

Not all features are available with every phone.

For additional information on audio system operation, including the SYNC® system, refer to the Owner's Literature.

Information and Entertainment System

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent
 ST3086-A	Multi-Media Interface Tester 105-00120
 ST3051-A	Universal Serial Bus (USB) Male-A To Male-A Cable CCMUSB2-AM-AM-10

Principles of Operation

Audio Front Control Module (ACM)

The Audio Front Control Module (ACM) can be operated with the key in RUN or ACC. The accessory delay feature allows the audio system to be operated for a preset period of time after the key is turned off and a front door has not been opened. The ACM sends AC voltage audio signals to the speakers or to the amplifiers, depending on vehicle configuration. The ACM can produce its own DTCs, which can be communicated to the scan tool through the Medium Speed Controller Area Network (MS-CAN).

Front Controls Interface Module (FCIM)

The Front Controls Interface Module (FCIM) acts as a customer interface with the audio system and the climate control system. When a switch is pressed, a message is broadcast over the MS-CAN . When a climate control switch is pressed, the HVAC module sends a message back to the FCIM to illuminate the correct switches to indicate the status of the climate control system.

Front Display Interface Module (FDIM)

For vehicles without navigation, the Front Display Interface Module (FDIM) is a stand-alone module. It receives messages for all of its displays, which include:

- Audio information
- Climate control fan speed and temperature setting
- Outside air temperature

- Compass heading

For vehicles with navigation, the FDIM is hardwired to the ACM . When the touchscreen is pressed, a signal is sent to the ACM , which acts on the signal either by changing the audio setting or by broadcasting a message via the MS-CAN to the module controlling the function that was selected. The audio system, navigation, and climate control video feed to the FDIM is provided by the ACM . If equipped with a rear view camera, the video feed for the camera is provided directly by the rear view camera.

Satellite Audio

The satellite radio antenna receives digital audio signals and sends them to the ACM through the satellite radio antenna cable.

Antenna â Fusion

The antenna receives AM/FM radio waves, and satellite radio signals (if equipped with satellite radio). All audio signals are sent to the ACM through the antenna cables.

Antenna â MKZ

The antenna receives both AM and FM radio waves. The antenna is built into the rear window glass. An antenna module is utilized to isolate the signals. The audio signals are then sent to the ACM through the AM/FM antenna cable. If equipped with satellite radio, the satellite radio antenna is mounted to the roof. It receives digital audio signals and sends them to the ACM .

SonyÂ® Sound

For vehicles with the SonyÂ® sound system, audio signals are sent from the ACM to the audio Digital Signal Processing (DSP) module, which processes the audio signals and sends them to all of the speakers. The audio DSP module uses internal software to produce an optimal sound environment. The audio DSP module communicates on the MS-CAN . Customer preference settings such as fade and balance are broadcast to the audio DSP module by the ACM .

THXÂ® Sound

For vehicles with the THXÂ® sound system, the audio DSP module provides theatre quality sound in the vehicle. Audio signals are sent from the ACM to the audio DSP module, which processes the audio signals and sends them to all of the speakers. An enable detection circuit is utilized for the amplifier (internal to the audio DSP module). The circuit turns the amplifier on. The audio DSP module communicates on the MS-CAN . Customer preference settings such as fade and balance are broadcast to the audio DSP module by the ACM .

Navigation System

The vehicle navigation system guides the user to a pre-entered destination. No navigation map DVD is needed, as the map guidance information is stored in the ACM hard-drive. The ACM calculates route information based on Global Positioning System (GPS) data. The ACM also uses vehicle speed and transmission gear selected signals received through the MS-CAN to detect vehicle speed and direction, resulting in more accurate navigation tracking.

The navigation display is shown on the FDIM . Either the FDIM touchscreen or the buttons on the FCIM can be used to interact with the navigation system.

The compass heading is derived from the GPS antenna signal. There are no serviceable parts for the compass.

A voice recognition system allows the user to interface with the system without using the touchscreen. A microphone provides the voice recognition input. The microphone is shared with the SYNCÂ® system.

Jukebox Feature

The navigation ACM contains a 10 gigabyte on-board hard drive that is capable of storing music ripped (recorded) from a music disc. The music can be loaded into the jukebox by inserting a disc (in the correct format) and following the on-screen instructions to load the music into the ACM . The jukebox cannot rip MP3 discs.

SYNCÂ® System

The SYNCÂ® system allows interaction with several types of customer devices, including mobile phones and media devices. The APIM contains an on-board Bluetooth chipset, which enables certain wireless devices to interact with the system.

The APIM consists of 2 internal modules: the Consumer Interface Processor (CIP) and the Vehicle Interface Processor (VIP). The modules are not replaceable individually, but can be flashed independently, if required.

The CIP interfaces with all of the inputs to the APIM . The CIP contains an analog-to-digital-to-analog converter, as well as the Bluetooth chipset. Any consumer-available application upgrades that are available are loaded directly to the CIP through the USB port.

The VIP provides an interface between the CIP and the vehicle. The main functions of the VIP are controlling the APIM power management and translating both inbound and outbound signals over the CAN .

The APIM can receive inputs from the following audio sources:

- USB port
- Audio input jack
- Bluetooth

The USB port can be used for connecting a media device (such as an iPodÂ®) with the device's available cable, or for directly plugging in a portable mass storage device (such as a "thumb drive"). When playing media files stored on a mass storage device, the SYNCÂ® system only plays files that do not have Digital Rights Management (DRM) protection. The USB port can also be used for uploading vehicle application upgrades.

The USB port is powered by the APIM , so no external power source is needed to power a device plugged into the USB port if the device supports this feature.

The audio input jack can be used for connecting a media device (such as an iPodÂ®) utilizing a 1/8-inch audio jack. When a device is connected through the audio input jack, only the speaker volume can be controlled by the ACM . All other functions (such as seek, fast forward, pause, etc.) must be carried out on the device itself.

The Bluetooth interface can accommodate both Bluetooth-enabled mobile phones and Bluetooth-enabled media devices. Any Bluetooth device used with the SYNCÂ® system must first be paired with the system before it is operational.

Bluetooth is a secure, short-range radio frequency that allows devices to communicate wirelessly through radio waves. The operating range of a Bluetooth signal is a maximum of 32 feet.

Only one Bluetooth phone and one Bluetooth media device can be connected to the system at any one time. If

an additional device of either type is paired with the system and made active, the APIM will disconnect any active connection and establish a connection with the new device.

It is important to understand that not all mobile phones will have the same level of features when interacting with the SYNCÂ® system. For a list of compatible phones, refer to the SyncMyRide website .

In addition to audio information, metadata may also be sent to the APIM from a device plugged into the USB port. Metadata consists of such information as artist, album title, song title, and genre. The metadata is used by the APIM to create indexes that can be used to sort for particular music, based on customer preference. Not all USB devices can send metadata to the APIM ; also, no metadata is transferred when a device is connected through the audio input jack. When a new media device is connected to the SYNCÂ® system, the APIM automatically indexes the information. This may take several minutes (depending on the amount of data on the device), and is considered normal operation. When a device that was previously connected to the SYNCÂ® system is reconnected, the APIM updates the index (rather than creating a new one), which reduces the amount of time needed to create the index.

The APIM receives both stereo and mono sound inputs, and can also transmit both stereo and mono sound. The mono function is used to receive the microphone input, and to send sound to the ACM for voice prompts, the Text-To-Speech (TTS) feature, ring tones, and any audio received through a connected mobile phone. The TTS feature speaks information so that it does not have to be read from the display.

The APIM communicates on the MS-CAN and High Speed Controller Area Network (HS-CAN). Communication with the scan tool is established through the HS-CAN .

Global Positioning System Module (GPSM)

The Global Positioning System Module (GPSM) provides vehicle location for real-time traffic reports and re-routing, and for identifying vehicle location in the event of a collision. The vehicle location information is broadcast to the APIM over the MS-CAN . The GPSM is part of the SYNCÂ® system and is only present for vehicles without navigation.

Voice Recognition For Vehicles With Navigation And The SYNCÂ® System

When the audio system enters voice recognition mode, the ACM initially controls the voice recognition feature. The microphone is wired directly to the APIM , which relays the microphone input to the ACM through dedicated wiring. If the first command spoken is part of the ACM voice recognition set, the ACM retains control of the voice recognition and takes the appropriate action(s). If the first command spoken is part of the APIM voice recognition set, the ACM shuts off its own voice recognition and broadcasts a Controller Area Network (CAN) message to the APIM , transferring the voice recognition to the SYNCÂ® system and providing the voice command that was spoken. The ACM controls the voice engine for the base audio, navigation, and climate control systems. The APIM controls the voice engine for the SYNCÂ® system (USB port, audio input jack, Bluetooth).

Steering Wheel Controls

The steering wheel controls consist of a series of resistors. Each steering wheel control switch function corresponds with a specific resistance value within the switch. When a switch is pressed, the ACM (or the APIM) monitors the change in reference voltage to determine the requested function.

Noise Suppression Equipment

The radio frequency suppression equipment reduces interference transmitted through the speakers by the engine ignition and electrical systems. When installing any new radio suppression equipment components, make sure that a good contact is made at all connections.

Audio Signals

Audio signal flow varies greatly depending on vehicle content.

Stereo signals contain left and right channel information, and are used for most audio signals.

A mono signal is used for the microphone input to the APIM . The mono signal is also used for the voice prompts, the TTS feature, ring tones, and any audio received through a connected mobile phone. These audio signals are output from the APIM to the ACM . The mono and stereo outputs from the APIM utilize separate circuits.

A digital signal is used to transmit data from a media device connected through the USB port to the APIM . The APIM then converts the signal to analog and relays the signal to the ACM .

A wireless signal is used to broadcast audio signals from a Bluetooth device to the APIM . As with a digital signal sent through the USB port, the APIM converts the wireless audio signal to analog and relays it to the ACM .

Network Communication

The following audio system components communicate via the MS-CAN :

- ACM
- Navigation ACM
- Audio DSP module (SonyÂ® sound)
- Audio DSP module (THXÂ® sound)
- FCIM
- FDIM (vehicles without navigation)
- APIM
- GPSM

There are numerous messages internal to the audio system. The functions of these messages include (but are not limited to):

- Changing the audio source
- Changing equalizer settings
- Updating the FDIM display
- Dialing phone numbers from the FCIM (if equipped with the SYNCÂ® system)

In addition, the following messages are utilized by the audio system in conjunction with systems outside of the audio system:

Audio System

Message	Transmitting Module	Receiving Module(s)	Audio System Function
Accelerometer and Yaw Sensor Data	Instrument Panel Cluster (IPC)	GPSM	Provides vehicle yaw rate to the GPSM for use in vehicle tracking.
Accessory Delay Status	SJB	ACM APIM	When active, this signal allows the audio component to be operated after the vehicle is shut off.

		FCIM FDIM	
Average Fuel Economy Data	IPC	ACM	Provides average fuel economy data to the ACM .
Belt-MinderÂ® Status	IPC	ACM	When this signal is active, the speaker output is reduced to allow the Belt-MinderÂ® tone to be more easily heard. This message only applies to vehicles with MyKey that have this feature currently enabled.
Climate Control Data (Hybrid only)	HVAC module	ACM	Provides the outside air temperature to the ACM .
Compass Display Status	IPC	FDIM	Indicates the compass heading or mode (calibration, zone). This message only applies to vehicles without navigation.
eCall Notification	Restraints Control Module (RCM)	APIM	Provides the eCall status to the APIM . This message is also used to confirm that the APIM and RCM are both configured for the eCall feature.
eCall Status	APIM	RCM	Provides the eCall status to the RCM . This message is also used to confirm that the APIM and RCM are both configured for the eCall feature.
English/Metric Mode	IPC	ACM	Indicates whether English or metric units is currently selected.
FCIM Button Press Data	FCIM	ACM APIM Audio DSP module IPC	Indicates when a button is pressed on the FCIM so the audio system can make the desired setting change.
Fuel Level (Instant)	IPC	APIM	Provides the instant fuel level to the APIM .
Historical Fuel Economy (Hybrid only)	IPC	ACM	Provides the historical fuel economy data to the ACM for display on the FDIM . This message only applies to vehicles with navigation.
HVAC Button Status (from ACM)	ACM	HVAC module	Indicates when a climate control setting is changed using the FDIM touchscreen (which is hardwired to the ACM) so the HVAC module can make the desired setting changes. This message only applies to vehicles with navigation.
HVAC Button Status (from FCIM)	FCIM	HVAC module	Indicates when a climate control button is pressed on the FCIM so the HVAC module can make the desired setting change.
HVAC Indicator Status (to ACM)	HVAC module	ACM	Indicates the mode of the HVAC module so the ACM can send the correct display information to the FDIM . This message only applies to vehicles with navigation.
HVAC Indicator Status (to FCIM)	HVAC module	FCIM	Indicates the mode of the HVAC module so the FCIM can illuminate the appropriate indicator on the bezel face.
	HVAC module		

HVAC Module Display Data		ACM (with navigation) FDIM (without navigation)	Indicates certain climate control settings such as temperature, fan speed, air distribution, and outside air temperature.
HVAC Voice Request	ACM	HVAC module	Provides climate control setting changes that are initiated through the voice recognition system. This message only applies to vehicles with navigation.
Ignition Switch Position	SJB	ACM APIM Audio DSP module FCIM FDIM GPSM	Indicates the ignition position to the audio system modules in order to control power management.
Instrument Illumination Level	SJB	ACM FCIM FDIM	Controls the backlight intensity, based on the position of the dimmer switch.
Navigation Rolling Wheel Count	IPC	ACM GPSM	Used by the ACM to more accurately track vehicle position when the GPS signal is temporarily unavailable. Used by the GPSM for vehicle tracking if the vehicle speed signal is lost.
Odometer Rolling Count	PCM	APIM	Provides the odometer reading to the APIM in order to initiate maintenance interval notifications.
Park Brake Status	SJB	ACM	Provides the park brake status to the ACM .
Parking Aid Sounder Volume Cutback Request	Parking Aid Module (PAM)	ACM	When this signal is active, the speaker output is reduced to allow the parking aid tone to be more easily heard.
Power Flow Status (Hybrid only)	IPC	ACM	Provides the approximate power flow data to the ACM for display on the FDIM . This message only applies to vehicles with navigation.
TPMS Status (Hybrid only)	SJB	APIM	Provides the current tire pressure and TPMS warning indicator status to the APIM .
Transmission Selector (PRNDL) Status	IPC	ACM GPSM	For the navigation system, this signal is used for more accurate navigation tracking. For the parking aid system, this signal is used by the ACM to determine if it should enable the speaker mute feature when a parking aid tone sounds. For vehicles with a rear view camera, this signal is used by the ACM to determine if it should allow the

			video feed from the rear view camera to be shown on the FDIM . For vehicles with the SYNCÂ® system but not navigation, this signal is used by the GPSM for more accurate vehicle tracking.
Vehicle Speed	IPC	ACM Audio DSP module GPSM	Used by the ACM (or audio DSP module) for the speed-compensated volume function. Used by the GPSM for vehicle tracking.
Vehicle Identification Number (VIN) Information	IPC	ACM APIM	Provides the VIN to verify the correct modules are installed.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Front Controls Interface Module (FCIM) • Front Display Interface Module (FDIM) • Antenna • Audio input jack • Noise suppression equipment • Speaker(s) • Steering wheel controls • Universal Serial Bus (USB) port	• Battery Junction Box (BJB) fuse(s): ♦ 20 (20A) (VBATT) ♦ 21 (20A) (VBATT) • Smart Junction Box (SJB) fuse(s): ♦ 13 (5A) (VBATT) ♦ 14 (10A) (VBATT) ♦ 19 (25A) (VBATT) ♦ 28 (5A) (START signal) ♦ 38 (20A) (VBATT) ♦ 39 (20A) (VBATT) ♦ 41 (15A) (Accessory delay) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. **NOTE:** Do not press any buttons on the FCIM or FDIM while the Audio Front Control Module (ACM) is carrying out the self-test.

   Clear the continuous DTCs and carry out the self-test diagnostics for the ACM .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, refer to the Symptom Charts.

DTC Charts

Pinpoint Tests

Pinpoint Test A: Poor Reception â AM/FM

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation â Fusion

The AM/FM antenna receives AM and FM radio waves and transmits them to the Audio Front Control Module (ACM) through the AM/FM antenna cable. The ACM powers the AM/FM antenna in order to amplify the AM signal.

MKZ

The AM/FM radio antenna, integral to the rear window, receives AM and FM radio waves. The antenna module sends the radio waves to the ACM through the AM/FM antenna cable.

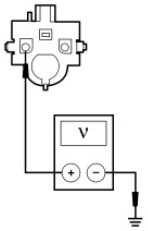
All Vehicles

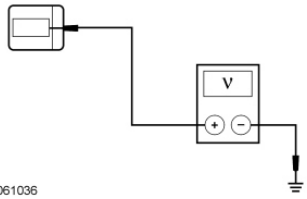
The noise suppression equipment reduces engine ignition and electrical systems interference transmitted through the speakers.

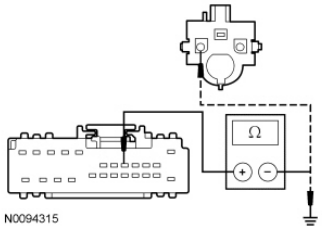
The RDS function allows the vehicle operator to choose which genre (category) of music to listen to. When the SCAN button is pressed, the ACM only stops at channels falling within the selected category. If no channel in the selected category is found, the ACM continues to scan without stopping. This may appear to be a reception issue, but it is actually due to the customer setting.

- DTC B1A56:21 (Antenna: Signal Amplitude â © Minimum) â sets when the signal strength is less than the pre-configured threshold value during the self-test.
- DTC B2103 (Antenna Not Connected) â sets when the signal strength is less than the pre-configured threshold value during the self-test. This DTC applies to base and mid-level sound only.

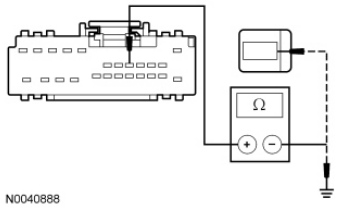
This pinpoint test is intended to diagnose the following:







- No channel found in the selected category
- Wiring, terminals or connectors
- AM/FM antenna
- AM/FM antenna cable
- Charging system
- Ignition system
- Noise suppression equipment
- Antenna module (MKZ only)
- ACM



PINPOINT TEST A: POOR RECEPTION â AM/FM

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE RDS SETTING	
• Turn the RDS function off. Refer to the Owner's Literature. • Scan for a good channel. • **Does the audio system find a good channel with normal reception?**	**Yes** The system is operating correctly at this time. The concern was a result of no channel being found in the selected category. **No** GO to A2 .
A2 CHECK THE AUDIO SYSTEM RECEPTION	
• Check the audio system reception with the engine running, and with the engine off. • **Does the poor reception only occur with the engine running?**	**Yes** GO to A3 . **No** GO to A7 .
A3 CHECK THE NOISE SUPPRESSION EQUIPMENT	

• Check the engine ground strap for security, cleanliness, and metal-to-metal contact. • **Are the connections clean, secure, and in metal-to-metal contact?**	**Yes** GO to A4 . **No** CLEAN and SECURE the connections, or INSTALL a new engine ground strap as needed. TEST the system for normal operation.
A4 CHECK THE RADIO INTERFERENCE CAPACITOR	
• Install a new radio interference capacitor. • Start the vehicle. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** The cause of the concern was an inoperative radio interference capacitor. The system is now operating correctly. **No** GO to A5 .
A5 CHECK THE GENERATOR	
• Ignition OFF. • Disconnect: Generator C102a . • Start the engine. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** INSTALL a new generator. REFER to Section 414-00 . TEST the system for normal operation. **No** GO to A6 .
A6 CHECK THE IGNITION CIRCUITS	
• Ignition OFF. • Connect: Generator C102a . • Check the ignition circuits for correct routing, grounding, and integrity of the connections. • **Are the ignition components OK?**	**Yes** USE a jumper cable to ground various parts of the vehicle to the frame (for example: engine, fenders, quarter panels, stone deflectors, air cleaner, body sheet metal). When the noise is eliminated, PROVIDE a permanent ground where necessary. TEST the system for normal operation. **No** REPAIR the ignition system as necessary. TEST the system for normal operation.
A7 CHECK THE AM/FM ANTENNA ENABLE CIRCUIT	
• Ignition OFF. • Disconnect: AM/FM Antenna C9021 (Fusion) . • Disconnect: Antenna Module C4194a (MKZ) . • Operate the audio system in radio tuner (AM/FM) mode. • For Fusion measure the voltage between the AM/FM antenna C9021-1, circuit CME44 (BU), harness side and ground.	**Yes** For Fusion GO to A11 . For MKZ, GO to A9 . **No** GO to A8 .

 N0094314 • For MKZ, measure the voltage between the antenna module C4194a-1, circuit CME44 (YE/GN), harness side and ground.  A0061036 • **Is the voltage greater than 10 volts?**	
A8 CHECK THE AM/FM ANTENNA ENABLE CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Disconnect: ACM C240a . • For Fusion, measure the resistance between the ACM C240a-5, circuit CME44 (YE/GN), harness side and the AM/FM antenna C9021-1, circuit CME44 (BU), harness side; and between the ACM C240a-5, circuit CME44 (YE/GN), harness side and ground.  N0094315 • For MKZ, measure the resistance between the ACM C240a-5, circuit CME44 (YE/GN), harness side and the antenna module C4194a-1, circuit CME44 (YE/GN), harness side; and between the ACM C240a-5, circuit CME44 (YE/GN), harness side and ground.	**Yes** GO to A13 . **No** REPAIR the circuit. TEST the system for normal operation.

 • **Is the resistance less than 5 ohms between the ACM and the AM/FM antenna (or antenna module), and greater than 10,000 ohms between the ACM and ground?**	
A9 CHECK THE ANTENNA GRID	
• Ignition OFF. • Inspect the antenna grid closely for signs of damage. • **Is the antenna grid OK?**	**Yes** GO to A10 . **No** REPAIR the antenna grid as necessary. REFER to Section 501-11 . TEST the system for normal operation.
A10 ISOLATE THE ANTENNA MODULE	
• Ignition OFF. • Install a new antenna module. Refer to Antenna Module in this section. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** The concern was caused by an inoperative antenna module. The system is now operating correctly. **No** GO to A12 .
A11 ISOLATE THE AM/FM ANTENNA	
• Ignition OFF. • Install a new AM/FM antenna. Refer to Antenna â AM/FM in this section. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** The concern was caused by an inoperative AM/FM antenna. The system is now operating correctly. **No** GO to A12 .
A12 ISOLATE THE AM/FM ANTENNA CABLE	
• Ignition OFF. • Substitute each AM/FM antenna cable by routing a new component. Do not remove the original antenna cable at this time. • Operate the audio system in radio tuner (AM/FM) mode. • **Is the reception OK?**	**Yes** INSTALL a new AM/FM antenna cable for the inoperative cable. REFER to Antenna Cable â AM/FM in this section. TEST the system for normal operation. **No** GO to A13 .
A13 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation.

♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: Poor Reception/Poor Sound Quality/No Sound â Satellite Radio

Normal Operation

Digital signals are received by the satellite radio antenna and sent to the Audio Front Control Module (ACM), as the satellite radio receiver is built-in to the ACM .

A short to ground in the satellite radio antenna typically has no effect on the antenna signal. However, an open in the antenna circuit results in no sound from the satellite radio system. A short to voltage in the antenna circuit can have varying effects on the system.

Obstructions to the antenna line of sight can affect reception, but this is considered normal operation. Possible obstructions include hills, tall buildings, tunnels, and being parked inside a garage. Be sure the vehicle is in a clear area, free of obstructions, before testing satellite radio reception.

DTC Description	Fault Trigger Conditions
• B1031 â SDARS Satellite Antenna Open	Sets when an open or high resistance is detected in the satellite antenna circuit. This DTC can be either continuous or on-demand.
• B1032 â SDARS Satellite Antenna Short	Sets when a short to ground is detected in the satellite antenna circuit. This DTC can be either continuous or on-demand.
• B1A89:01 â Satellite Antenna: General Electrical Failure	May set when any fault is detected in the satellite radio antenna circuit. This DTC can be either continuous or on-demand.
• B1A89:13 â Satellite Antenna: Circuit Open	Sets when an open is detected in the satellite radio antenna circuit. This DTC can be either continuous or on-demand.

This pinpoint test is intended to diagnose the following:

- Obstructions to the antenna line of sight
- No channel found in the selected category
- Satellite radio antenna
- Satellite radio antenna cable
- ACM

PINPOINT TEST B: POOR RECEPTION/POOR SOUND QUALITY/NO SOUND â SATELLITE RADIO

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE RECEPTION AND CATEGORY FILTER SETTING	
• Turn the category filter function off. For additional information, refer to the Owner's Literature. • Drive the vehicle to an open location, free of obstacles. • Scan for a good channel. • **Does the satellite audio system find a good channel with normal reception?**	**Yes** The system is operating correctly at this time. The concern was a result of no channel being found in the selected category. **No** GO to B2 .
B2 CHECK THE SATELLITE SIGNAL PID (SAT_SIG_STR)	
• Enter the following diagnostic mode on the scan tool: ACM DataLogger . • Monitor the ACM PID (SAT_SIG_STR). • **Does the PID indicate "No Signal"?**	**Yes** GO to B3 . **No** GO to Pinpoint Test I .
B3 CHECK THE SATELLITE RADIO ANTENNA CABLE RESISTANCE	
• Ignition OFF. • Disconnect: Satellite Radio Antenna Connection At ACM . • Disconnect: Satellite Radio Antenna Cable In-Line Connection At RH Kick Panel . • Disconnect: Satellite Radio Antenna Connection At Satellite Radio Antenna . • Measure the resistance of the front satellite radio antenna cable core between the ACM and the satellite radio antenna in-line connection; and between the front satellite radio antenna cable core and shield. • Measure the resistance of the rear satellite radio antenna cable core between the satellite radio antenna and the satellite radio antenna in-line connection; and between the rear satellite radio antenna cable core and shield. • **Is the resistance of each satellite radio antenna cable core less than 2 ohms, and the resistance between the core and shield of each satellite radio antenna cable greater than 10,000 ohms?**	**Yes** GO to B4 . **No** INSTALL a new front or rear satellite radio antenna cable. REFER to Antenna Cable â Satellite Radio in this section. CLEAR any DTCs present. TEST the system for normal operation.
B4 ISOLATE THE SATELLITE RADIO ANTENNA	
	Yes

• Install a new satellite radio antenna. Refer to Antenna â Satellite Radio in this section. • Operate the audio system in satellite radio mode. • **Is the reception OK?**	The concern was caused by an inoperative satellite radio antenna. The system is operating correctly at this time. CLEAR any DTCs present. **No** GO to B5 .
B5 CHECK FOR CORRECT ACM MODULE OPERATION	
• Ignition OFF. • Disconnect all the ACM module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM module connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM module. REFER to in Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: No Sound From One Or More Speakers (Not All Speakers) â Base, Mid-Level Sound

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

The Audio Front Control Module (ACM) directs audio signals to the speakers in the form of an AC voltage. The ACM provides internal circuit protection for shorts to ground or shorts to voltage.

A short to ground or short to voltage in the circuitry to one of the speakers can cause multiple speakers to lose sound due to the built-in overload protection feature of the ACM . In this case, a speaker fault DTC sets, and this pinpoint test should be followed to isolate the damaged circuit.

It should also be noted that when the ACM activates the built-in overload protection, DTC B1342 may also be set. The circuit failure must be repaired before DTC B1342 can be cleared.

The speaker walk test can be used to isolate a concern with a particular speaker. This can reduce the diagnostic steps necessary to isolate the concern. To carry out the speaker walk test, refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.

- DTC B2965 (Audio System Speaker Circuit Fault) â sets when a short to ground, short to voltage, or open is detected on any of the speaker circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Speaker
- ACM

PINPOINT TEST C: NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) â BASE, MID-LEVEL SOUND

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>

- **Is any voltage present?**

C7 CHECK THE SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between suspect speaker, harness side and the ACM , harness side; and between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LH front	C523-1 or C592a-1, then ground	C240a-8	VME07 (WH)
	C523-2 or C592a-2, then ground	C240a-21	RME07 (WH/BN)
RH front	C612-1 or C692a-1, then ground	C240a-11	VME10 (WH/VT)
	C612-2 or C692a-2, then ground	C240a-12	RME10 (WH/OG)
LH rear	C702-1, then ground	C240a-9	VME09 (WH/GN)
	C702-2, then ground	C240a-22	RME09 (BN/YE)
RH rear	C802-1, then ground	C240a-10	VME12 (BN/WH)
	C802-2, then ground	C240a-23	RME12 (BN/BU)

- **Are the resistances less than 5 ohms between the ACM and the suspect speaker, and greater than 10,000 ohms between the ACM and ground?**

Yes
GO to C8 .

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

C8 CHECK FOR CORRECT ACM OPERATION

- Disconnect all the ACM connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins

Yes
INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST

♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTC present.

Pinpoint Test D: No Sound From One Or More Speakers (Not All Speakers) â Premium Sound

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

The Audio Front Control Module (ACM) directs audio signals to the audio amplifier and to the subwoofer amplifier in the form of an AC voltage. The amplifiers boost the audio signals and send them to the speakers. The ACM provides internal circuit protection for shorts to ground or shorts to voltage.

A short to ground or short to voltage in the circuitry to one of the speakers may cause multiple speakers to lose sound due to the built-in overload protection feature of the ACM . In this case, a speaker fault DTC sets, and this pinpoint test should be followed to isolate the damaged circuit.

The speaker walk test can be used to isolate a concern with a particular speaker. This can reduce the diagnostic steps necessary to isolate the concern. To carry out the speaker walk test, refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.

To enable the amplifiers, the ACM sends voltage through individual enable/clip circuits. The circuits act as both an output (to enable the amplifier) and an input (to detect an overload condition). The voltage sent by the ACM passes through a variable resistor in each amplifier, then to ground. As the amplifier reaches maximum output, the resistance in the variable resistor decreases. This decreases the voltage drop, resulting in the ACM detecting a higher voltage on the enable/clip circuit. When the voltage reaches the clip threshold, the ACM clips the audio output signal to the amplifier (heard as distortion), in order to prevent damage to the amplifier and speakers.

The enable/clip status is based on the following voltages, as detected by the ACM :

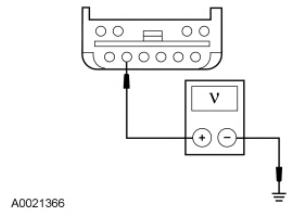
- Less than 0.4 volt: amplifier disabled
- Between 3.8 and 6.7 volts (nominal): amplifier enabled
- Greater than 8.5 volts: amplifier clipped

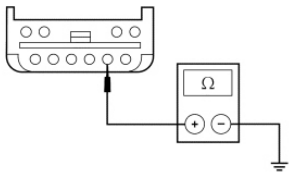
An open in the enable/clip circuit causes the speakers powered by that particular amplifier to produce no sound because the enable signal does not reach the audio amplifier. A short to ground or short to voltage can cause severe distortion to be heard in the speakers.

Root DTC Description	Failure-Type Codes	Fault Trigger Conditions
• B1A01 â	01, 11, 12, 13	Sets when a fault is detected in the LF speaker circuits. This DTC can be continuous or on-demand.

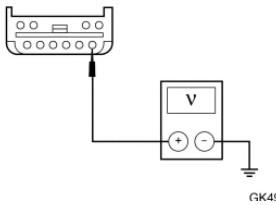
Speaker #1		
• B1A02 â Speaker #2	01, 11, 12, 13	Sets when a fault is detected in the RF speaker circuits. This DTC can be continuous or on-demand.
• B1A03 â Speaker #3	01, 11, 12, 13	Sets when a fault is detected in the RR speaker circuits. This DTC can be continuous or on-demand.
• B1A04 â Speaker #4	01, 11, 12, 13	Sets when a fault is detected in the LR speaker circuits. This DTC can be continuous or on-demand.
• B1A05 â Speaker #5	01, 02	Sets when a fault is detected in the subwoofer speaker circuits. This DTC can be continuous or on-demand.
• B1A06 â Speaker #6	01, 02	Sets when a fault is detected in the instrument panel speaker circuits. This DTC can be continuous or on-demand.

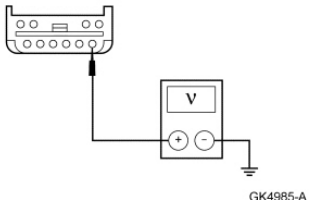
This pinpoint test is intended to diagnose the following:

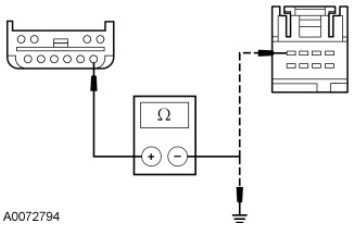




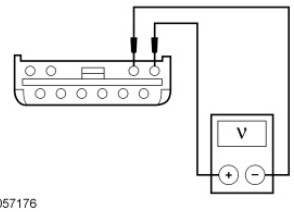
- Fuse
- Wiring, terminals or connectors
- Speaker
- Audio amplifier
- Subwoofer amplifier
- ACM

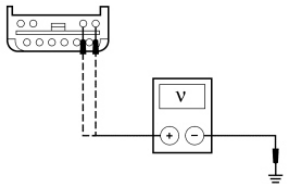






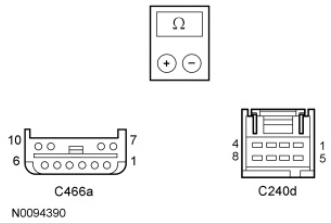
PINPOINT TEST D: NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) â PREMIUM SOUND





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

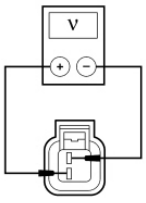


Test Step	Result / Action to Take
D1 DETERMINE THE INOPERATIVE SPEAKER(S)	
• Carry out the speaker walk test. Refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section. • **Is the concern only with the subwoofer speakers?**	**Yes** GO to D2 . **No** If the concern is only with a tweeter speaker, GO to D14 . For all other concerns, GO to

	D17 .
D2 DETERMINE THE INOPERATIVE SUBWOOFER	
• Operate the audio system in radio tuner (AM/FM) mode and observe the subwoofer operation. • **Do both of the subwoofers have a concern?**	**Yes** GO to D3 . **No** GO to D11 .
D3 CHECK THE SUBWOOFER AMPLIFIER VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: Subwoofer Amplifier C466a . • Measure the voltage between the subwoofer amplifier C466a-5, circuit SBP38 (BN/RD), harness side and ground.  A0021366 • **Is the voltage greater than 10 volts?**	**Yes** GO to D4 . **No** VERIFY the Smart Junction Box (SJB) fuse 38 (20A) is OK. If OK, REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
D4 CHECK THE SUBWOOFER AMPLIFIER GROUND CIRCUIT FOR CONTINUITY	
• Disconnect: Negative Battery Cable . • Measure the resistance between the subwoofer amplifier C466a-2, circuit GD148 (BK/YE), harness side and ground.  GK8801-A • **Is the resistance less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation.
D5 CHECK THE SUBWOOFER AMPLIFIER ENABLE CIRCUIT FOR CORRECT VOLTAGE	
• Connect: Negative Battery Cable . • Operate the audio system in radio tuner (AM/FM) mode. • Measure the voltage between the subwoofer amplifier C466a-1, circuit SME23 (VT/RD), harness side and ground.	**Yes** GO to D8 . **No** GO to D6 .

 • **Is the voltage between 3.8 and 6.7 volts?**	
D6 CHECK THE SUBWOOFER AMPLIFIER ENABLE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240d . • Ignition ON. • Measure the voltage between the subwoofer amplifier C466a-1, circuit SME23 (VT/RD), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to D7 .
D7 CHECK THE SUBWOOFER AMPLIFIER ENABLE CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the voltage between the subwoofer amplifier C466a-1, circuit SME23 (VT/RD), harness side and the ACM C240d-4, circuit SME23 (VT/RD), harness side and ground; and between the subwoofer amplifier C466a-1, circuit SME23 (VT/RD), harness side and ground.  • **Is the resistance less than 5 ohms between the subwoofer amplifier and the ACM , and greater than 10,000 ohms between the subwoofer amplifier and ground?**	**Yes** GO to D28 . **No** REPAIR the circuit. TEST the system for normal operation.
D8 CHECK THE AUDIO SIGNAL TO THE SUBWOOFER AMPLIFIER	

• Operate the audio system in radio tuner (AM/FM) mode. • Measure the AC voltage between the subwoofer amplifier C466a-7, circuit VME22 (VT/GN), harness side and the subwoofer amplifier C466a-8, circuit RME22 (GN/WH), harness side.  A0057176 • **Is a fluctuating AC voltage present?**	**Yes** INSTALL a new subwoofer amplifier. REFER to Subwoofer Amplifier in this section. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to D9 .
D9 CHECK THE AUDIO CIRCUITS TO THE SUBWOOFER AMPLIFIER FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Measure the voltage between the subwoofer amplifier C466a-7, circuit VME22 (VT/GN), harness side ground; and between the subwoofer amplifier C466a-8, circuit RME22 (GN/WH), harness side and ground.  N0035293 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to D10 .
D10 CHECK THE AUDIO CIRCUITS TO THE SUBWOOFER AMPLIFIER FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between the subwoofer amplifier, harness side and the ACM , harness side; and between the subwoofer amplifier, harness side and ground as follows:	**Yes** GO to D28 . **No** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.



Positive Meter Lead	Negative Meter Lead	Circuit
C466a-7	C240d-1, then ground	VME22 (VT/GN)
C466a-8	C240d-2, then ground	RME22 (GN/WH)

- **Is the resistance less than 5 ohms between the subwoofer amplifier and the ACM , and greater than 10,000 ohms between the subwoofer amplifier and ground?**

D11 CHECK THE AUDIO SIGNAL TO THE SUSPECT SUBWOOFER SPEAKER

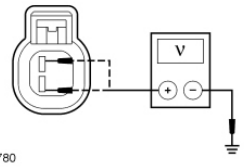
- Ignition OFF.
- Disconnect: Suspect Subwoofer Speaker .
- Ignition ON.
- Operate the audio system in radio tuner (AM/FM) mode.
- Measure the AC voltage between the LH subwoofer speaker C3120-1, circuit VME01 (GN/VT), harness side and the LH subwoofer speaker C3120-2, circuit RME01 (GY), harness side; or between the RH subwoofer speaker C3121-1, circuit VME02 (VT), harness side and the RH subwoofer speaker C3121-2, circuit RME02 (YE), harness side.

- **Is a fluctuating AC voltage present?**

Yes
INSTALL a new subwoofer speaker for the suspect speaker. REFER to Speaker â Subwoofer in this section. TEST the system for normal operation.

No
GO to D12 .

D12 CHECK THE AUDIO CIRCUITS TO THE SUSPECT SUBWOOFER SPEAKER FOR A SHORT TO VOLTAGE



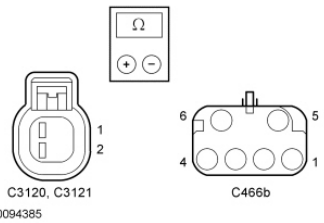
- Ignition OFF.
- Disconnect: Subwoofer Amplifier C466b .
- Ignition ON.
- Measure the voltage between the suspect subwoofer speaker, harness side and ground as follows:

Suspect Subwoofer Speaker	Positive Meter Lead	Negative Meter Lead
LH	C3120-1 VME01 (GN/VT)	C3120-2 RME01 (GY)
RH		

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to D13 .

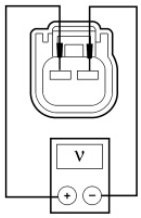
	C3121-1 VME02 (VT)	C3121-2 RME02 (YE)



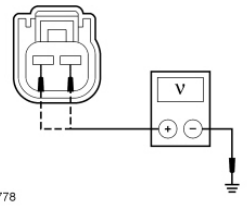
- **Is any voltage present?**

D13 CHECK THE AUDIO CIRCUITS TO THE SUSPECT SUBWOOFER SPEAKER FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the suspect subwoofer speaker, harness side and the subwoofer amplifier, harness side; and between the suspect subwoofer speaker, harness side and ground as follows:



Suspect Subwoofer Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
Subwoofer #1	C3120-1 C3120-2	C466b-1, then ground C466b-2, then ground	VME01 (GN/VT) RME01 (GY)
Subwoofer #2	C3121-1 C3121-2	C466b-3, then ground C466b-4, then ground	VME02 (VT) RME02 (YE)

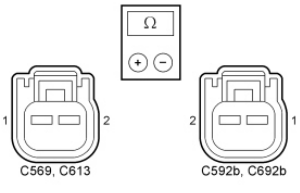


- **Is the resistance less than 5 ohms between the suspect subwoofer speaker and the subwoofer amplifier, and greater than 10,000 ohms between the suspect subwoofer**

Yes
INSTALL a new subwoofer amplifier. REFER to Subwoofer Amplifier in this section. TEST the system for normal operation.

No
REPAIR the circuit in question. TEST the system for normal operation.

speaker and ground?	
D14 CHECK FOR AN AUDIO SIGNAL TO THE SUSPECT TWEETER SPEAKER	
• Ignition OFF. • Disconnect: Suspect Tweeter Speaker . • Operate the audio system in radio tuner (AM/FM) mode. • Measure the AC voltage between the suspect tweeter speaker pin 1 and pin 2, harness side as follows: **Suspect Speaker** / **Positive Meter Lead** / **Negative Meter Lead** LH tweeter / C569-1 VME07 (WH) / C569-2 RME07 (WH/GN) RH tweeter / C613-1 VME11 (VT/OG) / C613-2 RME11 (YE/OG)  N0085777 • **Is a fluctuating AC voltage present?**	**Yes** INSTALL a new speaker for the suspect tweeter speaker. REFER to Speaker â Door in this section. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to D15 .
D15 CHECK THE CIRCUITS TO THE SUSPECT TWEETER SPEAKER FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: LF Door Speaker C592b (LH Speaker Concern) or RF Door Speaker C692b (RH Speaker Concern) . • Ignition ON. • Measure the voltage between the suspect tweeter speaker, harness side and ground as follows: **Suspect Tweeter Speaker** / **Positive Meter Lead** / **Negative Meter Lead** LH tweeter / C569-1 / VME07 (WH) LH tweeter / C569-2 / RME07 (WH/GN) RH tweeter / C613-1 / VME11 (VT/OG) RH tweeter / C613-2 / RME11 (YE/OG)	**Yes** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to D16 .

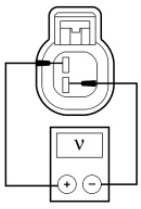


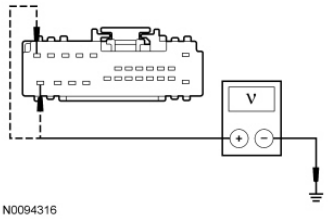
- **Is any voltage present?**

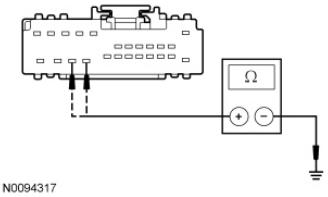
D16 CHECK THE CIRCUITS TO THE SUSPECT TWEETER SPEAKER FOR AN OPEN OR SHORT TO GROUND

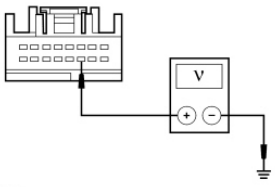
- Ignition OFF.
- Measure the resistance between the suspect tweeter speaker, harness side and the door speaker, harness side; and between the suspect tweeter speaker, harness side and ground as follows:

Suspect Tweeter Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LH tweeter	C569-1	C592b-1, then ground	VME07 (WH) or VME08 (GN/OG)
LH tweeter	C569-2	C592b-2, then ground	RME07 (WH/GN) or RME08 (GY/OG)
RH tweeter	C613-1	C692b-1, then ground	VME11 (VT/OG)
RH tweeter	C613-2	C692b-2, then ground	RME11 (YE/OG)

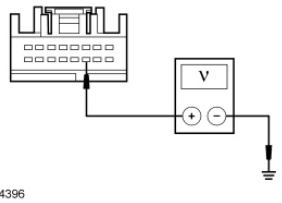


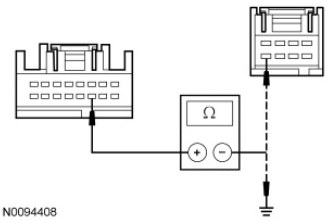






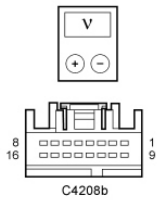
- **Is the resistance less than 5 ohms between the suspect tweeter speaker and the door speaker, and greater than 10,000 ohms between the suspect tweeter speaker and ground?**





Yes
INSTALL a new door speaker. REFER to Speaker â Door in this section. CLEAR any DTCs present. TEST the system for normal operation.

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.



D17 CHECK THE AUDIO SIGNALS TO THE SUSPECT SPEAKER

• Ignition OFF. • Disconnect: Suspect Speaker . • Operate the audio system in radio tuner (AM/FM) mode. • Measure the AC voltage between the suspect speaker pins, harness side as follows: **Suspect Speaker** / **Positive Meter Lead** / **Negative Meter Lead** LF door: C592a-1 VME07 (WH) / C592a-2 RME07 (WH/BN) RF door: C692a-1 VME10 (WH/VT) / C692a-2 RME10 (WH/OG) LR door: C702-1 VME09 (WH/GN) / C702-2 RME09 (BN/YE) RR door: C802-1 VME12 (BN/WH) / C802-2 RME12 (BN/BU) Instrument panel: C2363-1 VME06 (GN) / C2363-2 RME06 (GY/YE)  N0085779 • **Is a fluctuating AC voltage present?**	**Yes** INSTALL a new speaker for the suspect speaker. REFER to Speaker â Door in this section. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to D18 .
D18 CHECK THE AUDIO AMPLIFIER VOLTAGE	
• Ignition OFF. • Disconnect: Audio Amplifier C4208a . • Measure the voltage between the audio amplifier C4208a-12, circuit SBB20 (GN/RD), harness side and ground; and between the audio amplifier C4208a-24, circuit SBB21 (GY/RD), harness side and ground.	**Yes** GO to D19 . **No** VERIFY the Smart Junction Box (SJB) fuses 20 (20A) and 21 (20) are OK. If OK, REPAIR the circuit in question. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

 N0094316 • **Are the voltages greater than 10 volts?**	
D19 CHECK THE AUDIO AMPLIFIER GROUND CIRCUITS FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the audio amplifier C4208a-21, circuit GD148 (BK/YE), harness side and ground; and between the audio amplifier C4208a-22, circuit GD148 (BK/YE), harness side and ground.  N0094317 • **Are the resistances less than 5 ohms?**	**Yes** GO to D20 . **No** REPAIR the circuit in question. TEST the system for normal operation.
D20 CHECK THE AUDIO AMPLIFIER ENABLE CIRCUIT FOR CORRECT VOLTAGE	
• Ignition OFF. • Connect: Audio Amplifier C4208a . • Disconnect: Audio Amplifier C4208b . • Operate the audio system in radio tuner (AM/FM) mode. • Measure the voltage between the audio amplifier C4208b-11, circuit SME56 (BN), harness side and ground.  N0094396 • **Is the voltage between 3.8 and 6.7 volts?**	**Yes** GO to D23 . **No** GO to D21 .
D21 CHECK THE AUDIO AMPLIFIER ENABLE CIRCUIT FOR A SHORT VOLTAGE	

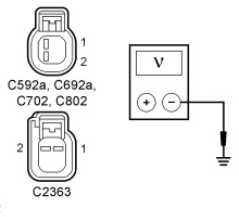
• Ignition OFF. • Connect: ACM C240d . • Ignition ON. • Measure the voltage between the audio amplifier C4208b-11, circuit SME56 (BN), harness side and ground.  N0094396 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to D22 .
D22 CHECK THE AUDIO AMPLIFIER ENABLE CIRCUIT FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the audio amplifier C4208b-11, circuit SME56 (BN), harness side and the ACM C240d-8, circuit SME56 (BN), harness side; and between the audio amplifier C4208b-11, circuit SME56 (BN), harness side and ground.  N0094408 • **Is the resistance less than 5 ohms between the audio amplifier and the ACM , and greater than 10,000 ohms between the audio amplifier and ground?**	**Yes** GO to D28 . **No** REPAIR the circuit. TEST the system for normal operation.
D23 CHECK THE AUDIO SIGNALS TO THE AUDIO AMPLIFIER	
• Connect: Audio Amplifier C4208a . • Disconnect: Audio Amplifier C4208b . • Ignition ON. • Operate the audio system in radio tuner (AM/FM) mode. • Measure the AC voltage between the audio amplifier pins, harness side as follows: **Suspect Speaker** / **Positive Meter Lead** / **Negative Meter Lead** LF door	**Yes** GO to D24 . **No** GO to D26 .

	C4208b-2 VME07 (WH)	C4208b-3 RME07 (WH/BN)
RF door	C4208b-1 VME10 (WH/VT)	C4208b-9 RME10 (WH/OG)
LR door	C4208b-6 VME09 (WH/GN)	C4208b-7 RME09 (BN/YE)
RR door	C4208b-5 VME12 (BN/WH)	C4208b-4 RME12 (BN/BU)
Instrument panel	C4208b-15 VME51 (BN/BU)	C4208b-14 RME51 (WH/BU)

N0104310

- **Is any voltage present?**

D24 CHECK THE SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE



- Ignition OFF.
- Connect: Audio Amplifier C4208b .
- Disconnect: Audio Amplifier C4208a .
- Ignition ON.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Yes
REPAIR the circuit in question.
TEST the system for normal operation.

No
GO to D25 .

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LF door	C592a-1 VME07 (WH)	Ground
	C592a-2 RME07 (WH/BN)	Ground
RF door	C692a-1 VME10 (WH/VT)	Ground
	C692a-2	Ground

	RME10 (WH/OG)	
LR door	C702-1 VME09 (WH/GN)	Ground
	C702-2 RME09 (BN/YE)	Ground
RR door	C802-1 VME12 (BN/WH)	Ground

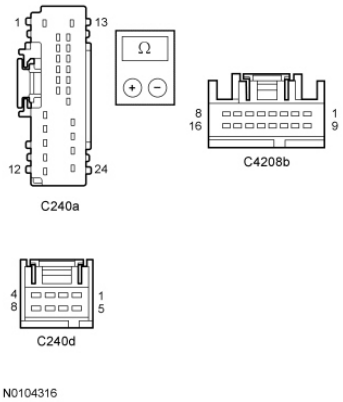
N0104311

- **Is any voltage present?**

D27 CHECK THE AUDIO CIRCUITS TO THE AUDIO AMPLIFIER FOR AN OPEN OR SHORT TO GROUND



- Ignition OFF.
- Measure the resistance between the ACM , harness side and the audio amplifier, harness side; and between the ACM , harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LF door	C240a-8	C4208b-2, then ground	VME07 (WH)

Yes
GO to D28 .

No
REPAIR the circuit in question.
CLEAR any DTCs present.
TEST the system for normal operation.

	C240a-21	C4208b-3, then ground	RME07 (WH/BN)
RF door	C240a-11	C4208b-1, then ground	VME10 (WH/VT)
	C240a-12	C4208b-9, then ground	RME10 (WH/OG)
LR door	C240a-9	C4208b-6, then ground	VME09 (WH/GN)
	C240a-22	C4208b-7, then ground	RME09 (BN/YE)
RR door	C240a-10	C4208b-5, then ground	VME12 (BN/WH)
	C240a-23	C4208b-4, then ground	RME12 (BN/BU)
Instrument panel	C240d-6	C4208b-15, then ground	VME51 (BN/BU)
	C2407-2	C4208b-14, then ground	RME51 (WH/BU)

- **Are the resistances less than 5 ohms between the audio amplifier and the suspect speaker, and greater than 10,000 ohms between the audio amplifier and ground?**

D28 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any

	DTCs present.

Pinpoint Test E: No Sound From One Or More Speakers (Not All Speakers) â SonyÂ® Sound

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

The Audio Front Control Module (ACM) directs the audio signals to the audio Digital Signal Processing (DSP) module in the form of an AC voltage. The audio DSP module boosts the audio signals and sends them to the speakers. The audio DSP module provides internal circuit protection for shorts to ground or shorts to voltage.

A short to ground or short to voltage in the circuit to one of the speakers may cause multiple speakers to lose sound due to the built-in overload protection feature of the audio DSP module. In this case, a speaker fault DTC sets, and this pinpoint test should be followed to isolate the damaged circuit.

The ACM sends the audio signals to the audio DSP module in the following banks:

Speaker Bank	Speakers
LH front (without navigation)	All LH speakers
LH front (navigation)	LF door, LF tweeter, LH instrument panel
RH front (without navigation)	All RH speakers
RH front (navigation)	RF door, RF tweeter, RH instrument panel
LH rear (navigation)	LR door
RH rear (navigation)	RR door
Center imaging (navigation)	Center instrument panel, LH parcel shelf, RH parcel shelf
Subwoofer (navigation)	Subwoofer #1, subwoofer #2

For vehicles with navigation, it is also important to note that if the navigation voice guidance setting is set too low, it may appear that the front speakers intermittently produce no sound. Make sure the voice guidance setting is set high enough to hear the voice guidance commands before addressing a concern with the front speakers.

The speaker walk test can be used to isolate a concern with a particular speaker. This can reduce the diagnostic steps necessary to isolate the concern. To carry out the speaker walk test, refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.

Root DTC Description	Failure-Type Codes	Fault Trigger Conditions
• B1A01 â	01, 11, 12, 13	Set by the audio DSP module when a failure is detected in the center front imaging speaker (part of the instrument panel speaker) circuit.

Speaker #1		
• B1A02 â Speaker #2	01, 11, 12, 13	Set by the audio DSP module when a failure is detected in the LH front door speaker circuit.
• B1A03 â Speaker #3	01, 11, 12, 13	Set by the audio DSP module when a failure is detected in the LH tweeter circuit.
• B1A04 â Speaker #4	01, 11, 12, 13	Set by the audio DSP module when a failure is detected in the LH rear door speaker circuit.
• B1A05 â Speaker #5	01, 11, 12, 13	Set by the audio DSP module when a failure is detected in the parcel shelf speaker circuit.
• B1A06 â Speaker #6	01, 11, 12, 13	Set by the audio DSP module when a failure is detected in the RH front door speaker circuit.
• B1A07 â Speaker #7	11, 12, 13	Set by the audio DSP module when a failure is detected in the RH tweeter circuit.
• B1A08 â Speaker #8	11, 12, 13	Set by the audio DSP module when a failure is detected in the RH rear door speaker circuit.
• B1A09 â Speaker #9	11, 12, 13	Set by the audio DSP module when a failure is detected in the RH subwoofer circuit.
• B1A10 â Speaker #10	11, 12, 13	Set by the audio DSP module when a failure is detected in the LH subwoofer circuit.

This pinpoint test is intended to diagnose the following:

- Fuse

- Wiring, terminals or connectors
- Speaker
- Audio DSP module
- ACM

PINPOINT TEST E: NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) â SONYÂ® SOUND

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
E1 CHECK FOR AN AUDIO SIGNAL TO THE SUSPECT SPEAKER	
• Ignition OFF. • Disconnect: Suspect Speaker. • Operate the audio system in radio tuner (AM/FM) mode. • Measure the AC voltage between the suspect speaker pins, harness side as follows:	**Yes** INSTALL a new speaker for the suspect speaker. REFER to the appropriate removal and installation procedure in this section. TEST the system for normal operation. **No** GO to E2 .

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LH front door	C523-1 VME07 (WH)	C523-2 RME07 (WH/BN)
RH front door	C612-1 VME10 (WH/VT)	C612-2 RME10 (WH/OG)
LH rear door	C702-1 VME09 (WH/GN)	C702-2 RME09 (BN/YE)
RH rear door	C802-1 VME12 (BN/WH)	C802-2 RME12 (BN/BU)
Instrument panel speaker	C2359-1 VME06 (GN)	C2359-2 RME06 (GY/YE)
LH tweeter		

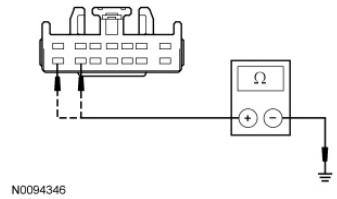
	C591-1 VME08 (GN/OG)	C591-2 RME08 (GY/OG)
RH tweeter	C691-1 VME11 (VT/OG)	C691-2 RME11 (YE/OG)
Rear center speaker	C3306-1 VME30 (GN/BN)	C3306-2 RME30 (VT/BN)
LH Subwoofer	C3120-1 VME01 (GN/VT)	C3120-2 RME01 (GY)
RH Subwoofer	C3121-1 VME02 (VT)	C3121-2 RME02 (YE)

- **Is a fluctuating AC voltage present?**

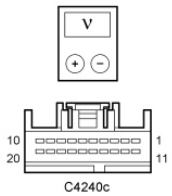
E2 CHECK THE AUDIO DSP MODULE VOLTAGE SUPPLY

- Ignition OFF.
- Disconnect: Audio DSP Module C4240a.
- Measure the voltage between the audio DSP module, harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead
C4240a-5 SBP19 (BU/RD)	Ground
C4240a-6 SBP19 (BU/RD)	Ground



- **Are the voltages greater than 10 volts?**



Yes
GO to E3 .

No
VERIFY the Battery Junction Box (BJB) fuse 19 (25A) is OK. If OK, REPAIR the circuit in question. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

E3 CHECK THE AUDIO DSP MODULE GROUND CIRCUITS FOR CONTINUITY

• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the audio amplifier, harness side and ground as follows: **Positive Meter Lead** / **Negative Meter Lead** C4240a-13 GD148 (BK/YE) — Ground C4240a-14 GD148 (BK/YE) — Ground  N0094346 • **Are the resistances less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR the circuit in question. TEST the system for normal operation.
E4 CHECK FOR AN AUDIO SIGNAL AT THE AUDIO DSP MODULE	
• Ignition OFF. • Connect: Audio DSP Module C4240a. • Disconnect: Audio DSP Module C4240c. • Operate the audio system in radio tuner (AM/FM) mode. • Measure the AC voltage between the audio DSP module pins, harness side as follows: **Suspect Speaker** / **Positive Meter Lead** / **Negative Meter Lead** LH front door or LH tweeter — C4240c-7 VME07 (WH) — C4240c-17 RME07 (WH/BN) RH front door or RH tweeter — C4240c-9 VME10 (WH/VT) — C4240c-19 RME10 (WH/OG) LH rear door — C4240c-8 VME09 — C4240c-18 RME09	**Yes** GO to E5 . **No** GO to E7 .

	(WH/GN)	(BN/YE)
RH rear door	C4240c-10 VME12 (BN/WH)	C4240c-20 RME12 (BN/BU)
Instrument panel or rear center	C4240c-6 VME51 (BN/BU)	C4240c-16 RME51 (WH/BU)
Subwoofer	C4240c-5 VME22 (VT/GN)	C4240c-15 RME22 (GN/WH)

N0102366

- **Is a fluctuating AC voltage present?**

E5 CHECK THE SPEAKER CIRCUITS FOR A SHORT TO VOLTAGE

- Ignition OFF.
- Connect: Audio DSP Module C4240c.
- Disconnect: Audio DSP Module C4240b (Except Subwoofer Concern).
- Disconnect: Audio DSP Module C4240a (Subwoofer Concern).
- Ignition ON.
- Measure the voltage between the suspect speaker, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead
LH front door	C591-1 VME08 (GN/OG)	Ground
	C591-2 RME08 (GY/OG)	Ground
RH front door	C612-1	Ground

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to E6 .

	VME10 (WH/VT)	
	C612-2 RME10 (WH/OG)	Ground
LH rear door	C702-1 VME09 (WH/GN)	Ground
	C702-2 RME09 (BN/YE)	Ground
RH rear door	C802-1 VME12 (BN/WH)	Ground
	C802-2 RME12 (BN/BU)	Ground
Instrument panel	C2359-1 VME06 (GN)	Ground
	C2359-2 RME06 (GY/YE)	Ground
LH tweeter	C591-1 VME08 (GN/OG)	Ground
	C591-2 RME08 (GY/OG)	Ground
RH tweeter	C691-1 VME11 (VT/OG)	Ground
	C691-2 RME11 (YE/OG)	Ground
Rear center speaker	C3306-1 VME30 (GN/BN)	Ground
	C3306-2	Ground

	RME30 (VT/BN)	
LH subwoofer	C3120-1 VME01 (GN/VT)	Ground
	C3120-2 RME01 (GY)	Ground
RH subwoofer	C3121-1 VME02 (VT)	Ground
	C3121-2 RME02 (YE)	Ground

- **Is any voltage present?**

E6 CHECK THE SPEAKER CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the audio DSP module, harness side and the suspect speaker, harness side; and between the audio DSP module, harness side and ground as follows:

Suspect Speaker	Positive Meter Lead	Negative Meter Lead	Circuit
LH front door	C4240b-2	C523-1, then ground	VME07 (WH)
	C4240b-10	C523-2, then ground	RME07 (WH/BN)
RH front door	C4240b-6	C612-1, then ground	VME10 (WH/VT)
	C4240b-14	C612-2, then ground	RME10 (WH/OG)
LH rear door	C4240b-4	C702-1, then ground	VME09 (WH/GN)
	C4240b-12	C702-2, then ground	RME09 (BN/YE)
RH rear door	C4240b-8		

Yes
GO to E10 .

No
REPAIR the circuit in question. TEST the system for normal operation.

		C802-1, then ground	VME12 (BN/WH)
	C4208b-16	C802-2, then ground	RME12 (BN/BU)
Instrument panel	C4240b-1	C2359-1, then ground	VME06 (GN)
	C4240b-9	C2359-2, then ground	RME06 (GY/YE)
LH tweeter	C4240b-3	C591-1, then ground	VME08 (GN/OG)
	C4240b-11	C591-2, then ground	RME08 (GY/OG)
RH tweeter	C4240b-7	C691-1, then ground	VME11 (VT/OG)

N0102370

- **Are the resistances less than 5 ohms between the audio DSP module and the ACM and greater than 10,000 ohms between the audio DSP module and ground?**

E9 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.
E10 CHECK FOR CORRECT AUDIO DSP MODULE OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors. • Disconnect all the audio DSP module connectors.	**Yes** INSTALL a new audio DSP module. REFER to Audio Digital Signal Processing (DSP) Module in this section.

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the audio DSP module connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test F: No Sound From One Or More Speakers (Not All Speakers) â THXÂ® Sound

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

The Audio Front Control Module (ACM) directs the audio signals to the audio Digital Signal Processing (DSP) module in the form of an AC voltage. The audio DSP module boosts the audio signals and sends them to the speakers. The audio DSP module provides internal circuit protection for shorts to ground or shorts to voltage.

A short to ground or short to voltage in the circuit to one of the speakers may cause multiple speakers to lose sound due to the built-in overload protection feature of the audio DSP module. In this case, a speaker fault DTC sets, and this pinpoint test should be followed to isolate the damaged circuit.

The ACM sends the audio signals to the audio DSP module in the following banks:

Speaker Bank	Speakers
LH front (without navigation)	All LH speakers
LH front (navigation)	LF door, LF tweeter, LH instrument panel
RH front (without navigation)	All RH speakers
RH front (navigation)	RF door, RF tweeter, RH instrument panel
LH rear (navigation)	LR door
RH rear (navigation)	RR door
Center imaging (navigation)	Center instrument panel, LH parcel shelf, RH parcel shelf
Subwoofer (navigation)	Subwoofer #1, subwoofer #2

For vehicles with navigation, it is also important to note that if the navigation voice guidance setting is set too low, it may appear that the front speakers intermittently produce no sound. Make sure the voice guidance setting is set high enough to hear the voice guidance commands before addressing a concern with the front speakers.

The speaker walk test can be used to isolate a concern with a particular speaker. This can reduce the diagnostic steps necessary to isolate the concern. To carry out the speaker walk test, refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.

Root DTC Description	Failure-Type Codes	Fault Trigger Conditions
• B1A01 â Speaker #1	01, 11, 12, 13	Set by the ACM when a fault is detected in the LF speaker output circuits, or by the audio DSP module when a failure is detected in the LH front imaging speaker (part of the instrument panel speaker) circuit.
• B1A02 â Speaker #2	01, 11, 12, 13	Set by the ACM when a fault is detected in the RF speaker output circuits, or by the audio DSP module when a failure is detected in the center front imaging speaker (part of the instrument panel speaker) circuit.
• B1A03 â Speaker #3	01, 11, 12, 13	Set by the ACM when a fault is detected in the RR speaker output circuits, or by the audio DSP module when a failure is detected in the RH front imaging speaker (part of the instrument panel speaker) circuit.
• B1A04 â Speaker #4	01, 11, 12, 13	Set by the ACM when a fault is detected in the LR speaker output circuits, or by the audio DSP module when a failure is detected in the LH front door tweeter circuit.
• B1A05 â Speaker #5	01, 11, 12, 13	Set by the ACM when a fault is detected in the subwoofer output circuits, or by the audio DSP module when a failure is detected in the RH front door tweeter circuit.
• B1A06 â Speaker #6	01, 11, 12, 13	Set by the ACM when a fault is detected in the instrument panel speaker output circuits, or by the audio DSP module when a failure is detected in the parcel shelf speaker circuit.
• B1A07 â Speaker #7	11, 12, 13	Set by the audio DSP module when a failure is detected in the LH front door speaker circuit.
• B1A08 â Speaker #8	11, 12, 13	Set by the audio DSP module when a failure is detected in the RH front door speaker circuit.
• B1A09 â Speaker #9	11, 12, 13	Set by the audio DSP module when a failure is detected in the LH rear door speaker circuit.
• B1A10 â Speaker #10	11, 12, 13	Set by the audio DSP module when a failure is detected in the RH subwoofer circuit.
• B1A11 â Speaker #11	11, 12, 13	Set by the audio DSP module when a failure is detected in the LH subwoofer circuit.
• B1A12 â Speaker #12	11, 12, 13	Set by the audio DSP module when a failure is detected in the RH rear door speaker circuit.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Speaker

- Audio DSP module
- ACM

PINPOINT TEST F: NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) â THXÂ® SOUND

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

N0102376

- **Are the resistances less than 5 ohms between the ACM and the audio DSP module, and greater than 10,000 ohms between the ACM and ground?**

F9 CHECK FOR CORRECT AUDIO DSP MODULE OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors . • Disconnect all the audio DSP module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the audio DSP module connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new audio DSP module. REFER to Audio Digital Signal Processing (DSP) Module in this section. CLEAR any DTCs present. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.
F10 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF.	**Yes** INSTALL a new ACM . REFER to

• Connect: All Disconnected Connectors . • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	Audio Control Module (ACM) â MKZ in this section. CLEAR any DTCs present. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test G: No Sound From All Speakers

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation â All Vehicles

When the ignition is in the START position, voltage is supplied to the Audio Front Control Module (ACM) through the START sense circuit. When the ACM receives this voltage, it mutes the speaker output.

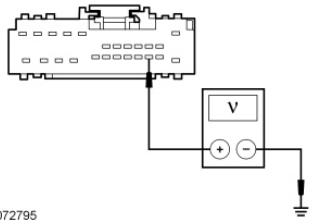
Vehicles With SonyÂ® Sound or THXÂ® Sound

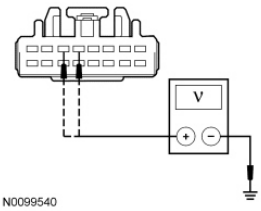
The ACM mutes the speaker output by removing the enable voltage to the audio Digital Signal Processing (DSP) module when the ignition is in the START position to prevent popping in the speakers as a result of voltage spikes during engine cranking. However, if there is a short to voltage on the enable circuit, the ACM continuously mutes the audio output, resulting in no sound from all speakers.

To enable the audio DSP module, the ACM sends voltage through the enable circuit. The enable status is based on the following voltage, as detected by the ACM :

- Less than 0.4 volt: amplifier disabled
- Between 3.8 and battery voltage: amplifier enabled

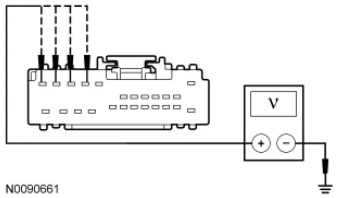
An open in the enable circuit causes the audio system to produce no sound because the enable signal does not reach the audio DSP module.





This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Audio DSP module (SonyÂ® sound, THXÂ® sound)
- ACM

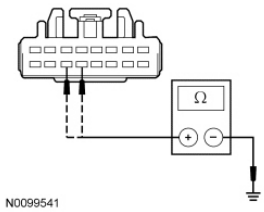


PINPOINT TEST G: NO SOUND FROM ALL SPEAKERS

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
G1 CHECK THE START SENSE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240a . • Ignition ON. • Measure the voltage between the ACM C240a-15, circuit CBP28 (GY/VT), harness side and ground.  A0072795 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** For SonyÂ® and THXÂ® sound systems, GO to G2 . For all other sound systems, GO to G7 .
G2 CHECK THE AUDIO DSP MODULE VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: Audio DSP Module C4240a (SonyÂ® Sound) or C4235a (THXÂ® Sound) . • For SonyÂ® sound, measure the voltage between the audio DSP module C4240a-5, circuit SBP19 (BU/RD), harness side and ground; and between the audio DSP module C4240a-6, circuit SBP19 (BU/RD), harness side and ground.  N0099540 • For THXÂ® sound, measure the voltage between the audio DSP module, harness side and ground as follows: **Positive Meter Lead** / **Negative Meter Lead** / **Circuit** C4235a-9 / Ground / SBB20 (GN/RD) C4235a-10 / Ground / SBB20 (GN/RD)	**Yes** GO to G3 . **No** VERIFY the Smart Junction Box (SJB) fuse 19 (25A) (SonyÂ®), or Battery Junction Box (BJB) fuses 20 (20A) and 21 (20A) (THXÂ®) are OK. If OK, REPAIR the circuit in question. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

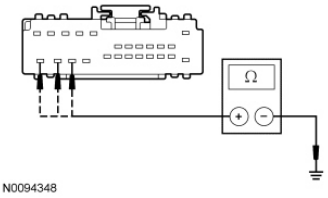


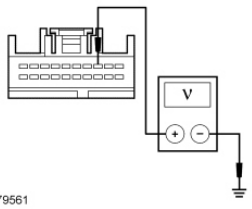
C4235a-11	Ground	SBB21 (GY/RD)
C4235a-12	Ground	SBB21 (GY/RD)

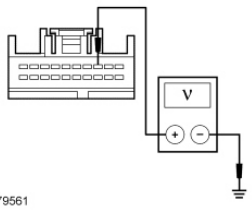
- **Are the voltages greater than 10 volts?**

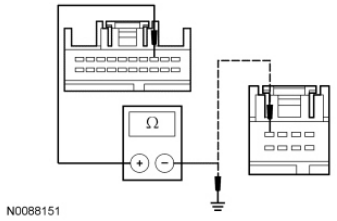
G3 CHECK THE AUDIO DSP MODULE GROUND CIRCUITS FOR CONTINUITY

- Disconnect: Negative Battery Cable .
- For SonyÂ® sound, measure the resistance between the audio DSP module C4240a-13, circuit GD148 (BK/YE), harness side and ground; and between the audio DSP module C4240a-14, circuit GD148 (BK/YE), harness side and ground.









- For THXÂ® sound, measure the resistance between the audio DSP module, harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C4235b-22	Ground	GD148 (BK/YE)
C4235b-23	Ground	GD148 (BK/YE)
C4235b-24	Ground	GD148 (BK/YE)

Yes
GO to G4 .

No
REPAIR the circuit in question. TEST the system for normal operation.

 N0094348 • **Are the resistances less than 5 ohms?**	
G4 CHECK THE AUDIO DSP MODULE ENABLE CIRCUIT FOR CORRECT VOLTAGE	
• Connect: Negative Battery Cable . • Connect: Audio DSP Module C4240a (SonyÂ® Sound) or C4235a (THXÂ® Sound) . • Disconnect: Audio DSP Module C4240c (SonyÂ® Sound) or C4235c (THXÂ® Sound) . • Operate the audio system in radio tuner (AM/FM) mode. • Measure the voltage between the audio DSP module C4240c-3 (SonyÂ® sound) or C4235c-3 (THXÂ® sound), circuit SME23 (VT/RD), harness side and ground.  N0079561 • **Is the voltage between 3.8 and 6.7 volts?**	**Yes** GO to G8 . **No** GO to G5 .
G5 CHECK THE AUDIO DSP MODULE ENABLE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240d . • Ignition ON. • Measure the voltage between the audio DSP module C4240c-3 (SonyÂ® sound) or C4235c-3 (THXÂ® sound), circuit SME23 (VT/RD), harness side and ground.  N0079561 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to G6 .
G6 CHECK THE AUDIO DSP MODULE ENABLE CIRCUIT FOR AN OPEN OR SHORT TO GROUND	

• Ignition OFF. • Measure the resistance between the audio DSP module C4240c-3 (SonyÂ® sound) or C4235c-3 (THXÂ® sound), circuit SME23 (VT/RD), harness side and the ACM C240d-4, circuit SME23 (VT/RD), harness side; and between the audio C4240c-3 (SonyÂ® sound) or C4235c-3 (THXÂ® sound), circuit SME23 (VT/RD), harness side and ground.  N0088151 • **Is the resistance less than 5 ohms between the audio DSP module and the ACM , and greater than 10,000 ohms between the audio DSP module and ground?**	**Yes** GO to G7 . **No** REPAIR the circuit. TEST the system for normal operation.
G7 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors . • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
G8 CHECK FOR CORRECT AUDIO DSP MODULE OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors . • Disconnect all the audio DSP module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the audio DSP module connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new audio DSP module. REFER to Audio Digital Signal Processing (DSP) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

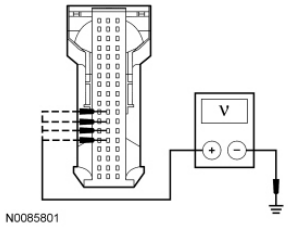
Pinpoint Test H: Poor Quality/Distorted/No Sound â SYNCÂ® System

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

The Accessory Protocol Interface Module (APIM) sends left and right channel analog audio signals to the Audio Front Control Module (ACM). This includes inputs from the Universal Serial Bus (USB) port, the audio input jack, and a Bluetooth media device.

This pinpoint test is intended to diagnose the following:



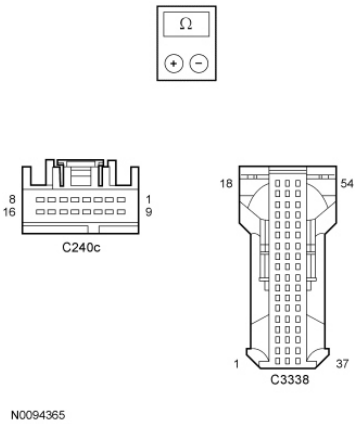
- Wiring, terminals or connectors
- APIM
- ACM

PINPOINT TEST H: POOR QUALITY/DISTORTED/NO SOUND â SYNCÂ® SYSTEM

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
H1 VERIFY THE OPERATION OF THE SYNCÂ® SYSTEM AUDIO SOURCES	
• Connect: Multi-Media Interface Tester . • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection. • **Is there poor quality/distorted/no sound from each SYNCÂ® audio source?**	**Yes** GO to H2 . **No** If the concern is only with some (but not all) of the audio sources, GO to Symptom Chart - SYNCÂ® System to diagnose the observed symptom. If all audio sources operate correctly, the concern is with the customer device.
H2 CHECK THE CIRCUITS FROM THE APIM FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240c . • Disconnect: APIM C3338 . • Measure the voltage between the APIM , harness side and ground as follows: **Connector-Pin / Circuit** C3338-23 / VME53 (VT/GN) C3338-24 / RME53 (BN/WH) C3338-25 / VME52 (BU)	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to H3 .

C3338-26	RME52 (GY/OG)



- **Is any voltage present?**

H3 CHECK THE CIRCUITS FROM THE APIM FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the ACM , harness side, and the APIM , harness side; and between the ACM , harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C240c-9	C3338-23, then ground	VME53 (VT/GN)
C240c-10	C3338-24, then ground	RME53 (BN/WH)
C240c-1	C3338-25, then ground	VME52 (BU)
C240c-2	C3338-26, then ground	RME52 (GY/OG)

- **Is the resistance less than 5 ohms between the ACM and the APIM , and greater than 10,000 ohms between the ACM and ground?**

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to H4 .

H4 CHECK FOR CORRECT APIM OPERATION	
• Connect: All Disconnected Connectors . • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. If the concern is still present, GO to H5 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
H5 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: The Satellite Radio Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

Digital signals are received by the satellite radio antenna and sent to the Audio Front Control Module (ACM) through the satellite radio antenna cable. The satellite radio receiver is internal to the ACM .

When a satellite radio subscription is activated, the Electronic Serial Number (ESN) of the built-in satellite radio receiver is associated with the Vehicle Identification Number (VIN). As a result, the ACM cannot be swapped from one vehicle to another.

When there is an open in the satellite radio antenna circuit, there is no satellite audio. The audio system display indicates a satellite radio antenna concern when the audio system is operated in satellite radio mode. To diagnose an open in the satellite radio antenna circuit, GO to Pinpoint Test B .

- DTC U2014:96 (Control Module Hardware: Component Internal Failure) â set by the non-navigation (MKZ) or navigation (all) ACM when a fault is detected in the internal satellite radio receiver. This results in complete loss of satellite radio functionality.

This pinpoint test is intended to diagnose the following:

- Subscription status
- Satellite radio system concern

- ACM

PINPOINT TEST I: THE SATELLITE RADIO IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
I1 CHECK THE SATELLITE RADIO DISPLAY	
• Turn the audio system on. • Operate the audio system in satellite radio mode and observe the Front Display Interface Module (FDIM) display. • **Does satellite radio information show on the FDIM display?**	**Yes** GO to I2 . **No** For vehicles without navigation, GO to Pinpoint Test K . For vehicles with navigation, GO to Pinpoint Test L .
I2 VERIFY AN ACTIVE SUBSCRIPTION	
• Operate the audio system in satellite radio mode and observe the FDIM display. • **Does the display indicate the subscription has expired?**	**Yes** The subscription has expired. INFORM the customer to contact Sirius to re-activate the subscription. **No** GO to I3 .
I3 CHECK THE SATELLITE SIGNAL PID (SAT_SIG_STR)	
• Enter the following diagnostic mode on the scan tool: ACM DataLogger . • Monitor the ACM PID (SAT_SIG_STR). • **Does the PID indicate "No Signal"?**	**Yes** GO to Pinpoint Test B . **No** For vehicles with navigation, GO to I4 . For all others, GO to I5 .
I4 CHECK THE ACM DTCs	
• Retrieve the ACM DTCs. • **Is DTC U2014:96 present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** GO to I5 .
I5 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No**

• Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test J: The Audio System Does Not Operate Correctly From The Front Controls Interface Module (FCIM)

Normal Operation

When a button is pressed on the Front Controls Interface Module (FCIM), a signal is broadcast over the Medium Speed Controller Area Network (MS-CAN) to the modules in the audio system. The FCIM is also the customer interface with the HVAC module.

If the FCIM can no longer communicate on the MS-CAN (due to loss of power, ground, etc.), the audio system remains in the operating state it was in prior to the failure. The steering wheel controls continue to operate.

- DTC B2924 (Audio Button Stuck) â set by the non-navigation (Fusion) FCIM if a switch is detected as active for greater than 3 seconds during the self-test, or for greater than 2 minutes during normal operation. When this occurs, the FCIM disables the switch until it detects it as no longer active.
- DTC U2013:63 (Switch Pack: Circuit / Component Protection Time-Out) â set by the non-navigation (MKZ) or navigation (all) FCIM if a switch is detected as active for greater than 3 seconds during the self-test, or for greater than 2 minutes during normal operation. When this occurs, the FCIM disables the switch until it detects it as no longer active.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- FCIM

PINPOINT TEST J: THE AUDIO SYSTEM DOES NOT OPERATE CORRECTLY FROM THE FCIM

Test Step	Result / Action to Take
J1 RETRIEVE ALL CONTINUOUS DTCs	
• Using the scan tool, retrieve all continuous DTCs. • **Are DTCs U0184, U0184:00, U0255, or U0255:00 present in any audio system module?**	**Yes** REFER to DTC Charts in this section. **No** GO to J2 .
J2 CHECK FOR DTC B2924 OR DTC U2013:63	
• Clear the FCIM DTCs. • Repeat the FCIM self-test,	**Yes** INSTALL a new FCIM . REFER to Front Controls Interface Module (FCIM) â Fusion or Front Controls Interface Module

making sure no FCIM buttons are pressed during the test. • **Is DTC B2924 or DTC U2013:63 present?**	(FCIM) â MKZ in this section. TEST the system for normal operation. **No** GO to J3 .
J3 CHECK FOR CORRECT FCIM OPERATION	
• Disconnect the FCIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FCIM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new FCIM . REFER to Front Controls Interface Module (FCIM) â Fusion or Front Controls Interface Module (FCIM) â MKZ in this section. CLEAR any DTCs present. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test K: An Individual Front Display Interface Module (FDIM) Display Is Inoperative â Vehicles Without Navigation

Normal Operation

The Front Display Interface Module (FDIM) receives inputs via the Medium Speed Controller Area Network (MS-CAN) from the following modules:

- ♦ Audio Front Control Module (ACM): audio system information
- ♦ Instrument Panel Cluster (IPC): compass heading information
- ♦ Accessory Protocol Interface Module (APIM): SYNCÂ® system information
- ♦ HVAC module: climate control system information

If the FDIM loses the signal from any of these modules, only that specific display is inoperative.

For the compass display, this pinpoint test is intended to diagnose a concern of the compass display being blank. For any other concerns with the compass display, including the compass being inaccurate, refer to Section 413-01 .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- FDIM

PINPOINT TEST K: AN INDIVIDUAL FDIM DISPLAY IS INOPERATIVE â VEHICLES WITHOUT NAVIGATION

Test Step	Result / Action to Take
K1 OBSERVE THE FDIM DISPLAY	

<table>
<tr><td>• Turn the audio system on and observe the FDIM screen.
• Is the FDIM display completely inoperative?</td><td>Yes
GO to Pinpoint Test N .

No
GO to K2 .</td></tr>
<tr><td>K2 CHECK FOR LOST COMMUNICATION DTCs SET IN THE FDIM</td><td></td></tr>
<tr><td>• Using the scan tool, retrieve all continuous DTCs.
• Is DTC U0155, U0155:00, U0184, U0184:00, U0197, or U0197:00 present in the FDIM ?</td><td>Yes
REFER to DTC Charts in this section.

No
GO to K3 .</td></tr>
<tr><td>K3 CHECK THE FDIM DISPLAY SEGMENTS</td><td></td></tr>
<tr><td>• Carry out the Audio Display Test. Refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.
• Do all of the FDIM segments illuminate?</td><td>Yes
GO to K4 .

No
GO to K5 .</td></tr>
<tr><td>K4 OBSERVE THE SPECIFIC INOPERATIVE DISPLAY</td><td></td></tr>
<tr><td>• Observe the inoperative FDIM display while carrying out the indicated diagnostic method as follows:
<table>
<tr><th>Inoperative Display</th><th>Diagnostic Method</th><th>Expected Results</th></tr>
<tr><td>Compass</td><td>Drive the vehicle in an open area while observing the display.</td><td>The compass display illuminates, indicating a directional heading or a calibration error.</td></tr>
<tr><td>Audio system</td><td>Turn the audio system on, press the AM/FM button, and adjust the volume.</td><td>The FDIM display updates to show the change in audio setting.</td></tr>
<tr><td>SYNCÂ® system (if equipped)</td><td>Turn the audio system on, press the phone button, and observe the display.</td><td>The FDIM display shows information relating to the phone.</td></tr>
<tr><td>Climate control system</td><td>Turn the climate control system on, adjust the fan to high speed, and set the temperature to various settings.</td><td>The FDIM display updates to show the change in climate control setting.</td></tr>
</table></td><td>Yes
The system is operating correctly at this time. INFORM the customer on the operation of the FDIM display.

No
If the compass heading is inaccurate or indicates a calibration error, REFER to Section 413-01 to diagnose the compass.

For all other concerns, GO to K5 .</td></tr>
</table>

• **Does the inoperative display confirm the expected results?**	
K5 CHECK FOR CORRECT FDIM OPERATION	
• Ignition OFF. • Disconnect the FDIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FDIM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new FDIM . REFER to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test L: An Individual FDIM Display Is Inoperative â Vehicles With Navigation

Normal Operation

The Front Display Interface Module (FDIM) display provides information based on the video signal from the Audio Front Control Module (ACM). In addition to the information that the ACM controls for the navigation and audio system, the ACM receives inputs via the Medium Speed Controller Area Network (MS-CAN) from the following modules:

♦ Accessory Protocol Interface Module (APIM): SYNCÂ® system information (if equipped)
♦ HVAC module: climate control system information

If the ACM loses the signal from any of these modules, only that specific display becomes inoperative.

This pinpoint test is intended to diagnose the following:

• Communication network concern
• FDIM
• ACM

PINPOINT TEST L: AN INDIVIDUAL FDIM DISPLAY IS INOPERATIVE â VEHICLES WITH NAVIGATION

Test Step	Result / Action to Take
L1 OBSERVE THE FDIM DISPLAY	
• Turn the audio system on and observe the FDIM screen. • **Is the FDIM display completely inoperative?**	**Yes** GO to Pinpoint Test O . **No** GO to L2 .
L2 CHECK THE FDIM DISPLAY SEGMENTS	
• Carry out the Audio Display Test. Refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.	**Yes** GO to L3 . **No**

• **Do all of the FDIM segments illuminate?**	GO to L6 .
L3 OBSERVE THE SPECIFIC INOPERATIVE DISPLAY	
• Observe the inoperative FDIM display while carrying out the indicated diagnostic method as follows: **Inoperative Display / Diagnostic Method / Expected Results** Audio system / Turn the audio system on, press the AM/FM button, and adjust the volume. / The FDIM display updates to show the change in audio setting. SYNCÂ® system (if equipped) / Turn the audio system on, press the phone button, and observe the display. / The FDIM display shows information relating to the phone. Climate control system / Turn the climate control system on, adjust the fan to high speed, and set the temperature to various settings. / The FDIM display updates to show the change in climate control setting. • **Does the inoperative display confirm the expected results?**	**Yes** The system is operating correctly at this time. INFORM the customer on the operation of the FDIM displays. **No** GO to L4 .
L4 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs (from all modules). • **Is DTC U0164, U0164:00, U0184, U0184:00, U0197, or U0197:00 (if equipped with the SYNCÂ® system) present in any module?**	**Yes** For DTC U0164, GO to Pinpoint Test AH . For DTC U0197, GO to Pinpoint Test AK . **No** GO to L5 .
L5 CHECK FOR CORRECT FDIM OPERATION	
• Ignition OFF. • Disconnect the FDIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new FDIM . REFER to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section. TEST the system for normal operation. If the concern is still present, GO to L6 .

• Connect the FDIM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
L6 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

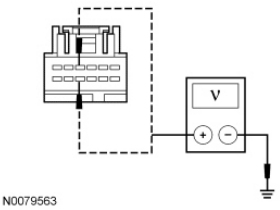
Pinpoint Test M: The Audio System Does Not Operate Correctly From The Front Display Interface Module (FDIM) â Vehicles With Navigation

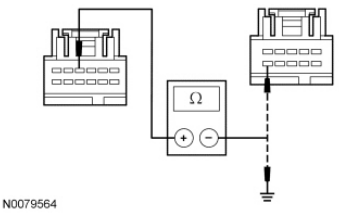
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

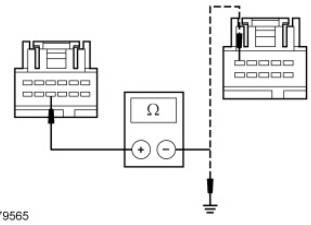
The Front Display Interface Module (FDIM) touchscreen sends a voltage signal to the Audio Front Control Module (ACM) when a touch sector is pressed. The ACM then takes the appropriate action, which can be a change in the audio system setting or broadcasting the information to the appropriate module through the Medium Speed Controller Area Network (MS-CAN).

- DTC U0162:00 (Lost Communication With Navigation Display Module: No Sub Type Information) â set by the ACM if it does not detect the FDIM for greater than 5 seconds with the ignition in the RUN position. When this occurs, the touchscreen controls are inoperative and the FDIM may not display correct (if any) information.





This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- FDIM
- ACM

PINPOINT TEST M: THE AUDIO SYSTEM DOES NOT OPERATE CORRECTLY FROM THE FDIM â VEHICLES WITH NAVIGATION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
M1 OBSERVE THE FDIM DISPLAY	

• Turn the audio system on and observe the FDIM screen. • **Is the FDIM display completely inoperative?**	**Yes** GO to Pinpoint Test O . **No** GO to M2 .
M2 CHECK FOR AUDIO SYSTEM OPERATION FROM THE FCIM	
• Carry out various audio system functions using the Front Controls Interface Module (FCIM). • **Does the audio system operate correctly from the FCIM ?**	**Yes** GO to M3 . **No** GO to Pinpoint Test J .
M3 CHECK THE TOUCHSCREEN TRANSMIT AND RECEIVE CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: FDIM C2410 . • Disconnect: ACM C240b . • Ignition ON. • Measure the voltage between the FDIM C2410-4, circuit CMN26 (BU/OG), harness side and ground; and between the FDIM C2410-10, circuit CMN24 (GY/VT), harness side and ground.  N0079563 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to M4 .
M4 CHECK THE TOUCHSCREEN TRANSMIT AND RECEIVE CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the FDIM C2410-4, circuit CMN26 (BU/OG), harness side and the ACM C240b-10, circuit CMN26 (BU/OG), harness side; and between the FDIM C2410-4, circuit CMN26 (BU/OG), harness side and ground.  N0079564	**Yes** GO to M5 . **No** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

• Measure the resistance between the FDIM C2410-10, circuit CMN24 (GY/VT), harness side and the ACM C240b-5, circuit CMN24 (GY/VT), harness side; and between the FDIM C2410-10, circuit CMN24 (GY/VT), harness side and ground.  • **Is the resistance less than 5 ohms between the FDIM and the ACM , and greater than 10,000 ohms between the FDIM and ground?**	
M5 ISOLATE THE FDIM	
• Connect: ACM C240b . • Install a new FDIM . Refer to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section. • Ignition ON. • Attempt various commands from the FDIM touchscreen. • **Does the system operate correctly?**	**Yes** The cause of the concern was an inoperative FDIM . The system is now operating correctly. **No** GO to M6 .
M6 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test N: The Front Display Interface Module (FDIM) Is Completely Inoperative â Vehicles Without Navigation

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

The Front Display Interface Module (FDIM) receives power at all times. The ignition switch position message is broadcast to the FDIM by the Smart Junction Box (SJB) via the Medium Speed Controller Area Network (MS-CAN).

Information from the audio system, the climate control system, the SYNCÂ® system, and the compass heading are shown on the FDIM display screen. If only one of these displays has a concern, GO to Pinpoint Test K .

This pinpoint test is intended to diagnose the following:

- Communication network concern
- FDIM

PINPOINT TEST N: THE FDIM IS COMPLETELY INOPERATIVE â VEHICLES WITHOUT NAVIGATION

Test Step	Result / Action to Take
N1 CHECK FOR SCAN TOOL COMMUNICATION WITH THE FDIM	
• Ignition ON. • Carry out the network test using the scan tool. • **Does the scan tool communicate with the FDIM ?**	**Yes** GO to N2 . **No** REFER to Section 418-00 .
N2 CHECK FOR CORRECT FDIM OPERATION	
• Ignition OFF. • Disconnect the FDIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FDIM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new FDIM . REFER to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Front Display Interface Module (FDIM) Is Completely Inoperative â Vehicles With Navigation

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

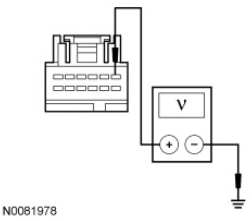
The Audio Front Control Module (ACM) enables the Front Display Interface Module (FDIM) by sending voltage through the enable circuit.

Video display information is sent to the FDIM from the ACM through a dedicated video cable. The video cable is only serviced by overlaying a new component.

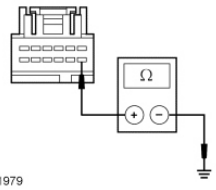
If there is a fault in the video cable, the FDIM may illuminate very dimly and have a greyish appearance. This is because the enable circuit is still active and enables the illumination, but no video signal reaches the FDIM .

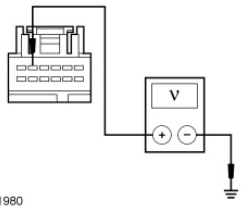
If the vehicle is equipped with a rear view camera, the video feed from the camera is hardwired to the FDIM .

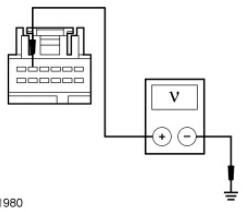
For all other display information, including the climate control and SYNCÂ® system displays, messages are sent to the ACM via the Medium Speed Controller Area Network (MS-CAN). The ACM then alters the video feed to the FDIM based on the messages it receives.



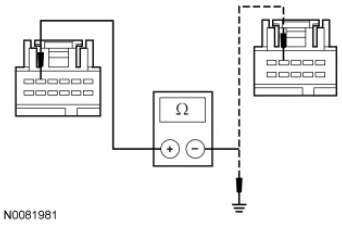
This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- FDIM
- ACM



PINPOINT TEST O: THE FDIM IS COMPLETELY INOPERATIVE â VEHICLES WITH NAVIGATION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
O1 CHECK THE FDIM VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: FDIM C2410 . • Measure the voltage between the FDIM C2410-1, circuit SBP14 (BN/RD), harness side and ground.  N0081978 • **Is the voltage greater than 10 volts?**	**Yes** GO to O2 . **No** VERIFY the Smart Junction Box (SJB) fuse 14 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
O2 CHECK THE FDIM GROUND CIRCUIT FOR CONTINUITY	
• Disconnect: Negative Battery Cable . • Measure the resistance between the FDIM C2410-7, circuit GD116 (BK/VT), harness side and ground.	**Yes** GO to O3 . **No** REPAIR the circuit. TEST the system for normal operation.

 N0081979 • **Is the resistance less than 5 ohms?**	
O3 CHECK THE FDIM ENABLE CIRCUIT FOR CORRECT VOLTAGE	
• Connect: Negative Battery Cable . • Ignition ON. • Turn the audio system on using the power button on the Front Controls Interface Module (FCIM). • Measure the voltage between the FDIM C2410-5, circuit CMN23 (WH/BU), harness side and ground.  N0081980 • **Is the voltage between 4.5 and 9.5 volts?**	**Yes** GO to O6 . **No** GO to O4 .
O4 CHECK THE FDIM ENABLE CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240b . • Ignition ON. • Measure the voltage between the FDIM C2410-5, circuit CMN23 (WH/BU), harness side and ground.  N0081980 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to O5 .
O5 CHECK THE FDIM ENABLE CIRCUIT FOR AN OPEN OR SHORT TO GROUND	

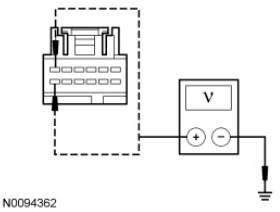
• Ignition OFF. • Measure the resistance between the FDIM C2410-5, circuit CMN23 (WH/BU), harness side and the ACM C240b-4, circuit CMN23 (WH/BU), harness side; and between the FDIM C2410-5, circuit CMN23 (WH/BU), harness side and ground.  • **Is the resistance less than 5 ohms between the FDIM and the ACM , and greater than 10,000 ohms between the FDIM and ground?**	**Yes** GO to O6 . **No** REPAIR the circuit. TEST the system for normal operation.
O6 ISOLATE THE VIDEO CABLE	
• Connect: ACM C240b . • Connect: FDIM C2410 . • Install a new video cable. Refer to **Video Cable** in this section. • Ignition ON. • Operate the audio system and observe the FDIM screen. • **Does the system operate correctly?**	**Yes** The cause of the concern was an inoperative video cable. The system is now operating correctly. **No** GO to O7 .
O7 ISOLATE THE FDIM	
• Install a new FDIM . Refer to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section. • Ignition ON. • Operate the audio system and observe the FDIM screen. • **Does the system operate correctly?**	**Yes** The cause of the concern was an inoperative FDIM . The system is now operating correctly. **No** GO to O8 .
O8 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: The Front Display Interface Module (FDIM) Does Not Display DVD Video Played From The Audio Front Control Module (ACM) â Vehicles With Navigation

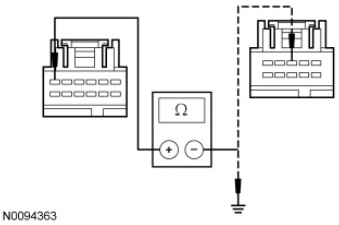
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

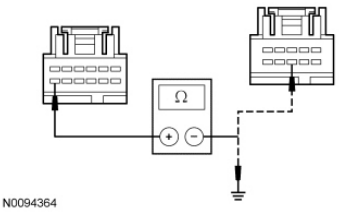
Normal Operation

Video from a DVD played in the Audio Front Control Module (ACM) is transmitted to the Front Display Interface Module (FDIM) through dedicated video circuits. This video feed is separate from all other video sources, so it is possible for the FDIM to operate correctly until a DVD video is played.



DVD video playback through the ACM is only enabled when the vehicle is in PARK. In all other gears, only the DVD audio is played. This is normal operation.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- FDIM
- ACM

PINPOINT TEST P: THE FDIM DOES NOT DISPLAY DVD VIDEO PLAYED FROM THE ACM â VEHICLES WITH NAVIGATION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
P1 CHECK THE FDIM VIDEO FEED CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240b . • Disconnect: FDIM C2410 . • Ignition ON. • Measure the voltage between the FDIM C2410-6, circuit VMN20 (BN/VT), harness side and ground; and between the FDIM C2410-12, circuit RMN20 (WH/GN), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to P2 .
P2 CHECK THE FDIM VIDEO FEED CIRCUITS FOR AN OPEN OR SHORT TO GROUND	

• Ignition OFF. • Measure the resistance between the FDIM C2410-6, circuit VMN20 (BN/VT), harness side and the ACM C240b-3, circuit VMN20 (BN/VT), harness side; and between the FDIM C2410-6, circuit VMN20 (BN/VT), harness side and ground.  N0094363 • Measure the resistance between the FDIM C2410-12, circuit RMN20 (WH/GN), harness side and the ACM C240b-8, circuit RMN20 (WH/GN), harness side; and between the FDIM C2410-12, circuit RMN20 (WH/GN), harness side and ground.  N0094364 • **Is the resistance less than 5 ohms between the FDIM and the ACM , and greater than 10,000 ohms between the FDIM and ground?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to P3 .
P3 ISOLATE THE FDIM	
• Connect: ACM C240b . • Install a new FDIM . Refer to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section. • Ignition ON. • Operate the audio system and observe the FDIM screen. • **Does the system operate correctly?**	**Yes** The cause of the concern was an inoperative FDIM . The system is now operating correctly. **No** GO to P4 .
P4 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present.	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may

• **Is the concern still present?**	have been caused by a loose or corroded connector.

Pinpoint Test Q: The Steering Wheel Controls Are Inoperative/Do Not Operate Correctly

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio/Navigation for schematic and connector information.

Normal Operation

There are 3different steering wheel controls configurations:

- Without the SYNCÂ® system
  - ♦ VOL-, VOL+, SEEK-, SEEK+, MEDIA
  - ♦ All switches are wired to the Audio Front Control Module (ACM)
- SYNCÂ® system without navigation
  - ♦ VOL-, VOL+, SEEK-, SEEK+, MEDIA, PHONE, OK
  - ♦ The VOL-, VOL+, SEEK-, and SEEK+ switches are wired to the ACM . The remaining switches are wired to the Accessory Protocol Interface Module (APIM).
- SYNCÂ® system with navigation
  - ♦ VOL-, VOL+, SEEK-, SEEK+, VOICE, MEDIA, PHONE
  - ♦ All switches are wired to the ACM

Voltage is sent from the ACM (or APIM) to the steering wheel controls, and the same module grounds the return circuit. The VOL-, VOL+, SEEK- and SEEK+ switches share signal and return circuits, while the VOICE, MEDIA, PHONE and OK switches share separate signal and return circuits.

For all configurations, when a switch is pressed, the voltage is routed through a specific resistor value for each function. The ACM (or APIM) then uses the reference voltage to determine which control input function has been selected.

DTC Description	Fault Trigger Conditions
• B1117 â Audio Steering Wheel Button Stuck (ACM)	Set by the non-navigation ACM when a steering wheel controls switch is detected as active for more than 120 seconds during normal operation, or for any duration during the self-test. A short to ground in the signal return circuit does not set this DTC, as the reference voltage falls out-of-range, resulting in DTC B2404 being set.
• B11BA:1C â Steering Wheel Audio Switch Pack: Circuit Voltage Out of Range	Set by the ACM when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck switch or a short to ground in the signal return circuit. This DTC applies to the VOL-, VOL+, SEEK-, SEEK+, and MEDIA switches.
• B11BA:63 â Steering Wheel Audio Switch Pack: Circuit /	Set by the ACM when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for more than 3 seconds during the self-test. A short to ground in the signal return circuit should not set this DTC, as the reference voltage would fall out-of-range, resulting in DTC B11BA:1C being set. This DTC applies to the VOL-, VOL+, SEEK-, SEEK+,

Component Protection Time-Out	and MEDIA switches.
• B1201:1C â Steering Wheel Audio Switch Pack 2: Circuit Voltage Out of Range	Set by the navigation ACM when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck switch or a short to ground in the signal return circuit. This DTC applies to the VOICE and PHONE switches.
• B1201:1C â Steering Wheel Audio Switch Pack 2: Circuit Voltage Out of Range	Set by the APIM when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck switch or a short to ground in the signal return circuit. This DTC applies to vehicles without navigation.
• B1201:63 â Steering Wheel Audio Switch Pack 2: Circuit / Component Protection Time-Out	Set by the navigation ACM when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for any duration during the self-test. A short to ground in the signal return circuit should not set this DTC, as the reference voltage would fall out-of-range, resulting in DTC B1201:1C being set. This DTC applies to the VOICE and PHONE switches.
• B1201:63 â Steering Wheel Audio Switch Pack 2: Circuit / Component Protection Time-Out	Set by the APIM when a steering wheel control switch is detected as active for more than 120 seconds during normal operation, or for any duration during the self-test. A short to ground in the signal return circuit should not set this DTC, as the reference voltage would fall out-of-range, resulting in DTC B1201:1C being set. This DTC applies to vehicles without navigation.
• B2404 â Audio Steering Wheel Switch Circuit Failure	Set by the non-navigation ACM when the reference voltage to the steering wheel controls is out-of-range. This can be caused by a number of different failures on the steering wheel controls circuit except for a stuck switch or a short to ground in the signal return circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Steering wheel controls
- ACM
- APIM (without navigation only)

PINPOINT TEST Q: THE STEERING WHEEL CONTROLS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: For vehicles equipped with navigation or not equipped with SYNC, start this pinpoint test at Step Q3.

Test Step	Result / Action to Take
Q1 CHECK THE SYNCÂ® SYSTEM OPERATION	
NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNC system. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNCÂ® inputs function correctly?**	**Yes** The SYNCÂ® system is operating correctly at this time. CARRY OUT a SYNCÂ® system Master Reset. REFER to the Owner's Literature. REVIEW the SYNCÂ® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** GO to Q2 .
Q2 RESET THE APIM AND RECHECK SYNCÂ® SYSTEM OPERATION	
• Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNCÂ® inputs function correctly?**	**Yes** The SYNCÂ® system is operating correctly at this time. CARRY OUT a SYNCÂ® system Master Reset. REFER to the Owner's Literature. REVIEW the SYNCÂ® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** GO to Q3 .
Q3 DETERMINE THE INOPERATIVE STEERING WHEEL CONTROLS	
• Determine which steering wheel controls are inoperative by pressing each steering wheel control switch individually while operating the audio system in various modes (AM/FM, SYNCÂ® (if equipped), etc.). • **Is the concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA switch?**	**Yes** GO to Q4 . **No** GO to Q5 .
Q4 MONITOR THE STEERING WHEEL CONTROL PIDs (EXCEPT NAVIGATION/SYNCÂ® SWITCHES)	

<table>
<tr><td>

- Enter the following diagnostic mode on the scan tool: ACM DataLogger.
- Monitor the steering wheel controls PIDs while pressing each steering wheel controls switch as follows:

Steering Wheel Controls Switch	PID
VOL-	SW_VOLDOWN
VOL+	SW_VOLUP
SEEK-	SW_SEEKMINUS
SEEK+	SW_SEEKPLUS
MEDIA	SW_MODE

- **Do the PID values agree with the switch positions?**

</td><td>

Yes
GO to Q11 .

No
If only one PID value is incorrect or the PID value always reads one particular switch position, INSTALL new steering wheel controls. REFER to Steering Wheel Controls in this section. CLEAR any DTCs present. TEST the system for normal operation.

Otherwise, GO to Q6 .

</td></tr>
<tr><td>

Q5 MONITOR THE STEERING WHEEL CONTROL PIDs (NAVIGATION/SYNCÂ® SWITCHES)

</td><td></td></tr>
<tr><td>

- Enter the following diagnostic mode on the scan tool: ACM DataLogger (With Navigation) or APIM DataLogger (Without Navigation).
- Monitor the steering wheel controls PIDs while pressing each steering wheel controls switch as follows:

ACM PIDs

Steering Wheel Controls Switch	ACM PID
VOICE	SW_VOICE
PHONE	SW_PHONE

APIM PIDs

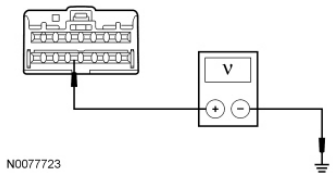
Steering Wheel Controls Switch	APIM PID
VOICE	SCS_VOICE
PHONE	SCS_PHONE
OK	SCS_OK

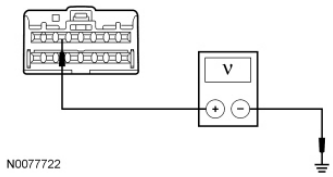
- **Do the PID values agree with the switch positions?**

</td><td>

Yes
For vehicles with navigation, GO to Q11 .

For vehicles without navigation, GO to Q12 .

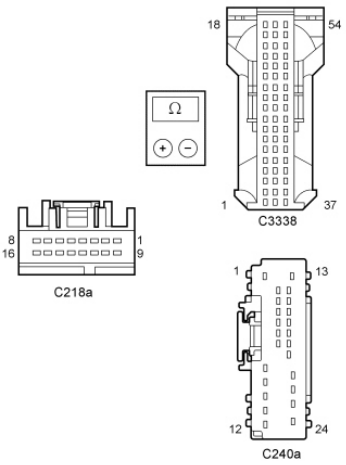




No
If only one PID value is incorrect or the PID value always reads one particular switch position, INSTALL new steering wheel controls. REFER to Steering Wheel Controls in this section. CLEAR any DTCs present. TEST the system for normal operation.

Otherwise, GO to Q6 .

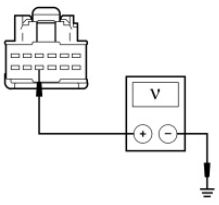
</td></tr>
<tr><td>



Q6 CHECK THE REFERENCE VOLTAGE CIRCUIT TO THE CLOCKSPRING FOR A SHORT TO VOLTAGE

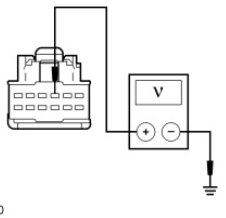
</td><td></td></tr>
</table>

• Ignition OFF. • Disconnect: Clockspring C218a. • Disconnect: ACM C240a or APIM C3338. • Ignition ON. • For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA switches, measure the voltage between the clockspring C218a-13, circuit VME14 (GY/YE), harness side and ground.  • For a concern with the VOICE, PHONE, or OK switches, measure the voltage between the clockspring C218a-6, circuit VME54 (BU/OG), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to Q7 .
Q7 CHECK THE CIRCUITS TO THE CLOCKSPRING FOR AN OPEN OR SHORT TO GROUND	
NOTE: Circuits RME24 (BU/WH) does not need to be checked for a short to ground. • Ignition OFF. • Measure the resistance between the clockspring, harness side and the ACM (or APIM), harness side; and between the clockspring, harness side and ground as follows:	**Yes** GO to Q8 . **No** REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.



Suspect Switch	Positive Meter Lead	Negative Meter Lead	Circuit
VOL-, VOL+, SEEK-, SEEK+, or MEDIA	C218a-13 C218a-12	C240a-18, then ground C240a-19, then ground	VME14 (GY/YE) RME24 (BU/WH)

VOICE, PHONE, or OK	C218a-6 C218a-4	C240a-17 (with navigation) or C3338-14 (without navigation), then ground C240a-16 (with navigation) or C3338-15 (without navigation), then ground	VME54 (BU/OG) RME24 (BU/WH)

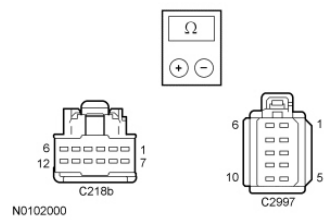


N0094358

- **Is the resistance less than 5 ohms between the ACM (or APIM) and the clockspring, and greater than 10,000 ohms between the ACM (or APIM) and ground?**

Q8 CHECK THE REFERENCE VOLTAGE CIRCUIT TO THE STEERING WHEEL CONTROLS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Clockspring C218b. • Disconnect: Steering Wheel Controls C2997.. • Ignition ON. • For a concern with the VOL-, VOL+, SEEK-, SEEK+, or MEDIA buttons, measure the voltage between the clockspring C218b-10, circuit VME14 (GY/YE), harness side and ground.  N0094359	**Yes** REPAIR the circuit. CLEAR any DTCs present. TEST the system for normal operation. **No** GO to Q9 .

- For a concern with the VOICE, PHONE, or OK buttons, measure the voltage between the clockspring C218b-3, circuit VME54 (BU/OG), harness side and ground.

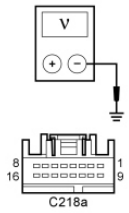


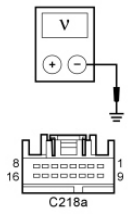
- **Is any voltage present?**

Q9 CHECK THE CIRCUITS TO THE STEERING WHEEL CONTROLS FOR AN OPEN OR SHORT TO GROUND

NOTE: Circuits RME24 (BU/WH) and RME54 (WH/VT) do not need to be checked for a short to ground.

- Ignition OFF.
- Measure the resistance between the clockspring, harness side and the steering wheel controls, harness side; and between the clockspring, harness side and ground as follows:





Suspect Switch	Positive Meter Lead	Negative Meter Lead	Circuit
VOL-, VOL+, SEEK-, SEEK+, or MEDIA	C218b-10 C218b-11	C2997-2, then ground C2997-4	VME14 (GY/YE) RME24 (BU/WH)
VOICE, PHONE, or OK	C218a-6 C218a-4	C2997-6, then ground C2997-7	VME54 (BU/OG) RME54 (WH/VT)

- **Is the resistance less than 5 ohms between the clockspring and the steering wheel controls, and**

Yes
GO to Q10 .

No
REPAIR the circuit in question. CLEAR any DTCs present. TEST the system for normal operation.

greater than 10,000 ohms between the clockspring and ground?	
Q10 CHECK THE REFERENCE VOLTAGE CIRCUITS TO THE CLOCKSPRING	
• Ignition OFF. • Disconnect: Clockspring C218a. • Ignition ON. • For vehicles without the SYNCÂ® system, measure the voltage between the lower clockspring C218a-6, circuit VME54 (BU/OG) and C218a-12, circuit RME24 (BU/WH); and between the lower clockspring C218a-13, circuit VME14 (GY/YE) and C218a-12, circuit RME24 (BU/WH).  N0109470 • For vehicles with the SYNCÂ® system, measure the voltage between the lower clockspring C218a-6, circuit VME54 (BU/OG) and C218a-4, circuit RME24 (BU/WH); and between the lower clockspring C218a-13, circuit VME14 (GY/YE) and C218a-12, circuit RME24 (BU/WH).  N0109470 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . CLEAR any DTCs present. TEST the system for normal operation. **No** INSTALL a new ACM. REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation.
Q11 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Connect: All Disconnected Connectors. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded

	connector. CLEAR any DTCs present.
Q12 CHECK FOR CORRECT APIM OPERATION	
• Connect: All Disconnected Connectors. • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test R: The Audio Input Jack Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation â Vehicles Without the SYNCÂ® System

Audio signals are sent from the audio input jack to the Audio Front Control Module (ACM). There are no external power or ground circuits to the audio input jack.

Vehicles With the SYNCÂ® System

Audio signals are sent from the audio input jack to the Accessory Protocol Interface Module (APIM). The signals are then sent to the ACM . There are no external power or ground circuits to the audio input jack.

- DTC B1D78:13 (Auxiliary Input: Circuit Open) â sets in continuous memory by the navigation ACM (vehicles without the SYNCÂ® system only) when an open is detected in the audio input jack circuitry for greater than 250 milliseconds.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Audio input jack
- APIM (vehicles with the SYNCÂ® system)
- ACM (vehicles without the SYNCÂ® system)

PINPOINT TEST R: THE AUDIO INPUT JACK IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Before carrying out this pinpoint test, make sure the MP3 device is operating correctly.

Test Step	Result / Action to Take
R1 CHECK THE AUDIO INPUT JACK AUDIO	

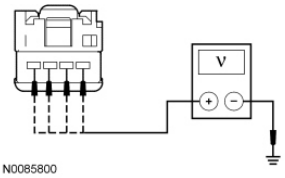
<table>
<tr><td>• Connect: Multi-Media Interface Tester .
• Using the Multi-Media Interface Tester, attempt to play an audio file using the audio input jack.
• Does the file play correctly?</td><td>Yes
The system is operating correctly at this time. The concern may be with the customer device.

No
GO to R2 .</td></tr>
<tr><td>R2 DETERMINE THE VEHICLE CONTENT</td><td></td></tr>
<tr><td>• Determine if the vehicle is equipped with the SYNCÂ® system.
• Is the vehicle equipped with the SYNCÂ® system?</td><td>Yes
GO to R3 .

No
GO to R4 .</td></tr>
<tr><td>R3 CHECK THE APIM AUDIO OUTPUT</td><td></td></tr>
<tr><td>• Using the Multi-Media Interface Tester, attempt to play an audio file using either the Universal Serial Bus (USB) port or Bluetooth.
• Is the audio output OK for the USB port or Bluetooth?</td><td>Yes
GO to R4 .

No
GO to Pinpoint Test H .</td></tr>
<tr><td>R4 CHECK THE AUDIO INPUT JACK CIRCUITS FOR A SHORT TO VOLTAGE</td><td></td></tr>
<tr><td>• Ignition OFF.
• Disconnect: Audio Input Jack C2401 (Vehicles Without the SYNCÂ® System) or C3337 (Vehicles With the SYNCÂ® System) .
• Disconnect: ACM C240c (Vehicles Without the SYNCÂ® System) or APIM C3338 (Vehicles With the SYNCÂ® System) .
• Ignition ON.
• Measure the voltage between the audio input jack, harness side and ground as follows:

<table><tr><th>Positive Meter Lead</th><th>Negative Meter Lead</th></tr><tr><td>C2401-1 or C3337-1



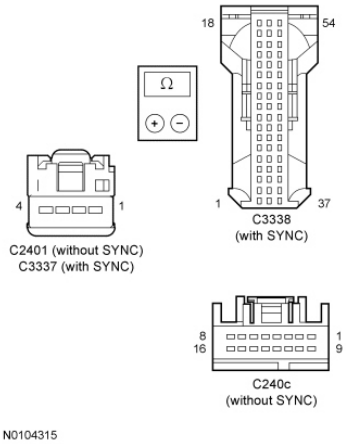
VME46 (BU/GN)</td><td>Ground</td></tr><tr><td>C2401-2 or C3337-2

RME46 (WH/GN)</td><td>Ground</td></tr><tr><td>C2401-3 or C3337-3

RME45 (YE/GN)</td><td>Ground</td></tr><tr><td>C2401-4 or C3337-4

VME45 (BU)</td><td>Ground</td></tr></table></td><td>Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to R5 .</td></tr>
</table>



- **Is any voltage present?**

R5 CHECK THE AUDIO INPUT JACK CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Ignition OFF.
- Measure the resistance between the audio input jack, harness side and the ACM (or APIM , if equipped with the SYNCÂ® system), harness side; and between the audio input jack, harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead	Circuit
C2401-1 or C3337-1	C240c-6 or C3338-47, then ground	VME46 (BU/GN)
C2401-2 or C3337-2	C240c-14 or C3338-48, then ground	RME46 (WH/GN)
C2401-3 or C3337-3	C240c-8 or C3338-46, then ground	RME45 (YE/GN)
C2401-4 or C3337-4	C240c-7 or C3338-45, then ground	VME45 (BU)

- **Is the resistance less than 5 ohms between the audio input jack and the ACM (or APIM , if equipped with the SYNCÂ® system), and greater than 10,000 ohms between the audio input jack and ground?**

Yes
GO to R6 .

No
REPAIR the circuit in question. TEST the system for normal operation.

R6 ISOLATE THE AUDIO INPUT JACK

• Connect: ACM C240c (Vehicles Without the SYNCÂ® System) or APIM C3338 (Vehicles With the SYNCÂ® System) . • Install a known good audio input jack. Refer to Audio Input Jack in this section. • Connect: Multi-Media Interface Tester . • Using the Multi-Media Interface Tester, attempt to play an audio file using the audio input jack. • **Does the file play correctly?**	**Yes** The concern was caused by an inoperative audio input jack. The system is operating correctly at this time. **No** For vehicles without the SYNCÂ® system, GO to R7 . For vehicles with the SYNCÂ® system, GO to R8 .
R7 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
R8 CHECK FOR CORRECT APIM OPERATION	
• Ignition OFF. • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initialize. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test S: Loud Popping Sound When Cycling The Ignition Switch

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

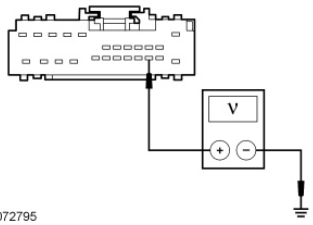
Normal Operation

Voltage is sent through the start input circuit to the Audio Front Control Module (ACM) with the ignition in the START position. Upon receiving this signal, the ACM mutes all speaker outputs to eliminate the possibility of voltage spikes producing a popping noise through the speakers.

For premium sound, the ACM disables the audio amplifier and subwoofer amplifier while the ignition is in

the START position by keeping the enable circuit voltages below 0.4 volt.

For the SonyÂ® and THXÂ® sound systems, the ACM disables the audio Digital Signal Processing (DSP) module while the ignition is in the START position by keeping the enable circuit voltage below 0.4 volt.



If there is a short to voltage on any of the enable circuits, distortion is heard in the speakers whenever the ACM is powered up, and that should be the primary concern addressed. If the speakers have distorted sound, GO to Symptom Chart - Sound Quality .

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- ACM

PINPOINT TEST S: LOUD POPPING SOUND WHEN CYCLING THE IGNITION SWITCH

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
S1 CHECK THE START INPUT CIRCUIT VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240a . • Disconnect: Starter Relay . • Hold the key in the START position. • Measure the voltage between the ACM C240a-15, circuit CBP28 (GY/VT), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** VERIFY the Smart Junction Box (SJB) fuse 28 (5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

Pinpoint Test T: The Speed Sensitive Volume Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio/Navigation for schematic and connector information.

Normal Operation

The speed sensitive volume function adjusts the volume based on the Vehicle Speed Sensor (VSS) signal from the Instrument Panel Cluster (IPC). The IPC does not generate the VSS signal; it gateways the signal

from the PCM. The Smart Junction Box (SJB) also receives this signal and should exhibit symptoms if the signal is lost.

This pinpoint test is intended to diagnose the following:

- Speed sensitive volume setting
- VSS signal concern
- Communication network concern
- ACM

PINPOINT TEST T: THE SPEED SENSITIVE VOLUME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
T1 CHECK THE SPEEDOMETER OPERATION	
• Drive the vehicle and observe the speedometer. • **Does the speedometer operate correctly?**	**Yes** GO to T2 . **No** REFER to Section 413-01 .
T2 CHECK THE SPEED SENSITIVE VOLUME SETTING	
• Turn the speed sensitive volume off. Refer to the Owner's Literature. • Operate the audio system in radio tuner (AM/FM) mode. • Drive the vehicle at various speeds and observe the speaker volume. • Set the speed sensitive volume to maximum compensation. Refer to the Owner's Literature. • Operate the audio system in radio tuner (AM/FM) mode. • Drive the vehicle at various speeds and observe the speaker volume. • **Does the volume remain constant with the speed sensitive volume turned off, and increase and decrease with vehicle speed with the speed sensitive volume set to maximum?**	**Yes** The system is operating correctly at this time. INSTRUCT the customer in the correct usage of the speed sensitive volume feature. **No** GO to T3 .
T3 CHECK FOR DTC U0155 OR DTC U0155:00	
• Using the scan tool, retrieve all continuous DTCs. • **Is DTC U0155 or DTC U0155:00 retrieved in any module?**	**Yes** GO to Pinpoint Test AG . **No** GO to T4 .
T4 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors.	**Yes** INSTALL a new ACM . REFER to Audio

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test U: The Audio Does Not Reduce When The Parking Aid Tone Sounds

Normal Operation

The Parking Aid Module (PAM) sends the volume cutback message to the Audio Front Control Module (ACM) via the Medium Speed Controller Area Network (MS-CAN). When the PAM sounds the parking aid tone, it broadcasts an enabled message to the ACM . When the ACM receives this message, it reduces the speaker output so that the parking aid tone can be heard more clearly.

- DTC U0159 (Lost Communication With Parking Assist Control Module (PAM)) â set by the non-navigation (Fusion) ACM when the volume cutback message is missing for greater than 5 seconds. When the message is missing, the ACM defaults to no volume cutback when the parking aid tone is sounding.
- DTC U0159:00 (Lost Communication With Parking Assist Control Module "A": No Sub Type Information) â set by the non-navigation (MKZ) or the navigation (all) ACM when the volume cutback message is missing for greater than 5 seconds. When the message is missing, the ACM defaults to no volume cutback when the parking aid tone is sounding.

This pinpoint test is intended to diagnose the following:

- Parking aid system concern
- ACM

PINPOINT TEST U: THE AUDIO DOES NOT REDUCE WHEN THE PARKING AID TONE SOUNDS

Test Step	Result / Action to Take
U1 CHECK THE PARKING AID SIGNAL	
• Apply the parking brake. • Place an object behind the vehicle within the range of the parking aid sensors. Refer to Section 413-13 . • Ignition ON. • Place the transmission in REVERSE (R). • Enter the following diagnostic mode on the scan tool: ACM DataLogger . • Monitor the parking aid input status PID (RPA_STAT) while the parking aid tone is sounding.	**Yes** GO to U2 . **No** REFER to Section 413-13 to continue diagnosis of the parking aid system.

• **Does the PID read "Enabled" when the parking aid tone is sounding?**	
U2 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test V: Voice Recognition Is Inoperative/Does Not Operate Correctly

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation â Vehicles Without Navigation

When the VOICE switch is pressed, it changes a reference voltage signal, and the audio system enters voice recognition mode. The VOICE switch is wired to the Accessory Protocol Interface Module (APIM).

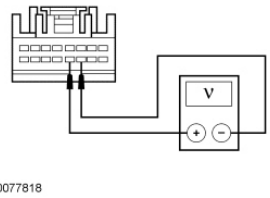
Vehicles With Navigation

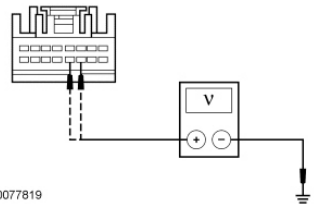
When the VOICE switch is pressed, it changes a reference voltage signal, and the audio system enters voice recognition mode. The VOICE switch is wired to the Audio Front Control Module (ACM). The APIM receives the microphone input and also broadcasts it to the ACM . The first voice commands spoken determine which system handles the voice commands.

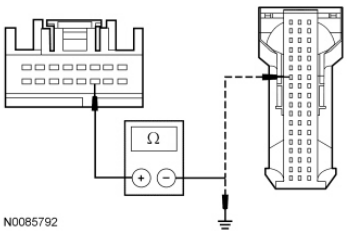
The microphone test is available through the scan tool or through the ACM self-diagnostic mode. Running this test causes the ACM to produce a test tone. If the system is operating correctly, the microphone detects the tone and produces a signal to the ACM indicating the tone was heard.

- DTC B1A16:01 (Microphone Input Circuit: General Electrical Failure) â set by the APIM during the on-demand self-test if it does not detect the microphone.
- DTC B1D79:01 (Microphone Input Circuit: General Electrical Failure) â set by the ACM during the microphone test when it does not receive an adequate signal from the microphone when the test tone is sounded.

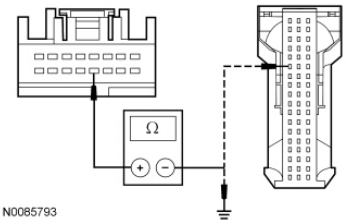
This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Microphone
- Steering wheel controls
- ACM (if equipped with navigation)
- APIM (if equipped)



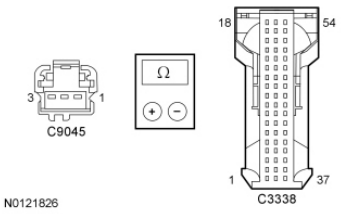
PINPOINT TEST V: VOICE RECOGNITION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
V1 CHECK THE OPERATION OF THE STEERING WHEEL CONTROLS	
• Operate the audio system in radio tuner (AM/FM) mode. • Press the VOICE switch on the steering wheel controls. • **Does the audio system enter voice recognition mode?**	**Yes** GO to V2 . **No** GO to Pinpoint Test Q to diagnose the steering wheel controls system.
V2 CHECK THE OPERATION OF THE VOICE RECOGNITION	
• Press the VOICE switch on the steering wheel controls. • Wait for the audio system to acknowledge the VOICE switch being pressed. • While still in voice recognition mode, speak the command "PHONE", and observe the audio system. • **Does the audio system acknowledge the command "PHONE"?**	**Yes** If the vehicle is equipped with navigation, GO to V3 . Otherwise, the system is operating correctly at this time. ADVISE the customer on the correct operation of the voice recognition system. **No** GO to V6 .
V3 CHECK THE MICROPHONE SIGNAL TO THE ACM	
• Operate the audio system in radio tuner (AM/FM) mode. • Disconnect: ACM C240c. • **NOTE:** ACM C240c must be disconnected after the ACM is powered on or the ACM will not receive the RUN message over the network. • Press the VOICE switch on the steering wheel controls. • While speaking a command, measure the AC voltage between the ACM C240c-11, circuit VMM13 (YE/GN), harness side and the ACM C240c-12, circuit RMM13 (BU), harness side.	**Yes** GO to V13 . **No** GO to V4 .

 N0077818 • **Is a fluctuating AC voltage present?**	
V4 CHECK THE MICROPHONE CIRCUITS TO THE ACM FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: APIM C3338. • Ignition ON. • Measure the voltage between the ACM C240c-11, circuit VMM13 (YE/GN), harness side and ground; and between the ACM C240c-12, circuit RMM13 (BU), harness side and ground.  N0077819 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to V5 .
V5 CHECK THE MICROPHONE CIRCUITS TO THE ACM FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the ACM C240c-11, circuit VMM13 (YE/GN), harness side and the APIM C3338-12, circuit VMM13 (YE/GN), harness side; and between the ACM C240c-11, circuit VMM13 (YE/GN), harness side and ground.  N0085792 • Measure the resistance between the ACM C240c-12, circuit RMM13 (BU), harness side and the APIM C3342-13, circuit RMM13 (BU), harness side; and between the ACM C240c-12, circuit RMM13 (BU), harness side and ground.	**Yes** GO to V9 . **No** REPAIR the circuit in question. TEST the system for normal operation.



- **Is the resistance less than 5 ohms between the ACM and the APIM , and greater than 10,000 ohms between the ACM and ground?**

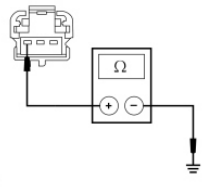
V6 CHECK THE MICROPHONE CIRCUITS FOR AN OPEN

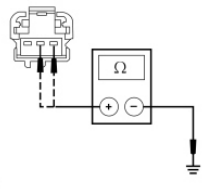
- Ignition OFF.
- Disconnect: Microphone C9045.
- Disconnect: APIM C3338.
- Measure the resistance between the microphone, harness side and between the APIM , harness side as follows:

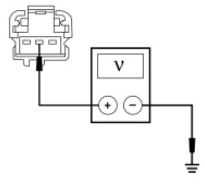
Positive Meter Lead	Negative Meter Lead	Circuit
C9045-1	C3338-18	RMM13 (BU)
C9045-2	C3338-5	VMM13 (YE/GN)
C9045-3	C3338-6	DMM13 (none)

- **Are the resistances less than 5 ohms?**

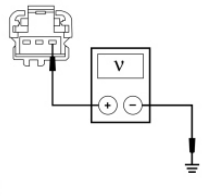
Yes
GO to V7 .







No
REPAIR the circuit in question. TEST the system for normal operation.



V7 CHECK THE MICROPHONE SHIELD

- Disconnect: Negative Battery Cable.
- Measure the resistance between the microphone C9045-3, circuit DMM13 (none), harness side and ground.

Yes
CONNECT the negative battery cable. GO to V8 .

No
REPAIR the circuit for an open. TEST the system for normal operation.

 N0121825 • **Is the resistance less than 5 ohms?**	
V8 CHECK THE MICROPHONE CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the microphone C9045-1, circuit RMM13 (BU), harness side and ground; and between the microphone C9045-2, circuit VMM13 (YE/GN), harness side and ground.  N0121824 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to V9 . **No** REPAIR the circuit in question. TEST the system for normal operation.
V9 CHECK THE MICROPHONE SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE	
• Measure the voltage between the microphoneC9045-2, circuit VMM13 (YE/GN), harness side and ground.  N0121828 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to V10 .
V10 CHECK THE MICROPHONE VOLTAGE SUPPLY CIRCUIT	
• Connect: APIM C3338. • Ignition ON. • Measure the voltage between the microphone C9045-1, circuit RMM13 (BU), harness side and ground.	**Yes** GO to V11 . **No** GO to V12 .

 • **Is the voltage greater than 10 volts?**	
V11 ISOLATE THE MICROPHONE	
• Connect: APIM C3342. • Install a new microphone. Refer to Microphone in this section. • Operate the audio system in radio tuner (AM/FM) mode. • Press the VOICE switch on the steering wheel controls and attempt several voice commands. • **Does the voice recognition operate correctly?**	**Yes** The fault was caused by an inoperative microphone. The system is now operating correctly. **No** GO to V12 .
V12 CHECK FOR CORRECT APIM OPERATION	
• Connect: All Disconnected Connectors. • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
V13 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test W: No Global Positioning System (GPS) Antenna Signal

Normal Operation

The Global Positioning System (GPS) antenna provides information from the GPS satellite system to the Audio Front Control Module (ACM). This information is used to calculate position and direction of travel.

A splitter is used in the front satellite radio antenna cable to split the signals between the satellite radio and the

GPS . It is possible that a concern in the GPS signal line after the splitter may cause a navigation system concern without affecting the satellite radio.

- DTC B119F:01 (GPS Antenna: General Electrical Failure) â sets when any failure is detected in the GPS antenna circuit.
- DTC B119F:13 (GPS Antenna: Circuit Open) â sets when an open is detected in the GPS antenna circuit.

This pinpoint test is intended to diagnose the following:

- Satellite radio antenna cable
- AM/FM/SDARS/NAV radio antenna
- ACM

PINPOINT TEST W: NO GPS ANTENNA SIGNAL

Test Step	Result / Action to Take
W1 CHECK THE SATELLITE SIGNAL PID (SAT_SIG_STR)	
• Enter the following diagnostic mode on the scan tool: ACM DataLogger . • Monitor the ACM PID (SAT_SIG_STR). • **Does the PID indicate "No Signal"?**	**Yes** GO to Pinpoint Test B . **No** GO to W2 .
W2 CHECK FOR GPS SIGNAL-RELATED DTCs	
• Clear the ACM DTCs. • Carry out the ACM self-test. • **Is DTC B119F:01 or DTC B119F:13 retrieved?**	**Yes** INSTALL a new front satellite radio antenna cable. REFER to Antenna Cable â Satellite Radio in this section. CLEAR the DTCs. TEST the system for normal operation. **No** GO to W3 .
W3 SUBSTITUTE KNOWN GOOD ANTENNA	
• Ignition OFF. • Install a known good AM/FM/SDARS/NAV antenna. Antenna â AM/FM/Satellite Radio/Navigation . • **Is the concern still present?**	**Yes** GO to W4 . **No** INSTALL a new AM/FM/SDARS/NAV radio antenna. REFER to Antenna â AM/FM/Satellite Radio/Navigation in this section. TEST the system for normal operation.
W4 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â

connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test X: The Position Cursor Is Inaccurate

Normal Operation

The primary source of vehicle location for the navigation system is the Audio Front Control Module (ACM) receiving the position signal through the Global Positioning System (GPS) antenna (integral to the satellite radio antenna).

In addition, the ACM receives the navigation rolling wheel count signal from the Instrument Panel Cluster (IPC) (which gateways the signal from the ABS module). This secondary signal is used to calculate vehicle position when the GPS signal is lost. It also supports the adaptive learning function of the ACM , whereby the ACM can compensate for long-term differences between the GPS signal location and the actual distance traveled by the vehicle.

If DTC B119F:01 or DTC B119F:13 is present, GO to Pinpoint Test W to diagnose a concern with the GPS antenna.

- DTC U2014:09 (Control Module Hardware: Component Failure) â sets when the ACM detects a fault in the internal gyroscope. The gyroscope is not serviceable.

This pinpoint test is intended to diagnose the following:

- GPS antenna concern
- Network message concern
- ACM

PINPOINT TEST X: THE POSITION CURSOR IS INACCURATE

Test Step	Result / Action to Take
X1 CHECK THE ACM FOR GPS SIGNAL-RELATED DTCs	
• Retrieve the ACM continuous DTCs. • **Is DTC B119F:01 or DTC B119F:13 present?**	**Yes** GO to Pinpoint Test W . **No** GO to X2 .
X2 CHECK FOR DTC U0155:00	
• Review the ACM continuous	**Yes** GO to Pinpoint Test AG .

DTCs. • **Is DTC U0155:00 present?**	**No** GO to X3 .
X3 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test Y: The Voice Guidance Is Inoperative/Does Not Operate Correctly

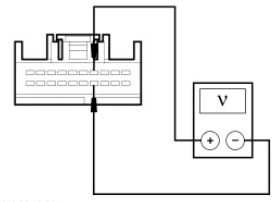
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation â Premium Sound

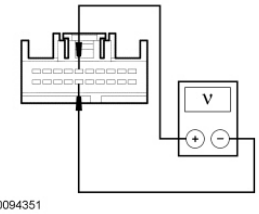
The voice-assisted route guidance is broadcast through the front speakers. The voice guidance volume can be adjusted using the settings on the Audio Front Control Module (ACM).

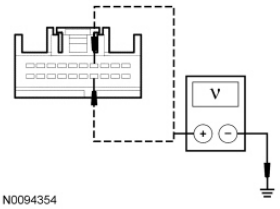
SonyÂ® or THXÂ® Sound

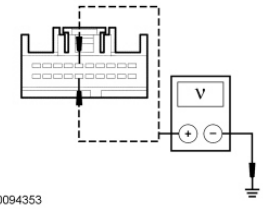
The voice-assisted route guidance is broadcast through the instrument panel speaker. The volume can be adjusted using the settings on the ACM . The ACM sends the voice guidance audio signals to the audio Digital Signal Processing (DSP) module through a dedicated pair of circuits.



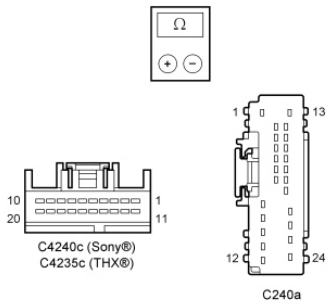
- DTC B1A07:01 (Speaker #7: General Electrical Failure) â sets when a fault is detected in the navigation audio circuits.







This pinpoint test is intended to diagnose the following:



- Incorrect voice guidance setting
- Wiring, terminals or connectors (except premium sound)
- Audio DSP module (except premium sound)
- ACM

PINPOINT TEST Y: THE VOICE GUIDANCE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Y1 CHECK THE VOICE GUIDANCE SETTING	
• Adjust the voice volume to approximately 50%. Refer to the Owner's Literature. • Set a destination and start the route using the navigation controls. Refer to the Owner's Literature. • Observe the voice guidance. • **Does the voice guidance operate correctly?**	**Yes** The concern was caused by an incorrect customer setting. INSTRUCT the customer in the correct use of the voice guidance feature. **No** GO to Y2 .
Y2 CHECK THE SPEAKER OUTPUT	
• Carry out the speaker walk test. Refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section. • **Do the front speakers (premium sound) or instrument panel speaker (SonyÂ® or THXÂ® sound) operate correctly?**	**Yes** For premium sound, GO to Y6 . For SonyÂ® or THXÂ® sound, GO to Y3 . **No** For premium sound, GO to Pinpoint Test D . For SonyÂ® sound, GO to Pinpoint Test E . For THXÂ® sound, GO to Pinpoint Test F .
Y3 CHECK THE NAVIGATION AUDIO SIGNAL TO THE AUDIO DSP MODULE	
• Ignition OFF. • Disconnect: Audio DSP Module 4240c (SonyÂ®) Or C4235c (THXÂ®) . • Operate the audio system in navigation mode. • For SonyÂ® sound, while pressing the REPEAT button on the ACM , measure the AC voltage between the audio DSP module C4240c-4, circuit VMN07 (GY), harness side and the audio DSP module C4240c-14, circuit RMN07 (VT), harness side.  N0094352 • For THXÂ® sound, while pressing the REPEAT button on the ACM , measure the AC voltage between the audio DSP module C4235c-6, circuit VMN07 (GY), harness side and the audio DSP module C4235c-16, circuit RMN07	**Yes** GO to Y7 . **No** GO to Y4 .

(VT), harness side.  N0094351 • **Is a fluctuating AC voltage present?**	
Y4 CHECK THE NAVIGATION AUDIO SIGNAL CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240a . • Ignition ON. • For SonyÂ® sound, measure the voltage between the audio DSP module C4240c-4, circuit VMN07 (GY), harness side and ground; and between the audio DSP module C4240c-14, circuit RMN07 (VT), harness side and ground.  N0094354 • For THXÂ® sound, measure the voltage between the audio DSP module C4235c-6, circuit VMN07 (GY), harness side and ground; and between the audio DSP module C4235c-16, circuit RMN07 (VT), harness side and ground.  N0094353 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to Y5 .
Y5 CHECK THE NAVIGATION AUDIO SIGNAL CIRCUITS FOR AN OPEN OR SHORT TO GROUND	

• Ignition OFF. • Measure the resistance between the audio DSP module, harness side and the ACM , harness side; and between the audio DSP module, harness side and ground as follows: **Sound System / Positive Meter Lead / Negative Meter Lead / Circuit** SonyÂ® / C4240c-4, then ground / C240a-2 / VMN07 (GY) / C4240c-14, then ground / C240a-14 / RMN07 (VT) THXÂ® / C4235c-6, then ground / C240a-2 / VMN07 (GY) / C4235c-16, then ground / C240a-14 / RMN07 (VT)  N0102377 • **Is the resistance less than 5 ohms between the audio DSP module and the ACM , and greater than 10,000 ohms between the audio DSP module and ground?**	**Yes** GO to Y6 . **No** REPAIR the circuit in question. TEST the system for normal operation.
Y6 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation after the repair. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Y7 CHECK FOR CORRECT AUDIO DSP MODULE OPERATION	
• Disconnect all the audio DSP module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the audio DSP module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new audio DSP module. REFER to Audio Digital Signal Processing (DSP) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test Z: The SYNCÂ® System Is Completely Inoperative

Normal Operation

When a button on the Front Controls Interface Module (FCIM) is pressed, a network message is sent to the Accessory Protocol Interface Module (APIM) via the Medium Speed Controller Area Network (MS-CAN). The APIM takes the appropriate action and sends a status message to the Front Display Interface Module (FDIM) (vehicles without navigation) or the Audio Front Control Module (ACM) (vehicles with navigation) in order to update the display screen.

- DTC U3000:04 (Control Module: System Internal Failure) â sets when the APIM detects a fault due to a device conflict or an internal failure.

This pinpoint test is intended to diagnose the following:

- Audio system concern
- Communication network concern
- Customer error
- Customer device
- APIM

PINPOINT TEST Z: THE SYNCÂ® SYSTEM IS COMPLETELY INOPERATIVE

Test Step	Result / Action to Take
Z1 CHECK FOR SCAN TOOL COMMUNICATION WITH THE APIM	
• Carry out the network test using the scan tool. • **Does the APIM pass the network test?**	**Yes** GO to Z2 . **No** REFER to Section 418-00 .
Z2 CHECK THE SYNCÂ® SYSTEM OPERATION	
	Yes The SYNCÂ® system is operating correctly at this time.

NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNCÂ® system. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNCÂ® inputs function correctly?**	CARRY OUT a SYNCÂ® system Master Reset. Refer to the Owner's Literature. REVIEW the SYNCÂ® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** GO to Z3 .
Z3 RESET THE APIM AND RECHECK SYNCÂ® SYSTEM OPERATION	
• Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNCÂ® inputs function correctly?**	**Yes** The SYNCÂ® system is operating correctly at this time. CARRY OUT a SYNCÂ® system Master Reset. REFER to the Owner's Literature. REVIEW the SYNCÂ® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** If only some (but not all) of the inputs are inoperative, GO to Symptom Chart - SYNCÂ®System to diagnose the observed symptom. If all inputs are inoperative and/or DTC U3000:04 is present, INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section.

Pinpoint Test AA: Unable To Pair Bluetooth Device

Normal Operation

When a new Bluetooth device is added, the Accessory Protocol Interface Module (APIM) and the Bluetooth device must be paired together. Most Bluetooth devices can pair with the SYNCÂ® system, although functionality may vary. To determine if a Bluetooth device is supported, retrieve the Consumer Interface Processor (CIP) software level using the Accessory Protocol Interface Module (APIM) Software Level Check in this section, and verify the customer device is on the compatibility list for the current CIP software level.

Pairing a Bluetooth device is accomplished through the "Add Device" selection of the phone menu. When pairing a device, the SYNCÂ® system generates a unique Personal Identification Number (PIN) that must be entered on the Bluetooth device in order for the pairing process to be successful. There are also some device-specific actions that must take place. For additional information on the pairing process, refer to the Owner's Literature.

This pinpoint test is intended to diagnose the following:

- Incompatible Bluetooth device
- Customer error
- Customer Bluetooth device
- APIM

PINPOINT TEST AA: UNABLE TO PAIR BLUETOOTH DEVICE

Test Step	Result / Action to Take
AA1 CHECK THE BLUETOOTH CONNECTION	
NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNCÂ® system. • Connect: Multi-Media Interface Tester . • Using the Multi-Media Interface Tester, connect to the SYNCÂ® system using Bluetooth. Follow the tool instructions. • Enter the following diagnostic mode on the scan tool: APIM DataLogger . • Monitor the Bluetooth device paired PID (BT_PAIR) and the Bluetooth device connected PID (BT_CONN). • **Do the PIDs BT_PAIR and BT_CONN both read "Yes"?**	**Yes** The SYNCÂ® system is operating correctly at this time. CARRY OUT a SYNCÂ® system Master Reset. REFER to the Owner's Literature. REVIEW the pairing process with the customer. If the customer device still does not pair, the fault is with the customer device. **No** GO to AA2 .
AA2 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AB: The Universal Serial Bus (USB) Port Is Inoperative/Does Not Operate Correctly

Normal Operation

The Universal Serial Bus (USB) port is connected to the Accessory Protocol Interface Module (APIM) through the USB cable. The USB port can be used to play audio files or upload software from mass storage devices, or for connecting a media device.

If supported by the user device, the USB can provide charging. Because of this feature, when a USB device is plugged into the USB port, the SYNCÂ® system does not automatically switch to the device.

If a USB mass storage device is used to play an audio file, the SYNCÂ® system only plays audio files that do not have Digital Rights Management (DRM) protection.

The USB cable and port are not serviceable separately.

- DTC B1252:04 (USB Port: System Internal Failure) â sets when the APIM detects an over-temperature condition in the USB circuit. This can be caused by a fault in the USB cable and port, or by the customer USB device.
- DTC B1252:11 (USB Port: Circuit Short to Ground) â sets when the APIM detects an over-current condition in the USB circuit. This can be caused by a fault in the USB cable and port, or by the customer USB device.

This pinpoint test is intended to diagnose the following:

- Customer USB device
- USB cable and port
- APIM

PINPOINT TEST AB: THE USB PORT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AB1 CHECK THE USB CONNECTION	
• Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port. • **Does the audio file play successfully using the USB connection?**	**Yes** The SYNCÂ® system is operating correctly. REVIEW the operation of the USB port with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** GO to AB2 .
AB2 INSPECT THE USB CABLE	
• Ignition OFF. • Disconnect: USB Cable At APIM . • Inspect the USB cable for damage. • Connect: USB Cable At APIM . • Ignition ON. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port. • **Does the audio file play successfully using the USB connection?**	**Yes** The concern was caused by the USB connection not being seated correctly. The system is now operating correctly. **No** GO to AB3 .
AB3 RESET THE APIM AND RECHECK SYNCÂ® SYSTEM OPERATION	
	Yes The SYNCÂ® system is operating correctly at this time.

NOTE: Carrying out a Master Reset returns all preference settings to the factory defaults, erases all the phone book and call histories, and deletes any devices paired with the SYNCÂ® system. • Carry out an APIM power reset by disconnecting the battery for 5 minutes, then reconnecting it. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, test the audio output for the audio input jack, USB port, and Bluetooth connection using the VOICE switch on the steering wheel controls to enter each mode. • **Do all of the SYNCÂ® inputs function correctly?**	CARRY OUT a SYNCÂ® system Master Reset. REFER to the Owner's Literature. REVIEW the SYNCÂ® system operation with the customer. If the customer device still does not operate correctly, the fault is with the customer device. **No** If only the USB port is inoperative, GO to AB4 . If additional inputs are inoperative, GO to Symptom Chart - SYNCÂ®System to diagnose the observed symptom. If all inputs are inoperative, INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section.
AB4 ISOLATE THE USB CABLE AND PORT	
• Install a new USB cable and port. Refer to Universal Serial Bus (USB) Cable and Port in this section. • Connect: Multi-Media Interface Tester. • Using the Multi-Media Interface Tester, attempt to play a file using the USB port. • **Does the audio file play successfully using the USB connection?**	**Yes** The concern was caused by an inoperative USB cable. The system is now operating correctly. **No** GO to AB5 .
AB5 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs present.

Pinpoint Test AC: The SYNCÂ® System Audible Prompts Are Inoperative/Do Not Operate Correctly

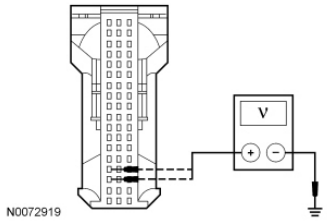
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

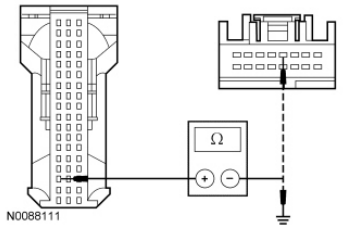
Normal Operation

The Text-To-Speech (TTS) and voice prompt features speak certain text information and interaction requests in order to minimize driver distraction while driving. The ringtone alerts the driver to an incoming call.

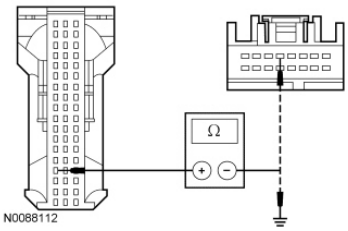
Audible prompts can range from a simple tone to more elaborate spoken text, based on the customer setting. When interaction mode is set to standard, detailed guidance is provided. When interaction mode is set to advanced, most prompts are tones only and minimal audible guidance is provided. Refer to the Owner's Literature for further information on voice interaction.

The audio signals for the TTS and voice prompt features, the ringtones, and audio from the outside device during a phone call, are sent from the Accessory Protocol Interface Module (APIM) to the Audio Front Control Module (ACM).





This pinpoint test is intended to diagnose the following:



- Customer setting
- Wiring, terminals or connectors
- ACM
- APIM

PINPOINT TEST AC: THE SYNCÂ® SYSTEM AUDIBLE PROMPTS ARE INOPERATIVE/DO NOT OPERATE CORRECTLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
AC1 CHECK THE AUDIBLE PROMPT SETTING	
• Operate the audio system in SYNCÂ® mode. • Verify the audible prompts are enabled. Refer to "SYNCÂ® Voice Recognition Feature" in the Owner's Literature. • Press the VOICE switch on the steering wheel controls and observe the SYNCÂ® system audible prompt. • **Does the SYNCÂ® system produce an audible prompt correctly?**	**Yes** The system is operating correctly at this time. The concern was caused by a customer setting. INSTRUCT the customer in the correct operation of the audible prompt feature. **No** GO to AC2 .
AC2 CHECK FOR A VOLTAGE SIGNAL FROM THE APIM	
NOTICE: **This pinpoint test step directs testing circuits using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring,**	**Yes** For vehicles with navigation, GO to Pinpoint Test Y . Otherwise, GO to AC6 . **No**

terminals, or connectors and subsequent electrical faults. • Operate the audio system in SYNCÂ® mode. • While pressing the VOICE switch repeatedly, measure the AC voltage by back-probing between the ACM C240c-4, circuit VMN14 (WH/VT), harness side and the ACM C240c-5, circuit RMN14 (GY/BN), harness side. • **Is an AC voltage produced each time the VOICE switch is pressed?**	GO to AC3 .
AC3 CHECK THE AUDIBLE PROMPT CIRCUITS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: ACM C240c . • Disconnect: APIM C3338 . • Ignition ON. • Measure the voltage between the APIM C3338-3, circuit VMN14 (WH/VT), harness side and ground; and between the APIM C3338-4, circuit RMN14 (GY/BN), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to AC4 .
AC4 CHECK THE AUDIBLE PROMPT CIRCUITS FOR AN OPEN OR SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the APIM C3338-3, circuit VMN14 (WH/VT), harness side and the ACM 240c-4, circuit VMN14 (WH/VT), harness side; and between the APIM C3338-3, circuit VMN14 (WH/VT), harness side and ground.  • Measure the resistance between the APIM C3338-4, circuit RMN14 (GY/BN), harness side and the ACM 240c-5, circuit RMN14 (GY/BN), harness side; and between the APIM C3338-4, circuit RMN14 (GY/BN), harness side and ground.	**Yes** GO to AC5 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 • **Is the resistance less than 5 ohms between the APIM and the ACM , and greater than 10,000 ohms between the APIM and ground?**	
AC5 CHECK FOR CORRECT APIM OPERATION	
• Connect: All Disconnected Connectors . • Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initalize. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
AC6 CHECK FOR CORRECT ACM OPERATION	
• Ignition OFF. • Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AD: DTC U0100:00

Normal Operation

The Accessory Protocol Interface Module (APIM) receives network messages from the PCM via the High Speed Controller Area Network (HS-CAN). These messages include the odometer reading and the fuel level.

As other modules outside of the audio system also receive these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0100:00 (Lost Communication With ECM /PCM "A": No Sub Type Information) â set by the APIM when it is missing messages from the PCM over the HS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- PCM

PINPOINT TEST AD: DTC U0100:00

Test Step	Result / Action to Take
AD1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0100 or DTC U0100:00 set in any modules?**	**Yes** GO to AD2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AD2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ APIM ♦ PCM ♦ Instrument Panel Cluster (IPC) • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For the APIM , REFER to DTC Charts in this section. For all other modules, REFER to the master list in Section 419-10 . **No** GO to AD3 .
AD3 CHECK FOR DTC U0100 OR DTC U0100:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0100 or DTC U0100:00 set in more than one module?**	**Yes** GO to AD4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, CHECK the wiring between the APIM and the PCM for an intermittent fault.
AD4 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new PCM. Refer to the appropriate section in Group 303 for the procedure.. CLEAR all continuous DTCs. REPEAT the APIM self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the APIM self-test.

Pinpoint Test AE: DTC U0140 Or DTC U0140:00

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

Several audio system modules receive network messages from the Smart Junction Box (SJB) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- Ignition switch position
- Illumination dimmer control
- Accessory delay status

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0140 (Lost Communication With Body Control Module (GEM)) â set by the non-navigation (Fusion) Audio Front Control Module (ACM), the Front Controls Interface Module (FCIM) (Fusion), or the Front Display Interface Module (FDIM) when network messages are missing from the SJB for greater than 5 seconds with the ignition in RUN.
- DTC U0140:00 (Lost Communication With Body Control Module: No Sub Type Information) â set by the non-navigation (MKZ) or navigation (all) ACM , the audio Digital Signal Processing (DSP) module, the Accessory Protocol Interface Module (APIM), the Global Positioning System Module (GPSM), or the FCIM (MKZ) when network messages are missing from the SJB for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- SJB

PINPOINT TEST AE: DTC U0140 OR DTC U0140:00

Test Step	Result / Action to Take
AE1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON.	**Yes** GO to AE2 .

• Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0140 or DTC U0140:00 set in any audio system module?**	**No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AE2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ Audio DSP module (if equipped) ♦ APIM (if equipped) ♦ FCIM ♦ FDIM ♦ GPSM (if equipped) ♦ SJB • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For an audio system module, REFER to DTC Charts in this section. For the SJB , REFER to Section 419-10 . **No** GO to AE3 .
AE3 CHECK FOR DTC U0140 OR DTC U0140:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0140 or DTC U0140:00 set in more than one audio system module?**	**Yes** GO to AE4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, CHECK the MS-CAN wiring between the SJB and the module in question for an intermittent fault.
AE4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0140 or DTC U0140:00.

Pinpoint Test AF: DTC U0151:00

Normal Operation

The Accessory Protocol Interface Module (APIM) receives the emergency call notification message from the Restraints Control Module (RCM) via the High Speed Controller Area Network (HS-CAN). This message indicates to the APIM the status of the emergency call system.

As other modules outside of the audio system also receive this message, all modules receiving it should exhibit a symptom if the message is missing.

- DTC U0151:00 (Lost Communication With Restraints Control Module: No Sub Type Information) â set by the APIM when it is missing the emergency call notification message from the RCM over the HS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Restraints system concern

PINPOINT TEST AF: DTC U0151:00

Test Step	Result / Action to Take
AF1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0151 or DTC U0151:00 set in any modules?**	**Yes** GO to AF2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AF2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ APIM ♦ PCM ♦ RCM ♦ Instrument Panel Cluster (IPC) • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For the APIM , REFER to DTC Charts in this section. For all other modules, REFER to the master list in Section 419-10 . **No** GO to AF3 .
AF3 CHECK FOR DTC U0151 OR DTC U0151:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test.	**Yes** GO to AF4 .

• **Is DTC U0151 or DTC U0151:00 set in more than one module?**	**No** If there is an observable audio system symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is an observable restraints system symptom, REFER to Section 501-20B to diagnose the symptom. If there is no observable symptom, CHECK the wiring between the APIM and the RCM for an intermittent fault.
AF4 CHECK FOR CORRECT RCM OPERATION	
• Disconnect all the RCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the RCM connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs.

Pinpoint Test AG: DTC U0155 Or DTC U0155:00

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

Several audio system modules receive network messages from the Instrument Panel Cluster (IPC) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- English/metric units
- Vehicle Identification Number (VIN)
- Transmission gear selected
- Vehicle speed

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0155 (Lost Communication With Instrument Panel Cluster (IC)) â set by the non-navigation (Fusion) Audio Front Control Module (ACM) or the Front Display Interface Module (FDIM) when network messages are missing from the IPC for greater than 5 seconds with the ignition in RUN.
- DTC U0155:00 (Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information) â set by the non-navigation (MKZ) or navigation (all) ACM , the audio Digital Signal Processing (DSP) module, the Global Positioning System Module (GPSM), or the Accessory Protocol Interface Module (APIM) when network messages are missing from the IPC for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- IPC

PINPOINT TEST AG: DTC U0155 OR DTC U0155:00

Test Step	Result / Action to Take
AG1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0155 or DTC U0155:00 set in any audio system module?**	**Yes** GO to AG2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AG2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ Audio DSP module (if equipped) ♦ APIM (if equipped) ♦ FDIM ♦ GPSM ♦ IPC • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For an audio system module, REFER to DTC Charts in this section. For the IPC , REFER to Section 413-01 . **No** GO to AG3 .
AG3 CHECK FOR DTC U0155 OR DTC U0155:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0155 or DTC U0155:00 set in more than one audio system module?**	**Yes** GO to AG4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, CHECK the MS-CAN wiring between the SJB and the module in question for an intermittent fault.
AG4 CHECK FOR CORRECT IPC OPERATION	
	Yes

• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • **Is the concern still present?**	INSTALL a new IPC . REFER to Section 413-01 . CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0155 or DTC U0155:00.

Pinpoint Test AH: DTC U0164 Or DTC U0164:00

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

Some audio system modules receive network messages from the HVAC module via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- HVAC indication status
- Outside temperature

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0164 (Lost Communication With HVAC Control Module (EATC)) â set by the non-navigation (Fusion) Front Controls Interface Module (FCIM) or the Front Display Interface Module (FDIM) when network messages are missing from the HVAC module for greater than 5 seconds with the ignition in RUN.
- DTC U0164:00 (Lost Communication With HVAC Control Module: No Sub Type Information) â set by the navigation Audio Front Control Module (ACM) when network messages are missing from the HVAC module for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- HVAC module

PINPOINT TEST AH: DTC U0164 OR DTC U0164:00

Test Step	Result / Action to Take
AH1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF.	**Yes** GO to AH2 . **No** The system is operating correctly at this time. The DTC

• Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0164 or DTC U0164:00 set in any audio system module?**	may have been set due to an intermittent fault in the network wiring.
AH2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ FCIM ♦ FDIM ♦ HVAC module • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** For an audio system module, REFER to DTC Charts in this section. For the HVAC module, REFER to Section 412-00A or Section 412-00B . **No** GO to AH3 .
AH3 CHECK FOR DTC U0164 OR DTC U0164:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0164 or DTC U0164:00 set in more than one audio system module?**	**Yes** GO to AH4 . **No** If there is an observable symptom, GO to Symptom Chart - General Audio System to diagnose the observed symptom. If there is no observable symptom, CHECK the MS-CAN wiring between the HVAC module and the module in question for an intermittent fault.
AH4 CHECK FOR CORRECT HVAC MODULE OPERATION	
• Disconnect all the HVAC module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the HVAC module connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0164 or DTC U0164:00.

Pinpoint Test AI: DTC U016A:00

Normal Operation

- DTC U016A:00 (Lost Communication With Global Positioning System Module: No Sub Type Information) â set by the Accessory Protocol Interface Module (APIM) when it is missing network messages from the Global Positioning System Module (GPSM) over the Medium Speed Controller Area Network (MS-CAN) for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- GPSM
- APIM

PINPOINT TEST AI: DTC U016A:00

Test Step	Result / Action to Take
AI1 CHECK THE APIM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the APIM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Repeat the APIM self-test. • **Is DTC U016A:00 still present?**	**Yes** GO to AI2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AI2 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AI3 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring. CHECK the MS-CAN wiring between the APIM and the GPSM for an intermittent fault.
AI3 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Carry out the network test using the scan tool. • **Does the GPSM pass the network test?**	**Yes** GO to AI4 . **No** REFER to Section 418-00 .
AI4 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ APIM ♦ GPSM • **Is DTC U3003:16 or DTC U3003:17 recorded in either module?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new GPSM . REFER to Global Positioning System Module (GPSM) â Fusion or Global Positioning System Module (GPSM) â MKZ in this section. CLEAR the APIM

	DTCs. REPEAT the APIM self-test. If DTC U016A:00 is still present, INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.

Pinpoint Test AJ: DTC U0184 Or DTC U0184:00

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

Several audio system modules receive network messages from the Audio Front Control Module (ACM) via the Medium Speed Controller Area Network (MS-CAN). These messages consist of various audio system related information.

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0184 (Lost Communication With Radio (ACM)) â set by theFront Controls Interface Module (FCIM) (Fusion) or the Front Display Interface Module (FDIM) when network messages are missing from the ACM for greater than 5 seconds with the ignition in RUN.
- DTC U0184:00 (Lost Communication With Radio: No Sub Type Information) â set by the audio Digital Signal Processing (DSP) module, the Accessory Protocol Interface Module (APIM), the FCIM (MKZ), and the Global Positioning System Module (GPSM) when network messages are missing from the ACM for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- ACM

PINPOINT TEST AJ: DTC U0184 OR DTC U0184:00

Test Step	Result / Action to Take
AJ1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0184 or DTC U0184:00 set in any audio system module?**	**Yes** GO to AJ2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.

AJ2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ Audio DSP module (if equipped) ♦ APIM (if equipped) ♦ FCIM ♦ FDIM ♦ GPSM • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** REFER to DTC Charts in this section. **No** GO to AJ3 .
AJ3 CHECK FOR DTC U0184 OR DTC U0184:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test. • **Is DTC U0184 or DTC U0184:00 set in more than one audio system module?**	**Yes** GO to AJ4 . **No** If there is an observable symptom, REFER to the appropriate Symptom Chart in this section. If there is no observable symptom, CHECK the MS-CAN wiring between the ACM and the module in question for an intermittent fault.
AJ4 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0184 or DTC U0184:00.

Pinpoint Test AK: DTC U0197 Or DTC U0197:00

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

Several audio system modules receive network messages from the Accessory Protocol Interface Module (APIM) via the Medium Speed Controller Area Network (MS-CAN). These messages consist of various audio system related information.

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

- DTC U0197 (Lost Communication With Telephone Control Module) â set by the non-navigation (Fusion) Audio Front Control Module (ACM) or the Front Display Interface Module (FDIM) when network messages are missing from the APIM for greater than 5 seconds with the ignition in RUN.
- DTC U0197:00 (Lost Communication With Radio: No Sub Type Information) â set by the non-navigation (MKZ) ACM , the navigation (all) ACM , the audio Digital Signal Processing (DSP) module, or the Global Positioning System Module (GPSM) when network messages are missing from the APIM for greater than 5 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- Audio system concern
- APIM

PINPOINT TEST AK: DTC U0197 OR DTC U0197:00

Test Step	Result / Action to Take
AK1 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0197 or DTC U0197:00 set in any audio system module?**	**Yes** GO to AK2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AK2 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ Audio DSP module (if equipped) ♦ APIM (if equipped) ♦ FDIM ♦ GPSM • **Is DTC B1317, B1318, U3003:16, or U3003:17 recorded in any module?**	**Yes** REFER to DTC Charts in this section. **No** GO to AK3 .
AK3 CHECK FOR DTC U0197 OR DTC U0197:00 SET IN MULTIPLE MODULES	
• Review the recorded results from the self-test.	**Yes** GO to AK4 .

• **Is DTC U0197 or DTC U0197:00 set in more than one audio system module?**	**No** If there is an observable symptom, REFER to the appropriate Symptom Chart in this section. If there is no observable symptom, CHECK the MS-CAN wiring between the APIM and the module in question for an intermittent fault.
AK4 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initialize. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0197 or DTC U0197:00.

Pinpoint Test AL: DTC U0238 Or DTC U0238:00

Normal Operation

- DTC U0238 (Lost Communication With Digital Audio Control Module "D" (DSP)) â set by the non-navigation Audio Front Control Module (ACM) (Fusion) or the Front Display Interface Module (FDIM) when network messages are missing from the audio Digital Signal Processing (DSP) module over the Medium Speed Controller Area Network (MS-CAN) for greater than 5 seconds with the ignition in the RUN position.
- DTC U0238:00 (Lost Communication With Digital Audio Control Module "D": No Sub Type Information) â set by the non-navigation ACM (MKZ) or the navigation ACM when network messages are missing from the audio DSP module over the MS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ACM
- FDIM
- APIM

PINPOINT TEST AL: DTC U0238 OR DTC U0238:00

NOTE: Only the non-navigation FDIM can set DTC U0238. Disregard the pinpoint test steps for the FDIM if the concern is on a vehicle with navigation.

Test Step	Result / Action to Take
AL1 CHECK THE ACM AND FDIM DTCs	
	Yes GO to AL2 .

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the APIM and FDIM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Repeat the APIM and FDIM self-tests. • **Is DTC U0238 or DTC U0238:00 still present?**	**No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AL2 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AL3 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring. CHECK the MS-CAN wiring between the audio DSP module and the module in question for an intermittent fault.
AL3 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Carry out the network test using the scan tool. • **Does the audio DSP module pass the network test?**	**Yes** GO to AL4 . **No** REFER to Section 418-00 .
AL4 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ Audio DSP module ♦ FDIM • **Is DTC B1316, B1317, U3003:16 or U3003:17 recorded in any module?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new audio DSP module. REFER to Audio Digital Signal Processing (DSP) Module in this section. CLEAR the ACM and FDIM DTCs. REPEAT the ACM and FDIM self-tests. If DTC U0238:00 is still present in the ACM , INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. If DTC U0238:00 is still present in the FDIM , INSTALL a new FDIM . REFER to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section.

	TEST the system for normal operation.

Pinpoint Test AM: DTC U0255 Or DTC U0256:00

Normal Operation

- DTC U0255 (Lost Communication With Front Controls Interface Module) â set by the non-navigation Audio Front Control Module (ACM) (Fusion) when network messages are missing from the Front Controls Interface Module (FCIM) over the Medium Speed Controller Area Network (MS-CAN) for greater than 5 seconds with the ignition in the RUN position.
- DTC U0256:00 (Lost Communication With Front Controls Interface Module: No Sub Type Information) â set by the non-navigation ACM (MKZ), the navigation ACM (all), or the Accessory Protocol Interface Module (APIM) when network messages are missing from the FCIM over the MS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ACM
- FCIM
- APIM

PINPOINT TEST AM: DTC U0255 OR DTC U0256:00

NOTE: Disregard the pinpoint test steps for the APIM if the concern is on a vehicle without the SYNCÂ® system.

Test Step	Result / Action to Take
AM1 CHECK THE ACM AND APIM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the ACM and APIM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Repeat the ACM and APIM self-tests. • **Is DTC U0255 or DTC U0256:00 still present?**	**Yes** GO to AM2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AM2 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AM3 . **No** The system is operating correctly at this time. The

	DTC may have been set due to an intermittent fault in the network wiring. CHECK the MS-CAN wiring between the FCIM and the module in question for an intermittent fault.
AM3 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Carry out the network test using the scan tool. • **Does the FCIM pass the network test?**	**Yes** GO to AM4 . **No** REFER to Section 418-00 .
AM4 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ APIM ♦ FCIM • **Is DTC B1316, B1317, U3003:16 or U3003:17 recorded in any module?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new FCIM . REFER to Front Controls Interface Module (FCIM) â Fusion or Front Controls Interface Module (FCIM) â MKZ in this section. CLEAR the ACM and APIM DTCs. REPEAT the ACM and APIM self-tests. If DTC U0255 (Fusion without navigation) or DTC U0256:00 (all MKZ or Fusion with navigation) is still present in the ACM , INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. If DTC U0256:00 is still present in the APIM , INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.

Pinpoint Test AN: DTC U0256 Or DTC U0255:00

Normal Operation

- DTC U0256 (Lost Communication With Front Display Interface Module) â set by the non-navigation Audio Front Control Module (ACM) (Fusion) when network messages are missing from the Front Display Interface Module (FDIM) over the Medium Speed Controller Area Network (MS-CAN) for greater than 5 seconds with the ignition in the RUN position.
- DTC U0255:00 (Lost Communication With Front Display Interface Module: No Sub Type Information) â set by the non-navigation ACM (MKZ) or the Accessory Protocol Interface Module (APIM) when network messages are missing from the FDIM over the MS-CAN for greater than 5 seconds with the ignition in the RUN position.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- ACM
- FDIM

- APIM

PINPOINT TEST AN: DTC U0256 OR DTC U0255:00

NOTE: Disregard the pinpoint test steps for the APIM if the concern is on a vehicle without the SYNCÂ® system.

Test Step	Result / Action to Take
AN1 CHECK THE ACM AND FDIM DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the ACM and APIM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Repeat the ACM and APIM self-tests. • **Is DTC U0256 or DTC U0255:00 still present?**	**Yes** GO to AN2 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
AN2 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AN3 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring. CHECK the MS-CAN wiring between the FDIM and the module in question for an intermittent fault.
AN3 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Carry out the network test using the scan tool. • **Does the FDIM pass the network test?**	**Yes** GO to AN4 . **No** REFER to Section 418-00 .
AN4 CHECK FOR BATTERY VOLTAGE OUT-OF-RANGE DTCs	
• Carry out the self-test for the following modules: ♦ ACM ♦ APIM ♦ FDIM • **Is DTC B1316, B1317, U3003:16 or U3003:17 recorded in any module?**	**Yes** REFER to DTC Charts in this section. **No** INSTALL a new FDIM . REFER to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section. CLEAR

	the ACM and APIM DTCs. REPEAT the ACM and APIM self-tests. If DTC U0256 (Fusion) or DTC U0255:00 (MKZ) is still present in the ACM , INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. If DTC U0256:00 is still present in the APIM , INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation.

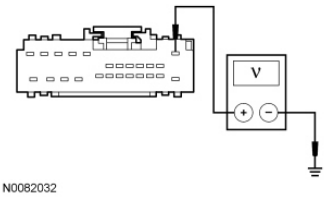
Pinpoint Test AO: DTC B1318 Or DTC U3003:16 (Audio Front Control Module (ACM))

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

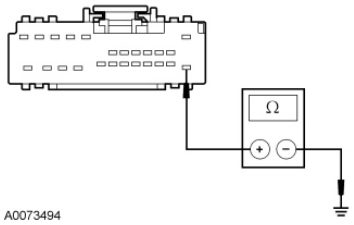
Normal Operation

- DTC B1318 (Battery Voltage Low) â set by the non-navigation (Fusion) Audio Front Control Module (ACM) as a continuous or on-demand DTC when the supply voltage falls below 10 volts for at least 10 seconds during normal operation.
- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) â set by the non-navigation (MKZ) or navigation (all) ACM as a continuous or on-demand DTC when the supply voltage falls below 10 volts for at least 10 seconds during normal operation, or for greater than 250 milliseconds during the self-test.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- High circuit resistance
- ACM



PINPOINT TEST AO: DTC B1318 Or DTC U3003:16 (ACM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AO1 RECHECK THE ACM DTCs	
• Clear the ACM DTCs. • Ignition OFF. • Ignition ON.	**Yes** GO to AO2 . **No**

• Wait 10 seconds. • Repeat the ACM self-test. • **Is DTC B1318 or DTC U3003:16 still present?**	The system is operating correctly at this time. The DTC may have set due to a previous low battery voltage condition.
AO2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous memory DTCs from all modules. • **Is DTC P0620, P0622, P0625, P0626, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AO3 .
AO3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AO4 . **No** REFER to Section 414-01 .
AO4 CHECK THE ACM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: ACM C240a . • Ignition ON. • Measure the voltage between the ACM C240a-1, circuit SBP39 (WH/RD), harness side and ground.  N0082032 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AO5 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.
AO5 CHECK THE ACM GROUND CIRCUIT FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the ACM C240a-13, circuit GD114 (BK/BU), harness side and ground.	**Yes** GO to AO6 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.

 • **Is the resistance less than 5 ohms?**	
AO6 CHECK FOR CORRECT ACM OPERATION	
• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AP: DTC U3003:17 (Audio Front Control Module (ACM))

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) â set by the Audio Front Control Module (ACM) when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation or the self-test.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- ACM

PINPOINT TEST AP: DTC U3003:17 (ACM)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AP1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve all continuous DTCs from all modules. • **Is DTC B1317, B1676, or B0563 (PCM), or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AP2 .
AP2 CHECK THE BATTERY VOLTAGE	

• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AP3 .
AP3 RECHECK FOR DTC U3003:17	
• Turn the engine off. • Ignition ON. • Clear the ACM DTCs. • Repeat the ACM self-test. • **Is DTC U3003:17 still present?**	**Yes** INSTALL a new ACM . REFER to Audio Control Module (ACM) â Fusion or Audio Control Module (ACM) â MKZ in this section. TEST this system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

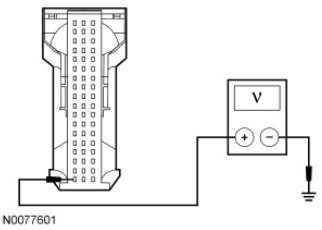
Pinpoint Test AQ: DTC U3003:16 (Accessory Protocol Interface Module (APIM))

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

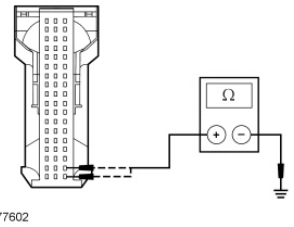
Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) â set by the Accessory Protocol Interface Module (APIM) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- High circuit resistance
- APIM



PINPOINT TEST AQ: DTC U3003:16 (APIM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AQ1 RECHECK THE APIM DTCs	
• Clear the APIM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 15 seconds.	**Yes** GO to AQ2 . **No** The system is operating correctly at

• Repeat the APIM self-test. • **Is DTC U3003:16 still present?**	this time. The DTC may have set due to a previous low battery voltage condition.
AQ2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous memory DTCs from all modules. • **Is DTC P0620, P0622, P0625, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AQ3 .
AQ3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AQ4 . **No** REFER to Section 414-01 .
AQ4 CHECK THE APIM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: APIM C3338 . • Ignition ON. • Measure the voltage between the APIM C3338-1, circuit SBB13 (GY/RD), harness side and ground.  N0077601 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AQ5 . **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.
AQ5 CHECK THE APIM GROUND CIRCUITS FOR CONTINUITY	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the APIM C3338-37, circuit GD148 (BK/YE), harness side and ground; and between the APIM C3338-38, circuit GD148 (BK/YE), harness side and ground.	**Yes** GO to AQ6 . **No** REPAIR the circuit in question for high resistance. CLEAR the DTCs. REPEAT the self-test.

 • **Are the resistances less than 5 ohms?**	
AQ6 CHECK FOR CORRECT APIM OPERATION	
• Disconnect the APIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the APIM connector and make sure it seats correctly. • Wait 2 minutes for the APIM to re-initialize. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AR: DTC U3003:17 (Accessory Protocol Interface Module (APIM))

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) â set by the Accessory Protocol Interface Module (APIM) when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- APIM

PINPOINT TEST AR: DTC U3003:17 (APIM)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AR1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve the continuous DTCs from all modules. • **Is DTC B1317, B1676, B0563 (PCM), or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AR2 .
AR2 CHECK THE BATTERY VOLTAGE	

• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AR3 .
AR3 RECHECK FOR DTC B1317	
• Ignition OFF. • Ignition ON. • Clear the APIM DTCs. • Repeat the APIM self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new APIM . REFER to Accessory Protocol Interface Module (APIM) in this section. TEST this system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

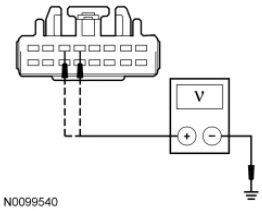
Pinpoint Test AS: DTC U3003:16 (Audio Digital Signal Processing (DSP) Module)

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

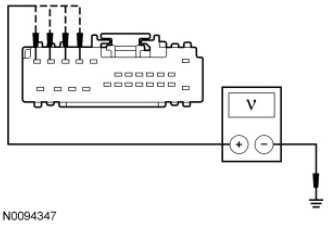
- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) â set by the audio Digital Signal Processing (DSP) module when the supply voltage falls below 10 volts for at least 10 seconds during normal operation, or for greater than 250 milliseconds during the self-test.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- High circuit resistance
- Audio DSP module

PINPOINT TEST AS: DTC U3003:16 (AUDIO DSP MODULE)



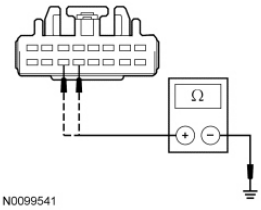
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AS1 RECHECK THE AUDIO DSP MODULE DTCs	
• Clear the audio DSP module DTCs. • Ignition OFF. • Ignition ON. • Wait at least 15 seconds.	**Yes** GO to AS2 . **No** The system is operating correctly at

• Repeat the audio DSP module self-test. • **Is DTC U3003:16 still present?**	this time. The DTC may have set due to a previous low battery voltage condition.
AS2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous memory DTCs from all modules. • **Is DTC P0620, P0622, P0625, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AS3 .
AS3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AS4 . **No** REFER to Section 414-01 .
AS4 CHECK THE AUDIO DSP MODULE VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: Audio DSP Module C4240a (SonyÂ® Sound) or C4235a (THXÂ® Sound) . • Ignition ON. • For vehicles with SonyÂ® sound, measure the voltage between the audio DSP module C4240a-5, circuit SBP19 (BU/RD), harness side and ground; and between the audio DSP module C4240a-6, circuit SBP19 (BU/RD), harness side and ground.  • For vehicles with THXÂ® sound, measure the voltage between the audio DSP module, harness side and ground as follows: **Positive Meter Lead** / **Negative Meter Lead** C4235a-9 (SBB20 (GN/RD)) / Ground C4235a-10 / Ground	**Yes** GO to AS5 . **No** REPAIR the circuit in question for high resistance. CLEAR the DTC. REPEAT the self-test.

SBB20 (GN/RD)	
C4235a-11 SBB21 (GY/RD)	Ground
C4235a-12 SBB21 (GY/RD)	Ground

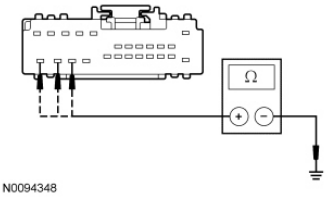


N0094347

- **Are the voltages within 0.2 volt of the recorded battery voltage?**

AS5 CHECK THE AUDIO DSP MODULE GROUND CIRCUITS FOR CONTINUITY

- Ignition OFF.
- Disconnect: Negative Battery Cable .
- For vehicles with SonyÂ® audio, measure the resistance between the audio DSP module C4240a-13, circuit GD148 (BK/YE), harness side and ground; and between the audio DSP module C4240a-14, circuit GD148 (BK/YE), harness side and ground.



N0099541

- For vehicles with THXÂ® audio, measure the resistance between the audio DSP module, harness side and ground as follows:

Positive Meter Lead	Negative Meter Lead
C4235a-22	GD148 (BK/YE)
C4235a-23	GD148 (BK/YE)
C4235a-24	GD148 (BK/YE)

Yes
GO to AS6 .

No
REPAIR the circuit in question for high resistance. TEST the system for normal operation.

 • **Are the resistances less than 5 ohms?**	
AS6 CHECK FOR CORRECT AUDIO DSP MODULE OPERATION	
• Disconnect all the audio DSP module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the audio DSP module connectors and make sure they seat correctly. • **Is the concern still present?**	**Yes** INSTALL a new audio DSP module. REFER to Audio Digital Signal Processing (DSP) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AT: DTC U3003:17 (Audio Digital Signal Processing (DSP) Module)

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) â set by the audio Digital Signal Processing (DSP) module when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation or the self-test.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- Audio DSP module

PINPOINT TEST AT: DTC U3003:17 (AUDIO DSP MODULE)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AT1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
• Ignition ON. • Retrieve all continuous DTCs from all modules. • **Is DTC B1317, B1676, or B0563 (PCM), or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AT2 .

AT2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AT3 .
AT3 RECHECK FOR DTC U3003:17	
• Turn the engine off. • Ignition ON. • Clear the audio DSP module DTCs. • Repeat the audio DSP module self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new audio DSP module. REFER to Audio Digital Signal Processing (DSP) Module in this section. TEST this system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test AU: DTC B1318 Or DTC U3003:16 (Front Controls Interface Module (FCIM))

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

- DTC B1318 (Battery Voltage Low) â set by the non-navigation (Fusion) Front Controls Interface Module (FCIM) when the supply voltage falls below 10 volts for greater than 10 seconds during normal operation or during the self-test.
- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) â set by the non-navigation (MKZ) or navigation (all) FCIM when the supply voltage falls below 10 volts for greater than 10 seconds during normal operation or for greater than 250 milliseconds during the self-test.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- High circuit resistance
- FCIM

PINPOINT TEST AU: DTC B1318 OR DTC U3003:16 (FCIM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take

<table>
<tr><td>AU1 RECHECK THE FCIM DTCs</td><td></td></tr>
<tr><td>• Clear the FCIM DTCs.
• Ignition OFF.
• Ignition ON.
• Wait at least 15 seconds.
• Repeat the FCIM self-test.

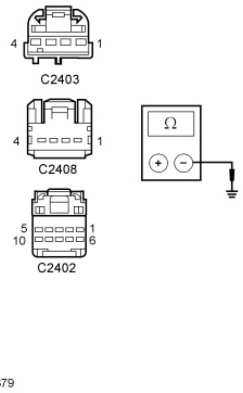
	SBP14 (BN/RD)	

N0102378

- **Is the voltage within 0.2 volt of the recorded battery voltage?**



AU5 CHECK THE FCIM GROUND CIRCUIT FOR CONTINUITY

- Ignition OFF.
- Disconnect: Negative Battery Cable .
- Measure the resistance between the FCIM , harness side and ground as follows:

Vehicle Equipment	Positive Meter Lead	Negative Meter Lead
Fusion without navigation	C2403-2 GD116 (BK/VT)	Ground
Fusion with navigation	C2408-4 GD116 (BK/VT)	Ground
MKZ	C2402-8 GD116 (BK/VT)	Ground

Yes
GO to AU6 .

No
REPAIR the circuit for high resistance. TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
AU6 CHECK FOR CORRECT FCIM OPERATION	
• Disconnect the FCIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FCIM connector and make sure it seats correctly. • **Is the concern still present?**	**Yes** INSTALL a new FCIM . REFER to Front Controls Interface Module (FCIM) â Fusion or Front Controls Interface Module (FCIM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AV: DTC U3003:17 (Front Controls Interface Module (FCIM))

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) â set by the Front Controls Interface Module (FCIM) when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation or the self-test.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- FCIM

PINPOINT TEST AV: DTC U3003:17 (FCIM)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AV1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	
	Yes

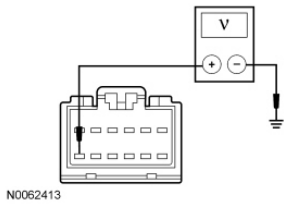
• Ignition ON. • Retrieve all continuous DTCs from all modules. • **Is DTC B1317, B1676, or B0563 (PCM), or U3003:17 set in more than one module?**	REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AV2 .
AV2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AV3 .
AV3 RECHECK FOR DTC U3003:17	
• Turn the engine off. • Ignition ON. • Clear the FCIM DTCs. • Repeat the FCIM self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new FCIM . REFER to Front Controls Interface Module (FCIM) â Fusion or Front Controls Interface Module (FCIM) â MKZ in this section. TEST this system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test AW: DTC B1318 (Front Display Interface Module (FDIM))

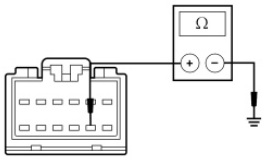
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

- DTC B1318 (Battery Voltage Low) â set by the Front Display Interface Module (FDIM) when the supply voltage falls below 10 volts for greater than 10 seconds during normal operation or during the self-test.



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- High circuit resistance
- FDIM

PINPOINT TEST AW: DTC B1318 (FDIM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AW1 RECHECK THE FDIM DTCs	
• Clear the FDIM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 15 seconds. • Repeat the FDIM self-test. • **Is DTC B1318 still present?**	**Yes** GO to AW2 . **No** The system is operating correctly at this time. The DTC may have set due to a previous low battery voltage condition.
AW2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous memory DTCs from all modules. • **Is DTC P0620, P0622, P0625, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AW3 .
AW3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AW4 . **No** REFER to Section 414-01 .
AW4 CHECK THE FDIM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: FDIM . • Ignition ON. • Measure the voltage between the FDIM C2407-12, circuit SBP14 (BN/RD), harness side and ground.  N0062413 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AW5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
AW5 CHECK THE FDIM GROUND CIRCUIT FOR CONTINUITY	

• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the FDIM C2407-8, circuit GD116 (BK/VT), harness side and ground.  N0077731 • **Is the resistance less than 5 ohms?**	**Yes** GO to AW6 . **No** REPAIR the circuit for high resistance. TEST the system for normal operation.
AW6 CHECK FOR CORRECT FDIM OPERATION	
• Disconnect the FDIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FDIM connector and make sure it seats correctly. • **Is the concern still present?**	**Yes** INSTALL a new FDIM . REFER to Front Display Interface Module (FDIM) â Fusion or Front Display Interface Module (FDIM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

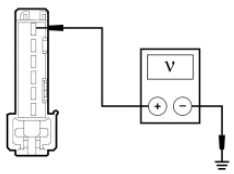
Pinpoint Test AX: DTC U3003:16 Global Positioning System Module (GPSM))

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

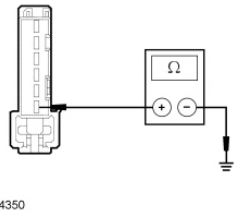
Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) â set by the Global Positioning System Module (GPSM) when the supply voltage falls below 10 volts for at least 10 seconds during normal operation, or for greater than 250 milliseconds during the self-test.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- High circuit resistance
- GPSM



PINPOINT TEST AX: DTC U3003:16 (GPSM)

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to

Section 414-01 .

Test Step	Result / Action to Take
AX1 RECHECK THE GPSM DTCs	
• Clear the GPSM DTCs. • Ignition OFF. • Ignition ON. • Wait at least 15 seconds. • Repeat the GPSM self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to AX2 . **No** The system is operating correctly at this time. The DTC may have set due to a previous low battery voltage condition.
AX2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Retrieve the continuous memory DTCs from all modules. • **Is DTC P0620, P0622, P0625, or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AX3 .
AX3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AX4 . **No** REFER to Section 414-01 .
AX4 CHECK THE GPSM VOLTAGE SUPPLY	
• Ignition OFF. • Measure and record the voltage at the battery. • Disconnect: GPSM C2300 . • Ignition ON. • Measure the voltage between the GPSM C2300-1, circuit SBP14 (BN/RD), harness side and ground.  N0094349 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AX5 . **No** REPAIR the circuit in question for high resistance. CLEAR the DTC. REPEAT the self-test.
AX5 CHECK THE GPSM GROUND CIRCUITS	

• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the GPSM C2300-6, circuit GD116 (BK/VT), harness side and ground.  N0094350 • **Are the resistances less than 5 ohms?**	**Yes** GO to AX6 . **No** REPAIR the circuit in question for high resistance. TEST the system for normal operation.
AX6 CHECK FOR CORRECT GPSM OPERATION	
• Disconnect the GPSM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the GPSM connector and make sure it seats correctly. • **Is the concern still present?**	**Yes** INSTALL a new GPSM . REFER to Global Positioning System Module (GPSM) â Fusion or Global Positioning System Module (GPSM) â MKZ in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AY: DTC U3003:17 (Global Positioning System Module (GPSM))

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) â set by the Global Positioning System Module (GPSM) when the supply voltage is greater than 15.8 volts for more than 250 milliseconds during normal operation or the self-test.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- GPSM

PINPOINT TEST AY: DTC U3003:17 (GPSM)

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AY1 CHECK FOR HIGH VOLTAGE DTCs SET IN OTHER MODULES	

• Ignition ON. • Retrieve all continuous DTCs from all modules. • **Is DTC B1317, B1676, or B0563 (PCM), or U3003:17 set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AY2 .
AY2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AY3 .
AY3 RECHECK FOR DTC U3003:17	
• Turn the engine off. • Ignition ON. • Clear the GPSM DTCs. • Repeat the GPSM self-test. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new GPSM . REFER to Global Positioning System Module (GPSM) â Fusion or Global Positioning System Module (GPSM) â MKZ in this section. TEST this system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Pinpoint Test AZ: The Audio System Does Not Operate Correctly From The Front Display Interface Module (FDIM) â MKZ Without Navigation

Normal Operation

When a button is pressed on the Front Display Interface Module (FDIM), a message is broadcast to the Audio Front Control Module (ACM) via the Medium Speed Controller Area Network (MS-CAN). The ACM then takes the appropriate action.

- DTC B2924 (Audio Button Stuck) â sets when the FDIM detects a button as active for greater than 120 seconds during normal operation, or for any duration during the self-test. When this occurs, the FDIM disables that particular button until the fault is cleared, or until the next ignition cycle.

This pinpoint test is intended to diagnose the following:

- Communication network concern
- FDIM

PINPOINT TEST AZ: THE AUDIO SYSTEM DOES NOT OPERATE CORRECTLY FROM THE FDIM â MKZ WITHOUT NAVIGATION

Test Step	Result / Action to Take
AZ1 CHECK the FDIM DTCs	
• Clear the FDIM DTCs. • Carry out the FDIM self-test, making sure no buttons are pressed while the self-test is running. • **Is DTC B2924 present?**	**Yes** INSTALL a new FDIM . REFER to Front Display Interface Module (FDIM) â MKZ in this section. TEST the system for normal operation. **No** GO to AZ2 .
AZ2 OBSERVE THE FDIM DISPLAY	
• Turn the audio system on and observe the FDIM screen. • **Is the FDIM display completely inoperative?**	**Yes** GO to Pinpoint Test N . **No** GO to AZ3 .
AZ3 CHECK FOR CORRECT FDIM OPERATION	
• Ignition OFF. • Disconnect the FDIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FDIM connector and make sure it seats correctly. • Operate the system and determine if the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new FDIM . REFER to Front Display Interface Module (FDIM) â MKZ in this section. TEST this system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test BA: SYNCÂ® Traffic, Directions And Information Service Is Inoperative

Normal Operation

The SYNCÂ® traffic, directions and information service is a subscription-based service that includes precise turn-by-turn directions, personalized real-time traffic updates with text alerts, business search, entertainment, news, sports, stocks, travel and weather. The customer's mobile phone is used to access and download the SYNCÂ® services. The Global Positioning System (GPS) antenna (integral to the Global Positioning System Module (GPSM)) is used to detect the location and direction of the vehicle. For additional information on the traffic, direction and information services subscription refer to the SyncMyRide website .

This pinpoint test is intended to diagnose the following:

- Accessory Protocol Interface Module (APIM)
- GPSM
- Subscription expired

PINPOINT TEST BA: SYNCÂ® TRAFFIC, DIRECTIONS AND INFORMATION SERVICE IS INOPERATIVE

Test Step	Result / Action to Take
BA1 VERIFY THE CUSTOMER SUBSCRIPTION AND PHONE NUMBER	
• **NOTE:** Prior to performing this pinpoint test step, inquire with the customer about SYNCÂ® traffic, directions and information service registration. • Verify that the customer has an active subscription and the correct phone number that is registered on the SYNCÂ® website. REFER to the SyncMyRide website . • **Is the subscription activated and the correct phone number registered?**	**Yes** GO to BA2 . **No** If the subscription is not activated, INFORM the customer that in order for the SYNCÂ® traffic, directions and information to function the subscription needs to be activated on the SYNCÂ® website. REFER to the SyncMyRide website . If the phone number is incorrect, INFORM the customer that the correct phone number must be registered on the SYNCÂ® website. REFER to the SyncMyRide website .
BA2 CHECK FOR APIM DTCs	
• Ignition ON. • Carry out the APIM self-test. • **Are any DTCs recorded in the APIM ?**	**Yes** REFER to the APIM DTC Chart in this section. **No** GO to BA3 .
BA3 CHECK FOR GPSM DTCs	
• Carry out the GPSM self-test. • **Are any DTCs recorded in the GPSM ?**	**Yes** REFER to the GPSM DTC Chart in this section. **No** INSTALL a new GPSM . For Fusion, REFER to Global Positioning System Module (GPSM) â Fusion . For MKZ, REFER to Global Positioning System Module (GPSM) â MKZ .

Pinpoint Test BB: Poor Sound Quality Or Distorted Sound From One Or More Speakers (Not All Speakers)

Diagnostic Overview

Diagnostics in this manual assume a certain skill level and knowledge of Ford-specific diagnostic practices. Refer to Diagnostic Methods in Section 100-00 for information about these practices.

Normal Operation

The Audio Front Control Module (ACM) sends audio signals to the speakers in the form of AC voltage, resulting in clear audio output.

Possible Sources

- Wiring, terminals, or connectors
- Speaker(s)
- Loose trim panel fasteners
- Loose trim panels
- Loose speaker grille
- Loose harnesses
- Loose items in storage areas
- Loose harness fasteners
- Loose door and handle lock components
- Loose component fasteners
- Watershield bonding and placement
- Subwoofer enclosure

PINPOINT TEST BB: POOR SOUND QUALITY OR DISTORTED SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS)

Test Step	Result / Action to Take
BB1 ISOLATE THE ZONE	
• Operate the audio system using digital media (CD, MP3, etc.). • Using the audio system fade and balance feature, adjust the audio sound to each of the four zones (LF, RF, LR and RR) of the vehicle to isolate the poor sound quality. • Locate and apply pressure to the trim panel(s) around the poor sound quality area in question. • **Does applying pressure to a trim panel reduce or eliminate the audible noise?**	**Yes** REPAIR or REPLACE the trim panel as needed. **No** GO to BB2 .
BB2 REMOVE AND INSPECT BEHIND/UNDERNEATH THE SUSPECT TRIM PANEL(S)	
• Remove the trim panel to access the suspect speaker. • Operate the audio system using digital media (CD, MP3, etc.). • Validate where the poor sound quality area is located. • Check: ♦ Trim panel for loose components (e.g. speaker grille) around the speaker area. ♦ Trim panel joining components for missing or broken pieces. ♦ Lock and handle mechanical parts for correct attachment. ♦ Wire harnesses for correct routing. ♦ Wire harness fasteners for correct attachment. ♦ Watershield for correct placement (speaker air path not blocked). ♦ Watershield for correct bonding to sheet metal. ♦ Storage areas for loose items. ♦ All child safety belt anchors (if equipped). ♦ All safety belt retractors. ♦ All speaker bracket fasteners and other fasteners are secured and tightened to specified torque.	**Yes** REPAIR or REPLACE any loose or broken component or fastener as needed. **No** GO to BB3 .

• **Was the source of the noise located?**	
BB3 CHECK THE SUSPECT SPEAKER FOR WATER INTRUSION	
• Inspect for watermarks. • Check the: ♦ Cone. ♦ Magnet. ♦ Basket. • **Are any watermarks present on the speaker?**	**Yes** VERIFY the water shield is in the correct location, REPAIR or REPLACE any trim, door, or speaker seal as required. DRY the speaker in question and TEST the system for normal operation. **No** GO to BB4 .
BB4 ISOLATE SPEAKER TO VERIFY NOISE	
• Remove the suspect speaker from its location and leave the speaker connected to the harness. • Hold the speaker away from any trim panel(s) and ensure the speaker is isolated from contact. • Operate the audio system using digital media (CD, MP3, etc.). • **Is the noise still present in the suspect speaker?**	**Yes** INSTALL a new speaker for the one in question. **No** LOCATE the source of the noise and REPAIR as needed.

Audio Control Module (ACM) Self-Diagnostic Mode

Audio Systems Without Navigation

NOTE: If the Audio Front Control Module (ACM) is inoperable the ACM part number may be obtained from a label affixed to the chassis.

1. Turn the ACM on.

2. Operate the audio system in radio tuner (AM/FM) mode.

3. Press and hold preset buttons 3 and 6 for 3 seconds until the speaker walk test begins.
   - The display indicates each speaker as it is tested.

4. **NOTE:** If the speaker walk test is the only test required, this procedure can be stopped after Step 3 by turning the ACM off.

   Before the speaker walk test is complete, carry out any of the following actions:

Preset Button Press	Diagnostic Function	Display	Diagnostic Function Description
1	ACM Self-Test	SELF TEST	The ACM carries out a self-test. At the end of the self-test, the display either indicates SELF PASS or scrolls through any DTCs present. Note that the self-test may not indicate all DTCs that are present. If additional DTCs are suspected, retrieve continuous and on-demand DTCs using the scan tool.
2	View DTCs	NO DTCS, or scrolls through DTCs	The ACM displays any DTCs that are present. To scroll through the DTCs, press the TUNE UP button. If no DTCs are present, the display reads NO DTCS.
3	AM/FM Antenna Signal Strength	SIGNAL ###	The ACM displays the AM/FM antenna signal strength. To run this test, the audio system should be in AM radio tuner mode before entering the ACM self-diagnostic mode.
4	Software Levels	SOFT LEVELS	The ACM displays software levels for various components of the audio system. Knowing the software levels may not aid diagnostics. Press the TUNE UP button to scroll through the software levels.
5	Display Test	DISPLAY TEST, then all segments illuminate	All of the ACM display segments illuminate.
6	Retrieve ACM Part Number	RADIO CONFIG	The ACM displays the ACM part number and various configuration levels. Press the TUNE UP button to scroll to the desired function.

5. To exit the self-diagnostic mode, turn the ACM off.

Satellite Radio Electronic Serial Number (ESN) Retrieval - Vehicles Without Navigation

NOTE: If the SDARS is inoperable the Electronic Serial Number (ESN) may be obtained from a label affixed to the chassis.

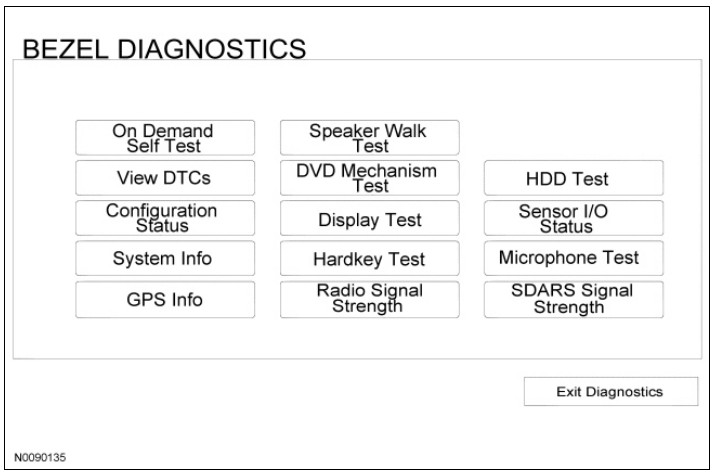
1. Operate the audio system in satellite radio mode.

2. Depending on vehicle configuration, press and hold the AUX button and preset button 1 or the SIRIUS button and preset button 1, simultaneously.
   - The Satellite Digital Audio Receiver System (SDARS) module Electronic Serial Number (ESN) displays on the screen.

3. Record the SDARS module ESN .

4. Turn the audio system off.

Audio Systems With Navigation



1. Turn the Audio Front Control Module (ACM) on.

2. Operate the audio system in radio tuner (AM/FM) mode.

3. Press and hold preset buttons 3 and 6 for 3 seconds until the speaker walk test begins.
   - The display indicates each speaker as it is tested.

4. **NOTE:** If the speaker walk test is the only test required, this procedure can be stopped after this step, or by allowing the speaker walk test to complete on its own.

   Before the speaker walk test is complete, press the "End Test" selection.

5. The following tests are available through the "BEZEL DIAGNOSTICS" menu:

Display Selection	Diagnostic Function Description

On Demand Self Test	The ACM carries out a self-test. At the end of the self-test, the display either indicates "Test Passed" or lists any DTCs present. Note that the self-test may not indicate all DTCs that are present. If DTCs are suspected, retrieve continuous and on-demand DTCs using the scan tool.
View DTCs	The ACM displays any DTCs that are present. If there is more than a full screen of DTCs present, to scroll through the DTCs, press the down arrow on the display. If no DTCs are present, the display reads NO DTCS. Press the "Clear DTCs" selection to clear any DTCs present.
Configuration Status	The display shows the ACM configuration. A "0" indicates the item is configured off, while a "1" indicates the item is configured on. If the ACM appears to be misconfigured, refer to Section 418-01 .
System Info	The ACM displays system information for various components of the audio system. The following items are most important for servicing the audio system: • Nav Radio Part Number - provides the ACM part number • ESN1 - provides the satellite radio Electronic Serial Number (ESN)
GPS Info	The current Global Positioning System (GPS) satellite information is shown, along with the current vehicle position. Pressing the "SV Status" selection provides additional information, if present.
Speaker Walk Test	The ACM carries out the speaker walk test.
DVD Mechanism Test	The ACM tests the internal CD/DVD drive mechanism.
Display Test	This test provides for testing of the touchscreen colors and the touchscreen sectors. Pressing any of the colors on the display causes the whole display to change to that color; pressing the display again returns to the Display Test menu. Pressing the "Touchscreen Activation Test" selection enters the touchscreen sector test. Press any area of the screen to test the touchscreen sector; press the "X" at the RH lower corner of the display to return to the Display Test menu.
Hardkey Test	This test provides for testing of the ACM buttons (not the touchscreen). When each button is pressed, the screen displays the button that is active. This test can also be used to isolate a stuck button.
Radio Signal Strength	The ACM displays the AM/FM antenna signal strength. To run this test, the audio system should be in AM radio tuner mode before entering the ACM self-diagnostic mode.
HDD Test	The ACM tests its internal hard drive.
Sensor I/O Status	The ACM displays inputs it is receiving from external sources. These inputs include: • Ignition - indicates ON (ignition in ACC or RUN) or OFF • Brake - indicates ON (vehicle in PARK) or OFF (vehicle not in PARK) • Illumination - indicates ON or OFF • ReverseGear - indicates ON (vehicle in REVERSE) or OFF (vehicle not in REVERSE)
Microphone Test	The ACM tests the microphone by supplying a test tone and monitoring the input from the microphone. If there is a concern with the microphone input, the ACM sets DTC B1D79:01. For diagnostics, refer to Diagnosis and Testing in this section.
SDARS Signal Strength	The ACM displays the satellite radio antenna signal strength.

6. To exit the self-diagnostic mode, press the "Exit Diagnostics" selection from the "BEZEL DIAGNOSTICS" menu.

;

Accessory Protocol Interface Module (APIM) Software Level Check

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable CCMUSB2-AM-AM-10 or equivalent

NOTE: This procedure applies to checking the Accessory Protocol Interface Module (APIM) software level. To program the APIM , refer to Accessory Protocol Interface Module (APIM) Programming in Section 418-01 .

1. Turn the Audio Front Control Module (ACM) on.

2. Connect the scan tool to the Data Link Connector (DLC).

3. Connect one end of the Universal Serial Bus (USB) male-A to male-A cable to the scan tool.

4. Connect the other end of the USB male-A to male-A cable to the vehicle USB port.

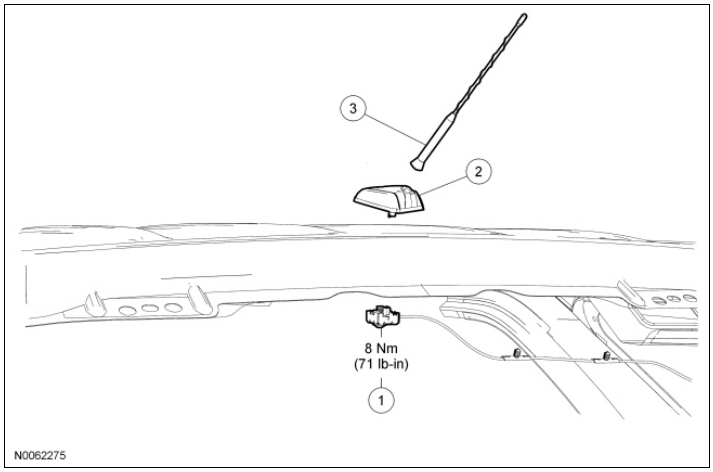
5. From the technician service publication website, run On-Line Automotive Service Information System (OASIS) using Quick Start or by manually entering the Vehicle Identification Number (VIN).

6. From the OASIS tab, select the "Sync/APIM" bullet.

7. Select the "Read APIM" button to verify the current APIM software level.
   - The display shows both the Vehicle Interface Processor (VIP) and Consumer Interface Processor (CIP) software levels.

8. The scan tool displays the following information:
   - Last Recorded State - Hardware
     - VIN : vehicle identification number associated with the current APIM
     - Installed date: date the APIM was installed
     - Radio: currently identified ACM in the vehicle
     - HW Part No.: APIM hardware part number
     - Un-installed date: date (if any) the APIM was uninstalled
     - S/N: APIM serial number
   - Last Recorded State - Software
     - Date/Time: date and time of last recorded software installation
     - VIP : VIP software that was installed at that time
     - CIP : CIP software that was installed at that time
     - Description: a description of the content of the software revision
   - History - Software
     - Date/Time: date and time of any recorded software installation

- ♦ VIP : VIP software that was installed at that time
- ♦ CIP : CIP software that was installed at that time
- ♦ Description: a description of the content of the software revision



- Available Software for Programming
  - ♦ Select: allows the software package to be selected
  - ♦ Lineage: the original software release, if the software available is a revision
  - ♦ VIP : VIP software level that is available with the selection
  - ♦ CIP : CIP software level that is available with the selection
  - ♦ Description: a description of the content of the software revision

9. Click a CIP software level to view the device compatibility list associated with the CIP software level, if desired.

10. To exit the APIM software level check, disconnect the scan tool from the DLC and the USB port, or exit the OASIS screen.

Antenna - AM/FM

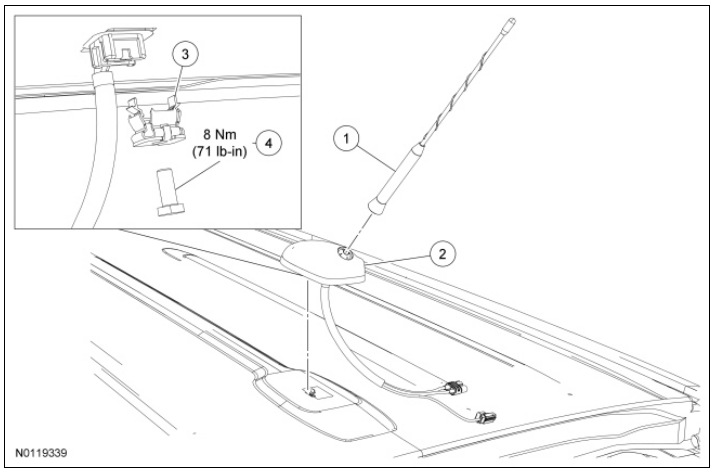
NOTE: Combination AM/FM/satellite antenna shown, others similar.

Item	Part Number	Description
1	-	Antenna cable bolt (part of 18812)
2	18936	Antenna
3	18813	Antenna mast

Removal and Installation

1. Remove the LH and RH assist handles. For additional information, refer to Headliner in Section 501-05 .

2. Remove the LH and RH C-pillar trim panels. For additional information, refer to Section 501-05 .



3. Carefully lower the rear of the headliner to gain access to the antenna.

4. Loosen the antenna cable bolt and disconhe cable from the antenna.
   - To install, tighten to 8 Nm (71 lb-in).

5. Remove the antenna.
   - Remove the antenna mast, if equipped.
   - Press the 2 tabs and remove the antenna.

6. To install, reverse the removal procedure.

Antenna - AM/FM/Satellite Radio/Navigation

Item	Part Number	Description
1	18813	Antenna mast
2	18936	Antenna
3	-	Antenna retaining clip
4	-	Antenna cable bolt (part of 18812)

Removal and Installation

1. Remove the LH and RH D-pillar trim panels. For additional information, refer to Section 501-05 .
2. Remove the rear dome lamp. For additional information, refer to Interior Lamp in Section 417-02 .
3. Carefully lower the rear of the headliner to gain access to the antenna.

   Remove the antenna cable bolt and retaining clip from the antenna.

   - To install, tighten to 8 Nm (71 lb-in).

5. Disconnect the antenna cable connectors.
6. Remove the antenna.
   - Remove the antenna mast, if equipped.
   - Press the 2 tabs and remove the antenna.
7. To install, reverse the removal procedure.

Antenna - Satellite Radio

NOTE: Combination AM/FM/satellite antenna shown, others similar.

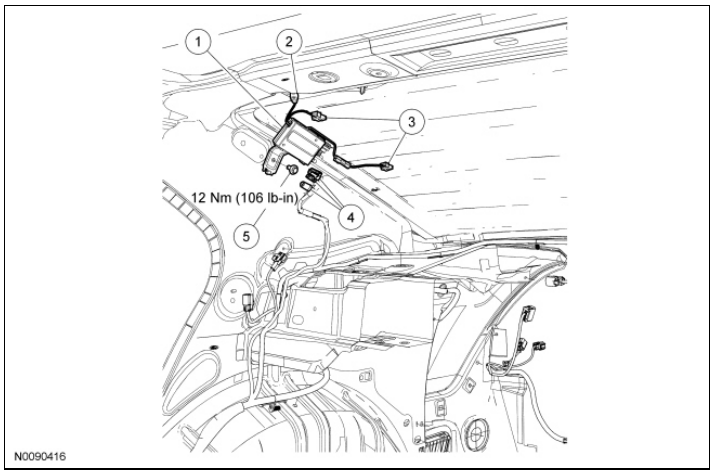
Item	Part Number	Description
1	-	Satellite radio antenna cable bolt (part of 18812)
2	18936	Satellite radio antenna
3	18813	Antenna mast (if equipped)

Removal and Installation

NOTE: This procedure applies to the stand-alone satellite radio antenna, the combination AM/FM/satellite radio antenna, and the combination satellite radio/Global Positioning System (GPS) antenna.

1. Remove the LH and RH assist handles. For additional information, refer to Headliner in Section 501-05 .

2. Remove the LH and RH C-pillar trim panels. For additional information, refer to Section 501-05 .



3. Carefully lower the rear of the headliner to gain access to the satellite radio antenna.

4. Loosen the satellite radio antenna cable bolt and disconnect the cable from the antenna.
   - To install, tighten to 8 Nm (71 lb-in).

5. Remove the antenna.
   - Remove the antenna mast, if equipped.
   - Press the 2 tabs and remove the satellite radio antenna.

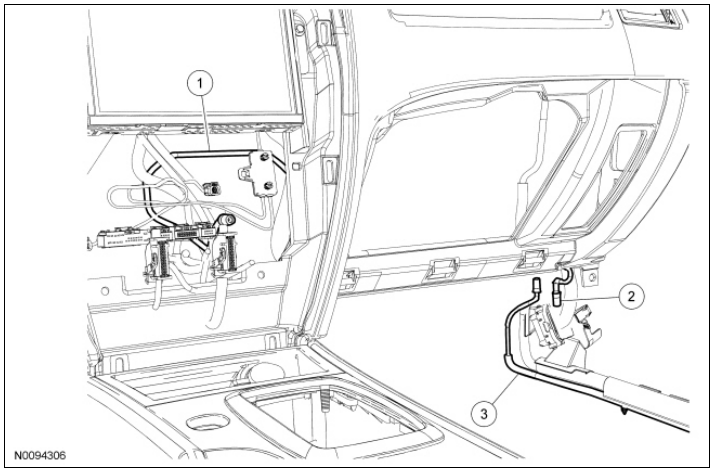
6. To install, reverse the removal procedure.

Antenna Module

Item	Part Number	Description
1	19C029	Antenna module
2	-	Antenna module-to-antenna connector (part of 19C029)
3	-	Heated rear window connectors (part of 19C029)
4	-	Antenna module electrical connectors (part of 14A005)
5	-	Antenna module bolt

Removal and Installation

1. Remove the RH C-pillar trim panel. For additional information, refer to Section 501-05 .



2. Disconnect the antenna module connectors.
   - Disconnect the antenna cable-to-antenna module connector.
   - Disconnect the antenna module electrical connectors.
   - Disconnect the antenna module-to-antenna connector.

3. Remove the bolt and the antenna module.
   - To install, tighten to 12 Nm (106 lb-in).

4. To install, reverse the removal procedure.

Antenna Cable - AM/FM

NOTE: Only the front AM/FM antenna cable is shown.

Item	Part Number	Description
1	18812	Front AM/FM antenna cable
2	-	Front-to-rear AM/FM antenna cable connection (part of 18812)
3	18812	Rear AM/FM antenna cable

Removal

NOTE: Both the front and rear AM/FM antenna cables are part of the vehicle wiring harness. Because the cables cannot be removed from the harness, this procedure applies to replacement of the cables only.

Front cable

1. Remove the Audio Front Control Module (ACM). For additional information, refer to Audio Control Module (ACM) - Fusion or Audio Control Module (ACM) - MKZ in this section. >

Rear cable

2. Remove the RH front and RH rear sill panels by pulling straight upward.
3. **NOTE:** For MKZ, it is only necessary to remove the RH C-pillar trim panel.

   Remove the LH and RH assist handles, and the LH and RH C-pillar trim panels. For additional information, refer to Section 501-05 .
4. **NOTE:** For Fusion, it is necessary to loosen the antenna cable bolt.

   Disconnect the rear AM/FM antenna cable from the AM/FM antenna (Fusion) or the antenna module (MKZ).
5. Remove the enable circuit.
   1. Disconnect C237 at the RH kick panel.
   2. Remove the pin retainer from the inside of the male side of the connector by pulling straight out with pliers.

3. Using a suitable tool such as a straight pick, release the locking tab and remove the enable circuit CME44 (BU) from C237-25.
4. Cut the existing circuit end and secure it with electrical tape.

Both cables

6. Disconnect the front-to-rear AM/FM antenna cable connection at the RH kick panel.
7. Cut the ends of the existing cable and tape them back to prevent NVH concerns.

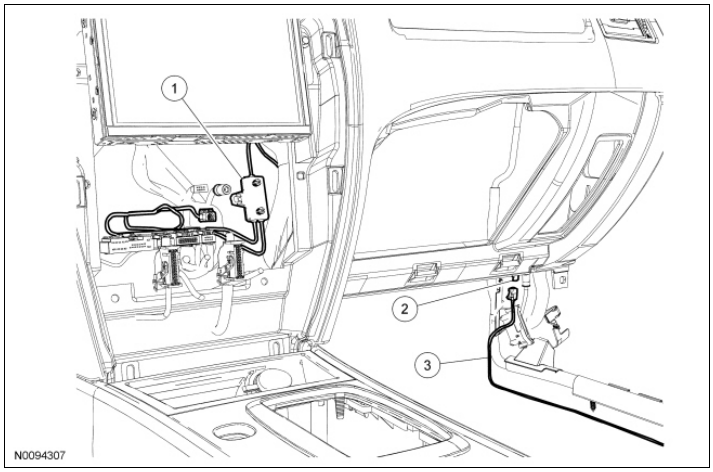
Installation

Both cables

1. Overlay the new AM/FM antenna cable on the vehicle wiring harness, following the routing of the original cable.
2. Secure the new AM/FM antenna cable with tape or zip ties, as necessary.
3. Connect the front-to-rear AM/FM antenna cable connection at the RH kick panel.

Front cable

4. Connect the front AM/FM antenna cable to the ACM .
5. Install the ACM . For additional information, refer to Audio Control Module (ACM) - Fusion or Audio Control Module (ACM) - MKZ in this section.



Rear cable

6. Install the enable circuit.
    1. Insert the enable circuit CME44 (BU) into C237-25.
    2. Install the pin retainer into the inside of the male side of the connector.
    3. Connect C237.
7. Connect the rear AM/FM antenna cable to the AM/FM antenna (Fusion) or the antenna module (MKZ).
    - For Fusion, tighten the bolt to 8 Nm (71 lb-in).
8. **NOTE:** For MKZ, only the RH C-pillar trim panel was removed.

   Install the LH and RH assist handles, and the LH and RH C-pillar trim panels. For additionnformation, refer to Section 501-05 .
9. Install the RH front and RH rear sill panels.

Antenna Cable - Satellite Radio

NOTE: The front satellite radio antenna cable with navigation is shown.

Item	Part Number	Description
1	18812/10E928	Front satellite radio antenna cable (without navigation/ with navigation)
2	-	Front-to-rear satellite radio antenna cable connection (part of 18812/ 10E928)
3	18812	Rear satellite radio antenna cable

Removal

NOTE: Both the front and rear satellite radio antenna cables are part of the vehicle wiring harness. Because the cables cannot be removed from the harness, this procedure applies to replacement of the cables only.

NOTE: For vehicles with navigation, a splitter is built-in to the front satellite radio antenna cable to split the satellite radio and Global Positioning System (GPS) signals.

Front cable

1. Remove the Audio Front Control Module (ACM). For additional information, refer to Audio Control Module (ACM) - Fusion or Audio Control Module (ACM) - MKZ in this section.

Rear cable

2. Remove the RH front and RH rear sill panels by pulling straight upward.

3. Remove the LH and RH assist handles, and the LH and RH C-pillar trim panels. For additional information, refer to Section 501-05 .

4. Loosen the antenna cable bolt and disconnect the cable from the antenna.

5. Remove the enable circuit.
    1. Disconnect C237 at the RH kick panel.

2. Remove the pin retainer from the inside of the male side of the connector by pulling straight out with pliers.
3. Using a suitable tool such as a straight pick, release the locking tab and remove the enable circuit CME44 (BU) from C237-25.
4. Cut the existing circuit end and secure it with electrical tape.

Both cables

6. Disconnect the front-to-rear satellite radio antenna cable connection at the RH kick panel.

7. Cut the ends of the existing cable and tape them back to prevent NVH concerns.

Installation

Both cables

1. Overlay the new satellite radio antenna cable on the vehicle wiring harness, following the routing othe original cable.

2. Secure the new AM/FM antenna cable with tape or zip ties, as necessary.
   - For the front satellite radio antenna cable on vehicles with navigation, secure the splitter using the built-in push-pins.

3. Connect the front-to-rear satellite radio antenna cable connection at the RH kick panel.

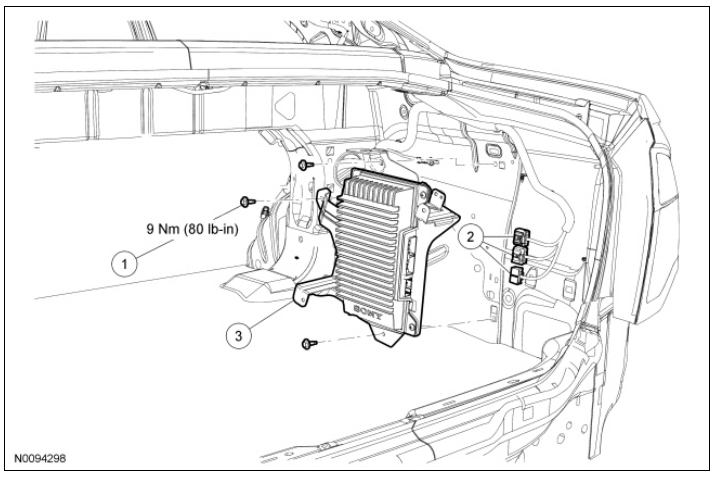
Front cable

4. Connect the front AM/FM antenna cable to the ACM .

5. Install the ACM . For additional information, refer to Audio Control Module (ACM) - Fusion or Audio Control Module (ACM) - MKZ in this section.

Rear cable

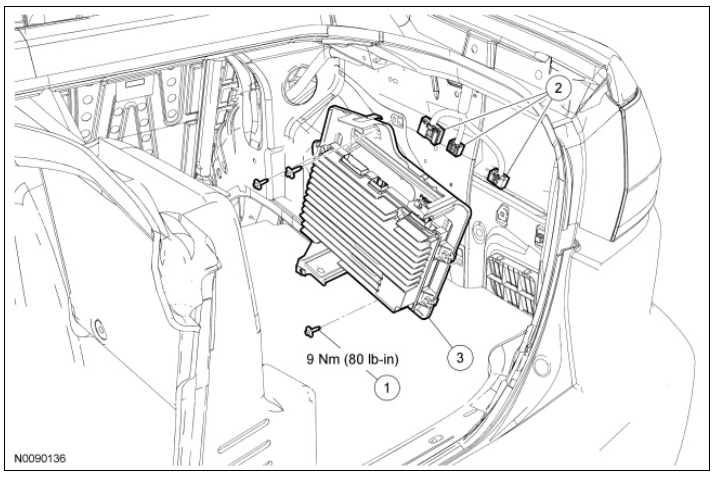
6. Install the enable circuit.
   1. Insert the enable circuit CME44 (BU) into C237-25.
   2. Install the pin retainer into the inside of the male side of the connector.
   3. Connect C237.



7. Connect the rear satellite radio antenna cable to the antenna.
   - Tighten the bolt to 8 Nm (71 lb-in).

8. Install the LH and RH assist handles, and the LH and RH C-pillar trim panels. For additional information, refer to Section 501-05 .

9. Install the RH front and RH rear sill panels.



Audio Digital Signal Processing (DSP) Module

Sony® Sound

Item	Part Number	Description
1	W505423-S	Audio Digital Signal Processing (DSP) module bolts (3 required)
2	-	Audio DSP module electrical connectors (part of 14A005)
3	18B849	Audio DSP module

THX® Sound

Item	Part Number	Description
1	W505423-S	Audio Digital Signal Processing (DSP) module bolts (3 required)
2	-	Audio DSP module electrical connectors (part of

		14A005)
3	18B849	Audio DSP module
4	5445422	RH luggage compartment trim panel

Removal and Installation

NOTE: This procedure applies to Fusion with Sony® sound and MKZ with THX® sound only. For all other amplifiers, refer to the appropriate procedure in this section.

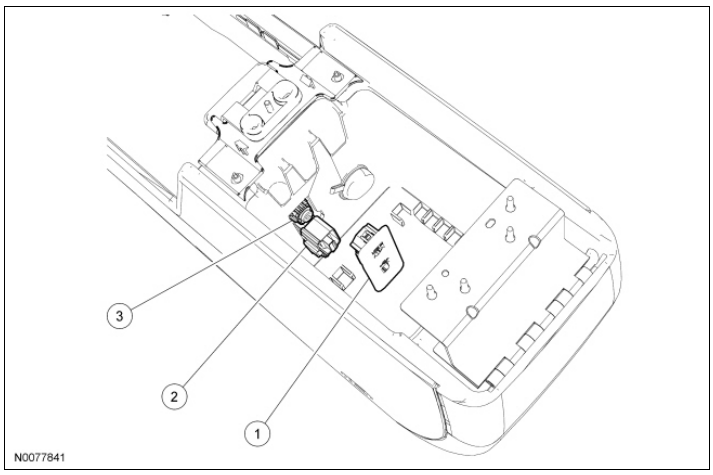
1. **NOTE:** Module configuration is required wew audio Digital Signal Processing (DSP) module is being installed.

   Upload the audio DSP module configuration information to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in Section 418-01 .

2. Remove the 4 pushpins and the RH luggage compartment trim panel.

3. Disconnect the audio DSP module electrical connectors.

4. Remove the 3 bolts and the audio DSP module.
   - To install, tighten to 9 Nm (80 lb-in).



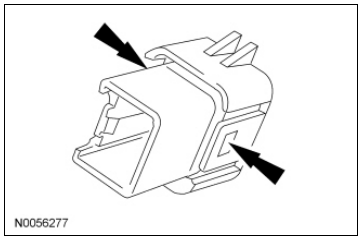
5. To install, reverse the removal procedure.
   - Download the configuration information to the audio DSP module. For additional information, refer to PMI in Section 418-01 .

Audio Input Jack

NOTE: Stowage bin door shown removed for clarity.

NOTE: Vehicle with the SYNC® system shown, others similar.

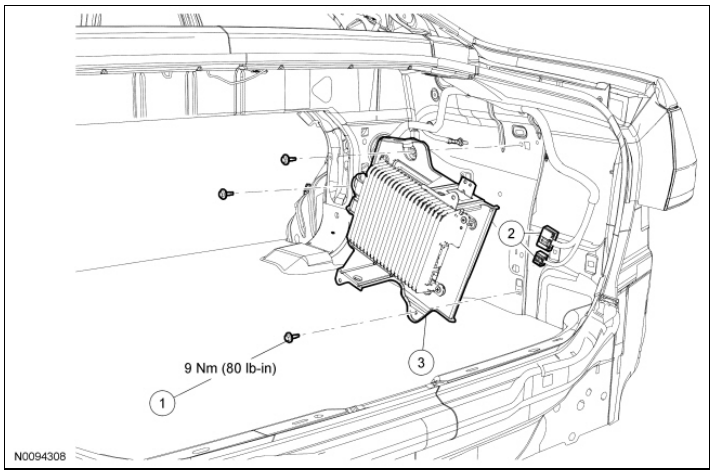
NOTE: Fusion shown, MKZ similar.



Item	Part Number	Description
1	-	Audio input jack bezel
2	-	Universal Serial Bus (USB) cable and port (if equipped) (part of 14D202)
3	19A164	Audio input jack

Removal and Installation

1. Open the floor console stowage bin door.



2. Using a suitable tool, remove the audio input jack bezel by prying straight back (Fusion) or straight up (MKZ).
    - Disconnect the Universal Serial Bus (USB) cable and port, if equipped.

3. Release the tabs and remove the audio input jack.

4. To install, reverse the removal procedure.

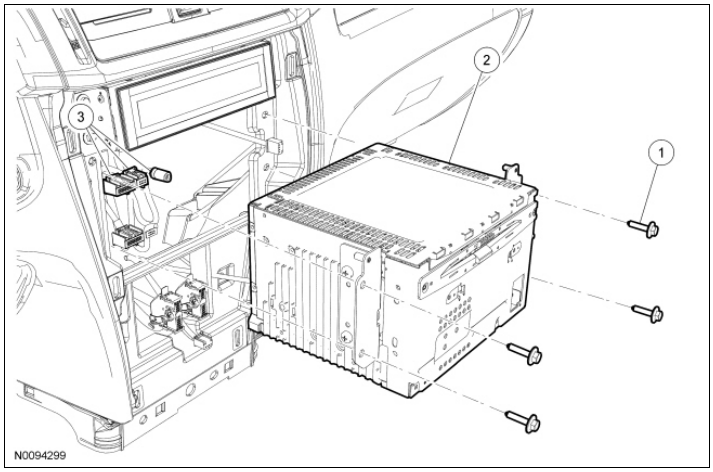
Audio Amplifier

Item	Part Number	Description
1	W505423-S	Audio amplifier bolts (3 required)
2	-	Audio amplifier electrical connectors (part of 14A005)
3	18B849	Audio amplifier

Removal and Installation

NOTE: This procedure applies to the MKZ with Premium Sound only. For all other amplifiers, refer to the appropriate procedure in this section.

1. Remove the 4 pushpins and the RH luggage compartment trim panel.



2. Disconnect the audio amplifier electrical connectors.

3. Remove the 3 bolts and the audio amplifier.
   - To install, tighten to 9 Nm (80 lb-in).

4. To install, reverse the removal procedure.

Audio Control Module (ACM) - Fusion

NOTE: Without navigation shown, with navigation similar.

Item	Part Number	Description
1	W707628	Audio Front Control Module (ACM) screws (4 required)
2	18806	ACM
3	-	ACM electrical connectors (part of 14401)

Removal and Installation

NOTE: It is not necessary to remove the Audio Front Control Module (ACM) to retrieve the part number. For additional information, refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.

All vehicles

1. **NOTE:** Module configuration is required when a new ACM is being installed.

   Upload the ACM configuration information to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in Section 418-01 .

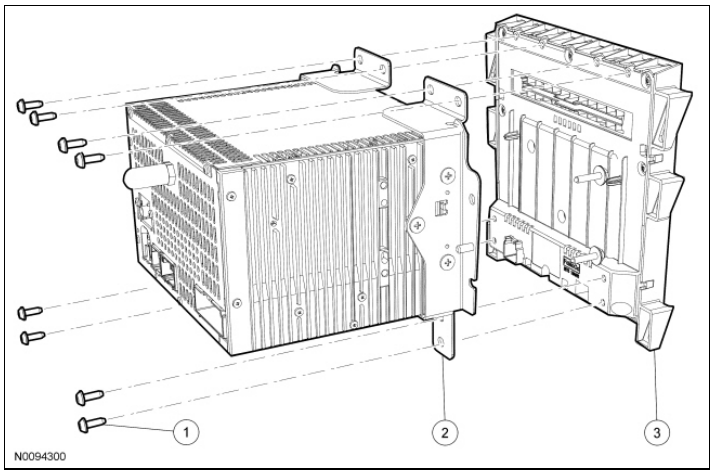
Vehicles with navigation

2. Remove the Front Display Interface Module (FDIM). For additional information, refer to Front Display Interface Module (FDIM) - Fusion in this section.

Vehicles without navigation

3. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .

All vehicles



4. **NOTE:** For vehicles with navigation, the 2 upper screws were removed with the FDIM .

   Remove the 4 screws (2 for navigation) and the ACM .

- Disconnect the electrical connectors.

5. To install, reverse the removal procedure.
   - Download the ACM configuration information from the scan tool. For additional information, refer to PMI in Section 418-01 .

Audio Control Module (ACM) - MKZ

Item	Part Number	Description
1	-	Audio Front Control Module (ACM) screws (8 required)
2	18806	ACM
3	18842	Front Controls Interface Module (FCIM)

Removal and Installation

NOTE: It is not necessary to remove the Audio Front Control Module (ACM) to retrieve the part number. For additional information, refer to Audio Control Module (ACM) Self-Diagnostic Mode in this section.

1. **NOTE:** Module configuration is required when a new ACM is being installed.

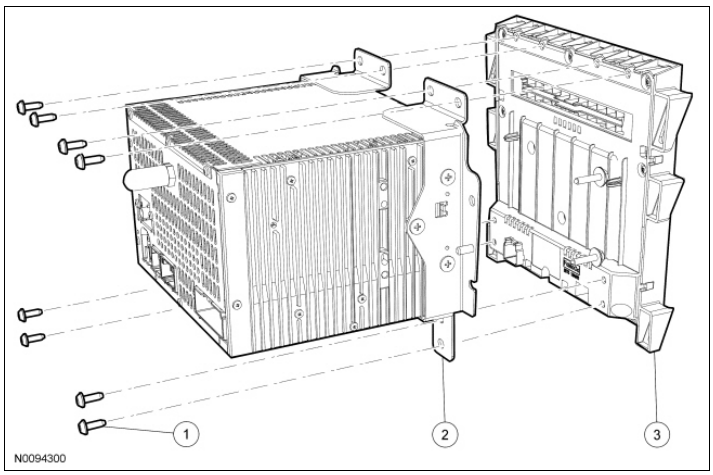
   Upload the ACM configuration infor to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in Section 418-01 .

2. Remove the Front Controls Interface Module (FCIM). For additional information, refer to Front Controls Interface Module (FCIM) - MKZ in this section.

3. Remove the 8 screws and the ACM .

4. To install, reverse the removal procedure.
   - Download the ACM configuration information from the scan tool. For additional information, refer to PMI in Section 418-01 .

Front Controls Interface Module (FCIM) - Fusion



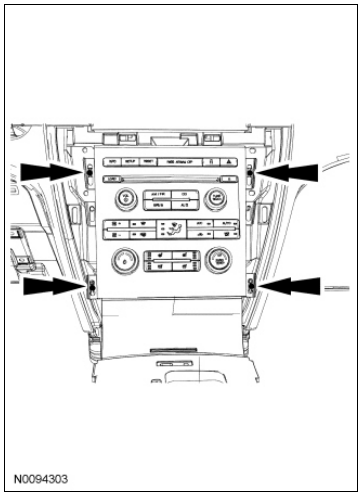
Item	Part Number	Description
1	-	Instrument panel center finish panel
3	W506943-S	Front Controls Interface Module (FCIM) screws (12 required)
3	18842	FCIM

Removal and Installation

1. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .
2. Remove the 12 screws and the FCIM .
3. To install, reverse the removal procedure.

Front Controls Interface Module (FCIM) - MKZ

Floor Console and Instrument Panel Components



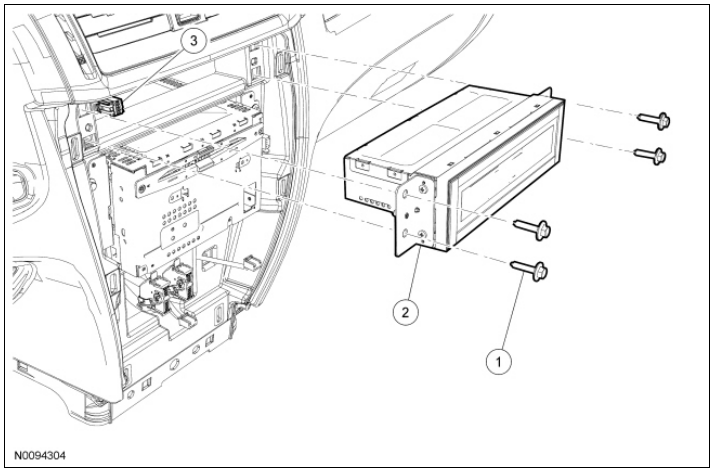
Item	Part Number	Description
1	-	Audio Front Control Module (ACM) screws (8 required)
2	18806	ACM
3	18842	Front Controls Interface Module (FCIM)

Removal and Installation

1. Remove the LH and RH floor console finish mouldings. For additional information, refer to Console - Floor, MKZ in Section 501-12 .

2. Remove the instrument panel finish moulding. For additional information, refer to Instrument Panel - Exploded View in Section 501-12 .

3. Remove the 4 screws and the Front Controls Interface Module (FCIM).
   - Disconnect the electrical connectors.



4. Remove the 8 screws and separate the Audio Front Control Module (ACM) from the FCIM .

5. To install, reverse the removal procedure.

Front Display Interface Module (FDIM) - Fusion

NOTE: Without navigation shown, with navigation similar.

Item	Part Number	Description
1	W707628-S	Front Display Interface Module (FDIM) screws (4 required)
2	10D885/10E899	FDIM (without navigation/ with navigation)
3	-	FDIM electrical connector (part of 14401)

Removal and Installation

NOTE: Vehicles without navigation require Programmable Module Installation (PMI) when a new module is being installed. For vehicles without navigation, the Front Display Interface Module (FDIM) is not a stand-alone module.

1. For vehicles without navigation, upload the FDIM configuration information to the scan tool. For additional information, refer to PMI in Section 418-01 .

2. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .

3. ***NOTICE:*** **For vehicles with navigation, make sure not to bend the video cable when removing the FDIM .**

   Remove the 4 screws and the FDIM .

   - Disconnect the electrical connectors.

4. To install, reverse the removal procedure.
   - For vehicles without navigation, download the configuration information to the FDIM . For additional information, refer to PMI in Section 418-01 .

Front Display Interface Module (FDIM) - MKZ

NOTE: With navigation shown, without navigation similar.

Item	Part Number	Description
1	W707628-S	Front Display Interface Module (FDIM) screws (4 required)
2	10D885/10E899	FDIM (without navigation/ with navigation)
3	-	FDIM electrical connector (part of 14401)

Removal and Installation

NOTE: Vehicles without navigation require Programmable Module Installation (PMI) when a new module is being installed. For vehicles without navigation, the Front Display Interface Module (FDIM) is not a stand-alone module.

1. For vehicles without navigation, upload the FDIM configuration information to the scan tool. For additional information, refer to PMI in Section 418-01 .

2. Remove the instrument panel center finish panel. For additional information, refer to Section 501-12 .

3. ***NOTICE:*** **For vehicles with navigation, make sure not to bend the video cable when removing the FDIM .**

   Remove the 4 screws and the FDIM .

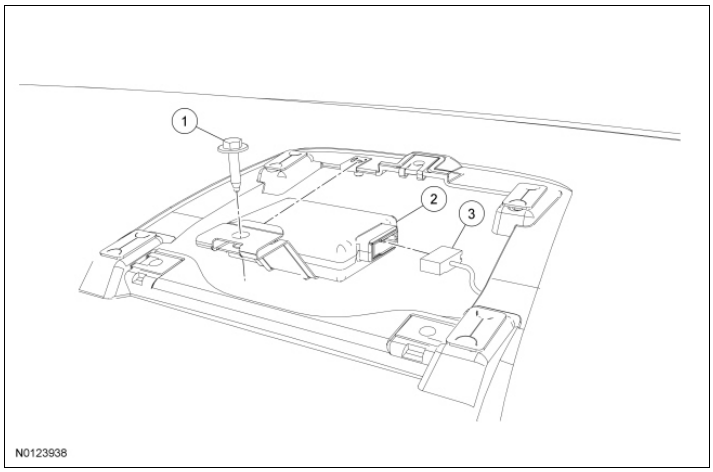
   - Disconnect the electrical connectors.

4. To install, reverse the removal procedure.
   - For vehicles without navigation, download the configuration information to the FDIM . For additional information, refer to PMI in Section 418-01 .

Global Positioning System Module (GPSM) - Fusion

NOTE: Steering wheel shown removed for clarity only.

Item	Part Number	Description
1	-	Global Positioning System Module (GPSM) electrical connector
2	10E893	GPSM



Removal and Installation

1. Remove the Instrument Panel Cluster (IPC). For additional information, refer to Section 413-01 .

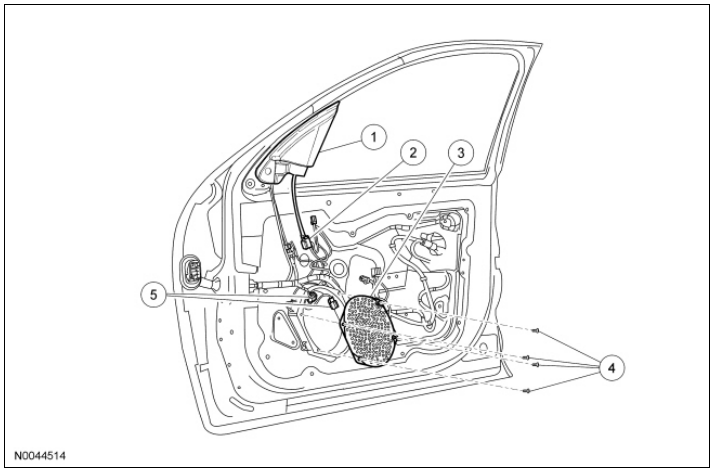
2. Release the clips and remove the Global Positioning System Module (GPSM).
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Global Positioning System Module (GPSM) - MKZ

Item	Part Number	Description
1	W707628	Bolt
2	10E893	Global Positioning System Module (GPSM)
3	-	GPSM electrical connector

Removal and Installation



1. Remove the instrument panel speaker. For additional information, refer to Section 415-00 .
2. Remove the Global Positioning System Module (GPSM) mounting bolt.
3. Remove the GPSM .
    - Disconnect the electrical connector.
4. To install, reverse the removal procedure.

&nbP>

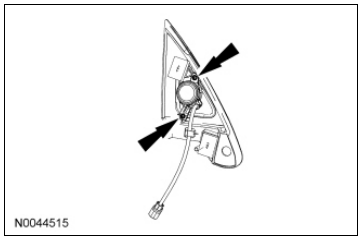
Speaker - Door

NOTE: Fusion shown, MKZ similar

NOTE: Front door shown, rear door similar.

Item	Part Number	Description
1	-	Sail panel
2	-	Front door tweeter speaker electrical connector (part of 18808)
3	18808	Door speaker
4	-	Door speaker screws (4 required)
5	-	Door speaker electrical connectors (part of 14630/14631)

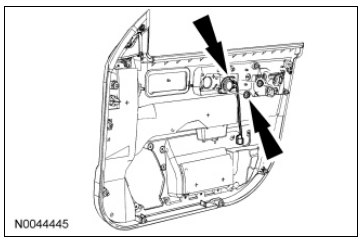
Removal and Installation



All speakers

1. Remove the door trim panel. For additional information, refer to Section 501-05 .

Front door tweeter speaker (Fusion)



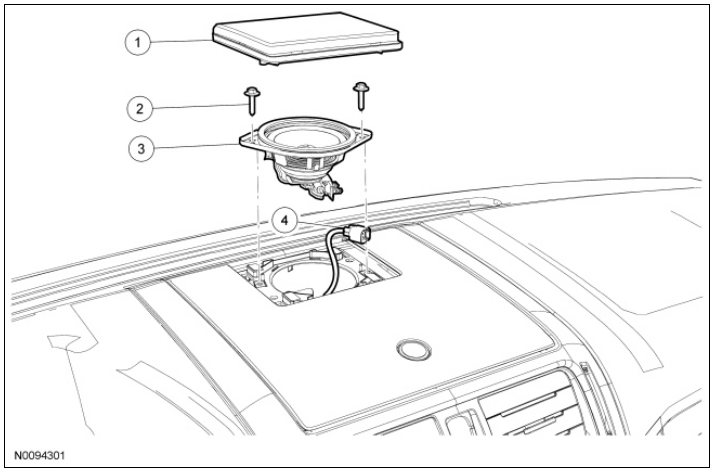
2. Remove the sail panel.
   - Disconnect the electrical connector.

3. Remove the 2 screws and the front door tweeter speaker from the sail panel.

Front door tweeter speaker (MKZ)

4. Remove the 2 nuts and the front door tweeter speaker from the door trim panel.

Front or rear door speaker



5. Remove the 4 screws and the door speaker.
    - Disconnect the electrical connectors.

All speakers

6. To install, reverse the removal procedure.

Speaker - Instrument Panel

NOTE: Vehicle without THX® shown, vehicles with THX® similar.

Item	Part Number	Description
1	5413594	Instrument panel speaker cover
2	W707628-S	Instrument panel speaker screws (Vehicles without THX® - 2 required, THX® - 3 required)
3	18978/18808	Instrument panel speaker (Sony®/THX®)
4	-	Instrument panel speaker electrical connector (part of 14401)

Removal and Installation

1. **NOTE:** For THX® sound, release the top 2 retaining clips of the center instrument panel finish panel to allow clearence for speaker cover removal.

   NOTE: For THX® sound, pry the speaker cover at the front, then lift.

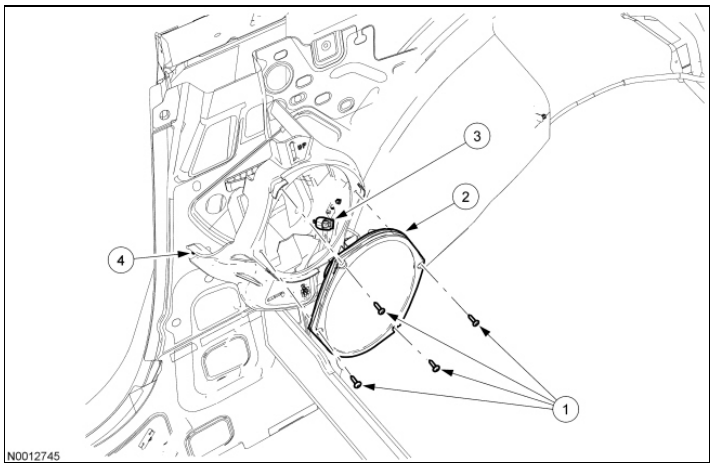
   Using a suitable tool such as a trim removal tool, remove the instrument panel speaker cover.

2. Remove the screws (2 for vehicles without THX® sound, 3 for THX® sound) and the instrument panel speaker.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Speaker - Parcel Shelf

Item	Part Number	Description
1	-	Parcel shelf speaker screws (3 required)
2	18808	Parcel shelf speaker
3	-	Parcel shelf speaker electrical connector (part of 14A005)



Removal and Installation

1. Remove the parcel shelf. For additional information, refer to Section 501-05 .

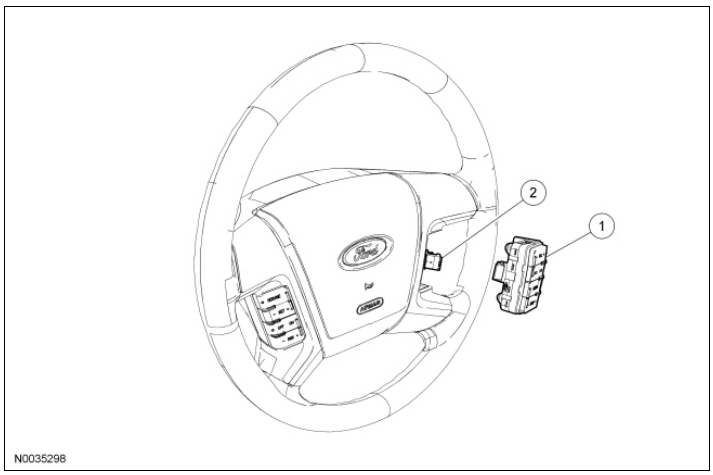
2. Remove the 3 screws and the parcel shelf speaker.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Speaker - Quarter Panel

Item	Part Number	Description
1	W709996	Quarter panel speaker screws (4 required)
2	18808	Quarter panel speaker
3	-	Quarter panel speaker electrical connector (part of 14A005)
4	W701930	Quarter panel speaker mounting bracket screws (3 required)

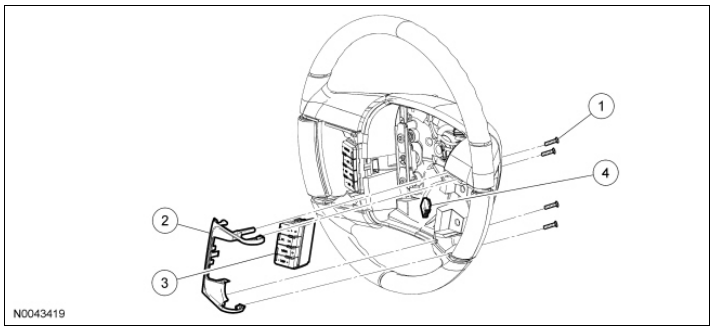
Removal and Installation



1. Remove the quarter trim panel. For additional information, refer to Section 501-05 .

2. Remove the 4 screws and the quarter panel speaker.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.



Steering Wheel Controls

Fusion

Item	Part Number	Description
1	9C888	Steering wheel controls
2	-	Steering wheel controls electrical connector (part of 14A411)

MKZ

Item	Part Number	Description
1	-	Steering wheel controls bezel screws (4 required)
2	-	Steering wheel controls bezel
3	9C888	Steering wheel controls
4	-	Steering wheel controls electrical connector (part of 14A411)

Removal and Installation

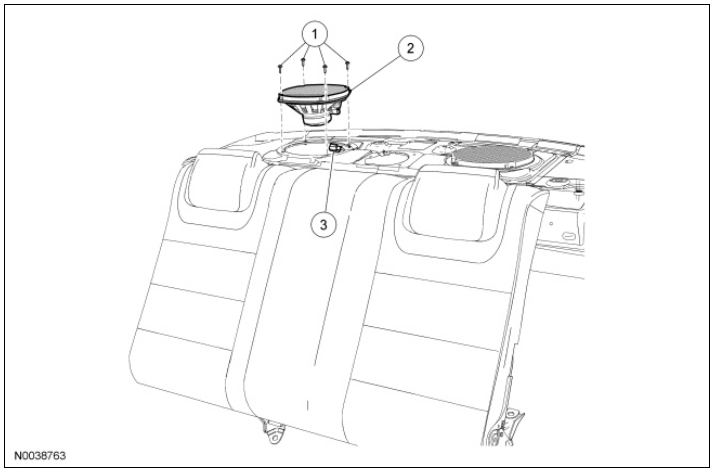
MKZ

1. Remove the driver air bag module. For additional information, refer to Section 501-20B .

2. Remove the 4 screws and the steering wheel controls bezel.

All vehicles

3. Remove the steering wheel controls by pulling the switch toward the rear of the vehicle.
   - Disconnect the electrical connector.



4. Remove the steering wheel controls bezel, if equipped.

5. To install, reverse the removal procedure.

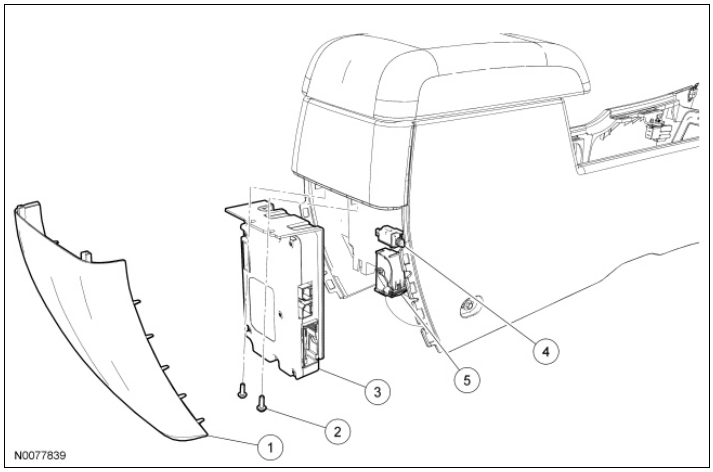
;

Speaker - Subwoofer

NOTE: RH side shown, LH side similar.

Item	Part Number	Description
1	-	Subwoofer speaker screws (4 required)
2	18808	Subwoofer speaker
3	-	Subwoofer speaker electrical connector (part of 14A005)

Removal and Installation



1. Remove the parcel shelf. For additional information, refer to Section 501-05 .

2. Remove the 4 screws and the subwoofer speaker.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Accessory Protocol Interface Module (APIM)

NOTE: Fusion shown, MKZ similar.

Item	Part Number	Description
1	-	Floor console rear trim panel (part of 045A36)
2	W505060-S	Accessory Protocol Interface Module (APIM) screws (2 required (Fusion), 4 required (MKZ))
3	14D212	APIM
4	14D202	Universal Serial Bus (USB) cable
5	-	APIM electrical connector (part of 14B079)

Removal and Installation

1. **NOTE:** It is necessary to record the current Accessory Protocol Interface Module (APIM) software and hardware level when a new APIM is being installed to make sure that the new component is the same version as the component being replaced.

   Retrieve and record the current APIM software and hardware level. For additional information, Accessory Protocol Interface Module (APIM) Software Level Check in this section.

2. Remove the floor console rear trim panel by pulling out at the botto disengage the clips then rotating the bottom of the panel out to release the upper retaining tabs.

3. **NOTE:** For Fusion, the APIM is removed as an assembly with the bracket.

   Remove the 2 screws (Fusion) or 4 screws (MKZ) and the APIM .

   - Disconnect the APIM electrical connector.
   - Disconnect the Universal Serial Bus (USB) cable.

4. To install, reverse the removal procedure.
   - If a new APIM is being installed, program the APIM to the correct software level. For additional information, refer to Accessory Protocol Interface Module (APIM) Programming

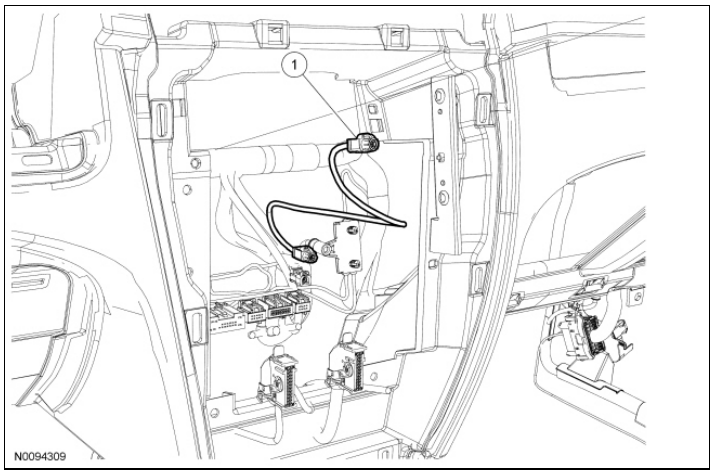
in Section 418-01 .

Universal Serial Bus (USB) Cable and Port

NOTE: Fusion shown, MKZ similar.

Item	Part Number	Description
1	-	Floor console rear trim panel (part of 045A36)
2	-	Universal Serial Bus (USB) cable and port-to-bezel connector (part of 14D202)
3	14D202	USB cable and port

Removal and Installation



1. Remove the floor console. For additional information, refer to Section 501-12 .
2. Disconnect the Universal Serial Bus (USB) cable and port-to-bezel connector.
3. Remove the floor console rear trim panel by pulling straight back to disengage the clips.
4. ***NOTICE:*** **Be careful not to flex the floor console RH side panel too much, or damage to the floor console may occur.**

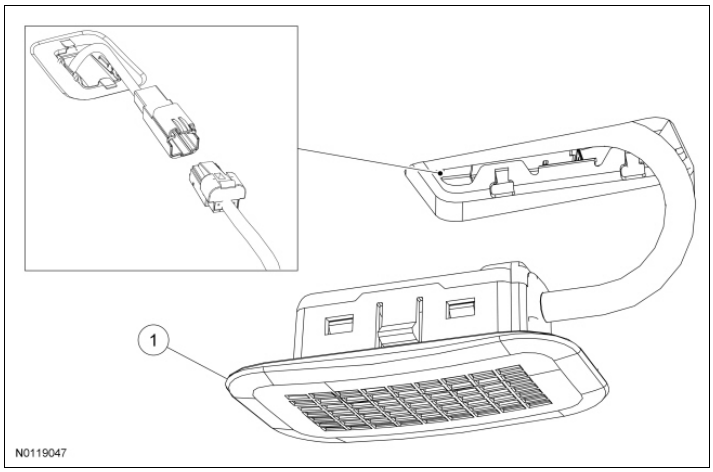
   Remove the USB cable and port.

   - Disconnect the USB cable and port-to-Accessory Protocol Interface Module (APIM) electrical connector.
   - Carefully flex the floor console RH side panel and remove the USB cable and port.
5. To install, reverse the removal procedure.

&nbs

Video Cable

Item	Part Number	Description
1	10E929	Video cable



Removal and Installation

1. Remove the Audio Front Control Module (ACM). For additional information, refer to Audio Control Module (ACM) - Fusion or Audio Control Module (ACM) - MKZ in this section.

2. Remove the video cable.

3. To install, reverse the removal procedure.
    - Secure the video cable using tape or zip-ties, as necessary.

Microphone

Item	Part Number	Description
1	19A391	Microphone

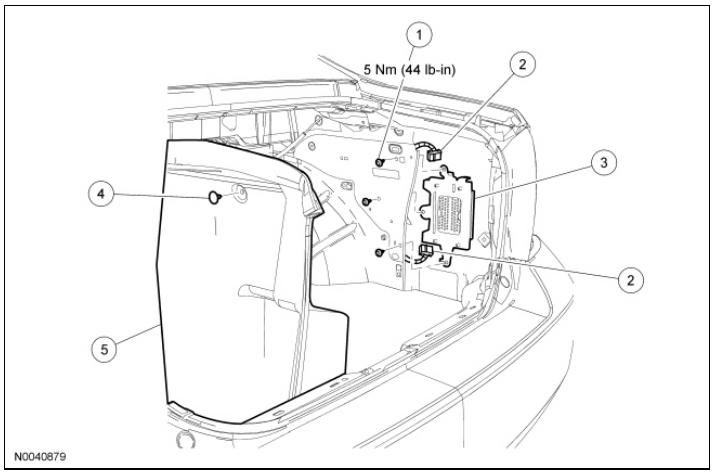
Removal

NOTE: If the microphone is removed from the headliner, a new microphone must be installed.

1. Using a suitable tool, (such as a thin small flat head screwdriver) twist and pry the microphone bezel from the headliner metal mounting bracket.

2. Remove the microphone from the headliner by grasping the microphone pigtail.
   - Disconnect the microphone electrical connector.

Installation



1. Reconnect the microphone electrical connector.

2. Wrap the connection with anti-rattle tape.

3. Feed the microphone pigtail into the headliner through the microphone hole.
   - Verify the microphone pigtail points towards the front of the vehicle.

4. Snap the microphone into the headliner mounting bracket.
   - Verify the mounting bracket and microphone are snug to the headliner.

Subwoofer Amplifier

Item	Part Number	Description
1	W503924	Subwoofer amplifier screws (3 required)
2	-	Subwoofer amplifier electrical connectors (part of 14A005)
3	18B849	Subwoofer amplifier
4	N802734	RH luggage compartment trim panel pushpins (4 required)
5	5445422	RH luggage compartment trim panel

Removal and Installation

NOTE: Make sure the key is in the OFF position.

1. Remove the 4 pushpins and the RH luggage compartment trim panel.

2. Disconnect the subwoofer amplifier electrical connectors.

3. Remove the 3 screws and the subwoofer amplifier.
   - To install, tighten to 5 Nm (44 lb-in).

4. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-ft	lb-in
Headlamp bolts	3.7	-	33
Rear lamp assembly nuts	6	-	53
Reversing lamp switch	24	18	-

Exterior Lighting

NOTE: If equipped, the perimeter lighting feature can be enabled or disabled. When enabled, the exterior lamps are illuminated when the UNLOCK button is pressed on the Remote Keyless Entry (RKE) transmitter. Refer to Section 501-14 for programming and diagnostics.

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Exterior Lighting System

The exterior lighting system consists of the following components:

- Headlamps
- Ballasts (if equipped with High Intensity Discharge (HID) headlamps) (located on the underside of each headlamp)
- Front side marker lamps
- Rear side marker lamps
- Rear lamp assemblies
- High mounted stoplamp
- Reversing lamps
- Headlamp switch
- Multifunction switch
- Hazard flasher lamp switch (located in front of the instrument panel storage bin for Fusion or the lower portion of the center instrument panel finish panel for MKZ)
- Light sensor
- Stoplamp switch
- Reversing lamp switch (located on the forward side of the manual transaxle)
- SJB (located to the left of the brake pedal)
- Headlamp Control Module (HCM) (located next to the SJB)

Battery Saver

NOTE: Time-out is 1 minute if the vehicle has less than 80 km (50 miles).

The battery saver is internal to the SJB and provides automatic shut-off of the headlamps and parking lamps after 10 minutes in order to save battery voltage. A timer is started when the ignition switch is turned to the OFF position with the headlamp switch in the HEADLAMPS ON position, or the headlamp switch is placed in the HEADLAMPS ON position with the ignition switch off. When the time-out period has elapsed, the voltage is automatically shut off to the lamps by the battery saver.

The battery saver does **not** control the parking lamps if the headlamp switch is in the PARKING LAMPS ON position.

Lamp Assembly Condensation

Exterior lamps are vented to accommodate normal changes in pressure. Condensation can be a natural by-product of this design. When moist air enters the lamp assembly through the vents, there is a possibility that condensation can occur if the temperature is cold. When normal condensation occurs, a thin film of mist can form on the interior of the lens. The thin mist eventually clears and exits through the vents during normal

operation. Time to clear the lens of acceptable mist varies with ambient humidity and lamp types. Normal condensation clears from any lamp in 48 hours under dry conditions.

Do **not** replace a lamp assembly with acceptable levels of condensation such as:

- presence of thin mist (no streaks, drip marks or droplets are present)
- fine mist covers less than 50% of the lens

Examples of unacceptable moisture (usually caused by a lamp housing leak):

- water puddling inside the lamp
- large water droplets, drip marks or streaks present on the interior of the lens

Headlamps - Fusion

The headlamp system is a quad-beam pattern system. It consists of replaceable low and high beam bulbs. The headlamp assembly has the park/turn lamp integrated into the headlamp assembly.

If the headlamps are on when the ignition switch is turned off, the battery saver feature turns off the headlamps after 10 minutes have elapsed.

When the low beams are requested (based on inputs to the SJB), the low beams are illuminated.

When the high beams are requested, the high beams are illuminated with the low beams.

When the flash-to-pass feature is requested, the high beams are illuminated for as long as the multifunction switch is held in the FLASH-TO-PASS position.

Headlamps - MKZ

The headlamp system is a quad-beam pattern system. It consists of replaceable low and high beam bulbs. The headlamp assembly has the park/turn and side marker lamps integrated into the headlamp assembly.

If the headlamps are on when the ignition switch is turned off, the battery saver feature turns off the headlamps after 10 minutes have elapsed.

When the low beams are requested (based on inputs to the SJB), the low beams are illuminated.

When the high beams are requested, the high beams are illuminated with the low beams.

When the flash-to-pass feature is requested, the high beams are illuminated for as long as the multifunction switch is held in the FLASH-TO-PASS position.

High Intensity Discharge (HID) Headlamps

Each HID headlamp consists of a ballast and replaceable low and higam bulbs. The ballasts provide the higher voltage required for the HID bulbs to illuminate.

When the low beams are on, the HID ballasts provide high voltage to the HID bulbs.

Autolamps

The autolamp system provides light sensitive automatic on/off control of the exterior lamps. The autolamp system keeps the exterior lamps on for a pre-selected period of time after the ignition switch is turned to the

OFF position (20 seconds is the factory default setting). The pre-selected time lapse is adjustable up to approximately 3 minutes. To adjust the setting, refer to Autolamps Time Delay Adjustment in this section.

Headlamps On With Wipers On Feature

If the headlamp switch is in the AUTOLAMPS ON position, this feature turns the exterior lamps on when the front wipers are on for more than 10 seconds (except during a mist wipe or while the wipers are on to clear washer fluid during a wash condition). The exception to this is when the exterior lights are on because of darkness determined by the autolamp system.

Refer to Section 501-16 for diagnostics of the headlamps on with wipers on feature.

Stoplamps

NOTE: The Fusion high mounted stoplamp has 9 LEDs mounted in the center third portion of the assembly. The outer left and right portions of the high mounted stoplamp are not illuminated. The high mounted stoplamp is not designed to illuminate the full width of the lens.

The stoplamp switch is located on the brake pedal assembly. The stoplamps are supplied voltage when the brake pedal is applied.

Turn Signal/Hazard Lamps

The front turn signal lamps are located within the headlamp assemblies. Fusion utilizes combination stop/turn lamps while MKZ has dedicated rear turn lamps. When the multifunction switch is placed in the LH or RH TURN positions, the SJB routes voltage to the LH or RH turn signal lamps. The SJB then cycles the voltage on and off approximately 80 times per minute. If a front or rear turn bulb is inoperative, the SJB cycles the voltage on and off approximately 160 times per minute.

When the hazard switch is pressed, the SJB supplies voltage to all the turn lamps. The SJB cycles the voltage on and off approximately 80 times per minute.

For Fusion, the hazard flasher lamp switch is mounted to the instrument panel upper storage compartment panel.

For MKZ, the hazard flasher lamp switch is part of the Front Controls Interface Module (FCIM).

Parking Lamps

The SJB supplies voltage to the parking lamps when demanded. The parking lamps include the following:

- Front parking lamps
- Front side marker lamps
- Rear parking lamps
- Rear side marker lamps
- License plate lamps

Fog Lamps

The fog lamp switch is integrated into the headlamp switch. When the fog lamp switch is engaged, the SJB provides ground for the fog lamp relay coil (integrated into the SJB), which then energizes and routes voltage to the fog lamps. The fog lamps can be turned on when the ignition is in run or accessory, the parking lamps are on, and the high beam headlamps are off.

On vehicles equipped with HID headlamps, the fog lamps are used for the Daytime Running Lamps (DRL), if this feature is enabled.

Reversing Lamps

When the transmission is placed in REVERSE (R), the reversing lamps are illuminated. The reversing lamps are located within the rear lamp assemblies (Fusion) or mounted to the luggage compartment lid (MKZ).

Daytime Running Lamps (DRL)

On vehicles with halogen headlamps, the DRL system illuminates the low beam headlamps at a reduced intensity.

On vehicles with HID headlamps, the DRL system operates the fog lamps at full intensity by energizing the fog lamp relay.

The DRL turn on when the following conditions are met:

- The ignition switch is in the RUN position.
- The headlamps have not been turned on by the autolamp system or the headlamp switch.
- The transmission is not in PARK (P) (automatic transaxle).
- The parking brake is released (manual transaxle).

The SJB can be configured to turn the DRL on for this vehicle. Refer to Section 418-01 for additional information on this programmable parameter.

Adaptive Headlighting

Vehicles equipped with adaptive front lighting have a Headlamp Control Module (HCM) to control the left/right swiveling of the headlamp bulbs. Depending on the inputs received (steering wheel angle and vehicle speed for example), the adaptive front lighting module HCM can change the angle at which the headlamps are aimed (left or right) to improve nighttime visibility around curves.

The swiveling motor within each headlamp (used to control the angle of the headlamp beams) are part of the headlamp assembly and cannot be repaired separately.

Diagnostic Trouble Code (DTC) Chart

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B106E	Solid State Driver Disabled Due to Short Circuit	**The module has temporarily disabled an output because an excessive current draw exists (such as a short to ground). The SJB cannot enable the output until the cause of the short is corrected. ADDRESS all other DTCs first.** After the cause of the concern is corrected, CLEAR the DTCs. REPEAT the self-test.
B106F	Module Disabled Due to External Fault	**The module has permanently disabled an output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed. ADDRESS all other DTCs first.** After the cause of the concern is corrected, INSTALL a new SJB . TEST the system for normal operation.
B1472	Lamp Headlamp Input Circuit Short to Ground	GO to Pinpoint Test D .
B1485	Brake Pedal Input Short to Battery	GO to Pinpoint Test L .

B2282	Left Turn Switch Short to Ground	GO to Pinpoint Test N .
B2498	Headlamp Switch Multiple Signals Input Active	ADDRESS any other DTCs first. GO to Pinpoint Test D .
B2A22	Headlamp Off Circuit Open	ADDRESS any other DTCs first. GO to Pinpoint Test D .
B2A23	High Beam Input Circuit Short to Ground	GO to Pinpoint Test E .
B2A24	Turn Signal Input Circuit Failure	DIAGNOSE all other DTCs and symptoms first. If no other DTCs or symptoms are present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B2A27	Right Front Turn Lamp Circuit Open	GO to Pinpoint Test O .
B2A28	Right Front Turn Lamp Circuit Short to Ground	GO to Pinpoint Test O .
B2A29	Left Front Turn Lamp Circuit Open	GO to Pinpoint Test O .
B2A2A	Left Front Turn Lamp Circuit Short to Ground	GO to Pinpoint Test O .
B2A2B	Left Corner Lamp Output Circuit Short to Ground	DIAGNOSE all other DTCs and symptoms first. If no other DTCs or symptoms are present, INSPECT the SJB and C2280f for bent pins, loose or corroded connections. If no concerns are found, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B2A2C	Right Corner Lamp Output Circuit Short to Ground	DIAGNOSE all other DTCs and symptoms first. If no other DTCs or symptoms are present, INSPECT the SJB and C2280f for bent pins, loose or corroded connections. If no concerns are found, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B2A2E	Right Front Lamp Low Beam Circuit Open	If the low beam is inoperative, GO to Pinpoint Test B . If the low beam is always on, GO to Pinpoint Test D .
B2A2F	Right Front Lamp Low Beam Circuit Short to Ground	GO to Pinpoint Test B .
B2A30	Left Front Lamp Low Beam Circuit Open	If the low beam is inoperative, GO to Pinpoint Test B .

		If the low beam is always on, GO to Pinpoint Test D .
B2A31	Left Front Lamp Low Beam Circuit Short to Ground	GO to Pinpoint Test B .
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Headlamp Control Module (HCM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B1A98:88	LIN Bus Circuit #1: Bus off	GO to Pinpoint Test AA .
B1D64:01	Left Headlamp Swivelling Motor: General Electrical Failure	INSTALL a new LH headlamp assembly. REFER to Headlamp Assembly in this section. CLEAR the DTCs. REPEAT the self-test.
B1D64:87	Left Headlamp Swivelling Motor: Missing Message	GO to Pinpoint Test AB .
B1D65:01	Right Headlamp Swivelling Motor: General Electrical Failure	INSTALL a new RH headlamp assembly. REFER to Headlamp Assembly in this section. CLEAR the DTCs. REPEAT the self-test.
B1D65:87	Right Headlamp Swivelling Motor: Missing Message	GO to Pinpoint Test AB .

Headlamps

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Exterior Lighting

The SJB monitors the headlamp switch position by sending voltage signals on multiple circuits to the headlamp switch. There is one circuit for each headlamp switch position. At any given time, one of the signal circuits is switched to ground.

If the SJB does not detect any of the inputs to the headlamp switch is active (switched to ground) for 5 seconds, the SJB turns on the parking lamps and headlamps and keeps them on until the battery saver feature times out.

Additionally, if the SJB detects multiple headlamp switch input circuits short to ground, the SJB turns the parking lamps and headlamps on and keeps them on until the battery saver feature times out.

Refer to Exterior Lighting for information regarding the Battery Saver feature.

If either of the above situations occur, the SJB **cannot** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

The SJB also monitors the multifunction switch for a flash-to-pass or high beam request. There are 2 voltage signal circuits which monitor this. When the multifunction switch is in the FLASH-TO-PASS or HIGH BEAM position, the voltage signal is routed to ground.

NOTE: The flash-to-pass feature does not require any input from the headlamp switch.

When the SJB receives an input requesting the headlamps on, the SJB supplies voltage to the low beam and high beam bulbs as necessary.

Headlamp Functionality

When the low beams are requested (based on inputs to the SJB), the low beams are illuminated.

Vehicles equipped with High Intensity Discharge (HID) headlamps utilize a relay to provide voltage to the ballasts. When the HID relays are energized, the ballasts provide the required high voltage to illuminate the HID bulbs.

When the high beams are requested, the high beams are illuminated and the low beams turn off.

When the flash-to-pass feature is requested, the high beams are illuminated as long as the multifunction switch is held in the FLASH-TO-PASS position.

Field-Effect Transistor (FET) Protection

Field-Effect Transistor (FET) is a type of transistor that when used with module software can be used to monitor and control current flow on module outputs. The FET protection strategy is used to prevent module damage in the event of excessive current flow.

The SJB utilizes a FET protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), DTC B106E and the associated continuous DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

The SJB FET protected output circuits for the headlamps are the LH and RH low beam output circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch • Multifunction switch • Headlamp assembly	• Battery Junction Box (BJB) fuse(s): ♦ 26 (15A) (LH ballast) ♦ 27 (15A) (RH ballast) • Smart Junction Box (SJB) fuse(s): ♦ 7 (10A) (LH low beam) ♦ 8 (10A) (RH low beam) ♦ 23 (15A) (high beams) • Bulb(s) • Headlamp relay • Wiring, terminals or connectors • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

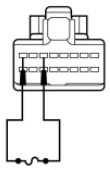
Pinpoint Test A: Both High Beams Are Inoperative

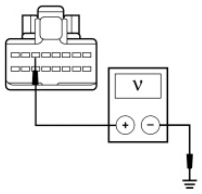
Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

Normal Operation

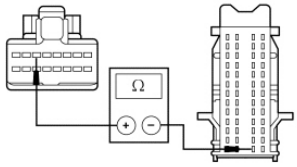
When the headlamp switch is placed in the HEADLAMPS ON position, the Smart Junction Box (SJB) monitors the high beam request circuit from the multifunction switch. When the multifunction switch is placed in the HIGH BEAM position, the signal is switched to ground, indicating a request for the high beams. The SJB then energizes the high beam relay (integrated into the SJB) which supplies voltage to the headlamps.

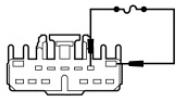
The SJB communicates to the Instrument Panel Cluster (IPC) (over the communication network) to illuminate the high beam indicator.





This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST A: BOTH HIGH BEAMS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE HIGH BEAM INDICATOR	
• Ignition OFF. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position.	**Yes** VERIFY the SJB fuse 23 (15A) is OK. If OK, GO to A5 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

• **Does the high beam indicator illuminate?**	**No** GO to A2 .
A2 BYPASS THE MULTIFUNCTION SWITCH	
• Place the headlamp switch in the OFF position. • Disconnect: Multifunction Switch C202. • Place the headlamp switch in the HEADLAMPS ON position. • Connect a fused jumper wire between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and the multifunction switch C202-8, circuit GD116 (BK/VT), harness side.  N0057365 • **Do the high beams illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to A3 .
A3 CHECK FOR VOLTAGE TO THE MULTIFUNCTION SWITCH	
• Measure the voltage between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and ground.  N0088166 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit GD116 (BK/VT) for an open. TEST the system for normal operation. **No** GO to A4 .
A4 CHECK THE HIGH BEAM REQUEST INPUT CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280b. • Measure the resistance between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and the SJB C2280b-27, circuit CLF17 (WH/OG), harness side.	**Yes** GO to A6 . **No** REPAIR circuit CLF17 (WH/OG) for an open. TEST the system for normal operation.

 N0057366 • **Is the resistance less than 5 ohms?**	
A5 CHECK THE SJB HIGH BEAM OUTPUT CIRCUIT FOR AN OPEN	
• Place the headlamp switch in the OFF position. • Disconnect: SJB C2280e. • Connect a fused jumper wire between the SJB C2280e-1, circuit CDC34 (WH/OG), harness side and the SJB C2280e-2, circuit CLF08 (YE/VT), harness side.  N0057367 • Ignition ON. • **Do the high beams illuminate?**	**Yes** REMOVE the jumper wire. GO to A6 . **No** REMOVE the jumper wire. REPAIR circuit CLF08 (YE/VT) for an open. TEST the system for normal operation.
A6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: One Low Beam Headlamp Is Inoperative

Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

Normal Operation - Fusion and MKZ With Halogen Headlamps

When the Smart Junction Box (SJB) detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage to the LH and RH low beam headlamps.

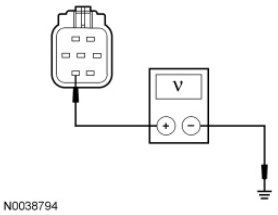
MKZ with High Intensity Discharge (HID) Headlamps

When the Smart Junction Box (SJB) detects the headlamp switch in the HEADLAMPS ON position and the multifunction switch in the LOW BEAM position, the SJB provides voltage to the LH and RH headlamp relays. When the headlamp relays are energized, voltage is switched to the headlamps.

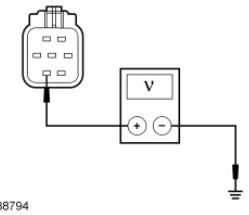
For MKZ with HID headlamps, the ballasts then provide the required high voltage to illuminate the HID headlamp bulbs.

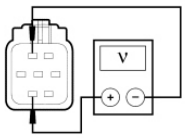
DTC Description	Fault Trigger Conditions
• B106E - Solid State Driver Disabled Due to Short Circuit	A continuous DTC that sets when the SJB has temporarily shut down the output driver. **The module has temporarily disabled a low beam output because an excessive current draw exists (such as a short to ground). T SJB cannot enable the low beam output until the cause of the short is corrected, the DTCs have been cleared and a successful self-test is run.**
• B106F - Module Disabled Due to External Fault	A continuous DTC that sets when the SJB has permanently shut down the output driver. **The module has permanently disabled a low beam output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed.**
• B2A2E - Right Front Lamp Low Beam Circuit Open	An on-demand DTC that sets when the SJB detects an open from the RH low beam output circuit.
• B2A2F - Right Front Lamp Low Beam Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the beam output circuit.
• B2A30 - Left Front Lamp Low Beam Circuit Open	An on-demand DTC that sets when the SJB detects an open from the LH low beam output circuit.
• B2A31 - Left Front Lamp Low Beam Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the LH low beam output circuit.

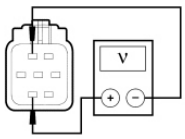
This pinpoint test is intended to diagnose the following:



- Fuse

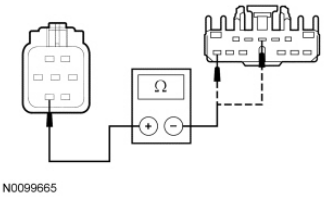


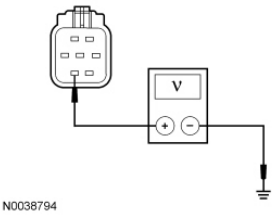




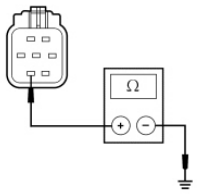
- Wiring, terminals or connectors
- Headlamp relay
- Ballast
- Bulb
- Headlamp assembly
- SJB

PINPOINT TEST B: ONE LOW BEAM HEADLAMP IS INOPERATIVE

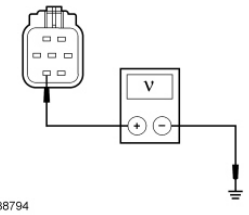


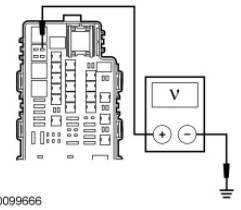


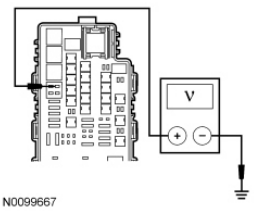
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Due to varying wattage ratings and resulting current draw of certain aftermarket headlamp bulbs, the SJB may activate its short circuit protection strategy, resulting in the low beam output circuit(s) becoming inoperative. Verify that the bulbs meet Ford specifications. If the bulbs do not meet Ford specifications, install the correct bulbs. Clear the DTCs and rhe on-demand self-test (required to reset the SJB). Correct any unresolved DTCs. Test the system for normal operation.







Test Step	Result / Action to Take
B1 CHECK FOR VOLTAGE TO THE HEADLAMP	
• Ignition OFF. • Disconnect: Inoperative Headlamp. • Place the headlamp switch in the HEADLAMPS ON position. • For Fusion or MKZ with halogen headlamps, measure the voltage between the LH headlamp C1021-6, circuit CLF04 (BN/BU), harness side and ground; or between the RH headlamp C1041-6, circuit CLF05 (BU/GN), harness side and ground.  N0038794 • For MKZ with HID headlamps, measure the voltage between the LH headlamp C1021-6, circuit CLF30 (VT/BN), harness side and ground; or between the RH headlamp C1041-6, circuit CLF31 (YE/GY), harness side and ground.	**Yes** GO to B2 . **No** For MKZ with halogen headlamps or Fusion, GO to B5 . For MKZ with HID headlamps, GO to B10 .

 N0038794 • **Is the voltage greater than 10 volts?**	
B2 CHECK FOR VOLTAGE TO THE HEADLAMP USING THE CONNECTOR GROUND	
• For Fusion or MKZ with halogen headlamps, measure the voltage between the LH headlamp C1021-6, circuit CLF04 (BN/BU), harness side and the LH headlamp C1021-1, circuit GD121 (BK/YE), harness side; or between the RH headlamp C1041-6, circuit CLF05 (BU/GN), harness side and the RH headlamp C1041-1, circuit GD123 (BK/GY), harness side.  N0099663 • For MKZ with HID headlamps, measure the voltage between the LH headlamp C1021-6, circuit CLF30 (VT/BN), harness side and the LH headlamp C1021-1, circuit GD121 (BK/YE), harness side; or between the RH headlamp C1041-6, circuit CLF31 (YE/GY), harness side and the RH headlamp C1041-1, circuit GD123 (BK/GY), harness side.  N0099663 • **Is the voltage greater than 10 volts?**	**Yes** For MKZ with HID headlamps, GO to B3 . For all others, REPAIR or INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. TEST the system for normal operation. **No** REPAIR circuit GD121 (BK/YE) (LH headlamp) or circuit GD123 (BK/GY) for an open. TEST the system for normal operation.
B3 SUBSTITUTE THE HID BULB	
• Place the headlamp switch in the OFF position. • Substitute a known good HID bulb. • Place the headlamp switch in the HEADLAMPS ON position. • **Does the headlamp illuminate?**	**Yes** INSTALL a new HID headlamp bulb. REFER to Headlamp Bulb - LH, MKZ or Headlamp Bulb - RH, MKZ in this section. TEST the system for normal operation.

	No REINSTALL the HID bulb. GO to B4 .
B4 SUBSTITUTE THE BALLAST	
• Place the headlamp switch in the OFF position. • Substitute a known good ballast. • Place the headlamp switch in the HEADLAMPS ON position. • **Does the headlamp illuminate?**	**Yes** INSTALL a new ballast. REFER to Ballast in this section. TEST the system for normal operation. **No** INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. TEST the system for normal operation.
B5 USE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Place the headlamp switch in the OFF position. • Check the recorded results from the SJB self-test. • **Is DTC B2A2E or DTC B2A30 present?**	**Yes** GO to B6 . **No** VERIFY the SJB fuse 7 (10A) (LH low beam) or fuse 8 (10A) (RH low beam) is OK. If OK, GO to B7 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the low beam output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B6 CHECK THE SJB HEADLAMP VOLTAGE SUPPLY CIRCUIT FOR AN OPEN (FUSION OR MKZ WITH HALOGEN HEADLAMPS)	
• Disconnect: SJB C2280e. • Measure the resistance between the LH headlamp C1021-6, circuit CLF04 (BN/BU), harness side and the SJB C2280e-13, circuit CLF04 (BN/BU), harness side; or between the RH headlamp C1041-6, circuit CLF05 (BU/GN), harness side and the SJB C2280e-4, circuit CLF05 (BU/GN), harness side.	**Yes** GO to B21 . **No** REPAIR circuit CLF04 (BN/BU) (LH headlamp) or circuit CLF05 (BU/GN) (RH headlamp) for an open. CLEAR the DTCs. REPEAT the self-test.

 • **Is the resistance less than 5 ohms?**	
B7 ISOLATE THE HEADLAMP AS THE CAUSE OF THE SHORT	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs **and** repeat the on-demand self-test **(required to enable the low beam output driver if DTC B106E is present)** . • Place the headlamp switch in the HEADLAMPS ON position. • Measure the voltage between the LH headlamp C1021-6, circuit CLF04 (BN/BU), harness side and ground; or between the RH headlamp C1041-6, circuit CLF05 (BU/GN), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to B9 . **No** GO to B8 .
B8 CHECK THE SJB LOW BEAM OUTPUT CIRCUIT FOR A SHORT TO GROUND (FUSION OR MKZ WITH HALOGEN HEADLAMPS)	
• Ignition OFF. • Disconnect: SJB C2280e. • Measure the resistance between the LH headlamp C1021-6, circuit CLF04 (BN/BU), harness side and ground; or between the RH headlamp C1041-6, circuit CLF05 (BU/GN), harness side and ground.	**Yes** GO to B21 . **No** REPAIR circuit CLF04 (BN/BU) (LH low beam) or circuit CLF05 (BU/GN) (RH low beam) for a short to ground. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the low beam output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

 N0068990 • **Is the resistance greater than 10,000 ohms?**	
B9 ISOLATE THE HEADLAMP AS THE CAUSE OF THE SHORT (FUSION OR MKZ WITH HID HEADLAMPS)	
• Ignition ON. • Disconnect: Headlamp Bulb. • Connect: Headlamp Assembly. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the on-demand self-test. • **Is DTC B2A31 (LH headlamp) or DTC B2A2F (RH headlamp) present?**	**Yes** INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the low beam output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** INSTALL a new headlamp bulb. REFER to Headlamp Bulb - LH, Fusion or Headlamp Bulb - RH, Fusion in this section. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the low beam output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B10 CHECK THE HEADLAMP RELAY	
• Place the headlamp switch in the OFF position. • Disconnect: Suspect Headlamp Relay. • Substitute a known good relay. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs **and** repeat the on-demand self-test **(required to enable the low beam output driver if DTC B106E is present)** . • Place the headlamp switch in the HEADLAMPS ON position. • Measure the voltage between the LH headlamp C1021-6, circuit CLF30 (VT/BN), harness side	**Yes** REMOVE the known good relay. INSTALL a new headlamp relay. TEST the system for normal operation. **No** For MKZ non-Hybrid, REMOVE the known good relay. GO to B11 . For MKZ Hybrid, REMOVE the known good relay. GO to B16 .

and ground; or between the RH headlamp C1041-6, circuit CLF31 (YE/GY), harness side and ground.  N0038794 • **Is the voltage greater than 10 volts?**	
B11 CHECK FOR VOLTAGE TO THE HEADLAMP RELAY	
• Place the headlamp switch in the OFF position. • Ignition OFF. • For the LH headlamp, measure the voltage between the LH headlamp relay pin 3, circuit SBB26 (YE/RD), BJB face side and ground.  N0099666 • For the RH headlamp, measure the voltage between the RH headlamp relay pin 3, circuit SBB27 (BU/RD), BJB face side and ground.  N0099667 • **Is the voltage greater than 10 volts?**	**Yes** GO to B12 . **No** VERIFY the BJB fuse 26 (15A) (LH headlamp) or fuse 27 (15A) (RH headlamp) is OK. If OK, REPAIR circuit SBB26 (YE/RD) (LH headlamp) or circuit SBB27 (BU/RD) (RH headlamp) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
B12 CHECK FOR VOLTAGE TO THE HEADLAMP RELAY USING THE RELAY GROUND	

• For the LH headlamp, measure the voltage between the LH headlamp relay pin 3, circuit SBB26 (YE/RD), BJB face side and the LH headlamp relay pin 2, circuit GD121 (BK/YE), BJB face side.  N0099668 • For the RH headlamp, measure the voltage between the RH headlamp relay pin 3, circuit SBB27 (BU/RD), BJB face side and the RH headlamp relay pin 2, circuit GD121 (BK/YE), BJB face side.  N0099669 • **Is the voltage greater than 10 volts?**	**Yes** GO to B13 . **No** REPAIR circuit GD121 (BK/YE) for an open. TEST the system for normal operation
B13 BYPASS THE HEADLAMP RELAY	
• Connect: Headlamp Assembly. • For the LH headlamp, connect a fused jumper wire between the LH headlamp relay pin 3, circuit SBB26 (YE/RD), BJB face side and the LH headlamp relay pin 5, circuit CLF30 (VT/BN), BJB face side.  N0099670 • For the RH headlamp, connect a fused jumper wire between the RH headlamp relay pin 3, circuit SBB27 (BU/RD), BJB face side and the RH headlamp relay pin 5, circuit CLF31 (YE/GY), BJB face side.	**Yes** REMOVE the jumper wire. GO to B14 . **No** REMOVE the jumper wire. REPAIR circuit CLF30 (VT/BN) (LH headlamp) or circuit CLF31 (YE/GY) (RH headlamp) for an open. TEST the system for normal operation.

 N0099671 • **Does the headlamp illuminate?**	
B14 CHECK THE SJB LOW BEAM OUTPUT CIRCUIT FOR A SHORT TO GROUND (MKZ NON-HYBRID HID HEADLAMPS)	
• Disconnect: SJB C2280e. • For the LH headlamp, measure the resistance between the LH headlamp relay pin 1, circuit CLF04 (BN/BU), BJB face side and ground.  N0099672 • For the RH headlamp, measure the resistance between the RH headlamp relay pin 1, circuit CLF05 (BU/GN), BJB face side and ground.  N0084265 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B15 . **No** REPAIR circuit CLF04 (BN/BU) (LH low beam) or circuit CLF05 (BU/GN) (RH low beam) for a short to ground. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the low beam output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B15 CHECK THE SJB HEADLAMP VOLTAGE SUPPLY CIRCUIT FOR AN OPEN (MKZ NON-HYBRID HID HEADLAMPS)	
• For the LH headlamp, measure the resistance between the LH headlamp relay pin 1, circuit CLF04 (BN/BU), BJB face side and the SJB C2280e-13, circuit CLF04 (BN/BU), harness side.	**Yes** GO to B21 . **No** REPAIR circuit CLF04 (BN/BU) (LH headlamp) or circuit CLF05 (BU/GN) (RH headlamp) for an open. TEST the system for normal operation.

 N0099673 • For the RH headlamp, measure the resistance between the RH headlamp relay pin 1, circuit CLF05 (BU/GN), BJB face side and the SJB C2280e-4, circuit CLF05 (BU/GN), harness side.  N0099674 • **Is the resistance less than 5 ohms?**	
B16 CHECK FOR VOLTAGE TO THE HEADLAMP RELAY (MKZ HYBRID)	
• Place the headlamp switch in the OFF position. • Ignition OFF. • For the LH headlamp, measure the voltage between the LH headlamp relay pin 3, circuit SBB26 (YE/RD), BJB face side and ground. • For the RH headlamp, measure the voltage between the RH headlamp relay pin 3, circuit SBB27 (BU/RD), BJB face side and ground. • **Is the voltage greater than 10 volts?**	**Yes** GO to B17 . **No** VERIFY the BJB fuse 26 (15A) (LH headlamp) or fuse 27 (15A) (RH headlamp) is OK. If OK, REPAIR circuit SBB26 (YE/RD) (LH headlamp) or circuit SBB27 (BU/RD) (RH headlamp) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
B17 CHECK FOR VOLTAGE TO THE HEADLAMP RELAY USING THE RELAY GROUND (MKZ HYBRID)	
• For the LH headlamp, measure the voltage between the LH headlamp relay pin 3, circuit SBB26 (YE/RD), BJB face side and the LH headlamp relay pin 1, circuit GD123 (BK/GY), BJB face side. • For the RH headlamp, measure the voltage between the RH headlamp relay pin 3, circuit SBB27 (BU/RD), BJB face side and the RH headlamp relay pin 1 circuit GD123 (BK/GY) BJB face side. • **Is the voltage greater than 10 volts?**	**Yes** GO to B18 . **No** REPAIR circuit GD121 (BK/YE) for an open. TEST the system for normal operation
B18 BYPASS THE HEADLAMP RELAY (MKZ HYBRID)	

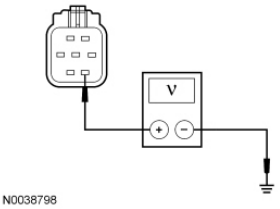
• Connect: Headlamp Assembly. • For the LH headlamp, connect a fused jumper wire between the LH headlamp relay pin 3, circuit SBB26 (YE/RD), BJB face side and the LH headlamp relay pin 5, circuit CLF30 (VT/BN), BJB face side. • For the RH headlamp, connect a fused jumper wire between the RH headlamp relay pin 3, circuit SBB27 (BU/RD), BJB face side and the RH headlamp relay pin 5, circuit CLF31 (YE/GY), BJB face side. • **Does the headlamp illuminate?**	**Yes** REMOVE the jumper wire. GO to B19 . **No** REMOVE the jumper wire. REPAIR circuit CLF30 (VT/BN) (LH headlamp) or circuit CLF31 (YE/GY) (RH headlamp) for an open. TEST the system for normal operation.
B19 CHECK THE SJB LOW BEAM OUTPUT CIRCUIT FOR A SHORT TO GROUND (MKZ HYBRID)	
• Disconnect: SJB C2280e. • For the LH headlamp, measure the resistance between the LH headlamp relay pin 2 circuit CLF04 (BN/BU), BJB face side and ground. • For the RH headlamp, measure the resistance between the RH headlamp relay pin 2 circuit CLF05 (BU/GN), BJB face side and ground. • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B20 . **No** REPAIR circuit CLF04 (BN/BU) (LH low beam) or circuit CLF05 (BU/GN) (RH low beam) for a short to ground. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the low beam output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B20 CHECK THE SJB HEADLAMP VOLTAGE SUPPLY CIRCUIT FOR AN OPEN (MKZ HYBRID)	
• For the LH headlamp, measure the resistance between the LH headlamp relay pin 2 circuit CLF04 (BN/BU), BJB face side and the SJB C2280e-13, circuit CLF04 (BN/BU), harness side. • For the RH headlamp, measure the resistance between the RH headlamp relay pin 2 circuit CLF05 (BU/GN), BJB face side and the SJB C2280e-4, circuit CLF05 (BU/GN), harness side. • **Is the resistance less than 5 ohms?**	**Yes** GO to B16 . **No** REPAIR circuit CLF04 (BN/BU) (LH headlamp) or circuit CLF05 (BU/GN) (RH headlamp) for an open. TEST the system for normal operation.
B21 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	

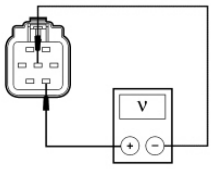
Pinpoint Test C: One High Beam Headlamp Is Inoperative

Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

Normal Operation



When low beams are on and the Smart Junction Box (SJB) detects the multifunction switch in the HIGH BEAM position, the SJB energizes an internal relay. When the relay is energized, the relay routes voltage to the headlamps.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Headlamp assembly

PINPOINT TEST C: ONE HIGH BEAM HEADLAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK FOR VOLTAGE TO THE HEADLAMP	
• Ignition OFF. • Disconnect: Inoperative Headlamp. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position. • Measure the voltage between the LH headlamp C1021-7, circuit CLF08 (YE/VT), harness side and ground; or between the RH headlamp C1041-7, circuit CLF08 (YE/VT), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to C2 . **No** REPAIR circuit CLF08 (YE/VT) for an open. TEST the system for normal operation.
C2 CHECK FOR VOLTAGE TO THE HEADLAMP USING THE HIGH BEAM GROUND PIN	

• Measure the voltage between the LH headlamp C1021-7, circuit CLF08 (YE/VT), harness side and the LH headlamp C1021-4, circuit GD121 (BK/YE), harness side; or between the RH headlamp C1041-7, circuit CLF08 (YE/VT), harness side and the RH headlamp C1041-4, circuit GD123 (BK/GY), harness side.  N0090414 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR or INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. TEST the system for normal operation. **No** REPAIR circuit GD121 (BK/YE) (LH headlamp) or circuit GD123 (BK/GY) (RH headlamp) for an open. TEST the system for normal operation.

Pinpoint Test D: The Low Beam(s) Are Always On

Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

Normal Operation

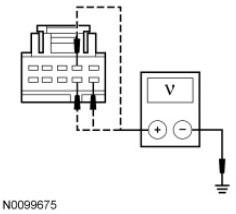
The Smart Junction Box (SJB) sends voltage signals to the headlamp switch through individual circuits (OFF, PARKING LAMPS and HEADLAMPS). At any given time, the headlamp switch routes one of the input circuits to ground.

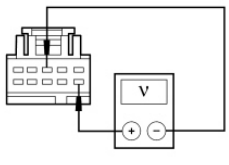
When the SJB detects the headlamp switch in the HEADLAMPS ON position (or a fault with one of the headlamp switch input circuits for more than 5 seconds) and the multifunction switch in the LOW BEAM position, the SJB provides voltage to the headlamps.

For MKZ equipped with High Intensity Discharge (HID) headlamps, a relay is utilized to provide voltage for the low beam headlamps.

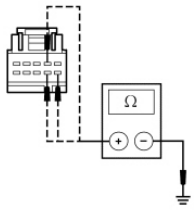
DTC Description	Fault Trigger Conditions
• B1472 - Lamp Headlamp Input Circuit Short to Ground	An on-demand DTC that may set when the SJB detects the headlamps on input circuit is short to ground.
• B2498 - Headlamp Switch Multiple Signals Input Active	An on-demand DTC that may set when the SJB detects multiple headlamp switch inputs active at the same time.
• B2A22 - Headlamp OFF Circuit Open	An on-demand DTC that sets when the SJB detects the headlamp switch off input circuit open.
• B2A2E - Right Front Lamp Low Beam Circuit Open	An on-demand DTC that sets when the SJB detects the RH low beam output circuit shorted to voltage.

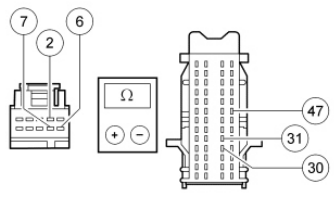
• B2A30 - Left Front Lamp Low Beam Circuit Open	An on-demand DTC that sets when the SJB detects the LH low beam output circuit shorted to volta





This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Headlamp relay
- Headlamp switch
- SJB

PINPOINT TEST D: THE LOW BEAM(S) ARE ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK FOR AUTOLAMP DTCs	
• Review the DTCs retrieved from the SJB self-test. • **Is DTC B1696, B1791, B1793 or B2008 present?**	**Yes** REFER to Autolamps in this section. **No** If equipped with autolamps, GO to D2 . If not equipped with autolamps, GO to D3 .
D2 CHECK THE SJB AUTOLAMP ON REQUEST PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • While placing the headlamp switch in the AUTOLAMPS ON and then OFF position, monitor the SJB headlamp switch PID (HDLMP_AUT_CKT). • **Does the PID indicate ON with the headlamp switch in the AUTOLAMPS ON position and OFF when the headlamp switch is in the OFF position?**	**Yes** GO to D3 . **No** GO to Pinpoint Test H .
D3 CHECK THE SJB HEADLAMP SWITCH PIDs	
NOTE: Make sure the headlamp switch is lined up in the correct position when monitoring the PIDs. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • **NOTE:** Only one PID should indicate ON at each headlamp switch position. • While moving the headlamp switch through all positions, monitor the SJB headlamp switch input PIDs (HDLMP_OFF_CKT, HDLMP_PRK_CKT, HDLMP_ON_CKT).	**Yes** GO to D8 . **No** GO to D4 .

• **Do the headlamp switch positions agree with the PIDs (with only one PID indicating ON in each position)?**	
D4 CHECK FOR VOLTAGE SIGNALS TO THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Measure the voltage between the headlamp switch, harness side and ground as follows: **Headlamp Switch Connector-Pin / Circuit** C205-6 — CLF23 (WH/VT) C205-2 — CLS34 (GY) C205-7 — CLF18 (BU/WH)  N0099675 • **Are the voltages greater than 10 volts?**	**Yes** GO to D5 . **No** GO to D6 .
D5 CHECK FOR VOLTAGE TO THE HEADLAMP SWITCH USING THE CONNECTOR GROUND	
• Measure the voltage between the headlamp switch C205-6, circuit CLF23 (WH/VT), harness side and the headlamp switch C205-3, circuit GD116 (BK/VT), harness side.  N0099676 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation. **No** REPAIR circuit GD116 (BK/VT) for an open. TEST the system for normal operation.
D6 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND	

• Disconnect: SJB C2280b. • Measure the resistance between the headlamp switch, harness side and ground as follows: | Headlamp Switch Connector-Pin	Circuit | |---|---| | C205-6 | CLF23 (WH/VT) | | C205-2 | CLS34 (GY) | | C205-7 | CLF18 (BU/WH) |  N0090404 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to D7 . **No** REPAIR the circuit in question for a short to ground. TEST the system for normal operation.
D7 CHECK THE HEADLAMP SWITCH INPUT CIRCUITS FOR AN OPEN	
• Measure the resistance between the headlamp switch, harness side and the SJB , harness side as follows: | Headlamp Switch Connector-Pin	SJB Connector-Pin	Circuit | |---|---|---| | C205-6 | C2280b-47 | CLF23 (WH/VT) | | C205-2 | C2280b-31 | CLF34 (YE/OG) | | C205-7 | C2280b-30 | CLF18 (BU/WH) |  N0090405 • **Are the resistances less than 5 ohms?**	**Yes** GO to D11 . **No** REPAIR the circuit in question for an open. TEST the system for normal operation.

D8 CHECK THE SJB OUTPUT	
• Disconnect: SJB C2280e. • **Does the LH or RH headlamp continue to illuminate?**	**Yes** For MKZ with halogen headlamps or Fusion, REPAIR circuit CLF04 (BN/BU) (LH headlamp) or circuit CLF05 (BU/GN) (RH headlamp) for a short to voltage. TEST the system for normal operation. For MKZ with HID headlamps, GO to D9 . **No** GO to D11 .
D9 CHECK THE HEADLAMP RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Suspect Headlamp Relay. • **Does the LH or RH headlamp continue to illuminate?**	**Yes** REPAIR circuit CLF30 (VT/BN) (LH headlamp) or circuit CLF31 (YE/GY) (RH headlamp) for a short to voltage. TEST the system for normal operation. **No** GO to D10 .
D10 CHECK HEADLAMP RELAY	
• Substitute a known good relay. • **Does the LH or RH headlamp continue to illuminate?**	**Yes** REPAIR circuit CLF04 (BN/BU) (LH headlamp) or circuit CLF05 (BU/GN) (RH headlamp) for a short to voltage. TEST the system for normal operation. **No** REMOVE the known good relay. INSTALL a new headlamp relay. TEST the system for normal operation.
D11 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

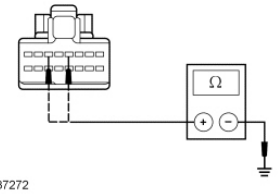
Pinpoint Test E: The High Beam(s) Are Always On

Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends a voltage signal to the multifunction switch for the high beam and flash-to-pass requests. When the multifunction switch is placed in the FLASH-TO-PASS or HIGH BEAM position, the voltage signal is routed to ground. When the SJB detects a request for flash-to-pass or high beams (when the low beams are on), the SJB energizes the high beam relay (integrated into the SJB), which routes voltage to the headlamps.

- DTC B1510 (Flash To Pass Switch Circuit Short to Ground) - an on-demand DTC that sets when the SJB detects the flash-to-pass request input circuit is short to ground.
- DTC B2A23 (High Beam Input Circuit Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground on the high beam request input circuit.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST E: THE HIGH BEAM(S) ARE ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

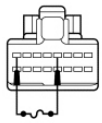
Test Step	Result / Action to Take
E1 CHECK FOR DTC B1510 OR DTC B2A23	
• Review the DTCs retrieved from the SJB self-test. • **Is DTC B1510 or DTC B2A23 present?**	**Yes** GO to E2 . **No** For Fusion or MKZ, GO to E4 .
E2 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Ignition ON. • **Do the high beams continue to illuminate?**	**Yes** GO to E3 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.
E3 CHECK THE HIGH BEAM AND FLASH-TO-PASS REQUEST INPUT CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b. • Measure the resistance between the multifunction switch C202-6, circuit CLF17 (WH/OG), harness side and ground; and between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and ground.	**Yes** GO to E5 . **No** REPAIR the circuit in question for a short to ground. CLEAR the DTCs. REPEAT the self-test.

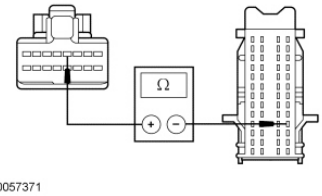
 N0037272 • **Are the resistances greater than 10,000 ohms?**	
E4 CHECK THE SJB HIGH BEAM OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE (FUSION OR MKZ)	
• Ignition OFF. • Disconnect: SJB C2280e. • Ignition ON. • **Do the high beams continue to illuminate?**	**Yes** REPAIR circuit CLF08 (YE/VT) for a short to voltage. TEST the system for normal operation. **No** GO to E5 .
E5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Flash-To-Pass Feature Is Inoperative

Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

Normal Operation





The Smart Junction Box (SJB) sends a voltage signal to the multifunction switch for the flash-to-pass request. When the multifunction switch is placed in the FLASH-TO-PASS position, the voltage signal is routed to ground. When the SJB detects a request for the flash-to-pass, the SJB provides voltage to the high beam headlamps.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST F: THE FLASH-TO-PASS FEATURE IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 VERIFY THE HIGH BEAM HEADLAMP OPERATION	
• Ignition ON. • Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the headlamps. • **Do the high beam headlamps illuminate?**	**Yes** GO to F2 . **No** GO to Pinpoint Test A .
F2 CHECK THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • Connect a fused jumper wire between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and the multifunction switch C202-8, circuit GD116 (BK/VT), harness side.  N0037273 • **Do the high beams illuminate?**	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to F3 .
F3 CHECK THE FLASH-TO-PASS REQUEST INPUT CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280b. • Measure the resistance between the multifunction switch C202-4, circuit CLF27 (GN/BN), harness side and the SJB C2280b-43, circuit CLF27 (GN/BN), harness side.  N0057371 • **Is the resistance less than 5 ohms?**	**Yes** GO to F4 . **No** REPAIR circuit CLF27 (GN/BN) for an open. TEST the system for normal operation.
F4 CHECK FOR CORRECT SJB OPERATION	

• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Autolamps

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Exterior Lighting

The SJB monitors the headlamp switch position by sending voltage signals on multiple circuits to the headlamp switch. There is one circuit for each headlamp switch position. At any given time, one of the signal circuits is switched to ground.

If the SJB does not detect any of the inputs to the headlamp switch is active (switched to ground) for 5 seconds, the SJB turns on the parking lamps and headlamps and keeps them on until the battery saver feature times out.

Additionally, if the SJB detects multiple headlamp switch input circuits short to ground, the SJB turns the parking lamps and headlamps on and keeps them on until the battery saver feature times out.

Refer to Exterior Lighting for information regarding the Battery Saver feature.

If either of the above situations occur, the SJB **cannot** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

Autolamps Feature

The SJB monitors the light sensor with a voltage reference signal. The light sensor input to the SJB varies with the ambient light conditions.

When the SJB receives an input from the headlamp switch indicating a request for the autolamps, the SJB monitors the light sensor for the ambient light condition. If the SJB determines the ambient light level is dark, the SJB supplies voltage to the exterior lamps.

If the ignition switch is already in the RUN position and the vehicle enters a dark/lighted area (such as when entering/exiting a non-lighted tunnel during the daytime), the transition from light to dark (or dark to light) needs to last 15 seconds before the SJB turns the exterior lamps on or off. This strategy is to prevent the exterior lamps from unnecessarily flashing on and off.

The SJB reacts quicker under extreme changes of ambient light conditions. If the SJB has detected a very dark condition, the exterior lamps are turned on after 1.5 seconds. If the SJB has detected a very high ambient light level, the exterior lamps are turned off after 4 seconds.

Headlamps On With Wipers On Feature

If the headlamp switch is in the AUTOLAMPS ON position and the front wipers are on for more than 10 seconds (except during a mist wipe or while the wipers are on to clear washer fluid during a wash condition), the exterior lamps turn on. The exterior lamps turn off when the ignition switch is changed to the OFF or ACC position, the headlamp switch is placed in the OFF position, or the front wipers are off for more than 30 seconds. The exception to this is when the exterior lights are on because of darkness determined by the light sensor.

For diagnostics regarding the headlamps on with wipers on feature, refer to Section 501-16 .

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Wiring, terminals or connectors • Light sensor • Smart Junction Box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
    - Verify the ignition key is in the ON position.
    - Verify the scan tool operation with a known good vehicle.
    - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

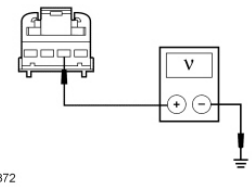
Pinpoint Tests

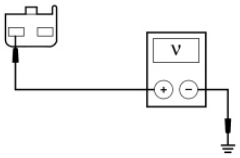
Pinpoint Test G: The Autolamps Are Inoperative

Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

Normal Operation

When the Smart Junction Box (SJB) detects the headlamp switch in the AUTOLAMPS ON position, the SJB monitors the light sensor input. The light sensor determines the amount of light based on the input received from the ambient lighting conditions. When the ambient level has reached a point (determined by the internal programming of the SJB), the SJB provides voltage to the headlamps, parking and license plate lamps.





This pinpoint test is intended to diagnose the following:

- Light sensor
- SJB

PINPOINT TEST G: THE AUTOLAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 CHECK THE MANUAL HEADLAMP OPERATION	

• Place the headlamp switch in the HEADLAMPS ON position. • **Do the headlamps and parking lamps operate correctly?**	**Yes** GO to G2 . **No** REFER to Headlamps or Parking, Rear and License Plate Lamps in this section.
G2 CHECK FOR VOLTAGE TO THE LIGHT SENSOR	
• Ignition OFF. • Disconnect: Light Sensor C286 or C287. • Ignition ON. • Place the headlamp switch in the AUTOLAMPS ON position. • For vehicles with automatic temperature control, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057372 • For vehicles with manual temperature control, measure the voltage between the light sensor C287-A, circuit VLF14 (BU/BN), harness side and ground.  N0057373 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. TEST the system for normal operation. **No** GO to G3 .
G3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: The Autolamps Are On Continuously

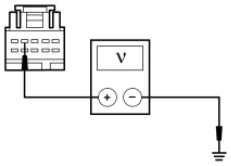
Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

Normal Operation

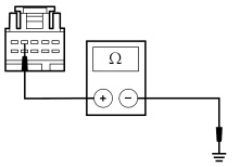
The Smart Junction Box (SJB) sends a voltage signal to the headlamp switch to monitor the request for autolamps and a voltage signal to the light sensor to determine the ambient light level.

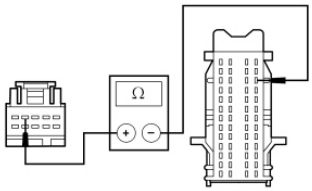
When the headlamp switch is placed in the AUTOLAMPS ON position, the voltage signal is routed to ground. When the SJB detects the headlamp switch in the AUTOLAMPS ON position, the SJB monitors the light sensor input. The light sensor determines the amount of light based on the input received from the ambient lighting conditions. When the ambient level has reached a point (determined by the internal programming of the SJB), the SJB provides voltage to the headlamps, parking and license plate lamps.

The SJB also monitors the windshield wiper motor status by sending a voltage signal to the wiper/washer module. When the windshield wiper is on (except during a mist wipe or while the wipers are on to clear washer fluid during a wash condition), the wiper/washer module grounds the circuit to indicate to the SJB that the wipers are on.

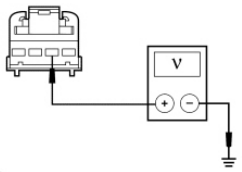


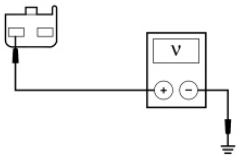
DTC Description	Fault Trigger Conditions
• B1696 - Autolamp On Circuit Short To Ground	An on-demand DTC that may set when the SJB detects a short to ground from the autolamps on input circuit.
• B1791 - Autolamp Sensor Input Circuit Open	An on-demand DTC that sets when the SJB detects an open or short to voltage from the light sensor input circuit.
• B1793 - Autolamp Sensor Input Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the light sensor input circuit.
• B2008 - Wipers On Signal Circuit Short to Ground	An on-demand DTC that sets when the SJB detects a short to ground from the wipers on input circuit.

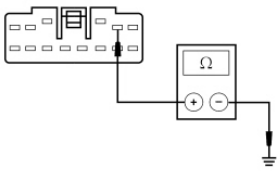




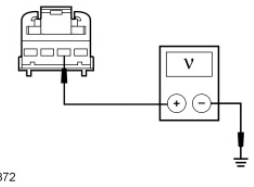
This pinpoint test is intended to diagnose the following:

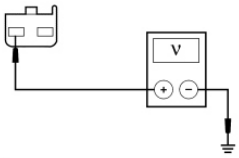


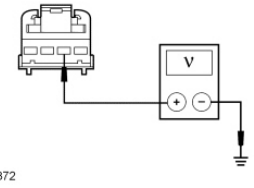




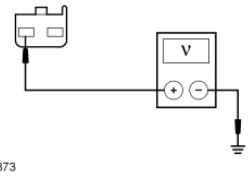
- Wiring, terminals or connectors
- Light sensor
- Headlamp switch
- Wiper/washer module
- SJB

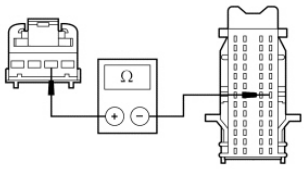


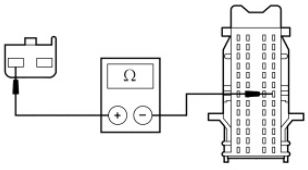




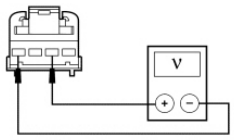
PINPOINT TEST H: THE AUTOLAMPS ARE ON CONTINU

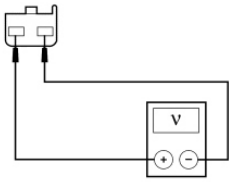


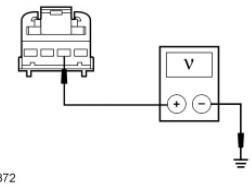


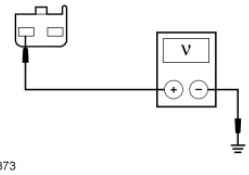


NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**









Test Step	Result / Action to Take
H1 CHECK THE SJB AUTOLAMP ON REQUEST PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • **NOTE:** Make sure the headlamp switch is in the OFF position. • While placing the headlamp switch in the AUTOLAMPS ON and then OFF position, monitor the SJB headlamp switch PID (HDLMP_AUT_CKT). • **Does the PID indicate ON with the headlamp switch in the AUTOLAMPS ON position and OFF when the headlamp switch is in the OFF position?**	**Yes** GO to H5 . **No** GO to H2 .
H2 CHECK FOR A VOLTAGE SIGNAL TO THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Measure the voltage between the headlamp switch C205-4, circuit CLF19 (VT/GN), harness side and ground.  N0099677 • **Is voltage greater than 10 volts?**	**Yes** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation. **No** GO to H3 .
H3 CHECK THE AUTOLAMPS REQUEST INPUT CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: SJB C2280b. • Measure the resistance between the headlamp switch C205-4, circuit CLF19 (VT/GN), harness side and ground.	**Yes** GO to H4 . **No** REPAIR circuit CLF19 (VT/GN) for a short to ground. TEST the system for normal operation.

 N0083964 • **Is the resistance greater than 10,000 ohms?**	
H4 CHECK THE AUTOLAMPS REQUEST INPUT CIRCUIT FOR AN OPEN	
• Measure the resistance between the headlamp switch C205-4, circuit CLF19 (VT/GN), harness side and the SJB C2280b-50, circuit CLF19 (VT/GN), harness side.  N0083965 • **Is the resistance less than 5 ohms?**	**Yes** GO to H15 . **No** REPAIR circuit CLF19 (VT/GN) for an open. TEST the system for normal operation.
H5 USE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Was DTC B2008, B1791 or B1793 recorded?**	**Yes** For DTC B2008, GO to H7 . For DTC B1791, GO to H9 . For DTC B1793, GO to H13 . **No** GO to H6 .
H6 CHECK FOR VOLTAGE TO THE LIGHT SENSOR (NO DTCs)	
• Ignition OFF. • Disconnect: Light Sensor C286 or C287. • Ignition ON. • Place the headlamp switch in the AUTOLAMPS ON position. • For vehicles with automatic temperature control, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. TEST the system for normal operation. **No** GO to H15 .

 N0057372 • For vehicles with manual temperature control, measure the voltage between the light sensor C287-A, circuit VLF14 (BU/BN), harness side and ground.  N0057373 • **Is the voltage approximately 5 volts?**	
H7 CHECK THE WIPER/WASHER MODULE	
• Ignition OFF. • Disconnect: Wiper/Washer Module C2157. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Repeat the SJB self-test. • **Is DTC B2008 still present?**	**Yes** GO to H8 . **No** INSTALL a new wiper/washer module. REFER to Section 501-16 . CLEAR the DTCs. REPEAT the self-test.
H8 CHECK THE WIPERS ON INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280f. • Measure the resistance between the wiper/washer module C2157-2, circuit CRW01 (WH), harness side and ground.  N0099678 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H15 . **No** REPAIR circuit CRW01 (WH) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
H9 CHECK FOR VOLTAGE TO THE LIGHT SENSOR (DTC B1791)	

• Ignition OFF. • Disconnect: Light Sensor C286. • Ignition ON. • Place the headlamp switch in the AUTOLAMPS ON position. • For vehicles with automatic temperature control, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057372 • For vehicles with manual temperature control, measure the voltage between the light sensor C287-A, circuit VLF14 (BU/BN), harness side and ground.  N0057373 • **Is the voltage approximately 5 volts?**	**Yes** GO to H12 . **No** GO to H10 .
H10 CHECK THE LIGHT SENSOR INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Place the headlamp switch in the OFF position. • Disconnect: SJB C2280b. • Ignition ON. • For vehicles with automatic temperature control, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057372 • For vehicles with manual temperature control, measure the voltage between the light sensor C287-A, circuit VLF14 (BU/BN), harness side and ground.	**Yes** REPAIR circuit VLF14 (BU/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to H11 .

 N0057373 • **Is any voltage present?**	
H11 CHECK THE LIGHT SENSOR INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • For vehicles with automatic temperature control, measure the resistance between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and the SJB C2280b-46, circuit VLF14 (BU/BN), harness side.  N0057378 • For vehicles with manual temperature control, measure the resistance between the light sensor C287-A, circuit VLF14 (BU/BN), harness side and the SJB C2280b-46, circuit VLF14 (BU/BN), harness side.  N0057379 • **Is the resistance less than 5 ohms?**	**Yes** GO to H15 . **No** REPAIR circuit VLF14 (BU/BN) for an open. CLEAR the DTCs. REPEAT the self-test.
H12 CHECK FOR VOLTAGE TO THE LIGHT SENSOR USING THE CONNECTOR GROUND	
• For vehicles with automatic temperature control, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and the light sensor C286-4, circuit GD116 (BK/VT), harness side.	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit GD116 (BK/VT) for an open. CLEAR the DTCs. REPEAT the

 N0084276 • For vehicles with manual temperature control, measure the voltage between the light sensor C287-A, circuit VLF14 (BU/BN), harness side and the light sensor C287-B, circuit GD116 (BK/VT), harness side.  N0085766 • **Is the voltage approximately 5 volts?**	self-test.
H13 CHECK FOR VOLTAGE TO THE LIGHT SENSOR (DTC B1793)	
• Disconnect: Light Sensor C286. • Ignition ON. • Place the headlamp switch in the AUTOLAMPS ON position. • For vehicles with automatic temperature control, measure the voltage between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057372 • For vehicles with manual temperature control, measure the voltage between the light sensor C287-A, circuit VLF14 (BU/BN), harness side and ground.  N0057373 • **Is the voltage approximately 5 volts?**	**Yes** INSTALL a new light sensor. REFER to Light Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to H14 .

H14 CHECK THE LIGHT SENSOR INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b. • For vehicles with automatic temperature control, measure the resistance between the light sensor C286-2, circuit VLF14 (BU/BN), harness side and ground.  N0057374 • For vehicles with manual temperature control, measure the resistance between the light sensor C287-A, circuit VLF14 (BU/BN), harness side and ground.  N0057375 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to H15 . **No** REPAIR circuit VLF14 (BU/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
H15 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Stoplamps

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Fusion

When the brake pedal is applied, voltage is routed to the SJB and the high mounted stoplamp. The SJB then supplies voltage to the rear stoplamps. The rear stoplamps are combination stop/turn lamps. The turn and hazard lamp functions override the rear stoplamp function.

NOTE: The Fusion high mounted stoplamp has 9 LEDs mounted in the center third portion of the assembly. The outer left and right portions of the high mounted stoplamp are not illuminated. The high mounted stoplamp is not designed to illuminate the full width of the lens.

MKZ

When the brake pedal is applied, voltage is routed to the high mounted stoplamp, the rear stoplamps and the SJB .

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Stoplamp switch	• Smart Junction Box (SJB) fuse 2 (15A) (stoplamp switch)

	• Bulb(s) • Wiring, terminals or connectors • Rear lamp assembly • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

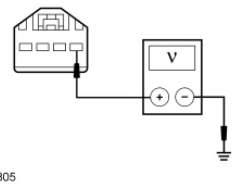
Symptom Chart

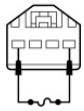
Pinpoint Tests

Pinpoint Test I: All The Stoplamps Are Inoperative

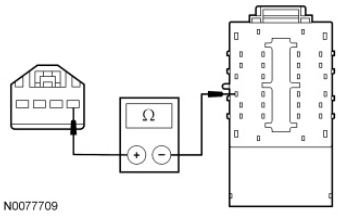
Refer to Wiring Diagrams Cell 90 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation





The stoplamp switch is supplied voltage from the Smart Junction Box (SJB) fuse 2 (15A). When the brake pedal is applied, the stoplamp switch routes voltage to the stoplamps and the SJB .



This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Stoplamp switch
- SJB

PINPOINT TEST I: ALL THE STOPLAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
I1 CHECK FOR VOLTAGE TO THE STOPLAMP SWITCH	
• Ignition OFF. • Disconnect: Stoplamp Switch C278. • Measure the voltage between the stoplamp switch C278-1, circuit SBP02 (YE/RD), harness side and ground.  N0038805 • **Is the voltage greater than 10 volts?**	**Yes** GO to I2 . **No** VERIFY the SJB fuse 2 (15A) is OK. If OK, GO to I3 . TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
I2 BYPASS THE STOPLAMP SWITCH	
• Connect a fused jumper wire between the stoplamp switch C278-1, circuit SBP02 (YE/RD), harness side and the stoplamp switch C278-4, circuit CCB08 (VT/WH), harness side.  N0038807	**Yes** REMOVE the jumper wire. INSTALL a new stoplamp switch. REFER to Stoplamp Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR circuit CCB08 (VT/WH) for an open. TEST the system for normal operation.

• **Do the stoplamps illuminate?**	
I3 CHECK CIRCUIT SBP02 (YE/RD) FOR AN OPEN	
• Disconnect: SJB C2280d. • Measure the resistance between the stoplamp switch C278-1, circuit SBP02 (YE/RD), harness side and the SJB C2280d-13, circuit SBP02 (YE/RD), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to I4 . **No** REPAIR SBP02 (YE/RD) for an open. TEST the system for normal operation.
I4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: One Or More Stoplamps Are Inoperative - Fusion

Refer to Wiring Diagrams Cell 90 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

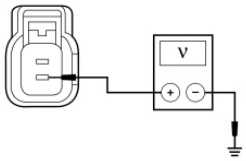
When the brake pedal is applied, the stoplamp switch routes voltage to the high moted stoplamp and the Smart Junction Box (SJB). When the SJB detects the brake pedal is applied, the SJB provides voltage to the LH and RH rear stoplamps. Each stoplamp has an independent ground circuit.

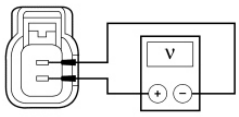
NOTE: The Fusion high mounted stoplamp has 9 LEDs mounted in the center third portion of the assembly. The outer left and right portions of the high mounted stoplamp are not illuminated. The high mounted stoplamp is not designed to illuminate the full width of the lens.

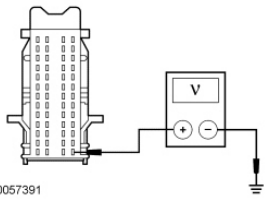
NOTE: SJB fuse 6 (20A) supplies voltage for both combination rear stop/turn lamps and both front turn lamps.

DTC Description	Fault Trigger Conditions

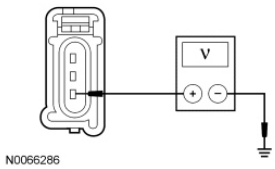
• B106E - Solid State Driver Disabled Due to Short Circuit	A continuous DTC that sets when the SJB has temporarily shut down the output driver. **The module has temporarily disabled a stoplamp output because an excessive current draw exists (such as a short to ground). The SJB cannot enable the stoplamp output until the cause of the short is corrected, the DTCs have been cleared and a successful lf-test is run.**
• B106F - Module Disabled Due to External Fault	A continuous DTC that sets when the SJB has permanently shut down the output driver. **The module has permanently disabled a stoplamp output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed.**
• B2044 - Left Rear Stop Lamp Circuit Short to Ground	A continuous and on-demand DTC that may set when the SJB detects a short to ground from the LH rear stop/turn lamp voltage supply circuit.
• B2045 - Left Rear Stop Lamp Circuit Open	An on-demand DTC that sets when the SJB detects an open from the LH rear stop/turn lamp voltage supply circuit.
• B2046 - Right Rear Stop Lamp Circuit Short to Ground	A continuous and on-demand DTC that may set when tan title="Smart Junction Box" class="popup" onmouseover="this.className='popupnounderline';" onmouseout="this.className='popup';">SJB detects a short to ground from the RH rear stop/turn lamp voltage supply circuit.
• B2047 - Right Rear Stop Lamp Circuit Open	An on-demand DTC that sets when the SJB detects an open from the RH rear stop/turn lamp voltage supply circuit.

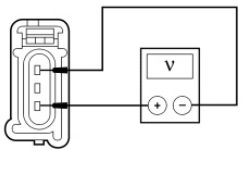




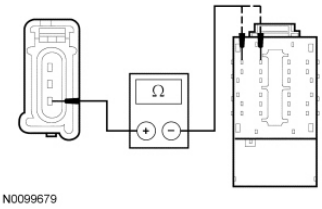


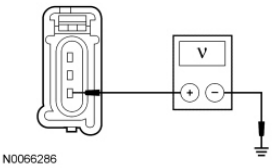
This pinpoint test is intended to diagnose the following:



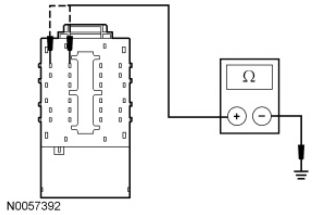


- Wiring, terminals or connectors
- Bulb holder
- High mounted stoplamp
- SJB





PINPOINT TEST J: ONE OR MORE STOPLAMPS ARE INOPERATIVE - FUSION



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
J1 DETERMINE THE INOPERATIVE STOPLAMP	
• Ignition OFF. • Apply the brake pedal and observe the stoplamps. • **Are all the stoplamps inoperative?**	**Yes** G Pinpoint Test I . **No** For the high mounted stoplamp, GO to J2 . If only one side (the LH or RH rear stoplamp) is inoperative, GO to J5 . If both sides (LH and RH rear stoplamps) are inoperative, VERIFY the SJB fuse 6 (20A) is OK. If OK, GO to J4 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the stoplamp output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
J2 CHECK FOR VOLTAGE TO THE HIGH MOUNTED STOPLAMP	

NOTE: The Fusion high mounted stoplamp has 9 LEDs mounted in the center third portion of the assembly. The outer left and right portions of the high mounted stoplamp are not illuminated. The high mounted stoplamp is not designed to illuminate the full width of the lens. • Disconnect: High Mounted Stoplamp C4233. • While applying the brake pedal, measure the voltage between the high mounted stoplamp C4233-2, circuit CCB08 (VT/WH), harness side and ground.  N0077757 • **Is the voltage greater than 10 volts?**	**Yes** GO to J3 . **No** REPAIR circuit CCB08 (VT/WH) for an open. TEST the system for normal operation.
J3 CHECK FOR VOLTAGE TO THE HIGH MOUNTED STOPLAMP USING THE CONNECTOR GROUND	
• While applying the brake pedal, measure the voltage between the high mounted stoplamp C4233-2, circuit CCB08 (VT/WH), harness side and the high mounted stoplamp C4233-1, circuit GD171 (BK/GY), harness side.  N0090428 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new high mounted stoplamp. TEST the system for normal operation. **No** REPAIR circuit GD171 (BK/GY) for an open. TEST the system for normal operation.
J4 CHECK FOR VOLTAGE TO THE SJB	
• Disconnect: SJB C2280b. • While applying the brake pedal, measure the voltage between the SJB C2280b-40, circuit CCB08 (VT/WH), harness side and ground.  N0057391	**Yes** GO to J11 . **No** REPAIR circuit CCB08 (VT/WH) for an open. CLEAR the DTCs. REPEAT the self-test.

• **Is the voltage greater than 10 volts?**	
J5 USE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB on-demand self-test. • **Is DTC B2045 or DTC B2047 present?**	**Yes** GO to J6 . **No** GO to J9 .
J6 CHECK FOR VOLTAGE TO THE INOPERATIVE STOPLAMP	
• Disconnect: Inoperative Rear Lamp. • While applying the brake pedal, measure the voltage between the LH rear lamp C412-3, circuit CLS18 (GY/BN), harness side and ground; or between the RH rear lamp C415-3, circuit CLS19 (VT/OG), harness side and ground.  N0066286 • **Is the voltage greater than 10 volts?**	**Yes** GO to J7 . **No** GO to J8 .
J7 CHECK FOR VOLTAGE TO THE INOPERATIVE STOPLAMP USING THE CONNECTOR GROUND	
• While applying the brake pedal, measure the voltage between the LH rear lamp C412-3, circuit CLS18 (GY/BN), harness side and the LH rear lamp C412-1, circuit GD171 (BK/GY), harness side; or between the RH rear lamp C415-3, circuit CLS19 (VT/OG), harness side and the RH rear lamp C415-3, circuit GD171 (BK/GY), harness side.  N0088174 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new bulb holder. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit GD171 (BK/GY) for an open. CLEAR the DTCs. REPEAT the self-test.
J8 CHECK THE SJB STOPLAMP OUTPUT CIRCUIT FOR AN OPEN	

• Disconnect: SJB C2280d. • Measure the resistance between the LH rear lamp C412-3, circuit CLS18 (GY/BN), harness side and the SJB C2280d-25, circuit CLS18 (GY/BN), harness side; or between the RH rear lamp C415-3, circuit CLS19 (VT/OG), harness side and the SJB C2280d-26, circuit CLS18 (GY/BN), harness side.  N0099679 • **Is the resistance less than 5 ohms?**	**Yes** GO to J11 . **No** REPAIR circuit CLS18 (GY/BN) (LH rear stoplamp) or circuit CLS19 (VT/OG) (RH rear stoplamp) for an open. CLEAR the DTCs. REPEAT the self-test.
J9 CHECK THE BULB HOLDER FOR A SHORT TO GROUND	
• Disconnect: Inoperative Rear Lamp. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs **and** repeat the self-test **(required to enable the turn lamp output driver if DTC B106E is present)** . • While applying the brake pedal, measure the voltage between the LH rear lamp C412-3, circuit CLS18 (GY/BN), harness side and ground; or between the RH rear lamp C415-3, circuit CLS19 (VT/OG), harness side and ground.  N0066286 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new bulb holder. TEST the system for normal operation. **No** GO to J10 .
J10 CHECK THE SJB STOPLAMP OUTPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280d. • Measure the resistance between the SJB C2280d-25, circuit CLS18 (GY/BN), harness side and ground; or between the SJB C2280d-26, circuit CLS19 (VT/OG), harness side and ground.	**Yes** GO to J11 . **No** REPAIR circuit CLS18 (GY/BN) (LH rear stoplamp) or circuit CLS19 (VT/OG) (RH rear stoplamp) for a short to ground. After the repair: If no DTCs are present, TEST the system for normal

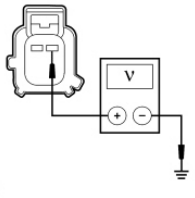
 • **Is the resistance greater than 10,000 ohms?**	operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the turn lamp output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
J11 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

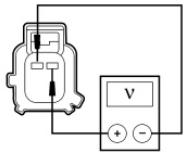
Pinpoint Test K: One Or More Stoplamps Are Inoperative - MKZ

Refer to Wiring Diagrams Cell 90 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Turn Signal/Stop/Hazard Lamps for schematic and connector information.

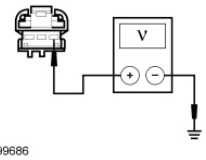
Normal Operation

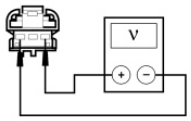
When the brake pedal is applied, the stoplamp switch routes voltage to the high mounted stoplamp and both rear stoplamps. Each stoplp has an independent ground circuit.





This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- High mounted stoplamp
- Rear lamp assembly

PINPOINT TEST K: ONE OR MORE STOPLAMPS ARE INOPERATIVE - MKZ

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
K1 DETERMINE THE INOPERATIVE STOPLAMP	

• Ignition OFF. • Apply the brake pedal and observe the stoplamps. • **Are all the stoplamps inoperative?**	**Yes** GO to Pinpoint Test I . **No** For the high mounted stoplamp, GO to K2 . For a LH or RH rear stoplamp, GO to K4 . /td>
K2 CHECK FOR VOLTAGE TO THE HIGH MOUNTED STOPLAMP	
• Disconnect: High Mounted Stoplamp. • While applying the brake pedal, measure the voltage between the high mounted stoplamp C475-1, circuit CCB08 (VT/WH), harness side and ground.  N0099682 • **Is the voltage greater than 10 volts?**	**Yes** GO to K3 . **No** REPAIR circuit CCB08 (VT/WH) for an open. TEST the system for normal operation.
K3 CHECK FOR VOLTAGE TO THE HIGH MOUNTED STOPLAMP USING THE CONNECTOR GROUND	
• While applying the brake pedal, measure the voltage between the high mounted stoplamp C475-1, circuit CCB08 (VT/WH), harness side and the high mounted stoplamp C475-2, circuit GD171 (BK/GY), harness side.  N0099685 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new high mounted stoplamp. REFER to High Mounted Stoplamp in this section. TEST the system for normal operation. **No** REPAIR circuit GD171 (BK/GY) for an open. TEST the system for normal operation.
K4 CHECK FOR VOLTAGE TO THE LH STOPLAMP	
• Disconnect: Inoperative Rear Stoplamp. • While applying the brake pedal, measure the voltage between the LH rear lamp C419-1, circuit CCB08 (VT/WH), harness side and ground; or between the RH rear lamp C418-1, circuit CCB08 (VT/WH), harness side and ground.	**Yes** GO to K5 . **No** REPAIR circuit CCB08 (VT/WH) for an open. TEST the system for normal operation.

 N0099686 • **Is the voltage greater than 10 volts?**	
K5 CHECK FOR VOLTAGE TO THE INOPERATIVE STOPLAMP USING THE CONNECTOR GROUND	
• While applying the brake pedal, measure the voltage between the LH rear lamp C419-1, circuit CCB08 (VT/WH), harness side and the LH rear lamp C419-3, circuit GD171 (BK/GY), harness side; or between the RH rear lamp C418-1, circuit CCB08 (VT/WH), harness side and the RH rear lamp C418-3, circuit GD171 (BK/GY), harness side.  N0099687 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new rear lamp assembly. REFER to Rear Lamp Assembly in this section. TEST the system for normal operation. **No** REPAIR circuit GD171 (BK/GY) for an open. TEST the system for normal operation.

Pinpoint Test L: The Stoplamps Are On Continuously

Refer to Wiring Diagrams Cell 90 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

When the brake pedal is applied, the stoplamp switch routes voltage to the LH and RH rear stoplamps (MKZ), the Smart Junction Box (SJB), the high mounted stoplamp and the PCM.

For Fusion, when the SJB detects the brake pedal is applied, the SJB provides voltage to the LH and RH rear stoplamps.

- DTC B1485 (Brake Pedal Input Short to Battery) - an on-demand DTC that sets when the SJB detects a short to voltage from the stoplamp switch input circuit.
- DTC B2045 (Left Rear Stop Lamp Circuit Open) - an on-demand DTC that sets when the SJB detects a short to voltage from the LH rear stop/turn lamp output circuit.
- DTC B2047 (Right Rear Stop Lamp Circuit Open) - an on-demand DTC that sets when the SJB detects a short to voltage from the RH rear stop/turn lamp output circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Stoplamp switch
- PCM
- SJB

PINPOINT TEST L: THE STOPLAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
L1 DETERMINE IF ALL THE STOPLAMPS ARE ILLUMINATED	
• Ignition OFF. • Observe the stoplamps with the brake pedal released. • **Are all of the stoplamps illuminated?**	**Yes** GO to L3 . **No** GO to L2 .
L2 CHECK THE SJB STOPLAMP OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280d. • **Do the stoplamps continue to illuminate?**	**Yes** If the LH rear lamp continues to illuminate, REPAIR circuit CLS18 (GY/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. If the RH rear lamp continues to illuminate, REPAIR circuit CLS19 (VT/OG) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to L7 .
L3 CHECK THE STOPLAMP SWITCH	
• Disconnect: Stoplamp Switch C278. • **Do the stoplamps continue to illuminate?**	**Yes** GO to L4 . **No** INSTALL a new stoplamp switch. REFER to Stoplamp Switch in this section. CLEAR the DTCs. REPEAT the self-test.
L4 CHECK THE PCM	
• Disconnect: PCM C175b. • **Do the stoplamps continue to illuminate?**	**Yes** GO to L5 . **No** GO to L6 .
L5 CHECK THE STOPLAMP SWITCH OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280b. • **Does the high mounted stoplamp continue to illuminate?**	**Yes** REPAIR circuit CCB08 (VT/WH) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No**

	GO to L7 .
L6 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B , Section 303-14C or Section 303-14D . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
L7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Turn Signal and Hazard Lamps

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The Smart Junction Box (SJB) monitors the multifunction switch position by sending voltage signals (for the LH and RH turn input) to the multifunction switch. When the multifunction switch is in the LH or RH TURN positions that input signal is switched to ground.

The SJB monitors the request for the hazard lamps by sending a voltage signal to the hazard flasher lamp switch. For MKZ, the hazard flasher lamp switch is integrated into the Front Controls Interface Module (FCIM).

When the SJB receives a request for a turn signal or hazard lamps, the SJB supplies voltage to the appropriate turn lamps.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch	• Smart Junction Box (SJB) fuse 6 (20A) • Wiring, terminals or connectors

• Hazard flasher lamp switch	• Bulbs • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

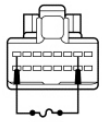
Pinpoint Tests

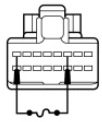
Pinpoint Test M: The Turn Signal Lamps Are Inoperative

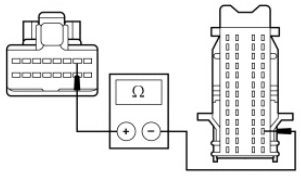
Refer to Wiring Diagrams Cell 90 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

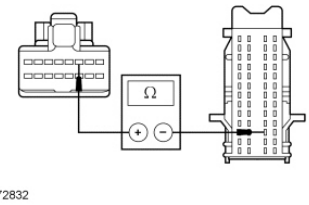
The Smart Junction Box (SJB) sends voltage signals to the multifunction switch. When the multifunction switch is switched to the LH or RH TURN positions, the voltage signal is switched to ground. When the SJB detects the multifunction switch in the LH or RH TURN position, the SJB sends voltage to the appropriate turn lamps.







This pinpoint test is intended to diagnose the following:



- Fuse
- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST M: THE TURN SIGNAL LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
M1 CHECK FOR CORRECT HIGH BEAM OPERATION	
• Place the headlamp switch in the HEADLAMPS ON position. • Place the multifunction switch in the HIGH BEAM position while observing the high beam headlamps. • **Do the high beams illuminate?**	**Yes** PLACE the headlamp switch in the OFF position. For Fusion, GO to M2 . For MKZ, VERIFY the SJB fuse 6 (20A) is OK. If OK, GO to M3 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. **No** PLACE the headlamp switch in the OFF position. GO to Pinpoint Test A .
M2 CHECK FOR CORRECT STOPLAMP OPERATION	
• Apply and release the brake pedal. • **Do the stoplamps operate correctly?**	**Yes** GO to M3 . **No** REFER to Stoplamps in this section.
M3 BYPASS THE MULTIFUNCTION SWITCH	
• Ignition OFF. • Disconnect: Multifunction Switch C202. • For an inoperative LH turn signal, connect a fused jumper wire between the multifunction switch C202-2, circuit CLS39 (VT/WH), harness side and the multifunction switch C202-8, circuit GD116 (BK/VT), harness side.	**Yes** REMOVE the jumper wire. INSTALL a new multifunction switch. REFER to Section 211-05 . TEST the system for normal operation. **No** REMOVE the jumper wire. GO to M4 .

 N0069012 • For an inoperative RH turn signal, connect a fused jumper wire between the multifunction switch C202-3, circuit CLS41 (GY/YE), harness side and the multifunction switch C202-8, circuit GD116 (BK/VT), harness side.  N0069013 • Ignition ON. • **Do the turn signals in question flash on and off?**	
M4 CHECK THE TURN SIGNAL REQUEST INPUT CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280b. • For an inoperative LH turn signal, measure the resistance between the multifunction switch C202-2, circuit CLS39 (VT/WH), harness side and the SJB C2280b-42, circuit CLS39 (VT/WH), harness side.  N0072831 • For an inoperative RH turn signal, measure the resistance between the multifunction switch C202-3, circuit CLS41 (GY/YE), harness side and the SJB C2280b-29, circuit CLS41 (GY/YE), harness side.	**Yes** GO to M5 . **No** REPAIR circuit CLS39 (VT/WH) (LH turn signal) or circuit CLS41 (GY/YE) (RH turn signal) for an open. TEST the system for normal operation.

 N0072832 • **Is the resistance less than 5 ohms?**	
M5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

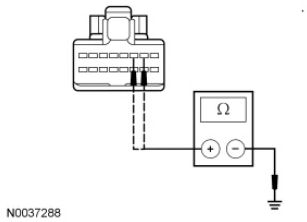
Pinpoint Test N: The Turn Signal Lamps Are Always On

Refer to Wiring Diagrams Cell 90 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Turn Signal/Stop/Hazard Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends voltage signals to the multifunction switch. When the multifunction switch is switched to the LH or RH TURN positions, the voltage signal is switched to ground. When the SJB detects the multifunction switch is in the LH or RH TURN position, the SJB sends voltage to the appropriate turn lamps.

- DTC B2281 (Right Turn Switch Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the RH turn signal input circuit.
- DTC B2282 (Left Turn Switch Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the LH turn signal switch input circuit.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multifunction switch
- SJB

PINPOINT TEST N: THE TURN SIGNAL LAMPS ARE ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
N1 CHECK THE MULTIFUNCTION SWITCH	

• Ignition OFF. • Disconnect: Multifunction Switch C202. • Ignition ON. • **Do the turn lamps continue to flash on and off?**	**Yes** GO to N2 . **No** INSTALL a new multifunction switch. REFER to Section 211-05 . CLEAR the DTCs. REPEAT the self-test.
N2 CHECK THE TURN SIGNAL REQUEST INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b. • Measure the resistance between the multifunction switch C202-2, (LH turn lamps), circuit CLS39 (VT/WH), harness side and ground; or between the multifunction switch C202-3, (RH turn lamps), circuit CLS41 (GY/YE), harness side and ground.  N0037288 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to N3 . **No** REPAIR circuit CLS39 (VT/WH) (LH turn signal) or circuit CLS41 (GY/YE) (RH turn signal) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
N3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Pinpoint Test O: One Turn Signal/Hazard Lamp Is Inoperative/Always On

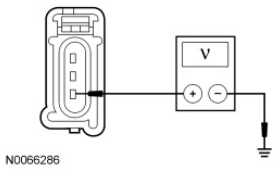
Refer to Wiring Diagrams Cell 90 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Turn Signal/Stop/Hazard Lamps for schematic and connector information.

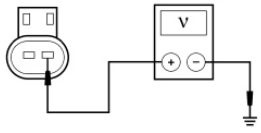
Normal Operation

When the Smart Junction Box (SJB) detects the multifunction switch is in the LH TURN position, the SJB provides voltage to the LH front turn lamp and LH rear turn lamp. When the SJB detects the multifunction switch is in the RH TURN position, the SJB provides voltage to the RH front turn lamp and the RH rear turn lamp.

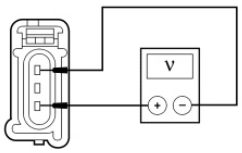
DTC Description	Fault Trigger Conditions
• B106E - Solid State Driver Disabled Due to Short Circuit	A contious DTC that sets when the SJB has temporarily shut down the output driver. **The module has temporarily disabled a turn lamp output because an excessive current draw exists (such as a short to ground). The SJB cannot enable the turn lamp output until the cause of the short is corrected, the DTCs have been cleared and a successful self-test is run.**
• B106F - Module Disabled Due to External Fault	A continuous DTC that sets when the SJB has permanently shut down the output driver. **The module has permanently disabled a turn lamp output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed.**
• B2048 - Left Rear Turn Lamp Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the LH rear turn lamp voltage supply circuit. >
• B2049 - Left Rear Turn Lamp Circuit Open	An on-demand DTC that sets when the SJB detects an open from the LH rear turn lamp voltage supply circuit.
• B2050 - Right Rear Turn Lamp Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the RH rear turn lamp voltage supply circuit.
• B2051 - Right Rear Turn Lamp Circuit Open	An on-demand DTC that sets when the SJB detects an open from the RH rear turn lamp voltage supply circuit.
• B2A27 - Right Front Turn Lamp Circuit Open	An on-demand DTC that sets when the SJB detects an open or short to voltage from the RH front turn lamp voltage supply circuit.
• B2A28 - Right Front Turn Lamp Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects ground from the RH front turn lamp voltage supply circuit.
	An on-demand DTC that sets when the SJB detects an open or short to voltage from the LH front turn lamp voltage supply circuit.

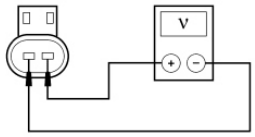
• B2A29 - Left Front Turn Lamp Circuit Open	
• B2A2A - Left Front Turn Lamp Circuit Short to Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the LH front turn lamp voltage supply circuit.

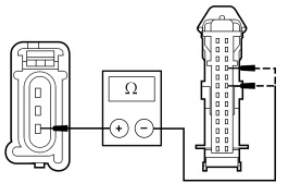




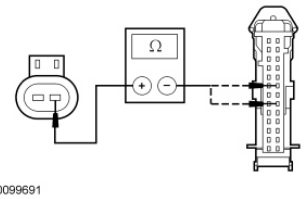
This pinpoint test is intended to diagnose the following:

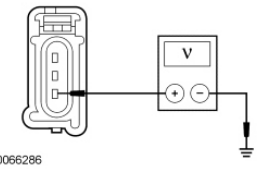




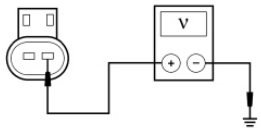


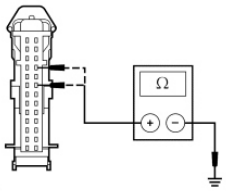
- Wiring, terminals or connectors
- Bulb holder
- Rear lamp assembly
- SJB

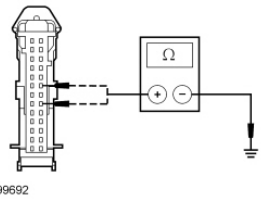




PINPOINT TEST O: ONE TURN SIGNAL/HAZARD LAMP IS INOPERATIVE/ALWAYS ON







NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
O1 CHECK THE STOPLAMPS	
• Apply and release the brake pedal while observing the stoplamps. • **Do the stoplamps operate correctly?**	**Yes** GO to O2 . **No** REFER to Stoplamps in this section.
O2 DETERMINE IF A TURN LAMP IS ALWAYS ON	
• Ignition ON. • Monitor the turn lamps while placing the multifunction switch in the RH TURN and then LH TURN positions. • **Is any turn lamp always on?**	**Yes** GO to O3 . **No** GO to O4 .
O3 CHECK THE SJB TURN LAMP OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280f (Front Turn Lamp). • Disconnect: SJB C2280c (Rear Turn Lamp). • Ignition ON. • **Does the turn lamp in question continue to illuminate?**	**Yes** REPAIR circuit CLS21 (BU/GN) (LH front), circuit CLS25 (YE/VT) (RH front), circuit CLS23 (GY/OG) (LH rear) or circuit CLS24 (BN/WH) (RH rear) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to O10 .

O4 USE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB on-demand self-test. • **Is DTC B2049, B2051, B2A27 or B2A29 present?**	**Yes** GO to O5 . **No** GO to O8 .
O5 CHECK FOR VOLTAGE TO THE TURN LAMP (OPEN DTC PRESENT)	
• Ignition OFF. • Disconnect: Inoperative Turn Lamp. • Activate the hazard flasher lamp function. • For a front lamp, measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and ground; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and ground.  N0066286 • For an MKZ rear turn lamp, measure the voltage between the LH rear turn lamp C4139-1, circuit CLS23 (GY/OG), harness side and ground; or between the RH front turn lamp C4140-1, circuit CLS24 (BN/WH), harness side and ground.  N0099688 • **Does the voltage alternate from 0 volts to greater than 10 volts?**	**Yes** GO to O6 . **No** GO to O7 .
O6 CHECK FOR VOLTAGE TO THE FRONT TURN LAMP USING THE CONNECTOR GROUND	
• For a front lamp, measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and the LH front turn lamp C1023-1, circuit GD123 (BK/GY), harness side; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and the RH front turn lamp C1043-1, circuit GD121 (BK/YE), harness	**Yes** For a front lamp, INSTALL a new bulb holder. TEST the system for normal operation. For an MKZ rear lamp, INSTALL a new rear lamp assembly. REFER to Rear Lamp Assembly in this section. TEST the

side.  N0088174 • For an MKZ rear turn lamp, measure the voltage between the LH rear turn lamp C4139-1, circuit CLS23 (GY/OG), harness side and the LH rear turn lamp C4139-2, circuit GD171 (BK/GY), harness side; or between the RH front turn lamp C4140-1, circuit CLS24 (BN/WH), harness side and the RH front turn lamp C4140-2, circuit GD171 (BK/GY), harness side.  N0099689 • **Does the voltage alternate from 0 volts to greater than 10 volts?**	system for normal operation. **No** REPAIR circuit GD123 (BK/GY) (LH front), circuit GD121 (BK/YE) (RH front) or circuit GD171 (BK/GY) (LH or RH rear) for an open. TEST the system for normal operation.
O7 CHECK THE SJB TURN LAMP OUTPUT CIRCUIT FOR AN OPEN	
• Turn the hazard lamp function off. • Disconnect: SJB C2280f (Front Turn Lamp). • Disconnect: SJB C2280c (Rear Turn Lamp). • For a front lamp, measure the resistance between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and the SJB C2280f-21, circuit CLS21 (BU/GN), harness side; or between the RH front turn lamp C1043-3, circuit CLS21 (BU/GN), harness side and the SJB C2280f-23, circuit CLS25 (YE/VT), harness side.  N0077710 • For an MKZ rear turn lamp, measure the voltage between the LH rear turn lamp C4139-1, circuit CLS23 (GY/OG), harness side and the SJB C2280c-21, circuit CLS23	**Yes** GO to O10 . **No** REPAIR circuit CLS21 (BU/GN) (LH front), circuit CLS25 (YE/VT) (RH front), circuit CLS23 (GY/OG) (LH rear) or circuit CLS24 (BN/WH) (RH rear) for an open. TEST the system for normal operation.

(GY/OG), harness side; or between the RH front turn lamp C4140-1, circuit CLS24 (BN/WH), harness side and the SJB C2280c-19, circuit CLS24 (BN/WH), harness side.  N0099691 • **Is the resistance less than 5 ohms?**	
O8 ISOLATE THE BULB HOLDER OR REAR LAMP ASSEMBLY AS THE CAUSE OF THE SHORT TO GROUND	
• Ignition OFF. • Disconnect: Inoperative Turn Lamp. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs **and** repeat the self-test **(required to enable the turn lamp output driver if DTC B106E is present)** . • Activate the hazard flasher lamp function. • For a front lamp, measure the voltage between the LH front turn lamp C1023-3, circuit CLS21 (BU/GN), harness side and ground; or between the RH front turn lamp C1043-3, circuit CLS25 (YE/VT), harness side and ground.  N0066286 • For an MKZ rear turn lamp, measure the voltage between the LH rear turn lamp C4139-1, circuit CLS23 (GY/OG), harness side and ground; or between the RH front turn lamp C4140-1, circuit CLS24 (BN/WH), harness side and ground.	**Yes** INSTALL a new bulb holder or rear lamp assembly in question. TEST the system for normal operation. **No** GO to O9 .

 N0099688 • **Does the voltage alternate from 0 to greater than 10 volts?**	
O9 CHECK THE SJB TURN LAMP OUTPUT CIRCUIT FOR A SHORT TO GROUND	
• Turn the hazard lamp function off. • Ignition OFF. • Disconnect: SJB C2280f (Front Turn Lamp). • Disconnect: SJB C2280c (Rear Turn Lamp). • For a front turn lamp, measure the resistance between the SJB C2280f-21 (LH turn lamp), circuit CLS21 (BU/GN), harness side and ground; or between the SJB C2280f-23 (RH turn lamp), circuit CLS25 (YE/VT), harness side and ground.  N0058672 • For a rear turn lamp, measure the resistance between the SJB C2280c-21 (LH turn lamp), circuit CLS23 (GY/OG), harness side and ground; or between the SJB C2280c-19 (RH turn lamp), circuit CLS24 (BN/WH), harness side and ground.  N0099692 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O10 . **No** REPAIR circuit CLS21 (BU/GN) (LH front), circuit CLS25 (YE/VT) (RH front), circuit CLS23 (GY/OG) (LH rear) or circuit CLS24 (BN/WH) (RH rear) for a short to ground. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the turn lamp output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
O10 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at

• Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test P: The Hazard Lamps Are Inoperative/Always On

Refer to Wiring Diagrams Cell 90 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Turn Signal/Stop/Hazard Lamps for schematic and connector information.

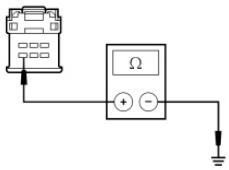
Normal Operation

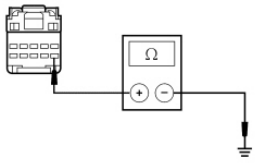
The Smart Junction Box (SJB) sends a voltage signal to the hazard flasher lamp switch. When the hazard flasher lamp switch is pressed, the voltage signal is routed to ground. When the SJB detects a request for the hazard lamps, the SJB provides voltage to the appropriate turn lamps.

The hazard flasher lamp switch is a momentary contact switch.

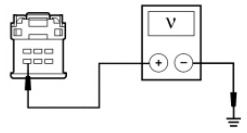
The hazard flasher lamp switch for MKZ is integrated into the Front Controls Interface Module (FCIM).

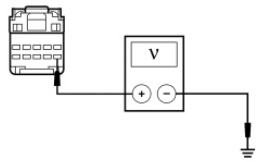
- DTC B2071 (Hazard Switch Signal Short to Ground) - an on-demand DTC that sets when the SJB detects a short to ground from the hazard flasher lamp switch input circuit.

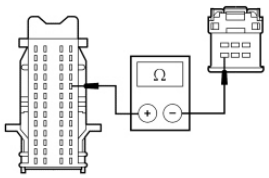


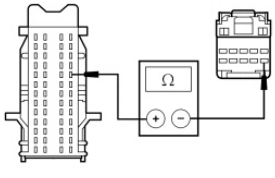


This pinpoint test is intended to diagnose the following:

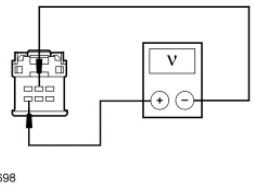








- Wiring, terminals or connectors
- Hazard flasher lamp switch (Fusion)
- FCIM (MKZ)
- SJB



PINPOINT TEST P: THE HAZARD LAMPS ARE INOPERATIVE/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
P1 CHECK THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded DTCs from the SJB self-test. • **Is DTC B2071 present?**	**Yes** GO to P2 . **No** GO to P4 .
P2 CHECK THE HAZARD FLASHER LAMP SWITCH	
• Disconnect: Hazard Flasher Lamp Switch C2039 (Fusion). • Disconnect: FCIM C2402 (MKZ). • Ignition ON.	**Yes** GO to P3 . **No** For Fusion, INSTALL a new hazard flasher lamp

• Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Repeat the SJB self-test. • **Is DTC B2071 still present?**	switch. REFER to Hazard Flasher Lamp Switch in this section. TEST the system for normal operation. For MKZ, INSTALL a new FCIM . REFER to Section 415-00 TEST the system for normal operation.
P3 CHECK THE HAZARD LAMP REQUEST INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: SJB C2280b. • For Fusion, measure the resistance between the hazard flasher lamp switch C2039-6, circuit CLS32 (BN/YE), harness side and ground.  N0099693 • For MKZ, measure the resistance between the FCIM C2402-6, circuit CLS32 (BN/YE), harness side and ground.  N0099694 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to P7 . **No** REPAIR circuit CLS32 (BN/YE) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
P4 CHECK FOR A VOLTAGE SIGNAL TO THE HAZARD FLASHER LAMP SWITCH OR THE FCIM	
• Ignition OFF. • Disconnect: Hazard Flasher Lamp Switch C2039 (Fusion). • Disconnect: FCIM C2402 (MKZ). • For Fusion, measure the voltage between the hazard flasher lamp switch C2039-6, circuit CLS32 (BN/YE), harness side and ground.	**Yes** For Fusion, GO to P6 . For MKZ, INSTALL a new FCIM . REFER to Section 415-00 . TEST the system for normal operation. **No** GO to P5 .

 N0099695 • For MKZ, measure the voltage between the FCIM C2402-6, circuit CLS32 (BN/YE), harness side and ground.  N0104286 • **Is the voltage greater than 10 volts?**	
P5 CHECK THE HAZARD LAMP REQUEST INPUT CIRCUIT FOR AN OPEN	
• For Fusion, measure the resistance between the SJB C2280b-48, circuit CLS32 (BN/YE), harness side and the hazard flasher lamp switch C2039-6, circuit CLS32 (BN/YE), harness side.  N0099696 • For MKZ, measure the resistance between the SJB C2280b-48, circuit CLS32 (BN/YE), harness side and the FCIM C2402-6, circuit CLS32 (BN/YE), harness side.  N0099697 • **Is the resistance less than 5 ohms?**	**Yes** GO to P7 . **No** REPAIR circuit CLS32 (BN/YE) for an open. TEST the system for normal operation.
P6 CHECK FOR VOLTAGE TO THE HAZARD FLASHER LAMP SWITCH USING THE	

CONNECTOR GROUND	
• Measure the voltage between the hazard flasher lamp switch C2039-6, circuit CLS32 (BN/YE), harness side and the hazard lamp switch C2039-2, circuit GD116 (BK/VT), harness side.  N0099698 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new hazard flasher lamp switch. REFER to Hazard Flasher Lamp Switch in this section. TEST the system for normal operation. **No** REPAIR circuit GD116 (BK/VT) for an open. TEST the system for normal operation.
P7 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Parking, Rear and License Plate Lamps

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB monitors the headlamp switch position by sending voltage signals on multiple circuits to the headlamp switch. There is one circuit for each headlamp switch position. At any given time, one of the signal circuits is switched to ground.

If the SJB does not detect any of the inputs to the headlamp switch is active (switched to ground) for 5 seconds, the SJB turns on the parking lamps and headlamps and keeps them on until the battery saver feature times out.

Additionally, if the SJB detects multiple headlamp switch input circuits short to ground, the SJB turns the parking lamps and headlamps on and keeps them on until the battery saver feature times out.

Refer to Exterior Lighting for information regarding the Battery Saver feature.

If either of the above situations occur, the SJB **cannot** be ruled immediately as being at fault. This is normal behavior of the SJB design as it has detected a fault with the inputs from the headlamp switch.

When the SJB receives an input from the headlamp switch indicating a request for the parking lamps, the SJB energizes the parking lamp relay, which supplies voltage to the exterior lamps.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Smart Junction Box (SJB) fuse 22 (15A) • Rear lamp assembly • Bulb(s) • Wiring, terminals, connectors • SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

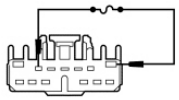
Pinpoint Tests

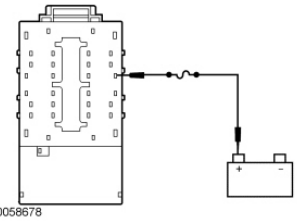
Pinpoint Test Q: One Or More Parking, Rear or License Plate Lamps Is Inoperative

Refer to Wiring Diagrams Cell 92 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

When the headlamp switch is placed in the PARKING LAMPS ON position, the Smart Junction Box (SJB) provides a ground for the parking lamp relay coil (integrated into the SJB). When the parking lamp relay is energized, voltage is routed to the front and rear parking lamps.

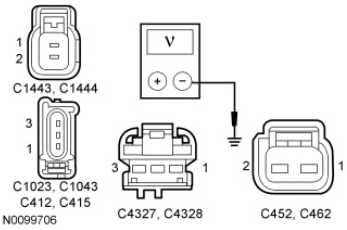




This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Bulb holder
- Rear lamp assembly
- SJB

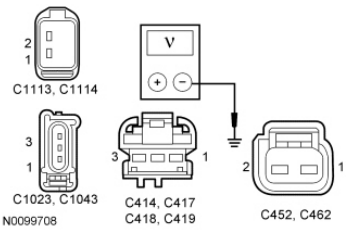
PINPOINT TEST Q: ONE OR MORE PARKING, REAR OR LICENSE PLATE LAMPS IS INOPERATIVE



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Q1 DETERMINE IF ALL THE PARKING LAMPS ARE INOPERATIVE	
• Ignition OFF. • Place the headlamp switch in the PARKING LAMPS ON position. • **Are all the parking lamps inoperative?**	**Yes** VERIFY the SJB fuse 22 (15A) is OK. If OK, GO to Q6 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. **No** If all the front parking lamps are inoperative, GO to Q2 . If all the rear parking and license plate lamps are inoperative, GO to Q3 . For all others, GO to Q4 .
Q2 CHECK THE SJB PARKING LAMP OUTPUT CIRCUIT FOR AN OPEN (FRONT LAMPS)	
• PLACE the headlamp switch in the OFF position. • Disconnect: SJB C2280e. • Connect a fused jumper wire between the SJB C2280e-1, circuit CDC34 (WH/OG), harness side and the SJB C2280e-6, circuit CLS30 (VT/WH), harness side.	**Yes** REMOVE the jumper wire. GO to Q6 . **No** REMOVE the jumper wire. REPAIR circuit CLS30 (VT/WH) for an open. TEST the system for normal

 N0058677 • Ignition ON. • **Do the front parking lamps illuminate?**	operation.
Q3 CHECK THE SJB PARKING LAMP OUTPUT CIRCUIT FOR AN OPEN (REAR LAMPS)	
• PLACE the headlamp switch in the OFF position. • Disconnect: SJB C2280d. • Connect a fused jumper wire between the positive battery terminal and the SJB C2280d-20, circuit CLS30 (VT/WH), harness side.  N0058678 • **Do the rear parking lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to Q6 . **No** REMOVE the jumper wire. REPAIR circuit CLS30 (VT/WH) for an open. TEST the system for normal operation.
Q4 CHECK FOR VOLTAGE TO THE INOPERATIVE LAMP	
• PLACE the headlamp switch in the OFF position. • Disconnect: Inoperative Lamp. • Place the headlamp switch in the PARKING LAMPS ON position. • For Fusion, measure the voltage between the inoperative lamp, harness side and ground as follows:	**Yes** GO to Q5 . **No** REPAIR circuit CLS30 (VT/WH) for an open. TEST the system for normal operation.



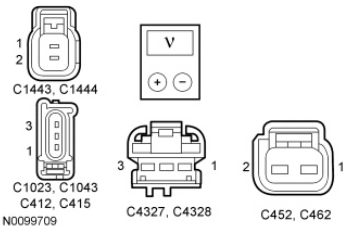
Inoperative Lamp	Connector-Pin	Circuit
LH front	C1023-2	CLS30 (VT/WH)
RH front	C1043-2	CLS30 (VT/WH)
LH front side marker	C1443-1	CLS30 (VT/WH)
RH front side marker	C1444-1	CLS30 (VT/WH)
LH rear	C412-2	

		CLS30 (VT/WH)
RH rear	C415-2	CLS30 (VT/WH)
LH rear side marker	C4328-1	CLS30 (VT/WH)
RH rear side marker	C4327-1	CLS30 (VT/WH)
LH license plate	C452-1	CLS30 (VT/WH)
RH license plate	C462-1	CLS30 (VT/WH)

- For MKZ, measure the voltage between the inoperative lamp, harness side and ground as follows:

Inoperative Lamp	Connector-Pin	Circuit
LH front	C1023-2	CLS30 (VT/WH)
RH front	C1043-2	CLS30 (VT/WH)
LH front side marker	C1113-1	CLS30 (VT/WH)
RH front side marker	C1114-1	CLS30 (VT/WH)
LH rear	C419-2	CLS30 (VT/WH)
RH rear	C418-2	CLS30 (VT/WH)
LH rear (luggage compartment lid)	C414-1	CLS30 (VT/WH)
RH rear (luggage compartment lid)	C417-1	CLS30 (VT/WH)
LH license plate	C452-1	CLS30 (VT/WH)
RH license plate	C462-1	CLS30 (VT/WH)

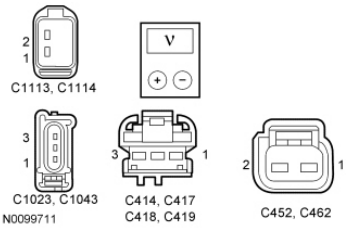
- **Is the voltage greater than 10 volts?**



Q5 CHECK FOR VOLTAGE TO THE INOPERATIVE LAMP USING THE CONNECTOR GROUND

- For Fusion, measure the voltage between the inoperative lamp connector, harness side as follows:

Inoperative Lamp	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH front	C1023-2 CLS30 (VT/WH)	C1023-1 GD123 (BK/GY)
RH front	C1043-2 CLS30 (VT/WH)	C1043-1 GD121 (BK/YE)
LH front side marker	C1443-1 CLS30 (VT/WH)	C1443-2 GD121 (BK/YE)
RH front side marker	C1444-1 CLS30 (VT/WH)	C1444-2 GD123 (BK/GY)
LH rear	C412-2 CLS30 (VT/WH)	C412-1 GD171 (BK/GY)
RH rear	C415-2 CLS30 (VT/WH)	C415-1 GD171 (BK/GY)
LH rear side marker	C4328-1 CLS30 (VT/WH)	C4328-3 GD171 (BK/GY)
RH rear side marker	C4327-1 CLS30 (VT/WH)	C4327-3 GD171 (BK/GY)
LH license plate	C452-1 CLS30 (VT/WH)	C452-2 GD171 (BK/GY)
RH license plate	C462-1 CLS30 (VT/WH)	C462-2 GD171 (BK/GY)



Yes
For a Fusion rear lamp, any front or license plate lamp, INSTALL a new bulb holder. TEST the system for normal operation. For a Fusion rear side marker, or an MKZ rear lamp, INSTALL a new lamp assembly. REFER to Rear Lamp Assembly or Reversing Lamp in this section. TEST the system for normal operation.

No
REPAIR the ground circuit in question for an open. TEST the system for normal operation.

- For MKZ, measure the voltage between the inoperative lamp connector, harness side as follows:

Inoperative Lamp	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH front	C1023-2 CLS30 (VT/WH)	C1023-1 GD123 (BK/GY)
RH front	C1043-2 CLS30 (VT/WH)	C1043-1 GD121 (BK/YE)
LH front side marker	C1113-1 CLS30 (VT/WH)	C1113-2 GD121 (BK/YE)
RH front side marker	C1114-1 CLS30 (VT/WH)	C1114-2 GD123 (BK/GY)
LH rear	C419-2 CLS30 (VT/WH)	C419-3 GD171 (BK/GY)
RH rear	C418-2 CLS30 (VT/WH)	C418-3 GD171 (BK/GY)
LH rear (luggage compartment lid)	C414-1 CLS30 (VT/WH)	C414-3 GD171 (BK/GY)
RH rear (luggage compartment lid)	C417-1 CLS30 (VT/WH)	C417-3 GD171 (BK/GY)
LH license plate	C452-1 CLS30 (VT/WH)	C452-2 GD171 (BK/GY)
RH license plate	C462-1 CLS30 (VT/WH)	C462-2 GD171 (BK/GY)

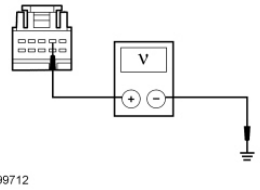
 • **Is the voltage greater than 10 volts?**	
Q6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

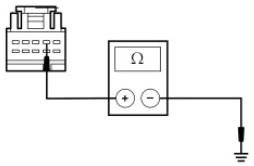
Pinpoint Test R: The Parking, Rear Or License Plate Lamps Are On Continuously

Refer to Wiring Diagrams Cell 92 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking, Rear and License Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) monitors the parking lamp request input from the headlamp switch. The SJB provides a ground for the parking lamp relay coil (integrated into the SJB) when a request for the parking lamps is received. When the parking lamp relay is energized, voltage is routed to the front and rear parking lamps.





- DTC B1578 (Lamp Park Input Circuit Short to Ground) - an on-demand DTC that may set when the SJB detects a short to ground from the parking lamps on input circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Headlamp switch
- SJB

PINPOINT TEST R: THE PARKING, REAR OR LICENSE PLATE LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
R1 USE THE RECORDED DTCs FROM THE SJB SELF-TEST	
• Check the recorded results from the SJB self-test. • **Is DTC B1578 present?**	**Yes** GO to R2 . **No** GO to R4 .

R2 CHECK FOR A VOLTAGE SIGNAL TO THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Measure the voltage between the headlamp switch C205-2, circuit CLS34 (GY), harness side and ground.  N0099712 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to R3 .
R3 CHECK CIRCUIT CLS34 (YE/OG) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280b. • Measure the resistance between the headlamp switch C205-2, circuit CLS34 (GY), harness side and ground.  N0083974 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to R5 . **No** REPAIR circuit CLS34 (GY) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
R4 CHECK THE SJB PARKING LAMPS OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280e. • Ignition ON. • **Do the parking lamps continue to illuminate?**	**Yes** REPAIR circuit CLS30 (VT/WH) for a short to voltage. TEST the system for normal operation. **No** GO to R5 .
R5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No**

♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Fog Lamps

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB monitors the headlamp switch position by sending a voltage signal to the headlamp switch. When the fog lamp switch is engaged, the voltage signal is routed to ground.

The fog lamps can be turned on when the following conditions are met:

- The ignition switch is in the RUN or START position.
- The low beam headlamps or the parking lamps are on.
- The high beams are not on.

When the SJB receives an input from the headlamp switch indicating a request for the fog lamps, the SJB provides voltage to the fog lamp relay. When the fog lamp relay is energized, voltage is routed to the fog lamps.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of electrical damage.

Visual Inspection Chart

Electrical

- Battery Junction Box (BJB) fuse 21 (15A) (fog lamp relay)
- Wiring, terminals or connectors
- Bulb(s)
- Headlamp switch
- Smart Junction Box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

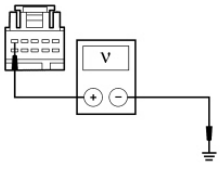
Pinpoint Tests

Pinpoint Test S: Both Fog Lamps Are Inoperative

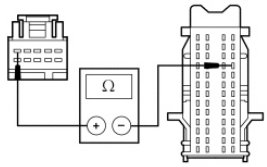
Refer to Wiring Diagrams Cell 86 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Fog Lamps for schematic and connector information.

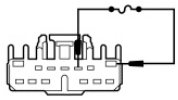
Normal Operation

The Smart Junction Box (SJB) sends a voltage signal to the headlamp switch to monitor the fog lamp request. When the fog lamp switch is engaged, the voltage signal is routed to ground.



When the SJB detects the fog lamps on request, the SJB energizes the fog lamp relay (integrated into the SJB). When the fog lamp relay is energized, voltage is routed to the fog lamps.





This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Headlamp switch
- SJB

PINPOINT TEST S: BOTH FOG LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

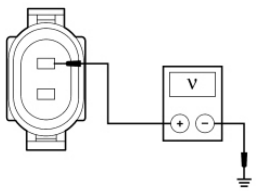
Test Step	Result / Action to Take
S1 CHECK THE SJB FOG LAMP SWITCH PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Data Logger. • Monitor the SJB fog lamp PID (FOG SW) while engaging the fog lamp switch. • **Does the PID indicate the fog lamp switch is on?**	**Yes** VERIFY the SJB fuse 21 (15A) is OK. If OK, GO to S4 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. **No** GO to S2 .
S2 CHECK FOR A VOLTAGE SIGNAL TO THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Measure the voltage between the headlamp switch C205-5, circuit CLF21 (GY/VT), harness side and ground.  N0099713 • Ignition ON.	**Yes** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation. **No** GO to S3 .

• **Is the voltage greater than 10 volts?**	
S3 CHECK THE FOG LAMPS ON REQUEST INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280b. • Measure the resistance between the headlamp switch C205-5, circuit CLF21 (GY/VT), harness side and the SJB C2280b-49, circuit CLF21 (GY/VT), harness side.  N0083975 • **Is the resistance less than 5 ohms?**	**Yes** GO to S5 . **No** REPAIR circuit CLF21 (GY/VT) for an open. TEST the system for normal operation.
S4 BYPASS THE SJB	
• Ignition OFF. • Disconnect: SJB C2280e. • Connect a fused jumper wire between the SJB C2280e-1, circuit CDC34 (WH/OG), harness side and the SJB C2280e-3, circuit CLF12 (BN/YE), harness side.  N0058681 • Ignition ON. • **Do the fog lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to S5 . **No** REMOVE the jumper wire. REPAIR circuit CLF12 (BN/YE) for an open. TEST the system for normal operation.
S5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

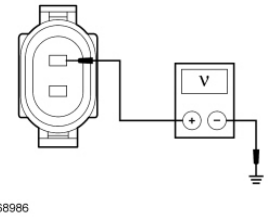
Pinpoint Test T: An Individual Fog Lamp Is Inoperative

Refer to Wiring Diagrams Cell 86 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Fog Lamps for schematic and connector information.

Normal Operation



When the fog lamp relay is energized, voltage is routed to the fog lamps. A separate ground circuit is supplied to each fog lamp.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

PINPOINT TEST T: AN INDIVIDUAL FOG LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
T1 CHECK FOR VOLTAGE TO THE FOG LAMP	
• Ignition OFF. • Disconnect: Inoperative Fog Lamp. • Ignition ON. • Place the headlamp switch in the PARKING LAMPS ON position and engage the fog lamp switch. • For Fusion, measure the voltage between the LH fog lamp C152-A, circuit CLF12 (BN/YE), harness side and ground; or between the RH fog lamp C162-A, circuit CLF12 (BN/YE), harness side and ground.  N0068986 • For MKZ, measure the voltage between the LH fog lamp C152-1, circuit CLF12 (BN/YE), harness side and ground; or between the RH fog lamp C162-1, circuit CLF12 (BN/YE), harness side and ground.	**Yes** REPAIR circuit GD121 (BK/YE) (LH fog lamp) or circuit GD123 (BK/GY) (RH fog lamp) for an open. TEST the system for normal operation. **No** REPAIR circuit CLF12 (BN/YE) for an open. TEST the system for normal operation.

 • **Is the voltage greater than 10 volts?**	

Pinpoint Test U: The Fog Lamps Are On Continuously

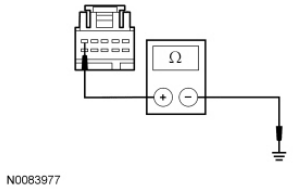
Refer to Wiring Diagrams Cell 86 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Fog Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) sends a voltage signal to the headlamp switch to monitor the fog lamp request. When the fog lamp switch is engaged, the voltage signal is routed to ground.

When the SJB detects the fog lamps on request, the SJB energizes the fog lamp relay (integrated into the SJB). When the fog lamp relay is energized, voltage is routed through 2 output circuits from the SJB . One output is to the fog lamps and the other output is to the headlamp switch (for the fog lamps on indicator).

- DTC B2254 (Front Fog Lamp Switch Failure) - an on-demand DTC that sets when the SJB detects a short to ground from the fog lamp on input circuit.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Headlamp switch
- SJB

PINPOINT TEST U: THE FOG LAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
U1 CHECK FOR RECORDED SJB DTCs	
• Check the recorded results from the SJB self-test. • **Is DTC B2254 present?**	**Yes** GO to U2 . **No** GO to U4 .
U2 CHECK THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test.	**Yes** GO to U3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. CLEAR the

• **NOTE:** Other DTCs will be present with the headlamp switch disconnected and should be ignored. • Repeat the SJB self-test. • **Is DTC B2254 still present?**	DTCs. REPEAT the self-test.
U3 CHECK THE FOG LAMPS ON REQUEST INPUT CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: SJB C2280b. • Measure the resistance between the headlamp switch C205-5, circuit CLF21 (GY/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to U6 . **No** REPAIR circuit CLF21 (GY/VT) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
U4 CHECK THE SJB FOG LAMPS OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE (TO HEADLAMP SWITCH)	
• Ignition OFF. • Disconnect: SJB C2280a. • Ignition ON. • **Do the fog lamps continue to illuminate?**	**Yes** GO to U5 . **No** REPAIR circuit CLF12 (BN/YE) to the headlamp switch for a short to voltage. TEST the system for normal operation.
U5 CHECK THE SJB FOG LAMPS OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE (TO THE FOG LAMPS)	
• Ignition OFF. • Disconnect: SJB C2280e. • Ignition ON. • **Do the fog lamps continue to illuminate?**	**Yes** REPAIR circuit CLF12 (BN/YE) for a short to voltage. TEST the system for normal operation. **No** GO to U6 .
U6 CHECK FOR CORRECT SJB OPERATION	
• Ignition OFF. • Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly.	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

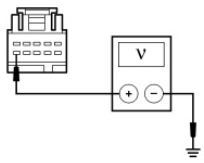
• Operate the system and verify the concern is still present. • **Is the concern still present?**	

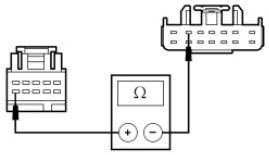
Pinpoint Test V: The Fog Lamps On Indicator Is Inoperative

Refer to Wiring Diagrams Cell 86 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Fog Lamps for schematic and connector information.

Normal Operation

When the Smart Junction Box (SJB) detects the fog lamps on request, the SJB energizes the fog lamp relay (integrated into the SJB). When the fog lamp relay is energized, voltage is routed through 2 output circuits from the SJB . One output is to the fog lamps and the other output is to the headlamp switch (for the fog lamps on indicator).





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Headlamp switch
- SJB

PINPOINT TEST V: THE FOG LAMPS ON INDICATOR IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
V1 CHECK THE HEADLAMP SWITCH	
• Ignition OFF. • Disconnect: Headlamp Switch C205. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Select the SJB fog lamps (FOG_LMP) active command. Command the fog lamps on. • **NOTE:** Make sure the fog lamps are illuminated when taking a reading. • Measure the voltage between the headlamp switch C205-10, circuit CLF12 (BN/YE), harness side and ground.	**Yes** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation. **No** GO to V2 .

 N0083978 • **Is the voltage greater than 10 volts?**	
V2 CHECK THE SJB FOG LAMPS OUTPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: SJB C2280a. • Measure the resistance between the headlamp switch C205-10, circuit CLF12 (BN/YE), harness side and the SJB C2280a-6, circuit CLF12 (BN/YE), harness side.  N0083979 • **Is the resistance less than 5 ohms?**	**Yes** GO to V3 . **No** REPAIR circuit CLF12 (BN/YE) for an open. CLEAR the DTCs. REPEAT the self-test.
V3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Reversing Lamps

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

For vehicles equipped with an automatic transaxle, the PCM (2.5L or 3.0L engine) or the Transmission Control Module (TCM) (3.5L engine) controls the coil ground side of the reversing lamps relay. When the vehicle is in reverse, the PCM or TCM energizes the reversing lamps relay to provide voltage to the reversing lamps.

For vehicles equipped with a manual transaxle, the reversing lamp switch controls the coil ground side of the reversing lamps relay. When the vehicle is in reverse, the reversing lamp switch contacts close to ground, energizing the reversing lamps relay to provide voltage to the reversing lamps.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect the following for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Reversing lamp switch (manual transaxle)	• Battery Junction Box (BJB) fuse 47 (10A) • Bulb(s) • Wiring, terminals or connectors • Reversing lamps relay

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM or TCM .

9. If the DTCs retrieved are related to the concern, refer to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test W: Both Reversing Lamps Are Inoperative

Refer to Wiring Diagrams Cell 11 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Fuse and Relay Information for schematic and connector information.

Refer to Wiring Diagrams Cell 93 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Reversing Lamps for schematic and connector information.

Normal Operation

Voltage is supplied from the Battery Junction Box (BJB) fuse 47 (10A) to the coil and switched sides of the reversing lamps relay. When the reversing lamps relay is energized, voltage is routed to the reversing lamps.

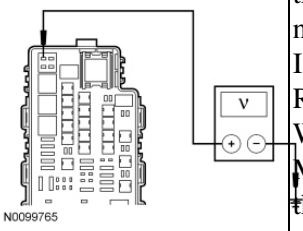
Automatic Transaxle

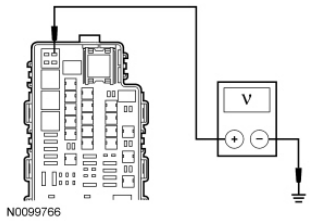
The PCM (2.5L or 3.0L engines) or the Transmission Control Module (TCM) (3.5L engine) monitors the transaxle gear status. When the PCM detects the transaxle in REVERSE (R), the PCM or TCM provides ground for the reversing lamps relay coil.

Manual Transaxle

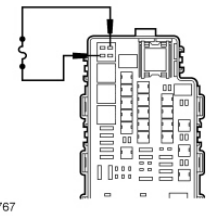
The reversing lamp switch controls the coil ground side of the reversing lamps relay. When the transaxle is in REVERSE (R), the reversing lamp switch contacts close, completing the path to ground for the reversing lamps relay coil.

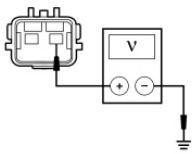
- DTC P1910 (Reverse Lamp Control Circuit/Open) - sets when the PCM detects no voltage on the reversing lamp relay coil ground control circuit (if the coil voltage supply circuit or the coil ground control circuit is open).



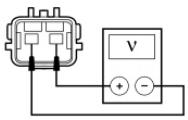


This pinpoint test is intended to diagnose the following:

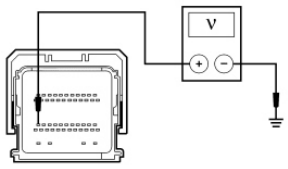


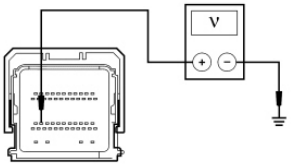


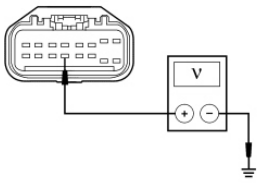
- Fuse
- Wiring, terminals or connectors
- Reversing lamps relay
- Reversing lamp switch
- PCM
- TCM



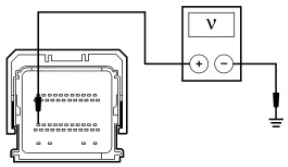
PINPOINT TEST W: BOTH REVERSING LAMPS ARE INOPERATIVE

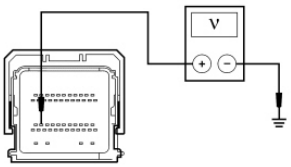


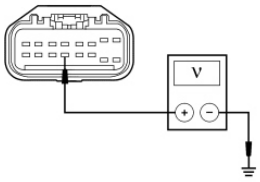




NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**







Test Step	Result / Action to Take
W1 CHECK THE REVERSING LAMPS RELAY	
• Ignition OFF. • Disconnect: Reversing Lamps Relay. • Ignition ON. • Substitute a known good relay and recheck the reversing lamps operation. • **Do the reversing lamps operate correctly?**	**Yes** REMOVE the known good relay. INSTALL a new reversing lamps relay. TEST the system for normal operation. **No**

	REMOVE the known good relay. GO to W2 .		
W2 CHECK FOR VOLTAGE TO THE REVERSING LAMPS RELAY COIL		• Ignition ON. • Measure the voltage between the reversing lamps relay pin 1, circuit CBK03 (GY), BJB face side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to W3 . **No** VERIFY the BJB fuse 47 (10A) is OK. If OK, REPAIR circuit CBK03 (GY) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
W3 CHECK FOR VOLTAGE TO THE REVERSING LAMPS RELAY SWITCH			
• Measure the voltage between the reversing lamps relay pin 3, circuit CBK03 (GY), BJB face side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to W4 . **No** REPAIR circuit CBK03 (GY) for an open. TEST the system for normal operation.		
W4 BYPASS THE REVERSING LAMPS RELAY			
• Connect a fused jumper wire between the reversing lamps relay pin 3, circuit CBK03 (GY), BJB face side and the reversing lamps relay pin 5, circuit	**Yes** REMOVE the jumper wire. For vehicles with a manual transaxle, GO to W5 . For		

CLS10 (GN/BN), BJB face side.  N0099767 • **Do the reversing lamps illuminate?**	vehicles with an automatic transaxle, GO to W7 . **No** REMOVE the jumper wire. REPAIR circuit CLS10 (GN/BN) for an open. TEST the system for normal operation.
W5 CHECK FOR VOLTAGE TO THE REVERSING LAMP SWITCH	
• Ignition OFF. • Connect: Reversing Lamps Relay. • Disconnect: Reversing Lamp Switch C169. • Ignition ON. • Measure the voltage between the reversing lamp switch C169-1, circuit CLS28 (BU/WH), harness side and ground.  N0099768 • **Is the voltage greater than 10 volts?**	**Yes** GO to W6 . **No** REPAIR circuit CLS28 (BU/WH) for an open. TEST the system for normal operation.
W6 CHECK FOR VOLTAGE TO THE REVERSING LAMP SWITCH USING THE CONNECTOR GROUND	
• Measure the voltage between the reversing lamp switch C169-1, circuit CLS28 (BU/WH), harness side and the reversing lamp switch C169-2, circuit GD121	**Yes** INSTALL a new reversing lamp switch. REFER to Reversing Lamp Switch in this section.

(BK/YE), harness side.  N0099769 • **Is the voltage greater than 10 volts?**	TEST the system for normal operation. **No** REPAIR circuit GD121 (BK/YE) for an open. TEST the system for normal operation.
W7 CHECK FOR PCM OR TCM TR SENSOR DTCs FROM THE SELF-TEST	
• Review the DTCs from the PCM (2.5L or 3.0L engine) or the TCM (3.5L engine) Key ON Engine OFF (KOEO) self-test. • **Are any TR sensor DTCs present?**	**Yes** REFER to Section 307-01A , Section 307-01B or Section 307-01C . **No** GO to W8 .
W8 CHECK THE REVERSING LAMPS RELAY COIL GROUND CONTROLLED CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175t (2.5L or 3.0L Engine). • Disconnect: TCM C1533 (3.5L Engine). • Ignition ON. • For Hybrid vehicles, measure the voltage between the PCM C175t-34, circuit CLS28 (BU/WH), harness side and ground.	**Yes** REPAIR circuit CLS28 (BU/WH) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to W9 .

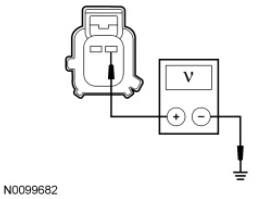
 N0077711 • For non-Hybrid vehicles with a 2.5L or 3.0L engine, measure the voltage between the PCM C175t-33, circuit CLS28 (BU/WH), harness side and ground.  N0099770 • For vehicles with a 3.5L engine, measure the voltage between the TCM C1533-13, circuit CLS28 (BU/WH), harness side and ground.  N0099771 • **Is any voltage present?**	
W9 CHECK FOR VOLTAGE TO THE PCM OR THE TCM WITH THE REVERSING LAMP RELAY CONNECTED	
• Ignition OFF. • Connect: Reversing Lamps Relay. • Ignition ON. • For Hybrid vehicles, measure the voltage between the PCM C175t-34, circuit CLS28 (BU/WH), harness side	**Yes** For vehicles with a 3.5L engine, GO to W10 . For all other vehicles, GO to W11 .

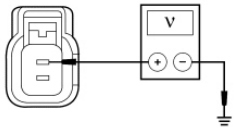
and ground.  N0077711 • For non-Hybrid vehicles with a 2.5L or 3.0L engine, measure the voltage between the PCM C175t-33, circuit CLS28 (BU/WH), harness side and ground.  N0099770 • For vehicles with a 3.5L engine, measure the voltage between the TCM C1533-13, circuit CLS28 (BU/WH), harness side and ground.  N0099771 • **Is the voltage greater than 10 volts?**	**No** REPAIR circuit CLS28 (BU/WH) for an open. CLEAR the DTCs. REPEAT the self-test.
W10 CHECK FOR CORRECT TCM OPERATION	
• Disconnect the TCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new TCM . REFER to Section 307-01A . TEST the

• Connect the TCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
W11 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B , Section 303-14C or Section 303-14D . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

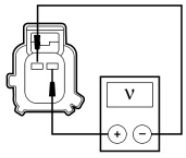
Pinpoint Test X: The Individual Reversing Lamp Is Inoperative

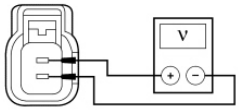
Refer to Wiring Diagrams Cell 93 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Reversing Lamps for schematic and connector information.





When the reversing lamps relay is energized, voltage is routed to the reversing lamps.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Bulb holder

PINPOINT TEST X: THE INDIVIDUAL REVERSING LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
X1 CHECK FOR VOLTAGE TO THE REVERSING LAMP	
• Ignition OFF. • Disconnect: Inoperative Reversing Lamp. • Apply the parking brake. • Ignition ON. • Select REVERSE. • For Fusion, measure the voltage between the LH rear lamp C487-1, circuit CLS10 (GN/BN), harness side and ground, or between the RH rear lamp C488-1, circuit CLS10 (GN/BN), harness side and ground.  N0099682 • For MKZ, measure the voltage between the LH rear lamp C451-1, circuit CLS10 (GN/BN), harness side and ground, or between the RH rear lamp C461-1, circuit CLS10 (GN/BN), harness side and ground.  N0099772 • **Is the voltage greater than 10 volts?**	**Yes** GO to X2 . **No** REPAIR circuit CLS10 (GN/BN) for an open. TEST the system for normal operation.
X2 CHECK FOR VOLTAGE TO THE REVERSING LAMP USING THE CONNECTOR GROUND	

• For Fusion, measure the voltage between the LH rear lamp C487-1, circuit CLS10 (GN/BN), harness side and the LH rear lamp C487-2, circuit GD171 (BK/GY), harness side, or between the RH rear lamp C488-1, circuit CLS10 (GN/BN), harness side and the RH rear lamp C488-2, circuit GD171 (BK/GY), harness side.  N0099685 • For MKZ, measure the voltage between the LH rear lamp C451-1, circuit CLS10 (GN/BN), harness side and the LH rear lamp C451-2, circuit GD171 (BK/GY), harness side, or between the RH rear lamp C461-1, circuit CLS10 (GN/BN), harness side and the RH rear lamp C461-2, circuit GD171 (BK/GY), harness side.  N0099773 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new bulb holder. TEST the system for normal operation. **No** REPAIR circuit GD171 (BK/GY) for an open. TEST the system for normal operation.

Pinpoint Test Y: The Reversing Lamps Are On Continuously

Refer to Wiring Diagrams Cell 93 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Reversing Lamps for schematic and connector information.

Normal Operation

Voltage is supplied from the Battery Junction Box (BJB) fuse 47 (10A) to the coil and switched sides of the reversing lamps relay. When the reversing lamps relay is energized, voltage is routed to the reversing lamps.

Automatic Transaxle

The PCM (2.5L or 3.0L engines) or the Transmission Control Module (TCM) (3.5L engine) monitors the transaxle gear status. When the PCM detects the transaxle is in REVERSE (R), the PCM or TCM provides ground for the reversing lamps relay coil.

Manual Transaxle

The reversing lamp switch controls the coil ground side of the reversing lamps relay. When the transaxle is in REVERSE (R), the reversing lamp switch contacts close, completing the path to ground for the reversing lamps relay coil.

- DTC P1910 (Reverse Lamp Control Circuit/Open) - sets when the PCM detects no voltage on the reversing lamp relay coil ground control circuit (if the coil ground control circuit is short to ground).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Reversing lamps relay
- Reversing lamp switch
- Auto-dimming interior mirror
- PCM
- TCM

PINPOINT TEST Y: THE REVERSING LAMPS ARE ON CONTINUOUSLY

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
Y1 CHECK THE REVERSING LAMPS RELAY	
• Ignition OFF. • Substitute a known good relay. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** REMOVE the known good relay. GO to Y2 . **No** REMOVE the known good relay. INSTALL a new reversing lamps relay. TEST the system for normal operation.
Y2 CHECK THE REVERSING LAMPS RELAY OUTPUT	
• Ignition OFF. • Disconnect: Reversing Lamps Relay. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** If equipped with an auto-dimming interior mirror, GO to Y3 . If not equipped with an auto-dimming interior mirror, REPAIR circuit CLS10 (GN/BN) for a short to voltage. TEST the system for normal operation. **No** For vehicles with a manual transaxle, GO to Y4 . For vehicles with an automatic transaxle, GO to Y5 .
Y3 ISOLATE THE SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Auto-Dimming Interior Mirror C911 or C9039. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** REPAIR circuit CLS10 (GN/BN) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new auto-dimming interior mirror. REFER to Section 501-09 . TEST the system for normal operation.
Y4 CHECK THE REVERSING LAMP SWITCH	
• Ignition OFF.	**Yes** REPAIR circuit CLS28 (BU/WH) for a short to ground. TEST

• Connect: Reversing Lamps Relay. • Disconnect: Reversing Lamp Switch C169. • Ignition ON. • **Do the reversing lamps continue to illuminate?**	the system for normal operation. **No** INSTALL a new reversing lamp switch. REFER to Reversing Lamp Switch in this section. TEST the system for normal operation.
Y5 CHECK FOR PCM OR TCM TR SENSOR DTCs FROM THE SELF-TEST	
• Review the DTCs from the PCM (2.5L or 3.0L engine) or the TCM (3.5L engine) Key ON Engine OFF (KOEO) self-test. • **Are any TR sensor DTCs present?**	**Yes** REFER to Section 307-01A , Section 307-01B or Section 307-01C . **No** GO to Y6 .
Y6 CHECK THE REVERSING LAMPS RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Connect: Reversing Lamps Relay. • Disconnect: PCM C175t (2.5L or 3.0L Engine,). • Disconnect: TCM C1533 (3.5L Engine). • Ignition ON. • **Do the reversing lamps continue to illuminate?**	**Yes** REPAIR circuit CLS28 (BU/WH) for a short to ground. TEST the system for normal operation. **No** For vehicles with a 3.5L engine, GO to Y7 . For all other vehicles, GO to Y8 .
Y7 CHECK FOR CORRECT TCM OPERATION	
• Disconnect the TCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the TCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new TCM . REFER to Section 307-01A . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
Y8 CHECK FOR CORRECT PCM OPERATION	
• Disconnect the PCM connector. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14D . TEST the system for normal operation.

♦ pushed-out pins • Connect the PCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR any DTCs. REPEAT the self-test.

Daytime Running Lamps (DRL)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB controls the Daytime Running Lamps (DRL) by using various inputs to determine whether or not the DRL should be illuminated. These inputs include:

- Ignition switch position
- Headlamp switch position
- Headlamps on or off
- Transmission gear selection (automatic transaxle)
- Parking brake applied or released (manual transaxle)

When the DRL is active, the SJB provides a pulse-width modulated voltage to the low beam headlamps. This illuminates the headlamps at a reduced intensity.

The DRL is not a programmable parameter for this vehicle.

Inspection and Verification

1. Verify the customer concern.

2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

3. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

4. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

5. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the RUN position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

6. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

7. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM, the SJB , and the IPC .

8. If the DTCs retrieved are related to the concern, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual or the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test Z: The Daytime Running Lamps (DRL) Are Inoperative

Normal Operation

When the ignition switch is in the RUN position, the headlamps are not on, the transaxle is not in PARK (P) (automatic transaxle) or the parking brake is not applied (manual transaxle), the Smart Junction Box (SJB) provides a pulse-width modulated voltage to the low beam headlamps. This illuminates the headlamps at a reduced intensity.

This pinpoint test is intended to diagnose the following:

- Exterior lighting system input/output
- Ignition switch input
- Transaxle gear input (automatic transaxle)
- Parking brake switch input (manual transaxle)
- SJB

PINPOINT TEST Z: THE DRL ARE INOPERATIVE

Test Step	Result / Action to Take
Z1 VERIFY THE DRL OPERATION	
• Ignition ON. • Place the headlamp switch in the OFF position.	**Yes** The system is operating correctly. INFORM the customer of the

• If equipped with an automatic transaxle, place the gear selector lever in any gear other than PARK (P). • If equipped with a manual transaxle, release the parking brake. • **Do the DRL illuminate?**	conditions required for the DRL to operate correctly. **No** GO to Z2 .
Z2 CHECK THE OPERATION OF THE HEADLAMPS (VEHICLES WITH HALOGEN HEADLAMPS) OR FOG LAMPS (VEHICLES WITH HID HEADLAMPS)	
• Place the headlamp switch in the HEADLAMPS ON position (and engage the fog lamp switch for vehicles with HID headlamps) and observe the headlamps/fog lamps. • **Do the headlamps/fog lamps operate correctly?**	**Yes** GO to Z3 . **No** REFER to Headlamps or Fog Lamps in this section.
Z3 CHECK THE IGNITION SWITCH INPUT	
• Place the headlamp switch in the OFF position. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB ignition switch PIDs (IGN_A_ECU, IGN_O_ECU, IGN_R_ECU, IGN_S_ECU) while cycling the ignition switch through all its positions. • **Does the PID agree with the ignition switch positions?**	**Yes** For vehicles with an automatic transaxle, GO to Z4 . For vehicles with a manual transaxle, GO to Z5 . **No** REFER to Section 211-05 to diagnose the ignition switch input.
Z4 CHECK THE TRANSAXLE GEAR INPUT	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM transmission gear status PID (TR) while placing the gear selector lever through all its positions. • **Does the PID agree with the gear selection?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** REFER to Section 307-01A , Section 307-01B or Section 307-01C to diagnose the digital Transmission Range (TR) sensor input.
Z5 CHECK THE BRAKE WARNING INDICATOR OPERATION	
• Ignition ON. • Apply and release the parking brake while observing the brake warning indicator. • **Does the brake warning indicator operate correctly?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** REFER to Section 413-01 to diagnose the brake warning indicator.

Adaptive Headlighting

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The Headlamp Control Module (HCM) receives information from the communication network such as vehicle speed, steering wheel angle and headlamps on status. Based on the information received, the HCM determines if the headlamps need to be angled left or right as well as the degree of angle.

The HCM does not operate the adaptive headlamps until the vehicle speed is above 5 km/h (3 mph).

When the ignition is placed in the RUN/START position, the HCM runs an initialization check to determine the straight-ahead position of the headlamps. If the HCM does not receive the required information over the communication network or determines that there is a fault with the circuitry to the sensors or control motors, it defaults the headlamps to the straight-ahead position and sets DTC(s).

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp assembly	• Smart Junction Box (SJB) fuse 42 (10A) • Wiring, terminals or connectors • Headlamp Control Module (HCM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the HCM .

9. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Chart in this section. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

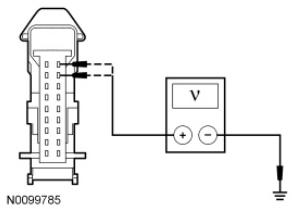
10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Symptom Chart

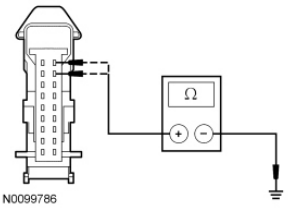
Symptom Chart

Pinpoint Tests

Pinpoint Test AA: DTC B1A98:88



- DTC B1A98:88 (LIN Bus Circuit #1: Bus off) - sets continuous and on-demand by the Headlamp Control Module (HCM) if communication is lost to the headlamps due to a circuit fault on the communication circuit between the HCM and the headlamps.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Headlamp assembly

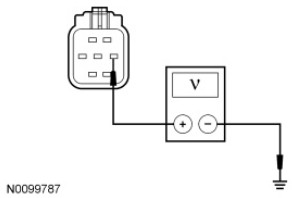
- HCM

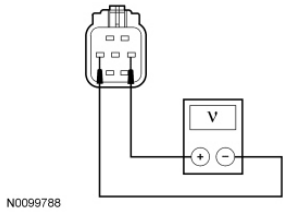
PINPOINT TEST AA: DTC B1A98:88

Test Step	Result / Action to Take
AA1 ISOLATE THE LH HEADLAMP ASSEMBLY AS THE CAUSE OF THE DTC	
• Ignition OFF. • Disconnect: LH Headlamp Assembly C1021. • Ignition ON. • Enter the following diagnostic mode on the scan tool: HCM Self-Test. • **NOTE:** Other DTCs can be present with the headlamp assembly disconnected and should be ignored. • Clear the DTCs and repeat the HCM self-test. • **Is DTC B1A98:88 still present?**	**Yes** GO to AA2 . **No** INSTALL a new LH headlamp assembly. REFER to Headlamp Assembly in this section. CLEAR the DTCs. REPEAT the self-test.
AA2 ISOLATE THE RH HEADLAMP ASSEMBLY AS THE CAUSE OF THE DTC	
• Ignition OFF. • Disconnect: RH Headlamp Assembly C1041. • Ignition ON. • Enter the following diagnostic mode on the scan tool: HCM Self-Test. • **NOTE:** Other DTCs can be present with the headlamp assembly disconnected and should be ignored. • Clear the DTCs and repeat the HCM self-test. • **Is DTC B1A98:88 still present?**	**Yes** GO to AA3 . **No** INSTALL a new RH headlamp assembly. REFER to Headlamp Assembly in this section. CLEAR the DTCs. REPEAT the self-test.
AA3 CHECK THE COMMUNICATION CIRCUITS TO THE HEADLAMPS FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: HCM C1600. • Ignition ON. • Measure the voltage between the HCM C1600-17, circuit VLF32 (YE), harness side, and ground; and the HCM C1600-18, circuit VLF33 (BU), harness side, and ground.  	**Yes** REPAIR circuit VLF32 (YE) (LH headlamp) or circuit VLF33 (BU) (RH headlamp) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to AA4 .

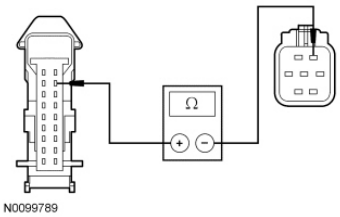
• **Is any voltage present?**	
AA4 CHECK THE COMMUNICATION CIRCUITS TO THE HEADLAMPS FOR A SHORT TO GROUND	
• Ignition OFF. • Measure the resistance between the HCM C1600-17, circuit VLF32 (YE), harness side, and ground; and the HCM C1600-18, circuit VLF33 (BU), harness side, and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AA5 . **No** REPAIR circuit VLF32 (YE) (LH headlamp) or circuit VLF33 (BU) (RH headlamp) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
AA5 CHECK FOR CORRECT HCM OPERATION	
• Disconnect all the HCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the HCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

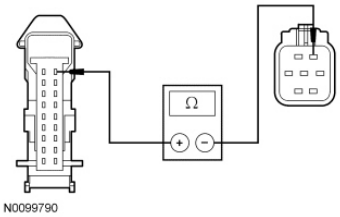
Pinpoint Test AB: DTC B1D64:87, B1D65:87





- DTC B1D64:87 (Left Headlamp Swivelling Motor: Missing Message) - sets continuous and on-demand in the Headlamp Control Module (HCM) if data messages from the LH headlamp are missing.
- DTC B1D65:87 (Right Headlamp Swivelling Motor: Missing Message) - sets continuous and on-demand in the HCM if data messages from the RH headlamp are missing.





This pinpoint test is intended to diae the following:

- Wiring, terminals or connectors
- Headlamp assembly
- HCM

PINPOINT TEST AB: DTC B1D64:87, B1D65:87

Test Step	Result / Action to Take

AB1 CHECK FOR VOLTAGE TO THE HEADLAMP	
• Ignition OFF. • Disconnect: LH Headlamp Assembly C1021 (DTC B1D64:87). • Disconnect: RH Headlamp Assembly C1041 (DTC B1D65:87). • Ignition ON. • Measure the voltage between the LH headlamp C1021-5, circuit CBP42 (GN), harness side and ground; or between the RH headlamp C1041-5, circuit CBP42 (GN), harness side and ground.  N0099787 • **Is the voltage greater than 10 volts?**	**Yes** GO to AB2 . **No** REPAIR circuit CBP42 (GN) for an open. CLEAR the DTCs. REPEAT the self-test.
AB2 CHECK FOR VOLTAGE TO THE HEADLAMP USING THE CONNECTOR GROUND	
• Measure the voltage between the LH headlamp C1021-5, circuit CBP42 (GN), harness side and the LH headlamp C1021-3, circuit GD121 (BK/YE), harness side; or between the RH headlamp C1041-5, circuit CBP42 (GN), harness side and the RH headlamp C1041-3, circuit GD123 (BK/GY), harness side.  N0099788 • **Is the voltage greater than 10 volts?**	**Yes** GO to AB3 . **No** REPAIR circuit GD121 (BK/YE) (LH headlamp) or circuit GD123 (BK/GY) (RH headlamp) for an open. CLEAR the DTCs. REPEAT the self-test.
AB3 CHECK THE COMMUNICATION CIRCUIT BETWEEN THE HCM AND THE HEADLAMP FOR AN OPEN	
• Ignition OFF. • Disconnect: HCM C1600. • For the LH headlamp, measure the resistance between the HCM C1600-17, circuit VLF32 (YE), harness side and the LH headlamp C1021-2, circuit VLF32 (YE), harness side.	**Yes** GO to AB4 . **No** REPAIR circuit VLF32 (YE) (LH headlamp) or circuit VLF33 (BU) (RH headlamp) for an open. CLEAR the DTCs. REPEAT the self-test.

 N0099789 • For the RH headlamp, measure the resistance between the HCM C1600-18, circuit VLF33 (BU), harness side and the RH headlamp C1041-2, circuit VLF33 (BU), harness side.  N0099790 • **Is the resistance less than 5 ohms?**	
AB4 CHECK FOR CORRECT HCM OPERATION	
• Disconnect all the HCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the HCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test AC: DTC U0100:87

- DTC U0100:87 (Lost Communication With ECM/PCM "A": Missing Message) - sets continuous in the Headlamp Control Module (HCM) if data messages received from the PCM over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- HCM
- PCM

PINPOINT TEST AC: DTC U0100:87

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out.

Test Step	Result / Action to Take
AC1 VERIFY THAT THE SCAN TOOL CAN COMMUNICATE WITH THE PCM	
• Ignition ON. • Check that a vehicle session can be established using the scan tool. • **Can a vehicle session be established?**	**Yes** GO to AC2 . **No** REFER to Section 418-00 to diagnose no communication with the PCM.
AC2 CHECK THE IPC CONTINUOUS MEMORY DTCs	
• Enter the following diagnostic mode on the scan tool: HCM Self-Test. • Clear the DTCs. Repeat the HCM self-test. • **Is DTC U0100:87 retrieved again?**	**Yes** GO to AC3 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AC3 RETRIEVE THE RECORDED DTCs FROM THE HCM SELF-TEST	
• Check for recorded DTCs from the HCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test AH . For DTC U3003:17 GO to Pinpoint Test AI . **No** GO to AC4 .
AC4 CHECK FOR DTC U0100 SET IN OTHER MODULES	
• Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0100 set in the Instrument Panel Cluster (IPC) or the Restraints Control Module (RCM)?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B , Section 303-14C or Section 303-14D . TEST the system for normal operation. **No** INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation.

Pinpoint Test AD: DTC U0101:87

- DTC U0101:87 (Lost Communication With TCM : No Sub-Type Information) - sets continuous in the Headlamp Control Module (HCM) if data messages received from the Transmission Control dule (TCM) over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- HCM
- TCM

PINPOINT TEST AD: DTC U0101:87

NOTE: If other new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out.

Test Step	Result / Action to Take
AD1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AD2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AD2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the TCM pass the network test?**	**Yes** GO to AD3 . **No** REFER to Section 418-00 .
AD3 CHECK THE RECORDED DTCs FROM THE HCM SELF-TEST	
• Check for recorded DTCs from the IPC self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test AH . For DTC U3003:17 GO to Pinpoint Test AI . **No** GO to AD4 .
AD4 RECHECK THE HCM DTCs	
• Enter the following diagnostic mode on the scan tool: HCM Self-Test. • Clear the DTCs. Repeat the IPC self-test. • **Is DTC U0101:87 still present?**	**Yes** INSTALL a new TCM . REFER to Section 307-01A . CLEAR the DTCs. REPEAT the self-test. If DTC U0101:87 is still present, INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AE: DTC U0121:87

Normal Operation

- DTC U0121:87 (Lost Communication With Anti-Lock Brake System (ABS) Control Module:

Missing Message) - sets continuous by the Headlamp Control Module (HCM) if data messages received from the ABS module over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

This pinpoint test is intended to diagnose the following:

- HCM
- ABS module

PINPOINT TEST AE: DTC U0121:87

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out.

Test Step	Result / Action to Take
AE1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AE2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AE2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the ABS module pass the network test?**	**Yes** GO to AE3 . **No** REFER to Section 418-00 .
AE3 RETRIEVE THE RECORDED DTCs FROM THE HCM SELF-TEST	
• Check for recorded DTCs from the HCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test AH . For DTC U3003:17 GO to Pinpoint Test AI . **No** GO to AE4 .
AE4 RECHECK THE HCM DTCs	
• Enter the following diagnostic mode on the scan tool: HCM Self-Test. • Clear the DTCs. Repeat the HCM self-test. • **Is DTC U0121:87 still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test. If DTC U0121:87 is still present, INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation.

	No The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AF: DTC U0126:87

- DTC U0126:87 (Lost Communication With Steering Wheel Angle Sensor Module: Missing Message) - sets continuous in the Headlamp Control Module (HCM) if data messages received from the Power Steering Control Module (PSCM) over the High Speed Controller Area Network (HS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .

The PSCM is integrated into the steering gear.

This pinpoint test is intended to diagnose the following:

- HCM
- PSCM

PINPOINT TEST AF: U0126:87

If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out.

Test Step	Result / Action to Take
AF1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AF2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AF2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the PSCM pass the network test?**	**Yes** GO to AF3 . **No** REFER to Section 418-00 .
AF3 RETRIEVE THE RECORDED DTCs FROM THE HCM SELF-TEST	
• Check for recorded DTCs from the HCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test AH . For DTC U3003:17 GO to Pinpoint Test AI . **No**

	GO to AF4 .
AF4 RECHECK THE HCM DTCs	
• Enter the following diagnostic mode on the scan tool: HCM Self-Test. • Clear the DTCs. Repeat the HCM self-test. • **Is DTC U0126:87 still present?**	**Yes** INSTALL a new steering gear. REFER to Section 211-02 . CLEAR the DTCs. REPEAT the self-test. If DTC U0126:87 is still present, INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AG: DTC U0155:87

- DTC U0155:87 (Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information) - sets continuous by the HCM if data messages (ignition switch status, headlamps on status) received from the IPC over the HS-CAN are missing. For a complete list of all network messages, refer to Section 418-00 .

The Smart Junction Box (SJB) communicates the headlamps on status to the IPC over the Medium Speed Controller Area Network (MS-CAN). The IPC acts as a gateway module and relays the information through the High Speed Controller Area Network (HS-CAN) to the HCM .

This pinpoint test is intended to diagnose the following:

- HCM
- IPC

PINPOINT TEST AG: U0155:87

NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during the Programmable Module Installation (PMI) or the PMI may not have been carried out.

Test Step	Result / Action to Take
AG1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to AG2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
AG2 CHECK THE COMMUNICATION NETWORK	
	Yes GO to AG3 .

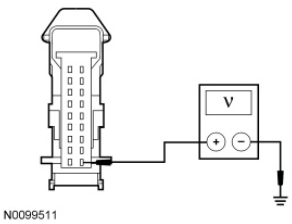
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the IPC pass the network test?**	**No** REFER to Section 418-00 .
AG3 RETRIEVE THE RECORDED DTCs FROM THE IPC SELF-TEST	
• Check for recorded DTCs from the HCM self-test. • **Is DTC U3003:16 or DTC U3003:17 recorded?**	**Yes** For DTC U3003:16, GO to Pinpoint Test AH . For DTC U3003:17 GO to Pinpoint Test AI . **No** GO to AG4 .
AG4 RECHECK THE HCM DTCs	
• Enter the following diagnostic mode on the scan tool: HCM Self-Test. • Clear the DTCs. Repeat the HCM self-test. • **Is DTC U0155:87 still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test. If DTC U0155:87 is still present, INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.

Pinpoint Test AH: DTC U3003:16

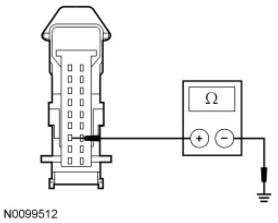
Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

- DTC U3003:16 (Battery Voltage: Circuit Voltage Below Threshold) - sets continuous and on-demand in the Headlamp Control Module (HCM) if the HCM detects battery voltage below 9 volts from the HCM voltage supply circuit.



This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- HCM

PINPOINT TEST AH: DTC U3003:16

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AH1 RECHECK THE HCM DTCs	&sp;
• Ignition ON. • Enter the following diagnostic mode on the scan tool: HCM Self-Test. • Clear the DTCs. Repeat the HCM self-test. • **Is DTC U3003:16 still present?**	**Yes** GO to AH2 . **No** The system is operating correctly at this time. The DTC may have been set due to a previous low battery voltage condition.
AH2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Carry out the PCM Key ON Engine OFF (KOEO) self-test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC P0620, P0622, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to AH3 .
AH3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Check the battery condition and verify that the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to AH4 . **No** REFER to Section 414-01 .
AH4 CHECK THE HCM VOLTAGE SUPPLY	
• Ignition OFF. • Disconnect: HCM C1600. • Ignition ON. • Measure and record the voltage at the battery. • Measure the voltage between the HCM C1600-10, circuit CBP42 (GN), harness side and ground.  N0099511 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	**Yes** GO to AH5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.
AH5 CHECK THE HCM GROUND CIRCUIT	

• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the HCM C1600-3, circuit GD121 (BK/YE), harness side and ground.  N0099512 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation. **No** REPAIR the circuit for high resistance. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AI: DTC U3003:17

Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

Normal Operation

- DTC U3003:17 (Battery Voltage: Circuit Voltage Above Threshold) - sets continuous and on-demand in the Headlamp Control Module (HCM) if the HCM detects battery voltage above 16 volts on the voltage input circuit.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- HCM

PINPOINT TEST AI: DTC U3003:17

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: DTC U3003:17 may be stored in the module memory due to past battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
AI1 CHECK FOR DTC B1317, B1676, P0563 (PCM) OR U3003:17 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules.	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AI2 .

• **Is DTC B1317, B1676, P0563 (PCM) or U3003:17 set in more than one module?**	
AI2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to AI3 .
AI3 RECHECK FOR DTC U3003:17	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: HCM Self-Test. • Clear the DTCs and repeat the HCM on-demand self-test.. • **Is DTC U3003:17 present?**	**Yes** INSTALL a new HCM . REFER to Headlamp Control Module (HCM) in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

Headlamp Adjustment

Special Tool(s)

 ST3041-A	Vision 100 Headlamp Aimer 196-00005 or equivalent

Headlamp Aiming

1. The headlamp aiming procedure depends on what type of beam pattern the headlamp is equipped with. Vehicles may come equipped with VOL, VOR or SAE only (includes sealed beam type) headlamps. To identify the headlamp beam pattern, look on the headlamp lens. Molded in small letters on the headlamp lens is one of the following:
    - SAE
    - VOL and SAE
    - VOR and SAE

2. Once the headlamp beam pattern is identified, aim the headlamps using one of the following methods as applicable.
    - Photometric aimers can aim VOL-, VOR- and SAE-type headlamps only. This is the preferred method of headlamp aiming.
    - Visual or screen method aiming can be used to aim VOL-, VOR- and SAE-type headlamps only.
    - Mechanical aimers cannot be used with VOR- or VOL-type headlamps. Aerodynamic lamps that can be aimed mechanically have 3 nibs molded into the lens of the lamp.

Photometric Aiming

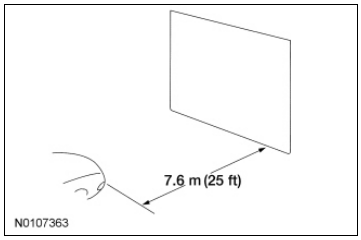
1. For the photometric aiming procedure, refer to the appropriate photometric headlamp aimer instruction manual.

Screen Method Aiming

All headlamp types

NOTE: Horizontal aim is not adjustable for VOL or VOR headlamps.

NOTE: Consult your state vehicle inspection manual for recommended tolerance ranges for visual aiming.



NOTE: The sight shield may need to be positioned or removed for access to the adjusters.

1. Before starting headlamp adjustment:
    - check the tire inflation.
    - check that no other load is in the vehicle other than a half tank of fuel.

- check that the headlamps are clean.
- check for correct headlamp operation.
- check that the vehicle is on level ground.
- if the vehicle is equipped with air suspension, make sure that the switch is on.

2. **NOTE:** The vertical wall or screen must be a minimum of 2.4 m (8 ft) wide.

   Park the vehicle on a level surface approximately 7.6 m (25 ft) from the vertical wall or screen directly in front of it.

3. **NOTE:** The center of the lamp is marked either on the lens (circle, crosshair or other mark) or on the bulb shield internal to the lamp (crosshair or other mark).

   Mark a horizontal reference line on the vertical wall or screen.

   1. Measure the center of the headlamp height to ground and record the measurement.
   2. Make a 2.4 m (8 ft) horizontal mark (using masking tape) on the vertical wall or screen at the same distance from the ground as previously recorded.

4. **NOTE:** This procedure should be done in a dark environment to effectively see the headlamp beam pattern.

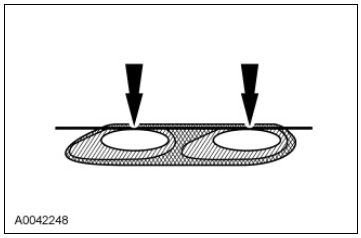
   Turn on the low beam headlamps to illuminate the wall or screen and open the hood.

5. **NOTE:** For SAE-type headlamps, the appearance of the beam pattern may vary between vehicles.

   On the wall or screen, locate the high intensity area of the beam pattern. Place the top edge of the high intensity zone even with the horizontal reference line.

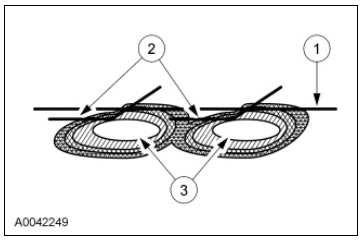
SAE-type headlamps

6. In addition to the horizontal line marked in Step 3, a pair of vertical lines must be marked at the center line of the headlamps on the wall or screen.
   1. Mark the center line of the vehicle on the wall or screen.
   2. Measure from the center of the headlamp to the center line of the vehicle.
   3. Make two 1.5 m (5 ft) vertical marks (using masking tape) on the wall or screen at the same distance from the vehicle center line as previously recorded.



7. On the wall or screen, locate the high intensity area of the beam pattern. Place the left edge of the high intensity zone even with the vertical line corresponding to the headlamp being adjusted.

VOR-type headlamps

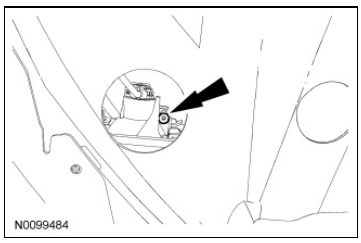


8. **NOTE:** The appearance of the VOR beam pattern may vary between vehicles.

   Identify at the top edge of this high intensity area a distinct horizontal cutoff in the beam pattern. If the top edge of this cutoff is not even with the horizontal reference line, the headlamp beam needs to be adjusted.

VOL-type headlamps

9. For VOL-type headlamps, there is a distinct cutoff in the left portion of the beam pattern. The edge of this cutoff should be positioned 50.2 mm (2 in) below the horizontal reference line.
   1. Horizontal reference line.
   2. Top edge of the beam pattern.
   3. High intensity zone.

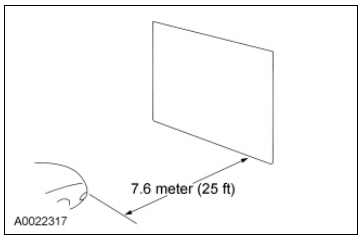


Mechanical Aiming

1. For the mechanical aiming procedure, refer to the appropriate mechanical headlamp aimer instruction manual.

Front Fog Lamp Adjustment

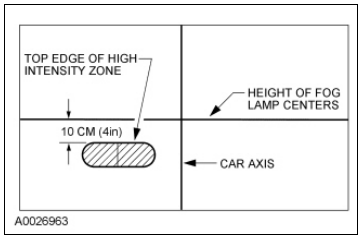
Front Fog Lamp Adjustment Screw Location



1. **NOTE:** Horizontal aim is not required for this vehicle and is not adjustable. Consult your state vehicle inspection center for recommended tolerance ranges for visual aiming.

   Before starting the fog lamp assembly adjustment:

   - make sure the vehicle is on level ground.
   - check the tire inflation.
   - make sure there are no other loads in the vehicle other than a half tank of fuel.
   - make sure the fog lamps and headlamps are clean.
   - make sure the headlamps are operating and are correctly aimed.



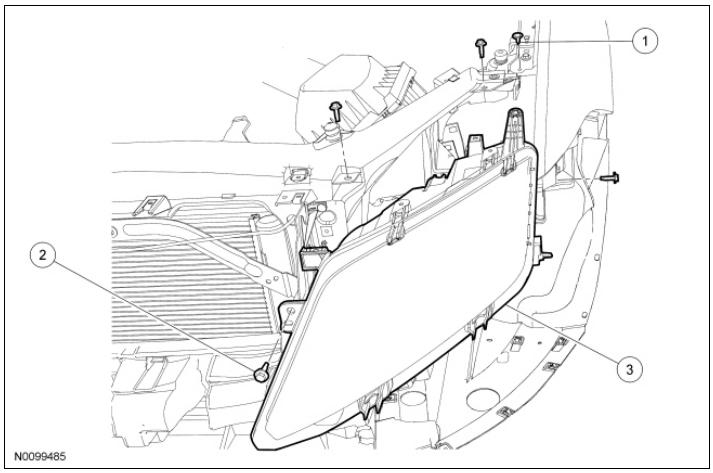
2. **NOTE:** The vertical wall screen must be a minimum of 2.4 m (8 ft) wide.

   Park the vehicle on a level surface approximately 7.6 m (25 ft) from the vertical wall or screen directly in front of it.

3. Measure the distance from the floor to the center of the fog lamp.

4. The correct visual aim for the fog lamps is with the top edge of the high-intensity zone 10 cm (4 in) below the horizontal center of the fog lamps.
   - Rotate the adjustment screw until the fog lamp beam is within specification.

Autolamps Time Delay Adjustment



NOTE: The time delay can be programmed through the message center using the message center buttons (if equipped) or using the following steps.

NOTE: Steps 2 through 5 must be carried out within a 10-second period.

1. Start with the ignition switch off and the headlamp switch in the AUTOLAMPS ON position.
2. Place the headlamp switch in the OFF position.
3. Place the ignition switch in the RUN position.
4. Place the ignition switch in the OFF position.
5. Place the headlamp switch in the AUTOLAMPS ON position. The exterior lamps turn on at this point.
6. Wait the desired amount of time and place the headlamp switch in the OFF position (maximum of 3 minutes). The exterior lamps turn off and the autolamp time delay is now set.

Headlamp Assembly

NOTE: Fusion shown, MKZ similar.

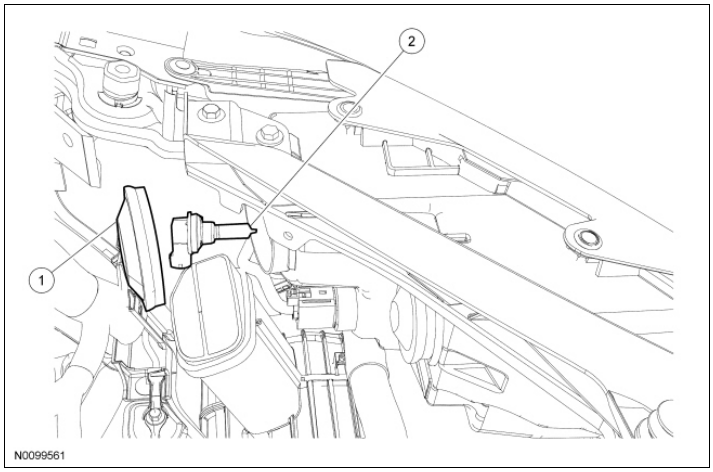
Item	Part Number	Description
1	-	Headlamp assembly pin-type retainer (part of 13005)
2	W711676	Headlamp assembly bolts (4 required)
3	13008	Headlamp assembly

Removal and Installation

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

1. Remove the front bumper cover. For additional information, refer to Section 501-19 .

2. Remove the headlamp assembly pin-type retainer.

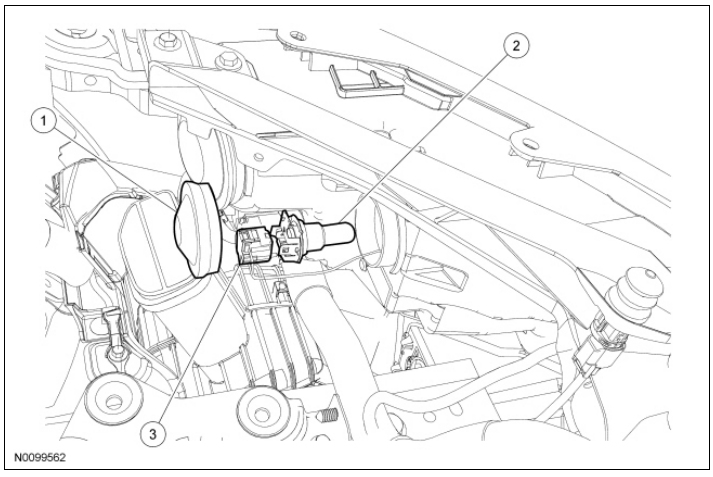


3. Remove the 4 bolts and the headlamp assembly.
   - Disconnect the electrical connectors.

4. To install, reverse the removal procedure.

Headlamp Bulb - LH, Fusion

Low Beam



NOTE: Non-Hybrid shown, Hybrid similar.

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp low beam bulb

High Beam

NOTE: Non-Hybrid shown, Hybrid similar.

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp high beam bulb

3	-	Headlamp high beam bulb electrical connector (part of 13008)

Removal and Installation

⚠ WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamps with the bulb removed from the headlamp.

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

Low beam bulb

1. For vehicles equipped with a 3.0L engine, remove the air cleaner. For additional information, refer to Section 303-12B .

High beam bulb

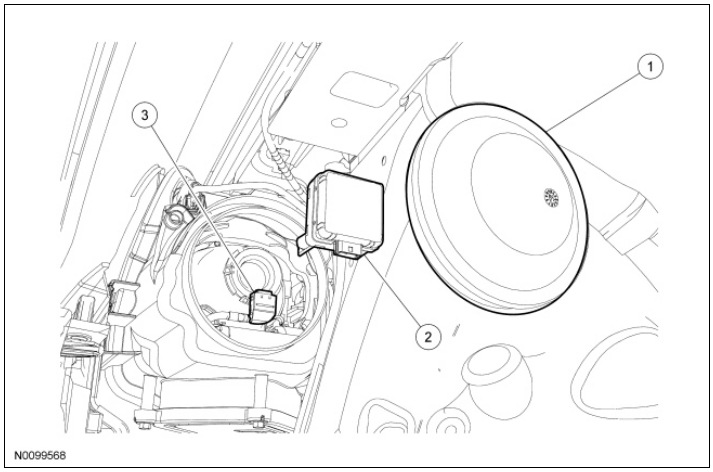
2. For Hybrid vehicles, remove the battery. For additional information, refer to Section 414-01 .

Low beam or high beam bulb

3. For non-Hybrid vehicles, if equipped remove the pin-type retainer and separate the small splash shield from the core support.

4. For Hybrid vehicles, remove the air cleaner ACL outlet pipe. For additional information, refer to Section 303-12D .

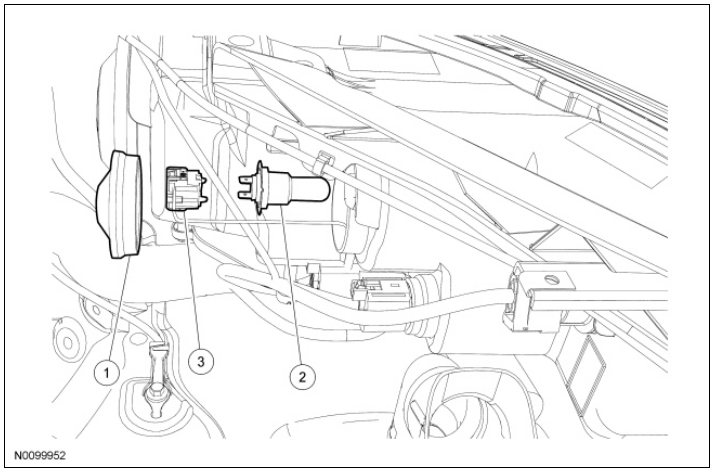
5. Remove the headlamp bulb protective cover.



6. Remove the headlamp bulb.
    - Disconnect the electrical connector.

7. To install, reverse the removal procedure.
    - Make sure the headlamp bulb protective cover is completely sealed.

Headlamp Bulb - LH, MKZ



Low Beam

NOTE: High Intensity Discharge (HID) bulb shown, halogen bulb similar.

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp low beam bulb
3	-	Headlamp low beam bulb electrical connector (part of 13008)

High Beam

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover

2	13N021	Headlamp high beam bulb
3	-	Headlamp high beam bulb electrical connector (part of 13008)

Removal and Installation

⚠ WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamps with the bulb removed from the headlamp.

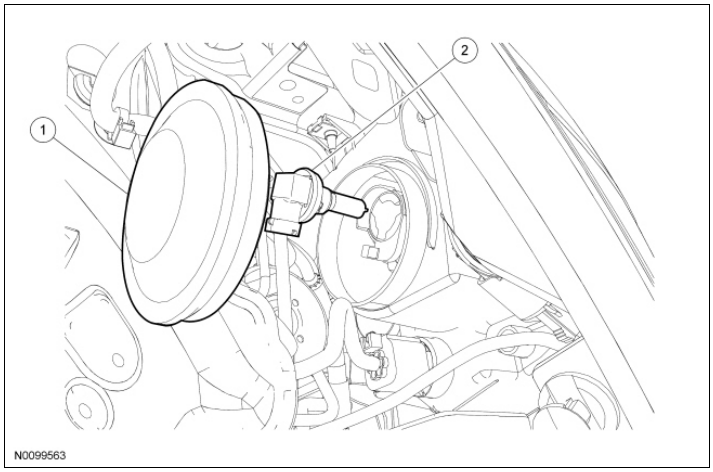
NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

High beam bulb

1. Remove the Air Cleaner ACL . For additional information, refer to Section 303-12C

Low beam or high beam bulb

2. Remove the headlamp bulb protective cover.

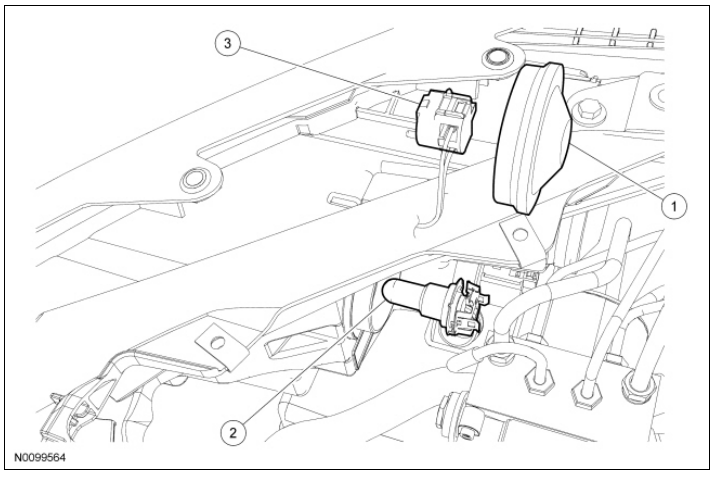


3. Remove the headlamp bulb.
   - Disconnect the electrical connector.

4. To install, reverse the removal procedure.
   - Make sure the headlamp bulb protective cover is completely sealed.

Headlamp Bulb - RH, Fusion

Low Beam



NOTE: Non-Hybrid shown, Hybrid similar.

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp low beam bulb

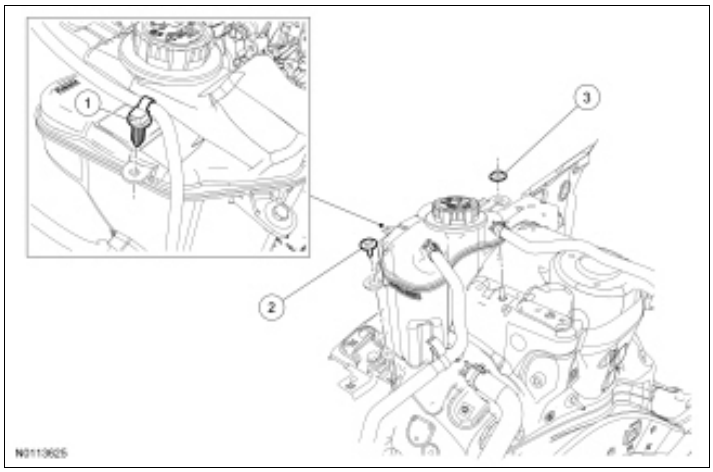
High Beam

NOTE: Non-Hybrid shown, Hybrid similar.

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp high beam bulb

3	-	Headlamp high beam bulb electrical connector (part of 13008)

Removal and Installation

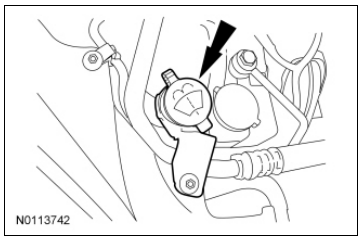


⚠ WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamps with the bulb removed from the headlamp.

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

Low beam bulb, all vehicles and High beam bulb, Hybrid vehicles



1. Position the engine coolant degas bottle aside.
    1. If equipped detach the wiring harness retainer from the degas bottle.
    2. Remove the bolt.
        - ♦ To install, tighten to 9 Nm (80 lb-in).
    3. Remove the nut.
        - ♦ To install, tighten to 9 Nm (80 lb-in).

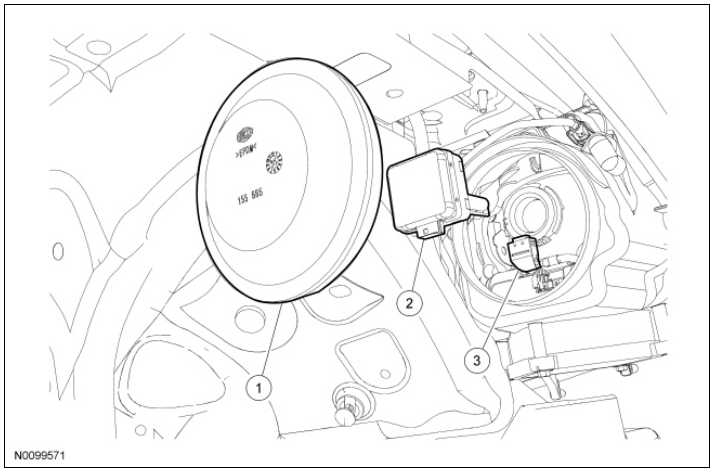
High beam bulb

2. For non Hybrid vehicles, remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.

3. For Hybrid vehicles, position aside the windshield washer reservoir filler tube.

Low beam or high beam bulb

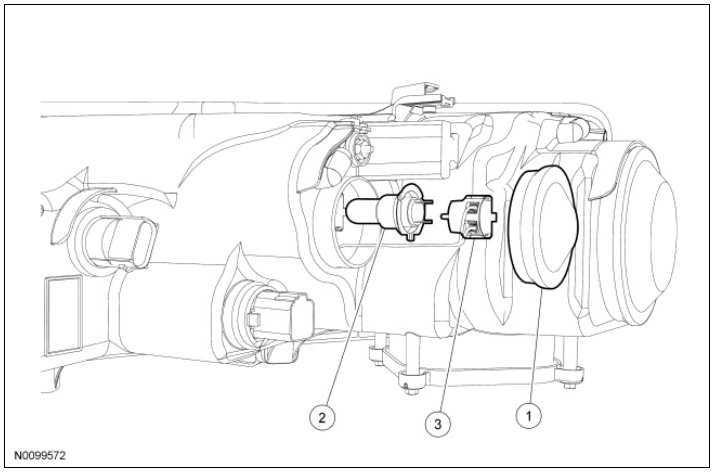
4. Remove the headlamp bulb protective cover.



5. Remove the headlamp bulb.
    - Disconnect the electrical connector.

6. To install, reverse the removal procedure.
    - Make sure the headlamp bulb protective cover is completely sealed.

Headlamp Bulb - RH, MKZ



Low Beam

NOTE: High Intensity Discharge (HID) bulb shown, halogen bulb similar.

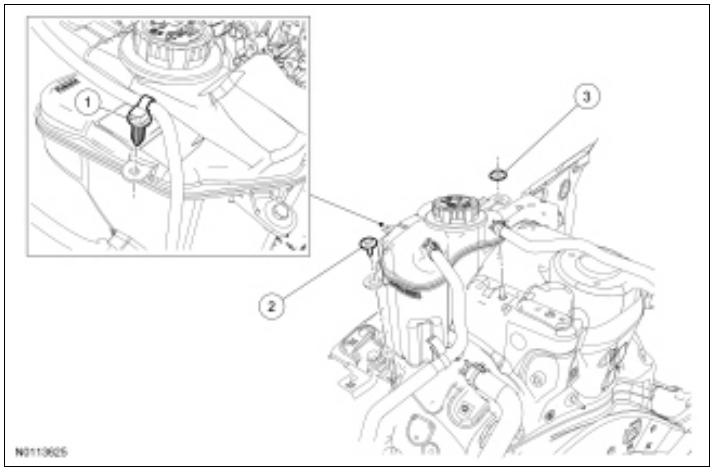
Item	Part Number	Description
1	13N019	Headlamp bulb protective cover
2	13N021	Headlamp low beam bulb
3	-	Headlamp low beam bulb electrical connector (part of 13008)

High Beam

Item	Part Number	Description
1	13N019	Headlamp bulb protective cover

2	13N021	Headlamp high beam bulb
3	-	Headlamp high beam bulb electrical connector (part of 13008)

Removal and Installation



⚠ WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamps with the bulb removed from the headlamp.

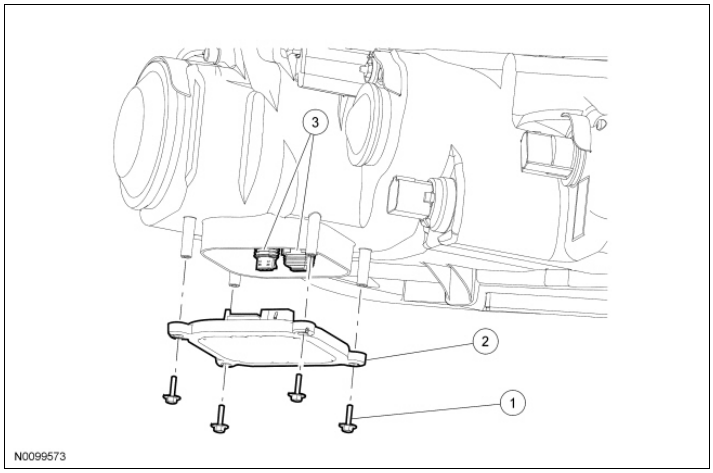
NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

Low beam bulb

1. Position the engine coolant degas bottle aside.
    1. Detach the wiring harness retainer from the degas bottle.
    2. Remove the bolt.
        - ♦ To install, tighten to 9 Nm (80 lb-in).
    3. Remove the nut.
        - ♦ To install, tighten to 9 Nm (80 lb-in).

High beam bulb

2. Remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.



Low beam or high beam bulb

3. Remove the headlamp bulb protective cover.

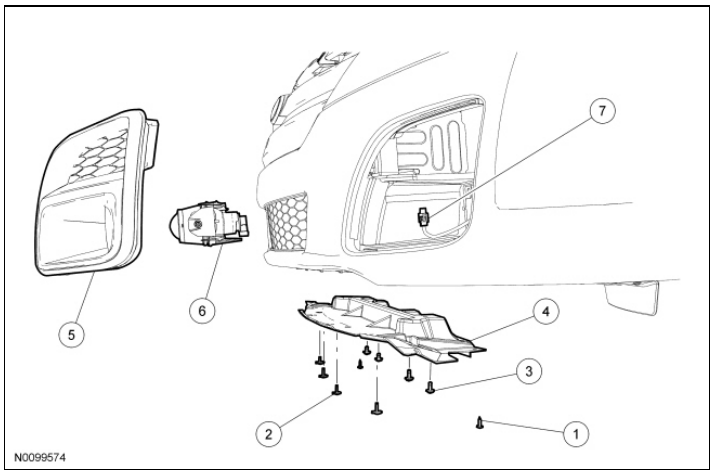
4. Remove the headlamp bulb.
    - Disconnect the electrical connector.

5. To install, reverse the removal procedure.
    - Make sure the headlamp bulb protective cover is completely sealed.

Ballast

Item	Part Number	Description
1	-	Ballast screws (4 required) (part of 13008)
2	13C170	Ballast
3	-	Ballast electrical connectors (part of 13008)

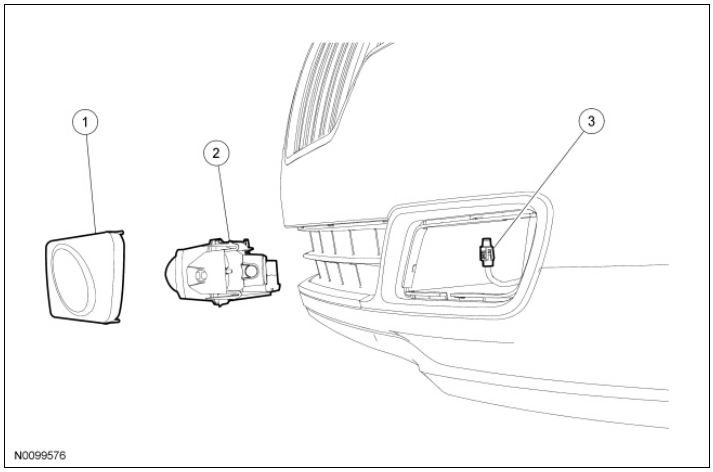
Removal and Installation



1. Remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.

2. Remove the 4 screws and the ballast.
   - Disconnect the electrical connectors.

3. To install, reverse the removal procedure.



Fog Lamp

Fusion

Item	Part Number	Description
1	W706805	Lower radiator air deflector outer screws (2 required)
2	W709976	Lower radiator air deflector front screws (4 required)
3	N807389	Lower radiator air deflector pin-type retainers (4 required)
4	8327	Lower radiator air deflector
5	17E811/17E810	Fog lamp bezel (LH/RH)
6	15K200	Fog lamp
7	-	Fog lamp electrical connector (part of 14290)

MKZ

Item	Part Number	Description

1	17E811/17E810	Fog lamp bezel LH/RH
2	15K200	Fog lamp
3	-	Fog lamp electrical connector (part of 14290)

Removal and Installation

NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

Fusion

2. Remove the 2 outer screws and the 4 front screws from the lower radiator air deflector.

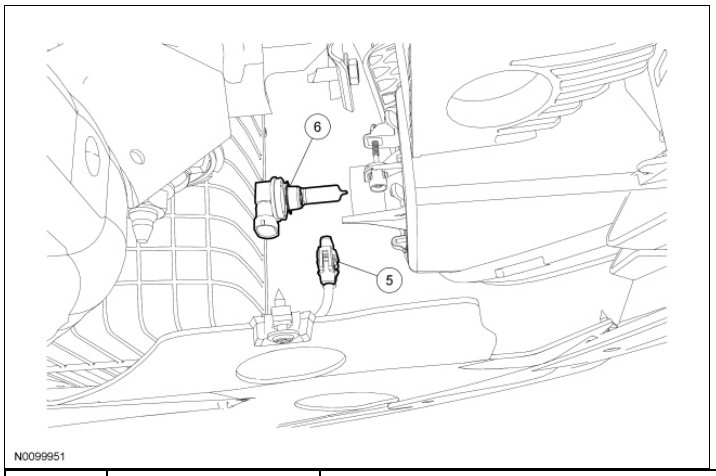
3. Remove the 4 pin-type retainers and the lower radiator air deflector.

All vehicles

4. **NOTE:** For MKZ, the fog lamp bezel tabs are located along the upper and lower edge close to each corner. They are released from the front using a thin flat-bladed tool (such as a pocket screwdriver). Usre not to damage the painted surface when releasing the tabs.

   Release the 4 tabs and remove the fog lamp bezel.

5. Release the locking tabs and remove the fog lamp.
   - Disconnect the electrical connector.



6. To install, reverse the removal procedure.

Fog Lamp Bulb

NOTE: Fusion shown, MKZ similar.

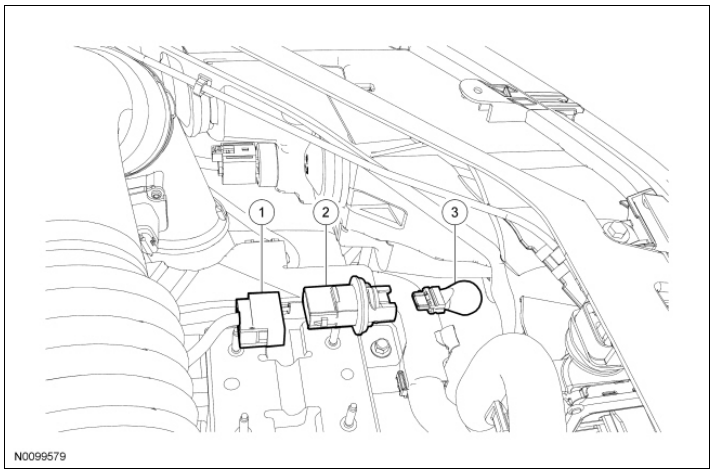
Item	Part Number	Description
1	W706805	Lower radiator air deflector outer screws (2 required)
2	W709976	Lower radiator air deflector front screws (4 required)
3	N807389	Lower radiator air deflector pin-type retainers (4 required)
4	8327	Lower radiator air deflector

Item	Part Number	Description
5	-	Fog lamp electrical connector (part of 14290)
6	13N021	Fog lamp bulb

Removal and Installation

⚠ WARNING: The bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

NOTE: The fog lamp bulb should not be removed from the fog lamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect fog lamp bulb performance. Contaminants may enter the fog lamp where they can settle on the lens and reflector. Never turn on the fog lamps with the bulb removed.



NOTE: Make sure the headlamp switch and the ignition switch are in the OFF position.

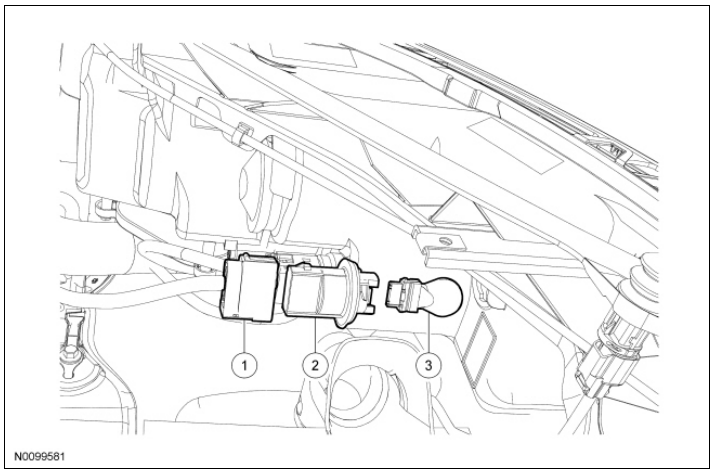
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the 2 outer screws and the 4 front screws from the lower radiator air deflector.
3. Remove the 4 pin-type retainers and the lower radiator air deflector.
4. Disconnect the electrical connector and remove the fog lamp bulb.

- To install, reverse the removal procedure.

Parking Lamp Bulb - LH, Fusion

NOTE: Hybrid shown, non-Hybrid similar.

Item	Part Number	Description
1	-	Front parking/turn lamp electrical connector (part of 14290)
2	13411	Front parking/turn lamp bulb socket
3	13466	Front parking/turn lamp bulb



Removal and Installation

NOTE: The front parking/turn lamp on non-Hybrid vehicles equipped with a 2.5L or 3.0L engine can be accessed without removing any components.

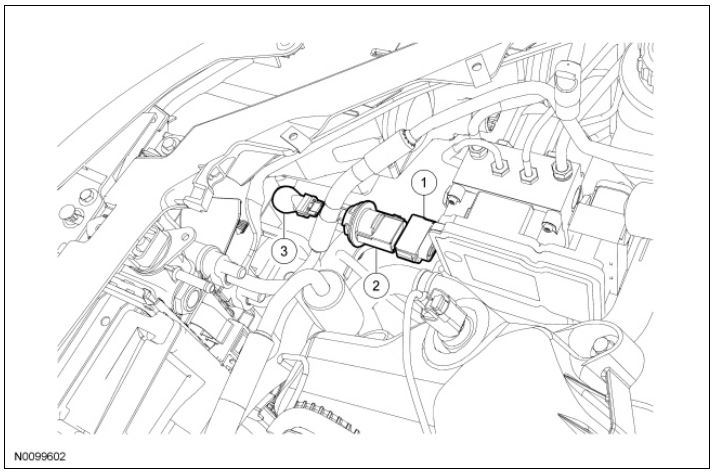
1. For Hybrid vehicles, remove the battery tray. For additional information, refer to Section 414-01 .
2. For vehicles equipped with a 3.5L engine, remove the air cleaner. For additional information, refer to Section 303-12C .
3. Disconnect the parking/turn lamp electrical connector.
4. Remove the front parking/turn lamp socket from the headlamp assembly.
    - Remove the front parking/turn lamp bulb.
5. To install, reverse the removal procedure.

Parking Lamp Bulb - LH, MKZ

NOTE: The air cleaner is shown removed for clarity.

Item	Part Number	Description
1	-	Front parking/turn lamp electrical connector (part of 14290)
2	13411	Front parking/turn lamp bulb socket
3	13466	Front parking/turn lamp bulb

Removal and Installation



NOTE: The front parking/turn lamp can be accessed without removing any components.

1. Disconnect the electrical connector and remove the front parking lamp socket from the headlamp assembly.
    - Remove the front parking lamp bulb.

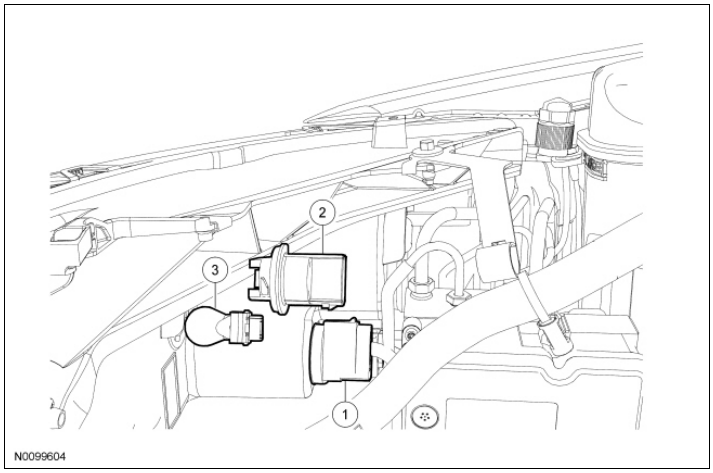
2. To install, reverse the removal procedure.

Parking Lamp Bulb - RH, Fusion

NOTE: Hybrid shown, non-Hybrid similar.

Item	Part Number	Description
1	-	Front parking/turn lamp electrical connector (part of 14290)
2	13411	Front parking/turn lamp bulb socket
3	13466	Front parking/turn lamp bulb

Removal and Installation



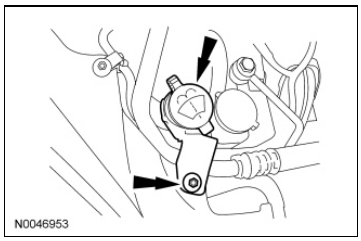
NOTE: The front parking/turn lamp on non-Hybrid vehicles can be accessed without removing any components.

1. Remove the headlamp assembly. For additional information, refer to Headlamp Assembly in this section.

2. Remove the front parking/turn lamp socket from the headlamp assembly.
   - Remove the front parking/turn lamp bulb.

3. To install, reverse the removal procedure.

Parking Lamp Bulb - RH, MKZ

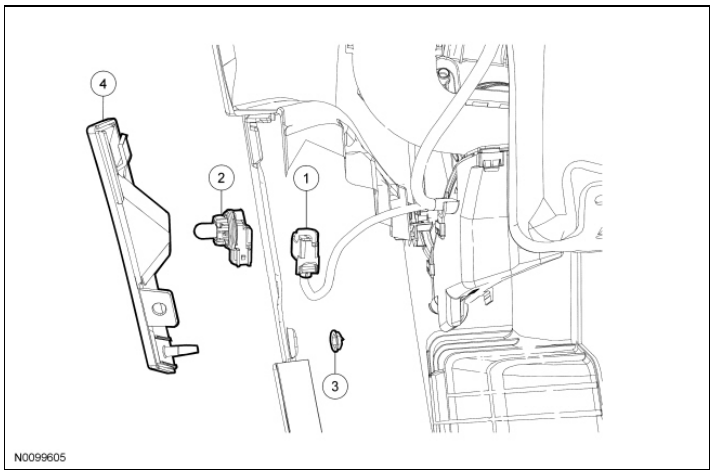


Item	Part Number	Description
1	-	Front parking/turn lamp electrical connector (part of 14290)
2	13411	Front parking/turn lamp bulb socket
3	13466	Front parking/turn lamp bulb

Removal and Installation

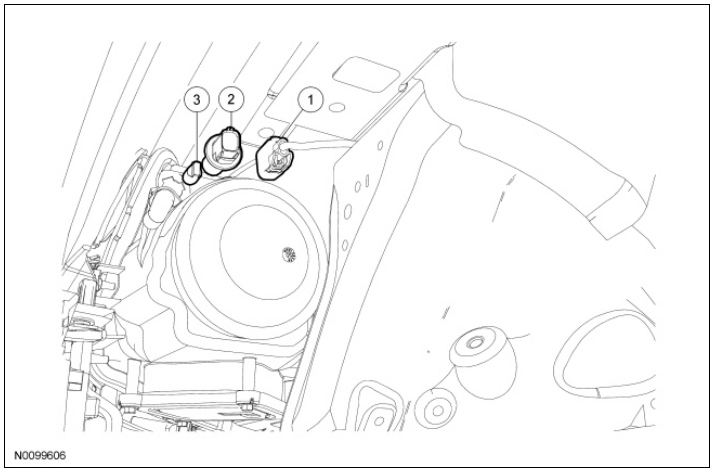
NOTE: The engine appearance cover can be removed for additional clearance.

1. Remove the bolt and the position aside the windshield washer reservoir filler tube.



2. Disconnect the electrical connector and remove the front parking lamp socket from the headlamp assembly.
    - Remove the front parking lamp bulb.

3. To install, reverse the removal procedure.

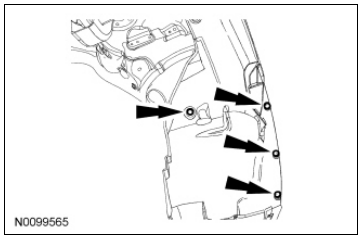


Side Marker Lamp - Front

Fusion

Item	Part Number	Description
1	-	Side marker lamp electrical connector (part of 14290)
2	-	Side marker lamp bulb socket (part of 13200)
3	W707501	Side marker lamp nut
4	13200	Side marker lamp

MKZ



Item	Part Number	Description
1	-	Side marker lamp electrical connector (part of 14290)
2	13411	Side marker lamp bulb socket
3	13466	Side marker lamp bulb

Removal and Installation

All vehicles

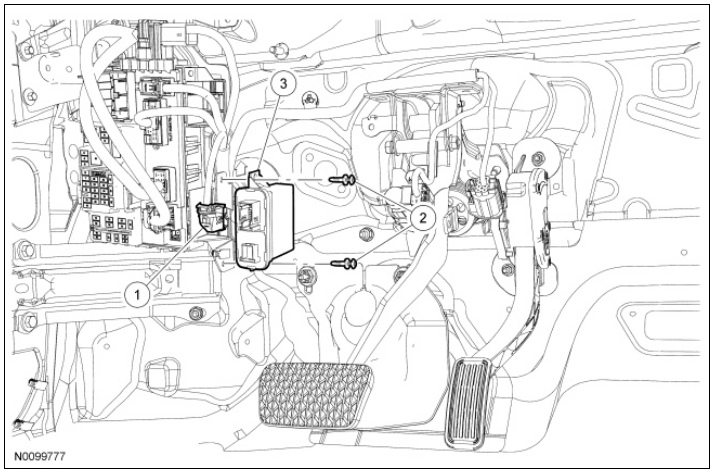
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 4 pin-type retainers and position the fender splash shield aside.

3. Disconnect the side marker lamp electrical connector.

Fusion

4. Remove the nut and remove the side marker lamp.



MKZ

5. Remove the side marker lamp from the headlamp assembly.

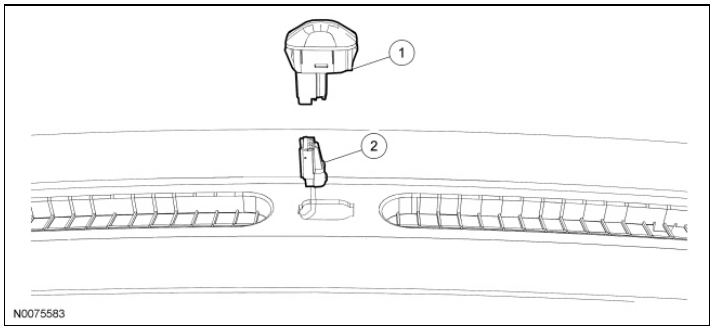
All vehicles

6. To install, reverse the removal procedure.

Headlamp Control Module (HCM)

Item	Part Number	Description
1	-	Headlamp Control Module (HCM) electrical connector (part of 14290)
2	W713134	HCM pin-type retainers (2 required)
3	13K198	HCM

Removal and Installation



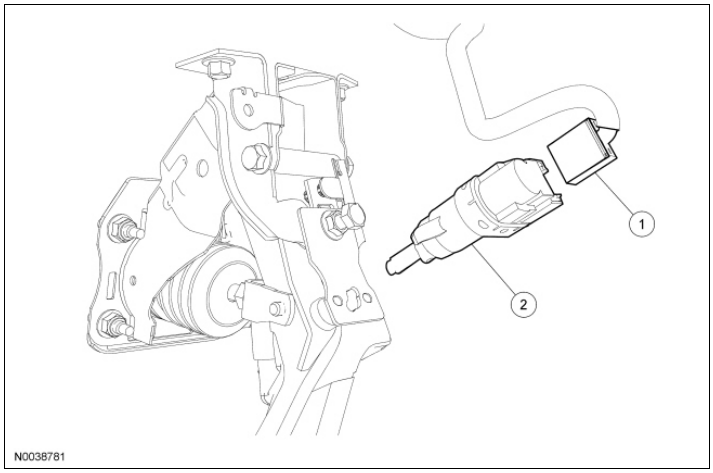
1. If installing a new Headlamp Control Module (HCM), upload the module configuration information to the scan tool. For additional information, refer to Section 418-01 .

2. Disconnect the HCM electrical connector.

3. Remove the 2 pin-type retainers and the HCM .

4. To install, reverse the removal procedure.
   - If installing a new HCM , download the HCM configuration information from the sn tool into the new HCM . For additional information, refer to Programmable Module Installation (PMI) Section 418-01 .

Light Sensor



Item	Part Number	Description
1	13A018	Light sensor
2	-	Light sensor electrical connector (part of 14401)

Removal and Installation

1. Using a suitable tool, remove the light sensor from the defroster grille.
    - Disconnect the electrical connector.

2. To install, reverse the removal procedure.

Stoplamp Switch

Item	Part Number	Description
1	-	Stoplamp switch electrical connector (part of 14290)
2	13480	Stoplamp switch

Removal and Installation

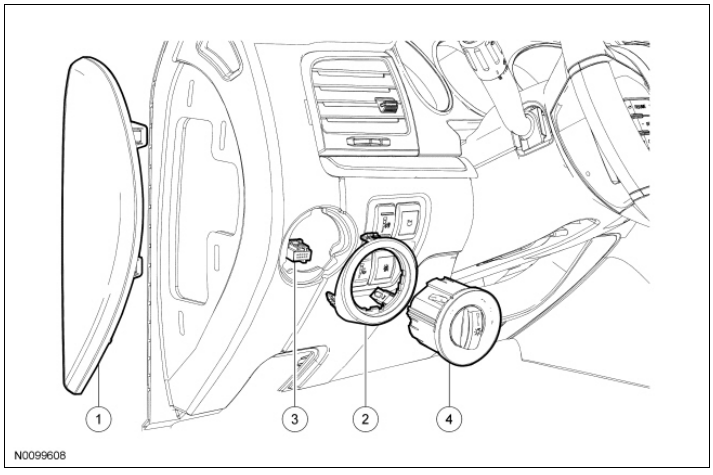
NOTICE: **Do not press, pull or otherwise move the brake pedal while removing or installing the stoplamp switch. The switch must be installed with the booster push rod attached to the brake pedal and with the brake pedal in the at-rest position. Installing the switch with the brake pedal in any other position results in incorrect adjustment and damage to the switch.**

1. ***NOTICE:*** **The switch plunger must be compressed for the switch to rotate in the bracket. Attempting to remove the switch with the plunger extended (during brake pedal apply) results in damage to the switch.**

   Rotate the stoplamp switch clockwise approximately one-eighth turn and remove the stoplamp switch.

   - Disconnect the electrical connector.

2. To install, reverse the removal procedure.



Headlamp Switch

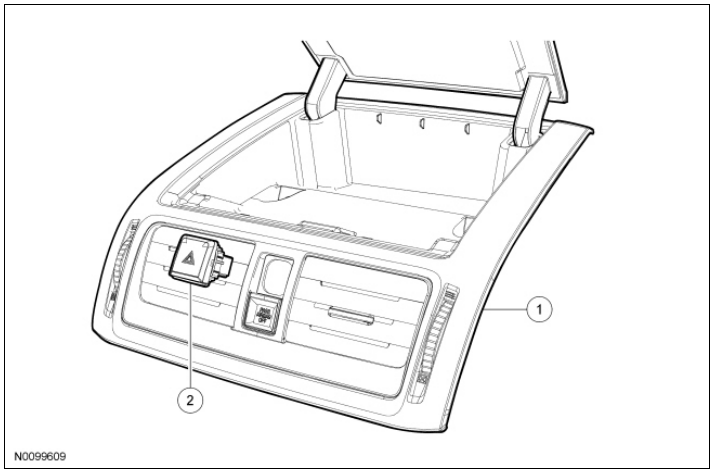
Fusion

Item	Part Number	Description
1	5404481	Instrument panel side finish panel
2	5404338	Headlamp switch bezel
3	-	Headlamp switch electrical connectors (part of 14401)
4	11654	Headlamp switch

MKZ

Item	Part Number	Description
1	5404481	Instrument panel side finish panel
2	-	Headlamp switch bezel
3	-	Headlamp switch electrical connector (part of 14401)
4	11654	Headlamp switch

Removal and Installation



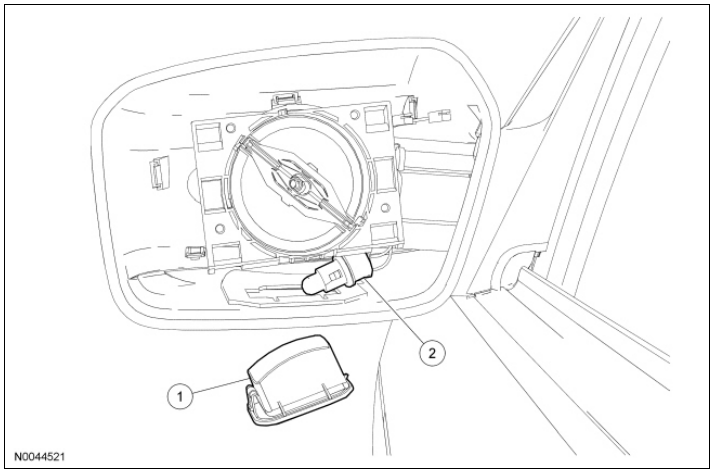
1. Remove the instrument panel side finish panel.
2. **NOTE:** The headlamp switch bezel is removed by pushing from behind.

   Release the tabs and remove the headlamp switch and bezel assembly.

   - Disconnect the electrical connector.
3. **NOTE:** The 3 retaining tabs on the headlamp switch are located at approximately the 3, 6 and 11 o'clock positions when viewed from the front.

   Release the tabs and separate the headlamp switch from the bezel.
4. To install, reverse the removal procedure.

Hazard Flasher Lamp Switch

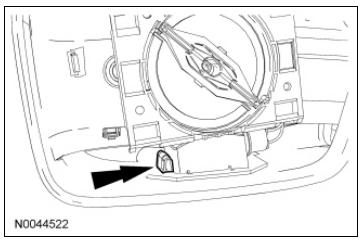


Item	Part Number	Description
1	5413594	Instrument panel upper storage compartment
2	13A350	Hazard flasher lamp switch

Removal and Installation

1. Remove the instrument panel upper storage compartment. For additional information, refer to Section 501-12 .
2. Release the tabs and remove the hazard flasher lamp switch.
3. To install, reverse the removal procedure.

Puddle Lamp



Item	Part Number	Description
1	13B375	Puddle lamp
2	-	Puddle lamp bulb socket (part of 17683)

Removal and Installation

1. Remove the exterior mirror glass. For additional information, refer to Section 501-09 .

2. Release the tab to remove the puddle lamp from the mirror housing.

3. **NOTE:** The LH puddle lamp bulb socket is rotated clockwise to remove and the RH puddle lamp bulb socket is rotated counterclockwise to remove.

   Rotate the puddle lamp bulb socket approximately one-quarter turn and remove it from the puddle lamp.

4. **NOTE:** When rotating the bulb socket in the puddle lamp, the socket should come to a stop indicating it is completely installed.

   NOTE: An audible click can be heard when the puddle lamp is fully seated.

   To install, reverse the removal procedure.

Reversing Lamp Switch

Item	Part Number	Description
1	-	Reversing lamp switch electrical connector (part of 7B229)
2	7B229	Reversing lamp switch
3	S995621	Reversing lamp switch gasket

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

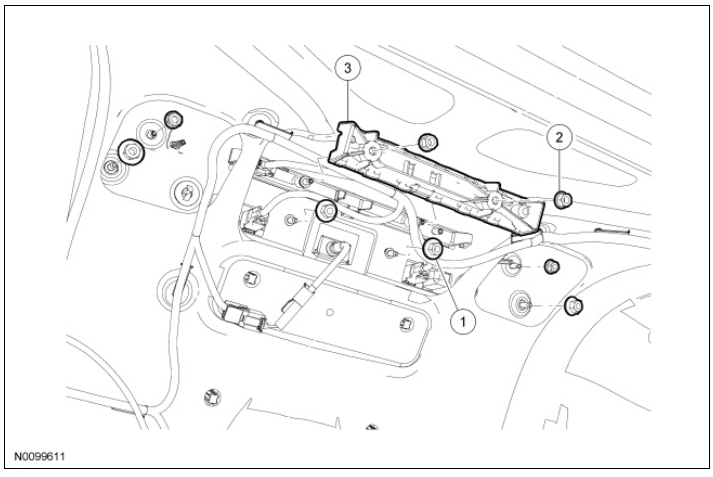
2. Remove the fasteners and the lower engine splash shield.

3. **NOTE:** Discard the reversing lamp switch gasket.

   Disconnect the electrical connector and remove the reversing lamp switch.

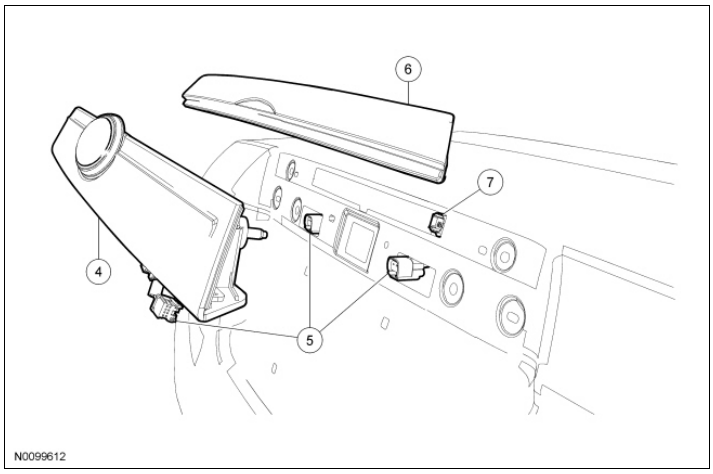
   - To install, tighten to 24 Nm (18 lb-ft).

4. To install, reverse the removal procedure.
   - Install a new reversing lamp switch gasket.
   - Check the transmission fluid and fill as necessary. For additional information, refer to Section 308-03 .



High Mounted Stoplamp

Parcel Shelf Mounted



Item	Part Number	Description
1	-	High mounted stoplamp electrical connector (part of 14A005)
2	13A613	High mounted stoplamp

Luggage Compartment Lid Mounted

Item	Part Number	Description
1	W709764	Luggage compartment lid moulding nuts (4 required)
2	W704141	High mounted stoplamp nuts (4 required)
3	13A417	High mounted stoplamp bracket

Luggage Compartment Lid Mounted (Continued)

Item	Part Number	Description
4	5442512	Luggage compartment lid moulding
5	-	Electrical connectors (part of 13A412)
6	13A613	High mounted stoplamp
7	-	High mounted stoplamp electrical connector

Removal and Installation /p>

Parcel shelf mounted

1. Disconnect the high mounted stoplamp electrical connector from within the luggage compartment.

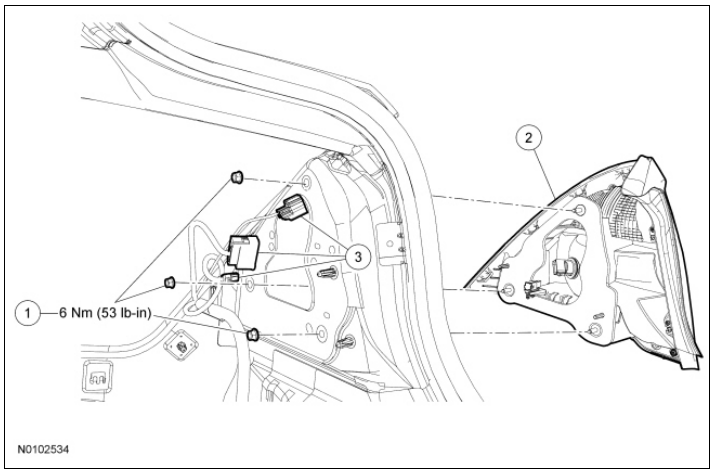
2. Push the high mounted stoplamp rearward to disengage the forward tabs and remove the high mounted stoplamp.

Luggage compartment lid mounted

3. Remove the luggage compartment lid trim panel.

4. Remove the 4 nuts and the luggage compartment lid moulding.
   - Disconnect the electrical connectors.

5. Remove the 4 nuts and the high mounted stoplamp bracket.



6. Release the 2 tabs and remove the high mounted stoplamp.
   - Disconnect the electrical connector.

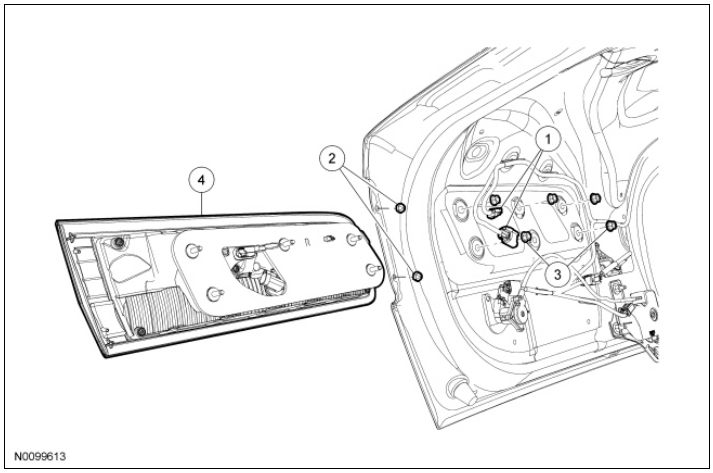
All vehicles

7. To install, reverse the removal procedure.

Rear Lamp Assembly

NOTE: Fusion shown, MKZ similar.

Item	Part Number	Description
1	W704141	Rear lamp assembly nuts (3 required)
2	13A505/13A504	Rear lamp assembly (LH/RH)
3	-	Rear lamp assembly electrical connectors (part of 14A005)



Removal and Installation

1. Remove the pin-type retainer and position the luggage compartment trim panel aside.

2. Remove the 3 nuts and the rear lamp assembly.
   - Disconnect the electrical connectors.
   - To install, tighten the nuts to 6 Nm (53 lb-in).

3. To install, reverse the removal procedure.

Reversing Lamp

Item	Part Number	Description
1	-	Electrical connectors (part of 14A005)
2	-	Reversing lamp outboard nuts (2 required)
3	W704141	Reversing lamp inboard nuts (5 required)
4	13405\13404	Reversing lamp (LH/RH)

Removal and Installation

1. Remove the pin-type retainers and the luggage compartment trim panel.
2. Disconnect the electrical connector(s).
3. Remove the 7 nuts and the reversing lamp.
4. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Interior Lighting Control Module (ILCM) bolts	1.6	14

Interior Lighting

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB controls all of the interior lighting functions. The interior lighting system consists of the following components:

- SJB
- Instrument panel dimmer switch
- Interior/map lamps
- Luggage compartment lamp
- Vanity mirror lamps
- Puddle lamps (if equipped)
- Scuff plate lamps (if equipped)
- Door ajar switches
- Luggage compartment lid ajar switch
- Ambient lighting module (Fusion) (if equipped)
- Ambient lighting switch (part of the traction control switch for Fusion) (if equipped)
- Ambient lighting select switch (MKZ (if equipped))
- Ambient lighting dimmer switch (MKZ (if equipped))
- Interior Lighting Control Module (ILCM) (MKZ)

The interior lighting system consists of up to 3 subsystems:

- Courtesy lamps
- Demand lamps
- Ambient lighting (if equipped)

Courtesy Lamps

The courtesy lamp subsystem consists of the interior dome lamps, the instrument panel dimmer switch, the overhead console lamps, scuff plate lamps (if equipped) and the puddle lamps (if equipped). The SJB supplies voltage to the courtesy lamps when the SJB receives the required input.

Demand Lamps

The demand lamps subsystem consists of the front map lamps, and the left and right vanity mirror lamps. The demand lamps are provided voltage from the battery saver relay (integrated into the SJB) when the battery saver relay is energized.

Ambient Lighting - Fusion

The ambient lighting subsystem consists of the ambient lighting module, ambient lighting select switch, and LEDs located throughout the vehicle. The LEDs are located on the center console cupholders, the storage bin, and the front and rear footwells. The ambient lighting system is powered through the accessory delay relay. The ambient lighting only illuminates when the key is in the on position.

Ambient Lighting - MKZ

The ambient lighting feature provides illumination to the center console cup holders, the storage bin, door map pockets and the front and rear footwells.

There are 4 different color LEDs (red, blue, green and white) housed within each LED assembly. By illuminating various color combinations, the LEDs are able to produce 7 different colors of ambient light. With each press of the ambient lighting select switch, the ILCM cycles through a different color variation. With each press of the ambient lighting dimmer switch, the ILCM changes the brightness setting of the ambient lighting or turns the ambient lighting feature off. The module retains the last color and brightness setting between uses.

Interior Lighting Delay

The interior lighting delay feature provides temporary illumination of the courtesy lamps after the doors are opened and then closed. The interior lighting delay feature keeps the courtesy lamps on for a period of 25 seconds after all the doors are closed. If during the 25-second delay time, the SJB detects that the ignition has been turned out of off if the vehicle is locked using the Remote Keyless Entry (RKE) or the keypad, the courtesy lamps are turned off.

Illuminated Entry

The illuminated entry requests the courtesy lamps to illuminate when the ignition is OFF and either the RKE transmitter UNLOCK button is pressed, or the vehicle is unlocked using the keypad. The illuminated entry requests the courtesy lamps off:

- after 25 seconds have elapsed.
- when the ignition is switched to the OFF position.
- when the RKE transmitter LOCK button is pressed.
- when the vehicle is locked using the keypad

Illuminated Exit

NOTE: The puddle lamps are not illuminated for the illuminated exit feature.

The illuminated exit requests the courtesy lamps to illuminate for 25 second when all doors are closed and the ignition key is removed from the ignition lock cylinder. The illuminated exit deactivates:

- when the ignition key is inserted into the ignition lock cylinder.
- when a door becomes ajar.
- after 25 seconds have elapsed.

Theater Lighting

The theater lighting feature ramps-up the courtesy lamps intensity over 0.7 second when courtesy lamp activation is requested. The theater lighting feature ramps-down the courtesy lamps intensity over 1.7 seconds when interior lighting deactivation is requested by any feature other than the panic alarm or battery saver.

Battery Saver

NOTE: Time-out is 1 minute if the vehicle has less than 80 km (50 miles).

The SJB provides automatic shut-off of the demand lamps and courtesy lamps after a 10-minute time-out period in order to save battery voltage. A timer in the SJB is started when the ignition is turned to the OFF position and all the doors and liftgate are closed. When 10 minutes have elapsed, voltage is automatically shut off to the lamps by the SJB .

Interior Lighting

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

When a vehicle door is ajar with the vehicle speed less than 15 km/h (9 mph) or 5 km/h (3 mph) for puddle lamps, or a request from the instrument panel dimmer switch is received, the SJB provides voltage to the interior courtesy and puddle lamp circuits. The SJB controls all interior lighting functions and timing by monitoring inputs from the door ajar switches, the instrument panel dimmer switch, the Remote Keyless Entry (RKE) transmitter and vehicle speed.

Interior Lamp Arbitrator

The SJB chooses between the interior lighting, dome defeat, interior lighting delay, illuminated entry, illuminated exit and battery saver to determine which feature has precedence of activating and deactivating the interior lamps.

Ambient Lighting - Fusion

The ambient lighting feature provides illumination to the center console cup holders, the storage bin, and the front and rear footwells The ambient lighting feature is powered by the accessory delay relay, which allows the ambient lighting feature to be used independent of the parking lamps status.

The ambient lighting module provides voltage and ground to the LEDs. There are 3 different color (red, blue and green) LEDs housed within each LED assembly. By illuminating various color combinations, the LEDs are able to produce 7 different colors of ambient light. The ambient lighting switch is an input to the ambient lighting module. With each press of the ambient lighting switch, the ambient lighting module cycles through a different color variation or turns the ambient lighting feature off. The module retains the last color setting between uses.

Ambient Lighting - MKZ

The Interior Lighting Control Module (ILCM) provides voltage to the LEDs. There are 4 different color LEDs (red, blue, green and white) housed within each LED assembly. By illuminating various color combinations, the LEDs are able to produce 7 different colors of ambient light. The ambient lighting select switch and ambient lighting dimmer switch are inputs to the ILCM . With each press of the ambient lighting select switch, the ILCM cycles through a different color variation. With each press of the ambient lighting dimmer switch, the ILCM changes the brightness setting of the ambient lighting or turns the ambient lightieature off. The module retains the last color and brightness setting between uses.

Battery Saver

NOTE: Time-out is 1 minute if the vehicle has less than 80 km (50 miles).

The SJB provides automatic shut-off of the demand lamps and courtesy lamps after a 10-minute time-out period in order to save battery voltage. A timer in the SJB is started when the ignition is turned to the OFF position and all the doors are closed. When the 10-minute time-out period has elapsed, the voltage is automatically shut off to the lamps by the SJB .

To activate the battery saver feature, one of the following events must occur:

- The ignition is turned to any position other than OFF.
- Any door becomes ajar.
- The UNLOCK button of the RKE transmitter is pressed.
- A key is inserted into the ignition lock cylinder.
- A valid keypad code is entered.
- The luggage compartment lid is opened.
- The instrument panel dimmer switch is placed in the DOME LAMP position.
- The headlamp switch is placed in the PARKING LAMPS or HEADLAMPS ON position.
- The multifunction switch is placed in the FLASH-TO-PASS position.
- The key is inserted into the ignition lock cylinder.

Field-Effect Transistor (FET) Protection

Field-Effect Transistor (FET) is a type of transistor that when used with module software can be used to monitor and control current flow on module outputs. The FET protection strategy is used to prevent module damage in the event of excessive current flow.

The SJB utilizes a FET protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A continuous DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit remains shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the continuous DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the

circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), DTC B106E and the associated continuous DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns.

When the first or second level is reached, the continuous DTC (associated with the short circuit) sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated continuous DTC. This DTC cannot be cleared and the module must be replaced.

The SJB FET protected output circuits for the interior lighting system are the interior courtesy lamp and puddle lamp output circuits.

The Interior Lighting Control Module (ILCM) operates in a similar manner. The ILCM FET protected output circuits for the ambient lighting system are the ambient lighting output circuits.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Smart Junction Box (SJB) fuse(s): ♦ 9 (15A) ♦ 10 (15A) ♦ 25 (10A) • Wiring, terminals or connectors • Bulb(s) • Courtesy lamps • Map lamps • Puddle lamp(s) • Scuff plate lamp(s) (if equipped) • Luggage compartment lamp • Vanity lamps • Instrument panel dimmer switch • Glove compartment lamp • Ambient lighting switch (if equipped)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication with the SJB , refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B106E	Solid State Driver Disabled Due to Short Circuit	**The module has temporarily disabled an output because an excessive current draw exists (such as a short to ground). The Smart Junction Box (SJB) cannot enable the output until the cause of the short is corrected. ADDRESS all other DTCs first.** After the cause of the concern is corrected, CLEAR the DTCs. REPEAT the self-test.
B106F	Module Disabled Due to External Fault	**The module has permanently disabled an output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed. ADDRESS all other DTCs first.** After the cause of the concern is corrected, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.
B1320	Driver Door Ajar Circuit Open	GO to Pinpoint Test F .
B1328		GO to Pinpoint Test F .

	Passenger Door Ajar Circuit Open

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Courtesy Lamps Do Not Illuminate With A Door Open

Refer to Wiring Diagrams Cell 110 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Door Locks for schematic and connector information.

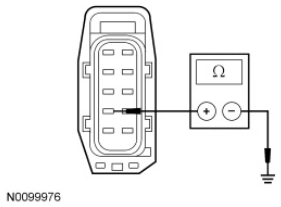
Refer to Wiring Diagrams Cell 113 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Luggage Compartment Lid Release for schematic and connector information.

Normal Operation

When any door is open, the ajar switch opens the circuit to the Smart Junction Box (SJB). The SJB monitors the ajar circuits, and based on the ajar status, the SJB supplies voltage to the courtesy lamps.

When any door is opened, a correct unlock code from the keyless entry keypad or an unlock request from a programmed Remote Keyless Entry (RKE) transmitter is detected, the SJB provides voltage to the courtesy lamps.

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- Door ajar switch
- SJB

PINPOINT TEST A: THE COURTESY LAMPS DO NOT ILLUMINATE WITH A DOOR OPEN

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CHECK THE COURTESY LAMP OPERATION USING THE INSTRUMENT PANEL DIMMER SWITCH	
• Operate the courtesy lamps using the instrument panel dimmer switch. • **Do the interior courtesy lamps illuminate using the instrument panel dimmer switch?**	**Yes** GO to A2 . **No** GO to Pinpoint Test C .
A2 CHECK THE DOOR AJAR SWITCH OPERATION	
• Ignition OFF. • Disconnect: Suspect Door Ajar Switch. • **Do the interior lamps illuminate?**	**Yes** INSTALL a new door latch in question. REFER to Section 501-14 . TEST the system for normal operation. **No** GO to A3 .
A3 CHECK THE AJAR SWITCH CIRCUIT FOR A SHORT TO GROUND	

<table>
<tr><td>
• Disconnect: SJB C2280c.
• Measure the resistance between the suspect ajar switch, harness side and ground as follows:

<table>
<tr><th>Location</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>LH front door</td><td>C525-8</td><td>CPL26 (GN/VT)</td></tr>
<tr><td>RH front door</td><td>C603-8</td><td>CPL31 (WH)</td></tr>
<tr><td>LH rear door</td><td>C704-8</td><td>CPL36 (GN)</td></tr>
<tr><td>RH rear door</td><td>C804-8</td><td>CPL39 (YE)</td></tr>
</table>

N0099976
• Is the resistance greater than 10,000 ohms?
</td><td>
Yes
GO to A4 .

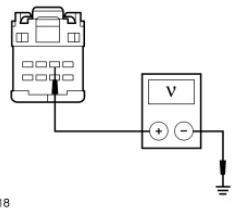
No
REPAIR the circuit in question for a short to ground. TEST the system for normal operation.
</td></tr>
<tr><td>A4 CHECK FOR CORRECT SJB OPERATION</td><td></td></tr>
<tr><td>
• Disconnect all the SJB connectors.
• Check for:
♦ corrosion
♦ damaged pins
♦ pushed-out pins
• Connect all the SJB connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• Is the concern still present?
</td><td>
Yes
INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
</td></tr>
</table>

Pinpoint Test B: The Courtesy Lamps Do Not Illuminate From The Instrument Panel Dimmer Switch

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation



The Smart Junction Box (SJB) turns the courtesy lamps on and off by monitoring the dimmer switch input and the dome lamp request input circuits. When the instrument panel dimmer switch is pushed to the second detent up, the backlighting dim up circuit and the dome request circuit are both requested to indicate a request to turn the courtesy lamps on. When the instrument panel dimmer switch is pushed to the second detent down, the backlighting dim down circuit and the dome request circuit are both requested to indicate a request to turn the courtesy lamps off.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Instrument panel dimmer switch
- SJB

PINPOINT TEST B: THE COURTESY LAMPS DO NOT ILLUMINATE FROM THE INSTRUMENT PANEL DIMMER SWITCH

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE DIMMABLE BACKLIGHTING ILLUMINATION	
• Ignition OFF. • Turn the headlamps switch to the PARKING LAMPS ON position. • Monitor the instrument panel dimmable backlighting while pushing the instrument panel dimmer switch from full on to full off. • **Does the instrument cluster illumination intensity change with the instrument panel dimmer switch position?**	**Yes** GO to B2 . **No** REFER to Section 413-00 to continue diagnosis of the dimmable backlighting illumination.
B2 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Turn the headlamps switch to the OFF position. • Disconnect: Instrument Panel Dimmer Switch C2065. • Measure the voltage between the instrument panel dimmer switch C2065-2, circuit CLN28 (GN/BU), harness side and ground.  N0104218 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new instrument panel dimmer switch. REFER to Section 413-00 . TEST the system for normal operation. **No** GO to B3 .
B3 CHECK THE DOME LAMP REQUEST INPUT CIRCUIT FOR AN OPEN	
• Disconnect: SJB C2280b. • Measure the resistance between the SJB C2280b-51, circuit CLN28 (GN/BU), harness side and the instrument panel dimmer switch C2065-2, circuit CLN28 (GN/BU), harness side. • **Is the resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. TEST the system for normal operation.
B4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors.	**Yes** INSTALL a new SJB . REFER

• Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

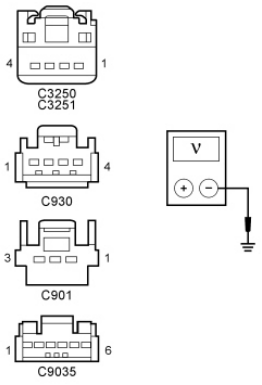
Pinpoint Test C: The Interior Courtesy Lamp(s) Are Inoperative

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation

Power is supplied to the interior courtesy lamps and cargo lamp by the Smart Junction Box (SJB) fuse 9 (15A). Based on the input status, the SJB supplies voltage to the interior courtesy lamps.

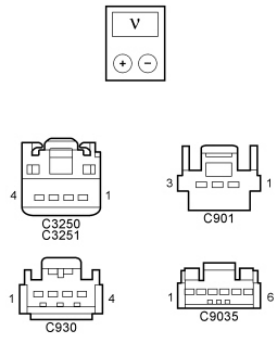
DTC Description	Fault Trigger Conditions
• B106E - Solid State Driver Disabled Due to Short Circuit	A continuous DTC that sets when the SJB has temporarily shut down the output driver. **The module has temporarily disabled the interior courtesy lamp output because an excessive current draw exists (such as a short to ground). The SJB cannot enable the interior courtesy lamp output until the cause of the short is corrected, the DTCs have been cleared and a successful self-test is run.**
• B106F - Module Disabled Due to External Fault	A continuous DTC that sets when the SJB has permanently shut down the output driver. **The module has permanently disabled the interior courtesy lamp output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed.**
• B2A35 - Interior Lighting Output Circuit Open	An on-demand DTC that sets when the SJB detects an open from the courtesy lighting output circuit.
• B2A36 - Interior Lighting Output Circuit Short To Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground from the courtesy lighting output circuit.



This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Interior lamp
- SJB

PINPOINT TEST C: THE INTERIOR COURTESY LAMP(S) ARE INOPERATIVE



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 CHECK THE OPERATION OF ALL THE INTERIOR COURTESY LAMPS	
• Ignition OFF. • Push up the instrument panel dimmer switch to the second up detent and observe the interior courtesy lamps. • **Are the interior courtesy lamps inoperative?**	**Yes** VERIFY the SJB fuse 9 (15A) is OK. If OK, GO to C4 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the interior courtesy lamp output driver if DTC B106E is present)** . TEST the system for normal operation. If DTC B106F is present, INSTALL a new SJB .

	REFER to Section 419-10 . TEST the system for normal operation. **No** GO to C2 .
C2 CHECK FOR VOLTAGE TO THE INTERIOR LAMP	
• Push the instrument panel dimmer switch down out of the DOME LAMP position. • Disconnect: Inoperative Lamp. • Push up the instrument panel dimmer switch to the second up detent. • Measure the voltage between the inoperative lamp, harness side and ground as follows: **Inoperative Lamp / Connector-Pin / Circuit** Front — C930-3 — VLN33 (GY/VT) Front (MKZ with ambient lighting) — C9035-3 — VLN33 (GY/VT) Rear — C901-1 — VLN33 (GY/VT) LH scuff plate — C3251-1 — VLN33 (GY/VT) RH scuff plate — C3250-1 — VLN33 (GY/VT)  N0104219 • **Is the voltage greater than 10 volts?**	**Yes** GO to C3 . **No** REPAIR circuit VLN33 (GY/VT) for an open. TEST the system for normal operation.
C3 CHECK FOR VOLTAGE TO THE INTERIOR LAMP USING THE CONNECTOR GROUND	

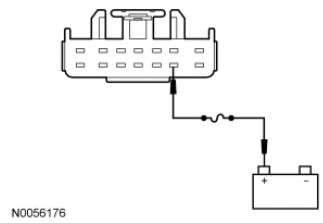
- Measure the voltage between the inoperative interior lamp connector, harness side as follows:

Inoperative Lamp	Connector-Pin/ Circuit	Connector-Pin/ Circuit
Front	C930-3 VLN33 (GY/VT)	C930-1 GD139 (BK/YE)
Front (MKZ with ambient lighting)	C9035-3 VLN33 (GY/VT)	C9035-1 GD139 (BK/YE)
Rear	C901-1 VLN33 (GY/VT)	C901-2 GD139 (BK/YE)
LH scuff plate	C3251-1 VLN33 (GY/VT)	C3251-3 GD126 (BK/WH)
RH scuff plate	C3250-1 VLN33 (GY/VT)	C3250-3 GD126 (BK/WH)

N0104220

- **Is the voltage greater than 10 volts?**

Yes
INSTALL a new interior lamp for the lamp in question. REFER to Interior Lamp - Front or Interior Lamp - Rear in this section. TEST the system for normal operation.



No
REPAIR the ground circuit in question for an open. TEST the system for normal operation.

C4 BYPASS THE SJB

- Ignition OFF.
- Disconnect: SJB C2280a.
- **NOTE:** If the jumper wire fails, refer to the Wiring Diagrams Manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, test the system for normal operation. If DTC B106E is present, clear the DTCs **and** repeat the self-test **(required to enable the courtesy lamp output driver if DTC B is present).** Test the system for normal operation. If DTC B106F is present, install a new SJB . Refer to Section 419-10 . Test the system for normal operation.

Yes
REMOVE the jumper wire. GO to C5 .

No
REMOVE the jumper wire. REPAIR circuit VLN33 (GY/VT) for an open.

• Connect a fused jumper wire between the SJB C2280a-9, circuit VLN33 (GY/VT), harness side and battery positive.  N0056176 • **Do the courtesy lamps illuminate?**	CLEAR the DTCs. REPEAT the self-test.
C5 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: The Puddle Lamp(s) Are Inoperative

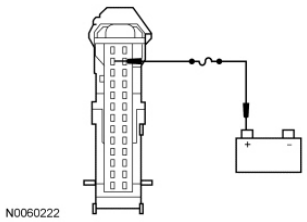
Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation

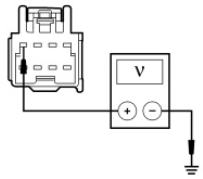
Power is supplied to the puddle lamps through the Smart Junction Box (SJB) fuse 10 (15A). Based on the input status, the SJB supplies voltage to the puddle lamps. The puddle lamps have separate ground circuits.

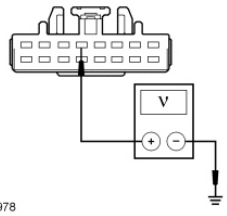
DTC Description	Fault Trigger Conditions
• B106E - Solid State Driver Disabled Due to Short Circuit	A continuous DTC that sets when the SJB has temporarily shut down the output driver. **The module has temporarily disabled the puddle lamp output because an excessive current draw exists (such as a short to ground). The SJB cannot enable the puddle lamp output until the cause of the short is corrected, the DTCs have been cleared an a successful self-test is run.**

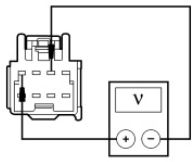
• B106F - Module Disabled Due to External Fault	A continuous DTC that sets when the SJB has permanently shut down the output driver. **The module has permanently disabled the puddle lamp output because an excessive current draw fault (such as a short to ground) has exceeded the limits that the SJB can withstand. The cause of the excessive current draw MUST be corrected before a new SJB is installed.**
• B2A39 - Puddle Lamp Output Circuit Open	An on-demand DTC that sets when the SJB detects an open on the puddle lamp output circuit.
• B2A3A - Puddle Lamp Output Circuit Short To Ground	A continuous and on-demand DTC that sets when the SJB detects a short to ground on the puddle lamp output circuit. This DTC may also set as a result when the SJB fuse 10 (15A) has failed or is removed.

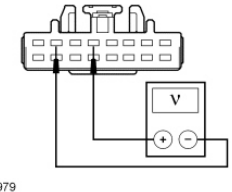


This pinpoint test is intended to diagnose the following:









- Fuse
- Wiring, terminals or connectors
- Exterior mirror

PINPOINT TEST D: THE PUDDLE LAMP(S) ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE PUDDLE LAMP OPERATION	
• Ignition OFF. • Operate the instrument panel dimmer switch to the DOME LAMP position. • **Are both the puddle lamps inoperative?**	**Yes** VERIFY the SJB fuse 10 (15A) is OK. If OK, GO to D2 . If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. After the repair: if no DTCs are present, TEST the system for normal operation. If DTC B106E is present, CLEAR the DTCs **and** REPEAT the self-test **(required to enable the puddle lamp output driver if DTC B106E is present)** . TEST the system for normal operation.

	If DTC B106F is present, INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** GO to D3 .
D2 BYPASS THE SJB	
• Operate the instrument panel dimmer switch out of the DOME LAMP position. • Disconnect: SJB C2280c. • **NOTE:** If the jumper wire fails, refer to the Wiring Diagrams Manual to identify the possible causes of the circuit short. After the repair: If no DTCs are present, test the system for normal operation. If DTC B106E is present, clear the DTCs **and** repeat the self-test **(required to enable the courtesy lamp output driver if DTC B106E is present).** Test the system for normal operation. If DTC B106F is present, install a new SJB . Refer to Section 419-10 . Test the system for normal operation. • Connect a fused jumper wire between the SJB C2280c-12, circuit CLN25 (VT), harness side and battery positive.  N0060222 • **Do the puddle lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to D3 . **No** REMOVE the jumper wire. REPAIR circuit CLN25 (VT) for an open. CLEAR the DTCs. REPEAT the self-test.
D3 CHECK FOR VOLTAGE TO THE EXTERIOR MIRROR	
• Operate the instrument panel dimmer switch out of the DOME LAMP position. • Disconnect: Suspect Exterior Mirror. • Operate the instrument panel dimmer switch to the DOME LAMP position. • For Fusion, measure the voltage between the LH exterior mirror C517-4, circuit CLN25 (VT), harness side and ground; or between the RH exterior mirror C625-4, circuit CLN25 (VT), harness side and ground.	**Yes** GO to D4 . **No** REPAIR circuit CLN25 (VT) for an open. TEST the system for normal operation.

 N0099743 • For MKZ, measure the voltage between the LH exterior mirror C522-5, circuit CLN25 (VT), harness side and ground; or between the RH exterior mirror C626-5, circuit CLN25 (VT), harness side and ground.  N0099978 • **Is the voltage greater than 10 volts?**	
D4 CHECK FOR VOLTAGE TO THE EXTERIOR MIRROR USING THE CONNECTOR GROUND	
• For Fusion, measure the voltage between the LH exterior mirror C517-4, circuit CLN25 (VT), harness side and the LH exterior mirror C517-6, circuit GD126 (BK/WH), harness side; or between the RH exterior mirror C625-4, circuit CLN25 (VT), harness side and the RH exterior mirror C625-6, circuit GD139 (BK/YE), harness side.  N0099744 • For MKZ, measure the voltage between the LH exterior mirror C522-5, circuit CLN25 (VT), harness side and LH exterior mirror C522-7, circuit GD126 (BK/WH), harness side; or between the RH exterior mirror C626-5, circuit CLN25 (VT), harness side and the RH exterior mirror C626-7, circuit GD139 (BK/YE), harness side.  N0099979	**Yes** INSTALL a new exterior mirror in question. REFER to Section 501-09 . TEST the system for normal operation. **No** REPAIR the ground circuit in question for an open. TEST the system for normal operation.

• **Is the voltage greater than 10 volts?**	

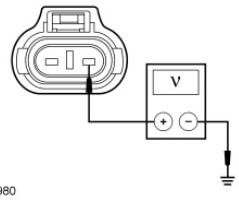
Pinpoint Test E: The Luggage Compartment Lamp Is Inoperative/Always On

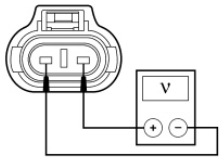
Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

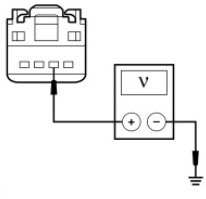
Normal Operation

Power is supplied to the luggage compartment lamp from the demand lighting circuit. Ground for the luggage compartment lamp is controlled by the luggage compartment latch. When the luggage compartment lid is opened, a switch inside the latch closes and completes the path to ground.

- DTC B1331 (Decklid Ajar Rear Door Circuit Failure) - an on-demand DTC that sets when the SJB detects an open from the luggage compartment lid ajar input circuit.







This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Luggage compartment lamp
- Luggage compartment lid latch

PINPOINT TEST E: THE LUGGAGE COMPARTMENT LAMP IS INOPERATIVE/ALWAYS ON

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
E1 DETERMINE IF THE LAMP IS INOPERATIVE OR ALWAYS ON	
• Open the luggage compartment lid and observe the luggage compartment lamp. • **Is the luggage compartment lamp illuminated?**	**Yes** GO to E2 . **No** GO to E3 .
E2 CHECK THE LUGGAGE COMPARTMENT LAMP GROUND CONTROLLED CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: Luggage Compartment Lid Latch C429. • **Does the luggage compartment lamp continue to illuminate?**	**Yes** REPAIR circuit CLN13 (WH/BU) for a short to ground. TEST the system for normal operation. **No** INSTALL a new luggage compartment lid latch. REFER to Section 501-14 . TEST the system for normal operation.
E3 CHECK FOR VOLTAGE TO THE LUGGAGE COMPARTMENT LAMP	

• Disconnect: Luggage Compartment Lamp C4198. • Ignition ON. • Measure the voltage between the luggage compartment lamp C4198-1, circuit CLN09 (YE/GN), harness side and ground.  N0099980 • **Is the voltage greater than 10 volts?**	**Yes** GO to E4 . **No** REPAIR circuit CLN09 (YE/GN) for an open. TEST the system for normal operation.
E4 CHECK FOR VOLTAGE TO THE LUGGAGE COMPARTMENT LAMP USING THE CONNECTOR GROUND	
• Measure the voltage between the luggage compartment lamp C4198-1, circuit CLN09 (YE/GN), harness side and the luggage compartment lamp C4198-2, circuit CLN13 (WH/BU), harness side.  N0099981 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new luggage compartment lamp. TEST the system for normal operation. **No** GO to E5 .
E5 CHECK FOR VOLTAGE TO THE LUGGAGE COMPARTMENT LID LATCH	
• Connect: Luggage Compartment Lamp C4198. • Disconnect: Luggage Compartment Lid Latch C429. • Measure the voltage between the luggage compartment lid latch C429-2, circuit CLN13 (WH/BU), harness side and ground.  N0099982 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new luggage compartment lid latch. REFER to Section 501-14 . TEST the system for normal operation. **No** REPAIR circuit CLN13 (WH/BU) for an open. TEST the system for normal operation.

Pinpoint Test F: The Interior Courtesy Lamps Stay On Continuously

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Refer to Wiring Diagrams Cell 110 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Door Locks for schematic and connector information.

Refer to Wiring Diagrams Cell 113 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Luggage Compartment Lid Release for schematic and connector information.

Normal Operation

When any door or liftgate is opened, a correct unlock code from the keyless entry keypad or an unlock request from a programmed Remote Keyless Entry (RKE) transmitter is detected, the Smart Junction Box (SJB) supplies voltage to the interior courtesy lamps.

DTC Description	Fault Trigger Conditions
• B1320 - Driver Door Ajar Circuit Open	An on-demand DTC that sets when the SJB detects an open from the LH front door ajar input circuit.
• B1328 - Passenger Door Ajar Circuit Open	An on-demand DTC that sets when the SJB detects an open from the RH front door ajar input circuit.
• B1336 - Door Ajar RR Circuit Open	An on-demand DTC that sets when the SJB detects an open from the RH rear door ajar input circuit.
• B1572 - Door Ajar LR Circuit Open	An on-demand DTC that sets when the SJB detects an open from the LH rear door ajar input circuit.
• B2A35 - Interior Lighting Output Circuit Open	An on-demand DTC that sets when the SJB detects a short to voltage from the courtesy lamp output circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Door ajar switch
- SJB

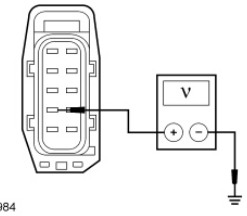
PINPOINT TEST F: THE INTERIOR COURTESY LAMPS STAY ON CONTINUOUSLY

NOTICE: **Use the correct probe a) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 CHECK THE SJB DTCs	

NOTE: Make sure all doors are closed before running the SJB on-demand self-test.

- Carry out the SJB on-demand self-test.
- **Is DTC B1320, B1328, B1336 or B1572 recorded?**



Yes
GO to F2 .

No
GO to F5 .

F2 CHECK FOR VOLTAGE TO THE DOOR AJAR SWITCH

- Ignition OFF.
- Disconnect: Suspect Door Ajar Switch.
- Measure the voltage between the suspect door ajar switch, harness side and ground as follows:

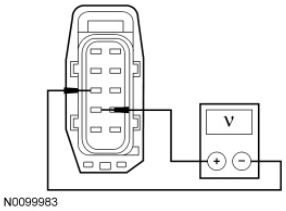
Suspect Door Ajar Switch	Connector-Pin	Circuit
LH front	C525-8	CPL26 (GN/VT)
RH front	C603-8	CPL31 (WH)
LH rear	C704-8	CPL36 (GN)
RH rear	C804-8	CPL39 (YE)

- **Is the voltage greater than 10 volts?**

Yes
GO to F3 .

No
GO to F4 .

F3 CHECK FOR VOLTAGE TO THE DOOR AJAR SWITCH USING THE CONNECTOR GROUND



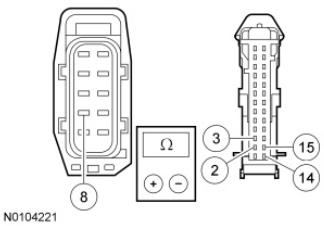
- Measure the voltage between the suspect door ajar switch, harness side and ground as follows:

Suspect Door Ajar Switch	Connector-Pin	Circuit
LH front	C525-8 CPL26 (GN/VT)	C525-6 GD126 (BK/WH)
RH front	C603-8 CPL31 (WH)	C603-6 GD139

Yes
INSTALL a new door latch for the ajar switch in question. REFER to Section 501-14 . CLEAR the DTCs. REPEAT the self-test.

No
REPAIR the ground circuit in question for an open. CLEAR the DTCs. REPEAT the self-test.

		(BK/YE)
LH rear	C704-8 CPL36 (GN)	C704-6 GD126 (BK/WH)
RH rear	C804-8 CPL39 (YE)	C804-6 GD139 (BK/YE)



- **Is the voltage greater than 10 volts?**

F4 CHECK THE DOOR AJAR SWITCH INPUT CIRCUIT FOR AN OPEN

- Disconnect: SJB C2280c.
- Measure the resistance between the suspect door ajar switch, harness side and the SJB , harness side as follows:

Suspect Door Ajar Switch Connector-Pin	SJB Connector-Pin	Circuit
LH front C525-8	C2280c-14	CPL26 (GN/VT)
RH front C603-8	C2280c-2	CPL31 (WH)
LH rear C704-8	C2280c-3	CPL36 (GN)
RH rear C804-8	C2280c-15	CPL39 (YE)

- **Is the resistance less than 5 ohms?**

Yes
GO to F5 .

No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

F5 CHECK THE SJB INTERIOR COURTESY LAMP OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE

NOTE: Make sure the doors are closed for correct test results. • Ignition OFF. • Disconnect: SJB C2280a. • Ignition ON. • Observe the interior courtesy lamps. • **Do the interior courtesy lamps continue to illuminate?**	**Yes** REPAIR circuit VLN33 (GY/VT) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to F6 .
F6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The Puddle Lamps Stay On Continuously

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation

When the request from the instrument panel dimmer switch is detected, any door is opened, a correct unlock code from the keyless entry keypad or an unlock request from a programmed Remote Keyless Entry (RKE) transmitter is detected, the Smart Junction Box (SJB) supplies voltage to the puddle lamps.

- DTC B2A39 (Puddle Lamp Output Circuit Open) - an on-demand DTC that sets when the SJB detects a short to voltage from the puddle lamp output circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST G: THE PUDDLE LAMPS STAY ON CONTINUOUSLY

NOTICE: **Use the correct probe adapt(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
G1 CHECK THE INTERIOR COURTESY LAMPS	
• Ignition OFF. • **Are the interior courtesy lamps illuminated?**	**Yes** GO to Pinpoint Test F .

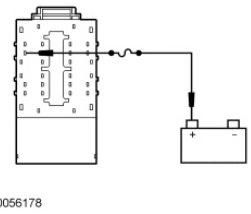
	No GO to G2 .
G2 CHECK THE SJB PUDDLE LAMP OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: SJB C2280c. • Ignition ON. • **Do the puddle lamps continue to illuminate?**	**Yes** REPAIR circuit CLN25 (VT) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. **No** GO to G3 .
G3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test H: All The Demand Lamps Are Inoperative

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) supplies voltage to the demand lamps. The demand lamps are ground through one circuit. The glove compartment lamp (MKZ only) is case grounded.



This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST H: ALL THE DEMAND LAMPS ARE INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

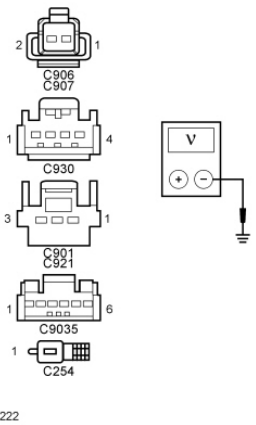
Test Step	Result / Action to Take
H1 CHECK THE OPERATION OF THE INTERIOR COURTESY LAMPS	
• Ignition OFF.	**Yes** GO to H2 .

• Operate the courtesy lamps by opening the LH front door. • **Do the courtesy lamps illuminate?**	**No** GO to Pinpoint Test A .
H2 CHECK CIRCUIT CLN09 (YE/GN) FOR AN OPEN	
• Disconnect: SJB C2280d. • Connect a fused jumper wire between the SJB C2280d-21, circuit CLN09 (YE/GN), harness side and battery positive.  N0056178 • **Do the demand lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to H3 . **No** REMOVE the jumper wire. REPAIR the circuit. TEST the system for normal operation.
H3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test I: An Individual Demand Lamp Is Inoperative

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation



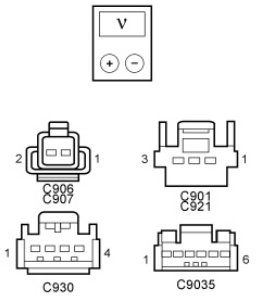
The Smart Junction Box (SJB) supplies voltage to the demand lamps. The demand lamps are grounded through one circuit. The glove compartment lamp (MKZ only) is case grounded.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Demand lamp

PINPOINT TEST I: AN INDIVIDUAL DEMAND LAMP IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>I1 CHECK FOR VOLTAGE TO THE DEMAND LAMP</td><td></td></tr>
<tr><td>
• Ignition OFF.
• Disconnect: Suspect Demand Lamp.
• Ignition ON.
• Measure the voltage between the suspect demand lamp, harness side and ground as follows:
<table>
<tr><th>Location</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>RH vanity mirror lamp</td><td>C906-1</td><td>CLN09 (YE/GN)</td></tr>
<tr><td>LH vanity mirror lamp</td><td>C907-1</td><td>CLN09 (YE/GN)</td></tr>
<tr><td>Front</td><td>C930-2</td><td>CLN09 (YE/GN)</td></tr>
<tr><td>Front (MKZ only)</td><td>C9035-2</td><td>CLN09 (YE/GN)</td></tr>

N0104222
• Is the voltage greater than 10 volts?
</td><td>Yes
GO to I2 .

No
REPAIR the circuit in question. TEST the system for normal operation.</td></tr>
<tr><td>I2 CHECK FOR VOLTAGE TO THE DEMAND LAMP USING THE CONNECTOR GROUND</td><td></td></tr>
</table>

- Measure the voltage between the inoperative demand lamp, harness side and ground as follows:

Inoperative Lamp	Connector-Pin/ Circuit	Connector-Pin/ Circuit
LH vanity mirror lamp	C907-1 CLN09 (YE/GN)	C907-2 GD139 (BK/YE)
RH vanity mirror lamp	C906-1 CLN09 (YE/GN)	C906-2 GD139 (BK/YE)
Front	C930-2 CLN09 (YE/GN)	C930-1 GD139 (BK/YE)
Front (MKZ only)	C9035-2 CLN09 (YE/GN)	C9035-6 GD139 (BK/YE)
Rear (with moonroof)	C921-3 CLN09 (YE/GN)	C921-2 GD139 (BK/YE)
Rear (without moonroof)	C901-3 CLN09 (YE/GN)	C901-2 GD139 (BK/YE)

N0104223

- **Is the voltage greater than 10 volts?**

Yes
INSTALL a new demand lamp for the suspect lamp. TEST the system for normal operation.

No
REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test J: The Battery Saver Does Not Deactivate After Time-Out

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation

The Smart Junction Box (SJB) controls the battery saver function. The battery saver function provides automatic shutoff of the interior lamps (courtesy lamps and demand lamps) after 10 minutes have elapsed in order to save battery power.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SJB

PINPOINT TEST J: THE BATTERY SAVER DOES NOT DEACTIVATE AFTER TIME-OUT

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

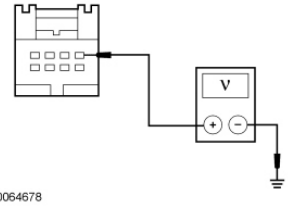
Test Step	Result / Action to Take
J1 CHECK THE SJB IGNITION SWITCH PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB DataLogger. • Monitor the SJB ignition switch PIDs (IGN_A_ECU, IGN_O_ECU, IGN_R_ECU and IGN_S_ECU) while rotating the ignition switch through all positions. • **Do the ignition switch PIDs agree with the ignition switch positions?**	**Yes** GO to J2 . **No** REFER to Section 211-05 .
J2 CHECK THE DEMAND LAMP VOLTAGE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SJB C2280e. • Ignition ON. • Operate the demand lamps. • **Do the demand lamps illuminate?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to J3 .
J3 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test K: The Ambient Lighting Is Inoperative - Fusion

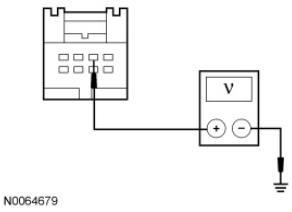
Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

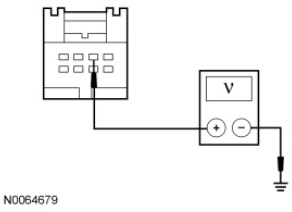
Normal Operation

When the ignition key is in the RUN or ACC position, the ambient lighting module supplies voltage and ground to the LEDs located in the floor console cup holders, storage tray, storage bin, door map pockets and the front and rear footwells. The ambient lighting switch is used to cycle through the 8 color combinations or to turn the ambient lighting feature off. There are 4 different color (red, blue, green and white) LEDs housed within each LED assembly.

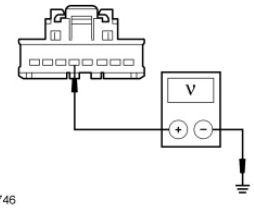


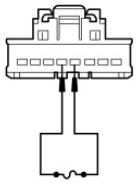
When the ignition key is in the RUN or ACC position, the ambient lighting switch and the ambient lighting module receive voltage. When the ambient lighting switch (a momentary contact switch) is pressed, voltage is routed to the ambient lighting module indicating a request for the module to cycle the ambient lighting to the next setting.



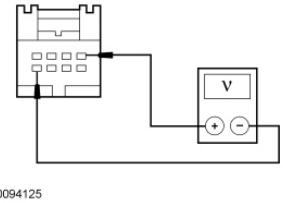


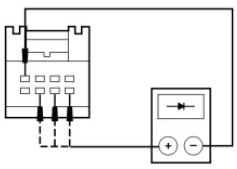
This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- Ambient lighting harness
- Ambient lighting switch
- Ambient lighting module





PINPOINT TEST K: THE AMBIENT LIGHTING IS INOPERATIVE - FUSION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
K1 CHECK FOR VOLTAGE TO THE AMBIENT LIGHTING MODULE	
• Ignition OFF. • Disconnect: Ambient Lighting Module C3256. • Ignition ON. • Measure the voltage between the ambient lighting module C3256-1, circuit CBX07 (GN/RD), harness side and ground.  N0064678 • **Is the voltage greater than 10 volts?**	**Yes** GO to K2 . **No** VERIFY the Smart Junction Box (SJB) fuse 41 (15A) is OK. If OK, REPAIR the circuit CBX07 (GN/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams

	Manual to identify the possible causes of the circuit short.
K2 CHECK THE INPUT FROM THE AMBIENT LIGHTING SWITCH	
• While pressing and releasing the ambient lighting switch, measure the voltage between the ambient lighting module C3256-2, circuit CLN54 (BN/YE), harness side and ground.  N0064679 • **Is the voltage greater than 10 volts with the switch pressed and 0 volts with the switch released?**	**Yes** GO to K6 . **No** If voltage is always present, GO to K3 . If no voltage is present, GO to K4 .
K3 CHECK THE AMBIENT LIGHTING SWITCH INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Traction Control/Ambient Lighting Switch C2304. • Ignition ON. • Measure the voltage between the ambient lighting module C3256-2, circuit CLN54 (BN/YE), harness side and ground.  N0064679 • **Is any voltage present?**	**Yes** REPAIR the circuit for a short to voltage. TEST the system for normal operation. **No** INSTALL a new traction control/ambient lighting switch. REFER to Section 206-09 . TEST the system for normal operation.
K4 CHECK FOR VOLTAGE TO THE AMBIENT LIGHTING SWITCH	

• Ignition OFF. • Connect: Ambient Lighting Module C3256. • Disconnect: Traction Control/Ambient Lighting Switch C2304. • Ignition ON. • Measure the voltage between the ambient lighting switch C2304-5, circuit CBP41 (BU), harness side and ground.  N0099746 • **Is the voltage greater than 10 volts?**	**Yes** GO to K5 . **No** VERIFY the SJB fuse 41 (15A) is OK. If OK, REPAIR the circuit for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
K5 BYPASS THE AMBIENT LIGHTING SWITCH	
• Connect and remove a fused jumper wire between the ambient lighting switch C2304-5, circuit CBP41 (BU), harness side and the ambient lighting switch C2304-4, circuit CLN54 (BN/YE), harness side.  N0099748 • **Do the ambient LEDs illuminate and cycle through a color change each time the jumper wire is connected and removed?**	**Yes** INSTALL a new traction control/ambient lighting switch. REFER to Section 206-09 . TEST the system for normal operation. **No** REPAIR the circuit for an open. TEST the system for normal operation.
K6 CHECK FOR VOLTAGE TO THE AMBIENT LIGHTING MODULE USING THE CONNECTOR GROUND	
• Measure the voltage between the ambient lighting module C3256-1, circuit CBX07 (GN/RD), harness side and the ambient lighting module C3256-8, circuit GD908 (BK), harness side.	**Yes** GO to K7 . **No** REPAIR the circuit for an open. TEST the

 N0094125 • **Is the voltage greater than 10 volts?**	system for normal operation.
K7 CHECK THE AMBIENT LIGHTING HARNESS	
• Ignition OFF. • Check any of the diode circuits between the ambient lighting module, harness side as follows: **Connector-Pin/Circuit** / **Connector-Pin/Circuit** C3256-5 CLN45 (GN) — C3256-4 RLN44 (BN) C3256-6 CLN46 (BU) — C3256-4 RLN44 (BN) C3256-7 CLN44 (OG) — C3256-4 RLN44 (BN)  N0064681 • **Does the meter indicate the circuit is good?**	**Yes** GO to K8 . **No** REPAIR or INSTALL a new ambient lighting harness. TEST the system for normal operation.
K8 CHECK FOR CORRECT AMBIENT LIGHTING MODULE OPERATION	
• Disconnect the ambient lighting module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new ambient lighting module. REFER to Ambient Lighting Module in this

• Connect the ambient lighting module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

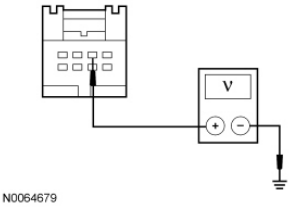
Pinpoint Test L: The Ambient Lighting Does Not Cycle Through All Color Combinations - Fusion

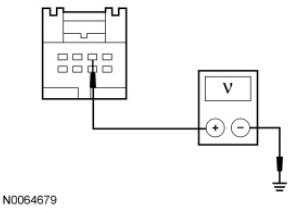
Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation

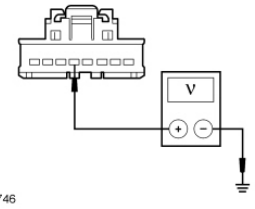
When the ignition key is in the RUN or ACC position, the ambient lighting module supplies voltage and ground to the LEDs located in the floor console cup holders, storage tray, storage bin, door map pockets and the front and rear footwells. The ambient lighting switch is used to cycle through the 8 color combinations or to turn the ambient lighting feature off. There are 4 different color (red, blue, green and white) LEDs housed within each LED assembly.

When the ignition key is in the RUN or ACC position, the ambient lighting switch and the ambient lighting module receive voltage. When the ambient lighting switch (a momentary contact switch) is pressed, voltage is routed to the ambie lighting module indicating a request for the module to cycle the ambient lighting to the next setting.





This pinpoint test is intended to diagnose the following:

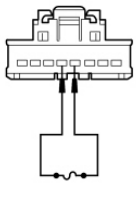


- Wiring, terminals or connectors
- Ambient lighting harness
- Ambient lighting switch
- Ambient lighting module

PINPOINT TEST L: THE AMBIENT LIGHTING DOES NOT CYCLE THROUGH ALL COLOR COMBINATIONS - FUSION

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
L1 CHECK THE INPUT FROM THE AMBIENT LIGHTING SWITCH	



• Ignition OFF. • Disconnect: Ambient Lighting Module C3256. • Ignition ON. • While pressing and releasing the ambient lighting switch, measure the voltage between the ambient lighting module C3256-2, circuit CLN54 (BN/YE), harness side and ground.  N0064679 • **Is the voltage greater than 10 volts with the switch pressed, and 0 volts with the switch released?**	**Yes** GO to L . **No** If voltage is always present, GO to L2 . If no voltage is present, GO to L3 .
L2 CHECK THE AMBIENT LIGHTING SWITCH INPUT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: Traction Control/Ambient Lighting Switch C2304. • Ignition ON. • Measure the voltage between the ambient lighting module C3256-2, circuit CLN54 (BN/YE), harness side and ground.  N0064679 • **Is any voltage present?**	**Yes** REPAIR the circuit for a short to voltage. TEST the system for normal operation. **No** INSTALL a new traction control/ambient lighting switch. REFER to Section 206-09 . TEST the system for normal operation.
L3 CHECK FOR VOLTAGE TO THE AMBIENT LIGHTING SWITCH	
• Ignition OFF. • Disconnect: Traction Control/Ambient Lighting Switch C2304. • Connect: Ambient Lighting Module C3256. • Ignition ON. • Measure the voltage between the ambient lighting switch C2304-5, circuit CBP41 (BU), harness side and ground.	**Yes** GO to L4 . **No** VERIFY the Smart Junction Box (SJB) fuse 41 (15A) is OK. If OK, REPAIR the circuit for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

- **Is the voltage greater than 10 volts?**

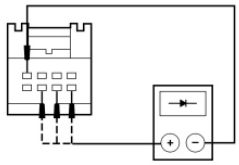
L4 BYPASS THE AMBIENT LIGHTING SWITCH

- Connect and remove a fused jumper wire between the ambient lighting switch C2304-5, circuit CBP41 (BU), harness side and the ambient lighting switch C2304-4, circuit CLN54 (BN/YE), harness side.

- **Do the ambient LEDs illuminate and cycle through a color change each time the jumper wire is connected and removed?**

Yes
INSTALL a new traction control/ambient lighting switch. REFER to Section 206-09 . TEST the system for normal operation.

No
REPAIR the circuit for an open. TEST the system for normal operation.



L5 CHECK THE AMBIENT LIGHTING HARNESS

- Ignition OFF.
- Check any of the diode circuits between the ambient lighting module, harness side as follows:

Connector-Pin/Circuit	Connector-Pin/Circuit
C3256-5 CLN45 (GN)	C3256-4 RLN44 (BN)
C3256-6 CLN46 (BU)	C3256-4 RLN44 (BN)
C3256-7 CLN44 (OG)	C3256-4 RLN44 (BN)

Yes
GO to L6 .

No
REPAIR or INSTALL a new ambient lighting harness. TEST the system for normal operation.

 N0064681 • **Does the meter indicate the circuit is good?**	
L6 CHECK FOR CORRECT AMBIENT LIGHTING MODULE OPERATION	
• Disconnect the ambient lighting module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ambient lighting module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ambient lighting module. REFER to Ambient Lighting Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

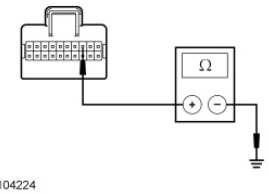
Pinpoint Test M: The Ambient Lighting Is Inoperative - MKZ

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

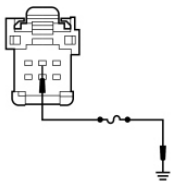
Normal Operation

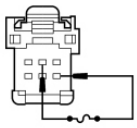
The Interior Lighting Control Module (ILCM) supplies voltage and ground to the LEDs located in the floor console cup holders, storage tray, storage bin, door map pockets and the front and rear footwells. The ambient lighting select switch is used to cycle through the 7 color combinations or to turn the ambient lighting feature off. There are 4 different color (red, blue, green and white) LEDs housed within each LED assembly.

The ILCM sends a voltage signal to the ambient lighting select switch. When the ambient lighting switch (a momentary contact switch) is pressed, the voltage signal is routed toround indicating a request for the module to cycle the ambient lighting to the next color setting.



- DTC B2B18 (Ambient Light Switch Input Fault) - a continuous and on-demand DTC that sets when the ILCM detects a short to ground from the ambient lighting select switch input circuit.





This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ambient lighting harness
- Ambient lighting select switch
- ILCM

PINPOINT TEST M: THE AMBIENT LIGHTING IS INOPERATIVE - MKZ

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
M1 CHECK FOR COMMUNICATION TO THE ILCM	
• Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • Carry out the network test using the scan tool. • **Does the scan tool communicate with the ILCM ?**	**Yes** GO to M2 . **No** REFER to Section 418-00 .
M2 CHECK THE INPUT FROM THE AMBIENT LIGHTING SWITCH	
• Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • While pressing and releasing the ambient lighting switch, monitor the ILCM ambient lighting select switch PID (AmbiColor). • **Does the PID read active with the switch pressed and idle with the switch released?**	**Yes** GO to M8 . **No** If the PID always reads active, GO to M3 . If the PID always reads idle, GO to M4 .
M3 CHECK THE AMBIENT LIGHTING SWITCH FOR A SHORT TO GROUND	
• Disconnect: Ambient Lighting Switch C2306. • Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • Monitor the ILCM ambient lighting select switch PID (AmbiColor). • **Does the PID still read active?**	**Yes** GO to M4 . **No** INSTALL a new ambient lighting select switch. REFER to Ambient Lighting Switch in this section. TEST the system for normal operation.
M4 CHECK THE AMBIENT LIGHTING SELECT SWITCH INPUT CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: ILCM C2301. • Measure the resistance between the ILCM C2301-8, circuit CPL60 (WH/BN), harness side and ground.  N0104224 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to M5 . **No** REPAIR circuit CPL60 (WH/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test.
M5 BYPASS THE AMBIENT LIGHTING SELECT SWITCH	

• Ignition OFF. • Disconnect: Ambient Lighting Select Switch C2306. • Ignition ON. • Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • Monitor the ILCM ambient lighting select switch PID (AmbiColor). • Connect a fused jumper wire between the ambient lighting select switch C2306-2, circuit CPL60 (WH/BN), harness side and ground.  N0104225 • **Does the PID read active?**	**Yes** GO to M6 . **No** GO to M7 .
M6 BYPASS THE AMBIENT LIGHTING SELECT SWITCH USING THE CONNECTOR GROUND	
• Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • Monitor the ILCM ambient lighting select switch PID (AmbiColor). • Connect and remove a fused jumper wire between the ambient lighting switch C2306-2, circuit CLN60 (BN/YE), harness side and the ambient lighting switch C2306-6, circuit GD908 (BK), harness side.  N0104226 • **Does the PID read active?**	**Yes** REMOVE the jumper wire. INSTALL a new ambient lighting switch. REFER to Ambient Lighting Switch in this section. TEST the system for normal operation. **No** REMOVE the jumper wire. REPAIR circuit GD908 (BK) for an open. TEST the system for normal operation.
M7 CHECK THE AMBIENT LIGHTING SELECT SWITCH INPUT CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: ILCM C2301. • Measure the resistance between the ILCM C2301-8, circuit CLN60 (BN/YE), harness side and the ambient lighting select switch C2306-2, circuit CLN60 (BN/YE), harness side. • **Is the resistance less than 5 ohms?**	**Yes** GO to M8 . **No** REPAIR circuit CLN60 (BN/YE) for an open. TEST the system for normal operation.
M8 CHECK THE AMBIENT LIGHTING RETURN CIRCUIT	

<table>
<tr>

</table>

Pinpoint Test N: The Ambient Lighting Does Not Cycle Through All Color Combinations - MKZ

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation

The Interior Lighting Control Module (ILCM) supplies voltagend ground to the LEDs located in the floor console cup holders, storage tray, storage bin, door map pockets and the front and rear footwells. The ambient lighting select switch is used to cycle through the 7 color combinations or to turn the ambient lighting feature off. There are 4 different color (red, blue, green and white) LEDs housed within each LED assembly.

The ILCM sends a voltage signal to the ambient lighting select switch. When the ambient lighting switch (a momentary contact switch) is pressed, the voltage signal is routed to ground indicating a request for the module to cycle the ambient lighting to the next color setting.

DTC Description	Fault Trigger Conditions
• B2B00 - Ambient Light Zone 1 Red Circuit Open	A continuous and on-demand DTC that sets when the ILCM detects an open from the ambient lighting zone 1 red circuit.
• B2B01 - Ambient Light Zone 1 Red Circuit Short to Ground	A continuous and on-demand DTC that sets when the ILCM detects a short to ground from the ambient lighting zone 1 red circuit.
• B2B02 - Ambient Light Zone 1 Green Circuit Open	inuous and on-demand DTC that sets when the ILCM detects an open from the ambient lighting zone 1 green circuit.
• B2B03 - Ambient Light Zone 1 Green Circuit Short to Ground	A continuous and on-demand DTC that sets when the ILCM detects a short to ground from the ambient lighting zone 1 green circuit.
• B2B04 - Ambient Light Zone 1 Blue Circuit Open	A continuous and on-demand DTC that sets when the ILCM detects an open from the ambient lighting zone 1 blue circuit.
• B2B05 - Ambient Light Zone 1 Blue Circuit Short to Ground	A continuous and on-demand DTC that sets when the ILCM detects a short to ground from the ambient lighting zone 1 blue circuit.
• B2B06 - Ambient Light Zone 1 Signature Circuit Open	A continuous and on-demand DTC that sets when the ILCM detects an open from the ambient lighting zone ure circuit.
• B2B07 - Ambient Light Zone 1 Signature Circuit Short to Ground	A continuous and on-demand DTC that sets when the ILCM detects a short to ground from the ambient lighting zone 1 signature circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ambient lighting harness
- Ambient lighting select switch
- ILCM

PINPOINT TEST N: THE AMBIENT LIGHTING DOES NOT CYCLE THROUGH ALL COLOR COMBINATIONS - MKZ

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

• Disconnect the ILCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ILCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ILCM . REFER to Interior Lighting Control Module (ILCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

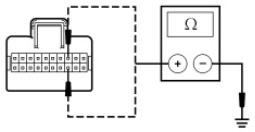
Pinpoint Test O: The Ambient Lighting Does Not Cycle Through Brightness Settings - MKZ

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

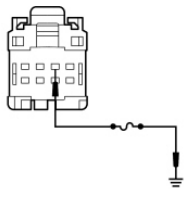
Normal Operation

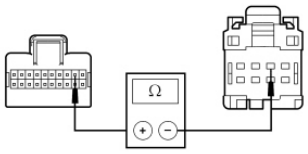
The Interior Lighting Control Module (ILCM) sends 2 voltage reference signals to the ambient lighting dimmer switch (dim up or didown). When the ambient lighting dimmer switch (a momentary contact switch) is pressed (dim up or dim down), the voltage signal is routed to the ground indicating a request for the module to cycle the ambient lighting to the next dim up or dim down setting.

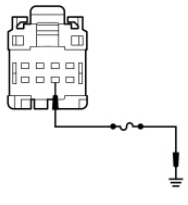
- DTC B2B18 (Ambient Light Switch Input Fault) - a continuous and on-demand DTC that sets when the ILCM detects a short to ground from the ambient lighting dim up or dim down input circuit.



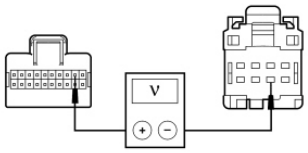
This pinpoint test is intended to diagnose the following:

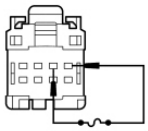






- Wiring, terminals or connectors
- Ambient lighting harness
- Ambient lighting dimmer switch
- ILCM





PINPOINT TEST O: THE AMBIENT LIGHTING DOES NOT CYCLE THROUGH BRIGHTNESS SETTINGS - MKZ

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
O1 CHECK THE INPUT FROM THE AMBIENT LIGHTING SWITCH	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • While pressing and releasing the ambient lighting dimmer switch up and down, monitor the ILCM ambient lighting dimmer switch PID (AmbiDim). • **Does the PID agree with the switch positions?**	**Yes** GO to O9 . **No** If the PID indicates up or down with the switch not pressed, GO to O2 . If the PID indicates idle when

	the switch is pressed up or down, GO to O4 .
O2 CHECK THE AMBIENT LIGHTING DIMMER SWITCH FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Ambient Lighting Dimmer Switch C2305. • Ignition ON. • Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • Monitor the ILCM ambient lighting dimmer switch PID (AmbiDim). • **Does the PID still indicate up or down?**	**Yes** GO to O3 . **No** INSTALL a new ambient lighting dimmer switch. REFER to Ambient Lighting Switch in this section. TEST the system for normal operation.
O3 CHECK THE AMBIENT LIGHTING DIMMER SWITCH INPUT CIRCUITS FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: ILCM C2301. • Measure the resistance between the ILCM C2301-9, circuit CLN61 (WH/VT), harness side and ground; and between the ILCM C2301-19, circuit CLN62 (BN/BU), harness side and ground.  N0104227 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to O9 . **No** REPAIR the circuit in question for a short to ground. CLEAR the DTCs. REPEAT the self-test.
O4 CHECK THE INPUT FROM THE AMBIENT LIGHTING DIMMER SWITCH DIM DOWN CIRCUIT	
• Ignition OFF. • Disconnect: Ambient Lighting Dimmer Switch C2305. • Ignition ON. • Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • Monitor the ILCM ambient lighting dimmer switch PID (AmbiDim). • Connect and remove a fused jumper wire between the ambient lighting switch C2305-3, circuit CLN61 (WH/VT), harness side and ground.	**Yes** GO to O6 . **No** GO to O5 .

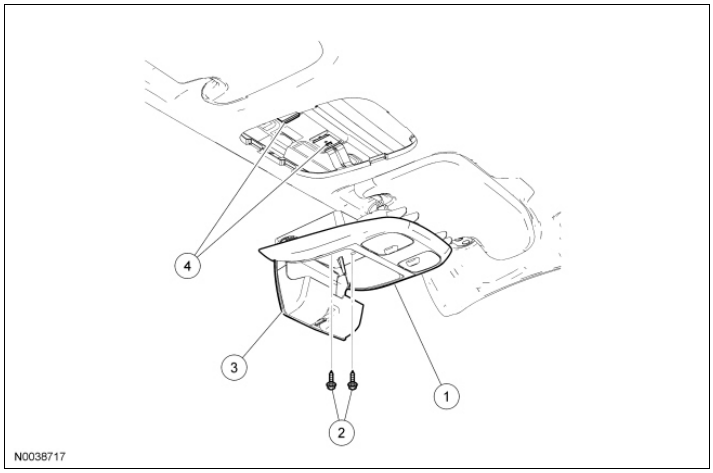
 N0104228 • **Does the PID indicate down?**	
O5 CHECK THE AMBIENT LIGHTING DIMMER SWITCH DIM DOWN CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: ILCM C2301. • Measure the resistance between the ILCM C2301-19, circuit CLN61 (WH/VT), harness side and the ambient lighting dimmer switch C2305-3, circuit CLN61 (WH/VT), harness side.  N0104229 • **Is the resistance less than 5 ohms?**	**Yes** GO to O9 . **No** REPAIR circuit CLN62 (BN/BU) for an open. TEST the system for normal operation.
O6 CHECK THE INPUT FROM THE AMBIENT LIGHTING DIMMER SWITCH DIM UP CIRCUIT	
• Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • Monitor the ILCM ambient lighting dimmer switch PID (AmbiDim). • Connect a fused jumper wire between the ambient lighting dimmer switch C2305-7, circuit CLN62 (BN/BU), harness side and ground.  N0104230 • **Does the PID indicate up?**	**Yes** REMOVE the jumper wire. GO to O8 . **No** REMOVE the jumper wire. GO to O7 .
O7 CHECK THE AMBIENT LIGHTING DIMMER SWITCH DIM UP CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: ILCM C2301. • Measure the resistance between the ILCM C2301-9, circuit CLN62 (BN/BU), harness side and the ambient lighting dimmer switch C2305-7, circuit CLN62 (BN/BU), harness side.  N0104231 • **Is the resistance less than 5 ohms?**	**Yes** GO to O9 . **No** REPAIR circuit CLN61 (WH/VT) for an open. TEST the system for normal operation.
O8 BYPASS THE AMBIENT LIGHTING DIMMER SWITCH	
• Enter the following diagnostic mode on the scan tool: ILCM DataLogger. • Monitor the ILCM ambient lighting dimmer switch PID (AmbiDim). • Connect a fused jumper wire between the ambient lighting dimmer switch C2305-3, circuit CLN61 (WH/VT), harness side and the ambient lighting switch C2305-4, circuit GD908 (BK), harness side.  N0104232 • **Does the PID indicate down?**	**Yes** INSTALL a new ambient lighting dimmer. REFER to Ambient Lighting Switch in this section. TEST the system for normal operation. **No** GO to O9 .
O9 CHECK FOR CORRECT ILCM OPERATION	
• Disconnect the ILCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ILCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ILCM . REFER to Interior Lighting Control Module (ILCM) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: DTC U0140 - Lost Communication With Smart Junction Box (SJB)

Normal Operation

- DTC U0140 (Lost Communication With SJB) - set by the Interior Lighting Control Module (ILCM) if data messages received from the SJB over the Medium Speed Controller Area Network (MS-CAN) are missing. For a complete list of all network messages, refer to Section 418-00 .



This pinpoint test is intended to diagnose the following:

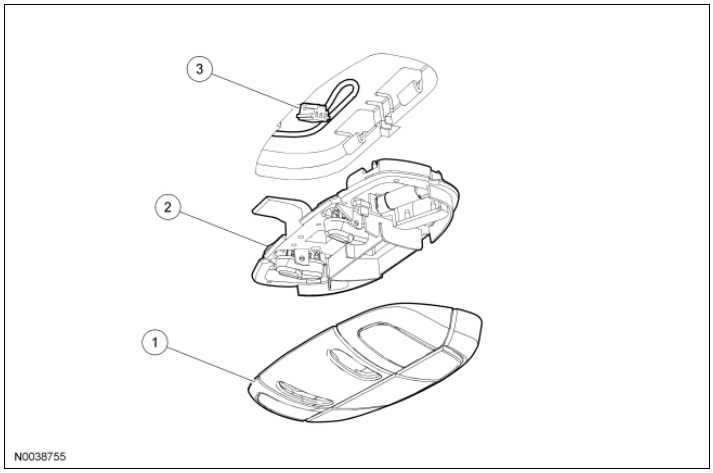
- Wiring, terminals or connectors
- ILCM

PINPOINT TEST P: DTC U0140 - LOST COMMUNICATION WITH SJB

Test Step	Result / Action to Take
P1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to P2 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
P2 CHECK THE COMMUNICATION NETWORK	
• Enter the following diagnostic mode on the scan tool: Network Test. • Carry out the network test. • **Does the SJB pass the network test?**	**Yes** GO to P3 . **No** REFER to Section 418-00 .
P3 RECHECK THE ILCM DTCs	
• Clear the DTCs. Repeat the ILCM self-test. • **Is DTC U0140 still present?**	**Yes** GO to P4 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
P4 CHECK FOR DTC U0140 or U0140:00 SET IN OTHER MODULES	
• Clear all DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds. • Enter the following diagnostic mode on the scan tool: Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0140 set in the Driver Seat Module (DSM) or the Driver Door Module (DDM)?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new ILCM . REFER to Interior Lighting Control Module (ILCM) in this section. TEST the system for normal operation.

Interior Lamp - Front

Item	Part Number	Description
1	54519A70	Overhead console
2	-	Overhead console screws (2 required)
3	-	Overhead console storage door (part of 54519A70)
4	-	Overhead console retainer brackets

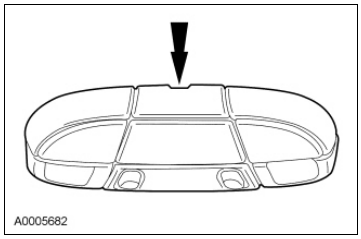


Removal and Installation

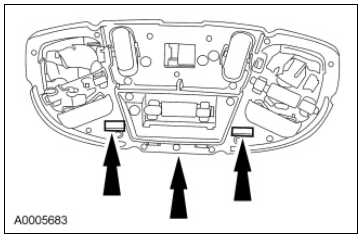
1. Open the overhead console storage door to access the screws.
   - Remove the 2 screws.

2. Pull the overhead console down and remove the console from the headliner retainer.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.



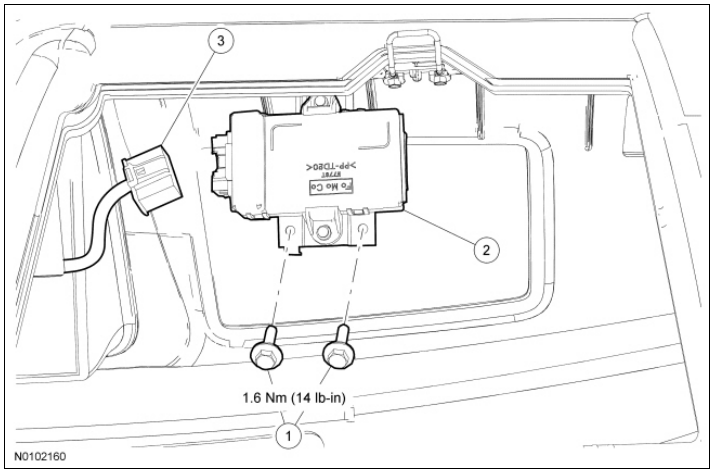
Interior Lamp - Rear



Item	Part Number	Description
1	13783	Rear interior lamp lens
2	13776	Rear interior lamp
3	-	Rear interior lamp electrical connector (part of 14334)

Removal and Installation

1. Remove the rear interior lamp lens.

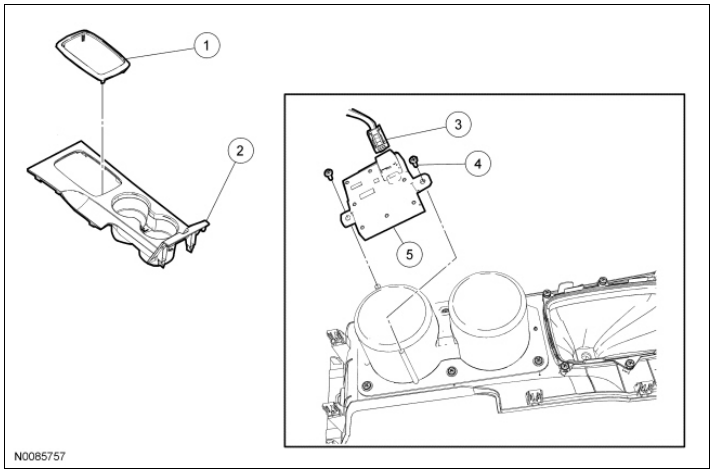


2. Release the 2 retaining clips (through the access holes) and remove the rear interior lamp assembly.
   - Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Interior Lighting Control Module (ILCM)

Item	Part Number	Description
1	-	Interior Lighting Control Module (ILCM) bolts (2 required)
2	13E702	ILCM
3	-	ILCM electrical connector (part of 13E720)



Removal and Installation

1. Remove the passenger air bag module. For additional information, refer to Section 501-20B .

2. Remove the 2 bolts and the Interior Lighting Control Module (ILCM).
   - To install, tighten to 1.6 Nm (14 lb-in).

3. To install, reverse the removal procedure.

Ambient Lighting Module

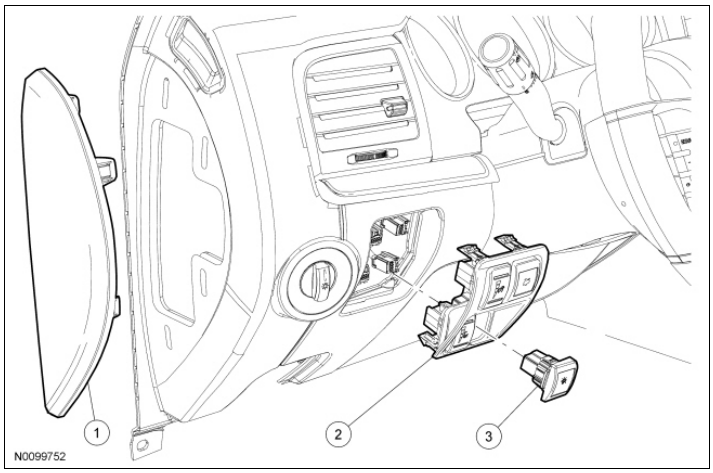
Item	Part Number	Description
1	061A16	Selector lever trim ring
2	045A76	Floor console finish panel
3	-	Ambient lighting module electrical connector (part of 14D375)
4	W701679	Ambient lighting module screws (2 required)
5	13C788	Ambient lighting module

Removal and Installation

1. If equipped with an automatic transaxle, remove the selector lever trim ring.

2. If equipped with a manual transaxle, remove the gearshift knob.

3. Open the storage compartment door.



4. Pull the floor console finish panel straight up to release the retainer clips and remove the finish panel.
   - Disconnect the ambient lighting module electrical connector.

5. Remove the 2 screws and the ambient lighting module.

6. To install, reverse the removal procedure.

Ambient Lighting Switch

NOTE: Ambient select switch shown, ambient dimmer switch similar.

Item	Part Number	Description
1	5404481	Instrument panel side finish panel
2	5404338	Switch bezel
3	13D806	Ambient lighting select switch

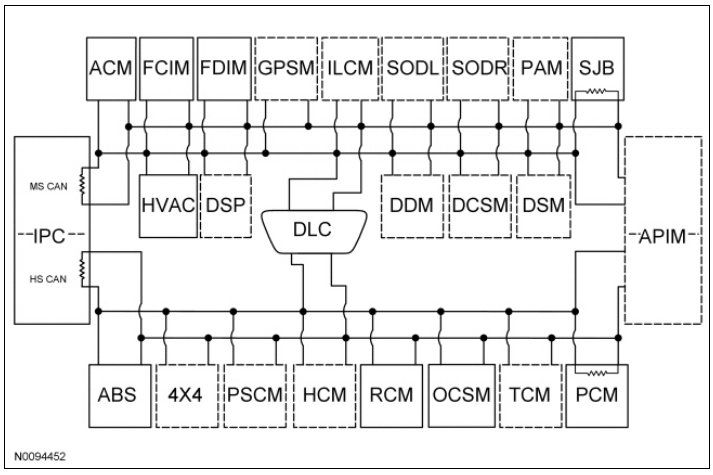
Removal and Installation

1. Remove the instrument panel side finish panel.
2. **NOTE:** The switch bezel is removed by pushing from behind.

   Remove the switch bezel.

   - Disconnect the electrical connectors.
3. Release the tabs and remove the ambient lighting switch.
4. To install, reverse the removal procedure.

Communications Network



NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Multiplexing is a method of sending 2 or more signals simultaneously over a single circuit. Multiplexing is used to allow 2 or more electronic modules (nodes) to communicate simultaneously over a twisted-wire pair [data (+) and data (-)] network. The information or messages that can be communicated on these wires consists of commands, status or data. The advantage of using multiplexing is to reduce the weight of the vehicle by reducing the number of redundant components and electrical wiring.

The vehicle has 2 module communication networks which are connected to the Data Link Connector (DLC), located under the instrument panel:

- High Speed Controller Area Network (HS-CAN)
- Medium Speed Controller Area Network (MS-CAN)

Network Topology

Module Name	Network Type	Termination Module
4X4 control module (if equipped)	HS-CAN	No
ABS module	HS-CAN	No
Accessory Protocol Interface Module (APIM) (if equipped)	HS-CAN MS-CAN	No No
Audio Front Control Module (ACM)	MS-CAN	No
Audio Digital Signal Processing (DSP) module (if equipped)	MS-CAN	No
Driver Door Module (DDM) (if equipped)	MS-CAN	No
Driver Seat Module (DSM) (if equipped)	MS-CAN	No
Dual Climate Controlled Seat Module (DCSM) (if equipped)	MS-CAN	No
Front Controls Interface Module (FCIM)	MS-CAN	No
Front Display Interface Module (FDIM)	MS-CAN	No

Global Positioning System Module (GPSM) (if equipped)	MS-CAN	No
Headlamp Control Module (HCM) (if equipped)	HS-CAN	No
HVAC module (if equipped)	MS-CAN	No
Interior Lighting Control Module (ILCM) (if equipped)	MS-CAN	No
Instrument Panel Cluster (IPC) (gateway module)	HS-CAN MS-CAN	Yes Yes
Occupant Classification System Module (OCSM)	HS-CAN	No
Parking Aid Module (PAM) (if equipped)	MS-CAN	No
Power Steering Control Module (PSCM) (if equipped)	HS-CAN	No
PCM	HS-CAN	Yes
Restraints Control Module (RCM)	HS-CAN	No
Smart Junction Box (SJB)	MS-CAN	Yes
Side Obstacle Detection Control Module - Left (SOD-L) (if equipped)	MS-CAN	No
Side Obstacle Detection Control Module - Right (SOD-R) (if equipped)	MS-CAN	No
Transmission Control Module (TCM) (if equipped)	HS-CAN	No

Network Termination

The CAN uses network termination to improve communication reliability. Termination modules are located at both ends of the network. As network messages are broadcast in the form of voltage signals, the network voltage signals are stabilized by the termination resistors.

Each termination module has an internal 120 ohm resistor that bridges across the positive and negative bus connection. With two 120 ohm resistors located in a parallel circuit configuration, the total network impedance, or total resistance, is 60 ohms.

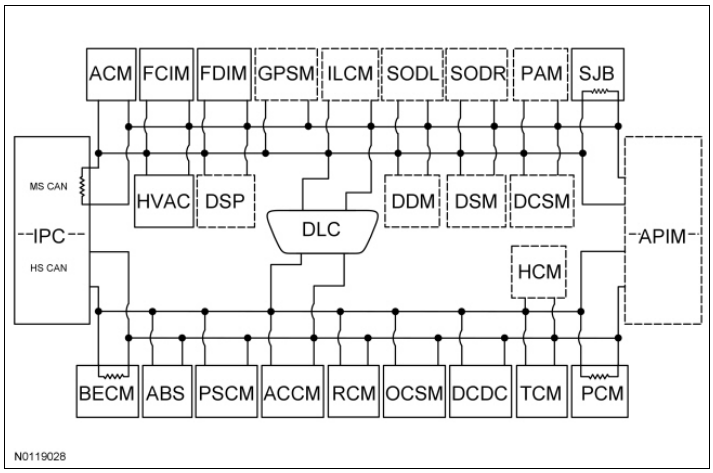
Network termination improves bus message reliability by:

- stabilizing bus voltage.
- eliminating electrical interference.

Gateway Module

The IPC is the gateway module, translating messages on the HS-CAN to MS-CAN and vice versa. This allows a message to be distributed throughout both networks. The IPC is the only module on this vehicle that has this ability.

Communications Network - Hybrid



NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Multiplexing is a method of sending 2 or more signals simultaneously over a single circuit. Multiplexing is used to allow 2 or more electronic modules (nodes) to communicate simultaneously over a twisted-wire pair [data (+) and data (-)] network. The information or messages that can be communicated on these wires consists of commands, status or data. The advantage of using multiplexing is to reduce the weight of the vehicle by reducing the number of redundant components and electrical wiring.

The vehicle has 2 module communication networks which are connected to the Data Link Connector (DLC), located under the instrument panel:

- High Speed Controller Area Network (HS-CAN)
- Medium Speed Controller Area Network (MS-CAN)

Network Topology

Module Name	Network Type	Termination Module
ABS module	HS-CAN	No
Accessory Protocol Interface Module (APIM) (if equipped)	HS-CAN MS-CAN	No/No
Air Conditioning Compressor Module (ACCM)	HS-CAN	No
Audio Front Control Module (ACM)	MS-CAN	No
Audio Digital Signal Processing (DSP) module (if equipped)	MS-CAN	No
Battery Energy Control Module (BECM)	HS-CAN	Yes
DC to DC Converter Control Module (DC/DC)	HS-CAN	No
Driver Door Module (DDM) (if equipped)	MS-CAN	No
Dual Climate Controlled Seat Module (DCSM) (if equipped)	MS-CAN	No
Driver Seat Module (DSM) (if equipped)	MS-CAN	No

Front Controls Interface Module (FCIM)	MS-CAN	No
Front Display Interface Module (FDIM)	MS-CAN	No
Global Positioning System Module (GPSM) (if equipped)	MS-CAN	No
Headlamp Control Module (HCM) (if equipped)	HS-CAN	No
HVAC module (if equipped)	MS-CAN	No
Interior Lighting Control Module (ILCM) (if equipped)	MS-CAN	No
Instrument Panel Cluster (IPC) (gateway module)	HS-CAN MS-CAN	No/Yes
Occupant Classification System Module (OCSM)	HS-CAN	No
Parking Aid Module (PAM) (if equipped)	MS-CAN	No

Network Termination

The CAN uses network termination to improve communication reliability. Termination modules are located at both ends of the network. Each termination module has an internal 120 ohm resistor that bridges across the positive and negative network circuit. With two 120 ohm resistors located in a parallel circuit configuration, the total network impedance, or total resistance, is 60 ohms.

Network termination improves bus message reliability by:

- stabilizing bus voltage.
- eliminating electrical interference.

Gateway Module

The IPC is the gateway module, translating messages on the HS-CAN to MS-CAN and vice versa. This allows a message to be distributed throughout both networks. The IPC is the only module on this vehicle that has this ability.

Communications Network

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025D or equivalent

Principles of Operation

Both the High Speed Controller Area Network (HS-CAN) and the Medium Speed Controller Area Network (MS-CAN) use an unshielded twisted-pair cable of data (+) and data (-) circuits. The HS-CAN operates at a maximum data transfer speed of 500 Kbps and is designed for applications in which modules must respond as rapidly as required by the driver or needed by the process being controlled. The MS-CAN operates at a maximum data transfer speed of 125 Kbps for bus messages and is designed for general information transfer.

High Speed Controller Area Network (HS-CAN) Modules

The following modules are on the HS-CAN :

- 4X4 control module (if equipped)
- ABS module
- Accessory Protocol Interface Module (APIM) (if equipped)
- Air Conditioning Compressor Module (ACCM) (Hybrid only)
- Battery Energy Control Module (BECM) (Hybrid only)
- DC to DC Converter Control Module (DC/DC) (Hybrid only)
- Headlamp Control Module (HCM) (if equipped)
- Instrument Panel Cluster (IPC) (gateway module)
- Occupant Classification System Module (OCSM)
- PCM
- Power Steering Control Module (PSCM) (if equipped)
- Restraints Control Module (RCM)
- Transmission Control Module (TCM) (if equipped)

Medium Speed Controller Area Network (MS-CAN) Modules

The following modules are on the MS-CAN :

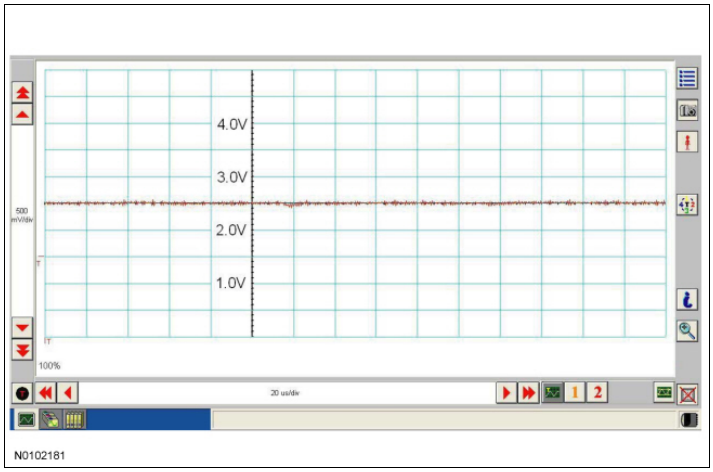
- Accessory Protocol Interface Module (APIM) (if equipped)
- Audio Front Control Module (ACM)

- Audio Digital Signal Processing (DSP) module (if equipped)
- Driver Door Module (DDM) (if equipped)
- Driver Seat Module (DSM) (if equipped)
- Dual Climate Controlled Seat Module (DCSM) (if equipped)
- Front Controls Interface Module (FCIM)
- Front Display Interface Module (FDIM)
- Global Positioning System Module (GPSM) (if equipped)
- HVAC module (if equipped)
- Interior Lighting Control Module (ILCM) (if equipped)
- Instrument Panel Cluster (IPC) (gateway module)
- Parking Aid Module (PAM) (if equipped)
- Smart Junction Box (SJB)
- Side Obstacle Detection Control Module - Left (SOD-L) (if equipped)
- Side Obstacle Detection Control Module - Right (SOD-R) (if equipped)

Controller Area Network (CAN) Fault Tolerance

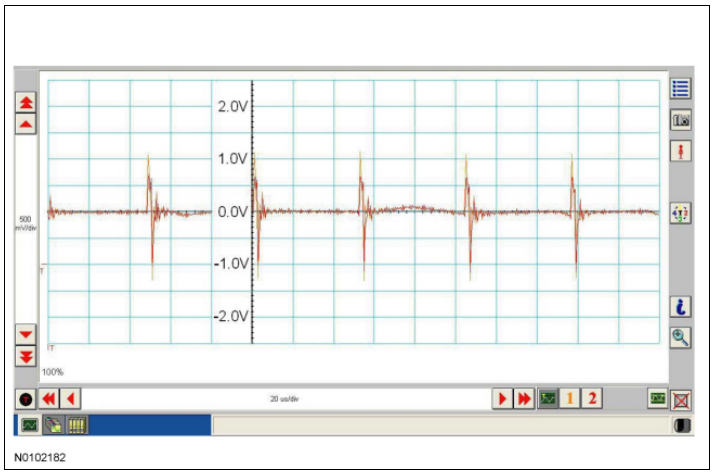
NOTE: The oscilloscope traces below are from the IDS oscilloscope taken using the IDS pre-configured CAN settings. The traces are for both data (+) and data (-) taken simultaneously (2-channel) at a sample rate of 1 mega-sample per second (1MS/s) or greater.

Traces below are viewed at 500mV per division (vertical axis) and 20 microseconds (20µ) per division (horizontal axis). Readings taken with a different oscilloscope vary from those shown. Compare any suspect readings to a known good vehicle.



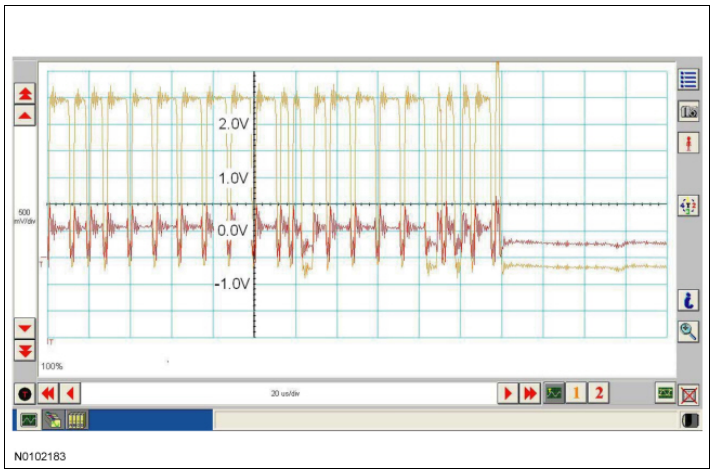
Normal CAN Operation

The data (+) and data (-) circuits are each regulated to approximately 2.5 volts during neutral or rested network traffic. As messages ae sent on the data (+) circuit, voltage is increased by approximately 1.0 volt. Inversely, the data (-) circuit is reduced by approximately 1.0 volt when a message is sent.



Successful communication of a message can usually be identified by the slight spike at the end of a message transmission. Any signals that are significantly different than the normal CAN waveform may cause network DTCs (U-codes) to set or may cause a complete network outage.

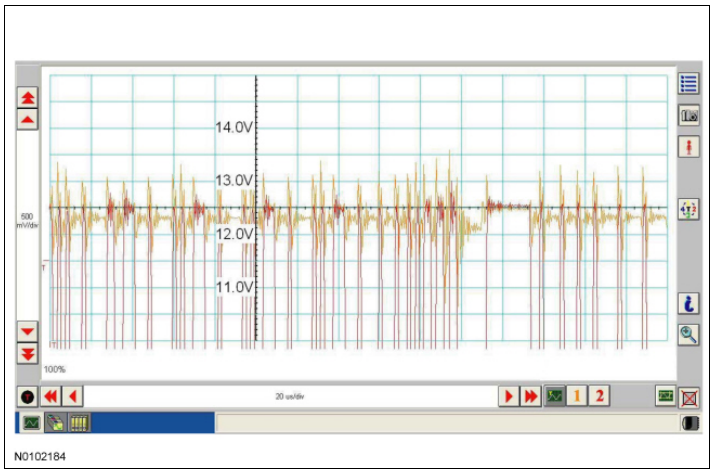
CAN Circuits Shorted Together



In the event that the data (+) and data (-) circuits become shorted together, the signal stays at base voltage (2.5V) continuously and all communication capabilities are lost.

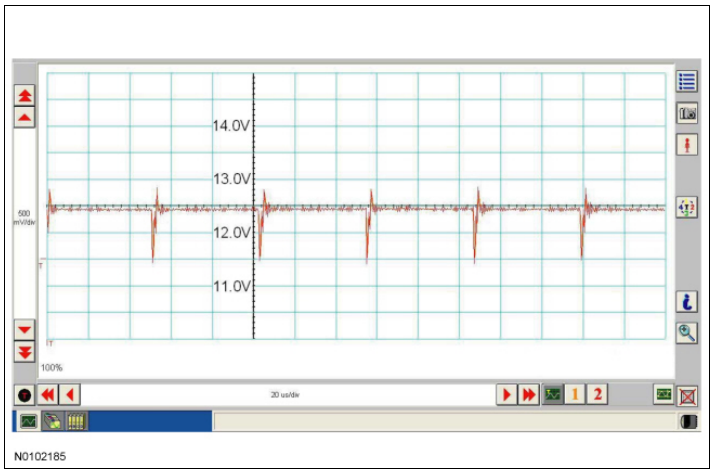
CAN (+) Circuit Shorted To Ground

In the event that the data (+) circuit becomes shorted to ground, both the data (+) and data (-) circuits are pulled low (0V) and all communication capabilities are lost.



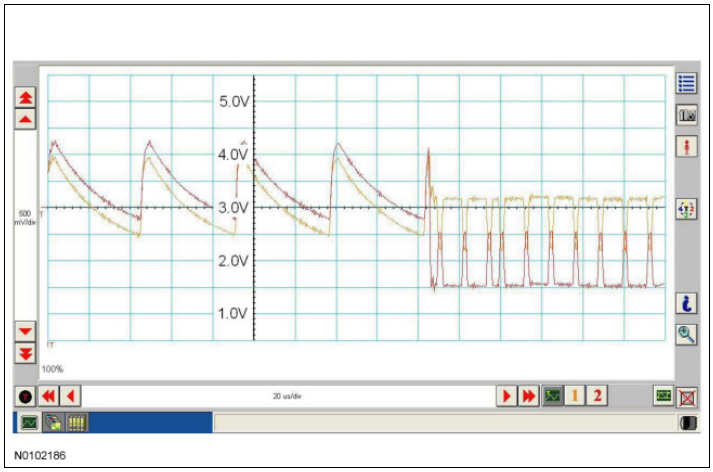
CAN (-) Circuit Shorted To Ground

In the event that the data (-) circuit becomes shorted to ground, the data (-) circuit is pulled low (0V) and the data (+) circuit reaches near-normal peak voltage (3.0V) during communication but falls to 0V instead of



normal base voltage (2.5V). Communication may continue but at a degraded level.

CAN (+) Circuit Shorted To Battery Voltage



In the event that the data (+) circuit becomes shorted to battery voltage, the data (+) circuit is pulled high (12V) and the data (-) circuit falls to abnormally high voltage (above 5V) during communication and reaches battery voltage (12V) for peak voltage. Communication may continue but at a degraded level.

CAN (-) Circuit Shorted To Battery Voltage

In the event that the data (-) circuit becomes shorted to battery voltage, both the data (+) and data (-) circuits are pulled high (12V) and all communication capabilities are lost.

CAN Circuit Signal Corruption

Rhythmic oscillations, inductive spikes or random interference can disrupt the network communications. The corruption signal source may be outside electrical interference such as motors or solenoids or internal interference generated from a module on the network. In some cases, an open in either the data (+) or data (-) circuit to a network module may cause the module to emit interference on the one circuit which is still connected. The trace shown is an example of a "sawtooth" pattern transmitted from a module with one open network circuit.

Other corruptions may be present when a module is intermittently powered up and down. The module on power up may initiate communication out of sync with other modules on the network causing momentary communication outages.

Controller Area Network (CAN) Multiplex Messages

Modules on the CAN utilize simultaneous communication of 2 or more messages on the same network circuits. The following chart summarizes the messages sent and received on the network.

CAN Module Communication Message Chart - Gasoline Engine

NOTE: This chart describes the specific HS-CAN and MS-CAN messages broadcast by each module, and the module(s) that receive the message.

Broadcast Message	Originating Module	Network Type	Receiving Module(s)

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.
   - If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

Visual Inspection Chart

Electrical
• BJB fuse(s): ♦ 12 (30A) (no communication with the DCSM) ♦ 16 (5A) (no communication with the TCM (3.5L only)) ♦ 17 (10A) (no communication with the BECM (hybrid only)) ♦ 19 (25A) (no communication with audio Digital Signal Processing (DSP) module ♦ 20 (20A) (no communication with the audio DSP module) ♦ 21 (20A) (no communication with the audio DSP module) ♦ 23 (10A) (no communication with the PCM, TCM (hybrid only)) ♦ 32 (30A) (no communication with the DSM) ♦ 39 (10A) (no communication with the TCM (hybrid only)) ♦ 40 (10A) (no communication with the PCM (hybrid only)) ♦ 42 (10A) (no communication with the ABS module (gasoline engine only)) ♦ 44 (10A) (no communication with the TCM (3.5L only)) ♦ 46 (15A) (no communication with the PCM (gasoline engine only)) ♦ 47 (10A) (no communication with the ABS module (hybrid only), ACCM (hybrid only), DC/DC (hybrid only))

- ♦ 48 (20A) (no communication with the BECM (hybrid only))
- SJB fuse(s):
  - ♦ 5 (10A) (no communication with the SJB)
  - ♦ 11 (10A) (no communication with the 4X4 control module)
  - ♦ 12 (7.5A) (no communication with the DDM)
  - ♦ 13 (5A) (no communication with the APIM)
  - ♦ 14 (10A) (no communication with the FCIM , FDIM , ILCM , GPSM)

  - ♦ 35 (10A) (no communication with the 4X4 control module, PAM , SOD-L , SOD-R)
  - ♦ 39 (20A) (no communication with the ACM)
  - ♦ 42 (10A) (no communication with the HCM , PSCM)
  - ♦ 46 (7.5A) (no communication with the OCSM)
- DLC
- Wiring harness
- Wiring, terminals or connectors

3. Connect the scan tool to the Data Link Connector (DLC).
   - **NOTE:** Make sure to use the latest scan tool software release.

     NOTE: The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

     If the Integrated Diagnostic System (IDS) does not communicate with the VCM :

     - ♦ Check the VCM connection to the vehicle.
     - ♦ Check the scan tool connection to the VCM .
     - ♦ GO to Pinpoint Test AF , to diagnose No Power To The Scan Tool.

4. Establish a scan tool session.
   - **NOTE:** The scan tool will first attempt to communicate with the PCM, after establishing communication with the PCM, the scan tool will then attempt to communicate with all other modules on the vehicle.

     If an IDS session cannot be established with the vehicle, (IDS may state "No communication can be established with the PCM"):

     - ♦ Choose "NO" when the scan tool prompts whether or not to retry communication.
     - ♦ Enter either a PCM part number, tear tag or calibration number to identify the vehicle and start a session (the PCM part number and 4-character tear tag are printed on the PCM label).
     - ♦ GO to Pinpoint Test A , to diagnose The PCM Does Not Respond To The Scan Tool.

5. Carry out the network test.
   - If the network test passes, retrieve and record the continuous memory DTCs and proceed to Step 6.
   - If the network test fails, GO to Symptom Chart to diagnose the failed communication network.
   - If a module fails to communicate during the network test, GO to Symptom Chart .

6. Retrieve and review the DTCs.
    - If the DTCs retrieved are related to the concern, go to DTC Charts. Follow the non-network DTC diagnostics (B-codes, C-codes, P-codes) prior to the network DTC diagnostics (U-codes). For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
    - If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

NOTE: Network DTCs (U-codes) are often a result of intermittent concerns such as damaged wiring or low battery voltage occurrences. Additionally, vehicle service procedures such as module reprogramming will often set network DTCs. Replacing a module to resolve a network DTC is unlikely to resolve the concern. To prevent repeat network DTC concerns, inspect all network wiring, especially connectors. Test the vehicle battery, refer to Section 414-01 .

Communication Network DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Source	Action
U0001	High Speed CAN Communication Bus	ABS module	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.
U0001:88	High Speed CAN Communication Bus: Bus Off	ABS module DC/DC HCM PSCM	The module could not communicate on the network at a point in time. The fault is currently not present. CLEAR the DTC. REPEAT the network test with the scan tool.

U2473	Unexpected Vehicle Speed	SJB	REFER to Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The PCM Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 23 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Electronic Engine Controls - 2.5L for schematic and connector information.

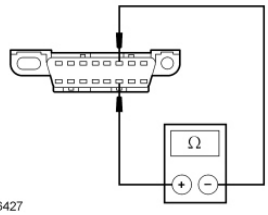
Refer to Wiring Diagrams Cell 24 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Electronic Engine Controls - 3.0L for schematic and connector information.

Refer to Wiring Diagrams Cell 25 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Electronic Engine Controls - 3.5L for schematic and connector information.

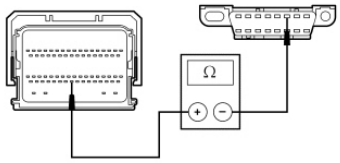
Normal Operation

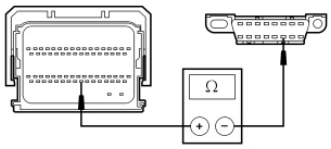
The PCM communicates with the scan tool through the High Speed Controller Area Network (HS-CAN). Circuits VDB04 (WH/BU) (HS-CAN +) and VDB05 (WH) (HS-CAN -) provide the network connection to the PCM. An Integrated Diagnostic System (IDS) session cannot be established if the PCM communication fails when attempting to identify the vehicle.

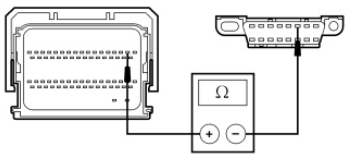
This pinpoint test is intended to diagnose the following:



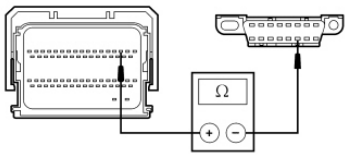
- Wiring, terminals or connectors

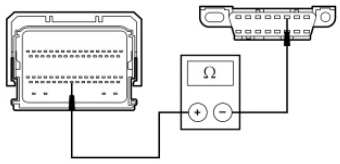


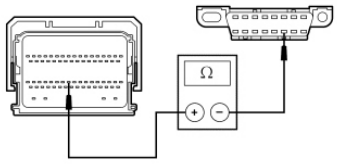




PCM







PINPOINT TEST A: THE PCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
A1 VERIFY WHETHER OTHER HS-CAN MODULES PASS THE NETWORK TEST	
• Enter the following diagnostic mode on the scan tool: Network Test . • In the LH pane of the IDS network test display screen, verify whether any HS-CAN modules passed the network test. • **Is the text "pass" or a DTC listed next to any of the following modules (if equipped): 4X4 control module, ABS module, ACCM (Hybrid only), Accessory Protocol Interface Module (APIM), Battery Energy Control Module (BECM) (Hybrid only), DC/DC (Hybrid only), Headlamp Control Module (HCM), Instrument Panel Cluster (IPC), Power Steering Control Module (PSCM), Restraints Control Module (RCM), Occupant Classification System Module (OCSM), PCM or Transmission Control Module (TCM)?**	**Yes** If "pass" or a DTC was listed next to the PCM, a network fault is not currently present. GO to Pinpoint Test AE to diagnose an intermittent HS-CAN fault condition. If "pass" or a DTC was listed next to one or more modules other than the PCM, GO to A2 . **No** No modules are currently communicating on the HS-CAN . GO to Pinpoint Test AD to diagnose no HS-CAN communication.
A2 VERIFY THE PC/ED MANUAL PINPOINT TEST QA HAS BEEN CARRIED OUT	
• Verify that the Powertrain Control/Emissions Diagnosis (PC/ED) manual pinpoint test QA has been carried out. • **Has pinpoint test QA been carried out?**	**Yes** GO to A3 . **No** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, Section 5, pinpoint test QA to diagnose no communication with the PCM.
A3 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance between 54 and 66 ohms?**	**Yes** CONNECT the negative battery cable. GO to A7 . **No** For 2.5L gasoline and 3.0L engines, GO to A4 . For 3.5L engine, GO to A5 . For 2.5L hybrid engine, GO to A6 .

A4 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN - 2.5L GAS AND 3.0L	
• Disconnect: PCM C175b . • Measure the resistance between the PCM C175b-59, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0077607 • Measure the resistance between the PCM C175b-58, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099486 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to A7 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
A5 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN - 3.5L	
• Disconnect: PCM C175b . • Measure the resistance between the PCM C175b-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026577 • Measure the resistance between the PCM C175b-3, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** CONNECT the negative battery cable. GO to A7 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0026578 • **Are the resistances less than 5 ohms?**	
A6 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN - 2.5L HYBRID	
• Disconnect: PCM C175b . • Measure the resistance between the PCM C175b-59, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0077607 • Measure e resistance between the PCM C175b-43, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0077608 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to A7 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
A7 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to the appropriate section in Section 303-14A , Section 303-14B or Section 303-14C . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with

	the scan tool.

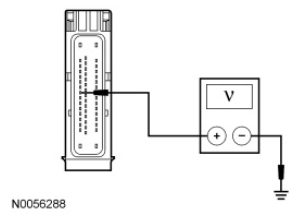
Pinpoint Test B: The ABS Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

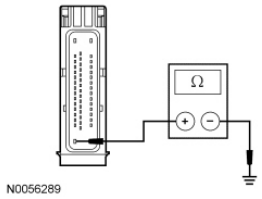
Refer to Wiring Diagrams Cell 42 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Dynamic Systems for schematic and connector information.

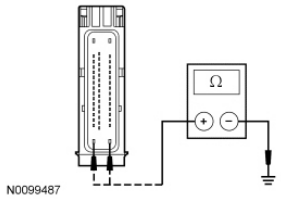
Normal Operation

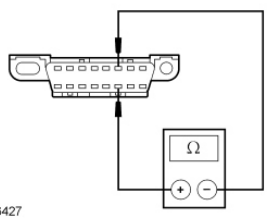
The ABS module communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).



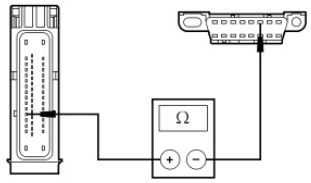
This pinpoint test is intended to diagnose the following:

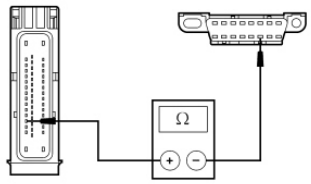






- Fuse
- Wiring, terminals or connectors
- ABS module





PINPOINT TEST B: THE ABS MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
B1 CHECK THE ABS MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: ABS Module C135 . • Ignition ON. • Measure the voltage between the ABS module C135-8, circuit CBP42 (GN) (gasoline engine) or C135-8, circuit CBK03 (GY), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to B2 . **No** VERIFY the SJB fuse 42 (10A) (gasoline engine) or BJB fuse 47 (10A) (hybrid) is OK. If OK, REPAIR the circuit in question. If not OK, refer to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

B2 CHECK THE ABS MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • For gasoline engine, measure the resistance between the ABS module C135-16, circuit GD123 (BK/GY), harness side and ground.  • For hybrid engine, measure the resistance between the ABS module C135-16, circuit GD121 (BK/YE), harness side and ground; and between the ABS module C135-47, circuit GD121 (BK/YE), harness side and ground.  • **Are the resistances less than 5 ohms?**	**Yes** For gasoline engine, GO to B3 . For hybrid engine, GO to B5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
B3 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Disconnect the scan tool cable from the Data Link Connector (DLC). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to B5 . **No** GO to B4 .

B4 CHECK THE HS-CAN CIRCUITS BETWEEN THE ABS MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the ABS module C135-12, circuit VDB04 (WH/BU), harness side and the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side.  N0026664 • Measure the resistance between the ABS module C135-13, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026665 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to B5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
B5 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect the ABS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ABS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

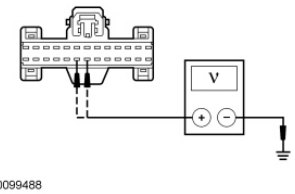
Pinpoint Test C: The Instrument Panel Cluster (IPC) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

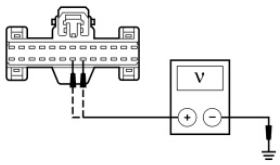
Refer to Wiring Diagrams Cell 60 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Instrument Cluster for schematic and connector information.

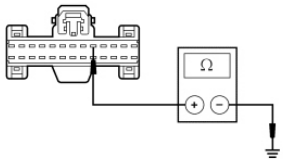
Normal Operation

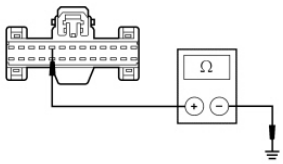
The Instrument Panel Cluster (IPC) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).



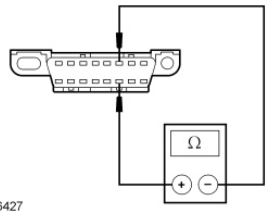
This pinpoint test is intended to diagnose the following:

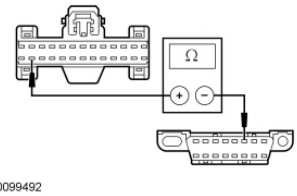


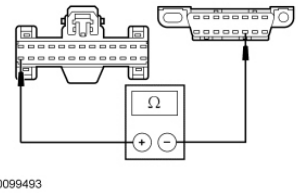




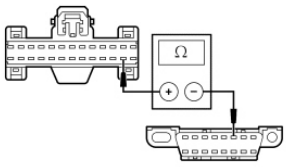
- Fuse
- Wiring, terminals or connectors
- IPC

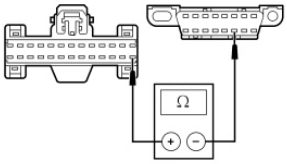


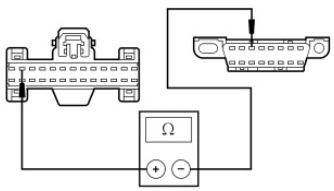


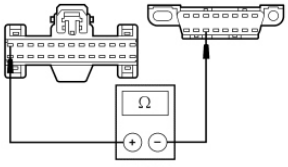


PINPOINT TEST C: THE IPC DOES NOT RESPOND TO THE SCAN TOOL

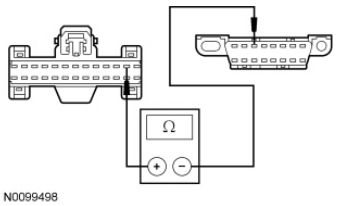


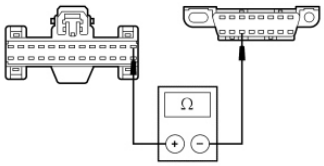






NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**





NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
C1 CHECK THE IPC VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Disconnect: Instrument Panel Cluster (IPC) C220 . • Ignition ON. • For gasoline engine, measure the voltage between the IPC C220-20, circuit CBP29 (WH/VT), harness side and ground; and between the IPC C220-21, circuit SBP26 (YE/RD), harness side and ground.  N0099488 • For hybrid engine, measure the voltage between the IPC C220-20, circuit CBP29 (WH/VT), harness side and ground; and between the IPC C220-19, circuit SBP26 (YE/RD), harness side and ground.	**Yes** GO to C2 . **No** VERIFY the Smart Junction Box (SJB) fuses 29 (5A) or 26 (15A) are OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. REPEAT the network test with the scan tool.

 N0099489 • **Are the voltages greater than 10 volts?**	
C2 CHECK THE IPC GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • For gasoline engine, measure the resistance between the IPC C220-5, circuit GD116 (BK/VT) harness side and ground.  N0099490 • For hybrid engine, measure the resistance between the IPC C220-9, circuit GD116 (BK/VT) harness side and ground.  N0099491 • **Is the resistance less than 5 ohms?**	**Yes** For gasoline engine, GO to C3 . For hybrid engine, GO to C5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
C3 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Disconnect the scan tool cable from the Data Link Connector (DLC). • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to C6 . **No** GO to C4 .

 N0026427 • **Is the resistance between 54 and 66 ohms?**	
C4 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE IPC FOR AN OPEN - GASOLINE	
• Measure the resistance between the IPC C220-25, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0099492 • Measure the resistance between the IPC C220-26, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099493 • **Are the resistances less than 5 ohms?**	**Yes** GO to C6 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
C5 CHECK THE HS-CAN CIRCUITS BETWEEN THE DLC AND THE IPC FOR AN OPEN - HYBRID	
• Measure the resistance between the IPC C220-15, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** GO to C7 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0099494 • Measure the resistance between the IPC C220-14, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099495 • **Are the resistances less than 5 ohms?**	
C6 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE IPC FOR AN OPEN - GASOLINE	
• Measure the resistance between the IPC C220-12, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0099496 • Measure the resistance between the IPC C220-13, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0099497 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to C8 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
C7 CHECK THE MS-CAN CIRCUITS BETWEEN THE DLC AND THE IPC FOR AN OPEN - HYBRID	

• Measure the resistance between the IPC C220-2, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0099498 • Measure the resistance between the IPC C220-1, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0099499 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to C8 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
C8 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

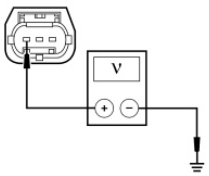
Pinpoint Test D: The Power Steering Control Module (PSCM) Does Not Respond To The Scan Tool

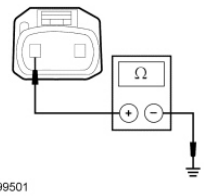
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 43 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Steering Controls for schematic and connector information.

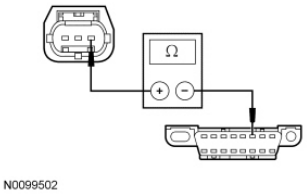
Normal Operation

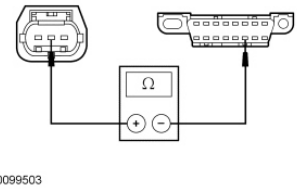
The Power Steering Control Module (PSCM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).





This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- PSCM

PINPOINT TEST D: THE PSCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
D1 CHECK THE PSCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: PSCM C1467b . • Ignition ON. • Measure the voltage between the PSCM C1467b-3, circuit CBP42 (GN), harness side and ground.  N0099500 • **Is the voltage greater than 10 volts?**	**Yes** GO to D2 . **No** VERIFY the Smart Junction Box (SJB) fuse 42 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
D2 CHECK THE PSCM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PSCM C1467a . • Disconnect: Negative Battery Cable . • Measure the resistance between the PSCM C1467a-2, circuit GD104 (BK/GN), harness side and ground.  N0099501 • **Is the resistance less than 5 ohms?**	**Yes** GO to D3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

D3 CHECK THE HS-CAN CIRCUITS BETWEEN THE PSCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the PSCM C1467b-1, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0099502 • Measure the resistance between the PSCM C1467b-2, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099503 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to D4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
D4 CHECK FOR CORRECT PSCM OPERATION	
• Disconnect all the PSCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PSCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PSCM . REFER to Section 211-04 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test E: The Restraints Control Module (RCM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 46 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Supplemental Restraint System for schematic and connector information.

Normal Operation

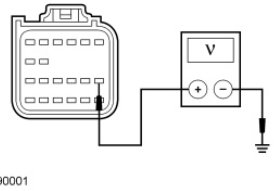
The Restraints Control Module (RCM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

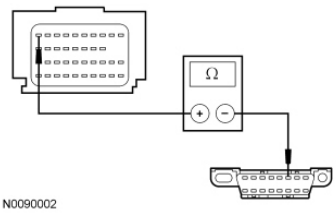
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Case ground open
- RCM

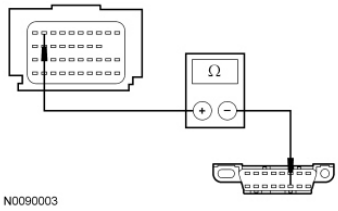
PINPOINT TEST E: THE RCM DOES NOT RESPOND TO THE SCAN TOOL

⚠ WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.





⚠ WARNING: Never probe the electrical connectors on airbag, Safety Canopy® or side air curtain assemblies. Failure to follow this instruction may result in the accidental deployment of these assemblies, which increases the risk of serious personal injury or death.



NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verificaton before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
E1 CHECK THE RCM CONNECTION	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: RCM C310a . • Disconnect: RCM C310b . • Inspect the RCM connector for damaged, pushed out or corroded pins. • **Are RCM C310a pin 13 and RCM C310b pins 9 and 10 OK?**	**Yes** GO to E2 . **No** REPAIR the RCM connector pins as necessary. REPOWER the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
E2 CHECK THE RCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	

• Repower the SRS . Refer to Section 501-20B . • Ignition ON. • Measure the voltage between the RCM C310a-13, circuit CBP32 (GN/VT), harness side and ground.  N0090001 • **Is the voltage greater than 10 volts?**	**Yes** GO to E3 . **No** VERIFY the Smart Junction Box (SJB) fuse 32 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
E3 CHECK THE RCM CASE GROUND	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the RCM case and a good chassis ground. • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR the RCM case ground as necessary. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
E4 CHECK THE HS-CAN CIRCUITS BETWEEN THE RCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the RCM C310b-10, circuit VDB04 (WH/BU), harness side and the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side.  N0090002 • Measure the resistance between the RCM C310b-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** CONNECT the negative battery cable. GO to E5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
E5 CHECK FOR CORRECT RCM OPERATION	
• Disconnect all the RCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the RCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test F: The Occupant Classification System Module (OCSM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 46 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Supplemental Restraint System for schematic and connector information.

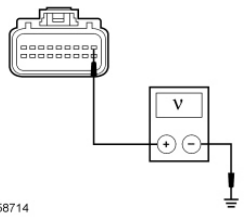
Normal Operation

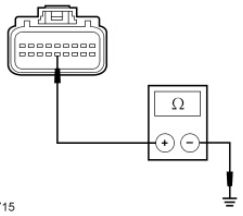
The Occupant Classification System Module (OCSM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

This pinpoint test is intended to diagnose the following:

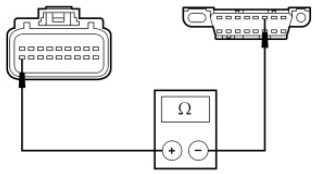
- Fuse
- Wiring, terminals or connectors
- OCSM

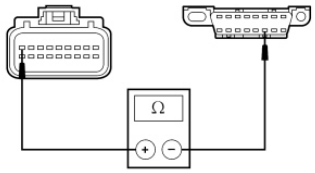
PINPOINT TEST F: THE OCSM DOES NOT RESPOND TO THE SCAN TOOL





⚠ **WARNING: Never disassemble or tamper with seat belt deployable components, including pretensioners, load limiters and inflators. Never back probe deployable device electrical connectors. Tampering or back probing may cause an accidental deployment and result in personal injury or death.**





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
F1 CHECK THE OCSM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Depower the SRS . Refer to Section 501-20B . • Disconnect: OCSM C3159 . • Deactivate the SRS . Refer to Section 501-20B . • Repower the SRS . Refer to Section 501-20B . • Ignition ON. • Measure the voltage between the OCSM C3159-1, circuit CBP46 (WH/BU), harness side and ground.  N0058714 • **Is the voltage greater than 10 volts?**	**Yes** GO to F2 . **No** VERIFY the Smart Junction Box (SJB) fuse 46 (7.5A) is OK. If OK, REPAIR the circuit. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
F2 CHECK THE OCSM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the OCSM C3159-14, circuit GD127 (BK/BU), harness side and ground.  N0058715 • **Is the resistance less than 5 ohms?**	**Yes** GO to F3 . **No** REPAIR the circuit. REACTIVATE the SRS . CONNECT the negative battery cable. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
F3 CHECK THE HS-CAN CIRCUITS BETWEEN THE OCSM AND THE DLC FOR AN OPEN	

• Measure the resistance between the OCSM C3159-18, circuit VDB04 (WH/BU), harness side and the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side.  N0026670 • Measure the resistance between the OCSM C3159-9, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026671 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to F4 . **No** REPAIR the circuit. REACTIVATE the SRS . CONNECT the negative battery cable. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.
F4 CHECK FOR CORRECT OCSM OPERATION	
• Disconnect the OCSM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the OCSM connector and make sure it seats correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new OCSM . REFER to Section 501-20B . REACTIVATE the SRS . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. REACTIVATE the SRS . REFER to Section 501-20B . CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test G: The Transmission Control Module (TCM) Does Not Respond To The Scan Tool

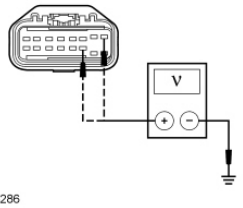
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 29 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Transmission Controls for schematic and connector information.

Normal Operation

The Transmission Control Module (TCM) is present on hybrid vehicles only. The TCM communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

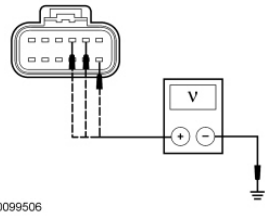
NOTE: Only vehicles with a 3.5L gasoline engine or 2.5L hybrid engine are equipped with a TCM . The PCM controls the transmission on 2.5L gasoline and 3.0L gasoline engine vehicles.



This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- TCM

PINPOINT TEST G: THE TCM DOES NOT RESPOND TO THE SCAN TOOL

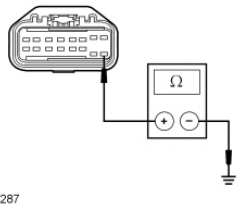


NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

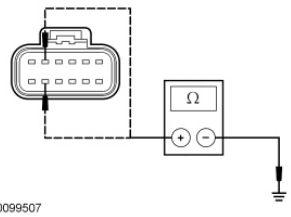
NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
G1 CHECK THE TCM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: TCM C1458a (2.5L Hybrid) . • Disconnect: TCM C1533 (3.5L) . • Ignition ON. • For 3.5L, measure the voltage between the TCM C1533-1, circuit SBB16 (VT/RD), harness side and ground; and between the TCM C1533-11, circuit CBP44 (VT), harness side and ground.  N0056286 • For 2.5L hybrid, measure the voltage between the TCM , harness side and ground as follows:	**Yes** GO to G2 . **No** For 3.5L gasoline, VERIFY the Battery Junction Box (BJB) fuse 16 (15A) or Smart Junction Box (SJB) fuse 44 (10A) is OK. For 2.5L hybrid, VERIFY the BJB fuse 23 (10A) or fuse 39 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

Connector-Pin	Circuit



C1458a-4	CBB39 (VT/WH)
C1458a-5	CBB39 (VT/WH)
C1458a-12	SBB23 (RD)

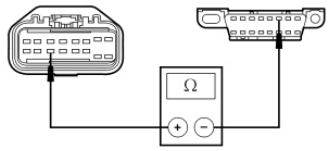


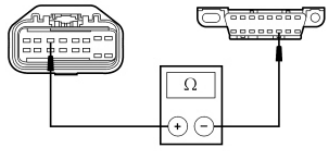
- **Are the voltages greater than 10 volts?**

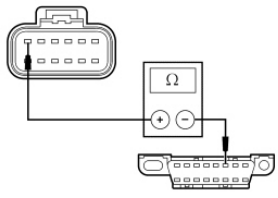
G2 CHECK THE TCM GROUND CIRCUITS FOR AN OPEN

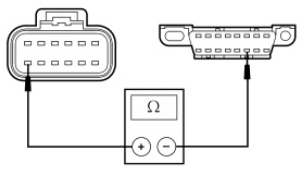
- Ignition OFF.
- Disconnect: Negative Battery Cable .
- For 3.5L gasoline, measure the resistance between the TCM C1533-9, circuit GD120 (BK/GN), harness side and ground.

- For 2.5L hybrid measure the resistance between the TCM C1458a-2, circuit GD121 (BK/YE), harness side and ground; and between the TCM C1458a-8, circuit GD121 (BK/YE), harness side and ground.









- **Are the resistances less than 5 ohms?**

Yes
For 3.5L engine, GO to G3 .

For 2.5L hybrid engine, GO to G4 .

No
REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

G3 CHECK THE HS-CAN CIRCUITS BETWEEN THE TCM AND THE DLC FOR AN OPEN - 3.5L ENGINE

• Measure the resistance between the TCM C1533-14, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026662 • Measure the resistance between t TCM C1533-6, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026663 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to G5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
G4 CHECK THE HS-CAN CIRCUITS BETWEEN THE TCM AND THE DLC FOR AN OPEN - 2.5L HYBRID ENGINE	
Measure the resistance between the TCM C1458a-1, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0099508 • Measure the resistance between the TCM C1458a-7, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099509	**Yes** CONNECT the negative battery cable. GO to G5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

• **Are the resistances less than 5 ohms?**	
G5 CHECK FOR CORRECT TCM OPERATION	
• Disconnect all the TCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the TCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new TCM . REFER to Section 307-01B . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test H: The 4X4 Control Module Does Not Respond To The Scan Tool

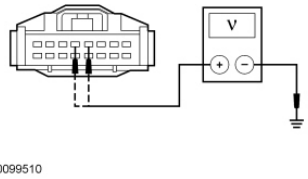
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

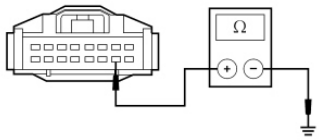
Refer to Wiring Diagrams Cell 34 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), All-Wheel Drive (AWD) for schematic and connector information.

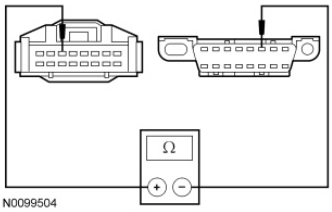
Normal Operation

The 4X4 control module communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).

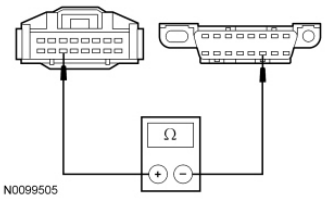
This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- 4X4 control module



PINPOINT TEST H: THE 4X4 CONTROL MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
H1 CHECK THE 4X4 CONTROL MODULE VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: 4X4 Control Module C3253 . • Ignition ON. • Measure the voltage between the 4X4 control module C3253-4, circuit CBP35 (YE/GY), harness side and ground;	**Yes** GO to H2 . **No** VERIFY the Smart Junction Box (SJB) fuse 11 (10A) or 35 (10A) is

and between the 4X4 control module C3253-5, circuit SBP11 (BU/RD), harness side and ground.  N0099510 • **Are the voltages greater than 10 volts?**	OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool.
H2 CHECK THE 4X4 CONTROL MODULE GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the 4X4 control module C3253-15, circuit GD126 (BK/WH), harness side and ground.  A0088928 • **Is the resistance less than 5 ohms?**	**Yes** GO to H3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
H3 CHECK THE HS-CAN CIRCUITS BETWEEN THE 4X4 CONTROL MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the 4X4 control module C3253-3, circuit VDB04 (WH/BU), harness side and the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side.  N0099504 • Measure the resistance between the 4X4 control module C3253-11, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** CONNECT the negative battery cable. GO to H4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
H4 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Disconnect the 4X4 control module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the 4X4 control module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to Section 308-07A . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

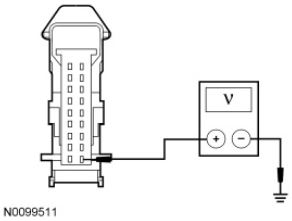
Pinpoint Test I: The Headlamp Control Module (HCM) Does Not Respond To The Scan Tool

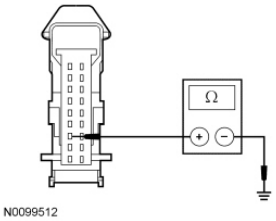
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 85 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Headlamps/Autolamps for schematic and connector information.

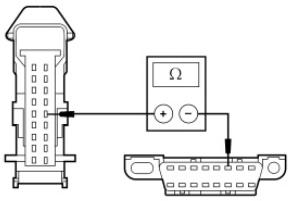
Normal Operation

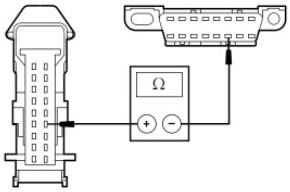
The Headlamp Control Module (HCM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).





This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- HCM

PINPOINT TEST I: THE HCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
I1 CHECK THE HCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: HCM C1600 . • Ignition ON. • Measure the voltage between the HCM C1600-10, circuit CBP42 (GN), harness side and ground.  N0099511 • **Is the voltage greater than 10 volts?**	**Yes** GO to I2 . **No** VERIFY the Smart Junction Box (SJB) fuse 42 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the short circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
I2 CHECK THE HCM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the HCM C1600-3, circuit GD121 (BK/YE), harness side and ground.  N0099512 • **Is the resistance less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
I3 CHECK THE HS-CAN CIRCUITS BETWEEN THE HCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the HCM C1600-14, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.	**Yes** CONNECT the negative battery cable. GO to I4 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0099513 • Measure the resistance between the HCM C1600-13, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099514 • **Are the resistances less than 5 ohms?**	
I4 CHECK FOR CORRECT HCM OPERATION	
• Disconnect the HCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the HCM connector and make sure it seats correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HCM . REFER to Section 417-01 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

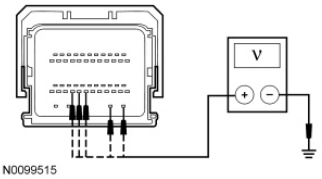
Pinpoint Test J: The Battery Energy Control Module (BECM) Does Not Respond To The Scan Tool

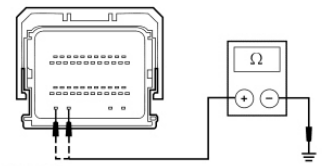
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

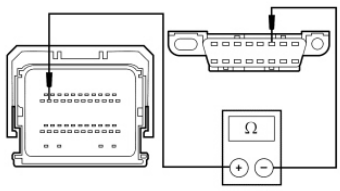
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

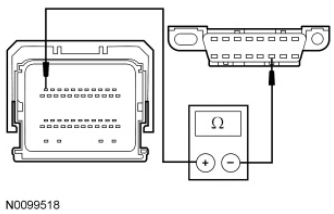
Normal Operation

The Battery Energy Control Module (BECM) is present on hybrid vehicles only. The BECM communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).









This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- BECM

PINPOINT TEST J: THE BECM DOES NOT RESPOND TO THE SCAN TOOL

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
J1 CHECK THE POWER TO THE BECM	
⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Disconnect: BECM C4237a . • Ignition ON. • Measure the voltage between the BECM , harness side and ground as follows: **Connector-Pin / Circuit** C4237a-41 CBB48 (GY/YE) C4237a-42 CBB48 (GY/YE) C4237a-43 CBB48 (GY/YE) C4237a-47 SBB17 (RD) C4237a-48 SBB17 (RD)	**Yes** GO to J2 . **No** VERIFY the Battery Junction Box (BJB) fuse 17 (10A) or 48 (20A) are OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0099515 • **Are the voltages greater than 10 volts?**	
J2 CHECK THE BECM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the BECM C4237a-49, circuit GD126 (BK/WH), harness side and ground; and between the BECM C4237a-50, circuit GD126 (BK/WH), harness side and ground  N0099516 • **Are the resistances less than 5 ohms?**	**Yes** GO to J3 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
J3 CHECK THE HS-CAN CIRCUITS BETWEEN THE BECM AND THE DLC FOR AN OPEN	
• Measure the resistance between the BECM C4237a-22, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0099517 • Measure the resistance between the BECM C4237a-11, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099518	**Yes** CONNECT the negative battery cable. GO to J4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

• **Are the resistances less than 5 ohms?**	
J4 CHECK FOR CORRECT BECM OPERATION	
NOTE: Do not disconnect the high voltage cables or connectors in the following step. • Disconnect the BECM **LOW VOLTAGE** connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the BECM **LOW VOLTAGE** connectors and make they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Section 414-03 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test K: The Air Conditioning Compressor Module (ACCM) Does Not Respond To The Scan Tool

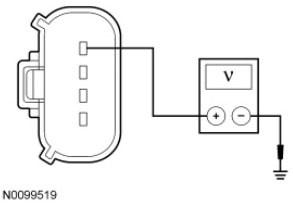
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

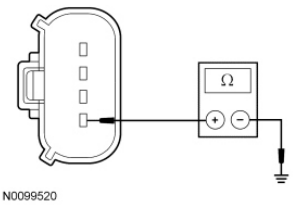
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

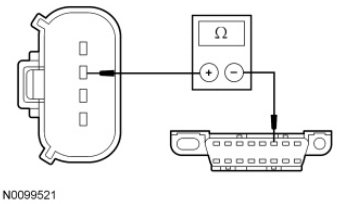
Normal Operation

The Air Conditioning Compressor Module (ACCM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

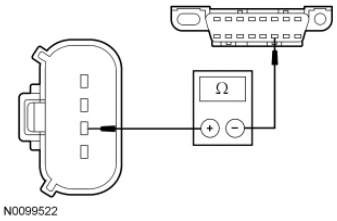
This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- ACCM



PINPOINT TEST K: THE ACCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
K1 CHECK THE ACCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: ACCM C1469a . • Ignition ON. • Measure the voltage between the ACCM C1469a-1, circuit CBK03 (GY), harness side and ground.  N0099519 • **Is the voltage greater than 10 volts?**	**Yes** GO to K2 . **No** VERIFY theBattery Junction Box (BJB) fuse 47 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
K2 CHECK THE ACCM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the ACCM C1469a-4, circuit GD123 (BK/GY), harness side and ground.  N0099520 • **Is the resistance less than 5 ohms?**	**Yes** GO to K3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
K3 CHECK THE HS-CAN CIRCUITS BETWEEN THE ACCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the ACCM C1469a-2, circuit VDB04 (WH/BU), harness side and the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side.  N0099521 • Measure the resistance between the ACCM C1469a-3, circuit VDB05 (WH), harness side and	**Yes** CONNECT the negative battery cable. GO to K4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

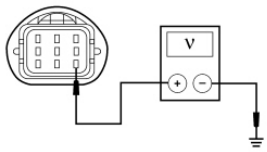
the DLC C251-14, circuit VDB05 (WH), harness side.  • **Are the resistances less than 5 ohms?**	
K4 CHECK FOR CORRECT ACCM OPERATION	
• Disconnect the ACCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ACCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACCM . REFER to Section 412-01 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test L: The DC to DC Converter Control Module (DC/DC) Does Not Respond To The Scan Tool

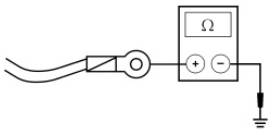
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

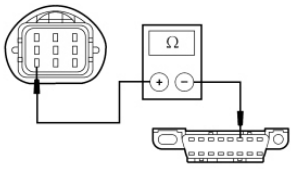
Refer to Wiring Diagrams Cell 12 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Charging System for schematic and connector information.

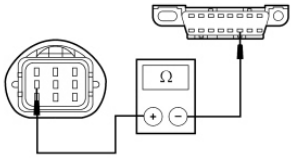
Normal Operation



The DC to DC Converter Control Module (DC/DC) is present on hybrid vehicles only. The DC/DC communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).







This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DC/DC

PINPOINT TEST L: THE DC/DC DOES NOT RESPOND TO THE SCAN TOOL

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
L1 CHECK THE DC/DC VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
⚠ WARNING: To prevent the risk of high-voltage shock, always follow precisely all warnings and service instructions, including instructions to depower the system. The high-voltage system utilizes approximately 300 volts DC, provided through high-voltage cables to its components and modules. The high-voltage cables and wiring are identified by orange harness tape or orange wire covering. All high-voltage components are marked with high-voltage warning labels with a high-voltage symbol. Failure to follow these instructions may result in serious personal injury or death. **⚠ WARNING: Always wear high-voltage insulated safety gloves with leather outer gloves and a face shield when servicing the battery pack sensor module (BPSM) and never remove the high-voltage BPSM connector unless directed by a service procedure. High voltage is present at the BPSM at all times, even with service disconnect plug removal . Depowering the system will not remove voltage from the BPSM connector with the orange harness. Follow all service instructions. Failure to follow these instructions may result in serious personal injury or death.** • Ignition OFF. • Disconnect: DC/DC C1457d . • Ignition ON. • Measure the voltage between the DC/DC C1457d-7, circuit CBK03 (GY), harness side and ground.  N0099523 • **Are the voltages greater than 10 volts?**	**Yes** GO to L2 . **No** VERIFY the Battery Junction Box (BJB) fuse 47 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
L2 CHECK THE DC/DC GROUNDS	
• Ignition OFF. • Disconnect: Negative Battery Cable . • **NOTE:** Do not disconnect the DC/DC ground eyelet C1457c. The measurement is taken between the negative battery eyelet and chassis ground. • Measure the resistance between the DC/DC C1457c-1, circuit GD108 (BK/VT), harness side and ground.	**Yes** GO to L3 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0099524 • **Is the resistance less than 5 ohms?**	
L3 CHECK THE HS-CAN CIRCUITS BETWEEN THE DC/DC AND THE DLC FOR AN OPEN	
• Measure the resistance between the DC/DC C1457d-9, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0099525 • Measure the resistance between the DC/DC C1457d-6, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099526 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to L4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
L4 CHECK FOR CORRECT DC/DC OPERATION	
NOTE: Do not disconnect the high voltage cables or connectors in the following step. • Disconnect the DC/DC **LOW VOLTAGE** connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the DC/DC **LOW VOLTAGE** connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DC/DC . REFER to Section 414-05 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network

	test with the scan tool.

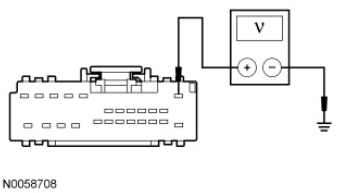
Pinpoint Test M: The Audio Front Control Module (ACM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

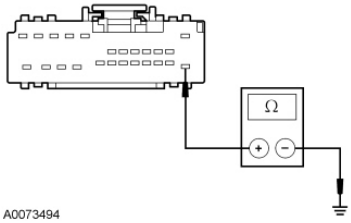
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

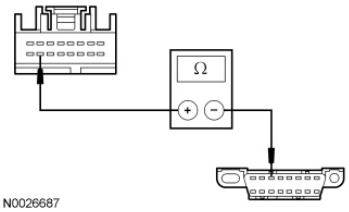
Normal Operation

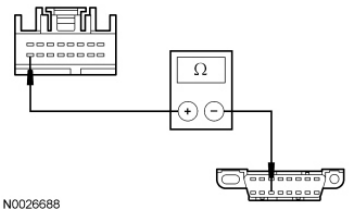
The Audio Front Control Module (ACM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).



This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- ACM

PINPOINT TEST M: THE ACM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
M1 CHECK THE ACM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: ACM C240a . • Ignition ON. • Measure the voltage between the ACM C240a-1, circuit SBP39 (WH/RD), harness side and ground.  N0058708 • **Is the voltage greater than 10 volts?**	**Yes** GO to M2 . **No** VERIFY the Smart Junction Box (SJB) fuse 39 (20A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

M2 CHECK THE ACM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the ACM C240a-13, circuit GD114 (BK/BU), harness side and ground.  A0073494 • **Is the resistance less than 5 ohms?**	**Yes** GO to M3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
M3 CHECK THE MS-CAN CIRCUITS BETWEEN THE ACM AND THE DLC FOR AN OPEN	
• Disconnect: ACM C240c . • Measure the resistance between the ACM C240c-15, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0026687 • Measure the resistance between the ACM C240c-16, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0026688 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to M4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
M4 CHECK FOR CORRECT ACM OPERATION	

• Disconnect all the ACM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the ACM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ACM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test N: The Front Controls Interface Module (FCIM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

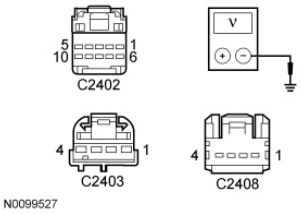
Normal Operation

The Front Controls Interface Module (FCIM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- FCIM

PINPOINT TEST N: THE FCIM DOES NOT RESPOND TO THE SCAN TOOL

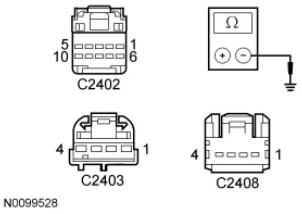


NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

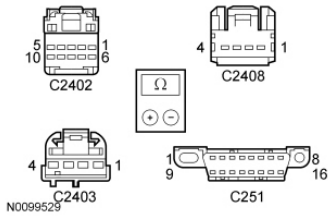
Test Step	Result / Action to Take
N1 CHECK THE FCIM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: FCIM C2403 (Without Navigation), FCIM C2408 (With Navigation, Except MKZ) or FCIM C2402 (With Navigation, MKZ) . • Ignition ON. • Measure the voltage between the FCIM , harness side and ground as follows:	**Yes** GO to N2 . **No** VERIFY the Smart Junction Box (SJB) fuse 14 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

	CLEAR the DTCs. REPEAT the network test with the scan tool.



FCIM Connector-Pin	Circuit
C2402-5	SBP14 (BN/RD)
C2403-1	SBP14 (BN/RD)
C2408-1	SBP14 (BN/RD)

- **Is the voltage greater than 10 volts?**



N2 CHECK THE FCIM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the FCIM , harness side and ground as follows:	**Yes** GO to N3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

FCIM Connector-Pin	Circuit
C2402-8	GD116 (BK/VT)
C2403-2	GD116 (BK/VT)
C2408-4	GD116 (BK/VT)

- **Is the resistance less than 5 ohms?**

N3 CHECK THE MS-CAN CIRCUITS BETWEEN THE FCIM AND THE DLC FOR AN OPEN	

• Measure the resistance between the FCIM , harness side and the Data Link Connector (DLC) harness side as follows: **FCIM Connector-Pin** / **Circuit** / **DLC Connector-Pin** / **Circuit** C2402-1 / VDB06 (GY/OG) / C251-3 / VDB06 (GY/OG) C2402-2 / VDB07 (VT/OG) / C251-11 / VDB07 (VT/OG) C2403-3 / VDB06 (GY/OG) / C251-3 / VDB06 (GY/OG) C2403-4 / VDB07 (VT/OG) / C251-11 / VDB07 (VT/OG) C2408-2 / VDB06 (GY/OG) / C251-3 / VDB06 (GY/OG) C2408-3 / VDB07 (VT/OG) / C251-11 / VDB07 (VT/OG)  • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to N4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
N4 CHECK FOR CORRECT FCIM OPERATION	
• Disconnect the FCIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FCIM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new FCIM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

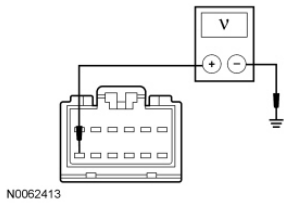
Pinpoint Test O: The Front Display Interface Module (FDIM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

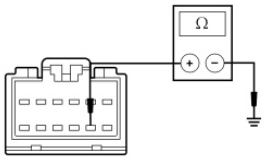
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

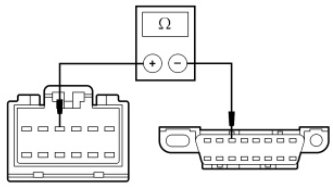
Normal Operation

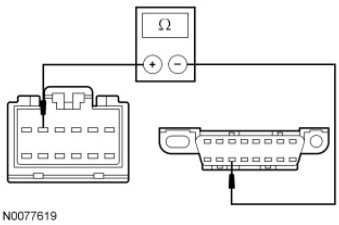
The Front Display Interface Module (FDIM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).



This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- FDIM

PINPOINT TEST O: THE FDIM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
O1 CHECK THE FDIM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: FDIM C2407 . • Ignition ON. • Measure the voltage between the FDIM C2407-12, circuit SBP14 (BN/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to O2 . **No** VERIFY the Smart Junction Box (SJB) fuse 14 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
O2 CHECK THE FDIM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the FDIM C2407-8, circuit GD116 (BK/VT), harness side and ground.	**Yes** GO to O3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0077731 • **Is the resistance less than 5 ohms?**	
O3 CHECK THE MS-CAN CIRCUITS BETWEEN THE FDIM AND THE DLC FOR AN OPEN	
• Measure the resistance between the FDIM C2407-4, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0077618 • Measure the resistance between the FDIM C2407-5, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0077619 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to O4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
O4 CHECK FOR CORRECT FDIM OPERATION	
• Disconnect the FDIM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the FDIM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new FDIM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

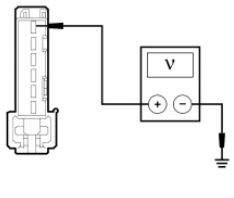
Pinpoint Test P: The Global Positioning System Module (GPSM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

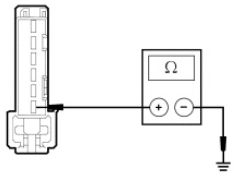
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

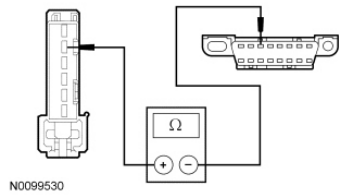
Normal Operation

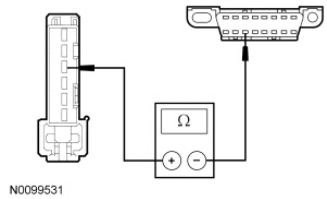
The Global Positioning System Module (GPSM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).



This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- GPSM

PINPOINT TEST P: THE GPSM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
P1 CHECK THE GPSM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: GPSM C2300 . • Ignition ON. • Measure the voltage between the GPSM C2300-1, circuit SBP14 (BN/RD), harness side and ground.  N0094349 • **Is the voltage greater than 10 volts?**	**Yes** GO to P2 . **No** VERIFY the Smart Junction Box (SJB) fuse 14 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
P2 CHECK THE GPSM GROUND CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the GPSM C2300-6, circuit GD116 (BK/VT), harness side and ground.  N0094350 • **Is the resistance less than 5 ohms?**	**Yes** GO to P3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
P3 CHECK THE MS-CAN CIRCUITS BETWEEN THE GPSM AND THE DLC FOR AN OPEN	
• Measure the resistance between the GPSM C2300-2, circuit VDB06 (GY/OG), harness side and the Data Link Connector (DLC) C251-3, circuit VDB06 (GY/OG), harness side.  N0099530 • Measure the resistance between the GPSM C2300-3, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0099531 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to P4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
P4 CHECK FOR CORRECT GPSM OPERATION	
• Disconnect the GPSM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new GPSM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No**

• Connect the GPSM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test Q: The Interior Lighting Control Module (ILCM) Does Not Respond To The Scan Tool

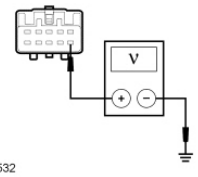
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

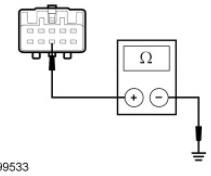
Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

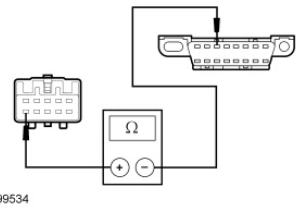
Normal Operation

The Interior Lighting Control Module (ILCM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

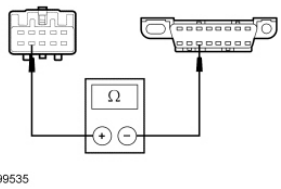
This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- ILCM



PINPOINT TEST Q: THE ILCM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
Q1 CHECK THE ILCM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: In-Line ILCM C2238 . • Ignition ON. • Measure the voltage between the in-line ILCM C2238-10, circuit SBP14 (BN/RD), harness side (male) and ground.	**Yes** GO to Q2 . **No** VERIFY the Smart Junction Box (SJB) fuse 14 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0099532 • **Is the voltage greater than 10 volts?**	
Q2 CHECK THE ILCM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the in-line ILCM C2238-8, circuit GD116 (BK/VT), harness side (male) and ground.  N0099533 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
Q3 CHECK THE MS-CAN CIRCUITS BETWEEN THE ILCM AND THE DLC FOR AN OPEN	
• Measure the resistance between the in-line ILCM C2238-6, circuit VDB06 (GY/OG), harness side (male) and the Data Link Connector (DLC) C251-3, circuit VDB06 (GY/OG), harness side.  N0099534 • Measure the resistance between the in-line ILCM C2238-7, circuit VDB07 (VT/OG), harness side (male) and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to Q4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
Q4 CHECK FOR CORRECT ILCM OPERATION	
• Disconnect the ILCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ILCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ILCM . REFER to Section 417-02 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test R: The Side Obstacle Detection Control Module - Left (SOD-L) Does Not Respond To The Scan Tool

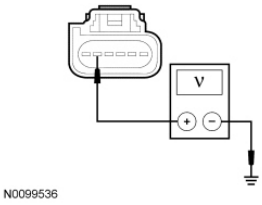
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

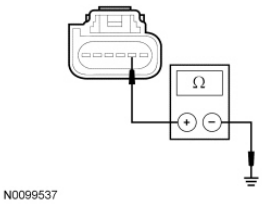
Refer to Wiring Diagrams Cell 131 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking Aid for schematic and connector information.

Normal Operation

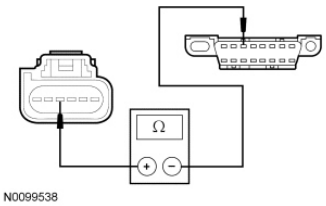
The Side Obstacle Detection Control Module - Left (SOD-L) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

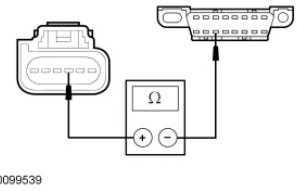
This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- SOD-L





PINPOINT TEST R: THE SOD-L DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take

R1 CHECK THE SOD-L VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: SOD-L C4230 . • Ignition ON. • Measure the voltage between the SOD-L C4230-5, circuit CBP35 (YE/GY), harness side and ground.  N0099536 • **Is the voltage greater than 10 volts?**	**Yes** GO to R2 . **No** VERIFY the Smart Junction Box (SJB) fuse 35 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
R2 CHECK THE SOD-L GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the SOD-L C4230-2, circuit GD171 (BK/GY), harness side and ground.  N0099537 • **Is the resistance less than 5 ohms?**	**Yes** GO to R3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
R3 CHECK THE MS-CAN CIRCUITS BETWEEN THE SOD-L AND THE DLC FOR AN OPEN	
• Measure the resistance between the SOD-L C4230-4, circuit VDB06 (GY/OG), harness side and the Data Link Connector (DLC) C251-3, circuit VDB06 (GY/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to R4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0099538 • Measure the resistance between the SOD-L C4230-3, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0099539 • **Are the resistances less than 5 ohms?**	
R4 CHECK FOR CORRECT SOD-L OPERATION	
• Disconnect the SOD-L connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-L connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-L . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test S: The Side Obstacle Detection Control Module - Right (SOD-R) Does Not Respond To The Scan Tool

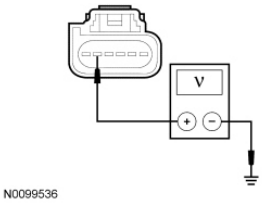
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

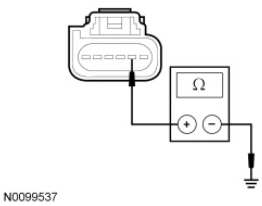
Refer to Wiring Diagrams Cell 131 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking Aid for schematic and connector information.

Normal Operation

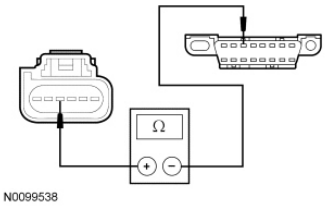
The Side Obstacle Detection Control Module - Right (SOD-R) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

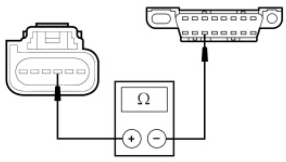
This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors





- SOD-R

PINPOINT TEST S: THE SOD-R DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
S1 CHECK THE SOD-R VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: SOD-R C4229 . • Ignition ON. • Measure the voltage between the SOD-R C4229-5, circuit CBP35 (YE/GY), harness side and ground.  N0099536 • **Is the voltage greater than 10 volts?**	**Yes** GO to S2 . **No** VERIFY the Smart Junction Box (SJB) fuse 35 (10A) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short. CLEAR the DTCs. REPEAT the network test with the scan tool.
S2 CHECK THE SOD-R GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the SOD-R C4229-2, circuit GD171 (BK/GY), harness side and ground.  N0099537 • **Is the resistance less than 5 ohms?**	**Yes** GO to S3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
S3 CHECK THE MS-CAN CIRCUITS BETWEEN THE SOD-R AND THE DLC FOR AN OPEN	

• Measure the resistance between the SOD-R C4229-4, circuit VDB06 (GY/OG), harness side and the Data Link Connector (DLC) C251-3, circuit VDB06 (GY/OG), harness side.  N0099538 • Measure the resistance between the SOD-R C4229-3, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0099539 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to S4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
S4 CHECK FOR CORRECT SOD-R OPERATION	
• Disconnect the SOD-R connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-R connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-R . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

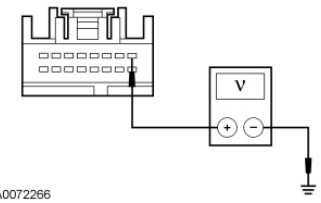
Pinpoint Test T: The Parking Aid Module (PAM) Does Not Respond To The Scan Tool

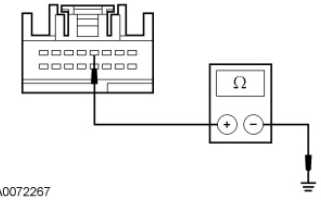
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 131 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Parking Aid for schematic and connector information.

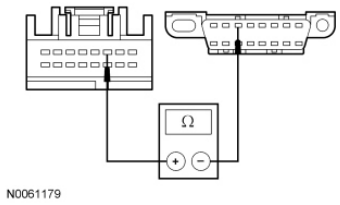
Normal Operation

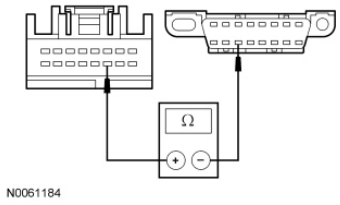
The Parking Aid Module (PAM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).





This pinpoint test is intended to diagnose the following:





- Fuse
- Wiring, terminals or connectors
- PAM

PINPOINT TEST T: THE PAM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
T1 CHECK THE PAM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PAM C4014 . • Ignition ON. • Measure the voltage between the PAM C4014-1, circuit CBP35 (YE/GY), harness side and ground.  A0072266 • **Is the voltage greater than 10 volts?**	**Yes** GO to T2 . **No** VERIFY the Smart Junction Box (SJB) fuse 35 (10A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the short circuit. TEST the system for normal operation.
T2 CHECK THE PAM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the PAM C4014-4, circuit GD171 (BK/GY), harness side and ground.  A0072267 • **Is the resistance less than 5 ohms?**	**Yes** GO to T3 . **No** REPAIR the circuit. CONNECT the negative battery cable. TEST the system for normal operation.

T3 CHECK THE MS-CAN CIRCUITS BETWEEN THE PAM AND THE DLC FOR AN OPEN	
• Measure the resistance between the PAM C4014-3, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0061179 • Measure the resistance between the PAM C4014-11, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0061184 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to T4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
T4 CHECK FOR CORRECT PAM OPERATION	
• Disconnect the PAM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the PAM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PAM . REFER to Section 413-13 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test U: The Smart Junction Box (SJB) Does Not Respond To The Scan Tool

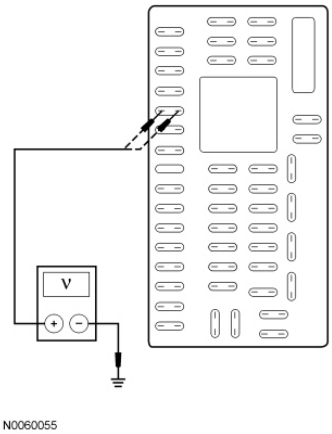
Refer to Wiring Diagrams Cell 10 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Grounds for schematic and connector information.

Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

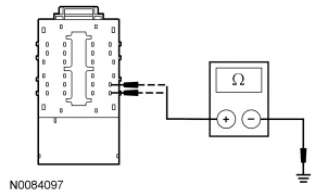
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

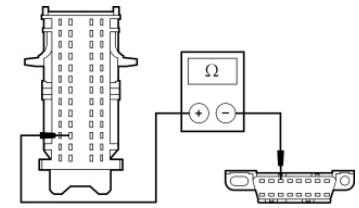
Normal Operation

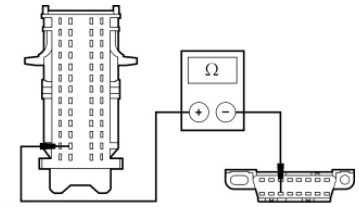
The Smart Junction Box (SJB) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).



This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- SJB

PINPOINT TEST U: THE SJB DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
U1 CHECK THE SJB VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition ON. • **NOTE:** Measurements are taken with the fuses installed. • Measure the voltage between the SJB fuse 5 (10A) and ground.  N0060055 • **Is the voltage greater than 10 volts?**	**Yes** GO to U2 . **No** VERIFY the SJB fuse 5 (10A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
U2 CHECK THE SJB GROUND CIRCUIT FOR AN OPEN	

• Ignition OFF. • Disconnect: Negative Battery Cable . • Disconnect: SJB C2280d . • Measure the resistance between the SJB C2280d-8, circuit GD126 (BK/WH), harness side and ground; and between the SJB C2280d-12, circuit GD126 (BK/WH), harness side and ground.  N0084097 • **Are the resistances less than 5 ohms?**	**Yes** GO to U3 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
U3 CHECK THE MS-CAN CIRCUITS BETWEEN THE SJB AND THE DLC FOR AN OPEN	
• Disconnect: SJB C2280b . • Measure the resistance between the SJB C2280b-37, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0064664 • Measure the resistance between the SJB C2280b-38, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0064665 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to U4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
U4 CHECK FOR CORRECT SJB OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No**

• Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test V: The HVAC Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

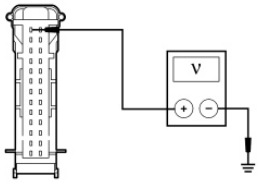
Refer to Wiring Diagrams Cell 54 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Manual Climate Control for schematic and connector information.

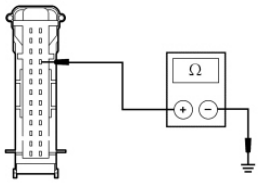
Refer to Wiring Diagrams Cell 55 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Automatic Climate Control System for schematic and connector information.

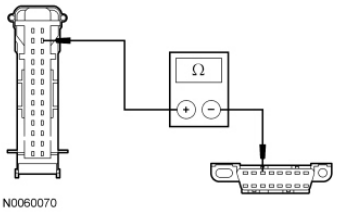
Normal Operation

The HVAC module communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

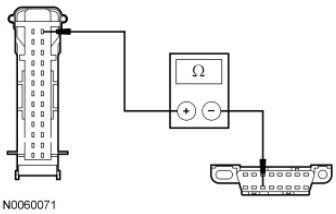
This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- HVAC module



PINPOINT TEST V: THE HVAC MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
V1 CHECK THE HVAC VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: HVAC Module C2357a (Manual A/C) . • Disconnect: HVAC Module C2356a (Dual Automatic Temperature Control (DATC)) . • Ignition ON. • Measure the voltage between the HVAC module C2357a-13 (manual), C228a-13 or C2356a-13 (DATC), circuit SBP15 (WH/RD), harness side and ground.	**Yes** GO to V2 . **No** VERIFY Smart Junction Box (SJB) fuse 15 (10A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

 N0084098 • **Is the voltage greater than 10 volts?**	
V2 CHECK THE HVAC GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the HVAC module C2357a-23 (manual), C228a-23 or C2356a-23 (DATC), circuit GD116 (BK/VT), harness side and ground.  N0057261 • **Is the resistance less than 5 ohms?**	**Yes** GO to V3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
V3 CHECK THE MS-CAN CIRCUITS BETWEEN THE HVAC MODULE AND THE DLC FOR AN OPEN	
• Measure the resistance between the HVAC module C2357a-25 (manual), C228a-25 or C2356a-25 (DATC), circuit VDB06 (GY/OG), harness side and the Data Link Connector (DLC) C251-3, circuit VDB06 (GY/OG), harness side.  N0060070 • Measure the resistance between the HVAC module C2357a-26 (manual), C228a-26 or C2356a-26 (DATC), circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to V4 . **No** REPAIR the circuit as necessary. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
V4 CHECK FOR CORRECT HVAC MODULE OPERATION	
• Disconnect all the HVAC module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the HVAC module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HVAC module. REFER to Section 412-01 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test W: The Audio Digital Signal Processing (DSP) Module Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

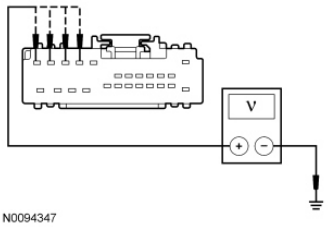
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

Normal Operation

The audio Digital Signal Processing (DSP) module communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

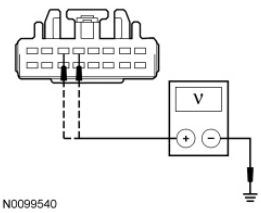
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Audio DSP module



PINPOINT TEST W: THE AUDIO DSP MODULE DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

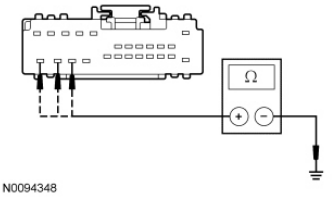


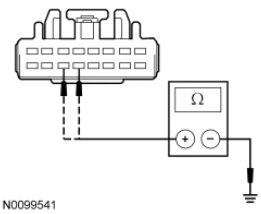
NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>W1 CHECK THE AUDIO DSP MODULE VOLTAGE SUPPLY CIRCUITS FOR AN OPEN</td><td></td></tr>
<tr><td>

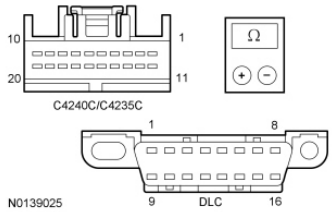
Ignition OFF.
Disconnect: Audio DSP Module C4235a (THX®) or C4240a (Sony®) .
Ignition ON.
For THX® sound, measure the voltage between the audio DSP module, harness side and ground as follows:

<table>
<tr><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>C4235a-9</td><td>SBB20 (GN/RD)</td></tr>
<tr><td>C4235a-10</td><td>SBB20 (GN/</td></tr>
<tr><td>C4235a-11</td><td>SBB21 (GY/RD)</td></tr>
<tr><td>C4235a-12</td><td>SBB21 (GY/RD)</td></tr>
</table>





For Sony® sound, measure the voltage between the audio DSP module, harness side and ground as follows:



<table>
<tr><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>C4240a-5</td><td>SBP19 (BU/RD)</td></tr>
<tr><td>C4240a-6</td><td>SBP19 (BU/RD)</td></tr>
</table>

Are the voltages greater than 10 volts?

</td><td>Yes
GO to W2 .

No
VERIFY the Smart Junction Box (SJB) fuse 19 (25A) (Sony® sound), or Battery Junction Box (BJB) fuse 20 (20A) or 21 (20A) (THX® sound) is OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the short circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.</td></tr>
<tr><td></td><td></td></tr>
</table>

W2 CHECK THE AUDIO DSP MODULE GROUND CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • For THX® sound, measure the resistance between the audio DSP module, harness side and ground as follows: **Connector-Pin / Circuit** C4235a-22 GD148 (BK/YE) C4235a-23 GD148 (BK/YE) C4235a-24 GD148 (BK/YE)  N0094348 • For Sony® sound, measure the resistance between the audio DSP module, harness side and ground as follows: **Connector-Pin / Circuit** C4240a-13 GD148 (BK/YE) C4240a-14 GD148 (BK/YE)  N0099541 • **Are the resistances less than 5 ohms?**	**Yes** GO to W3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
W3 CHECK THE MS-CAN CIRCUITS BETWEEN THE AUDIO DSP MODULE AND THE DLC FOR AN OPEN	

• Disconnect: Audio DSP Module C4235c (THX®) or C4240c (Sony®) . • Measure the resistance between the Medium Speed CAN circuits: ♦ For THX® sound, audio DSP module C4235c-11 and the DLC C251-3, circuit VDB06 (GY/OG), harness side. ♦ For THX® sound, audio DSP module C4235c-1 and the DLC C251-11, circuit VDB07 (VT/OG), harness side. ♦ For Sony® sound, audio DSP module C4240c-1 and the DLC C251-3, circuit VDB06 (GY/OG), harness side. ♦ For Sony® sound, audio DSP module C4240c-11 and the DLC C251-11, circuit VDB07 (VT/OG), h side.  • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable.GO to W4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
W4 CHECK FOR CORRECT AUDIO DSP MODULE OPERATION	
• Disconnect all the audio DSP module connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the audio DSP module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new audio DSP module. REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

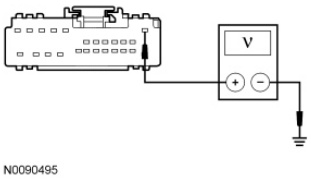
Pinpoint Test X: The Driver Door Module (DDM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

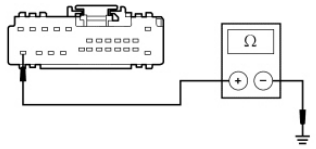
Refer to Wiring Diagrams Cell 123 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Memory Seats for schematic and connector information.

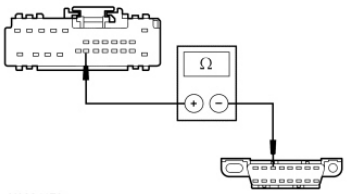
Normal Operation

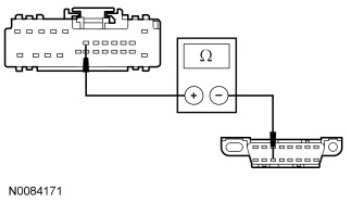
The Driver Door Module (DDM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).



This pinpoint test is intended to diagnose the following:







- Fuse
- Wiring, terminals or connectors
- DDM

PINPOINT TEST X: THE DRIVER DOOR MODULE (DDM) DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
X1 CHECK THE DDM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: DDM C568b . • Ignition ON. • Measure the voltage between the DDM C568b-1, circuit SBP12 (GN/RD), harness side and ground.  N0090495 • **Is the voltage greater than 10 volts?**	**Yes** GO to X2 . **No** VERIFY the Smart Junction Box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the short circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
X2 CHECK THE DDM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the DDM C568b-24, circuit GD126 (BK/WH), harness side and ground.	**Yes** GO to X3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0090496 • **Is the resistance less than 5 ohms?**	
X3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DDM AND THE DLC FOR AN OPEN	
• Measure the resistance between the DDM C568b-19, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0084170 • Measure the resistance between the DDM C568b-7, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0084171 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to X4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
X4 CHECK FOR CORRECT DDM OPERATION	
• Disconnect all the DDM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the DDM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DDM . REFER to Section 501-14 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test Y: The Dual Climate Controlled Seat Module (DCSM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Refer to Wiring Diagrams Cell 119 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Climate Controlled Seats for schematic and connector information.

Normal Operation

The Dual Climate Controlled Seat Module (DCSM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

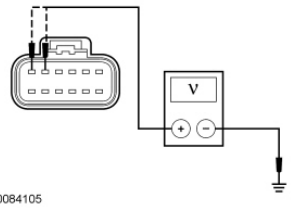
This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DCSM

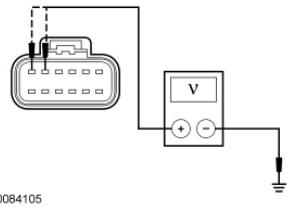
PINPOINT TEST Y: THE DCSM DOES NOT RESPOND TO THE SCAN TOOL

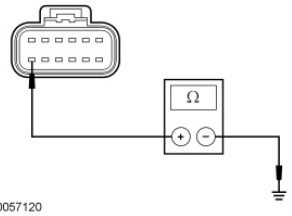
⚠ **WARNING: Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.**

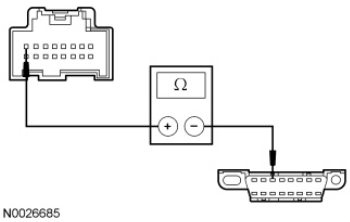
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



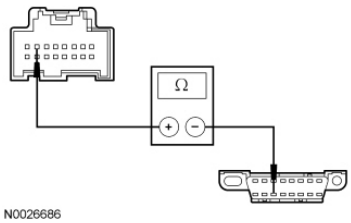
NOTE: If a seat equipped with a Supplemental Restraint System (SRS) component is being serviced, **the SRS must be depowered.** Refer to Section 501-20B .







NOTE: The air bag warning lamp illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate an SRS fault.



NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
Y1 VERIFY VEHICLE EQUIPMENT - SEAT SIDE AIR BAGS	
• Inspect the vehicle for seat side air bags. • **Is the vehicle equipped with seat side air bags?**	**Yes** GO to Y2 . **No** GO to Y3 .
Y2 CHECK THE DCSM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	

• Ignition OFF. • For vehicles with seat side air bags, carry out the following: ♦ Depower the SRS . Refer to Section 501-20B . ♦ Disconnect the driver seat side air bag module C3226. ♦ Connect the restraint system diagnostic tool (418-133) to the driver seat side air bag module C3226. ♦ Disconnect the passenger seat side air bag module C3227. ♦ Connect the restraint system diagnostic tool (418-133) to the passenger seat side air bag module C3227. ♦ Connect the negative battery cable. • Disconnect: DCSM C3305a . • Ignition ON. • Measure the voltage between the DCSM C3305a-E, circuit SBB12 (GN/RD) harness side and ground; and between the DCSM C3305a-F, circuit SBB12 (GN/RD) harness side and ground.  N0084105 • **Are the voltages greater than 10 volts?**	**Yes** GO to Y4 . **No** VERIFY the Battery Junction Box (BJB) fuse 12 (30A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
Y3 CHECK THE DCSM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: DCSM C3305a . • Ignition ON. • Measure the voltage between the DCSM C3305a-E, circuit SBB12 (GN/RD) harness side and ground; and between the DCSM C3305a-F, circuit SBB12 (GN/RD) harness side and ground.	**Yes** GO to Y4 . **No** VERIFY the Battery Junction Box (BJB) fuse 12 (30A) is OK. If OK, REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

 N0084105 • **Are the voltages greater than 10 volts?**	
Y4 CHECK THE DCSM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the DCSM C3305a-M, circuit GD139 (BK/YE), harness side and ground.  N0057120 • **Is the resistance less than 5 ohms?**	**Yes** GO to Y5 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
Y5 CHECK THE MS-CAN CIRCUITS BETWEEN THE DCSM AND THE DLC FOR AN OPEN	
• Disconnect: DCSM C3305c . • Measure the resistance between the DCSM C3305c-1, circuit VDB06 (GY/OG), harness side and the Data Link Connector (DLC) C251-3, circuit VDB06 (GY/OG), harness side.  N0026685 • Measure the resistance between the DCSM C3305c-2, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to Y6 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 • **Are the resistances less than 5 ohms?**	
Y6 CHECK FOR CORRECT DCSM OPERATION	
• Disconnect all the DCSM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the DCSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DCSM . REFER to Section 501-10 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test Z: The Driver Seat Module (DSM) Does Not Respond To The Scan Tool

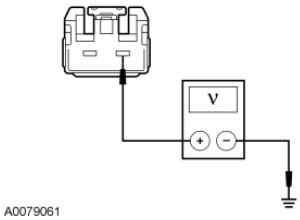
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

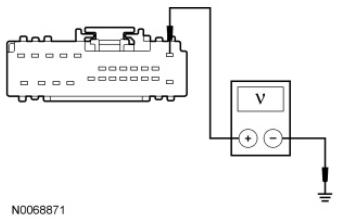
Refer to Wiring Diagrams Cell 123 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Memory Seats for schematic and connector information.

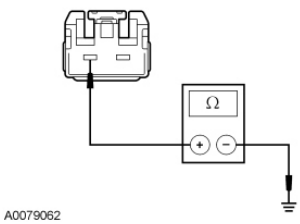
Normal Operation

The Driver Seat Module (DSM) communicates with the scan tool through the Medium Speed Controller Area Network (MS-CAN).

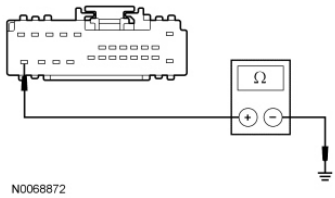
This pinpoint test is intended to diagnose the following:

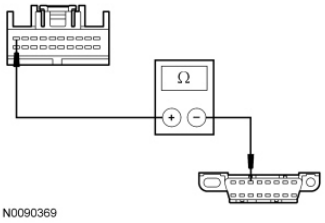


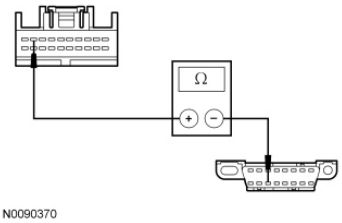




- Fuse
- Wiring, terminals or connectors
- DSM







PINPOINT TEST Z: THE DSM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take

Z1 CHECK THE DSM VOLTAGE SUPPLY CIRCUITS FOR AN OPEN	
• Ignition OFF. • Disconnect: DSM C3299a . • Disconnect: DSM C3299b . • Measure the voltage between the DSM C3299a-1, circuit SBB32 (VT/RD), harness side and ground.  A0079061 • Measure the voltage between the DSM C3299b-1, circuit SBP12 (GN/RD), harness side and ground.  N0068871 • **Are the voltages greater than 10 volts?**	**Yes** GO to Z2 . **No** VERIFY the Battery Junction Box (BJB) fuse 32 (30A) or the Smart Junction Box (SJB) fuse 12 (7.5) are OK. If OK, REPAIR the circuit in question. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the short circuit. CLEAR the DTCs. REPEAT the network test with the scan tool.
Z2 CHECK THE DSM GROUND CIRCUITS FOR AN OPEN	
• Disconnect: Negative Battery Cable . • Measure the resistance between the DSM C3299a-2, circuit GD126 (BK/WH), harness side and ground.  A0079062 • Measure the resistance between the DSM C3299b-24, circuit GD126 (BK/WH), harness side and ground.	**Yes** GO to Z3 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0068872 • **Are the resistances less than 5 ohms?**	
Z3 CHECK THE MS-CAN CIRCUITS BETWEEN THE DSM AND THE DLC FOR AN OPEN	
• Disconnect: DSM C3299d . • Measure the resistance between the DSM C3299d-10, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0090369 • Measure the resistance between the DSM C3299d-9, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0090370 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to Z4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
Z4 CHECK FOR CORRECT DSM OPERATION	
• Disconnect all the DSM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the DSM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present.	**Yes** INSTALL a new DSM . REFER to Section 501-10 . REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

• **Is the concern still present?**	

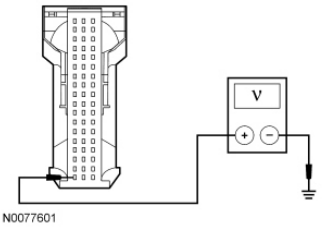
Pinpoint Test AA: The Accessory Protocol Interface Module (APIM) Does Not Respond To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

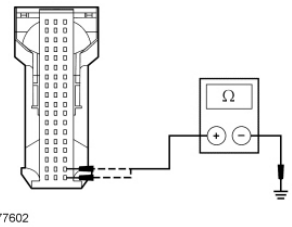
Refer to Wiring Diagrams Cell 130 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Audio System/Navigation for schematic and connector information.

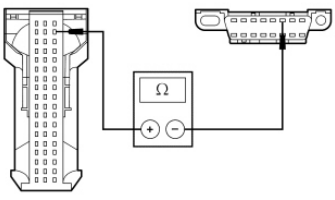
Normal Operation

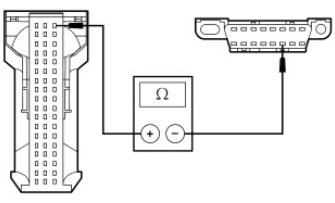
The Accessory Protocol Interface Module (APIM) communicates with the scan tool through the High Speed Controller Area Network (HS-CAN).



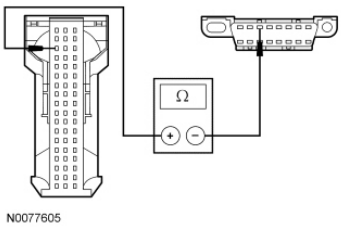
This pinpoint test is intended to diagnose the following:

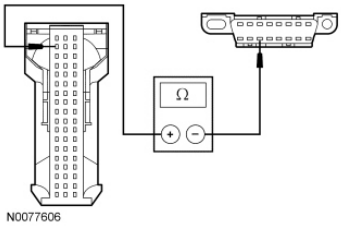






- Fuse
- Wiring, terminals or connectors
- APIM





PINPOINT TEST AA: THE APIM DOES NOT RESPOND TO THE SCAN TOOL

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AA1 CHECK THE APIM VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: APIM C3338 . • Ignition ON. • Measure the voltage between the APIM C3338-1, circuit SBP13 (GY/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to AA2 . **No** VERIFY the Smart Junction Box (SJB) fuse 13 (5A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

AA2 CHECK THE APIM GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the APIM C3338-37, circuit GD148 (BK/YE), harness side and ground; and between the APIM C3338-38, circuit GD148 (BK/YE), harness side and ground.  N0077602 • **Are the resistances less than 5 ohms?**	**Yes** GO to AA3 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
AA3 CHECK THE HS-CAN CIRCUITS BETWEEN THE APIM AND THE DLC FOR AN OPEN	
• Measure the resistance between the APIM C3338-53, circuit VDB04 (WH/BU), harness side and the Data Link Connector (DLC) C251-6, circuit VDB04 (WH/BU), harness side.  N0077603 • Measure the resistance between the APIM C3338-54, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0077604 • **Are the resistances less than 5 ohms?**	**Yes** GO to AA4 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

AA4 CHECK THE MS-CAN CIRCUITS BETWEEN THE APIM AND THE DLC FOR AN OPEN	
• Measure the resistance between the APIM C3338-16, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0077605 • Measure the resistance between the APIM C3338-17, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0077606 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to AA5 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
AA5 CHECK FOR CORRECT APIM OPERATION	
• Disconnect all the APIM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the APIM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Section 415-00 . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test AB: Intermittent No Medium Speed Controller Area Network (MS-CAN) Communication, One Or More Modules Are Not Responding During Network Test

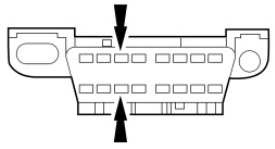
Normal Operation

When one of the 2 Medium Speed Controller Area Network (MS-CAN) circuits becomes open to a module on the network, intermittent or unreliable communication to all modules on the MS-CAN may result.

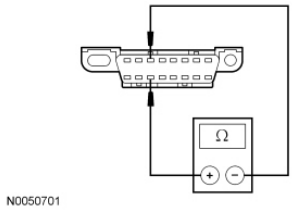
The following modules communicate on the MS-CAN :

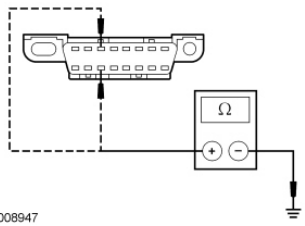
- Accessory Protocol Interface Module (APIM) (if equipped)
- Audio Front Control Module (ACM)
- Audio Digital Signal Processing (DSP) module (if equipped)
- Driver Seat Module (DSM) (if equipped)
- Driver Door Module (DDM) (if equipped)
- Dual Climate Controlled Seat Module (DCSM) (if equipped)
- Front Controls Interface Module (FCIM)
- Front Display Interface Module (FDIM)
- Global Positioning System Module (GPSM) (if equipped)
- HVAC module
- Instrument Panel Cluster (IPC)
- Interior Lighting Control Module (ILCM) (if equipped)
- Parking Aid Module (PAM) (if equipped)
- Side Obstacle Detection Control Module - Left (SOD-L) (if equipped)
- Side Obstacle Detection Control Module - Right (SOD-R) (if equipped)
- Smart Junction Box (SJB)

This pinpoint test is intended to diagnose the following:

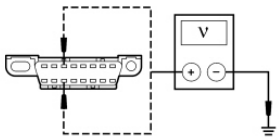


- Circuit VDB06 (GY/OG) (MS-CAN +) open
- Circuit VDB07 (VT/OG) (MS-CAN -) open





PINPOINT TEST AB: INTERMITTENT NO MEDIUM SPEED CONTROLLER AREA NETWORK (MS-CAN) COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST



NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Various network DTCs will set while disabling modules in this test procedure which will need to be cleared after the diagnostic procedure is completed.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AB1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Inspect DLC pins 3 and 11 for damage.  N0053178	**Yes** GO to AB2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.

• **Are DLC pins 3 and 11 OK?**	
AB2 CHECK THE MS-CAN TERMINATION RESISTANCE	
• Disconnect: Negative Battery Cable. • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to AB3 . **No** GO to Pinpoint Test AC .
AB3 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** GO to AB4 . **No** GO to Pinpoint Test AC .
AB4 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect: Negative Battery Cable. • Ignition ON. • Measure the voltage between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to AB5 .

 N0050702 • **Is the voltage greater than 6 volts?**	
AB5 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE SJB DISABLED	
• Disconnect: Smart Junction Box (SJB) Fuse 5 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test U . **No** INSTALL the removed fuse. If the vehicle is equipped with a Dual Climate Controlled Seat Module (DCSM), GO to AB6 . If the vehicle is not equipped with a DCSM , GO to AB7 .
AB6 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DCSM DISABLED	
• Disconnect: SJB Fuse 16 (15A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test Y . **No** INSTALL the removed fuse. GO to AB7 .
AB7 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ACM DISABLED	
• Disconnect: SJB Fuse 39 (20A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test M . **No** INSTALL the removed fuse. If the vehicle is equipped with an audio Digital Signal Processing (DSP) module, GO to AB8 . If the vehicle is not equipped with an audio DSP module, GO to AB9 .
AB8 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE AUDIO DSP MODULE DISABLED	
• Disconnect: BJB Fuses 20 (20A) and 21 (20A) (THX®) or Fuse 19 (25A) (Sony®). • Enter the following diagnostic mode on the scan tool: Networkest.	**Yes** INSTALL the removed fuses. GO to Pinpoint Test W . **No**

• Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	INSTALL the removed fuses. GO to AB9 .
AB9 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE HVAC MODULE DISABLED	
• Disconnect: SJB Fuse 15 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test V . **No** INSTALL the removed fuse. If the vehicle is equipped with an Accessory Protocol Interface Module (APIM), GO to AB10 . If the vehicle is not equipped with an APIM , GO to AB11 .
AB10 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE APIM DISCONNECTED	
• Disconnect: APIM C3342. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test AA . **No** INSTALL the removed fuses. GO to AB11 .
AB11 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE FCIM , FDIM , ILCM (IF EQUIPPED), AND GPSM (IF EQUIPPED) DISABLED	
• Disconnect: SJB Fuse 14 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to AB12 . **No** INSTALL the removed fuse. If the vehicle is equipped with a Driver Door Module (DDM) and/or a Driver Seat Module (DSM), GO to AB16 . If the vehicle is not equipped with a DDM and/or a DSM , GO to AB18 .
AB12 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE FCIM DISCONNECTED	
• Disconnect: Front Controls Interface Module (FCIM) C2402 (With Navigation, MKZ), C2403 (Without Navigation) or C2408 (With Navigation, except MKZ).	**Yes** CONNECT the FCIM . GO to Pinpoint Test N . **No**

• Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	CONNECT the FCIM . If the vehicle is equipped with an Interior Lighting Control Module (ILCM), GO to AB13 . If the vehicle is not equipped with an ILCM , GO to AB14 .
AB13 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ILCM DISCONNECTED	
• Disconnect: In-Line ILCM C2238. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** CONNECT the ILCM . GO to Pinpoint Test Q . **No** CONNECT the ILCM . GO to AB14 .
AB14 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE FDIM DISCONNECTED	
• Disconnect: Front Display Interface Module (FDIM) C2407. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** CONNECT the FDIM . GO to Pinpoint Test O . **No** CONNECT the FDIM . If the vehicle is equipped with a Global Positioning System Module (GPSM), GO to AB15 . If the vehicle is not equipped with a GPSM , an intermittent fault is not present. GO to Pinpoint Test AC .
AB15 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE GPSM DISCONNECTED	
• Disconnect: GPSM C2300. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** CONNECT the GPSM . GO to Pinpoint Test P . **No** An intermittent fault is not present. GO to Pinpoint Test AC .
AB16 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DDM (IF EQUIPPED) AND DSM (IF EQUIPPED) DISABLED	
• Disconnect: SJB Fuse 12 (7.5A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** If the vehicle is equipped with only a DDM , INSTALL the removed fuse. GO to Pinpoint Test X . If the vehicle is equipped with only a DSM , INSTALL the removed fuse. GO to Pinpoint Test Z . If the vehicle is

	equipped with both a DDM and DSM , INSTALL the removed fuse. GO to AB17 . **No** INSTALL the removed fuse. GO to AB18 .
AB17 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DDM DISCONNECTED	
• Disconnect: DDM C568b. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** CONNECT the DDM . GO to Pinpoint Test X . **No** CONNECT the DDM . GO to Pinpoint Test Z .
AB18 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE IPC DISABLED	
• Disconnect: SJB Fuses 26 (15A) and 29 (5A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test C . **No** INSTALL the removed fuses. If the vehicle is equipped with a Parking Aid Module (PAM) and/or side obstacle detection, GO to AB19 . If the vehicle is not equipped with a PAM and/or side obstacle detection, an intermittent fault is not present. GO to Pinpoint Test AC .
AB19 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE PAM (IF EQUIPPED), SOD-L (IF EQUIPPED) AND SOD-R (IF EQUIPPED) DISABLED	
• Disconnect: SJB Fuse 35 (10A). • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** If the vehicle is equipped with only a PAM , INSTALL the removed fuse. GO to Pinpoint Test T . If the vehicle is equipped with only side obstacle detection, INSTALL the removed fuse. GO to AB21 . If the vehicle is equipped with both a PAM and side obstacle detection, INSTALL the removed fuse. GO to AB20 . **No** INSTALL the removed fuse. An intermittent fault is not present. GO to Pinpoint Test AC .

AB20 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE PAM DISCONNECTED	
• Disconnect: PAM C4014. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** CONNECT the PAM . GO to Pinpoint Test T . **No** CONNECT the DDM . GO to AB21 .
AB21 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE SOD-L DISCONNECTED	
• Disconnect: SOD-L C4230. • Enter the following diagnostic mode on the scan tool: Network Test. • Repeat the network test. • **Do all other MS-CAN modules pass the network test?**	**Yes** CONNECT the SOD-L . GO to Pinpoint Test R . **No** CONNECT the SOD-L . GO to Pinpoint Test S .

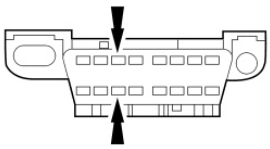
Pinpoint Test AC: No Medium Speed Controller Area Network (MS-CAN) Communication, All Modules Are Not Responding

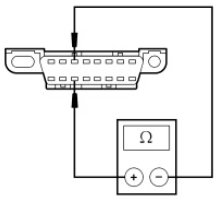
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Normal Operation

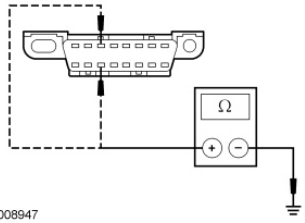
The Medium Speed Controller Area Network (MS-CAN) uses an unshielded twisted pair cable, circuits VDB06 (GY/OG) and VDB07 (VT/OG).

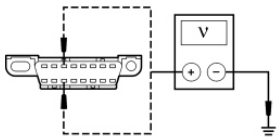
This pinpoint test is intended to diagnose the following:

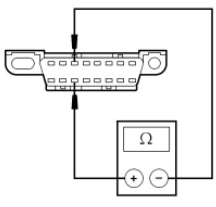




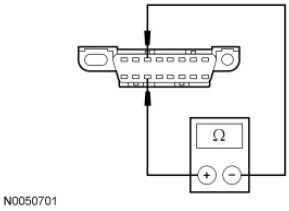
- Wiring, terminals or connectors
- Accessory Protocol Interface Module (APIM) (if equipped)
- Audio Front Control Module (ACM)
- Audio Digital Signal Processing (DSP) module (if equipped)
- Driver Door Module (DDM) (if equipped)
- Driver Seat Module (DSM) (if equipped)
- Dual Climate Controlled Seat Module (DCSM) (if equipped)
- Front Controls Interface Module (FCIM)
- Front Display Interface Module (FDIM)
- Global Positioning System Module (GPSM) (if equipped)
- HVAC module (if equipped)
- Interior Lighting Control Module (ILCM) (if equipped)
- Instrument Panel Cluster (IPC) (gateway module)
- Parking Aid Module (PAM) (if equipped)
- Smart Junction Box (SJB)
- Side Obstacle Detection Control Module - Left (SOD-L) (if equipped)
- Side Obstacle Detection Control Module - Right (SOD-R) (if equipped)

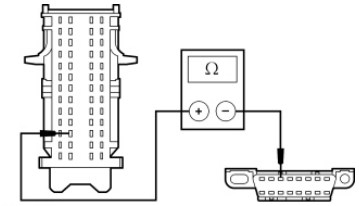


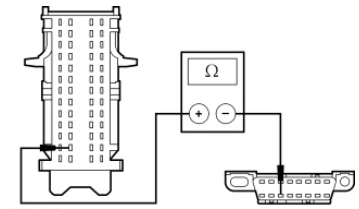




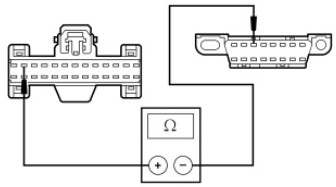
PINPOINT TEST AC: NO MS-CAN COMMUNICATION, ALL MODULES ARE NOT RESPONDING







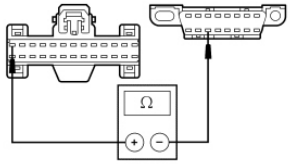
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

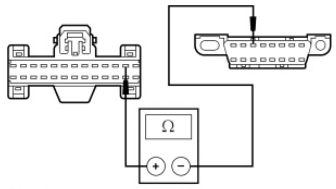
NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AC1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Inspect DLC pins 3 and 11 for damage.  N0053178 • **Are DLC pins 3 and 11 OK?**	**Yes** GO to AC2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
AC2 CHECK THE MS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to AC3 . **No** GO to AC5 .
AC3 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	



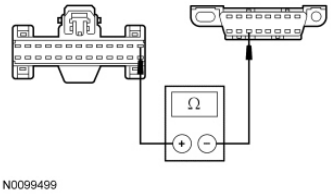
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0008947 • **Are the resistances greater than 1,000 ohms?**	**Yes** GO to AC4 . **No** GO to AC32 .
AC4 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect: Negative Battery Cable . • Ignition ON. • Measure the voltage between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.  N0050702 • **Is the voltage greater than 6 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The MS-CAN has tested within specifications. GO to Pinpoint Test AB to diagnose the intermittent MS-CAN fault.
AC5 CHECK THE MS-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to AC6 . **No** GO to AC9 .
AC6 CHECK THE MS-CAN TERMINATION RESISTOR WITH THE SJB DISCONNECTED	

• Disconnect: Smart Junction Box (SJB) C2280b . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance between 108 and 132 ohms?**	**Yes** GO to AC7 . **No** GO to AC8 .
AC7 CHECK THE MS-CAN CIRCUITS BETWEEN THE SJB AND THE DLC FOR AN OPEN	
• Measure the resistance between the SJB C2280b-37, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0064664 • Measure the resistance between the SJB C2280b-38, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0064665 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to AC53 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
AC8 CHECK THE MS-CAN CIRCUITS BETWEEN THE IPC AND THE DLC FOR AN OPEN	
• Disconnect: Instrument Panel Cluster (IPC) C220 . • For gasoline engine, measure the resistance between the IPC C220-12, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to AC61 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.



N0099496

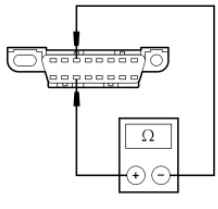
- For gasoline engine, measure the resistance between the IPC C220-13, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

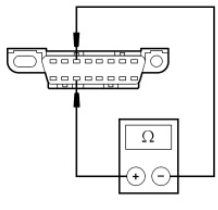


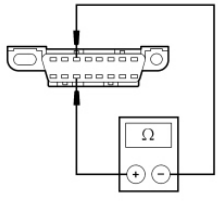
N0099497

- For hybrid engine, measure the resistance between the IPC C220-2, circuit VDB06 (GY/OG), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.

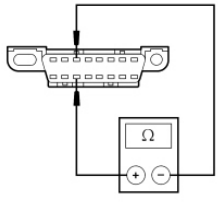
N0099498

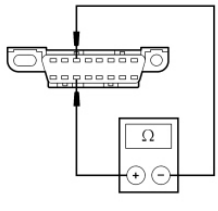


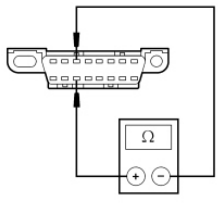


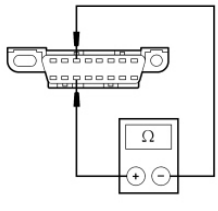


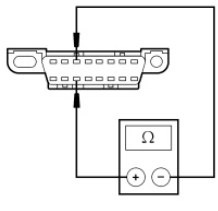
- For hybrid engine, measure the resistance between the IPC C220-1, circuit VDB07 (VT/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.



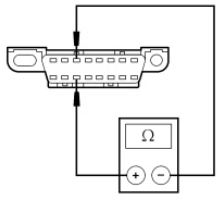


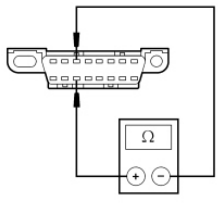


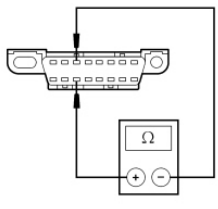




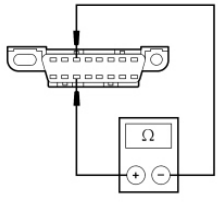
N0099499

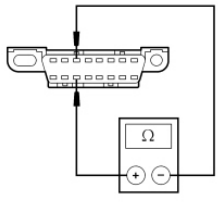




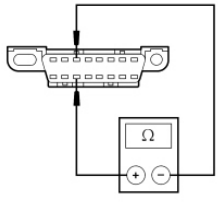


- **Are the resistances less than 5 ohms?**



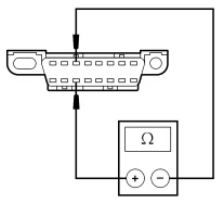


AC9 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	



• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC11 . **No** GO to AC10 .
AC10 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR AN OPEN	
• Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** A capacitor internal to a module may still be draining, causing irregular resistance readings. WAIT 5 minutes. REPEAT this pinpoint test.
AC11 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SJB DISCONNECTED	
• Disconnect: SJB C2280b . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with a Parking Aid Module (PAM), GO to AC12 . If the vehicle is not equipped with a PAM , GO to AC13 . **No** CONNECT the negative battery cable. GO to AC53 .
AC12 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PAM DISCONNECTED	

• Disconnect: PAM C4014 . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC13 . **No** CONNECT the negative battery cable. GO to AC54 .
AC13 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ACM DISCONNECTED	
• Disconnect: Audio Front Control Module (ACM) C240c . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with an audio Digital Signal Processing (DSP) module, GO to AC14 . If the vehicle is not equipped with an audio DSP module, GO to AC15 . **No** CONNECT the negative battery cable. GO to AC55 .
AC14 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE AUDIO DSP MODULE DISCONNECTED	
• Disconnect: Audio DSP Module C4235a . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC15 . **No** CONNECT the negative battery cable. GO to AC56 .



AC15 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE FCIM DISCONNECTED	
• Disconnect: Front Controls Interface Module (FCIM) C2402 (With Navigation, MKZ), C2403 (Without Navigation) or C2408 (With Navigation, Except MKZ) . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with a Front Display Interface Module (FDIM), GO to AC16 . If the vehicle is not equipped with an FDIM , GO to AC17 . **No** CONNECT the negative battery cable. GO to AC57 .
AC16 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE FDIM DISCONNECTED	
• Disconnect: FDIM C2407 . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC17 . **No** CONNECT the negative battery cable. GO to AC58 .
AC17 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE HVAC MODULE DISCONNECTED	
• Disconnect: HVAC Module C2357a (Manual) or C2356a (Dual Automatic Temperature Control (DATC)) . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.	**Yes** If the vehicle is equipped with a Global Positioning System Module (GPSM), GO to AC18 . If the vehicle is not equipped with a GPSM , GO to AC19 . **No** CONNECT the negative battery cable.

 N0050701 • **Is the resistance less than 5 ohms?**	GO to AC59 .
AC18 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE GPSM DISCONNECTED	
• Disconnect: GPSM C2300 . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC19 . **No** CONNECT the negative battery cable. GO to AC60 .
AC19 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE IPC DISCONNECTED	
• Disconnect: Instrument Panel Cluster (IPC) C220 . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with an Interior Lighting Control Module (ILCM), GO to AC20 . If the vehicle is not equipped with an ILCM , GO to AC21 . **No** CONNECT the negative battery cable. GO to AC61 .
AC20 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ILCM DISCONNECTED	

• Disconnect: ILCM C2301 . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC21 . **No** CONNECT the negative battery cable. GO to AC62 .
AC21 VERIFY VEHICLE EQUIPMENT - DSM	
• Verify whether the vehicle is equipped with a Driver Seat Module (DSM). • **Is the vehicle equipped with a DSM ?**	**Yes** GO to AC22 . **No** GO to AC23 .
AC22 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DSM DISCONNECTED	
• Disconnect: DSM C3299d . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC23 . **No** CONNECT the negative battery cable. GO to AC63 .
AC23 VERIFY VEHICLE EQUIPMENT - DCSM	
• Verify whether the vehicle is equipped with a Dual Climate Controlled Seat Module (DCSM). • **Is the vehicle equipped with a DCSM ?**	**Yes** GO to AC24 . **No** GO to AC25 .
AC24 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DCSM DISCONNECTED	

• Disconnect: DCSM C3305c . • Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0050701 • **Is the resistance less than 5 ohms?**	**Yes** GO to AC25 . **No** CONNECT the negative battery cable. GO to AC64 .
AC25 VERIFY VEHICLE EQUIPMENT - APIM	
• Verify whether the vehicle is equipped with anAccessory Protocol Interface Module (APIM). • **Is the vehicle equipped with an APIM ?**	**Yes** GO to AC26 . **No** GO to AC27 .
AC26 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE APIM DISCONNECTED	

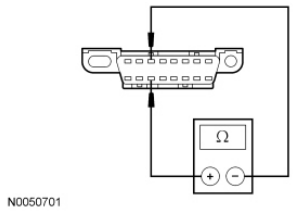
- Disconnect: APIM C3338 .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

N0050701

- **Is the resistance less than 5 ohms?**

Yes
GO to AC27 .

No
CONNECT the negative battery cable. GO to AC65 . **AC27 VERIFY VEHICLE EQUIPMENT - DDM**



- Verify whether the vehicle is equipped with a Driver Door Module (DDM).
- **Is the vehicle equipped with a DDM ?**

Yes

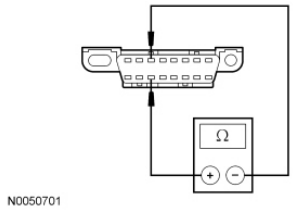
No
GO to AC29 . **AC28 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT**

TOGETHER WITH THE DDM DISCONNECTED

- Disconnect: DDM C568b .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

- **Is the resistance less than 5 ohms?**

Yes
GO to AC29 .



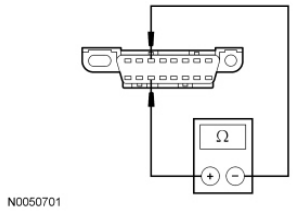
No
CONNECT the negative battery cable. GO to AC66 . **AC29 VERIFY VEHICLE EQUIPMENT - SIDE OBSTACLE DETECTION**

- Verify whether the vehicle is equipped with side obstacle detection.
- **Is the vehicle equipped with side obstacle detection?**

Yes
GO to AC30 .

No
REPAIR the circuits. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC30 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SOD-L DISCONNECTED**

- Disconnect: Side Obstacle Detection Control Module - Left (SOD-L) C4230 .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

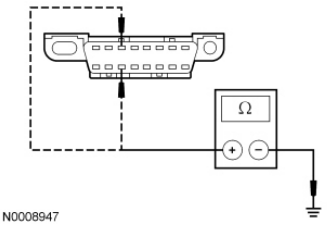


- **Is the resistance less than 5 ohms?**

Yes
GO to AC31 .

No
CONNECT the negative battery cable. GO to AC67 . **AC31 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE SOD-R DISCONNECTED**

- Disconnect: Side Obstacle Detection Control Module - Right (SOD-R) C4229 .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.

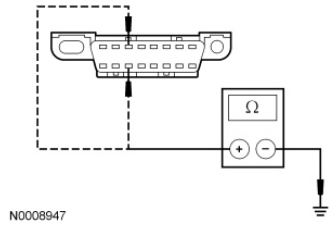


- **Is the resistance less than 5 ohms?**

Yes
REPAIR the circuit. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
CONNECT the negative battery cable. GO to AC68 . **AC32 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SJB DISCONNECTED**

- Disconnect: SJB C2280b .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.



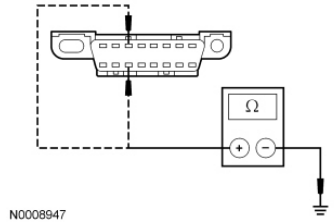
- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC53 .

No
If the vehicle is equipped with a Parking Aid Module (PAM), GO to AC33 .

If the vehicle is not equipped with a PAM , GO to AC34 . **AC33 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PAM DISCONNECTED**

- Disconnect: PAM C4014 .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.

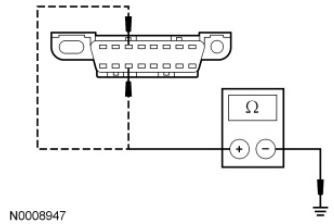


- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC54 .

No
GO to AC34 . **AC34 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ACM DISCONNECTED**

- Disconnect: Audio Front Control Module (ACM) C240c .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.



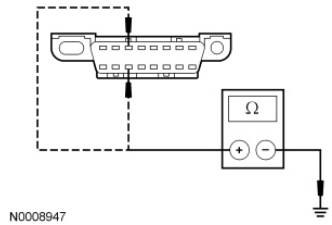
- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC55 .

No
If the vehicle is equipped with an audio Digital Signal Processing (DSP) module, GO to AC35 .

If the vehicle is not equipped with an audio DSP module, GO to AC36 . **AC35 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE AUDIO DSP MODULE DISCONNECTED**

- Disconnect: Audio DSP Module C4235a .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.

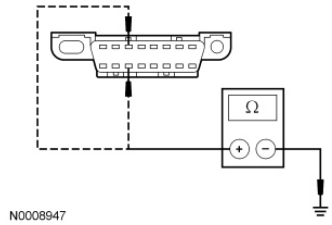


- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC56 .

No
GO to AC37 . **AC36 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE FCIM DISCONNECTED**

- Disconnect: Front Controls Interface Module (FCIM) C2402 (With Navigation, MKZ), C2403 (Without Navigation) or C2408 (With Navigation, Except MKZ) .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.



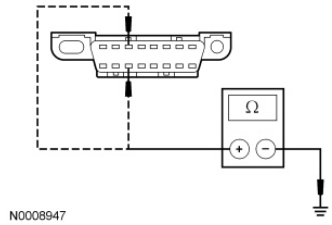
- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC57 .

No
If the vehicle is equipped with a Front Display Interface Module (FDIM), GO to AC37 .

If the vehicle is not equipped with an FDIM , GO to AC38 . **AC37 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE FDIM DISCONNECTED**

- Disconnect: FDIM C2407 .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.



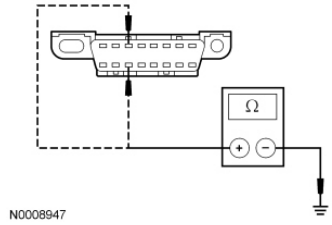
- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC58 .

No
GO to AC38 . **AC38 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE HVAC MODULE DISCONNECTED**

- Disconnect: HVAC Module C2357a (Manual) or C2356a (Dual Automatic Temperature Control (DATC)) .

- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.



- **Are the resistances greater than 1,000 ohms?**

Yes

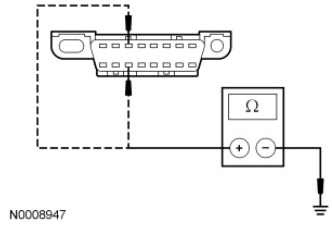
- Disconnect: DCSM C3305c .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.

- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC64 .



No
GO to AC46 . **AC46 VERIFY VEHICLE EQUIPMENT - APIM**

- Verify whether the vehicle is equipped with anAccessory Protocol Interface Module (APIM).
- **Is the vehicle equipped with an APIM ?**

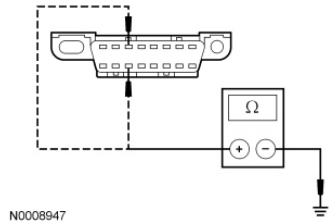
Yes
GO to AC47 .

No
GO to AC48 . **AC47 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE APIM DISCONNECTED**

- Disconnect: APIM C3338 .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.

- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC65 .



No
GO to AC48 . **AC48 VERIFY VEHICLE EQUIPMENT - DDM**

- Verify whether the vehicle is equipped with a Driver Door Module (DDM).
- **Is the vehicle equipped with a DDM ?**

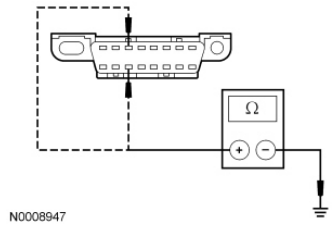
Yes
GO to AC49 .

No
GO to AC50 . **AC49 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE DDM DISCONNECTED**

- Disconnect: DDM C568b .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.

- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC66 .



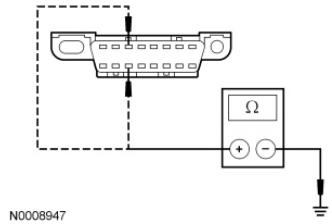
No
GO to AC50 . **AC50 VERIFY VEHICLE EQUIPMENT - SIDE OBSTACLE DETECTION**

- Verify whether the vehicle is equipped with side obstacle detection.
- **Is the vehicle equipped with side obstacle detection?**

Yes
GO to AC51 .

No
REPAIR the circuits. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC51 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SOD-L DISCONNECTED**

- Disconnect: Side Obstacle Detection Control Module - Left (SOD-L) C4230 .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.



- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC67 .

No
GO to AC52 . **AC52 CHECK THE MS-CAN (+) AND MS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE SOD-R DISCONNECTED**

- Disconnect: Side Obstacle Detection Control Module - Right (SOD-R) C4229 .
- Measure the resistance between the DLC C251-3, circuit VDB06 (GY/OG), harness side and ground; and between the DLC C251-11, circuit VDB07 (VT/OG), harness side and ground.

- **Are the resistances greater than 1,000 ohms?**

Yes
CONNECT the negative battery cable. GO to AC68 .

No
REPAIR the circuit. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC53 CHECK FOR CORRECT SJB OPERATION**

- Disconnect all the SJB connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins

- ♦ pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new SJB . REFER to Section 419-10 . CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC54 CHECK FOR CORRECT PAM OPERATION**

- Disconnect the PAM connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new PAM . REFER to Section 413-13 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC55 CHECK FOR CORRECT ACM OPERATION**

- Disconnect all the ACM connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect all the ACM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new ACM . REFER to Section 415-00 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC56 CHECK FOR CORRECT AUDIO DSP MODULE OPERATION**

- Disconnect all the audio DSP module connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins

- ♦ pushed-out pins
- Connect all the audio DSP module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new audio DSP module. REFER to Section 415-00 . CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool. **AC57**
CHECK FOR CORRECT FCIM OPERATION

- Disconnect the FCIM connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect the FCIM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new FCIM . REFER to Section 415-00 . CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool. **AC58**
CHECK FOR CORRECT FDIM OPERATION

- Disconnect the FDIM connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect the FDIM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new FDIM . REFER to Section 415-00 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC59**
CHECK FOR CORRECT HVAC MODULE OPERATION

- Disconnect all the HVAC module connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins

- ♦ pushed-out pins
- Connect all the HVAC module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new HVAC module. REFER to Section 412-01 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC60 CHECK FOR CORRECT GPSM OPERATION**

- Disconnect the GPSM connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect the GPSM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new GPSM . REFER to Section 415-00 . CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool. **AC61 CHECK FOR CORRECT IPC OPERATION**

- Disconnect the IPC connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect the IPC connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new IPC . REFER to Section 413-01 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC62 CHECK FOR CORRECT ILCM OPERATION**

- Disconnect the ILCM connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins

- ♦ pushed-out pins
- Connect the ILCM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new ILCM . REFER to Section 417-02 . CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool. **AC63 CHECK FOR CORRECT DSM OPERATION**

- Disconnect all the DSM connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect all the DSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new DSM . REFER to Section 501-10 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC64 CHECK FOR CORRECT DCSM OPERATION**

- Disconnect all the DCSM connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect all the DCSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new DCSM . REFER to Section 501-10 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC65 CHECK FOR CORRECT APIM OPERATION**

- Disconnect the APIM connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins

- ♦ pushed-out pins
- Connect the APIM connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new APIM . REFER to Section 415-00 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC66 CHECK FOR CORRECT DDM OPERATION**

- Disconnect all the DDM connectors.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new DDM . REFER to Section 501-14 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **AC67 CHECK FOR CORRECT SOD-L OPERATION**

- Disconnect the SOD-L connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins
  - ♦ pushed-out pins
- Connect the SOD-L connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new SOD-L . REFER to Section 419-03 . CONNECT all modules. CLEAR the DTCs. CONNECT all modules. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. REPEAT the network test with the scan tool. **AC68 CHECK FOR CORRECT SOD-R OPERATION**

- Disconnect the SOD-R connector.
- Check for:
  - ♦ corrosion
  - ♦ damaged pins

- ♦ pushed-out pins
- Connect the SOD-R connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new SOD-R . REFER to Section 419-03 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

No
The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

Pinpoint Test AD: Intermittent No High Speed Controller Area Network (HS-CAN) Communication, One Or More Modules Are Not Responding During Network Test

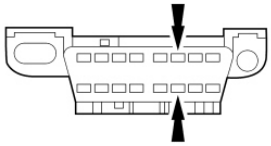
Normal Operation

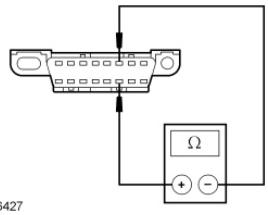
When one of the 2 High Speed Controller Area Network (HS-CAN) circuits becomes open to a module on the network, intermittent or unreliable communication to all modules on the HS-CAN may result.

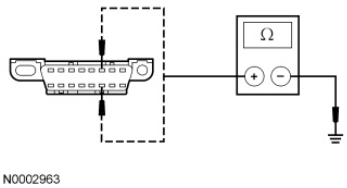
The following modules communicate on the HS-CAN :

- 4X4 control module (if equipped)
- ABS module
- Accessory Protocol Interface Module (APIM) (if equipped)
- Air Conditioning Compressor Module (ACCM) (Hybrid only)
- Battery Energy Control Module (BECM) (Hybrid only)
- DC/DC (Hybrid only)
- Headlamp Control Module (HCM) (if equipped)
- Instrument Panel Cluster (IPC)
- Occupant Classification System Module (OCSM)
- PCM
- Power Steering Control Module (PSCM) (if equipped)
- Restraints Control Module (RCM)
- Transmission Control Module (TCM) (if equipped)

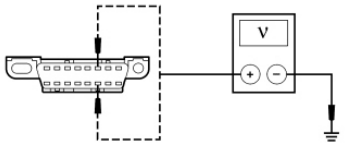
This pinpoint test is intended to diagnose the following:







- Circuit VDB04 (WH/BU) (HS-CAN +) open
- Circuit VDB05 (WH) (HS-CAN -) open



PINPOINT TEST AD: INTERMITTENT NO HS-CAN COMMUNICATION, ONE OR MORE MODULES ARE NOT RESPONDING DURING NETWORK TEST

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Various network DTCs will set while disabling modules in this test procedure which will need to be cleared after the diagnostic procedure is completed.

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AD1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the DLC . • Inspect DLC pins 6 and 14 for damage.  A0093867 • **Are DLC pins 6 and 14 OK?**	**Yes** GO to AD2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
AD2 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 54 and 66 ohms?**	**Yes** GO to AD3 . **No** GO to Pinpoint Test AE .
AD3 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963	**Yes** GO to AD4 . **No** GO to Pinpoint Test W .

• **Are the resistances greater than 1,000 ohms?**	
AD4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect: Negative Battery Cable . • Ignition ON. • Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002964 • **Is the voltage greater than 6 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** GO to AD5 .
AD5 CHECK FOR RESTORED COMMUNICATION WITH THE PCM DISABLED	
• Disconnect: Gasoline Engine - Battery Junction Box (BJB) Fuses 23 (10A) and 46 (15A) . • Disconnect: Hybrid - PCM C175b . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed s (gasoline engine) or CONNECT the PCM (hybrid). GO to Pinpoint Test A . **No** INSTALL the removed fuses (gasoline engine) or CONNECT the PCM (hybrid). If the vehicle is equipped with an Headlamp Control Module (HCM) and/or a Power Steering Control Module (PSCM), GO to AD6 . If the vehicle is not equipped with a HCM , GO to AD8 .
AD6 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE HCM (IF EQUIPPED) AND PSCM (IF EQUIPPED) DISABLED	
• Disconnect: Smart Junction Box (SJB) Fuse 33 (10A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. If the vehicle is equipped with only a HCM , GO to Pinpoint Test I . If the vehicle is equipped with only a PSCM , GO to Pinpoint Test D . If the vehicle is equipped with both a HCM and PSCM , GO to AD7 .

	No INSTALL the removed fuse. GO to AD8 .
AD7 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE HCM DISCONNECTED	
• Disconnect: HCM C1600 . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** CONNECT the HCM . GO to Pinpoint Test I . **No** CONNECT the HCM . GO to Pinpoint Test D .
AD8 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RCM DISABLED	
• Disconnect: SJB Fuse 32 (10A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test E . **No** INSTALL the removed fuse. For gasoline engine, GO to AD9 . For hybrid, GO to AD10 .
AD9 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ABS MODULE DISABLED - GASOLINE ENGINE	
• Disconnect: Battery Junction Box (BJB) Fuse 42 (10A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test B . **No** INSTALL the removed fuse. If the vehicle is equipped with a 4X4 control module, GO to AD13 . If the vehicle is not equipped with a 4X4 control module, GO to AD14 .
AD10 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ACCM , DC/DC AND ABS MODULE DISABLED - HYBRID	
• Disconnect: Battery Junction Box (BJB) Fuse 47 (10A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to AD11 . **No** INSTALL the removed fuse. If the vehicle is equipped with a 4X4 control module, GO to AD13 . AD14 .
AD11 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE ACCM DISCONNECTED	

• Disconnect: ACCM C1469a . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test K . **No** INSTALL the removed fuses. GO to AD12 .
AD12 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE DC/DC DISCONNECTED	
• Disconnect: DC/DC C1457d . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test L . **No** INSTALL the removed fuses. GO to Pinpoint Test B .
AD13 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE 4X4 MODULE DISABLED	
• Disconnect: SJB Fuses 11 (10A) and 35 (10A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test H . **No** INSTALL the removed fuses. GO to AD9 .
AD14 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE IPC DISABLED	
• Disconnect: SJB Fuses 26 (15A) and 29 (5A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuses. GO to Pinpoint Test C . **No** INSTALL the removed fuses. If the vehicle is equipped with an Accessory Protocol Interface Module (APIM) , GO to AD15 . If the vehicle is not equipped with an APIM ,GO to AD16 .
AD15 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE APIM DISABLED	
• Disconnect: SJB Fuse 13 (5A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test AA . **No** INSTALL the removed fuse. GO to AD16 .
AD16 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE OCSM	

DISABLED	
• Disconnect: SJB Fuse 46 (7.5A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test F . **No** INSTALL the removed fuse. If the vehicle is equipped with a Transmission Control Module (TCM), GO to AD17 . If the vehicle is not equipped with a TCM , GO to AD18 .
AD17 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE TCM DISABLED	
• Disconnect: Gasoline Engine - SJB Fuse 44 (10A) and BJB Fuse 16 (5A) . • Disconnect: Hybrid - TCM C1458a . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuses (gasoline engine) or CONNECT the TCM (hybrid). GO to Pinpoint Test G . **No** INSTALL the removed fuses (gasoline engine) or CONNECT the TCM (hybrid). GO to AD18 .
AD18 CHECK FOR RESTORED NETWORK COMMUNICATION WITH THE RCM DISABLED	
• Disconnect: SJB Fuse 32 (10A) . • Enter the following diagnostic mode on the scan tool: Network Test . • Repeat the network test. • **Do all other HS-CAN modules pass the network test?**	**Yes** INSTALL the removed fuse. GO to Pinpoint Test E . **No** INSTALL the removed fuse. An intermittent fault is not present. GO to Pinpoint Test AC .

Pinpoint Test AE: No High Speed Controller Area Network (HS-CAN) Communication, All Modules Are Not Responding

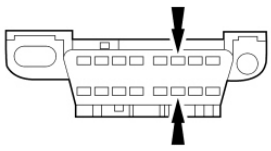
Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Normal Operation

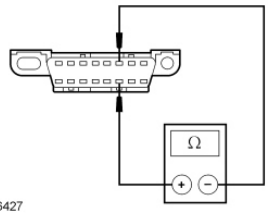
The High Speed Controller Area Network (HS-CAN) uses an unshielded twisted pair cable, circuits VDB04 (WH/BU) and VDB05 (WH).

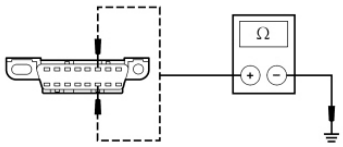
This pinpoint test is intended to diagnose the following:

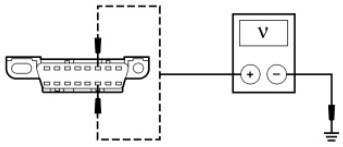
- Wiring, terminals or connectors
- 4X4 control module (if equipped)
- ABS module
- Accessory Protocol Interface Module (APIM) (if equipped)



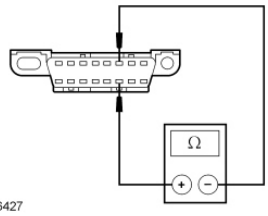
- Air Conditioning Compressor Module (ACCM) (Hybrid only)
- Battery Energy Control Module (BECM) (Hybrid only)
- DC to DC Converter Control Module (DC/DC) (Hybrid only)
- Headlamp Control Module (HCM) (if equipped)
- Instrument Panel Cluster (IPC) (gateway module)
- Occupant Classification System Module (OCSM)
- PCM
- Power Steering Control Module (PSCM) (if equipped)
- Restraints Control Module (RCM)
- Transmission Control Module (TCM) (if equipped)

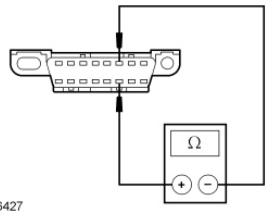


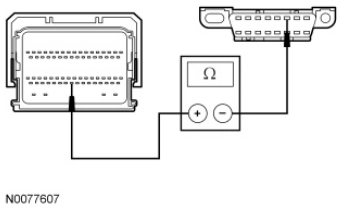


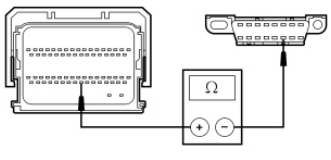


PINPOINT TEST AE: NO HS-CAN COMMUNICATION, ALL MODULES ARE NOT RESPONDING

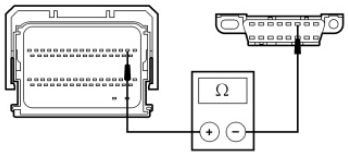


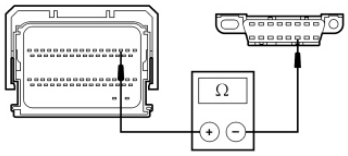


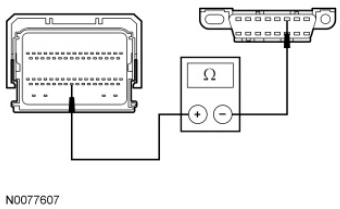




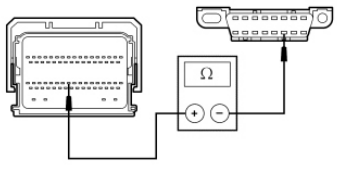
NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

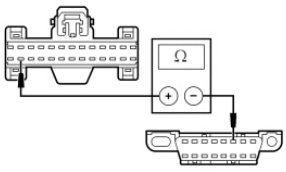


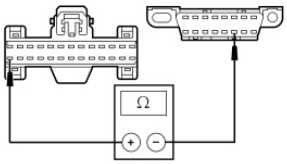




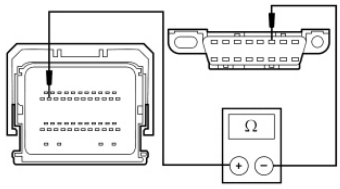
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

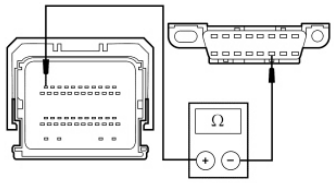


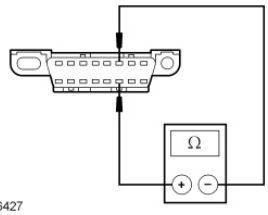


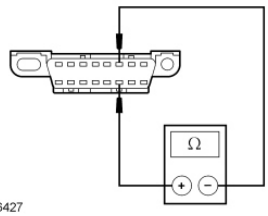


NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .





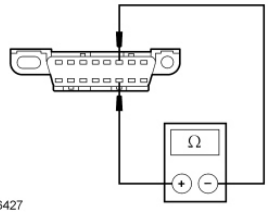


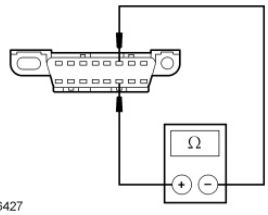


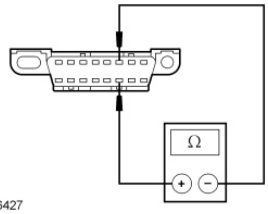
Test Step	Result / Action to Take
AE1 CHECK THE DLC PINS FOR DAMAGE	
• Ignition OFF. • Disconnect the scan tool cable from the Data Link Connector (DLC). • Inspect DLC pins 6 and 14 for damage.  A0093867 • **Are DLC pins 6 and 14 OK?**	**Yes** GO to AE2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE2 CHECK THE HS-CAN TERMINATION RESISTANCE	
• Ignition OFF. • Disconnect: Negative Battery Cable . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to AE3 . **No** GO to AE5 .

 N0026427 • **Is the resistance between 54 and 66 ohms?**	
AE3 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** GO to AE4 . **No** GO to AE28 .
AE4 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO VOLTAGE	
• Connect: Negative Battery Cable . • Ignition ON. • Measure the voltage between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002964 • **Are the voltages greater than 6 volts?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The HS-CAN has tested within specifications. GO to Pinpoint Test AD to diagnose an intermittent HS-CAN fault.
AE5 CHECK THE HS-CAN TERMINATION RESISTOR	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** GO to AE6 . **No** GO to AE12 .

 N0026427 • **Is the resistance between 108 and 132 ohms?**	
AE6 CHECK THE HS-CAN TERMINATION RESISTOR WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance between 108 and 132 ohms?**	**Yes** For 2.5L gas and 3.0L engine, GO to AE7 . For 3.5L engine, GO to AE8 . For 2.5L hybrid, GO to AE9 . **No** For 2.5L gas and 3.0L and 3.5L engine, GO to AE10 . For 2.5L hybrid, GO to AE11 .
AE7 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN - 2.5L GAS AND 3.0L	
• Measure the resistance between the PCM C175b-59, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0077607 • Measure the resistance between the PCM C175b-58, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0099486	**Yes** CONNECT the negative battery cable. GO to AE42 . **No** REPAIR the circuit in question. CONNECT the negativeattery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.



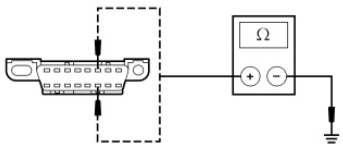


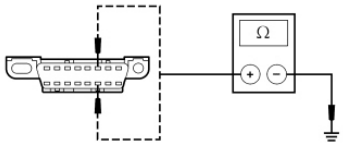


• **Are the resistances less than 5 ohms?**	
AE8 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN - 3.5L	
• Measure the resistance between the PCM C175b-2, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0026577 • Measure the resistance between the PCM C175b-3, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026578 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE42 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE9 CHECK THE HS-CAN CIRCUITS BETWEEN THE PCM AND THE DLC FOR AN OPEN - 2.5L HYBRID	
• Measure the resistance between the PCM C175b-59, circuit VDB04 (WH/BU), harness side and the DLC C251-6, circuit VDB04 (WH/BU), harness side.  N0077607 • Measure the resistance between the PCM C175b-43, circuit VDB05 (WH), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** CONNECT the negative battery cable. GO to AE42 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

 N0077608 • **Are the resistances less than 5 ohms?**	
AE10 CHECK THE HS-CAN CIRCUITS BETWEEN THE IPC (GASOLINE ENGINE) AND THE DLC FOR AN OPEN	
• Disconnect: Instrument Panel Cluster (IPC) C220 . • Measure the resistance between the IPC C220-25, circuit VDB04 (WH/BU), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.  N0099492 • Measure the resistance between the IPC C220-26, circuit VDB05 (WH), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0099493 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE50 **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE11 CHECK THE HS-CAN CIRCUITS BETWEEN THE BECM (HYBRID) AND THE DLC FOR AN OPEN	
• Disconnect: Battery Energy Control Module (BECM) C4237a . • Measure the resistance between the BECM C4237a-22, circuit VDB04 (WH/BU), harness side and the DLC C251-3, circuit VDB06 (GY/OG), harness side.	**Yes** CONNECT the negative battery cable. GO to AE53 . **No** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.

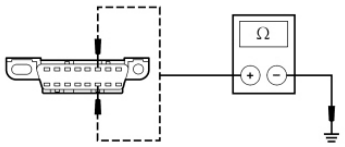
 N0099517 • Measure the resistance between the BECM C4237a-11, circuit VDB05 (WH), harness side and the DLC C251-11, circuit VDB07 (VT/OG), harness side.  N0099518 • **Are the resistances less than 5 ohms?**	
AE12 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to AE14 . **No** GO to AE13 .
AE13 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR AN OPEN	
• Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the circuit in question. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** A capacitor internal to a module may still be draining, causing irregular resistance readings. WAIT 5 minutes. REPEAT this pinpoint test.

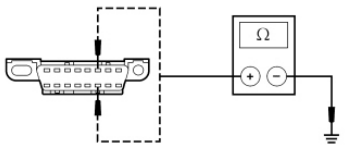




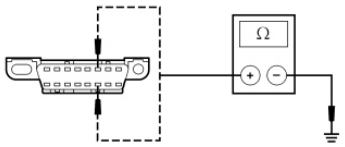
AE14 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with a Headlamp Control Module (HCM), GO to AE15 . If the vehicle is not equipped with an HCM , GO to AE16 . **No** CONNECT the negative battery cable. GO to AE42 .
AE15 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE HCM DISCONNECTED	
• Disconnect: HCM C1600 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to AE16 . **No** CONNECT the negative battery cable. GO to AE43 .
AE16 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ABS MODULE DISCONNECTED	
• Disconnect: ABS Module C135 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.	**Yes** If the vehicle is equipped with a 4X4 control module, GO to AE17 . If the vehicle is not equipped with a 4X4 control module, GO to AE18 . **No** CONNECT the negative battery cable. GO to AE44 .

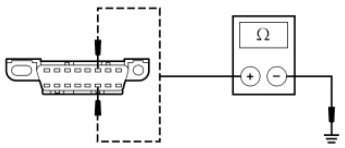
 N0026427 • **Is the resistance less than 5 ohms?**	
AE17 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE 4X4 CONTROL MODULE DISCONNECTED	
• Disconnect: 4X4 Control Module C3253 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to AE18 . **No** CONNECT the negative battery cable. GO to AE45 .
AE18 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE RCM DISCONNECTED	
• Disconnect: Restraints Control Module (RCM) C310b . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with a Power Steering Control Module (PSCM), GO to AE19 . If the vehicle is not equipped with a PSCM , GO to AE20 . **No** CONNECT the negative battery cable. GO to AE46 .
AE19 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE PSCM DISCONNECTED	

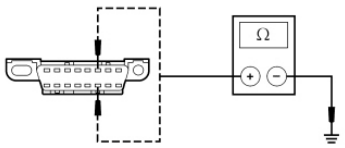




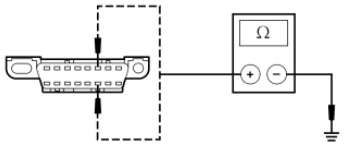
• Disconnect: Power Steering Control Module (PSCM) C1467b . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to AE20 . **No** CONNECT the negative battery cable. GO to AE47 .
AE20 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE OCSM DISCONNECTED	
• Disconnect: Occupant Classification System Module (OCSM) C3159 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with a Transmission Control Module (TCM), GO to AE21 . If the vehicle is not equipped with a TCM , GO to AE22 . **No** CONNECT the negative battery cable. GO to AE48 .
AE21 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE TCM DISCONNECTED	
• Disconnect: TCM C1458a (Hybrid) or C1533 (3.5L) . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to AE22 . **No** CONNECT the negative battery cable. GO to AE49 .

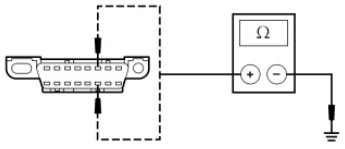




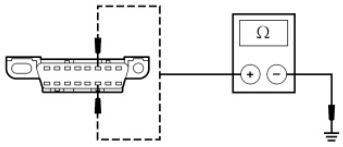


AE22 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE IPC DISCONNECTED	
• Disconnect: IPC C220 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** If the vehicle is equipped with an Accessory Protocol Interface Module (APIM), GO to AE23 . If the vehicle is not equipped with an APIM , GO to AE24 . **No** CONNECT the negative battery cable. GO to AE50 .
AE23 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE APIM DISCONNECTED	
• Disconnect: APIM C3338 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** For gasoline engine, REPAIR the circuits. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. For hybrid, GO to AE25 . **No** CONNECT the negative battery cable. GO to AE51 .
AE24 VERIFY VEHICLE EQUIPMENT - HYBRID	
• Verify whether the vehicle is a hybrid. • **Is the vehicle a hybrid?**	**Yes** GO to AE25 . **No** REPAIR the circuits. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE25 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE ACCM DISCONNECTED	





• Disconnect: Air Conditioning Compressor Module (ACCM) C1469a . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to AE26 . **No** CONNECT the negative battery cable. GO to AE52 .
AE26 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE BECM DISCONNECTED	
• Disconnect: Battery Energy Control Module (BECM) C4237a . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** GO to AE27 . **No** CONNECT the negative battery cable. GO to AE53 .
AE27 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TOGETHER WITH THE DC/DC DISCONNECTED	
• Disconnect: DC/DC C1457d . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and the DLC C251-14, circuit VDB05 (WH), harness side.  N0026427 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuits. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** CONNECT the negative battery cable. GO to AE54 .



AE28 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PCM DISCONNECTED	
• Disconnect: PCM C175b . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE42 . **No** If the vehicle is equipped with a Headlamp Control Module (HCM), GO to AE29 . If the vehicle is not equipped with an HCM , GO to AE30 .
AE29 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE HCM DISCONNECTED	
• Disconnect: HCM C1600 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE43 . **No** GO to AE30 .
AE30 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ABS MODULE DISCONNECTED	
• Disconnect: ABS Module C135 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.	**Yes** CONNECT the negative battery cable. GO to AE44 . **No** If the vehicle is equipped with a 4X4 control module, GO to AE31 . If the vehicle is not equipped with a 4X4 control module, GO to AE32 .

 N0002963 • **Are the resistances greater than 1,000 ohms?**	
AE31 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE 4X4 CONTROL MODULE DISCONNECTED	
• Disconnect: 4X4 Control Module C3253 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE45 . **No** GO to AE32 .
AE32 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE RCM DISCONNECTED	
• Disconnect: Restraints Control Module (RCM) C310b . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE46 . **No** If the vehicle is equipped with a Power Steering Control Module (PSCM), GO to AE33 . If the vehicle is not equipped with a PSCM , GO to AE34 .
AE33 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE PSCM DISCONNECTED	

• Disconnect: Power Steering Control Module (PSCM) C1467b . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE47 . **No** GO to AE34 .
AE34 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE OCSM DISCONNECTED	
• Disconnect: Occupant Classification System Module (OCSM) C3159 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE48 . **No** If the vehicle is equipped with a Transmission Control Module (TCM), GO to AE35 . If the vehicle is not equipped with a TCM , GO to AE36 .
AE35 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE TCM DISCONNECTED	
• Disconnect: TCM C1458a (Hybrid) or C1533 (3.5L) . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.	**Yes** CONNECT the negative battery cable. GO to AE49 . **No** GO to AE36 .

 N0002963 • **Are the resistances greater than 1,000 ohms?**	
AE36 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE IPC DISCONNECTED	
• Disconnect: IPC C220 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE50 . **No** If the vehicle is equipped with an Accessory Protocol Interface Module (APIM), GO to AE37 . If the vehicle is not equipped with an APIM , GO to AE38 .
AE37 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE APIM DISCONNECTED	
• Disconnect: APIM C3338 . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE51 . **No** For gasoline engine, REPAIR the circuits. CONNECT all modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool. For hybrid, GO to AE39 .
AE38 VERIFY VEHICLE EQUIPMENT - HYBRID	
• Verify whether the vehicle is a hybrid. • **Is the vehicle a hybrid?**	**Yes** GO to AE39 . **No** REPAIR the circuits. CONNECT all modules. CONNECT the negative

	battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE39 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE ACCM DISCONNECTED	
• Disconnect: Air Conditioning Compressor Module (ACCM) C1469a . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE52 . **No** GO to AE40 .
AE40 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE BECM DISCONNECTED	
• Disconnect: Battery Energy Control Module (BECM) C4237a . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.  N0002963 • **Are the resistances greater than 1,000 ohms?**	**Yes** CONNECT the negative battery cable. GO to AE53 . **No** GO to AE41 .
AE41 CHECK THE HS-CAN (+) AND HS-CAN (-) CIRCUITS FOR A SHORT TO GROUND WITH THE DC/DC DISCONNECTED	
• Disconnect: DC/DC C1457d . • Measure the resistance between the DLC C251-6, circuit VDB04 (WH/BU), harness side and ground; and between the DLC C251-14, circuit VDB05 (WH), harness side and ground.	**Yes** CONNECT the negative battery cable. GO to AE54 . **No** REPAIR the circuits. CONNECT all

 N0002963 • **Are the resistances greater than 1,000 ohms?**	modules. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE42 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to the appropriate section in Section 303-14A , Section 303-14B or Section 303-14C . CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE43 CHECK FOR CORRECT HCM OPERATION	
• Disconnect the HCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the HCM connector and make sure it seats correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new HCM . REFER to Section 417-01 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE44 CHECK FOR CORRECT ABS MODULE OPERATION	
• Disconnect the ABS module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the ABS module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. C CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

AE45 CHECK FOR CORRECT 4X4 CONTROL MODULE OPERATION	
• Disconnect the 4X4 control module connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the 4X4 control module connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new 4X4 control module. REFER to Section 308-07A . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE46 CHECK FOR CORRECT RCM OPERATION	
• Disconnect all the RCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the RCM connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new RCM . REFER to Section 501-20B . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE47 CHECK FOR CORRECT PSCM OPERATION	
• Disconnect all the PSCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PSCM connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PSCM . REFER to Section 211-05 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. REPEAT the network test with the scan tool.
AE48 CHECK FOR CORRECT OCSM OPERATION	
• Disconnect the OCSM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the OCSM connector and make sure it seats correctly. • Verify the concern is still present.	**Yes** INSTALL a new OCSM . REFER to Section 501-20B . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been

• **Is the concern still present?**	caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE49 CHECK FOR CORRECT TCM OPERATION	
• Disconnect the TCM connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the TCM connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new TCM . REFER to Section 307-01B . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE50 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE51 CHECK FOR CORRECT APIM OPERATION	
• Disconnect all the APIM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the APIM connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new APIM . REFER to Section 415-00 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE52 CHECK FOR CORRECT ACCM OPERATION	
• Disconnect all the ACCM connectors. • Check for: ♦ corrosion ♦ damaged pins	**Yes** INSTALL a new ACCM . REFER to Section 412-01 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

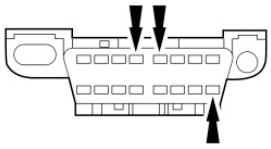
♦ pushed-out pins • Connect all the ACCM connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE53 CHECK FOR CORRECT BECM OPERATION	
NOTE: Do not disconnect the high voltage cables or connectors in the following step. • Disconnect all the BECM **LOW VOLTAGE** connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the BECM **LOW VOLTAGE** connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new BECM . REFER to Section 414-03 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.
AE54 CHECK FOR CORRECT DC/DC OPERATION	
• Disconnect all the DC/DC **LOW VOLTAGE** connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the DC/DC **LOW VOLTAGE** connectors and make sure they seat correctly. • Verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new DC/DC . REFER to Section 414-05 . CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CONNECT all modules. CLEAR the DTCs. REPEAT the network test with the scan tool.

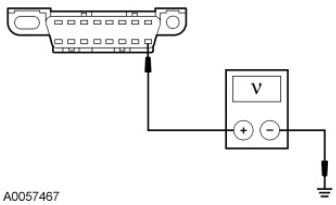
Pinpoint Test AF: No Power To The Scan Tool

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

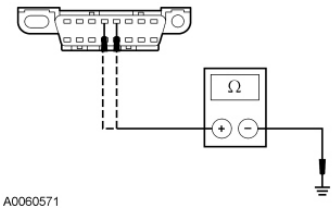
Normal Operation

The scan tool is connected to the Data Link Connector (DLC) to communicate with the High Speed Controller Area Network (HS-CAN) and the Medium Speed Controller Area Network (MS-CAN) communications network.





A loss of ground or poor ground at the DLC may result in HS-CAN or MS-CAN faults while the scan tool is connected.



This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Scan tool

PINPOINT TEST AF: NO POWER TO THE SCAN TOOL

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
AF1 CHECK THE DLC PINS FOR DAMAGE	
NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test. • Disconnect the scan tool cable from the DLC . • Inspect DLC pins 4, 5 and 16 for damage.  N0050767 • **Are DLC pins 4, 5 and 16 OK?**	**Yes** GO to AF2 . **No** REPAIR the DLC as necessary. CLEAR the DTCs. REPEAT the network test with the scan tool.
AF2 CHECK THE DLC VOLTAGE SUPPLY FOR AN OPEN	
• Measure the voltage between the DLC C251-16, circuit SBP20 (GN/RD), harness side and ground.  A0057467 • **Is the voltage greater than 10 volts?**	**Yes** GO to AF3 . **No** VERIFY the Smart Junction Box (SJB) fuse 20 (15A) is OK. If OK, REPAIR the circuit. REPEAT the network test with the scan tool.
AF3 CHECK THE DLC GROUND CIRCUITS FOR AN OPEN	

• Disconnect: Negative Battery Cable . • Measure the resistance between the DLC C251-4, circuit GD116 (BK/VT), harness side and ground; and between the DLC C251-5, circuit GD116 (BK/VT), harness side and ground.  A0060571 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. REPAIR the scan tool. REPEAT the network test with the scan tool. **No** CONNECT the negative battery cable. REPAIR the circuit in question. REPEAT the network test with the scan tool.

Module Configuration

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Principles of Operation

Configurable modules accommodate a variety of vehicle options, eliminating the need for many unique modules for one vehicle line. These modules must be configured when replaced as part of a repair procedure. Configurable modules should not be exchanged between vehicles since the settings are unique to each vehicle. Failure to configure a new module may result in improper operation and/or DTCs setting.

The 3 different methods of configuration are:

- Programmable Module Installation (PMI)
- Module reprogramming ("flashing")
- Programmable parameters

Some modules do not support all 3 methods.

Definition of Terms

The definitions of configuration terms are:

Programmable Module Installation (PMI)

PMI is a scan tool process which configures settings in a new module. Data used for the PMI process is automatically downloaded from the original module and stored when a scan tool session is started. If this data cannot be retrieved from the module being replaced, the scan tool may prompt for As-Built data entry or display a list of parameter values that need to be manually selected. Some modules are reprogrammed during PMI when a strategy/calibration update is available. To carry out PMI , refer to Programmable Module Installation (PMI) in this section.

NOTE: It is important that the scan tool identifies the vehicle and obtains configuration data prior to removing any modules. The new module must be able to communicate with the scan tool in order to carry out PMI .

Module Reprogramming

Module reprogramming (also referred to as "flashing") is a scan tool process which updates the strategy/calibration in a module. Reprogramming a module with the same level of software will not improve module operation or repair a hardware failure. Module reprogramming is automatically carried out during PMI when a later strategy/calibration is available.

NOTE: Module reprogramming should be limited to circumstances where a published TSB procedure recommends doing so.

NOTE: A module cannot communicate with other modules on the communication network while being reprogrammed. Clear any network communication DTCs which may have been set in other modules during the reprogramming process.

Accessory Protocol Interface Module (APIM) Programming

APIM programming is a process that updates the APIM Consumer Interface Processor (CIP) and Vehicle Interface Processor (VIP) software. The VIP programming updates the calibration files in the portion of the APIM which interfaces with the Controller Area Network (CAN). The CIP programming updates calibration files in the portion of the APIM that interfaces with mobile phones and other customer devices.

APIM programming uses the VCM to read and program the VIP software through the Data Link Connector (DLC). A web-based On-Line Automotive Service Information System (OASIS) application is used to read and program the CIP software via a Universal Serial Bus (USB) cable between the scan tool and vehicle USB port. Both the VCM and OASIS application must be running on the scan tool during APIM programming. To carry out APIM programming, refer to Accessory Protocol Interface Module (APIM) Programming in this section. To carry out APIM software level check, refer to Section 415-00 .

Programmable Parameters

Programmable parameters are customer preference items that may be modified by the dealer via scan tool or in some cases modified by the customer following a procedure listed in the vehicle Owner's Literature. While many configuration options may exist for a module, only a few of these options are programmable parameters.

Adaptive Learning and Calibration

Some modules require a separate learning procedure be carried out if replaced as part of a repair procedure. For adaptive learning and calibration instructions, refer to the specific module removal and installation procedures.

Vehicle Identification (VID) Block

Some PCMs contain a memory area called a Vehicle Identification (VID) block. The PCM VID block commonly stores powertrain configuration items such as Vehicle Identification Number (VIN), tire size, axle ratio, and whether or not the vehicle is equipped with speed control.

Module Address

A unique module address is assigned to each module on the network for identification.

As-Built Data

As-Built data is a VIN -specific module configuration record. During vehicle build, the configuration from all modules is downloaded and stored in the As-Built database. As-Built data will not reflect customer preference items that have been changed from the default state. These items will need to be changed using programmable parameters after the module is configured.

NOTE: It is not necessary to obtain As-Built data unless directed to do so by the scan tool. This data may be accessed from the technician service publication website.

The following chart lists As-Built data addresses and describes specific module configuration information:

Module Configuration and Parameter Chart

Module	Module Address	Requires PMI	Reprogram/ Flash Capable	Requires Adaptive Learning or Calibration	Available Programmable Parameters
4X4 control module	761	No	No	No	None
ABS module	760	Yes	Yes	No	None
Accessory Protocol Interface Module (APIM)	7D0	Yes	Yes	No	None
Air Conditioning Compressor Module (ACCM) (Hybrid only)	7C7	No	No	No	None
Audio Front Control Module (ACM)	727	Yes	Yes	No	• Phone module • Satellite Digital Audio Receiver System (SDARS) Canadian content • Tuner frequency setting
Audio Digital Signal Processing (DSP) module	783	Yes	Yes	No	None
Battery Energy Control Module (BECM) (Hybrid only)	7E4	Yes	No	No	• Configure battery end of life counter • Configure hybrid battery state of charge • Configure charge since rebalance • Configure battery age
DC to DC Converter Control Module (DC/DC) (Hybrid only)	746	No	No	No	None
Driver Door Module (DDM)	740	Yes	Yes	No	None
Driver Seat Module (DSM)	744	Yes	Yes	No	• Easy entry/exit
Dual Climate Controlled Seat	776	Yes	Yes	No	None

Module (DCSM)					
Front Controls Interface Module (FCIM)	7A7	No	No	No	None
Front Display Interface Module (FDIM)	7A6	Yes	Yes	No	• Cell phone module
Global Positioning System Module (GPSM)	701	No	No	No	None
Headlamp Control Module (HCM)	734	No	No	No	None
HVAC module	733	No	No	No	None
Interior Lighting Control Module (ILCM)	7B5	Yes	Yes	No	None
Instrument Panel Cluster (IPC)	720	Yes	Yes	No	None
Occupant Classification System Module (OCSM)	765	No	No	• Seat weight sensor re-zero	None
Parking Aid Module (PAM)	736	Yes	Yes	No	None
PCM	7E0	Yes	Yes	• Adaptive airflow • Idle speed • Refueling event • Fuel trim	None
Power Steering Control Module (PSCM)	730	Yes	Yes	No	None
Restraints Control Module (RCM)	737	Yes	Yes	• Seat weight sensor re-zero	• Driver Belt-Minder® • Passenger Belt-Minder®
Side Obstacle Detection Control Module - Left (SOD-L)	7C4	Yes	Yes	No	None
Side Obstacle Detection Control Module - Right (SOD-R)	7C6	Yes	Yes	No	None
Smart Junction Box (SJB)	726	Yes	Yes	• Tire Pressure Monitoring	• Auto locking • Auto unlocking

				System (TPMS) sensor calibration	• Global open (Lincoln only) • Lamps outage enable • Perimeter lighting feature • Daytime Running Lamps (DRL) present • Tire placard pressure
Transmission Control Module (TCM)	7E1	No	No	Yes	None

Inspection and Verification

This section provides step-by-step module configuration procedures. Carry out the Programmable Module Installation (PMI) procedure in this section when another workshop manual section directs to carry out configuration or when DTCs from the below list are present:

DTC Chart

NOTE: Some modules on this vehicle utilize a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous Memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Source	Action
B2477	Module Configuration Failure	• Driver Door Module (DDM) • Driver Seat Module (DSM) • Dual Climate Controlled Seat Module (DCSM) • Front Display Interface Module (FDIM) • Parking Aid Module (PAM) • Smart Junction Box (SJB)	CARRY OUT Programmable Module Installation (PMI). REFER to Programmable Module Installation (PMI) in this section.

Programmable Module Installation (PMI)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is Available

NOTE: Following module installation, some modules require a separate procedure be carried out. For instructions, refer to the specific module removal and installation procedures.

1. Connect the IDS and identify the vehicle as normal.
2. From the Toolbox icon, select Module Programming and press the check mark.
3. Select Programmable Module Installation.
4. Select the module that is being replaced.
5. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
6. Install the new module and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. The IDS downloads the data into the new module and displays Module Configuration Complete.
9. Test module for correct operation.

Programmable Module Installation (PMI) Using the Integrated Diagnostic System (IDS) When the Original Module is NOT Available

NOTE: Following module installation, some modules require a separate procedure be carried out. For instructions, refer to the specific module removal and installation procedures.

1. Install the new module.
2. Connect the IDS and identify the vehicle as normal.
3. From the Toolbox icon, select Module Programming and press the check mark.
4. Select Programmable Module Installation.

5. Select the module that was replaced.
6. Follow the on-screen instructions, turn the ignition key to the OFF position, and press the check mark.
7. Follow the on-screen instructions, turn the ignition key to the ON position, and press the check mark.
8. If the data is not available, the IDS displays a screen stating to contact the As-Built Data Center. Retrieve the data from the technician service publication website at this time and press the check mark.
9. Enter the module data and press the check mark.
10. The IDS downloads the data into the new module and displays Module Configuration Complete.
11. Test module for correct operation.

Accessory Protocol Interface Module (APIM) Programming

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST3051-A	Universal Serial Bus (USB) Male-A to Male-A Cable CCMUSB2-AM-AM-10 or equivalent

Accessory Protocol Interface Module (APIM) Programming Using the Integrated Diagnostic System (IDS)

NOTE:

- If a new Accessory Protocol Interface Module (APIM) is being installed, install a new APIM before carrying out the following procedure. For additional information, refer to Section 415-00 .
- When carrying out the programming procedures, follow the scan tool on-screen directions.
- Make sure the battery is fully charged before carrying out the programming steps.
- A hardwired internet connection is strongly recommended when programming.
- If unable to complete programming because operation stops or errors are received, internet browser settings may need to be configured. From the on-line OASIS tab, select the "Service Tips" tab, then select "SYNC Software Programming" under "Job Aids".

NOTE:

- For APIM flash programming:
  - The scan tool and a USB male A to male A cable (CCMUSB2-AM-AM-10 or equivalent) are required.
  - The flash procedure deletes any paired phones that were in the SYNC® system.
  - The file for the flash needs to be downloaded from the online database. Allow for extra time for the file to download. The files are approximately 80 megabyte.

1. **NOTE:** The IDS program must be closed before attempting to program the APIM .

   Open a session for the vehicle from the technician service publication web site, and run On-Line Automotive Service Information System (OASIS) using "Read VIN and DTC's".

2. From the OASIS tab, select the "SYNC" button.

3. There are 3 available options for APIM programming:
   - Standard latest version of current software and applications): Use this option to update the APIM to the latest software level.
   - Custom (show what's available, and let me choose): Use this option to show all the available options that can be programmed, or if a Technical Service Bulletin (TSB) directs for specific software version to be programmed.

- Module Replacement (restore software for newly installed hardware): Use this option when the APIM has been replaced.

4. After selecting 1 of the 3 options (Standard, Custom or Module Replacement), click the "Read SYNC" button to verify the current APIM , Vehicle Interface Processor (VIP) and Consumer Interface Processor (CIP) software levels.
    - The versions are compared to a online database. After the comparison, the available software is displayed.

5. **NOTE:** Do not disconnect the Vehicle Communication Module (VCM) or the USB cable during APIM programming.

   When carrying out the programming procedures, follow the scan tool on-screen directions.

   NOTE: If unable to complete programming because operation stops or errors are received, interned browser settings may need to be configured. From the on-line OASIS tab, select the "Service Tips" tab, then select "SYNC Software Programming" under "Job Aids".

   Select the "Program SYNC" button to begin the APIM programming process.

6. Follow the scan tool on-screen directions for APIM programming.
    - After programming is complete the scan tool displays "Programming has been completed successfully."

Anti-Theft

NOTE: The Integrated Keyhead Transmitter (IKT) key is a standard Passive Anti-Theft System (PATS) key with a Remote Keyless Entry (RKE) transmitter incorporated into the keyhead. For PATS , refer to Section 419-01B or Section 419-01C . For RKE , refer to Section 501-14 .

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The perimeter anti-theft system consists of the following:

- Door ajar switches (located in the latches)
- Exterior lamps
- Hood switch (located in the left front of the engine compartment, on the core support)
- Horn (located forward of the RF wheel well)
- Key-in-ignition switch
- Keyless entry keypad (if equipped)
- Luggage compartment lid disarm switch (located in the luggage compartment lid lock cylinder) (also known as the anti-theft inhibit switch)
- RKE transmitter (part of the IKT key)
- SJB (located under the instrument panel on the left side)

The perimeter anti-theft feature is controlled by the SJB . The alarm can be armed by using 1 of 3 commands:

- Pressing the LOCK button on the IKT key
- Pressing the door lock control switch to LOCK with the accompanying door open, then close the door
- Pressing the 7/8 and 9/0 buttons simultaneously on the keyless entry keypad (if equipped)

The SJB monitors the door ajar switches, the hood switch and the luggage compartment lid disarm switch (all doors, hood and luggage compartment lid must be closed and the key must be out of the ignition lock cylinder). The SJB arms the perimeter alarm after all of the inputs are closed for 20 seconds. From the time each individual input is closed, to the time the perimeter alarm is armed for that particular input (approximately 20 seconds), is the "pre-arm phase". The pre-arm phase is separate for each individual input. If the door lock control switch is pressed to LOCK with the accompanying door open, all of the inputs that are closed (hood, luggage compartment lid) immediately begin their pre-arm phase. After the door that was open is closed, that door begins its pre-arm phase. This causes all other entry points to be armed a few seconds before the last open entry point. The perimeter alarm arms in stages in relation to which input was closed first after the arming command was given.

In the event of an unauthorized entry, the SJB activates the alarm. When the alarm is activated, the SJB intermittently grounds the horn relay, causing the horn to sound in regular intervals, and intermittently powers the turn signals, causing the turn signals to flash in regular intervals.

An unauthorized entry is identified by the SJB when a door, hood or luggage compartment lid ajar switch is detected by the SJB as having been opened and no electronic unlock function (the RKE transmitter unlock button being pressed) was received. If an unauthorized entry occurs at a passenger door, hood or luggage compartment lid, the SJB activates the perimeter alarm.

If an unauthorized entry occurs at the driver door with the SJB detecting the driver door ajar switch as being opened (with no electronic unlock command detected by the SJB), there is a 12-second delay with the Instrument Panel Cluster (IPC) issuing a chime during this 12-second delay. If a valid, programmed PATS

key does not turn the ignition switch to the ON position within 12 seconds of the driver door ajar switch being detected as open, the SJB considers this event to be an unauthorized entry and activates the perimeter alarm. At this time, the message center in the IPC will display "TO STOP ALARM, START VEHICLE".

An authorized entry is identified by the SJB as any of the ajar switches being opened after an electronic unlock command from a programmed RKE transmitter or keyless entry keypad (if equipped) has been detected by the SJB .

The door lock control switches cannot disarm the perimeter alarm.

The perimeter alarm can be disarmed only by:

- pressing the UNLOCK button on the RKE transmitter (part of the IKT key).
- using a valid programmed PATS key to turn the ignition switch to the ON position.
- entering the correct vehicle unlock code on the keyless entry keypad (if equipped).

The perimeter alarm can be deactivated (not disarmed) by pressing the PANIC button on the RKE transmitter (part of the IKT key). This action will not disarm the alarm, but stops the alarm from activation (horn sounding and turn signal lamps flashing). The perimeter alarm continues to be armed.

Perimeter Alarm Inhibit

The anti-theft inhibit switch (also known as the luggage compartment lid disarm switch) can be used to inhibit (stop/prevent) an armed system from activating the alarm. If the luggage compartment lid is opened by turning the key in the luggage compartment lid lock cylinder, the SJB will not activate the perimeter alarm. The perimeter alarm will continue to be armed for the other closures (all of the doors and the hood), but the alarm will not activate with the luggage compartment lid open.

If the luggage compartment lid is released using the luggage compartment lid release button on the IKT key, the perimeter alarm will be disarmed for the luggage compartment lid only. The rest of the vehicle closures will continue to be armed.

Anti-Theft

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025D or equivalent

Principles of Operation

Perimeter Anti-Theft

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The perimeter anti-theft system (integral to the SJB) provides for vehicle security through an audible and visual notification if the vehicle doors, luggage compartment lid, or hood are opened while the system is armed. The system arms when:

- the doors, the luggage compartment lid, and the hood are closed.
- the key is in the OFF position.
- the vehicle is electronically locked using the lock button on the Remote Keyless Entry (RKE) transmitter (part of the Integrated Keyhead Transmitter (IKT) key), the keyless entry keypad (if equipped), or a door lock control switch (with a front door open, then closed).

There is a 20-second pre-arm delay after which each door, luggage compartment lid, and hood is armed. If a door, luggage compartment lid, or hood is open, the system still arms all the other closures. Only the open door, luggage compartment lid, or hood remains disarmed until it is closed. When the open entry point is closed, that entry point enters a 20-second pre-arm delay, then arms.

The hood switch and door ajar switches register as normally closed. The luggage compartment lid ajar switch registers as a normally closed switch. The SJB monitors the status of the hood switch, the luggage compartment lid ajar switch and door ajar switches. If these switches indicate an open entry point, the SJB energizes the horn and flasher relays, causing the horn to sound and the turn signal lamps to flash. The SJB disarms the perimeter alarm when it receives:

- an UNLOCK command through the keyless entry keypad (if equipped).
- an UNLOCK command through the RKE transmitter (part of the IKT key).
- a valid Passive Anti-Theft System (PATS) ignition key is turned to the ON position.

Alarm Event PIDs

The SJB has PIDs available that show what caused the last alarm events. The SJB has 4 alarm event PIDs and are AL_EVT1 through 4. The most recent alarm event is always listed in the first alarm event or trigger PID. These PIDs display what caused the alarm to trigger and can be a very useful tool when trying to identify the cause of a false alarm trigger.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Hood switch • Luggage compartment lid disarm switch	• Wiring, terminals or connectors • Smart Junction Box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B1520	Hood Switch Circuit Open	GO to Pinpoint Test B .
B2108	Trunk Key Cylinder Switch Failure	GO to Pinpoint Test D .
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Alarm System Does Not Operate Correctly - From The Driver Door

Normal Operation

If an unauthorized entry occurs at the driver door with the Smart Junction Box (SJB) detecting the driver door ajar switch as being opened (with no electronic unlock command detected by the SJB), there is a 12-second delay with the Instrument Panel Cluster (IPC) issuing a chime during this 12-second delay. If a valid, programmed Passive Anti-Theft System (PATS) key does not turn the ignition switch to the ON position within 12 seconds of the driver door ajar switch being detted as open, the SJB considers this event to be an unauthorized entry and activates the perimeter alarm.

This pinpoint test is intended to diagnose the following:

- Door ajar switch(es)
- SJB

PINPOINT TEST A: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY - FROM THE DRIVER DOOR

Test Step	Result / Action to Take
A1 CHECK THE OPERATION OF THE INTERIOR LAMPS	
• Connect: Close all doors.	**Yes** GO to A2 .

• Disconnect: Open the driver door. • **Do the interior lamps illuminate correctly?**	**No** REFER to Section 417-02 .
A2 CHECK THE DRIVER DOOR AJAR SWITCH INPUT	
• Ignition OFF. Connect: Close all doors. • Lock the vehicle electronically, using either the door lock control switch, the Remote Keyless Entry (RKE) transmitter (part of the Integrated Keyhead Transmitter (IKT) key) or the keypad (if equipped). • Wait for 30 seconds as the vehicle arms the perimeter alarm. • Open the driver door using the interior door handle. • **Does the IPC issue a chime for approximately 12 seconds, then does the perimeter alarm activate?**	**Yes** The vehicle is operating to design intent. INSTRUCT the customer on the correct operation of the vehicle and the perimeter alarm system. **No** GO to A3 .
A3 CHECK THE SJB FOR CORRECT OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CYCLE each key to the ON position for a minimum of 6 seconds to PROGRAM the RKE function of the IKT key. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: The Alarm System Does Not Operate Correctly - Alarm Does Not Activate With Hood Ajar/Open

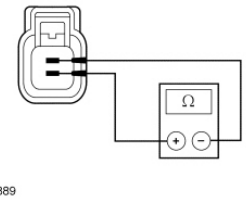
Refer to Wiring Diagrams Cell 117 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

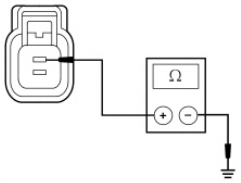
The hood switch is a normally closed switch. The Smart Junction Box (SJB) receives the hood switch status through circuit CPL25 (hood switch ajar sense circuit), the hood switch, and the hood switch ground circuit GD123. When the hood is open, the hood switch opens, removing the ground to the SJB .

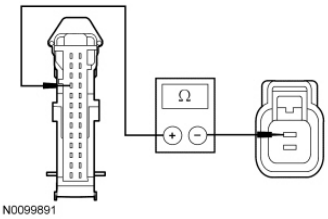
- DTC B1520 (Hood Switch Circuit Open) - an on-demand DTC that sets when there is an open in the circuit between the hood switch and the SJB , an open in the ground circuit to the hood switch, or the hood switch is stuck open during the on-demand self-test. If the hood is detected as always being

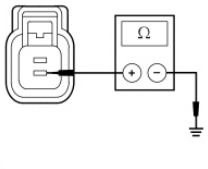
open, the perimeter alarm will never arm for the hood.



This pinpoint test is intended to diagnose the following:







- Wiring, terminals or connectors
- Hood switch
- SJB

PINPOINT TEST B: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY - M DOES NOT ACTIVATE WITH HOOD AJAR/OPEN

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
B1 CHECK THE HOOD SWITCH	
• Ignition OFF. • Disconnect: Hood Switch C127. • Measure the resistance between the hood switch C127-1, component side and the hood switch C127-2, component side while pressing the hood switch plunger in and then releasing it.  N0099889 • **Is the resistance less than 5 ohms with the hood switch plunger pressed and greater than 10,000 ohms with the hood switch plunger released?**	**Yes** GO to B2 . **No** INSTALL a new hood switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B2 CHECK THE HOOD SWITCH CIRCUIT CPL25 (HOOD SWITCH AJAR SENSE CIRCUIT) FOR A SHORT TO GROUND	
• Disconnect: SJB C2280f. • Measure the resistance between the hood switch C127-1, circuit CPL25 (BU/OG), harness side and ground.	**Yes** GO to B3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0099890 • **Is the resistance greater than 10,000 ohms?**	
B3 CHECK CIRCUIT CPL25 (HOOD SWITCH AJAR SENSE CIRCUIT) FOR AN OPEN	
• Measure the resistance between the SJB C2280f-10, circuit CPL25 (BU/OG), harness side and the hood switch C127-1, circuit CPL25 (BU/OG), harness side.  N0099891 • **Is the resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B4 CHECK CIRCUIT GD123 (HOOD SWITCH GROUND CIRCUIT) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the hood switch C127-2, circuit GD123 (BK/GY), harness side and ground.  N0099892 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the self-test.
B5 CHECK THE SJB FOR CORRECT OPERATION	
• Connect: Negative Battery Cable. • Disconnect all the SJB connectors. • Check for: ♦ corrosion	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CYCLE each key to the ON position for a minimum of 6 seconds to PROGRAM the Remote Keyless Entry (RKE) function of the Integrated Keyhead

♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Transmitter (IKT) keys. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test C: The Alarm System Does Not Operate Correctly - Flashers Or Horn Do Not Cycle During Anti-Theft Activation

Normal Operation

When an alarm event occurs, the Smart Junction Box (SJB) triggers the turn signals and the horn to signal an attempted theft.

This pinpoint test is intended to diagnose the following:

- Horn system concern
- Turn signals system concern
- SJB

PINPOINT TEST C: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY- FLASHERS OR HORN DO NOT CYCLE DURING ANTI-THEFT ACTIVATION

Test Step	Result / Action to Take
C1 CHECK THE ALARM ACTIVATION	
• Roll down the driver window and arm the perimeter alarm. After the alarm is armed (after a minimum of 20 seconds), open the driver door with the interior door handle to trigger the alarm. • **Do the horn and turn signals cycle on and off?**	**Yes** The alarm outputs are functioning correctly. TEST the system for normal operation. **No** If the turn signal lamps do not flash, GO to C2 . If the horn does not cycGO to C3 .
C2 CHECK THE TURN SIGNAL LAMPS OPERATION	
• Ignition ON. • Use the multifunction switch to activate the turn signals, and observe the turn signal lamps. • **Do the turn signal lamps operate correctly?**	**Yes** GO to C4 . **No** REFER to Section 417-01 .
C3 CHECK THE HORN OPERATION	
• Ignition ON.	**Yes** GO to C4 .

• Operate the horn by pressing the panic button on the IKT key. • **Does the horn operate correctly?**	**No** REFER to Section 413-06 .
C4 CHECK THE SJB FOR CORRECT OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CYCLE each key to the ON position for a minimum of 6 seconds to PROGRAM the Remote Keyless Entry (RKE) function of the Integrated Keyhead Transmitter (IKT) keys. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

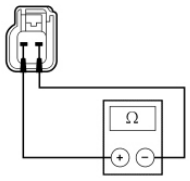
Pinpoint Test D: The Alarm System Does Not Operate Correctly - The Alarm Does Not Arm/Inhibit From The Luggage Compartment Lid

Refer to Wiring Diagrams Cell 117 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Remote Keyless Entry and Alarm for schematic and connector information.

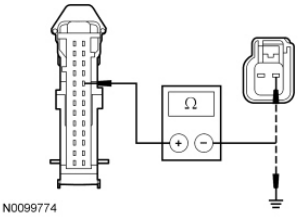
Normal Operation

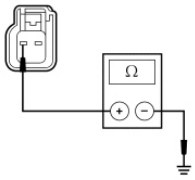
The Smart Junction Box (SJB) monitors the luggage compartment lid disarm switch on circuit CRT18 (luggage compartment lid disarm switch senscircuit) for a ground signal. The luggage compartment lid disarm switch is a normally open switch. When the key is turned to the unlock position, the disarm switch completes the circuit to ground on ground circuit GD171 signaling the SJB that an authorized entry to the luggage compartment is occurring. The SJB inhibits the alarm from activating until the luggage compartment lid is closed, then adds the luggage compartment lid to the protected entry points.

- DTC B2108 (Trunk Key Cylinder Switch Failure) - an on-demand DTC that sets when there is a short to ground in the circuit between the luggage compartment lid disarm switch and the SJB , or the luggage compartment lid disarm switch is shorted closed internally.



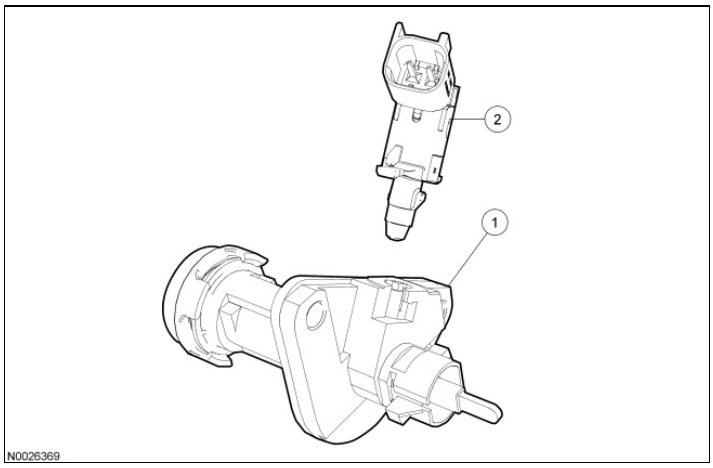
This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- Luggage compartment lid disarm switch
- SJB

PINPOINT TEST D: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY - THE ALARM DOES NOT ARM/INHIBIT FROM THE LUGGAGE COMPARTMENT LID



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
D1 CHECK THE LUGGAGE COMPARTMENT LID DISARM SWITCH	
NOTE: The luggage compartment lid disarm switch does not disarm (only inhibits) the perimeter alarm system. Once armed, the perimeter alarm can only be disarmed using the Integrated Keyhead Transmitter (IKT) key, the keyless entry keypad (if equipped), or if a valid Passive Anti-Theft System (PATS) key turns the ignition switch to the ON position. • Ignition OFF. • Disconnect: Luggage Compartment Lid Disarm Switch C4320. • Measure the resistance between the luggage compartment lid disarm switch C4320-1, component side and the luggage compartment lid disarm switch C4320-2, component side while turning the luggage compartment lid lock cylinder to the unlock position, then to the at-rest position.  N0099893 • **Is the resistance less than 5 ohms with the luggage compartment lid lock cylinder in the unlock position and greater than 10,000 ohms with the luggage compartment lid lock cylinder in the at-rest position?**	**Yes** GO to D2 . **No** INSTALL a new luggage compartment lid disarm switch. REFER to Luggage Compartment Lid Lock Cylinder in Section 501-14 . CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D2 CHECK CIRCUIT CRT18 (LUGGAGE COMPARTMENT LID DISARM SWITCH INPUT) FOR AN OPEN OR A SHORT TO GROUND	
• Disconnect: SJB C2280c. • Measure the resistance between the SJB C2280c-22, circuit CRT18 (YE/GY), harness side and the luggage compartment lid disarm switch C4320-1, circuit CRT18 (YE/GY), harness side; and between the SJB C2280c-22, circuit CRT18 (YE/GY), harness side and ground.	**Yes** GO to D3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

 N0099774 • **Is the resistance less than 5 ohms between the SJB and the luggage compartment lid disarm switch; and greater than 10,000 ohms between the SJB and ground?**	
D3 CHECK CIRCUIT GD171 (LUGGAGE COMPARTMENT LID DISARM SWITCH GROUND CIRCUIT) FOR AN OPEN	
• Disconnect: Negative Battery Cable. • Measure the resistance between the luggage compartment lid disarm switch C4320-2, circuit GD171 (BK/GY), harness side and ground.  N0077720 • **Is the resistance less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to D4 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
D4 CHECK THE SJB FOR CORRECT OPERATION	
• Disconnect all the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Section 419-10 . CYCLE each key to the ON position for a minimum of 6 seconds to PROGRAM the Remote Keyless Entry (RKE) function of the IKT keys. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Anti-Theft Inhibit Switch - Luggage Compartment

Item	Part Number	Description
1	5443262	Luggage compartment lid lock cylinder
2	13713	Luggage compartment anti-theft inhibit switch

Removal and Installation

1. Remove the luggage compartment lid lock cylinder. For additional information, refer to Section 501-14 .
2. Lift the retaining tabs, turn the switch clockwise and remove the luggage compartment anti-theft inhibit switch (also known as the luggage compartment lid disarm switch).
3. To install, reverse the removal procedure.

Anti-Theft

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The Passive Anti-Theft System (PATS) consists of the following components:

- Anti-theft indicator (located in the Instrument Panel Cluster (IPC))
- Encoded ignition Integrated Keyhead Transmitter (IKT) PATS key(s) (the key contains a transponder and a Remote Keyless Entry (RKE) transmitter)
- PATS transceiver (located around the ignition lock cylinder and under the lower steering column shroud)
- IPC
- PCM (located under the battery tray in the engine compartment)

PATS uses radio frequency identification technology to deter a drive-away theft. Passive means that it does not require any activity by the user.

The vehicle is equipped with 2 IKT PATS keys. The IKTs operate as a standard PATS key with an RKE transmitter incorporated into the keyhead. The IKTs require batteries for the RKE transmitter to operate. A maximum of 4 IKT keys can be programmed to operate the vehicle. If more than 4 IKT keys are programmed, the RKE portion of the additional keys do not operate. These additional keys start the vehicle, but do not operate the RKE system. If additional PATS keys are desired, a standard PATS key (a non- IKT key) can be used. For the purposes of this section, the PATS portion of the IKT key is referred to as a PATS key.

Passive Anti-Theft System (PATS) Function

The PATS function is controlled by the IPC . The PATS uses the IPC to carry out all of the PATS functions such as receiving the identification code from the PATS key, issuing a signal to the PCM to control the starter and fuel injectors enable, and initiating the key interrogation sequence when the ignition key is turned to the ON or START position. Because of the interaction between the IPC and the PCM, there are parameters that must be set if the IPC or the PCM (or both) are replaced. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section. If the IPC must be replaced for any reason (PATS concerns or an IPC concern), the PATS keys also must be programmed into the new IPC . Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. All elements of PATS must be functional before the vehicle starts. If any of the components are not working correctly, the vehicle does not start.

PATS is active only for a few seconds when the vehicle is starting. It is not a PATS concern if the vehicle stalls after it has been running for a minimum of 3 seconds. PATS cannot disable a running vehicle.

PATS may cause a vehicle no start due to either the fuel injectors or the starter not operating (starter relay does not close) or both. Always check for PATS DTCs from the IPC and DTCs from the PCM when a no-crank or no-start condition exists. A low state of charge in the vehicle battery may cause the PATS to allow starter operation, but prevent the fuel injectors from operating.

If the anti-theft indicator does not prove out (it may be either flashing or glowing steadily) and one (or both) of the previous conditions (fuel injectors and/or starter inoperative) are present, it may be due to a PATS concern. If the anti-theft indicator proves out, it may not be a PATS concern. If the anti-theft indicator does not illuminate at all, it may be an IPC concern. Refer to the Symptom Chart in this section.

PATS is not compatible with aftermarket remote start systems, which allow the vehicle to be started from the exterior of the vehicle. These systems may reduce the security of the vehicle, and also may be the cause of no-start concerns. Remote start systems must be removed from the vehicle before any PATS -related no-start concerns are investigated.

Unlimited Key Mode

PATS contains a feature called unlimited key mode. This feature allows a customer to program more than 8 vehicle keys, if requested. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same mechanically cut keys. For an individual customer, any randomly selected security key that has been previously mechanically cut and electronically programmed to the vehicle is acceptable.

If unlimited key mode is enabled, a maximum of 4 IKT keys can be programmed to the vehicle for RKE functionality. If more keys are required, they should be standard PATS keys. If more than 4 IKT keys are programmed to the vehicle, only 4 IKT keys have RKE functionality, however, all of them start the vehicle, if programmed correctly. Refer to Spare Key Programming â Unlimited Key Mode in this section.

MyKeyÂ® Feature

The MyKeyÂ® feature allows a restricted driving mode to be programmed into one (or more) key(s) supplied with the vehicle or into any (PATS) programmed spare key(s) to promote good driving habits. The MyKeyÂ® is a restricted key for all consecutive key cycles until the MyKeyÂ® restricted key is cleared. The remaining key(s) is referred to as an "administrator key" or admin key. There must always be at least one admin key. The IPC does not allow the last admin key to be programmed into a MyKeyÂ® restricted key. Both the admin key and the MyKeyÂ® can be used to see how many admin keys and MyKeyÂ® restricted keys are programmed to the vehicle, and how many total miles have been driven with the MyKeyÂ® restricted key active.

When the MyKeyÂ® feature is programmed, several features are modified including:

Standard Restricted Features

- **NOTE:** The standard restricted features below cannot be configured in any way.

  Belt-MinderÂ® chimes periodically with the audio system muted until the driver safety belt is buckled. If Belt-MinderÂ® has been disabled when the admin key is in the ignition lock cylinder, Belt-MinderÂ® still functions for the MyKeyÂ® driver. Belt-MinderÂ® cannot be disabled by the MyKeyÂ® driver.
- Audible and visual low fuel warnings are issued when the programmed Distance To Empty (DTE) value is reached (typically 75 miles).
- The parking aid system (if equipped), Blind Spot Information System (BLISÂ®) with cross traffic alert (if equipped) cannot be turned off.

Optional Restricted Features

- **NOTE:** The optional restricted features below can be configured to the customer preferences.

  The volume of the audio system can be programmed to limit the volume to 45% of the maximum volume.
- Vehicle speed can be programmed to be limited to 130 km/h (80 mph). Audible and visual warnings are issued when the vehicle speed of 130 km/h (80 mph) is attained.
- Audible and visual warnings are issued when the preselected vehicle speed of 75, 90 or 105 km/h (45, 55 or 65 mph) is attained.
- The AdvanceTracÂ® always on feature can be configured on or off. If configured to always on, at

this time the traction control cannot be disabled by the MyKeyÂ® driver.

Refer to Information and Message Center in the Description and Operation portion of Section 413-01 for all of the MyKeyÂ® system checks and system warning displays.

Refer to MyKeyÂ® Programming in this section or to the Owner's Literature for MyKeyÂ® programming information.

Check MyKeyÂ® System Status

The vehicle system check provides the status of the following MyKeyÂ® parameters:

- MYKEY DISTANCE â This odometer only tracks mileage when a MyKeyÂ® is used. If mileage does not accumulate, the intended MyKeyÂ® is not being used. The only way to reset this odometer to zero is by clearing the MyKeyÂ®. If this odometer is lower than the last time it was checked, the MyKeyÂ® system has been cleared.
- MYKEY(S) PROGRAMMED â Indicates how many MyKeysÂ® are programmed to the vehicle. It can also be used to determine if a MyKeyÂ® has been cleared.
- ADMIN KEYS PROGRAMMED â Indicates how many admin keys are programmed to the vehicle. It can also be used to determine if an additional spare key has been programmed to the vehicle.

Refer to the Owner's Literature for information on accessing the MyKeyÂ® system status in the message center.

Using MyKeyÂ® with Aftermarket Remote Start System

When using an aftermarket remote start system, the default settings recognize the remote start system as an additional admin key. If the remote start system has not been programmed as a MyKeyÂ® and the driver is a MyKeyÂ® driver, the driver could drive the vehicle using the remote start system as an admin key with no MyKeyÂ® restrictions. If requested by the customer to resolve this concern, the aftermarket remote start system needs to be programmed as a MyKeyÂ®. For information on programming the aftermarket remote start system as a MyKeyÂ®, refer to MyKeyÂ® Programming in this section.

Anti-Theft

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3104-A	Backprobe Pins POM6411 or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Anti-Theft Indicator

NOTE: Replacement of the Passive Anti-Theft System (PATS) transceiver does not require the PATS keys to be programmed into the Instrument Panel Cluster (IPC) again.

NOTE: Make sure any aftermarket remote start systems have been removed from the vehicle before any PATS -related no-start concerns are investigated.

NOTE: A minimum of 2 PATS keys must be programmed into the IPC before the vehicle starts. They do not need to be Integrated Keyhead Transmitter (IKT) keys. Either 2 IKT keys, or 2 standard PATS keys, or a combination of an IKT key and a standard PATS key is sufficient for the vehicle to start.

NOTE: If the IPC or the PCM is being replaced (or both), the parameters must be reset in both modules or the vehicle experiences a PATS no-start. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section.

PATS uses a visual anti-theft indicator located in the IPC . The indicator proves out for 3 seconds when the ignition key is in the ON or START position under normal operation. If there is a PATS concern, this anti-theft indicator either flashes rapidly or glows steadily when the ignition key is turned to the ON or START position. PATS also flashes the anti-theft indicator every 2 seconds when the ignition key is in the OFF position to act as a visual theft deterrent. Refer to Section 413-01 for the anti-theft indicator.

Encoded Passive Anti-Theft System (PATS) Keys

PATS uses a special ignition key, called an IKT key that is larger than a conventional ignition key. It contains a permanently installed electronic device called a transponder and also has the Remote Keyless Entry (RKE) transmitter integrated into the keyhead. Each transponder contains a unique encrypted identification code which is one of a very large number of combinations. The addition of this transponder to the key makes it an "encoded" key. The PATS portion of the IKT key does not require batteries and should last the lifetime of the vehicle. The transmitter portion of the IKT key has a battery. Each PATS key must be programmed into the IPC before it can be used to start the vehicle. A maximum of 4 IKT keys can be programmed to start the vehicle and also operate the RKE functions. If more than 4 IKT keys are programmed, the RKE portion of the additional IKT keys do not operate and the SJB sets a memory full DTC (B1138 - Memory Full) with the IPC setting the DTC B109E:42 (Remote Keyless Entry: General Memory Failure). These additional keys start the vehicle, but does not operate the RKE system. If additional PATS keys are desired, a standard PATS key (a non- IKT key) can be used. There are specific general procedures described in this section that must be carried out if a new PATS key is necessary. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment or Key Programming Using Two Programmed Keys in this section.

Passive Anti-Theft System (PATS) Transceiver

The PATS transceiver is located under the steering column shroud and communicates with the encoded ignition key. During each vehicle start sequence, the PATS transceiver reads the encoded ignition key identification code and sends data to the IPC . The IPC validates the code, and if it is the correct code, sends a message to the PCM to ground the starter relay solenoid coil and to also allow the fuel injectors to operate.

Passive Anti-Theft System (PATS) Operation

The PATS function is controlled by the IPC . With this type of PATS , there are parameters that need to be reset if either the IPC or the PCM (or both) are replaced. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section. When the PATS key is turned to the ON or START position, the IPC initiates the key interrogation sequence by sending a voltage signal to the PATS transceiver. The transceiver then uses its antenna to bounce a signal off the transponder in the PATS key. This process "reads" the PATS key identification code and sends the key identification code back to the IPC , which interprets it and determines if it matches one of the stored key codes. If it does match one of the stored key codes, the IPC sends a message to the PCM to ground the starter relay solenoid coil and to also allow the fuel injectors to operate. If it does not match one of the stored key codes, or it is only a partial key read or no key read, the IPC sends a message to the PCM to not ground the starter relay solenoid coil and not allow fuel injector operation. The anti-theft indicator in the IPC flashes (or may glow steadily) and the IPC stores one or more DTCs. All elements of PATS must be functional before the vehicle starts. If any of the components are not working correctly, the vehicle does not start. If the IPC must be replaced for any reason (PATS concerns or IPC concerns), the PATS keys must also be programmed into the new IPC . Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section.

PATS disables the vehicle from starting if there is:

- a damaged PATS key.
- a non-programmed PATS key.
- a non- PATS key (key has no electronics).
- damaged wiring.
- a damaged transceiver.
- a damaged IPC .
- a damaged PCM.

Passive Anti-Theft System (PATS) PIDs

Monitoring the PATS PIDs can be very useful in determining which diagnostic steps to follow. Viewing the MASTERKEY (master key) PID with both keys determines if the key is a programmed key and may also be

used to prove out the transceiver, circuitry and the IPC . IPC Viewing the MIN_KEYS (minimum number of keys) PID (this PID does not change) determines the minimum number of keys that must be programmed into the IPC . There must be at least 2 keys programmed into the IPC in this type of PATS before the vehicle starts. Viewing the N_KEYCODE (number of keys programmed) PID determines if the minimum number of keys have been programmed into the IPC . If the N_KEYCODE PID reads 0 or 1, additional key(s) needs to be programmed into the IPC in order to meet the minimum of 2 keys. If the N_KEYCODE PID reads 0 or 1, and the MASTERKEY PID reads Not Present, that particular key must be programmed into the IPC . If the N_KEYCODE PID reads 1, and the MASTERKEY PID reads Present, that particular key is already programmed into the IPC . In this particular case, though, there are not enough keys programmed (a minimum of 2 are needed before the vehicle starts) into the IPC and at least 1 more key needs to be programmed before the vehicle starts. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section.

Also, if the unlimited key mode has been enabled, the N_KEYCODE PID always reads 2, after the first 2 keys are programmed into the IPC , regardless of how many additional keys are added.

If the IPC was replaced, the parameters in the IPC , and the parameters in the PCM needs to be reset. When the parameters are reset, it clears (erases) the PCM ID from the IPC . A parameter reset causes the PCM to send a PCM ID to the IPC that is necessary for the system to operate. Make sure to cycle the key at least once, then turn the key ON and make an attempt to start the vehicle for 3-5 seconds before attempting more procedures. If only a PCM parameter reset occurs, the ID stored in the IPC does not match the ID being sent by the PCM, and may cause a PATS -related no-start. Carry out a PATS parameter reset, then turn the key ON and make an attempt to start the vehicle for 3-5 seconds before attempting more procedures.

If the PCM_ID (PCM id status) PID reads Stored, the IPC has a PCM ID stored. If it reads Not Stored, a parameter reset may resolve this concern. If the PATSENABL (vehicle enable status) PID reads Disabled, and the N_KEYCODE PID reads 2 or more and the MASTERKEY PID reads Present, the IPC and the PCM needs to have their parameters reset. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section.

If the PATSENABL PID reads Disabled, and the N_KEYCODE PID reads 1 and the MASTERKEY PID reads Present, or if the N_KEYCODE PID reads 0 and the MASTERKEY PID reads Not Present, a minimum of 2 keys need to be programmed into the IPC . Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section.

If the MASTERKEY PID continues to read Not Present after programming, this may indicate a defective key. The SPAREKEY PID is defaulted to Enable. With the SPAREKEY PID displaying Enable, the IPC accepts more than 2 keys (up to a maximum of 8) being programmed into the IPC using Key Programming Using Two Programmed Keys in this section. It can be toggled to Disable if the customer wants to disable the customer spare key programming function. Refer to Key Programming Switch State Control in this section. This switch state control does not affect the Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment procedure.

In summary, in order for the vehicle to start, the PATS PIDs and the correct state they must be in are as following:

PID	Normal State
N_KEYCODE	must read 2 or more
MASTERKEY	must read Present
PATSENABL	must read Enabled

PCM_ID	must read Stored
PCM_VFY	must read Yes

Use of Standard Passive Anti-Theft System (PATS) Keys

When using a standard (non- IKT) PATS key to start the vehicle, an IKT key (from another vehicle) on the same key ring may possibly be programmed into the vehicle for remote entry functionality, resulting in the IKT key being able to operate the lock and unlock functions of the vehicle (but the IKT key cannot start the vehicle). This should not cause a PATS no-start of either the first or the second vehicle, but the IKT key may be able to operate the lock and unlock functions of both vehicles. The IKT key is able to start the original vehicle to which it is programmed and does start the second vehicle. At this time, it is necessary to carry out an Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment procedure and then to make certain the IKT key for the second vehicle is removed from the key ring in order to prevent this concern from occurring again. Also, if an IKT key is used to start the vehicle, the vehicle only reads the IKT key in the ignition lock cylinder and does not read the second IKT on the key ring. Using an IKT key to start both vehicles, rather than standard PATS keys, prevents the second IKT (transmitter portion only) from being programmed into the first vehicle.

Unlimited Key Mode

PATS contains a feature called unlimited key mode and uses the UNL_KEY_MODE PID. This feature allows a customer to program more than 8 keys to their vehicle if they request it. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same mechanically cut keys, but no other keys from outside can be used to operate the vehicles. For an individual customer, any randomly selected security key that has been previously mechanically cut and electronically programmed to the vehicle is acceptable. Refer to Spare Key Programming - Unlimited Key Mode in this section.

Inspection and Verification

1. Verify the customer ncern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• PATS key • Use of a non- PATS key or incorrect PATS key • Remote start system installed	• Smart Junction Box (SJB) fuse 36 (5A) • Wiring, terminals or connectors • Instrument Panel Cluster (IPC) • PCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the IPC .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Instrument Panel Cluster (IPC) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B109E:42	Remote Keyless Entry: General Memory Failure	The Smart Junction Box (SJB) has 4 Integrated Keyhead Transmitters (IKTs) stored in memory and cannot program any more IKTs into the SJB memory. REFER to the Principles of Operation in this section to determine this is normal operation for this system.
B10D5:13	PATS Antenna: Circuit Open	There has been a Passive Anti-Theft System (PATS) transceiver antenna failure. GO to Pinpoint Test A .
B10D7:05	PATS Key: System Programming Failures	There was a failure in key programming. GO to Pinpoint Test I .
B10D7:51	PATS Key: Not Programmed	There is an unprogrammed PATS key. GO to Pinpoint Test C .
B10D7:87	PATS Key: Missing Message	No PATS key has been read by the IPC . GO to Pinpoint Test B .
B10D7:8F	PATS Key: Erratic	Only a partial PATS key was read. GO to Pinpoint Test D .
B10D8:00		

	PATS Key Less Than Minimum Programmed: No Sub Type Information	If DTCs B10D7:87, B10D7:51, B10D7:8F, B10D9:87 or B10D5:13 are present, they must be addressed first. If DTC B10D8:00 is the only DTC present, PROGRAM additional keys. REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
B10D9:87	PATS Transponder: Missing Message	The Instrument Panel Cluster (IPC) did not receive the PATS transceiver signal. GO to Pinpoint Test E .
B10DA:51	PATS PCM Identifier: Not Programmed	There is no PCM ID stored in the IPC . CARRY OUT a parameter reset of the IPC and the PCM, then CYCLE the ignition and make an attempt to start the vehicle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. REPEAT the self-test.
B10DA:61	PATS PCM Identifier: Signal Calculation Failure	CARRY OUT a parameter reset of the IPC and the PCM and CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key cycle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
B10DA:86	PATS PCM Identifier: Signal Invalid	**NOTE:** If DTCs B10DA:61 and B10DA:86 are both present, address DTC B10DA:61 first. GO to Pinpoint Test G .
U0100:00	Lost Communication With ECM /PCM "A": No Sub Type Information	**NOTE:** If DTCs U0100:00 and B10DA:61 are both present, address DTC B10DA:61 first. GO to Pinpoint Test G .
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

PCM DTC Chart

DTC	Description	Action
P1260	Theft Detected, Vehicle Immobilized	If there are any Passive Anti-Theft System (PATS) DTCs present in the Instrument Panel Cluster (IPC), ADDRESS them first. This DTC can also indicate a Controller Area Network (CAN) concern or a parameter reset concern. Make sure to verify if there are any communication concerns/DTCs with any modules. REFER to Section 418-00 . If DTC P1260 is the only DTC present, there may be a parameter reset concern or a power or ground concern with the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. If necessary, CHECK the powers and grounds to the PCM. REFER to the Wiring Diagrams Manual to determine the PCM power and ground circuits.
P1602	Immobilizer/ ECM Communication Error	**NOTE:** If IPC DTC B10DA:61 is also present, address IPC DTC B10DA:61 first. GO to Pinpoint Test G .
P1622	Immobilizer ID Does Not Match	CARRY OUT a parameter reset of the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key

		cycle. REPEAT the self-test.
All other DTCs	-	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: DTC B10D5:13

Normal Operation

- DTC B10D5:13 (PATS Antenna: Circuit Open) - a continuous and on-demand DTC that sets when there has been a Passive Anti-Theft System (PATS) transceiver antenna failure. The PATS transceiver may need to be replaced.

This pinpoint test is intended to diagnose the following:

- PATS transceiver

PINPOINT TEST A: DTC B10D5:13

Test Step	Result / Action to Take
A1 INSPECT THE PATS TRANSCEIVER FOR CORRECT INSTALLATION	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the Instrument Panel Cluster (IPC) again. • Ignition OFF. • Verify the PATS transceiver is correctly installed. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D5:13 retrieved?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** The system is OK.

Pinpoint Test B: DTC B10D7:87

Normal Operation

- DTC B10D7:87 (PATS Key: Missing Message) - a continuous and on-demand DTC that sets when no Passive Anti-Theft System (PATS) key has been read by the Instrument Panel Cluster (IPC).

This pinpoint test is intended to diagnose the following:

- PATS key
- PATS transceiver
- IPC

PINPOINT TEST B: DTC B10D7:87

NOTE: Large metallic objects, electric devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key can cause vehicle starting concerns and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the key off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key. (PATS keys from Ford, Rotunda, Strattec or Huf are approved Ford PATS keys.)

NOTE: This vehicle uses a Huf Integrated Keyhead Transmitter (IKT) key. If replacing an IKT key for any of these vehicles, it is recommended that the original Huf IKT key be replaced with another Huf IKT key. There are minor visual differences both externally and internally between the Huf IKT key and IKT keys used on other Ford and Lincoln vehicles that may be noticed by the customer. These visual differences do not affect the IKT key functionality in any way. Rotunda should supply a Huf IKT key when ordering replacement/new keys for this vehicle. The Owner's Literature can provide additional information concerning these differences. If replacing an IKT key (or adding another key) with a standard PATS key (not an IKT key), any of the brands (Ford, Rotunda, Strattec or Huf) can operate the system.

Test Step	Result / Action to Take
B1 RETRIEVE THE DTCs	
• Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D7:87 retrieved?**	**Yes** GO to B2 . **No** If any other IPC DTCs are retrieved, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . If no DTCs are retrieved, the system is OK.
B2 CHECK BOTH PATS KEYS	
• Obtain both PATS keys from the customer and follow the procedure using one PATS key, then the other. If the customer only has one PATS key, it is necessary to cut a new PATS	**Yes** If DTC B10D7:87 was present for both keys or the new key (if present), GO to B3 . If DTC B10D7:87 was not present for the new key, the original key may be damaged and should be replaced. REPLACE the damaged key with a new key. REFER to Integrated Keyhead

key. • If it is necessary to cut a new PATS key, program the new PATS key. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Using all existing keys, then the newly programmed key (if applicable), is DTC B10D7:87 present?**	Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. **No** If any other IPC DTCs are retrieved, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . If no IPC DTCs are retrieved, the system is OK.
B3 INSTALL A NEW PATS TRANSCEIVER	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. **NOTE:** Do not use the PATS key that may have been programmed in Step B2. • Ignition OFF. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Turn the key to the ON position using an existing customer PATS key. • Retrieve the IPC DTCs. • **Is DTC B10D7:87 retrieved?**	**Yes** GO to B4 . **No** The system is OK.
B4 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present.	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No**

• **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test C: DTC B10D7:51

Normal Operation

- DTC B10D7:51 (PATS Key: Not Programmed) - a continuous and on-demand DTC that sets when there is an unprogrammed Passive Anti-Theft System (PATS) key. There may not be a concern with the PATS key itself, but the key must be programmed into the PATS memory (unless the maximum number of keys are already programmed).

This pinpoint test is intended to diagnose the following:

- PATS key
- Instrument Panel Cluster (IPC)

PINPOINT TEST C: DTC B10D7:51

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key can cause vehicle starting concerns and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from toucng the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition switch off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key. (PATS keys from Ford, Rotunda, Strattec or Huf are approved Ford PATS keys.)

NOTE: Only 8 PATS keys can be programmed into the IPC during normal programming procedures (with the unlimited key mode being the exception). If the N_KEYCODE (number of keys programmed) PID reads more than 2 and less than 8, the concern may be the PATS key being used is an unprogrammed key. Verify this by also viewing the MASTERKEY (verifies if the key is programmed) PID. It must read Present for the key to be valid.

NOTE: This vehicle uses a Huf Integrated Keyhead Transmitter (IKT) key. If replacing an IKT key for any of these vehicles, it is recommended that the original Huf IKT key be replaced with another Huf IKT key. There are minor visual differences both externally and internally between the Huf IKT key and IKT keys used on other Ford and Lincoln vehicles that may be noticed by the customer. These visual differences do not affect the IKT key functionality in any way. Rotunda should supply a Huf IKT key when ordering replacement/new keys for this vehicle. The Owner's Literature can provide additional information concerning these differences. If replacing an IKT key (or adding another key) with a standard PATS key (not an IKT key), any of the brands (Ford, Rotunda, Strattec or Huf) can operate the system.

Test Step	Result / Action to Take
C1 RETRIEVE THE DTCs	
• **NOTE:** Follow this procedure using both PATS keys (using one at a time).	**Yes** GO to C2 . **No** If DTC B10D7:51 is retrieved for one PATS key, REPLACE that

• If only one key is available, cut a new key and program the keys. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • If both keys are available, program the keys. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D7:51 retrieved for both PATS keys?**	key and PROGRAM all the keys. REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B10D7:51 is not retrieved for either key, the system is OK. CHECK all customer PATS keys by attempting to start the vehicle with each key to verify all other PATS keys are programmed.
C2 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test D: DTC B10D7:8F

Normal Operation

- DTC B10D7:8F (PATS Key: Erratic) - a continuous and on-demand DTC that sets when only a partial Passive Anti-Theft System (PATS) key was read. Remote starter equipment can also cause this DTC.

This pinpoint test is intended to diagnose the following:

- PATS key
- PATS transceiver
- Instrument Panel Cluster (IPC)

PINPOINT TEST D: DTC B10D7:8F

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key can cause vehicle starting concerns and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key. (PATS keys from Ford, Rotunda, Strattec or Huf are approved Ford PATS keys.)

NOTE: This vehicle uses a Huf Integrated Keyhead Transmitter (IKT) key. If replacing an IKT key for any of these vehicles, it is recommended that the original Huf IKT key be replaced with another Huf IKT key. There are minor visual differences both externally and internally between the Huf IKT key and IKT keys used on other Ford and Lincoln vehicles that may be noticed by the customer. These visual differences do not affect the IKT key functionality in any way. Rotunda should supply a Huf IKT key when ordering replacement/new keys for this vehicle. The Owner's Literature can provide additional information concerning these differences. If replacing an IKT key (or adding another key) with a standard PATS key (not an IKT key), any of the brands mentioned above (Ford, Rotunda, Strattec or Huf) can operate the system.

Test Step	Result / Action to Take
D1 RETRIEVE THE DTCs	
• **NOTE:** Follow this procedure using both PATS keys (using one at a time). • If only one key is available, cut a new key and program the keys. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D7:8F retrieved for one or both PATS keys?**	**Yes** If DTC B10D7:8F is retrieved for one key, REPLACE that key and PROGRAM the new key. REFER to Spare Key Programming - Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B10D7:8F is retrieved for both PATS keys, GO to D2 . **No** The system is OK. CHECK all the customer PATS keys by attempting to start the vehicle with each key to verify all other PATS keys are programmed.
D2 INSTALL A NEW PATS TRANSCEIVER	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. • Ignition OFF. • Install a new PATS transceiver. Refer to Passive Anti-Theft	**Yes** GO to D3 . **No** The system is OK. CHECK all the customer PATS keys by attempting to start the vehicle with each key to verify all other PATS keys are programmed.

System (PATS) Transceiver in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Are any PATS DTCs retrieved?**	
D3 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

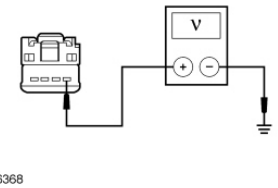
Pinpoint Test E: DTC B10D9:87

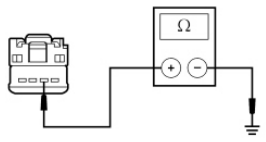
Refer to Wiring Diagrams Cell 112 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Passive Anti-Theft System for schematic and connector information.

Normal Operation

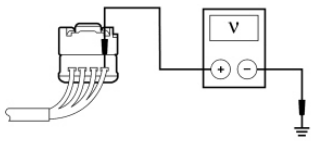
The Passive Anti-Theft System (PATS) transceiver receives voltage from the Smart Junction Box (SJB) fuse 36 (5A) on circuit CBP36 (vehicle power circuit) and is grounded on circuit GD116 (ground circuit). The PATS transceiver and the Instrument Panel Cluster (IPC) communicate on circuits VRT24 (receive circuit) and VRT23 (transmit circuit). The IPC compares the key code stored in memory and sends a signal to the PCM to enable the starter and the fuel injectors if the key code is correct.

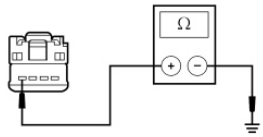
- DTC B10D9:87 (PATS Transponder: Missing Message) - a continuous and on-demand DTC that sets when the PATS transceiver signal is not received by the IPC . This DTC can be caused by circuits between the PATS transceiver and the IPC , or circuits to the PATS transceiver. This can also be caused by using the incorrect PATS transceiver part number.



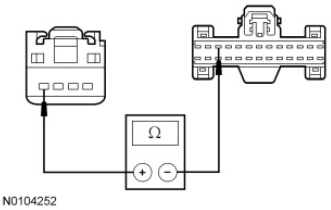


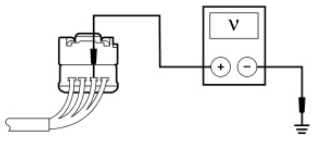
This pinpoint test is intended to diagnose the following:



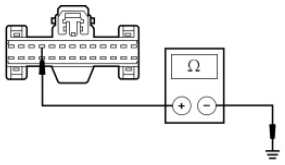


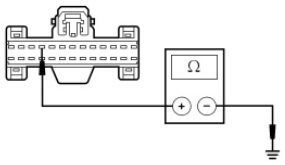
- Fuse
- Wiring, terminals or connectors
- PATS transceiver
- IPC

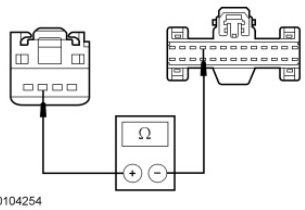




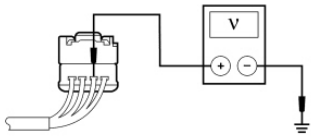
PINPOINT TEST E: DTC B10D9:87



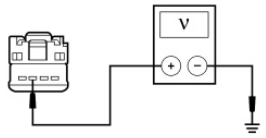




NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .



Test Step	Result / Action to Take
E1 CHECK THE PATS TRANSCEIVER POWER CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: PATS Transceiver C252. • Ignition ON. • Measure the voltage between the PATS transceiver C252-1, circuit CBP36 (BU/BN), harness side and ground.  A0096368 • **Is the voltage greater than 10 volts?**	**Yes** GO to E2 . **No** VERIFY the SJB fuse 36 (5A) is OK. If OK, REPAIR the circuit for an open. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
E2 CHECK THE PATS TRANSCEIVER GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the PATS transceiver C252-2, circuit GD116 (BK/VT), harness side and ground.  A0096369 • **Is the resistance less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to E3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
E3 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR VOLTAGE	

NOTICE: **This pinpoint test step directs using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** • Connect: PATS Transceiver C252. • Ignition ON. • Measure the voltage by backprobing between the PATS transceiver C252-4, circuit VRT24 (YE/OG), harness side and ground.  A0096370 • **Is the voltage greater than 8 volts?**	**Yes** GO to E6 . **No** GO to E4 .
E4 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220. • Disconnect: PATS Transceiver C252. • Measure the resistance between the PATS transceiver C252-4, circuit VRT24 (YE/OG), harness side and ground.  A0096371 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E5 . **No** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B10D9:87 is retrieved again, GO to E12 .
E5 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR AN OPEN	

• Measure the resistance between the PATS transceiver C252-4, circuit VRT24 (YE/OG), harness side and the IPC C220-11, circuit VRT24 (YE/OG), harness side.  N0104252 • **Is the resistance less than 5 ohms?**	**Yes** GO to E12 . **No** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
E6 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR VOLTAGE	
NOTICE: **This pinpoint test step directs using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. • Measure the voltage by backprobing between the PATS transceiver C252-3, circuit VRT23 (VT/GY), harness side and ground.  A0096373 • **Is the voltage greater than 8 volts?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B10D9:87 is retrieved again, GO to E12 . **No** GO to E7 .
E7 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR A SHORT TO GROUND WITH THE PATS TRANSCEIVER CONNECTED	

• Ignition OFF. • Disconnect: IPC C220. • Measure the resistance between the IPC C220-10, circuit VRT23 (VT/GY), harness side and ground.  N0104253 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E9 . **No** GO to E8 .
E8 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR A SHORT TO GROUND WITH THE PATS TRANSCEIVER DISCONNECTED	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. • Disconnect: PATS Transceiver C252. • Measure the resistance between the IPC C220-10, circuit VRT23 (VT/GY), harness side and ground.  N0104253 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
E9 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR AN OPEN	
• Disconnect: PATS Transceiver C252. • Measure the resistance between the PATS transceiver C252-3, circuit VRT23 (VT/GY), harness side and the IPC C220-10, circuit VRT23 (VT/GY), harness side.  N0104254 • **Is the resistance less than 5 ohms?**	**Yes** GO to E10 . **No** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

E10 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR VOLTAGE WHILE COMMANDED ON	
NOTICE: **This pinpoint test step directs using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. • Connect: PATS Transceiver C252. • Connect: IPC C220. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Trigger the IPC active command TRANSMIT (this is the TX circuit ON/OFF) to ON. • Measure the voltage by backprobing between the PATS transceiver C252-3, circuit VRT23 (VT/GY), harness side and ground.  A0096373 • **Is the voltage less than 5 volts?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** GO to E11 .
E11 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Disconnect: PATS Transceiver C252. • Ignition ON. • Measure the voltage between the PATS transceiver C252-3, circuit VRT23 (VT/GY), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** GO to E12 .

 A0096377 • **Is any voltage indicated?**	
E12 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test F: The Anti-Theft Indicator Is Always/Never On

Normal Operation

The Passive Anti-Theft System (PATS) uses a visual anti-theft indicator located in the Instrument Panel Cluster (IPC). The anti-theft indicator proves out for 3 seconds when the key is turned to the ON or START position. If there is a PATS concern, the anti-theft indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to the ON or START position. PATS also flashes the anti-theft indicator every 2 seconds at key off to act as a visual theft deterrent. The anti-theft indicator operation is controlled by the IPC .

This pinpoint test is intended to diagnose the following:

- IPC

PINPOINT TEST F: THE ANTI-THEFT INDICATOR IS ALWAYS/NEVER ON

Test Step	Result / Action to Take
F1 CHECK THE ANTI-THEFT INDICATOR FOR CORRECT OPERATION	

• Ignition OFF. • Press and hold the message center RESET button. • Ignition ON. • Continue holding the RESET button until ENGINEERING TEST MODE is displayed. • Release the RESET button. • Press and release the RESET button to advance through each stage of the IPC self-test. • Press and release RESET button until TELLTALE TEST is displayed. • **Does the anti-theft indicator illuminate, then turn off?**	**Yes** GO to F2 . **No** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test.
F2 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test G: DTC B10DA:86 and/or DTC U0100:00

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Normal Operation

During each vehicle start sequence, when the key is turned to the START or ON position, the Passive Anti-Theft System (PATS) transceiver reads the PATS key identification code and sends the data to the Instrument Panel Cluster (IPC). If there is no communication on the High Speed Controller Area Network (HS-CAN) between the IPC and the PCM, DTCs U0100:00 and/or B10DA:86 can set in the IPC and the vehicle can experience a PATS no-start.

If DTC B10DA:61 is present, refer to DTC Charts in this section.

- DTC B10DA:86 (PATS PCM Identifier: Signal Invalid) - a continuous DTC that sets only when the IPC does not receive the expected response from the PCM over the HS-CAN and the fault may not be present at the time of testing. The data sent by the PCM does not match the data expected by t IPC and this DTC is set. This DTC can be caused by the HS-CAN circuits between the IPC and the PCM or by either module. This DTC can also be set if the battery voltage is low.
- DTC U0100:00 (Lost Communication With ECM /PCM "A": No Sub Type Information) - a continuous DTC that sets only when the IPC loses communication with the PCM and the fault may not be present at the time of testing. This DTC can be caused by an HS-CAN circuit concern, the IPC or the PCM.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Low battery state of charge
- IPC
- PCM

PINPOINT TEST G: DTC B10DA:86 AND/OR DTC U0100:00

Test Step	Result / Action to Take
G1 CHECK THE BATTERY STATE OF CHARGE	
• Ignition OFF. • Check the battery state of charge with the battery condition test. Refer to Section 414-01 . • **Does the battery pass the battery condition test?**	**Yes** GO to G2 . **No** INSTALL a new battery. REFER to Section 414-01 .
G2 CHECK FOR MODULE COMMUNICATION ON THE HS-CAN	
• Connect the scan tool. • Ignition ON. • Carry out the network test using the scan tool. • **Is the scan tool unable to communicate with any of the modules on the HS-CAN ?**	**Yes** REFER to Section 418-00 to diagnose the module that is not communicating with the scan tool. **No** GO to G3 .
G3 INSPECT THE HS-CAN CIRCUITRY	
• Ignition OFF. • Inspect all of the HS-CAN circuitry, including the pin crimps, connector fit, corroded/bent/pushed-out/damaged pins and splice integrity in the 4 splices and 36 connections (8 connectors) between the PCM and the IPC . • **Does the HS-CAN circuitry pass the component inspection?**	**Yes** GO to G4 . **No** REPAIR the HS-CAN circuitry as necessary. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.
G4 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for:	**Yes** INSTALL a new PCM. Refer to the appropriate section in Group 303 for the

♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	procedure. RESET the parameters in both the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. If the concern is still present, GO to G5 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.
G5 CHECK FOR CORRECT IPC OPERATION • Disconnect all the IPC connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the IPC connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the PCM. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test H: The Vehicle Does Not Start

Normal Operation

During each vehicle start sequence, when the key is turned to the START or ON position, the Passive Anti-Theft System (PATS) transceiver reads the PATS key identification code and sends the data to the Instrument Panel Cluster (IPC). If the concern is due to a PATS concern, PATS DTCs should be set in the IPC and DTC P1260 in the PCM. If it is due to a starting system, or a driveability concern, there is no PATS DTCs in the IPC or DTC P1260 in the PCM.

This pinpoint test is intended to diagnose the following:

- Starting system concern
- PATS concern

PINPOINT TEST H: THE VEHICLE DOES NOT START

Test Step	Result / Action to Take
H1 CHECK FOR COMMUNICATION WITH THE PCM AND THE IPC	
• Connect the scan tool. • Ignition ON. • Carry out the network test using the scan tool. • **Does the scan tool establish communication with the PCM and the IPC ?**	**Yes** GO to H2 . **No** REFER to Section 418-00 to diagnose the module that is not communicating with the scan tool.
H2 CHECK FOR IPC DTCs	
• Retrieve the IPC continuous and on-demand DTCs. • **Are any IPC DTCs present?**	**Yes** REFER to DTC Charts in this section. **No** The no-start condition is not PATS -related. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the cause of the no-start condition.

Pinpoint Test I: DTC B10D7:05

Normal Operation

During each vehicle start sequence, when the key is turned to the START or ON position, the Passive Anti-Theft System (PATS) transceiver reads the PATS key identification code and sends the data to the Instrument Panel Cluster (IPC). If there is a bad transponder in the Integrated Keyhead Transmitter (IKT) key that is in the ignition lock cylinder, or if there was a concern during the programming of the IKT key, DTC B10D7:05 can set, and the vehicle experiences a PATS no-start.

- DTC B10D7:05 (PATS Key: System Programming Failures) - a continuous C that sets when there is a failure during the key programming procedure.

This pinpoint test is intended to diagnose the following:

- PATS key programming concern
- PATS key concern (transponder)

PINPOINT TEST I: DTC B10D7:05

Test Step	Result / Action to Take
I1 CHECK BOTH PATS KEYS	
NOTE: Check to make sure the new PATS keys are approved Ford encoded PATS keys. Unapproved PATS keys do not always operate correctly over various	**Yes** REPLACE the damaged key with the new key that was cut (if present), or CUT a new key to replace the damaged key. DISCARD the damaged key. PROGRAM the keys. REFER to Integrated

temperature ranges. (PATS keys from Ford, Rotunda, Strattec or Huf are approved Ford PATS keys.) **NOTE:** Follow this procedure using both PATS keys (using one at a time). • Obtain both PATS keys from the customer and follow the procedure using one PATS key, then the other. If the customer only has one PATS key, it is necessary to cut a new PATS key (does not have to be an IKT key). • If it is necessary to cut a new PATS key, cut the new key to match the original key. Program the PATS keys. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D7:05 present with either key?**	Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. **No** If other IPC DTCs are retrieved, REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 . If no IPC DTCs are retrieved, the system is OK.

MyKey® Restrictions on Vehicle Operation

Principles of Operation

MyKey® Operation

The MyKey® feature allows a restricted driving mode to be programmed into one (or more) key(s) supplied with the vehicle or into any (Passive Anti-Theft System (PATS)) programmed spare key(s) to promote good driving habits. The MyKey® is a restricted key for all consecutive key cycles until the MyKey® restricted key is cleared. The remaining key(s) is referred to as an "administrator key(s)" or admin key(s). There must always be at least one admin key. The Instrument Panel Cluster (IPC) does not allow the last administrator key to be programmed as a MyKey® restricted key. Both the admin key and the MyKey® can be used to see how many admin keys and MyKey® restricted keys are programmed to the vehicle, and how many total miles have been driven with the MyKey® active.

When the MyKey® feature is programmed, severalodified for the MyKey® driver only.

Inspection and Verification

1. Verify the customer concern.
2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
3. If the cause is not visually evident, verify the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Key Programming Using Two Programmed Keys

NOTE: This procedure only works if 2 or more programmed ignition keys (they do not have to be Integrated Keyhead Transmitter (IKT) keys) are present. If 2 programmed Passive Anti-Theft System (PATS) keys are not available, refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section.

NOTE: The Instrument Panel Cluster (IPC) PID SPAREKEY must be enabled for this procedure to operate. If this PID is not enabled, refer to ref="SCS~us~en~file=SCSJ1B06.HTM~gen~ref.HTM" >Key Programming Switch State Control in this section, in order to enable the customer spare key programming PID. The PID SPAREKEY is set to Enable when the vehicle is built.

NOTE: If the programming procedure is successful, the new key(s) starts the vehicle and the anti-theft indicator proves-out for approximately 3 seconds. If the programming procedure is not successful and the new key(s) does not start the engine, leave the key in the ON position for at least 3 seconds, then turn the key off. Repeat the key programming procedure from Step 1. If the failure repeats, refer to Anti-Theft in the Diagnosis and Testing portion of this section to review the DTCs and carry out the appropriate pinpoint tests.

NOTE: A minimum of 2 PATS keys must be programmed into the IPC before the vehicle starts.

NOTE: If the vehicle is in unlimited key mode, this spare key programming procedure still functions. Any 2 keys that can start the vehicle can be used to program an additional unlimited key.

NOTE: If additional keys are to be programmed, and the remaining keys are with the customer, or are not available, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the IPC PID SPAREKEY must be set to Enable.

NOTE: If the steps are not carried out as outlined, the programming procedure ends.

NOTE: Ignition keys must have a correct mechanical key cut for the vehicle and must be PATS encoded keys (contain a transponder). The key does not have to be an IKT key.

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the IPC .

NOTE: A maximum of 8 ignition keys can be programmed to a PATS vehicle, of which up to 4 can be IKT keys. If an attempt to program more than 4 IKT keys occurs, the Smart Junction Box (SJB) sets a memory full DTC B1138 with the IPC setting a memory full DTC B109E:42, and the additional IKT keys do not have any Remote Keyless Entry (RKE) function capability. If the vehicle is equipped with a message center, the IPC displays the message INT KEY COULD NOT PROGRAM. The PATS portion of the additional key functions, but the RKE transmitter function is inoperative.

NOTE: When in the unlimited key mode (after the first 2 keys have been programmed to the vehicle), the N_KEYCODE PID always reads 2, no matter how many keys are programmed to the vehicle.

1. Insert a programmed ignition key (can be an IKT or a standard PATS key) into the ignition lock cylinder and turn the key from the OFF position to the ON position.

2. Leave the key in the ON position for 3 seconds, but not longer than 10 seconds.

3. Turn the key to the OFF position and remove the first key.

4. Within 10 seconds of turning the key to the OFF position, insert a second programmed ignition key (can be an IKT or a standard PATS key) into the ignition lock cylinder and turn the key from the OFF position to the ON position.

5. Leave the key in the ON position for 3 seconds, but not longer than 10 seconds.

6. Turn the key to the OFF position and remove the second key.

7. Within 20 seconds of turning the key to the OFF position, insert the unprogrammed ignition key (new PATS or IKT key) into the ignition lock cylinder and turn the key from the OFF position to the ON position. Leave the key in the ON position for a minimum of 6 seconds (this additional 3 second time frame allows for the RKE data transfer to take place, if programming an IKT key).

8. **NOTE:** The new key now starts the vehicle and also operates the RKE functions, if there are 4 or fewer IKT keys programmed to the vehicle.

   Start the vehicle with the new key.

   - If it is an IKT key, verify the RKE functions operate correctly.

9. If additional programmed keys are desired, repeat Steps 1-8.

Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used when a customer needs more than one key programmed into the system aoes not have 2 programmed ignition keys available. This procedure is also useful when a programmed ignition key(s) is lost or the ignition lock cylinder is replaced, and it is desired to erase key code(s) from the Passive Anti-Theft System (PATS) memory.

NOTE: This procedure erases all programmed ignition keys from the vehicle memory and the vehicle cannot start until 2 keys are programmed to the vehicle. This procedure also erases the Integrated Keyhead Transmitter (IKT) Transmitter Identification Codes (TICs) from the Smart Junction Box (SJB), preventing the erased IKT key from operating the Remote Keyless Entry (RKE) functions on the vehicle.

NOTE: A minimum of 2 PATS keys must be programmed into the Instrument Panel Cluster (IPC) before the vehicle starts.

NOTE: Two PATS encoded (contains a transponder) keys (or IKTs) with the correct mechanical cut must be available to carry out this procedure. One or both of them may be the customer's original keys. One or both of them may be an IKT or a standard PATS key.

NOTE: If additional keys are to be programmed, refer to Key Programming Using Two Programmed Keys in this section. If the remaining keys are with the customer and are not available with the vehicle, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the IPC PID SPAREKEY must be enabled.

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the IPC .

1. Turn the key from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. From the scan tool menu select: Ignition Key Code Erase. Follow all IDS screen instructions until the key erase procedure completes. The scan tool additionally instructs you to program 2 keys in order to complete the process.

4. Turn the key to the OFF position and disconnect the scan tool (the key does not need to be removed at this time).

5. **NOTE:** The RKE data transfer takes place between the key and the IPC first. After both keys are programmed into the IPC , then the RKE data transfers from the IPC to the SJB . Until the final data

transfer takes place to the SJB , the RKE functions does not operate.

Turn the first PATS key to the ON position for a minimum of 6 seconds (this additional 3 second time frame allows for the RKE data transfer to take place).

6. Remove the first PATS key from the ignition lock cylinder.
7. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for a minimum of 6 seconds (this additional 3 second time frame allows for the RKE data transfer to take place).
8. Remove the second PATS key from the ignition lock cylinder.
9. The vehicle should now start with both PATS keys and the RKE transmitter portion of an IKT key should function.
10. If it is desired to program additional key(s) (only up to 8 keys total can be programmed into the IPC), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Key Programming Switch State Control

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: The spare key programming switch is a programmable switch which provides the capability to enable/disable the normal customer spare key programming procedure detailed in the Owneriterature. It must read Enable if more than 2 keys need to be programmed into the Instrument Panel Cluster (IPC). For additional information, refer to Key Programming Using Two Programmed Keys in this section. This programmable switch is provided as a convenience for rental company fleets or other fleet purchasers who may not want the spare key programming procedure available to the vehicle driver.

NOTE: The spare key programming switch state can be viewed with the IPC PID SPAREKEY.

NOTE: If the PID SPAREKEY reads Enable, up to 8 keys total can be programmed into the IPC using Key Programming Using Two Programmed Keys in this section. If the PID SPAREKEY reads DISABLE, the Key Programming Using Two Programmed Keys procedure does not function. This switch is set to Enable when the vehicle is built. This PID only affects the Key Programming Using Two Programmed Keys procedure.

1. Insert a programmed Passive Anti-Theft System (PATS) key (or Integrated Keyhead Transmitter (IKT) key) into the ignition lock cylinder and turn the key from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. **NOTE:** The default setting on delivery of all new vehicles is ENABLE, when viewing the IPC PID SPAREKEY.

   From the scan tool menu select: CUSTOMER SPARE KEY PROGRAMMING Enable and follow the IDS on-screen instructions in order to complete the procedure.

   - CUSTOMER SPARE KEY PROGRAMMING Enable - spare key programming procedure is accessible.
   - CUSTOMER SPARE KEY PROGRAMMING DISABLE - spare key programming procedure is not accessible.

Spare Key Programming - Unlimited Key Mode

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Enabling Unlimited Key Mode

NOTE: Unlimited key mode is intended for use by those customers who need more than 8 keys for their vehicle.

NOT> If unlimited key mode is enabled (or disabled), a maximum of 4 Integrated Keyhead Transmitter (IKT) keys can be programmed to the vehicle for Remote Keyless Entry (RKE) functionality. If more keys are required, they should be standard Passive Anti-Theft System (PATS) keys. If more than 4 IKT keys are programmed to the vehicle, the Smart Junction Box (SJB) sets DTC B1138 (Memory Full), the IPC sets DTC B109E:42 (Remote Keyless Entry: General Memory Failure) and only 4 IKT keys have RKE functionality, however, all of them start the vehicle, if programmed correctly.

NOTE: Before programming, the new key(s) must have the correct mechanical cut for the ignition lock cylinder.

NOTE: The unlimited key mode is set up by creating a special, unique unlimited transponder security key code and programming this key code into all of the vehicle keys so they contain the same key code.

NOTE: When in the unlimited key mode, the N_KEYCODE PID in the IPC always reads 2, no matter how many keys are programmed to the vehicle (after the first 2 keys have been programmed).

1. The customer must choose an 8-digit number (except for 00000000 or 00000001) to be programmed to all of their vehicles. All customer vehicles need to use the same number. Valid digits are 0-9 and the letters A-F.

2. **NOTE:** If the IPC PID UNL_KEY_ID is not available, unlimited key mode is turned on and must be turned off before viewing the stored code. At this time, unlimited keys can be programmed to the vehicle. To view/disable/change the stored code, follow the procedure for disabling the unlimited key mode below.

   Monitor the IPC PID UNL_KEY_ID and compare its value against the code chosen in Step 1. It should not be the same key code.

3. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

4. Once in security access, select: "program unlimited key code" and follow the IDS on-screen instructions. Enter the 8-digit code chosen by the customer in Step 1 of this procedure and follow the IDS on-screen instructions.

5. Select: "unlimited key mode ON" and follow the IDS on-screen instructions.
6. Select: "Ignition Key Code Erase" and follow the IDS on-screen instructions.
7. Disconnect the scan tool and turn the ignition switch to OFF (the key does not need to be removed at this time).
8. Turn the first PATS key to the ON position for 3 seconds (6 seconds if it is an IKT key).
9. Turn the first PATS key to the OFF position and remove the key from the ignition lock cylinder.
10. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds if it is an IKT key).
11. Start the vehicle with both PATS keys. The vehicle now starts with both PATS keys.
12. If it is desired to program additional key(s), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Disabling Unlimited Key Mode

NOTE: By disabling the unlimited key mode, the previous access code no longer operates the vehicle.

1. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the IDS on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
2. Select: "unlimited key mode OFF" and follow the IDS on-screen instructions.
3. Select: "Ignition Key Code Erase" and follow the IDS on-screen instructions.
4. Disconnect the scan tool and turn the ignition switch to OFF (the key does not need to be removed at this time).
5. Turn the first PATS key to the ON position for 3 seconds (6 seconds if it is an IKT key).
6. Turn the first PATS key to the OFF position and remove the key from the ignition lock cylinder.
7. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds if it is an IKT key).
8. Start the vehicle with both PATS keys. The vehicle now starts with both PATS keys.
9. **NOTE:** With the unlimited key mode turned off, a maximum of 8 keys can be programmed into the IPC using the Key Programming Using Two Programmed Keys procedure in this section. The IPC PID SPAREKEY must be enabled.

   If it is desired to program additional key(s), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed. The PID SPAREKEY must be enabled.

Spare Key Programming - Using Diagnostic Equipment

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used when a customer needs to have an additional key programmed into the vehicle without erasing stored key codes, but does no programmed keys available. This procedure is also useful when attempting to determine if an ignition key is defective, as a new key can be installed without erasing keys or without having 2 programmed keys available.

NOTE: Before programming, the new key must have the correct mechanical cut for the ignition lock cylinder.

NOTE: If 8 keys are already programmed, this procedure does not allow any more ignition keys to be programmed. The number of keys that are programmed into the Passive Anti-Theft System (PATS) can be determined by viewing the Instrument Panel Cluster (IPC) PID N_KEYCODE.

1. Turn the new, unprogrammed PATS key from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. **NOTE:** Make sure the selection made is "Program additional ignition key". If the "Ignition Key Code Erase" selection is made, all of the keys are erased from the system.

   From the scan tool menu select: "Program additional ignition key".

4. Turn the key to the OFF position and disconnect the scan tool (the key does not need to be removed at this time).

5. Start the vehicle with the new PATS key. The vehicle now starts with the new PATS key and also with the original PATS keys. If it is an IKT key, verify the RKE functions (if there are 4 or fewer IKT keys programmed).

Anti-Theft Security Access

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: The anti-theft security access procedure is used to obtain Passive Anti-Theft System (PATS) security access. PATS security access must be granted to erase ignition key codes, program ignition key codes, enable/disable unlimited key mode, set unlimited transponder key ID, reset n title="Passive Anti-Theft System" class="popup" onmouseover="this.className='popupnounderline';" onmouseout="this.className='popup';">PATS parameters in the IPC and the PCM and enable/disable the spare key programming switch (Instrument Panel Cluster (IPC) PID SPAREKEY). The anti-theft security access procedure invokes a 10-minute time delay prior to granting security access during which the scan tool must remain connected to the vehicle. Once security access is granted, a security access command menu is displayed which offers various command options.

NOTE: Once security access has been granted, multiple security access commands should be executed (if necessary) prior to exiting the command menu. This avoids an additional security access procedure and the associated 10 minute time delay.

1. From the scan tool, enter TOOLBOX. Select: BODY-SECURITY-PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to ENTER SECURITY ACCESS. This procedure takes approximately 10 minutes to carry out, during which time the ignition switch must be in the ON position and the scan tool must be connected to the vehicle.

2. After the 10-minute security access procedure is completed, follow the IDS on-screen instructions and a new menu is displayed with command options. Select only those functions required before exiting out of this menu. Do not select more functions than the procedure calls for or a PATS no-start may occur. Once exited out of this menu, the security access procedure must be repeated again to carry out additional commands.

Passive Anti-Theft System (PATS) Parameter Reset

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: A minimum of 2 Passive Anti-Theft System (PATS) keys must be programmed into the Instrument Panel Cluster (IPC) to complete this procedure and allow the vehicle to start.

1. Turn the key from the OFF position to the ON position.
2. From the scan tool, follow on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
3. From the scan tool, select: Parameter Reset and follow the on-screen instructions.
4. **NOTE:** If the IPC or the IPC and the PCM were replaced, updated or reconfigured, follow Steps 4-9. All vehicle keys are erased during the parameter reset procedure. Verify at least 2 vehicle keys are available prior to carrying out the PATS parameter reset. If only the PCM was replaced, go to Step 9.

   From the scan tool, select: Ignition Key Code Erase and follow the on-screen instructions.
5. Turn the key to the OFF position and disconnect the scan tool.
6. Turn the key to the ON position for 6 seconds.
7. Turn the key to the OFF position and remove the key.
8. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for 6 seconds.
9. Both keys now start the vehicle.
10. If more keys are required to be programmed, refer to Key Programming Using Two Programmed Keys in this section.

MyKey® Programming

Program a MyKey®

NOTE: After a MyKey® has been programmed, the remaining standard key(s) (the key[s] that is not programmed with the MyKey® feature) is referred to as an "administrator key(s)" or "admin" key(s). There must always be at least one admin key.

NOTE: The MyKey® feature can be cleared within the same key cycle that it was programmed. Follow the Clear MyKey® procedure in this section to clear the key of any restricted MyKey® status. If the key has been cycled, an admin key is required to clear the MyKey® programming.

1. Insert a programmed PATS ignition key into the ignition lock cylinder and turn the key from the OFF position to the RUN position. This key must be the one that is being programmed to the MyKey® restricted status.

2. Usi center buttons:
    1. Press the SETUP button until PRESS RESET TO CREATE MYKEY appears in the message center display.
    2. Press and release the RESET button. HOLD RESET TO CONFIRM MYKEY is displayed.
    3. Press and hold the RESET button (for approximately 2 seconds) until MARK THIS KEY AS RESTRICTED is displayed.
    4. Wait until KEY RESTRICTED AT NEXT START is displayed, then release the RESET button.

3. The MyKey® feature (standard restricted features) is successfully programmed into this particular key. Make sure it is labeled for easy identification. If you would like to customize the MyKey® with the audio volume limited, maximum speed limit, speed alert chimes, and AdvanceTrac® on/off restrictions, refer to Configuring MyKey® Optional Restricted Features in this section.
    - If the vehicle is equipped with remote start, also refer to Using MyKey® with Aftermarket Remote Start Systems in this section.

Configuring MyKey® Optional Restricted Features

1. To configure the MyKey® optional restricted features, carry out the following:
    1. Using an admin key that has not been programmed as a MyKey®, turn the ignition ON.
    2. Press and hold the SETUP button until RESET FOR MYKEY SETUP is displayed.
    3. Press and release the RESET button to display the MyKey® setup menus. The first programmable feature is: MYKEY MAX MPH OFF.
        - ♦ If you do not want to change the status of a feature that appears, press SETUP to accept the current setting and the message center displays the next feature.
        - ♦ If you want to change the status of the feature that is displayed, press RESET to turn a feature on/off (or toggle between choices). After the feature selection has been madand release SETUP to accept and the message center displays the next feature.
    4. Repeat the process for the next features of:
        - ♦ MYKEY MPH TONES 45 55 65 (choose the desired speed for the chime to sound)
        - ♦ MYKEY VOLUME LIMIT OFF (choose the audio volume to be limited to 45%)
        - ♦ MYKEY ADVTRAC CTRL ON (choose for the AdvanceTrac® to be automatically locked on or able to be turned on or off by the MyKey® driver)

Clear MyKeyTM

1. **NOTE:** This procedure is used to clear the MyKey® feature on all of the keys that are programmed to the vehicle. All of the keys then operate as normal (admin) keys with no restrictions.

   Using an admin key, turn the ignition ON.

2. Press SETUP until PRESS RESET TO CLEAR MYKEY appears.

3. Press and release the RESET button until HOLD RESET TO CONFIRM CLEAR is displayed.

4. Press and hold the RESET button until ALL MYKEYS CLEARED is displayed.
   - A MyKey® can also be cleared during the same key cycle that it was programmed by following Steps 2, 3 and 4 of this procedure.

Using MyKey® with Aftermarket Remote Start System

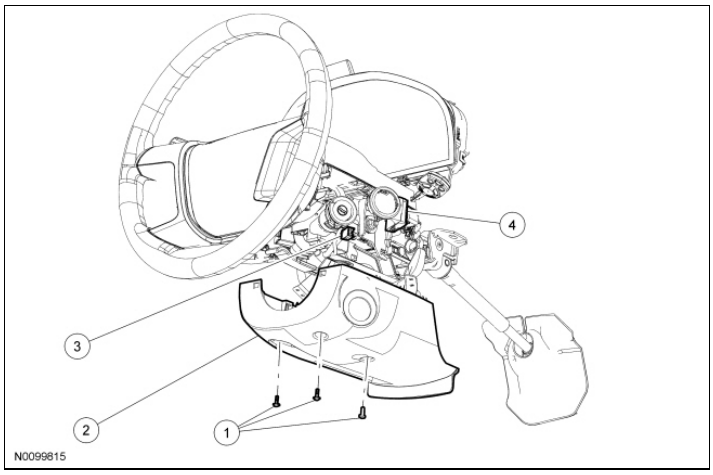
Program Remote Start System as a MyKey®

1. Enter the vehicle and close all doors.

2. Remote start the vehicle using a remote start fob.

3. Follow Steps 1-3 of the Program a MyKey® procedure in this section.

Clear MyKey® with the Remote Start System



NOTE: It is possible to program all of the keys as MyKeys®, with the remote start system being the only admin key. This procedure clears MyKey® in the event of the aftermarket remote start system being proghe only admin key.

1. Enter the vehicle and close all doors.

2. Remote start the vehicle using the remote start fob.

3. Follow Steps 1-4 of the Clear MyKey® procedure in this section.

Passive Anti-Theft System (PATS) Transceiver

Item	Part Number	Description
1	3K512	Steering column shroud screws (3 required)
2	3530	Steering column shroud (lower)
3	-	Passive Anti-Theft System (PATS) transceiver electrical connector (part of 14401)
4	15607	transceiver

Removal and Installation

1. Remove the 3 screws and the lower steering column shroud.

2. Disconnect the electrical connector and remove the Passive Anti-Theft System (PATS) transceiver.

3. **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the Instrument Panel Cluster (IPC) again.

   To install, reverse the removal procedure.

Anti-Theft

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The Passive Anti-Theft System (PATS) consists of the following components:

- Anti-theft indicator (located in the Instrument Panel Cluster (IPC))
- Encoded ignition Integrated Keyhead Transmitter (IKT) PATS key(s) (the key contains a transponder and a Remote Keyless Entry (RKE) transmitter)
- PATS transceiver (located around the ignition lock cylinder and under the lower steering column shroud)
- IPC
- Transmission Control Module (TCM) (located inside the transaxle)

PATS uses radio frequency identification technology to deter a drive-away theft. Passive means that it does not require any activity by the user.

The vehicle is equipped with 2 IKT PATS keys. The IKTs operate as a standard PATS key with an RKE transmitter incorporated into the keyhead. The IKTs require batteries for the RKE transmitter to operate. A maximum of 4 IKT keys can be programmed to operate the vehicle. If more than 4 IKT keys are programmed, the RKE portion of the additional keys do not operate. These additional keys start the vehicle, but does not operate the RKE system. If additional PATS keys are desired, a standard PATS key (a non- IKT key) can be used. For the purposes of this section, the PATS portion of the IKT key is referred to as a PATS key.

Passive Anti-Theft System (PATS) Function

The PATS function is controlled by the IPC . PATS uses the IPC to carry out all of the PATS functions such as receiving the ID code from the PATS key, issuing a signal to the TCM to control the starting and fuel injectors enable, and initiating the key interrogation sequence when the ignition key is turned to the ON or START position. Because of the interaction between the IPC and the TCM , there are parameters that must be set if the IPC and/or TCM are replaced. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section. If the IPC must be replaced for any reason (PATS or IPC concerns), the PATS keys also must be programmed into the new IPC . Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. All elements of PATS must be functional before the vehicle starts. If any of the components are not working correctly, the vehicle does not start.

PATS is active only for a few seconds when the vehicle is starting. It is not a PATS concern if the vehicle stalls after it has been running for a minimum of 3 seconds. PATS cannot disable a running vehicle.

PATS can cause a vehicle no start due to either the TCM does not start the engine or the TCM does not move the vehicle electrically or both. Always check for PATS DTCs from the IPC and DTCs from the TCM when a no-crank or no-start condition exists.

If the anti-theft indicator does not prove out (it may be either flashing or glowing steadily) and one (or both) of the previous conditions (TCM does not start the engine or move the vehicle electrically) are present, it may be due to a PATS concern. If the anti-theft indicator proves out, it may not be a PATS concern. If the anti-theft indicator does not illuminate at all, it may be an IPC concern. Refer to the Symptom Chart in this section.

PATS is not compatible with non-Ford remote start systems, which allow the vehicle to be started from the exterior of the vehicle. These systems may reduce the security of the vehicle, and also may be the cause of no-start concerns. Remote start systems must be removed from the vehicle before any PATS -related no-start concerns are investigated.

Unlimited Key Mode

PATS contains a feature called unlimited key mode. This feature allows a customer to program more than 8 vehicle keys, if requested. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same mechanically cut keys. For an individual customer, any randomly selected security key that has been previously mechanically cut and electronically programmed to the vehicle is acceptable.

If unlimited key mode is enabled, a maximum of 4 IKT keys can be programmed to the vehicle for RKE functionality. If more keys are required, they should be standard PATS keys. If more than 4 IKT keys are programmed to the vehicle, only the first 4 IKT keys that were programmed have RKE functionality, however, all of them start the vehicle, if programmed correctly. Refer to Spare Key Programming - Unlimited Key Mode in this section.

MyKey® Feature

The MyKey® feature allows a restricted driving mode to be programmed into one (or more) key(s) supplied with the vehicle or into any (PATS) programmed spare key(s) to promote good driving habits. The MyKey® is a restricted key for all consecutive key cycles until the MyKey® restricted key is cleared. The remaining key(s) is referred to as an "administrator key" or admin key. There must always be at least one admin key. The IPC does not allow the last admin key to be programmed into a MyKey® restricted key. Both the admin key and the MyKey® can be used to see how many admin keys and MyKey® restricted keys are programmed to the vehicle, and how many total miles have been driven with the MyKey® restricted key active.

When the MyKey® feature is programmed, several features are modified including:

Standard Restricted Features

- **NOTE:** The standard restricted features below cannot be configured in any way.

  Belt-Minder® chimes periodically with the audio system muted until the driver safety belt is buckled. If Belt-Minder® has been disabled when the admin key is in the ignition lock cylinder, Belt-Minder® still functions for the MyKey® driver. Belt-Minder® cannot be disabled by the MyKey® driver.
- Audible and visual low fuel warnings are issued when the programmed Distance To Empty (DTE) value is reached (typically 75 miles).
- The parking aid system (if equipped), Blind Spot Information System (BLIS®) with cross traffic alert (if equipped) cannot be turned off.

Optional Restricted Features

- **NOTE:** The optional restricted features below can be configured to the customer preferences.

  The volume of the audio system can be programmed to limit the volume to 45% of the maximum volume.
- Vehicle speed can be programmed to be limited to 130 km/h (80 mph). Audible and visual warnings are issued when the vehicle speed of 130 km/h (80 mph) is attained.
- Audible and visual warnings are issued when the preselected vehicle speed of 75, 90 or 105 km/h (45, 55 or 65 mph) is attained.
- The AdvanceTrac® always on feature can be configured on or off. If configured to always on, at this time the traction control cannot be disabled by the MyKey® driver.

Refer to Information and Message Center in the Description and Operation p target="_parent" href="SCS~us~en~file=SCSSD10L.HTM~gen~ref.HTM" >Section 413-01 for all of the MyKey® system checks and system warning displays.

Refer to MyKey® Programming in this section or to the Owner's Literature for MyKey® programming information.

Check MyKey® System Status

The vehicle system check provides the status of the following MyKey® parameters:

- MYKEY DISTANCE - This odometer only tracks mileage when a MyKey® is used. If mileage does not accumulate, the intended MyKey® is not being used. The only way to reset this odometer to zero is by clearing the MyKey®. If this odometer is lower than the last time it was checked, the MyKey® system has been cleared.
- MYKEY(S) PROGRAMMED - Indicates how many MyKeys® are programmed to the vehicle. It can also be used to determine if a MyKey® has been cleared.
- ADMIN KEYS PROGRAMMED - Indicates how many admin keys are programmed to the vehicle. It can also be used to determine if an additional spare key has been programmed to the vehicle.

Refer to the Owner's Literature for information on accessing the MyKey® system status in the message center.

Using MyKey® with Aftermarket Remote Start System

When using an aftermarket remote start system, the default settings recognize the remote start system as an additional admin key. If the remote start system has not been programmed as a MyKeis a MyKey® driver, the driver could drive the vehicle using the remote start system as an admin key with no MyKey® restrictions. If requested by the customer to resolve this concern, the aftermarket remote start system needs to be programmed as a MyKey®. For information on programming the aftermarket remote start system as a MyKey®, refer to MyKey® Programming in this section.

Anti-Theft

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent
 ST3104-A	Backprobe Pins POM6411 or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

Anti-Theft Indicator

NOTE: Replacement of the Passive Anti-Theft System (PATS) transceiver does not require the PATS keys to be programmed into the Instrument Panel Cluster (IPC) again.

NOTE: Make sure any non-Ford remote start systems have been removed from the vehicle before any PATS -related no-start concerns are investigated.

NOTE: A minimum of 2 PATS keys must be programmed into the IPC before the vehicle starts. They do not need to be Integrated Keyhead Transmitter (IKT) keys. Either 2 IKT keys, or 2 standard PATS keys, or a combination of an IKT key and a standard PATS key is sufficient for the vehicle to start.

NOTE: If the IPC and/or the Transmission Control Module (TCM) is being replaced, the parameters must be reset in both modules or the vehicle experiences a PATS no-start. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section.

PATS uses a visual anti-theft indicator located in the IPC . The indicator proves out for 3 seconds when the ignition key is in the ON or START position under normal operation. If there is a PATS concern, this anti-theft indicator either flashes rapidly or glows steadily when the ignition key is turned to the ON or START position. PATS also flashes the anti-theft indicator every 2 seconds when the ignition key is in the OFF position to act as a visual theft deterrent. Refer to Section 413-01 for the anti-theft indicator.

Encoded Passive Anti-Theft System (PATS) Keys

PATS uses a special ignition key, called an IKT key that is larger than a conventional ignition key. It contains a permanently installed electronic device called a transponder and also has the Remote Keyless Entry (RKE) transmitter integrated into the keyhead. Each transponder contains a unique encrypted identification code which is one of a very large number of combinations. The addition of this transponder to the key makes it an "encoded" key. The PATS portion of the IKT key does not require batteries and should last the lifetime of the vehicle. The transmitter portion of the IKT key has a battery. Each PATS key must be programmed into the IPC before it can be used to start the vehicle. A maximum of 4 IKT keys can be programmed to start the vehicle and also operate the RKE functions. If more than 4 IKT keys are programmed, the RKE portion of the additional IKT keys do not operate and the SJB sets DTC B1138, and the IPC sets DTC B109E:42 (both DTCs indicate a memory full condition). These additional keys start the vehicle, but cannot operate the RKE system, as only the first 4 IKT keys programmed have that RKE functionality. If additional PATS keys are desired, a standard PATS key (a non- IKT key) can be used. There are specific general procedures described in this section that must be carried out if a new PATS key is necessary. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment or Key Programming Using Two Programmed Keys in this section.

Passive Anti-Theft System (PATS) Transceiver

The PATS transceiver is located under the steering column shroud and communicates with the encoded ignition key. During each vehicle start sequence, the PATS transceiver reads the encoded ignition key ID code and sends data to the IPC . The IPC validates the code, and if it is the correct code, sends a message to the TCM to enable the engine and the electric drive.

Passive Anti-Theft System (PATS) Operation

The PATS function is controlled by the IPC . With this type of PATS , there are parameters that need to be reset if either the IPC and/or the TCM are replaced. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section. When the PATS key is turned to the ON or START position, the IPC initiates the key interrogation sequence by sending a voltage signal to the PATS transceiver. The transceiver then uses its antenna to bounce a signal off the transponder in the PATS key. This process "reads" the PATS key ID code and sends the key ID code back to the IPC , which interprets it and determines if it matches one of the stored key codes. If it does match one of the stored key codes, the IPC sends a message to the TCM to enable the engine and the electric drive. If it does not match one of the stored key codes, or it is only a partial key read or no key read, the IPC sends a message to the TCM to not enable the engine and the electric drive. The anti-theft indicator in the IPC flashes (or glows steadily) and the IPC stores one or more DTCs. All elements of PATS must be functional before the vehicle starts. If any of the components are not working correctly, the vehicle cannot start. If the IPC must be replaced for any reason, the PATS keys must also be programmed into the new IPC . Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section.

PATS disables the vehicle from starting if there is:

- a damaged PATS key.
- a non-programmed PATS key.
- a non- PATS key (key has no electronics).
- less than 2 keys programmed.
- damaged wiring.
- a damaged transceiver.
- a damaged IPC .
- a damaged TCM .

Passive Anti-Theft System (PATS) PIDs

Monitoring the PATS PIDs can be very useful in determining which diagnostic steps to follow. Viewing the

MASTERKEY (master key) PID with both keys determines if the key is a programmed key and can also be used to prove out the transceiver, circuitry and the IPC . A master key is a key that is programmed into the IPC . Viewing the MIN_KEYS (minimum number of keys) PID (this PID does not change) determines the minimum number of keys that must be programmed into the IPC . There must be at least 2 keys programmed into the IPC in this type of PATS before the vehicle starts. Viewing the N_KEYCODE (number of keys programmed) PID determines if the minimum number of keys have been programmed into the IPC . If the N_KEYCODE PID reads 0 or 1, additional key(s) need to be programmed into the IPC in order to meet the minimum of 2 keys. If the N_KEYCODE PID reads 0 or 1, and the MASTERKEY PID reads Not Present, that particular key must be programmed into the IPC . If the N_KEYCODE PID reads 1, and the MASTERKEY PID reads Present, that particular key is already programmed into the IPC . In this particular case, there are not enough keys programmed (a minimum of 2 are needed before the vehicle starts) into the IPC and at least 1 more key needs to be programmed before the vehicle starts. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section.

Also, if the unlimited key mode has been enabled, the N_KEYCODE PID always reads 2, after the first 2 keys are programmed into the IPC , regardless of how many additional keys are added.

When the parameters are reset, it clears (erases) the TCM ID from the IPC . A parameter reset causes the TCM to send a TCM ID to the IPC that is necessary for the system to operate. Make sure to cycle the key at least once, then turn the key ON and make an attempt to start the vehicle for 3-5 seconds before attempting more procedures. If only a TCM parameter reset occurs, the ID stored in the IPC does not match the ID being sent by the TCM , and can cause a PATS -related no-start. Carry out a PATS parameter reset, then turn the key ON and make an attempt to start the vehicle for 3-5 seconds before attempting more procedures.

If the PCM_ID (TCM id status) PID reads Stored, the IPC has a TCM ID stored. If it reads Not Stored, a parameter reset may resolve this concern. If the PATSENABL (vehicle enable status) PID reads Disabled, and the N_KEYCODE PID reads 2 or more and the MASTERKEY PID reads Present, the IPC and the TCM need to have their parameters reset. Refer to Passive Anti-Theft System (PATS) Parameter Reset in this section.

If the PATSENABL PID reads Disabled, and the N_KEYCODE PID reads 1 and the MASTERKEY PID reads Present, or if the N_KEYCODE PID reads 0 and the MASTERKEY PID reads Not Present, a minimum of 2 keys need to be programmed into the IPC . Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section.

If the MASTERKEY PID continues to read Not Present after programming, this may indicate a defective key. The SPAREKEY PID is defaulted to ENABLE. With the SPAREKEY PID displaying ENABLE, the IPC accepts more than 2 keys (up to a maximum of 8) being programmed into the IPC using Key Programming Using Two Programmed Keys in this section. It can be toggled to DISABLE if the customer wants to disable the customer spare key programming function. Refer to Key Programming Switch State Control in this section. This switch state control does not affect the Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment procedure.

In summary, in order for the vehicle to start, the PATS PIDs and their correct state they must be in are as following:

PID	Normal State
N_KEYCODE	must read 2 or more
MASTERKEY	must read Present
PCM_VFY	must read Yes

PATSENABL	must read Enabled
NOTE: The TCM ID PID in the IPC is displayed by the IDS scan tool as PCM_ID. PCM_ID	must read Stored

Use of Standard Passive Anti-Theft System (PATS) Keys

When using a standard (non- IKT) PATS key to start the vehicle, an IKT key (from another vehicle) on the same key ring can possibly be programmed into the vehicle for remote entry functionality, resulting in the IKT key being able to operate the lock and unlock functions of the vehicle (but the IKT key cannot start the vehicle). This should not cause a PATS no-start of either the first or the second vehicle, but the IKT key may be able to operate the lock and unlock functions of both vehicles. The IKT key is able to start the original vehicle to which it is programmed and is not able to start the second vehicle. At this time, it is necessary to carry out an Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment procedure and then to make certain the IKT key for the second vehicle is removed from the key ring in order to prevent this concern from occurring again. Also, if an IKT key is used to start the vehicle, the vehicle only reads the IKT key in the ignition lock cylinder and cannot read the second IKT on the key ring. Using an IKT key to start both vehicles, rather than standard PATS keys, prevents the second IKT (transmitter portion only) from being programmed into the first vehicle.

Unlimited Key Mode

PATS contains a feature called unlimited key mode and uses the UNL_KEY_MODE PID. This feature allows a customer to program more than 8 keys to their vehicle if they request it. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same mechanically cut keys, but no other keys from outside can be used to operate the vehicles. For an individual customer, any randomly selected security key that has been previously mechanically cut and electronically programmed to the vehicle is acceptable. Refer to Spare Key Programming - Unlimited Key Mode in this section.

Inspection and Verificaon

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Passive Anti-Theft System (PATS) key • Use of a non- PATS key or incorrect PATS key • Remote start system installed	• Smart Junction Box (SJB) fuse 36 (5A) • Wiring, terminals or connectors • Instrument Panel Cluster (IPC)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the IPC and the Transmission Control Module (TCM).

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Instrument Panel Cluster (IPC) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B109E:42	Remote Keyless Entry: General Memory Failure	The Smart Junction Box (SJB) has 4 Integrated Keyhead Transmitters (IKTs) stored in memory and cannot program any more IKTs into the SJB memory. REFER to Principles of Operation in this section to determine if this is normal operation for this system.
B10D5:13	PATS Antenna: Circuit Open	There has been a Passive Anti-Theft System (PATS) transceiver antenna failure. GO to Pinpoint Test A .
B10D7:05	PATS Key: System Programming Failures	There was a failure in key programming. GO to Pinpoint Test I .
B10D7:51	PATS Key: Not Programmed	There is an unprogrammed PATS key. GO to Pinpoint Test C .
B10D7:87		

	PATS Key: Missing Message	No PATS key has been read by the Instrument Panel Cluster (IPC). GO to Pinpoint Test B .
B10D7:8F	PATS Key: Erratic	Only a partial PATS key was read. GO to Pinpoint Test D .
B10D8:00	PATS Key Less Than Minimum Programmed: No Sub Type Information	If DTC B10D7:87, B10D7:51, B10D7:8F, B10D9:87 or B10D5:13 is present, they must be addressed first. If DTC B10D8:00 is the only DTC present, PROGRAM additional keys. REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
B10D9:87	PATS Transponder: Missing Message	The IPC did not receive the PATS transceiver signal. GO to Pinpoint Test E .
B10DA:51	PATS PCM Identifier: Not Programmed	There is no TCM ID stored in the IPC . CARRY OUT a parameter reset of the IPC and the TCM , then CYCLE the ignition and make an attempt to start the vehicle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. REPEAT the self-test.
B10DA:61	PATS PCM Identifier: Signal Calculation Failure	CARRY OUT a parameter reset of the IPC and the TCM and CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key cycle. REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
B10DA:86	PATS PCM Identifier: Signal Invalid	**NOTE:** If DTCs B10DA:61 and B10DA:86 are both present, address DTC B10DA:61 first. GO to Pinpoint Test G .
U0101:00	Lost Communication With TCM : No Sub Type Information	**NOTE:** If DTC U0101:00 or DTC B10DA:61 is present, address DTC B10DA:61 first. GO to Pinpoint Test G .
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Transmission Control Module (TCM) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
P1260:61	Theft Detected, Vehicle Immobilized: Signal Calculation Failure	If there are any Passive Anti-Theft System (PATS) DTCs present in the Instrument Panel Cluster (IPC), ADDRESS them first. This DTC can also indicate a Controller Area Network (CAN) concern or a parameter reset concern. Make sure to verify if there are any communication concerns/DTCs with any modules. REFER to Section 418-00 . If DTC P1260:61 is the only DTC present, there may be a parameter reset concern or a power or ground concern with the TCM . REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. If necessary, CHECK the powers and grounds to the TCM . REFER to the Wiring Diagrams Manual to determine the TCM

		power and ground circuits.
All other DTCs	-	REFER to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: DTC B10D5:13

Normal Operation

- DTC B10D5:13 (PATS Antenna: Circuit Open) - a continuous and on-demand DTC that sets when there has been a Passive Anti-Theft System (PATS) transceiver antenna failure. The PATS transceiver may need to be replaced.

This pinpoint test is intended to diagnose the following:

- PATS transceiver

PINPOINT TEST A: DTC B10D5:

Test Step	Result / Action to Take
A1 INSPECT THE PATS TRANSCEIVER FOR CORRECT INSTALLATION	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the Instrument Panel Cluster (IPC) again. • Ignition OFF. • Verify the PATS transceiver is correctly installed. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D5:13 retrieved?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** The system is OK.

Pinpoint Test B: DTC B10D7:87

Normal Operation

- DTC B10D7:87 (PATS Key: Missing Message) - a continuous and on-demand DTC that sets when no Passive Anti-Theft System (PATS) key has been read by the Instrument Panel Cluster (IPC).

This pinpoint test is intended to diagnose the following:

- PATS key
- PATS transceiver
- IPC

PINPOINT TEST B: DTC B10D7:87

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key can cause vehicle starting concerns and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the key off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key. (PATS keys from Ford, Rotunda, Strattec or Huf are approved Ford PATS keys.)

NOTE: This vehicle uses a Huf Integrated Keyhead Transmitter (IKT) key. If replacing an IKT key for any of these vehicles, it is recommended that the original Huf IKT key be replaced with another Huf IKT key. There are minor visual differences both externally and internally between the Huf IKT key and IKT keys used on other Ford and Lincoln vehicles that may be noticed by the customer. These visual differences does not affect the IKT key functionality in any way. Rotunda should supply a Huf IKT key when ordering replacement/new keys for this vehicle. The Owner's Literature can provide additional information concerning these differences. If replacing an IKT key (or adding another key) with a standard PATS key (not an IKT key), any of the brands (Ford, Rotunda, Strattec or Huf) can operate the system.

Test Step	Result / Action to Take
B1 RETRIEVE THE DTCs	
• Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D7:87 retrieved?**	**Yes** GO to B2 . **No** If any other IPC DTCs are retrieved, REFER to Section 419-10 . If no DTCs are retrieved, the system is OK.
B2 CHECK BOTH PATS KEYS	
• Obtain both PATS keys from the customer and follow the procedure using one PATS key, then the other. If the customer only has one PATS key, it is necessary to cut a new PATS key. • If it is necessary to cut a new	**Yes** If DTC B10D7:87 was present for both keys or the new key (if present), GO to B3 . If DTC B10D7:87 was not present for the new key, the original key may be damaged and should be replaced. REPLACE the damaged key with a new key. REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the

PATS key, program the new PATS key. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Using all existing keys, then the newly programmed key (if applicable), is DTC B10D7:87 present?**	ignition. REPEAT the self-test. TEST the system for normal operation. **No** If any other IPC DTCs are retrieved, REFER to Section 419-10 . If no IPC DTCs are retrieved, the system is OK.
B3 INSTALL A NEW PATS TRANSCEIVER	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. **NOTE:** Do not use the PATS key that may have been programmed in Step B2. • Ignition OFF. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Turn the key to the ON position using an existing customer PATS key. • Retrieve the IPC DTCs. • **Is DTC B10D7:87 retrieved?**	**Yes** GO to B4 . **No** The system is now OK. The concern was caused by a damaged PATS transceiver.
B4 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the Transmission Control Module (TCM). REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition.

• Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test C: DTC B10D7:51

Normal Operation

- DTC B10D7:51 (PATS Key: Not Programmed) - a continuous and on-demand DTC that sets when there is an unprogrammed Passive Anti-Theft System (PATS) key. There may not be an concern with the PATS key itself, but the key must be programmed into the PATS memory (unless the maximum number of keys are already programmed).

This pinpoint test is intended to diagnose the following:

- PATS key
- Instrument Panel Cluster (IPC)

PINPOINT TEST C: DTC B10D7:51

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key can cause vehicle starting concerns and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the ctomer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition switch off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key. (PATS keys from Ford, Rotunda, Strattec or Huf are approved Ford PATS keys.)

NOTE: Only 8 PATS keys can be programmed into the IPC during normal programming procedures (with the unlimited key mode being the exception). If the N_KEYCODE (number of keys programmed) PID reads more than 2 and less than 8, the concern may be the PATS key being used is an unprogrammed key. Verify this by also viewing the MASTERKEY (verifies if the key is programmed) PID. It must read Present for the key to be valid.

NOTE: This vehicle uses a Huf Integrated Keyhead Transmitter (IKT) key. If replacing an IKT key for any of these vehicles, it is recommended that the original Huf IKT key be replaced with another Huf IKT key. There are minor visual differences both externally and internally between the Huf IKT key and IKT keys used on other Ford and Lincoln vehicles that may be noticed by the customer. These visual differences does not affect the IKT key functionality in any way. Rotunda should supply a Huf IKT key when ordering replacement/new keys for this vehicle. The Owner's Literature can provide additional information concerning these differences. If replacing an IKT key (or adding another key) with a standard PATS key (not an IKT key), any of the brands (Ford, Rotunda, Strattec or Huf) can operate the system.

Test Step	Result / Action to Take
C1 RETRIEVE THE DTCs	
	Yes GO to C2 .

• **NOTE:** Follow this procedure using both PATS keys (using one at a time). • If only one key is available, cut a new key and program the keys. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • If both keys are available, program the keys. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D7:51 retrieved for both PATS keys?**	**No** If DTC B10D7:51 is retrieved for one PATS key, REPLACE that key and PROGRAM all the keys. REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B10D7:51 is not retrieved for either key, the system is OK. CHECK all customer PATS keys by attempting to start the vehicle with each key to verify all other PATS keys are programmed.
C2 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the Transmission Control Module (TCM). REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test D: DTC B10D7:8F

Normal Operation

- DTC B10D7:8F (PATS Key: Erratic) - a continuous and on-demand DTC that sets when only a partial Passive Anti-Theft System (PATS) key was read. Remote starter equipment can also cause this DTC.

This pinpoint test is intended to diagnose the following:

- PATS key

- PATS transceiver
- Instrument Panel Cluster (IPC)

PINPOINT TEST D: DTC B10D7:8F

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key can cause vehicle starting concerns and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key. (PATS keys from Ford, Rotunda, Strattec or Huf are approved Ford PATS keys.)

NOTE: This vehicle uses a Huf Integrated Keyhead Transmitter (IKT) key. If replacing an IKT key for any of these vehicles, it is recommended that the original Huf IKT key be replaced with another Huf IKT key. There are minor visual differences both externally and internally between the Huf IKT key and IKT keys used on other Ford and Lincoln vehicles that may be noticed by the customer. These visual differences does not affect the IKT key functionality in any way. Rotunda should supply a Huf IKT key when ordering replacement/new keys for this vehicle. The Owner's Literature can provide additional information concerning these differences. If replacing an IKT key (or adding another key) with a standard PATS key (not an IKT key), any of the brands mentioned above (Ford, Rotunda, Strattec or Huf) can operate the system.

Test Step	Result / Action to Take
D1 RETRIEVE THE DTCs	
• **NOTE:** Follow this procedure using both PATS keys (using one at a time). • If only one key is available, cut a new key and program the keys. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D7:8F retrieved for one or both PATS keys?**	**Yes** If DTC B10D7:8F is retrieved for one key, REPLACE that key and PROGRAM the new key. REFER to Spare Key Programming - Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B10D7:8F is retrieved for both PATS keys, GO to D2 . **No** The system is OK. CHECK all the customer PATS keys by attempting to start the vehicle with each key to verify all other PATS keys are programmed.
D2 INSTALL A NEW PATS TRANSCEIVER	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC	**Yes** GO to D3 . **No** The system is now OK. The concern was caused by a damaged

again. • Ignition OFF. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Are any PATS DTCs retrieved?**	PATS transceiver. CHECK all the customer PATS keys by attempting to start the vehicle with each key to verify all other PATS keys are programmed.
D3 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the Transmission Control Module (TCM). REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test E: DTC B10D9:87

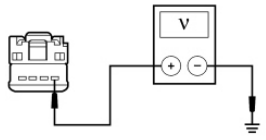
Refer to Wiring Diagrams Cell 112 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Passive Anti-Theft System for schematic and connector information.

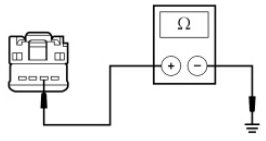
Normal Operation

The Passive Anti-Theft System (PATS) transceiver receives voltage from the Smart Junction Box (SJB) fuse 36 (5A) on the vehicle power circuit and is grounded on the ground circuit. The PATS transceiver and the Instrument Panel Cluster (IPC) communicate on the receive circuit and on the transmit circuit. The IPC compares the key code stored in memory and sends a signal to the Transmission Control Module (TCM) to enable the starter and the fuel injectors if the key code is correct.

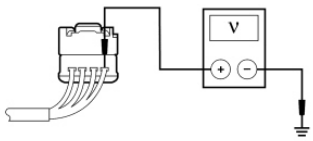
- DTC B10D9:87 (PATS Transponder: Missing Message) - a continuous and on-demand DTC that sets when the PATS transceiver signal is not received by the IPC . This DTC can be caused by circuits between the PATS transceiver and the IPC , or circuits to the PATS transceiver. This can also be caused by using the incorrect PATS transceiver part number.

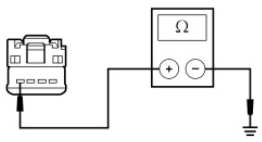
This pinpoint test is intended to diagnose the following:



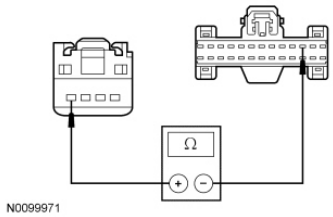


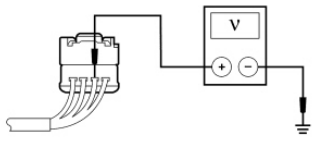
- Fuse
- Wiring, terminals or connectors
- PATS transceiver



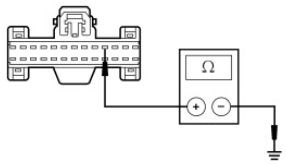


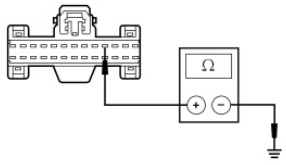
- IPC

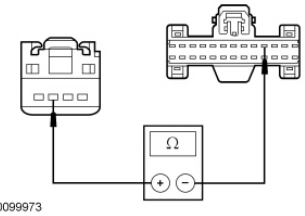




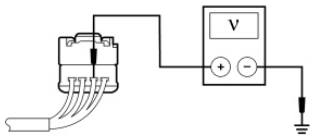
PINPOINT TEST E: DTC B10D9:87



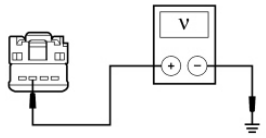




NOTICE: **Use the correct probe adapter(s) when making meurements. Failure to use the correct probe adapter(s) may damage the connector.**



NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .



Test Step	Result / Action to Take
E1 CHECK THE PATS TRANSCEIVER POWER CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: PATS Transceiver C252. • Ignition ON. • Measure the voltage between the PATS transceiver C252-1, circuit CBP36 (BU/BN), harness side and ground.  A0096368 • **Is the voltage greater than 10 volts?**	**Yes** GO to E2 . **No** VERIFY the SJB fuse 36 (5A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.
E2 CHECK THE PATS TRANSCEIVER GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Measure the resistance between the PATS transceiver C252-2, circuit GD116 (BK/VT), harness side and ground.  A0096369 • **Is the resistance less than 5 ohms?**	**Yes** GO to E3 . **No** REPAIR the circuit. CONNECT the negative battery cable. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
E3 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR VOLTAGE	

NOTICE: **This pinpoint test step directs using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** • Connect: Negative Battery Cable. • Connect: PATS Transceiver C252. • Ignition ON. • Measure the voltage by backprobing between the PATS transceiver C252-4, circuit VRT24 (YE/OG), harness side and ground.  A0096370 • **Is the voltage greater than 8 volts?**	**Yes** GO to E6 . **No** GO to E4 .
E4 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: IPC C220. • Disconnect: PATS Transceiver C252. • Measure the resistance between the PATS transceiver C252-4, circuit VRT24 (YE/OG), harness side and ground.  A0096371 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E5 . **No** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B10D9:87 is retrieved again, GO to E12 .
E5 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR AN OPEN	

• Measure the resistance between the PATS transceiver C252-4, circuit VRT24 (YE/OG), harness side and the IPC C220-3, circuit VRT24 (YE/OG), harness side.  N0099971 • **Is the resistance less than 5 ohms?**	**Yes** GO to E12 . **No** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
E6 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR VOLTAGE	
NOTICE: **This pinpoint test step directs using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. • Measure the voltage by backprobing between the PATS transceiver C252-3, circuit VRT23 (VT/GY), harness side and ground.  A0096373 • **Is the voltage greater than 8 volts?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B10D9:87 is retrieved again, GO to E12 . **No** GO to E7 .
E7 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR A SHORT TO GROUND WITH THE PATS TRANSCEIVER CONNECTED	

• Ignition OFF. • Disconnect: IPC C220. • Measure the resistance between the IPC C220-4, circuit VRT23 (VT/GY), harness side and ground.  N0099972 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E9 . **No** GO to E8 .
E8 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR A SHORT TO GROUND WITH THE PATS TRANSCEIVER DISCONNECTED	
NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. • Disconnect: PATS Transceiver C252. • Measure the resistance between the IPC C220-4, circuit VRT23 (VT/GY), harness side and ground.  N0099972 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
E9 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR AN OPEN	
• Disconnect: PATS Transceiver C252. • Measure the resistance between the PATS transceiver C252-3, circuit VRT23 (VT/GY), harness side and the IPC C220-4, circuit VRT23 (VT/GY), harness side.  N0099973 • **Is the resistance less than 5 ohms?**	**Yes** GO to E10 . **No** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

E10 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR VOLTAGE USING THE ACTIVE COMMAND	
NOTICE: **This pinpoint test step directs using a back-probe method. Use the special back-probe tool specified in the tool list in this section. Do not force test leads or other probes into connectors. Adequate care must be exercised to avoid connector terminal damage while ensuring that good electrical contact is made with the circuit or terminal. Failure to follow these instructions may cause damage to wiring, terminals, or connectors and subsequent electrical faults.** **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IPC again. • Connect: PATS Transceiver C252. • Connect: IPC C220. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Trigger the IPC active command TRANSMIT (this is the TX circuit ON/OFF) to ON. • Measure the voltage by backprobing between the PATS transceiver C252-3, circuit VRT23 (VT/GY), harness side and ground.  A0096373 • **Is the voltage less than 5 volts?**	**Yes** INSTALL a new PATS transceiver. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** GO to E11 .
E11 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: IPC C220. • Disconnect: PATS Transceiver C252. • Ignition ON. • Measure the voltage between the PATS transceiver C252-3, circuit VRT23 (VT/GY), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. **No** GO to E12 .

 A0096377 • **Is any voltage indicated?**	
E12 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the TCM . REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test F: The Anti-Theft Indicator Is Always/Never On

Normal Operation

The Passive Anti-Theft System (PATS) uses a visual anti-theft indicator located in the Instrument Panel Cluster (IPC). The anti-theft indicator proves out for 3 seconds when the key is turned to the ON or START position. If there is a PATS concern, the anti-theft indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to the ON or START position. PATS flashes the anti-theft indicator every 2 seconds at key off to act as a visual theft deterrent. The anti-theft indicator operation is controlled by the IPC .

This pinpoint test is intended to diagnose the following:

- IPC

PINPOINT TEST F: THE ANTI-THEFT INDICATOR IS ALWAYS/NEVER ON

Test Step	Result / Action to Take
F1 CHECK THE ANTI-THEFT INDICATOR FOR CORRECT	

OPERATION	
• Ignition OFF. • Connect the scan tool. • Ignition ON. • Enter the following diagnostic mode on the scan tool: IPC DataLogger. • Trigger the IPC active command THEFT_LMP (PATS indicator only) to ON, then OFF. • **Does the anti-theft indicator illuminate, then turn off?**	**Yes** GO to F2 . **No** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the Transmission Control Module (TCM). REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test.
F2 CHECK FOR CORRECT IPC OPERATION	
• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the TCM . REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test G: DTC B10DA:86 or DTC U0101:00

Refer to Wiring Diagrams Cell 14 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Module Communications Network for schematic and connector information.

Normal Operation

During each vehicle start sequence, when the key is turned to the START or ON position, the Passive Anti-Theft System (PATS) transceiver reads the PATS key ID code and sends the data to the Instrument Panel

Cluster (IPC). If there is no communication on the High Speed Controller Area Network (HS-CAN) between the IPC and the Transmission Control Module (TCM), DTC U0101:00 or DTC B10DA:86 can set in the IPC and the vehicle can experience a PATS no-start.

If DTC B10DA:61 is present, refer to DTC Charts in this section.

- DTC B10DA:86 (PATS PCM Identifier: Signal Invalid) - a continuous DTC that sets only when the IPC does not receive the expected response from the TCM over the HS-CAN and the fault may not be present at the time of testing. The data sent by the TCM does not match the data expected by the IPC and this DTC is set. This DTC can be caused by the HS-CAN circuits between the IPC and the TCM or by either module. This DTC can also be set if the battery voltage is low.
- DTC U0101:00 (Lost Communication With TCM : No Sub Type Information) - a continuous DTC that sets only when the IPC loses communication with the TCM and the fault may not be present at the time of testing. This DTC can be caused by a HS-CAN circuit concern, the IPC or the TCM .

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Low battery state of charge
- IPC
- TCM

PINPOINT TEST G: DTC B10DA:86 OR DTC U0101:00

Test Step	Result / Action to Take
G1 CHECK THE BATTERY STATE OF CHARGE	
• Ignition OFF. • Check the batry state of charge with the battery condition test. Refer to Section 414-01 . • **Does the battery pass the battery condition test?**	**Yes** GO to G2 . **No** INSTALL a new battery. REFER to Section 414-01 .
G2 CHECK FOR MODULE COMMUNICATION ON THE HS-CAN	
• Connect the scan tool. • Ignition ON. • Carry out the network test using the scan tool. • **Is the scan tool unable to communicate with any of the modules on the HS-CAN ?**	**Yes** REFER to Section 418-00 to diagnose the module that is not communicating with the scan tool. **No** GO to G3 .
G3 INSPECT THE HS-CAN CIRCUITRY	
• Ignition OFF. • Inspect all of the HS-CAN circuitry, including the pin crimps, connector fit, corroded/bent/pushed-out/damaged pins and splice integrity in the 4 splices and 36	**Yes** GO to G4 . **No** REPAIR the HS-CAN circuitry as necessary. CLEAR the DTCs. CYCLE the ignition. REPEAT

connections (8 connectors) between the TCM and the IPC . • **Does the HS-CAN circuitry pass the component inspection?**	the self-test. TEST the system for normal operation.
G4 CHECK FOR CORRECT TCM OPERATION	
• Disconnect all the TCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the TCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new TCM . REFER to Section 307-01C . RESET the parameters in both the IPC and the TCM . REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. If the concern is still present, GO to G5 . **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.
G5 CHECK FOR CORRECT IPC OPERATION	
• Disconnect all the IPC connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the IPC connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . RESET the parameters in both the IPC and the TCM . REFER to Passive Anti-Theft System (PATS) Parameter Reset in this section. PROGRAM the PATS keys into the new IPC . REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test H: The Vehicle Does Not Start

Normal Operation

During each vehicle start sequence, when the key is turned to the START or ON position, the Passive Anti-Theft System (PATS) transceiver reads the PATS key ID code and sends the data to the Instrument Panel Cluster (IPC). If the concern is due to a PATS concern, PATS DTCs can set in the IPC , and DTC P1260:61 in the Transmission Control Module (TCM). If it is due to a starting system, or a driveability concern, there is no PATS DTCs in the IPC or DTC P1260 in the PCM or DTC P1260:61 in the TCM .

This pinpoint test is intended to diagnose the following:

- Starting system concern
- PATS concern

PINPOINT TEST H: THE VEHICLE DOES NOT START

Test Step	Result / Action to Take
H1 CHECK FOR COMMUNICATION WITH THE TCM AND IPC	
• Connect the scan tool. • Ignition ON. • Carry out the network test using the scan tool. • **Does the scan tool establish communication with the TCM and the IPC ?**	**Yes** GO to H2 . **No** REFER to Section 418-00 to diagnose the module that is not communicating with the scan tool.
H2 CHECK FOR IPC DTCs	
• Retrieve the IPC continuous and on-demand DTCs. • **Are any IPC DTCs present?**	**Yes** REFER to DTC Charts in this section. **No** The no-start condition is not PATS -related. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the cause of the no-start condition.

Pinpoint Test I: DTC B10D7:05

Normal Operation

During each vehicle start sequence, when the key is turned to the START or ON position, the Passive Anti-Theft System (PATS) transceiver reads the PATS key ID code and sends the data to the Instrument Panel Cluster (IPC). If there is a bad transponder in the Integrated Keyhead Transmitter (IKT) key that is in the ignition lock cylinder, or if there was a concern during the programming of the IKT key, DTC B10D7:05 can set, and the vehicle experiences a PATS no-start.

- DTC B10D7:05 (PATS Key: System Programming Failures) - a continuous DTC that sets when there was a failure during the key programming procedure.

This pinpoint test is intended to diagnose the following:

- PATS key programming concern
- PATS key concern (transponder)

PINPOINT TEST I: DTC B10D7:05

Test Step	Result / Action to Take
I1 CHE BOTH PATS KEYS	

NOTE: Check to make sure the new PATS keys are approved Ford encoded PATS keys. Unapproved PATS keys do not always operate correctly over various temperature ranges. (PATS keys from Ford, Rotunda, Strattec or Huf are approved Ford PATS keys.) **NOTE:** Follow this procedure using both PATS keys (using one at a time). • Obtain both PATS keys from the customer and follow the procedure using one PATS key, then the other. If the customer only has one PATS key, it is necessary to cut a new PATS key (does not have to be an IKT key). • If it is necessary to cut a new PATS key, cut the new key to match the original key. Program the PATS keys. Refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. • Ignition ON. • Clear the IPC DTCs. • Ignition OFF. • Ignition ON. • Retrieve the IPC DTCs. • **Is DTC B10D7:05 present with either key?**	**Yes** REPLACE the damaged key with the new key that was cut (if present), or CUT a new key to replace the damaged key. DISCARD the damaged key. PROGRAM the keys. REFER to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. **No** If other IPC DTCs are retrieved, REFER to Section 419-10 . If no IPC DTCs are retrieved, the system is now OK. The concern was caused by a PATS key programming concern.

MyKey® Restrictions on Vehicle Operation

Principles of Operation

MyKey® Operation

The MyKey® feature allows a restricted driving mode to be programmed into one (or more) key(s) supplied with the vehicle or into any (Passive Anti-Theft System (PATS)) programmed spare key(s) to promote good driving habits. The MyKey® is a restricted key for all consecutive key cycles until the MyKey® restricted key is cleared. The remaining key(s) is referred to as an "administrator key(s)" or admin key(s). There must always be at least one admin key. The Instrument Panel Cluster (IPC) does not allow the last administrator key to be programmed as a MyKey® restricted key. Both the admin key and the MyKey® can be used to see how many admin keys and MyKey® restricted keys are programmed to the vehicle, and how many total miles have been driven with the MyKey® active.

When the MyKey® feature is pral features are modified for the MyKey® driver only.

Inspection and Verification

1. Verify the customer concern.
2. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
3. If the cause is not visually evident, verify the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Key Programming Using Two Programmed Keys

NOTE: This procedure works only if 2 or more programmed ignition keys (they do not have to be Integrated Keyhead Transmitter (IKT) keys) are present. If 2 programmed Passive Anti-Theft System (PATS) keys are not available, refer to Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment in this section.

NOTE: The Instrument Panel Cluster (IPC) PID SPAREKEY must be enabled for this procedure to operate. If this PID is not enabled, refer to Key Programming Switch State Control in this section in order to enable the customer spare key programming PID. The IPC PID SPAREKEY is set to ENABLE when the vehicle is built.

NOTE: If the programming procedure is successful, the new key(s) starts the vehicle and the anti-theft indicator proves-out for approximately 3 seconds. If the programming procedure is not successful and the new key(s) does not start the engine, leave the key in the ON position for at least 3 seconds, then turn the key off. Repeat the key programming procedure from Step 1. If the failure repeats, refer to Anti-Theft in the Diagnosis and Testing portion of this section to review the DTCs and carry out the appropriate pinpoint tests.

NOTE: A minimum of 2 PATS keys must be programmed into the IPC before the vehicle starts.

NOTE: If the vehicle is in unlimited key mode, this spare key programming procedure still functions. Any 2 keys that start the vehicle can be used to program an additional unlimited key.

NOTE: If additional keys are to be programmed, and the remaining keys are with the customer, or are not available, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the PID SPAREKEY must be enabled.

NOTE: If the steps are not carried out as outlined, the programming procedure ends.

NOTE: Ignition keys must have a correct mechanical key cut for the vehicle and must be PATS encoded keys (contain a transponder). The key does not have to be an IKT key.

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the IPC .

NOTE: A maximum of 8 ignition keys can be programmed to a PATS vehicle, of which up to 4 can be IKTs . If an attempt to program more than 4 IKTs occurs, the Smart Junction Box (SJB) sets DTC B1138, and the IPC sets DTC B109E:42 (both DTCs indicate a memory full condition), and the additional IKTs do not have any Remote Keyless Entry (RKE) function capability. If the vehicle is equipped with a message center, the IPC displays the message INT KEY COULD NOT PROGRAM. The PATS portion of the additional key(s) function, but the RKE transmitter function is inoperative.

NOTE: When in the unlimited key mode (after the first 2 keys have been programmed to the vehicle), the N_KEYCODE PID always reads 2, no matter how many keys are programmed to the vehicle.

1. Insert a programmed ignition key (can be an IKT or a standard PATS key) into the ignition lock cylinder and turn the key from the OFF position to the ON position.

2. Leave the key in the ON position for 3 seconds, but not longer than 10 seconds.

3. Turn the key to the OFF position and remove the first key.

4. Within 10 seconds of turning the key to the OFF position, insert a second programmed ignition key (can be an IKT or a standard PATS key) into the ignition lock cylinder and turn the key from the OFF position to the ON position.

5. Leave the key in the ON position for 3 seconds, but not longer than 10 seconds.

6. Turn the key to the OFF position and remove the second key.

7. Within 20 seconds of turning the key to the OFF position, insert the unprogrammed ignition key (new PATS or IKT key) into the ignition lock cylinder and turn the key from the OFF position to the ON position. Leave the key in the ON position for a minimum of 6 seconds (this additional 3 second time frame allows for the RKE data transfer to take place, if programming an IKT key).

8. **NOTE:** The new key now starts the vehicle and also operates the RKE functions, if there are 4 or fewer IKT keys programmed to the vehicle.

   Start the vehicle with the new key.

   - If it is an IKT key, verify the RKE functions.

9. If additional programmed keys are desired, repeat Steps 1-8.

Integrated Keyhead Transmitter (IKT) Key Programming Using Diagnostic Equipment

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used when a customer needs more than one key programmed into the system and 2 programmed ignition keys are not available. This procedure is also useful when a programmed ignition key(s) is lost or the ignition lock cylinder is replaced, and it is desired to erase key code(s) from the PassAnti-Theft System (PATS) memory.

NOTE: This procedure erases all programmed ignition keys from the vehicle memory and the vehicle does not start until 2 keys are programmed to the vehicle. This procedure also erases the Integrated Keyhead Transmitter (IKT) Transmitter Identification Codes (TICs) from the Smart Junction Box (SJB), preventing the erased IKT from operating the Remote Keyless Entry (RKE) functions on the vehicle.

NOTE: A minimum of 2 PATS keys must be programmed into the Instrument Panel Cluster (IPC) before the vehicle starts.

NOTE: Two PATS encoded (contains a transponder) keys (or IKTs) with the correct mechanical cut must be available to carry out this procedure. One or both of them can be the customer's original keys. One or both of them may be an IKT or a standard PATS key.

NOTE: If additional keys are to be programmed, refer to Key Programming Using Two Programmed Keys in this section. If the remaining keys are with the customer and are not available with the vehicle, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the IPC PID SPAREKEY must be enabled.

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the IPC .

1. Turn the key from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. From the scan tool menu select: Ignition Key Code Erase. Follow all IDS screen instructions until key erase procedure completes. The scan tool additionally instructs you to program 2 keys to complete the process.

4. Turn the key to the OFF position and disconnect the scan tool.

5. **NOTE:** The RKE data transfer takes place between the key and the IPC first. After both keys are programmed into the IPC , then the RKE data transfers from the IPC to the SJB . Until the final data transfer takes place to the SJB , the RKE functions do not operate.

Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for a minimum of 6 seconds (this additional 3 second time frame allows for the RKE data transfer to take place).

6. Remove the first PATS key from the ignition lock cylinder.
7. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for a minimum of 6 seconds.
8. Remove the second encoded key from the ignition lock cylinder.
9. The vehicle should now start with both ignition keys and the RKE transmitter portion of an IKT should function.
10. If it is desired to program additional key(s) (only up to 8 keys total can be programmed into the IPC), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Key Programming Switch State Control

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: The spare key programming switch is a programmable switch which provides the capability to enable/disable the normal customer spare key programming procedure detailed in the Owner's Literature. It must read ENABLE if more than 2 keys need to be programmed into the Instrument Panel Cluster (IPC). For additional information, refer to Key Programming Using Two Programmed Keys in this section. This programmable switch is provided as a convenience for rental company fleets or other fleet purchasers who may not want the spare key programming procedure available to the vehicle driver.

NOTE: The spare key programming switch state can be viewed with the IPC SPAREKEY PID.

NOTE: If the IPC SPAREKEY PID reads ENABLE, up to 8 keys total can be programmed into the IPC using the Key Programming Using Two Programmed Keys procedure in this section. If the SPAREKEY PID reads DISABLE, the Key Programming Using Two Programmed Keys procedure does not function. This switch is set to ENABLE when the vehicle is built. This PID only affects the Key Programming Using Two Programmed Keys procedure.

1. Insert a programmed Passive Anti-Theft System (PATS) key (or Integrated Keyhead Transmitter (IKT)) into the ignition lock cylinder and turn the key from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the IDS on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. **NOTE:** The default setting on delivery of all new vehicles is ENABLE, when viewing the IPC SPAREKEY PID.

   From the scan tool menu select: Customer Spare Key Programming Enable and follow the IDS on-screen instructions in order to complete the procedure.

   - CUSTOMER SPARE KEY PROGRAMMING ENABLE - spare key programming procedure is accessible.
   - CUSTOMER SPARE KEY PROGRAMMING DISABLE - spare key programming procedure is not accessible.

Spare Key Programming - Unlimited Key Mode

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Enabling Unlimited Key Mode

NOTE: Unlimited key mode is intended for use by those customers who need more than 8 keys for their vehicle.

NOTE: If unlimited key mode is enabled, a maximum of 4 Integrated Keyhead Transmitter (IKT) keys can be programmed to the vehicle for Remote Keyless Entry (RKE) functionality. If more keys are required, they shouandard Passive Anti-Theft System (PATS) keys. If more than 4 IKT keys are programmed to the vehicle, the Smart Junction Box (SJB) sets DTC B1138, and the IPC sets DTC B109E:42 (both DTCs indicate a memory full condition), and only 4 IKT keys have RKE functionality, however, all of them start the vehicle, if programmed correctly.

NOTE: Before programming, the new key(s) must have the correct mechanical cut for the ignition lock cylinder.

NOTE: The unlimited key mode is set up by creating a special, unique unlimited transponder security key code and programming this key code into all of the vehicle keys so they contain the same key code.

NOTE: When in the unlimited key mode, the N_KEYCODE PID always reads 2, no matter how many keys are programmed to the vehicle (after the first 2 keys have been programmed).

1. The customer must choose an 8-digit number (except for 00000000 or 00000001) to be programmed to all of their vehicles. All customer vehicles need to use the same number. Valid digits are 0-9 and the letters A-F.

2. **NOTE:** If the PID UNL_KEY_ID is not available, unlimited key mode is turned on and must be turned off before viewing the stored code. At this time, unlimited keys can be programmed to the vehicle. To view/disable/change the stored code, follow the procedure for disabling the unlimited key mode below.

   Monitor the PID UNL_KEY_ID and compare its value against the code chosen in Step 1. It should not be the same key code.

3. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the IDS on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

4. Once in security access, select: "program unlimited key code" and follow the IDS on-screen instructions. Enter the 8-digit code chosen by the customer in Step 1 of this procedure and follow the IDS on-screen instructions.

5. Select: "unlimited key mode ON" and follow the IDS on-screen instructions.
6. Select: "Ignition Key Code Erase" and follow the IDS on-screen instructions.
7. Disconnect the scan tool and turn the ignition switch to OFF.
8. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds if it is an IKT key).
9. Remove the first PATS key from the ignition lock cylinder.
10. Insert the next PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds for an IKT key).
11. If it is desired to program additional key(s), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Disabling Unlimited Key Mode

NOTE: By disabling the unlimited key mode, the previous access code no longer operates the vehicle.

1. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the IDS on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
2. Select: "unlimited key mode OFF" and follow the IDS on-screen instructions.
3. Select: "Ignition Key Code Erase" and follow the IDS on-screen instructions.
4. Disconnect the scan tool and turn the ignition switch to OFF.
5. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds for an IKT key).
6. Remove the first PATS key from the ignition lock cylinder.
7. Insert the next PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds for an IKT key).
8. **NOTE:** With the unlimited key mode turned off, a maximum of 8 keys can be programmed into the IPC using the Key Programming Using Two Programmed Keys procedure in this section. The IPC PID SPAREKEY must be enabled.

   If it is desired to program additional key(s), refer to Key Programming Using Two Programmed Keys in this section for each additional key that needs to be programmed.

Spare Key Programming - Using Diagnostic Equipment

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: This procedure is used when a customer needs to have an additional key programmed into the vehicle without erasing stored key codes, but 2 programmed keys are not available. This procedure is also useful when attempting to determine if an ignition key is damaged, as a new key can be installed without erasing keys or without having 2 programmed keys availablep>**NOTE:** Before programming, the new key must have the correct mechanical cut for the ignition lock cylinder.

NOTE: If 8 keys are already programmed, this procedure does not allow any more ignition keys to be programmed. The number of keys that are programmed into the Passive Anti-Theft System (PATS) can be determined by viewing the Instrument Panel Cluster (IPC) PID N_KEYCODE.

1. Turn the new key to be programmed from the OFF position to the ON position.

2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.

3. **NOTE:** Make sure the selection made is "program additional ignition key". If the "Ignition Key Code Erase" selection is made, all of the keys are erased from the system.

   From the scan tool menu select: "program additional ignition key".

4. Turn the key to the OFF position and disconnect the scan tool.

5. Start the vehicle with the new PATS key. The vehicle now starts with the new PATS key and also with the original PATS keys. If it is an IKT key, verify the RKE functions (if there are 4 or fewer IKT keys programmed).

Anti-Theft Security Access

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: The anti-theft security access procedure is used to obtain Passive Anti-Theft System (PATS) security access. PATS security access must be granted to erase ignition key codes, program ignition key codes, enable/disable unlimited key mode, set unlimited transponder ID and enable/disable the spare key programming switch (Instrument Panel Cluster (IPC) PID SPAREKEY). The anti-theft security access procedure invokes a 10-minute time delay prior to granting security access during which the scan tool must remain connected to the vehicle. Once security access is granted, a security access command menu is displayed which offers various command options.

NOTE: Once security access has been granted, multiple security access commands can be executed (if necessary) prior to exiting the command menu. This avoids an additional security access procedure and the associated 10 minute time delay.

1. From the scan tool, enter TOOLBOX. Select: BODY-SECURITY-PATS Functions and follow the Integrated Diagnostic System (IDS) on-screen instructions to ENTER SECURITY ACCESS. This procedure takes approximately 10 minutes to carry out, during which time the ignition switch must be in the ON position and the scan tool must be connected to the vehicle.

2. After the 10-minute security access procedure is completed, follow the IDS on-screen instructions and a new menu is displayed with command options. Select only those functions required before exiting out of this menu. Do not select more functions than the procedure calls for. Once exited out of this menu, the security access procedure must be repeated again to carry out additional commands.

Passive Anti-Theft System (PATS) Parameter Reset

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

NOTE: A minimum of 2 Passive Anti-Theft System (PATS) keys must be programmed into the Instrument Panel Cluster (IPC) to complete this procedure and allow the vehicle to start.

1. Turn the key from the OFF position to the ON position.
2. From then tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to Anti-Theft Security Access in this section.
3. From the scan tool, select: Parameter Reset and follow the on-screen instructions.
4. **NOTE:** If the IPC or the IPC and the PCM were replaced, updated or reconfigured, follow Steps 4-9. All vehicle keys are erased during the parameter reset procedure. Verify at least 2 vehicle keys are available prior to carrying out the PATS parameter reset. If only the PCM was replaced, go to Step 9.

   From the scan tool, select: Ignition Key Code Erase and follow the on-screen instructions.
5. Turn the key to the OFF position and disconnect the scan tool.
6. Turn the key to the ON position for 6 seconds.
7. Turn the key to the OFF position and remove the key.
8. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for 6 seconds.
9. Both keys now start the vehicle.
10. If more keys are required to be programmed, refer to Key Programming Using Two Programmed Keys in this section.

MyKey® Programming

Program a MyKey®

NOTE: After a MyKey® has been programmed, the remaining standard key(s) (the key[s] that is not programmed with the MyKey® feature) is referred to as an "administrator key(s)" or "admin" key(s). There must always be at least one admin key.

NOTE: The MyKey® feature can be cleared within the same key cycle that it was programmed. Follow the Clear MyKey® procedure in this section to clear the key of any restricted MyKey® status. If the key has been cycled, an admin key is required to clear the MyKey® programming.

1. Insert a programmed PATS ignition key into the ignition lock cylinder and turn the key from the OFF position to the RUN position. This key must be the one that is being programmed to the MyKey® restricted status.

   Using the message center buttons:

   1. Press the SETUP button until PRESS RESET TO CREATE MYKEY appears in the message center display.
   2. Press and release the RESET button. HOLD RESET TO CONFIRM MYKEY is displayed.
   3. Press and hold the RESET button (for approximately 2 seconds) until MARK THIS KEY AS RESTRICTED is displayed.
   4. Wait until KEY RESTRICTED AT NEXT START is displayed, then release the RESET button.

3. The MyKey® feature (standard restricted features) is successfully programmed into this particular key. Make sure it is labeled for easy identification. If you would like to customize the MyKey® with the audio volume limited, maximum speed limit, speed alert chimes, and AdvanceTrac® on/off restrictions, refer to Configuring MyKey® Optional Restricted Features in this section.
   - If the vehicle is equipped with remote start, also refer to Using MyKey® with Aftermarket Remote Start Systems in this section.

Configuring MyKey® Optional Restricted Features

1. To configure the MyKey® optional restricted features, carry out the following:
   1. Using an admin key that has not been programmed as a MyKey®, turn the ignition ON.
   2. Press and hold the SETUP button until RESET FOR MYKEY SETUP is displayed.
   3. Press and release the RESET button to display the MyKey® setup menus. The first programmable feature is: MYKEY MAX MPH OFF.
      - ♦ If you do not want to change the status of a feature that appears, press SETUP to accept the current setting and the message center displays the next feature.
      - ♦ If you want to change the status of the feature that is displayed, press RESET to turn a feature on/off (or toggle between choices). After the feature sele been made, press and release SETUP to accept and the message center displays the next feature.
   4. Repeat the process for the next features of:
      - ♦ MYKEY MPH TONES 45 55 65 (choose the desired speed for the chime to sound)
      - ♦ MYKEY VOLUME LIMIT OFF (choose the audio volume to be limited to 45%)
      - ♦ MYKEY ADVTRAC CTRL ON (choose for the AdvanceTrac® to be automatically locked on or able to be turned on or off by the MyKey® driver)

Clear MyKeyTM

1. **NOTE:** This procedure is used to clear the MyKey® feature on all of the keys that are programmed to the vehicle. All of the keys then operate as normal (admin) keys with no restrictions.

   Using an admin key, turn the ignition ON.

2. Press SETUP until PRESS RESET TO CLEAR MYKEY appears.

3. Press and release the RESET button until HOLD RESET TO CONFIRM CLEAR is displayed.

4. Press and hold the RESET button until ALL MYKEYS CLEARED is displayed.
   - A MyKey® can also be cleared during the same key cycle that it was programmed by following Steps 2, 3 and 4 of this procedure.

Using MyKey® with Aftermarket Remote Start System

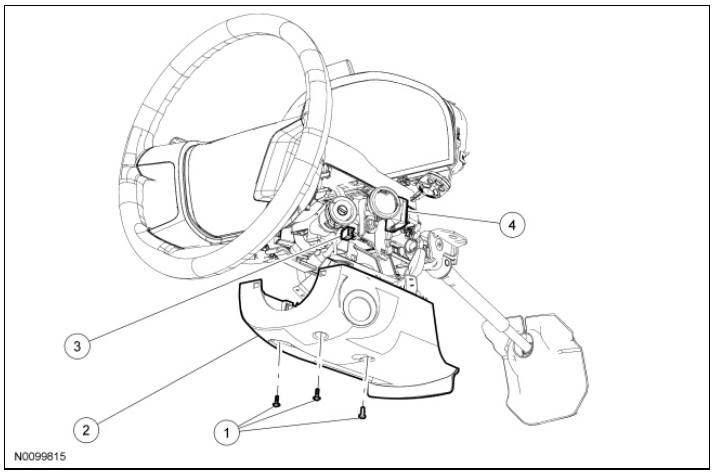
Program Remote Start System as a MyKey®

1. Enter the vehicle and close all doors.

2. Remote start the vehicle using a remote start fob.

3. Follow Steps 1-3 of the Program a MyKey® procedure in this section.

Clear MyKey® with the Remote Start System



NOTE: It is possible to program all of the keys as MyKeys®, with the remote start system being the only admin key. This procedure clears MyKey® in the event of the aftermarket remote startng programmed as the only admin key.

1. Enter the vehicle and close all doors.

2. Remote start the vehicle using the remote start fob.

3. Follow Steps 1-4 of the Clear MyKey® procedure in this section.

Passive Anti-Theft System (PATS) Transceiver

Item	Part Number	Description
1	3K512	Steering column shroud screws (3 required)
2	3530	Steering column shroud (lower)
3	-	Passive Anti-Theft System (PATS) transceiver electrical connector (part of 14401)
4	15607	PATS transceiver

Removal and Installation

1. Remove the 3 screws and the lower steering column shroud.

2. Disconnect the electrical connector.

3. Using a suitable tool such as a dentist pick, pull the tangs outward and remove the Passive Anti-Theft System (PATS) transceiver.

4. **NOTE:** Replacement of the PATS transceiver does not require the PATS keys to be programmed into the Instrument Panel Cluster (IPC) again.

   To install, reverse the removal procedure.

Switch Settings

Switch Position	1	2	3	4	5	6	7	8	9	10	11	12
Up, + or On	Left	Left	Left	Left	Left	Left	Left	Left	Left	Left	Left	Left
Middle, 0 or Neutral	Middle	Middle	Middle	Middle	Middle	Middle	Middle	Middle	Middle	Middle	Middle	Middle
Down, - or Off	Right	Right	Right	Right	Right	Right	Right	Right	Right	Right	Right	Right

Universal Transmitter

On early build vehicles, the universal transmitter can be identified by the Homelink® symbol and one red indicator light.

On late build vehicles, the universal transmitter uses the Lear Car2U® System. It is identified by the lack of a symbol, but with 3 red indicator lights. Each of the 3 buttons has a red indicator light located behind the 3 buttons.

The universal transmitter is an integral part of the LH sun visor and provides a convenient way to substitute up to 3 hand-held transmitters with a single built-in device. The universal transmitter can learn the radio frequency codes of most current transmitters. The universal transmitter:

- operates garage doors, gates and home/office lighting and security systems.
- learns and transmits the radio frequency of up to 3 hand-held transmitters from any of the systems mentioned above.
- is powered by the vehicle battery and charging system.

Universal Transmitter

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical	Electrical
• Universal transmitter	• Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Universal Transmitter is Inoperative

Refer to Wiring Diagrams Cell 89 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Interior Lamps for schematic and connector information.

Normal Operation

The universal transmitter receives voltage through the battery saver relay power output circuit. The power and ground circuits are shared with the LH vanity mirror lamp.

When a programmed button is pressed on the universal transmitter, a wireless signal is sent to the receiver unit.

This pinpoint test is intended to diagnose the following:

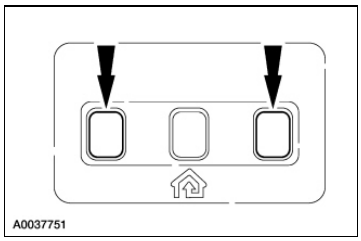
- Interior lighting concerns
- Universal transmitter
- Receiver unit

PINPOINT TEST A: THE UNIVERSAL TRANSMITTER IS INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK THE LH SUN VISOR VANITY MIRROR OPERATION	
• Check the illumination of the LH sun visor vanity mirror lamps. • **Do the vanity mirror lamps illuminate?**	**Yes** GO to A2 . **No** REFER to Section 417-02 to continue diagnosis of the vanity mirror lamps.
A2 PROGRAM A HAND-HELD TRANSMITTER INTO THE UNIVERSAL TRANSMITTER	
• Program the universal transmitter. Refer to Universal Transmitter Programming in this section. • **Does the universal transmitter program successfully?**	**Yes** The universal transmitter is OK. VERIFY the receiver unit operates correctly by attempting to operate the device. **No** INSTALL a new LH sun visor assembly. REFER to Section 501-05 . TEST the system for normal operation.

Universal Transmitter Programming

Universal Transmitter Programming (Fixed Code) - Early Build (Homelink®)



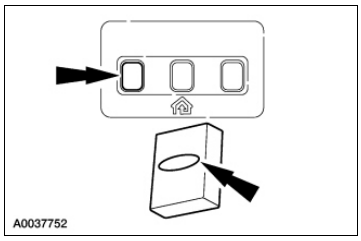
NOTE: A new battery in the hand-held transmitter may allow quicker and easier training due to a more accurate transmission of the radio frequency signal.

NOTE: This procedure is for early build vehicles only.

1. Verify the hand-held transmitter is operative by pressing a button and observing the illumination of the indicator on the hand-held transmitter.

2. Turn the ignition to the ON position.

3. Prepare for programming the universal transmitter by erasing all 3 channels by holding down the 2 outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.



4. Select 1 of the 3 universal transmitter buttons to be used for programming.

5. Hold the end of the hand-held transmitter 25-51 mm (1-2 in) from the front surface of the universal transmitter so that the red light on the universal transmitter can still be seen.

6. **NOTE:** During programming, the hand-held transmitter may automatically stop transmitting after 2 seconds, which may not be long enough to program the universal transmitter. If programming with this type of hand-held transmitter, continue to hold the button on the universal transmitter while pressing and releasing the hand-held transmitter button every 2 seconds.

   At the same time, press the hand-held transmitter button and the desired button on the universal transmitter until the red light on the universal transmitter flashes first slowly, and then rapidly. Release both bons when the rapid flashing begins.

7. Firmly press and hold for 5 seconds and release the just-trained universal transmitter button up to 2 separate times to activate the garage door. If, after 2 separate times, the garage door still does not activate, press and hold the just-trained universal transmitter button and observe the red indicator light.

- If the red indicator light stays on constantly, the programming is complete and the device should activate when the universal transmitter button is pressed and released.
- If the red indicator light blinks rapidly for 2 seconds and then turns to a constant light, carry out the Training a Garage Door Opener Equipped With "Rolling Codes" - Early Build procedure to complete the programming of a rolling code-equipped device (most commonly a garage door opener).

Universal Transmitter Programming (Rolling Code) - Early Build (Homelink®)

NOTE: It may be helpful to have an assistant with this procedure.

1. At the garage door opener receiver (the motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found near where the hanging antenna wire is attached to the motor-head unit; or it may be under the light bulb cover of the motor-head unit.

2. Turn the ignition to the ON position.

3. **NOTE:** Step 4 must be initiated within 30 seconds of pressing and releasing the "learn" or "smart" button.

   Firmly press and release the "learn" or "smart" button. (The name and cof the button may vary by manufacturer).

4. Return to the vehicle and firmly press, hold for 2 seconds and release the programmed universal transmitter button. Repeat the press/hold/release sequence a second time and depending on the brand of the garage door opener (or other rolling code-equipped device), repeat this sequence a third time to complete the programming process.

Universal Transmitter Programming (Rolling Code) - Late Build (Lear Car2U®)

⚠ WARNING: To avoid the risk of serious injury from the door closing, make sure that people and objects are clear of the garage door opener or security device that is being programmed. When programming a garage door, it is advised to park outside of the garage.

NOTE: Read the instructions completely before attempting to program the Lear Car2U® System. Because of the steps involved, it may be helpful to have an assistant when programming the universal transmitter. Programming the rolling code garage door opener involves time-sensitive actions. Read the entire procedure before beginning so the procedure can be carried out in a timely fashion. If the time-sensitive actions are not carried out in a timely fashion, the device times out and the procedure needs to be repeated.

NOTE: Make sure to keep the original remote control transmitter for use in other vehicles as well as for future Lear Car2U® System programming. It is only needed for fixed code device programming.

NOTE: This procedure is for rolling code devices. In order to determine if you have a fixed code or a rolling code device, open the garage door opener transmitter and if is a panel of coded dip switches present, the device is a fixed code device. If there are no coded dip switches present, the device is a rolling code device.

1. Turn the ignition to the ON position.

2. At the same time, firmly press the 2 outside Lear Car2U® System buttons for 1-2 seconds, then release the buttons.

3. **NOTE:** Step 4 must be initiated within 30 seconds of pressing and releasing the "learn" or "smart" button.

At the garage door opener receiver (the motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found near where the hanging antenna wire is attached to the motor-head unit; or it may be under the light bulb cover of the motor-head unit.

- For technical assistance, refer to the Owner's Literature.

4. Return to the vehicle and firmly press and hold for 5-20 seconds the universal transmitter button that is desired to be programmed. During this time, the selected button red indicator light blinks slowly. Once the garage door begins to move, within one second, release the button. With the button released, the red indicator light begins to blink rapidly until programming is complete. Repeat the press/hold/release sequence a second time and depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming process.

5. After successful programming, the Lear Car2U® System operates the garage door opener using the button that was programmed. The red indicator light in front of the programmed button illuminates to confirm the Lear Car2U® System is responding (and is programmed) to the button command.

Erasing the Lear Car2U® System Buttons (Rolling Code) - Late Build

1. To erase the rolling code programming from the Lear Car2U® Sysrn the ignition key to the on position, firmly press and hold the 2 outside Lear Car2U® System buttons at the same time for approximately 20 seconds until the 3 red indicator lights begin to blink rapidly.

2. When the 3 red indicator lights begin to blink, release the buttons. The codes for all of the 3 buttons are erased.

Universal Transmitter Programming (Fixed Code) - Late Build (Lear Car2U®)

⚠ WARNING: To avoid the risk of serious injury from the door closing, make sure that people and objects are clear of the garage door opener or security device that is being programmed. When programming a garage door, it is advised to park outside of the garage.

NOTE: Do not use the Lear Car2U® System with any garage door opener that does not have a "stop and reverse" feature. This includes any garage door opener model manufactured before April 1, 1982.

NOTE: Read the instructions completely before attempting to program the Lear Car2U® System. Because of the steps involved, it may be helpful to have an assistant when programming the universal transmitter.

NOTE: Make sure to keep the original remote control transmitter for use in other vehicles as well as for future Lear Car2U® System programming. It is only needed for fixed code device programming.

NOTE: This procedure is for fixed code devices. In order to determine if you have a fixed code or a rolling code device, open the garage door opener transmitter and if there is a panel of coded dip switches present, the device is a fixed code device. If there are no coded dip switches present, the device is a rolling code dIf so, refer to the Training a Garage Door Opener Equipped With "Rolling Codes" - Late Build procedure.

NOTE: In order to program a fixed code device, paper and a pen or pencil is necessary.

1. **NOTE:** When a switch is in the Up, +, or On position, circle "Left". When a switch is in the Middle, 0 or Neutral position, circle "Middle". When a switch is in the Down, -, or Off position, circle "Right".

   Open the battery cover of the universal transmitter and record the dip switch settings from left to right

for all 8 to 12 switches. For additional information, refer to Specifications in this section.

2. Turn the ignition to the ON position.

3. To input these positions into the Lear Car2U® System, at the same time, press all 3 Lear Car2U® System buttons for a few seconds and then release to put the device into the programming mode. The 3 red indicator lights blink slowly. Within 2.5 minutes, enter the corresponding dip switch settings from left to right (starting with number 1) into the Lear Car2U® System by pressing and releasing the buttons corresponding to the settings you circled.
    - For example, if the dip switch settings were 1 (Left), 2 (Middle), 3 (Middle), 4 (Right), etc., press and release the left Lear Car2U® System button, then the middle button, then the middle button, then the right button, etc.

4. After inputting the dip switch settings, at the same time, press and release all 3 Lear Car2U® System buttons. The 3 red indicator lights are turned on continuously.

5. Press and hold the Lear Car2U® System button you would like to use to control the garage door.

6. Once the garage door starts to move, within one second, release the button. During this time, the selected button indicator light blinks slowly. Do not release the button until the garage door movesmay take anywhere from 5-55 seconds, depending on the make/model of the garage door opener.

7. The 3 red indicator lights begin to blink rapidly until programming is complete. If the garage door opener does not operate, repeat Steps 1-6.
    - For technical assistance, refer to the Owner's Literature.

8. After successful programming, the Lear Car2U® System operates the garage door opener using the button that was programmed. The red indicator light in front of the programmed button turns on to confirm the Lear Car2U® System is responding (and is programmed) to the button command.

Erasing the Lear Car2U® System Buttons (Fixed Code) - Late Build

1. To erase the fixed code programming from the Lear Car2U® System, turn the ignition key to the on position, firmly press and hold the 2 outside Lear Car2U® System buttons at the same time for approximately 20 seconds until the 3 red indicator lights begin to blink rapidly.

2. When the 3 red indicator lights begin to blink, release the buttons. The codes for all of the 3 buttons are erased.

Cruise Control

The cruise control system consists of the following components:

- Cruise control switches
- Cruise control deactivator switch (part of the stoplamp switch)
- Stoplamp switch
- Cruise control indicator
- Clutch pedal cruise control deactivator switch (manual transaxle)
- PCM
- Electronically-controlled throttle body
- Clockspring

The cruise control system is electronically controlled by the PCM. The cruise control system is designed to maintain a selected vehicle speed between 40 km/h (25 mph) and the maximum limited vehicle speed.

During normal driving, the vehicle speed may vary slightly from the set speed due to road conditions. The vehicle speed may fluctuate when driving up and down a steep hill. If the vehicle speed decreases more than 16 km/h (10 mph) below the set speed, the cruise control disengages.

Cruise Control

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit 300-NUD105-R025DE or equivalent

Principles of Operation

The cruise control system is controlled by the PCM. The cruise control system is designed to maintain a selected vehicle speed above 37 km/h (23 mph) to the maximum limited vehicle speed. The cruise control system is controlled by the steering wheel mounted switches, the stoplamp switch, the clutch pedal cruise control deactivator switch (manual transaxle), and the cruise control deactivator switch (part of the stoplamp switch). The steering wheel mounted switches are hardwired to the PCM through the clockspring.

Pressing and releasing the ON switch turns the cruise control system on. Pressing and releasing the SET+ or SET- switch while the vehicle is traveling at the desired speed activates the cruise control system.

For early build vehicles, the cruise control indicator in the Instrument Panel Cluster (IPC) illuminates when the system is engaged. For late build vehicles, the cruise control system has 2 indicators in the IPC . The cruise control amber indicator illuminates when the system is on. The cruise control green indicator illuminates when the system is engaged.

Tapping the SET+ or the SET- switch while in the set mode increases or decreases the maintained vehicle speed by 1.6 km/h (1 mph) per tap. If the respective switch is pressed and held, the vehicle speed continues to accelerate or decelerate until the switch is released.

Pressing and releasing the OFF switch, or switching the ignition switch to the OFF position, turns the cruise control system off. Applying the brake pedal or the clutch pedal (manual transaxle) puts the cruise control system into the standby mode. Pressing the RESUME or RSM switch when the cruise control system is in the standby mode causes the vehicle to accelerate to the last set speed. Resume does not function if the OFF switch is pressed, the ignition switch is in the OFF position, or if the current vehicle speed is below the minimum operational speed.

The clutch pedal cruise control deactivator switch is incorporated on vehicles equipped with a manual transaxle. When the clutch pedal is applied with the vehicle cruise control system engaged, the normally closed switch opens and signals the PCM to deactivate the cruise control.

Whenever the cruise control system is engaged and active, a cruise control icon on the IPC is illuminated.

The cruise control deactivator switch (part of the stoplamp switch) is provided as an additional safety feature. When the brake pedal is pressed, an electrical signal is sent from the stoplamp switch to the PCM to deactivate the cruise control system. The PCM sends a message to the IPC and the illuminated cruise control icon is turned off. Under increased brake pedal effort, the deactivator switch opens and removes the voltage signal from the PCM input circuit, deactivating the cruise control system.

The clockspring provides the electrical interface between the steering column wiring and the cruise control switches in the steering wheel.

The inputs to the PCM are:

- Output Shaft Speed (OSS) sensor
- Digital Transmission Range (TR) sensor (automatic transaxle)
- Cruise control switch
- Clutch pedal cruise control deactivator switch (manual transaxle)
- Cruise control deactivator switch (part of the stoplamp switch)
- Accelerator pedal position sensor
- Parking brake

The outputs of the PCM are:

- Cruise control indicator lamp
- Throttle command

The cruise control system throttle position is completely controlled by the PCM through the electronically controlled throttle body. Cruise control electronics are contained entirely within the PCM.

For non-hybrid vehicles, when the cruise control system is active, the PCM corrects for deviations in the actual vehicle speed by proportionally moving the throttle plate. The PCM modulates the throttle to minimize error between actual and desired vehicle speed. The PCM strategy uses the throttle control for smooth accelerations.

For hybrid vehicles, when the electric traction motor is powering the vehicle and the cruise control is active, the electronic actuator corrects for deviations in the actual vehicle speed by proportionally applying wheel torque. The control electronics modulate the wheel torque to minimize error between the actual vehicle speed and the desired speed.

The PCM sends a message over the Controller Area Network (CAN) to the IPC whenever the cruise control indicator should be turned on or off.

For non-hybrid vehicles, in the event of an off command or a deactivation request from any source, the cruise control system carries out a deactivation and immediately returns the throttle to the idle position.

For hybrid vehicles, in the event of an off command or a deactivation request from any source except a brake pedal tap, the system carries out a hard deactivation and immediately returns control to the accelerator pedal.

The cruise control system provides self-diagnostics. Cruise control is disabled anytime an error is detected in the system. No IPC indicator or message center messages are displayed when faults occur. Fault codes are logged by the PCM.

An Electronic Throttle Control (ETC) system fault also causes the cruise control system to be disabled. In this case, an ETC system warning indicator or message center message is displayed.

Additionally, the following conditions cause the cruise control system to deactivate:

- Transmission gear selector in a position other than D or OD (automatic transaxle)
- Vehicle clutch pedal is applied (manual transaxle)
- Cruise control set speed is over-ridden with the accelerator pedal for a period longer than 5 minutes
- Vehicle speed loss from set speed of greater than 16 km/h (10 mph) occurs
- Vehicle speed falls below the minimum allowable limit of 37 km/h (23 mph)
- Cruise control switch is pressed or stuck for longer than 2 minutes
- ABS fault

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Throttle body • Stoplamp Switch	• Battery Junction Box (BJB) fuse(s): ♦ 49 (15A), 2.5L or 3.0L engine ♦ 49 (20A), 3.5L engine • Wiring, terminals or connectors • Cruise control switch • Clutch pedal cruise control deactivator switch (manual transaxle) • Stoplamp switch • PCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .
10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

PCM DTC Chart

DTCs	Description	Action
P0572	Brake Switch A Circuit Low	GO to Pinpoint Test B .
P0573	Brake Switch A Circuit High	GO to Pinpoint Test B .
P0579	Cruise Control Multifunction Input A Circuit Range/Performance	GO to Pinpoint Test C .
P0581	Cruise Control Multifunction Circuit High	GO to Pinpoint Test C .
P1703	Brake Switch Out of Self-Test Range	GO to Pinpoint Test B .
All other DTCs	-	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Cruise Control Is Inoperative

Refer to Wiring Diagrams Cell 31 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Speed Control for schematic and connector information.

Normal Operation

A reference voltage is sent from the PCM to the steering wheel cruise control switches. When a switch is pressed, the voltage is routed through a specific resistor value for each function. The PCM provides the ground for the reference voltage. The PCM uses this reference voltage to determine which control input function has been selected. When the brake pedal is applied the PCM deactivates the cruise control, if engaged.

The cruise control deactivator switch (part of the stoplamp switch) interrupts the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

Vehicles equipped with a manual transaxle have an additional clutch pedal cruise control deactivator switch. The clutch pedal cruise control deactivator switch provides a ground signal to the PCM. When the clutch pedal is applied, the normally closed clutch pedal cruise control deactivator switch opens and removes the ground signal to the PCM which deactivates the cruise control, if engaged.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM not configured for cruise control
- Stoplamp switch
- Clutch pedal cruise control deactivator switch
- Cruise control switch
- Digital Transmission Range (TR) sensor
- Vehicle speed signal
- ABS fault
- PCM
- Transmission Control Module (TCM)

PINPOINT TEST A: THE CRUISE CONTROL IS INOPERATIVE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
A1 VERIFY PCM CONFIGURATION	
• Enter the following diagnostic mode on the scan tool: Programmable Parameters. • Verify that the cruise control is enabled in the PCM. • **Is the cruise control enabled?**	**Yes** GO to A2 . **No** ENABLE the cruise control in the PCM using the scan tool programmable parameters menu. TEST the system for normal operation.
A2 CHECK FOR PCM DTCs	
• Review the recorded DTCs from the PCM self-test. • **Are any non-cruise control DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. REPAIR all PCM DTCs and RETEST the cruise control. **No** GO to A3 .
A3 CHECK FOR ABS DTCs	
• Review the recorded DTCs from the ABS self-test. • **Are any DTCs recorded?**	**Yes** REFER to the Section 206-09 . REPAIR all ABS DTCs and RETEST the cruise control system for normal operation.

	No GO to A4 .
A4 CHECK THE VEHICLE SPEED	
• Check for correct operation of the speedometer. • **Does the speedometer operate correctly?**	**Yes** For 3.5L engines, GO to A6 . Otherwise, GO to A5 . **No** REFER to the Section 413-01 to diagnose the speedometer.
A5 CHECK THE STOPLAMP SWITCH (BOO1 AND BOO2) PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PIDs BOO1 (brake pedal top travel) and BOO2 (brake pedal bottom travel) while applying and releasing the brake pedal as follows: • **Do the PID values agree with the brake pedal positions?**	**Yes** If equipped with an automatic transaxle, GO to A9 . If equipped with a manual transaxle, GO to A7 . **No** GO to Pinpoint Test B .
A6 CHECK THE STOPLAMP SWITCH (BOO AND BPA) PIDs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PIDs BOO (brake pedal top travel) and BPA (brake pedal bottom travel) while applying and releasing the brake pedal as follows:	**Yes** GO to A8 . **No** GO to Pinpoint Test B .

Brake Pedal Position	BOO1 PID	BOO2 PID
Released	Off	Off
Applied firmly	On	On

Brake Pedal Position	BOO PID	BPA PID
Released	Off	Off
Applied firmly	On	On

• **Do the PID values agree with the brake pedal positions?**	
A7 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH (CPP_TOP) PID	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID (CPP_TOP) while pressing and releasing the clutch pedal. • **Does the PID value read NO with the clutch pedal released and YES with the clutch pedal applied?**	**Yes** GO to A10 . **No** GO to A11 .
A8 MONITOR THE TCM TR PID	
• Enter the following diagnostic mode on the scan tool: TCM DataLogger. • Monitor the TCM PID (TR). • Select DRIVE. • **Does the PID value agree with the TR selector lever position?**	**Yes** GO to A10 . **No** REFER to Section 307-01A to continue diagnosis of the digital TR sensor.
A9 MONITOR THE PCM TR PID	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PID (TR). • Select DRIVE. • **Does the PID value agree with the TR selector lever position?**	**Yes** GO to A10 . **No** REFER to Section 307-01B or Section 307-01C to continue diagnosis of the digital TR sensor.
A10 CHECK THE CRUISE CONTROL SWITCH	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Press each cruise control switch while monitoring the cruise control switch PID (SCCS).	**Yes** GO to A13 . **No** If only one switch does not display the correct PID value, INSTALL a new cruise control switch. REFER to Cruise Control Switch in this section. TEST the system for normal operation. Otherwise, GO to Pinpoint Test C .

Cruise Control Switch	SCCS PID Value
-	NONE Pressed
RESUME (non-hybrid)	RESUME
RSM (hybrid)	RESUME
CNCL RSM (late build)	RESUME
OFF	Off
ON	On
ON OFF (late build)	On/Off
SET +	SET/+
SET -	SET/-

• **Does the PID value agree with thewitch position?**	
A11 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Clutch Pedal Cruise Control Deactivator Switch C2070. • Disconnect: Negative Battery Cable. • Measure the resistance between the clutch pedal cruise control deactivator switch C2070-5, circuit GD120 (BK/GN), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A12 . **No** REPAIR the circuit. TEST the system for normal operation.
A12 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH CIRCUIT FOR AN OPEN	
• Disconnect: PCM C175t. • Measure the resistance between the PCM C175t-27, circuit CE904 (GN/VT), harness side and the clutch pedal cruise control deactivator switch C2070-4, circuit CE904 (GN/VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new clutch pedal cruise control deactivator switch. REFER to Cruise Control Deactivator Switch in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
A13 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No**

• Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC P0572, P0573 Or P1703

Refer to Wiring Diagrams Cell 31 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Speed Control for schematic and connector information.

Normal Operation

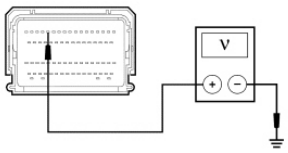
When the brake pedal is applied, the normally open stoplamp switch closes and sends a voltage to the PCM disengaging the cruise control.

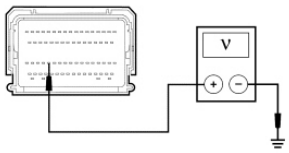
The normally closed cruise control deactivator switch (part of the stoplamp switch), opens and removes the voltage signal to the PCM when the brake pedal is applied firmly. This is a redundant cruise control deactivation signal to the PCM.

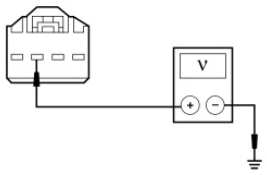
- DTC P0572 (Brake Switch A Circuit Low) - sets when the PCM senses a short to ground in the stoplamp switch circuits.
- DTC P0573 (Brake Switch A Circuit High) - sets when the PCM senses a open or a short to voltage in the stoplamp switch circuits.
- DTC P1703 (Brake Switch Out Of Self Test Range) - sets when there is an open or short in the deactivator switch circuits or when there is an open or short in the stoplamp circuits when the PCM self test is carried out.

This pinpoint test is intended to diagnose the following:

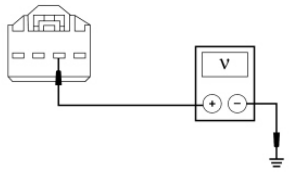
- Wiring, terminals or connectors

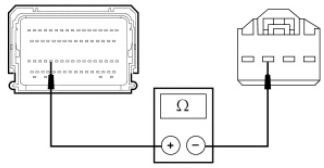


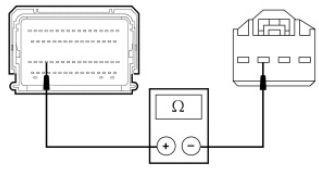




- ABS module
- PCM







PINPOINT TEST B: DTC P0572, P0573 OR P1703

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CHECK THE OPERATION OF THE STOPLAMPS	
• Ignition ON. • Operate the stoplamps. • **Do the stoplamps operate correctly?**	**Yes** GO to B2 . **No** REFER to Section 417-01 to continue diagnosis of the stoplamps.
B2 CHECK FOR ABS DTCs	
	Yes

• Review the recorded DTCs from the ABS self-test. • **Are any DTCs recorded?**	REFER to Section 206-09 . REPAIR all ABS module DTCs and RETEST the cruise control. **No** For 3.5L engines, GO to B3 . Otherwise, GO to B4 .
B3 CHECK THE STOPLAMP SWITCH (BOO AND BPA) PIDs	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PIDs BOO (brake pedal top travel) and BPA (brake pedal bottom travel) while applying and releasing the brake pedal as follows: **Brake Pedal Position** / **BOO PID** / **BPA PID** Released / Off / Off Applied firmly / On / On • **Do the PID values agree with the brake pedal position?**	**Yes** GO to B9 . **No** For an incorrect BOO1 PID value, GO to B5 . If the BOO2 PID value reads On, GO to B7 . If the BOO2 PID value reads OFF, GO to B6 .
B4 CHECK THE STOPLAMP SWITCH (BOO1 AND BOO2) PIDs	
• Enter the following diagnostic mode on the scan tool: PCM DataLogger. • Monitor the PCM PIDs BOO1 (brake pedal top travel) and BOO2 (brake pedal bottom travel) while applying and releasing the brake pedal as follows: **Brake Pedal Position** / **BOO1 PID** / **BOO2 PID** Released / Off / Off Applied firmly / On / On • **Do the PID values agree with the brake pedal position?**	**Yes** GO to B9 . **No** For an incorrect BOO1 PID value, GO to B5 . If the BOO2 PID value reads On, GO to B7 . If the BOO2 PID value reads OFF, GO to B6 .
B5 CHECK THE STOPLAMP SWITCH CIRCUIT FOR VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175b. • Ignition ON. • For vehicles with 2.5L and 3.0L engines, while applying the brake pedal, measure the voltage between the PCM C175b-13, circuit CCB08 (VT/WH), harness side and	**Yes** GO to B9 . **No** REPAIR the circuit for an open. CLEAR the DTCs. TEST the system for normal operations.

ground.  N0077669 • For vehicles with 3.5L engines, while applying the brake pedal, measure the voltage between the PCM C175b-46, circuit CCB08 (VT/WH), harness side and ground.  N0038827 • **Is the voltage greater than 10 volts with the brake pedal applied and 0 volts with the brake pedal released?**	
B6 CHECK THE CRUISE CONTROL DEACTIVATOR SWITCH CIRCUIT FOR A SHORT TO VOLTAGE	
• Disconnect: Stoplamp Switch C278. • Measure the voltage between the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side and ground.  N0094436 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operations. **No** INSTALL a new stoplamp switch. REFER to Section 417-01 . CLEAR the DTCs. TEST the system for normal operations.
B7 CHECK THE CRUISE CONTROL DEACTIVATOR SWITCH VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Disconnect: Stoplamp Switch C278. • Measure the voltage between the stoplamp switch C278-2, circuit CBK02 (GN), harness side and ground.	**Yes** GO to B8 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operations.

 N0038829 • **Is the voltage greater than 10 volts?**	
B8 CHECK THE CRUISE CONTROL DEACTIVATOR SWITCH CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: PCM C175b. • For vehicles with 2.5L and 3.0L engines, measure the resistance between the PCM C175b-46, circuit CES09 (VT/OG), harness side and the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side.  N0085686 • For vehicles with 3.5L engines, measure the resistance between the PCM C175b-47, circuit CES09 (VT/OG), harness side and the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side.  N0038831 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new stoplamp switch. REFER to Section 417-01 . CLEAR the DTCs. TEST the system for normal operations. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operations.
B9 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Cruise Control Switches Do Not Operate Correctly

Refer to Wiring Diagrams Cell 31 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Speed Control for schematic and connector information.

Normal Operation

Voltage is sent from the PCM to the cruise control switches. When a switch is pressed, the voltage is routed through a specific resistor value for each function and the PCM grounds the reference voltage. The PCM uses this reference voltage to determine which cruise control input function has been selected.

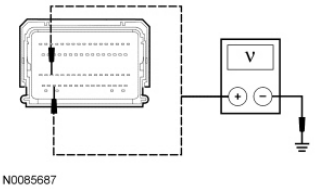
- DTC P0579 (Cruise Control Multifunction Input A Circuit Range/Performance) - sets when the cruise control switch circuits are open, shorted to voltage or ground.
- DTC P0581 (Cruise Control Multi-Function Input A Circuit High) - sets when the cruise control switch circuits are open or shorted to voltage.

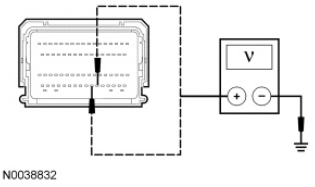
This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Cruise control switches
- PCM

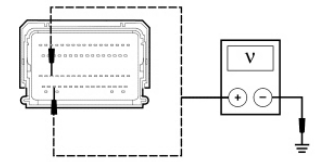
&;

PINPOINT TEST C: THE CRUISE CONTROL SWITCHES DO NOT OPERATE CORRECTLY





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**



<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>C1 CHECK THE CRUISE CONTROL SWITCH</td><td></td></tr>
<tr><td>• Enter the following diagnostic mode on the scan tool: PCM DataLogger.
• Press each cruise control switch while monitoring the cruise control switch PID (SCCS).

<table><tr><th>Cruise Control Switch</th><th>SCCS PID Value</th></tr><tr><td>-</td><td>NONE Pressed</td></tr><tr><td>RESUME (non-hybrid)</td><td>RESUME</td></tr><tr><td>RSM (hybrid)</td><td>RESUME</td></tr><tr><td>CNCL RSM (late build)</td><td>RESUME</td></tr><tr><td>OFF</td><td>Off</td></tr><tr><td>ON</td><td>On</td></tr><tr><td>ON OFF (late build)</td><td>On/Off</td></tr><tr><td>SET +</td><td>SET/+</td></tr><tr><td>SET -</td><td>SET/-</td></tr></table></td><td>Yes

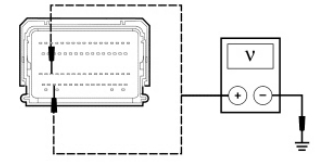
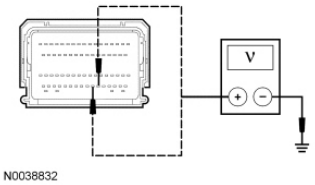
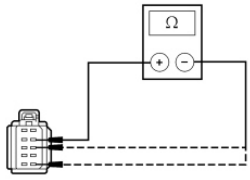
• **Does the PID value agree with the switch position?**	
C2 CHECK THE CRUISE CONTROL SWITCH CIRCUITRY FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: PCM C175b. • Ignition ON. • Turn the parking lamps on. • For vehicles with 2.5L and 3.0L engines, measure the voltage between the PCM C175b-64, circuit VES10 (WH), harness side and ground; and between the PCM C175b-48, circuit RES08 (GN/BN), harness side and ground.  N0085687 • For vehicles with 3.5L engines, measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.  N0038832 • **Is any voltage present?**	**Yes** TURN the parking lamps off. GO to C3 . **No** TURN the parking lamps off. GO to C6 .
C3 CHECK THE CRUISE CONTROL SWITCH CIRCUITRY FOR A SHORT TO VOLTAGE WITH THE CLOCKSPRING DISCONNECTED	
• Ignition OFF. • Disconnect: Clockspring C218a. • Ignition ON. • For vehicles with 2.5L and 3.0L engines, measure the voltage between the PCM C175b-64, circuit VES10 (WH), harness side and ground; and between the PCM C175b-48, circuit RES08 (GN/BN), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation. **No** GO to C4 .

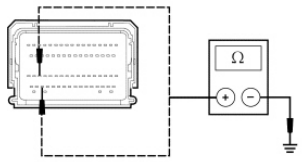


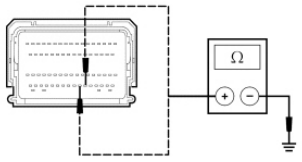
N0085687

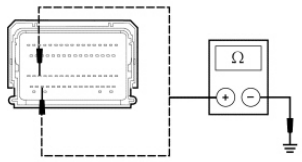


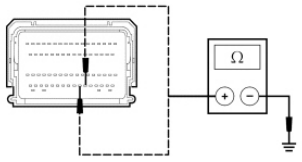


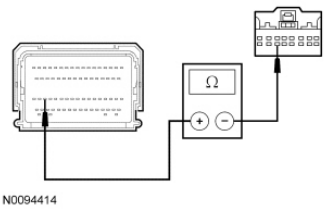
- For vehicles with 3.5L engines, measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.

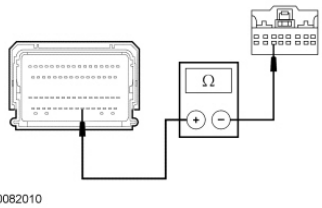


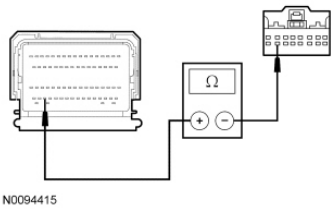




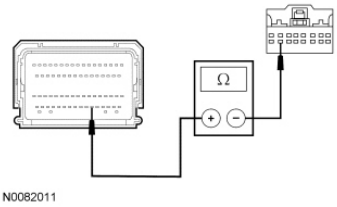


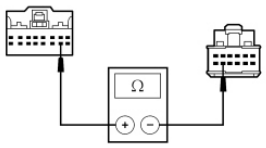


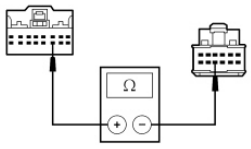




N0038832







- **Is any voltage present?**

C4 CHECK THE CLOCKSPRING FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Connect: Clockspring C218a. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring Connector C218b. • Connect the battery. • Ignition ON. • Turn the parking lamps on. • For vehicles with 2.5L and 3.0L engines, measure the voltage between the PCM C175b-64, circuit VES10 (WH), harness side and ground; and between the PCM C175b-48, circuit RES08 (GN/BN), harness side and ground.  N0085687 • For vehicles with 3.5L engines, measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.	**Yes** INSTALL a new clockspring. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. TEST the system for normal operation. **No** GO to C5 .

 N0038832 • **Is any voltage present?**	
C5 CHECK THE STEERING WHEEL CRUISE CONTROL SWITCH CIRCUITS FOR A SHORT TO THE STEERING WHEEL ILLUMINATION CIRCUIT	
• Measure the resistance between the steering wheel cruise control switch C2998-2, circuit VLN04 (VT/GY), harness side and the steering wheel cruise control switch C2998-3, circuit RES08 (GN/BN), harness side; and between the steering wheel cruise control switch C2998-2, circuit VLN04 (VT/GY), harness side and the steering wheel cruise control switch C2998-5, circuit VES10 (WH), harness side.  N0094413 • **Are the resistances greater than 10,000?**	**Yes** INSTALL a new cruise control switch. REFER to Cruise Control Switch in this section. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. TEST the system for normal operation. **No** INSTALL a new steering wheel. REFER to Section 211-04 . CLEAR the DTCs. TEST the system for normal operation.
C6 CHECK THE CRUISE CONTROL SWITCH CIRCUITRY FOR A SHORT TO GROUND	
• Ignition OFF. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring Connector C218b. • For vehicles with 2.5L and 3.0L engines, measure the resistance between the PCM C175b-64, circuit VES10 (WH), harness side and ground; and between the PCM C175b-48, circuit RES08 (GN/BN), harness side and ground.	**Yes** GO to C8 . **No** GO to C7 .

 N0085688 • For vehicles with 3.5L engines, measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.  N0038833 • **Are the resistances greater than 10,000 ohms?**	
C7 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND	
• Disconnect: Clockspring C218a. • For vehicles with 2.5L and 3.0L engines, measure the resistance between the PCM C175b-64, circuit VES10 (WH), harness side and ground; and between the PCM C175b-48, circuit RES08 (GN/BN), harness side and ground.  N0085688 • For vehicles with 3.5L engines, measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.  N0038833 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new clockspring. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. TEST the system for normal operation. **No** GO to C10 .

C8 CHECK THE CRUISE CONTROL SWITCH CIRCUITRY FOR AN OPEN	
• Disconnect: Clockspring C218a. • For vehicles with 2.5L and 3.0L engines, measure the resistance between the PCM C175b-48, circuit RES08 (GN/BN), harness side and the clockspring C218a-14, circuit RES08 (GN/BN), harness side.  N0094414 • For vehicles with 3.5L engines, measure the resistance between the PCM C175b-57, circuit RES08 (GN/BN), harness side and the clockspring C218a-14, circuit RES08 (GN/BN), harness side.  N0082010 • For vehicles with 2.5L and 3.0L engines, measure the resistance between the PCM C175b-64, circuit VES10 (WH), harness side and the clockspring C218a-15, circuit VES10 (WH), harness side.  N0094415 • For vehicles with 3.5L engines, measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the clockspring C218a-15, circuit VES10 (WH), harness side.	**Yes** GO to C9 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

 N0082011 • **Are the resistances less than 5 ohms?**	
C9 CHECK THE CLOCKSPRING FOR AN OPEN	
• Disconnect: Clockspring C218b. • ⚠ **WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.** • Remove the driver air bag module. Refer to Section 501-20B . • Measure the resistance between the clockspring C218a pin 15, component side and the upper clockspring C218b pin 8, component side.  N0094416 • Measure the resistance between the clockspring C218a pin 14, component side and the upper clockspring C218b pin 9, component side.  N0094417 • **Are the resistances less than 5 ohms?**	**Yes** GO to C10 . **No** INSTALL a new clockspring. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. TEST the system for normal operation.
C10 CHECK THE CIRCUITS TO THE STEERING WHEEL CRUSIE CONTROL SWITCH CIRCUITRY FOR AN OPEN OR SHORT TO GROUND	
NOTE: Circuit RES08 (GN/BN) does not need to be checked for a short to ground. • Ignition OFF. • Measure the resistance between the clockspring, harness side and the steering wheel controls, harness side; and between the clockspring, harness side and ground as follows:	**Yes** INSTALL a new cruise control switch. REFER to Cruise Control Switch in this section. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. TEST the system for normal

	operation. **No** INSTALL a new steering wheel. REFER to Section 211-04 . CLEAR the DTCs. TEST the system for normal operation.

Inoperative Switch	Positive Meter Lead	Negative Meter Lead	Circuit
Cruise control switch	C218b-8 C218b-9	C2998-5, then ground C2998-3	VES10 (WH) RES08 (GN/BN)

N0094361

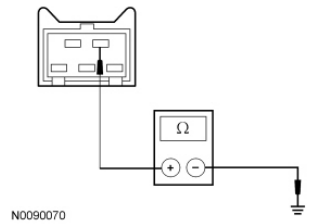
- **Is the resistance less than 5 ohms between the clockspring and the steering wheel controls, and greater than 10,000 ohms between the clockspring and ground?**

C11 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . INSTALL the driver air bag module. REFER to Section 501-20B . TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. INSTALL the driver air bag module. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Cruise Control Does Not Disengage When The Clutch Is Applied

Refer to Wiring Diagrams Cell 31 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Speed Control for schematic and connector information.

Normal Operation

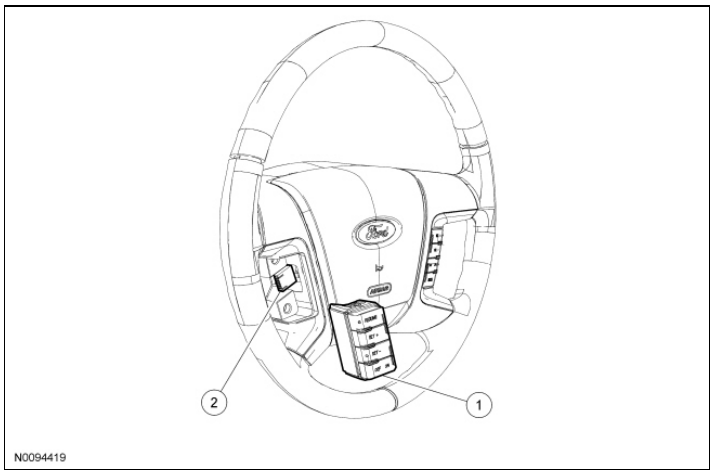


Vehicles equipped with a manual transaxle have an additional clutch pedal cruise control deactivator switch. The PCM receives a ground signal through the normally closed clutch pedal cruise control deactivator switch. When the clutch pedal is applied, the clutch pedal cruise control deactivator switch opens and removes the ground signal to the PCM disengaging the cruise control.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clutch pedal cruise control deactivator switch
- PCM

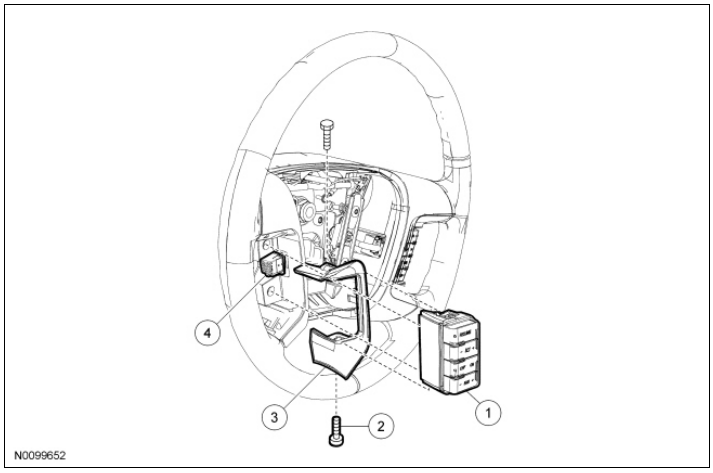
PINPOINT TEST D: THE CRUISE CONTROL DOES NOT DISENGAGE WHEN THE CLUTCH IS APPLIED



NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
D1 CHECK THE CPP SWITCH (CPP_TOP) PID	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: PCM DataLogger. • While applying and releasing the clutch pedal monitor the PCM PID (CPP_TOP). • **Does the PID value read NO with the clutch pedal released and YES with the clutch pedal applied?**	**Yes** GO to D4 . **No** GO to D2 .
D2 CHECK THE CLUTCH PEDAL CRUISE CONTROL DEACTIVATOR SWITCH GROUND CIRCUIT FOR A SHORT TO GROUND	
• Disconnect: Clutch Pedal Cruise Control Deactivator Switch C2070. • Disconnect: PCM C175b. • Measure the resistance between the clutch pedal cruise control deactivator switch C2070-4, circuit CE904 (GN/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new clutch pedal cruise control deactivator switch. REFER to Cruise Control Deactivator Switch in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
D3 CHECK FOR CORRECT PCM OPERATION	
• Disconnect all the PCM connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins	**Yes** INSTALL a new PCM. REFER to Section 303-14A , Section 303-14B or Section 303-14C . TEST the system for normal operation.

• Connect all the PCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.



Cruise Control Switch

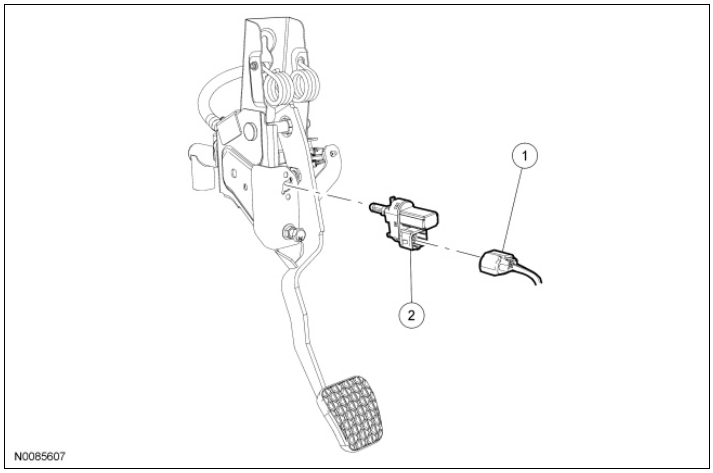
Without Bezel

Item	Part Number	Description
1	9C888	Cruise control switch
2	-	Cruise control switch electrical connector (part of 14672)

With Bezel

Item	Part Number	Description
1	9C888	Cruise control switch
2	-	Steering wheel controls bezel screws (2 required)
3	3D758	Steering wheel controls bezel
4	-	Cruise control switch electrical connector (part of 14672)

Removal and Installation



1. Remove the center steering wheel bezel. For additional information, refer to Section 211-04 .

2. Remove the cruise control switch and bezel by prying the switch with a suitable tool, such as a flat bladed screw driver, toward the rear of the vehicle.
    - Disconnect the electrical connector.

3. Remove the screws and the steering wheel controls bezel, if equipped.

4. To install, reverse the removal procedure.

Cruise Control Deactivator Switch

Item	Part Number	Description
1	-	Cruise control deactivator switch electrical connector (part of 14290 harness)
2	7C534	Cruise control deactivator switch

Removal and Installation

1. Disconnect the electrical connector.
2. Rotate the cruise control deactivator switch counterclockwise one-quarter turn.
3. Remove the cruise control deactivator switch.
4. **NOTE:** When installing the cruise control deactivator switch, it is automatically self-adjusting to the correct position. Do not pull up or push down on the pedal during installation. Initial installation of the cruise control deactivator switch allows for one adjustment. If additional adjustments are necessary, install a new switch.

   To install, reverse the removal procedure.

Blind Spot Monitoring

NOTE: The Blind Spot Information System (BLISTM) and Cross Traffic Alert (CTA) system share the same exterior mirror LEDs, Side Obstacle Detection Control Module - Left (SOD-L) and Side Obstacle Detection Control Module - Right (SOD-R) for system components.

BLISTM consists of:

- SOD-L (located at the lower LH rear quarter panel behind the rear bumper cover)
- SOD-R (located at the lower RH rear quarter panel behind the rear bumper cover)
- BLISTM customer ON/OFF feature (integral to the Instrument Panel Cluster (IPC) message center)
- Exterior mirror BLISTM / CTA LEDs (integral to the left and right exterior mirrors)

BLISTM is a vehicle feature that aids the driver in assessing whether another vehicle is within an area to either side of the vehicle extending rearward to approximately 3 m (10 ft) beyond the rear bumper. This area is known as the blind zone. The BLISTM alerts the driver to the presence of vehicles in the blind zone while driving on roads and freeways. The system is not designed to prevent contact with other vehicles or objects. BLISTM is designed to provide a warning to assist the driver in detecting vehicles in the blind zone.

Cross Traffic Alert (CTA)

NOTE: The BLISTM and CTA system share the same exterior mirror LEDs, SOD-L and SOD-R for system components.

The CTA system consists of:

- SOD-L (located at the lower LH rear quarter panel behind the rear bumper cover)
- SOD-R (located at the lower RH rear quarter pa behind the rear bumper cover)
- **NOTE:** CTA customer ON/OFF feature is not available on early build hybrid vehicles.

  CTA customer ON/OFF feature (integral to the IPC message center)
- Exterior mirror BLISTM / CTA LEDs (integral to the left and right exterior mirrors)

The CTA system assists the driver in backing out of a parking space. The CTA system uses the SOD-L , SOD-R , exterior mirror BLISTM / CTA LEDs, a warning chime from the parking aid speaker and a message in the IPC message center to notify the driver of impending traffic.

When the vehicle is in REVERSE (R) the CTA system can detect a vehicle that is approaching at a speed up to 24 km/h (15 mph) and is approximately 13.7 m (45 ft) from the side of the vehicle on the left or right side. The CTA system's response time and performance can degrade if vehicles are approaching at speeds greater than 24 km/h (15 mph).

Blind Spot Monitoring

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: If the vehicle is towing a trailer, the Blind Spot Information System (BLISTM) or Cross Traffic Alert (CTA) system might detect the trailer, causing a false alert.

NOTE: The BLISTM and CTA system both utilize the Side Obstacle Detection Control Module - Left (SOD-L), Side Obstacle Detection Control Module - Right (SOD-R) and the exterior mirror BLISTM / CTA LEDs.

The SOD-L and SOD-R run a self diagnostic check on each vehicle start cycle and illuminate the exterior mirror BLISTM / CTA amber LED for approximately 3 seconds indicating that the BLISTM and CTA system is operational. For BLISTM , the exterior mirror BLISTM / CTA LED is at 95 percent illumination to be seen clearly during the day and is dimmed down to 10 percent at night. For the CTA system, the exterior mirror BLISTM / CTA LED is always at 85 percent illumination.

Blind Spot Information System (BLISTM)

When the vehicle is started, both exterior mirror BLISTM / CTA amber LEDs briefly illuminate to indicate that the system is operating. If a BLISTM fault is present, the LEDs remain illuminated and a message in the message center displays BLIND SPOT SYSTEM FAULT. System faults car that cause the associated left or right exterior mirror BLISTM / CTA amber LED not to illuminate; only the message center message fault is displayed.

BLISTM becomes active the first time the transaxle is placed in DRIVE (D) after starting the engine and driving forward at a vehicle speed greater than 5 km/h (3 mph). Upon that initial sequence, BLISTM remains active for all speeds including 0 km/h (0 mph). BLISTM is also active if the transaxle is placed in NEUTRAL (N). If the transaxle is selected out of DRIVE (D) or NEUTRAL (N) the system has entered the CTA mode. When the transaxle is shifted back into DRIVE (D), BLISTM is activated once the vehicle is driven above 5 km/h (3 mph).

NOTE: BLISTM does not normally detect parked vehicles, pedestrians or objects such as fences, rails, trees, etc. BLISTM does not provide any additional warning when the turn signal is activated.

BLISTM can trigger an alert for vehicles that enter the blind zone from the rear or merge into the blind zone from the side. The exterior mirror BLISTM / CTA amber LED illuminates in the right and/or left exterior mirror. For vehicles that are being passed or vehicles that enter the blind zone from the front, the system can trigger an alert only after the vehicle is present in the blind zone for more than 2 seconds. For vehicles that pass through the blind zone quickly, typically less than 2 seconds, BLISTM cannot trigger an alert.

BLISTM utilizes 2 modules that have integral radar sensors located rearward of the rear wheel under the rear bumper cover. The 2 modules, SOD-L and SOD-R , are hardwired to the exterior mirrors to illuminate the LEDs. For correct operation of BLISTM , the rear side bumper cover should be free of obstructions such as a large build up of mud, snow or ice. Small build up of debris and materials does not hinder the operation of the system. There should be no bumper stickers of any type placed in this area of the bumper cover.

Due to the nature of radar technology, false alerts and missed targets may occur under certain circumstances. False alerts are when the LED illuminates with no target present. False alerts up to 3% (3 out of 100 targets) is normal operation. Circumstances that cause false alerts are freeway divider, concrete walls, cyclone fencing, sharp turns around a pole or building and coming to a stop with a vehicle directly behind and very close. False alerts are temporary and self-correct.

Missed targets are when a target is present and the LED does not illuminate. Missed targets up to 1% (1 out of 100 targets) is normal operation. Circumstances that cause missed targets are:

- Debris build up on the rear quarter panel fascias
- Certain maneuvering of vehicles entering and exiting the blind zone
- Vehicles passing through the blind zone at very fast rates
- Severe weather conditions
- When several vehicles forming a convoy pass through the blind zone

The exterior mirror indicators may not operate correctly when the vehicle accelerates from a standing-start with a vehicle alongside.

BLISTM can be turned off by selecting the blind spot ON/OFF function in the message center. BLISTM is turned off in the IPC by selecting the blind spot system with the SETUP switch for the message center and selecting the system on or off with the RESET switch. The message BLIND SPOT SYS OFF is displayed in the message center. When turning BLISTM from on to off or off to on, the exterior mirror BLISTM / CTA amber LEDs flash twice. When BLISTM is off, the driver cannot receive any alerts. The system is reactivated on the next ignition cycle.

BLISTM can be disabled permanently (even after an ignition cycle) by using a scan tool. When using the scan tool disable function in the programmable parameters menu, BLISTM remains disabled until it is reactivated using the scan tool. When the system is disabled the message center displays BLIND SPOT DISABLED. A system fault occurs if BLISTM is not disabled in both the SOD-L and the SOD-R .

There are some system faults that can set DTCs which are logged in the SOD-L or SOD-R . These DTCs can set a message in the message center that displays BLIND SPOT SYSTEM FAULT. There are also symptom based faults that do not set a DTC. GO to Symptom Chart .

Cross Traffic Alert (CTA) System

NOTE: The BLISTM and CTA system both utilize the SOD-L SOD-R and the exterior mirror BLISTM / CTA LEDs.

NOTE: The CTA system faults may not occur until the transaxle is placed in REVERSE (R).

The CTA system is an alert feature that assists the driver in backing out of a front-in parking space. When the transaxle is in REVERSE (R) the CTA system is active. The driver is warned of an approaching vehicle when an audio alert chime from the parking aid speaker sounds, the right or left exterior mirror BLISTM / CTA amber LED flashes, and the message center displays VEHICLE COMING FROM RIGHT or VEHICLE COMING FROM LEFT to warn the driver from which direction vehicles are approaching.

The CTA system detects vehicle approaching up to 14 m (45 ft) away (approximately the width of 5 parking spaces). Backing out of parking spots slowly increases the radar sensor coverage in close proximity situations. The CTA system coverage also decreases when parking at shallow angles, which is described in the Owner's Literature.

The CTA system utilizes the same SOD-L and SOD-R as BLISTM .

The CTA system cannot normally detect stationary vehicles, humans, animals or objects such as fences, guard rails or trees. The system does not function when the transaxle is not in REVERSE (R).

The CTA system has detection limitations due to the nature of the radar technology for the SOD-L and SOD-R . There can be certain instances where vehicles entering and exiting the blind spot zone may not be detected. The circumstances that may cause non-detection are:

- Debris build up on the rear quarter panel fascias
- The rear quarter panel of the vehicle is obstructed or partially obstructed by an adjacently parked vehicle or object
- Approaching vehicle passing at speeds greater than 24 km/h (15 mph)
- Severe weather conditions
- Driving in reverse (R) faster than 5 km/h (3 mph)
- Backing out of an angled parking spot

Due to the nature of radar technology, there may be certain instances when the CTA system alerts the operator, however no objects or vehicles are present when backing up. This is known as a false alert. False alert rate of up to 5% (5 times out of 100 reversals) is normal. Circumstances that may cause a false alert when backing up are backing out of a garage, backing into a parking space and objects or vehicles that are very close to the radar sensors. False alerts are temporary and self-correct.

NOTE: The CTA system customer ON/OFF feature is not available on early build hybrid vehicles.

The CTA system can be turned off by selecting the CTA system ON/OFF function in the message center. The CTA system is turned off in the message center by selecting the CTA system with the SETUP switch for the message center and selecting the system on or off with the RESET switch. The message CTA SYSTEM OFF is displayed in the message center. The CTA system cannot be deactivated in the message center when the transaxle is in REVERSE (R). The system is reactivated on the next ignition cycle.

The CTA system can be disabled permanently (even after an ignition cycle) by using a scan tool. When using the scan tool disable function in the programmable parameters menu, the CTA system remains disabled until it is reactivated using the scan tool. When the system is disabled the message center displays CTA DISABLED. A system fault occurs if the CTA system is not disabled in both the SOD-L and the SOD-R .

There are some system faults that set DTCs which are logged in the SOD-L or SOD-R . These DTCs that are logged can set a message in the message center that displays CTA SYSTEM FAULT. There are also some symptom based faults that do not set a DTC. GO to Symptom Chart .

Blocked Sensor

NOTE: The CTA system faults may not occur until the transaxle is placed in REVERSE (R).

An excessive build up of materials on the left and/or right rear quarter panel fascias, such as mud or snow, can cause the BLISTM or CTA system functionality to degrade. Heavy rain can have the same effect. If the system is in a blocked state, the radar misses targets, but still counts them.

After approximately 4 counted/missed targets, the system sends a blocked sensor message over the Medium Speed Controller Area Network (MS-CAN) to the . The message center displays BLIND SPOT NOT AVAILABLE or CTA NOT AVAILABLE message. The not available message is followed by a BLOCK SENSOR SEE MANUAL message in the message center. If the blocked condition is determined by either system the message center displays BLIND SPOT NOT AVAILABLE or CROSS TRAFFIC NOT AVAILABLE and the appropriate left and/or right exterior mirror BLISTM / CTA LED illuminates.

The message center warning can be cleared by the driver but the exterior mirror BLISTM / CTA LED remains illuminated. Once the blockage is removed, the system requires some drive time and a system detection of at least 2 vehicle objects prior to realizing it is unblocked. The ignition key can also be cycled off to clear the blocked state. However, if the blockage is still present after the key cycle and after some drive time, the system detects again that it is blocked. The blocked message is displayed again in the message center.

Due to the nature of radar technology, it is possible to get a blockage warning and not actually be blocked. This is rare and known as a false blockage warning. A false blocked condition either self-clears or clears after an ignition cycle.

There are several conditions that cause the BLISTM or CTA system to not operate correctly These conditions include:

- Ice, snow or soil adhering to the rear quarter panel surface around the radar sensor.
- Adverse weather conditions such as heavy rain or heavy snow or under conditions where water is sprayed.

The rear quarter panels and rear bumper cover should be cleaned of mud, snow, ice or any obstruction to restore normal operation.

Network Communication

While there are numerous messages internal to the SOD-L and SOD-R , the following messages are utilized by the BLISTM and CTA system.

BLISTM and CTA System Network Communication Messages

NOTE: Both the Medium Speed Controller Area Network (MS-CAN) and the High Speed Controller Area Network (HS-CAN) are used for intermeddle communication. A gateway message is transferred from one network to another network through e IPC . Refer to Section 418-00 for network communication information.

Broadcast Message	Originating Module	Network Type	Receiving Module
Ignition switch position	SJB	MS-CAN	SOD-R and SOD-L
Instrument illumination level	SJB	MS-CAN	SOD-R and SOD-L
Park lamp status	SJB	MS-CAN	SOD-R and SOD-L
Side obstacle detection cross traffic alert	SOD-L	MS-CAN	IPC PAM
Side obstacle detection cross traffic alert	SOD-R	MS-CAN	

			IPC PAM
Side obstacle detection cross traffic status	SOD-L	MS-CAN	IPC
Side obstacle detection cross traffic status	SOD-R	MS-CAN	IPC
Side obstacle detection system status	SOD-L	MS-CAN	IPC
Side obstacle detection system status	SOD-R	MS-CAN	IPC
Side obstacle detection cross traffic command	IPC	MS-CAN	SOD-R and SOD-L
Side obstacle detection enabled status	IPC	MS-CAN	SOD-R and SOD-L
Transmission selector (PRNDL) status	PCM	HS-CAN	IPC
Transmission selector (PRNDL) status (gateway)	IPC	MS-CAN	SOD-R and SOD-L
Vehicle speed	PCM	HS-CAN	IPC
Vehicle speed (gateway)	IPC	MS-CAN	SOD-R and SOD-L

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Rear bumper cover • Lower rear bumper quarter panel splash shield	• Smart Junction Box (SJB) fuse 35 (10A) • Left and right exterior mirrors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).
5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM :

   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM .
   - Refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
    - If the scan tool responds with no communication with the Side Obstacle Detection Control Module - Right (SOD-R), GO to Symptom Chart .
    - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
    - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SOD-R and Side Obstacle Detection Control Module - Left (SOD-L).

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to the Diagnostic Trouble Code (DTC) Chart in Section 419-10 .

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Side Obstacle Detection Control Module - Left (SOD-L) and Side Obstacle Detection Control Module - Right (SOD-R) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
B11D6:11	Driver Display Alert LED: Circuit Short To Ground	GO to Pinpoint Test D .
B11D6:15	Driver Display Alert LED: Circuit Short To Battery Or Open	GO to Pinpoint Test D .
U2100:00	Initial Configuration Not Complete: No Sub Type Information	The Side Obstacle Detection Control Module - Left (SOD-L) or Side Obstacle Detection Control Module - Right (SOD-R) is not configured. REFER to Section 418-01 for Programmable Module Installation (PMI) to configure the SOD-L or SOD-R . CLEAR all DTCs. TEST the system for normal operation.
U0155:00	Lost Comunitcation With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information	GO to Pinpoint Test J .
U0423:00	Invalid Data Received From Instrument Panel Cluster Control Module: No Sub Type Information	DTC U0423:00 is set when the SOD-L or SOD-R receives invalid network data from the IPC . RETRIEVE and REPAIR all non-network DTCs in the IPC . REFER to Section 413-01 .
U3000:44	Control Module: Data Failure	GO to Pinpoint Test H .
U3000:45	Control Module: Program Memory Failure	GO to Pinpoint Test H .
U3000:46	Control Module: Calibration/Parameter Memory Failure	GO to Pinpoint Test H .
U3000:48		GO to Pinpoint Test H .

	Control Module: Supervision Software Failure	
U3000:49	Control Module: Internal Electronic Failure	GO to Pinpoint Test H .
U3000:4A	Control Module: Incorrect Component Installed	GO to Pinpoint Test H .

Instrument Panel Cluster (IPC) DTC Chart

NOTE: This module utilizes a 5-character DTC followed by a 2-character failure-type code. The failure-type code provides information about specific fault conditions such as opens, or shorts to ground. Continuous memory DTCs have an additional 2-character DTC status code suffix to assist in determining DTC history.

DTC	Description	Action
U0232:00	Lost Communication With Side Obstacle Detection Control Module Left: No Sub-Type Information	REFER to Section 413-01 .
U0233:00	Lost Communication With Side Obstacle Detection Control Module Right: No Sub-Type Information	REFER to Section 413-01 .

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: The Blind Spot Information System (BLISTM) Is Inoperative/Does Not Operate Correctly Or Poor Performance And No Message Center Warning Message Or Warning Led Indicators Present

Normal Operation

On each ignition cycle, the Side Obstacle Detection Control Module - Right (SOD-R) and Side Obstacle Detection Control Module - Left (SOD-L) run a self diagnostic check during which the exterior mirror Blind Spot Information System (BLISTM)/Cross Traffic Alert (CTA) LEDs illuminate for 3 seconds then turn off indicating the system is operational. BLISTM is enabled when the ignition switch is in the RUN position and the DRIVE (D) gear is selected.

NOTE: BLISTM is turned off for one key cycle only when using the message center switches. Permanently disabling BLISTM is carried out in the Integrated Diagnostic System (IDS) programmable parameters menu.

The SOD-R and SOD-L receive a drive gear input and a vehicle speed signal message from the Instrument Panel Cluster (IPC) through the Medium Speed Controller Area Network (MS-CAN). For non-hybrid and late build hybrid vehicles, The system can be disabled through the message center which is part of the IPC .

The SOD-L and SOD-R are identical modules except that the SOD-R uses an address ground pin for configuration. The address ground is necessary so that BLISTM can decipher between the SOD-L and SOD-R .

BLISTM can miss vehicles in the blind zone, indicate false alerts and operate poorly due to extreme weather conditions or a build up of debris over the SOD-L and SOD-R .

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- BLISTM is not configured on with the scan tool
- IPC
- SOD-L
- SOD-R
- Vehicle speed signal

PINPOINT TEST A: BLISTM IS INOPERATIVE/DOES NOT OPERATE CORRECTLY OR POOR PERFORMANCE AND NO MESSAGE CENTER WARNING MESSAGE OR WARNING LED INDICATORS PRESENT

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
A1 CARRY OUT THE SOD-L AND SOD-R DIAGNOSTIC SYSTEM CHECK	
• Start the engine. • Observe the left and right exterior mirror BLISTM / CTA LEDs. • **Do the left and right BLISTM / CTA LEDs illuminate and turn off after 3 seconds?**	**Yes** GO to A2 . **No** GO to Pinpoint Test D .
A2 VERIFY BLISTM OPERATION	
• Drive the vehicle and test BLISTM to verify the customer's concern. • **Does BLISTM operate correctly?**	**Yes** The fault may have been caused by an intermittent condition such as poor weather conditions or customer's perception of how BLISTM operates. REFER to Owner's Literature. TEST the system for normal operation. **No** GO to A3 .
A3 CHECK FOR SOD-L AND SOD-R OBSTRUCTIONS	
• Check the lower rear side bumper cover fascia and lower rear bumper cover splash shield for a build up of mud, bumper stickers or any obstruction.	**Yes** CLEAN and REMOVE all obstructions from the lower rear side bumper cover fascia and lower rear bumper cover splash shield. TEST the system for normal operation. **No**

• **Are any obstructions present?**	GO to A4 .
A4 CHECK FOR DAMAGE TO THE LOWER REAR SIDE BUMPER COVER OR THE SOD-L AND SOD-R	
• Check the lower rear side bumper cover fascia, lower rear bumper cover splash shield and the SOD-L and SOD-R mounting bracket for damage. • **Is any damage present?**	**Yes** REPAIR or INSTALL any damaged parts. TEST the system for normal operation. **No** GO to A5 .
A5 VERIFY THE SOD-L AND SOD-R PASS THE NETWORK TEST	
• Enter the following diagnostic mode on the scan tool: Network Test . • Verify that the SOD-L and SOD-R pass the network test. • **Do the SOD-L and SOD-R pass the network test?**	**Yes** GO to A6 . **No** For SOD-L , REFER to Section 418-00 , The SOD-L Does Not Respond To The Scan Tool. For SOD-R , GO to Pinpoint Test E .
A6 VERIFY BLISTM CONFIGURATION	
NOTE: BLISTM must be enabled in both the SOD-L and the SOD-R . • Enter the following diagnostic mode on the scan tool: Programmable Parameters . • Verify that BLISTM is enabled in the SOD-L and SOD-R . • **Is BLISTM enabled?**	**Yes** GO to A7 . **No** ENABLE an title="Blind Spot Information System" class="popup" onmouseover="this.className='popupnounderline';" onmouseout="this.className='popup';">BLISTM in the SOD-L and SOD-R using the scan tool programmable parameters menu. TEST the system for normal operation.
A7 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SOD-L AND SOD-R SELF-TESTS	
• Check the SOD-L and SOD-R DTCs from the continuous and on-demand self-tests. • **Are any SOD-L and SOD-R DTCs recorded?**	Yes REFER to DTC Charts in this section. **No** GO to A8 .
A8 CHECK FOR VEHICLE SPEED SIGNAL DTCs	
• Enter the following diagnostic mode on the scan tool: IPC CMDTCs .	**Yes** REFER to Section 419-10 for a list of all DTCs. **No** For an inoperative SOD-L , GO to A9 .

• Check for correct operation of the speedometer in the IPC . • **Are vehicle speed display faults and DTCs related to vehicle speed present?**	For an inoperative SOD-R , GO to A10 .
A9 CHECK FOR CORRECT SOD-L OPERATION	
• Disconnect the SOD-L connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-L connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-L . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
A10 CHECK FOR CORRECT SOD-R OPERATION	
• Disconnect the SOD-R connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-R connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-R . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: The Cross Traffic Alert (CTA) System Is Inoperative/Does Not Operate Correctly Or Poor Performance And No Warning Led Indicators Present

NOTE: The Cross Traffic Alert (CTA) system customer ON/OFF feature in the Instrument Panel Cluster (IPC) is not available on early build hybrid vehicles.

Normal Operation

On each ignition cycle, the Side Obstacle Detection Control Module - Right (SOD-R) and Side Obstacle Detection Control Module - Left (SOD-L) run a self diagnostic check during which the exterior mirror Blind Spot Information System (BLISTM)/ CTA LEDs illuminate for 3 seconds then turn off indicating the system is operational. The CTA system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. For non-hybrid and late build hybrid vehicles, the system can be turned off through the message center which is part of the IPC .

NOTE: The CTA system is turned off for one key cycle only when using the message center switches. Permanently disabling the CTA system is carried out in the Integrated Diagnostic System (IDS) programmable parameters menu.

The SOD-R and SOD-L receive a reverse gear input and a vehicle speed signal message from the IPC through the Medium Speed Controller Area Network (MS-CAN). The CTA system, SOD-R and SOD-L send a message through the MS-CAN to the Parking Aid Module (PAM) to signal an audible tone to alert the driver.

The SOD-L and SOD-R are identical modules except that the SOD-R uses an address ground pin for configuration. The address ground is necessary so that the CTA system can decipher between the right and the left module.

The CTA system may operate poorly in extreme weather conditions or when a build up of debris over the SOD-L and SOD-R is present.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- CTA system is not configured on with the scan tool
- IPC
- PAM
- SOD-L
- SOD-R
- Vehicle speed signal

PINPOINT TEST B: THE CTA SYSTEM IS INOPERATIVE/DOES NOT OPERATE CORRECTLY OR POOR PERFORMANCE AND NO WARNING LED INDICATORS PRESENT

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
B1 CARRY OUT THE SOD-L AND SOD-R DIAGNOSTIC SYSTEM CHECK	
• Start the engine. • Observe the left and right exterior mirror BLISTM / CTA LEDs. • **Do the left and right BLISTM / CTA LEDs illuminate and turn off after 3 seconds?**	**Yes b> GO to B2 .** **No GO to Pinpoint Test D .**
B2 VERIFY THE CTA SYSTEM OPERATION	
• **NOTE:** The CTA system only operates in reverse (R) while backing out of a front-in parking space. • Test the CTA system to verify the customer's concern. • **Does the CTA system operate correctly?**	**Yes** The fault may have been caused by an intermittent condition such as poor weather conditions or customer's perception of how the CTA system operates. REFER to Owner's Literature. TEST the system for normal operation. **No** GO to B3 .
B3 CHECK FOR SOD-L AND SOD-R OBSTRUCTIONS	
	Yes CLEAN and REMOVE all obstructions from the

• Check the lower rear side bumper cover fascia and lower rear bumper cover splash shield for a build up of mud, bumper stickers or any obstruction. • **Are any obstructions present?**	lower rear side bumper cover fascia and lower rear bumper cover splash shield. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK FOR DAMAGE TO THE LOWER REAR SIDE BUMPER COVER OR THE SOD-L AND SOD-R	
• Check the lower rear side bumper cover fascia, lower rear bumper cover splash shield and the SOD-L and SOD-R mounting bracket for damage. • **Is any damage present?**	**Yes** REPAIR or INSTALL any damaged parts. TEST the system for normal operation. **No** GO to B5 .
B5 VERIFY THE SOD-L AND SOD-R PASS THE NETWORK TEST	
• Enter the following diagnostic mode on the scan tool: Network Test . • Verify that the SOD-L and SOD-R pass the network test. • **Do the SOD-L and SOD-R pass the network test?**	**Yes** GO to B6 . **No** For SOD-L , REFER to Section 418-00 , The SOD-L Does Not Respond To The Scan Tool. For SOD-R , GO to Pinpoint Test E .
B6 VERIFY THE CTA SYSTEM CONFIGURATION	
NOTE: The CTA must be enabled in both the SOD-L and the SOD-R . • Enter the following diagnostic mode on the scan tool: Programmable Parameters . • Verify that the CTA system is enabled in the SOD-L and SOD-R . • **Is the CTA system enabled?**	**Yes** GO to B7 . **No** ENABLE the CTA system in the SOD-L and SOD-R using the scan tool programmable parameters menu. TEST the system for normal operation.
B7 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SOD-L AND SOD-R SELF-TESTS	
• Check the SOD-L and SOD-R DTCs from the continuous and on-demand self-tests. • **Are any SOD-L and SOD-R DTCs recorded?**	**Yes** REFER to DTC Charts in this section. **No** GO to B8 .
B8 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS	
• Check the PAM DTCs from the continuous and on-demand self-tests. • **Are any PAM DTCs recorded?**	**Yes** REFER to Section 413-13 . REPAIR all PAM DTCs and TEST the CTA system for normal operation.

	No GO to B9 .
B9 CHECK FOR VEHICLE SPEED SIGNAL DTCs	
• Enter the following diagnostic mode on the scan tool: IPC CMDTCs . • Check for correct operation of the speedometer in the IPC . • **Are vehicle speed display faults and DTCs related to vehicle speed present?**	**Yes** REFER to Section 419-10 for a list of all DTCs. **No** GO to B10 .
B10 CHECK FOR CORRECT PRNDL DISPLAY OPERATION	
• Enter the following diagnostic mode on the scan tool: IPC CMDTCs . • Check for correct operation of the PRNDL in the IPC . • **Are PRNDL display faults and DTCs related to the PRNDL present?**	**Yes** REFER to Section 413-01 . **No** For an inoperative SOD-L , GO to B11 . For an inoperative SOD-R , GO to B12 .
B11 CHECK FOR CORRECT SOD-L OPERATION	
• Disconnect the SOD-L connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-L connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-L . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
B12 CHECK FOR CORRECT SOD-R OPERATION	
• Disconnect the SOD-R connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-R connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-R . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: The Left Or Right Exterior Mirror Blind Spot Information System (BLISTM)/Cross Traffic Alert (CTA) LED Is Constantly On And A Message In The Instrument Panel Custer (IPC) Message Center Is Present, But No DTCs Are Recorded

Refer to Wiring Diagrams Cell 136 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Emergency Messageing System for schematic and connector information.

NOTE: The Cross Traffic Alert (CTA) system customer ON/OFF feature in the Instrument Panel Cluster (IPC) is not available on early build hybrid vehicles.

Normal Operation

On each ignition cycle, the Side Obstacle Detection Control Module - Right (SOD-R) and Side Obstacle Detection Control Module - Left (SOD-L) run a self diagnostic check during which the exterior mirror Blind Spot Information System (BLISTM)/ CTA LEDs illuminate for 3 seconds then turn off indicating the system is operational. The CTA system is enabled when the ignition switchis in the RUN position and the REVERSE (R) gear is selected. For non-hybrid and late build hybrid vehicles, the system can be turned on and off through the message center, which is part of the IPC .

The SOD-R and SOD-L receive a PRNDL gear input and a vehicle speed signal message from the IPC through the Medium Speed Controller Area Network (MS-CAN). The CTA system, SOD-R and SOD-L send a message through the MS-CAN to the Parking Aid Module (PAM) to signal an audible tone to alert the driver.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- SOD-L
- SOD-R
- Parking Aid Module (PAM)

PINPOINT TEST C: THE LEFT OR RIGHT EXTERIOR MIRROR BLISTM / CTA LED IS CONSTANTLY ON AND A MESSAGE IN THE IPC MESSAGE CENTER IS PRESENT, BUT NO DTCs ARE RECORDED

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
C1 VERIFY THE SOD-L AND SOD-R PASS THE NETWORK TEST	
• Enter the following diagnostic mode on the scan tool: Network Test . • Verify that the SOD-L and SOD-R pass the network test. • **Do the SOD-L and SOD-R pass the network test?**	**Yes** GO to C2 . **No** For SOD-L , REFER to Section 418-00 , The SOD-L Does Not Respond To The Scan Tool. For SOD-R , GO to Pinpoint Test E .
C2 CHECK FOR VEHICLE SPEED SIGNAL DTCs	
• Enter the following diagnostic mode on the scan tool: IPC CMDTCs . • Check for correct operation of the speedometer in the IPC .	**Yes** REFER to Section 419-10 for a list of all DTCs. **No** GO to C3 .

• **Are vehicle speed display faults and DTCs related to vehicle speed present?**	
C3 CHECK FOR PRNDL DTCs	
• Enter the following diagnostic mode on the scan tool: IPC CMDTCs . • Check for correct operation of the PRNDL in the IPC . • **Are PRNDL display faults and DTCs related to the PRNDL present?**	**Yes** REFER to Section 413-01 . **No** For a BLISTM fault, GO to Pinpoint Test A . For a CTA system fault, GO to C4 .
C4 CHECK FOR PAM DTCs	
• Enter the following diagnostic mode on the scan tool: PAM CMDTCs . • Check DTCs in the PAM . • **Are DTCs present?**	**Yes** REFER to Section 413-13 . **No** GO to Pinpoint Test B .

Pinpoint Test D: DTC B11D6:11 Or DTC B11D6:15 (LED MAY ALWAYS BE ON)

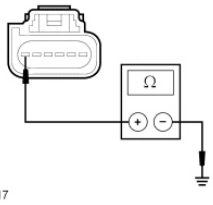
Refer to Wiring Diagrams Cell 136 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Emergency Messaging System for schematic and connector information.

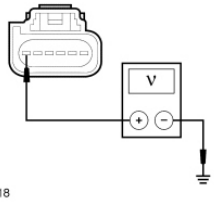
Normal Operation

On each ignition cycle, the Side Obstacle Detection Control Module - Right (SOD-R) and Side Obstacle Detection Control Module - Left (SOD-L) run a self-diagnostic check during which the exterior mirror Blind Spot Information System (BLISTM)/Cross Traffic Alert (CTA) LEDs illuminate for 3 seconds then turn off indicating the system is operational. If a DTC fault is present, a system fault message is displayed in the message center.

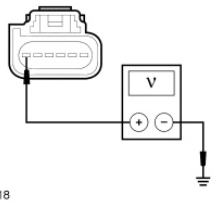
- DTC B11D6:11 (Driver Display Alert LED: Circuit Short To Ground) - sets when the SOD-R or SOD-L detect a short to ground on the exterior mirror BLISTM / CTA LED supply circuit.
- DTC B11D6:15 (Driver Display Alert LED: Circuit Short To Battery or open) - sets when the SOD-R or pan title="Side Obstacle Detection Control Module - Left" class="popup" onmouseover="this.className='popupnounderline';" onmouseout="this.className='popup';">SOD-L detect a short to battery voltage or an open on the exterior mirror BLISTM / CTA LED supply circuit.

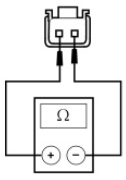
This pinpoint test is intended to diagnose the following:



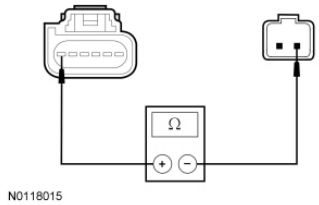


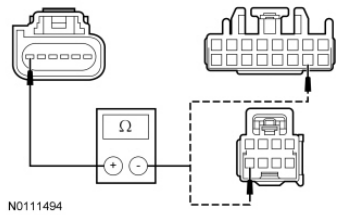
- Wiring, terminals or connectors
- SOD-L
- SOD-R
- Exterior mirror BLISTM / CTA LED



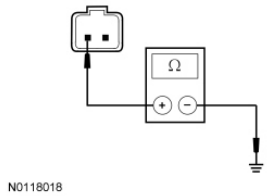


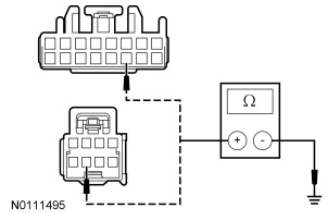
PINPOINT TEST D: DTC B11D6:11 OR DTC B11D6:15 (LED MAY ALWAYS BE ON)





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**





NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
D1 CHECK THE DTCs FROM THE SOD-L AND SOD-R SELF-TESTS	
• For a LH concern, check the SOD-L DTCs from the self-tests. • For a RH concern, check the SOD-R DTCs from the self-tests. • **Are any SOD-L or SOD-R DTCs recorded?**	**Yes** For DTC B11D6:11, GO to D2 . For DTC B11D6:15, GO to D5 . For all other DTCs, REFER to DTC Charts in this section. **No** GO to D6 .
D2 CHECK THE EXTERIOR MIRROR BLISTM / CTA LED FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Left Exterior Mirror BLISTM / CTA LED C576 (LH concern) . • Disconnect: Right Exterior Mirror BLISTM / CTA LED C676 (RH concern) . Ignition ON. • **NOTE:** It is normal for DTC B11D6:15 to set when carrying out this step. It can be ignored. • For a LH concern, clear the SOD-L DTCs. Repeat the self-test. • For a RH concern, clear the SOD-R DTCs. Repeat the self-test. • **Is DTC B11D6:11 retrieved?**	**Yes** GO to D3 . **No** INSTALL a new exterior mirror glass for the one in question. REFER to Section 501-09 . CLEAR any DTCs. TEST the system for normal operation.
D3 CHECK THE EXTERIOR MIRROR FOR A SHORT TO GROUND	
• Ignition OFF. • Disconnect: Left Exterior Mirror C517 or C522 (LH concern) . • Disconnect: Right Exterior Mirror C625 or C626 (RH concern) . • Ignition ON. • **NOTE:** It is normal for DTC B11D6:15 to set when carrying out this step. It can be ignored. • For a LH concern, clear the SOD-L DTCs. Repeat the self-test. • For a RH concern, clear the SOD-R DTCs. Repeat the self-test. • **Is DTC B11D6:11 retrieved?**	**Yes** GO to D4 . **No** INSTALL a new exterior mirror for the one in question. REFER to Section 501-09 . CLEAR any DTCs. TEST the system for normal operation.
D4 CHECK THE EXTERIOR MIRROR BLISTM / CTA LED SUPPLY CIRCUIT FOR A SHORT TO GROUND	

• Ignition OFF. • Disconnect: SOD-L C4230 (LH concern) . • Disconnect: SOD-R C4229 (RH concern) . • For a LH concern, measure the resistance between the SOD-L C4230-6, circuit CRB04 (YE/GN), harness side and ground. • For a RH concern, measure the resistance between the SOD-R C4229-6, circuit CRB02 (BU/BN), harness side and ground.  N0099817 • **Is the resistance greater than 10,000 ohms?**	**Yes** For a LH concern, GO to D13 . For a RH concern, GO to D14 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
D5 CARRY OUT THE SOD-L AND SOD-R DIAGNOSTIC SYSTEM CHECK	
• Start the engine. • Observe the left and right exterior mirror BLISTM / CTA LEDs. • **After 5 seconds does the LED in question remain illuminated?**	**Yes** GO to D6 . **No** GO to D8 .
D6 CHECK THE EXTERIOR MIRROR BLITM / CTA LED SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE	
• Ignition OFF. • Disconnect: SOD-L C4230 (LH concern) . • Disconnect: SOD-R C4229 (RH concern) . • Ignition ON. • For a LH concern, measure the voltage between the SOD-L C4230-6, circuit CRB04 (YE/GN), harness side and ground. • For a RH concern, measure the voltage between the SOD-R C4229-6, circuit CRB02 (BU/BN), harness side and ground.  N0099818 • **Is any voltage present?**	**Yes** GO to D7 . **No** For a LH concern, GO to D13 . For a RH concern, GO to D14 .
D7 CHECK THE EXTERIOR MIRROR FOR A SHORT TO VOLTAGE	

• Ignition OFF. • Disconnect: Left Exterior Mirror C517 or C522 (LH concern) . • Disconnect: Right Exterior Mirror C625 or C626 (RH concern) . • Ignition ON. • For a LH concern, measure the voltage between the SOD-L C4230-6, circuit CRB04 (YE/GN), harness side and ground. • For a RH concern, measure the voltage between the SOD-R C4229-6, circuit CRB02 (BU/BN), harness side and ground.  N0099818 • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** INSTALL a new exterior mirror for the one in question. REFER to Section 501-09 . CLEAR the DTCs. TEST the system for normal operation.
D8 CHECK THE EXTERIOR MIRROR GLASS BLISTM / CTA LED FOR AN OPEN	
• Ignition OFF. • Disconnect: Left Exterior Mirror BLISTM / CTA LED C576 (LH concern) . • Disconnect: Right Exterior Mirror BLISTM / CTA LED C676 (RH concern) . • For a LH concern, measure the resistance betweene BLISTM / CTA LED C576-1, component side and the BLISTM / CTA LED C576-2, component side. • For a RH concern, measure the resistance between the BLISTM / CTA LED C676-1, component side and the BLISTM / CTA LED C676-2, component side.  N0118014 • **Is the resistance less than 2000 ohms?**	**Yes** GO to D9 . **No** INSTALL a new exterior mirror glass for the one in question. REFER to Section 501-09 . CLEAR the DTCs. TEST the system for normal operation.
D9 CHECK THE EXTERIOR MIRROR BLISTM / CTA LED SUPPLY CIRCUIT FOR AN OPEN	

• Disconnect: SOD-L C4230 (LH concern) . • Disconnect: SOD-R C4229 (RH concern) . • For a LH concern, measure the resistance between the SOD-L C4230-6, circuit CRB04 (YE/GN), harness side and the left exterior mirror BLISTM / CTA LED C576-1, harness side. • For a RH concern, measure the resistance between the SOD-R C4229-6, circuit CRB02 (BU/BN), harness side and the right exterior mirror BLISTM / CTA LED C676-1, harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to D11 . **No** GO to D10 .
• Disconnect: Left Exterior Mirror C517 or C522 (LH concern) . • Disconnect: Right Exterior Mirror C625 or C626 (RH concern) . • For a LH concern, measure the resistance between the SOD-L C4230-6, circuit CRB04 (YE/GN), harness side and the left exterior mirror C522-10 or C517-8, circuit CRB04 (YE/GN), harness side. • For a RH concern, measure the resistance between the SOD-R C4229-6, circuit CRB02 (BU/BN), harness side and the right exterior mirror C626-10 or C625-8, circuit CRB02 (BU/BN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new exterior mirror for the one in question. REFER to Section 501-09 . CLEAR any DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
D11 CHECK THE EXTERIOR MIRROR BLISTM / CTA LED GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Negative Battery Cable . • For a LH concern, measure the resistance between the left exterior mirror BLISTM / CTA LED C576-2, harness side and ground.	**Yes** For a LH concern, GO to D13 . For a RH concern, GO to D14 . **No** GO to D12 .

• For a RH concern, measure the resistance between the right exterior mirror BLISTM / CTA LED C676-2, harness side and ground.  N0118018 • **Is the resistance less than 5 ohms?**	
D12 CHECK THE EXTERIOR MIRROR GROUND CIRCUIT FOR AN OPEN	
• Disconnect: Left Exterior Mirror C517 or C522 (LH concern) . • Disconnect: Right Exterior Mirror C625 or C626 (RH concern) . • For a LH concern, measure the resistance between the left exterior mirror C522-11 or C517-7, circuit GD126 (BK/WH), harness side and ground. • For a RH concern, measure the resistance between the right exterior mirror C626-11 or C625-7, circuit GD139 (BK/YE), harness side and ground.  N0111495 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new exterior mirror for the one in question. REFER to Section 501-09 . CLEAR any DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
D13 CHECK FOR CORRECT SOD-L OPERATION	
• Connect all the disconnected connectors. • Disconnect the SOD-L connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-L connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-L . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
D14 CHECK FOR CORRECT SOD-R OPERATION	
• Connect all the disconnected connectors.	**Yes** INSTALL a new SOD-R . REFER to

• Disconnect the SOD-R connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-R connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

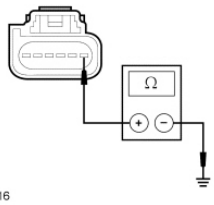
Pinpoint Test E: The Side Obstacle Detection Control Module - Right (SOD-R) Does Not Respond To The Scan Tool Or Cannot Be Configured

Refer to Wiring Diagrams Cell 136 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Emergency Messaging System for schematic and connector information.

Normal Operation

The Side Obstacle Detection Control Module - Left (SOD-L) and Side Obstacle Detection Control Module - Right (SOD-R) are identical modules except that the SOD-R uses an address ground pin for configuration. The address ground is necessary so that the Blind Spot Information System (BLISTM) or the Cross Traffic Alert (CTA) system can decipher beteen the SOD-R and the SOD-L during configuration. The SOD-R communicates over the Medium Speed Controller Area Network (MS-CAN).

This pinpoint test is intended to diagnose the following:



- Wiring, terminals or connectors
- SOD-R

PINPOINT TEST E: THE SOD-R DOES NOT RESPOND TO THE SCAN TOOL OR CANNOT BE CONFIGURED

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
E1 VERIFY THE SOD-R PASSES THE NETWORK TEST	
• Enter the following diagnostic mode on the scan tool: Network Test . • Verify that the SOD-R passes the network test. • **Does SOD-R pass the network test?**	**Yes** The system is operating correctly at this time. The concern may have been caused by high network traffic or an intermittent problem. TEST the system for normal operation. **No** GO to E2 .
E2 CHECK THE SOD-R ADDRESS GROUND CIRCUIT FOR AN OPEN	

• Disconnect: Negative Battery Cable . • Disconnect: SOD-R C4229 . • Measure the resistance between the SOD-R C4229-1, circuit GD171 (BK/GY), harness side and ground.  N0099816 • **Is the resistance less than 5 ohms?**	**Yes** CONFIGURE the SOD-R . REFER to Section 418-01 . **No** REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test F: The Instrument Panel Cluster (IPC) Message Center Displays A Blocked Sensor Message

Normal Operation

A blocked sensor message indicates that there is an obstruction on the rear bumper cover fascia that does not allow the radar from the Side Obstacle Detection Control Module - Right (SOD-R) and Side Obstacle Detection Control Module - Left (SOD-L) to penetrate. Wet mud, thick mud, heavy rain, heavy road splash from rain, snow or ice are possible obstructions.

If the system is in a blocked state, the radar misses targets, but still counts them. After approximately 4 counted/missed targets, the system sends a BLOCK SENSOR and BLIND SPOT NOT AVAILABLE or CTA NOT AVAILABLE message to the Instrument Panel Cluster (IPC).

This pinpoint test is intended to diagnose the following:

- SOD-L
- SOD-R

PINPOINT TEST F: THE IPC MESSAGE CENTER DISPLAYS A BLOCKED SENSOR MESSAGE

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

Test Step	Result / Action to Take
F1 INSPECT REAR BUMPER FASCIA COVER FOR DAMAGE	
• Inspect for damage on the rear bumper fascia cover and proper bracket connection to sheet metal .	**Yes** For the rear bumper cover, REPAIR or REPLACE the rear bumper cover as necessary. REFER to Section 501-19 . For the SOD-L or the SOD-R bracket, REPAIR or REPLACE the SOD-L or the SOD-R bracket. REFER to Side Obstacle Detection

• **Is the rear bumper fascia cover damaged or incorrect bracket connection?**	(SOD) Module in this section. TEST the system for normal operation. **No** GO to F2 .
F2 INSPECT THE SOD-R AND SOD-L FOR DEBRIS, MUD, SNOW OR ICE	
• Inspect for debris, mud, snow or ice on the rear bumper fascia cover and SOD-R and SOD-L module housing. • **Is the rear bumper fascia cover and radar unit obstructed or blocked due to the concerns above?**	**Yes** REMOVE and CLEAN the rear bumper fascia cover and module as necessary. Once the vehicle is cleaned, complete one key cycle and test drive the vehicle. The blocked module needs to detect an unblocked situation or 2 good detected vehicles or targets before clearing. TEST the system for normal operation. **No** For an inoperative SOD-L , GO to F3 . For an inoperative SOD-R , GO to F4 .
F3 CHECK FOR CORRECT SOD-L OPERATION	
• Disconnect the SOD-L connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-L connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-L . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.
F4 CHECK FOR CORRECT SOD-R OPERATION	
• Disconnect the SOD-R connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SOD-R connector and make sure it seats correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SOD-R . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test G: The Blind Spot Information System (BLISTM) and Cross Traffic Alert (CTA) System Cannot Be Turned Off In The Instrument Panel Cluster (IPC) Message Center

NOTE: The CTA system customer ON/OFF feature in theInstrument Panel Cluster (IPC) is not available on early build hybrid vehicles.

Normal Operation

The Side Obstacle Detection Control Module - Right (SOD-R) and Side Obstacle Detection Control Module - Left (SOD-L) communicate over the Medium Speed Controller Area Network (MS-CAN) with the Instrument Panel Cluster (IPC). The Blind Spot Information System (BLISTM) and the Cross Traffic Alert (CTA) system can be turned on and off through the message center which is part of the IPC . The CTA system cannot be disabled in the message center when the transaxle selector gear is in REVERSE (R).

NOTE: The BLISTM and/or CTA system are turned off for one key cycle only when using the message center switches. Permanently disabling the BLISTM and/or CTA system is carried out in the Integrated Diagnostic System (IDS) programmable parameters menu.

This pinpoint test is intended to diagnose the following:

- IPC
- SOD-R
- SOD-L

PINPOINT TEST G: THE BLISTM AND CTA SYSTEM CANNOT BE TURNED OFF IN THE IPC MESSAGE CENTER

Test Step	Result / Action to Take
G1 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND IPC , SOD-R AND SOD-L SELF-TESTS	
• Check the IPC , SOD-R and SOD-L DTCs from the continuous and on-demand self-tests. • **Are any IPC , SOD-R or SOD-L DTCs recorded?**	**Yes** For IPC , REFER to Section 413-01 . REPAIR all IPC DTCs and RETEST the BLISTM and CTA system for normal operation. For SOD-R or SOD-L DTCs, REFER to the DTC Charts in this section. **No** GO to G2 .
G2 CHECK THE MESSAGE CENTER FOR CORRECT OPERATION	
• Check the message center for correct operation, while turning the BLISTM and CTA system off and on. • **Does the message center operate correctly?**	**Yes** The system is operating correctly at this time. **No** REFER to Section 413-01 to diagnose the message center not operating correctly.

Pinpoint Test H: DTC U3000:44,45,46,48,49 Or 4A /b>

Normal Operation

On each ignition cycle, the Side Obstacle Detection Control Module - Right (SOD-R) and Side Obstacle Detection Control Module - Left (SOD-L) run a self-diagnostic check during which the exterior mirror BLISTM / CTA LEDs illuminate for 3 seconds then turn off indicating the system is operational. If a DTC fault is present, a system fault message is displayed in the message center.

DTC Description	Fault Trigger Conditions
• DTC U3000:44 - Control Module: Data Failure	sets when the SOD-R or SOD-L detects an internal RAM memory failure.
• DTC U3000:45 - Control Module: Program Memory Failure	sets when the SOD-R or SOD-L detects an internal softwareure.
• DTC U3000:46 - Control Module: Calibration/Parameter Memory Failure	sets when the SOD-R or SOD-L detects a failure with the EEPROM.
• DTC U3000:48 - Control Module: Supervision Software Failure	sets when the SOD-R or SOD-L detects a calibration failure.
• DTC U3000:49 - Control Module: Internal Electronic Failure	sets when the SOD-R or SOD-L detects an internal electronic communication failure.
• DTC U3000:4A - Control Module: Incorrect Component Installed	sets when the SOD-R or SOD-L detects a weak or no sample radar signal.

This pinpoint test is intended to diagnose the following:

- SOD-R
- SOD-L

PINPOINT TEST H: DTC U3000:44,45,46,48,49 OR 4A

Test Step	Result / Action to Take
H1 CHECK THE SOD-R and SOD-L FOR DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SOD-R and SOD-L Module Self-Test . • Clear the DTCs. • Ignition OFF. • Wait 5 seconds • Ignition ON.	**Yes** INSTALL a new SOD-R or SOD-L . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by an intermittent problem.

• Repeat the SOD-R and SOD-L module self-test. • **Are any U3000 DTCs present?**	

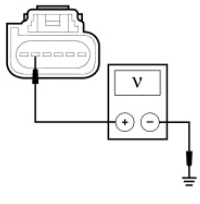
Pinpoint Test I: The Left Or Right Exterior Mirror Blind Spot Information System (BLISTM)/Cross Traffic Alert (CTA) LED Appears Dim Or Does Not Illuminate With No DTC Or Message In The Instrument Panel Cluster (IPC) Message Center Present

Refer to Wiring Diagrams Cell 136 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Vehicle Emergency Messaging System for schematic and connector information.

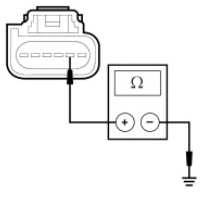
Normal Operation

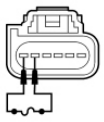
For the Blind Spot Information System (BLISTM), the exterior mirror BLISTM /Cross Traffic Alert (CTA) LED is at 95 percent illumination to be seen clearly during the day and is dimmed down to 10 percent at night. For the CTA system, the exterior mirror BLISTM / CTA LED is always at 85 percent illumination.

This pinpoint test is intended to diagnose the following:

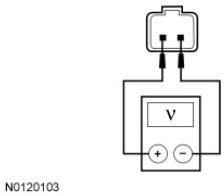


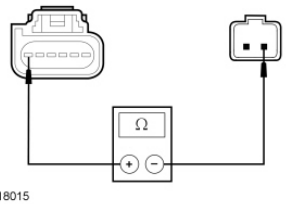
- Wiring, terminals or connectors
- Side Obstacle Detection Control Module - Right (SOD-R)
- Side Obstacle Detection Control Module - Left (SOD-L)
- Exterior mirror BLISTM / CTA LED





PINPOINT TEST I: THE LEFT OR RIGHT EXTERIOR MIRROR BLISTM / CTA LED APPEARS DIM OR DOES NOT ILLUMINATE WITH NO DTC OR MESSAGE IN THE IPC MESSAGE CENTER PRESENT





NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
I1 VERIFY THE CUSTOMER'S CONCERN	
• Carry out the diagnostic system check. • Start the engine. • Observe the left and right exterior mirror BLISTM / CTA LEDs and compare the illumination in each mirror. • **Is one LED noticeably dimmer than the other?**	**Yes** GO to I2 . **No** The concern may be due to customer perception or ambient lighting conditions. TEST the system for normal operation.
I2 VERIFY THE EXTERIOR MIRROR BLISTM / CTA LED OPERATION	
• Ignition OFF. • Apply the park brake. • Ignition ON. • Select REVERSE. • Enter the following diagnostic mode on the scan tool: SOD-R and/or SOD-L DataLogger .	**Yes** The concern may be due to customer perception, ambient lighting conditions or system functionality. TEST the system for normal operation. **No**

• **NOTE:** The SOD-R and SOD-L are separate modules and the active command PID needs to be commanded on in each individual module. • Select the SOD-R or SOD-L PID (CTALERT) and active command the LED ON. • Observe the left and/or right exterior mirror BLISTM / CTA LED and message center. • **Does the LED blink brightly, audible tone and a message in the message center display CTA ALERT?**	GO to I3 .
I3 CHECK THE SOD-R OR SOD-L VOLTAGE SUPPLY CIRCUIT	
• Ignition OFF. • Disconnect: SOD-L C4230 (LH concern) . • Disconnect: SOD-R C4229 (RH concern) . • Ignition ON. • For a LH concern, measure the voltage between the SOD-L C4230-5, circuit CBP35 (YE/GY), harness side and ground. • For a RH concern, measure the voltage between the SOD-R C4229-5, circuit CBP35 (YE/GY), harness side and ground.  N0099536 • **Is the voltage greater than 10 volts?**	**Yes** GO to I4 . **No** REPAIR the circuit in question. TEST the system for normal operation.
I4 CHECK THE SOD-R OR SOD-L GROUND CIRCUIT FOR AN OPEN	
• Ignition OFF. • Disconnect: Negative Battery Cable . • For a LH concern, measure the resistance between the SOD-L C4230-2, circuit GD171 (BK/GY), harness side and ground. • For a RH concern, measure the resistance between the SOD-R C4229-2, circuit GD171 (BK/GY), harness side and ground.	**Yes** GO to I5 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 N0099537 • **Is the resistance less that 5 ohms?**	
I5 CHECK THE SUSPECTED EXTERIOR MIRROR BLISTM / CTA LED FOR ILLUMINATION	
• Connect: Negative Battery Cable . • Ignition OFF. • For a LH concern, connect a fused jumper wire between the SOD-L C4230-5, circuit CBP35 (YE/GY), harness side and the SOD-L C4230-6, circuit CRB04 (YE/GN), harness side. • For a RH concern, connect a fused jumper wire between the SOD-R C4229-5, circuit CBP35 (YE/GY), harness side and the SOD-R C4229-6, circuit CRB02 (BU/BN), harness side.  N0102472 • Ignition ON. • **Does the LED appear dim?**	**Yes** GO to I6 . **No** For a LH concern, INSTALL a new SOD-L . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation. For a RH concern, INSTALL a new SOD-R . REFER to Side Obstacle Detection (SOD) Module in this section. TEST the system for normal operation.
I6 CHECK THE SUSPECTED EXTERIOR MIRROR BLISTM / CTA LED CIRCUITS	
• Ignition OFF. • Disconnect: Left Exterior Mirror BLISTM / CTA LED C576 (LH concern) . • Disconnect: Right Exterior Mirror BLISTM / CTA LED C676 (RH concern) . • Ignition ON. • For a LH concern, measure the voltage between the left exterior mirror BLISTM / CTA LED C576-1, harness side and the left exterior mirror BLISTM / CTA LED C576-2, harness side. • For a RH concern, measure the voltage between the right exterior mirror BLISTM / CTA LED C676-1, harness side and the right exterior mirror BLISTM / CTA LED C676-2, harness side.	**Yes** INSTALL a new exterior mirror glass for the LED in question. REFER to Section 501-09 . TEST the system for normal operation. **No** GO to I7 .

 N0120103 • **Is the voltage greater than 10 volts?**	
I7 CHECK THE SUSPECTED EXTERIOR MIRROR BLISTM / CTA LED VOLTAGE SUPPLY CIRCUIT FOR AN OPEN	
• Ignition OFF. • For a LH concern, measure the resistance between the SOD-L C4230-6, circuit CRB04 (YE/GN), harness side and left exterior mirror BLISTM / CTA LED C576-1, harness side. • For a RH concern, measure the resistance between the SOD-R C4229-6, circuit CRB02 (BU/BN), harness side and the right exterior mirror BLISTM / CTA LED C676-1, harness side.  N0118015 • **Is the resistance less than 5 ohms?**	**Yes** For a LH concern, REPAIR circuit GD126 (BK/WH) for an open. TEST the system for normal operation. For a RH concern, REPAIR circuit GD139 (BK/YE) for an open. TEST the system for normal operation. **No** For a LH concern, REPAIR circuit CRB04 (YE/GN) for an open. TEST the system for normal operation. For a RH concern, REPAIR circuit CRB02 (BU/BN) for an open. TEST the system for normal operation.

Pinpoint Test J: DTC U0155:00

Normal Operation

The Side Obstacle Detection Control Module - Right (SOD-R) and Side Obstacle Detection Control Module - Left (SOD-L) receive network messages from the Instrument Panel Cluster (IPC) via the Medium Speed Controller Area Network (MS-CAN). The following information is included in the messages:

- Transmission gear selected
- Vehicle speed

As more than one module receives these messages, all modules receiving a particular message should exhibit a symptom if the message is missing.

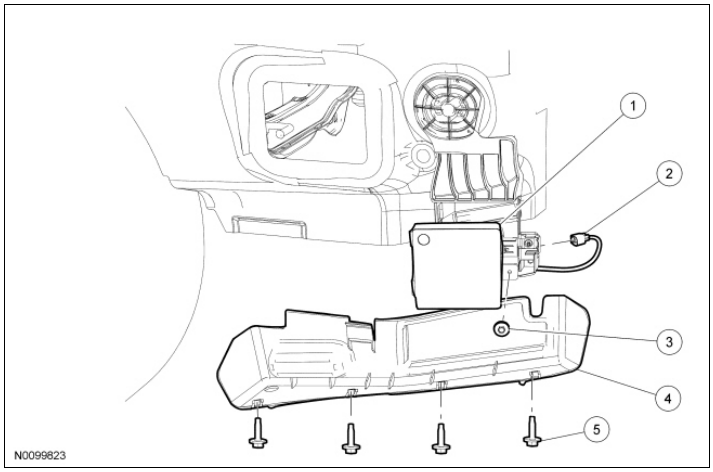
- DTC U0155:00 (Lost Communication With Instrument Panel Cluster (IPC) Control Module: No Sub Type Information) - set by the SOD-R or the SOD-L when network messages are missing from the IPC for greater than 2 seconds with the ignition in RUN.

This pinpoint test is intended to diagnose the following:

- Communication network concern

- Blind Spot Information System (BLISTM)/Cross Traffic Alert (CTA) system concern
- IPC

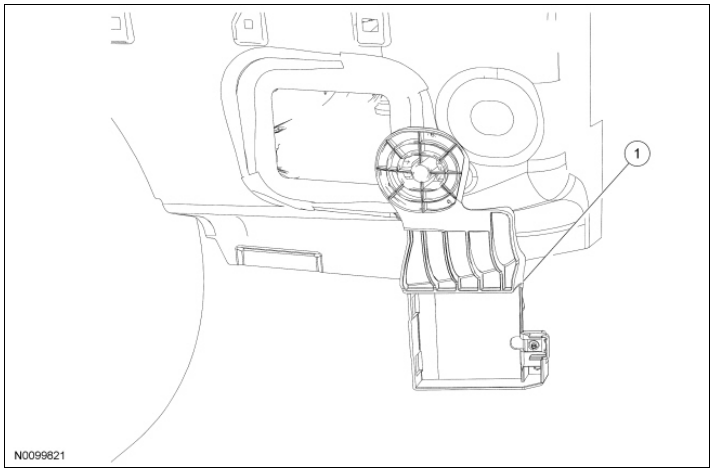
PINPOINT TEST J: DTC U0155:00



Test Step	Result / Action to Take
J1 VERIFY THE CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to J2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
J2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the IPC pass the network test?**	**Ye** GO to J3 . **No** REFER to Section 418-00 .
J3 RECHECK THE SOD-R OR THE SOD-L DTCs	
• Clear the DTCs. Repeat the SOD-R or the SOD-L self-test. • **Is DTC U0155:00 still present?**	**Yes** GO to J4 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or an intermittent fault condition.
J4 CHECK FOR LOST COMMUNICATION DTCs	
• Ignition ON. • Clear continuous DTCs from all modules. • Ignition OFF. • Ignition ON. • Wait at least 10 seconds. • Retrieve all continuous DTCs from all modules. • **Is DTC U0155:00 set in any module?**	**Yes** GO to J5 . **No** The system is operating correctly at this time. The DTC may have been set due to an intermittent fault in the network wiring.
J5 CHECK FOR CORRECT IPC OPERATION	

• Disconnect the IPC connector. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the IPC connector and make sure it seats correctly. • **Is the concern still present?**	**Yes** INSTALL a new IPC . REFER to Section 413-01 . CLEAR all continuous DTCs. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR all continuous DTCs. REPEAT the self-test for the module(s) that set DTC U0155:00.

Side Obstacle Detection (SOD) Module



NOTE: Rear bumper cover removed for clarity.

NOTE: Left rear quarter panel shown, right side similar.

Item	Part Number	Description
1	14C689	Side Obstacle Detection Control Module - Left (SOD-L)/Side Obstacle Detection Control Module - Right (SOD-R)
2	-	SOD-L / SOD-R electrical connector (part of 15K868)
3	W705796	SOD-L / SOD-R screw and washer
4	-	Lower rear bumper quarter panel splash shield
5	-	Lower rear bumper quarter panel splash shield screws

Bracket

Item	Part Number	Description
1	14D190/14D189	SOD-L bracket/ SOD-R bracket

Removal and Installation

Side obstacle detection (SOD) module only

1. **NOTE:** Module configuration is only required if a new Side Obstacle Detection Control Module - Left (SOD-L) or Side Obstacle Detection Control Module - Right (SOD-R) is being installed. Upload the SOD-L or SOD-R module configuration information to the scan tool. For additional information, refer to Programmable Module Installation (PMI) in Section 418-01

   With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the 3 rear fender splash shield push pins. For additional information, refer to Front End Body Panels - Exploded View in Section 501-19 .

3. Remove the 4 lower rear bumper quarter panel splash shield screws.

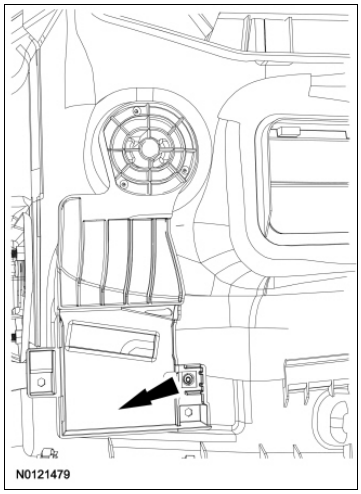
4. Remove the rear bumper cover screw and gently flex it to access the SOD-L or the SOD-R .
   - Remove the screw and washer.
   - Disconnect the electrical connector.

5. Remove the SOD-L or the SOD-R .

6. To install, reverse the removal procedure.
   - Download the SOD-L or the SOD-R configuration information. For additional information, refer to Section 418-01 .
   - **NOTE:** When enabling the Blind Spot Information System (BLIS®) and Cross Traffic Alert (CTA) system make sure to enable the systems in both the SOD-L and the SOD-R . Failure to do so results in a mismatch system fault.

     Verify in the programmable parameters that the Blind Spot Information System (BLIS®) and Cross Traffic Alert (CTA) system are enabled in the SOD-L and SOD-R .
   - After the SOD-L or the SOD-R is configured, shift the selector lever though all the transaxle gear positions (PRNDL).

SOD-L / SOD-R Bracket only



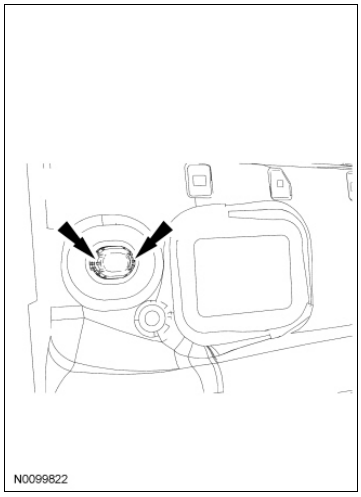
1. Remove the rear bumper cover. For additional information, refer to Section 501-19 .

8. Remove the SOD-L or the SOD-R .
   - Remove the screw and washer.
   - Disconnect the electrical connector and the wiring harness retainer.

9. **NOTE:** The SOD-L / SOD-R bracket has a strip of adhesive tape that holding it to the vehicle.

   Using a suitable tool, such as a flat-bladed scraper, pry the SOD-L / SOD-R bracket away from the vehicle.

   - To install, apply hand pressure over the adhesive tape bonding area for a minimum of 15 seconds.



10. **NOTE:** Remove the adhesive tape protective cover before installing the retaining tabs in the vehicle body.

    NOTE: When installing the new SOD-L / SOD-R bracket, make sure the retaining tab portion of the SOD-L / SOD-R bracket snaps firmly into the vehicle and 2 audible clicks are heard.

    Using a suitable tool, such as pliers, squeeze the retaining tabs of the SOD-L / SOD-R bracket, located in the luggage compartment behind the side carpet panel, and remove the SOD-L / SOD-R bracket.

    - Discard the SOD-L / SOD-R bracket.

11. **NOTE:** Allow the adhesive tape bonding surface to completely dry before installing the new SOD-L / SOD-R bracket.

    Clean the adhesive tape bonding surface.

    - Using a flat bladed wood or plastic scraper remove the remaining adhesive from the vehicle body.
    - Clean the adhesive tape bonding surface on the vehicle body with isopropyl alcohol (obtain locally).

12. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Driver Door Module (DDM) nuts	3	27
Smart Junction Box (SJB) nuts	5	44

Module Controlled Functions

Smart Junction Box (SJB)

The Smart Junction Box (SJB) is located on the LH side cowl under the instrument panel and has control of the following systems:

- Interior lighting
- Exterior lighting
- Dimmable backlighting
- Battery saver function
- Delayed accessory relay function
- Global open function (MKZ)
- Horn
- Heated rear window
- Brake shift interlock
- Power door locks
- Remote Keyless Entry (RKE) system
- Perimeter alarm
- Tire Pressure Monitoring System (TPMS)

Refer to the appropriate section in this manual for system specific information and diagnostics.

Battery Saver

NOTE: Time-out is 1 minute if the vehicle has less than 80 km (50 miles).

The SJB provides automatic shut-off of some system controlled components after a time-out period in order to save battery voltage. A timer in the SJB is started when the ignition is turned OFF and all the doors are closed. When 10 minutes have elapsed, the voltage is automatically shut off by the SJB . While the SJB has voltage disabled, if the ignition changed out of OFF, any door becomes ajar, the UNLOCK button of the RKE transmitter is pressed, a valid keypad code is entered, or the instrument panel dimmer switch is pressed, the SJB restores voltage and starts the timer again.

Post Crash Alert Feature

The post crash alert is a function controlled by the SJB . If the Restraints Control Module (RCM) determines an impact of enough severity (the air bags may or may not be deployed), the post crash alert function is activated. The post-crash alert function activates the hazard lamp function and cycles the horn on 3 times, then off for 4 seconds, and repeats this cycle until the battery is discharged or the function is turned off. The post crash alert function can be turned off by:

- pressing the hazard flasher lamp switch (which may need to be pressed twice).
- pressing the RKE transmitter UNLOCK button.
- pressing the RKE transmitter PANIC button.

Diagnostic Trouble Code (DTC) Chart

Each module has a comprehensive DTC chart listed in an appropriate section. Refer to the table below for the appropriate section.

Master DTC Index

Module	Reference
ABS Module	REFER to Section 206-09 .
Accessory Protocol Interface Module (APIM)	REFER to Section 415-00 .
Air Conditioning Compressor Module (ACCM)	REFER to Section 412-00B .
Audio Control Module (ACM)	REFER to Section 415-00 .
Battery Energy Control Module (BECM)	REFER to Section 414-03 .
Digital Signal Processing (DSP)	REFER to Section 415-00 .
Driver Door Module (DDM)	REFER to Section 501-14 .
Driver Seat Module (DSM)	REFER to Section 501-10 .
Dual Climate Controlled Seat Module (DCSM)	REFER to Section 501-10 .
Front Controls Interface Module (FCIM)	REFER to Section 415-00 .
Front Display Interface Module (FDIM)	REFER to Section 415-00 .
Global Positioning System Module (GPSM)	REFER to Section 415-00 .
Headlamp Control Module (HCM)	REFER to Section 417-01 .
HVAC Module	For non-hybrid vehicles, REFER to Section 412-00A . For hybrid vehicles, REFER to Section 412-00B .
Instrument Panel Cluster (IPC)	REFER to Section 413-01 .
Interior Lighting Control Module (ILCM)	REFER to Section 417-02 .
Occupant Classification System Module (OCSM)	REFER to Section 501-20B .
Parking Aid Module (PAM)	REFER to Section 413-13 .
PCM	REFER to Section 303-14A , Section 303-14B , Section 303-14C or Section 303-14D .
Power Steering Control Module (PSCM)	REFER to Section 211-00A or Section 211-00B .
Restraints Control Module (RCM)	REFER to Section 501-20B .
Side Obstacle Detection Control Module - Left (SOD-L)	REFER to Section 419-04 .
Side Obstacle Detection Control Module - Right (SOD-R)	REFER to Section 419-04 .

Smart Junction Box (SJB)	REFER to the Smart Junction Box (SJB) DTC Chart in this section.
Transmission Control Module (TCM) (Aisin AW21)	REFER to Section 307-01A .
4X4 control module	REFER to Section 308-07A .
DC to DC Converter Control Module (DC/DC)	REFER to Section 414-05 .

Smart Junction Box (SJB)

Special Tool(s)

 ST3093-A	Fluke 77-IV Digital Multimeter FLU77-4 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool
 ST2574-A	Flex Probe Kit NUD105-R025D or equivalent

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also known as the Generic Electronic Module (GEM).

The SJB controls various systems (such as exterior lighting, interior lighting, power door locks, anti-theft system, dimmable backlighting and the battery saver feature) by monitoring inputs from switches, sensors and messages sent from other modules on the Medium Speed Controller Area Network (MS-CAN). Based on the inputs received, the SJB activates outputs. For example, the SJB monitors the headlamp switch position. Based on this input, the SJB may provide voltage to the exterior lamps.

Field-Effect Transistor (FET) Protection

A Field-Effect Transistor (FET) is a type of transistor that when used with module software can be used to monitor and control current flow on module outputs. The FET protection strategy is used to prevent module damage in the event of excessive current flow.

The SJB utilizes an FET protective circuit strategy for many of its outputs (for example, a headlamp output circuit). Output loads (current level) are monitored for excessive current (typically short circuits) and are shut down (turns off the voltage or ground provided by the module) when a fault event is detected. A short circuit DTC is stored at the fault event and a cumulative counter is started.

When the demand for the output is no longer present, the module resets the FET circuit protection to allow the circuit to function. The next time the driver requests a circuit to activate that has been shut down by a previous short (FET protection) and the circuit is still shorted, the FET protection shuts off the circuit again and the cumulative counter advances.

When the excessive circuit load occurs often enough, the module shuts down the output until a repair procedure is carried out. Each FET protected circuit has 3 predefined levels of short circuit tolerance based on the harmful effect of each circuit fault on the FET and the ability of the FET to withstand it. A module lifetime level of fault events is established based upon the durability of the FET . If the total tolerance level is determined to be 600 fault events, the 3 predefined levels would be 200, 400 and 600 fault events.

When each tolerance level is reached, the short circuit DTC that was stored on the first failure cannot be cleared by a command to clear the continuous DTCs. The module does not allow this code to be cleared or the circuit restored to normal operation until a successful self-test proves that the fault has been repaired. After the self-test has successfully completed (no on-demand DTCs present), DTC B106E and the associated DTC (the DTC related to the shorted circuit) automatically clears and the circuit function returns.

When each level is reached, the DTC associated with the short circuit sets along with DTC B106E. These DTCs can be cleared using the module on-demand self-test, then the Clear DTC operation on the scan tool (if the on-demand test shows the fault corrected). The module never resets the fault event counter to zero and continues to advance the fault event counter as short circuit fault events occur.

If the number of short circuit fault events reach the third level, then DTCs B106F and B1342 set along with the associated short circuit DTC. DTC B106F cannot be cleared and the module must be replaced after the repair.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Smart Junction Box (SJB) fuse 5 (10A) • Wiring, terminals or connectors • Smart Junction Box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **NOTE:** Make sure to use the latest scan tool software release.

   If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

5. **NOTE:** The Vehicle Communication Module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM .

   If the scan tool does not communicate with the VCM

   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM .
   - refer to Section 418-00 , No Power To The Scan Tool, to diagnose no power to the scan tool.

6. If the scan tool does not communicate with the vehicle:
   - verify the ignition is ON.

- ♦ The air bag warning indicator prove-out confirms ignition ON (other indicators may not prove ignition ON). If the ignition does not turn on, refer to Section 211-05 to diagnose no power in RUN.
- verify the scan tool operation with a known good vehicle.
- refer to Section 418-00 to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to Section 418-00 .
   - If the network test passes, retrieve and record the continuous memory DTCs.

8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB .

9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to Diagnostic Trouble Code (DTC) Chart in this section.

10. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

DTC Charts

Smart Junction Box (SJB) DTC Chart

DTC	Description	Action
B106B	Tire Pressure Sensor Low Battery	REFER to Section 204-04 .
B106D	Tire Pressure Monitor System (TPMS) Initiators Not Configured	REFER to Section 204-04 .
B106E	Solid State Driver Disabled Due to Short Circuit	GO to Pinpoint Test A .
B106F	Module Disabled Due to External Fault	GO to Pinpoint Test A .
B1138	Memory Full	REFER to Section 419-01B .
B1139	Invalid Transmitter Identification Code	REFER to Section 501-14 .
B1302	Accessory Delay Relay Coil Circuit Failure	REFER to Section 501-11 .
B1304	Accessory Delay Relay Coil Circuit Short to Battery	REFER to Section 501-11 .
B1317	Battery Voltage High	GO to Pinpoint Test B .
B1318	Battery Voltage Low	GO to Pinpoint Test C .
B1320	Driver Door Ajar Circuit Open	REFER to Section 417-02 .
B1328	Passenger Door Ajar Circuit Open	REFER to Section 417-02 .
B1331	Decklid Ajar Rear Door Circuit Failure	REFER to Section 417-02 .
B1336	Door Ajar RR Circuit Open	REFER to Section 417-02 .
B1342	ECU is Faulted	DIAGNOSE all other DTCs first. If no other DTCs are present, INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this

		section. TEST the system for normal operation.
B1352	Ignition Key-In Circuit Failure	REFER to Section 413-01 .
B1472	Lamp Headlamp Input Circuit Short to Ground	REFER to Section 417-01 .
B1485	Brake Pedal Input Short to Battery	REFER to Section 417-01 .
B1510	Flash to Pass Switch Circuit Short to Ground	REFER to Section 417-01 .
B1520	Hood Switch Circuit Open	REFER to Section 419-01A .
B1572	Door Ajar LR Circuit Open	REFER to Section 417-02 .
B1578	Lamp Park Input Circuit Short to Ground	REFER to Section 417-01 .
B1624	Lamp Keypad Output Open Circuit	REFER to Section 501-14 .
B1626	Lamp Keypad Output Short Circuit to Ground	REFER to Section 501-14 .
B1696	Autolamp On Circuit Short to Ground	REFER to Section 417-01 .
B1791	Autolamp Sensor Input Circuit Open	REFER to Section 417-01 .
B1793	Autolamp Sensor Input Circuit Short To Ground	REFER to Section 417-01 .
B2008	Wipers On Signal Circuit Short To Ground	REFER to Section 417-01 .
B2044	Left Rear Stop Lamp Circuit Short To Ground	REFER to Section 417-01 .
B2045	Left Rear Stop Lamp Circuit Open	REFER to Section 417-01 .
B2046	Right Rear Stop Lamp Circuit Short To Ground	REFER to Section 417-01 .
B2047	Right Rear Stop Lamp Circuit Open	REFER to Section 417-01 .
B2048	Left Rear Turn Lamp Circuit Short To Ground	REFER to Section 417-01 .
B2049	Left Rear Turn Lamp Circuit Open	REFER to Section 417-01 .
B2050	Right Rear Turn Lamp Circuit Short To Ground	REFER to Section 417-01 .
B2051	Right Rear Turn Lamp Circuit Open	REFER to Section 417-01 .
B2071	Hazard Switch Signal Short To Ground	REFER to Section 417-01 .
B2100	Door Driver Key Cylinder Switch Failure	REFER to Section 419-01A .
B2108	Trunk Key Cylinder Switch Failure	REFER to Section 419-01A .
B213A		REFER to Section 413-00 .

	Digital Dimmer Switch Input Circuit Failure	
B2254	Front Fog Lamp Switch Failure	REFER to Section 417-01 .
B2276	Less Than 2 Transmitters Programmed	REFER to Section 501-14 .
B2281	Right Turn Switch Short To Ground	REFER to Section 417-01 .
B2282	Left Turn Switch Short To Ground	REFER to Section 417-01 .
B2425	Remote Keyless Entry Out Of Synchronization	REFER to Section 501-14 .
B2477	Module Configuration Failure	CARRY OUT Programmable Module Installation (PMI) on the SJB . REFER to Section 418-01 .
B2479	Park Brake Switch Circuit Short To Ground	REFER to Section 413-01 .
B2498	Headlamp Switch Multiple Signals Input Active	REFER to Section 417-01 .
B2572	Brake Shift Interlock Output Circuit Failure	For non-Hybrid vehicles, REFER to Section 307-05A . For Hybrid vehicles, REFER to Section 307-05B .
B2667	Liftglass Release Switch Circuit Failure	REFER to Section 501-14 .
B2844	Ignition Fault	REFER to Section 211-05 .
B2868	Left Front Tire Pressure Sensor Fault	REFER to Section 204-04 .
B2869	Right Front Tire Pressure Sensor Fault	REFER to Section 204-04 .
B2870	Right Rear Tire Pressure Sensor Fault	REFER to Section 204-04 .
B2871	Left Rear Tire Pressure Sensor Fault	REFER to Section 204-04 .
B2872	Tire Pressure Sensor Fault	REFER to Section 204-04 .
B287A	Tire Pressure System Fault	REFER to Section 204-04 .
B2947	Global Opening/Closing Circuit Open	REFER to Section 501-11 .
B2949	Global Opening/Closing Circuit Short to Battery	REFER to Section 501-11 .
B29B7	White Lighting Output Circuit Open	REFER to Section 413-00 .
B29B8	White Lighting Output Circuit Short To Ground	REFER to Section 413-00 .
B2A20	Ignition Stuck In START	REFER to Section 211-05 .
B2A21	One or More Configuration Files Missing Or Corrupt	CARRY OUT Programmable Module Installation (PMI) on the SJB . REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC B2A21 is retrieved again, INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation.

B2A22	Headlamp OFF Circuit Open	REFER to Section 417-01 .
B2A23	High Beam Input Circuit Short To Ground	REFER to Section 417-01 .
B2A24	Turn Signal Input Circuit Failure	REFER to Section 417-01 .
B2A25	Trim Panel Lock Switch Circuit Failure	REFER to Section 501-14 .
B2A26	Keypad Switch Circuit Failure	REFER to Section 501-14 .
B2A27	Right Front Turn Lamp Circuit Open	REFER to Section 417-01 .
B2A28	Right Front Turn Lamp Circuit Short To Ground	REFER to Section 417-01 .
B2A29	Left Front Turn Lamp Circuit Open	REFER to Section 417-01 .
B2A2A	Left Front Turn Lamp Circuit Short To Ground	REFER to Section 417-01 .
B2A2E	Right Front Lamp Low Beam Circuit Open	REFER to Section 417-01 .
B2A2F	Right Front Lamp Low Beam Circuit Short To Ground	REFER to Section 417-01 .
B2A30	Left Front Lamp Low Beam Circuit Open	REFER to Section 417-01 .
B2A31	Left Front Lamp Low Beam Circuit Short To Ground	REFER to Section 417-01 .
B2A32	LED Backlighting Output Circuit Open	REFER to Section 413-00 .
B2A33	LED Backlighting Output Circuit Short To Ground	REFER to Section 413-00 .
B2A35	Interior Lighting Output Circuit Open	REFER to Section 417-02 .
B2A36	Interior Lighting Output Circuit Short To Ground	REFER to Section 417-02 .
B2A39	Puddle Lamp Output Circuit Open	REFER to Section 417-02 .
B2A3A	Puddle Lamp Output Circuit Short To Ground	REFER to Section 417-02 .
C1125	Brake Fluid Level Sensor Input Circuit Failure	REFER to Section 413-01 .
C2780	ECU in Manufacturer Sub-State	REFER to Section 204-04 .
P062F	Internal Control Module EEPROM Error	CARRY OUT Programmable Module Installation (PMI). REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC P062F is retrieved again, INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation.
U0155	Lost Communication With Instrument Panel Cluster	GO to Pinpoint Test D .

	(IC) Control Module	
U2050	No Application Present	CARRY out Programmable Module Installation (PMI) for the SJB . REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC U2050 is retrieved again, INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation.
U2472	Unexpected Ignition State	REFER to Section 211-05 .
U2473	Unexpected Vehicle Speed (VSS)	**NOTE:** Sets during the self-test if vehicle speed exceeds 3 mph (5 kph) or vehicle speed cannot be determined by the SJB . VERIFY the speedometer operates correctly. If the speedometer does not operate correctly, REFER to Section 413-01 . If the speedometer operates correctly, the self-test is carried out while the vehicle is moving. STOP the vehicle and REPEAT the self-test.

Symptom Chart

Symptom Chart

Pinpoint Tests

Pinpoint Test A: DTCs B106E, B106F

Normal Operation

The Smart Junction Box (SJB) controls the output of several vehicle systems by means of solid state drivers. A DTC sets when an overload occurs on any of these drivers. The module also tracks the number of repetitive faults on each of these circuits, and then it compares said number of overloads to 3 progressive thresholds established for each circuit. If the third threshold has not been met, the DTC for the affected circuit can be cleared by eliminating the fault, clearing the DTCs and then running a self-test.

At the point that each of the first 2 thresholds is met, DTC B106E sets along with a DTC related to the affected circuit. Once the final (third) threshold has been met, the affected output is permanently disabled, and DTC B106F sets, at which time the SJB must be replaced.

- DTC B106E (Solid State Driver Disabled Due to Short Circuit) - a continuous DTC that sets when the SJB has disabled an output circuit due to a repetitive fault that overloads said circuit. A corresponding DTC for the circuit in question is also set.

- DTC B106F (Module Disabled Due to External Fault) - a continuous DTC that sets when the SJB has permanently disabled one or more output functions due to a repetitive circuit overload. DTC B1342 also sets at this time.

When DTC B1342 is set because the module has reached a third threshold and the SJB has permanently disabled an output, no DTCs can be cleared from the SJB . Using the module self-test to confirm a repair is not possible and a measurement using a digital multimeter of the affected output circuit is required to make

sure the fault condition no longer exists.

This pinpoint test is intended to diagnose the following:

- Output circuit short
- SJB

PINPOINT TEST A: DTCs B106E, B106F

Test Step	Result / Action to Take
A1 REVIEW THE DTCs	
NO: **First follow the necessary diagnostics to resolve DTC B106E and any other present DTCs (ignoring B106F). DTC B106E is only present when there is another DTC due to software or circuitry issues that must be resolved before another self-test is run. DTC B106F is only present once the final threshold has been met. Failure to correct the fault condition first may cause damage to the new SJB , resulting in a repeat repair.** • Review the DTCs from the SJB self-test. • **Are any other DTCs present, besides B106E, B106F or B1342?**	**Yes** CORRECT the DTCs. REFER to the Smart Junction Box (SJB) DTC chart in this section. After the repair, GO to A2 . **No** GO to A2 .
A2 REPEAT THE SJB SELF-TEST	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs and repeat the SJB self-test. • **Is DTC B106F or DTC B1342 present?**	**Yes** INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The circuit short has been repaired.

Pinpoint Test B: DTC B1317

Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

Normal Operation

- DTC B1317 (Battery Voltage High) - a continuous and on-demand DTC that sets when the SJB detects battery voltage above 15.5 volts.

This pinpoint test is intended to diagnose the following:

- Charging system concern
- SJB

PINPOINT TEST B: DTC B1317

NOTE: DTC B1317 may be stored in the module memory due to previous battery charging or vehicle jump starting events.

Test Step	Result / Action to Take
B1 CHECK FOR DTC B1317, B1676 OR P0563 SET IN OTHER MODULES	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: (All Modules) Self-Test. • Retrieve the continuous memory DTCs from all modules. • **Is DTC B1317, B1676 or P0563 (PCM) set in more than one module?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to B2 .
B2 CHECK THE BATTERY VOLTAGE	
• Turn off all interior/exterior lights and accessories. • Start and run the engine at approximately 2,000 rpm for 3 minutes while monitoring the battery voltage. • **Does the battery voltage rise to 15.5 volts or higher?**	**Yes** REFER to Section 414-00 to diagnose an overcharging condition. **No** GO to B3 .
B3 RECHECK FOR DTC B1317	
• Turn the engine off. • Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the continuous memory DTCs. • Carry out the SJB self-test. • **Is DTC B1317 present?**	**Yes** INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation. **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.

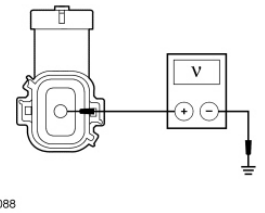
Pinpoint Test C: DTC B1318

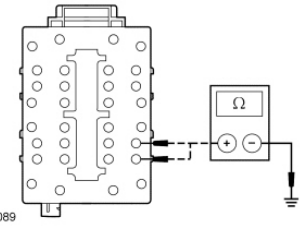
Refer to Wiring Diagrams Cell 13 (Fusion/MKZ , Fusion Hybrid/MKZ Hybrid), Power Distribution/SJB for schematic and connector information.

Normal Operation

- DTC B1318 (Battery Voltage Low) - a continuous and on-demand DTC that sets when the SJB detects battery voltage below 10 volts.

This pinpoint test is intended to diagnose the following:





- Wiring, terminals or connectors
- High circuit resistance
- SJB

PINPOINT TEST C: DTC B1318

NOTICE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: Failure to disconnect the battery when instructed will result in false resistance readings. Refer to Section 414-01 .

Test Step	Result / Action to Take
C1 RECHECK THE SJB DTCs	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: SJB Self-Test. • Clear the DTCs. Repeat the SJB self-test. • **Is DTC B1318 still present?**	**Yes** GO to C2 . **No** The system is operating normally at this time. The DTC may have been set previously during battery charging or while jump starting the vehicle.
C2 CHECK FOR CHARGING SYSTEM DTCs IN THE PCM	
• Enter the following diagnostic mode on the scan tool: PCM Self-Test. • Retrieve the continuous memory DTCs from the PCM. • **Is DTC P0620, P0625, P0626 or P065B set in the PCM?**	**Yes** REFER to Section 414-00 . **No** GO to C3 .
C3 CHECK THE BATTERY CONDITION AND STATE OF CHARGE	
• Ignition OFF. • Check the battery condition and verify the battery is fully charged. Refer to Section 414-01 . • **Is the battery OK and fully charged?**	**Yes** GO to C4 . **No** REFER to Section 414-00 .
C4 CHECK THE SJB VOLTAGE SUPPLY	
• Measure and record the voltage at the battery. • Disconnect: SJB C2280G. • Ignition ON. • Measure the voltage between the SJB C2280G-1, circuit SDC02 (RD), harness side and ground.	**Yes** GO to C5 . **No** REPAIR the circuit for high resistance. CLEAR the DTC. REPEAT the self-test.

 N0082088 • **Is the voltage within 0.2 volt of the recorded battery voltage?**	
C5 CHECK THE SJB GROUND CIRCUIT	
• Ignition OFF. • Disconnect: Negative Battery Cable. • Disconnect: SJB C2280D. • Measure the resistance between the SJB C2280D-8, circuit GD126 (BK/WH), harness side and ground; and between the SJB C2280D-12, circuit GD126 (BK/WH), harness side and ground.  N0082089 • **Are the resistances less than 5 ohms?**	**Yes** CONNECT the negative battery cable. GO to C6 . **No** REPAIR the circuit for high resistance. CONNECT the negative battery cable. TEST the system for normal operation.
C6 CHECK FOR CORRECT SJB OPERATION	
• Disconnect the SJB connectors. • Check for: ♦ corrosion ♦ damaged pins ♦ pushed-out pins • Connect the SJB connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation. **No** The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: DTC U0155

Normal Operation

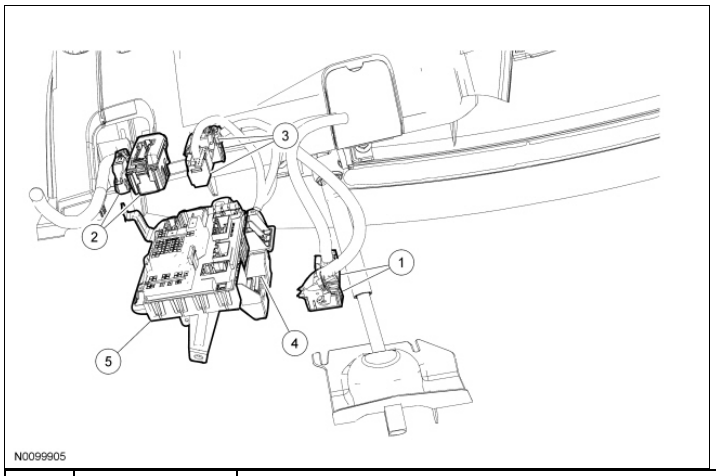
- DTC U0155 (Lost Communication With Instrument Panel Cluster (IC) Control Module) - a continuous DTC that sets when the SJB does not receive messaged data (loses communication) from the Instrument Panel Cluster (IPC) for longer than 5 minutes.

This pinpoint test is intended to diagnose the following:

- Module communication
- IPC

- SJB

PINPOINT TEST D: DTC U0155



Test Step	Result / Action to Take
D1 VERIFY CUSTOMER CONCERN	
• Ignition ON. • Verify that there is an observable symptom present. • **Is an observable symptom present?**	**Yes** GO to D2 . **No** The system is operating normally at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
D2 CHECK THE COMMUNICATION NETWORK	
• Ignition ON. • Enter the following diagnostic mode on the scan tool: Network Test . • Carry out the network test. • **Does the IPC pass the network test?**	**Yes** GO to D3 . **No** REFER to Section 418-00 , The IPC Does Not Respond To The Scan Tool.
D3 RETRIEVE THE RECORDED DTCs FROM THE SELF-TEST	
• Check for recorded SJB DTCs from the self-test. • **Is DTC B1317 or B1318 recorded?**	**Yes** For DTC B1317, GO to Pinpoint Test B . For DTC B1318, GO to Pinpoint Test C . **No** GO to D4 .
D4 RECHECK THE SJB DTCs	
NOTE: If new modules were installed prior to the DTC being set, the module configuration may be incorrectly set during Programmable Module Installation (PMI) or the PMI may not have been carried out. • Clear the DTCs. Repeat the SJB self-test. • **Is DTC U0155 still present?**	**Yes** GO to D5 . **No** The system is operating correctly at this time. The DTC may have been set due to high network traffic or intermittent fault condition.
D5 CHECK FOR DTC U0155 OR DTC U0155:00 IN OTHER MODULES	
• Clear the DTCs. • Ignition OFF. • Ignition ON. • Wait 10 seconds.	**Yes** INSTALL a new IPC . REFER to Section 413-01 . TEST the system for normal operation. **No**

• Enter the following diagnostic mode on the scan tool: Self-Test . • Retrieve the continuous memory DTCs from all modules. • **Is DTC U0155 or DTC U0155:00 set in any other module?**	INSTALL a new SJB . REFER to Smart Junction Box (SJB) in this section. TEST the system for normal operation.

Smart Junction Box (SJB)

Special Tool(s)

 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool

Item	Part Number	Description
1	-	Smart Junction Box (SJB) electrical connectors (part of 14401) (2 required)
2	-	SJB electrical connectors (part of 14A005) (2 required)
3	-	SJB electrical connectors (part of 14290) (2 required)
4	-	SJB locking tab
5	-	SJB

Removal

NOTICE: **Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage to the module may result.**

NOTE: Prior to the removal of the module, it is necessary to upload the module configuration information to the appropriate scan tool. This information needs to be downloaded into the new module once installed. For additional information, refer to Section 418-01 .

NOTE: The Tire Pressure Monitoring System (TPMS) functionality is integral to the Smart Junction Box (SJB).

NOTE: A new SJB is delivered in a "manufacturing mode" with 7 pre-set DTCs. In order to clear the 7 pre-set manufacturing mode DTCs, the following must occur:

- A successful configuration of the SJB .

- A successful TPMS sensor training.
- A successful self-test including the clearing of all DTCs.

NOTE: The DTC B106D is present when the SJB is not configured, even on applications that are not equipped with initiators.

- The 7 manufacturing mode DTCs are:
  - ♦ B106D (Tire Pressure Monitor System [TPMS] Initiators Not Configured)
  - ♦ B2477 (Module Configuration Failure)
  - ♦ B2868 (Left Front Tire Pressure Sensor Fault)
  - ♦ B2869 (Right Front Tire Pressure Sensor Fault)
  - ♦ B2870 (Right Rear Tire Pressure Sensor Fault)
  - ♦ B2871 (Left Rear Tire Pressure Sensor Fault)
  - ♦ C2780 (ECU in Manufacturer Sub-State)

1. **NOTE:** This step is only necessary if the SJB is being replaced.

   Upload the module configuration information from the SJB into the scan tool. For additional information, refer to Section 418-01 .

2. Disconnect the 7 electrical connectors.

3. Lift the SJB locking tab outward and slide the SJB upward to disengage it from the SJB bracket.

Installation

1. Position the SJB into the 3 keyholes of the SJB bracket and slide it downward until the SJB locking tab snaps into place.

2. **NOTE:** If the SJB is not being replaced, this is the last step that is necessary.

   Connect the 7 electrical connectors.

3. **NOTE:** If the Programmable Module Installation (PMI) procedure was not followed when a new SJB was installed, the Remote Keyless Entry (RKE) function (from the Integrated Keyhead Transmitter (IKT)) of the SJB must be programmed, or the IKT RKE functions is inoperative. IKTs can be programmed to the new SJB by cycling each IKT key to the ON position for a minimum of 6 seconds. If a new Instrument Panel Cluster (IPC) was installed, the IKT keys must be programmed to the new IPC . For additional information, refer to Section 419-01B .

   NOTE: DTC B2276 may be set, indicating there are less than 2 transmitters programmed to the SJB . For additional information, refer to Section 501-14 .

   Download the SJB configuration information from the scan tool to the SJB . For additional information, refer to Section 418-01 .

4. Train the tire pressure sensors. For additional information, refer to Section 204-04 .

5. **NOTE:** DTC C2780 cannot be cleared if any other DTCs are present in the SJB . When successful, this step clears the DTC C2780.

   Carry out the SJB self-test (must include an on-demand self-test) by clearing the DTCs, and then retrieving the DTCs to confirm all DTCs have been cleared.
