6. Reconnect the connectors to the driver's under- dash fuse/relay box, and do the following input tests:
   - If any test indicates a problem, find and correct the cause, then recheck the system.
   - If all the input tests prove OK, the driver's MICU must be faulty; replace the driver's under- dash fuse/relay box (see **DRIVER'S UNDER- DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
F11	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Blown No. 15(10 A) fuse in the under- hood fuse/relay box • An open or high resistance in the wire
Q1	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G402) • An open or high resistance in the ground wire
Q2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
R2	BRN	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G401) • An open or high resistance in the ground wire
R5	BLK	In all ignition switch positions or all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground(G402) • An open or high resistance in the ground wire
N7	WHT	Under all conditions	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's under-dash fuse/relay box • A short to ground in the wire
Q17	YEL	Hazard warning switch pressed	Measure the voltage to ground: There should be battery voltage.	• Faulty hazard warning switch • An open or high resistance in the wire
R13.	LT GRN	Ignition switch ON (II), or power mode ON, turn signal switch in left position	Measure the voltage between terminals R13 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire

R3	. BLK	Ignition switch ON (II), or power mode ON, turn signal switch in right or neutral position	Measure the voltage between terminals R13 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire
R14 . R3	GRY . BLK	Ignition switch ON (II), or power mode ON, turn signal switch in right position	Measure the voltage between terminals R14 and R3: There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the wire
		Ignition switch ON (II), or power mode ON, turn signal switch in left or neutral position	Measure the voltage between terminals R14 and R3: There should be about 5 V.	• Faulty combination light switch • A short to ground in the wire

HAZARD WARNING SWITCH TEST/REPLACEMENT

1. Remove the dashboard center vent (see **DASHBOARD CENTER VENT REMOVAL/INSTALLATION**).
2. Push out the hazard warning switch (A) from behind the dashboard center vent.

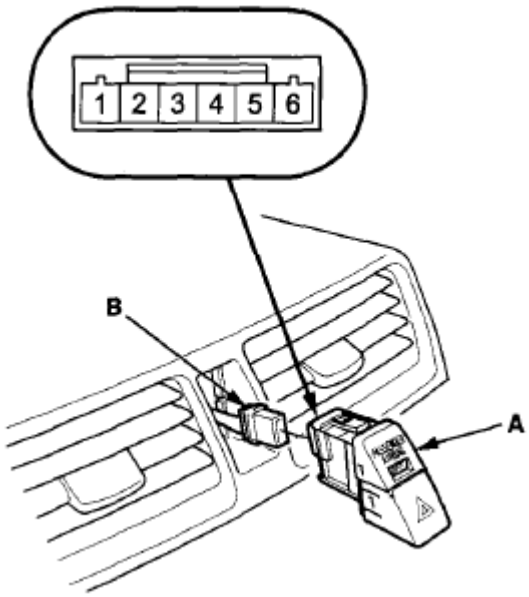

Fig. 8: Identifying Hazard Warning Switch & 6P Connector With Connector End View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 6P connector (B) from the hazard warning switch.
4. Check for continuity between the terminals in each switch position according to the table.

NOTE:

- **Make sure the correct test lead (+ or -) is placed on the terminal.**

- **When checking for continuity across the diode, use the diode setting on the digital volt/ohm meter to check the diode bias.**
- **Be careful of this characteristic; a diode is one that conducts fully in one direction (forward) and not at all in the opposite direction (reverse).**

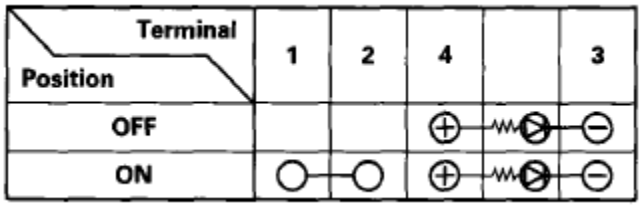

Fig. 9: Hazard Warning Switch Continuity Reference Chart
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the continuity is not as specified, replace the hazard warning switch.
6. Install the switch in the reverse order of removal.

FRONT TURN SIGNAL/PARKING LIGHT REPLACEMENT

REPLACEMENT

1. Remove the splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
2. Remove the bolt (A), then pull the front turn signal light (B) from the front bumper.

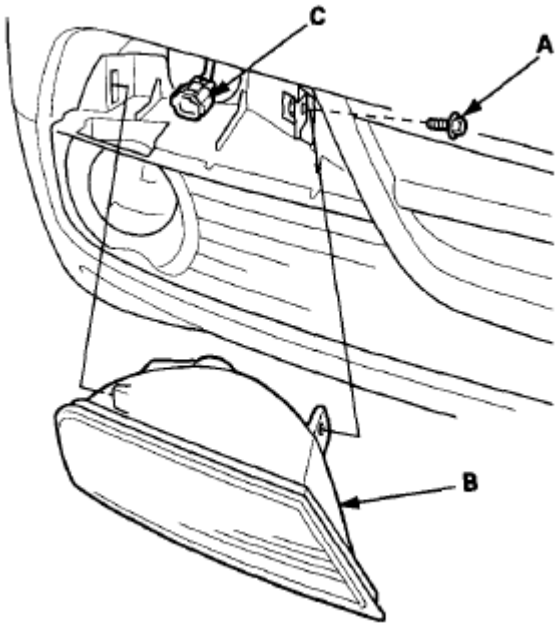

Fig. 10: Identifying Front Turn Signal Light, 3P Connector And Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the 3P connector (C) from the front turn signal light.
4. Install in the reverse order of removal.

BULB REPLACEMENT

1. Remove the inner fender (see **FRONT INNER FENDER REPLACEMENT**).
2. Disconnect the 3P connector (A) from the front turn signal light (B).

   Front Turn Signal/Parking Light: 24/2.2 CP

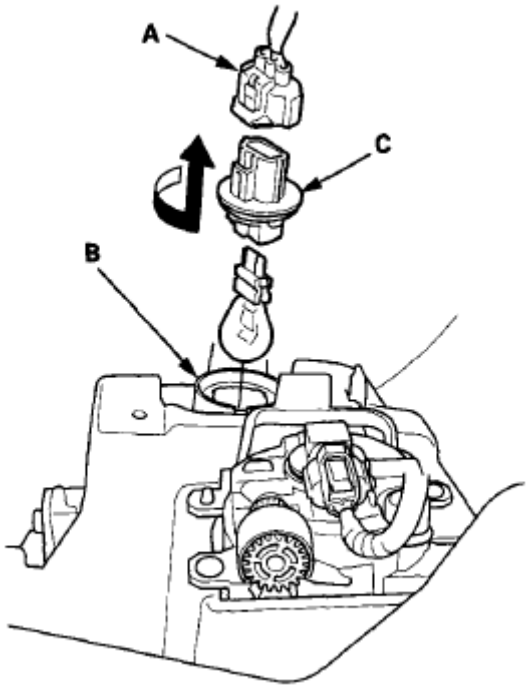

Fig. 11: Disconnecting 3P Connector From Front Turn Signal Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   The illustration shows the right side.

3. Turn the bulb socket (C) 45 ° counter clockwise to remove it from the housing.
4. Install a new bulb in the reverse order of removal.

SIDE TURN SIGNAL LIGHT REPLACEMENT

1. Remove the mirror holder (see **POWER MIRROR REPLACEMENT**).
2. Remove the screw (A), then pull out side turn signal light (B), then disconnect the 2P connector (C) from it.

   Side Turn Signal Light: LED

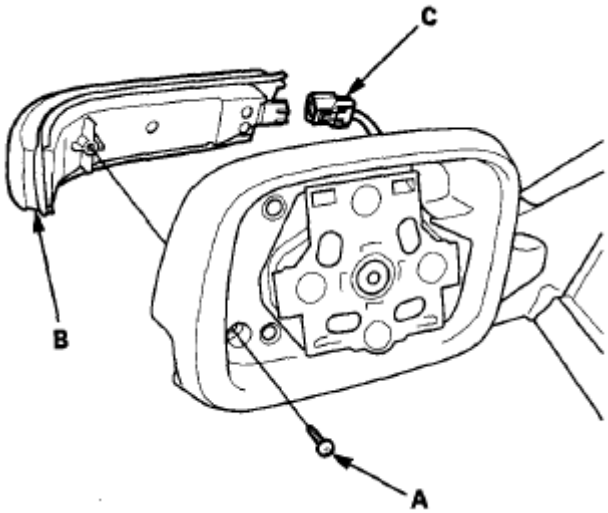

Fig. 12: Identifying 2P Connector, Side Turn Signal Light And Screw
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the light in the reverse order of removal.

GENERAL INFORMATION

Acura - 1987-13

ENGINE OIL LIFE/MAINTENANCE MINDER

NOTE: To determine the appropriate reset procedure, refer to ENGINE OIL LIFE/MAINTENANCE MINDER RESET INDEX. Only the vehicles listed in this index have an engine oil life or maintenance minder indicator.

ENGINE OIL LIFE/MAINTENANCE MINDER RESET INDEX

2011-13	Engine Oil Life/Maintenance Minder - Procedure 6
ZDX	
2010-13	Engine Oil Life/Maintenance Minder - Procedure 1

ENGINE OIL LIFE/MAINTENANCE MINDER - PROCEDURE 1

1. Turn ignition switch to ON (II) position.

NOTE: Models equipped with the keyless access system have an engine start/stop button instead of an ignition switch. ON Mode is the equivalent

of ON (II)

NOTE: On RDX: If the engine oil life is not displayed, press the SEL/RESET button on the steering wheel repeatedly until the multi-information display shows blank, SH-AWD and tire pressure.

2. Push and release the SEL/RESET button repeatedly until the engine oil life indicator is displayed.
3. Press and hold SEL/RESET button for more than 10 seconds. The remaining engine oil life reset mode will be shown on multi-information display.

NOTE: If you are resetting the display when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.

4. Press UP or DOWN button repeatedly until the RESET indicator is displayed, then press the SEL/RESET button. The maintenance item code(s) will disappear, and the engine oil life will reset to 100.
5. If you want to cancel the oil life reset mode, select CANCEL.

ENGINE OIL LIFE/MAINTENANCE MINDER - PROCEDURE 2

Resetting Multi-Information Display

1. Turn the ignition switch to ON (II).
2. Press the SELECT/RESET button repeatedly until the oil life is displayed (if more than 15%) or the maintenance message is displayed (if oil life is less than 15%).

NOTE: If you are resetting the display when the oil life is more than 15%, the maintenance message "SERVICE DUE SOON" will be displayed. Make sure the maintenance items requiring service have been performed before resetting this display.

3. Press and hold the SELECT/RESET button for 10 seconds until you see the maintenance message or "MAINTENANCE RESET". If the maintenance message is displayed, press and hold the SELECT/RESET button again for 10 seconds until you see "MAINTENANCE RESET".
   - To reset the display, press the SELECT/RESET button to select "OK". The next time the ignition switch is turned to "ON", the display will show "OIL LIFE 100%".
   - If you do not want to reset the display, press the <or> side of the INFO button to select "Cancel".

NOTE:

- **If the required service is performed and the display is not reset or if the display is reset without performing the service, the system will not show the proper maintenance levels. This can lead to serious mechanical problems because there will be no record of when maintenance is needed.**
- **If the indicated maintenance service is not performed and the**

remaining engine oil life is less than 0 percent, "SERVICE PAST DUE" will display, have the service performed immediately and make sure to reset the display as previously described.

- **If the message "SERVICE DUE NOW" does not appear more than 12 months after the display is reset, change the engine oil every year.**

ENGINE OIL LIFE/MAINTENANCE MINDER - PROCEDURE 3

With Technology Package

1. Turn ignition switch to ON (II) position.
2. Press the SEL/RESET knob on steering wheel until engine oil life is displayed.
3. Press and hold SEL/RESET knob for about 10 seconds. The remaining engine oil life reset mode will be shown on multi-information display.
4. Select RESET by pressing INFO (up or down) button, then press the SEL/RESET button to reset the engine oil life display. The maintenance item code(s) will disappear, and engine oil life will reset to 100. To cancel the oil life reset mode, select CANCEL.

Without Technology Package

1. Turn ignition switch to ON (II) position.
2. Press the SELECT/RESET knob repeatedly until engine oil life is displayed.
3. Press and hold SELECT/RESET knob for about 10 seconds. The engine oil life and maintenance item code(s) will blink.
4. Press SELECT/RESET knob for another 5 seconds. The maintenance item code(s) will disappear, and engine oil life will reset to "100".

ENGINE OIL LIFE/MAINTENANCE MINDER - PROCEDURE 4

1. Turn ignition switch to ON (II) position.
2. If engine oil life minder is not displayed, press the SEL/RESET button on steering wheel repeatedly until oil life minder is displayed.
3. Press and hold the SEL/RESET button for more than 10 seconds. The remaining engine oil life reset mode will be shown on the multi-information display.
4. Press the UP or DOWN arrow buttons on steering wheel to select RESET, and press SEL/RESET button. The maintenance item code(s) will disappear, and the engine oil life will reset to 100.
5. To cancel resetting the oil life reset mode, press the UP or DOWN arrow buttons to select CANCEL, and press SEL/RESET button.

NOTE: If you do not complete the reset procedure within 30 seconds after selecting the reset mode, the mode will be canceled automatically.

ENGINE OIL LIFE/MAINTENANCE MINDER - PROCEDURE 5

1. Turn ignition switch to ON (II) position.
2. If the oil life minder is not displayed, press the SEL/RESET button on the steering wheel repeatedly until it is.
3. Press and hold the SEL/RESET button on the steering wheel for 10 seconds. The remaining engine oil life reset mode will be shown on the multi-information display.
4. To reset the engine oil life, press the UP or DOWN button on steering wheel to select RESET on the display, and press the SEL/RESET button.
5. To cancel resetting the oil life, press the UP or DOWN button on steering wheel to select CANCEL on the display, and press SEL/RESET button.

ENGINE OIL LIFE/MAINTENANCE MINDER - PROCEDURE 6

1. Turn power mode to ON.
2. Press the UP or DOWN buttons on the steering wheel (right side) to display CUSTOMIZE SETTINGS on the multi-information display (center of instrument cluster).
3. Press the SEL/RESET button to select CUSTOMIZE SETTINGS.
4. Press the UP or DOWN buttons on the steering wheel to display MAINTENANCE INFO. Press the SEL/RESET button to select.
5. To reset the engine oil life, press the UP or DOWN button on steering wheel to select RESET on the display, and press the SEL/RESET button.
6. To cancel resetting the oil life, press the UP or DOWN button on steering wheel to select CANCEL on the display, and press SEL/RESET button.

MAINTENANCE REQUIRED LIGHT

NOTE: To determine the appropriate reset procedure, refer to MAINTENANCE REQUIRED LIGHT RESET INDEX. Only the vehicles listed in this index have a MAINTENANCE REQUIRED light.

1999-2003	**Maintenance Required - Procedure 4**
3.5RL	
1996-2004	**Maintenance Required - Procedure 5**

MAINTENANCE REQUIRED - PROCEDURE 1

1. For the first 6000 miles after completion of scheduled maintenance and indicator light reset, the MAINT REQD reminder light will illuminate for 2 seconds when ignition is turned to ON position. Between 6000-7500 miles, the MAINT REQD reminder light will illuminate for 2 seconds, then flash for 8 seconds, and then go out. After exceeding 7500 miles without having scheduled maintenance performed, light will remain on until it is reset.
2. When service has been completed, reset MAINT REQD reminder light. To reset light, ensure ignition switch is in OFF position. Turn ignition switch to ON position, with engine off. Push RESET button on maintenance reminder unit located behind lower dash cover and hold for 3 seconds. See **Fig. 1**. Turn ignition switch to OFF position. Turn ignition switch to ON position and verify MAINT REQD light has been reset.

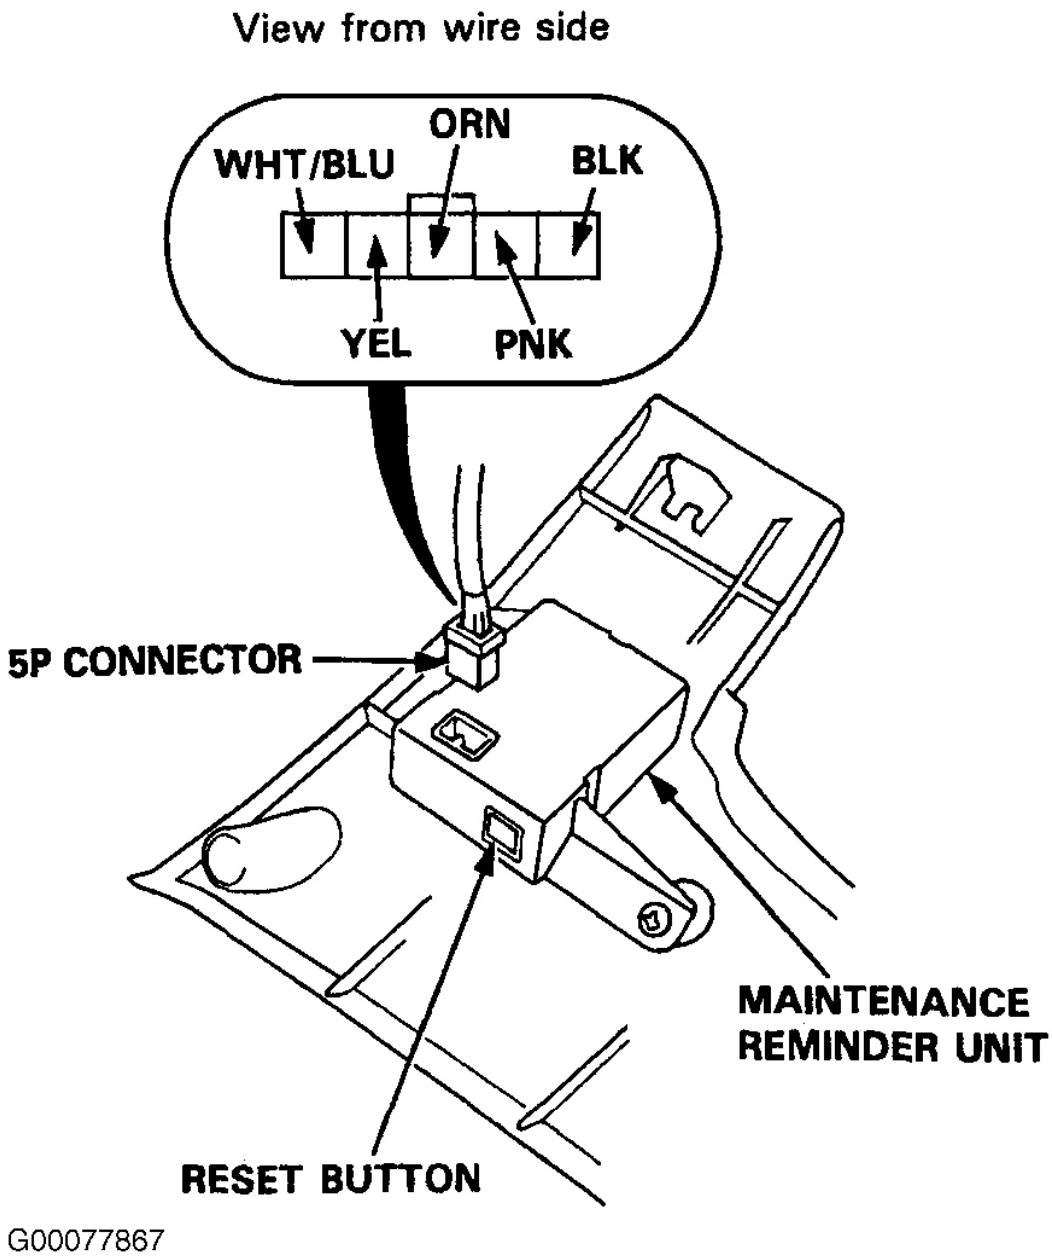

Fig. 1: Locating Maintenance Reminder Unit (Integra)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINTENANCE REQUIRED - PROCEDURE 2

1. At each 7500 mile service interval, the MAINTENANCE REQUIRED light will change from Green to Yellow. If service is not performed (and light is not reset), the MAINTENANCE REQUIRED light will change from Yellow to Red.

2. When service has been completed, reset MAINTENANCE REQUIRED reminder light. To reset light, turn ignition ON. Push button located under dash to the right of steering column (above gas pedal) and hold for 3 seconds. Turn ignition OFF. Start engine and verify light has been reset.

MAINTENANCE REQUIRED - PROCEDURE 3

1. At each 7500 mile service interval, the MAINTENANCE REQUIRED light will change from Green to Yellow. If service is not performed (and light is not reset), the MAINTENANCE REQUIRED light will change from Yellow to Red.
2. When service has been completed, reset MAINTENANCE REQUIRED reminder light. To reset reminder light, turn ignition off. Insert ignition key in slot provided below tachometer. See **Fig. 2**.

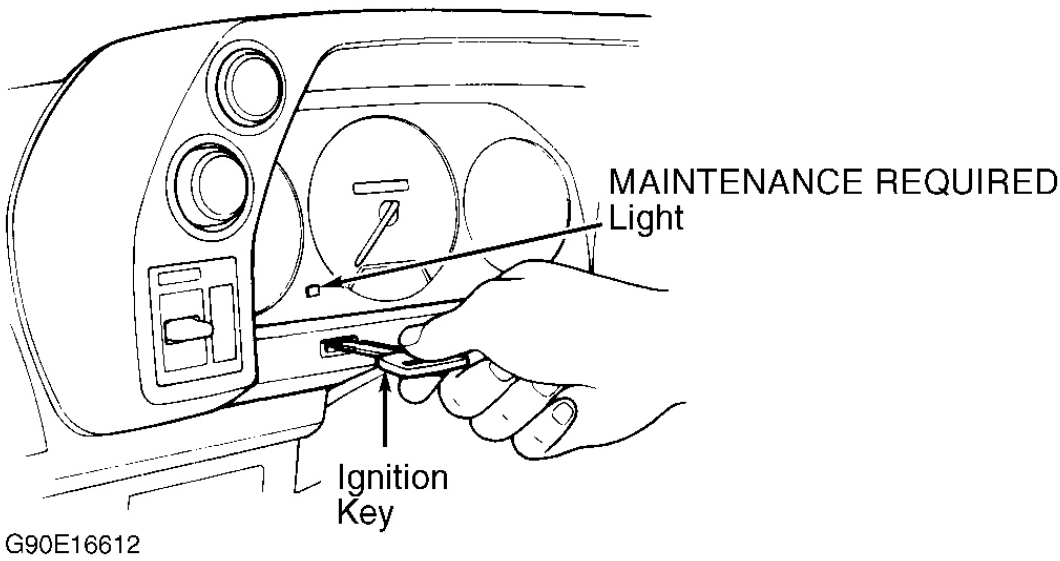

Fig. 2: Resetting Maintenance Required Light
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINTENANCE REQUIRED - PROCEDURE 4

1. At 5900-6100 miles MAINT REQ'D light blinks for 10 seconds when the ignition switch is turned to ON (II) position. At 7400-7600 miles MAINT REQ'D light illuminates and stays on while ignition switch is in ON (II) position.
2. To reset MAINT REQ'D light, turn ignition switch to OFF position. Push and hold the Trip or Select and the reset buttons simultaneously. Turn ignition switch to ON (II) position, and continue to hold buttons for more than 10 seconds.

MAINTENANCE REQUIRED - PROCEDURE 5

1. For the first 6,000 miles after Maintenance Required Indicator is reset, will come on for 2 seconds when

you turn ignition switch to ON (II). Between 6,000 and 7,500 miles, this indicator will light for 2 seconds when you first turn ignition switch to ON (II) and then flash for 10 seconds. If you exceed 7,500 miles without having scheduled maintenance preformed, this indicator will remain on as a constant reminder.

2. To reset, turn engine OFF. Press and hold Select and Reset buttons on instrument panel, then turn ignition switch to ON (II). Hold buttons for approximately 10 seconds until indicator goes off.

MAINTENANCE REQUIRED - PROCEDURE 6

1. For the first 8000 miles after completion of scheduled maintenance and indicator light reset, the MAINT REQ'D reminder light will illuminate for 2 seconds when ignition is turned to ON (II) position. Between 8000-10,000 miles, the MAINT REQ'D reminder light will illuminate for 2 seconds and then flash for 10 seconds, when ignition is turned on. After exceeding 10,000 miles without having scheduled maintenance performed, light will remain on until it is reset.
2. When service has been completed, reset MAINT REQ'D reminder light. To reset light, turn ignition switch to OFF position. Press and hold SELECT/RESET button located on right side of instrument cluster. While still holding button, turn ignition switch to ON (II) position, with engine off. Hold button until reminder light resets, after about 10 seconds.
3. If MAINT REQ'D reminder light does not reset, ensure headlights, parking lights, or both are turned off when resetting reminder light. The MAINT REQ'D indicator cannot be reset if any of these lights are on. If vehicle is equipped with daytime running lights and lights come on when ignition switch is turned to ON (II) position, daytime running lights must be disabled before indicator light can be reset.

SCHEDULED SERVICE DUE LIGHT

NOTE: To determine the appropriate reset procedure, refer to SCHEDULED SERVICE DUE LIGHT RESET INDEX. Only the vehicles listed in this index have a SCHEDULED SERVICE DUE light.

SCHEDULED SERVICE DUE LIGHT RESET INDEX

Model & Year	Reset Procedure
Legend	
1988-90	Scheduled Service Due Light - Procedure 1

SCHEDULED SERVICE DUE LIGHT - PROCEDURE 1

1. Every 7500 miles, a SCHEDULED SERVICE DUE warning light will illuminate as a reminder to change oil and oil filter. After servicing is completed, reset warning light.
2. To reset warning light, locate SERVICE RESET button. See **Fig. 3**. With ignition switch in the ON position, press SERVICE RESET button for 3 seconds. To verify reset, turn ignition switch off and on. Light should not come on.

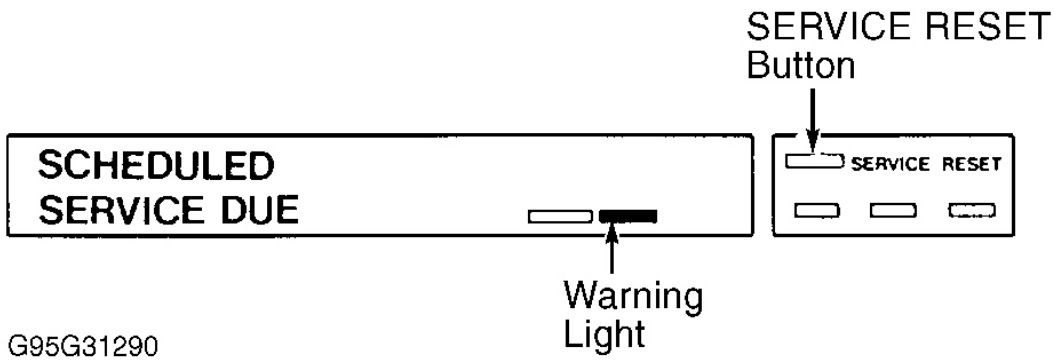

Fig. 3: Identifying Scheduled Service Light Reset Button
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TIRE PRESSURE MONITOR SYSTEM (TPMS)

NOTE: **To determine the appropriate reset procedure, refer to TPMS RESET PROCEDURE INDEX. Only the vehicles listed in this index are equipped with tire pressure monitor system.**

TPMS RESET PROCEDURE INDEX

Model & Year	Reset Procedure
ILX	
2013	TPMS Reset - Procedure 2
MDX

TSX	
2007-12	TPMS Reset - Procedure 1
ZDX	
2010-12	TPMS Reset - Procedure 1

TPMS RESET - PROCEDURE 1

Tire Pressure Monitor System

NOTE: All four sensor IDs must be memorized to the TPMS control unit whenever you do any of these actions:

- **Replace the TPMS control unit.**
- **Replace the tire pressure sensor.**
- **Substitute a known-good wheel with tire pressure sensor.**

NOTE: When replacing the TPMS control unit, use the HDS to memorize IDs.

NOTE: On models equipped with PAX tire systems, if a tire is repaired or replaced, the warning indicator (and the mileage counter that supports it) must be reset, no matter how far the vehicle was driven in the run flat mode. See appropriate manufacturer service information.

If low tire pressure indicator and multi-information display indicator(s) are lit continuously due to low pressure in one or more tires, adjust tire inflation to proper pressure as indicated on the tire and loading information placard. The light will remain on until tire pressure is properly set. If warning light is still illuminated or the TPMS indicator is lit continuously, there is a problem in the TPM system. Refer to manufacturer service information.

Memorizing Sensors IDs Automatically

NOTE: To ensure the control unit memorizes the correct ID, the vehicle with the new sensor must be at least 10 ft (3 m) from any other TPMS pressure sensor not installed on that vehicle.

After rotating the tires or replacing a tire pressure sensor, drive the vehicle for at least 40 seconds at a speed of 15 mph (24 km/h) or more, and all the sensor IDs will be memorized automatically.

NOTE: When replacing the TPMS control unit, use the HDS to memorize IDs. After the IDs are memorized, reduce the pressure in all four tires to less than the appropriate specification, and check to see that the four tire indicators come on.

Memorizing Sensor IDs with the Scan Tool (HDS)

NOTE: When replacing the TPMS control unit, use the HDS to memorize IDs.

NOTE: The HDS can memorize the ID of a new tire pressure sensor or a previously memorized ID.

1. With the ignition switch in LOCK (0), connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II) (or press the engine start/stop button to select the ON mode).

3. Make sure the HDS communicates with the vehicle and the TPMS control unit.
4. Memorize the ID of the tire pressure sensor by following the screen prompts on the HDS. See the HDS Help menu for specific instructions.
5. Turn the ignition switch to LOCK (0) (or press the engine start/stop button to select the OFF mode).

NOTE: When replacing the TPMS control unit, use the HDS to memorize IDs. After the IDs are memorized, reduce the pressure in all four tires to less than the appropriate specification, and check to see that the four tire indicators come on.

TPMS RESET - PROCEDURE 2

Tire Pressure Monitor System

NOTE: All four sensor IDs must be memorized to the TPMS control unit whenever you do any of these actions:

- **Replace the TPMS control unit.**
- **Replace the tire pressure sensor.**
- **Substitute a known-good wheel with tire pressure sensor.**

NOTE:

- **A TPMS sensor activation tool is necessary to do this procedure.**
- **Let the vehicle sit for at least 5 minutes to allow the tire pressure sensors to switch to sleep mode.**
- **To ensure the TPMS control unit memorizes the correct sensor ID, the vehicle with the new tire pressure sensor must be at least 10 ft (3 m) away from other vehicles that have sensors.**
- **When doing a tire rotation, memorizing the sensors is not needed.**

Memorizing Sensor IDs with the Scan Tool (HDS)

1. Connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.
2. Press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the vehicle and the TPMS control unit. If it does not communicate, troubleshoot the DLC circuit.
4. Select Sensor ID Learning from the Mode Menu on the HDS.
5. Follow the HDS screen prompts to turn on the TPMS sensor activation tool.
6. Hold the TPMS sensor activation tool near the valve stem of one wheel, and memorize the tire pressure sensor ID by following the screen prompts on the HDS.

NOTE:

- **If you press the engine start/stop button to select the OFF mode before memorizing all four sensor IDs, the memorizing sensor ID is**

canceled.

- **If more than one sensor ID is displayed on the HDS, verify that the vehicle has not been driven for 5 minutes, and there are no other vehicles or tire pressure sensors within 10 ft (3 m).**
- **See the HDS Help menu for specific instructions.**

7. Repeat procedure for each wheel until all four sensor IDs are memorized. When all four IDs are memorized, the low tire pressure/TPMS indicator blinks
8. Press the engine start/stop button to select the OFF mode.
9. Disconnect the HDS from the DLC.
10. Test-drive the vehicle at 28 mph (45 km/h) or more for at least 3 minutes.
11. Make sure the low tire pressure/TPMS indicator does not blink.
12. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.

2012 MAINTENANCE

Maintenance - TL

MAINTENANCE

LUBRICANTS AND FLUIDS

Application	Lubricant or Fluid
Engine	Acura Motor Oil J35Z6 engine: 0W-20 J37A4 engine: 5W-20 Look for the API certification seal on the oil container. Make sure it says "For Gasoline Engines." SAE viscosity: See chart.
Manual transmission	Acura Manual Transmission Fluid (MTF): Always use Acura MTF. Using motor oil can cause stiffer shifting because it does not contain the proper additives.
Automatic transmission	Acura Automatic Transmission Fluid (ATF DW-1): Always use Acura ATF DW-1. Using a non-Acura ATF can affect shift quality.
Transfer assembly (SH-AWD models)	Hypoid gear oil GL4 or GL5: Use an SAE 90 viscosity hypoid gear oil, API classified GL4 or GL5 only. Viscosity SAE 90: above 0°F (-18°C)
Rear differential (SH-AWD models)	Acura All-Wheel Drive Fluid (DPSF)
Brake system (including VSA lines) Clutch system (manual transmission)	Acura DOT 3 Brake Fluid: Always use Acura DOT 3 Brake Fluid. Using a non-Acura brake fluid can cause corrosion and decrease the life of the system.
Cooling system	Acura Long Life Antifreeze/Coolant Type 2

NOTE: SH-AWD model is shown.

MAINTENANCE MINDER™

GENERAL INFORMATION

Maintenance Minder

The Maintenance Minder is an important feature of the multi-information display. Based on engine and transmission operating conditions, and accumulated engine revolutions, the TL's onboard computer (ECM/PCM) calculates the remaining engine oil and the transmission fluid life. The system also displays the remaining engine oil life along with the code(s) for other scheduled maintenance items needing service.

Meter

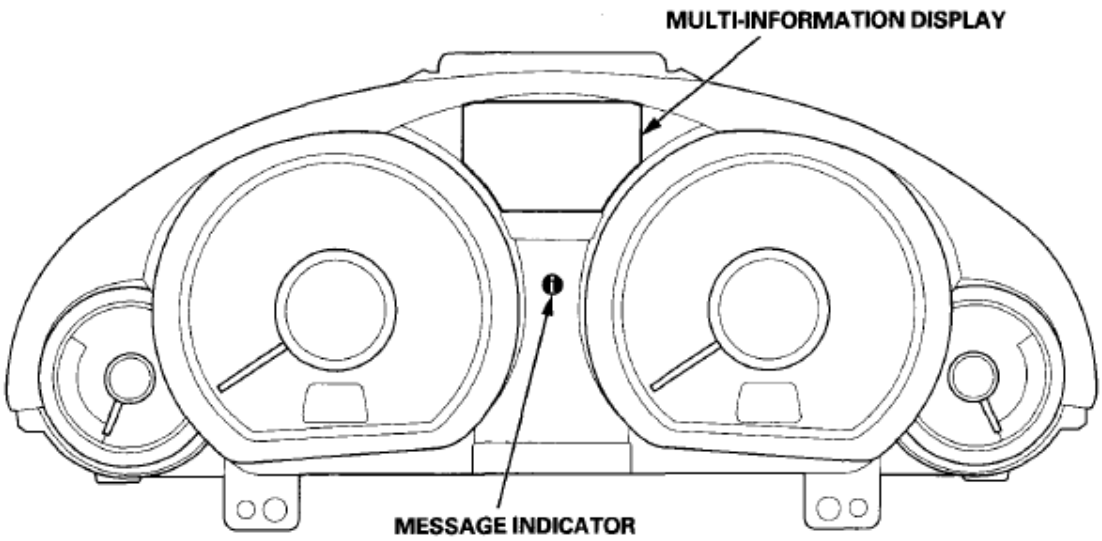

Fig. 5: Identifying Message Indicator And Multi-Information Display
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Steering Wheel

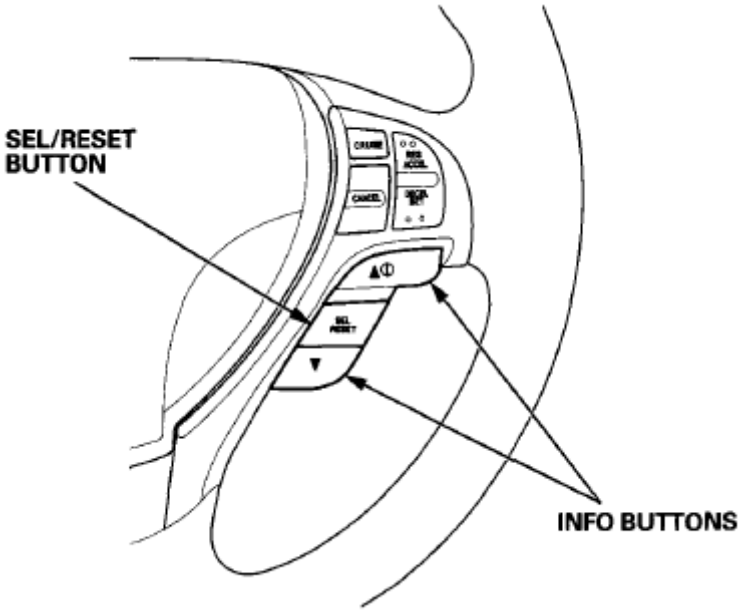

Fig. 6: Identifying Info Buttons On Steering Wheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Service Information

1. The remaining engine oil life (A) is shown as a percentage on the multi-information display. To see the current engine oil life, turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode then push and release the SEL/RESET button repeatedly until the engine oil life displays.

Fig. 7: Displaying - Oil Life
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. When the ignition switch is ON (II) or the vehicle ignition in the ON mode and the remaining engine oil life is 15 % to 6 %, the remaining engine oil life and other scheduled maintenance item(s) needing service are displayed.

   The Maintenance Minder message "SERVICE DUE SOON" (A) also comes on. To cancel the message, press the INFO button. The display continues to show the remaining engine oil life (B) and the message indicator (C) until it is reset.

   - Complete list of maintenance main items (D) (see **MAINTENANCE MAIN ITEMS**).
   - Complete list of maintenance sub items (E) (see **MAINTENANCE SUB ITEMS**).

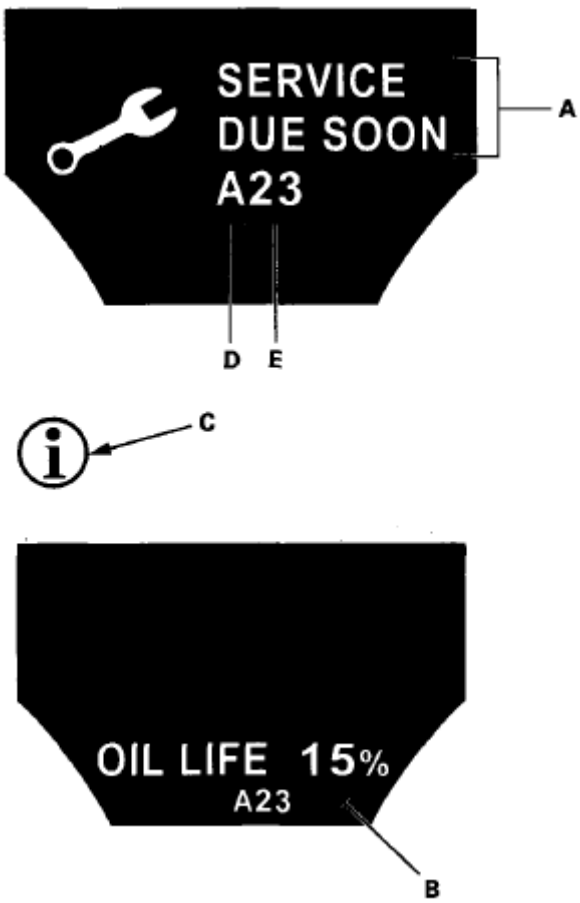

Fig. 8: Displaying - Service Due Soon
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. When the ignition switch is ON (II), or the vehicle ignition in the ON mode, and the remaining engine oil life is 5 % to 1 %, the Maintenance Minder message "SERVICE DUE NOW" is displayed along with the same maintenance item code(s). If the Maintenance Minder message display is canceled, a "SERVICE" message appears.

Fig. 9: Displaying - Service Due Now
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. When the ignition switch is ON (II), or the vehicle ignition in the ON mode, and the remaining engine oil

life is 0 %, the Maintenance Minder message "SERVICE PAST DUE" is displayed along with the same maintenance item code(s).

Fig. 10: Displaying - Service Past Due
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the indicated maintenance is not done, the "SERVICE PAST DUE" message shows a negative distance traveled, for example "10 miles," on the display. If the negative distance traveled is between 0 and 9, the message is displayed for only a few seconds when the ignition switch is turned to ON (II), or press the engine start/stop button to select the ON mode. The negative distance traveled (A) remains displayed after the vehicle is driven more than 10 miles (for USA models) or 10 km (for Canada models) after 0 % oil life is reached, and the display cannot be canceled. This means the indicated maintenance item (s) should have been done more than 10 miles (or 10 km) ago.

Fig. 11: Displaying - 10 Miles Service Past Due
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Resetting the Maintenance Minder

NOTE:

- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**
- **The engine oil life and maintenance item(s) can be independently reset with the HDS.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. If system message(s) are displayed, press the INFO button to cancel the display.
3. Push and release the SEL/RESET button repeatedly until the engine oil life indicator is displayed.
4. Press and hold the SEL/RESET button for about 10 seconds, the "OIL LIFE RESET" mode display appears.

NOTE:

- **If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**
- **To cancel the "OIL LIFE RESET" mode, press the INFO button repeatedly until the "CANCEL" indicator is displayed, then press the SEL/RESET button.**

Fig. 12: Displaying - Oil Life Reset Menu
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Press the INFO button to select "RESET," then press the SEL/RESET button. The maintenance item code (s) will disappear, and the engine oil life will reset to "100%."

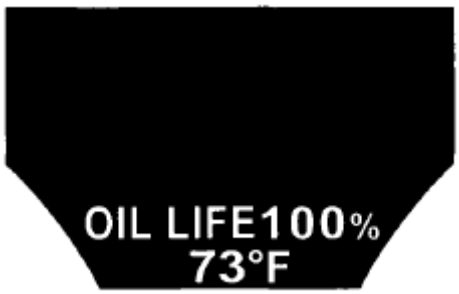

Fig. 13: Displaying - Oil Life And Temperature
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Resetting Individual Maintenance Items

1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) (see **HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM)**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

3. Make sure the HDS communicates with the vehicle and the engine control module/powertrain control module (ECM/PCM). If it doesn't communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Select GAUGES in the BODY ELECTRICAL with the HDS.
5. Select ADJUSTMENT in the GAUGES with the HDS.
6. Select MAINTENANCE MINDER in the ADJUSTMENT with the HDS.
7. Select RESET in the MAINTENANCE MINDER with the HDS.
8. Select the individual maintenance item you wish to reset with the HDS.

MAINTENANCE MAIN ITEMS

If the message "SERVICE DUE NOW" does not appear more than 12 months after the display is reset, change the engine oil every year.

NOTE:

- **Independent of the maintenance messages in the multi-information display, replace the brake fluid every 3 years.**
- **Inspect idle speed every 160, 000 miles (256, 000 km).**
- **Adjust the valves during services A, B, 1, 2, or 3 if they are noisy.**

Symbol	Maintenance Main Items
A	Replace engine oil (see **ENGINE OIL LEVEL CHECK**) o Engine oil capacity without oil filter: 4.0 L (4.2 US qt).
	Replace engine oil and oil filter (see **ENGINE OIL FILTER REPLACEMENT**) o Engine oil capacity with oil filter: 4.3 L (4.5 US qt).
	Check front and rear brakes (see **COMPONENT LOCATION INDEX**) • Check pads and discs for wear (thickness), damage, and cracks. • Check calipers for damage, leaks, and tightness of mounting bolts. • Check parking brake linings for cracking, glazing, wear, and for oil or grease contamination.
	Check parking brake adjustment (see **PEDAL FREE PLAY**) o Check the number of clicks (6 to 8) when parking brake lever is pulled with 196 N (20.0 kgf, 44.1 lbf) of force.
	Inspect tie-rod ends, steering gearbox, and gearbox boots (see **STEERING LINKAGE AND GEARBOX INSPECTION**) • Check steering linkage. • Check boots for damage and leaking grease.
	Inspect suspension components

	• Check bolts for tightness. • Check condition of ball joint boots for deterioration and damage. ○ Front (see **COMPONENT LOCATION INDEX - FRONT SUSPENSION**) ○ Rear (see **COMPONENT LOCATION INDEX - REAR SUSPENSION**)
	Inspect driveshaft boots (see **DRIVESHAFT INSPECTION**) ○ Check boots for cracks and boot bands for tightness.
	Inspect brake hoses and lines including VSA lines (see **BRAKE HOSE AND LINE INSPECTION**) ○ Check master cylinder and VSA modulator-control unit for damage and leakage.
B	Inspect all fluid levels and condition of fluids • Engine coolant (see **COOLANT CHECK**) • Manual transmission fluid (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**) • Automatic transmission fluid (see **ATF LEVEL CHECK**) • Transfer assembly fluid (SH-AWD models) ○ M/T (see **TRANSFER ASSEMBLY FLUID INSPECTION AND REPLACEMENT**) ○ A/T (see **TRANSFER ASSEMBLY FLUID REPLACEMENT**) • Rear differential fluid (SH-AWD models) (see **REAR DIFFERENTIAL FLUID INSPECTION AND REPLACEMENT**) • Clutch fluid (see **CLUTCH HYDRAULIC SYSTEM BLEEDING**) • Brake fluid (see **BRAKE SYSTEM BLEEDING**) • Windshield washer fluid
	Inspect exhaust system* • Check catalytic converter heat shields, exhaust pipes, and muffler for damage, leaks, and tightness. ○ Without SH-AWD (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**) ○ With SH-AWD (see **J37A4 ENGINE (WITH SH-AWD)**)
	Inspect fuel lines* • Without SH-AWD (see **FUEL LINE INSPECTION**) • With SH-AWD (see **WITH SH-AWD**) and connections* • Without SH-AWD (see **FUEL LINE/QUICK-CONNECT FITTING PRECAUTIONS**)

	• With SH-AWD (see **WITH SH-AWD**) ○ Check for loose connections, cracks, and deterioration; retighten loose connections and replace damaged parts.

NOTE: According to state and federal regulations, failure to do the maintenance items marked with an asterisk (*) will not void the client's emissions warranties. However, Acura recommends that all maintenance services be done at the recommended interval, to ensure long-term reliability.

MAINTENANCE SUB ITEMS

Number	Maintenance Sub Items
1	Rotate tires, and check tire inflation and condition ○ Follow the pattern shown in the Owner's Manual.
2	Replace air cleaner element (see **AIR CLEANER ELEMENT INSPECTION/REPLACEMENT**) ○ If the vehicle is driven primarily in dusty conditions, replace every 15, 000 miles (24, 000 km). Replace dust and pollen filter (see **DUST AND POLLEN FILTER REPLACEMENT**) • If the vehicle is driven mostly in areas that have high concentrations of dust, pollen, or soot in the air, replace every 15, 000 miles (24, 000 km). • Replace filter whenever airflow from the heating and air conditioning system is less than normal.
	Inspect drive belt (see **DRIVE BELT INSPECTION**) ○ Look for cracks and damage, and inspect auto-tensioner; no adjustment is needed.
3	Replace manual transmission fluid (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**) • Capacity: 2.1 L (2.2 US qt) • Use Acura MTF.
	Replace automatic transmission fluid (see **ATF REPLACEMENT**) • Capacity: 3.1 L (3.3 US qt) • Use Acura Automatic Transmission Fluid (ATF DW-1).
	Replace transfer assembly fluid (SH-AWD models) • Capacity: 0.43 L (0.45 US qt) ○ M/T (see **TRANSFER ASSEMBLY FLUID INSPECTION AND**

	REPLACEMENT) ○ A/T (see **TRANSFER ASSEMBLY FLUID REPLACEMENT**) • Use hypoid gear oil GL4 or GL5.
4	Replace spark plugs (see **IGNITION COIL AND SPARK PLUG REMOVAL/INSTALLATION**) • J35Z6: Use DILZKR7A11G (NGK) • J37A4: Use ILZKR7B-11S (NGK), SXU22HCR11S (DENSO)
	Replace timing belt ○ J35Z6 (see **TIMING BELT REPLACEMENT**) ○ J37A4 (see **TIMING BELT REPLACEMENT**) and inspect water pump (see **WATER PUMP INSPECTION**) ○ If the vehicle is regularly driven in very high temperatures over 110°F (43°C), or in very low temperatures under - 20°F (- 29°C), replace every 60, 000 miles (USA)/100, 000 km (Canada).
	Inspect valve clearance (cold) • Intake: 0.20- 0.24 mm (0.008- 0.009in), Exhaust: 0.28- 0.32 mm (0.011- 0.012 in) ○ J35Z6 (see **VALVE CLEARANCE ADJUSTMENT**) ○ J37A7 (see **VALVE CLEARANCE ADJUSTMENT**)
5	Replace engine coolant (see **COOLANT CHECK**) • Capacity (including reservoir): 6.3 L (1.66 US gal) • Use Acura Long Life Antifreeze/Coolant Type 2
6	Replace rear differential fluid (SH-AWD models) (see **REAR DIFFERENTIAL FLUID INSPECTION AND REPLACEMENT**) • Capacity: 2.53 L (2.67 US qt) • Use Acura All-Wheel Drive Fluid (DPSF). • Driving in mountainous areas at very low vehicle speeds results in higher level of mechanical (shear) stress to fluid. This requires differential fluid changes more frequently than recommended by the Maintenance Minder. If the vehicle is regularly driven in these conditions, have the differential fluid changed at 7, 500 miles (12, 000 km), thereafter every 15, 000 miles (24, 000 km).

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If engine electrical maintenance is required)

The Acura TL SRS includes a driver's airbag in the steering wheel hub, a front passenger's airbag in the, dashboard above the glove box, front seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in this Service Information. Servicing, disassembling, or replacing SRS items requires special precautions and tools, and should be done by an authorized Acura dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work should be done by an authorized Acura dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the front airbags, side airbags, side curtain airbags, and/or front seat belt tensioners.
- Do not bump or impact the SRS unit, front impact sensors, side impact sensors, or rear safing sensor, especially when the ignition switch is in ON (II), or the engine start/stop button is in the ON mode, for at least 3 minutes after the ignition switch is turned to LOCK (0), or after the engine start/stop button is pressed to select the OFF mode; otherwise, the system may fail in a collision, or the airbags or the tensioners may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, center console, dashboard, dashboard undercover, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

2012 RESTRAINTS

Seat Belts - TL

COMPONENT LOCATION INDEX

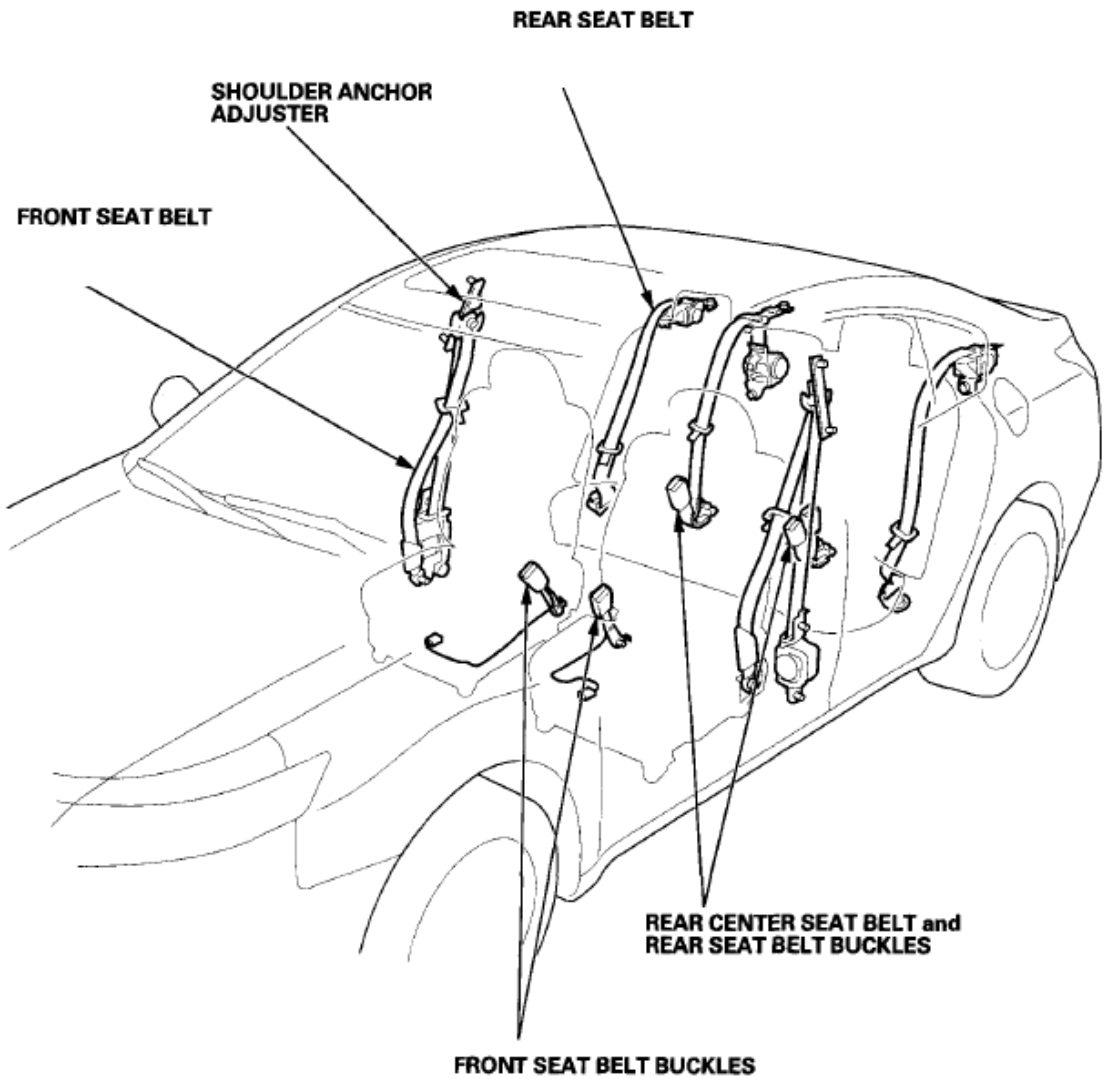

Fig. 1: Seat Belts Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FRONT SEAT BELT REPLACEMENT

FRONT SEAT BELT

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

NOTE:

- **If replacing the front seat belts after deployment, refer to Component Replacement/Inspection After Deployment (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT) for a complete list of other parts that must also be replaced.**
- **Put on gloves to protect your hands.**
- **Take care no to scratch the body or tear the seat covers.**
- **Check the front seat belts for damage, and replace them if necessary. Be careful not to damage them during removal and installation.**
- **The driver's seat is shown; the passenger's seat is similar.**

1. Slide the front seat all the way forward. Carefully pry up on the bottom of the anchor cover (A) at the pry point (B) with the appropriate trim tool to release the hooks (C) and the tab (D), then remove the cover by pulling it upward.

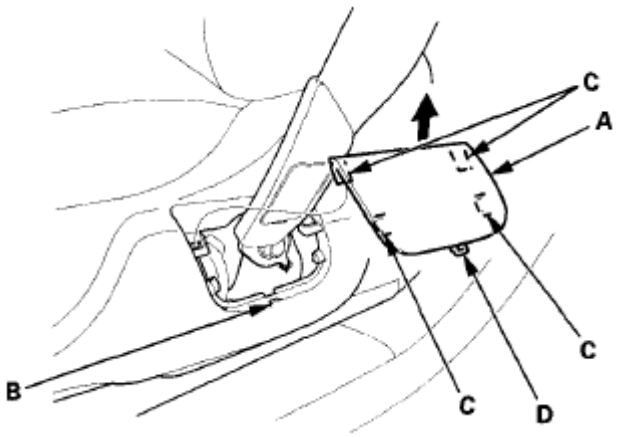

Fig. 2: Identifying Front Seat Anchor Cover, Pry Point, Hooks And Tab
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the lower anchor bolt (A).

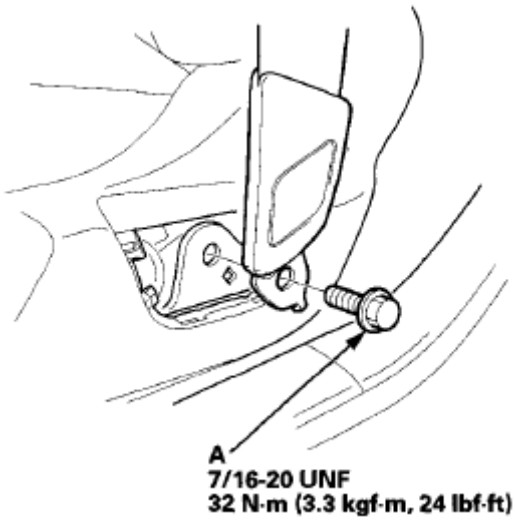

Fig. 3: Identifying Lower Anchor Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before beginning work.
4. Remove the B-pillar upper/lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
5. Remove the upper anchor bolt (A).

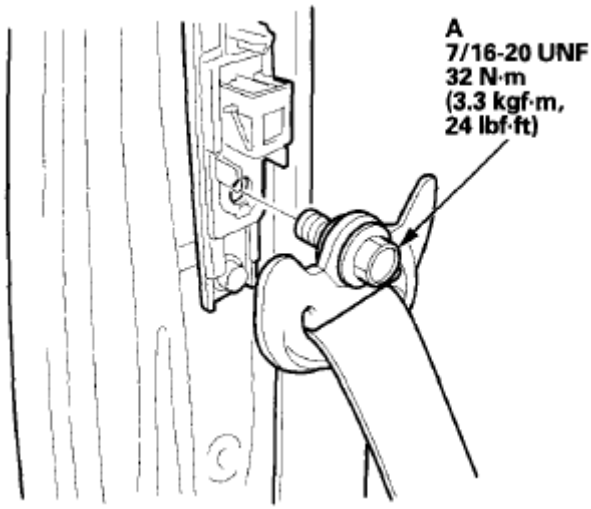

Fig. 4: Identifying Upper Anchor Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the seat belt tensioner connector (A). Remove the upper retractor mounting bolt (B) and the lower retractor bolt (C), then remove the front seat belt assembly (D).

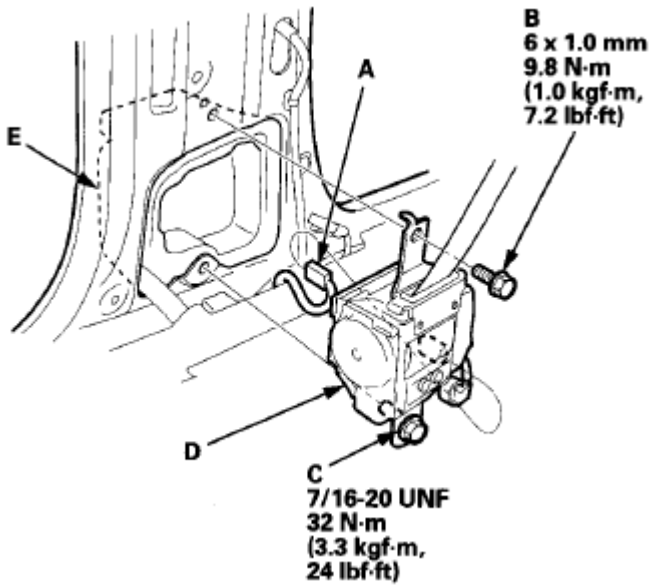

Fig. 5: Removing Upper Retractor Mounting Bolt And Lower Retractor Bolt, And Front Seat Belt Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. If necessary, remove the front seat belt protector (E).
8. Remove the shoulder anchor adjuster (A).

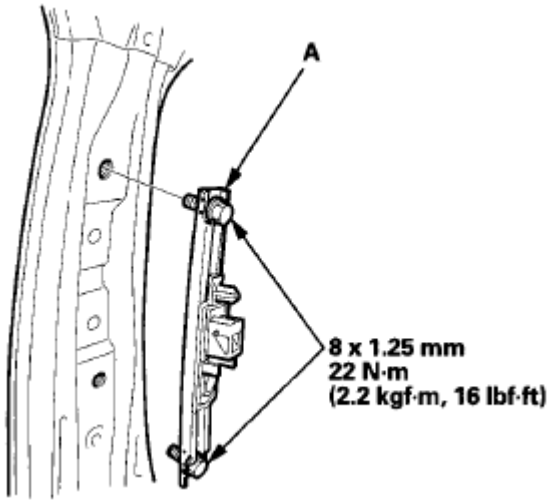

Fig. 6: Removing Shoulder Anchor Adjuster With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the seat belt assembly in the reverse order of removal, and note these items:
   - Check that the **retractor** locking mechanism functions.
   - Assemble the washer, the collars, and the bushing on the upper anchor bolt and the retractor bolt as shown.

- Apply medium strength liquid thread lock to the upper anchor bolt before reinstallation.
- Tighten the bolts by hand first, then tighten to the specified torque.
- Before installing the anchor bolts, make sure there are no twists or kinks in the seat belt.
- Make sure the seat connector is plugged in properly.
- Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
- Check for any DTCs that may have been set during repairs, and clear them.

Upper anchor bolt installation

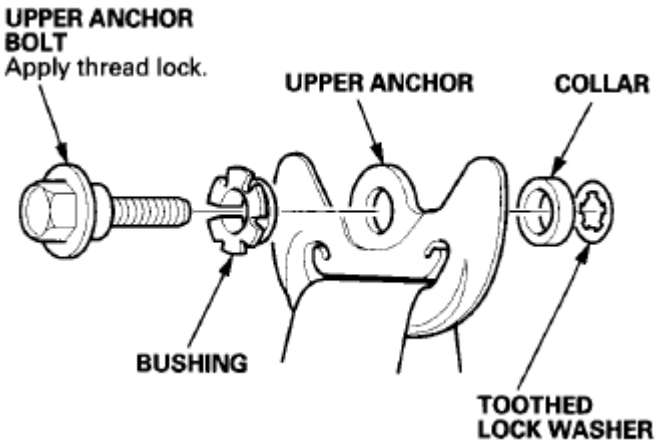

Fig. 7: Installing Upper Anchor Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Retractor bolt installation

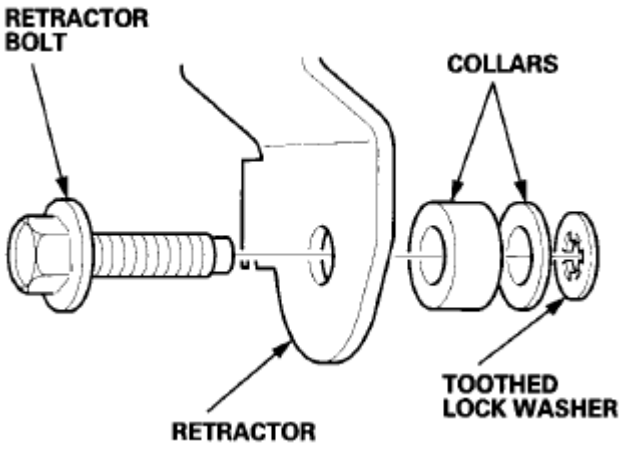

Fig. 8: Installing Retractor Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FRONT SEAT BELT BUCKLE

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the body or tear the seat covers.**

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before beginning work.
2. Remove the front seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
3. Lift up the front seat, disconnect the seat belt buckle switch connector (A), then detach the connector clip (B) and the harness clip(s) (C).

Driver's seat (Without seat ventilation)

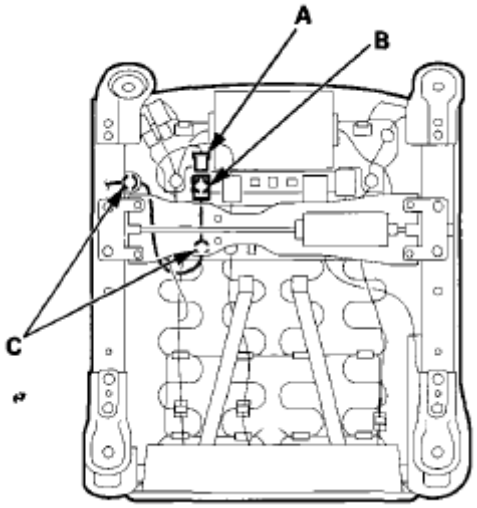

Fig. 9: View Of Driver's Seat (Without Seat Ventilation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driver's seat (With seat ventilation)

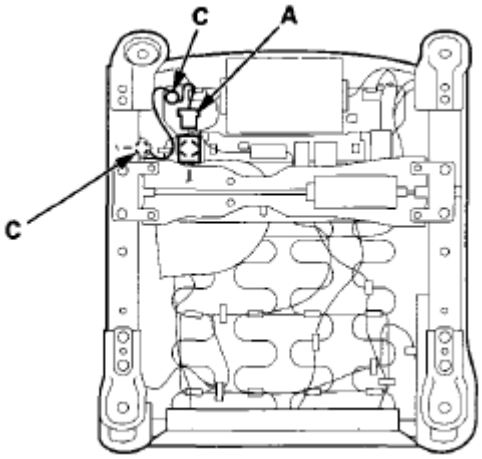

Fig. 10: View Of Driver's Seat (With Seat Ventilation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Passenger's seat

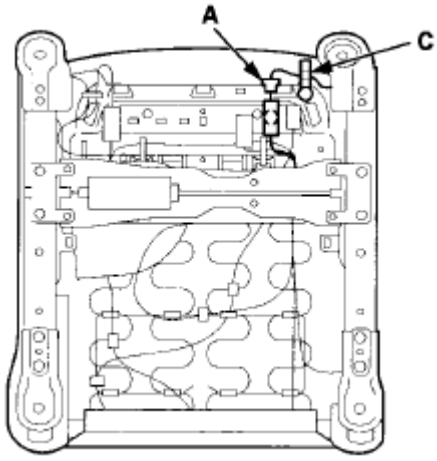

Fig. 11: View Of Passenger's Seat
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the center anchor bolt (A), and detach the harness clips (B), then remove the seat belt buckle (C).

Driver's seat

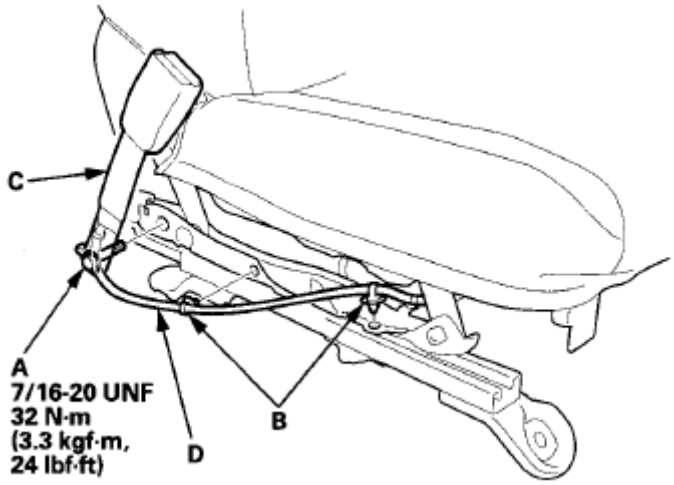

Fig. 12: Identifying Center Anchor Bolt, Harness Clips, And Seat Belt Buckle (Driver's Seat) With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Passenger's seat

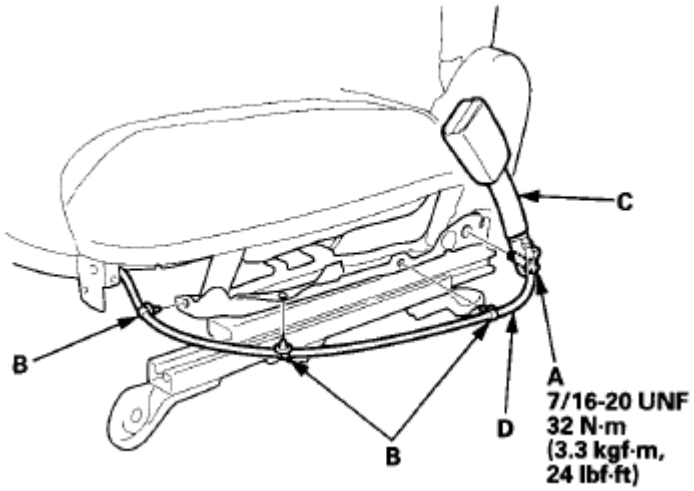

Fig. 13: Identifying Center Anchor Bolt, Harness Clips, And Seat Belt Buckle (Passenger's Seat) With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Pull out the seat belt buckle switch harness (D) through the space between the seat cushion and the seat track.
6. Install the buckle in the reverse order of removal, and note these items:
   - Assemble the washers and the collar on the center anchor bolt as shown.
   - Before installing the center anchor bolt, make sure there are no twists or kinks in the front seat belt.
   - Tighten the bolts by hand first, then tighten to the specified torque.
   - Make sure the connector is plugged in properly.

- Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
- Check for any DTCs that may have been set during repairs, and clear them.

Center anchor bolt installation

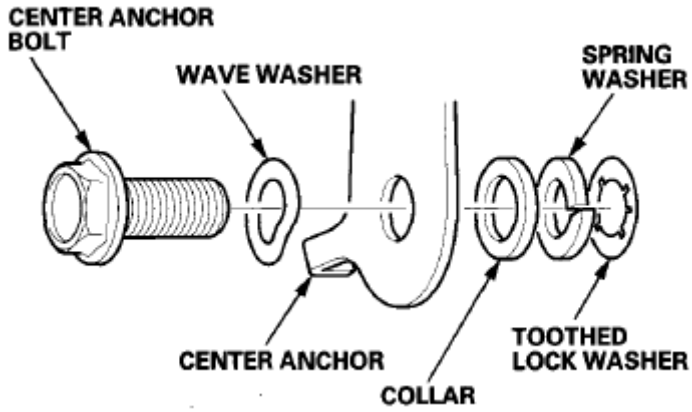

Fig. 14: Installing Center Anchor Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

REAR SEAT BELT REPLACEMENT

REAR SEAT BELT

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the body or tear the seat covers.**
- **Check the front seat belts for damage, and replace them if necessary. Be careful not to damage them during removal and installation.**

1. Remove the rear seat cushion and the rear seat-back (see **REAR SEAT REMOVAL/INSTALLATION**).
2. Remove the lower anchor bolt (A).

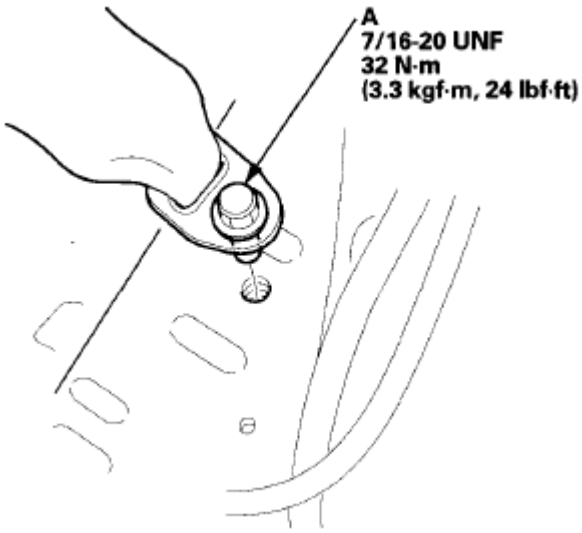

Fig. 15: Identifying Lower Anchor Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove these items:
   - C-pillar trims, both sides (see **TRIM REMOVAL/INSTALLATION - PILLAR AREAS**)
   - Rear shelf (see **TRIM REMOVAL/INSTALLATION - REAR SHELF AREA**)
4. Remove the retractor mounting bolt (A) and the retractor bolt (B), then remove the rear seat belt assembly (C).

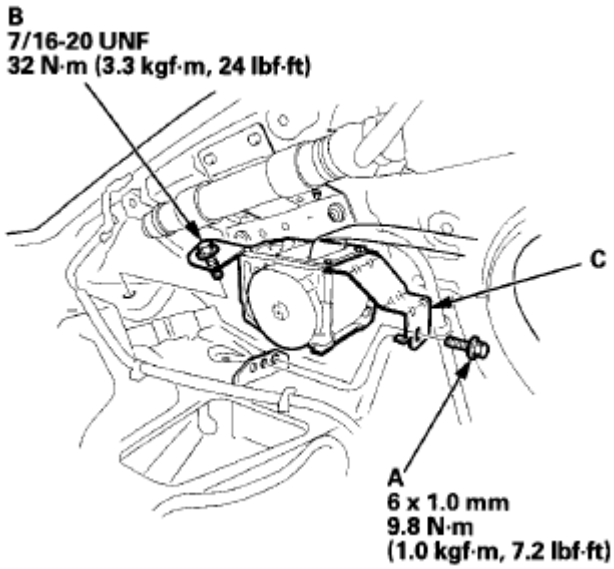

Fig. 16: Identifying Retractor Mounting Bolt And Retractor Bolt And Rear Seat Belt Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the rear seat belt assembly in the reverse order of removal, and note these items:

- Check that the **retractor** locking mechanism functions.
- Before installing the anchor bolt, make sure there are no twists or kinks in the rear seat belt.

REAR CENTER SEAT BELT AND REAR SEAT BELT BUCKLES

NOTE:

- **Put on gloves to protect your hands.**
- **Take care not to scratch the body or tear the seat covers.**
- **Check the center seat belt for damage, and replace it if necessary. Be careful not to damage it during removal and installation.**

1. Remove the rear seat cushion (see **REAR SEAT REMOVAL/INSTALLATION**).
2. Remove the center anchor bolts (A), then remove the right seat belt buckle (B), the center seat belt buckle (C), and the left seat belt buckle (D).

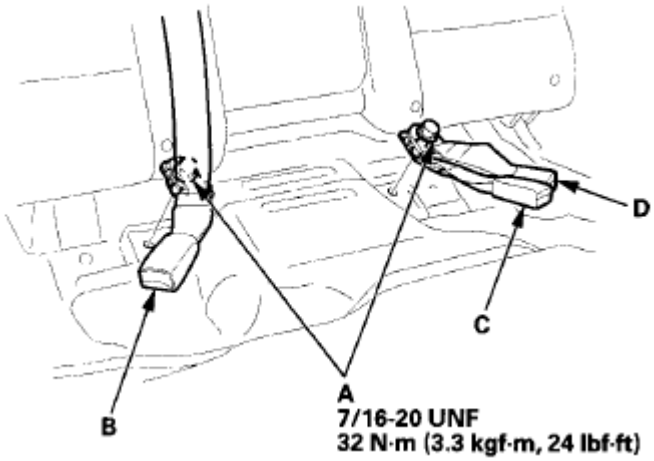

Fig. 17: Identifying Center Anchor Bolts, Right Seat Belt Buckle, Center Seat Belt Buckle And Left Seat Belt Buckle With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the rear seat-back (see **REAR SEAT REMOVAL/INSTALLATION**).
4. Remove these items:
   - C-pillar trims, both sides (see **C-PILLAR TRIM**)
   - Rear shelf (see **TRIM REMOVAL/INSTALLATION - REAR SHELF AREA**)
5. Remove the upper anchor bolt (A).

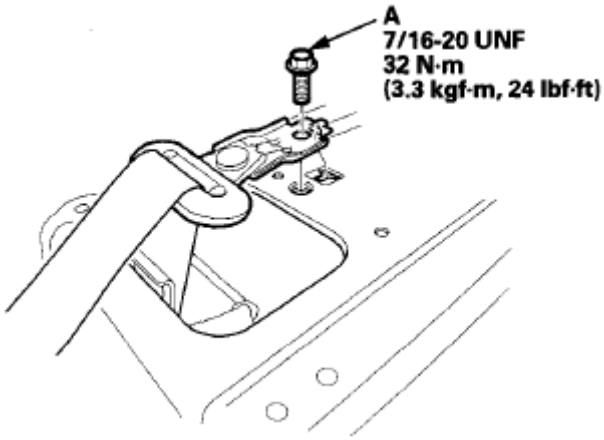

Fig. 18: Identifying Upper Anchor Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Loosen the retractor mounting bolt (A), and remove the retractor bolt (B), then remove the center seat belt assembly (C).

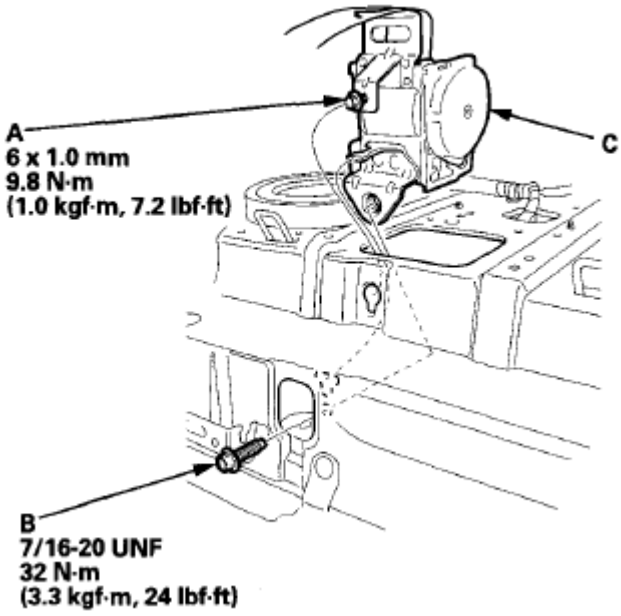

Fig. 19: Identifying Retractor Mounting Bolt, Retractor Bolt And Center Seat Belt Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the seat belt and buckles in the reverse order of removal, and note these items:
   - Check that the **retractor** locking mechanism functions.
   - Assemble the washer on the center anchor bolt as shown.
   - Before installing the center anchor bolt, make sure there are no twists or kinks in the center seat belt.

- Tighten the bolts by hand first, then tighten to the specified torque.

Center anchor bolt installation

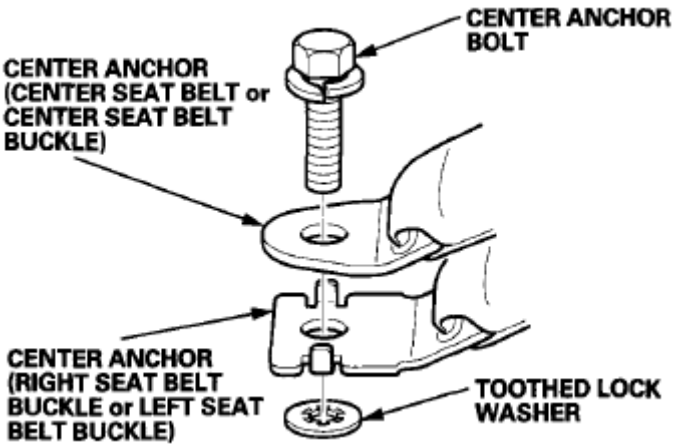

Fig. 20: Installing Center Anchor Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSPECTION

OUT OF VEHICLE

For front seat belt retractors with seat belt tensioners, review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

RETRACTOR

1. Before installing the retractor, check that the seat belt can be pulled out freely.
2. Make sure that the seat belt does not lock when the retractor (A) is leaned slowly up to 15 ° from the mounted position. The seat belt should lock when the retractor is leaned over 40 °. Do not attempt to disassemble the retractor.

   Driver's side

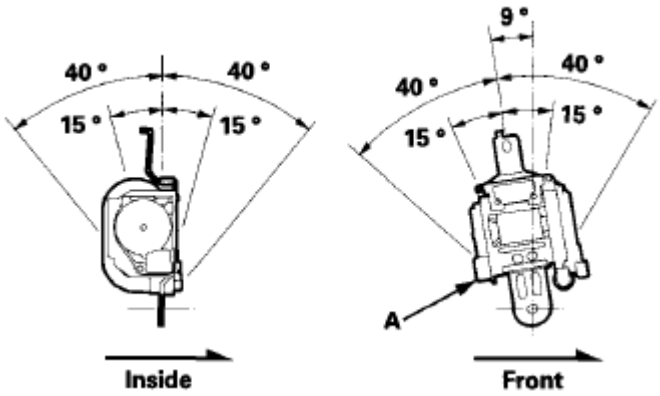

Fig. 21: Identifying Seat Belt Retractor Locking Angle (Driver's Side)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Passenger's side

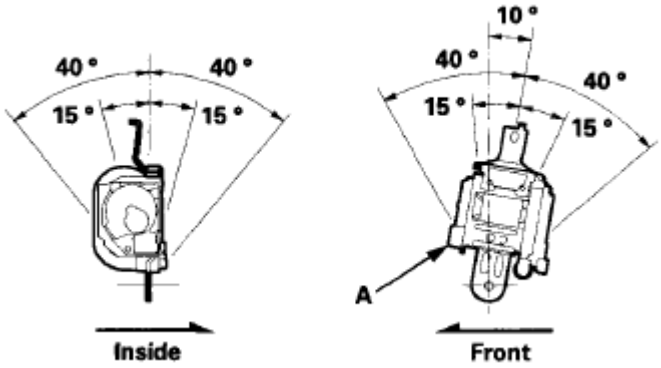

Fig. 22: Identifying Seat Belt Retractor Locking Angle (Passenger's Side)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear

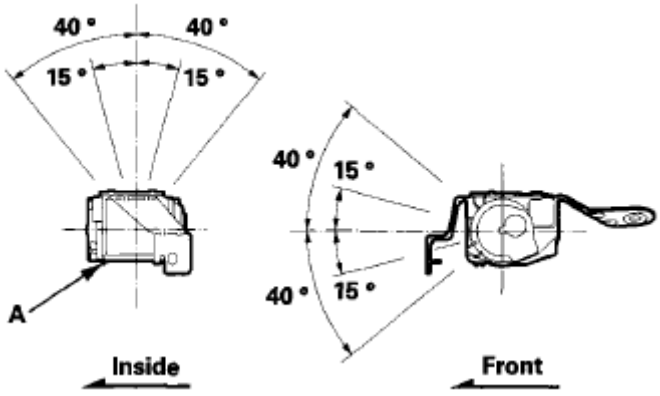

Fig. 23: Identifying Seat Belt Retractor Locking Angle (Rear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear center

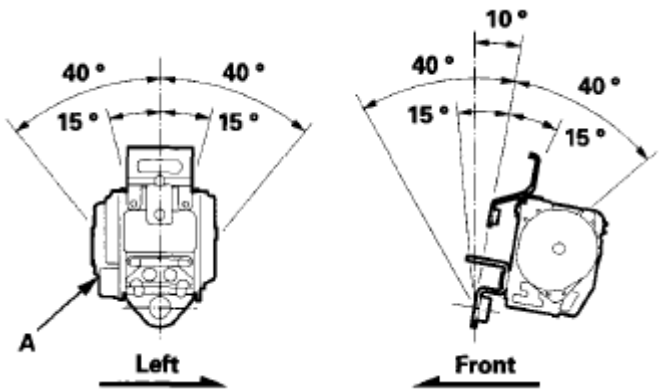

Fig. 24: Identifying Seat Belt Retractor Locking Angle (Rear Center)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

IN-VEHICLE

1. Check that the seat belt is not twisted or caught on anything.
2. After installing the anchors, check for free movement on the anchor bolts. If necessary, remove the anchor bolts, and check that the washers and other parts are not damaged or improperly installed.
3. Check the seat belts for damage or discoloration. Clean with a shop towel if necessary. Use only soap and water to clean the seat belt.

NOTE: Dirt build-up in the loops of the upper anchors can cause the seat belts to retract slowly. Wipe the inside of the loops with a clean cloth dampened with isopropyl alcohol.

4. Check that the seat belt does not lock when pulled out slowly. The seat belt is designed to lock only during a sudden stop or impact.
5. Make sure that the seat belt will retract automatically when released.
6. For each passenger's seat belt, check the seat belt retractor locking mechanism automatic locking retractor (ALR). This function is for securing child seats.
    1. Pull the seat belt all the way out to engage the ALR. The seat belt should retract, but not extend. This is normal.
    2. To disengage the ALR, release the seat belt and allow it to fully retract, then pull the seat belt out part-way. The seat belt should retract and extend normally.
7. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

2012 RESTRAINTS

Supplemental Restraint System - TL

COMPONENT LOCATION INDEX

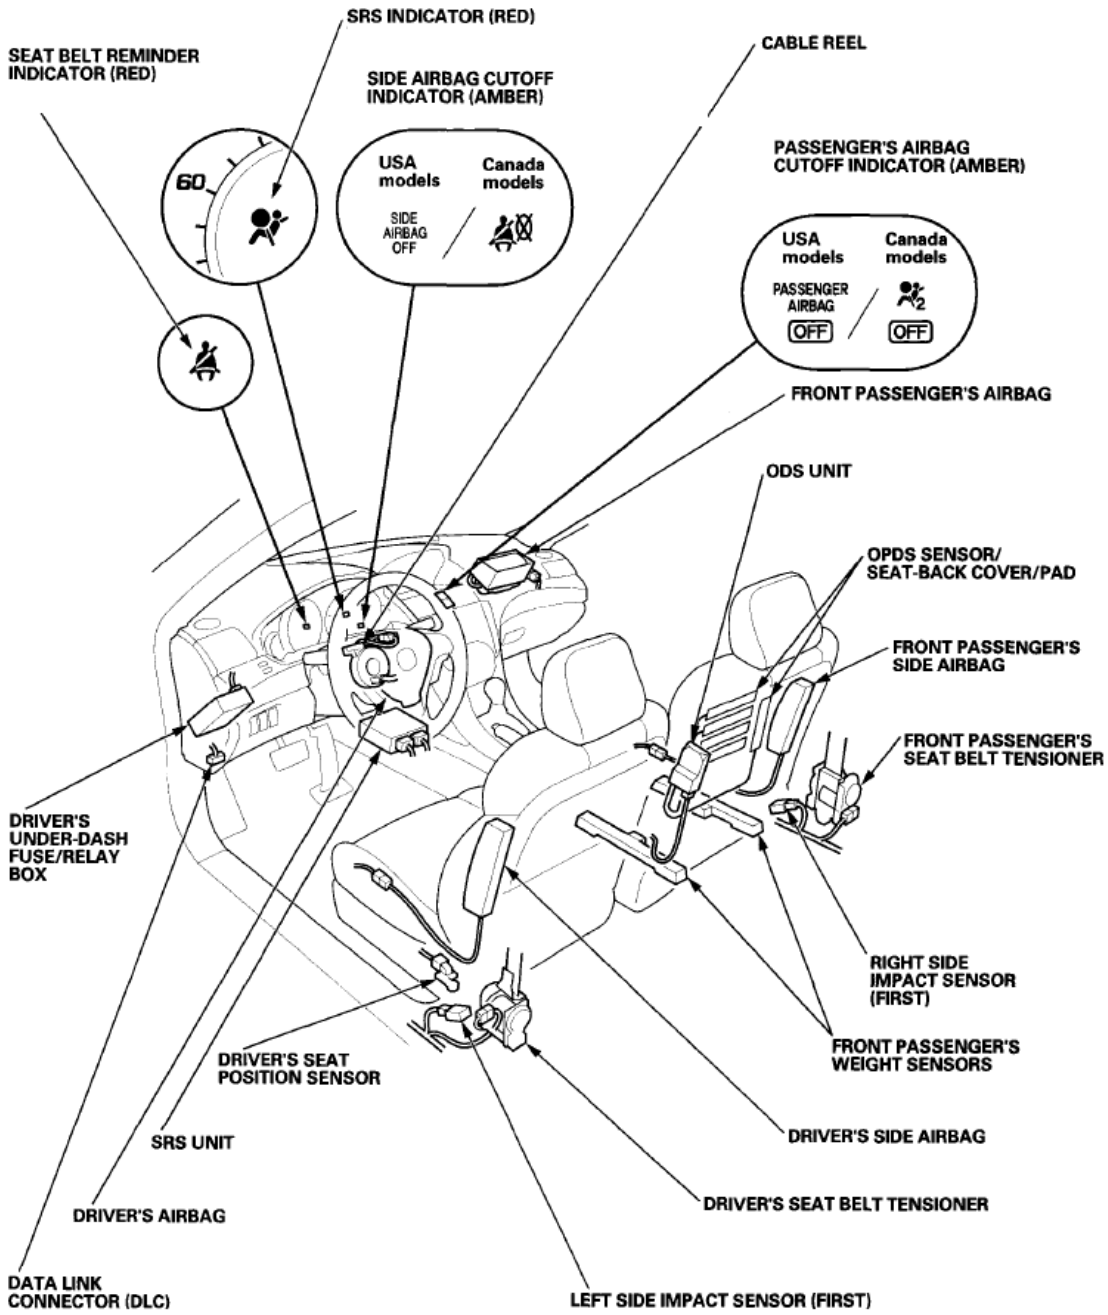

Fig. 1: Supplemental Restraint System Components Location (1 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

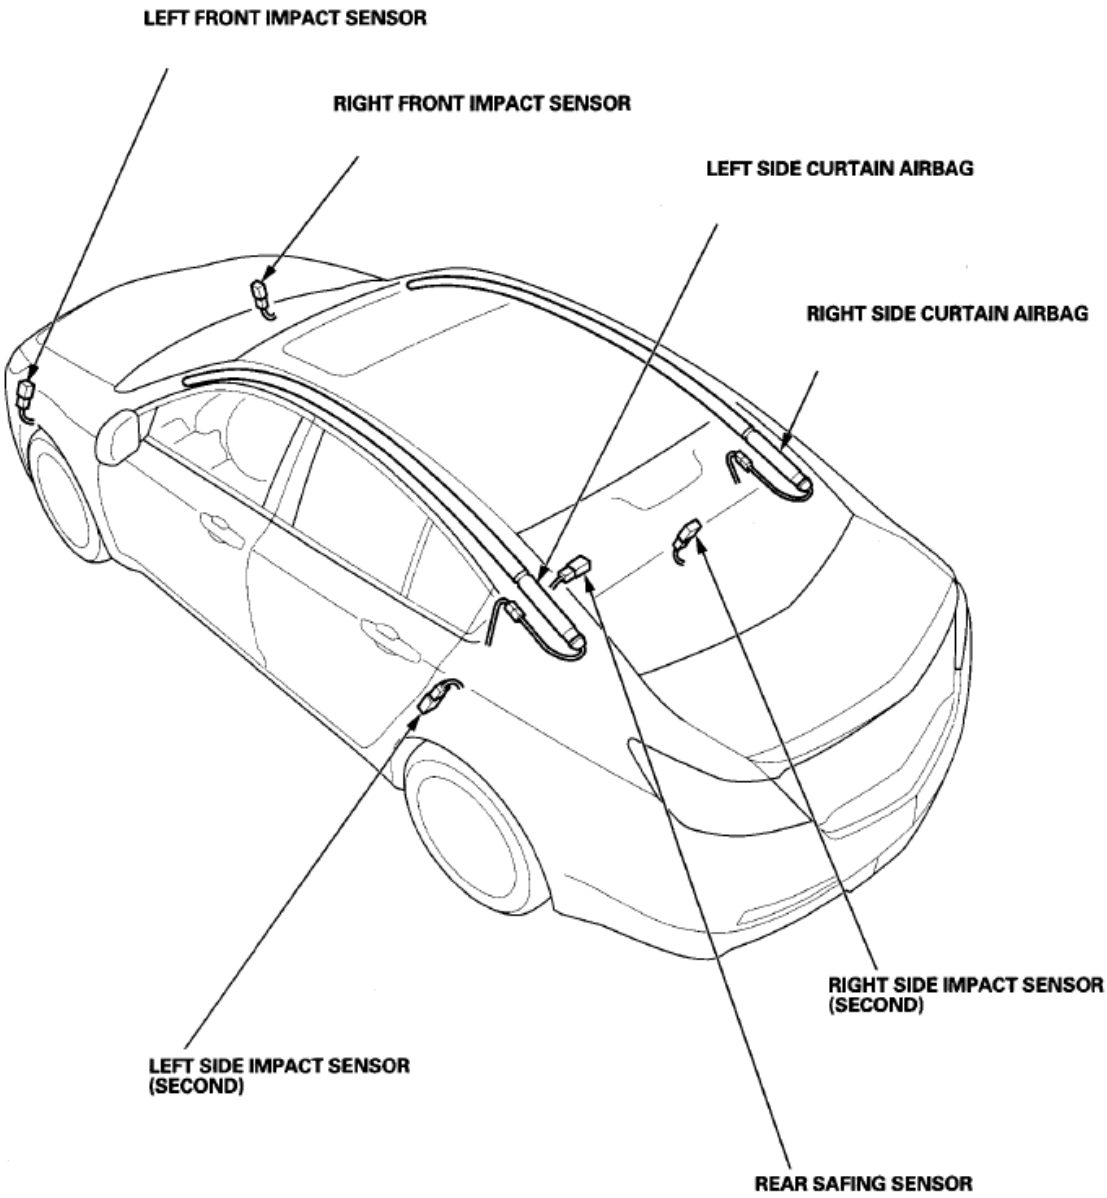

Fig. 2: Supplemental Restraint System Components Location (2 Of 2)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PRECAUTIONS AND PROCEDURES

GENERAL PRECAUTIONS

NOTE: Some systems store data in memory that is lost when the battery is disconnected. Before disconnecting the battery, refer to Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

Please read the following precautions carefully before servicing the SRS, or the airbags could accidentally deploy and cause damage or injuries.

- Except when doing electrical inspections that requires battery power, always turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, disconnect the negative cable from the battery, then wait at least 3 minutes before starting work.

NOTE: The SRS memory is not erased even if the ignition switch is turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode, or if the battery cables are disconnected from the battery.

- Use replacement parts which are manufactured to the same standards and quality as the original parts. Do not install used SRS parts. Use only new parts when making SRS repairs.
- Carefully inspect any SRS part before you install it. Do not install any part that shows signs of being dropped or improperly handled, such as dents, cracks or deformation.

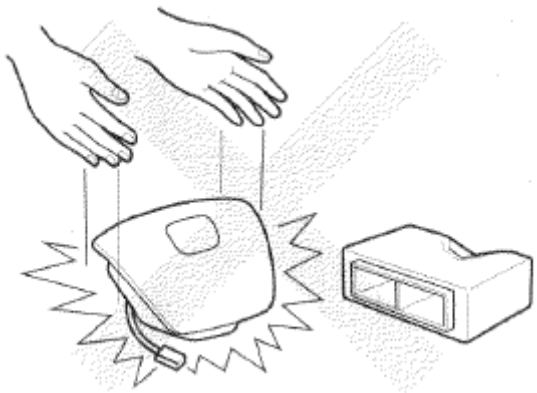

Fig. 3: Identifying Dropped Or Improperly Handled SRS Part
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Before disconnecting the SRS unit connectors, always disconnect the appropriate SRS parts connectors.
- Use only a digital multimeter to check the system. If it is not a Honda multimeter, make sure its output is 10 mA (0.01 A) or less when switched to the lowest value in the ohmmeter range. A tester with a higher output could cause accidental deployment and possible injury.
- Do not put objects on the front passenger's airbag.

STEERING-RELATED PRECAUTIONS

Cable Reel Alignment

- Misalignment of the cable reel could cause an open in the wiring, making the SRS, remote steering wheel controls, or the horn inoperative. Center the cable reel whenever you do the following (see step 5).
  - Installation of the steering wheel.
  - Installation of the cable reel.
  - Installation of the steering column.

- Other steering-related adjustment or installation.

- Do not disassemble the cable reel.
- Do not apply grease to the cable reel.
- If the cable reel shows any signs of damage, replace it with a new one. For example, if the cable reel does not rotate smoothly, replace it.

AIRBAG HANDLING AND STORAGE

Do not disassemble an airbag. It has no serviceable parts. Once an airbag has been deployed, it cannot be repaired or reused.

For temporary storage of an airbag during service, observe the following precautions.

- Store the removed airbag with the pad surface up. Never put anything on the airbag.

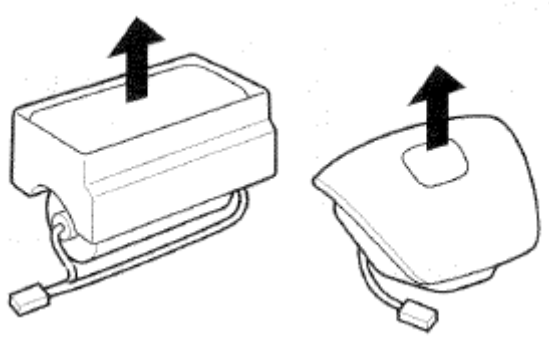

Fig. 4: Removing Airbag With Pad Surface Up
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- To prevent damage to the airbag, keep it away from any oil, grease, detergent, or water.

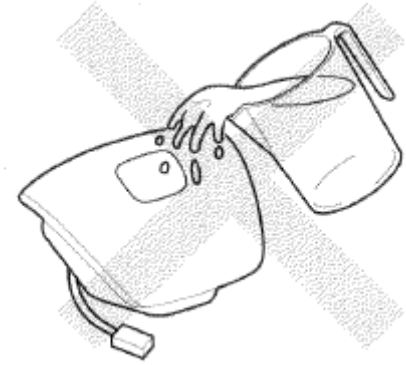

Fig. 5: Preventing Damage To Airbag, Keep It Away From Any Oil, Grease, Detergent, Or Water
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Store the removed airbag on a secure, flat surface away from any high heat source (exceeding 200°F (93° C)).

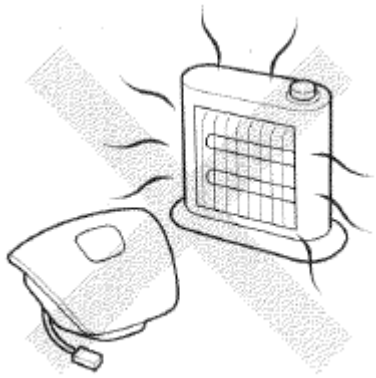

Fig. 6: Caution - Do Not Store Near High Heat Source
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Never do electrical tests on the airbags, such as measuring resistance.
- Do not position yourself in front of the airbag during removal, inspection, or replacement.

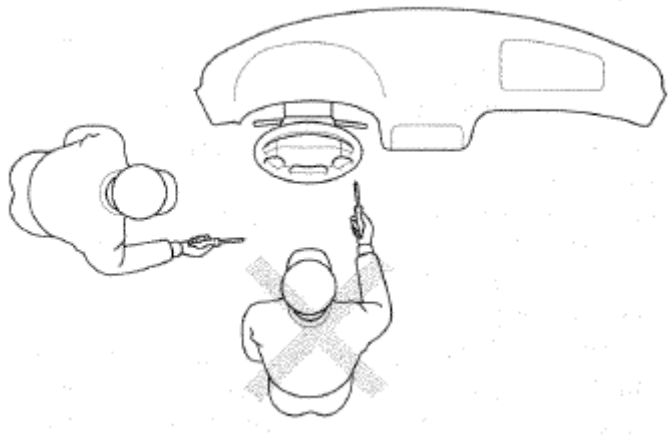

Fig. 7: Caution - Do Not Position Yourself In Front Of The Airbag During Removal, Inspection, Or Replacement
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- For proper disposal of a damaged airbag or tensioner, refer to **AIRBAG AND TENSIONER DISPOSAL**.
- The side curtain airbag module assembly is a long, jointed part containing an inflator (A), a flexible bag (B), and brackets (C). When removing or installing the side curtain airbag assembly, never:
  - Handle the flexible bag.
  - Drop the airbag assembly.
  - Cut, tear, or unwrap the tape strips.

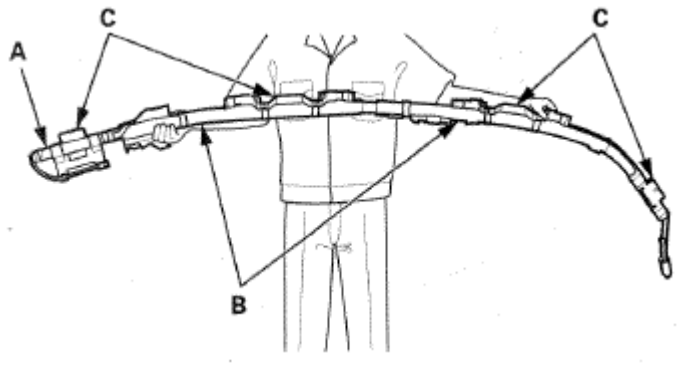

Fig. 8: Handling Flexible Bag
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SRS UNIT, FRONT AND SIDE IMPACT SENSORS, REAR SAFING SENSOR, DRIVER'S SEAT POSITION SENSOR, AND FRONT PASSENGER'S WEIGHT SENSORS

NOTE: Some systems store data in memory that is lost when the battery is disconnected. Before disconnecting the battery, refer to Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

- Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode. Disconnect the negative cable from the battery, then wait at least 3 minutes before starting installation or replacement of the SRS unit, or disconnecting the connectors from the SRS unit.
- Be careful not to bump or impact the SRS unit, the front impact sensors, the side impact sensors, or the rear safing sensor when the ignition switch is in ON (II), press the engine start/stop button to select the ON mode, for at least 3 minutes after the ignition switch is turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode.
- Do not reconnect any connectors to the SRS unit until it is fully installed, including torquing the TORX bolts.
- During installation or replacement, be careful not to bump (by impact wrench, hammer, etc.) the area around the SRS unit, the front impact sensors, the side impact sensors, or the rear safing sensor. The airbags could accidentally deploy and cause damage or injury.

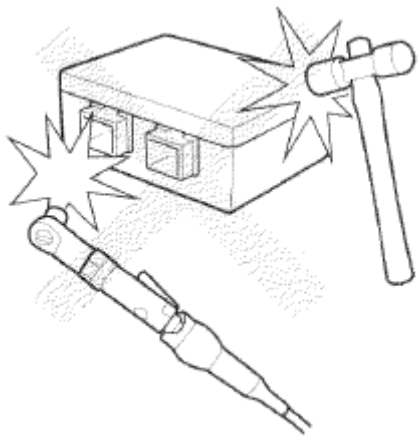

Fig. 9: Caution - Do Not Bump (By Impact Wrench, Hammer, Etc.) The Area Around The SRS Unit, The Front Impact Sensors, The Side Impact Sensors, Or The Rear Safing Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- After a collision where the front airbags, the side airbags, the side curtain airbags, or the front seat belt tensioners deploy, go to **COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT**. After a collision where the airbags or the side airbags do not deploy, inspect for any damage or any deformation on the SRS unit, the front impact sensors, the rear safing sensor, and the side impact sensors. If there is any damage, replace the SRS unit and/or the sensors. Also, do the front seat active head restraint inspection (see **FRONT SEAT ACTIVE HEAD RESTRAINT INSPECTION**). Replace all damaged parts.

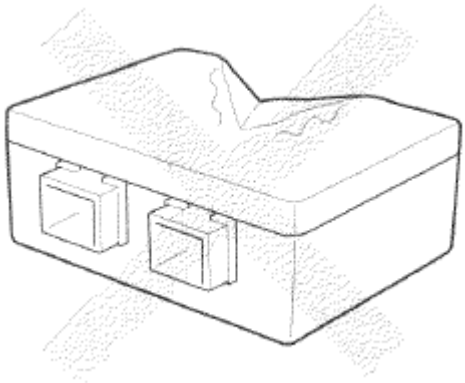

Fig. 10: Caution Of Component Replacement/Inspection After Deployment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Do not disassemble the SRS unit, the front impact sensors, the side impact sensors, the rear safing sensor, the driver's seat position sensor, or the front passenger's weight sensors.
- Always install the SRS unit, driver's seat position sensor, all impact sensors, and the rear safing sensor with the new TORX bolts to the specified torque.
- Do not spill water or oil on the SRS unit or any of the sensors.

WIRING PRECAUTIONS

Some of the SRS wiring can be Identified by a special yellow outer covering, and the SRS connectors can be identified by their yellow color. Observe the following instructions.

- Never attempt to modify, splice, or repair SRS wiring.

  If there is an open or damage to the SRS wiring, replace the harness.

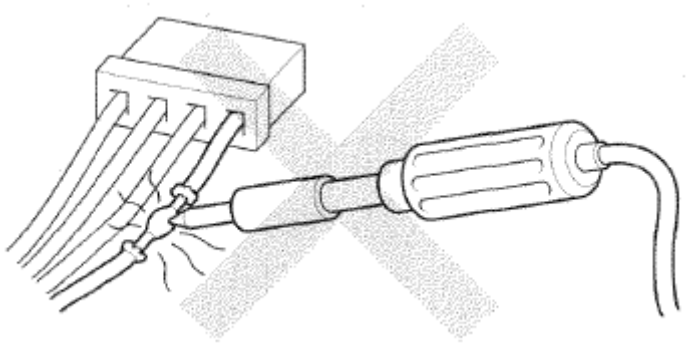

Fig. 11: Caution - Do Not Attempt To Modify, Splice, Or Repair SRS Wiring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Be sure to install the harness wires so they do not get pinched or interfere with other parts.

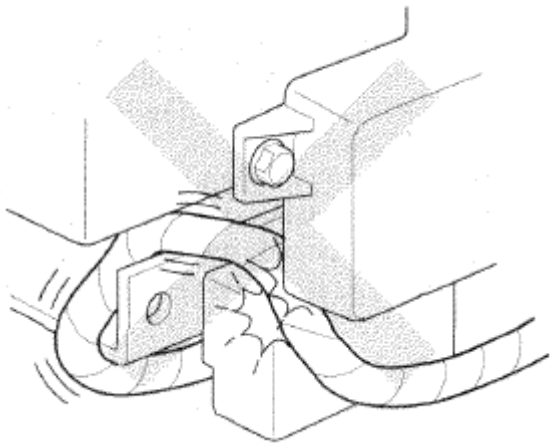

Fig. 12: Caution - Be Sure To Install The Harness Wires So They Do Not Get Pinched Or Interfere With Other Parts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Make sure all SRS ground locations are clean, and the grounds are securely fastened for optimum metal-to-metal contact. Poor grounds can cause intermittent problems that are difficult to diagnose.
- Do not use any silicon based cleaners or lubricants on any SRS connectors or terminals.

PRECAUTIONS FOR ELECTRICAL INSPECTIONS

Special Tools Required

Back Probe Adapter, 17 mm 07TAZ-001020A

- Make sure the battery is fully charged when doing electrical test. If the battery is not fully charged, the results of the tests may not be accurate.
- When using electrical test equipment, insert the probe of the tester into the wire side of the connector (except SRS unit connectors and waterproof SRS connectors). Do not insert the probe of the tester into the terminal side of the connector, and do not tamper with the connector.

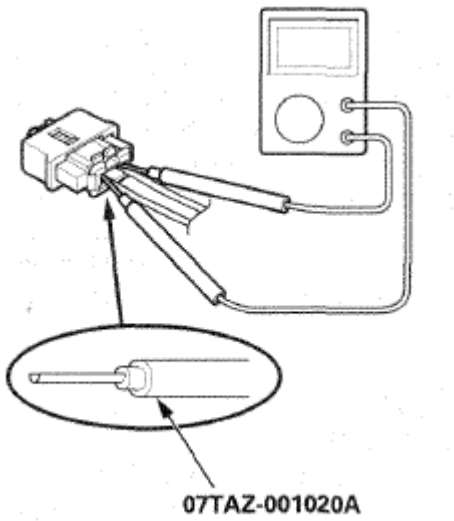

Fig. 13: Identifying Back Probe Adapter, 17 mm 07TAZ-001020A
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Use the back probe adapter, 17 mm. Do not insert the probe forcibly.

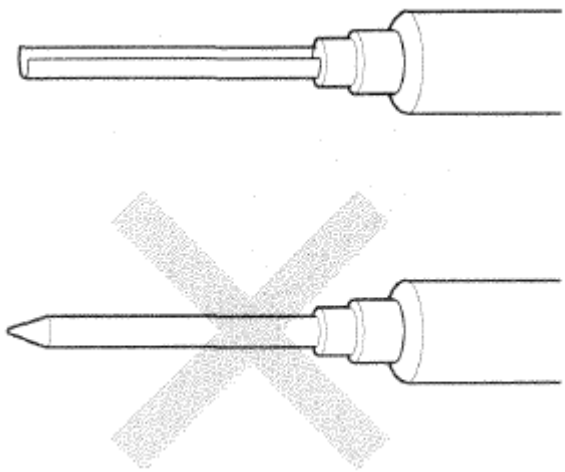

Fig. 14: Caution Of Inserting Probe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Use specified service connectors in troubleshooting. Using improper tools could cause a diagnostic error due to poor metal-to-metal contact.

SRS UNIT CONNECTORS

When diagnosing or troubleshooting at an SRS unit connector (A), use the terminal test port below the terminal you need to check. Gently insert the pin probes of the tester or jumper wire at the terminal test port from the terminal side.

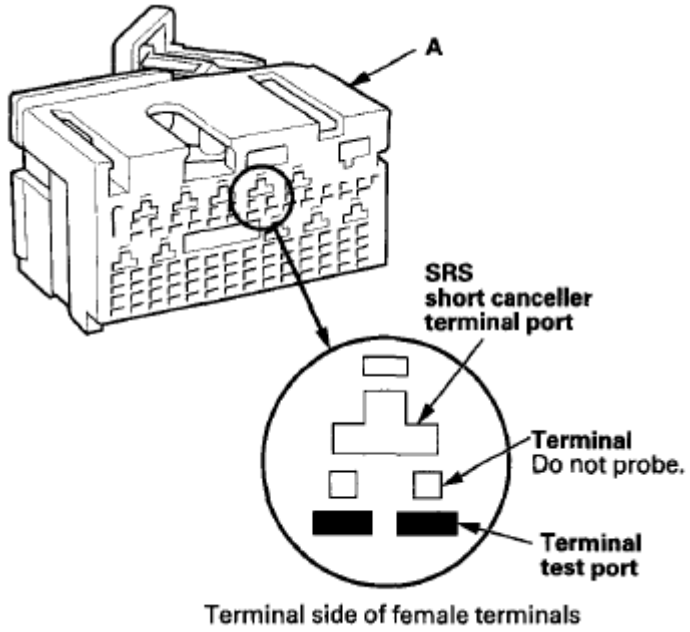

Fig. 15: Identifying SRS Unit Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE:

- **Do not insert the pin probes of the tester or a jumper wire at the terminal port or the SRS short canceller terminal port.**
- **To prevent damage to the connector terminals, do not insert the test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.**

WATERPROOF SRS CONNECTORS

When diagnosis or troubleshooting is done at a waterproof SRS connector (A), use the terminal test port above the terminal you need to check. Gently insert the pin probe of the tester or jumper wire at the terminal test port from the terminal side.

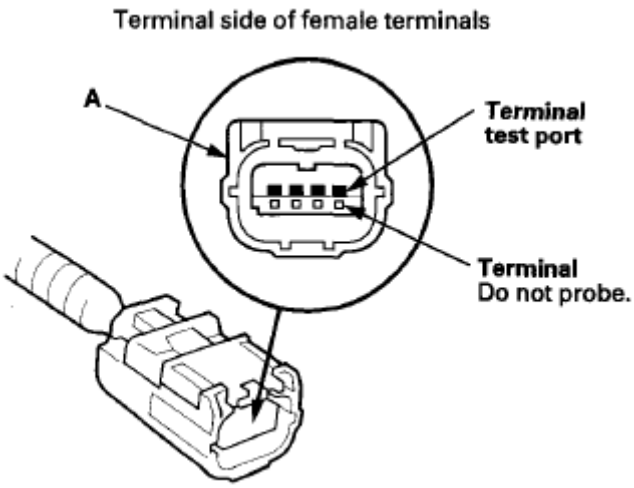

Fig. 16: Identifying Waterproof SRS Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE:

- **Do not insert the pin probes of the tester or a jumper wire into the terminal port.**
- **To prevent damage to the connector terminals, do not insert the test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals can cause a poor connection and an incorrect measurement.**

LEVER-LOCKED CONNECTOR

The SRS unit connectors have a lever lock.

SRS Unit Connectors

Disconnecting

To release the lock (A), pull the lever (B) while pushing the lock on the outside of the connector, then pull out the connector (C).

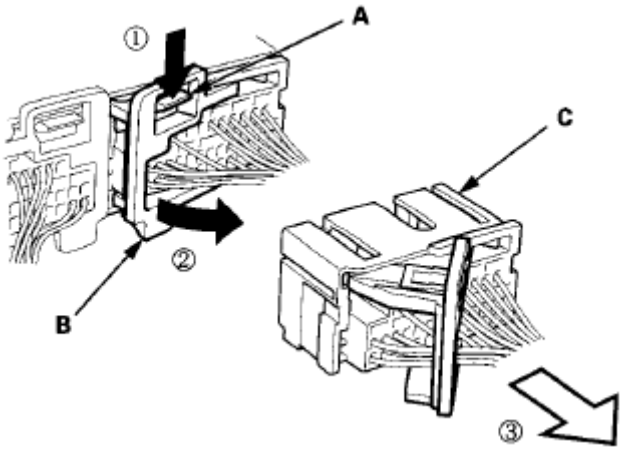

Fig. 17: Disconnecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

To reconnect the connector (A), push in on the connector. As the connector is pressed in, the lever (B) moves to the locked position.

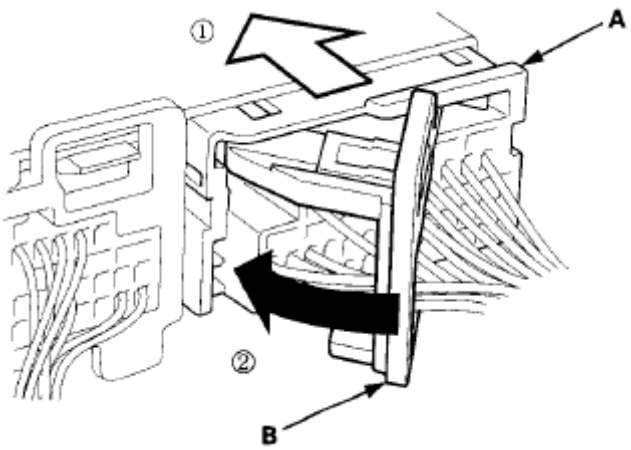

Fig. 18: Connecting Lever-Locked Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SPRING-LOADED LOCK CONNECTOR

Some SRS connectors have a spring-loaded lock.

Front Airbag Connectors/Front Seat Belt Tensioner Connector

Disconnecting

To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector, then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector.

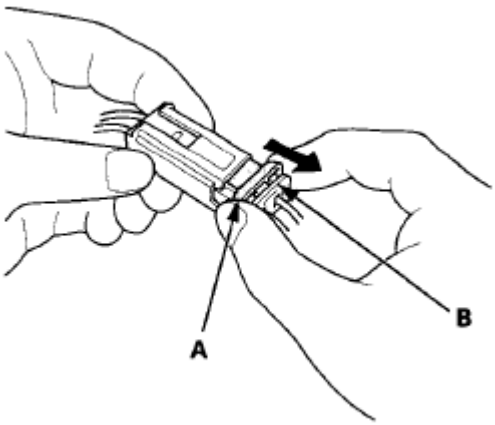

Fig. 19: Disconnecting Spring-Loaded Lock Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

To reconnect, hold the pawl-side connector, and press on the back of the sleeve-side connector in the direction shown. As the two connector halves are pressed together, the sleeve (A) is pushed back by the pawl (B). Do not touch the sleeve.

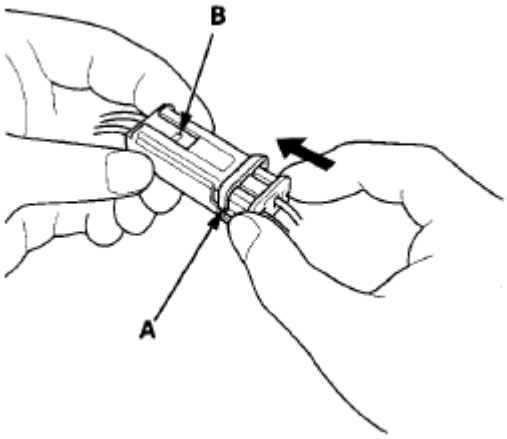

Fig. 20: Connecting Spring-Loaded Lock Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Airbag Connector/Side Curtain Airbag Connector

Disconnecting

To release the lock, pull the spring-loaded sleeve (A) toward the stop (6) while holding the opposite half of the connector, then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector half.

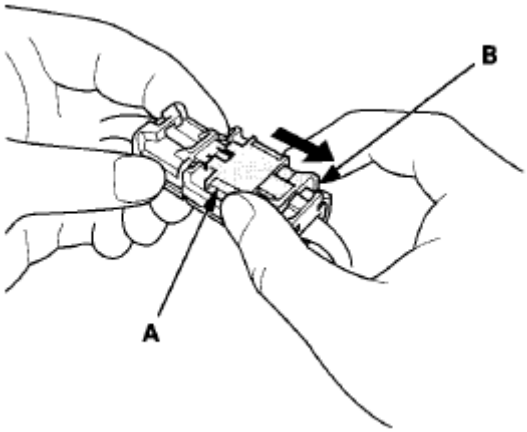

Fig. 21: Disconnecting Side Airbag Connector/Side Curtain Airbag Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Connecting

Hold both connector halves, and press them firmly together until the projection (A) of the sleeve-side connector clicks.

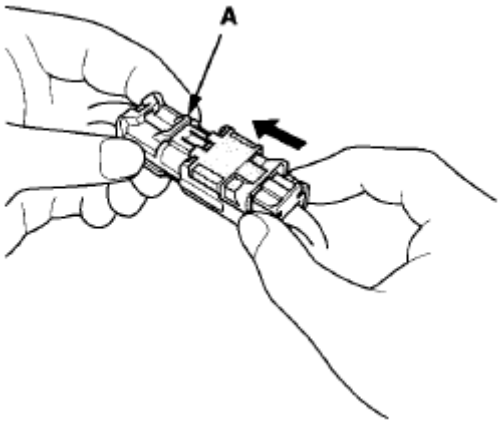

Fig. 22: Connecting Side Airbag Connector/Side Curtain Airbag Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS

Special Tools Required

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **To prevent damage to the connector cavity, insert an SRS short canceller straight into the cavity from the terminal side.**
- **Before installing an SRS short canceller, wash it with electrical contact cleaner, then dry it with compressed air.**

- **Do not use an SRS short canceller if it is damaged.**
- **Make sure to remove an SRS short canceller before reconnecting the SRS unit connector.**
- **Some systems store data in memory that is lost when the battery is disconnected. Before disconnecting the battery, refer to Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**

When SRS unit connectors A (39P) and B (39P) are disconnected, short circuits are automatically created in the connector to prevent accidental deployment of an airbag or tensioner. The circuit may need to be opened sometimes when diagnosing the system. Insert an SRS short canceller in the specified cavities when necessary to keep the circuit open for diagnosis.

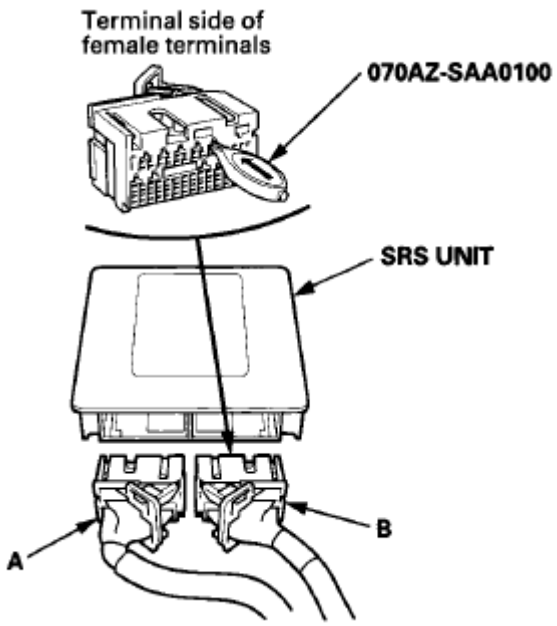

Fig. 23: Identifying SRS Unit Connectors (39P) And (39P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Terminal numbers are shown on the wire side of the female terminals. Insert the SRS short canceller(s) into the cavities on the terminal side of the connector.

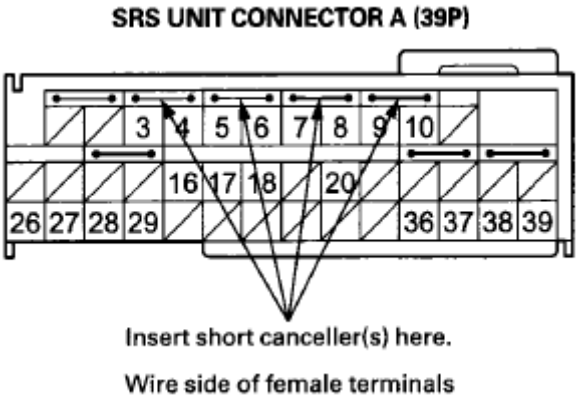

Fig. 24: Identifying SRS Short Canceller(s)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

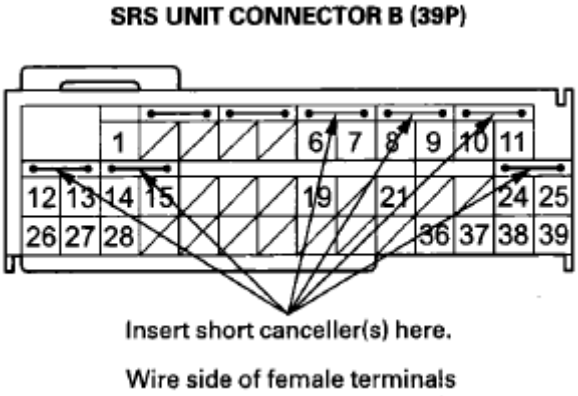

Fig. 25: Identifying SRS Short Canceller(s) With Terminal Side Of Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

FRONT SEATS WITH SIDE AIRBAGS

Front seats with side airbags have a "SIDE AIRBAG" label on the seat-back.

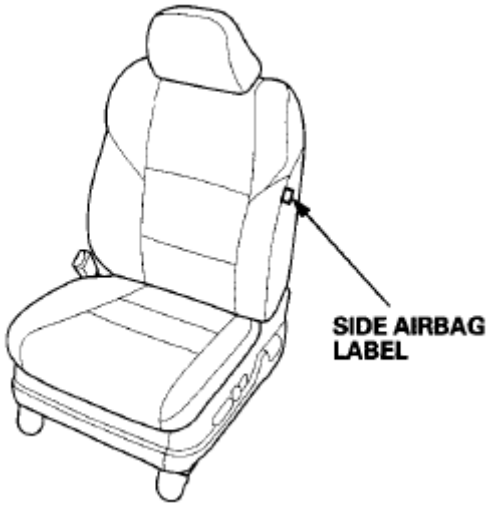

Fig. 26: Identifying Front Seats With Side Airbag Label
Courtesy of AMERICAN HONDA MOTOR CO., INC.

- Clean the seats with a damp cloth. Do not soak the seats with liquid. Do not spray steam on the seats.
- Do not repair a torn or frayed seat-back cover/pad. Replace the seat-back cover/pad if it is damaged.
- After a collision where the side airbag was deployed, replace the side airbag and the seat frame with the new parts. If the seat-back cover is split, it must be replaced. Refer to **COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT**.
- Never put aftermarket accessories on the seats (covers, pads, seat heaters, lights, etc.).

DISCONNECTING SYSTEM CONNECTORS

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.

   Driver's Airbag

2. Remove the access panel (A) from the steering wheel, then disconnect the cable reel 4P connector (B) from the driver's airbag 4P connector.

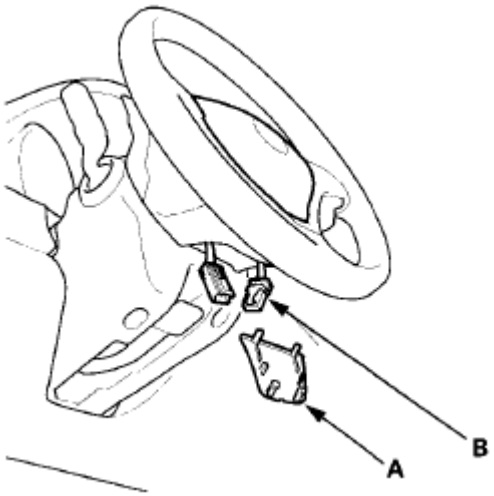

Fig. 27: Identifying Steering Wheel Access Panel And Driver's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Front Passenger's Airbag

3. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
4. Disconnect the dashboard wire harness 4P connector (A) from the front passenger's airbag 4P connector.

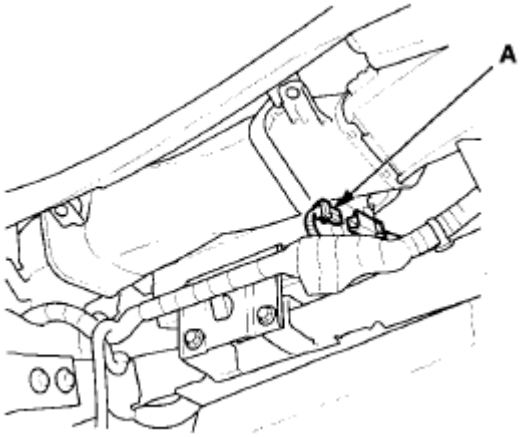

Fig. 28: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Airbag

5. Disconnect the SRS floor wire harness 2P connectors (A) from the driver's and the front passenger's side airbag 2P connectors.

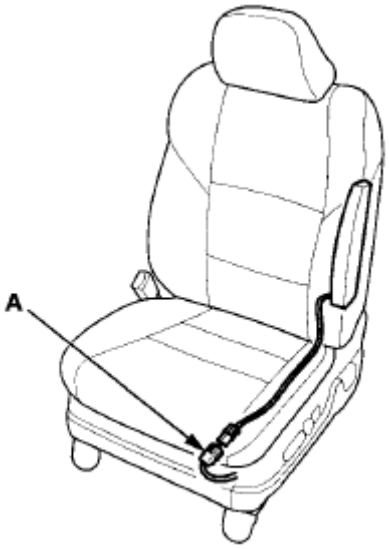

Fig. 29: Identifying SRS Floor Wire Harness 2P Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Curtain Airbag

6. Remove the C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connectors (A) from the left and right side curtain airbag 2P connectors.

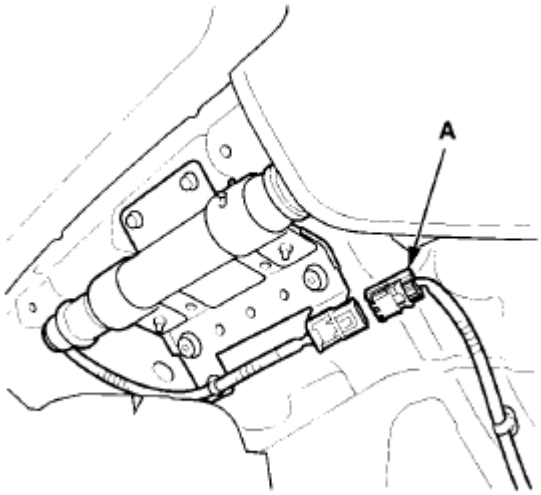

Fig. 30: Identifying SRS Floor Wire Harness 2P Connectors (Left And Right Side)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Front Seat Belt Tensioner

8. Remove the B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
9. Disconnect the SRS floor wire harness 4P connectors (A) from the driver's and the front passenger's seat

belt tensioner 4P connectors.

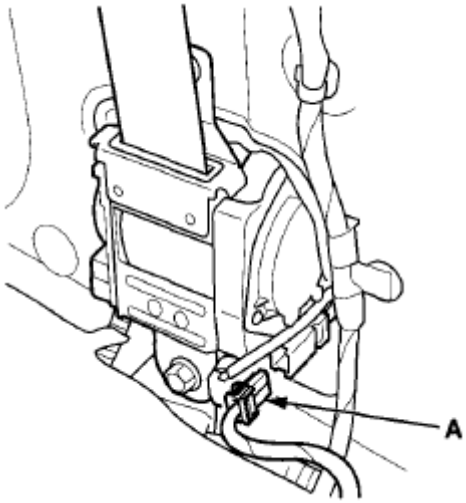

Fig. 31: Identifying SRS Floor Wire Harness 4P Connectors (Driver's And Front Passenger's Seat Belt Tensioner)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SRS Unit

10. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**) and heater joint ducts (see step 3).
11. Disconnect SRS unit connectors A (39P) and B (39P) from the SRS unit.

NOTE: The SRS unit connectors have lever locks. Release the locks before disconnecting the connectors.

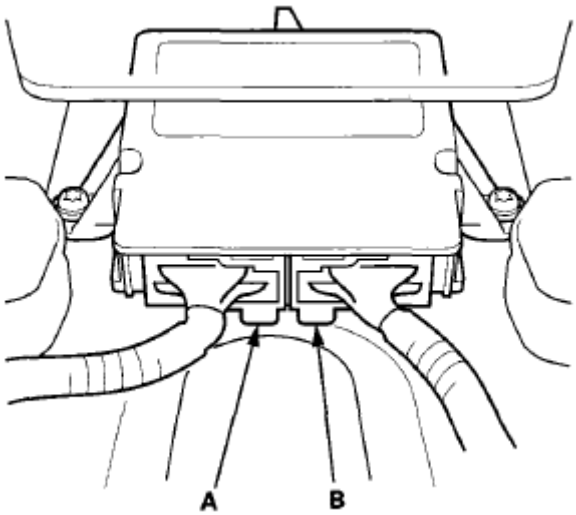

Fig. 32: Identifying SRS Unit Connectors (39P) And (39P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GENERAL TROUBLESHOOTING INFORMATION

DTC (DIAGNOSTIC TROUBLE CODES)

The self-diagnostic function of the SRS unit allows it to locate the causes of system problems and store this information in memory. For easier troubleshooting, this data can be retrieved with the HDS via the data link circuit.

- When you turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, the SRS indicator should come on. If it goes off after 6 seconds, the system is normal, and is not currently detecting any problems.
- If there is a problem, the system locates and defines the problem, stores this information in memory, and turns on the SRS indicator. The data remains in memory even if the ignition switch is turned to LOCK (0), the engine start/stop button is pressed to select the OFF mode, or the battery is disconnected.
- The data is stored in memory as a diagnostic trouble code (DTC).
- DTCs are either latching or resetting depending on the malfunction. With resetting DTCs, the SRS indicator goes off the next time the ignition switch is turned to ON (II), or the engine start/stop button is pressed to select the ON mode, and the system is normal, but the DTC is still stored. With latching DTCs, the SRS indicator does not turn OFF until the malfunction is repaired and the DTC is cleared.
- When you connect the HDS to the data link connector (DLC), you can retrieve a more detailed DTC in the HDS "SRS" menu.

NOTE: Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

- After reading and recording the DTC, go to the troubleshooting procedure for that code.

Precautions

- Make sure the battery is fully charged. If the battery is dead or low, electrical measurements values may not be correct.
- Use only a digital multimeter to check the system. Make sure its output is 10 mA (0.01 A) or less when switched to the smallest value in the ohmmeter range. A tester with a higher output could damage the airbag circuit or cause accidental airbag deployment and possible injury.
- Whenever the ignition switch is in ON (II), the engine start/stop button is pressed to select the ON mode, or has been turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode for less than 3 minutes, be careful not to bump the SRS unit; the airbags could accidentally deploy and cause damage or injuries.
- Before removing the dashboard wire harness or SRS floor wire harness, disconnect the driver's airbag connector, the front passenger's airbag connector, both side airbag connectors, both side curtain airbag connectors, and both front seat belt tensioner connectors.
- Do not touch a tester probe to the terminals in the SRS unit or harness connectors, and do not connect the

SRS unit terminals or the sensor terminals with a jumper wire. Use only the back probe set and the digital multimeter. Back probe spring-loaded lock type connectors correctly.

HOW TO READ DTCS

NOTE: Make sure the battery is fully charged before you begin.

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Connect the HDS to the data link connector (DLC) (A).

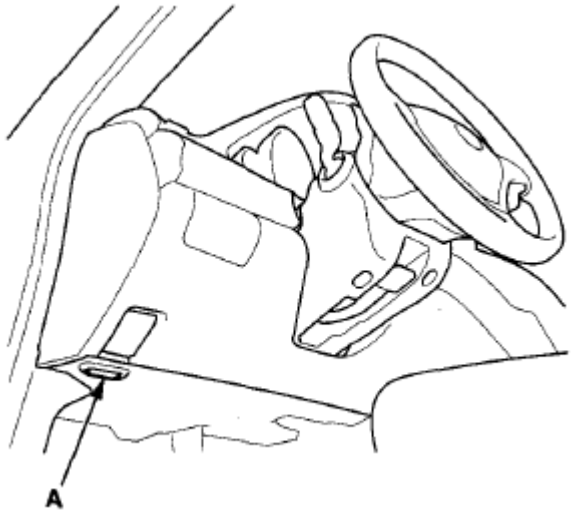

Fig. 33: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, inspect the power line of SRS unit, fuses, and ground, and if there is not any abnormality found, then go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Use the HDS to check for SRS DTCs.
6. Read and record the DTCs.

NOTE:

- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**
- **Do not clear the DTCs until instructed by the troubleshooting procedure.**

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then

wait for 10 seconds.

8. Disconnect the HDS from the DLC.
9. Do the troubleshooting procedure for the DTC.

HOW TO CLEAR DTCS

NOTE: Make sure the battery is fully charged before you begin.

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Connect the HDS to the data link connector (DLC) (A).

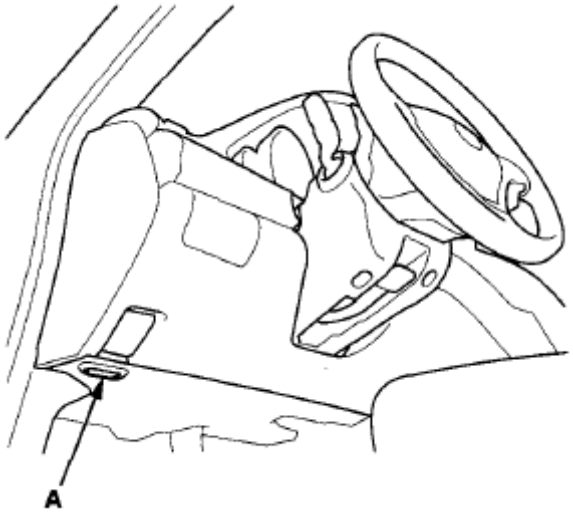

Fig. 34: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
5. In the SRS MENU of the HDS, select SRS, then DTC to clear DTCs.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then wait for 10 seconds.
7. Disconnect the HDS from the DLC.

TROUBLESHOOTING INTERMITTENT FAILURES

If there was a malfunction that sets a DTC, but it does not recur, a DTC will be stored in the memory, and the SRS indicator may come on depending on the malfunction detected.

NOTE:

- **Check the condition of the battery (see BATTERY TEST), and the charging system (see ALTERNATOR AND REGULATOR CIRCUIT**

TROUBLESHOOTING). Low battery voltage may cause some intermittent failures.

- **A faulty or damaged cable reel can cause intermittent problems related to the driver's airbag inflator DTCs.**

After checking the DTC, troubleshoot as follows:

1. Check for DTCs with the HDS (see How to Read DTCs).
2. Clear the DTCs with the HDS (see How to Clear DTCs).
3. Set the parking brake, then start the engine, and let it idle.
4. The SRS indicator comes on for about 6 seconds and then goes off.
5. Shake the related wire harnesses and the connectors, and look for loose connections, poor pin fits, and poor grounds.
6. Take a test-drive (quick acceleration, quick braking, and cornering), turn the steering wheel fully left and right, and hold it there for 5 to 10 seconds. If the problem recurs, the SRS indicator will come on.
7. If you cannot duplicate the concern, ask the client about the conditions when it occurred, or ask the client to demonstrate the concern.
8. If you cannot duplicate the intermittent failure, the system is OK at this time.

SRS UNIT UPDATE

Special Tools Required

- Honda Diagnostic System (HDS) tablet tester
- Honda Interface Module (HIM) and an iN workstation with the latest HDS software version
- HDS pocket tester
- GNA600 and an iN workstation with the latest HDS software version
- MVCI unit with the latest control module (CM) update software installed

Any one of the above updating tools can be used.

NOTE:

- **Make sure the HDS/iN workstation or the MVCI unit has latest HDS software version.**
- **Before you update the SRS unit, make sure the battery in the vehicle is fully charged.**
- **Never turn the ignition switch to LOCK (0) or ACC (I), or press the engine start/stop button to select the OFF or ACC mode during the update. If there is a problem with the update, leave the ignition switch in ON (II), or press the engine start/stop button to select the ON mode.**
- **To prevent SRS unit damage, do not operate anything electrical (headlights, audio system, brakes, A/C, power windows, moonroof (if equipped), door locks, etc.) during the update.**

- **To ensure the latest program is installed, do an SRS unit update whenever the SRS unit is substituted or replaced.**
- **You cannot update an SRS unit with the program it already has. It will only accept a new program.**
- **If you need to diagnose the HIM because the HIM's red (#3) light came on or was flashing during the update, leave the ignition switch in ON (II), or press the engine start/stop button to select the ON mode when you disconnect the HIM from the data link connector (DLC). This will prevent SRS unit damage.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Connect the HDS to the data link connector (DLC) (A).

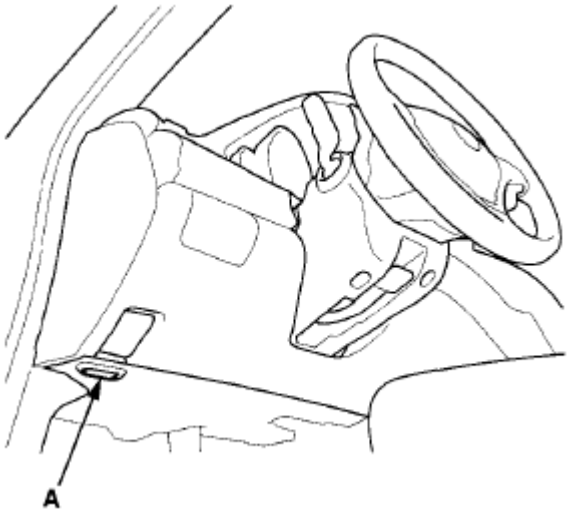

Fig. 35: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, but do not start the engine.
4. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
5. Select the update program, and follow the screen prompts to update the SRS unit.
6. If the software in the SRS unit is the latest, disconnect the updating tool from the DLC, and go back to the procedure that you were doing. If the software in the SRS unit is not the latest, follow the instructions on the screen.

NOTE: **If you run into a problem during the update procedure (programming takes over 15 minutes, status bar goes over 100%, D position or immobilizer indicator flashes, HDS tablet freezes, etc.), follow these steps to minimize the chance of damaging the SRS unit:**

- Leave the ignition switch in ON (II), or press the engine start/stop button to select the ON mode.
- Connect a jumper battery (do not connect a battery charger).
- Shut down the updating tool.
- Disconnect the updating tool from the DLC.
- Reboot the updating tool.
- Reconnect the updating tool to the DLC, and try the update procedure again.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the HDS from the DLC.

ODS UNIT INITIALIZATION

NOTE:

- **After SRS unit or ODS unit is replaced, do this procedure to initialize the ODS unit.**
- **ODS unit initialization initializes both the OPDS sensor and the front passenger's seat weight sensor.**

OPDS SENSOR INITIALIZATION

When you replace a seat-back cover/pad, the SRS unit, and/or the ODS unit, initialize the OPDS sensor with the HDS.

NOTE:

- **Before initializing the ODS unit, make sure the battery is fully charged.**
- **A new (uninitialized) ODS unit installed with a faulty OPDS sensor (DTC 86-1x or 86-2x) can cause DTCs 85-71 and 85-78. If the SRS has a hard DTC 86-1x or 86-2x, troubleshoot the DTCs completely before replacing the ODS unit.**
- **Before initializing the ODS unit, clear the DTCs.**
- **Make sure nothing is on the front passenger's seat, including after market seat covers or mats.**
- **Make sure there is nothing in the front passenger's seat-back pocket.**
- **Keep the A/C and the heater off.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Set the seat-back in a normal position.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Connect the HDS to the data link connector (DLC) (A).

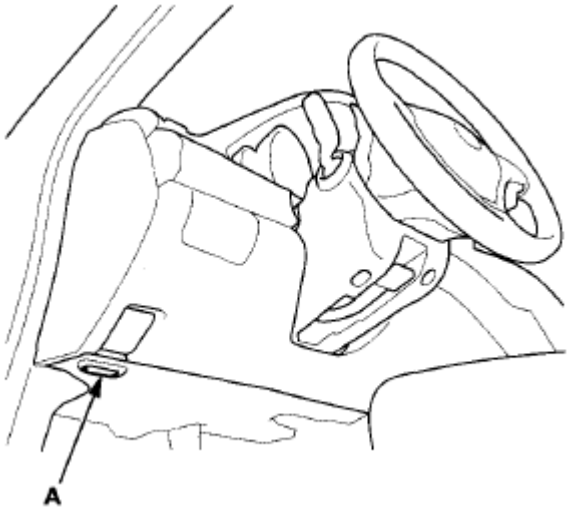

Fig. 36: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
7. From the HDS Main Menu, select SRS, then INITIALIZATION. In the INITIALIZATION Menu, select ODS Initialization. Follow the prompts until the OPDS sensor initialization has been completed.
8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then wait for 10 seconds.
9. Disconnect the HDS from the DLC.

NOTE: **If the ODS unit fails to initialize after several attempts, replace the seat-back cover/pad equipped with an OPDS sensor (see FRONT SEAT-BACK COVER REPLACEMENT), and retry. If the ODS unit continues to fail to initialize, replace the ODS unit (see ODS UNIT REPLACEMENT).**

FRONT PASSENGER'S WEIGHT SENSOR INITIALIZATION

When you replace the SRS unit, the front passenger's weight sensor, the front passenger's seat frame, or the ODS unit, initialize the front passenger's weight sensor with the HDS.

NOTE:

- **Before initializing the front passenger's weight sensor, make sure the battery is fully charged.**
- **Before initializing the ODS unit, clear the DTCs.**
- **Make sure all components of the front passenger's seat are correctly installed.**
- **Make sure nothing is on the front passenger's seat, including after market seat covers or mats.**

- **Make sure there is nothing in the front passenger's seat-back pocket.**
- **Keep the windows and the moonroof closed.**
- **Do all initialization procedures, except test-driving, in the service bay.**
- **Make sure the vehicle is on level ground.**
- **Keep the A/C and the heater off.**
- **Do not touch the front passenger's seat during the operation check.**
- **Do not expose the front passenger's seat to sudden temperature changes.**

1. Position the front passenger's seat all the way rearward, and adjust the seat-back to the forward most position. Do not move the seat from this position until the initialization is completed.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Connect the HDS to the data link connector (DLC) (A).

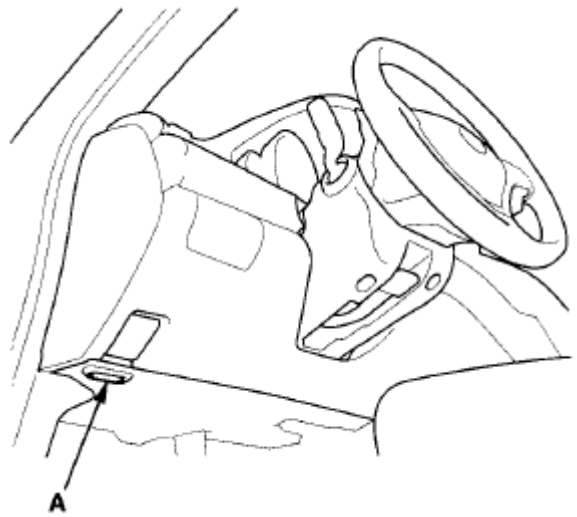

Fig. 37: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
6. Drive the vehicle, and accelerate to 22 mph (36 km/h), then stop on level ground.
7. From the HDS Main Menu, select SRS, then INITIALIZATION. In the INITIALIZATION Menu, select SWS Initialization. Follow the prompts until the front passenger's weight sensor initialization has been completed.
8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Disconnect the HDS from the DLC.

ODS UNIT OPERATION CHECK

AFTER REPLACING FRONT PASSENGER'S SEAT COMPONENT(S)

NOTE: Check the ODS unit operation after any of these actions:

- Front passenger's seat component(s) replacement (except ODS unit and/or front passenger's weight sensor).
- SRS unit replacement.
- Remove the front passenger's weight sensor(s).
- After a vehicle collision (see **FRONT PASSENGER'S WEIGHT SENSOR OUTPUT CHECK AFTER A VEHICLE COLLISION**).

PRE-OPERATION CHECK SET-UP

- Make sure all the components of the front passenger's seat are correctly installed.
- Position the front passenger's seat all the way rearward, and adjust the seat-back to the forward most position. Do not move the seat from this position until the output check is completed.
- Make sure nothing is on the front passenger's seat, including after market seat covers or mats.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Keep the windows and the moonroof closed.
- Do all initialization procedures, except test-driving, in the service bay.
- Make sure the vehicle is on level ground.
- Turn the heater and the A/C off.
- Do not touch the front passenger's seat during the operation check.
- Do not expose the front passenger's seat to sudden temperature changes.
- Make sure all aftermarket devices such as amplifiers, fluorescent light, air purifiers, CB or HAM radios, etc. are turned off.

1. Drive the vehicle, accelerate to 22 mph (36 km/h), then stop on level ground.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Connect the HDS to the data link connector (DLC) (A).

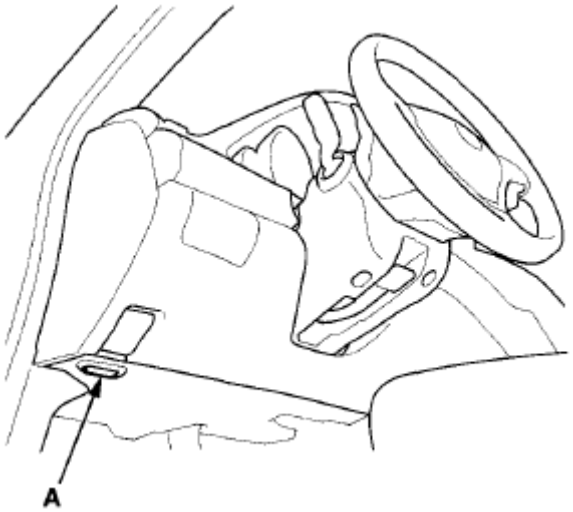

Fig. 38: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
6. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select AFTER REPLACING FRONT PASSENGER'S SEAT COMPONENT(S). Follow the prompts until the ODS unit operation check has been completed.
7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the HDS from the DLC.

FRONT PASSENGER'S WEIGHT SENSOR OUTPUT CHECK AFTER A VEHICLE COLLISION

NOTE: Check the front passenger's weight sensor output after this action:

- After a vehicle collision

PRE-OPERATION CHECK SET-UP

- Make sure all the components of the front passenger's seat are correctly installed.
- Position the front passenger's seat all the way rearward, and adjust the seat-back to the forward most position. Do not move the seat from this position until the output check is completed.
- Make sure nothing is on the front passenger's seat, including after market seat covers or mats.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Keep the windows and the moonroof closed.
- Do all initialization procedures, except test-driving, in the service bay.
- Make sure the vehicle is on level ground.

- Turn the heater and the A/C off.
- Do not touch the front passenger's seat during the operation check.
- Do not expose the front passenger's seat to sudden temperature changes.
- Make sure all aftermarket devices such as amplifiers, fluorescent light, air purifiers, CB or HAM radios, etc. are turned off.

1. Drive the vehicle, accelerate to 22 mph (36 km/h), then stop on level ground.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Connect the HDS to the data link connector (DLC) (A).

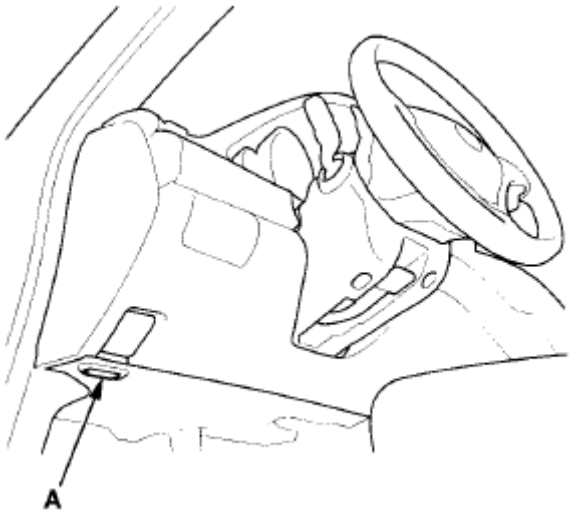

Fig. 39: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
6. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select AFTER A VEHICLE COLLISION. Follow the prompts until the front passenger's weight sensor output check has been completed.
7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the HDS from the DLC.

DRIVER'S SEAT POSITION SENSOR OPERATION CHECK

Check the driver's seat position sensor after the driver's seat position sensor replacement.

1. Make sure the driver's seat is in the full forward position.
2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Connect the HDS to the data link connector (DLC) (A).

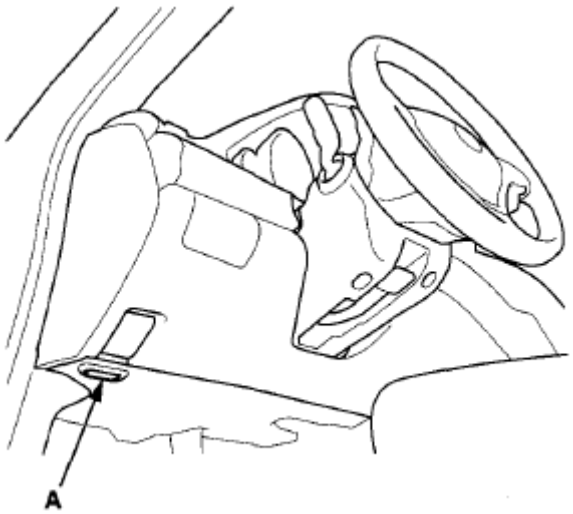

Fig. 40: Identifying Data Link Connector (DLC)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
6. From the HDS Main Menu, select SRS, then Data List.
7. Using two pieces of tape (A), make alignment marks (B) on the upper rail outer cover (C) and the front door sill trim (D) as shown. The driver's seat position sensor should read NEAR on the HDS.

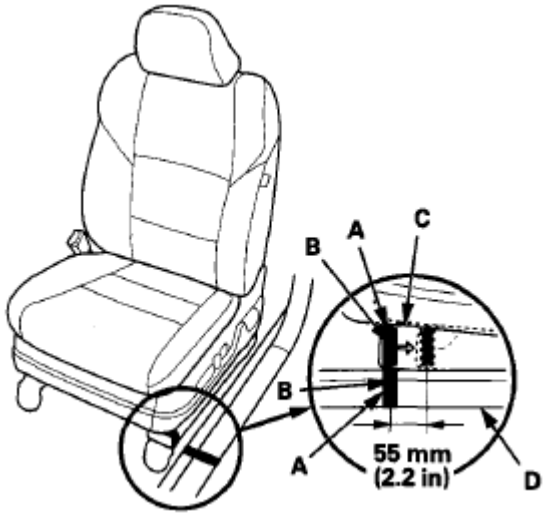

Fig. 41: Identifying Pieces Of Tape, Make Alignment Marks, Upper Rail Outer Cover And Front Door Sill Trim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Move the seat back in small increments (about 5 mm, 0.2 in) until the driver's seat position sensor reads NOT NEAR on the HDS. The seat should be about 55 mm (2.2 in) from the front.

NOTE: **It takes a few seconds for the HDS to display changes, so wait for about 5 seconds between each movement. If the driver's seat position sensor data does not work as described above, check the driver's seat position sensor for damage, and replace parts as needed.**

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect the HDS from the DLC.

DTC TROUBLESHOOTING INDEX

SRS DTC	Detection Item	Notes
11-1X	Open in the driver's airbag first inflator	DTC Troubleshooting
11-2x	Increased resistance in the driver's airbag first inflator	
11-3X	Short to another wire or decreased resistance in the driver's airbag first inflator	DTC Troubleshooting
11-4X	Open in the driver's airbag second inflator	DTC Troubleshooting
11-5x	Increased resistance in the driver's airbag second inflator	
11-6X	Short to another wire or decreased resistance in the driver's airbag second inflator	DTC Troubleshooting
11-8X	Short to power in the driver's airbag first inflator	DTC Troubleshooting
11-9X	Short to ground in the driver's airbag first inflator	DTC Troubleshooting
11-AX	Short to power in the driver's airbag second inflator	DTC Troubleshooting
11-BX	Short to ground in the driver's airbag second inflator	DTC Troubleshooting
12-1X	Open in the front passenger's airbag first inflator	DTC Troubleshooting
12-2x	Increased resistance in the front passenger's airbag first inflator	
12-3X	Short to another wire or decreased resistance in the front passenger's airbag first inflator	DTC Troubleshooting
12-4X	Open in the front passenger's airbag second inflator	DTC Troubleshooting
12-5x	Increased resistance in the front passenger's airbag second inflator	
12-6X	Short to another wire or decreased resistance in the front passenger's airbag second inflator	DTC Troubleshooting
12-8X	Short to power in the front passenger's airbag first inflator	DTC Troubleshooting
12-9X	Short to ground in the front passenger's airbag first inflator	DTC Troubleshooting
12-AX	Short to power in the front passenger's airbag second inflator	DTC Troubleshooting
12-BX	Short to ground in the front passenger's airbag second inflator	DTC Troubleshooting
21-1X	Open in the driver's seat belt tensioner	DTC Troubleshooting
21-2x	Increased resistance in the driver's seat belt tensioner	
21-3X	Short to another wire or decreased resistance in the driver's seat belt tensioner	DTC Troubleshooting
21-8X	Short to power in the driver's seat belt tensioner	DTC Troubleshooting
21-9X	Short to ground in the driver's seat belt tensioner	DTC Troubleshooting
22-1X	Open in the front passenger's seat belt tensioner	DTC Troubleshooting

22-2x	Increased resistance in the front passenger's seat belt tensioner

NOTE:

The "x" at the end of each DTC denotes a numeric character (0 thru 9) or an alpha character (A thru F) that you may also see on the HDS display. The alphanumeric character is unrelated to your DTC troubleshooting; it is used by the SRS unit manufacturer.

Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

SWS DTC INDEX

SRS DTC	SWS DTC	Detection Item
81-4X	41-xx	Internal failure of the ODS unit
	42-xx	
	43-xx	
81-71	71-xx	ODS unit not calibrated
82-11	11-1X	No signal from the inner side front passenger's weight sensor
82-12	12-2x	No signal from the inner side front passenger's weight sensor
82-13	13-3x	No signal from the inner side front passenger's weight sensor
83-21	21-1x	No signal from the outer side front passenger's weight sensor
83-22	22-2x	No signal from the outer side front passenger's weight sensor
83-23	23-3x	No signal from the outer side front passenger's weight sensor

NOTE:

The "x" at the end of each DTC denotes a numeric character (0 thru 9), or an alpha character (A thru F) that you may also see on the HDS display. The alphanumeric character is unrelated to your DTC troubleshooting; it is used by the SRS unit manufacturer.

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
SRS indicator does not come on	Symptom Troubleshooting (see **SRS INDICATOR DOES NOT COME ON**)	-
SRS indicator stays on, but no DTCs are stored, or cannot be read	Symptom Troubleshooting (see **SRS INDICATOR STAYS ON, BUT NO DTCS ARE STORED, OR CANNOT BE READ**)	• Charging system for under or overcharging • Communication with the HDS
Side airbag cutoff indicator flashes	Check for DTCs. If any DTC is indicated, go to the **DTC TROUBLESHOOTING**	ODS unit initialization
Side airbag cutoff indicator stays on	Symptom Troubleshooting (see **SIDE AIRBAG CUTOFF INDICATOR STAYS ON**)	-
Side airbag cutoff indicator does not come on	Symptom Troubleshooting (see **SIDE AIRBAG CUTOFF INDICATOR DOES NOT COME ON**)	-
Passenger's airbag cutoff indicator flashes	Check for DTCs. If any DTC is indicated, go to the **DTC TROUBLESHOOTING**	ODS unit initialization
Passenger's airbag cutoff indicator stays on or comes on suddenly	Symptom Troubleshooting (see **PASSENGER'S AIRBAG CUTOFF INDICATOR STAYS ON OR COMES ON SUDDENLY**)	ODS unit initialization
Passenger's airbag cutoff indicator does not come on	Check for DTCs. If any DTC is indicated, go to the **DTC TROUBLESHOOTING**	-
Faulty seat belt reminder indicator	Symptom Troubleshooting (see **FAULTY SEAT BELT REMINDER INDICATOR**)	-
HDS does not communicate with the SRS unit or the vehicle	DLC Circuit Troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**)	Communication with the HDS

SYSTEM DESCRIPTION

SRS COMPONENTS

Airbags

The SRS is a safety device which, when used with the front seat belts, is designed to help protect the driver and front passenger in a frontal impact exceeding a certain set limit. The system consists of the SRS unit (A) including safing sensor and impact sensor, the cable reel (B), the driver's airbag (C), the front passenger's airbag (D), the side airbags (E), the side curtain airbags (F), the front seat belt tensioners (G), the side impact sensors (first) (H), the front impact sensors (I), the rear safing sensor (J), and the side impact sensors (second) (K).

Since the driver's and the front passenger's airbags use the same sensors, both normally inflate at the same time. However, it is possible for only one airbag to inflate. This can occur when collision severity is near the threshold for airbag deployment. In such case, the SRS will only deploy airbags when the protection provided by the front seat belt is insufficient.

Front Passenger's Weight Sensors

The front passenger's weight sensors (L) are part of the front passenger's seat base. The front passenger's weight sensors detect the weight on the seat, and send the information to the ODS unit (M). If the total weight is about 65 lbs (30 kg) or less, the ODS unit sends a signal to the SRS unit to prevent the front passenger's airbag from deploying. When the front passenger's airbag is disabled, the passenger airbag cutoff indicator (N) on the center panel comes on to alert the driver that the front passenger's airbag will not deploy in a front-end collision.

NOTE: The sensors only detect the weight on the seat. The sensors do not detect the weight of the passenger's legs or arms that may be resting on the floor or armrests.

Driver's Seat Position Sensor

The driver's seat position sensor (0) is under the driver's seat on the left side. When the driver's seat is moved to the most forward position, the deployment of the driver's airbag is moderated to decrease its force of impact during a front-end collision.

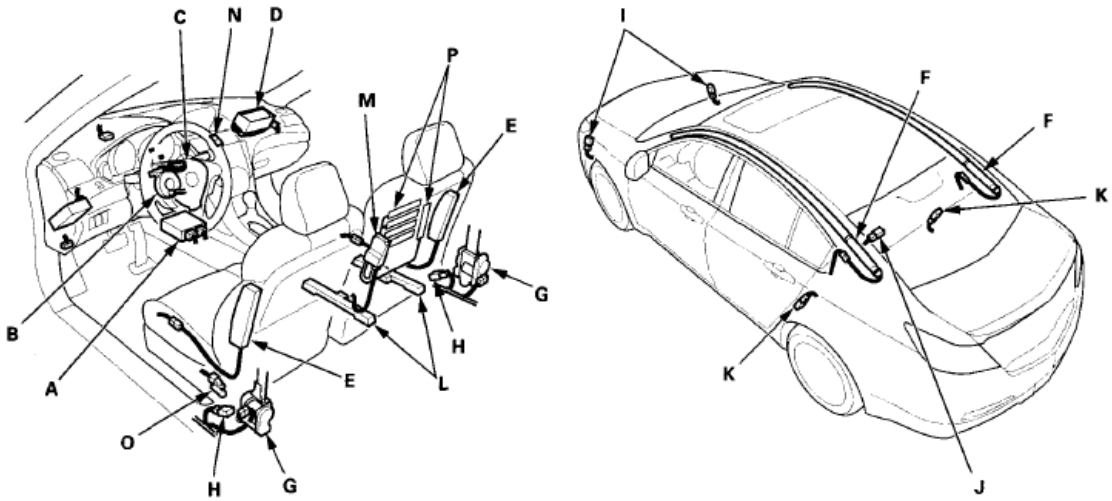

Fig. 42: Identifying SRS Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear Safing Sensor

The rear safing sensor is located under the rear seat cushion. The rear safing sensor performs the same basic function as the safing sensor in the SRS unit. It measures sideways G force, such as the force the vehicle would receive in a side collision in the rear, and sends that information to the SRS unit. The SRS unit uses that information, and the information from the side impact sensors to determine the side that is impacted and the force. If the threshold is met, the SRS unit deploys the side airbag, the side curtain airbag, and the front seat belt tensioner on that side.

SIDE AIRBAG CUTOFF INDICATOR/OPDS OPERATION

The OPDS sensors (P) are located on the front passenger's seat- back foam pad. The ODS unit detects front

passenger's position on the seat by using the OPDS sensors, then sends the signals to the SRS unit. The indicator comes on when the front passenger's seat is occupied by a small adult or child who is leaning into the deployment path, or when an object (grocery bag, briefcase, purse, etc.) is in the seat. This indicates the passenger's side airbag is off and will not deploy; there is no problem with the side airbag. If the passenger sits upright or moves to another seat, or you remove the object from the seat, the indicator should go off. There will be some delay between the occupant's repositioning, and when the indicator will turn on or off.

PASSENGER'S AIRBAG CUTOFF INDICATOR/FRONT PASSENGER'S WEIGHT SENSOR OPERATION

The indicator comes on if the weight on the front passenger's seat is about 65 lbs (30 kg) or less. This indicates the front passenger's airbag is off and will not deploy. The front airbag is shut off to reduce the chance of airbag-caused injuries.

SRS OPERATION

The main circuit in the SRS unit senses and analyzes the force of impact and, if necessary, ignites the inflator charges. If battery voltage is too low or power is disconnected due to the impact, the voltage regulator and the back-up power circuit will keep voltage at a constant level.

For the SRS to operate:

Front Seat Belt Tensioners

1. The front impact sensor, the side impact sensor, or the rear safing sensor must activate and send electric signals to the microprocessor.
2. The microprocessor must compute the signals and trigger the tensioners.
3. The charges must ignite and deploy the tensioners.

Driver's and Front Passenger's Airbag(s)

1. The front impact sensor must activate and send electric signals to the microprocessor.
2. The microprocessor must compute the signals and trigger the front airbag inflators.
3. The triggered inflators must ignite and deploy the front airbags.

Side Airbag(s)

1. The side impact sensor must activate and send electric signals to the microprocessor.
2. The microprocessor must compute the signals and trigger the side airbag inflators. However, the microprocessor does not trigger the front passenger's side airbag if the SRS unit determines that the front passenger's head is in the deployment path of the side airbag.
3. The triggered inflators must ignite and deploy the side airbags.

Side Curtain Airbag(s)

1. The side impact sensor or the rear safing sensor must activate and send electrical signals to the

microprocessor.

2. The microprocessor must compute the signals and trigger the side curtain airbag and the side airbag inflators.
3. The triggered inflators must ignite and deploy the side curtain airbag and the side airbag at the same time.

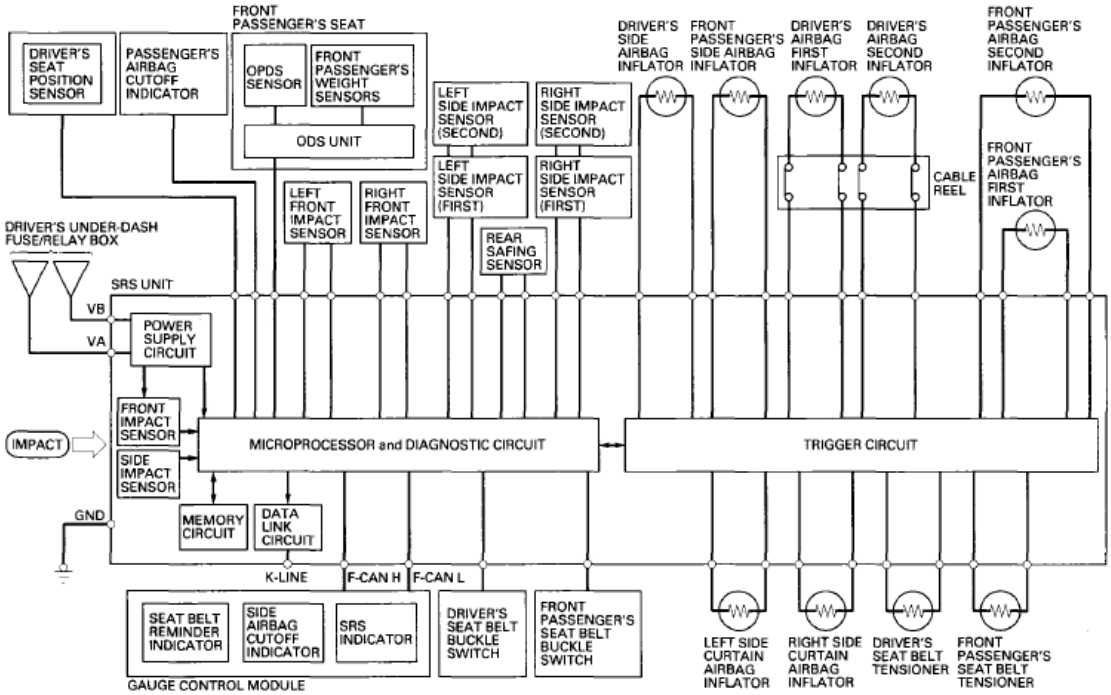

Fig. 43: Driver's And Front Passenger's Airbag(s) Block Diagram
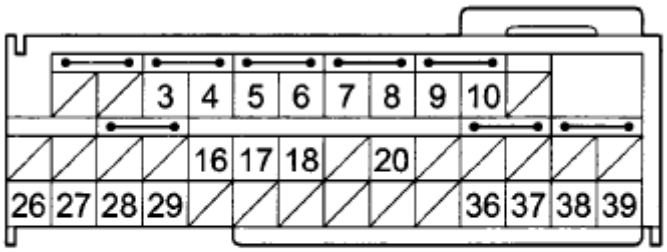
Courtesy of AMERICAN HONDA MOTOR CO., INC.



Self-Diagnostic System

A self-diagnostic circuit is built into the SRS unit; when the ignition switch is turned to ON (II), or the engine start/stop button is pressed to select the ON mode, the SRS indicator comes on and goes off after about 6 seconds if the system is operating normally. If the indicator does not come on, or does not go off after 6 seconds, or comes on while driving, it indicates a problem in the system. The system must be inspected and repaired as soon as possible.

For better serviceability, the SRS unit memory stores any DTCs related to the cause of the malfunction. The SRS unit is connected to the data link connector (DLC). This information can be read with the HDS when it is connected to the DLC (see **GENERAL TROUBLESHOOTING INFORMATION**).

NOTE: Before you disconnect the negative cable from the battery for troubleshooting, refer to Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

SRS UNIT INPUTS AND OUTPUTS AT CONNECTOR A (39P)

Wire side of female terminals

DTC TROUBLESHOOTING

DTC 11-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-4X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE DRIVER'S AIRBAG SECOND INFLATOR; DTC 11-5X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE DRIVER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the access panel from the steering wheel (see step 2), then disconnect the cable reel 4P connector (A) from the driver's airbag 4P connector.

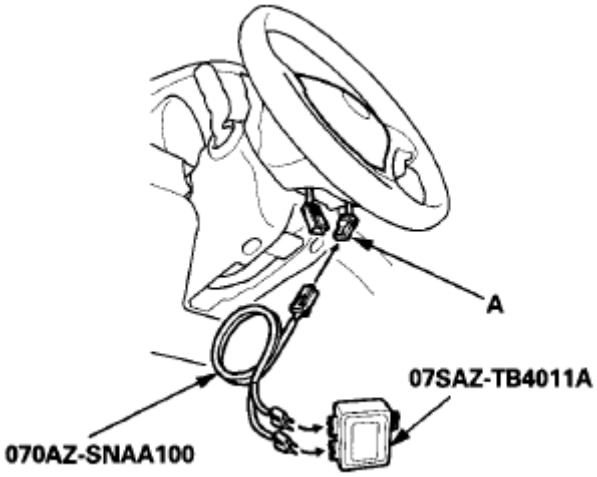

Fig. 54: Identifying Access Panel And Cable Reel 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead J to the cable reel 4P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Check for DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

    YES - Go to step 12.

    NO - Open or increased resistance in the driver's airbag first or second inflator; replace the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
15. Disconnect the dashboard wire harness 4P connector (A) from the cable reel 4P connector.

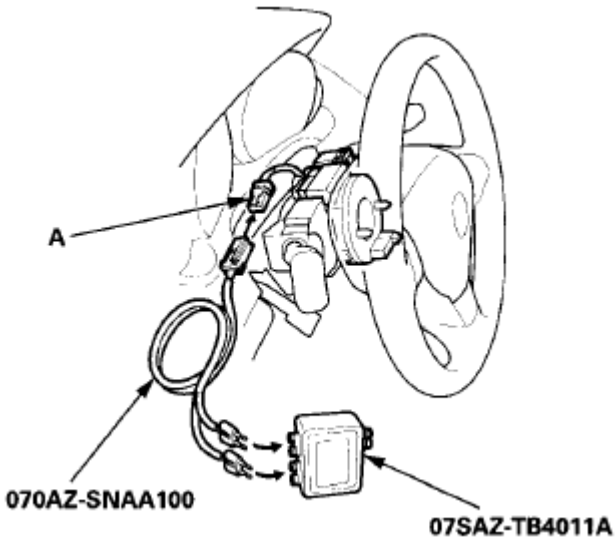

Fig. 55: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead J to the dashboard wire harness 4P connector.
17. Reconnect the negative cable to the battery.
18. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
20. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 11-1x, 11-2x, 11-4x, or 11-5x indicated?

    YES - Go to step 21.

    NO - Open or increased resistance in the cable reel; replace the cable reel (see **CABLE REEL REPLACEMENT**), then clear the DTC.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect the negative cable from the battery, then wait at least 3 minutes.
23. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
24. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the dashboard wire harness 4P connector.
25. Measure the resistance of the SRS simulator lead J black and red terminals respectively. There should be less than 1.0 ohms.

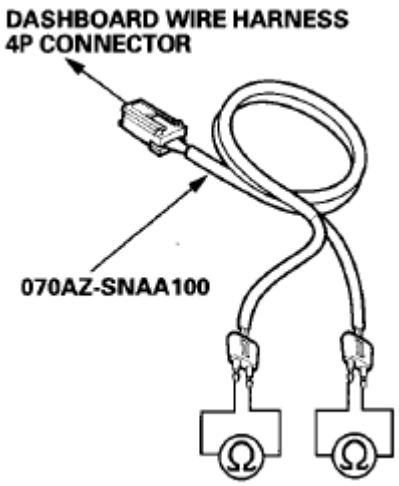

Fig. 56: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC 11-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-6X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE DRIVER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead J 070AZ-SNAA100
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection**

(see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 11-3x or 11-6x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the access panel from the steering wheel (see step 2), then disconnect the cable reel 4P connector (A) from the driver's airbag 4P connector.

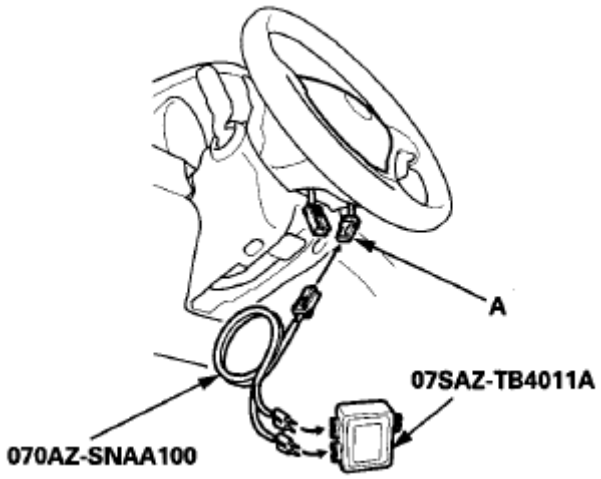

Fig. 57: Identifying Access Panel And Cable Reel 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead J to the cable reel 4P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 11-3x or 11-6x indicated?

    YES - Go to step 12.

    NO - Short to another wire in the driver's airbag first or second inflator; replace the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
15. Disconnect the dashboard wire harness 4P connector (A) from the cable reel 4P connector.

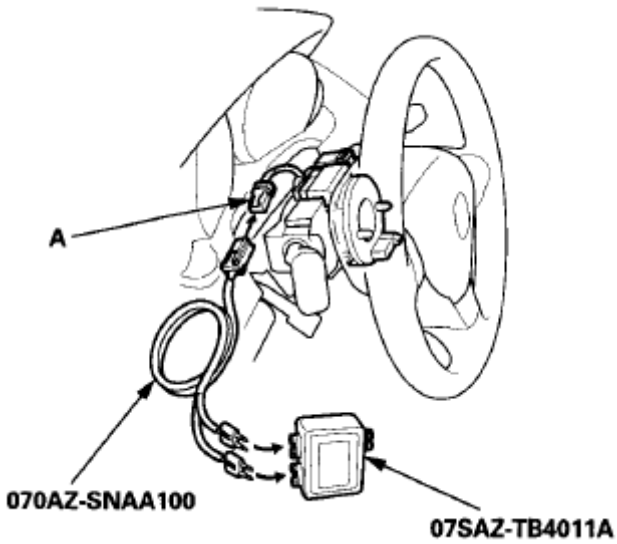

Fig. 58: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead J to the dashboard wire harness 4P connector.
17. Reconnect the negative cable to the battery.
18. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
20. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 11-3x or 1 l-6x indicated?

    YES - Go to step 21.

NO - Short to another wire in the cable reel; replace the cable reel (see **CABLE REEL REPLACEMENT**), then clear the DTC.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect the negative cable from the battery, then wait at least 3 minutes.
23. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
24. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the dashboard wire harness 4P connector.
25. Connect the SRS short cancellers (070AZ-SAA0100) to SRS unit connector A (39P) terminals No. 3 and No. 4, and terminals No. 7 and No. 8 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
26. Measure the resistance of the SRS simulator lead J black and red terminals respectively. There should be an open circuit or at least 1 Mohms.

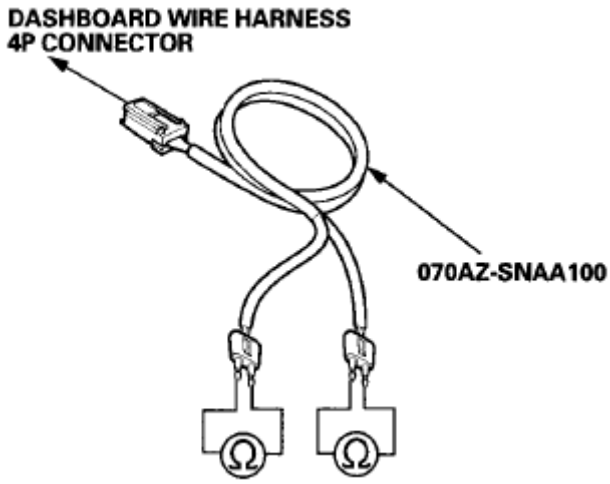

Fig. 59: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC 11-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-AX ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE DRIVER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 11-8x or 11-Ax indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the access panel from the steering wheel (see step 2), then disconnect the cable reel 4P connector (A) from the driver's airbag 4P connector.

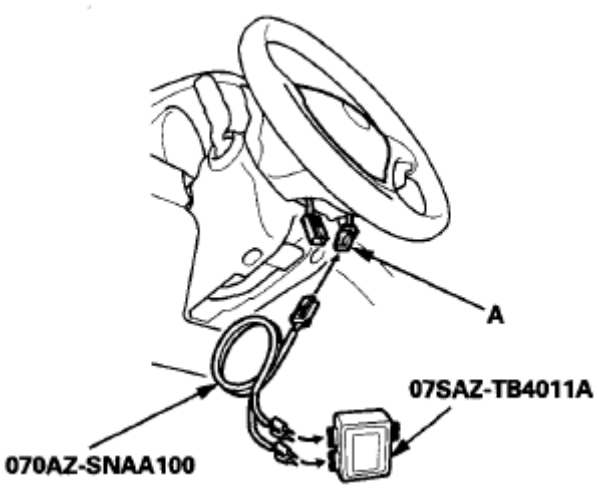

Fig. 60: Identifying Access Panel And Driver's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead J to the cable reel 4P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 11-8x or 11-Ax indicated?

    YES - Go to step 12.

    NO - Short to power in the driver's airbag first or second inflator; replace the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
15. Disconnect the dashboard wire harness 4P connector (A) from the cable reel 4P connector.

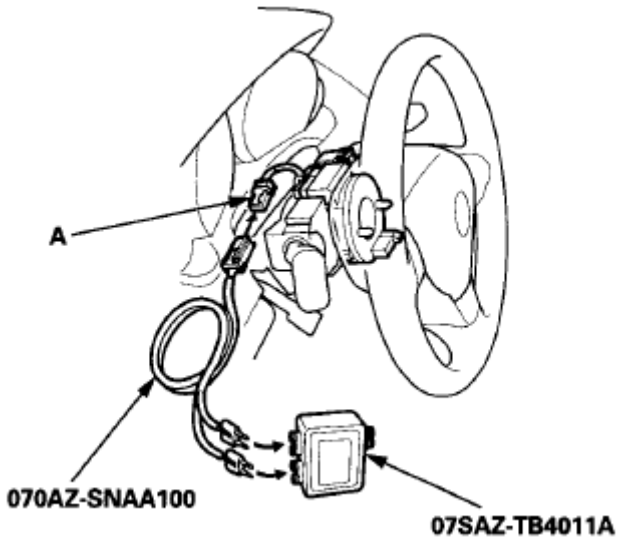

Fig. 61: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead J to the dashboard wire harness 4P connector.
17. Reconnect the negative cable to the battery.
18. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
20. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 11-8x or 11-Ax indicated?

    YES - Go to step 21.

    NO - Short to power in the cable reel; replace the cable reel (see **CABLE REEL REPLACEMENT**), then clear the DTC.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect the negative cable from the battery, then wait at least 3 minutes.
23. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
24. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the dashboard wire harness 4P connector.
25. Reconnect the negative cable to the battery.
26. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
27. Measure the voltage between each terminal of SRS simulator lead J and body ground individually. There should be less than 0.2 V.

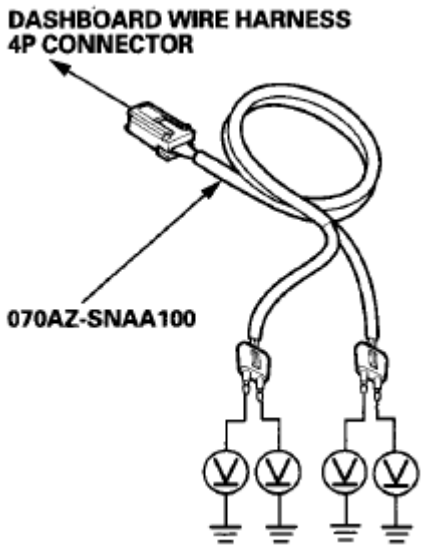

Fig. 62: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC 11-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE DRIVER'S AIRBAG FIRST INFLATOR; DTC 11-BX ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE DRIVER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection**

(see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 11-9x or 11-Bx indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the access panel from the steering wheel (see step 2), then disconnect the cable reel 4P connector (A) from the driver's airbag 4P connector.

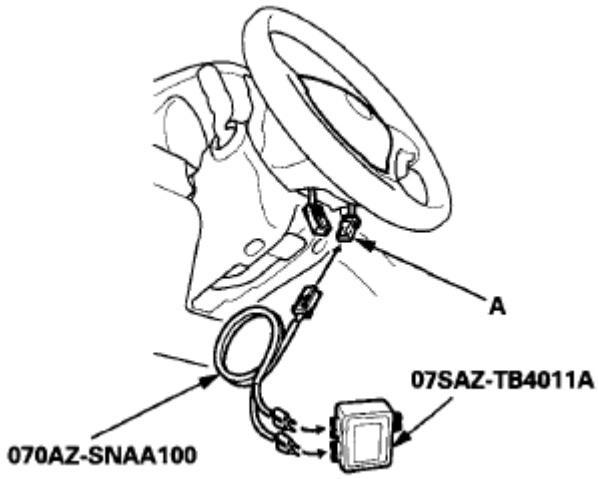

Fig. 63: Identifying Cable Reel 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead J to the cable reel 4P connector.
8. Reconnect the negative cable from the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 11-9x or 11-Bx indicated?

    YES - Go to step 12.

    NO - Short to ground in the driver's airbag first or second inflator; replace the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
15. Disconnect the dashboard wire harness 4P connector (A) from the cable reel 4P connector.

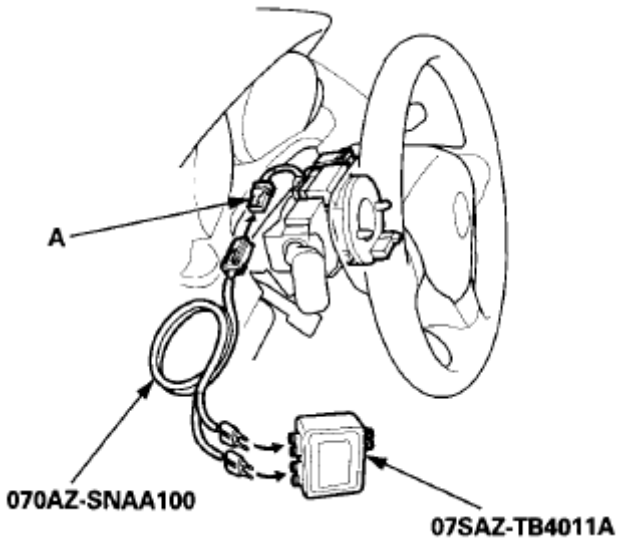

Fig. 64: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead J to the dashboard wire harness 4P connector.
17. Reconnect the negative cable to the battery.
18. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
20. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 11-9x or 11-fix indicated?

    YES - Go to step 21.

NO - Short to ground in the cable reel; replace the cable reel (see **CABLE REEL REPLACEMENT**), then clear the DTC.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Disconnect the negative cable from the battery, then wait at least 3 minutes.
23. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
24. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the dashboard wire harness 4P connector.
25. Measure the resistance between each terminal of SRS simulator lead J and body ground individually. There should be an open circuit or at least 1 Mohms.

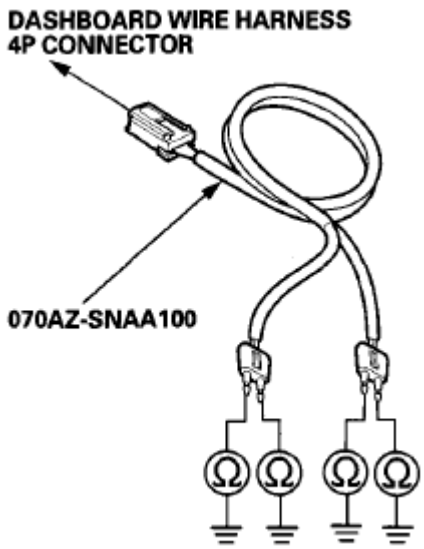

Fig. 65: Measuring Resistance Between Each Terminal Of SRS Simulator Lead J And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC 12-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-4X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE FRONT PASSENGER'S AIRBAG SECOND INFLATOR; DTC 12-5X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE FRONT PASSENGER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 12-1x, 12-2x, 12-4x, or 12-5x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
7. Disconnect the dashboard wire harness 4P connector (A) from the front passenger's airbag 4P connector.

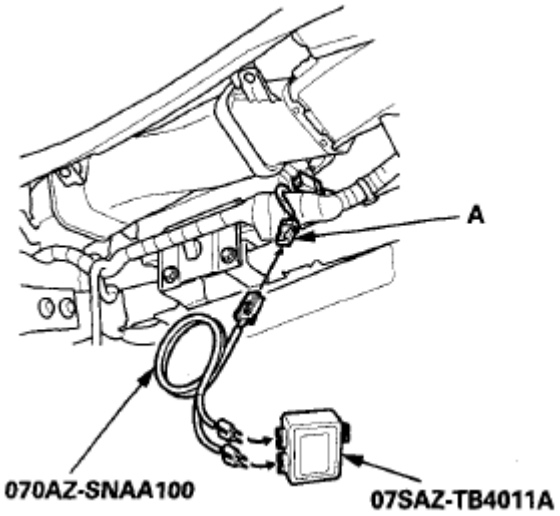

Fig. 66: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect the SRS simulator lead J to the dashboard wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 12-1x, 12-2x, 12-4x, or 12-5x indicated?

    YES - Go to step 13.

    NO - Open or increased resistance in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the dashboard wire harness 4P connector.
17. Measure the resistance of the SRS simulator lead J black and red terminals respectively. There should be less than 1.0 ohms.

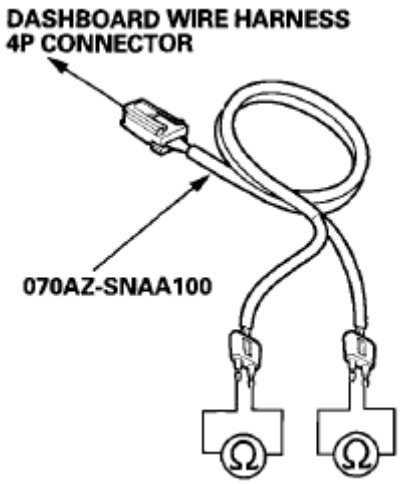

Fig. 67: Measuring Resistance Of SRS Simulator Lead J Black And Red Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC 12-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-6X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE FRONT PASSENGER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead J 070AZ-SNAA100
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection**

(see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 12-3x or 12-6x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
7. Disconnect the dashboard wire harness 4P connector (A) from the front passenger's airbag 4P connector.

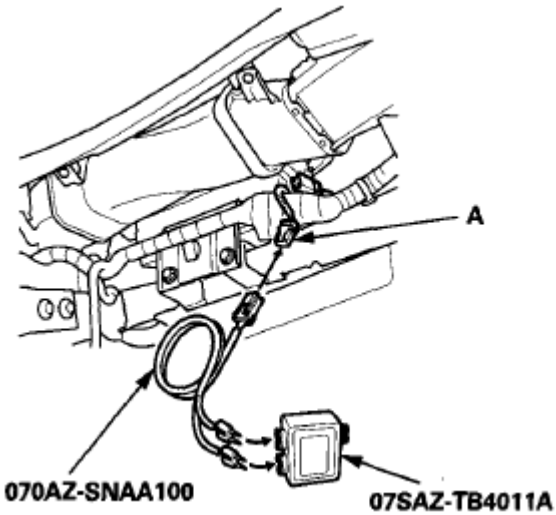

Fig. 68: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect the SRS simulator lead J to the dashboard wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait

for 10 seconds.

12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 12-3x or 12-6x indicated?

    YES - Go to step 13.

    NO - Short to another wire in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the dashboard wire harness 4P connector.
17. Connect the SRS short cancellers (070AZ-SAA0100) to SRS unit connector A (39P) terminals No. 5 and No. 6, and terminals No. 9 and No. 10 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
18. Measure the resistance of the SRS simulator lead J black and red terminals respectively. There should be an open circuit or at least 1 Mohms

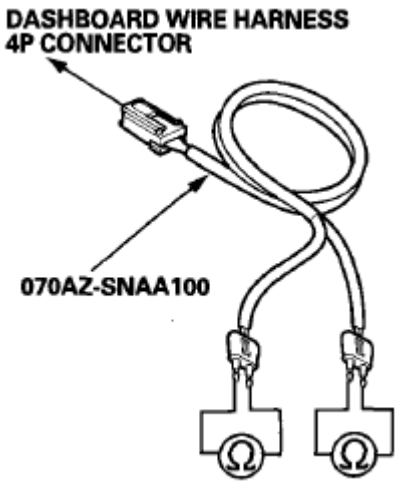

Fig. 69: Measuring Resistance Of SRS Simulator Lead J Black And Red Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear

the DTC.

DTC 12-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-AX ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE FRONT PASSENGER AIRBAG SECOND INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 12-8x or 12-Ax indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
7. Disconnect the dashboard wire harness 4P connector (A) from the front passenger's airbag 4P connector.

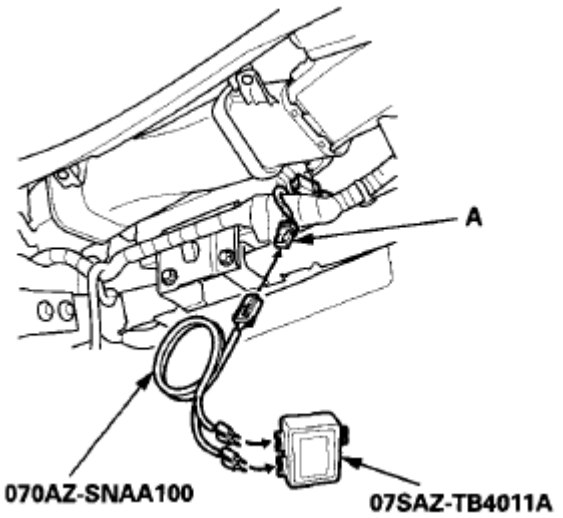

Fig. 70: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect the SRS simulator lead J to the dashboard wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 12-8x or 12-Ax indicated?

    YES - Go to step 13.

    NO - Short to power in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the dashboard wire harness 4P connector.
17. Reconnect the negative cable to the battery.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Measure the voltage between each terminal of SRS simulator lead J and body ground individually. There should be less than 0.2 V.

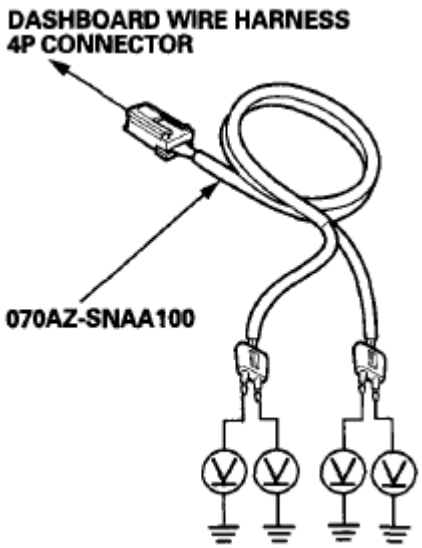

Fig. 71: Measuring Voltage Between Each Terminal Of SRS Simulator Lead J And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC 12-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE FRONT PASSENGER'S AIRBAG FIRST INFLATOR; DTC 12-BX ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE FRONT PASSENGER'S AIRBAG SECOND INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection**

(see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 12-9x or 12-Bx indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
7. Disconnect the dashboard wire harness 4P connector (A) from the front passenger's airbag 4P connector.

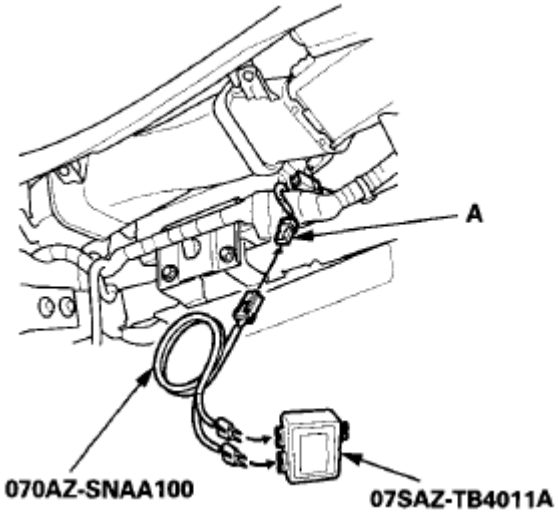

Fig. 72: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 ohms connectors), and then connect the SRS simulator lead J to the dashboard wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait

for 10 seconds.

12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 12-9x or 12-Bx indicated?

    YES - Go to step 13.

    NO - Short to ground in the front passenger's airbag first or second inflator; replace the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the dashboard wire harness 4P connector.
17. Measure the resistance between each terminal of SRS simulator lead J and body ground individually. There should be an open circuit or at least 1 Mohms.

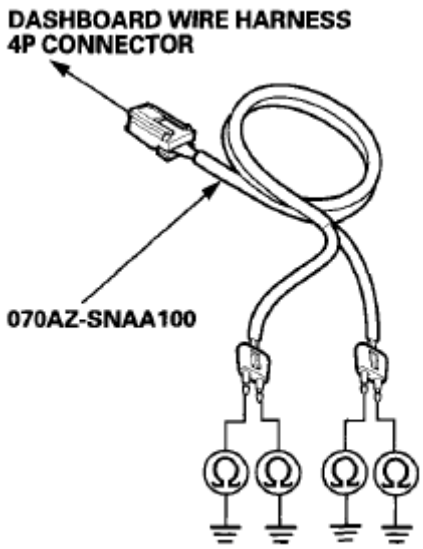

Fig. 73: Measuring Resistance Between Each Terminal Of SRS Simulator Lead J And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the

DTC.

DTC 21-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE DRIVER'S SEAT BELT TENSIONER; DTC 21-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE DRIVER'S SEAT BELT TENSIONER

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead K 070AZ-SNAA200
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 21-1x or 21-2x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the left side B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
7. Disconnect the SRS floor wire harness 4P connector (A) from the driver's seat belt tensioner 4P connector.

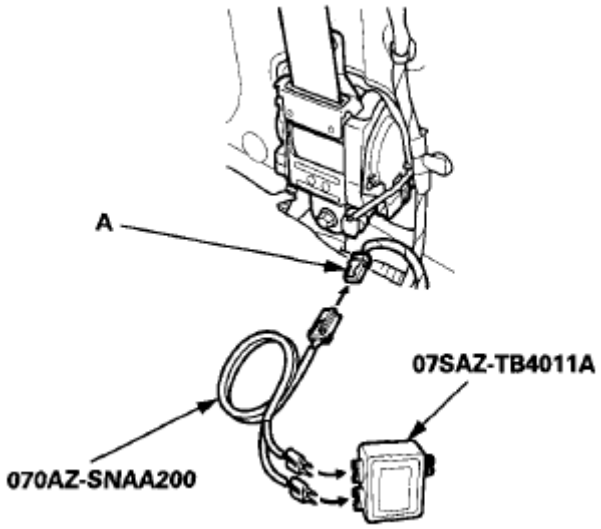

Fig. 74: Identifying SRS Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead K to the SRS floor wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 21-1x or 21-2x indicated?

    YES - Go to step 13.

    NO - Open or increased resistance in the driver's seat belt tensioner; replace the driver's seat belt (see **FRONT SEAT BELT REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Connect an SRS short canceller (070AZ-SAA0100) to SRS unit connector B (39P) terminals No. 12 and No. 13 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
17. Measure the resistance between SRS unit connector B (39P) terminals No. 12 and No. 13. There should be 2.0- 3.0 ohms.

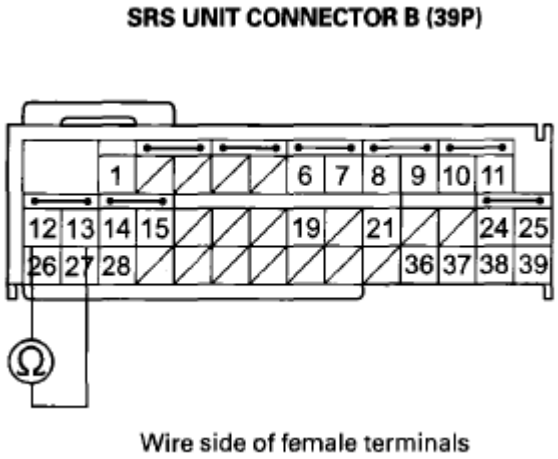

Fig. 75: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 12 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Open or increased resistance in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 21-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE DRIVER'S SEAT BELT TENSIONER

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead K 070AZ-SNAA200
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 21-3x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the left side B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
7. Disconnect the SRS floor wire harness 4P connector (A) from the driver's seat belt tensioner 4P connector.

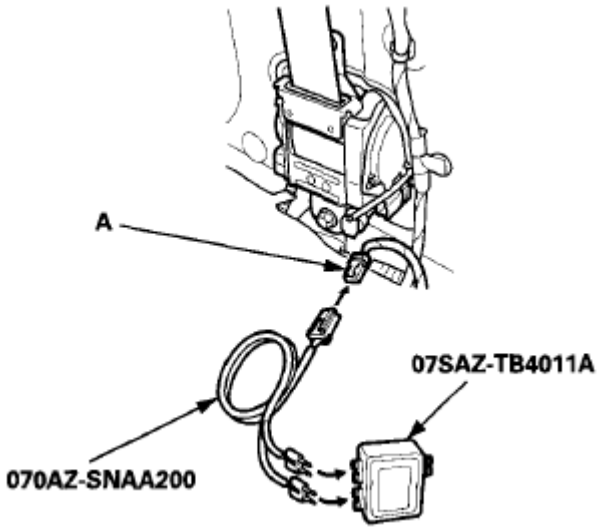

Fig. 76: Identifying SRS Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead K to the SRS floor wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait

for 10 seconds.

12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 21-3x indicated?

    YES - Go to step 13.

    NO - Short to another wire in the driver's seat belt tensioner; replace the driver's seat belt (see **FRONT SEAT BELT REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect SRS simulator lead K from the SRS floor wire harness 4P connector.
17. Connect an SRS short canceller (070AZ-SAA0100) to SRS unit connector B (39P) terminals No. 12 and No. 13 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
18. Measure the resistance between SRS unit connector B (39P) terminals No. 12 and No. 13. There should be an open circuit or at least 1 Mohms.

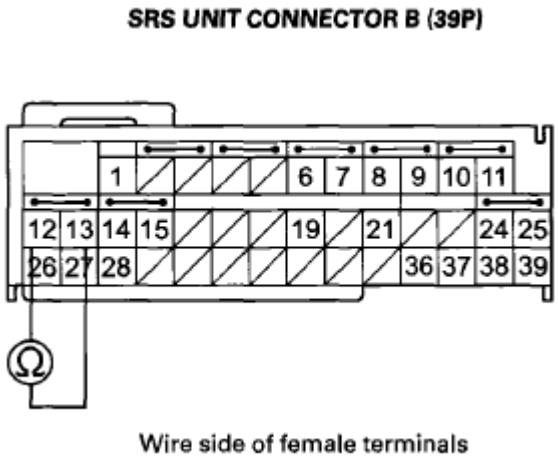

Fig. 77: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 12 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 21-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE DRIVER'S SEAT BELT TENSIONER

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead K 070AZ-SNAA200

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 21-8x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the left side B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
7. Disconnect the SRS floor wire harness 4P connector (A) from the driver's seat belt tensioner 4P connector.

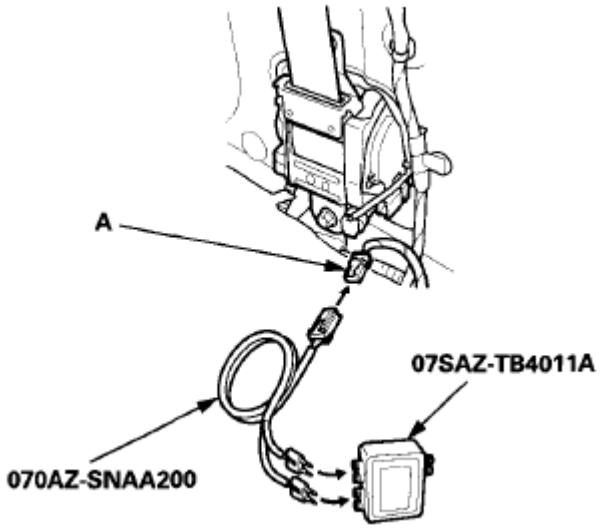

Fig. 78: Identifying SRS Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead K to the SRS floor wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 21-8x indicated?

    YES - Go to step 13.

    NO - Short to power in the driver's seat belt tensioner; replace the driver's seat belt (see **FRONT SEAT BELT REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect SRS simulator lead K from the SRS floor wire harness 4P connector.
17. Reconnect the negative cable to the battery.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Measure the voltage between body ground and SRS unit connector B (39P) terminals No. 12 and No. 13 individually. There should be less than 0.2 V.

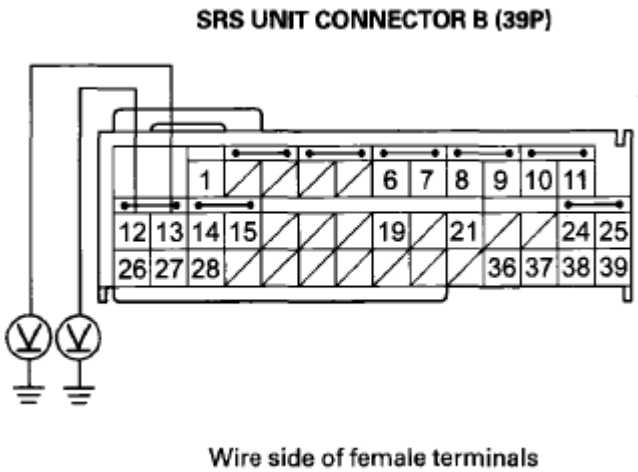

Fig. 79: Measuring Voltage Between Body Ground And SRS Unit Connector B (39P) Terminals No. 12 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 21-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE DRIVER'S SEAT BELT TENSIONER

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead K 070AZ-SNAA200

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 21-9x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the left side B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
7. Disconnect the SRS floor wire harness 4P connector (A) from the driver's seat belt tensioner 4P connector.

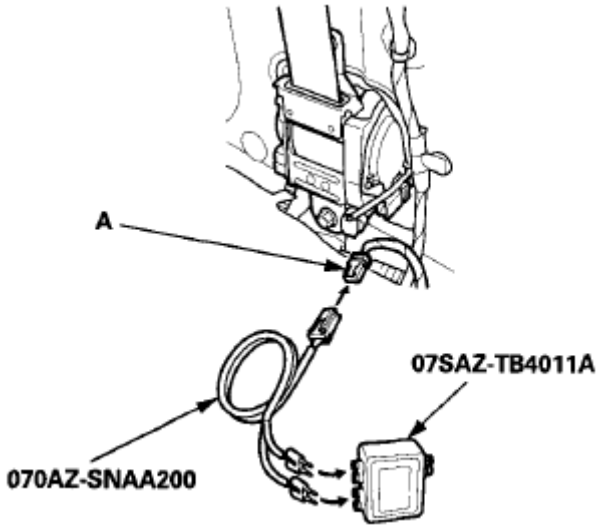

Fig. 80: Identifying SRS Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead K to the SRS floor wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait

for 10 seconds.

12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 21-9x indicated?

    YES - Go to step 13.

    NO - Short to ground in the driver's seat belt tensioner; replace the driver's seat belt (see **FRONT SEAT BELT REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect SRS simulator lead K from the SRS floor wire harness 4P connector.
17. Measure the resistance between body ground and SRS unit connector B (39P) terminals No. 12 and No. 13 individually. There should bean open circuit or at least 1 Mohms.

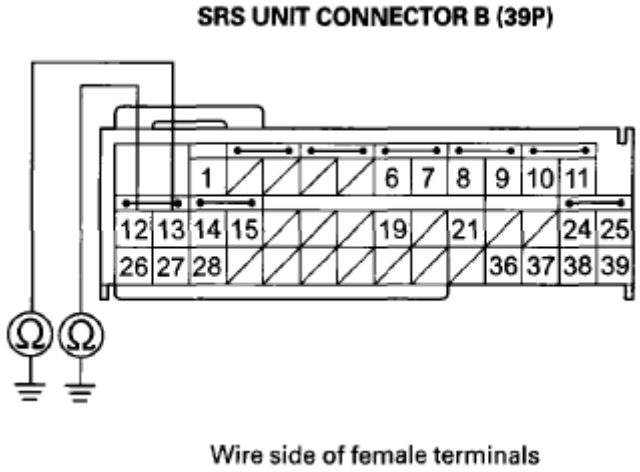

Fig. 81: Measuring Resistance Between Body Ground And SRS Unit Connector B (39P) Terminals No. 12 And No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 22-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE FRONT PASSENGER'S SEAT

BELT TENSIONER; DTC 22-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE FRONT PASSENGER'S SEAT BELT TENSIONER

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead K 070AZ-SNAA200
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 22-1x or 22-2x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the right side B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
7. Disconnect the SRS floor wire harness 4P connector (A) from the front passenger's seat belt tensioner 4P connector.

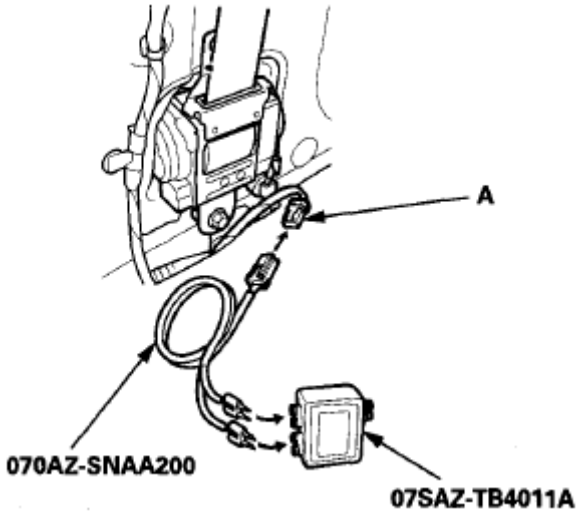

Fig. 82: Identifying SRS Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead K to the SRS floor wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 22-1x or 22-2x indicated?

    YES - Go to step 13.

    NO - Open or increased resistance in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see **FRONT SEAT BELT REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Connect an SRS short canceller (070AZ-SAA0100) to SRS unit connector B (39P) terminals No. 14 and No. 15 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
17. Measure the resistance between SRS unit connector B(39P) terminals No. 14 and No. 15. There should be 2.0- 3.0 ohms.

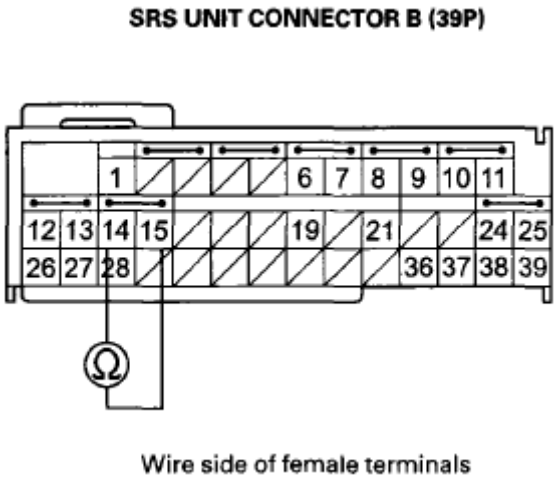

Fig. 83: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 14 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Open or increased resistance in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 22-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE FRONT PASSENGER'S SEAT BELT TENSIONER

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead K 070AZ-SNAA200
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 22-3x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the right side B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
7. Disconnect the SRS floor wire harness 4P connector (A) from the front passenger's seat belt tensioner 4P connector.

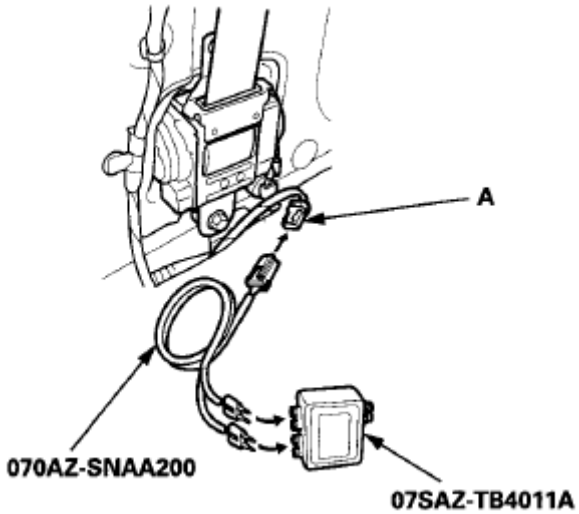

Fig. 84: Identifying SRS Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead K to the SRS floor wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 22-3x indicated?

    YES - Go to step 13.

    NO - Short to another wire in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see **FRONT SEAT BELT REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect SRS simulator lead K from the SRS floor wire harness 4P connector.
17. Connect an SRS short canceller (070AZ-SAA0100) to SRS unit connector B (39P) terminals No. 14 and No. 15 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
18. Measure the resistance between SRS unit connector B (39P) terminals No. 14 and No. 15. There should be an open circuit or at least 1 Mohms

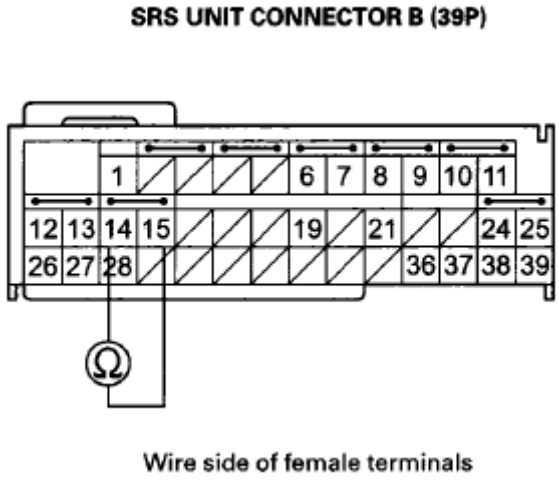

Fig. 85: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 14 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 22-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE FRONT

PASSENGER'S SEAT BELT TENSIONER

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead K 070AZ-SNAA200

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 22-8x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the right side B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
7. Disconnect the SRS floor wire harness 4P connector (A) from the front passenger's seat belt tensioner 4P connector.

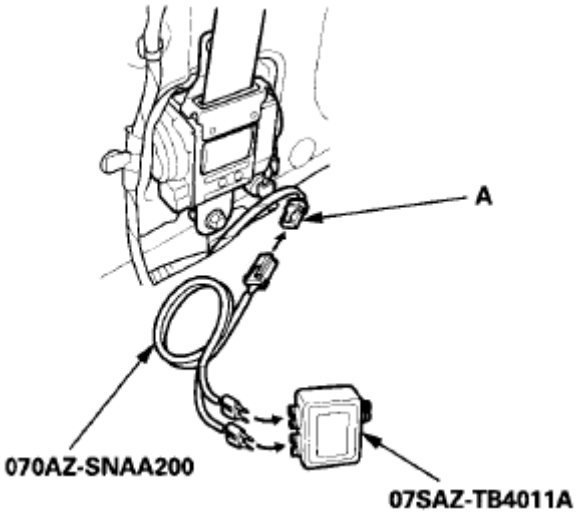

Fig. 86: Identifying SRS Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead K to the SRS floor wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 22-8x indicated?

    YES - Go to step 13.

    NO - Short to power in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see **FRONT SEAT BELT REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect SRS simulator lead K from the SRS floor wire harness 4P connector.
17. Reconnect the negative cable to the battery.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Measure the voltage between body ground and SRS unit connector B (39P) terminals No. 14 and No. 15 individually. There should be less than 0.2 V.

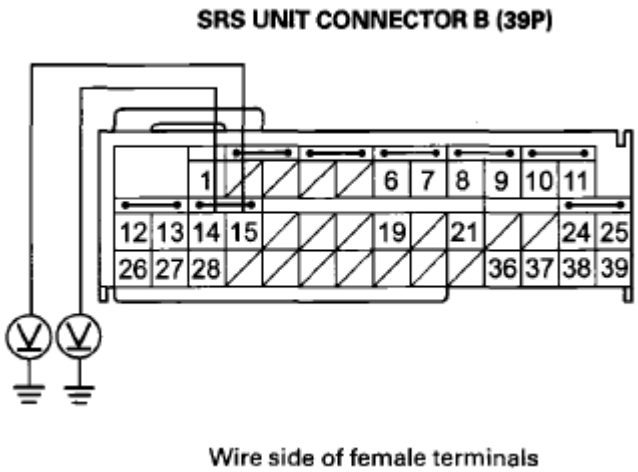

Fig. 87: Measuring Voltage Between Body Ground And SRS Unit Connector B (39P) Terminals No. 14 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 22-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE FRONT PASSENGER'S SEAT BELT TENSIONER

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead K 070AZ-SNAA200

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 22-9x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the right side B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
7. Disconnect the SRS floor wire harness 4P connector (A) from the front passenger's seat belt tensioner 4P connector.

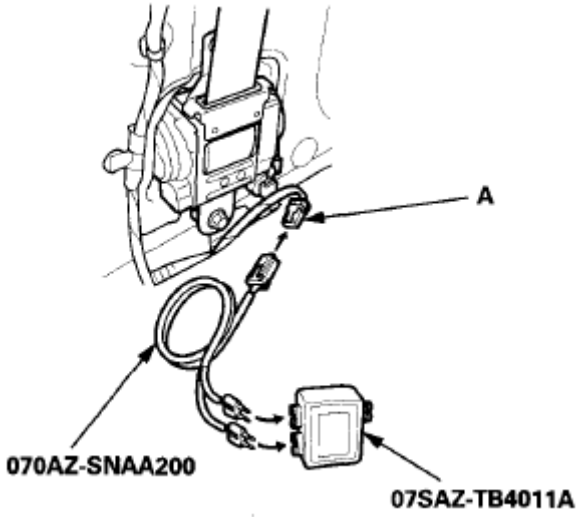

Fig. 88: Identifying SRS Floor Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 ohms connectors), and then connect SRS simulator lead K to the SRS floor wire harness 4P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 22-9x indicated?

    YES - Go to step 13.

    No - Short to ground in the front passenger's seat belt tensioner; replace the front passenger's seat belt (see **FRONT SEAT BELT REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect SRS simulator lead K from the SRS floor wire harness 4P connector.
17. Measure the resistance between body ground and SRS unit connector B (39P) terminals No. 14 and No. 15 individually. There should bean open circuit or at least 1 Mohms.

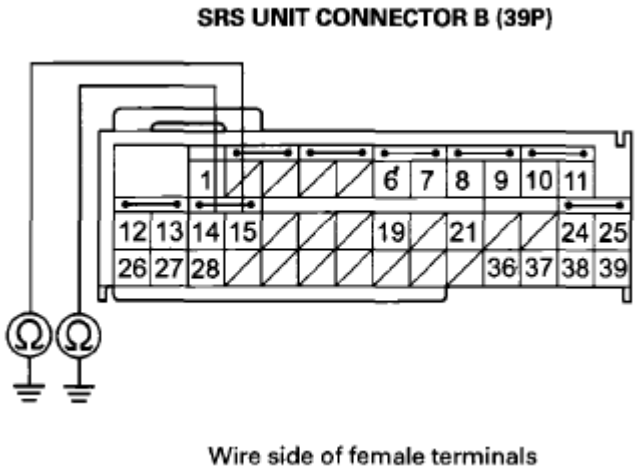

Fig. 89: Measuring Resistance Between Body Ground And SRS Unit Connector B (39P) Terminals No. 14 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 31-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE DRIVER'S SIDE AIRBAG INFLATOR; DTC 31-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN

THE DRIVER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 31-1x or 31-2x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness connector (A) from the driver's side airbag 2P connector.

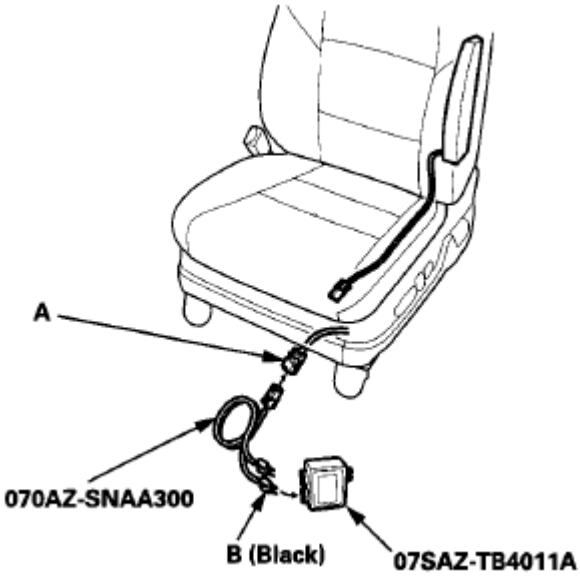

Fig. 90: Identifying SRS Floor Wire Harness Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 31-1x or 31-2x indicated?

    YES - Go to step 12.

    NO - Open or increased resistance in the driver's side airbag inflator; replace the driver's side airbag (see **SIDE AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
16. Measure the resistance of the SRS simulator lead L black terminal (A). There should be less than 1.0 ohms.

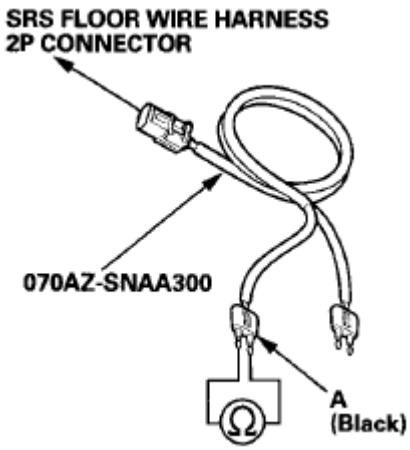

Fig. 91: Measuring Resistance Of SRS Simulator Lead L Black Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Open or increased resistance in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 31-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE DRIVER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 31-3x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 2P connector (A) from the driver's side airbag 2P connector.

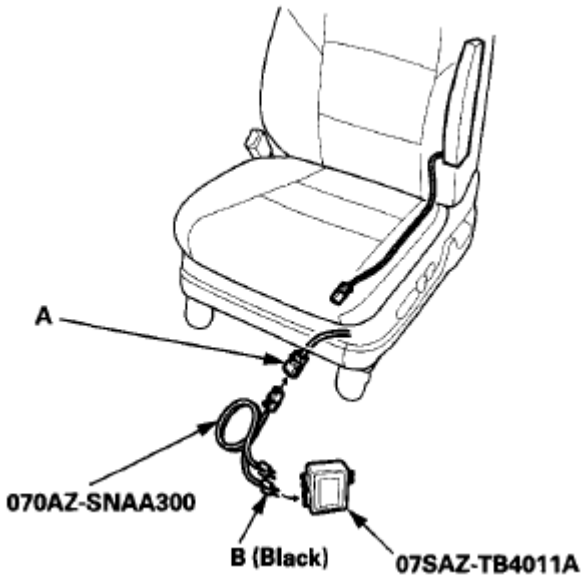

Fig. 92: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 31-3x indicated?

    YES - Go to step 12.

    NO - Short to another wire in the driver's side airbag inflator; replace the driver's side airbag (see **SIDE AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
16. Connect an SRS short canceller (070AZ-SAA0100) to SRS unit connector B (39P) terminals No. 6 and No. 7 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
17. Measure the resistance of the SRS simulator lead L black terminal (A). There should be an open circuit or at least 1 Mohms

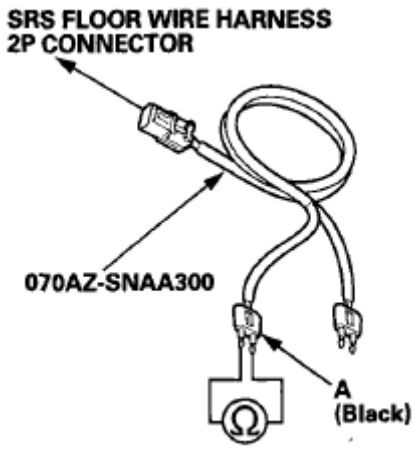

Fig. 93: Measuring Resistance Of SRS Simulator Lead L Black Terminal (A)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 31-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE DRIVER'S SIDE

AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 31-8x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 2P connector (A) from the driver's side airbag 2P connector.

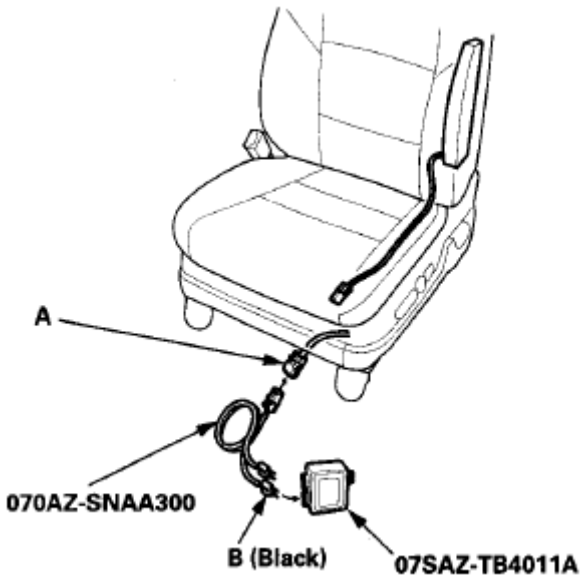

Fig. 94: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 31-8x indicated?

    YES - Go to step 12.

    NO - Short to power in the driver's side airbag inflator; replace the driver's side airbag (see **SIDE AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
16. Reconnect the negative cable to the battery.
17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
18. Measure the voltage between black terminal (A) of SRS simulator lead L and body ground individually. There should be less than 0.2 V.

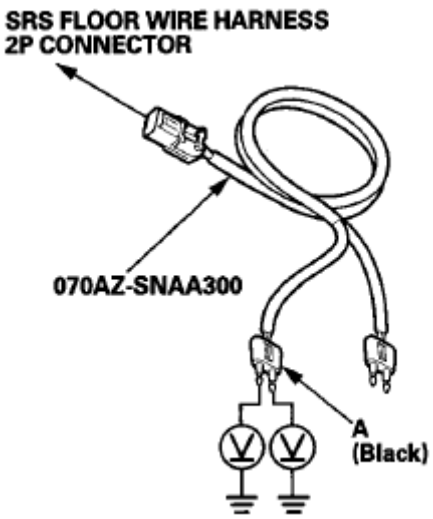

Fig. 95: Measuring Voltage Between Black Terminal (A) Of SRS Simulator Lead L And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 31-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE DRIVER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 31-9x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 2P connector (A) from the driver's side airbag 2P connector.

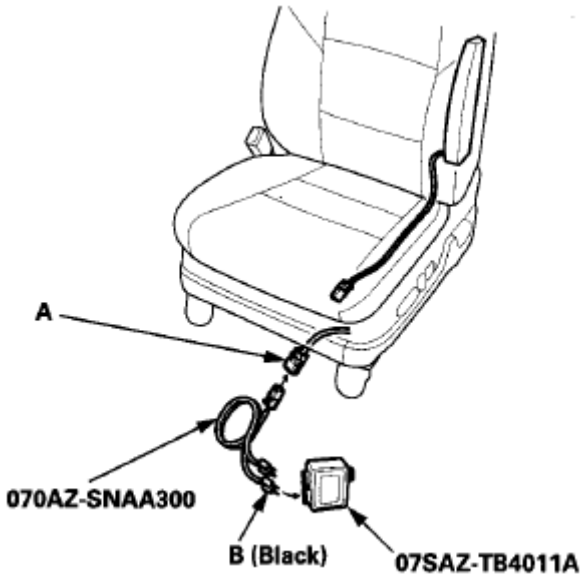

Fig. 96: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait

for 10 seconds.

11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 31-9x indicated?

    YES - Go to step 12.

    NO - Short to ground in the driver's side airbag inflator; replace the driver's side airbag (see **SIDE AIRBAG REPLACEMENT**), then clear the DTC

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
16. Measure the resistance between black terminal (A) of SRS simulator lead L and body ground individually. There should be an open circuit or at least 1 Mohms.

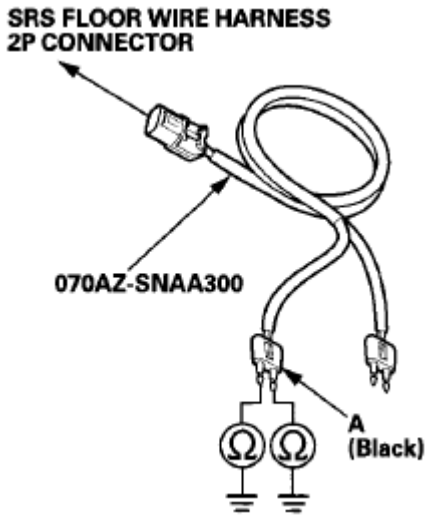

Fig. 97: Measuring Resistance Between Black Terminal (A) Of SRS Simulator Lead L And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 32-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE FRONT PASSENGER'S SIDE AIRBAG INFLATOR; DTC 32-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE FRONT PASSENGER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 32-1x or 32-2x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 2P connector (A) from the front passenger's side airbag 2P connector.

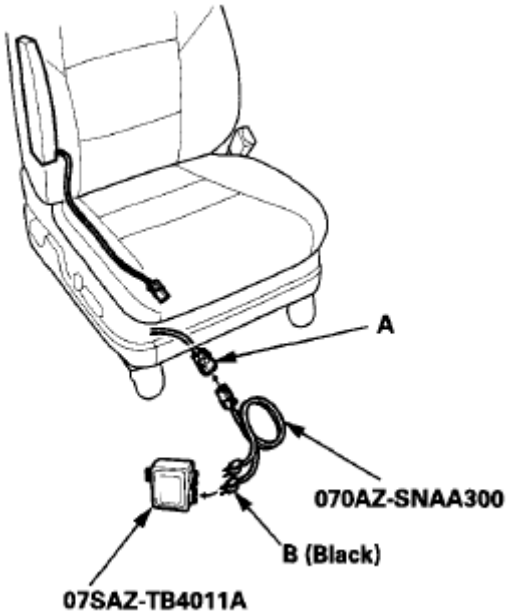

Fig. 98: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 32-1x or 32-2x indicated?

    YES - Go to step 12.

    NO - Open or increased resistance in the front passenger's side airbag inflator; replace the front passenger's side airbag (see **SIDE AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
16. Measure the resistance of the SRS simulator lead L black terminal (A). There should be less than 1.0 ohms.

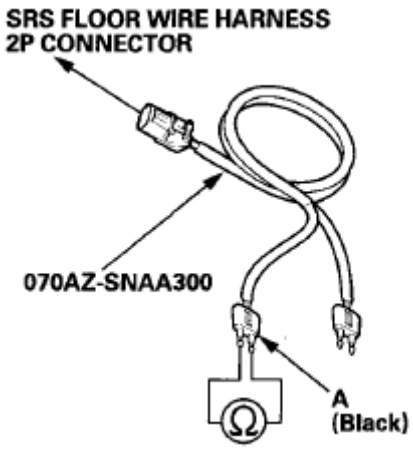

Fig. 99: Measuring Resistance Of SRS Simulator Lead L Black Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Open or increased resistance in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 32-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE FRONT PASSENGER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 32-3x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 2P connector (A) from the front passenger's side airbag 2P connector.

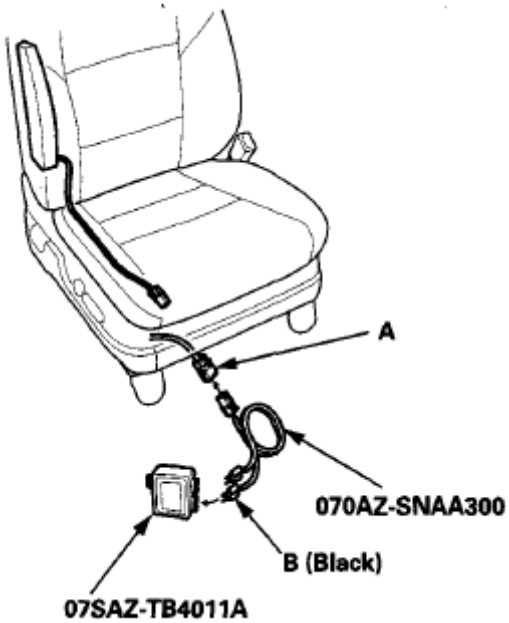

Fig. 100: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 32-3x indicated?

    YES - Go to step 12.

    NO - Short to another wire in the front passenger's side airbag inflator; replace the front passenger's side airbag (see **SIDE AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
16. Connect an SRS short canceller (070AZ-SAA0100) to SRS unit connector B (39P) terminals No. 8 and No. 9 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
17. Measure the resistance of the SRS simulator lead L black terminal (A). There should be an open circuit or at least 1 Mohms

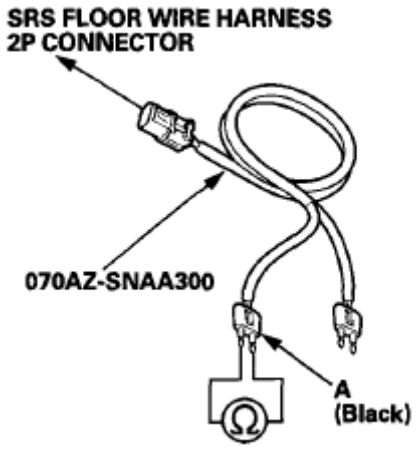

Fig. 101: Measuring Resistance Of SRS Simulator Lead L Black Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear

the DTC.

DTC 32-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE FRONT PASSENGER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 32-8x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 2P connector (A) from the front passenger's side airbag 2P connector.

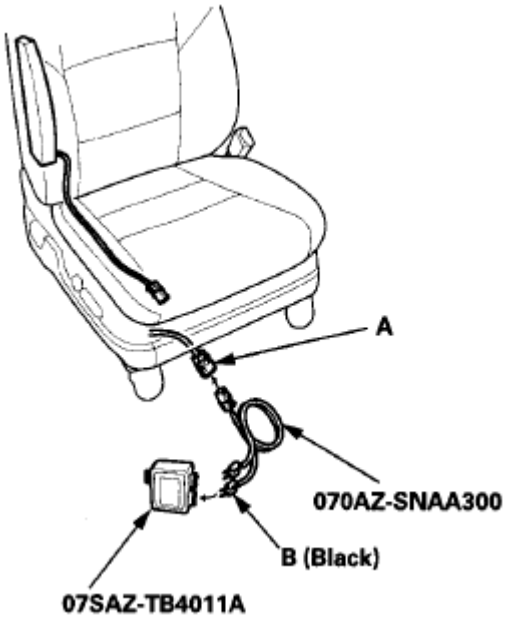

Fig. 102: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 32-8x indicated?

    YES - Go to step 12.

    NO - Short to power in the front passenger's side airbag inflator; replace the front passenger's side airbag (see **SIDE AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
16. Reconnect the negative cable to the battery.
17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
18. Measure the voltage between black terminal (A) of SRS simulator lead L and body ground individually.

There should be less than 0.2 V.

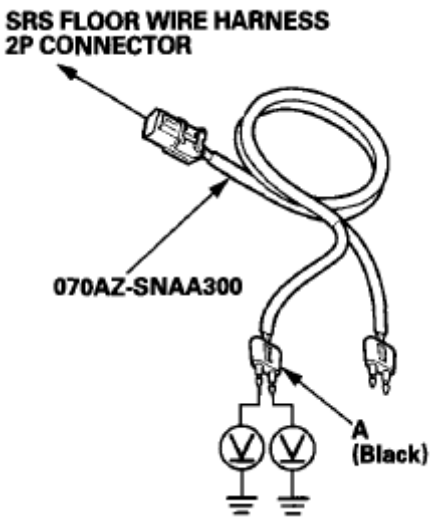

Fig. 103: Measuring Voltage Between Black Terminal (A) Of SRS Simulator Lead L And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 32-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE FRONT PASSENGER'S SIDE AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING**

INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 32-9x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 2P connector (A) from the front passenger's side airbag 2P connector.

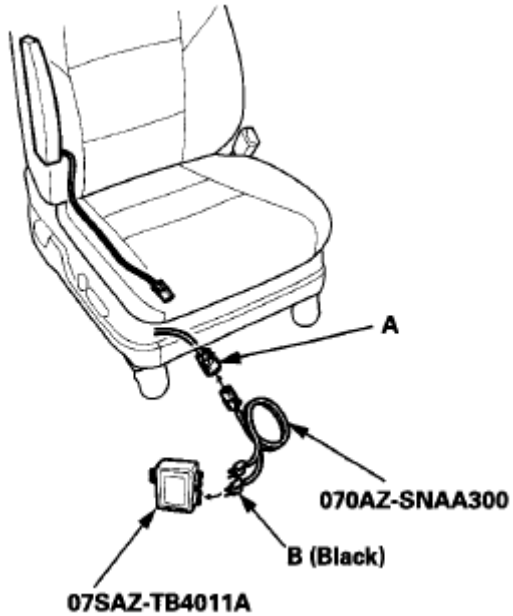

Fig. 104: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.

8. Reconnect the negative cable to the battery.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 32-9x indicated?

    YES - Go to step 12.

    NO - Short to ground in the front passenger's side airbag inflator; replace the front passenger's side airbag (see **SIDE AIRBAG REPLACEMENT**), then clear the DTC.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
16. Measure the resistance between black terminal (A) of SRS simulator lead L and body ground individually. There should be an open circuit or at least 1 Mohms

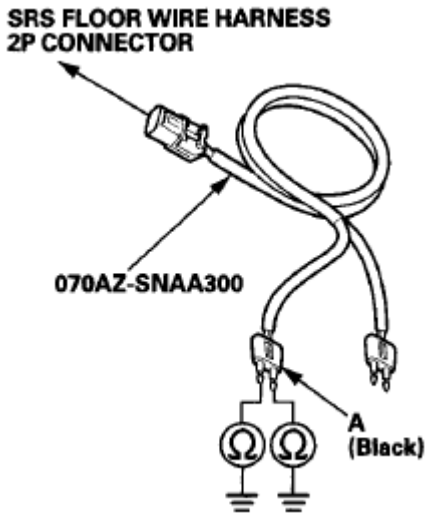

Fig. 105: Measuring Resistance Between Black Terminal (A) Of SRS Simulator Lead L And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the

DTC does not clear, replace the SRS floor wire harness.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 33-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE LEFT SIDE CURTAIN AIRBAG INFLATOR; DTC 33-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE LEFT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 33-1x or 33-2x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the left side C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connector (A) from the left side curtain airbag 2P connector.

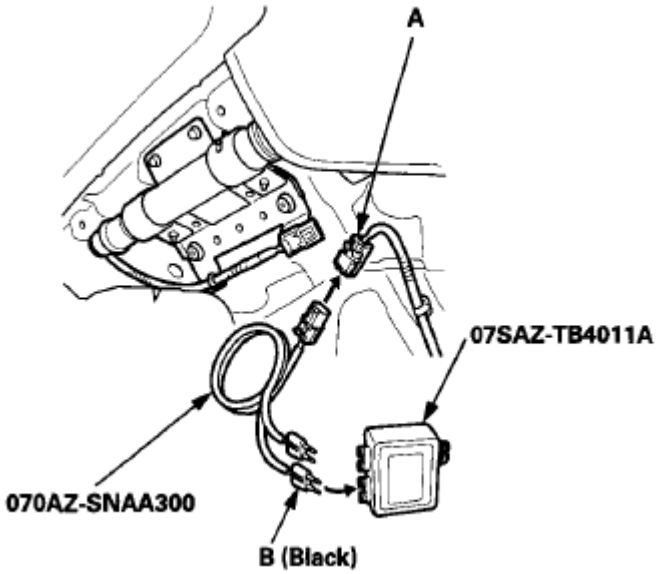

Fig. 106: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 33-1x or 33-2x indicated?

    YES - Go to step 13.

    NO - Open or increased resistance in the left side curtain airbag Inflator; replace the left side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
17. Measure the resistance of the SRS simulator lead L black terminal (A). There should be less than 1.0 ohms.

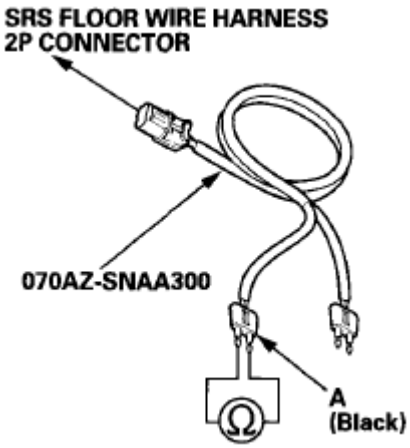

Fig. 107: Measuring Resistance Of SRS Simulator Lead L Black Terminal (A)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at the SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Open or increased resistance in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 33-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE LEFT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 33-3x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the left side C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connector (A) from the left side curtain airbag 2P connector.

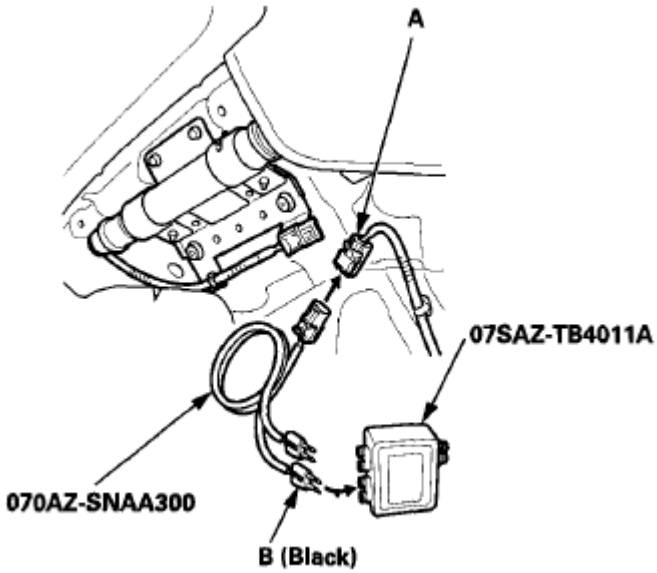

Fig. 108: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait

for 10 seconds.

12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 33-3x indicated?

    YES - Go to step 13.

    NO - Short to another wire in the left side curtain airbag inflator; replace the left side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
17. Connect an SRS short canceller (070AZ-SAA0100) to SRS unit connector B (39P) terminals No. 10 and No. 11 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
18. Measure the resistance of the SRS simulator lead L black terminal (A). There should be an open circuit or at least 1 Mohms

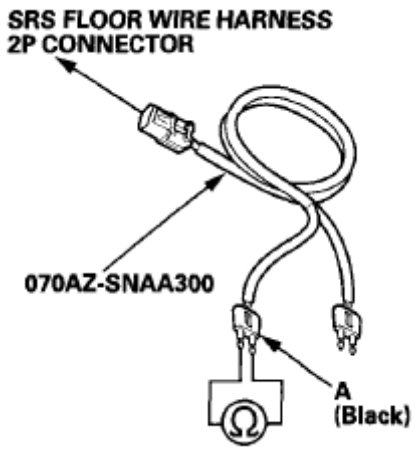

Fig. 109: Measuring Resistance Of SRS Simulator Lead L Black Terminal (A)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 33-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE LEFT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 33-8x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the left side C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connector (A) from the left side curtain airbag 2P connector.

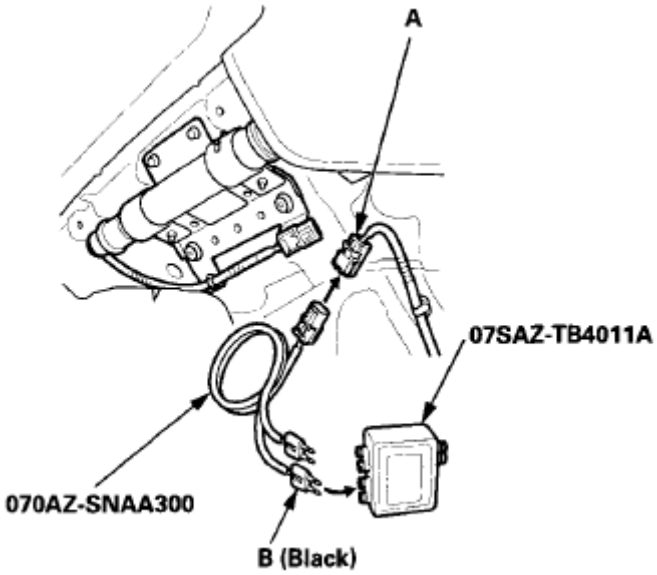

Fig. 110: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 33-8x indicated?

    YES - Go to step 13.

    NO - Short to power in the left side curtain airbag inflator; replace the left side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
17. Reconnect the negative cable to the battery.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Measure the voltage between black terminal (A) of SRS simulator lead L and body ground individually. There should be less than 0.2 V.

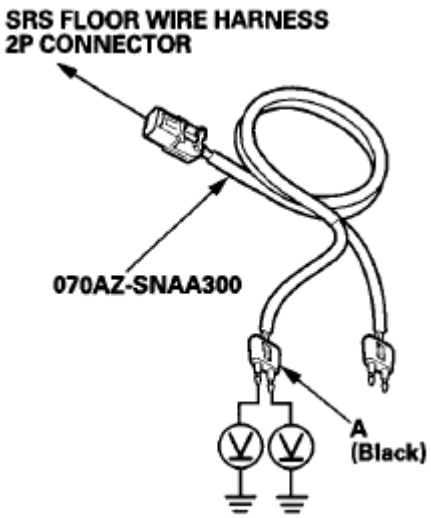

Fig. 111: Measuring Voltage Between Black Terminal (A) Of SRS Simulator Lead L And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 33-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE LEFT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 33-9x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the left side C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connector (A) from the left side curtain airbag 2P connector.

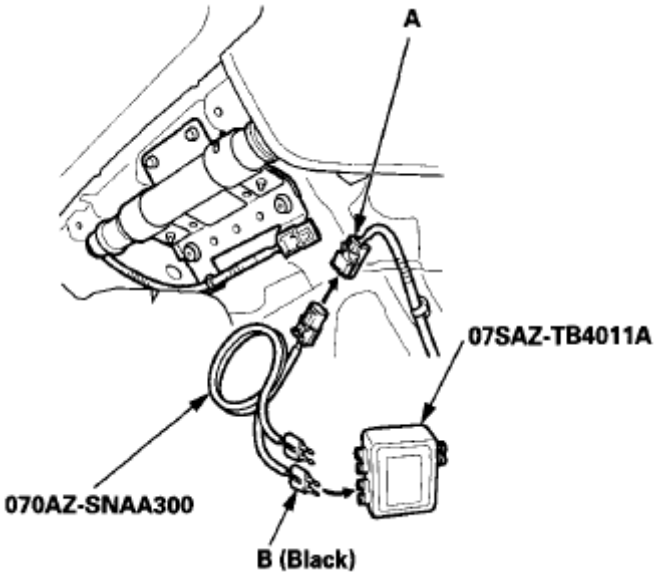

Fig. 112: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 33-9x indicated?

    YES - Go to step 13.

    NO - Short to ground in the left side curtain airbag inflator; replace the left side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
17. Measure the resistance between black terminal (A) of SRS simulator lead L and body ground individually. There should be an open circuit or at least 1 Mohms.

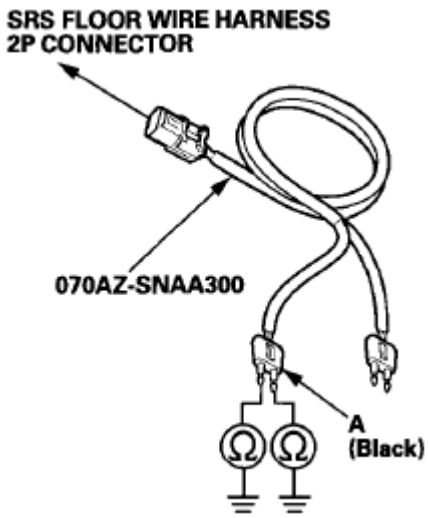

Fig. 113: Measuring Resistance Between Black Terminal (A) Of SRS Simulator Lead L And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the

DTC.

DTC 34-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE RIGHT SIDE CURTAIN AIRBAG INFLATOR; DTC 34-2X ("X" CAN BE 0 THRU 9 OR A THRU F): INCREASED RESISTANCE IN THE RIGHT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 34-1x or 34-2x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the right side C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connector (A) from the right side curtain airbag 2P connector.

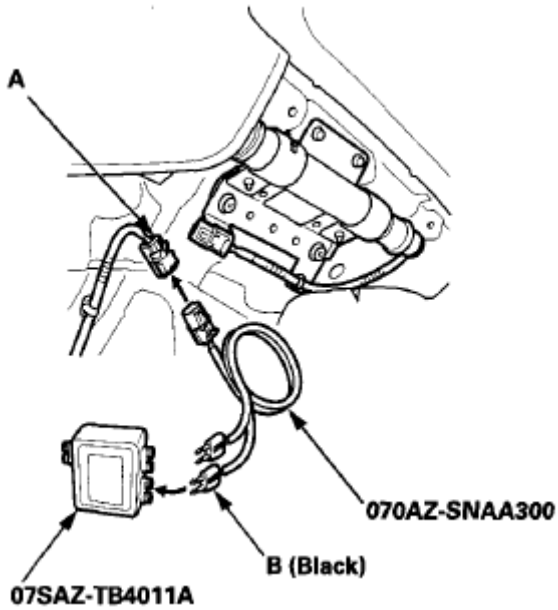

Fig. 114: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 34-1x or 34-2x indicated?

    YES - Go to step 13.

    NO - Open or increased resistance in the right side curtain airbag inflator; replace the right side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
17. Measure the resistance of the SRS simulator lead L black terminal (A). There should be less than 1.0 ohms.

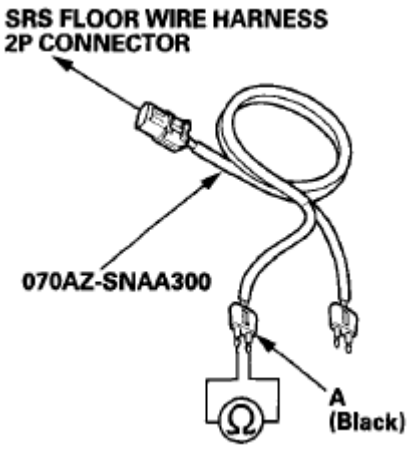

Fig. 115: Measuring Resistance Of SRS Simulator Lead L Black Terminal (A)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Open or increased resistance in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 34-3X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO ANOTHER WIRE OR DECREASED RESISTANCE IN THE RIGHT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300
- SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 34-3x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the right side C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connector (A) from the right side curtain airbag 2P connector.

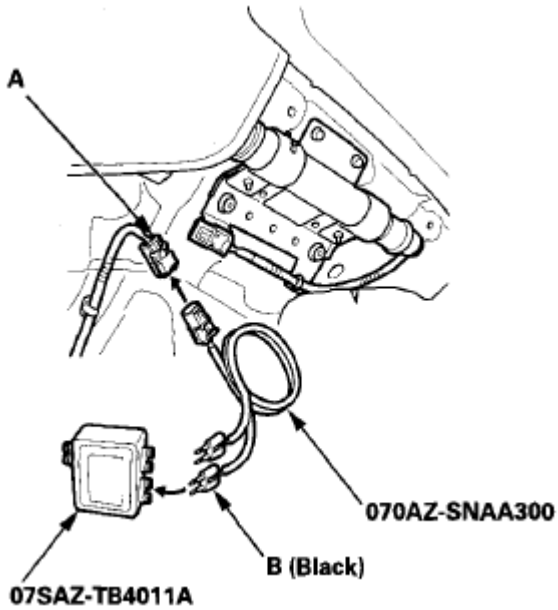

Fig. 116: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 34-3x indicated?

    YES - Go to step 13.

    NO - Short to another wire in the right side curtain airbag inflator; replace the right side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
17. Connect an SRS short canceller (070AZ-SAA0100) to SRS unit connector B (39P) terminals No. 24 and No. 25 (see **OPENING THE SRS UNIT SHORTING CONNECTORS FOR DIAGNOSIS**).
18. Measure the resistance of the SRS simulator lead L black terminal (A). There should be an open circuit or at least 1 Mohms

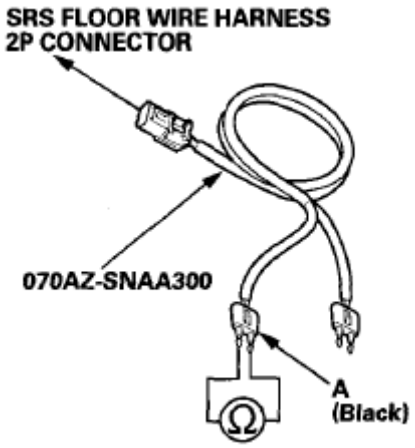

Fig. 117: Measuring Resistance Of SRS Simulator Lead L Black Terminal (A)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear

the DTC.

DTC 34-8X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE RIGHT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 34-8x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the right side C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connector (A) from the right side curtain airbag 2P connector.

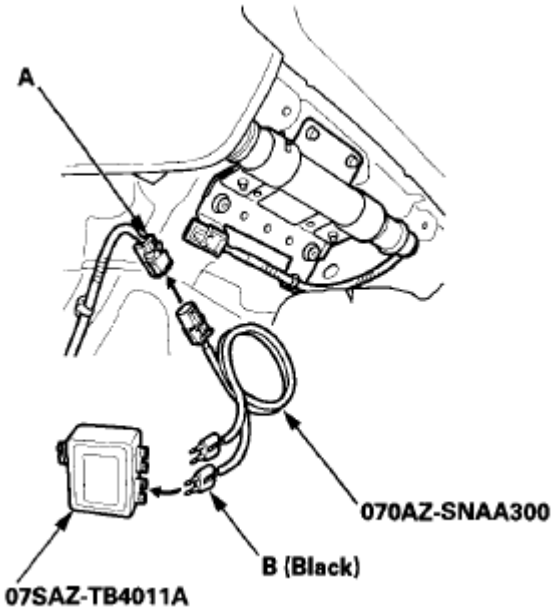

Fig. 118: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.
9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 34-8x indicated?

    YES - Go to step 13.

    NO - Short to power in the right side curtain airbag inflator; replace the right side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
17. Reconnect the negative cable to the battery.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Measure the voltage between black terminal (A) of SRS simulator lead L and body ground individually.

There should be less than 0.2 V.

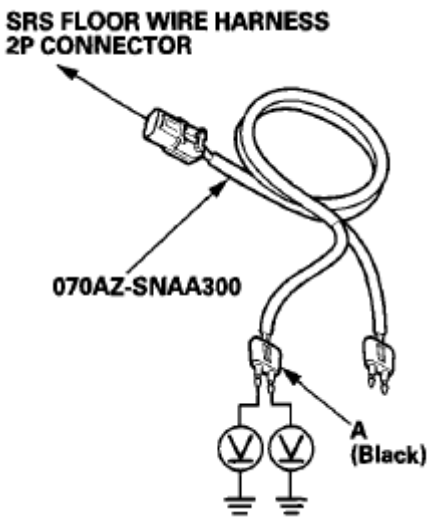

Fig. 119: Measuring Voltage Between Black Terminal (A) Of SRS Simulator Lead L And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 34-9X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO GROUND IN THE RIGHT SIDE CURTAIN AIRBAG INFLATOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING**

INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 34-9x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Remove the right side C-pillar trim (see **C-PILLAR TRIM**).
7. Disconnect the SRS floor wire harness 2P connector (A) from the right side curtain airbag 2P connector.

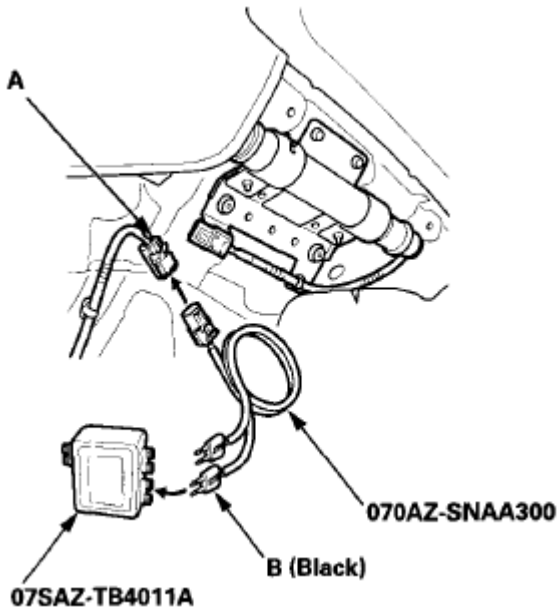

Fig. 120: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the black terminal (B) of SRS simulator lead L to the SRS inflator simulator (2 ohms connector), and then connect SRS simulator lead L to the SRS floor wire harness 2P connector.

9. Reconnect the negative cable to the battery.
10. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 34-9x indicated?

    YES - Go to step 13.

    NO - Short to ground in the right side curtain airbag inflator; replace the right side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the negative cable from the battery, then wait at least 3 minutes.
15. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
16. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the SRS floor wire harness 2P connector.
17. Measure the resistance between black terminal (A) of SRS simulator lead L and body ground individually. There should be an open circuit or at least 1 Mohms.

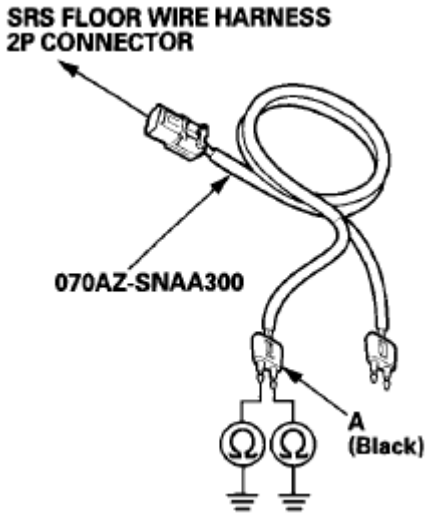

Fig. 121: Measuring Resistance Between Black Terminal (A) Of SRS Simulator Lead L And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the

DTC does not clear, replace the SRS floor wire harness.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 41-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE LEFT FRONT IMPACT SENSOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 41-1x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Check for these connector connections and harness.
   - SRS unit connector A (39P) and the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).

- Left engine compartment wire harness 2P connector and the left front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**).
- C305 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

Are the connector connections and harness OK?

YES - Go to step 7.

NO - Repair the poor connector connections or replace the harness, then clear the DTC, and retest. If DTC 41-1x is still present, go to step 7.

7. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Disconnect the left engine compartment wire harness 2P connector from the left front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**).
9. Measure the resistance between SRS unit connector A (39P) terminals No. 36 and No. 37. There should be an open circuit or at least 1 Mohms.

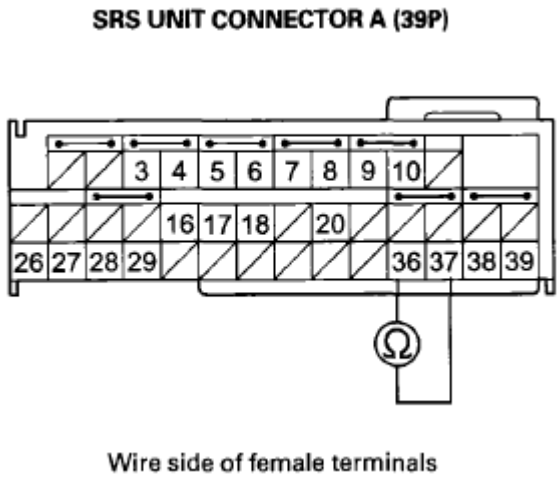

Fig. 122: Measuring Resistance Between SRS Unit Connector A (39P) Terminals No. 36 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to another wire in the left engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

10. Measure the resistance between body ground and SRS unit connector A (39P) terminals No. 36 and No. 37 individually. There should be an open circuit or at least 1 Mohms.

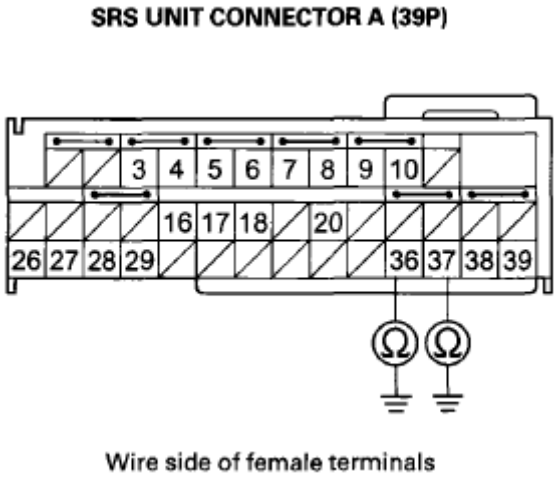

Fig. 123: Measuring Resistance Between Body Ground And SRS Unit Connector A (39P) Terminals No. 36 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 11.

NO - Short to ground in the left engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

11. Reconnect the negative cable to the battery.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between body ground and SRS unit connector A (39P) terminals No. 36 and No. 37 individually. There should be less than 0.2 V.

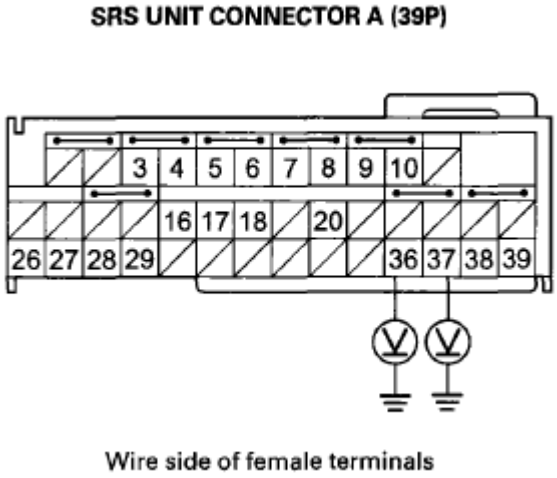

Fig. 124: Measuring Voltage Between Body Ground And SRS Unit Connector A (39P) Terminals No. 36 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 14.

NO - Short to power in the left engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

14. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
15. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), and then connect SRS simulator lead L to the left engine compartment wire harness 2P connector (B).

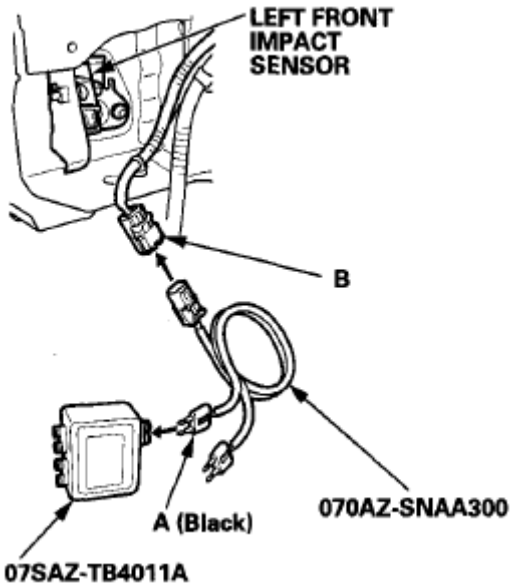

Fig. 125: Identifying SRS Simulator Lead L To Left Engine Compartment Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Measure the resistance between SRS unit connector A (39P) terminals No. 36 and No. 37. There should be less than 1.0 ohms.

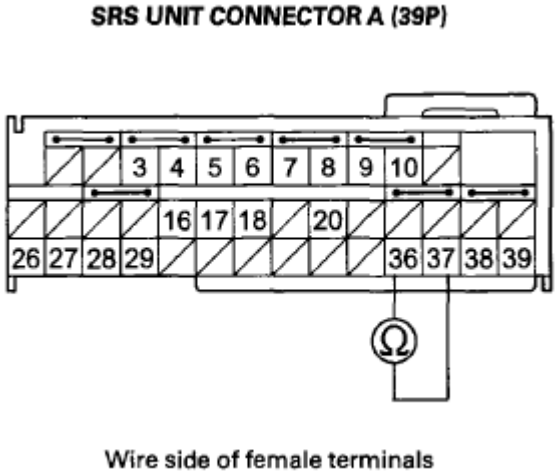

Fig. 126: Measuring Resistance Between SRS Unit Connector A (39P) Terminals No. 36 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty left front impact sensor or SRS unit; replace the left front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the left engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

DTC 42-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE RIGHT FRONT IMPACT SENSOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit**

software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 42-1x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Check for these connector connections and harness.
   - SRS unit connector A (39P) and the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
   - Right engine compartment wire harness 2P connector and the right front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**).
   - C208 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

   Are the connector connections and harness OK?

   YES - Go to step 7.

   NO - Repair the poor connector connections or replace the harness, then clear the DTC, and retest. If DTC 42-1x is still present, go to step 7.

7. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Disconnect the right engine compartment wire harness 2P connector from the right front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**).
9. Measure the resistance between SRS unit connector A (39P) terminals No. 38 and No. 39. There should be an open circuit or at least 1 Mohms.

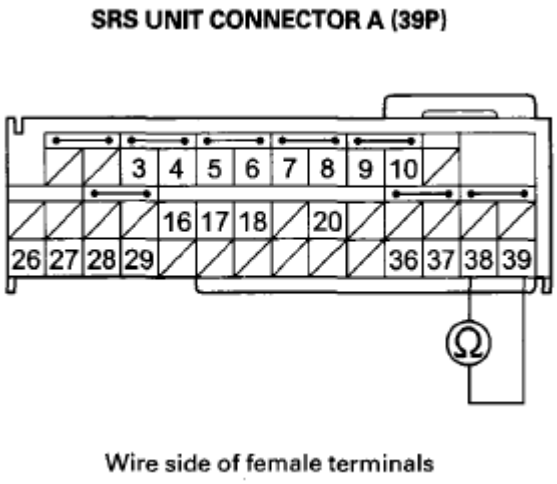

Fig. 127: Measuring Resistance Between SRS Unit Connector A (39P) Terminals No. 38 And No. 39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to another wire in the right engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

10. Measure the resistance between body ground and SRS unit connector A (39P) terminal No. 38 and No. 39 individually. There should be an open circuit or at least 1 Mohms.

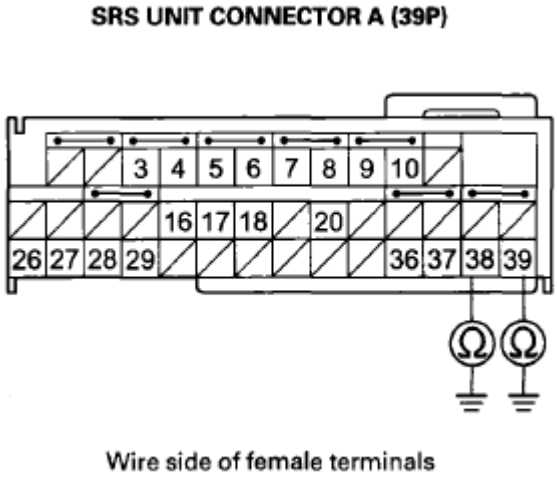

Fig. 128: Measuring Resistance Between Body Ground And SRS Unit Connector A (39P) Terminal No. 38 And No. 39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 11.

NO - Short to ground in the right engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

11. Reconnect the negative cable to the battery.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between body ground and SRS unit connector A (39P) terminal No. 38 and No. 39 individually. There should be less than 0.2 V.

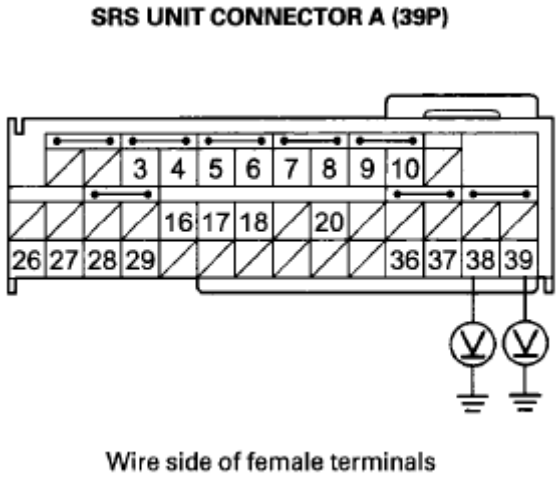

Fig. 129: Measuring Voltage Between Body Ground And SRS Unit Connector A (39P) Terminal No. 38 And No. 39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 14.

NO - Short to power in the right engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), and then connect SRS simulator lead L to the right engine compartment wire harness 2P connector (B).

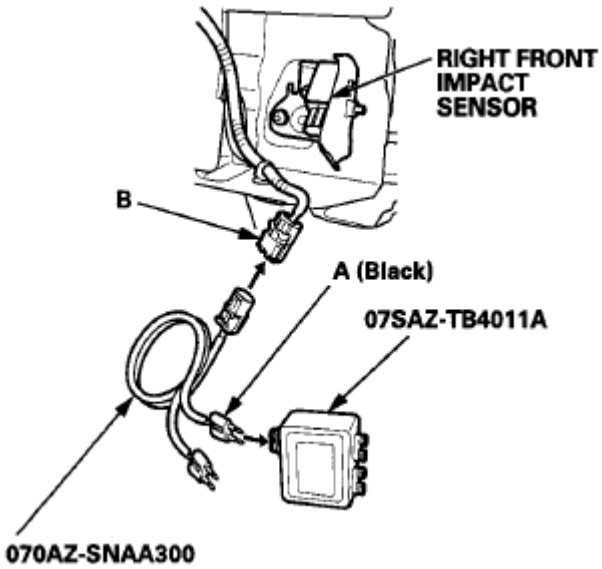

Fig. 130: Identifying SRS Simulator Lead L To Right Engine Compartment Wire Harness 2P Connector (B)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Measure the resistance between SRS unit connector A (39P) terminals No. 38 and No. 39. There should be less than 1.0 ohms.

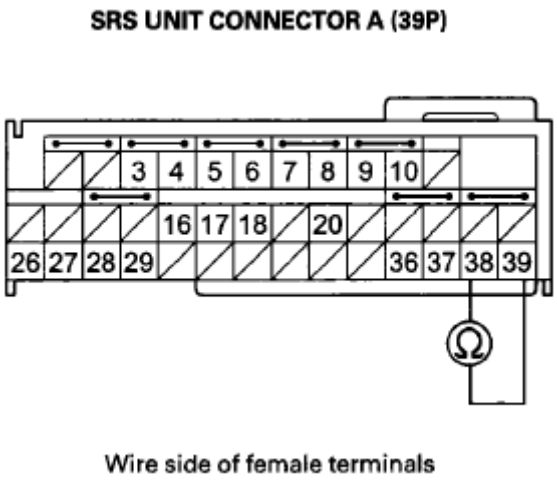

Fig. 131: Measuring Resistance Between SRS Unit Connector A (39P) Terminals No. 38 And No. 39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty right front impact sensor or SRS unit; replace the right front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the right engine compartment wire harness or the dashboard wire harness; replace the

faulty harness, then clear the DTC.

DTC 41-2X, 41-3X, 41-8X, 41-9X, 41-AX, 41-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE LEFT FRONT IMPACT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 41-2x, 41-3x, 41-8x, 41-9x, 41-Ax, or 41-Bx indicated?

YES - Faulty left front impact sensor or SRS unit; replace the left front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 42-2X, 42-3X, 42-8X, 42-9X, 42-AX, 42-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE RIGHT FRONT IMPACT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 42-2x, 42-3x, 42-8x, 42-9x, 42-Ax, or 42-Bx indicated?

YES - Faulty right front impact sensor or SRS unit; replace the right front impact sensor (see **FRONT IMPACT SENSOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 43-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE LEFT SIDE IMPACT SENSOR (FIRST)

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 43-1x indicated?

YES -

- If DTC 43-11 is indicated, go to step 4.
- If DTC 43-1x except 43-11 is indicated alone or DTC 43-11 and 45-11 are indicated, faulty left side impact sensor (first); replace the left side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**), then clear the DTC.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 4P connector from the left side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).
7. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Measure the resistance between SRS unit connector B (39P) terminals No. 36 and No. 37. There should be an open circuit or at least 1 Mohms.

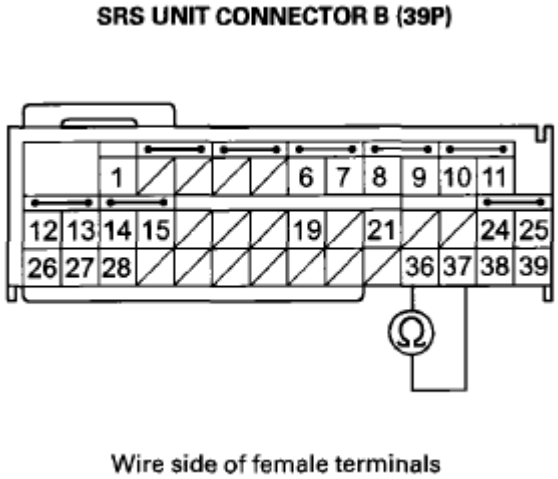

Fig. 132: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 36 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 9.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

9. Measure the resistance between body ground and SRS unit connector B (39P) terminals No. 36 and No. 37 individually. There should be an open circuit or at least 1 Mohms.

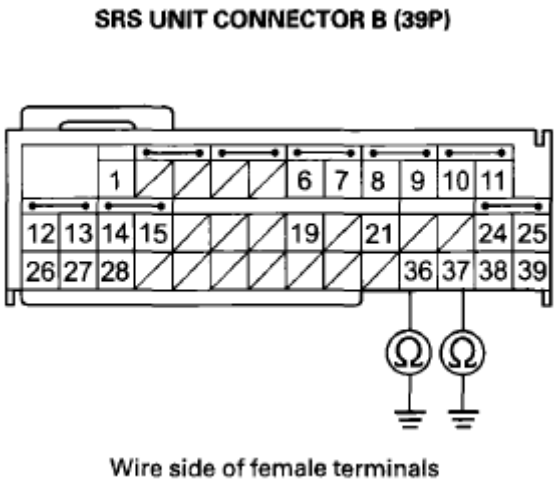

Fig. 133: Measuring Resistance Between Body Ground And SRS Unit Connector B (39P) Terminals No. 36 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

10. Reconnect the negative cable to the battery.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Measure the voltage between body ground and SRS unit connector B (39P) terminals No. 36 and No. 37 individually. There should be less than 0.2 V.

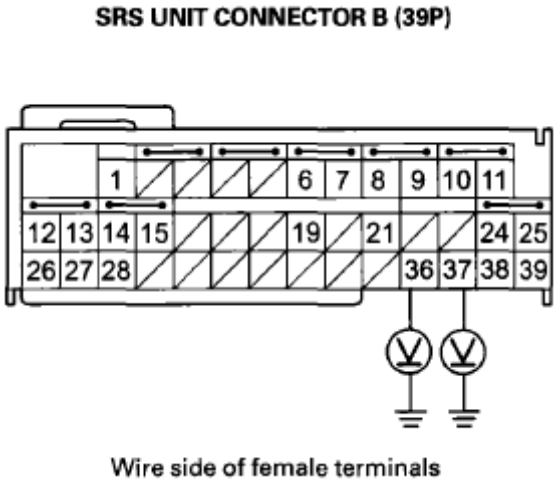

Fig. 134: Measuring Voltage Between Body Ground And SRS Unit Connector B (39P) Terminals No. 36 And No. 37

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 13.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

13. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
14. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), and then connect SRS simulator lead L to the SRS floor wire harness 4P connector (B).

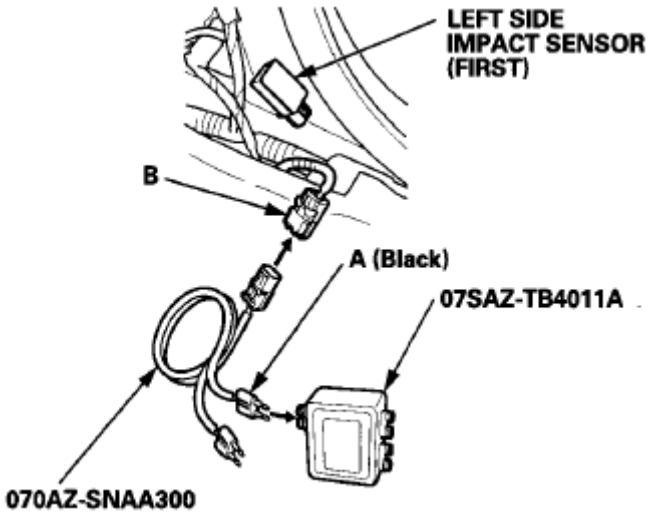

Fig. 135: Connecting Black Terminal (A) Of SRS Simulator Lead L To SRS Inflator Simulator (Jumper Connector)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Measure the resistance between SRS unit connector B (39P) terminals No. 36 and No. 37. There should be less than 1.0 ohms.

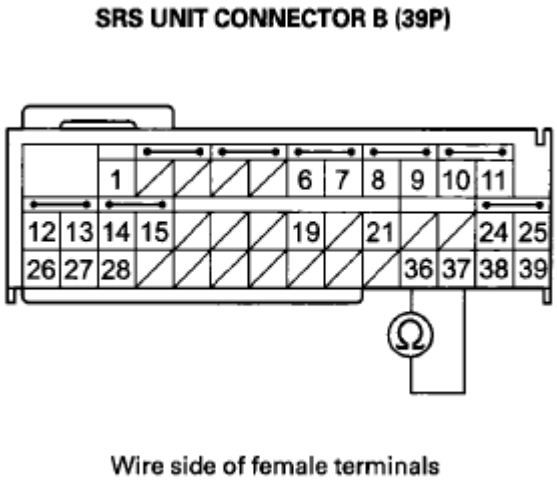

Fig. 136: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 36 And No. 37
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty left side impact sensor (first) or SRS unit; replace the left side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 44-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE RIGHT SIDE IMPACT SENSOR (FIRST)

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 44-1x indicated?

   YES -

   - If DTC 44-11 is indicated, go to step 4.
   - If DTC 44-1x except 44-11 is indicated alone, or DTC 44-11 and 46-11 are indicated, faulty right side impact sensor (first); replace the right side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**), then clear the DTC.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 4P connector from the right side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).
7. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Measure the resistance between SRS unit connector B (39P) terminals No. 38 and No. 39. There should be an open circuit or at least 1 Mohms.

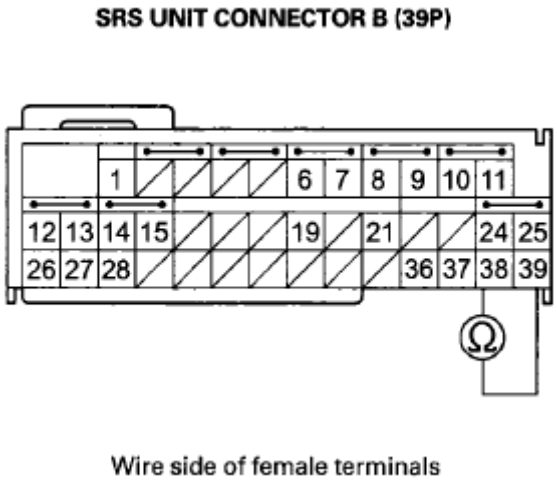

Fig. 137: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 38 And No. 39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 9.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

9. Measure the resistance between body ground and SRS unit connector B (39P) terminals No. 38 and No. 39 individually. There should be an open circuit or at least 1 Mohms

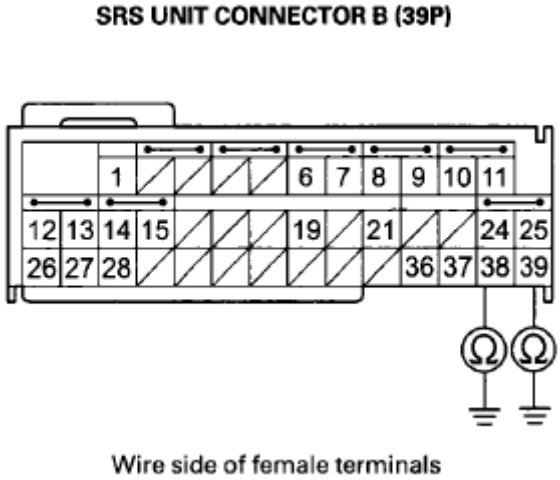

Fig. 138: Measuring Resistance Between Body Ground And SRS Unit Connector B (39P) Terminals No. 38 And No. 39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

10. Reconnect the negative cable to the battery.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Measure the voltage between body ground and SRS unit connector B (39P) terminals No. 38 and No. 39 individually. There should be less than 0.2 V.

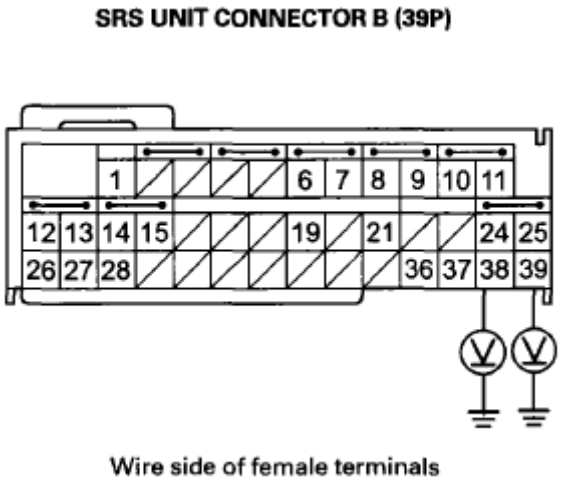

Fig. 139: Measuring Voltage Between Body Ground And SRS Unit Connector B (39P) Terminals No. 38 And No. 39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 13.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), and then connect SRS simulator lead L to the SRS floor wire harness 4P connector (B).

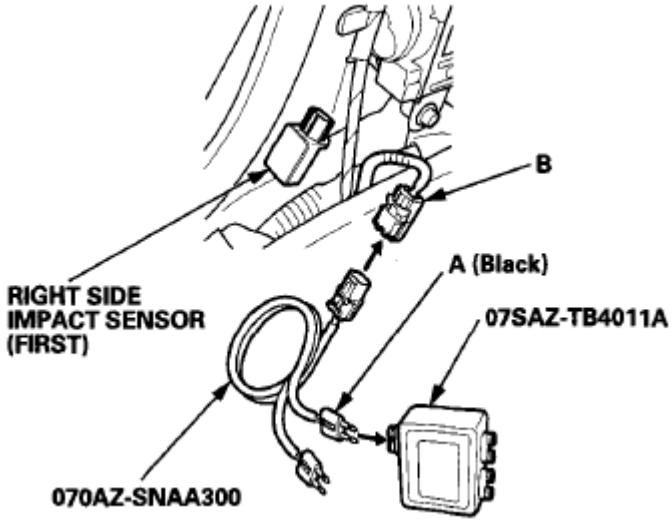

Fig. 140: Connecting Black Terminal (A) Of SRS Simulator Lead L To SRS Inflator Simulator (Jumper Connector)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Measure the resistance between SRS unit connector B (39P) terminals No. 38 and No. 39. There should be less than 1.0 ohms.

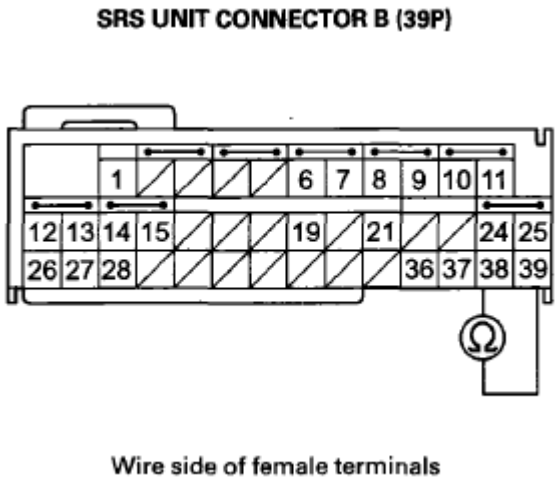

Fig. 141: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 38 And No. 39
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty right side impact sensor (first) or SRS unit; replace the right side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 43-2X, 43-3X, 43-8X, 43-9X, 43-AX, 43-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE LEFT SIDE IMPACT SENSOR (FIRST)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait

for 10 seconds.

3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 43-2x, 43-3x, 43-8x, 43-9x, 43-Ax, or 43-Bx indicated?

YES - Faulty left side impact sensor (first) or SRS unit; replace the left side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 44-2X, 44-3X, 44-8X, 44-9X, 44-AX, 44-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE RIGHT SIDE IMPACT SENSOR (FIRST)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 44-2x, 44-3x, 44-8x, 44-9x, 44-Ax, or 44-Bx indicated?

YES - Faulty right side impact sensor (first) or SRS unit; replace the right side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 45-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE LEFT SIDE IMPACT SENSOR (SECOND)

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 45-1x indicated?

   YES -

   - If DTC 45-11 is indicated, go to step 4.
   - If DTC 45-1x except 45-11 is indicated alone, faulty left side impact sensor (second); replace the left side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**), then clear the DTC.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 4P connector from the left side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).
7. Disconnect the SRS floor wire harness 2P connector from the left side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**).
8. Measure the resistance between SRS floor wire harness 2P connector terminals No. 1 and No. 2. There should be an open circuit or at least 1 Mohms

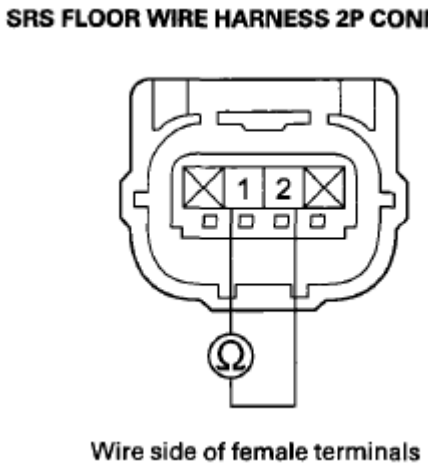

Fig. 142: Measuring Resistance Between SRS Floor Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 9.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

9. Measure the resistance between body ground and SRS floor wire harness 2P connector terminals No. 1 and No. 2 individually. There should be an open circuit or at least 1 Mohms.

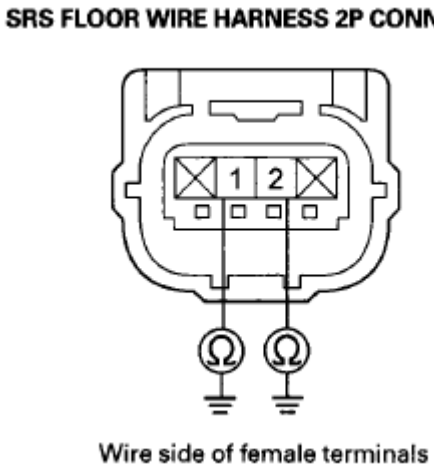

Fig. 143: Measuring Resistance Between Body Ground And SRS Floor Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

10. Reconnect the negative cable to the battery.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Measure the voltage between body ground and SRS floor wire harness 2P connector terminals No. 1 and No. 2 individually. There should be less than 0.2 V.

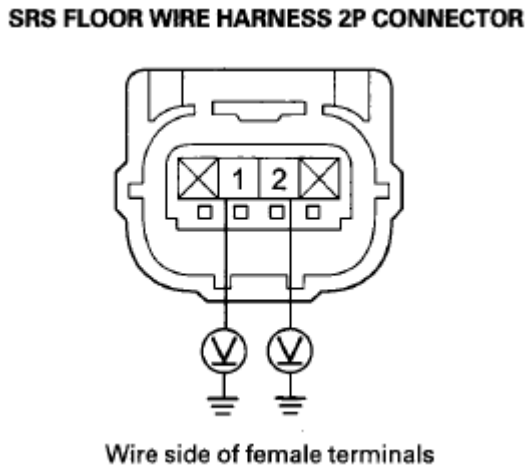

Fig. 144: Measuring Voltage Between Body Ground And SRS Floor Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 13.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Connect the red terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), and then connect SRS simulator lead L to the SRS floor wire harness 4P connector (B).

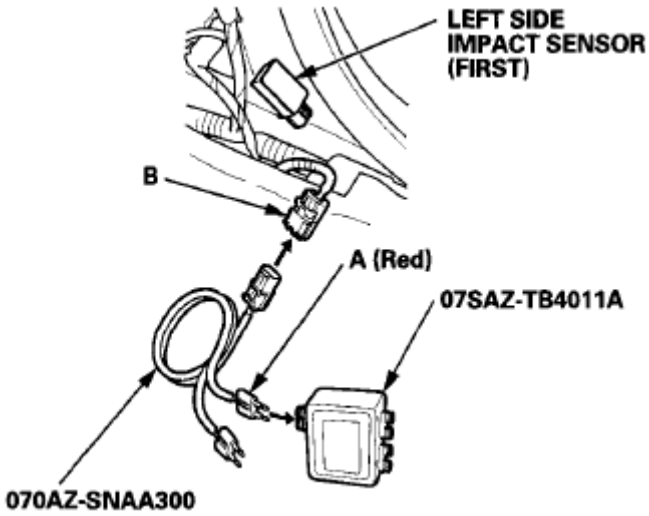

Fig. 145: Connecting Red Terminal Of SRS Simulator Lead L To SRS Inflator Simulator (Jumper Connector)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Measure the resistance between SRS floor wire harness 2P connector terminals No. 1 and No. 2. There should be less than 1.0 ohms.

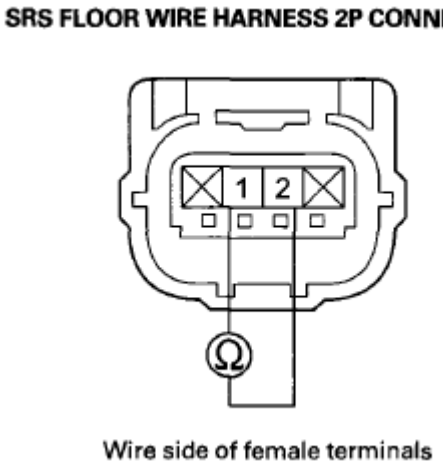

Fig. 146: Measuring Resistance Between SRS Floor Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty left side impact sensor (second) or SRS unit; replace the left side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 46-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE RIGHT SIDE IMPACT SENSOR (SECOND)

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 46-1x indicated?

   YES -

   - If DTC 46-11 is indicated, go to step 4.
   - If DTC 46-1x except 46-11 is indicated alone, faulty right side impact sensor (second); replace the right side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**), then clear the DTC.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the SRS floor wire harness 4P connector from the right side impact sensor (first) (see **SIDE IMPACT SENSOR (FIRST) REPLACEMENT**).
7. Disconnect the SRS floor wire harness 2P connector from the right side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**).

8. Measure the resistance between SRS floor wire harness 2P connector terminals No. 1 and No. 2. There should be an open circuit or at least 1 Mohms.

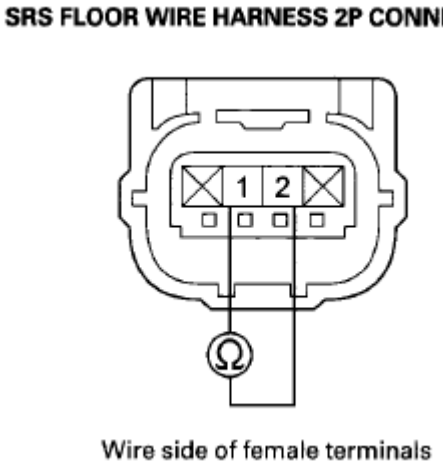

Fig. 147: Measuring Resistance Between SRS Floor Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 9.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

9. Measure the resistance between body ground and SRS floor wire harness 2P connector terminals No. 1 and No. 2 individually. There should be an open circuit or at least 1 Mohms.

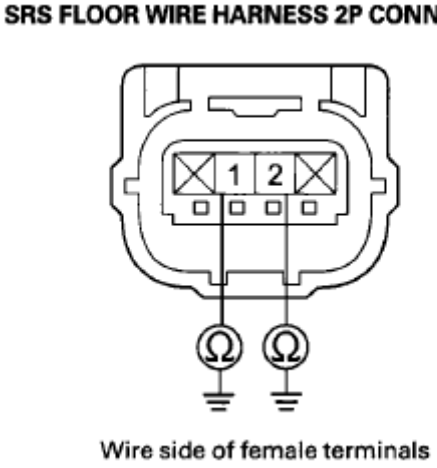

Fig. 148: Measuring Resistance Between Body Ground And SRS Floor Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

10. Reconnect the negative cable to the battery.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Measure the voltage between body ground and SRS floor wire harness 2P connector terminal No. 1 and No. 2 individually. There should be less than 0.2 V.

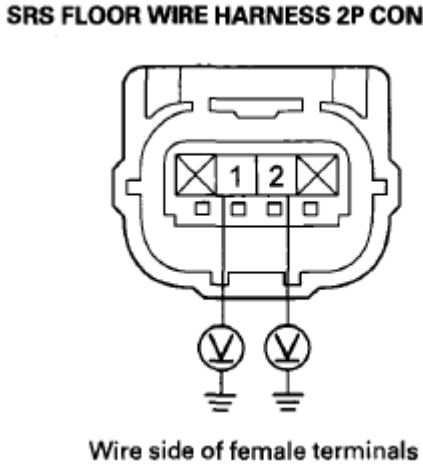

Fig. 149: Measuring Voltage Between Body Ground And SRS Floor Wire Harness 2P Connector Terminal No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 13.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Connect the red terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), and then connect SRS simulator lead L to the SRS floor wire harness 4P connector (B).

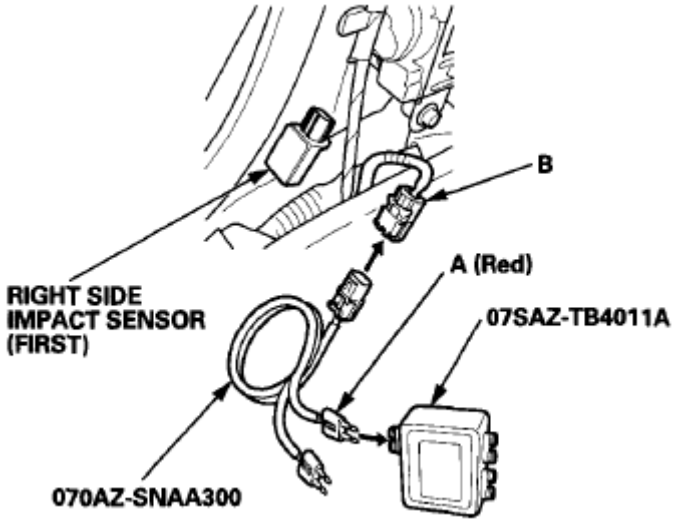

Fig. 150: Connecting Red Terminal Of SRS Simulator Lead L To SRS Inflator Simulator (Jumper Connector)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Measure the resistance between SRS floor wire harness 2P connector the terminals No. 1 and No. 2. There should be less than 1.0 ohms.

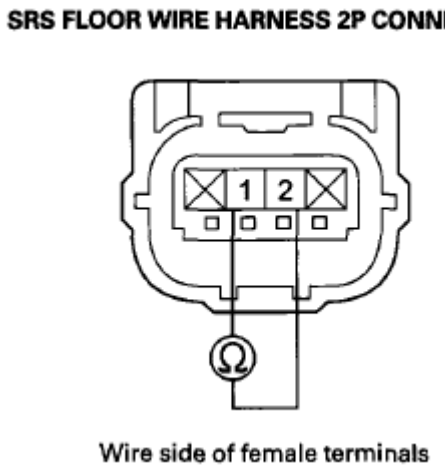

Fig. 151: Measuring Resistance Between SRS Floor Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty right side impact sensor (second) or SRS unit; replace the right side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC 45-2X, 45-3X, 45-8X, 45-9X, 45-AX, 45-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE LEFT SIDE IMPACT SENSOR (SECOND)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 45-2x, 45-3x, 45-8x, 45-9x, 45-Ax, or 45-Bx indicated?

YES - Faulty left side impact sensor (second) or SRS unit; replace the left side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 46-2X, 46-3X, 46-8X, 46-9X, 46-AX, 46-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE RIGHT SIDE IMPACT SENSOR (SECOND)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 46-2x, 46-3x, 46-8x, 46-9x, 46-Ax, or 46-Bx indicated?

YES - Faulty right side impact sensor (second) or SRS unit; replace the right side impact sensor (second) (see **SIDE IMPACT SENSOR (SECOND) REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 51-XX, 52-XX, 53-XX, 54-XX, 55-XX, 57-XX, 58-XX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE SRS UNIT

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before troubleshooting any of these DTCs, check the battery/system voltage and battery cable connections (see BATTERY TEST). If the voltage is low, repair the charging system, test and charge the battery, or replace the battery before troubleshooting the SRS. If the battery/system voltage is now OK, ask the client if the battery ever went dead or if the engine was started and run with the battery in a low state of charge. A dead battery may trigger one or more of these DTCs.**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 51-xx, 52-xx, 53-xx, 54-xx, 55-xx, 57-xx, or 58-xx indicated?

YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 53-FF: SRS UNIT PROGRAMMING ERROR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **This DTC is indicated when a SRS unit update is not completed properly.**
- **Do not turn the ignition switch to ACC (I) or LOCK (0), or press the engine start/stop button to select the ACC or OFF mode while updating the SRS unit. If you turn the ignition switch to ACC (I) or LOCK (0), or press the engine start/stop button to select the ACC or OFF mode before you complete the SRS unit update procedure, the SRS unit can be damaged.**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Do the SRS unit update procedure (see **SRS UNIT UPDATE**).
2. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 53-FF indicated?

YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Update is complete.

DTC 56-11, 56-21: LOST COMMUNICATION WITH THE ECM/PCM (PGM-FI SYSTEM); DTC 56-12, 56-13, 56-22, 56-23: UNDEFINED DATA RECEIVED FROM THE ECM/PCM (PGM-FI SYSTEM)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING**

INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Check for any F-CAN and B-CAN communication DTCs with the HDS.

   Are there any communication DTCs?

   YES - Go to the appropriate **DTC TROUBLESHOOTING**.

   NO - Go to step 2.

2. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 56-11, 56-12, 56-13, 56-21, 56-22, or 56-23 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Start the engine, and see if the malfunction indicator lamp (MIL) also stays on.

   Does the MIL stay on longer than 30 seconds?

   YES - Go to MIL Circuit Troubleshooting (see **MIL CIRCUIT TROUBLESHOOTING**).

   NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS (see **GENERAL TROUBLESHOOTING INFORMATION**).

   NOTE: This step must be done to protect the ECM/PCM from damage.

9. Disconnect ECM/PCM connector A (49P) from the ECM/PCM (see **ECM/PCM REPLACEMENT**).
10. Disconnect the negative cable from the battery, then wait at least 3 minutes.
11. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).

12. Check for continuity between SRS unit connector A (39P) terminal No. 16 and ECM/PCM connector A (49P) terminal No. 49, and between SRS unit connector A (39P) terminal No. 17 and ECM/PCM connector A (49P) terminal No. 48.

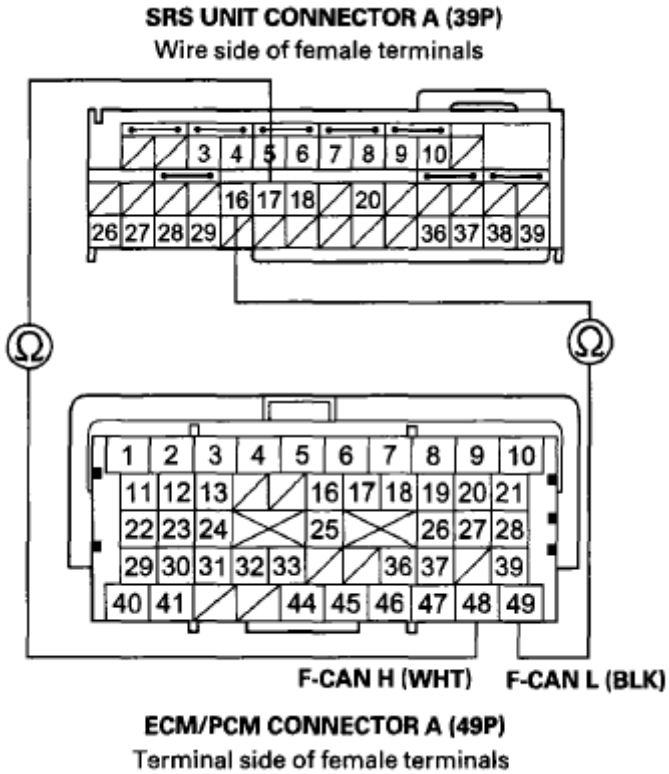

Fig. 152: Checking For Continuity Between SRS Unit Connector And ECM/PCM Connector, And Between SRS Unit Connector And ECM/PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the left engine compartment wire harness or dashboard wire harness.

NO - Open in the harness between SRS unit connector A (39P) terminal No. 16 and ECM/PCM connector A (49P) terminal No. 49, or between SRS unit connector A (39P) terminal No. 17 and ECM/PCM connector A (49P) terminal No. 48 (left engine compartment wire harness or dashboard wire harness); replace the faulty harness, then clear the DTC.

DTC 56-25: LOST COMMUNICATION WITH THE GAUGE CONTROL MODULE

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced**

with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).

- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Check for any F-CAN and B-CAN communication DTCs with the HDS.

   Are there any communication DTCs?

   YES - Go to the appropriate **DTC TROUBLESHOOTING**.

   NO - Go to step 2.

2. Release the parking brake, turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and see if the brake system indicator comes on for 2 seconds and then goes off.

   Does the brake system indicator come on and then go off after 2 seconds?

   YES - Go to step 3.

   NO - Faulty gauge control module. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**), and retest. If the gauge control module fails the self-diagnosis, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
5. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 56-25 indicated?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect the negative cable from the battery, then wait at least 3 minutes.

8. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
9. Disconnect the gauge control module 32P connector from the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
10. Check for continuity between SRS unit connector A (39P) terminal No. 16 and gauge control module 32P connector terminal No. 13, and between SRS unit connector A (39P) terminal No. 17 and gauge control module 32P connector terminal No. 14.

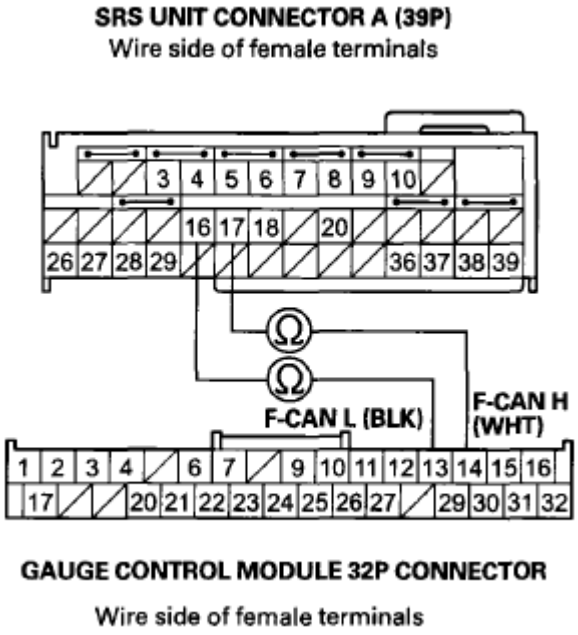

Fig. 153: Checking For Continuity Between SRS Unit Connector And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Open in the harness between the SRS unit connector A (39P) terminal No. 16 and gauge control module 32P connector terminal No. 13, or between the SRS unit connector A (39P) terminal No. 17 and gauge control module 32P connector terminal No. 14; replace the dashboard wire harness, then clear the DTC.

DTC 56-26, 56-27: UNDEFINED DATA RECEIVED FROM THE GAUGE CONTROL MODULE

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were**

properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).

- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Check for any F-CAN and B-CAN communication DTCs with the HDS.

   Are there any communication DTCs?

   YES - Go to the appropriate **DTC TROUBLESHOOTING**.

   NO - Go to step 2.

2. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 56-26 or 56-27 indicated?

   YES - Faulty gauge control module. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**), and retest. If the gauge control module fails the self-diagnosis, replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 61-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE DRIVER'S SEAT BELT BUCKLE SWITCH

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds. Buckle and unbuckle the driver's seat belt several times.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 61-1x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Install a jumper wire between SRS unit connector B (39P) terminal No. 19 and body ground.

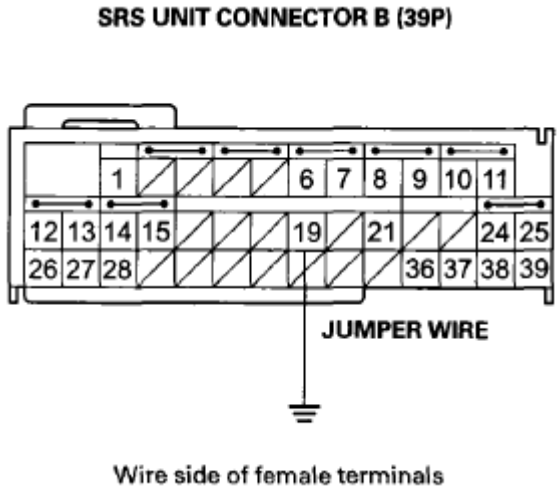

Fig. 154: Installing Jumper Wire Between SRS Unit Connector (39P) Terminal No. 19 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
8. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 61-2x indicated?

   YES - Go to step 9.

NO - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness or the driver's seat wire harness.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Remove the jumper wire from SRS unit connector B (39P).
11. Disconnect the driver's seat wire harness 2P connector (A) from the driver's seat belt buckle switch 2P connector.

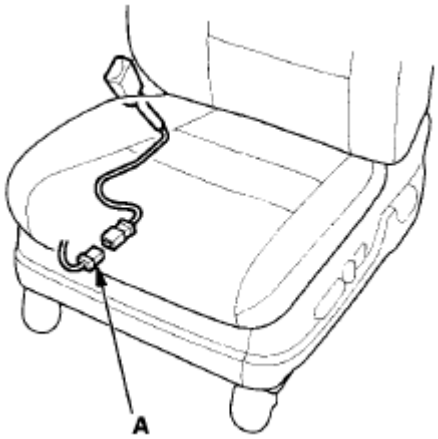

Fig. 155: Identifying Driver's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
13. Measure the voltage between driver's seat wire harness 2P connector terminal No. 2 and body ground. There should be more than 10 V.

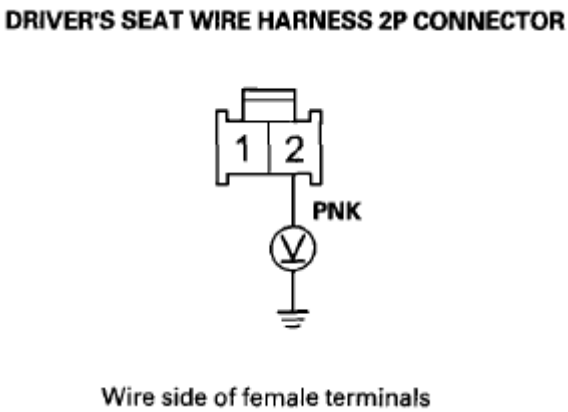

Fig. 156: Measuring Voltage Between Driver's Seat Wire Harness 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 14.

NO - Open in the SRS floor wire harness or the driver's seat wire harness; replace the faulty harness, then clear the DTC.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Measure the resistance between driver's seat wire harness 2P connector terminal No. 1 and body ground. There should be less than 1.0 ohms.

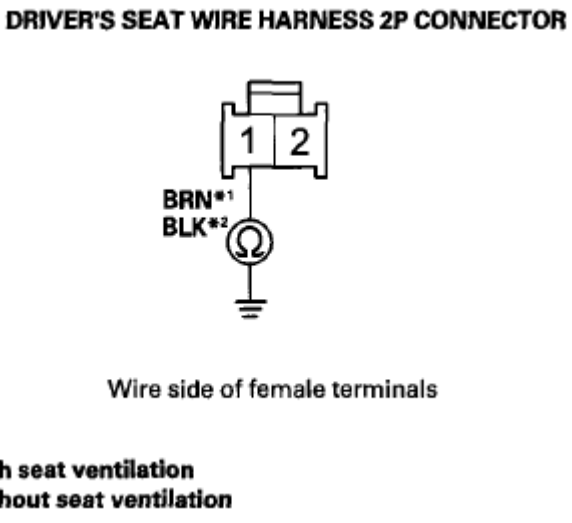

Fig. 157: Measuring Resistance Between Driver's Seat Wire Harness 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

***1 : With seat ventilation**

***2 : Without seat ventilation**

Is the resistance as specified?

YES - Faulty driver's seat belt buckle switch; replace the driver's seat belt buckle assembly (see **FRONT SEAT BELT BUCKLE**), then clear the DTC.

NO - Open in the SRS floor wire harness or the driver's seat wire harness; check for a poor ground at G701 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). If the ground is OK, replace the faulty harness, then clear the DTC.

DTC 61-2X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT IN THE DRIVER'S SEAT BELT BUCKLE SWITCH

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds. Buckle and unbuckle the driver's seat belt several times.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 61-2x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the driver's seat wire harness 2P connector (A) from the driver's seat belt buckle switch 2P connector.

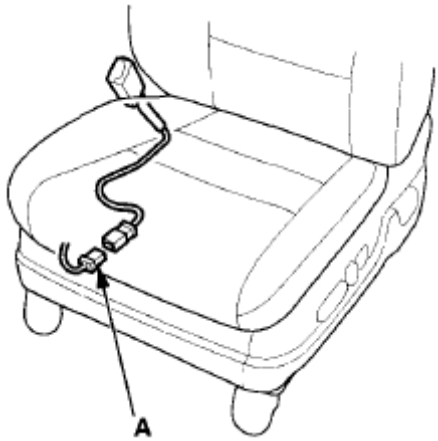

Fig. 158: Identifying Driver's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

8. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 61-2x indicated?

   YES - Short to ground in the SRS floor wire harness or the driver's seat wire harness; replace the faulty harness, then clear the DTC.

   NO - Faulty driver's seat belt buckle switch; replace the driver's seat belt buckle assembly (see **FRONT SEAT BELT BUCKLE**), then clear the DTC.

DTC 62-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE FRONT PASSENGER'S SEAT BELT BUCKLE SWITCH

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds. Buckle and unbuckle the front passenger's seat belt several times.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 62-1x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Install a jumper wire between SRS unit connector B (39P) terminal No. 21 and body ground.

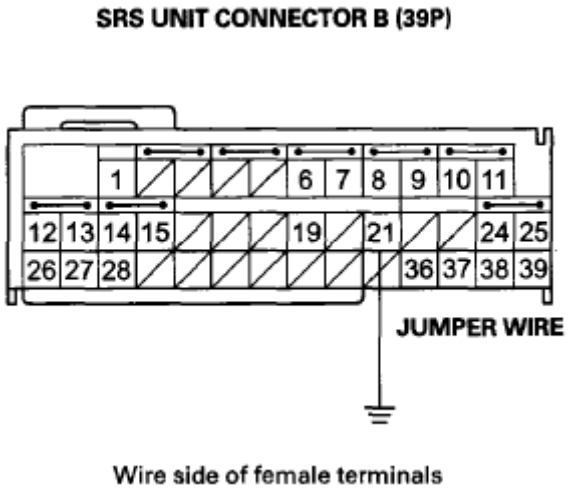

Fig. 159: Installing Jumper Wire Between SRS Unit Connector B (39P) Terminal No. 21 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
8. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 62-2x indicated?

   YES - Go to step 9.

   NO - Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection between the connector and the SRS unit. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the SRS floor wire harness or the front passenger's seat wire harness.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Remove the jumper wire from SRS unit connector B (39P).
11. Disconnect the front passenger's seat wire harness 2P connector (A) from the front passenger's seat belt buckle switch 2P connector.

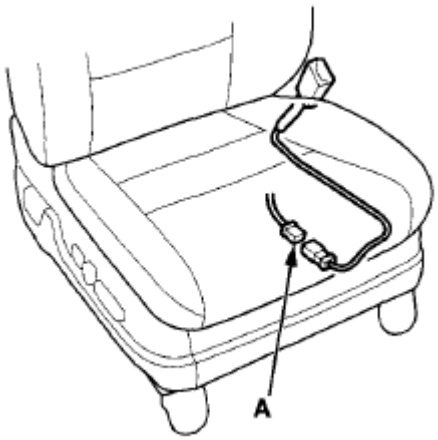

Fig. 160: Identifying Front Passenger's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
13. Measure the voltage between front passenger's seat wire harness 2P connector terminal No. 2 and body ground. There should be more than 10 V.

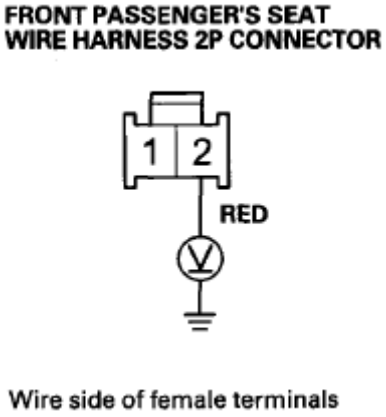

Fig. 161: Measuring Voltage Between Front Passenger's Seat Wire Harness 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 14.

NO - Open in the SRS floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Measure the resistance between front passenger's seat wire harness 2P connector terminal No. 1 and body

ground. There should be less than 1.0 ohms.

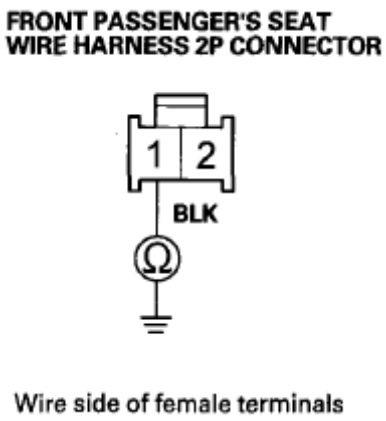

Fig. 162: Measuring Resistance Between Front Passenger's Seat Wire Harness 2P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty front passenger's seat belt buckle switch; replace the front passenger's seat belt buckle assembly (see **FRONT SEAT BELT BUCKLE**), then clear the DTC.

NO - Open in the SRS floor wire harness or the front passenger's seat wire harness; check for a poor ground at G702 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). If the ground is OK, replace the faulty harness, then clear the DTC.

DTC 62-2X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT IN THE FRONT PASSENGER'S SEAT BELT BUCKLE SWITCH

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds. Buckle and unbuckle the front passenger's seat belt several times.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 62-2x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the front passenger's seat wire harness 2P connector (A) from the front passenger's seat belt buckle switch 2P connector.

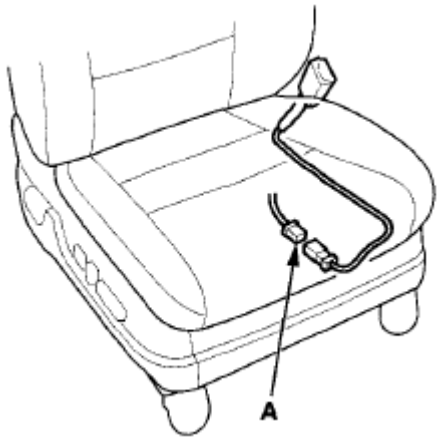

Fig. 163: Identifying Front Passenger's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
8. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 62-2x indicated?

YES - Short to ground in the SRS floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

NO - Faulty front passenger's seat belt buckle switch; replace the front passenger's seat belt buckle assembly (see **FRONT SEAT BELT BUCKLE**), then clear the DTC.

DTC 71-1X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN IN THE DRIVER'S SEAT POSITION SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**

- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Raise the driver's seat all the way up.
2. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 71-1x indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for these connector connections and body ground.
   - SRS unit connector B (39P) and the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
   - Driver's seat wire harness and the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**).
   - C701 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).
   - G701 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**).

   Are the connector connections and body ground OK?

   YES - Go to step 7.

   NO - Repair the poor connections or body ground, then clear the DTC, and retest. If DTC 71-1x is still present, go to step 7.

7. Disconnect the driver's seat wire harness 2P connector (A) from the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**).

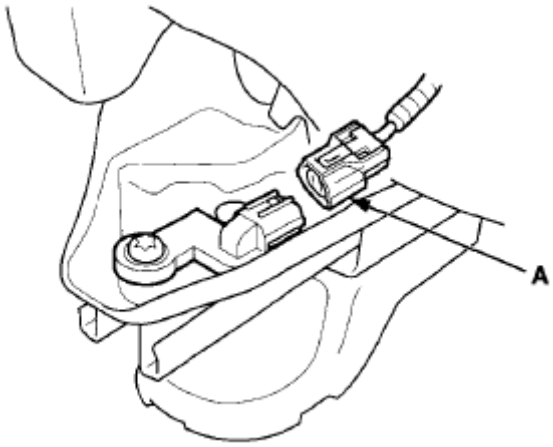

Fig. 164: Identifying Driver's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install a jumper wire between driver's seat wire harness 2P connector terminals No. 1 and No. 2.

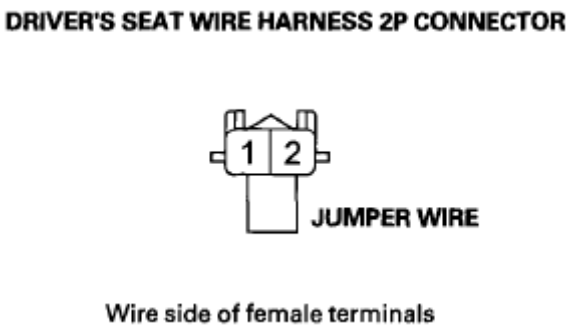

Fig. 165: Installing Jumper Wire Between Driver's Seat Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Disconnect the negative cable from the battery, then wait at least 3 minutes.
10. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
11. Measure the resistance between SRS unit connector B (39P) terminal No. 28 and body ground. There should be less than 1.0 ohms.

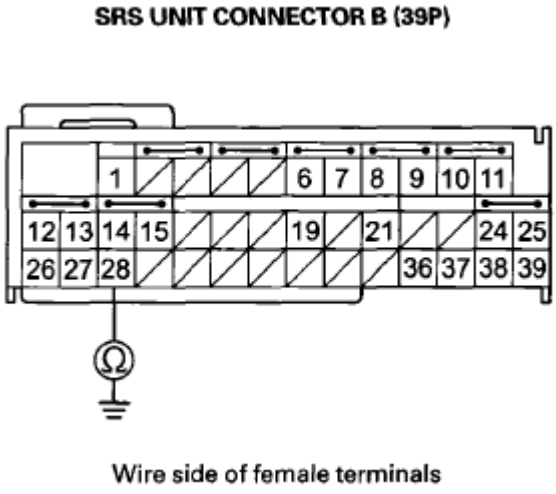

Fig. 166: Measuring Resistance Between SRS Unit Connector B (39P) Terminal No. 28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty driver's seat position sensor or SRS unit; replace the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the SRS floor wire harness or the driver's seat wire harness; replace the faulty harness, then clear the DTC.

DTC 71-2X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT IN THE DRIVER'S SEAT POSITION SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Raise the driver's seat all the way up.
2. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 71-2x indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the driver's seat wire harness 2P connector (A) from the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**).

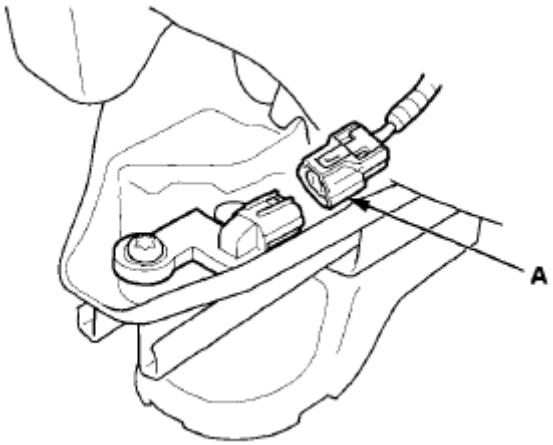

Fig. 167: Identifying Driver's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 71-2x indicated?

   YES - Go to step 10.

   NO - Faulty driver's seat position sensor; replace the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**), then clear the DTC.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Disconnect the negative cable from the battery, then wait at least 3 minutes.

12. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
13. Measure the resistance between SRS unit connector B (39P) terminal No. 28 and body ground. There should be an open circuit or at least 1 Mohms

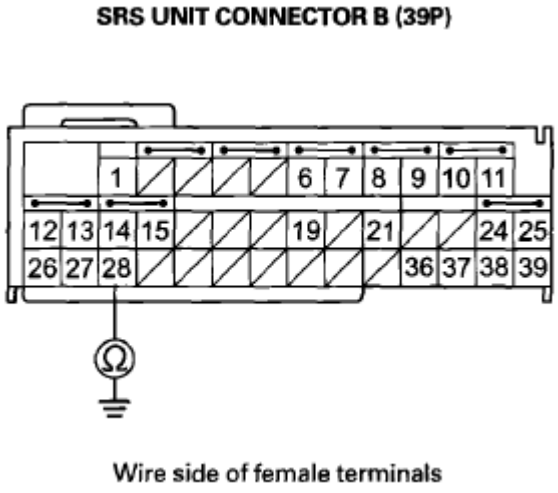

Fig. 168: Measuring Resistance Between SRS Unit Connector B (39P) Terminal No. 28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty driver's seat position sensor or SRS unit; replace the driver's seat position sensor (see **DRIVER'S SEAT POSITION SENSOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the SRS floor wire harness or the driver's seat wire harness; replace the faulty harness, then clear the DTC.

DTC 81-4X ("X" CAN BE 0 THRU 9 OR A THRU F), 81-63, 81-64: INTERNAL THE FAILURE OF THE ODS UNIT

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with**

the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.

- **These DTCs are codes that relate to the front passenger's weight sensor operation.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 81-4x, 81-63, or 81-64 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. Do the front passenger's weight sensor initialization (see **FRONT PASSENGER'S WEIGHT SENSOR INITIALIZATION**).
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
7. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 81-4x, 81-63, or 81-64 indicated?

   YES - Go to step 8.

   NO - The system is OK at this time.

8. Replace the ODS unit (see **ODS UNIT REPLACEMENT**).
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 81-4x, 81-63, or 81-64 indicated?

    YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

    NO - The system is OK at this time.

DTC 81-61: NO SIGNAL FROM THE ODS UNIT; DTC 81-62: INCORRECT DATA FROM THE ODS UNIT

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**
- **These DTCs are codes that relate to the front passenger's weight sensor operation.**

1. Make sure nothing is on the front passenger's seat.
2. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 81-61 or 81-62 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check the No. 5 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 7.

   NO - Replace the fuse, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. If the fuse blows again, check for a short to ground in the driver's under-dash fuse/relay box No. 5 (7.5 A) fuse circuit (dashboard wire harness, SRS floor wire harness, or front passenger's seat wire harness); replace the faulty harness, then clear the DTC, and retest. If the DTC is still present, replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then clear the DTC.

7. Remove the front seat back panel (see **FRONT SEAT-BACK COVER REPLACEMENT**).
8. Turn over the seat-back cover/pad to gain access to the ODS unit (see **ODS Unit Replacement**).

9. Remove the cover from the ODS unit (see step 5).
10. Check the connector connection between the ODS unit 18P connector (A) and the ODS unit (B).

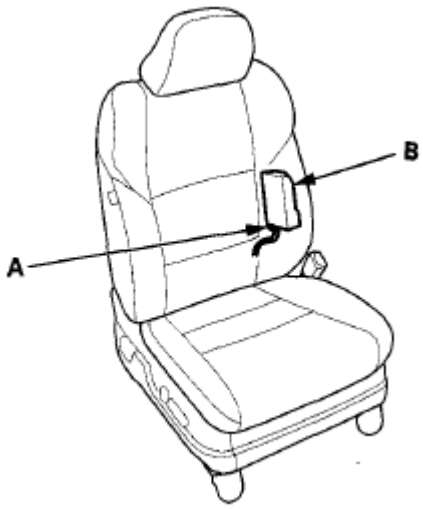

Fig. 169: Identifying ODS Unit 18P Connector And ODS Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the connector connection OK?

YES - Go to step 11.

NO - Repair the poor connector connection, then clear the DTC, and retest. If DTC 81-61 or 81-62 is still present, go to step 11.

11. Disconnect the ODS unit 18P connector (A) from the ODS unit (B).

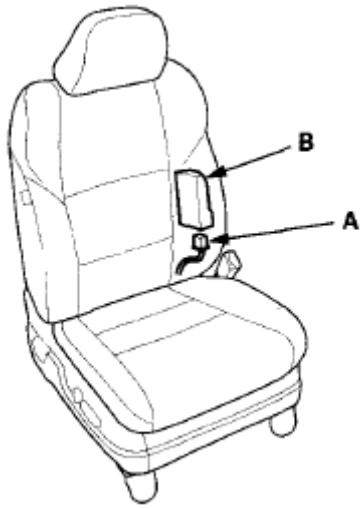

Fig. 170: Identifying ODS Unit 18P Connector From ODS Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
13. Measure the voltage between ODS unit 18P connector terminal No. 1 and body ground. There should be battery voltage.

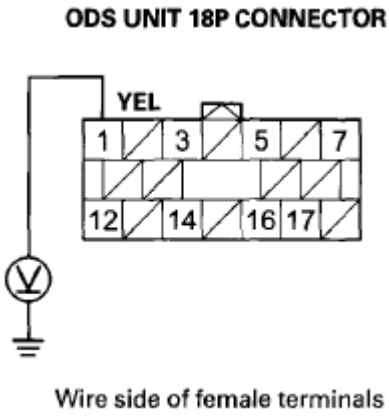

Fig. 171: Measuring Voltage Between ODS Unit 18P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 14.

NO - Open in the dashboard wire harness, the SRS floor wire harness, or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Measure the resistance between ODS unit 18P connector terminals No. 12 and body ground. There should be less than 1.0 ohms.

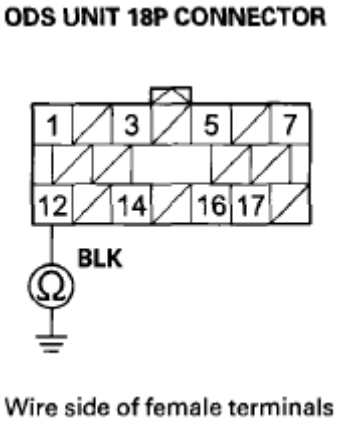

Fig. 172: Measuring Resistance Between ODS Unit 18P Connector Terminals No. 12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 16.

NO - Open in the SRS floor wire harness, the front passenger's seat wire harness, poor connection at the ground G702 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or poor connection at the ODS unit 18P connector and the ODS unit. Check the connectors; if the connection is OK, replace the faulty harness, then clear the DTC.

16. Disconnect the negative cable from the battery, then wait at least 3 minutes.
17. Disconnect SRS unit connector B (39P) from the SRS unit (see step 10).
18. Measure the resistance between SRS unit connector B (39P) terminal No. 1 and body ground. There should be an open circuit or at least 1 Mohms.

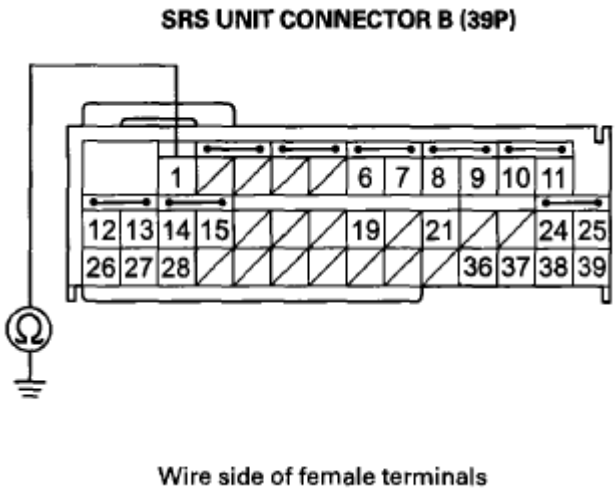

Fig. 173: Measuring Resistance Between SRS Unit Connector (39P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 19.

NO - Short to ground in the SRS floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

19. Reconnect the negative cable to the battery.
20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
21. Measure the voltage between SRS unit connector B (39P) terminal No. 1 and body ground. There should be less than 0.2 V.

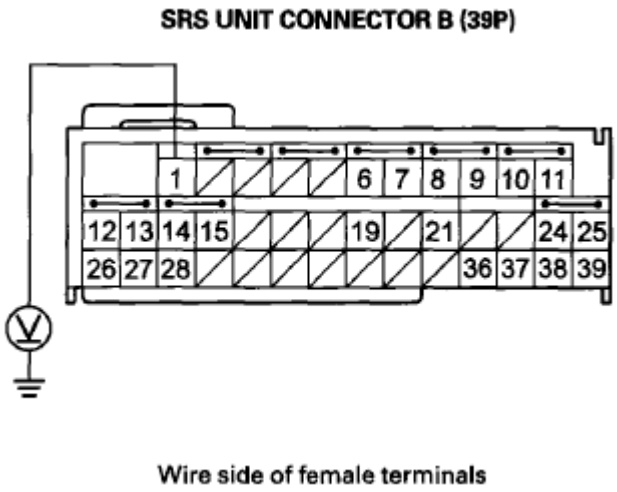

Fig. 174: Measuring Voltage Between SRS Unit Connector B (39P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 22.

NO - Short to power in the SRS floor wire harness or the front seat passenger's seat wire harness; replace the faulty harness, then clear the DTC.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Measure the resistance between SRS unit connector B (39P) terminal No. 1 and ODS unit 18P connector terminal No. 7. There should be less than 1.0 ohms.

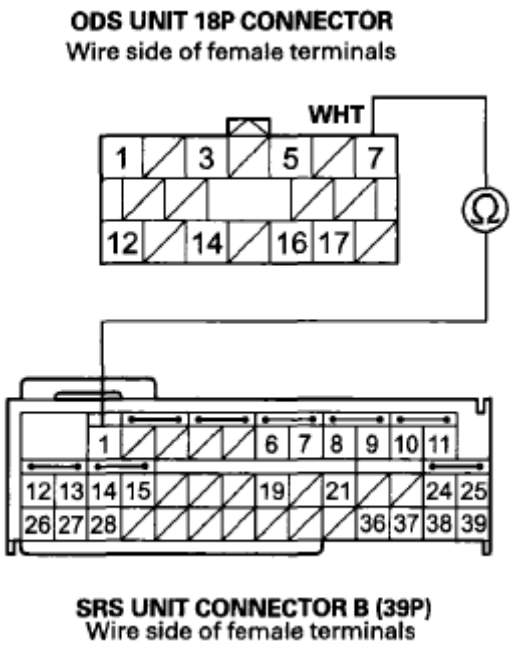

Fig. 175: Measuring Resistance Between SRS Unit Connector B (39P) Terminal No. 1 And ODS Unit 18P Connector Terminal No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty ODS unit or SRS unit; replace the ODS unit (see **ODS UNIT REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the harness between SRS unit connector B (39P) terminal No. 1 and ODS unit 18P connector terminal No. 7 (SRS floor wire harness or front passenger's seat wire harness); replace the faulty harness, then clear the DTC.

DTC 81-71, 81-78: ODS UNIT NOT CALIBRATED

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

- **These DTCs are codes that relate to the front passenger's weight sensor operation.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 81-71 or 81-78 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. Do the front passenger's weight sensor initialization (see **FRONT PASSENGER'S WEIGHT SENSOR INITIALIZATION**).
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
7. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 81-71 or 81-78 indicated?

   YES - Go to step 8.

   NO - The system is OK at this time.

8. Replace the ODS unit (see **ODS UNIT REPLACEMENT**).
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 81-71 or 81-78 indicated?

    YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

    NO - The system is OK at this time.

DTC 81-79: FRONT PASSENGER'S WEIGHT SENSORS INITIAL CHECK FAILURE

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced**

with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).

- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**
- **These DTCs are codes that relate to the front passenger's weight sensor operation.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 81-79 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Make sure nothing is on the front passenger's seat.
6. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
8. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 81-79 indicated?

   YES - Go to step 9.

   NO - The system is OK at this time.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Loosen the front passenger's seat mounting bolts (see **FRONT SEAT REMOVAL/INSTALLATION**), and shake the seat in all directions. Tighten the seat mounting bolts to the specified torque.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
12. Do the front passenger's weight sensor initialization (see **FRONT PASSENGER'S WEIGHT SENSOR INITIALIZATION**).

13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
14. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 81-79 indicated?

    YES - Go to step 15.

    NO - The system is OK at this time.

15. Replace the front passenger's weight sensor assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**).
16. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
18. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 81-79 indicated?

    YES - Replace the ODS unit (see **ODS UNIT REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

    NO - The system is OK at this time.

DTC 82-11: NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 82-11 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select SWS DTC CHECK.

   Is an SWS DTC also indicated?

   YES -

   - DTC 11-11: Short to power in the front passenger's weight sensor (inner side) power circuit; go to step 5.
   - DTC 11-12: Short to ground in the front passenger's weight sensor (inner side) power circuit; go to step 11.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the front passenger's seat wire harness 2P connector (A) from the front passenger's weight sensor (inner side).

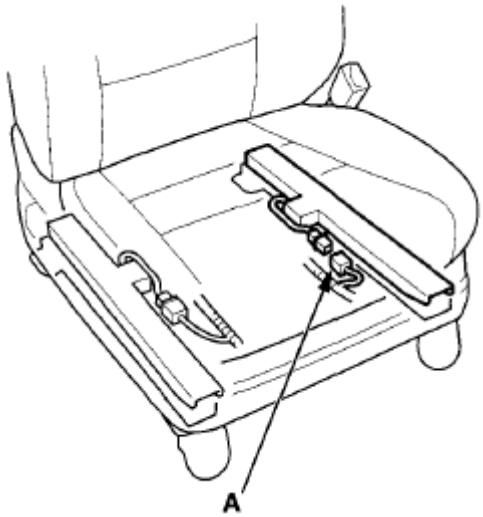

Fig. 176: Identifying Front Passenger's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

10. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select SWS DTC CHECK.

    Is SWS DTC 11-11 indicated?

    YES - Short to power in the front passenger's seat wire harness; replace the front passenger's seat wire harness, then clear the DTC, and retest If the DTC is still present, replace the ODS unit (see **ODS UNIT REPLACEMENT**).

    NO - Faulty front passenger's weight sensor (inner side); replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then clear the DTC.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Disconnect the front passenger's seat wire harness 2P connector (A) from the front passenger's weight sensor (inner side).

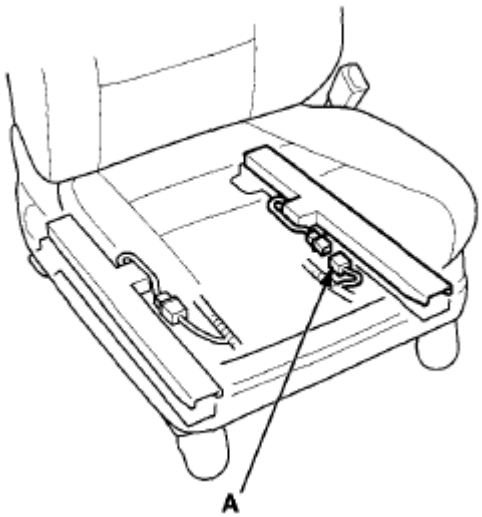

Fig. 177: Identifying Front Passenger's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
16. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select SWS DTC CHECK.

    Is SWS DTC 11-12 indicated?

    YES - Go to step 17.

NO - Faulty front passenger's weight sensor (inner side); replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then clear the DTC.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Measure the resistance between front passenger's seat wire harness 2P connector terminal No. 2 and body ground. There should be an open circuit or at least 1 Mohms

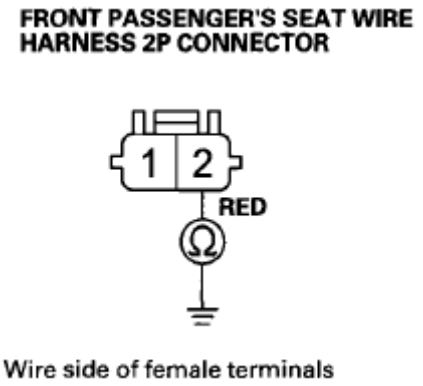

Fig. 178: Measuring Resistance Between Front Passenger's Seat Wire Harness 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty ODS unit; replace the ODS unit (see **ODS UNIT REPLACEMENT**), then clear the DTC.

NO - Short to ground in the front passenger's seat wire harness; replace the front passenger's seat wire harness, then clear the DTC.

DTC 82-12: NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 82-12 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the front passenger's seat wire harness 2P connector (A) from the front passenger's weight sensor (inner side).

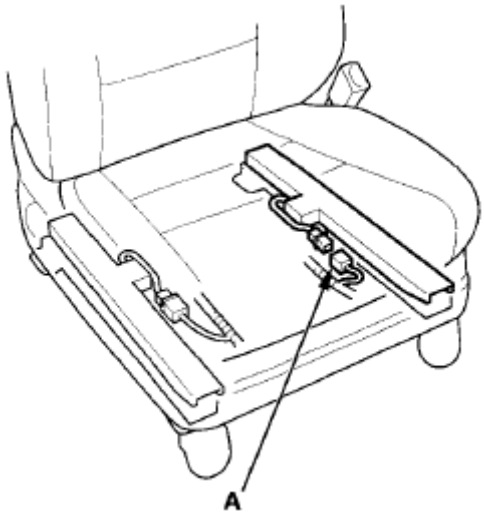

Fig. 179: Identifying Front Passenger's Seat Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Measure the voltage between front passenger's seat wire harness 2P connector terminals No. 1 and No. 2. There should be more than 6 V.

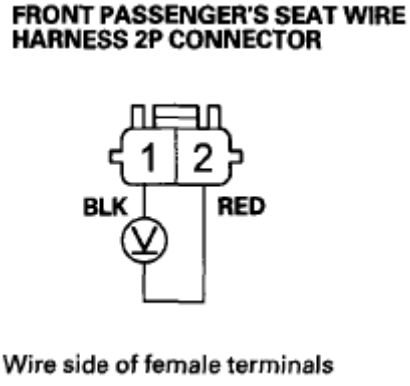

Fig. 180: Measuring Voltage Between Front Passenger's Seat Wire Harness 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty front passenger's weight sensor (inner side); replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then clear the DTC.

NO - Open in the front passenger's seat wire harness; replace the front passenger's seat wire harness, then clear the DTC, and retest. If the DTC is still present, replace the ODS unit (see **ODS UNIT REPLACEMENT**).

DTC 82-13: NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 82-13 indicated?

YES - Faulty front passenger's weight sensor (inner side); replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then clear the DTC.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 83-21: NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were**

properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).

- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 83-21 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select SWS DTC CHECK.

   Is an SWS DTC also indicated?

   YES -

   - DTC 21-11: Short to power in the front passenger's weight sensor (outer side) power circuit; go to step 5.
   - DTC 21-12: Short to ground in the front passenger's weight sensor (outer side) power circuit; go to step 11.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

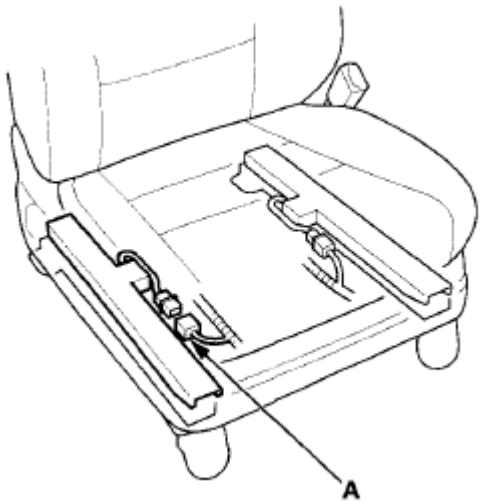

Fig. 181: Identifying Front Passenger's Seat Wire Harness 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the front passenger's seat wire harness 3P connector (A) from the front passenger's weight sensor (outer side).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
10. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select SWS DTC CHECK.

    Is SWS DTC 21-11 indicated?

    YES - Short to power in the front passenger's seat wire harness; replace the front passenger's seat wire harness, then clear the DTC, and retest. If the DTC is still present, replace the ODS unit (see **ODS UNIT REPLACEMENT**).

    NO - Faulty front passenger's weight sensor (outer side); replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then clear the DTC.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Disconnect the front passenger's seat wire harness 3P connector (A) from the front passenger's weight sensor (outer side).

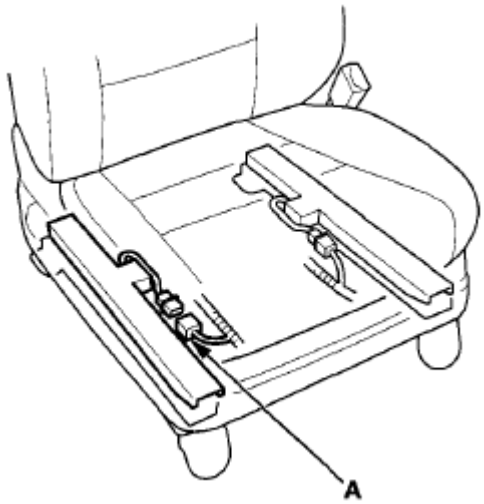

Fig. 182: Identifying Front Passenger's Seat Wire Harness 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
16. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select SWS DTC CHECK.

    Is SWS DTC 21-12 indicated?

    YES - Go to step 17.

    NO - Faulty front passenger's weight sensor (outer side); replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then clear the DTC.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Measure the resistance between front passenger's seat wire harness 3P connector terminal No. 3 and body ground. There should be an open circuit or at least 1 Mohms

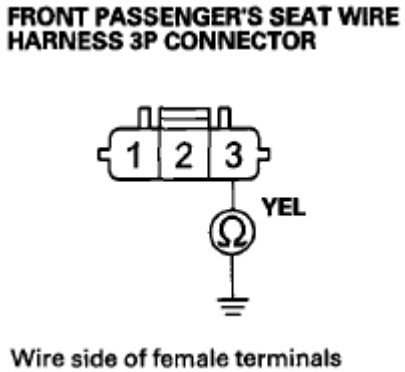

Fig. 183: Measuring Resistance Between Front Passenger's Seat Wire Harness 3P Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty ODS unit; replace the ODS unit (see **ODS UNIT REPLACEMENT**), then clear the DTC.

NO - Short to ground in the front passenger's seat wire harness; replace the front passenger's seat wire harness, then clear the DTC.

DTC 83-22: NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 83-22 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the front passenger's seat wire harness 3P connector (A) from the front passenger's weight sensor (outer side).

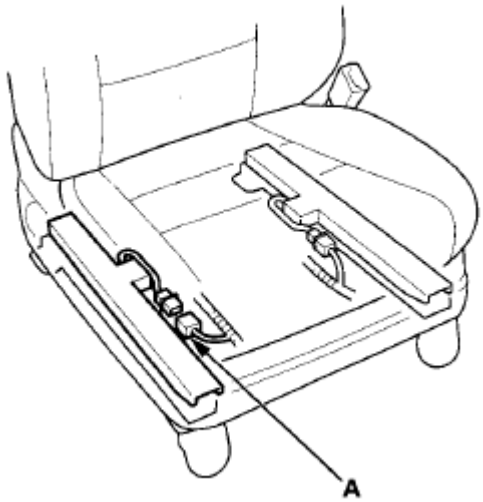

Fig. 184: Identifying Front Passenger's Seat Wire Harness 3P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Measure the voltage between front passenger's seat wire harness 3P connector terminals No. 1 and No. 3. There should be more than 6 V.

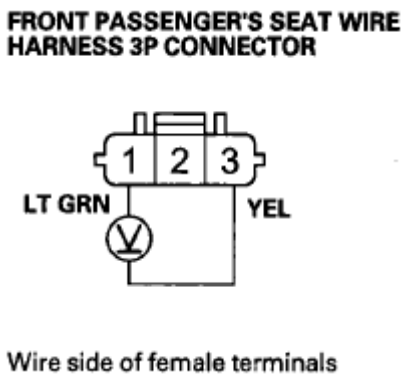

Fig. 185: Measuring Voltage Between Front Passenger's Seat Wire Harness 3P Connector Terminals No. 1 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty front passenger's weight sensor (outer side); replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then clear the DTC.

NO - Open in the front passenger's seat wire harness; replace the front passenger's seat wire harness, then clear the DTC, and retest. If the DTC is still present, replace the ODS unit (see **ODS UNIT REPLACEMENT**).

DTC 83-23: NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 83-23 indicated?

YES - Faulty front passenger's weight sensor (outer side); replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**), then clear the DTC.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC 85-4X ("X" CAN BE 0 THRU 9 OR A THRU F), 85-63, 85-64: INTERNAL FAILURE OF THE ODS UNIT

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

- **These DTCs are codes that relate to the ODS unit operation.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 85-4x, 85-63, or 85-64 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. Do the ODS unit initialization (see **ODS UNIT INITIALIZATION**).
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
7. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 85-4x, 85-63, or 85-64 indicated?

   YES - Go to step 8.

   NO - The system is OK at this time.

8. Replace the ODS unit (see **ODS UNIT REPLACEMENT**).
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 85-4x, 85-63, or 85-64 indicated?

    YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

    NO - The system is OK at this time.

DTC 85-61: NO SIGNAL FROM THE ODS UNIT; DTC 85-62: INCORRECT DATA FROM THE ODS UNIT

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were**

properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).

- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**
- **These DTCs are codes that relate to the ODS unit operation.**

1. Make sure nothing is on the front passenger's seat.
2. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 85-61 or 85-62 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check the No. 5 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 7.

   NO - Replace the fuse, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. If the fuse blows again, check for a short to ground in the driver's under-dash fuse/relay box No. 5 (7.5 A) fuse circuit (dashboard wire harness, SRS floor wire harness, or front passenger's seat wire harness); replace the faulty harness, then clear the DTC, and retest. If the DTC is still present, replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then clear the DTC.

7. Remove the front seat back panel (see **FRONT SEAT-BACK COVER REPLACEMENT**).
8. Turn over the seat-back cover/pad to gain access to the ODS unit (see **ODS Unit Replacement**).
9. Remove the cover from the ODS unit (see step 5).
10. Check the connector connection between the ODS unit 18P connector (A) and the ODS unit (B).

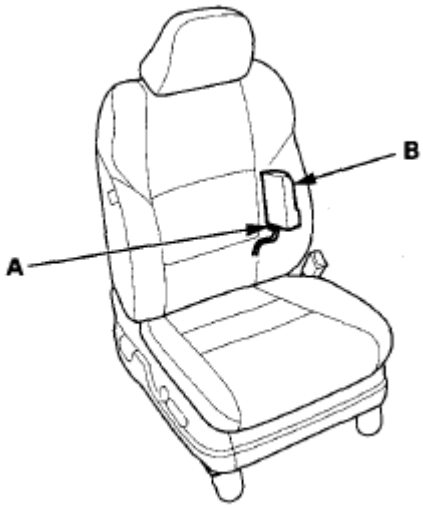

Fig. 186: Identifying ODS Unit 18P Connector And ODS Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the connector connection OK?

YES - Go to step 11.

NO - Repair the poor connector connection, then clear the DTC, and retest. If DTC 85-61 or 85-62 is still present, go to step 11.

11. Disconnect the ODS unit 18P connector (A) from the ODS unit (B).

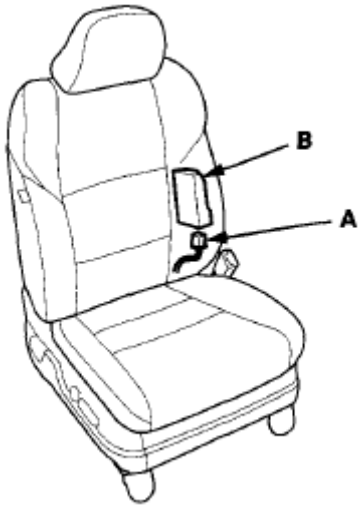

Fig. 187: Identifying ODS Unit 18P Connector From ODS Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.

13. Measure the voltage between ODS unit 18P connector terminal No. 1 and body ground. There should be battery voltage.

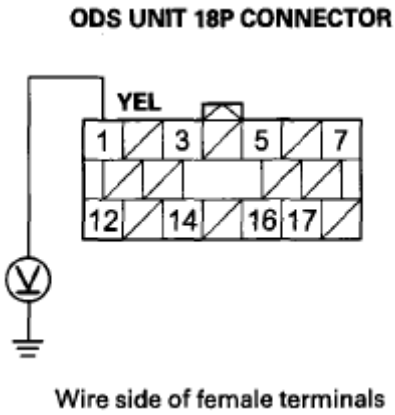

Fig. 188: Measuring Voltage Between ODS Unit 18P Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 14.

NO - Open in the dashboard wire harness, the SRS floor wire harness, or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Measure the resistance between ODS unit 18P connector terminals No. 12 and body ground. There should be less than 1.0 ohms.

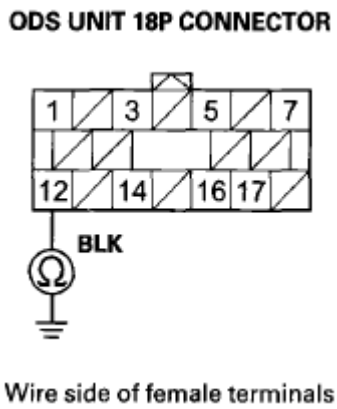

Fig. 189: Measuring Resistance Between ODS Unit 18P Connector Terminals No. 12 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 16.

NO - Open in the SRS floor wire harness, the front passenger's seat wire harness, poor connection at the ground G702 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or poor connection at the ODS unit 18P connector and the ODS unit. Check the connectors; if the connection is OK, replace the faulty harness, then clear the DTC.

16. Disconnect the negative cable from the battery, then wait at least 3 minutes.
17. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
18. Measure the resistance between SRS unit connector B (39P) terminal No. 1 and body ground. There should be an open circuit or at least 1 Mohms.

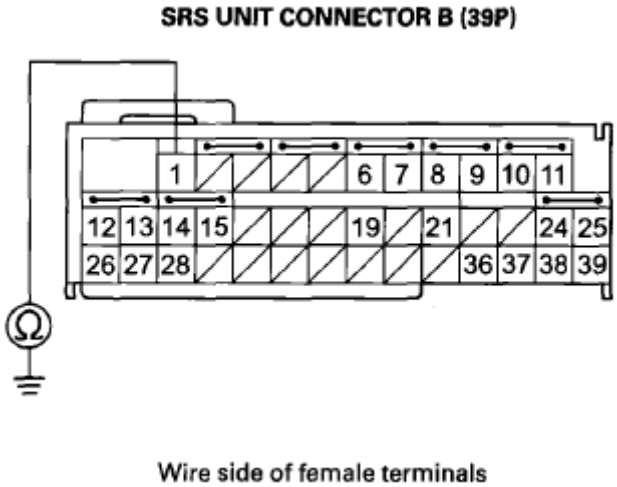

Fig. 190: Measuring Resistance Between SRS Unit Connector B (39P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 19.

NO - Short to ground in the SRS floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

19. Measure the resistance between SRS unit connector B (39P) terminal No. 1 and ODS unit 18P connector terminal No. 7. There should be less than 1.0 ohms.

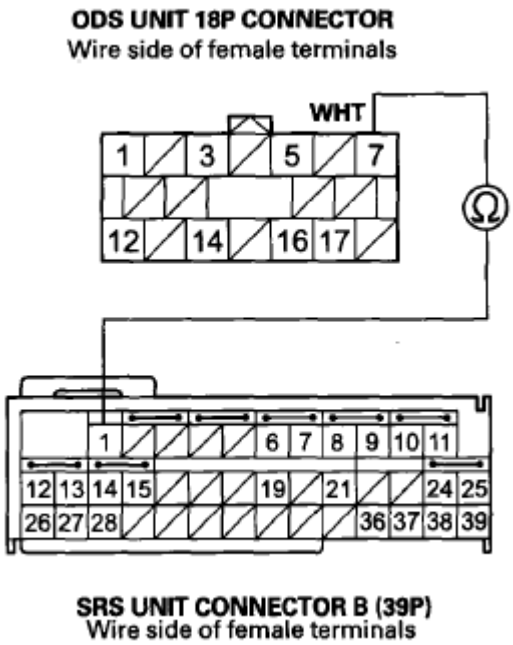

Fig. 191: Measuring Resistance Between SRS Unit Connector B (39P) Terminal No. 1 And ODS Unit 18P Connector Terminal No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 20.

NO - Open in the harness between SRS unit connector B (39P) terminal No. 1 and ODS unit 18P connector terminal No. 7 (SRS floor wire harness or front passenger's seat wire harness); replace the faulty harness, then clear the DTC.

20. Reconnect the negative cable to the battery.
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Measure the voltage between SRS unit connector B (39P) terminal No. 1 and body ground. There should be less than 0.2 V.

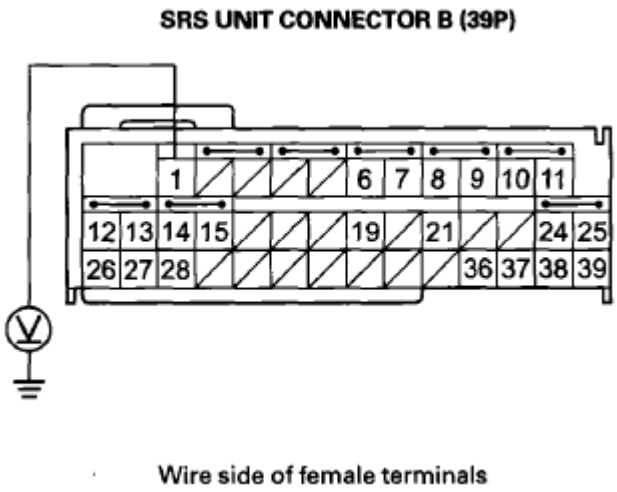

Fig. 192: Measuring Voltage Between SRS Unit Connector B (39P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 23.

NO - Short to power in the SRS floor wire harness or the front seat passenger's seat wire harness; replace the faulty harness, then clear the DTC.

23. Replace the ODS unit (see **ODS UNIT REPLACEMENT**).
24. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
25. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
26. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 85-61 or 85-62 indicated?

YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - The system is OK at this time.

DTC 85-71, 85-78: ODS UNIT NOT INITIALIZED

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and**

Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**
- **These DTCs are codes that relate to the ODS unit operation.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 85-71 or 85-78 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. Do the ODS unit initialization (see **ODS UNIT INITIALIZATION**).
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
7. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 85-71 or 85-78 indicated?

   YES - Go to step 8.

   NO - The system is OK at this time.

8. Replace the ODS unit (see **ODS UNIT REPLACEMENT**).
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
11. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

    Is DTC 85-71 or 85-78 indicated?

    YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

    NO - The system is OK at this time.

DTC 85-79: OPDS SENSOR INITIAL CHECK FAILURE

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**
- **These DTCs are codes that relate to the ODS unit operation.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 85-79 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Make sure nothing is on the front passenger's seat.
6. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
8. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 85-79 indicated?

   YES - Go to step 9.

   NO - The system is OK at this time.

9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Do the ODS unit initialization (see **ODS UNIT INITIALIZATION**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait

for 10 seconds.

12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 85-79 indicated?

YES - Replace the ODS unit (see **ODS UNIT REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the seat-back cover/pad equipped with an OPDS sensor (see **FRONT SEAT-BACK COVER REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - The system is OK at this time.

DTC 86-1X ("X" CAN BE 0 THRU 9 OR A THRU F): FAULTY OPDS SEAT-BACK SENSOR; DTC 86-2X ("X" CAN BE 0 THRU 9 OR A THRU F): FAULTY OPDS SEAT SUPPORT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 86-1x or 86-2x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the front seat back panel (see **FRONT SEAT-BACK COVER REPLACEMENT**).
6. Turn over the seat-back cover/pad to gain access to the ODS unit (see **ODS Unit Replacement**).
7. Remove the cover (A), then check the connector connection between the ODS unit 18P connector (B) and the OPDS sensor connectors (C), and the ODS unit.

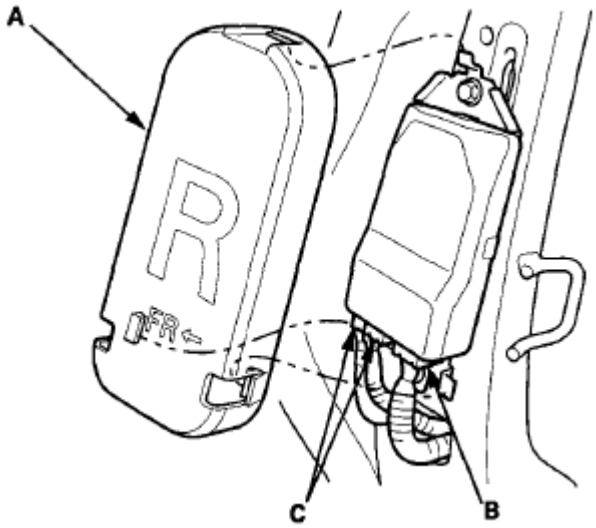

Fig. 193: Identifying Cover, ODS Unit 18P Connector And OPDS Sensor Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Are the connector connections OK?

YES - Go to step 8.

NO - Repair the poor connector connections, then clear the DTC, and retest. If DTC 86-1x or 86-2x is still present, go to step 8.

8. Replace the seat-back cover/pad equipped with an OPDS sensor (see **FRONT SEAT-BACK COVER REPLACEMENT**).
9. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
10. Do the ODS unit initialization (see **ODS UNIT INITIALIZATION**).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
12. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC 86-1x or 86-2x indicated?

YES - Replace the ODS unit (see **ODS UNIT REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - The system is OK at this time.

DTC 92-1X ("X" CAN BE 0 THRU 9 OR A THRU F): SHORT TO POWER IN THE PASSENGER'S AIRBAG CUTOFF INDICATOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced**

with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).

- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**
- **If there are other SRS DTCs stored with 92-1 x; troubleshoot them first.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 92-1x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the passenger's airbag cutoff indicator 6P connector (see **PASSENGER'S AIRBAG CUTOFF INDICATOR REPLACEMENT**).
7. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between SRS unit connector A (39P) terminal No. 20 and body ground. There should be less than 0.2 V.

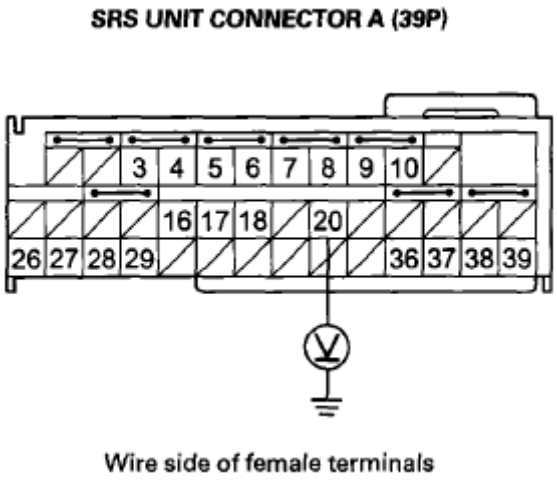

Fig. 194: Measuring Voltage Between SRS Unit Connector A (39P) Terminal No. 20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Faulty passenger's airbag cutoff indicator or SRS unit; replace the passenger's airbag cutoff indicator (see **PASSENGER'S AIRBAG CUTOFF INDICATOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC 92-2X ("X" CAN BE 0 THRU 9 OR A THRU F): OPEN OR SHORT TO GROUND IN THE PASSENGER'S AIRBAG CUTOFF INDICATOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**
- **If there are other SRS DTCs stored with 92-2x; troubleshoot them first.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC 92-2x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Disconnect the passenger's airbag cutoff indicator 6P connector (see **PASSENGER'S AIRBAG CUTOFF INDICATOR REPLACEMENT**).
7. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Measure the resistance between SRS unit connector A (39P) terminal No. 20 and passenger's airbag cutoff indicator 6P connector terminal No. 5. There should be less than 1.0 ohms.

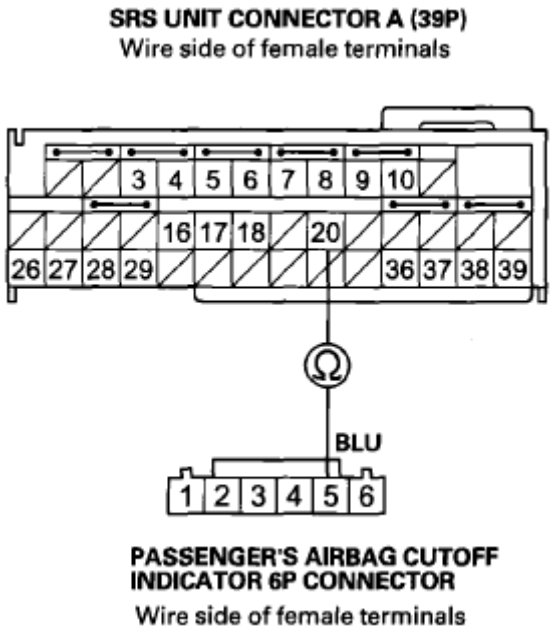

Fig. 195: Measuring Resistance Between SRS Unit Connector Terminal No. 20 And Passenger's Airbag Cutoff Indicator Connector Terminal No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 9,

NO - Open in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

9. Measure the resistance between SRS unit connector A (39P) terminal No. 20 and body ground. There should be an open circuit or more than 1 Mohms.

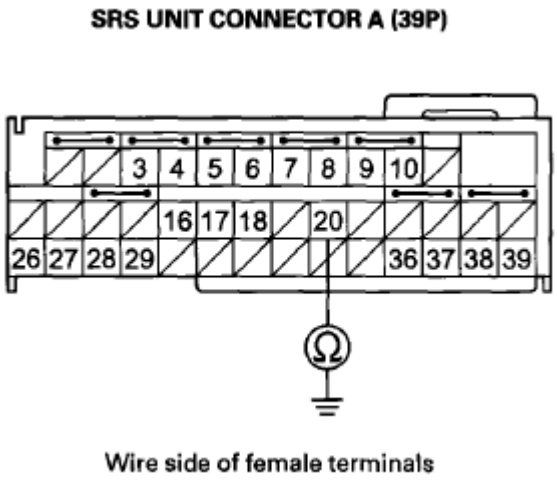

Fig. 196: Measuring Resistance Between SRS Unit Connector A (39P) Terminal No. 20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty passenger's airbag cutoff indicator or SRS unit; replace the passenger's airbag cutoff indicator (see **PASSENGER'S AIRBAG CUTOFF INDICATOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC A1-1X ("X" CAN BE 0 THRU 9 OR A THRU F): FAULTY POWER SUPPLY (VA LINE)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit**

software (see SRS UNIT UPDATE), and retest.

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC A1-1x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check the No. 5 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Go to step 6.

   NO - Replace the fuse, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. If the fuse blows again, check for a short to ground in the driver's under-dash fuse/relay box No. 5 (7.5 A) fuse circuit (dashboard wire harness, SRS floor wire harness, or front passenger's seat wire harness); replace the faulty harness, then clear the DTC, and retest. If the DTC is still present, replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then clear the DTC.

6. Disconnect the negative cable from the battery, then wait at least 3 minutes.
7. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between SRS unit connector A (39P) terminal No. 26 and body ground. There should be battery voltage.

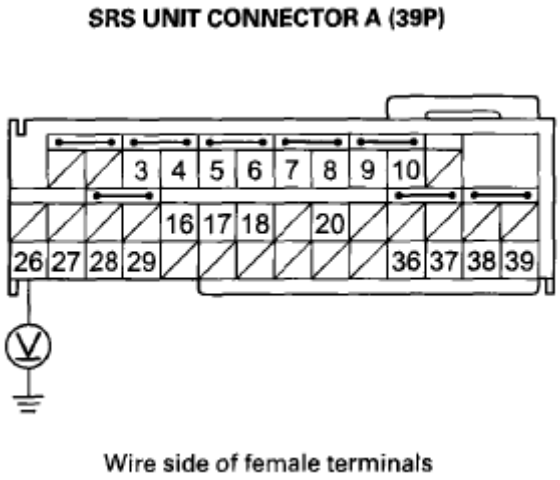

Fig. 197: Measuring Voltage Between SRS Unit Connector A (39P) Terminal No. 26 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the battery voltage?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Open in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC A2-1X ("X" CAN BE 0 THRU 9 OR A THRU F): FAULTY POWER SUPPLY (VB LINE)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC A2-1x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check the No. 11 (10 A) fuse in the driver's under-dash fuse/relay box.

Is the fuse OK?

YES - Go to step 6.

NO - Replace the fuse, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. If the fuse blows again, check for a short to ground in the dashboard wire harness in the driver's under-dash fuse/relay box No. 11 (10 A) fuse circuit; replace the dashboard wire harness, then clear the DTC, and retest. If the DTC is still present, replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**), then clear the DTC.

6. Disconnect the negative cable from the battery, then wait at least 3 minutes.
7. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Reconnect the negative cable to the battery.
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between SRS unit connector A (39P) terminal No. 27 and body ground. There should be battery voltage.

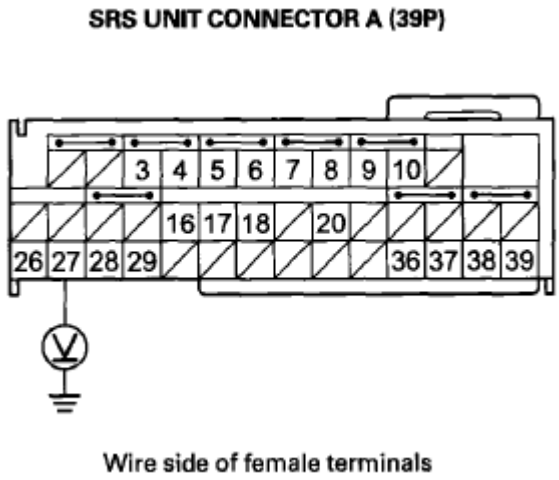

Fig. 198: Measuring Voltage Between SRS Unit Connector A (39P) Terminal No. 27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the battery voltage?

YES - Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit; check the connection. If the connection is OK, replace the SRS unit (see **SRS UNIT REPLACEMENT**). If the DTC does not clear, replace the dashboard wire harness.

NO - Open in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC A3-1X ("X" CAN BE 0 THRU 9 OR A THRU F): SRS UNIT CONNECTOR A NOT PROPERLY INSTALLED

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC A3-1x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Check the connector connection between SRS unit connector A (39P) and the SRS unit.

   Is the connector connection OK?

   YES - Go to step 7.

NO - Repair the poor connector connection, then clear the DTC, and retest. If DTC A3-1x is still present, go to step 7.

7. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Check for bent or damaged terminals on the SRS unit.

   Are any terminals bent or damaged?

   YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

   NO - Replace the dashboard wire harness, then clear the DTC.

DTC A4-1X ("X" CAN BE 0 THRU 9 OR A THRU F): SRS UNIT CONNECTOR B NOT PROPERLY INSTALLED

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Is DTC A4-1x indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Check the connector connection between SRS unit connector B (39P) and the SRS unit.

Is the connector connection OK?

YES - Go to step 7.

NO - Repair the poor connector connection, then clear the DTC, and retest. If DTC A4-1x is still present, go to step 7.

7. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Check for bent or damaged terminals on the SRS unit.

Are any terminals bent or damaged?

YES - Replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Replace the SRS floor wire harness, then clear the DTC.

DTC B2-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE REAR SAFING SENSOR

Special Tools Required

- SRS Inflator Simulator 07SAZ-TB4011A
- SRS Simulator Lead L 070AZ-SNAA300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES), General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION), and Battery Terminal Disconnection and Reconnection (see BATTERY TERMINAL DISCONNECTION AND RECONNECTION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B2-1x indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the negative cable from the battery, then wait at least 3 minutes.
6. Check for these connector connections and harness.
   - SRS unit connector B (39P) (see **DISCONNECTING SYSTEM CONNECTORS**).
   - SRS floor wire harness 2P connector and the rear safing sensor (see **REAR SAFING SENSOR REPLACEMENT**).

Are the connector connections and harness OK?

YES - Go to step 7.

NO - Repair the poor connector connections or replace the harness, then clear the DTC, and retest. If DTC B2-1x is still present, go to step 7.

7. Disconnect SRS unit connector B (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
8. Disconnect the SRS floor wire harness 2P connector from the rear safing sensor (see **REAR SAFING SENSOR REPLACEMENT**).
9. Measure the resistance between SRS unit connector B (39P) terminals No. 26 and No. 27. There should be an open circuit or at least 1 Mohms

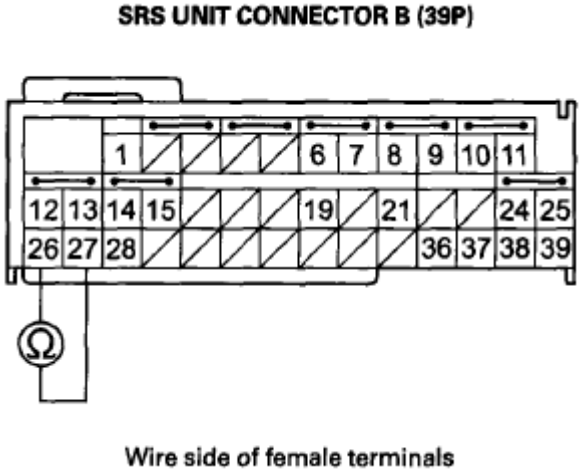

Fig. 199: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 26 And No. 27
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 10.

NO - Short to another wire in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

10. Measure the resistance between body ground and SRS unit connector B (39P) terminals No. 26 and No. 27 individually. There should be an open circuit or at least 1 Mohms

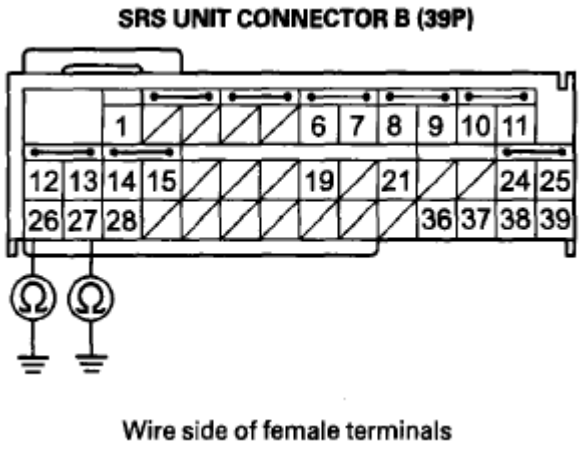

Fig. 200: Measuring Resistance Between Body Ground And SRS Unit Connector B (39P) Terminals No. 26 And No. 27
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Go to step 11.

NO - Short to ground in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

11. Reconnect the negative cable to the battery.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between body ground and SRS unit connector B (39P) terminals No. 26 and No. 27 individually. There should be less than 0.2 V.

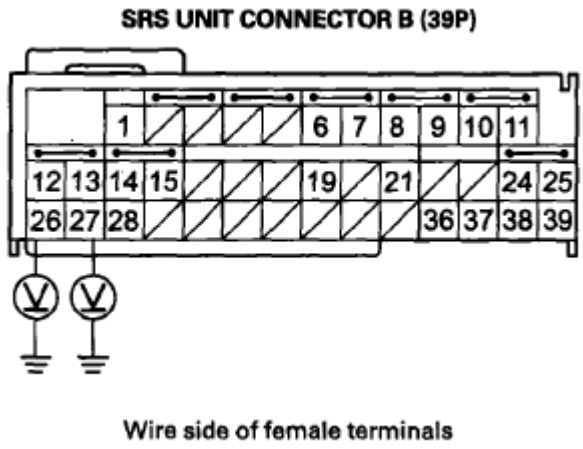

Fig. 201: Measuring Voltage Between Body Ground And SRS Unit Connector B (39P) Terminals No. 26 And No. 27
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the voltage as specified?

YES - Go to step 14.

NO - Short to power in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), and then connect the SRS simulator lead L to the SRS floor wire harness 2P connector (B).

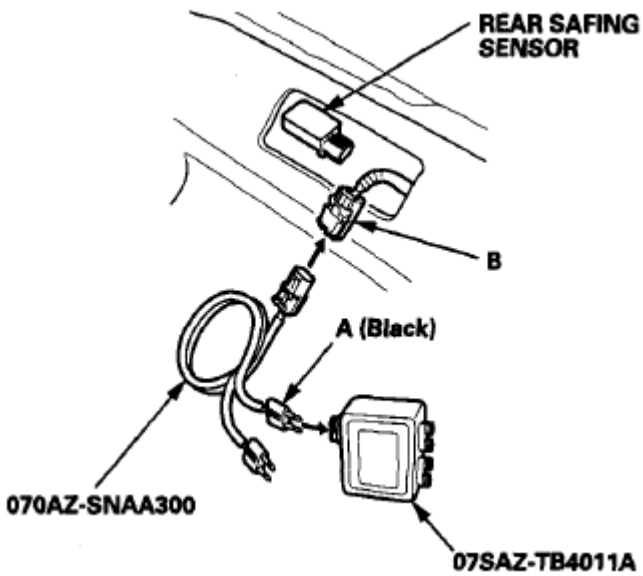

Fig. 202: Connecting Black Terminal Of SRS Simulator Lead L To SRS Inflator Simulator (Jumper Connector)

Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Measure the resistance between SRS unit connector B (39P) terminals No. 26 and No. 27. There should be less than 1.0 ohms.

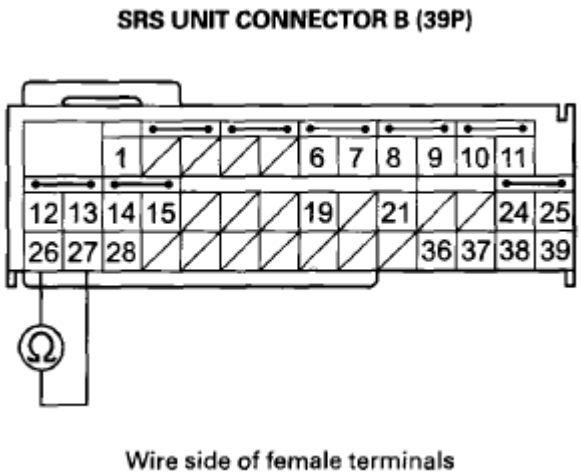

Fig. 203: Measuring Resistance Between SRS Unit Connector B (39P) Terminals No. 26 And No. 27
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty rear safing sensor or SRS unit; replace the rear safing sensor (see **REAR SAFING SENSOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the SRS floor wire harness; replace the SRS floor wire harness, then clear the DTC.

DTC B2-2X, B2-3X, B2-8X, B2-9X, B2-AX, B2-BX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE REAR SAFING SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC B2-2x, B2-3x, B2-8x, B2-9x, B2-Ax, or B2-BX indicated?

YES - Faulty rear safing sensor or SRS unit; replace the rear safing sensor (see **REAR SAFING SENSOR REPLACEMENT**), then clear the DTC, and retest. If the DTC is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC EX-11 ("X" CAN BE 0 THRU 9 OR A THRU F): CONTROL OPERATION RECORDED

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, then wait for 10 seconds.
3. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

Is DTC Ex-11 indicated?

YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Intermittent failure, the system is OK at this time. Go to **TROUBLESHOOTING INTERMITTENT FAILURES**. If another DTC is indicated, troubleshoot the DTC.

DTC FX-11 ("X" CAN BE 0 THRU 9 OR A THRU F): AIRBAGS AND/OR TENSIONERS DEPLOYMENT RECORDED

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, review SRS Precautions and Procedures (see PRECAUTIONS AND PROCEDURES) and General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **Refer to the DTCs shown:**
  - **DTC F1-11: Driver's airbag and/or driver's seat belt tensioner deployed.**
  - **DTC F2-11: Front passenger's airbag and/or front passenger's seat belt tensioner deployed.**
  - **DTC F3-11: Driver's side airbag, left side curtain airbag, and/or driver's seat belt tensioner deployed.**
  - **DTC F4-11: Front passenger's side airbag, right side curtain airbag, and/or front passenger's seat belt tensioner deployed.**
  - **DTC F6-11: Left side curtain airbag or right side curtain airbag deployed.**

When any airbags or tensioners have deployed, go to **COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT**.

DTC 41-XX, 42-XX, 43-XX ("X" CAN BE 0 THRU 9 OR A THRU F): INTERNAL FAILURE OF THE ODS UNIT

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

Do the troubleshooting for SRS DTC 81-4x (see **DTC 81-4X ("X" CAN BE 0 THRU 9 OR A THRU F), 81-63, 81-64: INTERNAL THE FAILURE OF THE ODS UNIT**).

DTC 71-XX ("X" CAN BE 0 THRU 9 OR A THRU F): ODS UNIT NOT CALIBRATED

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in**

a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).

- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

Do the troubleshooting for SRS DTC 81-71 (see **DTC 81-71, 81-78: ODS UNIT NOT CALIBRATED**).

DTC 11-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

Do the troubleshooting for SRS DTC 82-11 (see **DTC 82-11: NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR**).

DTC 12-2X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

Do the troubleshooting for SRS DTC 82-12 (see **DTC 82-12: NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR**).

DTC 13-3X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

Do the troubleshooting for SRS DTC 82-13 (see **DTC 82-13: NO SIGNAL FROM THE INNER SIDE FRONT PASSENGER'S WEIGHT SENSOR**).

DTC 21-1X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

Do the troubleshooting for SRS DTC 83-21 (see **DTC 83-21: NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR**).

DTC 22-2X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These**

SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

Do the troubleshooting for SRS DTC 83-22 (see **DTC 83-22: NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR**).

DTC 23-3X ("X" CAN BE 0 THRU 9 OR A THRU F): NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that ail the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Only read DTCs from the SRS menu, not from SWS menus unless instructed to check SWS DTCs. SWS (ODS unit) DTCs are subcodes of SRS unit DTCs. Only troubleshoot the corresponding SRS DTCs. These SWS DTCs are cleared when you turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.**

Do the troubleshooting for SRS DTC 83-23 (see **DTC 83-23: NO SIGNAL FROM THE OUTER SIDE FRONT PASSENGER'S WEIGHT SENSOR**).

SYMPTOM TROUBLESHOOTING

SRS INDICATOR DOES NOT COME ON

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then wait for 10 seconds.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

   Does the SRS indicator come on?

   YES - Intermittent failure, the system is OK at this time.

NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, then wait for 10 seconds.
4. Connect the HDS to the data link connector (DLC) (see step 2).
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
7. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the SRS indicator blink?

   YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

   NO - Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

SRS INDICATOR STAYS ON, BUT NO DTCS ARE STORED, OR CANNOT BE READ

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, make sure the battery is fully charged. If the battery voltage is low, SRS indicator may stays on.**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Start the engine, and see if the malfunction indicator lamp (MIL) also stays on.

   Does the MIL stay on longer than 30 seconds?

   YES - Go to MIL Circuit Troubleshooting (see **MIL CIRCUIT TROUBLESHOOTING**).

   NO - Go to step 2.

2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Connect the HDS to the data link connector (DLC) (see step 2).
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
6. Check for communication to the SRS with the HDS.

Does the HDS communicate with the SRS unit?

YES - Go to step 7.

NO - Go to step 10.

7. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Are any SRS DTCs indicated?

   YES - Do the SRS DTC troubleshooting.

   NO - Go to step 8.

8. Check for body electrical DTCs with the HDS (see **WIRE COLOR CODES**).

   Is DTC U0151 indicated?

   YES - Troubleshoot DTC U0151 (see **DTC U0151: GAUGE CONTROL MODULE LOST COMMUNICATION WITH SRS UNIT (SRS MESSAGE)**).

   NO - Go to step 9.

9. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the SRS indicator blink?

   YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

   NO - Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Check the No. 5 (7.5 A) and No. 11 (10 A) fuse in the driver's under-dash fuse/relay box.

    Is the fuse OK?

    YES - Go to step 12.

    NO - Replace the fuse, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. If the fuse blows again, check for a short to ground in the driver's under-dash fuse/relay box No. 5 (7.5 A) and No. 11 (10 A) fuse circuits (dashboard wire harness, SRS floor wire harness, or front passenger's seat wire harness); replace the faulty harness, then clear the DTC, and retest. If the problem is still present, replace the driver's under-dash fuse/relay box (see **DRIVER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**).

12. Check the connector connections between SRS unit connector A (39P) and driver's under-dash fuse/relay

box connector M (4P).

Are the connector connections OK?

YES - Go to step 13.

NO - Repair the poor connector connections, and retest. If the problem is still present, go to step 13.

13. Disconnect the negative cable from the battery, then wait at least 3 minutes.
14. Disconnect SRS unit connector A (39P) from the SRS unit (see **DISCONNECTING SYSTEM CONNECTORS**).
15. Reconnect the negative cable to the battery.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Measure the voltage between body ground and SRS unit connector A (39P) terminal No. 26 and No. 27 individually. There should be battery voltage.

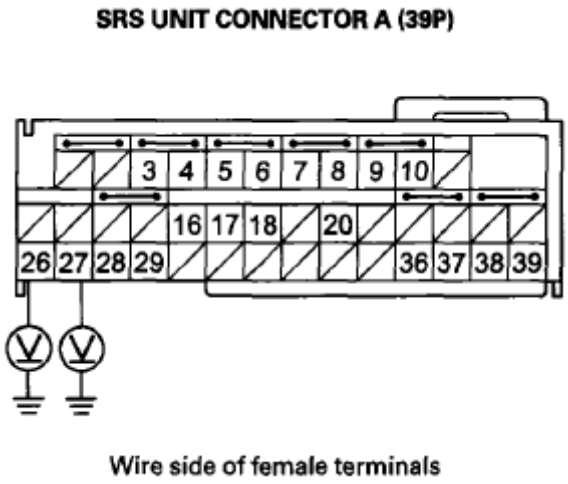

Fig. 204: Measuring Voltage Between Body Ground And SRS Unit Connector A (39P) Terminal No. 26 And No. 27
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 18.

NO - Open in the dashboard wire harness; replace the dashboard wire harness.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Measure the resistance between body ground and SRS unit connector A (39P) terminals No. 28 and No. 29 individually. There should be less than 1.0 ohms.

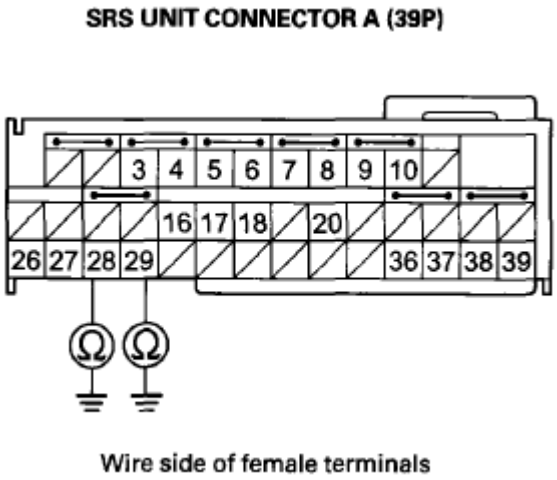

Fig. 205: Measuring Resistance Between Body Ground And SRS Unit Connector A (39P) Terminals No. 28 And No. 29
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance as specified?

YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

NO - Open in the dashboard wire harness; check for a poor ground at G404 (see **CONNECTOR TO FUSE/RELAY BOX INDEX**). If the ground is OK, replace the dashboard wire harness.

SIDE AIRBAG CUTOFF INDICATOR STAYS ON

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Make sure nothing is on the front passenger's seat.
2. Make sure the seat-back is dry.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and see if the SRS indicator comes on.

Does the SRS indicator come on and stay on?

YES - Go to the **SYMPTOM TROUBLESHOOTING** "SRS indicator stays on, but no DTCs are stored, or cannot be read".

NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check for body electrical DTCs with the HDS (see **WIRE COLOR CODES**).

   Is DTC U0151 indicated?

   YES - Troubleshoot DTC U0151 (see **DTC U0151: GAUGE CONTROL MODULE LOST COMMUNICATION WITH SRS UNIT (SRS MESSAGE)**).

   NO - Go to step 6.

6. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the side airbag cutoff indicator blink?

   YES - Do the ODS unit initialization (see **ODS UNIT INITIALIZATION**), and retest. If the problem is still present, replace the seat-back cover/pad equipped with an OPDS sensor (see **FRONT SEAT-BACK COVER REPLACEMENT**), and retest. If the problem is still present, replace the SRS unit (see **SRS UNIT REPLACEMENT**).

   NO - Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

SIDE AIRBAG CUTOFF INDICATOR DOES NOT COME ON

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **If the SRS indicator also stays on, go to SRS indicator stays on, but no DTCs are stored, or cannot be read (see SRS INDICATOR STAYS ON, BUT NO DTCS ARE STORED, OR CANNOT BE READ).**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Turn the ignition to switch LOCK (0), or press the engine start/stop button to select the OFF mode, then wait for 10 seconds.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the side airbag cutoff indicator comes on for about 6 seconds.

   Does the side airbag cutoff indicator come on?

   YES - Intermittent failure, the system is OK at this time.

NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Connect the HDS to the data link connector (DLC) (see step 2).
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
7. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the side airbag cutoff indicator blink?

   YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

   NO - Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

PASSENGER'S AIRBAG CUTOFF INDICATOR STAYS ON OR COMES ON SUDDENLY

NOTE: Under the following conditions, the passenger's airbag cutoff indicator stays on or comes on suddenly:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see **COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT**).
- When no one is sitting on the front passenger's seat, but there is an object on the seat more than 11 lbs
- (5 kg).
- The front seat belt is buckled, but no one is sitting on the front passenger's seat.
- Someone who is less than about 65 lbs (30 kg) is sitting on the front passenger's seat.
- Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see **SRS UNIT UPDATE**), and retest.

1. Check for these items, then recheck the passenger's airbag cutoff indicator.
   - The front passenger's seat is installed correctly.
   - Nothing is/was on the front passenger's seat.
   - Nothing is/was under the front passenger's seat.
   - Nothing is/was in the front passenger's seat-back pocket.
   - Whoever was sitting on the front passenger's seat was sitting in the proper sitting position.
   - The seat weight sensors may not measure the correct weight of the front passenger. If the front passenger's weight is more than 65 lbs (30 kg) but is supporting some of their body weight with their feet on the floor, or with their hands and arms on an arm rest, the actual weight of the passenger is not measured.

Does the passenger's airbag cutoff indicator stay on?

YES - Go to step 2.

NO - The vehicle is OK at this time.

2. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
3. Connect the HDS to the data link connector (DLC) (see step 2).
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Make sure the HDS communicates with the vehicle and the SRS unit. If it does not communicate, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
6. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select AFTER REPLACING FRONT PASSENGER'S SEAT COMPONENT(S), and follows the prompts.

   Does the passenger's airbag cutoff indicator stay on?

   YES - Go to step 7.

   NO - The vehicle is OK at this time.

7. From the HDS Main Menu, select SRS, then Inspection. In the Inspection Menu, select AFTER A VEHICLE COLLISION, and follows the prompts.

   Does the passenger's airbag cutoff indicator stay on?

   YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**), and retest. If the problem is still present, replace the ODS unit (see **ODS UNIT REPLACEMENT**), and retest. If the problem is still present, replace the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT**).

   NO - The vehicle is OK at this time.

FAULTY SEAT BELT REMINDER INDICATOR

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components, of the correct part number, and that they were properly installed (see COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT).**
- **Before doing this troubleshooting procedure, make sure the battery is fully charged (see BATTERY TEST). If the battery voltage is low, SRS indicator may stay on.**
- **Before replacing the SRS unit, check the SRS unit software version with the HDS. If the software version is not the latest, update the SRS unit software (see SRS UNIT UPDATE), and retest.**

1. Clear the DTCs with the HDS (see **HOW TO CLEAR DTCS**).

   Are any SRS DTCs indicated?

   YES - Do the SRS DTC troubleshooting.

   NO - Go to step 2.

2. Check for body electrical DTCs with the HDS (see **WIRE COLOR CODES**).

   Is DTC U0151 indicated?

   YES - Troubleshoot DTC U0151 (see **DTC U0151: GAUGE CONTROL MODULE LOST COMMUNICATION WITH SRS UNIT (SRS MESSAGE)**).

   NO - Go to step 3.

3. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Does the seat belt reminder indicator blink?

   YES - Faulty SRS unit; replace the SRS unit (see **SRS UNIT REPLACEMENT**).

   NO - Faulty gauge control module; replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT

NOTE:

- **If the harness is broken or damaged in the areas relevant to the replacement parts shown below, replace the harness, do not repair it.**
- **Before doing any SRS repairs. Check for DTCs with the HDS (see DTC (DIAGNOSTIC TROUBLE CODES)) for the less obvious deployed components (front seat belt tensioners, front impact sensors, side impact sensors, rear safing sensor, etc.).**
- **Do not replace the ODS unit unless it is physically damaged or a specific fault was found during DTC troubleshooting because it could complicate troubleshooting other DTCs.**
- **After a vehicle collision, do the ODS unit operation check (see ODS UNIT OPERATION CHECK).**
- **After a vehicle collision, inspect the front seat active head restraints (see FRONT SEAT ACTIVE HEAD RESTRAINT INSPECTION).**

After a collision where the front seat belt tensioners deployed, replace these items:

- SRS unit

- Front seat belt(s)
- Front impact sensor(s)

After a collision where the front airbag(s) deployed, replace these items:

- SRS unit
- Deployed front airbag(s)
- Front seat belt(s)
- Front impact sensor(s)
- Dashboard

After a collision where a side airbag deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side airbag(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- Seat frame and related parts
- Front seat belt(s)

After a collision where a side curtain airbag has deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side curtain airbag(s)
- Front seat belt(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- Rear safing sensor
- A-pillar trim
- B-pillar upper trim
- C-pillar trim
- Front grab handle
- Rear grab handle
- All related trim clips
- Sunvisor

After a moderate to severe side or rear collision, inspect for any damage on the side curtain airbag or other related components. Replace the components as needed.

A-PILLAR TRIM

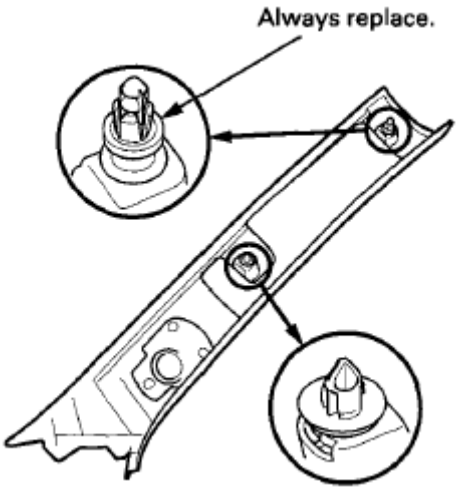

Fig. 206: Identifying A-Pillar Trim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

B-PILLAR TRIM

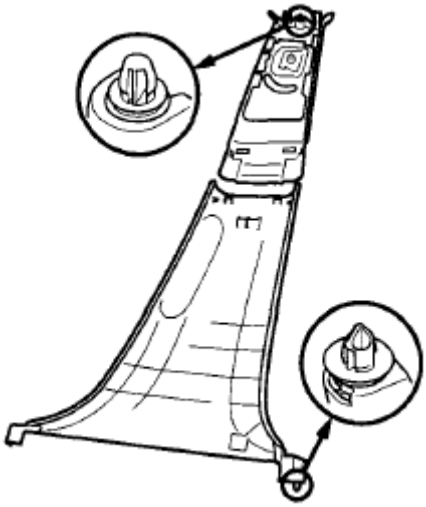

Fig. 207: Identifying B-Pillar Trim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

C-PILLAR TRIM

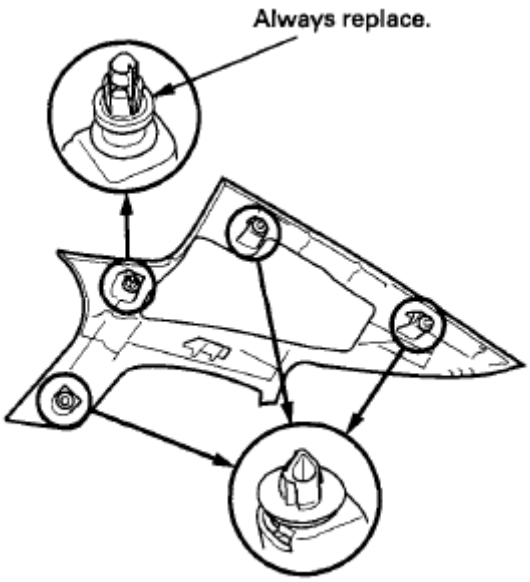

Fig. 208: Identifying C-Pillar Trim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

During the repair process, inspect these areas:

- Inspect all the SRS wire harnesses. Replace, do not repair, any damaged harnesses.
- Inspect the cable reel for heat damage. If there is any damage, replace the cable reel (see **CABLE REEL REPLACEMENT**).

After the vehicle is completely repaired, turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. If the SRS indicator comes on for about 6 seconds and then goes off, the SRS is OK. If the indicator does not function properly, use the HDS to check for DTCs (see **HOW TO READ DTCS**). If you cannot retrieve a code, do the SRS Symptom Troubleshooting.

CHECKING AND ADJUSTING THE HEADLINER/PILLAR TRIM OVERLAP

To prevent the side curtain airbag from deploying and damaging the pillar trim (A-pillar trim, B-pillar trim, C-pillar trim), the overlap between the headliner and pillar trim must be less then 8 mm (0.3 in) To check the overlap, do this:

1. Install the headliner (A) and the pillar trim (B).

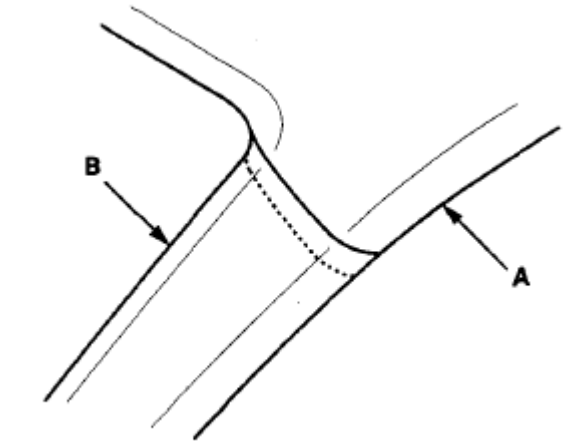

Fig. 209: Identifying Headliner And Pillar Trim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Apply masking tape (A) to the headliner (B) to mark the upper edge of the pillar trim (C).

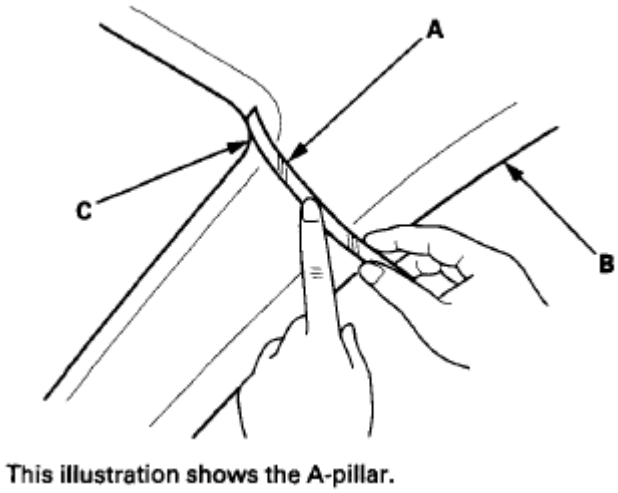

Fig. 210: Applying Masking Tape To Headliner
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the pillar trim, and measure the headliner overlap.
   - If the overlap is less than 8 mm (0.3 in), remove the tape, and install the pillar trim.
   - If the overlap is more than 8 mm (0.3 in), go to step 4.

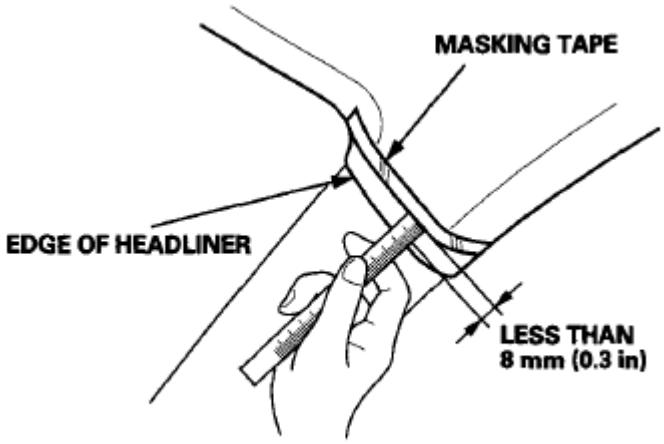

Fig. 211: Measuring Headliner Overlap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Carefully trim the headliner with a utility knife, reducing the overlap to less than 8 mm (0.3 in).

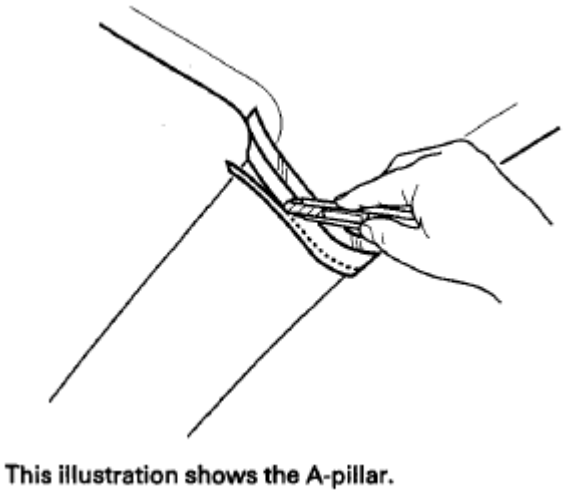

Fig. 212: Reducing Overlap With Utility Knife
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the tape, and install the pillar trim.

DRIVER'S AIRBAG REPLACEMENT

NOTE: If replacing the driver's airbag after deployment, refer to COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT for a complete list of other parts that must also be replaced.

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the access panel (A) from the steering wheel, then disconnect the cable reel 4P connector (B) from the driver's airbag 4P connector.

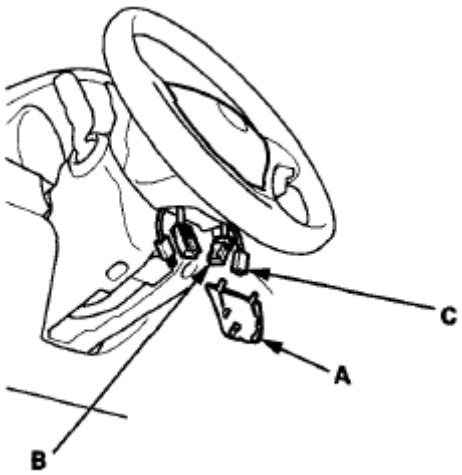

Fig. 213: Identifying Access Panel, Cable Reel 4P Connector And Driver's Airbag 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the horn switch 1P connector (C) from the driver's airbag 1P connector.
4. Remove the two TORX bolts (A) using a TORX T30 bit.

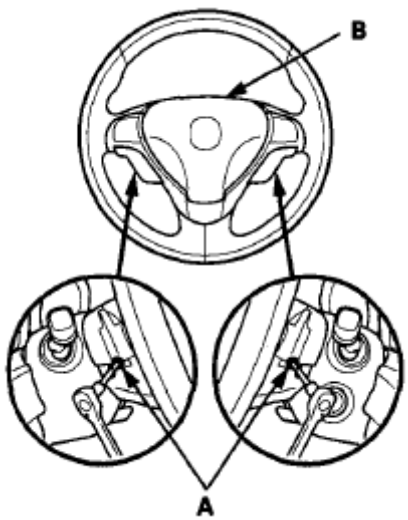

Fig. 214: Removing Two Torx Bolts Using Torx T30 Bit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the driver's airbag (B).

INSTALLATION

NOTE: If you are replacing a deployed driver's airbag, inspect the cable reel for heat damage. If there is any damage, replace the cable reel (see CABLE REEL REPLACEMENT).

1. Place the driver's airbag (A) in the steering wheel, and tighten the new TORX bolts (B) to the specified torque, using a TORX T30 bit.

NOTE: Make sure the clearance (C) between the steering wheel and horn pad is the specified value.

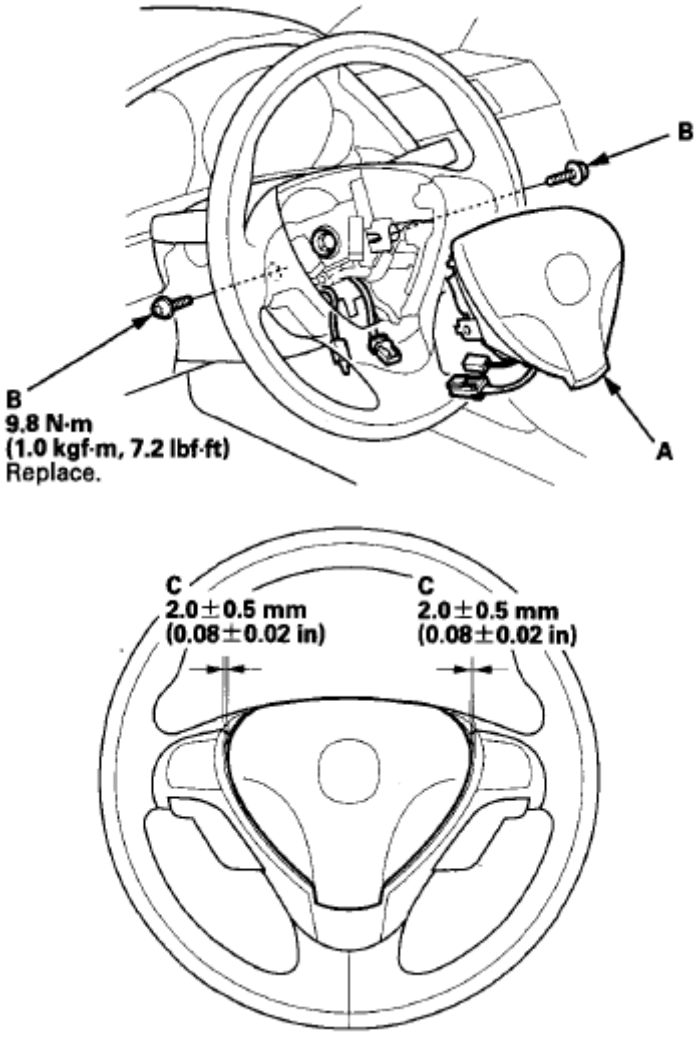

Fig. 215: Identifying Driver's Airbag, Torx Bolts And Clearance Between Steering Wheel And Horn Pad With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the driver's airbag 4P connector (A) and horn switch 1P connector (B), then install the access panel (C) on the steering wheel.

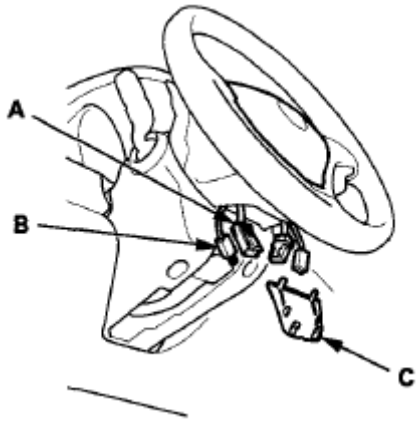

Fig. 216: Identifying Driver's Airbag 4P Connector, Horn Switch 1P Connector And Access Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. After installing the driver's airbag, confirm proper system operation:
   - Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.
   - Make sure the horn works properly.

FRONT PASSENGER'S AIRBAG REPLACEMENT

NOTE: If replacing the front passenger's airbag after deployment, refer to COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT for a complete list of other parts that must also be replaced.

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
3. Disconnect the dashboard wire harness 4P connector (A) from front passenger's airbag 4P connector.

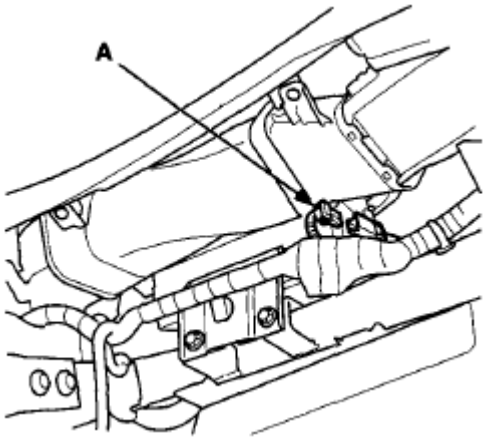

Fig. 217: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the two screws, then remove the passenger's dashboard ducts (A, B).

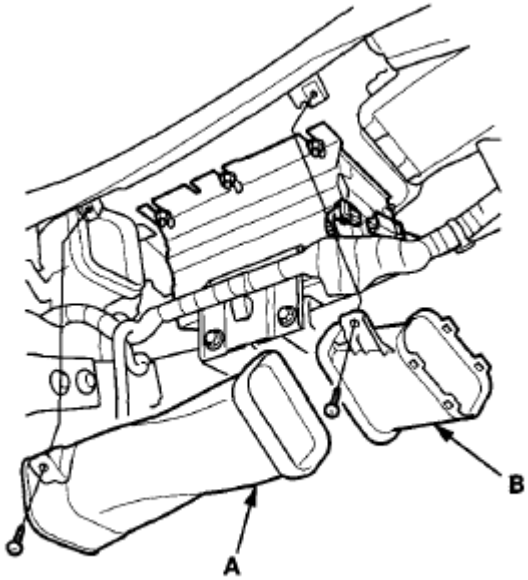

Fig. 218: Removing Passenger's Dashboard Ducts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Detach the clip (A), then remove the mounting nuts (B) and the mounting bolts (C) from the bracket (D).

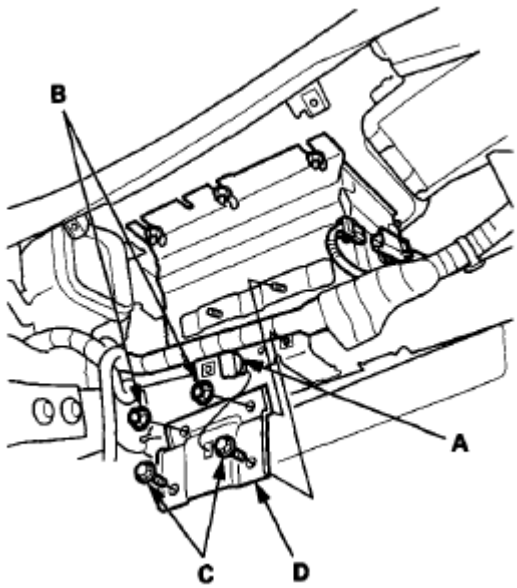

Fig. 219: Identifying Clip, Mounting Nuts And Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the mounting nuts (A) from the front passenger's airbag (B), then remove the front passenger's airbag.

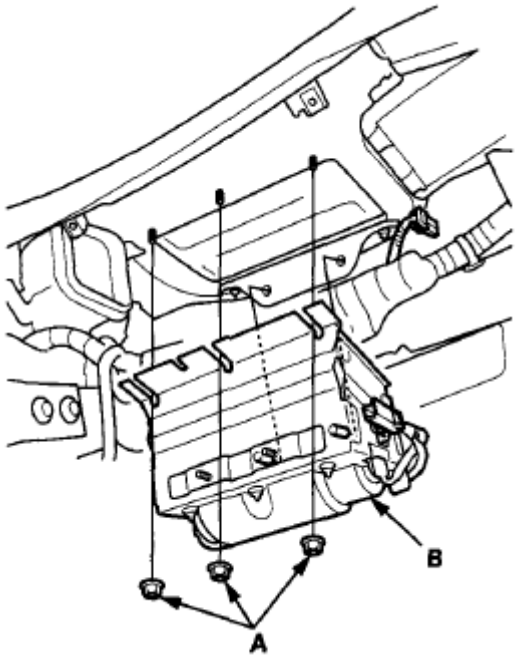

Fig. 220: Removing Mounting Nuts From Front Passenger's Airbag
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Place the front passenger's airbag (A) into the bracket. Install the front passenger's airbag new mounting nuts (B) to the specified torque.

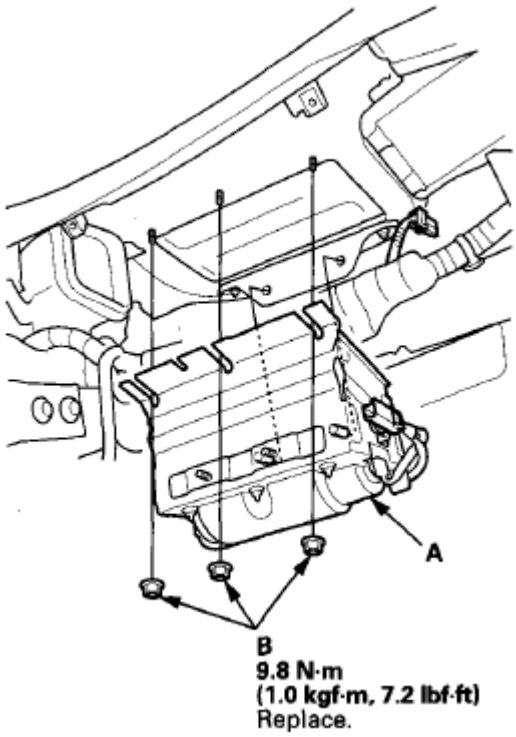

Fig. 221: Identifying Front Passenger's Airbag And Front Passenger's Airbag Mounting Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the bracket (A) with the new mounting bolts (B) and the new mounting nuts (C) to the specified torque, then install the clip (D).

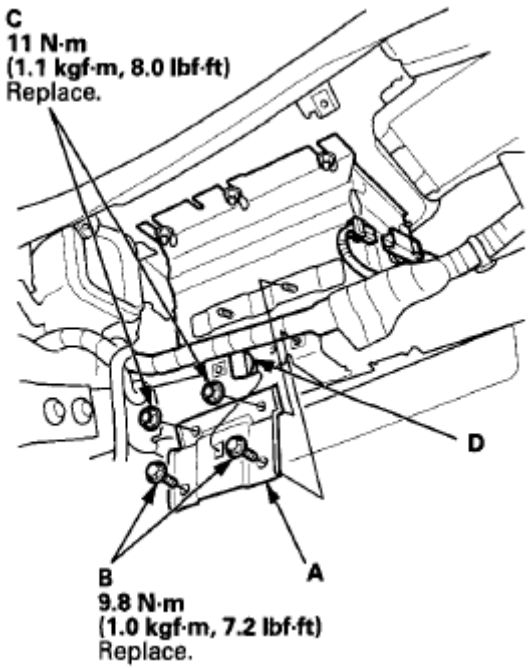

Fig. 222: Installing Bracket With Mounting Bolts And Mounting Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the passenger's dashboard ducts (A, B) with the two screws.

NOTE: Make sure the passenger's dashboard ducts are connected securely.

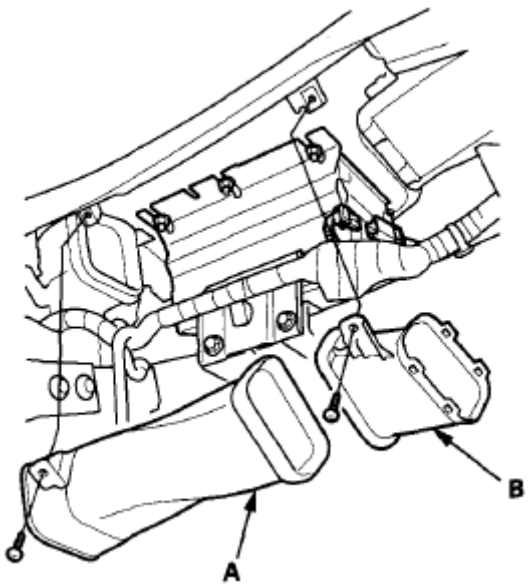

Fig. 223: Identifying Passenger's Dashboard Ducts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Connect the dashboard wire harness 4P connector (A) to the front passenger's airbag 4P connector, then reinstall the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).

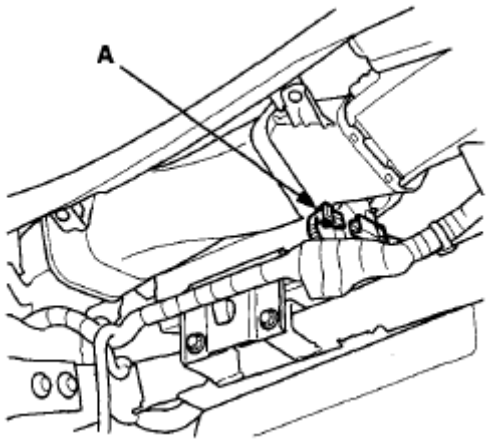

Fig. 224: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
6. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
7. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
8. After installing the front passenger's airbag, confirm proper system operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SIDE AIRBAG REPLACEMENT

NOTE: If replacing the side airbag after deployment, refer to COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT for a complete list of other parts that must also be replaced.

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the front seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
3. Detach the clips (A) and harness holder (B) of side airbag harness from the seat cushion frame.

Driver's Seat With Seat Ventilation

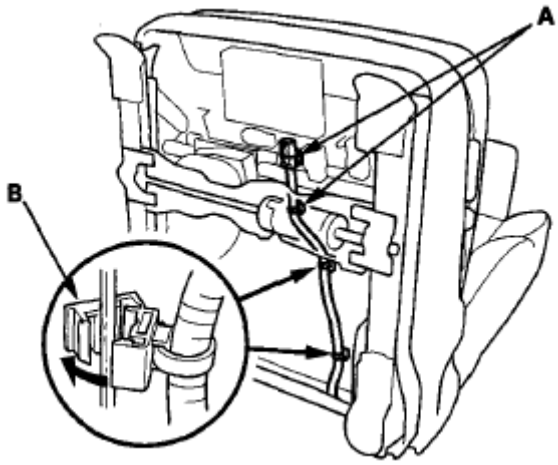

Fig. 225: Detaching Clips And Harness Holder Of Side Airbag Harness From Seat Cushion Frame (Driver's Seat With Seat Ventilation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driver's Seat Without Seat Ventilation

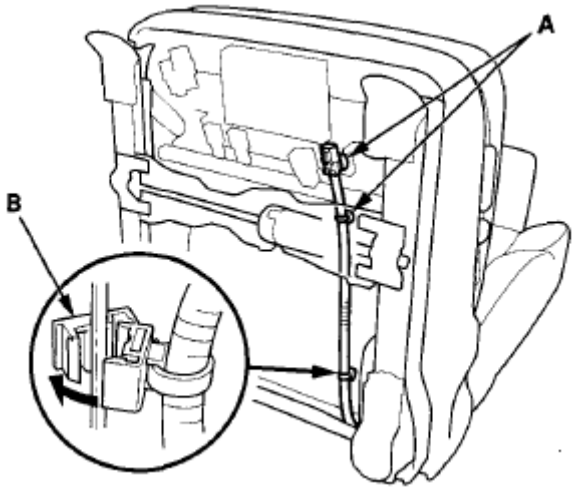

Fig. 226: Detaching Clips And Harness Holder Of Side Airbag Harness From Seat Cushion Frame (Driver's Seat Without Seat Ventilation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Front Passenger's Seat A

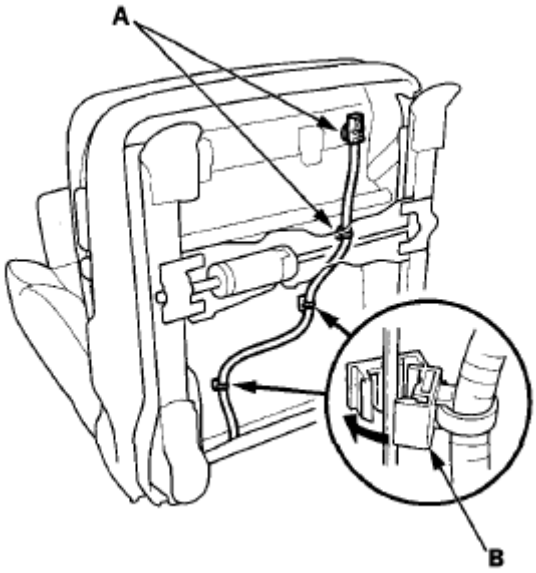

Fig. 227: Detaching Clips And Harness Holder Of Side Airbag Harness From Seat Cushion Frame (Front Passenger's Seat)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the front seat back panel (see **FRONT SEAT-BACK COVER REPLACEMENT**).
5. Turn over the seat-back cover/pad to gain access to the side airbag (see **FRONT SEAT-BACK COVER REPLACEMENT**).
6. Release airbag attachment wire B from airbag attachment wire A and seat-back frame (C).

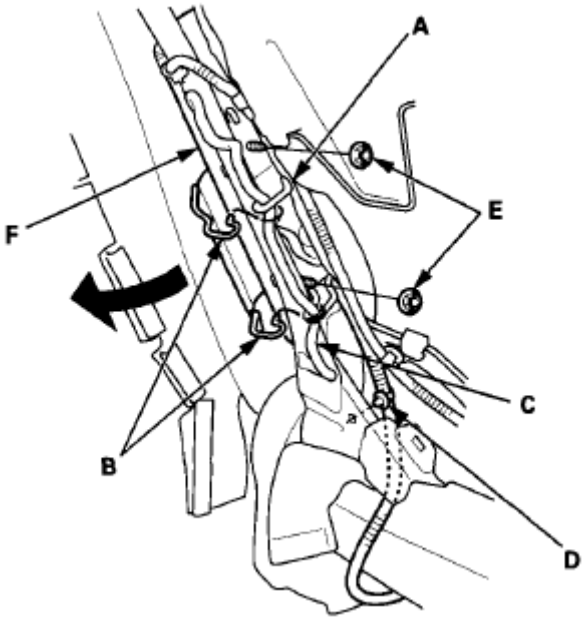

Fig. 228: Releasing Airbag Attachment Wire From Airbag Attachment Wire And Seat-Back Frame
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Detach the clip (D). Pull out the side airbag harness in the seat-back cover, then remove the two mounting nuts (E) and the side airbag (F).

INSTALLATION

NOTE:

- **If the side airbag lid is secured with tape, remove the tape.**
- **Do not open the lid on the side airbag cover.**
- **If you are replacing a deployed airbag, replace the attachment wire A and B.**
- **Make sure that the seat-back cover/pad is installed properly. Improper installation may prevent proper deployment.**
- **Be sure to install the harness so that they are not pinched or interfering with other parts.**

1. Place the side airbag (C) on the seat-back frame. Install the two new side airbag mounting nuts (D) to the specified torque.

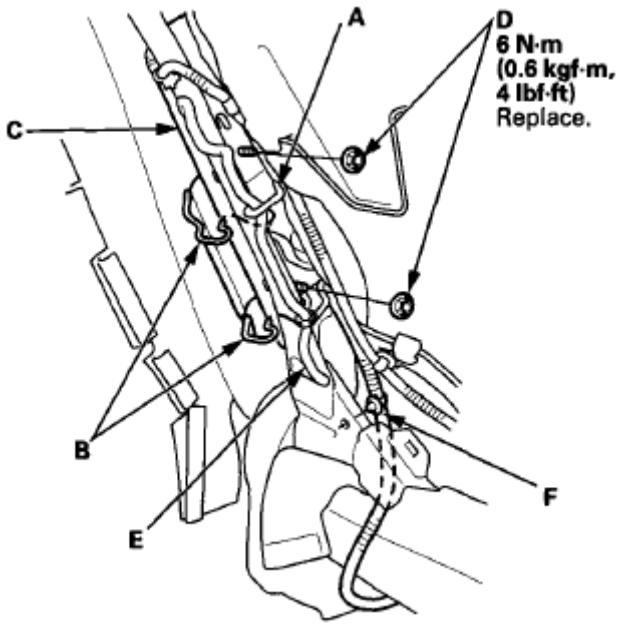

Fig. 229: Identifying Wire A And B, Side Airbag And Side Airbag Mounting Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install airbag attachment wire B in airbag attachment wire A and the seat-back frame (E).

NOTE: **Make sure airbag attachment wires A, B are installed in the reinforcing cloths correctly (see FRONT SEAT-BACK COVER REPLACEMENT).**

3. Install the side airbag harness into the seat-back cover, then install the clip (F).

4. Reinstall the seat-back cover/pad in the reverse order of removal (see **FRONT SEAT-BACK COVER REPLACEMENT**).
5. Install the front seat back panel (see **FRONT SEAT-BACK COVER REPLACEMENT**).
6. Install the clips (A) and harness holder (B) of side airbag harness to seat cushion frame.

Driver's Seat With Seat Ventilation

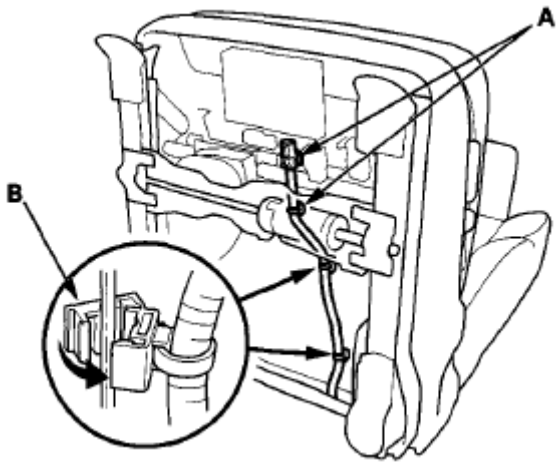

Fig. 230: Installing Clips And Harness Holder Of Side Airbag Harness To Seat Cushion Frame (Driver's Seat With Seat Ventilation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driver's Seat Without Seat Ventilation

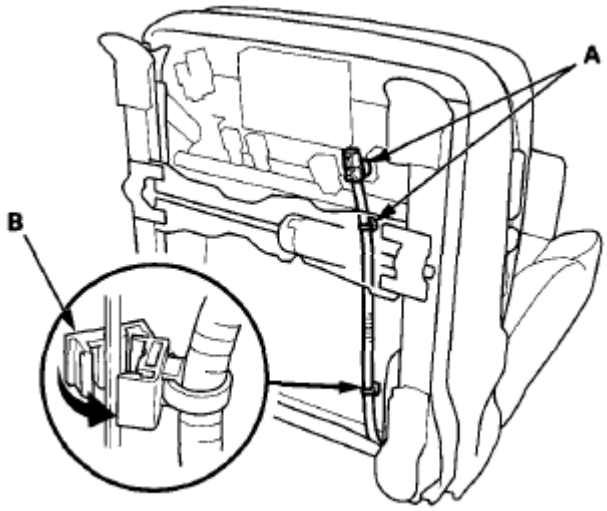

Fig. 231: Installing Clips And Harness Holder Of Side Airbag Harness To Seat Cushion Frame (Driver's Seat Without Seat Ventilation)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Front Passenger's Seat A

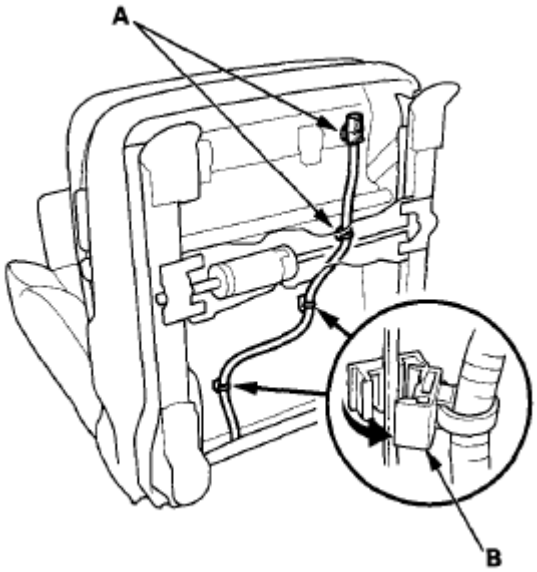

Fig. 232: Installing Clips And Harness Holder Of Side Airbag Harness To Seat Cushion Frame (Front Passenger's Seat)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the front seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
8. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
9. Move the front seat and the seat-back through their full ranges of movement, making sure the harness are not pinched or interfering with other parts.
10. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. After installing the side airbag, confirm proper system operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SIDE CURTAIN AIRBAG REPLACEMENT

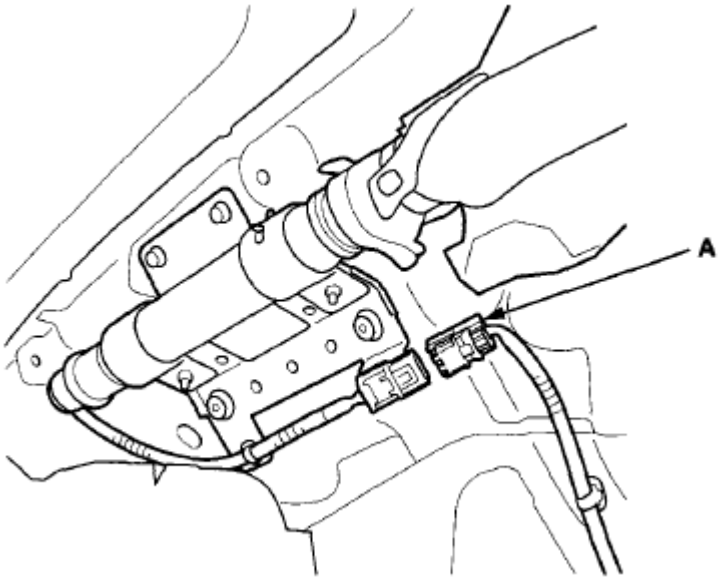
REMOVAL

NOTE:

- **If replacing the side curtain airbag after deployment, refer to COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT for a complete list of other parts that must also be replaced.**
- **Review the interior trim replacement procedure before doing repair or service (see COMPONENT LOCATION INDEX).**
- **Removal of the side curtain airbag must be done according to Precaution and Procedures (see PRECAUTIONS AND PROCEDURES).**

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.

2. Remove the headliner (see **HEADLINER REMOVAL/INSTALLATION**).
3. Disconnect the SRS floor wire harness 2P connector (A) from the side curtain airbag 2P connector.



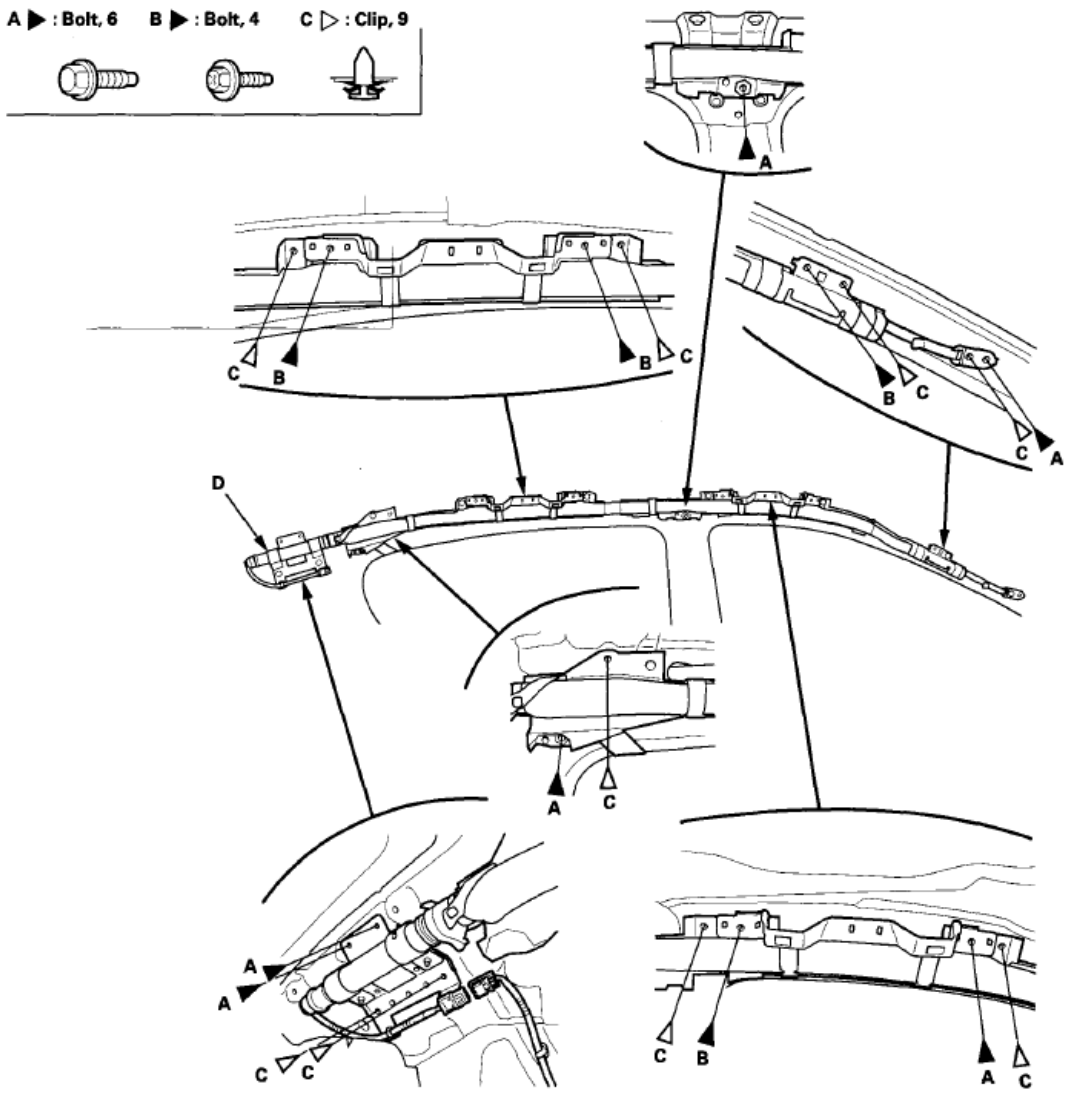


Fig. 233: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Left side shown; right side is similar.

4. Remove the side curtain mounting bolts (A) and mounting bolts (B) from the bracket. Detach the clips (C), then remove the side curtain airbag (D).

Left side shown; right side is similar.

Fig. 234: Removing Side Curtain Mounting Bolts And Mounting Bolts From Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

NOTE:

- **If replacing the side curtain airbag after deployment, refer to COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT for a complete list of other parts that must also be replaced.**
- **Installation of the side curtain airbag must be done according to precautions and procedures (see PRECAUTIONS AND PROCEDURES).**
- **If the side curtain airbag is frayed, or has any other visible damage, replace it. Do not attempt to repair an airbag.**
- **When you install the airbag, make sure it is not twisted, and that it is not caught between the inflator bracket by the bracket bolts.**

- **Make sure that the side curtain airbag inflator retainer is installed properly. Otherwise the airbag could incorrectly deploy and cause damage or injuries.**
- **If there is any damage to the side curtain airbag, do not try to repair it. Replace any damaged side curtain airbag.**

1. Place the side curtain airbag assembly on the side of the roof, and fit its clips (A) into the holes in the body. Tighten the mounting bolts (B) and the new side curtain airbag mounting bolts (C) to the specified torque.

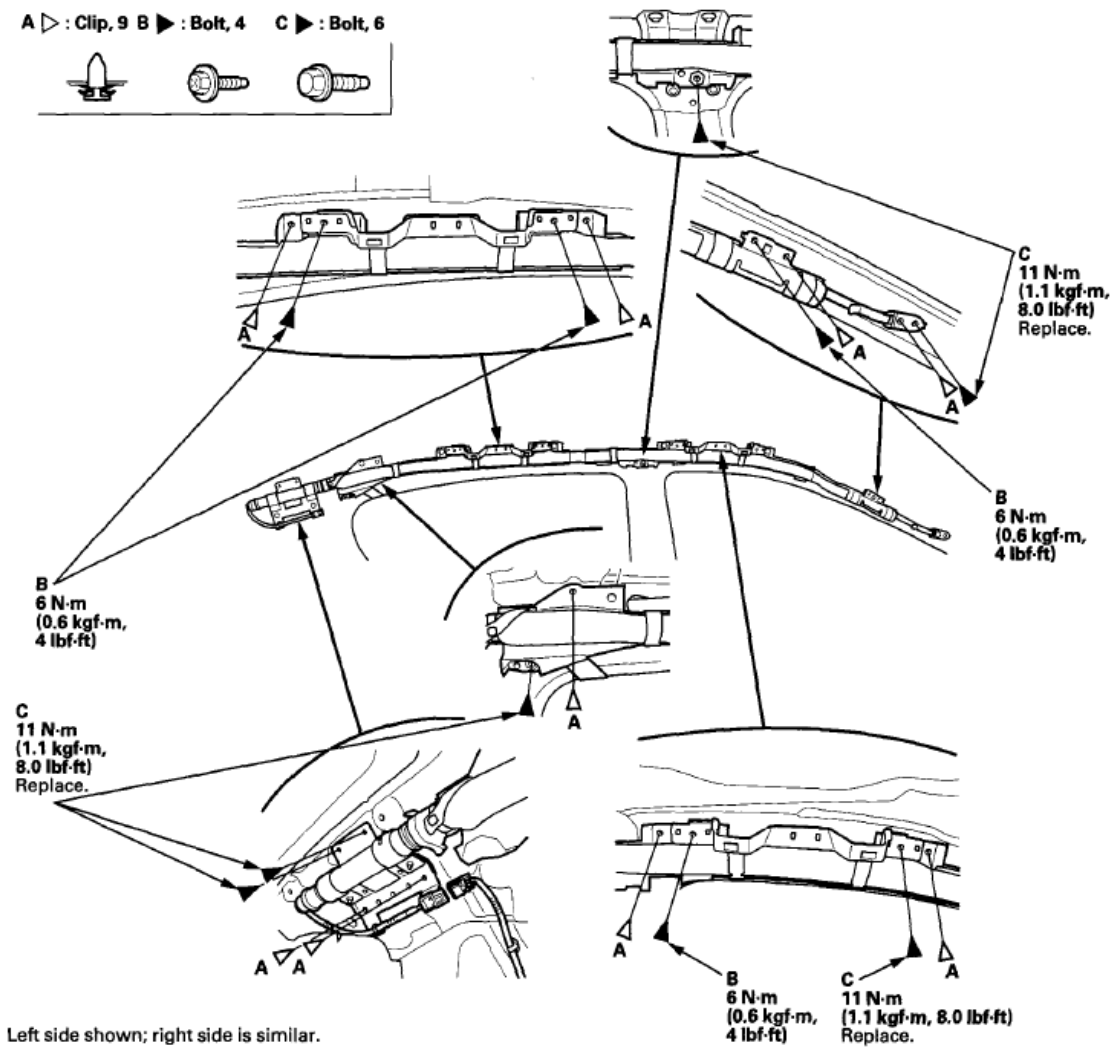

Fig. 235: Identifying Clips, Mounting Bolts And Side Curtain Airbag Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the SRS floor wire harness 2P connector (A) to the side curtain airbag 2P connector.

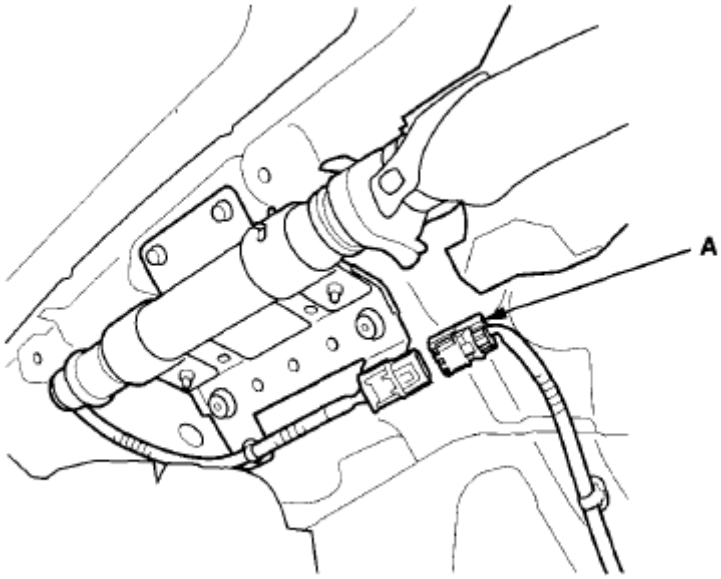

Fig. 236: Identifying SRS Floor Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. After installing the side curtain airbag, confirm proper system operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.
6. Install all removed parts in reverse order of removal. If the clips are stress-whitened, replace them with new ones.
7. Confirm proper headliner/pillar trim overlap (see **CHECKING AND ADJUSTING THE HEADLINER/PILLAR TRIM OVERLAP**).

AIRBAG AND TENSIONER DISPOSAL

Special Tools Required

Deployment Tool 07AAZ-000A100

Before scrapping any front airbags, side airbags, side curtain airbags, and front seat belt tensioners (including those in a whole vehicle to be scrapped), the part(s) must be deployed. If the vehicle is still within the warranty period, the Acura District Parts and Service Manager must give approval and/or special instruction before deploying the part(s). Only after the part(s) have been deployed (as the result of vehicle collision, for example), can they be scrapped. If the parts appear intact (not deployed), treat them with extreme caution. Follow this procedure.

DEPLOYING AIRBAGS IN THE VEHICLE

If an SRS equipped vehicle is to be entirely scrapped, its front airbags, side airbags, side curtain airbags, and front seat belt tensioners should be deployed while still in the vehicle. These parts should not be considered as salvageable parts and should never be installed in another vehicle.

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes.
2. Confirm that each front airbag, side airbag, side curtain airbag, or front seat belt tensioner is securely mounted.
3. Confirm that the deployment tool is functioning properly by following the check procedure on the tool label.

Driver's Airbag

4. Remove the access panel (A) from the steering wheel, then disconnect the cable reel 4P connector (B) from the driver's airbag 4P connector.

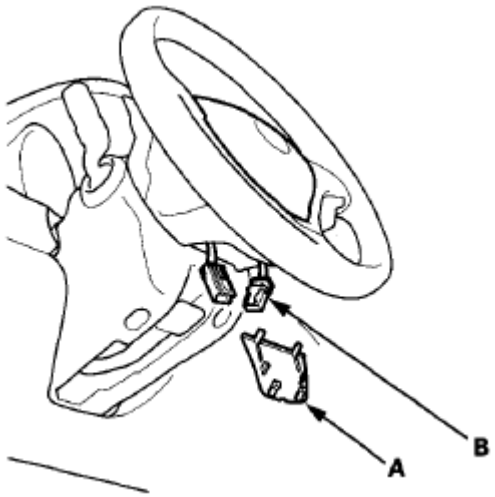

Fig. 237: Identifying Access Panel And Cable Reel 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Front Passenger's Airbag

5. Remove the glove box (see **GLOVE BOX REMOVAL/INSTALLATION**).
6. Disconnect the dashboard wire harness 4P connector (A) from the front passenger's airbag 4P connector.

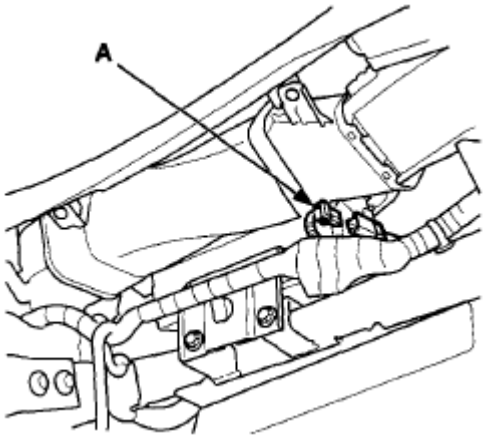

Fig. 238: Identifying Dashboard Wire Harness 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Airbag

7. Disconnect the SRS floor wire harness 2P connectors (A) from the driver's and the front passenger's side airbag 2P connectors.

Fig. 239: Identifying SRS Floor Wire Harness 2P Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Side Curtain Airbag

8. Remove the C-pillar trim (see **C-PILLAR TRIM**).
9. Disconnect the SRS floor wire harness 2P connectors (A) from the left and right side curtain airbag 2P connectors.

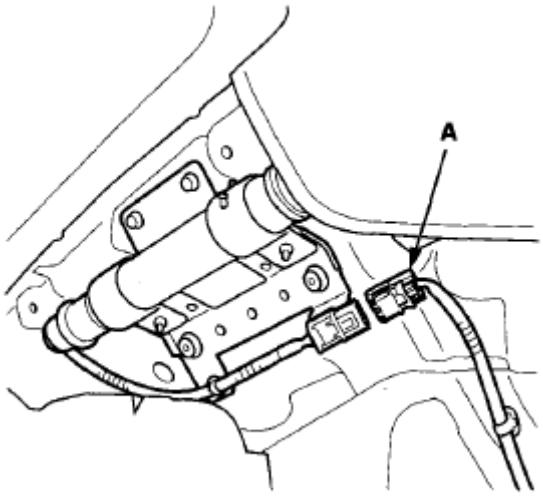

Fig. 240: Identifying SRS Floor Wire Harness 2P Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Front Seat Belt Tensioner

10. Remove the B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
11. Disconnect the SRS floor wire harness 4P connectors (A) from the driver's and the front passenger's seat belt tensioner 4P connectors. Pull the seat belt out all the way and cut it.

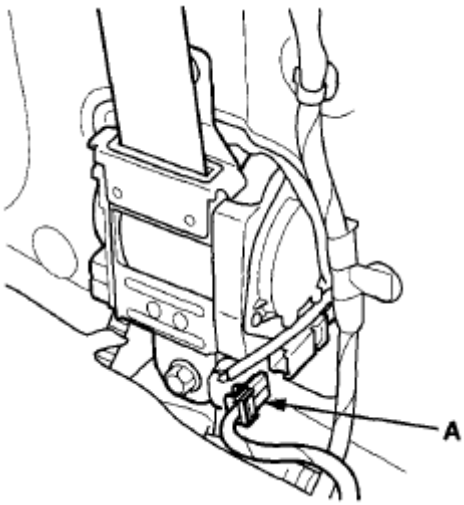

Fig. 241: Identifying SRS Floor Wire Harness 4P Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Cut off each connector, and strip the ends of the wires. Twist each pair of unlike colored wires together, and clip an alligator clip (A) from the deployment tool to each pair.

NOTE:

- **Place the deployment tool at least 10 m (33 ft) away from the vehicle.**
- **The driver's and the front passenger's airbags have dual inflators.**

Twist each pair of unlike colored wires together, and clip an alligator clip to each pair.

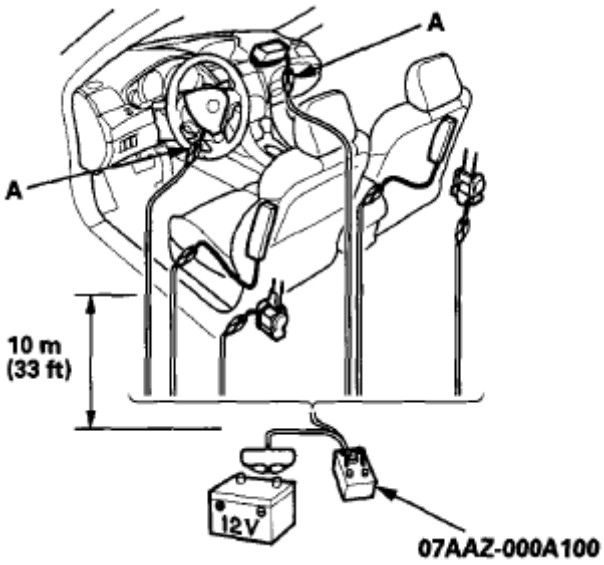

Fig. 242: Identifying Alligator Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

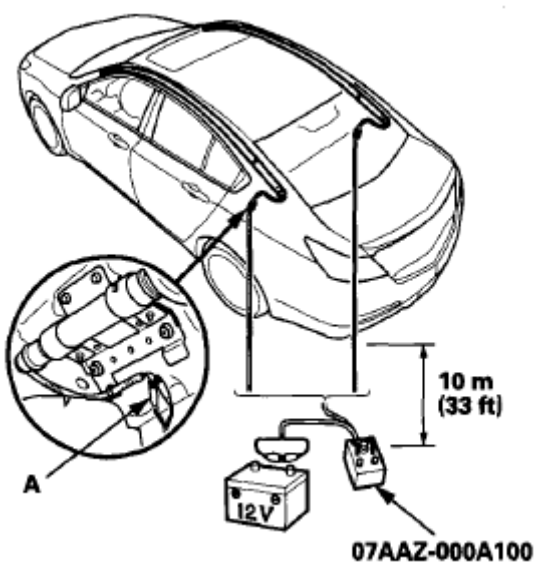

Fig. 243: Identifying Alligator Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Connect a 12 V battery to the tool.
    - If the green light on the tool comes on, the igniter circuit is defective and cannot deploy the component. Go to **DISPOSAL OF DAMAGED COMPONENTS**.
    - If the red light on the tool comes on, the component is ready to be deployed.

14. Push the tool's deployment switch. The airbags and tensioners should deploy (deployment is both highly audible and visible: A loud noise and rapid inflation of the bag, followed by slow deflation).
    - If the components deploy and the green light on the tool comes on, continue with this procedure.
    - If a component does not deploy, and the green light comes on, its igniter is defective. Go to **DISPOSAL OF DAMAGED COMPONENTS**.
    - During deployment, the airbags can become hot enough to burn you. Wait for 30 minutes after deployment before touching the airbags.
15. Dispose of the complete airbag or tensioner. No part of it can be reused. Place it in a sturdy plastic bag (A), and seal it securely. Dispose of the deployed airbag according to your local regulations.

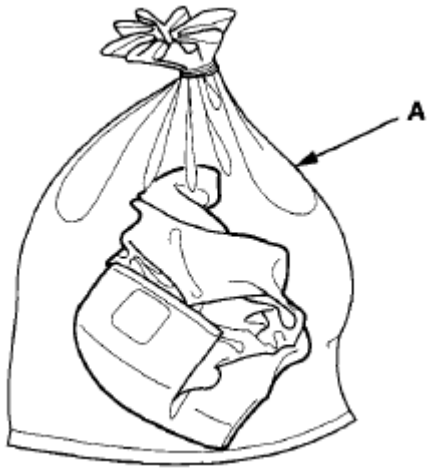

Fig. 244: Disposing Of Deployed Airbag
Courtesy of AMERICAN HONDA MOTOR CO., INC.

DEPLOYING COMPONENTS OUT OF THE VEHICLE

If an intact airbag or tensioner has been removed from a scrapped vehicle, or has been found defective or damaged during transit, storage, or service, it should be deployed as follows:

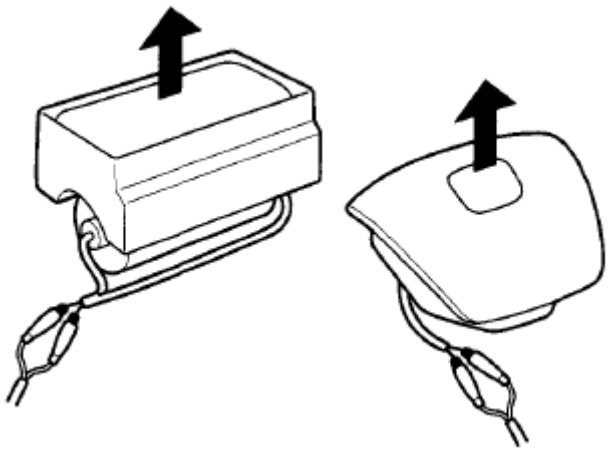

Fig. 245: Removing Airbag From Scrapped Vehicle

Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Confirm that the deployment tool is functioning properly by following the check procedure Deploying Airbags in the Vehicle on the tool label.
2. Position the airbag face up, outdoors, on flat ground, at least 10 m (33 ft) from any obstacles or people.
3. Follow steps 12 through 15 of the Deploying Airbag in the Vehicle.

NOTE: The driver's and the front passenger's airbags have dual inflators. Twist each pair of unlike colored wires together, and clip an alligator clip to each pair.

DISPOSAL OF DAMAGED COMPONENTS

1. If installed in a vehicle, follow the removal procedure for the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**), the front passenger's airbag (see **FRONT PASSENGER'S AIRBAG REPLACEMENT**), the side airbag (see **SIDE AIRBAG REPLACEMENT**), the side curtain airbag (see **SIDE CURTAIN AIRBAG REPLACEMENT**), and the front seat belt tensioner (see **FRONT SEAT BELT REPLACEMENT**).
2. In all cases, make a short circuit by cutting, stripping, and twisting together the two inflator wires.

NOTE: The driver's and front passenger's airbags have dual inflators. The like color wires go to the individual inflators. Twist the like colored wires together.

3. Package the component in exactly the same packaging that the new replacement part came in.
4. Mark the outside of the box DAMAGED AIRBAG NOT DEPLOYED, DAMAGED SIDE AIRBAG NOT DEPLOYED, DAMAGED SIDE CURTAIN AIRBAG NOT DEPLOYED, or DAMAGED SEAT BELT TENSIONER NOT DEPLOYED so it does not get confused with your parts stock.
5. Contact your Acura District Parts and Service Manager for instructions on how and where to return it for disposal.

DEPLOYMENT TOOL CHECK

1. Connect the yellow clips to both switch protector handles on the tool.
2. Then connect the red lead to the positive battery post and the black lead to the negative battery post.
3. Push the operation switch: The green light should come on, indicating that the tool is operating properly and is ready for use. If the red light stays on, the tool is faulty, and another one must be used for the procedure.
4. Disconnect the tool clips and connectors from the protector handles and the battery.

CABLE REEL REPLACEMENT

REMOVAL

1. Set the front wheels in the straight ahead position.

2. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
3. Remove the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).
4. Disconnect the cable reel subharness 20P connector (A) from the cable reel.

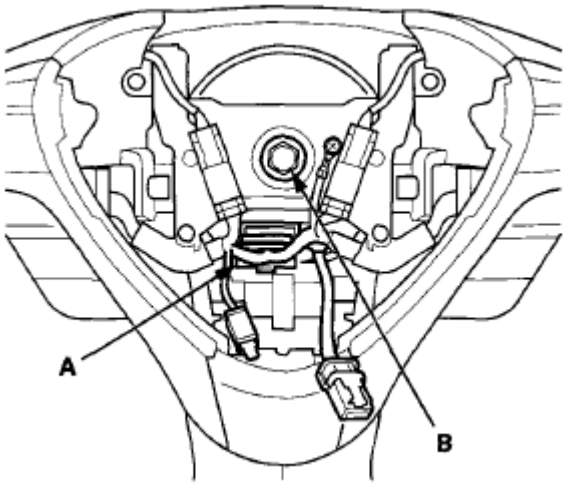

Fig. 246: Identifying Cable Reel Subharness 20P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Loosen the steering wheel bolt (B) three turns.
6. Install a commercially available steering wheel puller on the steering wheel (see **STEERING WHEEL REMOVAL**).
7. Remove the steering wheel puller, then remove the steering wheel bolt and steering wheel from the steering column.
8. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
9. Disconnect the dashboard wire harness 4P connector (A) from the cable reel 4P connector (B), then disconnect the dashboard wire harness 20P connector (C) from the cable reel (D).

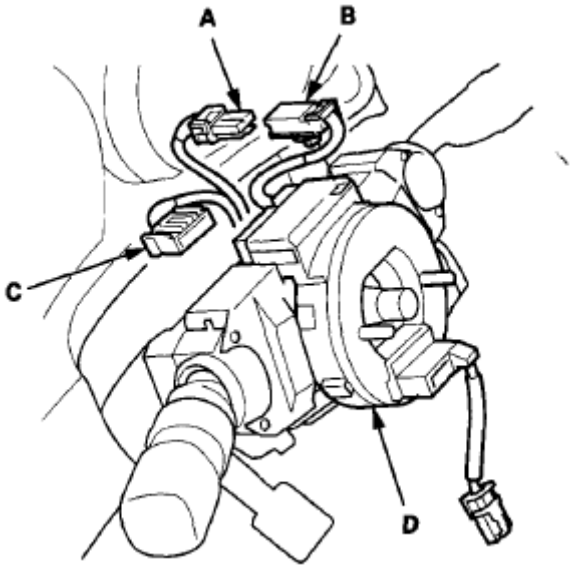

Fig. 247: Identifying Dashboard Wire Harness 4P Connector, Cable Reel 4P Connector And Dashboard Wire Harness 20P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Release the upper lock tab (A) under the cable reel connector with a 90 ° hook shaped tool (B). Slide the tool below the cable reel connector just above the lock tab. Release the lower lock tab (C), and slide the cable reel off the column.

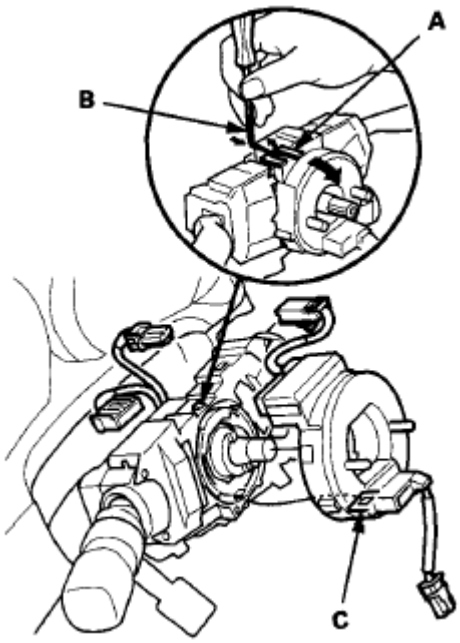

Fig. 248: Releasing Upper Lock Tab Under Cable Reel Connector With 90 ° Hook Shaped Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Before installing the steering wheel, make sure the front wheels are aligned straight ahead.
2. Set the turn signal canceling sleeve (A) so that the projections (B) are aligned vertically.

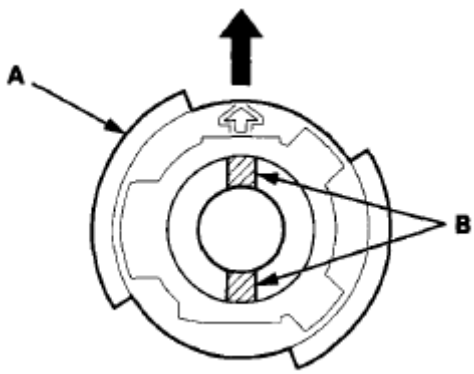

Fig. 249: Setting Turn Signal Canceling Sleeve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Carefully install the cable reel (A) on the steering column shaft. Then connect the dashboard wire harness 20P connector (B) to the cable reel, and connect the cable reel 4P connector (C) to the dashboard wire harness 4P connector (D).

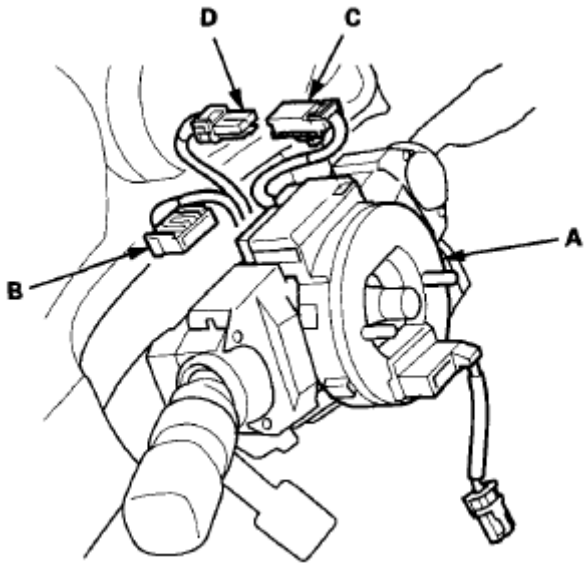

Fig. 250: Identifying Cable Reel, Dashboard Wire Harness 20P Connector And Cable Reel 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
5. Before installing the steering wheel, make sure the front wheels are pointing straight ahead, then center the cable reel (A). Do this by first rotating the cable reel clockwise until it stops. Then rotate it counterclockwise (about three turns) until the arrow mark (B) on the cable reel label points straight up.

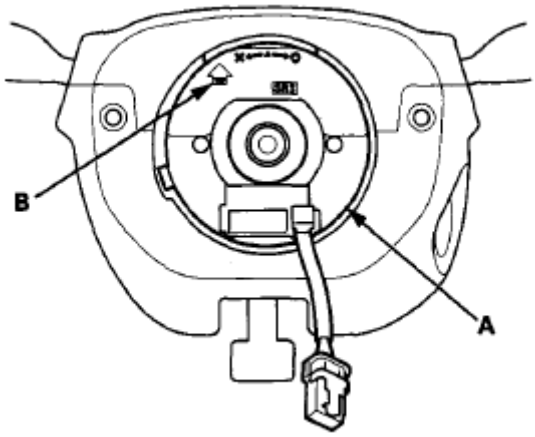

Fig. 251: Identifying Center Cable Reel And Arrow Mark
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Position the two tabs (A) of the turn signal canceling sleeve (B) as shown. Install the steering wheel on to the steering column shaft, making sure the steering wheel hub (C) engages the pins (D) of the cable reel and tabs of the turn signal canceling sleeve. Do not tap on the steering wheel or steering column shaft when installing the steering wheel.

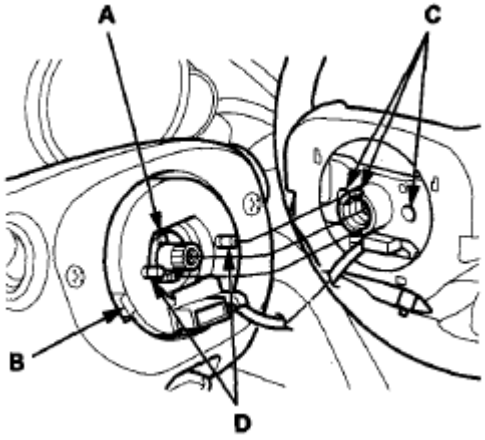

Fig. 252: Positioning Two Tabs Of Turn Signal Canceling Sleeve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the steering wheel bolt (A), and tighten it to the specified torque. Connect the cable reel subharness 20P connector (B). Make sure the wire harness is routed and fastened properly.

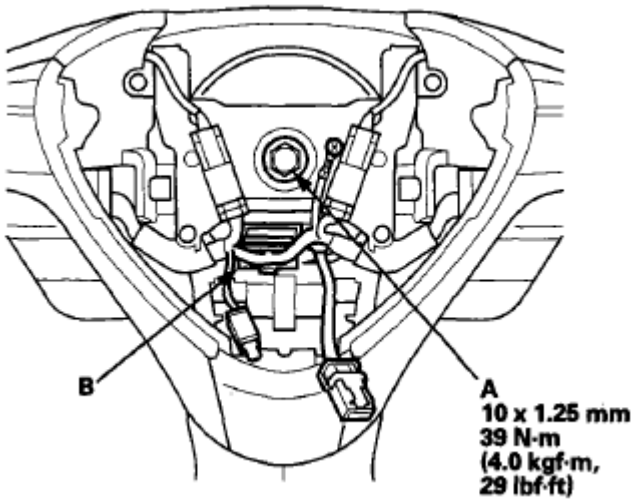

Fig. 253: Identifying Steering Wheel Bolt And Cable Reel Subharness 20P Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the driver's airbag (see **INSTALLATION**).
9. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
10. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
11. After installing the cable reel, confirm proper system operation:
    - Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.
    - Make sure the horn and turn signal switches works properly.
    - Make sure the steering wheel switches works properly.
    - Make sure the horn works properly.
12. After installation, check the steering wheel spoke angle. If the steering spoke angles to the right and left are not equal (steering wheel is not centered), correct the engagement of the wheel/column shaft splines.

SRS UNIT REPLACEMENT

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
3. Detach the clip (A), then pull down on the center heater joint duct (B) to remove it.

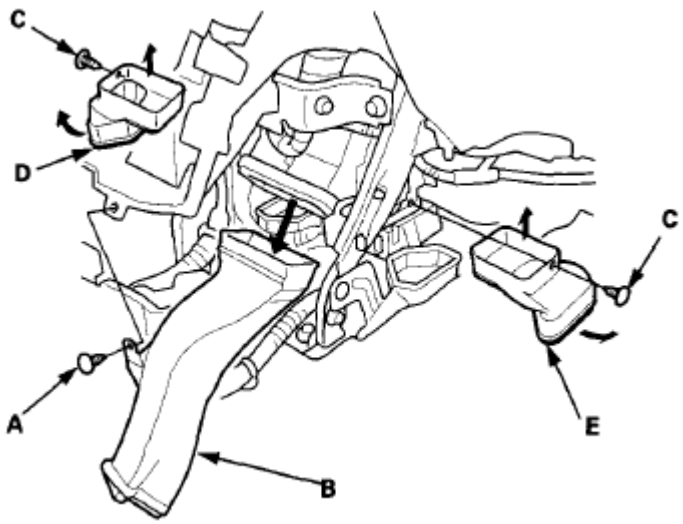

Fig. 254: Detaching Clip And Pull Down On Center Heater Joint Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the clips (C), then remove the left and right heater ducts (D, E).
5. Remove the two screws from the driver's side center console clip bracket (A), then remove the bracket.

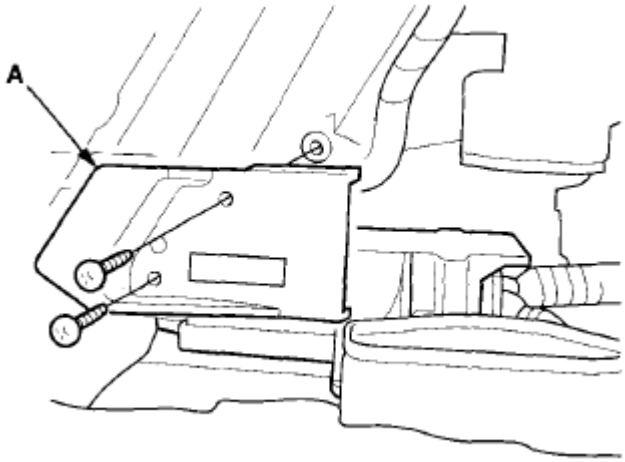

Fig. 255: Identifying Driver's Side Center Console Clip Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the TORX bolt (A) using a TORX T30 bit.

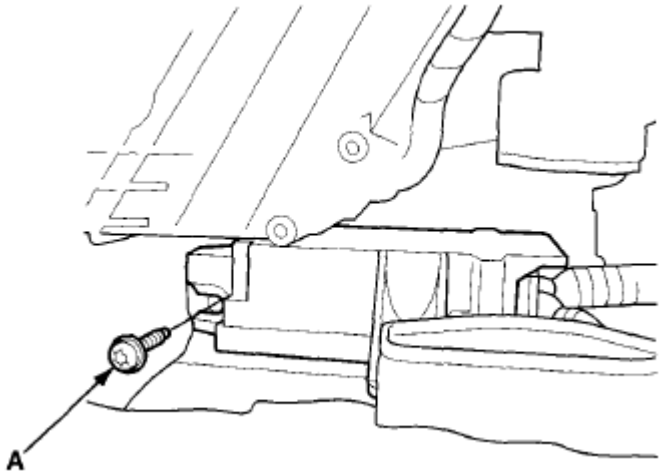

Fig. 256: Identifying Torx Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect SRS unit connectors A (39P) and B (39P) from the SRS unit (C).

NOTE: The SRS unit connectors have lever locks. Release the locks before disconnecting the connectors (see SPRING-LOADED LOCK CONNECTOR).

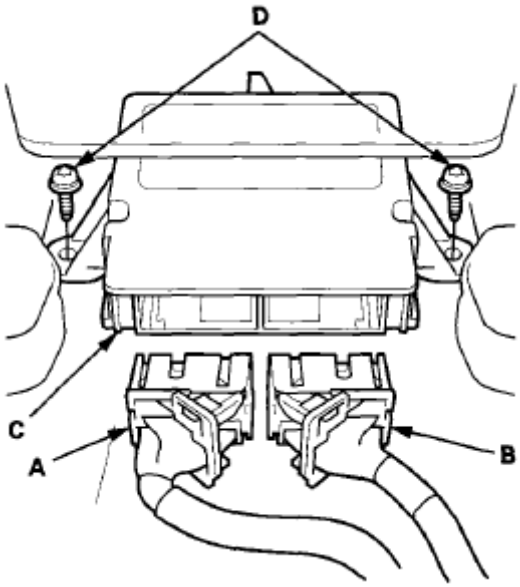

Fig. 257: Identifying SRS Unit Connectors (39P) And (39P) And SRS Unit
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the TORX bolts (D) using a TORX T30 bit, then remove the SRS unit from the driver's side.

INSTALLATION

1. Install the SRS unit (A) with the new TORX bolt (B) using a TORX T30 bit.

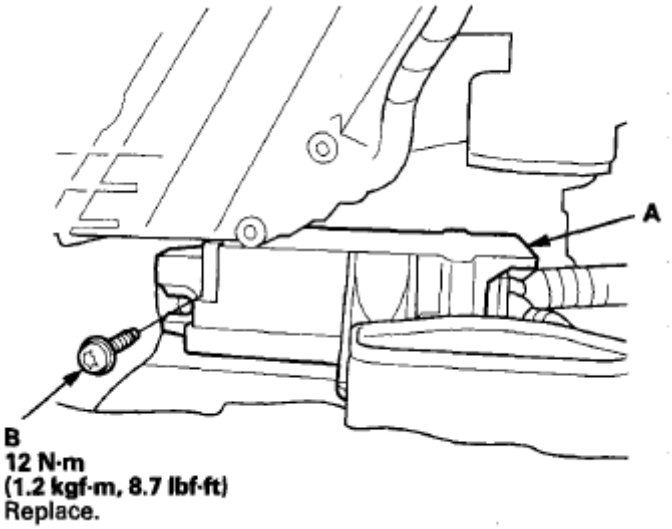

Fig. 258: Identifying SRS Unit And Torx Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the new TORX bolts (C) using a TORX T30 bit.

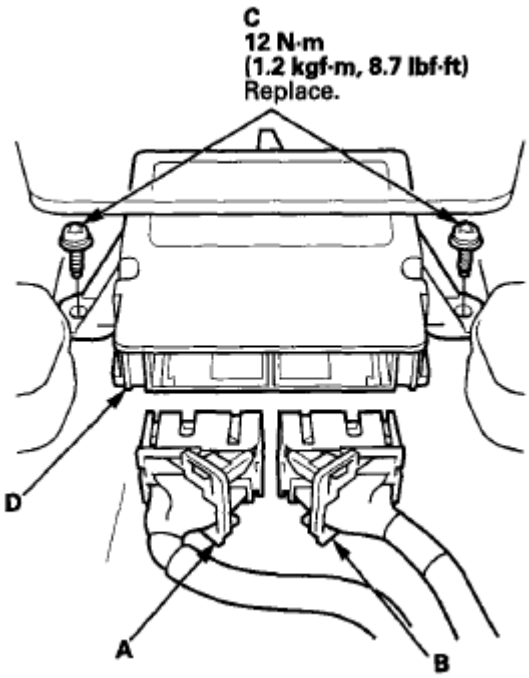

Fig. 259: Installing Torx Bolts Using Torx T30 Bit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Connect the SRS connectors A (39P) and B (39P) to the SRS unit (D); push them into position until they click and the lever locks are fully secured (see **LEVER-LOCKED CONNECTOR**).

4. Tighten the three installed TORX bolt to the specified torque.
5. Install the driver's side center console clip bracket (A) with the two screws.

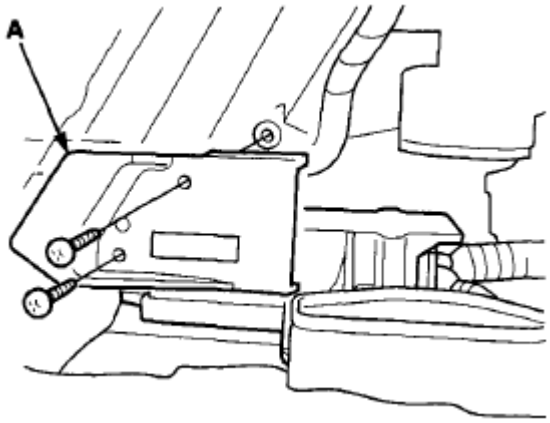

Fig. 260: Identifying Driver's Side Center Console Clip Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the left and right heater joint ducts (A, B), then push the clips (C).

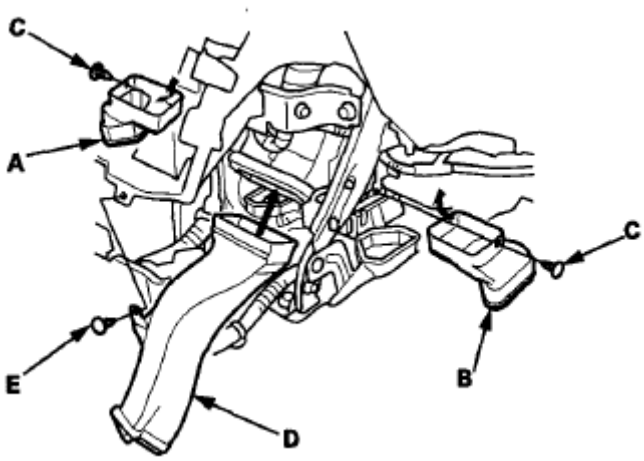

Fig. 261: Identifying Left And Right Heater Joint Ducts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the center heater joint duct (D), then push the clips (E).
8. Make sure the heater joint ducts are installed securely.
9. Install the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
10. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
11. Make sure the SRS unit has the latest software. If it does not have the latest, update the software in the SRS unit (see **SRS UNIT UPDATE**).
12. Do the ODS unit initialization (see **ODS UNIT INITIALIZATION**).

13. Check the operation of the ODS unit with the HDS (see **ODS UNIT OPERATION CHECK**).
14. Confirm proper SRS operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SIDE IMPACT SENSOR (FIRST) REPLACEMENT

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).
3. Disconnect the SRS floor wire harness 4P connector (A) from the side impact sensor (first) (B).

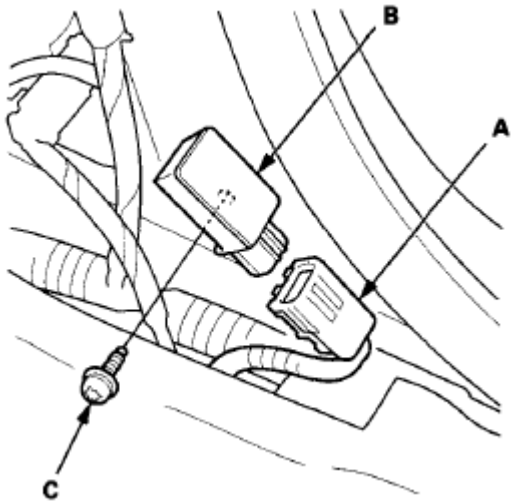

Fig. 262: Disconnecting SRS Floor Wire Harness 4P Connector From Side Impact Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the TORX bolt (C) using a TORX T30 bit, then remove the side impact sensor (first).

INSTALLATION

1. Install the side impact sensor (first) (A) with the new TORX bolt (B) using a TORX T30 bit, and tighten the TORX bolt to the specified torque.

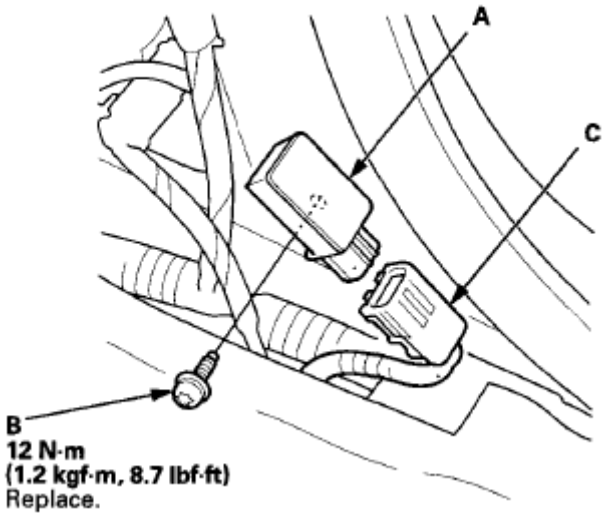

Fig. 263: Installing Side Impact Sensor With Torx Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the SRS floor wire harness 4P connector (C) to the side impact sensor (first).
3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. Confirm proper SRS operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.
6. Install the B-pillar lower trim (see **B-PILLAR UPPER/LOWER TRIM**).

SIDE IMPACT SENSOR (SECOND) REPLACEMENT

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the rear seat (see **REAR SEAT REMOVAL/INSTALLATION**).
3. Disconnect the SRS floor wire harness 2P connector (A) from the side impact sensor (second) (B).

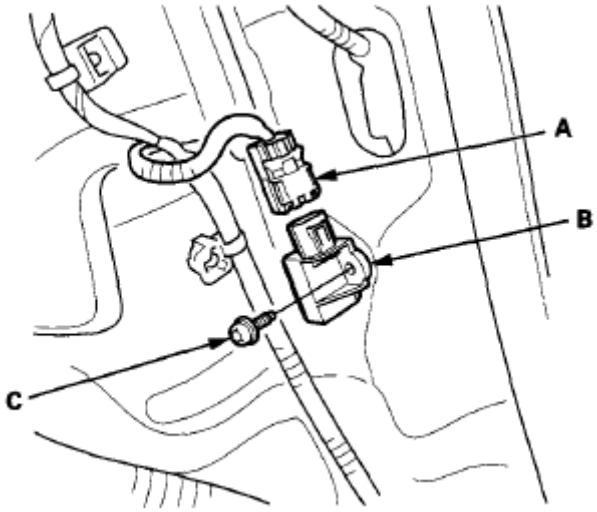

Fig. 264: Identifying SRS Floor Wire Harness 2P Connector And Side Impact Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the TORX bolt (C) using a TORX T30 bit, then remove the side impact sensor (second).

INSTALLATION

1. Install the side impact sensor (second) (A) with the new TORX bolt (B) using a TORX T30 bit, and tighten the TORX bolt to the specified torque.

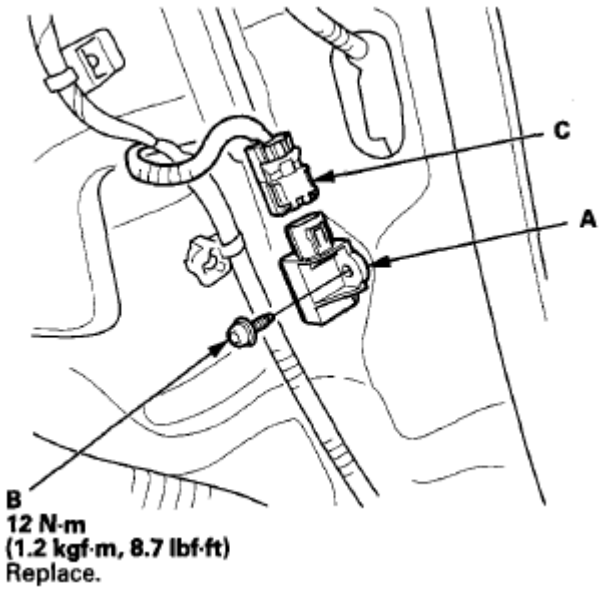

Fig. 265: Installing Side Impact Sensor With Torx Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the SRS floor wire harness 2P connector (C) to the side impact sensor (second).
3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION**

AND RECONNECTION).

4. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. Confirm proper SRS operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.
6. Install the rear seat (see **REAR SEAT REMOVAL/INSTALLATION**).

REAR SAFING SENSOR REPLACEMENT

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the rear seat cushion (see **REAR SEAT CUSHION COVER REPLACEMENT**).
3. Disconnect the SRS floor wire harness 2P connector (A) from the rear safing sensor (B).

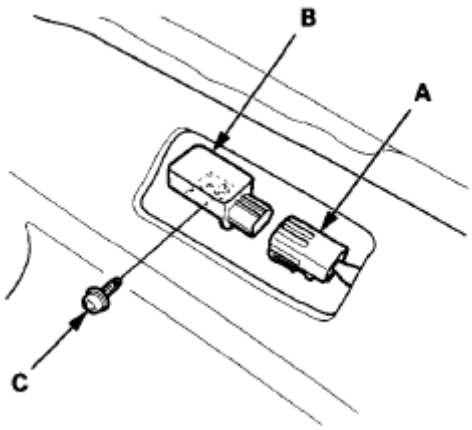

Fig. 266: Disconnecting SRS Floor Wire Harness 2P Connector From Rear Safing Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the TORX bolt (C) using a TORX T30 bit, then remove the rear safing sensor.

INSTALLATION

1. Install the rear safing sensor (A) with the new TORX bolt (B) using a TORX T30 bit, and tighten the TORX bolt to the specified torque.

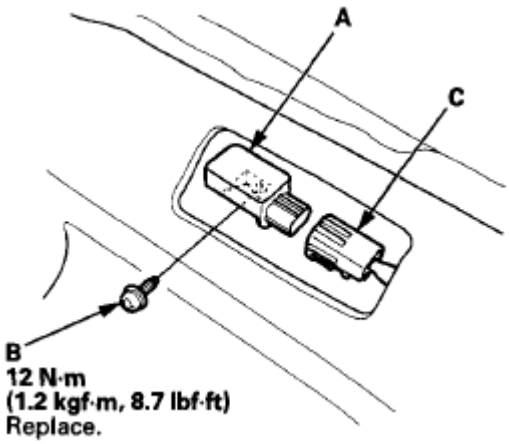

Fig. 267: Identifying Rear Safing Sensor And Torx Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the SRS floor wire harness 2P connector (C) to the rear safing sensor.
3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. Confirm proper SRS operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.
6. Install the rear seat cushion (see **REAR SEAT CUSHION COVER REPLACEMENT**).

FRONT PASSENGER'S WEIGHT SENSOR REPLACEMENT

REMOVAL

NOTE:

- **Removal of the front passenger's weight sensors must be done according to Precautions and Procedures (see PRECAUTIONS AND PROCEDURES).**
- **The front passenger's weight sensors is part of the seat frame and must be replaced as assembly.**

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT SEAT FRAME REPLACEMENT**).

INSTALLATION

NOTE:

- **Be sure to install the harness wires so they are not pinched or interfering with other parts.**
- **The front passenger's weight sensor are part of the seat frame and must be replaced as assembly.**

1. Install the removed parts to the new the front passenger's seat frame/front passenger's weight sensors as an assembly (see **FRONT SEAT FRAME REPLACEMENT**).
2. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
3. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
4. Do the front passenger's weight sensor initialization (see **FRONT PASSENGER'S WEIGHT SENSOR INITIALIZATION**).
5. Confirm proper SRS operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

ODS UNIT REPLACEMENT

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the front passenger's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
3. Remove the front seat back panel (see **FRONT SEAT-BACK COVER REPLACEMENT**).
4. Turn over the seat-back cover/pad to gain access to the ODS unit (see **FRONT SEAT-BACK COVER REPLACEMENT**).
5. Remove the cover (A), then disconnect the ODS unit 18P connector (B) and the OPDS sensor connectors (C) from the ODS unit (D).

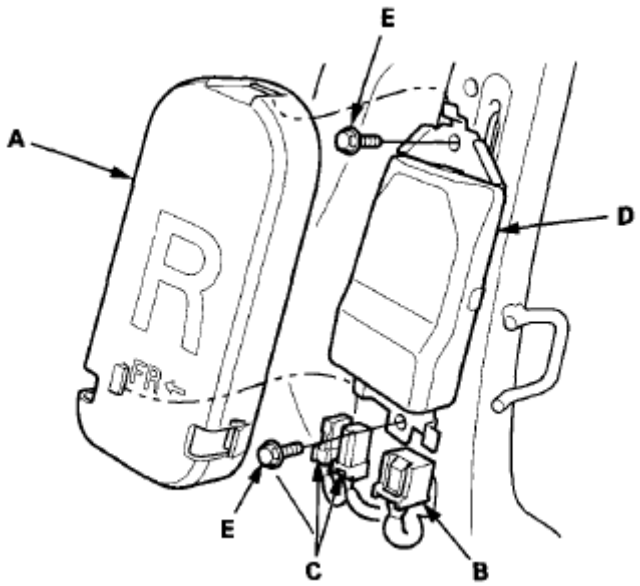

Fig. 268: Identifying Cover, ODS Unit 18P Connector And OPDS Sensor Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the two bolts (E) and the ODS unit.

INSTALLATION

NOTE:

- **Be sure to install the harness so that they are not pinched or interfering with other parts.**
- **Make sure that the seat-back cover/pad is installed properly. Improper installation may prevent proper deployment.**

1. Place the ODS unit (A) on the seat-back frame. Tighten the new two mounting bolts (B) to the specified torque.

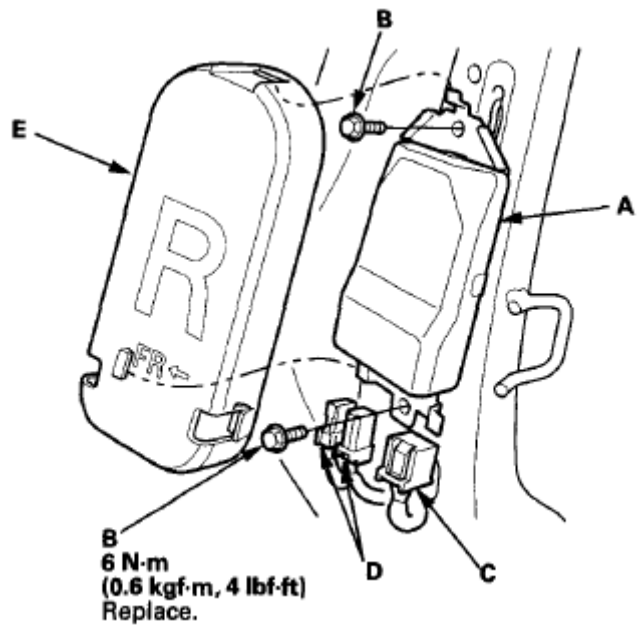

Fig. 269: Identifying ODS Unit And Two Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the ODS unit 18P connector (C) and the OPDS sensor connectors (D) to the ODS unit. Reinstall the cover (E).
3. Install the seat-back cover/pad in the reverse order of removal (see **FRONT SEAT-BACK COVER REPLACEMENT**).
4. Install the front seat back panel (see **FRONT SEAT-BACK COVER REPLACEMENT**).
5. Install the front passenger's seat (see **FRONT SEAT REMOVAL/INSTALLATION**).
6. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
7. Set the seat-back in the normal position, and make sure there is nothing on the front passenger's seat.
8. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
9. Do the ODS unit initialization (see **ODS UNIT INITIALIZATION**).
10. Confirm proper SRS operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

FRONT IMPACT SENSOR REPLACEMENT

REMOVAL

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), then wait at least 3 minutes before starting work.
2. Remove the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).
3. Left side: Detach the clip (A), then remove the bolts (B), then release the intake air resonator (C).

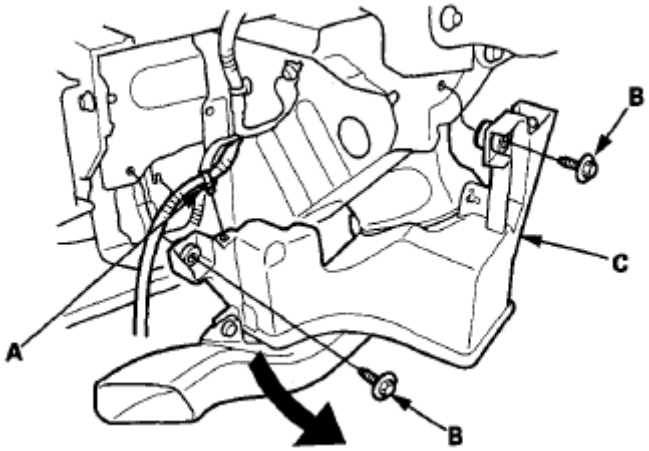

Fig. 270: Removing Bolts And Releasing Intake Air Resonator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the left or right engine compartment wire harness 2P connector (A) from the front impact sensor (B).

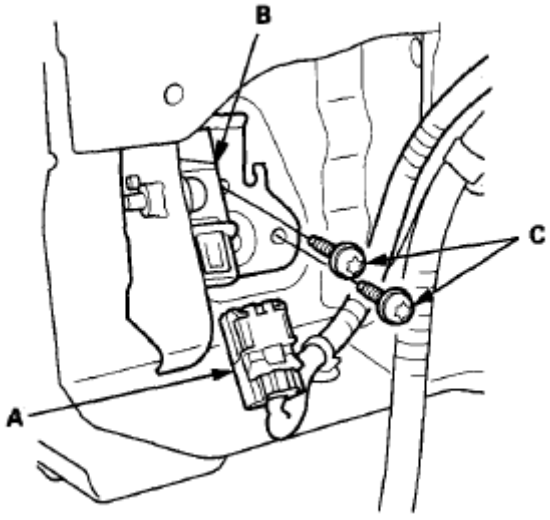

Fig. 271: Identifying Left Or Right Engine Compartment Wire Harness 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the TORX bolts (C) using a TORX T30 bit, then remove the front impact sensor.

INSTALLATION

1. Install the front impact sensor (A) with the new TORX bolt (B) using a TORX T30 bit, and tighten the TORX bolt to the specified torque.

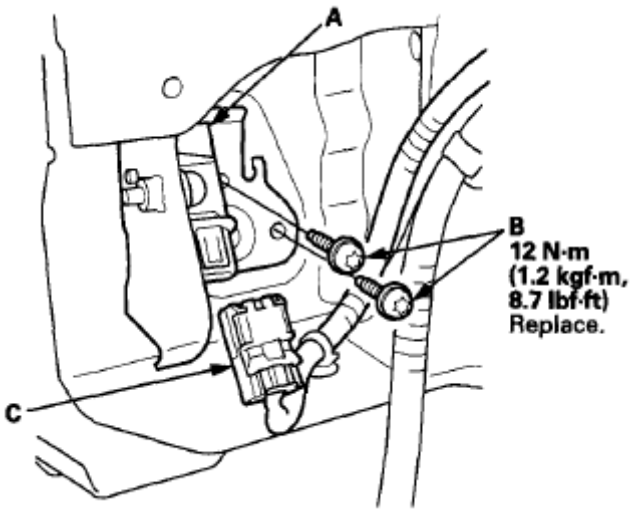

Fig. 272: Identifying Front Impact Sensor And Torx Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the left or right engine compartment wire harness 2P connector (C) to the front impact sensor.
3. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
5. Confirm proper SRS operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.
6. Left side: Install the intake air resonator (A) with the bolts (B), and tighten the bolts to the specified torque, then push the clip (C).

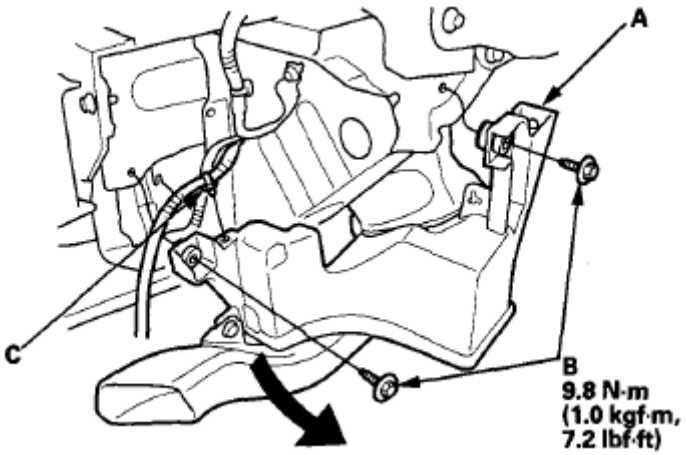

Fig. 273: Identifying Intake Air Resonator & Fasteners With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the front bumper (see **FRONT BUMPER REMOVAL/INSTALLATION**).

DRIVER'S SEAT POSITION SENSOR REPLACEMENT

REMOVAL

NOTE: Do not turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, while removing the driver's seat position sensor.

1. Raise the driver's seat all the way up.
2. Remove the recline cover (see **FRONT SEAT RECLINE COVER REMOVAL/INSTALLATION**).
3. Disconnect the driver's seat wire harness 2P connector (A) from the driver's seat position sensor (B).

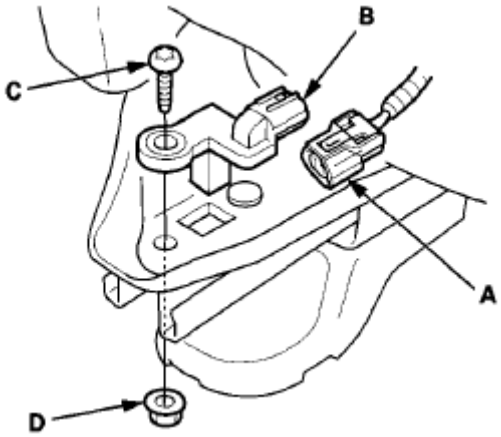

Fig. 274: Disconnecting Driver's Seat Wire Harness 2P Connector From Driver's Seat Position Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the TORX bolt (C) and nut (D) using a TORX T30 bit, then remove the driver's seat position sensor.

INSTALLATION

NOTE:

- **Be sure to install the harness so it is not pinched or interferes with other parts.**
- **Do not turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, while installing the driver's seat position sensor.**

1. Install the driver's seat position sensor (A) with the new TORX bolt (B) and the new nut (C) using a TORX T30 bit, and tighten the TORX bolt while holding the nut to the specified torque.

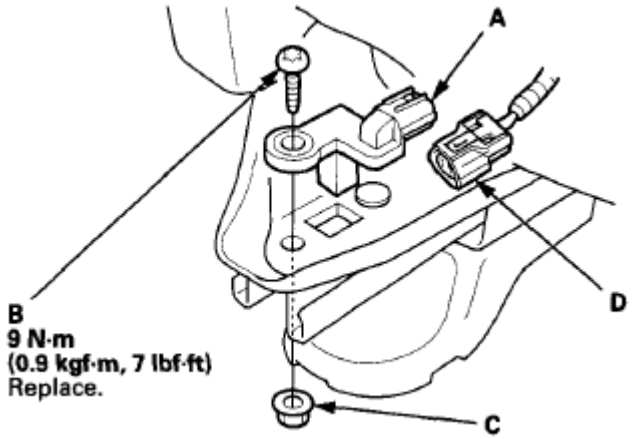

Fig. 275: Installing Driver's Seat Position Sensor With Torx Bolt And Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the driver's seat wire harness 2P connector (D) to the driver's seat position sensor.
3. Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
4. Check the operation of the driver's seat position sensor with the HDS (see **DRIVER'S SEAT POSITION SENSOR OPERATION CHECK**).
5. Confirm proper SRS operation: Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.
6. Install the recline cover (see **FRONT SEAT RECLINE COVER REMOVAL/INSTALLATION**).

PASSENGER'S AIRBAG CUTOFF INDICATOR REPLACEMENT

1. Remove the dashboard center vent (see **DASHBOARD CENTER VENT REMOVAL/INSTALLATION**).
2. Disconnect the 6P connector (A) from the passenger's airbag cutoff indicator (B).

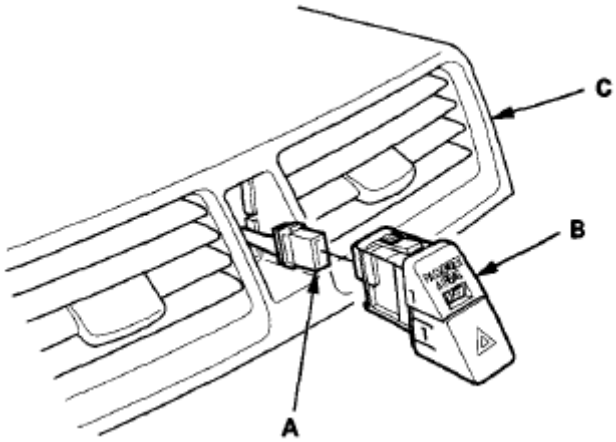

Fig. 276: Disconnecting 6P Connector From Passenger's Airbag Cutoff Indicator
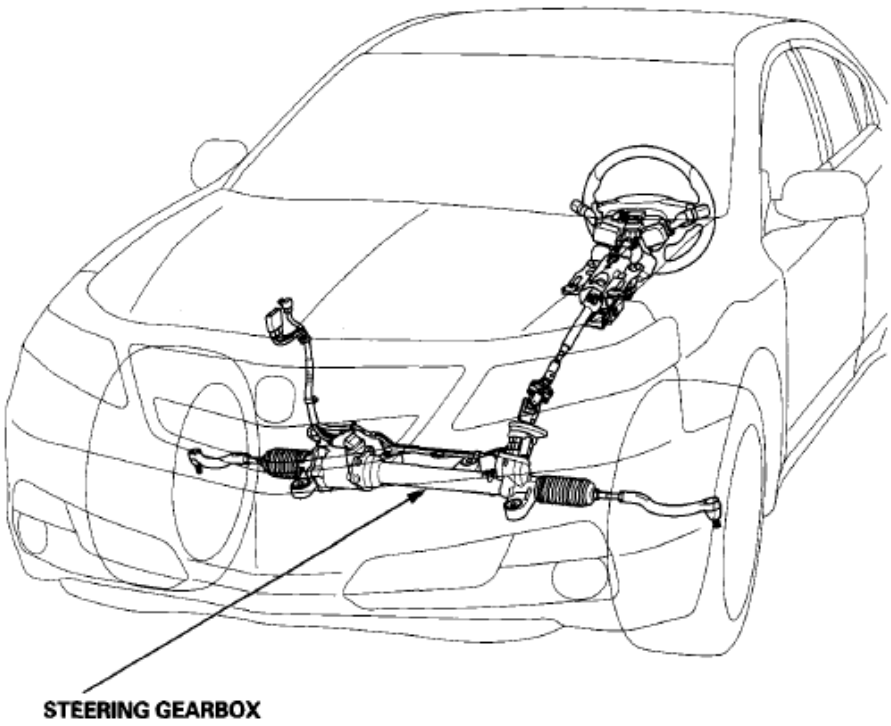
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Push out the passenger's airbag cutoff indicator from behind the dashboard center vent (C).
4. Reinstall the parts in the reverse order of removal.
5. After installing the passenger's airbag cutoff indicator, confirm proper system operation:
   - Clear any DTCs with the HDS (see **HOW TO CLEAR DTCS**).
   - Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If driving support maintenance is required)



The Acura TL SRS includes a driver's airbag in the steering wheel hub, a front passenger's airbag in the dashboard above the glove box, front seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in this Service Information. Servicing, disassembling, or replacing SRS items requires special precautions and tools, and should be done by an authorized Acura dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work should be done by an authorized Acura dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the front airbags, side airbags, side curtain airbags, and/or front seat belt tensioners.
- Do not bump or impact the SRS unit, front impact sensors, side impact sensors, or rear safing sensor, especially when the ignition switch is in ON (II), or the engine start/stop button is in the ON mode, for at least 3 minutes after the ignition switch is turned to LOCK (0), or after the engine start/stop button is pressed to select the OFF mode; otherwise, the system may fail in a collision, or the airbags or the tensioners may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, center console, dashboard, dashboard undercover, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

Electronic Power Steering (EPS) System - TL

COMPONENT LOCATION INDEX

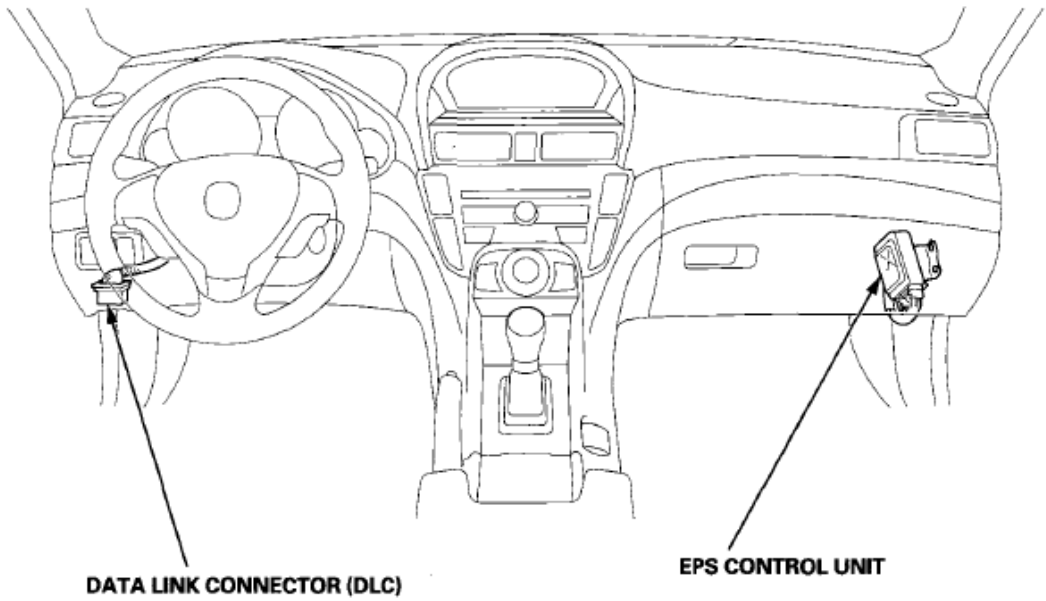

Fig. 1: Electronic Power Steering (EPS) System Components Location

Courtesy of AMERICAN HONDA MOTOR CO., INC.

GENERAL TROUBLESHOOTING INFORMATION

EPS INDICATOR

Under normal conditions, the EPS indicator (A) comes on when the ignition switch is turned to ON (II), or press the engine start/stop button to select the ON mode, then goes off after the engine is started. This indicates that the LED and its circuit are operating correctly. If there is a failure in the system after the engine is started, the EPS indicator will stay on, and the power assist is turned off or restricted.

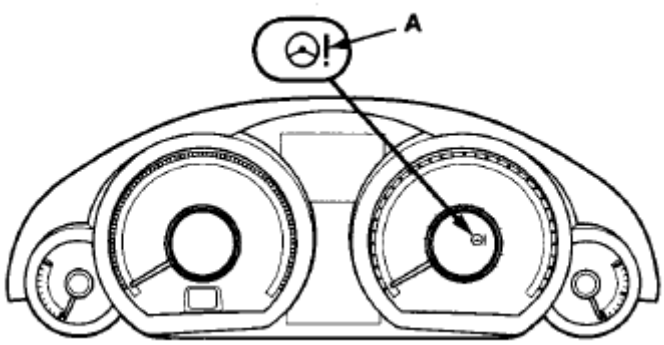

Fig. 2: Identifying EPS Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the EPS indicator comes on, the control unit stores the DTC. In this case, the control unit may activate the EPS system after the engine starts again, but it keeps the EPS indicator on.

When DTC 51-01, 51-02 or 51-06 is stored in the control unit, the EPS indicator will stay on until the DTC is erased. When a problem is detected and the EPS indicator comes on, there are cases when the indicator stays on until the ignition switch is turned to LOCK (0), or press the engine start/stop button to select the OFF mode, and cases when the indicator goes off automatically when the system returns to normal. Even though the system is operating normally, the EPS indicator will come on under some conditions with the vehicle stopped and the engine at high speed with constant input from the steering wheel.

To determine the actual cause of the problem, question the client about the conditions during which the problem occurred, taking the above conditions into consideration.

DIAGNOSTIC TROUBLE CODE (DTC)

- If the CPU cannot be activated, or it fails, the EPS indicator comes on, but no EPS DTC is stored.
- The memory can hold any number of DTCs. However, when the same DTC is detected more than once, the most recent DTC is written over the prior DTC, therefore only one occurrence is stored.
- The lowest DTC is indicated first. The DTCs are indicated in ascending order, not in the order that they occurred.
- The DTCs are stored in the EEPROM (non-volatile memory) therefore the stored DTCs cannot be erased by disconnecting the battery. Do the specified procedures to clear the DTCs.

SELF-DIAGNOSIS

Self-diagnosis can be classified into three categories:

- Initial diagnosis: Done right after the engine starts and until the EPS indicator goes off.
- Regular diagnosis: Done right after the initial diagnosis until the ignition switch is turned to LOCK (0), or press the engine start/stop button to select the OFF mode.
- Steering diagnosis: Done during regular diagnosis while turning the steering wheel.

The EPS control unit does the following functions when a problem is detected by self-diagnosis:

1. Turns on the EPS indicator.
2. Stores the DTC.
3. Stops or restricts power assist and manual steering operation resumes.

NOTE: For DTCs 11-01, 11-02, 12-01, 21-01, 21-02, 22-01, 35-04, 36-02, and 37-01 the EPS indicator will go off automatically, and the system returns to normal.

RESTRICTION ON POWER ASSIST OPERATION

Repeated extreme steering force, such as turning the steering wheel continuously back-and-forth with the vehicle stopped, causes an increase in electrical current draw by the EPS motor. The increase of electric current causes the EPS motor to heat up. Because this heat adversely affects the system, the control unit monitors the electric current draw of the EPS motor.

When the control unit detects heat build-up in the EPS motor, it reduces the electric current to the EPS motor gradually to protect the system, and it restricts the power assist operation. The EPS indicator does not come on during this function.

When steering torque is not applied to the steering wheel, or when the ignition is turned to LOCK (0), or press the engine start/stop button to select the OFF mode and the EPS motor cools, the control unit will restore the power assist gradually until it's fully restored (after about 8 minutes).

TORQUE SENSOR NEUTRAL POSITION

The EPS control unit stores the torque sensor neutral position in the EEPROM. The torque sensor neutral position must be memorized whenever the steering gearbox or the EPS control unit is replaced.

NOTE: The torque sensor neutral position is not affected when erasing the DTCs.

HOW TO TROUBLESHOOT DTCS

The troubleshooting procedures assume that the cause of the problem is still present and the EPS indicator is still on. Following the procedure when the EPS indicator does not come on can result in incorrect diagnosis.

1. Question the client about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the EPS indicator came on, such as while turning, after turning, when the vehicle was at a certain speed, etc.
2. When the EPS indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor terminal contact, etc., in the affected circuit before you start troubleshooting.
3. After troubleshooting, clear the DTC and test-drive the vehicle. Be sure the EPS indicator does not come on.

HOW TO USE THE HDS (HONDA DIAGNOSTIC SYSTEM)

NOTE: Make sure the battery is in good condition and fully charged.

1. If the system indicators stay on, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

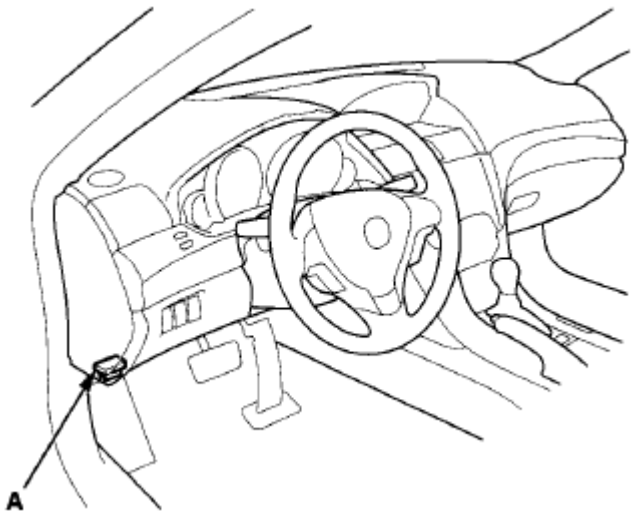

Fig. 3: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Check the diagnostic trouble code (DTC) and note it. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:
- **The HDS reads the DTC, the current data, and other system data.**
- **For specific operations, refer to the Help menu that came with the HDS.**

HOW TO RETRIEVE DTCS

1. With the ignition switch in LOCK (0), or the engine start/stop button in select the OFF mode, connect the HDS to the data link connector (DLC) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the **DTC TROUBLESHOOTING**. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.
5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

HOW TO CLEAR DTCS

1. With the ignition switch in LOCK (0), or the engine start/stop button in select the OFF mode, connect the HDS to the data link connector (DLC) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Clear the DTC(s) by following the screen prompts on the HDS.
5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

MEMORIZING THE TORQUE SENSOR NEUTRAL POSITION

The torque sensor neutral position must be memorized whenever the steering gearbox or the EPS control unit is replaced. Note that the torque sensor neutral position is not affected when erasing the DTC.

NOTE: The torque sensor is temperature sensitive. When memorizing the torque sensor neutral position, the ambient temperature must be above 68°F (20°C).

1. With the ignition switch in LOCK (0) or with the vehicle ignition in the OFF mode, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

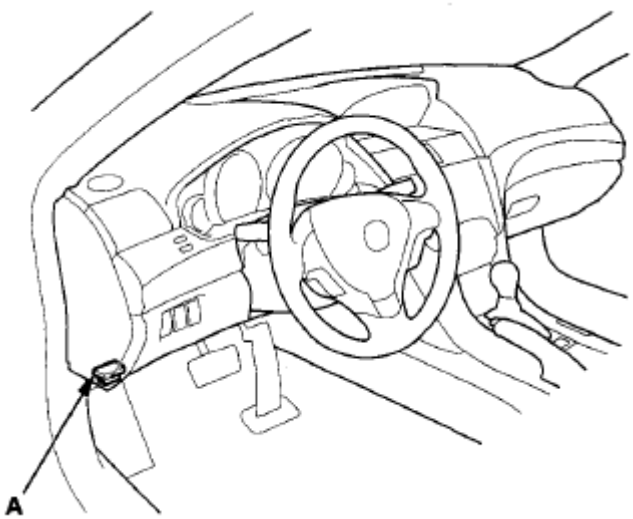

Fig. 4: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. From the EPS MENU, select MISCELLANEOUS TEST, then TORQUE SENSOR LEARN, and follow the screen prompts on the HDS.

NOTE: See the HDS Help menu for specific instructions.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

DTC TROUBLESHOOTING INDEX

DTC	Detection Item	Note

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
HDS does not communicate with the EPS control unit or the vehicle	Troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**)	
EPS indicator does not come on	Symptom Troubleshooting (see **SYMPTOM TROUBLESHOOTING**)	
EPS indicator does not go off, and no DTCs are stored	Symptom Troubleshooting (see **EPS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED**)	
EPS indicator is not on, no DTCs are stored, but there is no power assist or power assist is reduced	1. Check the EPS motor power wires between the EPS control unit and the EPS motor for a short to body ground. Repair as needed. 2. If the EPS motor power wires are OK, replace the steering gearbox (short in the EPS motor) (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).	

	3. Check the power and body ground connections at the EPS control unit.

15	BLK	F-CAN L (F-CAN-LO)	F-CAN communication circuit	With ignition switch ON (II), or vehicle in ON mode: pulses (1.5-2.5 V)
16	PUR	IG1 (Ignition 1)	Power source for activating the system	With ignition switch ON (II), or vehicle in ON mode: battery voltage (about 12 V)
17	LT BLU	K-LINE (Data link connector)	Communicates with HDS	With ignition switch ON (II), or vehicle in ON mode and the HDS disconnected: pulses or battery voltage (about 12 V)
26	BRN	S3 (Signal 3)	Detects EPS motor angle sensor signal	With engine running: pulses (0-5 V)
27	PNK	R2 (EPS Motor angle sensor 2)	Detects EPS motor angle sensor signal	With engine running: pulses (0-5 V)
28	BLU	S4 (Signal 4)	Detects EPS motor angle sensor signal	With engine running: pulses (0-5 V)

SYSTEM OUTLINE

The Acura TL is equipped with electric power steering (EPS). The driver's steering force is assisted by an electric motor at the steering gearbox. Compared to a hydraulic assist power steering system, the EPS is more efficient because it does not use engine power to drive an oil pump to generate hydraulic pressure.

The system uses an EPS control unit to monitor and control the EPS motor's assisting force to match driving conditions:

- Low vehicle speeds: High power assist (for easy handling)
- High speed driving: Low power assist (for stable driving)
- Low speed to high speed driving: Change smoothly from high assist to low assist

System Operation

The steering force from the steering wheel is sent to the pinion shaft. The torque sensor measures the difference between the force applied to the pinion shaft and the resistance to turning the wheels due to road friction. The torque sensor converts steering torque input and its direction into voltage signals that are sent to the EPS control unit. The EPS control unit uses these signals along with the engine and the vehicle speed signals from the ECM/PCM to calculate the direction and the amount of assist needed. The EPS control unit then sends out the appropriate command to the EPS motor. The EPS motor transmits its power through a ball screw mechanism to push the steering rack right or left.

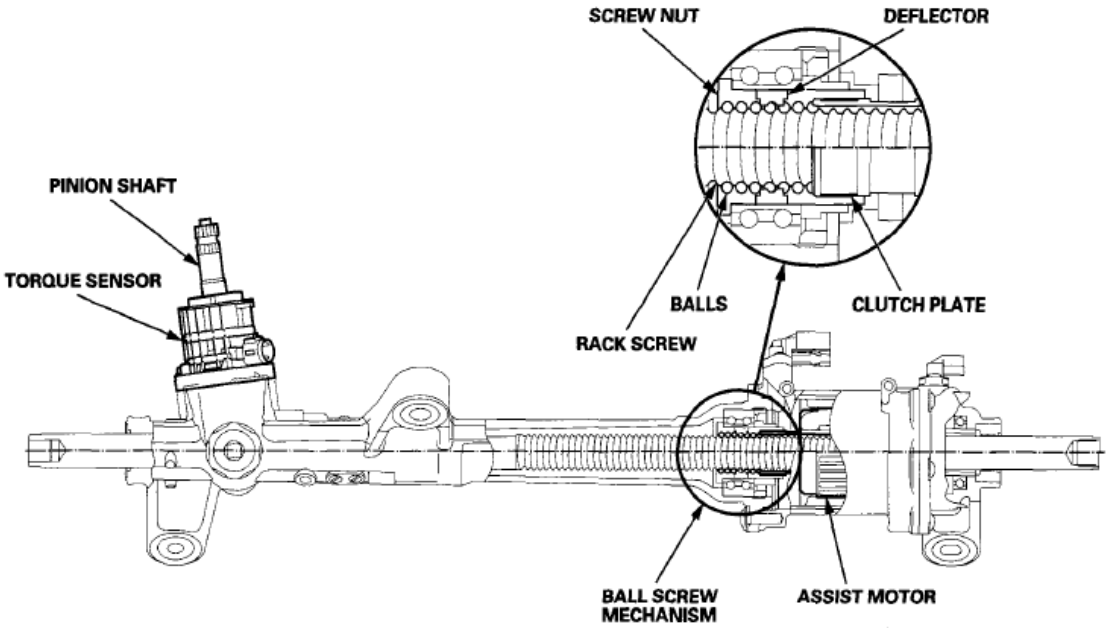

Fig. 9: Electric Power Steering System Operation Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Torque Sensor Operation

When the steering wheel is turned, inductance is changed by the movement of the core within the Torque Sensor. The amount this voltage changes varies with the amount of movement, and direction of the core, then it is amplified by the interface circuitry of the sensor coil and output to the EPS control unit as a steering signal.

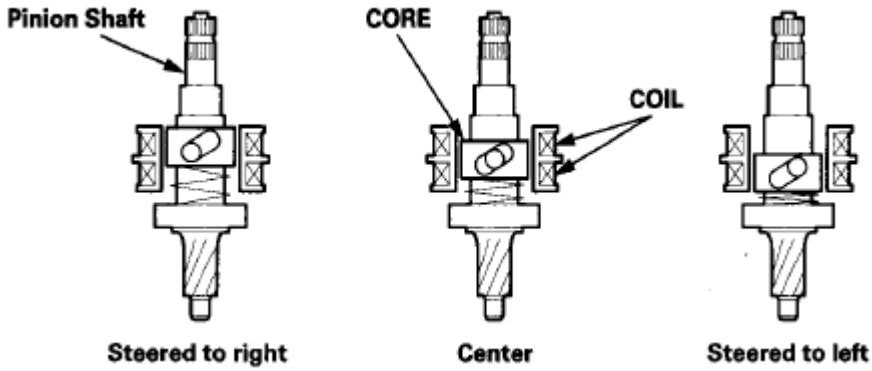

Fig. 10: Torque Sensor Operation Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

EPS CONTROL UNIT OPERATION

The EPS control unit controls the EPS motor by these signals:

- Vehicle speed signal (for ECM/PCM)
- Engine speed signal (for ECM/PCM)

- EPS motor angle sensor signal
- Torque sensor signal

At idle or low vehicle speeds, the EPS control unit sends a signal to the ECM/PCM to increase the engine idle speed to prevent the engine from stalling.

If the EPS control unit detects a failure in the system, it stores a DTC, and sends a signal to the gauge control.

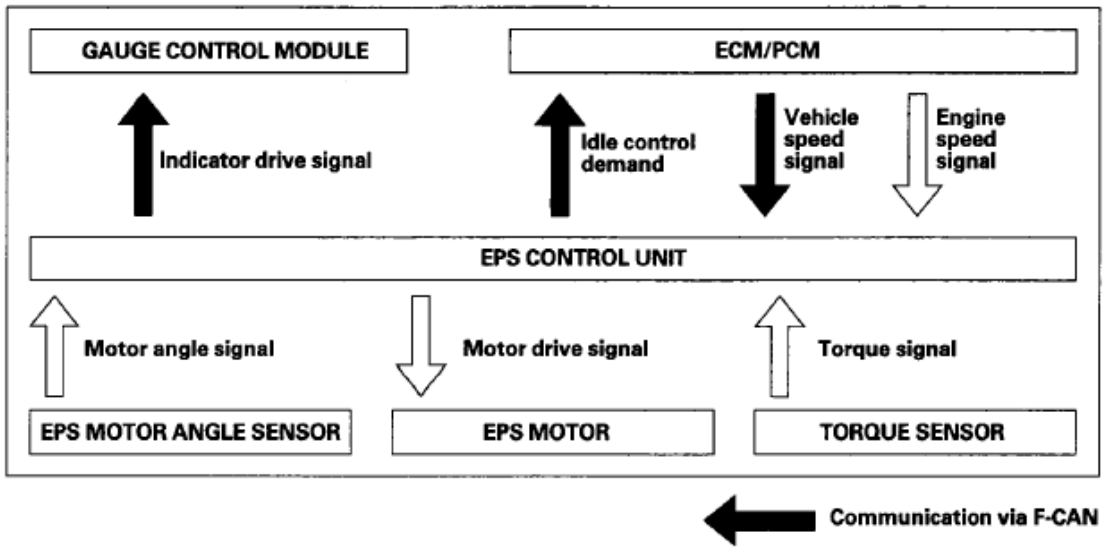

Fig. 11: EPS Control Unit Operation Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Power Relay (built into the EPS control unit)

When the system is operating normally, the CPU turns the power relay on, and the power is provided to the FET bridge. If the CPU detects a failure in the system which has the demand to shut down the system, the CPU turns the power relay off.

Fail-Safe Relay (built into the EPS control unit)

When the system is operating normally, the CPU turns the fail-safe relay on and the power is provided to the EPS motor. If the CPU detects a failure in the system, the CPU turns the fail-safe relay off at the same time it turns the power relay off.

Current Sensor

An electric current detection circuit monitors the current of each phase circuit to the motor, and sends a signal to the CPU.

EPS MOTOR OPERATION

The EPS uses an efficient brushless DC type motor. The EPS motor control circuit is composed of a system

control CPU, FET drive circuit, H type FET bridge, power relay, fail-safe relay, electric current sensor, and the EPS motor. From the input sensor signals, the CPU calculates and outputs the appropriate three-phase current for the FET drive circuit.

DTC TROUBLESHOOTING

DTC 11-01: LOW/HIGH IG1-TERMINAL VOLTAGE; DTC 11-02: BATTERY VOLTAGE

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Wait at least 60 seconds.
6. Check for DTCs with the HDS.

   Is DTC 11-01 or 11-02 indicated?

   YES - Go to step 7.

   NO - Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect EPS control unit connector D (28P).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between EPS control unit connector D (28P) terminal No. 16 and body ground.

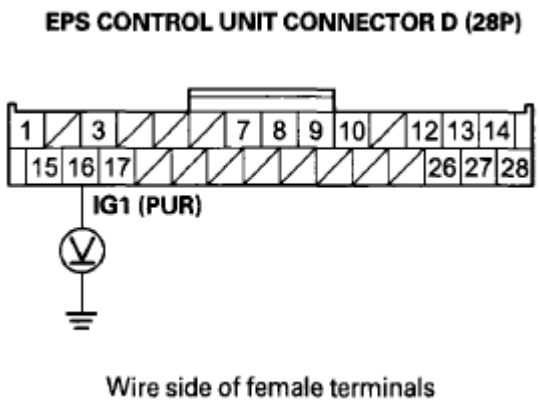

Fig. 16: Measuring Voltage Between EPS Control Unit Connector D (28P) Terminal No. 16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Check for loose terminals in the EPS control unit connectors and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - If there is no voltage, or the voltage is lower than specified, repair an open or high resistance in the wire between the No. 6 (7.5 A) fuse in the driver's under-dash fuse/relay box and EPS control unit. If the wire checks OK, check the battery (see **BATTERY TEST**), and troubleshoot the alternator regulator circuit (see **ALTERNATOR AND REGULATOR CIRCUIT TROUBLESHOOTING**).

DTC 12-01: MOTOR POWER SUPPLY VOLTAGE

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the BATTERY in the EPS DATA LIST with the HDS.

   Is there battery voltage?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EPS control unit.

   NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Check the No. 2-1 (70 A) fuse in the under-hood fuse/relay box.

   Is the fuse blown?

   YES - Go to step 5.

   NO - Reinstall the checked fuse, then go to step 13.

5. Disconnect EPS control unit connector A (2P).
6. Check for continuity between EPS control unit connector A (2P) terminal No. 2 and body ground.

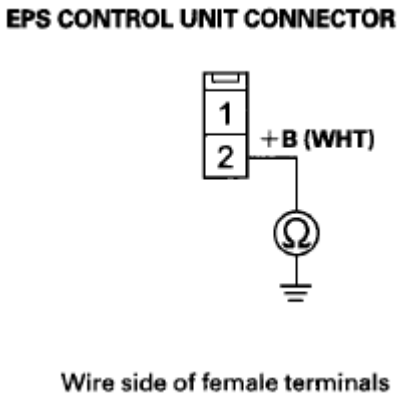

Fig. 17: Checking Continuity Between EPS Control Unit Connector A (2P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the EPS control unit and the No. 2-1 (70 A) fuse in the under-hood fuse/relay box.

NO - Install a new No. 2-1 (70 A) fuse in the under-hood fuse/relay box, then go to step 7.

7. Reconnect EPS control unit connector A (2P).
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Clear the DTC with the HDS.
10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Start the engine.
12. Check for DTCs with the HDS.

Is DTC 12-01 indicated?

YES - Replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Troubleshooting is complete.

13. Disconnect EPS control unit connector A (2P).
14. Measure the voltage between EPS control unit connector A (2P) terminal No. 2 and body ground.

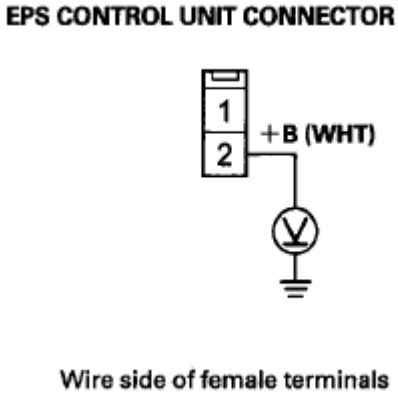

Fig. 18: Measuring Voltage Between EPS Control Unit Connector A (2P) Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Repair an open in the wire between the EPS control unit and the No. 2-1 (70 A) fuse in the under-hood fuse/relay box.

DTC 21-01: EXCESSIVE CHANGE OF THE VEHICLE SPEED SIGNAL; DTC 21-02: COMPARISON BETWEEN THE VEHICLE SPEED AND THE ENGINE SPEED SIGNAL

NOTE:

- **If the MIL indicator is on, troubleshoot the fuel and emissions systems first.**
- **Even though the system is operating normally, the EPS indicator will come on caused by the detecting condition of DTC 21-01 or DTC 21-02 when you raise the engine speed with the vehicle stopped.**
- **Clear the DTC related to the ABS or VSA system.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**), and allow all wheels to rotate freely.
3. Connect the HDS to the data link connector (DLC).
4. Turn off the VSA function by using the VSA OFF switch.
5. Start the engine, then run the vehicle in the 4th (M/T), or D position (A/T).
6. Check the VEHICLE SPEED in the EPS DATA LIST with the HDS.

   Is the vehicle speed indicated?

   YES - The system is OK at this time.

   NO - Go to step 7.

7. Check for DTCs in the fuel and emissions systems (M/T) or A/T system (ATT) with the HDS.

   Is DTC P0720 (M/T), P0721 (A/T), P0722 (A/T), or P0723 (A/T) indicated?

   YES - Troubleshoot the indicated DTC(s).

   NO - Go to step 8.

8. Start the engine, and check the tachometer.

   Is the tachometer working correctly?

   YES - Go to step 10.

   NO - Go to step 9.

9. Check for DTCs in the gauge control module with the HDS.

   Are any DTCs indicated?

   YES - Troubleshooting the indicated DTC(s).

NO - Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 1 and recheck. If the ECM/PCM was updated and DTCs are not indicated, troubleshooting is complete. If the ECM/PCM was substituted and DTCs are not indicated, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Short the SCS line with the HDS.
12. Disconnect EPS control unit connector D (28P) and ECM/PCM connector A (49P).
13. Check for continuity between EPS control unit connector D (28P) terminal No. 1 and ECM/PCM connector A (49P) terminal No. 48.

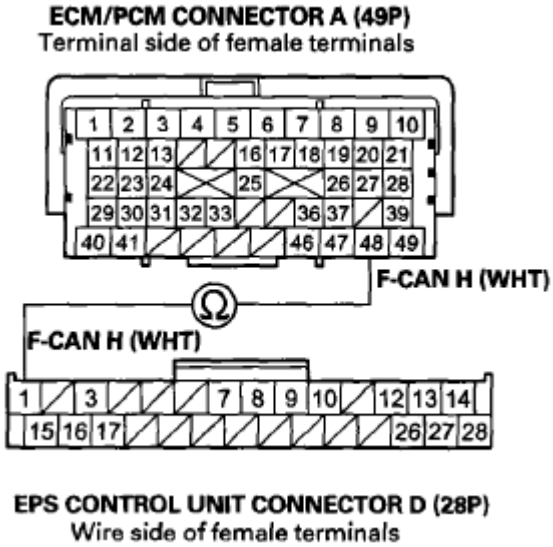

Fig. 19: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 1 And ECM/PCM Connector A (49P) Terminal No. 48
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Repair an open in the wire between the EPS control unit and the ECM/PCM.

14. Check for continuity between EPS control unit connector D (28P) terminal No. 15 and ECM/PCM connector A (49P) terminal No. 49.

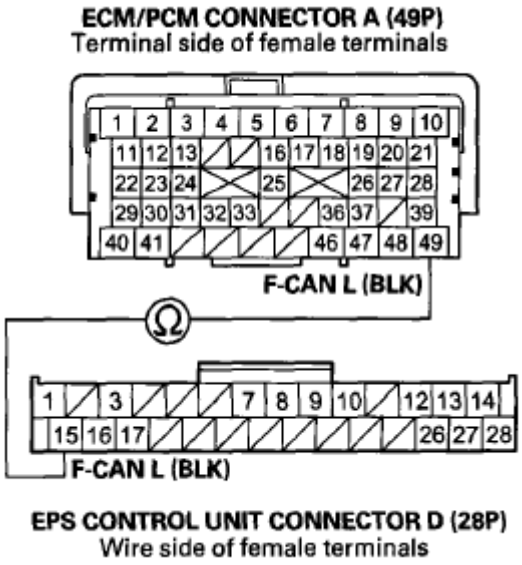

Fig. 20: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 15 And ECM/PCM Connector A (49P) Terminal No. 49
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Repair an open in the wire between the EPS control unit and the ECM/PCM.

DTC 22-01: ENGINE SPEED SIGNAL

NOTE: If the MIL indicator is on, troubleshoot the fuel and emissions systems first.

1. Start the engine.
2. Check the ENGINE SPEED in the EPS DATA LIST with the HDS.

   Is there 0 RPM at idle?

   YES - Go to step 3.

   NO - The system is OK at this time.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect EPS control unit connector D (28P).
5. Start the engine.
6. Measure the voltage between EPS control unit connector D (28P) terminal No. 3 and body ground.

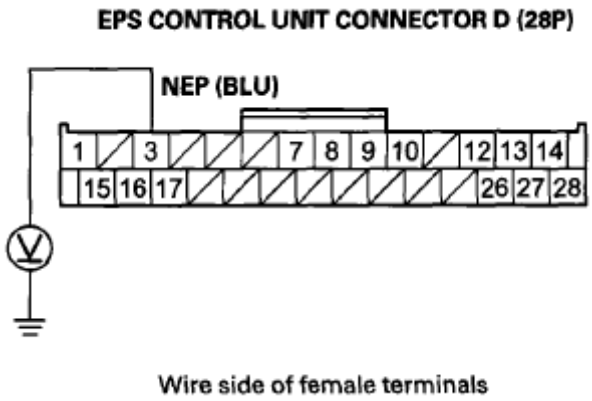

Fig. 21: Measuring Voltage Between EPS Control Unit Connector D (28P) Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there any voltage?

YES - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Short the SCS line with the HDS.
9. Disconnect ECM/PCM connector A (49P).
10. Check for continuity between EPS control unit connector D (28P) terminal No. 3 and body ground.

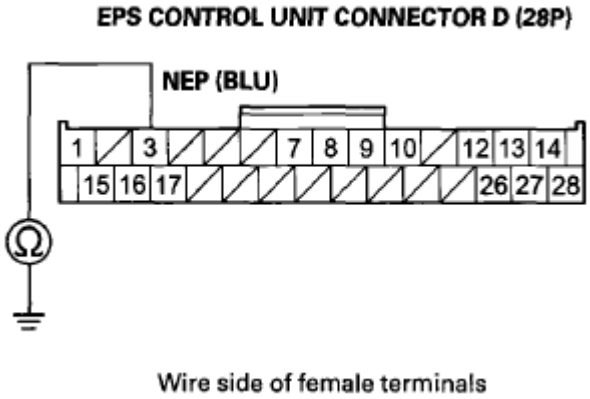

Fig. 22: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the EPS control unit and the ECM/PCM.

NO - Go to step 11.

11. Check for continuity between EPS control unit connector D (28P) terminal No. 3 and ECM/PCM connector A (49P) terminal No. 33.

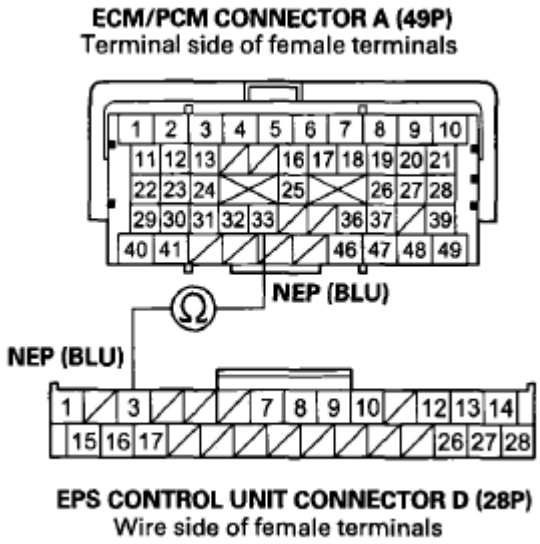

Fig. 23: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 3 And ECM/PCM Connector A (49P) Terminal No. 33
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 1 and recheck. If the ECM/PCM was updated and DTCs are not indicated, troubleshooting is complete. If the ECM/PCM was substituted and DTCs are not indicated, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair open in the wire between the EPS control unit and the ECM/PCM.

DTC 31-01: TORQUE SENSOR NEUTRAL POSITION NOT WRITTEN

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Do the memorizing of the torque sensor neutral position (see **MEMORIZING THE TORQUE SENSOR NEUTRAL POSITION**).
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check for DTCs with the HDS.

Is DTC 31-01 indicated?

YES - Replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - The system is OK at this time.

DTC 32-01: EPS CONTROL UNIT INTERNAL CIRCUIT (CURRENT SENSOR); DTC 32-02: EPS CONTROL UNIT INTERNAL CIRCUIT (CURRENT SENSOR); DTC 35-01: EPS CONTROL UNIT INTERNAL CIRCUIT (CPU); DTC 35-02: EPS CONTROL UNIT INTERNAL CIRCUIT (EEPROM); DTC 35-04: EPS CONTROL UNIT INTERNAL CIRCUIT (CPU COMMUNICATION); DTC 35-07: EPS CONTROL UNIT INTERNAL CIRCUIT (INHL/INHR PORTS); DTC 36-02: EPS CONTROL UNIT INTERNAL CIRCUIT (INH OUTPUT CIRCUIT); DTC 37-01: EPS CONTROL UNIT INTERNAL CIRCUIT (STEP-UP CIRCUIT)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Check for DTCs with the HDS.

Is DTC 32-01, 32-02, 35-01, 35-02, 35-04, 35-07, 36-02, or 37-01 indicated?

YES - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

DTC 32-07: EPS CONTROL UNIT INTERNAL CIRCUIT (CURRENT SENSOR)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Turn the steering wheel to the right or left, and wait 10 seconds or more.
6. Check for DTCs with the HDS.

Is DTC 32-07 indicated?

YES - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

DTC 32-08: EPS CONTROL UNIT INTERNAL CIRCUIT (CURRENT SENSOR); DTC 32-09: MOTOR CURRENT CORRELATION

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Turn the steering wheel to the right or left, and wait 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 32-08 or 32-09 indicated?

   YES - Go to step 7.

   NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect EPS control unit connector B (2P) and connector C (2P).
9. Check for continuity between following terminals of EPS control unit connector B (2P) and connector C (2P).

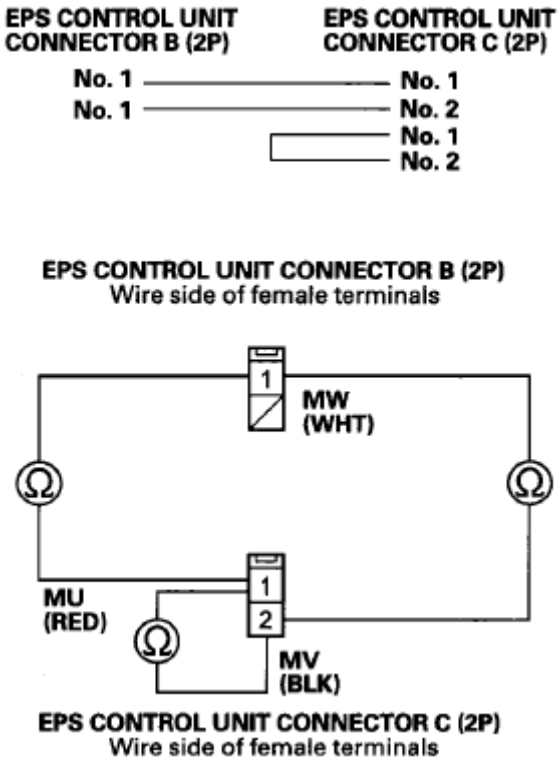

Fig. 24: Checking Continuity Between Terminals Of EPS Control Unit Connector B (2P) And Connector C (2P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose terminals in the EPS control unit connectors and EPS motor connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Go to step 10.

10. Disconnect the EPS motor 3P connector.
11. On the EPS motor side, check for continuity between EPS motor 3P connector terminals No. 1 and No. 2, No. 1 and No. 3, and No. 2 and No. 3 individually.

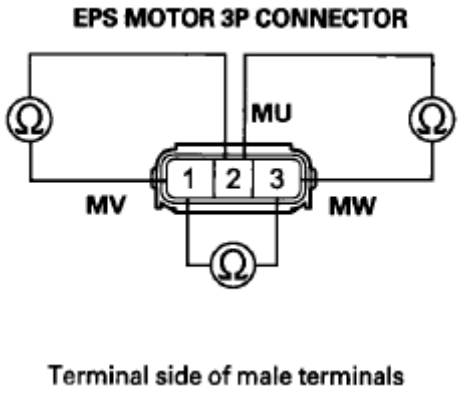

Fig. 25: Checking Continuity Between EPS Motor 3P Connector Terminals No. 1 And No. 2, No. 1 And No. 3, And No. 2 And No. 3 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair an open in the wire between the EPS control unit and the EPS motor.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

DTC 33-01: LOWER FET STUCK ON; DTC 33-06: LOWER FET STUCK ON

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Check for DTCs with the HDS.

Is DTC 33-01 or 33-06 indicated?

YES - Go to step 6.

NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect EPS control unit connector B (2P) and connector C (2P).
8. Check for continuity between body ground and EPS control unit connector B (2P) terminal No. 1, connector C (2P) terminal No. 1, and connector C (2P) terminal No. 2 individually.

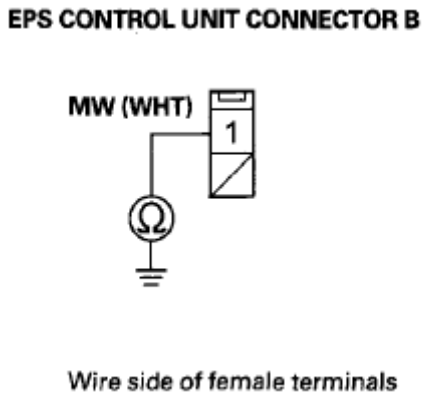

Fig. 26: Checking Continuity Between Body Ground And EPS Control Unit Connector B (2P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

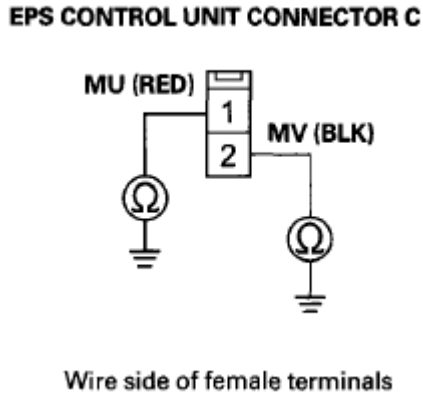

Fig. 27: Checking Continuity Between Body Ground And Connector C (2P) Terminal No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

9. Disconnect the EPS motor 3P connector.
10. Check for continuity between body ground and EPS control unit connector B (2P) terminal No. 1, connector C (2P) terminal No. 1, and connector C (2P) terminal No. 2 individually.

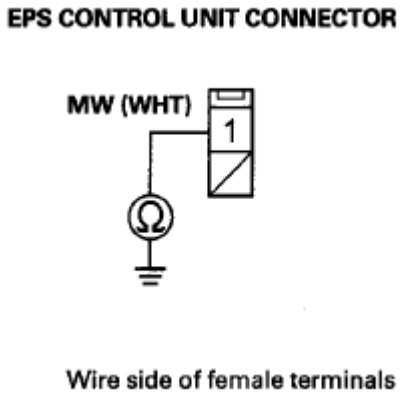

Fig. 28: Checking Continuity Between Body Ground And EPS Control Unit Connector B (2P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

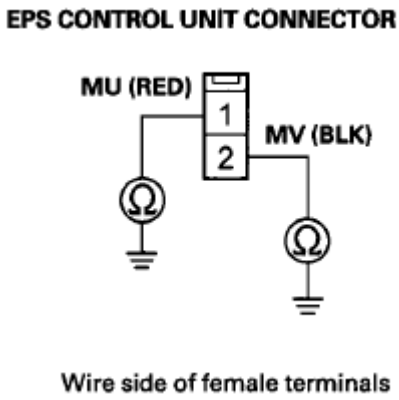

Fig. 29: Checking Continuity Between Body Ground And Connector C (2P) Terminal No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the EPS control unit and the EPS motor.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

DTC 33-02: UPPER FET STUCK ON; DTC 33-07: UPPER FET STUCK ON

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Check for DTCs with the HDS.

   Is DTC 33-02 or 33-07 indicated?

   YES - Go to step 6.

   NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect EPS control unit connector B (2P) and connector C (2P).
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between body ground and EPS control unit connector B (2P) terminal No. 1, connector C (2P) terminal No. 1, and connector C (2P) terminal No. 2 individually.

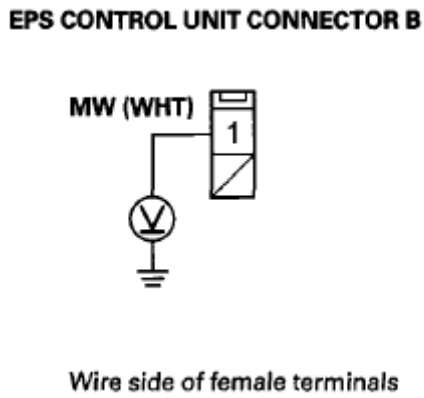

Fig. 30: Measuring Voltage Between Body Ground And EPS Control Unit Connector B (2P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

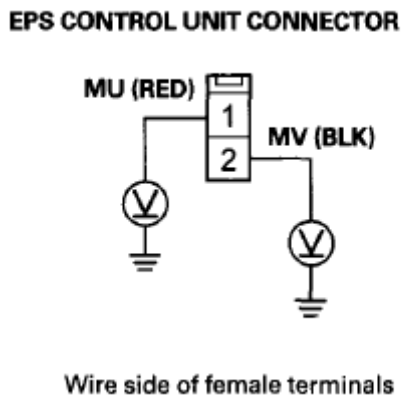

Fig. 31: Measuring Voltage Between Body Ground And Connector C (2P) Terminal No. 1 And No. 2 Individually

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Check for loose terminals in the EPS control unit connectors and the EPS motor connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Disconnect the EPS motor 3P connector.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Measure the voltage between body ground and EPS control unit connector B (2P) terminal No. 1, connector C (2P) terminal No. 1, and connector C (2P) terminal No. 2 individually.

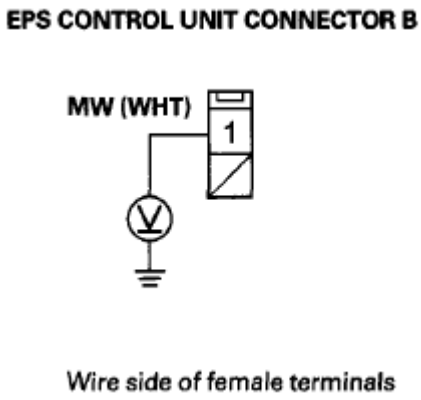

Fig. 32: Measuring Voltage Between Body Ground And EPS Control Unit Connector B (2P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

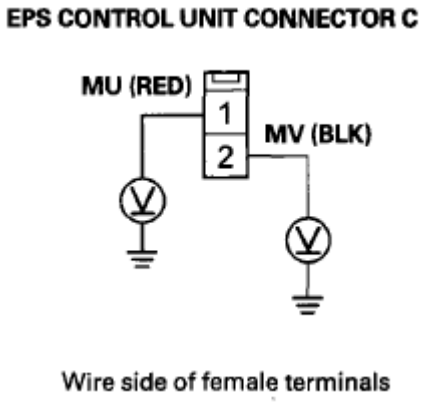

Fig. 33: Measuring Voltage Between Body Ground And Connector C (2P) Terminal No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair a short to power in the wire between the EPS control unit and the EPS motor.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

DTC 34-01: POWER RELAY

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Check for DTCs with the HDS.

Is DTC 34-01 indicated?

YES - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

DTC 34-02: FAIL-SAFE RELAY

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Check for DTCs with the HDS.

Is DTC 34-02 indicated?

YES - Go to step 6.

NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect EPS control unit connector B (2P) and connector C (2P).
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between body ground and EPS control unit connector B (2P) terminal No. 1, connector C (2P) terminal No. 1, and connector C (2P) terminal No. 2 individually.

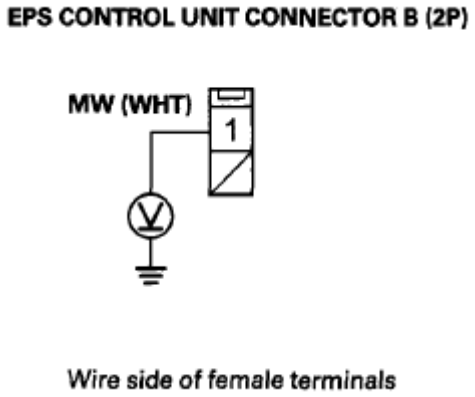

Fig. 34: Measuring Voltage Between Body Ground And EPS Control Unit Connector B (2P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

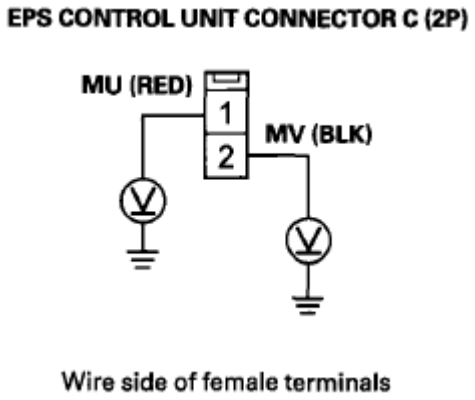

Fig. 35: Measuring Voltage Between Body Ground And Connector C (2P) Terminal No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair a short to power in the wire between the EPS control unit and the EPS motor.

NO - Replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

DTC 35-05: EPS CONTROL UNIT INTERNAL CIRCUIT (A/D CONVERSION)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Wait 10 seconds or more.
6. Check for DTCs with the HDS.

Is DTC 35-05 indicated?

YES - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

DTC 51-01: TORQUE SENSOR (VT1, VT2 LOW/HIGH VOLTAGE)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the ADVT1 in the EPS DATA LIST with the HDS.

   Is the voltage at 1.45-4.10 V?

   YES - Go to step 3.

   NO - Go to step 4.

3. Check the ADVT2 in the EPS DATA LIST with the HDS.

   Is the voltage at 1.56-4.28 V?

   YES - Check for loose terminals or poor connections. If the connections are good, the system is OK at this time.

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect EPS control unit connector D (28P).
6. Measure the resistance between EPS control unit connector D (28P) terminals No. 9 and No. 10.

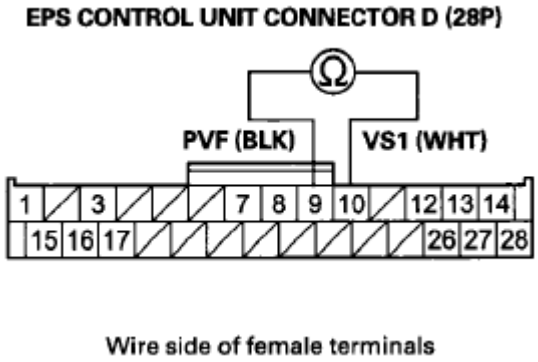

Fig. 36: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminals No. 9 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 12- 15 ohms?

YES - Go to step 7.

NO - Go to step 11.

7. Measure the resistance between EPS control unit connector D (28P) terminals No. 8 and No. 9.

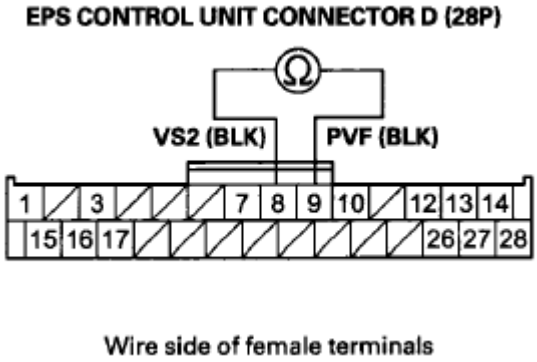

Fig. 37: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminals No. 8 And No. 9
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 12- 15 ohms?

YES - Go to step 8.

NO - Go to step 13.

8. Check for continuity between EPS control unit connector D (28P) terminal No. 9 and body ground.

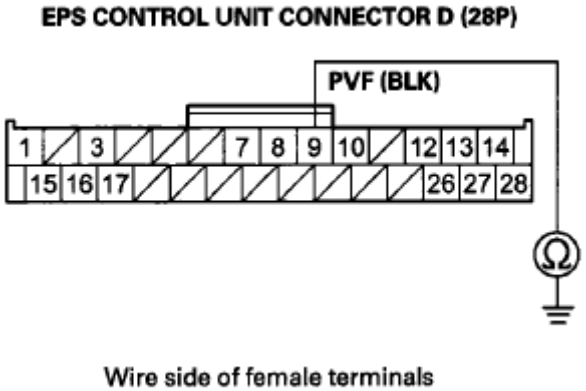

Fig. 38: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

9. Disconnect the torque sensor 3P connector from the steering gearbox.
10. Check for continuity between EPS control unit connector D (28P) terminal No. 9 and body ground.

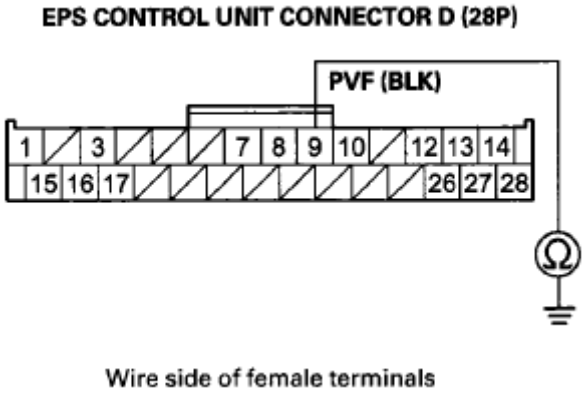

Fig. 39: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the torque sensor and the EPS control unit.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

11. Disconnect the torque sensor 3P connector from the steering gearbox.
12. On the sensor side, measure the resistance between torque sensor 3P connector terminals No. 1 and No. 2.

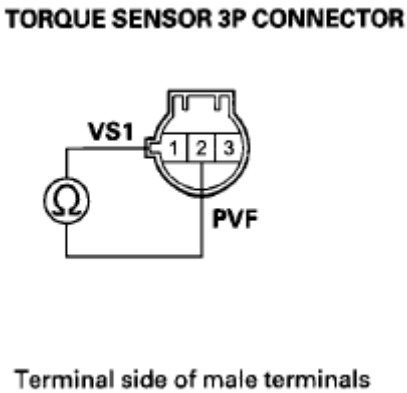

Fig. 40: Measuring Resistance Between Torque Sensor 3P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 12- 15 ohms?

YES - Repair an open or a short between the PNK and the BLU wires in the torque sensor circuit between the torque sensor and the EPS control unit.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

13. Disconnect the torque sensor 3P connector from the steering gearbox.
14. On the sensor side, measure the resistance between torque sensor 3P connector terminals No. 2 and No. 3.

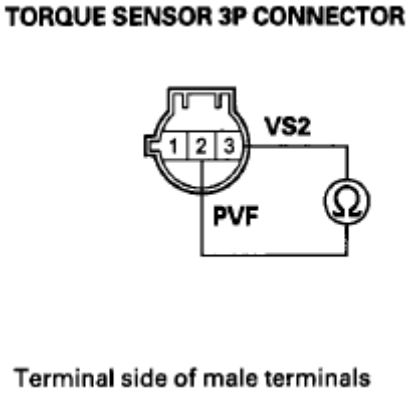

Fig. 41: Measuring Resistance Between Torque Sensor 3P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 12- 15 ohms?

YES - Repair an open or a short between the BLU and the PUR wires in the torque sensor circuit between the torque sensor and the EPS control unit.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

DTC 51-02: TORQUE SENSOR (VT3 DIFFERENTIAL-AMPLIFICATION FUNCTION); DTC 51-03: TORQUE SENSOR (VT1, VT2 RAPID CHANGE); DTC 51-06: TORQUE SENSOR (VT1, VT2 AVERAGE); DTC 51-07: TORQUE SENSOR (VT1, VT2 CHECK)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Check for DTCs with the HDS.

Is DTC 51-02, 51-03, 51-06, or 51-07 indicated?

YES - Go to step 6.

NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Disconnect EPS control unit connector D (28P).
8. Measure the resistance between EPS control unit connector D (28P) terminals No. 9 and No. 10.

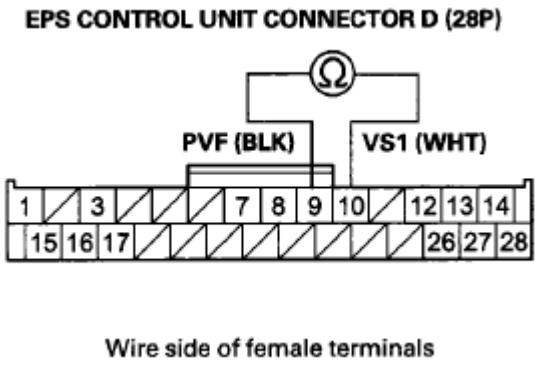

Fig. 42: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminals No. 9 And No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 12- 15 ohms?

YES - Go to step 9.

NO - Go to step 13.

9. Measure the resistance between EPS control unit connector D (28P) terminals No. 8 and No. 9.

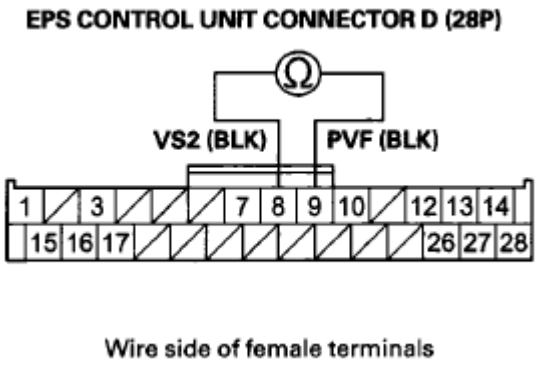

Fig. 43: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminals No. 8 And No. 9
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 12- 15 ohms?

YES - Go to step 10.

NO - Go to step 15.

10. Check for continuity between EPS control unit connector D (28P) terminal No. 9 and body ground.

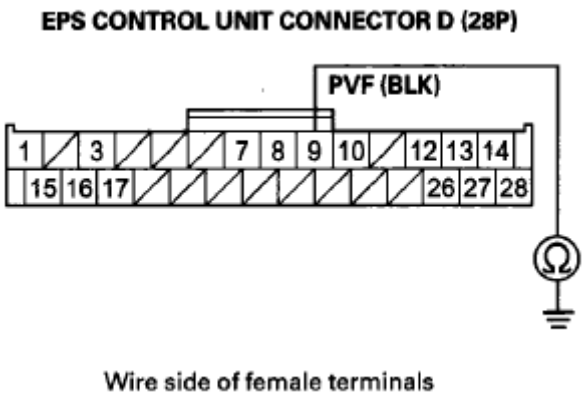

Fig. 44: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

11. Disconnect the torque sensor 3P connector from the steering gearbox.
12. Check for continuity between EPS control unit connector D (28P) terminal No. 9 and body ground.

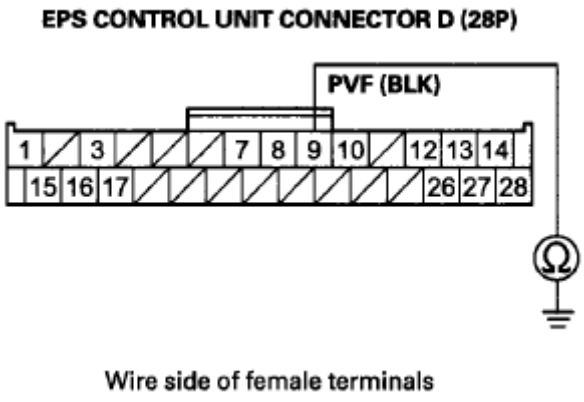

Fig. 45: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 9 And

Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the torque sensor and the EPS control unit.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

13. Disconnect the torque sensor 3P connector from the steering gearbox.
14. On the sensor side, measure the resistance between torque sensor 3P connector terminals No. land No. 2.

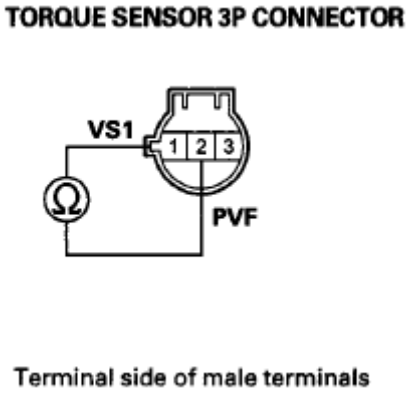

Fig. 46: Measuring Resistance Between Torque Sensor 3P Connector Terminals No. Land No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 12- 15 ohms?

YES - Repair an open or a short between the PNK and the BLU wires in the torque sensor circuit between the torque sensor and the EPS control unit.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

15. Disconnect the torque sensor 3P connector from the steering gearbox.
16. On the sensor side, measure the resistance between torque sensor 3P connector terminals No. 2 and No. 3.

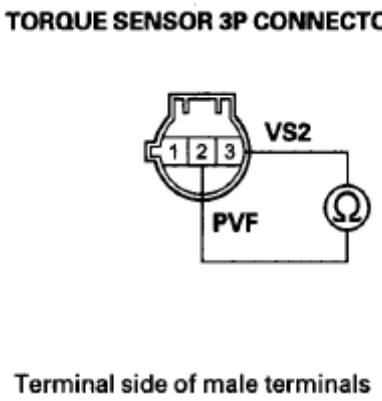

Fig. 47: Measuring Resistance Between Torque Sensor 3P Connector Terminals No. 2 And No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 12- 15 ohms?

YES - Repair an open or a short between the BLU and the PUR wires in the torque sensor circuit between the torque sensor and the EPS control unit.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

DTC 61-04: MOTOR HARNESS MALFUNCTION

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Turn the steering wheel to the right or left, and wait 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 61-04 indicated?

   YES - Go to step 7.

   NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect EPS control unit connector B (2P) and connector C (2P).
9. Check for continuity between the following terminals of EPS control unit connector B (2P) and connector C (2P).

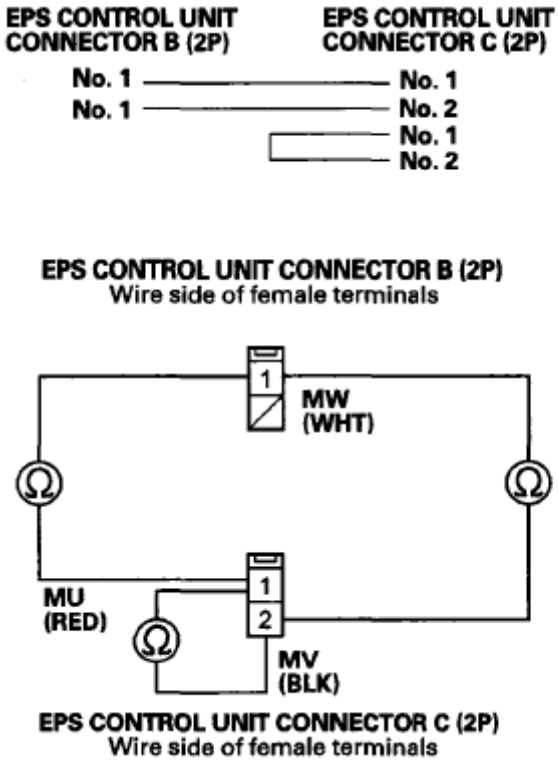

Fig. 48: Checking Continuity Between Terminals Of EPS Control Unit Connector B (2P) And Connector C (2P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Go to step 13.

10. Check for continuity between body ground and EPS control unit connector B (2P) terminal No. 1, connector C (2P) terminal No. 1, and connector C (2P) terminal No. 2 individually.

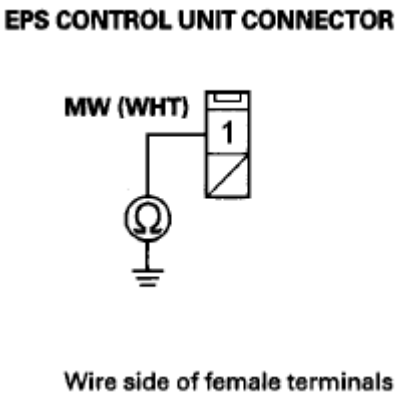

Fig. 49: Checking Continuity Between Body Ground And EPS Control Unit Connector B (2P)

Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

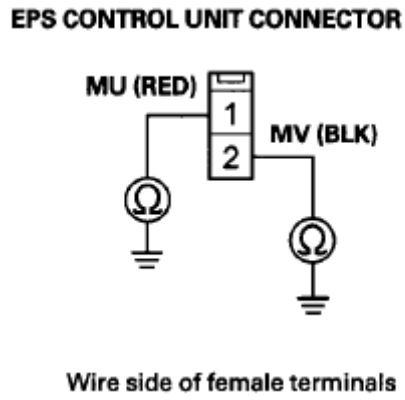

Fig. 50: Checking Continuity Between Body Ground And Connector C (2P) Terminal No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Check for loose terminals in the EPS control unit connectors, and repair if necessary- If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

11. Disconnect the EPS motor 3P connector.
12. Check for continuity between body ground and EPS control unit connector B (2P) terminal No. 1, connector C (2P) terminal No. 1, and connector C (2P) terminal No. 2 individually.

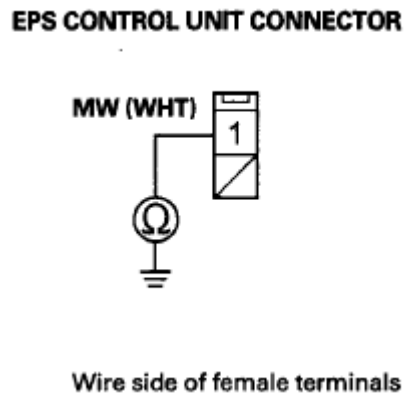

Fig. 51: Checking Continuity Between Body Ground And EPS Control Unit Connector B (2P) Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

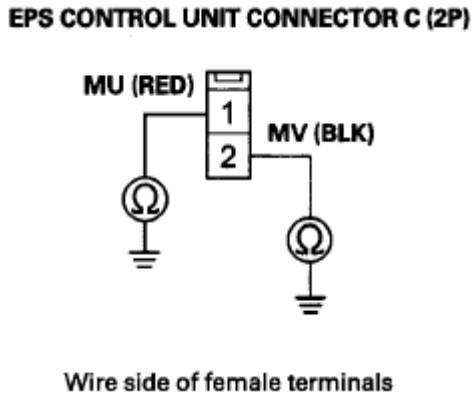

Fig. 52: Checking Continuity Between Body Ground And Connector C (2P) Terminal No. 1 And No. 2 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the EPS control unit and the EPS motor.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

13. Disconnect the EPS motor 3P connector.
14. On the EPS motor side, check for continuity between EPS motor 3P connector terminals No. 1 and No. 2, No. 1 and No. 3, and No. 2 and No. 3 individually.

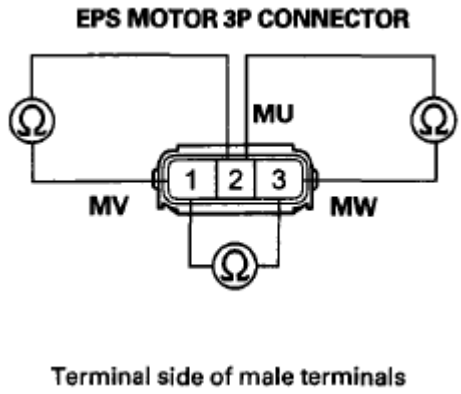

Fig. 53: Checking Continuity Between EPS Motor 3P Connector Terminals No. 1 And No. 2, No. 1 And No. 3, And No. 2 And No. 3 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair an open in the wire between the EPS control unit and the EPS motor.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND**

INSTALLATION).

DTC 71-01: MOTOR ANGLE SENSOR (SIN/COS SIGNALS); DTC 71-02: MOTOR ANGLE SENSOR (NEUTRAL POSITION LEARNING OF SIN/COS); DTC 71-03: MOTOR ANGLE SENSOR (SIN/COS SIGNALS)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Turn the steering wheel to the right or left, and wait 10 seconds or more.
6. Check for DTCs with the HDS.

   Is DTC 71-01, 71-02, or 71-03 indicated?

   YES - Go to step 7.

   NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect EPS control unit connector D (28P).
9. Measure the resistance between the following terminals of EPS control unit connector D (28P).

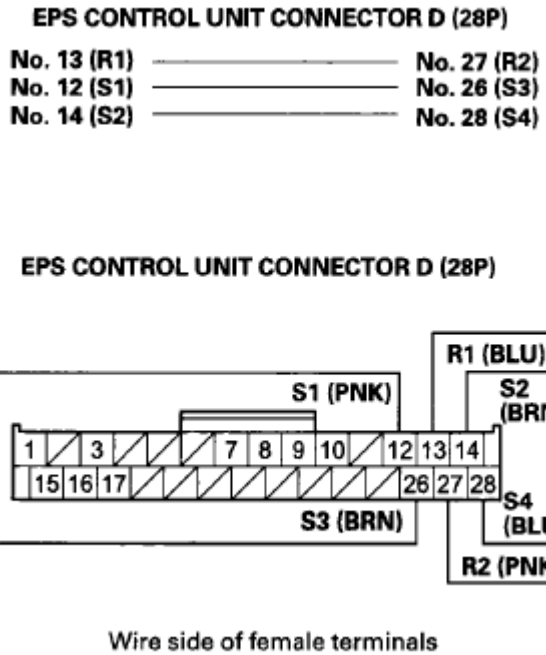

Fig. 54: Measuring Resistance Between Terminals Of EPS Control Unit Connector D (28P)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between R1- R2 5- 50 ohms, S1- S3 10- 100 ohms, and S2- S4 10- 100 ohms?

YES - Go to step 10.

NO - Go to step 13.

10. Check for continuity between body ground and EPS control unit connector D (28P) terminal No. 12, terminal No. 13, terminal No. 14, terminal No. 26, terminal No. 27, and terminal No. 28 individually.

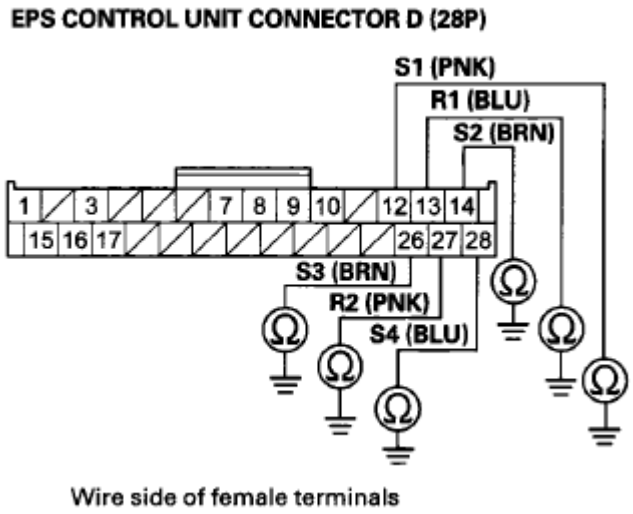

Fig. 55: Checking Continuity Between Body Ground And EPS Control Unit Connector D (28P) Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

11. Disconnect the EPS motor angle sensor 6P connector.
12. On the sensor side, check for continuity between body ground and EPS motor angle sensor 6P connector terminal No. 1, terminal No. 2, terminal No. 3, terminal No. 4, terminal No. 5, and terminal No. 6 individually.

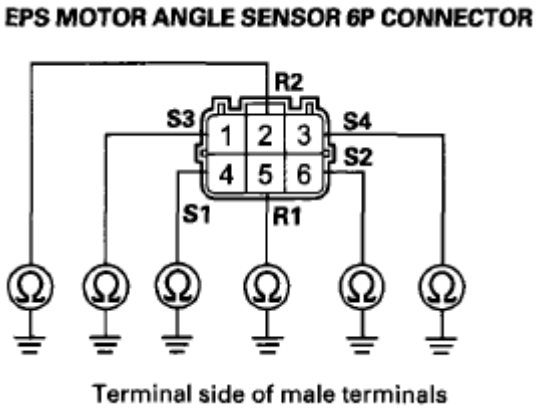

Fig. 56: Checking Continuity Between Body Ground And EPS Motor Angle Sensor 6P Connector Terminals Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

NO - Repair a short to body ground in the wire between the EPS motor angle sensor 6P connector and the EPS control unit.

13. Disconnect the EPS motor angle sensor 6P connector.
14. On the sensor side, measure the resistance between the following terminals of the EPS motor angle sensor 6P connector.

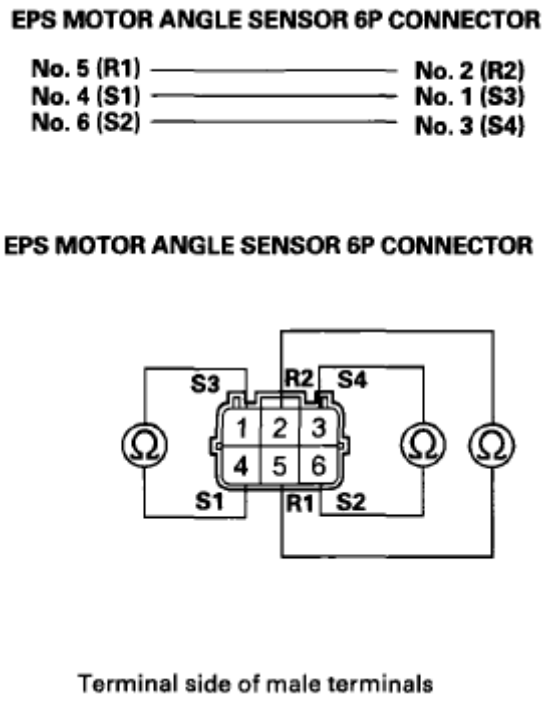

Fig. 57: Measuring Resistance Between Terminals Of EPS Motor Angle Sensor 6P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between R1- R2 5- 50 ohms, S1- S3 10- 100 ohms, and S2- S4 10- 100 ohms?

YES - Repair an open or a short to body ground in the wire between the EPS motor angle sensor 6P connector and the EPS control unit.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

DTC 71-04: MOTOR ANGLE SENSOR (CHECK SIGNALS)

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Start the engine.
5. Turn the steering wheel to the right or left, and wait 10 seconds or more.
6. Check for DTCs with the HDS.

Is DTC 71-04 indicated?

YES - Go to step 7.

NO - Troubleshoot the indicated DTC. If there are no DTCs, the system is OK at this time.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect EPS control unit connector D (28P).
9. Measure the resistance between the EPS control unit connector D (28P) terminal No. 13 and No. 27.

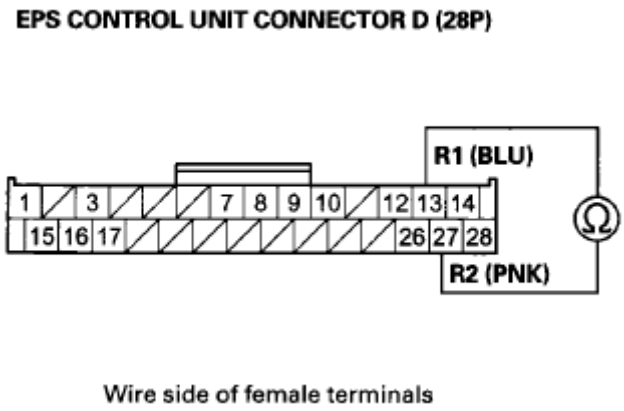

Fig. 58: Measuring Resistance Between EPS Control Unit Connector D (28P) Terminal No. 13 And No. 27
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 5- 50 ohms?

YES - Go to step 10.

NO - Go to step 13.

10. Check for continuity between body ground and EPS control unit connector D (28P) terminal No. 13 and terminal No. 27 individually.

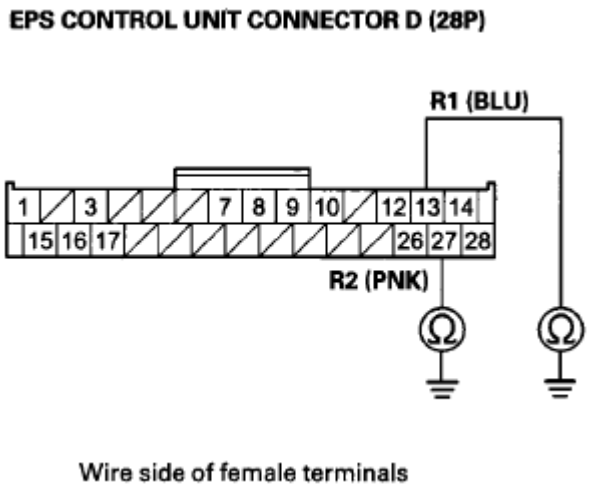

Fig. 59: Checking Continuity Between Body Ground And EPS Control Unit Connector D (28P) Terminal No. 13 And Terminal No. 27 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

11. Disconnect the EPS motor angle sensor 6P connector.
12. On the sensor side, check for continuity between body ground and EPS motor angle sensor 6P connector terminal No. 2 and terminal No. 5 individually.

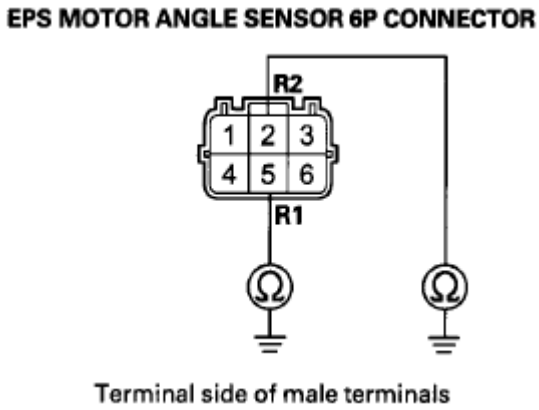

Fig. 60: Checking Continuity Between Body Ground And EPS Motor Angle Sensor 6P Connector Terminal No. 2 And Terminal No. 5 Individually
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

NO - Repair a short to body ground in the wire between the EPS motor angle sensor 6P connector and the EPS control unit.

13. Disconnect the EPS motor angle sensor 6P connector.
14. On the sensor side, measure the resistance between EPS motor angle sensor 6P connector terminals No. 2 and No. 5.

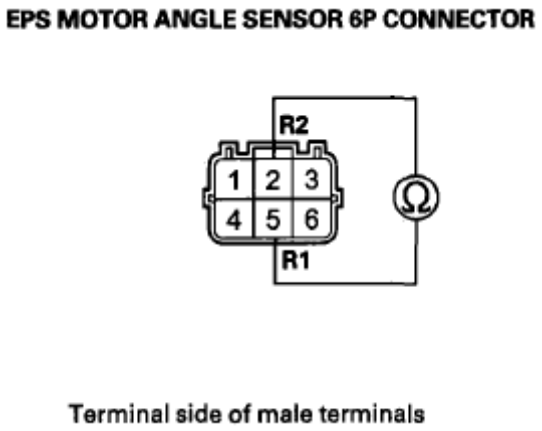

Fig. 61: Measuring Resistance Between EPS Motor Angle Sensor 6P Connector Terminals No. 2 And No. 5
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is the resistance between 5- 50 ohms?

YES - Repair an open or a short to body ground in the wire between the EPS motor angle sensor 6P connector and the EPS control unit.

NO - Replace the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

SYMPTOM TROUBLESHOOTING

EPS INDICATOR DOES NOT COME ON

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and watch the EPS indicator.

   Does the EPS indicator come on?

   YES - The system is OK at this time.

   NO - Troubleshoot the gauge control module (see **SELF-DIAGNOSTIC FUNCTION**).

EPS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Check the No. 6 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse blown?

   YES - Go to step 3.

NO - Reinstall the checked fuse, then go to step 7.

3. Disconnect EPS control unit connector D (28P).
4. Check for continuity between EPS control unit connector D (28P) terminal No. 16 and body ground.

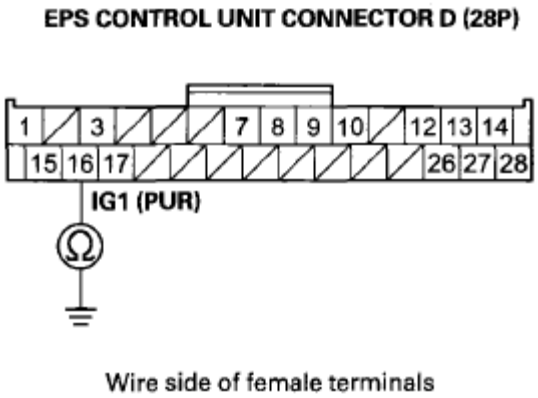

Fig. 62: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the EPS control unit and the No. 6 (7.5 A) fuse in the driver's under-dash fuse/relay box.

NO - Install a new No. 6 (7.5 A) fuse in the driver's under-dash fuse/relay box, then go to step 5.

5. Reconnect EPS control unit connector D (28P).
6. Start the engine, and watch the EPS indicator.

Does the EPS indicator come on, then go off?

YES - Troubleshooting is complete. The system is OK at this time.

NO - Replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

7. Disconnect EPS control unit connector D (28P).
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between EPS control unit connector D (28P) terminal No. 16 and body ground.

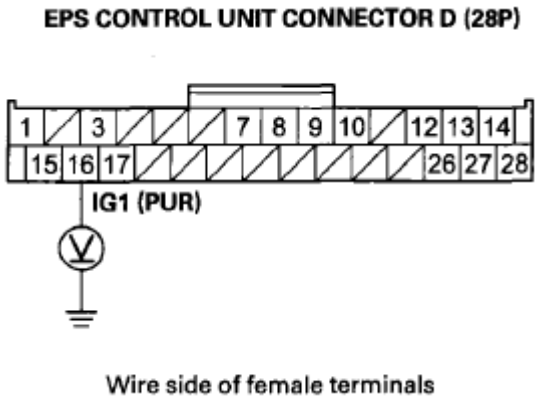

Fig. 63: Measuring Voltage Between EPS Control Unit Connector D (28P) Terminal No. 16 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Repair an open in the wire between the EPS control unit and driver's under-dash fuse/relay box.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Disconnect EPS control unit connector A (2P).
12. Check for continuity between EPS control unit connector A (2P) terminal No. 1 and body ground.

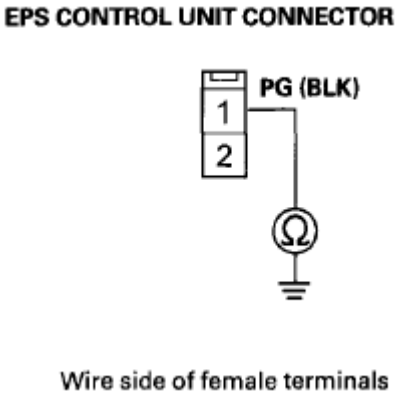

Fig. 64: Checking Continuity Between EPS Control Unit Connector A (2P) Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair an open in the wire between the EPS control unit and body ground (G204).

13. Disconnect the gauge control module 32P connector.
14. Check for continuity between EPS control unit connector D (28P) terminal No. 1 and gauge control module 32P connector terminal No. 14.

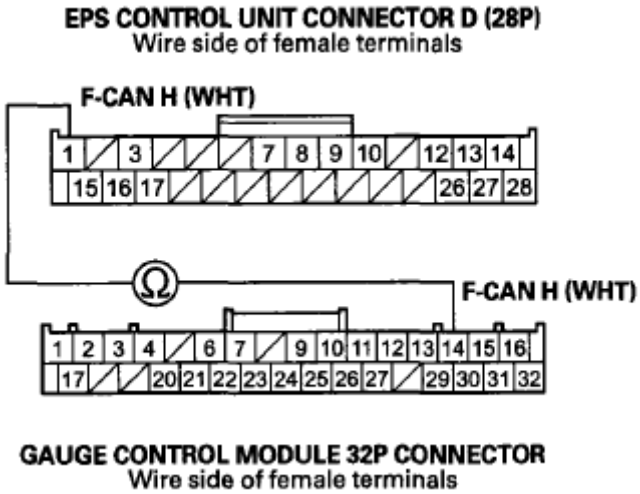

Fig. 65: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 1 And Gauge Control Module 32P Connector Terminal No. 14
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 15.

NO - Repair an open in the wire between the EPS control unit and the gauge control module.

15. Check for continuity between EPS control unit connector D (28P) terminal No. 15 and gauge control module 32P connector terminal No. 13.

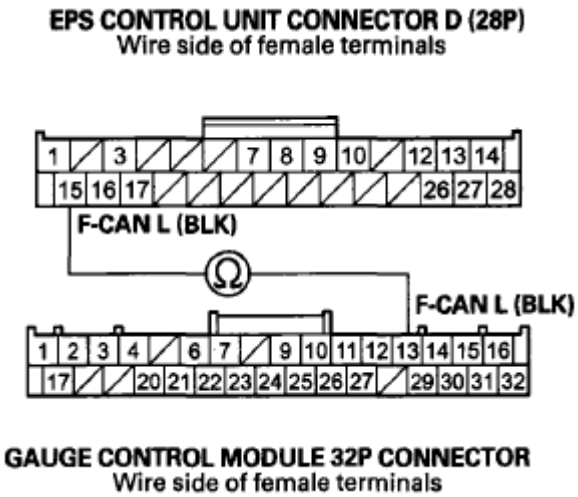

Fig. 66: Checking Continuity Between EPS Control Unit Connector D (28P) Terminal No. 15 And

Gauge Control Module 32P Connector Terminal No. 13
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose terminals in the EPS control unit connectors, and repair if necessary. If no poor connections are found, replace the EPS control unit (see **EPS CONTROL UNIT REMOVAL/INSTALLATION**).

NO - Repair an open in the wire between the EPS control unit and the gauge control module.

STEERING GEARBOX REMOVAL AND INSTALLATION

Special Tools Required

- Ball Joint Thread Protector, 12 mm 07AAF-SDAA100
- Ball Joint Remover, 28 mm 07MAC-SL0A202
- Engine Support Hanger, A and Reds AAR-T1256*
- Engine Hanger Balance Bar VSB02C000019*
- 2008 V6 Attachment Arm SIL02C000033*
- Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
- Subframe Adapter VSB02C000016*
- Subframe Alignment Pin 070AG-SJAA10S

*Available through the Acura Tool and Equipment Program, 888-424-6857.

Note these items during removal and installation:

- Using clean solvent and a brush, wash any oil and dirt off the end of the steering gearbox. Avoid any electrical parts. Blow dry with compressed air.
- Lower the front subframe from the body, and remove the steering gearbox through the gap produced by lowering the front subframe.

REMOVAL

1. Disconnect the hood support struts from the pivot ball on both sides (bolted to the hood). Raise and secure the hood in a vertical position. Remove the passenger's side pivot ball and install it into the lower threaded hole, then reattach the support strut.

NOTE: Do not attempt to close the hood with the support strut in the vertical position, as it will damage the support strut and hood.

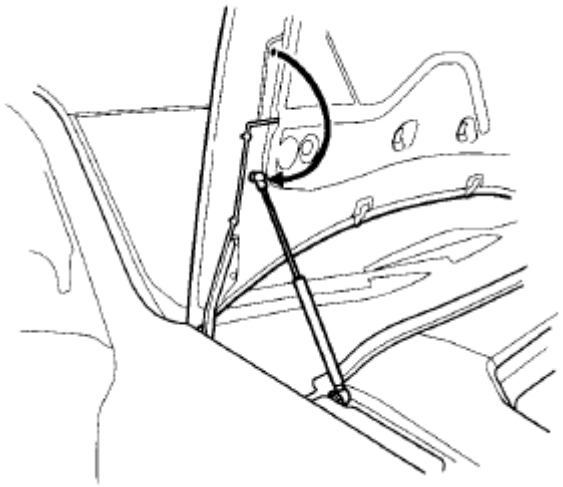

Fig. 67: Disconnecting Hood Support Struts From Pivot Ball On Both Sides
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the engine compartment covers (see **ENGINE COMPARTMENT COVER REPLACEMENT**).
3. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Remove the front strut brace (see **FRAME BRACE REPLACEMENT**).
5. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
6. Remove the front wheels.
7. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
8. Remove the steering joint cover (A).

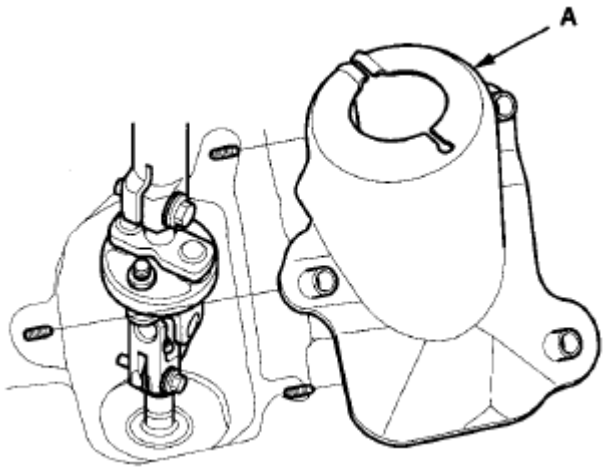

Fig. 68: Identifying Steering Joint Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Center the steering wheel spokes, and install a commercially available steering wheel holder tool (A).

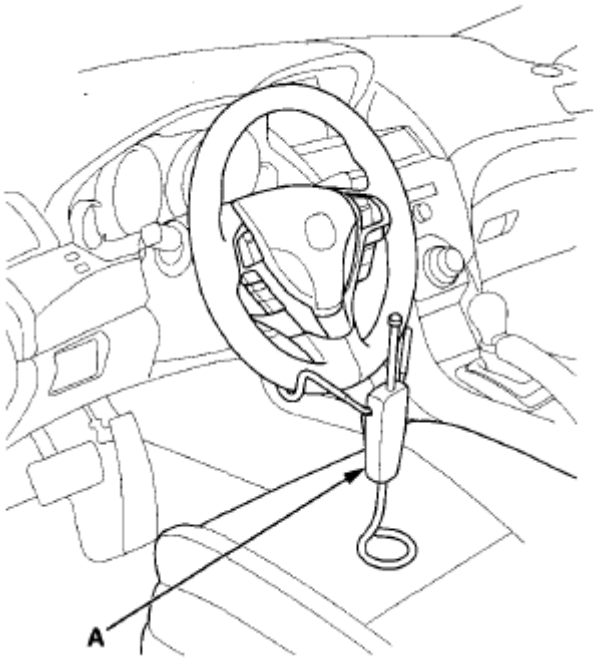

Fig. 69: Identifying Steering Wheel Holder Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Loosen the upper steering joint bolt (A), and remove the lower steering joint bolt (B). Disconnect the steering joint (C) by sliding the steering joint into the column shaft (D). Tighten the upper steering joint bolt to hold the steering joint in place.

NOTE: Do not disconnect the steering joint from the column shaft.

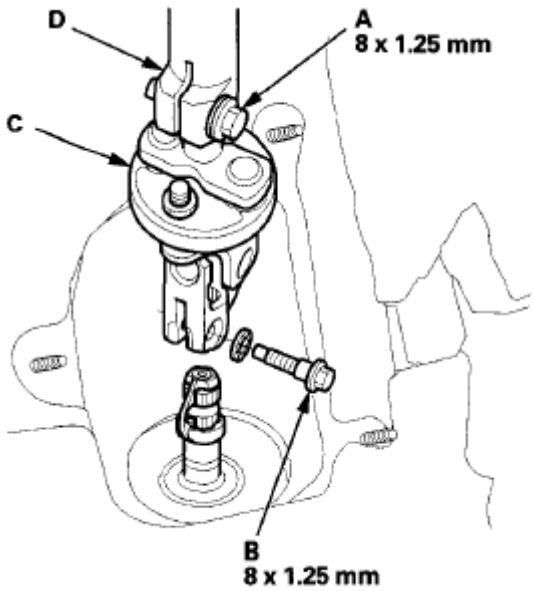

Fig. 70: Identifying Steering Joint, Column Shaft, Upper And Lower Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the center guide (A) (if equipped) from the top of the pinion shaft (B), and discard it.

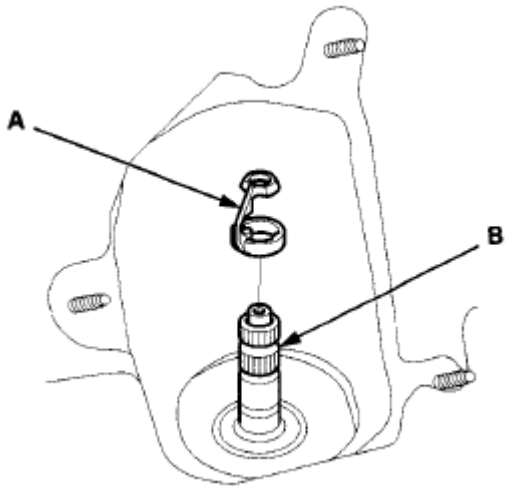

Fig. 71: Identifying Center Guide And Pinion Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Wrap vinyl tape over the splines on the pinion shaft.
13. Remove the cotter pin (A) from the tie-rod end ball joint, then remove the nut (B) on both sides.

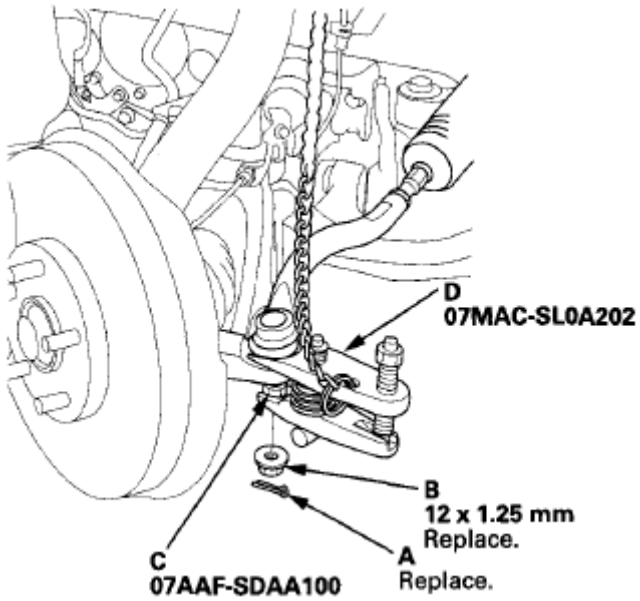

Fig. 72: Identifying Ball Joint Thread Protector, Remover, Cotter Pin And Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Disconnect the tie-rod end ball joint from the knuckle using the ball joint thread protector (C) and the ball joint remover (D) (see **BALL JOINT REMOVAL**).

NOTE: Be careful not to damage the ball joint boot when installing the remover.

15. Remove the power steering heat shield (A).

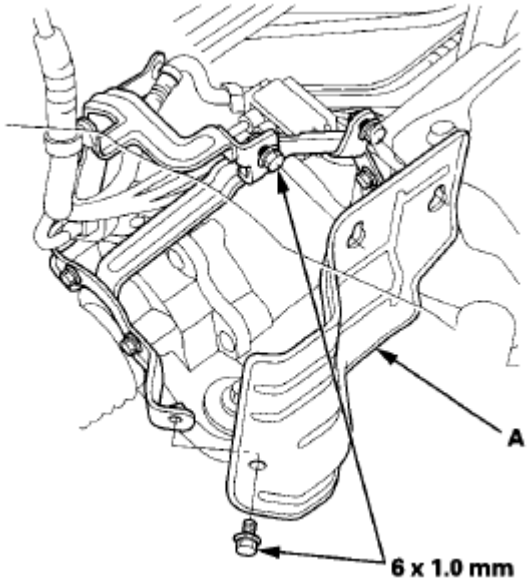

Fig. 73: Identifying Power Steering Heat Shield
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Disconnect the EPS subharness 12P connector (A) and the EPS subharness 3P connector (B) by pushing the lock (C) and pulling up the lever (D).

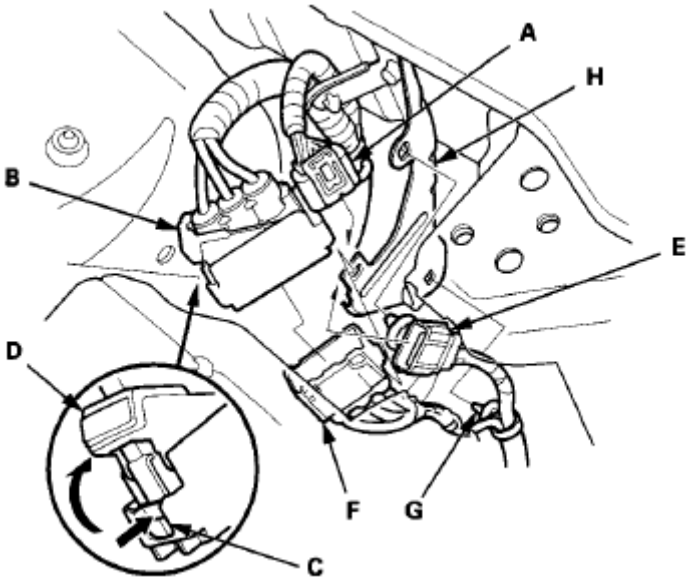

Fig. 74: Identifying EPS Subharness 12P Connector, 3P Connector, Lock, Lever, Harness Bracket And Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the EPS subharness 12P connector (E), the EPS subharness 3P connector (F), and the harness clip (G) from the harness bracket (H).
18. Wrap the connectors with vinyl tape to avoid contamination from grease or water.
19. Remove the harness clips (A), then remove the heat shield bracket (B) from the steering gearbox.

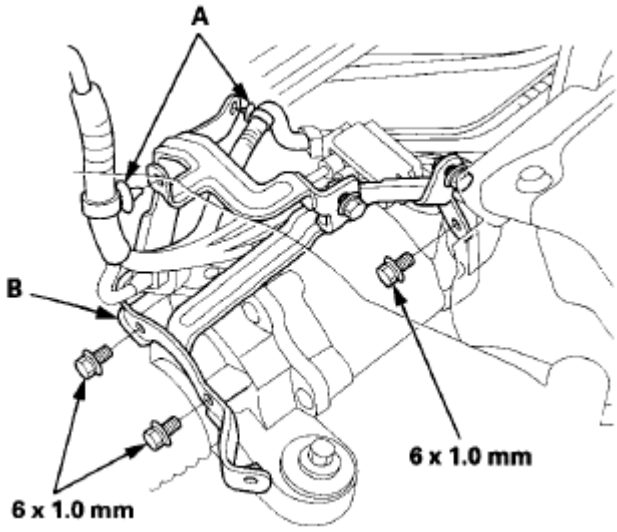

Fig. 75: Identifying Heat Shield Bracket And Harness Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Remove the steering gearbox mounting bolts (A) and washers (B) from the steering gearbox.

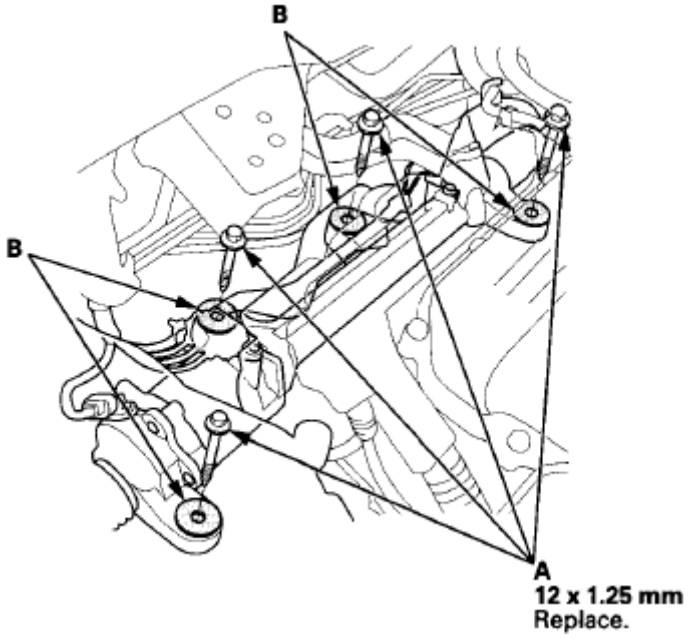

Fig. 76: Identifying Steering Gearbox Mounting Bolts And Washers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Remove the bolt (A) securing the connector bracket (B) from the front cylinder head; use the bracket bolt hole (C) to attach the engine hanger balance bar front arm.

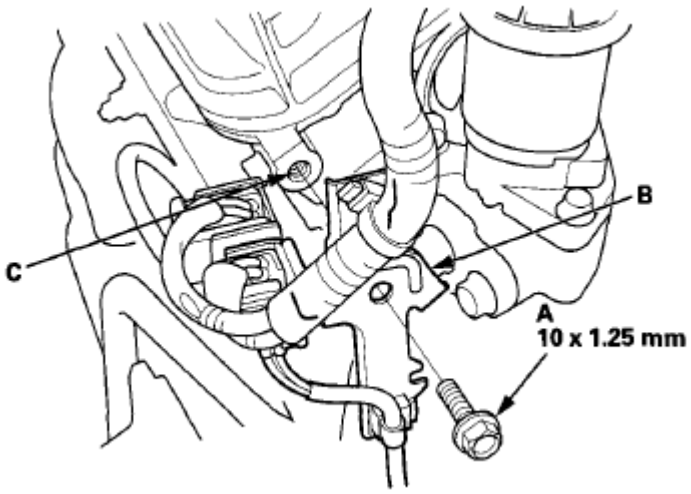

Fig. 77: Identifying Connector Bracket, Bracket Bolt Hole And Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Remove the harness clamp (A), then remove the bolt (B) securing the engine mount control solenoid valve bracket (C) from the rear cylinder head; use the bracket bolt hole (D) to attach the 2008 V6 attachment arm.

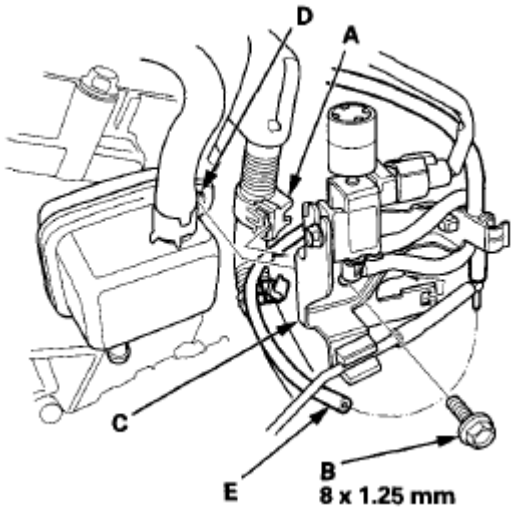

Fig. 78: Identifying Harness Clamp, Control Solenoid Valve Bracket, Bracket Bolt Hole, Vacuum Hose And Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. A/T: Disconnect the vacuum hose (E).
24. Install the engine hanger balance bar (VSB02C000019). Attach the front arm (A) to the front cylinder head with a 10 mm (0.39 in) spacer (B) and a 10 x 1.25 mm bolt (C). Remove the rear arm from the

engine hanger balance bar, then install the 2008 V6 attachment arm (SIL02C000033). Attach the 2008 V6 attachment arm to the rear cylinder head with a 10 mm (0.39 in) spacer (D) and an 8 x 1.25 mm bolt (E).

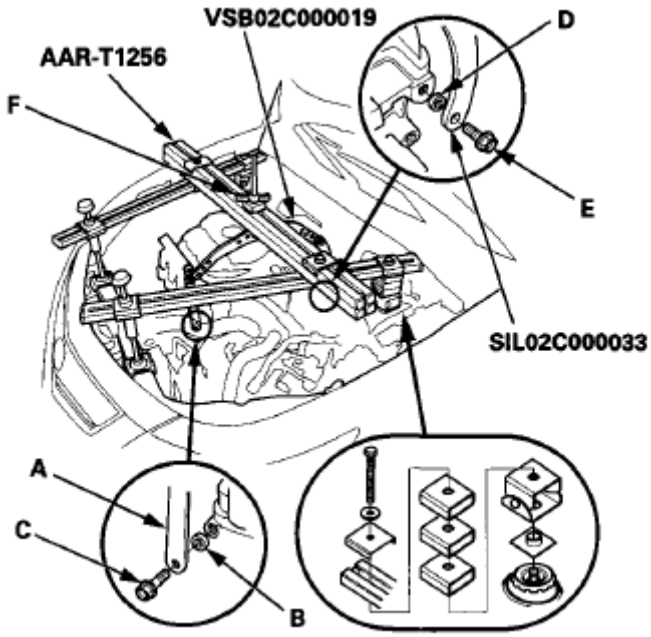

Fig. 79: Identifying Front Arm, Spacers, Bolts And Wing Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Install the engine support hanger (AAR-T1256) onto the vehicle as shown above, and attach the hook to the slotted hole in the engine hanger balance bar. Tighten the wing nut (F) by hand, and lift and support the engine/transmission.

NOTE:

- **Be careful when working around the windshield.**
- **AAR-T1256 two sets required for stacking two cross section bars.**

26. Remove the front engine mount stop (A) and the vacuum hose bracket (B), then remove the front engine mount bolt (C).

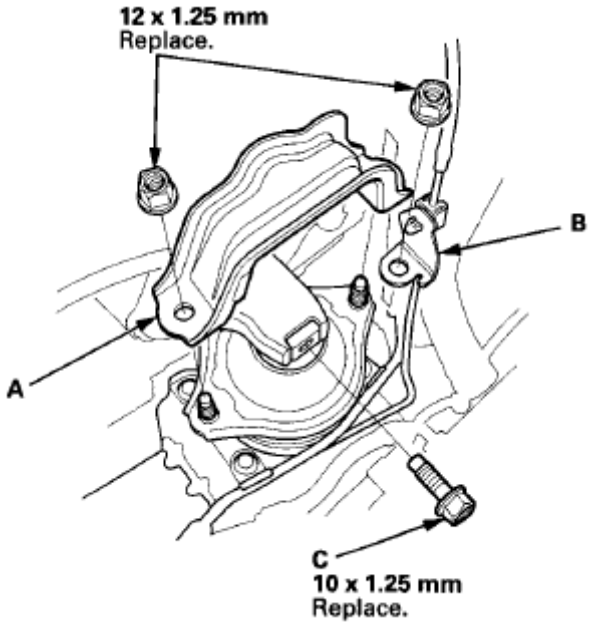

Fig. 80: Identifying Vacuum Hose Bracket, Front Engine Mount Stop And Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. M/T: Remove the front engine mount bolts (A), then remove the front engine mount (B), and disconnect the vacuum hose (C).

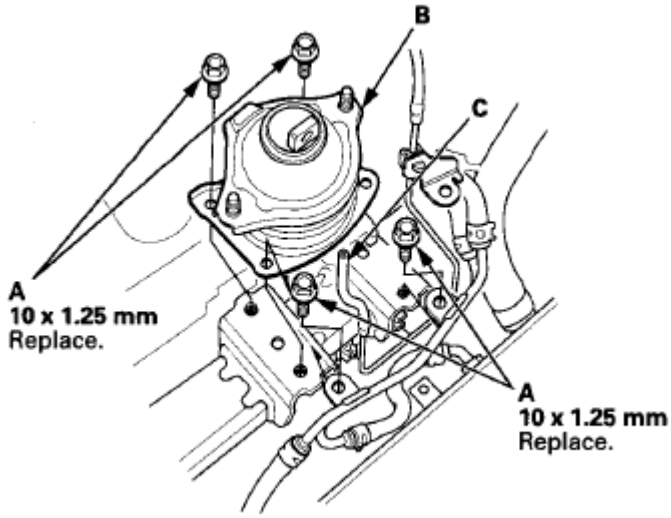

Fig. 81: Identifying Vacuum Hose, Front Engine Mount And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. M/T: Remove the rear engine mount (A).

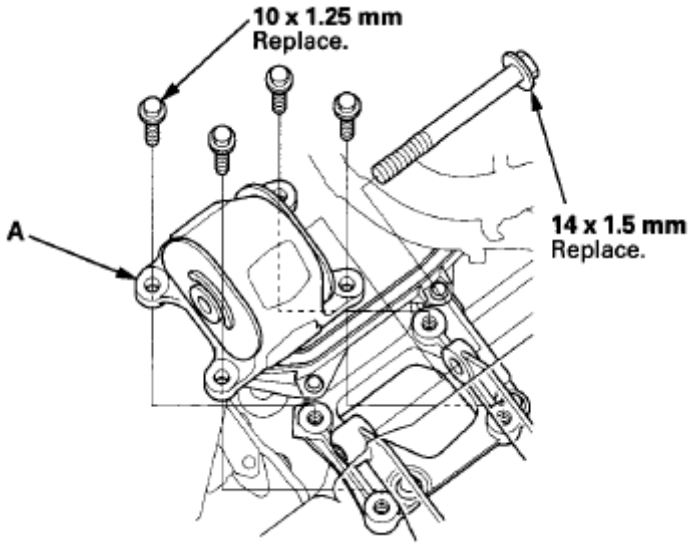

Fig. 82: Identifying Rear Engine Mount
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. A/T: Remove the rear engine mount stop (A) and the heat shield (B), then remove the rear engine mount (C).

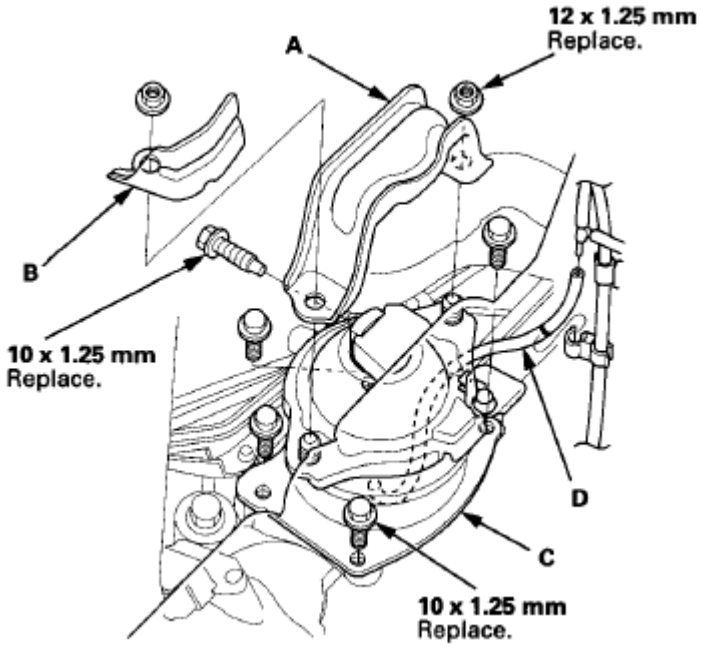

Fig. 83: Identifying Vacuum Hose, Heat Shield, Rear Engine Mount And Stop
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. A/T: Disconnect the vacuum hose (D).
31. Remove the EPS subharness holder (A), then remove the rear engine mount base (B).

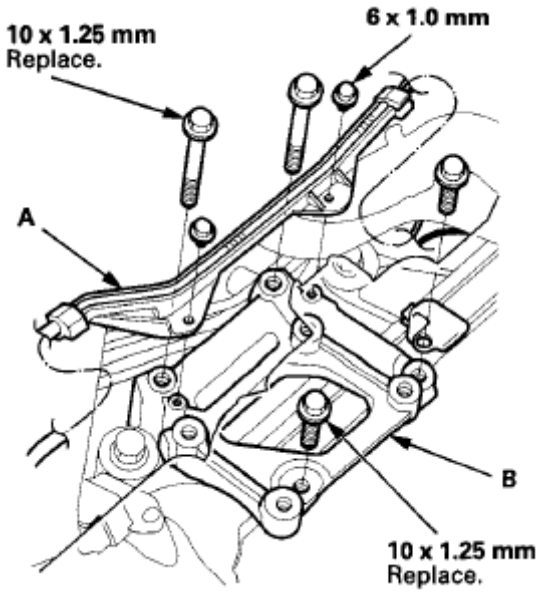

Fig. 84: Identifying EPS Subharness Holder And Rear Engine Mount Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Raise the vehicle on a lift.
33. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
34. Remove the front subframe stiffener (A).

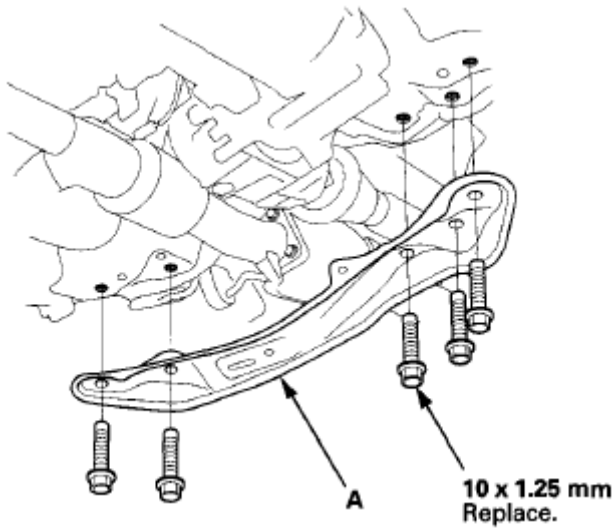

Fig. 85: Identifying Front Subframe Stiffener
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Remove exhaust pipe A:
    - Without SH-AWD (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**)
    - With SH-AWD (see **J37A4 ENGINE (WITH SH-AWD)**)

36. With SH-AWD: Remove the propeller shaft (see **PROPELLER SHAFT REMOVAL**).
37. M/T: Remove the transfer assembly (see **TRANSFER ASSEMBLY FLUID INSPECTION AND REPLACEMENT**).
38. Remove the cotter pin (A) from the knuckle ball joint, then remove the castle nut (B).

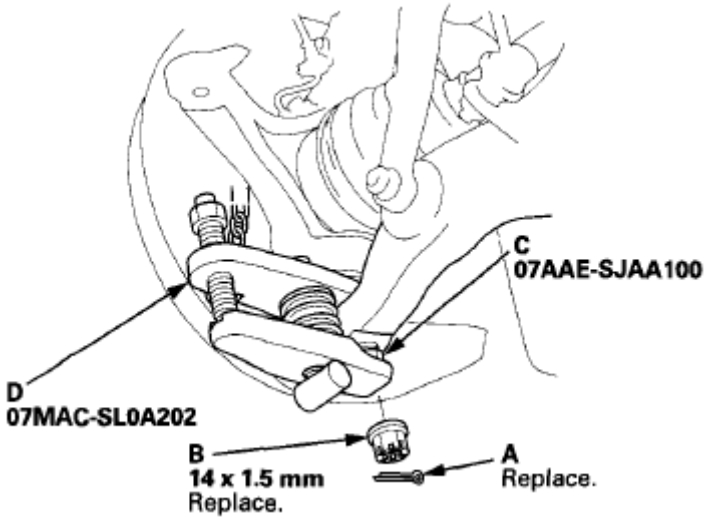

Fig. 86: Identifying Ball Joint Thread Protector, Remover, Cotter Pin And Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Disconnect the knuckle ball joint from the lower arm using the ball joint thread protector (C) and the ball joint remover (D) (see **BALL JOINT REMOVAL**).

NOTE:

- **Be careful not to damage the ball joint boot when installing the remover.**
- **Do not force or hammer on the lower arm, or pry between the lower arm and the knuckle. You could damage the ball joint.**

40. Remove the damper fork mounting nut (A) while holding the mounting bolt (B), then remove the mounting bolt.

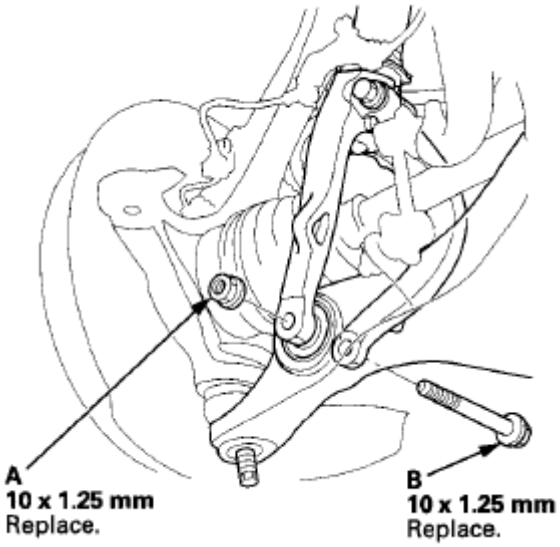

Fig. 87: Identifying Damper Fork Mounting Nut And Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Remove the front subframe middle mount (A) on both sides.

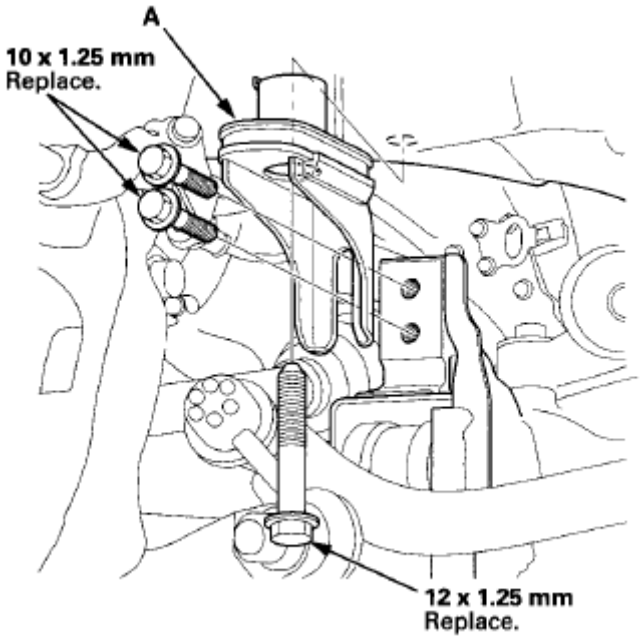

Fig. 88: Identifying Front Subframe Middle Mount
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Remove the nuts (A) securing the lower transmission mount.

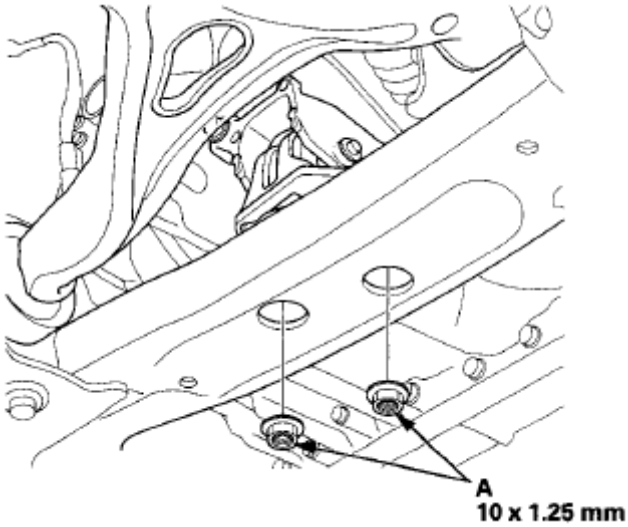

Fig. 89: Identifying Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Attach the subframe adapter (A) to a transmission jack, then raise up the jack to the subframe. Hang the belt (B) over the front of the subframe, then secure the belt by inserting the stop (C) and then tighten the wing nut (D).

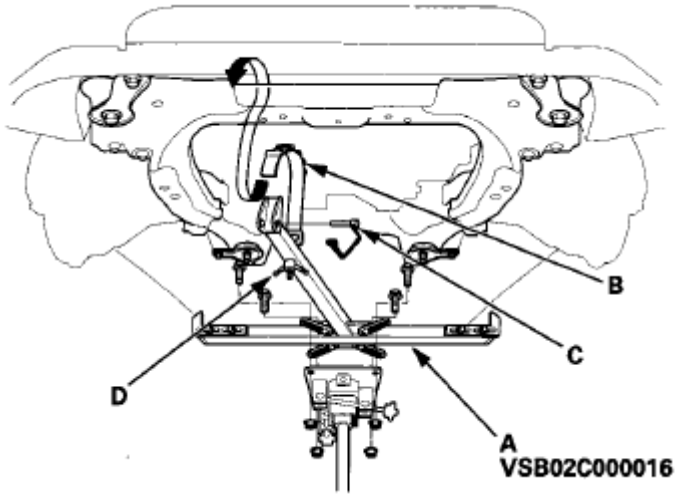

Fig. 90: Identifying Subframe Adapter, Belt, Stop And Wing Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Remove the stiffener mounting bolt (A) on both sides.

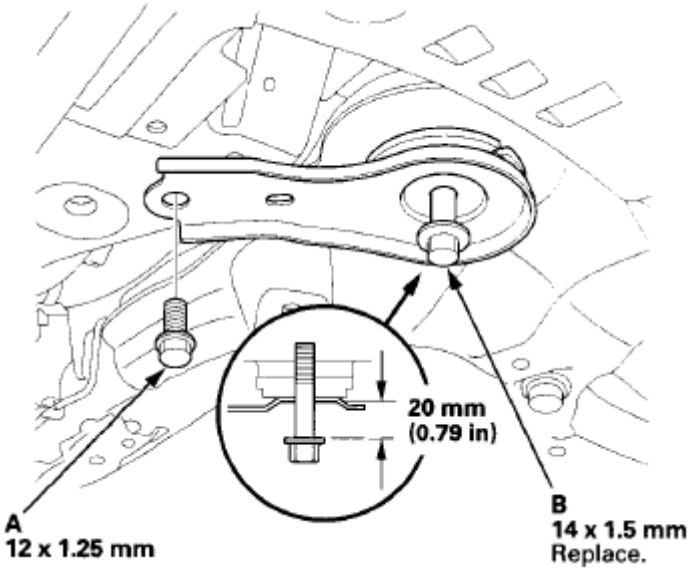

Fig. 91: Identifying Stiffener And Subframe Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Loosen the subframe mounting bolt (B) on both sides so they are about 20 mm (0.79 in) from the mounting surface. Do not loosen the front subframe mounting bolts more than necessary.
46. Remove the stiffener mounting bolt (A) and subframe mounting bolt (B) from the rear stiffeners (C) on both sides.

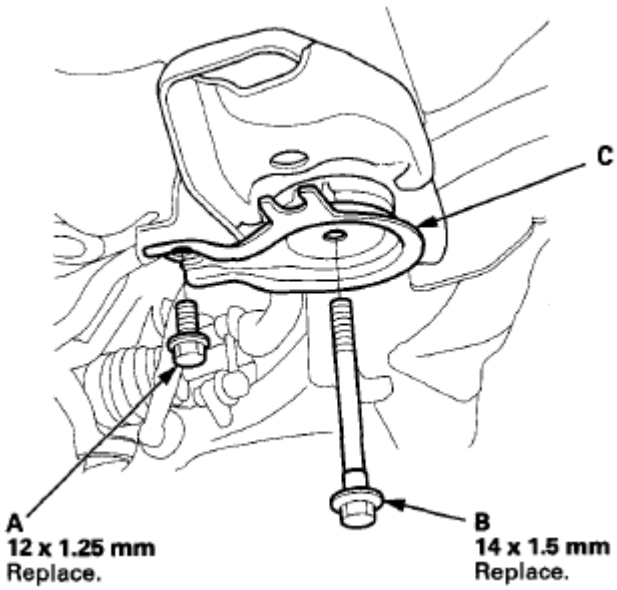

Fig. 92: Identifying Rear Stiffeners, Stiffener And Subframe Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Lower the jack slowly until the front subframe has dropped about 70 mm (2.76 in).

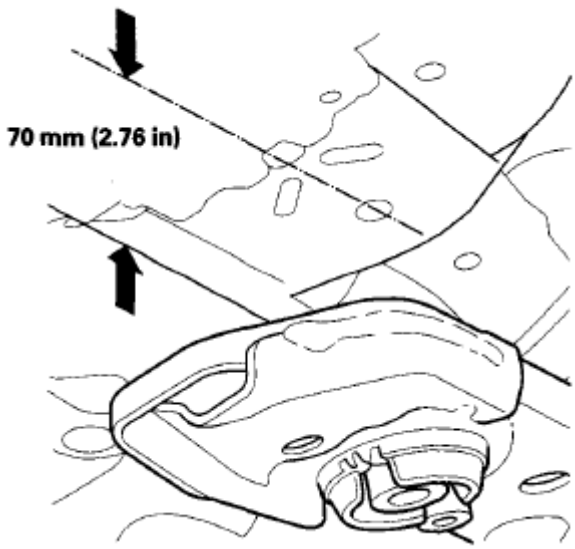

Fig. 93: Identifying Front Subframe Dropping Dimension
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Remove the EPS subharness (A) from the steering gearbox (B).

NOTE: Disconnect the EPS subharness 3P connector (C) by pushing the lock (D) and pulling down the lever (E).

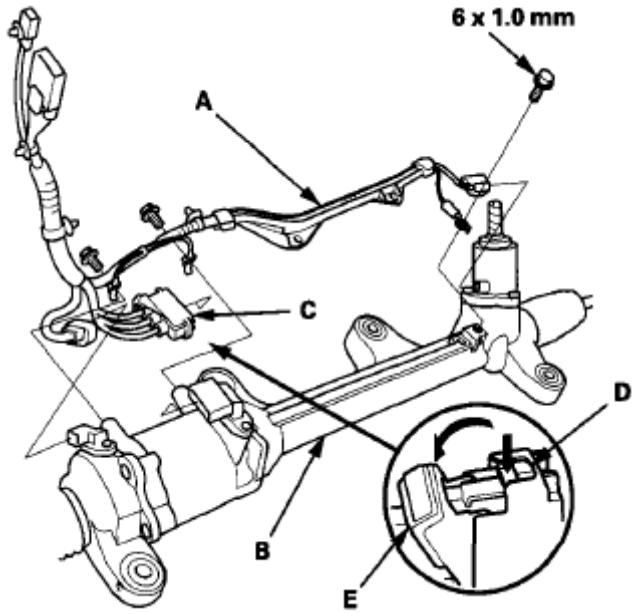

Fig. 94: Identifying EPS Subharness, 3P Connector, Steering Gearbox, Lock And Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Carefully move the steering gearbox (A) toward the driver's side until the pinion shaft clears the fenderwell opening on the body.

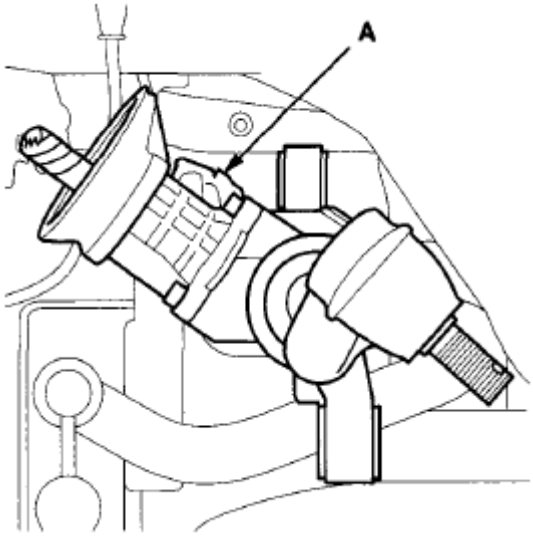

Fig. 95: Identifying Steering Gearbox
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Remove the steering gearbox (A) through the fenderwell opening on the driver's side.

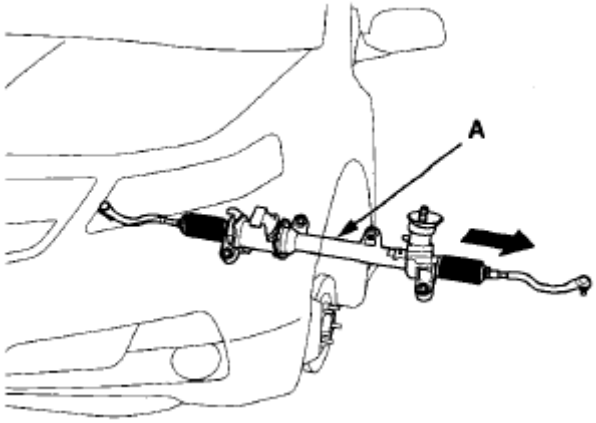

Fig. 96: Removing Steering Gearbox
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Remove the pinion shaft grommet (A) from the top of the torque sensor (B).

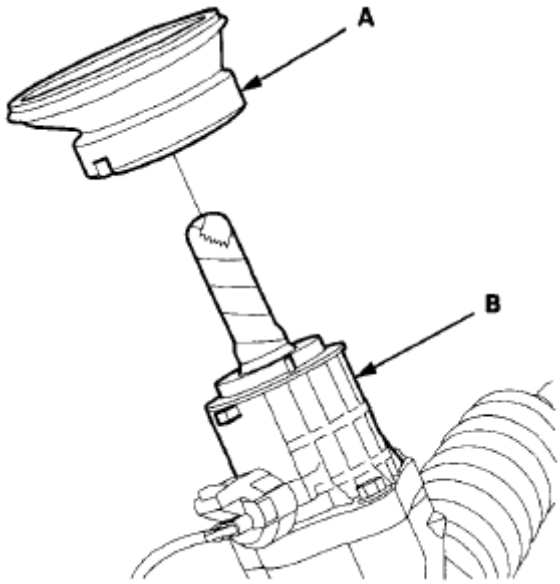

Fig. 97: Identifying Pinion Shaft Grommet And Torque Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Before installing the steering gearbox, make sure that no grease is on the mating surface of the steering gearbox and the front subframe. To prevent the gearbox mounting bolts from loosening after the installation, remove any grease from the bolt holes.
2. Wrap vinyl tape around the splines on the pinion shaft (A).

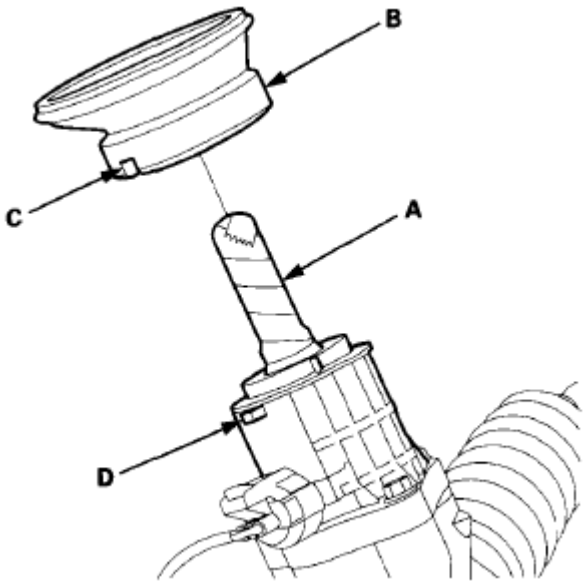

Fig. 98: Identifying Pinion Shaft, Grommet, Cutout And Lug Portion
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the pinion shaft grommet (B). Align the cutout (C) in the pinion shaft grommet with the lug portion (D) on the torque sensor. The grommet must not have a gap at the mating surface of the grommet and torque sensor.
4. Slide the steering gearbox (A) between the front subframe and the body from the driver's side.

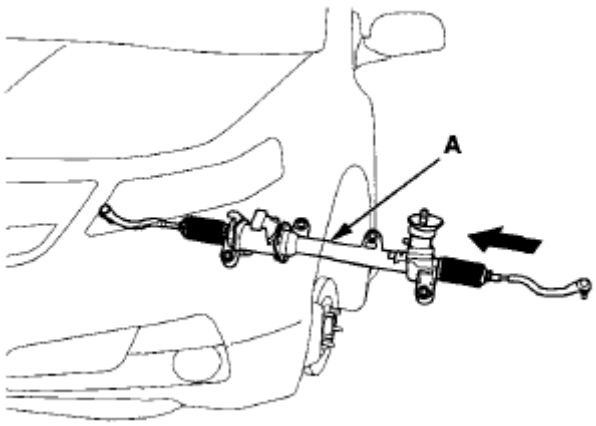

Fig. 99: Sliding Steering Gearbox Between Front Subframe And Body From Driver's Side
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Carefully move the steering gearbox (A) toward the passenger's side until the pinion shaft clears the wheelwell opening on the body.

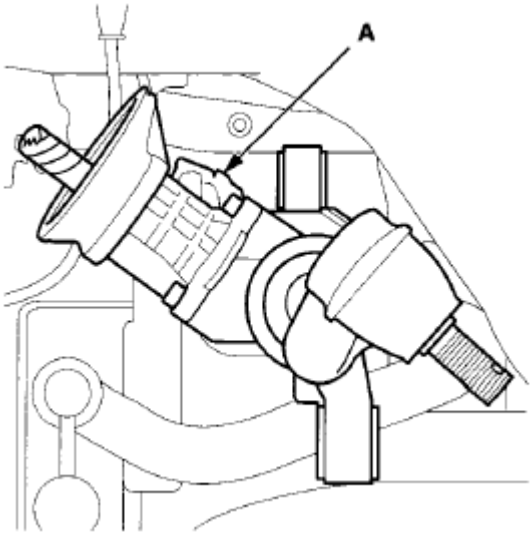

Fig. 100: Identifying Steering Gearbox
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Continue moving the steering gearbox toward the passenger's side until the steering gearbox is in position.
7. Install the EPS subharness (A) to the steering gearbox (B).

NOTE: Pull up the lever (C) of the EPS subharness 3P connector (D), then confirm the connector is fully seated.

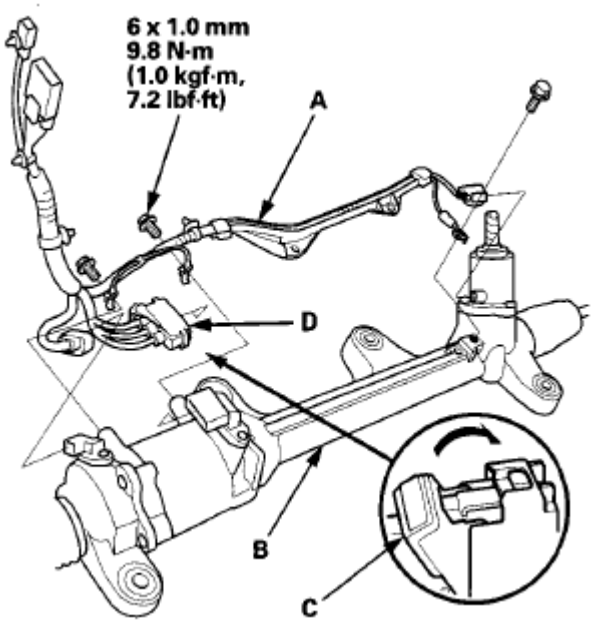

Fig. 101: Identifying EPS Subharness, 3P Connector, Steering Gearbox And Lever With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Loosely install the new right rear subframe mounting bolt (A) and the new stiffener mounting bolt (B); insert the 15.7 mm side of the subframe alignment pin (C) through the positioning slot (D) on the rear stiffener, through the positioning hole (E) on the front subframe, and into the positioning hole (F) on the body.

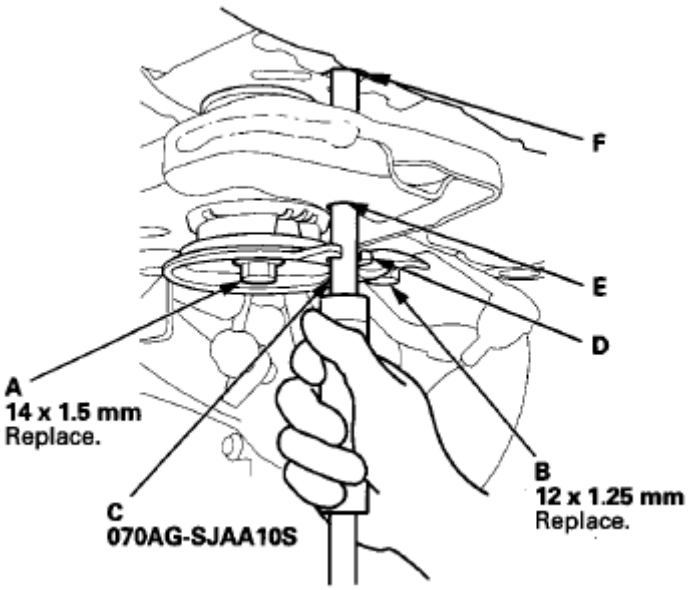

Fig. 102: Identifying Positioning Slot, Hole, Subframe Alignment Pin, Rear Subframe And Stiffener Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Loosely install the new left rear subframe mounting bolt and the new stiffener mounting bolt with the same procedure as the right rear using the subframe alignment pin.
10. Loosely install the new front subframe mounting bolt (A) and the stiffener mounting bolt (B) on both sides.

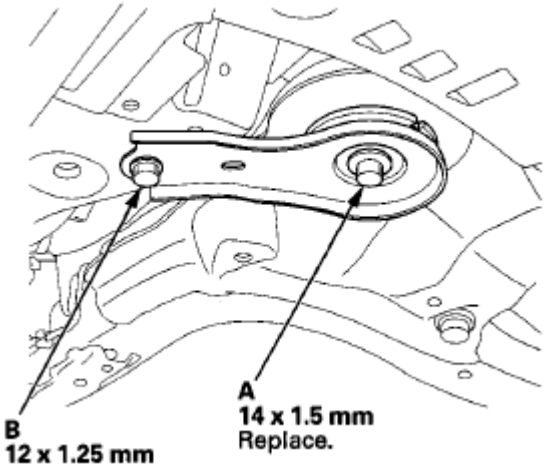

Fig. 103: Identifying Front Subframe And Stiffener Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Tighten the right rear subframe mounting bolt (A) to the specified torque.

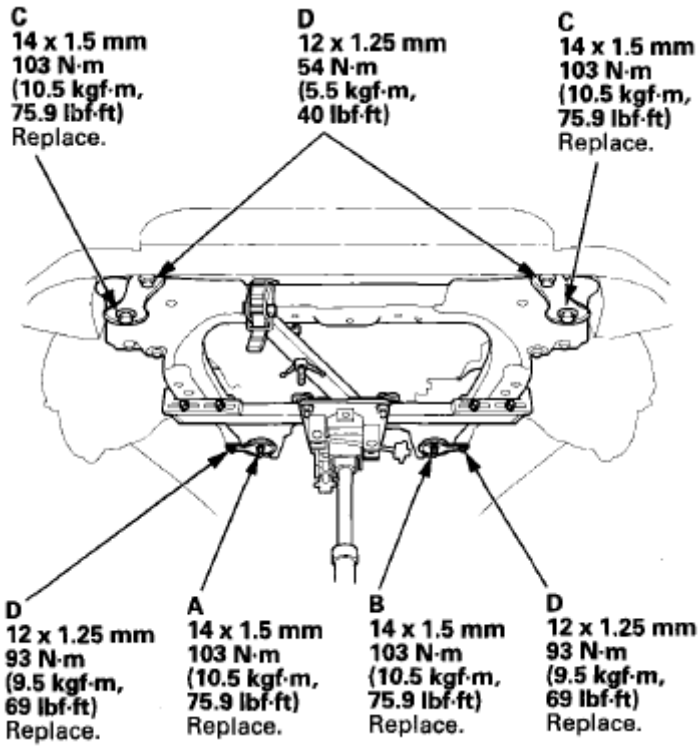

Fig. 104: Identifying Stiffener And Right, Left, Front Rear Subframe Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Tighten the left rear subframe mounting bolt (B) to the specified torque.
13. Tighten the front subframe mounting bolts (C) to the specified torque.

NOTE: Check all of the subframe mounting bolts, and retighten if necessary.

14. Tighten the stiffener mounting bolts (D) to the specified torque.

NOTE: Before tightening the stiffener mounting bolts, check that the positioning holes and slot are aligned using the subframe alignment pin.

15. Tighten the nuts (A) securing the lower transmission mount.

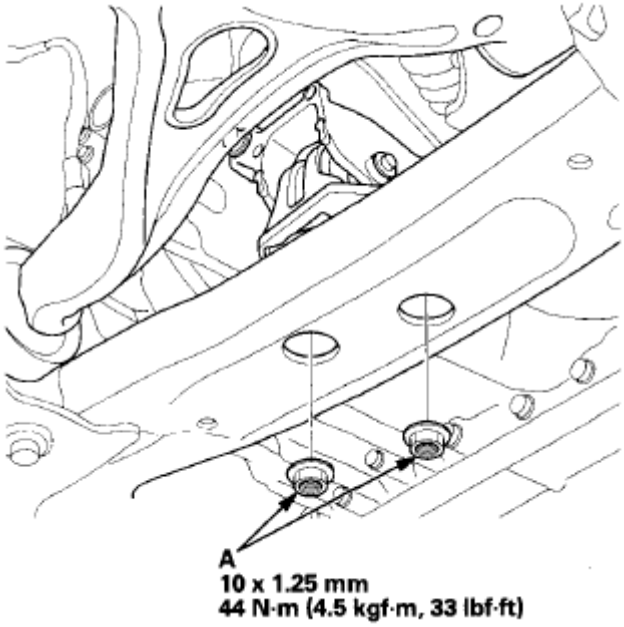

Fig. 105: Identifying Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the front subframe middle mounts (A) on both sides with new mounting bolts, and tighten them to the specified torque.

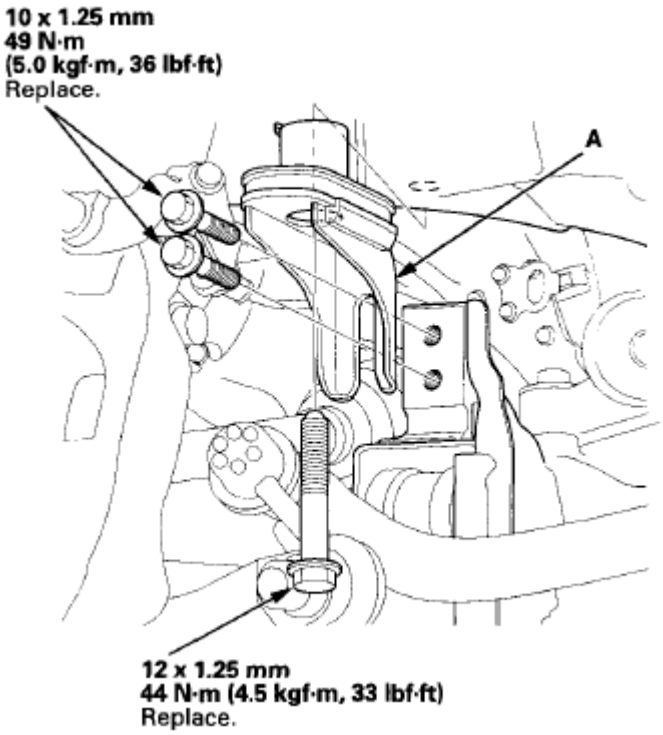

Fig. 106: Identifying Front Subframe Middle Mounts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the transmission jack supporting the front subframe.
18. Install the new damper fork mounting bolt (A) and new mounting nut (B), and loosely tighten the nut while holding the mounting bolt.

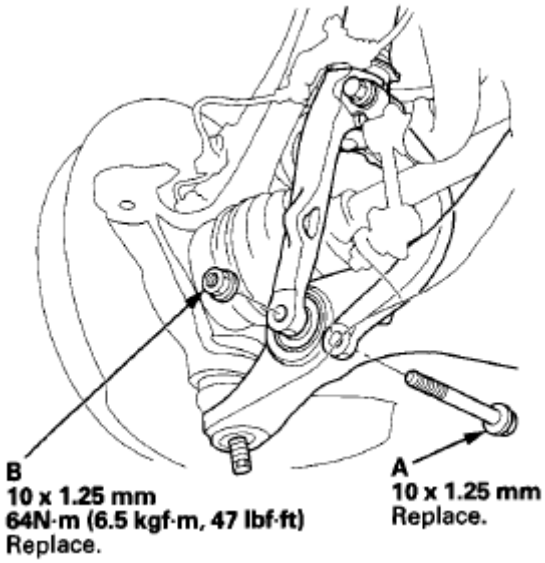

Fig. 107: Identifying Damper Fork Mounting Bolt And Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Tighten the new castle nut (A) to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.

NOTE: Insert the new cotter pin (B) into the ball joint pin hole from the front to the rear of the vehicle, and bend its end as shown in illustration below. Check the ball joint pin hole direction before connecting the ball joint.

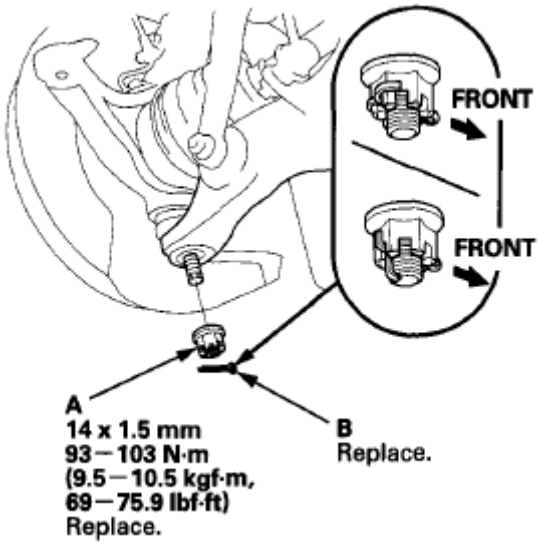

Fig. 108: Identifying Cotter Pin And Castle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. M/T: Install the transfer assembly (see **TRANSFER ASSEMBLY INSTALLATION**).
21. With SH-AWD: Install the propeller shaft (see **PROPELLER SHAFT INSTALLATION**).
22. Install exhaust pipe A:
    - Without SH-AWD (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**)
    - With SH-AWD (see **J37A4 ENGINE (WITH SH-AWD)**)
23. Install the front subframe stiffener (A).

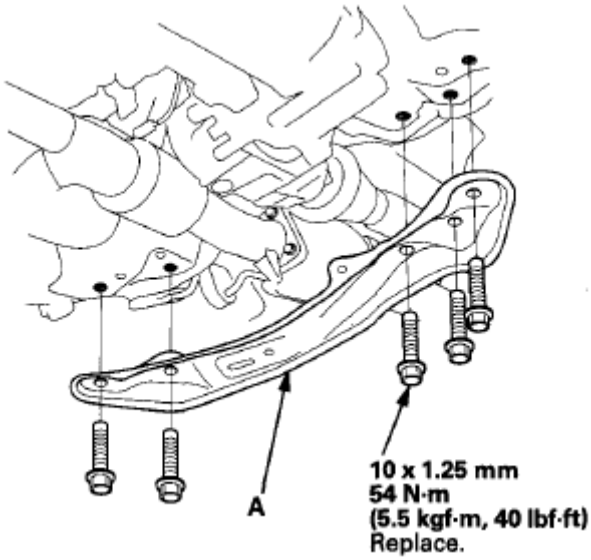

Fig. 109: Identifying Front Subframe Stiffener With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
25. Lower the vehicle.
26. Install the rear engine mount base (A), then install the EPS subharness (B).

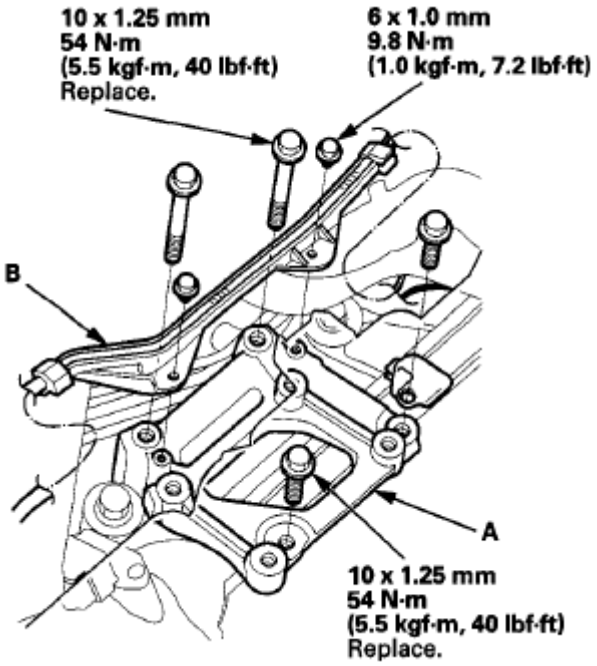

Fig. 110: Identifying Rear Engine Mount Base And EPS Subharness With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. M/T: Tighten the new rear engine mount bolts to the specified torque in the sequence shown below.

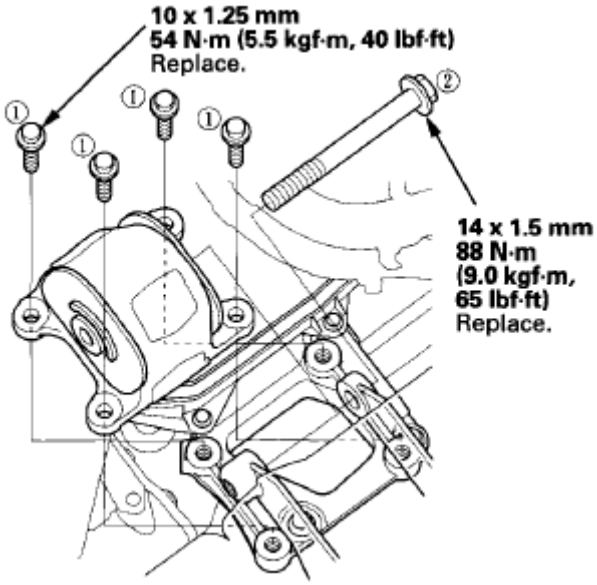

Fig. 111: Identifying Rear Engine Mount Bolts With Tightening Sequence With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. A/T: Tighten the new rear engine mount bolt (A) and (B), then install the rear engine mount stop (C) and the heat shield (D).

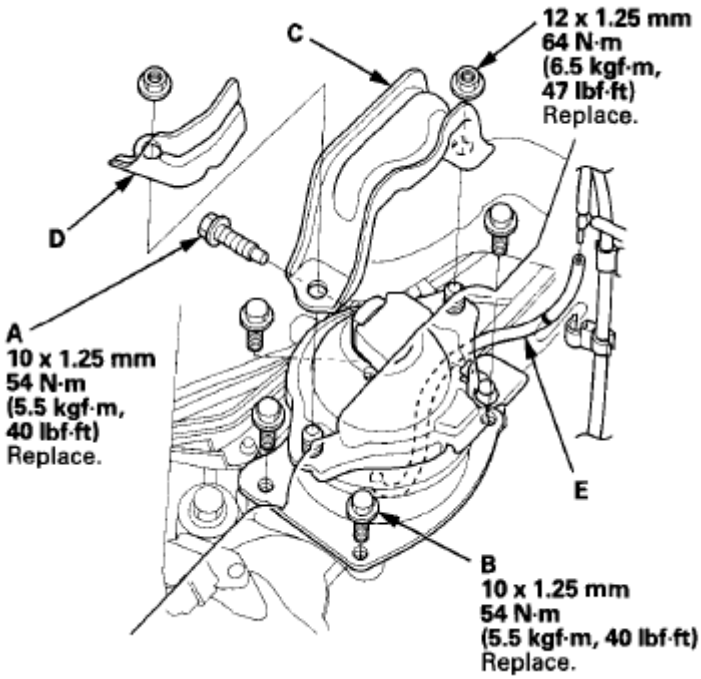

Fig. 112: Identifying Vacuum Hose, Heat Shield, Rear Engine Mount Stop And Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. A/T: Connect the vacuum hose (E).
30. M/T: Connect the vacuum hose (A), then align the front engine mount with its mounting holes, and install new front engine mount bolts (B).

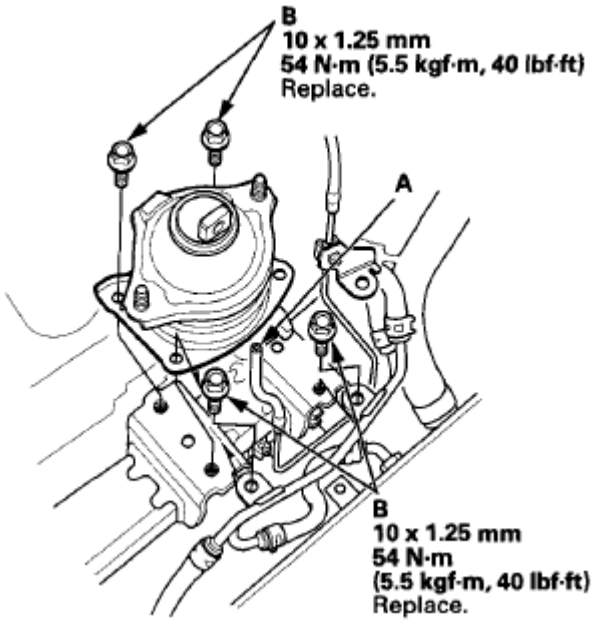

Fig. 113: Identifying Vacuum Hose And Front Engine Mount Bolts With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Tighten the new front engine mount bolt (A), then install the front engine mount stop (B) and the vacuum hose bracket (C).

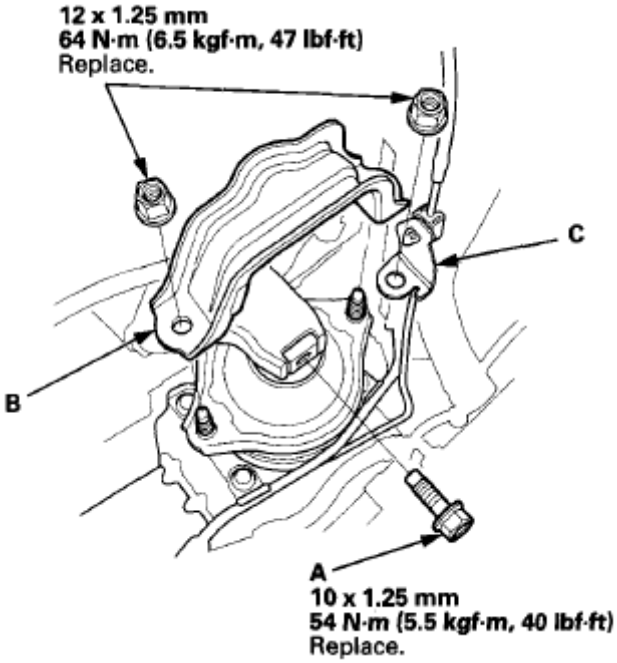

Fig. 114: Identifying Vacuum Hose Bracket, Front Engine Mount Stop And Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Remove the engine support hanger and the engine hanger balance bar.
33. Install the connector bracket (A) to the front cylinder head.

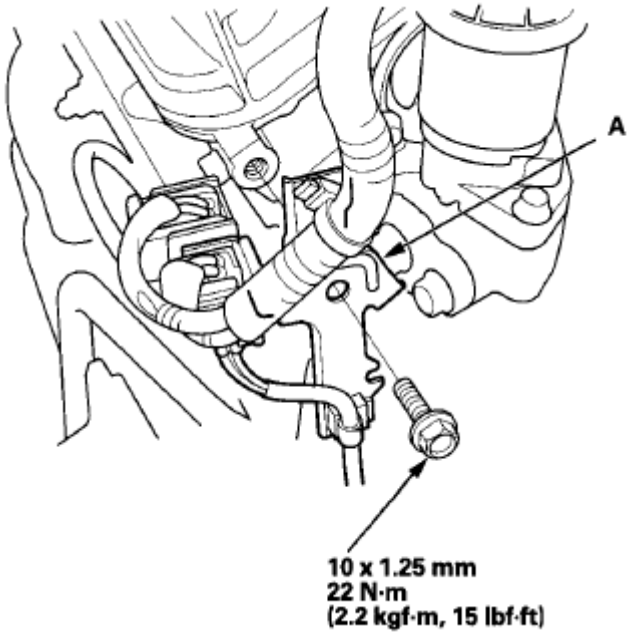

Fig. 115: Identifying Connector Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Install the engine mount control solenoid valve bracket (A) to the rear cylinder head, then install the harness clamp (B).

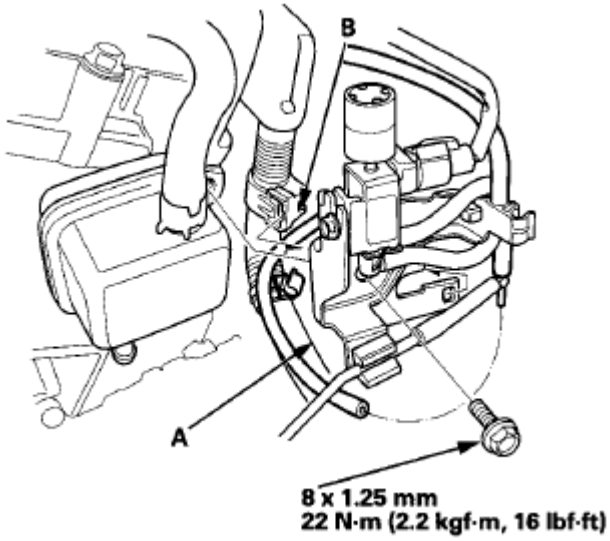

Fig. 116: Identifying Control Solenoid Valve Bracket And Harness Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Install the washers (A) and new steering gearbox mounting bolts (B) to the steering gearbox, then loosely tighten them.

NOTE: Make sure that the washers are in the correct position.

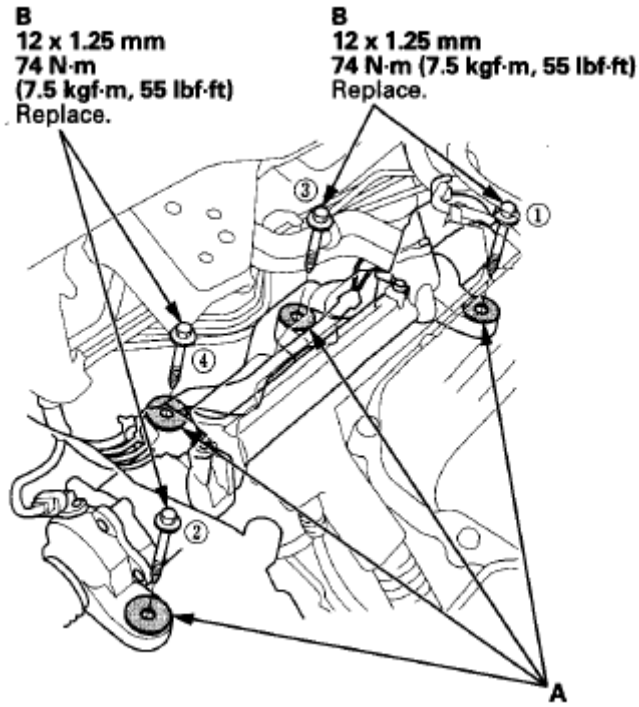

Fig. 117: Identifying Washers And Steering Gearbox Mounting Bolts With Tightening Sequence & With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Tighten the steering gearbox mounting bolts to the specified torque in the sequence shown above.

NOTE: Check all of the steering gearbox mounting bolts, and retighten if necessary.

37. Install the heat shield bracket (A) to the steering gearbox, then install the harness clips (B).

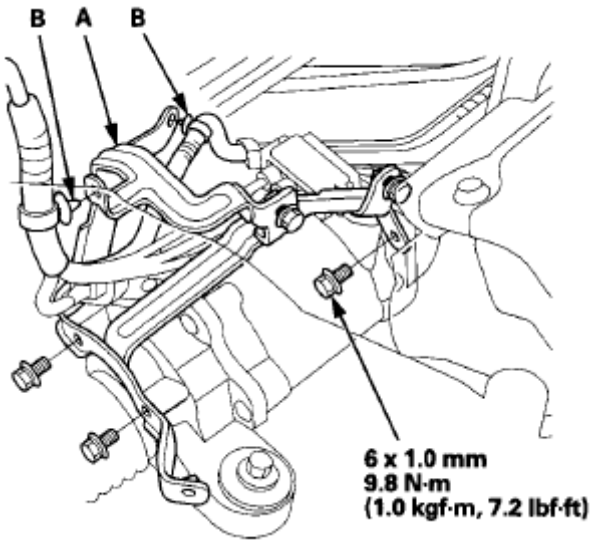

Fig. 118: Identifying Heat Shield Bracket And Harness Clips With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Remove the vinyl tape from the connectors.
39. Install the EPS subharness 12P connector (A), the EPS subharness 3P connector (B), and the harness clip (C) to the harness bracket (D).

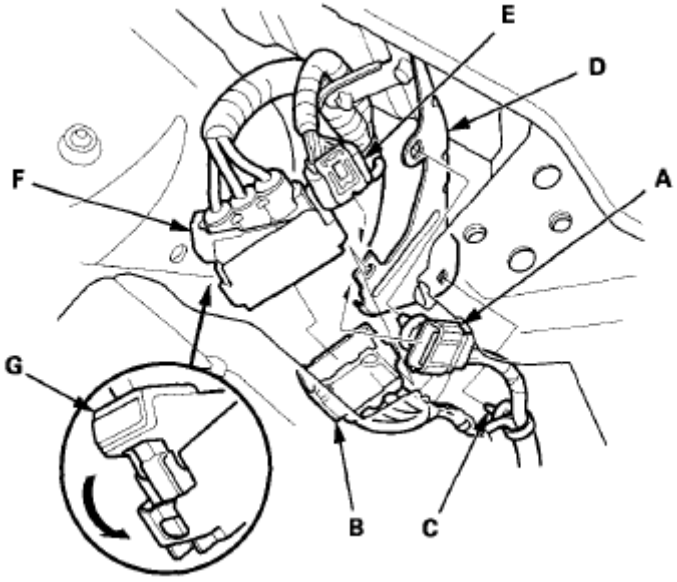

Fig. 119: Identifying EPS Subharness 12P Connector, 3P Connector, Lever, Harness Bracket And Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Connect the EPS subharness 12P connector (E) and EPS subharness 3P connector (F), and pull down the lever (G), then confirm the connector is fully seated.
41. Install the power steering heat shield (A) with the flange bolts, and tighten them to the specified torque.

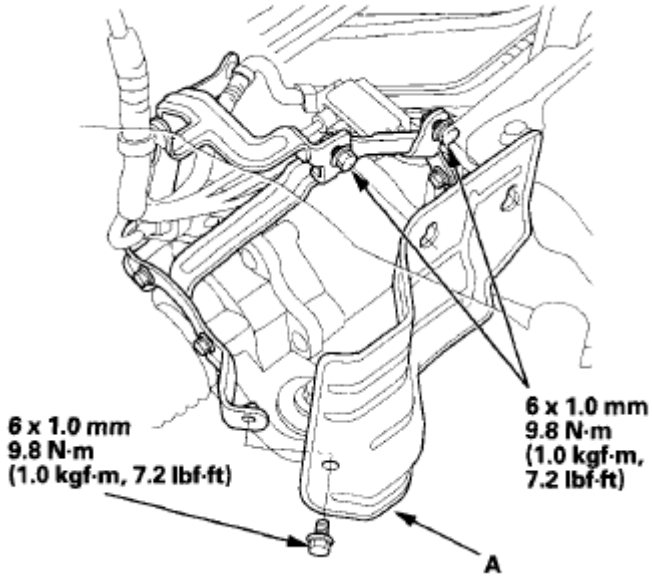

Fig. 120: Identifying Power Steering Heat Shield With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Wipe off any grease contamination from the ball joint tapered section and threads. Connect the tie-rod end ball joint (A) to the knuckle. Install the new nut (B), and tighten it to the specified torque.

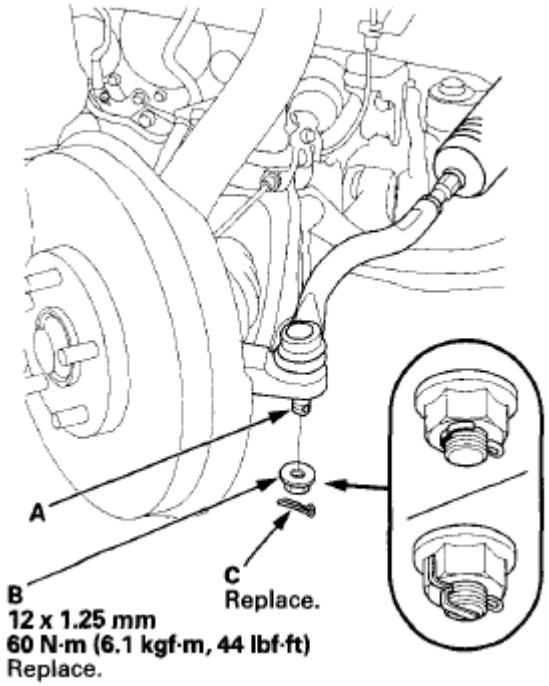

Fig. 121: Identifying Cotter Pin, Ball Joint And Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Install a new cotter pin (C), and bend it as shown above.

44. Place a floor jack under the lower arm, and raise the suspension to load it with the vehicle's weight. Do not place the jack against the ball joint pin of the knuckle.
45. Tighten the damper fork mounting nut while holding the mounting bolt to the specified torque.
46. Remove the vinyl tape around the splines on the pinion shaft.
47. Loosen the upper steering joint bolt (A), and slip the lower end of the steering joint (B) onto the pinion shaft (C) taking care to align the gap (D) within the angle.

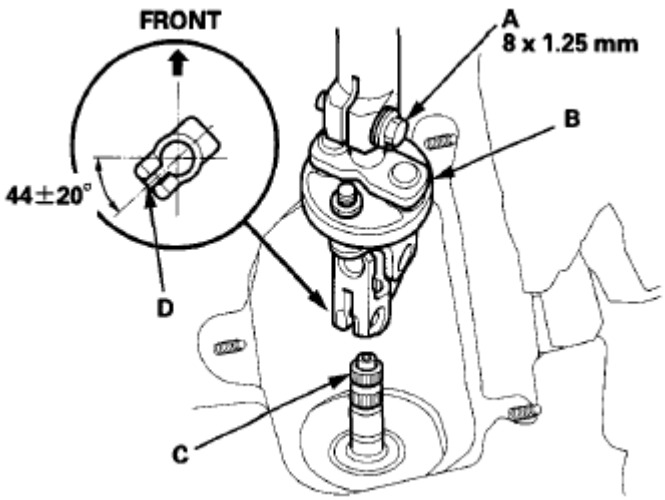

Fig. 122: Identifying Steering Joint, Pinion Shaft, Gap And Upper Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, then loosely install the lower steering joint bolt (C). Be sure that the joint bolt is securely in the groove in the pinion shaft.

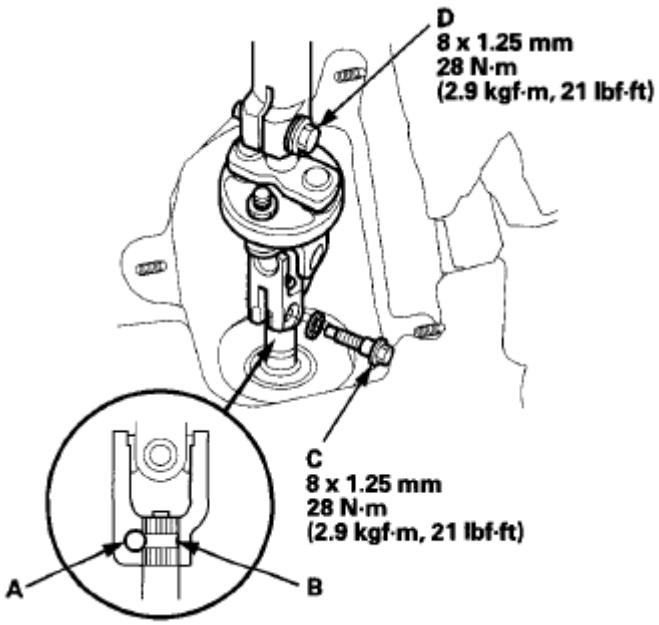

Fig. 123: Identifying Groove, Bolt Hole, Upper And Lower Steering Joint Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Pull on the steering joint to make sure that the steering joint is fully seated, then tighten the lower joint bolt to the specified torque.
50. Tighten the upper steering joint bolt (D) to the specified torque.
51. Remove the steering wheel holder tool (A).

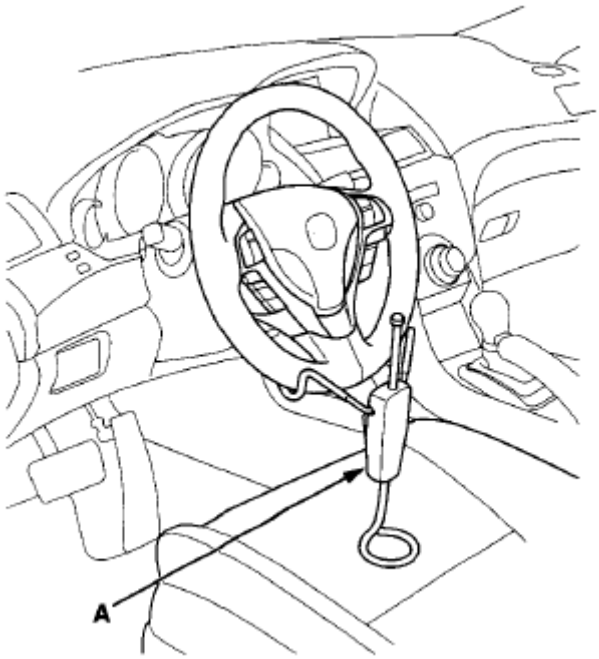

Fig. 124: Identifying Steering Wheel Holder Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Install the steering joint cover (A).

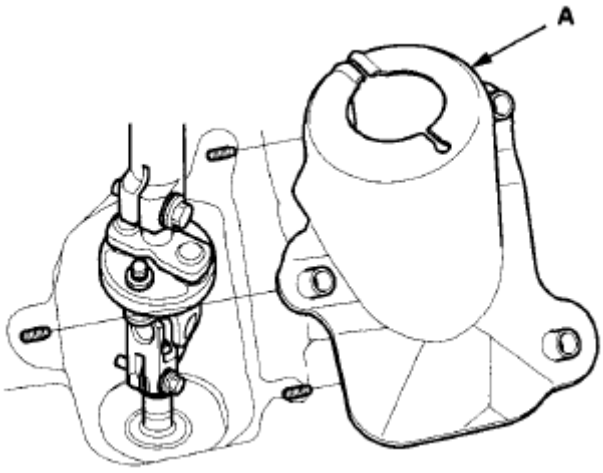

Fig. 125: Identifying Steering Joint Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Install the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
54. Install the front wheels, then set the wheels in the straight ahead position.

NOTE: Before installing the wheel, clean the mating surface between the brake disc and the inside of the wheel.

55. With the tires raised off the ground (vehicle on a lift), check for the following symptoms by turning the steering wheel fully to the right and left several times.

Symptom	Probable cause
Rubbing sound coming from the lower steering column area.	Steering column joint is contacting the cover.
Grating sound from the lower steering column area, or a rough feeling during steering.	Poor engagement of the pinion shaft splines.
Noise from around the steering wheel during steering.	Poor engagement of the SRS cable reel with the steering wheel, or a damaged cable reel.

56. Lower the vehicle.
57. Install the front strut brace (see **FRAME BRACE REPLACEMENT**).
58. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), and check these items:
    - Make sure the horn and turn signal switches work properly.
    - Make sure the steering wheel switches work properly.
59. Install the engine compartment covers (see **ENGINE COMPARTMENT COVER REPLACEMENT**).
60. Reinstall the hood support struts to the upper location on both sides of the hood.
61. After installation, check these items:
    - Start the engine, allow it to idle, and turn the steering wheel from lock to lock several times.
    - Check that the EPS indicator does not come on.
    - Check the steering wheel spoke angle. If steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft splines.
    - Do the torque sensor neutral position memorization (see **MEMORIZING THE TORQUE SENSOR NEUTRAL POSITION**).
    - With SH-AWD: Do the VSA sensor neutral position memorization (see **YAW RATE-ACCELERATION SENSOR REPLACEMENT**).
    - Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

RACK END REMOVAL AND INSTALLATION

EXPLODED VIEW

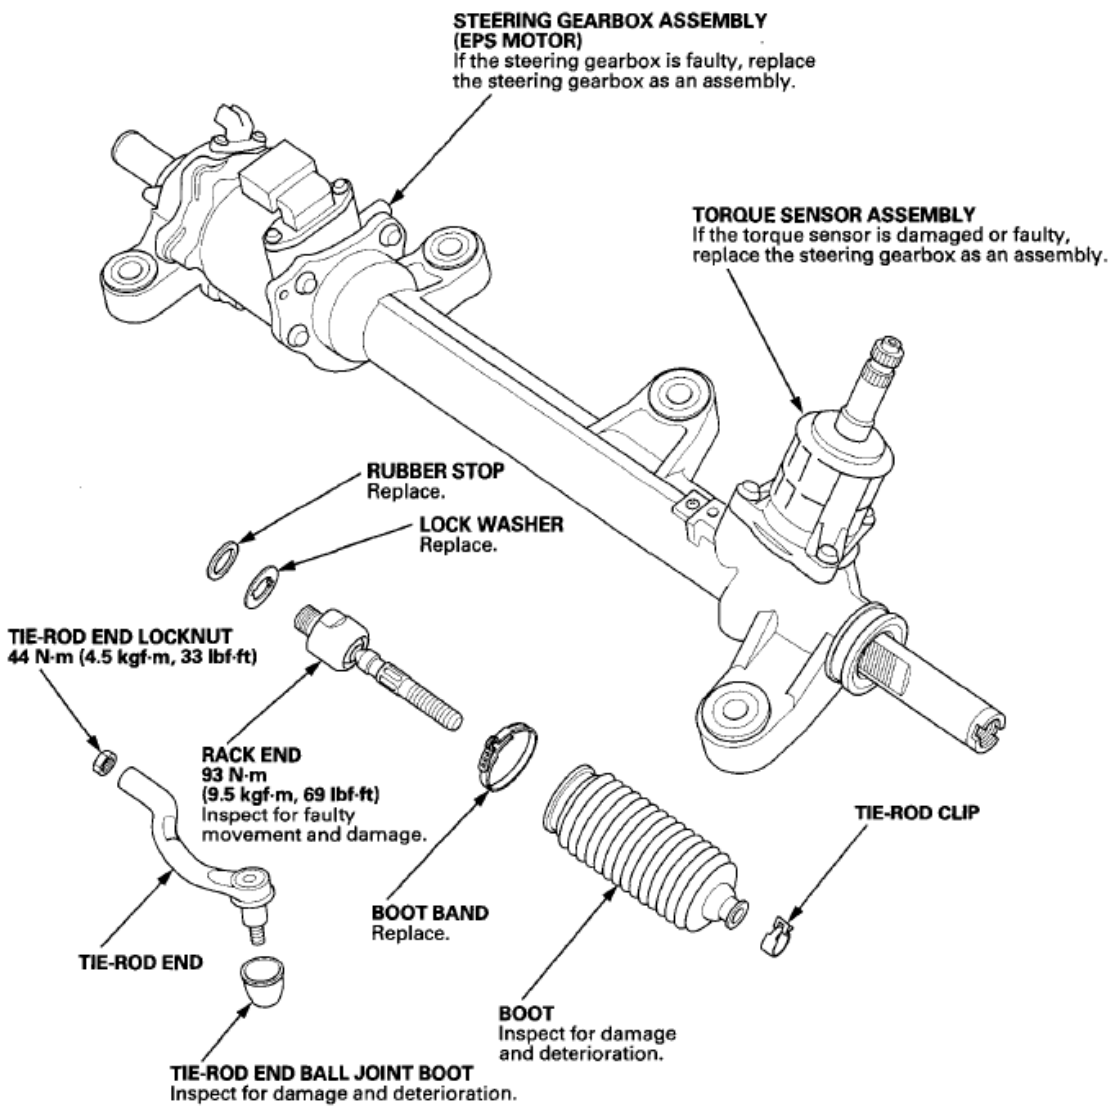

Fig. 126: Exploded View Of Rack End With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

REMOVAL

NOTE:

- **Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.**
- **Refer to the EXPLODED VIEW as needed during the following procedure.**

1. Remove the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).
2. Remove the tie-rod ends from the rack end.
3. Remove the boot band (A). Remove the tie-rod clip (B), and pull the boots away from the end of the steering gearbox. Repeat this step for the other side.

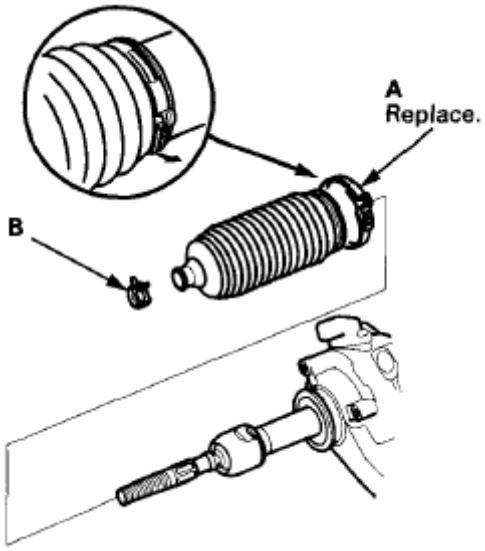

Fig. 127: Identifying Boot Band And Tie-Rod Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Hold the gearbox housing using a C-clamp (A) and wooden blocks (B) to a work bench as shown below. Do not clamp the cylinder part of the gearbox housing in a vise.

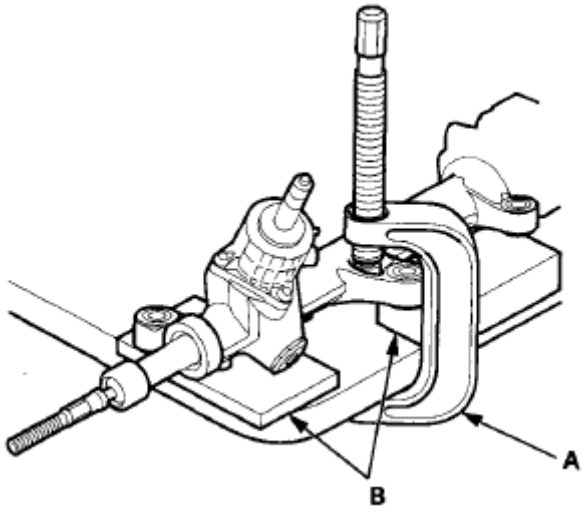

Fig. 128: Identifying C-Clamp And Wooden Blocks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Unbend the lock washer (A).

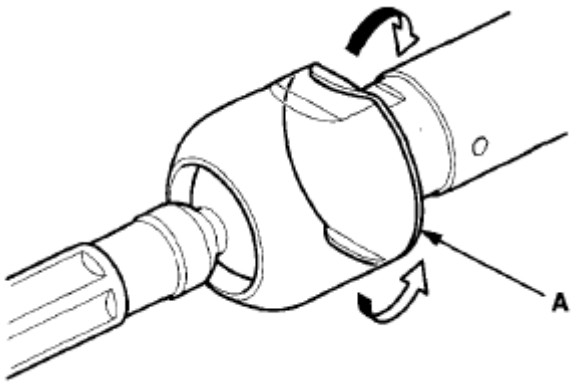

Fig. 129: Unbending Lock Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Hold the flat surface sections (A) of the steering rack (B) with one wrench, and unscrew rack end (C) with another wrench. Be careful not to damage the rack surface with the wrench.

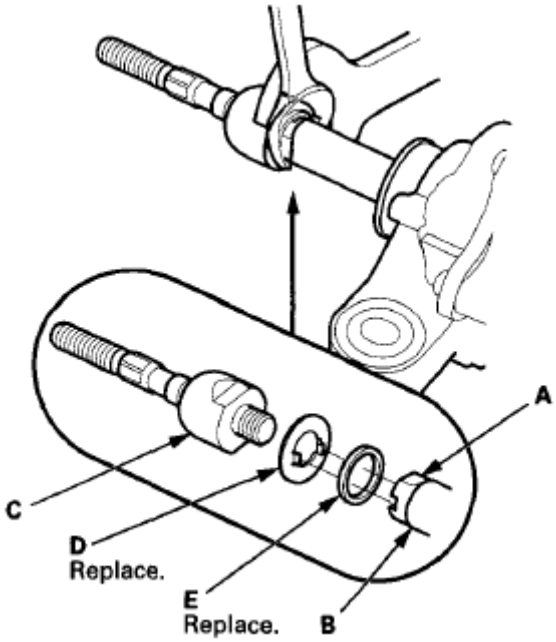

Fig. 130: Identifying Flat Surface Sections, Steering Rack, Unscrew Rack End, Lock Washer And Rubber Stop
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the lock washer (D) and the rubber stop (E). Repeat steps 5 thru 7 for the other side.

INSTALLATION

NOTE:

- **Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.**

- **Refer to the EXPLODED VIEW as needed during the following procedure.**

1. Hold the gearbox housing using a C-clamp (A) and wooden blocks (B) to a work bench as shown below. Do not clamp the cylinder part of the gearbox housing in a vise.

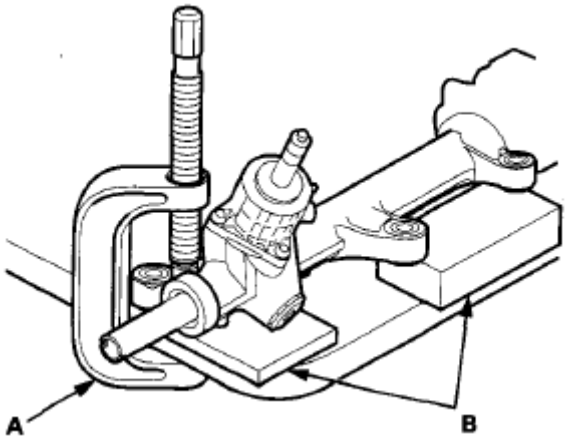

Fig. 131: Identifying C-Clamp And Wooden Blocks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new rubber stop (A) and a new lock washer (B). Align the lock washer tabs (C) with the slots (D) on the steering rack (E) while holding the lock washer in place.

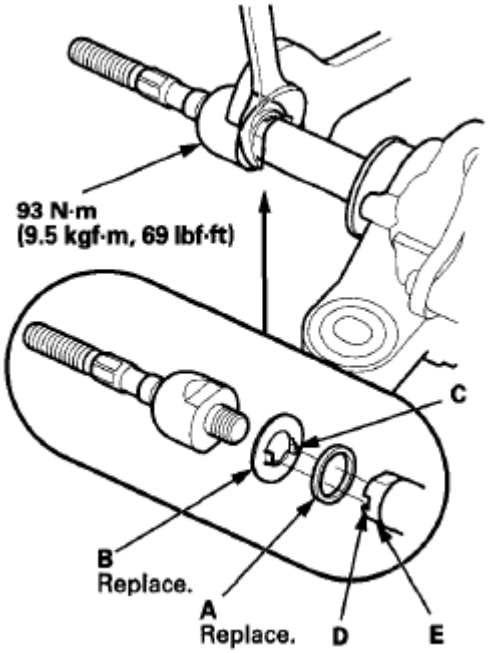

Fig. 132: Identifying Rubber Stop, Lock Washer, Lock Washer Tabs, Slots And Steering Rack With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Hold the flat surface sections of the steering rack with one wrench, and tighten both rack ends with another wrench. Be careful not to damage the rack surface with the wrench.
4. Bend the lock washer (A) back against the flat spots (B) on the rack end joint housing. Repeat steps 2 thru 4 for the other side.

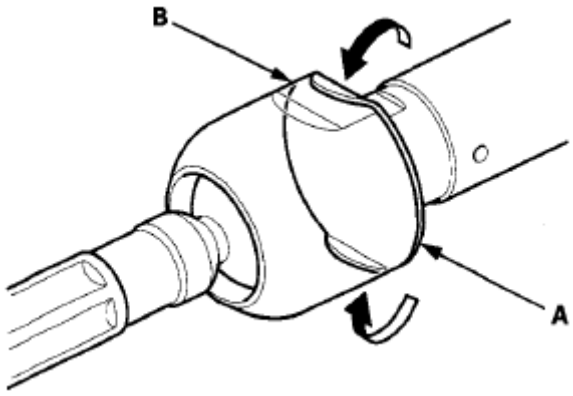

Fig. 133: Bending Lock Washer Back Against Flat Spots On Rack End Joint Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Apply multipurpose grease to the circumference of the rack end joint housing (A).

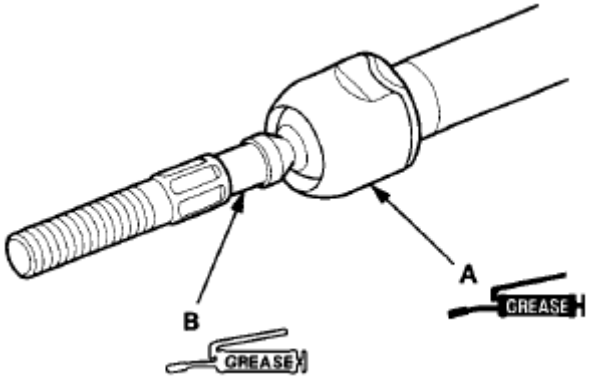

Fig. 134: Applying Multipurpose And Silicone Grease To Circumference Of Rack End Joint Housing And Boot Fitting Grooves On Rack End Respectively
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Apply a light coat of silicone grease to the boot fitting grooves (B) on the rack end.

NOTE: Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.

7. Clean off any grease or contamination from the boot installation grooves (A) around the gearbox housing. Install the boot (B) on the rack end with the tie-rod clip (C), and fit the boot end in the installation grooves in the housing properly.

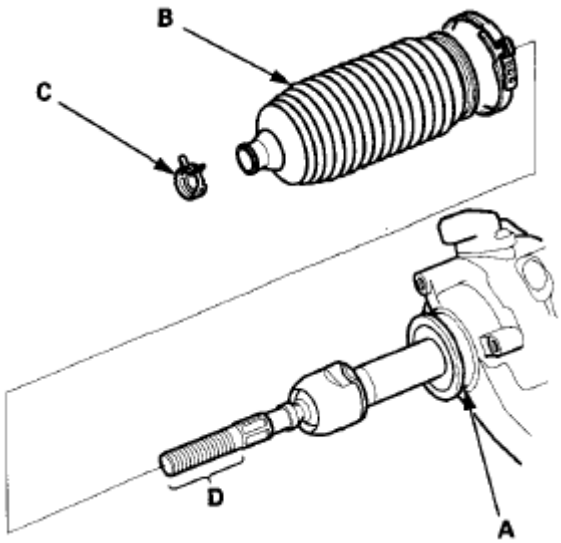

Fig. 135: Identifying Threaded Section, Tie-Rod Clip, Boot Installation Grooves And Boot
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. After installing the boot, wipe the grease off the threaded section (D) of the rack end.
9. Install the new boot band by aligning the tabs (A) with the holes (B) of the band.

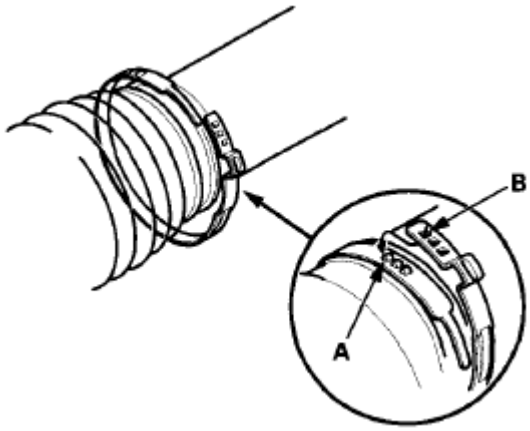

Fig. 136: Identifying Tabs And Holes Of Band
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Close the ear position (A) of the boot band (B) with commercially available pincers Oetiker 1098 or equivalent (C). Repeat steps 7 thru 10 for the other side.

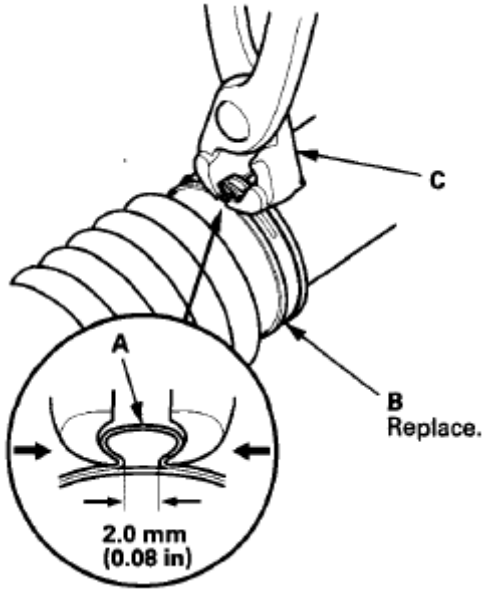

Fig. 137: Identifying Ear Position, Boot Band & SST
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Slide the steering rack right and left to be certain that the boots are not deformed or twisted.
12. Install the tie-rod ends to the rack ends.
13. Install the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

RACK GUIDE REMOVAL/INSTALLATION

NOTE: During removal/installation, do not allow dust, dirt, or other foreign materials to enter the steering gearbox.

1. Loosen the locknut (A), then remove the rack guide screw (B), the spring (C), and the rack guide (D).

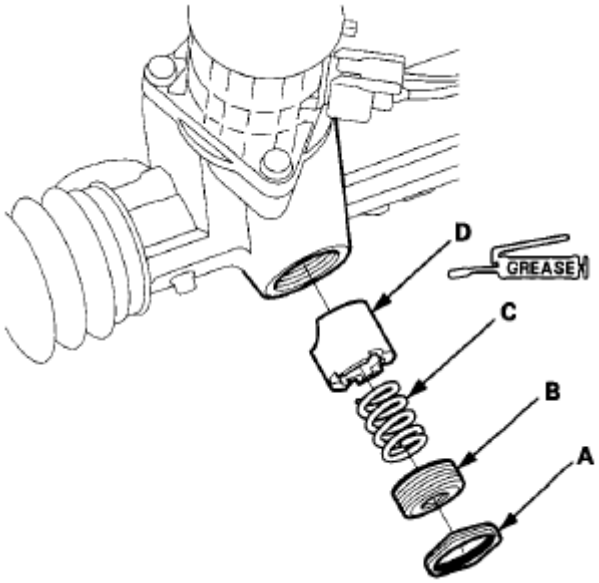

Fig. 138: Identifying Rack Guide, Locknut, Rack Guide Screw And Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Apply steering grease to the sliding surface and the circumference of the rack guide, and install it onto the gearbox housing. Wipe the grease off the threaded section of the gearbox housing.
3. Install the spring onto the gearbox housing.
4. Remove the old sealant from the rack guide screw and apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads. Loosely install the rack guide screw on the steering gearbox.

NOTE: If more than 5 minutes have passed after applying the sealant, remove the old sealant and residue, and reapply new sealant.

5. Loosely install the locknut.
6. Adjust the rack guide screw (see **RACK GUIDE ADJUSTMENT**). After adjusting, check that the rack moves smoothly by sliding the rack right and left.

EPS CONTROL UNIT REMOVAL/INSTALLATION

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
2. Remove these items:
   - Passenger's dashboard undercover (see **GLOVE BOX DAMPER REPLACEMENT**)
   - Passenger's front door sill trim (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**)
   - Passenger's kick panel (see **TRIM REMOVAL/INSTALLATION - DOOR AREAS**)
   - Passenger's under-dash fuse/relay box (see **PASSENGER'S UNDER-DASH FUSE/RELAY BOX (MICU) REMOVAL AND INSTALLATION**)
3. Disconnect EPS control unit connector A (2P), connector B (2P), connector C (2P), and connector D

(28P).

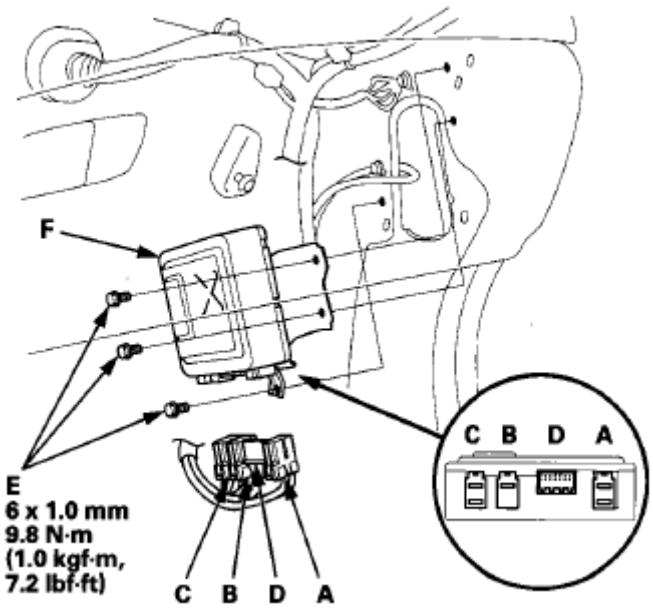

Fig. 139: Identifying EPS Control Unit & Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the bolts (E) from the EPS control unit (F).
5. Remove the EPS control unit.
6. Install the EPS control unit in the reverse order of removal.
7. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
8. Do the torque sensor neutral position memorization (see **MEMORIZING THE TORQUE SENSOR NEUTRAL POSITION**).
9. After installation, start the engine, allow it to idle, and turn the steering wheel from lock to lock several times. Check that the EPS indicator does not come on.

2012 STEERING

Power Steering System - TL

SPECIAL TOOLS

Ref.No.	Tool Number	Description	Qty
①	070AG-SJAA10S	Subframe Alignment Pin	1
②	07965-SA50500	Bearing Driver Attachment, 36 mm	1
③	07AAE-SJAA100	Ball Joint Thread Protector, 14 mm	1
④	07AAF-SDAA100	Ball Joint Thread Protector, 12 mm	1
⑤	07MAA-SL00100, 07916-SA50001, or 07AAA-TL2A100	Locknut Wrench, 40 mm	1
⑥	07MAC-SL0A202	Ball Joint Remover, 28 mm	1

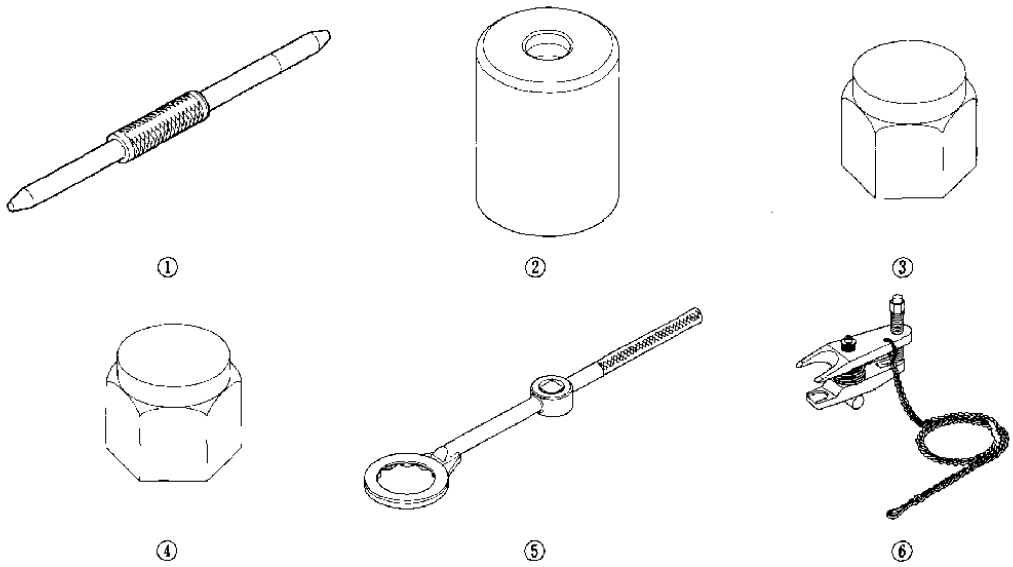

Fig. 1: Identifying Power Steering System Special Tools
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COMPONENT LOCATION INDEX

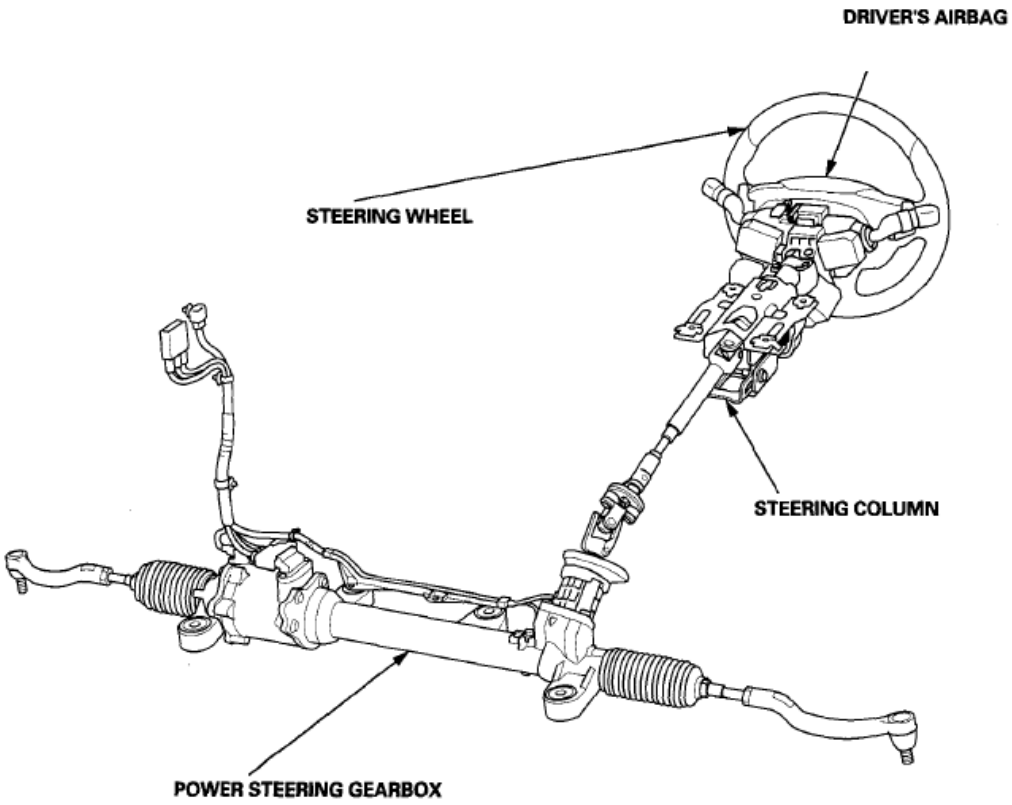

Fig. 2: Power Steering System Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

STEERING WHEEL ROTATIONAL PLAY CHECK

1. Set the front wheels in the straight ahead position.
2. Measure how far you can turn the steering wheel left and right without moving the front wheels.
   - If the play is within the limit, the steering gearbox and the steering linkages are OK.
   - If the play exceeds the limit, adjust the rack guide (see **RACK GUIDE ADJUSTMENT**). If the play is still excessive after rack guide adjustment, do the steering linkage and gearbox inspection (see **STEERING LINKAGE AND GEARBOX INSPECTION**).

Rotational play: 0-10 mm (0-0.39 in)

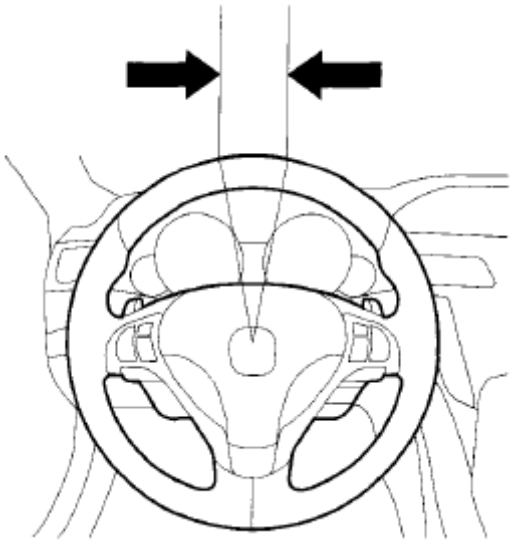

Fig. 3: Measuring Rotational Play Of Steering Wheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

POWER ASSIST CHECK

NOTE: This test should be done with original equipment tires and wheels at the correct tire pressure.

1. Start the engine, and let it idle.
2. Attach a commercially available spring scale (A) to the steering wheel. With the engine idling and the vehicle on a clean, dry floor, pull the scale as shown below, and read it as soon as the tires begin to turn.

   Initial turning load: 29 N (3.0 kgf, 6.6 lbf)

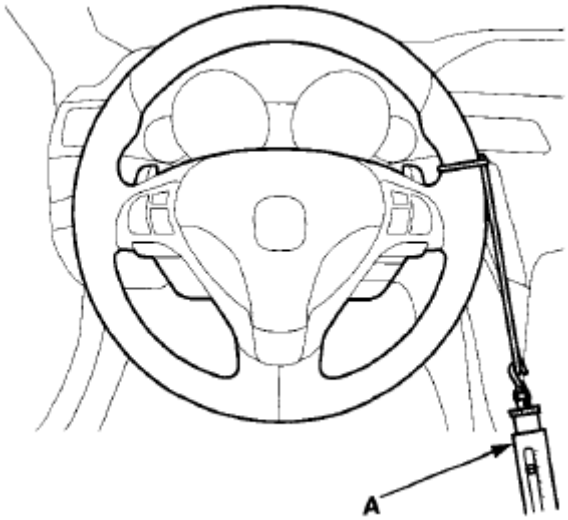

Fig. 4: Attaching Spring Scale To Steering Wheel

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the scale reads no more than the specification, the power assist is OK. If it reads more, check these items:
   - Steering linkage (see **STEERING LINKAGE AND GEARBOX INSPECTION**)
   - Rack guide adjustment (see **RACK GUIDE ADJUSTMENT**)
   - EPS system (see **GENERAL TROUBLESHOOTING INFORMATION**)

STEERING LINKAGE AND GEARBOX INSPECTION

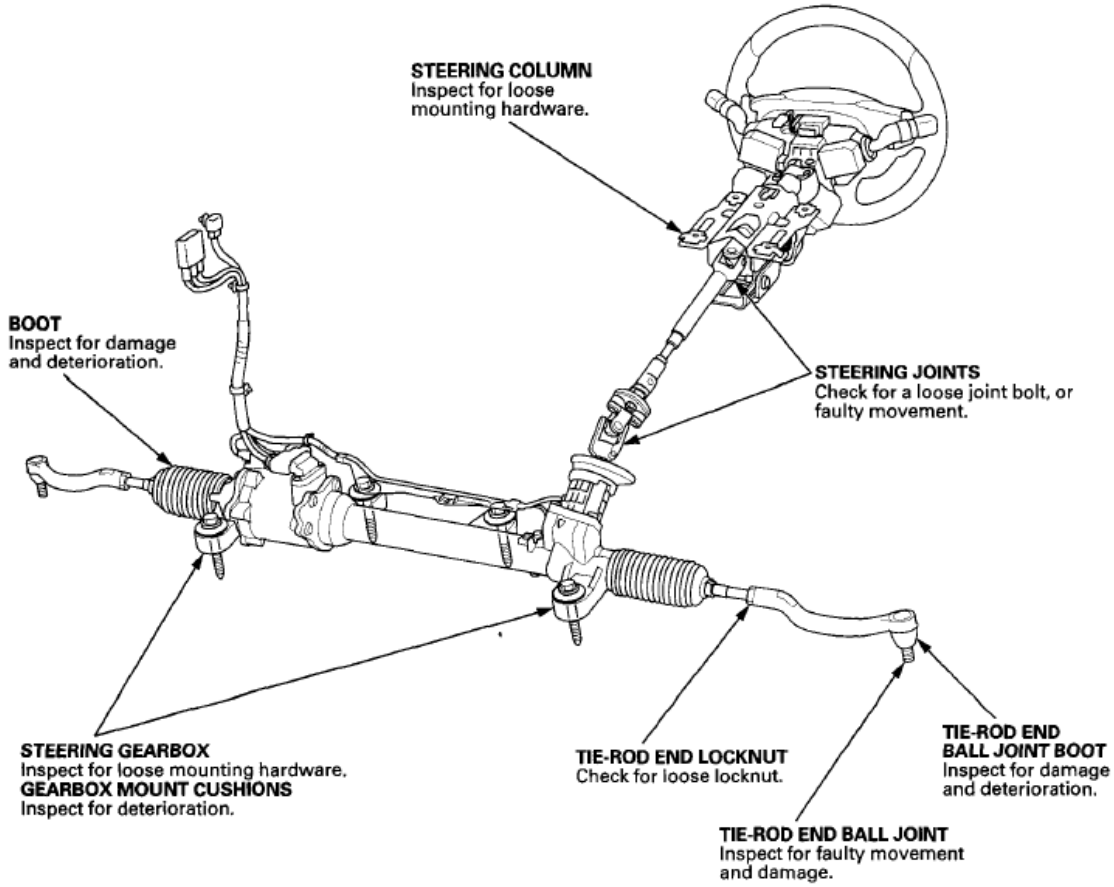

Fig. 5: Identifying Steering Linkage And Gearbox Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

STEERING WHEEL REMOVAL

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**), and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

1. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).

2. Set the front wheels in the straight ahead position, then remove the driver's airbag from the steering wheel (see **DRIVER'S AIRBAG REPLACEMENT**).
3. Disconnect the cable reel subharness connector (A).

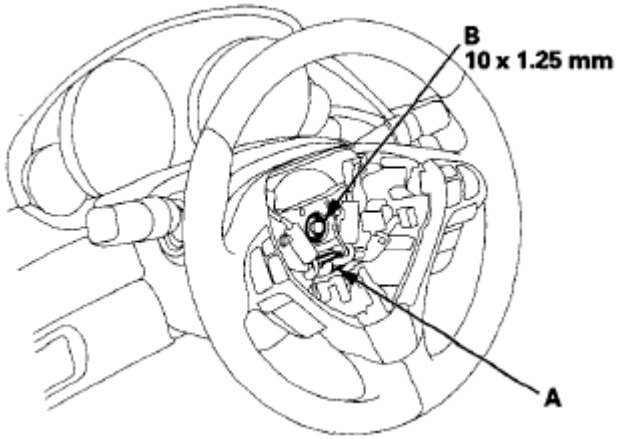

Fig. 6: Identifying Cable Reel Subharness Connector And Steering Wheel Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Loosen the steering wheel bolt (B) three turns.
5. Install a commercially available steering wheel puller (A) on the steering wheel (B). Free the steering wheel from the steering column shaft by turning the pressure bolt (C) of the puller.

   Note these items when removing the steering wheel:

   - Do not tap on the steering wheel or the steering column shaft when removing the steering wheel.
   - If you thread the puller bolts (D) into the wheel hub more than five threads, the bolts will hit the cable reel and damage it. To prevent this, install a pair of jam nuts five threads up on each puller bolt.

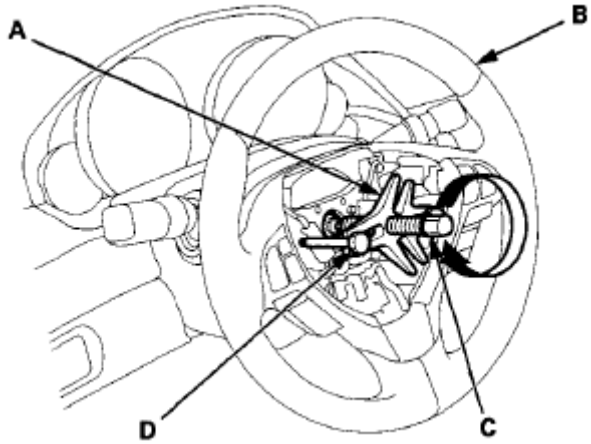

Fig. 7: Freeing Steering Wheel From Steering Column Shaft By Turning Pressure Bolt Of Puller

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the steering wheel puller, then remove the steering wheel bolt (A) and the steering wheel (B) from the steering column.

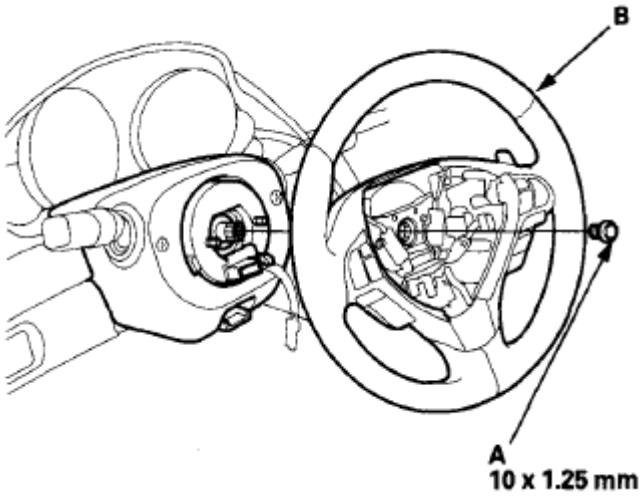

Fig. 8: Identifying Steering Wheel And Steering Wheel Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

STEERING WHEEL DISASSEMBLY/REASSEMBLY

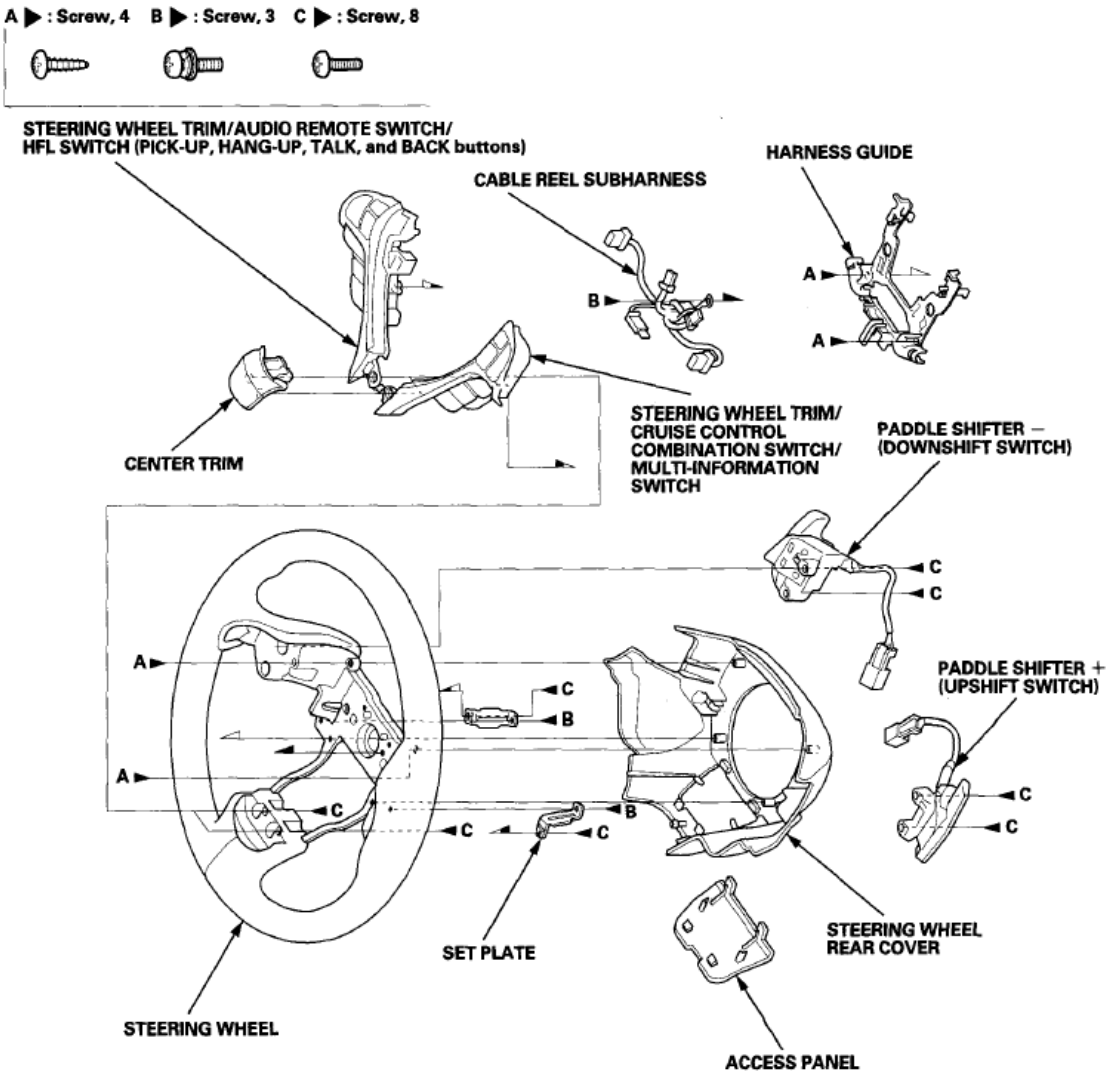

Fig. 9: Exploded View Of Steering Wheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

STEERING WHEEL INSTALLATION

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**), and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

1. Before installing the steering wheel, make sure the front wheels are pointing straight ahead, then center the cable reel (A). Do this by first rotating the cable reel clockwise until it stops. Then rotate it counterclockwise about three full turns. The arrow mark (B) on the cable reel label should point straight up.

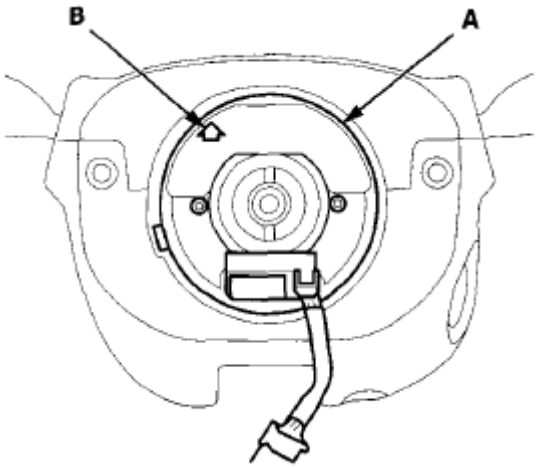

Fig. 10: Identifying Cable Reel And Arrow Mark
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Position the two tabs (A) of the turn signal canceling sleeve (B) as shown below. Install the steering wheel on to the steering column shaft, making sure the steering wheel hub (C) engages the pins (D) of the cable reel and the tabs of the turn signal canceling sleeve. Do not tap on the steering wheel or steering column shaft when installing the steering wheel.

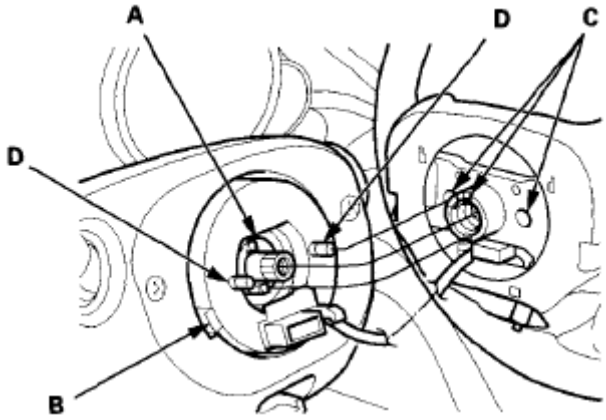

Fig. 11: Identifying Steering Wheel Hub, Sleeve, Tabs And Pins
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the steering wheel bolt (A), and tighten it to the specified torque. Connect the cable reel subharness connector (B). Make sure the wire harness is routed and fastened properly.

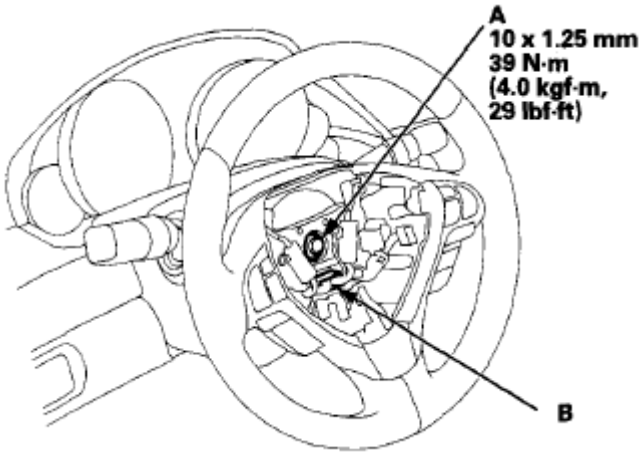

Fig. 12: Identifying Cable Reel Subharness Connector And Steering Wheel Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).
5. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), and check these items:
   - Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds, and then goes off.
   - Make sure the horn and turn signal switches work properly.
   - Make sure the steering wheel switches work properly.
6. After installation, check these items:
   - Check the steering wheel spoke angle. If the steering spoke angles to the right and left are not equal (steering wheel is not centered), correct the engagement of the wheel/column shaft splines.
   - With SH-AWD: Do the VSA sensor neutral position memorization (see **YAW RATE-ACCELERATION SENSOR REPLACEMENT**).

STEERING COLUMN REMOVAL AND INSTALLATION

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**), and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repairs or service.

REMOVAL

1. Tilt the steering column at the way up, and move it all the way in.
2. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
3. Remove the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**), and the steering wheel (see **STEERING WHEEL REMOVAL**).
4. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER**

REMOVAL/INSTALLATION).

5. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
6. Remove the steering joint cover (A).

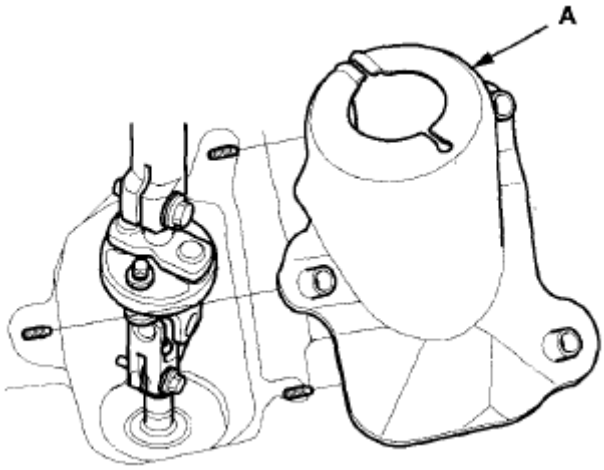

Fig. 13: Identifying Steering Joint Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Loosen the upper steering joint bolt (A), and remove the lower steering joint bolt (B). Disconnect the steering joint (C) by sliding the steering joint into the column shaft (D). Tighten the upper steering joint bolt to hold the steering joint in place.

NOTE:

- **Do not disconnect the steering joint from the column shaft.**
- **If the center guide (E) is in place and has not moved, leave it in place.**
- **If the center guide has come off, discard it.**

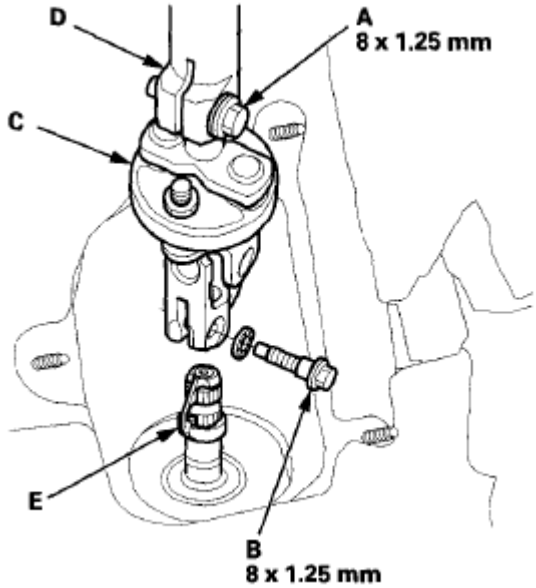

Fig. 14: Identifying Steering Joint, Column Shaft, Center Guide, Upper And Lower Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Disconnect the wire harness connectors from the combination switch assembly/cable reel (A).

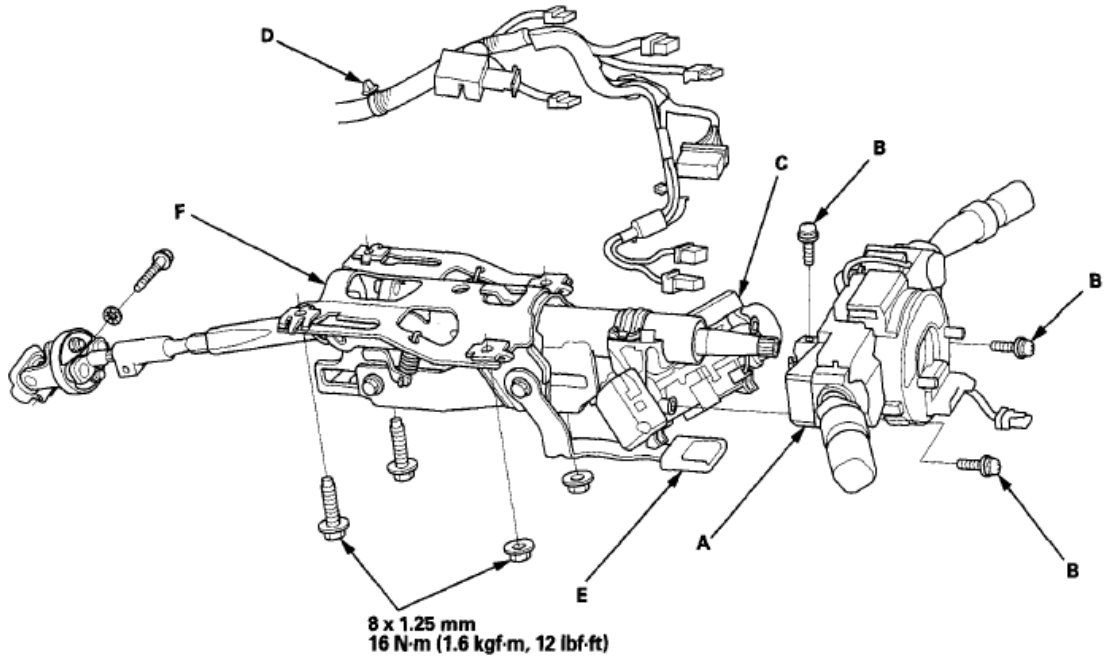

Fig. 15: Exploded View Of Steering Column With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the combination switch assembly/cable reel from the steering column shaft by removing the three screws (B).
10. Disconnect the connectors from the ignition switch (C), and release the wire harness clip (D) from the steering column.
11. Make sure that the lock lever (E) is in the locked position. Remove the steering column (F) by removing the attaching nuts and bolts, and carefully guide it out of the dashboard.

INSTALLATION

1. Install the steering column in the reverse order of removal, and note these items:
    - Make sure the wires are not caught or pinched by any parts.
    - Tighten the three screws (A) in the sequence shown below.

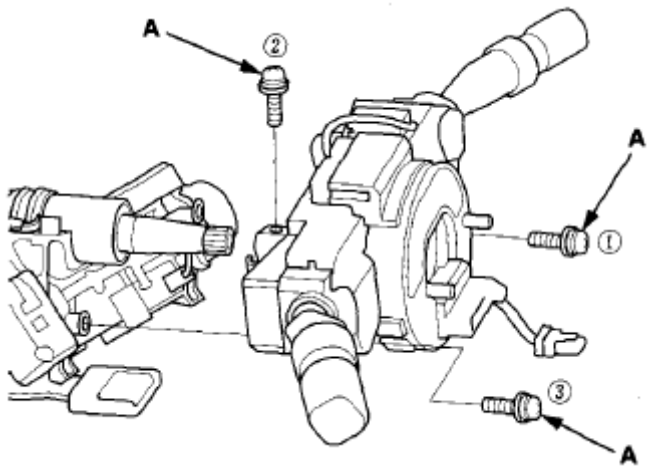

Fig. 16: Identifying Screws With Tightening Sequence
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Center the steering rack within its stroke.
3. Loosen the upper steering joint bolt (A) and slip the lower end of the steering joint (B) onto the pinion shaft (C).

NOTE:

- **Pinion shaft with center guide: Install the steering joint by aligning the center guide (D).**
- **Pinion shaft without center guide: Position the steering column by aligning the gap (E) with the angle.**

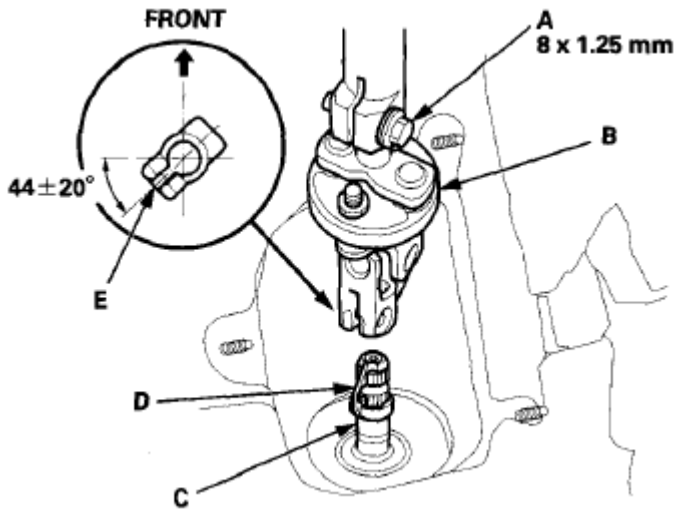

Fig. 17: Identifying Pinion Shaft, Center Guide, Gap, Upper And Lower Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft, then loosely

install the lower steering joint bolt (C). Be sure that the joint bolt is securely in the groove in the pinion shaft.

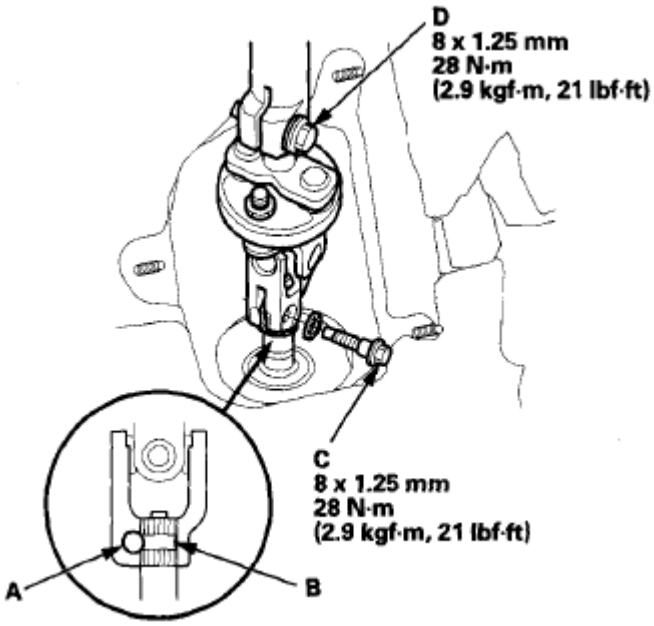

Fig. 18: Identifying Bolt Hole, Groove, Upper And Lower Steering Joint Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Pull on the steering joint to make sure that the steering joint is fully seated, then tighten the lower joint bolt to the specified torque.
6. Tighten the upper steering joint bolt (D) to the specified torque.
7. Install the steering joint cover (A).

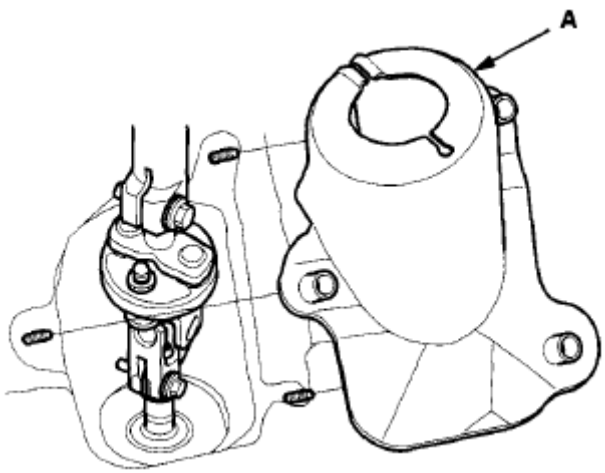

Fig. 19: Identifying Steering Joint Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
9. Install the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
10. Install the steering wheel (see **STEERING WHEEL INSTALLATION**), and the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).
11. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**), and check these items:
    - Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the SRS indicator comes on for about 6 seconds, and then goes off.
    - Make sure the horn and turn signal switches work properly.
    - Make sure the steering wheel switches work properly.
12. After installation, check these items:
    - Check the steering wheel spoke angle. If the steering spoke angles to the right and left are not equal (steering wheel and rack are not centered), correct the engagement of the joint/pinion shaft splines.
    - With SH-AWD: Do the VSA sensor neutral position memorization (see **YAW RATE-ACCELERATION SENSOR REPLACEMENT**).
    - Set the steering column to the center tilt position, and to the center telescopic position, then do the front toe inspection (see **WHEEL ALIGNMENT**).

STEERING COLUMN INSPECTION

INSPECTION

1. Remove the steering column (see **STEERING COLUMN REMOVAL AND INSTALLATION**).
2. Check these items:
    - Check for loose bearing mounting nuts (A). If they are loose, replace the column as an assembly.
    - Check the steering column ball bearings (B) and the steering joints (C) for play and proper movement. If any bearing is noisy or has excessive play, replace the steering column as an assembly.
    - Check the sliding capsules (D) for distortion or breakage. If there is distortion or breakage, replace the steering column as an assembly.
    - Check the tilt mechanism and telescopic mechanism for movement and damage.

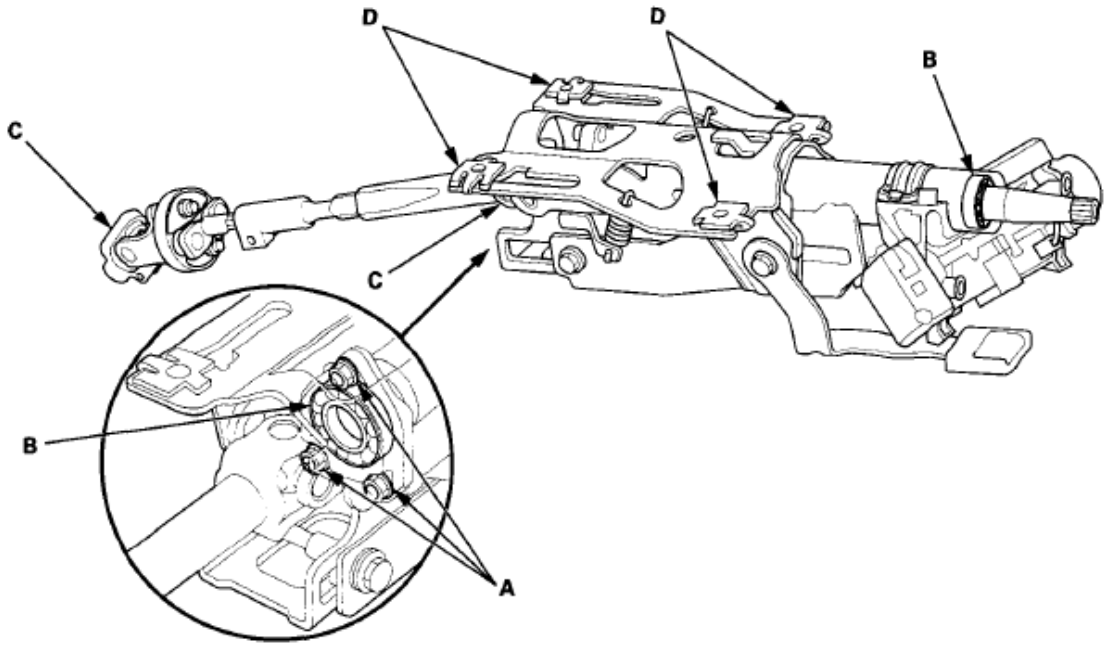

Fig. 20: Identifying Steering Column Ball Bearings, Steering Joints, Sliding Capsules And Mounting Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the steering column (see **INSTALLATION**).

CHECK OF TILTING FORCE

1. Set the steering wheel in the straight ahead driving position, and loosen the lock lever fully.
2. Attach a commercially available spring scale (A) to the highest point of the steering wheel, and tilt the steering column to the lowest position.

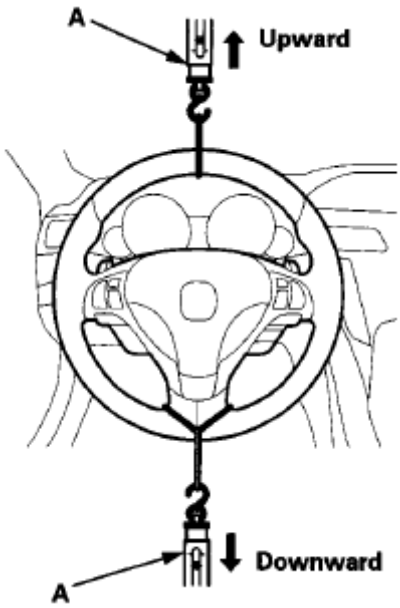

Fig. 21: Attaching Spring Scale To Steering Wheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pull the spring scale straight up, and read the force required to move the steering column.
4. Attach the spring scale to the lowest point of the steering wheel.
5. Pull the spring scale straight down, and read the force required to move the steering column.

   Tilting force (upward/downward):

   Standard: 70 N (7.1 kgf, 15 lbf) max.

6. If the measurement is higher than specified, or if the tilt function feels rough, do the following:
   1. Loosen the steering column mounting nuts and bolts so they are finger-tight.
   2. Release the lock lever, and tilt and telescope the steering column several times.
   3. Tilt the column down, then tighten the lock lever.
   4. Tighten the mounting nuts, then tighten the mounting bolts.
7. Test the tilting force again. If the force is still higher than the specification, replace the steering column as an assembly (see **STEERING COLUMN REMOVAL AND INSTALLATION**).

CHECK OF TELESCOPING FORCE

1. Set the steering wheel in the straight ahead driving position, and loosen the lock lever fully, and push in the steering wheel to the fully telescoped in position.
2. Attach a commercially available spring scale (A) to the center point of the steering wheel as shown below.

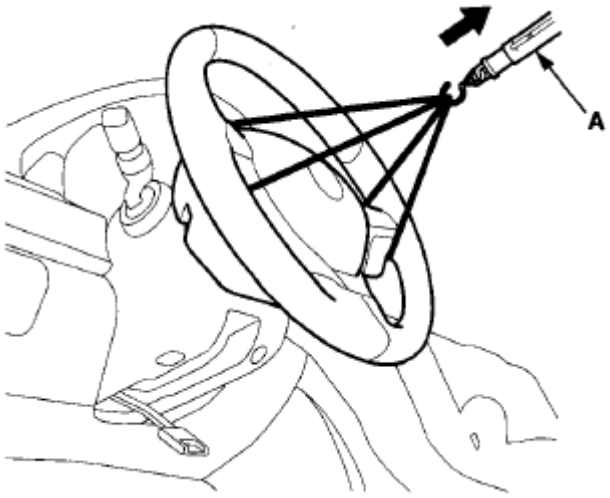

Fig. 22: Attaching Spring Scale To Center Point Of Steering Wheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pull the spring scale, and read the force required to move the steering column during telescoping out.

   Telescoping force:

   Standard: 116 N (11.8 kgf, 26.1 lbf) max.

4. If the measurement is higher than specified, replace the steering column as an assembly, (see **STEERING COLUMN REMOVAL AND INSTALLATION**)

CHECK OF LOCK LEVER FORCE

1. Move the lock lever (A) from the loosened position to the locked position three to five times, then release the lock lever. Adjust the steering column to the center tilt position and also to the full telescopic out position, and hold the steering wheel.

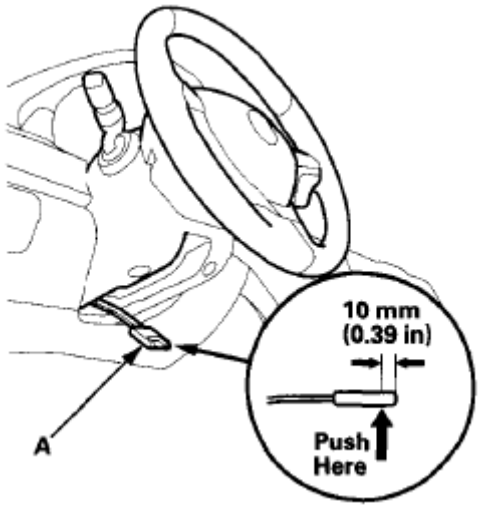

Fig. 23: Identifying Lock Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Using a commercially available push-pull gauge, push the lock lever 10 mm (0.39 in) in from its end, and measure the force required to move the lock lever.

   Lock lever force:

   50-70 N (5.1-7.1 kgf, 11-16 lbf) min.

3. If the measurement is out of the specification, adjust the lock lever force using the following procedures:
   1. Remove the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).
   2. Adjust the lock lever force by turning the nut (A).
   3. Check the lock lever force again. If the measurement is still out of specification, replace the steering column as an assembly (see **STEERING COLUMN REMOVAL AND INSTALLATION**).
   4. Install the column covers (see **SIDE DEFOGGER VENT TRIM REMOVAL/INSTALLATION**).

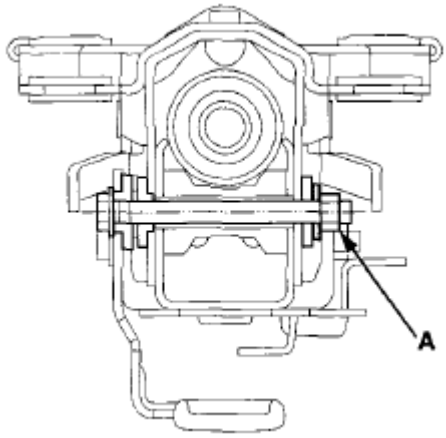

Fig. 24: Identifying Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

STEERING LOCK REPLACEMENT

1. Remove the steering column (see **STEERING COLUMN REMOVAL AND INSTALLATION**).
2. Center-punch both of the shear bolts (A), and drill their heads off with a 5 mm (0.20 in) drill bit. Be careful not to damage the steering lock when removing the shear bolts.

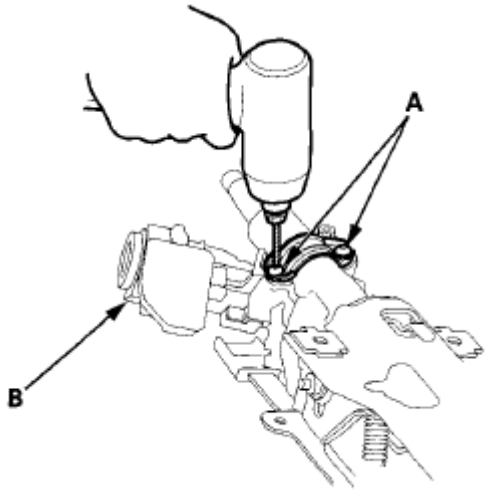

Fig. 25: Center-Punching Shear Bolts And Removing From Steering Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the shear bolts from the steering lock (B), then remove the steering lock.
4. Remove the immobilizer-keyless control unit from the steering lock, then install it on the new steering lock (see **IMMOBILIZER-KEYLESS CONTROL UNIT REGISTRATION**).
5. Install the steering lock without the key inserted.
6. Loosely tighten the new shear bolts.
7. Insert the ignition key, and check for proper operation of the steering wheel lock and that the ignition key turns freely.
8. Tighten the shear bolts (A) until the hex heads (B) twist off.

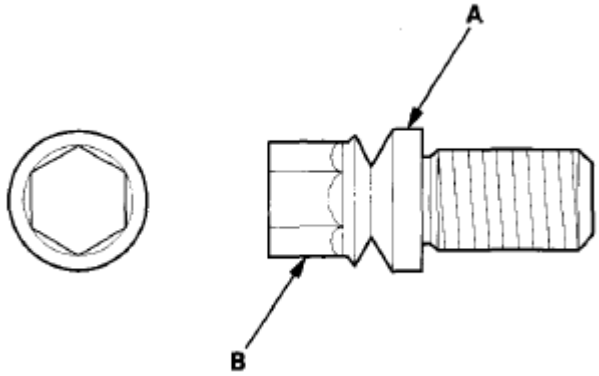

Fig. 26: Identifying Shear Bolts And Hex Heads
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the steering column (see **INSTALLATION**).
10. Rewrite all new keys to the immobilizer-keyless control unit (see **IMMOBILIZER KEY REGISTRATION**), and make sure the immobilizer system works properly.

RACK GUIDE ADJUSTMENT

Special Tools Required

Locknut Wrench, 40 mm 07MAA-SL00100, 07916-SA50001, or 07AAA-TL2A100

1. Set the front wheels in the straight ahead position.
2. Loosen the rack guide screw locknut (A) with the locknut wrench, then remove the rack guide screw (B).

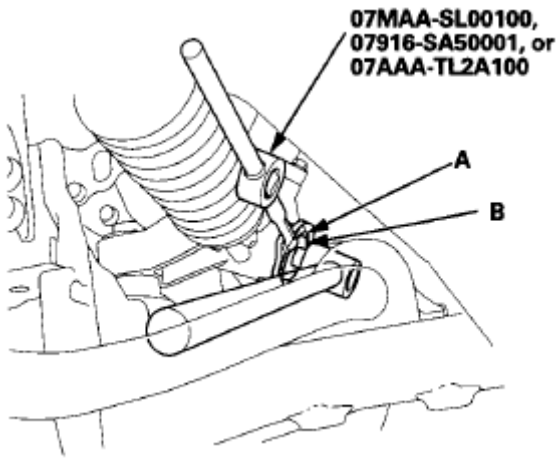

Fig. 27: Identifying Rack Guide Screw And Locknut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the old sealant from the rack guide screw (A), and apply new sealant (Three Bond 1215 or Loctite 5699) to the middle of the threads (B). Loosely install the rack guide screw on the steering gearbox.

NOTE: If more than 5 minutes have passed after applying the sealant, remove the old sealant and residue, and reapply new sealant.

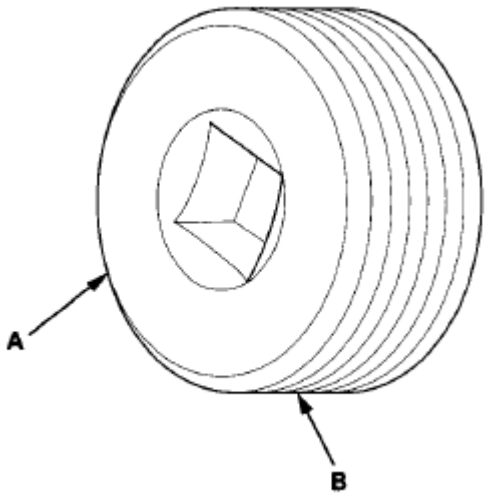

Fig. 28: Identifying Rack Guide Screw And Threads
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Tighten the rack guide screw (A) to 25 N.m (2.5 kgf.m, 18 lbf.ft), then loosen it.

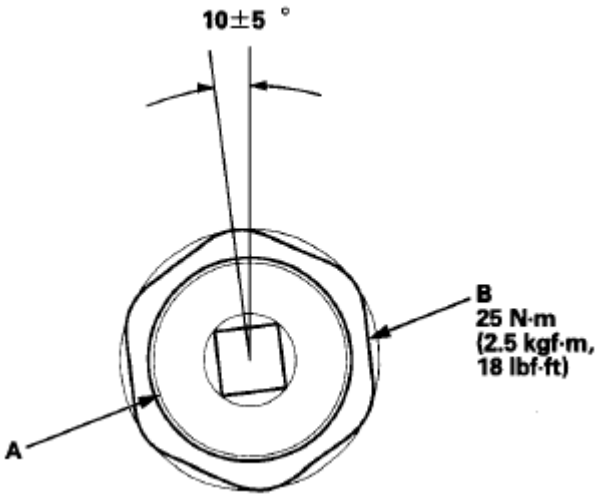

Fig. 29: Identifying Rack Guide Screw And Locknut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Retighten the rack guide screw to 5.9 N.m (0.6 kgf.m, 4 lbf.ft), then back it off to the specified angle.

   Specified return angle: 10±5°

6. Hold the rack guide screw stationary with a wrench, and tighten the locknut (B) by hand until it's fully seated.
7. Install the locknut wrench on the locknut, and hold the rack guide screw stationary with a wrench. Tighten the locknut to the specified torque.
8. Check for unusual steering effort through the complete turning range.
9. Check the steering wheel rotational play (see **STEERING WHEEL ROTATIONAL PLAY CHECK**) and the power assist (see **POWER ASSIST CHECK**).

TIE-ROD END BALL JOINT BOOT REPLACEMENT

Special Tools Required

Bearing Driver Attachment, 36 mm 07965-SA50500

1. Disconnect the tie-rod end ball joint from the knuckle (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).
2. Remove the tie-rod end from the rack end (see **RACK END REMOVAL AND INSTALLATION**).
3. Remove the ball joint boot from the tie-rod end, and wipe the old grease off the ball pin.
4. Pack the lower area of the ball pin (A) with fresh multipurpose grease.

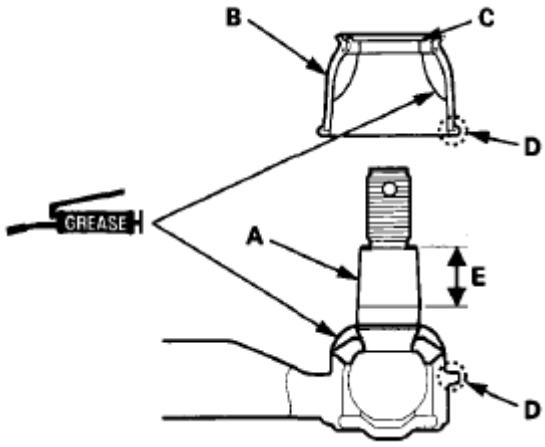

Fig. 30: Identifying Ball Pin, Ball Joint Boot, Boot Mounting Area, Tapered Section And Lip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Pack the interior of the ball joint boot (6) and lip (C) with fresh multipurpose grease.

   Note these items when installing new grease:

   - Keep grease off the boot mounting area (D) and the tapered section (E) of the ball pin.
   - Do not allow dust, dirt, or other foreign materials to enter the boot.

6. Install the ball joint boot (A) using the bearing driver attachment. The boot must not have a gap at the boot installation sections (B). After installing the boot, check the ball pin tapered section for grease contamination, and wipe it if necessary.

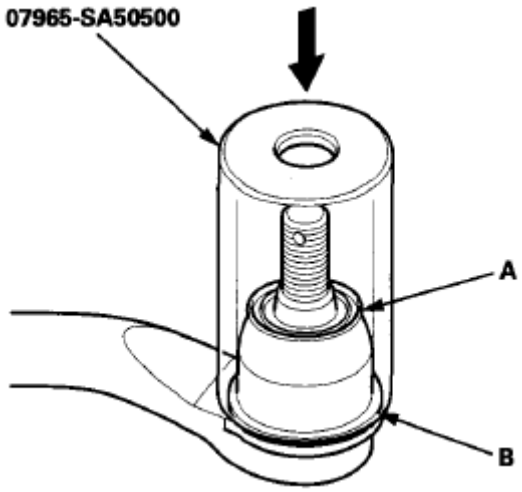

Fig. 31: Installing Ball Joint Boot Using Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the tie-rod end to the rack end.
8. Connect the tie-rod end ball joint to the knuckle (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).

9. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

GEARBOX MOUNT CUSHION REPLACEMENT

1. Remove the steering gearbox (see **STEERING GEARBOX REMOVAL AND INSTALLATION**).
2. Position a 36 mm socket (A) on the flange part of the gearbox housing with a washer (B), a 10 x 150 mm flange bolt (C) and a 10 mm nut (D) as shown below.

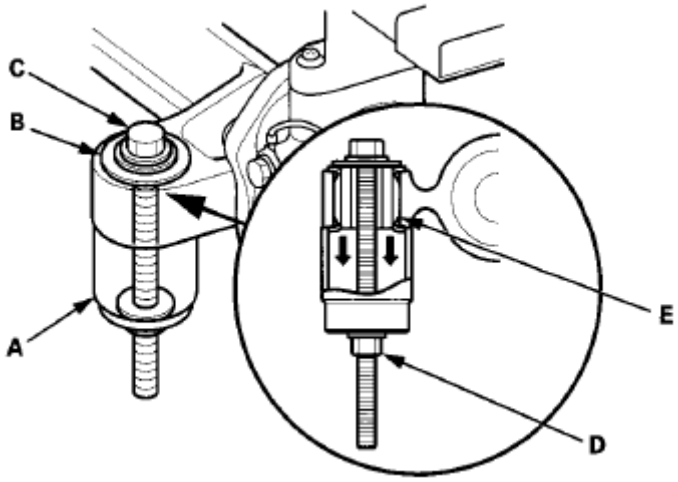

Fig. 32: Identifying Socket, Washer, Gearbox Mount Cushion, Flange Bolt And Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Hold the flange bolt with a wrench, and tighten the nut with a wrench. Remove the gearbox mount cushion (E).
4. Apply a mild soap and water solution to the new gearbox mount cushion surface (A), then place the mount cushion on the gearbox mounting cushion hole.

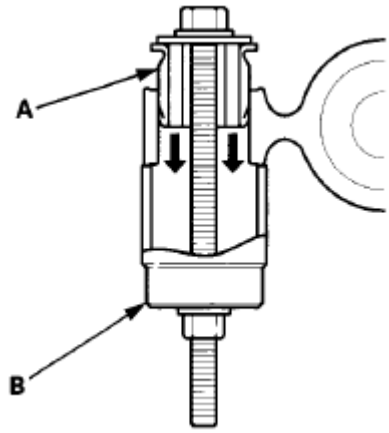

Fig. 33: Identifying Gearbox Mount Cushion Surface And Socket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Position a 36 mm socket (B) on the flange part of the gearbox housing with a washer, a flange bolt, and the nut as shown above.
6. Install the gearbox mount cushion by tightening the nut until the mount cushion edge (A) properly fits on the gearbox flange surface (B).

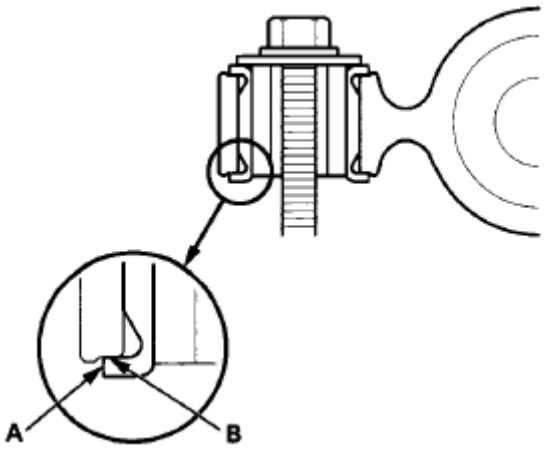

Fig. 34: Identifying Mount Cushion Edge And Gearbox Flange Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the steering gearbox (see **INSTALLATION**).

WHEEL ALIGNMENT

NOTE: After adjusting the wheel alignment on a model with SH-AWD, do the VSA sensor neutral position memorization (see YAW RATE-ACCELERATION SENSOR REPLACEMENT).

The suspension can be adjusted for front and rear toe.

PRE-ALIGNMENT CHECKS

For proper inspection and adjustment of the wheel alignment, do these checks:

1. Release the parking brake to avoid an incorrect measurement.
2. Make sure the suspension is not modified.
3. Make sure the fuel tank is full, and that the spare tire, the jack, and the tools are in place on the vehicle.
4. Check the tire size and tire pressure.

   Tire size:

   Without SH-AWD:

   17 inch wheels:

   Front/Rear: P245/50R17 98V

   18 inch wheels:

   Front/Rear: P245/45R18 96V

   With SH-AWD:

   18 inch wheels:

   Front/Rear: P245/45R18 96V

   19 inch wheels:

   Front/Rear: P245/40R19 94V

   Tire pressure (at cold):

   Without SH-AWD:

   Front/Rear: 220 kPa (2.2 kgf/cm^2 , 32 psi)

   With SH-AWD (P245/45R18 96V tire):

   Front/Rear: 220 kPa (2.2 kgf/cm^2 , 32 psi)

   With SH-AWD (P245/40R19 94V tire):

   Front/Rear: 235 kPa (2.4 kgf/cm^2 , 34 psi)

5. Check the runout of the wheels and tires (see **WHEEL RUNOUT INSPECTION**).
6. Check the suspension ball joints (Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).

Hold a tire with your hands, and move it up and down and right and left to check for movement).

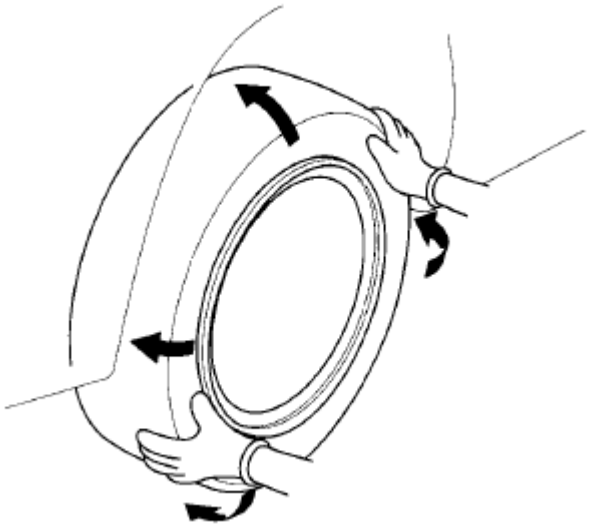

Fig. 4: Checking Suspension Ball Joints
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Before doing alignment inspections, be sure to remove all extra weight from the vehicle, and no one should be inside the vehicle (driver or passengers).
8. Lower the vehicle to the ground. Bounce the vehicle up and down several times to stabilize the suspension.
9. Check that the steering column is set at the center tilt position and the center telescopic position.

CASTER INSPECTION

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Check the caster angle.

   Caster angle: 3° 48 '±45'

   (Maximum difference between the right and left side: 0 ° 30')

   - If the measurement is within specifications, measure the camber angle.
   - If the measurement is not within specifications, check for bent or damaged suspension components.

CAMBER INSPECTION

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Check the camber angle.

Camber angle:

Front: -0 ° 30'$^{+30'}_{-45'}$

Rear: -1 °00'$^{+30'}_{-45'}$

(Maximum difference between the right and left side: 0 ° 30')

- If the measurement is within specifications, measure the toe-in.
- If the measurement is not within specifications, check for bent or damaged suspension components.

REAR TOE INSPECTION/ADJUSTMENT

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Release the parking brake to avoid an incorrect measurement.
2. Check the toe.

   Rear toe-in: 2±2 mm (0.08±0.08 in)

   - If adjustment is required, go to step 3.
   - If no adjustment is required, go to **FRONT TOE INSPECTION/ADJUSTMENT**.
3. Hold the adjusting bolt (A) on the rear control arm (B), and loosen the self-locking nut (C).

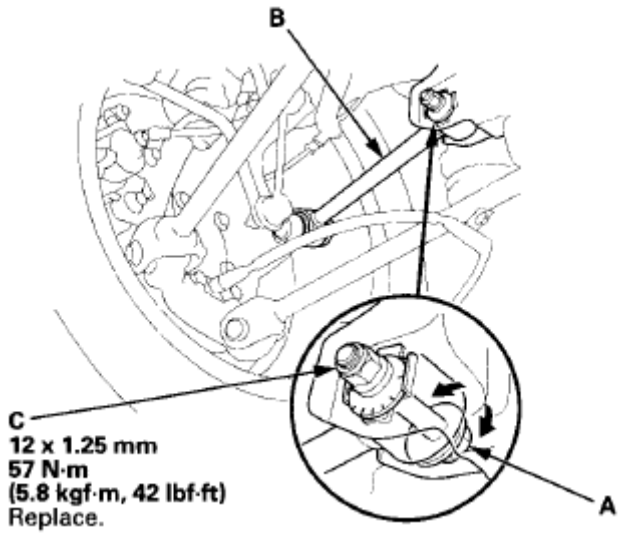

Fig. 5: Identifying Rear Control Arm, Self-Locking Nut And Adjusting Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Replace the self-locking nut with a new one, and lightly tighten it.

NOTE: Always use a new self-locking nut whenever it has been tightened to the specified torque.

5. Adjust the rear toe by turning the adjusting bolt until the toe is correct.
6. While holding the adjusting bolt, tighten the self-locking nut to the specified torque.

FRONT TOE INSPECTION/ADJUSTMENT

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Set the steering column to the middle tilt position and telescopic positions. Center the steering wheel spokes, and install a steering wheel holder tool.
2. Check the toe with the wheels pointed straight ahead.

   Front toe-in: 0±2 mm (0±0.08 in)

   - If adjustment is required, go to step 3.
   - If no adjustment is required, remove the alignment equipment.
3. Loosen the tie-rod end locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both tie-rods (C) until the front toe is within specifications.

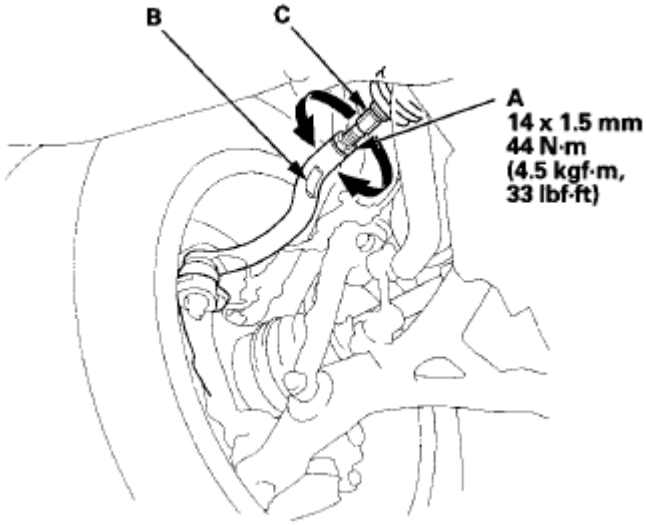

Fig. 6: Turning Both Tie-Rods Till Front Toe Comes Within Specifications With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. After adjusting, tighten the tie-rod end locknuts to the specified torque. Reposition the rack-end boot if it is twisted or displaced.

TURNING ANGLE INSPECTION

Use commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels.

   Turning angle:

   Inward: 38 ° 06' ±2 °

   Outward (reference): 30° 24' ±1°

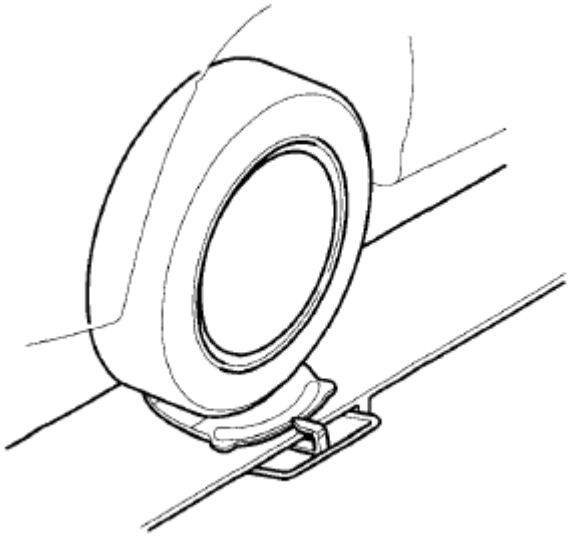

Fig. 7: Measuring Turning Angle Of Wheels
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. If the measurement is not within the specifications, even up both sides of the tie-rod threaded section length while adjusting the front toe. If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

WHEEL BEARING END PLAY INSPECTION

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the wheels.
3. Install suitable flat washers (A) and the wheel nuts (B). Tighten the nuts to the specified torque to hold the brake disc or the brake disc/drum securely against the hub.

   Front

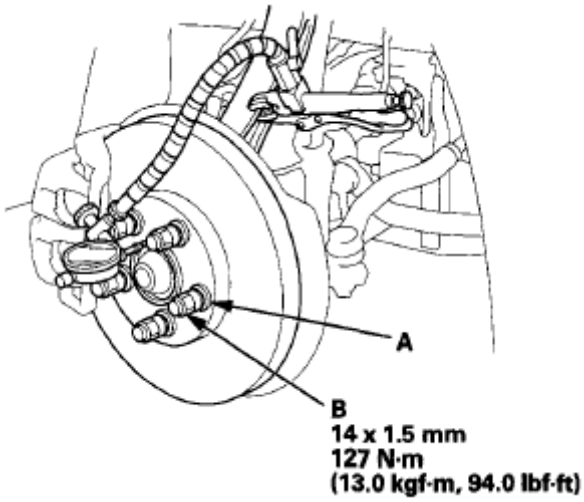

Fig. 8: Identifying Flat Washers And Wheel Nuts With Torque Specifications - Front
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear

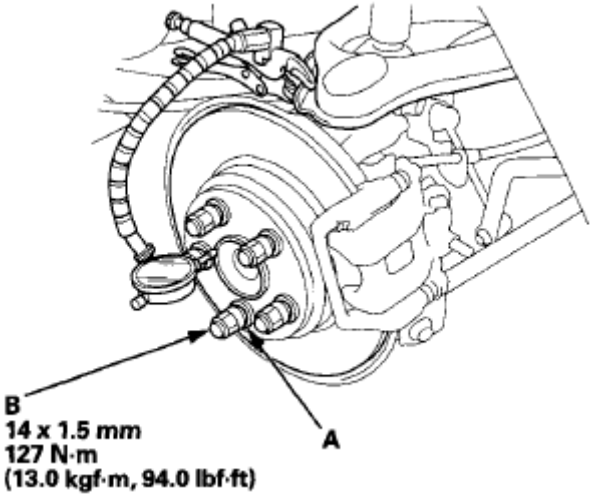

Fig. 9: Identifying Flat Washers And Wheel Nuts With Torque Specifications - Rear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Attach the dial gauge. Place the dial gauge against the hub flange.
5. Measure the bearing end play while moving the brake disc or the brake disc/drum inward and outward.

   Wheel bearing end play:

   Front/Rear: 0- 0.05 mm (0- 0.0020 in)

6. If the bearing end play measurement is more than the standard, replace the wheel bearing or the hub bearing unit.

WHEEL RUNOUT INSPECTION

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Check for bent or deformed wheels.
3. Set up the dial gauge as shown, and measure the axial runout by turning the wheel.

   Front and rear wheel axial runout:

   Standard: 0- 0.7 mm (0- 0.028 in)

   Service limit: 2.0 mm (0.079 in)

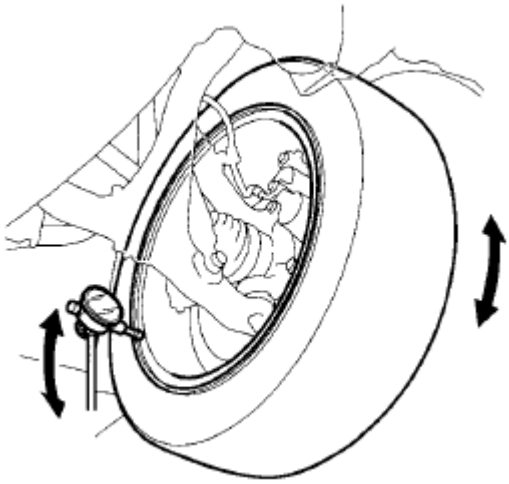

Fig. 10: Measuring Front And Rear Wheel Axial Runout Using Dial Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reset the dial gauge to the position shown, and measure the radial runout.

   Front and rear wheel radial runout:

   Standard: 0- 0.7 mm (0- 0.028 in)

   Service limit: 1.5 mm (0.059 in)

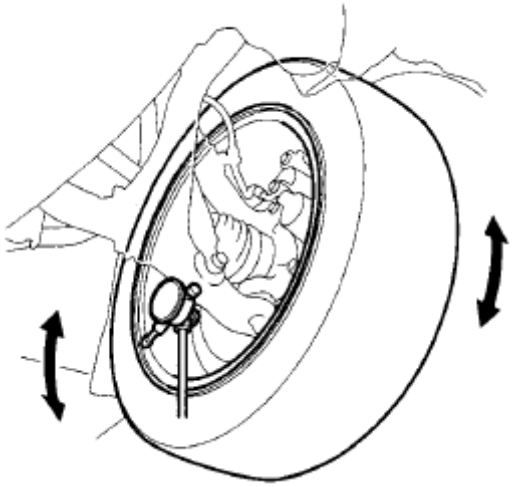

Fig. 11: Measuring Front And Rear Wheel Radial Runout Using Dial Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the wheel runout is not within the specification, check the wheel bearing end play (see **TURNING ANGLE INSPECTION**), and make sure the mating surfaces between the brake disc or the brake disc/drum and the inside of the wheel are clean.
6. If the bearing end play is within the specification but the wheel runout is more than the service limit, replace the wheel.

WHEEL BOLT REPLACEMENT

Special Tools Required

Ball Joint Remover, 28 mm 07MAC-SL0A202

NOTE:
- **Do not use a hammer or impact tools (pneumatic or electric) to remove and install the wheel bolts.**
- **Be careful not to damage the threads of the wheel bolts.**

FRONT

1. Remove the front hub (see **KNUCKLE/HUB REPLACEMENT**).
2. Separate the wheel bolt (A) from the hub (B) using a hydraulic press. Support the hub with hydraulic press attachments (C) or equivalent tools.

NOTE: Before installing the new wheel bolt, clean the mating surfaces on the bolt and the hub.

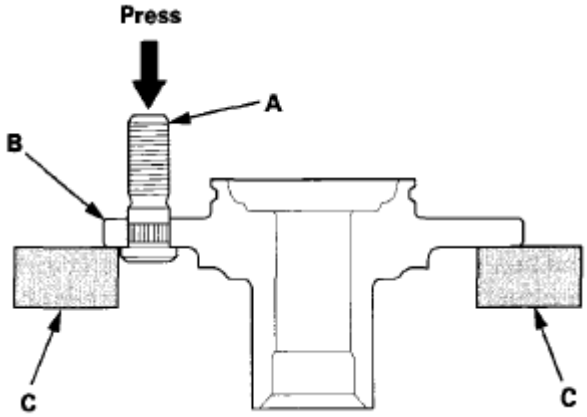

Fig. 12: Separating Wheel Bolt From Hub Using Hydraulic Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Insert the new wheel bolt into the hub while aligning the splined surfaces on the hub hole with the wheel bolt.

NOTE:
- **Degrease the area around the wheel bolt.**
- **Make sure the wheel bolt is installed vertically to the hub disc surface.**

4. Install the wheel bolt using a hydraulic press until the wheel bolt shoulder is fully seated.
5. Install the front hub (see **KNUCKLE/HUB REPLACEMENT**).

NOTE: If you cannot tighten the wheel nut to the specified torque value when installing the wheel, replace the front hub as an assembly.

REAR

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear brake disc/drum (see **REAR BRAKE DISC REPLACEMENT**).
3. Separate the wheel bolt (A) from the hub (B) using the ball joint remover (C), and keep the jaw (D) of the ball joint remover vertically against the wheel bolt (see **BALL JOINT REMOVAL**).

NOTE:
- **If the angle of the remover against the wheel bolt is not vertical, readjust the ball joint remover by turning the head (E) of the adjusting bolt (F).**
- **Before installing the new wheel bolt, clean the mating surfaces on the bolt and the hub.**

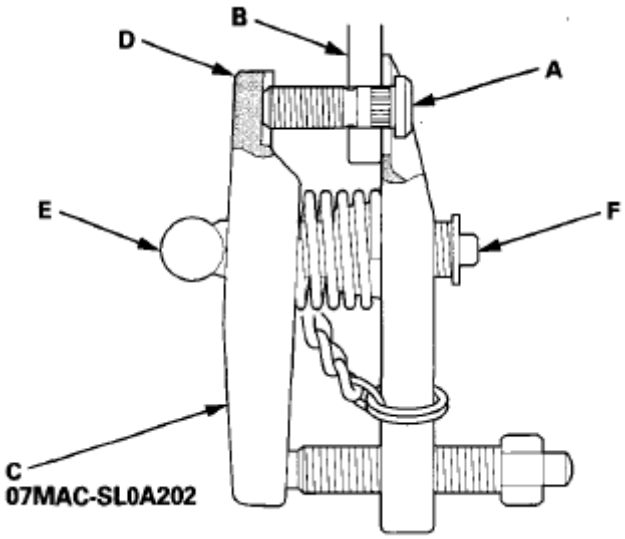

Fig. 13: Identifying Hub, Ball Joint Remover, Jaw, Head, Adjusting And Wheel Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Insert the new wheel bolt (A) into the hub (B) while aligning the splined surfaces (C) on the hub hole with the wheel bolt. Adjust the measurement (D) with the washers (P/N 94101-14800 or equivalent) (E), then install a nut (P/N 90304-SHJ-A91 or equivalent) (F) hand-tight.

NOTE:

- **Degrease the area around the wheel bolt and the threaded section of the nut.**
- **Make sure the wheel bolt is installed vertically to the hub disc surface.**
- **Do not install the nut and the washers that have been used as tools on a vehicle.**

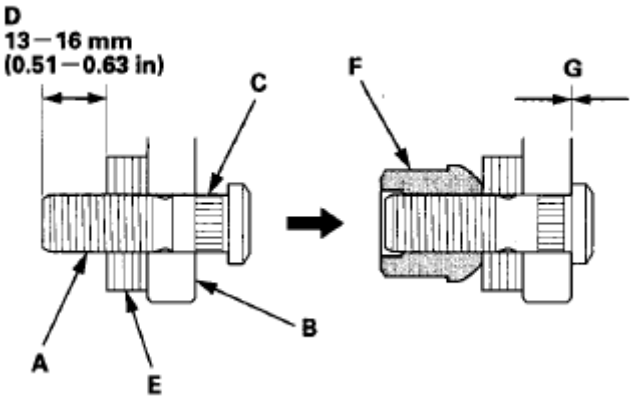

Fig. 14: Inserting Wheel Bolt Into Hub While Aligning Splined Surfaces On Hub Hole With Wheel Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Tighten the nut until the wheel bolt is drawn fully into the hub. Do not exceed the maximum torque limit.

Make sure there is no gap (G) between the bolt and the hub.

Limited torque:

127 N.m (13.0 kgf.m, 94.0 lbf.ft) max.

6. Install the rear brake disc/drum (see **REAR BRAKE DISC REPLACEMENT**).

NOTE:

- **If you cannot tighten the wheel nut to the specified torque when installing the wheel, replace the rear hub bearing unit as an assembly.**
- **Before installing the wheel, clean the mating surfaces between the brake disc/drum and the inside of the wheel.**

BALL JOINT REMOVAL

Special Tools Required

- Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
- Ball Joint Thread Protector, 12 mm 07AAF-SDAA100
- Ball Joint Thread Protector, 10 mm 07AAF-SECA120
- Ball Joint Remover, 32 mm 07MAC-SL0A102
- Ball Joint Remover, 28 mm 07MAC-SL0A202

NOTE: Always use a ball joint remover to disconnect a ball joint. Do not strike the housing or any other part of the ball joint connection to disconnect it.

1. Install a hex nut (A) or the ball joint thread protector onto the threads of the ball joint (B).

NOTE: Using a hex nut, make sure the nut is flush with the ball joint pin end to prevent damage to the threaded end of the ball joint pin.

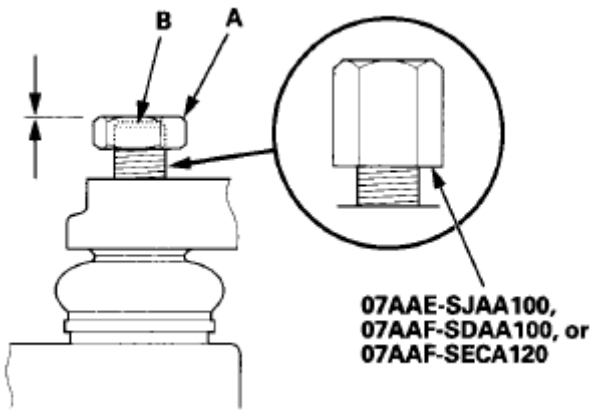

Fig. 15: Identifying Hex Nut And Threads Of Ball Joint
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Apply grease to the ball joint remover on the areas as shown (A). This will ease the installation of the tool, and prevent damage to the pressure bolt (B) threads.

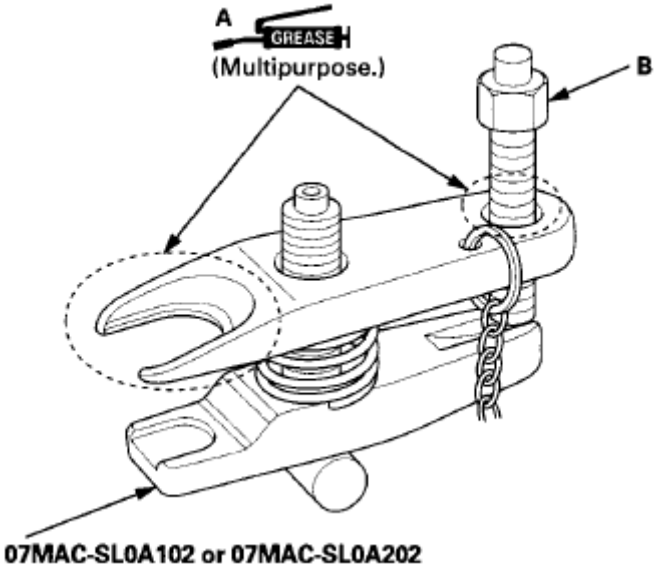

Fig. 16: Applying Grease To Ball Joint Remover On Specified Areas
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosen the pressure bolt (A), and install the ball joint remover as shown. Insert the jaws carefully, making sure not to damage the ball joint boot. Adjust the jaw spacing by turning the adjusting bolt (B).

NOTE: Fasten the safety chain (C) securely to a suspension arm or the subframe (D). Do not fasten it to a brake line or wire harness.

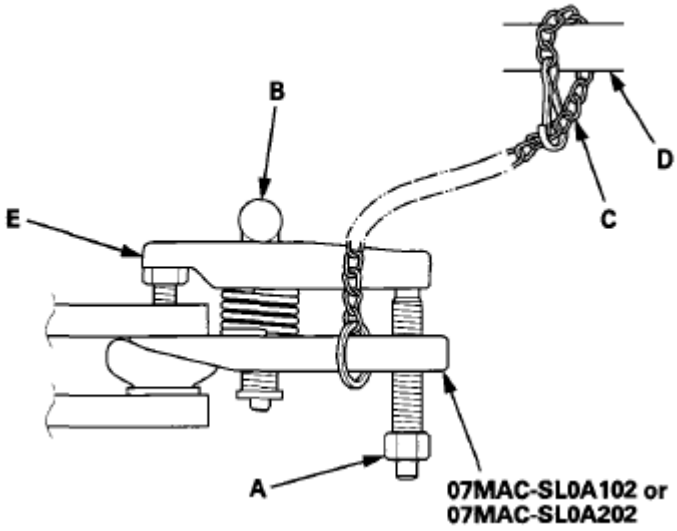

Fig. 17: Identifying Safety Chain, Subframe, Jaw, Pressure And Adjusting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. After adjusting the adjusting bolt, make sure the head of the adjusting bolt is in the position shown to allow the jaw (E) to pivot.
5. With a wrench, tighten the pressure bolt until the ball joint pin pops loose from the ball joint connecting hole. If necessary, apply penetrating type lubricant to loosen the ball joint pin.

NOTE: Do not use pneumatic or electric tools on the pressure bolt.

6. Remove the ball joint remover, then remove the nut or the ball joint thread protector from the end of the ball joint pin, and pull the ball joint out of the ball joint connecting hole. Inspect the ball joint boot, and replace it if damaged.

BALL JOINT BOOT INSPECTION/REPLACEMENT

Special Tools Required

- Clip Guide, 45 mm 070AG-SJA0300
- Clip Guide, 41 mm 07974-SA50700

FRONT KNUCKLE/FRONT UPPER ARM/REAR UPPER ARM

1. Check the ball joint boot for weakness, damage, cracks, and grease leaks.

NOTE:
- **If the ball joint boot is damaged with grease leaks, replace the appropriate part as an assembly.**
- **If the ball joint boot is weak and crack, but does not leak grease, go to step 2. Replace the appropriate ball joint boot.**

2. Disconnect the appropriate ball joint connection, and remove the component including the ball joint:
   - The front knuckle (see **KNUCKLE/HUB REPLACEMENT**).
   - The front upper arm (see **UPPER ARM REPLACEMENT**).
   - The rear upper arm (see **UPPER ARM REPLACEMENT**).
3. Paint a alignment mark (A) in the center between the both boot clip end faces (B) on the appropriate part (C).

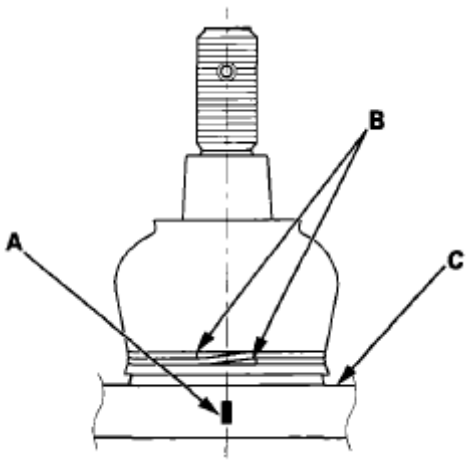

Fig. 18: Identifying Boot Clip End Faces And Alignment Mark
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the boot clip and the boot.
5. Pack the interior and lip (A) of a new boot with grease. Keep the grease off of the boot-to-housing mating surfaces (B).

NOTE: Use the grease that comes with the ball joint kit, or multi-purpose grease.

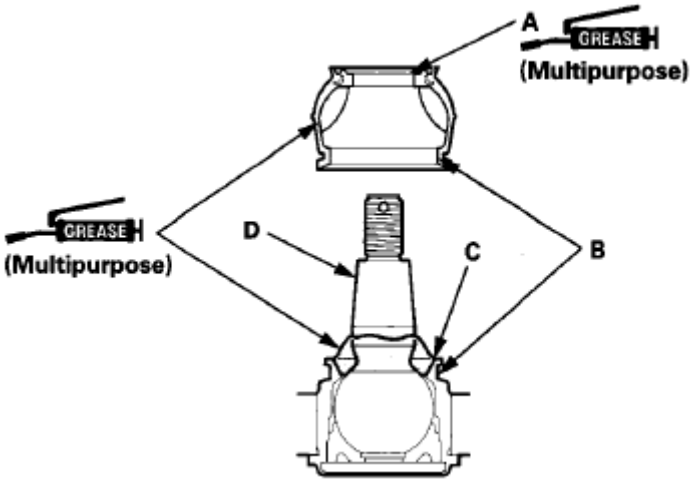

Fig. 19: Identifying Lip, Boot-To-Housing Mating Surfaces, Base And Ball Joint Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Pack fresh grease into the base (C). Do not let dirt or other foreign materials get into the boot.
7. Install the boot on the ball joint, then squeeze it gently to force out any air, then wipe the grease off the tapered portion of the ball joint pin (D).
8. The front knuckle ball joint or the rear upper arm ball joint: Adjust the depth by turning the clip guide until its base is just above the groove around (A) the bottom of the boot. Then slide the clip (B) over the tool and into position on the boot.

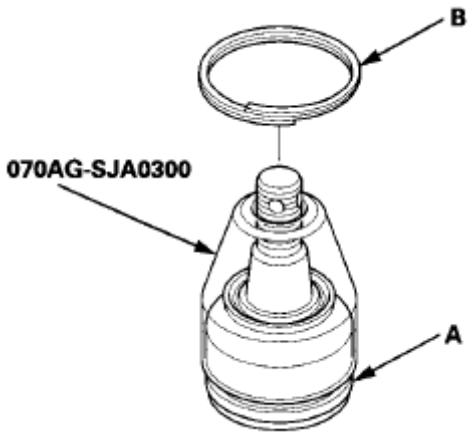

Fig. 20: Identifying Clip And Groove Around Bottom Of Boot
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. The front upper arm ball joint: Adjust the clip guide with the adjusting bolt (A) until its base is just above the groove around (B) the bottom of the boot. Then slide the clip (C) over the clip guide and into position on the boot.

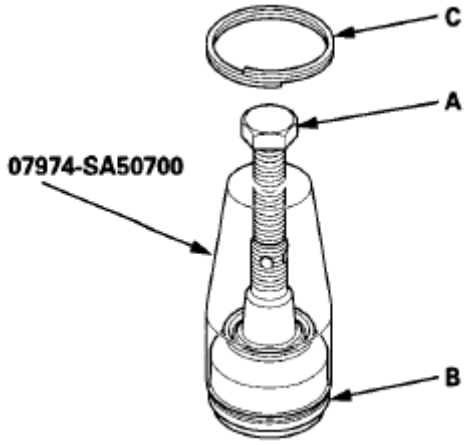

Fig. 21: Identifying Clip, Adjusting Bolt And Groove Around Bottom Of Boot
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Align the center between the both end faces of the boot clip to alignment mark of the appropriate part.
11. After installing a boot, wipe any grease off the exposed portion of the ball joint pin.
12. Install all of the removed parts.

2012 SUSPENSION

Front Suspension - TL

KNUCKLE/HUB/WHEEL BEARING REPLACEMENT

EXPLODED VIEW

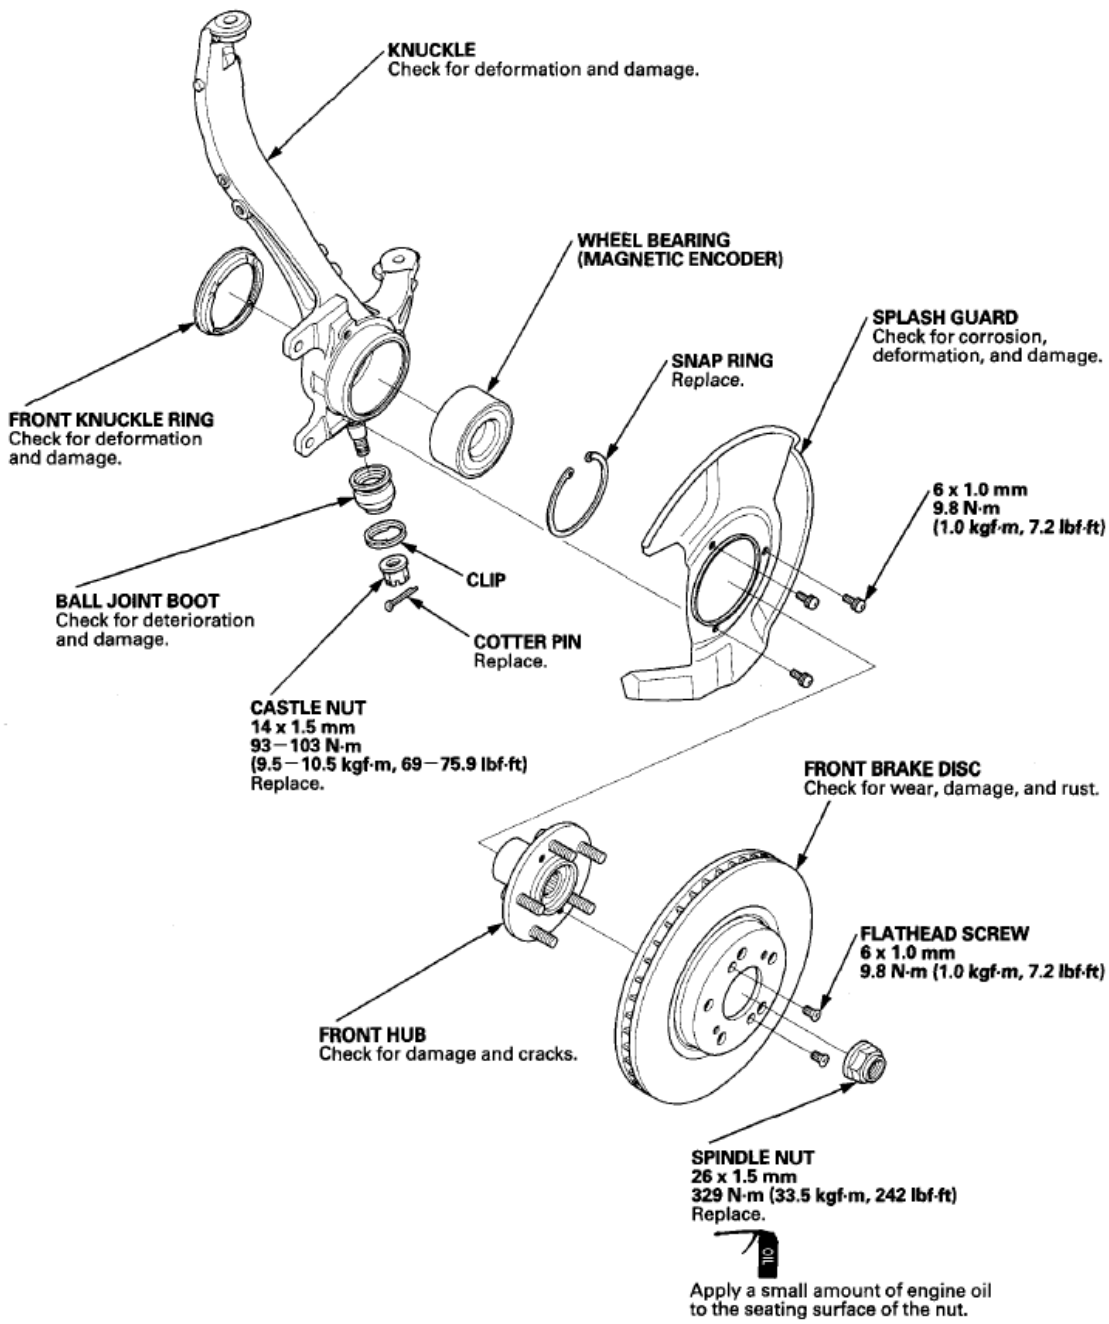

Fig. 1: Exploded View Of Knuckle/Hub/Wheel Bearing With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Special Tools Required

- Ball Joint Remover, 28 mm 07MAC-SL0A202
- Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
- Ball Joint Thread Protector, 12 mm 07AAF-SDAA100
- Ball Joint Thread Protector, 10 mm 07AAF-SECA120
- Hub Dis/Assembly Pin, 42mm 07GAF-SD4A100
- Attachment, 72 x 75 mm 07746-0010600
- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment, 96 mm 07ZAD-PNAA100
- Support Base 07965-SD90100

NOTE: Refer to the EXPLODED VIEW as needed during the following procedure.

KNUCKLE/HUB REPLACEMENT

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the wheel nuts (A) and the front wheel.

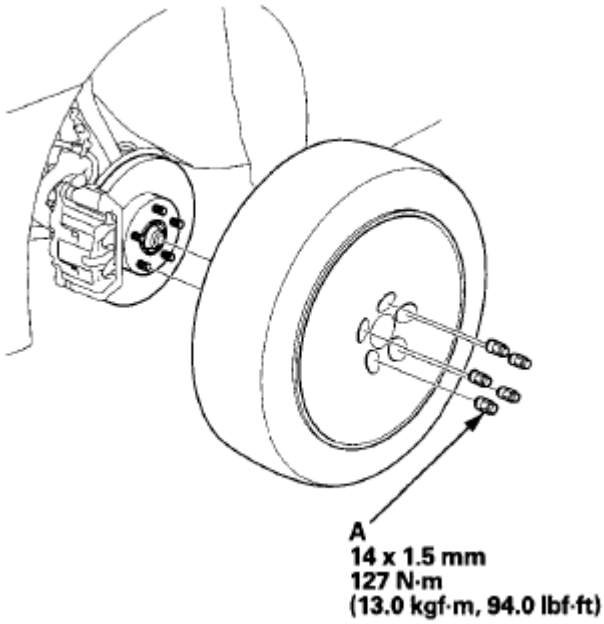

Fig. 2: Identifying Wheel Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the brake hose bracket mounting bolt (A).

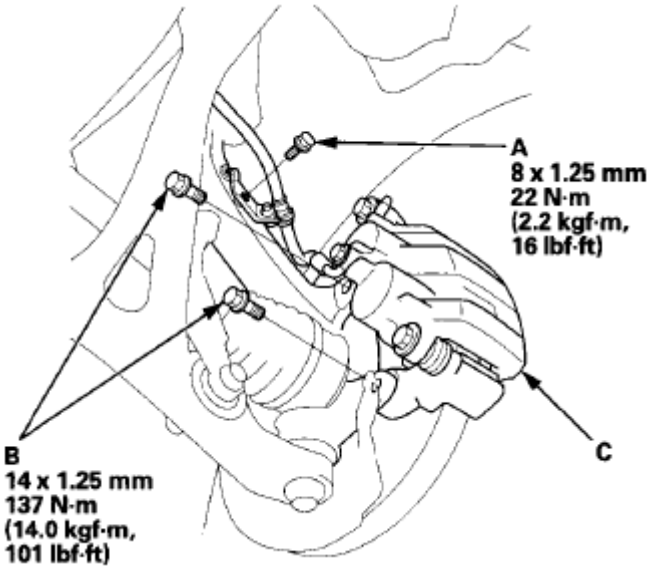

Fig. 3: Identifying Caliper Assembly, Brake Caliper Bracket And Brake Hose Bracket Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the brake caliper bracket mounting bolts (B), then remove the caliper assembly (C) from the knuckle. To prevent damage to the caliper assembly or the brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. Do not twist the brake hose excessively.
5. Remove the wheel speed sensor harness bracket (A) and the wheel speed sensor (B) from the knuckle. Do not disconnect the wheel speed sensor connector.

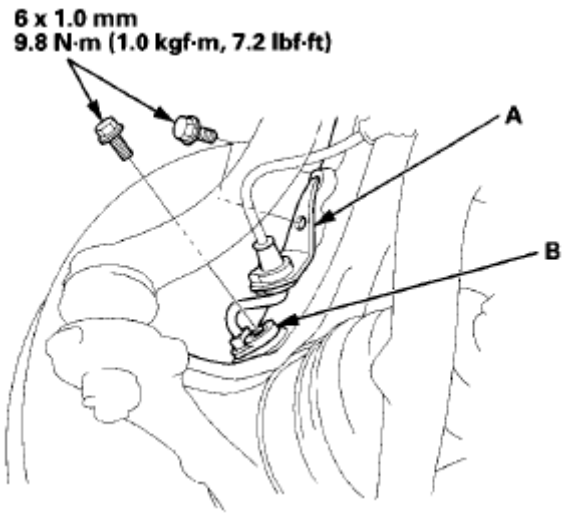

Fig. 4: Identifying Wheel Speed Sensor And Harness Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Pry up the stake (A) on the spindle nut (B), then remove the nut.

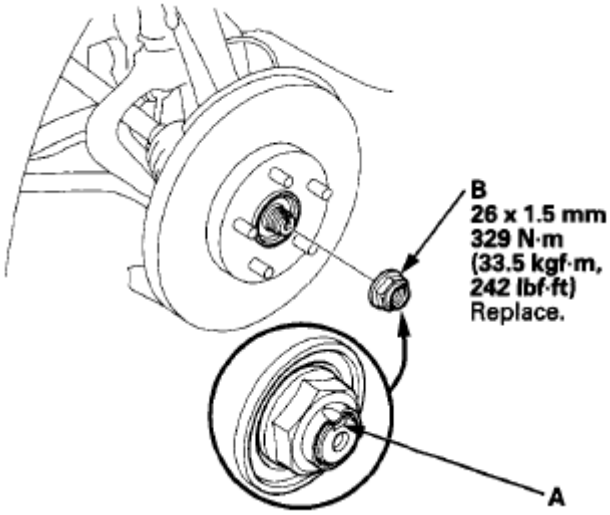

Fig. 5: Identifying Stake And Spindle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the front brake disc (see **FRONT BRAKE DISC REPLACEMENT**).
8. Check the front hub for damage and cracks.
9. Remove the cotter pin (A) from the tie-rod end ball joint, then remove the nut (B).

NOTE:

- **Use the new nut during reassembly.**
- **During installation, install the new cotter pin after tightening the nut, and bend its end as shown.**

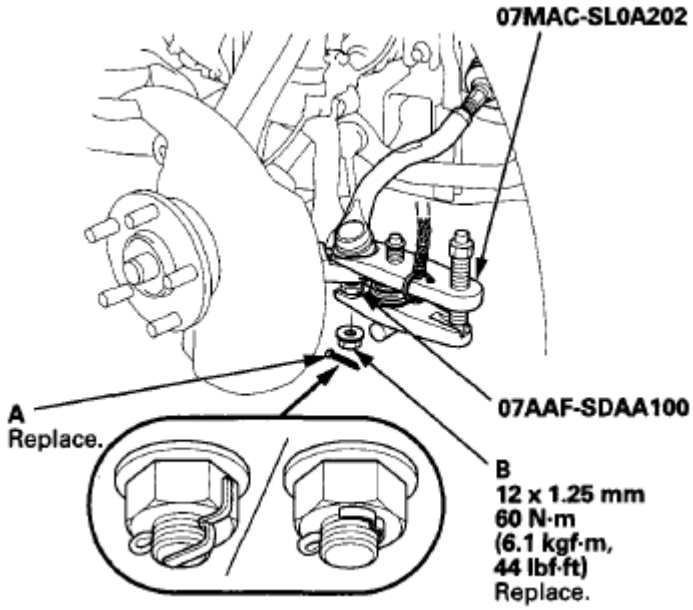

Fig. 6: Identifying Cotter Pin And Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Disconnect the tie-rod end ball joint from the knuckle using the ball joint thread protector and the ball joint remover (see **BALL JOINT REMOVAL**).
11. Remove the cotter pin (A) from the knuckle ball joint, then remove the castle nut (B).

NOTE:

- **Use the new castle nut during reassembly.**
- **During installation, insert the new cotter pin into the ball joint pin hole from the front to the rear of the vehicle, and bend its end as shown. Check the ball joint pin hole direction before connecting the ball joint.**

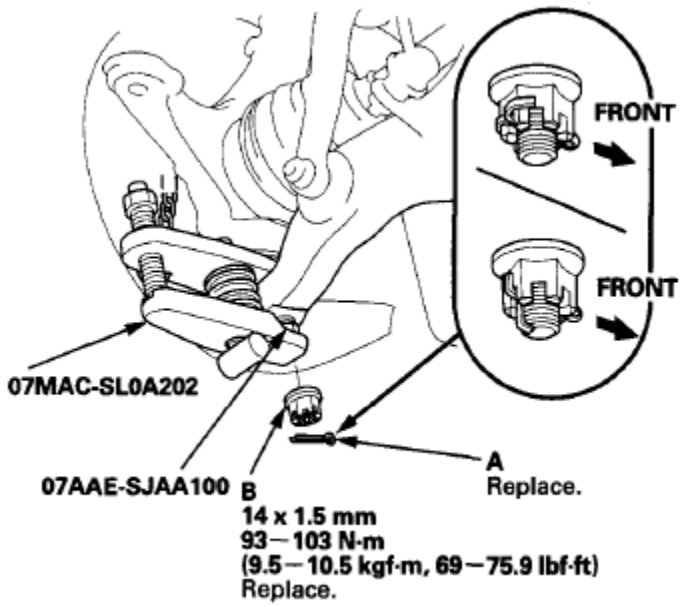

Fig. 7: Identifying Cotter Pin And Castle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Disconnect the knuckle ball joint from the lower arm using the ball joint thread protector and the ball joint remover (see **BALL JOINT REMOVAL**).

NOTE:

- **Be careful not to damage the ball joint boot when installing the remover.**
- **Do not force or hammer on the lower arm, or pry between the lower arm and the knuckle. You could damage the ball joint.**

13. Remove the cotter pin (A) from the upper arm ball joint, then remove the castle nut (B).

NOTE: **During installation, insert the new cotter pin into the ball joint pin hole from the front to the rear of the vehicle, and bend its end as shown. Check the ball joint pin hole direction before connecting the ball joint.**

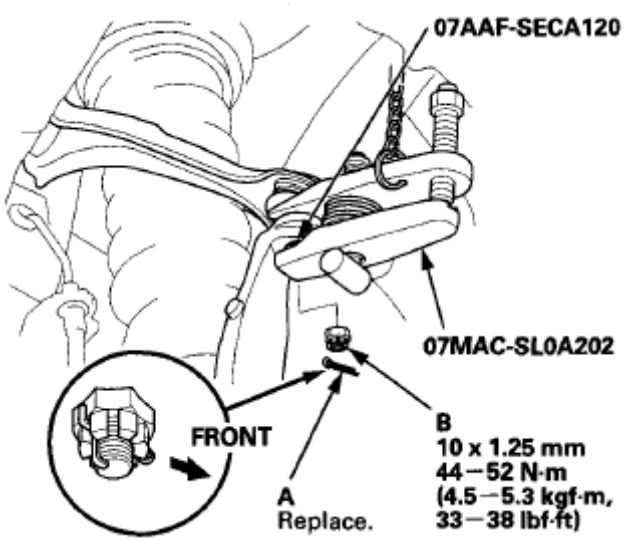

Fig. 8: Identifying Cotter Pin And Castle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Disconnect the upper arm ball joint from the knuckle using the ball joint thread protector and the ball joint remover (see **BALL JOINT REMOVAL**).
15. Pull the knuckle (A) outward, and separate the outboard joint (B) from the front hub using a soft face hammer, then remove the knuckle/hub.

NOTE:

- **Do not pull the driveshaft end outward. The driveshaft inboard joint may come apart.**
- **During installation, apply grease to the mating surfaces of the wheel bearing and the driveshaft outboard joint (see FRONT DRIVESHAFT REASSEMBLY).**

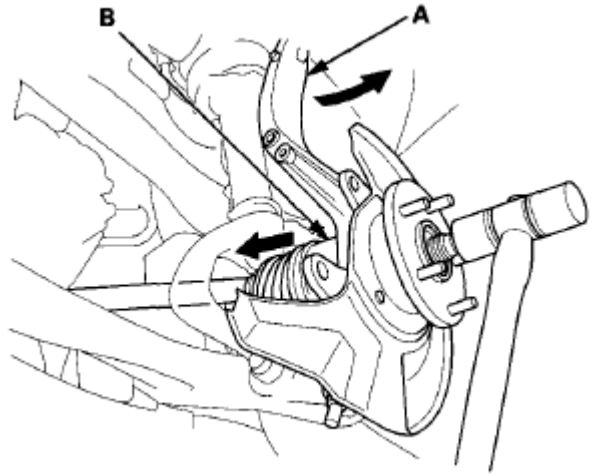

Fig. 9: Pulling Knuckle Outward And Separating Outboard Joint From Front Hub

Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the knuckle/hub in the reverse order of removal, and note these items:
    - Be careful not to damage the ball joint boot when connecting the knuckle.
    - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, the threaded section, and the mating surfaces of the castle nut.
    - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
    - Use a new spindle nut on reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
    - Before installing the brake disc, clean the mating surfaces between the front hub and the inside of the brake disc.
    - Before installing the wheel, clean the mating surfaces between the brake disc and the inside of the wheel.
17. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

WHEEL BEARING REPLACEMENT

1. Remove the knuckle/hub.
2. Separate the hub (A) from the knuckle (B) using the hub dis/assembly pin and a hydraulic press. Hold the knuckle with the attachment (C) of the hydraulic press or equivalent tool. Be careful not to damage or deform the splash guard (D). Hold onto the hub to keep it from falling when pressed clear.

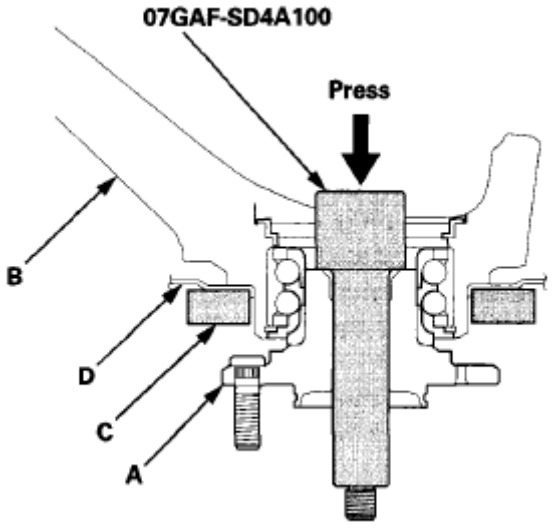

Fig. 10: Separating Hub From Knuckle Using Hub Dis/Assembly Pin And Hydraulic Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Press out the wheel bearing inner race (A) of the hub (B) using the hub dis/assembly pin, a commercially

available bearing separator (C), and a press.

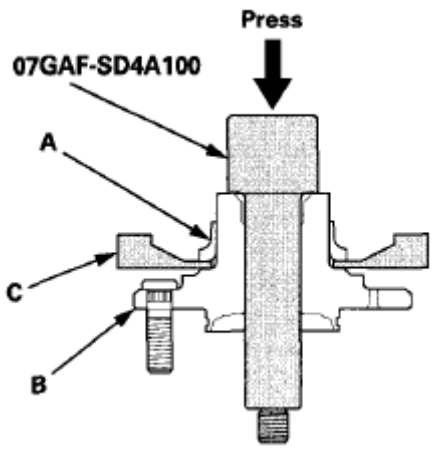

Fig. 11: Pressing Out Wheel Bearing Inner Race Of Hub Using Hub Dis/Assembly Pin, Bearing Separator And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the snap ring (A) and the splash guard (B) from the knuckle (C).

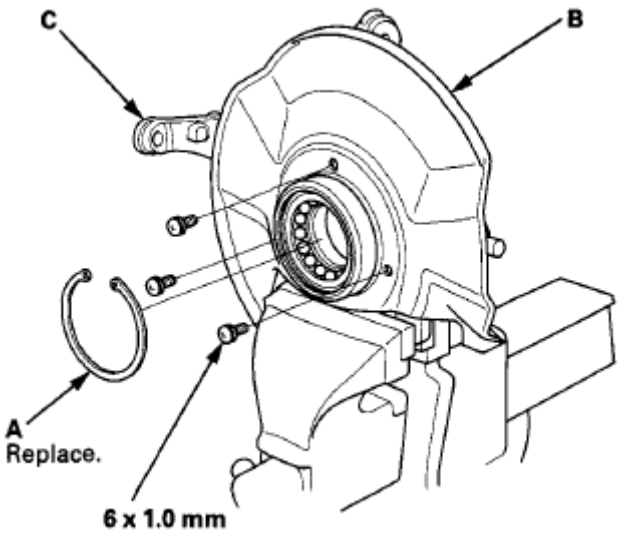

Fig. 12: Identifying Snap Ring, Splash Guard And Knuckle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Press the wheel bearing (A) out of the knuckle (B) using the attachment, the driver handle, and a press.

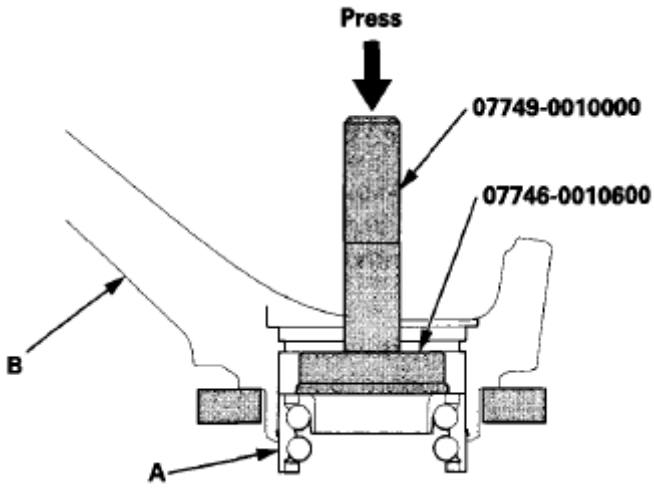

Fig. 13: Pressing Wheel Bearing Out Of Knuckle Using Attachment, Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Wash the knuckle and the hub thoroughly in high flash point solvent before reassembly.
7. Press a new wheel bearing (A) into the knuckle (B) using the old bearing (C), a steel plate (D), the attachment, the support base, and a press.

NOTE:

- **Install the wheel bearing with the wheel speed sensor magnetic encoder (E) (brown color), toward the inside of the knuckle.**
- **Remove any oil, grease, dust, metal debris, and other foreign material from the magnetic encoder surface.**
- **Keep any magnetic tools away from the magnetic encoder surface.**
- **Be careful not to damage the magnetic encoder surface when you insert the wheel bearing.**

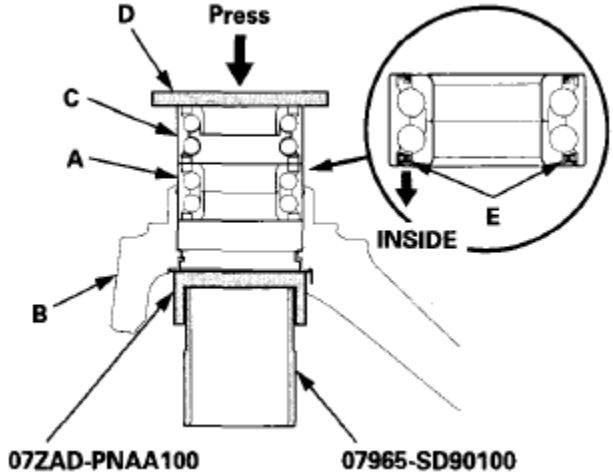

Fig. 14: Pressing Wheel Bearing Into Knuckle Using Old Bearing, Steel Plate, Attachment, Support Base And Press

Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Check the front knuckle ring (A) for damage or deformation, and replace it if necessary.

NOTE: When installing the new front knuckle ring, position the knuckle ring notch portion (B) toward the cut out (C) near the ball joint in the knuckle, and align the center of the knuckle ring ledge portion (D) with the center of the wheel speed sensor hole (E) on the knuckle as shown.

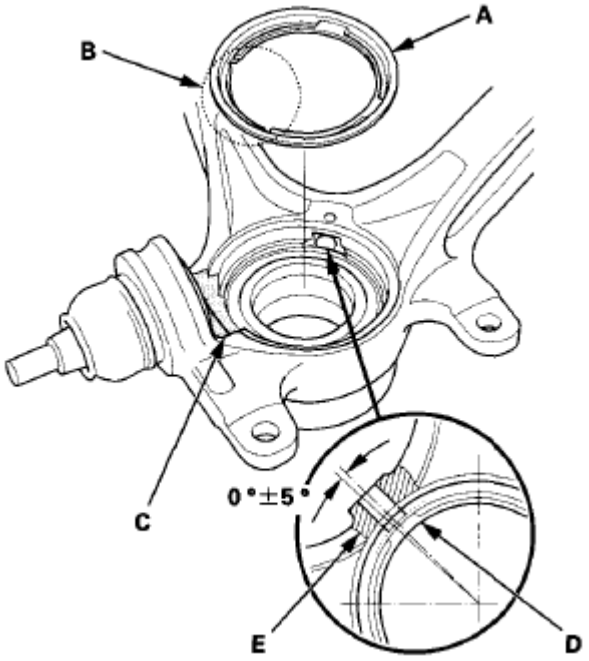

Fig. 15: Identifying Front Knuckle Ring, Notch And Ledge Portion, Wheel Speed Sensor Hole And Cut Out
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the new snap ring (A) securely in the knuckle (B).

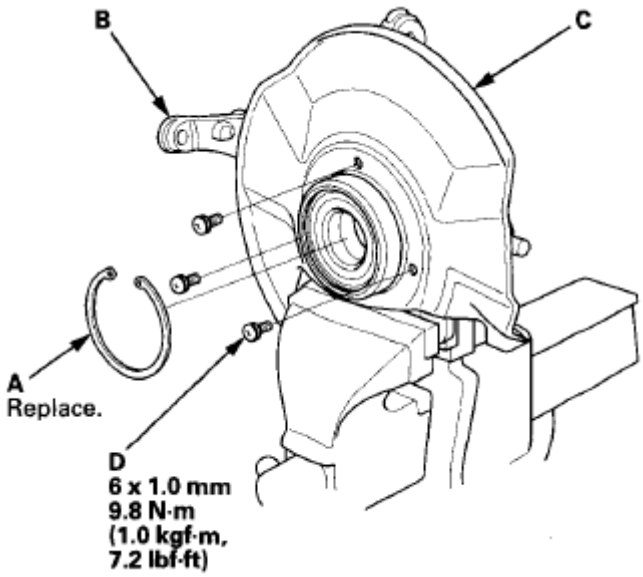

Fig. 16: Identifying Snap Ring, Knuckle, Splash Guard And Screws With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the splash guard (C), and tighten the screws (D) to the specified torque.
11. Install the hub (A) onto the knuckle (B) using the attachment, the driver handle, the support base, and a hydraulic press. Be careful not to damage the splash guard (C).

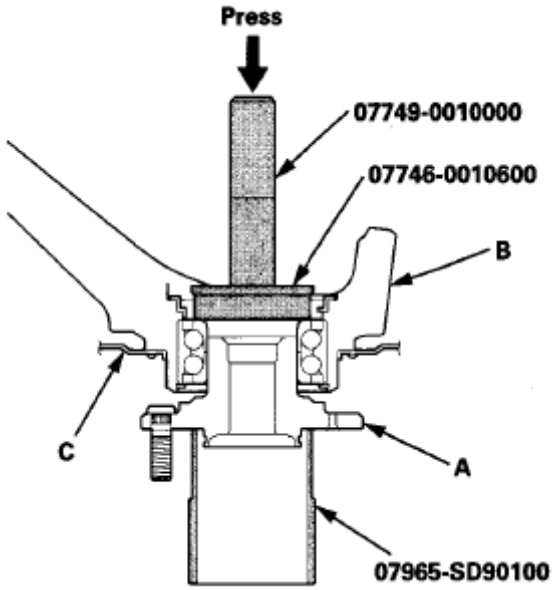

Fig. 17: Installing Hub Onto Knuckle Using Attachment, Driver Handle, Support Base And Hydraulic Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the knuckle/hub.

KNUCKLE BALL JOINT INSPECTION

NOTE: When inspecting the ball joint, the vehicle will be shaken strongly. Make sure to support the front jacking bracket correctly with a suitable jack (see LIFT AND SUPPORT POINTS).

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Check all bolts, nuts, and bushings on the suspension components, and make sure that there is no looseness, deterioration, or damage.
3. Measure the gap between the lower arm (A) and the knuckle (B) using the vernier caliper with a dial or digital gauge (C). Record the measured gap.

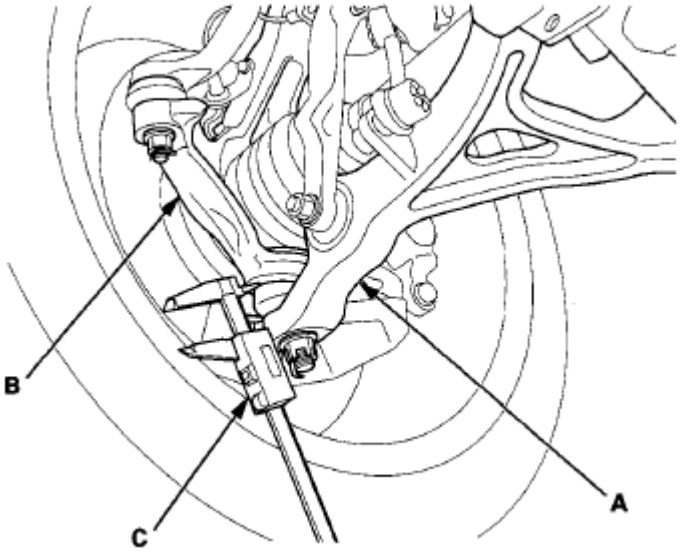

Fig. 18: Measuring Gap Between Lower Arm And Knuckle Using Vernier Caliper With Dial Or Digital Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Position a jack stand (A) about 305 mm (12.01 in) away from the front wheel.

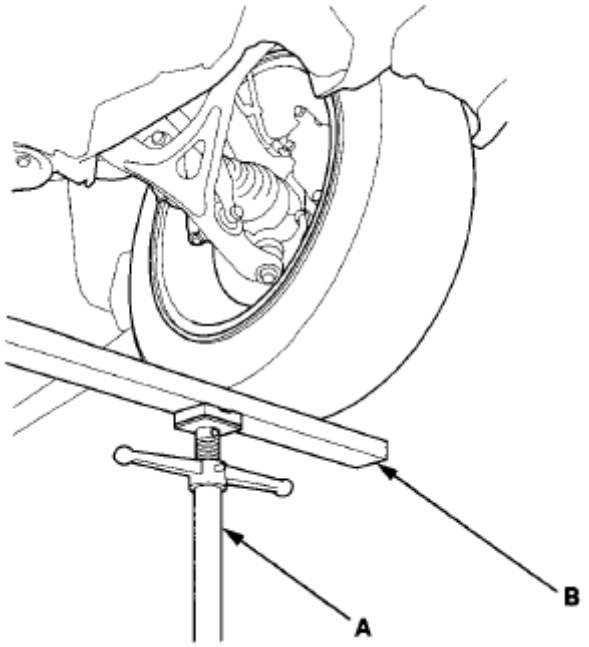

Fig. 19: Positioning Jack Stand Away From Front Wheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Place a wood block (B) on top of the jack stand and under the front wheel.
6. Have an assistant apply downward pressure on the wood block to raise the wheel (You only have to raise the weight of the wheel and knuckle assembly to fully extend the ball joint).
7. Measure the gap between the lower arm (A) and the knuckle (B) using the vernier caliper with a dial or digital gauge (C) while the ball joint is being extended. Record the measured gap.

NOTE: Measure the same point as step 3.

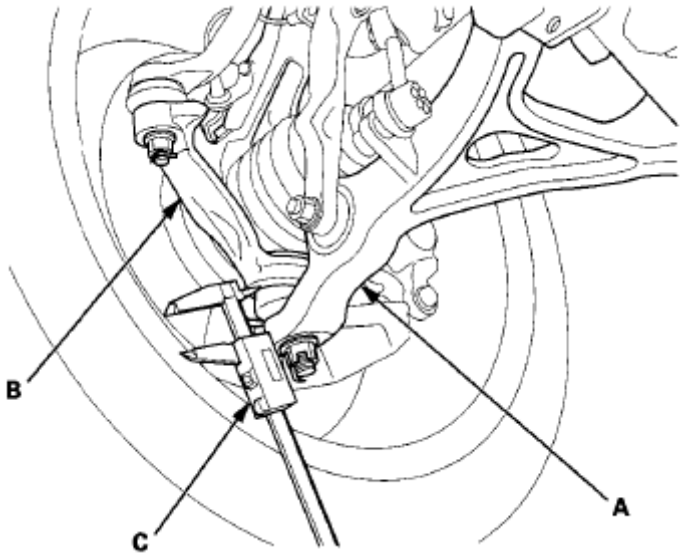

Fig. 20: Measuring Gap Between Lower Arm And Knuckle Using Vernier Caliper With Dial Or Digital Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Compare gap measured in step 3 and step 7.

   Maximum difference: 0.2 mm (0.008 in)

   - If the difference is more than 0.2mm (0.008 in), replace the knuckle ball joint (see **KNUCKLE BALL JOINT REPLACEMENT**).
   - If the difference is less than 0.2mm (0.008 in), the knuckle ball joint is OK.

KNUCKLE BALL JOINT REPLACEMENT

Special Tools Required

- Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
- Ball Joint Remover, 32 mm 07MAC-SL0A102
- Ball Joint Tool Kit 07AAF-TL2A150
- Adapter G 07XAF-001050A
- C-Frame OTC7248, commercially available

NOTE: Paint mark (A) indicates the knuckle ball joint has been replaced. Do not replace the ball joint with the paint mark; you must replace the knuckle as an assembly (see KNUCKLE/HUB/WHEEL BEARING REPLACEMENT).

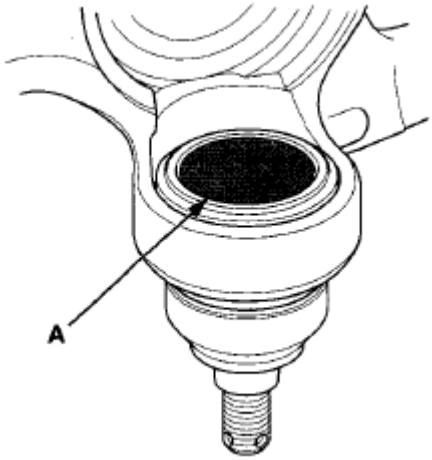

Fig. 21: Identifying Paint Mark
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the front wheel.

3. Remove the wheel speed sensor harness bracket mounting bolt (A).

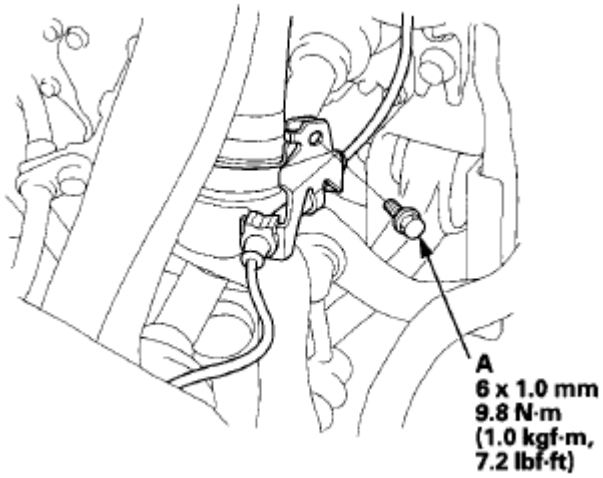

Fig. 22: Identifying Wheel Speed Sensor Harness Bracket Mounting Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Pry up the stake (A) on the spindle nut (B), then remove the nut.

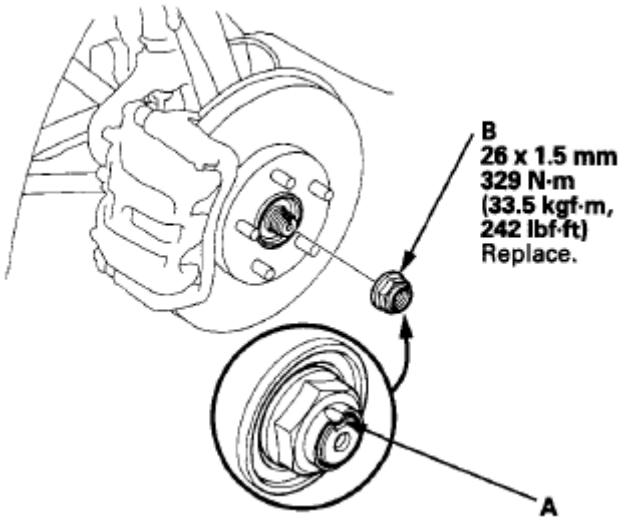

Fig. 23: Identifying Stake And Spindle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the damper fork mounting nut (A) while holding the mounting bolt (B), then remove the mounting bolt.

NOTE: Use the new damper fork mounting bolt and the new mounting nut, and torque the nut while holding the bolt during reassembly.

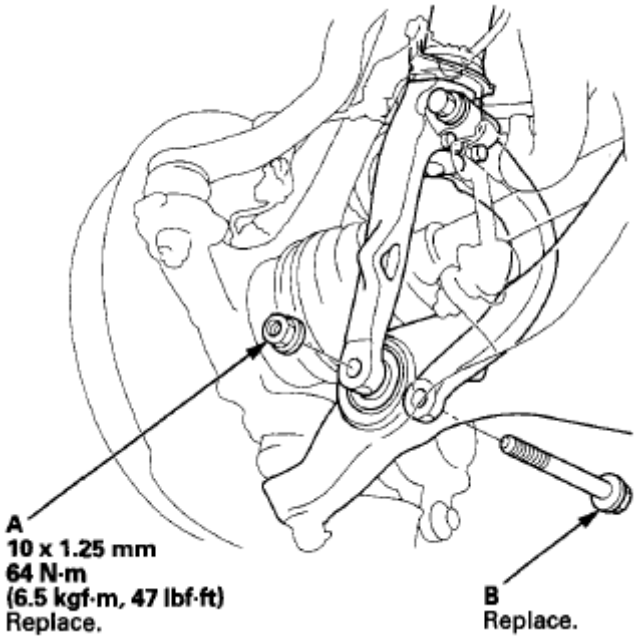

Fig. 24: Identifying Damper Fork Mounting Nut And Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the cotter pin (A) from the knuckle ball joint, then remove the castle nut (B).

NOTE: During installation, insert the new cotter pin into the ball joint pin hole from the front to the rear of the vehicle, and bend its end as shown. Check the ball joint pin hole direction before connecting the ball joint.

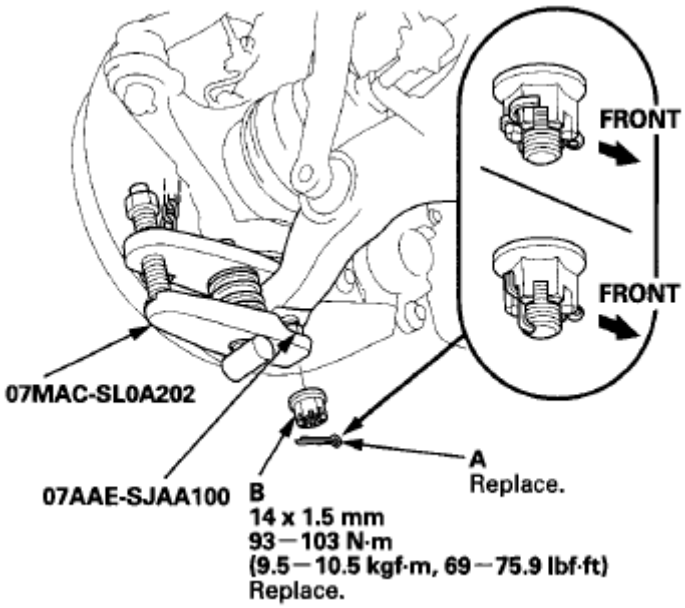

Fig. 25: Identifying Cotter Pin And Castle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the knuckle ball joint from the lower arm using the ball joint thread protector and the ball joint remover (see **BALL JOINT REMOVAL**).

NOTE:

- **Be careful not to damage the ball joint boot when installing the remover.**
- **Do not force or hammer on the lower arm, or pry between the lower arm and the knuckle. You could damage the ball joint.**

8. Pull the knuckle (A) outward, and separate the outboard joint (B) from the front hub using a soft face hammer outward, then move aside the knuckle/hub.

NOTE:

- **Do not pull the driveshaft end outward. The driveshaft inboard joint may come apart.**
- **During installation, apply grease to the mating surfaces of the wheel bearing and the driveshaft outboard joint (see FRONT DRIVESHAFT REASSEMBLY).**

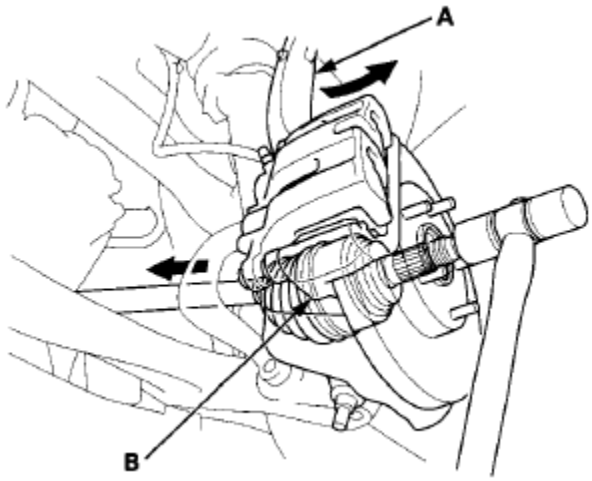

Fig. 26: Pulling Knuckle Outward And Separate Outboard Joint From Front Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the front knuckle ring (A) from the knuckle.

NOTE: **When installing the new front knuckle ring, position the knuckle ring notch portion toward the cut out near the ball joint in the knuckle, and align the center of the knuckle ring ledge portion with the center of the wheel speed sensor hole on the knuckle as shown (see step 8).**

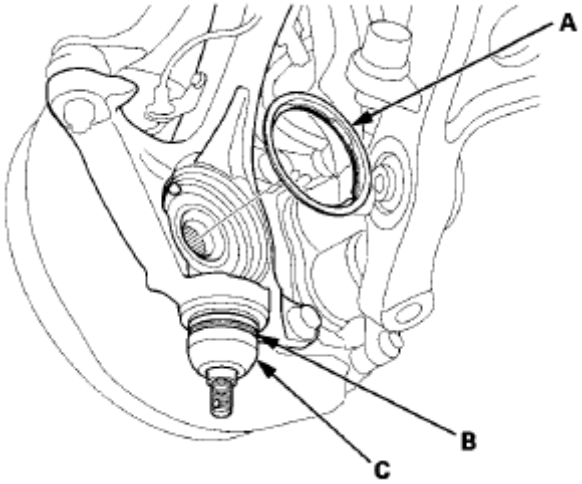

Fig. 27: Identifying Front Knuckle Ring, Boot Clip And Boot
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the boot clip (B) and the boot (C), then wipe grease off the exposed portion of the ball joint (see **BALL JOINT REMOVAL**).
11. Install the attachments (07AAF-TL2A300-A and B) of the ball joint tool kit through the hub center. Position the projection of the attachment (07AAF-TL2A300-B) toward the lower side of the knuckle (A). Tighten it into place by hand.

NOTE: Make sure that it is parallel between the top (B) of the knuckle ball joint and the flat aspect (C) of the attachment.

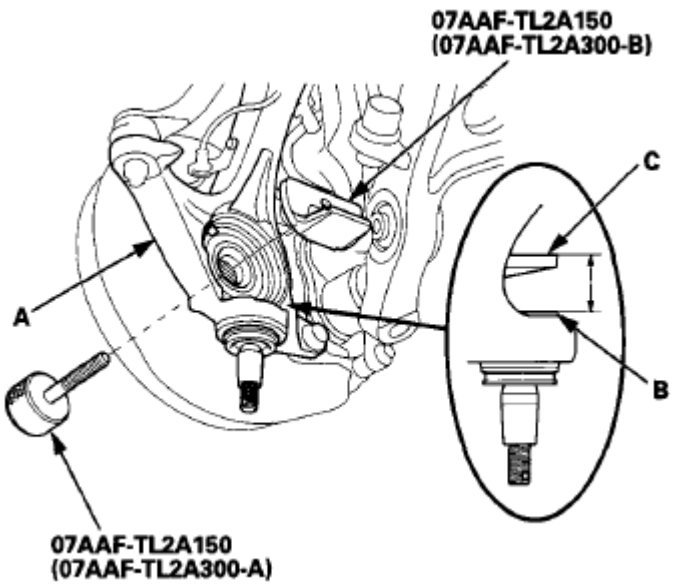

Fig. 28: Installing Attachments Of Ball Joint Tool Kit Through Hub Center
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Position the ball joint tool kit, the adapter G, and the C-frame OTC7248, commercially available to knuckle ball joint (A) as shown.

NOTE: Make sure the attachments are installed securely.

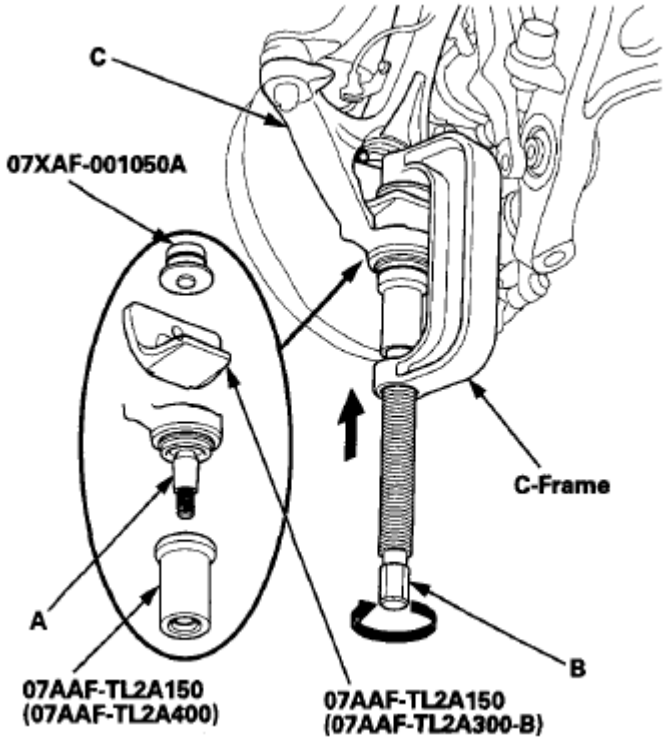

Fig. 29: Positioning Ball Joint Tool Kit, Adapter G And C-Frame OTC7248 To Knuckle Ball Joint
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Tighten the pressure bolt (B) of the C-frame, and remove the knuckle ball joint.

NOTE: When tightening the pressure bolt, fix the knuckle (C) and outboard joint securely.

14. Remove the attachments (07AAF-TL2A300-A and B) of the ball joint tool kit from the hub.
15. Clean the mating surfaces of the new knuckle ball joint (A) and the knuckle (B). Position the ball joint tool kit and the C-frame OTC7248, commercially available to ball joint as shown.

NOTE:

- **Make sure the attachments are installed securely.**
- **Align the knuckle and the ball joint boot to the alignment mark of the appropriate part (see BALL JOINT REMOVAL).**

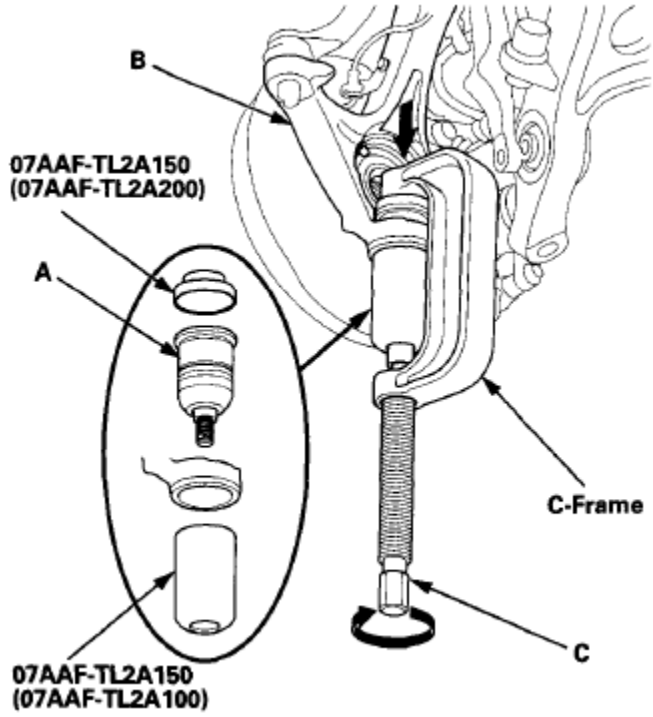

Fig. 30: Cleaning Mating Surfaces Of Knuckle Ball Joint And Knuckle And Positioning Ball Joint Tool Kit And C-Frame OTC7248 To Ball Joint
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Tighten the pressure bolt (C) of the C-frame until the knuckle ball joint shoulder is fully seated in the knuckle.

NOTE: When tightening the pressure bolt, fix the knuckle and outboard joint securely.

17. Using a yellow oil-based paint marker, paint a mark (A) to the top of the knuckle ball joint as shown.

NOTE: The paint mark is used to identify a knuckle that has had the ball joint replaced. Replace the knuckle as an assembly if the knuckle ball joint has the paint mark.

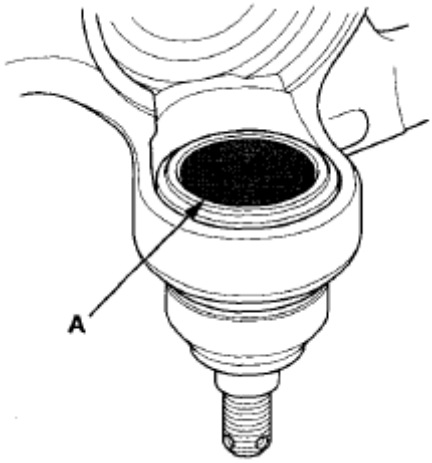

Fig. 31: Identifying Paint Mark
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Install all of the removed parts in the reverse order of removal, and note these items:
    - First install all of the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening it to the specified torque. Do not place the jack against the ball joint pin of the knuckle.
    - Be careful not to damage the ball joint boot when connecting the knuckle.
    - Before connecting the ball joint, degrease the threaded section, the tapered portion of the ball joint pin, and the ball joint connecting hole, the threaded section, and the mating surfaces of the castle nut.
    - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
    - Use a new spindle nut on reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
    - Before installing the wheel, clean the mating surfaces between the brake disc and the inside of the wheel.
19. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

UPPER ARM REPLACEMENT

Special Tools Required

- Ball Joint Thread Protector, 10 mm 07AAF-SECA120
- Ball Joint Remover, 28 mm 07MAC-SL0A202

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the front wheel.
3. Remove the front damper/spring (see **DAMPER/SPRING REMOVAL AND INSTALLATION**).

4. Remove the cotter pin (A) from the upper arm ball joint, then remove the castle nut (B).

NOTE: During installation, install the new cotter pin into the ball joint pin hole from the front to the rear of the vehicle, and bend its end as shown. Check the ball joint pin hole direction before connecting the ball joint.

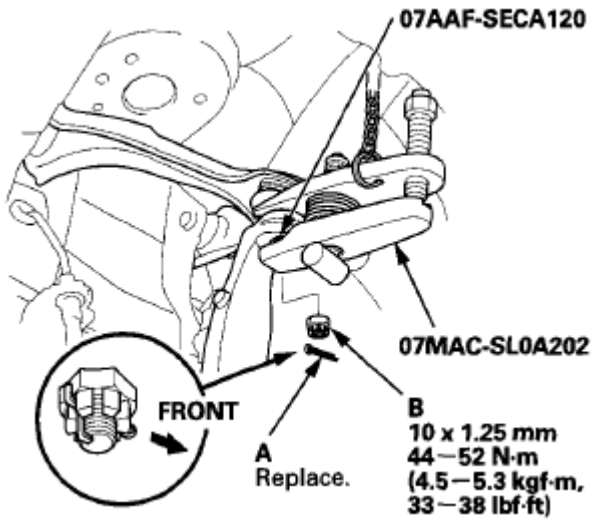

Fig. 32: Removing Cotter Pin From Upper Arm Ball Joint And Castle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the upper arm ball joint from the knuckle using the ball joint thread protector and the ball joint remover (see **BALL JOINT REMOVAL**).
6. Remove the upper arm mounting bolts (A), then remove the upper arm (B).

NOTE: Use new upper arm mounting bolts during reassembly.

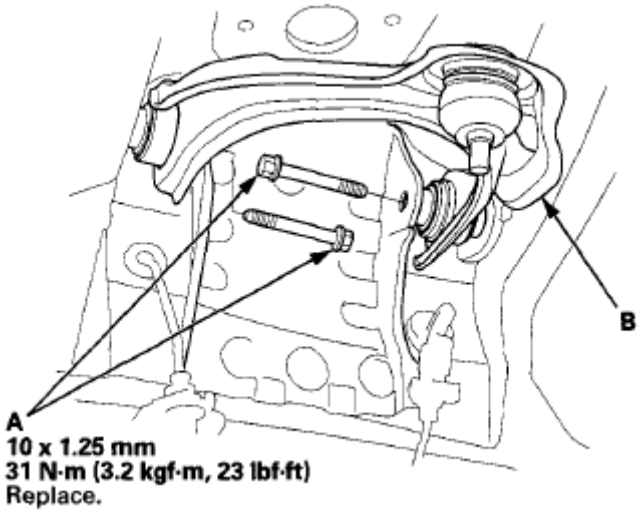

Fig. 33: Identifying Upper Arm And Upper Arm Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the upper arm in the reverse order of removal, and note these items:
   - First install all of the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening it to the specified torque. Do not place the jack against the ball joint pin of the knuckle.
   - Be careful not to damage the ball joint boot when connecting the knuckle.
   - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, the threaded section, and the mating surfaces of the castle nut.
   - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
   - Before installing the wheel, clean the mating surfaces between the brake disc and the inside of the wheel.
8. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

LOWER ARM REMOVAL/INSTALLATION

Special Tools Required

- Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
- Ball Joint Remover, 28 mm 07MAC-SL0A202

REMOVAL/INSTALLATION

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the front wheel.
3. Remove the spindle nut (see step 6).
4. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
5. Remove the damper fork mounting nut (A) while holding the mounting bolt (B), then remove the mounting bolt.

NOTE: Use the new damper fork mounting bolt and the new mounting nut, and torque the nut while holding the bolt during reassembly.

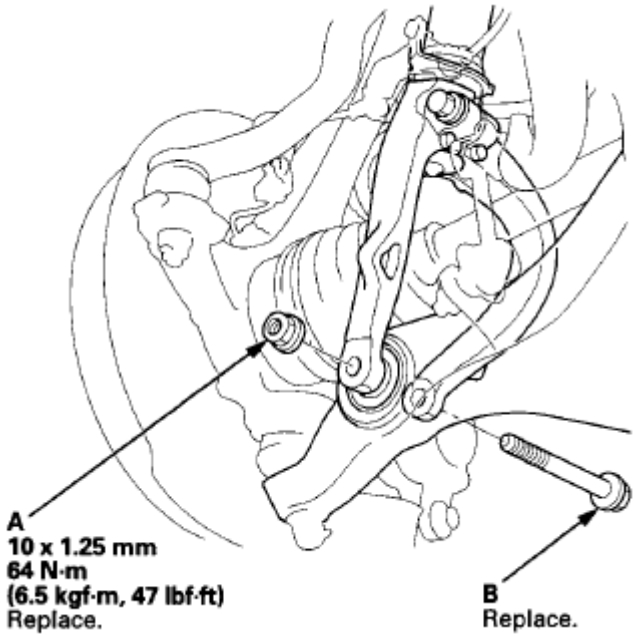

Fig. 34: Identifying Damper Fork Mounting Nut And Mounting Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the stabilizer link from the lower arm (see **STABILIZER LINK REMOVAL/INSTALLATION**).
7. Remove the cotter pin (A) from the knuckle ball joint, then remove the castle nut (B).

NOTE:

- **Use the new castle nut during reassembly.**
- **During installation, insert the new cotter pin into the ball joint pin hole from the front to the rear of the vehicle, and bend its end as shown. Check the ball joint pin hole direction before connecting the ball joint.**

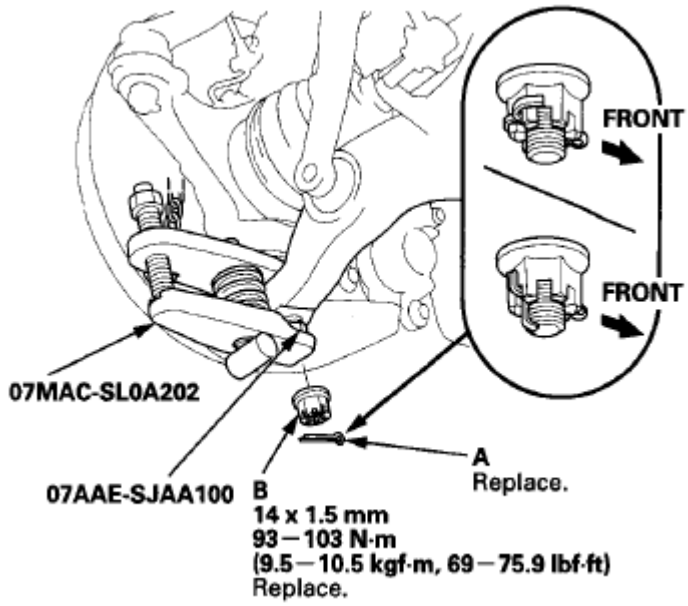

Fig. 35: Removing Cotter Pin From Knuckle Ball Joint And Castle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Disconnect the knuckle ball joint from the lower arm using the ball joint thread protector and the ball joint remover (see **BALL JOINT REMOVAL**).

NOTE:
- **Be careful not to damage the ball joint boot when installing the remover.**
- **Do not force or hammer on the lower arm, or pry between the lower arm and the knuckle. You could damage the ball joint.**

9. Pull the knuckle (A) outward, and separate the outboard joint (B) from the front hub using a soft face hammer.

NOTE: **Do not pull the driveshaft end outward. The driveshaft inboard joint may come apart.**

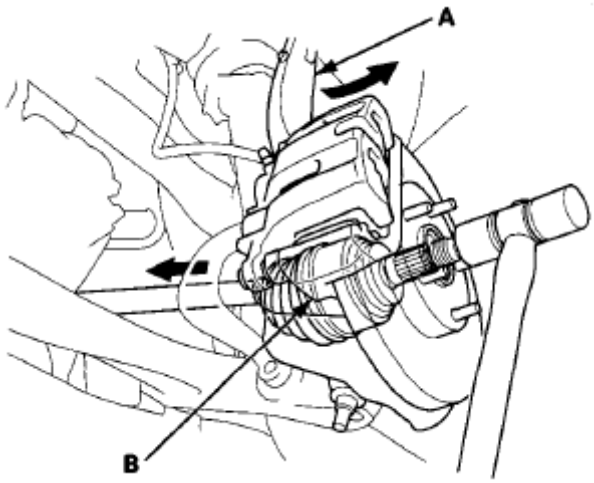

Fig. 36: Pulling Knuckle Outward And Separating Outboard Joint From Front Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the lower arm mounting bolts, mounting nuts, and the washers, then remove the lower arm (A).

NOTE: Use new lower arm mounting bolts, new mounting nuts, and new washers during reassembly.

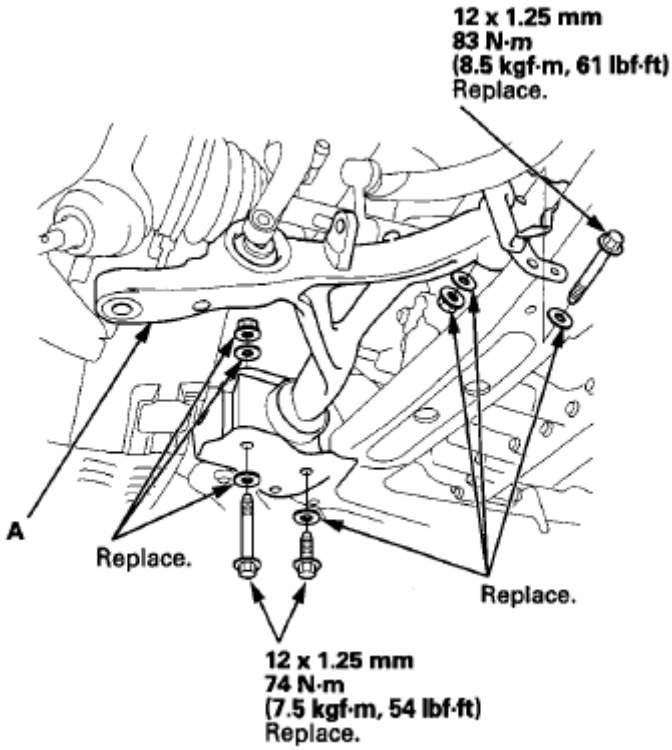

Fig. 37: Identifying Lower Arm With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the lower arm in the reverse order of removal, and note these items:
    - First install all of the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening it to the specified torque. Do not place the jack against the ball joint pin of the knuckle.
    - Be careful not to damage the ball joint boot when connecting the knuckle.
    - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, the threaded section, and the mating surfaces of the castle nut.
    - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
    - Refer to **STABILIZER LINK REMOVAL/INSTALLATION** to connect the stabilizer bar to the lower arm (see).
    - Use a new spindle nut on reassembly.
    - Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
    - Before installing the wheel, clean the mating surfaces between the brake disc and the inside of the wheel.
12. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

COMPLIANCE BUSHING BRACKET REPLACEMENT

1. Remove the self-locking nut (A), then remove the lower arm stopper (B) and the compliance bushing bracket (C).

NOTE: Do not remove the compliance bushing from the bracket.

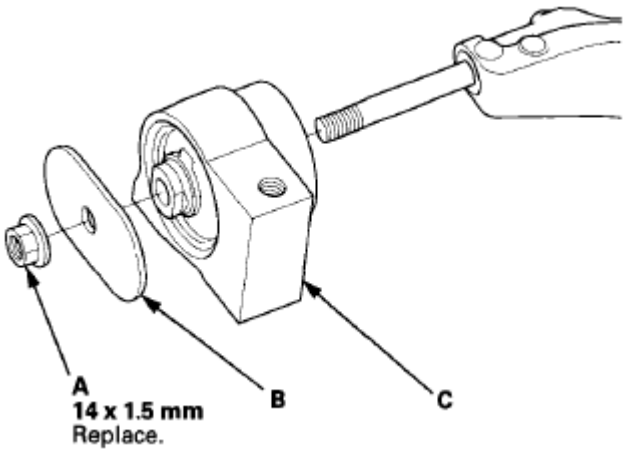

Fig. 38: Identifying Lower Arm Stopper, Compliance Bushing Bracket And Self-Locking Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Position the lower arm center line (A) with the end (B) of the compliance bushing bracket to the angle as shown.

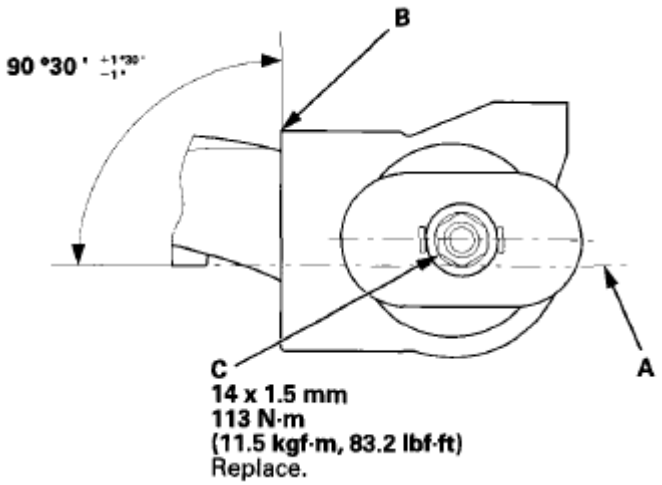

Fig. 39: Positioning Lower Arm Center Line With End Of Compliance Bushing Bracket To Specified Angle With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new self-locking nut (C), then tighten the nut to the specified torque.

STABILIZER LINK REMOVAL/INSTALLATION

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the front wheel.
3. Remove the flange nuts (A) while holding the respective joint pin (B) with a hex wrench (C), then remove the stabilizer link (D).

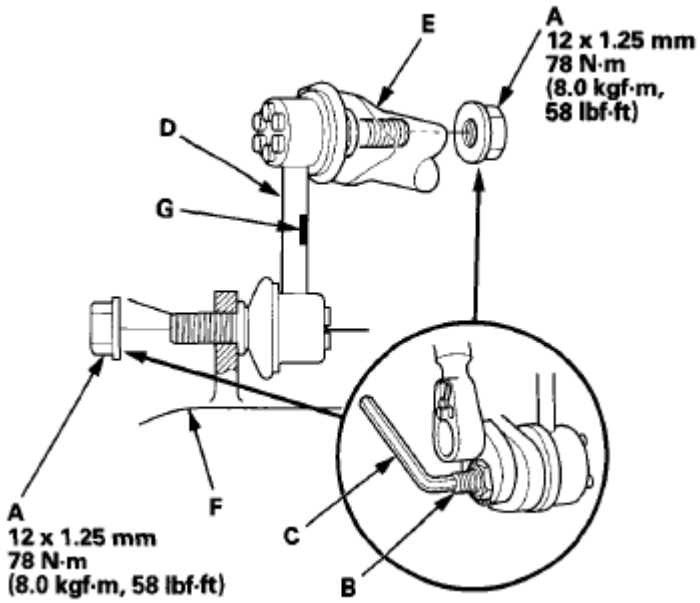

Fig. 40: Identifying Stabilizer Bar, Link, Hex Wrench, Lower Arm, Paint Mark And Flange Nuts With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the stabilizer link on the stabilizer bar (E) and the lower arm (F) with the joint pins set at the center of their range of movement.

NOTE: The stabilizer link has a paint mark (G). The left stabilizer link is marked with yellow paint, and the right stabilizer link is marked with white paint.

5. Install the new flange nuts, and tighten them to the specified torque while holding the respective joint pin with a hex wrench.
6. Clean the mating surfaces between the brake disc and the inside of the wheel, then install the front wheel.

STABILIZER BAR REPLACEMENT

Special Tools Required

- 2008 V6 Attachment Arm SIL02C000033*
- Engine Support Hanger, A and Reds AAR-T1256*
- Engine Hanger Balance Bar VSB02C000019*
- Subframe Adapter VSB02C000016*
- Subframe Alignment Pin 070AG-SJAA10S

*: Available through the Acura Tool and Equipment Program, 888-424-6857

NOTE: When you replace the stabilizer bar, lower the front subframe from the body, and replace the stabilizer bar through the gap created by lowering the front subframe.

1. Disconnect the hood support struts from the pivot ball on both sides (bolted to the hood). Raise and secure the hood in a vertical position. Remove the passenger's side pivot ball and install it into the lower threaded hole, then reattach the support strut.

NOTE: Do not attempt to close the hood with the support strut in the vertical position, as it will damage the support strut and hood.

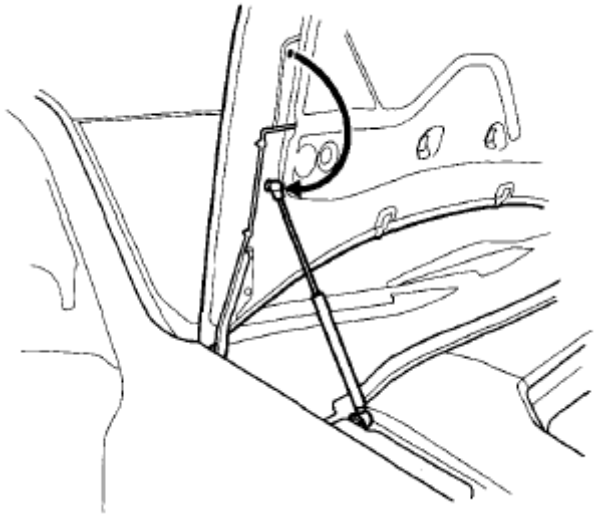

Fig. 41: Removing Passenger's Side Pivot Ball And Installing Into Lower Threaded Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the engine compartment covers (see **ENGINE COMPARTMENT COVER REPLACEMENT**).
3. Do the battery terminal disconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
4. Remove the front strut brace (see **FRAME BRACE REPLACEMENT**).
5. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
6. Remove the front wheels.
7. Disconnect both sides of the stabilizer link from the stabilizer bar (see **STABILIZER LINK REMOVAL/INSTALLATION**).
8. Disconnect both sides of the tie-rod end ball joint from the knuckle (see step 9).
9. Remove the steering joint cover (A).

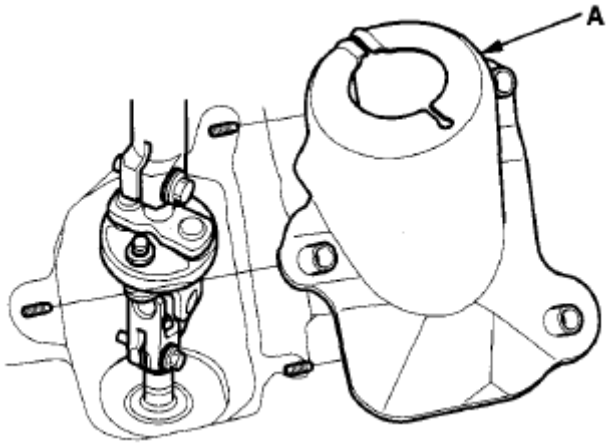

Fig. 42: Identifying Steering Joint Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Center the steering wheel spokes, and install a commercially available steering wheel holder tool (A).

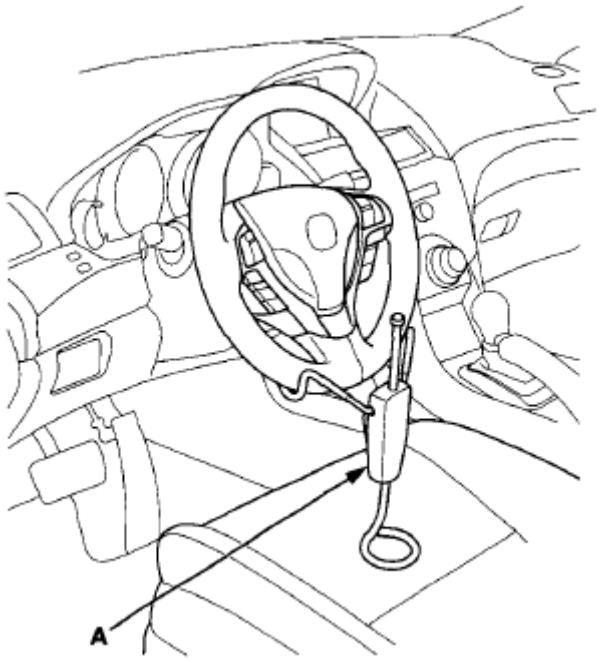

Fig. 43: Identifying Steering Wheel Holder Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Loosen the upper steering joint bolt (A), and remove the lower steering joint bolt (B). Disconnect the steering joint (C) by sliding the steering joint into the column shaft (D). Tighten the steering joint upper bolt to hold the column shaft.

NOTE:

- **If the center guide (E) is in place and has not moved, leave it in place.**
- **If the center guide has moved or been removed, discard it.**

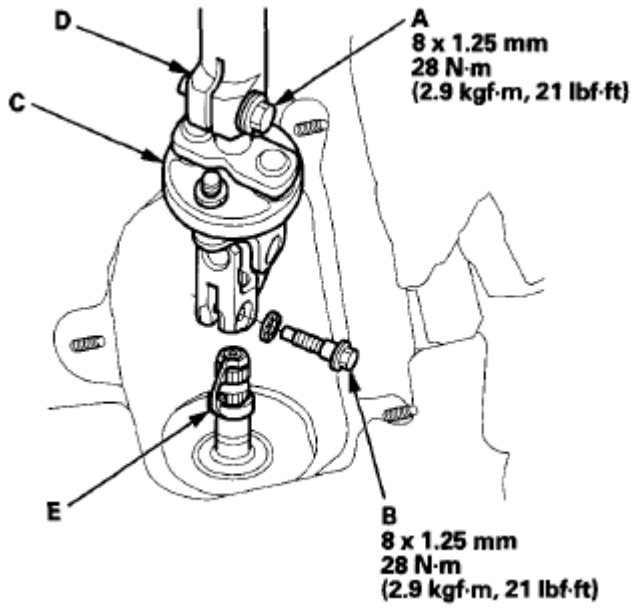

Fig. 44: Identifying Steering Joint, Column Shaft, Center Guide, Upper And Lower Steering Joint Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the power steering heat shield (A).

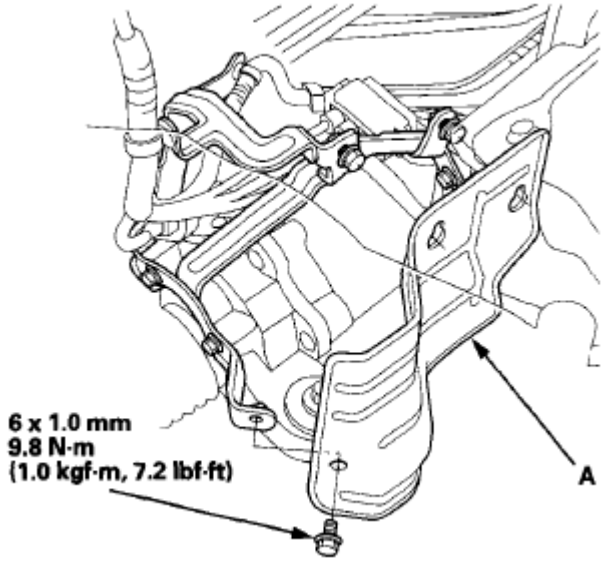

Fig. 45: Identifying Power Steering Heat Shield With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the bolt (A) securing the connector bracket (B) from the front cylinder head; use the bracket bolt hole (C) to attach the engine hanger balance bar front arm.

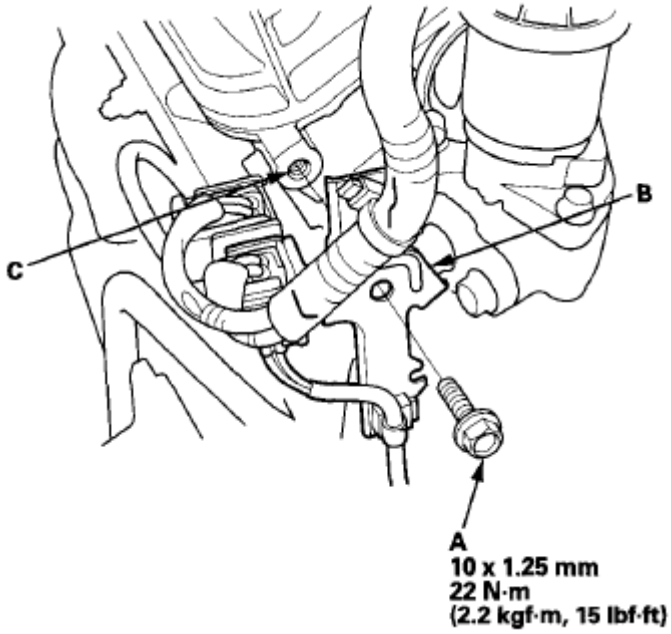

Fig. 46: Identifying Connector Bracket, Bracket Bolt Hole And Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the harness clamp (A), then remove the bolt (B) securing the engine mount control solenoid valve bracket (C) from the rear cylinder head; use the bracket bolt hole (D) to attach the 2008 V6 attachment arm.

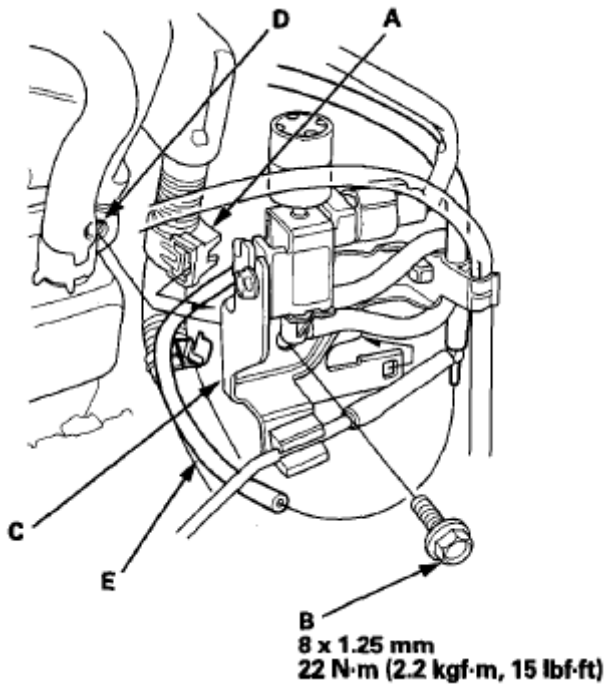

Fig. 47: Identifying Vacuum Hose, Control Solenoid Valve Bracket, Bracket Bolt Hole, Harness Clamp And Bolt With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. A/T: Disconnect the vacuum hose (E).
16. Install the engine hanger balance bar (VSB02C000019). Attach the front arm (A) to the front cylinder head with a 10 mm (0.39 in) spacer (B) and a 10 x 1.25 mm bolt (C). Remove the rear arm from the engine hanger balance bar, then install the 2008 V6 attachment arm (SIL02C000033). Attach the 2008 V6 attachment arm to the rear cylinder head with a 10 mm (0.39 in) spacer (D) and an 8 x 1.25 mm bolt (E).

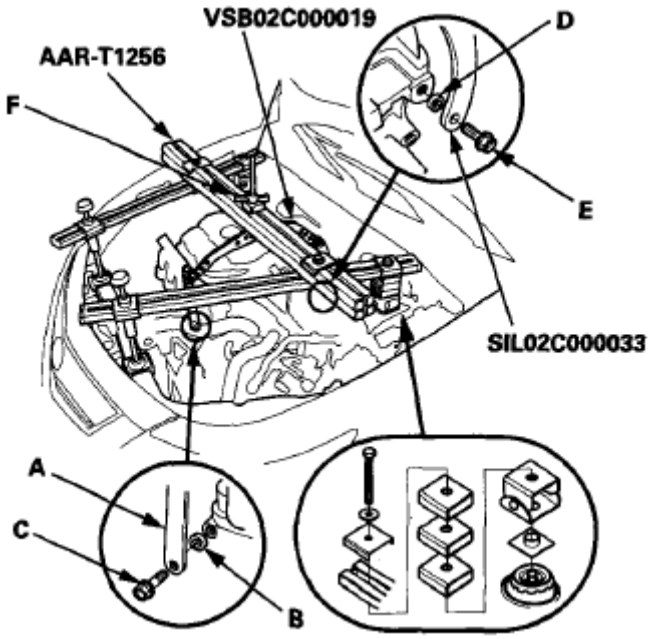

Fig. 48: Installing Engine Hanger Balance Bar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Install the engine support hanger (AAR-T1256) onto the vehicle as shown, and attach the hook to the slotted hole in the engine hanger balance bar. Tighten the wing nut (F) by hand, and lift and support the engine/transmission.

NOTE:
- **Be careful when working around the windshield.**
- **AAR-T1256 two sets required for stacking two cross section bars.**

18. Remove the front engine mount stop (A), then remove the front engine mount bolt (B).

NOTE: Use new nuts (C) and a front engine mount bolt during reassembly.

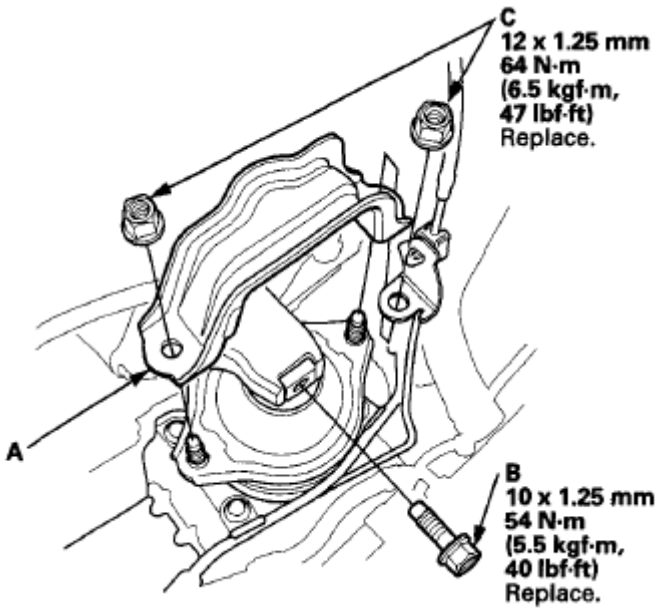

Fig. 49: Identifying Front Engine Mount Stop, Bolt And Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. M/T: Remove the rear engine mount bolts from the rear engine mount (A) and the rear engine mount bracket (B).

NOTE: Use new engine mount bolts during reassembly.

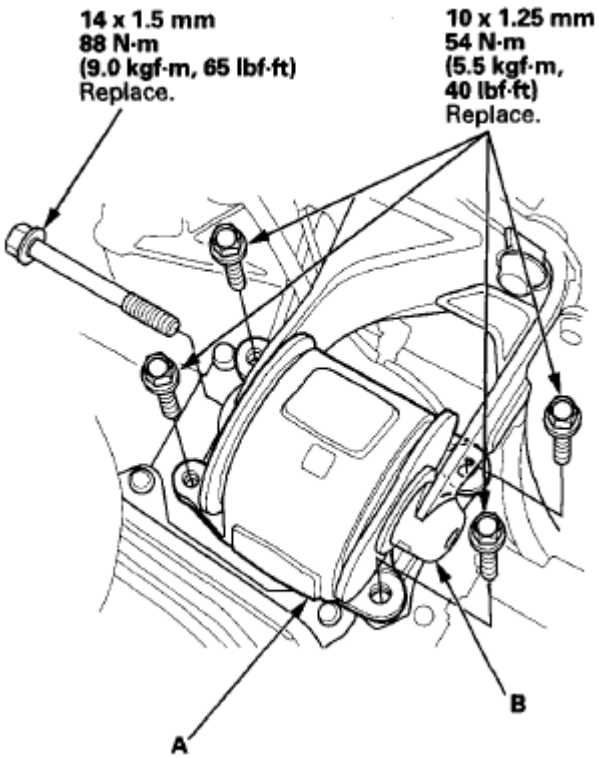

Fig. 50: Identifying Rear Engine Mount And Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. A/T: Remove the rear engine mount stop (A).

NOTE: Use new nuts (B) during reassembly.

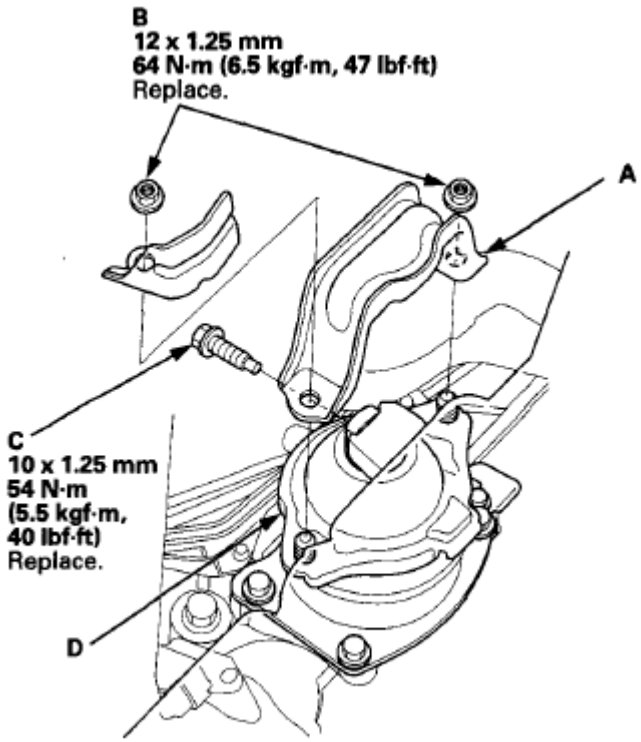

Fig. 51: Identifying Rear Engine Mount, Stop, Bolt And Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. A/T: Remove the rear engine mount bolt (C) from the rear engine mount (D).

NOTE: Use a new rear engine mount bolt during reassembly.

22. Raise the vehicle on the lift.
23. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
24. Remove the flange bolts, and remove the front subframe stiffener (A).

NOTE: Use new flange bolts during reassembly.

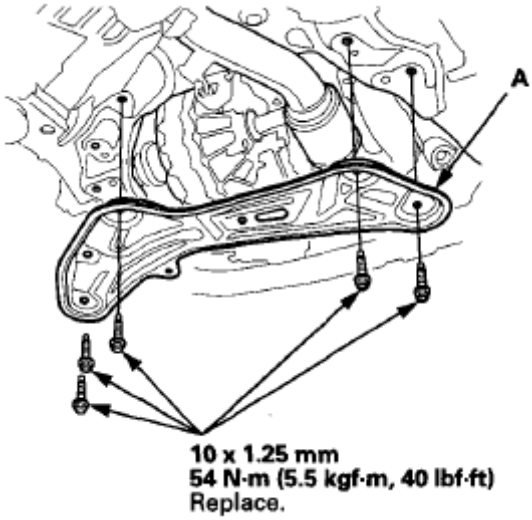

Fig. 52: Identifying Front Subframe Stiffener With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Remove exhaust pipe A:
    - Without SH-AWD (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**)
    - With SH-AWD (see **J37A4 ENGINE (WITH SH-AWD)**)
26. With SH-AWD: Remove the propeller shaft (see **PROPELLER SHAFT REMOVAL**).
27. Remove the front subframe mounting bolts, and the front subframe middle mounts (A).

NOTE: Use new mounting bolts during reassembly.

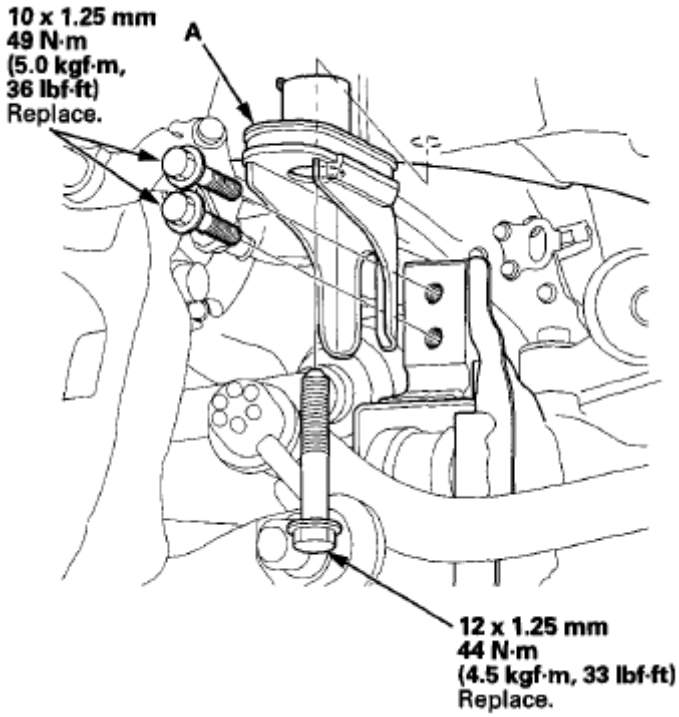

Fig. 53: Identifying Front Subframe Middle Mounts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Remove the nuts (A) securing the lower transmission mount.

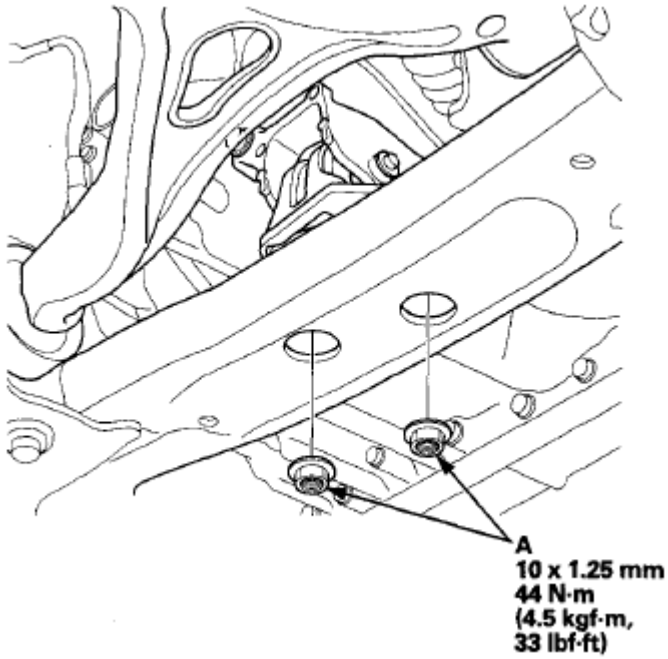

Fig. 54: Identifying Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Attach the subframe adapter (VSB02C000016) to a transmission jack, then raise up the jack to the subframe. Hang the belt (A) over the front of the subframe, then secure the belt by inserting the stop (B) and then tighten the wing nut (C).

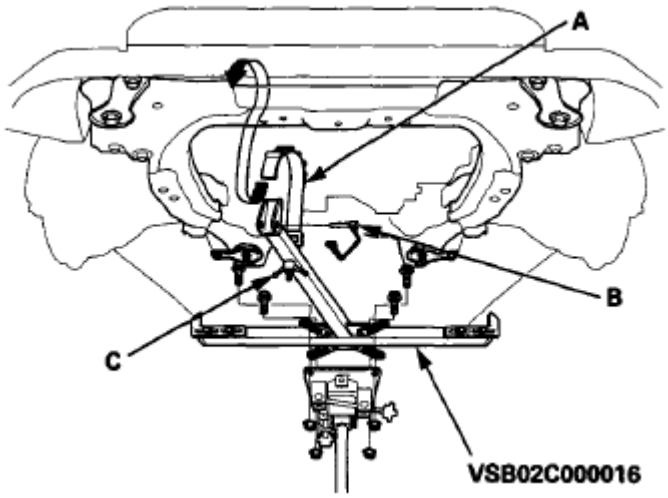

Fig. 55: Attaching Subframe Adapter To Transmission Jack And Raising Up Jack To Subframe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Remove the stiffener mounting bolt (A) on both sides of the front stiffener (B).

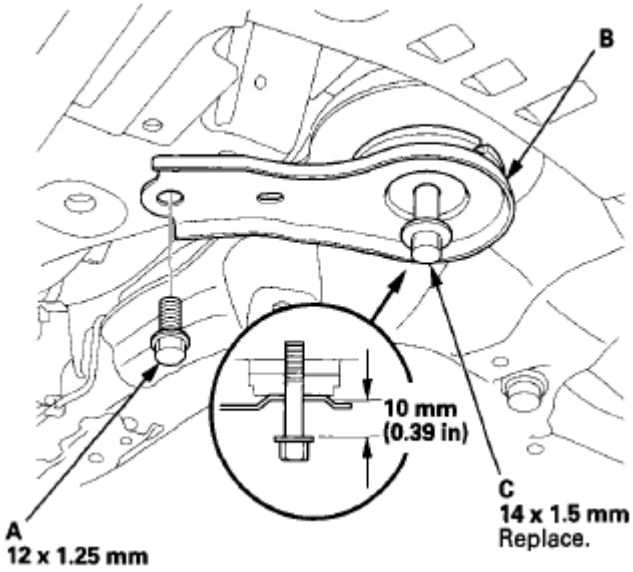

Fig. 56: Identifying Front Stiffener, Stiffener And Subframe Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Loosen the subframe mounting bolts (C) to obtain a 10 mm (0.39 in) distance between the bolt seat and the mounting surface. Do not loosen the mounting bolts more than necessary.
32. Remove the stiffener mounting bolt (A) on both sides of the rear stiffener (B).

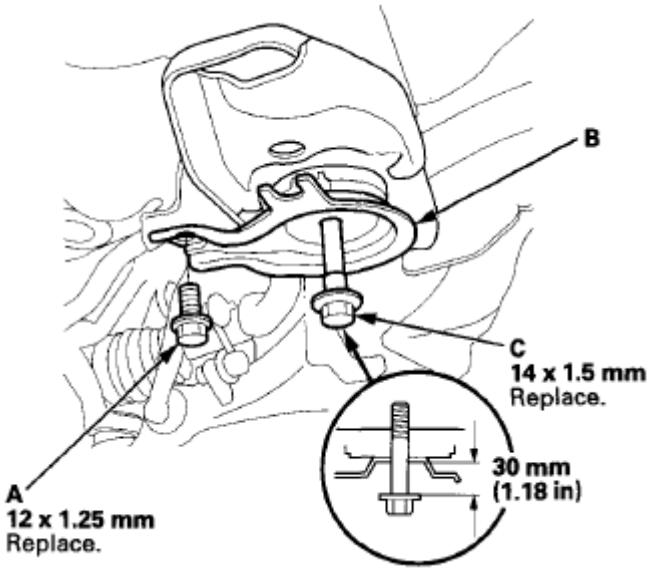

Fig. 57: Identifying Rear Stiffener, Stiffener And Subframe Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Loosen the subframe mounting bolts (C) to obtain a 30 mm (1.18 in) distance between the bolt seat and the mounting surface. Do not loosen the mounting bolts more than necessary.
34. Lower the transmission jack slowly with the subframe adapter until the front subframe has dropped about 30 mm (1.18 in).

NOTE: Do not lower the front subframe beyond the loosened subframe mounting bolts clearance.

35. Remove the flange bolts (A) and the bushing holders (B), then remove the bushings (C).

NOTE: Use new flange bolts during reassembly.

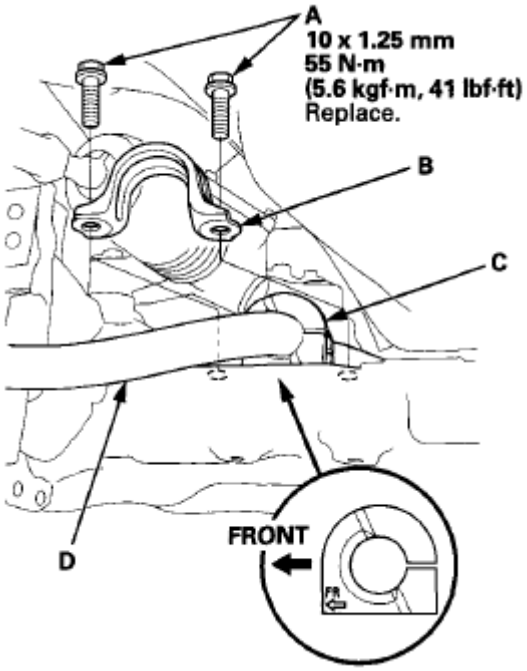

Fig. 58: Identifying Stabilizer Bar, Bushings, Bushing Holders And Flange Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Move the stabilizer bar (D) toward the passenger's side, and remove the stabilizer bar.
37. Install the stabilizer bar.

NOTE:

- **Note the right and left direction of the stabilizer bar.**
- **Note the direction of installation for the bushings.**
- **Do not set the bushings on the bent or curved part of the stabilizer bar.**

38. Loosely install the new right rear subframe mounting bolt (A) and the new stiffener mounting bolt (B); insert the 15.7 mm side of the subframe alignment pin (070AG-SJAA10S) through the positioning slot (C) on the rear stiffener, through the positioning hole (D) on the front subframe, and into the positioning hole (E) on the body, then tighten the right rear subframe mounting bolt.

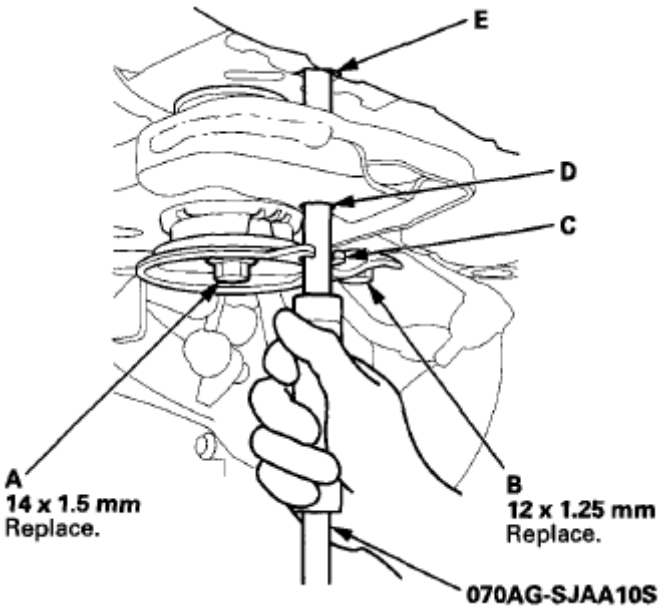

Fig. 59: Inserting Side Of Subframe Alignment Pin Through Positioning Slot On Rear Stiffener, Front Subframe And Into Positioning Hole On Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Loosely install the new left rear subframe mounting bolt and the new stiffener mounting bolt with the same procedure as the right rear using the subframe alignment pin.
40. Loosely install the new subframe mounting bolt (A) and the stiffener mounting bolt (B) to both front stiffeners (C).

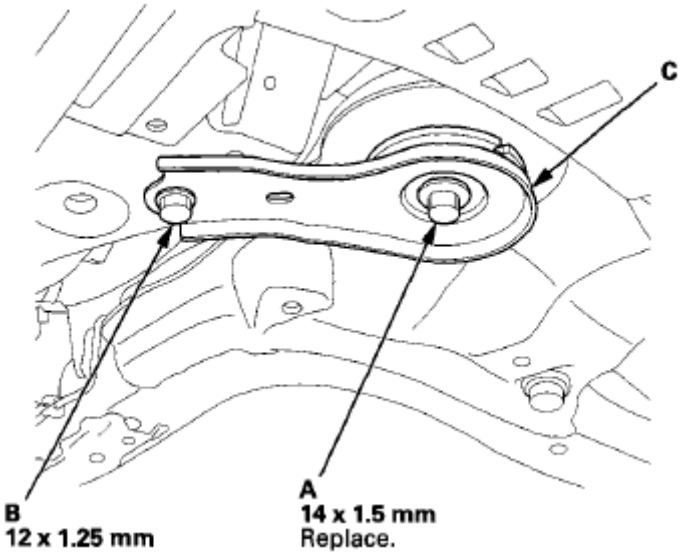

Fig. 60: Identifying Front Stiffeners, Subframe And Stiffener Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Tighten the right rear subframe mounting bolt (A) to the specified torque.

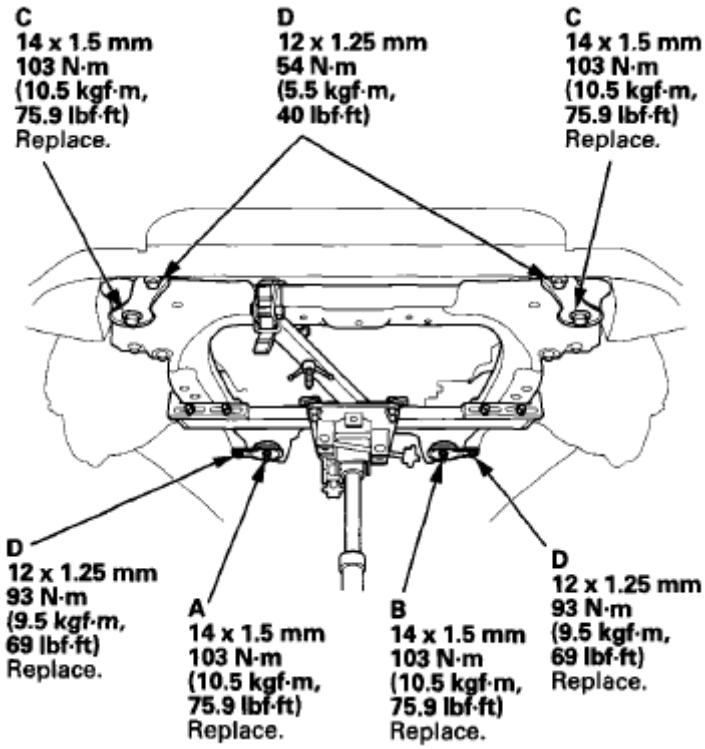

Fig. 61: Identifying Stiffener And Rear Subframe Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Tighten the left rear subframe mounting bolt (B) to the specified torque.
43. Tighten the front side subframe mounting bolts (C) to the specified torque.

NOTE: Check all of the subframe mounting bolts, and retighten if necessary.

44. Tighten the stiffener mounting bolts (D) to the specified torque.

NOTE: Before tightening the stiffener mounting bolts, check that the positioning holes and slot are aligned using the subframe alignment pin.

45. Install all of the removed parts in the reverse order of removal, and note these items:
    - Refer to **STABILIZER LINK REMOVAL/INSTALLATION** to connect the stabilizer bar to the links.
    - If the center guide is in place, use it to determine the steering joint installation angle.
    - If the center guide is gone, check the steering joint installation angle (see **STEERING COLUMN REMOVAL AND INSTALLATION**).
    - When connecting the front and rear engine mount, first lightly tighten the mounting bolts, supporting the engine/transmission with a floor jack, then remove the jack, and tighten the bolts to the specified torque.
    - Before installing the wheel, clean the mating surfaces between the brake disc and inside of the wheel.

46. Do the battery terminal reconnection procedure (see **BATTERY TERMINAL DISCONNECTION AND RECONNECTION**).
47. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

DAMPER/SPRING REMOVAL AND INSTALLATION

REMOVAL

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the front wheel.
3. Remove the wheel speed sensor harness bracket (A).

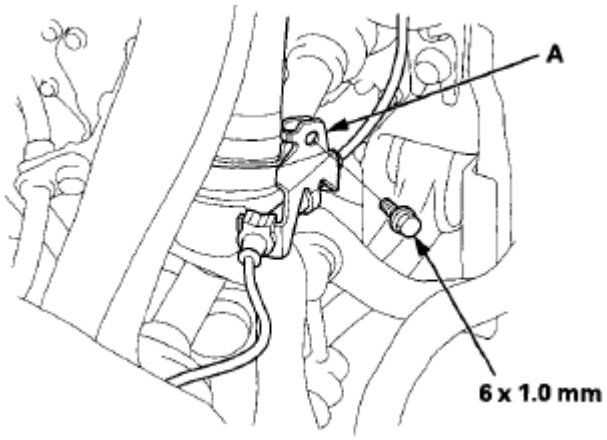

Fig. 62: Identifying Wheel Speed Sensor Harness Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the damper pinch bolt (A) and the damper fork mounting nut (B) while holding the mounting bolt (C), then remove the damper fork (D) from the damper and the lower arm.

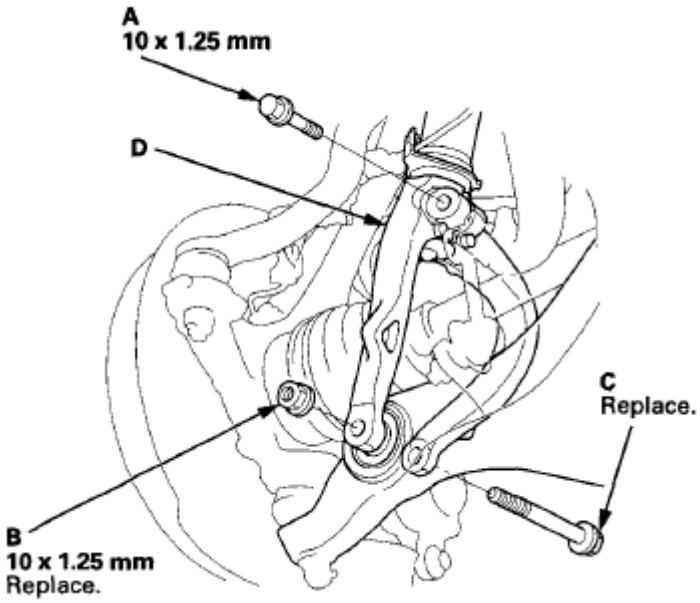

Fig. 63: Identifying Damper Fork, Mounting Nut And Damper Pinch Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the front strut brace mounting nuts (A).

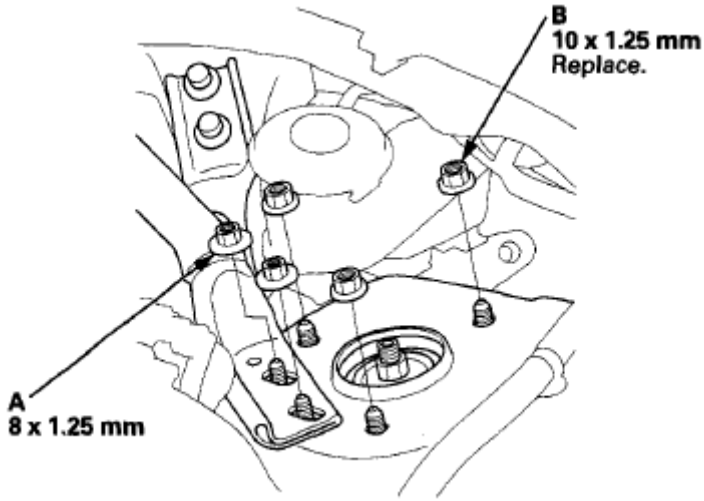

Fig. 64: Identifying Front Strut Brace And Damper Mounting Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the damper mounting nuts (B) from the top of the damper. Do not let the damper/spring drop down under its own weight.
7. Remove the damper/spring (A).

NOTE: Be careful not to damage the body.

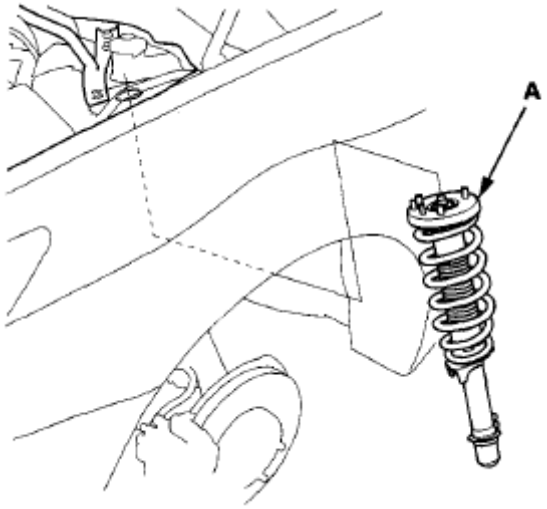

Fig. 65: Identifying Damper/Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Position the damper/spring (A) in the body with the aligning tab (B) facing inside.

NOTE: Be careful not to damage the body.

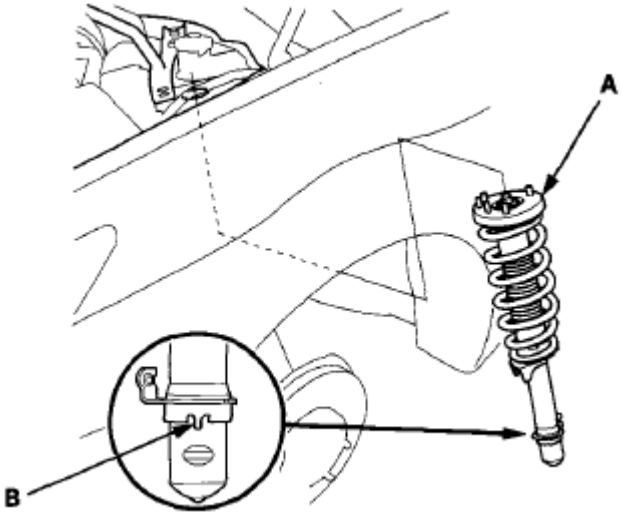

Fig. 66: Identifying Damper/Spring And Aligning Tab
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Loosely install the new damper mounting nuts (A) to the top of the damper.

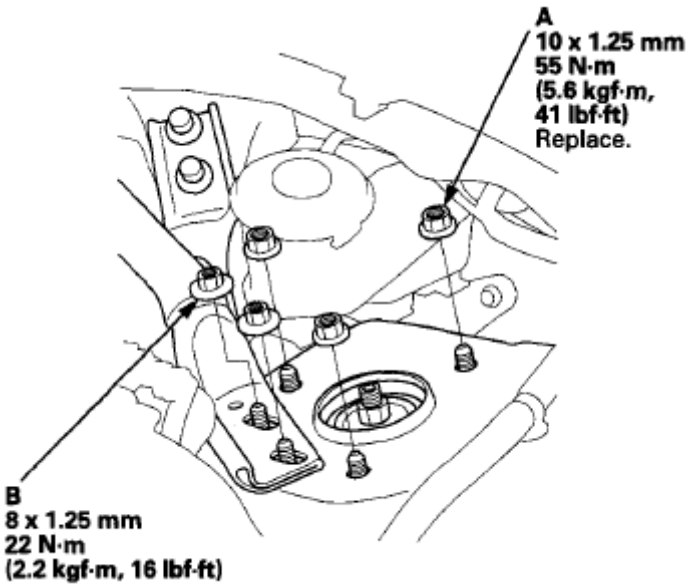

Fig. 67: Identifying Front Strut Brace And Damper Mounting Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosely install the front strut brace mounting nuts (B).
4. Install the damper fork (A) over the driveshaft and onto the lower arm (B). Install the aligning tab (C) on the damper unit into the slot (D) of the damper fork.

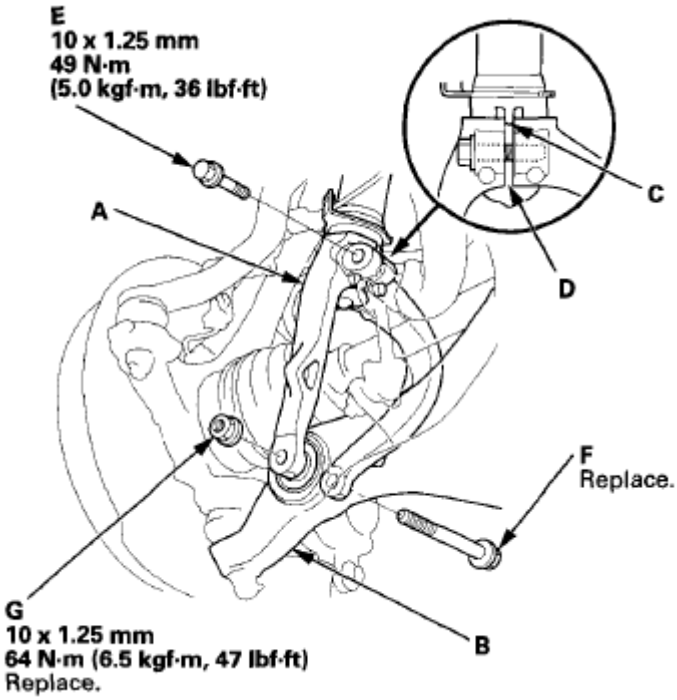

Fig. 68: Identifying Damper Fork, Lower Arm, Aligning Tab, Slot, Damper Pinch Bolt And Mounting Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Loosely install the damper pinch bolt (E) into the damper fork.
6. Connect the damper fork and the lower arm with the new damper fork mounting bolt (F), then lightly tighten the new mounting nut (G).
7. Place a floor jack under the lower arm, and raise the suspension to load it with the vehicle's weight.

NOTE: Do not place the jack directly on the ball joint pin to load the suspension.

8. Tighten the damper pinch bolt and the damper fork mounting nut while holding the mounting bolt to the specified torque.
9. Tighten the damper mounting nuts and front strut brace mounting nuts on top of the damper to the specified torque.
10. Install the wheel speed sensor harness bracket (A).

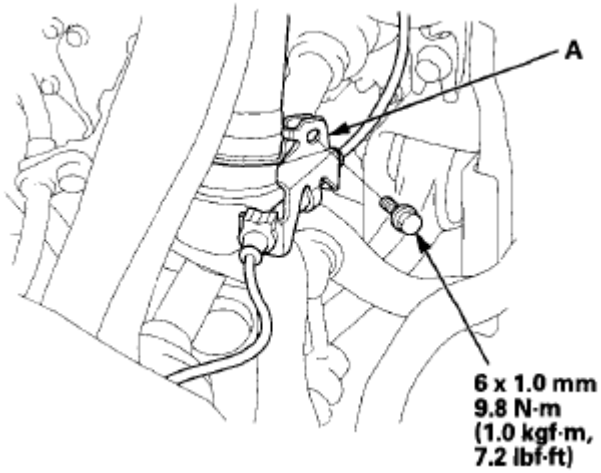

Fig. 69: Identifying Wheel Speed Sensor Harness Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Clean the mating surfaces between the brake disc and the inside of the wheel, then install the front wheel.
12. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

DAMPER/SPRING DISASSEMBLY, INSPECTION, AND REASSEMBLY

EXPLODED VIEW

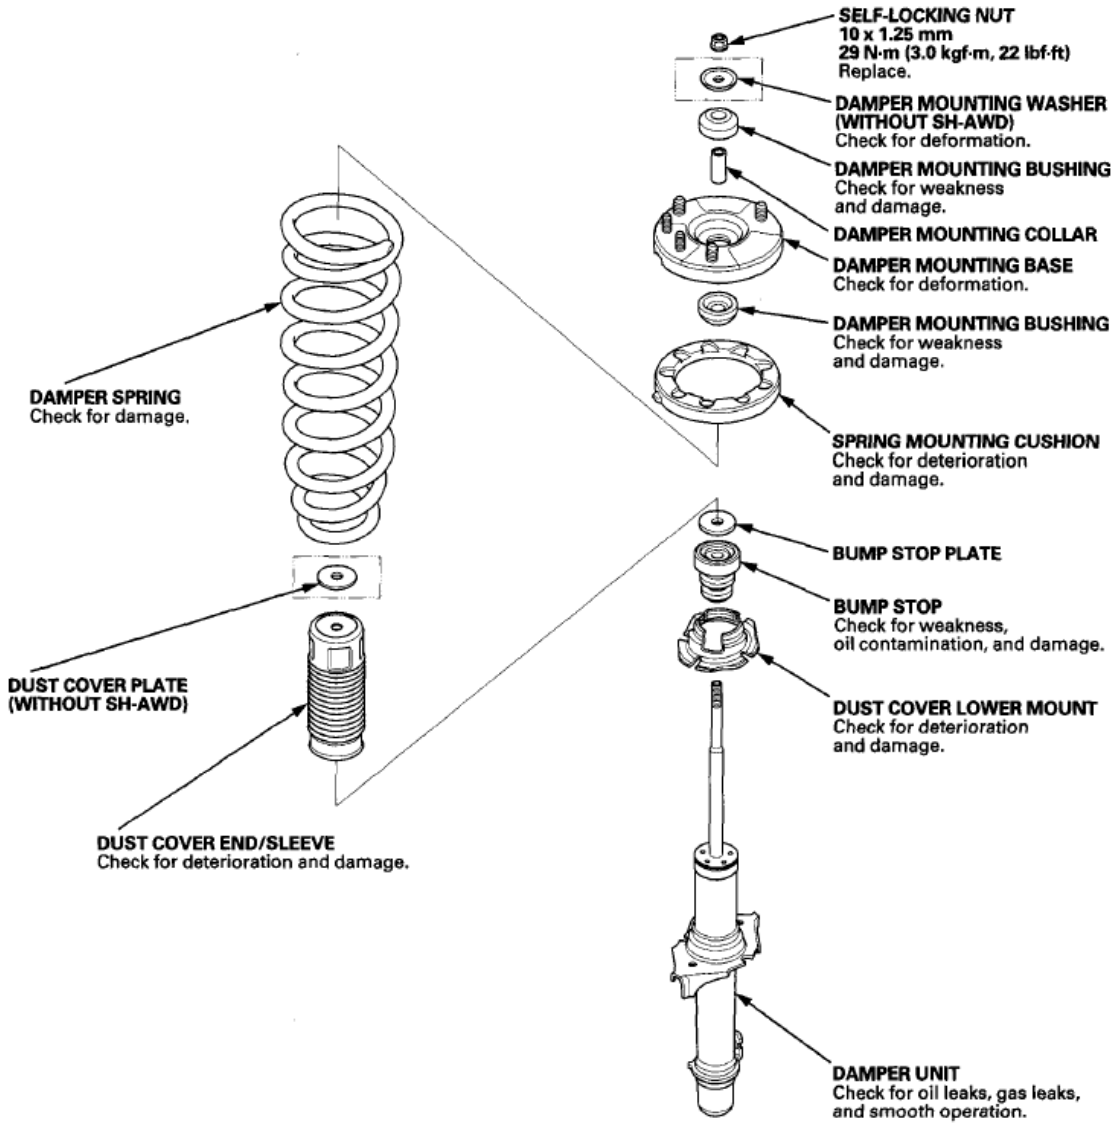

Fig. 70: Exploded View Of Damper/Spring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE:

- **When compressing the damper spring, use a commercially available strut spring compressor (Branick MST-580A or Model 7200, or equivalent) according to the manufacturer's instructions.**
- **Refer to the EXPLODED VIEW as needed during the following procedure.**

DISASSEMBLY

1. Compress the damper spring, then remove the self-locking nut (A) while holding the damper shaft with a hex wrench (B). Do not compress the damper spring more than is necessary to remove the self-locking nut.

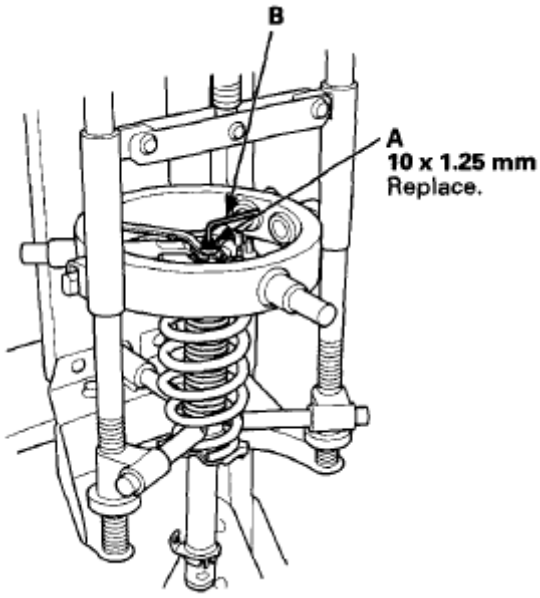

Fig. 71: Identifying Hex Wrench And Self-Locking Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Release the pressure from the strut spring compressor, then disassemble the damper as shown in the Exploded View.

INSPECTION

1. Reassemble all the parts, except for the damper spring.
2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.

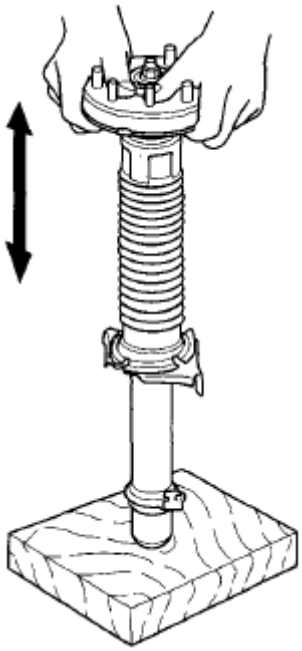

Fig. 72: Compressing Damper Assembly By Hand And Checking For Smooth Operation Through Full Stroke
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for oil leaks, abnormal noises, and binding during these tests.

REASSEMBLY

1. Install the spring mounting cushion (A) on the damper mounting base (B) by aligning the tab (C) and the notch (D).

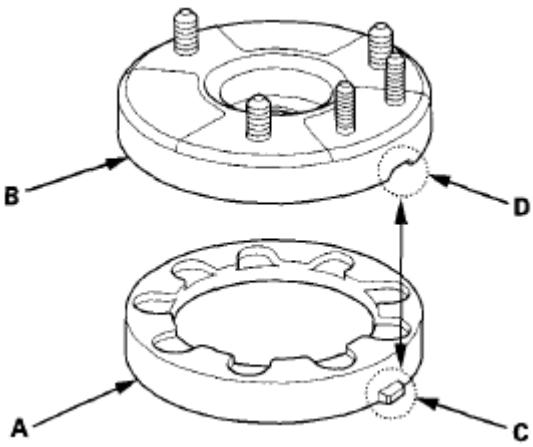

Fig. 73: Identifying Spring Mounting Cushion, Damper Mounting Base, Aligning Tab And Notch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install all the parts except the damper mounting washer (Without SH-AWD) and the self-locking nut onto

the damper unit by referring to the **EXPLODED VIEW**.

3. Compress the damper spring using a strut spring compressor. Do not compress the spring excessively.
4. Align the lower end (A) of the damper spring with the stepped part (B) of the dust cover lower mount and the lower spring seat on the damper unit.

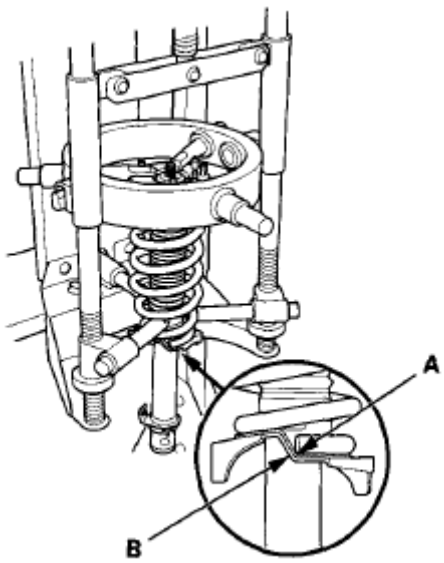

Fig. 74: Aligning Lower End Of Damper Spring With Stepped Part Of Dust Cover Lower Mount
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Position the tab (A) on the spring mounting cushion facing forward but toward the inside of the vehicle.

Left

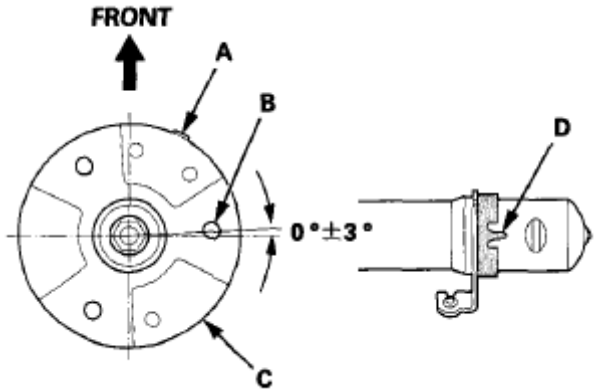

Fig. 75: Positioning Tab On Spring Mounting Cushion - Left
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Right

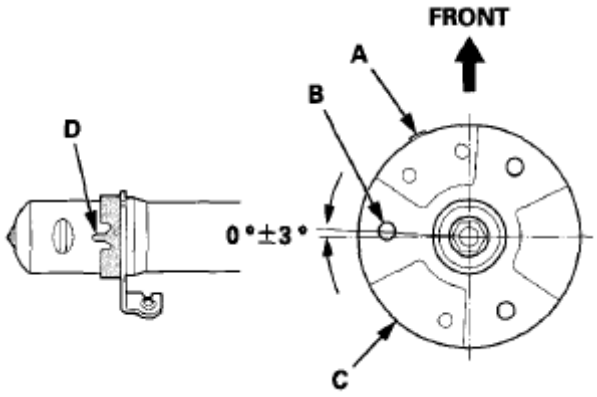

Fig. 76: Positioning Tab On Spring Mounting Cushion - Right
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Align the angle of the stud (B) on the damper mounting base (C) with the aligning tab (D) on the bottom of the damper unit as shown.
7. Install the damper mounting washer (without SH-AWD) (A) and the new self-locking nut (B).

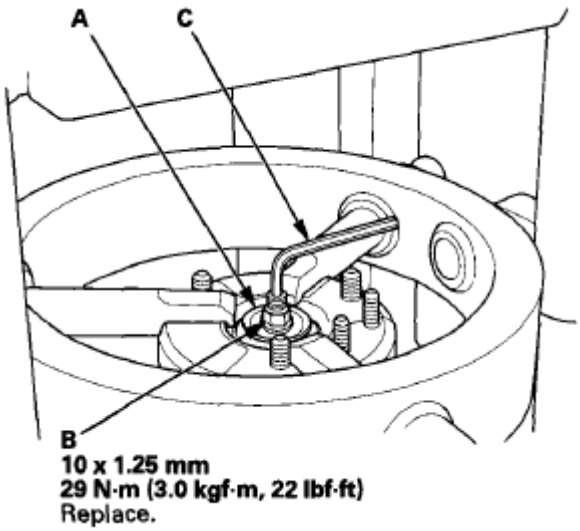

Fig. 77: Identifying Self-Locking Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Hold the damper shaft with a hex wrench (C), and tighten the self-locking nut to the specified torque.
9. Remove the damper/spring from the strut spring compressor.

2012 SUSPENSION

Rear Suspension - TL

KNUCKLE/HUB BEARING UNIT REPLACEMENT

EXPLODED VIEW

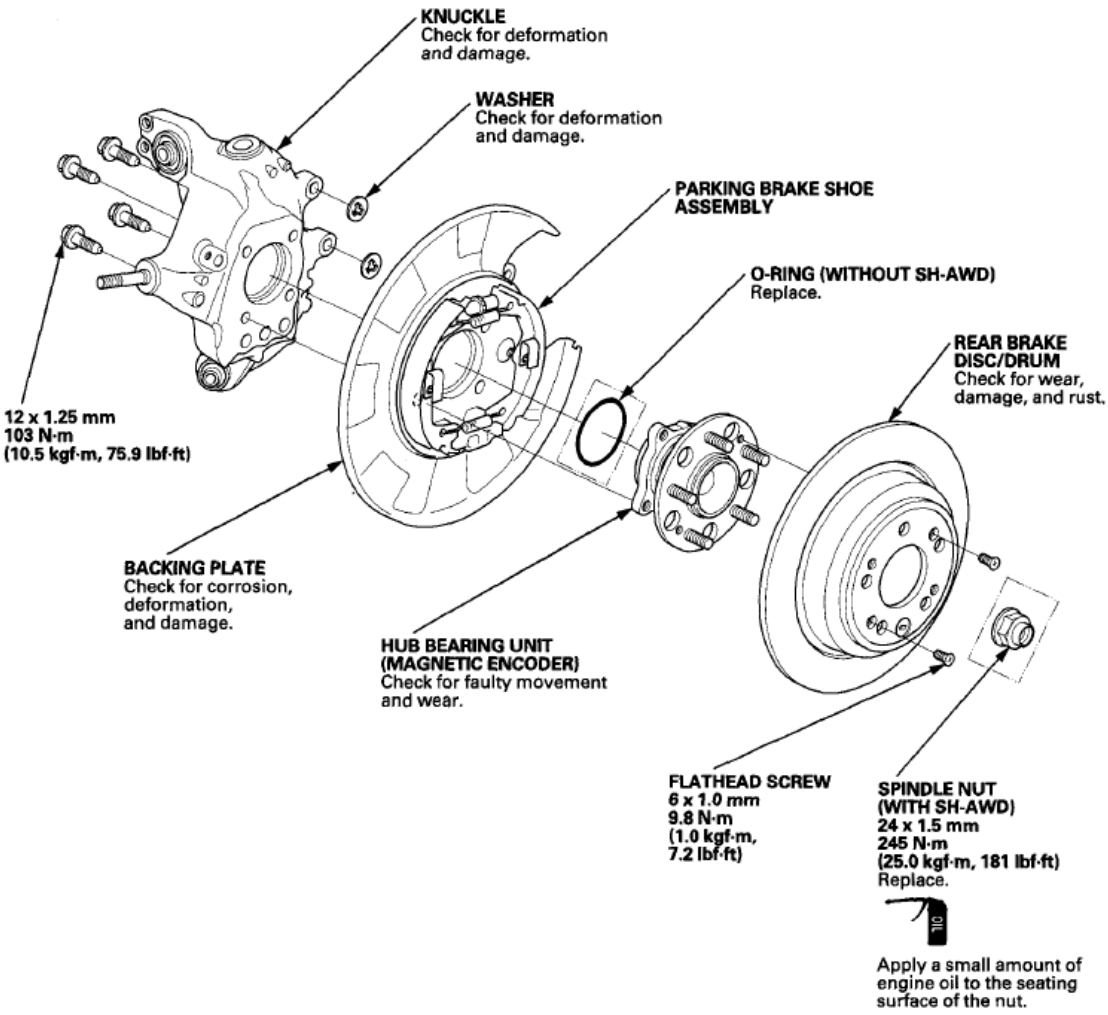

Fig. 1: Exploded View Of Knuckle/Hub Bearing Unit With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Special Tools Required

- Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
- Ball Joint Remover, 32 mm 07MAC-SL0A102

NOTE: Refer to the EXPLODED VIEW as needed during the following procedure.

HUB BEARING UNIT REPLACEMENT

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the wheel nuts (A), and the rear wheel.

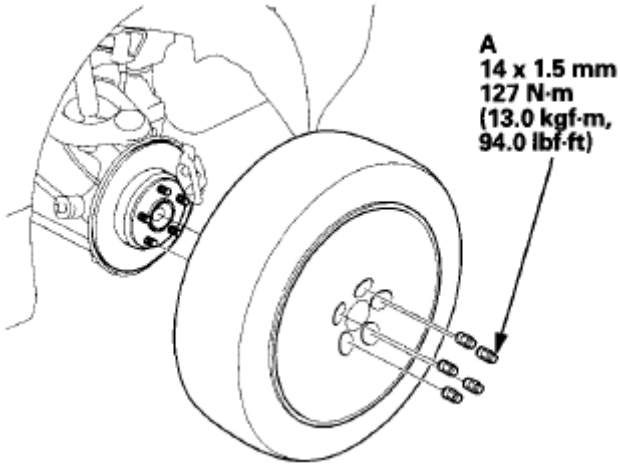

Fig. 2: Identifying Wheel Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Release the parking brake lever fully.
4. Remove the brake hose mounting bolt (A).

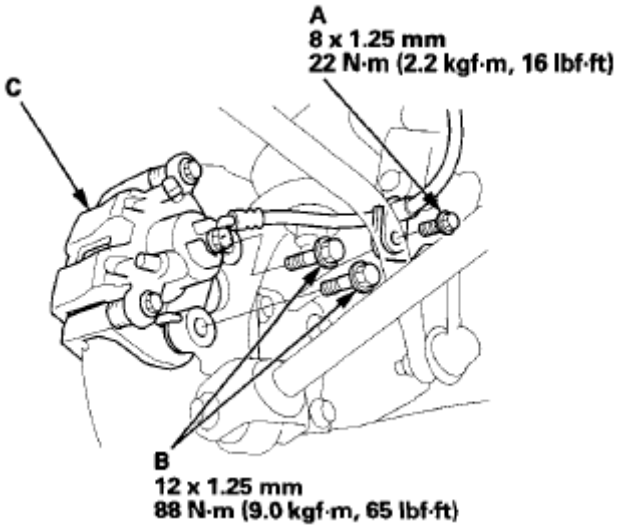

Fig. 3: Identifying Brake Hose Mounting Bolts, Bracket Mounting Bolts And Caliper Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the brake caliper bracket mounting bolts (B), then remove the caliper assembly (C) from the knuckle. To prevent damage to the caliper assembly or the brake hose, use a short piece of wire to hang

the caliper assembly from the undercarriage. Do not twist the brake hose excessively.

6. Remove the two washers (A).

NOTE: During installation, make sure the washers are installed between the brake caliper bracket and the knuckle.

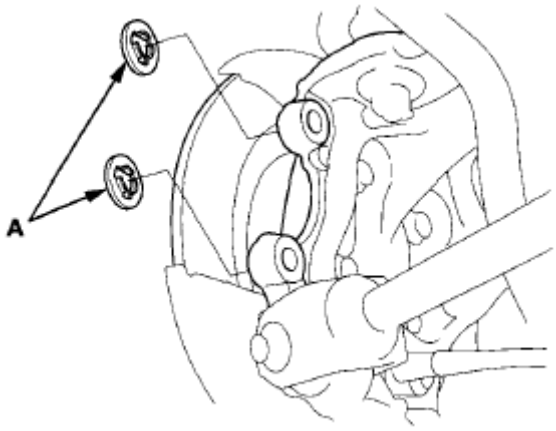

Fig. 4: Identifying Hub Bearing Washers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. With SH-AWD: Pry up the stake (A) on the spindle nut (B), then remove the nut.

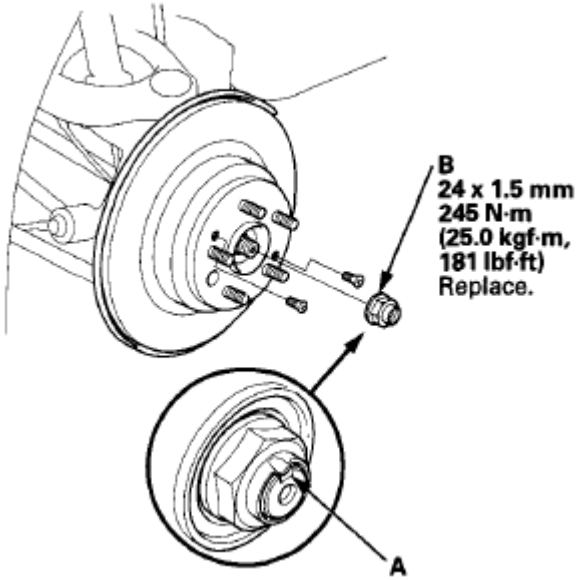

Fig. 5: Identifying Stake And Spindle Nut With Torque Specifications (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the rear brake disc/drum (see **REAR BRAKE DISC REPLACEMENT**).
9. Without SH-AWD: Remove the hub bearing unit (A) and the O-ring (B).

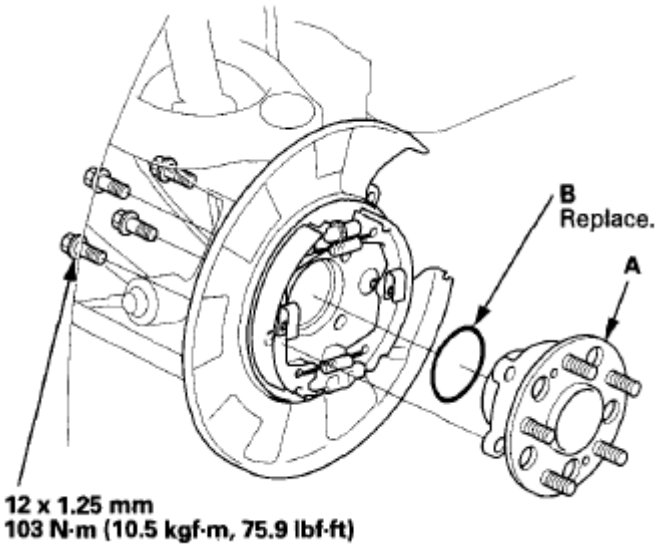

Fig. 6: Identifying Hub Bearing Unit And O-Ring With Torque Specifications (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. With SH-AWD: Remove the flange bolts (A), and remove the hub bearing unit (B) by tapping the driveshaft end (C) with a soft face hammer while drawing the hub bearing unit outward.

NOTE: Do not pull the driveshaft end outward. The driveshaft inboard joint may come apart.

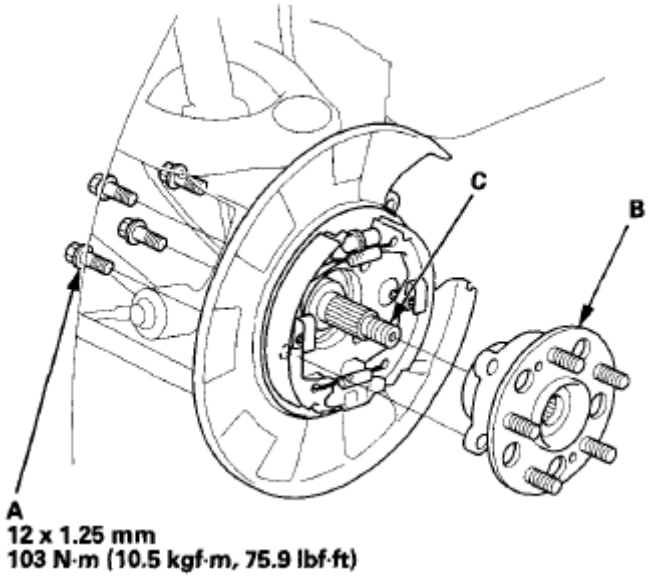

Fig. 7: Identifying Hub Bearing Unit With Torque Specifications (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check the hub bearing unit for damage and cracks.

12. Install the hub bearing unit in the reverse order of removal, and note these items:
    - Without SH-AWD: Use a new O-ring on reassembly.
    - With SH-AWD: Use a new spindle nut on reassembly.
    - With SH-AWD: Before installing the spindle nut, apply a small amount of engine oil to the seating surface of the nut. After tightening, use a drift to stake the spindle nut shoulder against the driveshaft.
    - Before installing the brake disc/drum, clean the mating surfaces between the hub bearing unit and the brake disc/drum.
    - Before installing the wheel, clean the mating surfaces between the brake disc/drum and the inside of the wheel.
13. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

KNUCKLE REPLACEMENT

NOTE: The illustrations show the model without SH-AWD; the model with SH-AWD is similar.

1. Remove the hub bearing unit.
2. Remove the parking brake shoes, and disconnect the parking brake cable from the parking brake lever (see **PARKING BRAKE SHOE REPLACEMENT**).
3. Remove the parking brake cable mounting nuts (A) from the backing plate (B), and remove the parking brake cable (C).

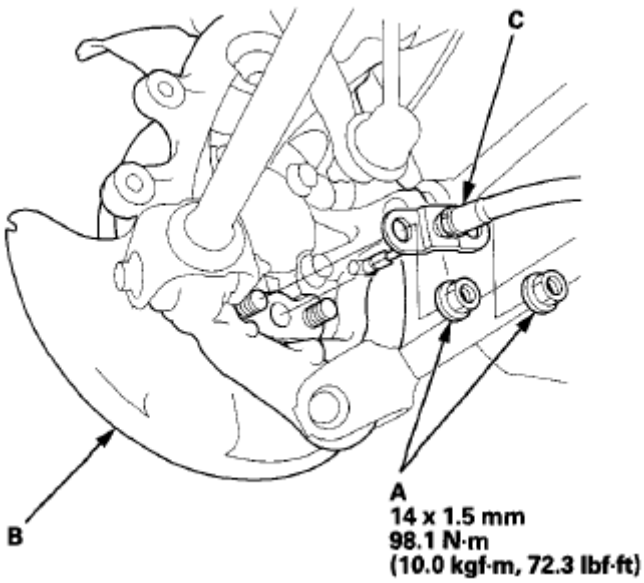

Fig. 8: Identifying Mounting Nuts, Backing Plate And Parking Brake Cable With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the backing plate with the parking brake shoe assembly.

5. Remove the lock pin (A) from the upper arm ball joint, then remove the castle nut (B).

NOTE: During installation, install the lock pin as shown after tightening the new castle nut.

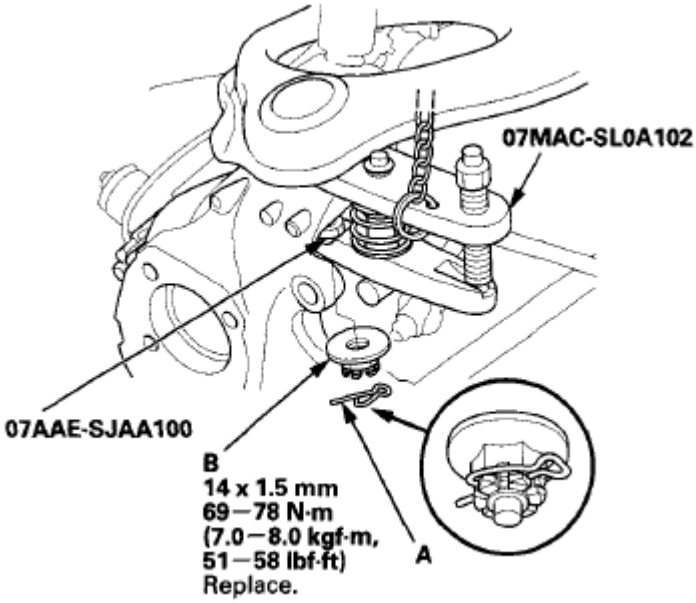

Fig. 9: Identifying Lock Pin And Castle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the upper arm ball joint from the knuckle using the ball joint thread protector and the ball joint remover (see **BALL JOINT REMOVAL**).

NOTE:

- **Be careful not to damage the ball joint boot when installing the remover.**
- **During installation, to connect the ball joint, raise up the suspension with a jack (see step 7).**

7. Remove the wheel speed sensor (A) from the knuckle. Do not disconnect the wheel speed sensor connector.

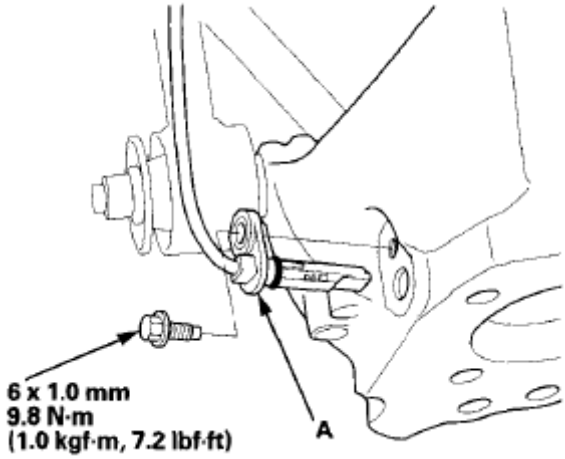

Fig. 10: Identifying Wheel Speed Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the brake hose bracket mounting nuts (A), then disconnect the brake hose bracket (B) from the knuckle.

NOTE: Use the new mounting nuts during reassembly.

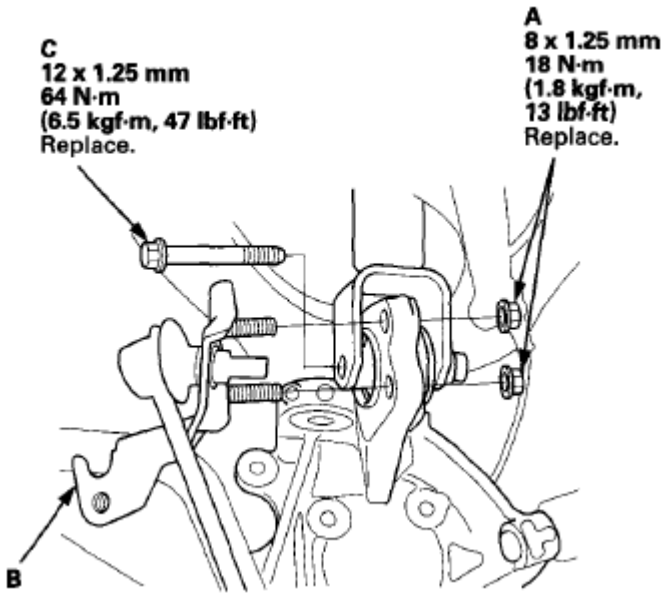

Fig. 11: Identifying Brake Hose Bracket, Mounting Nuts And Damper Lower Mounting Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the damper lower mounting bolt (C).

NOTE: Use a new mounting bolt during reassembly.

10. Remove the control arm mounting self-locking nut (A) and the washer (B).

NOTE: Use a new self-locking nut during reassembly.

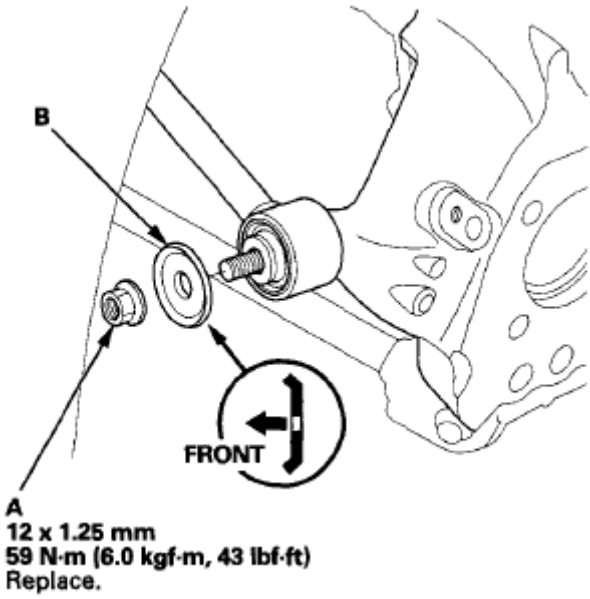

Fig. 12: Removing Control Arm Mounting Self-Locking Nut And Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the lower arm A mounting bolt (A), and the lower arm B mounting bolt (B), then remove the knuckle (C).

NOTE: Use new mounting bolts during reassembly.

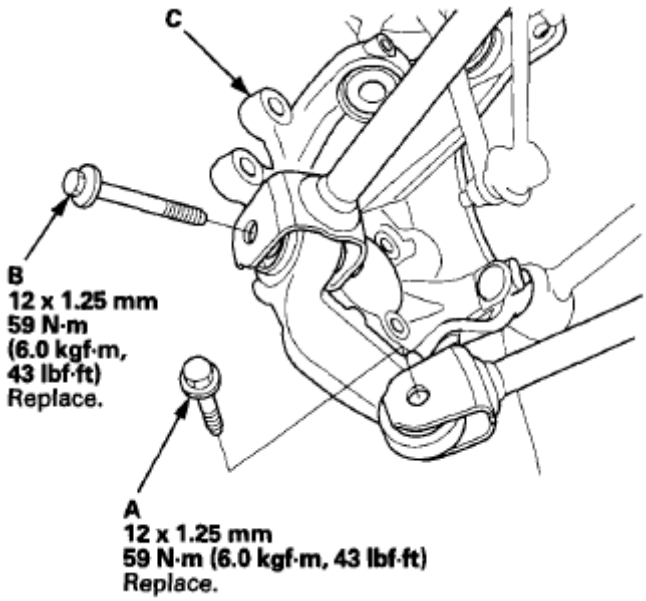

Fig. 13: Identifying Lower Arm Mounting Bolts And Knuckle With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the knuckle in the reverse order of removal, and note these items:
    - First install all of the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque.
    - Be careful not to damage the ball joint boot when connecting the knuckle.
    - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, the threaded section, and the mating surfaces of the castle nut.
    - Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
    - Before installing the wheel, clean the mating surfaces between the brake disc/drum and the inside of the wheel.
13. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

UPPER ARM REPLACEMENT

Special Tools Required

- Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
- Ball Joint Remover, 32 mm 07MAC-SL0A102

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Remove the rear damper/spring (see **DAMPER/SPRING REMOVAL AND INSTALLATION**).
4. Release the parking brake lever fully.

5. Remove the brake caliper bracket mounting bolts (A), then remove the caliper assembly (B) from the knuckle. To prevent damage to the caliper assembly or the brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. Do not twist the brake hose excessively.

NOTE: Make sure the washers (C) are reinstalled between the brake caliper bracket and the knuckle, if they are removed (see step 6).

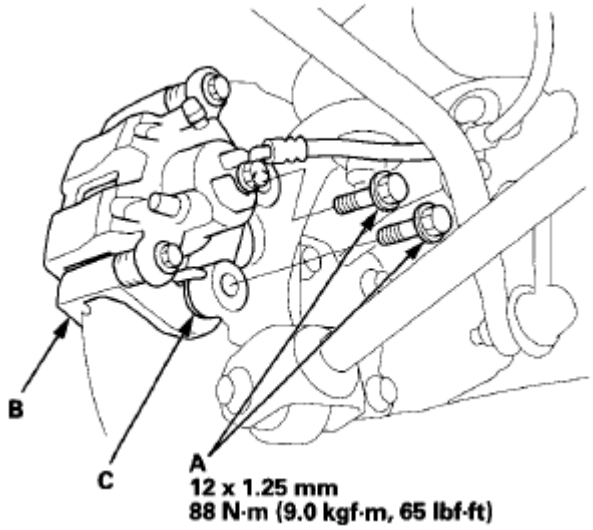

Fig. 14: Identifying Brake Caliper Bracket Mounting Bolts, Caliper Assembly And Washers With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the lock pin (A) from the upper arm ball joint, then remove the castle nut (B).

NOTE: During installation, install the lock pin as shown after tightening the new castle nut.

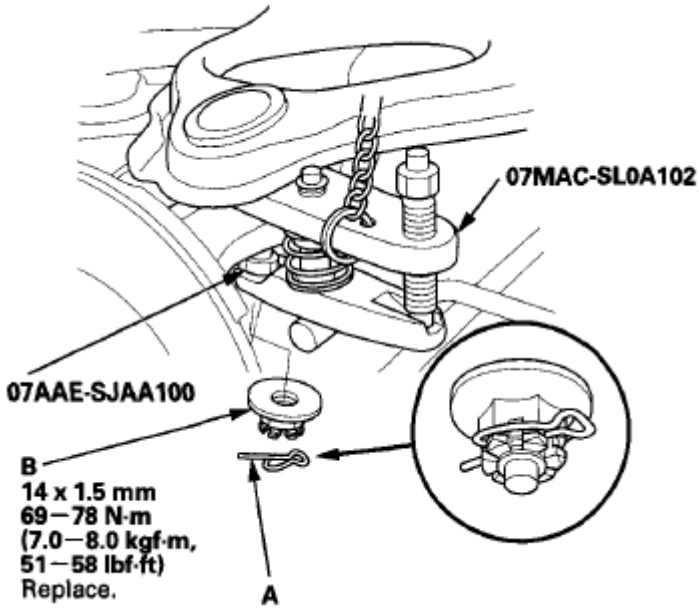

Fig. 15: Identifying Lock Pin And Castle Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the upper arm ball joint from the knuckle using the ball joint thread protector and the ball joint remover (see **BALL JOINT REMOVAL**).

NOTE:

- **Be careful not to damage the ball joint boot when installing the remover.**
- **During installation, to connect the ball joint, position a floor jack under the connecting point of the knuckle and lower arm A, and raise the suspension with the jack.**

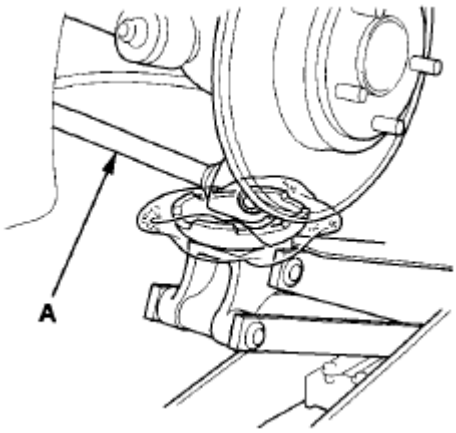

Fig. 16: Positioning Floor Jack Under Connecting Point Of Knuckle And Lower Arm
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the wheel speed sensor harness bracket (A).

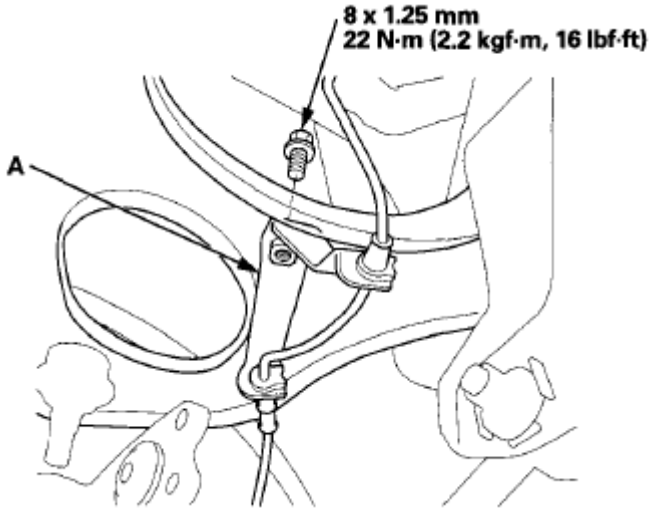

Fig. 17: Identifying Wheel Speed Sensor Harness Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the upper arm mounting bolts (A), then remove the upper arm (B).

NOTE: Use new mounting bolts during reassembly.

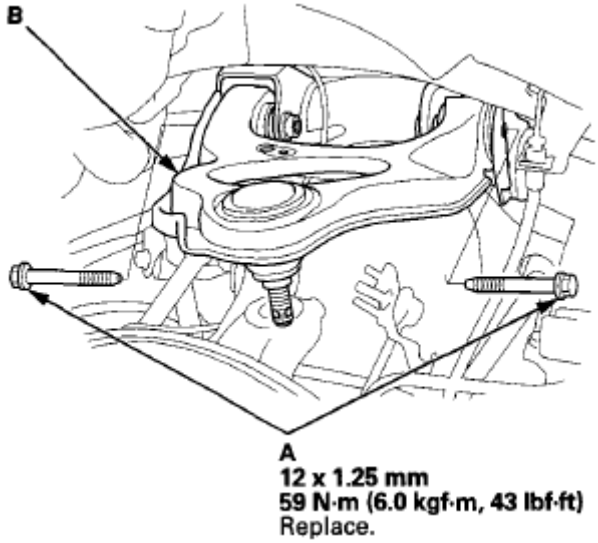

Fig. 18: Identifying Upper Arm And Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the upper arm in the reverse order of removal, and note these items;
    - First install all of the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque.
    - Be careful not to damage the ball joint boot when connecting the knuckle.
    - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball

joint pin, the ball joint connecting hole, the threaded section, and the mating surfaces of the castle nut.

- Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.
- Before installing the wheel, clean the mating surfaces between the brake disc/drum and the inside of the wheel.

11. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

LOWER ARM A REPLACEMENT

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Remove the parking brake cable mounting bolt (B).

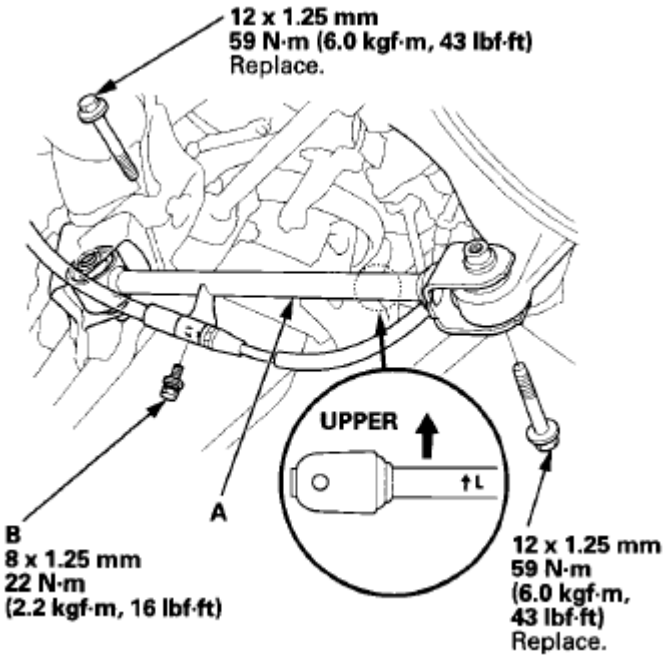

Fig. 19: Identifying Lower Arm And Parking Brake Cable Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the lower arm A mounting bolts, then remove lower arm A.

NOTE: Use new mounting bolts during reassembly.

5. Install lower arm A in the reverse order of removal, and note these items:
   - First install all of the components, and lightly tighten the bolts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque.
   - Before installing the wheel, clean the mating surfaces between the brake disc/drum and the inside

of the wheel.

6. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

CONTROL ARM REPLACEMENT

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel,
3. Remove the control arm mounting self-locking nut (A) and the washer (B) from the knuckle side.

NOTE: Use a new self-locking nut during reassembly.

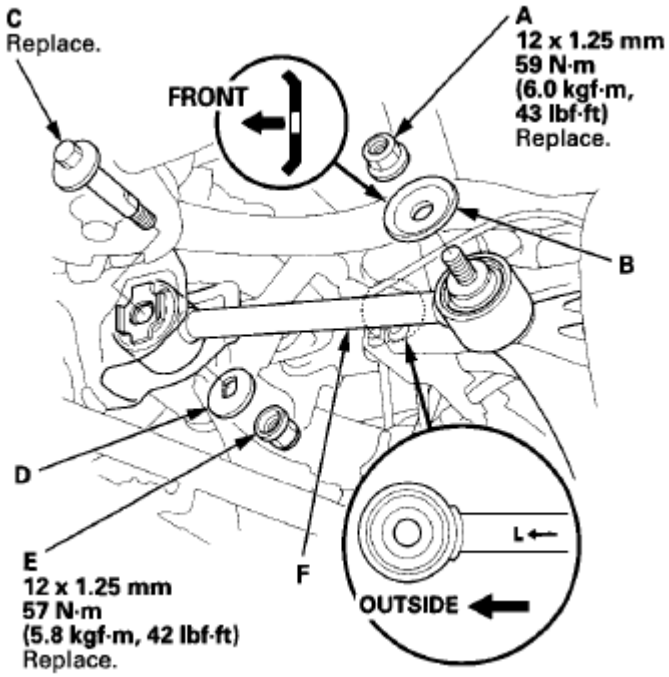

Fig. 20: Identifying Self-Locking Nuts, Washer, Adjusting Bolt, Cam Plate And Control Arm With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Mark the cam positions of the adjusting bolt (C) and the adjusting cam plate (D) with the frame.
5. Remove the self-locking nut (E) while holding the adjusting bolt, then remove the adjusting cam plate, the adjusting bolt, and the control arm (F).

NOTE: Use a new adjusting bolt and a new self-locking nut during reassembly.

6. Install the control arm in the reverse order of removal, and note these items:
   - First install all of the components, and lightly tighten the bolts and the nuts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque.
   - Position the extended surfaces of the cam on the adjusting bolt and the adjusting cam plate facing

down.

- Align the cam positions of the adjusting bolt and the adjusting cam plate with the marked positions on the frame when tightening the self-locking nut.
- Before installing the wheel, clean the mating surfaces between the brake disc/drum and the inside of the wheel.

7. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

LOWER ARM B REPLACEMENT

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Remove the lower arm B mounting bolts, then remove lower arm B.

NOTE: Use new mounting bolts during reassembly.

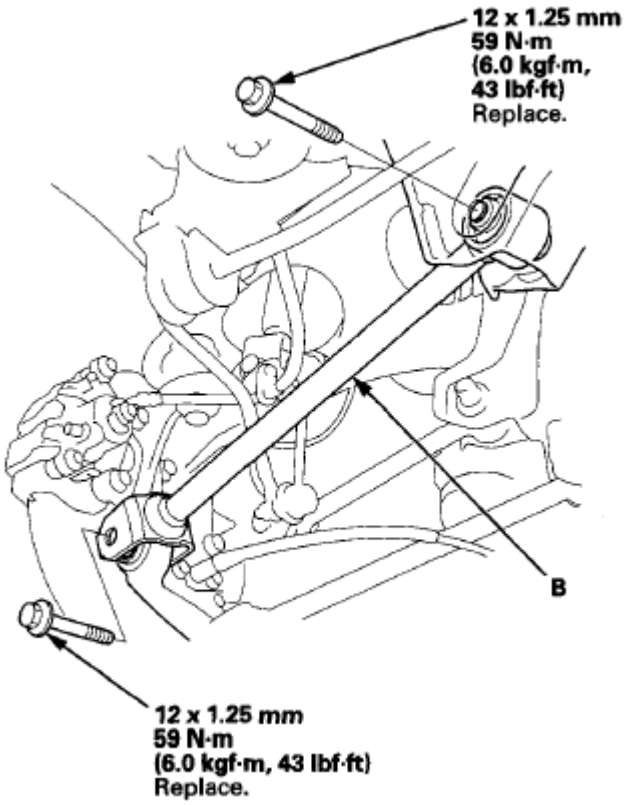

Fig. 21: Identifying Lower Arm B & Fasteners With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install lower arm B in the reverse order of removal, and note these items:
   - First install all of the components, and lightly tighten the bolts, then raise the suspension to load it with the vehicle's weight before fully tightening to the specified torque.
   - Before installing the wheel, clean the mating surfaces between the brake disc/drum and the inside

of the wheel.

5. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

STABILIZER LINK REMOVAL/INSTALLATION

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Remove the self-locking nuts (A) while holding the respective joint pin (B) with a hex wrench (C), then remove the stabilizer link (D).

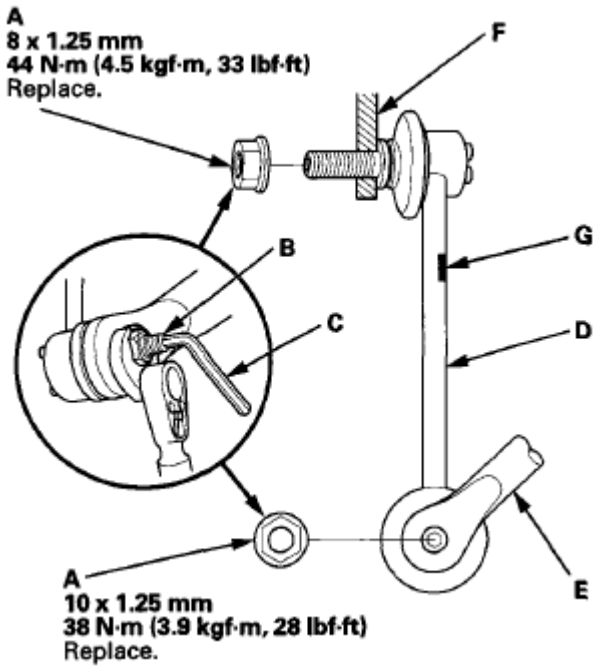

Fig. 22: Identifying Self-Locking Nut, Joint Pin, Hex Wrench, Stabilizer Link, Bar, Brake Hose Bracket And Paint Mark With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the stabilizer link on the stabilizer bar (E) and the brake hose bracket (F) with the joint pins set at the center of their range of movement.

NOTE:

- **The stabilizer link has a paint mark (G). The paint mark indicates the difference between the left and right stabilizer links.**
- **Install the end of the stabilizer link with the paint mark in the upper position.**

5. Install the new self-locking nuts, and tighten them to the specified torque while holding the respective joint pin with a hex wrench.
6. Clean the mating surfaces between the brake disc/drum and the inside of the wheel, then install the rear wheel.

7. Test-drive the vehicle.
8. After 5 minutes of driving, tighten the self-locking nuts again to the specified torque.

STABILIZER BAR REPLACEMENT

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheels.
3. Disconnect both stabilizer links from the stabilizer bar (see **STABILIZER LINK REMOVAL/INSTALLATION**).
4. Remove the flange bolts (A) and the bushing holders (B), then remove the bushings (C) and the stabilizer bar (D).

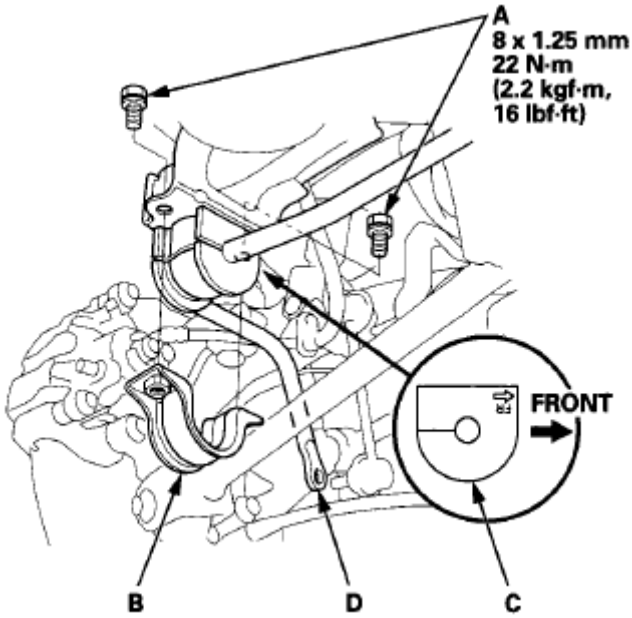

Fig. 23: Identifying Flange Bolts, Bushing Holder, Bushing And Stabilizer Bar With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the stabilizer bar in the reverse order of removal, and note these items:
   - Note the right and left direction of the stabilizer bar.
   - Note the direction of installation for the bushing.
   - Do not set the bushings on the bent or curved part of the stabilizer bar.
   - Refer to the **STABILIZER LINK REMOVAL/INSTALLATION** to connect the stabilizer bar to the links.
   - Before installing the wheel, clean the mating surfaces between the brake disc/drum and the inside of the wheel.

DAMPER/SPRING REMOVAL AND INSTALLATION

REMOVAL

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the rear wheel.
3. Remove the brake hose mounting bolt (A).

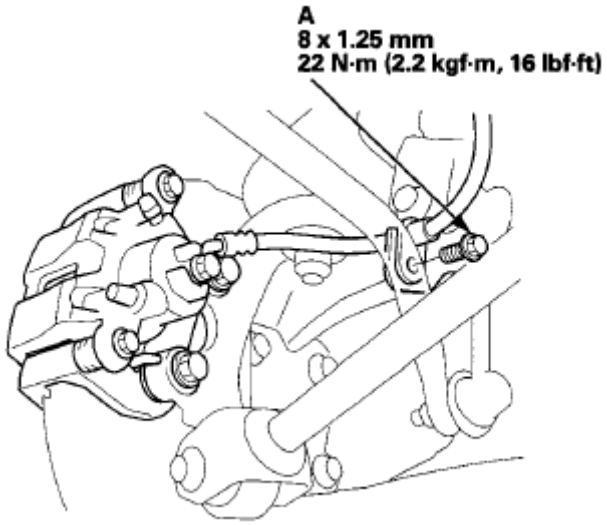

Fig. 24: Identifying Brake Hose Mounting Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the rear seat (see **REAR SEAT REMOVAL/INSTALLATION**).
5. Remove the damper mounting nuts (A) from the top of the damper.

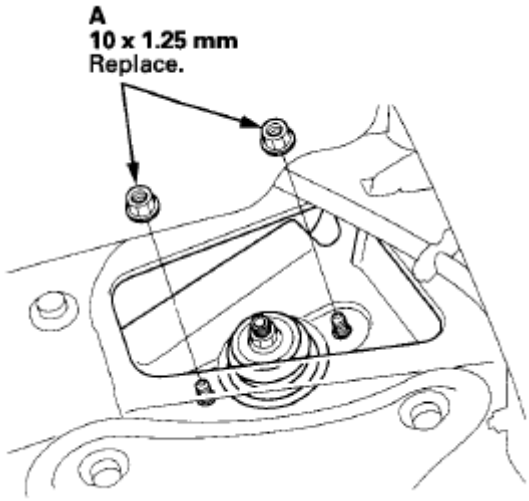

Fig. 25: Identifying Damper Mounting Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the brake hose bracket mounting nuts (A), then disconnect the brake hose bracket (B) from the

knuckle.

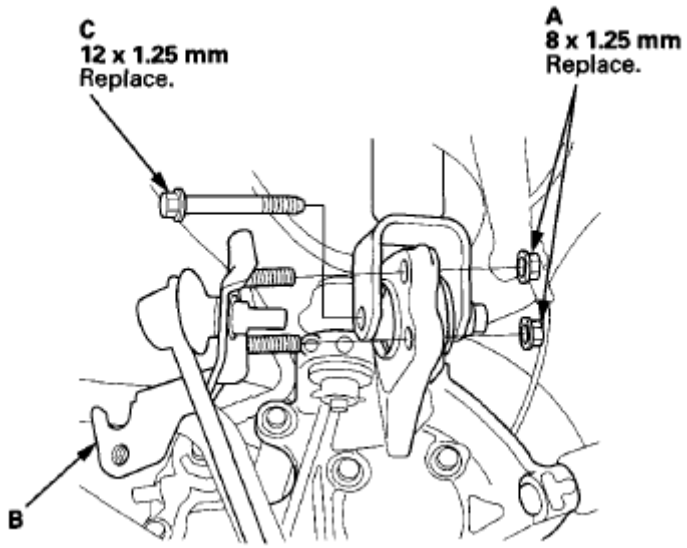

Fig. 26: Identifying Brake Hose Bracket, Mounting Nuts And Damper Lower Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the damper lower mounting bolt (C).
8. Remove the damper/spring (A) by lowering the rear suspension.

NOTE: Be careful not to damage the body.

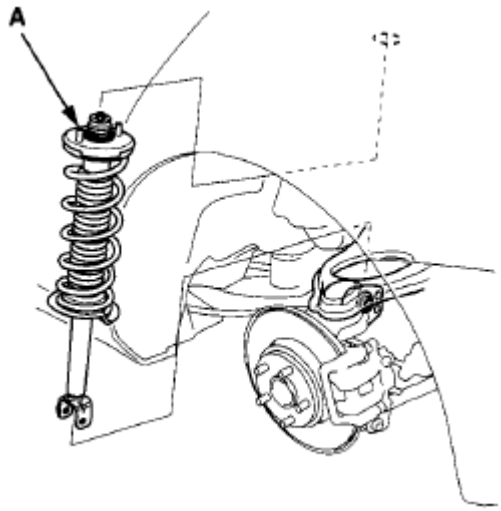

Fig. 27: Identifying Damper/Spring Of Rear Suspension
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

1. Lower the rear suspension, and position the damper/spring (A) in the body with the welded nut (B) on the

bottom of the damper facing forward.

NOTE:

- **Be careful not to damage the body.**
- **Make sure the damper is installed in the correct direction.**

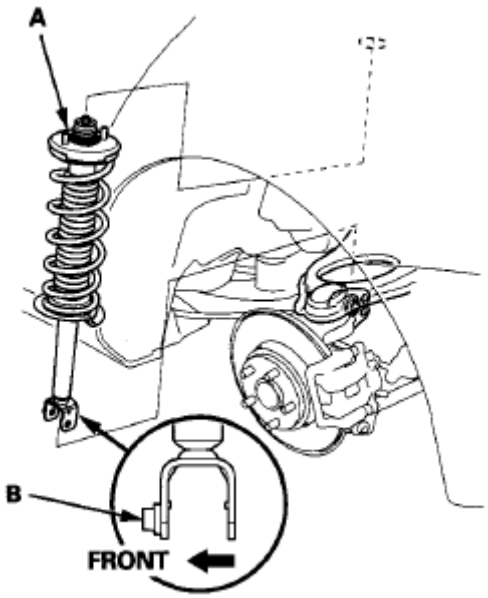

Fig. 28: Identifying Damper/Spring And Welded Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Loosely install the new damper mounting nuts (A) to the top of the damper.

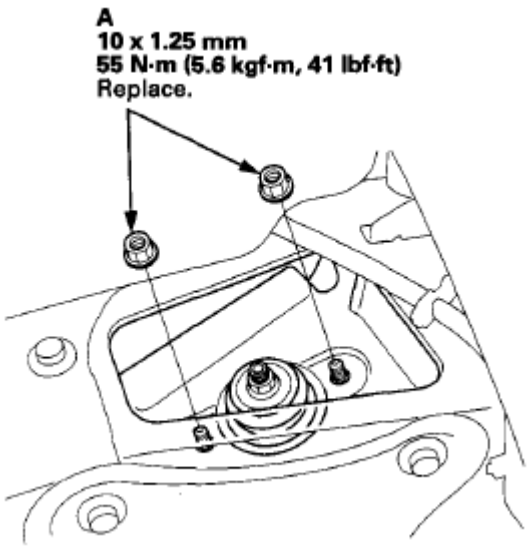

Fig. 29: Identifying Damper Mounting Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosely install the new damper lower mounting bolt (A) on the bottom of the damper. Connect the brake hose bracket (B) to the knuckle, and loosely install the new brake hose bracket mounting nuts (C).

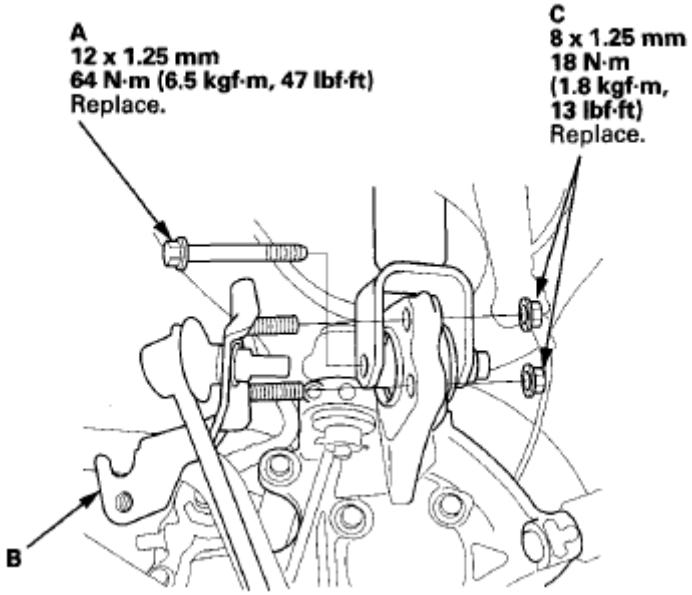

Fig. 30: Identifying Brake Hose Bracket, Lower Mounting Bolt And Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Place a floor jack under the connecting point of the knuckle and lower arm A, and raise the suspension to load it with the vehicle's weight.
5. Tighten the damper lower mounting bolt and the brake hose bracket mounting nuts to the specified torque.
6. Tighten the damper mounting nuts on top of the damper to the specified torque.
7. Install the brake hose mounting bolt (A), and tighten the mounting bolt to the specified torque.

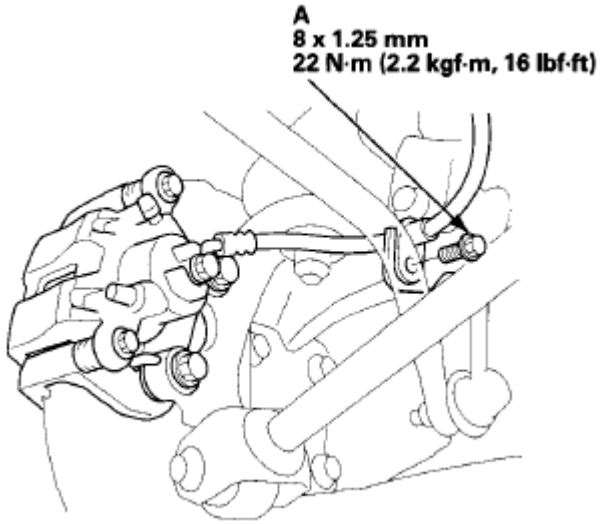

Fig. 31: Identifying Brake Hose Mounting Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the rear seat (see **REAR SEAT REMOVAL/INSTALLATION**).
9. Clean the mating surfaces between the brake disc/drum and the inside of the wheel, then install the rear wheel.
10. Check the wheel alignment, and adjust it if necessary (see **WHEEL ALIGNMENT**).

DAMPER/SPRING DISASSEMBLY, INSPECTION, AND REASSEMBLY

EXPLODED VIEW

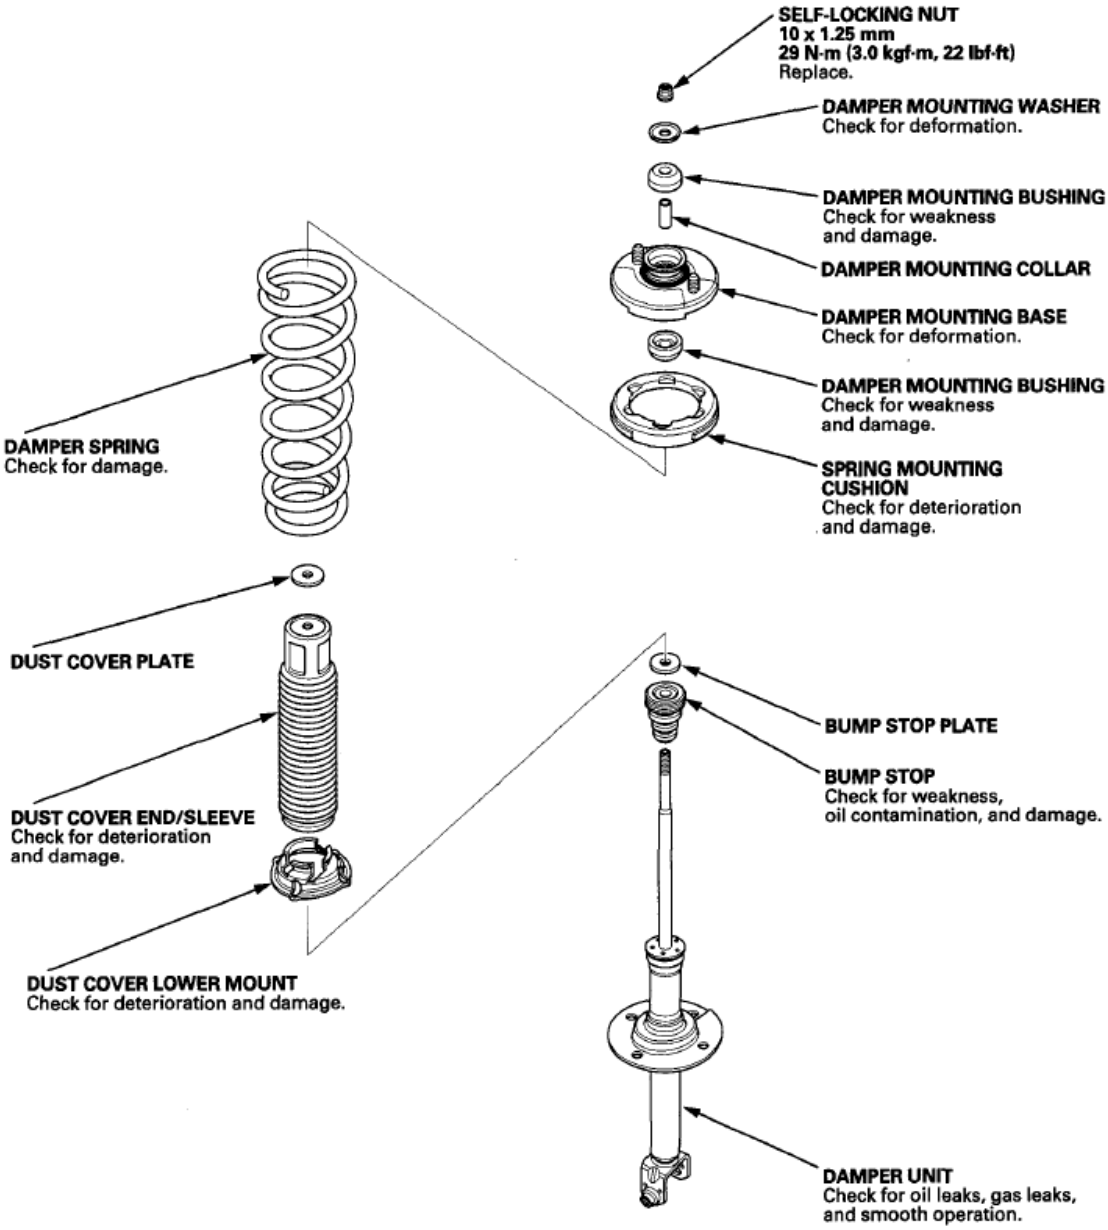

Fig. 32: Exploded View Of Damper/Spring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE:

- **When compressing the damper spring, use a commercially available strut spring compressor (Branick MST-580A or Model 7200, or equivalent) according to the manufacturer's instructions.**
- **Refer to the EXPLODED VIEW as needed during the following procedure.**

DISASSEMBLY

1. Compress the damper spring, then remove the self-locking nut (A) while holding the damper shaft with a hex wrench (B). Do not compress the damper spring more than is necessary to remove the self-locking nut.

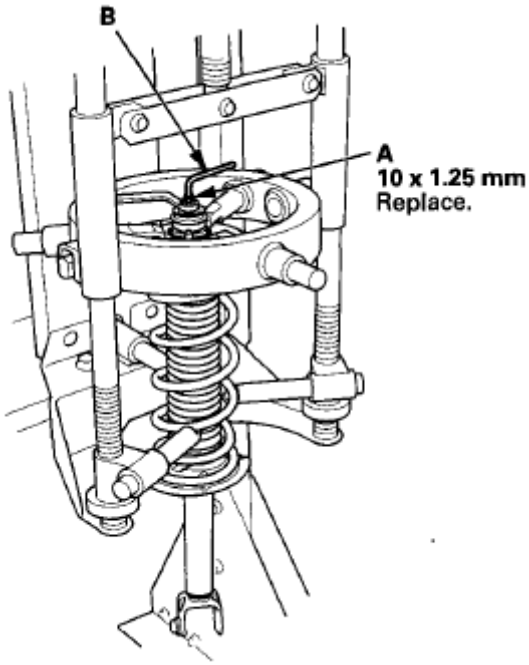

Fig. 33: Compressing Damper Spring Using Holding Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Release the pressure from the strut spring compressor, then disassemble the damper as shown in the Exploded View.

INSPECTION

1. Reassemble all parts, except for the damper spring.
2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced.

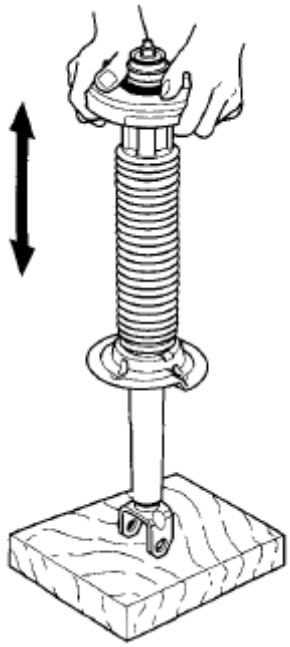

Fig. 34: Checking Smooth Operation Of Damper Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for oil leaks, abnormal noises, and binding during these tests.

REASSEMBLY

1. Install the spring mounting cushion (A) on the damper mounting base (B) by aligning the tabs (C) and the notches (D).

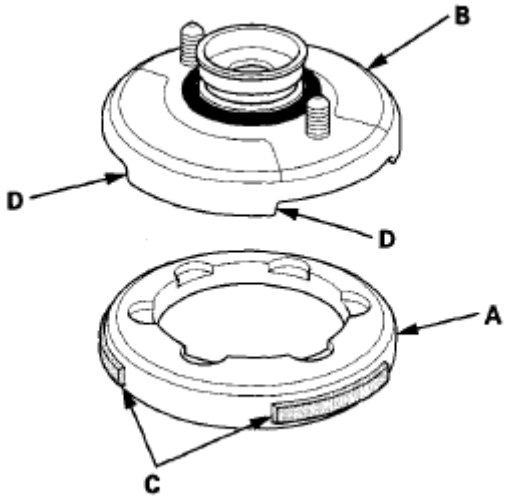

Fig. 35: Installing Spring Mounting Cushion With Aligning Tabs And Notches
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install all the parts except the damper mounting washer and the self-locking nut onto the damper unit by

referring to the **EXPLODED VIEW**.

3. Compress the damper spring using a strut spring compressor. Do not compress the spring excessively.
4. Align the lower end (A) of the damper spring with the stepped part (B) of the dust cover lower mount and the lower spring seat on the damper unit.

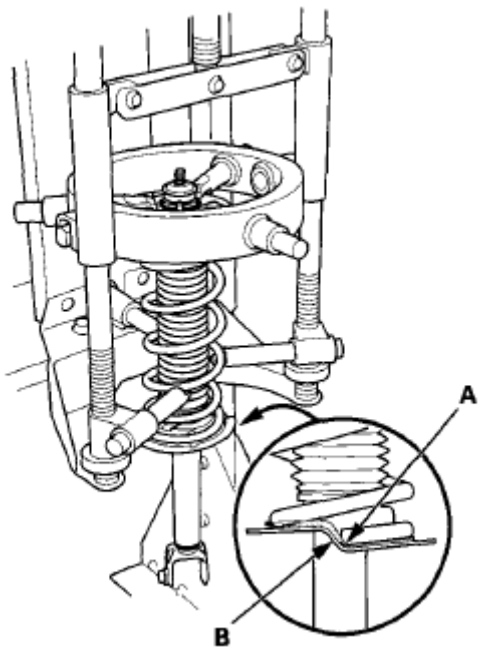

Fig. 36: Identifying Lower End And Stepped Part Of Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Align the angle of the stud (A) on the damper mounting base (B) with the welded nut (C) on the bottom of the damper unit as shown.

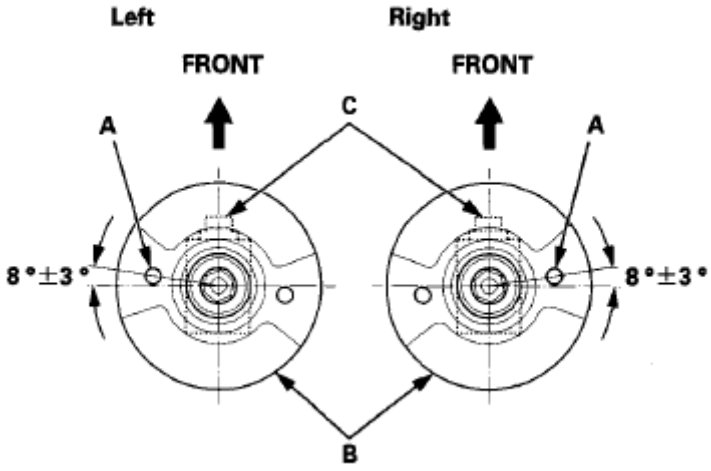

Fig. 37: Aligning Angle Of Stud On Damper Mounting Base With Welded Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the damper mounting washer (A), and loosely install the new self-locking nut (B).

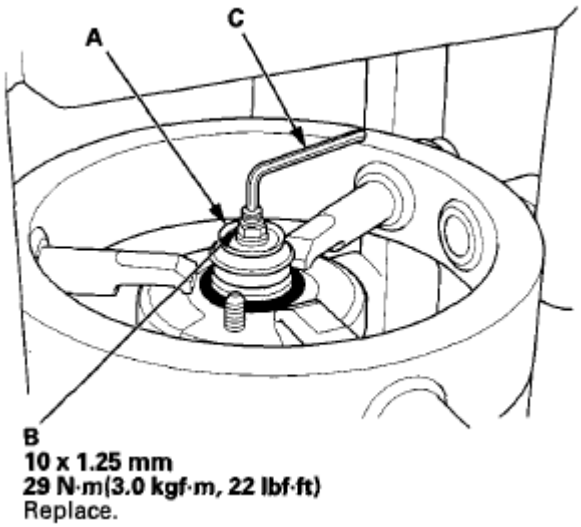

Fig. 38: Installing Damper Mounting Washer And Self-Locking Nut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Hold the damper shaft with a hex wrench (C), and tighten the self-locking nut to the specified torque.
8. Remove the damper/spring from the strut spring compressor.

2012 SUSPENSION

Tire Pressure Monitoring System - TL

COMPONENT LOCATION INDEX

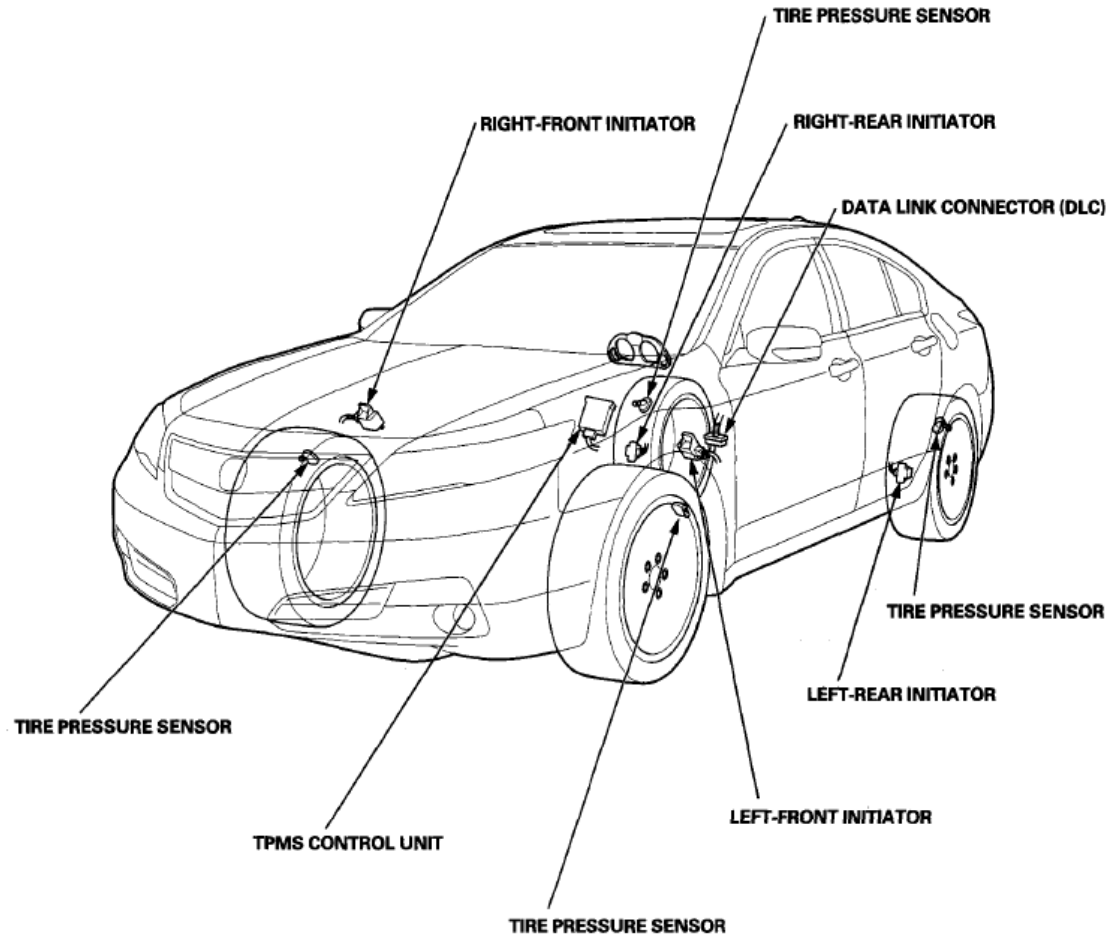

Fig. 1: TPMS Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GENERAL TROUBLESHOOTING INFORMATION

SYSTEM INDICATOR

The system has seven indicators.

- The low tire pressure indicator (A)
- The message indicator (B)
- The TPMS indicator (C)
- The right-front (RF) tire indicator (D)

- The left-front (LF) tire indicator (E)
- The right-rear (RR) tire indicator (F)
- The left-rear (LR) tire indicator (G)

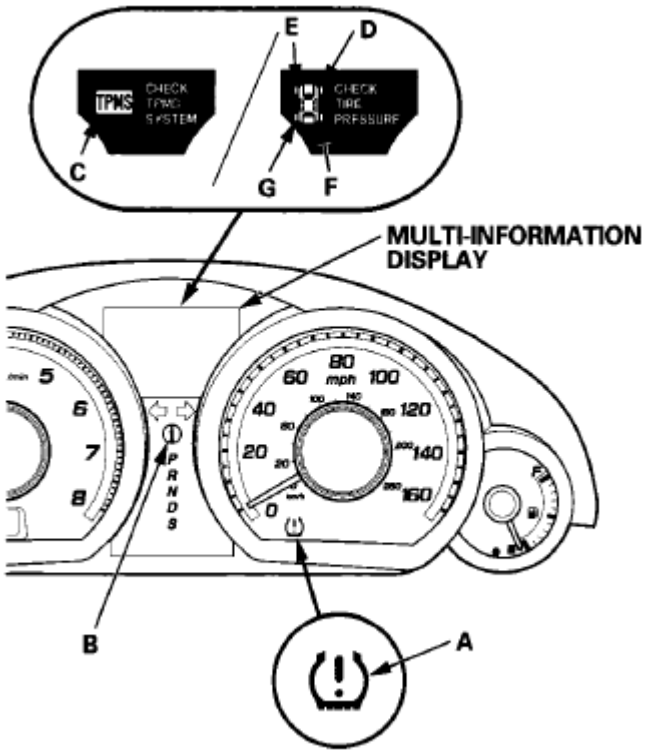

Fig. 2: Identifying TPMS Indicators
Courtesy of AMERICAN HONDA MOTOR CO., INC.

THE LOW TIRE PRESSURE INDICATOR

- If the system detects low tire pressure in any of the four tires, the low tire pressure indicator and the appropriate tire indicator(s) come on, as well as the message indicator.
- If the TPMS control unit detects a problem in the system during an indication of low tire pressure, it will turn off the tire indicator(s), store the DTC(s), and turn on the TPMS indicator and the low tire pressure indicator after blinking.

THE TPMS INDICATOR

- If a problem in the system is detected, the TPMS indicator comes on, as well as the message indicator, and the low tire pressure indicator comes on after blinking for about 75 seconds.
- If low tire pressure and a problem in the system are detected, the TPMS indicator comes on, as well as the message indicator, and the low tire pressure indicator comes on after blinking for about 75 seconds.

If the system is OK, the low tire pressure indicator should come on when you turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and then goes off 2 seconds later. If it does not,

there is a problem with the system.

DTC 11, 13, 15, 17

If the system detects low tire pressure in any of the four tires, the low tire pressure indicator and the appropriate tire indicator(s) with the message indicator come on, and the TPMS control unit sets one or more of these codes: DTC 11, 13, 15, 17. When the tire pressure returns to normal, and TPMS control unit receives the normal pressure signal from the tire pressure sensor, the TPMS control unit turns off the indicators.

TIRE PRESSURE CHANGING BY TEMPERATURE

Tire pressures increase slightly as the temperature in the tires rises during driving. Pressures can also increase or decrease slightly with changes in outside air temperature. A temperature change of about 18°F (10°C) changes tire pressure by about 10 kPa (0.1 kgf/cm^2 , 1.5 psi). If the temperature drops, tire pressure could decrease enough to turn on the low tire pressure indicator and tire indicator(s), but later, the tire temperature could increase enough to turn indicator off. To resolve a complaint of such intermittent indications, confirm and clear the stored DTC(s) and check the tire pressures. Then explain to the client how temperature changes can affect the system.

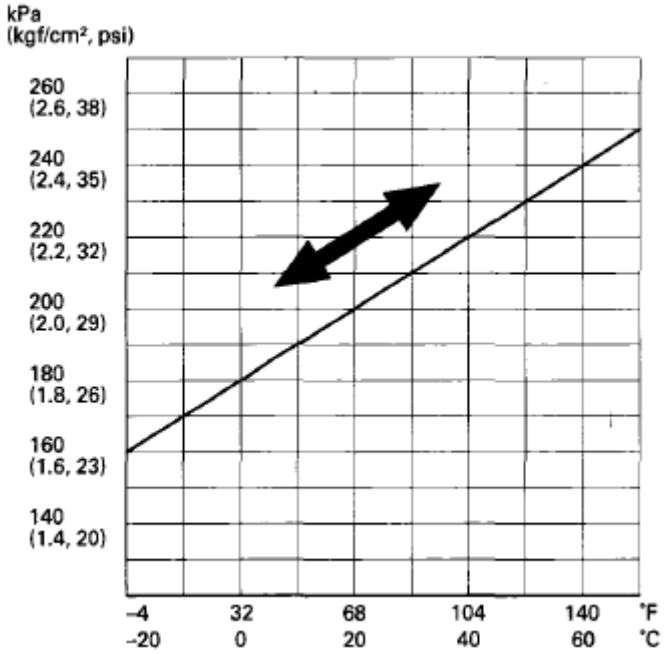

Fig. 3: Tire Pressure Versus Temperature Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

PROBLEMS THAT ARE NOT SYSTEM FAULTS

- Tire Sealant

  Fluid sealant used to repair a punctured tire can damage the tire pressure sensor mounted on each wheel. It can prevent the system from detecting the correct tire pressure, which sets a DTC 11, 13, 15 or 17 even

though the system is normal.

- Cold Weather

  When the weather is extremely cold, about - 4°F (- 20°C) or colder, the output of the lithium battery in each tire pressure sensor may drop far enough that the TPMS control unit sets a DTC for low battery voltage (31, 33, 35, or 37) even though the system is normal.

- Non-TPMS Type Wheels (Including Spare Tire) Vehicles equipped with TPMS must use wheels made for the system. Every TPMS type wheel has an exclusive mark; do not use any other type of wheel (see **WHEELS**).

When a flat tire is replaced with the spare tire, the TPMS indicator comes on (DTC 32, 34, 36, or 38) because the system is no longer receiving the signal from the flat tire's transmitter. This is not a problem with the spare tire.

HOW A DIAGNOSTIC TROUBLE CODE (DTC) IS SET

- When the system detects a problem, the TPMS control unit sets a code, but shifts to fail-safe mode, and does not alert the driver to low tire pressures.
- If the TPMS control unit loses power, or fails, the TPMS indicator and the low tire pressure indicator (starts blinking) comes on, but no DTCs are set.
- The memory can hold all the DTCs that could possibly be set. However, when the same DTCs are detected more than once, the most recent one overwrites the previous one, so only the latest DTC of each type is stored.
- DTCs are indicated in ascending order, not in the order they occurred.
- Set DTCs are stored in the EEPROM (nonvolatile memory), and cannot be cleared by disconnecting the battery. To clear a DTC, connect the HDS (Honda Diagnostic System) to the data link connector (DLC), and follow the screen prompts.

HOW TO TROUBLESHOOT DTCS

DTC troubleshooting procedures assume that the cause of the problem is still present and the TPMS indicator and the low tire pressure indicator (starts blinking) are still on. Do not use a troubleshooting procedure unless the system has set the DTC listed for it.

1. Ask the client to describe the conditions when the indicators came on or blinked, and try to reproduce the same conditions for troubleshooting. Find out if the client checked and/or adjusted tire pressures since the indicator came on.
2. If an indicator does not come on during the test-drive, check for loose terminals, poor contact due to damaged terminals, etc. before you start troubleshooting.
3. After troubleshooting, repair and clear the DTCs, and test-drive the vehicle. Make sure no indicators come on.

HOW TO RETRIEVE DTCS

1. With the ignition switch in LOCK (0), or press the engine start/stop button to select the OFF mode, connect the HDS (Honda Diagnostic System) to the data link connector (DLC) (A) located under the driver's side of the dashboard.

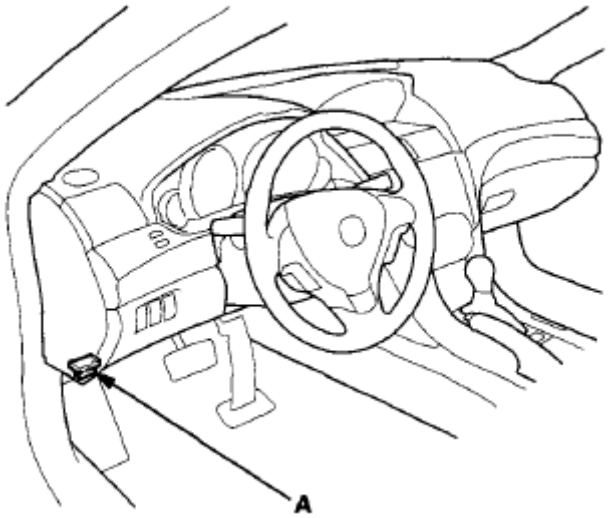

Fig. 4: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the vehicle and the TPMS control unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting.

NOTE: See the HDS Help menu for specific instructions.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

HOW TO CLEAR DTCS

1. With the ignition switch in LOCK (0), or press the engine start/stop button to select the OFF mode, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

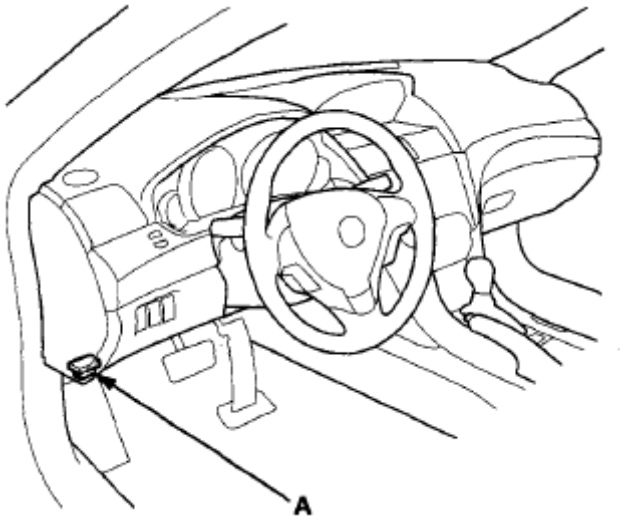

Fig. 5: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the vehicle and the TPMS control unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Clear the DTC(s) by following the screen prompts on the HDS.

NOTE: See the HDS Help menu for specific instructions.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

MEMORIZING THE TIRE PRESSURE SENSOR ID

MEMORIZING A TIRE PRESSURE SENSOR ID

All four sensor IDs must be memorized to the TPMS control unit whenever you do any of these actions:

- Replace the TPMS control unit.
- Replace the tire pressure sensor.
- Substitute a known-good wheel with tire pressure sensor.

NOTE:

- **To ensure the TPMS control unit memorizes the correct sensor ID, the vehicle with the new tire pressure sensor must be at least 10 ft (3 m) away from other vehicles that have sensors.**
- **When replacing the TPMS control unit, use the HDS to memorize sensor IDs.**

MEMORIZING A TIRE PRESSURE SENSOR ID AUTOMATICALLY

After rotating the tires or replacing a tire pressure sensor, drive the vehicle for at least 40 seconds at a speed of 15 mph (24 km/h) or more, and all the sensor IDs are memorized automatically.

NOTE: After the sensor IDs are memorized, reduce the pressure in all four tires to less than the appropriate specification, and check to see that the four tire indicators come on.

MEMORIZE A TIRE PRESSURE SENSOR ID WITH THE HDS

The HDS can memorize the sensor ID of a new tire pressure sensor or a previously memorized sensor ID.

1. With the ignition switch in LOCK (0), or press the engine start/stop button to select the OFF mode, connect the HDS to the data link connector (DLC) (A) located under the driver's side of the dashboard.

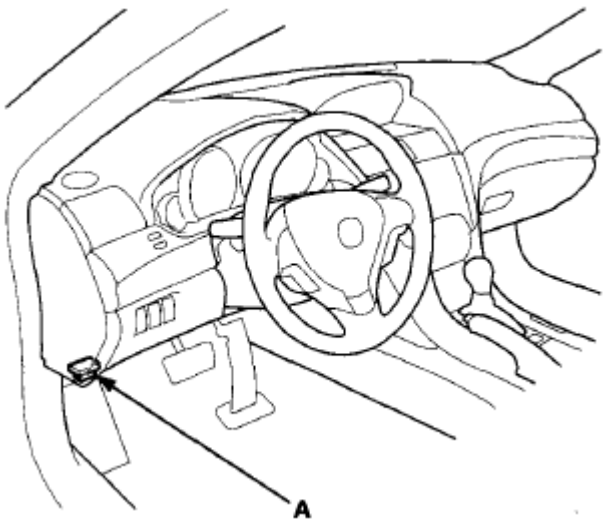

Fig. 6: Identifying Data Link Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the vehicle and the TPMS control unit. If it does not, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Memorize the tire pressure sensor ID by following the screen prompts on the HDS.

NOTE:

- **See the HDS Help menu for specific instructions.**
- **When replacing the TPMS control unit, use the HDS to memorize sensor IDs.**
- **After the sensor IDs are memorized, reduce the pressure in all four tires to less than the appropriate specification, and check to see that the four tire indicators come on.**

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

DTC TROUBLESHOOTING INDEX

DTC	Detection Item	Troubleshooting
11	Right-Front Tire Low Air Pressure	DTC Troubleshooting (see **DTC 11, 13, 15, 17: TIRE LOW AIR PRESSURE**)

Terminal number	Wire color	Terminal sign	Description	Signal
15	BLU	RF LF GND (RF low frequency ground)	Ground for the right-front initiator	For the first 5 seconds after turning the ignition switch ON (II), or vehicle in ON mode: less than 0.1V
16	PNK	LR LF SIG. (LR low frequency signal)	Detects the signal from the left-rear initiator	For the first 5 seconds after turning the ignition switch ON (II), or vehicle in ON mode: pulses 0- 2 V
				After 40 seconds with ignition switch ON (II), or vehicle in ON mode: less than 0.1 V
				For the first 5 seconds after turning the

17	ORN	RR LF SIG. (RR low frequency signal)	Detects the signal from the right-rear initiator	ignition switch ON (II), or vehicle in ON mode: pulses 0- 2 V After 40 seconds with ignition switch ON (II), or vehicle in ON mode: less than 0.1 V
18	LT GRN	LR LF PWR. (LR low frequency power)	Power source for the left-rear initiator	For the first 5 seconds after turning the ignition switch ON (II), or vehicle in ON mode: About 7 V
19	BLU	RR LF PWR. (RR low frequency power)	Power source for the right-rear initiator	For the first 5 seconds after turning the ignition switch ON (II), or vehicle in ON mode: About 7 V
20	BRN	LF LF PWR. (LF low frequency power)	Power source for the left-front initiator	For the first 5 seconds after turning the ignition switch ON (II), or vehicle in ON mode: About 7 V

System Structure

Whenever the ignition switch is turned ON (II), or the engine start/stop button is pressed to select the ON mode, the TPMS control unit continuously monitors all four tire pressure sensors and the system function. If it detects low pressure in a tire, it alerts the driver by turning on the low tire pressure indicator and the appropriate tire indicator. If it detects a problem in the system, it turns on the TPMS indicator and the low tire pressure indicator (starts blinking).

Initiators

Mounted on the top of each wheelwell, each initiator sends a start/stop signal to the tire pressure sensor in the tire below it.

TPMS Control Unit

Mounted on top of the brake pedal support member, the TPMS control unit sends signals to the initiators and receives signals from the tire pressure sensor to verify pressure sensor IDs every time the ignition switch is turned ON (II), or the engine start/stop button is pressed to select the ON mode. It also receives signals from the transmitters for tire pressure and the sensor condition, and it continuously monitors and controls the system.

Indicators

All indicators are in the gauge control module: The low tire pressure indicator (LED indicator), the four tire indicators (on the multi-information display) to show which tire is affected, and the TPMS indicator (on the multi-information display) that comes on only if there's a problem with the system. The message indicator (LED indicator) comes on when there is one or more indicators on in the multi-information display. When two or more tire pressures are low, the low tire pressure indicator comes on about 5 seconds before the appropriate tire indicator. Once low pressure is detected, the system scans all four tire pressure sensors to ensure that it turns on the correct tire indicator.

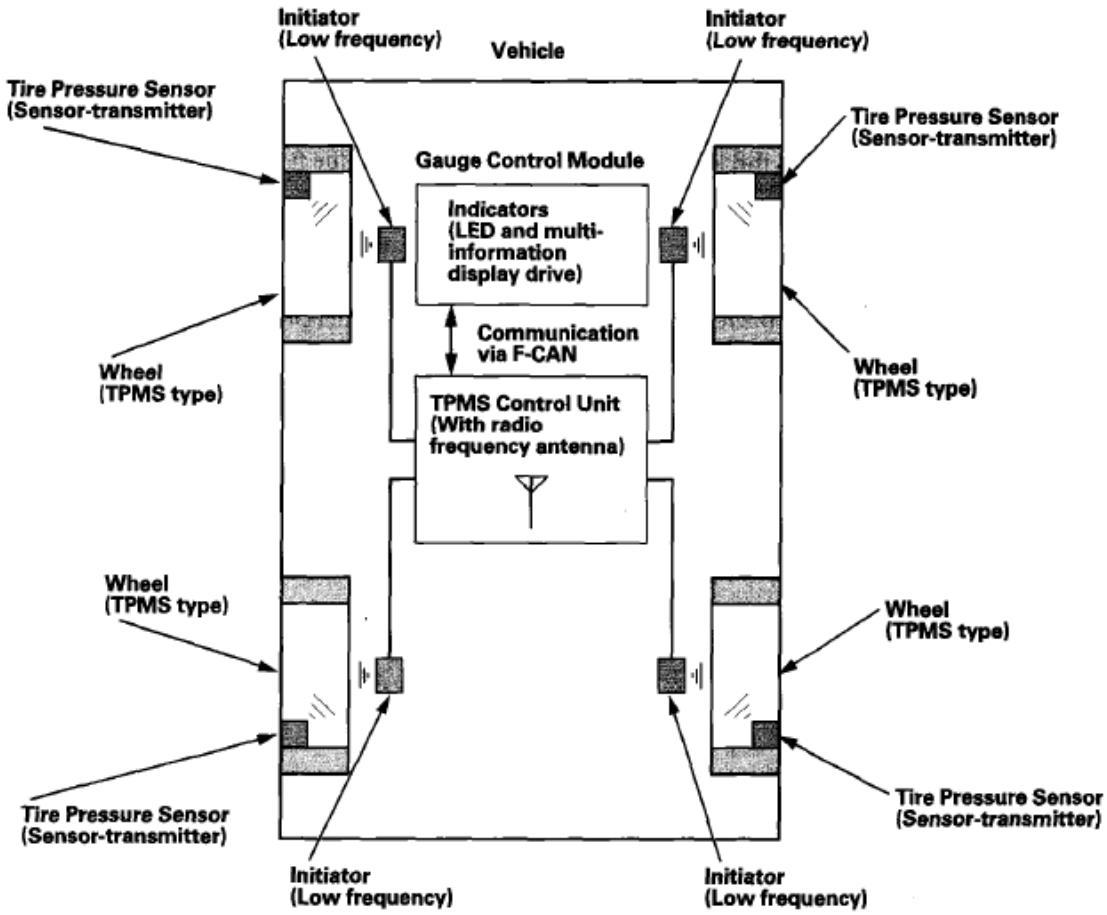

Fig. 9: TPMS Indicators System Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Tire Pressure Sensor

Each sensor is an integrated unit made up of the tire valve stem, a pressure sensor, and a transmitter. The unit is attached to the inside of the wheel, around the valve stem. The sensor transmits internal tire information onetime per 60 seconds to the TPMS control unit. When the TPMS control unit receives a tire pressure reading of less than: With 17 inch and 18 inch wheels 175 kPa (1.8 kgf/cm^2 , 25 psi), or with 19 inch wheels 186 kPa (1.9 kgf/cm^2 , 27 psi), the TPMS control unit then turns on the low tire pressure indicator and the appropriate tire(s) indicator. When that tire's pressure is increased to more than: With 17 inch and 18 inch wheels 200 kPa (2.0 kgf/cm^2 , 29 psi), or with 19 inch wheels 215 kPa (2.2 kgf/cm^2 , 31 psi), the transmitter sends the tire pressure reading to the TPMS control unit, and the TPMS control unit turns the indicators off.

Wheels

The TPMS will not work unless TPMS type wheels are installed on the vehicle. The original equipment wheels have a "TPMS" mark (A) on them, and are counterweighted by adding material to counterbalance the weight of the tire pressure sensor (B).

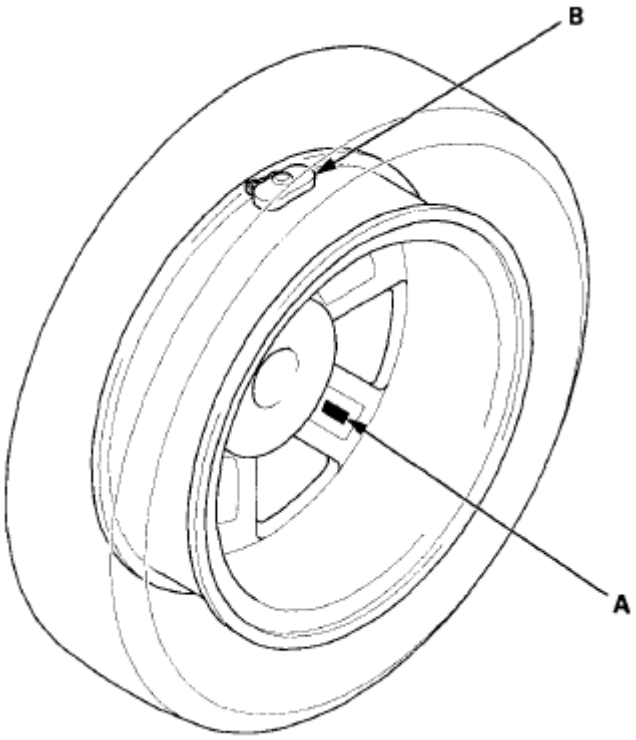

Fig. 10: Identifying TPMS Mark And Tire Pressure Sensor

System Communication

- When the ignition switch is turned ON (II), or the engine start/stop button is pressed to select the ON mode, an RF (radio frequency) band wave signal is transmitted from each tire pressure sensor to the TPMS control unit.
- When the ignition switch is turned ON (II), or the engine start/stop button is pressed to select the ON mode, the initiators send a LF (low frequency) band wave signal to the tire pressure sensors, switching them from sleep mode to normal function mode. When the ignition switch is turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode, the sensors switch from normal function mode back to sleep mode to extend their battery life.
- Each tire pressure sensor has its own tire pressure sensor ID to prevent jamming by similar systems on other vehicles. After memorizing all the sensor IDs, the TPMS control unit recognizes only those specific signals.
- An tire pressure sensor ID can be memorized manually or automatically. Each initiator is hardwired to the TPMS control unit. Every time the ignition is turned to ON (II), or the engine start/stop button is pressed to select the ON mode, the TPMS control unit asks each initiator to wake up the appropriate tire pressure sensor. The transmitters in the tire pressure sensors then transmit the sensor IDs, and the TPMS control unit receives, and memorizes them. The TPMS control unit then knows which sensor ID belongs to each tire location. This recurring sensor ID confirmation prevents any confusion in the system as a result of normal tire rotation.

NOTE: Be careful not to bend the brackets on the TPMS control unit and the front/rear

initiators. Misalignment of the TPMS control unit and initiators could interfere with sending and receiving signals.

DTC TROUBLESHOOTING

DTC 11, 13, 15, 17: TIRE LOW AIR PRESSURE

NOTE: If low tire pressure is detected, the TPMS control unit sets one or more of these DTCs, and turns on the low tire pressure indicator and the appropriate tire indicator(s). If the low tire pressure and tire indicators come on because of a low tire pressure, and the client corrects it before bringing the vehicle in, the DTCs will be stored, but all the indicators turns off.

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb sticker.
3. Test-drive the vehicle.

   Does the low tire pressure indicator go off?

   YES - The system is OK at this time. Check for and repair the cause of air loss.

   NO - Go to step 4.

4. Check the RF, LF, RR, or LR TIRE PRESSURE in the TPMS DATA LIST with the HDS, and compare it with the measured actual tire pressure.

   NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

   Is the indicated tire pressure on the HDS within 40 kPa (0.4 kgf/cm^2 , 6 psi) of the actual tire pressure?

   YES - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

   NO - Check that the tire pressure sensor is properly mounted. If the mounting is OK, then replace the appropriate tire pressure sensor (see **TIRE PRESSURE SENSOR REPLACEMENT**).

DTC 21, 22, 23, 24: TIRE PRESSURE SENSOR ABNORMALLY HIGH TEMPERATURE

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the tire indicated by the DTCs you retrieved.

   NOTE: An abnormal rise in the internal temperature of the tires can be caused by:

   - Excessive braking
   - Failure to release the parking brake (rear tires only)
   - Leaving the vehicle running while parked
   - Improper assembly of a wheel and tire

DTC	Tire Location
21	Right-front
22	Left-front
23	Right-rear
24	Left-rear

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Make sure the tires have cooled down.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

   Does the TPMS indicator go off within one minute?

   YES - The system is OK at this time. Clear the DTC with the HDS.

   NO - Go to step 6.

6. Check the RF, LF, RR, or LR TIRE PRESSURE SENSOR TEMPERATURE in the TPMS DATA LIST with the HDS.

   NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

   Is 176°F (80°C) or more indicated?

   YES - Replace the appropriate tire pressure sensor (see **TIRE PRESSURE SENSOR REPLACEMENT**).

   NO - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

DTC 31, 33, 35, 37: TIRE PRESSURE SENSOR LOW BATTERY VOLTAGE

NOTE: This problem occurs when the temperature around the sensor is - 4°F (- 20°C) or less. Note that the diagnosis must be made in a place where ambient temperature is - 4°F (- 20°C) or more.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

   Does the TPMS indicator go off within one minute?

   YES - The system is OK at this time. Clear the DTC with the HDS.

NO - Go to step 2.

2. Check the RF, LF, RR, or LR TIRE PRESSURE SENSOR BATTERY STATUS in the TPMS DATA LIST with the HDS.

NOTE: **If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.**

DTC	Tire Location
31	Right-front
33	Left-front
35	Right-rear
37	Left-rear

Is LOW indicated?

YES - Replace the appropriate tire pressure sensor (see **TIRE PRESSURE SENSOR REPLACEMENT**).

NO - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

DTC 32, 34, 36, 38: TIRE PRESSURE SENSOR SIGNAL FAILURE

NOTE:

- **Inspect for an aftermarket electrical device(s) (such as an inverter, battery charger, CB radio, etc) interfering with the RF signal from the tire pressure sensors when the ignition switch is ON (II), or press the engine start/stop button to select the ON mode.**
- **Vehicle must be driven for 3 minutes at 15 mph (24 km/h) or more for DTC 32, 34, 36, or 38 to set.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the DTC indicated to the tire location to make sure the wheel is a TPMS type with the tire pressure sensor.

DTC	Tire Location
32	Right-front
34	Left-front
36	Right-rear
38	Left-rear

Is a TPMS type wheel with a tire pressure sensor mounted on the vehicle?

YES - Go to step 3.

NO - Install a TPMS type wheel, and memorize the tire pressure sensor ID. Drive the vehicle above 15 mph (24 km/h) continuously for 40 seconds, or memorize the sensor ID with the HDS (see **MEMORIZING THE TIRE PRESSURE SENSOR ID**).

3. Test-drive the vehicle.
4. Check the VEHICLE SPEED in the TPMS DATA LIST with the HDS.

Is the vehicle's speed indicated?

YES - Go to step 10.

NO - Go to step 5.

5. Clear the DTC with the HDS.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Wait about 5 seconds.
9. Check for DTCs with the HDS.

Is DTC 85 indicated?

YES - Go to the **DTC 85 TROUBLESHOOTING**.

NO - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Check TPMS DATA LIST for RF, LF, RR, or LR TIRE PRESSURE SENSOR STATUS changes to NORMAL with the HDS.

NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

DTC	Tire Location
32	Right-front
34	Left-front

36	Right-rear
38	Left-rear

Is NORMAL indicated within one full turn of the tire?

YES - The system is OK at this time. Clear the DTC with the HDS.

NO - Go to step 13.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Substitute a wheel with a known-good tire pressure sensor on the vehicle.
15. To memorize the tire pressure sensor ID, drive the vehicle above 15 mph (24 km/h) for 40 continuous seconds, or memorize the sensor ID with the HDS (see **MEMORIZING THE TIRE PRESSURE SENSOR ID**).
16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
18. Check TPMS DATA LIST for RF, LF, RR, and LR TIRE PRESSURE SENSOR STATUS changes to NORMAL with the HDS.

NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

DTC	Tire Location
32	Right-front
34	Left-front
36	Right-rear
38	Left-rear

Is NORMAL indicated within one full turn of the tire?

YES - Replace the tire pressure sensor on the original wheel (see **TIRE PRESSURE SENSOR REPLACEMENT**).

NO - Go to step 19.

19. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
20. Substitute an initiator from a known-good location on the current vehicle, or from another known-good vehicle (see **INITIATOR REPLACEMENT**).
21. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
22. Check TPMS DATA LIST for RF, LF, RR, and LR TIRE PRESSURE SENSOR STATUS changes to

NORMAL with the HDS.

NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

DTC	Tire Location
32	Right-front
34	Left-front
36	Right-rear
38	Left-rear

Is NORMAL indicated within one full turn of the tire?

YES - Replace the appropriate initiator (see **INITIATOR REPLACEMENT**).

NO - Go to step 23.

23. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
24. Disconnect the appropriate initiator 3P connector.

DTC	Initiator Location
32	Right-front
34	Left-front
36	Right-rear
38	Left-rear

25. Disconnect the TPMS control unit 20P connector.
26. Check for continuity between the appropriate TPMS control unit 20P connector terminal and appropriate initiator 3P connector terminal No. 1.

DTC	TPMS Control Unit 20P Connector Terminal	Initiator Location
32	No. 1	Right-front
34	No. 20	Left-front

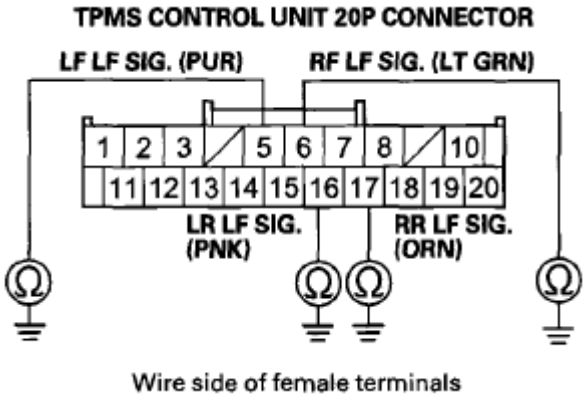

Fig. 18: Checking Continuity Between Body Ground And TPMS Control Unit 20P Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the TPMS control unit and the appropriate initiator.

NO - Go to step 30.

30. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
31. Measure the voltage between body ground and the appropriate TPMS control unit 20P connector terminal.

DTC	TPMS Control Unit 20P Connector Terminal

Is there battery voltage?

YES - Repair a short to power in the wire between the TPMS control unit and the appropriate initiator.

NO - Replace the TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**).

DTC 41: ABNORMAL SIGNAL RECEPTION ERROR

NOTE:

- **Inspect for an aftermarket electrical device(s) (such as an inverter, battery charger, CB radio, etc) interfering with the RF signal from the tire pressure sensors when the ignition switch is ON (II), or press the engine start/stop button to select the ON mode.**
- **If DTC 32, 34, 36, or 38 is also set, troubleshoot those DTCs first.**

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Check all four wheels to make sure they are the TPMS type with the tire pressure sensor.

   Is each wheel a TPMS type with a tire pressure sensor mounted on the vehicle?

   YES - Go to step 3.

   NO - Install a TPMS type wheel, and memorize the tire pressure sensor ID. Drive the vehicle above 15 mph (24 km/h) continuously for 40 seconds, or memorize the sensor ID with the HDS (see **MEMORIZING THE TIRE PRESSURE SENSOR ID**).

3. Test-drive the vehicle.
4. Check the VEHICLE SPEED in the TPMS DATA LIST with the HDS.

   Is the vehicle speed indicated?

   YES - Go to step 10.

   NO - Go to step 5.

5. Clear the DTC with the HDS.
6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Wait about 5 seconds.
9. Check for DTCs with the HDS.

   Is DTC 85 indicated?

YES - Go to the **DTC 85 TROUBLESHOOTING**.

NO - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

10. Turn the ignition switch to LOCK(0), or press the engine start/stop button to select the OFF mode.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Check TPMS DATA LIST for LF, RF, LR, and RR TIRE PRESSURE SENSOR STATUS changes to NORMAL with the HDS.

NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

Is NORMAL indicated within one full turn of the tire?

YES - The system is OK at this time. Clear the DTC with the HDS.

NO - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

DTC 45: INITIATOR CIRCUIT SHORT DETECTION

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
4. Check for DTCs with the HDS.

Is DTC 45 indicated?

YES - Go to step 5.

NO - The system is OK at this time.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the TPMS control unit 20P connector.
7. Check for continuity between body ground and the appropriate TPMS control unit 20P connector terminal.

Terminal Name	TPMS Control Unit 20P Connector Terminal

Is there battery voltage?

YES - Repair a short to power in the wire between the TPMS control unit and the appropriate initiator.

NO - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**) and recheck.

DTC 51, 53, 55, 57: TIRE PRESSURE SENSOR REGISTRATION ERROR

NOTE: The following DTCs will only set during initialization with the HDS.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the DTC indicated to the tire location to make sure the wheel is a TPMS type with the tire pressure sensor.

DTC	Tire Location
51	Right-front
53	Left-front
55	Right-rear
57	Left-rear

Is a TPMS type wheel with a tire pressure sensor mounted on the vehicle?

YES - Go to step 3.

NO - Install a TPMS type wheel, and memorize the tire pressure sensor ID. Drive the vehicle above 15

mph (24 km/h) continuously for 40 seconds, or memorize the sensor ID with the HDS (see **MEMORIZING THE TIRE PRESSURE SENSOR ID**).

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Check TPMS DATA LIST for RF, LF, RR, or LR TIRE PRESSURE SENSOR STATUS changes to NORMAL with the HDS.

NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

DTC	Tire Location
51	Right-front
53	Left-front
55	Right-rear
57	Left-rear

Is NORMAL indicated within one full turn of the tire?

YES - The system is OK at this time. Clear the DTC with the HDS.

NO - Go to step 6.

6. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Substitute a wheel with a known-good tire pressure sensor on the vehicle.
8. To memorize the tire pressure sensor ID, drive the vehicle above 15 mph (24 km/h) for 40 continuous seconds, or memorize the sensor ID with the HDS (see **MEMORIZING THE TIRE PRESSURE SENSOR ID**).
9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
11. Check TPMS DATA LIST for RF, LF, RR, or LR TIRE PRESSURE SENSOR STATUS changes to NORMAL with the HDS.

NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

DTC	Tire Location
51	Right-front
53	Left-front
55	Right-rear
57	Left-rear

Is NORMAL indicated within one full turn of the tire?

YES - Replace the tire pressure sensor on the original wheel (see **TIRE PRESSURE SENSOR REPLACEMENT**).

NO - Go to step 12.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Substitute an initiator from a known-good location on the current vehicle, or from another known-good vehicle (see **INITIATOR REPLACEMENT**).
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Check TPMS DATA LIST for RF, LF, RR, and LR TIRE PRESSURE SENSOR STATUS changes to NORMAL with the HDS.

NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

DTC	Tire Location
51	Right-front
53	Left-front
55	Right-rear
57	Left-rear

Is NORMAL indicated within one full turn of We tire?

YES - Replace the appropriate initiator (see **INITIATOR REPLACEMENT**).

NO - Go to step 16.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Disconnect the appropriate initiator 3P connector.

DTC	Initiator Location
51	Right-front

53	Left-front
55	Right-rear
57	Left-rear

18. Disconnect the TPMS control unit 20P connector.
19. Check for continuity between the appropriate TPMS control unit 20P connector terminal and appropriate initiator 3P connector terminal No. 1.

DTC	TPMS Control Unit 20P Connector Terminal	Initiator Location
51	No. 1	Right-front

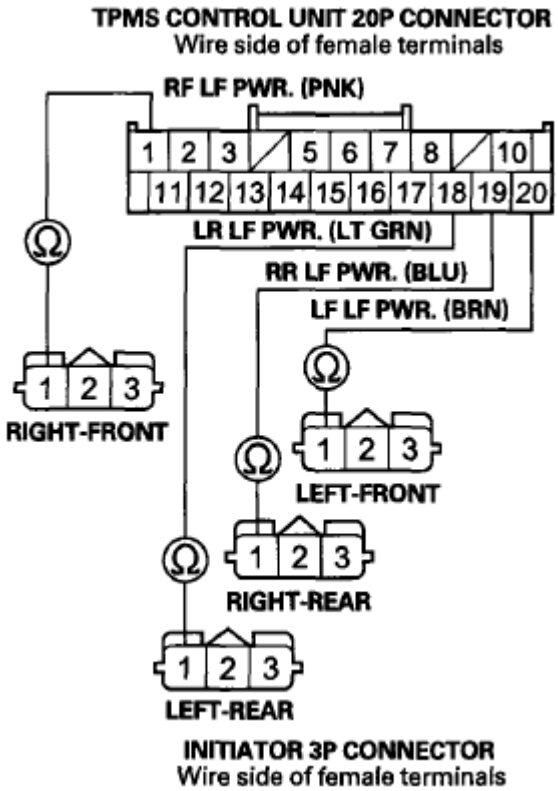

Fig. 25: Checking Continuity Between TPMS Control Unit 20P Connector Terminal And Initiator 3P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 20.

NO - Repair an open in the wire between the TPMS control unit and the appropriate initiator.

20. Check for continuity between the appropriate TPMS control unit 20P connector terminal and appropriate initiator 3P connector terminal No. 3.

DTC	TPMS Control Unit 20P Connector Terminal	Initiator Location
51	No. 15	Right-front
53	No. 14	Left-front
55	No. 13	Right-rear
57	No. 12	Left-rear

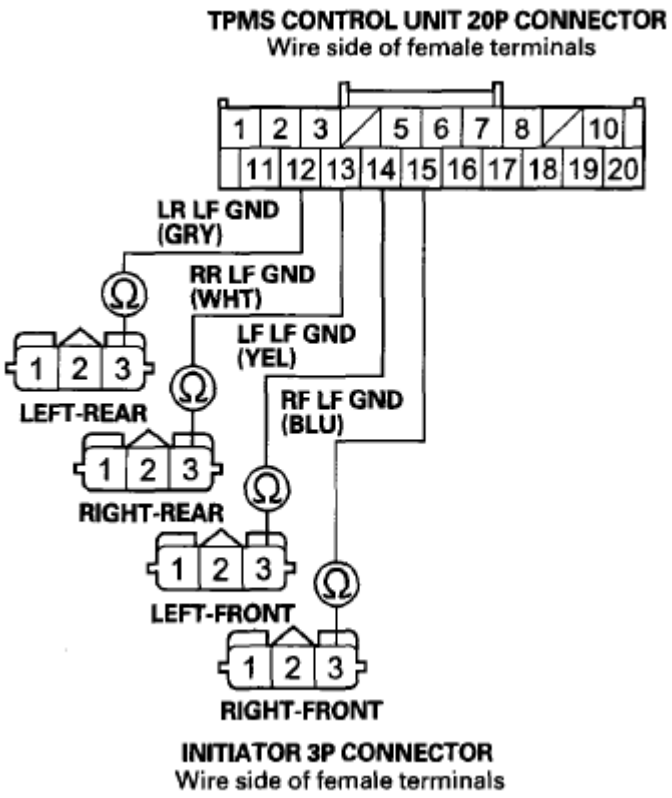

Fig. 26: Checking Continuity Between TPMS Control Unit 20P Connector Terminal And Initiator 3P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 21.

NO - Repair an open in the wire between the TPMS control unit and the appropriate initiator.

21. Check for continuity between the appropriate TPMS control unit 20P connector terminal and appropriate initiator 3P connector terminal No. 2.

DTC	TPMS Control Unit 20P Connector Terminal	Initiator Location

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 22.

NO - Repair an open in the wire between the TPMS control unit and the appropriate initiator.

22. Check for continuity between body ground and the appropriate TPMS control unit 20P connector terminal.

DTC	TPMS Control Unit 20P Connector Terminal
51	No. 6
53	No. 5
55	No. 17
57	No. 16

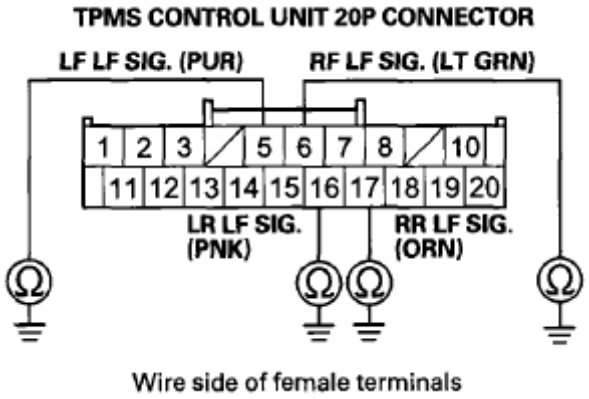

Fig. 28: Checking Continuity Between Body Ground And TPMS Control Unit 20P Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the TPMS control unit and the appropriate initiator.

NO - Go to step 23.

23. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
24. Measure the voltage between body ground and the appropriate TPMS control unit 20P connector terminal.

DTC	TPMS Control Unit 20P Connector Terminal
51	No. 6
53	No. 5
55	No. 17
57	No. 16

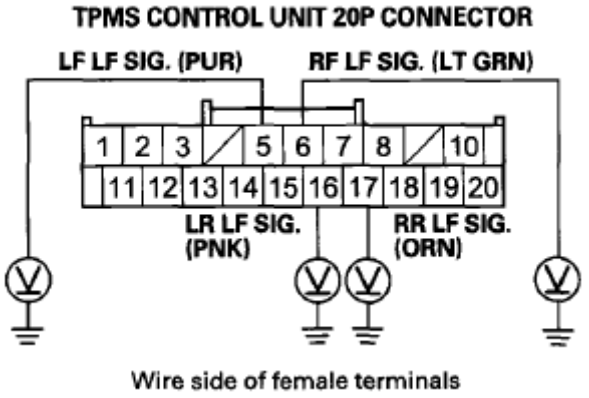

Fig. 29: Measuring Voltage Between Body Ground And TPMS Control Unit 20P Connector

Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair a short to power in the wire between the TPMS control unit and the appropriate initiator.

NO - Replace the TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**).

DTC 61, 63, 65, 67: INITIATOR CIRCUIT OPEN DETECTION

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
4. Check for DTCs with the HDS, and note the indicated DTC(s).

   Is DTC 61, 63, 65, and/or 67 indicated?

   YES - Go to step 5.

   NO - The system is OK at this time.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the appropriate initiator 3P connector.

DTC	Initiator Location
61	Right-front
63	Left-front
65	Right-rear
67	Left-rear

7. Disconnect the TPMS control unit 20P connector.
8. Check for continuity between the appropriate TPMS control unit 20P connector terminal and appropriate initiator 3P connector terminal No. 1.

DTC	TPMS Control Unit 20P Connector Terminal	Initiator Location
61	No. 1	Right-front
63	No. 20	Left-front
65	No. 19	Right-rear
67	No. 18	Left-rear

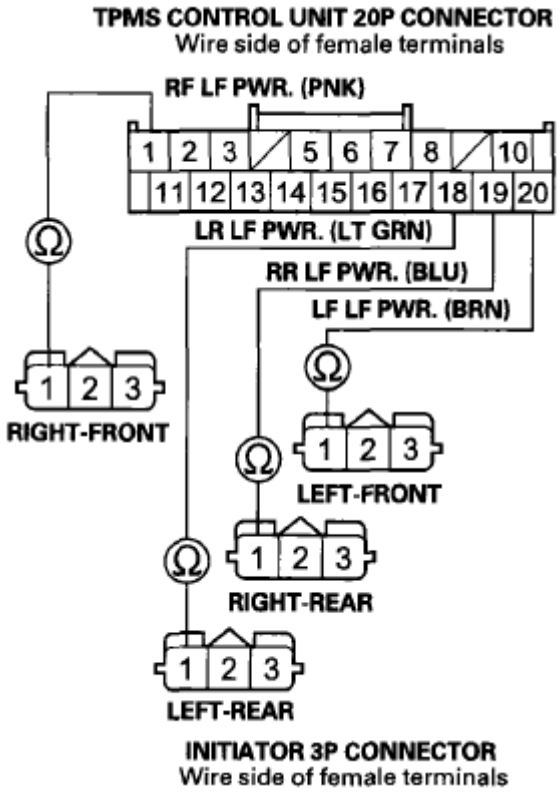

Fig. 30: Checking Continuity Between TPMS Control Unit 20P Connector Terminal And Initiator 3P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 9.

NO - Repair an open in the wire between the TPMS control unit and the appropriate initiator.

9. Check for continuity between the appropriate TPMS control unit 20P connector terminal and appropriate initiator 3P connector terminal No. 3.

DTC	TPMS Control Unit 20P Connector Terminal	Initiator Location
61	No. 15	Right-front
63	No. 14	Left-front
65	No. 13	Right-rear
67	No. 12	Left-rear

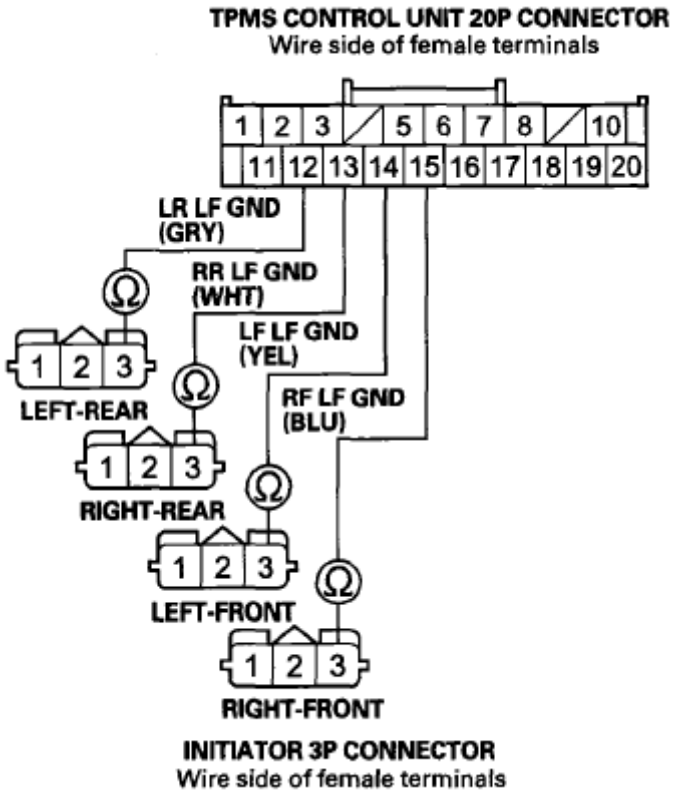

Fig. 31: Checking Continuity Between TPMS Control Unit 20P And Initiator 3P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 10.

NO - Repair an open in the wire between the TPMS control unit and the appropriate initiator.

10. Check for continuity between the appropriate TPMS control unit 20P connector terminal and appropriate initiator 3P connector terminal No. 2.

DTC	TPMS Control Unit 20P Connector Terminal	Initiator Location
61	No. 6	Right-front
63	No. 5	Left-front
65	No. 17	Right-rear
67	No. 16	Left-rear

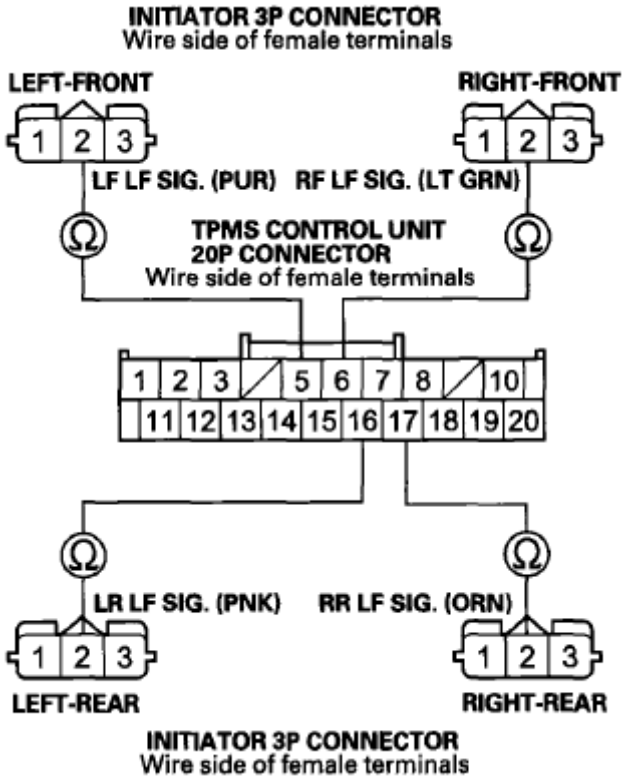

Fig. 32: Checking Continuity Between TPMS Control Unit 20P And Initiator 3P Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 11.

NO - Repair an open in the wire between the TPMS control unit and the appropriate initiator.

11. Check for noted DTC(s) in step 4.

    Were DTC 61, 63, 65, and 67 indicated at the same time?

    YES - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

    NO - Go to step 12.

12. Swap a known-good initiator with the initiator indicated by the DTC (see **INITIATOR REPLACEMENT**).

DTC	Initiator Location
61	Right-front

63	Left-front
65	Right-rear
67	Left-rear

13. Reconnect all connectors.
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Clear the DTC with the HDS.
16. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
17. Check for DTCs with the HDS, and compare the indicated DTC with the noted DTC(s) in step 4.

DTC	Initiator Location
61	Right-front
63	Left-front
65	Right-rear
67	Left-rear

Does the indicated DTC change between the initiators that were replaced in step 12?

YES - Replace the appropriate initiator (see **INITIATOR REPLACEMENT**).

NO - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

DTC 81: TPMS CONTROL UNIT FAILURE

NOTE: Low battery voltage can cause this DTC. Make sure the battery is fully charged and in good condition (see BATTERY TEST).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
4. Check for DTCs with the HDS.

Is DTC 81 indicated?

YES - Replace the TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**).

NO - The system is OK at this time. Check for loose terminals and poor connections at the TPMS control unit and G403.

DTC 83: NO VSP SIGNAL

NOTE: Check for fuel and emissions systems DTCs with the HDS, and troubleshoot the ECM/PCM and F-CAN communication errors first (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Test-drive the vehicle.
4. Check for DTCs with the HDS.

   Is DTC 83 indicated?

   YES - Go to step 5.

   NO - The system is OK at this time.

5. Check for DTCs with the HDS.

   Is DTC 85 indicated?

   YES - Go to **DTC 85 TROUBLESHOOTING**.

   NO - Go to step 6.

6. Test-drive the vehicle.
7. Check the VEHICLE SPEED in the TPMS DATA LIST with the HDS.

   Is the vehicle's speed indicated?

   YES - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

   NO - Go to step 8.

8. Check the speedometer.

   Does the speedometer register speed?

   YES - Replace the TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**).

   NO - Update the ECM/PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM/PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 1 and recheck. If the ECM/PCM was updated and DTCs are not indicated, troubleshooting is complete. If the ECM/PCM was substituted and DTCs and not indicated, replace the original ECM/PCM (see **ECM/PCM REPLACEMENT**).

DTC 85: F-CAN COMMUNICATION FAILURE

NOTE: Check for fuel and emissions systems DTCs with the HDS, and troubleshoot the ECM/PCM and F-CAN communication errors first (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
4. Wait about 5 seconds.
5. Check for DTCs with the HDS.

   Is DTC 85 indicated?

   YES - Go to step 6.

   NO - The system is OK at this time.

6. Test-drive the vehicle.

   Does the speedometer work?

   YES - Go to step 10.

   NO - Go to step 7.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Disconnect the TPMS control unit 20P connector.
9. Test-drive the vehicle.

   Does the speedometer work?

   YES - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

   NO - Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and reconnect all connectors, then check and troubleshoot the fuel and emissions systems (see **GENERAL TROUBLESHOOTING INFORMATION**).

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Short the SCS line with the HDS.
12. Disconnect ECM/PCM connector A (49P).
13. Disconnect the TPMS control unit 20P connector.
14. Check for continuity between the TPMS control unit 20P connector terminals and the ECM/PCM connector A (49P) terminals according to the table.

Terminal Name	TPMS Control Unit 20P Connector Terminal	ECM/PCM Connector A (49P) Terminal
F-CAN L	No. 11	No. 49
F-CAN H	No. 2	No. 48

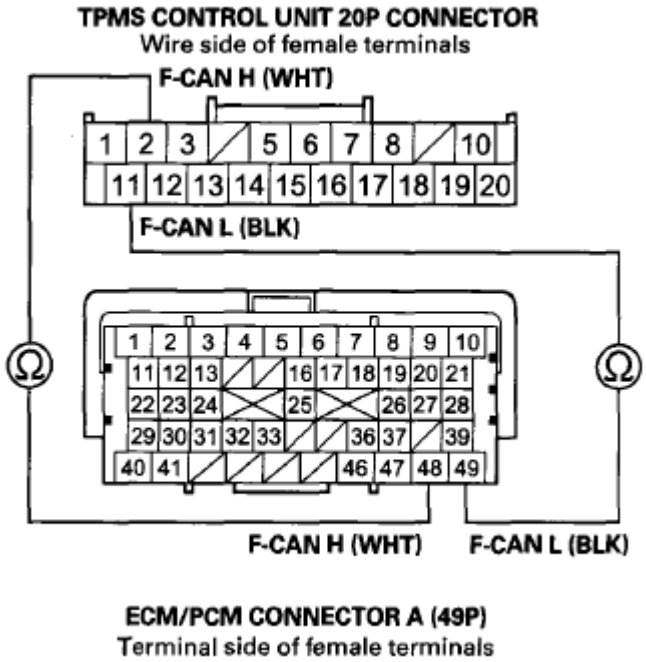

Fig. 33: Checking Continuity Between TPMS Control Unit 20P And ECM/PCM Connector A (49P) Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose terminals and poor connections at the TPMS control unit and G403. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

NO - Repair an open in the appropriate wire between the TPMS control unit and the ECM/PCM.

DTC 91, 93, 95, 97: TIRE PRESSURE SENSOR INTERNAL ERROR

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Turn the ignition switch to LOCK (0) and then back to ON (II), or press the engine start/stop button to select the OFF mode and then the ON mode.
4. Wait about 1 minute.
5. Check for DTCs with the HDS.

NOTE: The tire pressure sensor of the appropriate wheel is shown.

DTC	Tire Location
91	Right-front
93	Left-front
95	Right-rear
97	Left-rear

Is DTC 91, 93, 95, or 97 indicated?

YES - Replace the appropriate tire pressure sensor (see **TIRE PRESSURE SENSOR REPLACEMENT**).

NO - The system is OK at this time.

SYMPTOM TROUBLESHOOTING

LOW TIRE PRESSURE INDICATOR DOES NOT COME ON, AND NO DTCS ARE STORED

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the low pressure indicator for several seconds when the ignition switch is turned ON (II), or the engine start/stop button is pressed to select the ON mode.

   Did the indicator come on, and then go off?

   YES - Go to step 3.

   NO - Do the troubleshooting for the gauge control module (see **SELF-DIAGNOSTIC FUNCTION**). If necessary, substitute a known-good gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and recheck.

3. Lower the pressure in each tire until the low tire pressure indicator comes on (see table).

NOTE:

- **If 5 minutes has passed since the ignition switch has been turned ON (II), or the engine start/stop button has been pressed to select the ON mode, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and wait 2 minutes, then turn it back ON (II), or select the ON mode.**
- **Reinflate the tire before continuing to the next tire.**
- **After noting whether the low tire pressure indicator came on, make sure it goes off when you reinflate the tire before proceeding to the next tire.**

Model	Qualification	Specified Tire Pressure Lower Limit

17 inch or 18 inch wheels	Front and rear	175 kPa (1.8 kgf/cm^2 , 25 psi)
19 inch wheels	Front and rear	186 kPa (1.9 kgf/cm^2 , 27 psi)

Does the indicator come on when the pressure drops below the specified tire pressure lower limit?

YES - The system is OK at this time.

NO - Go to step 4.

4. Check the TIRE PRESSURE in the TPMS DATA LIST with the HDS, and compare it with the actual measured tire pressure.

NOTE: If UNDEFINED is shown on the sensor transmitter status, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, rotate the tire 1/4 turn, then turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and try again. If UNDEFINED is still displayed, repeat this procedure until NORMAL is shown.

Is the indicated tire pressure on the HDS within 40 kPa (0.4 kgf/cm^2 , 6 psi) of the actual tire pressure?

YES - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

NO - Replace the appropriate tire pressure sensor (see **TIRE PRESSURE SENSOR REPLACEMENT**).

LOW TIRE PRESSURE INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED

NOTE: If the low tire pressure indicator is turned on at the same time as the TPMS indicator, go to the following TPMS symptom troubleshooting first: TPMS indicator does not go off, and no DTCs are stored (see TPMS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the low tire pressure indicator for several seconds when the ignition switch is turned ON (II), or the engine start/stop button is pressed to select the ON mode.

Did the indicator come on, and then blink for about 75 seconds?

YES - Check for gauge DTCs with the HDS (see **WIRE COLOR CODES**) and go to the indicated gauge **DTC'S TROUBLESHOOTING**.

NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the TPMS control unit 20P connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check the low tire pressure indicator for several seconds when the ignition switch is turned ON (II), or the engine start/stop button is pressed to select the ON mode.

   Did the indicator come on, and then blink for about 75 seconds?

   YES - Replace the TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**).

   NO - Do the troubleshooting for the gauge control module (see **SELF-DIAGNOSTIC FUNCTION**). If necessary, substitute a known-good gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and recheck.

TPMS INDICATOR DOES NOT COME ON, AND NO DTCS ARE STORED

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Disconnect the TPMS control unit 20P connector.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
4. Check the TPMS indicator when the ignition switch is turned ON (II), or the engine start/stop button is pressed to select the ON mode.

   Did the indicator come on?

   YES - Check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **TPMS CONTROL UNIT REPLACEMENT**), and recheck.

   NO - Do the troubleshooting for the gauge control module (see **SELF-DIAGNOSTIC FUNCTION**). If necessary, substitute a known-good gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**), and recheck.

TPMS INDICATOR DOES NOT GO OFF, AND NO DTCS ARE STORED

NOTE: If the TPMS control unit was replaced, the TPMS indicator will be on until all four tire pressure sensor ID codes are learned.

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Check the No. 29 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse blown?

   YES - Replace the fuse. Turn the ignition switch to ON (II) and then back to LOCK (0), or press the engine start/stop button to select the ON mode and then the OFF mode. If the fuse blows again, repair the short to ground on the No. 29 (7.5 A) fuse circuit.

NO - Reinstall the checked fuse, then go to step 3.

3. Check the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse blown?

   YES - Replace the fuse. Turn the ignition switch to ON (II) and then back to LOCK (0), or press the engine start/stop button to select the ON mode and then the OFF mode. If the fuse blows again, repair the short to ground on the No. 12 (7.5 A) fuse circuit.

   NO - Reinstall the checked fuse, then go to step 4.

4. Do the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**).

   Is the gauge control module OK?

   YES - Go to step 5.

   NO - Replace the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).

5. Disconnect the TPMS control unit 20P connector.
6. Measure the voltage between body ground and TPMS control unit 20P connector terminal No. 10.

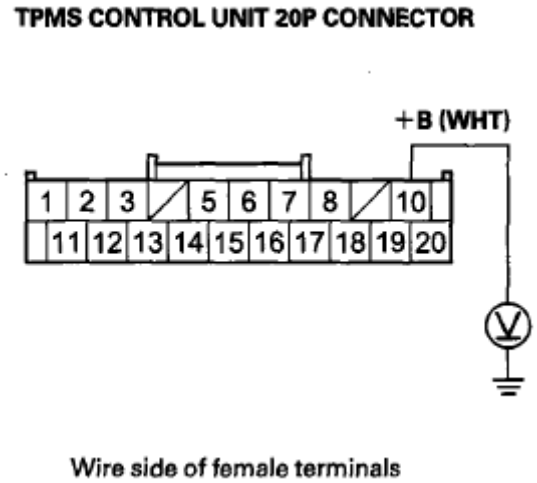

Fig. 34: Measuring Voltage Between Body Ground And TPMS Control Unit 20P Connector Terminal No. 10
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 7.

NO - Repair an open in the wire between the TPMS control unit and the No. 29 (7.5 A) fuse in the driver's under-dash fuse/relay box.

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between body ground and TPMS control unit 20P connector terminal No. 8.

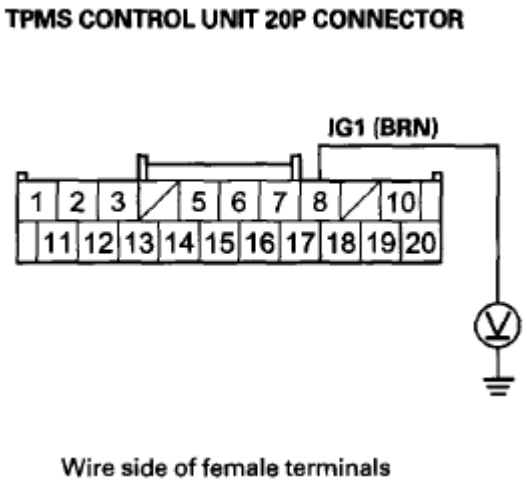

Fig. 35: Measuring Voltage Between Body Ground And TPMS Control Unit 20P Connector Terminal No. 8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair an open in the wire between the TPMS control unit and the No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box.

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Reconnect the TPMS control unit 20P connector.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Measure the voltage between body ground and TPMS control unit 20P connector terminal No. 3.

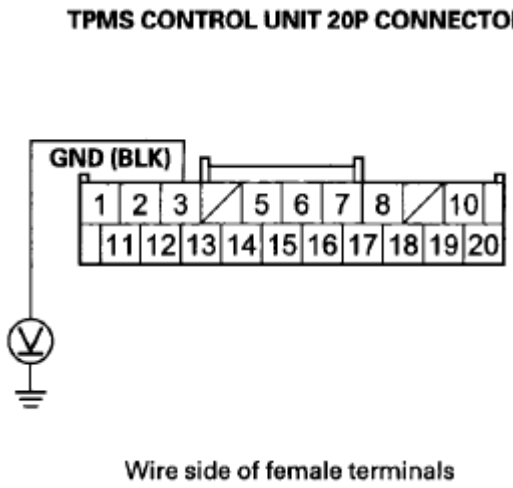

Fig. 36: Measuring Voltage Between Body Ground And TPMS Control Unit 20P Connector Terminal No. 3
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 0.1 V or more?

YES - Repair an open or high resistance in the wire between the TPMS control unit and body ground (G403).

NO - Go to step 13.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect gauge control module 32P connector.
15. Disconnect the TPMS control unit 20P connector.
16. Check for continuity between the TPMS control unit 20P connector terminals and the gauge control module 32P connector terminals according to the table.

Terminal Name	TPMS Control Unit 20P Connector Terminal	Gauge Control Module 32P Connector
F-CAN L	No. 11	No. 13
F-CAN H	No. 2	No. 14

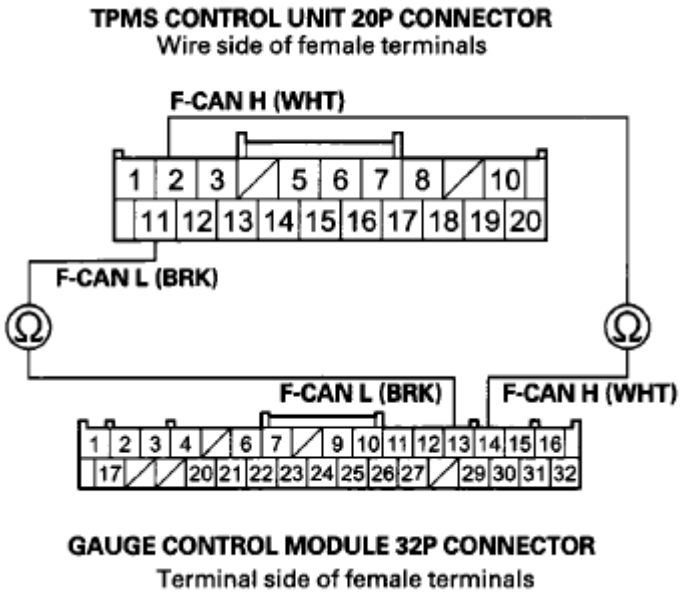

Fig. 37: Checking Continuity Between TPMS Control Unit 20P And Gauge Control Module 32P Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Do the troubleshooting for the gauge control module (see **SELF-DIAGNOSTIC FUNCTION**). If the gauge control module is OK, check for loose terminals and poor connections at the TPMS control unit. If necessary, substitute a known-good TPMS control unit (see **GAUGE CONTROL MODULE REPLACEMENT**), and recheck.

NO - Repair an open in the wire between the TPMS control unit and the gauge control module.

TPMS CONTROL UNIT REPLACEMENT

NOTE: Make sure the TPMS control unit mounting bracket is not bent or twisted as this may affect its communication with the initiators and the tire pressure sensors.

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
3. Disconnect the TPMS control unit connector (A).

NOTE: The TPMS control unit is located on the brake pedal support member (B).

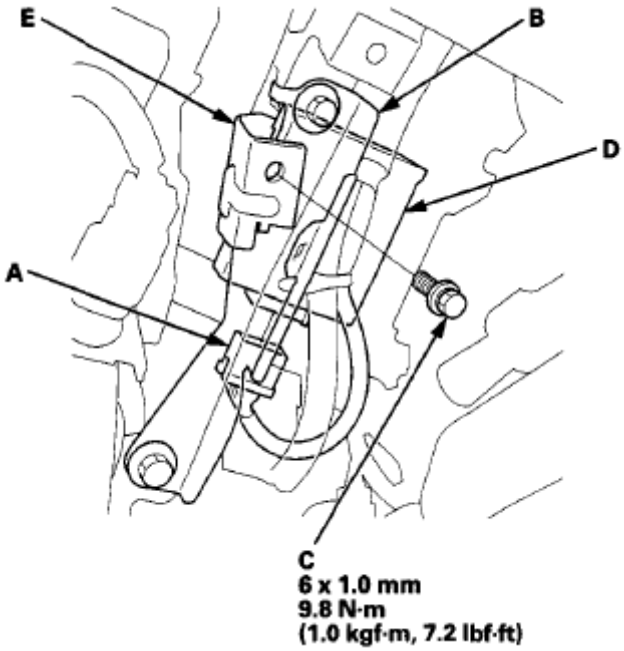

Fig. 38: Identifying TPMS Control Unit, Connector, Brake Pedal Support Member, Flange Bolt And Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the flange bolt (C) from the brake pedal support member.
5. Remove the TPMS control unit (D) with the bracket (E).
6. Remove the TPMS control unit (A) from the bracket (B).

NOTE: To disconnect the TPMS control unit from its bracket, insert a small flat-tipped screwdriver (C) between the TPMS control unit and the bracket shown in (D) to release the hook, then slide out the TPMS control unit.

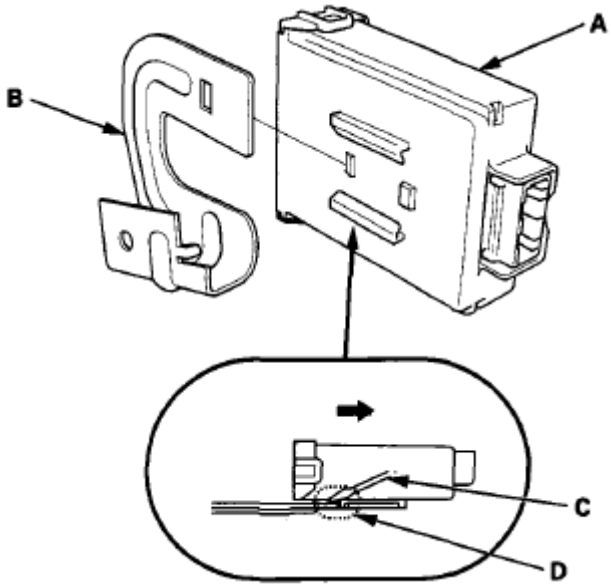

Fig. 39: Removing TPMS Control Unit With Bracket Using Small Flat-Tipped Screwdriver
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the TPMS control unit in the reverse order of removal.

NOTE: Make sure the TPMS control unit is properly installed. You will hear a click when the TPMS control unit is securely mounted on the bracket.

8. Connect the HDS, and memorize the tire pressure sensor IDs (see **MEMORIZING THE TIRE PRESSURE SENSOR ID**). Do not memorize the IDs automatically.

INITIATOR REPLACEMENT

NOTE: Make sure the initiator mounting bracket is not bent or twisted as this may affect its communication with the TPMS control unit and the tire pressure sensor.

FRONT

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
3. Remove the front wheel.
4. Remove the front inner fender (see **FRONT INNER FENDER REPLACEMENT**).
5. Disconnect the initiator connector (A).

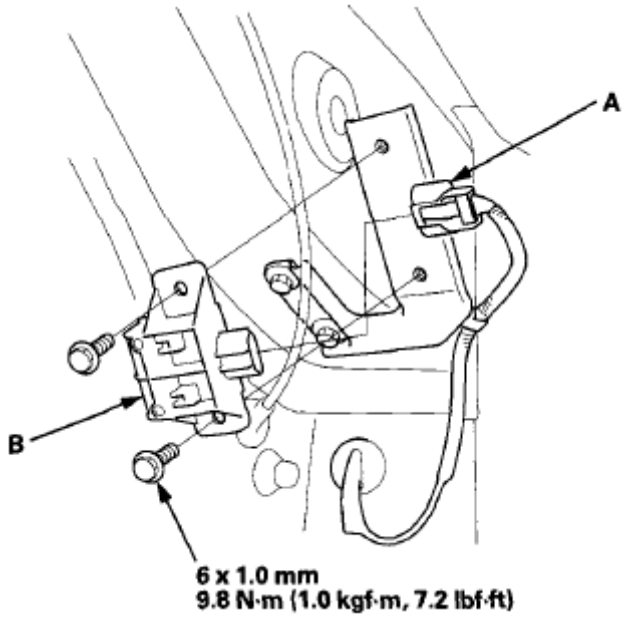

Fig. 40: Identifying Initiator Connector And Initiator From Bracket With Torque Specifications (Front)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the initiator (B) from the bracket.
7. Install the initiator in the reverse order of removal.

REAR

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
3. Remove the rear wheel.
4. Remove the rear inner fender cover (see **REAR INNER FENDER REPLACEMENT**).
5. Disconnect the initiator connector (A).

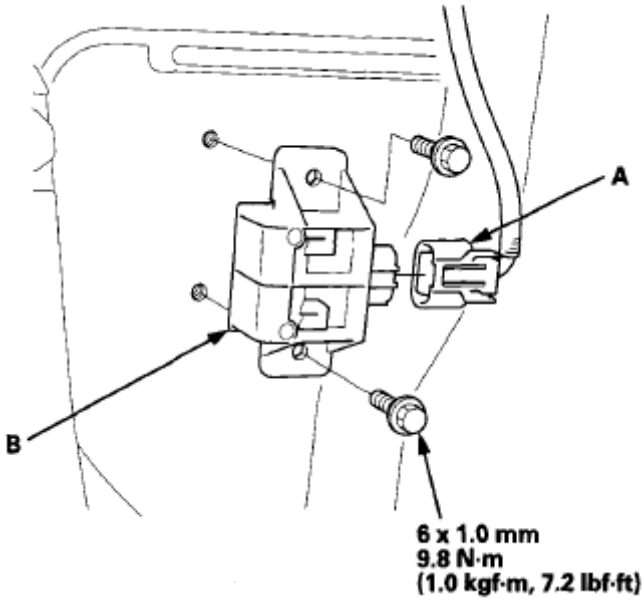

Fig. 41: Identifying Initiator Connector And Initiator From Bracket With Torque Specifications (Rear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the initiator (B) from the inner side of the wheelwell.
7. Install the initiator in the reverse order of removal.

TIRE PRESSURE SENSOR REPLACEMENT

REMOVAL

NOTE: Each tire pressure sensor contains a lithium anode battery that is not removable. The complete tire pressure sensor should be disposed of according to local battery disposal guidelines or requirements. An improperly disposed of battery can be harmful to the environment.

1. Raise and support the vehicle (see **LIFT AND SUPPORT POINTS**).
2. Remove the wheel with the faulty tire pressure sensor.
3. Remove the tire valve stem cap and the valve stem core to deflate the tire.
4. Remove any balance weights, and then break the bead loose from the wheel with a commercially available tire changer (A).

NOTE: Note these items to avoid damaging the tire pressure sensor:

- **Do the outside of the wheel first.**
- **Position the wheel as shown so the valve stem (B) is 90 degrees from the bead breaker (C) as shown.**

- **Do not position the bead breaker of the tire changer too close to the rim.**

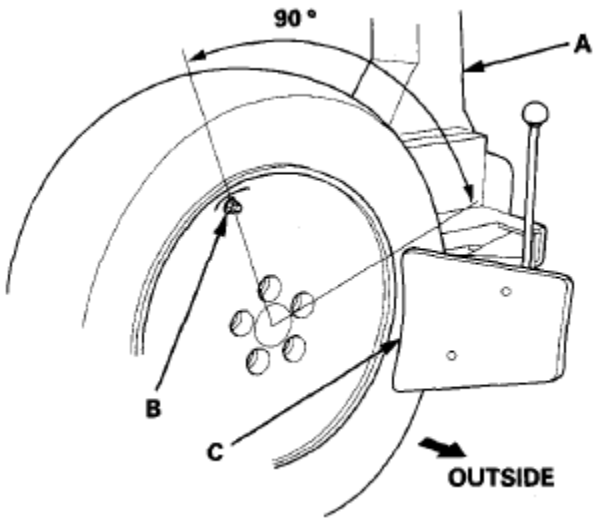

Fig. 42: Identifying Tire Changer, Valve Stem And Bead Breaker
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Position the wheel so that the tire machine (A) and the tire iron (B) are next to the valve stem (C), and will move away from it when the machine starts. Then remove the tire from the wheel.

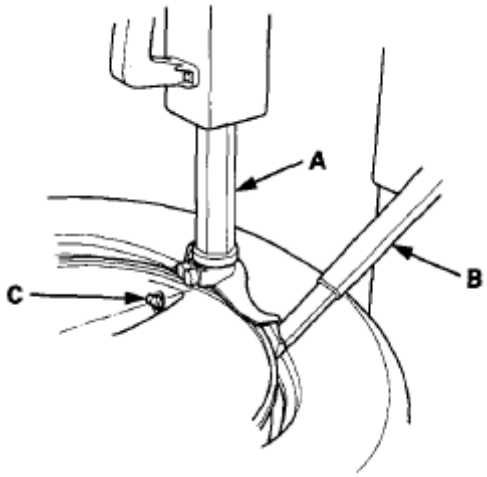

Fig. 43: Identifying Tire Machine, Tire Iron And Valve Stem
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the valve stem nut (A) and the washer (B), then remove the tire pressure sensor with the valve stem (C) from the wheel.

NOTE: Check the nut and the washer, if they have deterioration or damage, replace them with new ones during reassembly.

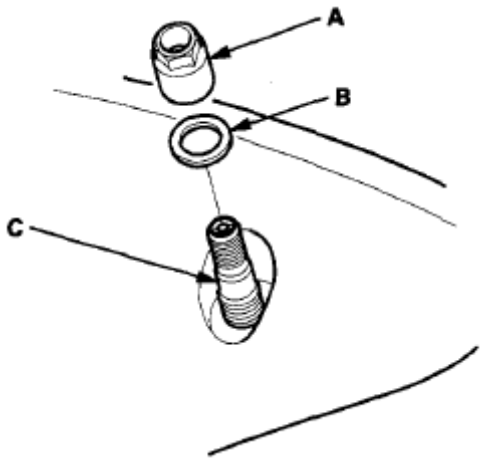

Fig. 44: Identifying Valve Stem, Washer And Valve Stem Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove and replace the valve stem grommet (A) from the tire pressure sensor (B).

NOTE:

- **The valve stem grommet might stay in the wheel; make sure you remove it.**
- **Always use a new valve stem grommet whenever the tire pressure sensor has been removed from the wheel, or when replacing the tire.**

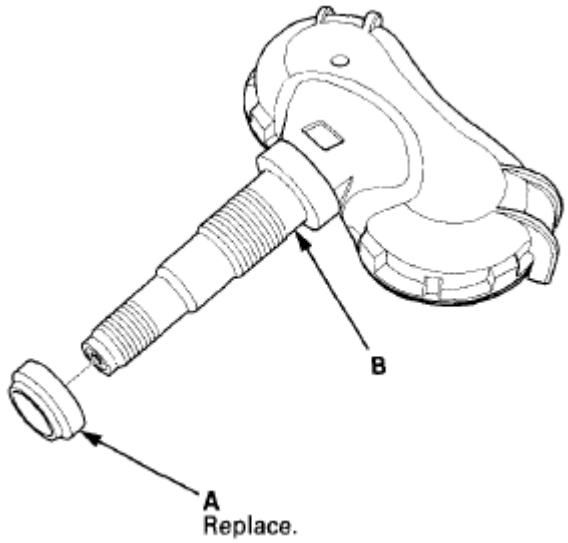

Fig. 45: Identifying Valve Stem Grommet And Tire Pressure Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INSTALLATION

NOTE:

- **Use only wheels that have a "TPMS" mark (A) on them.**

- **The vehicle may be equipped with one of the these types of wheels.**

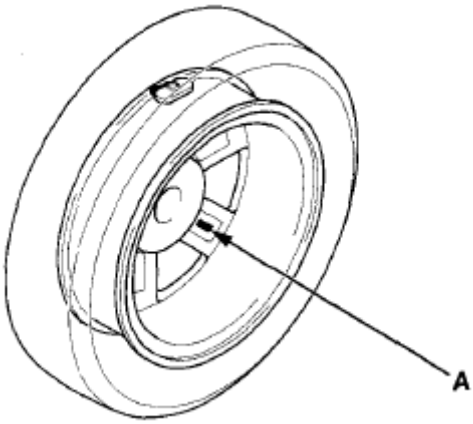

Fig. 46: Identifying TPMS Mark On Wheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

1. Before installing the tire pressure sensor, clean the mating surfaces on the sensor and the wheel.
2. Install the tire pressure sensor (A) and the washer (B) to the wheel (C), and tighten the valve stem nut (D) finger tight. Make sure the pressure sensor is resting on the wheel.

NOTE: Install the tire pressure sensor so that the sensor housing surface (E) should not exceed the protrusion (F) of the wheel to prevent the sensor housing from being caught on the bead of the tire when assembling the tire. Be sure to always mount the tire pressure sensor with the feet (G) in the downward position toward the wheel.

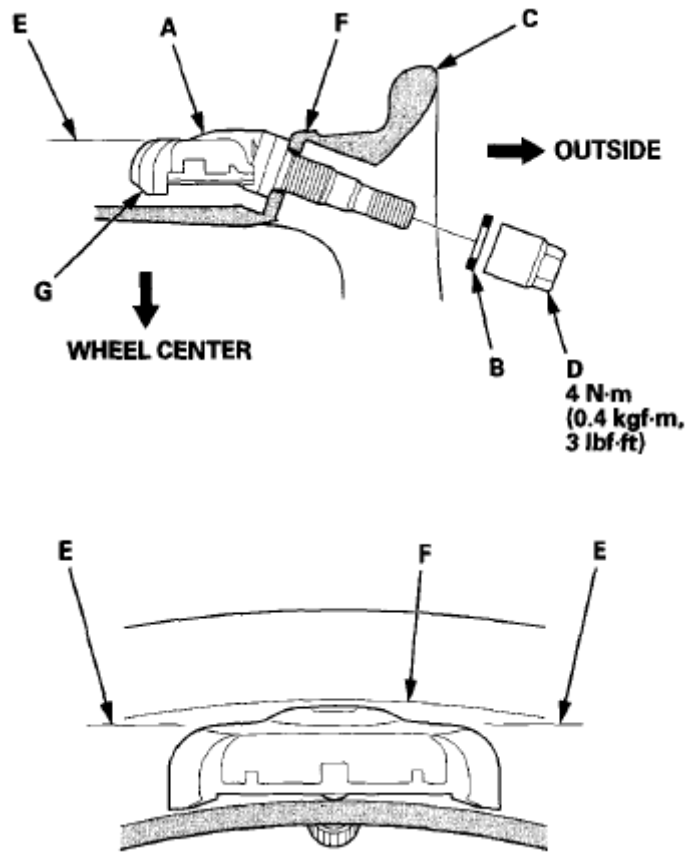

Fig. 47: Installing Tire Pressure Sensor And Washer To Wheel With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Tighten the valve stem nut to the specified torque while holding the tire pressure sensor.

NOTE:

- **Do not use air or electric impact tools to tighten a valve stem nut.**
- **Do not twist the tire pressure sensor to adjust its position with the wheel, as this will damage or deform the valve stem grommet.**

4. Lube the tire bead sparingly, with a paste-type tire mounting lubricant, and position the wheel so that the tire machine (A) is next to the valve stem (B) and will move away from it when the machine starts. Then install the tire onto the wheel.

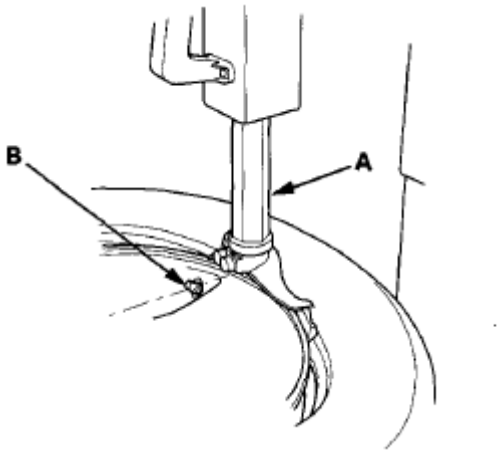

Fig. 48: Positioning Wheel So That Tire Machine Is Next To Valve Stem
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. With a dry air source, inflate the tire to 300 kPa (3.1 kgf/cm^2 , 44 psi) to seat the tire bead to the rim, then adjust the tire pressure (see **WHEEL ALIGNMENT**), then install the valve stem cap.

NOTE: Make sure the tire bead is seated on both sides of the rim evenly.

6. Check and adjust the wheel balance, then install the wheels on the vehicle.
7. Lower the vehicle. Torque the wheel nuts to specifications (see **KNUCKLE/HUB/WHEEL BEARING REPLACEMENT**).
8. Connect the HDS, and memorize the tire pressure sensor IDs (see **MEMORIZING THE TIRE PRESSURE SENSOR ID**).

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If brakes maintenance is required)

The Acura TL SRS includes a driver's airbag in the steering wheel hub, a front passenger's airbag in the dashboard above the glove box, front seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in this Service Information. Servicing, disassembling, or replacing SRS items requires special precautions and tools, and should be done by an authorized Acura dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work should be done by an authorized Acura dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the front airbags, side airbags, side curtain airbags, and/or front seat belt tensioners.
- Do not bump or impact the SRS unit, front impact sensors, side impact sensors, or rear safing sensor, especially when the ignition switch is in ON (II), or the engine start/stop button is in the ON mode, for at least 3 minutes after the ignition switch is turned to LOCK (0), or after the engine start/stop button is pressed to select the OFF mode; otherwise, the system may fail in a collision, or the airbags or the tensioners may deploy.

- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, center console, dashboard, dashboard undercover, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.

2012 TRANSMISSION

Automatic Transmission - TL

GENERAL TROUBLESHOOTING INFORMATION

HOW TO CHECK FOR DTCS WITH THE HONDA DIAGNOSTIC SYSTEM (HDS)

When the powertrain control module (PCM) senses an abnormality in the input or output system, the D indicator (A) in the gauge control module (B) will usually blink.

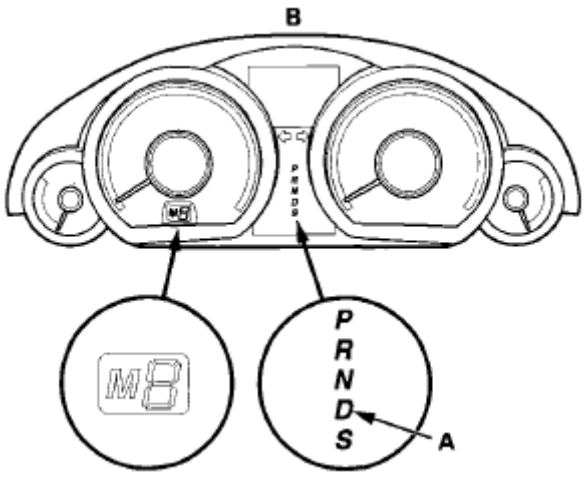

Fig. 3: Identifying D Indicator And Gauge Control Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the Honda Diagnostic System (HDS) is connected to the data link connector (DLC) (A) located under the driver's side of the dashboard, and when the ignition switch is turned to ON (II), or the engine start/stop button is pressed to select the ON mode and the appropriate menu is selected, it will indicate the diagnostic trouble code (DTC).

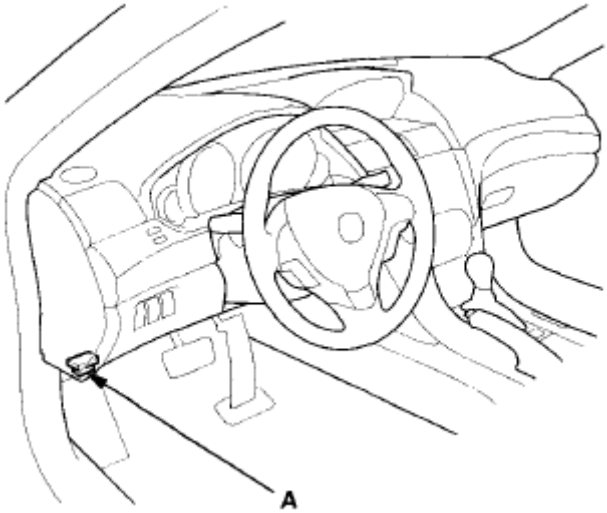

Fig. 4: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the D indicator or the malfunction indicator lamp (MIL) has been reported on, or if a driveability problem is suspected, follow this procedure:

1. Connect the HDS to the DLC. (See the HDS user's manual for specific instructions.)
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Check for Pending or Confirmed DTCs with the HDS.
4. Record the freeze data and the on-board snapshots for all fuel and emissions DTCs and A/T DTCs.
5. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC.
6. Clear the DTC and the data.
7. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data, and then recheck for a DTC. If the A/T DTC returns, go to the indicated **DTC'S TROUBLESHOOTING**. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

SYMPTOM TROUBLESHOOTING VERSUS DTC TROUBLESHOOTING

Some symptoms will not set DTCs or cause the D indicator to blink. If the MIL was reported ON or the D indicator has been blinking, check for DTCs. If the vehicle has an abnormal symptom, and there are no DTCs stored, do the symptom troubleshooting. Check the list of probable cause(s) for the symptom, in the sequence listed, until you find the problem.

HOW TO CHECK FOR DTCS WITH THE SCS MODE (RETRIEVING THE FLASH CODES)

NOTE: The preferred method is to use the HDS to retrieve the DTCs.

When the PCM senses an abnormality in the input or output system, the D indicator (A) in the gauge control module (B) will usually blink.

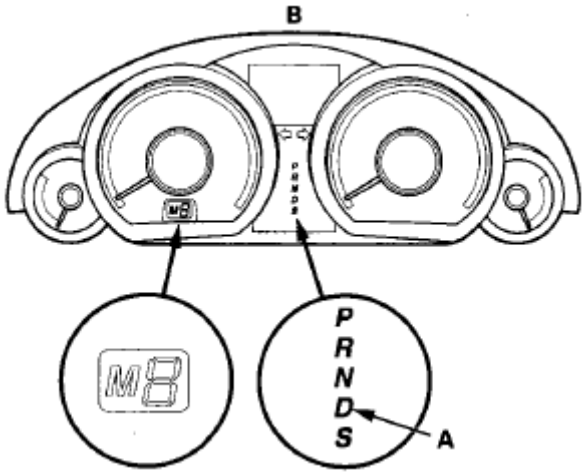

Fig. 5: Identifying D Indicator And Gauge Control Module
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the D indicator has been reported on, connect the HDS to the DLC (A) located under the driver's side of the dashboard. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, select SCS mode, then the D indicator will indicate (blink) the DTC.

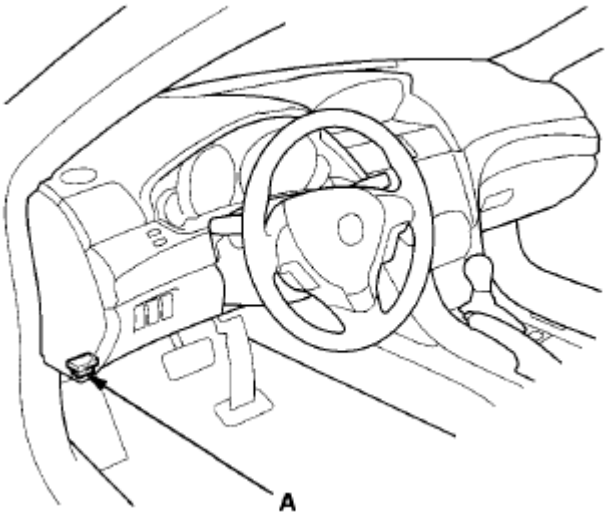

Fig. 6: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

If the D indicator and the MIL come on at the same time, or if a driveability problem is suspected, follow this procedure:

1. Connect the HDS to the DLC. (See the HDS user's manual for specific instructions.)
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select SCS mode, then observe the D indicator in the gauge control module. Codes 1 through 9 are indicated by individual short blinks. Code 10 and above are indicated by a series of long and short blinks. One long blink equals 10 short blinks. Add the long and short blinks together to determine the code.

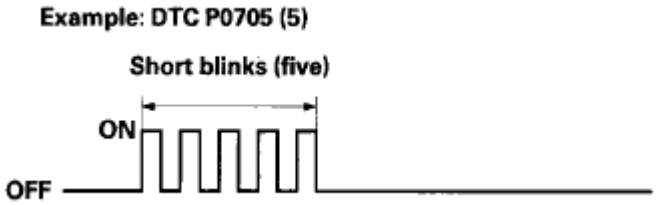

Fig. 7: Display - DTC P0705 (5) Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

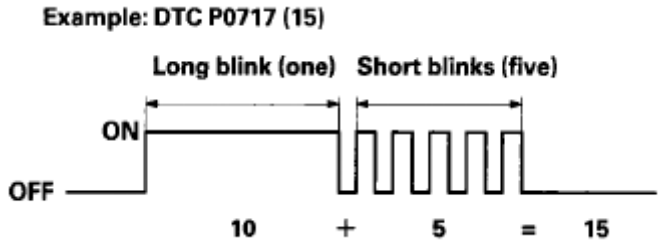

Fig. 8: Display - DTC P0717 (15) Graph
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Record all fuel and emissions DTCs and A/T DTCs.
5. If there is a fuel and emissions DTC, first check the fuel and emissions system as indicated by the DTC.
6. Clear the DTC and the data.
7. If the freeze data is available, drive the vehicle for several minutes with periods of wide open throttle, steady cruise, and stop and go, and then recheck for DTCs. If the A/T DTC returns, go to the indicated **DTC'S TROUBLESHOOTING**. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

HOW TO TROUBLESHOOT CIRCUITS AT THE PCM CONNECTORS

NOTE: The PCM overwrites data and monitors the EVAP system for about 40 minutes after the ignition switch is turned to LOCK (0), or the engine start/stop button is pressed to select the OFF mode. Jumping the SCS line after turning the ignition switch to LOCK (0), or pressing the engine start/stop button to select the OFF mode cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.

1. Jump the SCS line with the HDS.
2. Canada model: If equipped, remove the PCM connector guard (A).

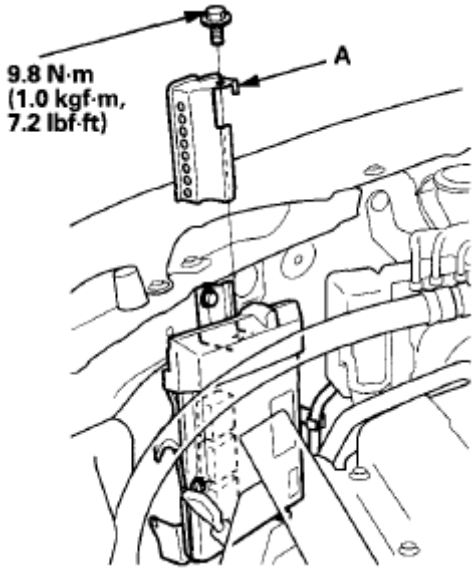

Fig. 9: Identifying PCM Connector Guard With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect PCM connectors A, B, and C.

NOTE: PCM connectors A, B, and C have symbols (A=[], B=delta, C=o) embossed on them for identification.

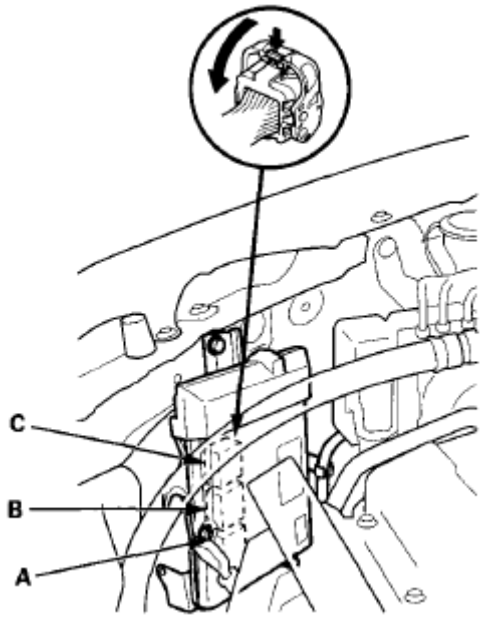

Fig. 10: Identifying PCM Connector A, B And C
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. When diagnosis/troubleshooting is done at the PCM connector, use the terminal test port (A) above the

terminal you need to check.

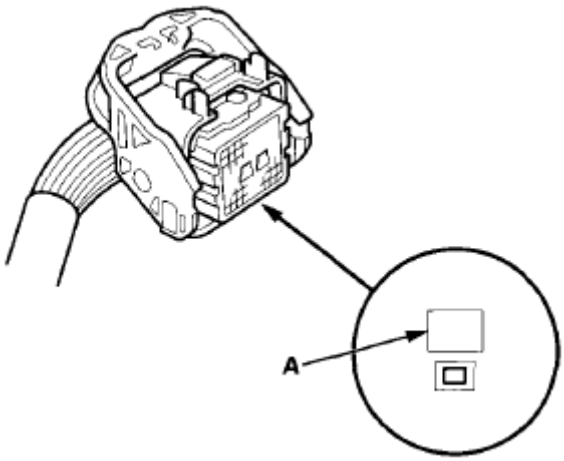

Fig. 11: Identifying Terminal Test Port Of PCM Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect one side of the patch cord's terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminals (C) to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (D).

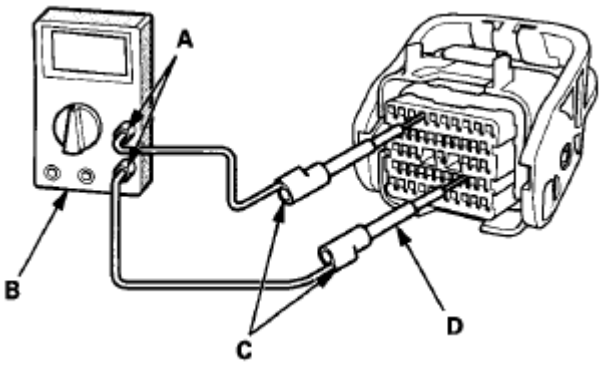

Fig. 12: Identifying Patch Cord's Terminals, Digital Multimeter And Banana Jack
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Gently insert the pin probe (male) into the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- **For accurate results, always use the pin probe (male).**
- **To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes. Damaged terminals cause a poor connection and an incorrect measurement.**
- **Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.**

CLEAR A/T DTCS PROCEDURE

1. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

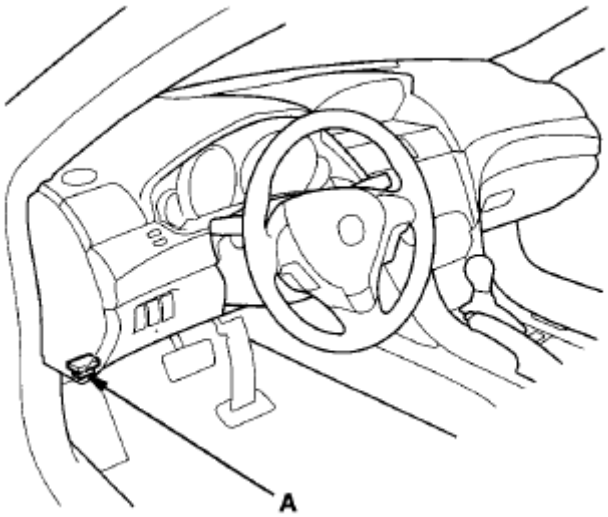

Fig. 13: Identifying Data Link Connector (DLC) Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
4. Clear the DTC(s) with the HDS.

OBD STATUS

The OBD status shows the current system status of each DTC and all of the parameters. This function is used to see if a repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on-board diagnosis is successfully completed.
- FAILED: The on-board diagnosis has finished but failed.
- NOT COMPLETED: The on-board diagnosis was running but is out of the enable conditions of the DTC.

HOW TO END A TROUBLESHOOTING SESSION (REQUIRED AFTER ANY TROUBLESHOOTING)

NOTE: Reset the PCM/TCM with the HDS while the engine is stopped.

1. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait for 30 seconds.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and

disconnect the HDS from the DLC.

4. Start the engine with the shift lever in P or N, and warm it up to normal operating temperature (the radiator fan comes on).
5. To verify that the problem is repaired, test-drive the vehicle for several minutes at speeds over 31 mph (50 km/h) or under the same conditions as those indicated by the freeze data.

PCM/TCM RESET

NOTE: To reset the PCM/TCM, initialize only the automatic transmission memory stored in the PCM or the TCM.

1. Select the A/T system with the HDS.
2. Reset the PCM/TCM with the HDS while the engine is stopped.
3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait for 30 seconds.
5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and disconnect the HDS from the DLC.

FAILURE REPRODUCTION TECHNIQUE

NOTE: Make sure to follow these points while the vehicle is raised on a lift for the test-drive.

- Disable the VSA by pressing the VSA OFF button.
- VSA DTC(s) may come on when test-driving on a lift. If the VSA DTC(s) come on, clear the DTC(s) with the HDS.
- Use the sequential sportshift mode to manually select gears.

SELF-DIAGNOSIS

If the PCM detects the failure of a signal from a sensor, a switch, a solenoid valve, or from another control unit, it stores Pending or Confirmed DTCs. Depending on the failure, a Confirmed DTC is stored in either the first or the second drive cycle. When a Confirmed DTC is stored, the PCM blinks the D indicator and/or turns on the MIL by a signal sent to the gauge control module via F-CAN.

- **One Drive Cycle Detection Method**

  When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another control unit, the PCM stores a Pending or Confirmed DTC for the failure and blinks the D indicator and/or turns on the MIL immediately.

- **Two Drive Cycle Detection Method**

  When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another

control unit in the first drive cycle, the PCM stores a Pending DTC. The D indicator and the MIL do not turn on at this time. If the failure continues in the second drive cycle, the PCM stores a Confirmed DTC and blinks the D indicator and/or turns on the MIL.

FAIL-SAFE FUNCTION

When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another control unit, the PCM ignores that signal and substitutes a pre-programmed value for that signal to allow the automatic transmission to continue operating. This causes a DTC to be stored and the D indicator blink and/or the MIL to come on. The transmission may not shift normally during fail-safe operation. Do not run the test driving diagnosis when the MIL is ON, or when the D indicator is blinking.

DTC TROUBLESHOOTING INDEX

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

DTC(1)	Two Drive Cycle Detection	D Indicator	MIL	Detection Item
P0705 (5)(2)	- -	Blinks	ON	Short in Transmission Range Switch Circuit (Multiple Shift-Position Input)
P0706 (6)(2)	o	OFF	ON	Open in Transmission Range Switch Circuit
P0711 (28)(2)	o	Blinks	OFF	Problem in ATF Temperature Sensor Circuit

P2827 (67)(2)	o	Blinks	OFF	Open in Line Pressure Solenoid Valve A Circuit

(1) The DTC in parentheses is the flash code the D indicator indicates when the data link connector (DLC) is connected to the HDS, and in the SCS mode.

(2) This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

SYMPTOM TROUBLESHOOTING INDEX

NOTE: Do an all DTC check with the HDS and troubleshoot those first before following the repair procedures listed in the index.

Symptom	Probable cause(s)	Notes
When you turn the ignition switch to ON (II), the D indicator comes on and stays on in all shift lever positions, or it never comes on at all	• F-CAN communication line error • Gauge control module defective • PCM defective	• Check the F-CAN communication line (see **F-CAN CIRCUIT TROUBLESHOOTING**). • Check the F-CAN communication line by using the gauge control module self-diagnostic function (see **THE COMMUNICATION LINE CHECK**). • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function (see **THE INDICATOR DRIVE CIRCUIT CHECK**).
A/T gear position indicator does not come on with the shift lever in that position	• F-CAN communication line error • Gauge control module defective • Transmission range switch defective • PCM defective	• Check the F-CAN communication line (see **F-CAN CIRCUIT TROUBLESHOOTING**). • Check the F-CAN communication line by using the gauge control module self-diagnostic function (see **THE COMMUNICATION LINE CHECK**). • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function (see **THE INDICATOR DRIVE CIRCUIT CHECK**). • Inspect the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).
	• F-CAN communication line error • Gauge control	• Check the F-CAN communication line (see **F-CAN CIRCUIT TROUBLESHOOTING**). • Check the F-CAN communication line by using the gauge control module self-diagnostic function (see **THE COMMUNICATION LINE CHECK**).

Shift indicator does not work	module defective • Transmission range switch defective • PCM defective	• Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function (see **THE INDICATOR DRIVE CIRCUIT CHECK**). • Inspect the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**).
When you press the paddle shifter + (upshift switch) in D and S, the transmission does not upshift	A problem in the paddle shifter + (upshift switch) circuit	Check the paddle shifter + (upshift switch) circuit (see **PADDLE SHIFTER + (UPSHIFT SWITCH) CIRCUIT TROUBLESHOOTING**).
When you press the paddle shifter - (downshift switch) in D and S, the transmission does not downshift	A problem in the paddle shifter - (downshift switch) circuit	Check the paddle shifter - (downshift switch) circuit (see **PADDLE SHIFTER - (DOWNSHIFT SWITCH) CIRCUIT TROUBLESHOOTING**).
Shift lever cannot be moved from P while pressing on the brake pedal	• Accelerator pedal position sensor circuit • Accelerator pedal position sensor defective • Brake pedal position switch circuit • Brake pedal position switch defective • Shift lock solenoid defective • Shift lock solenoid control circuit • Shift lock mechanism defective • Throttle body defective • Relative throttle position sensor value too high • Transmission range switch	• Inspect the APP sensor signal (see **APP SENSOR SIGNAL INSPECTION**). • Troubleshoot the shift lock system circuit (see **SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING**). • Test the shift lock solenoid (see **SHIFT LOCK SOLENOID TEST**). • Inspect the transmission range switch (see **TRANSMISSION RANGE SWITCH TEST**). • Reset the PCM (see **HDS CLEAR COMMAND**). • Test the throttle body (see **THROTTLE BODY TEST**). If it fails, replace the throttle body (see **THROTTLE BODY REMOVAL/INSTALLATION**).

	ATPP switch stuck OFF • Transmission range switch ATPP switch line opened	
Engine runs, but vehicle does not move in any gear	• Transmission range switch broken or out of adjustment • Shift cable broken or out of adjustment • Connection between shift cable and transmission or shift lever is worn • Drive plate defective or transmission incorrectly installed • Torque converter clutch piston defective • Torque converter defective • Low ATF level • ATF pump worn or binding • Main regulator valve stuck or spring worn • Foreign material in separator plate orifice • Manual valve defective • ATF strainer clogged	• Inspect the transmission range switch. If the transmission range switch fails the inspection, replace the switch. If the inspection is OK, check for proper transmission range switch installation, and adjust the shift cable. • Check for a loose shift cable at the shift lever and the selector control lever. • Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Replace the torque converter. • Check the ATF level, and check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an RPM-related ticking noise or a high pitched squeak. • Check the main regulator valve in the regulator valve body for free movement, and check the valve springs for wear and damage. • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the manual valve in the manual valve body for wear and damage, and check the manual lever guide pin for wear and damage. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Check the torque converter regulator valve in the regulator valve body for free movement, and check the valve spring for wear and damage. • Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the

	• Torque converter regulator valve defective • Mainshaft worn or damaged • Countershaft worn or damaged • Final gears worn or damaged • Park mechanism defective • Selector control shaft worn or damaged • Axle disengaged	differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF cooler lines. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF pump seizure, use the proper tools. • Install the main seal flush with the torque converter housing. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage. • Inspect the mainshaft and the countershaft for wear and damage. • Inspect the park mechanism at the park lever link and park gear. • Check the axles.
Vehicle moves in R, but not in D or S	• Transmission range switch broken or out of adjustment • Shift cable broken or out of adjustment • Connection between shift cable and transmission or shift lever is worn • Manual valve defective • 1st accumulator defective • Idler gears worn or damaged	• Inspect the transmission range switch. If the transmission range switch fails the inspection, replace the switch. If the inspection is OK, check for proper transmission range switch installation, and adjust the shift cable. • Check for a loose shift cable at the shift lever and the selector control lever. • Check the manual valve in the manual valve body for wear and damage, and check the manual lever guide pin for wear and damage. • Check the 1st accumulator piston, the O-ring, and the spring in the manual valve body for wear and damage. • Inspect the mainshaft, the countershaft, the secondary shaft, the third shaft, and idler gears for wear and damage.
	• Transmission range switch broken or out of adjustment • Shift cable broken or out of adjustment • Connection	• Inspect the transmission range switch. If the transmission range switch fails the inspection, replace the switch. If the inspection is OK, check for proper transmission range switch installation, and adjust the shift cable. • Check for a loose shift cable at the shift lever and the selector control lever. • Check for a missing shift fork bolt on the shift fork shaft.

Vehicle moves in D and S, but not in R (or moves forward in R)	between shift cable and transmission or shift lever is worn • Shift fork shaft stuck • Manual valve defective • 4th accumulator defective • 4th clutch defective • Reverse gears worn or damaged • Reverse idler gear shaft/holder worn or damaged • Reverse selector or reverse selector hub worn or damaged	• Check the shift fork shaft detent for wear and damage. • Check the manual valve in the manual valve body for wear and damage, and check the manual lever guide pin for wear and damage. • Check the 4th accumulator piston, the O-ring, and the spring in the regulator valve body for wear and damage. • Check the 4th clutch pressure (see **PRESSURE TEST**). • Inspect the clutch clearance for the 4th clutch. • Inspect the reverse idler gear shaft/holder for wear and damage. • Inspect the reverse selector gear teeth chamfers, and inspect the engagement teeth chamfers of the third shaft reverse gear and the reverse selector hub. Replace the reverse gears and the reverse selector if they are worn or damaged. If the transmission makes clicking, grinding, or whirring noises, also replace the third shaft 4th gear, the reverse idler gear, the mainshaft 3rd gear, and the countershaft 2nd gear.
Poor acceleration; engine RPM abnormally rises when starting off in D, S, and R	• A/T clutch pressure control solenoid valve D defective • Output shaft (countershaft) speed sensor defective • Torque converter one-way clutch defective • Low ATF level • ATF pump worn or binding • Main regulator valve stuck or spring worn • ATF strainer clogged • Stator shaft worn	• Inspect A/T clutch pressure control solenoid valve D with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check the output shaft (countershaft) speed sensor installation. • Inspect the output shaft (countershaft) speed sensor O-ring for wear and damage. • Check the stall speed (see **STALL SPEED TEST**). • Replace the torque converter. • Check the ATF level, and check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an RPM-related ticking noise or a high pitched squeak. • Check the main regulator valve in the regulator valve body for free movement, and check the valve springs for wear and damage. • Check the ATF strainer for debris. If the strainer is

	or damaged	clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Check the stator shaft splines for wear and damage.
Poor acceleration; engine RPM abnormally rises when starting off in D, S, and R; stall speed high in D and S	• Drive plate defective or transmission incorrectly installed • Torque converter clutch piston defective • Torque converter defective • 1st accumulator defective • 1st clutch defective • 2nd clutch defective	• Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed in R (see **STALL SPEED TEST**). • Replace the torque converter. • Check the 1st and 2nd clutch pressures (see **PRESSURE TEST**). • Inspect the clutch clearance for the 1st and 2nd clutches. • Check the 1st accumulator piston, the O-ring, and the spring in the manual valve body for wear and damage.
Poor acceleration; engine RPM abnormally rises when starting off in D, S, and R; stall speed high in R	• Drive plate defective or transmission incorrectly installed • Torque converter clutch piston defective • Torque converter defective • 4th accumulator defective • 4th clutch defective	• Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed in R (see **STALL SPEED TEST**). • Replace the torque converter. • Check the 4th clutch pressure (see **PRESSURE TEST**). • Inspect the clutch clearance for the 4th clutch. • Check the 4th accumulator piston, the O-ring, and the spring in the regulator valve body for wear and damage.
Poor acceleration; engine RPM abnormally rises when starting off in D, S, and R; stall speed low	• Engine output low • Torque converter clutch piston defective	• Check the stall speed (see **STALL SPEED TEST**). • Replace the torque converter. • Check the engine control system.
	• Engine output low	• Check the stall speed (see **STALL SPEED TEST**). • Replace the torque converter. • Check the engine control system.

Engine idle vibration	• Torque converter clutch piston defective • Transmission or engine mount defective	• Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Inspect the transmission or engine mount. • Inspect the valve clearance.
Vehicle moves in N	• Shift solenoid valve C defective • Line pressure solenoid valve A defective • ATF temperature sensor defective • Low ATF level • Excessive ATF • Main regulator valve stuck or spring worn • Foreign material in separator plate orifice • Lubrication regulator valve defective • Lubrication shift valve defective • Lock-up shift valve defective • 1st clutch defective • 2nd clutch defective • 3rd clutch defective • 4th clutch defective • 5th clutch defective • 6th clutch defective • Clearance between	• Inspect the shift solenoid valve C function with the HDS (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect the line pressure solenoid valve A function with the HDS (see **LINE PRESSURE SOLENOID VALVE A TEST**). • Check for a seized line pressure solenoid valve A, and inspect the O-rings. • Check the ATF level, and check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check the ATF level, and drain the ATF if it is over-filled. • Check the ATF temperature sensor O-ring for wear and damage. • Check the main regulator valve in the regulator valve body for free movement, and check the valve springs for wear and damage. • Check all clutch pressures. • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the lubrication regulator valve, the lubrication shift valve, and the lock-up shift valve in the main valve body for free movement, and check the valve springs for wear and damage. • Check the stall speed (see **STALL SPEED TEST**). • Inspect the clutch clearance for all clutches. • Check the needle bearings on all shafts for seizure,

	clutch end-plate and top disc incorrect • Needle bearings seized, worn, or damaged	wear, and damage.
Delayed engagement after shifting from N to D or S, or excessive shock when shifting	• Shift solenoid valve C defective • A/T clutch pressure control solenoid valve D defective • Shift cable broken or out of adjustment • Connection between shift cable and transmission or shift lever is worn • ATF temperature sensor defective • Low ATF level • Foreign material in separator plate orifice • 1st accumulator defective • ATF strainer clogged • Lock-up shift valve defective • 1st clutch defective • Clearance between clutch end-plate and top disc incorrect	• Inspect the shift solenoid valve C function with the HDS (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect A/T clutch pressure control solenoid valve D with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check for a loose shift cable at the shift lever and the selector control lever. • Inspect the ATF temperature sensor O-ring for wear and damage. • Check the ATF level, and check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Check the lock-up shift valve in the main valve body for free movement, and check the valve spring for wear and damage. • Check the 1st clutch pressure (see **PRESSURE TEST**). • Inspect the clutch clearance for the 1st clutch. • Check the 1st accumulator piston, the O-ring, and the spring in the manual valve body for wear and damage.
	• Shift solenoid valve C defective • A/T clutch	• Inspect the shift solenoid valve C function with the HDS (see **SHIFT SOLENOID VALVE C TEST**

Delayed engagement after shifting from N to R, or excessive shock when shifting	pressure control solenoid valve D defective • Shift cable broken or out of adjustment • Connection between shift cable and transmission or shift lever is worn • ATF temperature sensor defective • Foreign material in separator plate orifice • Shift valve C defective • Reverse inhibitor valve defective • 4th accumulator defective • 4th/reverse air check valve stuck • ATF strainer clogged • Lock-up shift valve defective • 4th clutch defective • Clearance between clutch end-plate and top disc incorrect	**AND REPLACEMENT**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect A/T clutch pressure control solenoid valve D with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check for a loose shift cable at the shift lever and the selector control lever. • Inspect the ATF temperature sensor O-ring for wear and damage. • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Check the lock-up shift valve, shift valve C, and the reverse inhibitor valve in the main valve body for free movement, and check the valve spring for wear and damage. • Check the 4th clutch pressure (see **PRESSURE TEST**). • Inspect the clutch clearance for the 4th clutch. • Check the 4th accumulator piston, the O-ring, and the spring in the regulator valve body for wear and damage. • Check for a stuck 4th/reverse air check valve in the main valve body.
Transmission does not shift	• A/T clutch pressure control solenoid valve A defective • A/T clutch pressure control solenoid valve B defective • A/T clutch	• Inspect A/T clutch pressure control solenoid valve A with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve B with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve C with the HDS (see **A/T CLUTCH PRESSURE**

	pressure control solenoid valve C defective • Output shaft (countershaft) speed sensor defective	**CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check the output shaft (countershaft) speed sensor installation. • Inspect the output shaft (countershaft) speed sensor O-ring for wear and damage.
Excessive shock or engine RPM abnormally rises on all upshifts and downshifts	• A/T clutch pressure control solenoid valve A defective • A/T clutch pressure control solenoid valve B defective • A/T clutch pressure control solenoid valve C defective • Input shaft (mainshaft) speed sensor defective • Output shaft (countershaft) speed sensor defective • ATF temperature sensor defective • Low ATF level • ATF pump worn or binding • Main regulator valve stuck or spring worn • Foreign material in separator plate orifice • 1st accumulator defective • ATF strainer clogged • Clearance between clutch end-plate	• Inspect A/T clutch pressure control solenoid valve A with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve B with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve C with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check the speed sensor installation. • Inspect the speed sensor O-ring for wear and damage. • Inspect the ATF temperature sensor O-ring for wear and damage. • Check the ATF level, and check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Check the main regulator valve in the regulator valve body for free movement, and check the valve springs for wear and damage. • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 1st accumulator piston, the O-ring, and the spring in the manual valve body for wear and damage. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found,

	and top disc incorrect	replace the torque converter. • Inspect the clutch clearance for all clutches.
Excessive shock or engine RPM abnormally rises on 1-2 upshift or 2-1 downshift	• Shift solenoid valve A defective • A/T clutch pressure control solenoid valve A defective • A/T clutch pressure control solenoid valve B defective • A/T clutch pressure control solenoid valve C defective • Transmission fluid pressure switch A (2nd clutch) defective • Foreign material in separator plate orifice • A/T clutch pressure control solenoid valve A accumulator defective • 2nd air check valve stuck • 2nd clutch defective • Clearance between clutch end-plate and top disc incorrect	• Inspect the shift solenoid valve A function with the HDS (see **SHIFT SOLENOID VALVE A AND B TEST**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect A/T clutch pressure control solenoid valve A with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve B with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve C with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 2nd clutch pressure (see **PRESSURE TEST**). • Inspect the clutch clearance for the 2nd clutch. • Check the A/T clutch pressure control solenoid valve A accumulator piston, the O-ring, and the springs in the secondary valve body for wear and damage. • Check for a stuck 2nd air check valve in the torque converter housing.
	• Shift solenoid valve A defective • Shift solenoid valve B defective • A/T clutch pressure control solenoid valve A defective	• Inspect the shift solenoid valves A and B function

Excessive shock or engine RPM abnormally rises on 2-3 upshift or 3-2 downshift	• A/T clutch pressure control solenoid valve B defective • A/T clutch pressure control solenoid valve C defective • Transmission fluid pressure switch B (3rd clutch) defective • Foreign material in separator plate orifice • A/T clutch pressure control solenoid valve A accumulator defective • A/T clutch pressure control solenoid valve B accumulator defective • 2nd air check valve stuck • 3rd air check valve stuck • 2nd clutch defective • 3rd clutch defective • Clearance between clutch end-plate and top disc incorrect	with the HDS (see **SHIFT SOLENOID VALVE A AND B TEST**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect A/T clutch pressure control solenoid valve A with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve B with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve C with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 2nd and 3rd clutch pressures (see **PRESSURE TEST**). • Inspect the clutch clearance for the 2nd and 3rd clutches. • Check the A/T clutch pressure control solenoid valve A and B accumulator pistons, the O-rings, and the springs in the secondary valve body for wear and damage. • Check for a stuck 2nd air check valve in the torque converter housing. • Check for a stuck 3rd air check valve in the stator shaft support.
	• Shift solenoid valve B defective • A/T clutch pressure control solenoid valve A defective • A/T clutch	• Inspect the shift solenoid valve B function with the

Excessive shock or engine RPM abnormally rises on 3-4 upshift or 4-3 downshift	pressure control solenoid valve B defective • A/T clutch pressure control solenoid valve C defective • Transmission fluid pressure switch C (4th clutch) defective • Shift fork shaft stuck • Foreign material in separator plate orifice • Shift valve C defective • Reverse inhibitor valve defective • D inhibitor valve defective • A/T clutch pressure control solenoid valve B accumulator defective • A/T clutch pressure control solenoid valve C accumulator defective • 3rd air check valve stuck • 4th/reverse air check valve stuck • 3rd clutch defective • 4th clutch defective • Clearance between clutch end-plate and top disc incorrect	HDS (see **SHIFT SOLENOID VALVE A AND B TEST**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect A/T clutch pressure control solenoid valve A with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve B with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve C with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check for a missing shift fork bolt on the shift fork shaft. • Check the shift fork shaft detent for wear and damage. • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check shift valve C, the reverse inhibitor valve, and the D inhibitor valve in the main valve body for free movement, and check the valve spring for wear and damage. • Check the 3rd and 4th clutch pressures (see **PRESSURE TEST**). • Inspect the clutch clearance for the 3rd and 4th clutches. • Check the A/T clutch pressure control solenoid valve B and C accumulator pistons, the O-rings, and the springs in the secondary valve body for wear and damage. • Check for a stuck 3rd air check valve in the stator shaft support. • Check for a stuck 4th/reverse air check valve in the main valve body.

Excessive shock or engine RPM abnormally rises on 4-5 upshift or 5-4 downshift	• Shift solenoid valve A defective • A/T clutch pressure control solenoid valve A defective • A/T clutch pressure control solenoid valve B defective • A/T clutch pressure control solenoid valve C defective • Transmission fluid pressure switch D (5th clutch) defective • Shift fork shaft stuck • Foreign material in separator plate orifice • Shift valve C defective • Reverse inhibitor valve defective • D inhibitor valve defective • A/T clutch pressure control solenoid valve A accumulator defective • A/T clutch pressure control solenoid valve C accumulator defective • 4th/reverse air check valve stuck • 5th air check valve stuck • 4th clutch	• Inspect the shift solenoid valve A function with the HDS (see **SHIFT SOLENOID VALVE A AND B TEST**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect A/T clutch pressure control solenoid valve A with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve B with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve C with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check for a missing shift fork bolt on the shift fork shaft. • Check the shift fork shaft detent for wear and damage. • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check shift valve C, the reverse inhibitor valve, and the D inhibitor valve in the main valve body for free movement, and check the valve spring for wear and damage. • Check the 4th and 5th clutch pressures (see **PRESSURE TEST**). • Inspect the clutch clearance for the 4th and 5th clutches. • Check the A/T clutch pressure control solenoid valve A and C accumulator pistons, the O-rings, and the springs in the secondary valve body for wear and damage. • Check for a stuck 4th/reverse air check valve in the main valve body. • Check for a stuck 5th air check valve in the torque

	defective • 5th clutch defective • Clearance between clutch end-plate and top disc incorrect	converter housing.
Excessive shock or engine RPM abnormally rises on 5-6 upshift or 6-5 downshift	• Shift solenoid valve A defective • Shift solenoid valve B defective • A/T clutch pressure control solenoid valve A defective • A/T clutch pressure control solenoid valve B defective • A/T clutch pressure control solenoid valve C defective • Transmission fluid pressure switch E (6th clutch) defective • Foreign material in separator plate orifice • A/T clutch pressure control solenoid valve A accumulator defective • A/T clutch pressure control solenoid valve B accumulator defective • 5th air check valve stuck • 6th air check valve stuck	• Inspect the shift solenoid valves A and B function with the HDS (see **SHIFT SOLENOID VALVE A AND B TEST**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect A/T clutch pressure control solenoid valve A with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve B with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve C with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice. • Check the 5th and 6th clutch pressures (see **PRESSURE TEST**). • Inspect the clutch clearance for the 5th and 6th clutches. • Check the A/T clutch pressure control solenoid valve A and B accumulator pistons, the O-rings, and the springs in the secondary valve body for wear and damage. • Check for a stuck 5th air check valve in the torque converter housing.

	• 5th clutch defective • 6th clutch defective Clearance between clutch end-plate and top disc incorrect	• Check for a stuck 6th air check valve in the stator shaft support.
Noise from transmission in all shift lever positions	• ATF pump worn or binding • Lubrication regulator valve defective • Lubrication shift valve defective • Final gears worn or damaged • Idler gears worn or damaged • Thrust washers seized, worn or damaged • Mainshaft, countershaft, secondary shaft, and third shaft bearings worn or damaged	• Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF cooler lines. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. If no cause for contamination is found, replace the torque converter. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF pump seizure, use the proper tools. • Install the main seal flush with the torque converter housing. If you push it into the torque converter housing until it bottoms out, it will block the fluid return passage and result in damage. • Check the ball bearing for the mainshaft, the countershaft, the secondary shaft, and the third shaft. • Inspect the mainshaft, the countershaft, the secondary shaft, the third shaft, and idler gears for wear and damage. • Check the thrust washers on all shafts for seizure, wear, and damage. • Check the lubrication regulator valve and the lubrication shift valve in the main valve body for free movement, and check the valve springs for wear and damage.
	• A/T clutch pressure control	• Inspect A/T clutch pressure control solenoid valve A with the HDS (see **A/T CLUTCH PRESSURE**

Noise from transmission in D and S	solenoid valve A defective • A/T clutch pressure control solenoid valve B defective • A/T clutch pressure control solenoid valve C defective	**CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve B with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Inspect A/T clutch pressure control solenoid valve C with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**).
Noise from transmission in R	Reverse gears worn or damaged	• Inspect the reverse idler gear shaft/holder for wear and damage. • Inspect the reverse selector gear teeth chamfers, and inspect the engagement teeth chamfers of the third shaft reverse gear and the reverse selector hub. Replace the reverse gears and the reverse selector if they are worn or damaged. If the transmission makes clicking, grinding, or whirring noises, also replace the third shaft 4th gear, the reverse idler gear, the mainshaft 3rd gear, and the countershaft 2nd gear.
Vehicle does not accelerate above 34 mph (55 km/h)	Torque converter one-way clutch defective	• Check the stall speed (see **STALL SPEED TEST**). • Replace the torque converter.
Vibration in all shift lever positions	• Drive plate defective or transmission incorrectly installed • Torque converter clutch piston defective • Torque converter defective • ATF pump worn or binding • Transmission or engine mount defective • Low engine output (horsepower)	• Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Inspect the differential pinion gears for wear. If the differential pinion gears are worn, replace the differential assembly, replace the ATF strainer, thoroughly clean the transmission, and clean the ATF cooler lines. • Replace the torque converter. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF pump seizure, use the proper tools. • Inspect the transmission or engine mount.

		• Check the valve adjustment. • Check the engine control system.
Shift lever does not operate smoothly	• Transmission range switch defective or out of adjustment • Shift cable broken, binding, or out of adjustment • Connection between shift cable and transmission or shift lever is worn • Manual valve defective • Selector control shaft worn or damaged	• Inspect the transmission range switch. If the transmission range switch fails the inspection, replace the switch. If the inspection is OK, check for proper transmission range switch installation, and adjust the shift cable. • Check for a loose shift cable at the shift lever and the selector control lever. • Check the manual valve in the main valve body for wear and damage, and check the manual lever guide pin for wear and damage.
Transmission does not shift into P	• Shift cable broken, binding, or out of adjustment • Connection between shift cable and transmission or shift lever is worn • Park mechanism defective	• Check for a loose shift cable at the shift lever and the selector control lever. • Inspect the countershaft and the secondary shaft for wear and damage. • Inspect the park mechanism at the parking holder and park gears.
Torque converter clutch does not disengage	• Shift solenoid valve C defective • Drive plate defective or transmission incorrectly installed • Torque converter clutch piston defective • Torque converter defective	• Inspect the shift solenoid valve C function with the HDS (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Replace the torque converter. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque

	• Lock-up shift valve defective	down the main valve body. This will cause ATF pump seizure, use the proper tools. • Check the lock-up shift valve in the main valve body for free movement, and check the valve springs for wear and damage.
Torque converter clutch does not operate smoothly	• A/T clutch pressure control solenoid valve D defective • Drive plate defective or transmission incorrectly installed • Torque converter clutch piston defective • Torque converter defective • Torque converter regulator valve defective • Lock-up control valve defective	• Inspect A/T clutch pressure control solenoid valve D with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check the line pressure (see **PRESSURE TEST**). • Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed (see **STALL SPEED TEST**). • Replace the torque converter. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF pump seizure, use the proper tools. • Check the torque converter regulator valve and the lock-up control valve in the regulator valve body for free movement, and check the valve springs for wear and damage.
Torque converter clutch does not engage	• Shift solenoid valve C defective • A/T clutch pressure control solenoid valve D defective • Drive plate defective or transmission incorrectly installed • Torque converter clutch piston defective • Torque converter defective • Torque converter	• Inspect the shift solenoid valve C function with the HDS (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Inspect A/T clutch pressure control solenoid valve D with the HDS (see **A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST**). • Check the line pressure (see **PRESSURE TEST**). • Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed (see **STALL SPEED TEST**). • Replace the torque converter. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF

	regulator valve defective • Lock-upshift valve defective • Lock-up control valve defective	pump seizure, use the proper tools. • Check the torque converter regulator valve and the lock-up control valve in the regulator valve body for free movement, and check the valve springs for wear and damage. • Check the lock-up shift valve in the main valve body for free movement, and check the valve springs for wear and damage.
A/T gear position indicator does not indicate shift lever positions	• Transmission range switch defective or out of adjustment • Shift cable broken or out of adjustment • Connection between shift cable and transmission or shift lever is worn	• Inspect the transmission range switch. If the transmission range switch fails the inspection, replace the switch. If the inspection is OK, check for proper transmission range switch installation, and adjust the shift cable. • Check for a loose shift cable at the shift lever and the selector control lever.
Speedometer and odometer do not work	Output shaft (countershaft) speed sensor defective	• Check the output shaft (countershaft) speed sensor installation. • Inspect the output shaft (countershaft) speed sensor O-ring for wear and damage. • Check for a poor connection at the output shaft (countershaft) speed sensor.
Engine does not start	• Transmission range switch defective or out of adjustment • Shift cable broken or out of adjustment • Connection between shift cable and transmission or shift lever is worn • Drive plate defective or transmission incorrectly installed • Torque converter	• Inspect the transmission range switch. If the transmission range switch fails the inspection, replace the switch. If the inspection is OK, check for proper transmission range switch installation, and adjust the shift cable. • Check for a loose shift cable at the shift lever and the selector control lever. • Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak.

	clutch piston defective • Torque converter defective • ATF pump worn or binding • Mainshaft worn or damaged	• Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF pump seizure, use the proper tools. • Replace the torque converter. • Inspect the mainshaft.
Engine stalls when shifted to D from N	• Shift solenoid valve C defective • Drive plate defective or transmission incorrectly installed • Torque converter clutch piston defective • Torque converter defective • Torque converter regulator valve defective • Lock-up shift valve defective • Lock-up control valve defective	• Inspect the shift solenoid valve C function with the HDS (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**). • Check for a seized shift solenoid valve, and inspect the O-rings. • Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or a high pitched squeak. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF pump seizure, use the proper tools. • Replace the torque converter. • Check the torque converter regulator valve and the lock-up control valve in the regulator valve body for free movement, and check the valve springs for wear and damage. • Check the lock-up shift valve in the main valve body for free movement, and check the valve springs for wear and damage.
	• Drive plate defective or transmission incorrectly installed • Torque converter	• Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the stall speed (see **STALL SPEED TEST**). • Check the line pressure (see **PRESSURE TEST**). • Improper alignment of the ATF pump and the torque converter housing may cause ATF pump seizure. The symptoms are mostly an rpm-related ticking noise or

Engine stops when shifted to R from N	clutch piston defective • Torque converter defective • Torque converter regulator valve defective • Lock-up shift valve defective • Lock-up control valve defective	a high pitched squeak. • Be careful not to damage the torque converter housing when replacing the main ball bearing. You may also damage the ATF pump when you torque down the main valve body. This will cause ATF pump seizure, use the proper tools. • Replace the torque converter. • Check the torque converter regulator valve and the lock-up control valve in the regulator valve body for free movement, and check the valve springs for wear and damage. • Check the lock-up shift valve in the main valve body for free movement, and check the valve springs for wear and damage.
No engine braking	• Shift cable broken or out of adjustment • Connection between shift cable and transmission or shift lever is worn • Output shaft (countershaft) speed sensor defective	• Check for a loose shift cable at the shift lever and the selector control lever. • Check the output shaft (countershaft) speed sensor installation. • Inspect the output shaft (countershaft) speed sensor O-ring for wear and damage.
Engine does not rev to high RPM, and the transmission upshifts at low RPM (engine at normal operating temperature)	• VTEC rocker arms defective • Low engine output (horsepower)	• J35Z6 engine: Check the VTEC rocker arms (see **VTEC ROCKER ARM TEST**). • J37A4 engine: Check the VTEC rocker arms (see **VTEC ROCKER ARM TEST**). • Check the fuel pressure (see **FUEL PRESSURE TEST**).
HDS does not communicate with the PCM	DLC circuit	Troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).

SYSTEM DESCRIPTION

GENERAL DESCRIPTION

The automatic transmission is a transverse-mounted five-shaft design with an electronically controlled hydraulic circuit that provides six forward speeds and one in reverse. Engine output is transmitted through the torque converter, a combination of shafts which hold gears and clutches and a differential that transmits power to the driving wheels. SH-AWD equipped model also has a transfer assembly which transmits power to the SH-AWD differential.

Shaft, Gears, and Clutches

The clutches and gears are installed on the input shaft (mainshaft), the secondary shaft, the third shaft, and the idler gear shaft. These gears are in constant mesh with those on the output shaft (countershaft). When specific gears are engaged by the clutches, power is transmitted through the mainshaft, to the secondary shaft, the third shaft, the idler gear shaft, and/or the countershaft, then to the final driven gear of the differential to provide drive.

Shift Control Mechanism

To perform hydraulic control, shift control, and lock-up control of the automatic transmission, the PCM controls shift solenoid valves A, B, and C, line pressure solenoid valve A, and automatic transmission (A/T) clutch pressure control solenoid valves A, B, C, and D. The PCM switches each shift solenoid valve ON and OFF. This changes the positions of the shift valves in the valve bodies which open and close ports to send hydraulic pressure to the appropriate clutch. A/T clutch pressure control solenoid valves A, B, C, and D control the clutch pressure regulated by each of them, which allows smooth shifts and lock-up of the torque converter.

Electronic Control

Shifting and lock-up are achieved by a system of solenoid valves driven by the PCM, which controls ATF flow through various valves in the valve bodies to select the appropriate gears for all driving conditions.

Hydraulic Control

The valve bodies consist of the main valve body, the regulator valve body, the secondary valve body, the stator shaft support, and the manual valve body. They are installed to the torque converter housing. Fluid regulated by the regulator valve passes through the manual valve to the various control valves. All the clutches receive fluid from the shaft internal hydraulic circuit. Also, the hydraulic control body is adapted to the secondary valve body, which includes the main shift hydraulic circuit, the solenoid valve, the hydraulic switch, etc. to shorten the fluid passage and optimize the hydraulic pressure.

Torque Converter

The torque converter is connected to the flywheel. It consists of an impeller (pump), turbine, stator, and torque converter clutch piston, which uses ATF to transmit engine power to the input shaft (mainshaft). Around the outside of the torque converter housing, the starter ring gear is installed, which is used to start the engine.

Lock-Up Mechanism

The lock-up causes the input shaft (mainshaft) to rotate at the same speed as the engine crankshaft by engaging the torque converter cover with the turbine by the torque converter clutch. Together with the hydraulic control, the PCM optimizes the timing and degree of lock-up. The lock-up mechanism operates in D (during accelerating: 1st, 2nd, 3rd, 4th, 5th, and 6th gears/during decelerating: 2nd, 3rd, 4th, 5th, and 6th gears), S with automatic shift mode (during accelerating: 1st, 2nd, 3rd, 4th, and 5th gears/during decelerating: 2nd, 3rd, 4th, and 5th gears), and S with sequential sportshift mode (during accelerating: 1st, 2nd, 3rd, 4th, 5th, and 6th gears/during decelerating: 2nd, 3rd, 4th, 5th, and 6th gears). The torque converter clutch is in the torque converter. The multi-plate torque converter clutch increases the torque capacity and extends the lock-up area, improving fuel economy.

Gear Selection

The shift lever has five positions; P: PARK, R: REVERSE, N: NEUTRAL, D: DRIVE 1st through 6th gear ranges with automatic shift mode and D-paddle shift mode, and S: DRIVE 1st through 5th gear ranges with automatic shift mode and 1st through 6th gear ranges with sequential sportshift mode.

Position		Description
P: PARK		Front wheels locked; the park pawl engaged with the park gear on the countershaft. All clutches are released.
R: REVERSE		Reverse; the reverse selector engaged with the third shaft 4th gear and the 4th clutch engaged.
N: NEUTRAL		All clutches are released.
D: DRIVE (1st through 6th)		General driving; starts off in 1st gear, shifts to 2nd, 3rd, 4th, 5th, then 6th gear, depending on the vehicle speed and the throttle position. Downshifts through 5th, 4th, 3rd, 2nd, and 1st on deceleration to stop. The lock-up mechanism operates in 1st through 6th gears while accelerating, and in 2nd through 6th gears while decelerating.
S: DRIVE	Automatic shift mode (1st through 5th)	Used for rapid acceleration at highway speeds and general driving, up-hill and down-hill driving; starts off in 1st gear, shifts to 2nd, 3rd, 4th, then 5th gear, depending on the vehicle speed and the throttle position. Downshifts through 4th, 3rd, 2nd, and 1st on deceleration to stop. The lock-up mechanism operates in 1st through 5th gears while accelerating, and in 2nd through 5th gears while decelerating.
	Sequential sportshift mode (1st through 6th)	Manual gear shift driving; the vehicle can start off in 1st gear, and does not upshift automatically. The vehicle can also start off in 2nd gear, and does not upshift and downshift automatically. Downshifts automatically to 1st on deceleration to stop. The lock-up mechanism operates in 1st through 6th gears while accelerating, and in 2nd through 6th gears while decelerating.

Starting the engine is possible only in P and N because of a neutral-safety switch built into the transmission range switch.

Automatic Transmission (A/T) Gear Position Indicator

The A/T gear position indicator in the gauge control module shows which shift lever position that has been selected.

Shift Indicator

When you operate the paddle shift switch, the shift indicator in the gauge control module displays the gear selected. The shift indicator also displays the gear selected in the D-paddle shift mode and the sequential sportshift mode.

Transfer Assembly (With SH-AWD)

The transfer assembly consists of the transfer hypoid drive gear/shaft assembly, the transfer output shaft (hypoid gear), and the companion flange. The transfer assembly is on the rear side of the transmission, beside the differential. The transfer drive gear on the differential drives the transfer output shaft in the transmission. The transfer output shaft in the transmission is connected to the transfer hypoid drive gear/shaft assembly by splines.

Power is transmitted from the transfer drive gear on the differential to the rear differential via the transfer assembly and the propeller shaft.

CLUTCHES AND GEARS

The six speed automatic transmission applies hydraulic pressure to the clutches to engage or disengage the gears. When hydraulic pressure is introduced into the clutch drum, the clutch piston moves and presses the steel plates and the clutch discs. Power is then transmitted through the engaged clutch pack to its gear mounted on the shaft. Likewise, when the hydraulic pressure is bled from the clutch drum, the piston releases the steel plates and the clutch discs. Then the steel plates rotate with the clutch drum, and the clutch discs rotate with gear on the shaft. The clutch discs are released from the steel plates. This allows the clutch disc to spin independently, transmitting no power.

1st Clutch

The 1st clutch engages/disengages 1st gear, and is located at the right end of the secondary shaft. The 1st clutch is supplied hydraulic pressure through the secondary shaft by a circuit connected to the internal hydraulic circuit.

2nd Clutch

The 2nd clutch engages/disengages 2nd gear, and is located at the left end of the secondary shaft. The 2nd clutch is joined back-to-back to the 5th clutch. The 2nd clutch is supplied hydraulic pressure through the secondary shaft by a circuit connected to the internal hydraulic circuit.

3rd Clutch

The 3rd clutch engages/disengages 3rd gear, and is located at the left end of the mainshaft. The 3rd clutch is joined back-to-back to the 6th clutch. The 3rd clutch is supplied hydraulic pressure through the mainshaft by a circuit connected to the internal hydraulic circuit.

4th Clutch

The 4th clutch engages/disengages 4th gear, and is located at the right end of the third shaft. The 4th clutch is supplied hydraulic pressure through the third shaft by a circuit connected to the internal hydraulic circuit. The vehicle also moves backward when the 4th clutch is engaged while the reverse selector hub engages with the reverse gear.

5th Clutch

The 5th clutch engages/disengages 5th gear, and is located at the left end of the secondary shaft. The 5th clutch is joined back-to-back to the 2nd clutch. The 5th clutch is supplied hydraulic pressure through the secondary shaft by a circuit connected to the internal hydraulic circuit.

6th Clutch

The 6th clutch engages/disengages 6th gear, and is located at the left end of the mainshaft. The 6th clutch is joined back-to-back to the 3rd clutch. The 6th clutch is supplied hydraulic pressure through the mainshaft by a

circuit connected to the internal hydraulic circuit.

One-Way Clutch

The one-way clutch is located between the countershaft 1st gear and the park gear. The park gear is splined with the countershaft. The countershaft 1st gear engages the outer race surface of the one-way clutch, and the park gear engages the inner race surface of the one-way clutch. The one-way clutch locks when power is transmitted from the secondary shaft 1st gear to the countershaft 1st gear. The 1st clutch and 1st gear remain engaged in 1st, 2nd, 3rd, 4th, 5th, and 6th gear ranges in D or S. However, the one-way clutch disengages when the 2nd, 3rd, 4th, 5th, or 6th clutches and gears are applied in D or S. This is because the rotational speed of the countershaft exceeds that of 1st gear, which causes the one-way clutch to free-wheel with the 1st clutch still engaged.

Transmission Cutaway View

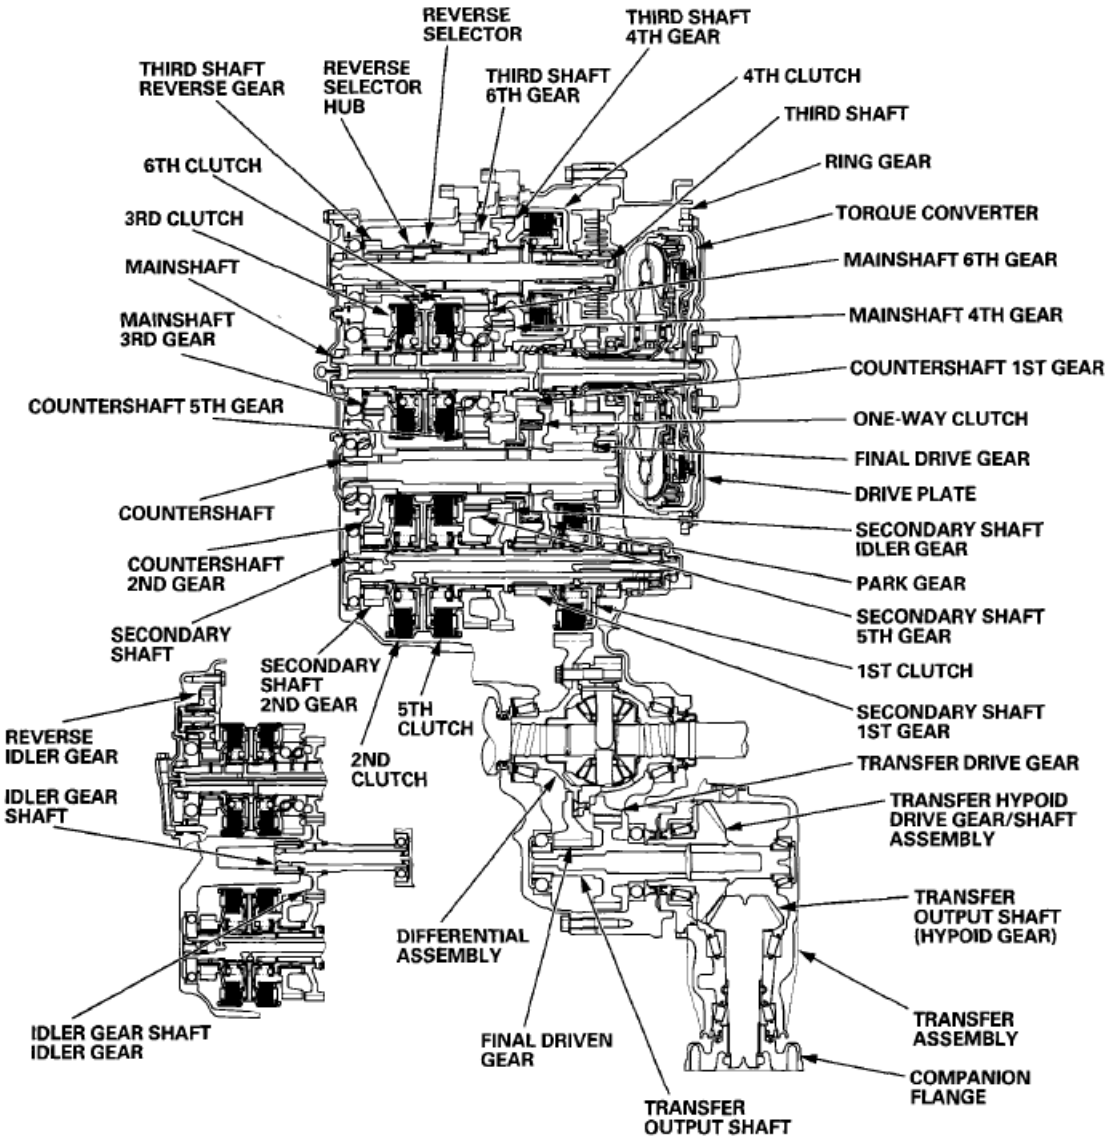

Fig. 16: Transmission Cutaway View

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

Gear operation

Gears on the mainshaft:

- 3rd gear is engaged/disengaged with the mainshaft by the 3rd clutch.
- 6th gear is engaged/disengaged with the mainshaft by the 6th clutch.
- 4th gear is splined with the mainshaft and rotates with the mainshaft.

Gears on the secondary shaft:

- 1st gear is engaged/disengaged with the secondary shaft by the 1st clutch.
- 2nd gear is engaged/disengaged with the secondary shaft by the 2nd clutch.
- 5th gear is engaged/disengaged with the secondary shaft by the 5th clutch.
- Idler gear is splined with the secondary shaft, and rotates with the secondary shaft.

Gears on the third shaft:

- 4th gear is engaged/disengaged with the third shaft by the 4th clutch.
- Reverse selector hub is splined with the third shaft and rotates with the third shaft.
- Reverse selector on the reverse selector hub switches between the reverse gear and 6th gear.

Gears on the countershaft:

- Final drive gear is integral with the countershaft.
- 2nd gear, 5th gear, and park gear are splined with the countershaft, and rotate with the countershaft.
- 1st gear is engaged with the park gear splined with the countershaft by the one-way clutch when accelerating. It is disengaged from the park gear by the one-way clutch when decelerating.

Gears on the idler gear shaft:

- Idler gear is press-fitted with the idler gear shaft, and rotates with the idler gear shaft.
- Idler gear is engaged with the mainshaft 4th gear and the secondary shaft idler gear, and transmits the mainshaft rotation to the secondary shaft.

POWER FLOW

P Position

Hydraulic pressure is not applied to the clutches; power is not transmitted to the countershaft. The countershaft is locked by the park pawl interlocking the park gear on the countershaft.

N Position

Engine output transmitted from the mainshaft drives the mainshaft 4th gear, the third shaft 4th gear, the idler gear shaft idler gear, and the secondary shaft idler gear, but since hydraulic pressure is not applied to the clutches, output is not transmitted to the countershaft. In this position, the position of the reverse selector differs according to whether the shift lever shifted from D or R:

- When shifted from D, the reverse selector engages with the third shaft 6th gear and the reverse selector hub, and the 6th gear engages with the third shaft.
- When shifted from R, the reverse selector engages with the third shaft reverse gear and the reverse selector hub, and the reverse gear engages with the third shaft.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

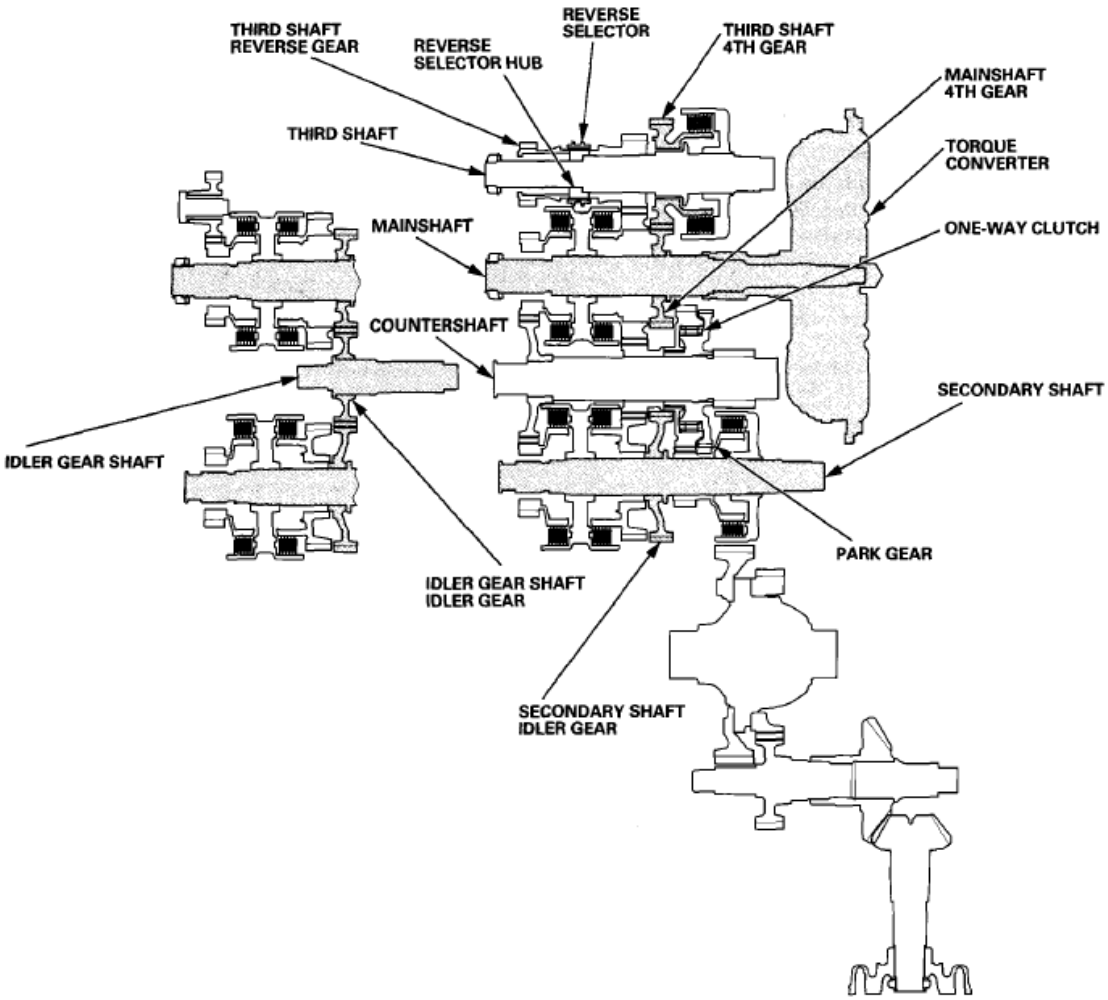

Fig. 17: Automatic Transmission Power Flow Diagram (N Position)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

D Position and S Position with Automatic Shift Mode

In D, the optimum gear is automatically selected from 1st, 2nd, 3rd, 4th, 5th, and 6th gears; and 1st, 2nd, 3rd, 4th, and 5th gears in S with automatic shift mode according to conditions between the accelerator pedal command or position (engine loading) and the vehicle speed.

In 1st gear

- Hydraulic pressure is applied to the 1st clutch, then the 1st clutch engages the secondary shaft 1st gear with the secondary shaft.
- Mainshaft rotation is transmitted to the mainshaft 4th gear splined with the mainshaft.
- The mainshaft 4th gear drives the secondary shaft idler gear splined with the secondary shaft and the secondary shaft via the idler gear shaft idler gear.
- The secondary shaft and the secondary shaft 1st gear engaged by the 1st clutch, and the secondary shaft 1st gear drives the countershaft 1st gear.
- The countershaft 1st gear drives the park gear splined with the countershaft via the one-way clutch.
- With SH-AWD: Power is transmitted from the countershaft to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the differential.
- With SH-AWD: As the final driven gear turns the differential assembly, power is transmitted through the transfer drive gear to the transfer output shaft that drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

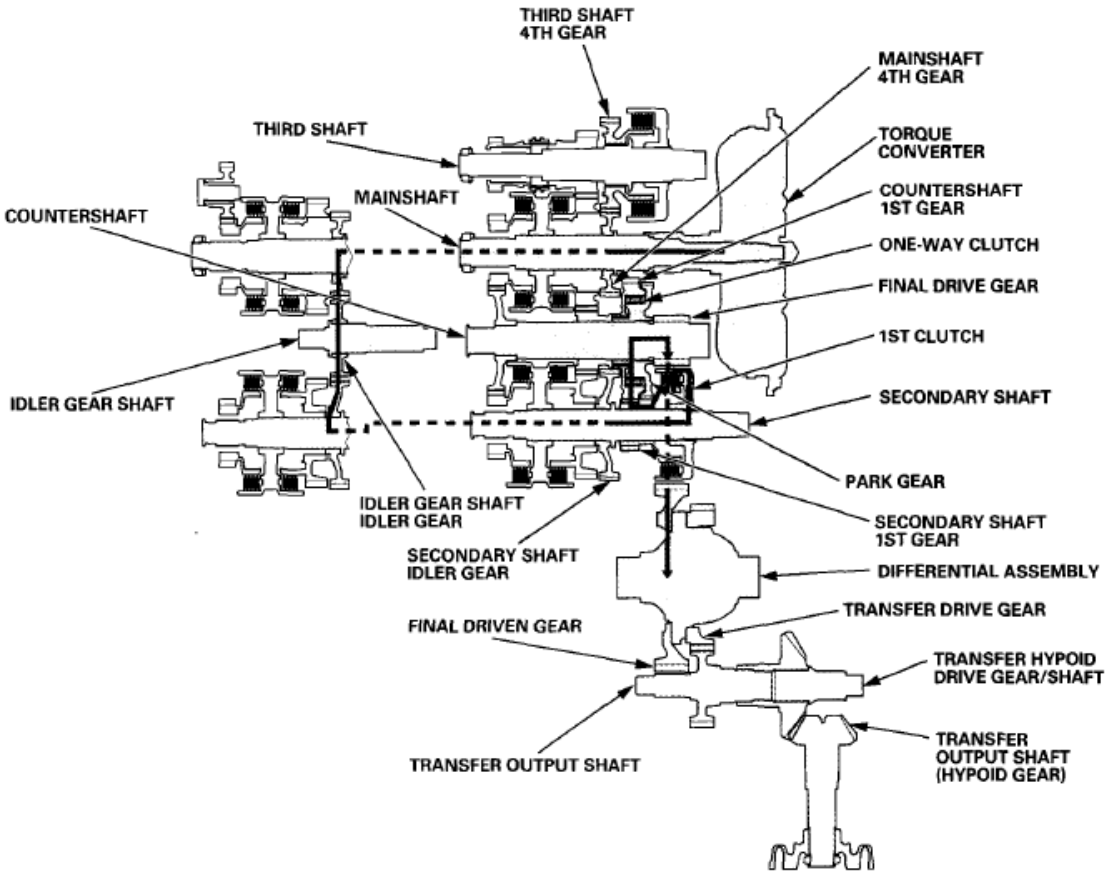

Fig. 18: Automatic Transmission Power Flow Diagram (In D And S Position And 1st Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 2nd gear

- Hydraulic pressure is applied to the 2nd clutch, then the 2nd clutch engages the secondary shaft 2nd gear with the secondary shaft.
- Mainshaft rotation is transmitted to the mainshaft 4th gear splined with the mainshaft.
- The mainshaft 4th gear drives the secondary shaft idler gear splined to the secondary shaft and the secondary shaft via the idler gear shaft idler gear.
- The secondary shaft and the secondary shaft 2nd gear engaged by the 2nd clutch, and the secondary shaft 2nd gear drives the countershaft 2nd gear splined with the countershaft and the countershaft.
- With SH-AWD: Power is transmitted from the countershaft to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the differential.
- With SH-AWD: As the final driven gear turns the differential assembly, power is transmitted through the transfer drive gear to the transfer output shaft that drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of the countershaft exceeds that of 1st gear, power output from 1st gear is cut off at the one-way clutch.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

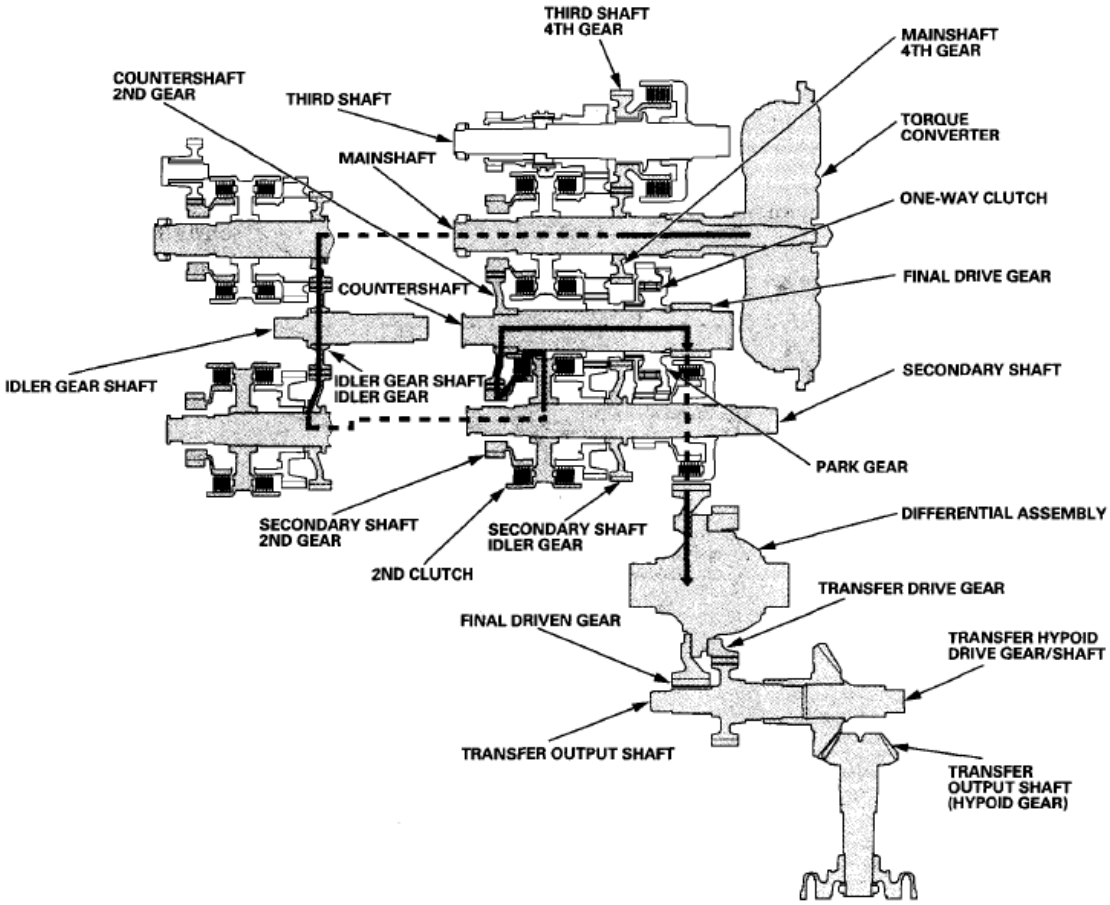

Fig. 19: Automatic Transmission Power Flow Diagram (In D And S Position And 2nd Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 3rd gear

- Hydraulic pressure is applied to the 3rd clutch, then the 3rd clutch engages the mainshaft 3rd gear with the mainshaft.
- Mainshaft rotation is transmitted from the mainshaft 3rd gear engaged with the 3rd clutch to the countershaft 2nd gear splined with the countershaft.
- With SH-AWD: Power is transmitted from the countershaft to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the differential.
- With SH-AWD: As the final driven gear turns the differential assembly, power is transmitted through the transfer drive gear to the transfer output shaft that drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of the countershaft exceeds that of 1st gear, power output from 1st gear is cut off at the one-way clutch.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

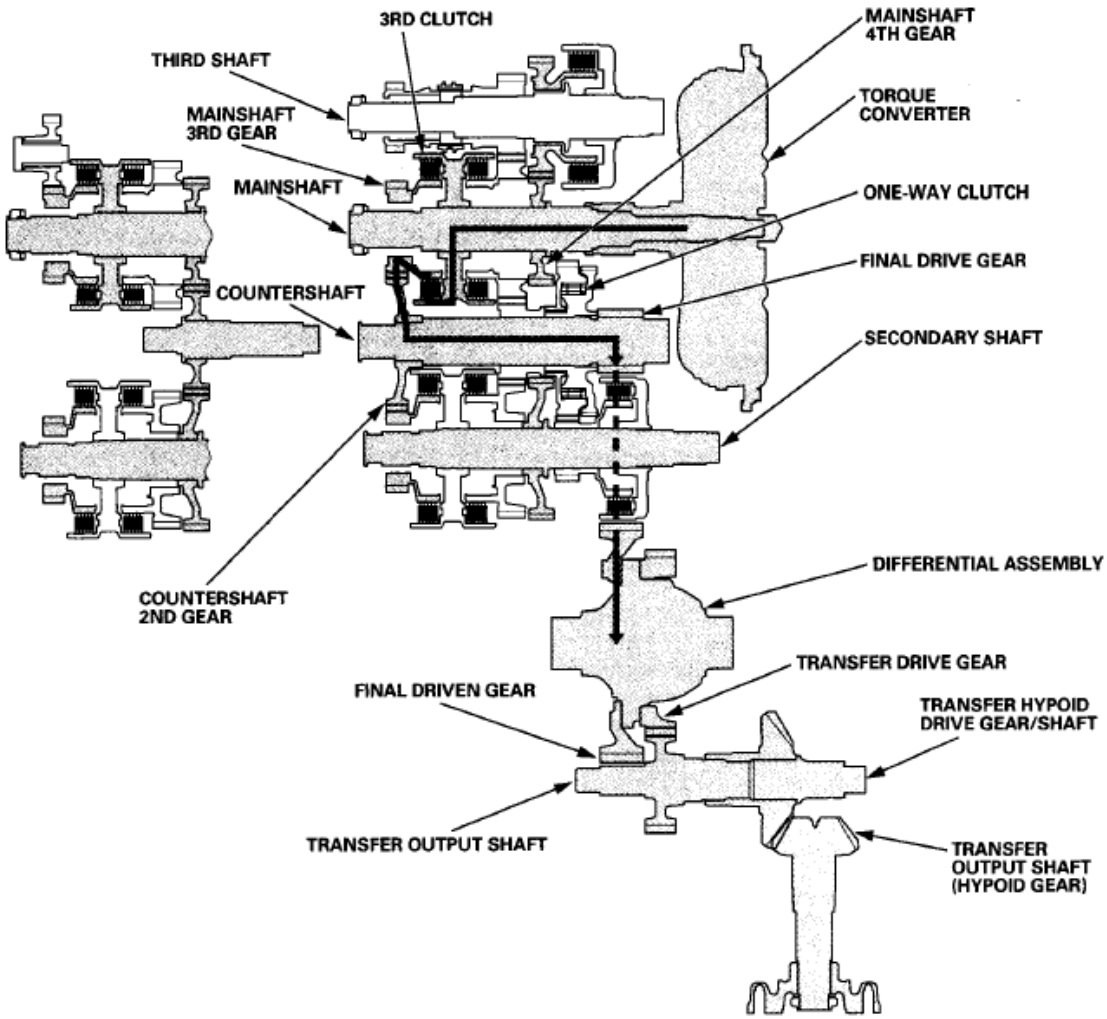

Fig. 20: Automatic Transmission Power Flow Diagram (In D And S Position And 3rd Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 4th gear

- Hydraulic pressure is applied to the D inhibitor valve to engage the reverse selector with the third shaft 6th gear while the shift lever is in the forward range (D and S).
- Hydraulic pressure is applied to the 4th clutch, then the 4th clutch engages the third shaft 4th gear with the third shaft.
- Mainshaft rotation is transmitted to the third shaft 4th gear via the mainshaft 4th gear splined with the mainshaft.
- Rotation of the third shaft 4th gear is transmitted to the third shaft 6th gear from the reverse selector hub via the reverse selector.
- The third shaft 6th gear drives the countershaft 5th gear splined with the countershaft and the countershaft

via the mainshaft 6th gear.

- With SH-AWD: Power is transmitted from the countershaft to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the differential.
- With SH-AWD: As the final driven gear turns the differential assembly, power is transmitted through the transfer drive gear to the transfer output shaft that drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of the countershaft exceeds that of 1st gear, power output from 1st gear is cut off at the one-way clutch.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

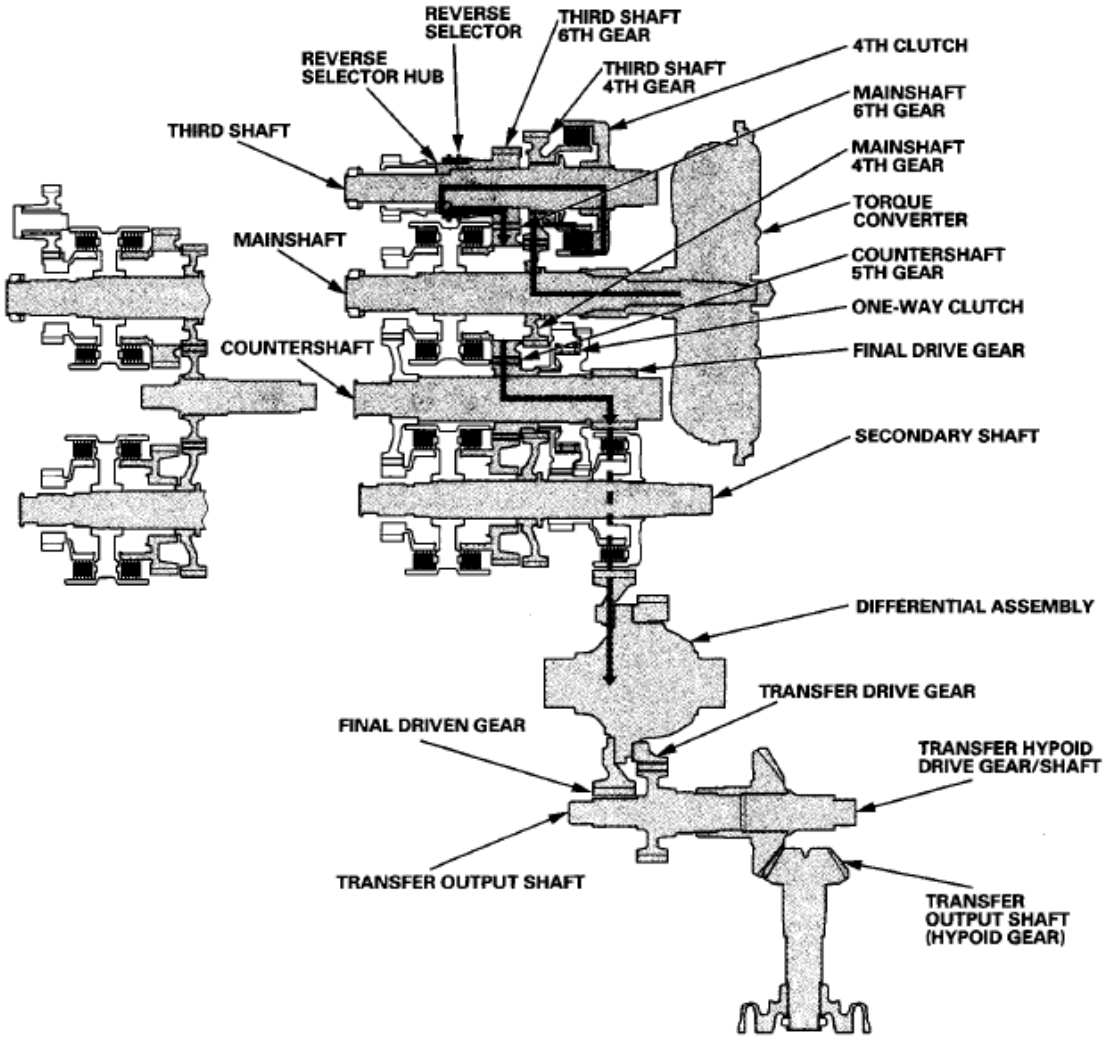

Fig. 21: Automatic Transmission Power Flow Diagram (In D And S Position And 4th Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 5th gear

- Hydraulic pressure is applied to the 5th clutch, then the 5th clutch engages the secondary shaft 5th gear with the secondary shaft.
- Mainshaft rotation is transmitted to the mainshaft 4th gear splined with the mainshaft.
- The mainshaft 4th gear drives the secondary shaft idler gear splined with the secondary shaft and the secondary shaft via the idler gear shaft idler gear.
- The secondary shaft and the secondary shaft 5th gear engaged by the 5th clutch, and the secondary shaft 5th gear drives the countershaft 5th gear splined with the countershaft and the countershaft.
- With SH-AWD: Power is transmitted from the countershaft to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the differential.
- With SH-AWD: As the final driven gear turns the differential assembly, power is transmitted through the transfer drive gear to the transfer output shaft that drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of the countershaft exceeds that of 1st gear, power output from 1st gear is cut off at the one-way clutch.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

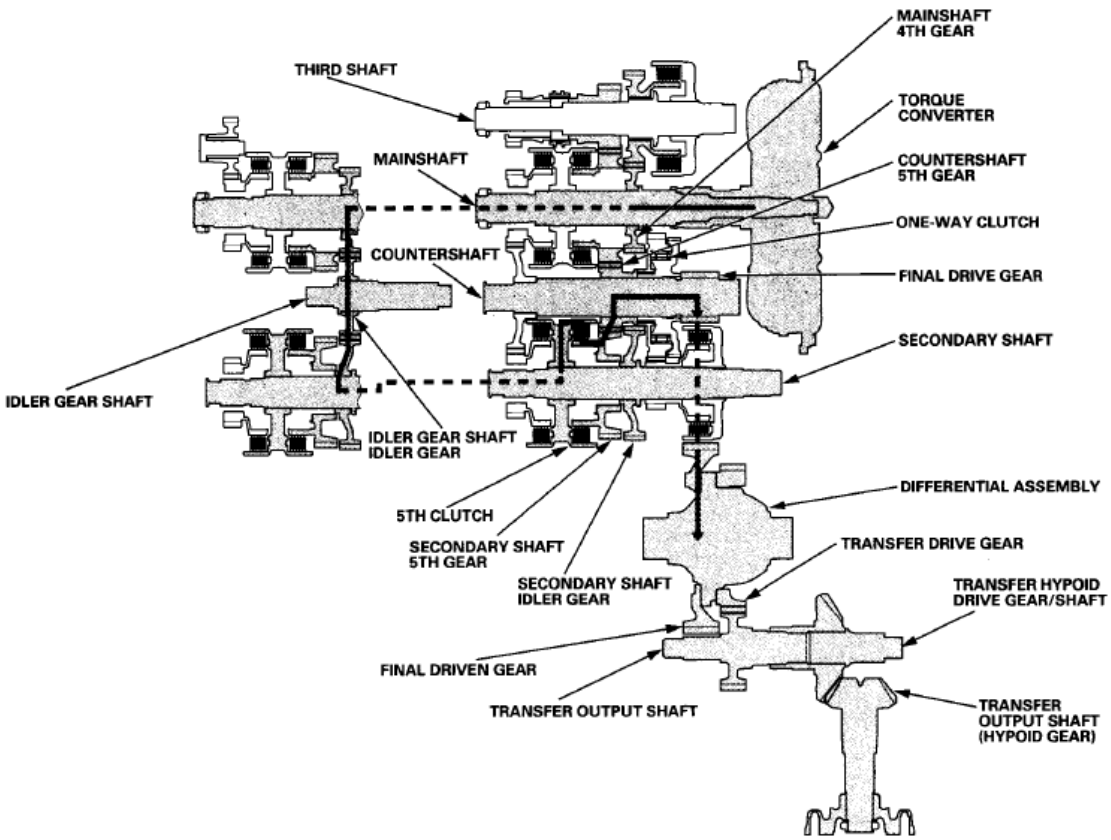

Fig. 22: Automatic Transmission Power Flow Diagram (In D And S Position And 5th Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

In 6th gear

- Hydraulic pressure is applied to the 6th clutch, then the 6th clutch engages the mainshaft 6th gear with the mainshaft.
- Mainshaft rotation is transmitted from the mainshaft 6th gear engaged with the 6th clutch to the countershaft 5th gear splined with the countershaft.
- With SH-AWD: Power is transmitted from the countershaft to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the differential.
- With SH-AWD: As the final driven gear turns the differential assembly, power is transmitted through the transfer drive gear to the transfer output shaft that drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).
- Hydraulic pressure is also applied to the 1st clutch, but since the rotation speed of the countershaft exceeds that of 1st gear, power output from 1st gear is cut off at the one-way clutch.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

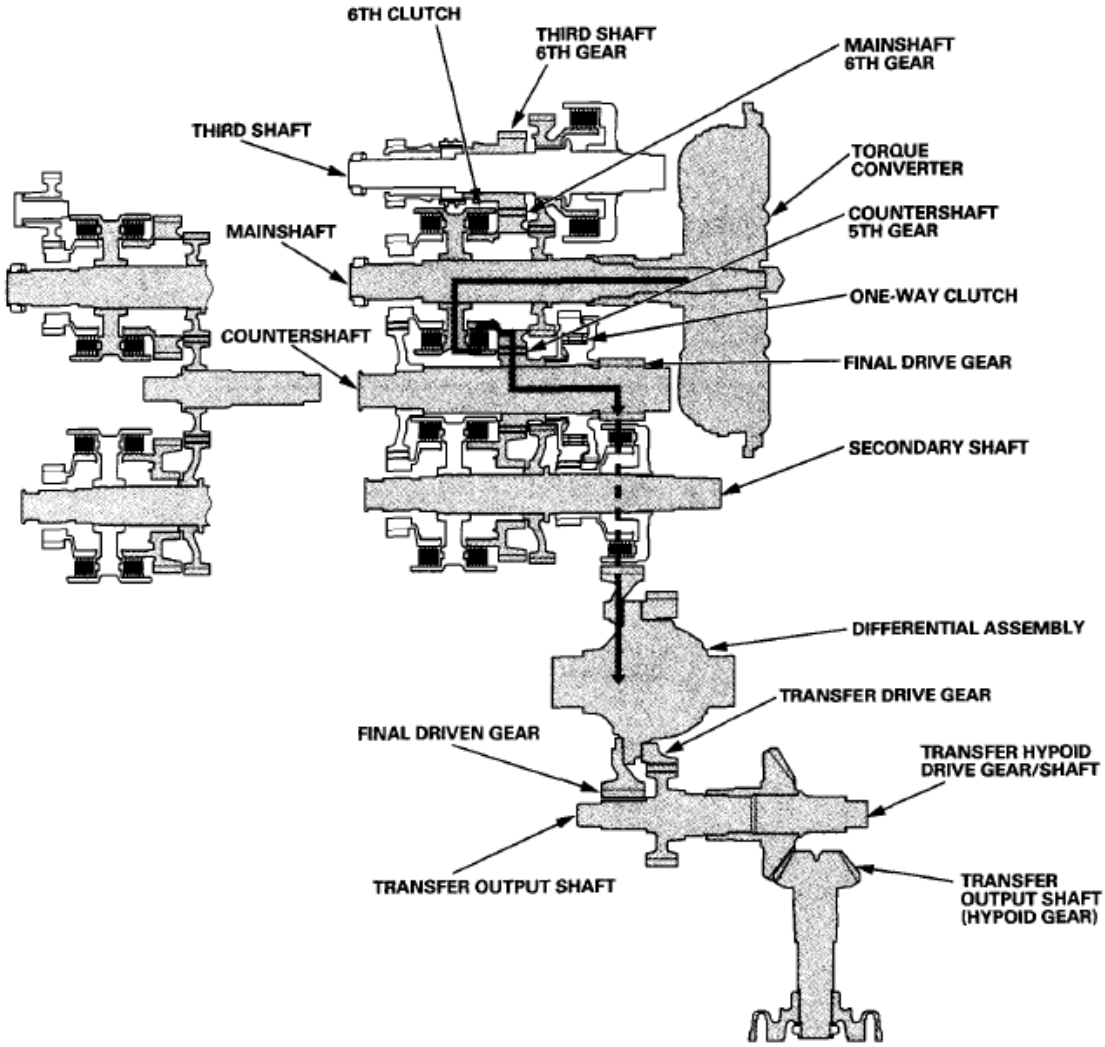

Fig. 23: Automatic Transmission Power Flow Diagram (In D And S Position And 6th Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

R Position

- Hydraulic pressure is applied to the D inhibitor valve to engage the reverse selector with the third shaft reverse gear while the shift lever is in R.
- Hydraulic pressure is applied to the 4th clutch, then the 4th clutch engages the third shaft 4th gear with the third shaft.
- Mainshaft rotation is transmitted to the third shaft 4th gear via the mainshaft 4th gear splined with the mainshaft.
- Rotation of the third shaft 4th gear is transmitted from the reverse selector hub that rotates with the third shaft to the third shaft reverse gear, via the reverse selector.
- The third shaft reverse gear drives the mainshaft 3rd gear via the reverse idler gear.
- The mainshaft 3rd gear drives the countershaft 2nd gear splined with the countershaft and the countershaft.

- The rotation direction of the countershaft is changed by the reverse idler gear.
- With SH-AWD: Power is transmitted from the countershaft to the final drive gear, which in turn drives the final driven gear and the transfer drive gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear and the differential.
- With SH-AWD: As the final driven gear turns the differential assembly, power is transmitted through the transfer drive gear to the transfer output shaft that drives the transfer hypoid drive gear/shaft and the transfer output shaft (hypoid gear).

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

ELECTRONIC CONTROL SYSTEM

Electronic Control

The electronic control system consists of the PCM, sensors, and eight solenoid valves.

Functional Diagram

The PCM receives input signals from the sensors, switches, and other control units, processes data, and outputs signals for the engine control system and the A/T control system. The A/T control system includes shift control, clutch pressure control, lock-up control, and A/T system hydraulic control. The PCM switches the shift solenoid valves and the A/T clutch pressure control solenoid valves ON and OFF in a specific sequence to control gear selection and torque converter clutch lock-up. It also controls the appropriate operating hydraulic pressure to the automatic transmission.

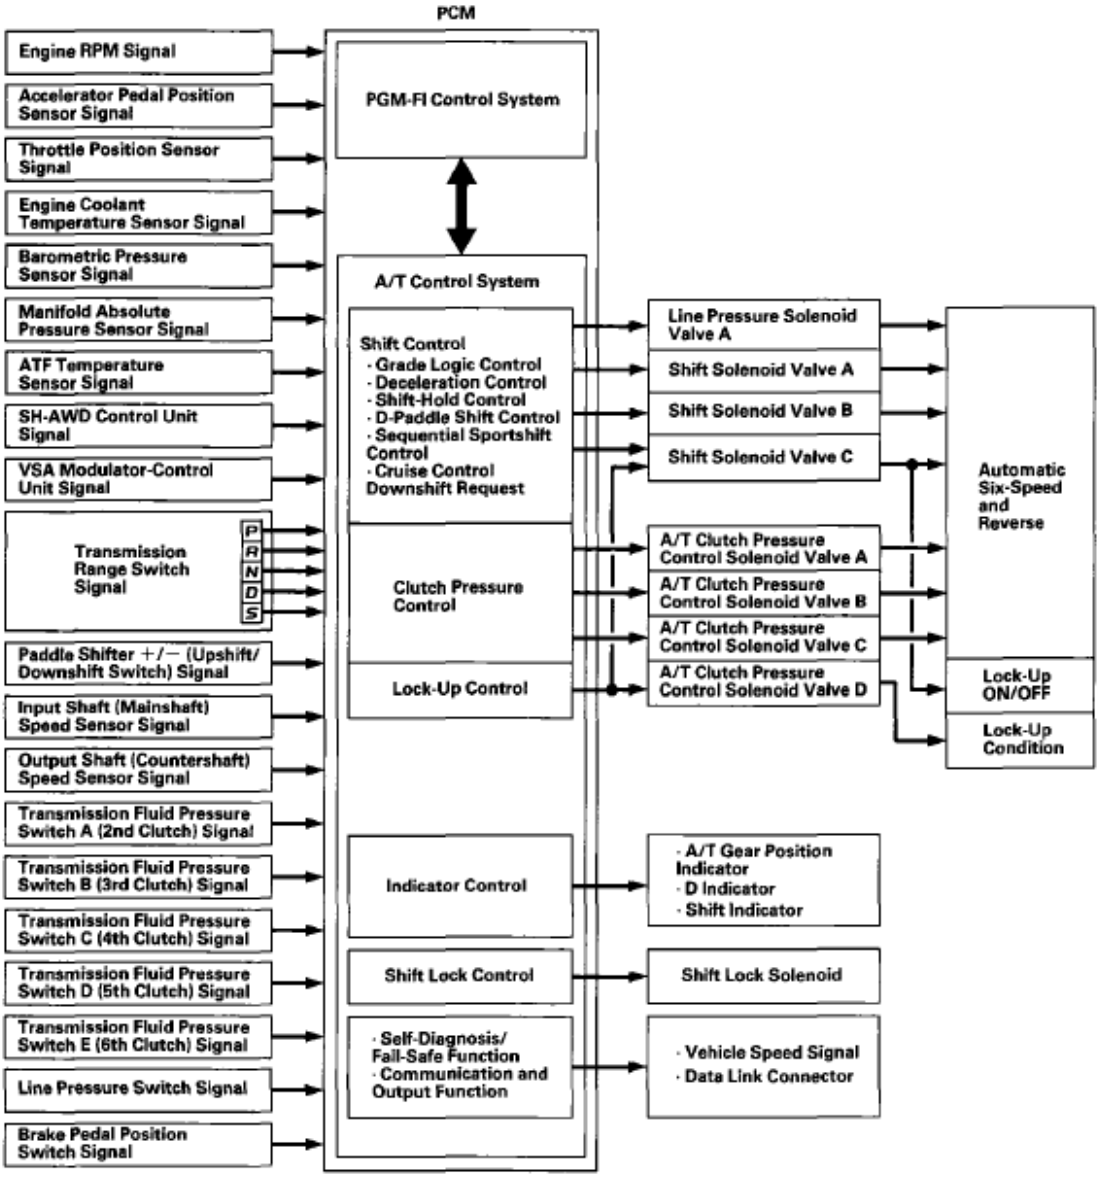

Fig. 25: Electronic Control System - Functional Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shift Control

The PCM instantly determines which gear should be selected by various inputs from sensors and switches, and it actuates the solenoid valves to control gear selection.

Shift solenoid valve:

Shift solenoid valves A, B, and C switch to the hydraulic pressure supply circuit to the clutch. Shift solenoid valves A, B, and C are normally closed (ON-OPEN/OFF-CLOSE); the normally closed solenoid valve port opens to allow ATF to pass through when the PCM turns it ON, and the port closes, blocking fluid flow when turned OFF.

A/T clutch pressure control solenoid valve:

A/T clutch pressure control solenoid valves A, B, C, and D apply hydraulic pressure to each clutch via the hydraulic valve body circuit. A/T clutch pressure control solenoid valve D supplies hydraulic pressure to the torque converter clutch. A/T clutch pressure control solenoid valves A, B, C, and D are normally closed (ON-OPEN/OFF-CLOSE); the normally closed solenoid valve port opens to allow ATF to pass through when the PCM turns it ON, and the port closes, blocking fluid flow when turned OFF. These solenoid valves are controlled by current and are duty controlled depending on the vehicle speed and the throttle position.

Line pressure solenoid valve:

Line pressure solenoid valve A controls the hydraulic pressure in the hydraulic control system valve bodies of the automatic transmission. Line pressure solenoid valve A is normally closed (ON-OPEN/OFF-CLOSE); the normally closed solenoid valve port opens to allow ATF to pass through when the PCM turns it ON, and the port closes, blocking fluid flow when turned OFF.

The combination of driving signals to solenoid valves for each gear is in the following table.

Shift Lever Position	P	R	N	D, S					
				1st	2nd	3rd	4th	5th	6th
Shift solenoid valve A	ON	OFF	ON	ON	ON	OFF	OFF	OFF	OFF
Shift solenoid valve B	OFF	OFF	OFF	ON	ON	ON	ON or OFF	ON or OFF	OFF
Shift solenoid valve C	ON	ON	OFF	ON or OFF	ON or OFF	ON or OFF	ON or OFF	ON or OFF	ON or OFF
Line pressure solenoid valve A	ON or OFF	ON or OFF	ON or OFF	ON or OFF	ON or OFF	ON or OFF	ON or OFF	ON or OFF	ON or OFF
A/T clutch pressure control solenoid valve A	OFF	OFF	OFF	OFF	ON	OFF	OFF	ON	OFF
A/T clutch pressure control solenoid valve B	OFF	OFF	OFF	OFF	OFF	ON	OFF	OFF	ON
A/T clutch pressure control solenoid valve C	OFF	OFF	OFF	OFF	OFF	OFF	ON	OFF	OFF
A/T clutch pressure control	OFF	ON	OFF	ON or	ON or	ON or	ON or	ON or	ON or

solenoid valve D				OFF	OFF	OFF	OFF	OFF	OFF

Shift Control - Grade Logic Control

The grade logic control system is used to control shifting in D, and in S with automatic shift mode. The PCM compares actual driving conditions with programmed driving conditions, based on the input signal from the throttle position sensor, the engine coolant temperature sensor, the barometric pressure sensor, the brake pedal position switch, and the transmission range switch to switch shifting control from the normal control to the ascending or descending control when the PCM determines that the vehicle is ascending a slope or being driven down a slope.

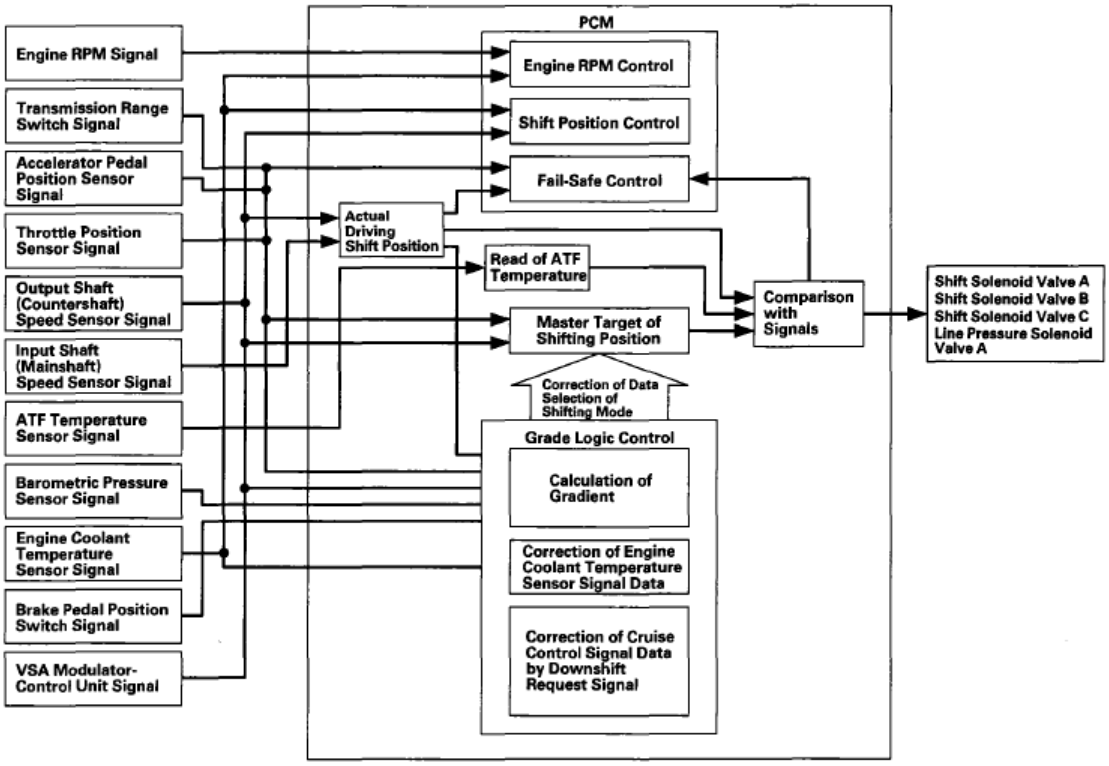

Fig. 26: Shift Control - Grade Logic Control Flow Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Grade Logic Control: Ascending Control

When the PCM determines that the vehicle is climbing a hill in D and in S with automatic shift mode, the system extends the engagement area of 2nd gear, 3rd gear, 4th gear, and 5th gear to prevent the transmission from frequently shifting between 2nd and 3rd gears, between 3rd and 4th gears, between 4th and 5th gears, and between 5th and 6th gears, so the vehicle can run smoothly and have more power when needed.

NOTE: Shift commands stored in the PCM between 2nd and 3rd gears, between 3rd and 4th gears, between 4th and 5th gears, and between 5th and 6th gears, enable the PCM to automatically select the most suitable gear based on the steepness of the grade.

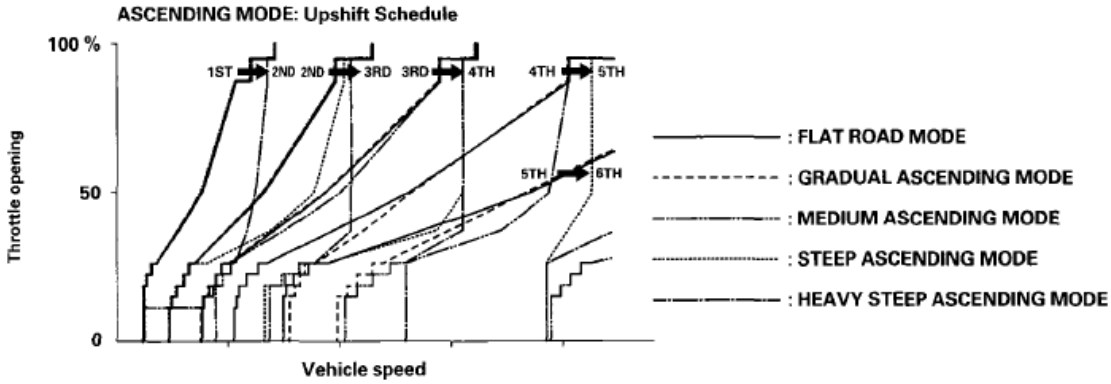

Fig. 27: Grade Logic Control Ascending Control Graph

Grade Logic Control: Descending Control

When the PCM determines that the vehicle is going down a hill in D, and in S with automatic shift mode, the upshift speed from 5th to 6th gear, from 4th to 5th gear, from 3rd to 4th gear, and from 2nd to 3rd (when the throttle is closed) becomes higher than the set speed for flat road driving to extend the 5th gear, 4th gear, 3rd gear, and 2nd gear driving areas. This, in combination with engine braking from the deceleration lock-up, achieves smooth driving when the vehicle is descending. There are descending modes with different 5th gear, 4th gear, 3rd gear, and 2nd gear driving areas based on the steepness of the grade stored in the PCM. When the vehicle is in 6th, 5th, or 4th gear, and the vehicle is decelerating while applying the brakes on a steep hill, the transmission downshifts to a lower gear. When you accelerate, the transmission then returns to a higher gear from the current position.

Deceleration Control

When the vehicle goes around a corner and needs to decelerate first and then accelerate, the PCM goes into the deceleration control mode to reduce the number of times the transmission shifts. When the vehicle is decelerating from speeds above 27 mph (43 km/h), the PCM anticipates upcoming acceleration, and shifts the transmission from 4th to 3rd earlier than normal.

Shift-Hold Control

Shift-hold control maintains transmission gear position during cornering to avoid frequently shifting. When the vehicle is cornering, the PCM extends the engagement of 2nd, 3rd, 4th, and 5th to prevent the transmission from frequently shifting between 3rd, 4th, 5th, and 6th gears. When the PCM determines that the vehicle is cornering by the accelerator pedal position, the vehicle speed, and the lateral G-force estimate from the RPM difference between each wheel, it delays the upshift from 3rd to 4th, 4th to 5th, and 5th to 6th gears, which improves the engine output and the engine braking. The transmission resumes the normal upshift pattern after the PCM determines that normal driving has resumed.

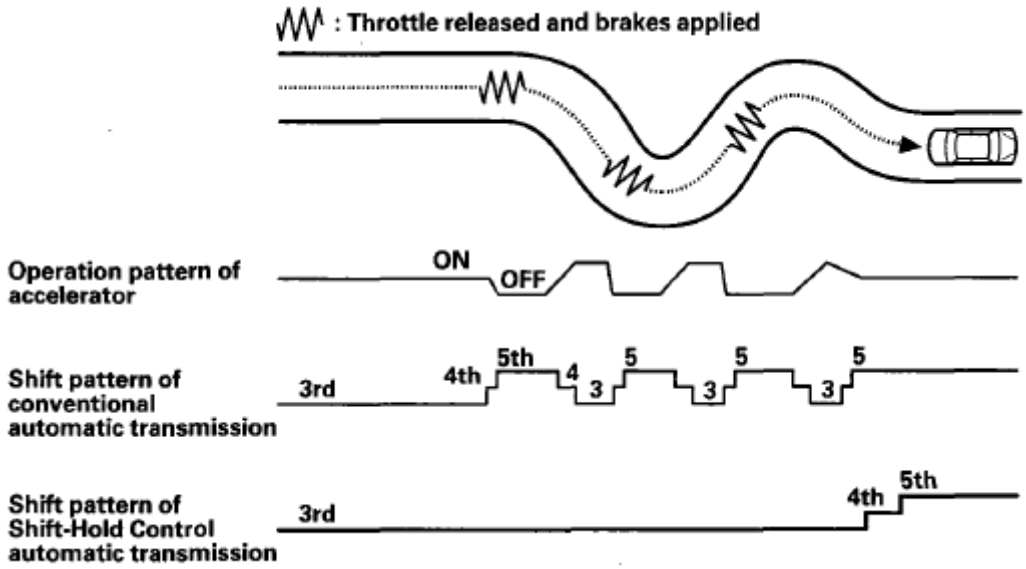

Fig. 28: Deceleration And Shift-Hold Control Pattern
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shift Control - Manual Shift Mode

The transmission is equipped with a D-paddle shift mode in D, and with a sequential sportshift mode in S.

Either mode can be activated by pressing the paddle shifter + (upshift switch) or the paddle shifter - (downshift switch) while driving with the shift lever is in D and S.

D-Paddle Shift Mode

To engage the D-paddle shift mode, press either of the steering wheel mounted paddle shifters while driving in D. In this mode, the transmission can downshift by pressing the paddle shifter -, or upshift by pressing the paddle shifter +. Each time the transmission is shifted using the paddles, the shift indicator in the gauge control module displays the current position. The display turns off when the transmission upshifts or downshifts automatically while coasting. The transmission stays in 6th gear if the paddle shifter + is pressed when driving in 6th gear, and the shift indicator displays "6" for 2 seconds, then goes off. The transmission stays in 1st gear if the paddle shifter - is pressed when driving in 1st gear, and the shift indicator displays "1" for 2 seconds, then goes off. The transmission stays in the current gear and does not upshift to the next higher gear if the paddle shifter + is pressed while driving below the minimum allowable speed, and the shift indicator blinks the number of the next higher gear several times, then returns to the number of the current gear.

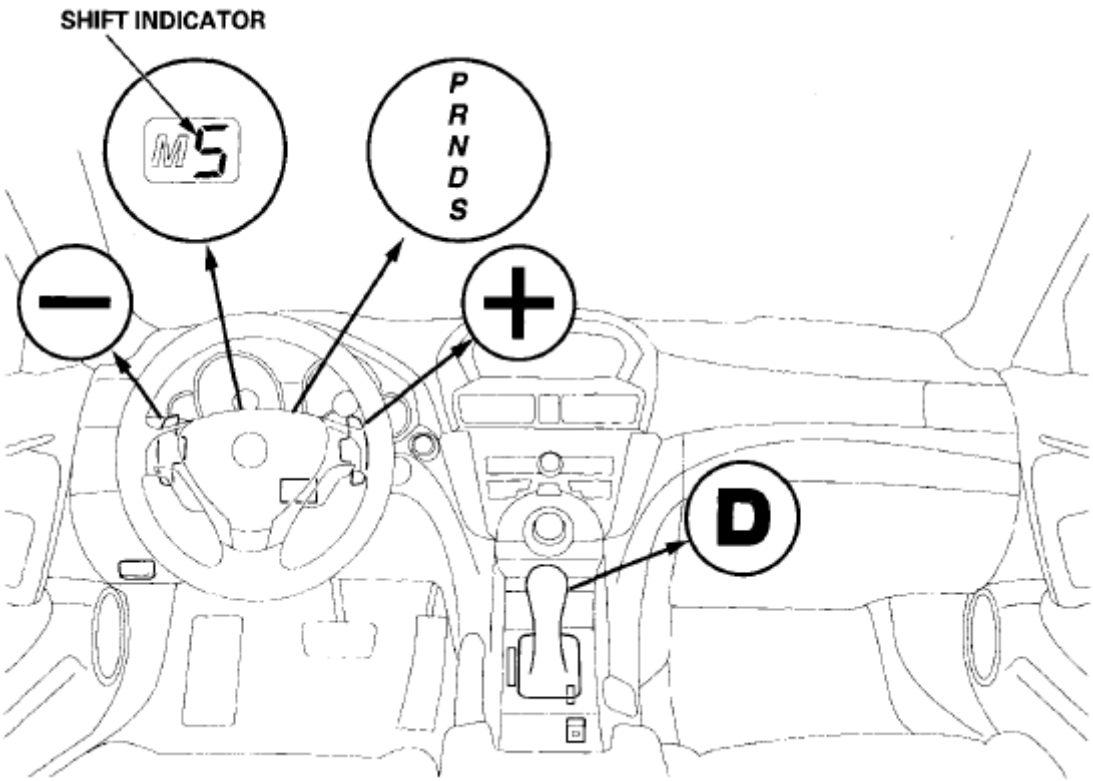

Fig. 29: Identifying Manual Shift Mode And D-Paddle Shift Mode
Courtesy of AMERICAN HONDA MOTOR CO., INC.

S Position Automatic Shift Mode and Sequential Sportshift Mode

The S position has two shifting modes; the automatic shift mode and the sequential sportshift mode. In the S position automatic shift mode, the transmission upshifts and downshifts automatically from 1st through 5th gear, if the paddle shifters are not pressed. When the paddle shifter + (upshift switch) or the paddle shifter - (downshift switch) is pressed, the automatic shift mode is canceled and the sequential sportshift mode comes into operation. The shift indicator displays the number of the selected gear. In the sequential sportshift mode, the driver can shift up and down manually from 1st through 6th gear by using the paddle shifters, much like a manual transmission. The paddle shifters are installed on the back of the steering wheel, and the driver can shift gears by pressing the paddle shifters without taking either hand off the steering wheel. In the sequential sportshift mode, the transmission must be shifted up and down by pressing the paddle shifters.

However, if the vehicle is coasting at a speed that would cause the engine to over-rev by downshifting, the transmission will not shift when the paddle shifter - is pressed. The shift indicator blinks the number of the selected gear position several times, then returns to the current gear. If the vehicle speed reaches an appropriate speed while the shift indicator is blinking, the transmission downshifts and the shift indicator displays the selected gear. Likewise, if the vehicle is driving below an appropriate speed to upshift when the paddle shifter + is pressed, the transmission will not shift. The shift indicator blinks the number of the selected gear several times, and then returns to the number of the current gear. If the vehicle speed reaches an appropriate upshift speed while the shift indicator is blinking, the transmission upshifts and the shift indicator displays the selected gear.

The sequential sportshift mode has automatic downshifting areas so the vehicle can run smoothly with more power to cope with upcoming acceleration. When coasting in 6th gear, 5th gear, or 4th gear, the transmission downshifts to the next lower gear if the vehicle slows down to the programmed speed, or by pressing the brake pedal. When the transmission decelerates to a stop, the transmission shifts to 1st gear automatically. The transmission can be shifted to 2nd gear by pressing the paddle shifter + while the vehicle is stopped, and the vehicle can start off in 2nd gear. The sequential sportshift mode is canceled when moving the shift lever to any position other than S.

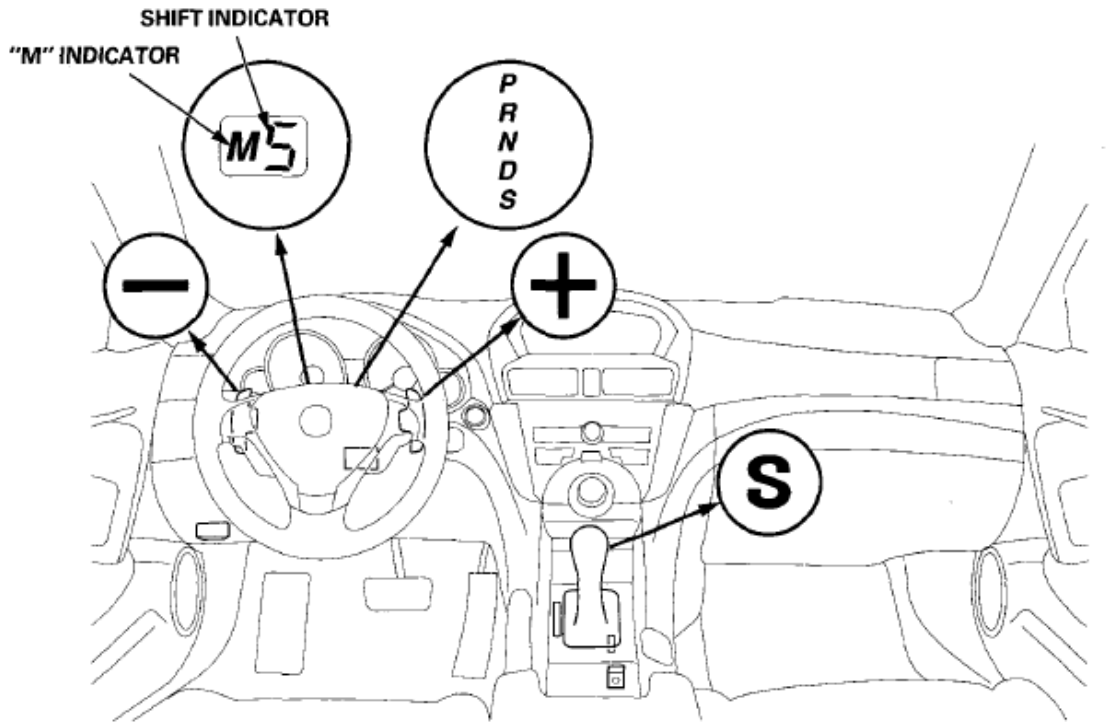

Fig. 30: Identifying S Position Automatic Shift Mode And Sequential Sport Shift Mode
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Clutch Pressure Control

The PCM actuates A/T clutch pressure control solenoid valves A, B, C, and D to control the clutch pressure. When shifting between gears or during lock-up, the clutch pressure is regulated by A/T clutch pressure control solenoid valves A, B, C, and D engages and disengages the clutch smoothly. The PCM receives input signals from the various sensors and switches, then processes the data, and outputs current to A/T clutch pressure control solenoid valves A, B, C, and D.

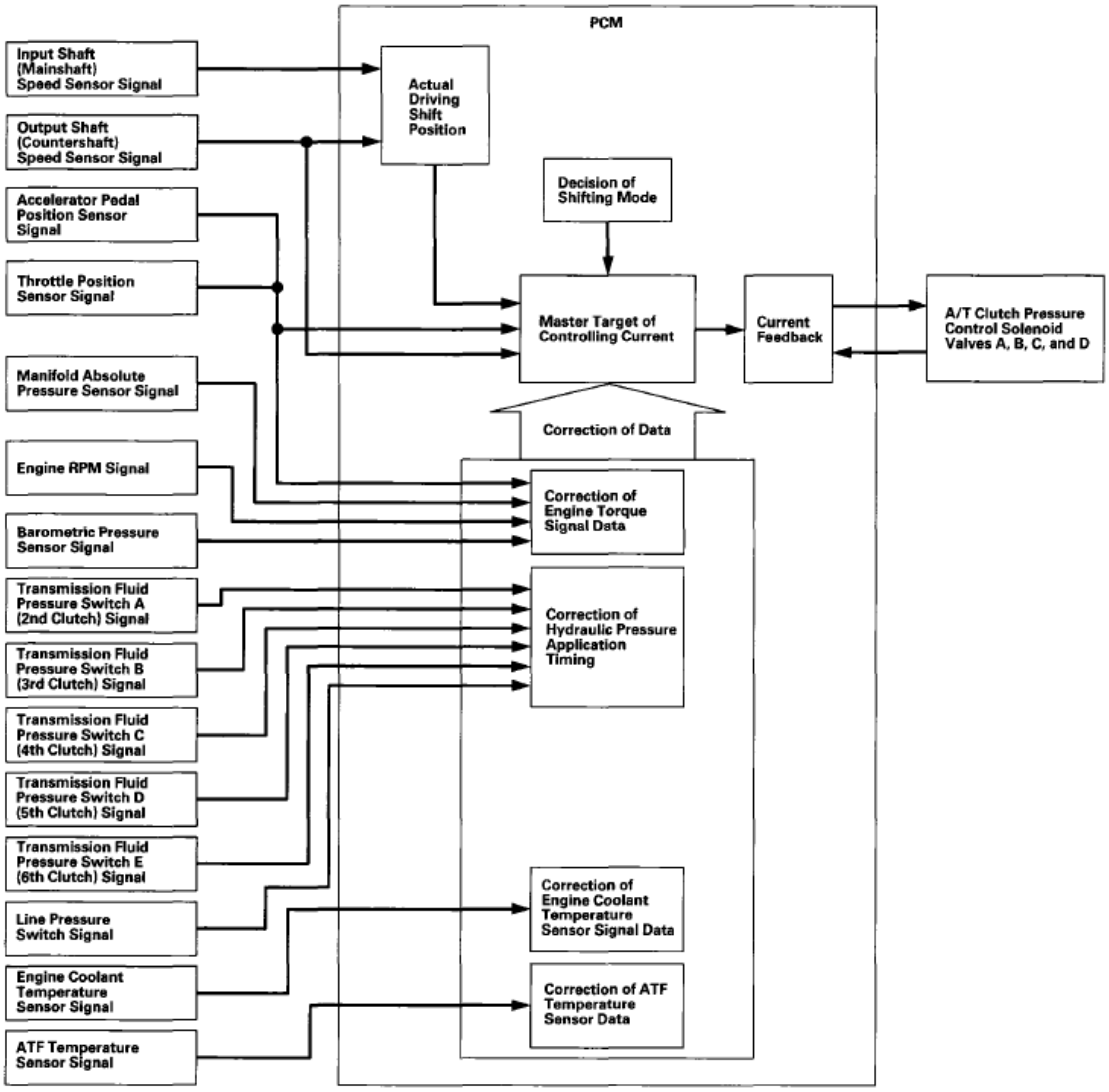

Fig. 31: Clutch Pressure Control Flow Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Lock-Up Control

Shift solenoid valve C and A/T clutch pressure control solenoid valve D control the hydraulic pressure to switch the lock-up shift valve and lock-up ON and OFF. When the PCM actuates shift solenoid valve C and A/T clutch pressure control solenoid valve D ON, lock-up starts. A/T clutch pressure control solenoid valve D applies and regulates hydraulic pressure to the lock-up control valve to control the amount of lock-up. The lock-up mechanism operates:

- D - accelerating in 1st, 2nd, 3rd, 4th, 5th, and 6th gears
- D - decelerating in 2nd, 3rd, 4th, 5th, and 6th gears
- S with automatic shift mode - accelerating in 1st, 2nd, 3rd, 4th, and 5th gears
- S with automatic shift mode - decelerating in 2nd, 3rd, 4th, and 5th gears
- S with sequential sportshift mode - accelerating in 1st, 2nd, 3rd, 4th, 5th, and 6th gears

- S with sequential sportshift mode - decelerating in 2nd, 3rd, 4th, 5th, and 6th gears

HYDRAULIC CONTROLS

The valve bodies include the main valve body, the regulator valve body, the secondary valve body, the stator shaft support, and the manual valve body. The ATF pump is driven by splines on the end of the torque converter which is attached to the engine. Fluid flows through the main regulator valve to maintain specified pressure through the manual valve body, directing pressure to each of the clutches. The hydraulic control body is attached to the secondary valve body, which includes the main shift hydraulic circuit, the solenoid valves, the hydraulic pressure switches, etc. to shorten the fluid passage and optimize the hydraulic pressure. The secondary valve body has shift solenoid valves A and B, line pressure solenoid valve A, the line pressure switch, transmission fluid pressure switch B (3rd clutch), transmission fluid pressure switch E (6th clutch), and automatic transmission (A/T) clutch pressure control solenoid valves A, B, C, and D, and is mounted to the transmission housing. Shift solenoid valve C is mounted to the torque converter housing.

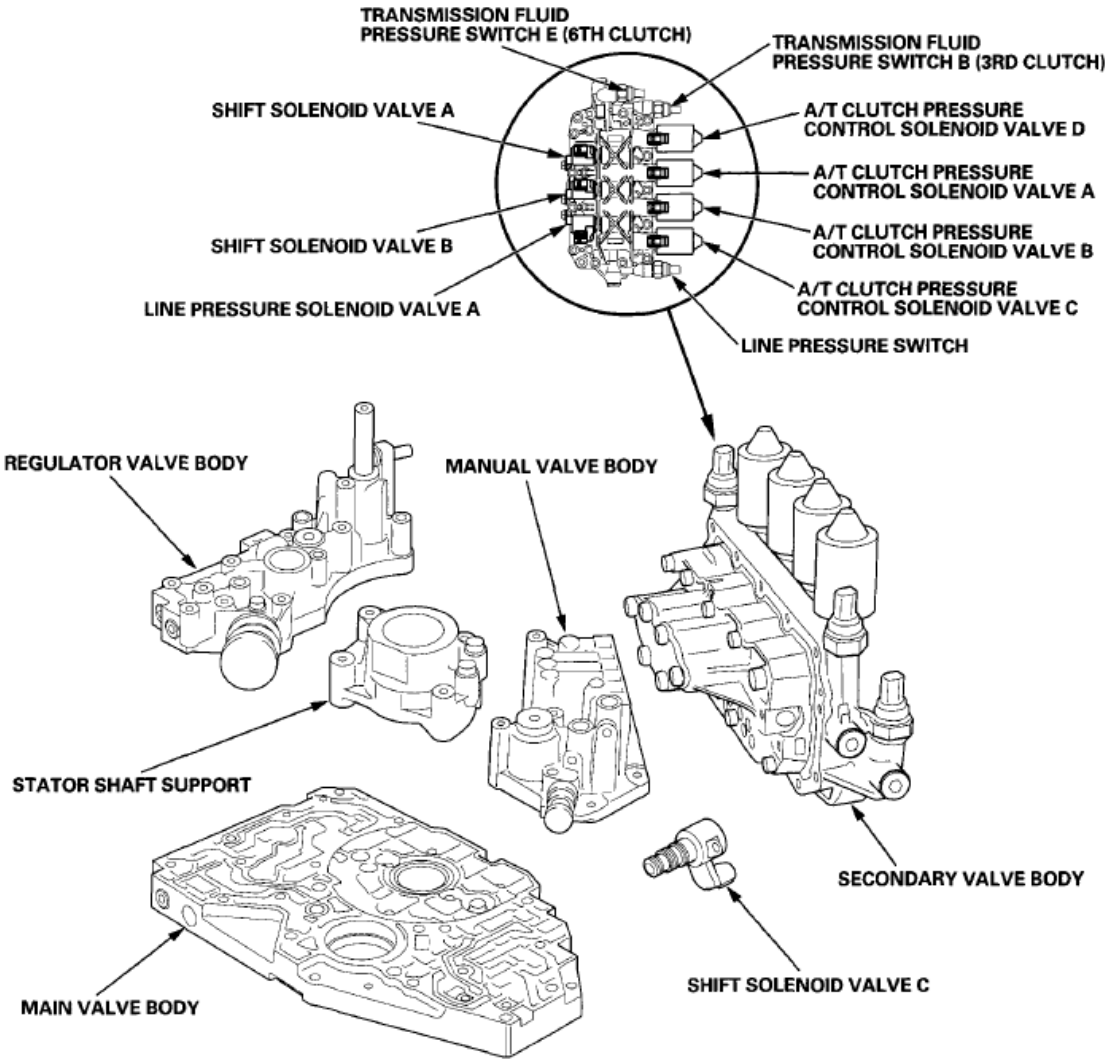

Fig. 38: Identifying Hydraulic Controls And Related Components Of Automatic Transmission
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Main Valve Body

The main valve body contains shift valve C, the D inhibitor valve, the reverse inhibitor valve, the lock-up shift valve, the lubrication regulator valve, the lubrication shift valve, the ATF pump drive gear, and the ATF pump driven gear. The primary function of the main valve body is to switch hydraulic pressure ON and OFF to control the hydraulic control system.

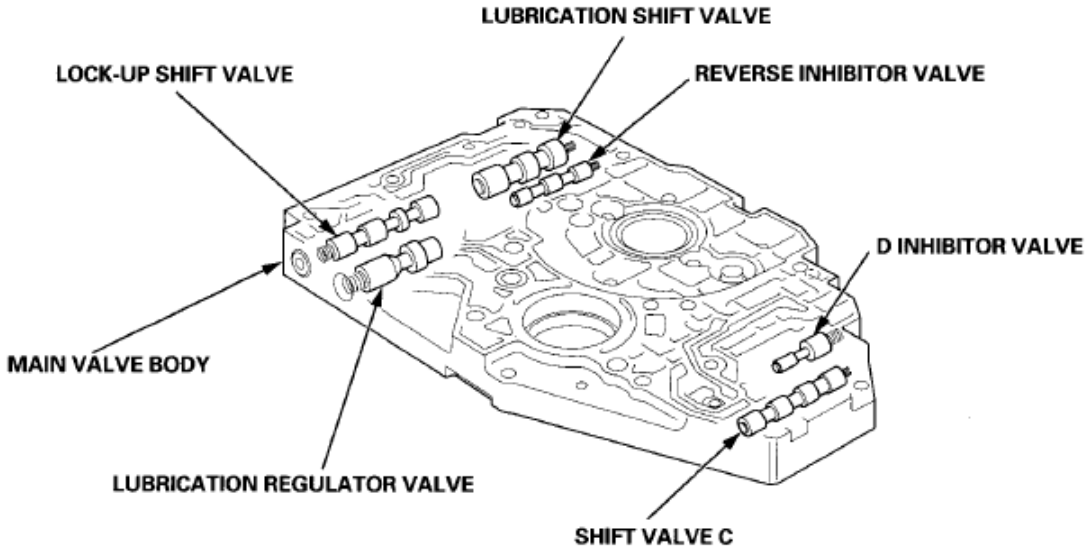

Fig. 39: Identifying Main Valve Body And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Regulator Valve Body

The regulator valve body is located on the main valve body. The regulator valve body contains the main regulator valve, the cooler relief valve, the torque converter regulator valve, the lock-up control valve, the shift fork shaft, and the 4th accumulator.

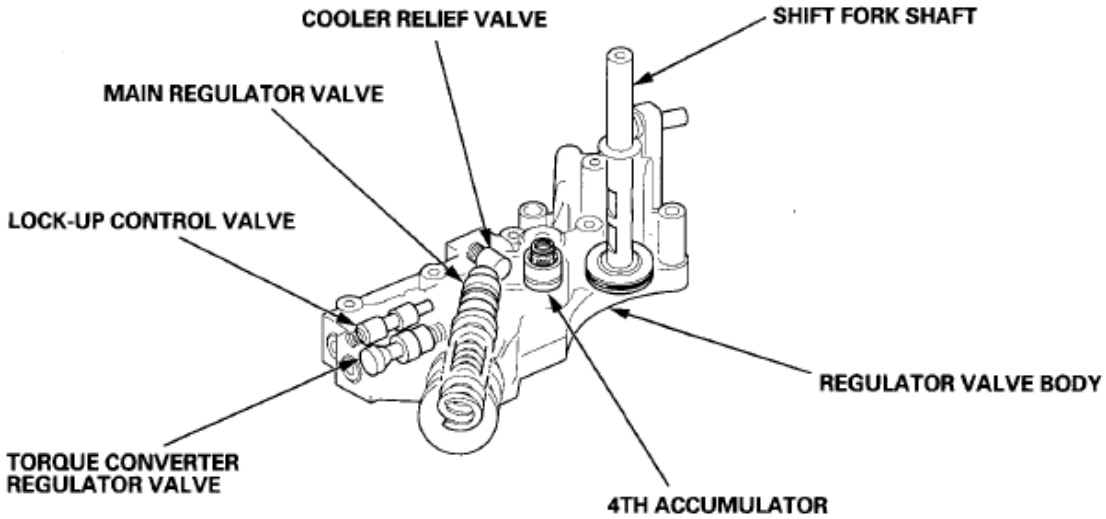

Fig. 40: Identifying Regulator Valve Body And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Main Regulator Valve

The main regulator valve maintains constant hydraulic pressure from the ATF pump to the hydraulic control system, while also providing fluid to the torque converter and the lubrication system. Fluid from ATF pump flows through the 1 cavity and the 1' cavity of the main regulator valve. Then the fluid entered in the 1' cavity

pushes the main regulator valve to the spring side, this movement uncovers the fluid ports to the torque converter and the lubrication system on the main regulator valve. The fluid flows out to the torque converter and the lubrication system, then the main regulator valve returns under spring force when the pressure in the 1' cavity of the main regulator valve is lowered below that in the 1 cavity, which covers the fluid ports to the torque converter and the lubrication system. According to the level of the hydraulic pressure through the V cavity, the position of the main regulator valve changes, and the amount of fluid from the 1 cavity through the torque converter changes. This operation is continued maintaining the line pressure.

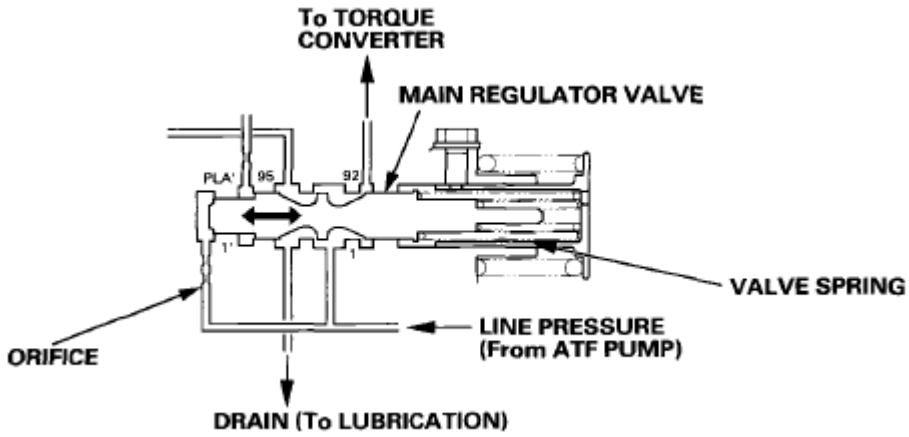

Fig. 41: Main Regulator Valve Operation Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Line Pressure Control during Low Loading

Both in D or S under low engine load condition after warming up the engine and in all ranges (P, R, N, D, or S) under the low ATF temperature condition, the PCM operates line pressure solenoid valve A, and switches the line pressure to a pressure that is lower than normal. This operation can reduce the friction in the transmission.

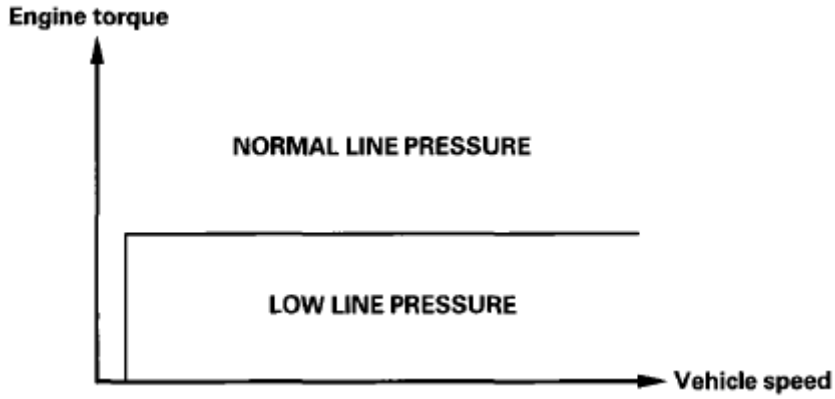

Fig. 42: Line Pressure Control Graph During Low Loading
Courtesy of AMERICAN HONDA MOTOR CO., INC.

The PCM turns line pressure solenoid valve A ON, and applies the hydraulic pressure to the PLA' cavity on the main regulator valve. When hydraulic pressure is applied to the PLA' cavity, the main regulator valve is pushed to the spring side. This operation reduces the drain port of the main regulator valve, and causes the line pressure

to be lower than normal.

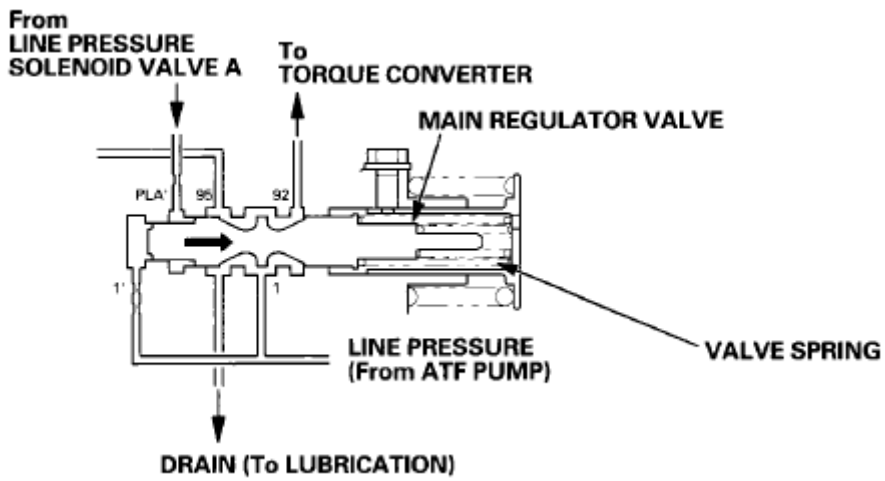

Fig. 43: Line Pressure Control During Low Loading Operation Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Line Pressure Control during High Loading

Increases in hydraulic pressure according to torque are regulated by the main regulator valve using stator torque reaction. The stator shaft is splined to the stator in the torque converter, and the stator shaft arm end contacts the regulator spring cap. When the vehicle is accelerating or climbing (torque converter range), stator torque reaction occurs on the stator shaft, and the stator shaft arm pushes the regulator spring cap in the direction of the arrow in proportion to the reaction. The stator reaction spring compresses, and the main regulator valve moves to increase the line pressure which is regulated by the main regulator valve. The line pressure reaches its maximum pressure when the stator torque reaction reaches its maximum position.

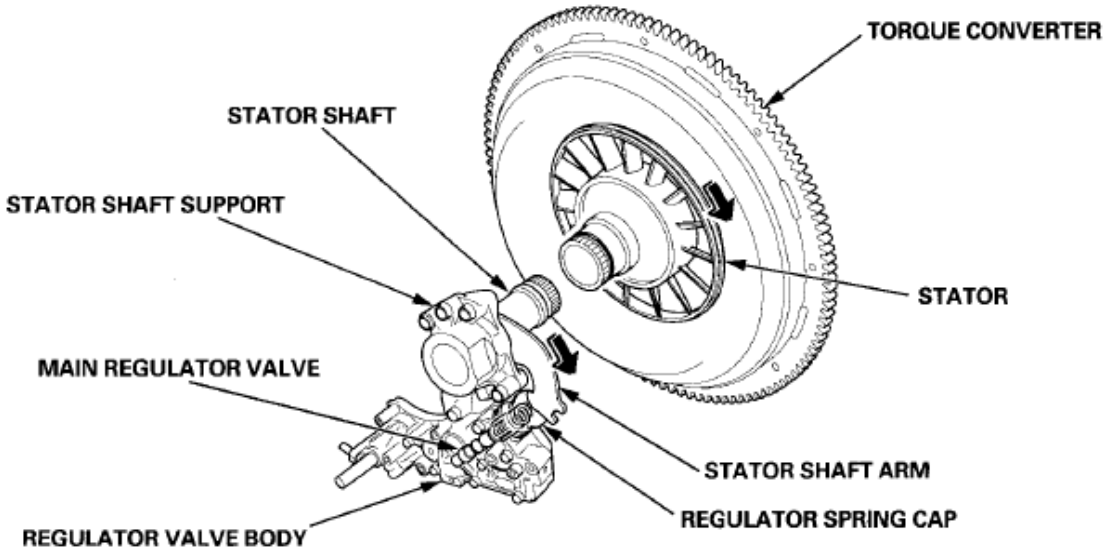

Fig. 44: Identifying Line Pressure Control During High Loading
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Secondary Valve Body

The secondary valve body contains the main shift hydraulic circuit, the solenoid valves, the hydraulic pressure switches, etc. The secondary valve body consists of shift solenoid valves A and B, line pressure solenoid valve A, A/T clutch pressure control solenoid valves A, B, C, and D, shift valves A and B, the A/T clutch pressure control solenoid valve A accumulator, the A/T clutch pressure control solenoid valve B accumulator, the A/T clutch pressure control solenoid valve C accumulator, the line pressure switch, transmission fluid pressure switch B (3rd clutch), and transmission fluid pressure switch E (6th clutch). The secondary valve body is mounted on the transmission housing.

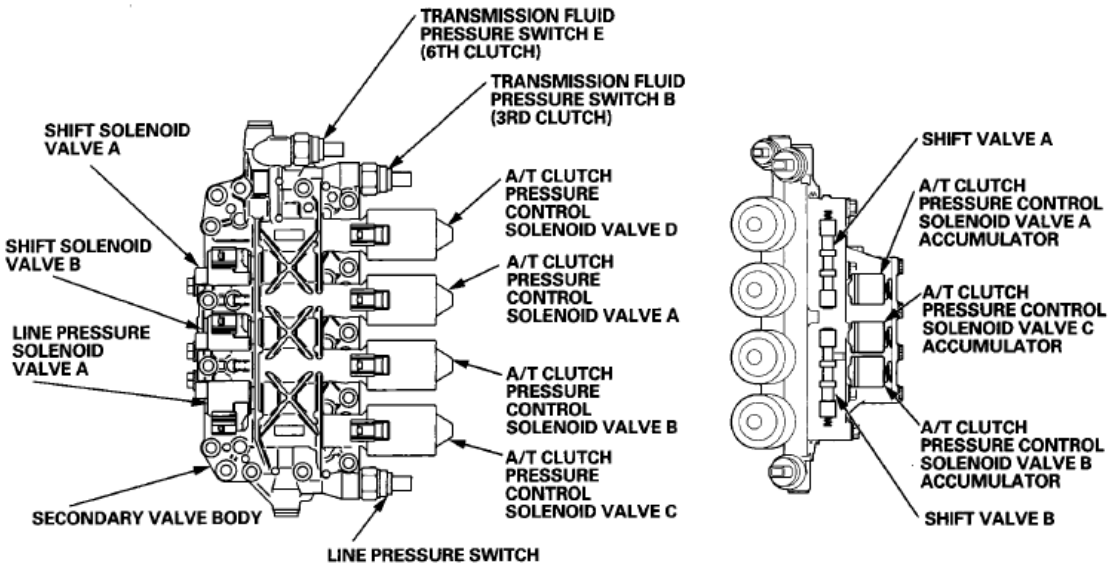

Fig. 45: Identifying Secondary Valve Body And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Manual Valve Body

The manual valve body is located on the main valve body; it contains the 1st accumulator and the manual valve.

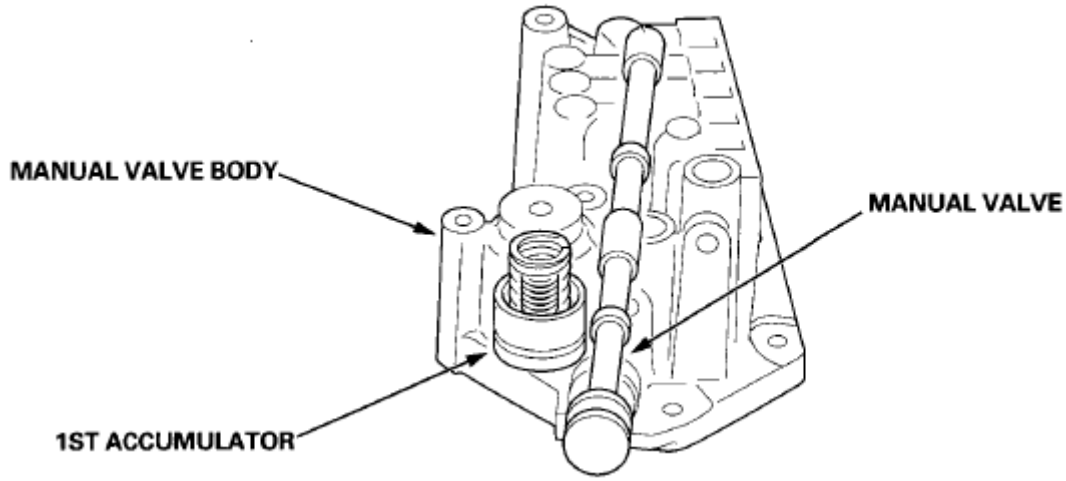

Fig. 46: Identifying Manual Valve Body And Related Components

HYDRAULIC FLOW

Distribution of Hydraulic Pressure

As the engine turns, the ATF pump starts to operate. Automatic transmission fluid (ATF) is drawn through the ATF strainer (filter) and discharged into the hydraulic circuit. Then, ATF flowing from the ATF pump becomes line pressure that is regulated by the main regulator valve. Torque converter pressure from the main regulator valve is regulated by the torque converter regulator valve and then flows to the torque converter. The torque converter regulator valve prevents torque converter pressure from rising. Line pressure also becomes torque converter clutch pressure that is regulated by the lock-up control valve, and flows to the torque converter clutch. The PCM switches shift solenoid valves ON and OFF, and it controls the shift solenoid pressure to the shift valves. Applying shift solenoid pressure to the shift valves moves the position of the shift valve, and switches the port of hydraulic pressure. The PCM also controls A/T clutch pressure control solenoid valves A, B, C, and D. The A/T clutch pressure control solenoid valves regulate hydraulic pressure, and applies the pressure to the clutch. When shifting between gears, the clutches are engaged by the A/T clutch pressure control solenoid valve pressures. The PCM actuates the shift solenoid valves to move the position of the shift valves. This movement switches the fluid flow to each clutch. Shifting is completed after the clutch is engaged by the A/T clutch pressure control solenoid valve pressures.

Shifting to N from R

Line pressure (1) regulated by the main regulator valve flows to the shift solenoid valves. The PCM switches the shift solenoid valves ON and OFF. The conditions of the shift solenoid valves and the positions of the shift valves are as follows:

- Shift solenoid valve A is ON, and opens shift solenoid valve A pressure port (SA); shift valve A is moved to the right side by hydraulic pressure (SA) from shift solenoid valve A.
- When shifting to N from R, shift solenoid valve B is OFF, and closes shift solenoid valve B pressure port (SB); shift valve B remains on the left side under a spring force, and shift valve C is moved to the left side by hydraulic pressure (4B) that is applied from shift valve A through shift valve B.

- When shifting to N from R, shift solenoid valve C is ON, and opens shift solenoid valve C pressure port (SC); the reverse inhibitor valve is moved to the left side by hydraulic pressure (SC) from shift solenoid valve C.
- The manual valve covers the ports leading pressure to the clutches in N, and hydraulic pressure is not applied to the clutches.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

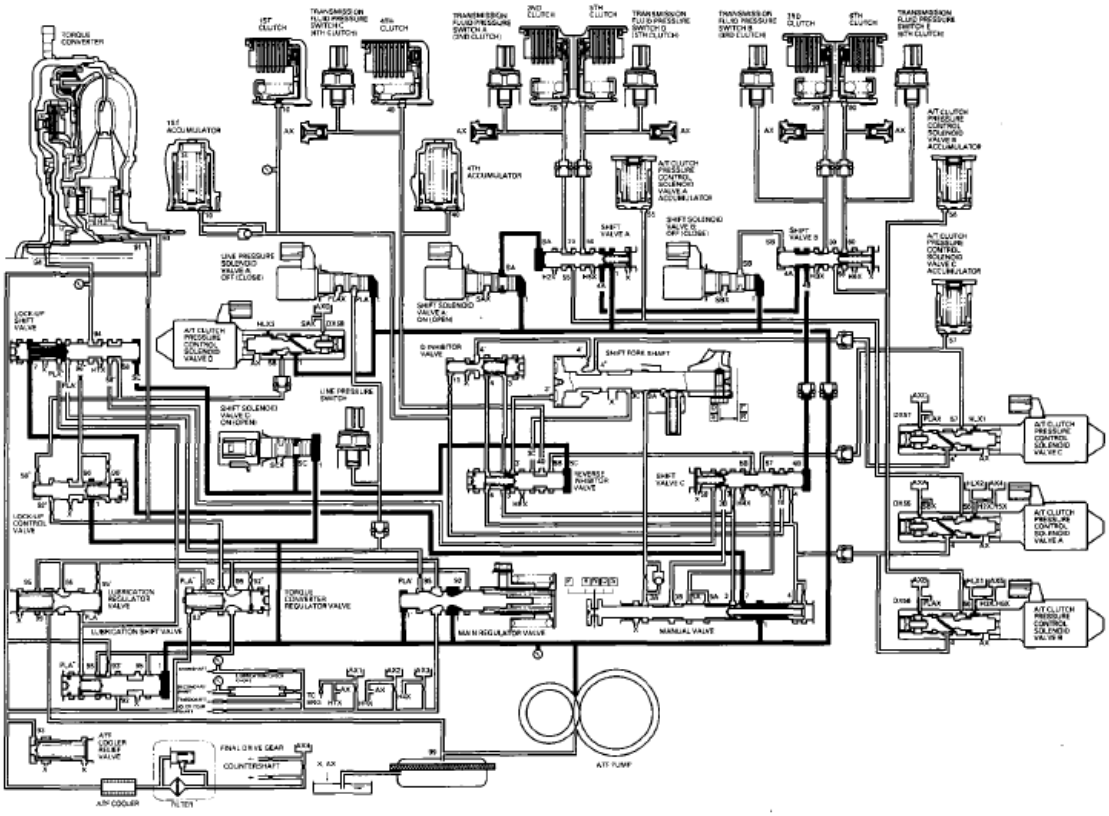

Fig. 47: Automatic Transmission Power Flow Diagram (Shifting To N From R)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shifting to N from D

Line pressure (1) regulated by the main regulator valve flows to the shift solenoid valves. The PCM switches the shift solenoid valves ON and OFF. The conditions of the shift solenoid valves and the positions of the shift valves are as follows:

- Shift solenoid valve A is ON, and opens shift solenoid valve A pressure port (SA); shift valve A is moved to the right side by hydraulic pressure (SA) from shift solenoid valve A.
- When shifting to N from D, shift solenoid valve B is ON, and opens shift solenoid valve B pressure port (SB); shift valve B is moved to the right side by hydraulic pressure (SB) from shift solenoid valve B, and shift valve C is moved to the right side by a spring force.
- When shifting to N from D, shift solenoid valve C is OFF, and closes shift solenoid valve C pressure port

(SC); the reverse inhibitor valve is moved to the right side by a spring force.

- The manual valve covers the ports leading pressure to the clutches in N, and hydraulic pressure is not applied to the clutches.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

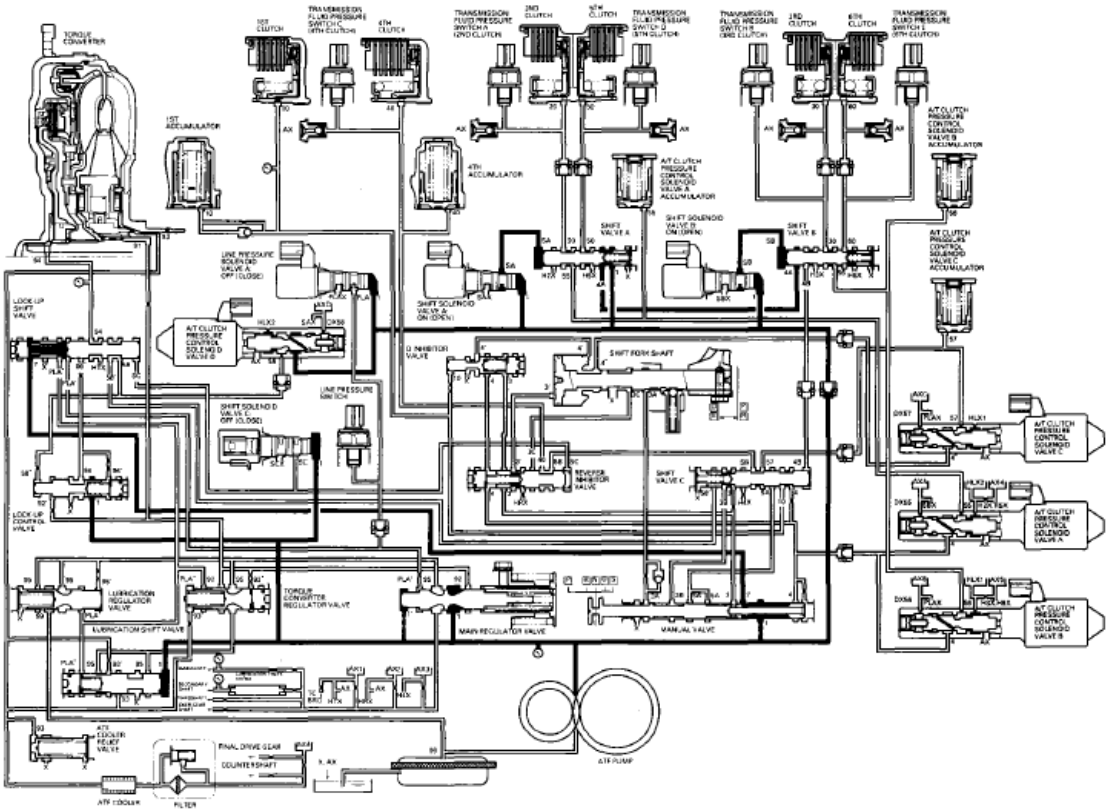

Fig. 48: Automatic Transmission Power Flow Diagram (Shifting To N From D)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shifting to D and S from N

When shifting to D or S from N, the condition of shift solenoid valves A and B remains the same as in N, and the manual valve moves to the D position. Line pressure (4) from the manual valve is applied to the shift valve C line pressure port (4) and the A/T clutch pressure control solenoid valves A pressure port (4) and B pressure port (4). As shift solenoid valve A is ON and shift solenoid valve B is OFF, the line pressure (4A) from shift valve A applies to the shift valve C pressure port (4B) through shift valve B (4A, 4B). Shift valve C remains on the left side by the hydraulic pressure (4B) from shift valve B. Immediately after moving the shift lever to D or S from N, A/T clutch pressure control solenoid valve D operates to apply A/T clutch pressure control solenoid valve D pressure (58) to the 1st clutch through lock-up shift valve pressure ports (58, 58'), shift valve C pressure ports (58', 3B), manual valve pressure ports (3B, 5A), and shift valve C pressure ports (5A, 10). A/T clutch pressure control solenoid valve D gently applies hydraulic pressure to the 1st clutch, which avoids generating shock while in gear.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

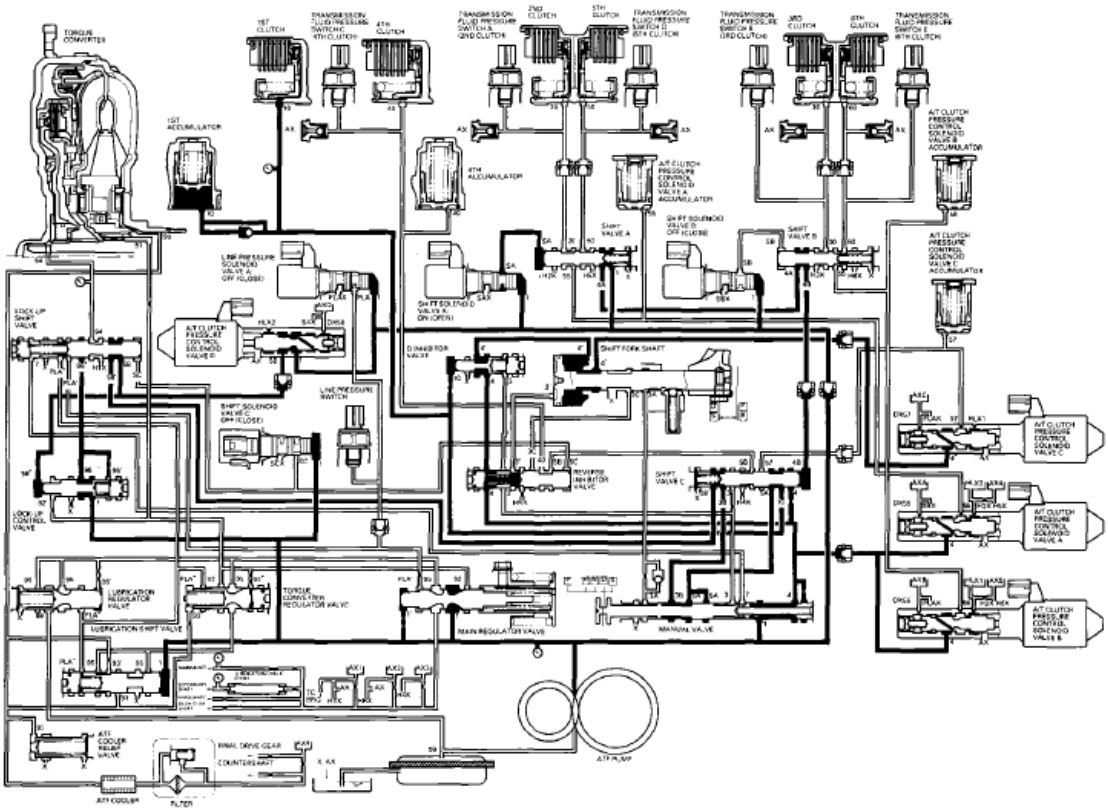

Fig. 49: Automatic Transmission Power Flow Diagram (Shifting To D And S From N)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driving in 1st gear

The PCM turns shift solenoid valves A and B ON in 1st gear. Shift solenoid valve B is turned ON from OFF to apply the shift solenoid valve B pressure (SB) to shift valve B. Shift valve B is moved to the right side by the shift solenoid valve B pressure (SB) to close the line pressure port (4B) leading to shift valve C. As the line pressure (4B) from shift valve B is not applied to shift valve C, shift valve C is moved to the right side by a spring force to connect the line pressure port (4) on shift valve C and the 1st clutch pressure port (10). With this shift valve C movement, the line pressure (4) from the manual valve becomes 1st clutch pressure (10) at shift valve C, and flows to the 1st clutch. Then the 1st clutch is engaged by 1st clutch pressure (10).

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

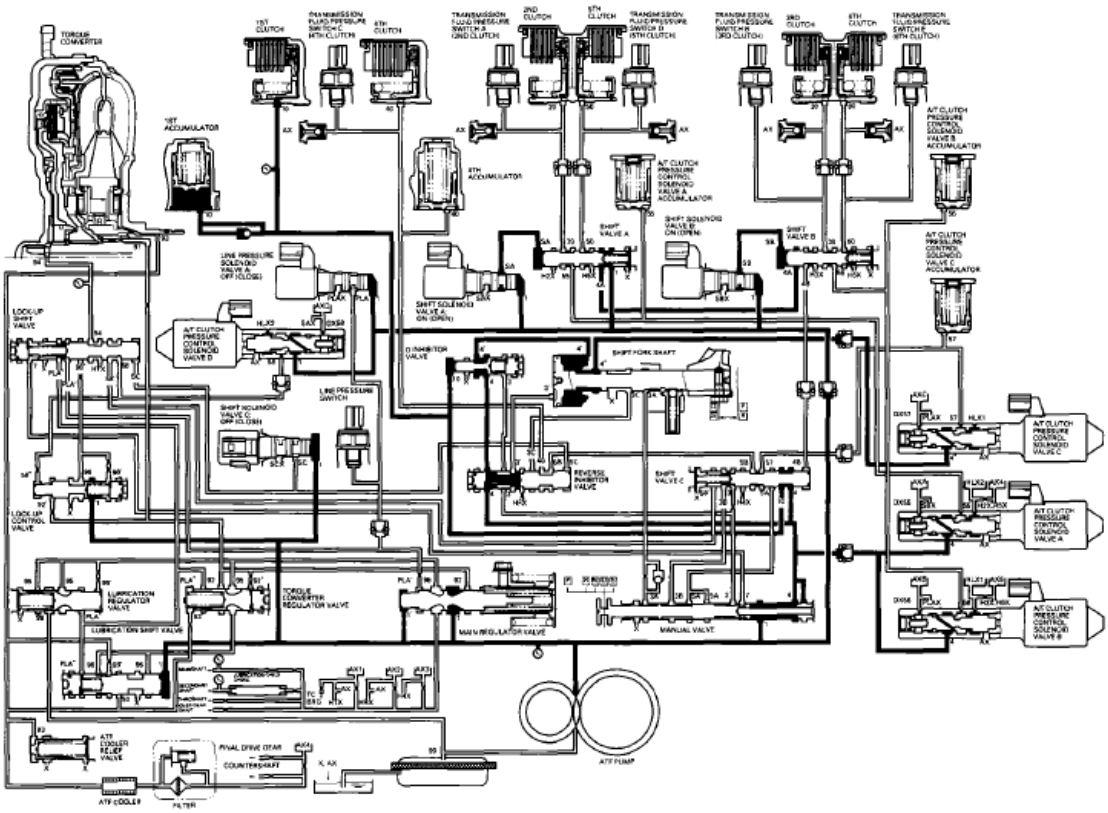

Fig. 50: Automatic Transmission Power Flow Diagram (Driving In 1st Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driving in 2nd gear

The condition of shift solenoid valves A and B in 2nd gear remains the same as in 1st gear, which turns shift solenoid valves A and B ON. As the speed of the vehicle reaches the programmed value, the PCM activates A/T clutch pressure control solenoid valve A, and applies CPC pressure (55) to shift valve A. Shift valve A remains on the right side as with the 1st gear. The CPC pressure (55) from A/T clutch pressure control solenoid valve A becomes 2nd clutch pressure (20) at shift valve A, and flows to the 2nd clutch. Then the 2nd clutch is engaged by 2nd clutch pressure (20). The 1st clutch is also engaged, but since the rotation speed of the countershaft exceeds that of 1st gear, no power is transmitted because the one-way clutch causes 1st gear to free-wheel.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

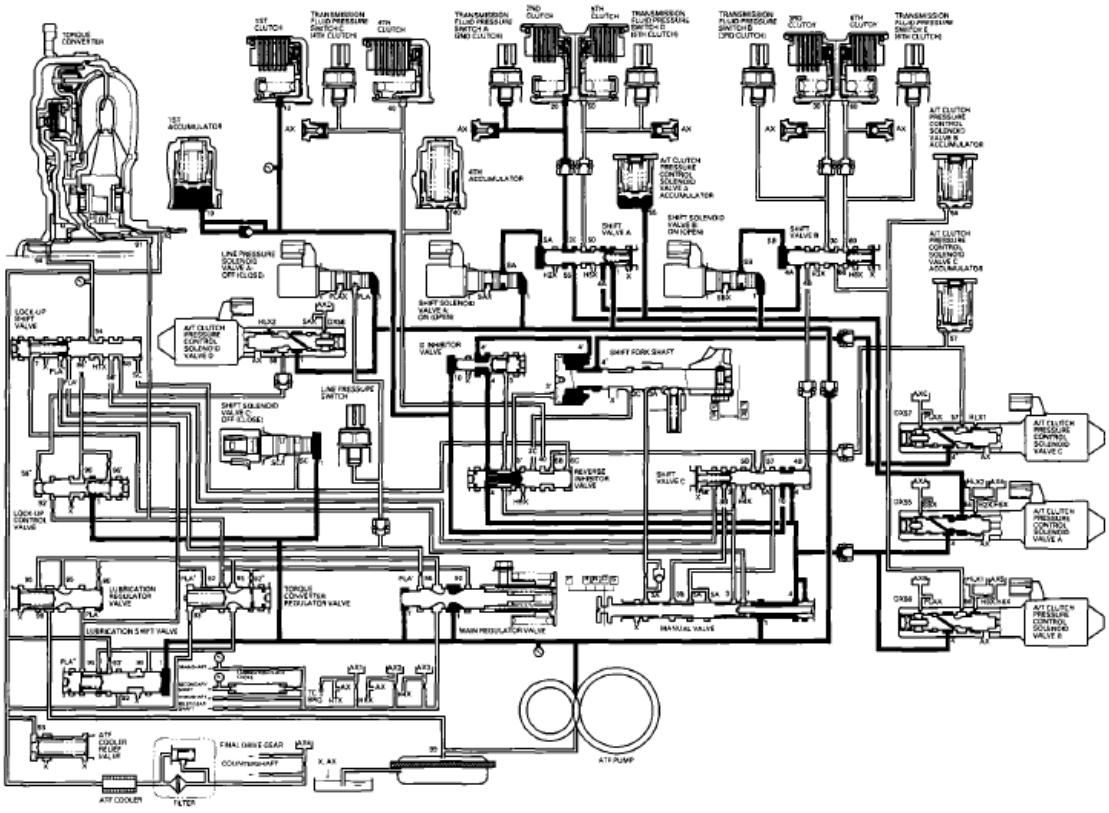

Fig. 51: Automatic Transmission Power Flow Diagram (Driving In 2nd Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driving in 3rd gear

The PCM turns shift solenoid valve A OFF and shift solenoid valve B ON in 3rd gear. As the speed of the vehicle reaches the programmed value, the PCM activates A/T clutch pressure control solenoid valve B, and applies CPC pressure (56) to the shift valve B pressure port (56). Shift valve B remains on the right side as with the 1st gear. The CPC pressure (56) from A/T clutch pressure control solenoid valve B becomes 3rd clutch pressure (30) at shift valve B, and flows to the 3rd clutch. Then the 3rd clutch is engaged by 3rd clutch pressure (30). 1st clutch is also engaged, but since the rotation speed of the countershaft exceeds that of 1st gear, no power is transmitted because the one-way clutch causes 1st gear to free-wheel.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

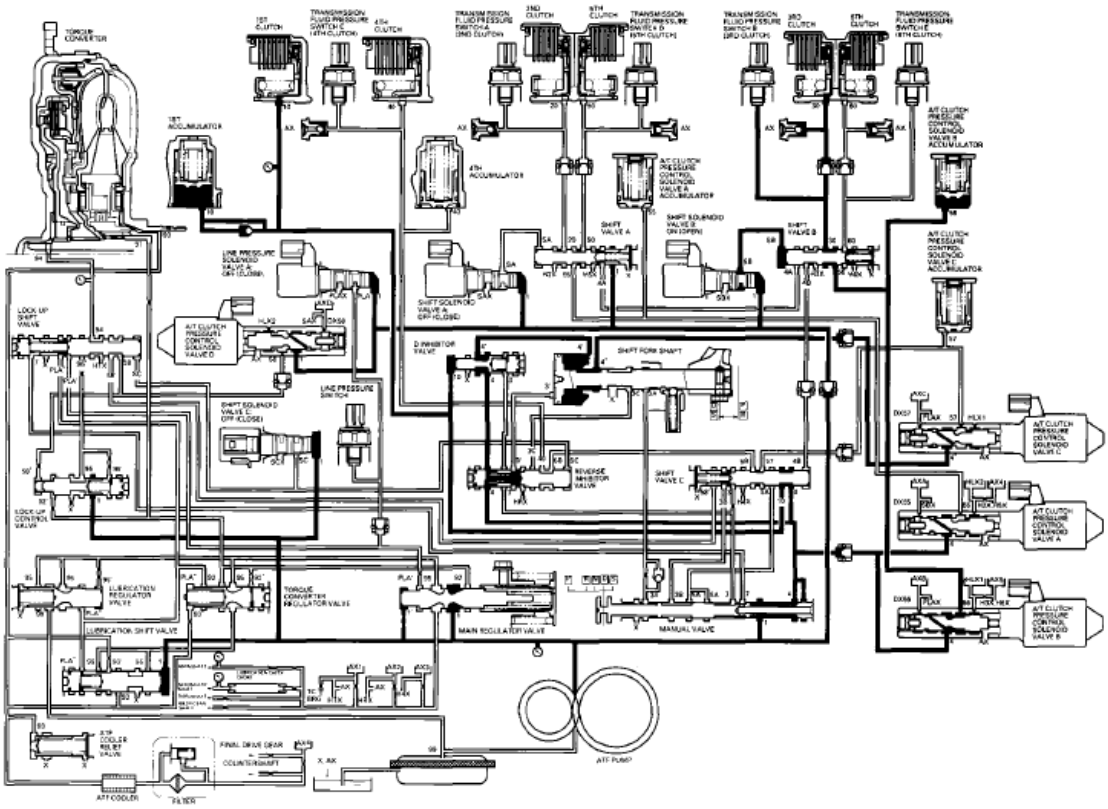

Fig. 52: Automatic Transmission Power Flow Diagram (Driving In 3rd Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driving in 4th gear

The PCM turns shift solenoid valves A OFF and shift solenoid valve B ON and OFF (depending on the shift map) in 4th gear. As the speed of the vehicle reaches the programmed value, the PCM activates A/T clutch pressure control solenoid valve C, and applies CPC pressure (57) to the shift valve C pressure port (57). As the line pressure (4B) from shift valve B is not applied to shift valve C, shift valve C is moved to the right side by a spring force to connect the CPC pressure port (57) on shift valve C and the line pressure port (5B) leading to the reverse inhibitor valve. Since reverse inhibitor valve also remains on the right side under a line pressure (4), it connects the CPC pressure port (5B) from shift valve C on the reverse inhibitor valve to the pressure port (40) leading to the 4th clutch. With this shift valve C and the reverse inhibitor valve operations, the CPC pressure (57) flows from the reverse inhibitor valve pressure port (5B, 40) to the 4th clutch through shift valve C pressure ports (57, 5B). Then the 4th clutch is engaged by 4th clutch pressure (40). 1st clutch is also engaged, but since the rotation speed of the countershaft exceeds that of 1st gear, no power is transmitted because the one-way clutch causes 1st gear to free-wheel.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

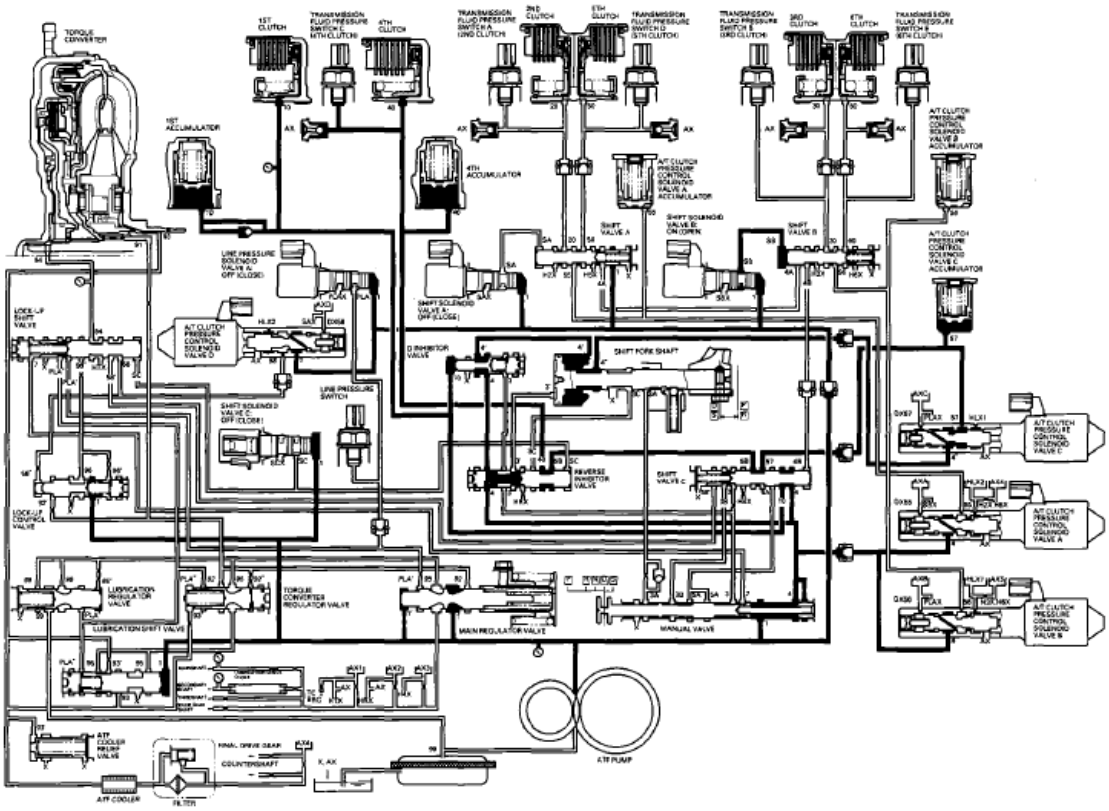

Fig. 53: Automatic Transmission Power Flow Diagram (Driving In 4th Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driving in 5th gear

The condition of shift solenoid valves A and B in 5th gear remains the same as in 4th gear, which turns shift solenoid valve A OFF and shift solenoid valve B ON and OFF (depending on the shift map). As the speed of the vehicle reaches the programmed value, the PCM activates A/T clutch pressure control solenoid valve A, and applies CPC pressure (55) to the shift valve A pressure port (55). As shift solenoid valve A remains OFF, shift valve A is moved to the left side by a spring force, to connect the CPC pressure port (55) on shift valve A and the 5th clutch pressure port (50). With this shift valve A movement, the CPC pressure (55) becomes 5th clutch pressure (50) at shift valve A, and flows to the 5th clutch. Then the 5th clutch is engaged by 5th clutch pressure (50). 1st clutch is also engaged, but since the rotation speed of the countershaft exceeds that of 1st gear, no power is transmitted because the one-way clutch causes 1st gear to free-wheel.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

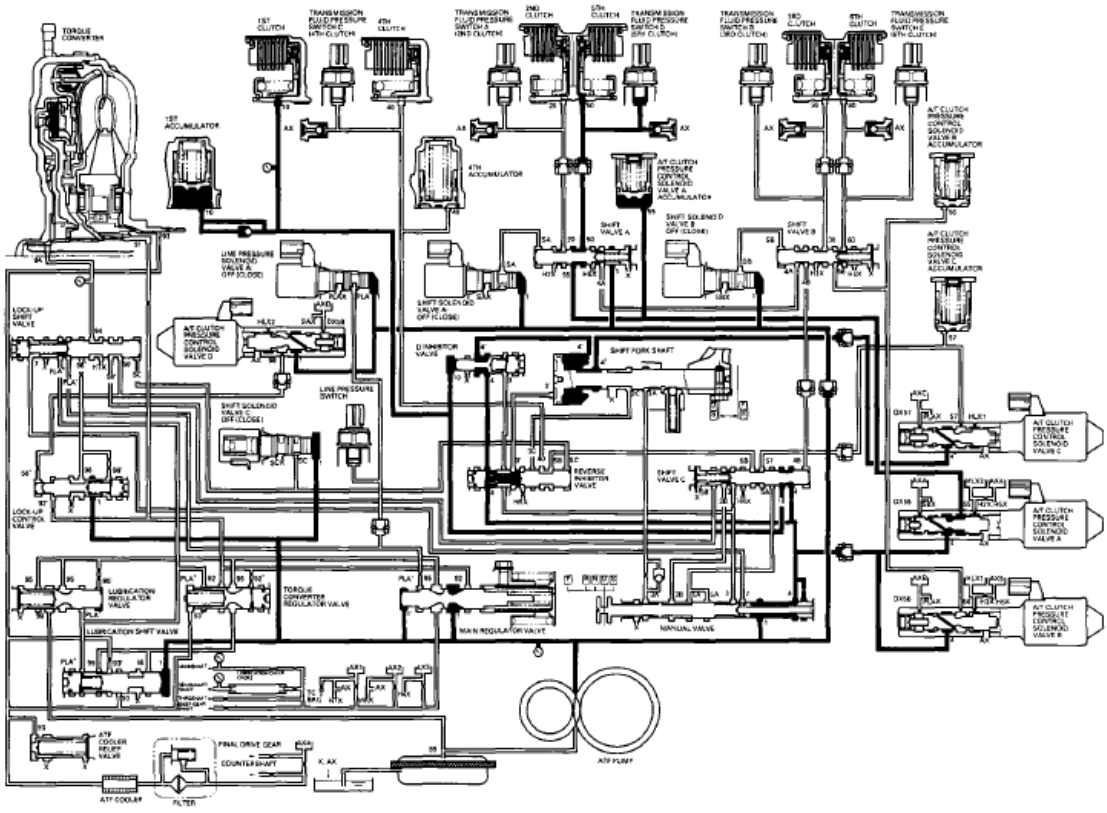

Fig. 54: Automatic Transmission Power Flow Diagram (Driving In 5th Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driving in 6th gear

The PCM turns shift solenoid valves A and B OFF in 6th gear. As the speed of the vehicle reaches the programmed value, the PCM activates A/T clutch pressure control solenoid valve B, and applies CPC pressure (56) to the shift valve B pressure port (56). As shift solenoid valve B remains OFF, shift valve B is moved to the left side by a spring force, to connect the CPC pressure port (56) on shift valve B and the 6th clutch pressure port (60). With this shift valve B movement, the CPC pressure (56) becomes 6th clutch pressure (60) at shift valve B, and flows to the 6th clutch. Then the 6th clutch is engaged by 6th clutch pressure (60). 1st clutch is also engaged, but since the rotation speed of the countershaft exceeds that of 1st gear, no power is transmitted because the one-way clutch causes 1st gear to free-wheel.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

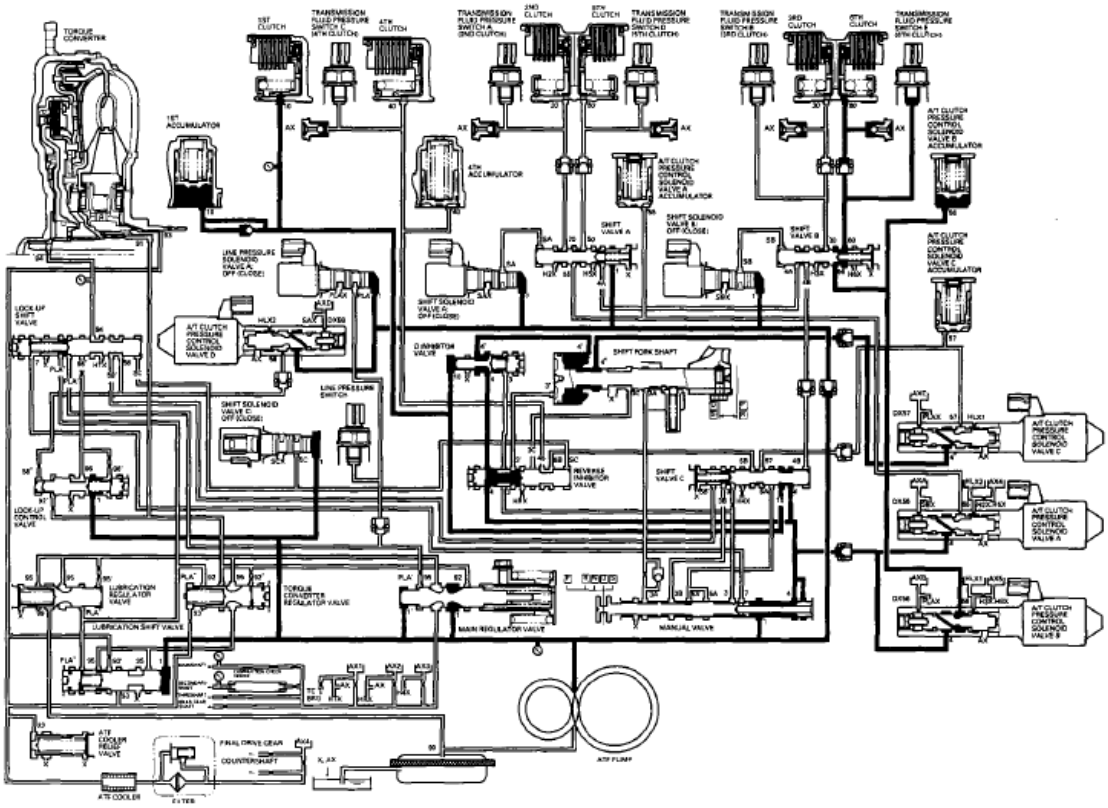

Fig. 55: Automatic Transmission Power Flow Diagram (Driving In 6th Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shifting to R from N

The vehicle is moved backward by engaging the 4th clutch. When shifting to R from N, shift solenoid valve A turns ON, shift solenoid valve B turns OFF, and shift solenoid valve C turns ON, and the manual valve moves to the R position. Line pressure (3) from the manual valve is applied to the shift valve C line pressure port (3) and the reverse inhibitor valve line pressure port (3). Reverse inhibitor valve is moved to the left side by the shift solenoid valve C pressure (SC) to connect the line pressure port (3C) from the shift fork shaft on the reverse inhibitor valve and the 4th clutch pressure port (40) leading to the 4th clutch. As the line pressure (1, 4A) flows from shift valve A to the shift valve C line pressure port (4B) through shift valve B (4A, 4B), shift valve C is moved to the left side. Immediately after moving the shift lever to R from N, A/T clutch pressure control solenoid valve D operates to apply the A/T clutch pressure control solenoid valve D pressure (58) to the 4th clutch through lock-up shift valve pressure ports (58, 58'), shift valve C pressure ports (58', 3B), manual valve pressure ports (3B, 3A), shift fork shaft pressure ports (3A, 3C), and reverse inhibitor valve pressure ports (3C, 40). Then, A/T clutch pressure control solenoid valve D gently applies hydraulic pressure to the 4th clutch, which avoids generating shock while in gear.

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

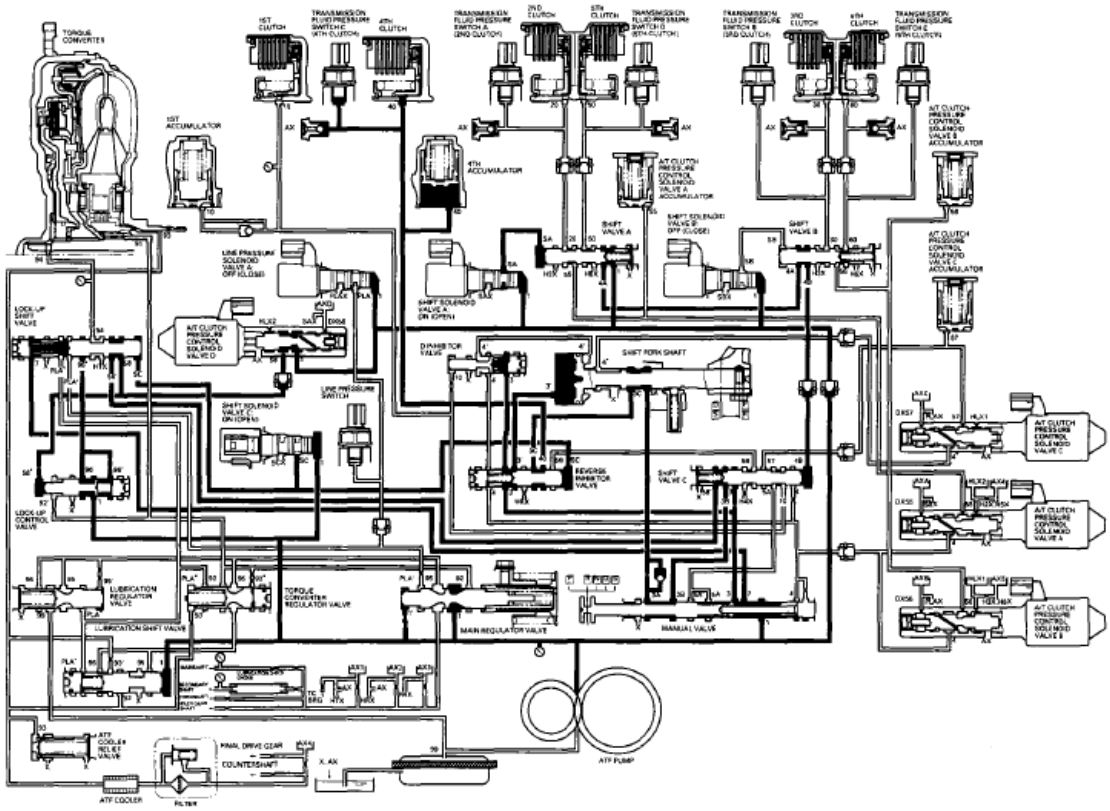

Fig. 56: Automatic Transmission Power Flow Diagram (Shifting To R From N)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Driving in R

The vehicle is moved backward by engaging the 4th clutch and reversing the mainshaft rotation with the reverse idler gear. Shift solenoid valves A and B remain OFF, and shift solenoid valve C turns ON when the vehicle moving backward. As shift solenoid valves A and B remain OFF, shift valve C is moved to the right side by a spring force to connect the line pressure port (3) on shift valve C and the line pressure port (3B) leading to the reverse inhibitor valve. The reverse inhibitor valve is moved to the left side by the shift solenoid valve C pressure (SC) to connect the line pressure port (3C) from the shift fork shaft on the reverse inhibitor valve and the 4th clutch pressure port (40) leading to the 4th clutch. The line pressure (3) from the manual valve is also applied to the shift fork shaft line pressure port (31) through the reverse inhibitor valve line pressure ports (3, 3'), which moves the shift fork shaft to the right side, and connects the port (3A) from the manual valve on the shift fork shaft to the line pressure port (3C) leading to the reverse inhibitor valve. With this shift valve C, reverse inhibitor valve, and shift fork shaft movement, the line pressure (3C) becomes 4th clutch pressure (40) at the reverse inhibitor valve, and flows to the 4th clutch. Then the 4th clutch is engaged by 4th clutch pressure (40).

Reverse Inhibitor Control

When R is selected while the vehicle is moving forward at speeds over 6 mph (10 km/h), the PCM commands shift solenoid valve C to remain OFF so that shift solenoid valve C pressure (SC) is not applied to the reverse inhibitor valve. Line pressure (3) stops at the reverse inhibitor valve, and is not applied to the shift fork shaft. This control does not switch to the hydraulic circuit leading to reverse while the vehicle is moving forward at

speeds over 6 mph (10 km/h).

NOTE: When used, "left" or "right" indicates direction on the hydraulic circuit.

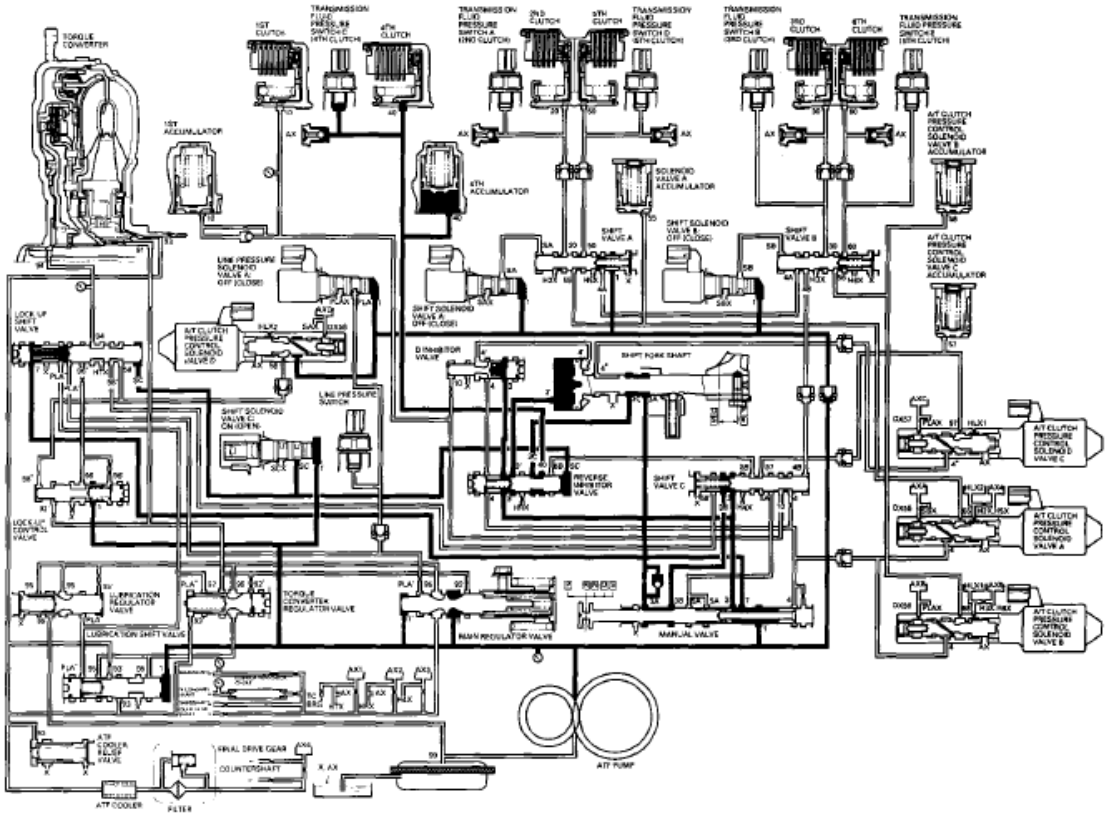

Fig. 57: Automatic Transmission Power Flow Diagram (Driving In R)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

LOCK-UP SYSTEM

The lock-up mechanism operates in D (during accelerating: 1st, 2nd, 3rd, 4th, 5th, and 6th gears/during decelerating: 2nd, 3rd, 4th, 5th, and 6th gears), S with automatic shift mode (during accelerating: 1st, 2nd, 3rd, 4th, and 5th gears/during decelerating: 2nd, 3rd, 4th, and 5th gears), and S with sequential sportshift mode (during accelerating: 1st, 2nd, 3rd, 4th, 5th, and 6th gears/during decelerating: 2nd, 3rd, 4th, 5th, and 6th gears). The pressurized fluid is supplied through a lock-up fluid passage in the torque converter, causing the torque converter clutch in the torque converter to be engaged. As this takes place, the mainshaft rotates at the same speed as the engine crankshaft. The PCM controls the shift solenoid valve C pressure and A/T clutch pressure control solenoid valve D pressure to optimize the lock-up timing and the amount of the lock-up. The shift solenoid C pressure operates the lock-up shift valve to switch the lock-up ON and OFF. The A/T clutch pressure control solenoid valve D pressure operates the lock-up control valve to control the degree of lock-up.

Torque Converter Clutch Lock-Up ON (Engaging Torque Converter Clutch)

The fluid pressure is applied to the lock-up fluid passage (94) in the torque converter, causing the torque converter clutch in the torque converter to be engaged and then the turbine and the torque converter cover to be

engaged. The mainshaft rotates at the same speed as the engine crankshaft when the torque converter clutch in the torque converter is engaged.

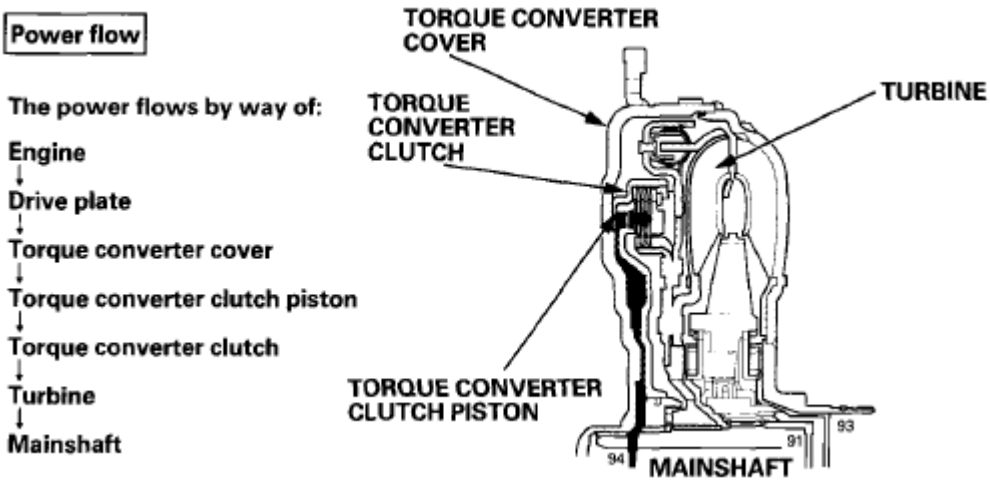

Fig. 58: Identifying Torque Converter Clutch Lock-Up ON
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Torque Converter Clutch Lock-Up OFF (Disengaging Torque Converter Clutch)

When the fluid pressure to the lock-up fluid passage (94) in the torque converter is blocked, the torque converter clutch in the torque converter is released. The turbine and the torque converter cover are also released at this time, causing the mainshaft and the engine crankshaft to rotate at a different speed.

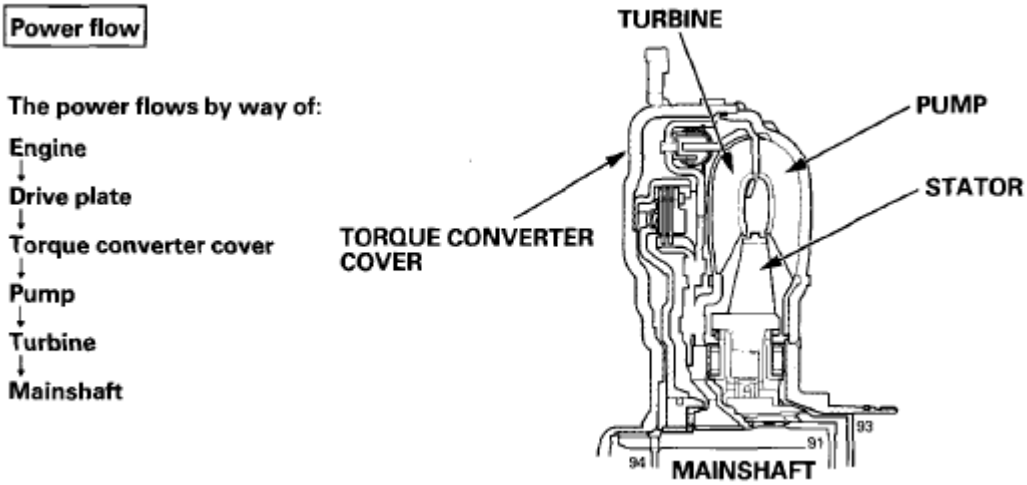

Fig. 59: Identifying Torque Converter Clutch Lock-Up OFF
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT LOCK SYSTEM

The shift lock system prevents the shift lever from moving unless certain conditions are met. The shift lock solenoid is normally OFF. After starting the engine in P, the shift lever cannot move to any other position

because the shift lock stop stops the lock pin. When the brake pedal is pressed and the accelerator pedal is not pressed, the PCM commands the shift lock solenoid is ON; the shift lock solenoid plunger pulls the shift lock stop to release the lock pin. Pressing the shift lever button allows the shift lever to move to any other position. When the brake pedal and the accelerator pedal are pressed at the same time, the PCM does not command the solenoid ON and the shift lock system remains locked.

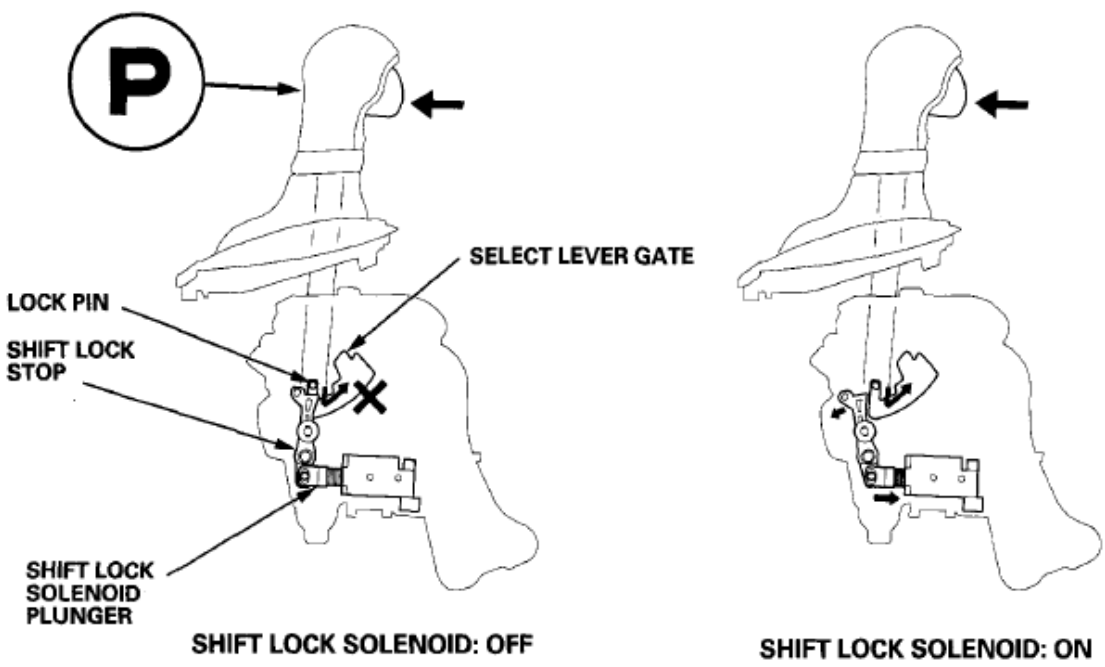

Fig. 60: Identifying Shift Lock Solenoid
Courtesy of AMERICAN HONDA MOTOR CO., INC.

When the shift lock system does not operate due to mechanical or electrical problem, you can unlock the shift lock temporarily by inserting the ignition key into the shift lock release hole and pressing the shift lock release. When the shift lock release is pressed, the shift lock stop releases the lock pin, and the shift lever can move to any other position.

DTC TROUBLESHOOTING

DTC P0705: SHORT IN TRANSMISSION RANGE SWITCH CIRCUIT (MULTIPLE SHIFT-POSITION INPUT)

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see**

GENERAL TROUBLESHOOTING INFORMATION).

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Compare the ATPP, ATPR, ATPN, ATPD, ATPS, ATPFWD, and ATPRVS inputs with the HDS to the following table, in each shift lever position.

	ATP P	ATP R	ATP N	ATP D	ATP S	ATP FWD	ATP RVS
P	o	X	X	X	X	X	X
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	X
D	X	X	X	o	X	o	X
S	X	X	X	X	o	o	X
o: ON X: OFF							

Do the transmission range switch signals match?

YES - Intermittent failure, the system is OK at this time.

NO - Go to step 3.

3. Compare the ATPP, ATPR, ATPN, ATPD, ATPS, ATPFWD, and ATPRVS inputs with the HDS to the table in step 2, in each shift lever position.

Are any transmission range switch signals ON in all shift lever positions?

YES - Go to step 9.

NO - Record the input that did not indicate ON, then go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the transmission range switch connector.
6. Connect the transmission range switch connector terminal which incorrectly indicates ON in step 3 to body ground with a jumper wire.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Compare the ATPP, ATPR, ATPN, ATPD, ATPS, ATPFWD, and ATPRVS inputs with the HDS to the table in step 2.

Do multiple transmission range switch signals indicate ON?

YES - Repair a short in the wires between the transmission range switch and the PCM, refer to the following table.

NO - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**).

	ATP P	ATP R	ATP N	ATP D	ATP S	ATP FWD	ATP RVS
PCM	A16	C25	C26	C17	C46	C18	C19
Transmission Range Switch	7	8	4	9	10	5	1

9. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Disconnect the transmission range switch connector.
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Check the transmission range switch signal that remained ON with the HDS.

    Does any transmission range switch signals remain ON?

    YES - Go to step 13.

    NO - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**).

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Check for continuity to body ground in the circuit that remained ON in step 2.

    Does the circuit that indicated ON have continuity to ground?

    YES - Repair a short to body ground in the wire between the corresponding transmission range switch connector terminal and the PCM.

    NO - Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**). If the PCM was updated, replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0706: OPEN IN TRANSMISSION RANGE SWITCH CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Make sure the shift cable is adjusted properly (see **SHIFT CABLE ADJUSTMENT**).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Compare the ATPP, ATPR, ATPN, ATPD, ATPS, ATPFWD, and ATPRVS inputs with the HDS to the following table, in each shift lever position.

	ATP P	ATP R	ATP N	ATP D	ATP S	ATP FWD	ATP RVS

p	o	X	X	X	X	X	X
R	X	o	X	X	X	X	o
N	X	X	o	X	X	X	X
D	X	X	X	o	X	o	X
S	X	X	X	X	o	o	X
o: ON X: OFF							

Do the transmission range switch signals match?

YES - Intermittent failure, the system is OK at this time.

NO - Go to step 4.

4. Compare the ATPP, ATPR, ATPN, ATPD, ATPS, ATPFWD, and ATPRVS inputs with the HDS to the table in step 3, in each shift lever position.

   Do all signals remain OFF?

   YES - Go to step 14.

   NO - Record the input that did not indicate ON, then go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the transmission range switch connector.
7. Connect the transmission range switch connector terminal which did not indicate ON in step 4 to body ground with a jumper wire.
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the transmission range switch signal that did not indicate ON with the HDS.

   Does the transmission range switch signal indicate ON?

   YES - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**).

   NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector A (49P) or C (49P).
13. Check for continuity between the transmission range switch connector terminal and the PCM connector terminal of the input which indicated OFF. Refer to the following table.

	ATP P	ATP R	ATP N	ATP D	ATP S	ATP FWD	ATP RVS

PCM	A16	C25	C26	C17	C46	C18	C19
Transmission Range Switch	7	8	4	9	10	5	1

Is there continuity?

YES - Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**). If the PCM was updated, replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between the corresponding transmission range switch connector terminal and the PCM.

14. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
15. Disconnect the transmission range switch connector.
16. Check for continuity between transmission range switch connector terminal No. 6 and body ground.

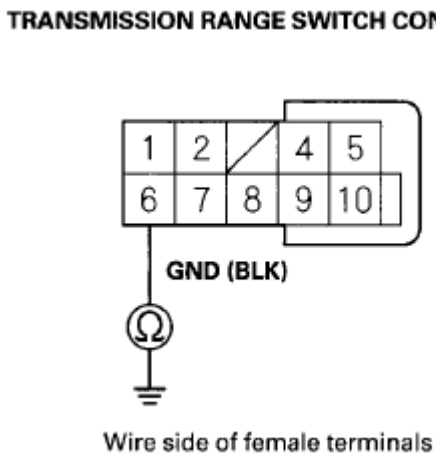

Fig. 64: Checking Continuity Between Transmission Range Switch Connector Terminal No. 6 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**).

NO - Repair an open in the wire between the transmission range switch and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

DTC P0711: PROBLEM IN ATF TEMPERATURE SENSOR CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the ATF Temperature with the HDS in the A/T Data List.

   Does the ATF Temperature indicate - 4°F (- 20°C) or below?

   YES - Go to step 3.

   NO - Go to step 5.

3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
4. Check the ATF Temperature with the HDS in the A/T Data List.

   Does the ATF Temperature remain - 4°F (- 20°C) or below?

   YES - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**), then go to step 8.

   NO - Intermittent failure, the system is OK at this time. If there is an abnormal temperature rise in the ATF temperature sensor, go to step 16.

5. Check the ATF Temperature with the HDS in the A/T Data List.

   Does the ATF Temperature exceed 230°F (110°C)?

   YES - Go to step 6.

   NO - Intermittent failure, the system is OK at this time.

6. Let the engine cool until the Engine Coolant Temperature reads 122°F (50°C) or below with the HDS in the A/T Data List.
7. Check the ATF Temperature with the HDS in the A/T Data List.

   Does the ATF Temperature remain 230°F (110°C) or higher?

   YES - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**), then go to step 8.

   NO - Intermittent failure, the system is OK at this time. If there is an abnormal decrease in temperature of the ATF temperature sensor, go to step 16.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Clear the DTC with the HDS.

10. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and allow the engine coolant to cool down to outside air temperature.
12. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

    Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait for 20 seconds, then start the engine. Warm the engine up to normal operating temperature (the radiator fan comes on). Start off in D, accelerate with the throttle opened at least 4 degrees, and run the vehicle at speeds over 19 mph (30 km/h) for at least 5 minutes. Or test-drive the vehicle for at least 20 seconds while the ATF temperature reads - 4°F to 230°F (- 20°C to 110°C) by monitoring with the HDS. Slowdown, and stop the wheels.
14. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0711 indicated?

    YES - Check for poor connections or loose terminals between the ATF temperature sensor and the PCM, then go to step 1.

    NO - Go to step 15.

15. Monitor the OBD STATUS for P0711 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were found in step 14, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the HDS indicates FAILED, check for poor connections and loose terminals at the ATF temperature sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 10.

16. Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
17. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and allow the engine coolant to cool down to outside air temperature.
19. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

    Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

20. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and wait for 20 seconds, then start the engine. Warm the engine up to normal operating temperature (the radiator fan comes on). Start off in D, accelerate with the throttle opened at least 4 degrees, and run the vehicle at speeds over 19 mph (30 km/h) for at least 5 minutes. Or test-drive the vehicle for at least 20 seconds while the ATF temperature reads - 4°F to 230°F (- 20°C to 110°C) by monitoring with the HDS. Slow down, and stop the wheels.
21. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0711 indicated?

    YES - Check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 17. If the PCM was substituted, go to step 1.

    NO - Go to step 22.

22. Monitor the OBD STATUS for P0711 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 21, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 17. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 17.

DTC P0712: SHORT IN ATF TEMPERATURE SENSOR CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the ATF Temp Sensor (V) with the HDS in the A/T Data List.

    Is the ATF Temp Sensor (V) 0.07 V or less?

    YES - Go to step 3.

    NO - Intermittent failure, the system is OK at this time. Check for an intermittent short to body ground in the wire between the ATF temperature sensor and the PCM.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the ATF temperature sensor connector.
5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Check the ATF Temp Sensor (V) with the HDS in the A/T Data List.

   Is the ATF Temp Sensor (V) 0.07 V or less?

   YES - Go to step 7.

   NO - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**), then go to step 11.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Jump the SCS line with the HDS.
9. Disconnect PCM connector C (49P).
10. Check for continuity between ATF temperature sensor connector terminal No. 2 and body ground.

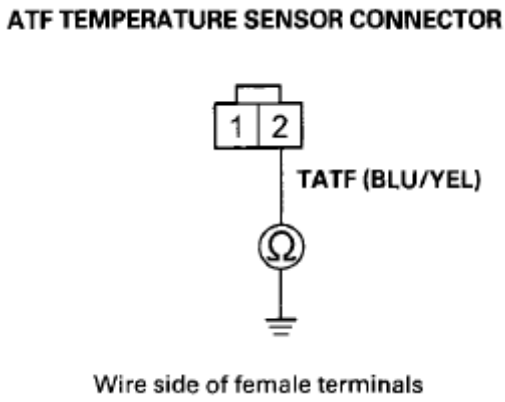

Fig. 65: Checking Continuity Between ATF Temperature Sensor Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C33 and ATF temperature sensor connector terminal No. 2, then go to step 11.

NO - Go to step 17.

11. Reconnect all connectors.
12. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
13. Clear the DTC with the HDS.
14. Start the engine in P, and wait for at least 20 seconds.
15. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0712 indicated?

YES - Check for an intermittent short to body ground in the wire between the ATF temperature sensor and the PCM, then go to step 1.

NO - Go to step 16.

16. Monitor the OBD STATUS for P0712 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 15, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the HDS indicates FAILED, check for an intermittent short to body ground in the wire between the ATF temperature sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 14.

17. Reconnect all connectors.
18. Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
19. Start the engine in P, and wait for at least 20 seconds.
20. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0712 indicated?

    YES - Check for an intermittent short to body ground in the wire between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 19. If the PCM was substituted, go to step 1.

    NO - Go to step 21.

21. Monitor the OBD STATUS for P0712 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 20, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the HDS indicates FAILED, check for an intermittent short to body ground in the wire between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 19. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 19.

DTC P0713: OPEN IN ATF TEMPERATURE SENSOR CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the ATF Temp Sensor (V) with the HDS in the A/T Data List.

   Does the ATF Temp Sensor (V) exceed 4.93 V?

   YES - Go to step 3.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals between the ATF temperature sensor and the PCM.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the ATF temperature sensor connector.
5. Connect ATF temperature sensor connector terminal No. 2 to body ground with a jumper wire.

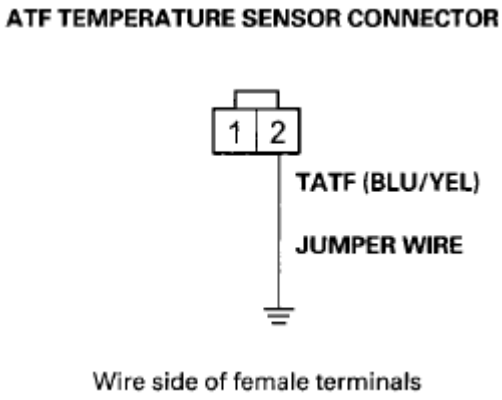

Fig. 66: Identifying ATF Temperature Sensor Connector Terminal No. 2 Connection With Body Ground Using Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the ATF Temp Sensor (V) with the HDS in the A/T Data List.

   Does the ATF Temp Sensor (V) drop to 0.07 V or less?

   YES - Go to step 8.

   NO - Go to step 13.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

9. Remove the jumper wire.
10. Connect ATF temperature sensor connector terminals No. 1 and No. 2 with a jumper wire.

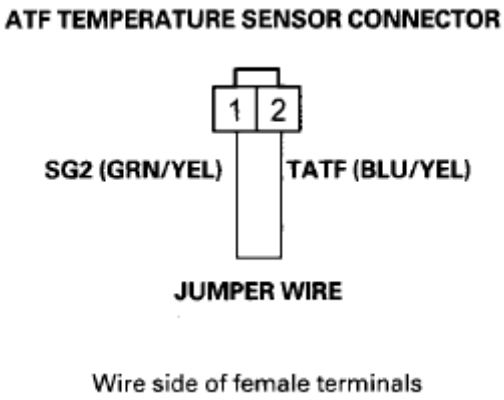

Fig. 67: Identifying ATF Temperature Sensor Connector Terminals No. 1 And No. 2 Connection Using Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
12. Check the ATF Temp Sensor (V) with the HDS in the A/T Data List.

    Does the ATF Temp Sensor (V) remain 0.07 V or less?

    YES - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**), then go to step 17.

    NO - Repair an open in the wire between PCM connector terminal C16 and the ATF temperature sensor connector terminal No. 1, then go to step 17.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Jump the SCS line with the HDS.
15. Disconnect PCM connector C (49P).
16. Check for continuity between PCM connector terminal C33 and ATF temperature sensor connector terminal No. 2.

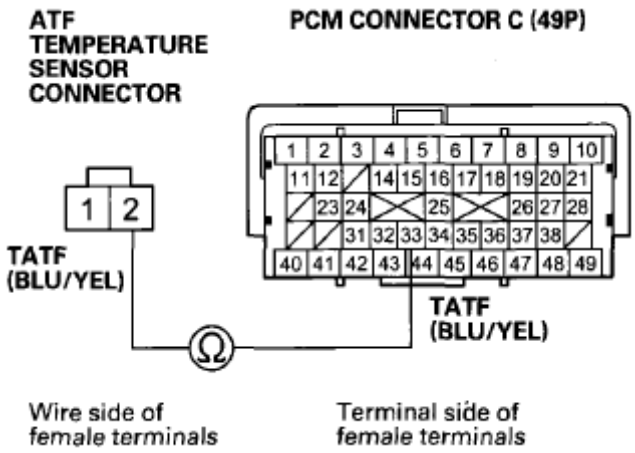

Fig. 68: Checking Continuity Between PCM Connector Terminal C33 And Atf Temperature Sensor Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the connections are OK, go to step 23.

NO - Repair an open in the wire between PCM connector terminal C33 and ATF temperature sensor connector terminal No. 2, then go to step 17.

17. Reconnect all connectors.
18. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
19. Clear the DTC with the HDS.
20. Start the engine in P, and wait for at least 20 seconds.
21. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0713 indicated?

    YES - Check for poor connections or loose terminals between the ATF temperature sensor and the PCM, then go to step 1.

    NO - Go to step 22.

22. Monitor the OBD STATUS for P0713 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 21, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals between the ATF

temperature sensor and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 20.

23. Reconnect all connectors.
24. Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
25. Start the engine in P, and wait for at least 20 seconds.
26. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0713 indicated?

    YES - Check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 25. If the PCM was substituted, go to step 1.

    NO - Go to step 27.

27. Monitor the OBD STATUS for P0713 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 26, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals between the ATF temperature sensor and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**) then go to step 25. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 25.

DTC P0714: ATF TEMPERATURE SENSOR INTERMITTENT FAILURE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **An engine block heater must not be used.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check the following parameters with the HDS:
   - ATF Temperature in the A/T Data List
   - ECT Sensor 2 in the PGM-FI Data List

   Do the ATF Temperature and ECT Sensor 2 read the same as the ambient air temperature?

YES - Go to step 6.

NO - Go to step 3.

3. Record the value of the ATF Temperature in the A/T Data List with the HDS.
4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and wait for at least 30 minutes.
5. Compare the current ATF Temperature to the ATF Temperature recorded in step 3.

   Did the ATF Temperature change?

   YES - Leave the engine off for at least 6 hours, then go to step 6.

   NO - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**).

6. Record the values of the ATF Temperature and ECT Sensor 2 with the HDS.
7. Compare the values of the ATF Temperature Sensor and ECT Sensor 2.

   Is the value of the ATF Temperature Sensor higher than the value of ECT Sensor 2 by 58°F (32°C), or is the value of the ATF Temperature Sensor lower than the value of ECT Sensor 2 by 43°F (24°C)?

   YES - Replace the ATF temperature sensor (see **ATF TEMPERATURE SENSOR REPLACEMENT**).

   NO - Intermittent failure, the system is OK at this time.

DTC P0716: PROBLEM IN INPUT SHAFT (MAINSHAFT) SPEED SENSOR CIRCUIT; DTC P0721: PROBLEM IN OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine, disable the VSA by pressing the VSA OFF button, move the shift lever to D, and run the vehicle with the engine speed above 2, 000 RPM for at least 10 seconds. Slow down, and stop the wheels.

5. Check for pending or Confirmed DTCs with the HDS.

   Is DTC P0718 or P0723 indicated?

   YES - Go to the **DTC P0718 TROUBLESHOOTING** or the **DTC P0723 TROUBLESHOOTING** .

   NO - Go to step 6.

6. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0716 or P0721 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time.

7. Check the input shaft (mainshaft) speed sensor or the output shaft (countershaft) speed sensor for poor connection and proper installation.

   Are the connection and installation OK?

   YES - Replace the input shaft (mainshaft) speed sensor or the output shaft (countershaft) speed sensor, then go to step 8.

   NO - Reinstall the speed sensor and connect the speed sensor connector, then go to step 8.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Clear the DTC with HDS.
10. Start the engine, disable the VSA by pressing the VSA OFF button, move the shift lever to D, and run the vehicle with the engine speed above 2, 000 RPM for at least 10 seconds. Slow down, and stop the wheels.
11. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0716 or P0721 indicated?

    YES - Go to step 1.

    NO - Troubleshooting is complete.

DTC P0717: PROBLEM IN INPUT SHAFT (MAINSHAFT) SPEED SENSOR CIRCUIT (NO SIGNAL INPUT); DTC P0718: INPUT SHAFT (MAINSHAFT) SPEED SENSOR INTERMITTENT FAILURE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused**

by a mechanical problem in the transmission.

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine, disable the VSA by pressing the VSA OFF button, move the shift lever to D, and run the vehicle with the engine speed above 2, 000 RPM. Compare the Input Shaft (Mainshaft) Speed and the Output Shaft (Countershaft) Speed with the HDS in the A/T Data List. Slow down, and stop the wheels.

   Are the speeds about the same?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the input shaft (mainshaft) speed sensor connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 1 and body ground.

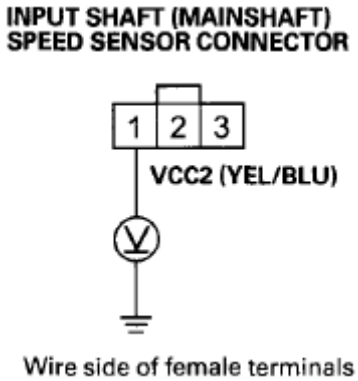

Fig. 69: Measuring Voltage Between Input Shaft Speed Sensor Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 9.

NO - Repair an open in the wire between PCM connector terminal C12 and the input shaft (mainshaft) speed sensor, then go to step 15.

9. Measure the voltage between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

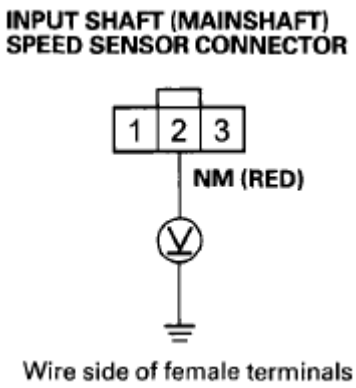

Fig. 70: Measuring Voltage Between Input Shaft Speed Sensor Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 10.

NO - Go to step 11.

10. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 3 and body ground.

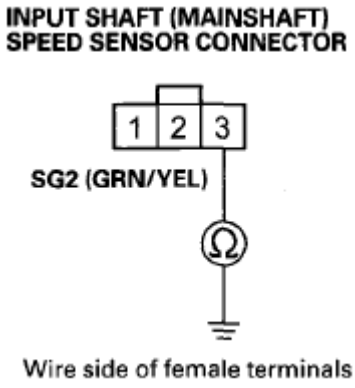

Fig. 71: Checking Continuity Between Input Shaft Speed Sensor Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the input shaft (mainshaft) speed sensor (see **INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT**), then go to step 15.

NO - Repair an open in the wire between the input shaft (mainshaft) speed sensor connector and PCM connector terminal C16, then go to step 15.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector B (49P).
14. Check for continuity between input shaft (mainshaft) speed sensor connector terminal No. 2 and body ground.

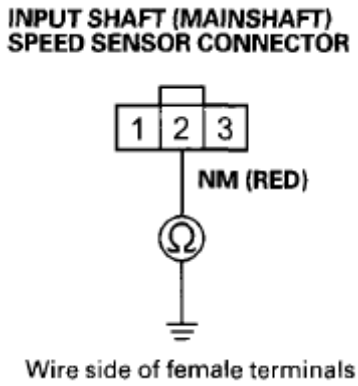

Fig. 72: Checking Continuity Between Input Shaft Speed Sensor Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal B37 and the input shaft (mainshaft) speed sensor, then go to step 15.

NO - Repair an open in the wire between PCM connector terminal B37 and the input shaft (mainshaft) speed sensor, then go to step 15.

15. Reconnect all connectors.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Clear the DTC with the HDS.
18. Start the engine, disable the VSA by pressing the VSA OFF button, move the shift lever to D, and run the vehicle with the engine speed above 2, 000 RPM. Compare the Input Shaft (Mainshaft) Speed and the Output Shaft (Countershaft) Speed with the HDS in the A/T Data List. Slow down, and stop the wheels.

Are the speeds about the same?

YES - Troubleshooting is complete.

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0722: PROBLEM IN OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR CIRCUIT (NO SIGNAL INPUT); DTC P0723: OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR INTERMITTENT FAILURE

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine, disable the VSA by pressing the VSA OFF button, move the shift lever to D, and run the vehicle with the engine speed above 2, 000 RPM. Compare the Input Shaft (Mainshaft) Speed and the Output Shaft (Countershaft) Speed with the HDS in the A/T Data List. Slow down, and stop the wheels.

   Are the speeds about the same?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the output shaft (countershaft) speed sensor connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 1 and body ground.

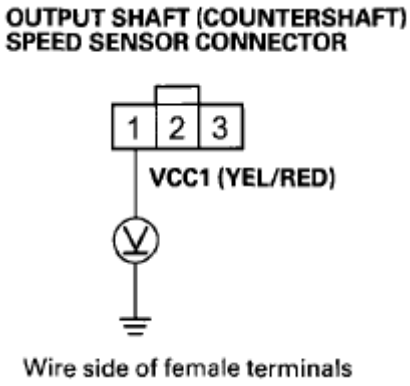

Fig. 73: Measuring Voltage Between Output Shaft Speed Sensor Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 9.

NO - Repair an open in the wire between PCM connector terminal B36 and the output shaft (countershaft) speed sensor, then go to step 15.

9. Measure the voltage between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

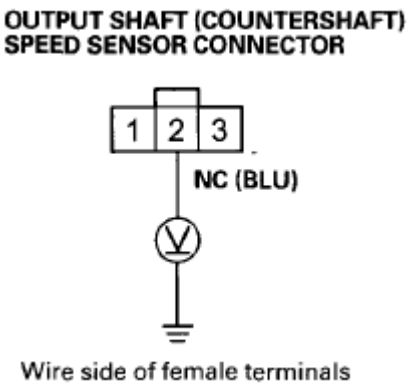

Fig. 74: Measuring Voltage Between Output Shaft Speed Sensor Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there about 5 V?

YES - Go to step 10.

NO - Go to step 11.

10. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 3 and body ground.

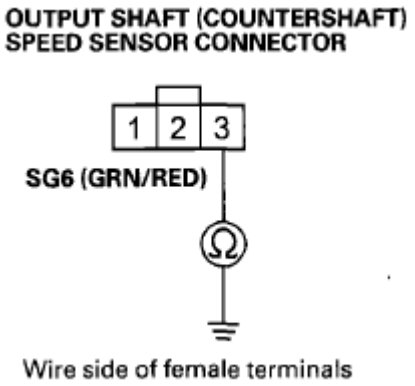

Fig. 75: Checking Continuity Between Output Shaft Speed Sensor Connector Terminal No. 3 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the output shaft (countershaft) speed sensor (see **OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT**), then go to step 15.

NO - Repair an open in the wire between the output shaft (countershaft) speed sensor and PCM connector terminal C15, then go to step 15.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector B (49P).
14. Check for continuity between output shaft (countershaft) speed sensor connector terminal No. 2 and body ground.

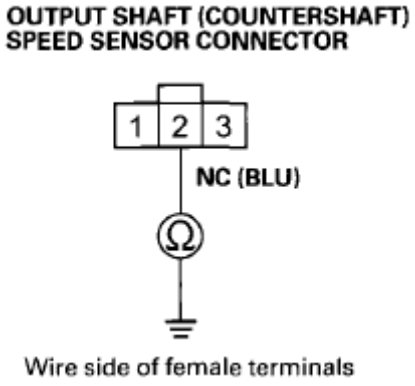

Fig. 76: Checking Continuity Between Output Shaft Speed Sensor Connector Terminal No. 2 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal B38 and the output shaft (countershaft) speed sensor, then go to step 15.

NO - Repair an open in the wire between PCM connector terminal B38 and the output shaft (countershaft) speed sensor, then go to step 15.

15. Reconnect all connectors.
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
17. Clear the DTC with the HDS.
18. Start the engine, disable the VSA by pressing the VSA OFF button, move the shift lever to D, and run the vehicle with the engine speed above 2, 000 RPM. Compare the Input Shaft (Mainshaft) Speed and the Output Shaft (Countershaft) Speed with the HDS in the A/T Data List. Slow down, and stop the wheels.

Are the speeds about the same?

YES - Troubleshooting is complete.

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0729: PROBLEM IN 6TH CLUTCH AND 6TH CLUTCH HYDRAULIC CIRCUIT

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 6th gear in D for at least 12 seconds. Slow down, and stop the wheels.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0729 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs were indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

5. Measure the 6th clutch pressure (see **PRESSURE TEST**).

Is the 6th clutch pressure within the service limit?

YES - Faulty 6th clutch. Replace the 3rd/6th clutch or the transmission. If you are replacing the 3rd/6th clutch, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the 3rd/6th clutch and the torque converter.

NO - Go to step 6.

6. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within the service limits?

   YES - Clogged 6th clutch hydraulic circuit. Clean the 6th clutch hydraulic circuit or replace the transmission. If you are cleaning the 6th clutch hydraulic circuit, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the torque converter.

   NO - Faulty ATF pump or main regulator valve. Replace the main valve body (ATF pump), the regulator valve body (main regulator valve), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

DTC P0731: PROBLEM IN 1ST CLUTCH AND 1ST CLUTCH HYDRAULIC CIRCUIT

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 1st gear in D, at speeds over 7 mph (12 km/h), and for at least 12 seconds. Slow down, and stop the wheels.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0731 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs were indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

5. Measure the 1st clutch pressure (see **PRESSURE TEST**).

   Is the 1st clutch pressure within the service limit?

   YES - Faulty 1st clutch. Replace the 1st clutch or the transmission. If you are replacing the 1st clutch,

clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the 1st clutch and the torque converter.

NO - Go to step 6.

6. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within the service limits?

   YES - Clogged 1st clutch hydraulic circuit. Clean the 1st clutch hydraulic circuit or replace the transmission. If you are cleaning the 1st clutch hydraulic circuit, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the torque converter.

   NO - Faulty ATF pump or main regulator valve. Replace the main valve body (ATF pump), the regulator valve body (main regulator valve), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

DTC P0732: PROBLEM IN 2ND CLUTCH AND 2ND CLUTCH HYDRAULIC CIRCUIT

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 2nd gear in D, at speeds over 7 mph (12 km/h), and for at least 12 seconds. Slow down, and stop the wheels.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0732 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs were indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

5. Measure the 2nd clutch pressure (see **PRESSURE TEST**).

   Is the 2nd clutch pressure within the service limit?

   YES - Faulty 2nd clutch. Replace the 2nd/5th clutch or the transmission. If you are replacing the 2nd/5th clutch, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the 2nd/5th clutch and the torque

converter.

NO - Go to step 6.

6. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within the service limits?

   YES - Clogged 2nd clutch hydraulic circuit. Clean the 2nd clutch hydraulic circuit or replace the transmission. If you are cleaning the 2nd clutch hydraulic circuit, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the torque converter.

   NO - Faulty ATF pump or main regulator valve. Replace the main valve body (ATF pump), the regulator valve body (main regulator valve), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

DTC P0733: PROBLEM IN 3RD CLUTCH AND 3RD CLUTCH HYDRAULIC CIRCUIT

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 3rd gear in D for at least 12 seconds. Slow down, and stop the wheels.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0733 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs were indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

5. Measure the 3rd clutch pressure (see **PRESSURE TEST**).

   Is the 3rd clutch pressure within the service limit?

   YES - Faulty 3rd clutch. Replace the 3rd/6th clutch or the transmission. If you are replacing the 3rd/6th clutch, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the 3rd/6th clutch and the torque converter.

NO - Go to step 6.

6. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within the service limits?

   YES - Clogged 3rd clutch hydraulic circuit. Clean the 3rd clutch hydraulic circuit or replace the transmission. If you are cleaning the 3rd clutch hydraulic circuit, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the torque converter.

   NO - Faulty ATF pump or main regulator valve. Replace the main valve body (ATF pump), the regulator valve body (main regulator valve), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

DTC P0734: PROBLEM IN 4TH CLUTCH AND 4TH CLUTCH HYDRAULIC CIRCUIT

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 4th gear in D for at least 12 seconds. Slow down, and stop the wheels.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0734 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs were indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

5. Measure the 4th clutch pressure (see **PRESSURE TEST**).

   Is the 4th clutch pressure within the service limit?

   YES - Faulty 4th clutch. Replace the 4th clutch or the transmission. If you are replacing the 4th clutch, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the 4th clutch and the torque converter.

   NO - Go to step 6.

6. Measure the line pressure (see **PRESSURE TEST**).

Is the line pressure within the service limits?

YES - Clogged 4th clutch hydraulic circuit. Clean the 4th clutch hydraulic circuit or replace the transmission. If you are cleaning the 4th clutch hydraulic circuit, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the torque converter.

NO - Faulty ATF pump or main regulator valve. Replace the main valve body (ATF pump), the regulator valve body (main regulator valve), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

DTC P0735: PROBLEM IN 5TH CLUTCH AND 5TH CLUTCH HYDRAULIC CIRCUIT

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Test-drive the vehicle in 5th gear in D for at least 12 seconds. Slow down, and stop the wheels.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0735 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs were indicated, go to the indicated **DTC'S TROUBLESHOOTING**.

5. Measure the 5th clutch pressure (see **PRESSURE TEST**).

   Is the 5th clutch pressure within the service limit?

   YES - Faulty 5th clutch. Replace the 2nd/5th clutch or the transmission. If you are replacing the 2nd/5th clutch, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the 2nd/5th clutch and the torque converter.

   NO - Go to step 6.

6. Measure the line pressure (see **PRESSURE TEST**).

   Is the line pressure within the service limits?

YES - Clogged 5th clutch hydraulic circuit. Clean the 5th clutch hydraulic circuit or replace the transmission. If you are cleaning the 5th clutch hydraulic circuit, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the torque converter.

NO - Faulty ATF pump or main regulator valve. Replace the main valve body (ATF pump), the regulator valve body (main regulator valve), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

DTC P0741: TORQUE CONVERTER CLUTCH HYDRAULIC CIRCUIT STUCK OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0761 indicated?

   YES - Go to the **DTC P0761 TROUBLESHOOTING**.

   NO - Go to step 3.

3. Warm up the engine to normal operating temperature (the radiator fan comes on).
4. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
5. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 6.

6. Warm up the engine to normal operating temperature (the radiator fan comes on).
7. Clear the DTC with the HDS.
8. Test-drive the vehicle on a level road with a steady throttle at 60 mph (96 km/h) for at least 22 seconds, or test-drive the vehicle for several minutes under the same conditions as those indicated by the freeze data.
9. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0741 indicated?

YES - Go to step 10.

NO - Intermittent failure, the system is OK at this time.

10. Select Clutch Pressure Control (Linear) Solenoid Valve D in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve D with the HDS.

    Does the HDS indicate NORMAL?

    YES - If the HDS indicates NORMAL, go to step 11. If the HDS indicates failure other than A/T clutch pressure control solenoid valve D, follow the instructions indicated on the HDS for the test result.

    NO - Faulty A/T clutch pressure control solenoid valve D. Replace the secondary valve body (A/T clutch pressure control solenoid valve D) (see **SECONDARY VALVE BODY REPLACEMENT**).

11. Measure the torque converter clutch pressure (see **PRESSURE TEST**) while monitoring the A/T Shift Sol VLV. C signal with the HDS.

    Dose the torque converter clutch pressure rise when A/T Shift Sol VLV. C turns on?

    YES - Faulty lock-up shift valve or lock-up control valve. Replace the main valve body (lock-up shift valve), the regulator valve body (lock-up control valve), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

    NO - Faulty torque converter clutch. Replace the torque converter.

DTC P0746: A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0746 is stored in the PCM, the transmission does not shift to any gear other than 3rd or 4th gear because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Clear the DTC with the HDS.
6. Select Clutch Pressure Control (Linear) Solenoid Valve A in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve A with the HDS.

   Does the HDS indicate NORMAL?

   YES - Intermittent failure, the system is OK at this time.

   NO - Faulty A/T clutch pressure control solenoid valve A. Replace the secondary valve body (A/T clutch pressure control solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P0747: A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0747 is stored in the PCM, the transmission does not shift to any gear other than 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the 5th Pressure Switch signal with the HDS in the A/T Data List.

   Is the 5th Pressure Switch ON?

   YES - Replace transmission fluid pressure switch D (5th clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) REPLACEMENT**).

   NO - Go to step 4.

4. Warm up the engine to normal operating temperature (the radiator fan comes on).
5. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
6. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 7.

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Start the engine.

9. With the brake pedal pressed, shift to D, and check the 2nd Pressure Switch signal with the HDS in the A/T Data List.

   Does the 2nd Pressure Switch turn on with a shock caused by engaging gears?

   YES - Faulty A/T clutch pressure control solenoid valve A. Replace the secondary valve body (A/T clutch pressure control solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

   NO - Intermittent failure, the system is OK at this time.

DTC P0751: SHIFT SOLENOID VALVE A STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0751 is stored in the PCM, the transmission does not shift to any gear other than 3rd or 4th gear because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Clear the DTC with the HDS.
7. Start the engine, disable the VSA by pressing the VSA OFF button.
8. Run the vehicle with the shift lever in D, and let the transmission shift slowly to 2nd gear, and check the 3rd Pressure Switch signal, the 5th Pressure Switch signal, and the Shift Control when the transmission shifts from 1st gear to 2nd gear with the HDS in the A/T Data List. Slow down, and stop the wheels.

   NOTE: Repeat two or three times if shifts are normal.

   Does the 5th Pressure Switch turn on momentarily in 2nd gear, then does the 3rd Pressure Switch turn on

with a harsh shift?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time.

9. Select Shift Solenoid Valve A in the Miscellaneous Test Menu, and check that shift solenoid valve A operates with the HDS.

   Is a clicking sound heard?

   YES - Faulty shift valve A. Replace the secondary valve body (shift valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

   NO - Faulty shift solenoid valve A. Replace the secondary valve body (shift solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P0752: SHIFT SOLENOID VALVE A STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0752 is stored in the PCM, the transmission does not shift to any gear other than 2nd or 4th gear because of the fail-safe function, but if that DTC is a Pending DTC, the transmission does not shift to any gear other than 3rd or 6th gear because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Clear the DTC with the HDS.

7. Start the engine, disable the VSA by pressing the VSA OFF button.
8. Run the vehicle with the shift lever in D, and let the transmission shift slowly to 4th gear, and check the 3rd Pressure Switch signal, the 4th Pressure Switch signal, and the Shift Control when the transmission shifts from 3rd gear to 4th gear with the HDS in the A/T Data List. Slow down, and stop the wheels.

NOTE: Repeat two or three times if shifts are normal.

Does the 4th Pressure Switch turn off in 4th gear, then does the 3rd Pressure Switch turn on with a harsh shift?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time.

9. Select Shift Solenoid Valve A in the Miscellaneous Test Menu, and check that shift solenoid valve A operates with the HDS.

Is a clicking sound heard?

YES - Faulty shift valve A. Replace the secondary valve body (shift valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

NO - Faulty shift solenoid valve A. Replace the secondary valve body (shift solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P0756: SHIFT SOLENOID VALVE B STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0756 is stored in the PCM, the transmission does not shift to any gear other than 2nd or 5th gear because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission.

NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

5. Clear the DTC with the HDS.
6. Start the engine.
7. With the brake pedal pressed, shift to D, and check the A/T Shift Sol VLV. B signal, the Input Shaft (Mainshaft) Speed, and the Shift Control with the HDS in the A/T Data List.

   Is the Input Shaft (Mainshaft) Speed 0 RPM when A/T Shift Sol VLV. B is OFF, and about the same as the engine speed when A/T Shift Sol VLV. B is ON?

   YES - Shift to P, and go to step 10.

   NO - Shift to P, and go to step 8.

8. Clear the DTC with the HDS.
9. With the brake pedal pressed, shift to D, and check the A/T Shift Sol VLV. B signal, the Input Shaft (Mainshaft) Speed, and the Shift Control with the HDS in the A/T Data List.

   Does the Input Shaft (Mainshaft) Speed remain steady when A/T Shift Sol VLV. B is OFF and when it is ON?

   YES - Faulty 1st gear one-way clutch. Replace the countershaft 1st gear or the transmission. If you are replacing the countershaft 1st gear, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the countershaft 1st gear and the torque converter.

   NO - Intermittent failure, the system is OK at this time.

10. Select Shift Solenoid Valve B in the Miscellaneous Test Menu, and check that shift solenoid valve B operates with the HDS.

    Is a clicking sound heard?

    YES - Go to step 11.

    NO - Faulty shift solenoid valve B. Replace the secondary valve body (shift solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

    Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Clear the DTC with the HDS.
15. Start the engine, disable the VSA by pressing the VSA OFF button. With the brake pedal pressed, shift to

S, and upshift to 2nd gear by pressing the paddle shifter + (upshift switch).

16. Run the vehicle, and upshift to 3rd gear by pressing the paddle shifter + (upshift switch), and check the 3rd Pressure Switch signal, the 6th Pressure Switch signal, and the Shift Control with the HDS in the A/T Data List. Slow down, and stop the wheels.

    In 3rd gear, was the 3rd Pressure Switch OFF and was the 6th Pressure Switch ON?

    YES - Faulty shift valve B. Replace the secondary valve body (shift valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

    NO - Faulty shift valve C. Replace the main valve body (shift valve C) or the transmission. If you are replacing the main valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body and the torque converter.

DTC P0757: SHIFT SOLENOID VALVE B STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0757 is stored in the PCM, the transmission does not shift to any gear other than 2nd or 4th gear because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Clear the DTC with the HDS.
7. Start the engine, disable the VSA by pressing the VSA OFF button.
8. Run the vehicle with the shift lever in D, and let the transmission shift slowly to 6th gear, and check the 2nd Pressure Switch signal, the 3rd Pressure Switch signal, the 4th Pressure Switch signal, and the Shift

Control when the transmission shifts from 5th gear to 6th gear with the HDS in the A/T Data List. Slow down, and stop the wheels.

NOTE: Repeat two or three times if shifts are normal.

Does the 3rd Pressure Switch turn on momentarily in 6th gear, then does the 2nd Pressure Switch or the 4th Pressure Switch turn on in 6th gear?

YES - Go to step 9.

NO - Intermittent failure, the system is OK at this time.

9. Select Shift Solenoid Valve B in the Miscellaneous Test Menu, and check that shift solenoid valve B operates with the HDS.

   Is a clicking sound heard?

   YES - Faulty shift valve B. Replace the secondary valve body (shift valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

   NO - Faulty shift solenoid valve B. Replace the secondary valve body (shift solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P0761: SHIFT SOLENOID VALVE C STUCK OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Clear the DTC with the HDS.
6. Test-drive the vehicle in reverse gear.

NOTE: Repeat two or three times if shifts are normal.

Does the vehicle move with reverse gear?

YES - Intermittent failure, the system is OK at this time.

NO - Go to step 7.

7. Select Shift Solenoid Valve C in the Miscellaneous Test Menu, and check that shift solenoid valve C operates with the HDS.

   Is a clicking sound heard?

   YES - Faulty reverse inhibitor valve or shift fork shaft. Replace the main valve body (reverse inhibitor valve), the regulator valve body (shift fork shaft), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

   NO - Faulty shift solenoid valve C. Replace shift solenoid valve C (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**).

DTC P0762: SHIFT SOLENOID VALVE C STUCK ON

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Clear the DTC with the HDS.
6. Start the engine.
7. With the brake pedal pressed, shift to D, and check the A/T Shift Sol VLV. B signal, the Input Shaft (Mainshaft) Speed, and the Shift Control with the HDS in the A/T Data List.

   Does the Input Shaft (Mainshaft) Speed remain steady when A/T Shift Sol VLV. B is OFF, and does the Input Shaft (Mainshaft) Speed read 0 RPM when A/T Shift Sol VLV. B is ON?

YES - Go to step 8.

NO - Intermittent failure, the system is OK at this time.

8. Select Shift Solenoid Valve C in the Miscellaneous Test Menu, and check that shift solenoid valve C operates with the HDS.

   Is a clicking sound heard?

   YES - Faulty 1st gear one-way clutch. Replace the countershaft 1st gear or the transmission. If you are replacing the countershaft 1st gear, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the countershaft 1st gear and the torque converter.

   NO - Faulty shift solenoid valve C. Replace shift solenoid valve C (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**).

DTC P0776: A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0776 is stored in the PCM, the transmission does not shift to any gear other than 2nd or 4th gear because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Clear the DTC with the HDS.
6. Select Clutch Pressure Control (Linear) Solenoid Valve B in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve B with the HDS.

   Does the HDS indicate NORMAL?

   YES - Intermittent failure, the system is OK at this time.

NO - Faulty A/T clutch pressure control solenoid valve B. Replace the secondary valve body (A/T clutch pressure control solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P0777: A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0777 is stored in the PCM, the transmission does not shift to any gear other than 3rd or 6th gear because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Clear the DTC with the HDS.
6. Start the engine.
7. With the brake pedal pressed, shift to D, and check the 3rd Pressure Switch signal and the 6th Pressure Switch signal with the HDS in the A/T Data List.

   Does the 6th Pressure Switch turn on momentarily, then does the 3rd Pressure Switch turn on with a harsh shift?

   YES - Faulty A/T clutch pressure control solenoid valve B. Replace the secondary valve body (A/T clutch control solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

   NO - Intermittent failure, the system is OK at this time.

DTC P0796: A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0796 is stored in the PCM, the transmission does not shift to any gear other than 2nd or 5th gear because of the fail-safe function, but if that DTC is a Pending DTC, the transmission does not shift to any gear other**

than 3rd or 6th gear because of the fail-safe function.

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Clear the DTC with the HDS.
6. Select Clutch Pressure Control (Linear) Solenoid Valve C in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve C with the HDS.

   Does the HDS indicate NORMAL?

   YES - Intermittent failure, the system is OK at this time.

   NO - Faulty A/T clutch pressure control solenoid valve C, shift valve C, D inhibitor valve, reverse inhibitor valve, or shift fork shaft. Replace the secondary valve body (A/T clutch pressure control solenoid valve C) (see **SECONDARY VALVE BODY REPLACEMENT**), the main valve body (shift valve C, D inhibitor valve, or reverse inhibitor valve), the regulator valve body (shift fork shaft), or the transmission. If you are replacing the main valve body or the regulator valve body, clean off any metal debris or excessive clutch material inside the transmission, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body or the regulator valve body and the torque converter.

DTC P0797: A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0797 is stored in the PCM, the transmission does not shift to any gear other than 1st or 4th gear because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

YES - Replace the transmission.

NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Clear the DTC with the HDS.
6. Start the engine.
7. With the brake pedal pressed, shift to D, and check the 4th Pressure Switch signal with the HDS in the A/T Data List.

   Does the 4th Pressure Switch turn on momentarily?

   YES - Faulty A/T clutch pressure control solenoid valve C. Replace the secondary valve body (A/T clutch pressure control solenoid valve C) (see **SECONDARY VALVE BODY REPLACEMENT**).

   NO - Intermittent failure, the system is OK at this time.

DTC P0812: OPEN IN TRANSMISSION RANGE SWITCH ATPR SWITCH CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Shift to R, and monitor the A/T R Switch signal with the HDS in the A/T Data List.

   Is the A/T R Switch ON?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the transmission range switch connector.
5. Connect a jumper wire between transmission range switch connector terminal No. 8 and body ground.

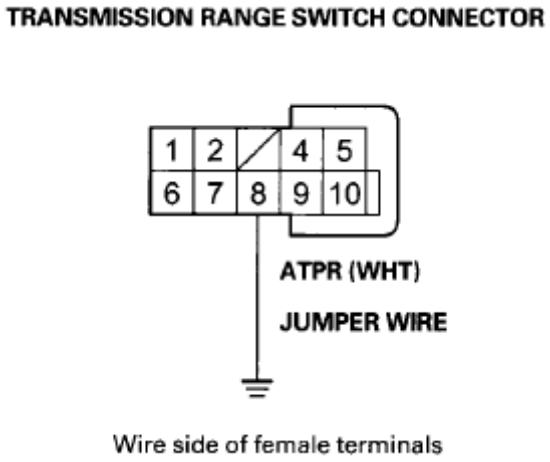

Fig. 77: Identifying Jumper Wire Between Transmission Range Switch Connector Terminal No. 8 And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the A/T R Switch signal with the HDS.

   Is the A/T R Switch ON?

   YES - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**), then go to step 12.

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector C (49P).
11. Check for continuity between PCM connector terminal C25 and body ground.

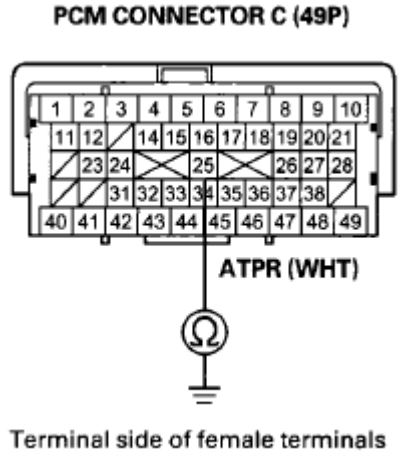

Fig. 78: Checking Continuity Between PCM Connector Terminal C25 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair an open in the wire between PCM connector terminal C25 and the transmission range switch, then go to step 12.

12. Reconnect all connectors.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Clear the DTC with the HDS.
15. Test-drive the vehicle in R at speeds below 3 mph (5 km/h) for at least 2 seconds, then increase the speed and test-drive at speeds over 3 mph (5 km/h) for at least 2 seconds. Slow down, and stop the wheels.
16. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0812 indicated?

YES - Check for poor connections or loose terminals between the transmission range switch and the PCM, then go to step 1.

NO - Go to step 17.

17. Monitor the OBD STATUS for P0812 in the DTCs MENU with the HDS.

Does the HDS indicate PASSED?

YES - Troubleshooting is complete. If any other Pending or Confirmed DTCs were indicated in step 16, go to the indicated **DTC'S TROUBLESHOOTING**.

NO - If the HDS indicates FAILED, check for poor connections or loose terminals between the transmission range switch and the PCM, then go to step 1. If the HDS indicates NOT COMPLETED, go to step 15.

18. Reconnect all connectors.
19. Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**).
20. Test-drive the vehicle in R at speeds below 3 mph (5 km/h) for at least 2 seconds, then increase the speed and test-drive at speeds over 3 mph (5 km/h) for at least 2 seconds. Slow down, and stop the wheels.
21. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0812 indicated?

YES - Check for poor connections or loose terminals between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE**

ECM/PCM), then go to step 20. If the PCM was substituted, go to step 1.

NO - Go to step 22.

22. Monitor the OBD STATUS for P0812 in the DTCs MENU with the HDS.

    Does the HDS indicate PASSED?

    YES - If the PCM was updated, troubleshooting is complete. If the PCM was substituted, replace the original PCM (see **ECM/PCM REPLACEMENT**). If any other Pending or Confirmed DTCs were indicated in step 21, go to the indicated **DTC'S TROUBLESHOOTING**.

    NO - If the HDS indicates FAILED, check for poor connections or loose terminals between the transmission range switch and the PCM. If the PCM was updated, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), then go to step 20. If the PCM was substituted, go to step 1. If the HDS indicates NOT COMPLETED, go to step 20.1

DTC P0842: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0842 is stored in the PCM, the transmission does not shift to any gear other than 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the 2nd Pressure Switch signal with the HDS in the A/T Data List.

   Is the 2nd Pressure Switch ON?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the transmission fluid pressure switch A (2nd clutch) connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the 2nd Pressure Switch signal with the HDS in the A/T Data List.

   Is the 2nd Pressure Switch OFF?

YES - Replace transmission fluid pressure switch A (2nd clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) REPLACEMENT**).

NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector C (49P).
11. Check for continuity between PCM connector terminal C27 and body ground.

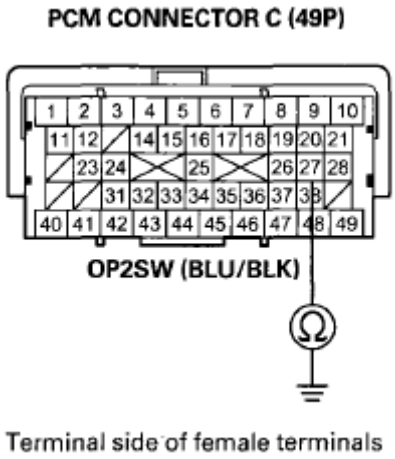

Fig. 79: Checking Continuity Between PCM Connector Terminal C27 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C27 and transmission fluid pressure switch A (2nd clutch).

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0843: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION)**
- **If DTC P0843 is stored in the PCM, the transmission does not shift to any gear other than 2nd through 4th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels

to rotate freely.

Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine, disable the VSA by pressing the VSA OFF button. Run the vehicle with the sequential sportshift mode in 2nd gear. Check the 2nd Pressure Switch signal with the HDS in the A/T Data List. Slow down, and stop the wheels.

   Is the 2nd Pressure Switch ON in 2nd gear?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between transmission fluid pressure switch A (2nd clutch) and the PCM.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the transmission fluid pressure switch A (2nd clutch) connector.
7. Connect a jumper wire between the transmission fluid pressure switch A (2nd clutch) connector terminal and body ground.

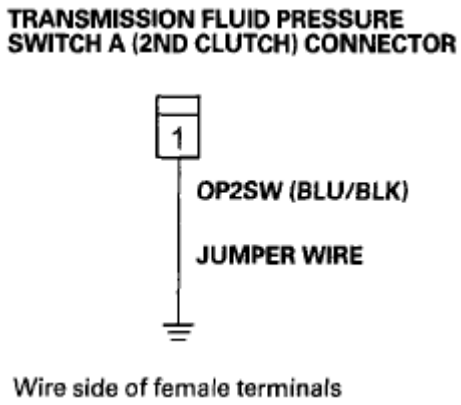

Fig. 80: Identifying Jumper Wire Between Transmission Fluid Pressure Switch A (2nd Clutch) Connector Terminal And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the 2nd Pressure Switch signal with the HDS in the A/T Data List.

   Is the 2nd Pressure Switch ON?

   YES - Replace transmission fluid pressure switch A (2nd clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) REPLACEMENT**).

   NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Remove the jumper wire.
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminal C27 and the transmission fluid pressure switch A (2nd clutch) connector terminal.

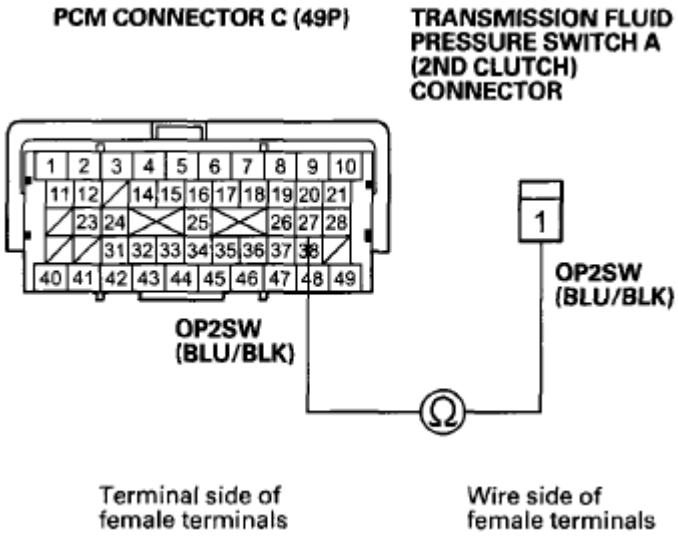

Fig. 81: Checking Continuity Between PCM Connector Terminal C27 And Transmission Fluid Pressure Switch A (2nd Clutch) Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C27 and transmission fluid pressure switch A (2nd clutch).

DTC P0847: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0847 is stored in the PCM, the transmission does not shift to any gear other than 3rd or 6th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the 3rd Pressure Switch signal with the HDS in the A/T Data List.

   Is the 3rd Pressure Switch ON?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the transmission fluid pressure switch B (3rd clutch) connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the 3rd Pressure Switch signal with the HDS in the A/T Data List.

   Is the 3rd Pressure Switch OFF?

   YES - Replace transmission fluid pressure switch B (3rd clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) REPLACEMENT**).

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector C (49P).
11. Check for continuity between PCM connector terminal C38 and body ground.

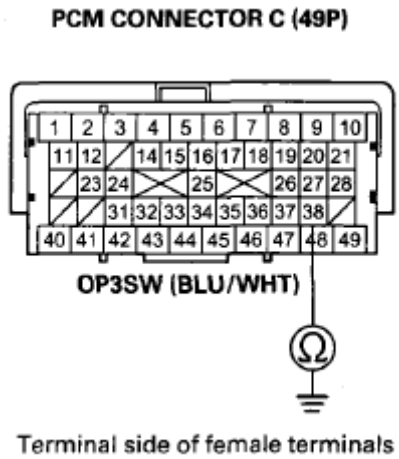

Fig. 82: Checking Continuity Between PCM Connector Terminal C38 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C38 and transmission fluid pressure switch B (3rd clutch).

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0848: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION)**
- **If DTC P0848 is stored in the PCM, the transmission does not shift to any gear other than 3rd through 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine, disable the VSA by pressing the VSA OFF button. Run the vehicle with the sequential sportshift mode in 3rd gear. Check the 3rd Pressure Switch signal with the HDS in the A/T Data List. Slow down, and stop the wheels.

   Is the 3rd Pressure Switch ON in 3rd gear?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between transmission fluid pressure switch B (3rd clutch) and the PCM.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the transmission fluid pressure switch B (3rd clutch) connector.
7. Connect a jumper wire between the transmission fluid pressure switch B (3rd clutch) connector terminal and body ground.

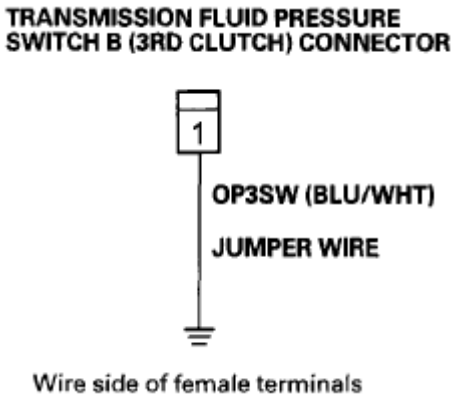

Fig. 83: Identifying Jumper Wire Between Transmission Fluid Pressure Switch B (3rd Clutch) Connector Terminal And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the 3rd Pressure Switch signal with the HDS in the A/T Data List.

   Is the 3rd Pressure Switch ON?

   YES - Replace transmission fluid pressure switch B (3rd clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) REPLACEMENT**).

   NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Remove the jumper wire.
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminal C38 and the transmission fluid pressure switch B (3rd clutch) connector terminal.

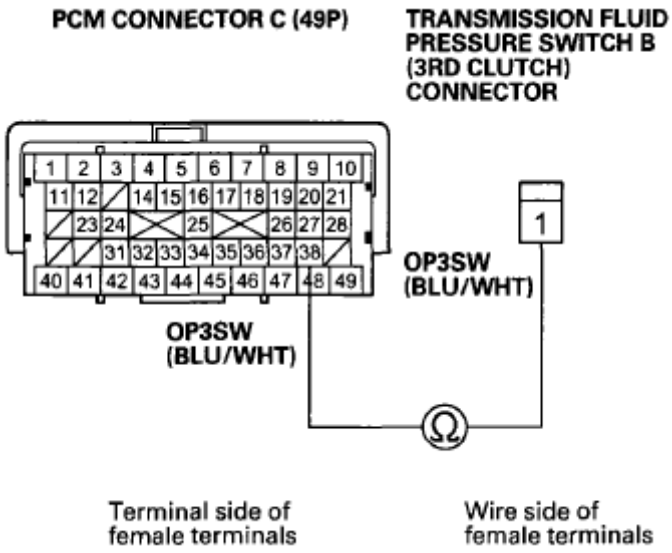

Fig. 84: Checking Continuity Between PCM Connector Terminal C38 And Transmission Fluid Pressure Switch B (3rd Clutch) Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C38 and transmission fluid pressure switch B (3rd clutch).

DTC P084C: SHORT IN LINE PRESSURE SWITCH CIRCUIT, OR LINE PRESSURE SWITCH STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P084C is stored in the PCM, engine torque is restricted because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the Line Pressure Pressure Switch signal with the HDS in the A/T Data List.

Is the Line Pressure Pressure Switch ON?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the line pressure switch connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the Line Pressure Pressure Switch signal with the HDS in the A/T Data List.

   Is the Line Pressure Pressure Switch OFF?

   YES - Replace the line pressure switch (see **LINE PRESSURE SWITCH REPLACEMENT**).

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector C (49P).
11. Check for continuity between PCM connector terminal C35 and body ground.

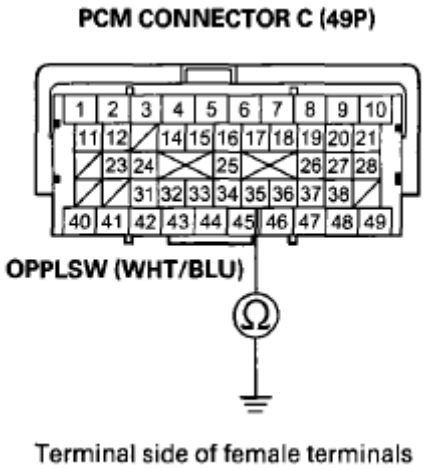

Fig. 85: Checking Continuity Between PCM Connector Terminal C35 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C35 and the line pressure switch.

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0872: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see**

GENERAL TROUBLESHOOTING INFORMATION).

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0872 is stored in the PCM, the transmission does not shift to any gear other than 1st or 4th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the 4th Pressure Switch signal with the HDS in the A/T Data List.

   Is the 4th Pressure Switch ON?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the transmission fluid pressure switch C (4th clutch) connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the 4th Pressure Switch signal with the HDS in the A/T Data List.

   Is the 4th Pressure Switch OFF?

   YES - Replace transmission fluid pressure switch C (4th clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) REPLACEMENT**).

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector C (49P).
11. Check for continuity between PCM connector terminal C37 and body ground.

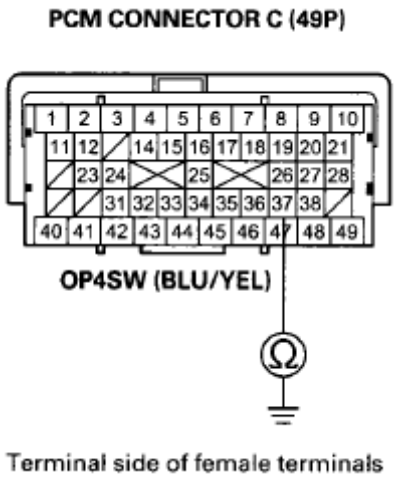

Fig. 86: Checking Continuity Between PCM Connector Terminal C37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C37 and transmission fluid pressure switch C (4th clutch).

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0873: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0873 is stored in the PCM, the transmission does not shift to any gear other than 1st or 4th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine, disable the VSA by pressing the VSA OFF button. Run the vehicle with the sequential sportshift mode in 4th gear. Check the 4th Pressure Switch signal with the HDS in the A/T Data List. Slow down, and stop the wheels.

   Is the 4th Pressure Switch ON in 4th gear?

YES - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between transmission fluid pressure switch C (4th clutch) and the PCM.

NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the transmission fluid pressure switch C (4th clutch) connector.
7. Connect a jumper wire between the transmission fluid pressure switch C (4th clutch) connector terminal and body ground.

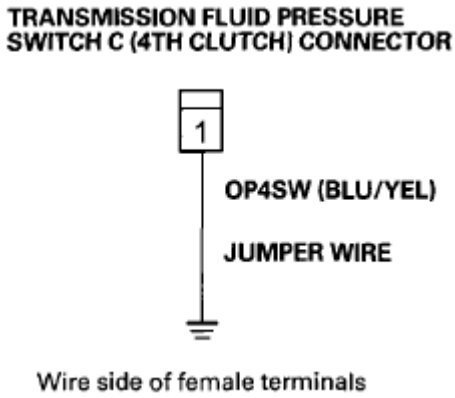

Fig. 87: Identifying Jumper Wire Between Transmission Fluid Pressure Switch C (4th Clutch) Connector Terminal And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the 4th Pressure Switch signal with the HDS in the A/T Data List.

Is the 4th Pressure Switch ON?

YES - Replace transmission fluid pressure switch C (4th clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) REPLACEMENT**).

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Remove the jumper wire.
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminal C37 and the transmission fluid pressure switch C (4th clutch) connector terminal.

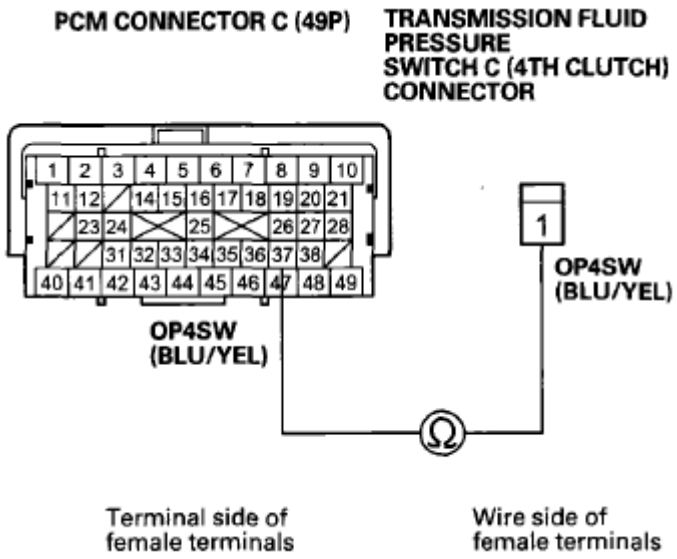

Fig. 88: Checking Continuity Between PCM Connector Terminal C37 And Transmission Fluid Pressure Switch C (4th Clutch) Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C37 and transmission fluid pressure switch C (4th clutch).

DTC P0877: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0877 is stored in the PCM, the transmission does not shift to any gear other than 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the 5th Pressure Switch signal with the HDS in the A/T Data List.

Is the 5th Pressure Switch ON?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the transmission fluid pressure switch D (5th clutch) connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the 5th Pressure Switch signal with the HDS in the A/T Data List.

Is the 5th Pressure Switch OFF?

YES - Replace transmission fluid pressure switch D (5th clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) REPLACEMENT**).

NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector C (49P).
11. Check for continuity between PCM connector terminal C14 and body ground.

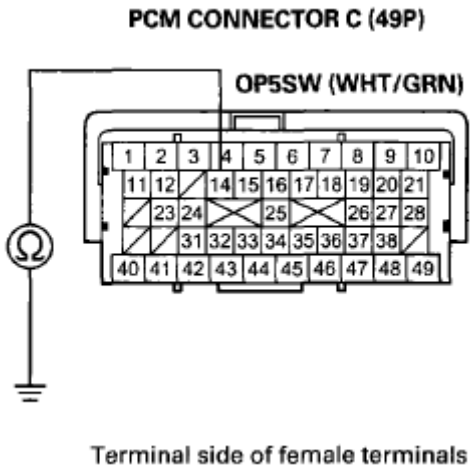

Fig. 89: Checking Continuity Between PCM Connector Terminal C14 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C14 and transmission fluid pressure switch D (5th clutch).

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0878: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0878 is stored in the PCM, the transmission does not shift to any gear other than 2nd through 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine, disable the VSA by pressing the VSA OFF button. Run the vehicle with the sequential sportshift mode in 5th gear. Check the 5th Pressure Switch signal with the HDS in the A/T Data List. Slow down, and stop the wheels.

   Is the 5th Pressure Switch ON in 5th gear?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between transmission fluid pressure switch D (5th clutch) and the PCM.

   NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the transmission fluid pressure switch D (5th clutch) connector.
7. Connect a jumper wire between the transmission fluid pressure switch D (5th clutch) connector terminal and body ground.

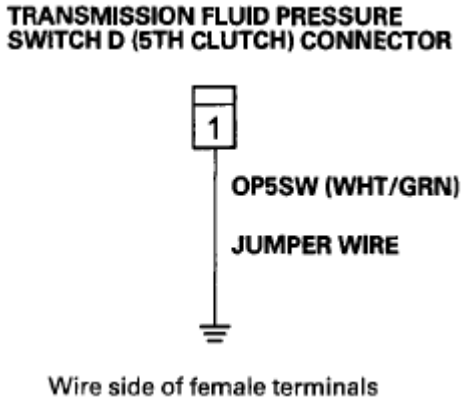

Fig. 90: Identifying Jumper Wire Between Transmission Fluid Pressure Switch D (5th Clutch) Connector Terminal And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the 5th Pressure Switch signal with the HDS in the A/T Data List.

   Is the 5th Pressure Switch ON?

   YES - Replace transmission fluid pressure switch D (5th clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) REPLACEMENT**).

   NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Remove the jumper wire.
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminal C14 and the transmission fluid pressure switch D (5th clutch) connector terminal.

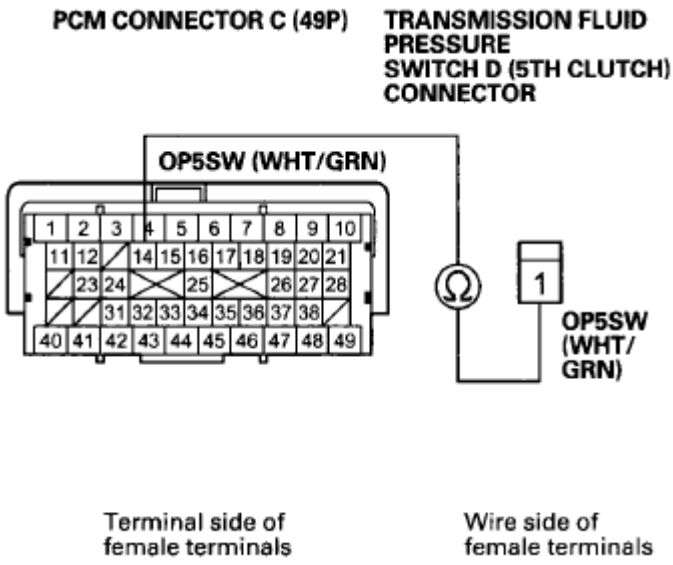

Fig. 91: Checking Continuity Between PCM Connector Terminal C14 And Transmission Fluid Pressure Switch D (5th Clutch) Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C14 and transmission fluid pressure switch D (5th clutch).

DTC P0962: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0962 is stored in the PCM, the transmission does not shift to 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0962 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between A/T clutch pressure control solenoid valve A and the PCM.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Check for a blown No. 10 (10 A) fuse in the driver's under-dash fuse/relay box.

   Is the No. 10 (10 A) fuse OK?

   YES - Go to step 6.

   NO - Repair a short to body ground in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

6. Jump the SCS line with the HDS.
7. Disconnect PCM connectors A (49P).
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between PCM connector terminals A1 and body ground.

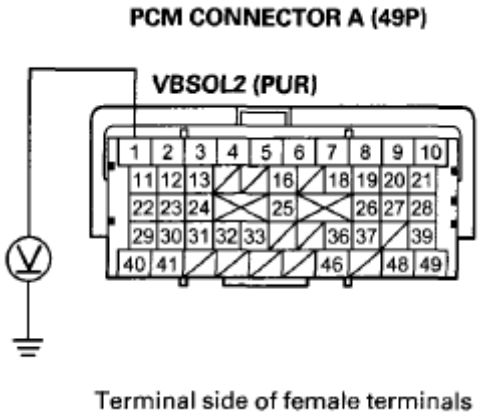

Fig. 92: Measuring Voltage Between PCM Connector Terminals A1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 10.

NO - Repair an open in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector C (49P).
13. Check for continuity between PCM connector terminal C21 and body ground.

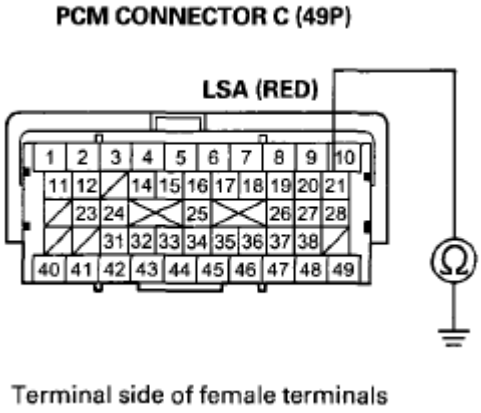

Fig. 93: Checking Continuity Between PCM Connector Terminal C21 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Go to step 16.

14. Disconnect the A/T clutch pressure control solenoid valve A connector.
15. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 1 and body ground.

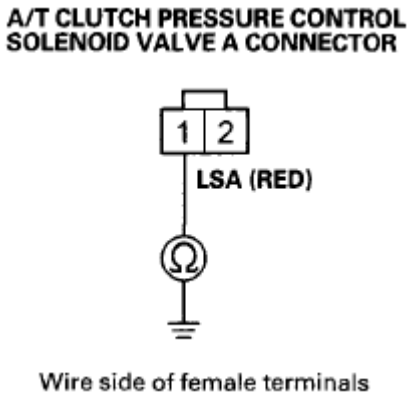

Fig. 94: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve A Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C21 and A/T clutch pressure control solenoid valve A.

NO - Faulty A/T clutch pressure control solenoid valve A. Replace the secondary valve body (A/T clutch pressure control solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

16. Disconnect the A/T clutch pressure control solenoid valve A connector.
17. Check for continuity between PCM connector terminal C21 and A/T clutch pressure control solenoid valve A connector terminal No. 1.

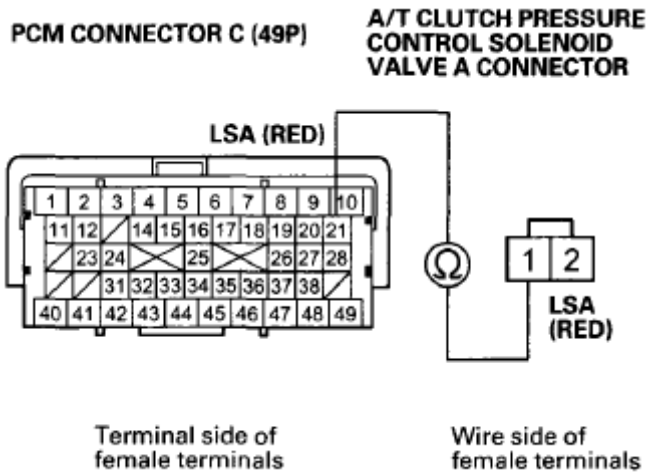

Fig. 95: Checking Continuity Between PCM Connector And A/T Clutch Pressure Control Solenoid Valve A Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair an open in the wire between A/T clutch pressure control solenoid valve A connector terminal No. 1 and PCM connector terminal C21.

18. Check for continuity between A/T clutch pressure control solenoid valve A connector terminal No. 2 and body ground.

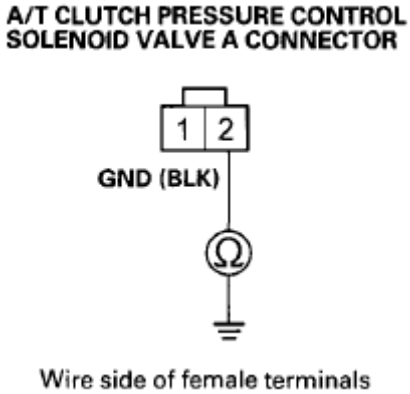

Fig. 96: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve A Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair an open in the wire between the A/T clutch pressure control solenoid valve A connector and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

19. Measure the resistance between A/T clutch pressure control solenoid valve A connector terminals No. 1 and No. 2.

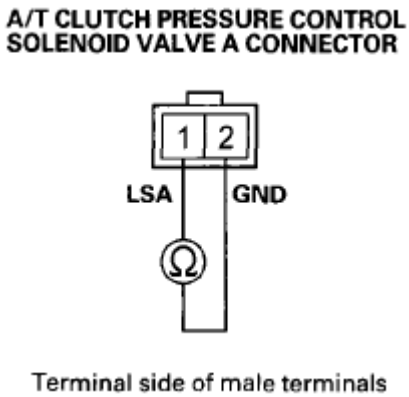

Fig. 97: Measuring Resistance Between A/T Clutch Pressure Control Solenoid Valve A Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 4.7-5.9 ohms?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Faulty A/T clutch pressure control solenoid valve A. Replace the secondary valve body (A/T clutch pressure control solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P0963: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0963 is stored in the PCM, the transmission does not shift to 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0963 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time.

4. Check the A/T C.P.C. Sol VLV. A Actual command with the HDS in the A/T Data List.

   Is there 35 mA or more?

   YES - Go to step 5.

   NO - Faulty A/T clutch pressure control solenoid valve A. Replace the secondary valve body (A/T clutch control solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect PCM connector B (49P).
8. Check for continuity between:
   - PCM connector terminal B1 and body ground.
   - PCM connector terminal B40 and body ground.

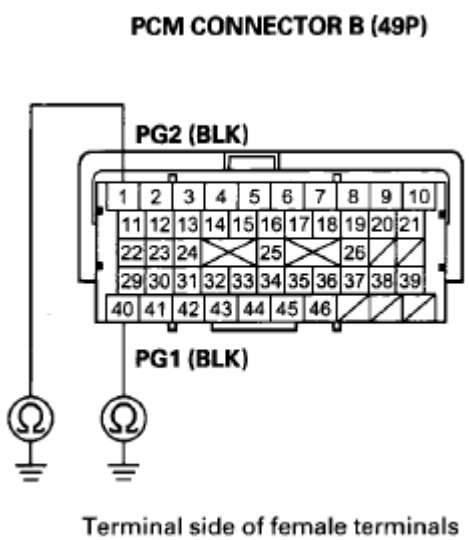

Fig. 98: Checking Continuity Between PCM Connector Terminal B1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wires between:

- PCM connector terminal B1 and body ground (G101) (see **CONNECTOR TO FUSE/RELAY**

BOX INDEX), or repair poor body ground (G101).

- PCM connector terminal B40 and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

DTC P0966: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0966 is stored in the PCM, the transmission does not shift to any gear other than 1st, 2nd, or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0966 Indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between A/T clutch pressure control solenoid valve B and the PCM.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Jump the SCS line with the HDS.
6. Disconnect PCM connector B (49P).
7. Check for continuity between PCM connector terminal B10 and body ground.

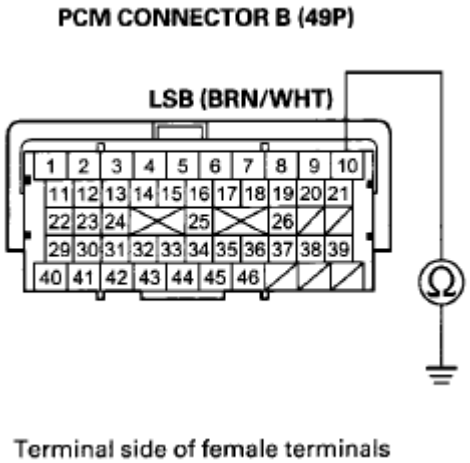

Fig. 99: Checking Continuity Between PCM Connector Terminal B10 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Go to step 10.

8. Disconnect the A/T clutch pressure control solenoid valve B connector.
9. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 1 and body ground.

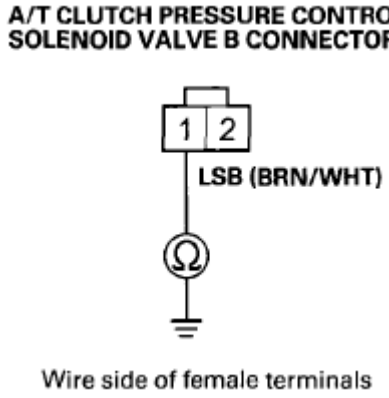

Fig. 100: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve B Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal B10 and A/T clutch pressure control solenoid valve B.

NO - Faulty A/T clutch pressure control solenoid valve B. Replace the secondary valve body (A/T clutch pressure control solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

10. Disconnect the A/T clutch pressure control solenoid valve B connector.
11. Check for continuity between PCM connector terminal B10 and A/T clutch pressure control solenoid valve B connector terminal No. 1.

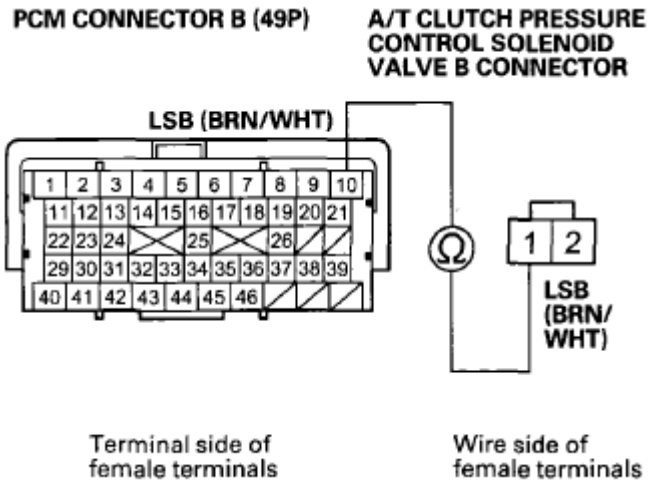

Fig. 101: Checking Continuity Between PCM Connector Terminal B10 And A/T Clutch Pressure Control Solenoid Valve B Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair an open in the wire between A/T clutch pressure control solenoid valve B connector terminal No. 1 and PCM connector terminal B10.

12. Check for continuity between A/T clutch pressure control solenoid valve B connector terminal No. 2 and body ground.

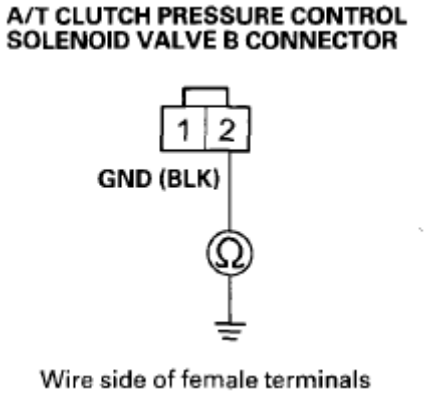

Fig. 102: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve B Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair an open in the wire between the A/T clutch pressure control solenoid valve B connector and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

13. Measure the resistance between A/T clutch pressure control solenoid valve B connector terminals No. 1 and No. 2.

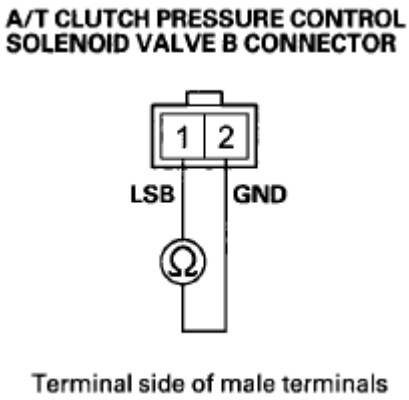

Fig. 103: Measuring Resistance Between A/T Clutch Pressure Control Solenoid Valve B Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 4.7-5.9 ohms?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Faulty A/T clutch pressure control solenoid valve B. Replace the secondary valve body (A/T clutch pressure control solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P0967: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE B

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0967 is stored in the PCM, the transmission does not shift to any gear other than 1st, 2nd, or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0967 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time.

4. Check the A/T C.P.C. Sol VLV. B Actual command with the HDS in the A/T Data List.

   Is there 35 mA or more?

   YES - Go to step 5.

   NO - Faulty A/T clutch pressure control solenoid valve B. Replace the secondary valve body (A/T clutch pressure control solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect PCM connector B (49P).
8. Check for continuity between:
   - PCM connector terminal B1 and body ground.
   - PCM connector terminal B40 and body ground.

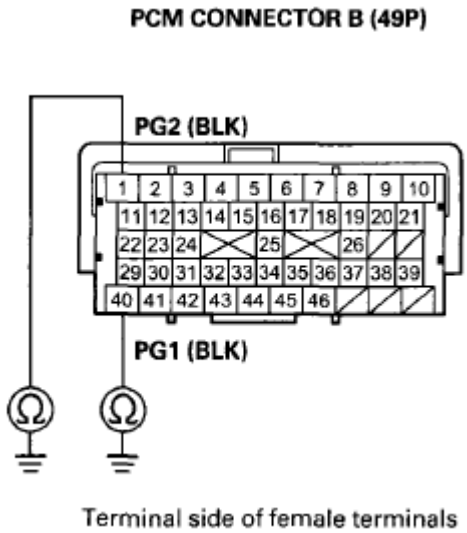

Fig. 104: Checking Continuity Between PCM Connector Terminal B1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wires between:

- PCM connector terminal B1 and body ground (G101) (see **CONNECTOR TO FUSE/RELAY**

BOX INDEX), or repair poor body ground (G101).

- PCM connector terminal B40 and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

DTC P0970: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0970 is stored in the PCM, the transmission does not shift to any gear other than 1st, 2nd, or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0970 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between A/T clutch pressure control solenoid valve C and the PCM.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Jump the SCS line with the HDS.
6. Disconnect PCM connector B (49P).
7. Check for continuity between PCM connector terminal B21 and body ground.

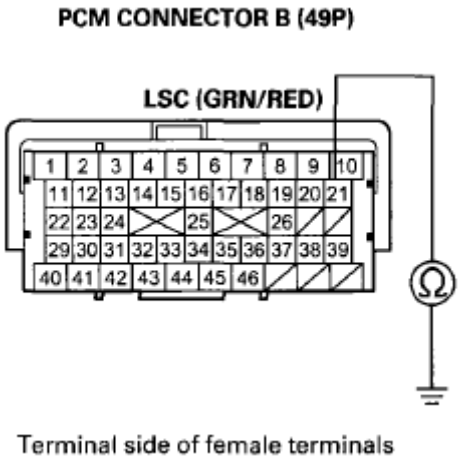

Fig. 105: Checking Continuity Between PCM Connector Terminal B21 And Body Ground

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 8.

NO - Go to step 10.

8. Disconnect the A/T clutch pressure control solenoid valve C connector.
9. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 1 and body ground.

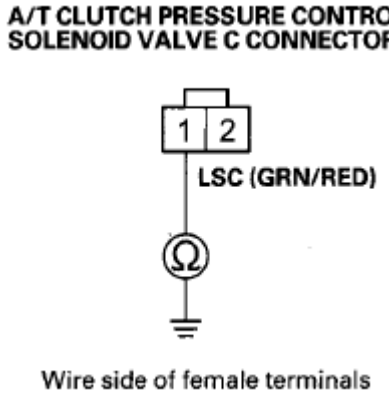

Fig. 106: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve C Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal B21 and A/T clutch pressure control solenoid valve C.

NO - Faulty A/T clutch pressure control solenoid valve C. Replace the secondary valve body (A/T clutch pressure control solenoid valve C) (see **SECONDARY VALVE BODY REPLACEMENT**).

10. Disconnect the A/T clutch pressure control solenoid valve C connector.
11. Check for continuity between PCM connector terminal B21 and A/T clutch pressure control solenoid valve C connector terminal No. 1.

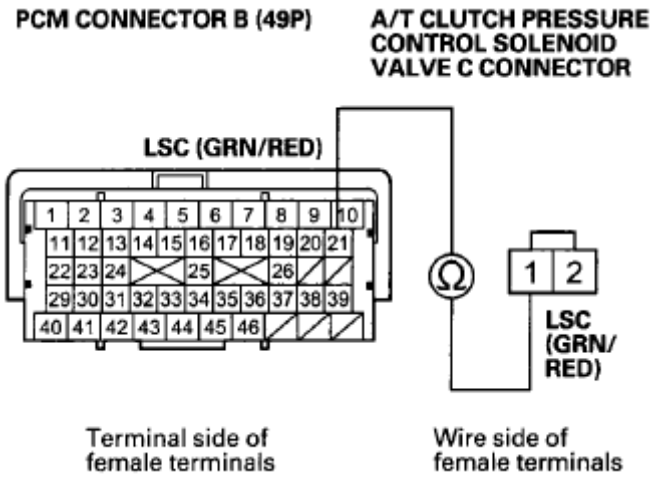

Fig. 107: Checking Continuity Between PCM Connector Terminal B21 And A/T Clutch Pressure Control Solenoid Valve C Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 12.

NO - Repair an open in the wire between A/T clutch pressure control solenoid valve C connector terminal No. 1 and PCM connector terminal B21.

12. Check for continuity between A/T clutch pressure control solenoid valve C connector terminal No. 2 and body ground.

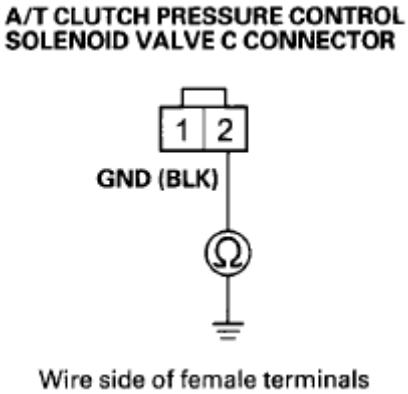

Fig. 108: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve C Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair an open in the wire between the A/T clutch pressure control solenoid valve C connector and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

13. Measure the resistance between A/T clutch pressure control solenoid valve C connector terminals No. 1 and No. 2.

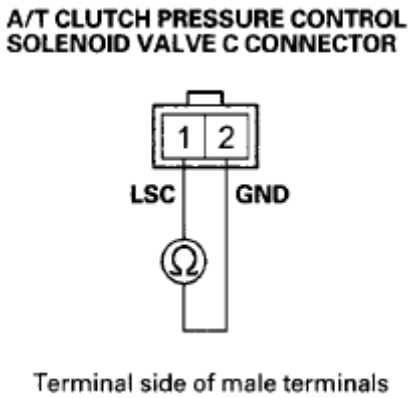

Fig. 109: Measuring Resistance Between A/T Clutch Pressure Control Solenoid Valve C Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 4.7-5.9 ohms?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Faulty A/T clutch pressure control solenoid valve C. Replace the secondary valve body (A/T clutch pressure control solenoid valve C) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P0971: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE C

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0971 is stored in the PCM, the transmission does not shift to any gear other than 1st, 2nd, or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0971 indicated?

YES - Go to step 4.

NO - Intermittent failure, the system is OK at this time.

4. Check the A/T C.P.C. Sol VLV. C Actual command with the HDS in the A/T Data List.

   Is there 35 mA or more?

   YES - Go to step 5.

   NO - Faulty A/T clutch pressure control solenoid valve C. Replace the secondary valve body (A/T clutch pressure control solenoid valve C) (see **SECONDARY VALVE BODY REPLACEMENT**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect PCM connector B (49P).
8. Check for continuity between:
   - PCM connector terminal B1 and body ground.
   - PCM connector terminal B40 and body ground.

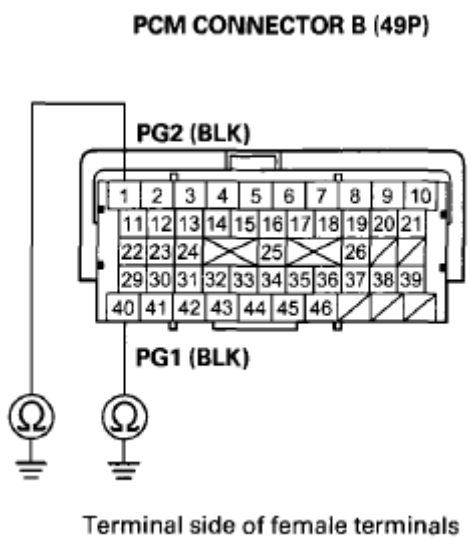

Fig. 110: Checking Continuity Between PCM Connector Terminal B1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wires between:

- PCM connector terminal B1 and body ground (G101) (see **CONNECTOR TO FUSE/RELAY**

BOX INDEX), or repair poor body ground (G101).

- PCM connector terminal B40 and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

DTC P0973: SHORT IN SHIFT SOLENOID VALVE A CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0973 is stored in the PCM, the transmission does not shift to 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine in P, and wait for at least 1 second.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0973 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve A and the PCM.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for a blown No. 10 (10 A) fuse in the driver's under-dash fuse/relay box.

   Is the No. 10 (10 A) fuse OK?

   YES - Go to step 7.

   NO - Repair a short to body ground in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors A (49P).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between PCM connector terminals A1 and body ground.

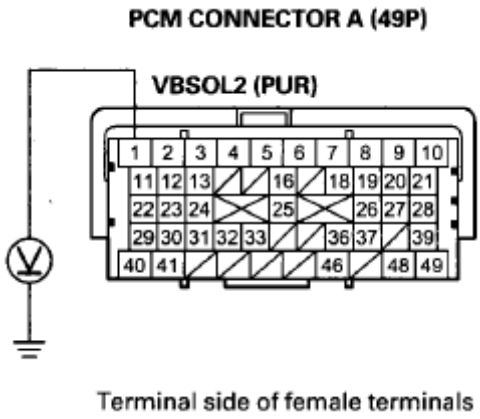

Fig. 111: Measuring Voltage Between PCM Connector Terminals A1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Repair an open in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Disconnect the shift solenoid valve A connector.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Clear the DTC with the HDS.
15. Start the engine in P, and wait for at least 1 second.
16. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0973 indicated?

YES - Go to step 17.

NO - Faulty shift solenoid valve A. Replace the secondary valve body (shift solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Jump the SCS line with the HDS.
19. Disconnect PCM connector C (49P).
20. Check for continuity between PCM connector terminals C20 and body ground.

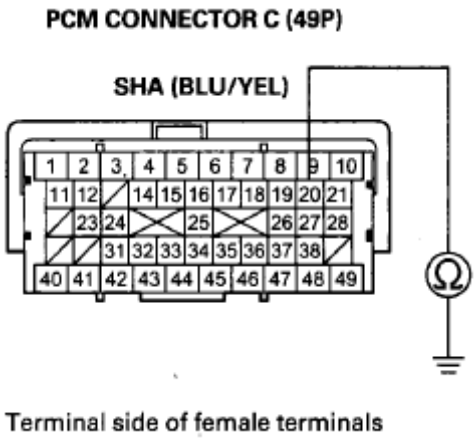

Fig. 112: Checking Continuity Between PCM Connector Terminals C20 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C20 and shift solenoid valve A connector terminal No. 2.

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0974: OPEN IN SHIFT SOLENOID VALVE A CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0974 is stored in the PCM, the transmission does not shift to 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. With the brake pedal pressed, shift to R, and wait for at least 1 second.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0974 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve A and the PCM.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for a blown No. 10 (10 A) fuse in the driver's under-dash fuse/relay box.

   Is the No. 10 (10 A) fuse OK?

   YES - Go to step 7.

   NO - Repair a short to body ground in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors A (49P).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between PCM connector terminals A1 and body ground.

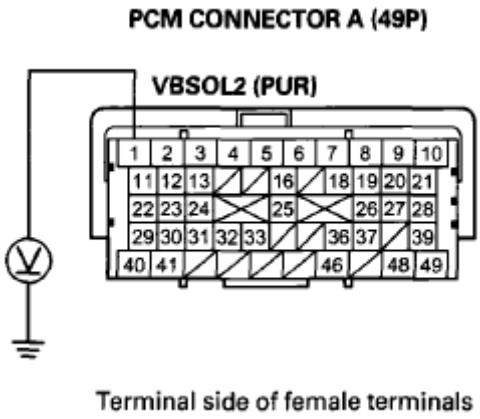

Fig. 113: Measuring Voltage Between PCM Connector Terminals A1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Repair an open in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Disconnect the shift solenoid valve A connector.
13. Connect a jumper wire between shift solenoid valve A connector terminal No. 2 and body ground.

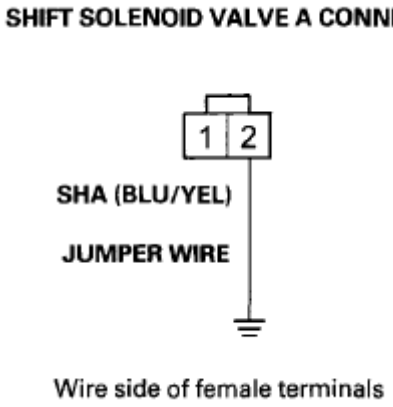

Fig. 114: Identifying Jumper Wire Between Shift Solenoid Valve A Connector Terminal No. 2 And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Clear the DTC with the HDS.
16. Start the engine in P, and wait for at least 1 second.
17. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0973 indicated?

YES - Go to step 18.

NO - Go to step 21.

18. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
19. Remove the jumper wire.
20. Check for continuity between shift solenoid valve A connector terminal No. 1 and body ground.

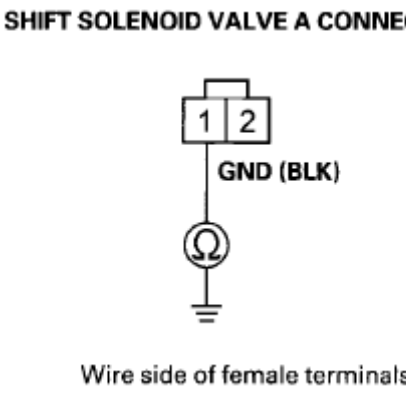

Fig. 115: Checking Continuity Between Shift Solenoid Valve A Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty shift solenoid valve A. Replace the secondary valve body (shift solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

NO - Repair an open in the wire between shift solenoid valve A and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Remove the jumper wire.
23. Jump the SCS line with the HDS.
24. Disconnect PCM connector C (49P).
25. Check for continuity between PCM connector terminal C20 and shift solenoid valve A connector terminal No. 2.

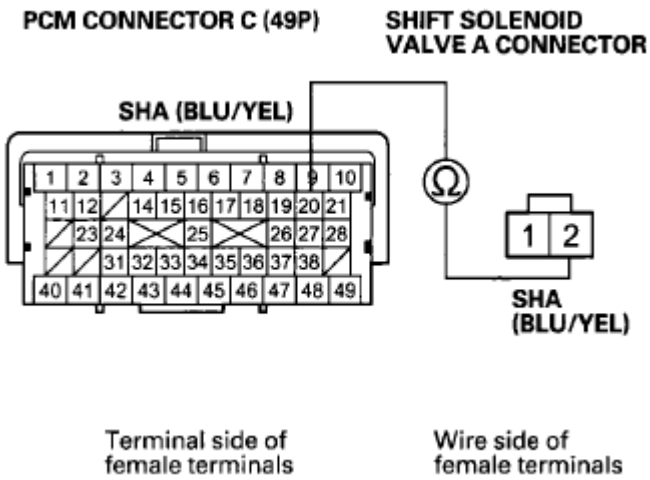

Fig. 116: Checking Continuity Between PCM Connector Terminal C20 And Shift Solenoid Valve A Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C20 and shift solenoid valve A connector terminal No. 2.

DTC P0976: SHORT IN SHIFT SOLENOID VALVE B CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0976 is stored in the PCM, the transmission does not shift to any gear other than 1st, 2nd, or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. With the brake pedal pressed, shift to D, and wait for at least 3 seconds, then move the shift lever back into P.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0976 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the shift solenoid valve B connector.
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Clear the DTC with the HDS.
9. Start the engine. With the brake pedal pressed, shift to D, and wait for at least 3 seconds, then move the shift lever back into P.
10. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0976 indicated?

    YES - Go to step 11.

    NO - Faulty shift solenoid valve B. Replace the secondary valve body (shift solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminals C28 and body ground.

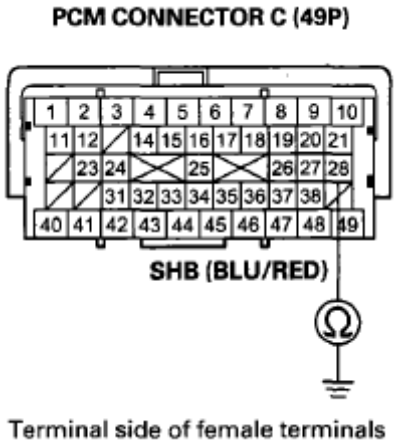

Fig. 117: Checking Continuity Between PCM Connector Terminals C28 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C28 and shift solenoid valve B connector terminal No. 2.

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0977: OPEN IN SHIFT SOLENOID VALVE B CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0977 is stored in the PCM, the transmission does not shift to any gear other than 1st, 2nd, or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine in P, and wait for at least 1 second.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0977 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve B and the PCM.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the shift solenoid valve B connector.
7. Connect a jumper wire between shift solenoid valve B connector terminal No. 2 and body ground.

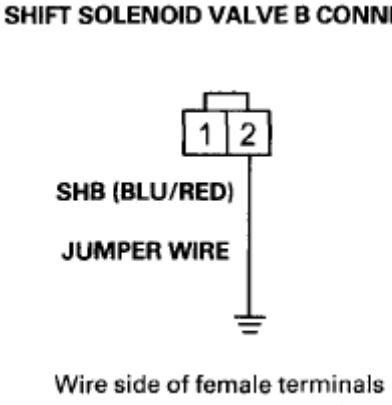

Fig. 118: Identifying Jumper Wire Between Shift Solenoid Valve B Connector Terminal No. 2 And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Clear the DTC with the HDS.
10. Start the engine. With the brake pedal pressed, shift to D, and wait for at least 3 seconds, then move the shift lever back into P.
11. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P0976 indicated?

    YES - Go to step 12.

    NO - Go to step 15.

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Remove the jumper wire.
14. Check for continuity between shift solenoid valve B connector terminal No. 1 and body ground.

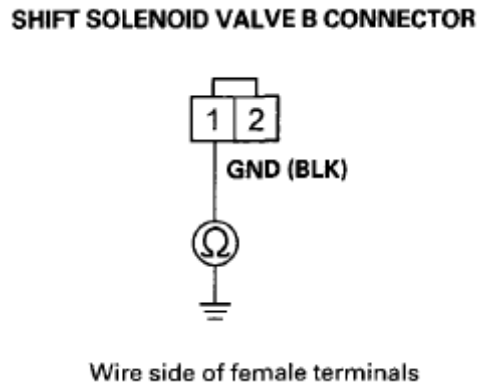

Fig. 119: Checking Continuity Between Shift Solenoid Valve B Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty shift solenoid valve B. Replace the secondary valve body (shift solenoid valve B) (see **SECONDARY VALVE BODY REPLACEMENT**).

NO - Repair an open in the wire between shift solenoid valve B and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

15. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
16. Remove the jumper wire.
17. Jump the SCS line with the HDS.
18. Disconnect PCM connector C (49P).
19. Check for continuity between PCM connector terminal C28 and shift solenoid valve B connector terminal No. 2.

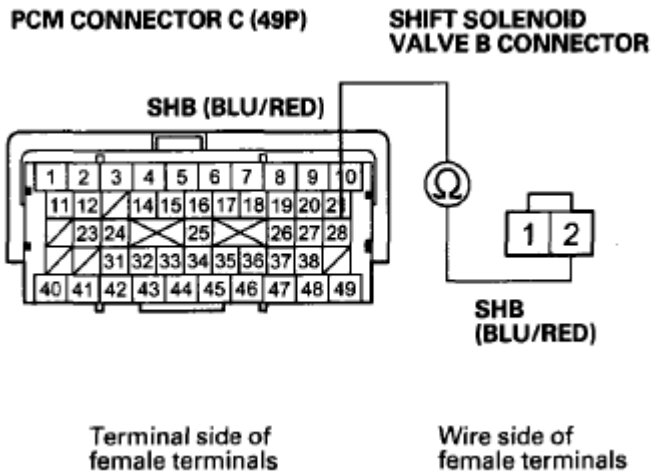

Fig. 120: Checking Continuity Between PCM Connector Terminal C28 And Shift Solenoid Valve B Connector Terminal No. 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C28 and shift solenoid valve B connector terminal No. 2.

DTC P0979: SHORT IN SHIFT SOLENOID VALVE C CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0979 is stored in the PCM, the transmission does not shift to 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine in P, and wait for at least 1 second.
4. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P0979 indicated?

   YES - Go to step 5.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve C and the PCM.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for a blown No. 10 (10 A) fuse in the driver's under-dash fuse/relay box.

   Is the No. 10 (10 A) fuse OK?

   YES - Go to step 7.

   NO - Repair a short to body ground in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors A (49P).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

10. Measure the voltage between PCM connector terminals A1 and body ground.

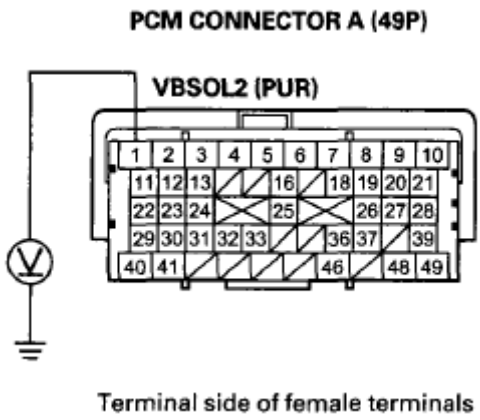

Fig. 121: Measuring Voltage Between PCM Connector Terminals A1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Repair an open in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Disconnect the shift solenoid valve C connector.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
14. Clear the DTC with the HDS.
15. Start the engine in P, and wait for at least 1 second.
16. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0979 indicated?

YES - Go to step 17.

NO - Replace shift solenoid valve C (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**).

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Jump the SCS line with the HDS.
19. Disconnect PCM connector C (49P).
20. Check for continuity between PCM connector terminals C9 and body ground.

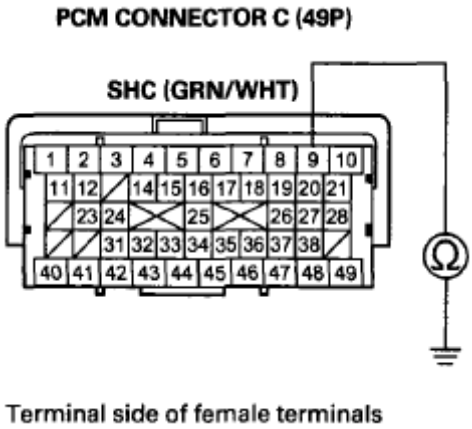

Fig. 122: Checking Continuity Between PCM Connector Terminals C9 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C9 and shift solenoid valve C connector terminal No. 2.

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0980: OPEN IN SHIFT SOLENOID VALVE C CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0980 is stored in the PCM, the transmission does not shift to 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine. With the brake pedal pressed, shift to N or D, and wait for at least 1 second.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0980 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve C and the PCM.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

6. Check for a blown No. 10 (10 A) fuse in the driver's under-dash fuse/relay box.

   Is the No. 10 (10 A) fuse OK?

   YES - Go to step 7.

   NO - Repair a short to body ground in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

7. Jump the SCS line with the HDS.
8. Disconnect PCM connectors A (49P).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between PCM connector terminals A1 and body ground.

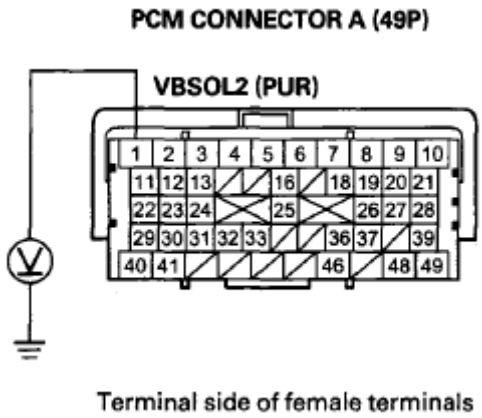

Fig. 123: Measuring Voltage Between PCM Connector Terminals A1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Repair an open in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Connect PCM connector A (49P).
13. Disconnect the shift solenoid valve C connector.
14. Connect a jumper wire between shift solenoid valve C connector terminal No. 2 and body ground.

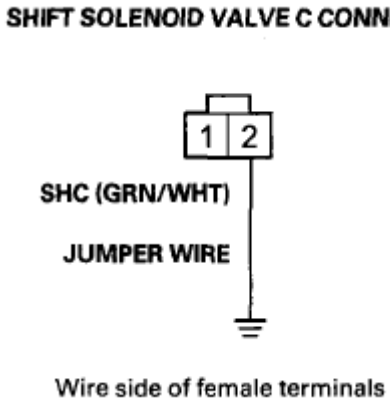

Fig. 124: Identifying Jumper Wire Between Shift Solenoid Valve C Connector Terminal No. 2 And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Clear the DTC with the HDS.
17. Start the engine in P, and wait for at least 1 second.
18. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P0979 indicated?

YES - Go to step 19.

NO - Go to step 22.

19. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
20. Remove the jumper wire.
21. Check for continuity between shift solenoid valve C connector terminal No. 1 and body ground.

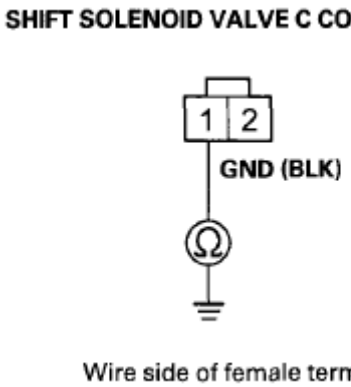

Fig. 125: Checking Continuity Between Shift Solenoid Valve C Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace shift solenoid valve C (see **SHIFT SOLENOID VALVE C TEST AND REPLACEMENT**).

NO - Repair an open in the wire between shift solenoid valve C and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Remove the jumper wire.
24. Jump the SCS line with the HDS.
25. Disconnect PCM connector C (49P).
26. Check for continuity between PCM connector terminal C9 and shift solenoid valve C connector terminal No. 2.

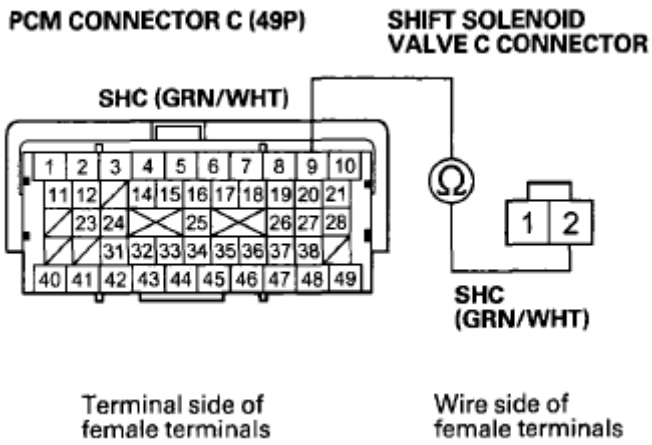

Fig. 126: Checking Continuity Between PCM Connector Terminal C9 And Shift Solenoid Valve C Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C9 and shift solenoid valve C connector terminal No. 2.

DTC P0989: SHORT IN TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**

- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P0989 is stored in the PCM, the transmission does not shift to any gear other than 3rd or 6th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check the 6th Pressure Switch signal with the HDS in the A/T Data List.

   Is the 6th Pressure Switch ON?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Disconnect the transmission fluid pressure switch E (6th clutch) connector.
6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the 6th Pressure Switch signal with the HDS in the A/T Data List.

   Is the 6th Pressure Switch OFF?

   YES - Replace transmission fluid pressure switch E (6th clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) REPLACEMENT**).

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Jump the SCS line with the HDS.
10. Disconnect PCM connector C (49P).
11. Check for continuity between PCM connector terminal C31 and body ground.

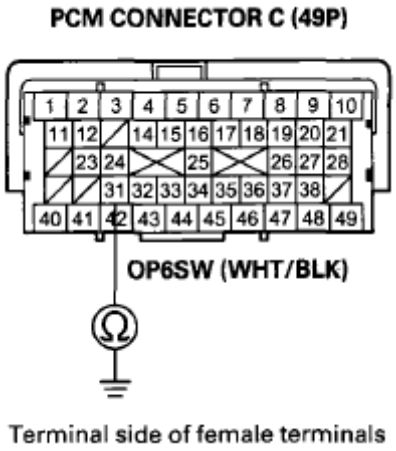

Fig. 127: Checking Continuity Between PCM Connector Terminal C31 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal C31 and transmission fluid pressure switch E (6th clutch).

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P0990: OPEN IN TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) CIRCUIT, OR TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) STUCK OFF

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P0990 is stored in the PCM, the transmission does not shift to any gear other than 3rd or 6th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine, disable the VSA by pressing the VSA OFF button. Run the vehicle with the sequential sportshift mode in 6th gear. Check the 6th Pressure Switch signal with the HDS in the A/T Data List. Slow down, and stop the wheels.

   Is the 6th Pressure Switch ON in 6th gear?

YES - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between transmission fluid pressure switch E (6th clutch) and the PCM.

NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Disconnect the transmission fluid pressure switch E (6th clutch) connector.
7. Connect a jumper wire between the transmission fluid pressure switch E (6th clutch) connector terminal and body ground.

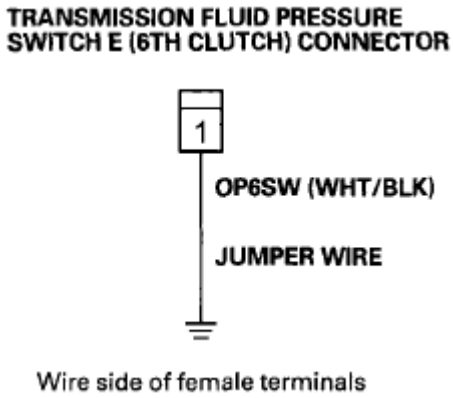

Fig. 128: Identifying Jumper Wire Between Transmission Fluid Pressure Switch E (6th Clutch) Connector Terminal And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Check the 6th Pressure Switch signal with the HDS in the A/T Data List.

Is the 6th Pressure Switch ON?

YES - Replace transmission fluid pressure switch E (6th clutch) (see **TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) REPLACEMENT**).

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Remove the jumper wire.
12. Jump the SCS line with the HDS.
13. Disconnect PCM connector C (49P).
14. Check for continuity between PCM connector terminal C31 and the transmission fluid pressure switch E (6th clutch) connector terminal.

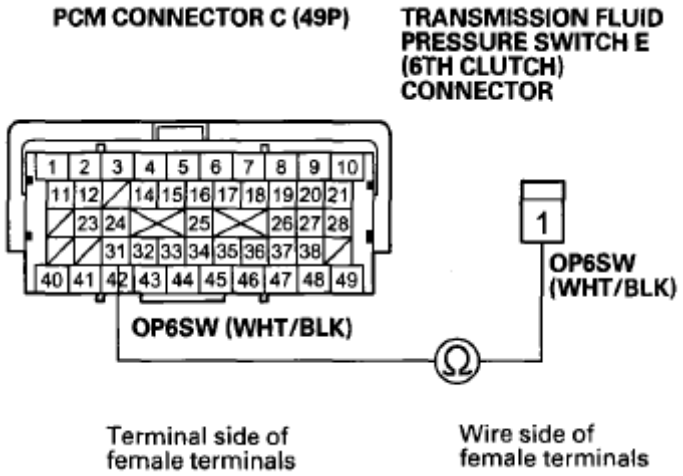

Fig. 129: Checking Continuity Between PCM Connector And Transmission Fluid Pressure Switch E (6th Clutch) Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C31 and transmission fluid pressure switch E (6th clutch).

DTC P1717: OPEN IN TRANSMISSION RANGE SWITCH ATPRVS SWITCH CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Shift to R, and monitor the Reverse Switch (ATPRVS) signal with the HDS.

   Is the Reverse Switch (ATPRVS) ON?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 3.

3. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
4. Disconnect the transmission range switch connector.
5. Connect a jumper wire between the transmission range switch connector terminal No. 1 and body ground.

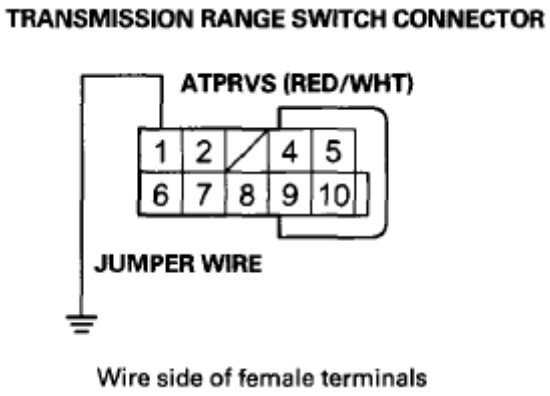

Fig. 130: Identifying Jumper Wire Between Transmission Range Switch Connector Terminal No. 1 And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Check the Reverse Switch (ATPRVS) signal with the HDS.

   Is the Reverse Switch (ATPRVS) ON?

   YES - Replace the transmission range switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**).

   NO - Go to step 8.

8. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
9. Remove the jumper wire.
10. Jump the SCS line with the HDS.
11. Disconnect PCM connector C (49P).
12. Check for continuity between PCM connector terminal C19 and transmission range switch connector terminal No. 1.

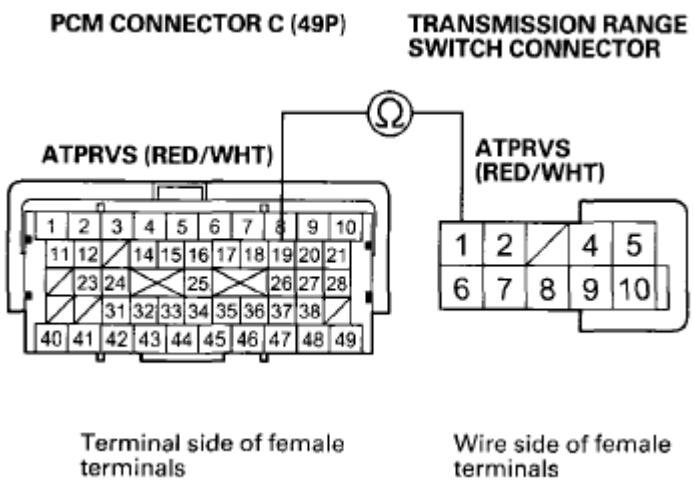

Fig. 131: Checking Continuity Between PCM Connector Terminal C19 And Transmission Range Switch Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal C19 and the transmission range switch.

DTC P177A: LINE PRESSURE SOLENOID VALVE A STUCK OFF, OR LINE PRESSURE SWITCH STUCK OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Clear the DTC with the HDS.
7. Start the engine. With the brake pedal pressed, shift to D, then release the brake pedal.
8. Monitoring the APP Sensor (%) with the HDS in the A/T Data List, press (2 % opened) and release (0 % opened) the accelerator pedal every 2 seconds. Then check the Line Pressure Sol VLV. A signal and the Line Pressure Pressure Switch signal with the HDS in the A/T Data List.

   Is the Line Pressure Pressure Switch ON when Line Pressure Sol VLV. A is ON, and OFF when Line Pressure Sol VLV. A is OFF?

   YES - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals

between the line pressure switch and the PCM.

NO - Go to step 9.

9. Select Line Pressure Solenoid A in the Miscellaneous Test Menu, and check that line pressure solenoid valve A operates with the HDS.

   Is a clicking sound heard?

   YES - Go to step 16.

   NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Check for a blown No. 13 (15 A) fuse in the driver's under-dash fuse/relay box.

    Is the No. 13 (15 A) fuse OK?

    YES - Go to step 12.

    NO - Repair a short to body ground in the wire between PCM connector terminal B2 and the driver's under-dash fuse/relay box.

12. Jump the SCS line with the HDS.
13. Disconnect PCM connector B (49P).
14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Measure the voltage between PCM connector terminal B2 and body ground.

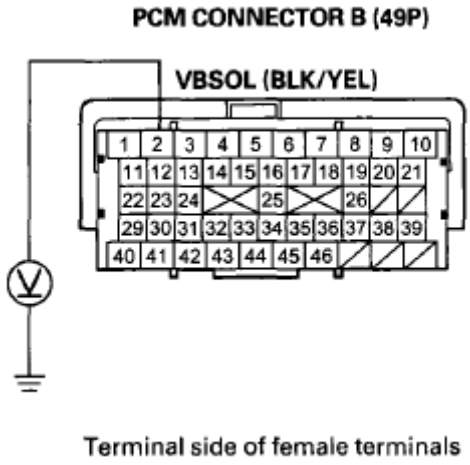

Fig. 132: Measuring Voltage Between PCM Connector Terminal B2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Faulty line pressure solenoid valve A. Replace the secondary valve body (line pressure solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal B2 and the driver's under-dash fuse/relay box.

16. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
17. Disconnect the line pressure switch connector.
18. Connect a jumper wire between the line pressure switch connector terminal and body ground.

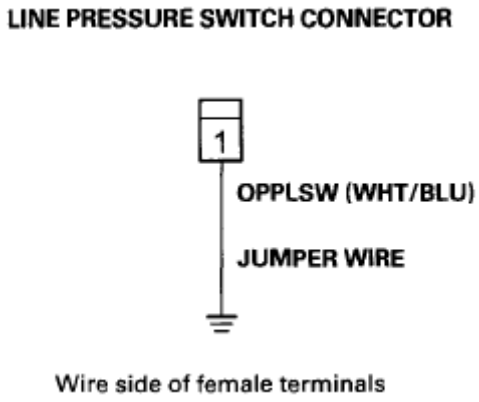

Fig. 133: Identifying Jumper Wire Between Line Pressure Switch Connector Terminal And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
20. Check the Line Pressure Pressure Switch signal with the HDS in the A/T Data List.

Is the Line Pressure Pressure Switch ON?

YES - Replace the line pressure switch (see **LINE PRESSURE SWITCH REPLACEMENT**).

NO - Go to step 21.

21. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
22. Remove the jumper wire.
23. Jump the SCS line with the HDS.
24. Disconnect PCM connector C (49P).
25. Check for continuity between PCM connector terminal C35 and the line pressure switch connector terminal.

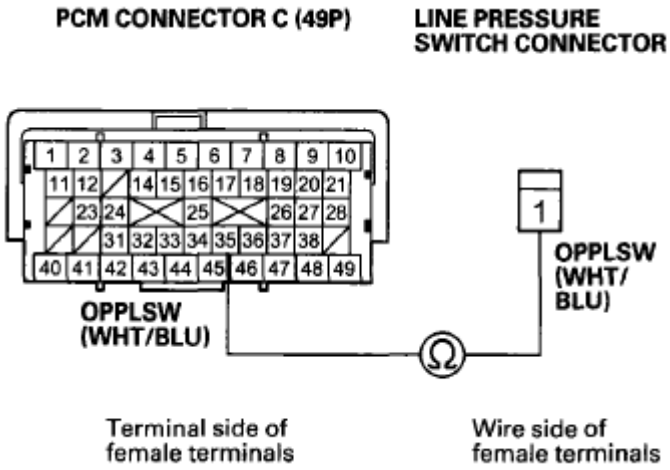

Fig. 134: Checking Continuity Between PCM Connector Terminal C35 And Line Pressure Switch Connector Terminal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between the line pressure switch connector terminal and PCM connector terminal C35.

DTC P2714: A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE D STUCK OFF

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Clear the DTC with the HDS.
6. Start the engine.
7. With the brake pedal pressed, shift to D, and check the A/T Shift Sol VLV. B signal, the Input Shaft

(Mainshaft) Speed, and the Shift Control with the HDS in the A/T Data List.

Does the Input Shaft (Mainshaft) Speed remain steady when A/T Shift Sol VLV. B is OFF, and does the Input Shaft (Mainshaft) Speed read 0 RPM when A/T Shift Sol VLV. B is ON?

YES - Go to step 8.

NO - Intermittent failure, the system is OK at this time.

8. Clear the DTC with the HDS.
9. Select Clutch Pressure Control (Linear) Solenoid Valve D in the Miscellaneous Test Menu, and test A/T clutch pressure control solenoid valve D with the HDS.

   Does the HDS indicate NORMAL?

   YES - Faulty lock-up shift valve. Replace the main valve body (lock-up shift valve) or the transmission. If you are replacing the main valve body, clean off any metal debris or excessive clutch material inside the transmission, the torque converter, the ATF cooler, the ATF hoses, the ATF pipes, and the hydraulic circuit. Then, replace the main valve body.

   NO - Faulty A/T clutch pressure control solenoid valve D. Replace the secondary valve body (A/T clutch pressure control solenoid valve D) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P2720: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE D CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P2720 is stored in the PCM, the transmission does not shift to 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2720 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between A/T clutch pressure control solenoid valve D and the PCM.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.

5. Check for a blown No. 10 (10 A) fuse in the driver's under-dash fuse/relay box.

   Is the No. 10 (10 A) fuse OK?

   YES - Go to step 6.

   NO - Repair a short to body ground in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

6. Jump the SCS line with the HDS.
7. Disconnect PCM connectors A (49P).
8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between PCM connector terminals A1 and body ground.

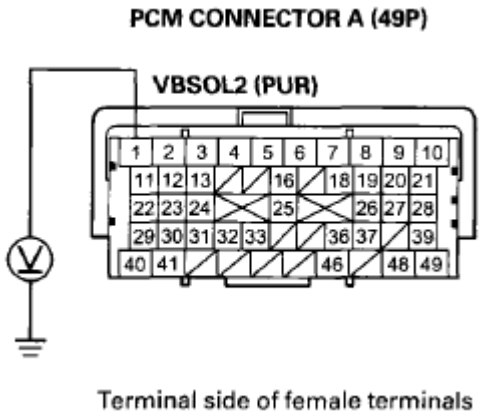

Fig. 135: Measuring Voltage Between PCM Connector Terminals A1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

   Is there battery voltage?

   YES - Go to step 10.

   NO - Repair an open in the wire between PCM connector terminal A1 and the driver's under-dash fuse/relay box.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector B (49P).
13. Check for continuity between PCM connector terminal B43 and body ground.

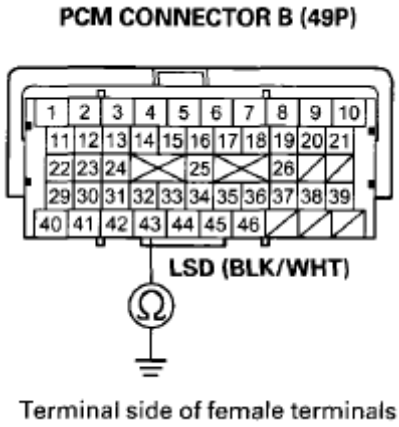

Fig. 136: Checking Continuity Between PCM Connector Terminal B43 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 14.

NO - Go to step 16.

14. Disconnect the A/T clutch pressure control solenoid valve D connector.
15. Check for continuity between A/T clutch pressure control solenoid valve D connector terminal No. 1 and body ground.

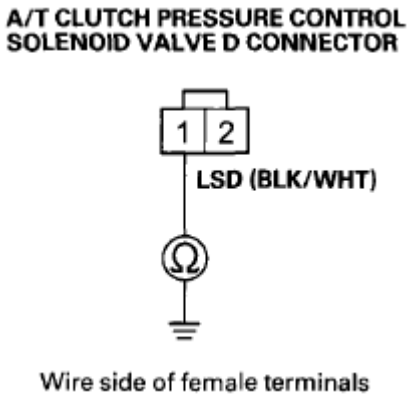

Fig. 137: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve D Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal B43 and A/T clutch pressure control solenoid valve D.

NO - Faulty A/T clutch pressure control solenoid valve D. Replace the secondary valve body (A/T clutch

pressure control solenoid valve D) (see **SECONDARY VALVE BODY REPLACEMENT**).

16. Disconnect the A/T clutch pressure control solenoid valve D connector.
17. Check for continuity between PCM connector terminal B43 and A/T clutch pressure control solenoid valve D connector terminal No. 1.

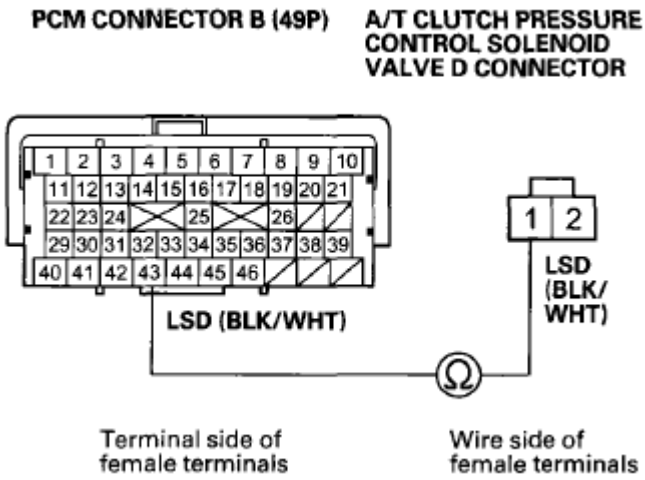

Fig. 138: Checking Continuity Between PCM Connector And A/T Clutch Pressure Control Solenoid Valve D Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 18.

NO - Repair an open in the wire between A/T clutch pressure control solenoid valve D connector terminal No. 1 and PCM connector terminal B43.

18. Check for continuity between A/T clutch pressure control solenoid valve D connector terminal No. 2 and body ground.

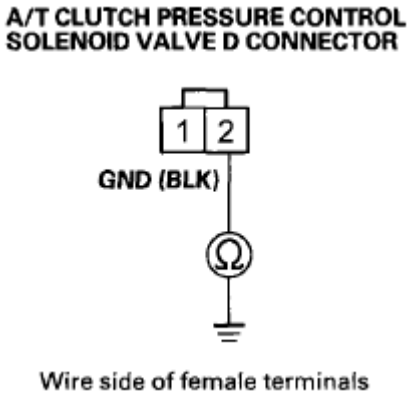

Fig. 139: Checking Continuity Between A/T Clutch Pressure Control Solenoid Valve D Connector

Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 19.

NO - Repair an open in the wire between the A/T clutch pressure control solenoid valve D connector and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

19. Measure the resistance between A/T clutch pressure control solenoid valve D connector terminals No. 1 and No. 2.

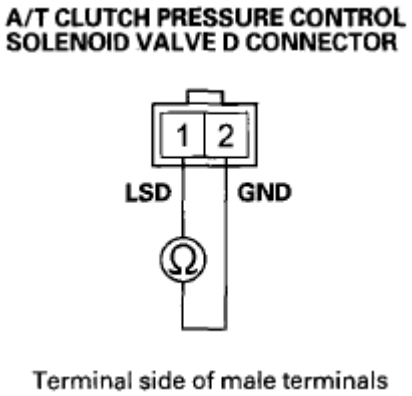

Fig. 140: Measuring Resistance Between A/T Clutch Pressure Control Solenoid Valve D Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there 4.7 - 5.9 ohms?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Faulty A/T clutch pressure control solenoid valve D. Replace the secondary valve body (A/T clutch pressure control solenoid valve D) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P2721: PROBLEM IN A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE D

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**
- **If DTC P2721 is stored in the PCM, the transmission does not shift to 2nd or 5th gear because of the fail-safe function.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2721 indicated?

   YES - Go to step 4.

   NO - Intermittent failure, the system is OK at this time.

4. Check the A/T C.P.C. Sol VLV. D Actual command with the HDS in the A/T Data List.

   Is there 35 mA or more?

   YES - Go to step 5.

   NO - Faulty A/T clutch pressure control solenoid valve D. Replace the secondary valve body (A/T clutch pressure control solenoid valve D) (see **SECONDARY VALVE BODY REPLACEMENT**).

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect PCM connector B (49P).
8. Check for continuity between:
   - PCM connector terminal B1 and body ground.
   - PCM connector terminal B40 and body ground.

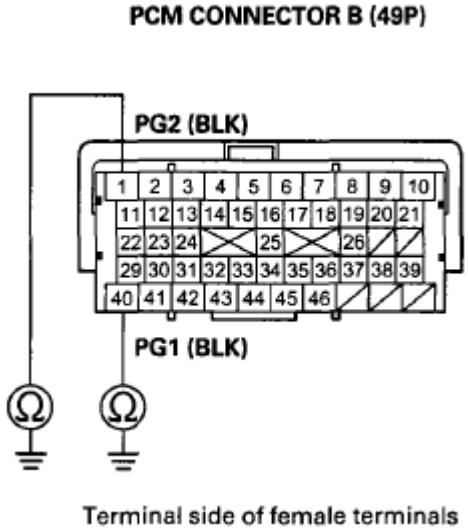

Fig. 141: Checking Continuity Between PCM Connector Terminal B1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wires between:

- PCM connector terminal B1 and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).
- PCM connector terminal B40 and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

DTC P2821: LINE PRESSURE SOLENOID VALVE A STUCK ON

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **If DTC P2821 is stored in the PCM, engine torque is restricted because of the fail-safe function.**

1. Warm up the engine to normal operating temperature (the radiator fan comes on).
2. Make sure that the transmission is filled to the proper level, and check for fluid leaks.
3. Drain the ATF (see **ATF REPLACEMENT**) through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES - Replace the transmission.

   NO - Replace the ATF (see **ATF REPLACEMENT**), then go to step 4.

4. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Clear the DTC with the HDS.
7. Start the engine. With the brake pedal pressed, shift to D, then release the brake pedal.
8. Monitoring the APP Sensor (%) with the HDS in the A/T Data List, press (2 % opened) and release (0 % opened) the accelerator pedal every 2 seconds. Then check the Line Pressure Sol VLV. A signal and the Line Pressure Pressure Switch signal with the HDS in the A/T Data List.

   Is the Line Pressure Pressure Switch ON when Line Pressure Sol VLV. A is ON, and OFF when Line Pressure Sol VLV. A is OFF?

   YES - Intermittent failure, the system is OK at this time.

NO - Faulty line pressure solenoid valve A. Replace the secondary valve body (line pressure solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

DTC P2826: SHORT IN LINE PRESSURE SOLENOID VALVE A CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

4. Start the engine. With the brake pedal pressed, shift to D, then release the brake pedal.
5. Monitoring the APP Sensor (%) with HDS in the A/T Data List, press (2 % opened) and release (0 % opened) the accelerator pedal every 2 seconds.
6. Check for Pending or Confirmed DTCs with the HDS.

   Is DTC P2826 indicated?

   YES - Go to step 7.

   NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between line pressure solenoid valve A and the PCM.

7. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
8. Check for a blown No. 13 (15 A) fuse in the driver's under-dash fuse/relay box.

   Is the No. 13 (15 A) fuse OK?

   YES - Go to step 9.

   NO - Repair a short to body ground in the wire between PCM connector terminal B2 and the driver's under-dash fuse/relay box.

9. Jump the SCS line with the HDS.
10. Disconnect PCM connector B (49P).
11. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.

12. Measure the voltage between PCM connector terminal B2 and body ground.

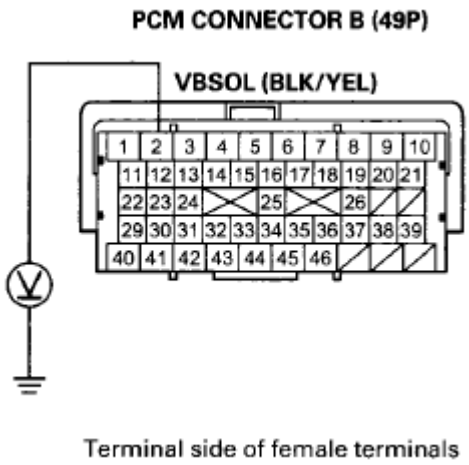

Fig. 142: Measuring Voltage Between PCM Connector Terminal B2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 13.

NO - Repair an open in the wire between PCM connector terminal B2 and the driver's under-dash fuse/relay box.

13. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
14. Disconnect the line pressure solenoid valve A connector.
15. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
16. Clear the DTC with the HDS.
17. Start the engine. With the brake pedal pressed, shift to D, then release the brake pedal.
18. Monitoring the APP Sensor (%) with HDS in the A/T Data List, press (2 % opened) and release (0 % opened) the accelerator pedal every 2 seconds.
19. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2826 indicated?

YES - Go to step 20.

NO - Faulty line pressure solenoid valve A. Replace the secondary valve body (line pressure solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Jump the SCS line with the HDS.
22. Disconnect PCM connector B (49P).

23. Check for continuity between PCM connector terminal B44 and body ground.

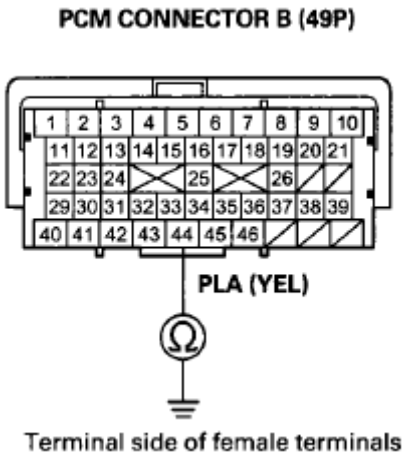

Fig. 143: Checking Continuity Between PCM Connector Terminal B44 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between PCM connector terminal B44 and line pressure solenoid valve A connector terminal No. 2.

NO - Replace the PCM (see **ECM/PCM REPLACEMENT**).

DTC P2827: OPEN IN LINE PRESSURE SOLENOID VALVE A CIRCUIT

NOTE:

- **Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and review the General Troubleshooting Information (see GENERAL TROUBLESHOOTING INFORMATION).**
- **This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.**

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
2. Clear the DTC with the HDS.
3. Start the engine in P, and wait for at least 1 second.
4. Check for Pending or Confirmed DTCs with the HDS.

Is DTC P2827 indicated?

YES - Go to step 5.

NO - Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between line pressure solenoid valve A and the PCM.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
6. Check for a blown No. 13 (15 A) fuse in the driver's under-dash fuse/relay box.

   Is the No. 13 (15 A) fuse OK?

   YES - Go to step 7.

   NO - Repair a short to body ground in the wire between PCM connector terminal B2 and the driver's under-dash fuse/relay box.

7. Jump the SCS line with the HDS.
8. Disconnect PCM connector B (49P).
9. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
10. Measure the voltage between PCM connector terminal B2 and body ground.

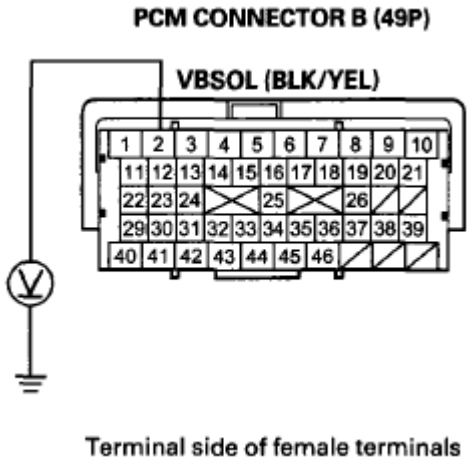

Fig. 144: Measuring Voltage Between PCM Connector Terminal B2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Repair an open in the wire between PCM connector terminal B2 and the driver's under-dash fuse/relay box.

11. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
12. Disconnect the line pressure solenoid valve A connector.
13. Connect a jumper wire between line pressure solenoid valve A connector terminal No. 2 and body ground.

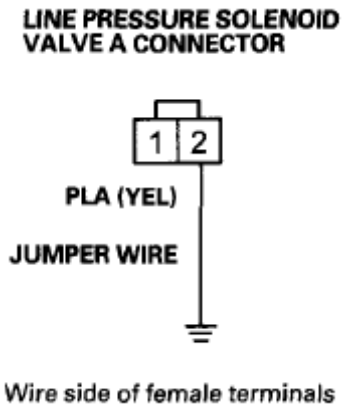

Fig. 145: Identifying Jumper Wire Between Line Pressure Solenoid Valve A Connector Terminal No. 2 And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
15. Clear the DTC with the HDS.
16. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

    Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

17. Start the engine. With the brake pedal pressed, shift to D, then release the brake pedal.
18. Monitoring the APP Sensor (%) with HDS in the A/T Data List, press (2 % opened) and release (0 % opened) the accelerator pedal every 2 seconds.
19. Check for Pending or Confirmed DTCs with the HDS.

    Is DTC P2826 indicated?

    YES - Go to step 20.

    NO - Go to step 23.

20. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
21. Remove the jumper wire.
22. Check for continuity between line pressure solenoid valve A connector terminal No. 1 and body ground.

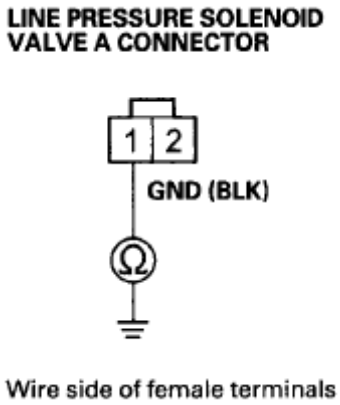

Fig. 146: Checking Continuity Between Line Pressure Solenoid Valve A Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Faulty line pressure solenoid valve A. Replace the secondary valve body (line pressure solenoid valve A) (see **SECONDARY VALVE BODY REPLACEMENT**).

NO - Repair an open in the wire between line pressure solenoid valve A and body ground (G101) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G101).

23. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
24. Remove the jumper wire.
25. Jump the SCS line with the HDS.
26. Disconnect PCM connector B (49P).
27. Check for continuity between PCM connector terminal B44 and line pressure solenoid valve A connector terminal No. 2.

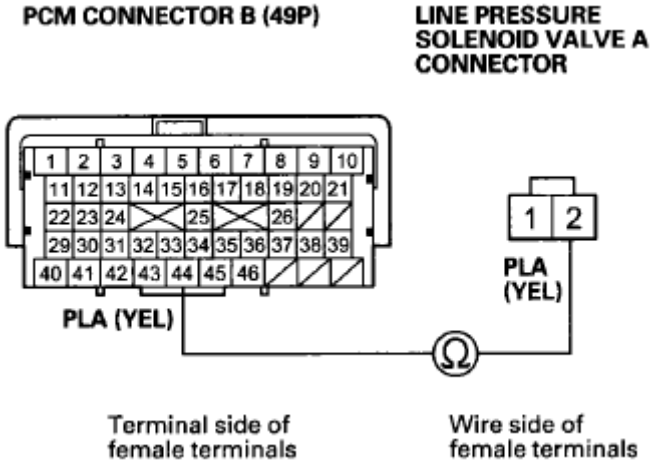

Fig. 147: Checking Continuity Between PCM Connector Terminal B44 And Line Pressure Solenoid Valve A Connector Terminal No. 2

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Replace the PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal B44 and line pressure solenoid valve A connector terminal No. 2.

ROAD TEST

1. Apply the parking brake, and block all four wheels.
2. Warm up the engine to normal operating temperature (the radiator fan comes on).
3. Shift to D while pressing the brake pedal. Press the accelerator pedal, and release it suddenly; the engine should not stall.
4. Repeat step 3 in all shift lever positions.
5. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

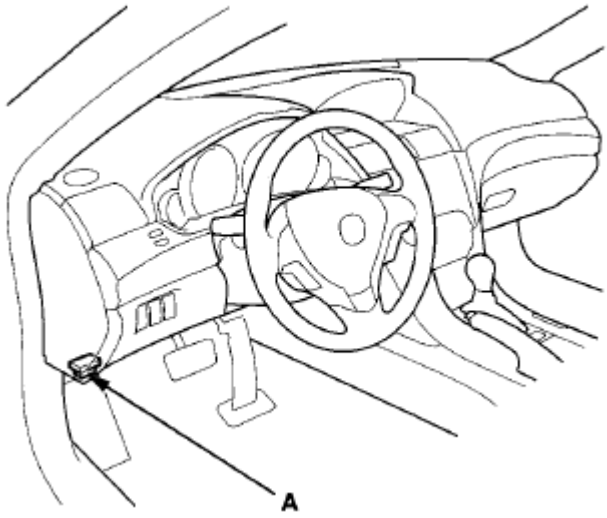

Fig. 148: Identifying DLC Under Driver's Side Of Dashboard
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
7. Make sure the HDS communicates with the PCM, and go to the A/T Data List. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
8. Prepare the HDS to take a HIGH SPEED SNAP SHOT (refer to the HDS user's guide for more details if needed):
    - Select the High Speed icon.
    - Select these parameters:
        - Vehicle Speed

- Output Shaft (Countershaft) Speed (RPM)
- Input Shaft (Mainshaft) Speed (RPM)
- Engine Speed
- TP Sensor
- APP Sensor A (V)
- ETR
- Battery Voltage
- Shift Control
- Brake Switch

- Set the Trigger Type to Parameter.
- Adjust the Parameter setting to APP Sensor A above 1.4 V.
- Set the Record Time to 60 seconds.
- Set the Trigger Point to (Negative) - 30 seconds.

9. Find a suitable level road. When you are ready to do the test, press OK with the HDS.
10. Accelerate quickly until APP Sensor A reads 1.5 V. Maintain a steady throttle until the transmission shifts to 6th gear, then slow the vehicle and come to a stop.
11. Save the snapshot if the entire event was recorded, or increase the recording time setting as necessary, and repeat step 10.
12. Adjust the parameter setting to 2.18 V. Test-drive the vehicle again. Accelerate quickly until APP Sensor A reads 2.28 V. Maintain a steady throttle until the transmission shifts to 6th gear (or a reasonable speed), then slow the vehicle and come to a stop.
13. Save the snapshot if the entire event was recorded, or increase the recording time setting as necessary, and repeat step 12.
14. Accelerate quickly until the accelerator pedal is to the floor. Maintain a steady pedal until the transmission shifts to 5th gear, then slow to a stop, and save the snapshot.

NOTE: Only perform the full throttle test pass the 2-3 shift if road conditions and local law/regulations allow it.

15. Review each snapshot individually, and compare the Shift Control, APP Sensor A (V), and the Vehicle Speed to the following table:

UPSHIFT: D POSITION (WITH SH-AWD)

APP Sensor A (V): 1.5 V	
1st --> 2nd	6 - 7 mph (9 - 11 km/h)
2nd --> 3rd	11 - 14 mph (18 - 22 km/h)
3rd --> 4th	21 - 23 mph (33 - 37 km/h)
4th --> 5th	27 - 31 mph (43 - 49 km/h)
5th --> 6th	41 - 44 mph (65 - 71 km/h)
Lock-up ON	3 - 5 mph (4 - 8 km/h)
APP Sensor A (V): 2.28 V	

1st --> 2nd	14 - 17 mph (23 - 27 km/h)
2nd --> 3rd	29 - 33 mph (47 - 53 km/h)
3rd --> 4th	46 - 49 mph (73 - 79 km/h)
4th --> 5th	65 - 69 mph (104 - 110 km/h)
5th --> 6th	90 - 94 mph (144 - 150 km/h)
Lock-up ON	5 - 8 mph (8 - 12 km/h)
Fully - opened throttle APP Sensor A (V): 4.5 V	
1st --> 2nd	41 - 44 mph (65 - 71 km/h)
2nd --> 3rd	67 - 71 mph (107 - 113 km/h)
3rd --> 4th	95 - 99 mph (152 - 158 km/h)
4th --> 5th	112 - 116 mph (179 - 185 km/h)
Lock-up ON	10 - 14 mph (16 - 22 km/h)

DOWNSHIFT: D POSITION (WITH SH-AWD)

APP Sensor A (V): 1.5 V	
Lock-up OFF	1 - 4 mph (2 - 6 km/h)
6th --> 5th	38 - 41 mph (60 - 66 km/h)
5th --> 4th	25 - 29 mph (40 - 46 km/h)
4th --> 3rd	17 - 19 mph (27 - 31 km/h)
2nd --> 1st	4 - 7 mph (7 - 11 km/h)
APP Sensor A (V): 2.28 V	
Lock-up OFF	1 - 4 mph (2 - 6 km/h)
6th --> 5th	58 - 61 mph (92 - 98 km/h)
5th --> 4th	36 - 39 mph (57 - 63 km/h)
4th --> 3rd	21 - 25 mph (34 - 40 km/h)
3rd --> 2nd	11 - 14 mph (17 - 23 km/h)
2nd --> 1st	4 - 7 mph (7 - 11 km/h)
Fully-opened throttle APP Sensor A (V): 4.5 V	
Lock-up OFF	1 - 4 mph (2 - 6 km/h)
5th --> 4th	104 - 108 mph (167 - 173 km/h)
4th --> 3rd	75 - 79 mph (120 - 126 km/h)
3rd --> 2nd	51 - 54 mph (81 - 87 km/h)
2nd --> 1st	25 - 28 mph (40 - 44 km/h)

UPSHIFT: D POSITION (WITHOUT SH - AWD)

APP Sensor A (V): 1.5 V	
1st --> 2nd	6 - 7 mph (9 - 11 km/h)
2nd --> 3rd	11 - 14 mph (18 - 22 km/h)
3rd --> 4th	21 - 23 mph (33 - 37 km/h)
4th --> 5th	27 - 31 mph (43 - 49 km/h)
5th --> 6th	41 - 44 mph (65 - 71 km/h)

Lock-up ON	3 - 5 mph (4 - 8 km/h)
APP Sensor A (V): 2.28 V	
1st --> 2nd	16 - 24 mph (25 - 38 km/h)
2nd --> 3rd	31 - 43 mph (50 - 69 km/h)
3rd --> 4th	48 - 61 mph (76 - 98 km/h)
4th --> 5th	67 - 87 mph (107 - 139 km/h)
5th --> 6th	92 - 118 mph (147 - 188 km/h)
Lock-up ON	5 - 8 mph (8 - 12 km/h)
Fully - opened throttle APP Sensor A (V): 4.5 V	
1st --> 2nd	41 - 44 mph (65 - 71 km/h)
2nd --> 3rd	67 - 71 mph (107 - 113 km/h)
3rd --> 4th	95 - 99 mph (152 - 158 km/h)
Lock-up ON	10 - 14 mph (16 - 22 km/h)

DOWNSHIFT: D POSITION (WITHOUT SH - AWD)

APP Sensor A (V): 1.5 V	
Lock-up OFF	1 - 4 mph (2 - 6 km/h)
6th --> 5th	38 - 41 mph (60 - 66 km/h)
5th --> 4th	25 - 29 mph (40 - 46 km/h)
4th --> 3rd	17 - 19 mph (27 - 31 km/h)
3rd --> 1st	4 - 7 mph (7 - 11 km/h)
APP Sensor A (V): 2.28 V	
Lock-up OFF	1 - 4 mph (2 - 6 km/h)
6th --> 5th	58 - 61 mph (92 - 98 km/h)
5th --> 4th	36 - 39 mph (57 - 63 km/h)
4th --> 3rd	21 - 25 mph (34 - 40 km/h)
3rd --> 2nd	11 - 14 mph (17 - 23 km/h)
2nd --> 1st	4 - 7 mph (7 - 11 km/h)
Fully - opened throttle APP Sensor A (V): 4.5 V	
Lock-up OFF	1 - 4 mph (2 - 6 km/h)
5th --> 4th	104 - 108 mph (167 - 173 km/h)
4th --> 3rd	75 - 79 mph (120 - 126 km/h)
3rd --> 2nd	51 - 54 mph (81 - 87 km/h)
2nd --> 1st	25 - 28 mph (40 - 44 km/h)

16. Drive the vehicle in 5th or 6th gear in S with the sequential sportshift mode, then decelerate and downshift to 2nd gear. The vehicle should immediately begin to slow down from the engine braking, then slow to a stop.
17. Shift to R, accelerate from a stop at full throttle momentarily, and check for abnormal noise and clutch slippage.
18. Park the vehicle on an upward slope (about 16 degrees), apply the parking brake, and shift into P. Release the brake; the vehicle should not move.

NOTE: **Always use the parking brake to hold the vehicle when stopped on an incline in gear. Depending on the grade of the incline, the vehicle could roll if the brake is released.**

STALL SPEED TEST

1. Make sure the transmission fluid is filled to the proper level (see **ATF LEVEL CHECK**).
2. Apply the parking brake, and block all four wheels.
3. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

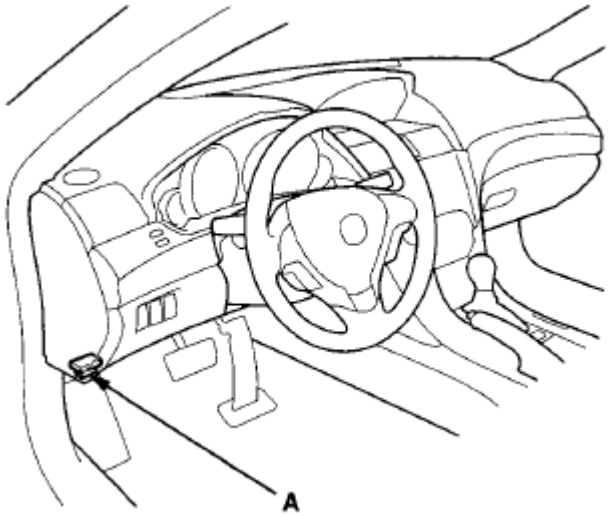

Fig. 149: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
5. Make sure the HDS communicates with the PCM, and go to the A/T Data List. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
6. Make sure the A/C switch is OFF.
7. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on).
8. Shift to D while pressing the brake pedal firmly, then press the accelerator pedal for 6 to 8 seconds, and note the engine speed. Do not move the shift lever or remove your foot off the brake pedal, while raising the engine speed.
9. Allow 2 minutes for cooling between test, then repeat the test with the shift lever in S and R.

NOTE:

- **Do not test stall speed for more than 10 seconds at a time.**
- **Record the engine speed at 6 to 8 seconds after pressing the accelerator pedal. Higher engine speed will be indicated for 5 seconds.**
- **Stall speed tests should be used for diagnostic purposes only.**

- **The stall speed should be the same in D, S, and R.**
- **Do not test stall speed with A/T pressure gauges installed.**

Stall Speed RPM:

Specification: 2, 000 RPM

Service Limit: 1, 800- 2, 100 RPM

10. If any of the stall speeds are out of the service limit, refer to the problems and probable causes listed in the table below.

Problem	Probable causes
Stall speed RPM high in D, S, and R	• ATF pump output low • Main regulator valve stuck • Slipping clutch
Stall speed RPM high in R	Slippage of 4th clutch
Stall speed RPM low in D, S, and R	• Engine output low • Engine throttle valve closed • Torque converter one-way clutch slipping

PRESSURE TEST

Special Tools Required

- A/T Oil Pressure Gauge Set 07406-0020400 or 07406-0020401
- AT Pressure Test Hose 07AAJ-PY4A100
- A/T Pressure Adapter 07MAJ-PY40120
- Pressure Gauge Adapter 070AJ-RT4A101

NOTE:

- **Check for DTCs. If any DTCs are stored, troubleshoot and clear them first.**
- **Do not allow dust or other foreign particles to enter the port while installing the pressure gauge adapter.**
- **Disable the VSA by pressing the VSA OFF button.**
- **Be sure to check the ATF level after each pressure port test. When installing or removing the pressure gauge adapter, ATF may run out of the pressure inspection ports.**
- **VSA DTC(s) may come on during the test-drive. If the VSA DTC(s) come on, clear the DTC(s) after testing is done with the HDS.**

1. Make sure the transmission fluid is filled to the proper level (see **ATF LEVEL CHECK**).

2. With SH-AWD: Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely.

   Without SH-AWD: Block the rear wheels, and raise the front of the vehicle, make sure it is securely supported, and allow the front wheels to rotate freely, or raise the vehicle on a lift.

3. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
4. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

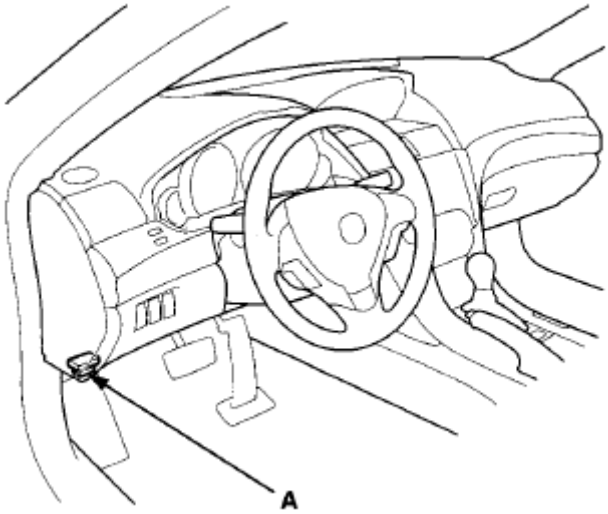

Fig. 150: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
6. Make sure the HDS communicates with the PCM, and go to the A/T Data List. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
7. Connect the A/T pressure adapter to the A/T pressure test hose, then connect the A/T pressure test hose to the A/T oil pressure gauge set.

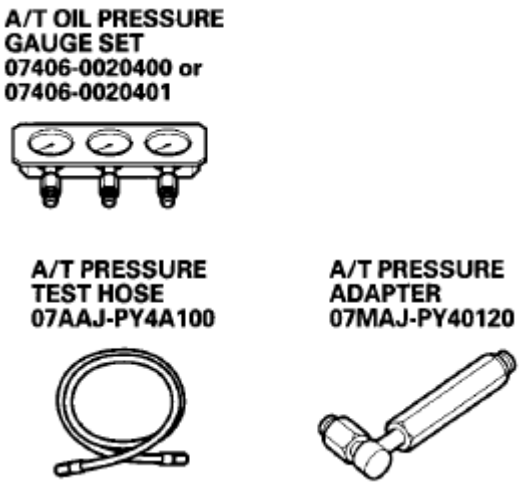

Fig. 151: Identifying A/T Oil Pressure Gauge Set
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. When testing the oil pressure at each inspection port, select a suitable adapter from the following table, and connect each adapter to the pressure gauge assembled in step 7.

Tool	Connect to
Pressure gauge adapter A and E	• 2nd clutch pressure • 4th clutch pressure
Pressure gauge adapter B	• 1st clutch pressure • 5th clutch pressure • Torque converter clutch pressure
Pressure gauge adapter C	• Line pressure
Pressure gauge adapter D	• 3rd clutch pressure • 6th clutch pressure

PRESSURE GAUGE ADAPTER 070AJ-RT4A101

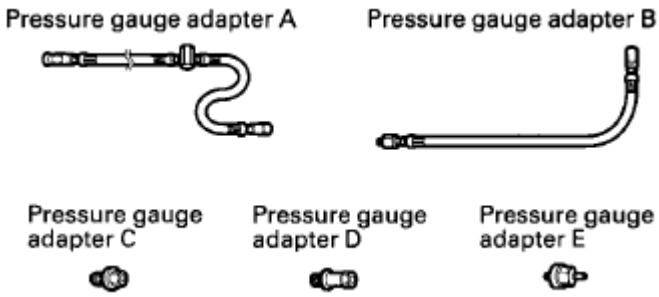

Fig. 152: Identifying Pressure Gauge Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install pressure gauge adapter C to the line pressure inspection port (A), then connect the A/T pressure adapter to pressure gauge adapter C.

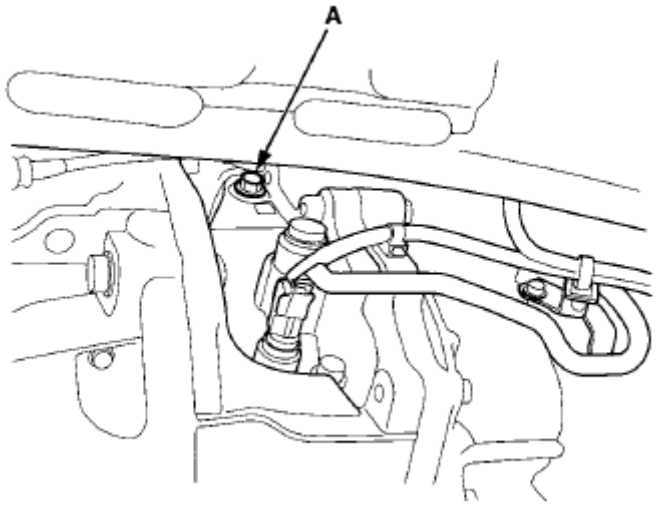

Fig. 153: Identifying Line Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Start the engine in P, and warm it up to normal operating temperature (ATF temperature between 122°F and 212°F (50°C and 100°C)).
11. Move the shift lever to D.
12. Measure the low line pressure when the APP sensor opening less than 25 % and Line Pressure Sol VLV. A is ON with the HDS in the A/T Data List.
13. Measure the normal line pressure while holding the engine speed at 2, 000 RPM with the shift lever in P or N.

NOTE: When measuring the normal line pressure, do not measure with the shift lever in other than P or N.

Line Pressure	Fluid Pressure	
	Standard	Service Limit
Low	667 - 716 kPa (6.80 - 7.30 kgf/cm^2 , 96.7 - 103.8 psi)	Lower limit: 618 kPa (6.30 kgf/cm^2 , 89.6 psi) Upper limit: 765 kPa (7.80 kgf/cm^2 , 111.0 psi)
Normal	1, 177-1, 294 kPa (12.0-13.2 kgf/cm^2 , 170.7-187.7 psi)	1, 079 kPa (11.00 kgf/cm^2 , 156.5 psi)

14. Turn the engine off, then disconnect pressure gauge adapter C from the line pressure inspection port.
15. Install a new sealing bolt to the line pressure inspection port, and tighten the bolt to 20 N.m (2.0 kgf.m, 14 lbf.ft). Do not reuse the old sealing bolt.
16. Connect pressure gauge adapter B to the torque converter clutch pressure inspection port (A), then connect the A/T pressure adapter to pressure gauge adapter B.

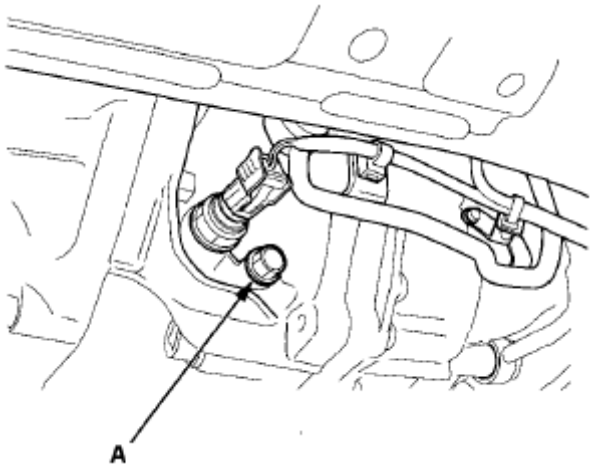

Fig. 154: Identifying Torque Converter Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Start the engine, and run the vehicle with sequential sportshift mode in 2nd gear.
18. Measure the torque converter clutch pressure while holding the engine speed at 4, 000 RPM.

Pressure	Fluid Pressure	
	Standard	Service Limit
Torque converter clutch pressure	294 kPa (3.00 kgf/cm^2 , 42.7 psi)	245 kPa (2.50 kgf/cm^2 , 35.6 psi)

19. Turn the engine off, then disconnect pressure gauge adapter B from the torque converter clutch pressure inspection port.
20. Install a new sealing bolt to the torque converter clutch pressure inspection port, and tighten the sealing bolt to 20 N.m (2.0 kgf.m, 14 lbf.ft). Do not reuse the old sealing bolt.
21. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
22. Remove the battery base (see **ENGINE REMOVAL**).

NOTE: The following procedure must be done to accurately test the pressure.

23. Remove the harness clamp (A).

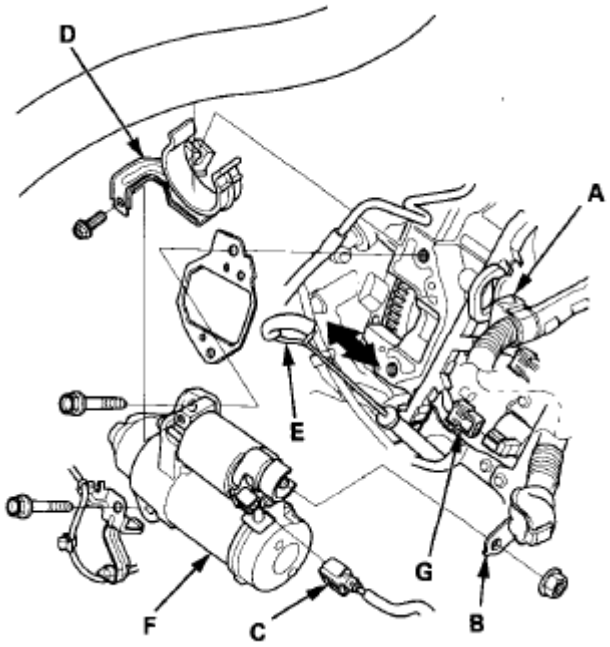

Fig. 155: Identifying Clamp, Starter Cable, Terminal Connector, Bracket, Dipstick And Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Disconnect the positive starter cable (B) and the S terminal connector (C).
25. Remove the lower radiator hose bracket (D) and the dipstick (E).
26. Remove the two bolts holding the starter, then remove the starter (F).
27. Disconnect the line pressure solenoid valve A connector (G).
28. Temporarily install the starter (A), then tighten the bolts.

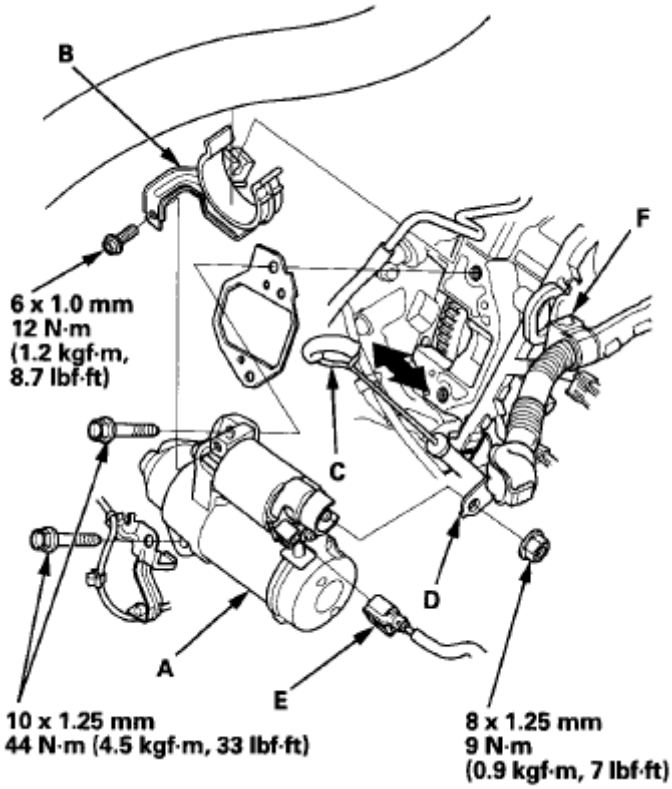

Fig. 156: Identifying Starter, Bracket, Dipstick, Starter Cable, Connector And Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Install the lower radiator hose bracket (B) and the dipstick (C).
30. Connect the positive starter cable (D) and the S terminal connector (E). Make sure the crimped side of the ring terminal faces away from the starter when you connect it.
31. Install the harness clamp (F).
32. Install the battery base (see **ENGINE INSTALLATION**).
33. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).
34. Disconnect the transmission fluid pressure switch C (4th clutch) connector, and remove transmission fluid pressure switch C (4th clutch).
35. Install transmission fluid pressure switch C (4th clutch) and the washer (B) to pressure gauge adapter A, then connect the A/T pressure adapter to pressure gauge adapter A.

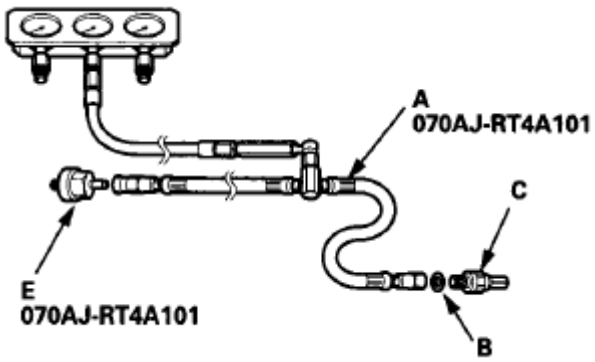

Fig. 157: Identifying Transmission Fluid Pressure Switch C And Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Install pressure gauge adapter E (quick connector) to the 4th clutch pressure inspection port (B), then connect pressure gauge adapter A to pressure gauge adapter E (quick connector). Connect the transmission fluid pressure switch C (4th clutch) connector to transmission fluid pressure switch C (4th clutch).

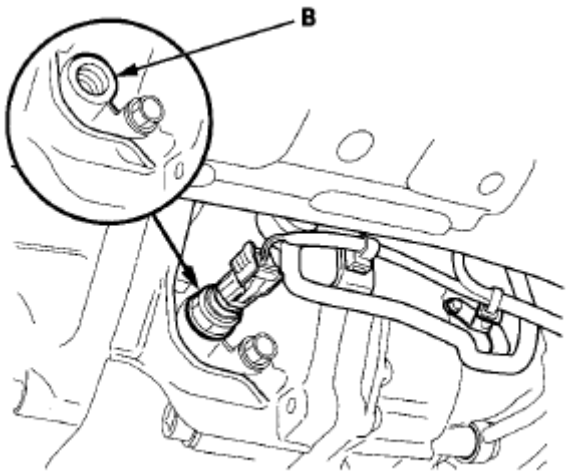

Fig. 158: Identifying Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Start the engine, and run the vehicle with the sequential sportshift mode in 4th gear.
38. Measure the 4th clutch pressure while holding the engine speed at 2, 000 RPM.

Pressure	Fluid Pressure	
	Standard	Service Limit
4th clutch	1, 123 - 1, 172 kPa (11.45 - 11.95 kgf/cm^2 , 162.9 - 170.0 psi)	1, 079 kPa (11.00 kgf/cm^2 , 156.5 psi)

39. Bring the engine back to an idle, then apply the brake pedal to stop the wheels from rotating.

40. Shift to R, then release the brake pedal. Measure the 4th clutch pressure while holding the engine speed at 2, 000 RPM.

Pressure	Fluid Pressure	
	Standard	Service Limit
4th clutch in R	1, 123 - 1, 172 kPa (11.45 - 11.95 kgf/cm^2 , 162.9 - 170.0 psi)	1, 079 kPa (11.00 kgf/cm^2 , 156.5 psi)

41. Turn the engine off.
42. Disconnect the transmission fluid pressure switch C (4th clutch) connector from transmission fluid pressure switch C (4th clutch). Remove the pressure gauge adapters from the 4th clutch pressure inspection port.
43. Remove transmission fluid pressure switch C (4th clutch) from pressure gauge adapter A.
44. Install transmission fluid pressure switch C (4th clutch) and a new sealing washer, and tighten transmission fluid pressure switch C (4th clutch) to 20 N.m (2.0 kgf.m, 14 lbf.ft). Do not reuse the old sealing washer.
45. Connect the transmission fluid pressure switch C (4th clutch) connector.
46. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
47. Remove the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
48. Connect pressure gauge adapter B to the 1st clutch pressure inspection port (A) or the 5th clutch pressure inspection port (C), then connect the A/T pressure adapter to pressure gauge adapter B.

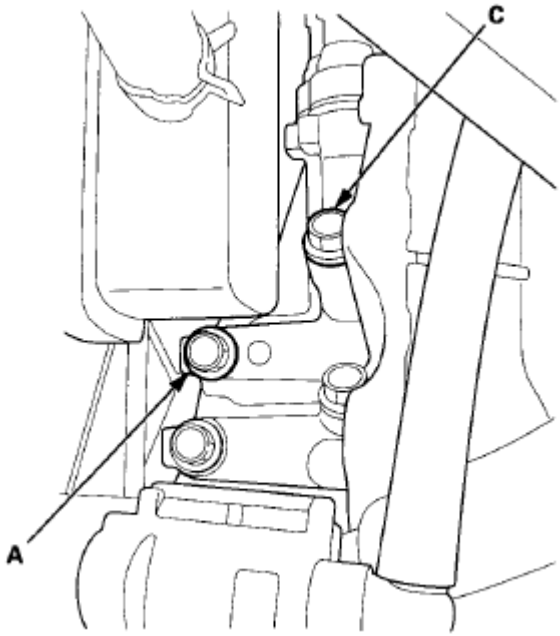

Fig. 159: Identifying 1st And 5th Clutch Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Temporarily install the intake air duct and the air cleaner.

50. Start the engine, and run the vehicle with the sequential sportshift mode in 1st or 5th gear.
51. Measure the 1st or 5th clutch pressure while holding the engine speed at 2, 000rpm.

Pressure	Fluid Pressure	
	Standard	Service Limit
1st clutch 5th clutch	1, 123 - 1, 172 kPa (11.45 - 11.95 kgf/cm^2 , 162.9 - 170.0 psi)	1, 079 kPa (11.00 kgf/cm^2 , 156.5 psi)

52. Turn the engine off, remove the intake air duct and the air cleaner.
53. Disconnect the pressure gauge adapter from the 1st or 5th clutch pressure inspection port.
54. Install a new sealing bolt in the 1st or 5th clutch pressure inspection port, and tighten the sealing bolt to 20 N.m (2.0 kgf.m, 14 lbf.ft). Do not reuse the old sealing bolt.
55. Connect pressure gauge adapter D to the 3rd pressure inspection port (A) or the 6th pressure inspection port (B), then connect the A/T pressure adapter to pressure gauge adapter 0.

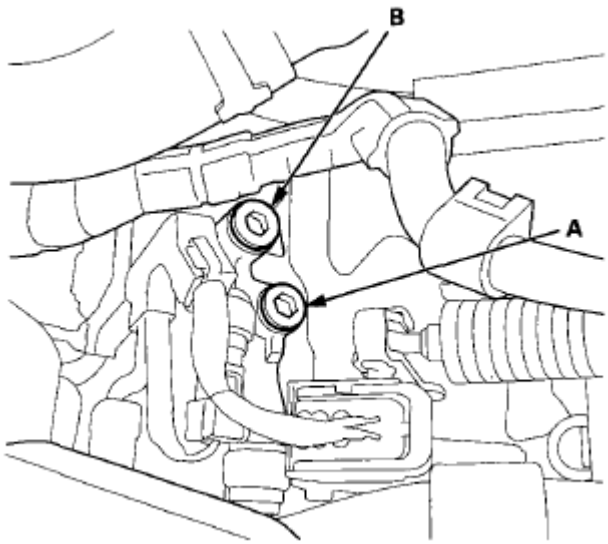

Fig. 160: Identifying 3rd Pressure Inspection Port And 6th Pressure Inspection Port
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Temporarily install the intake air duct and the air cleaner.
57. Start the engine, and run the vehicle with the sequential sportshift mode in 3rd or 6th gear.
58. Measure the 3rd or 6th clutch pressure while holding the engine speed at 2, 000 RPM.

Pressure	Fluid Pressure	
	Standard	Service Limit
3rd clutch 6th clutch	1, 123 - 1, 172 kPa (11.45 - 11.95 kgf/cm^2 , 162.9 - 170.0 psi)	1, 079 kPa (11.00 kgf/cm^2 , 156.5 psi)

59. Turn the engine off, then remove the intake air duct and the air cleaner.

60. Disconnect the pressure gauge adapter from the 3rd or 6th clutch pressure inspection port.
61. Install a new sealing bolt in the 3rd or 6th clutch pressure inspection port, and tighten the sealing bolt to 27 N.m (2.8 kgf.m, 20 lbf.ft). Do not reuse the old sealing bolt.
62. Disconnect the transmission fluid pressure switch A (2nd clutch) connector, and remove transmission fluid pressure switch A (2nd clutch).
63. Install transmission fluid pressure switch A (2nd clutch) (B) and the washer (C) to pressure gauge adapter A, then connect the A/T pressure adapter to pressure gauge adapter A.

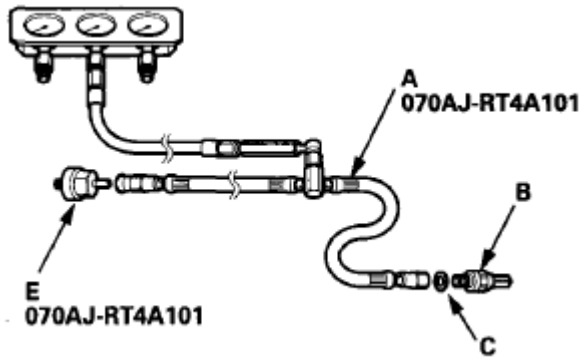

Fig. 161: Identifying Transmission Fluid Pressure Switch A, Washer, Quick Connector And A/T Pressure Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

64. Install pressure gauge adapter E (quick connector) to the 2nd clutch pressure inspection port (B), then connect pressure gauge adapter A to pressure gauge adapter E (quick connector). Connect the transmission fluid pressure switch A (2nd clutch) connector to transmission fluid pressure switch A (2nd clutch).

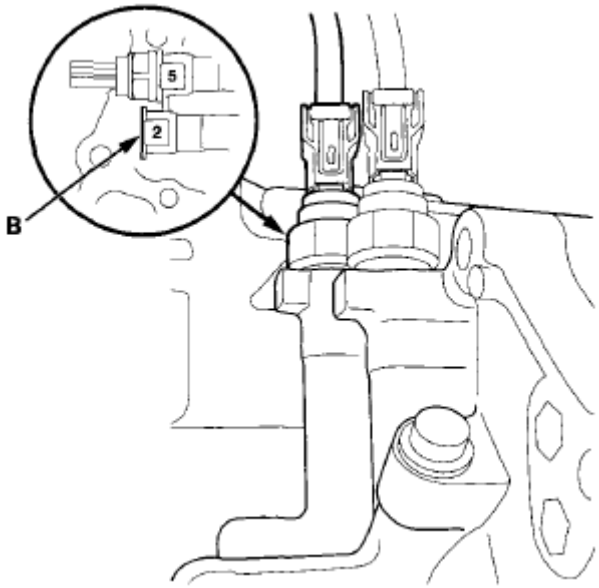

Fig. 162: Identifying 2nd Clutch Pressure Inspection Port

Courtesy of AMERICAN HONDA MOTOR CO., INC.

65. Temporarily install the intake air duct and the air cleaner.
66. Start the engine, and run the vehicle with the sequential sportshift mode in 2nd gear.
67. Measure the 2nd clutch pressure while holding the engine speed at 2, 000 RPM.

Pressure	Fluid Pressure	
	Standard	Service Limit
2nd clutch	1, 123 - 1, 172 kPa (11.45 - 11.95 kgf/cm^2 , 162.9 - 170.0 psi)	1, 079 kPa (11.00 kgf/cm^2 , 156.5 psi)

68. Turn the engine off, remove the intake air duct and the air cleaner.
69. Disconnect the transmission fluid pressure switch A (2nd clutch) connector from transmission fluid pressure switch A (2nd clutch). Disconnect the pressure gauge adapters from the 2nd clutch pressure inspection port.
70. Remove transmission fluid pressure switch A (2nd clutch) from pressure gauge adapter A.
71. Install transmission fluid pressure switch A (2nd clutch) and a new sealing washer, and tighten transmission fluid pressure switch A (2nd clutch) to 20 N.m (2.0 kgf.m, 14 lbf.ft). Do not reuse the old sealing washer.
72. Connect the transmission fluid pressure switch A (2nd clutch) connector.
73. Install the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
74. Install the air cleaner (see **THROTTLE BODY CLEANING**).
75. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
76. Remove the battery base (see **ENGINE REMOVAL**).
77. Remove the harness clamp (A).

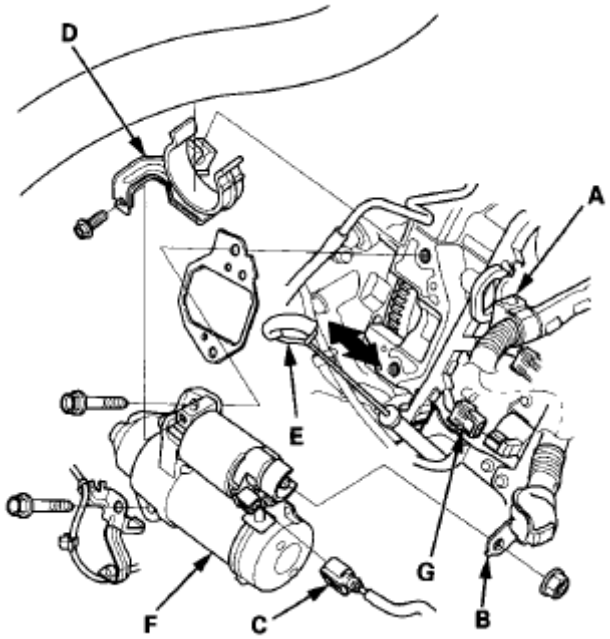

Fig. 163: Identifying Clamp, Starter Cable, Connector, Bracket, Dipstick, Starter And Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

78. Disconnect the positive starter cable (B) and the S terminal connector (C).
79. Remove the lower radiator hose bracket (D) and the dipstick (E).
80. Remove the two bolts holding the starter, then remove the starter (F).
81. Connect the line pressure solenoid valve A connector (G).
82. Install the starter (A), then tighten the bolts.

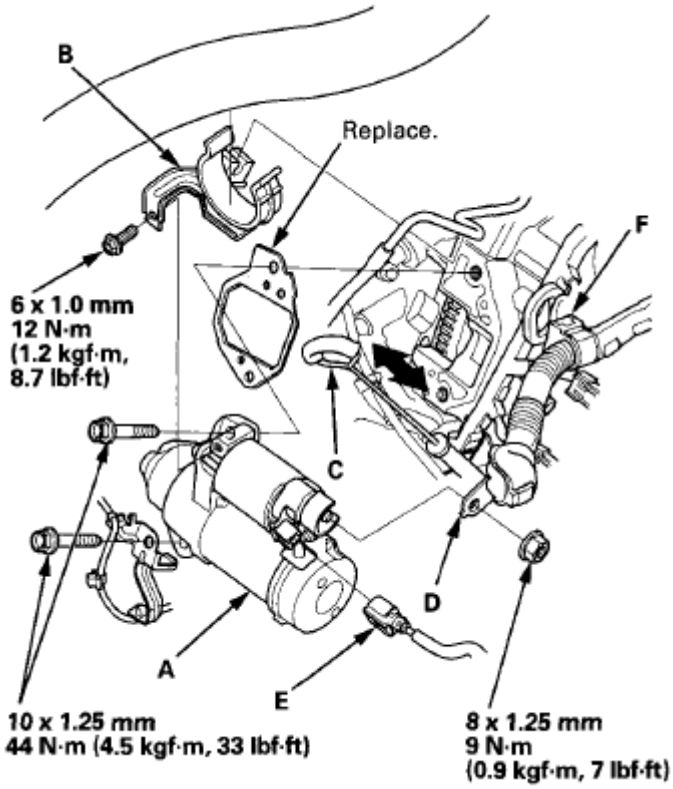

Fig. 164: Identifying Starter, Bracket, Dipstick, Starter Cable, Terminal Connector And Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

83. Install the lower radiator hose bracket (B) and the dipstick (C).
84. Connect the positive starter cable (D) and the S terminal connector (E). Make sure the crimped side of the ring terminal faces away from the starter when you connect it.
85. Install the harness clamp (F).
86. Install the battery base (see **ENGINE INSTALLATION**).
87. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).
88. If any DTCs are stored, clear the DTC with the HDS.
89. If any of the pressures are out of the service limit, refer to the problems and probable causes listed in the table below.

Problem	Probable causes
No or low line pressure	• Torque converter • ATF pump • Main regulator valve • Clogged ATF strainer
No or low 1st clutch pressure	1st clutch
No or low 2nd clutch pressure	2nd clutch

No or low 3rd clutch pressure	3rd clutch
No or low 4th clutch pressure	4th clutch
No or low 5th clutch pressure	5th clutch
No or low 6th clutch pressure	6th clutch
No or low 4th clutch pressure in R	• Shift fork shaft • 4th clutch
No or low torque converter clutch pressure	• Lock-up control valve • Lock-up shift valve • Shift solenoid valve C

90. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).

SECONDARY VALVE BODY REPLACEMENT

1. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
2. Remove the battery base (see **ENGINE REMOVAL**).
3. Remove the starter (see **STARTER REMOVAL AND INSTALLATION**).
4. Disconnect these connectors:
   - Shift solenoid valve A connector (A)
   - Shift solenoid valve B connector (B)
   - Shift solenoid valve C connector (C)
   - Line pressure solenoid valve A connector (D)

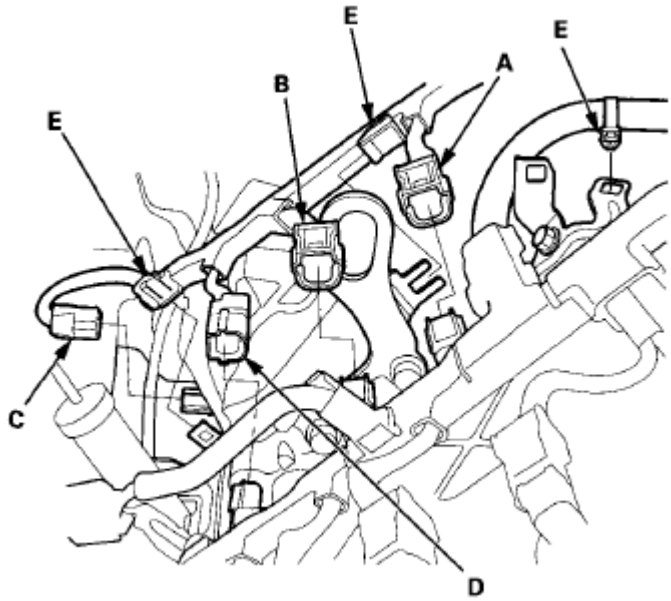

Fig. 165: Identifying A, B And C Connectors And Line Pressure Solenoid Valve A Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the harness clamps (E).
6. Disconnect these connectors:
   - A/T clutch pressure control solenoid valve A connector (A)
   - A/T clutch pressure control solenoid valve B connector (B)
   - A/T clutch pressure control solenoid valve C connector (C)
   - A/T clutch pressure control solenoid valve D connector (D)
   - Transmission fluid pressure switch B (3rd clutch) connector (E)
   - Transmission fluid pressure switch E (6th clutch) connector (F)
   - Line pressure switch connector (G)
   - Transmission range switch connector (H)

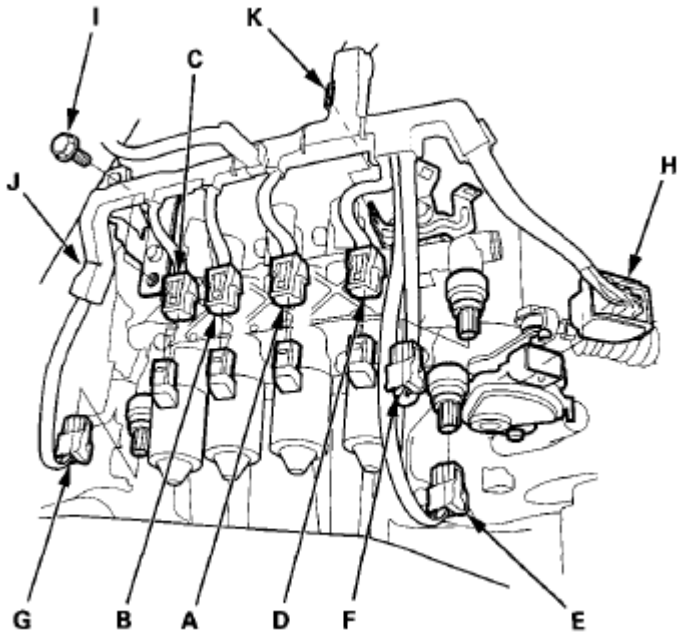

Fig. 166: Identifying A, B, C And D, Transmission Fluid Pressure Switch E, Line Pressure Switch And Transmission Range Switch Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the bolt (I) securing the harness cover (J), and remove the harness clamp (K).
8. Remove the harness cover bracket (A).

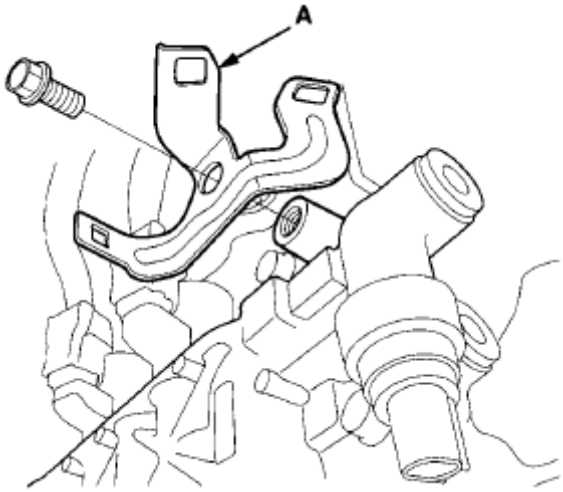

Fig. 167: Identifying Harness Cover Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Raise the vehicle on a lift, and make sure it is supported securely.
10. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
11. Remove the harness clamp (A), then remove the ATF dipstick (B) and the ATF dipstick guide tube (C) with the O-ring (D).

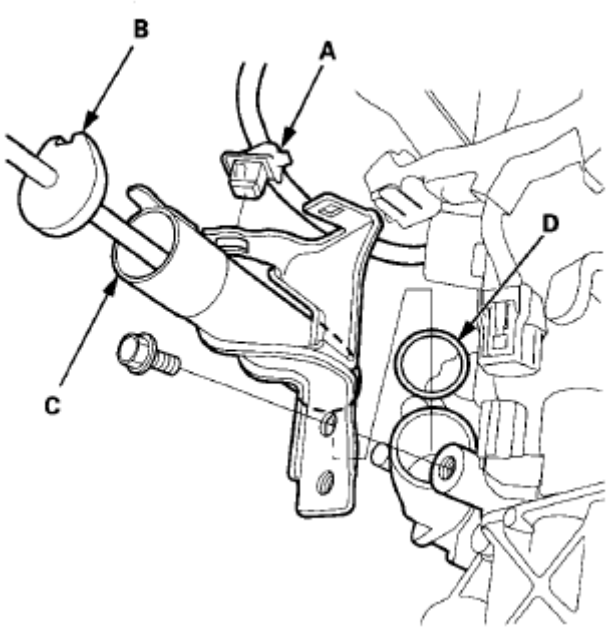

Fig. 168: Identifying Clamp, ATF Dipstick, ATF Dipstick Guide Tube And O-Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the secondary valve body (A) and the gasket (B). Remove the ATF pipes (C).

NOTE: There are 11 ATF pipes. Do not drop the ATF pipes into the transmission. If an ATF pipe is dropped into the transmission, the transmission will need to be disassembled to recover the pipe(s).

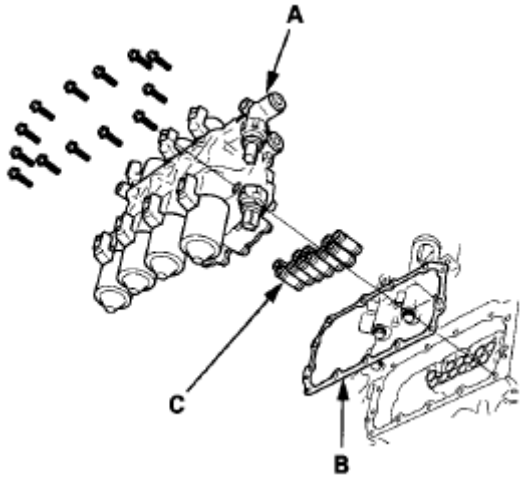

Fig. 169: Identifying Secondary Valve Body, Gasket And ATF Pipes
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Replace the secondary valve body.
14. Clean the mounting surfaces of the transmission housing. Do not allow dust or other foreign particles to enter the transmission.
15. Apply ATF to new O-rings (A), and install the O-rings over the ATF pipes (B). Then install the ATF pipes with the filter ends (C) facing the secondary valve body (D) into the transmission.

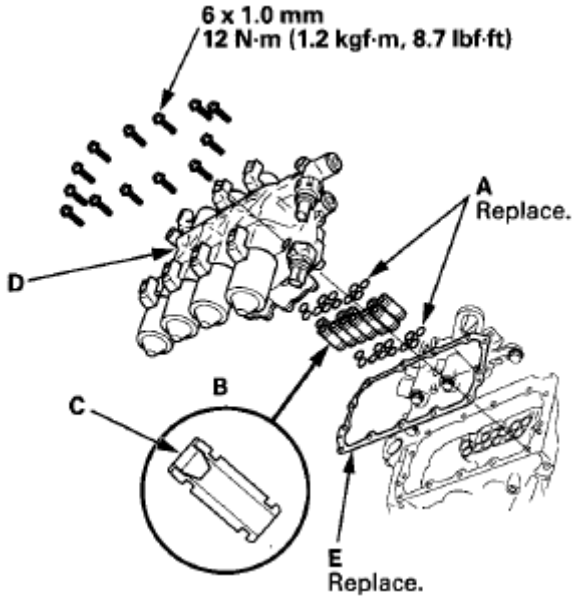

Fig. 170: Identifying O-Ring, Atf Pipes, Filter Ends And Secondary Valve Body With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install a new gasket (E) to the transmission housing.
17. Install the secondary valve body while aligning the ATF pipes with the pipe holes on the secondary valve body, and secure the secondary valve body with the bolts.
18. Install the dipstick guide tube (A) with a new O-ring (B), the dipstick (C), and the harness clamp (D).

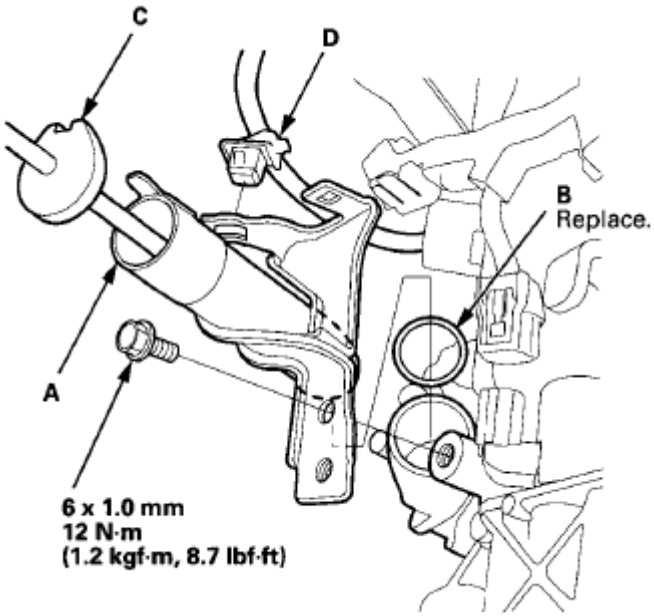

Fig. 171: Identifying Dipstick Guide Tube, O-Ring, Dipstick And Harness Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Install the harness cover bracket (A).

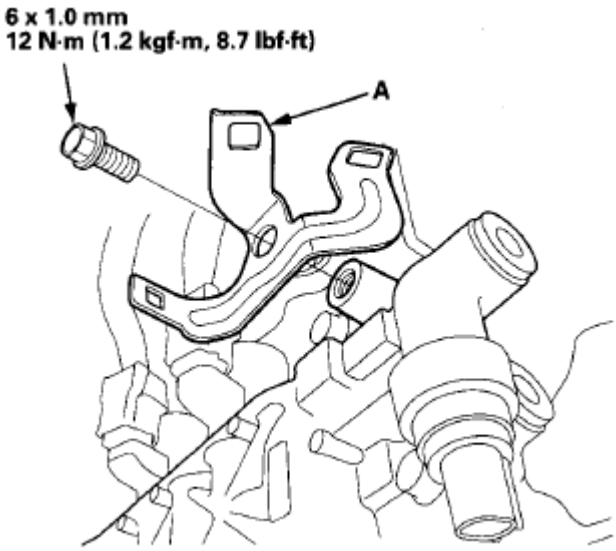

Fig. 172: Identifying Harness Cover Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Install the bolt (A) securing the harness cover (B), and install the harness clamp (C).

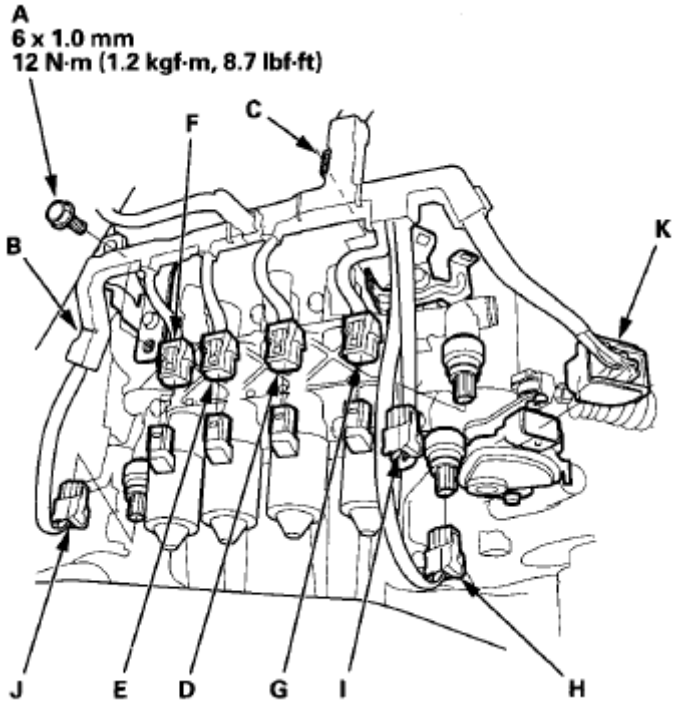

Fig. 173: Identifying Bolt, Harness Cover And Harness Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Connect these connectors:
    - A/T clutch pressure control solenoid valve A connector (D)
    - A/T clutch pressure control solenoid valve B connector (E)
    - A/T clutch pressure control solenoid valve C connector (F)
    - A/T clutch pressure control solenoid valve D connector (G)
    - Transmission fluid pressure switch B (3rd clutch) connector (H)
    - Transmission fluid pressure switch E (6th clutch) connector (I)
    - Line pressure switch connector (J)
    - Transmission range switch connector (K)
22. Install the harness clamps (A).

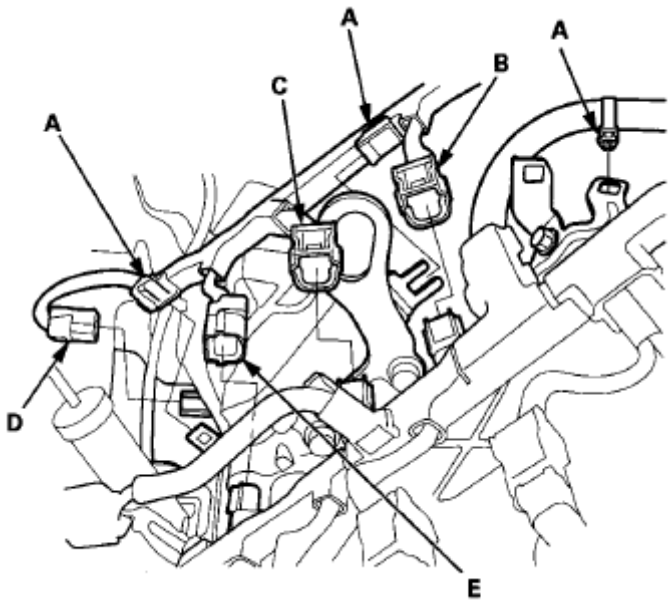

Fig. 174: Identifying Harness Clamps, A, B, C And D Connector And Line Pressure Solenoid Valve A Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Connect these connectors:
    - Shift solenoid valve A connector (B)
    - Shift solenoid valve B connector (C)
    - Shift solenoid valve C connector (D)
    - Line pressure solenoid valve A connector (E)
24. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
25. Install the starter (see **STARTER REMOVAL AND INSTALLATION**).
26. Install the battery base (see **ENGINE INSTALLATION**).
27. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

SHIFT SOLENOID VALVE A AND B TEST

1. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

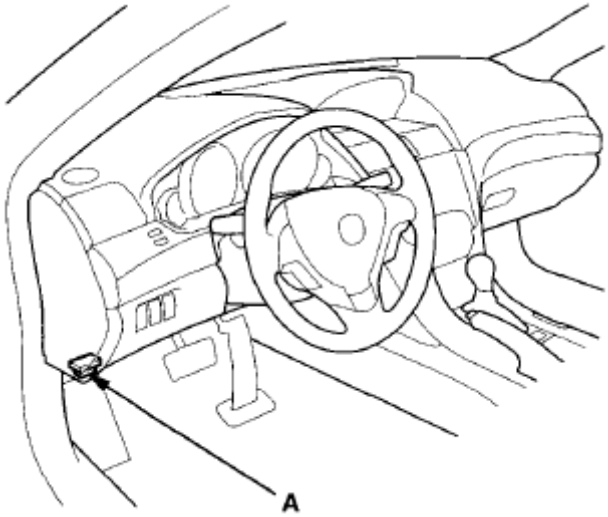

Fig. 175: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Shift Solenoid Valve A or B in the Miscellaneous Test Menu on the HDS.
4. Check that shift solenoid valve A or B operates with the HDS. A clicking sound should be heard.
   - If a clicking sound is heard, the solenoid valve is OK. The test is complete, disconnect the HDS.
   - If no clicking sound is heard, go to step 5 and test the solenoid valve.
5. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
6. Remove the battery base (see **ENGINE REMOVAL**).
7. Remove the starter (see **STARTER REMOVAL AND INSTALLATION**).
8. Remove the secondary valve body (see **SECONDARY VALVE BODY REPLACEMENT**).
9. Measure the resistance of the shift solenoid valve between connector terminals No. 1 and No. 2.

   Standard: 13.8 - 17.1 ohms

   - If the resistance is out of the standard, replace the secondary valve body, then go to step 11.
   - If the resistance is within the standard, go to step 10 and check the solenoid valve for a clicking sound.

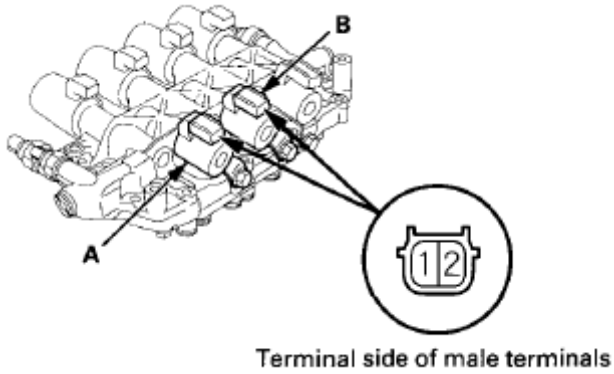

Fig. 176: Measuring Resistance Of Shift Solenoid Valve Between Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Connect a jumper wire from the negative battery terminal to shift solenoid valve A or B connector terminal No. 1, and connect another jumper wire from the positive battery terminal to connector terminal No. 2.
    - If a clicking sound is heard, repair the wire between the PCM connector terminal and the defective shift solenoid valve, then go to step 11.
    - If no clicking sound is heard, replace the secondary valve body, then go to step 11.
11. Install the secondary valve body (see **SECONDARY VALVE BODY REPLACEMENT**).
12. Install the starter (see **STARTER REMOVAL AND INSTALLATION**).
13. Install the battery base (see **ENGINE INSTALLATION**).
14. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

SHIFT SOLENOID VALVE C TEST AND REPLACEMENT

1. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

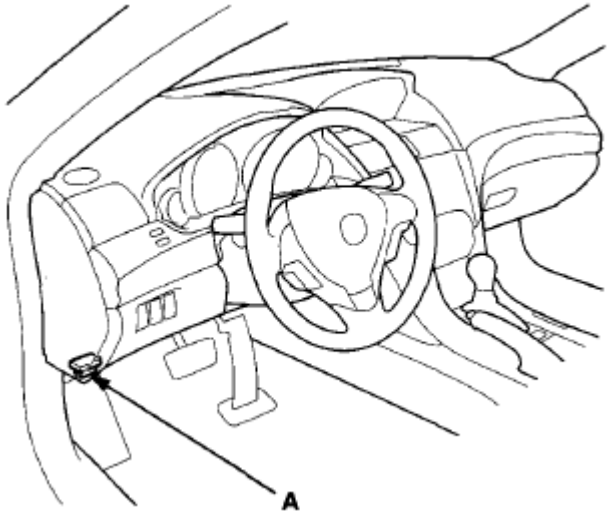

Fig. 177: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Shift Solenoid Valve C in the Miscellaneous Test Menu on the HDS.
4. Check that shift solenoid valve C operates with the HDS. A clicking sound should be heard.
   - If a clicking sound is heard, the solenoid valve is OK. The test is complete, disconnect the HDS.
   - If no clicking sound is heard, go to step 5 and test the solenoid valve.
5. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
6. Remove the ATF dipstick.
7. Remove the harness clamps (A).

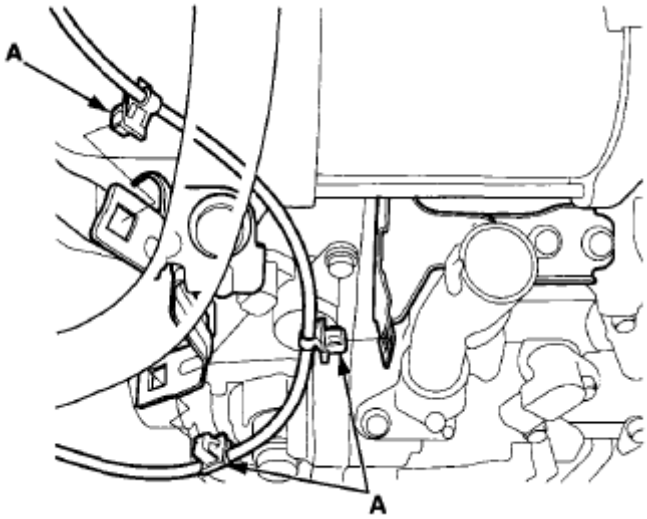

Fig. 178: Identifying Harness Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Disconnect the shift solenoid valve C connector (A), and remove shift solenoid valve C with the O-rings (B).

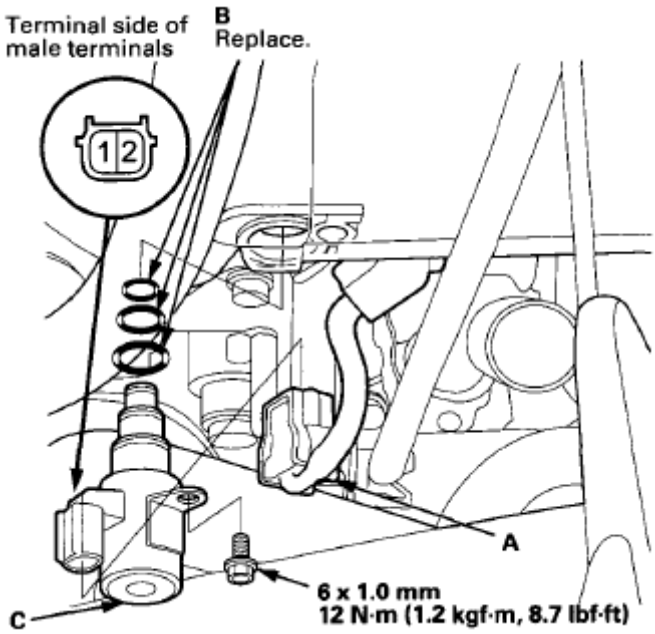

Fig. 179: Identifying Shift Solenoid Valve C Connector And O-Rings With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Measure the resistance of the shift solenoid valve between connector terminals No. 1 and No. 2.

   Standard: 13.8 - 17.1 ohms

   - If the resistance is out of the standard, go to step 14 and replace the shift solenoid valve.
   - If the resistance is within the standard, go to step 10 and check the solenoid valve for a clicking sound and operation.

10. Connect a tube (A) to shift solenoid valve C.

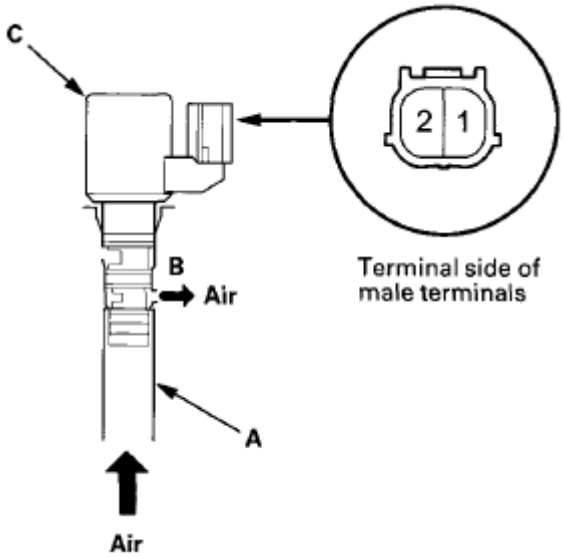

Fig. 180: Identifying Tube, Air Exhaust Valve And Shift Solenoid Valve C
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Connect a jumper wire from the negative battery terminal to shift solenoid valve C connector terminal No. 1, and connect another jumper wire from the positive battery terminal to connector terminal No. 2.
    - If a clicking sound is heard, go to step 12.
    - If no clicking sound is heard, go to step 14 and replace the shift solenoid valve.
12. Connect a jumper wire from the negative battery terminal to shift solenoid valve C connector terminal No. 1, and connect another jumper wire from the positive battery terminal to connector terminal No. 2. Blow the air to the tube.
    - If the air goes out of the port (B), go to step 13.
    - If the air does not go out of the port (B), go to step 14 and replace the shift solenoid valve.
13. Disconnect the jumper wires from the shift solenoid valve C connector. Blow air into the tube (A):
    - If the air goes out of the port (B), go to step 14 and replace shift solenoid valve C.
    - If the air does not go out of the port (B), repair the wire between the PCM connector terminal and shift solenoid valve C.
14. Install new O-rings (three O-rings per solenoid valve) on the solenoid valve.

NOTE: A new solenoid valve comes with new O-rings. If you install a new solenoid valve, use the O-rings provided with it.

15. Install shift solenoid valve C, and connect the shift solenoid valve C connector.
16. Connect the harness clamps.
17. Install the ATF dipstick.
18. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

LINE PRESSURE SOLENOID VALVE A TEST

1. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

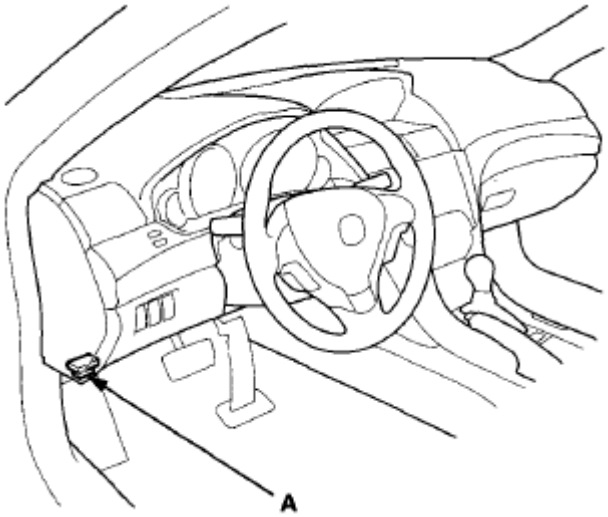

Fig. 181: Identifying Data Link Connector (DLC) Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Line Pressure Solenoid Valve A in the Miscellaneous Test Menu on the HDS.
4. Check that line pressure solenoid valve A operates with the HDS. A clicking sound should be heard.
   - If a clicking sound is heard, the solenoid valve is OK. The test is complete, disconnect the HDS.
   - If no clicking sound is heard, go to step 5 and test the solenoid valve.
5. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
6. Remove the battery base (see **ENGINE REMOVAL**).
7. Remove the starter (see **STARTER REMOVAL AND INSTALLATION**).
8. Remove the secondary valve body (see **SECONDARY VALVE BODY REPLACEMENT**).
9. Measure the resistance of line pressure solenoid valve A between connector terminals No. 1 and No. 2.

   Standard: 13.8 - 17.1 ohms

   - If the resistance is out of the standard, replace the secondary valve body, then go to step 11.
   - If the resistance is within the standard, go to step 10 and check the solenoid valve for a clicking sound.

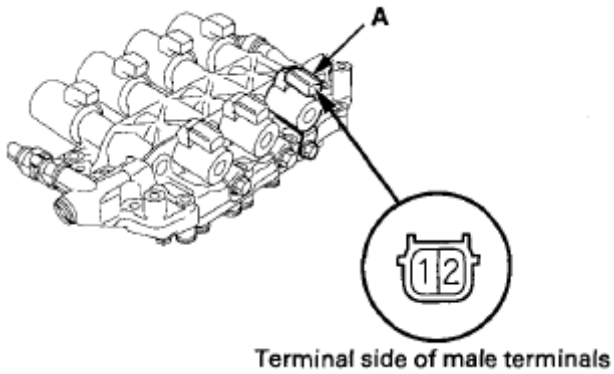

Fig. 182: Identifying Line Pressure Solenoid Valve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Connect a jumper wire from the negative battery terminal to line pressure solenoid valve A connector terminal No. 1, and connect another jumper wire from the positive battery terminal to connector terminal No. 2.
    - If a clicking sound is heard, repair the wire between the PCM connector terminal and line pressure solenoid valve A, then go to step 11.
    - If no clicking sound is heard, replace the secondary valve body, then go to step 11.
11. Install the secondary valve body (see **SECONDARY VALVE BODY REPLACEMENT**).
12. Install the starter (see **STARTER REMOVAL AND INSTALLATION**).
13. Install the battery base (see **ENGINE INSTALLATION**).
14. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

A/T CLUTCH PRESSURE CONTROL SOLENOID VALVE A, B, C, AND D TEST

1. Connect the HDS to the DLC (A) located under the driver's of the dashboard.

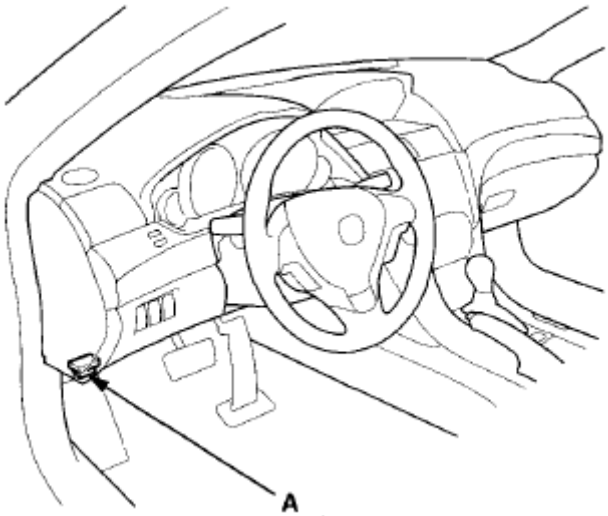

Fig. 183: Identifying Data Link Connector (DLC) Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Clutch Pressure Control (Linear) Solenoid Valve A, B, C, and D individually in the Miscellaneous Test Menu on the HDS.
4. Test A/T clutch pressure control solenoid valve A, B, C, and D individually with the HDS.
   - If the valves test OK, the test is complete. Disconnect the HDS.
   - If any of the valves do not test OK, follow the instructions on the HDS.
   - If any of the valves do not test OK, and the HDS does not determine the cause, go to step 5.
5. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
6. Remove the battery base (see **ENGINE REMOVAL**).
7. Disconnect the A/T clutch pressure control solenoid valve A, B, C, or D connector.

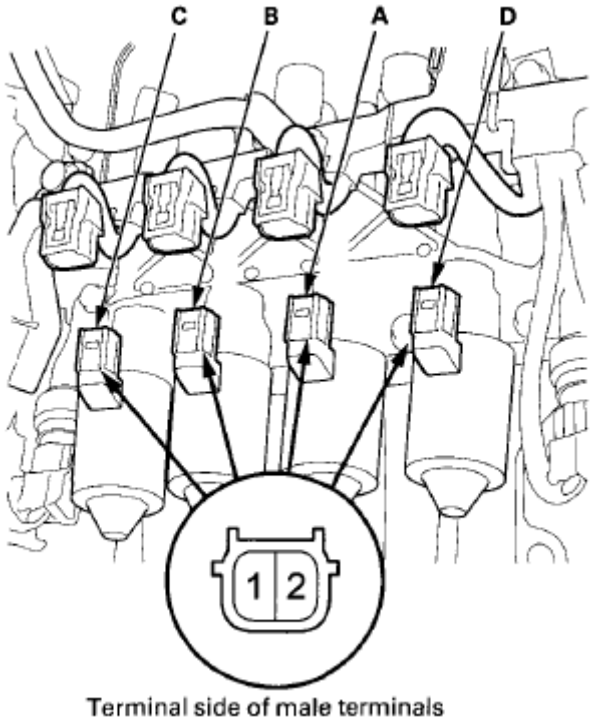

Fig. 184: Identifying A/T Clutch Pressure Control Solenoid Valve A, B, C, Or D Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Measure the resistance between connector terminals No. 1 and No. 2 for each A/T clutch pressure control solenoid valve A, B, C, and D.

Standard: 4.7 - 5.9 ohms

- If the resistance is out of the standard, replace the secondary valve body (see **SECONDARY VALVE BODY REPLACEMENT**).
- If the resistance is within the standard, go to step 9.

9. Connect a jumper wire from the negative battery terminal to solenoid valve A, B, C, and D connector terminal No. 2, and connect another jumper wire from the positive battery terminal to connector terminal No. 1 individually.
   - If an operating sound is heard, the solenoid valve is OK. Reconnect the connector, and install all removed parts.
   - If no operating sound is heard, replace the secondary valve body (see **SECONDARY VALVE BODY REPLACEMENT**).

INPUT SHAFT (MAINSHAFT) SPEED SENSOR REPLACEMENT

1. Raise the vehicle on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
3. Disconnect the input shaft (mainshaft) speed sensor connector, and remove the input shaft (mainshaft) speed sensor (A).

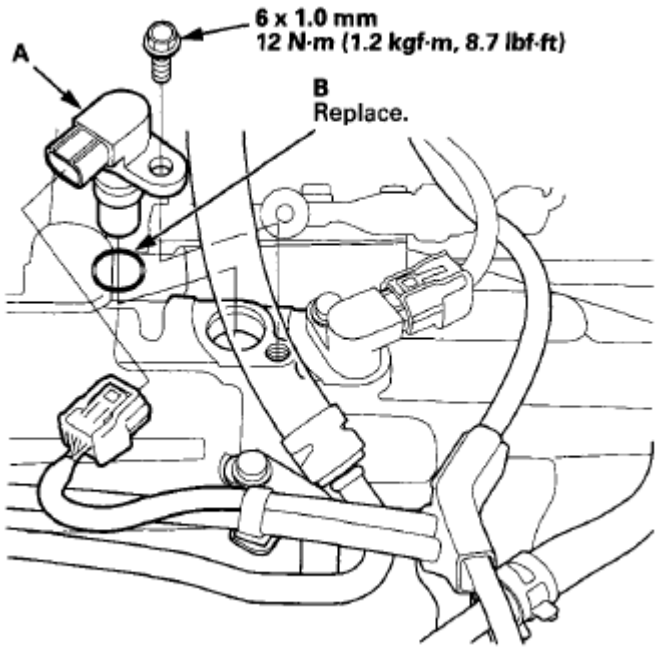

Fig. 185: Identifying Input Shaft Speed Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new O-ring (B) on the new input shaft (mainshaft) speed sensor, then install the input shaft (mainshaft) speed sensor.
5. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.

6. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).

OUTPUT SHAFT (COUNTERSHAFT) SPEED SENSOR REPLACEMENT

1. Raise the vehicle on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
3. Disconnect the output shaft (countershaft) speed sensor connector, and remove the output shaft (countershaft) speed sensor (A).

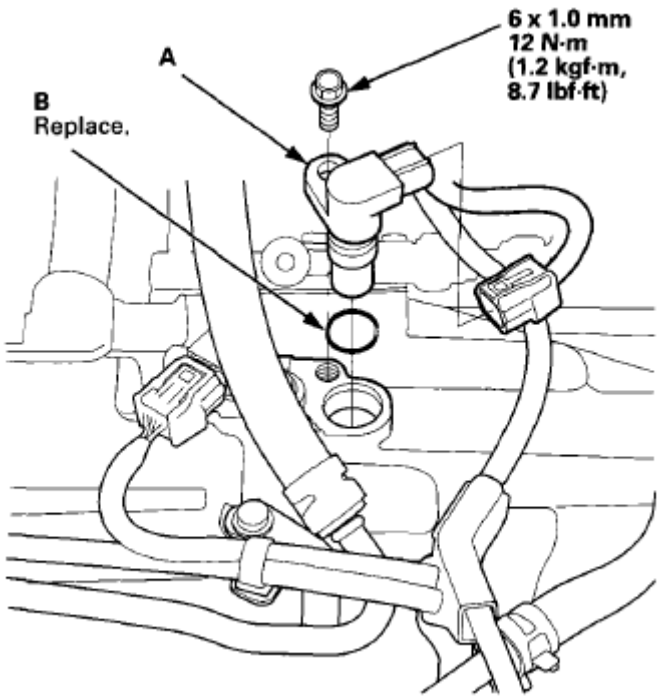

Fig. 186: Identifying Output Shaft Speed Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new O-ring (B) on the new output shaft (countershaft) speed sensor, then install the output shaft (countershaft) speed sensor.
5. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.
6. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).

TRANSMISSION FLUID PRESSURE SWITCH A (2ND CLUTCH) REPLACEMENT

1. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
2. Remove the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
3. Disconnect the transmission fluid pressure switch A (2nd clutch) connector, and remove transmission

fluid pressure switch A (2nd clutch) and the sealing washer (B).

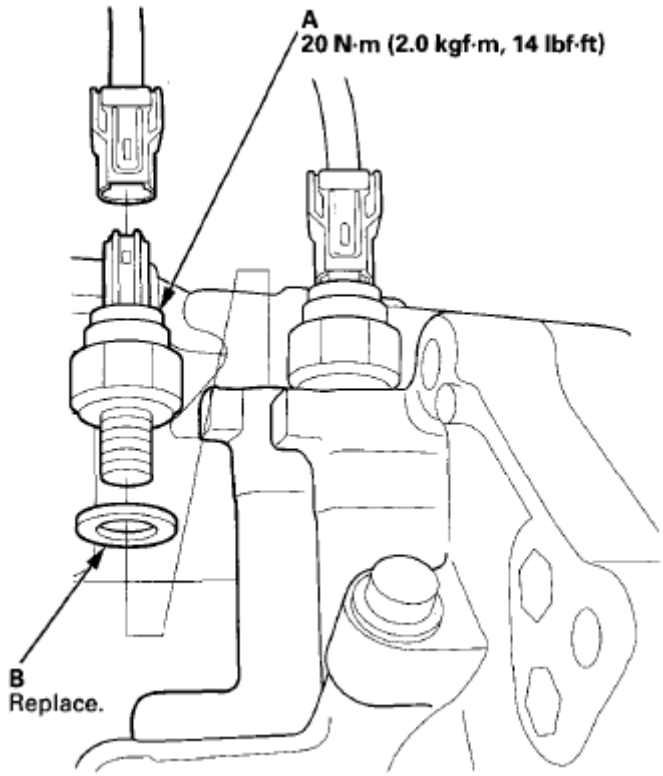

Fig. 187: Identifying Transmission Fluid Pressure Switch And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new transmission fluid pressure switch A (2nd clutch) with a new sealing washer, and tighten the switch.
5. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.
6. Install the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
7. Install the air cleaner (see **THROTTLE BODY CLEANING**).

TRANSMISSION FLUID PRESSURE SWITCH B (3RD CLUTCH) REPLACEMENT

1. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
2. Remove the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
3. Disconnect the transmission fluid pressure switch B (3rd clutch) connector, and remove transmission fluid pressure switch B (3rd clutch) and the sealing washer (A).

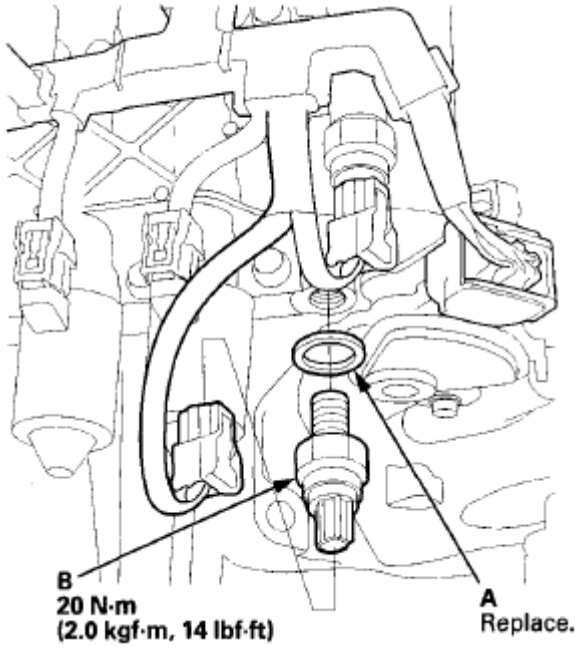

Fig. 188: Identifying Transmission Fluid Pressure Switch B And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new transmission fluid pressure switch B (3rd clutch) with a new sealing washer, and tighten the switch.
5. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.
6. Install the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
7. Install the air cleaner (see **THROTTLE BODY CLEANING**).

TRANSMISSION FLUID PRESSURE SWITCH C (4TH CLUTCH) REPLACEMENT

1. Raise the vehicle on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
3. Disconnect the transmission fluid pressure switch C (4th clutch) connector, and remove transmission fluid pressure switch C (4th clutch) and the sealing washer (A).

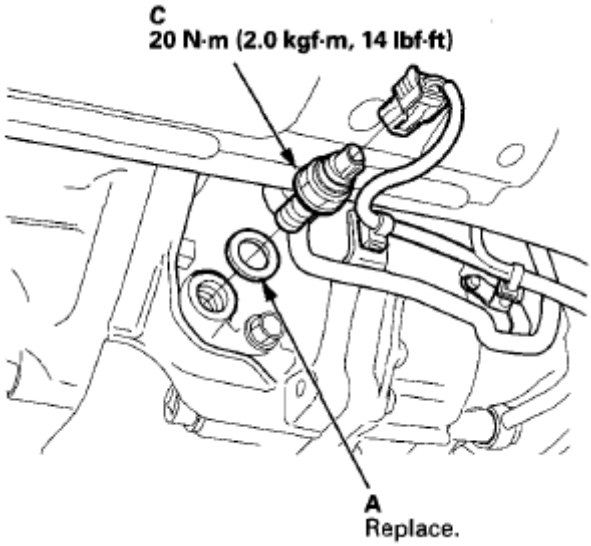

Fig. 189: Identifying Transmission Fluid Pressure Switch And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new transmission fluid pressure switch C (4th clutch) with a new sealing washer, and tighten the switch.
5. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.
6. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).

TRANSMISSION FLUID PRESSURE SWITCH D (5TH CLUTCH) REPLACEMENT

1. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
2. Remove the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
3. Disconnect the transmission fluid pressure switch D (5th clutch) connector, and remove transmission fluid pressure switch D (5th clutch) and the sealing washer (A).

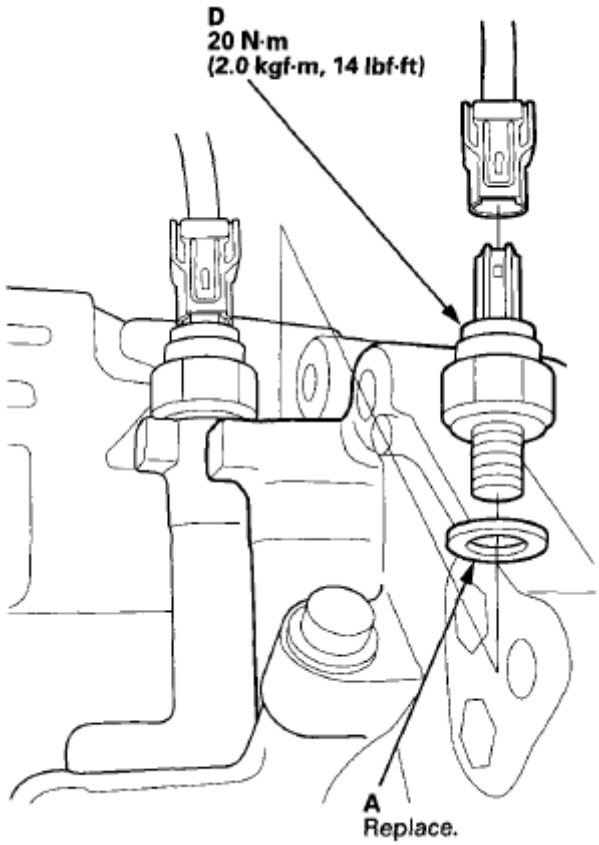

Fig. 190: Identifying Transmission Fluid Pressure Switch D And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new transmission fluid pressure switch D (5th clutch) with a new sealing washer, and tighten the switch.
5. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.
6. Install the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
7. Install the air cleaner (see **THROTTLE BODY CLEANING**).

TRANSMISSION FLUID PRESSURE SWITCH E (6TH CLUTCH) REPLACEMENT

1. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
2. Remove the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
3. Disconnect the transmission fluid pressure switch E (6th clutch) connector, and remove transmission fluid pressure switch E (6th clutch) and the sealing washer (A).

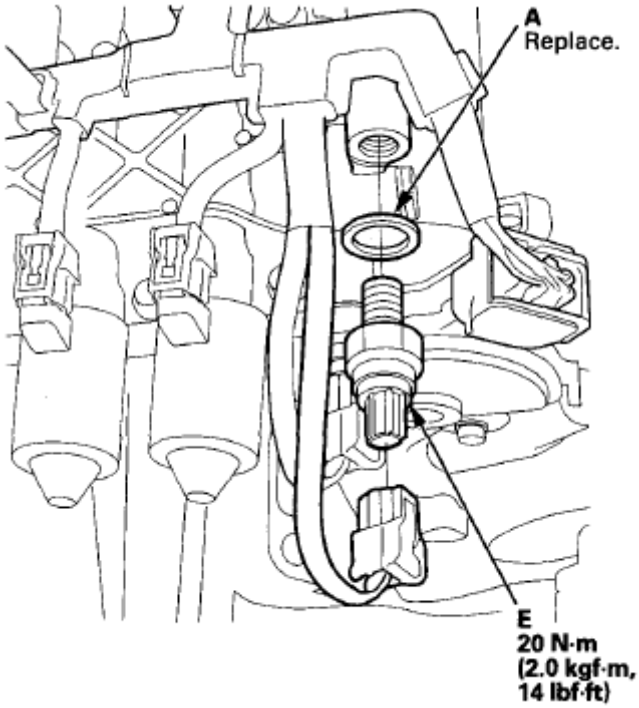

Fig. 191: Identifying Transmission Fluid Pressure Switch E And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new transmission fluid pressure switch E (6th clutch) with a new sealing washer, and tighten the switch.
5. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.
6. Install the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
7. Install the air cleaner (see **THROTTLE BODY CLEANING**).

LINE PRESSURE SWITCH REPLACEMENT

1. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
2. Remove the battery base (see **ENGINE REMOVAL**).
3. Disconnect the line pressure switch connector, and remove the line pressure switch (A) and the sealing washer (B).

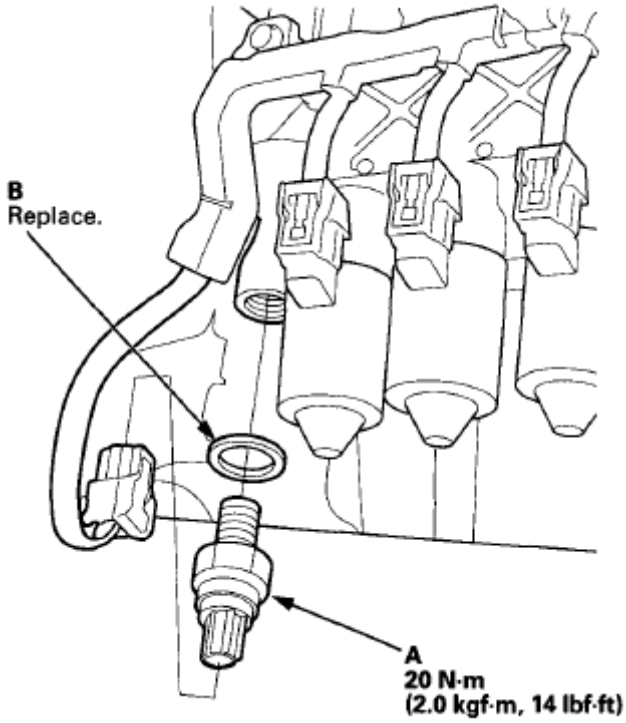

Fig. 192: Identifying Line Pressure Switch And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new line pressure switch with a new sealing washer, and tighten the switch.
5. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.
6. Install the battery base (see **ENGINE INSTALLATION**).
7. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

ATF TEMPERATURE SENSOR REPLACEMENT

1. Raise the vehicle on a lift, or apply the parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
3. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

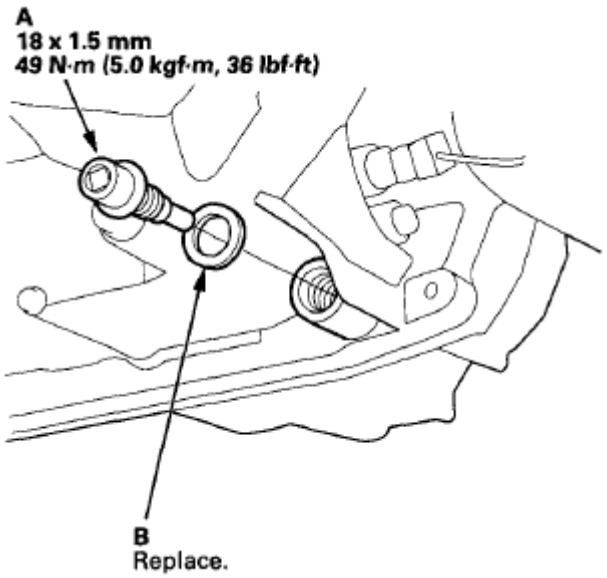

Fig. 193: Identifying Drain Plug And Automatic Transmission Fluid (ATF) With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reinstall the drain plug with a new sealing washer (B).
5. Disconnect the ATF temperature sensor connector (A), then remove the ATF temperature sensor (B).

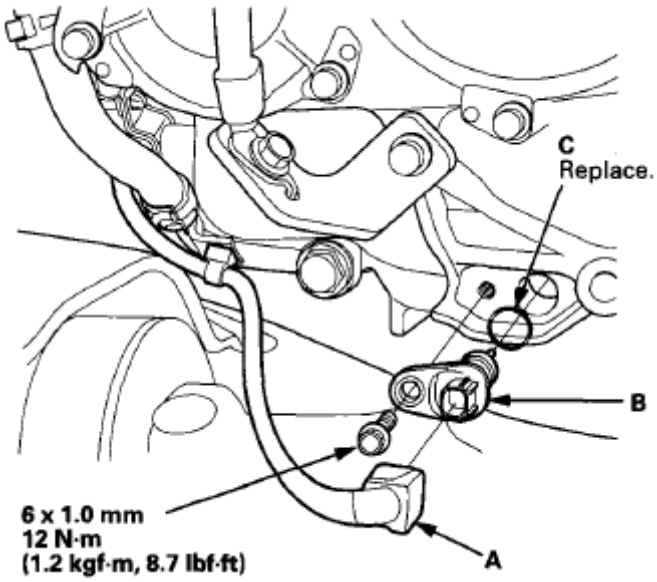

Fig. 194: Identifying ATF Temperature Sensor Connector And ATF Temperature Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install a new O-ring (C) on a new ATF temperature sensor, and install the ATF temperature sensor.
7. Check the connector for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector

securely.

8. Refill the transmission with ATF (see **ATF REPLACEMENT**).
9. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).

ATF LEVEL CHECK

NOTE:

- **Keep all foreign particles out of the transmission.**
- **Check the fluid level within 60- 90 seconds after turning the engine off.**
- **Higher fluid level may be indicated if the radiator fan comes on twice or more.**

1. Park the vehicle on the level ground.
2. Warm up the engine to normal operating temperature (the radiator fan comes on), then turn the engine off.
3. Remove the ATF dipstick (yellow loop) (A) from the dipstick guide tube, and wipe it with a clean cloth.

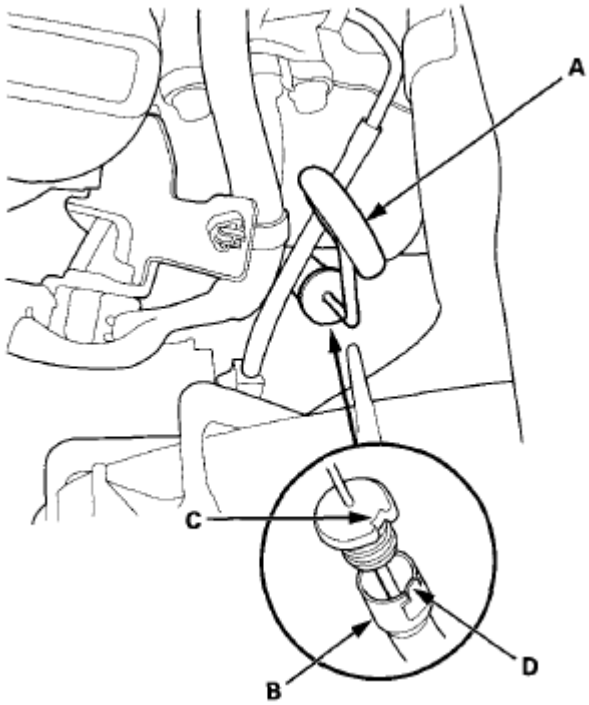

Fig. 195: Identifying ATF Dipstick (Yellow Loop), Dipstick Guide Tube, Notch And Guide Tab
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Insert the dipstick back into the dipstick guide tube (B) aligning the notch (C) with the guide tab (D).
5. Remove the dipstick and check the fluid level. It should be between the upper mark (A) and the lower mark (B).

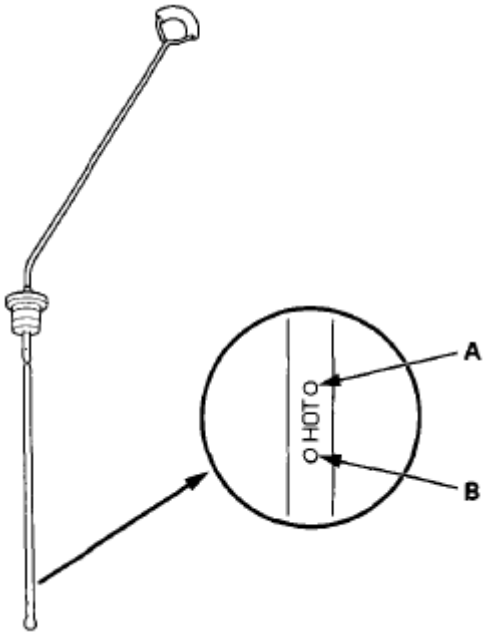

Fig. 196: Identifying Upper And Lower Mark On Dipstick
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the ATF level is below the lower mark, check for fluid leaks at the transmission, the hoses, and the line joints. If a problem is found, fix it before filling the transmission with ATF.

NOTE: If the vehicle is driven when the ATF level is below the lower mark, one or more of these symptoms may occur:

- Transmission damage.
- Vehicle does not move in any gear.
- Vehicle accelerates poorly, and flares when starting off in forward and reverse positions.
- The engine vibrates at idle.

7. If the ATF level is above the upper mark, drain the ATF to proper level (see **ATF REPLACEMENT**).

NOTE: If the vehicle is driven when the ATF level is above the upper mark, the vehicle may creep forward while in N, or have shifting problems.

8. If necessary, fill the transmission with the recommended fluid through the filler hole (A) to bring the fluid level between the upper mark and the lower mark of the dipstick. Do not fill past the upper mark. Always use Acura ATF DW-1 Automatic Transmission Fluid (ATF). Using a non-Acura ATF can affect shift quality.

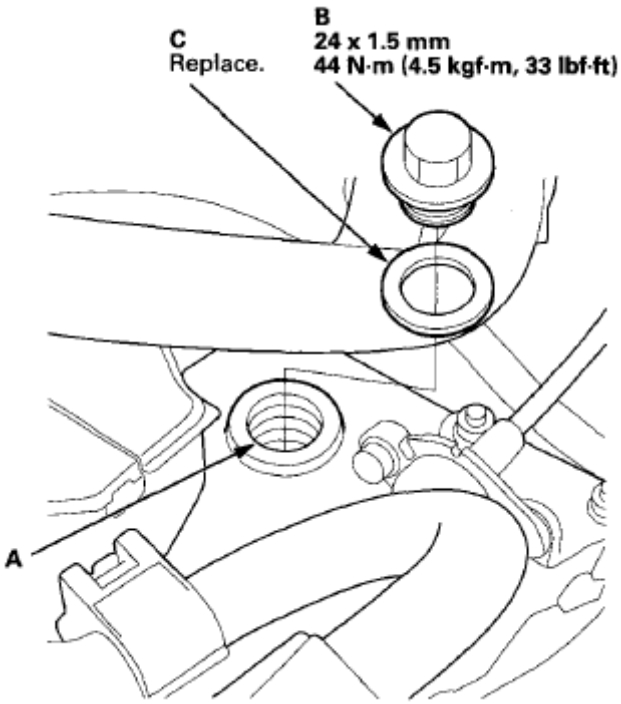

Fig. 197: Identifying Filler Hole & Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the ATF filler bolt (B) with a new sealing washer (C).
10. Insert the dipstick back into the dipstick guide tube.

ATF REPLACEMENT

NOTE: Keep all foreign particles out of the transmission.

1. Park the vehicle on the level ground.
2. Warm up the engine to normal operating temperature (the radiator fan comes on), and turn the engine off.
3. Raise the vehicle on a lift, make sure it is securely supported.
4. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
5. Remove the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
6. Remove the ATF filler bolt (A) and the sealing washer (B).

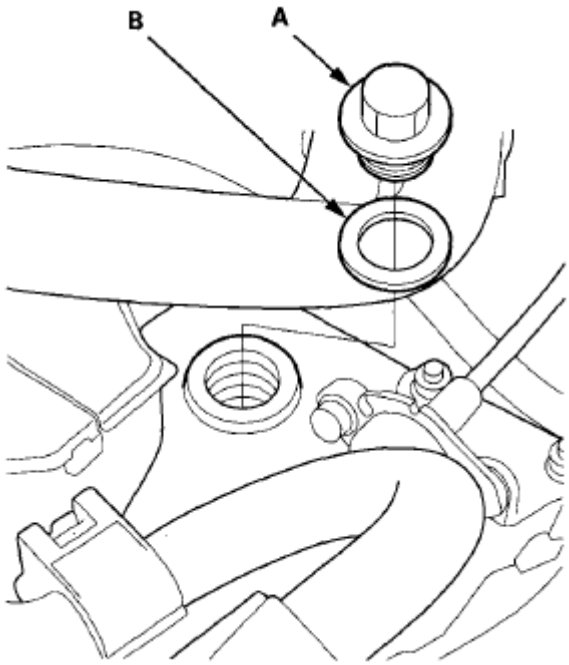

Fig. 198: Identifying Filler Bolt And Sealing Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

NOTE: If a cooler cleaning is necessary, refer to the ATF COOLER CLEANING.

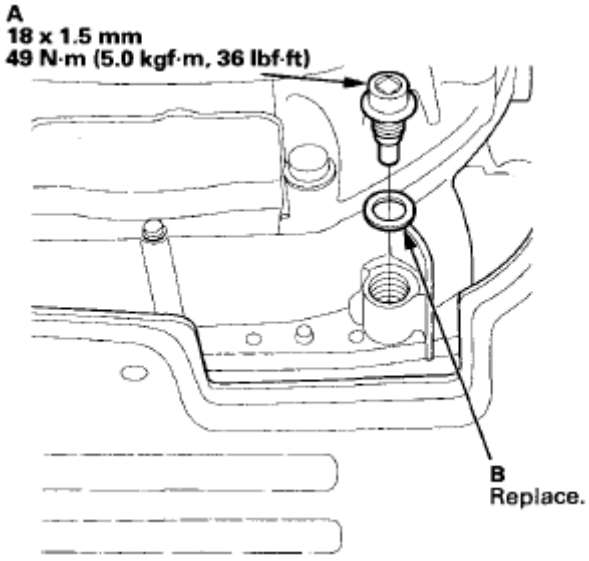

Fig. 199: Identifying Drain Plug And Automatic Transmission Fluid (ATF) With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Reinstall the drain plug with a new sealing washer (B).
9. Refill the transmission with the recommended fluid through the filler hole (A). Always use Acura ATF DW-1 Automatic Transmission Fluid (ATF). Using a non-Acura ATF can affect shift quality.

   Automatic Transmission Fluid Capacity

   With SH-AWD:

   3.1 L (3.3 US qt) at change

   7.8 L (8.2 US qt) at overhaul

   Without SH-AWD:

   3.1 L (3.3 US qt) at change

   7.1 L (7.5 US qt) at overhaul

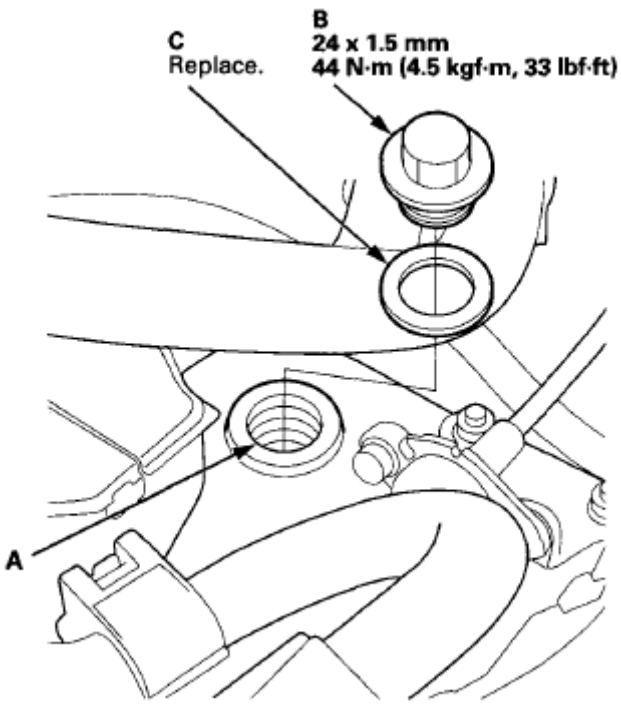

Fig. 200: Identifying Filler Hole, Filler Bolt And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the ATF filler bolt (B) with a new sealing washer (C).
11. Remove the ATF dipstick (A).

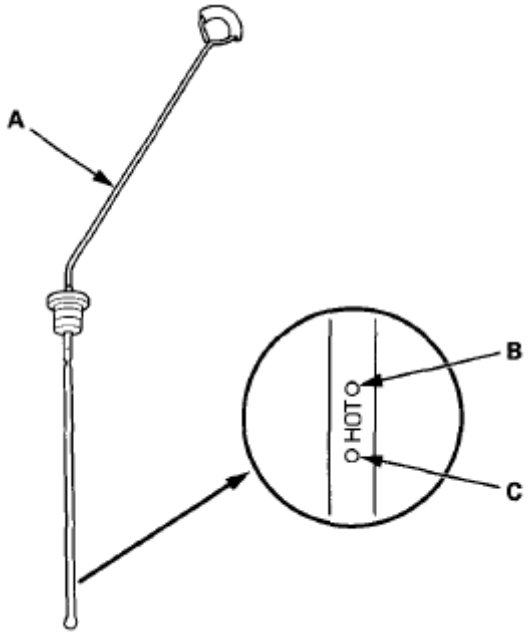

Fig. 201: Identifying ATF Dipstick, Upper And Lower Mark On Dipstick
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Make sure the fluid level is between the upper mark (B) and the lower mark (C) on the dipstick, then insert the dipstick back into the dipstick guide tube.
13. Install the intake air duct (see **INTAKE MANIFOLD REMOVAL AND INSTALLATION**).
14. Install the air cleaner (see **THROTTLE BODY CLEANING**).
15. If the Maintenance Minder required ATF replacement, reset the Maintenance Minder (see **MAINTENANCE MINDER™**), and this procedure is complete. If the Maintenance Minder did not require you to replace the ATF, go to step 16.
16. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

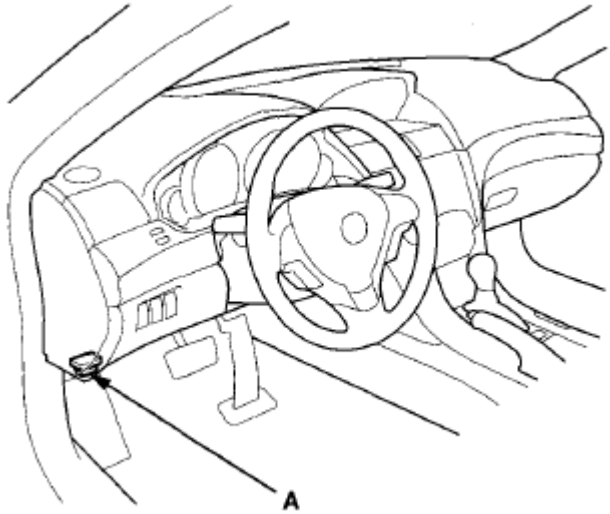

Fig. 202: Identifying Data Link Connector Location

Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
18. Select GAUGES in the BODY ELECTRICAL with the HDS.
19. Select ADJUSTMENT in the GAUGES with the HDS.
20. Select MAINTENANCE MINDER in the ADJUSTMENT with the HDS.
21. Select RESET in the MAINTENANCE MINDER with the HDS.
22. Select MAINTENANCE SUB ITEM 3 RESET in the RESET with the HDS, and reset the ATF life with the HDS.

TRANSMISSION REMOVAL

Special Tools Required

- Engine Support Hanger, A and Reds AAR-T1256*
- 2008 V6 Attachment Arm SIL02C000033*
- Engine Hanger Balance Bar VSB02C000019*
- Subframe Adapter VSB02C000016*

*: Available through the Acura Tool and Equipment Program 888-424-6857.

NOTE:

- **Use fender covers to avoid damaging painted surfaces.**
- **Special tool Reds engine support hanger AAR-T1256 must be used with the side engine mount installed.**

1. Remove the engine compartment covers (see **ENGINE COMPARTMENT COVER REPLACEMENT**).
2. Disconnect the support strut from the pivot ball on both sides (bolted to the hood). Raise and secure the hood in a vertical position. Remove the passenger's side pivot ball and install it into the lower threaded hole, then reattach the support strut.

NOTE: Do not attempt to close the hood with the support strut in the vertical position; it will damage the support strut and the hood.

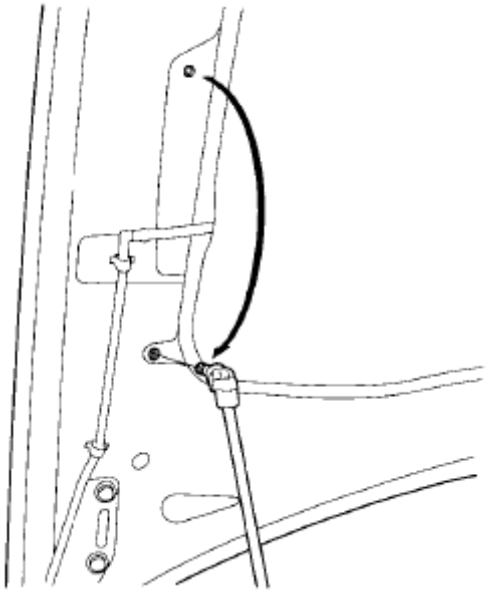

Fig. 203: Installing Pivot Ball Into Lower Threaded Hole And Reattach Support Strut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
4. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
5. Remove the strut brace (see **FRAME BRACE REPLACEMENT**).
6. Remove the steering joint cover (A).

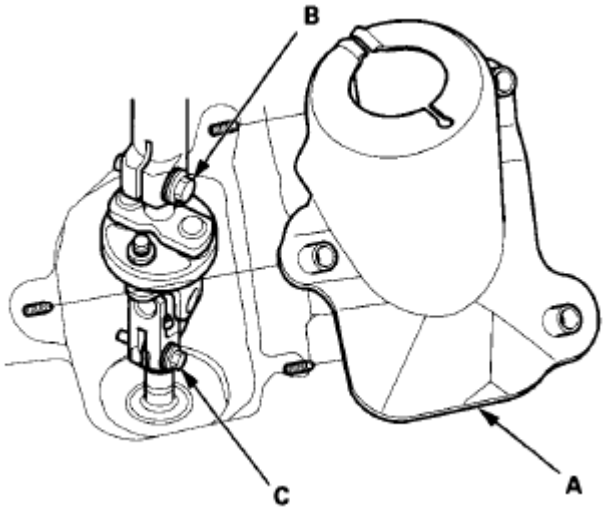

Fig. 204: Identifying Steering Joint Cover, Upper And Lower Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Loosen the upper steering joint bolt (B) and the lower steering bolt (C).
8. Center the steering wheel spokes, and install a commercially available steering wheel holder tool (A).

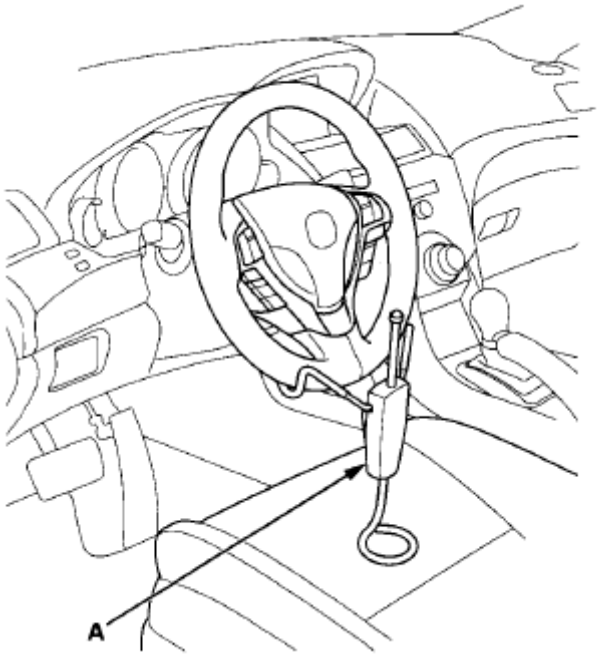

Fig. 205: Holding Steering Wheel Using Holder Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the lower steering joint bolt (A). Disconnect the steering joint (B) by sliding the steering joint into the column shaft (C). Tighten the upper steering joint bolt (D) to hold the steering joint in place.

NOTE: Do not disconnect the steering joint from the column shaft.

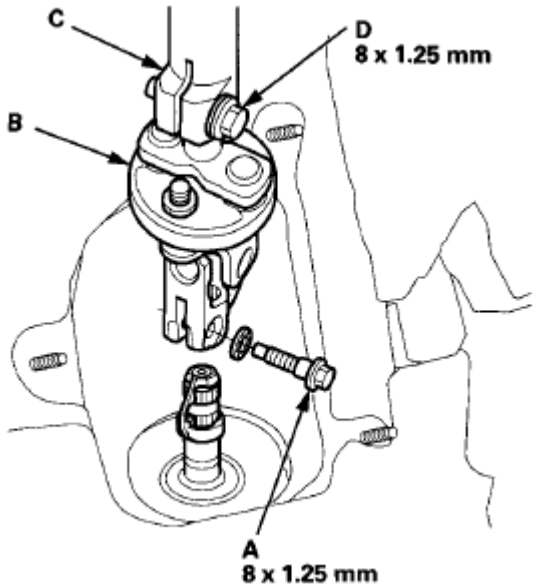

Fig. 206: Identifying Lower Steering Joint Bolt, Steering Joint, Column Shaft And Upper Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the center guide (A) (if equipped) from the top of the pinion shaft (B), and discard it.

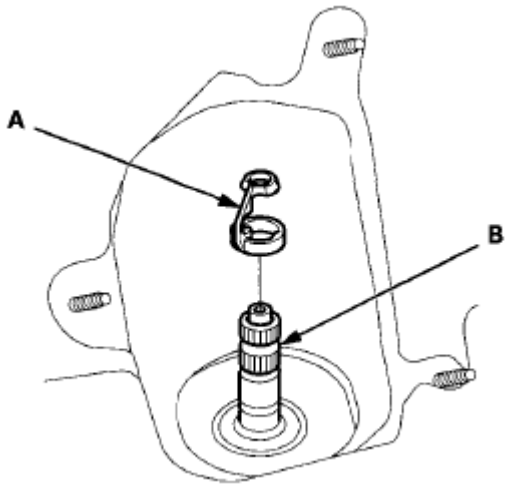

Fig. 207: Identifying Center Guide And Pinion Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Wrap vinyl tape over the splines on the pinion shaft.
12. Remove the ATF dipstick, then remove the starter (see **STARTER REMOVAL AND INSTALLATION**).
13. Remove the bolt (A) securing the harness cover (B), and remove the harness clamp (C).

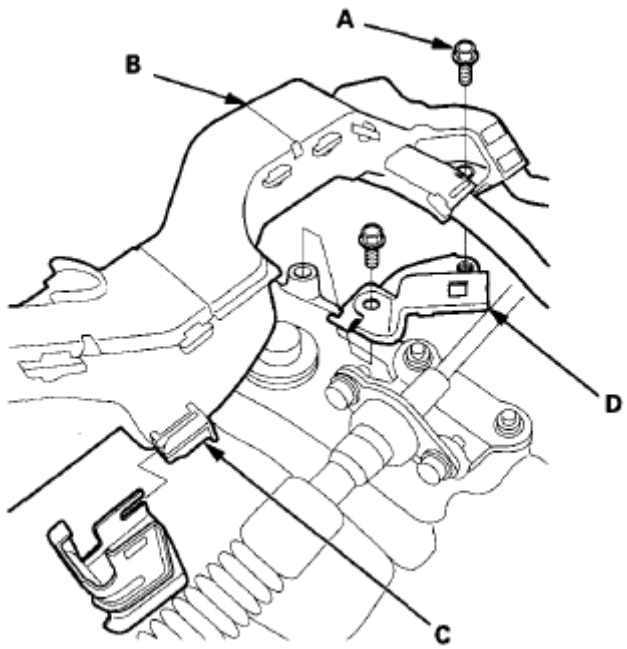

Fig. 208: Identifying Bolt, Harness Cover, Clamp And Clamp Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the clamp bracket (D).
15. Remove the harness clamp (A), and remove the clamp bracket (B).

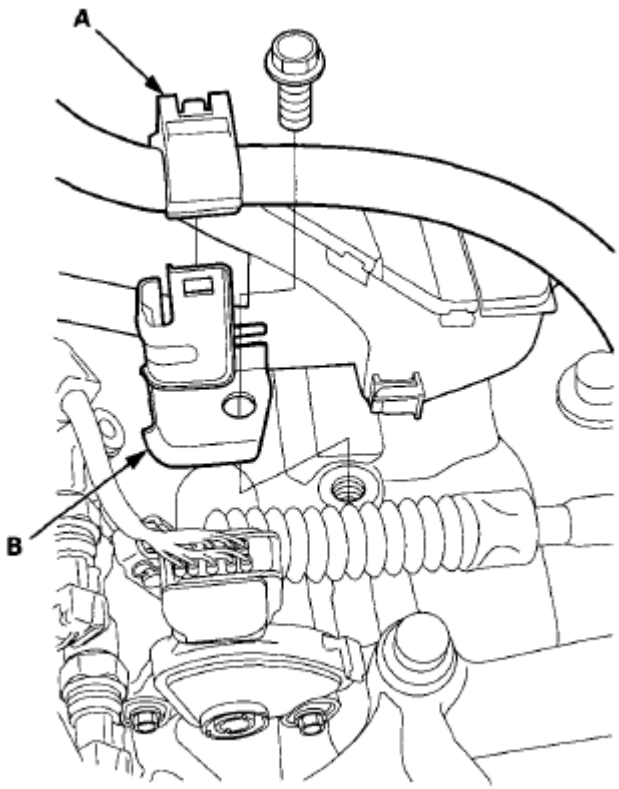

Fig. 209: Identifying Harness Clamp And Clamp Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Remove the spring clip (A) and the control pin (B), then separate the shift cable end (C) from the selector control lever (D).

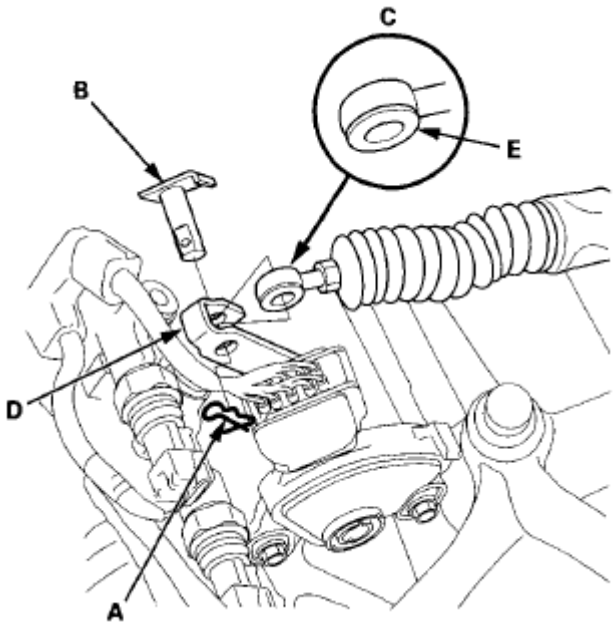

Fig. 210: Identifying Spring Clip, Control Pin, Shift Cable End And Selector Control Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Check the bushing (E) in the shift cable end for proper fit and wear. If the bushing is loose or worn, replace the shift cable (see **SHIFT CABLE REPLACEMENT**).
18. Remove the nuts (A) securing the shift cable bracket (B).

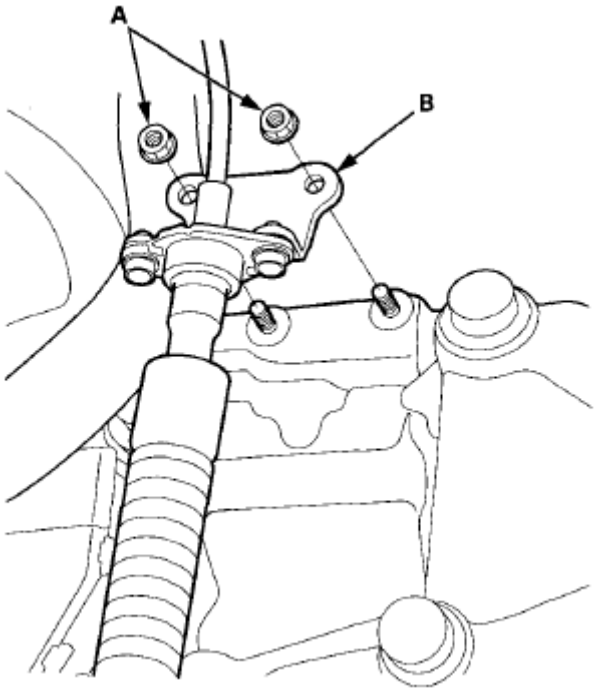

Fig. 211: Identifying Nuts And Shift Cable Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Disconnect these connectors:
    - Shift solenoid valve A connector (A)
    - Shift solenoid valve B connector (B)
    - Shift solenoid valve C connector (C)
    - Line pressure solenoid valve A connector (D)

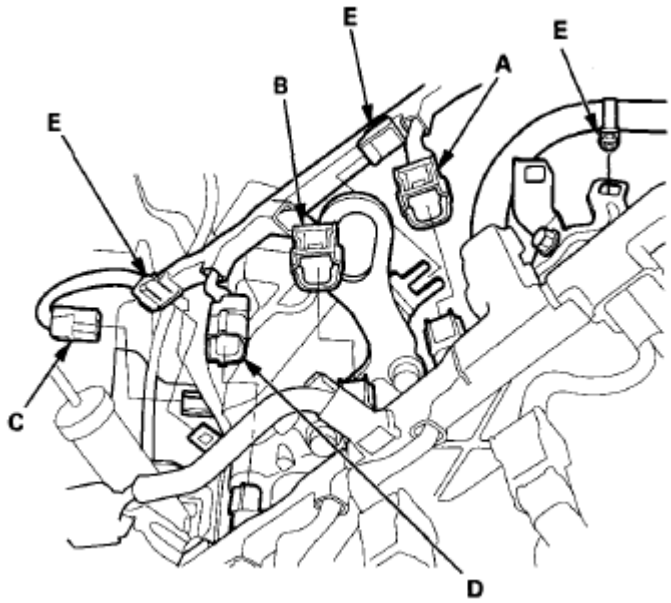

Fig. 212: Identifying Shift Solenoid Valve A, B And C Connector And Line Pressure Solenoid Valve A Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Remove the harness clamps (E).
21. Disconnect these connectors:
    - A/T clutch pressure control solenoid valve A connector (A)
    - A/T clutch pressure control solenoid valve B connector (B)
    - A/T clutch pressure control solenoid valve C connector (C)
    - A/T clutch pressure control solenoid valve D connector (D)
    - Transmission fluid pressure switch B (3rd clutch) connector (E)
    - Transmission fluid pressure switch E (6th clutch) connector (F)
    - Line pressure switch connector (G)
    - Transmission range switch connector (H)

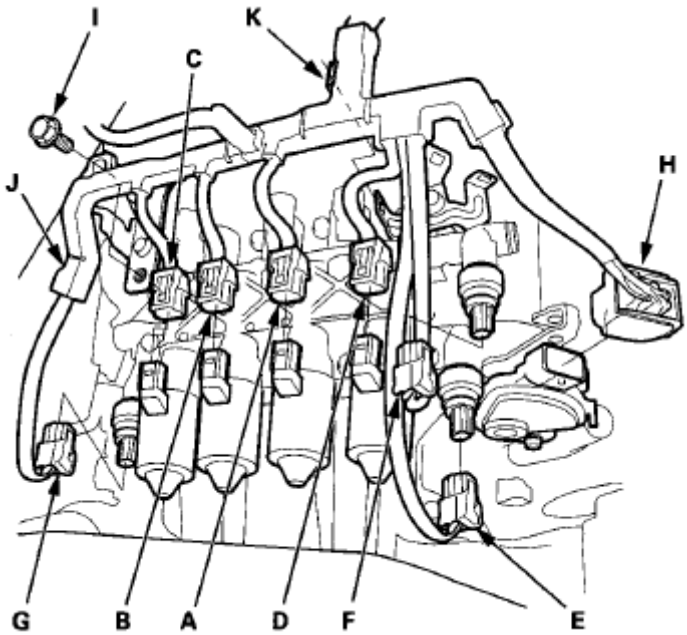

Fig. 213: Identifying Different Connectors, Bolts, Harness Cover And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Remove the bolt (I) securing the harness cover (J), and remove the harness clamp (K).
23. Remove the harness cover bracket (A).

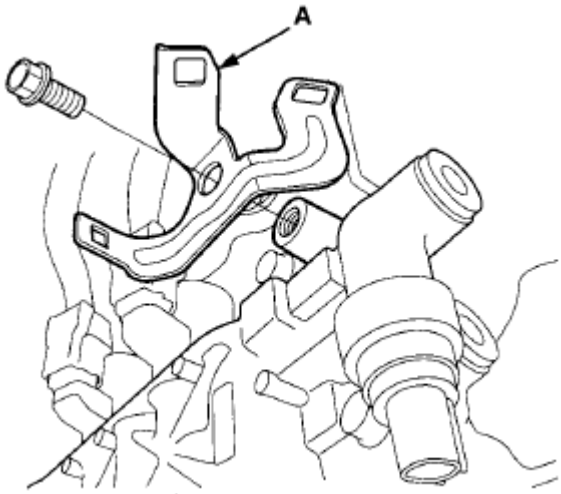

Fig. 214: Identifying Cover Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Disconnect the transmission fluid pressure switch A (2nd clutch) connector (A) and the transmission fluid pressure switch D (5th clutch) connector (B).

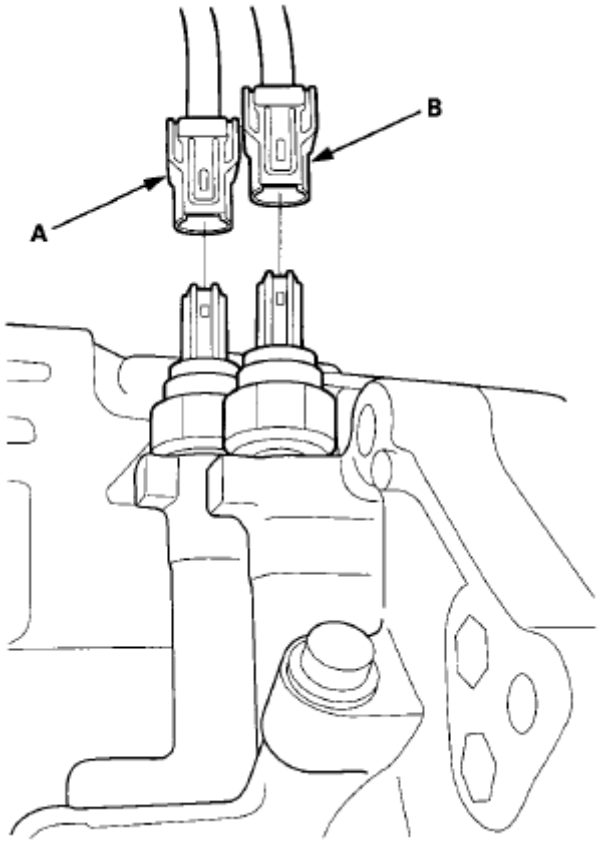

Fig. 215: Identifying Transmission Fluid Pressure Switch A Connector And Transmission Fluid Pressure Switch D Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Remove the bolt (A) securing the connector bracket (B) from the front cylinder head; use the bracket bolt hole (C) to attach the engine hanger balance bar front arm.

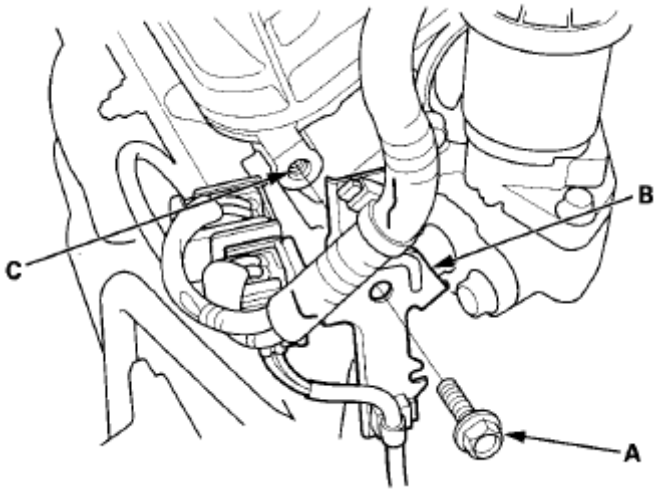

Fig. 216: Identifying Bolt, Connector Bracket And Bracket Bolt Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Remove the harness clamp (A), then remove the bolt (B) securing the engine mount control solenoid valve bracket (C) from the rear cylinder head; use the bracket bolt hole (D) to attach the 2008 V6 attachment arm.

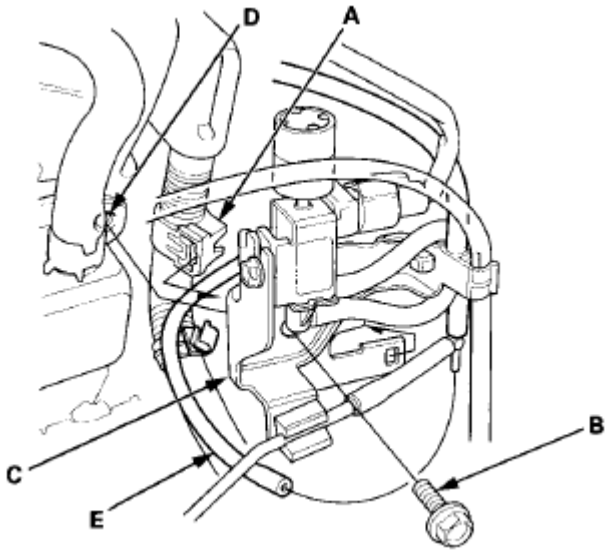

Fig. 217: Identifying Harness Clamp, Bolt, Vacuum Hose And Control Solenoid Valve Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Disconnect the vacuum hose (E).
28. Install the engine hanger balance bar (VSB02C000019). Attach the front arm (A) to the front cylinder head with a 10 mm (0.39 in) spacer (B) and a 10 x 1.25 mm bolt (C). Remove the rear arm from the engine hanger balance bar, then install the 2008 V6 attachment arm (SIL02C000033). Attach the 2008 V6 attachment arm to the rear cylinder head with a 10 mm (0.39 in) spacer (D) and an 8 x 1.25 mm bolt (E).

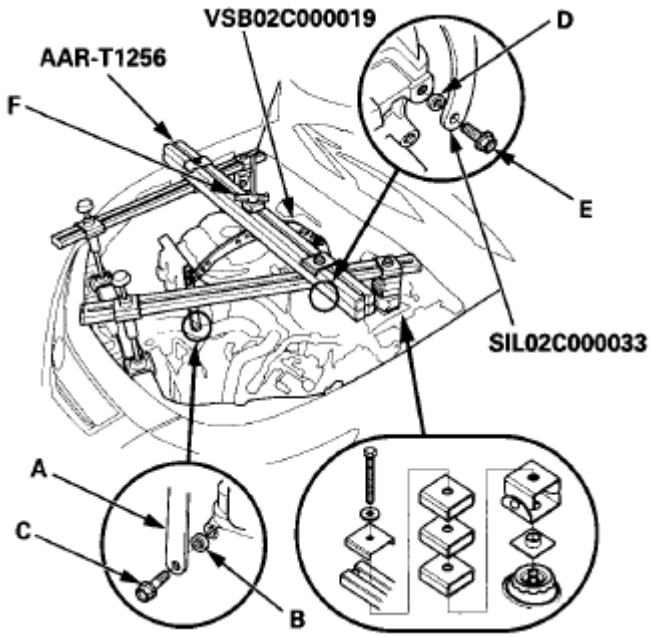

Fig. 218: Identifying Front Arm, Spacer And Bolt Of Engine Hanger Balance Bar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Install the engine support hanger (AAR-T1256) onto the vehicle as shown, and attach the hook to the slotted hole in the engine hanger balance bar. Tighten the wing nut (F) by hand, and lift and support the transmission.

NOTE:

- **Be careful when working around the windshield.**
- **AAR-T1256 two sets required for stacking two cross section bars.**

30. Remove the upper transmission housing mounting bolts.

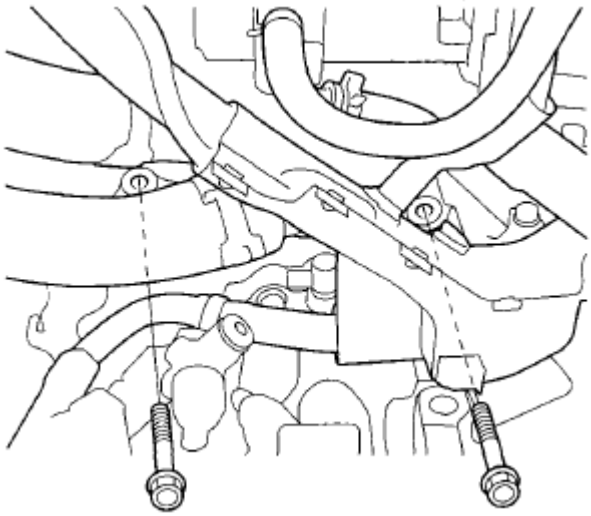

Fig. 219: Removing Upper Transmission Housing Mounting Bolts

Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Remove the upper transmission mount bracket bolts (A) (B), and remove the bolt (C) securing the clamp bracket.

NOTE: Do not remove the bolt (D) from the upper transmission mount. If the bolt is removed, the upper transmission mount must be replaced as an assembly.

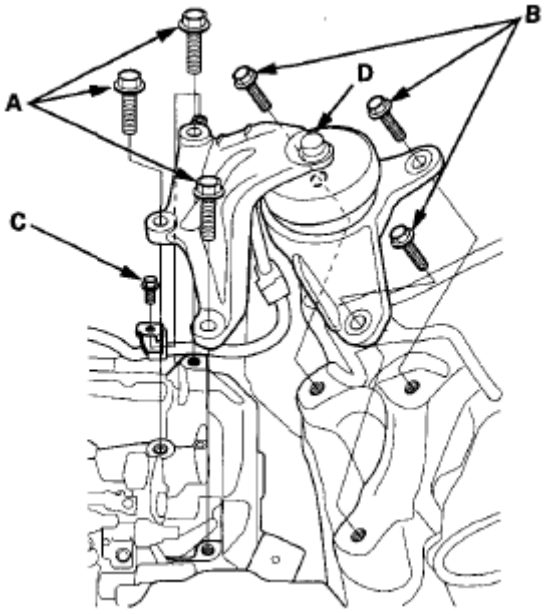

Fig. 220: Identifying Bracket Bolts And Transmission Assembly Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Remove the vacuum hose (A) from the vacuum pipe (B), and remove the vacuum pipe from its clamp (C).

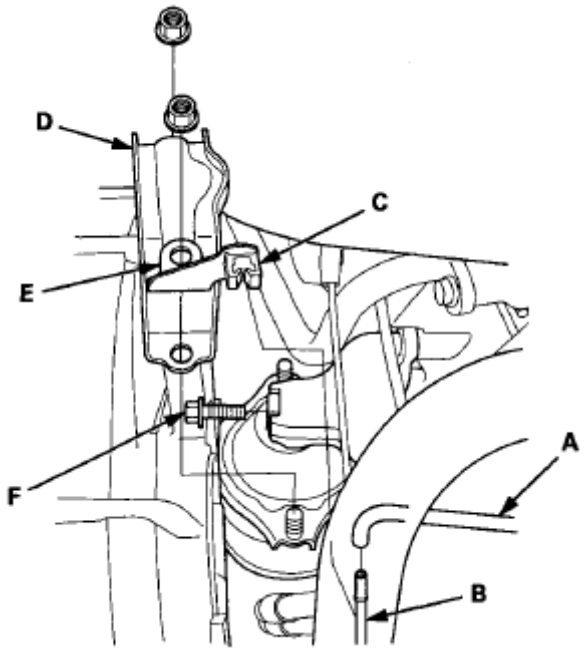

Fig. 221: Identifying Vacuum Hose, Vacuum Pipe, Front Engine Mount Bolt, Clamp Bracket And Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Remove the front engine mount stop (D) and the clamp bracket (E), and remove the front engine mount bolt (F).
34. Remove the rear engine mount stop (A) and the heat shield (B), and remove the rear engine mount bolt (C).

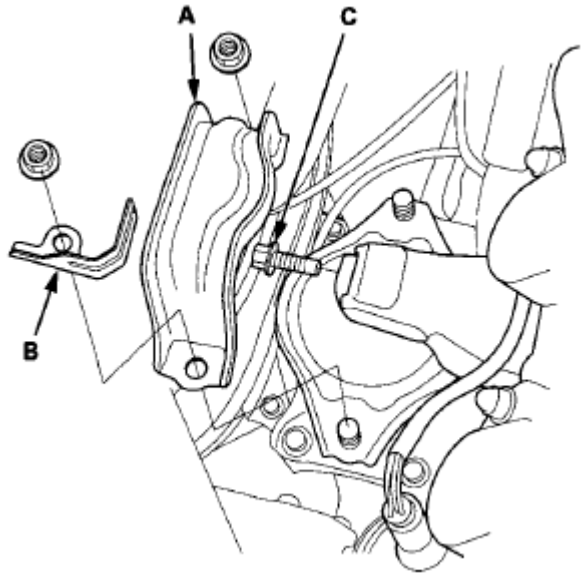

Fig. 222: Identifying Rear Engine Mount Stop, Heat Shield And Rear Engine Mount Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Disconnect the EPS connectors (A) and remove the harness clamps (B).

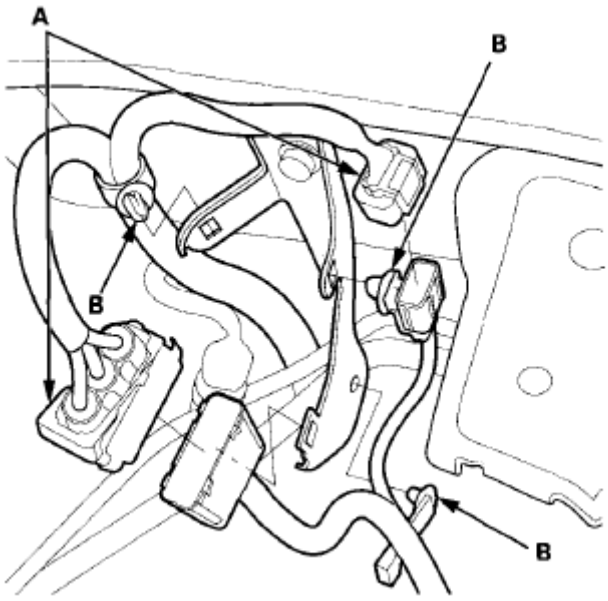

Fig. 223: Identifying EPS Connectors And Harness Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Raise the vehicle on a lift, and make sure it is securely supported.
37. Remove the front wheels.
38. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
39. Remove the drain plug (A), and drain the ATF.

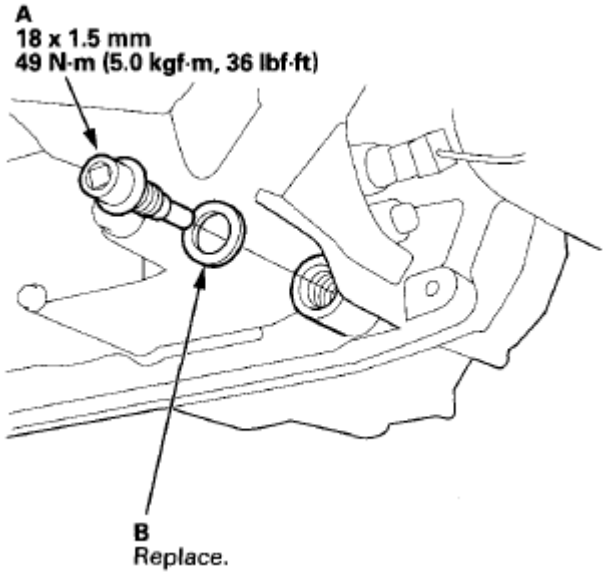

Fig. 224: Identifying Drain Plug And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Reinstall the drain plug with a new sealing washer (B).
41. Disconnect the ATF temperature sensor connector (A), then remove the harness clamp (B).

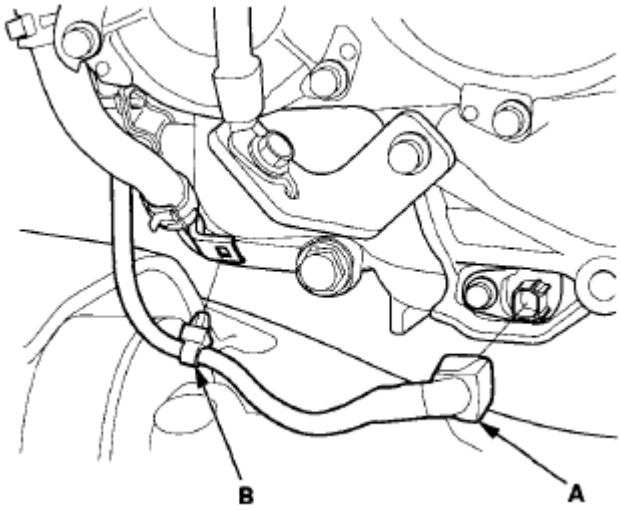

Fig. 225: Identifying ATF Temperature Sensor Connector And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Disconnect the transmission fluid pressure switch C (4th clutch) connector (A), then remove the harness clamp (B).

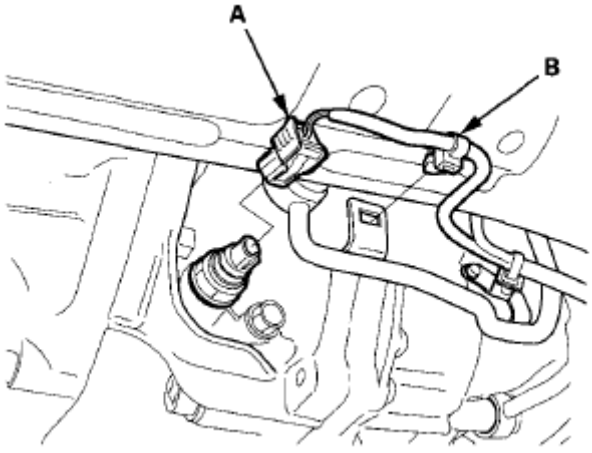

Fig. 226: Identifying Transmission Fluid Pressure Switch C (4th Clutch) Connector And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Disconnect the input shaft (mainshaft) speed sensor connector (A) and the output shaft (countershaft) speed sensor connector (B), then remove the harness clamps (C).

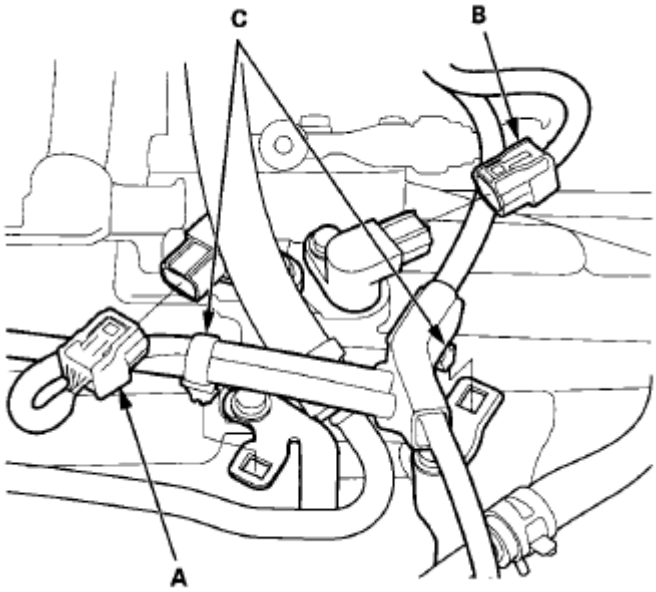

Fig. 227: Identifying Input And Output Shaft Speed Sensor Connectors And Harness Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Remove the ATF cooler hoses (A) from the ATF cooler lines (B). Turn the ends of the cooler hoses up to prevent ATF from flowing out, then plug the cooler hoses and the lines.

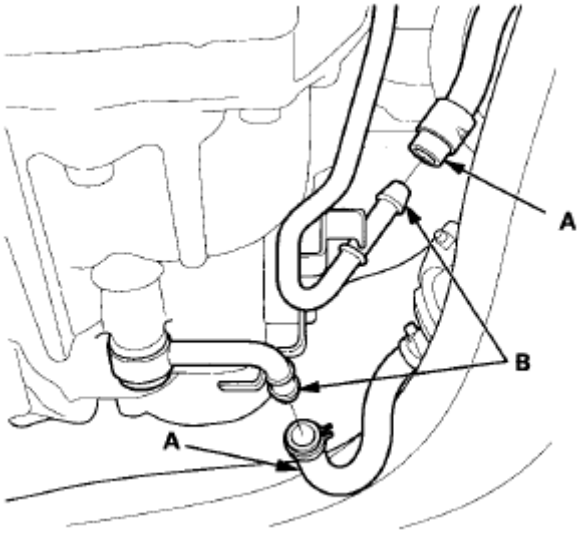

Fig. 228: Identifying ATF Cooler Hoses And Cooler Lines
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Remove the ATF cooler hoses (A) from the ATF cooler lines (B). Turn the ends of the cooler hoses up to prevent ATF from flowing out, then plug the cooler hoses and the lines.

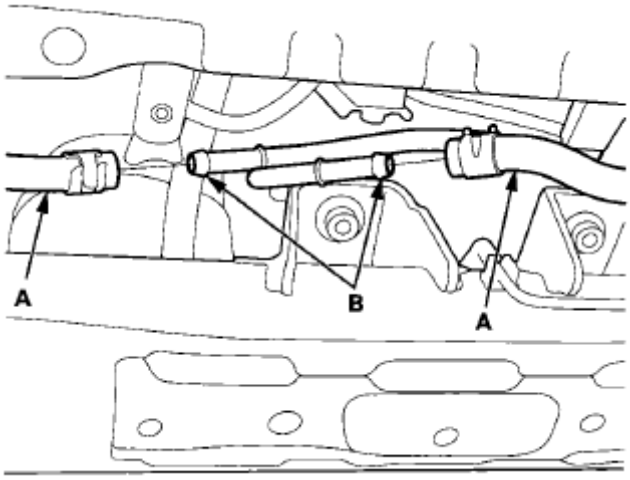

Fig. 229: Identifying ATF Cooler Hoses And Cooler Lines
Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Remove the front subframe stiffener.

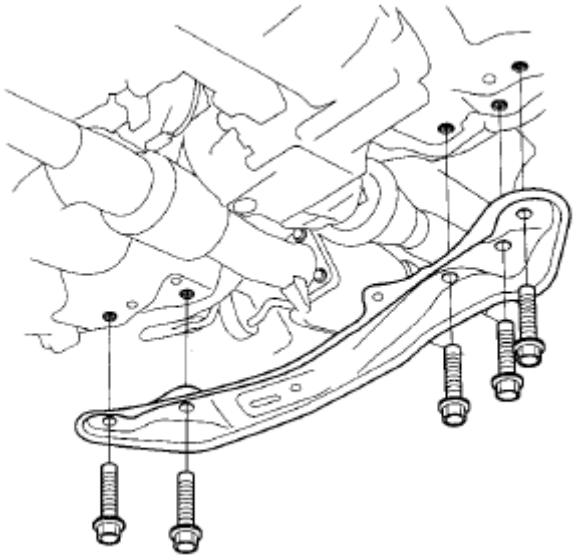

Fig. 230: Removing Front Subframe Stiffener
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Remove exhaust pipe A and the under-floor three way catalytic converter (TWC):
    - With SH-AWD (see **J37A4 ENGINE (WITH SH-AWD)**).
    - Without SH-AWD (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**).
48. With SH-AWD: Remove the propeller shaft (see **PROPELLER SHAFT REMOVAL**).
49. With SH-AWD: Disconnect the breather hose (A) from the breather pipe (B) on the transfer assembly, and remove the breather hose from the clamp (C).

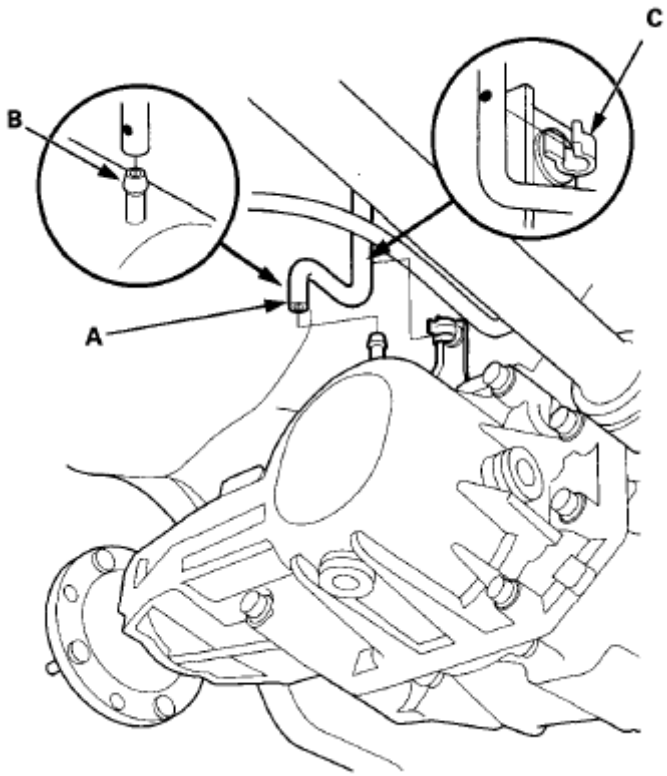

Fig. 231: Identifying Breather Hose, Breather Pipe And Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. With SH-AWD: Remove the transfer assembly from the transmission.

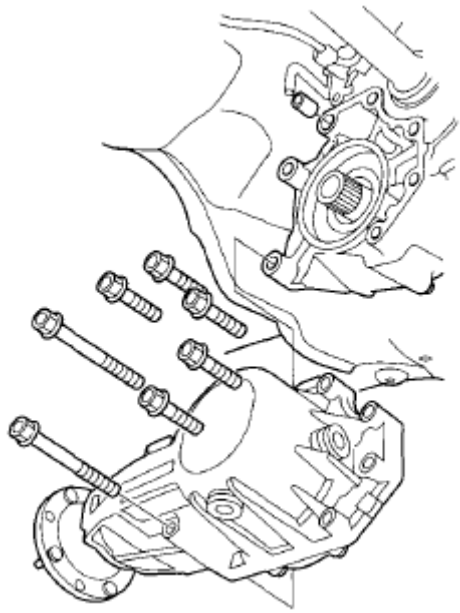

Fig. 232: Removing Transfer Assembly From Transmission
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Remove the cotter pins (A) and the nuts (B), and separate the tie-rod end ball joints (C) from the knuckles (see **KNUCKLE/HUB/WHEEL BEARING REPLACEMENT**).

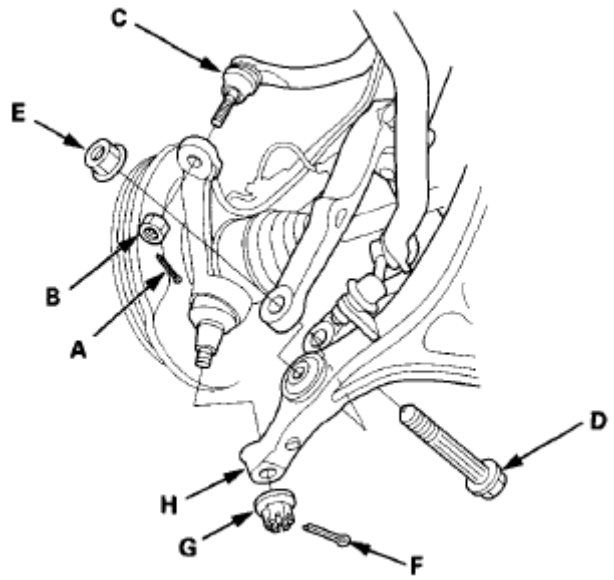

Fig. 233: Identifying Cotter Pins, Nuts, Tie-Rod End Ball Joints, Damper Fork Mounting Bolts And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Remove the damper fork mounting bolts (D) and nuts (E).
53. Remove the cotter pins (F) and the castle nuts (G), and separate the lower arms (H) from the knuckles (see **LOWER ARM REMOVAL/INSTALLATION**).
54. Remove the left side driveshaft from the differential and the right side driveshaft from the intermediate shaft. Coat all precision machined surfaces with clean engine oil, then put plastic bags over the driveshaft ends. Support the driveshafts on both sides with nylon straps.

NOTE: Plug the left side driveshaft hole to prevent dirt and solvent from entering the transmission.

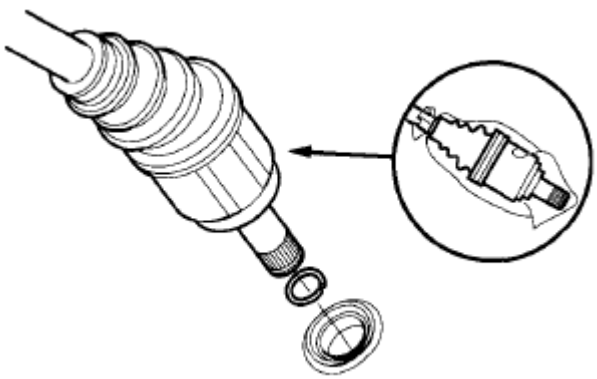

Fig. 234: Identifying Driveshafts With Nylon Straps

Courtesy of AMERICAN HONDA MOTOR CO., INC.

55. Remove the torque converter cover (A), and remove the drive plate bolts (B) (8) while rotating the crankshaft pulley.

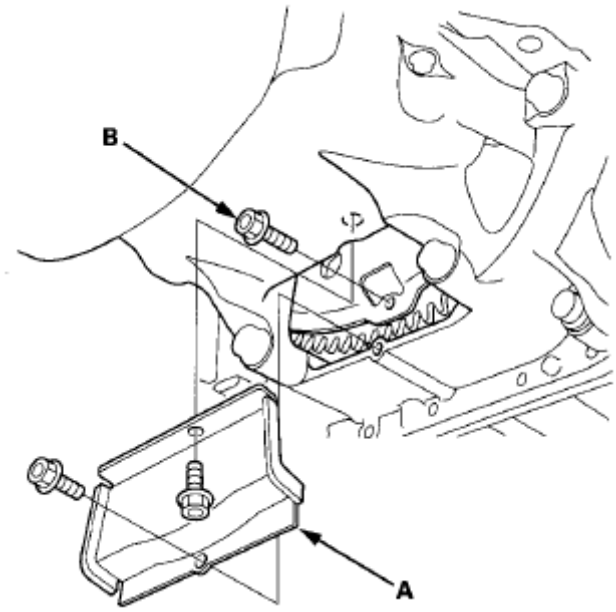

Fig. 235: Identifying Torque Converter Cover And Drive Plate Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Remove the lower transmission mount bolts (A) and the transmission ground terminal bracket (B).

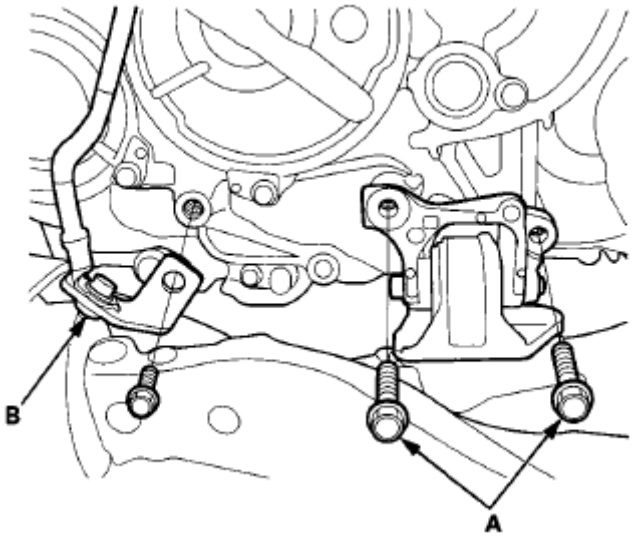

Fig. 236: Identifying Lower Transmission Mount Bolts And Transmission Ground Terminal Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

57. Loosen both front subframe middle mount bolts.

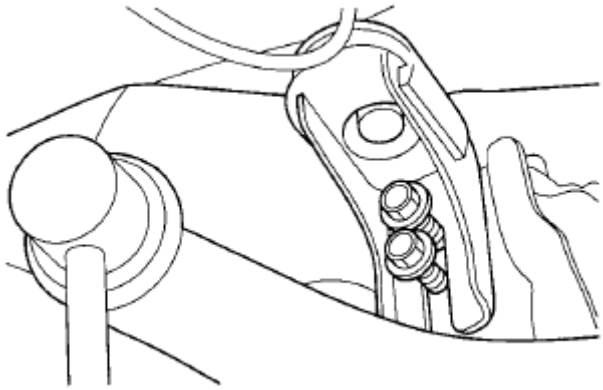

Fig. 237: Loosening Front Subframe Middle Mount Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

58. Attach the subframe adapter (VSB02C000016) to the front subframe by looping the strap (A) over the front of the front subframe, then secure the strap with the stop (B), then tighten the wing nut (C).

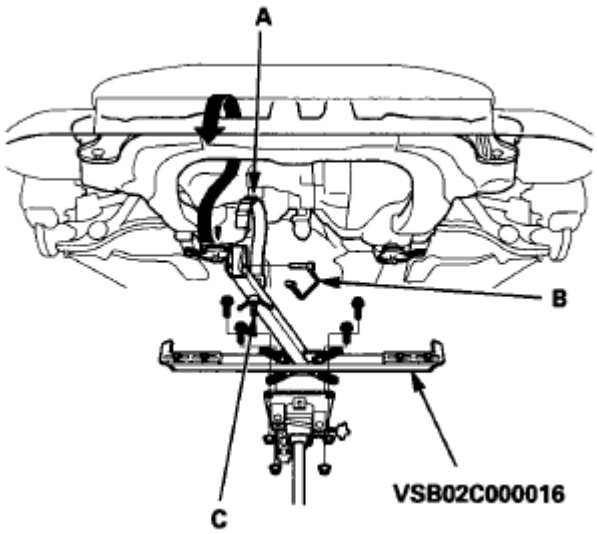

Fig. 238: Identifying Strap, Stop And Wing Nut Of Subframe Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

59. Raise the jack and line up the slots in the arms with the bolt holes on the corner of the jack base, then tighten the bolts.
60. Remove the four bolts securing the stiffeners (A) and the four bolts securing the front subframe (B), then lower the front subframe.

NOTE: Check that the front subframe is free of the ATF cooler hoses and the electrical wiring.

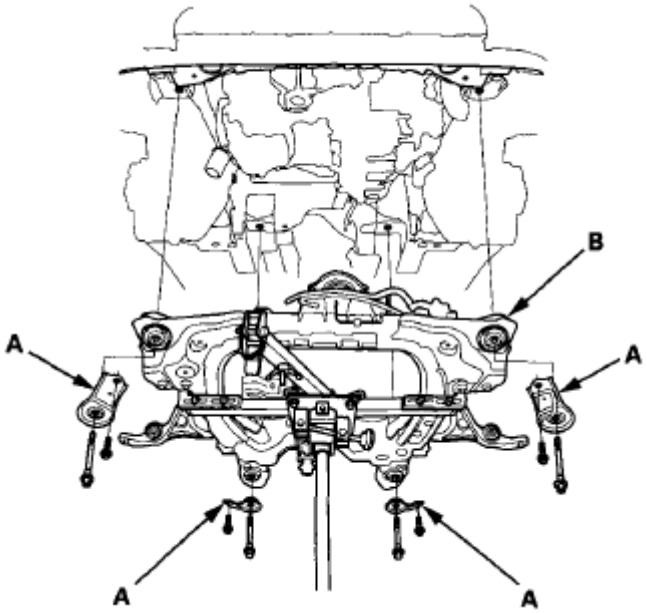

Fig. 239: Identifying Stiffeners And Front Subframe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

61. Support the transmission with a transmission jack.
62. Remove the intermediate shaft (A). Coat all precision machined surfaces with clean engine oil, then put plastic bags over intermediate shaft ends.

NOTE: Plug the intermediate shaft hole (B) to prevent dirt and solvent from entering the transmission.

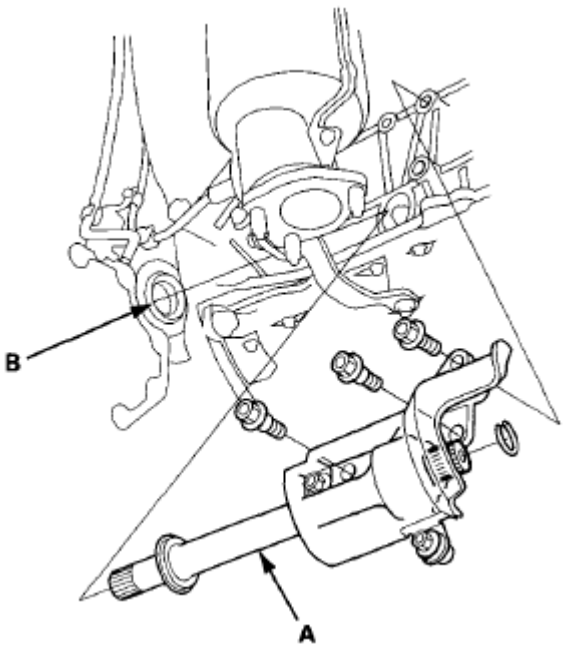

Fig. 240: Identifying Intermediate Shaft And Intermediate Shaft Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

63. Remove the front engine mount bracket.

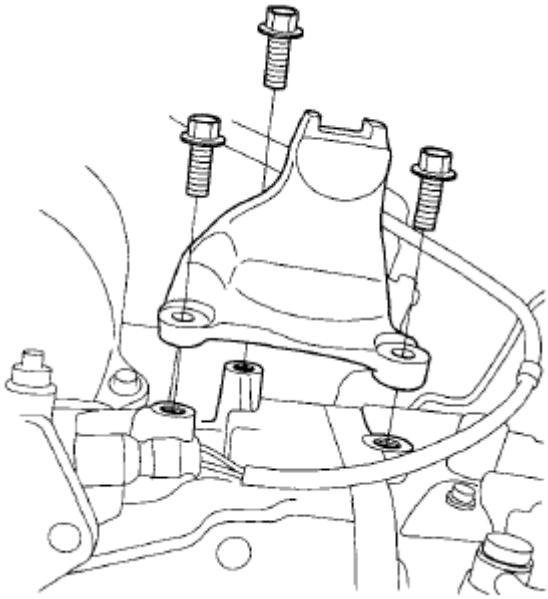

Fig. 241: Removing Front Engine Mount Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

64. Remove the crankshaft position (CKP) sensor cover (A), and disconnect the CKP sensor connector (B).

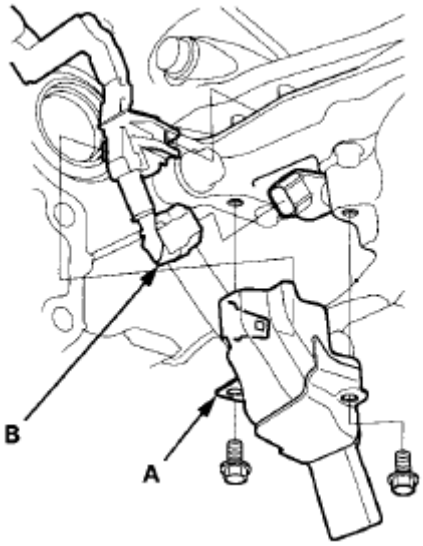

Fig. 242: Identifying Crankshaft Position (CKP) Sensor Cover And CKP Sensor Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

65. Remove the lower transmission housing mounting bolts.

Front side

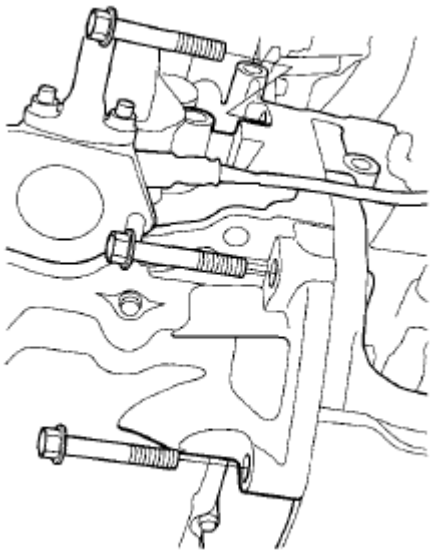

Fig. 243: Removing Lower Transmission Housing Mounting Bolts (Front Side)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear side

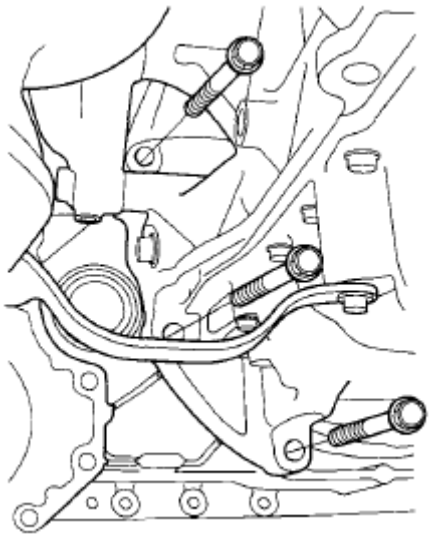

Fig. 244: Removing Lower Transmission Housing Mounting Bolts (Rear Side)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

66. Lower the transmission by loosening the wing nut of the engine support hanger, and tilt the engine just enough for the transmission to clear its end from the side frame.
67. Slide the transmission away from the engine to remove it from the vehicle.
68. Remove the torque converter (A), the O-ring (B), and the dowel pins (C).

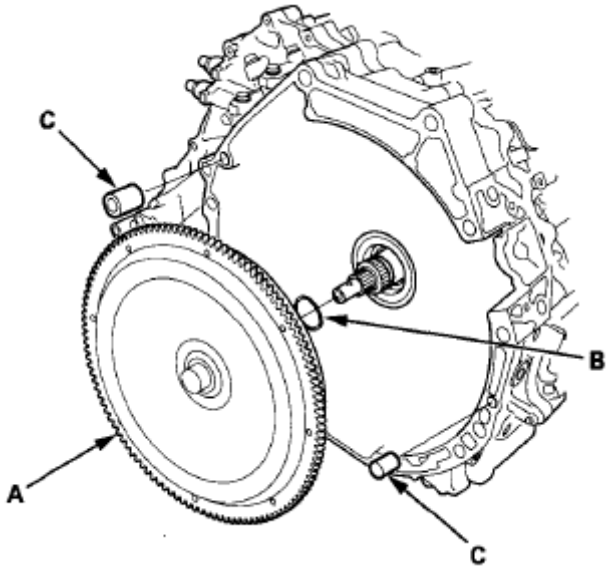

Fig. 245: Identifying Torque Converter, O-Ring And Dowel Pins
Courtesy of AMERICAN HONDA MOTOR CO., INC.

69. Inspect the drive plate, and replace it if it is damaged (see **DRIVE PLATE REMOVAL AND INSTALLATION**).

DRIVE PLATE REMOVAL AND INSTALLATION

1. Remove the transmission assembly (see **TRANSMISSION REMOVAL**).
2. Remove the drive plate (A) and the washer (B) from the engine.

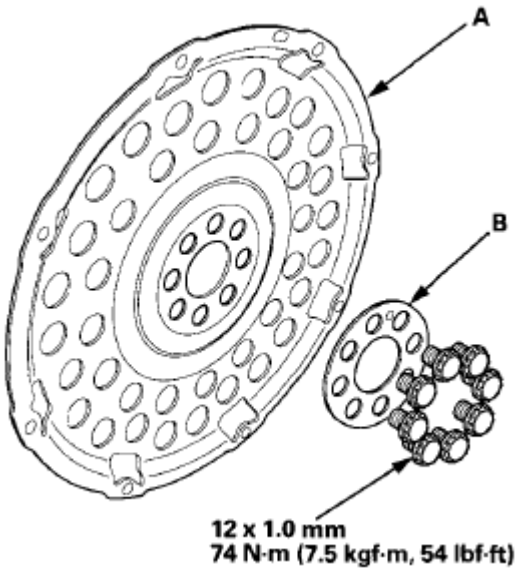

Fig. 246: Identifying Drive Plate And Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the drive plate and the washer on the engine crankshaft, and tighten the eight bolts in a crisscross pattern in at least two steps.
4. Install the transmission assembly (see **TRANSMISSION INSTALLATION**).

TRANSMISSION INSTALLATION

Special Tools Required

- 2008 V6 Attachment Arm SIL02C000033
- Engine Support Hanger, A and Reds AAR-T1256*
- Engine Hanger Balance Bar VSB02C000019*
- Subframe Adapter VSB02C000016*

*: Available through the Acura Tool and Equipment Program 888-424-6857.

NOTE: Use fender covers to avoid damaging painted surfaces.

1. If you did not clean the ATF cooler after removing the transmission, and you are installing an overhauled or remanufactured transmission, clean the ATF cooler (see **ATF COOLER CLEANING**), failure to do this can cause a repeat transmission failure.
2. Install a new O-ring (A) on the torque converter (B), then install the torque converter on the mainshaft (C).

NOTE: Make sure the torque converter is fully engaged on the mainshaft, the stator shaft, and the ATF pump drive gear. Failure to do so will result in severe transmission or engine damage.

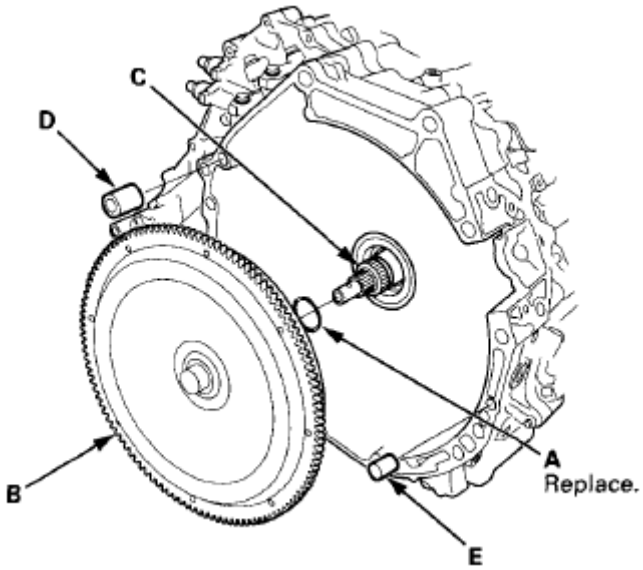

Fig. 247: Identifying O-Ring, Torque Converter, Dowel Pins And Mainshaft

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the 14x20 mm dowel pin (D) and the 10x20 mm dowel pin (E) in the torque converter housing.
4. Place the transmission on the jack, and raise it to the engine level.
5. Attach the transmission to the engine, and install the lower transmission housing mounting bolts.

Front side

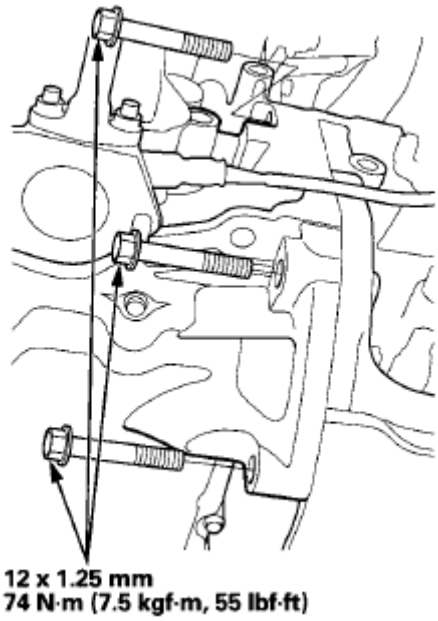

Fig. 248: Installing Lower Transmission Housing Mounting Bolts With Torque Specifications (Front Side)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear side

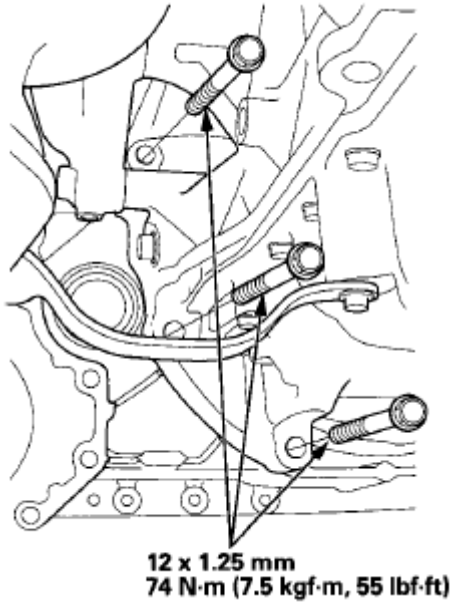

Fig. 249: Installing Lower Transmission Housing Mounting Bolts With Torque Specifications (Rear Side)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Connect the crankshaft position (CKP) sensor connector (A), and install the CKP sensor cover (B).

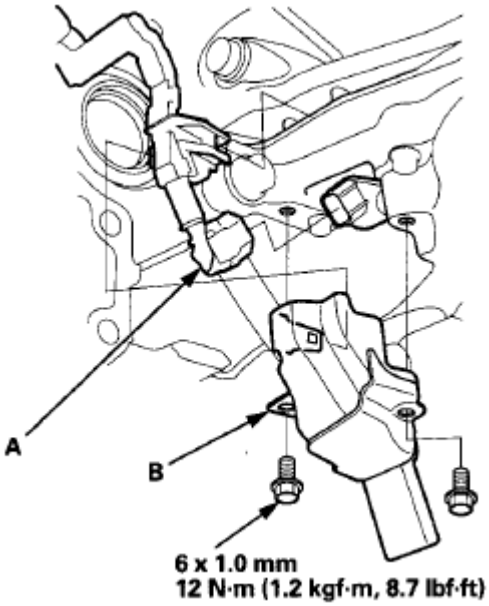

Fig. 250: Identifying Crankshaft Position (CKP) Sensor Connector And CKP Sensor Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the front engine mount bracket with new bolts.

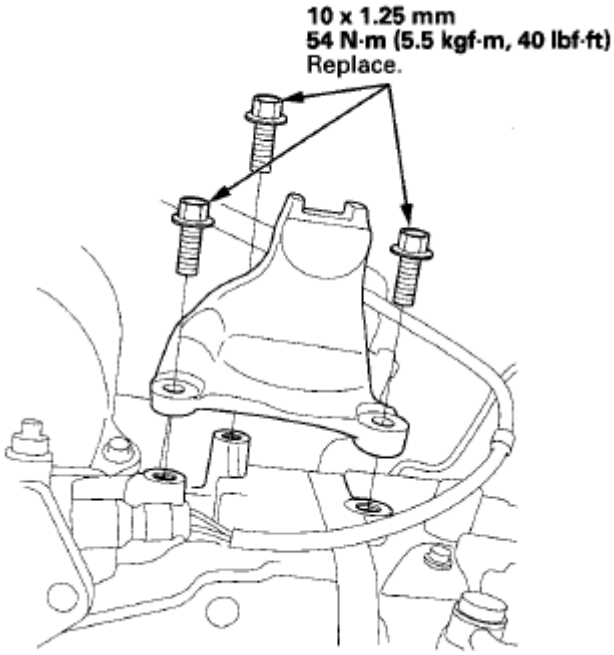

Fig. 251: Installing Front Engine Mount Bracket With New Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install a new set ring (A) on the intermediate shaft (B).

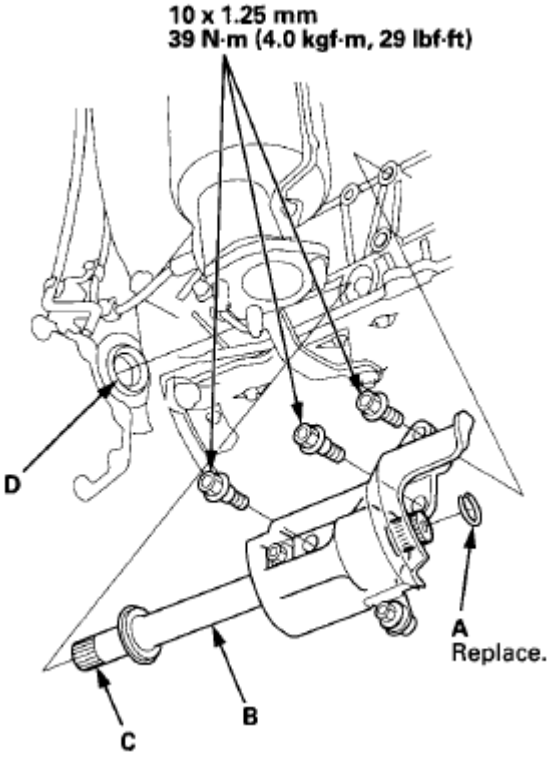

Fig. 252: Identifying Set Ring And Intermediate Shaft With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Clean the areas where the intermediate shaft contacts the transmission (differential) with solvent, and dry with compressed air. Apply ATF to the intermediate shaft splines (C), then install the intermediate shaft, be sure not to allow dust or other foreign particles to enter the transmission.

NOTE: Insert the intermediate shaft carefully to prevent damaging the oil seal (D).

10. Install a new set ring (A) on the left driveshaft (B).

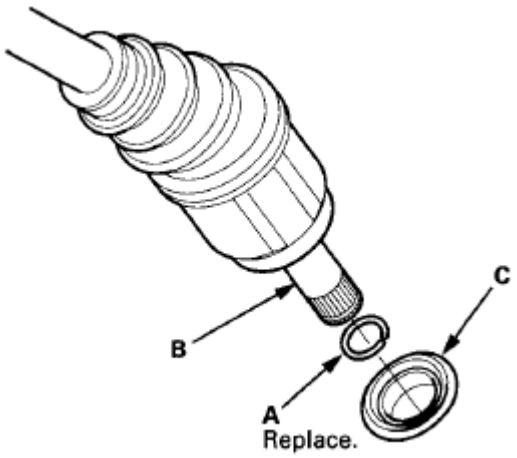

Fig. 253: Identifying Set Ring And Left Driveshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Clean the areas where the left driveshaft contacts the transmission (differential) with solvent, and dry with compressed air. Then install the left driveshaft, be sure not to allow dust or other foreign particles to enter the transmission. Turn the steering knuckle fully outward, and slide the driveshaft into the differential until you feel its set ring fully engages the side gear.

NOTE: Insert the left driveshaft horizontally to prevent damaging the oil seal (C).

12. Apply the recommended grease to the right driveshaft inboard joint splines (see **FRONT DRIVESHAFT INSTALLATION**).
13. Slide the right driveshaft over the intermediate shaft splines until you feel the driveshaft fully engages the intermediate shaft set ring.
14. Set the subframe adapter (VSB02C000016) to the front subframe by looping the strap (A) over the front of the front subframe, then secure the strap with the stop (B), then tighten the wing nut (C).

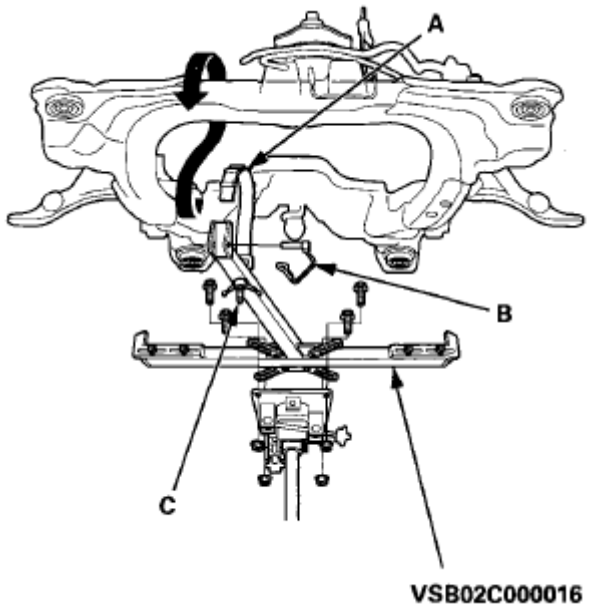

Fig. 254: Identifying Strap, Stop And Wing Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Raise the front subframe up to the body, then loosely install new front subframe mounting bolts (A), the front stiffener mounting bolts (B), and new rear stiffener mounting bolts (C).

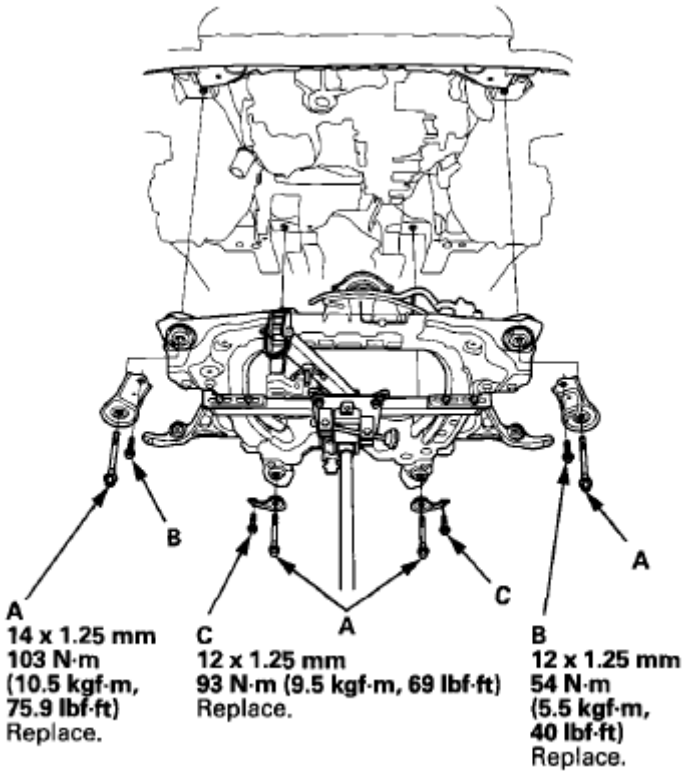

Fig. 255: Identifying Front Subframe Mounting Bolts, Front Stiffener Mounting Bolts And Rear

Stiffener Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Align the front subframe with the subframe alignment pin (see **SUBFRAME REPLACEMENT**).
17. Remove the jack and the subframe adapter.
18. Replace the front subframe middle mount bolts, then tighten the bolts to the specified torque.

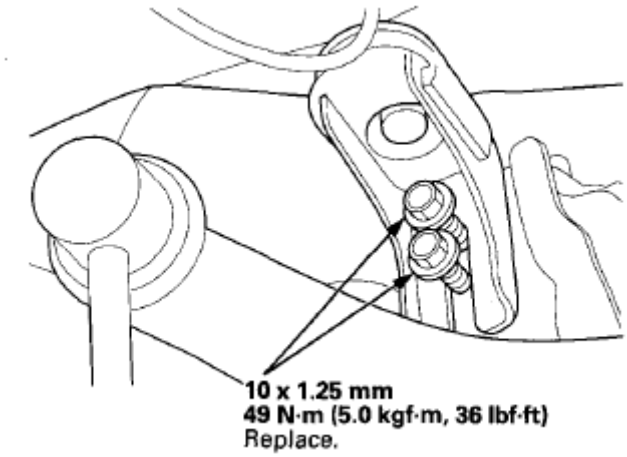

Fig. 256: Tightening Bolts To Specified Torque With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Install the lower transmission mount bolts (A) and the transmission ground terminal bracket (B).

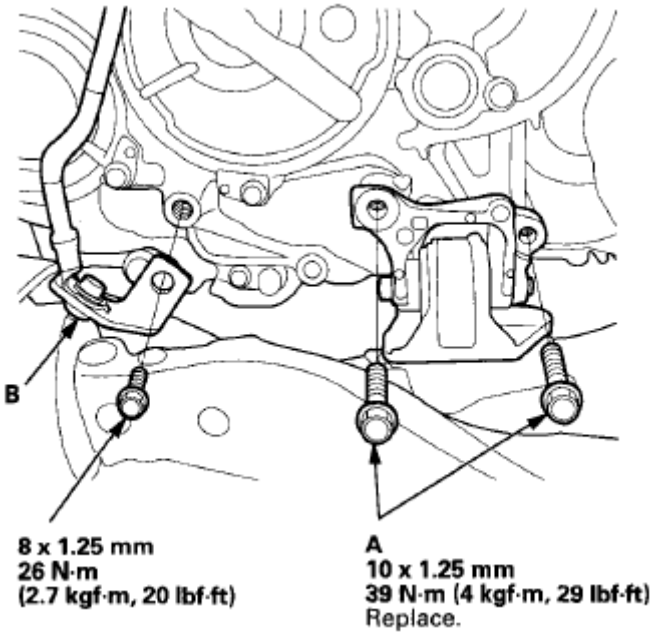

Fig. 257: Identifying Lower Transmission Mount Bolts And Transmission Ground Terminal Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Attach the torque converter to the drive plate (A) with eight bolts (B). Rotate the crankshaft pulley as necessary to tighten the bolt to half of the specified torque, then to the final torque, in a crisscross pattern. After tightening the last bolt, check that the crankshaft rotates freely.

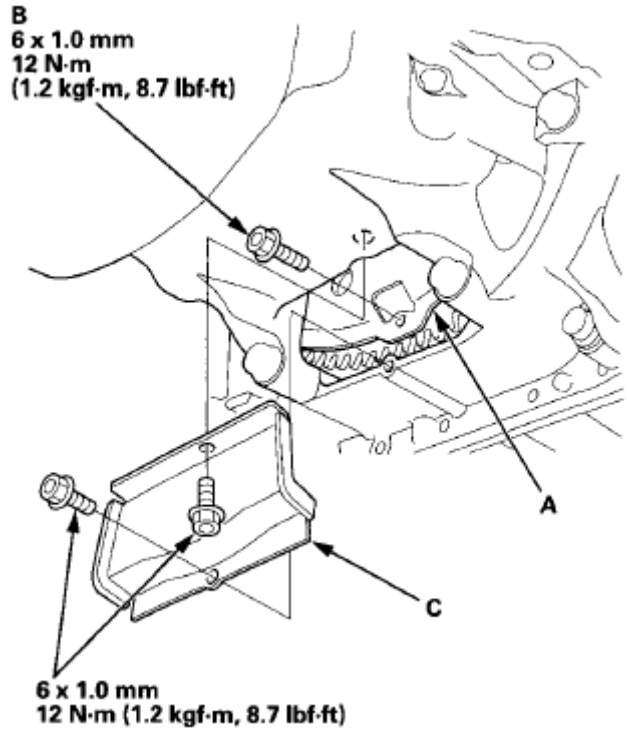

Fig. 258: Identifying Drive Plate, Torque Converter Cover And Bolts Of Transmission With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Install the torque converter cover (C).
22. Install the ball joints (A) to each lower arm (B).

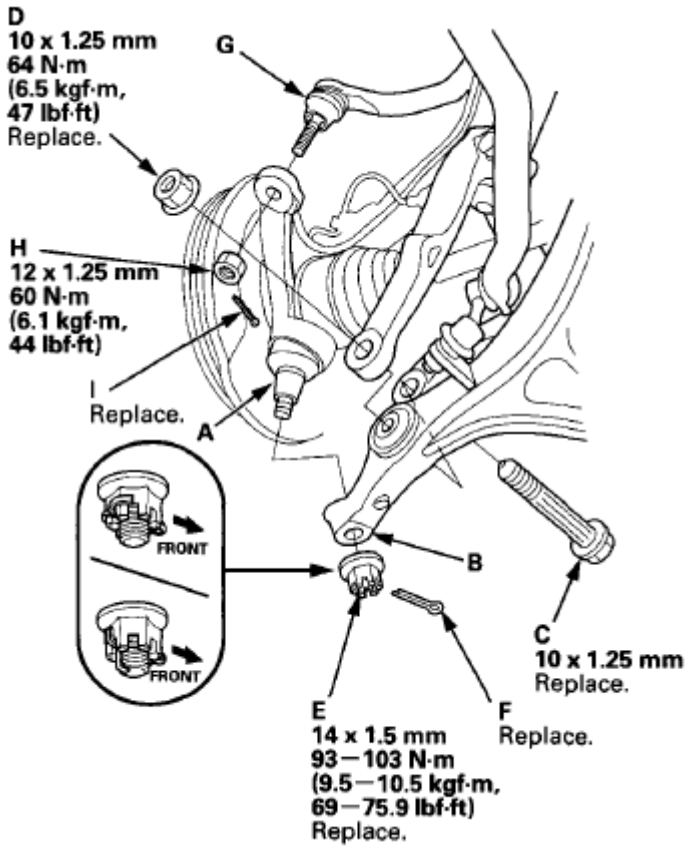

Fig. 259: Identifying Ball Joints, Damper Fork Bolts, Nuts, Cotter Pins And Lower Arm With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Install new damper fork mounting bolts (C) and nuts (D), and secure the ball joints with new castle nuts (E).

NOTE: Do not install the cotter pin (F) onto the castle nut until the castle nut tightened to the specified torque.

24. Install the tie-rod end ball joints (G) to the knuckles with nuts (H), and install new cotter pins (I).
25. With SH-AWD: Install the dowel pin (A) in the transmission, and install the transfer assembly (B) on the transmission.

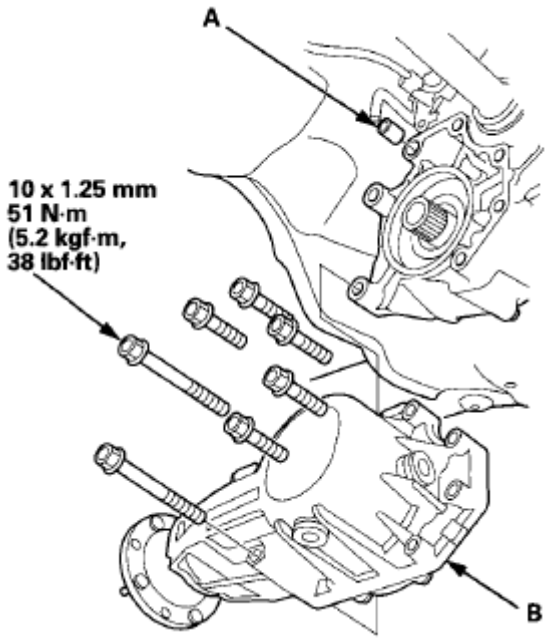

Fig. 260: Identifying Dowel Pin And Transfer Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. With SH-AWD: Connect the breather hose (A) over the breather pipe (B) with facing the dot mark (C) to the rear side of the vehicle, and install the breather hose to the clamp (D) at the dot mark (E).

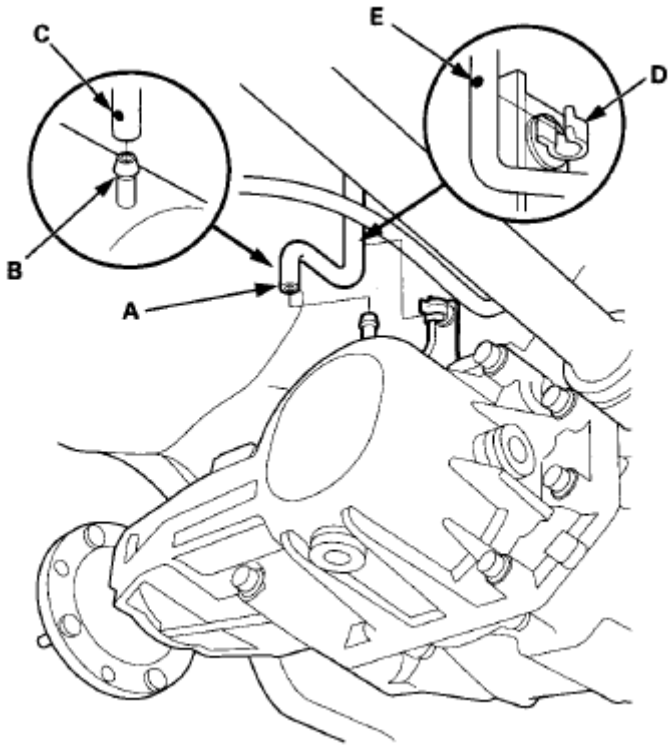

Fig. 261: Identifying Breather Hose, Breather Pipe Dot Mark, Clamp And Dot Mark

Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. With SH-AWD: Install the propeller shaft (see **PROPELLER SHAFT INSTALLATION**).
28. Install exhaust pipe A and the under-floor three way catalytic converter (TWC):
    - With SH-AWD (see **J37A4 ENGINE (WITH SH-AWD)**).
    - Without SH-AWD (see **EXHAUST PIPE AND MUFFLER REPLACEMENT**).
29. Install the front subframe stiffener with new mounting bolts.

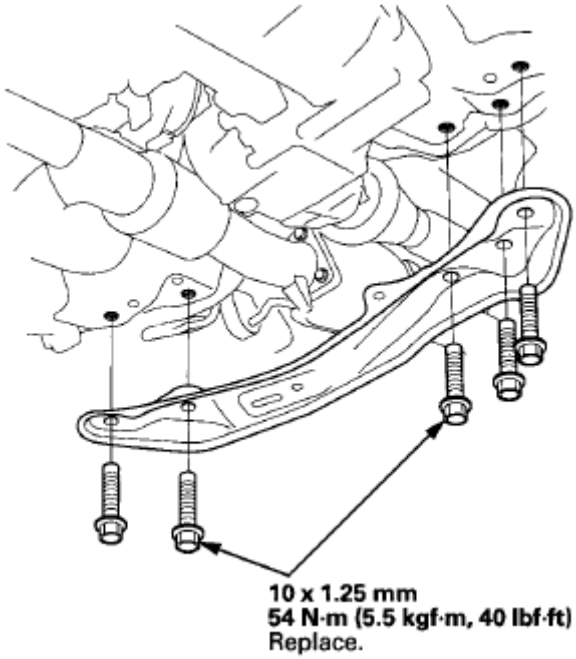

Fig. 262: Installing Front Subframe Stiffener With Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Connect the ATF cooler hoses (A) to the ATF cooler lines (B), then secure the hoses with the clips (C) (see **ATF COOLER HOSE REPLACEMENT**).

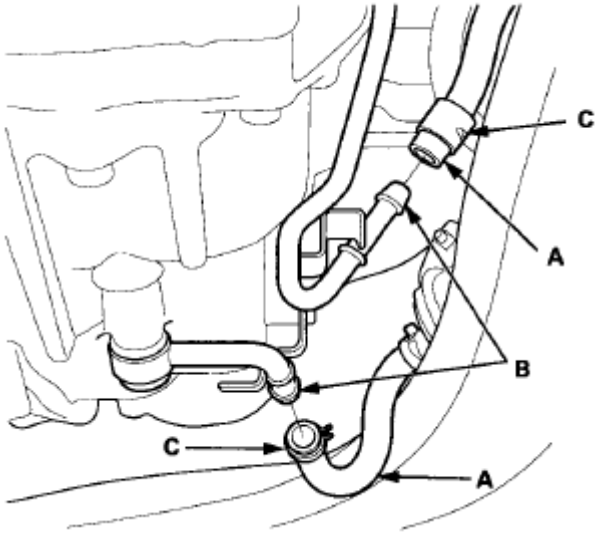

Fig. 263: Identifying ATF Cooler Lines And Hoses And Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Connect the ATF cooler hoses (A) to the ATF cooler lines (B), then secure the hoses with the clips (C) (see **ATF COOLER HOSE REPLACEMENT**).

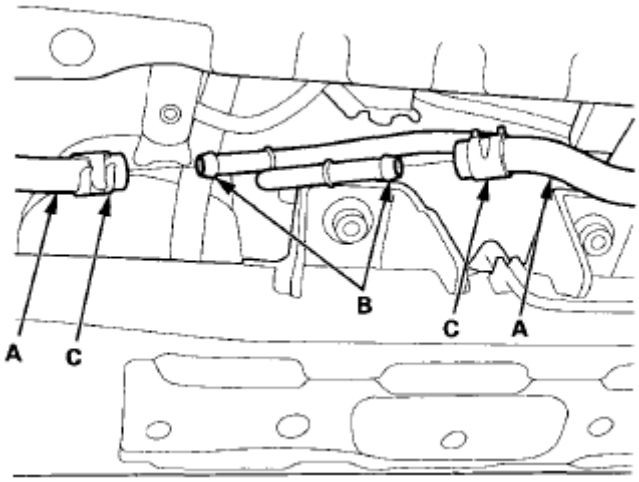

Fig. 264: ATF Cooler Hoses And Lines And Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Connect the input shaft (mainshaft) speed sensor connector (A) and the output shaft (countershaft) speed sensor connector (B), then install the harness clamps (C).

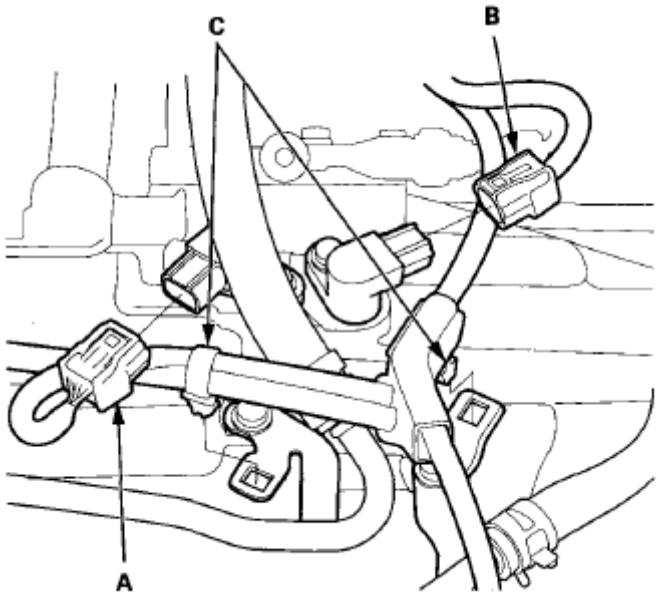

Fig. 265: Identifying Input And Output Shaft Speed Sensor Connector And Harness Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Connect the transmission fluid pressure switch C (4th clutch) connector (A), then install the harness clamp (B).

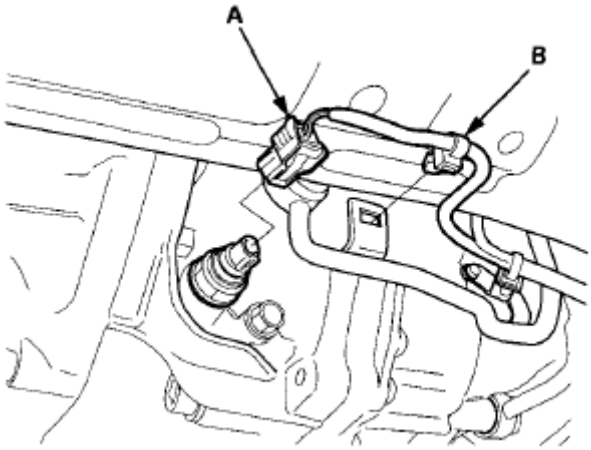

Fig. 266: Identifying Transmission Fluid Pressure Switch C Connector And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Connect the ATF temperature sensor connector (A), then install the harness clamp (B).

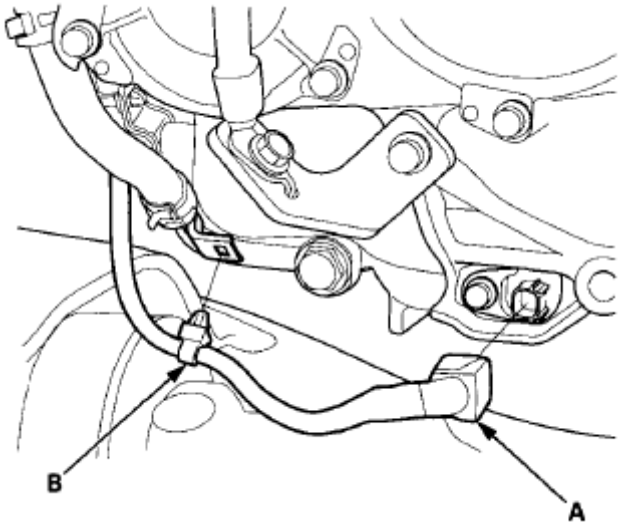

Fig. 267: Identifying ATF Temperature Sensor Connector And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Connect the EPS connectors (A) and install the harness clamps (B).

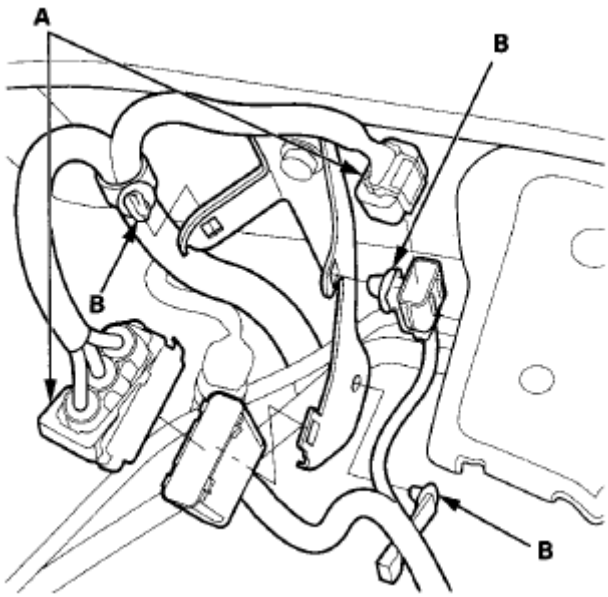

Fig. 268: Identifying EPS Connectors And Harness Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Install new upper transmission housing mounting bolts.

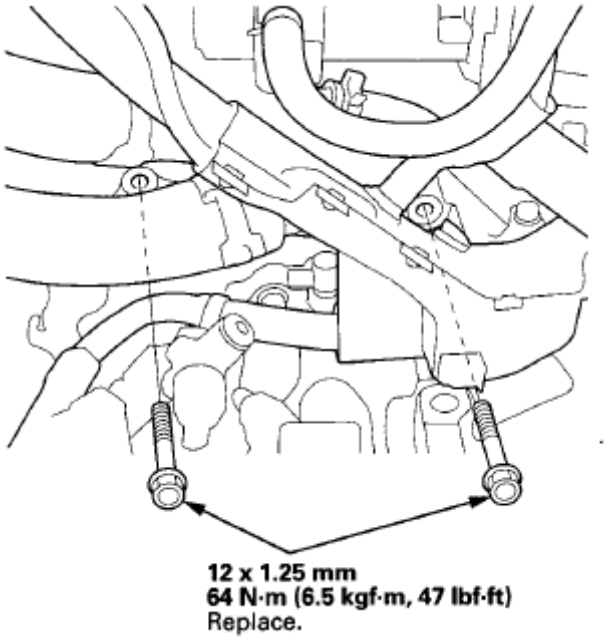

Fig. 269: Installing Upper Transmission Housing Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Install new upper transmission mount bracket bolts (A) (B), and install the bolt (C) securing the clamp bracket.

NOTE: If bolt (D) was removed by mistake during removal, the upper transmission mount bracket must be replaced as an assembly.

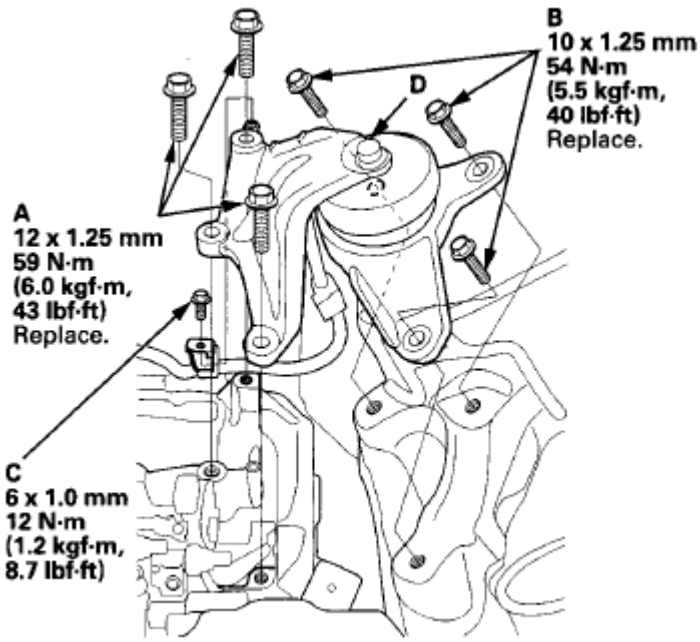

Fig. 270: Identifying Mount Bracket And Bolts With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Install a new rear engine mount bolt (A), then install the rear engine mount stop (B) and the heat shield (C) with new nuts (D).

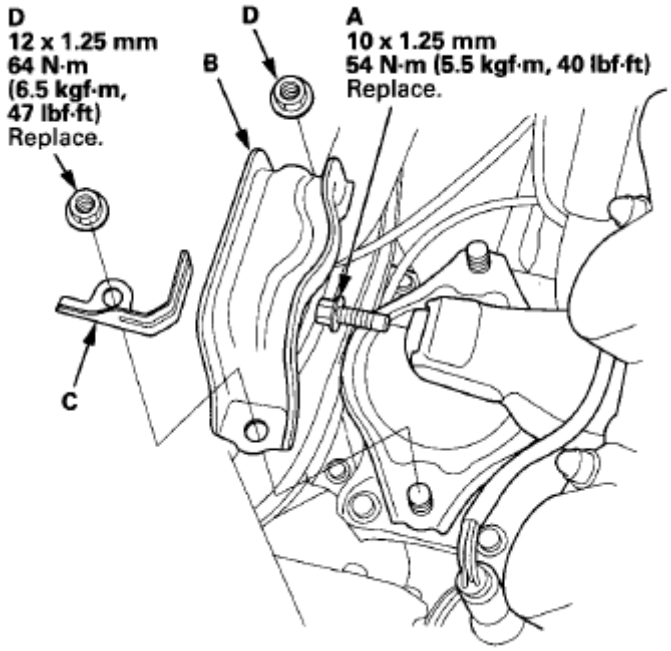

Fig. 271: Identifying Rear Engine Mount Bolt, Rear Engine Mount Stop And Heat Shield Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Install a new front engine mount bolt (A), then install the front engine mount stop (B) and the clamp bracket (C) with new nuts (D).

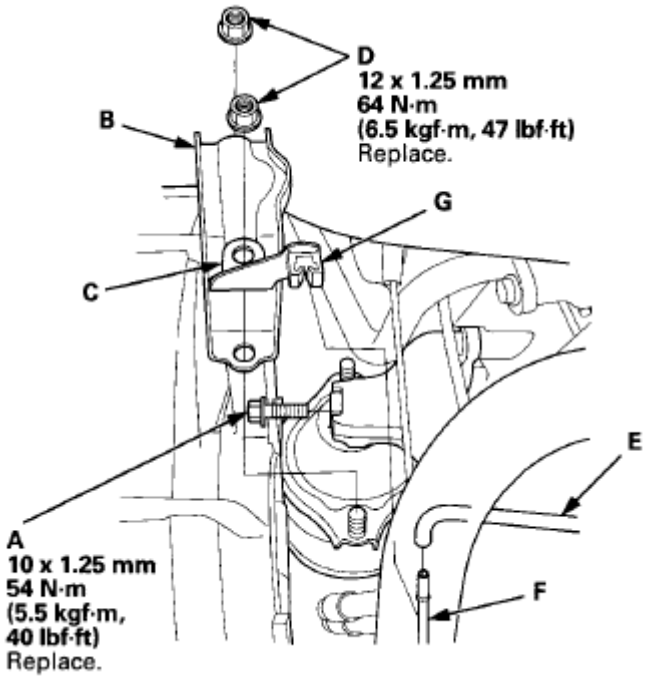

Fig. 272: Identifying Front Engine Mount Stop And Bolt, Vacuum Pipe And Hose And Clamp Bracket Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Install the vacuum hose (E) to the vacuum pipe (F), and install the vacuum pipe on its clamp (G).
41. Remove the engine support hanger, the engine hanger balance bar, and the 2008 V6 attachment arm.
42. Install the connector bracket to the front cylinder head.

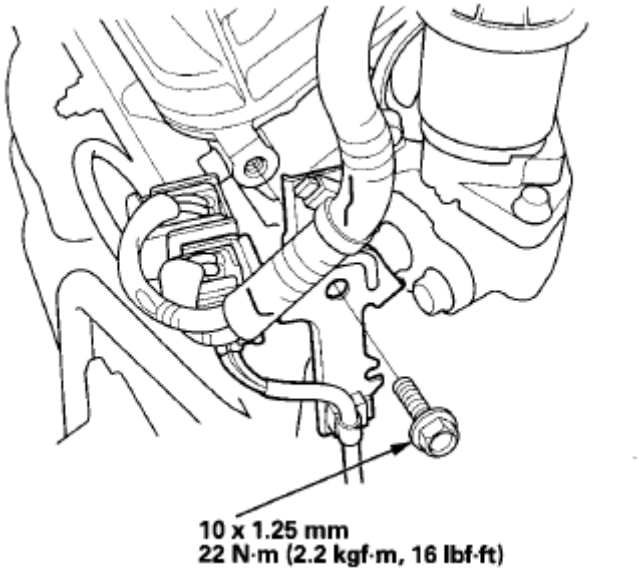

Fig. 273: Installing Connector Bracket To Front Cylinder Head With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Install the engine mount control solenoid valve bracket to the rear cylinder head, then install the harness clamp (A).

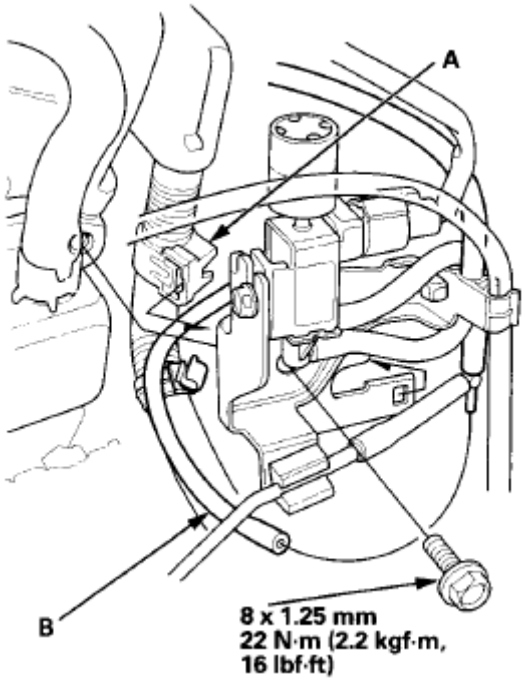

Fig. 274: Identifying Harness Clamp And Vacuum Hose With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Connect the vacuum hose (B).
45. Connect the transmission fluid pressure switch A (2nd clutch) connector (A) and the transmission fluid pressure switch D (5th clutch) connector (B).

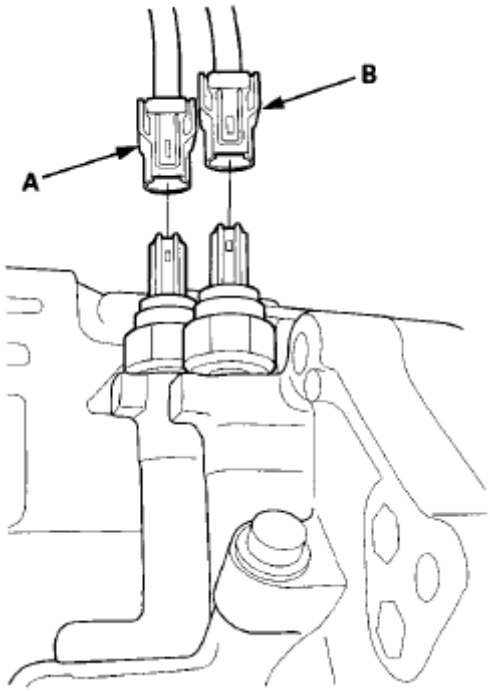

Fig. 275: Identifying Transmission Fluid Pressure Switch A Connector And Transmission Fluid Pressure Switch D Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Install the harness cover bracket (A).

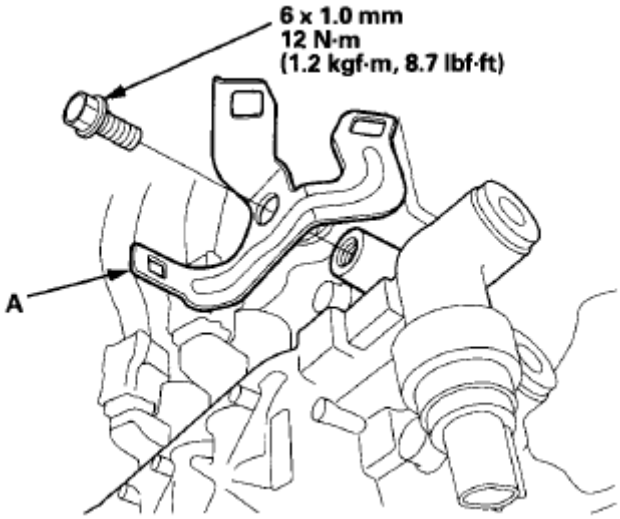

Fig. 276: Installing Harness Cover Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Install the bolt (A) securing the harness cover (B), and install the harness clamp (C).

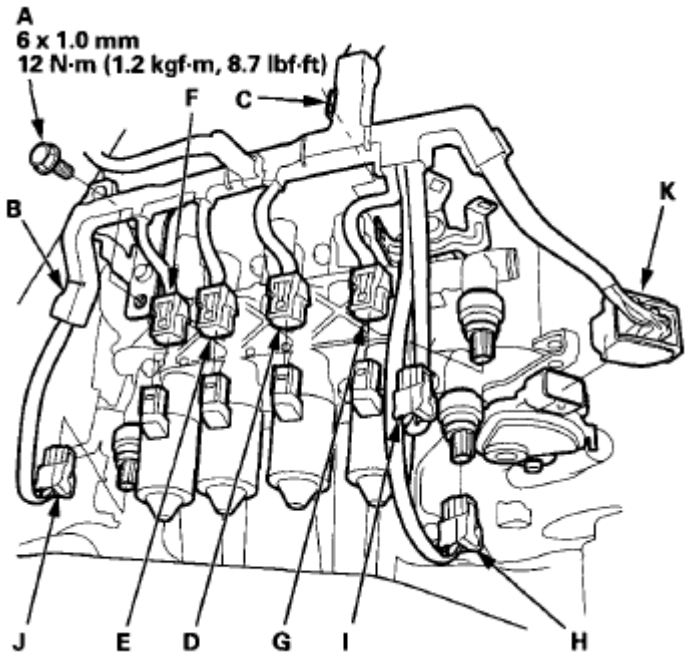

Fig. 277: Identifying Bolt, Harness Cover And Harness Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Connect these connectors:
    - A/T clutch pressure control solenoid valve A connector (D)
    - A/T clutch pressure control solenoid valve B connector (E)
    - A/T clutch pressure control solenoid valve C connector (F)
    - A/T clutch pressure control solenoid valve D connector (G)
    - Transmission fluid pressure switch B (3rd clutch) connector (H)
    - Transmission fluid pressure switch E (6th clutch) connector (I)
    - Line pressure switch connector (J)
    - Transmission range switch connector (K)
49. Install the harness clamps (A).

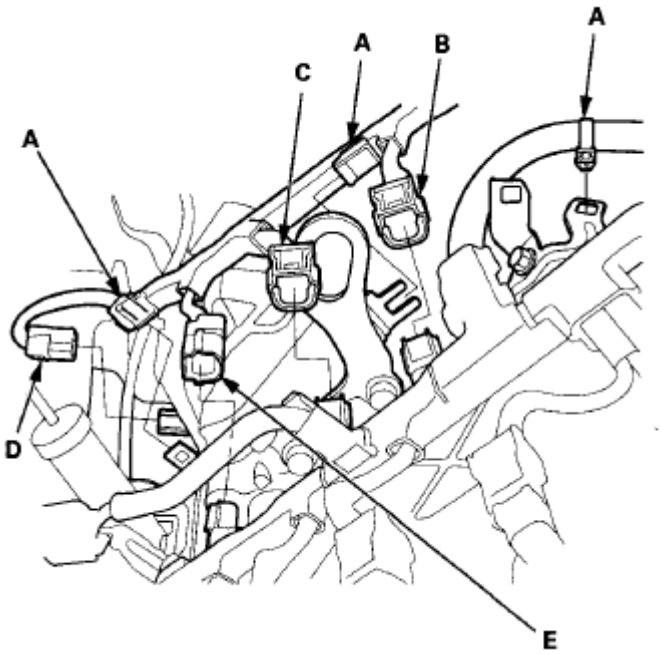

Fig. 278: Identifying Solenoid Valve A, B And C Connectors And Line Pressure Solenoid Valve A Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Connect these connectors:
    - Shift solenoid valve A connector (B)
    - Shift solenoid valve B connector (C)
    - Shift solenoid valve C connector (D)
    - Line pressure solenoid valve A connector (E)
51. Install the shift cable bracket (A).

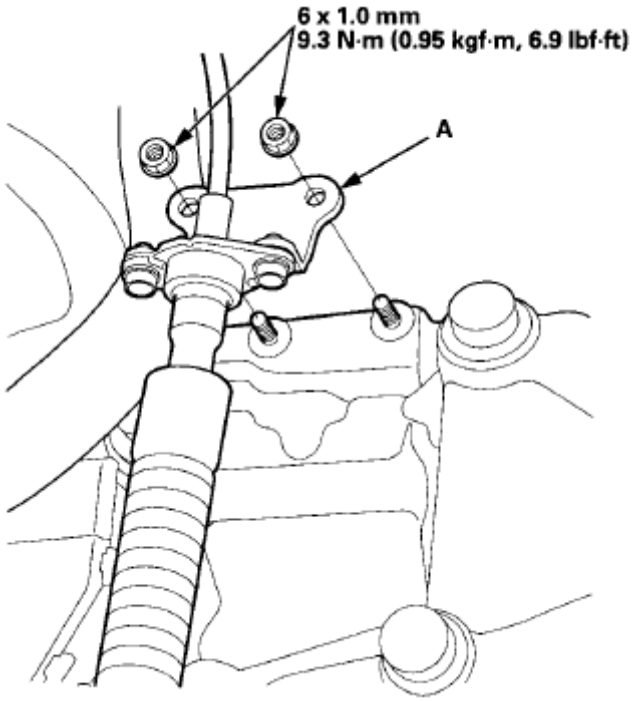

Fig. 279: Installing Shift Cable Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Apply molybdenum grease to the hole in the bushing (A) in the shift cable end (B).

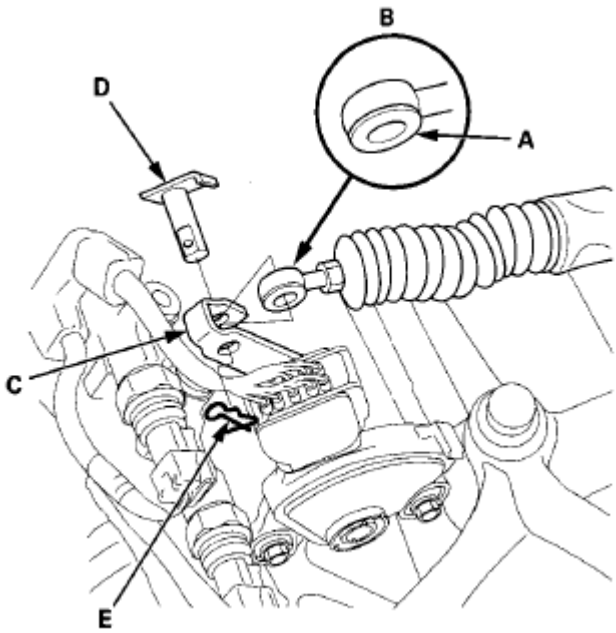

Fig. 280: Identifying Bushing, Shift Cable End, Control End, Control Pin And Spring Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Attach the shift cable end to the control lever (C), then insert the control pin (D) into the control lever

hole through the shift cable end, and secure the control pin with the spring clip (E).

54. Install the clamp bracket (A), and install the harness clamp (B).

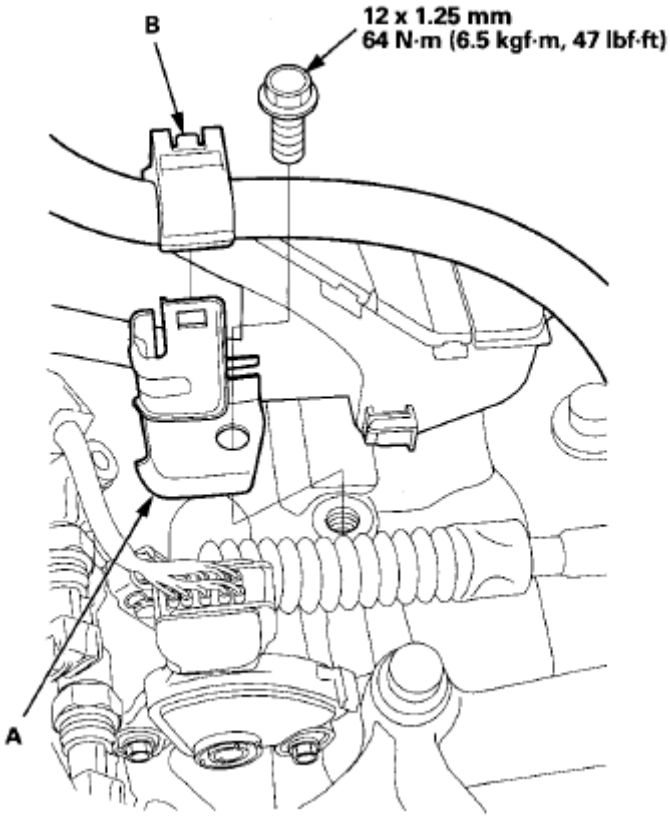

Fig. 281: Identifying Clamp Bracket And Harness Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

55. Install the bolt (A) securing the harness cover (B) and install the harness clamp (C).

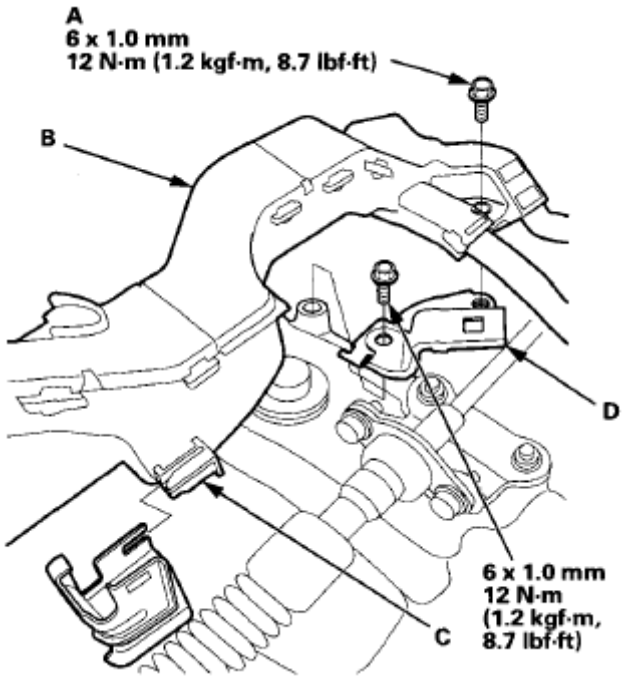

Fig. 282: Identifying Harness Cover And Clamp And Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Install the clamp bracket (D).
57. Install the starter (see **STARTER REMOVAL AND INSTALLATION**) and install the ATF dipstick.
58. Loosen the upper steering joint bolt (A), and slip the lower end of the steering joint (B) onto the pinion shaft (C).

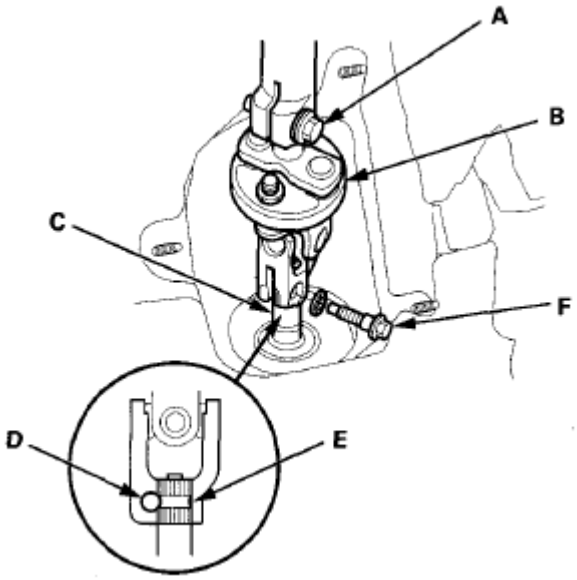

Fig. 283: Identifying Upper Steering Bolts, Lower End Housing Steering Joint And Pinion Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

59. Align the bolt hole (D) on the steering joint with the groove (E) around the pinion shaft, then loosely install the lower steering joint bolt (F). Be sure that the joint bolt is securely in the groove in the pinion shaft.
60. Remove the steering wheel holder tool (A).

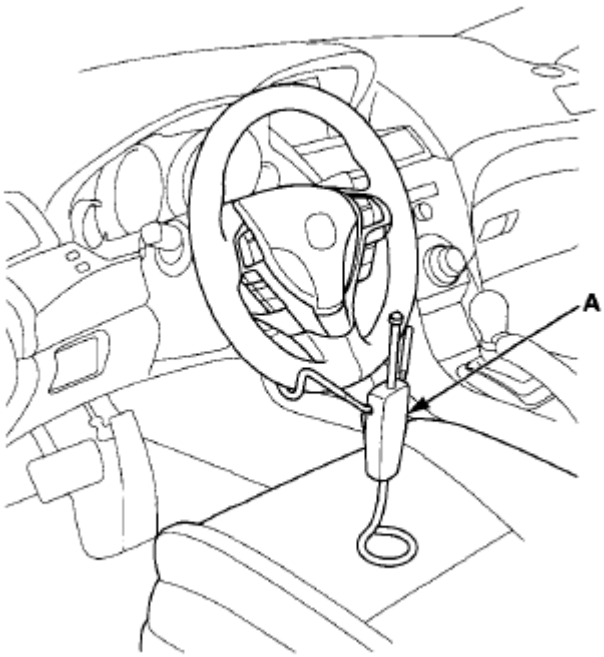

Fig. 284: Removing Steering Wheel Holder Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

61. Tighten the upper and lower steering joint bolts (A) to the specified torque.

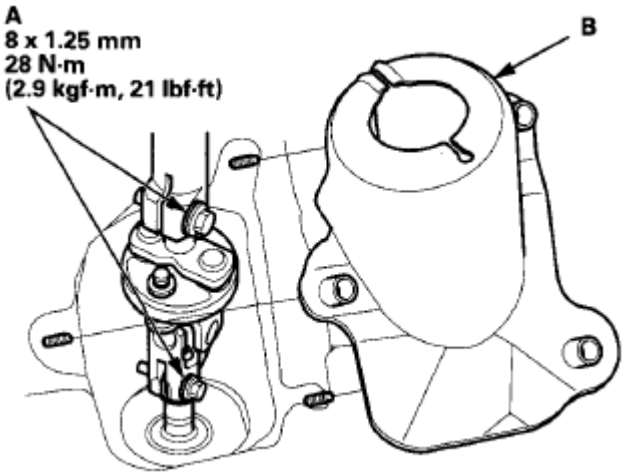

Fig. 285: Identifying Upper And Lower Steering Joint Bolts And Steering Joint Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

62. Install the steering joint cover (B).
63. Install the strut brace (see **FRAME BRACE REPLACEMENT**). Loosely install the strut brace mounting nuts.
64. Refill the transmission with ATF (see **ATF REPLACEMENT**).
65. Install the air cleaner (see **THROTTLE BODY CLEANING**).
66. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).
67. Place a floor jack under the lower arm, and raise the front suspension to load it with the vehicle's weight. Do not place the jack against the ball joint pin of the knuckle. Tighten the damper fork mounting nuts while holding the mounting bolt to 64 N.m (6.5 kgf.m, 47 lbf.ft)
68. Tighten the ball joint mounting castle nuts to 93 - 103 N.m (9.5 - 10.5 kgf.m, 69-75.9 lbf.ft), then install new cotter pins onto the castle nuts, then bend the cotter pin ends (see **LOWER ARM REMOVAL/INSTALLATION**).
69. Tighten the strut brace mounting nuts to 22 N.m (2.2 kgf.m, 16 lbf.ft).
70. Install the engine compartment covers (see **ENGINE COMPARTMENT COVER REPLACEMENT**).
71. Reinstall the hood support struts to the upper location on both sides of the hood.
72. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
73. Install the front wheels.
74. Set the parking brake. Start the engine, and shift the transmission through all positions three times. Check the shift lever operation, the A/T gear position indicator operation, and the shift cable adjustment (see **SHIFT CABLE ADJUSTMENT**).
75. Check the front wheel alignment (see **WHEEL ALIGNMENT**).
76. Start the engine in P or N, and warm it up to normal operating temperature (the radiator fan comes on).
77. Turn off the engine, and Check the ATF level (see **ATF LEVEL CHECK**).
78. Do the road test (see **ROAD TEST**).

ATF COOLER CLEANING

Special Tools Required

- ATF Cooler Cleaner GHTTTCF6H*
- Magnetic Nonbypass Spin-On Filter GTHGNBP2*

*: Available through the Acura Tool and Equipment Program 888-424-6857.

Before installing an overhauled or remanufactured automatic transmission, you must thoroughly clean the ATF cooler to prevent system contamination. Failure to do so could cause a repeat automatic transmission failure.

The cleaning procedure involves heated ATF delivered under high pressure (100 psi). Check the security of all hoses and connections. Always wear safety glasses or a face shield, along with gloves and protective clothing. If you get ATF in your eyes or on your skin, rinse with water immediately.

WARNING:

- **Improper use of the ATF cooler cleaner can result in burns and other**

serious injuries.

- **Always wear eye protection and protective clothing, and follow this procedure.**

1. Check the fluid in the cooler cleaner tank. (The fluid level should be 4.5 inches from the top of the filler neck.) Adjust the level if needed; do not overfill. Use only Acura ATF DW-1; do not use any additives.

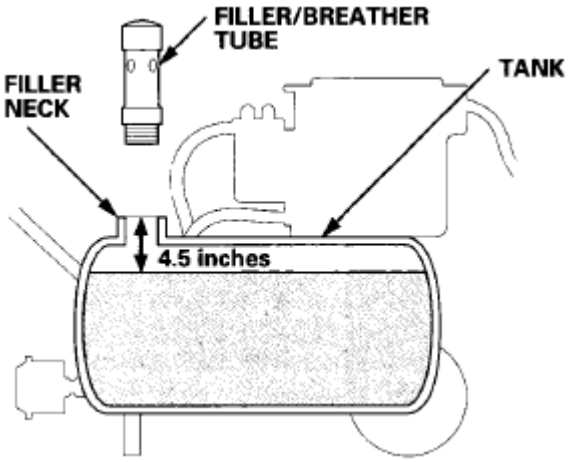

Fig. 286: Identifying Filler Neck, Filler/Breather Tube And Tank Of Cooler Cleaner Tank
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Plug the cooler cleaner into a 110 V grounded electrical outlet.

NOTE: Make sure the outlet has no other appliances (light fixtures, drop lights, extension cords) plugged into it. Also, never plug the cooler cleaner into an extension cord or drop light; you could damage the unit.

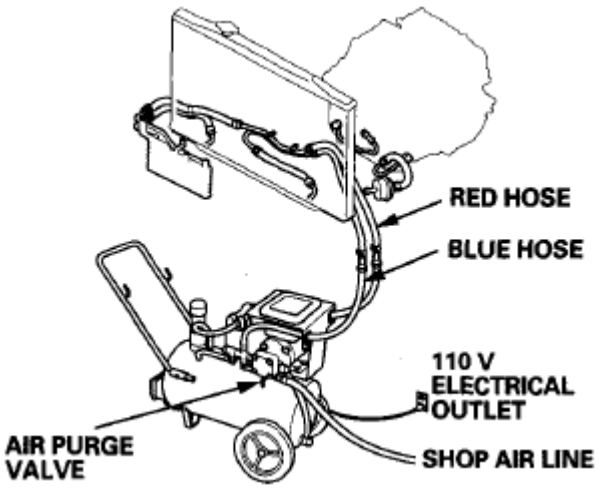

Fig. 287: Identifying Air Purge Valve, Shop Air Line, Electrical Outlet, Blue And Red Hoses
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Flip the HEAT toggle switch to ON; the green indicator above the toggle switch comes on. Wait 1 hour for the cooler cleaner to reach its operating temperature. (The cooler cleaner is ready to use when the temperature gauge reads 140°F to 150°F.)

NOTE: If the red indicator above the HEAT toggle switch comes on, the fluid level in the tank is too low for the tank heater to work (see step 1 of this procedure).

4. Select the appropriate pair of fittings, and attach them to the radiator, to the hoses, or to the banjo bolts for flow through the ATF cooler cleaner.

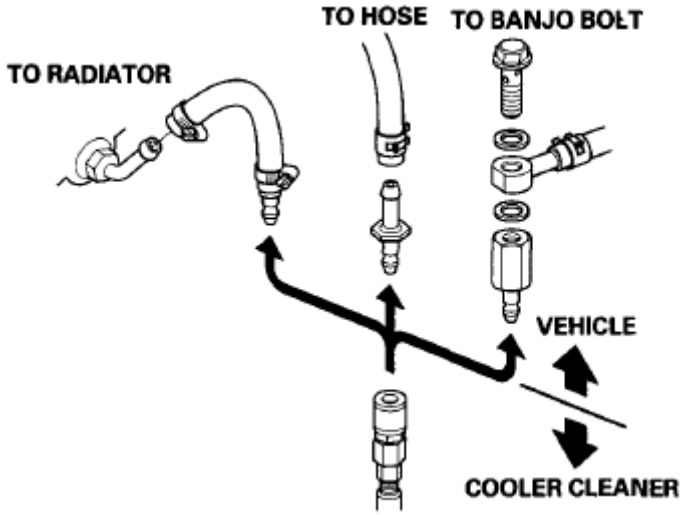

Fig. 288: Identifying Pair Of Fittings For Radiator, Hoses And Banjo Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Connect the red hose to the cooler outlet line (the line that normally goes to the external filter on the transmission).
6. Connect the blue hose to the cooler inlet line.
7. Connect a shop air hose (regulated to 100 to 125 psi) to the air purge valve.

NOTE: The quick-connect fitting has a one-way check valve to keep ATF from entering your shop's air system. Do not remove or replace the fitting. Attach the coupler provided with the cooler cleaner to your shop air line if your coupler is not compatible.

8. Flip the MOTOR toggle switch to ON; the green indicator above the toggle switch comes on. Let the pump run for 5 minutes. While the pump is running, open and close the air purge valve periodically to cause agitation and improve the cleaning process. Always open the valve slowly. At the end of the 5-minute cleaning period, leave the air purge valve open.

NOTE: While the pump is running with the air purge valve open, it is normal to

see vapor coming from the filler/breather tube vents.

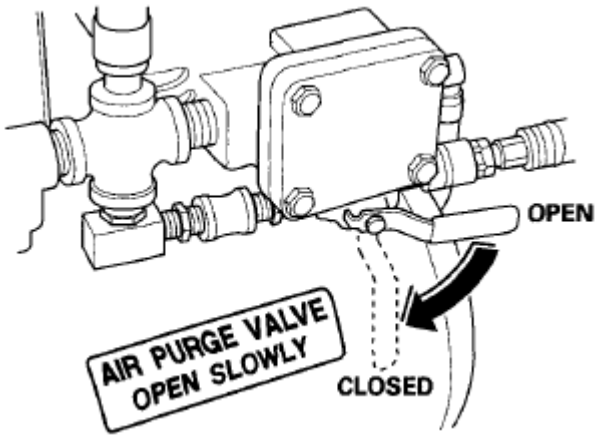

Fig. 289: Identifying ATF Cooler Cleaner And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. With the air purge valve open, flip the MOTOR toggle switch to OFF; the green indicator goes off. Leave the air purge valve open for at least 15 seconds to purge the lines and hoses of residual ATF, then close the valve.
10. Disconnect the red and blue hoses from the ATF cooler. Now connect the red hose to the cooler inlet line.
11. Now connect the blue hose to the cooler outlet line.
12. Flip the MOTOR toggle switch to ON, and let the pump run for 5 minutes. While the pump is running, open and close the air purge valve periodically. Always open the valve slowly. At the end of the 5-minute cleaning period, leave the air purge valve open.

NOTE: While the pump is running with the air purge valve open, it is normal to see vapor coming from the filler/breather tube vents.

13. With the air purge valve open, flip the MOTOR toggle switch to OFF. Leave the air purge valve open for at least 15 seconds to purge the lines and hoses of residual ATF, then close the valve.
14. Disconnect the red and blue hoses from the ATF cooler lines.
15. Connect the red and blue hoses to each other.
16. Disconnect the shop air from the air purge valve. Disconnect and stow the coupler if used.
17. Disconnect and stow the fittings from the ATF cooler inlet and outlet lines.
18. Unplug the cooler cleaner from the 110 V outlet.

Tool Maintenance

Follow these instructions to keep the ATF cooler cleaner working properly:

- Replace the two magnetic nonbypass spin-on filters after every 20 hours of use, based on the hour-meter, or when you notice a restriction in the ATF flow.

- Check the level and condition of the fluid in the tank before each use.
- Replace the ATF in the tank when it looks dark or dirty.

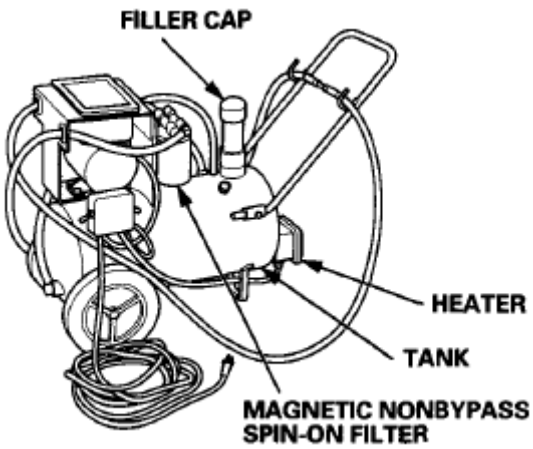

Fig. 290: Identifying Filler Cap, Heater, Tank And Magnetic Non By Pass Spin On Filter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ATF COOLER HOSE REPLACEMENT

EXPLODED VIEW

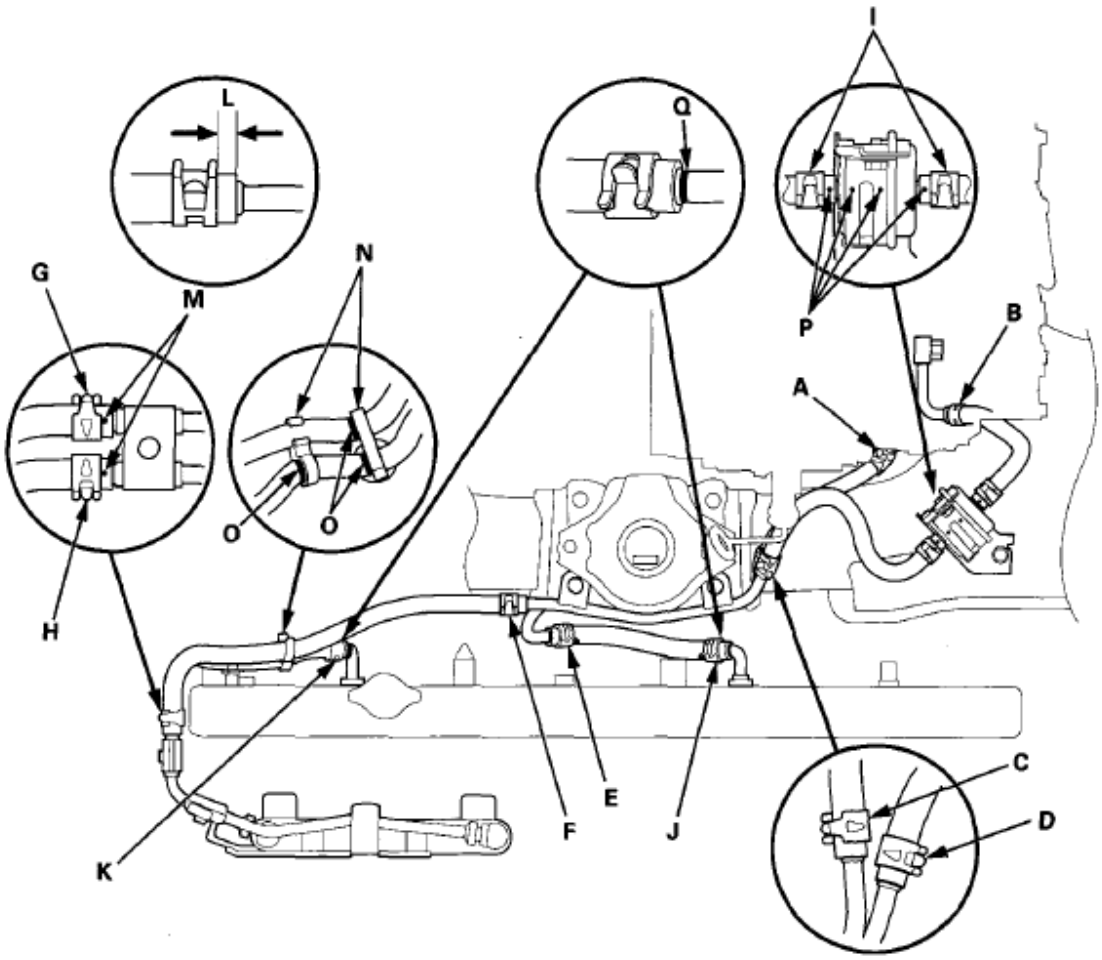

Fig. 291: Exploded View Of ATF Cooler Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: When installing the hose clamps, make sure they do not interfere with the surrounding parts.

1. Install the ATF cooler hoses over the ATF cooler lines with the clips at the appropriate points in reference to the following list. Align the white paint marks (M) facing the right of the vehicle.

Point	Distance from Hose End to Clip (L)	Hose End Contact Point
A	6 - 8 mm (0.24 - 0.31 in)	Bulge
B		
C		
D		
E		
F		
G		
H		

I		Nearest point to ATF filter housing
J K	2 - 4 mm (0.08-0.16 in)	Paint Mark (Q)

2. Secure the ATF cooler hose with the clamps (N) at the white paint line (O) in the direction shown.
3. Align the paint marks (P) facing up of the vehicle.
4. Refill the transmission with ATF to the proper level (see **ATF REPLACEMENT**).

ATF COOLER REPLACEMENT

1. Raise the vehicle on a lift, or apply parking brake, block both rear wheels, and raise the front of the vehicle. Make sure it is securely supported.
2. Remove the ATF cooler assembly.

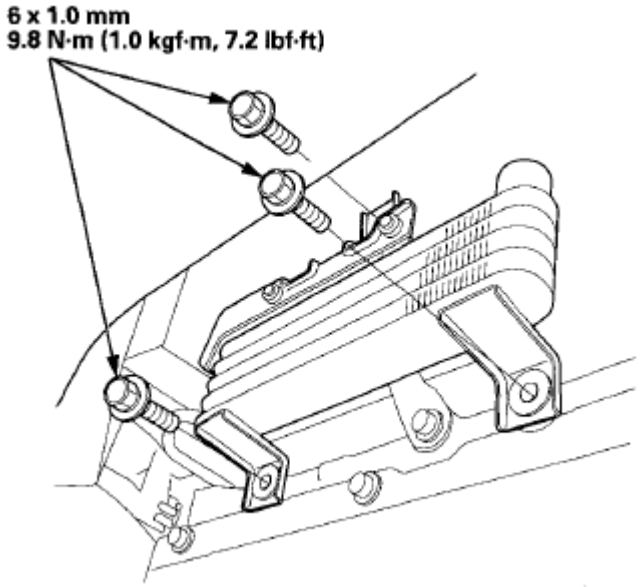

Fig. 292: Identifying ATF Cooler Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the ATF cooler hoses (A) from the ATF cooler lines (B), then plug the hoses. Replace the ATF cooler.

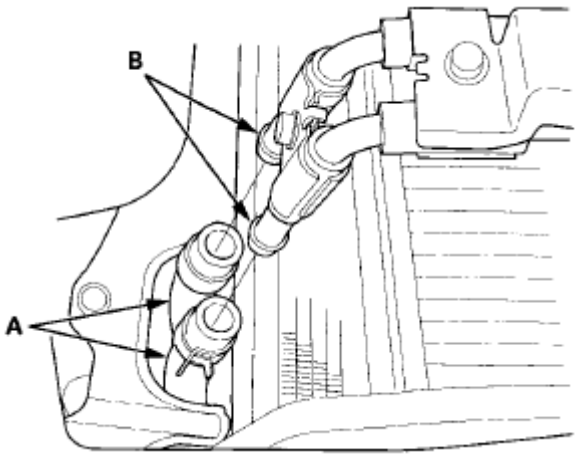

Fig. 293: Identifying ATF Cooler Hoses And Lines
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If needed, replace the ATF cooler rubber mounts (A) and the collars (B).

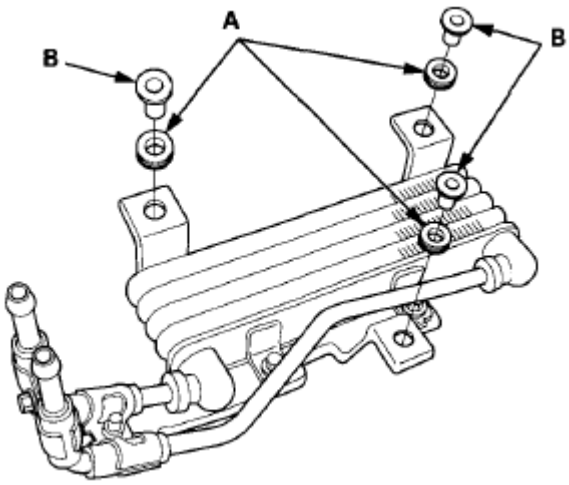

Fig. 294: Identifying ATF Cooler Rubber Mounts And Collars
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the ATF cooler, then remove the plugs from the hose.
6. Connect the ATF cooler hoses (see **ATF COOLER HOSE REPLACEMENT**).
7. Secure the ATF cooler with the bolts.
8. Check the ATF level (see **ATF LEVEL CHECK**).

ATF FILTER REPLACEMENT

NOTE: The ATF filter is not a scheduled maintenance item. Replace the filter only if it is leaking, or contaminated, or when the transmission is being overhauled or replaced with a remanufactured unit.

1. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
2. Remove the battery base (see **ENGINE REMOVAL**).
3. Raise the vehicle on a lift, and make sure it is securely supported.
4. Remove the drain plug (A), and drain the ATF.

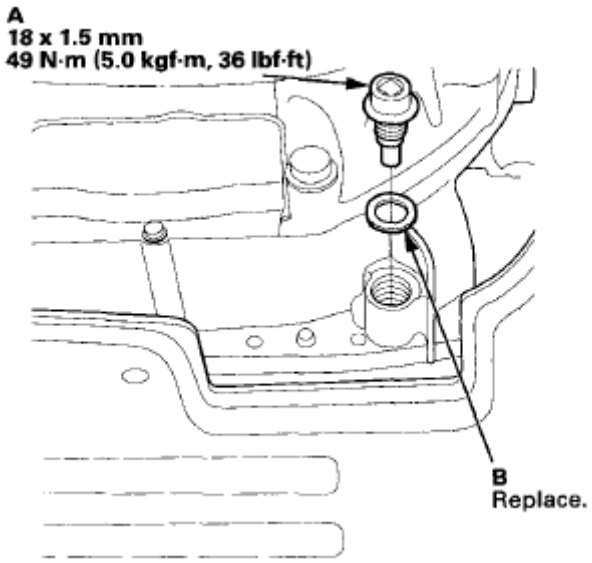

Fig. 295: Identifying Drain Plug And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Reinstall the drain plug with a new sealing washer (B).
6. Disconnect the ATF cooler hoses (A) from the ATF filter (B).

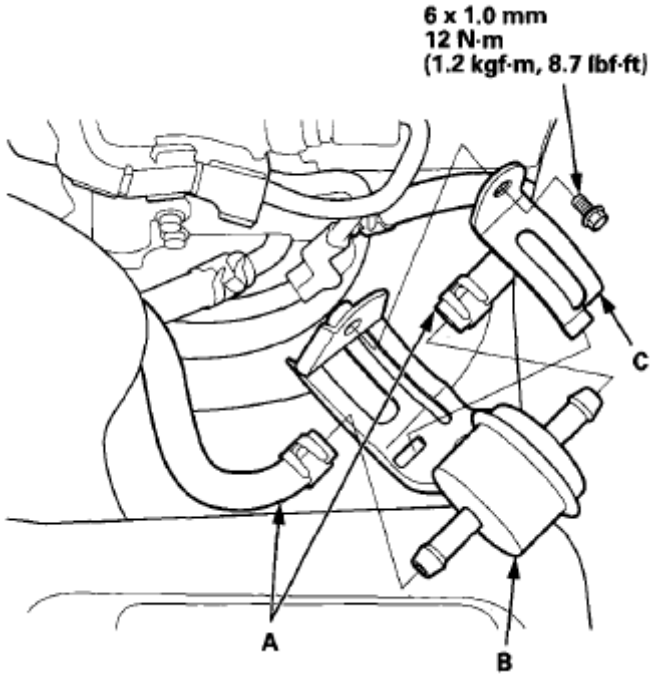

Fig. 296: Identifying ATF Cooler Hoses, ATF Filter And ATF Filter Holder With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the ATF filter holder (C), and remove the ATF filter.
8. Install a new ATF filter, and secure it with its holder and bolt.
9. Connect the ATF cooler hose (see **ATF COOLER HOSE REPLACEMENT**).
10. Refill the transmission with ATF (see **ATF REPLACEMENT**).
11. Install the battery base (see **ENGINE INSTALLATION**).
12. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

SHIFT LEVER REMOVAL

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Move the shift lever to R.
3. Remove the nut securing the shift cable end.

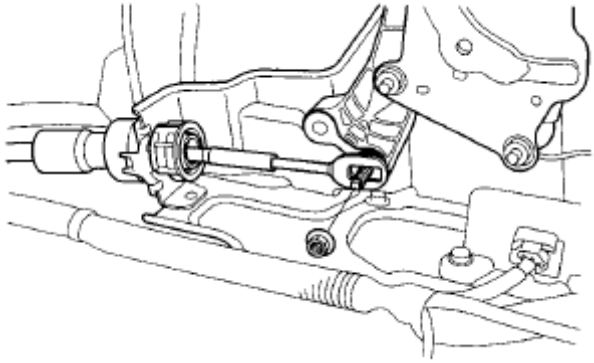

Fig. 297: Removing Nut Securing Shift Cable End
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Unlock the retainer (A).

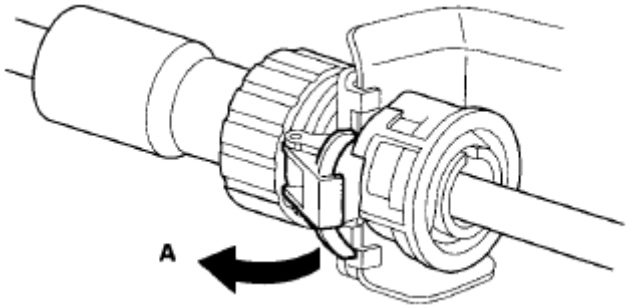

Fig. 298: Unlock Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Rotate the socket holder retainer (A) counterclockwise (B) until it stops, and push the retainer lock (C) into the socket holder retainer to lock the retainer.

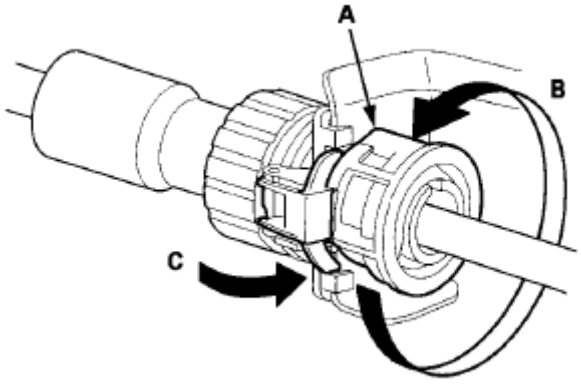

Fig. 299: Rotating Socket Holder Retainer Counterclockwise And Retainer Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Slide the socket holder (A) away from the bracket as shown to remove the shift cable (B) from the shift

cable bracket (C). Do not remove the shift cable by pulling the shift cable guide (D).

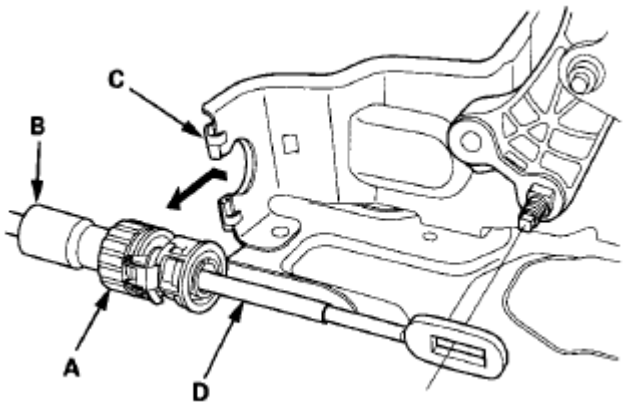

Fig. 300: Identifying Socket Holder, Shift Cable, Shift Cable Bracket And Shift Cable Guide
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the shift lever 4P connector (A), and remove the shift lever 4P connector from the shift lever bracket base (B).

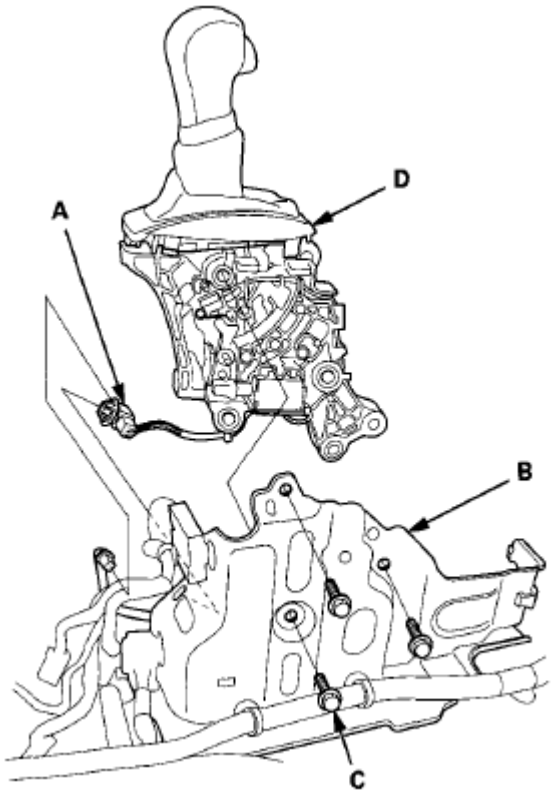

Fig. 301: Identifying 4P Connector, Shift Lever Bracket Base And Mounting Bolts And Shift Lever Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the shift lever mounting bolts (C), then remove the shift lever assembly (D).

SHIFT LEVER INSTALLATION

1. Install the shift lever assembly (A).

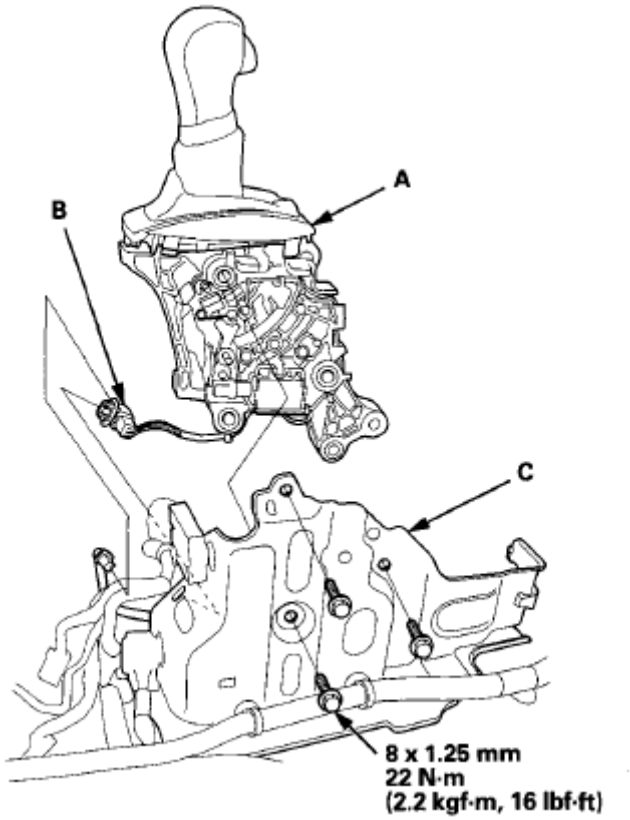

Fig. 302: Identifying Shift Lever Assembly, 4P Connector And Shift Lever Bracket Base With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Connect the shift lever 4P connector (B).
3. Install the shift lever 4P connector on the shift lever bracket base (C).
4. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the R position indicator comes on.

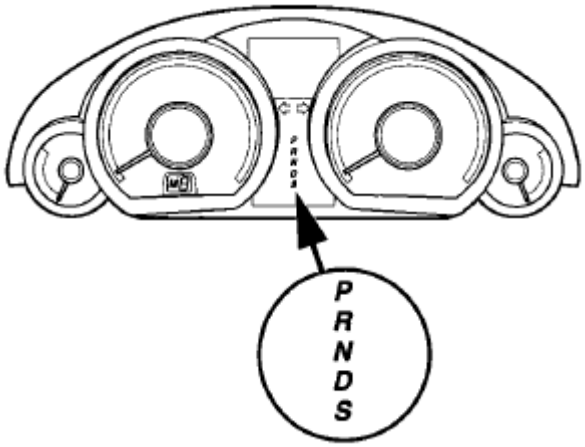

Fig. 303: Display - PRNDS Indicators
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If necessary, push the shift cable (A) until it stops, then release it. Pull the shift cable back one step from the P position so that the shift position is in R. Do not hold the shift cable guide (B) to adjust the shift cable.

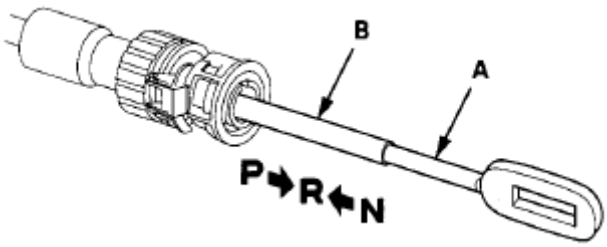

Fig. 304: Identifying Shift Cable And Shift Cable Guide
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Move the shift lever in P, then turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
7. Move the shift lever in R, then insert a 6.0 mm (0.24 in) pin (A) into the positioning hole (B) on the shift lever positioning guide, and into the positioning hole on the shift lever bracket. Use only a 6.0 mm (0.24 in) pin with no burrs.

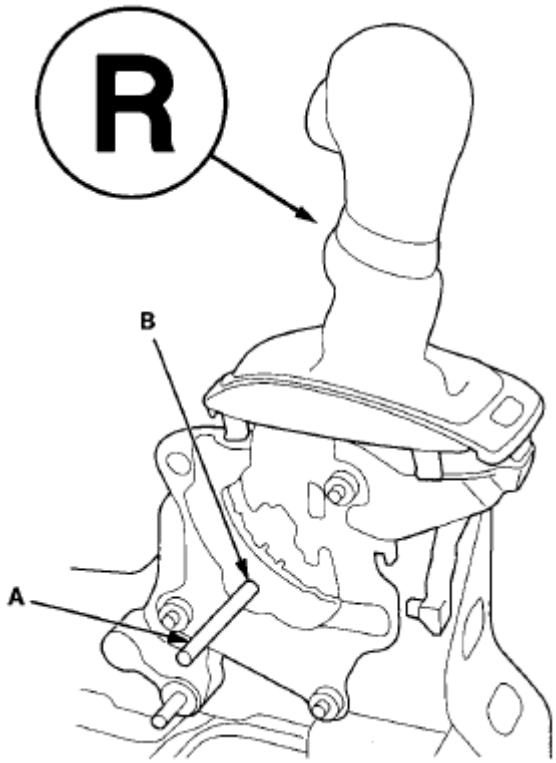

Fig. 305: Identifying Shift Lever, Pin And Positioning Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Align the shift cable slot (A) between the socket holder (B) and the socket holder retainer (C) with the opening (D) in the shift cable bracket (E), then slide the holder into the bracket while installing the shift cable end (F) over the mounting stud (G) by aligning its square hole with the square fitting (H) at the bottom of the stud. Do not install the shift cable by holding the shift cable guide (I).

NOTE: When the socket holder is installed in the shift cable bracket, the retainer lock is unhinged and releases the holder retainer lock, then the holder retainer returns under spring force to secure the shift cable.

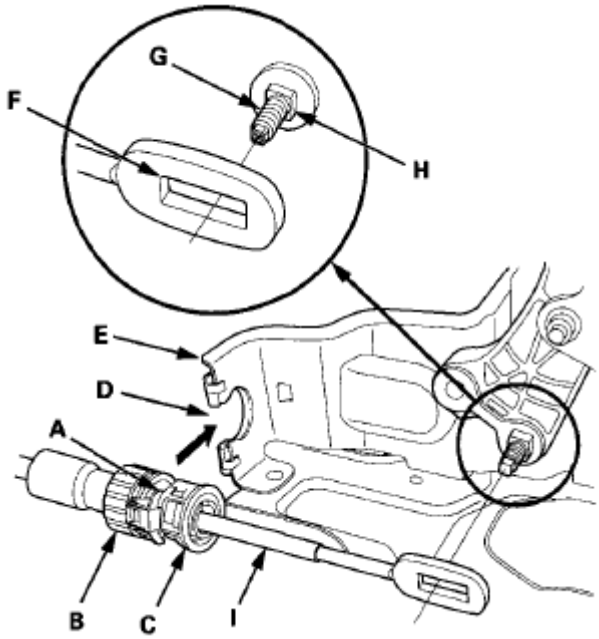

Fig. 306: Identifying Shift Lever And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Push the retainer lock (A) fully to lock the socket holder retainer (8), and make sure that the retainer lock fits into the hinged-joint (C). If the retainer lock does not fit with the edge of the hinged-joint, rotate the holder retainer counterclockwise while pushing the retainer lock until it locks.

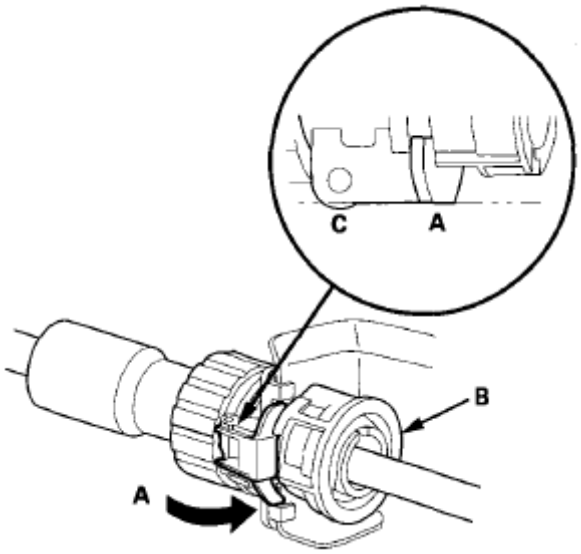

Fig. 307: Pushing Retainer Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Make sure the shift cable end (A) is properly installed on the mounting stud (B).
    - If the cable end is out of position with the mounting stud, remove the shift cable from the shift

cable bracket, then reinstall the cable end over the mounting stud before reinstalling the shift cable to the shift cable bracket. Do not install the shift cable end on the mounting stud with the shift cable installed on the shift cable bracket.

- If the shift cable end does not ride at the bottom of the mounting stud, rotate the stud to align the square fitting with the hole.

Properly installed:

Cable end rides at the bottom of the mounting stud.

Fig. 308: Identifying Shift Cable End And Mounting Stud (Properly Installed)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Improperly installed:

Cable end out of position with the mounting stud.

Fig. 309: Identifying Shift Cable End And Mounting Stud (Improperly Installed)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Cable end out of alignment with the mounting stud.

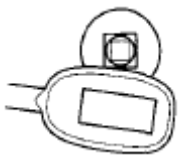

Fig. 310: Cable End Out Of Alignment With Mounting Bolts - Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install and tighten the nut (A) on the shift cable end.

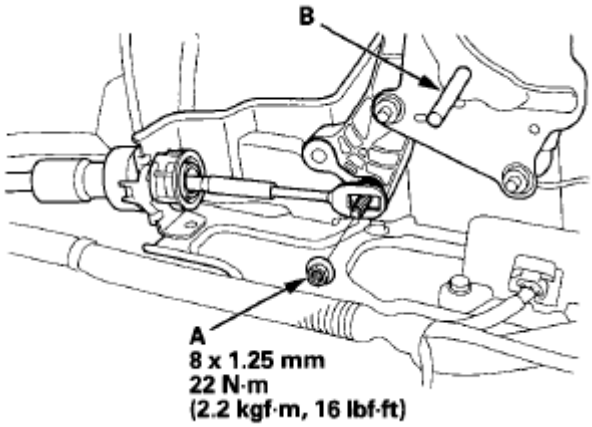

Fig. 311: Identifying Nut And Pin Of Shift Lever Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the 6.0 mm (0.24 in) pin (B) that was installed to hold the shift lever.
13. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Move the shift lever to each position, and check that the A/T gear position indicator follows the transmission range switch.
14. Shift the shift lever to P, and check that the shift lock works properly. Push the shift lock release, and check that the shift lever releases, and also check that the shift lever locks when it is shifted back to P.
15. Install the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).

SHIFT LEVER KNOB REPLACEMENT

NOTE: Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.

1. Grasp the shift lever boot ring, and slip it out of the shift lever knob.

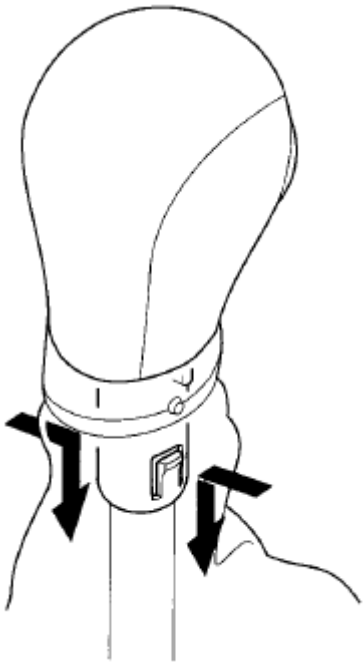

Fig. 312: Grasping Shift Lever Boot Ring And Slip It Out Of Shift Lever Knob
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Wrap the end of a flat-tip screwdriver with tape, pry the shift lever knob cover locks (A), and remove the shift lever knob cover (B).

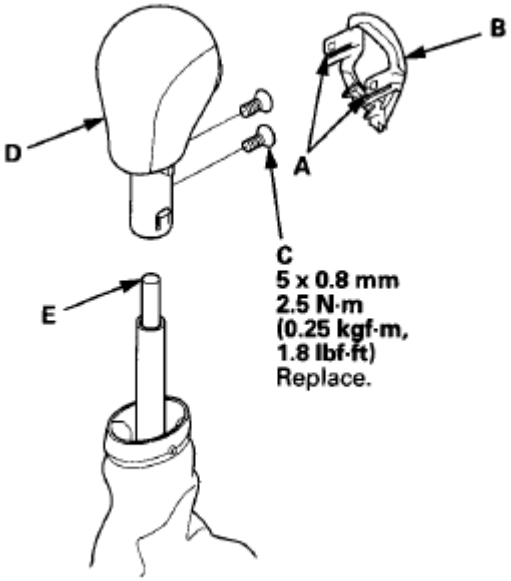

Fig. 313: Identifying Shift Lever Knob Cover Locks And Shift Lever Knob Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the screws (C), and remove the shift lever knob (D).

4. Apply silicone grease to the top (E) of the shift lever rod.
5. Install a new shift lever knob on the shift lever, and secure it with new screws.
6. Install the shift lever knob cover on the shift lever knob.
7. Slide the shift lever boot ring over the shift lever knob until it snaps on.

SHIFT LEVER DISASSEMBLY/REASSEMBLY

EXPLODED VIEW

NOTE: Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.

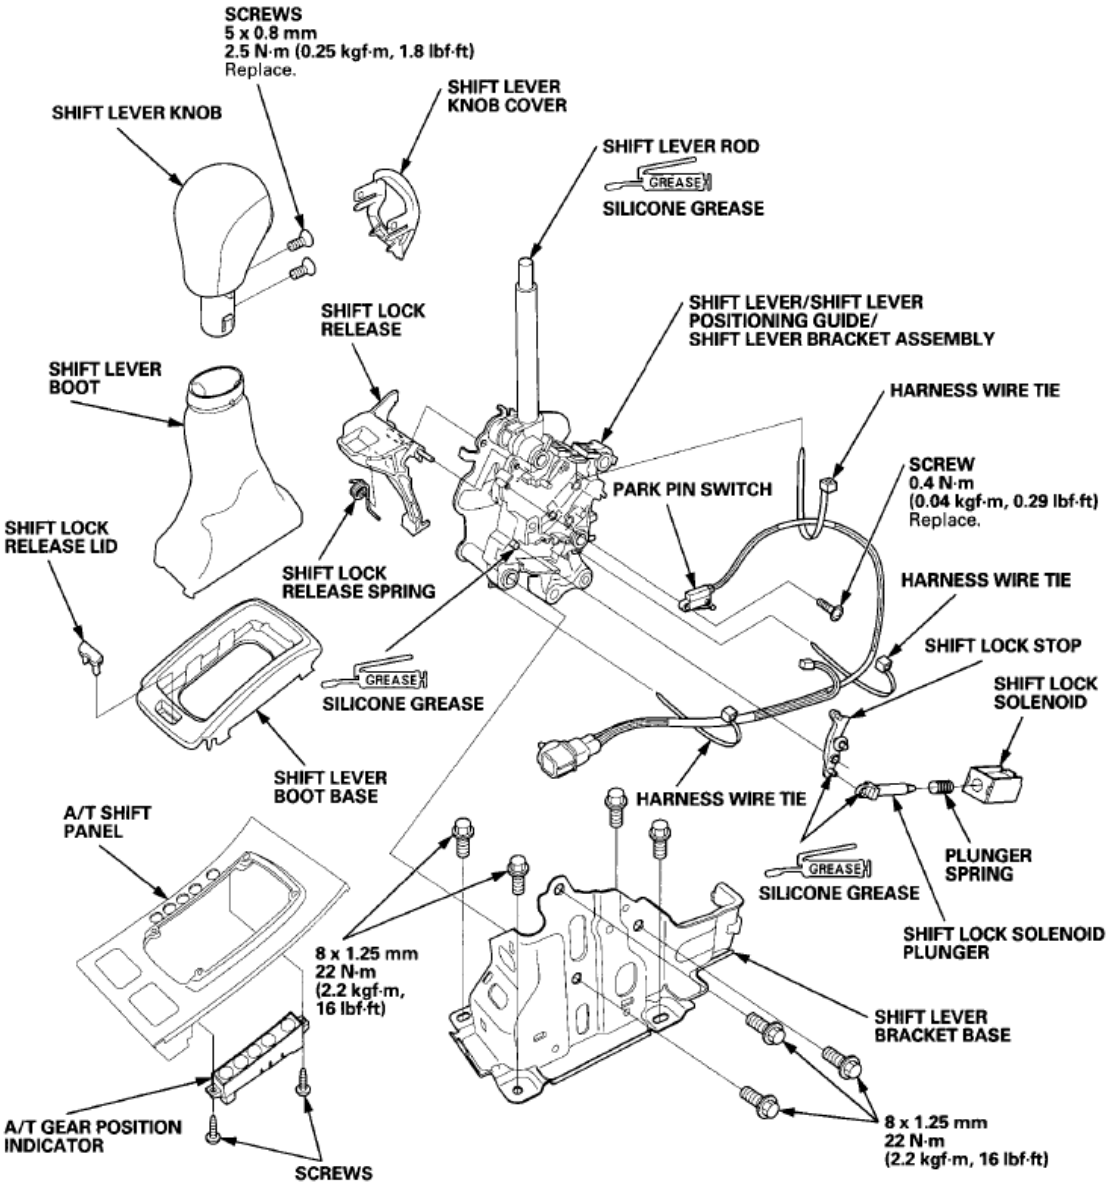

Fig. 314: Exploded View Of Shift Lever Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT LEVER BOOT AND SHIFT LEVER BOOT BASE REPLACEMENT

1. Remove the shift lever knob (see **SHIFT LEVER KNOB REPLACEMENT**).
2. Apply protective tape (A) to the A/T shift panel (B) along the side edge of the shift lever boot base (C). Pry up on the edge of the shift lever trim with a flat-tapped screwdriver wrapped with protective tape to release the hooks (D).

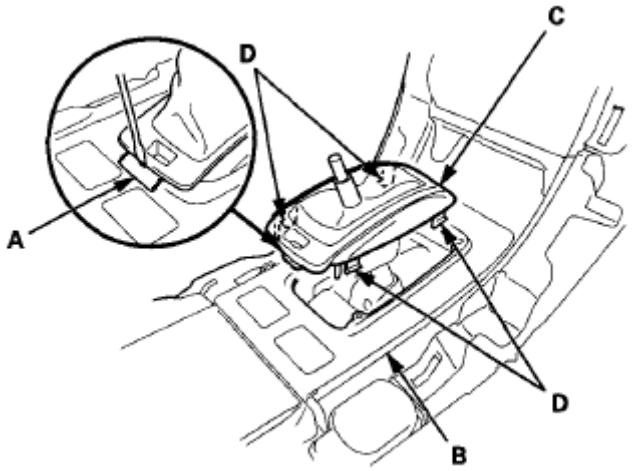

Fig. 315: Identifying Protective Tape, A/T Shift Panel, Shift Lever Boot Base And Hooks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Release the lock tabs (A) on the shift lever boot using a screwdriver.

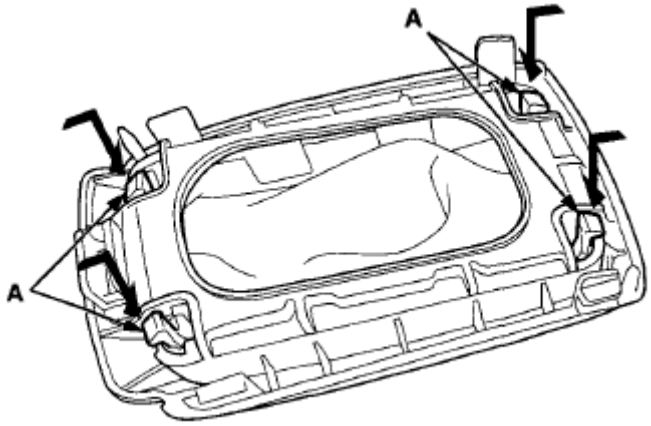

Fig. 316: Releasing Lock Tabs On Shift Lever Boot Using Screwdriver
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Replace the shift lever boot (A) or the shift lever boot base (B).

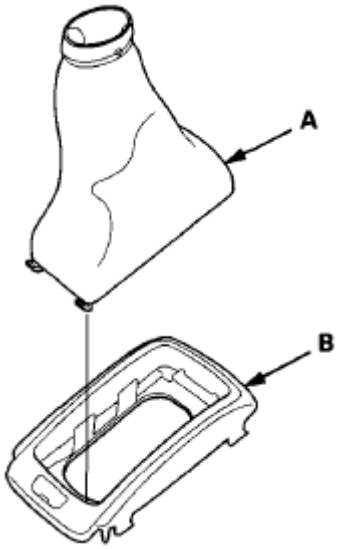

Fig. 317: Identifying Shift Lever Boot And Shift Lever Boot Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the shift lever boot on the shift lever boot base.
6. Install the shift lever boot base (A) on the A/T shift panel.

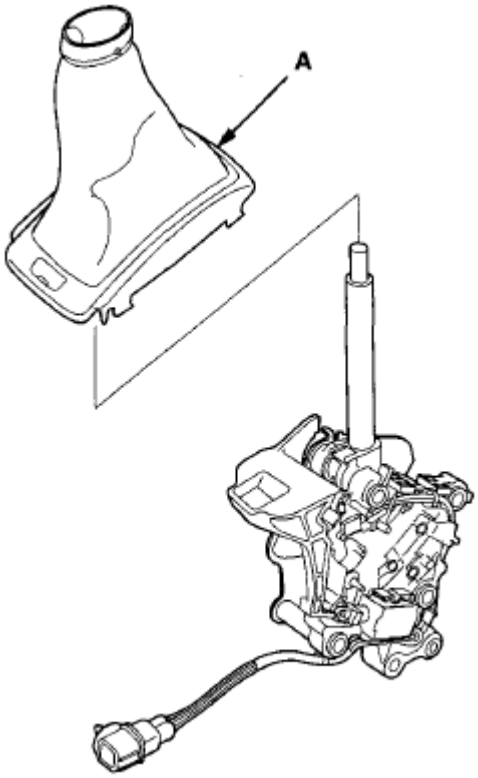

Fig. 318: Installing Shift Lever Boot Base On A/T Shift Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the shift lever knob (see **SHIFT LEVER KNOB REPLACEMENT**).

SHIFT CABLE REPLACEMENT

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Move the shift lever to R.
3. Remove the nut securing the shift cable end.

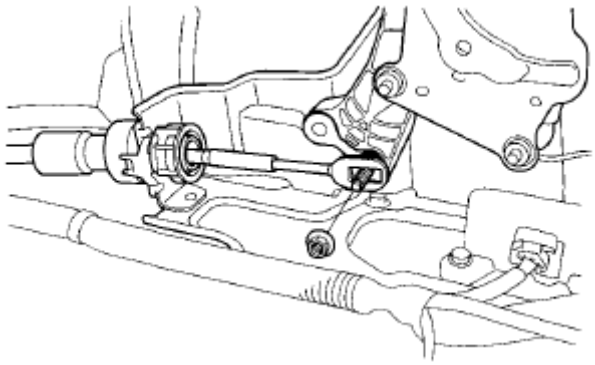

Fig. 319: Removing Nut Securing Shift Cable End
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Unlock the retainer lock (A).

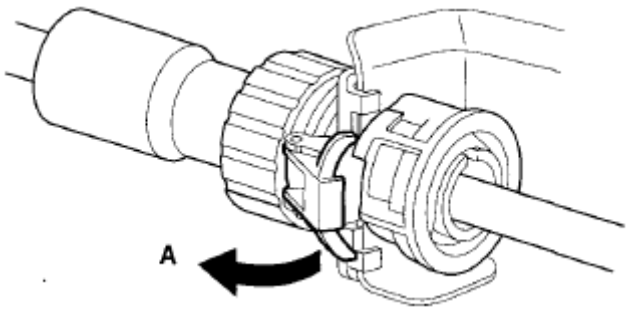

Fig. 320: Unlock Retainer Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Rotate the socket holder retainer (A) counterclockwise (B) until it stops, and push the retainer lock (C) into the socket holder retainer to lock the retainer.

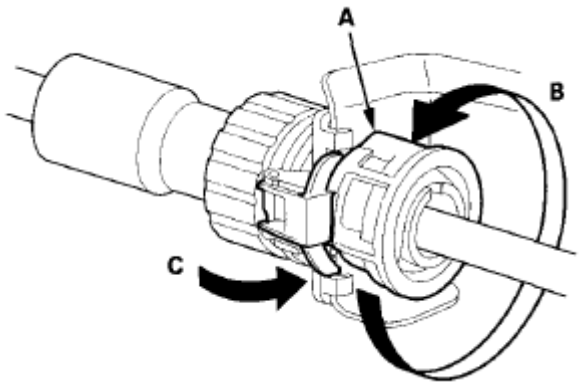

Fig. 321: Rotating Socket Holder Retainer Counterclockwise
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Slide the socket holder (A) away from the bracket as shown to remove the shift cable (B) from the socket holder bracket (C). Do not remove the shift cable by pulling the shift cable guide (D).

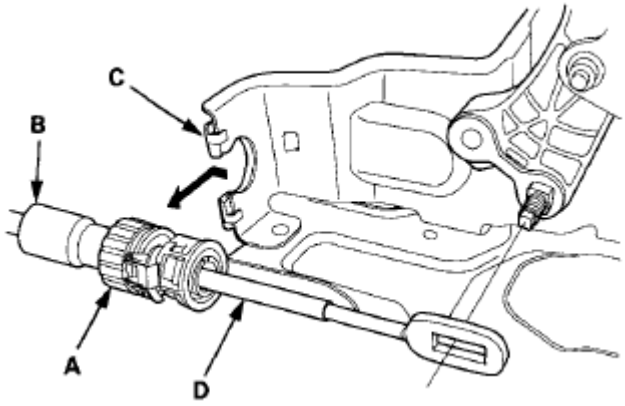

Fig. 322: Identifying Socket Holder, Shift Cable, Socket Holder Bracket And Shift Cable Guide
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
8. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
9. Remove the spring clip (A) and the control pin (B), then separate the shift cable end (C) from the control lever (D).

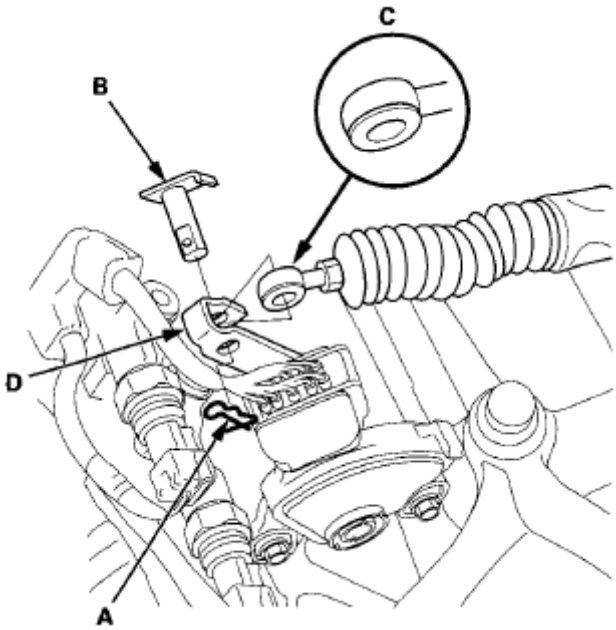

Fig. 323: Identifying Spring Clip, Control Pin, Shift Cable End And Control Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Remove the nuts (A) securing the shift cable bracket (B).

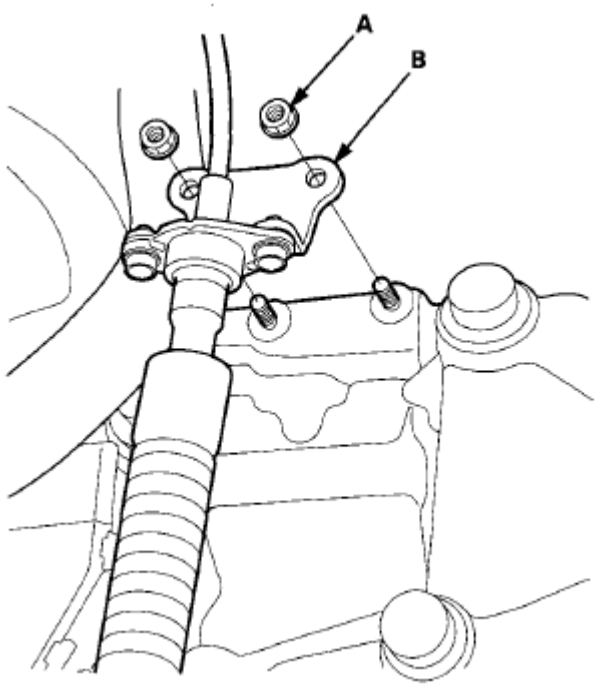

Fig. 324: Identifying Shift Cable Bracket And Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Raise the vehicle on a lift, or apply parking brake, block both rear wheels, and raise the front of the

vehicle. Make sure it is securely supported.

12. Remove the heat shield.

With SH-AWD

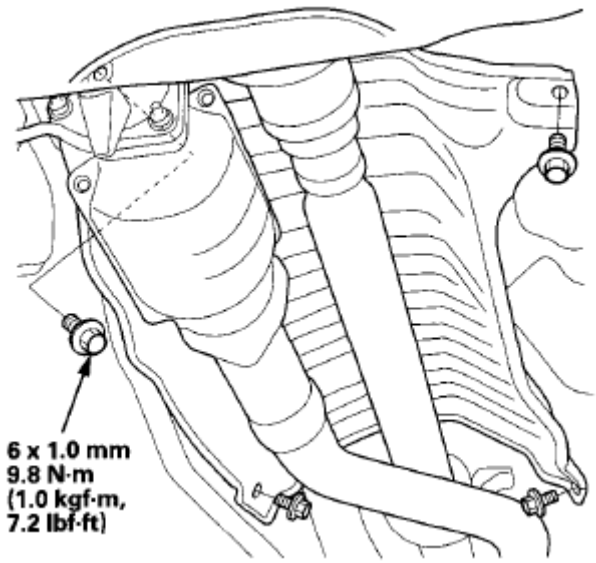

Fig. 325: Identifying Heat Shield With Torque Specifications (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

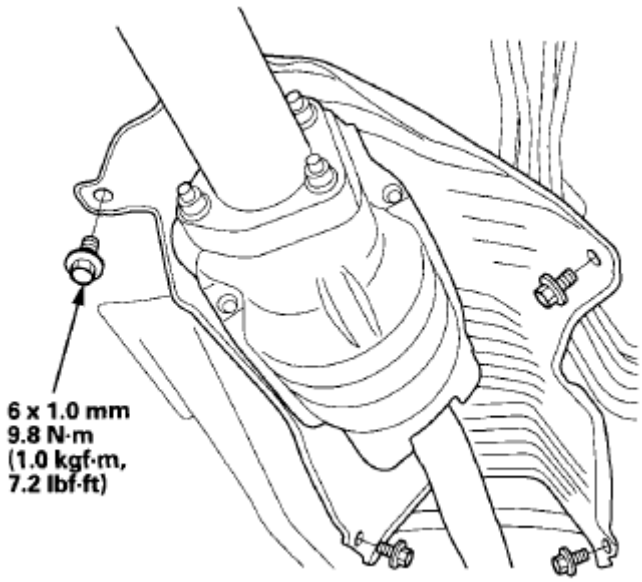

Fig. 326: Identifying Heat Shield With Torque Specifications (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the bolt securing the shift cable bracket (A).

With SH-AWD

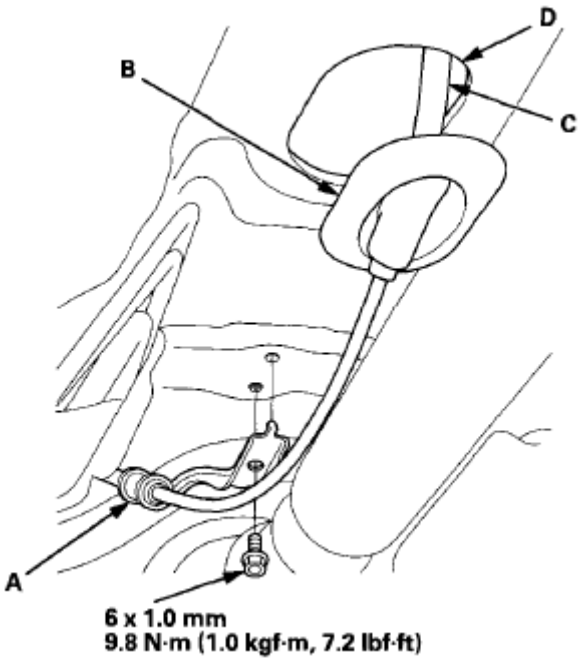

Fig. 327: Identifying Cable Bracket, Cable Grommet, Shift Cable And Grommet Hole With Torque Specifications (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Without SH-AWD

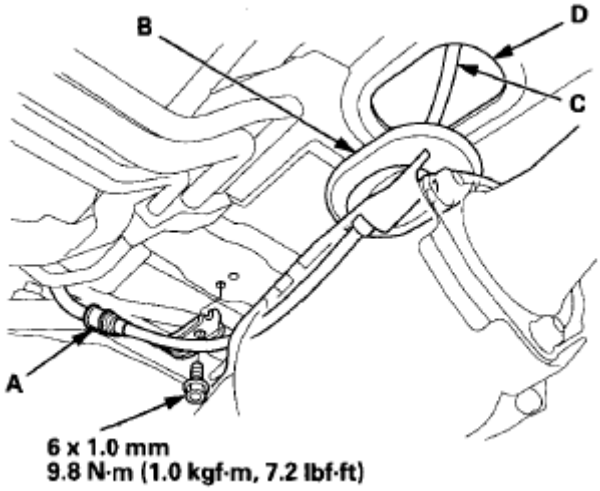

Fig. 328: Identifying Cable Bracket, Cable Grommet, Shift Cable And Grommet Hole With Torque Specifications (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the shift cable grommet (B), and pull out the shift cable (C).

15. Insert a new shift cable through the grommet hole (D), and install the grommet in its hole. Do not bend the shift cable excessively.
16. Secure the shift cable bracket with the bolt.
17. Install the heat shield.
18. Install the shift cable bracket (A).

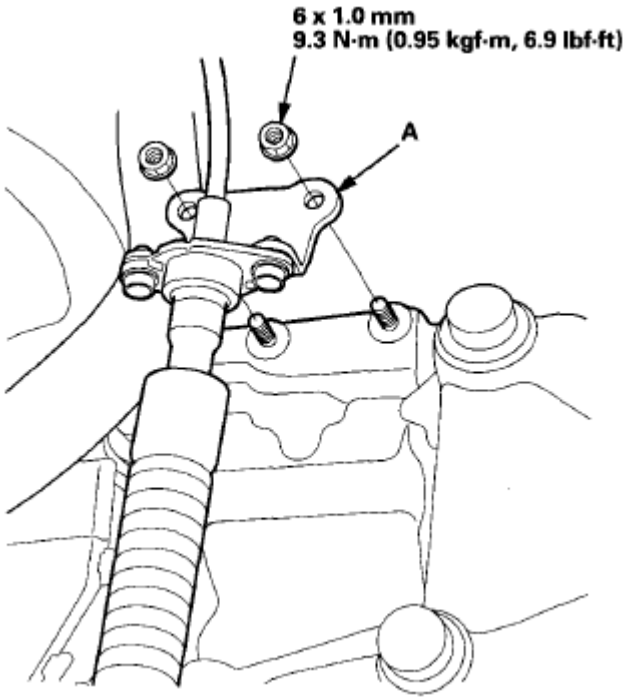

Fig. 329: Installing Shift Cable Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Attach the shift cable end (A) to the control lever (B), then insert the control pin (C) into the control lever hole through the shift cable end, and secure the control pin with the spring clip (D).

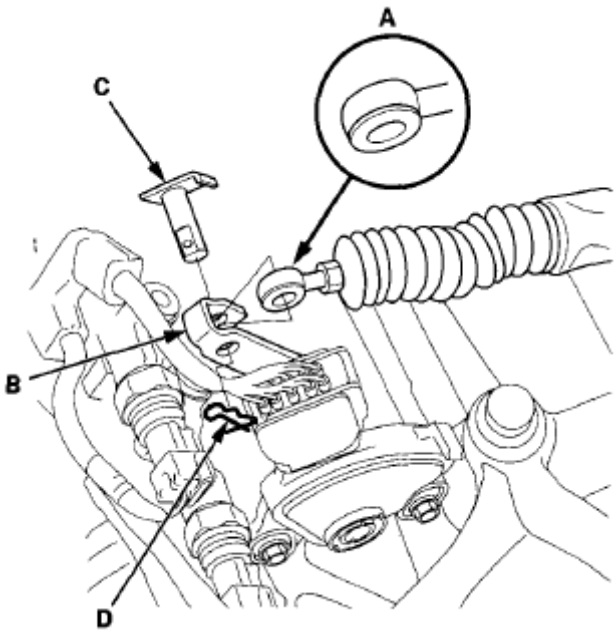

Fig. 330: Identifying Shift Cable End, Control Lever, Control Pin And Spring Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
21. Install the air cleaner (see **THROTTLE BODY CLEANING**).
22. Adjust the shift cable (see **SHIFT CABLE ADJUSTMENT**).

SHIFT CABLE ADJUSTMENT

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Move the shift lever to R.
3. Remove the nut securing the shift cable end.

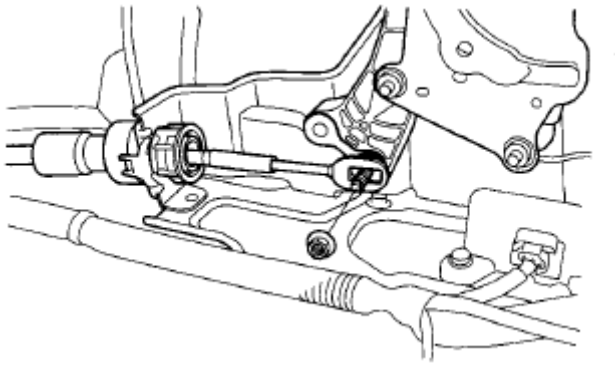

Fig. 331: Identifying Nut Securing Shift Cable End
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Unlock the retainer (A).

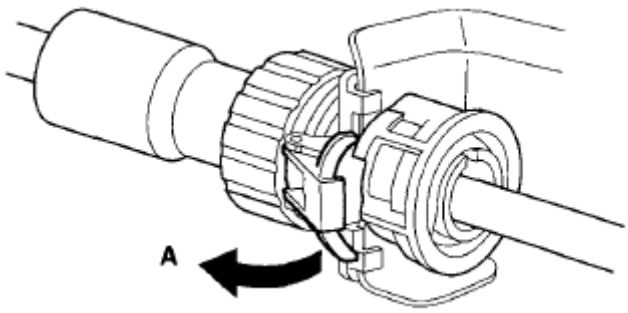

Fig. 332: Unlock Retainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Rotate the socket holder retainer (A) counterclockwise (B) until it stops, and push the retainer lock (C) into the socket holder retainer to lock the retainer.

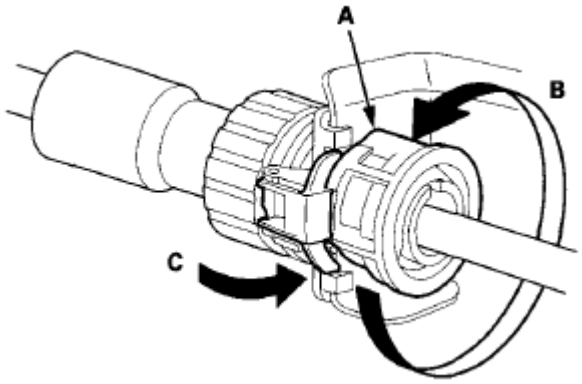

Fig. 333: Rotating Socket Holder Retainer Counterclockwise
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Slide the socket holder (A) away from the bracket as shown to remove the shift cable (B) from the shift cable bracket (C). Do not remove the shift cable by pulling the shift cable guide (D).

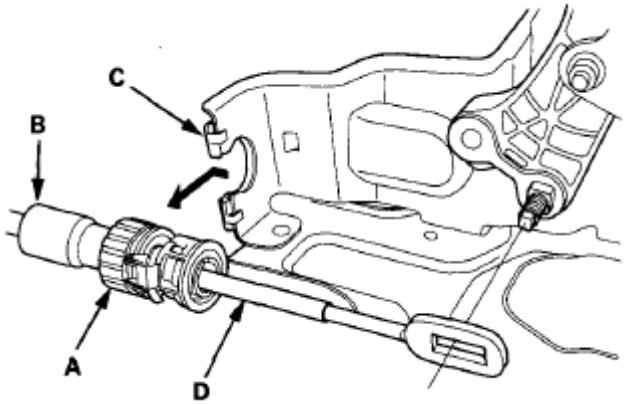

Fig. 334: Identifying Socket Holder, Shift Cable, Shift Cable Bracket And Shift Cable Guide
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and check that the R position indicator comes on.

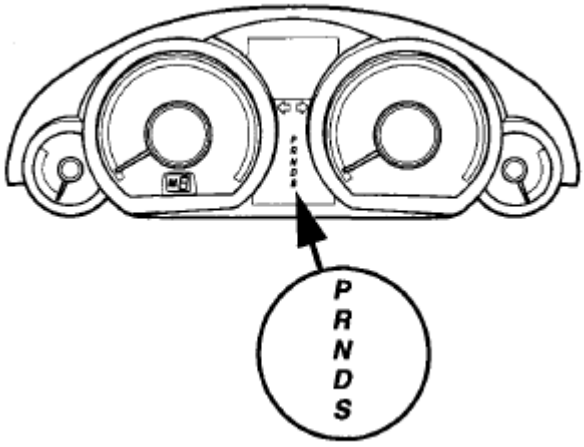

Fig. 335: Display - PRNDS Indicators
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. If necessary, push the shift cable (A) until it stops, then release it. Pull the shift cable back one step from the P position so that the shift position is in R. Do not hold the shift cable guide (B) to adjust the shift cable.

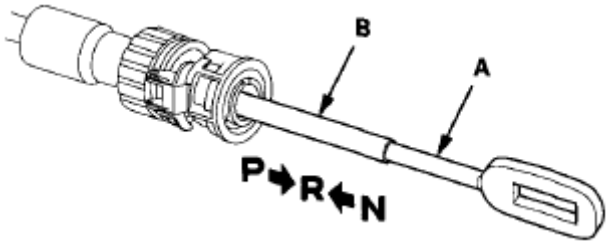

Fig. 336: Identifying Shift Cable And Shift Cable Guide
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Move the shift lever in P, turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
10. Move the shift lever in R, then insert a 6.0 mm (0.24 in) pin (A) into the positioning hole (B) on the shift lever positioning guide, and into the positioning hole on the shift lever bracket. Use only a 6.0 mm (0.24 in) pin with no burrs.

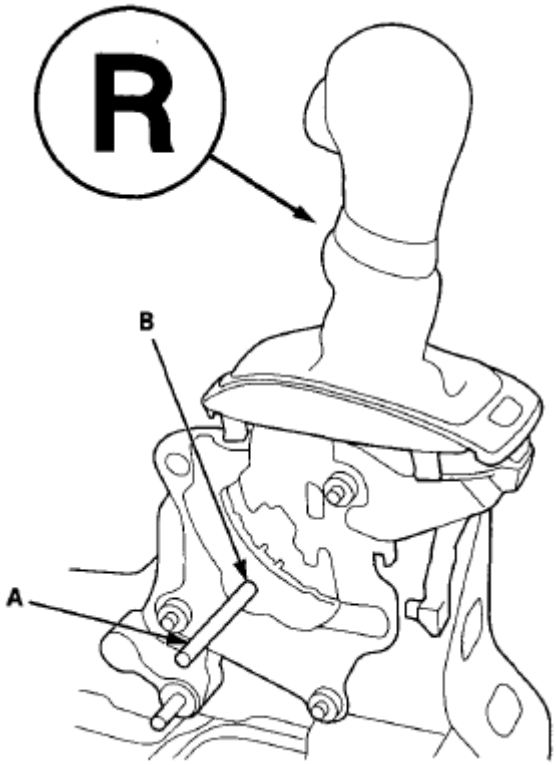

Fig. 337: Identifying Shift Lever (R), Pins And Positioning Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Align the shift cable slot (A) between the socket holder (B) and the socket holder retainer (C) with the opening (D) in the shift cable bracket (E), then slide the holder into the bracket while installing the shift cable end (F) over the mounting stud (G) by aligning its square hole with the square fitting (H) at the bottom of the stud. Do not install the shift cable by holding the shift cable guide (I).

NOTE: When the socket holder is installed in the shift cable bracket, the retainer lock is unhinged and releases the holder retainer lock, then the holder retainer returns under spring force to secure the shift cable.

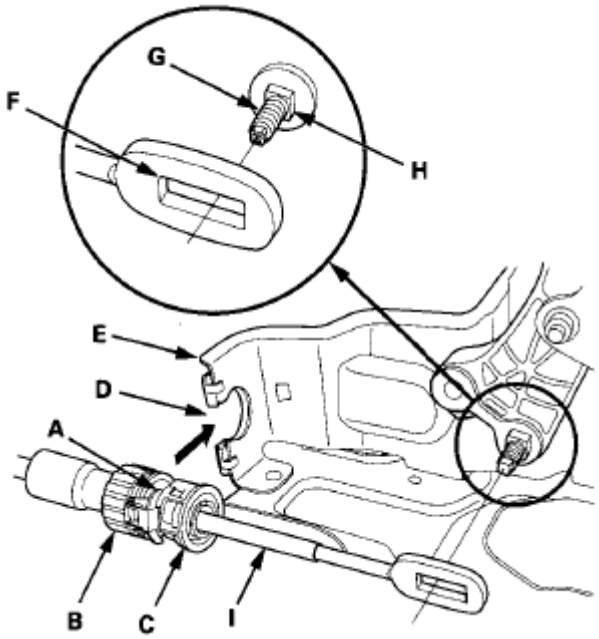

Fig. 338: Identifying Shift Cable And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Push the retainer lock (A) fully to lock the socket holder retainer (B), and make sure that the retainer lock fits into the hinged-joint (C). If the retainer lock does not fit with the edge of the hinged-joint, rotate the holder retainer counterclockwise while pushing the retainer lock until it locks.

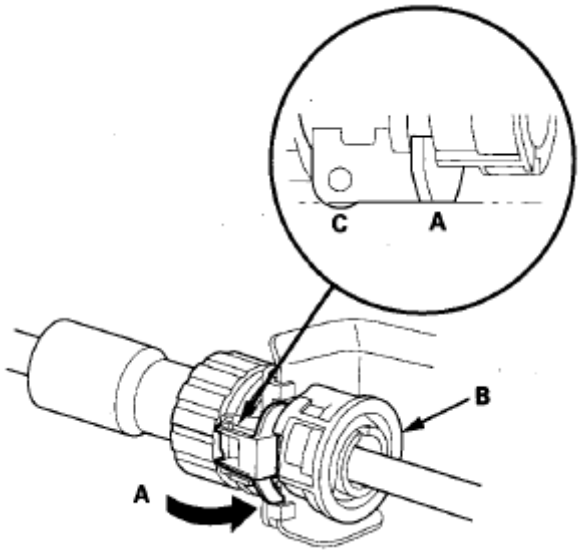

Fig. 339: Pushing Retainer Lock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Make sure the shift cable end (A) is properly installed on the mounting stud (B).
    - If the cable end is out of position with the mounting stud, remove the shift cable from the shift

cable bracket, then reinstall the cable end over the mounting stud before reinstalling the shift cable to the shift cable bracket. Do not install the shift cable end on the mounting stud with the shift cable installed on the shift cable bracket.

- If the shift cable end does not ride at the bottom of the mounting stud, rotate the stud to align the square fitting with the hole.

Properly installed:

Cable end rides at the bottom of the mounting stud.

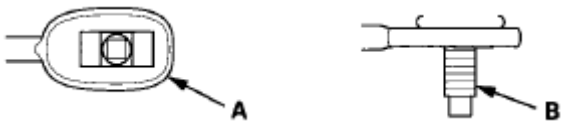

Fig. 340: Identifying Shift Cable End And Mounting Stud (Properly Installed)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Improperly installed:

Cable end out of position with the mounting stud.

Fig. 341: Identifying Shift Cable End And Mounting Stud (Improperly Installed)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Cable end out of alignment with the mounting stud.

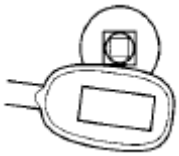

Fig. 342: Cable End Out Of Alignment With Mounting Stud - Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install and tighten the nut (A) on the shift cable end.

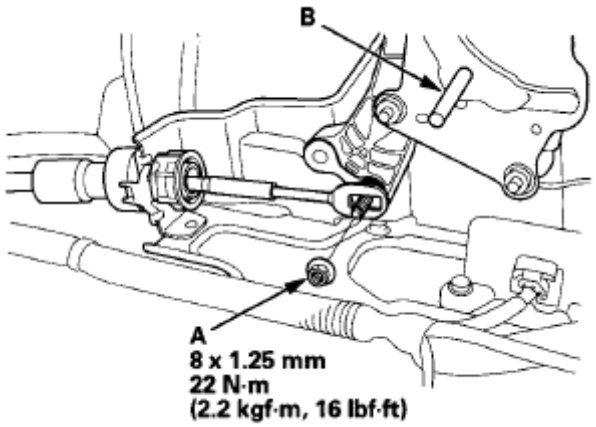

Fig. 343: Identifying Nut And Pin Of Shift Cable Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the 6.0 mm (0.24 in) pin (B) that was installed to hold the shift lever.
16. Turn the ignition switch to ON (II), or press the engine/start stop button to select the ON mode. Move the shift lever to each position, and check that the A/T gear position indicator follows the transmission range switch.
17. Shift the shift lever to P, and check that the shift lock works properly. Push the shift lock release, and check that the shift lever releases, and also check that the shift lever locks when it is shifted back to P.
18. Install the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).

Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSMISSION RANGE SWITCH TEST

1. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
2. Disconnect the transmission range switch connector.

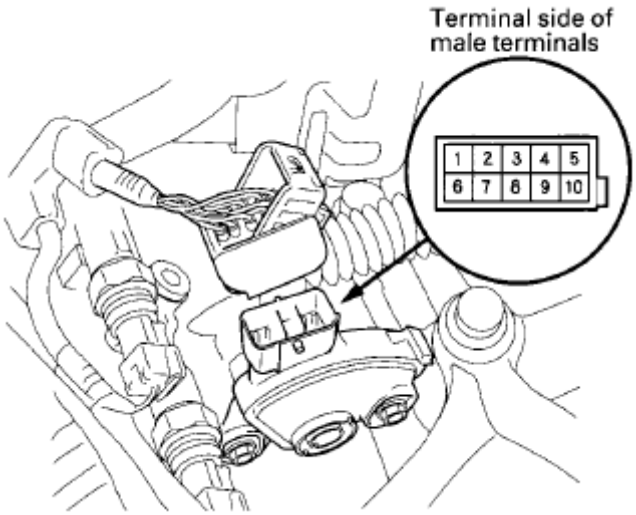

Fig. 346: Identifying Transmission Range Switch Connector Terminals
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check for continuity between the terminals at the transmission range switch connector. There should be continuity between the terminals in the following table for each transmission range switch position.

Transmission Range Switch Connector

Position/Connector Terminal/Signal Connections										
	1	2	3	4	5	6	7	8	9	10
	ATP RVS	ATP NP	–	ATP N	ATP FWD	GND	ATP P	ATP R	ATP D	ATP S
P		○				○	○			
R	○					○		○		
N		○		○		○				
D					○	○			○	
S					○	○				○

Fig. 347: Checking Continuity Between Terminals At Transmission Range Switch Connector Using Reference Table
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. The transmission range switch test is finished if the test results are OK. Reinstall all removed components. If there is no continuity between any terminals, check the transmission range switch installation. If the switch installation is OK, replace the switch (see **TRANSMISSION RANGE SWITCH REPLACEMENT**).
5. Install the air cleaner (see **THROTTLE BODY CLEANING**).

TRANSMISSION RANGE SWITCH REPLACEMENT

1. Remove the air cleaner (see **THROTTLE BODY CLEANING**).
2. Remove the spring clip (A) and the control pin (B), then separate the shift cable end (C) from the control lever (D).

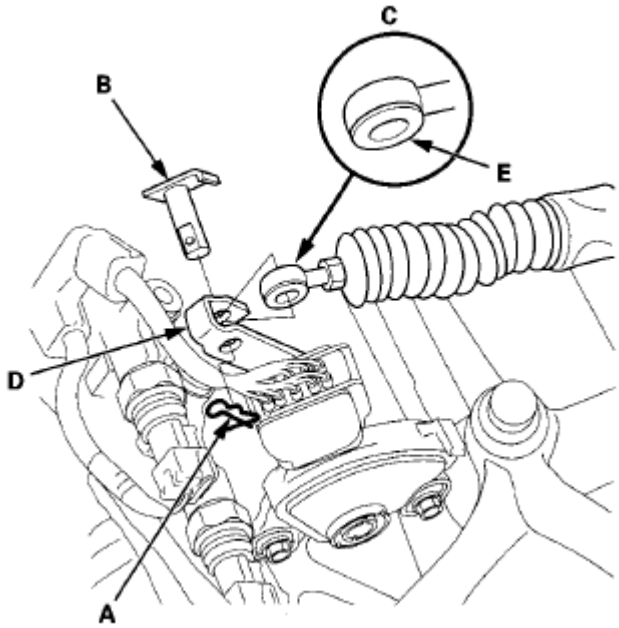

Fig. 348: Identifying Spring Clip, Control Pin, Shift Cable End And Control Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Check the bushing (E) in the shift cable end for a proper fit and wear. If the bushing is loose or worn, replace the shift cable (see **SHIFT CABLE REPLACEMENT**).
4. Disconnect the transmission range switch connector.
5. Remove the nuts (A) securing the shift cable bracket (B).

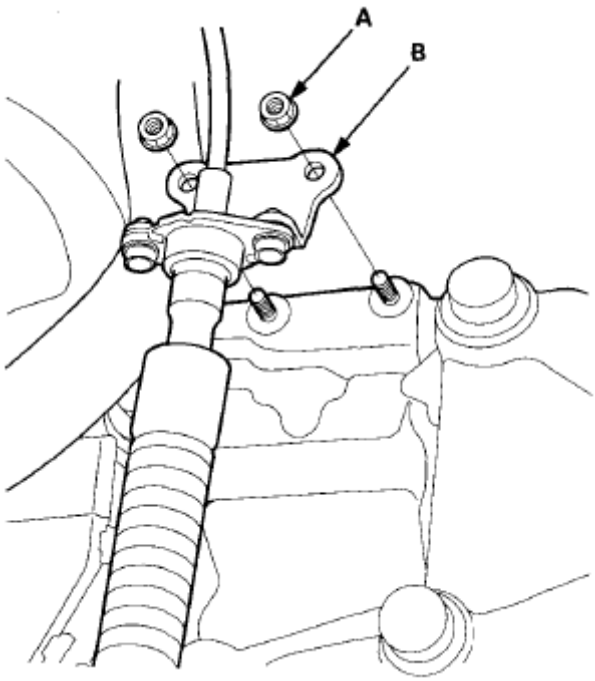

Fig. 349: Identifying Nuts And Shift Cable Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the transmission range switch.

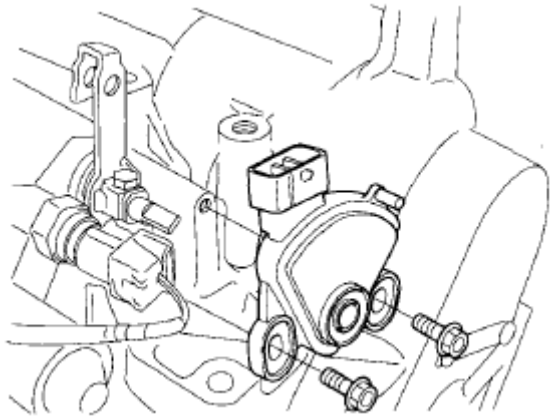

Fig. 350: Removing Transmission Range Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Turn the control lever fully counterclockwise to the P position. Turn the control lever clockwise two clicks to the N position.

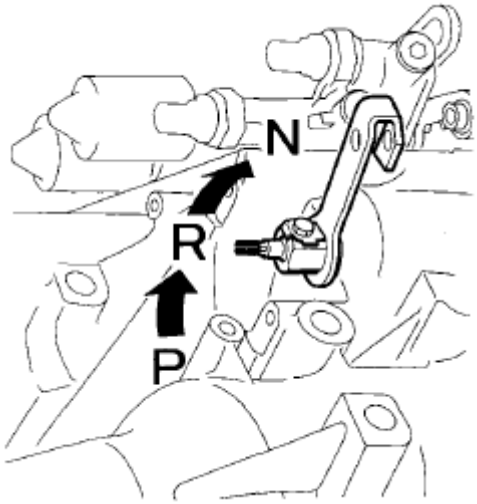

Fig. 351: Turning Control Lever Clockwise Two Clicks To N Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Set a new transmission range switch (A) to the N position. Align the cutouts (B) on the rotary-frame with the neutral positioning cutouts (C) on the transmission range switch, then put a 2.0 mm (0.079 in) feeler gauge blade (D) in the cutouts to hold the transmission range switch in the N position.

NOTE: Be sure to use a 2.0 mm (0.079 in) feeler gauge blade or equivalent to hold the transmission range switch in the N position.

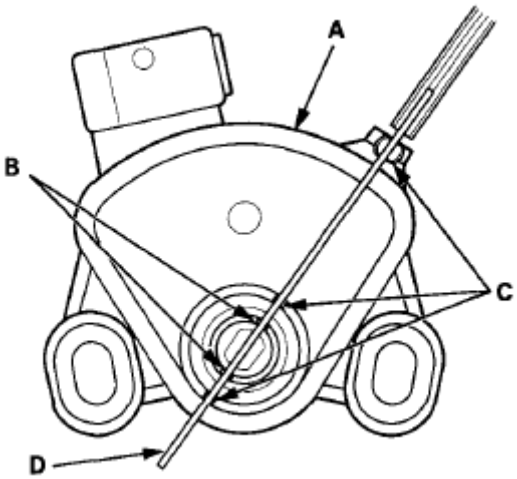

Fig. 352: Identifying Transmission Range Switch, Cutouts, Neutral Positioning Cutouts And Feeler Gauge Blade
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the transmission range switch (A) gently on the selector control shaft (B) while holding it in the N position with the 2.0 mm (0.079 in) blade (C).

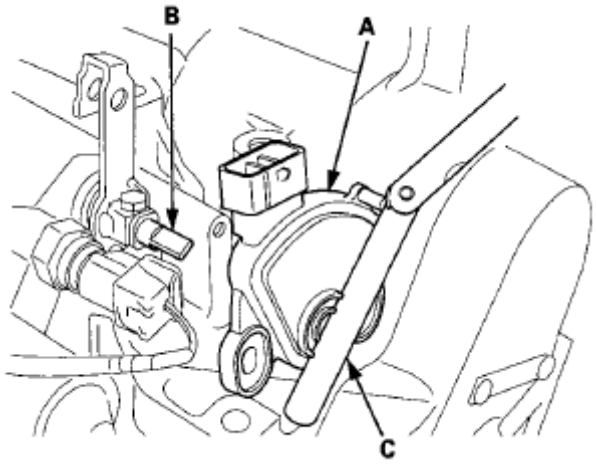

Fig. 353: Identifying Transmission Range Switch, Control Shaft And Blade
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Tighten the bolts on the transmission range switch while you continue to hold the N position. Do not move the transmission range switch when tightening the bolts. Then remove the feeler gauge.

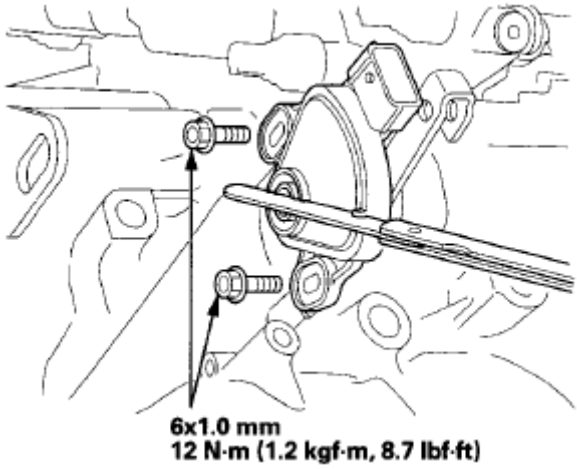

Fig. 354: Identifying Bolts On Transmission Range Switch With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Check the connectors for corrosion, dirt, or oil, and clean or repair if necessary, then connect the connector securely.
12. Install the shift cable bracket (A).

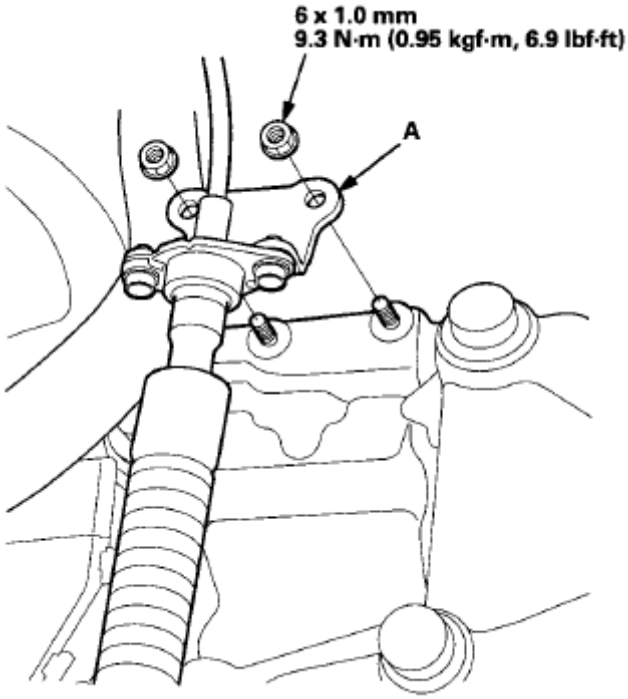

Fig. 355: Installing Shift Cable Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Apply molybdenum grease to the hole in the bushing (A) in the shift cable end (B).

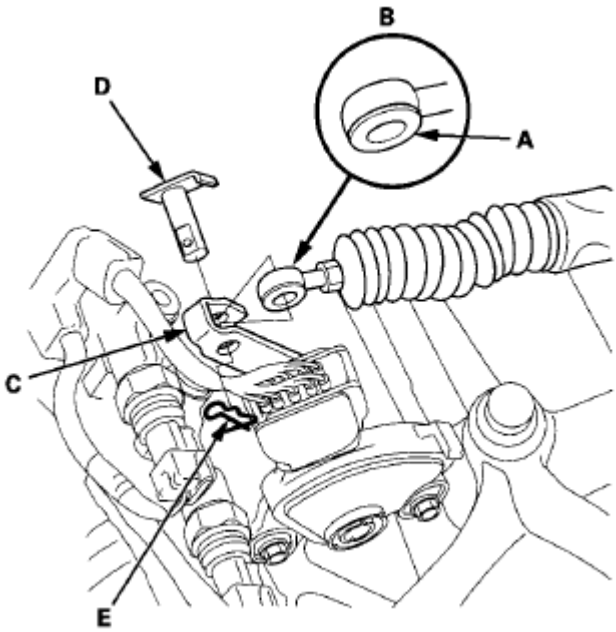

Fig. 356: Identifying Bushing, Shift Cable End, Control Lever, Control Pin And Spring Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Attach the shift cable end to the control lever (C), then insert the control pin (D) into the control lever

hole through the shift cable end, and secure the control pin with the spring clip (E).

15. Install the air cleaner (see **THROTTLE BODY CLEANING**).
16. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Move the shift lever through all positions, and verify the transmission range switch matches with the A/T gear position indicator.
17. Check that the engine starts in P and N, and does not start in any other shift lever position.
18. Check that the back-up lights come on when the shift lever is in R.
19. Raise the vehicle on a lift, make sure it is securely supported, and allow all four wheels to rotate freely. Then start the engine, and check the shift lever operation.

PADDLE SHIFTER + (UPSHIFT SWITCH) CIRCUIT TROUBLESHOOTING

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repair or service.

1. Remove the steering wheel (see **STEERING WHEEL REMOVAL**).
2. Check for continuity between cable reel subharness 20P connector terminals No. 15 and No. 12 when pressing and releasing the paddle shifter + (upshift switch).

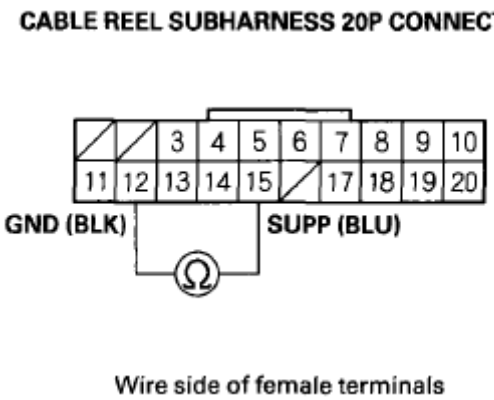

Fig. 357: Checking Continuity Between Cable Reel Subharness 20P Connector Terminals No. 15 And No. 12
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity when pressing the paddle shifter + (upshift switch) and no continuity when the paddle shifter + (upshift switch) is released?

YES - Go to step 5.

NO - Go to step 3.

3. Disconnect the paddle shifter + (upshift switch) connector.
4. Check for continuity between paddle shifter + (upshift switch) connector terminals No. 3 and No. 4 when pressing and releasing the paddle shifter + (upshift switch).

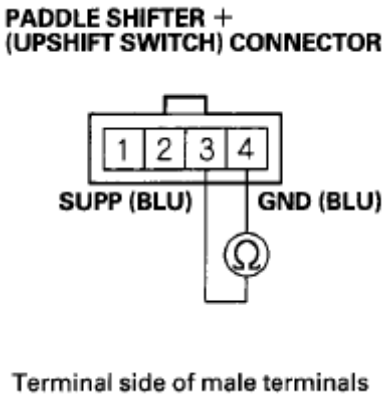

Fig. 358: Checking Continuity Between Paddle Shifter + (Upshift Switch) Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity when pressing the paddle shifter + (upshift switch) and no continuity when the paddle shifter + (upshift switch) is released?

YES - Replace the cable reel subharness.

NO - Replace the paddle shifter + (upshift switch (see **PADDLE SHIFTER REPLACEMENT**)).

5. Remove the cable reel (see **CABLE REEL REPLACEMENT**).
6. Check for continuity between cable reel 20P connector terminal No. 2 and body ground.

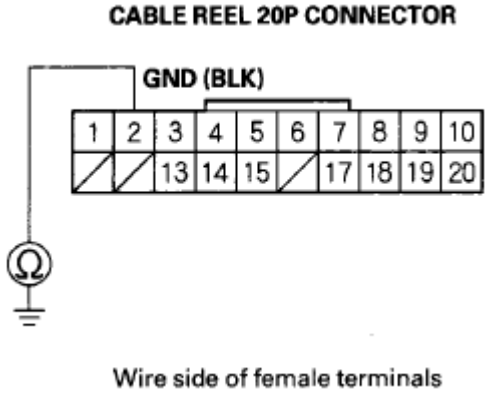

Fig. 359: Checking Continuity Between Cable Reel 20P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 7.

NO - Repair an open in the wire between cable reel 20P connector terminal No. 2 and body ground

(G405) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G405).

7. Check for continuity between cable reel 20P connector terminal No. 15 and body ground.

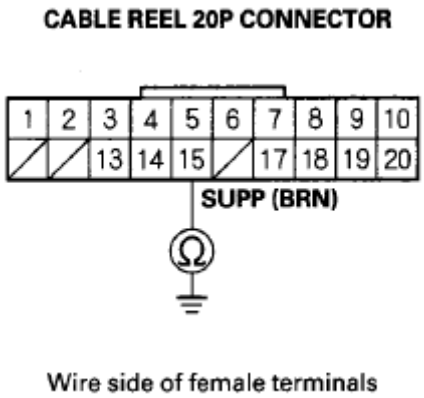

Fig. 360: Checking Continuity Between Cable Reel 20P Connector Terminal No. 15 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in wire between cable reel 20P connector terminal No. 15 and PCM connector terminal A36.

NO - Go to step 8.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between cable reel 20P connector terminals No. 2 and No. 15.

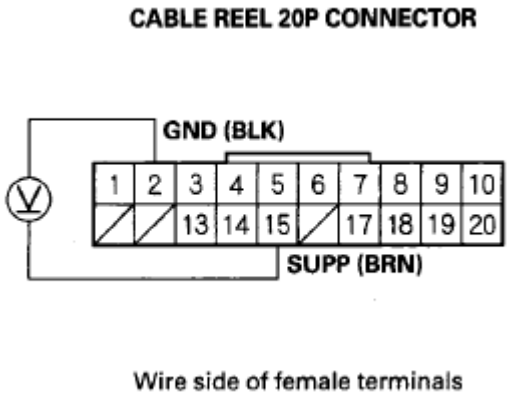

Fig. 361: Measuring Voltage Between Cable Reel 20P Connector Terminals No. 2 And No. 15
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace the cable reel (see **CABLE REEL REPLACEMENT**).

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector A (49P).
13. Connect cable reel 20P connector terminal No. 15 to body ground with a jumper wire.

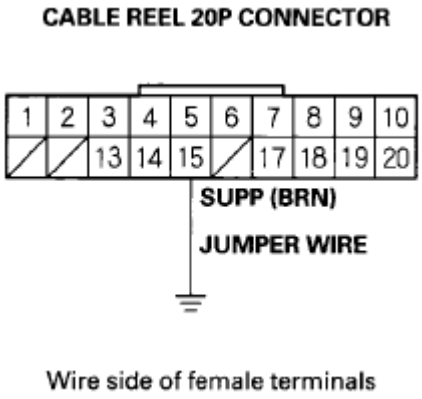

Fig. 362: Identifying Cable Reel 20P Connector Terminal No. 15 Connection With Body Ground Using Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check for continuity between PCM connector terminal A36 and body ground.

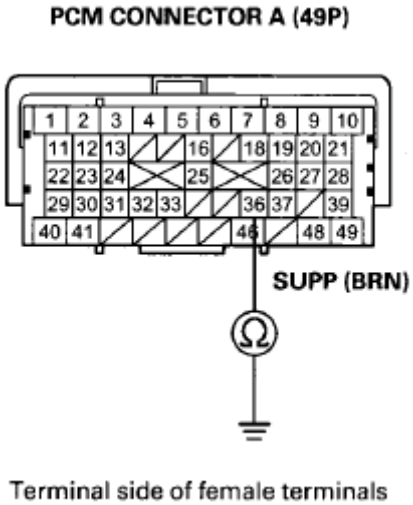

Fig. 363: Checking Continuity Between PCM Connector Terminal A36 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose or poor connections at PCM connector terminal A36. If the connection is OK, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**) and recheck.

NO - Repair an open in the wire between PCM connector terminal A36 and the cable reel 20P connector.

PADDLE SHIFTER - (DOWNSHIFT SWITCH) CIRCUIT TROUBLESHOOTING

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repair or service.

1. Remove the steering wheel (see **STEERING WHEEL REMOVAL**).
2. Check for continuity between cable reel subharness 20P connector terminals No. 17 and No. 8 when pressing and releasing the paddle shifter - (downshift switch).

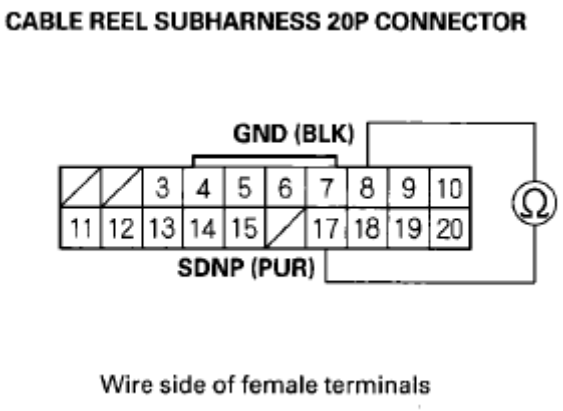

Fig. 364: Checking Continuity Between Cable Reel Subharness 20P Connector Terminals No. 17 And No. 8
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity when pressing the paddle shifter - (downshift switch) and no continuity when the paddle shifter - (downshift switch) is released?

YES - Go to step 5.

NO - Go to step 3.

3. Disconnect the paddle shifter - (downshift switch) connector.
4. Check for continuity between paddle shifter - (downshift switch) connector terminals No. 3 and No. 4 when pressing and releasing the paddle shifter - (downshift switch).

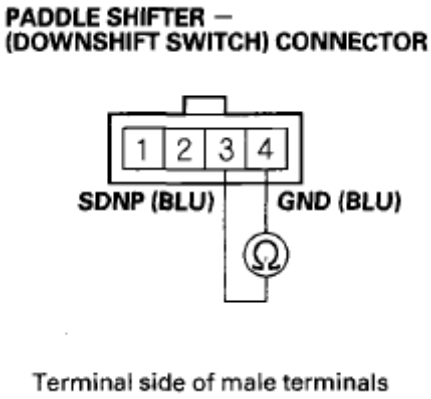

Fig. 365: Checking Continuity Between Paddle Shifter - Connector Terminals No. 3 And No. 4
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity when pressing the paddle shifter - (downshift switch) and no continuity when the paddle shifter - (downshift switch) is released?

YES - Replace the cable reel subharness.

NO - Replace the paddle shifter - (downshift switch) (see **PADDLE SHIFTER REPLACEMENT**)).

5. Remove the cable reel (see **CABLE REEL REPLACEMENT**).
6. Check for continuity between cable reel 20P connector terminal No. 5 and body ground.

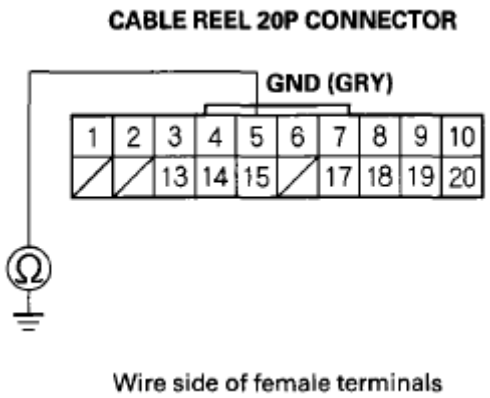

Fig. 366: Checking Continuity Between Cable Reel 20P Connector Terminal No. 5 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 7.

NO - Repair an open in the wire between cable reel 20P connector terminal No. 5 and body ground (G401) (see **CONNECTOR TO FUSE/RELAY BOX INDEX**), or repair poor body ground (G401).

7. Check for continuity between cable reel 20P connector terminal No. 17 and body ground.

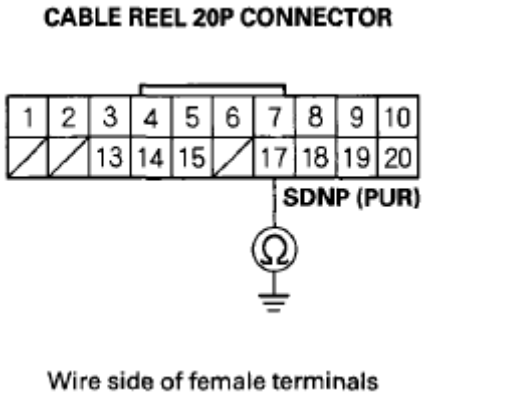

Fig. 367: Checking Continuity Between Cable Reel 20P Connector Terminal No. 17 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between cable reel 20P connector terminal No. 17 and PCM connector terminal A37.

NO - Go to step 8.

8. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
9. Measure the voltage between cable reel 20P connector terminals No. 5 and No. 17.

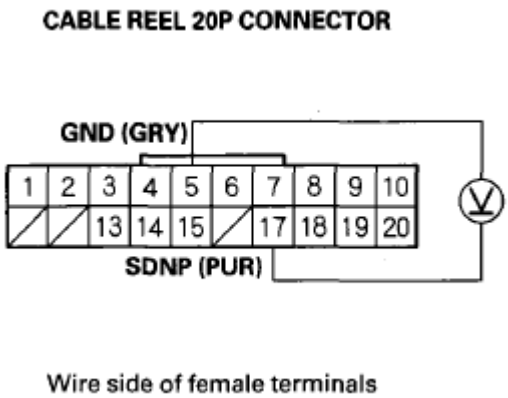

Fig. 368: Measuring Voltage Between Cable Reel 20P Connector Terminals No. 5 And No. 17
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Replace the cable reel (see **CABLE REEL REPLACEMENT**).

NO - Go to step 10.

10. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
11. Jump the SCS line with the HDS.
12. Disconnect PCM connector A (49P).
13. Connect cable reel 20P connector terminal No. 17 to body ground with a jumper wire.

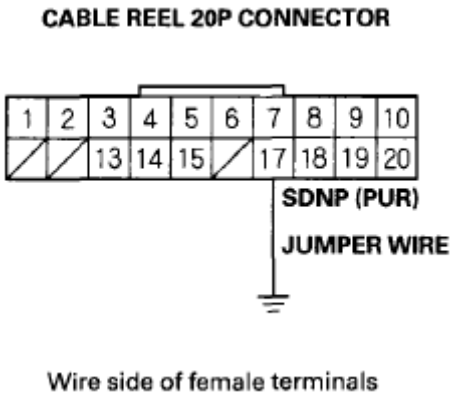

Fig. 369: Identifying Cable Reel 20P Connector Terminal No. 17 Connection With Body Ground Using Jumper Wire
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Check for continuity between PCM connector terminal A37 and body ground.

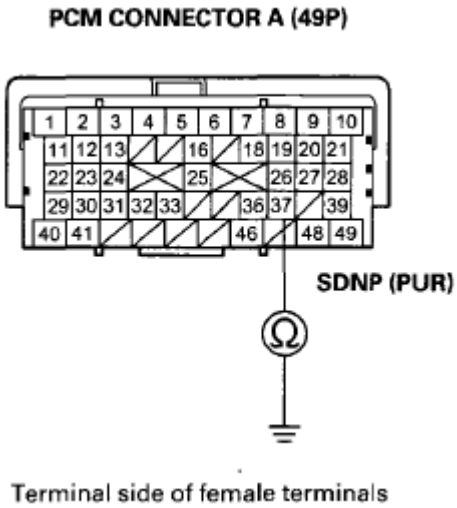

Fig. 370: Checking Continuity Between PCM Connector Terminal A37 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check for loose or poor connections at PCM connector terminal A37. If the connection is OK, substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**) and recheck.

NO - Repair an open in the wire between PCM connector terminal A37 and the cable reel 20P connector.

PADDLE SHIFTER ILLUMINATION CIRCUIT TROUBLESHOOTING

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repair or service.

1. Remove the driver's airbag (see **DRIVER'S AIRBAG REPLACEMENT**).
2. Disconnect the paddle shifter connector.
3. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode, and turn the combination light switch to the PARKING (SMALL) position.
4. Measure the voltage between paddle shifter connector terminal No. 1 and body ground.

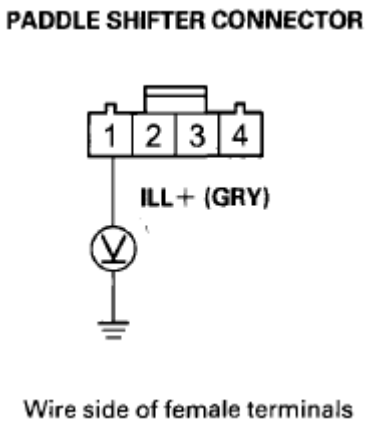

Fig. 371: Measuring Voltage Between Paddle Shifter Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 8.

NO - Go to step 5.

5. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode, and turn the combination light switch to the OFF position.
6. Check the No. 6 (7.5 A) fuse in the passenger's under-dash fuse/relay box.

Is the fuse OK?

YES - Repair an open in the wire between paddle shifter connector terminal No. 1 and the passenger's under-dash fuse/relay box.

NO - Go to step 7.

7. Check for continuity between paddle shifter connector terminal No. 1 and body ground.

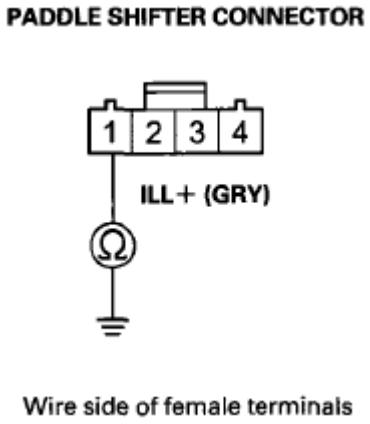

Fig. 372: Checking Continuity Between Paddle Shifter Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between paddle shifter connector terminal No. 1 and the passenger's under-dash fuse/relay box.

NO - Install a new No. 6 (7.5 A) fuse in the passenger's under-dash fuse/relay box, then go to step 4.

8. Remove the gauge control module (see **GAUGE CONTROL MODULE REPLACEMENT**).
9. Check for continuity between paddle shifter connector terminal No. 2 and the gauge control module 32P connector terminal No. 21.

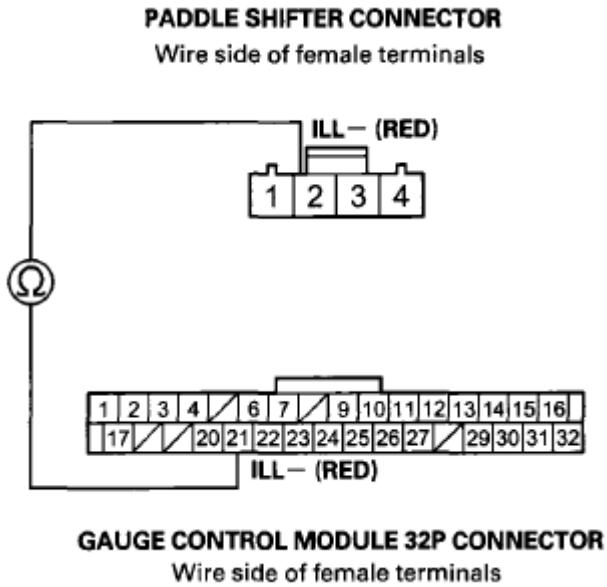

Fig. 373: Checking Continuity Between Paddle Shifter Connector And Gauge Control Module 32P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Check the illumination control circuit in the gauge control module self-diagnostic function (see **SELF-DIAGNOSTIC FUNCTION**). If the test results are OK, replace the paddle shifter (see **PADDLE SHIFTER REPLACEMENT**).

NO - Repair an open in the wire between paddle shifter connector terminal No. 2 and the gauge control module.

PADDLE SHIFTER REPLACEMENT

SRS components are located in this area. Review the SRS component locations (see **COMPONENT LOCATION INDEX**) and the precautions and procedures (see **PRECAUTIONS AND PROCEDURES**) before doing repair or service.

1. Remove the steering wheel (see **STEERING WHEEL REMOVAL**).
2. Remove the four screws (A) securing the steering wheel rear cover (B).

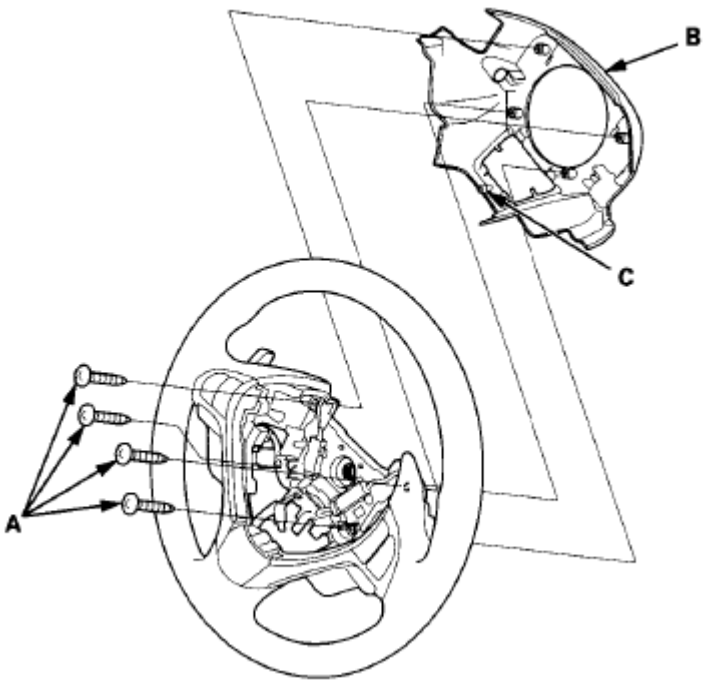

Fig. 374: Identifying Screws, Steering Wheel Rear Cover And Snap-Fit Portion
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pull the snap-fit portion (C) up carefully, then remove the steering wheel rear cover.
4. Disconnect the paddle shifter + (upshift switch) connector or the paddle shifter - (downshift switch)

connector. Remove the screws (A) securing the paddle shifter + (upshift switch) (B) or the paddle shifter - (downshift switch) (C), then remove the paddle shifter + or the paddle shifter -.

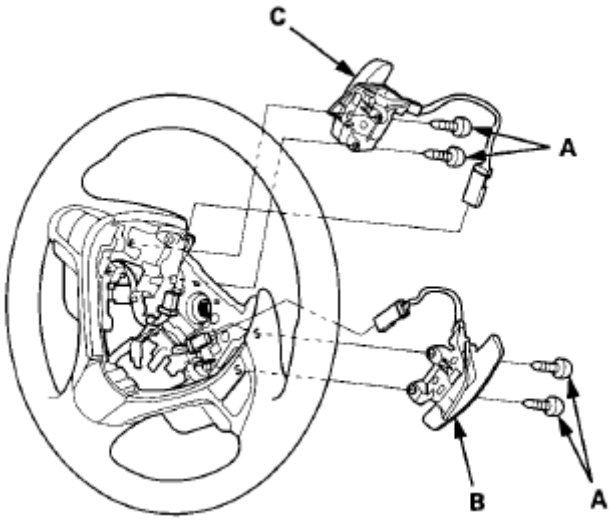

Fig. 375: Identifying Screws, Paddle Shifter + (Upshift Switch) And Paddle Shifter - (Downshift Switch)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install a new paddle shifter + or a new paddle shifter - on the steering wheel.
6. Connect the paddle shifter + connector or the paddle shifter - connector securely, and install the connector in the connector holder.
7. Install the steering wheel rear cover with the screws.
8. Install the steering wheel (see **STEERING WHEEL INSTALLATION**).

A/T GEAR POSITION INDICATOR REPLACEMENT

1. Remove the A/T shift panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).
2. Remove the A/T gear position indicator (A) from the A/T shift panel (B).

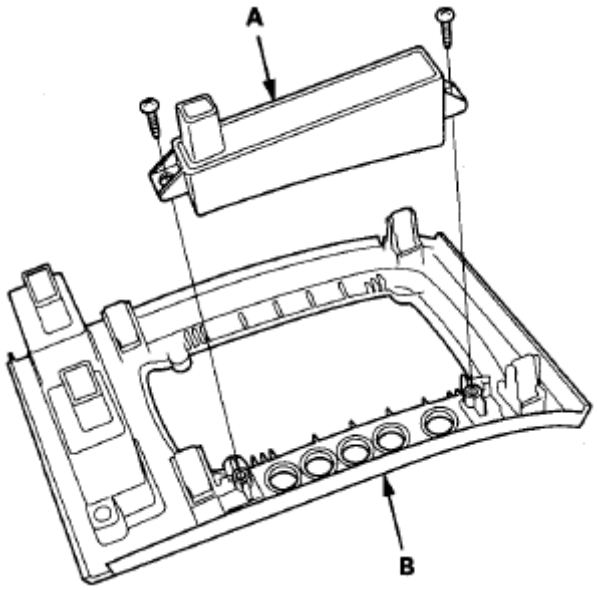

Fig. 376: Removing A/T Gear Position Indicator From A/T Shift Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new A/T gear position indicator with the screws.
4. Install the A/T shift panel (see **CENTER CONSOLE PANEL REMOVAL/INSTALLATION**).

COMPONENT LOCATION INDEX

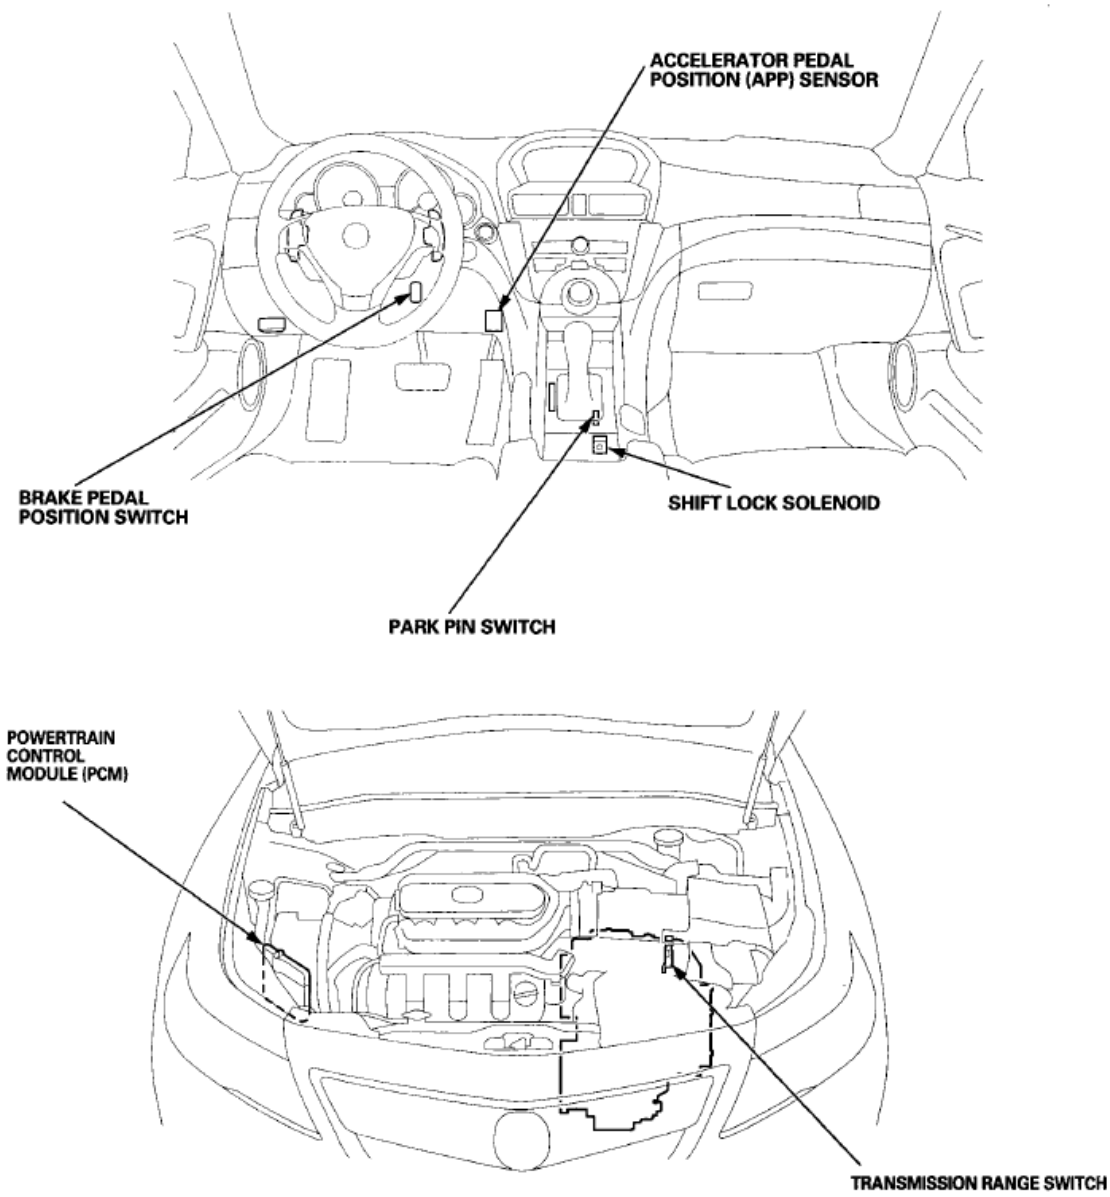

Fig. 377: Identifying A/T Inter Lock System Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CIRCUIT DIAGRAM

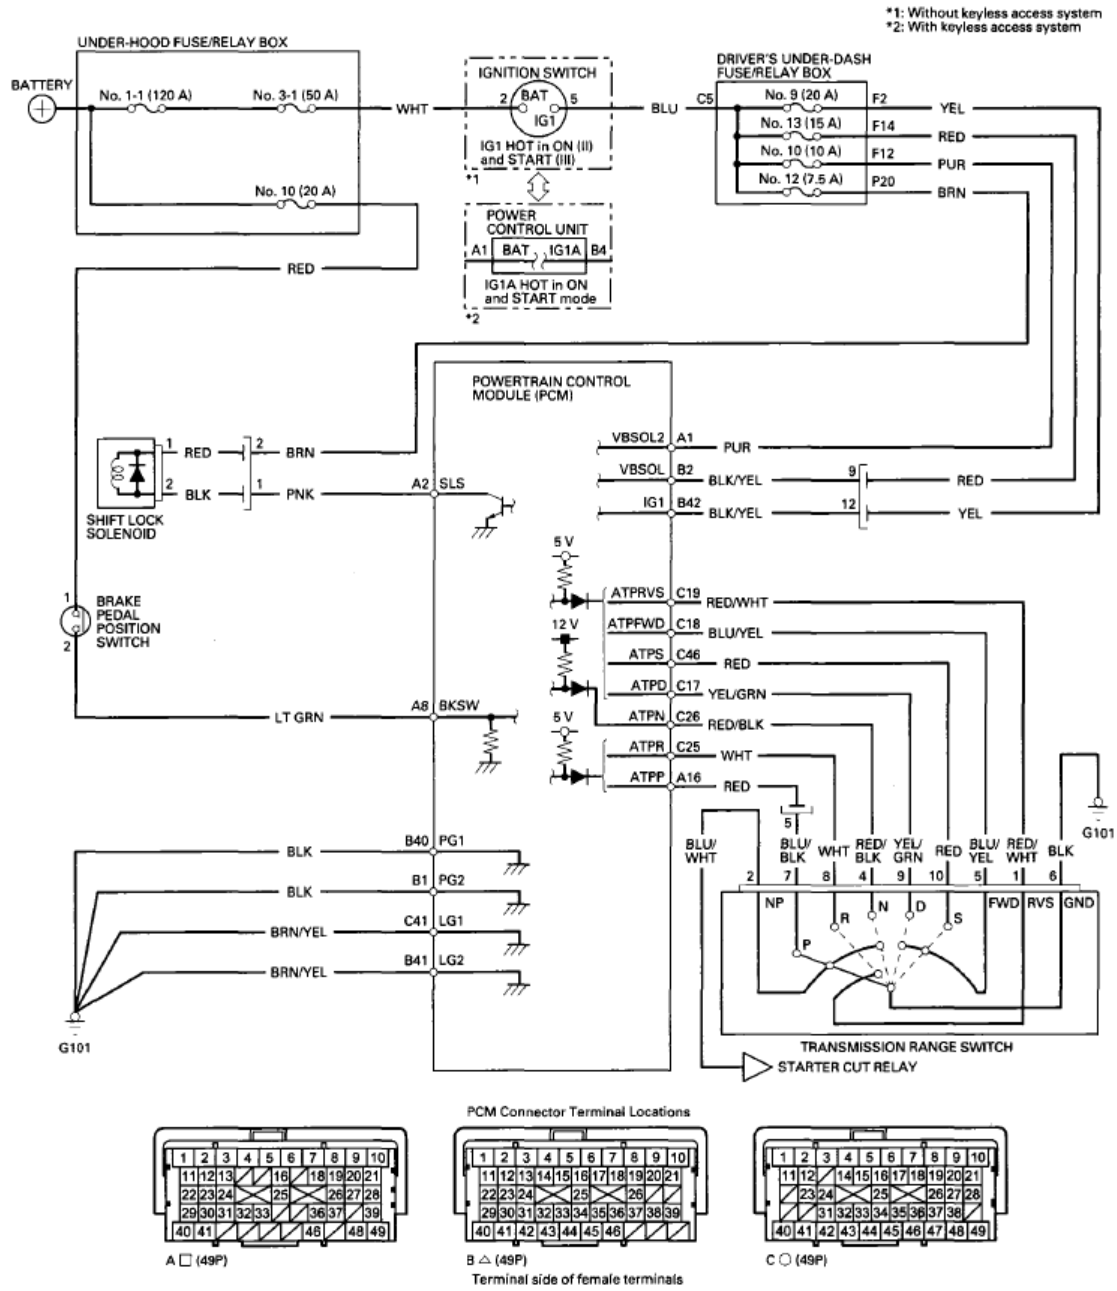

Fig. 378: A/T Inter Lock System - Circuit Diagram
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING

NOTE: Check for A/T DTCs. If any DTCs are present, troubleshoot those first.

1. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

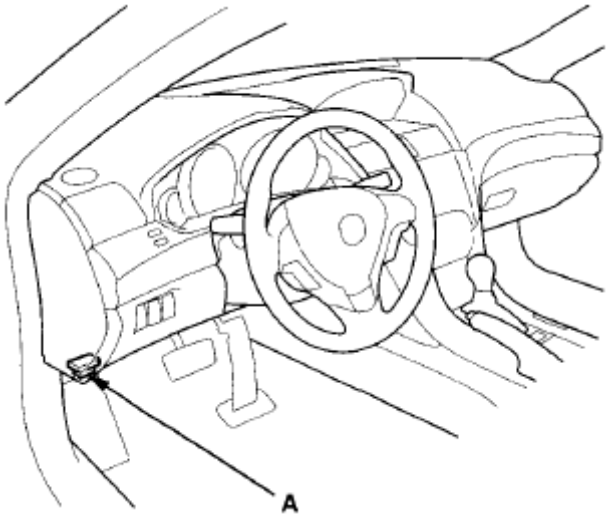

Fig. 379: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.

   Does the shift lock solenoid work properly?

   YES - Go to step 16.

   NO - Go to step 4.

4. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
5. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
6. Disconnect the shift lock solenoid connector (see **SHIFT LOCK SOLENOID REPLACEMENT**).
7. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
8. Measure the voltage between shift lock solenoid connector terminal No. 1 and body ground.

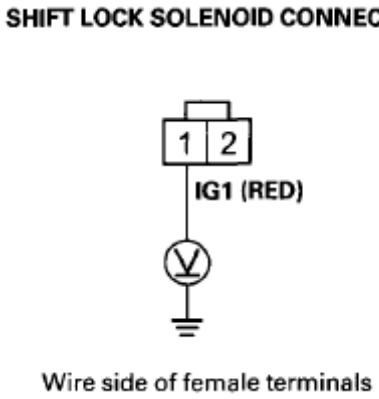

Fig. 380: Measuring Voltage Between Shift Lock Solenoid Connector Terminal No. 1 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Check for a blown No. 12 (7.5 A) fuse in the driver's under-dash fuse/relay box. If the fuse is blown, replace it. If the fuse blows again, repair a short in the No. 12 (7.5 A) fuse circuit. If the fuse is OK, repair an open in the wire between shift lock solenoid connector terminal No. 1 and the driver's under-dash fuse/relay box.

9. With the shift lever in P, press the brake pedal. Do not press the accelerator pedal.
10. Measure the voltage between shift lock solenoid connector terminals No. 1 and No. 2 while pressing the brake pedal.

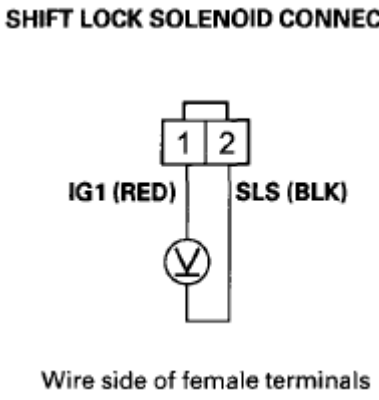

Fig. 381: Measuring Voltage Between Shift Lock Solenoid Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 11.

NO - Go to step 12.

11. Release the brake pedal, and measure the voltage between shift lock solenoid connector terminals No. 1 and No. 2. The shift lever must be in P.

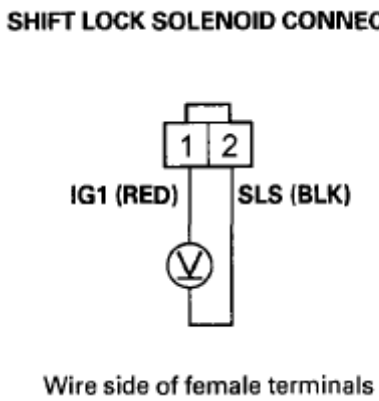

Fig. 382: Measuring Voltage Between Shift Lock Solenoid Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Repair a short to body ground in the wire between PCM connector terminal A2 and the shift lock solenoid connector.

NO - Check the shift lock mechanism. If the mechanism is OK, replace the shift lock solenoid (see **SHIFT LOCK SOLENOID REPLACEMENT**).

12. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
13. Jump the SCS line with the HDS.
14. Disconnect PCM connector A (49P).
15. Check for continuity between PCM connector terminal A2 and shift lock solenoid connector terminal No. 2.

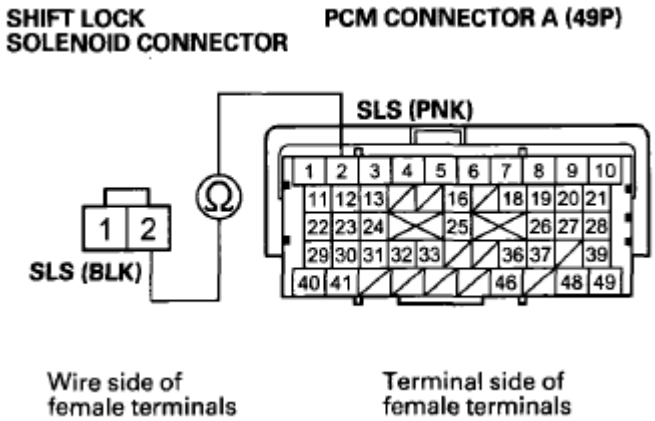

Fig. 383: Checking Continuity Between PCM Connector Terminal A2 And Shift Lock Solenoid Connector Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), and recheck. If the symptom goes away with a known-good PCM, replace the original PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal A2 and the shift lock solenoid connector.

16. Monitor the Brake Switch with the HDS in the A/T Data List, and press the brake pedal.

    Is the Brake Switch ON?

    YES - Go to step 21.

    NO - If the brake lights come on, go to step 17. If the brake lights do not work, repair faulty brake light circuit.

17. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
18. Jump the SCS line with the HDS.
19. Disconnect PCM connector A (49P).
20. Measure the voltage between PCM connector terminal A8 and body ground while pressing the brake pedal and when the brake pedal is released.

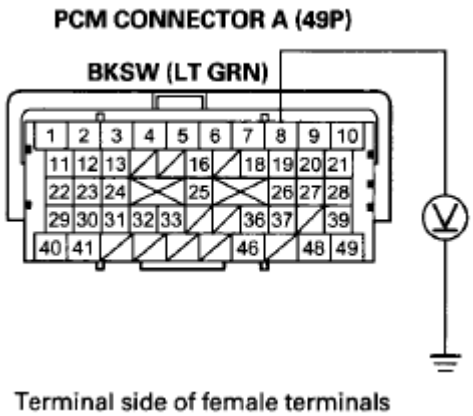

Fig. 384: Measuring Voltage Between PCM Connector Terminal A8 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage while pressing the brake pedal and about 0 V when the pedal is released?

YES - Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a

known-good PCM (see **SUBSTITUTING THE ECM/PCM**), and recheck. If the symptom goes away with a known-good PCM, replace the original PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal A8 and the brake pedal position switch.

21. Monitor the A/T P Switch with the HDS in the A/T Data List with the shift lever in P.

    Is the A/T P Switch ON?

    YES - Go to step 31.

    NO - Go to step 22.

22. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
23. Disconnect the transmission range switch connector.
24. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
25. Connect a jumper wire between transmission range switch connector terminal No. 7 and body ground.

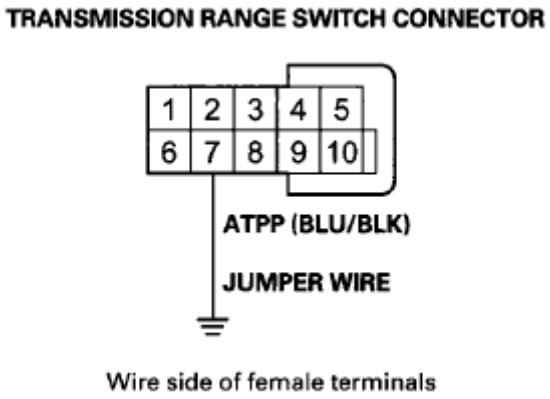

Fig. 385: Identifying Jumper Wire Between Transmission Range Switch Connector Terminal No. 7 And Body Ground Connection
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Check the A/T P Switch signal with the HDS in the A/T Data list.

    Is the A/T P Switch ON?

    YES - Replace the transmission range switch.

    NO - Go to step 27.

27. Turn the ignition switch to LOCK (0), or press the engine start/stop button to select the OFF mode.
28. Jump the SCS line with the HDS.
29. Disconnect PCM connector A (49P).

30. Check for continuity between PCM connector terminal A16 and transmission range switch connector terminal No. 7.

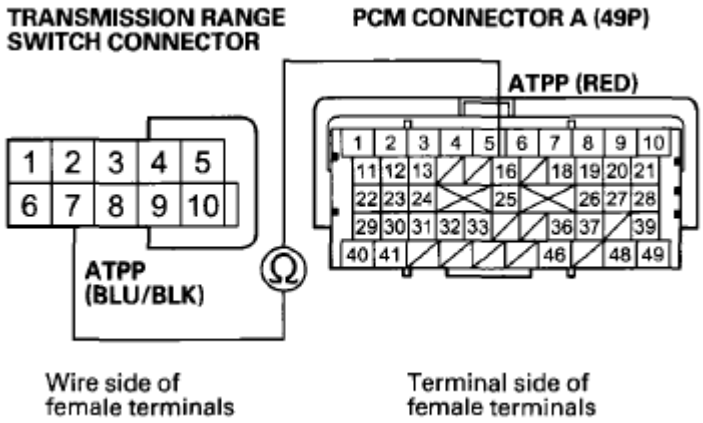

Fig. 386: Checking Continuity Between PCM Connector Terminal A16 And Transmission Range Switch Connector Terminal No. 7
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), and recheck. If the symptom goes away with a known-good PCM, replace the original PCM (see **ECM/PCM REPLACEMENT**).

NO - Repair an open in the wire between PCM connector terminal A16 and the transmission range switch connector.

31. Check APP Sensor A with the HDS in the A/T Data List. Do not press the accelerator pedal.

Is the APP Sensor (%) opening 5 % or more, or APP sensor A (V)1.16 V or higher?

YES - Check the APP Sensor (see **APP SENSOR SIGNAL INSPECTION**).

NO - Update the PCM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good PCM (see **SUBSTITUTING THE ECM/PCM**), and recheck. If the symptom goes away with a known-good PCM, replace the original PCM (see **ECM/PCM REPLACEMENT**).

SHIFT LOCK SOLENOID TEST

1. Connect the HDS to the DLC (A) located under the driver's side of the dashboard.

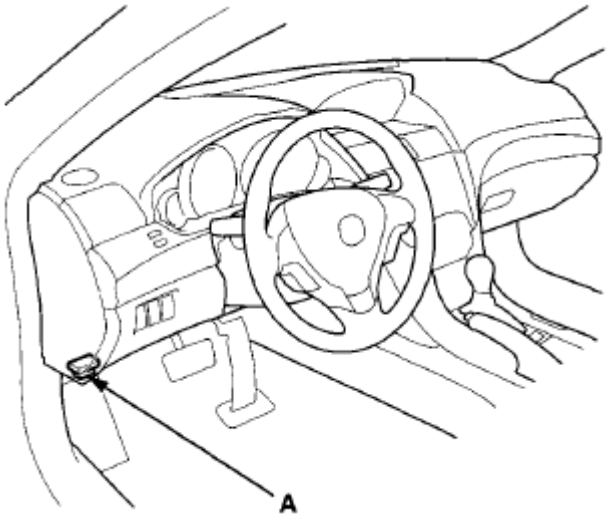

Fig. 387: Identifying Data Link Connector Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode. Make sure the HDS communicates with the PCM. If it does not, go to the DLC circuit troubleshooting (see **DLC CIRCUIT TROUBLESHOOTING**).
3. Select Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.
4. Check that the shift lever can be moved out of P when the Shift Lock Solenoid is ON. Move the shift lever back to P, and check that it locks with the Shift Lock Solenoid is OFF.
5. Check that the shift lock releases when the shift lock release is pushed, and check that it locks when the shift lock release is released.
6. If the shift lock solenoid does not work properly, go to the **SHIFT LOCK SYSTEM TROUBLESHOOTING** (see).

SHIFT LOCK SOLENOID REPLACEMENT

NOTE: Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.

1. Remove the shift lever assembly (see **SHIFT LEVER REMOVAL**).
2. Release the lock tabs retaining the shift lock solenoid using thin-bladed screwdrivers.

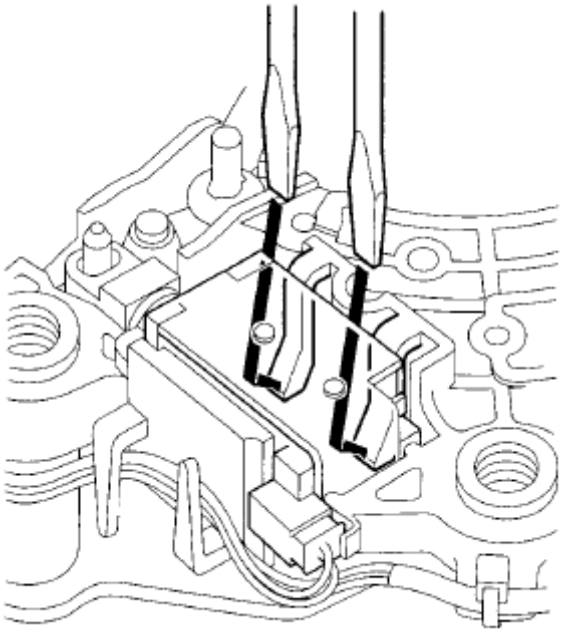

Fig. 388: Releasing Lock Tabs Retaining Shift Lock Solenoid Using Thin-Bladed Screwdrivers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Insert a 6.0 mm pin (A), and push the shift lock solenoid (B) out.

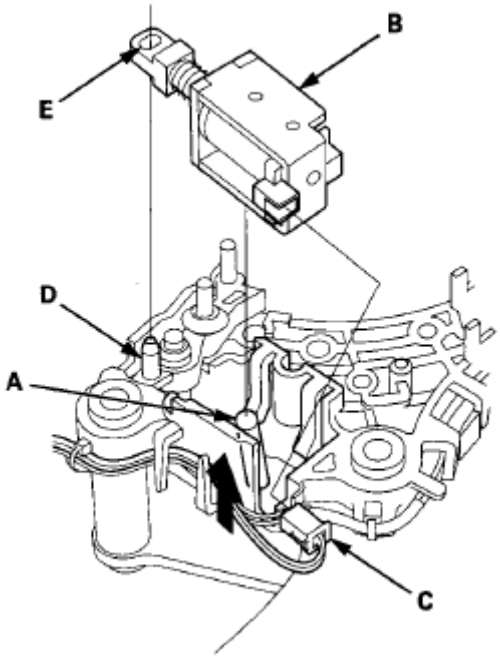

Fig. 389: Identifying Pin, Shift Lock Solenoid And Connector, Tip And Solenoid Plunger Hole
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the shift lock solenoid connector (C).

5. Apply silicone grease to the tip (D) of the shift lock stop and the solenoid plunger hole (E).
6. Connect the shift lock solenoid connector.
7. Install a new shift lock solenoid by aligning the joint of the shift lock solenoid plunger with the tip of the shift lock stop, then push the shift lock solenoid into the shift lever securely.
8. Install the shift lever assembly (see **SHIFT LEVER INSTALLATION**).

SHIFT LOCK STOP/SHIFT LOCK STOP CUSHION REPLACEMENT

NOTE: Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.

1. Remove the shift lock solenoid (see **SHIFT LOCK SOLENOID REPLACEMENT**).
2. Remove the shift lock stop (A) and the stop cushion (B) as a set.

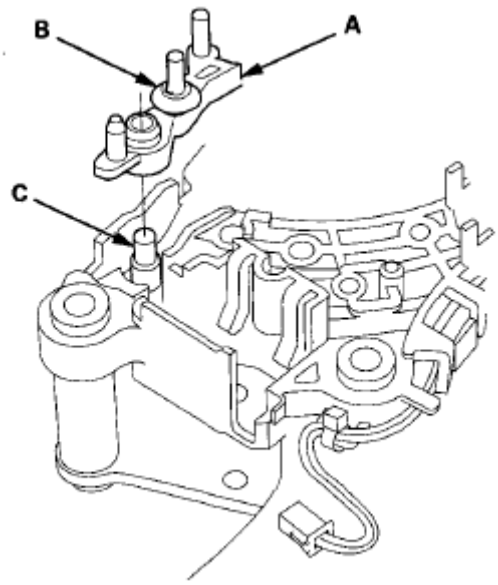

Fig. 390: Identifying Shift Lock Stop, Stop Cushion And Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Apply silicone grease to the pin (C) on the shift lever bracket, and install new shift lock stop over the pin.
4. Install the shift lock solenoid (see **SHIFT LOCK SOLENOID REPLACEMENT**).

SHIFT LOCK RELEASE AND RELEASE SPRING REPLACEMENT

1. Remove the shift lever assembly (see **SHIFT LEVER REMOVAL**).
2. Remove the shift lever knob (see **SHIFT LEVER KNOB REPLACEMENT**).
3. Remove the shift lever boot and the shift lever boot base (see **SHIFT LEVER BOOT AND SHIFT LEVER BOOT BASE REPLACEMENT**).
4. Release the lock (A) of the shift lock release (B), then remove the shift lock release.

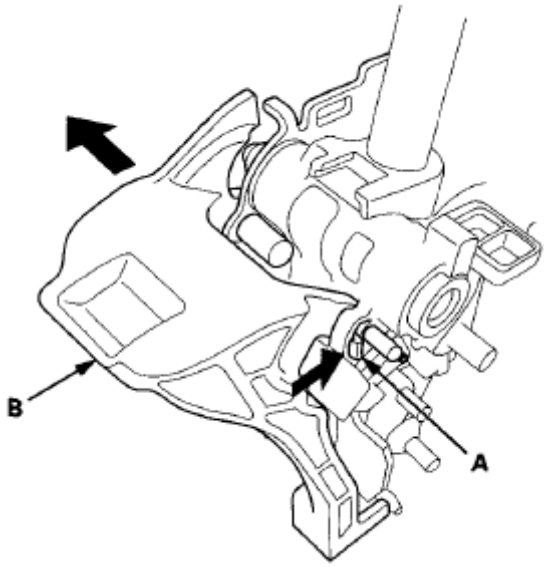

Fig. 391: Identifying Lock, Shift Lock Release And Release Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the release spring (A) from the shift lock release (B).

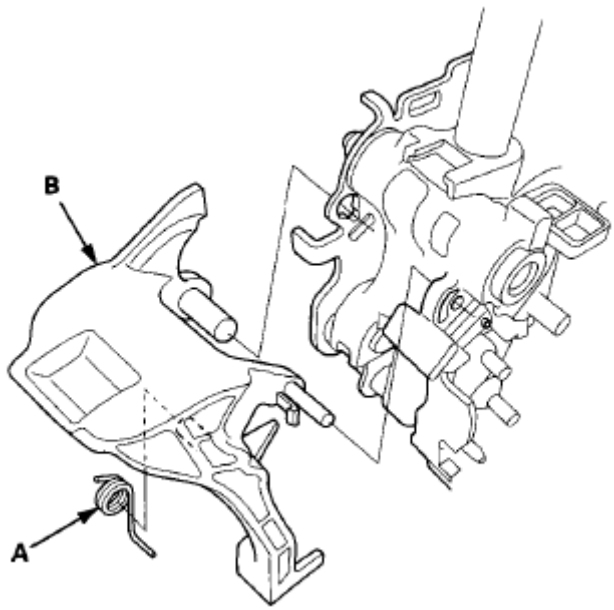

Fig. 392: Identifying Release Spring And Shift Lock Release
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Replace the shift lock release or the release spring.
7. Install the shift lock release spring in the shift lock release.
8. Install the shift lock release on the shift lever.
9. Make sure that the release spring end (A) is installed in the shift lock release (B), and the hooked end (C)

of the release spring is on the shift lever bracket as shown.

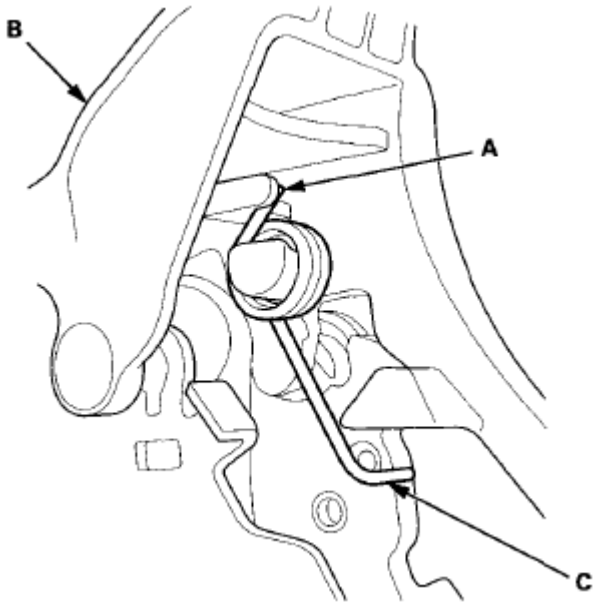

Fig. 393: Identifying Release Spring End, Shift Lock Release And Hooked End
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the shift lever boot and the shift lever boot base (see **SHIFT LEVER BOOT AND SHIFT LEVER BOOT BASE REPLACEMENT**).
11. Install the shift lever knob (see **SHIFT LEVER KNOB REPLACEMENT**).
12. Install the shift lever assembly (see **SHIFT LEVER INSTALLATION**).

PARK PIN SWITCH REPLACEMENT

NOTE: The park pin switch and the shift lock solenoid harness are not available separately. Replace the park pin switch and the shift lock solenoid harness as a set.

1. Remove the shift lever knob (see **SHIFT LEVER KNOB REPLACEMENT**).
2. Remove the shift lever boot and the shift lever boot base (see **SHIFT LEVER BOOT AND SHIFT LEVER BOOT BASE REPLACEMENT**).
3. Remove the shift lock solenoid (see **SHIFT LOCK SOLENOID REPLACEMENT**).
4. Remove the harness wire ties (A), and remove the park pin switch (B).

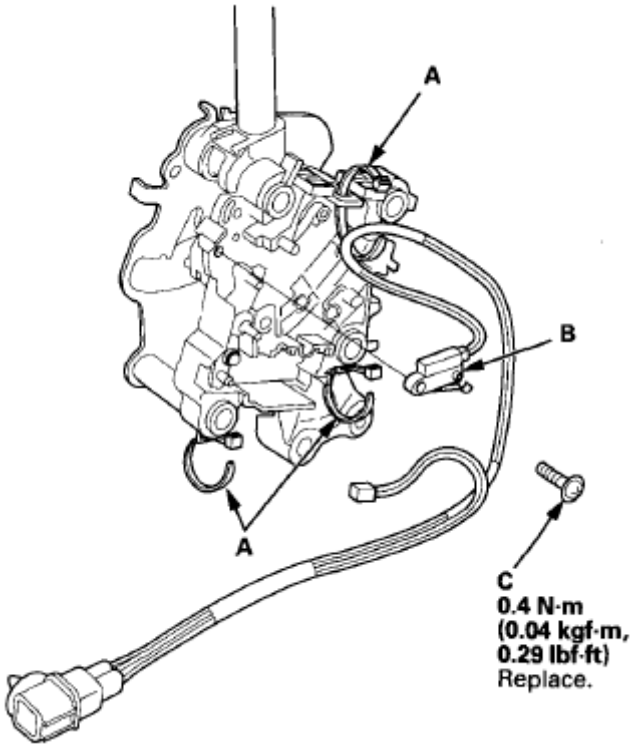

Fig. 394: Identifying Harness Wire Ties And Park Pin Switch With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Replace the park pin switch.
6. Install the park pin switch, and secure the park pin switch with a new screw (C).
7. Connect the shift lock solenoid connector to the shift lock solenoid. Then install the shift lock solenoid (see step 7).
8. Route the harnesses as shown. Take the slack out of the harnesses, and secure the harnesses with the harness wire ties (A).

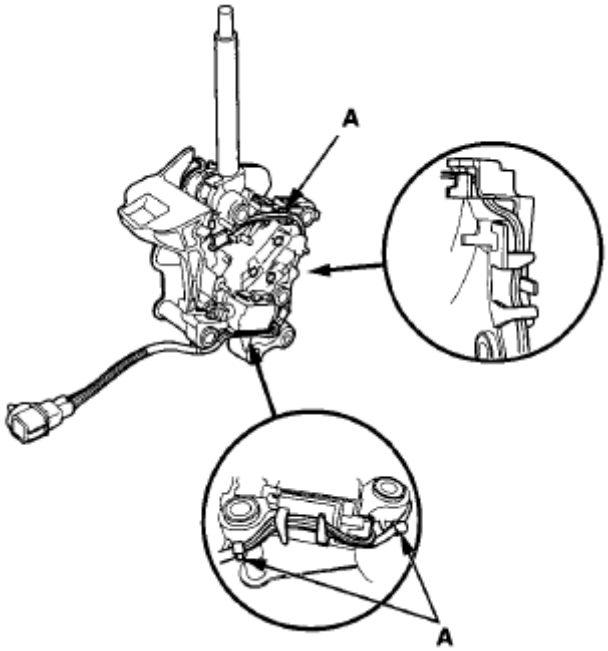

Fig. 395: Identifying Harness Wire Ties
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the shift lever boot and the shift lever boot base (see **SHIFT LEVER BOOT AND SHIFT LEVER BOOT BASE REPLACEMENT**).
10. Install the shift lever knob (see **SHIFT LEVER KNOB REPLACEMENT**).
11. Install the shift lever assembly (see **SHIFT LEVER INSTALLATION**).

TRANSMISSION DISASSEMBLY

EXPLODED VIEW

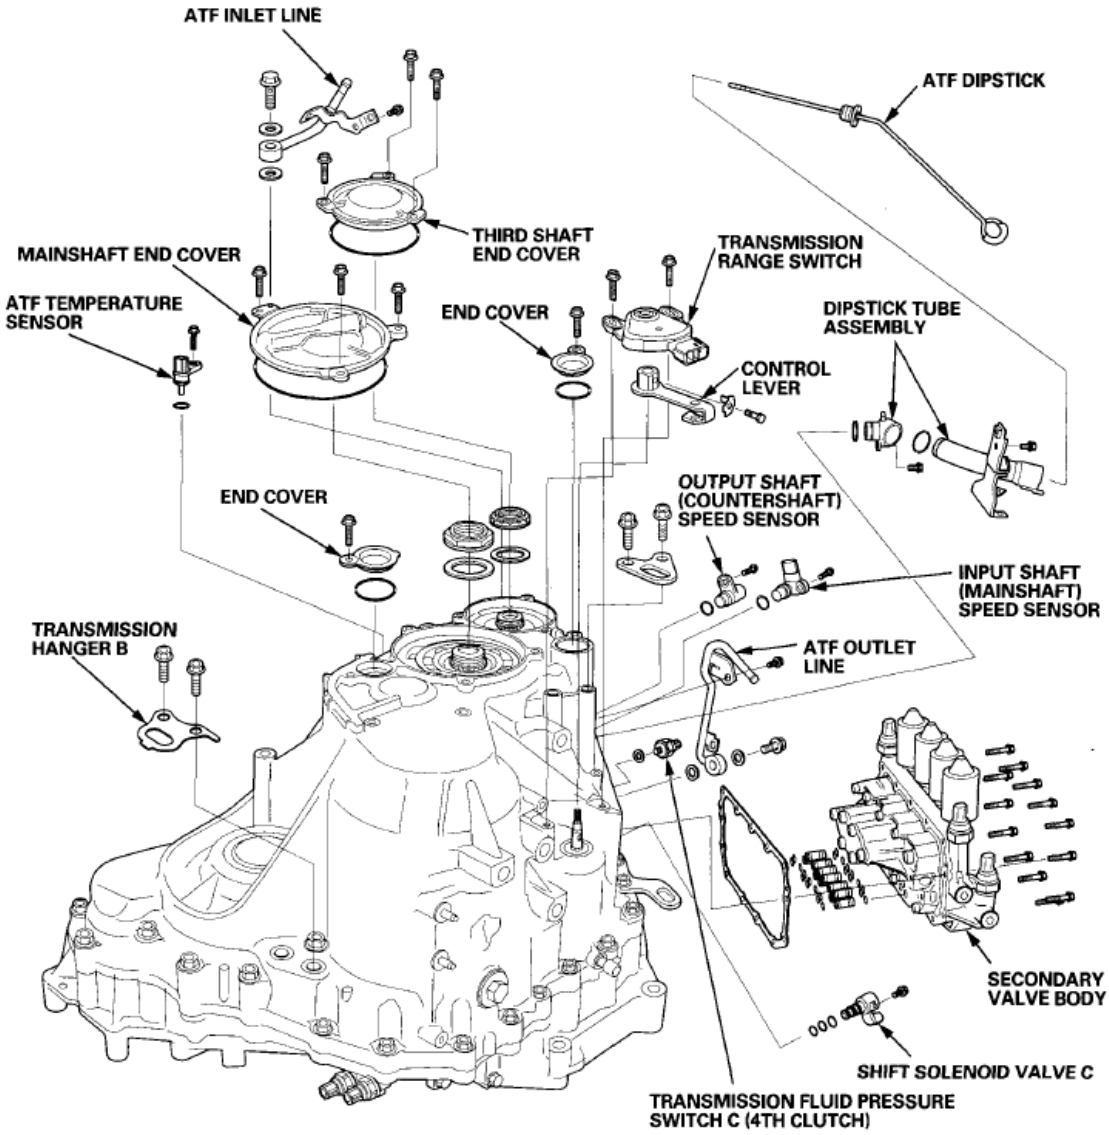

Fig. 396: Exploded View Of Transmission Disassembly (1 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

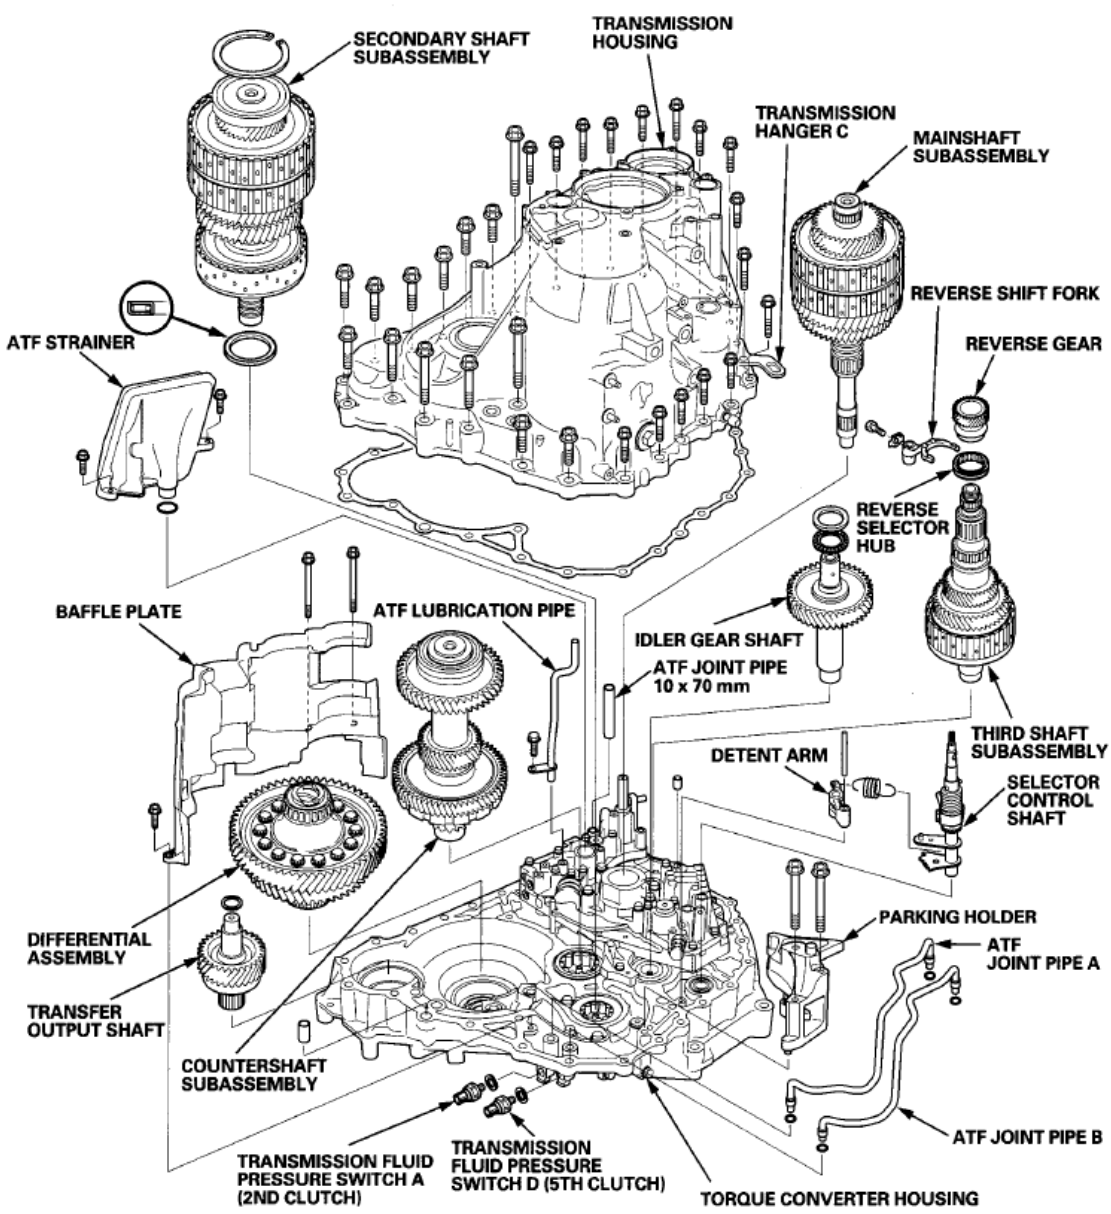

Fig. 397: Exploded View Of Transmission Disassembly (2 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

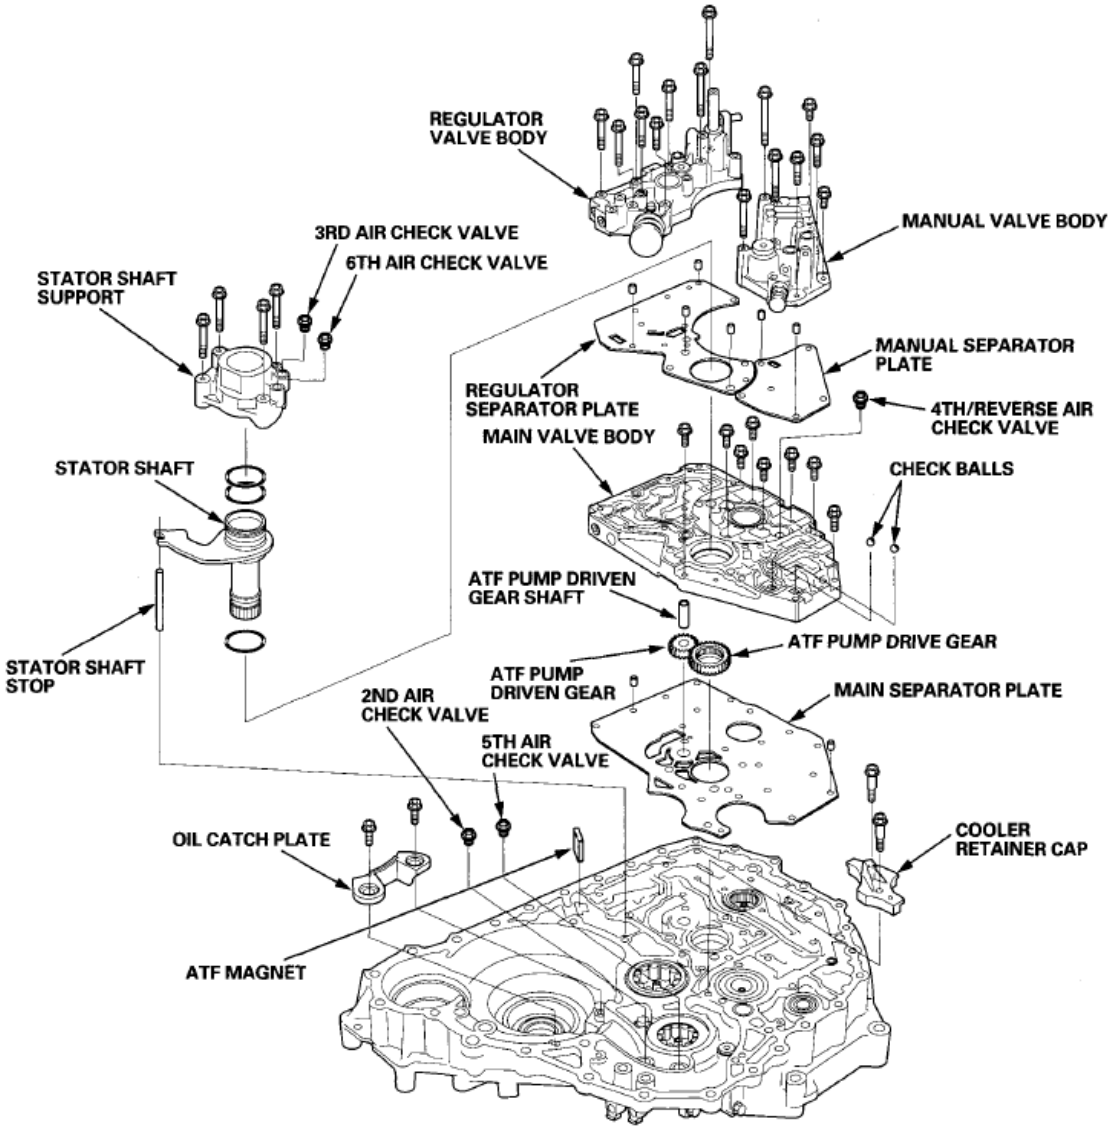

Fig. 398: Exploded View Of Transmission Disassembly (3 Of 3)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: This illustration shows the SH-AWD transfer assembly that is not available on all models.

Special Tools Required

Mainshaft Holder Set 07PAB-0010001

NOTE: Refer to the EXPLODED VIEW as needed during the following procedure.

1. Remove the dipstick tube assembly (A) with the O-rings.

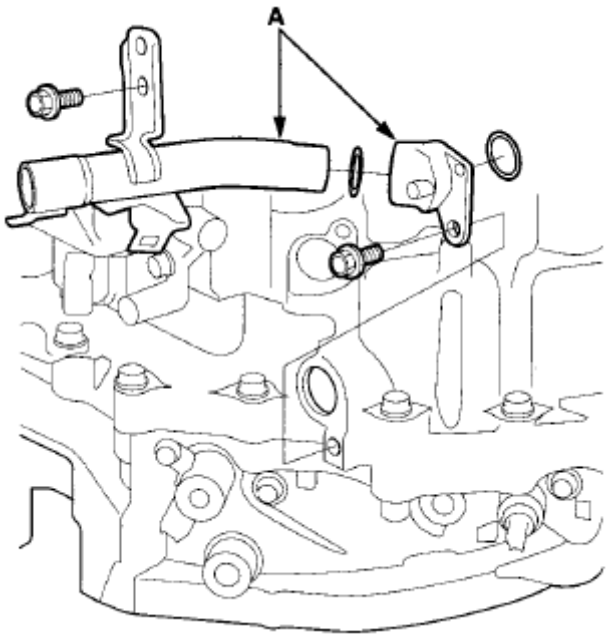

Fig. 399: Identifying Dipstick Tube Assembly With O-Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the transmission range switch (A).

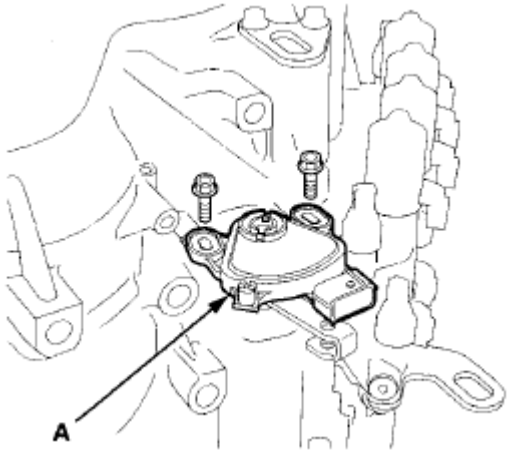

Fig. 400: Identifying Transmission Range Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pry the lock tab of the lock washer (A) on the control lever (B), then remove the bolt, the lock washer, and the control lever.

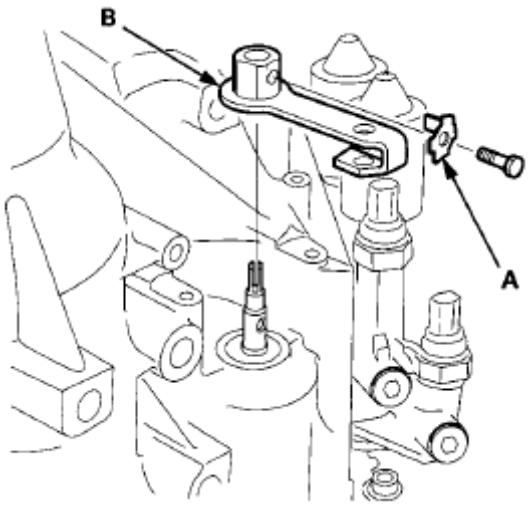

Fig. 401: Identifying Lock Washer And Control Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the input shaft (mainshaft) speed sensor (A) and the output shaft (countershaft) speed sensor (B) with the O-rings.

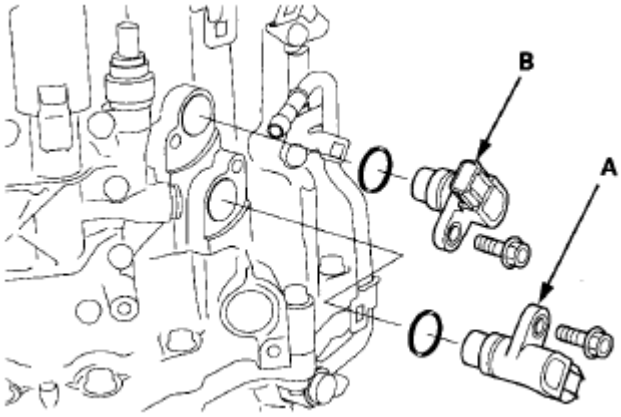

Fig. 402: Identifying Input And Output Mainshaft Speed Sensors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the ATF temperature sensor (A) with the O-ring.

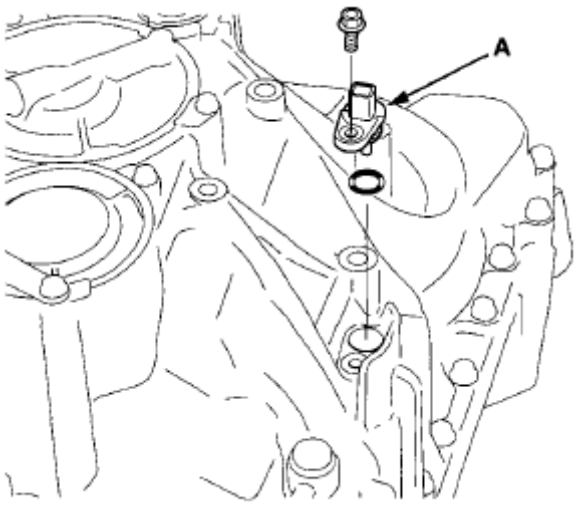

Fig. 403: Identifying ATF Temperature Sensor With O-Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the ATF outlet line banjo bolt (A) with the sealing washers, and remove the ATF outlet line (B).

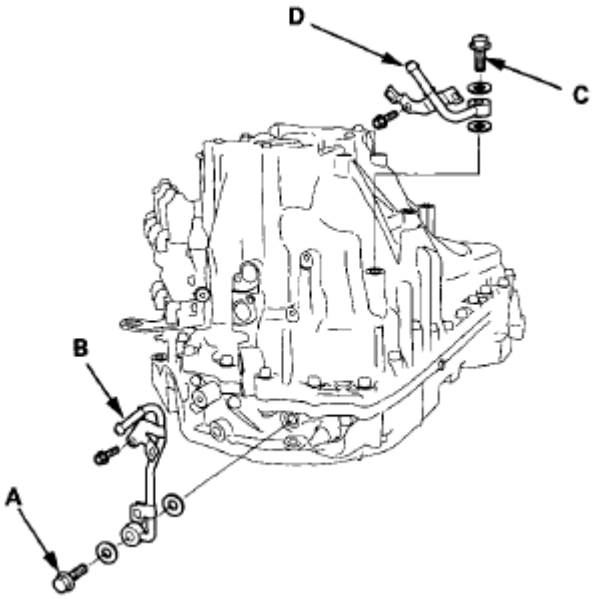

Fig. 404: Identifying ATF Outlet And Inlet Line Banjo Bolt, And ATF Inlet And Outlet Line
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the ATF inlet line banjo bolt (C) with the sealing washers and remove the ATF inlet line (D).
8. Remove transmission hanger A.

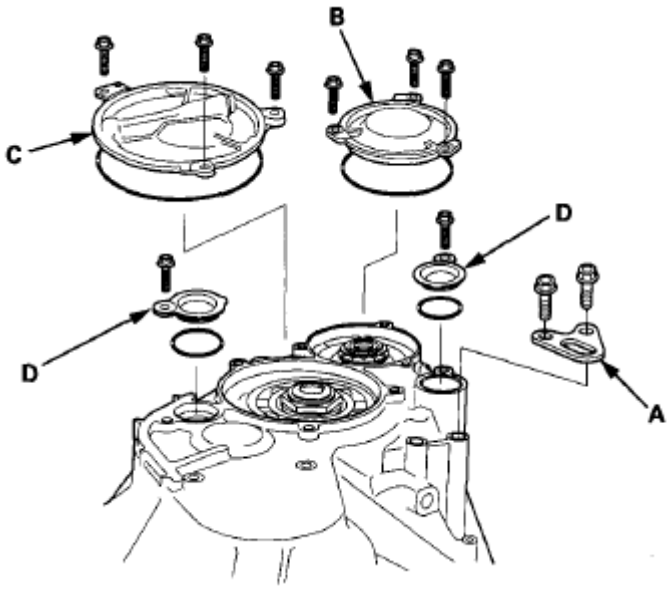

Fig. 405: Identifying Transmission Hanger, Shaft Cover, Mainshaft End Cover And End Covers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the third shaft end cover (B), the mainshaft end cover (C), and the end covers (D) (two) with the O-rings.
10. Remove transmission fluid pressure switch A (2nd clutch) with the sealing washer.

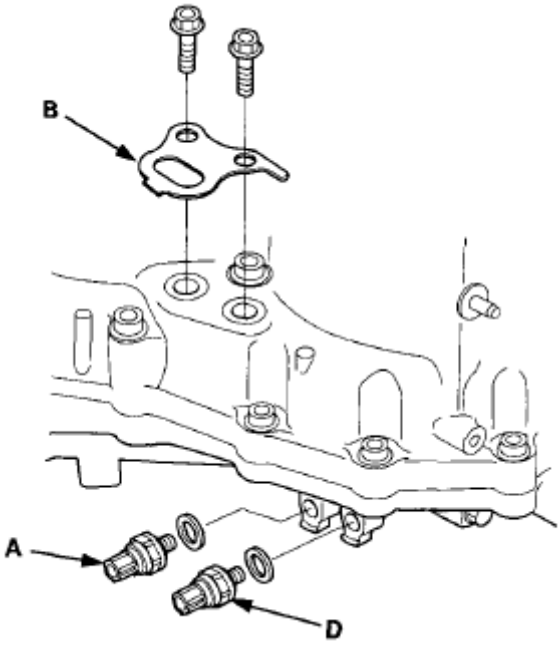

Fig. 406: Identifying Transmission Fluid Pressure Switch A And D And Transmission Hanger
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove transmission fluid pressure switch D (5th clutch) with the sealing washer.

12. Remove transmission hanger B.
13. Remove transmission fluid pressure switch C (4th clutch) (A) with the sealing washer.

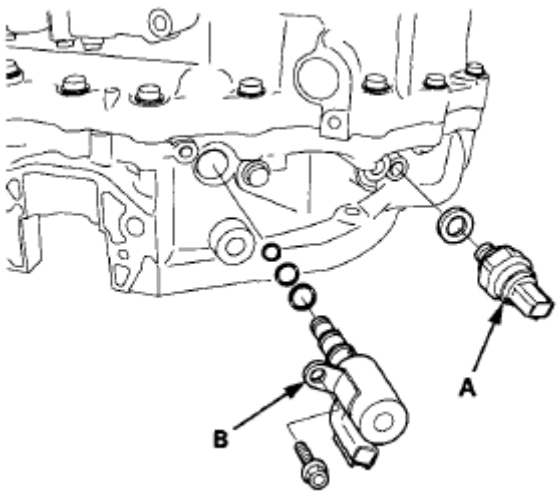

Fig. 407: Identifying Transmission Fluid Pressure Switch C (4th Clutch) And Shift Solenoid Valve C
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove shift solenoid valve C (B) with the O-rings.
15. Remove the secondary valve body (A). Remove the ATF pipes (B) with the O-rings, and the gasket (C).

NOTE: Do not disassemble the secondary valve body. If any problem occurs, replace the assembly.

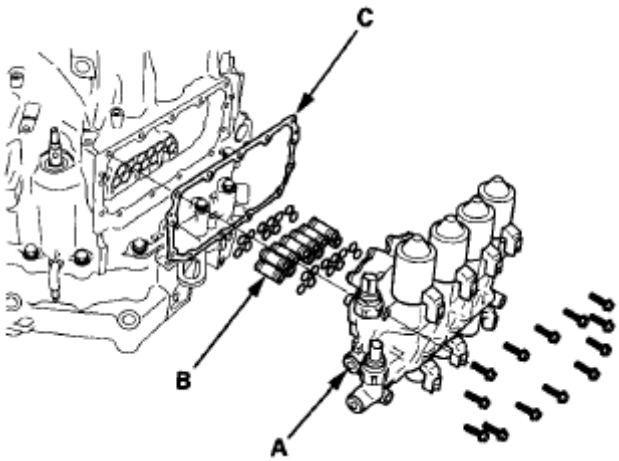

Fig. 408: Identifying Secondary Valve Body And ATF Pipes
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the mainshaft holder onto the mainshaft.

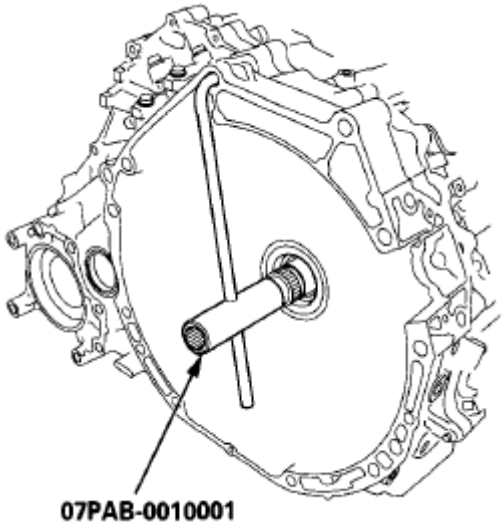

Fig. 409: Installing Mainshaft Holder Onto Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Using a chisel, cut the lock tab (A) of the locknut (B) securing the mainshaft and third shaft locknuts.

NOTE:
- **Keep all of the chiseled particles out of the transmission.**
- **The illustration shows the mainshaft locknut.**

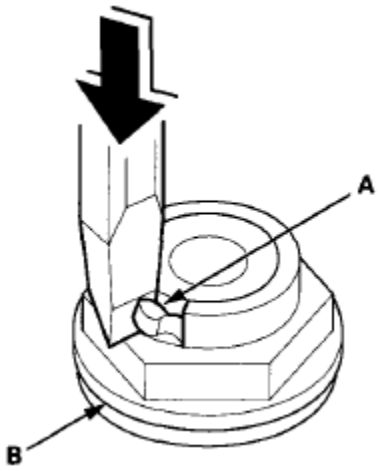

Fig. 410: Cutting Lock Tab Of Lock Nut Using Chisel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Remove the locknuts (A) from the mainshaft (B) and the third shaft (C).

NOTE: The third shaft locknut has left-hand threads.

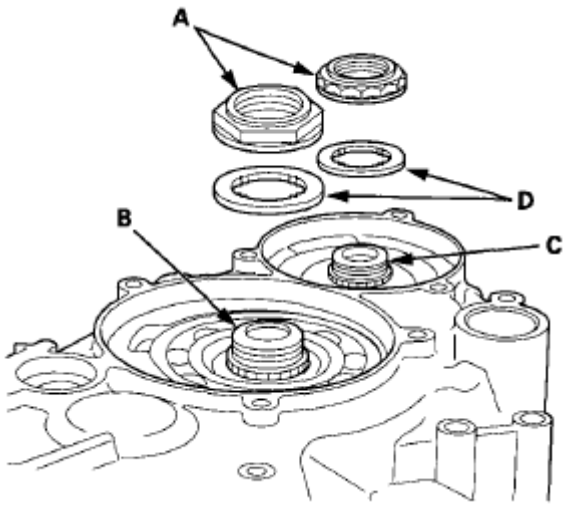

Fig. 411: Identifying Locknuts, Mainshaft, Lock Washers And Third Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Pry the lock washers (D), and remove them.

NOTE: Keep all of the particles out of the transmission.

20. Remove the transmission housing mounting bolts (10 x 1.25 mm bolts (A), 8 x 1.25 mm bolts (B)) and transmission hanger C.

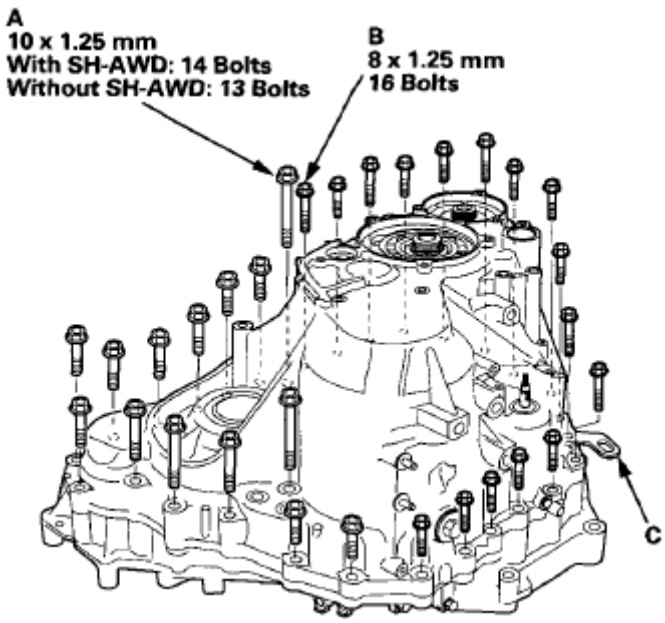

Fig. 412: Identifying Transmission Housing Mounting Bolts And Transmission Hanger
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. While expanding the snap ring of the countershaft bearing with snap ring pliers, lift the transmission

housing.

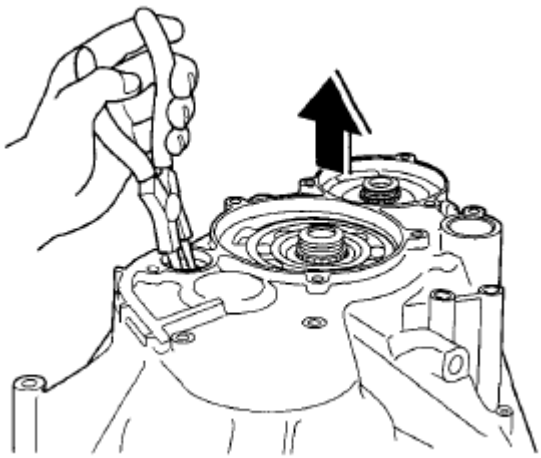

Fig. 413: Lifting Transmission Housing By Expanding Snap Ring Using Ring Pliers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Release the snap ring pliers, and remove the transmission housing (A), the two dowel pins (B), and the gasket (C).

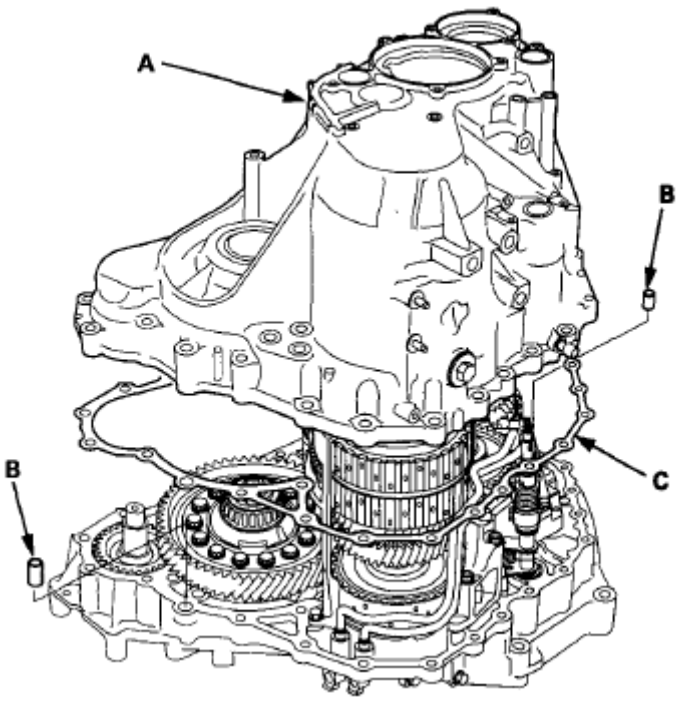

Fig. 414: Identifying Transmission Housing, Dowel Pins And Gasket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Remove ATF joint pipes A and B with the O-rings.

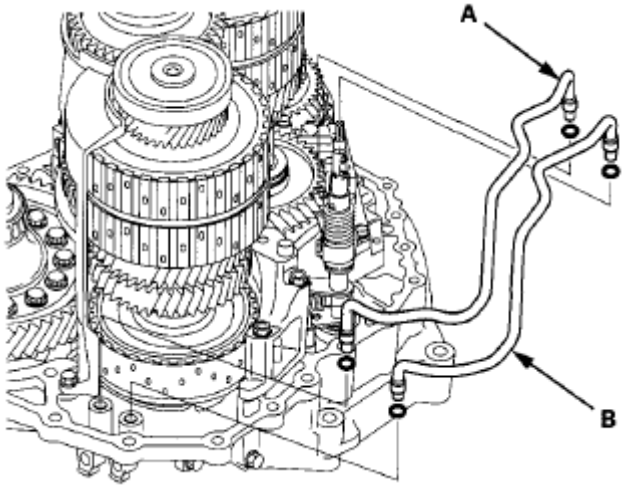

Fig. 415: Identifying ATF Joint Pipes A And B
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Remove the ATF strainer (A) with the O-ring.

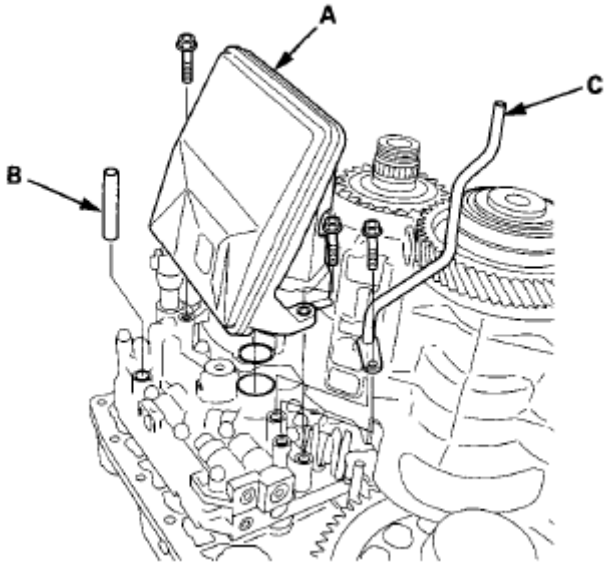

Fig. 416: Identifying ATF Strainer, ATF Joint Pipe And ATF Lubrication Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Remove the 10 x 70 mm ATF joint pipe (B) and the ATF lubrication pipe (C).
26. Remove the mainshaft holder from the mainshaft.
27. Pry the lock tab of the lock washer (A) on the shift fork (B), then remove the bolt and the lock washer.

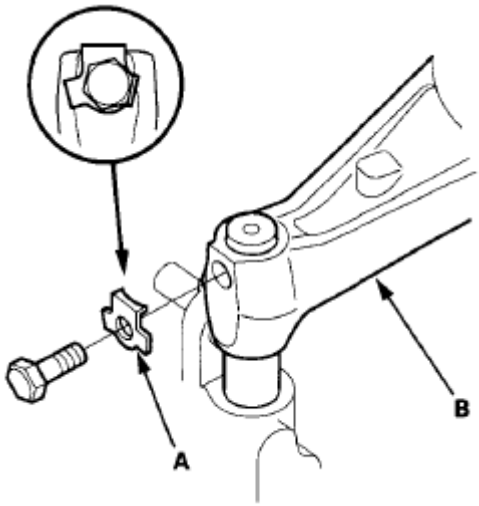

Fig. 417: Identifying Lock Washer And Shift Fork
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Remove the reverse gear (A), the reverse selector hub (B), the shift fork (C), and the baffle plate (D) together.

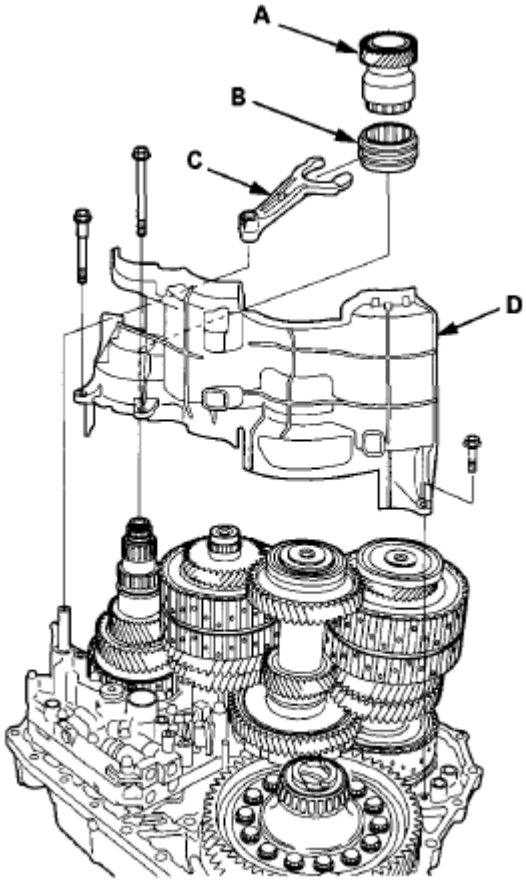

Fig. 418: Identifying Reverse Gear, Reverse Selector Hub, Shift Fork And Baffle Plate

Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Remove the mainshaft subassembly (A), the countershaft subassembly (B), the secondary shaft subassembly (C), and the idler gear shaft (D) together, and remove the needle bearing (E) from the torque converter housing.

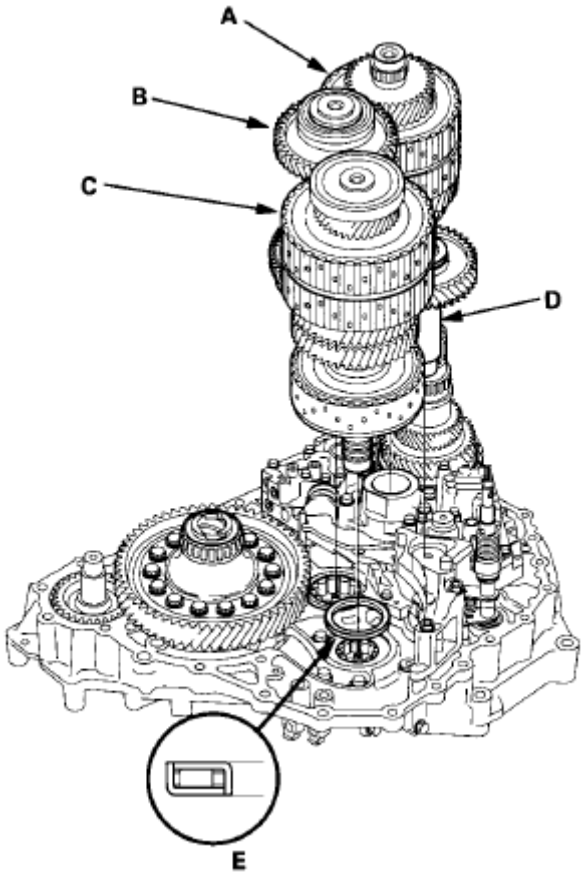

Fig. 419: Identifying Mainshaft, Countershaft And Secondary Subassemblies, Idler Gear Shaft And Needle Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Remove the third shaft (A).

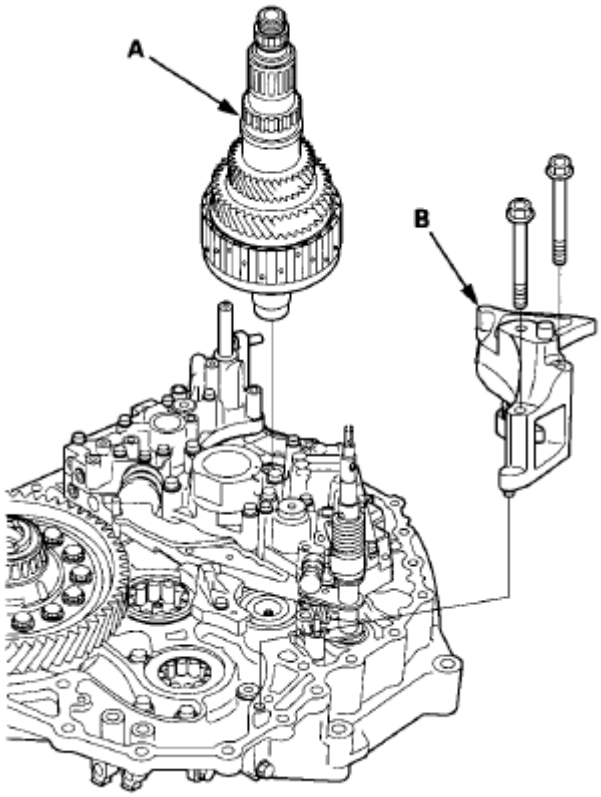

Fig. 420: Identifying Third Shaft And Parking Holder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Remove the parking holder (B).
32. Remove the detent arm (A), the detent arm shaft (B), and the detent arm spring (C).

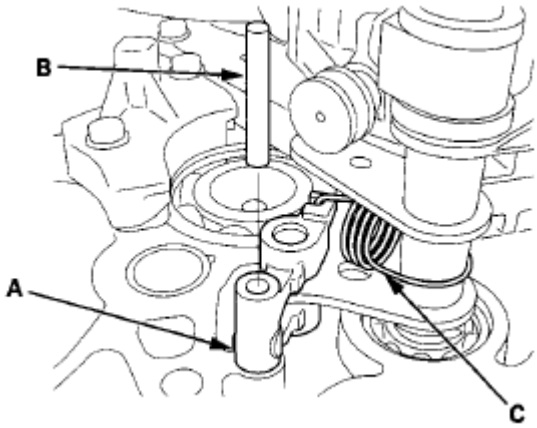

Fig. 421: Identifying Detent Arm, Detent Arm Shaft And Detent Arm Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Remove the selector control shaft (A).

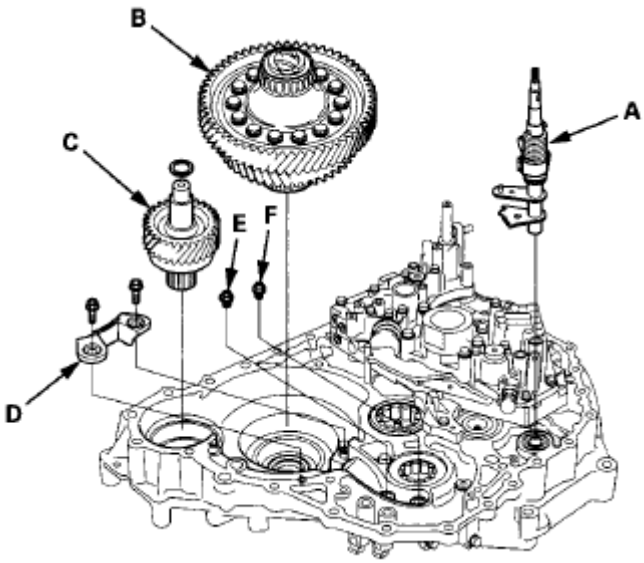

Fig. 422: Identifying Selector Control Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Remove the differential assembly (B).
35. With SH-AWD: Remove the transfer output shaft (C) with the thrust shim.
36. Remove the oil catch plate (D), the 2nd air check valve (E), and the 5th air check valve (F).
37. Remove the cooler retainer cap (A).

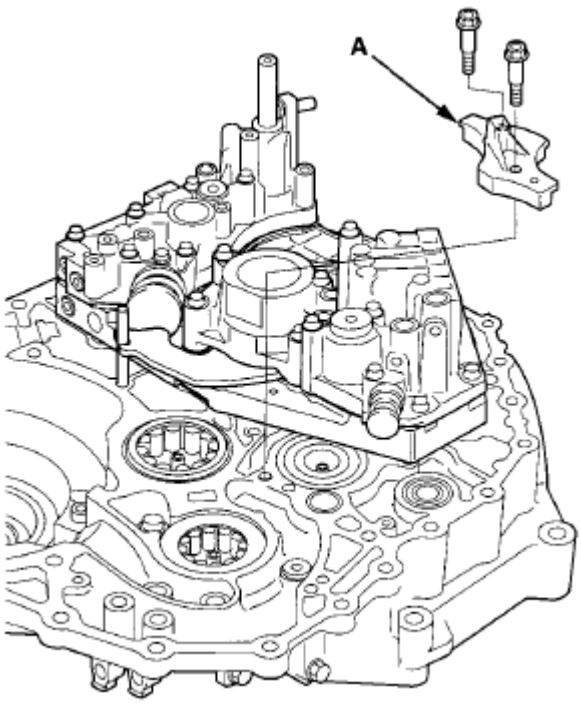

Fig. 423: Identifying Cooler Retainer Cap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Remove the 3rd air check valve (A), the 6th air check valve (B), the stator shaft support (C), the stator shaft (D), the stator shaft stop (E), and the dowel pins (F) (two).

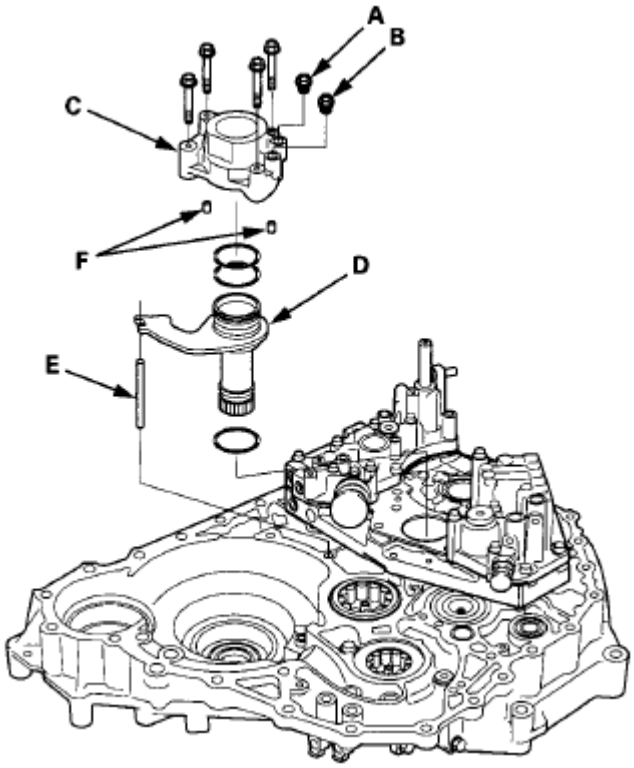

Fig. 424: Identifying 3rd And 6th Air Check Valves, Stator Shaft Support, Stator Shaft And Stop And Dowel Pins
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Remove the manual valve body (A) (seven bolts), the dowel pins (B) (two), the manual separator plate (C), and the check balls (D) (two). Do not let the check balls fall out, and do not use a magnet to remove the check balls, it may magnetize them.

NOTE: Do not disassemble the manual valve body. If any problem occurs, replace the assembly.

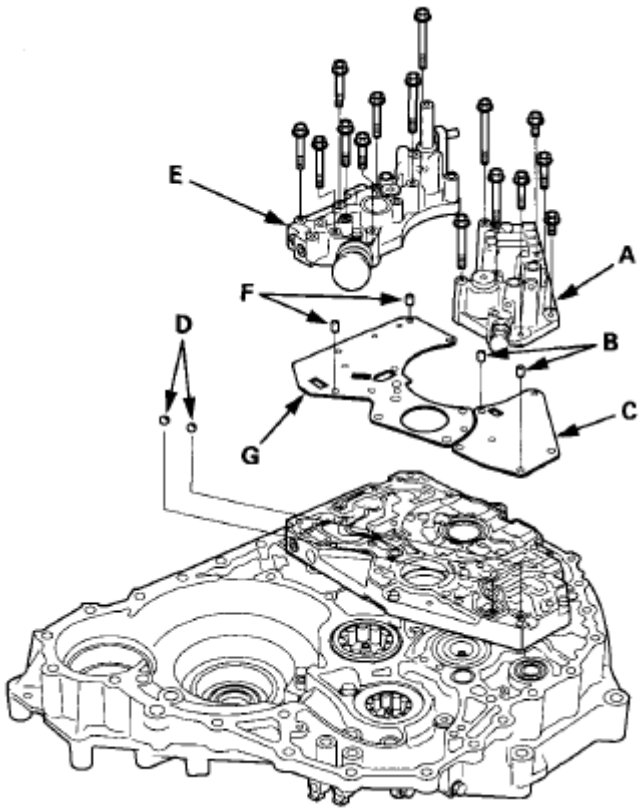

Fig. 425: Identifying Manual Valve Body, Dowel Pins, Manual Separator Plate And Check Balls
Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Remove the regulator valve body (E) (eight bolts), the dowel pins (F) (two), and the regulator separator plate (G).

NOTE: Do not disassemble the regulator valve body. If any problem occurs, replace the assembly.

41. Remove the 4th/reverse air check valve (A) and the main valve body (B) (eight bolts).

NOTE: Do not disassemble the main valve body. If any problem occurs, replace the assembly.

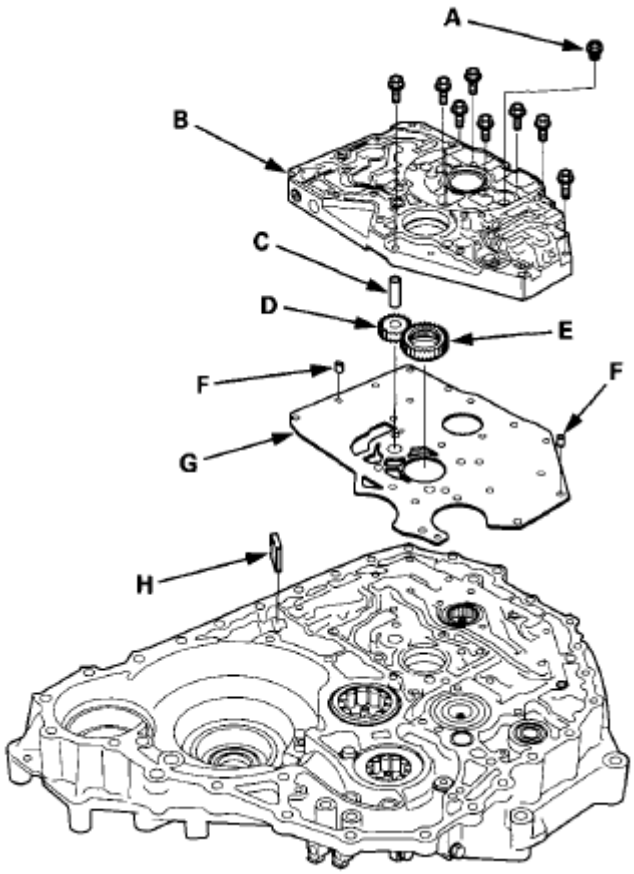

Fig. 426: Identifying Air Check Valve, Main Valve Body, ATF Pump Driven Gear Shaft, ATF Pump Driven And Drive Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Remove the ATF pump driven gear shaft (C), then remove the ATF pump driven gear (D) and the ATF pump drive gear (E).
43. Remove the dowel pins (F) (two) and the main separator plate (G).
44. Remove the ATF magnet (H), clean it, then reinstall it in the torque converter housing.
45. Clean the inlet opening (A) of the ATF strainer (B) thoroughly with compressed air, then check that it is good condition and that the inlet opening is not clogged.

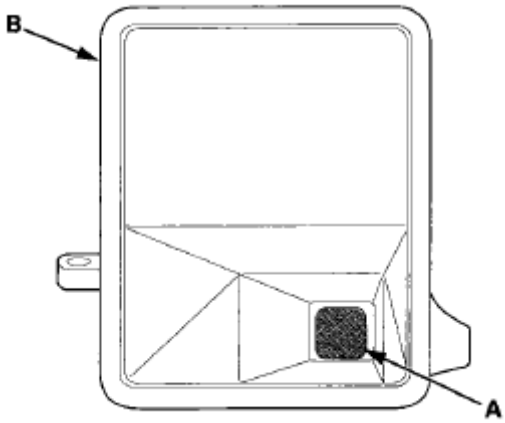

Fig. 427: Identifying Inlet Opening And ATF Strainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Check the ATF strainer for clogs, debris, or damage. If the strainer is clogged or damaged, replace it.

ATF PUMP INSPECTION

1. Lubricate the ATF pump drive gear (A), the ATF pump driven gear (B), and the ATF pump driven gear shaft (C) with ATF, then install them in the main valve body (D). Install the ATF pump driven gear with its grooved and chamfered side facing up.

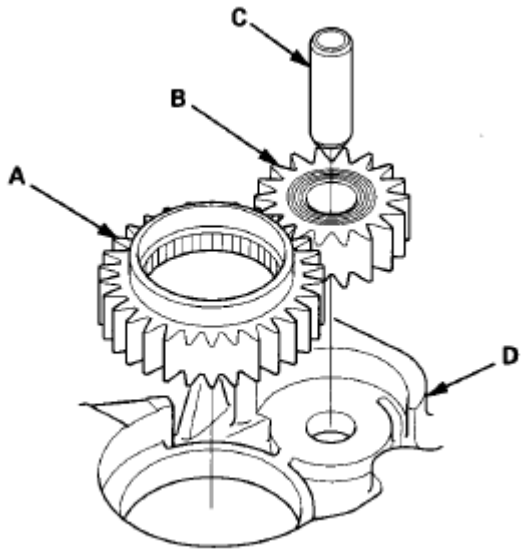

Fig. 428: Identifying ATF Pump Drive Gear, ATF Pump Driven Gear, ATF Pump Driven Gear Shaft And Main Valve Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the side clearance of the ATF pump drive gear (A) and the ATF pump driven gear (B).

ATF Pump Gears Side (Radial) Clearance

Standard (New):

ATF Pump Drive Gear

0.210 - 0.265 mm (0.009 - 0.010 in)

ATF Pump Driven Gear

0.070 - 0.125 mm (0.003 - 0.004 in)

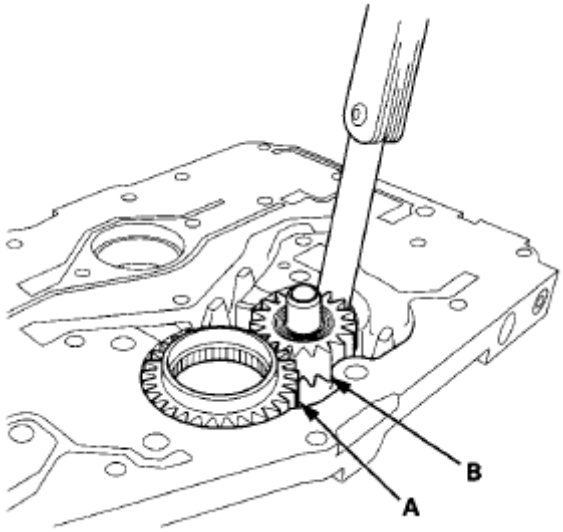

Fig. 429: Measuring Side Clearance Of ATF Pump Drive Gear And ATF Pump Driven Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ATF pump driven gear shaft. Measure the thrust clearance between the ATF pump drive gear (A) and the main valve body (B), and between the ATF pump driven gear (C) and the main valve body using a straight edge (D) and a feeler gauge (E).

ATF Pump Drive/Driven Gear Thrust (Axial)

Clearance

Standard (New): 0.04 - 0.07 mm (0.002 - 0.002 in)

Service Limit: 0.07 mm (0.002 in)

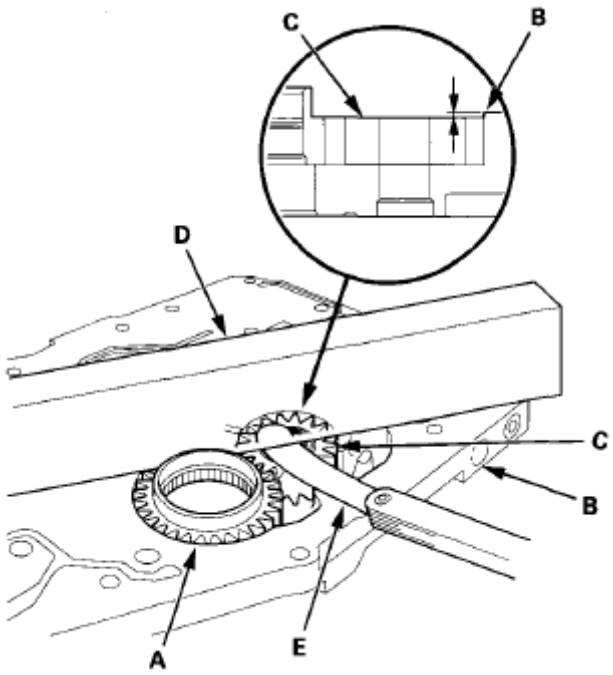

Fig. 430: Identifying ATF Pump Drive And Driven Gear, Main Valve Body, Straight Edge And Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the measurements are out of the standards, replace the main valve body assembly.

REVERSE IDLER GEAR REMOVAL/INSTALLATION

1. Remove the reverse idler gear assembly (A) from the transmission housing.

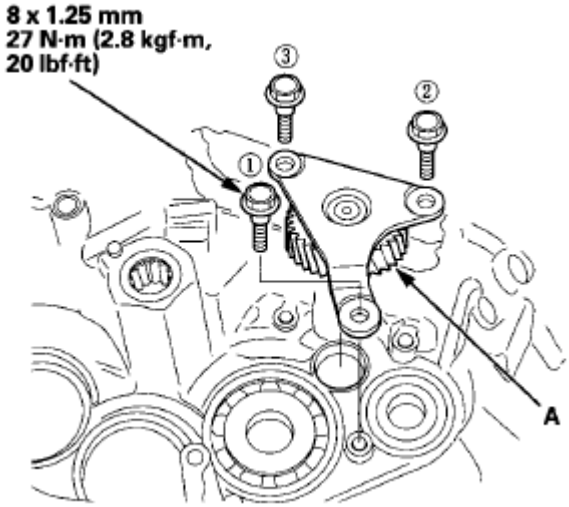

Fig. 431: Identifying Reverse Idler Gear Assembly With Tightening Sequence & With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the reverse idler gear assembly in the transmission housing. Tighten the bolts in the numbered sequence shown.

MAINSHAFT BEARING REMOVAL

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Seal Driver Attachment, 80 mm ID. 07VAD-P8A010A

1. Remove the reverse idler gear assembly (see **REVERSE IDLER GEAR REMOVAL/INSTALLATION**).
2. To remove the mainshaft bearing, expand the snap ring using snap ring pliers, then push the bearing out using the 15 x 135L driver handle and the 80 mm I.D. seal driver attachment. Do not remove the snap ring unless it is necessary to clean the groove in the transmission housing.

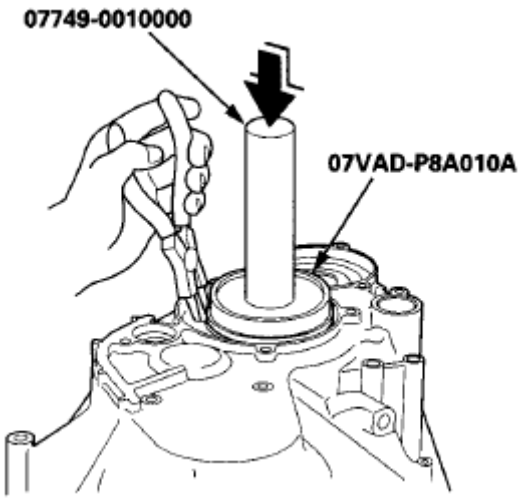

Fig. 432: Expanding Snap Ring Using Snap Ring Pliers To Remove Mainshaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINSHAFT BEARING INSTALLATION

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Seal Driver Attachment, 80 mm ID. 07VAD-P8A010A

1. Install the mainshaft bearing (A) in the direction shown.

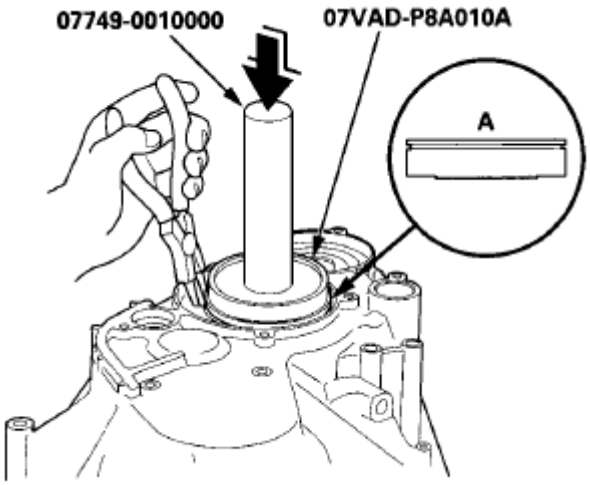

Fig. 433: Installing Mainshaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Expand the snap ring using snap ring pliers, and insert the bearing part-way into the transmission housing using the 15 x 135L driver handle and the 80 mm I.D. seal driver attachment.
3. Release the snap ring pliers, then push the bearing down into the transmission housing until the snap ring snaps in place around it.
4. After installing the bearing, check that the snap ring (A) is seated in the bearing and the housing groove, and that the snap ring end gap (B) is 0 - 7 mm (0 - 0.28 in).

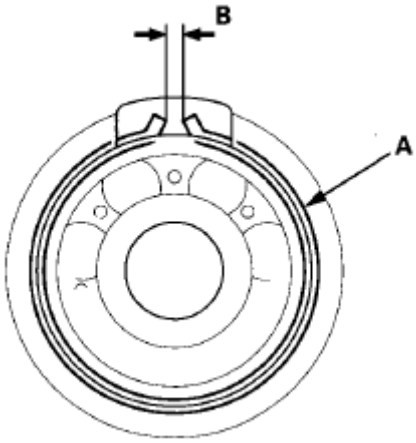

Fig. 434: Identifying Snap Ring And Snap Ring End Gap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the reverse idler gear assembly (see **REVERSE IDLER GEAR REMOVAL/INSTALLATION**).

THIRD SHAFT BEARING REMOVAL

Special Tools Required

- Oil Seal Driver Attachment, 71.5mm 07GAD-SE00100
- Driver Handle, 15 x 135L 07749-0010000

1. Remove the reverse idler gear assembly (see **REVERSE IDLER GEAR REMOVAL/INSTALLATION**).
2. To remove the third shaft bearing, expand the snap ring using snap ring pliers, then push the bearing out using the 15 x 135L driver handle and the 71.5 mm oil seal driver attachment. Do not remove the snap ring unless it is necessary to clean the groove in the transmission housing.

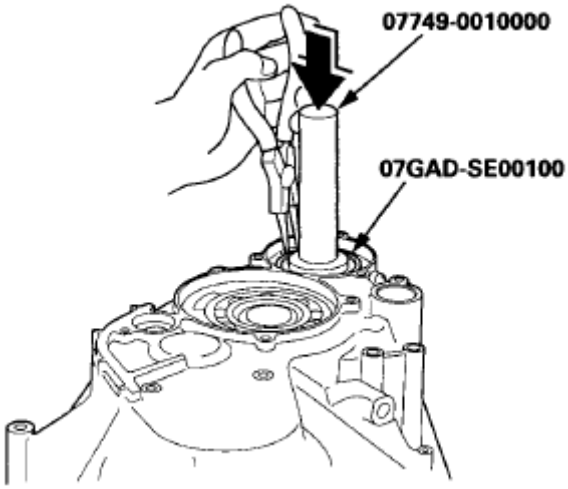

Fig. 435: Expanding Snap Ring Using Snap Ring Pliers To Remove Third Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

THIRD SHAFT BEARING INSTALLATION

Special Tools Required

- Oil Seal Driver Attachment, 71.5mm 07GAD-SE00100
- Driver Handle, 15 x 135L 07749-0010000

1. Install the third shaft bearing (A) in the direction shown.

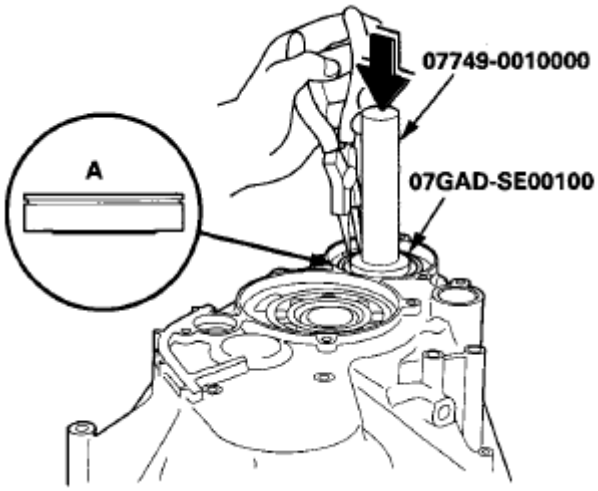

Fig. 436: Installing Third Shaft Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Expand the snap ring using snap ring pliers, and insert the bearing part-way into the transmission housing using the 15 x 135L driver handle and the 71.5 mm oil seal driver attachment.
3. Release the snap ring pliers, then push the bearing down into the transmission housing until the snap ring snaps in place around it.
4. After installing the bearing, check that the snap ring (A) is seated in the bearing and the housing groove, and that the snap ring end gap (B) is 0 - 7 mm (0 - 0.28 in).

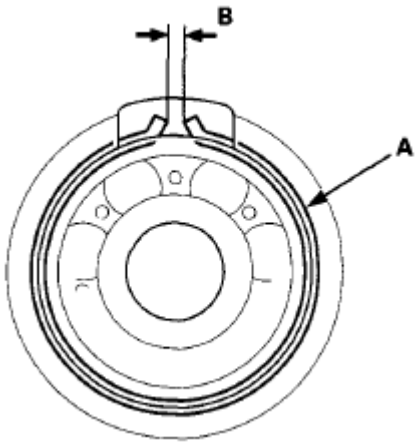

Fig. 437: Identifying Snap Ring And Snap Ring End Gap
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the reverse idler gear assembly (see **REVERSE IDLER GEAR REMOVAL/INSTALLATION**).

IDLER GEAR SHAFT BEARING REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 37 x 40 mm 07746-0010200
- Driver Handle, 15 x 135L 07749-0010000
- Slide Hammer 07936-371020A
- Remover Handle 07936-3710100
- Bearing Remover Shaft Set, 22 mm 070MC-MFR0100

1. Heating the transmission housing to about 212°F (100°C) using a heat gun (A). Do not heat the transmission housing more than 212°F (100°C).

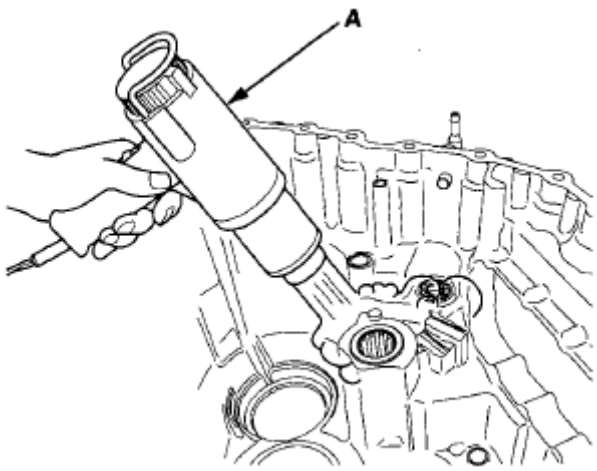

Fig. 438: Heating Transmission Housing To About 212°F (100°C) Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the idler gear shaft bearing from the transmission housing using the 22 mm bearing remover shaft, the remover handle, and the slide hammer.

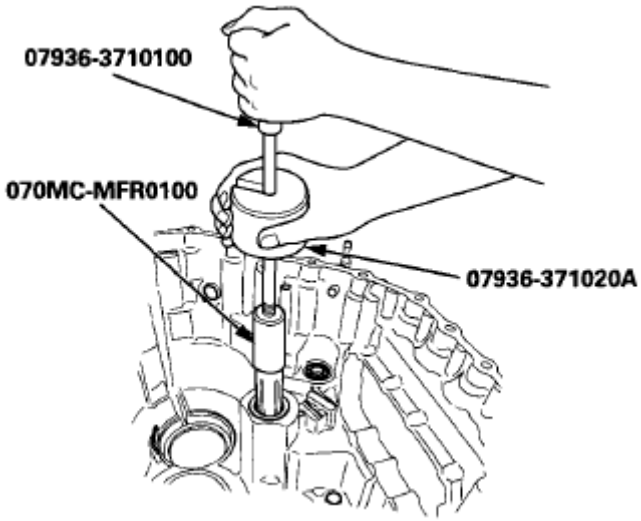

Fig. 439: Removing Idler Gear Shaft Bearing Using Bearing Remover Shaft, Remover Handle And Slide Hammer

Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new bearing until it bottoms in the transmission housing using the 15 x 135L driver handle and the 37 x 40 mm bearing driver attachment.

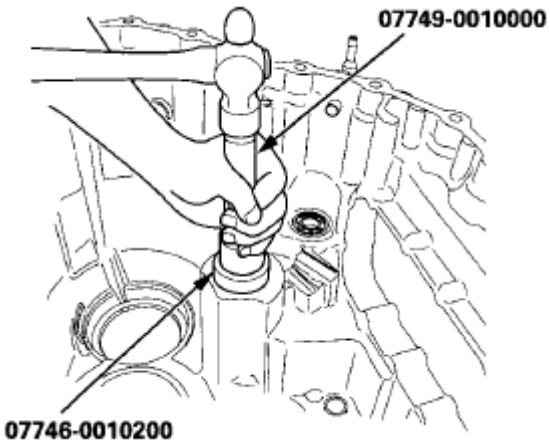

Fig. 440: Installing Bearing In Transmission Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECTOR CONTROL SHAFT BEARING REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Bearing Remover Shaft Set, 15 mm 07936-KC10500
- Slide Hammer 07936-371020A
- Bearing Driver Attachment, 28x30 mm 07946-1870100

1. Remove the selector control shaft bearing from the transmission housing using the 15 mm bearing remover shaft and the slide hammer.

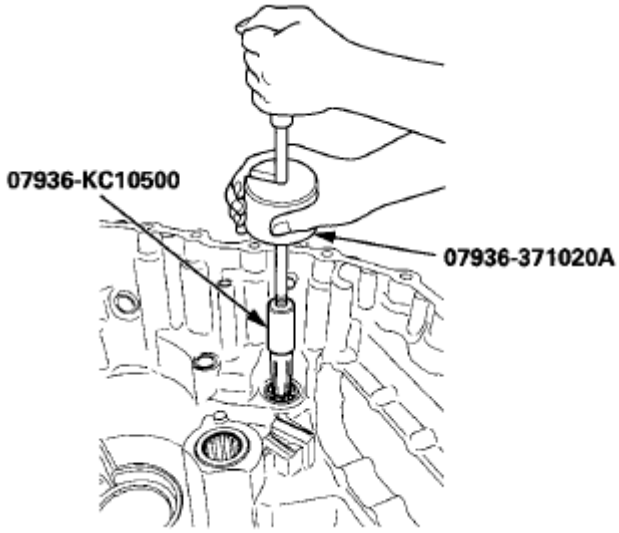

Fig. 441: Removing Selector Control Shaft Bearing Using Bearing Remover Shaft And Slide Hammer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing until it bottoms in the transmission housing using the 15 x 135L driver handle and the 28 x 30 mm bearing driver attachment.

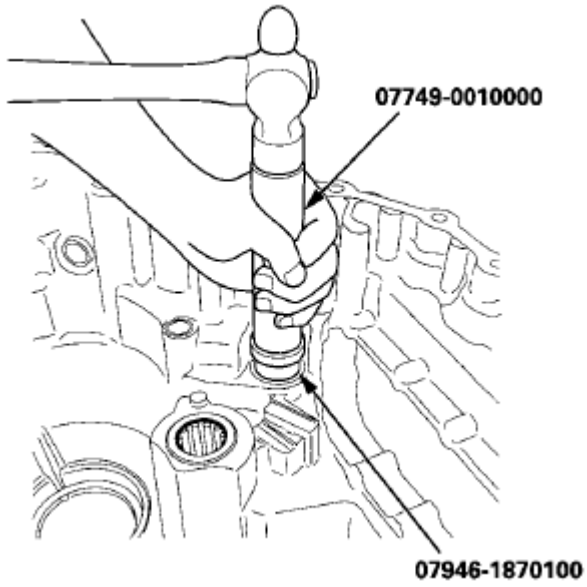

Fig. 442: Installing New Bearing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECTOR CONTROL SHAFT OIL SEAL REPLACEMENT

Special Tools Required

- Attachment, 22 x 24 mm 07746-001A800
- Driver Handle, 15 x 135L 07749-0010000

1. Remove the oil seal from the transmission housing.

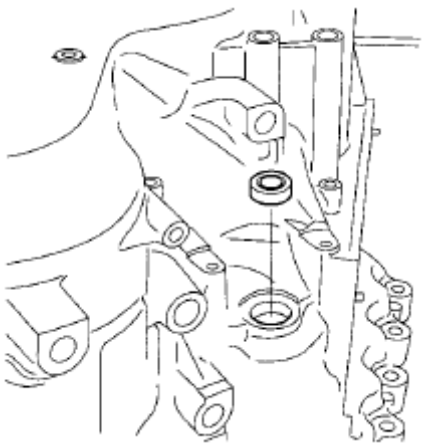

Fig. 443: Removing Oil Seal From Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new oil seal (A) in the transmission housing to a depth (B) of 0.3 - 1.0 mm (0.012 - 0.039 in) below the transmission housing surface (C) using the 15 x 135L driver handle and the 22 x 24 mm attachment.

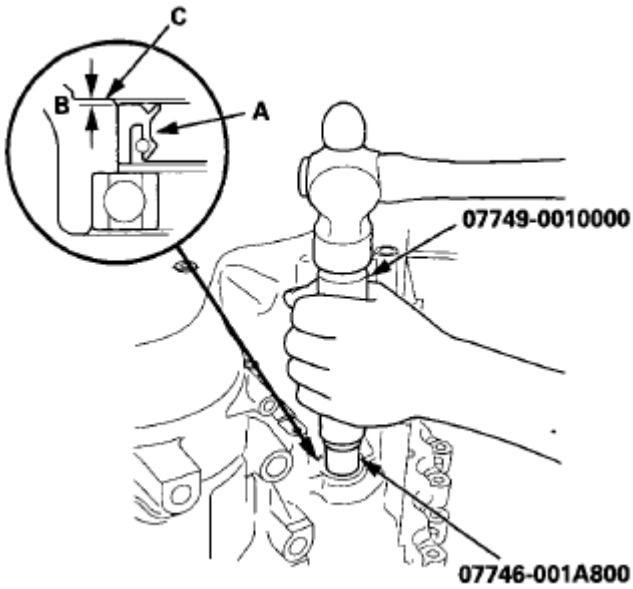

Fig. 444: Installing Oil Seal Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINSHAFT BEARING AND OIL SEAL REPLACEMENT

Special Tools Required

- Adjustable Bearing Puller, 25 - 40 mm 07736-A01000B
- Bearing Driver Attachment, 62x68 mm 07746-0010500
- Bearing Driver Attachment, 72 x 75 mm 07746-0010600
- Driver Handle, 15 x 135L 07749-0010000
- Slide Hammer 07936-371020A
- Bearing Remover Shaft 07JAC-PH80200

1. Remove the oil seal from the torque converter housing.

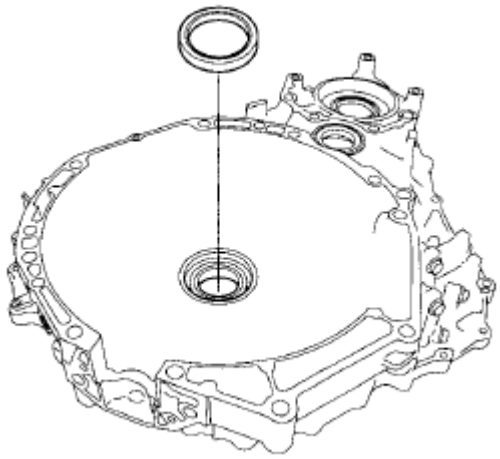

Fig. 445: Removing Oil Seal From Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the mainshaft bearing using the 25- 40 mm adjustable bearing puller, the bearing remover shaft, and the slide hammer.

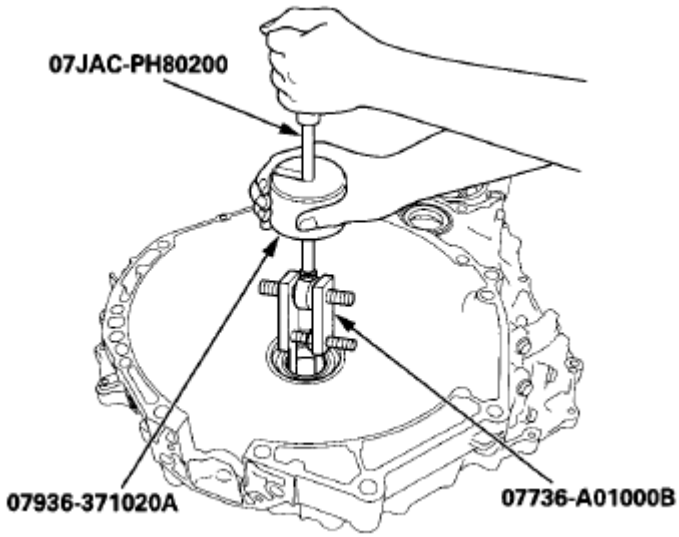

Fig. 446: Removing Mainshaft Bearing Using Adjustable Bearing Puller, Bearing Remover Shaft And Slide Hammer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new bearing until it bottoms in the torque converter housing using the 15 x 135L driver handle and the 62 x 68 mm bearing driver attachment.

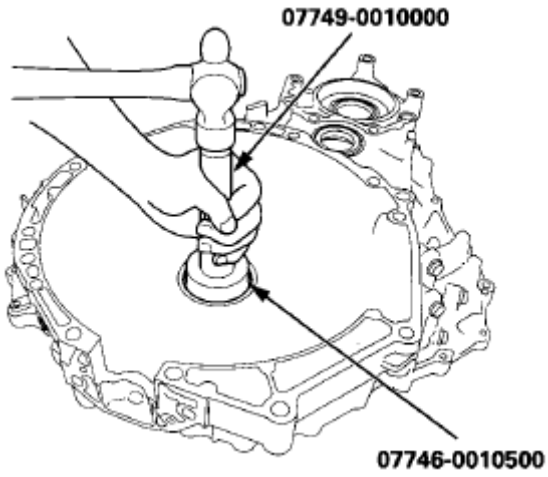

Fig. 447: Installing Bearing In Torque Converter Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new oil seal flush with the torque converter housing using the 15 x 135L driver handle and the 72 x 75 mm bearing driver attachment.

NOTE: Do not drive the oil seal into the torque converter housing until it bottoms out, it will block the fluid return passage and cause transmission damage.

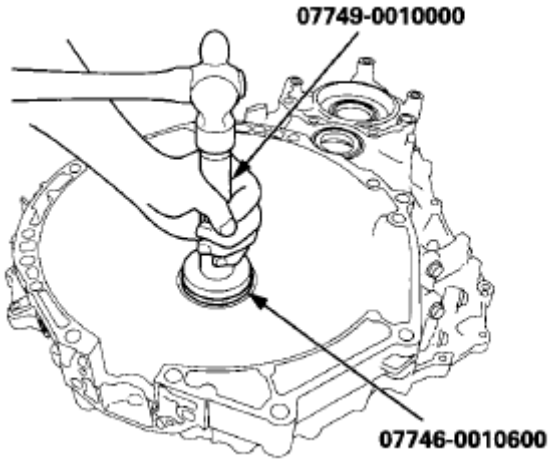

Fig. 448: Installing Oil Seal Flush Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT BEARING REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 72 x 75 mm 07746-0010600
- Adjustable Bearing Puller, 25 - 40 mm 07736-A01000B
- Driver Handle, 15 x 135L 07749-0010000
- Slide Hammer 07936-371020A
- Bearing Remover Shaft 07JAC-PH80200

1. Remove the countershaft bearing from the torque converter housing using the 25- 40 mm adjustable bearing puller, the bearing remover shaft, and the slide hammer.

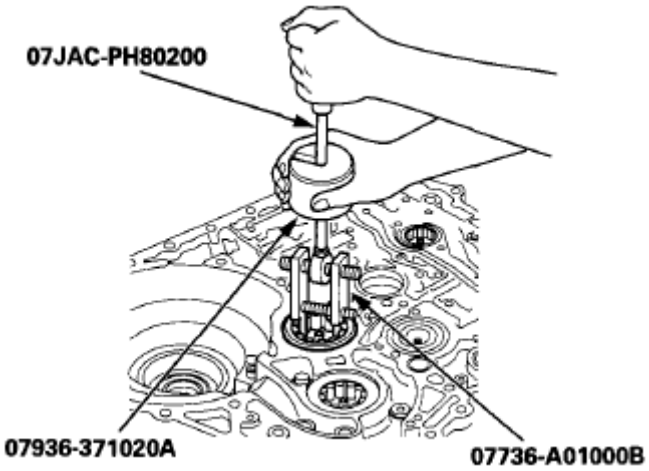

Fig. 449: Removing Countershaft Bearing Housing Using Bearing Puller, Bearing Remover Shaft And Slide Hammer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check the ATF guide plate (A), and replace it if it is damaged.

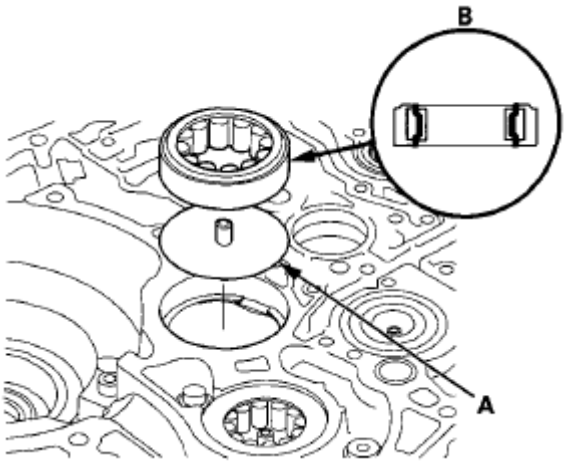

Fig. 450: Identifying ATF Guide Plate And Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new bearing (B) in the direction shown.
4. Drive the bearing (A) in the torque converter housing using the 15 x 135L driver handle and the 72 x 75 mm bearing driver attachment; install the bearing outer notch-cut (B) to a depth (C) of 0- 0.14 mm (0- 0.0055 in) below the torque converter housing surface (D). 07749-0010000

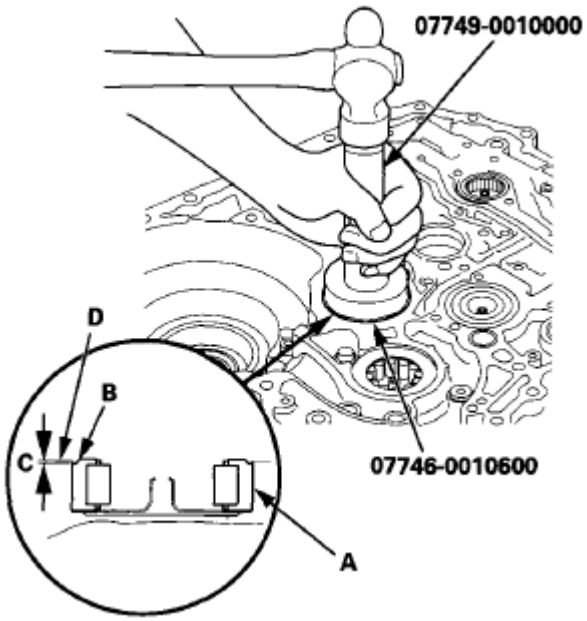

Fig. 451: Driving Bearing In Torque Converter Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY SHAFT BEARING REPLACEMENT

Special Tools Required

- Adjustable Bearing Puller, 45- 75 mm 07YAC-0010100
- Bearing Driver Attachment, 62 x 68 mm 07746-0010500
- Driver Handle, 15 x 135L 07749-0010000
- Slide Hammer 07936-371020A
- Bearing Remover Shaft 07JAC-PH80200

1. Remove the secondary shaft bearing from the torque converter housing using the 45- 75 mm adjustable bearing puller, the bearing remover shaft, and the slide hammer.

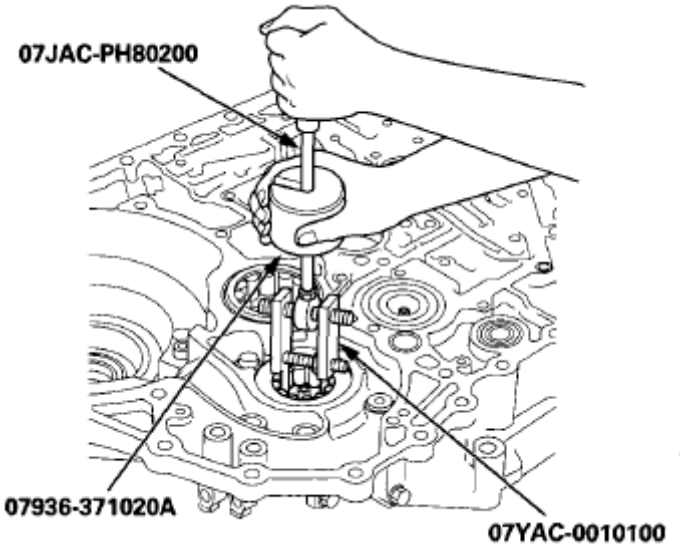

Fig. 452: Removing Secondary Shaft Bearing Using Bearing Puller, Bearing Remover Shaft And Slide Hammer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Cover the tip of the 1st clutch ATF feed pipe with a shop rag. Apply air pressure to the ATF feed pipe hole (A) of the 1st clutch hydraulic circuit, and remove the ATF guide collar (B), the 28.6 x 40.8 x 13 mm secondary shaft bearing (C), and the ATF feed pipe assembly (D) from the transmission housing.

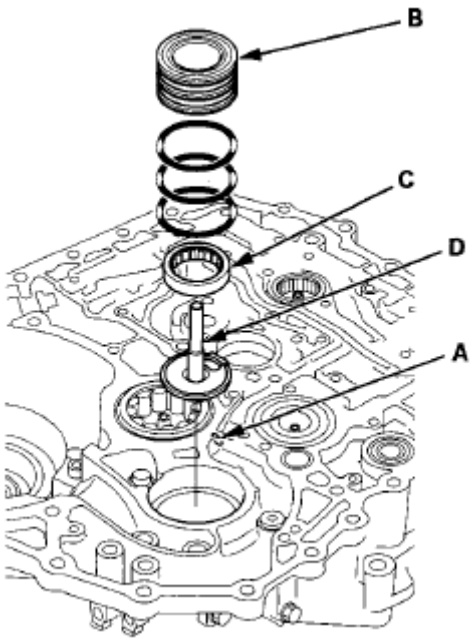

Fig. 453: Identifying ATF Feed Pipe Hole, ATF Guide Collar, Secondary Shaft Bearing And ATF Feed Pipe Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new O-ring (A) on the ATF feed pipe assembly (B), then install the ATF feed pipe assembly in

the torque converter housing by aligning the finger (C) with the groove (D).

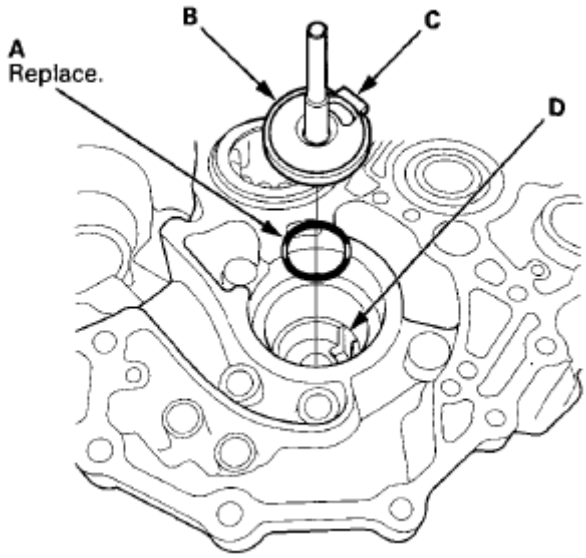

Fig. 454: Identifying O-Ring, ATF Feed Pipe Assembly, Finger And Groove
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the 28.6 x 40.8 x 13 mm bearing (A) into the torque converter housing.

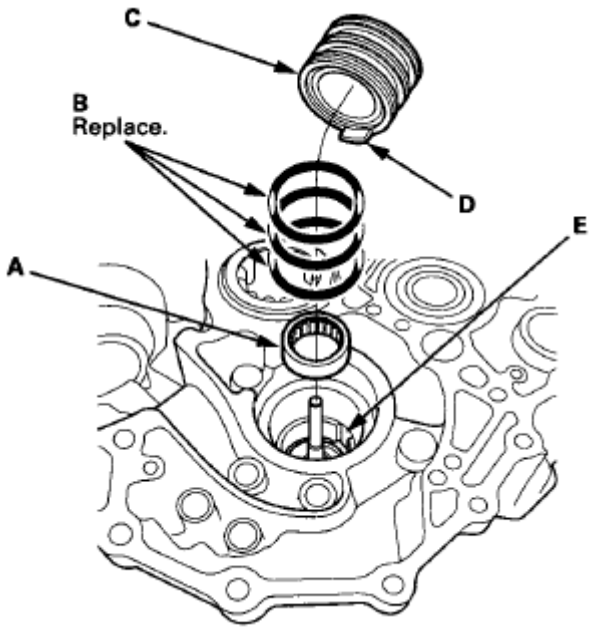

Fig. 455: Identifying Bearing, O-rings, ATF Guide Collar, Finger And Groove
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install new O-rings (B) on the ATF guide collar (C), then install the guide collar in the torque converter housing by aligning the finger (D) with the groove (E).

6. Install the bearing until it bottoms in the direction shown in the torque converter housing using the 15 x 135L driver handle and the 62 x 68 mm bearing driver attachment.

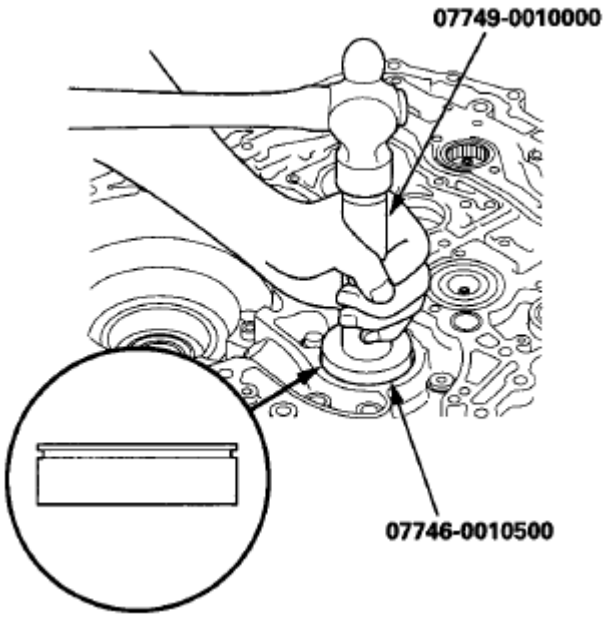

Fig. 456: Installing Bearing In Torque Converter Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

THIRD SHAFT BEARING REPLACEMENT

Special Tools Required

- Adjustable Bearing Puller, 25- 40 mm 07736-A01000B
- Bearing Driver Attachment, 52 x 55 mm 07746-0010400
- Driver Handle, 15 x 135L 07749-0010000
- Slide Hammer 07936-371020A
- Bearing Remover Shaft 07JAC-PH80200

1. Remove the third shaft bearing from the torque converter housing using the 25- 40 mm adjustable bearing puller, the bearing remover shaft, and the slide hammer.

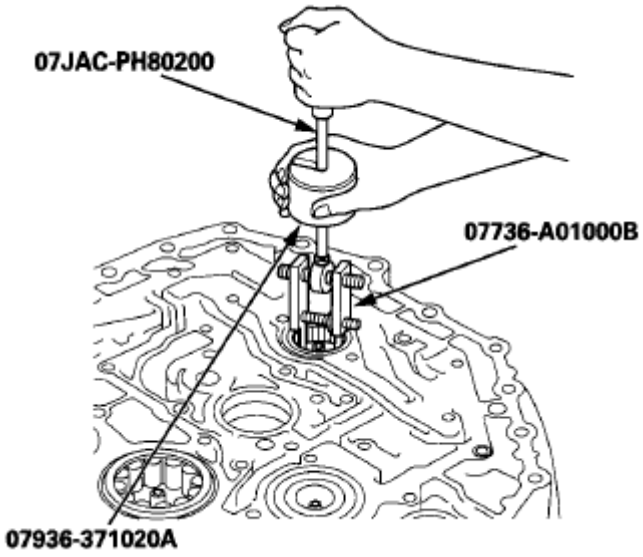

Fig. 457: Removing Third Shaft Bearing Housing Using Bearing Puller, Bearing Remover Shaft And Slide Hammer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check the ATF guide plate (A), and replace it if it is damaged.

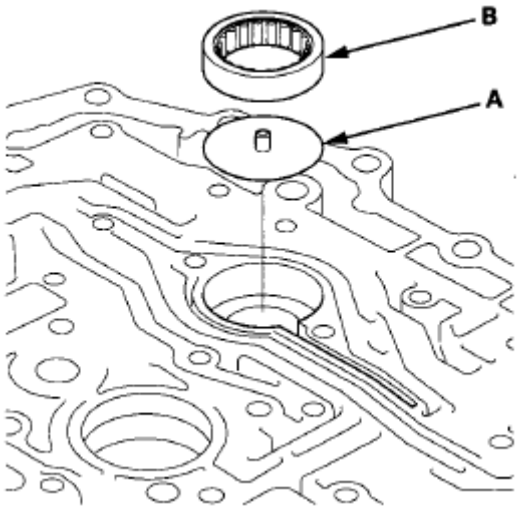

Fig. 458: Identifying ATF Guide Plate And Bearing In Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new bearing (B) in the torque converter housing.
4. Drive the bearing (A) into the torque converter housing using the 15 x 135L driver handle and the 52 x 55 mm bearing driver attachment; install the bearing to a depth (B) of 0 - 0.07 mm (0 - 0.0012 in) below the torque converter housing surface (C).

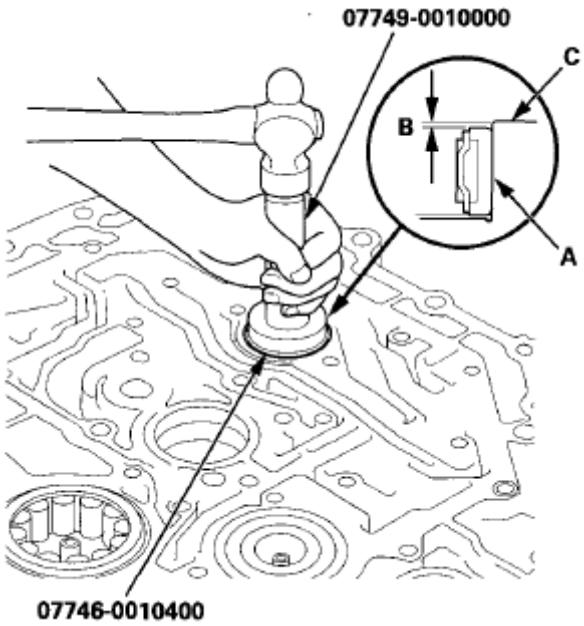

Fig. 459: Drive Bearing Into Torque Converter Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

IDLER GEAR SHAFT BEARING REPLACEMENT

Special Tools Required

- Adjustable Bearing Puller, 25- 40 mm 07736-A01000B
- Bearing Driver Attachment, 52 x 55 mm 07746-0010400
- Driver Handle, 15 x 135L 07749-0010000
- Slide Hammer 07936-371020A
- Bearing Remover Shaft 07JAC-PH80200

1. Remove the idler gear shaft bearing from the torque converter housing using the 25- 40 mm adjustable bearing puller, the bearing remover shaft, and the slide hammer.

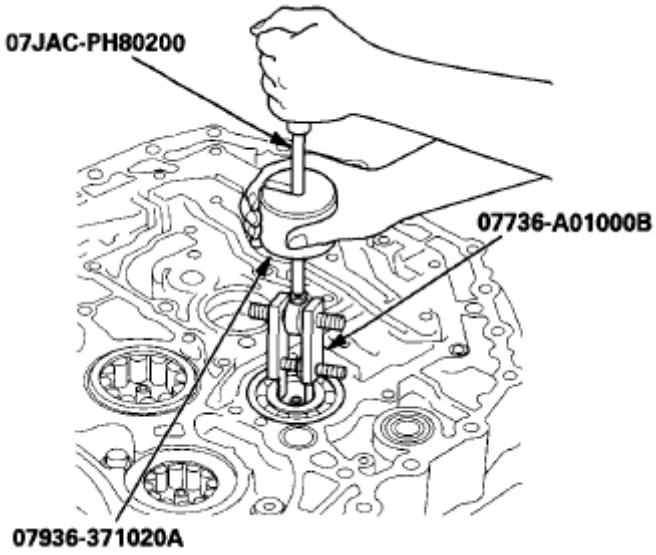

Fig. 460: Removing Idler Gear Shaft Bearing Using Bearing Puller, Bearing Remover Shaft And Slide Hammer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Check the ATF guide plate (A), and replace it if it is damaged.

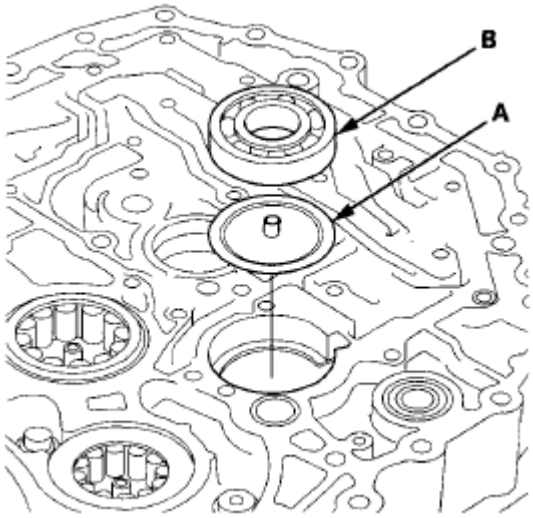

Fig. 461: Identifying ATF Guide Plate And Bearing In Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new bearing (B) in the torque converter housing.
4. Drive the bearing until it bottoms into the torque converter housing using the 15 x 135L driver handle and the 52 x 55 mm bearing driver attachment.

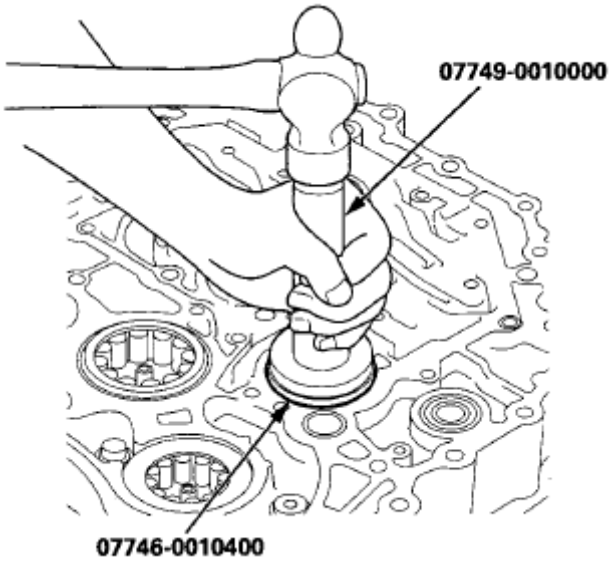

Fig. 462: Driving Bearing Into Torque Converter Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECTOR CONTROL SHAFT BEARING REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 32 x 35 mm 07746-0010100
- Driver Handle, 15 x 135L 07749-0010000
- Slide Hammer 07936-371020A
- Bearing Remover Shaft Set, 15 mm 07936-KC10500

1. Remove the selector control shaft bearing from the torque converter housing using the 15 mm bearing remover shaft and the slide hammer.

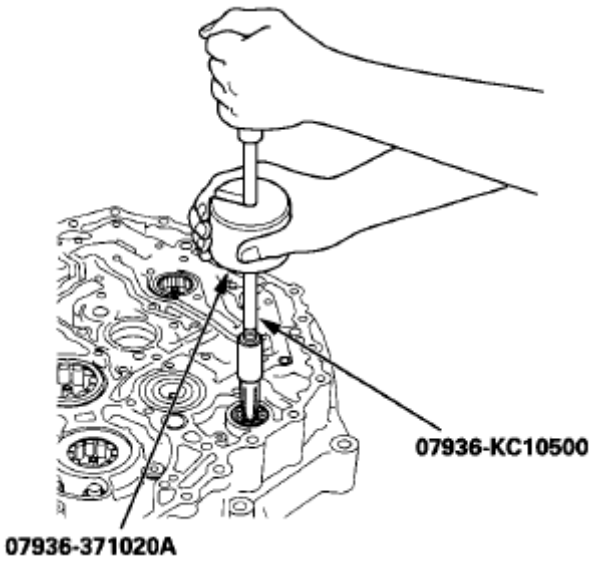

Fig. 463: Removing Selector Control Shaft Bearing Using Bearing Remover Shaft And Slide Hammer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing until it bottoms out in the torque converter housing using the 15 x 135L driver handle and the 32 x 35 mm bearing driver attachment.

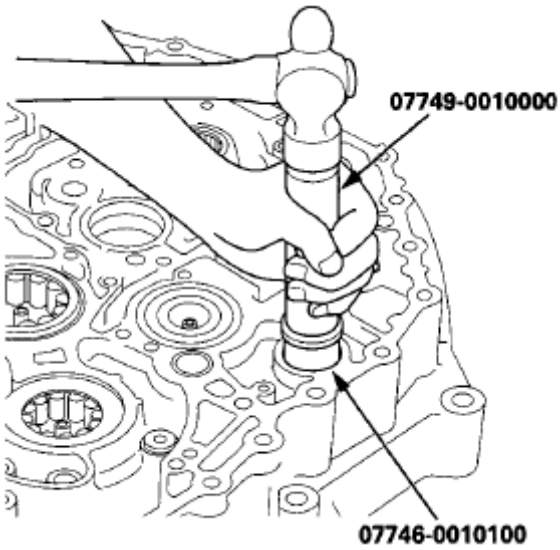

Fig. 464: Installing Bearing In Torque Converter Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINSHAFT DISASSEMBLY

EXPLODED VIEW

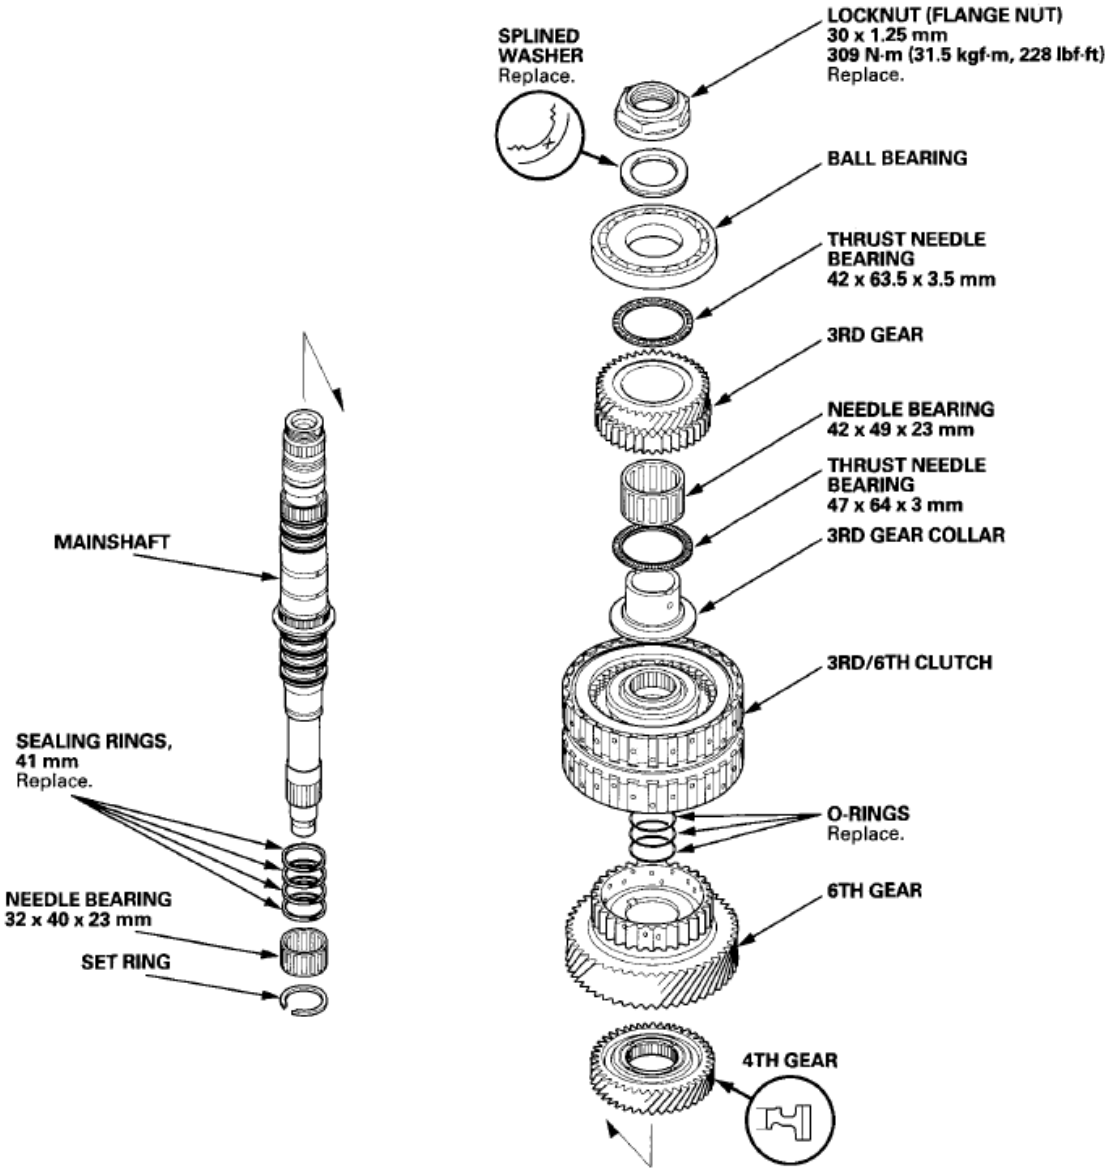

Fig. 465: Exploded View Of Mainshaft With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: Refer to the EXPLODED VIEW as needed during the following procedure.

1. Remove the 42 x 63.5 x 3.5 mm thrust needle bearing (A), 3rd gear (B), the 42 x 49 x 23 mm needle bearing (C), and the 47 x 64 x 3 mm thrust needle bearing (D) from the mainshaft (E).

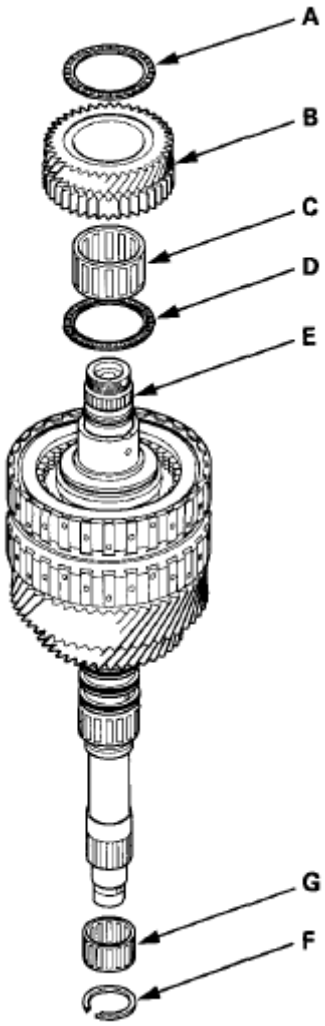

Fig. 466: Removing Thrust Needle Bearing, 3rd Gear, Needle Bearing And Thrust Needle Bearing From Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the set ring (F) and the 32 x 40 x 23 mm needle bearing (G).
3. Place 4th gear (A) on press bases (B), and place a spacer (C) between the mainshaft (D) and the press to prevent damaging the mainshaft.

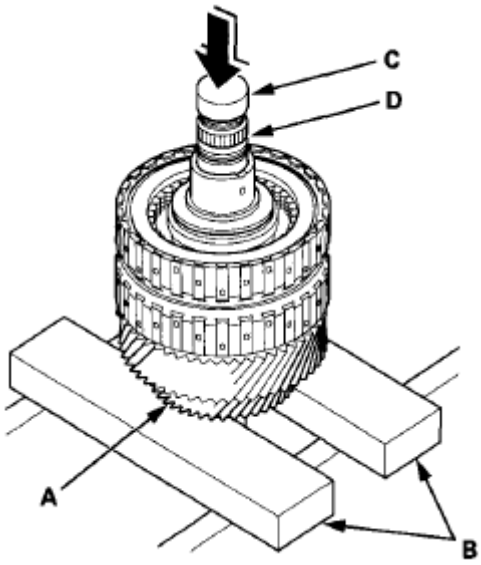

Fig. 467: Identifying 4th Gear, Press Bases, Spacer And Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the 3rd gear collar (A), the 3rd/6th clutch (B), 6th gear (C), and 4th gear (D) using a press.

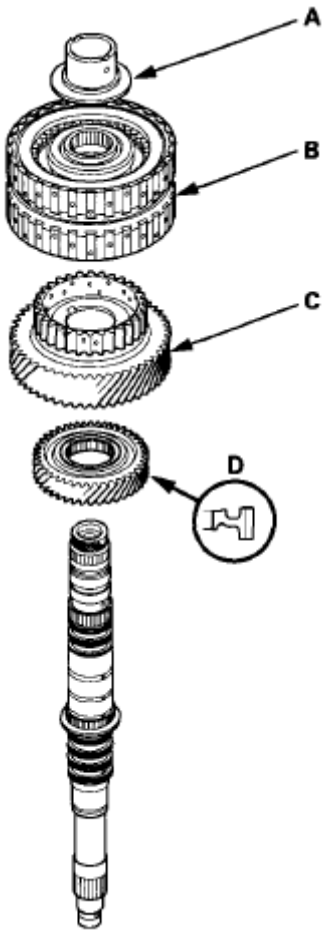

Fig. 468: Identifying 3rd Gear Collar, 3rd/6th Clutch, 6th Gear And 4th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the O-rings (A) from the mainshaft (B).

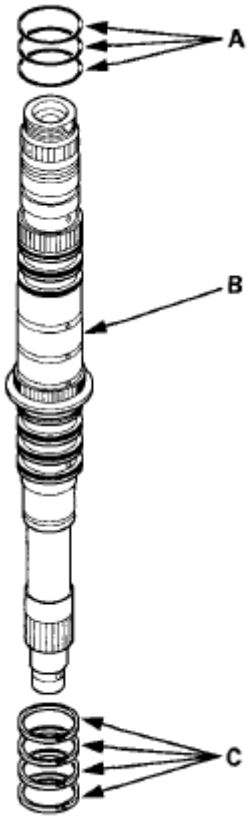

Fig. 469: Identifying O-Rings, Mainshaft And Sealing Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the sealing rings (C) from the mainshaft.
7. Inspect the bearings for galling and rough movement.
8. Check the shaft bearing surfaces for scoring and excessive wear, and check the shaft splines for excessive wear and damage.
9. Inspect 6th gear for wear and damage, and inspect the 6th gear bearing for wear and rough rotation.
10. Replace the 6th gear if the gear or the bearing is worn or damaged.

MAINSHAFT REASSEMBLY

Special Tools Required

- Driver Handle, 40 mm I.D. 07746-0030100
- Bearing Driver Attachment, 35 mm I.D. 07746-0030400

1. Install new sealing rings (A).

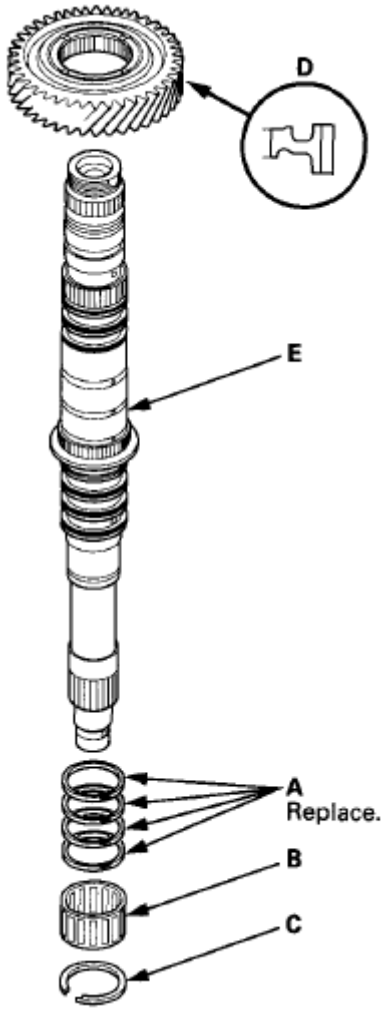

Fig. 470: Identifying Sealing Rings, Needle Bearing, 4th Gear, Mainshaft And Set Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 32 x 40 x 23 mm needle bearing (B) and the set ring (C).
3. Slide 4th gear (D) over the mainshaft (E) in the direction shown.
4. Place 4th gear (A) on press bases (B), and place a spacer (C) between the mainshaft (D) and the press to prevent damaging the mainshaft.

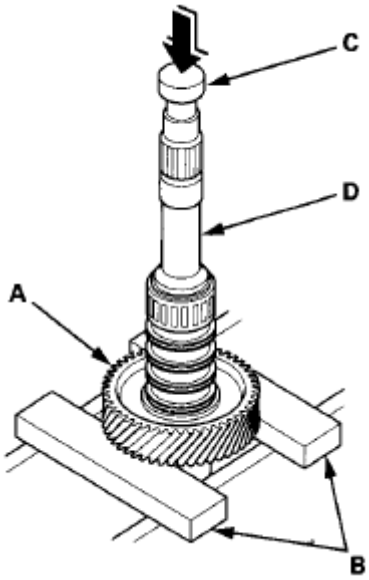

Fig. 471: Identifying 4th Gear, Press Bases, Spacer And Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install 4th gear using a press.
6. Install 6th gear (A) over the mainshaft (B), then press it into place using the 40 mm I.D. driver handle and the press.

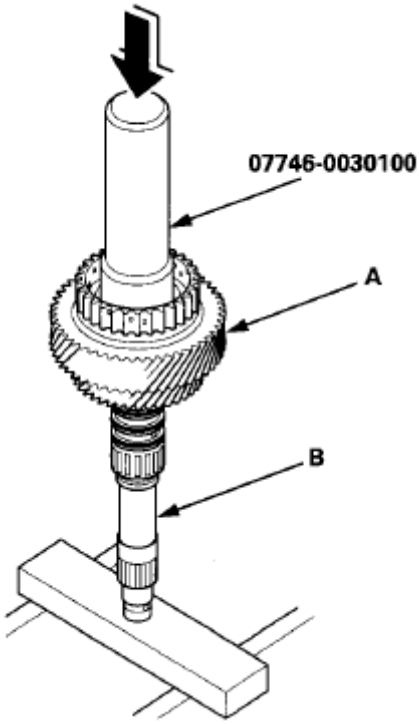

Fig. 472: Identifying 6th Gear And Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Wrap the shaft splines with electrical tape to prevent O-ring damage, install new O-rings (A) on the mainshaft (B), then remove the tape.

NOTE: Lubricate the O-rings with ATF before installing them.

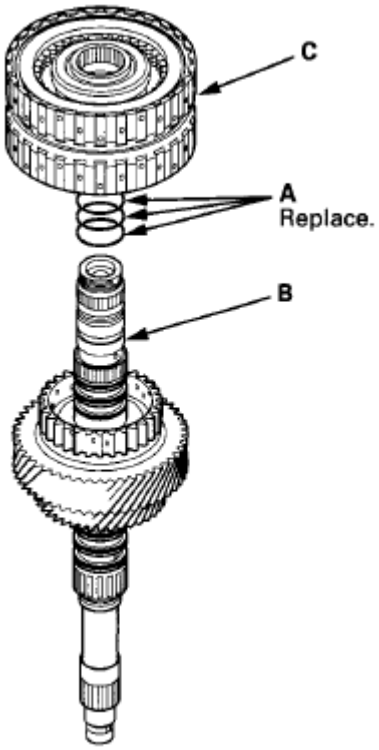

Fig. 473: Identifying O-Rings, 3rd/6th Clutch And Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the 3rd/6th clutch (C).
9. Install the 3rd gear collar (A) over the mainshaft (B), then press it into place using the 40 mm I.D. driver handle, the 35 mm I.D. bearing driver attachment, and the press.

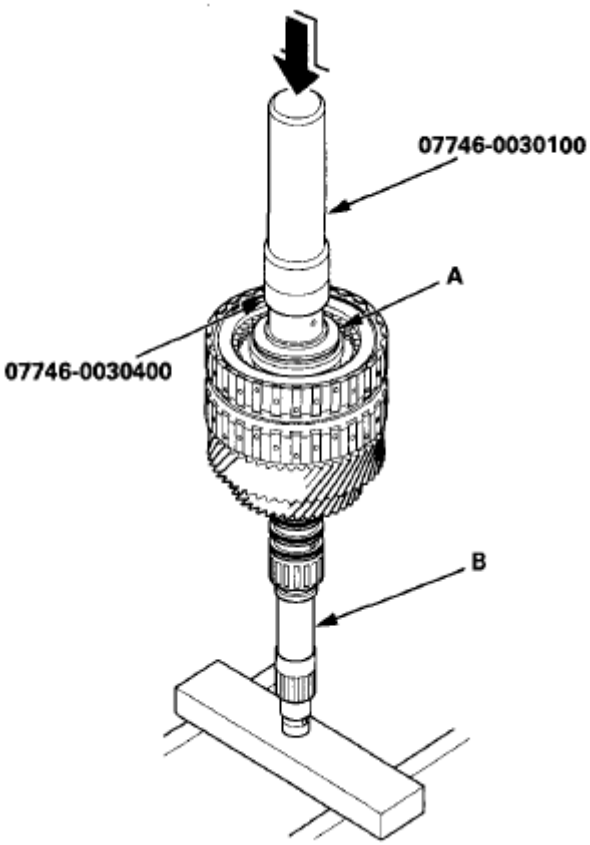

Fig. 474: Installing 3rd Gear Collar Over Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the 47 x 64 x 3 mm thrust needle bearing (A), the 42 x 49 x 23 mm needle bearing (B), 3rd gear (C), and the 42 x 63.5 x 3.5 mm needle bearing (D).

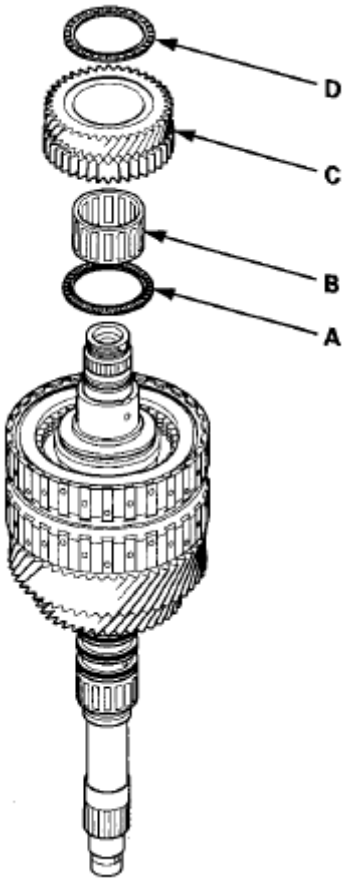

Fig. 475: Identifying Thrust Needle Bearing, Needle Bearing, 3rd Gear, And Needle Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT DISASSEMBLY

EXPLODED VIEW

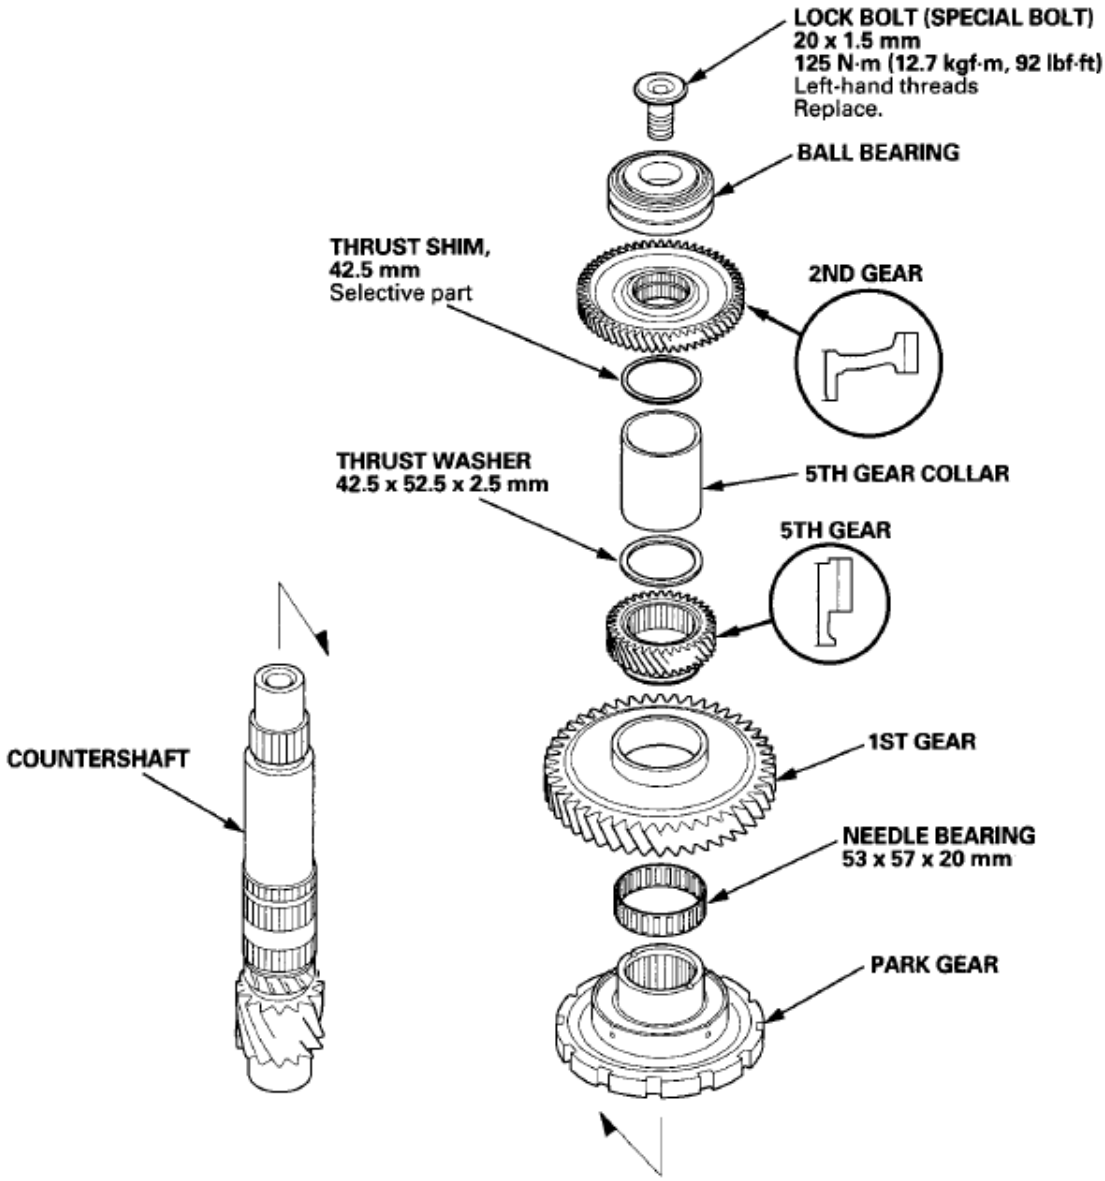

Fig. 476: Exploded View Of Countershaft With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: Refer to the EXPLODED VIEW as needed during the following procedure.

1. Secure the final drive gear part of the countershaft in a bench vise with wood blocks, loosen the lock bolt (A), and remove it. The lock bolt has left-hand threads.

NOTE: After this procedure, remove wood chips that may be stuck to the gear.

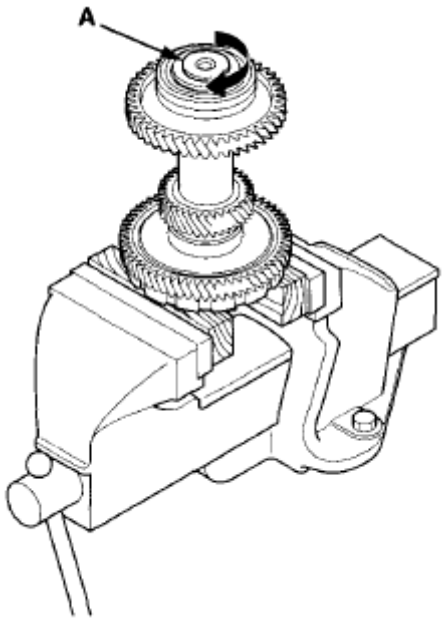

Fig. 477: Loosening Lock Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Place the park gear (A) on press bases (B), and place a spacer (C) between the countershaft (D) and the press to prevent damaging the countershaft.

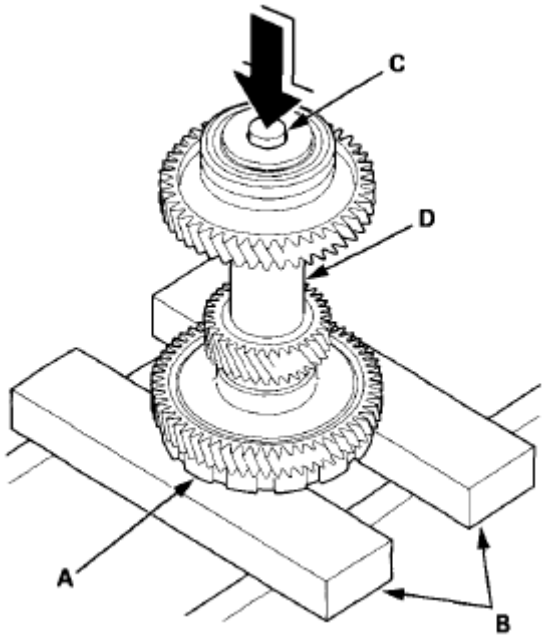

Fig. 478: Placing Park Gear On Press Bases And Place Spacer Between Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the ball bearing (A), 2nd gear (B), the 42.5 mm thrust shim (C), the 5th gear collar (D), the 42.5 x 52.5 x 2.5 mm thrust washer (E), 5th gear (F), 1st gear (G), the 53 x 57 x 20 mm needle bearing (H),

and the park gear (I) using a press.

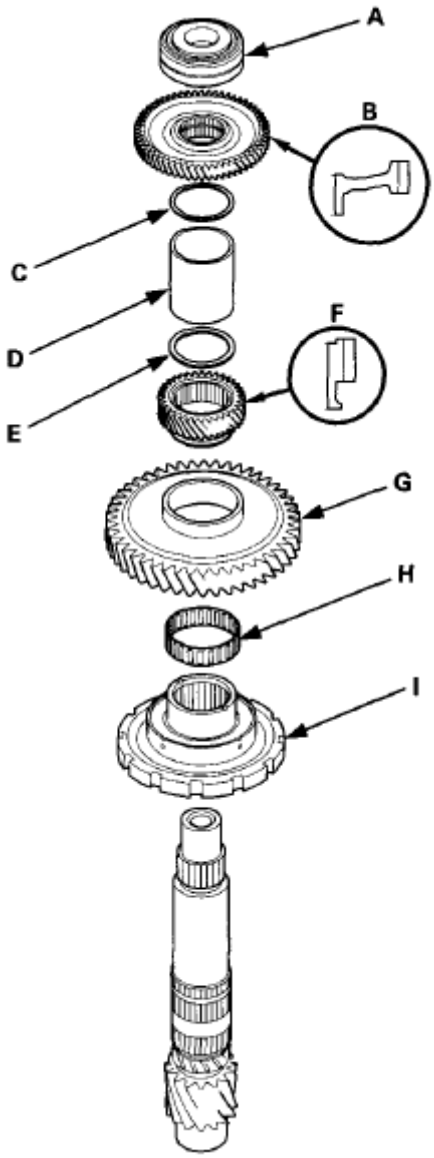

Fig. 479: Identifying Ball And Needle Bearing, 2nd Gear, Thrust Shim, 5th Gear And Collar, Thrust Washer, 1st Gear, And Park Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the bearing for galling and rough movement.
5. Check the shaft bearing surfaces for scoring and excessive wear, and check the shaft splines for excessive wear and damage.
6. Check the countershaft 2nd gear axial clearance and the 5th gear axial clearance (see **COUNTERSHAFT 2ND GEAR AND 5TH GEAR AXIAL CLEARANCE INSPECTION**), and check the 1st gear one-way clutch (see **1ST GEAR ONE-WAY CLUTCH INSPECTION**).

COUNTERSHAFT 2ND GEAR AND 5TH GEAR AXIAL CLEARANCE

INSPECTION

Special Tools Required

Driver Handle, 40 mm I.D. 07746-0030100

1. Slide the park gear (A) over the countershaft (B).

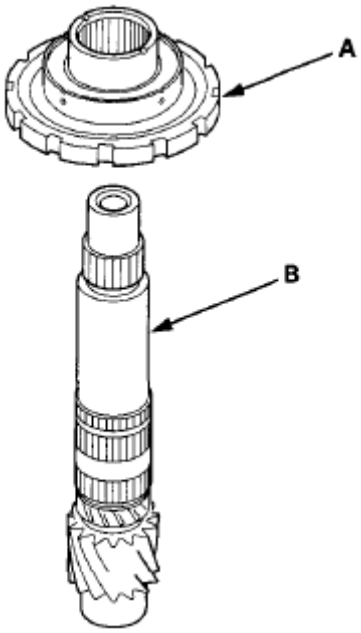

Fig. 480: Identifying Park Gear And Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Place the park gear (A) on press bases (B), and place a spacer (C) between the countershaft (D) and the press to prevent damaging the countershaft.

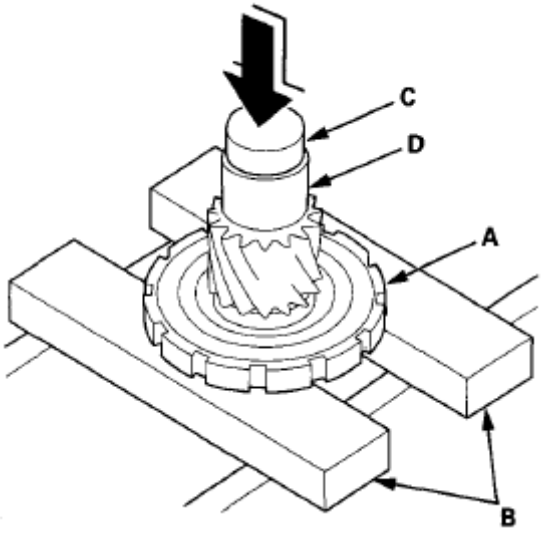

Fig. 481: Placing Park Gear On Press Bases And Place Spacer Between Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the park gear using a press.
4. Install the 53 x 57 x 20 mm needle bearing (A), 1st gear (B), 5th gear (C), the 42.5 x 52.5 x 2.5 mm thrust washer (D), the 5th gear collar (E), the 42.5 mm thrust shim (F), and 2nd gear (G) on the countershaft (H). Install 2nd gear and 5th gear in the direction shown.

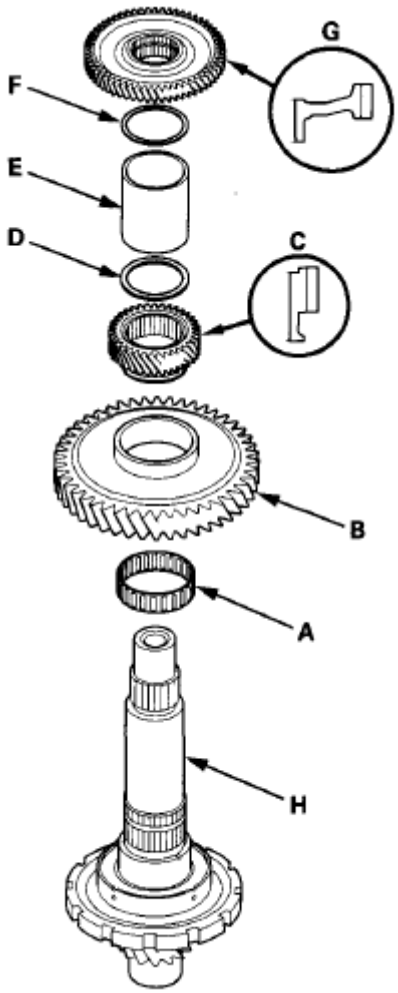

Fig. 482: Identifying Needle Bearing, 1st Gear, 5th Gear, Thrust Washer, Gear Collar, Thrust Shim, And 2nd Gear On Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the ball bearing (A) over the countershaft (B), then press it into place using the 40 mm I.D. driver handle and the press.

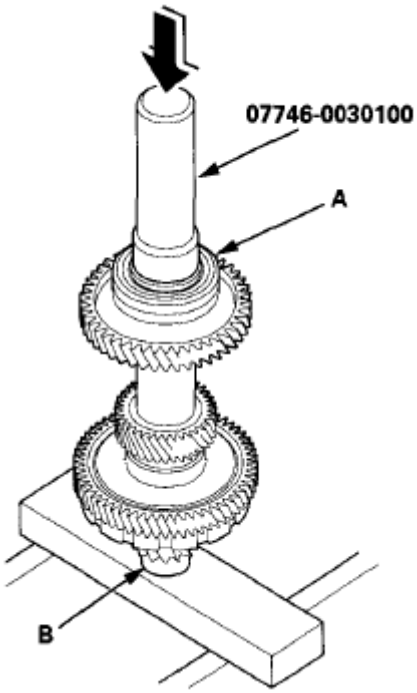

Fig. 483: Identifying Ball Bearing And Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Secure the final drive gear part of the countershaft in a bench vise with wood blocks, install the old lock bolt (A), and tighten it to 125 N.m (12.7 kgf.m, 92 lbf.ft). The lock bolt has left-hand threads.

NOTE: After this procedure, remove wood chips that may be stuck to the gear.

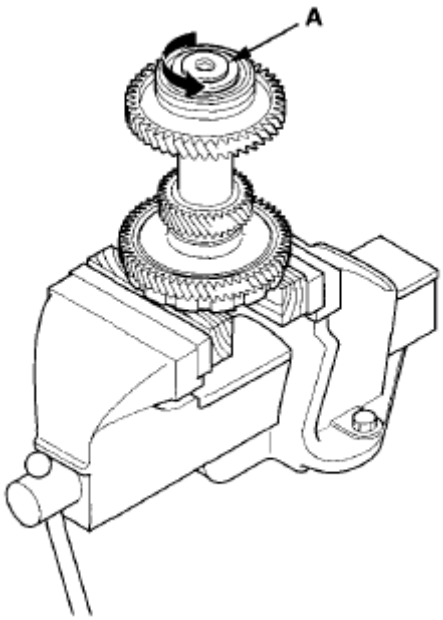

Fig. 484: Installing Lock Bolt

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Measure the clearance between the 5th gear collar (A) and the 42.5 mm thrust shim (B) with a feeler gauge (C) in at least three places. Use the average as the actual clearance.

   Standard: 0.04 - 0.10 mm (0.002 - 0.003 in)

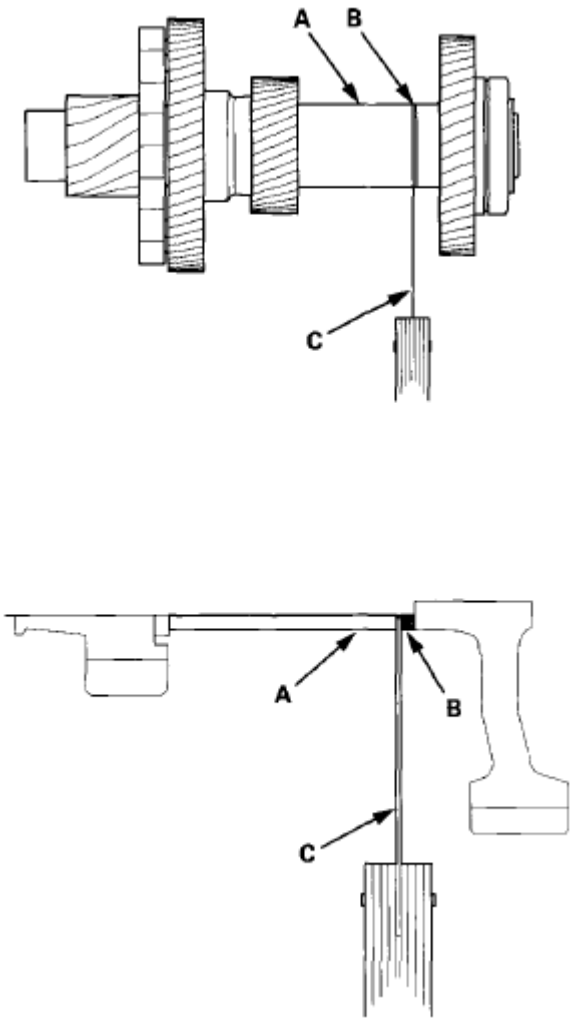

Fig. 485: Measuring Clearance Between 5th Gear Collar And Thrust Shim With Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. If the clearance is out of the standard, remove the 42.5 mm thrust shim and measure its thickness.
9. Select and install a new 42.5 mm thrust shim, then recheck the clearance.

THRUST SHIM, 42.5 MM

No.	Thickness
A	1.82 mm (0.0717 in)
B	1.86 mm (0.0732 in)

C	1.90 mm (0.0748 in)
D	1.94 mm (0.0764 in)
E	1.98 mm (0.0780 in)
F	2.02 mm (0.0795 in)
G	2.06 mm (0.0811 in)
H	2.10 mm (0.0827 in)
I	2.14 mm (0.0843 in)
J	2.18 mm (0.0858 in)
K	2.22 mm (0.0874 in)
L	2.26 mm (0.0890 in)

1ST GEAR ONE-WAY CLUTCH INSPECTION

1. Install the 53 x 57 x 20 mm needle bearing (A) and 1st gear (B) on the park gear (C).

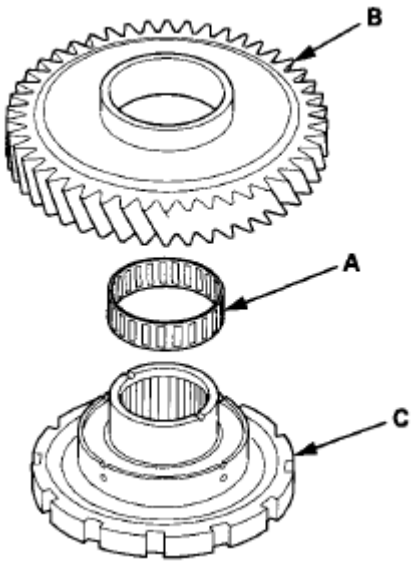

Fig. 486: Installing Needle Bearing And 1st Gear On Park Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Hold the park gear (A), and turn 1st gear (B) in the direction shown to be sure it turns freely. Also make sure 1st gear locks in the opposite direction.

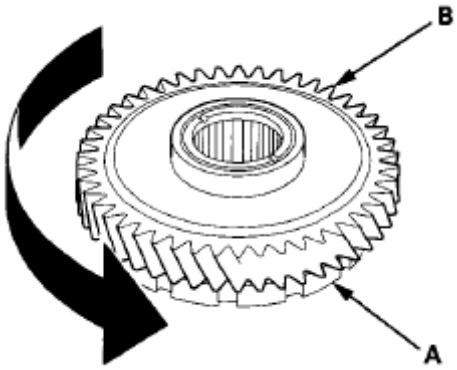

Fig. 487: Identifying Park Gear And 1st Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If any problem occurs on the 1st gear one-way clutch, replace 1st gear. The 1st gear one-way clutch is not available separately from 1st gear.

COUNTERSHAFT REASSEMBLY

Special Tools Required

Driver Handle, 40 mm I.D. 07746-0030100

1. Slide the park gear (A) over the countershaft (B).

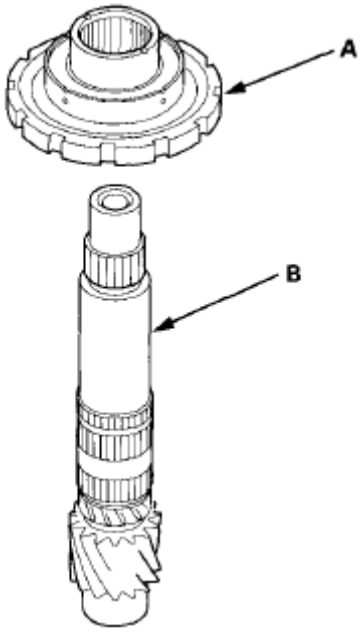

Fig. 488: Identifying Park Gear And Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Place the park gear (A) on press bases (B), and place a spacer (C) between the countershaft (D) and the press to prevent damaging the countershaft.

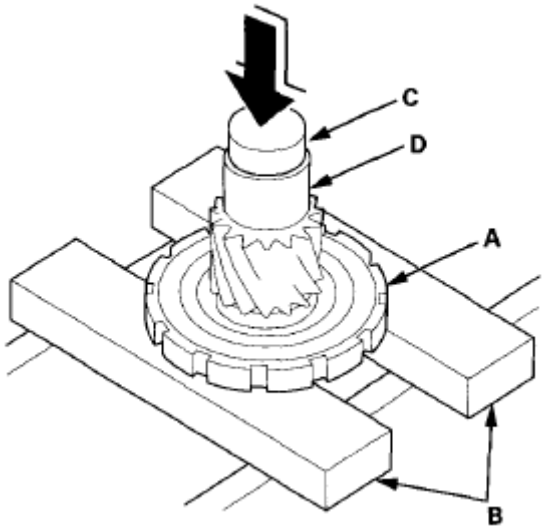

Fig. 489: Placing Park Gear On Press Bases And Place Spacer Between Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the park gear using a press.
4. Install the 53 x 57 x 20 mm needle bearing (A), 1st gear (B), 5th gear (C), the 42.5 x 52.5 x 2.5 mm thrust washer (D), the 5th gear collar (E), the selected 42.5 mm thrust shim (F), and 2nd gear (G) on the countershaft (H). Install 2nd gear and 5th gear in the direction shown.

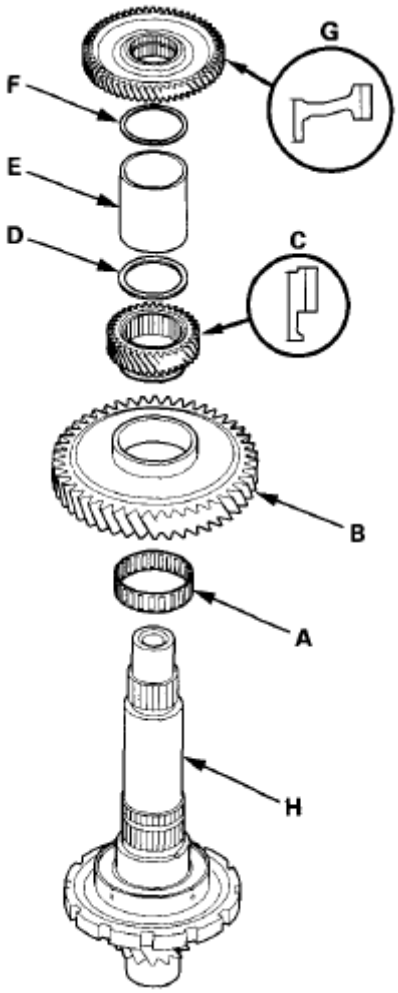

Fig. 490: Identifying Needle Bearing, 1st Gear, 5th Gear, Thrust Washer, 5th Gear Collar, Thrust Shim, 2nd Gear And Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the ball bearing (A) over the countershaft (B), then press it into place using the 40 mm I.D. driver handle and the press.

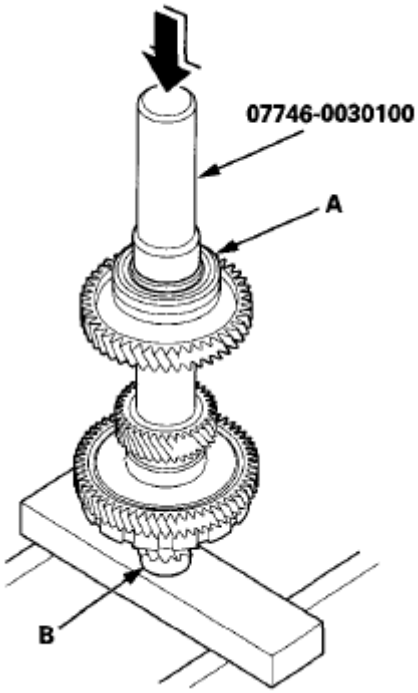

Fig. 491: Installing Ball Bearing Over Countershaft Using Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Secure the final drive gear part of the countershaft in a bench vise with wood blocks, install a new lock bolt (A), and tighten it to 125 N.m (12.7 kgf.m, 92 lbf.ft). The lock bolt has left-hand threads.

NOTE: After this procedure, remove wood chips that may be stuck to the gear.

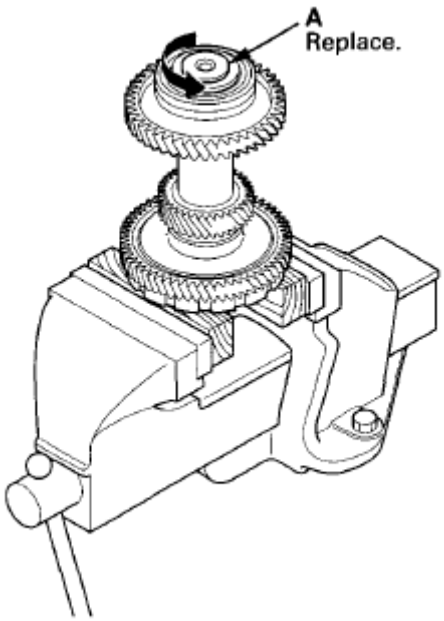

Fig. 492: Installing Lock Bolt

Courtesy of AMERICAN HONDA MOTOR CO., INC.

SECONDARY SHAFT DISASSEMBLY

EXPLODED VIEW

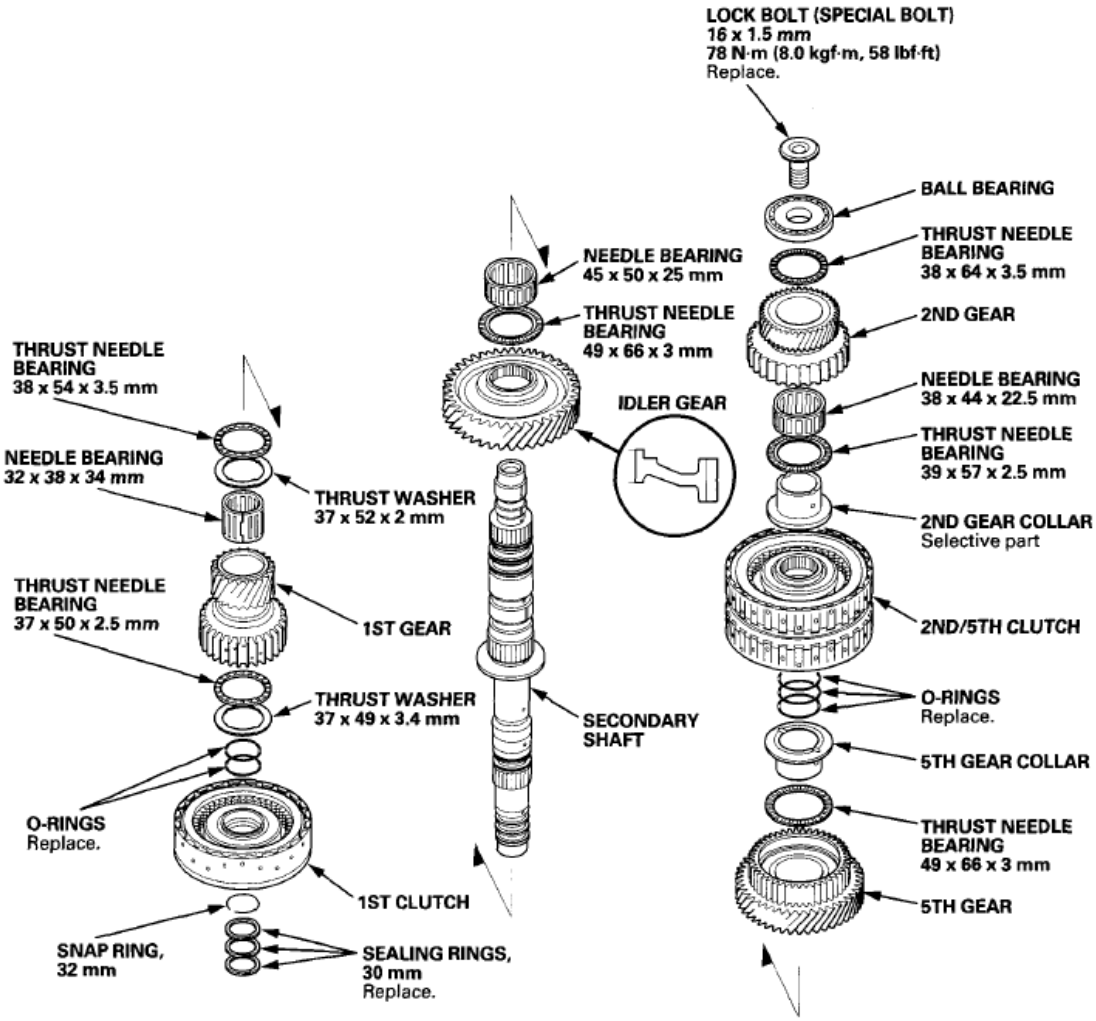

Fig. 493: Exploded View Of Secondary Shaft With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: Refer to the EXPLODED VIEW as needed during the following procedure.

1. Remove the sealing rings (A).

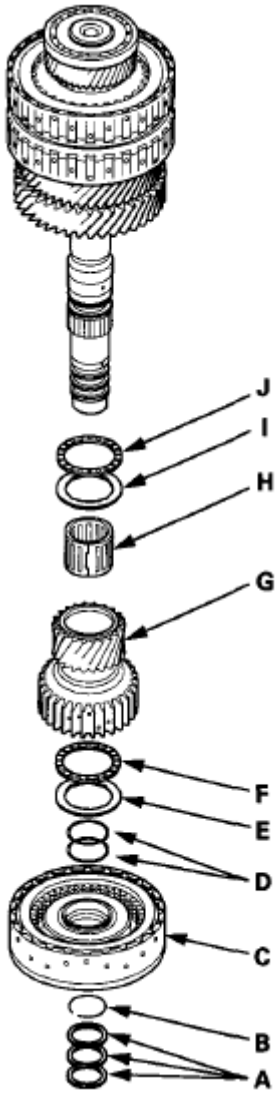

Fig. 494: Identifying Sealing Rings And Snap Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the 32 mm snap ring (B), and remove the 2nd clutch (C) and O-rings (D).
3. Remove the 37 x 49 x 3.4 mm thrust washer (E), the 37 x 50 x 2.5 mm thrust needle bearing (F), 1st gear (G), the 32 x 38 x 34 mm needle bearing (H), the 37 x 52 x 2 mm thrust washer (I), and the 38 x 54 x 3.5 mm thrust needle bearing (J).
4. Secure the idler gear (A) on the secondary shaft (B) in a bench vise with wood blocks, loosen the lock bolt (C), and remove it.

NOTE: After this procedure, remove wood chips that may be stuck to the gear.

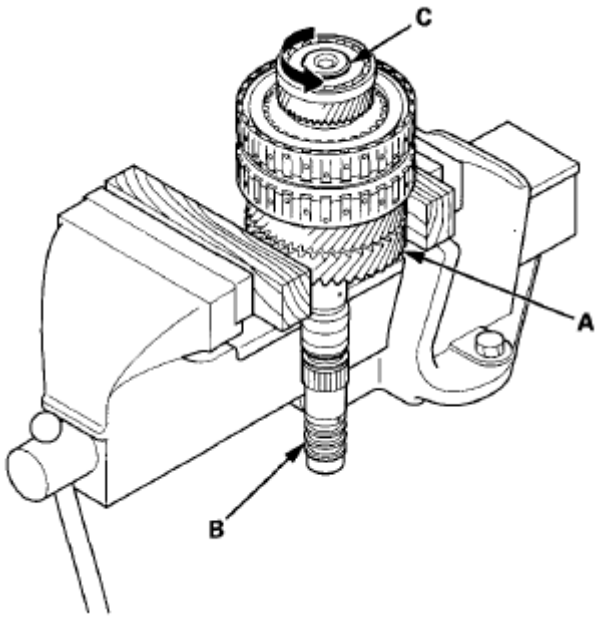

Fig. 495: Loosening Lock Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Place the idler gear (A) on press bases (B), and place a spacer (C) between the secondary shaft (D) and the press to prevent damaging the secondary shaft.

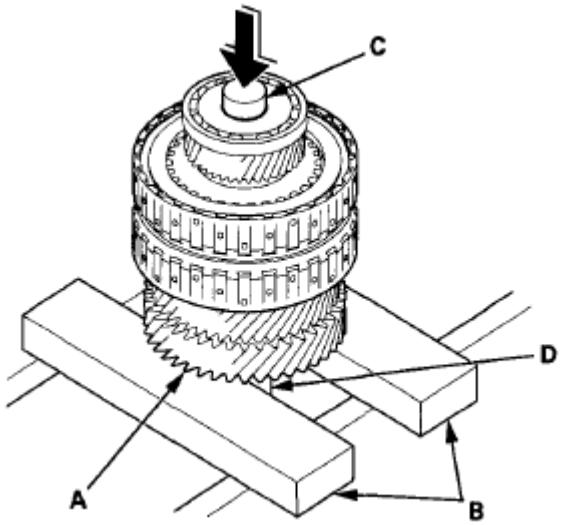

Fig. 496: Placing Idler Gear On Press Bases, And Place Spacer Between Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the ball bearing (A), the 38 x 64 x 3.5 mm thrust needle bearing (B), 2nd gear (C), the 38 x 44 x 22.5 mm needle bearing (D), the 39 x 57 x 2.5 mm thrust needle bearing (E), the 2nd gear collar (F), the 2nd/5th clutch (G), the O-rings (H), the 5th gear collar (I), the 49 x 66 x 3 mm thrust needle bearing (J), 5th gear (K), the 45 x 50 x 25 mm needle bearing (L), the 49 x 66 x 3 mm thrust needle bearing (M), and the idler gear (N) using a press.

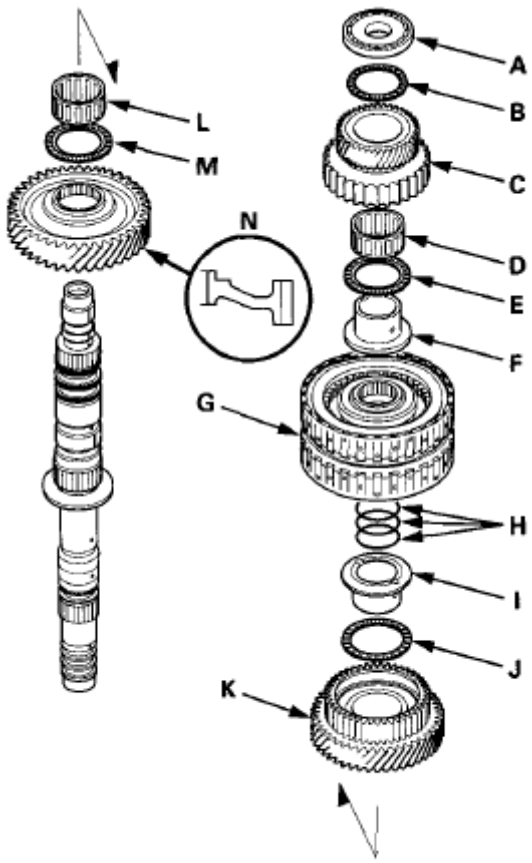

Fig. 497: Identifying Ball And Needle Bearings, Thrust Needle Bearing, 2nd And 5th Gears And Collars, 2nd/5th Clutch, O-Rings And Idler Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Inspect the bearings for galling and rough movement.
8. Check the shaft bearing surfaces for scoring and excessive wear, and check the shaft splines for excessive wear and damage.
9. Check the secondary shaft 2nd gear and 5th gear axial clearance (see **SECONDARY SHAFT 2ND GEAR AND 5TH GEAR AXIAL CLEARANCE INSPECTION**), and check the secondary shaft installation height (see **SECONDARY SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT**).

SECONDARY SHAFT 2ND GEAR AND 5TH GEAR AXIAL CLEARANCE INSPECTION

Special Tools Required

Driver Handle, 40 mm I.D. 07746-0030100

1. Slide the idler gear (A) over the secondary shaft (B) in the direction shown.

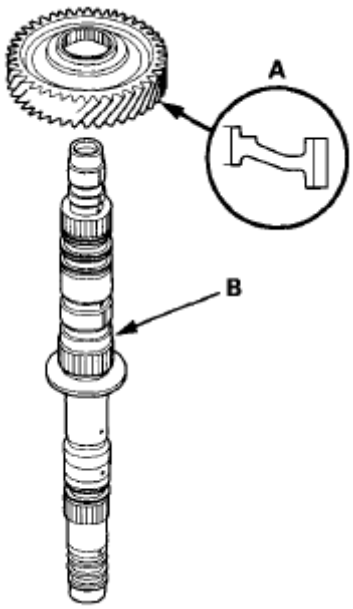

Fig. 498: Identifying Idler Gear And Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Place the idler gear (A) on press bases (B), and place a spacer (C) between the secondary shaft (D) and the press to prevent damaging the secondary shaft.

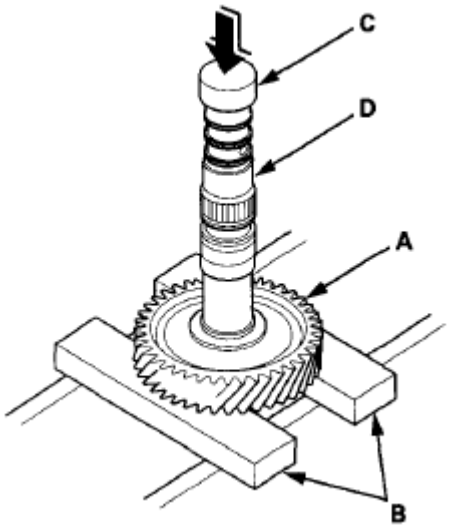

Fig. 499: Placing Idler Gear On Press Bases And Place Spacer Between Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the idler gear using a press.
4. Install the 49 x 66 x 3 mm thrust needle bearing (A), the 45 x 50 x 25 mm needle bearing (B), 5th gear (C), the 49 x 66 x 3 mm thrust needle bearing (D), and the 5th gear collar (E) on the secondary shaft (F).

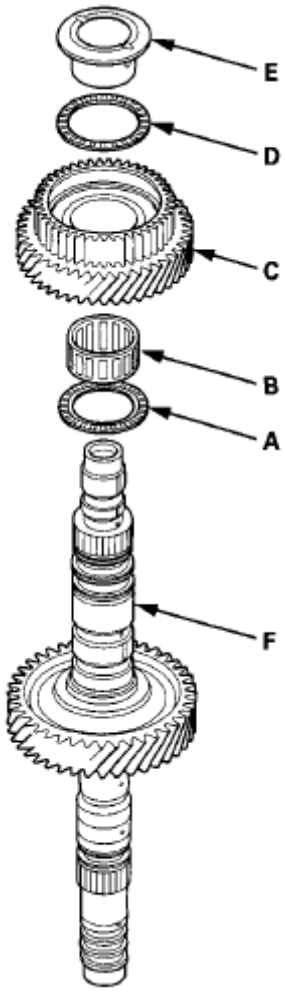

Fig. 500: Identifying Thrust Needle Bearing, Needle Bearing, 5th Gear, Thrust Needle Bearing, 5th Gear Collar And Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Press the 5th gear collar into place using the 40 mm I.D. driver handle and the press.

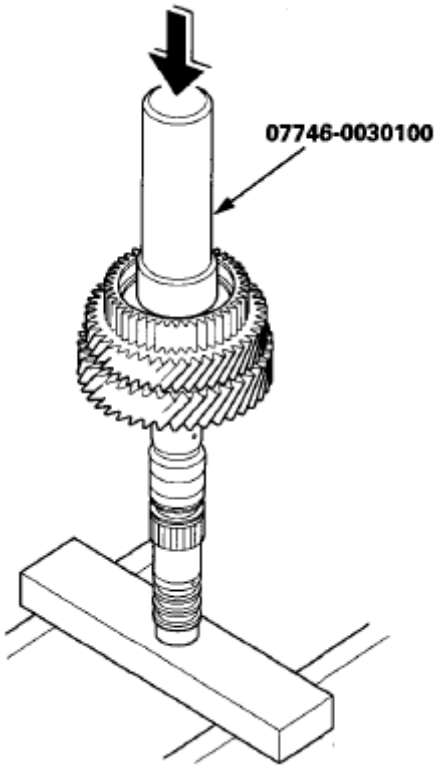

Fig. 501: Pressing 5th Gear Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the 2nd/5th clutch (A) and the 2nd gear collar (B) on the secondary shaft (C).

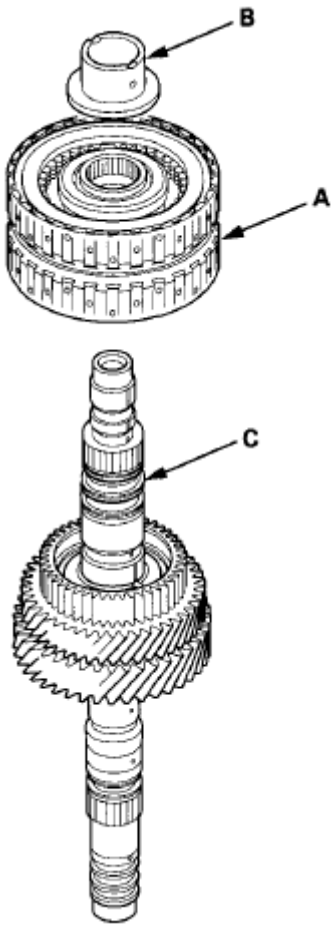

Fig. 502: Identifying 2nd/5th Clutch And 2nd Gear Collar On Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the ball bearing (A) over the secondary shaft (B), then press it into place using the 40 mm I.D. driver handle and the press.

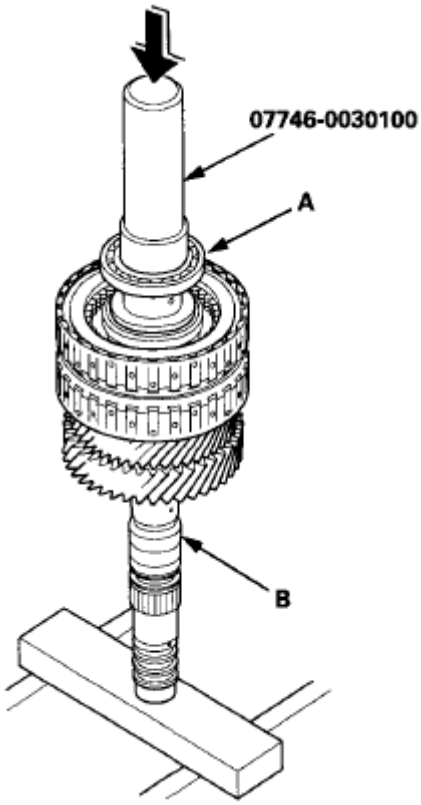

Fig. 503: Identifying Ball Bearing Over Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Secure the idler gear (A) on the secondary shaft (B) in a bench vise with wood blocks, install the old lock bolt (C), and tighten it to 78 N.m (8.0 kgf.m, 58 lbf.ft).

NOTE: After this procedure, remove wood chips that may be stuck to the gear.

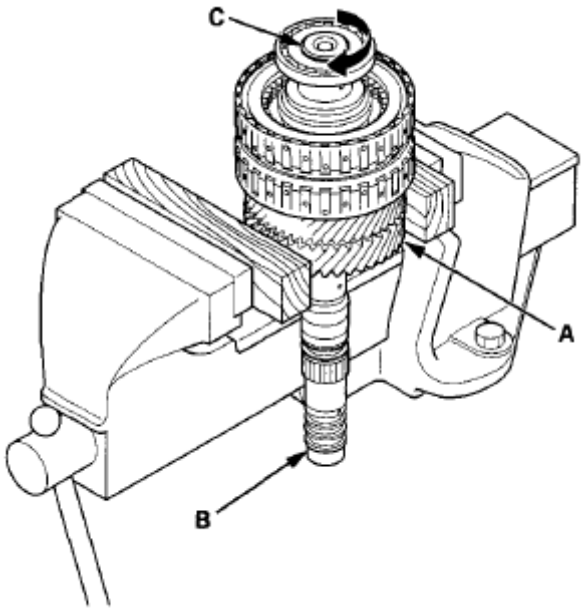

Fig. 504: Identifying Idler Gear Secondary Shaft, Wood Blocks And Lock Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Measure the clearance between the 2nd gear collar (A) and the ball bearing (B) with a feeler gauge (C) in at least three places. Use the average as the actual clearance.

   Standard: 0.05 - 0.12 mm (0.002 - 0.004 in)

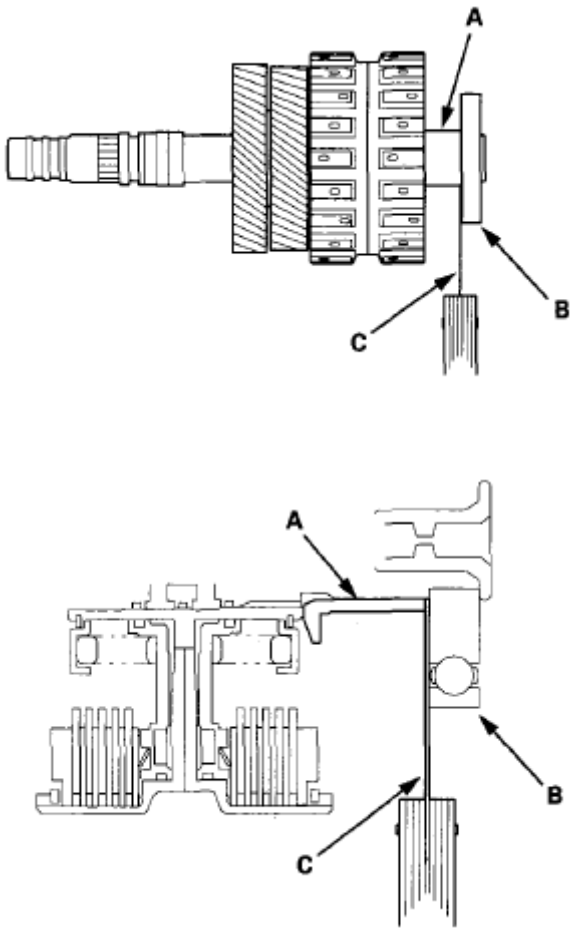

Fig. 505: Measuring Clearance Between 2nd Gear Collar And Ball Bearing With Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. If the clearance is out of the standard, remove the 2nd gear collar and measure its height.

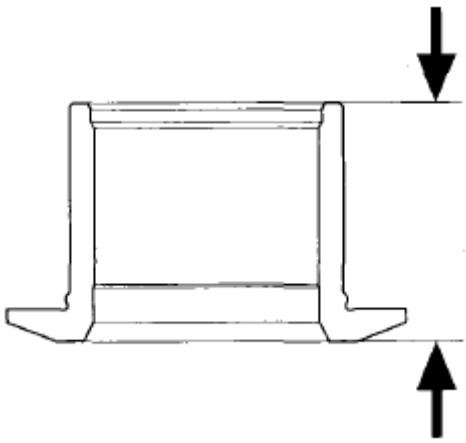

Fig. 506: Measuring Height Of Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Select and install a new 2nd gear collar, then recheck the clearance.

2ND GEAR COLLAR

No.	Height
A	32.89 mm (1.2949 in)
B	32.94 mm (1.2968 in)
C	32.99 mm (1.2988 in)
D	33.04 mm (1.3008 in)
E	33.09 mm (1.3028 in)
F	33.14 mm (1.3047 in)
G	33.19 mm (1.3067 in)
H	33.24 mm (1.3087 in)

SECONDARY SHAFT REASSEMBLY

Special Tools Required

Driver Handle, 40 mm I.D. 07746-0030100

1. Slide the idler gear (A) over the secondary shaft (B) in the direction shown.

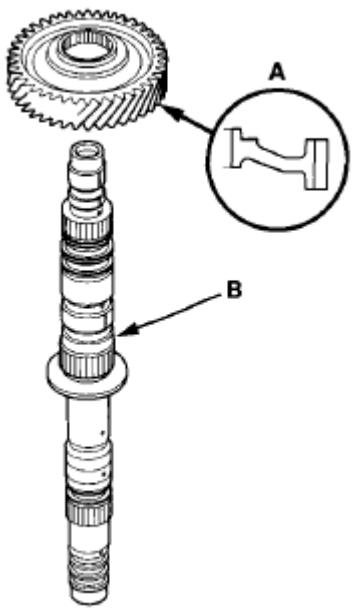

Fig. 507: Identifying Idler Gear And Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Place the idler gear (A) on press bases (B), and place a spacer (C) between the secondary shaft (D) and the press to prevent damaging the secondary shaft.

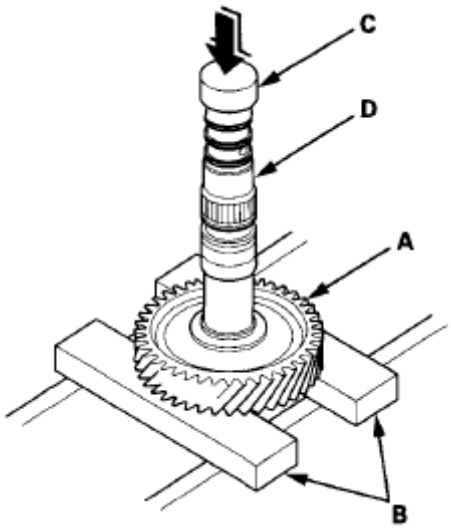

Fig. 508: Placing Idler Gear On Press Bases And Place Spacer Between Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the idler gear using a press.
4. Install the 49 x 66 x 3 mm thrust needle bearing (A), the 45 x 50 x 25 mm needle bearing (B), 5th gear (C), the 49 x 66 x 3 mm thrust needle bearing (D), and the 5th gear collar (E) on the secondary shaft (F).

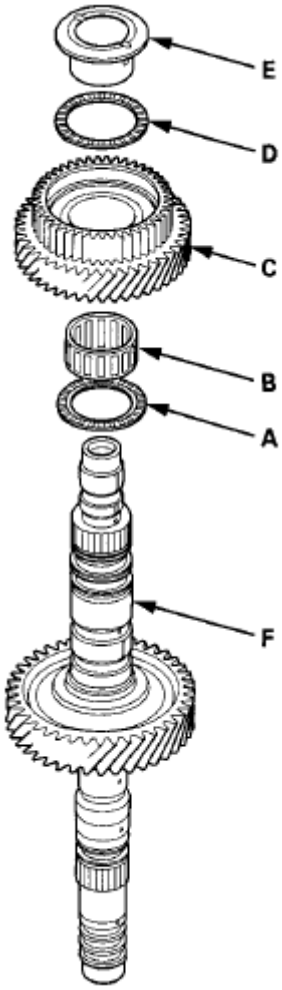

Fig. 509: Identifying Thrust Needle Bearing, Needle Bearing, 5th Gear, Thrust Needle Bearing, 5th Gear Collar And Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Press the 5th gear collar into place using the 40 mm I.D. driver handle and the press.

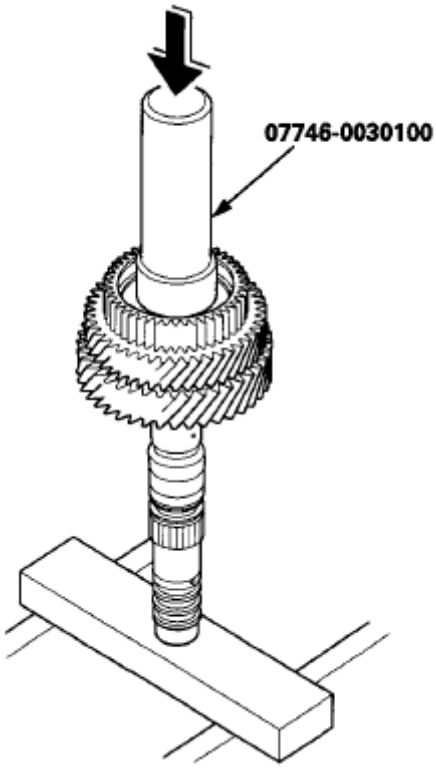

Fig. 510: Pressing 5th Gear Collar Using Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Wrap the shaft splines with electrical tape to prevent O-ring damage, install new O-rings (A) on the secondary shaft (B), then remove the tape.

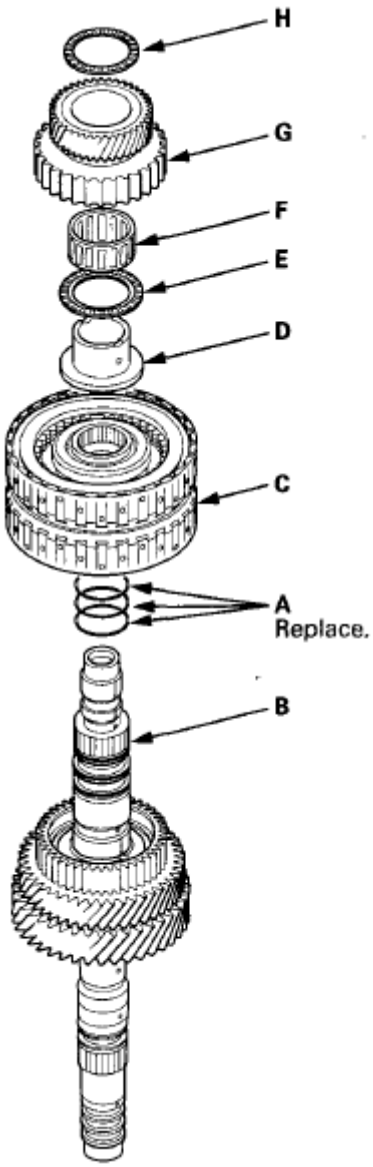

Fig. 511: Identifying O-Rings, 2nd/5th Clutch, 2nd Gear Collar, Thrust Needle Bearing, Needle Bearing, 2nd Gear And Thrust Needle Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the 2nd/5th clutch (C), the selected 2nd gear collar (D), the 39 x 57 x 2.5 mm thrust needle bearing (E), the 38 x 44 x 22.5 mm needle bearing (F), 2nd gear (G), and the 38 x 64 x 3.5 mm thrust needle bearing (H).
8. Install the ball bearing (A) over the secondary shaft (B), then press it into place using the 40 mm I.D. driver handle and the press.

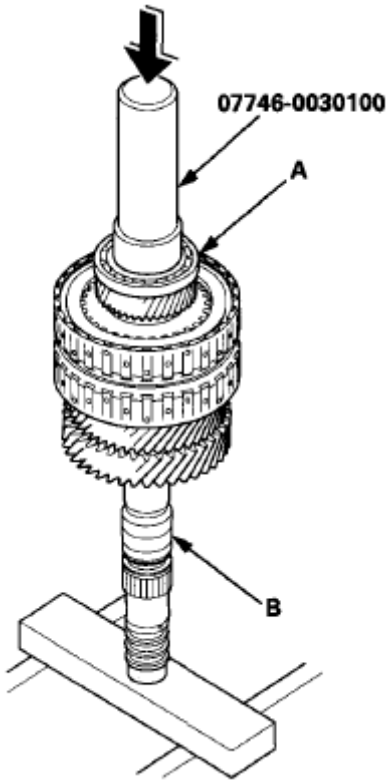

Fig. 512: Installing Ball Bearing Over Secondary Shaft Using Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Secure the idler gear (A) on the secondary shaft (B) in a bench vise with wood blocks, install a new lock bolt (C), and tighten it to 78 N.m (8.0 kgf.m, 58 lbf.ft).

NOTE: After this procedure, remove wood chips that may be stuck to the gear.

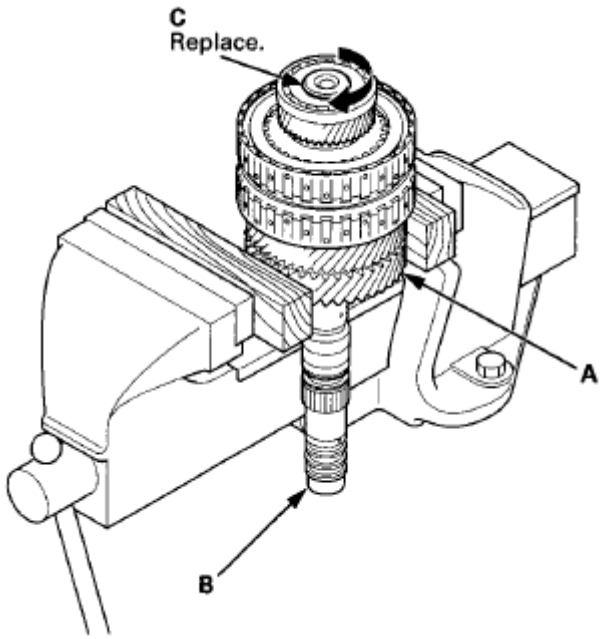

Fig. 513: Identifying Idler Gear, Secondary Shaft And Lock Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the 38 x 54 x 3.5 mm thrust needle bearing (A), the 37 x 52 x 2 mm thrust washer (B), the 32 x 38 x 34 mm needle bearing (C), 1st gear (D), the 37 x 50 x 2.5 mm thrust needle bearing (E), and the 37 x 49 x 3.4 mm thrust washer (F) on the secondary shaft (G).

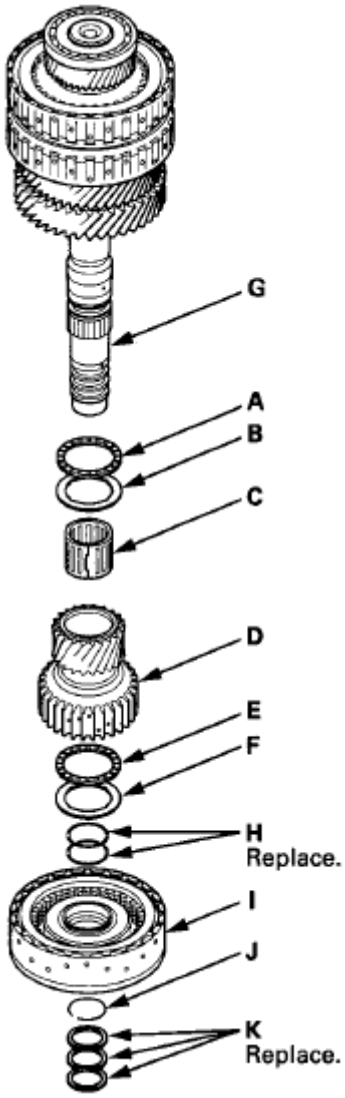

Fig. 514: Identifying Needle Bearing, Thrust Washer, Needle Bearing, 1st Gear, Thrust Needle Bearing, Thrust Washer And Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Wrap the shaft splines with electrical tape, and install new O-rings (H) in the O-ring grooves, then remove the tape.
12. Install the 1st clutch (I) on the secondary shaft, and secure the 1st clutch with the 32 mm snap ring (J).
13. Install new sealing rings (K).

SECONDARY SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT

1. Install the thrust needle bearing (A) in the torque converter housing (B) in the direction shown, and install the secondary shaft assembly (C).

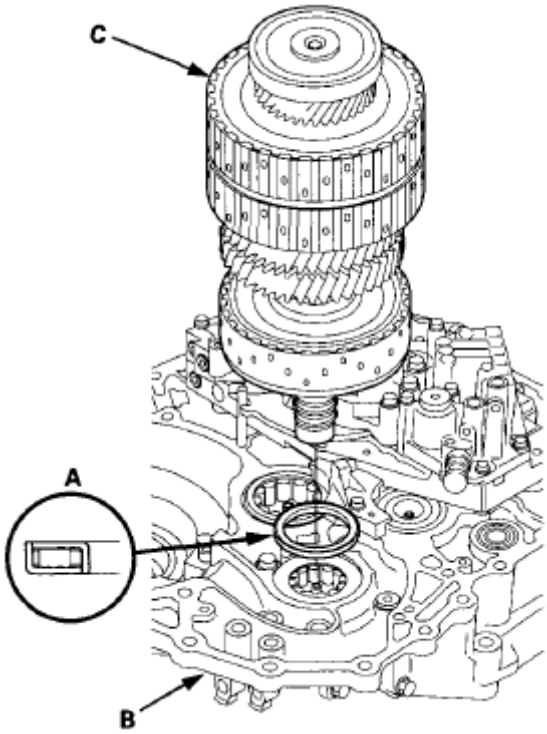

Fig. 515: Installing Thrust Needle Bearing In Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new gasket (A) on the torque converter housing.

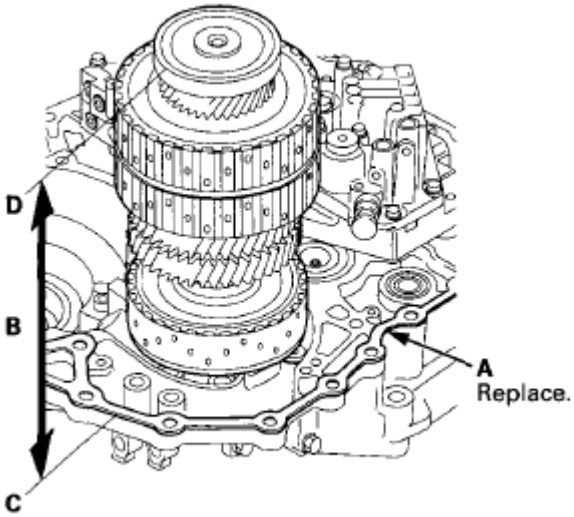

Fig. 516: Measuring Height Of Secondary Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Secondary Shaft Cutaway View

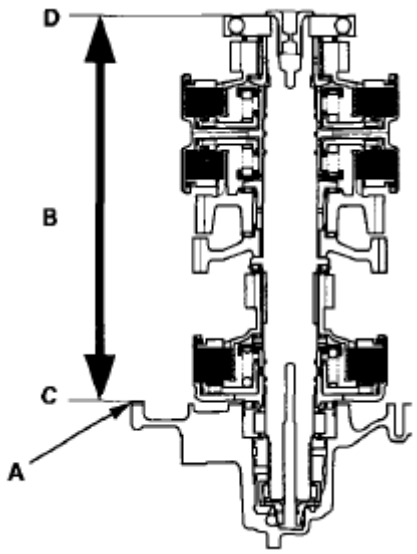

Fig. 517: Secondary Shaft Cutaway View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the height (B) of the secondary shaft installation between the surface (C) of the gasket and the top of the ball bearing outer race (D), then note the measurement.
4. While compressing the 89 mm thrust shim (A) using snap ring pliers, remove the 89 mm thrust shim from the transmission housing, and measure its thickness.

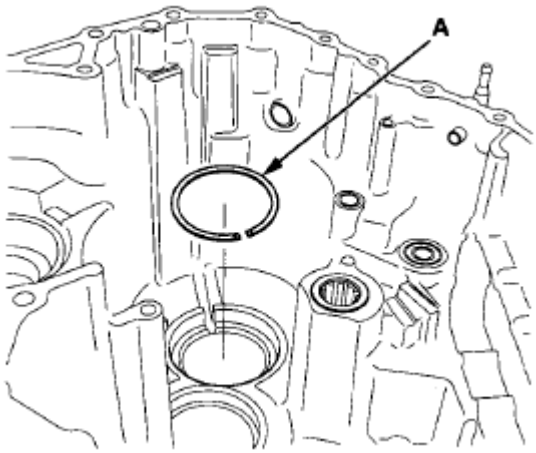

Fig. 518: Identifying Thrust Shim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Calculate the thickness of the 89 mm thrust shim using the formula.

Formula:

89 mm Thrust Shim Thickness

= Secondary Shaft Installation Height Standard - Measurement

Secondary Shaft Installation Height

Standard:

259.10 - 259.19 mm (10.2008 - 10.2043 in)

6. Select an 89 mm thrust shim from the following table.

THRUST SHIM, 89 MM

No.	Thickness
A	0.85 mm (0.0335 in)
B	0.92 mm (0.0362 in)
C	0.99 mm (0.0390 in)
D	1.06 mm (0.0417 in)
E	1.13 mm (0.0445 in)
F	1.20 mm (0.0472 in)
G	1.27 mm (0.0500 in)
H	1.34 mm (0.0528 in)
I	1.41 mm (0.0555 in)
J	1.48 mm (0.0583 in)
K	1.55 mm (0.0610 in)
L	1.62 mm (0.0638 in)
M	1.69 mm (0.0665 in)
N	1.76 mm (0.0693 in)
O	1.83 mm (0.0720 in)
P	1.90 mm (0.0748 in)
Q	1.97 mm (0.0776 in)
R	2.04 mm (0.0803 in)
S	2.11 mm (0.0831 in)
T	2.18 mm (0.0858 in)

7. Install the thrust shim in the transmission housing.

THIRD SHAFT DISASSEMBLY

EXPLODED VIEW

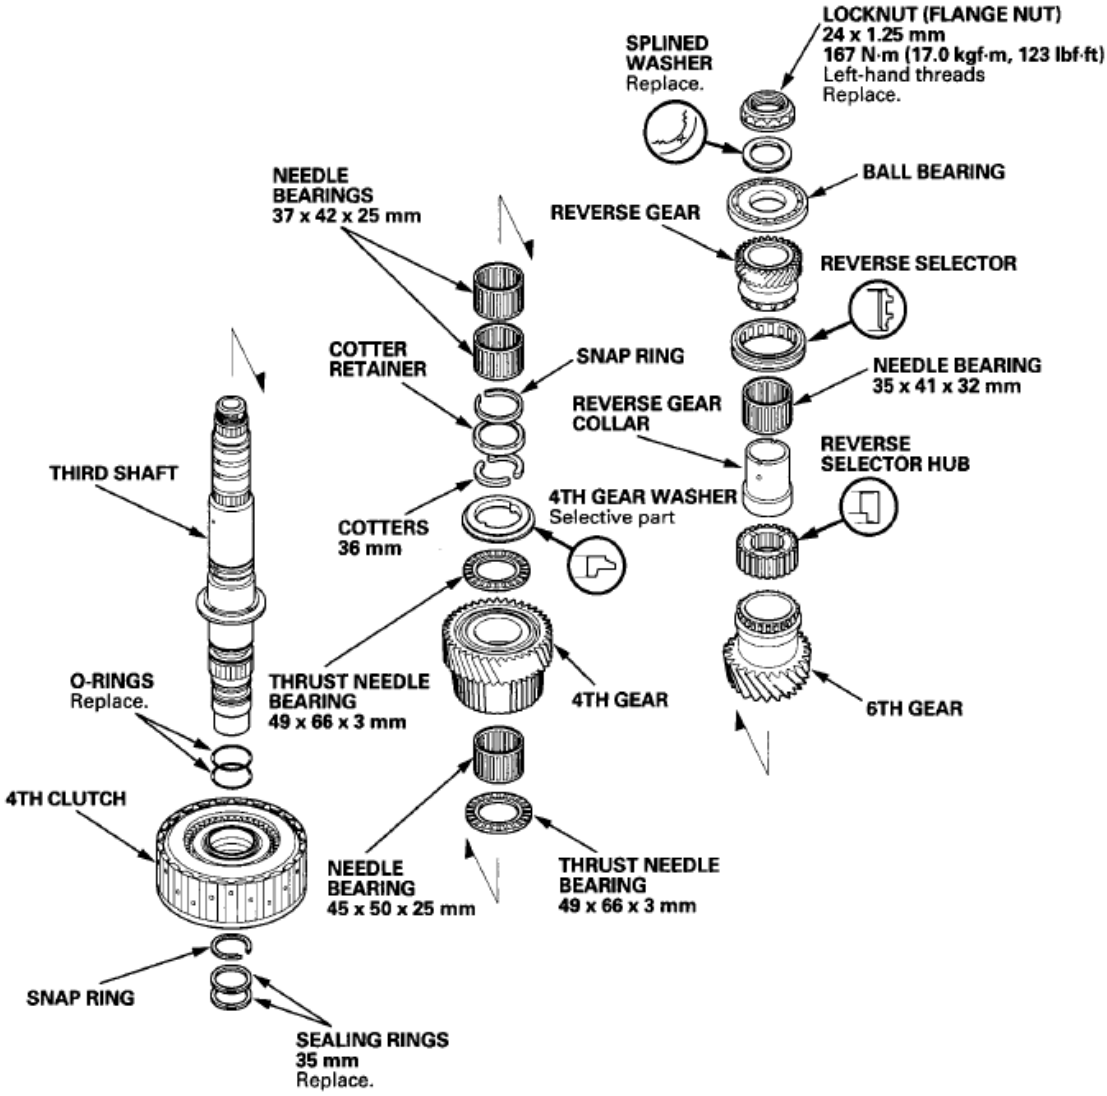

Fig. 519: Exploded View Of Third Shaft With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: Refer to the EXPLODED VIEW as needed during the following procedure.

1. Remove the reverse gear (A), the reverse selector (B), the 35 x 41 x 32 mm needle bearing (C), and the reverse gear collar (D).

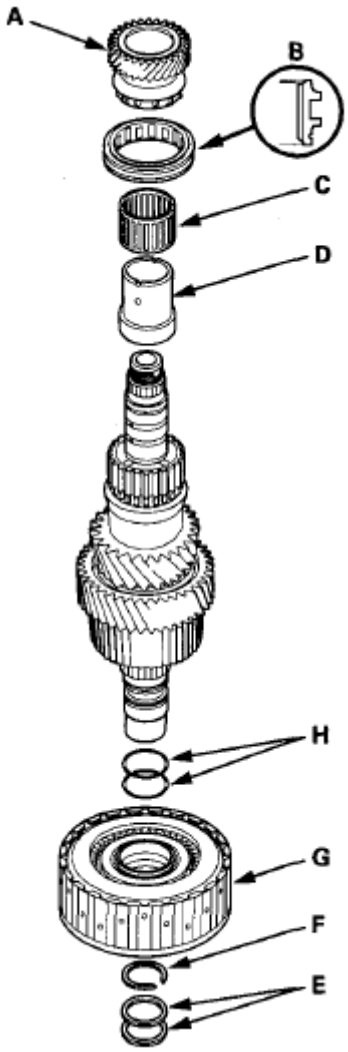

Fig. 520: Identifying Reverse Gear, Reverse Selector, Needle Bearing, Reverse Gear Collar, Sealing Rings, Snap Ring, 4th Clutch And O-Rings
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the sealing rings (E), the snap ring (F), the 4th clutch (G), and the O-rings (H).
3. Install a commercially available bearing separator (A) on the tapered part (B) of 6th gear (C). Place a spacer (D) between the third shaft (E) and the press to prevent damaging the third shaft.

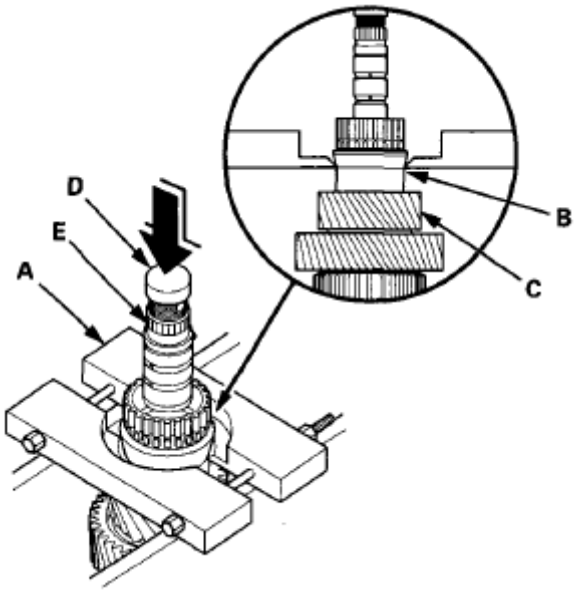

Fig. 521: Installing Bearing Separator On Tapered Part Of 6th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the reverse selector hub (A), 6th gear (B), and the 37 x 42 x 25 mm needle bearings (C) using a press.

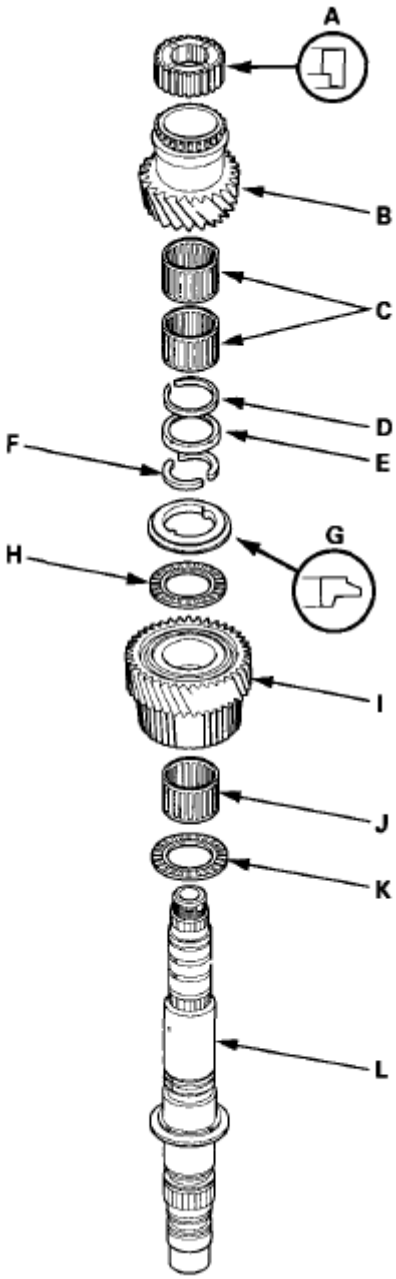

Fig. 522: Identifying Third Shaft Assembly Related Parts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the snap ring (D), the cotter retainer (E), and the 36 mm cotters (F), and remove the 4th gear washer (G), the 49 x 66 x 3 mm thrust needle bearing (H), 4th gear (I), the 45 x 50 x 25 mm needle bearing (J), and the 49 x 66 x 3 mm thrust needle bearing (K) from the third shaft (L).
6. Inspect the bearings for galling and rough movement.
7. Check the shaft bearing surfaces for scoring and excessive wear, and check the shaft splines for excessive wear and damage.
8. Check the third shaft 6th gear axial clearance (see **THIRD SHAFT 6TH GEAR AXIAL CLEARANCE**

INSPECTION).

THIRD SHAFT 6TH GEAR AXIAL CLEARANCE INSPECTION

Special Tools Required

- Driver Handle, 40 mm I.D. 07746-0030100
- Bearing Driver Attachment, 30 mm I.D. 07746-0030300

1. Install the 49 x 66 x 3 mm thrust needle bearing (A), the 45 x 50 x 25 mm needle bearing (B), 4th gear (C), the 49 x 66 x 3 mm thrust needle bearing (D), and the 4th gear washer (E), and install the 36 mm cotters (F), the cotter retainer (G), and the snap ring (H) on the third shaft (I). Install the 4th gear washer by aligning the fingers (J) with the grooves (K), and in the direction shown.

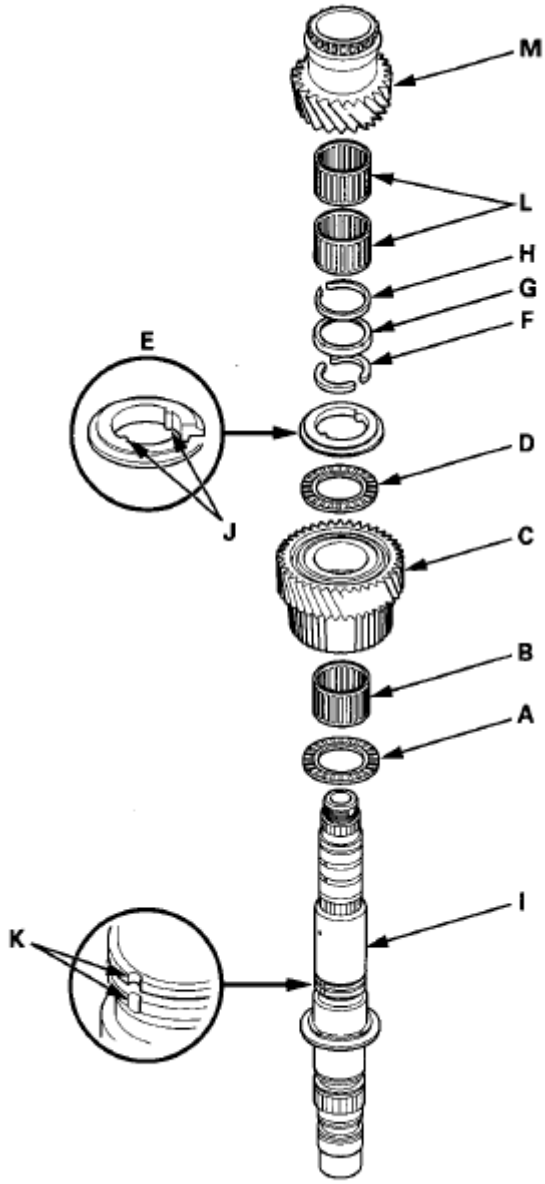

Fig. 523: Identifying Third Shaft 6th Gear Axial Related Parts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 37 x 42 x 25 mm needle bearings (L) and 6th gear (M) on the third shaft.
3. Apply ATF to the shaft splines of the reverse selector hub contact area, then slide the reverse selector hub (A) over the third shaft (B), then press it into place using the 40 mm I.D. driver handle, the 30 mm I.D. bearing driver attachment, and a press.

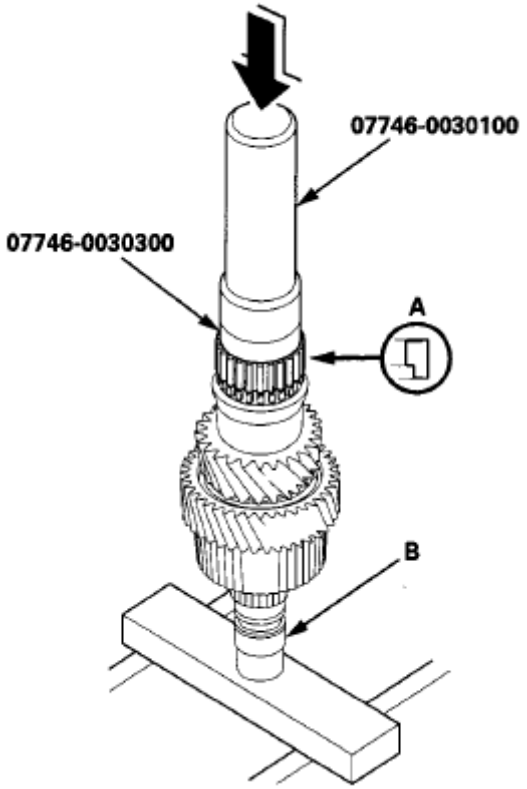

Fig. 524: Sliding Reverse Selector Hub Over Third Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the clearance between 6th gear (A) and the reverse selector hub (B) with a feeler gauge (C) in at least three places. Use the average as the actual clearance.

   Standard: 0.045 - 0.420 mm (0.002 - 0.016 in)

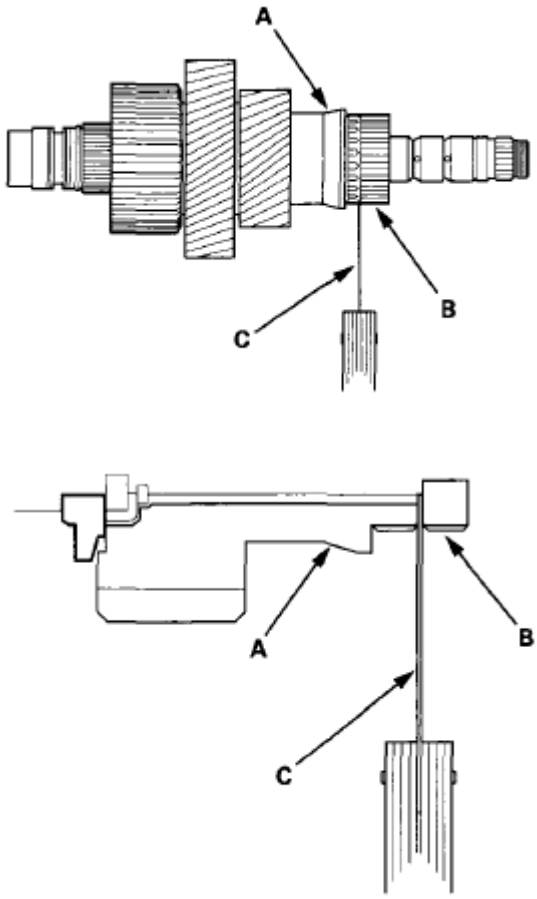

Fig. 525: Measuring Clearance Between 6th Gear And Reverse Selector Hub With Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. If the clearance is out of the standard, remove the 4th gear washer and measure its thickness.

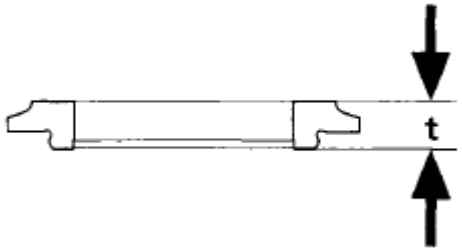

Fig. 526: Measuring Thickness Of 4th Gear Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Select and install a new 4th gear washer, then recheck the clearance.

4TH GEAR WASHER

No.	Thickness (t)
A	8.515 mm (0.33524 in)

B	8.540 mm (0.33622 in)
C	8.565 mm (0.33720 in)
D	8.590 mm (0.33819 in)
E	8.615 mm (0.33917 in)
F	8.640 mm (0.34016 in)

THIRD SHAFT REASSEMBLY

Special Tools Required

- Driver Handle, 40 mm I.D. 07746-0030100
- Bearing Driver Attachment, 30 mm I.D. 07746-0030300

1. Install the 49 x 66 x 3 mm thrust needle bearing (A), the 45 x 50 x 25 mm needle bearing (B), 4th gear (C), the 49 x 66 x 3 mm thrust needle bearing (D), and the selected 4th gear washer (E), and install the 36 mm cotters (F), the cotter retainer (G), and the snap ring (H) on the third shaft (I). Install the 4th gear washer by aligning the fingers (J) with the grooves (K), and in the direction shown.

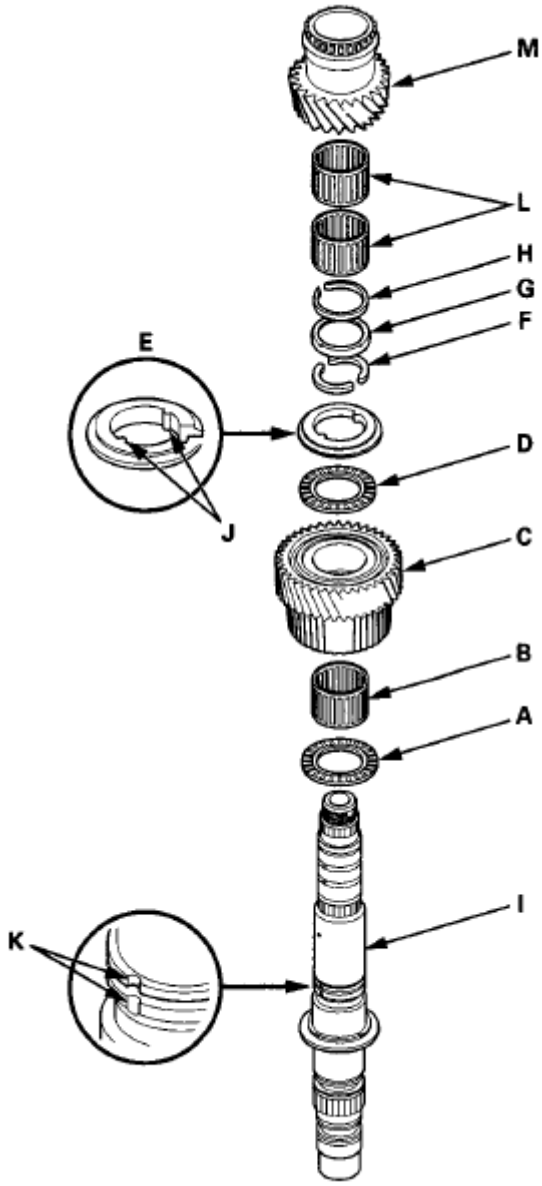

Fig. 527: Identifying Third Shaft Assembly Parts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 37 x 42 x 25 mm needle bearings (L) and 6th gear (M) on the third shaft.
3. Apply ATF to the shaft splines of the reverse selector hub contact area, then slide the reverse selector hub (A) over the third shaft (B), then press it into place using the 40 mm I.D. driver handle, the 30 mm I.D. bearing driver attachment, and a press.

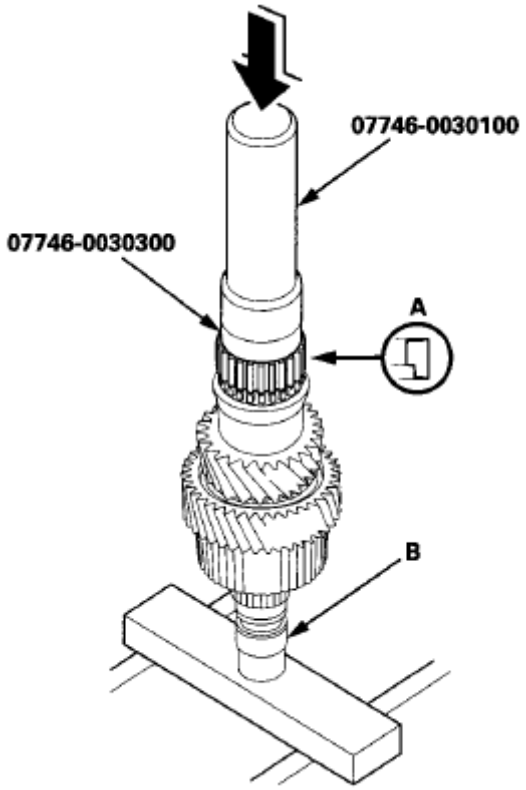

Fig. 528: Sliding Reverse Selector Hub Over Third Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the reverse gear collar (A), the 35 x 41 x 32 mm needle bearing (B), the reverse selector (C), and the reverse gear (D) on the third shaft (E).

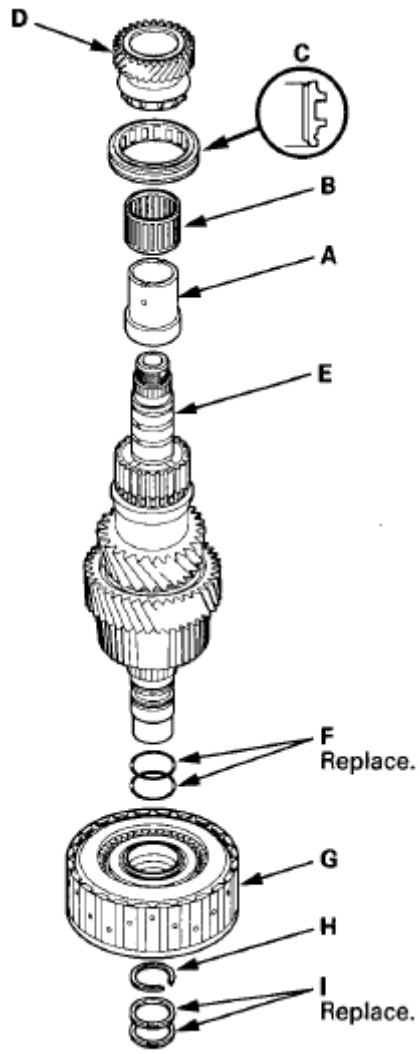

Fig. 529: Identifying Reverse Gear Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Wrap the shaft splines with electrical tape, and install new O-rings (F) in the 4th clutch O-ring grooves, then remove the tape.
6. Install the 4th clutch (G) on the secondary shaft, and secure the 4th clutch with the 35 mm snap ring (H).
7. Install new sealing rings (I).

IDLER GEAR SHAFT DISASSEMBLY

EXPLODED VIEW

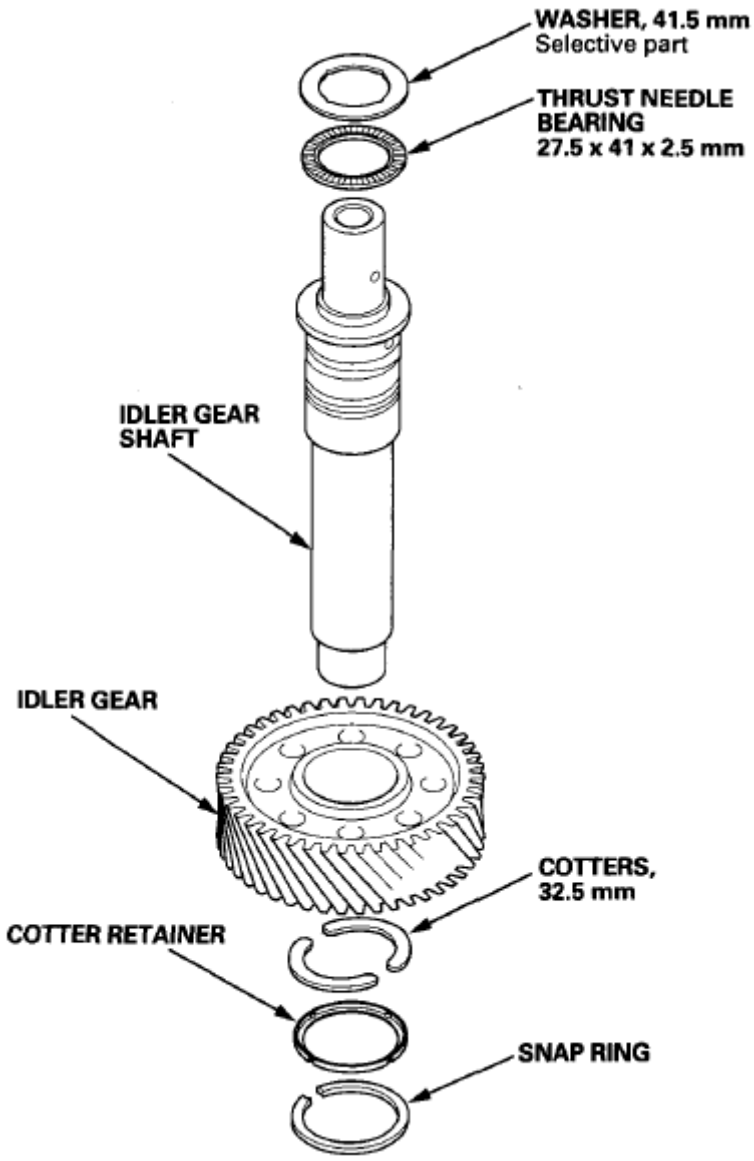

Fig. 530: Exploded View Of Idler Gear Shaft Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

NOTE: Refer to the EXPLODED VIEW as needed during the following procedure.

1. Remove the 41.5 mm washer (A) and the 27.5 x 41 x 2.5 mm thrust needle bearing (B).

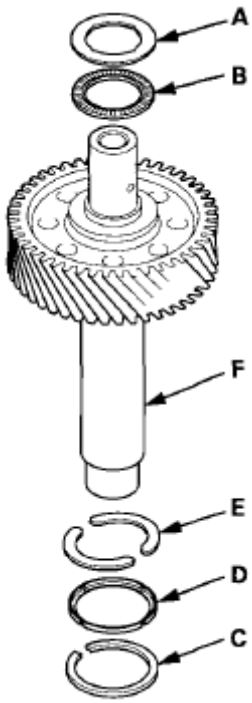

Fig. 531: Identifying Washer, Thrust Needle Bearing, Cotter Retainer, Idler Gear Shaft And Cotters
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the snap ring (C), the cotter retainer (D), and the 32.5 mm cotters (E) from the idler gear shaft (F).
3. Place the idler gear (A) on press bases (B), and place a spacer (C) between the idler gear shaft (D) and the press to prevent damaging the idler gear shaft.

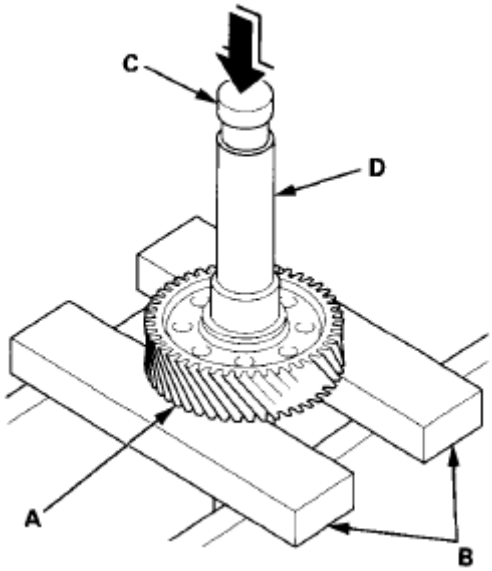

Fig. 532: Placing Idler Gear On Press Bases And Spacer Between Idler Gear Shaft

Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the idler gear using a press.
5. Inspect the bearings for galling and rough movement.
6. Check the shaft bearing surfaces for scoring and excessive wear.
7. Check the idler gear shaft installation height (see **IDLER GEAR SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT**).

IDLER GEAR SHAFT REASSEMBLY

1. Install the idler gear (A) over the idler gear shaft (B).

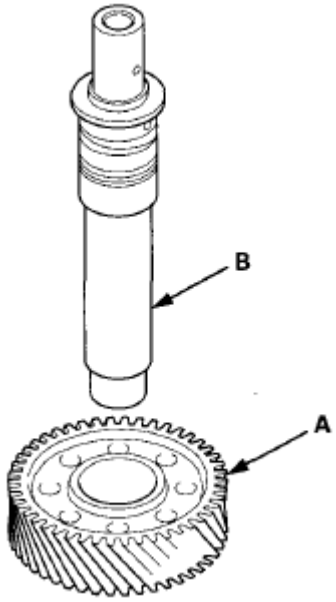

Fig. 533: Installing Idler Gear Over Idler Gear Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Place the idler gear (A) on press bases (B), and place a spacer (C) between the idler gear shaft (D) and the press to prevent damaging the idler gear shaft.

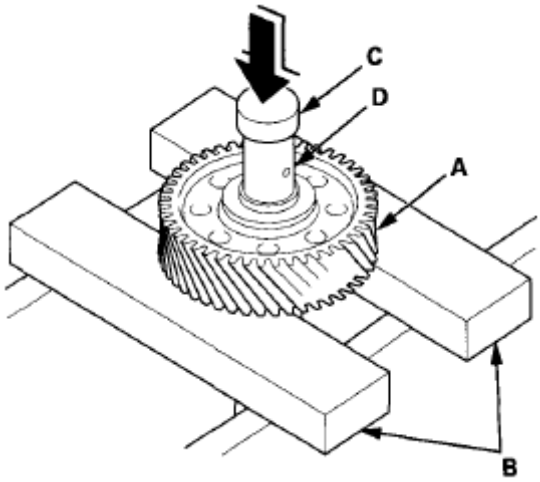

Fig. 534: Placing Idler Gear On Press Bases And Place Spacer Between Idler Gear Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the idler gear using a press.
4. Install the 32.5 mm cotter (A), the cotter retainer (B), and the snap ring (C) on the idler gear shaft (D).

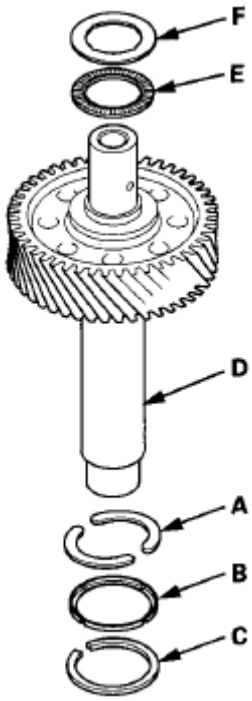

Fig. 535: Identifying Cotter, Cotter Retainer, Snap Ring, Idler Gear Shaft, Thrust Needle Bearing And Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the 27.5 x 41 x 2.5 mm thrust needle bearing (E) and the 41.5 mm washer (F).

IDLER GEAR SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT

1. Install the idler gear shaft (A) in the torque converter housing, and install the 27.5 x 41 x 2.5 mm thrust needle bearing (B) and the 41.5 mm washer (C) on the idler gear shaft.

   Idler Gear Shaft Installation Height:

   Standard:

   116.24 - 116.30 mm (4.5764 - 4.5787 in)

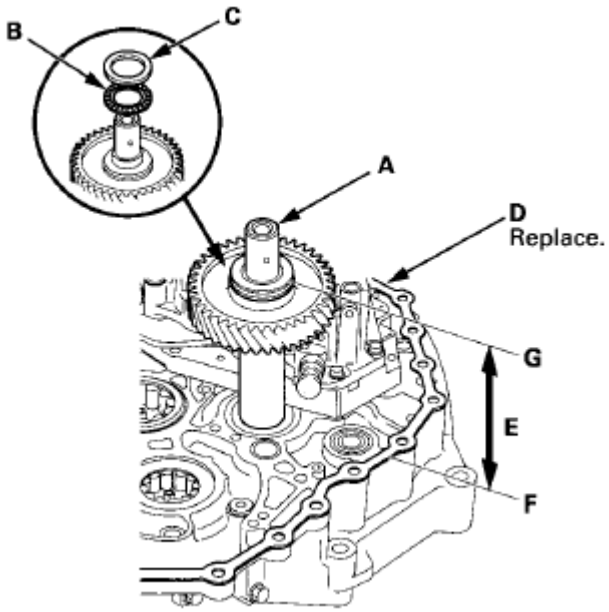

Fig. 536: Identifying Idler Gear Shaft, Thrust Needle Bearing, Washer, Gasket And Surfaces
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Idler Gear Shaft Cutaway View

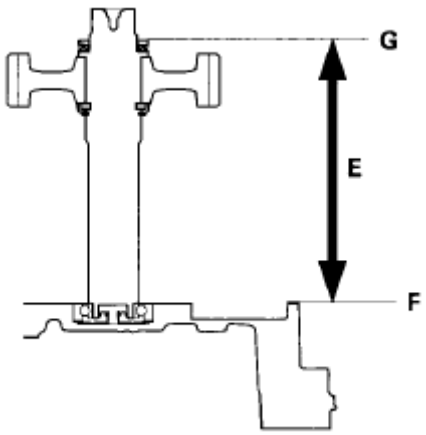

Fig. 537: Idler Gear Shaft Cutaway View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new gasket (D) on the torque converter housing.
3. Measure the installation height (E) of the idler gear shaft between the surface (F) of the gasket and the surface (G) of the 41.5 mm washer.
4. If the measurement is out of the standard, remove the 41.5 mm washer and measure its thickness.
5. Select and install a new 41.5 mm washer, then recheck the installation height.

WASHER, 41.5 MM

No.	Thickness
A	1.26 mm (0.0496 in)
B	1.30 mm (0.0512 in)
C	1.34 mm (0.0528 in)
D	1.38 mm (0.0543 in)
E	1.42 mm (0.0559 in)
F	1.46 mm (0.0575 in)
G	1.50 mm (0.0591 in)
H	1.54 mm (0.0606 in)
I	1.58 mm (0.0622 in)
J	1.62 mm (0.0638 in)
K	1.66 mm (0.0654 in)
L	1.70 mm (0.0669 in)
M	1.74 mm (0.0685 in)
N	1.78 mm (0.0701 in)
O	1.82 mm (0.0717 in)
P	1.86 mm (0.0732 in)
Q	1.90 mm (0.0748 in)
R	1.94 mm (0.0764 in)
S	1.98 mm (0.0780 in)
T	2.02 mm (0.0795 in)
U	2.06 mm (0.0811 in)

CLUTCH CLEARANCE INSPECTION

Special Tools Required

Clutch Compressor Attachment 07ZAE-PRP0100

1. Set a dial indicator (A) on the clutch end-plate (B).

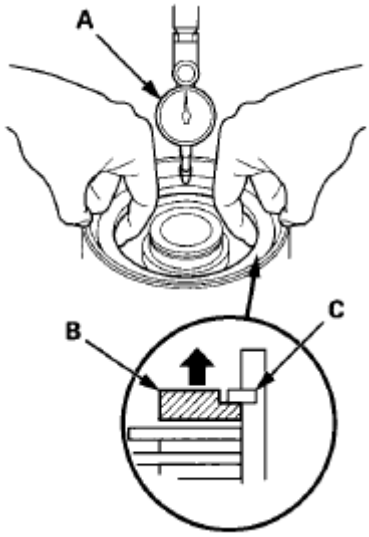

Fig. 538: Setting Dial Indicator On Clutch End-Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Zero the dial indicator with the clutch end-plate lifted up to the snap ring (C).
3. Release the clutch end-plate to lower it, then put the clutch compressor attachment on the end-plate (A).

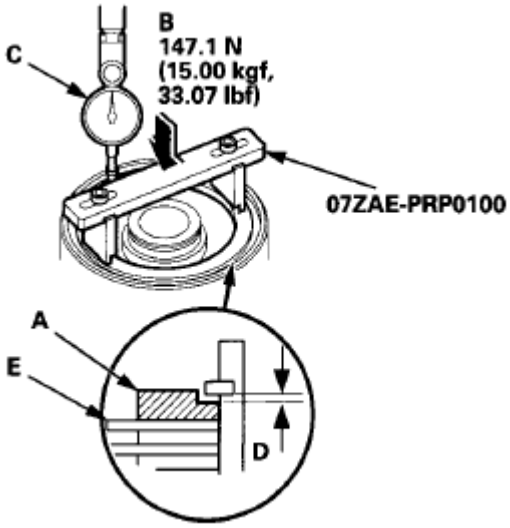

Fig. 539: Identifying Clutch End-Plate With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Press the clutch compressor attachment down with 147.1 N (15.00 kgf, 33.07 lbf) (B) using a force gauge or equivalent, and read the dial indicator (C).
5. The dial indicator reads the clearance (D) between the clutch end-plate and the top disc (E). Take measurements in at least three places, and use the average as the actual clearance.

Clearance Between Clutch End-Plate and Top Disc

Standard:

1st Clutch: 1.50 - 1.70 mm (0.0591 - 0.0669 in)

2nd Clutch: 1.25 - 1.45 mm (0.0492 - 0.0571 in)

3rd Clutch: 1.25 - 1.45 mm (0.0492 - 0.0571 in)

4th Clutch: 1.50 - 1.70 mm (0.0591 - 0.0669 in)

5th Clutch: 1.25 - 1.45 mm (0.0492 - 0.0571 in)

6th Clutch: 1.25 - 1.45 mm (0.0492 - 0.0571 in)

6. If the measurement is out of the standard, replace the clutch assembly.

TRANSMISSION REASSEMBLY

Special Tools Required

Mainshaft Holder Set 07PAB-0010001

NOTE:

- **Refer to the EXPLODED VIEW in the Transmission Disassembly as needed during the following procedure.**
- **Apply a light coat of clean ATF on all tubes, O-rings, and moving parts before reassembly.**

1. Make sure that the ATF magnet (A) is cleaned and installed in the torque converter housing. Clean and install the ATF magnet, if necessary.

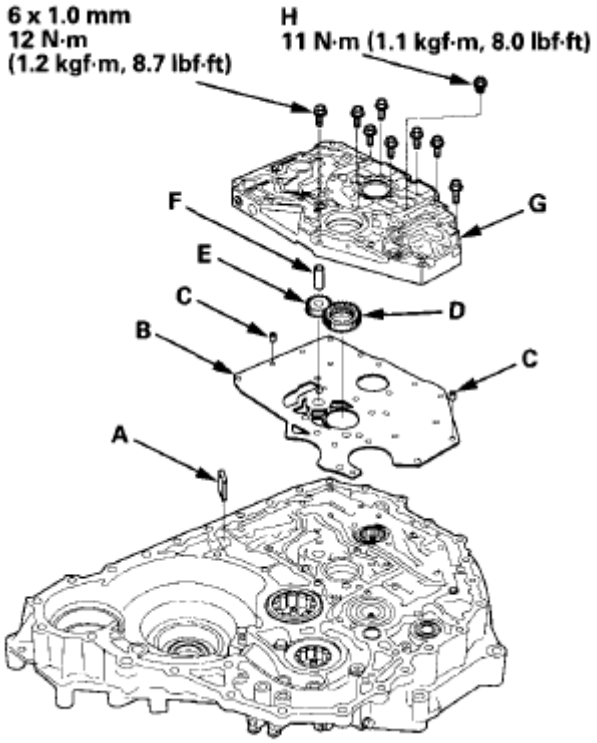

Fig. 540: Identifying ATF Magnet, Main Separator Plate, Dowel Pins And ATF Pump Driven Gear With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

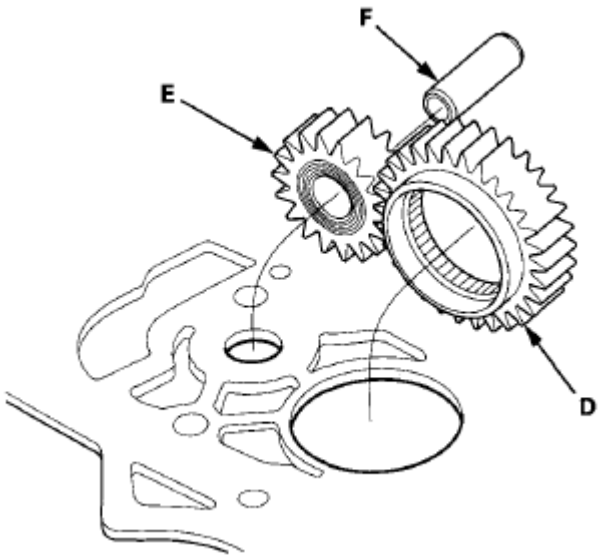

Fig. 541: Identifying ATF Pump Driven And Drive Gear And Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the main separator plate (B) and the two dowel pins (C) on the torque converter housing.
3. Install the ATF pump drive gear (D), the ATF pump driven gear (E), and the ATF pump driven gear shaft

(F). Install the ATF pump driven gear with its grooved and chamfered side facing down.

4. Install the main valve body (G) (eight bolts).
5. Install the 4th/reverse air check valve (H).
6. Make sure the ATF pump drive gear (A) rotates smoothly in the normal operating direction, and the ATF pump driven gear shaft (B) moves smoothly in the axial and normal operating direction.

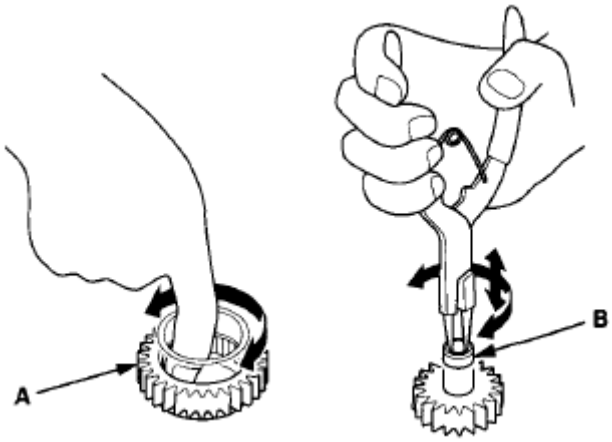

Fig. 542: Rotating ATF Pump Drive And Driven Gear Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. If the ATF pump drive gear and ATF pump driven gear shaft do not move smoothly, loosen the main valve body bolts. Realign the ATF pump driven gear shaft, and retighten the bolts to the specified torques, then recheck. Failure to align the ATF pump driven gear shaft correctly will result in a seized ATF pump drive gear or ATF pump driven gear shaft.
8. Install the two check balls (A) in the main valve body.

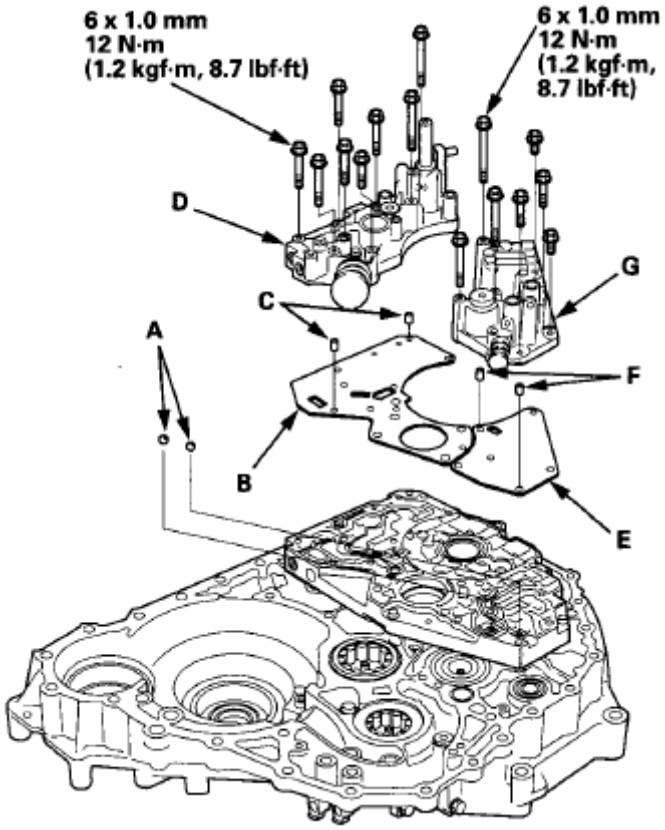

Fig. 543: Identifying Transmission Assembly Components With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the regulator separator plate (B) and the two dowel pins (C) on the main valve body, and install the regulator valve body (D) (eight bolts).
10. Install the manual separator plate (E) and the two dowel pins (F) on the main valve body, and install the manual valve body (G) (seven bolts).
11. Install the two dowel pins (A) on the main valve body.

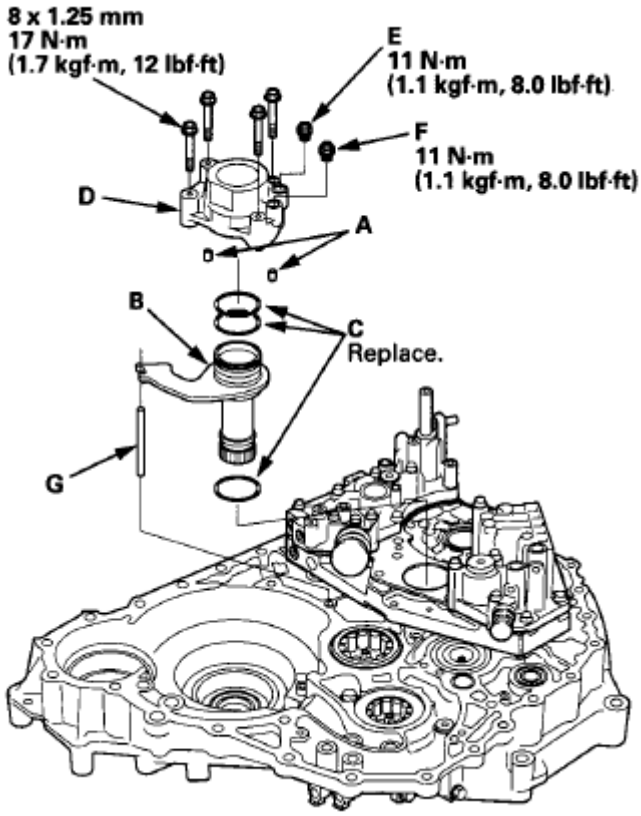

Fig. 544: Identifying Dowel Pins, Stator Shaft, O-Ring, Shaft Support, 3rd And 6th Air Check Valve And Shaft Stop With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the stator shaft (B) with new O-rings (three) (C), and install the stator shaft support (D) (four bolts).
13. Install the 3rd air check valve (E) and the 6th air check valve (F).
14. Install the stator shaft stop (G) in the torque converter housing.
15. Install the cooler retainer cap (A).

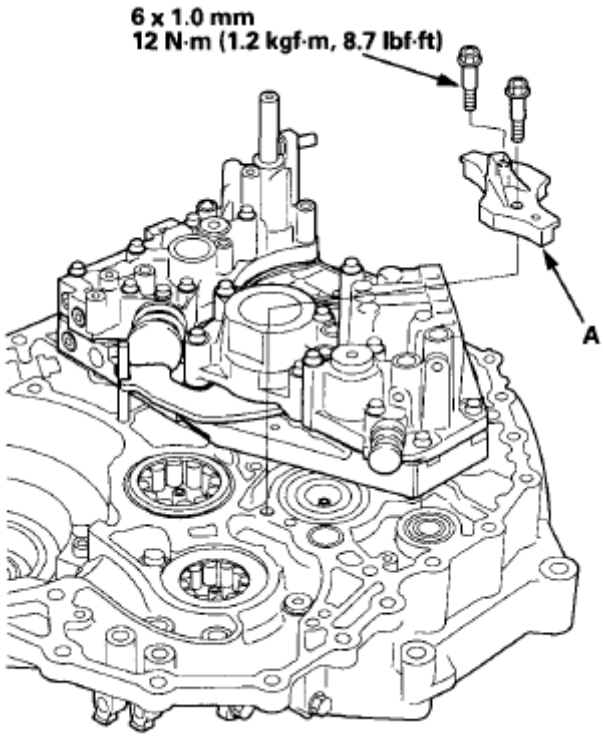

Fig. 545: Identifying Cooler Retainer Cap With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the 2nd air check valve (A), the 5th air check valve (B), and the oil catch plate (C).

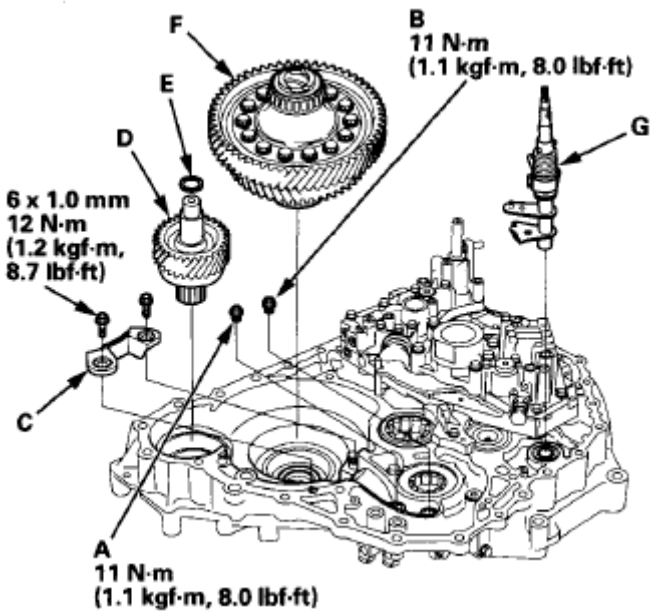

Fig. 546: Identifying 2nd Air Check Valve, 5th Air Check Valve, Oil Catch Plate, Transfer Output Shaft And Thrust Shim With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. With SH-AWD: Install the transfer output shaft (D) in the torque converter housing, and install the thrust shim (E) on the top of the transfer output shaft.
18. Install the differential assembly (F) in the torque converter housing.
19. Install the selector control shaft (G).
20. Align the control lever pin (A) with the manual valve guide (B).

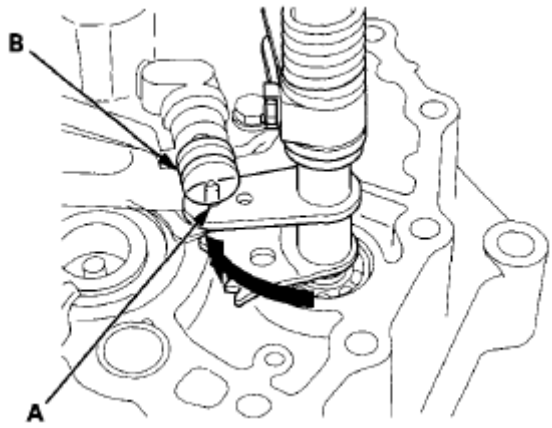

Fig. 547: Identifying Control Lever Pin And Manual Valve Guide
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Hook the detent spring (A) to the detent arm (B) and the selector control shaft (C), then install the detent arm and the detent arm shaft (D) into the torque converter housing.

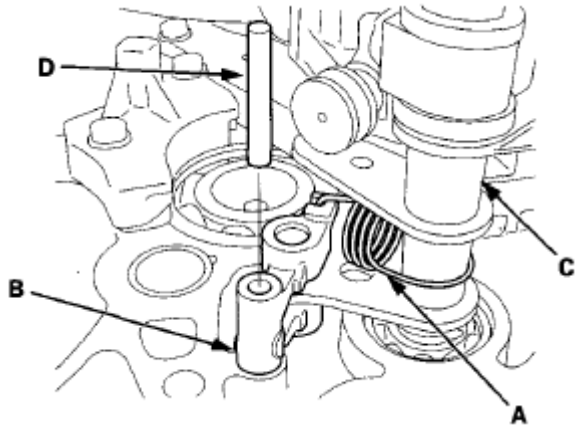

Fig. 548: Identifying Detent Spring, Detent Arm, Selector Control Shaft, Detent Arm And Detent Arm Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Install the parking holder (A).

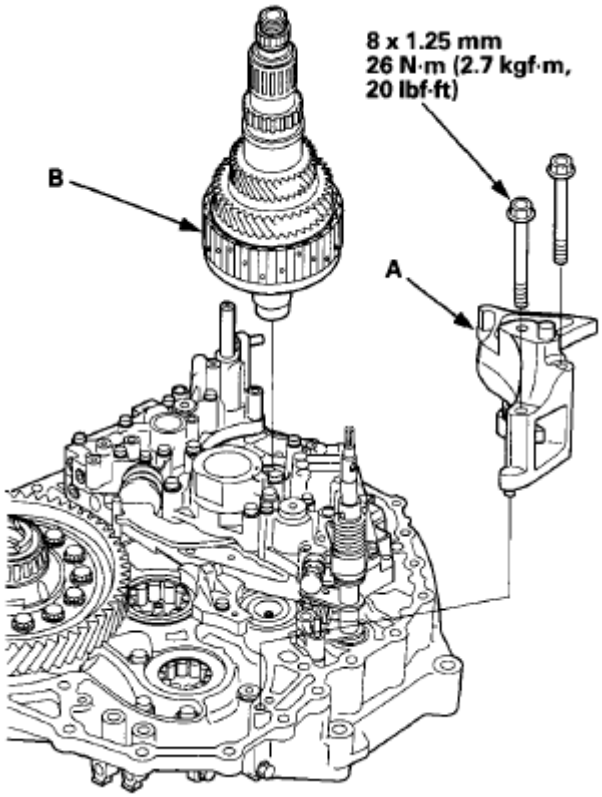

Fig. 549: Identifying Parking Holder And 3rd Shaft With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Install the third shaft (B) into the main valve body.
24. Assemble the mainshaft, the countershaft, the secondary shaft, and the idler gear shaft.
25. Install the thrust needle bearing (A) on the secondary shaft bearing in the torque converter housing.

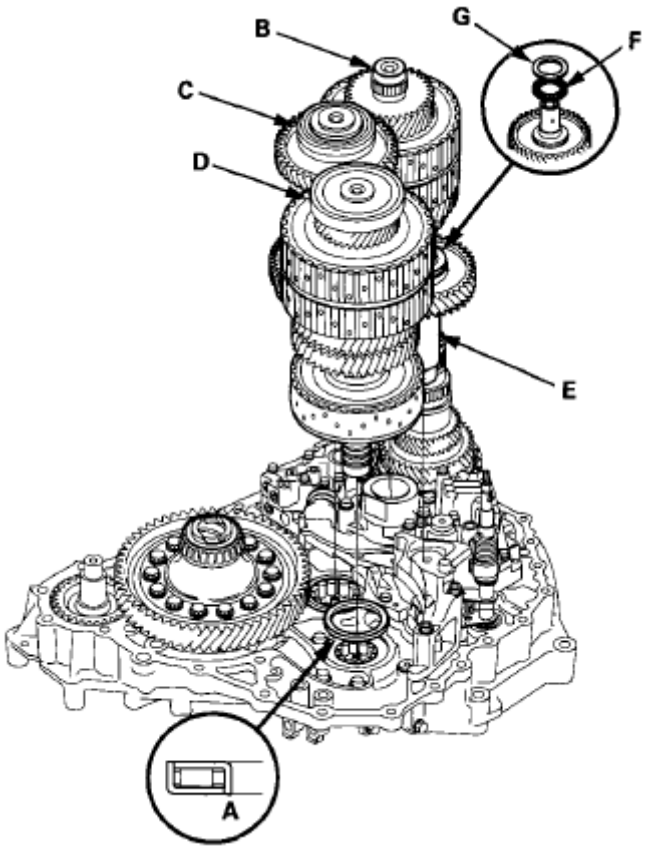

Fig. 550: Identifying Transmission Reassembly Related Parts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Join the mainshaft subassembly (B), the countershaft subassembly (C), the secondary shaft subassembly (D), and the idler gear shaft subassembly (E) together, and install them in the torque converter housing. Install the 27.5 x 41 x 2.5 mm thrust needle bearing (F) and the 41.5 mm washer (G) on the top of the idler gear shaft.
27. Turn the shift fork shaft (A) so the large chamfered hole is facing the fork bolt hole of the shift fork.

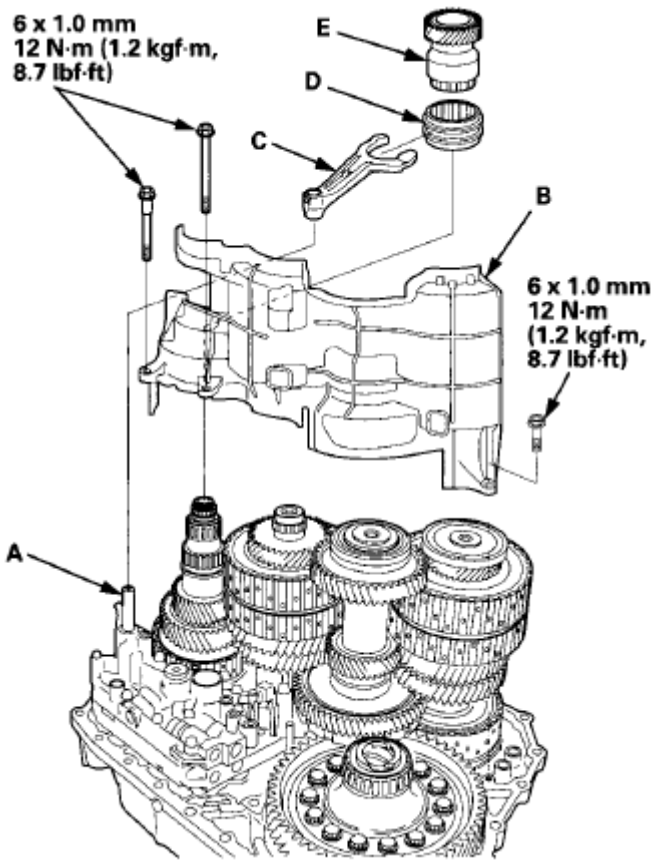

Fig. 551: Identifying Shift Fork Shaft, Baffle Plate, Shift Fork Reverse Selector Hub And Gear With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Install the baffle plate (B), the shift fork (C), the reverse selector hub (D), and the reverse gear (E) together.
29. Secure the shift fork (A) to the shift fork shaft with the lock bolt and a new lock washer (B), then bend the lock tab of the lock washer against the bolt head.

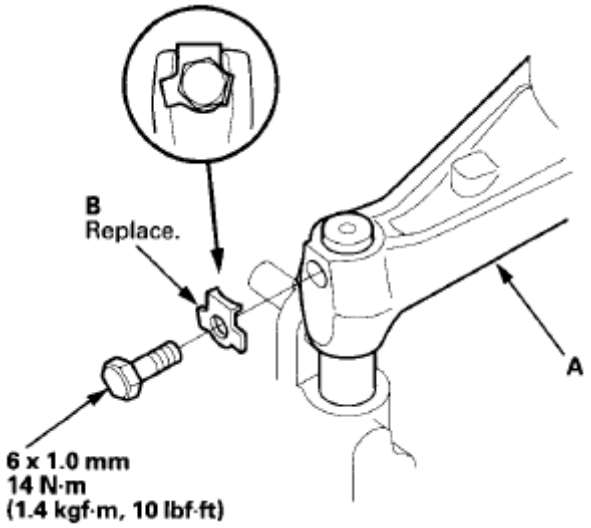

Fig. 552: Identifying Shift Fork And Lock Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Install the lubrication pipe (A) and the 10 x 70 mm ATF joint pipe (B) into the regulator valve body (C).

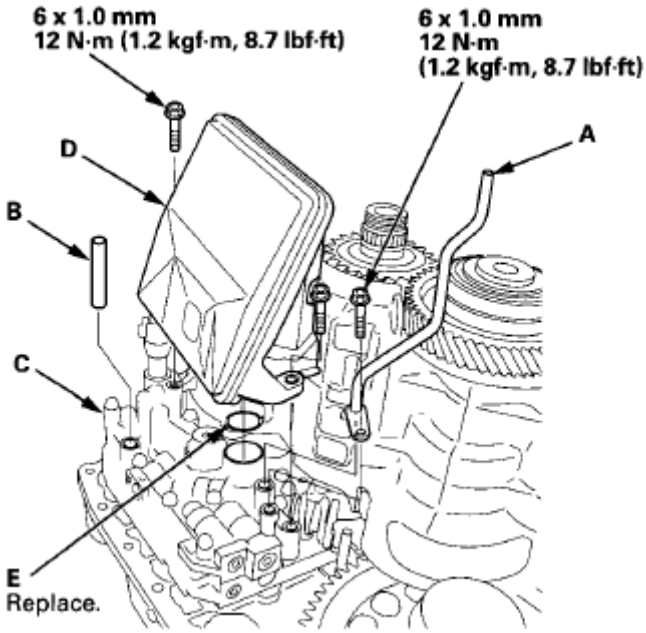

Fig. 553: Identifying Lubrication Pipe, ATF Joint Pipe, Regulator Valve Body, ATF Strainer And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Install the ATF strainer (D) with a new O-ring (E).
32. Install new O-rings (C) (four) on the ATF joint pipes A and B, and install the ATF joint pipes A and B into the manual valve body (D) and the torque converter housing (E).

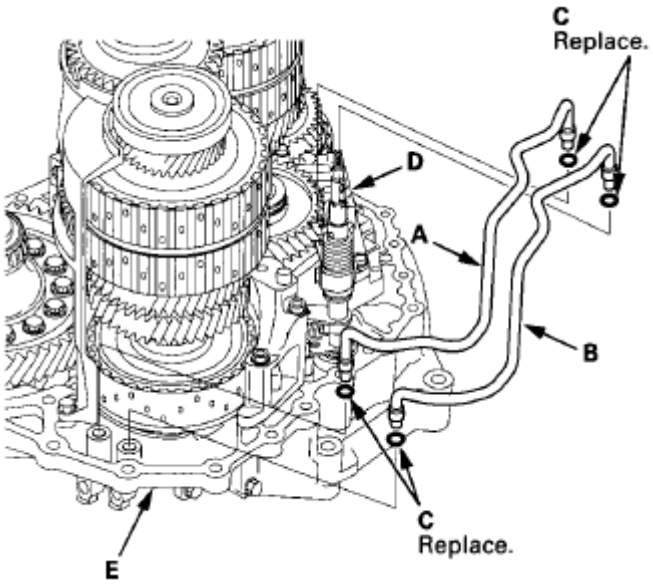

Fig. 554: Identifying O-Rings And Manual Valve Body
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Install the two dowel pins (A) and a new gasket (B) on the torque converter housing (C).

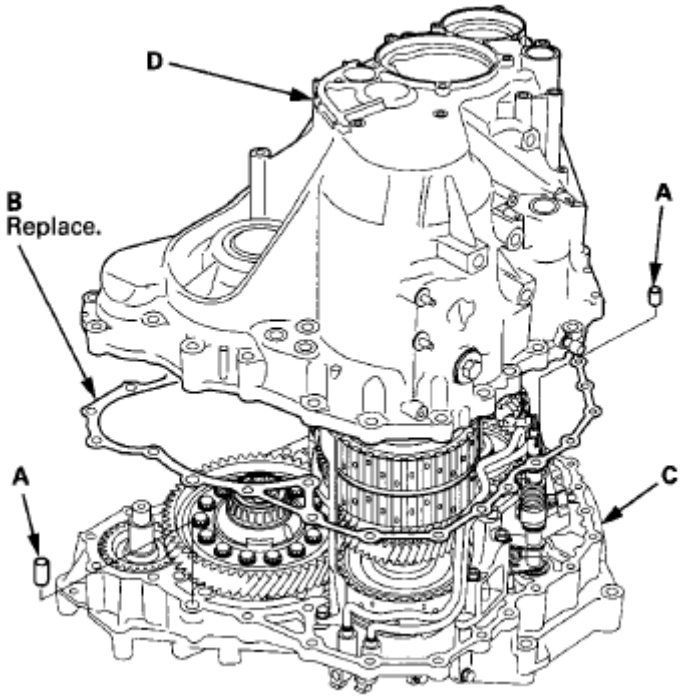

Fig. 555: Identifying Dowel Pins, Gasket, Torque Converter Housing And Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Place the transmission housing (D) on the torque converter housing.
35. Wrap a screwdriver tip with tape to prevent damaging the reverse idler gear teeth. Engage the reverse

idler gear with the reverse gears by rotating the idler gear using a screwdriver.

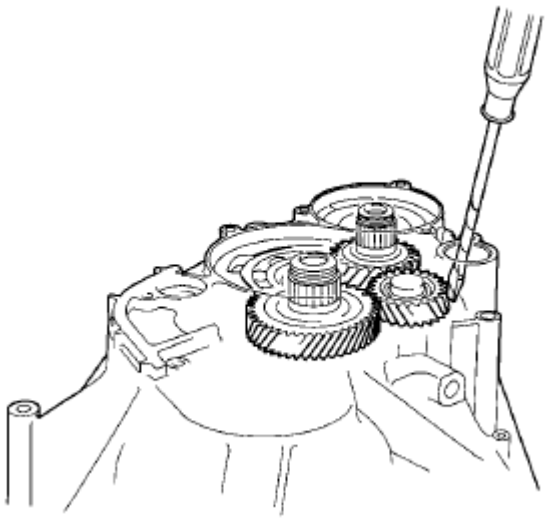

Fig. 556: Engaging Reverse Idler Gear With Reverse Gears By Rotating Idler Gear Using Screwdriver
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. While expanding the snap ring of the countershaft bearing using snap ring pliers, install the transmission housing onto the bearing part-way. Then release snap ring pliers, and push down on the transmission housing until it bottoms and snap ring snaps into place on the countershaft bearing snap ring groove.

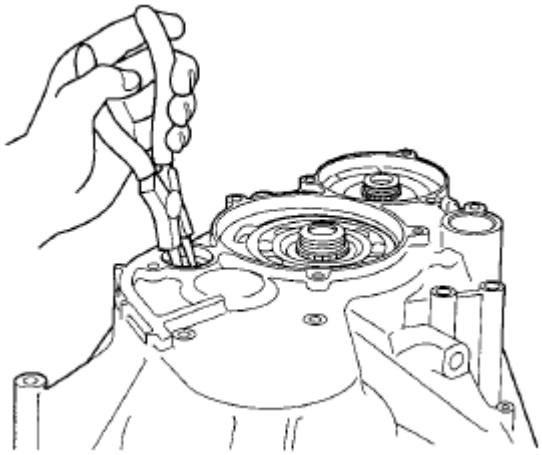

Fig. 557: Expanding Snap Ring Of Countershaft Bearing Using Snap Ring Pliers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Install the transmission housing mounting bolts along with transmission hanger C, and tighten the bolts in at least two steps in a criss-cross pattern to the specified torques.

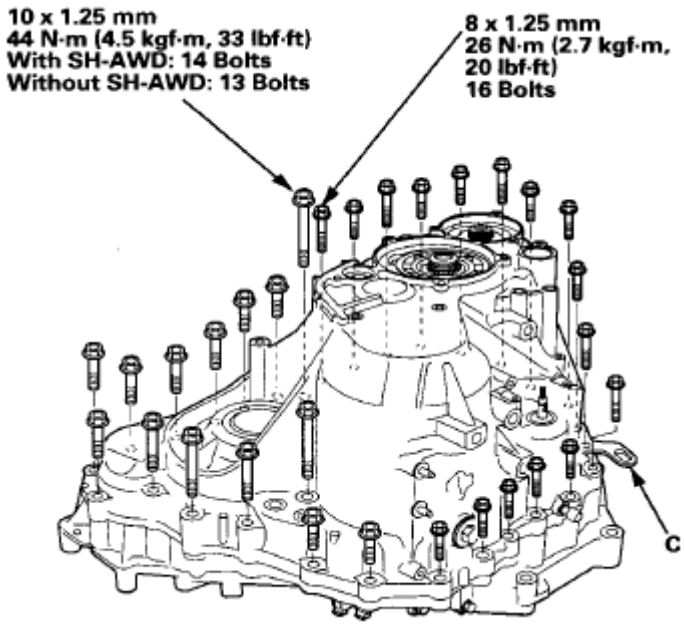

Fig. 558: Installing Transmission Housing Mounting Bolts Along With Transmission Hanger C With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Install the mainshaft holder onto the mainshaft.

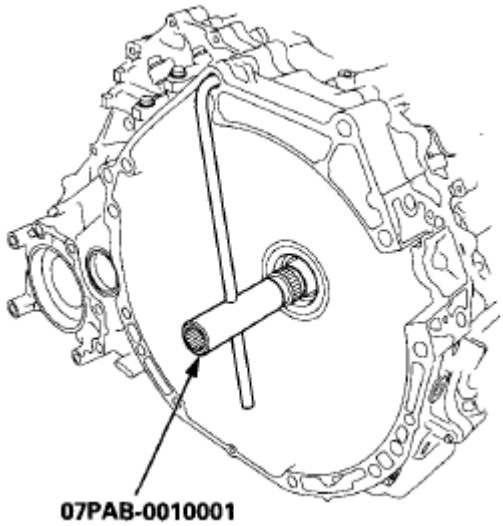

Fig. 559: Installing Mainshaft Holder Onto Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

39. Install the control lever (A) over the selector control shaft (B). Secure the control lever with a new lock washer (C) and the bolt, then bend the lock tab of the lock washer against the bolt head.

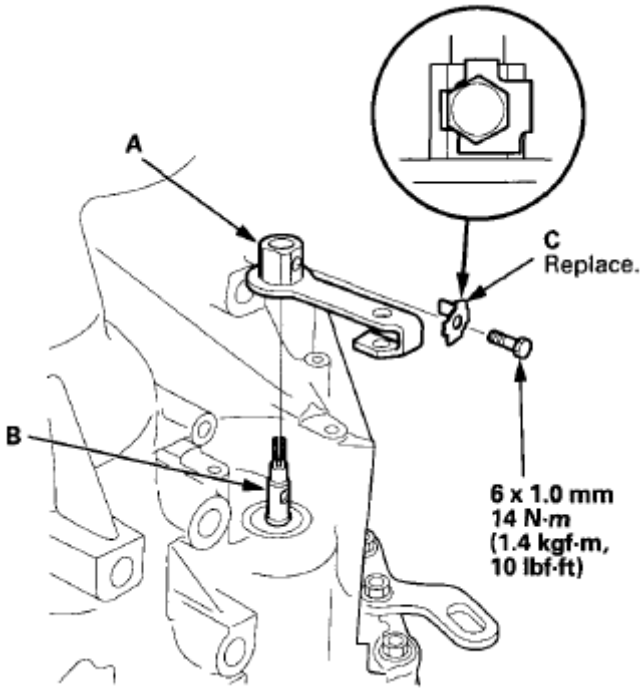

Fig. 560: Identifying Control Lever, Selector Control Shaft And Lock Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Shift the transmission in the P position by rotating the control lever. Do not use the control shaft to adjust the shift position. If the selector control shaft tips are squeezed together, it will cause a faulty signal or position due to play between the control shaft and the transmission range switch.

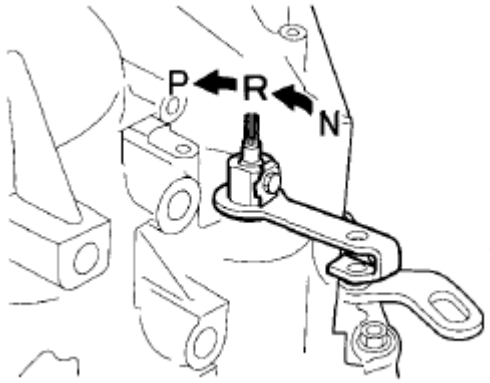

Fig. 561: Rotating Control Lever By Shifting Transmission In P Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Install the old lock washers (A) with the marked side (B) up over the mainshaft (C) and the third shaft (D), and apply ATF to surfaces of the old lock washers and the old locknuts (E).

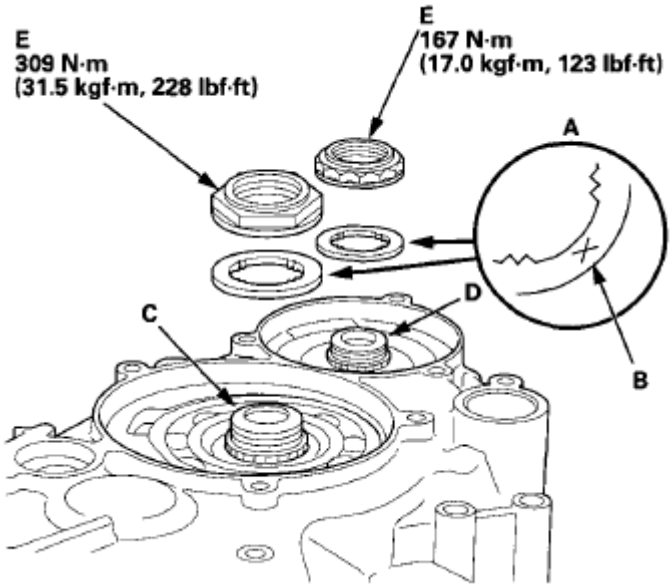

Fig. 562: Identifying Lock Washers, Marked Side, Mainshaft, Third Shaft And Locknuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Install the old locknuts, and tighten them to seat the lock washers to the specified torques, then remove the old locknuts and the old lock washers.

NOTE: The third shaft locknut has left-hand threads.

43. Install new locknuts and new lock washers, and tighten them to the specified torques, then stake the locknuts to a depth (A) of 0.7 - 1.3 mm (0.028- 0.051 in) using a 3.5 mm punch (B).

NOTE:

- **Do not rotate the locknuts in the reverse direction after the locknuts are seated to the lock washers.**
- **The third shaft locknut has left-hand threads.**

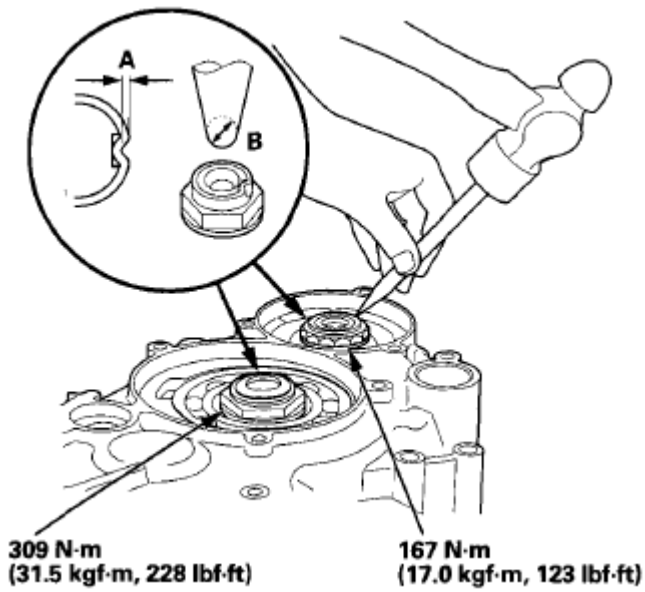

Fig. 563: Installing Locknuts And Lock Washers With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Install transmission hanger A.

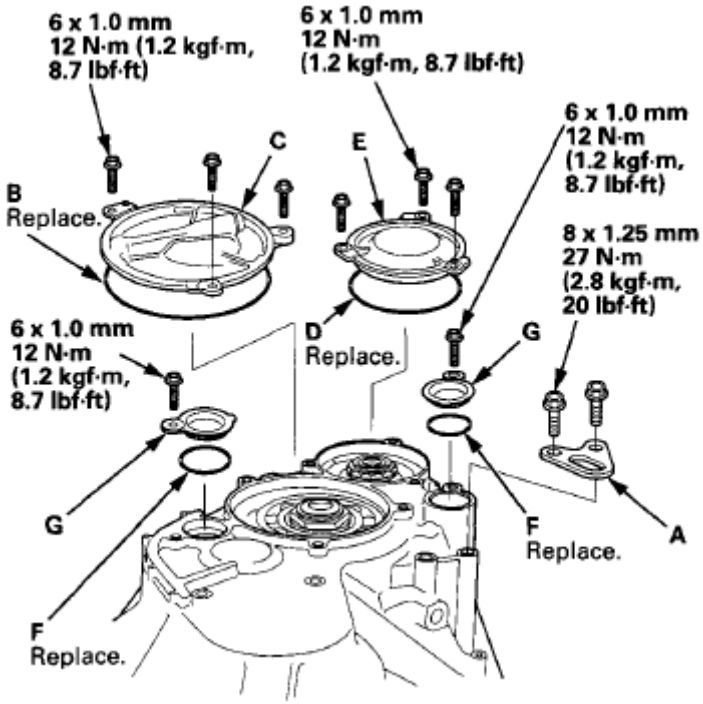

Fig. 564: Identifying Transmission Hangers, O-Rings, Mainshaft And End Covers With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Install a new O-ring (B) on the mainshaft end cover (C), and install the mainshaft end cover. Install a new O-ring (D) on the third shaft end cover (E), and install the third shaft end cover.
46. Install new O-rings (F) on the end covers (G), and install the end covers.
47. Apply ATF to new O-rings (A), and install the O-rings over the ATF pipes (B). Then install the ATF pipes with the filter ends (C) facing the secondary valve body (D) into the transmission.

NOTE: There are 11 ATF pipes. Do not drop the ATF pipes into the transmission. If an ATF pipe is dropped into the transmission, the transmission will need to be disassembled.

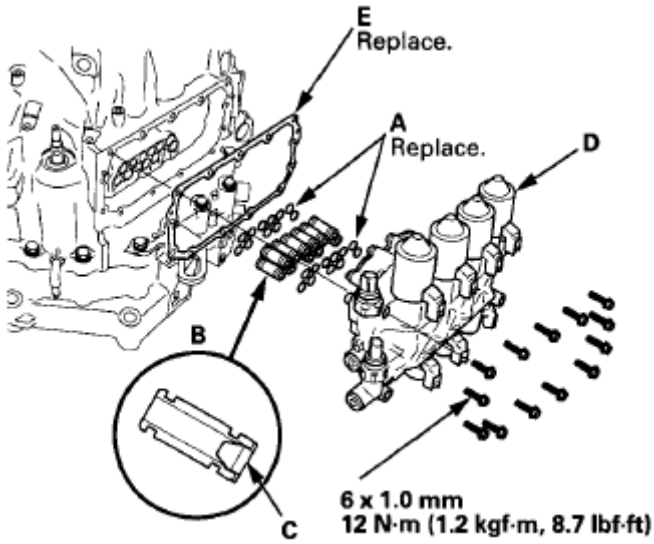

Fig. 565: Identifying O-Ring, ATF Pipes, Filter Ends, Gasket And Secondary Valve Body With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Install a new gasket (E) on the transmission housing.
49. Install the secondary valve body while aligning the ATF pipes with the pipe holes on the secondary valve body, and secure the secondary valve body with the bolts.
50. Install new O-rings (A) on shift solenoid valve C (B), and install shift solenoid valve C.

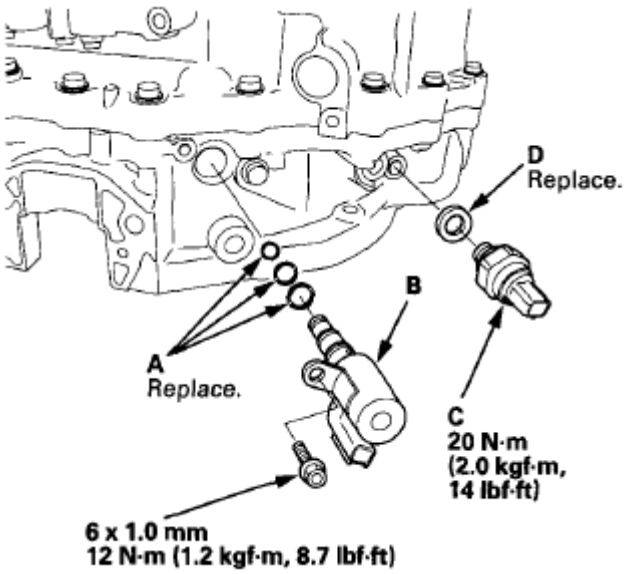

Fig. 566: Identifying O-Ring, Shift Solenoid Valve C And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Install transmission fluid pressure switch C (4th clutch) (C) with a new sealing washer (D). Tighten the switch by gripping the metal part, not the plastic part.
52. Install transmission fluid pressure switch A (2nd clutch) with a new sealing washer (C). Tighten the switch by gripping the metal part, not the plastic part.

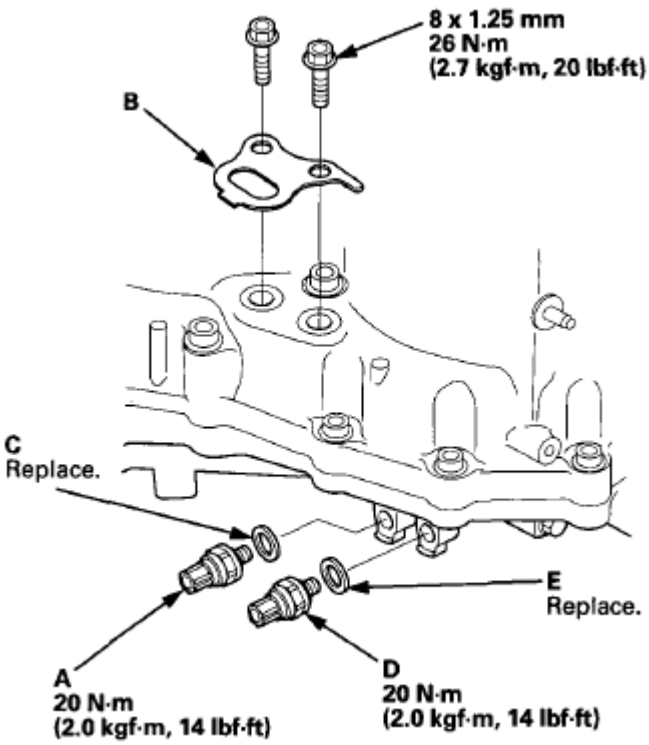

Fig. 567: Identifying Fluid Pressure Switch And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Install transmission fluid pressure switch D (5th clutch) with a new sealing washer (E). Tighten the switch by gripping the metal part, not the plastic part.
54. Install transmission hanger B.
55. Install the ATF outlet line (A), and secure it with the banjo bolt (B) and new sealing washers (C), then secure the ATF outlet line with the bracket bolt.

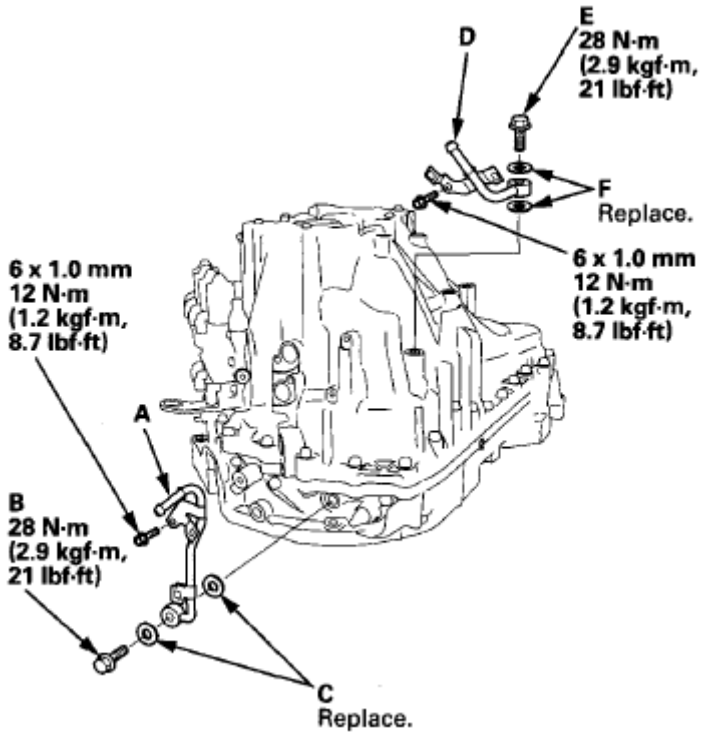

Fig. 568: Identifying ATF Outlet Line, Banjo Bolt, Sealing Washers And ATF Inlet Line With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Install the ATF inlet line (D), and secure it with the banjo bolt (E) and new sealing washers (F).
57. Install a new O-ring (A) on the ATF temperature sensor (B), and install the ATF temperature sensor.

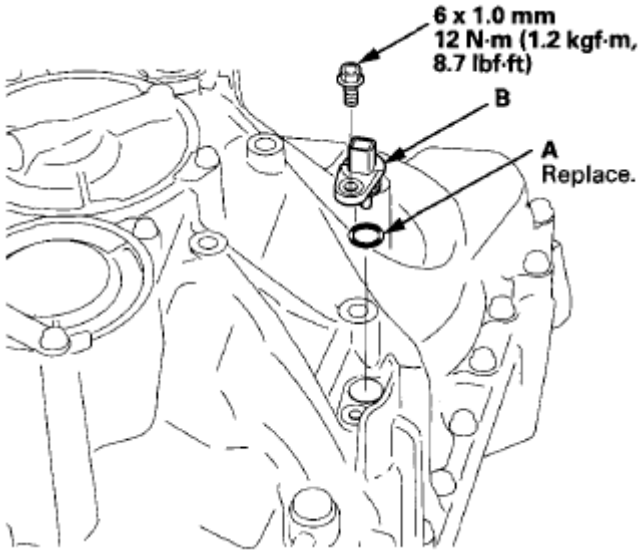

Fig. 569: Identifying O-Ring And ATF Temperature Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

58. Install a new O-ring (A) on the input shaft (mainshaft) speed sensor (B), and install the input shaft (mainshaft) speed sensor.

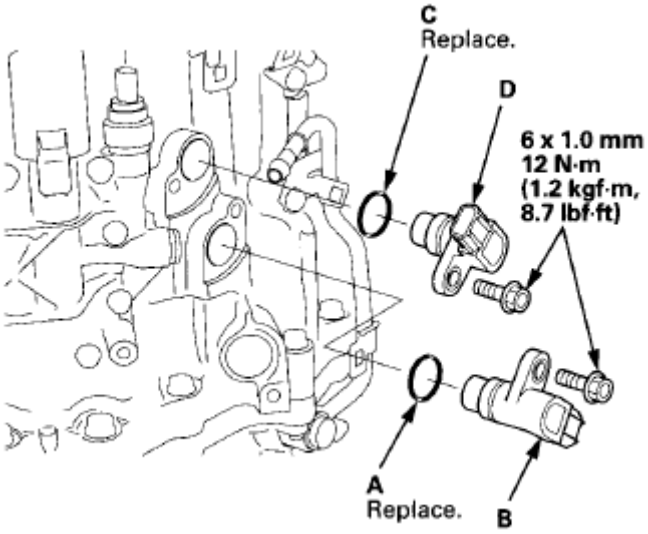

Fig. 570: Identifying O-Ring And Input Shaft Speed Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

59. Install a new O-ring (C) on the output shaft (countershaft) speed sensor (D), and install the output shaft (countershaft) speed sensor.
60. Shift the transmission into the N position by rotating the control lever from the P position. Do not use the control shaft to adjust the shift position. If the selector control shaft tips are squeezed together, it will cause a faulty signal or position due to play between the control shaft and the transmission range switch.

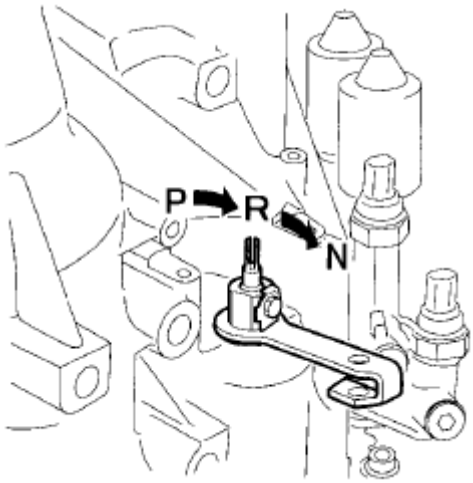

Fig. 571: Rotating Control Lever From P Position To N Position
Courtesy of AMERICAN HONDA MOTOR CO., INC.

61. Align the cutouts (A) on the rotary-frame with the N positioning cutouts (B) on the transmission range switch (C), then put a 2.0 mm (0.079 in) feeler gauge blade (D) in the cutouts to hold the switch in the N position.

NOTE: Be sure to use a 2.0 mm (0.079 in) blade or equivalent to hold the switch in the N position.

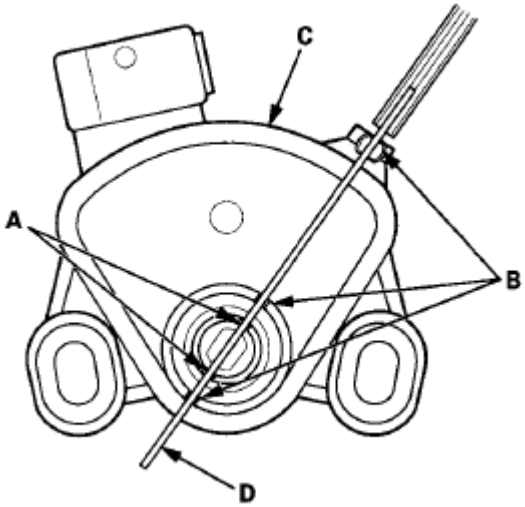

Fig. 572: Identifying Cutouts, Transmission Range Switch And Feeler Gauge Blade
Courtesy of AMERICAN HONDA MOTOR CO., INC.

62. Install the transmission range switch (A) gently on the selector control shaft while holding it in the N position with the 2.0 mm (0.079 in) blade (B).

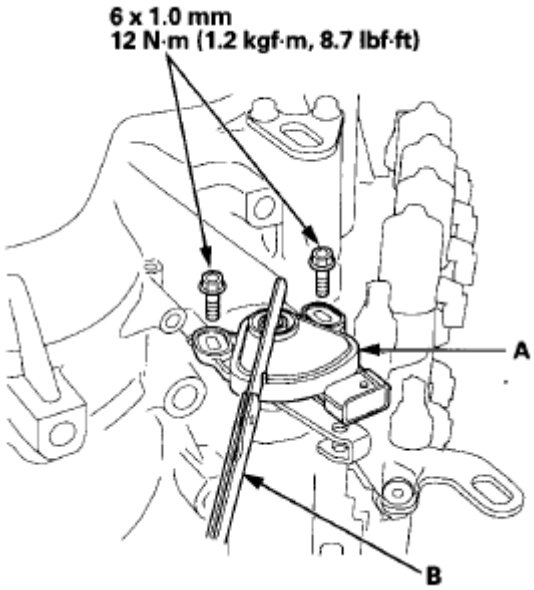

Fig. 573: Identifying Transmission Range Switch And Blade With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

63. Tighten the bolts on the transmission range switch while you continue to hold the N position. Do not move the transmission range switch when tightening the bolts. Remove the feeler gauge.
64. Install the ATF dipstick guide tubes (A) with new O-rings (B).

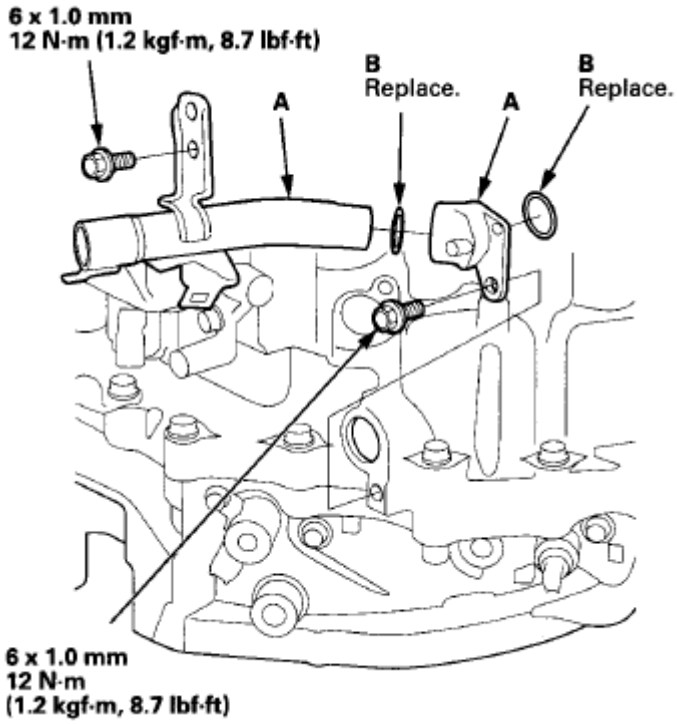

Fig. 574: Identifying ATF Dipstick Guide Tubes And O-Rings With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

65. Install the ATF dipstick in the guide tube.

COMPONENT LOCATION INDEX

WITH SH-AWD

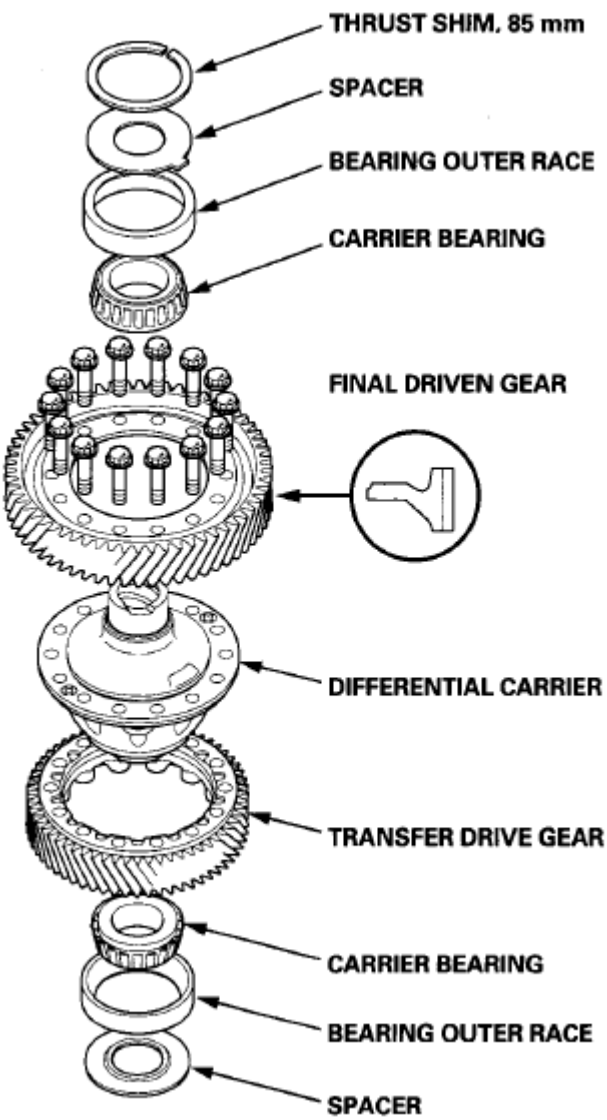

Fig. 575: Identifying A/T Differential And Related Components (With SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

WITHOUT SH-AWD

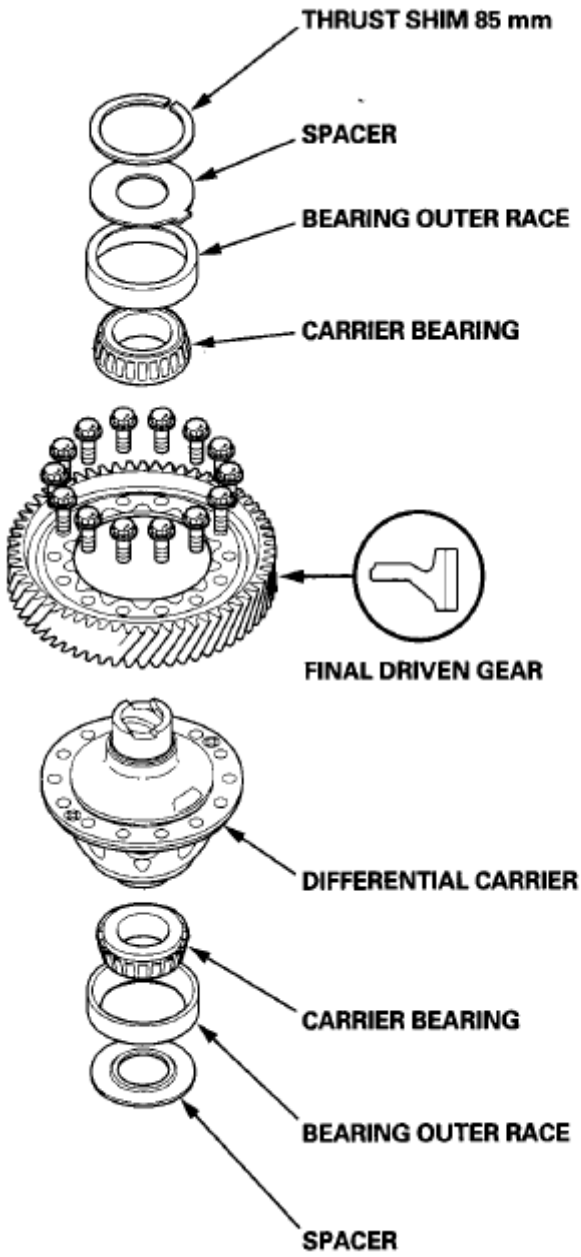

Fig. 576: Identifying A/T Differential And Related Components (Without SH-AWD)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BACKLASH INSPECTION

1. With SH-AWD: Remove the final driven gear and the transfer drive gear from the differential carrier (see **DIFFERENTIAL CARRIER, FINAL DRIVEN GEAR, AND TRANSFER DRIVE GEAR REPLACEMENT**).

   Without SH-AWD: Remove the final driven gear (see **DIFFERENTIAL CARRIER AND FINAL DRIVEN GEAR REPLACEMENT**).

2. Install both axles into the differential assembly (A) and place the axles on V-blocks (B).

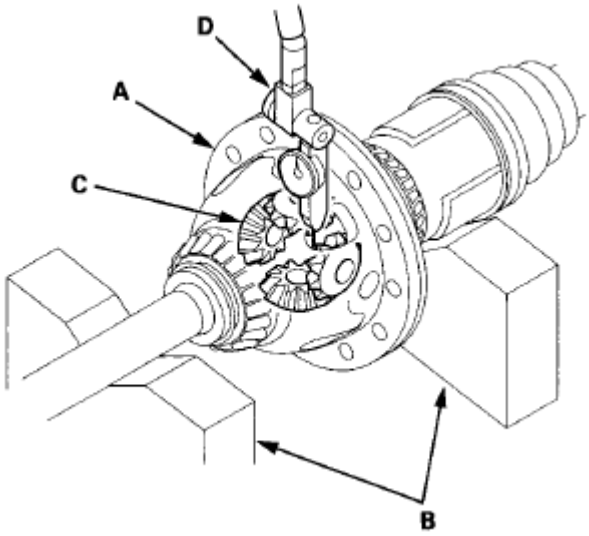

Fig. 577: Identifying Differential Assembly, V-Blocks, Pinion Gears And Dial Indicators
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the backlash of the pinion gears (C) with a dial indicator (D).

   Standard (New): 0.05 - 0.15 mm (0.0020 - 0.0059 in)

4. If the backlash is out of the standard, replace the differential assembly.
5. With SH-AWD: Install the final driven gear and the transfer drive gear on the differential carrier (see **DIFFERENTIAL CARRIER, FINAL DRIVEN GEAR, AND TRANSFER DRIVE GEAR REPLACEMENT**).

   Without SH-AWD: Install the final driven gear (see **DIFFERENTIAL CARRIER AND FINAL DRIVEN GEAR REPLACEMENT**).

DIFFERENTIAL CARRIER, FINAL DRIVEN GEAR, AND TRANSFER DRIVE GEAR REPLACEMENT

NOTE: Inspect and adjust the bearing preload whenever the differential carrier is replaced.

1. Remove the final driven gear (A) and the transfer drive gear (B) from the differential carrier (C).

   NOTE: The final driven gear bolts have left-hand threads.

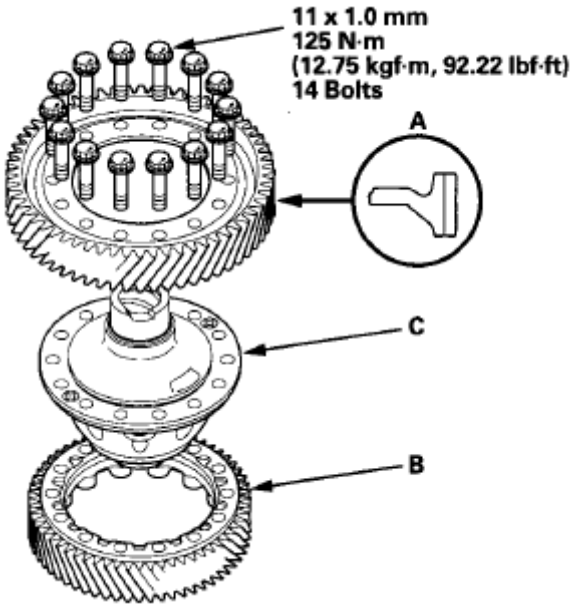

Fig. 578: Identifying Driven Gear, Drive Gear And Differential Carrier With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the final driven gear and the transfer drive gear on the differential carrier in the direction shown.
3. Install the bolts through the differential carrier to the transfer drive gear.
4. Tighten the bolts to the specified torque in a crisscross pattern in at least two steps.

DIFFERENTIAL CARRIER AND FINAL DRIVEN GEAR REPLACEMENT

NOTE: Inspect and adjust the carrier bearing preload whenever the differential carrier is replaced.

1. Remove the final driven gear (A) from the differential carrier (B).

NOTE: The final driven gear bolts (C) have left-hand threads.

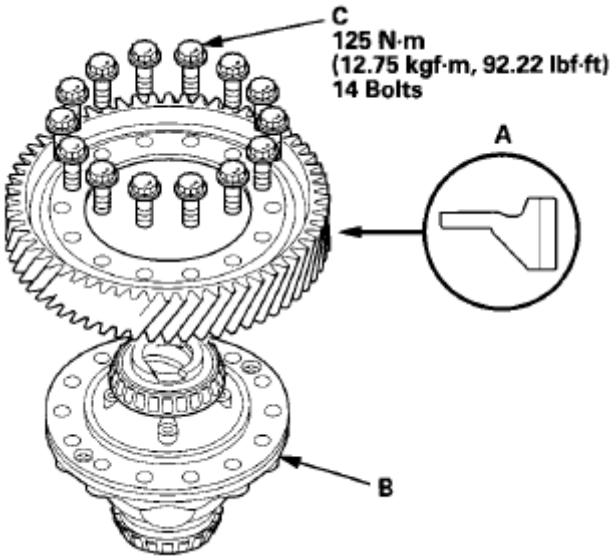

Fig. 579: Identifying Driven Gear, Differential Carrier And Driven Gear Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the final driven gear on the differential carrier in the direction shown.
3. Tighten the bolts to the specified torque in a crisscross pattern in at least two steps.

CARRIER BEARING REPLACEMENT

Special Tools Required

Installer Attachment, 45 x 55 mm 07MAD-PR90100

NOTE:

- **The carrier bearing and the carrier bearing outer race should be replaced as a set.**
- **Inspect and adjust the carrier bearing preload whenever the bearing is replaced.**
- **Check the bearing for wear and rough rotation. If the bearing is OK, removal is not necessary.**

1. Remove the carrier bearing (A) using a commercially available bearing puller (B), a bearing separator (C), and a spacer (D).

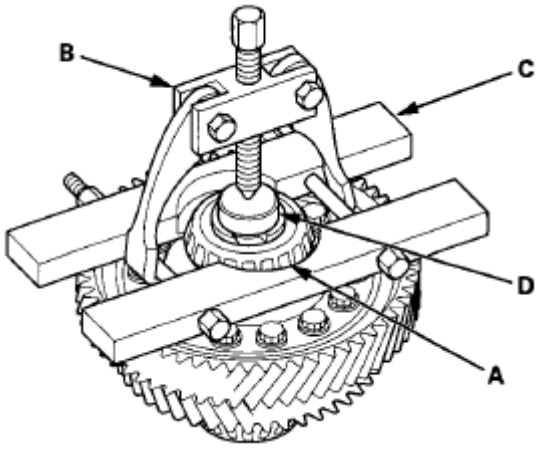

Fig. 580: Identifying Carrier Bearing, Bearing Puller, Bearing Separator And Spacer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new carrier bearing until it bottoms using the 45 x 55 mm installer attachment and a press.

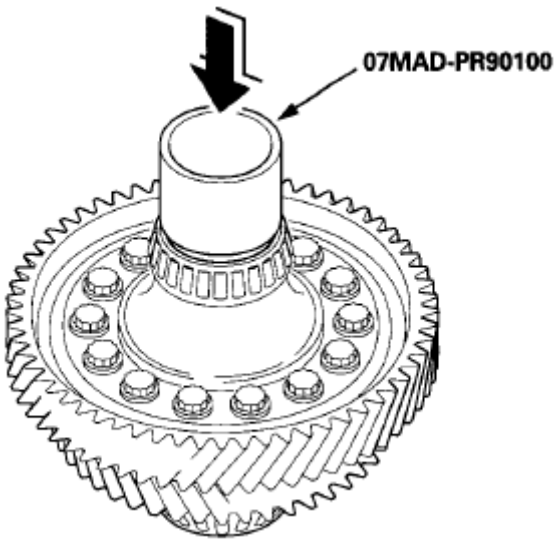

Fig. 581: Installing Carrier Bearing Until It Bottoms Using Installer Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OIL SEAL REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment, 58 mm 07JAD-PH80101
- Oil Seal Driver Attachment, 60 mm 07LAD-SM40100

1. Remove the oil seal from the transmission housing.

Fig. 582: Removing Oil Seal From Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the oil seal from the torque converter housing.

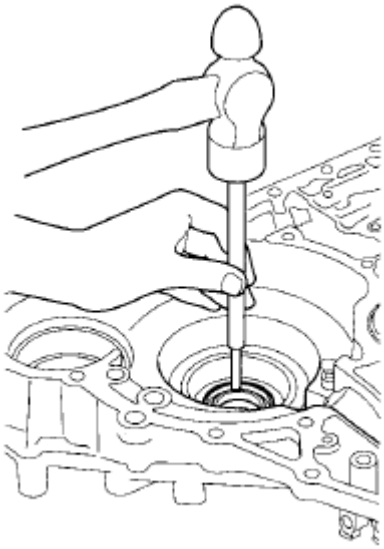

Fig. 583: Removing Oil Seal From Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new oil seal flush with the transmission housing using the 15 x 135L drive handle and the 60 mm oil seal driver attachment.

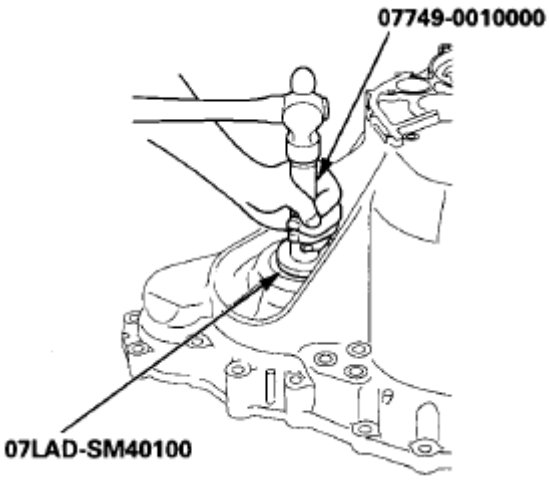

Fig. 584: Installing Oil Seal Flush With Transmission Housing Using Drive Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new oil seal flush with the torque converter housing using the 15 x 135L drive handle and the 58 mm oil seal driver attachment.

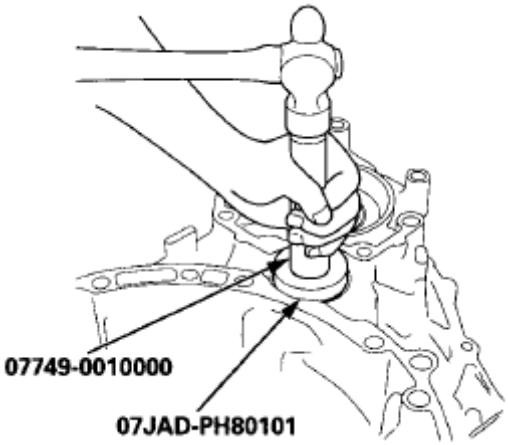

Fig. 585: Installing Oil Seal Flush With Torque Converter Housing Using Drive Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CARRIER BEARING OUTER RACE REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Attachment, 83 mm 07HAD-SG00100

NOTE:

- **Replace the carrier bearing with a new one whenever the bearing outer**

race is replaced.

- **Do not use the 85 mm thrust shim on the torque converter housing side.**
- **Adjust the preload after replacing the bearing and the outer race.**
- **Coat all parts with ATF during installation.**

1. Remove the bearing outer race (A), the spacer (B), and the 85 mm thrust shim (C) from the transmission housing (D) by heating the transmission housing to about 212°F (100°C) with a heat gun (E). Do not heat the transmission housing more than 212°F (100°C).

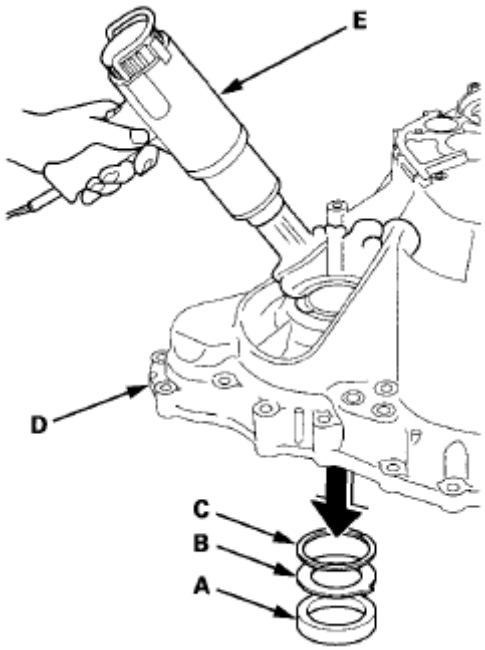

Fig. 586: Removing Bearing Outer Race, Spacer And Thrust Shim From Transmission Housing By Heating With Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 85 mm thrust shim (A) in the transmission housing (B).

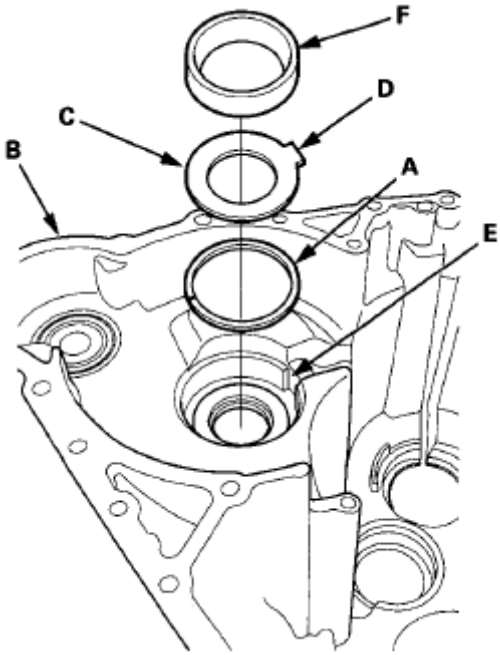

Fig. 587: Identifying Thrust Shim, Transmission Housing, Spacer, Tab, Groove And Bearing Outer Race
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the spacer (C) by aligning the tab (D) with the groove (E), and install the bearing outer race (F) in the transmission housing.
4. Drive the outer race securely into the transmission housing using the 15 x 135L driver handle and the 83 mm attachment so there is no clearance between the outer race, the spacer, the 85 mm thrust shim, and the transmission housing.

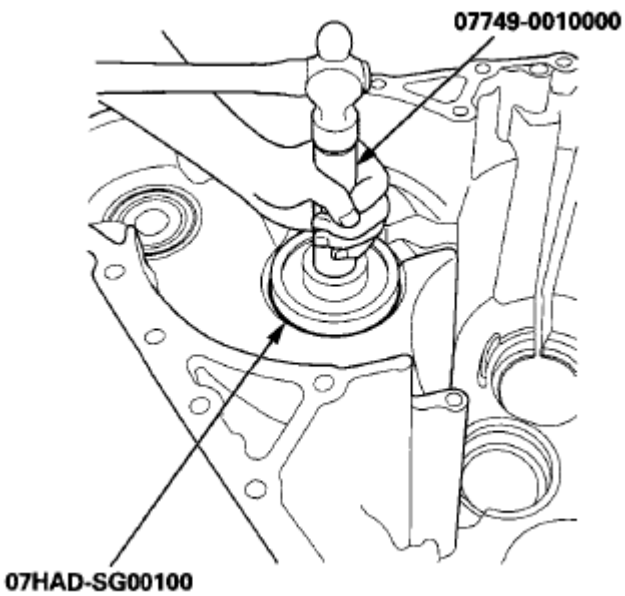

Fig. 588: Driving Outer Race Securely Into Transmission Housing Using Driver Handle And

Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the bearing outer race (A) and the spacer (B) from the torque converter housing (C).

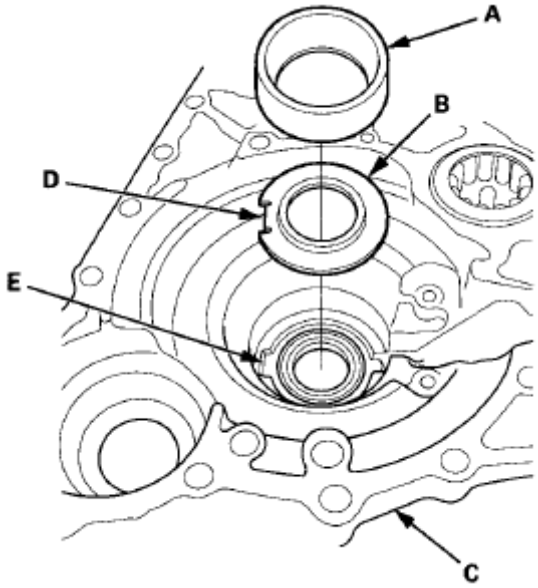

Fig. 589: Identifying Bearing Outer Race, Spacer, Tab And Groove
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the spacer by aligning the tab (D) with the groove (E), and install a new bearing outer race in the torque converter housing.
7. Drive the bearing outer race securely in the torque converter housing using the 15 x 135L driver handle and the 83 mm attachment.

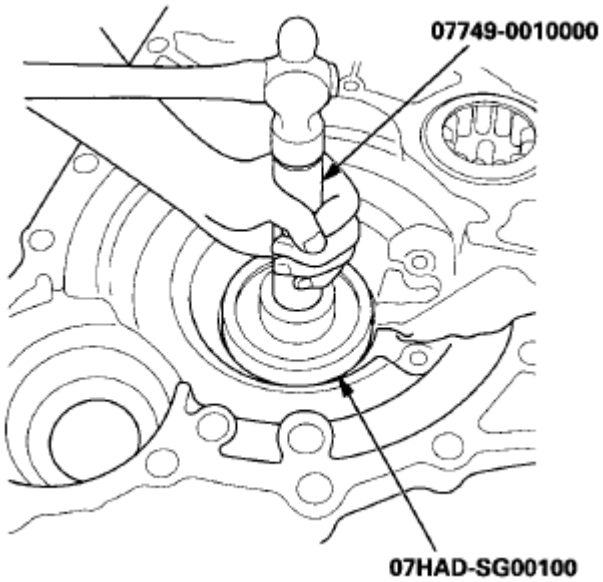

Fig. 590: Driving Bearing Outer Race Securely In Torque Converter Housing Using Driver Handle And Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CARRIER BEARING PRELOAD INSPECTION

Special Tools Required

- Attachment, 83 mm 07HAD-SG00100
- Preload Inspection Tool 070AJ-0020101
- Driver Handle, 15 x 135L 07749-0010000

NOTE: If the transmission housing, the torque converter housing, the differential carrier, the tapered roller bearing, the bearing outer race, or the thrust shim were replaced, the bearing preload must be adjusted.

1. Remove the bearing outer race (A), the spacer (B), and the 85 mm thrust shim (C) from the transmission housing (D) by heating the transmission housing to about 212°F (100 CC) with a heat gun (E). Do not heat the transmission housing more than 212°F (100°C).

NOTE: Let the transmission housing cool to room temperature before adjusting the bearing preload.

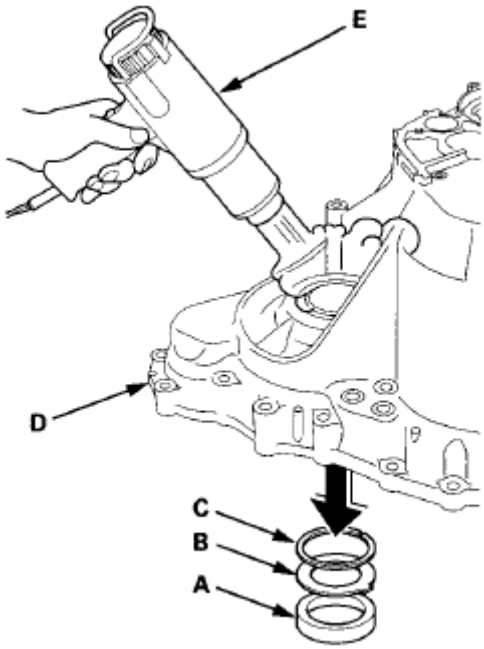

Fig. 591: Removing Bearing Outer Race, Spacer And Thrust Shim From Transmission Housing By Heating With Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Replace the tapered roller bearing when the bearing outer race is to be replaced.
3. Do not use an 85 mm shim on the torque converter housing side.
4. Install the 85 mm thrust shim (A) in the transmission housing (B). If you install a new 85 mm thrust shim, use the same thickness shim as the old one.

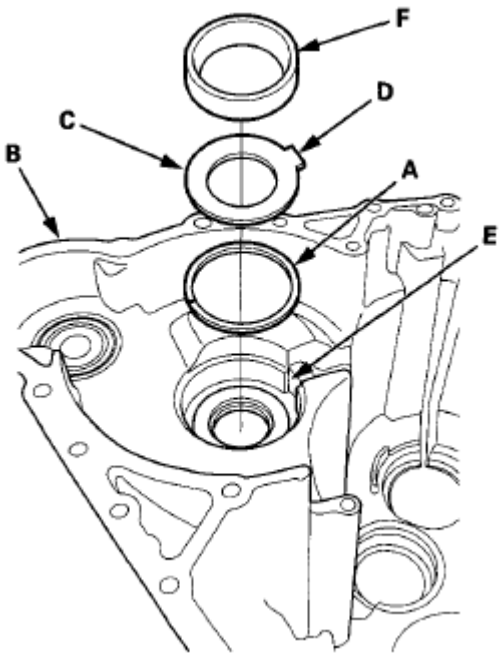

Fig. 592: Identifying Thrust Shim, Transmission Housing, Spacer, Tab And Groove
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the spacer (C) by aligning the tab (D) with the groove (E), and install the bearing outer race (F) in the transmission housing.
6. Drive the bearing outer race securely in the transmission housing using the 15 x 135L driver handle and the 83 mm attachment so there is no clearance between the bearing outer race, the spacer, the 85 mm thrust shim, and the transmission housing.

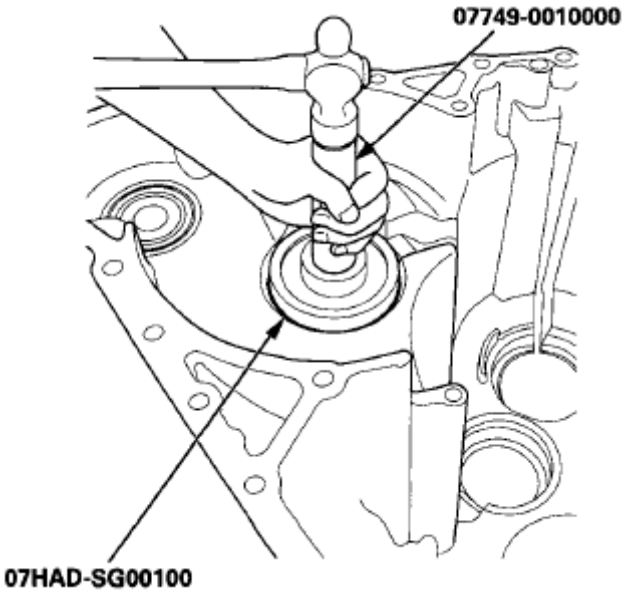

Fig. 593: Driving Bearing Outer Race Securely In Transmission Housing Using Driver Handle And Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the differential assembly (B) in the torque converter housing (C), and install a new gasket (D) and the two dowel pins (E) on the torque converter housing.

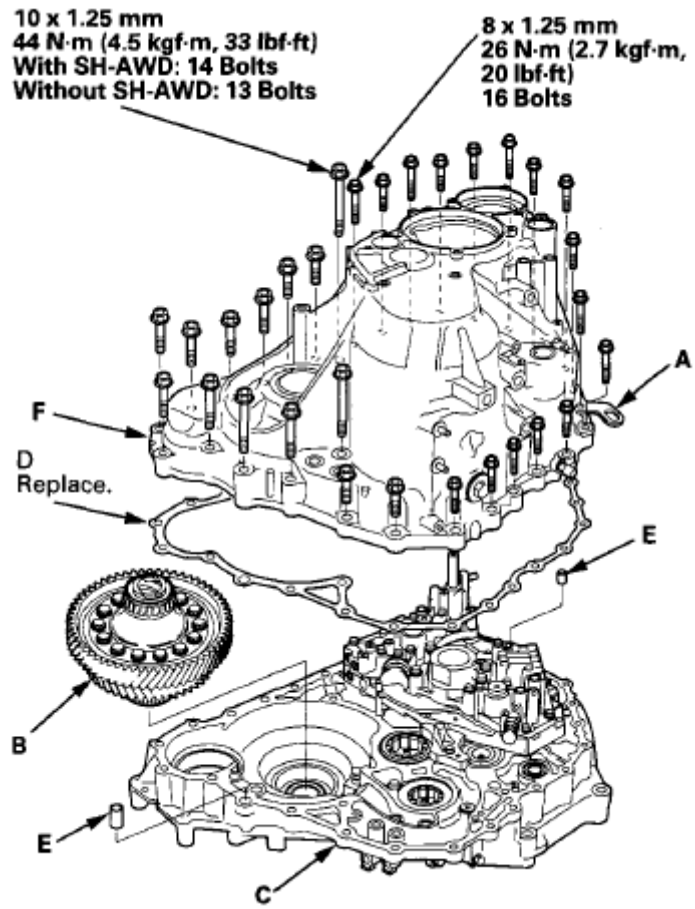

Fig. 594: Identifying Differential Assembly, Torque Converter Housing, Gasket And Dowel Pins With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the transmission housing (F), and install the mounting bolts (With SH-AWD: 30 bolts, without SH-AWD: 29 bolts) with transmission hanger A, then tighten the bolts.
9. Rotate the differential assembly in both directions to seat the bearings.
10. Measure the starting torque of the differential assembly with the preload inspection tool, a torque wrench (A), and a socket (B). Measure the starting torque at normal room temperature in both directions.

Standard

New bearings:

3.9- 5.6 N.m (40- 57 kgf.cm, 35- 49 lbf.in)

Reused bearings:

3.6- 5.3 N.m (37- 54 kgf.cm, 32- 47 lbf.in)

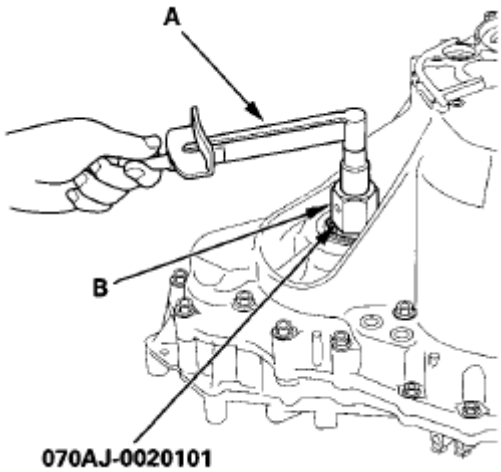

Fig. 595: Measuring Starting Torque Of Differential Assembly With Inspection Tool, Torque Wrench And Socket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. If the measurement is out of the standard, remove the 85 mm thrust shim and measure its thickness.
12. Select a new 85 mm thrust shim. To increase the starting torque, increase thickness of the 85 mm thrust shim. To decrease the starting torque, decrease the thickness of the 85 mm thrust shim. Changing the 85 mm shim to the next size will increase or decrease the starting torque about 0.5- 0.6 N.m (5.10- 6.12 kgf.cm, 4.4- 5.3 lbf.in).

THRUST SHIM, 85 MM

No.	Thickness
A	1.350 mm (0.05315 in)
B	1.375 mm (0.05413 in)
C	1.400 mm (0.05512 in)
D	1.425 mm (0.05610 in)
E	1.450 mm (0.05709 in)
F	1.475 mm (0.05807 in)
G	1.500 mm (0.05906 in)
H	1.525 mm (0.06004 in)
I	1.550 mm (0.06102 in)
J	1.575 mm (0.06201 in)
K	1.600 mm (0.06299 in)
L	1.625 mm (0.06398 in)
M	1.650 mm (0.06496 in)
N	1.675 mm (0.06594 in)
O	1.700 mm (0.06693 in)
P	1.725 mm (0.06791 in)

AR	1.300 mm (0.05118 in)
AS	1.325 mm (0.05217 in)

13. Install a new thrust shim, then recheck the starting torque.

COMPONENT LOCATION INDEX

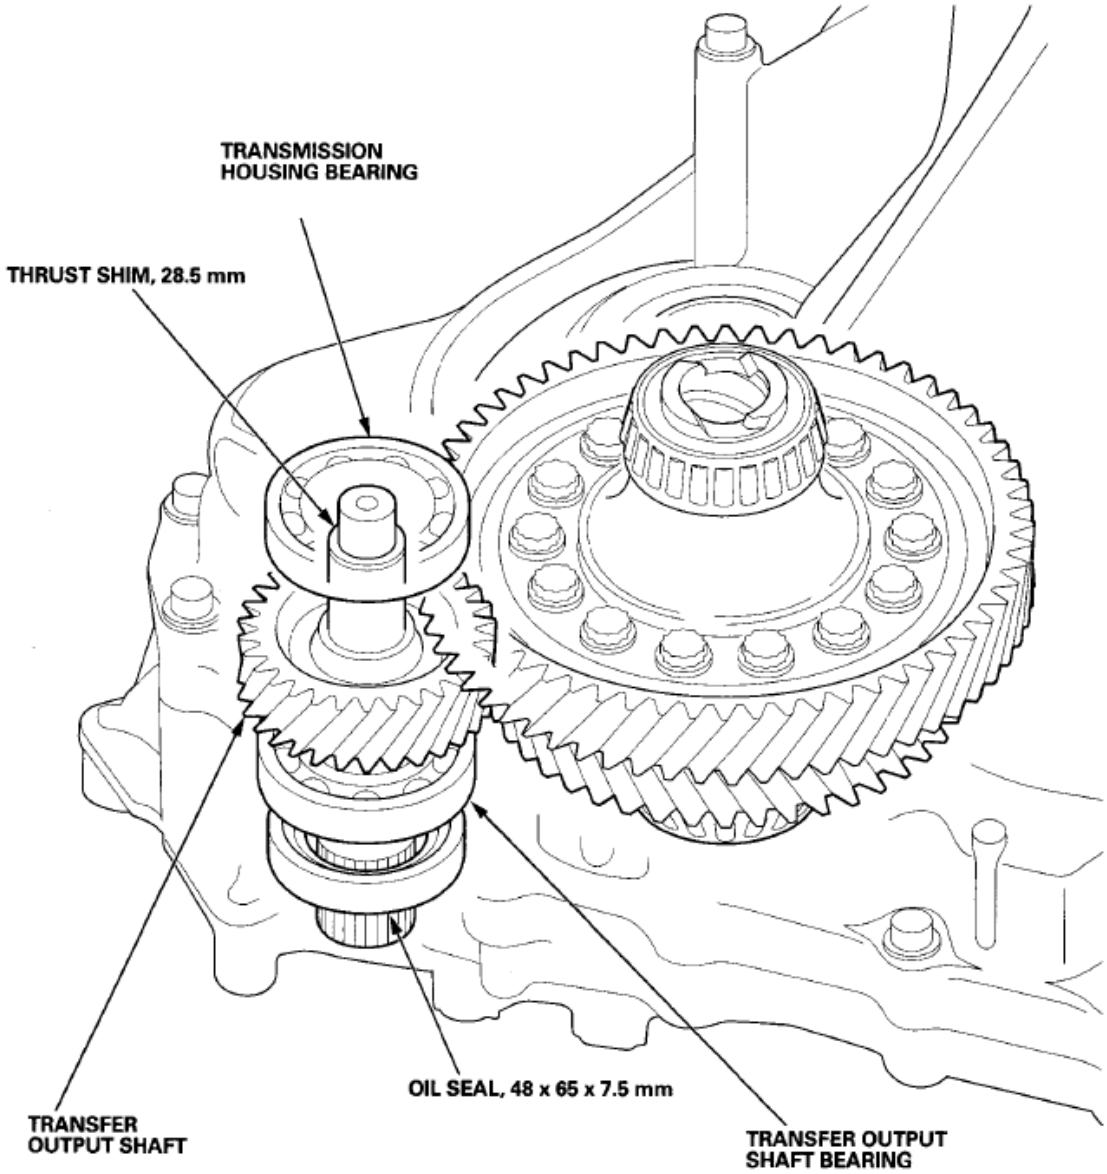

Fig. 596: Identifying Transfer Output Shaft Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER OUTPUT SHAFT BEARING REPLACEMENT

Special Tools Required

Driver Handle, 40 mm I.D. 07746-0030100

1. Remove the transfer output shaft bearing (A) with a commercially available puller (B), a bearing separator (C), and a spacer (D). Place a spacer between the transfer output shaft and the puller to prevent damaging the transfer output shaft.

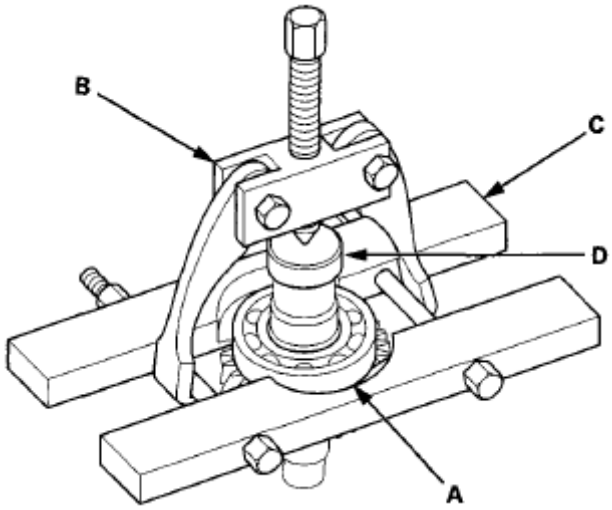

Fig. 597: Removing Transfer Output Shaft Bearing With Puller, Bearing Separator And Spacer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing (A) until it bottoms on the transfer output shaft using the 40 mm I.D. driver handle and a press.

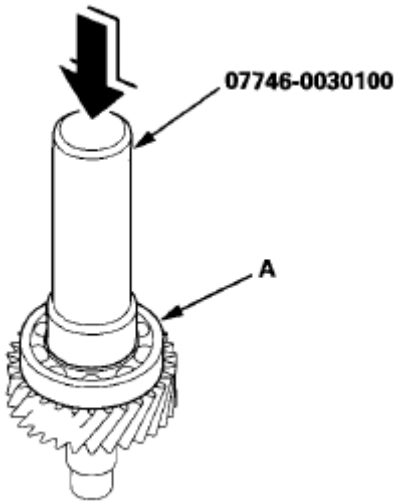

Fig. 598: Installing Bearing Until It Bottoms On Transfer Output Shaft Using Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OIL SEAL REPLACEMENT

Special Tools Required

- Oil Seal Driver Attachment, 65 mm 07JAD-SH30100
- Driver Handle, 15 x 135L 07749-0010000

1. Remove the oil seal from the torque converter housing.

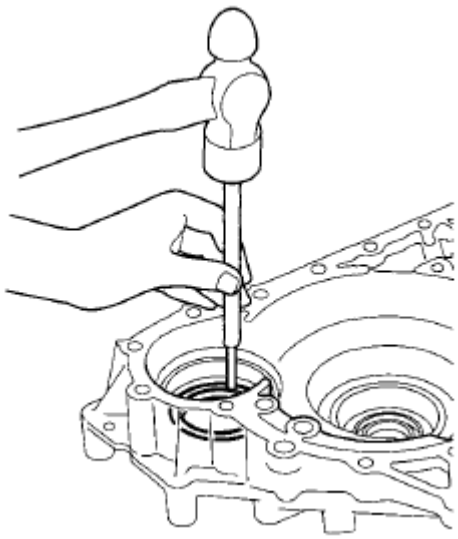

Fig. 599: Removing Oil Seal From Torque Converter Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new oil seal flush with the torque converter housing using the 15 x 135L driver handle and the 65 mm oil seal driver attachment.

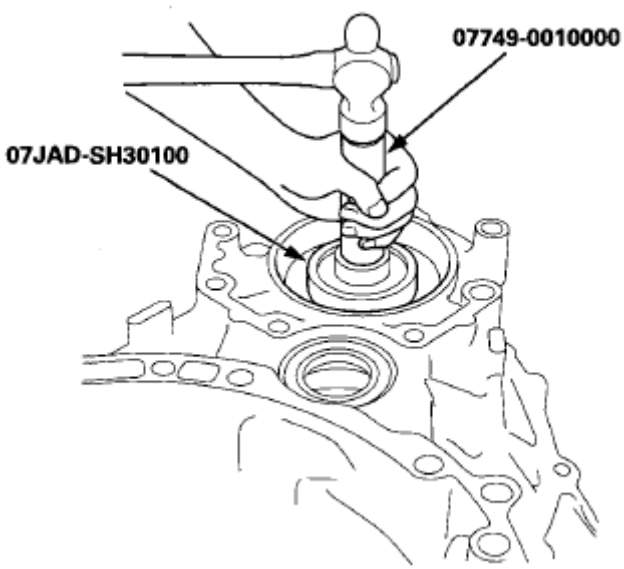

Fig. 600: Installing Oil Seal Flush Using Driver Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSMISSION HOUSING BEARING REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver, 66 mm 07947-3710200

1. Remove the transfer output shaft bearing (A) from the transmission housing (B) by heating the transmission housing to about 212°F (100°C) with a heat gun (C). Do not heat the transmission housing more than 212°F(100°C).

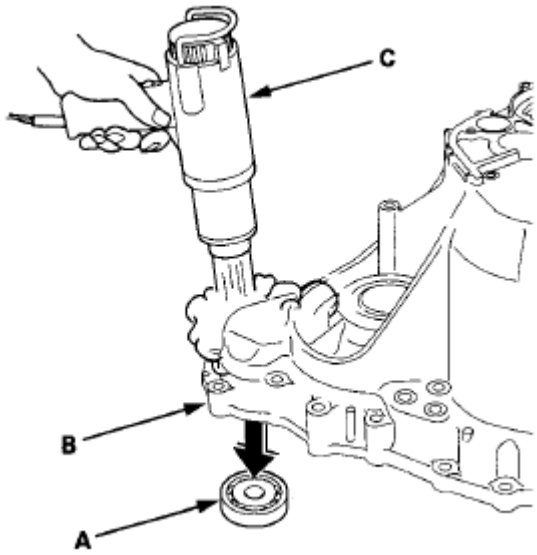

Fig. 601: Removing Transfer Output Shaft Bearing From Transmission Housing By Heating With Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing in the transmission housing in the direction shown.

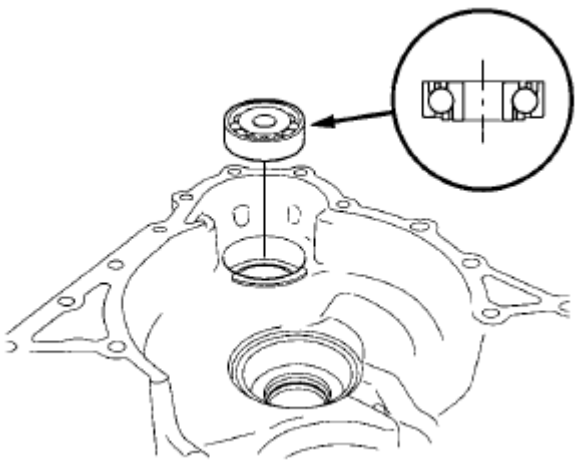

Fig. 602: Installing Bearing In Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Drive a new bearing until it bottoms in the transmission housing using the 15 x 135L driver handle and

the 66 mm oil seal driver.

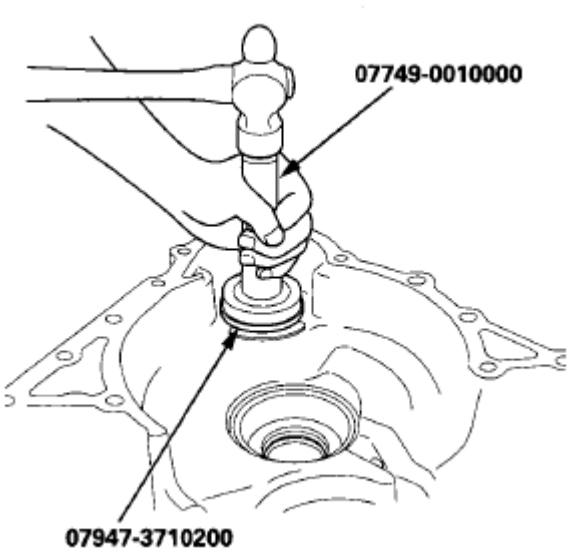

Fig. 603: Driving Bearing Until It Bottoms In Transmission Housing Using Driver Handle And Oil Seal Driver
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER OUTPUT SHAFT INSTALLATION HEIGHT INSPECTION/ADJUSTMENT

NOTE: If the transfer output shaft, the transfer output shaft bearing, the transmission housing bearing, the transmission housing, or the torque converter housing were replaced, adjust the transfer output shaft installation height with the 28.5 mm thrust shim.

1. Install the transfer output shaft (A) in the torque converter housing, and install the 28.5 mm thrust shim (B) on the top of the shaft. If you install a new 28.5 mm thrust shim, use the same thickness shim as the old one.

   Standard: 47.26 - 47.30 mm (1.8606 - 1.8622 in)

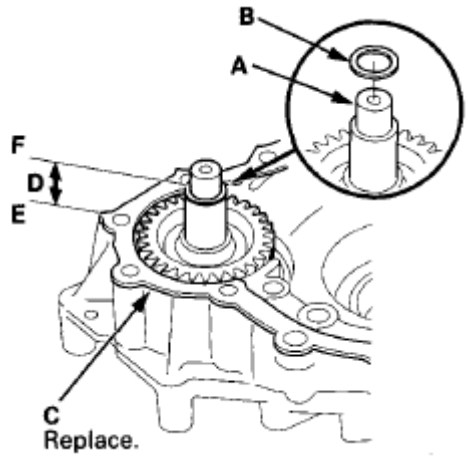

Fig. 604: Installing Transfer Output Shaft In Torque Converter Housing And Thrust Shim On Top Of Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Transfer Output Shaft Cutaway View

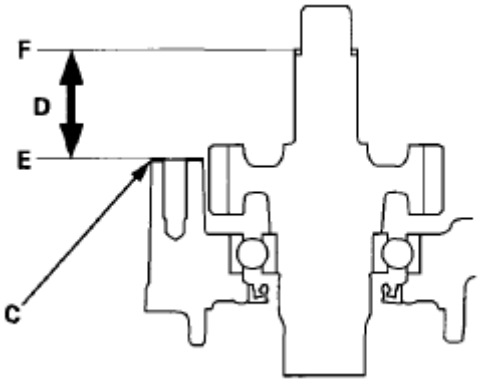

Fig. 605: Transfer Output Shaft Cutaway View
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new gasket (C) on the torque converter housing.
3. Measure the height (D) of the transfer output shaft installation between the surface (E) of the gasket and the top (F) of the 28.5 mm thrust shim in at least three places. Use the average as the actual height.
4. If the measurement is out of the standard, remove the 28.5 mm thrust shim and measure its thickness.
5. Select and install a new thrust shim, then recheck the installation height.

THRUST SHIM, 28.5 MM

No.	Thickness
A	1.82 mm (0.0717 in)
B	1.84 mm (0.0724 in)
C	1.86 mm (0.0732 in)
D	1.88 mm (0.0740 in)

E	1.90 mm (0.0748 in)
F	1.92 mm (0.0756 in)
G	1.94 mm (0.0764 in)
H	1.96 mm (0.0772 in)
I	1.98 mm (0.0780 in)
J	2.00 mm (0.0787 in)
K	2.02 mm (0.0795 in)
L	2.04 mm (0.0803 in)
M	2.06 mm (0.0811 in)
N	2.08 mm (0.0819 in)
O	2.10 mm (0.0827 in)
P	2.12 mm (0.0835 in)
Q	2.14 mm (0.0843 in)
R	2.16 mm (0.0850 in)
S	2.18 mm (0.0858 in)
T	2.20 mm (0.0866 in)
U	2.22 mm (0.0874 in)
V	2.24 mm (0.0882 in)
W	2.26 mm (0.0890 in)
X	2.28 mm (0.0898 in)
Y	2.30 mm (0.0906 in)
Z	2.32 mm (0.0913 in)
AA	2.34 mm (0.0921 in)
AB	1.78 mm (0.0701 in)
AC	1.80 mm (0.0709 in)

COMPONENT LOCATION INDEX

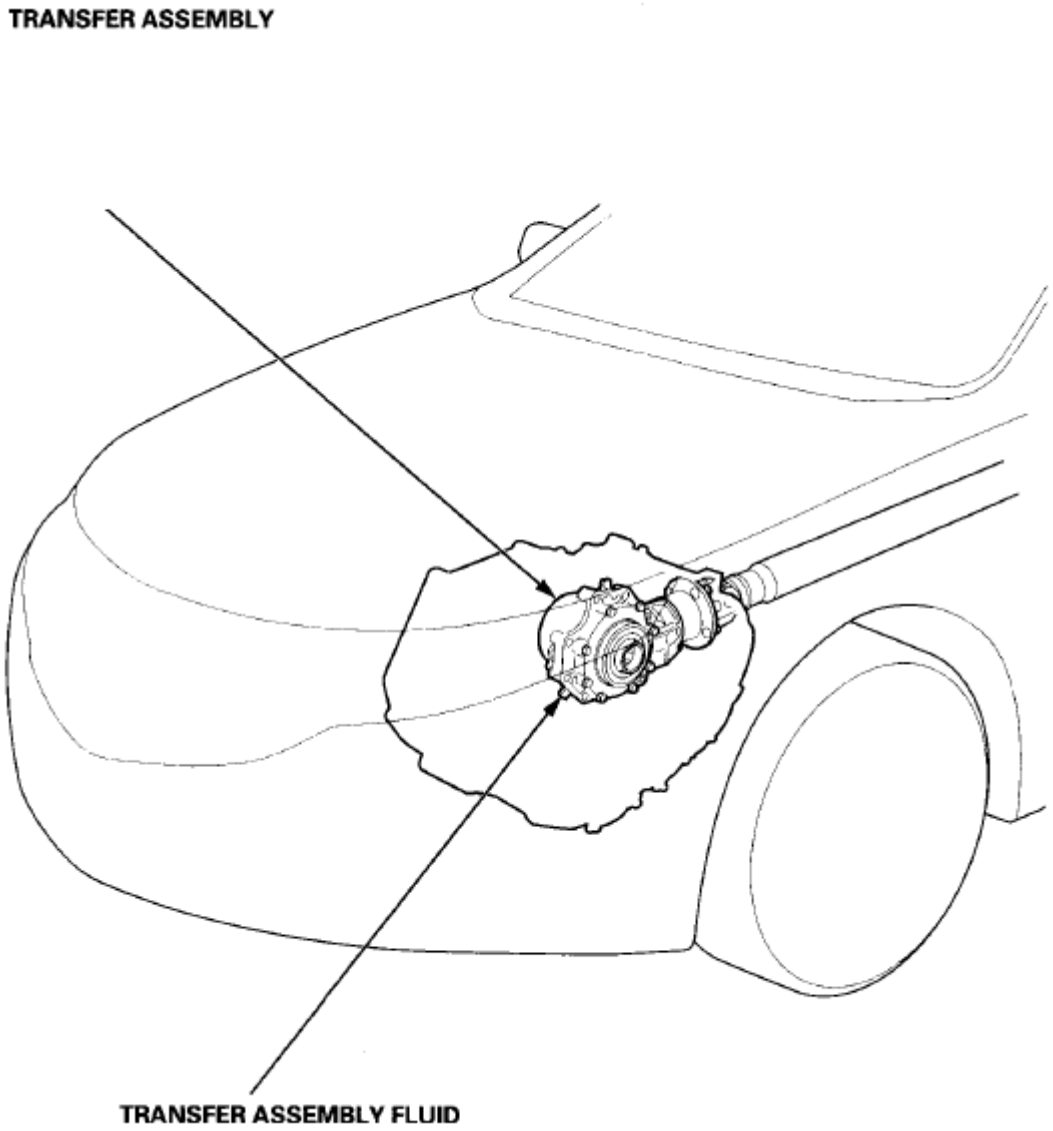

Fig. 606: Identifying Transfer Assembly Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER ASSEMBLY FLUID REPLACEMENT

1. Warm up the engine to normal operating temperature (the radiator fan comes on), then turn the engine off.
2. Raise the vehicle on a lift, and make sure it is securely supported.
3. Remove the drain plug (A), and drain the transfer fluid (hypoid gear oil).

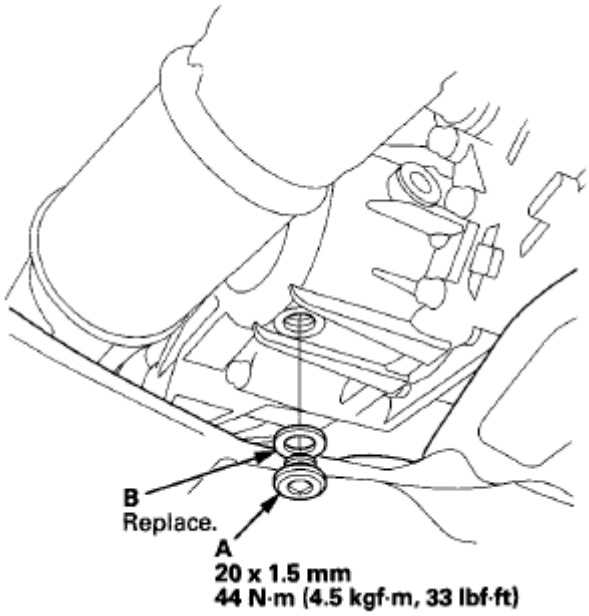

Fig. 607: Identifying Drain Plug And Sealing Washer Of Transfer Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reinstall the drain plug with a new sealing washer (B).
5. Remove the filler plug (A) and the sealing washer (B).

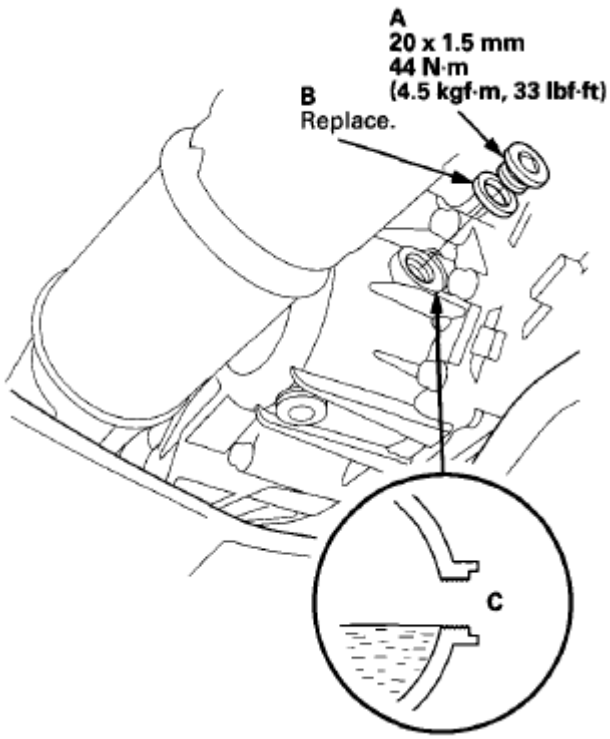

Fig. 608: Removing Filler Plug And Sealing Washer With Torque Specifications

Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Refill the transfer assembly with the recommended fluid (hypoid gear oil) through the filler hole (C) until the fluid flows out. Use a SAE 90 viscosity hypoid gear oil, API classified GL4 or GL5 only.

   Viscosity:

   SAE 90: Above 0°F (-18°C)

   Transfer Fluid (Hypoid Gear Oil) Capacity:

   0.43 L (0.45 US qt) at change

   0.45 L (0.48 US qt) at overhaul

7. Install the filler plug with a new sealing washer.

INSPECTION

TRANSFER GEAR BACKLASH MEASUREMENT

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Shift the transmission into N.
3. Make reference marks (A) across the No. 1 propeller shaft (B) and the transfer companion flange (C).

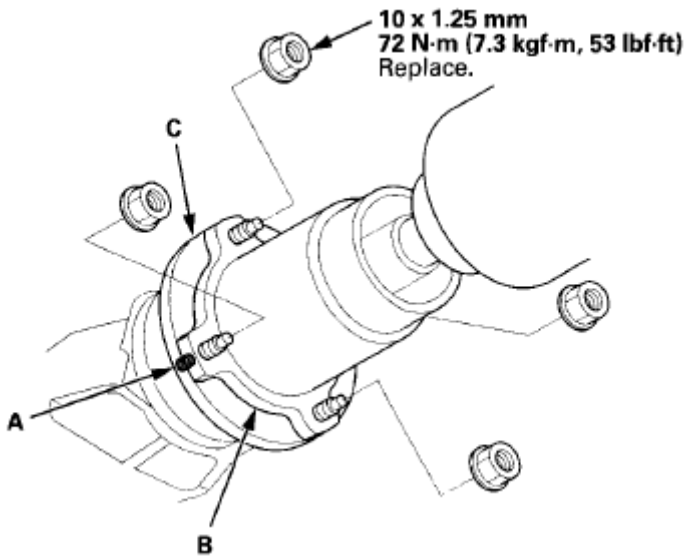

Fig. 609: Making Reference Marks Across Propeller Shaft And Transfer Companion Flange With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Separate the No. 1 propeller shaft from the transfer companion flange.

5. Set a dial indicator (A) on the transfer companion flange (B); position the dial indicator tip (C) on the direct extension of the bolt hole center (D).

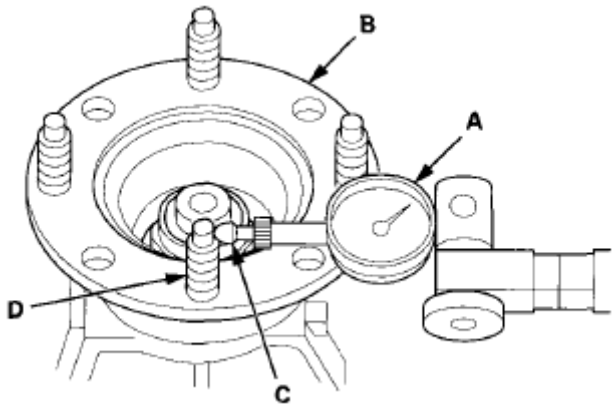

Fig. 610: Setting Dial Indicator On Transfer Companion Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure the transfer gear backlash.

   Standard: 0.06 - 0.16 mm (0.0024 - 0.0063 in)

7. If the transfer gear backlash is out of the standard, replace the transfer assembly.

TOTAL STARTING TORQUE MEASUREMENT

NOTE: To prevent damage to the transfer housing, always use wood blocks or equivalent materials between the transfer housing and a bench vice.

1. Remove the transfer assembly (see **TRANSFER ASSEMBLY REMOVAL**).
2. Secure the transfer housing (A) in a bench vise (B) with wood blocks.

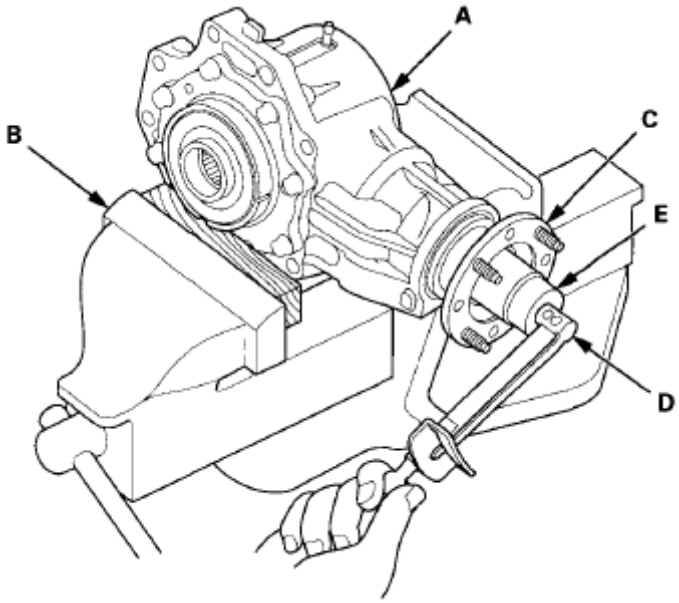

Fig. 611: Identifying Transfer Housing, Bench Vise, Companion Flange, Torque Wrench And Socket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Rotate the companion flange several turns to seat the tapered roller bearings.
4. Measure the total starting torque at the companion flange (C) with a torque wrench (D) and a socket (E).

   Standard: 2.64 - 4.23 N.m (26.9 - 43.1 kgf.cm, 23.3 - 37.4 lbf.in)

5. If the total starting torque is out of the standard, replace the transfer assembly.

Fluid Leak Check

1. Check for fluid leaks between the mating faces of the transfer assembly and the transmission.
2. If there is leak, remove the transfer cover, then replace the transfer cover oil seal and the O-ring (see **TRANSFER COVER OIL SEAL REPLACEMENT**).
3. Check for fluid leaks between the transfer companion flange and the transfer oil seal.
4. If there is leak, replace the transfer oil seal and the O-ring (see **TRANSFER COVER OIL SEAL REPLACEMENT**). Do not replace the oil seal with the transfer assembly on the transmission.

TRANSFER ASSEMBLY REMOVAL

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Shift the transmission into N.
3. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
4. Remove the drain plug (A), and drain the automatic transmission fluid (ATF).

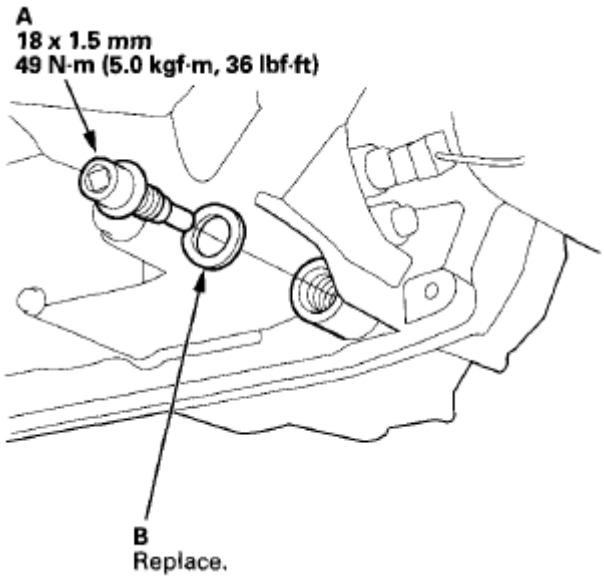

Fig. 612: Identifying Drain Plug And Drain Automatic Transmission Fluid (ATF) With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Reinstall the drain plug with a new sealing washer (B).
6. Remove the front subframe stiffener.

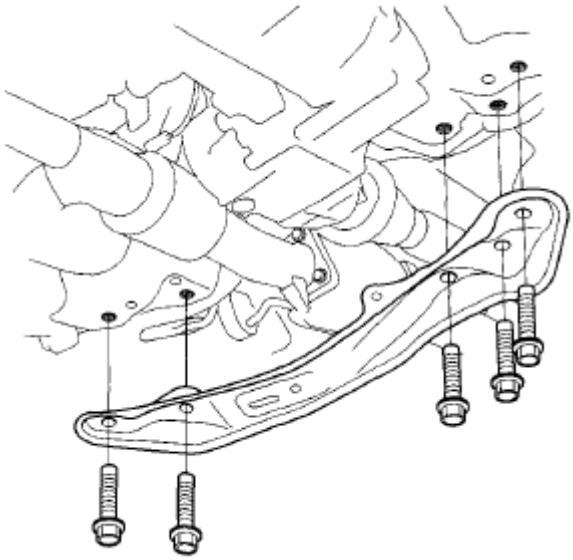

Fig. 613: Identifying Front Subframe Stiffener
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove exhaust pipe A (see **J37A4 ENGINE (WITH SH-AWD)**).
8. Remove the bolt securing the transfer breather hose bracket (A), and disconnect the breather hose (B) from the breather pipe (C) on the transfer assembly.

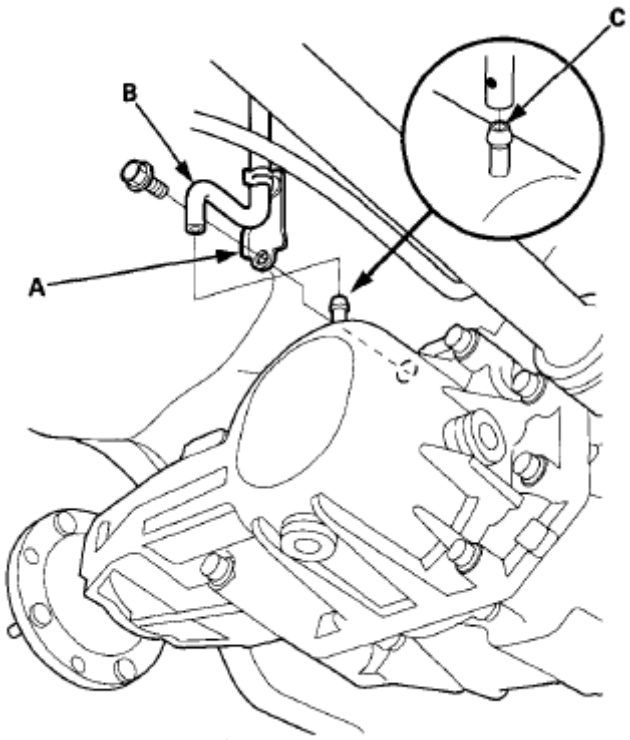

Fig. 614: Identifying Transfer Breather Hose Bracket, Breather Hose And Breather Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Make reference marks (A) across the No. 1 propeller shaft (B) and the transfer companion flange (C).

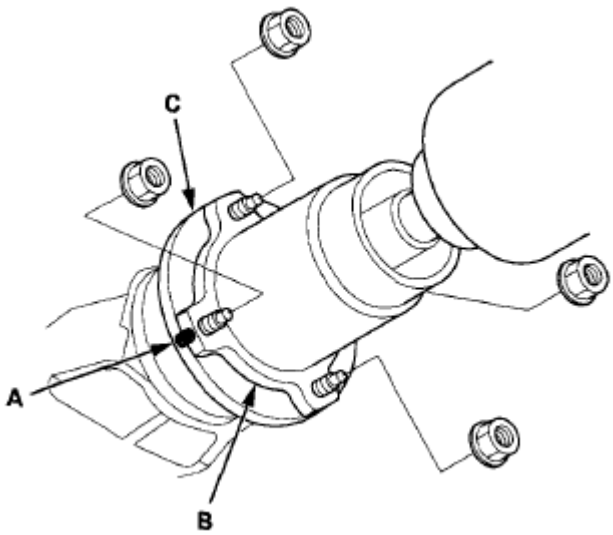

Fig. 615: Making Reference Marks Across Propeller Shaft And Transfer Companion Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Separate the No. 1 propeller shaft from the transfer companion flange.
11. Remove the transfer assembly from the transmission.

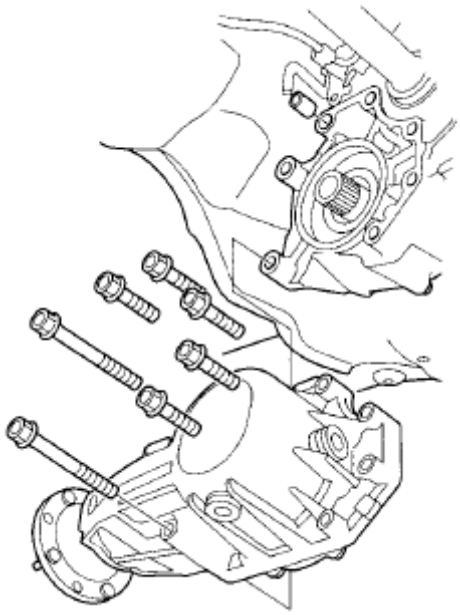

Fig. 616: Removing Transfer Assembly From Transmission
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER ASSEMBLY INSTALLATION

1. Clean the areas where the transfer assembly contacts the transmission with solvent, and dry with compressed air. Then apply ATF to the contact area.
2. Install the dowel pin (A) in the transmission, and install the transfer assembly (B) on the transmission.

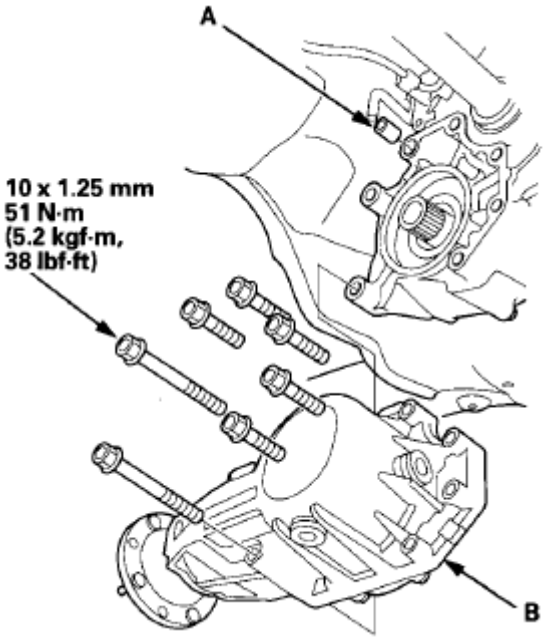

Fig. 617: Identifying Dowel Pins And Transfer Assembly On Transmission With Torque

Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the No. 1 propeller shaft (A) to the transfer companion flange (B) by aligning the reference marks (C). Make sure you use new mounting bolts.

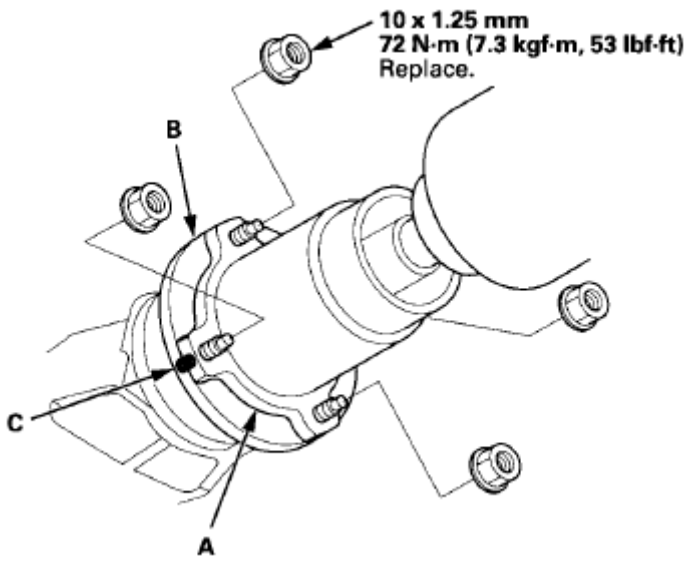

Fig. 618: Identifying Propeller Shaft And Transfer Companion Flange With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the transfer breather hose bracket (A) on the transfer assembly, and connect the breather hose (B) over the breather pipe (C) with facing the dot mark (D) to the rear side of the vehicle.

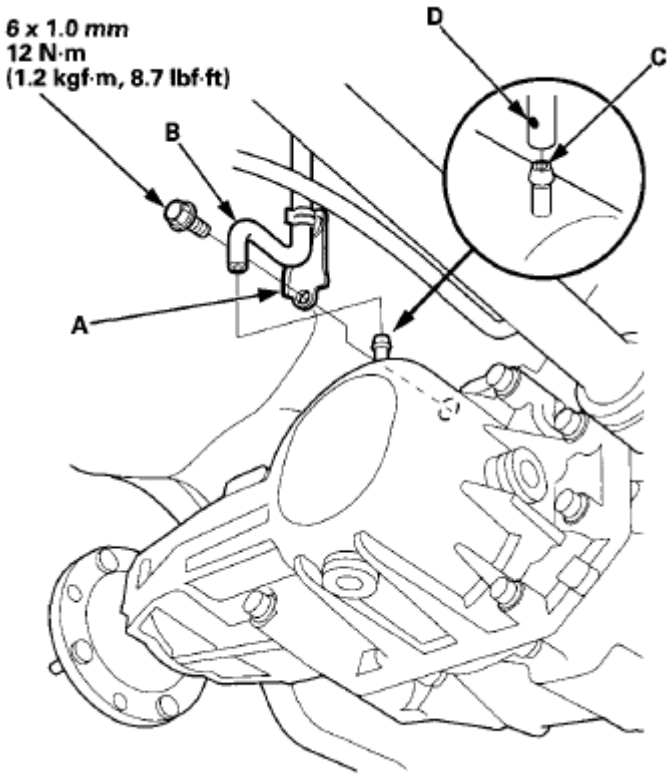

Fig. 619: Identifying Transfer Breather Hose Bracket, Breather Hose And Breather Pipe With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install exhaust pipe A (see **J37A4 ENGINE (WITH SH-AWD)**).
6. Install the front subframe stiffener with new mounting bolts.

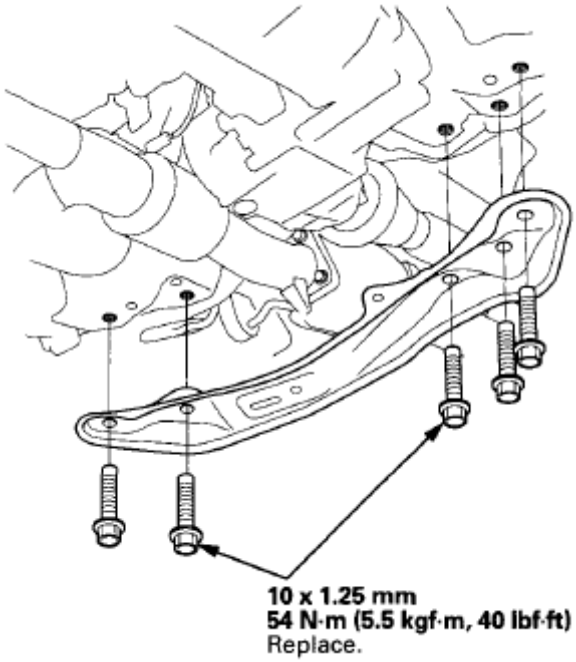

Fig. 620: Installing Front Subframe Stiffener With Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Refill the transfer assembly with transfer fluid (hypoid gear oil), if necessary (see **TRANSFER ASSEMBLY FLUID REPLACEMENT**).
8. Refill the transmission with ATF (see **ATF REPLACEMENT**).
9. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).

DISASSEMBLY

EXPLODED VIEW

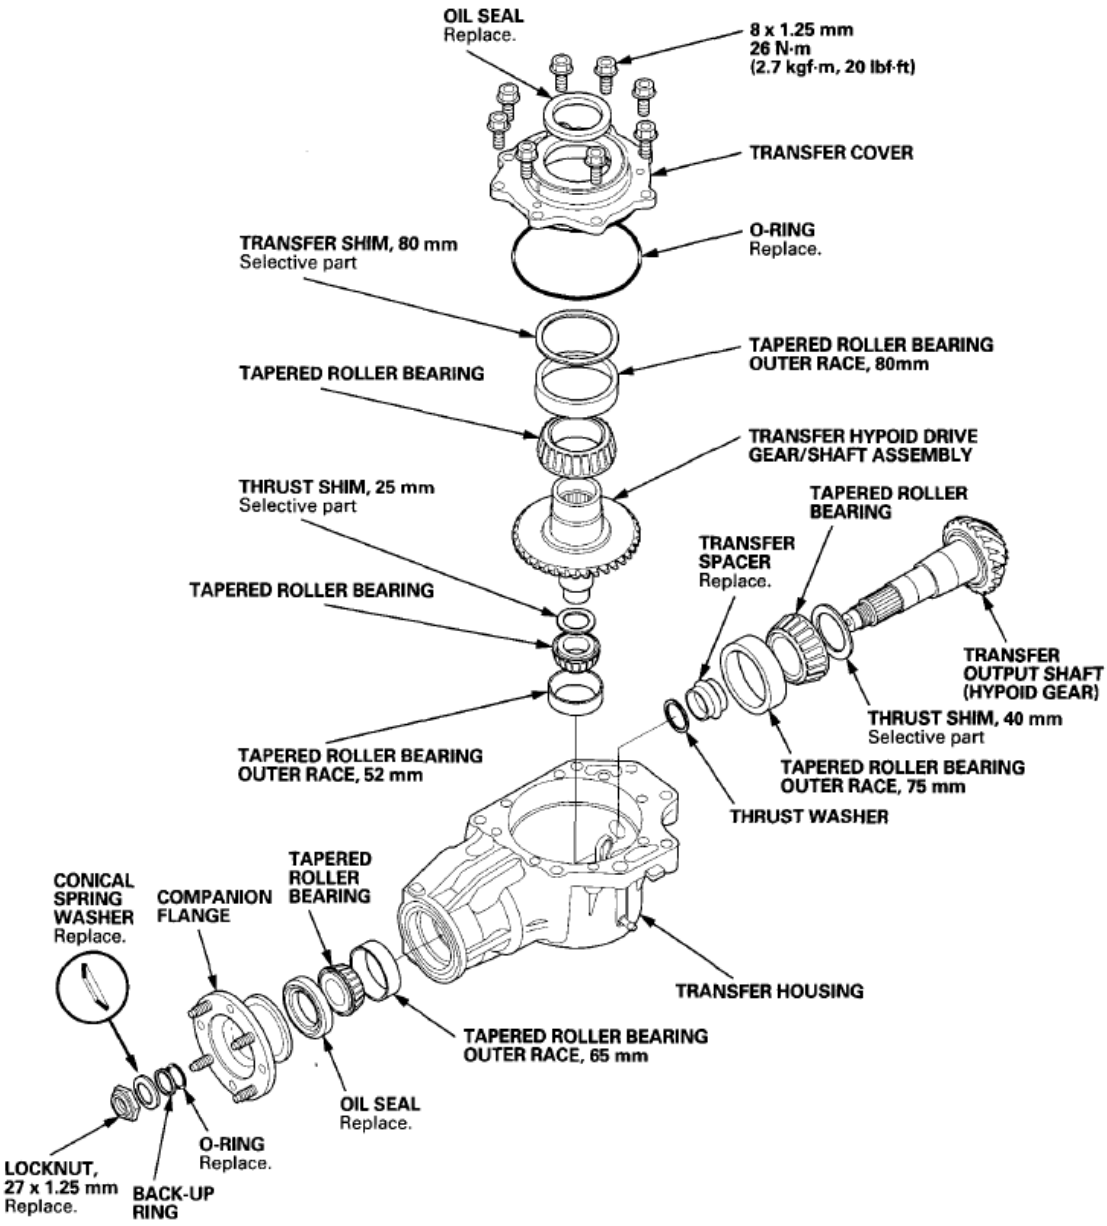

Fig. 621: Exploded View Of Transmission With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Special Tools Required

Flange Holder 07XAB-0010101

NOTE: To prevent damage to the transfer housing, always use wood blocks or equivalent materials between the transfer housing and a bench vise.

1. Remove the transfer cover (A) from the transfer housing (6).

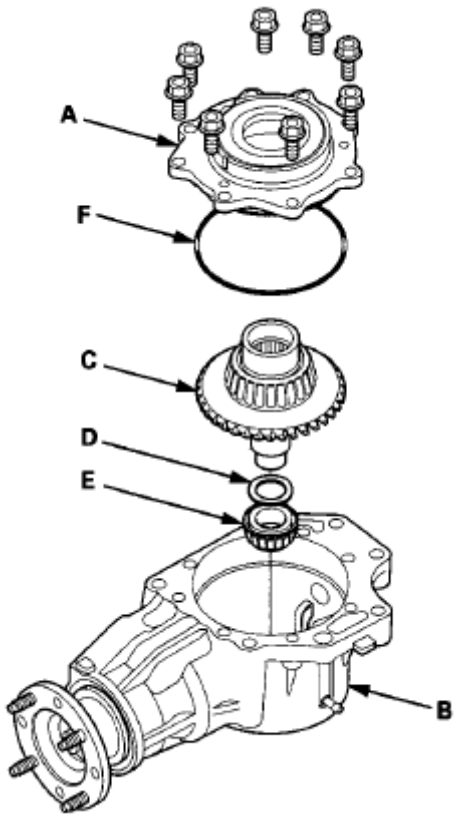

Fig. 622: Identifying Transfer Cover And Housing, Thrust Shim, Roller Bearing, O-Ring And Drive Gear/Shaft Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the transfer hypoid drive gear/shaft assembly (C), the 25 mm thrust shim (D), and the tapered roller bearing (E).
3. Remove the O-ring (F) from the transfer cover.
4. Remove the oil seal from the transfer cover (see **TRANSFER COVER OIL SEAL REPLACEMENT**).
5. Drain the transfer fluid (hypoid gear oil) from the transfer housing.
6. Cut the lock tab on the locknut using a chisel.

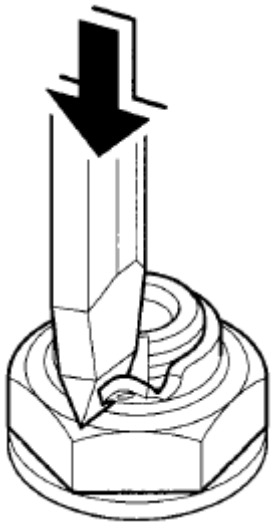

Fig. 623: Cutting Lock Tab On Locknut Using Chisel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Secure the transfer housing in a bench vise with wood blocks.

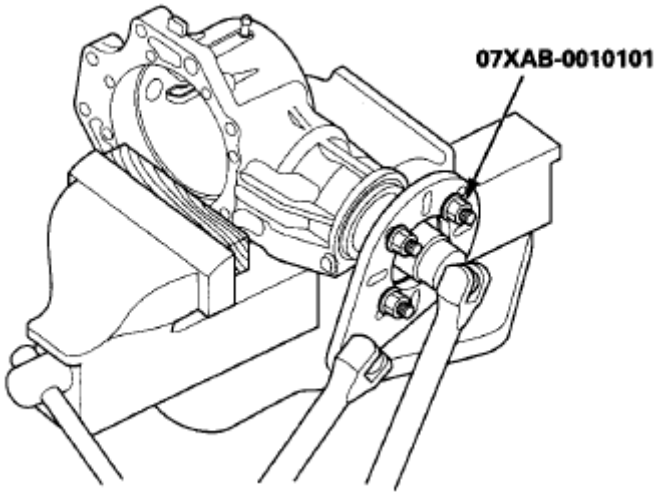

Fig. 624: Securing Transfer Housing In Bench Vise With Wood Blocks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the flange holder on the companion flange, then loosen the locknut.
9. Remove the flange holder.
10. Remove the locknut (A), the conical spring washer (B), the back-up ring (C), the O-ring (D), and the companion flange (E) from the transfer output shaft (hypoid gear) (F).

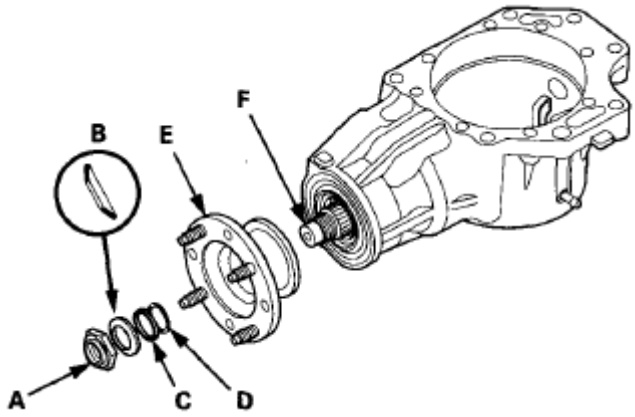

Fig. 625: Identifying Locknut, Conical Spring Washer, Back-Up Ring, O-Ring, Companion Flange And Transfer Output Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the transfer output shaft (hypoid gear) (A) from the transfer housing (B), then remove the thrust washer (C) and the transfer spacer (D) from the transfer output shaft (hypoid gear).

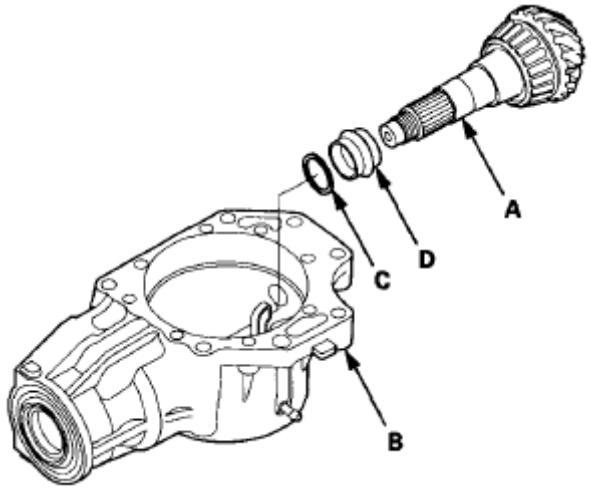

Fig. 626: Identifying Transfer Output Shaft, Transfer Housing, Thrust Washer And Transfer Spacer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the oil seal (A) and the tapered roller bearing (B) from the transfer housing (C).

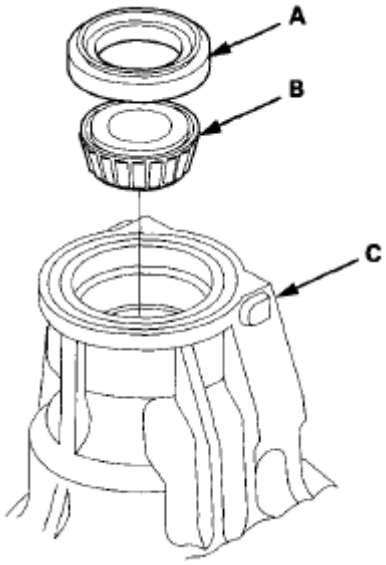

Fig. 627: Identifying Oil Seal, Tapered Roller Bearing And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER HYPOID DRIVE GEAR BEARING REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Bearing Driver Attachment, 42 x 47 mm 07746-0010300
- Installer Attachment 40 mm 07LAD-PW50601

1. Remove the tapered roller bearing (A) from the transfer hypoid drive gear (B) using the 15 x 135L driver handle, the 42 x 47 mm bearing driver attachment, a bearing separator (C) and a press.

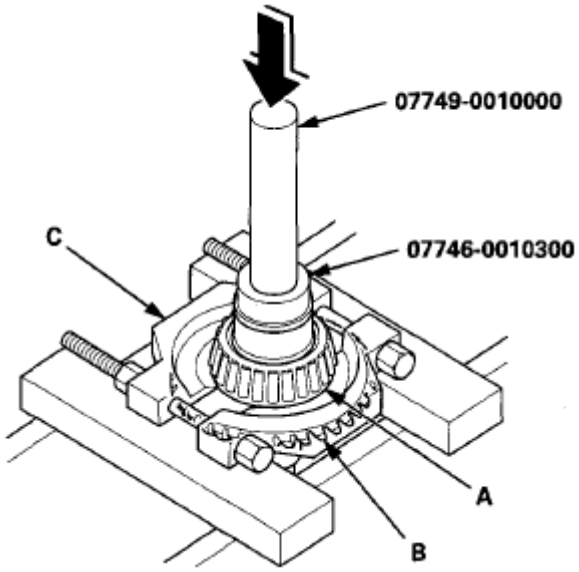

Fig. 628: Removing Tapered Roller Bearing From Transfer Hypoid Drive Gear Using Driver Handle And Bearing Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing on the transfer hypoid drive gear using the 42 x47 mm driver handle, the 15 x 135L bearing driver attachment, the installer attachment 40 mm, and the press.

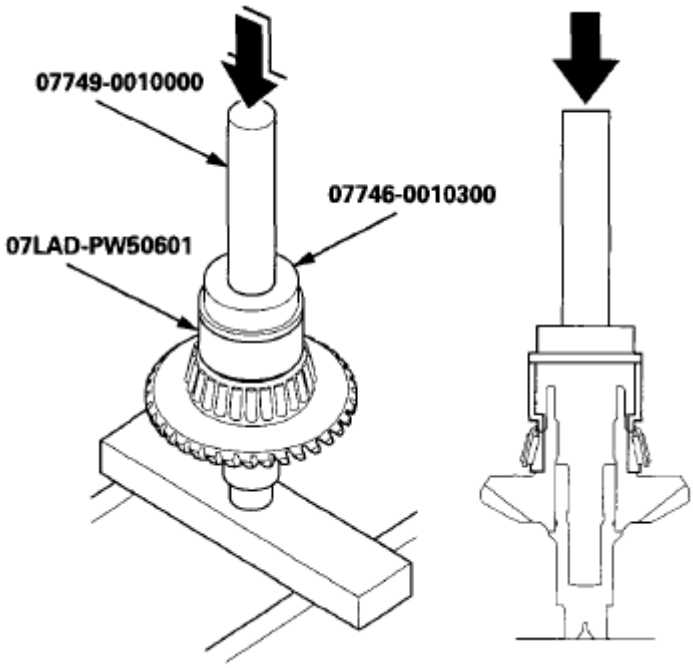

Fig. 629: Installing Bearing On Transfer Hypoid Drive Gear Using Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER OUTPUT SHAFT (HYPOID GEAR) BEARING

REMOVAL/INSTALLATION

Special Tools Required

Driver Handle, 40 mm I.D. 07746-0030100

1. Remove the tapered roller bearing (A) from the transfer output shaft (hypoid gear) (B) using a bearing separator (C) and a press. Place a spacer (D) between the transfer output shaft and the press to prevent damaging the transfer output shaft.

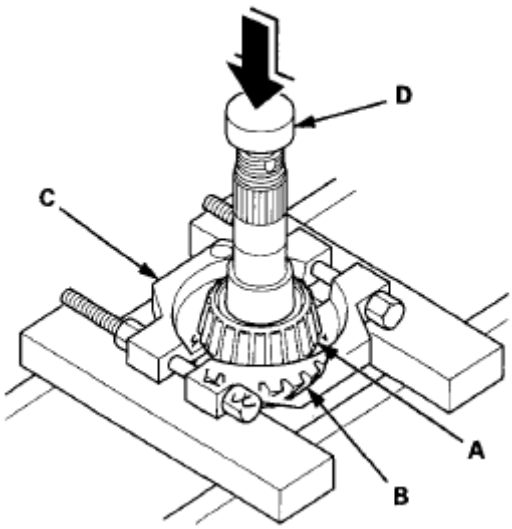

Fig. 630: Removing Tapered Roller Bearing From Transfer Output Shaft Using Bearing Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 40 mm thrust shim (A) over the transfer output shaft (hypoid gear).

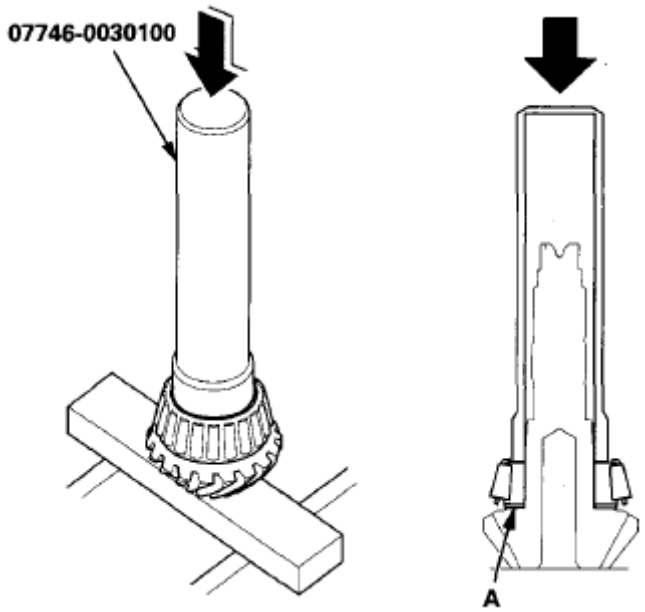

Fig. 631: Installing Thrust Shim Over Transfer Output Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the tapered roller bearing over the transfer output shaft (hypoid gear) using the 40 mm driver I.D. handle and the press.

TRANSFER HOUSING TAPERED ROLLER BEARING OUTER RACE REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Bearing Driver Attachment, 52x55 mm 07746-0010400
- Oil Seal Driver Attachment, 65 mm 07JAD-SH30100
- Tapered Bearing Race Installer A 07MAF-SP0011A
- Installer Shaft 07MAF-SP0013A

NOTE: Replace the tapered roller bearing outer race and the tapered roller bearing as a set.

1. Remove the 52 mm tapered roller bearing outer race (A), the 75 mm tapered roller bearing outer race (B), and the 65 mm tapered roller bearing outer race (C) from the transfer housing (D).

NOTE: Some tapered roller bearing outer races (52 mm, 65 mm, and 75 mm) are press-fitted in the transfer housing and must be removed by heating the transfer housing.

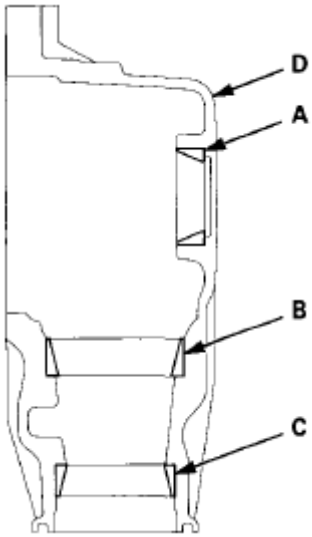

Fig. 632: Identifying Roller Bearing Outer Races And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the press-fitted tapered roller bearing outer race (A) from the transfer housing (B) by heating the transfer housing to about 212°F (100°C) using a heat gun (C). Do not heat the transfer housing more than 212°F(100°C).

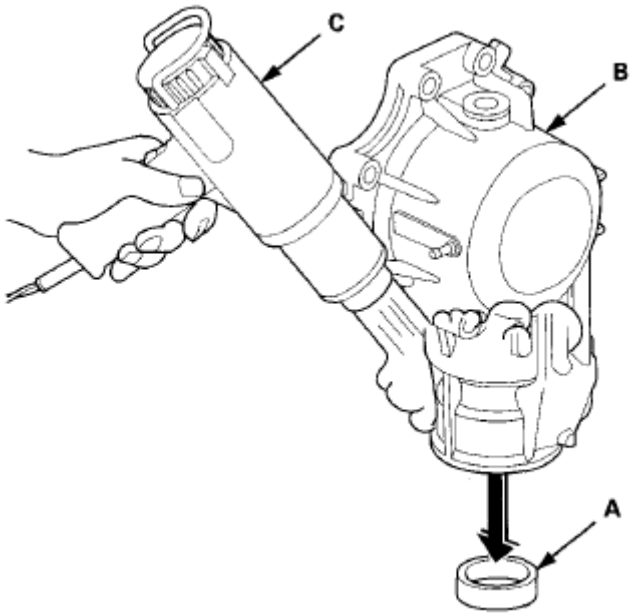

Fig. 633: Removing Press-Fitted Tapered Roller Bearing Outer Race By Heating Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new 52 mm tapered roller bearing outer race (A) until it bottoms in the transfer housing (B) using the 15 x 135L driver handle and the 52 x 55 mm bearing driver attachment.

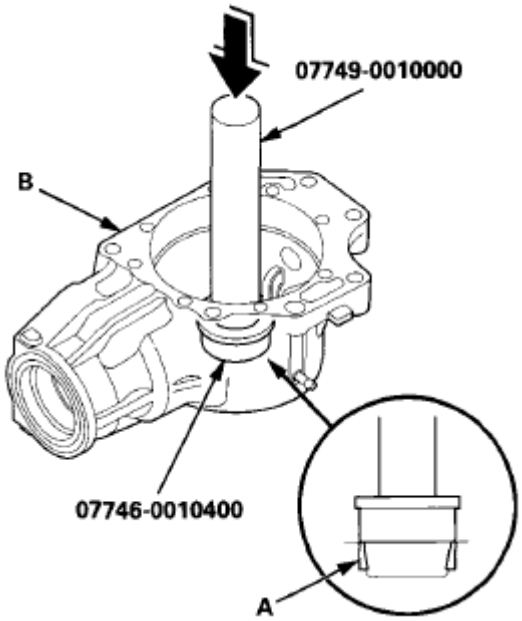

Fig. 634: Installing Tapered Roller Bearing Outer Race Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new 75 mm tapered roller bearing outer race (A) and a new 65 mm tapered roller bearing outer race (B) in the transfer housing (C), set the 65 mm oil seal driver attachment and tapered bearing race installer A over the tapered roller bearing outer races, and install the installer shaft through the 65 mm oil seal driver attachment and installer.

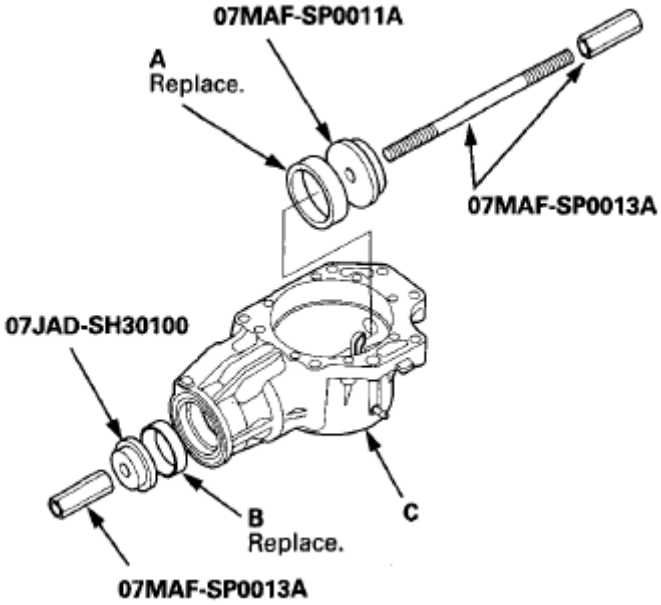

Fig. 635: Identifying Roller Bearing Outer Race, Tapered Roller Bearing Outer Race And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Tighten the installer shaft nut (A) to install the tapered roller bearing outer races (B) (C) into the transfer housing (D) securely.

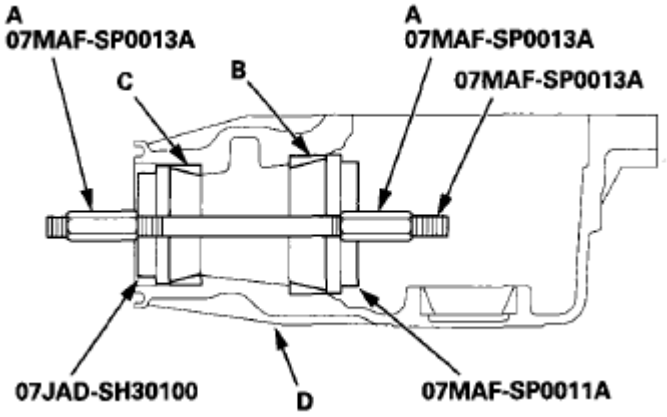

Fig. 636: Identifying Installer Shaft Nut, Tapered Roller Bearing Outer Races And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER COVER TAPERED ROLLER BEARING OUTER RACE REMOVAL/INSTALLATION

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Bearing Driver Attachment, 78 x 80 mm 07NAD-PX40100

NOTE: Replace the tapered roller bearing with the outer race whenever the tapered roller bearing is replaced.

1. Remove the 80 mm bearing outer race (A) and the 80 mm thrust shim (B) from the transfer cover (C). If the tapered roller bearing outer race is press-fitted, remove the tapered roller bearing outer race by heating the transfer cover to about 212°F (100°C) using a heat gun (D). Do not heat the transfer cover more than 212°F (100°C).

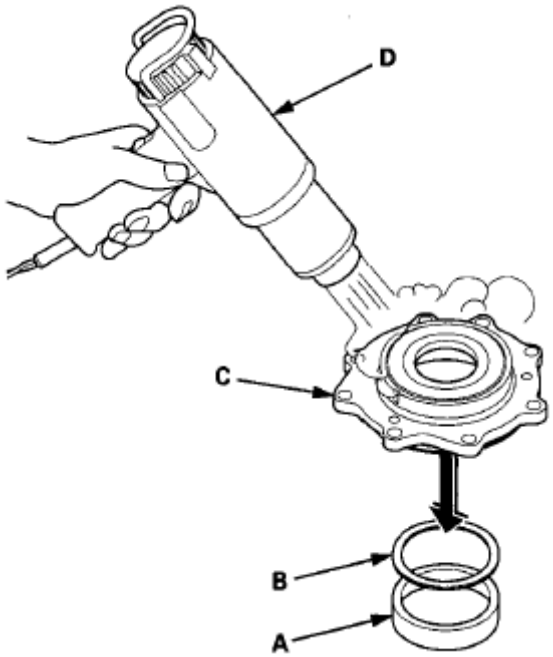

Fig. 637: Removing Tapered Roller Bearing Outer Race By Heating Transfer Cover Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 80 mm thrust shim (A) and the 80 mm tapered roller bearing outer race (B) in the transfer cover (C).

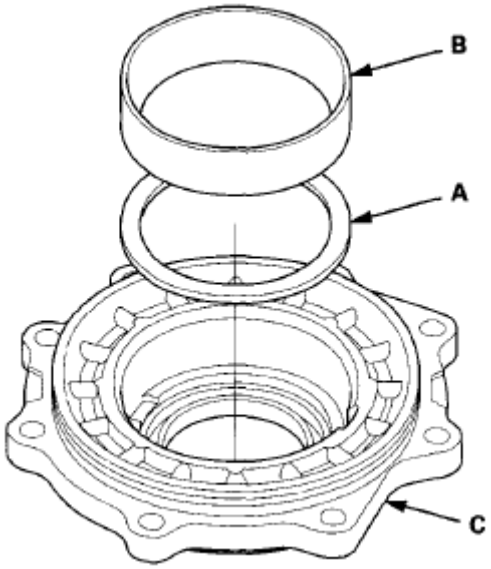

Fig. 638: Identifying Thrust Shim, Tapered Roller Bearing Outer Race And Transfer Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Drive the 80 mm tapered roller bearing outer race securely in the transfer cover using the 15 x 135L driver handle and the 78 x 80 mm bearing driver attachment so there is no clearance between the 80 mm

tapered roller bearing outer race, the 80 mm thrust shim, and the transfer cover.

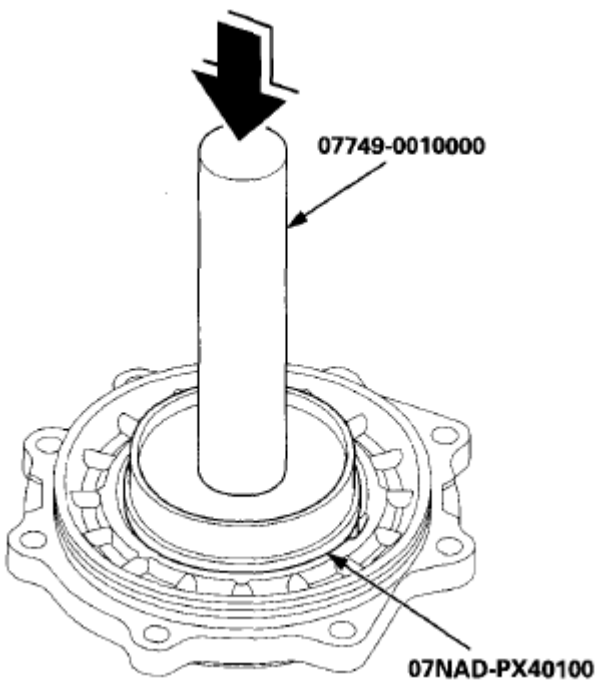

Fig. 639: Driving Tapered Roller Bearing Outer Race Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER COVER OIL SEAL REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment, 65 mm 07JAD-SH30100

1. Remove the oil seal (A) from the transfer cover (B).

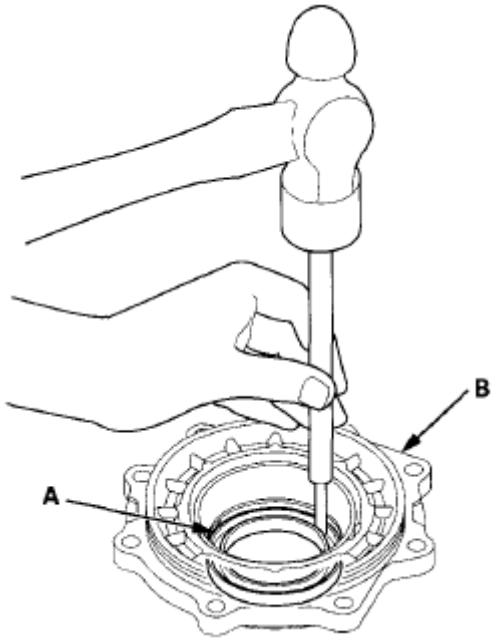

Fig. 640: Removing Oil Seal From Transfer Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new oil seal (A) in the transfer cover (B) to a height (C) of 0- 1 mm (0- 0.04 in) above the transfer cover surface using the 15 x 135L driver handle and the 65 mm oil seal driver attachment.

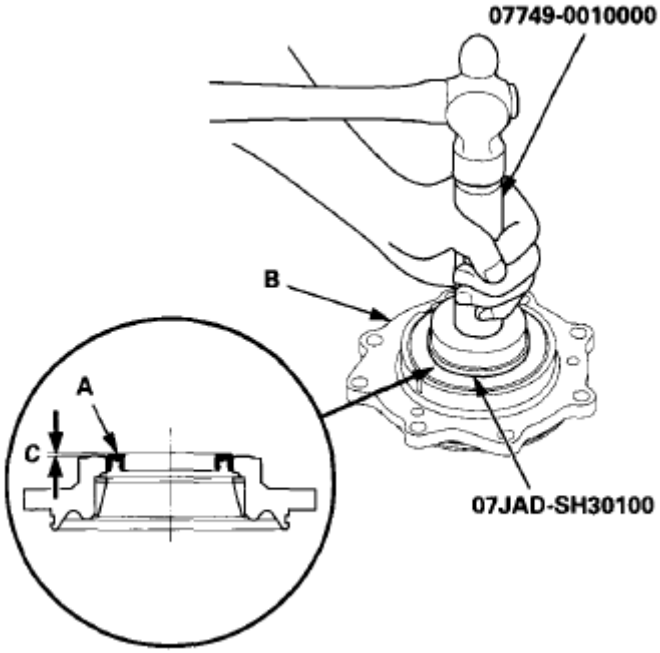

Fig. 641: Installing Oil Seal In Transfer Cover Using Driver Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

REASSEMBLY

Special Tools Required

- Driver Handle, 40 mm I.D. 07746-0030100
- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment, 65 mm 07JAD-SH30100
- Flange Holder 07XAB-0010101
- Bearing Driver Attachment, 78 x 80 mm 07NAD-PX40100

NOTE:

- **While reassembling the transfer assembly:**
  - **Check and adjust the transfer gear tooth contact.**
  - **Measure and adjust the transfer gear backlash.**
  - **Check and adjust the tapered roller bearing starting torque.**
- **Coat all parts with transfer fluid (hypoid gear oil) during reassembly.**
- **Replace the tapered roller bearing and the tapered roller bearing outer race as a set.**
- **Replace the transfer hypoid drive gear and the transfer output shaft (hypoid gear) as a set if either part is replaced.**
- **To prevent damage to the transfer housing, always use wood blocks or equivalent materials between the transfer housing and a bench vise.**

1. Select the 40 mm thrust shim if the transfer output shaft (hypoid gear) is replaced. Calculate the thickness of the 40 mm thrust shim using the following formula, and select the shim from the following table.

   FORMULA: A/100 - B/100 + C = X

   A: Number on the existing transfer output shaft (hypoid gear)

   B: Number on the replacement transfer output shaft (hypoid gear)

   C: Thickness of the existing 40 mm thrust shim

   X: Thickness needed for the replacement 40 mm thrust shim

   NOTE: The number on the transfer output shaft (hypoid gear) is shown in 1/100 mm.

   EXAMPLE

   A: Existing transfer output shaft (hypoid gear) Number= +2

   B: Replacement transfer output shaft (hypoid gear) Number = - 1

C: Existing 40 mm thrust shim thickness = 1.05 mm

X: Replacement 40 mm thrust shim thickness

X = A/100-B/100 + C

= 2/100 - (- 1)/100 + 1.05

= 0.02 + 0.01 + 1.05 = 1.08 (mm)

Select No. M 40 mm thrust shim of 1.08 mm (0.043 in)

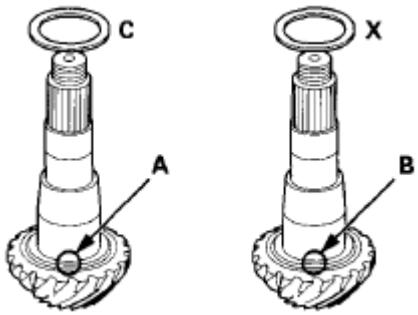

Fig. 642: Identifying Transfer Output Shafts And Thrust Shims
Courtesy of AMERICAN HONDA MOTOR CO., INC.

THRUST SHIM, 40 MM

No.	Thickness
A	0.72 mm (0.0283 in)
B	0.75 mm (0.0295 in)
C	0.78 mm (0.0307 in)
D	0.81 mm (0.0319 in)
E	0.84 mm (0.0331 in)
F	0.87 mm (0.0343 in)
G	0.90 mm (0.0354 in)
H	0.93 mm (0.0366 in)
I	0.96 mm (0.0378 in)
J	0.99 mm (0.0390 in)
K	1.02 mm (0.0402 in)
L	1.05 mm (0.0413 in)
M	1.08 mm (0.0425 in)
N	1.11 mm (0.0437 in)
O	1.14 mm (0.0449 in)

2. Select the 40 mm thrust shim if the tapered roller bearing on the transfer output shaft (hypoid gear) is replaced. Measure the thickness of the replacement bearing and the existing bearing, and calculate the

difference of the bearing thickness. Adjust the thickness of the existing 40 mm thrust shim by the amount of difference in bearing thickness, and select the replacement 40 mm thrust shim.

3. Install the 40 mm thrust shim (A) on the transfer output shaft (hypoid gear) (B), then install the tapered roller bearing (C) using the 40 mm I.D. driver handle and a press.

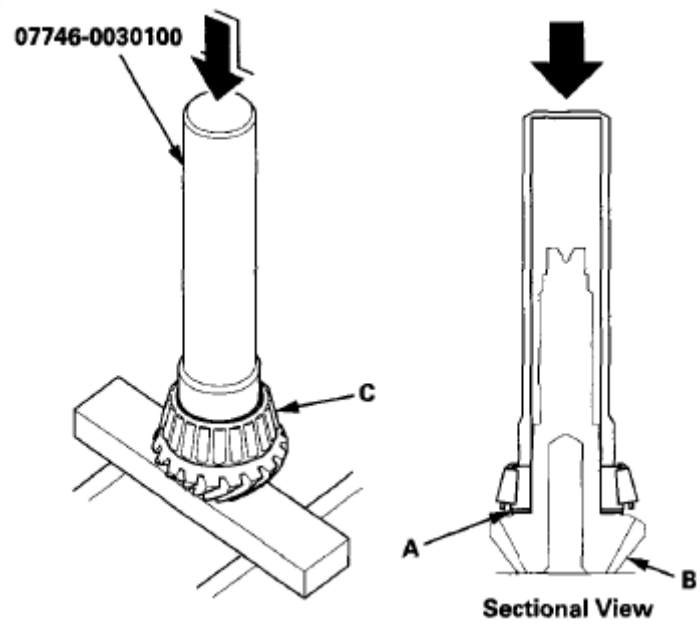

Fig. 643: Installing Thrust Shim On Transfer Output Shaft Using Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Place the tapered roller bearing (A) on the tapered roller bearing outer race of the companion flange side in the transfer housing (B), and install a new oil seal (C).

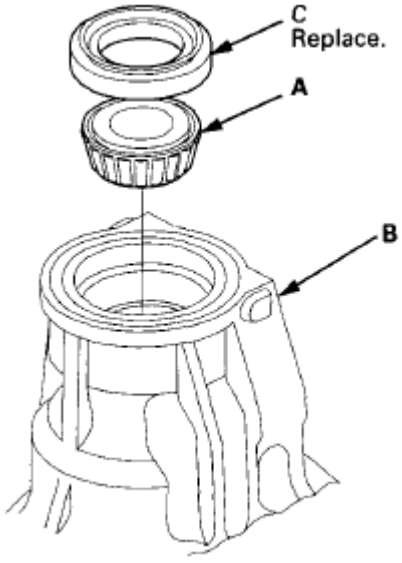

Fig. 644: Placing Tapered Roller Bearing On Tapered Roller Bearing Outer Race In Transfer

Housing And Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Drive the oil seal securely in the transfer housing using the 15 x 135L driver handle and the 65 mm oil seal driver attachment.

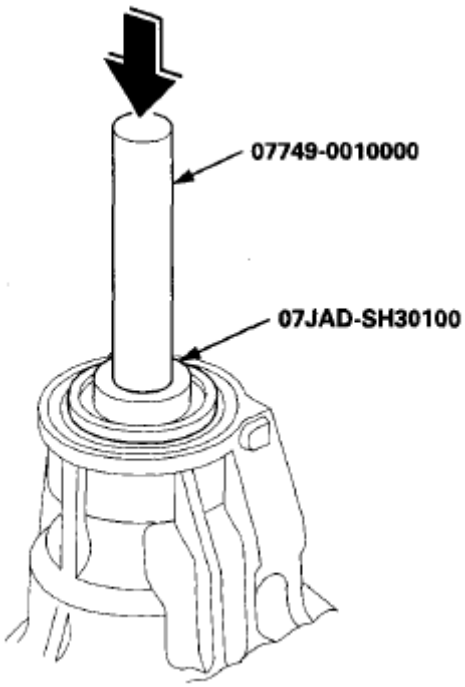

Fig. 645: Driving Oil Seal In Transfer Housing Using Driver Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the transfer output shaft (hypoid gear) (A) in the transfer housing (B). Do not install the transfer spacer and the thrust washer on the transfer output shaft (hypoid gear).

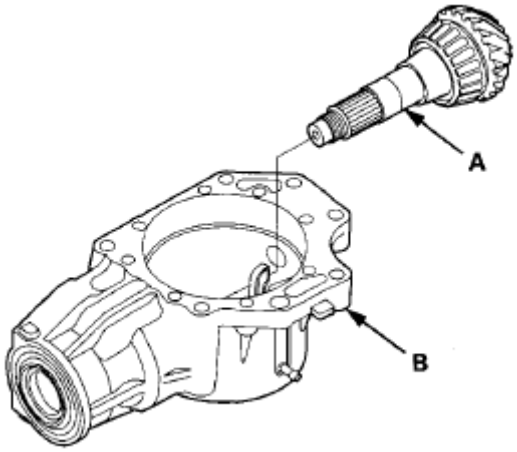

Fig. 646: Installing Transfer Output Shaft In Transfer Housing

Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the companion flange (A), the conical spring washer (B) (in the direction shown), and a new locknut (C) on the transfer output shaft (hypoid gear) (D). Do not install the O-ring and the back-up ring.

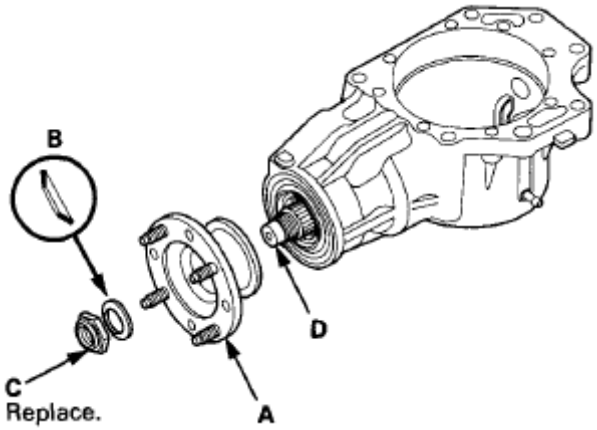

Fig. 647: Identifying Companion Flange, Conical Spring Washer Locknut And Transfer Output Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Secure the transfer housing (A) in a bench vise (B) with wood blocks.

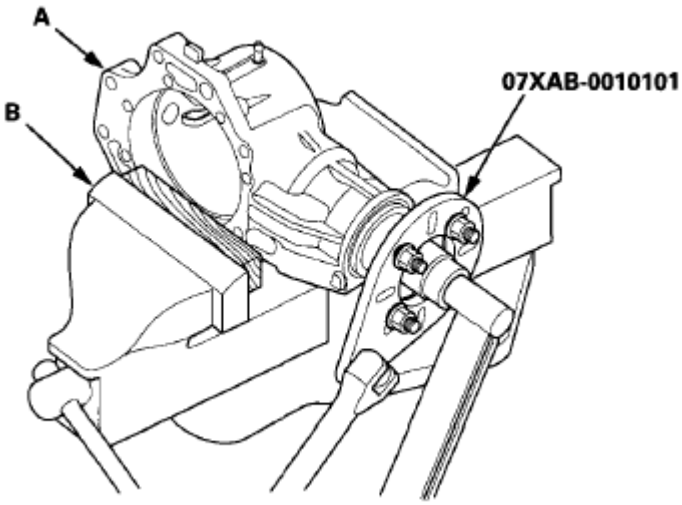

Fig. 648: Securing Transfer Housing In Bench Vise With Wood Blocks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the flange holder on the companion flange.
10. Tighten the locknut while measuring the starting torque of the transfer output shaft (hypoid gear) so the starting torque is within 1.15- 1.71 N.m (11.7- 17.4 kgf.cm, 10.2- 15.1 lbf.in). Do not stake the locknut in this step.
11. Remove the flange holder.

12. Apply Prussian Blue to both sides of the transfer hypoid drive gear teeth lightly and evenly.
13. Install the tapered roller bearing (A), the 25 mm thrust shim (B), and the transfer drive gear/shaft assembly (C) in the transfer housing (D).

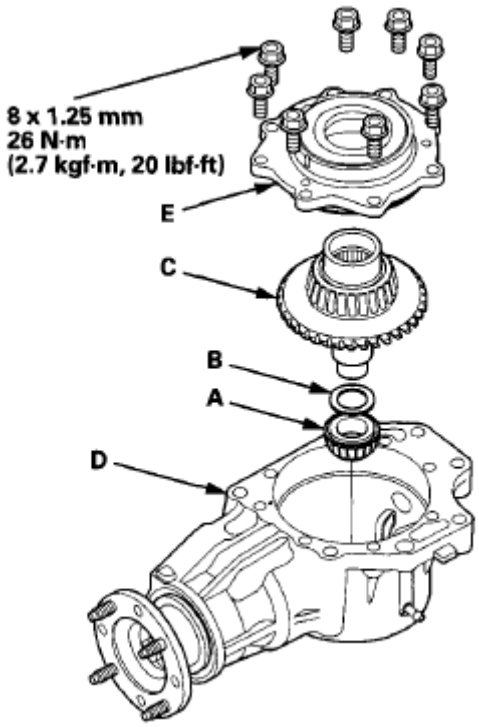

Fig. 649: Identifying Tapered Roller Bearing, Thrust Shim And Transfer Drive Gear/Shaft Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the transfer cover (E), and secure it with the bolts. Do not install the O-ring on the transfer cover.
15. Rotate the companion flange in both directions until the transfer gears rotate one full turn in both directions.
16. Set a dial indicator (A) on the transfer companion flange (B); position the dial indicator tip (C) on the top of the bolt (D).

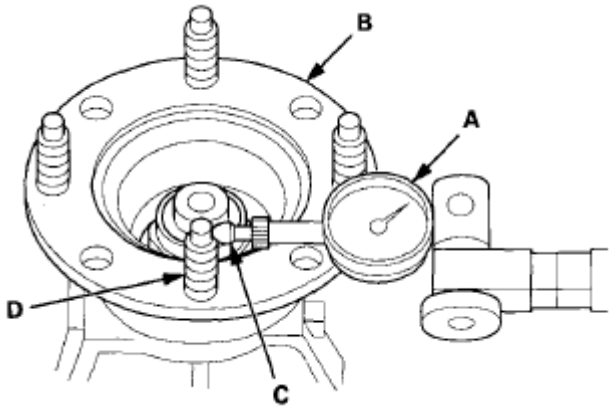

Fig. 650: Setting Dial Indicator On Transfer Companion Flange, Position Dial Indicator Tip On Top Of Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Measure transfer gear backlash.

    Standard: 0.06- 0.16 mm (0.0024- 0.0063 in)

18. Remove the transfer cover and the transfer hypoid drive gear/shaft assembly, and check the transfer hypoid drive gear tooth contact pattern.

    CORRECT TOOTH CONTACT PATTERN

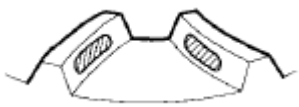

Fig. 651: Checking Transfer Hypoid Drive Gear Tooth Contact Pattern (Correct Tooth Contact Pattern)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INCORRECT TOOTH CONTACT PATTERN

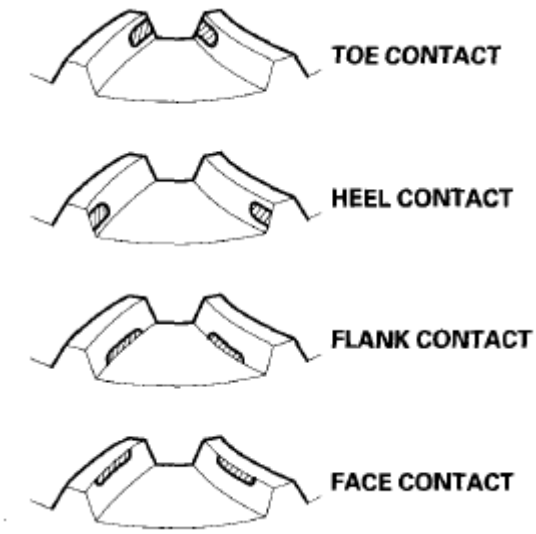

Fig. 652: Checking Transfer Hypoid Drive Gear Tooth Contact Pattern (Incorrect Tooth Contact Pattern)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. If the backlash is out of the standard, adjust the backlash with the 40 mm thrust shim, and recheck. Do not use more than two 40 mm thrust shims to adjust the backlash.
20. If the transfer gear tooth contact is incorrect, adjust the tooth contact with the 25 mm, 40 mm, or 80 mm thrust shim. Do not use more than two shims of each thrust shim to adjust the tooth contact.
    - Toe Contact

      Use a thinner 40 mm thrust shim to move the transfer output shaft (hypoid gear) away from the transfer hypoid drive gear. Because this movement causes the transfer gear backlash to change, move the transfer hypoid drive gear toward the transfer output shaft (hypoid gear) to adjust the transfer gear backlash as follows:

      - Reduce the thickness of the 25 mm thrust shim.
      - Increase the thickness of the 80 mm thrust shim by reducing the amount of the 25 mm thrust shim.
    - Heel Contact

      Use a thicker 40 mm thrust shim to move the transfer output shaft (hypoid gear) toward the transfer hypoid drive gear. Because this movement causes the transfer backlash to change, move the transfer hypoid drive gear away from the transfer output shaft (hypoid gear) to adjust the transfer gear backlash as follows:

      - Increase the thickness of the 25 mm thrust shim.
      - Reduce the thickness of the 80 mm thrust shim by reducing the amount of the 25 mm thrust shim.
    - Flank Contact

Use a thicker 25 mm thrust shim to move the transfer hypoid drive gear away from the transfer output shaft (hypoid gear).

Flank contact must be adjusted within the limits of the transfer gear backlash. If the backlash exceeds the limits, adjust as described under Heel Contact.

- Face Contact

  Use a thinner 25 mm thrust shim to move the transfer hypoid drive gear toward the transfer output shaft (hypoid gear).

  Face contact must be adjusted within the limits of the transfer gear backlash. If the backlash exceeds the limits, adjust as described under Toe Contact.

THRUST SHIM, 25 MM

No.	Thickness
1.70	1.70 mm (0.0669 in)
1.73	1.73 mm (0.0681 in)
1.76	1.76 mm (0.0693 in)
1.79	1.79 mm (0.0705 in)
1.82	1.82 mm (0.0717 in)
1.85	1.85 mm (0.0728 in.)
1.88	1.88 mm (0.0740 in)
1.91	1.91 mm (0.0752 in)
1.94	1.94 mm (0.0764 in)
1.97	1.97 mm (0.0776 in)
2.00	2.00 mm (0.0787 in)
2.03	2.03 mm (0.0799 in)
2.06	2.06 mm (0.0811 in)
2.09	2.09 mm (0.0823 in)
2.12	2.12 mm (0.0835 in)
2.15	2.15 mm (0.0846 in)
2.18	2.18 mm (0.0858 in)
2.21	2.21 mm (0.0870 in)
2.24	2.24 mm (0.0882 in)

21. Remove the transfer cover (A), the transfer hypoid drive gear/shaft assembly (B), the 25 mm thrust shim (C), and the tapered roller bearing (D) from the transfer housing (E) after adjusting the transfer gear backlash or transfer gear tooth contact.

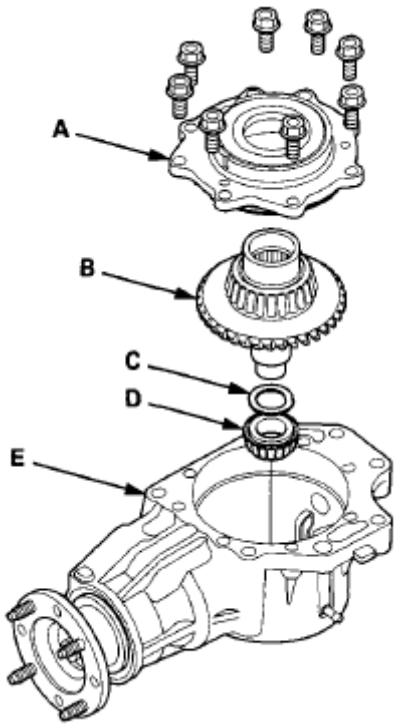

Fig. 653: Identifying Transfer Cover And Housing, Drive Gear/Shaft Assembly, Thrust Shim And Tapered Roller Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Secure the transfer housing (A) in the bench vise (B) with wood blocks.

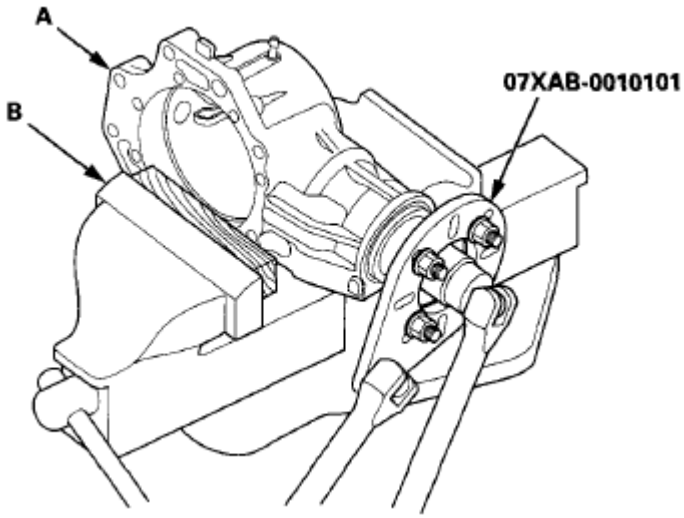

Fig. 654: Securing Transfer Housing In Bench Vise With Wood Blocks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Install the flange holder on the companion flange, then loosen the locknut.
24. Remove the flange holder.

25. Remove the locknut (A), the conical spring washer (B), and the companion flange (C) from the transfer output shaft (hypoid gear) (D).

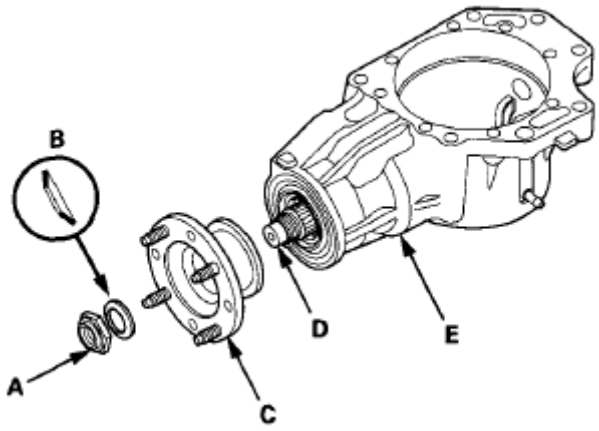

Fig. 655: Identifying Locknut, Conical Spring Washer, Companion Flange, Transfer Housing And Transfer Output Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Remove the transfer output shaft (hypoid gear) from the transfer housing (E).
27. Install a thrust washer (A) and a new transfer spacer (B) on the transfer output shaft (hypoid gear) (C), and install them in the transfer housing (D).

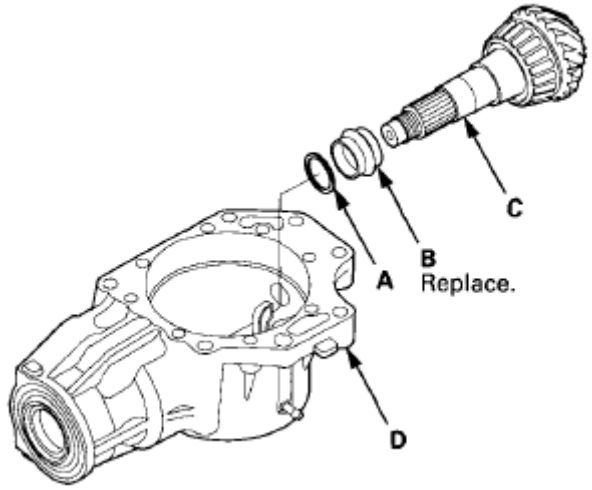

Fig. 656: Identifying Thrust Washer, Transfer Spacer, Transfer Output Shaft, And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Coat the threads of the locknut and transfer output shaft (hypoid gear) with transfer fluid (hypoid gear oil).
29. Install the companion flange (A). Coat a new O-ring (B) with transfer fluid (hypoid gear oil), then install the O-ring, the back-up ring (C), a new conical spring washer (D), and a new locknut (E) on the transfer

output shaft (hypoid gear) (F). Install the conical spring washer in the direction shown.

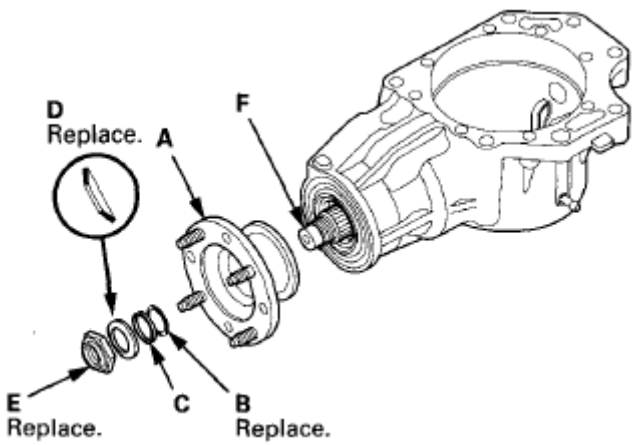

Fig. 657: Identifying Companion Flange, Transfer Fluid, O-Ring, Back-Up Ring, Washer, Locknut And Output Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Secure the transfer housing (A) in the bench vise (B) with wood blocks.

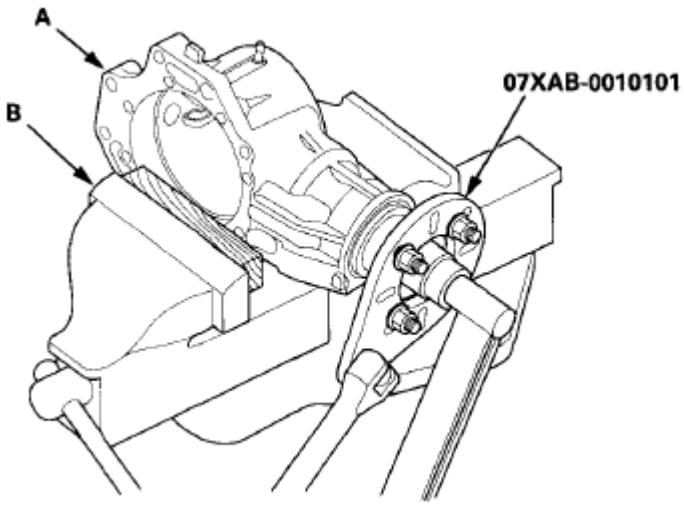

Fig. 658: Securing Transfer Housing In Bench Vise With Wood Blocks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Install the flange holder on the companion flange.
32. Tighten the locknut to the lower torque specification, then check starting torque. If starting torque is low, increase the torque on the locknut until the starting torque is acceptable.

Tightening Torque:

108 - 294 N.m (11.0 - 30.0 kgf.m, 79.6 - 217 lbf.ft)

Starting Torque:

1.15 - 1.71 N.m (11.7 - 17.4 kgf.cm, 10.2 - 15.1 lbf.in)

NOTE:

- **Rotate the companion flange several times to seat the tapered roller bearings, then measure the starting torque.**
- **If the starting torque exceeds 1.71 N.m (17.4 kgf.cm, 15.1 lbf.in), replace the transfer spacer and reassemble the parts. Do not adjust the torque with the locknut loose.**
- **If the tightening torque exceeds 294 N.m (30.0 kgf.m, 217 lbf.ft), replace the transfer spacer and reassemble the parts.**

33. Remove the flange holder.
34. Stake the locknut to a depth (A) of at least 0.7 mm (0.03 in) using a 3.5 mm punch (B). Be careful not to make a crack on the locknut when staking.

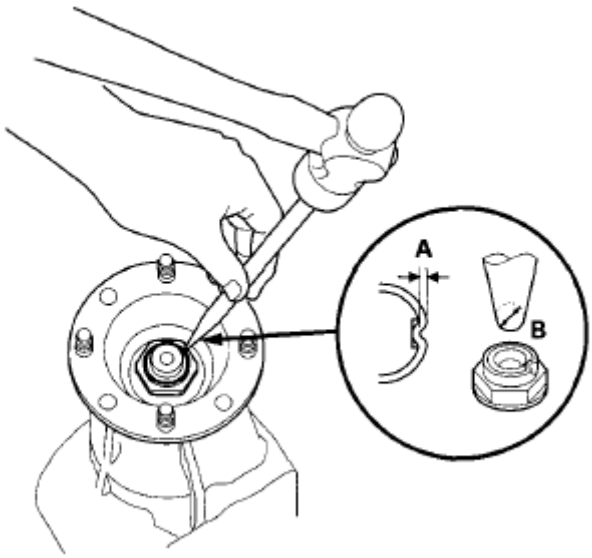

Fig. 659: Staking Locknut To Depth At Least Using Punch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Install the tapered roller bearing (A), the 25 mm thrust shim (B), and the transfer hypoid drive gear/shaft assembly (C) in the transfer housing (D).

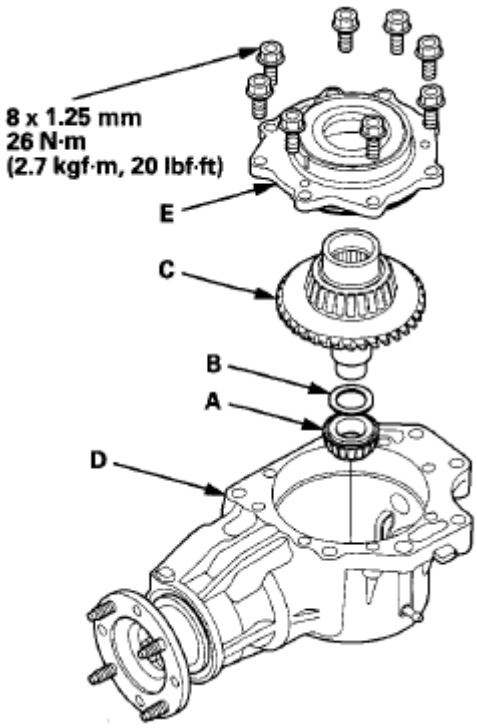

Fig. 660: Identifying Tapered Roller Bearing, Thrust Shim, Drive Gear/Shaft Assembly, Transfer Housing And Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Temporally install the transfer cover (E) without the O-ring. Install and tighten the bolts.
37. Secure the transfer housing (A) in the bench vise (B) with wood blocks.

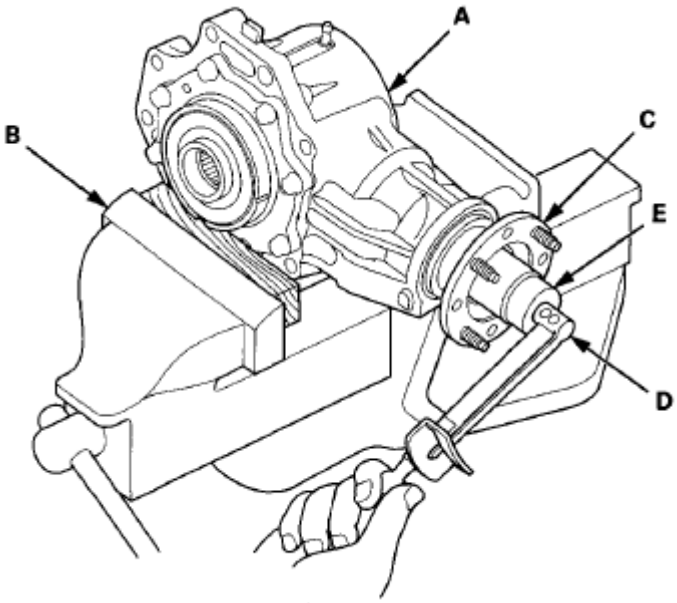

Fig. 661: Securing Transfer Housing In Bench Vise With Wood Blocks

Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Rotate the transfer companion flange (C) several times to seat the tapered roller bearings.
39. Measure the total starting torque at the companion flange by using a torque wrench (D) and a socket (E).
40. Calculate the transfer hypoid drive gear/shaft starting torque by using the following formula.

Transfer Hypoid Drive Gear/Shaft Starting

Torque Formula:

A - B = X

A: Actual total starting torque (measured in step 39)

B: Actual transfer output shaft (hypoid gear) starting torque (measured in step 32)

X: Transfer hypoid drive gear-shaft starting torque

41. Check that the calculated transfer hypoid drive gear/shaft starting torque is within the following reference value range.

Reference Value Range of Transfer Hypoid Drive Gear/Shaft Starting Torque:

1.49 - 2.52 N.m (15.2 - 25.7 kgf.cm, 13.1 - 22.3 lbf.in)

- If the calculated transfer hypoid drive gear/shaft starting torque is within the reference value range, remove the transfer cover from the transfer housing, then go to step 48.
- If the calculated transfer hypoid drive gear/shaft starting torque is out of the reference value range, go to step 42.

42. Remove the bearing outer race (A) and the 80 mm thrust shim (B) from the transfer cover (C). If the tapered roller bearing outer race is press-fitted, remove the tapered roller bearing outer race by heating the transfer cover to about 212°F (100°C) using a heat gun (D). Do not heat the transfer cover more than 212° F (100°C).

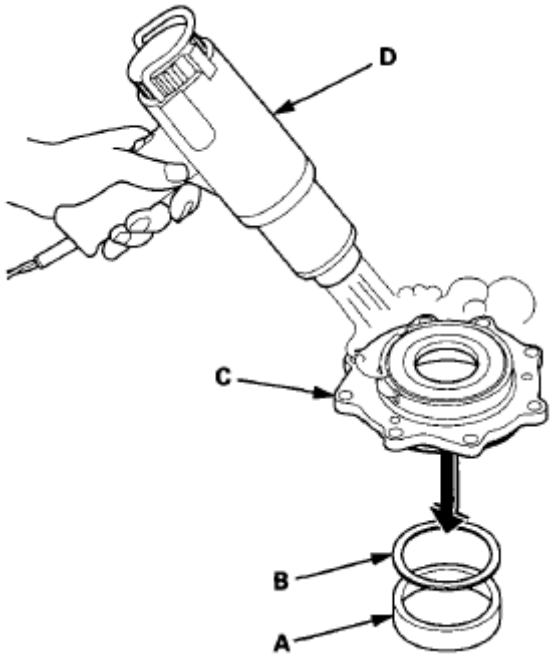

Fig. 662: Removing Tapered Roller Bearing Outer Race By Heating Transfer Cover Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Measure thickness of the removed 80 mm thrust shim, and select a new 80 mm thrust shim.

THRUST SHIM, 80 MM

No.	Thickness
A	1.52 mm (0.0598 in)
B	1.55 mm (0.0610 in)
C	1.58 mm (0.0622 in)
D	1.61 mm (0.0634 in)
E	1.64 mm (0.0646 in)
F	1.67 mm (0.0657 in)
G	1.70 mm (0.0669 in)
H	1.73 mm (0.0681 in)
1	1.76 mm (0.0693 in)
J	1.79 mm (0.0705 in)

L	1.85 mm (0.0728 in)
M	1.88 mm (0.0740 in)
N	1.91 mm (0.0752 in)
O	1.94 mm (0.0764 in)
P	1.97 mm (0.0776 in)
Q	2.00 mm (0.0787 in)

R	2.03 mm (0.0799 in)
S	2.06 mm (0.0811 in)
T	2.09 mm (0.0823 in)
U	2.12 mm (0.0835 in)
V	2.15 mm (0.0846 in)
W	2.18 mm (0.0858 in)
X	2.21 mm (0.0870 in)
Y	2.24 mm (0.0882 in)
Z	2.27 mm (0.0894 in)
AA	2.30 mm (0.0906 in)
AB	2.33 mm (0.0917 in)
AC	2.36 mm (0.0929 in)
AD	2.39 mm (0.0941 in)
AE	2.42 mm (0.0953 in)
AF	2.45 mm (0.0965 in)
AG	2.48 mm (0.0976 in.)
AH	2.51 mm (0.0988 in)
Al	2.54 mm (0.1000 in)
AJ	2.57 mm (0.1012 in)
AK	2.60 mm (0.1024 in)
AL	2.63 mm (0.1035 in)
AM	2.66 mm (0.1047 in)

44. Install the 80 mm thrust shim (A) and the tapered roller bearing outer race (B) in the transfer cover (C). If you heated the transfer cover, let it cool to room temperature before installing the 80 mm thrust shim.

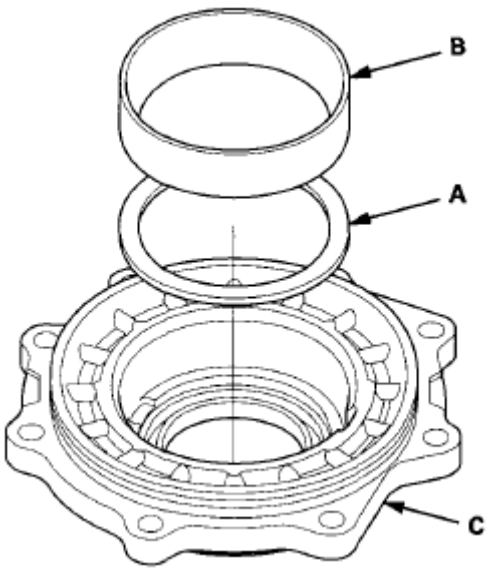

Fig. 663: Identifying Thrust Shim And Tapered Roller Bearing Outer Race In Transfer Cover

Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Drive the 80 mm tapered roller bearing outer race securely in the transfer cover using the 15 x 135L driver handle and the 78 x 80 mm bearing driver attachment so there is no clearance between the 80 mm tapered roller bearing outer race, the 80 mm thrust shim, and the transfer cover.

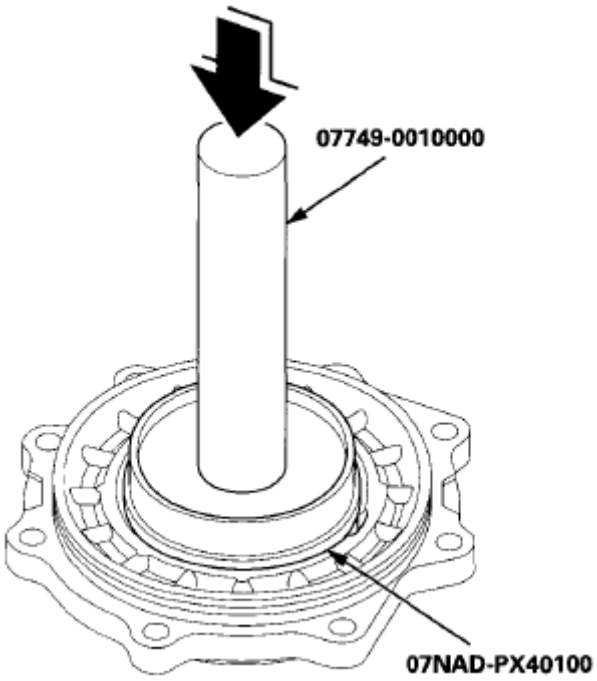

Fig. 664: Driving Tapered Roller Bearing Outer Race Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Install the oil seal from the transfer cover (see **TRANSFER COVER OIL SEAL REPLACEMENT**).
47. After replacing the 80 mm thrust shim, recheck and make sure that the total starting torque is within specification.
48. Install a new O-ring (A) on the transfer cover (B), then install the transfer cover on the transfer housing (C).

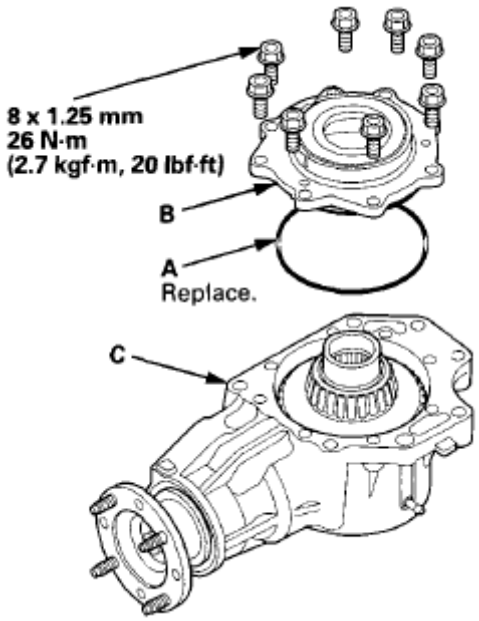

Fig. 665: Identifying O-Ring, Transfer Cover And Transfer Housing With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Remove the filler plug (A), then refill the transfer assembly with transfer fluid (hypoid gear oil). Use an SAE 90 viscosity hypoid gear oil, API classified GL4 or GL5 only.

Viscosity:

SAE 90: Above 0°F (-18°C)

Hypoid Gear Oil Capacity: 0.45 L (0.48 US qt)

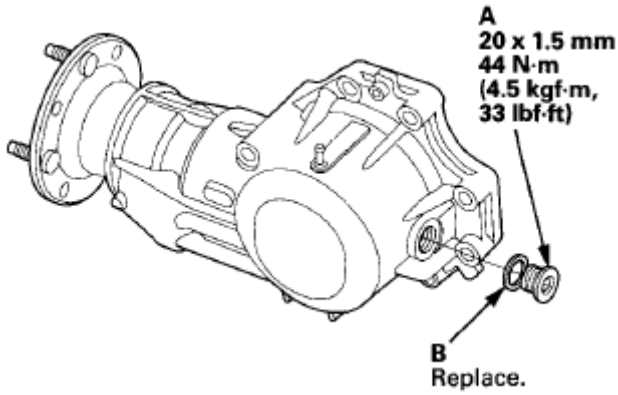

Fig. 666: Identifying Filler Plug And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Install the filler plug with a new sealing washer (B).

SYSTEM DESCRIPTION

DUAL MASS FLYWHEEL

Function

The dual mass flywheel is designed to reduce the noise and vibration produced by the engine, the clutch, and the transmission during acceleration and cruising.

Construction

The flywheel assembly is actually two flywheels in one, which raises the inertial mass on both the engine and transmission when the clutch is engaged. The inner and outer flywheels are connected by torsion springs. This combination effectively dampers changes in engine speed before they are transmitted to the transmission. Since there are torsion springs between the flywheels, none are used in the clutch disc, which reduces the inertial mass on the mainshaft when the clutch is disengaged. This reduction of the rotating inertial mass reduces the load on the synchro rings, allowing the transmission to shift smoothly.

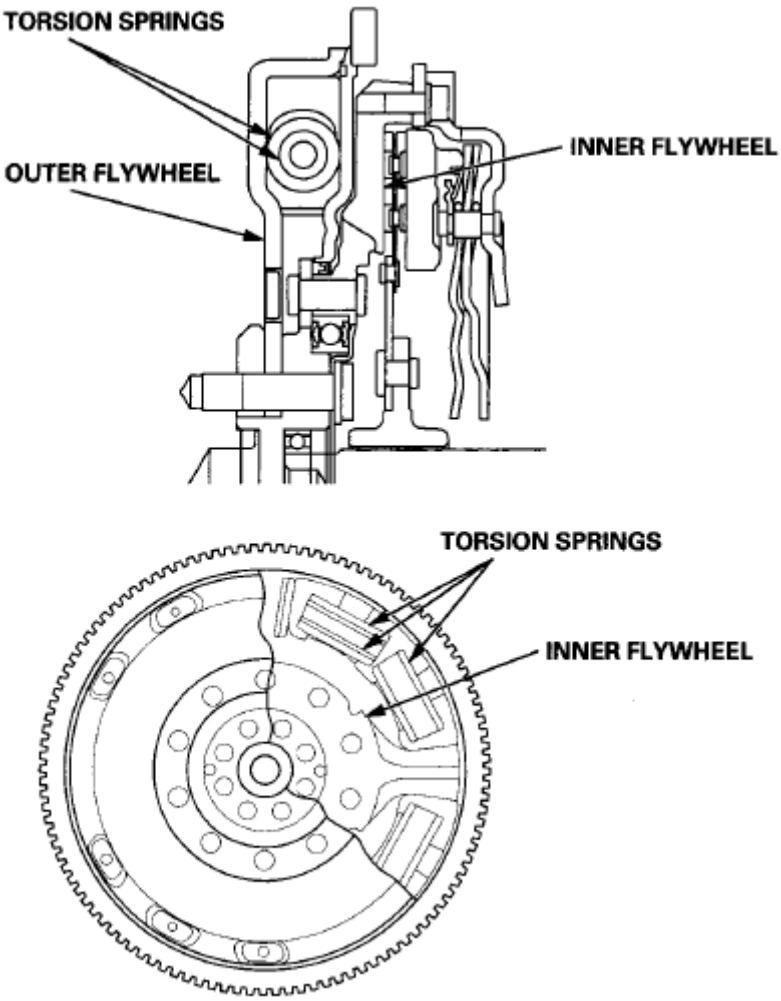

Fig. 3: Identifying Dual Mass Flywheel And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

CLUTCH HYDRAULIC SYSTEM BLEEDING

NOTE:

- **Do not reuse the drained fluid. Always use Acura DOT 3 Brake Fluid from an unopened container. Using a non-Acura brake fluid can cause corrosion and shorten the life of the system.**
- **Make sure no dirt or other foreign matter is allowed to contaminate the brake fluid.**

- **Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately with water.**
- **It may be necessary to limit the movement of the release fork with a block of wood to remove all the air from the system.**
- **Use fender covers to avoid damaging painted surfaces.**

1. Make sure the brake fluid level in the clutch reservoir (A) is at the MAX (upper) level line (B).

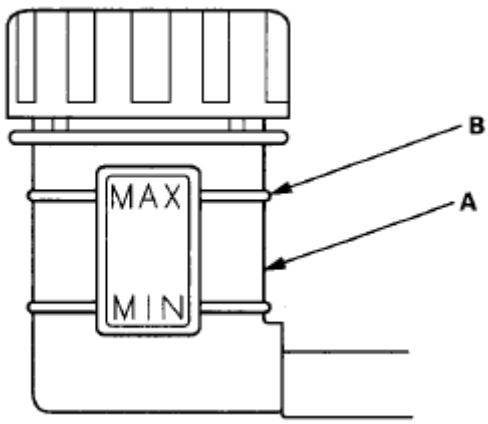

Fig. 4: Identifying Clutch Reservoir And Level Line
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Attach one end of a clear tube to the bleeder screw (A), and put the other end into a container. Loosen the bleeder screw to allow air to escape from the system.

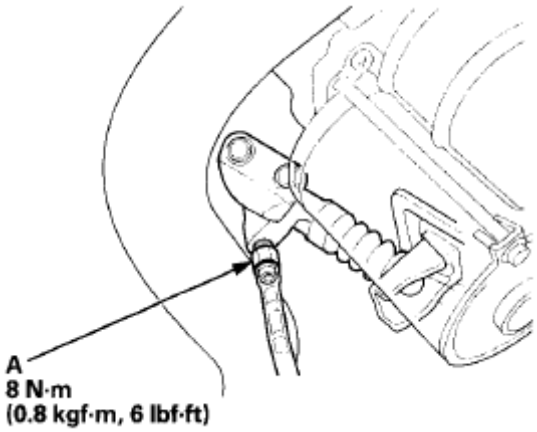

Fig. 5: Identifying Bleeder Screw With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure there is an adequate supply of fluid in the reservoir, then slowly push the clutch pedal all the way down. Before releasing the pedal, have an assistant temporarily tighten the bleeder screw. Loosen the bleeder screw, and push the clutch pedal down again. Repeat this step until no more bubbles appear at the

clear tube.

NOTE: Make sure the fluid level on the reservoir does not go below MIN.

4. Tighten the bleeder screw securely.
5. Refill the brake fluid in the reservoir to the MAX (upper) level line.

CLUTCH PEDAL, CLUTCH PEDAL POSITION SWITCH A, AND CLUTCH PEDAL POSITION SWITCH B ADJUSTMENT

NOTE:

- **For a cruise control problem, check clutch pedal position switch B (see CLUTCH PEDAL POSITION SWITCH B TEST).**
- **For a clutch pedal position switch operation problem, check clutch pedal position switch A (see CLUTCH PEDAL POSITION SWITCH A TEST).**
- **Remove the driver's floor mat before adjusting the clutch pedal.**
- **If there is no clearance between the master cylinder piston and the push rod, the release bearing will be held against the diaphragm spring, which can result in clutch slippage or other clutch problems.**

1. Disconnect the clutch pedal position switch A connector and the clutch pedal position switch B connector.
2. Loosen the clutch pedal position switch B locknut (A), and back off clutch pedal position switch B until it no longer touches the clutch pedal (C).

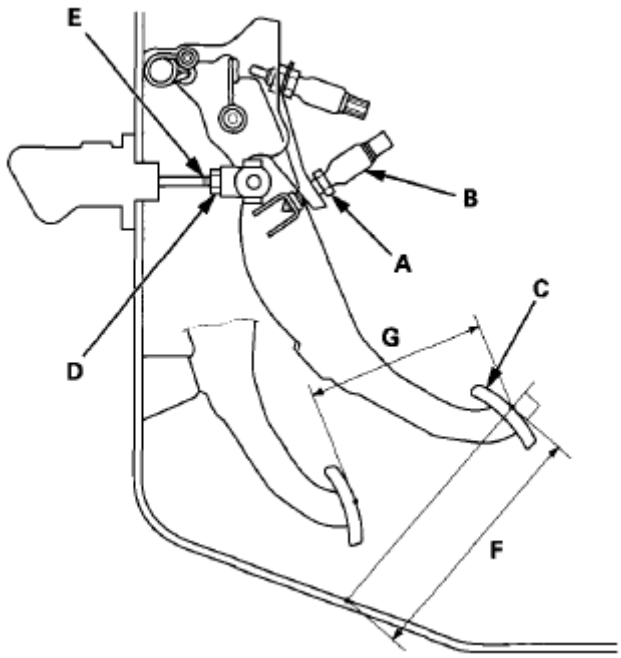

Fig. 6: Identifying Locknut, Back Off Clutch Pedal Position Switch B, Clutch Pedal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Loosen the clutch push rod locknut (D), and turn the push rod (E) in or out to get the specified height (F), and the stroke (G) at the clutch pedal. If adjusting the push rod causes the clutch pedal to contact clutch pedal position switch B, back off the switch further.

   F Clutch Pedal Height: 156 mm (6.14 in)

   G Clutch Pedal Stroke: 130-140 mm (5.12-5.51 in)

4. Tighten the clutch push rod locknut (A).

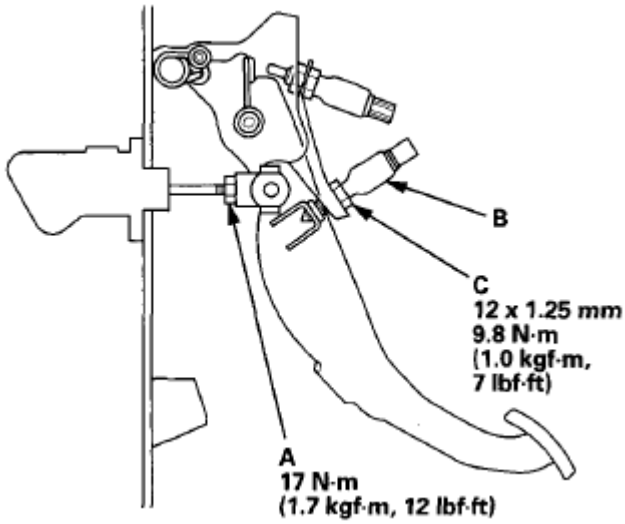

Fig. 7: Identifying Clutch Push Rod Locknut And Clutch Pedal Position Switch B With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. With the clutch pedal released, turn in clutch pedal position switch B until it contacts the clutch pedal.
6. Turn in clutch pedal position switch B an additional 3/4 to 1 turn. Make sure the clutch pedal height did not change.
7. While holding clutch pedal position switch B, tighten the locknut (C).
8. Loosen the clutch pedal position switch A locknut (B).

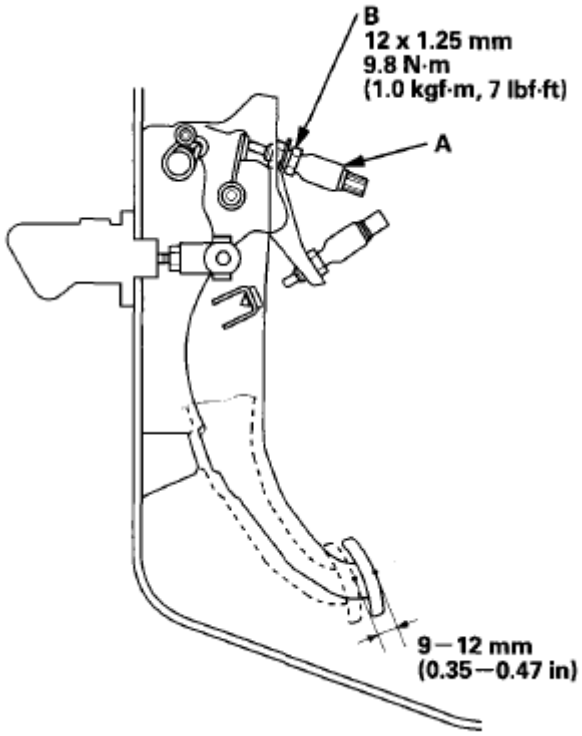

Fig. 8: Identifying Clutch Pedal Position Switch A Locknut With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Fully press the clutch pedal to the floor, then release the clutch pedal 9-12 mm (0.35-0.47 in) and hold it there.
10. Adjust the position of clutch pedal position switch A so the engine starts with the clutch pedal in this position.
11. While holding clutch pedal position switch A, tighten the locknut.
12. Check the clutch operation.
13. Connect the clutch pedal position switch A connector and the clutch pedal position switch B connector, then check the cruise control and the clutch pedal position switch operation.

CLUTCH PEDAL ASSEMBLY REPLACEMENT

1. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
2. Disconnect the clutch pedal position switch A connector (C) and the clutch pedal position switch B connector (D).

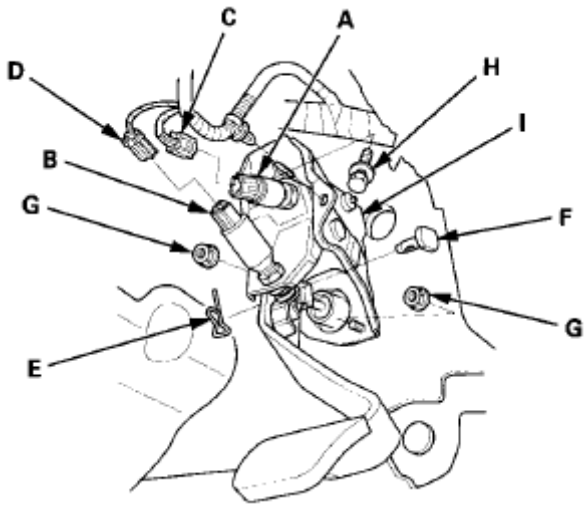

Fig. 9: Identifying Clutch Pedal Assembly And Related Components
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Pry out the lock pin (E), and pull the clevis pin (F) out of the clevis.
4. Remove the master cylinder mounting nuts (G) and the clutch pedal mounting bolt (H).
5. Remove the clutch pedal assembly (I).
6. Remove clutch pedal position switch A and clutch pedal position switch B.
7. Loosely install clutch pedal position switch A and clutch pedal position switch B.

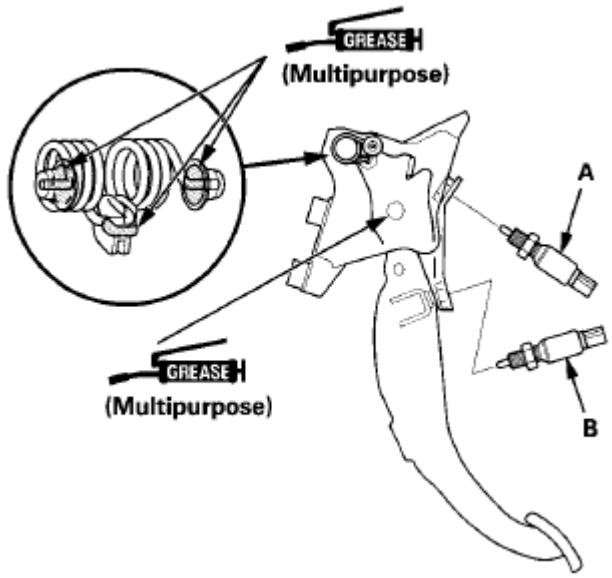

Fig. 10: Identifying Clutch Pedal Position Switch A And B
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the clutch pedal assembly (A).

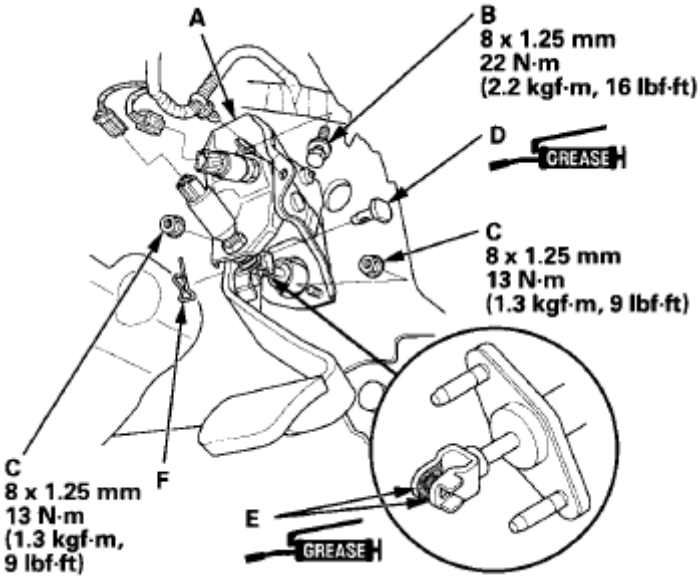

Fig. 11: Identifying Clutch Pedal Assembly, Mounting Bolts And Nuts, Clevis Pin, Lock Pin And Mating Surfaces With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the clutch pedal mounting bolt (B) and the master cylinder mounting nuts (C).
10. Apply multipurpose grease to the clevis pin (D), and the mating surfaces (E) of the clevis and the pedal. Slide the clevis pin into the clevis, then install the lock pin (F).
11. Adjust the clutch pedal, **CLUTCH PEDAL POSITION SWITCH B, AND CLUTCH PEDAL POSITION SWITCH A**.

NOTE: Connect the switch connectors after adjusting them.

12. Check the clutch operation.
13. Reinstall the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).

CLUTCH MASTER CYLINDER REPLACEMENT

NOTE:

- **Use fender covers to avoid damaging painted surfaces.**
- **Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately with water.**

1. Remove and discard the brake fluid from the clutch reservoir with a syringe or other suitable device.
2. Remove the clutch reservoir (A).

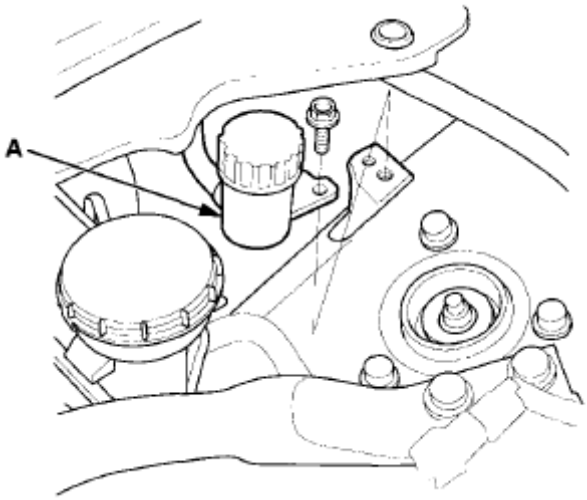

Fig. 12: Identifying Clutch Reservoir
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Disconnect the clutch line (A) from the clutch master cylinder (B). To prevent spills, cover the line joint with rags or clean shop towels.

NOTE: Loosen the flare nut (C) while holding the clutch line connector (D) using a wrench.

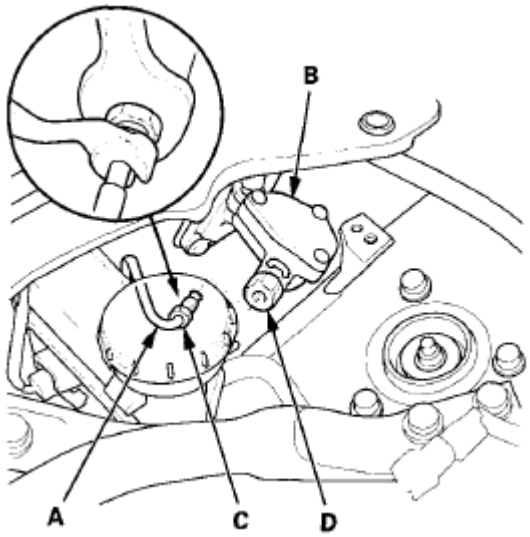

Fig. 13: Identifying Clutch Line, Clutch Master Cylinder, Flare Nut And Clutch Line Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
5. Pry out the lock pin (A), and pull the clevis pin (B) out of the clevis. Remove the master cylinder mounting nuts (C).

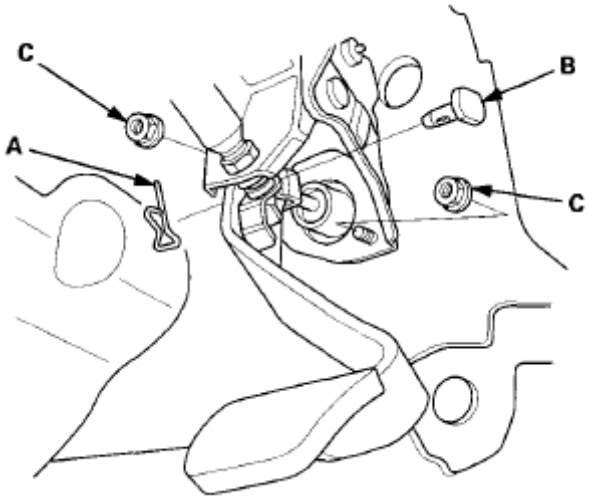

Fig. 14: Identifying Lock Pin, Clevis Pin And Master Cylinder Mounting Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the clutch master cylinder (A) and the clutch master cylinder seal (B).

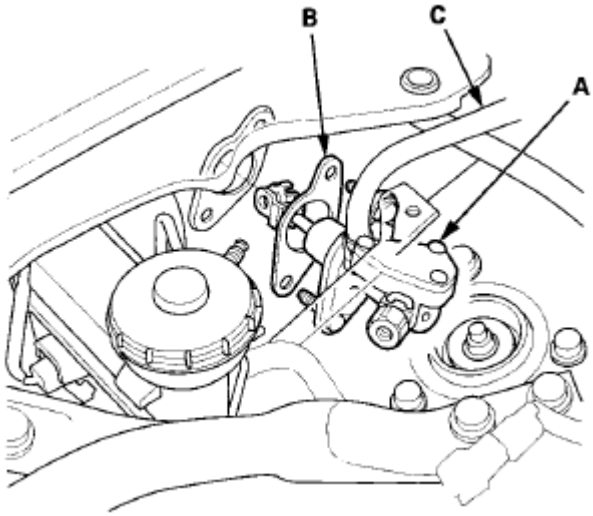

Fig. 15: Identifying Clutch Master Cylinder And Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the reservoir hose (C).

NOTE: Inspect the hose. If the hose has damage, leaks, interference, or twisting, replace it.

8. Remove the retaining clip (A), then remove the clutch line connector (B) and the O-ring (C) from the master cylinder (D).

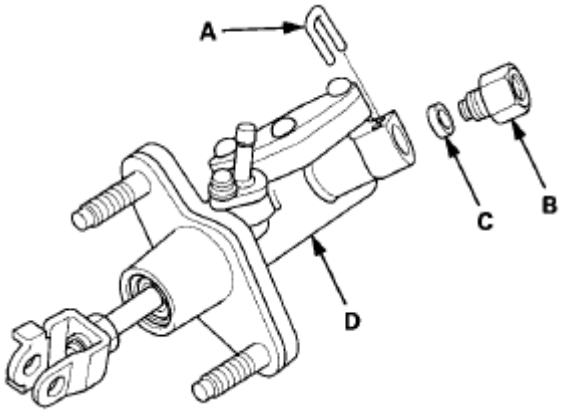

Fig. 16: Identifying Retaining Clip, Clutch Line Connector, O-Ring And Master Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the clutch line connector (A) with a new O-ring (B), then set in a new retaining clip (C) to the master cylinder (D).

NOTE:

- **Apply silicone grease (P/N 08C30-B0234M) on the O-ring and the joint part (E) of the clutch line connector.**
- **Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.**

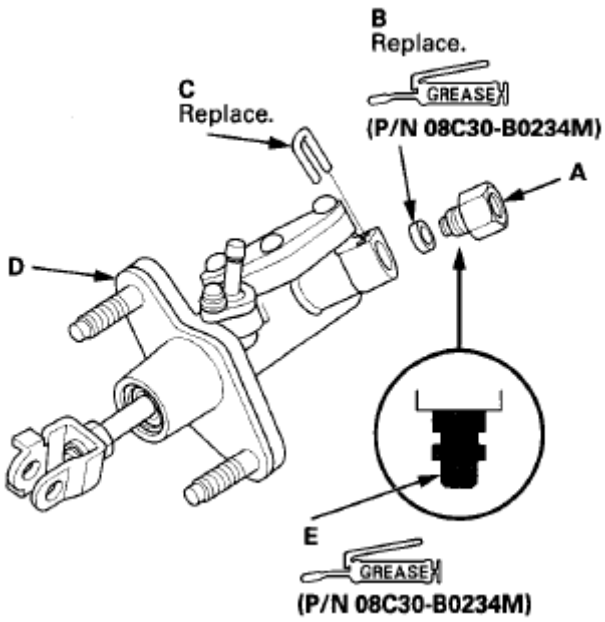

Fig. 17: Identifying Clutch Line Connector, O-Ring, Retaining Clip And Master Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. To prevent the retaining clip (A) from coming off, pry apart the tip (B) of the clip with a screwdriver.

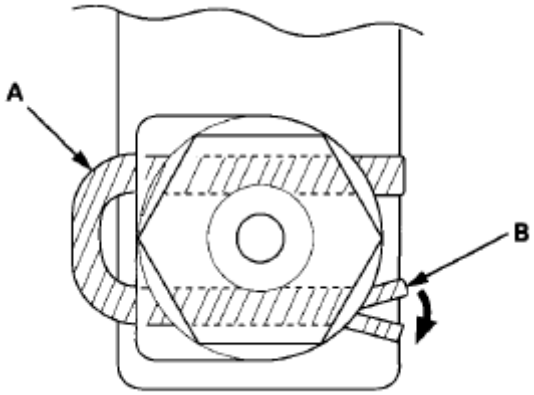

Fig. 18: Identifying Retaining Clip And Clip Tip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Connect the reservoir hose, and adjust the hose clamp (A) positions and its direction.

NOTE: When attaching the reservoir hose, align the yellow mark on the hose to the rib on reservoir connection area, and the blue mark on the hose to the rib on the clutch master cylinder connection area.

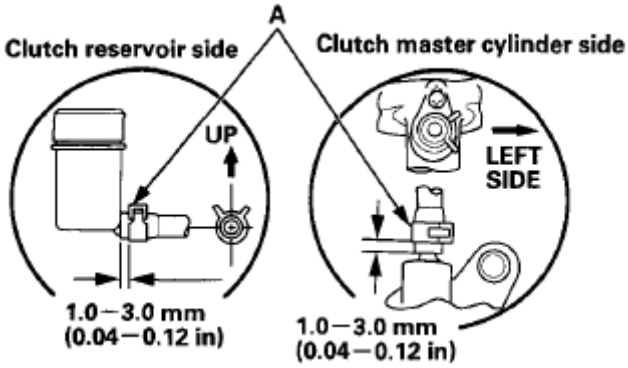

Fig. 19: Identifying Hose Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install a new clutch master cylinder seal (A) and the clutch master cylinder (B).

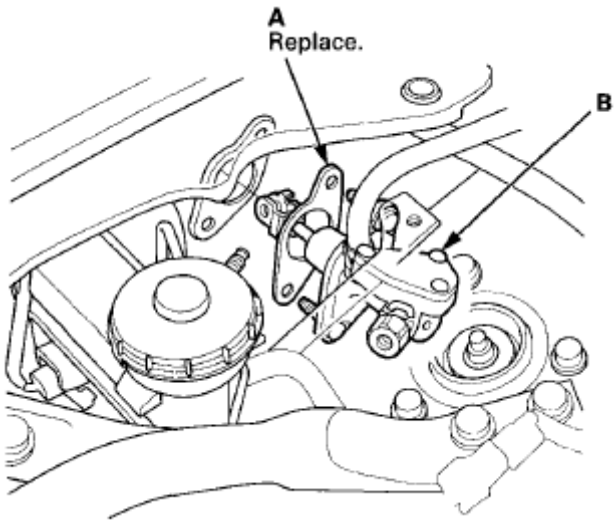

Fig. 20: Identifying Clutch Master Cylinder And Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the master cylinder mounting nuts (A).

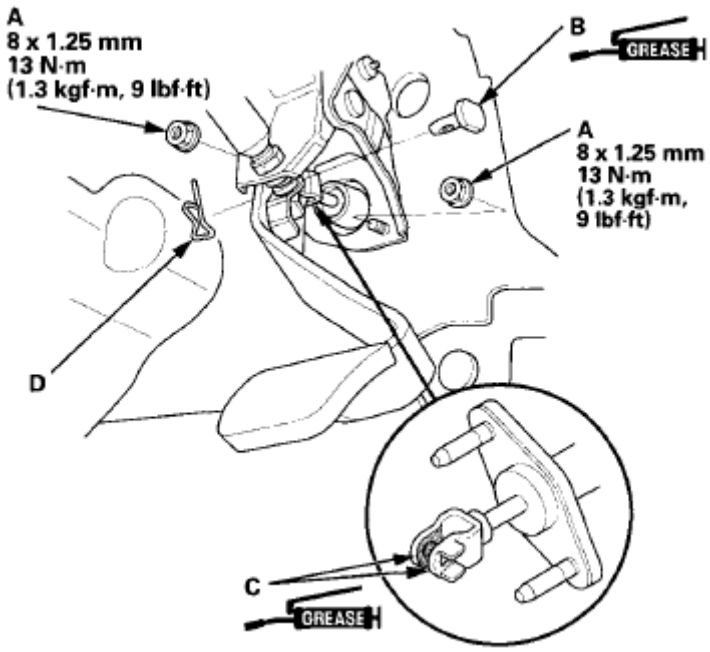

Fig. 21: Identifying Mounting Nuts, Clevis Pin, Mating Surfaces And Clutch Line Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Apply multipurpose grease to the clevis pin (B), and the mating surfaces (C) of the clevis and the pedal. Slide the clevis pin into the clevis, then install the lock pin (D).
15. Connect the clutch line (A) to the clutch master cylinder (B).

NOTE: **Tighten the flare nut (C) while holding the clutch line connector (D) using a wrench.**

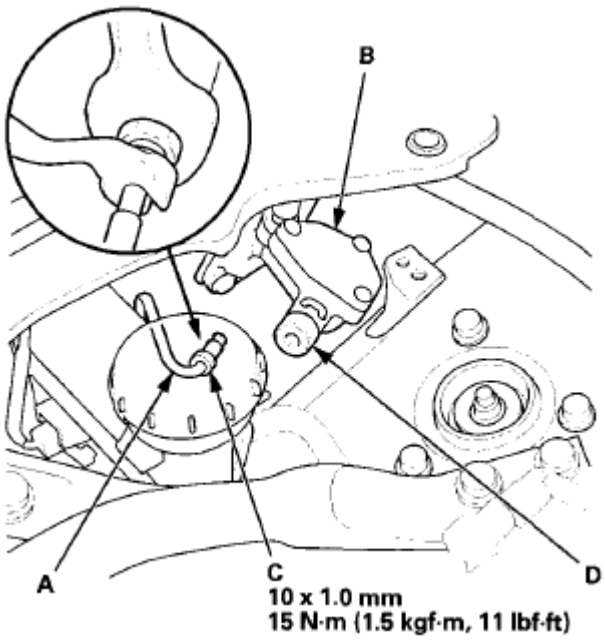

Fig. 22: Identifying Clutch Line, Clutch Master Cylinder, Flare Nut And Clutch Line Connector And Wrench With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the clutch reservoir (A).

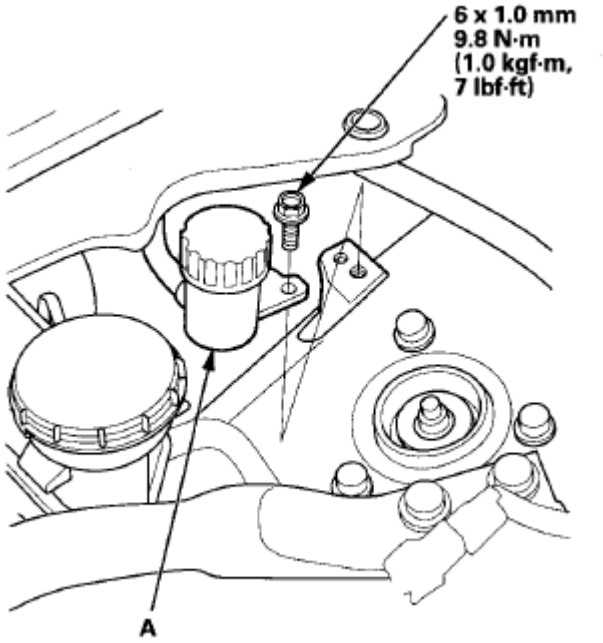

Fig. 23: Identifying Clutch Reservoir With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Bleed the **CLUTCH HYDRAULIC SYSTEM**.
18. Adjust the clutch pedal, **CLUTCH PEDAL POSITION SWITCH B, AND CLUTCH PEDAL POSITION SWITCH A**.
19. Check the clutch operation and check for leaks.
20. Reinstall the driver's dashboard undercover (see **DRIVER'S DASHBOARD UNDERCOVER REMOVAL/INSTALLATION**).
21. Test-drive the vehicle.

SLAVE CYLINDER REPLACEMENT

NOTE:

- **Use fender covers to avoid damaging painted surfaces.**
- **Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately with water.**
- **Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.**

REMOVAL/INSTALLATION

1. Remove the clutch line bracket (A) and the slave cylinder (B).

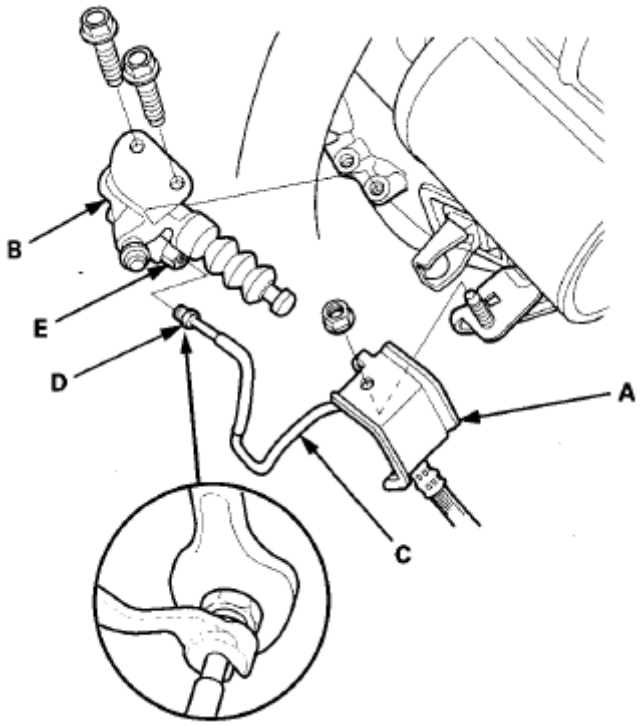

Fig. 24: Identifying Clutch Line Bracket And Slave Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Disconnect the clutch line (C) from the slave cylinder. To prevent spills, cover the line joint with rags or clean shop towels.

NOTE: Loosen the flare nut (D) while holding the clutch line connector (E) using a wrench.

3. Pull back the boot (A), and apply silicone grease (P/N 08C30-B0234M) to the boot and slave cylinder. Reinstall the boot.

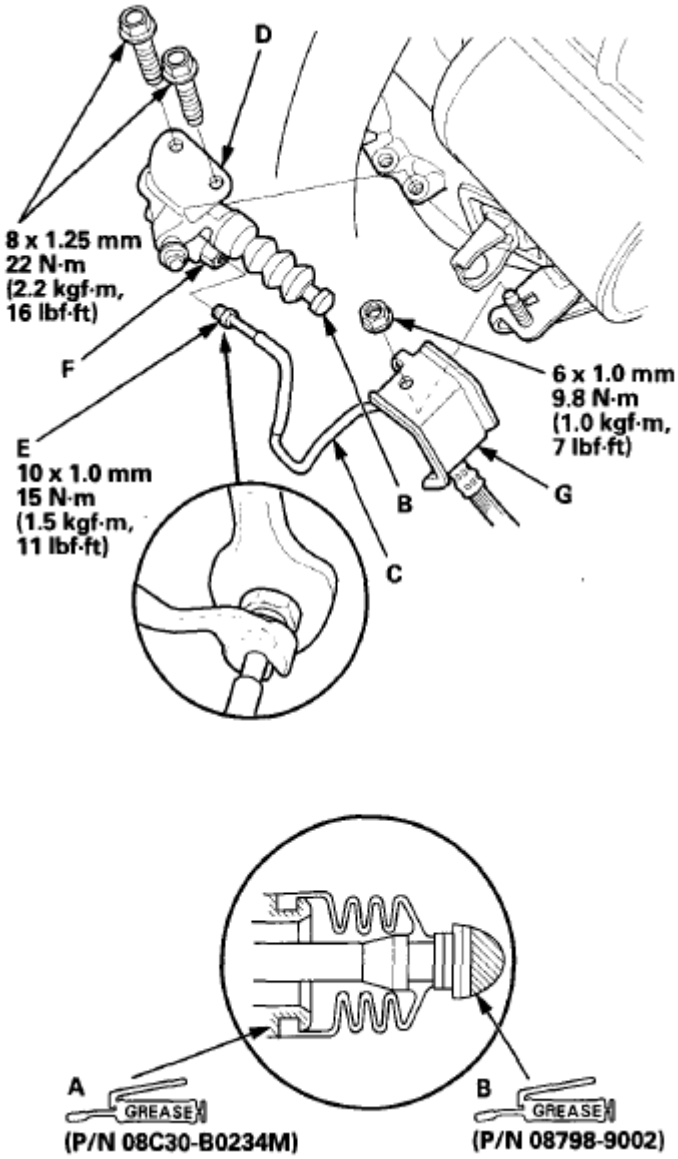

Fig. 25: Identifying Boot, Push Rod, Clutch Line, Slave Cylinder, Flare Nut And Clutch Line Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Apply a light coat of super high temp urea grease (P/N 08798-9002) to the push rod (B) of the slave cylinder.
5. Connect the clutch line (C) to the slave cylinder (D), and tighten the flare nut (E).

NOTE: Tighten the flare nut while holding the clutch line connector (F) using a wrench.

6. Install the slave cylinder and the clutch line bracket (G).
7. Bleed the **CLUTCH HYDRAULIC SYSTEM**.

8. Check the clutch operation and check for leaks.
9. Test-drive the vehicle.

O-RING REPLACEMENT

1. Remove the slave cylinder.
2. Remove the roll pins (A), then remove the clutch line connector (B) and the O-ring (C) from the slave cylinder (D).

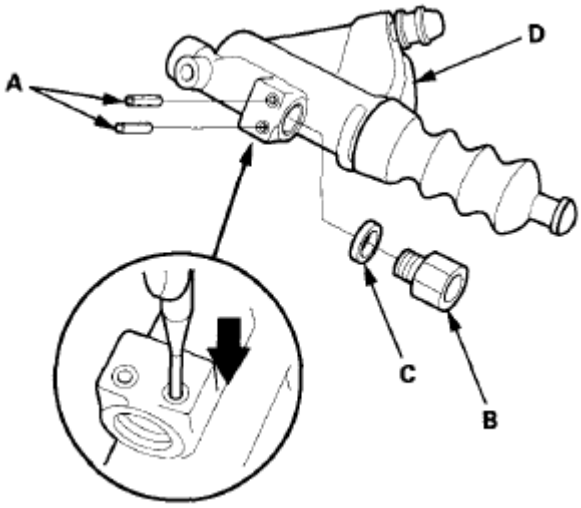

Fig. 26: Identifying Roll Pins, Clutch Line Connector, O-Ring And Slave Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the clutch line connector (A) with a new O-ring (B), then set in new roll pins (C) to the slave cylinder (D).

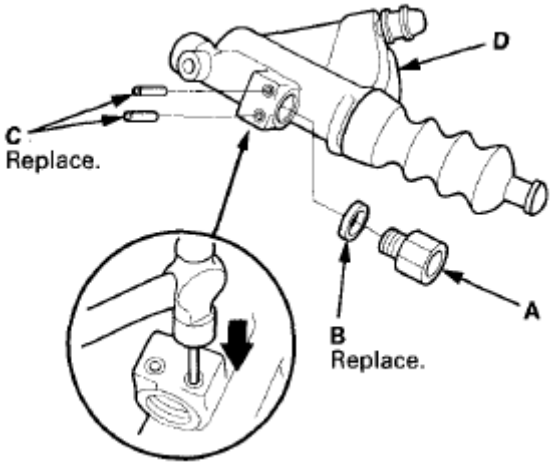

Fig. 27: Identifying Clutch Line Connector, O-ring, Roll Pins And Slave Cylinder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the slave cylinder.

CLUTCH HOSE REPLACEMENT

NOTE:

- **Replace the clutch hose if it is twisted, cracked, or if it leaks.**
- **Use fender covers to avoid damaging painted surfaces.**
- **Do not spill brake fluid on the vehicle; it may damage the paint or plastic. If brake fluid does contact the paint or plastic, wash it off immediately with water.**

1. Remove the air intake duct splash separator (A).

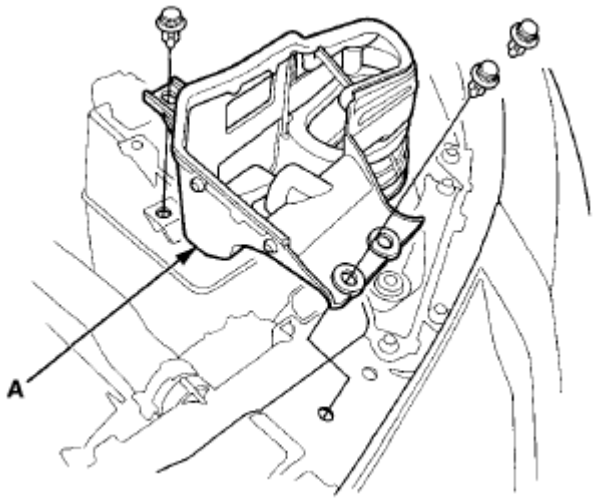

Fig. 28: Identifying Air Intake Duct Splash Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
3. Remove the harness clamps (A), then remove the battery base (B).

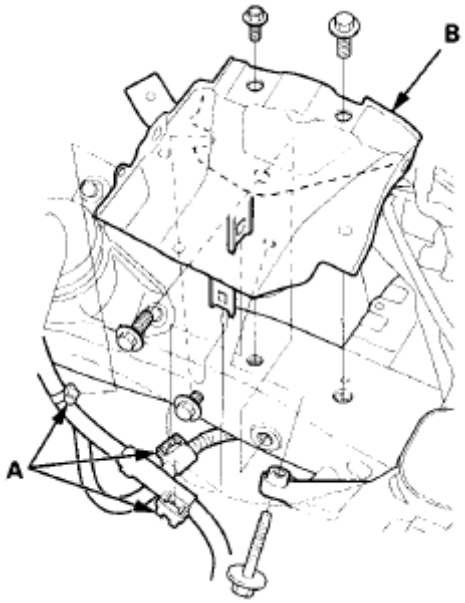

Fig. 29: Identifying Harness Clamps And Battery Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Disconnect the clutch hose (A) from the clutch lines (B).

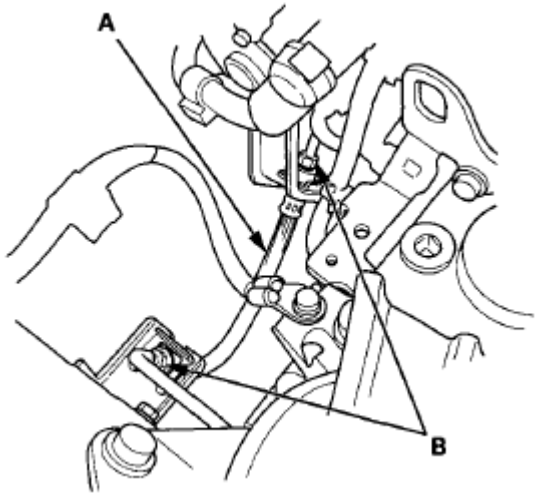

Fig. 30: Identifying Clutch Hose And Clutch Lines
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove and discard the clutch hose clips (A) from the clutch hose (B).

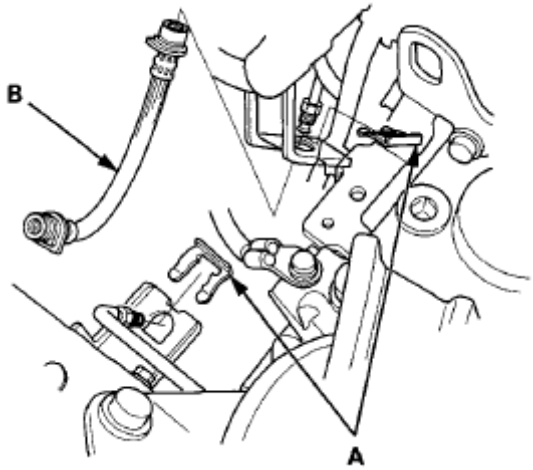

Fig. 31: Identifying Clutch Hose Clips And Clutch Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the clutch hose from the clutch hose brackets.
7. Install the clutch hose (A) into the clutch hose brackets with the new clutch hose clips (B).

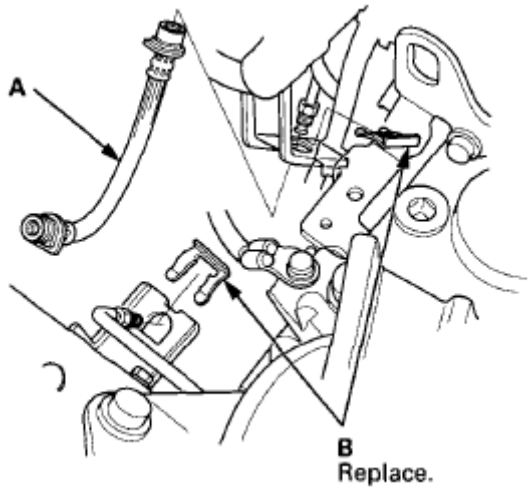

Fig. 32: Identifying Clutch Hose And Clips
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Connect the clutch lines (A) to the clutch hose (B).

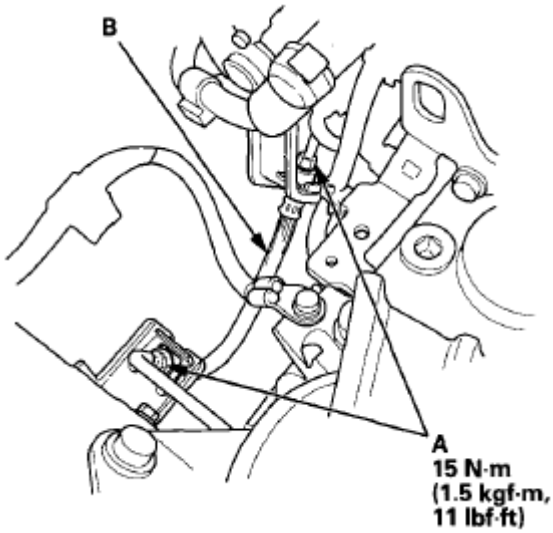

Fig. 33: Identifying Clutch Lines And Clutch Hose With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Bleed the **CLUTCH HYDRAULIC SYSTEM**.
10. Do the following checks:
    - Check the clutch hose and line joint for leaks, and tighten if necessary.
    - Check the clutch hose for interference and twisting.
11. Install the battery base (A) and the harness clamps (B).

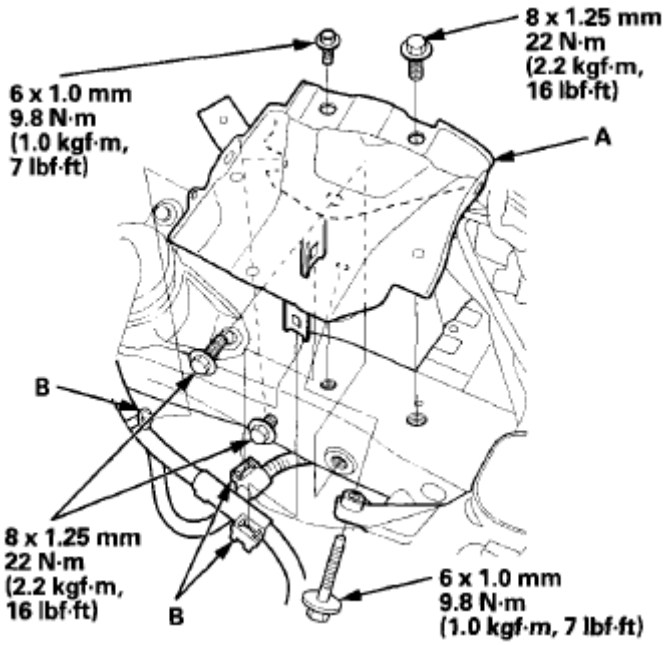

Fig. 34: Identifying Battery Base And Harness Clamps With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).
13. Install the air intake duct splash separator (A).

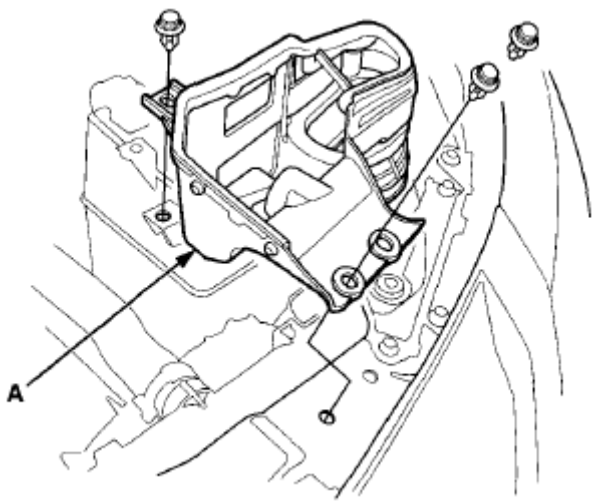

Fig. 35: Identifying Air Intake Duct Splash Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Test-drive the vehicle.

CLUTCH REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 22 x 24 mm 07746-0010800
- Driver Handle, 15 x 135L 07749-0010000
- Remover Handle 07936-3710100
- Slide Hammer 07936-371020A
- Bearing Remover Shaft Set, 20 mm 07936-3710600
- Clutch Alignment Shaft 07AAF-P8EA000
- Clutch Alignment Disc 07JAF-PM7011A
- Ring Gear Holder 07LAB-PV00100
- Clutch Alignment Shaft 07ZAF-PR8A100

ENGINE SIDE

Pressure Plate Inspection and Removal

1. Remove the transmission (see **TRANSMISSION REMOVAL**).
2. Check the evenness of the height of the diaphragm spring fingers using the clutch alignment disc (A), the clutch alignment shaft (B), the remover handle (C), and a feeler gauge (D). If the height difference is

more than the service limit, replace the pressure plate.

Standard (New): 0.6 mm (0.024 in) max.

Service Limit: 0.8 mm (0.031 in)

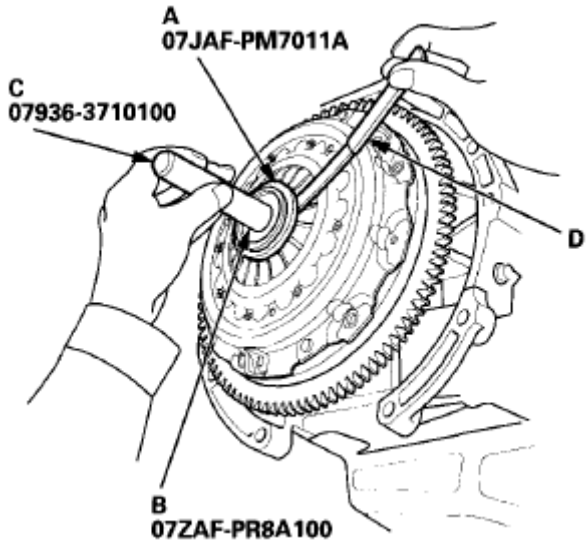

Fig. 36: Identifying Clutch Alignment Disc And Shaft, Remover Handle, Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the ring gear holder (A) and the clutch alignment shaft (B).

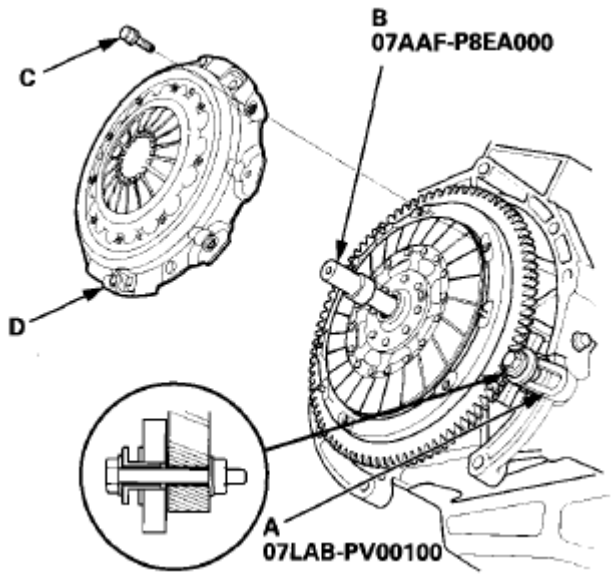

Fig. 37: Identifying Ring Gear Holder, Clutch Alignment Shaft, Mounting Bolts And Pressure Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. To prevent warping, loosen the pressure plate mounting bolts (C) in a crisscross pattern in several steps,

then remove the pressure plate (D).

5. Inspect the fingers of the diaphragm spring (A) for wear at the release bearing contact area.

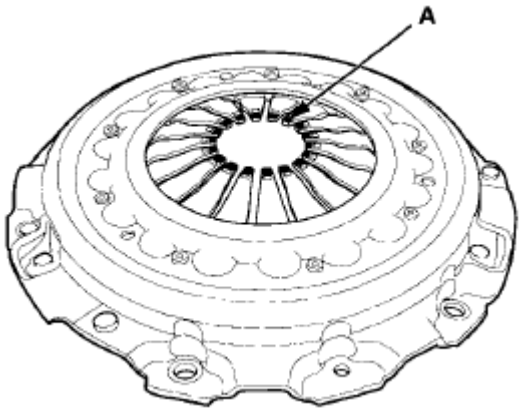

Fig. 38: Identifying Diaphragm Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Inspect the pressure plate surface (A) for wear, cracks, and burning.

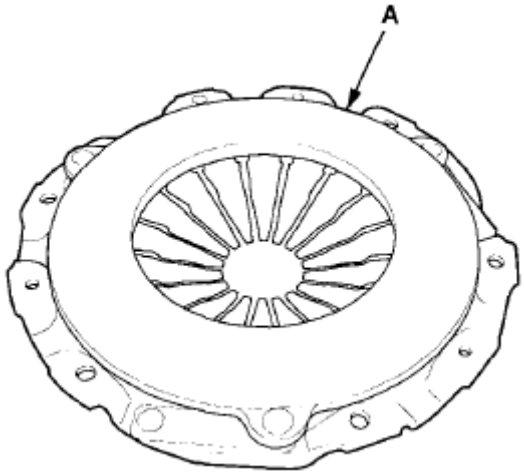

Fig. 39: Identifying Pressure Plate Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Inspect for warpage using a straight edge (A) and a feeler gauge (B). Measure across the pressure plate (C). If the most measurement difference is more than the service limit, replace the pressure plate.

   Standard (New): 0.02 mm (0.001 in) max.

   Service Limit: 0.15 mm (0.005 in)

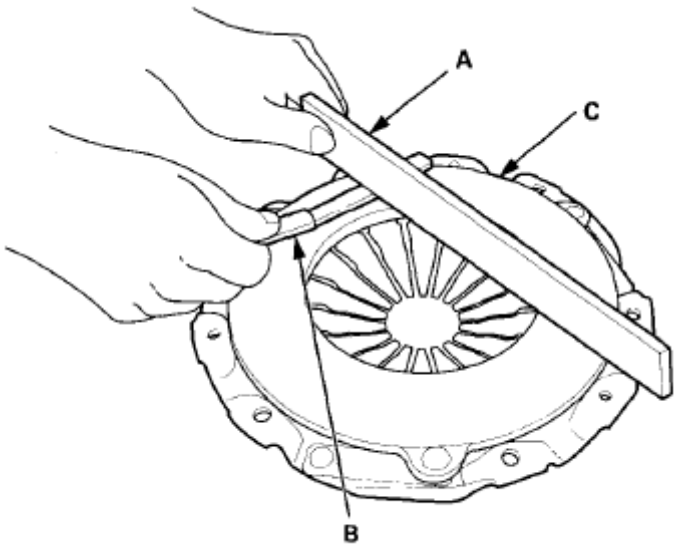

Fig. 40: Identifying Straight Edge, Feeler Gauge And Pressure Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Clutch Disc Inspection and Removal

8. Remove the clutch disc (A) and the clutch alignment shaft (B).

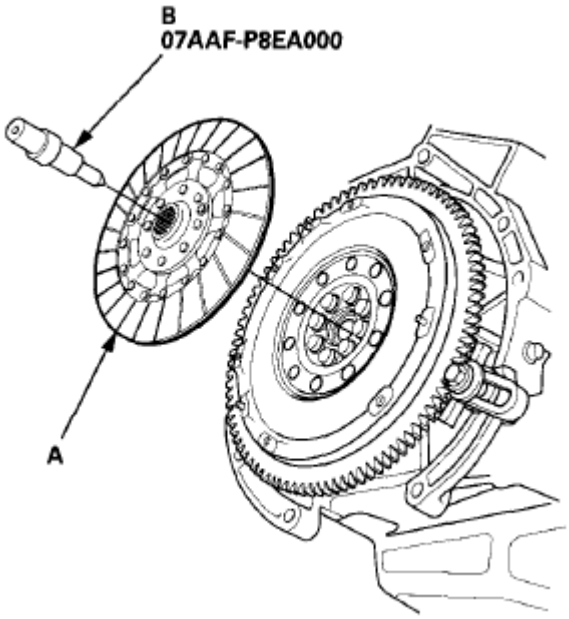

Fig. 41: Identifying Clutch Disc And Clutch Alignment Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Inspect the lining of the clutch disc for signs of slippage or oil. If the clutch disc looks burnt or is oil soaked, replace the clutch disc. If the clutch disc is oil soaked, find and repair the source of the oil leak.

10. Measure the clutch disc thickness. If the measurement is less than the service limit, replace the clutch disc.

    Standard (New): 7.9-8.5 mm (0.311-0.335 in)

    Service Limit: 6.0 mm (0.236 in)

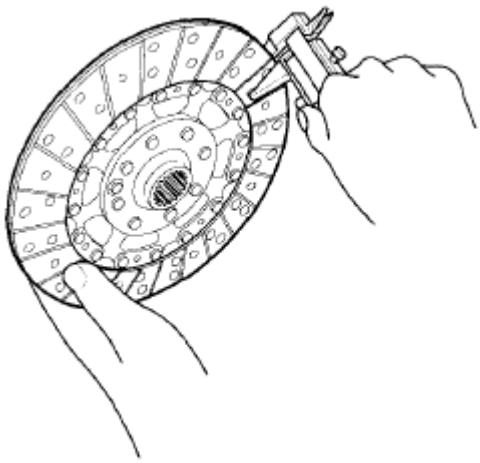

Fig. 42: Measuring Clutch Disc Thickness
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Measure the depths of the rivets from the clutch disc lining surface (A) to the rivets (B) on both sides. If the measurement is less than the service limit, replace the clutch disc.

    Standard (New): 1.35-1.95 mm (0.0531-0.0768 in)

    Service Limit: 0.7 mm (0.028 in)

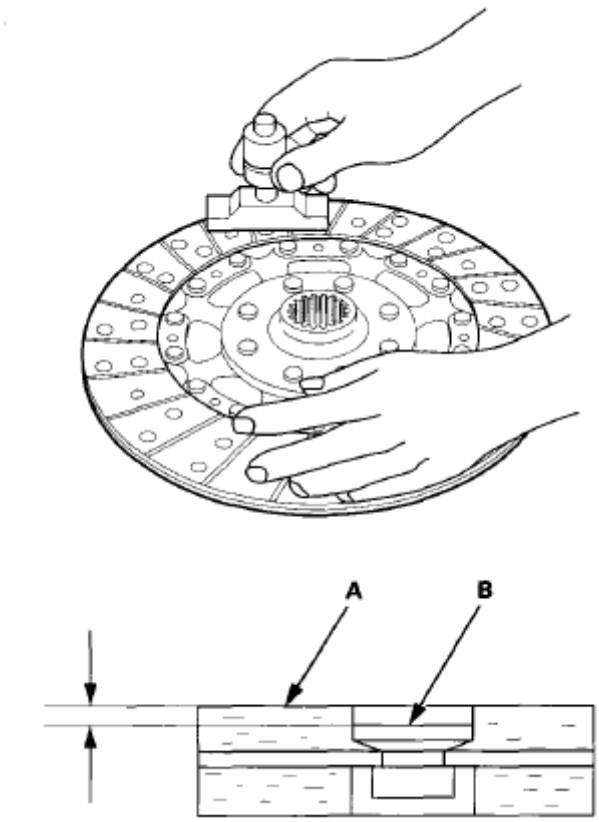

Fig. 43: Measuring Depths Of Rivets From Clutch Disc Lining Surface To Rivets On Both Sides
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Flywheel Inspection

12. Remove the ring gear holder.
13. Inspect the ring gear teeth for wear and damage.
14. Inspect the clutch disc mating surface on the flywheel for wear, cracks, and burning.
15. Measure the flywheel (A) runout using a dial indicator (B). Through at least two full turns with pushing against the flywheel each time you turn it to take up the crankshaft thrust washer clearance. If the measurement is not within the standard, replace the flywheel, and recheck the runout; go to step 16.

    Standard (New): 0.3 mm (0.012 in) max.

    Service Limit: 0.4 mm (0.016 in)

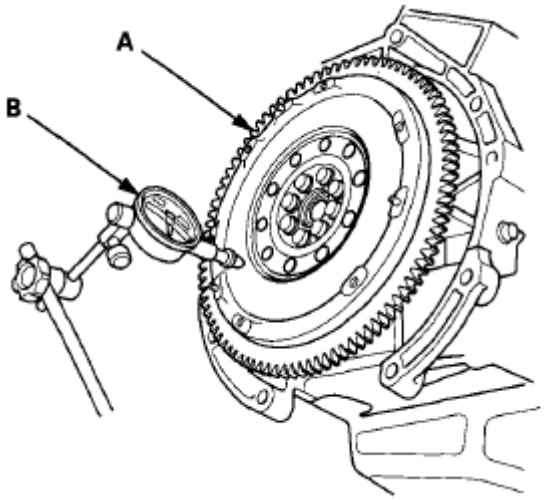

Fig. 44: Measuring Flywheel Runout Using Dial Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Flywheel Replacement

16. Install the ring gear holder (A).

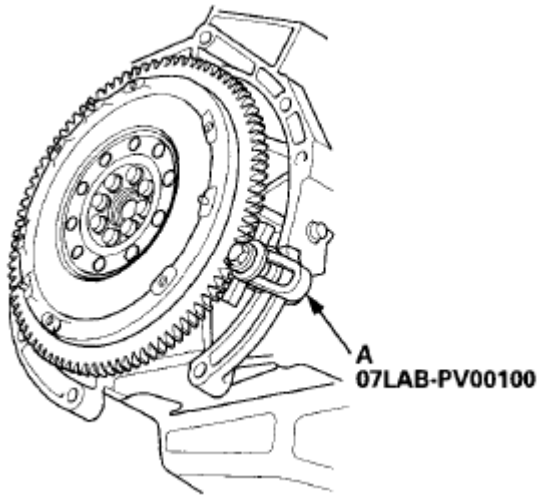

Fig. 45: Identifying Ring Gear Holder
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Loosen the flywheel mounting bolts in a crisscross pattern in several steps. Remove the bolts, then remove the flywheel and the ring gear holder.
18. Install the flywheel on the crankshaft, and install the mounting bolts finger-tight.
19. Install the ring gear holder (A), then torque the flywheel mounting bolts (B) in a crisscross pattern in several steps.

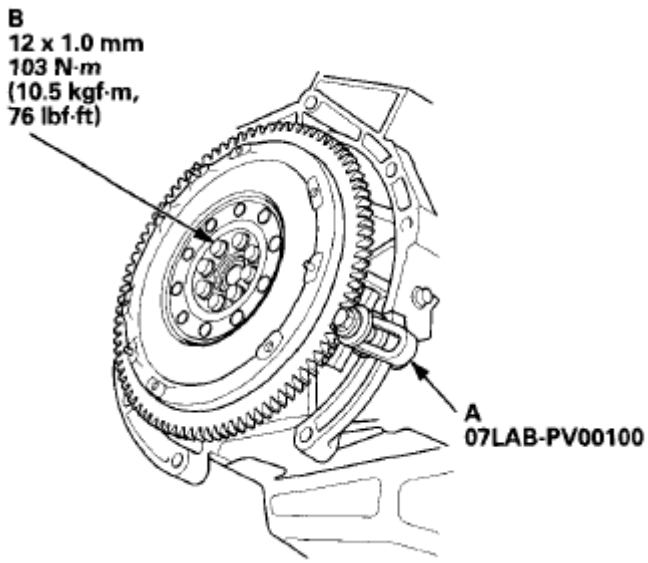

Fig. 46: Identifying Ring Gear Holder And Flywheel Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Pilot Bearing Inspection

20. Turn the inner race of the pilot bearing with your finger. The pilot bearing should turn smoothly and quietly. Check that the pilot bearing outer race fits tightly in the flywheel. If the race does not turn smoothly, quietly, or fit tight in the flywheel, replace the pilot bearing; go to step 21.

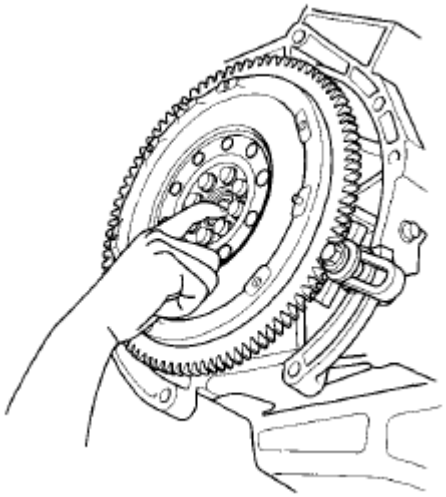

Fig. 47: Turning Inner Race Of Pilot Bearing With Your Finger
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Pilot Bearing Replacement

21. Remove the pilot bearing (A) using the slide hammer (B), the remover handle (C), and the 20 mm bearing remover shaft set (D).

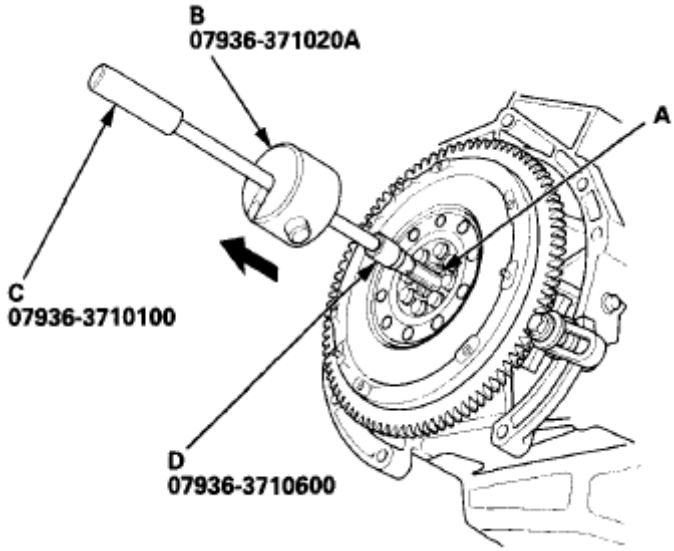

Fig. 48: Identifying Pilot Bearing, Slide Hammer, Remover Handle And Bearing Remover Shaft Set
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Install a new pilot bearing (A) into the flywheel using the 15 x 135L driver handle (B) and the 22 x 24 mm bearing driver attachment (C).

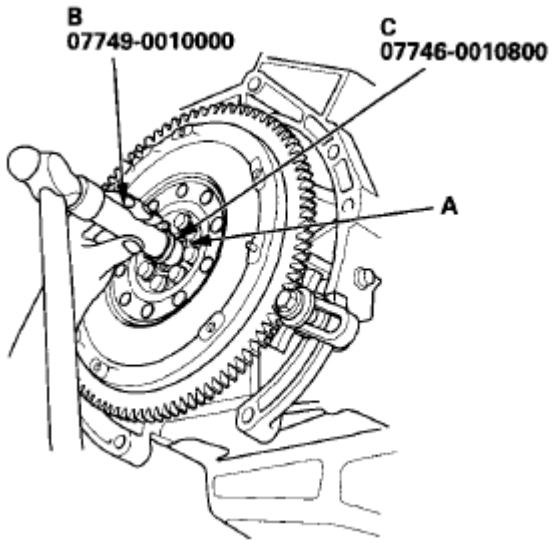

Fig. 49: Identifying Pilot Bearing, Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Clutch Disc and Pressure Plate Installation

23. Temporarily install the clutch disc onto the splines of the transmission mainshaft. Make sure the clutch disc slides freely on the mainshaft.
24. Apply super high temp urea grease (P/N 08798-9002) to the splines (A) of the clutch disc (B), then install the clutch disc using the clutch alignment shaft (C).

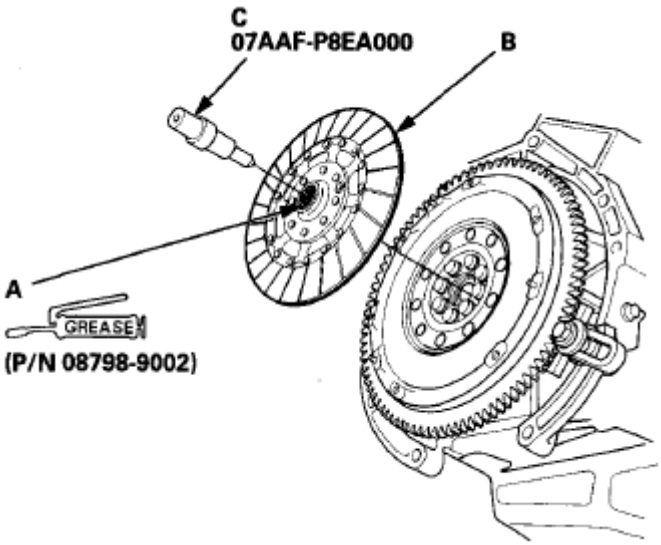

Fig. 50: Identifying Splines, Clutch Disc And Clutch Alignment Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Align (±60 degrees) the point marks (A) across the pressure plate (B) and the flywheel (C).

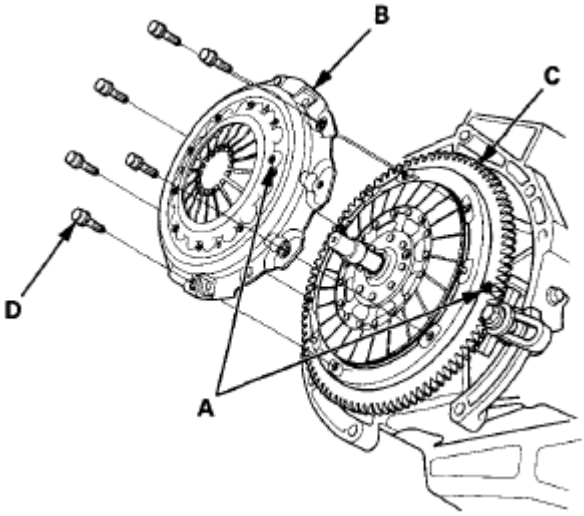

Fig. 51: Identifying Point Marks, Pressure Plate And Flywheel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Install the pressure plate and the mounting bolts (D), finger-tight.
27. Torque the pressure plate mounting bolts (A) in a crisscross pattern. Tighten the bolts in several steps to prevent warping the diaphragm spring. Make sure that there is no clearance between the pressure plate and the flywheel.

Specified Torque: 25 N.m (2.6 kgf.m, 19 lbf.ft)

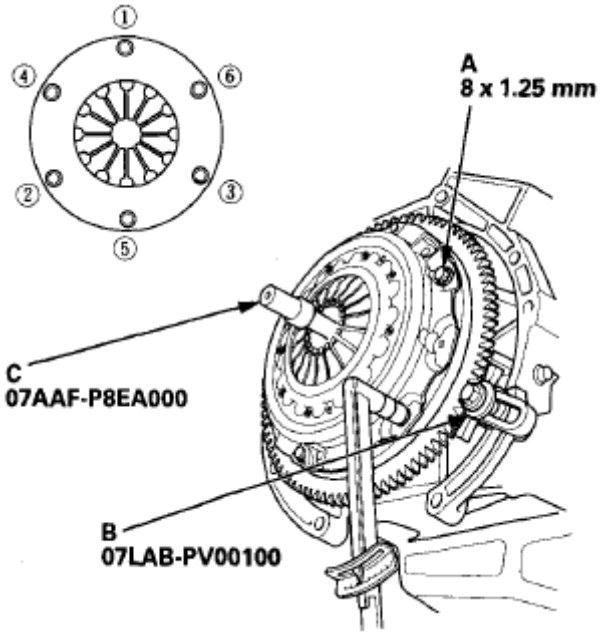

Fig. 52: Identifying Mounting Bolts, Ring Gear Holder And Clutch Alignment Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Remove the ring gear holder (B) and the clutch alignment shaft (C).
29. Make sure the diaphragm spring fingers are all the same height.
30. Do the release bearing inspection, and replace it if necessary.
31. Install the transmission (see **TRANSMISSION INSTALLATION**).

TRANSMISSION SIDE

Release Bearing Removal

1. Remove the transmission (see **TRANSMISSION REMOVAL**).
2. Remove the release fork boot (A) from the clutch housing (B).

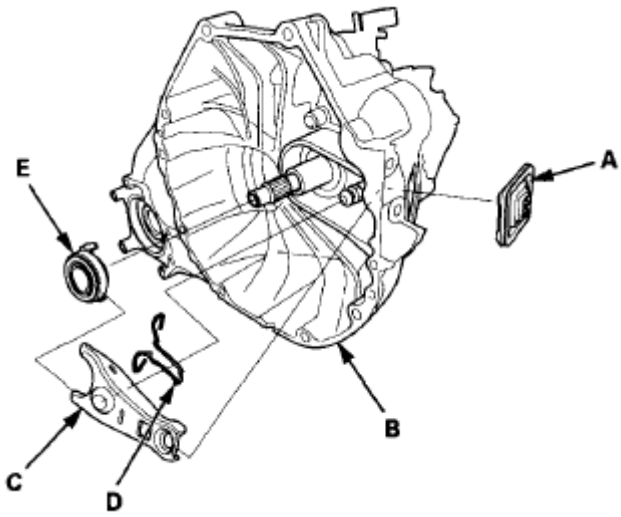

Fig. 53: Identifying Fork Boot, Clutch Housing, Fork Set Spring And Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the release fork (C) from the clutch housing by squeezing the release fork set spring (D). Remove the release bearing (E).

Release Bearing Inspection

4. Check the play of the release bearing by spinning it by hand. If there is excessive play or noise, replace the release bearing.

NOTE: The release bearing is packed with grease. Do not wash it in solvent.

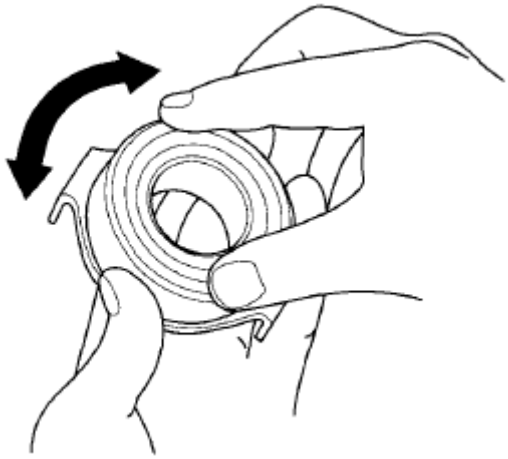

Fig. 54: Checking Play Of Release Bearing By Spinning It By Hand
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Release Bearing Installation

5. Apply super high temp urea grease (P/N 08798-9002) to the release fork (A), the release fork bolt (B), the release bearing (C), and the release bearing guide (D) in the shaded areas, then set the release fork set spring (E).

NOTE: Replace the release fork bolt if necessary.

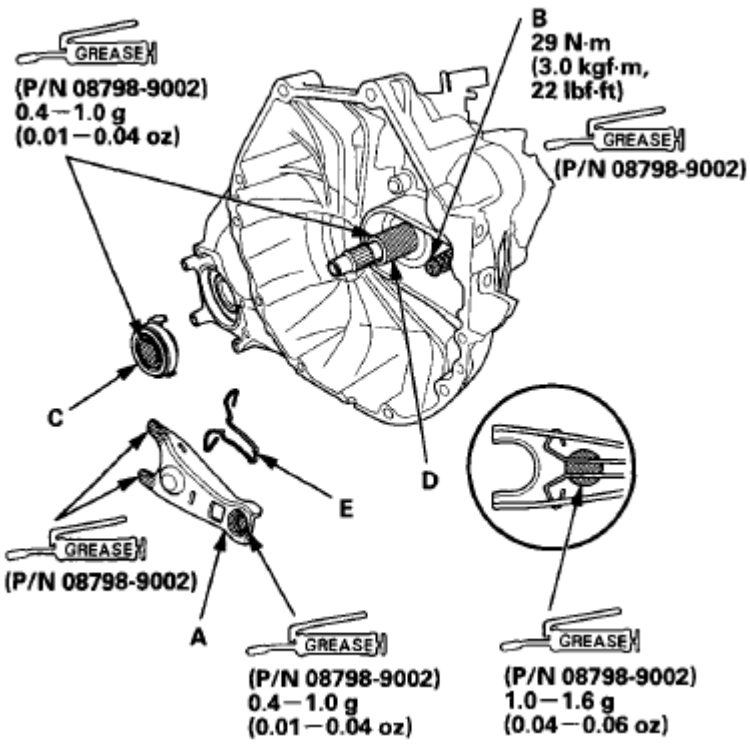

Fig. 55: Identifying Fork, Fork Bolt, Bearing, Bearing Guide And Fork Set Spring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. With the release fork (A) slide between the release bearing pawls (B), install the release bearing on the mainshaft while inserting the release fork through the hole (C) in the clutch housing.

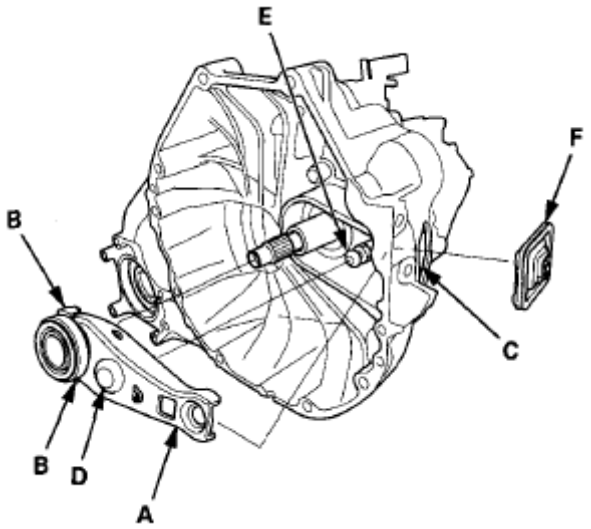

Fig. 56: Identifying Fork, Bearing Pawls, Hole, Detent, Fork Bolt And Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Align the detent (D) of the release fork with the release fork bolt (E), then press the detent of the release fork over the release fork bolt squarely.
8. Install the release fork boot (F). Make sure the boot seals around the release fork and the clutch housing.
9. Move the release fork (A) right and left to make sure that it fits properly against the release bearing (B) and that the release bearing slides smoothly. Wipe off any excess grease.

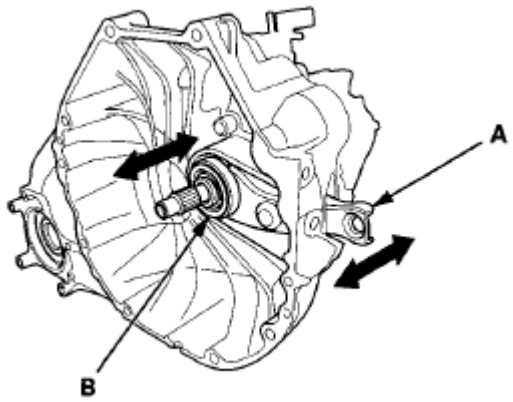

Fig. 57: Identifying Fork And Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the transmission (see **TRANSMISSION INSTALLATION**).

COMPONENT LOCATION INDEX

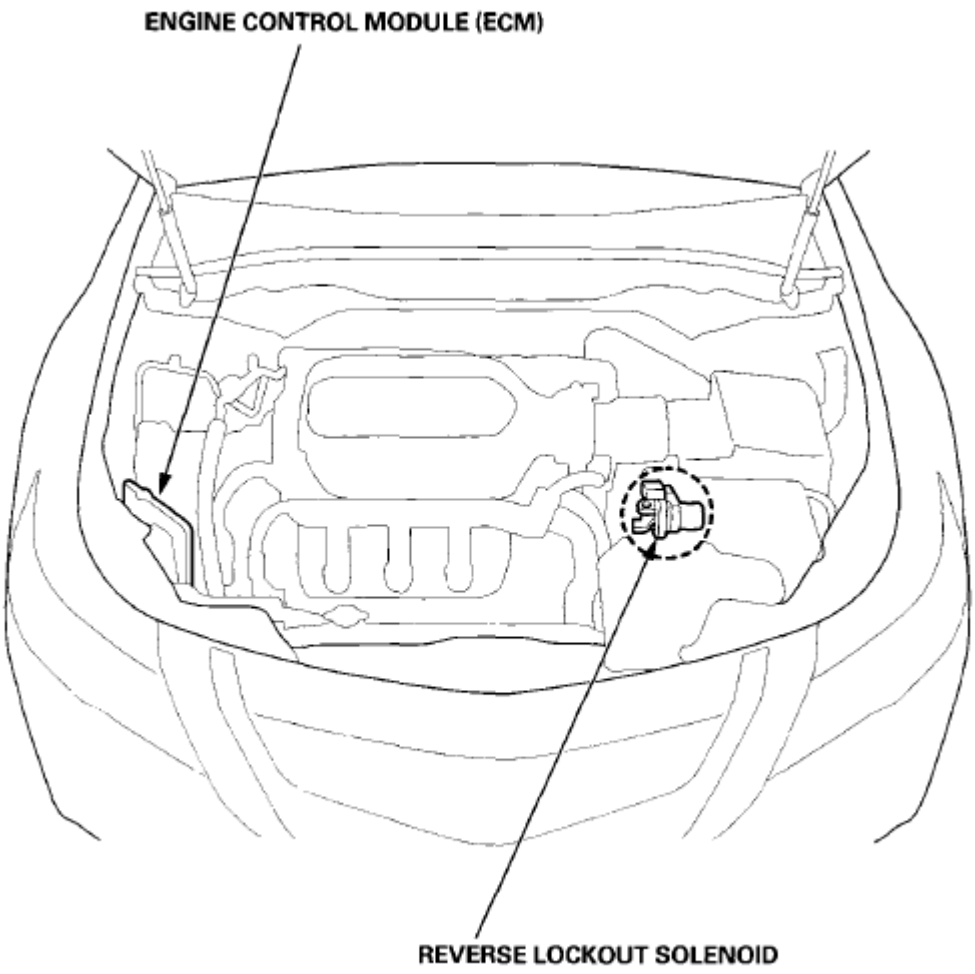

Fig. 2: ECM & Reverse Lockout Solenoid Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYSTEM DESCRIPTION

At vehicle speeds of 12 mph (20 km/h) or more, the ECM, which monitors the signals from the output shaft (countershaft) speed sensor, activates the reverse lockout solenoid, which pushes the select lock cam and the select lock pin into the locked position. As a result, the interlock cannot rotate to the reverse select position, making it impossible to engage reverse gear. As the vehicle speed drops to of 9 mph (15 km/h) or less, the ECM turns off the reverse lockout solenoid. The select lock pin spring pulls back the select lock pin, enabling the interlock to move freely so reverse gear can be selected.

Vehicle speed	Inhibitor	Reverse selection
Above 12 mph (20 km/h)	ON	Not allowed
Below 9 mph (15 km/h)	OFF	OK

Vehicle in OFF mode	OFF	OK

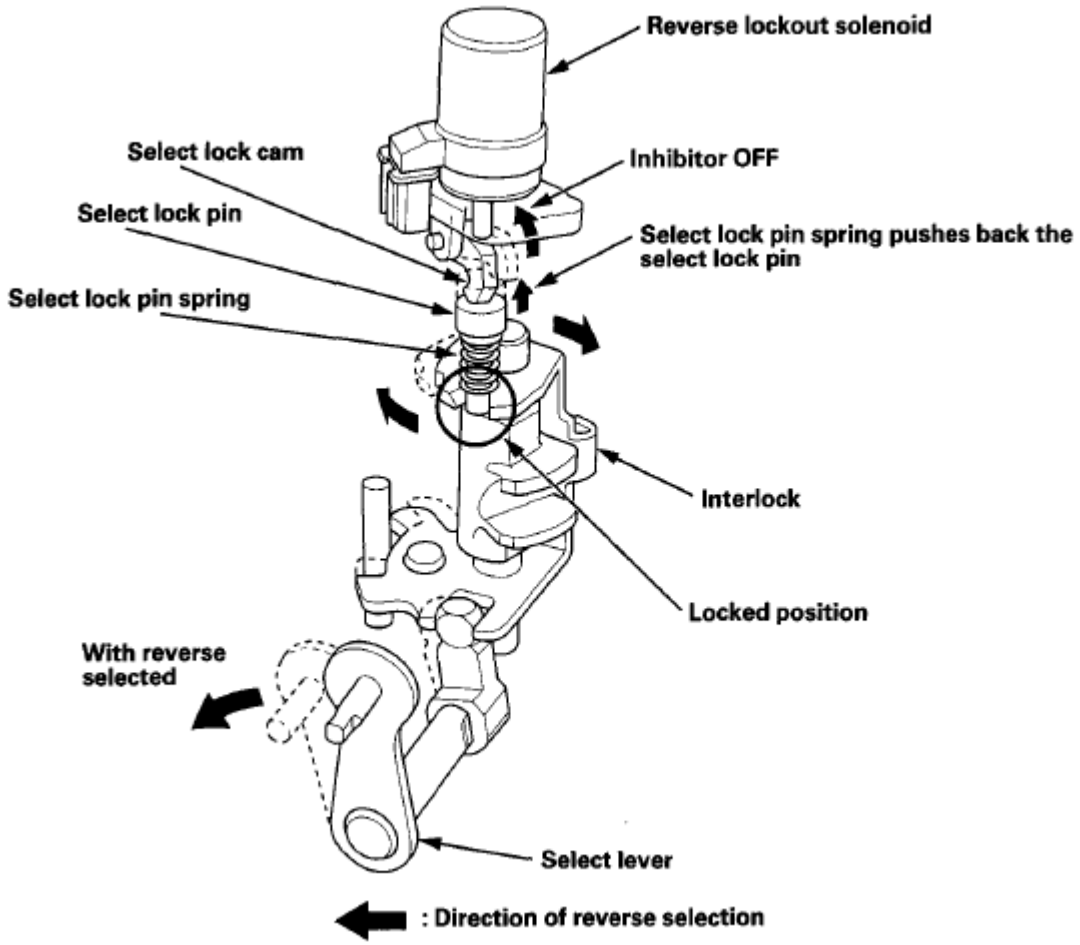

Fig. 3: Identifying Reverse Lockout System Components

SYMPTOM TROUBLESHOOTING

DRIVER CAN SELECT REVERSE GEAR WHEN VEHICLE SPEED IS 12 MPH (20 KM/H) OR

MORE

NOTE:

- **When checking if the transmission will shift to reverse while the wheels are being driven forward, raise the vehicle on a lift, make sure it is securely supported, and allow the front wheels to rotate freely.**
- **Do not release the clutch pedal if you can select reverse gear while the wheels are driven forward.**
- **When the vehicle is on a lift, and you make the wheels rotate, turn off the VSA system by the VSA OFF switch.**
- **Refer to How to Troubleshoot Circuits at the ECM Connectors in the Fuel and Emissions Systems Information before troubleshooting this circuit (see HOW TO TROUBLESHOOT CIRCUITS AT THE ECM/PCM CONNECTORS).**

1. Press the engine start/stop button to select the OFF mode.
2. Check the No. 13 (15 A) fuse in the driver's under-dash fuse/relay box.

   Is the fuse OK?

   YES - Reinstall the fuse, then go to step 3.

   NO - Install a new No. 13(15 A) fuse, and recheck. If the fuse continues to blow, check for short to body ground in the wire between the No. 13 (15 A) fuse in the driver's under-dash fuse/relay box and the reverse lockout solenoid.

3. Test-drive the vehicle.
4. Check for fuel and emissions system's DTCs with the HDS.

   Are there any DTCs stored in the ECM?

   YES - Go to the indicated ECM DTC's troubleshooting.

   NO - Go to step 5.

5. Press the engine start/stop button to select the OFF mode.
6. Disconnect the reverse lockout solenoid 2P connector.
7. Press the engine start/stop button to select the ON mode.
8. Measure the voltage between reverse lockout solenoid 2P connector terminal No. 2 and body ground.

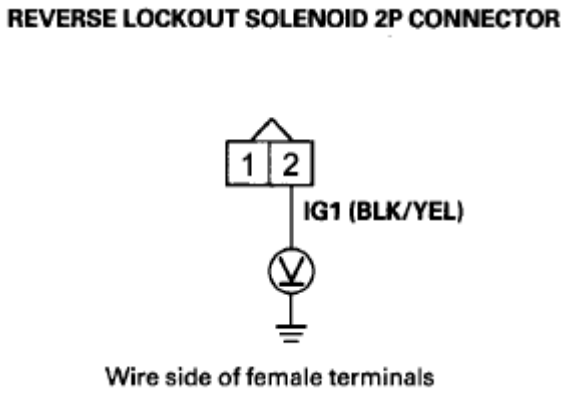

Fig. 5: Measuring Voltage Between Reverse Lockout Solenoid 2P Connector Terminal No. 2 And Body Ground
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there battery voltage?

YES - Go to step 9.

NO - Repair an open in the wire between the reverse lockout solenoid and the No. 13 (15 A) fuse in the driver's under-dash fuse/relay box.

9. Press the engine start/stop button to select the OFF mode.
10. Jump the SCS line with the HDS.
11. Disconnect ECM connector A (49P).
12. Check for continuity between reverse lockout solenoid 2P connector terminal No. 1 and ECM connector A (49P) terminal No. 2.

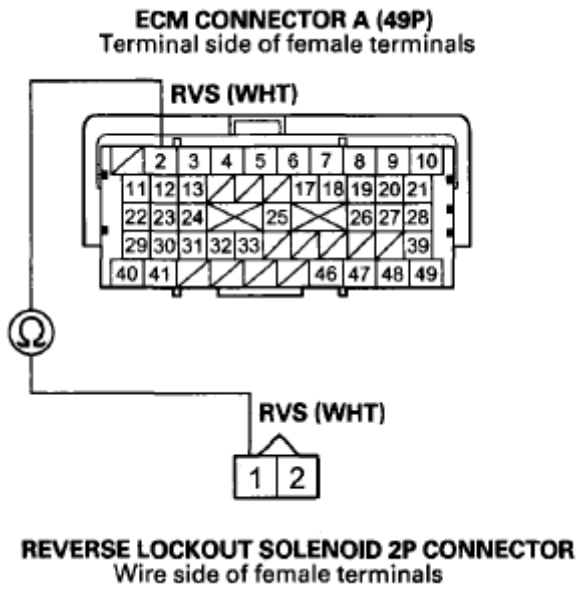

Fig. 6: Checking Continuity Between Reverse Lockout Solenoid 2P Connector Terminal No. 1 And

ECM Connector (49P) Terminal No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Go to step 13.

NO - Repair an open in the wire between the reverse lockout solenoid and the ECM.

13. Do the reverse lockout solenoid test (see **REVERSE LOCKOUT SOLENOID TEST**).

Is the reverse lockout solenoid OK?

YES - Check for loose terminals or poor connections at the ECM. If necessary, update the ECM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom goes away with a known-good ECM, replace the original ECM (see **ECM/PCM REPLACEMENT**).

NO - Repair or replace the reverse lockout solenoid (see **REVERSE LOCKOUT SOLENOID DISASSEMBLY/REASSEMBLY**).

DRIVER CANNOT SELECT REVERSE GEAR WHEN VEHICLE SPEED IS 9 MPH (15 KM/H) OR LESS

NOTE:

- **When checking if the transmission will shift to reverse while the wheels are being driven forward, raise the vehicle on a lift, make sure it is securely supported, and allow the front wheels to rotate freely.**
- **Do not release the clutch pedal if you can select reverse gear while the wheels are driven forward.**
- **When the vehicle is on a lift, and you make the wheels rotate, turn off the VSA system by the VSA OFF switch.**
- **Refer to How to Troubleshoot Circuits at the ECM Connectors in the Fuel and Emissions Systems Information before troubleshooting this circuit (see HOW TO TROUBLESHOOT CIRCUITS AT THE ECM/PCM CONNECTORS).**

1. Press the engine start/stop button to select the OFF mode.
2. Try to shift the transmission into reverse.

Can you shift the transmission into the reverse?

YES - Go to step 4.

NO - Go to step 3.

3. Do the reverse lockout solenoid test (see **REVERSE LOCKOUT SOLENOID TEST**).

Is the reverse lockout solenoid OK?

YES - Check the reverse idler gear shaft assembly (see **REVERSE IDLER GEAR SHAFT ASSEMBLY DISASSEMBLY/REASSEMBLY**), or inspect the internal transmission.

NO - Repair or replace the reverse lockout solenoid (see **REVERSE LOCKOUT SOLENOID DISASSEMBLY/REASSEMBLY**).

4. Start the engine.

   Can you shift the transmission into the reverse?

   YES - Intermittent failure, the system is OK at this time.

   NO - Go to step 5.

5. Press the engine start/stop button to select the OFF mode.
6. Jump the SCS line with the HDS.
7. Disconnect ECM connector A (49P).
8. Disconnect the reverse lockout solenoid 2P connector.
9. Check for continuity between body ground and reverse lockout solenoid 2P connector terminal No. 1.

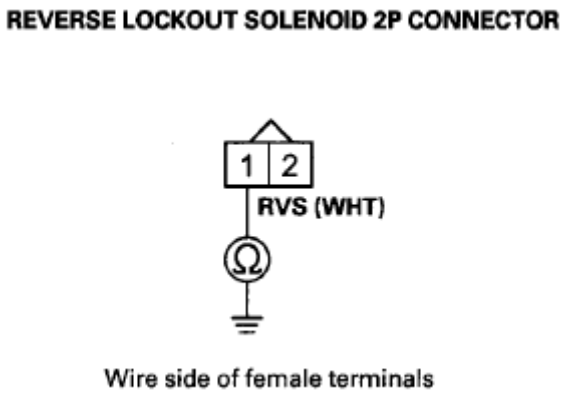

Fig. 7: Checking Continuity Between Body Ground And Reverse Lockout Solenoid 2P Connector Terminal No. 1
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Is there continuity?

YES - Repair a short to body ground in the wire between the reverse lockout solenoid and the ECM.

NO - Check for loose terminals or poor connections at the ECM. If necessary, update the ECM if it does not have the latest software (see **ECM/PCM UPDATE**), or substitute a known-good ECM (see **SUBSTITUTING THE ECM/PCM**), then recheck. If the symptom goes away with a known-good ECM, replace the original ECM (see **ECM/PCM REPLACEMENT**).

REVERSE LOCKOUT SOLENOID TEST

1. Remove the reverse lockout solenoid (see **REVERSE LOCKOUT SOLENOID DISASSEMBLY/REASSEMBLY**).
2. Connect jumper wires from the battery positive terminal to reverse lockout solenoid 2P connector terminal No. 2, and from the battery negative terminal to reverse lockout solenoid 2P connector terminal No. 1.

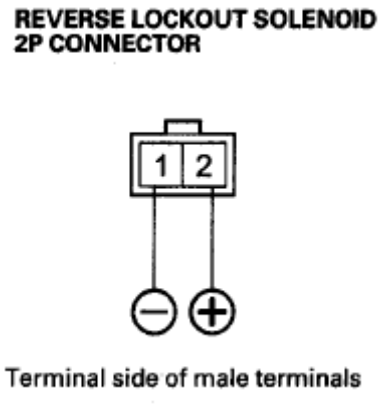

Fig. 8: Identifying Reverse Lockout Solenoid 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Make sure the reverse lockout solenoid works. If the reverse lockout solenoid does not work, replace it.

NOTE: The inhibitor should be pushed out when applying battery voltage to the solenoid, and the inhibitor should be released when there is no battery voltage at the solenoid.

REVERSE LOCKOUT SOLENOID DISASSEMBLY/REASSEMBLY

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
2. Remove the air cleaner assembly (see **THROTTLE BODY CLEANING**).
3. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
4. Support the under engine/transmission with a floor jack.

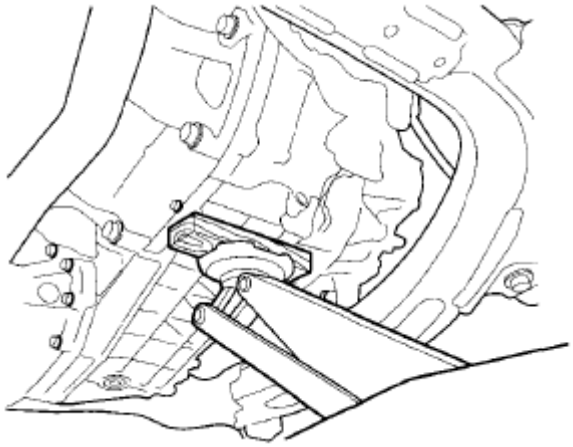

Fig. 9: Supporting Under Engine/Transmission Using Floor Jack
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Remove the upper transmission mount bracket bolts (A).

NOTE: Do not remove the bolt (B) from the upper transmission mount. If the bolt is removed, the upper transmission mount must be replaced as an assembly.

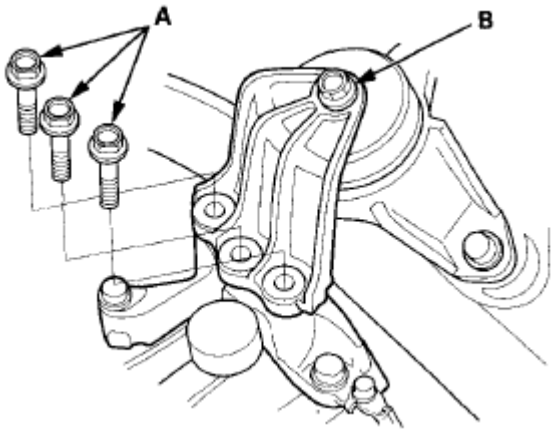

Fig. 10: Identifying Upper Transmission Mount Bracket Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Disconnect the ground cable (A), then remove the upper transmission mount bracket (B).

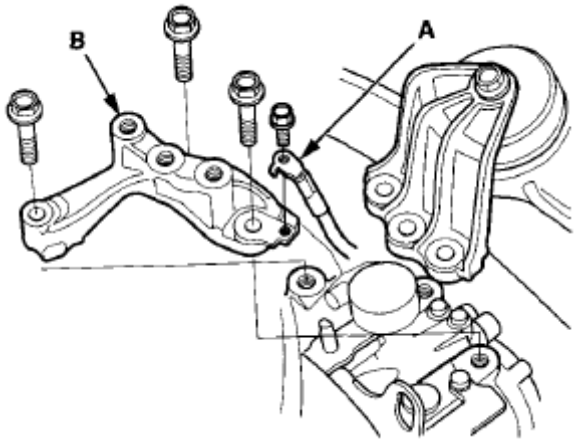

Fig. 11: Identifying Upper Transmission Mount Bracket And Ground Cable
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Disconnect the reverse lockout solenoid connector (A).

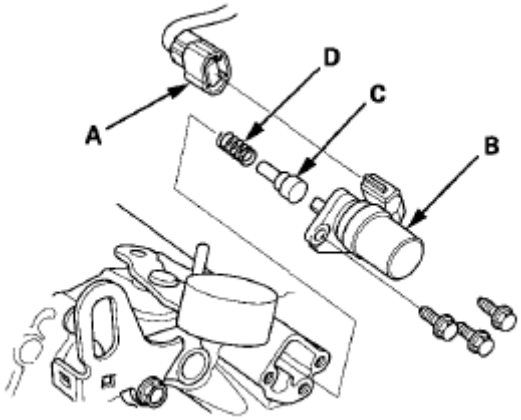

Fig. 12: Identifying Reverse Lockout Solenoid, Reverse Lockout Solenoid Connector, Lock Pin And Lock Pin Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the reverse lockout solenoid (B), the select lock pin (C), and the select lock pin spring (D).
9. Remove the pin (A) and the select lock cam (B).

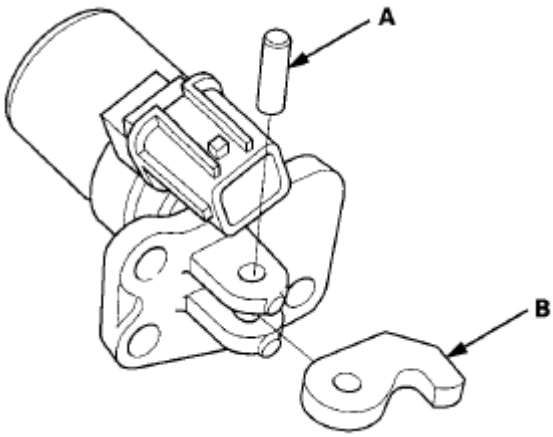

Fig. 13: Identifying Lock Cam And Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the components of the reverse lockout solenoid in the reverse order of removal.
11. Clean any dirt and oil from the sealing surface of the reverse lockout solenoid and the transmission housing.
12. Apply liquid gasket, P/N 08717-0004, 08718-0001, 08718-0003, 08718-0004, or 08718-0009 evenly to the transmission housing mating surface of the reverse lockout solenoid. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

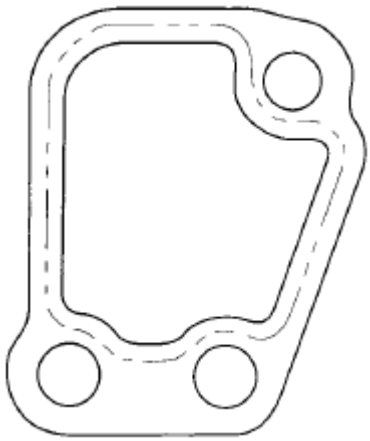

Fig. 14: Identifying Transmission Housing Mating Surface
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the select lock pin spring (A), the select lock pin (B), and the reverse lockout solenoid (C).

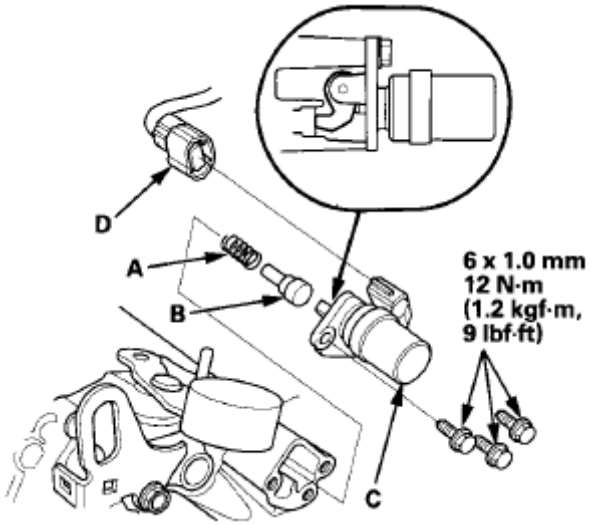

Fig. 15: Identifying Lock Pin, Lock Pin Spring, Reverse Lockout Solenoid And Reverse Lockout Solenoid Connector With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Connect the reverse lockout solenoid connector (D).
15. Install the upper transmission mount bracket (A) with new bolts, and connect the ground cable (B).

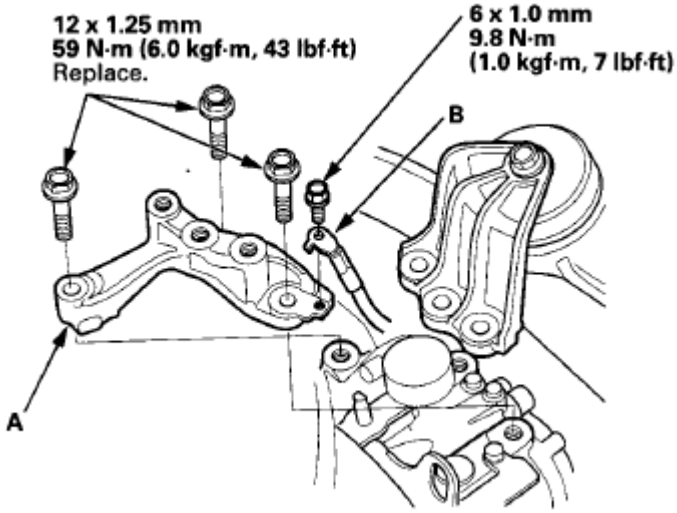

Fig. 16: Identifying Upper Transmission Mount Bracket And Ground Cable With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Connect the upper transmission mount bracket (A) and the upper transmission mount (B) with new bolts.

NOTE: If the bolt (C) was loosened by mistake during removal, the upper transmission mount must be replaced as an assembly.

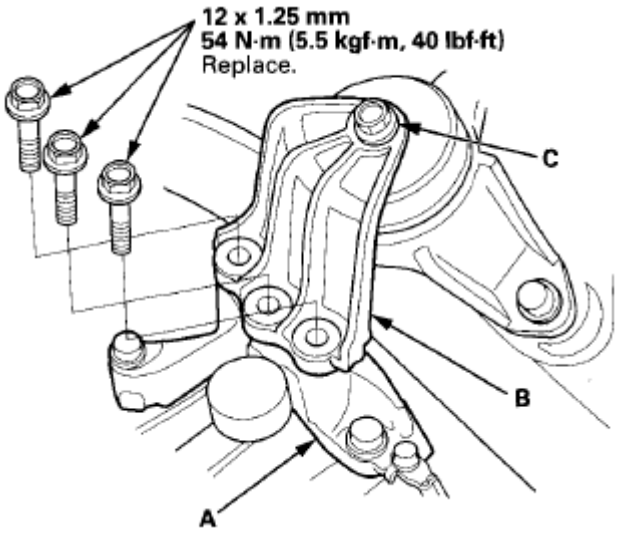

Fig. 17: Identifying Upper Transmission Mount Bracket, Upper Transmission Mount And Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the floor jack that support the engine/transmission.
18. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
19. Install the air cleaner assembly (see **THROTTLE BODY CLEANING**).
20. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

COMPONENT LOCATION INDEX

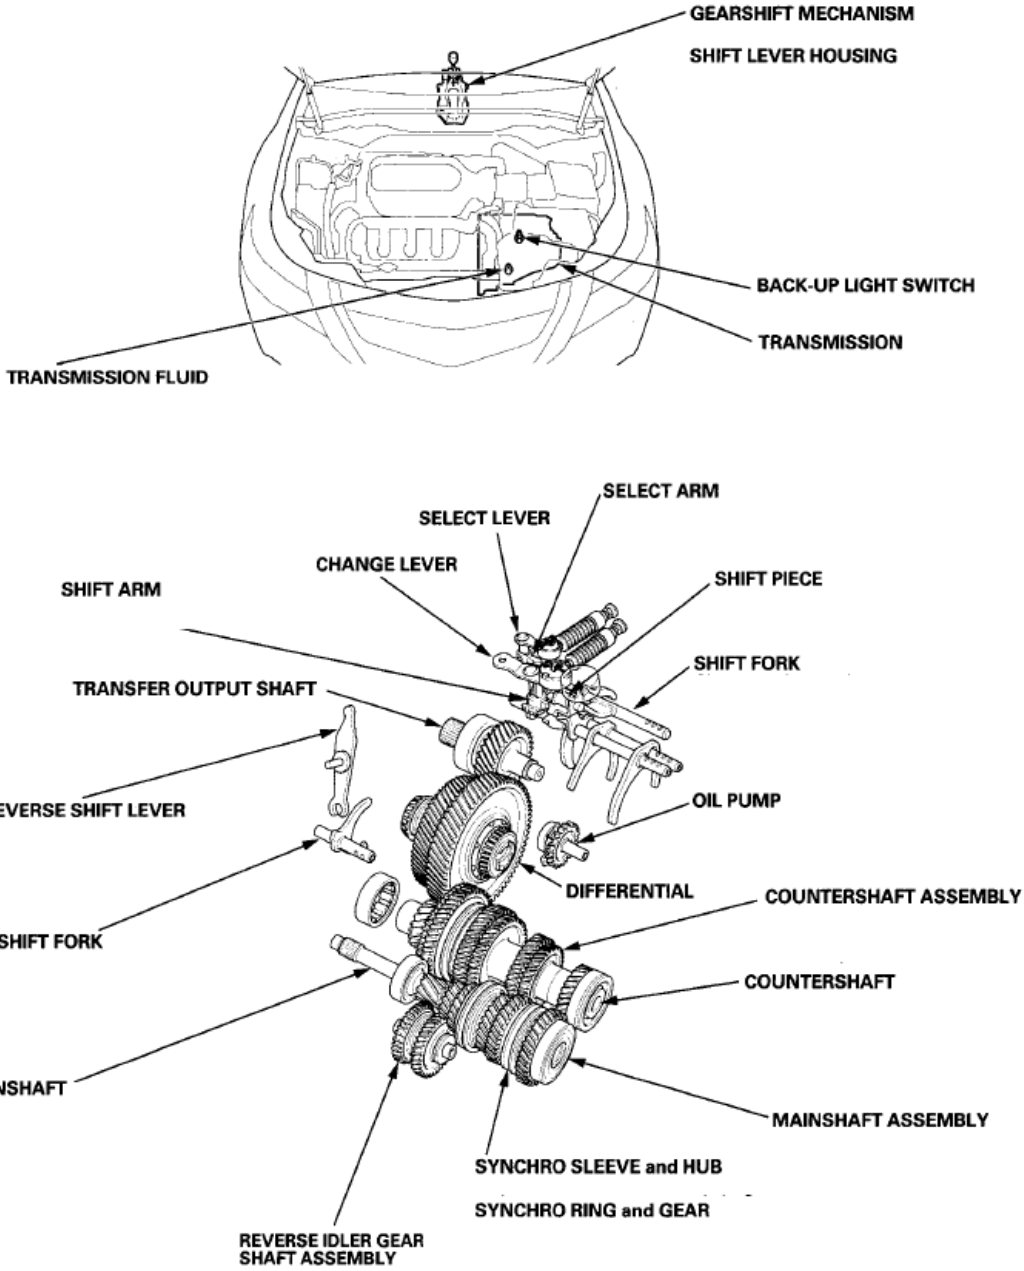

Fig. 18: Identifying Manual Transmission Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure
	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the clutch (see **CLUTCH REPLACEMENT**).

Hard to shift into 1st gear	3. Check the change lever and the select lever (see **TRANSMISSION DISASSEMBLY**). 4. Check the 1st synchro ring and 1st gear (see **SYNCHRO RING AND GEAR INSPECTION**). 5. Check the 1st/2nd synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
Hard to shift into 2nd gear	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the change lever and the select lever (see **TRANSMISSION DISASSEMBLY**). 3. Check the 2nd synchro ring and 2nd gear (see **SYNCHRO RING AND GEAR INSPECTION**). 4. Check the 1st/2nd synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
Hard to shift into 3rd gear	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the change lever and the select lever (see **TRANSMISSION DISASSEMBLY**). 3. Check the 3rd synchro ring and 3rd gear (see **SYNCHRO RING AND GEAR INSPECTION**). 4. Check the 3rd/4th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
Hard to shift into 4th gear	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the change lever and the select lever (see **TRANSMISSION DISASSEMBLY**). 3. Check the 4th synchro ring and 4th gear (see **SYNCHRO RING AND GEAR INSPECTION**). 4. Check the 3rd/4th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
Hard to shift into 5th gear	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the change lever and the select lever (see **TRANSMISSION DISASSEMBLY**). 3. Check the 5th synchro ring and 5th gear (see **SYNCHRO RING AND GEAR INSPECTION**). 4. Check the 5th/6th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND**

	REASSEMBLY).
Hard to shift into 6th gear	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the change lever and the select lever (see **TRANSMISSION DISASSEMBLY**). 3. Check the 6th synchro ring and 6th gear (see **SYNCHRO RING AND GEAR INSPECTION**). 4. Check the 5th/6th synchro sleeve and hub (see **SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY**).
Hard to shift into reverse	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the clutch (see **CLUTCH REPLACEMENT**). 3. Check the change lever and the select lever (see **TRANSMISSION DISASSEMBLY**). 4. Check the reverse shift lever (see **REVERSE SHIFT LEVER CLEARANCE INSPECTION**). 5. Check the reverse shift fork and reverse idler gear (see **SHIFT FORK CLEARANCE INSPECTION**). 6. Check reverse gears.
HDS does not communicate with the ECM or the vehicle	Troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
Driver can select reverse gear when vehicle speed is 12 mph (20 km/h) or more	Do the symptom troubleshooting (see **SYMPTOM TROUBLESHOOTING**).
Driver cannot select reverse gear when vehicle speed is 9 mph (15 km/h) or less	Do the symptom troubleshooting (see **DRIVER CANNOT SELECT REVERSE GEAR WHEN VEHICLE SPEED IS 9 MPH (15 KM/H) OR LESS**).
Noise from the transmission	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the MTF level (unfilled or in surplus the transmission with the MTF). 3. Check the transmission gears. 4. Check the transmission bearings. 5. Check the differential carrier, the final driven gear, and the carrier bearings.
Shift lever does not operate smoothly	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the shift cables and their joints (see **GEARSHIFT MECHANISM REPLACEMENT**). 3. Check the shift lever housing with the shift lever shaft.

	4. Check the change lever and the select lever (see **TRANSMISSION DISASSEMBLY**).
Transmission jumps out of gear	1. Check and/or replace the MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**). 2. Check the detent balls and springs for proper size and/or damage (see **EXPLODED VIEW - TRANSMISSION HOUSING**). 3. Check the teeth of the synchro rings and the gears (see **SYNCHRO RING AND GEAR INSPECTION**). 4. Check for bent, deform, or damage of the shift forks.

TRANSMISSION FLUID INSPECTION AND REPLACEMENT

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Raise the vehicle on a lift, and make sure it is securely supported.
2. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
3. Remove the fluid check bolt (A) and the sealing washer (B). Check the condition of the MTF and make sure it is at the proper level (C).

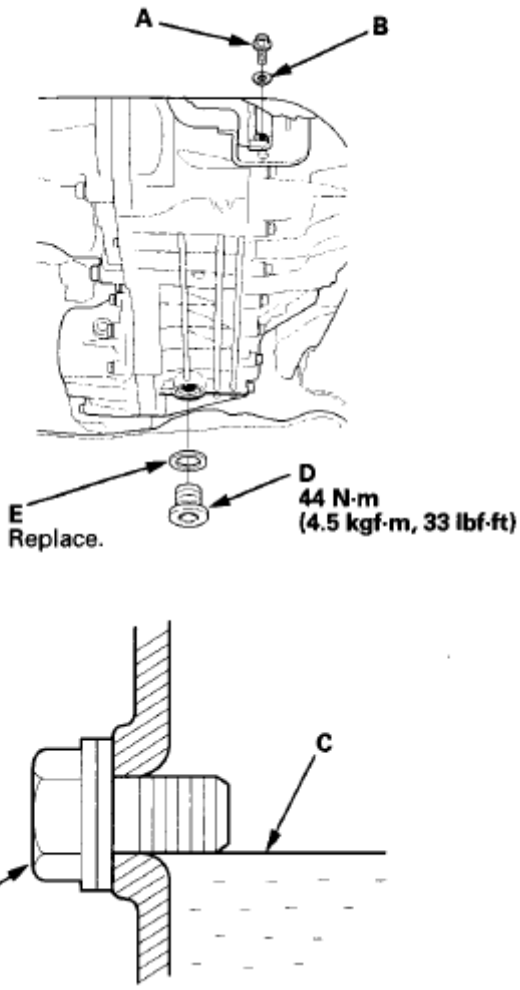

Fig. 19: Identifying Sealing Washer, Drain Plug, MTF Proper Level And Fluid Check Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If the fluid is dirty, remove the drain plug (D) and the sealing washer (E), and drain the MTF.
5. Install the drain plug with a new sealing washer.
6. Lower the vehicle.
7. Remove the filler plug (A) and the sealing washer (B).

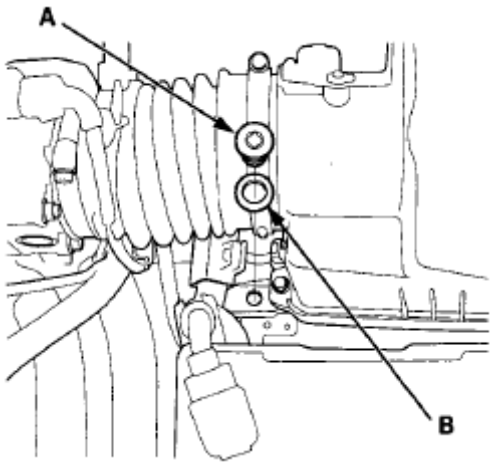

Fig. 20: Identifying Filler Plug And Sealing Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Refill the MTF from the filler plug hole on the transmission, until the MTF overflows from the fluid check bolt hole (A). Always use Acura Manual Transmission Fluid (MTF).

   Fluid Capacity:

   2.1 L (2.2 US qt) at fluid change

   2.5 L (2.6 US qt) at overhaul

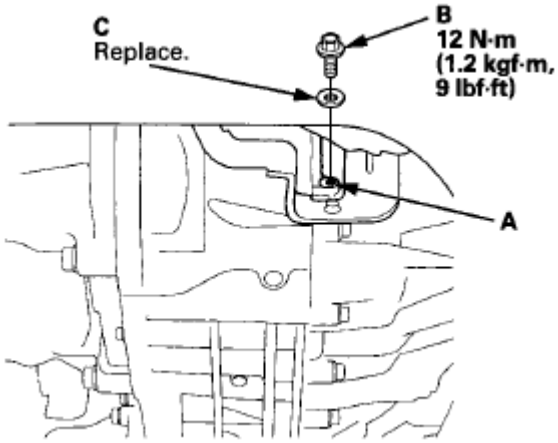

Fig. 21: Identifying Fluid Check Bolt Hole, Sealing Washer And Fluid Check Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Raise the vehicle on a lift.
10. After the fluid stops overflowing, install the fluid check bolt (B) with a new sealing washer (C).
11. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
12. Lower the vehicle.

13. Install the filler plug (A) with a new sealing washer (B).

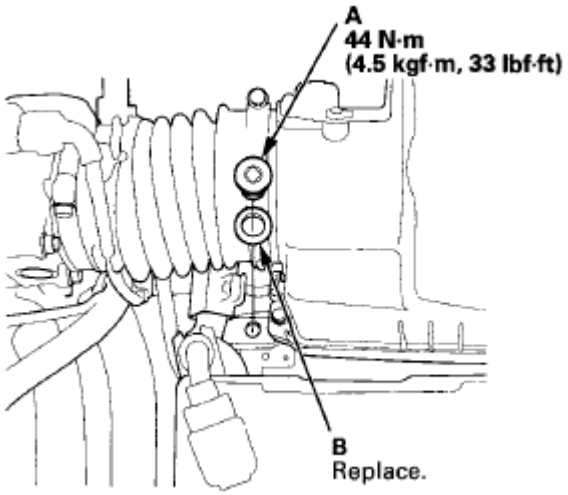

Fig. 22: Identifying Sealing Washer And Filler Plug With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC) (see **GENERAL TROUBLESHOOTING INFORMATION**).
15. Press the engine start/stop button to select the ON mode.
16. Make sure the HDS communicates with the vehicle and the engine control module (ECM). If it does not communicate, troubleshoot the DLC circuit (see **DLC CIRCUIT TROUBLESHOOTING**).
17. Select GAUGES in the BODY ELECTRICAL with the HDS.
18. Select ADJUSTMENT in the GAUGES with the HDS.
19. Select MAINTENANCE MINDER in the ADJUSTMENT with the HDS.
20. Select RESET in the MAINTENANCE MINDER with the HDS.
21. Select RESETTING THE MTF LIFE with the HDS.

BACK-UP LIGHT SWITCH TEST/REPLACEMENT

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Remove the air intake duct splash separator (A).

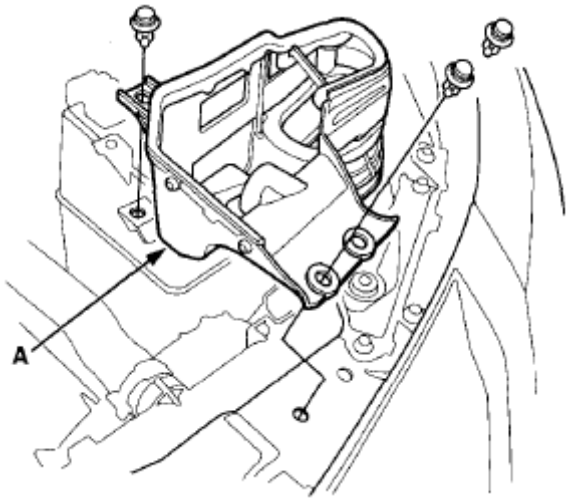

Fig. 23: Identifying Air Intake Duct Splash Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
3. Remove the harness clamps (A), then remove the battery base (B).

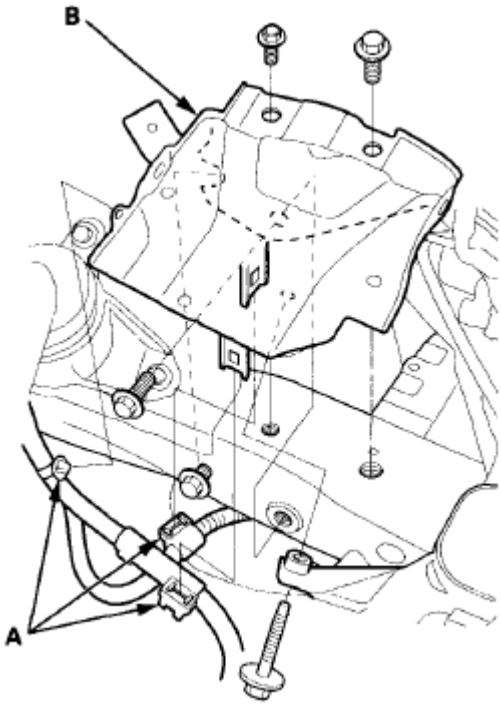

Fig. 24: Identifying Battery Base And Harness Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove transmission hanger A.

Fig. 25: Identifying Transmission Hanger
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the back-up light switch 2P connector (A).

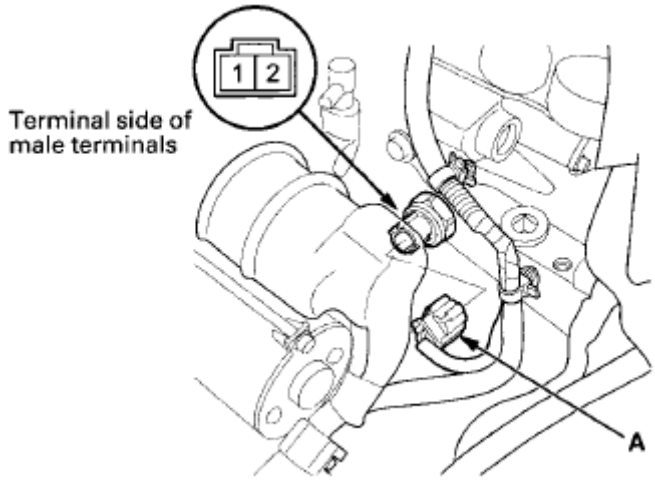

Fig. 26: Identifying Back-Up Light Switch 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Check for continuity between back-up light switch 2P connector terminals No. 1 and No. 2. There should be continuity only when the shift lever is in reverse.
   - If the test result is OK, go to step 9.
   - If the test result is not OK, go to step 7.

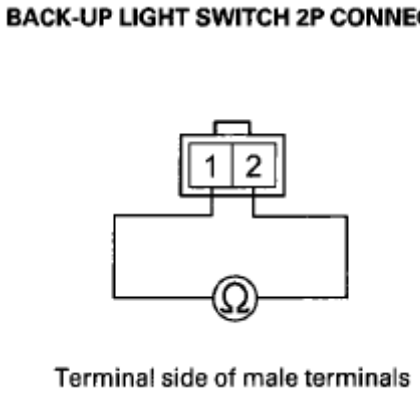

Fig. 27: Checking Continuity Between Back-Up Light Switch 2P Connector Terminals No. 1 And No. 2
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the back-up light switch (A). Check for continuity between back-up light switch 2P connector terminals No. 1 and No. 2. There should be continuity when the switch end (B) is pressed, and no continuity when the switch end is released.
   - If the test result is OK, check the reverse shift mechanism in the transmission.
   - If the test result is not OK, replace the back-up light switch.

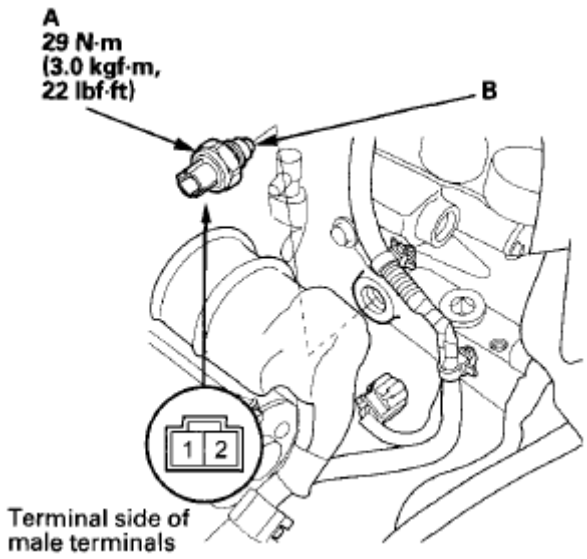

Fig. 28: Identifying Back-Up Light Switch And Switch End With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

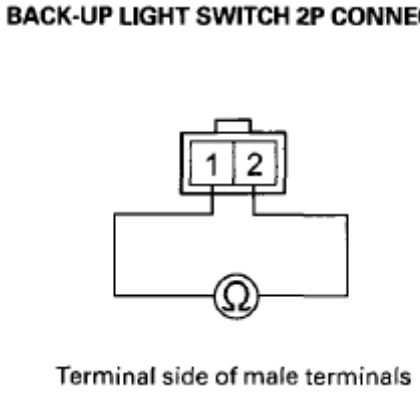

Fig. 29: Identifying Back-Up Light Switch 2P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Apply liquid gasket (P/N 08717-0004, 08718-0001, 08718-0012, 08718-0003, 08718-0004, or P/N 08718-0009) to the threads of the back-up light switch, and install it on the transmission housing.
9. Connect the back-up light switch 2P connector.
10. Install transmission hanger A.

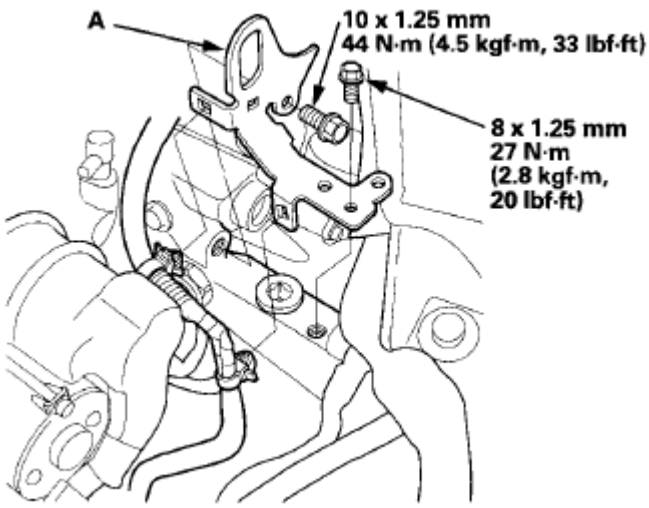

Fig. 30: Identifying Transmission Hanger With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the battery base (A) and the harness clamps (B).

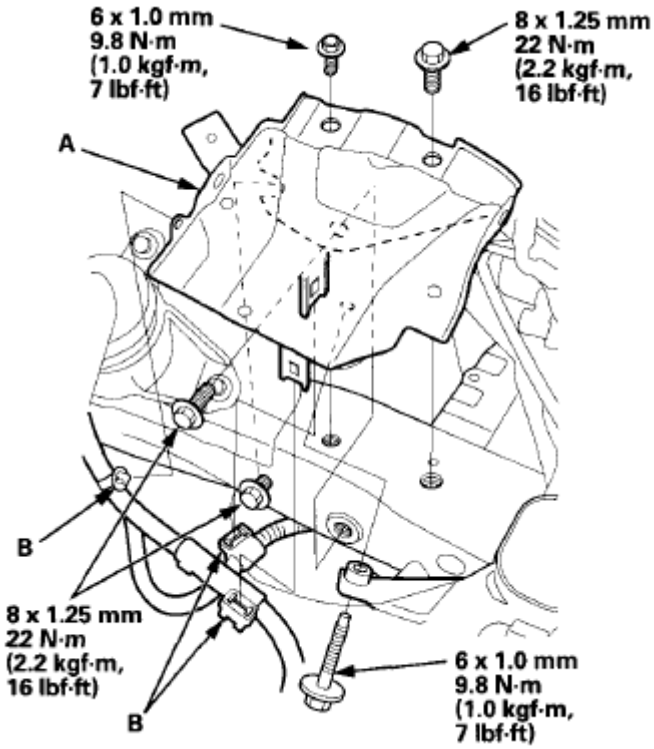

Fig. 31: Identifying Battery Base And Harness Clamps With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).
13. Install the air intake duct splash separator (A). A.

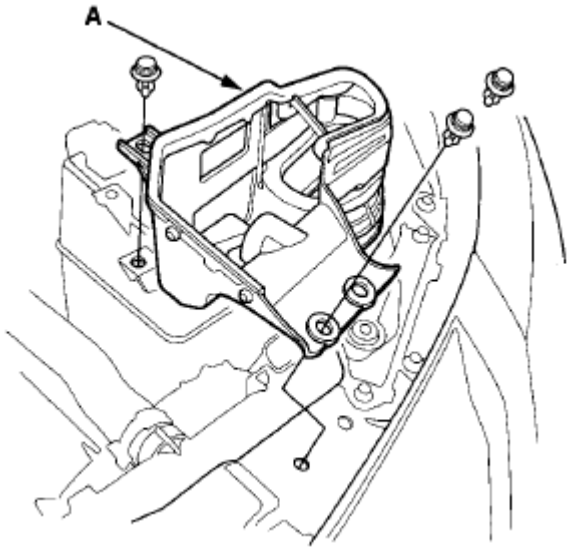

Fig. 32: Identifying Air Intake Duct Splash Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSMISSION REMOVAL

Special Tools Required

- Engine Support Hanger, A and Reds AAR-T1256*
- 2008 V6 Attachment Arm SIL02C000033*
- Subframe Adapter VSB02C000016*
- Engine Hanger Balance Bar VSB02C000019*

*: Available through the Acura Tool and Equipment Program 888-424-6857

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Remove the engine compartment cover (see **ENGINE COMPARTMENT COVER REPLACEMENT**).
2. Disconnect the support strut (A) from the pivot ball on both sides (bolted to the hood). Raise and secure the hood in a vertical position. Remove the passenger's side pivot ball and install it into the lower threaded hole, then reattach the support strut.

NOTE: Do not attempt to close the hood with the support strut in the vertical position; it will damage the support strut and the hood.

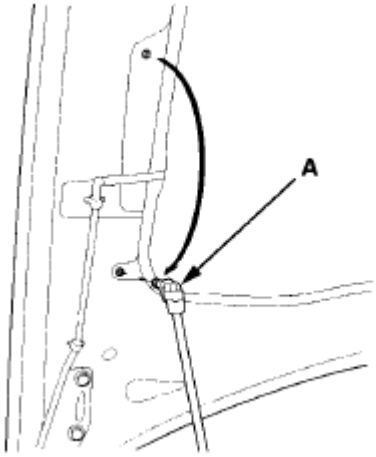

Fig. 33: Identifying Support Strut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the air intake duct splash separator (A).

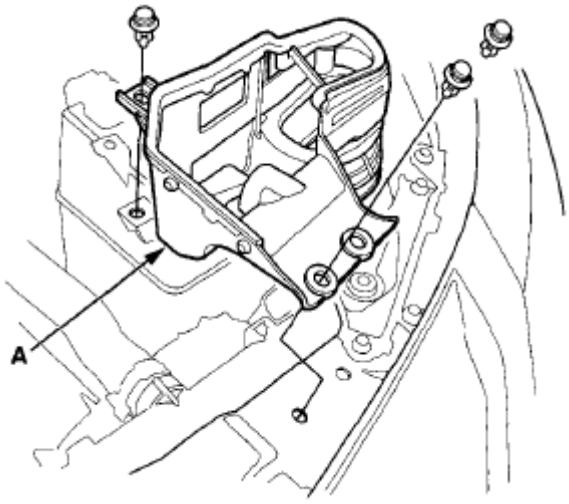

Fig. 34: Identifying Air Intake Duct Splash Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Do the battery removal procedure (see **BATTERY REMOVAL AND INSTALLATION**).
5. Remove the air cleaner assembly (see **THROTTLE BODY CLEANING**).
6. Remove the intake air duct (A).

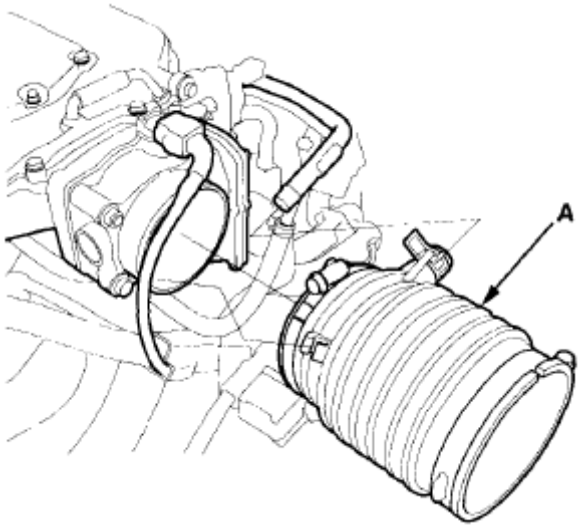

Fig. 35: Identifying Intake Air Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the harness clamps (A), then remove the battery base (B).

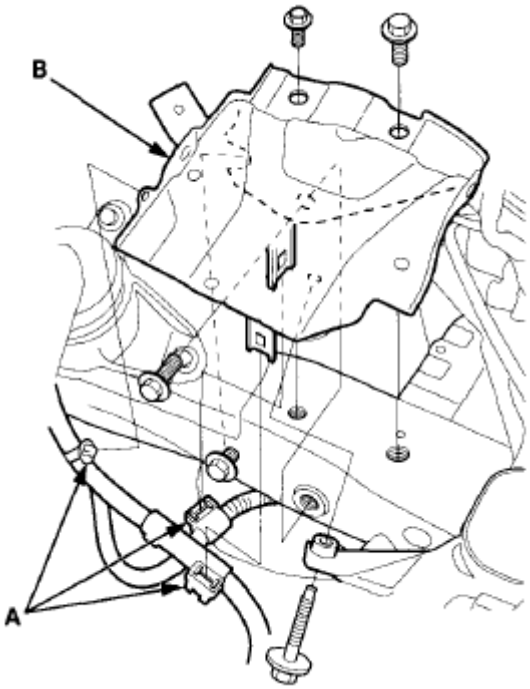

Fig. 36: Identifying Harness Clamps And Battery Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Remove the steering joint cover (A).

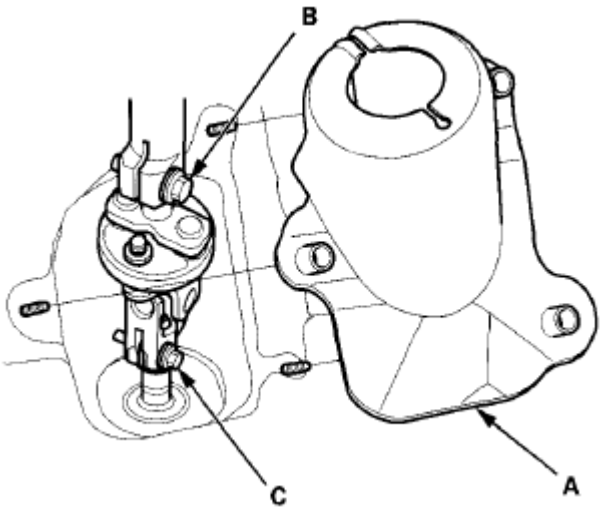

Fig. 37: Identifying Steering Joint Cover, Upper And Lower Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Loosen the upper steering joint bolt (B) and the lower steering bolt (C).
10. Center the steering wheel spokes, and install a commercially available steering wheel holder tool (A).

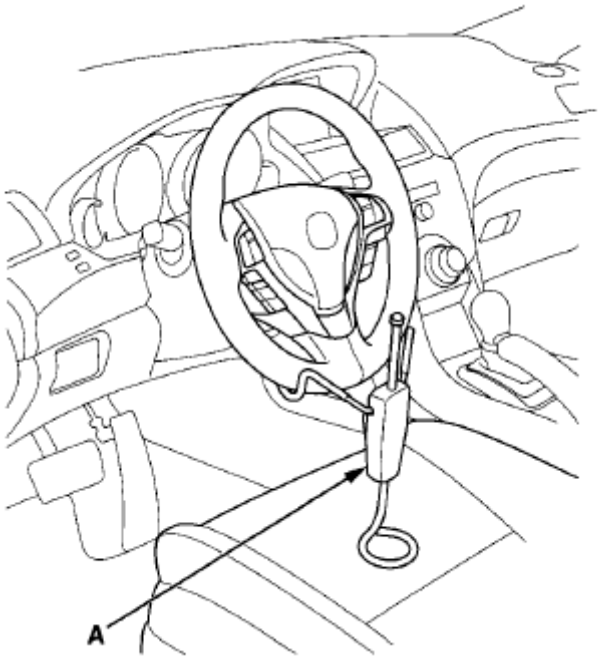

Fig. 38: Identifying Steering Wheel Holder Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the lower steering joint bolt (A). Disconnect the steering joint (B) by sliding the steering joint into the column shaft (C). Tighten the upper steering joint bolt (D) to hold the steering joint in place.

NOTE: Do not disconnect the steering joint from the column shaft.

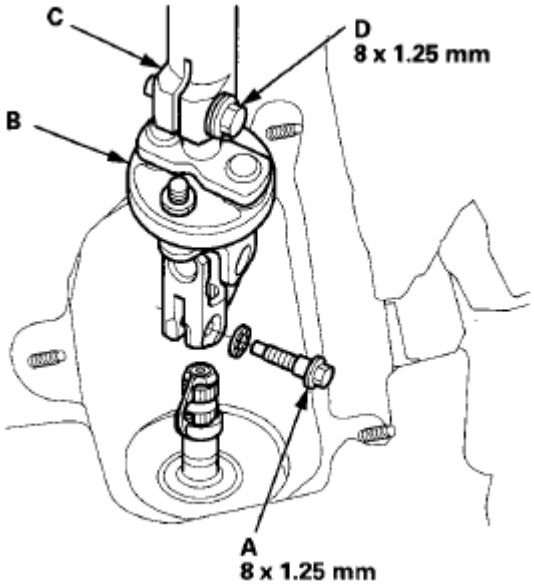

Fig. 39: Identifying Steering Joint, Column Shaft, Upper And Lower Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the center guide (A) (if equipped) from the top of the pinion shaft (B), and discard it.

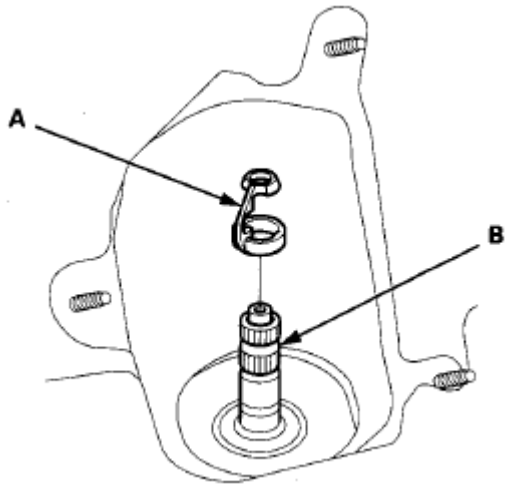

Fig. 40: Identifying Center Guide And Pinion Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Wrap vinyl tape over the splines on the pinion shaft.
14. Disconnect the EPS connectors (A), and remove the harness clamps (B).

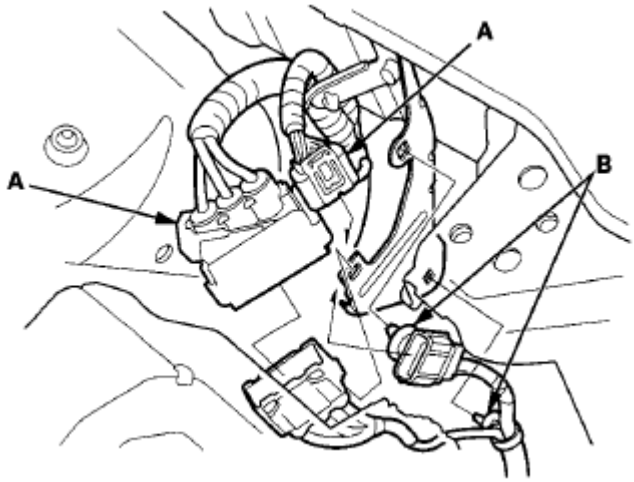

Fig. 41: Identifying EPS Connectors And Harness Clamps
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Raise the vehicle on a lift, and make sure it is securely supported.
16. Remove the front wheels.
17. Remove the strut brace (see **FRAME BRACE REPLACEMENT**).
18. Remove the harness clamp (A), disconnect the positive starter cable (B) and the S terminal connector (C).

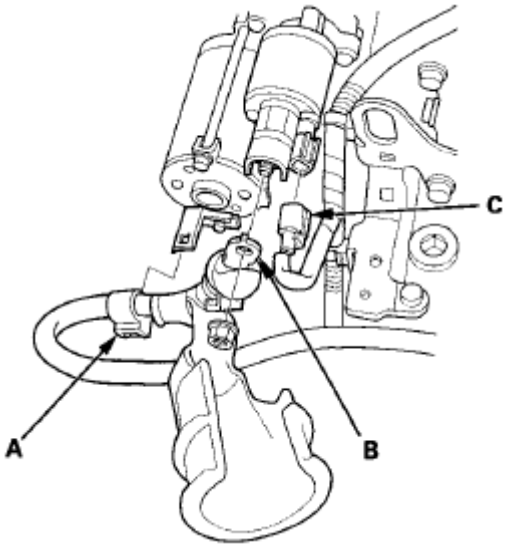

Fig. 42: Identifying S Terminal Connector, Positive Starter Cable And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Remove the starter (A) and the vacuum pipe bracket (B).

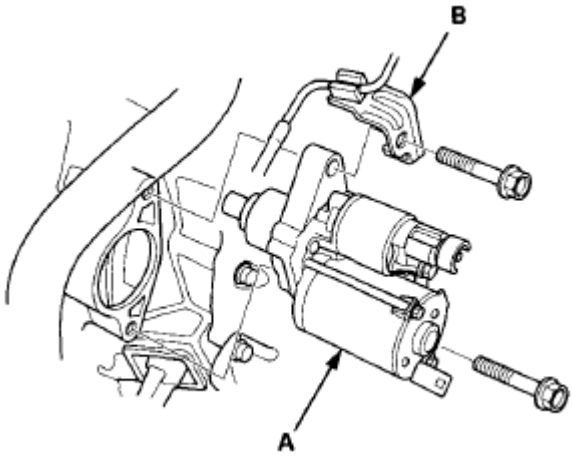

Fig. 43: Identifying Starter And Vacuum Pipe Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Disconnect the back-up light switch connector (A), the input shaft (mainshaft) speed sensor connector (B), the output shaft (countershaft) speed sensor connector (C), and the front secondary HO2S 4P connector (D), then remove the harness clamps (E).

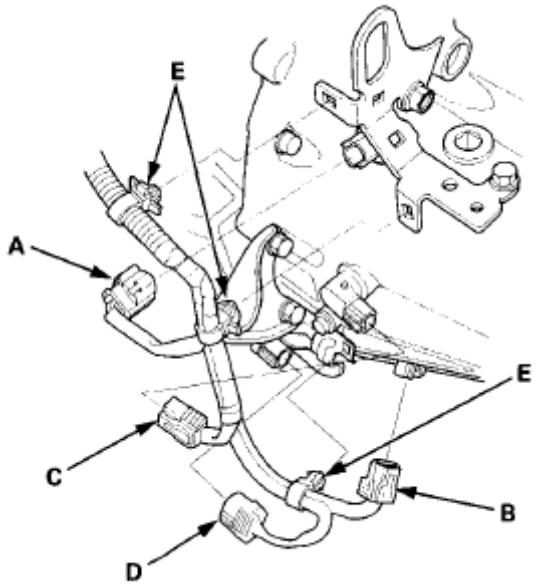

Fig. 44: Identifying Back-Up Light Switch Connector, Input And Output Shaft Speed Sensor Connector, Front Secondary HO2S 4P Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Disconnect the reverse lockout solenoid connector (A), remove the harness holder mounting bolt (B) and the harness clamps (C), then swing the harness holder (D) out of the way.

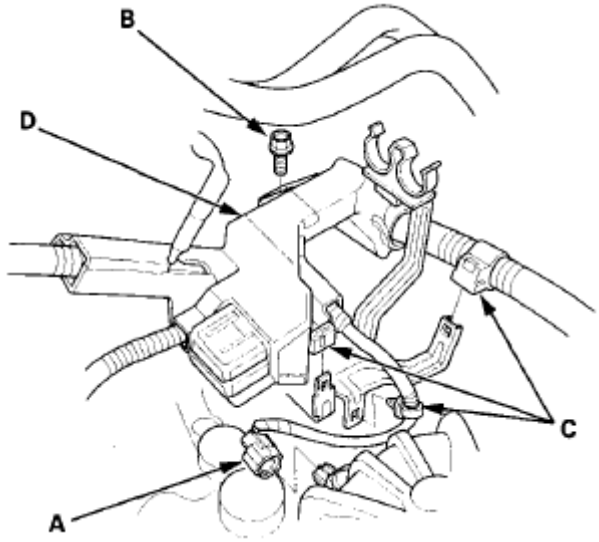

Fig. 45: Identifying Reverse Lockout Solenoid Connector, Harness Clamps, Harness Holder And Harness Holder Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Remove the harness bracket (A).

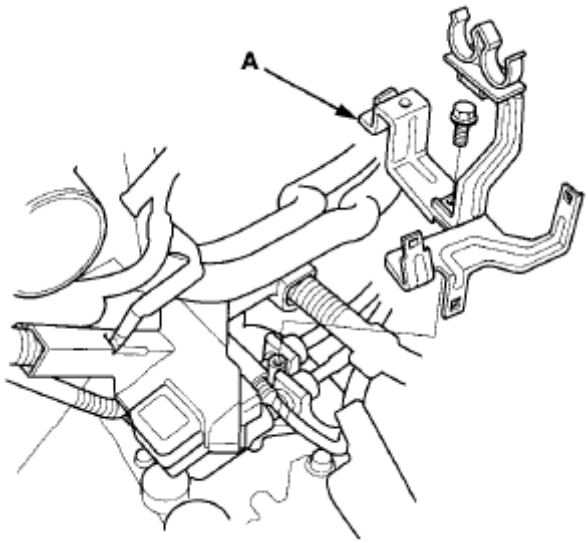

Fig. 46: Identifying Harness Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Remove the lock pins (A) and the shift cable bracket bolts (B), then carefully remove both cables (C) and the bracket (D) together out of the way to avoid bending the cables.

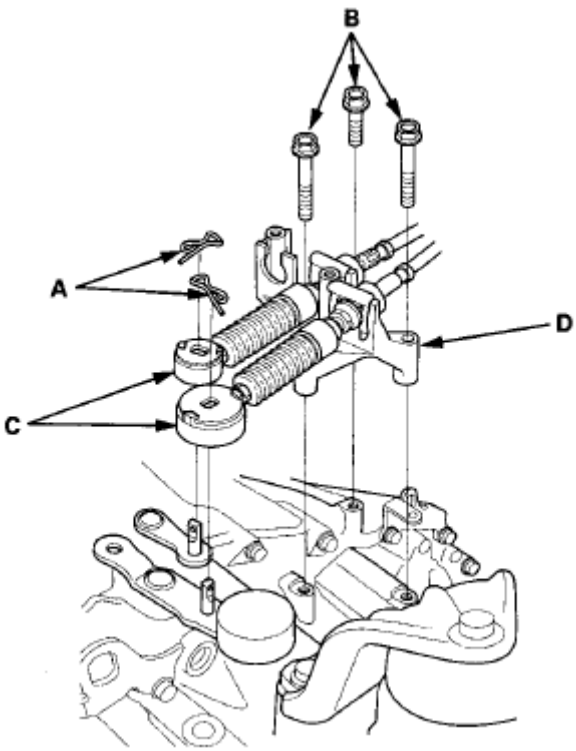

Fig. 47: Identifying Cables, Bracket, Lock Pins And Shift Cable Bracket Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Remove the slave cylinder mounting bolts (A) and the clutch line bracket mounting nut (B), then

carefully move the slave cylinder (C) out of the way to avoid bending the clutch line.

NOTE: Do not press the clutch pedal after the slave cylinder has been removed.

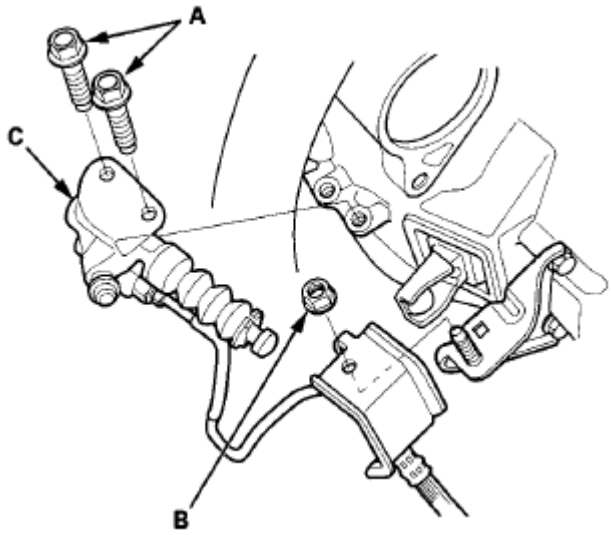

Fig. 48: Identifying Slave Cylinder, Slave Cylinder Mounting Bolts And Clutch Line Bracket Mounting Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

25. Remove the bolt (A) securing the connector bracket (B) from the front cylinder head; use the bracket bolt hole (C) to attach the engine hanger balance bar front arm.

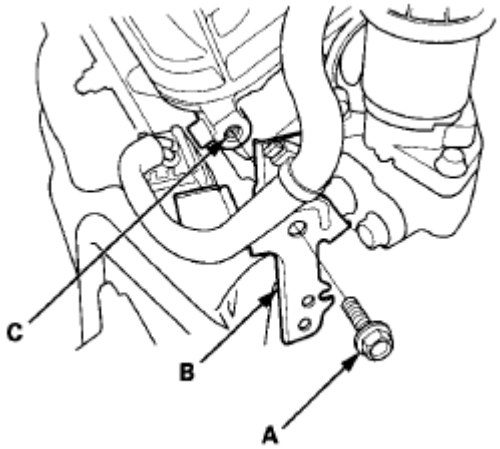

Fig. 49: Identifying Connector Bracket, Bracket Bolt Hole And Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Remove the bolt (A) securing the engine mount control solenoid valve bracket (B) from the rear cylinder head; use the bracket bolt hole (C) to attach the 2008 V6 attachment arm.

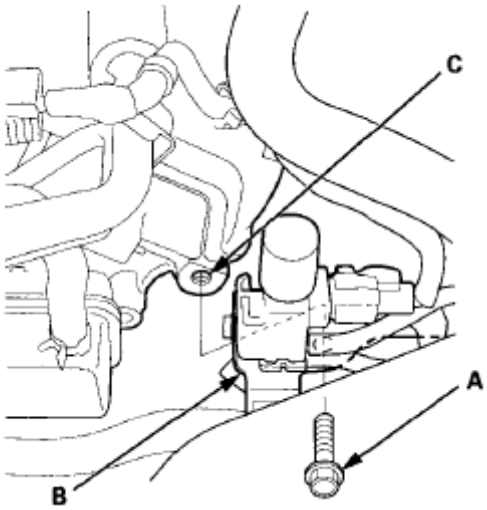

Fig. 50: Identifying Engine Mount Control Solenoid Valve Bracket, Bracket Bolt Hole And Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Lift and support the engine with the A and Reds engine support hanger (AAR-T1256) and the engine hanger balance bar (VSB02C000019). Attach the front arm (A) to the front cylinder head with a spacer (B) and a 10 x 1.25 mm bolt (C). Attach the 2008 V6 attachment arm (SIL02C000033) to the rear cylinder head with an 8 x 1.25 mm bolt (D).

NOTE:

- **Be careful when working around the windshield.**
- **Be careful not to damage the hood opener cable when installing the engine support hanger at the front bulkhead.**
- **AAR-T1256 two sets required for stacking additional cross section bar.**

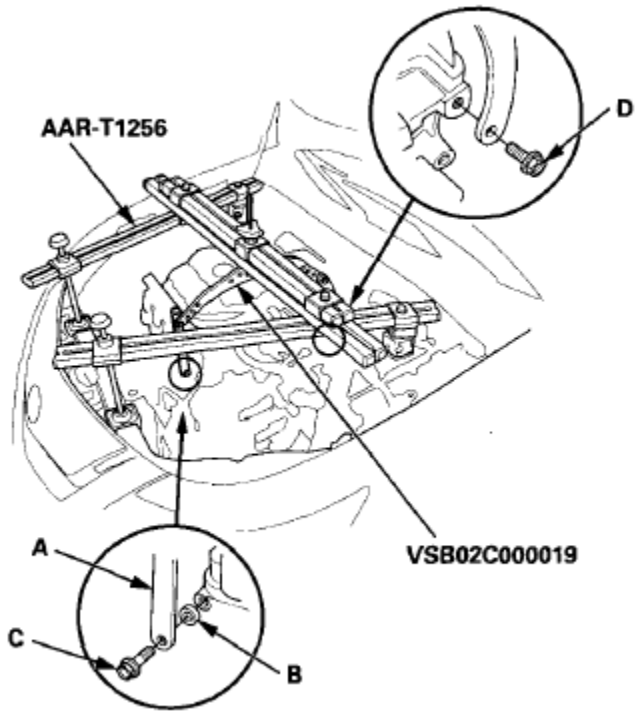

Fig. 51: Identifying Front Arm, Front Cylinder Head With A Spacer And Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Remove the front engine mount stop (A) with the vacuum pipe bracket (B), and disconnect the vacuum hose (C).

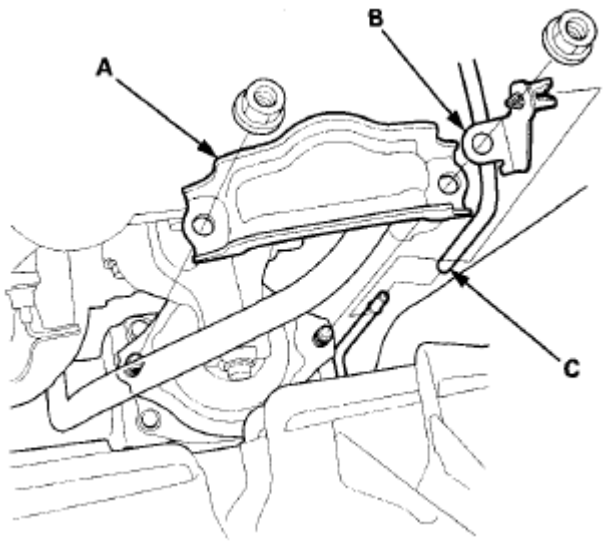

Fig. 52: Identifying Front Engine Mount Stop, Vacuum Pipe Bracket And Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Remove the front engine mount bolts (A).

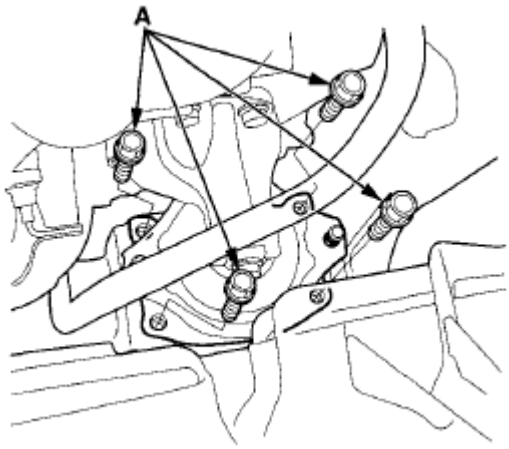

Fig. 53: Identifying Front Engine Mount Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Remove the rear engine mount bolt (A).

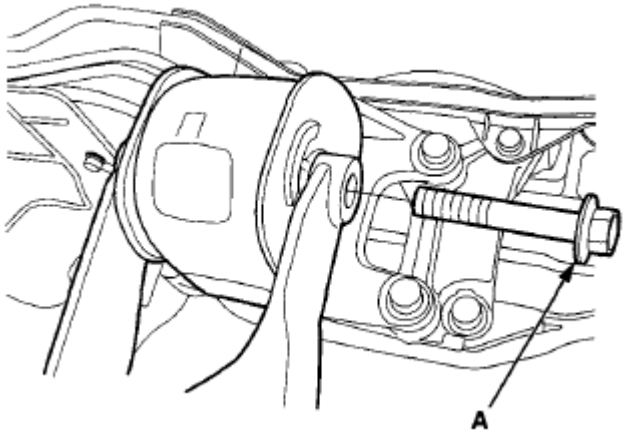

Fig. 54: Identifying Rear Engine Mount Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Remove the upper transmission mount bracket bolts (A).

NOTE: Do not remove the bolt (B) from the upper transmission mount. If the bolt is removed, the upper transmission mount must be replaced as an assembly.

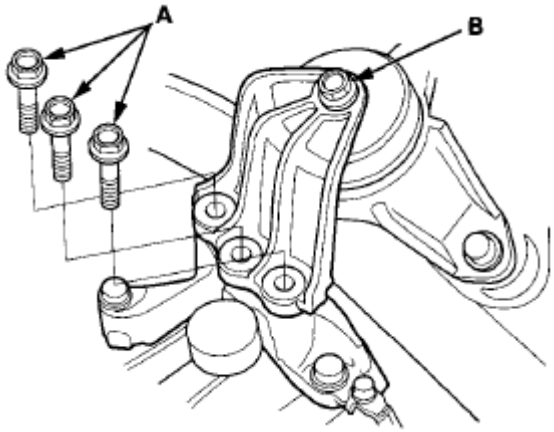

Fig. 55: Identifying Upper Transmission Mount Bracket Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

32. Disconnect the ground cable (A), then remove the upper transmission mount bracket (B).

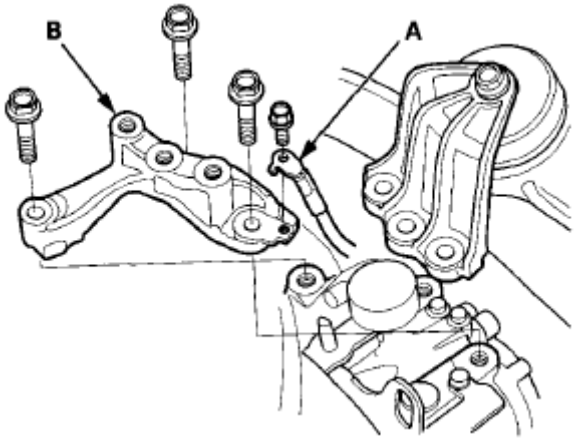

Fig. 56: Identifying Upper Transmission Mount Bracket And Ground Cable
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Remove the upper transmission mounting bolts (A).

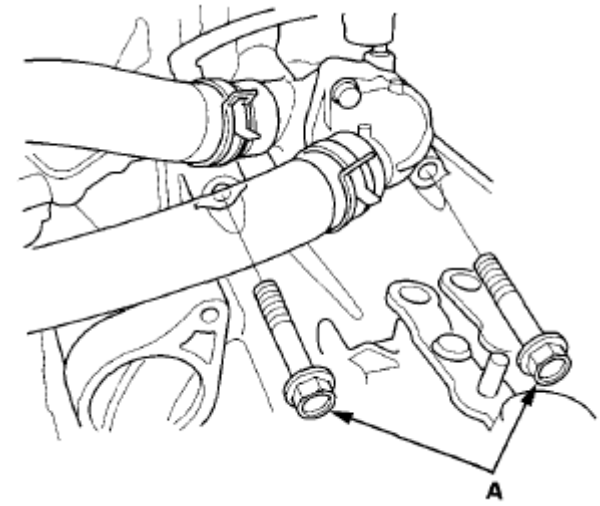

Fig. 57: Identifying Upper Transmission Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

34. Remove the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
35. Remove the drain plug (A) and drain the MTF. Reinstall the drain plug with a new sealing washer (B).

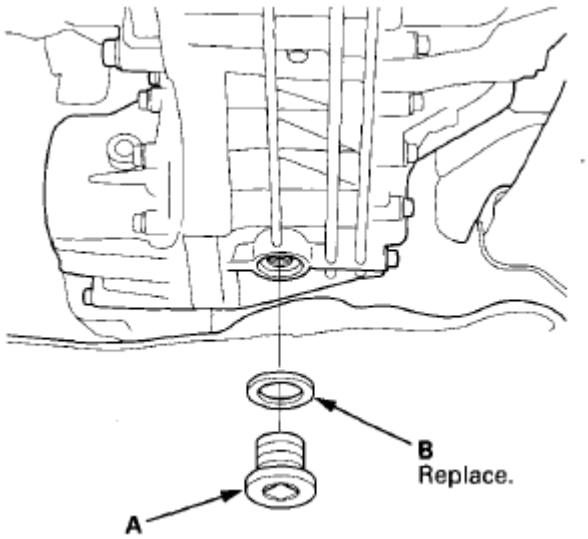

Fig. 58: Identifying Drain Plug And Sealing Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Remove exhaust pipes A and B (see **J37A4 ENGINE (WITH SH-AWD)**).
37. Remove the propeller shaft (see **PROPELLER SHAFT REMOVAL**).
38. Remove the damper fork (see **DAMPER/SPRING REMOVAL AND INSTALLATION**).
39. Remove the cotter pin from the tie-rod end ball joint, then remove the nut (see **KNUCKLE BALL JOINT INSPECTION**).
40. Disconnect the tie-rod end ball joint from the knuckle (see **KNUCKLE BALL JOINT INSPECTION**).

41. Remove the cotter pin from the knuckle ball joint, then remove the castle nut (see **KNUCKLE BALL JOINT INSPECTION**).
42. Disconnect the knuckle ball joint from the lower arm (see **KNUCKLE BALL JOINT INSPECTION**).
43. Remove the subframe middle mount (A).

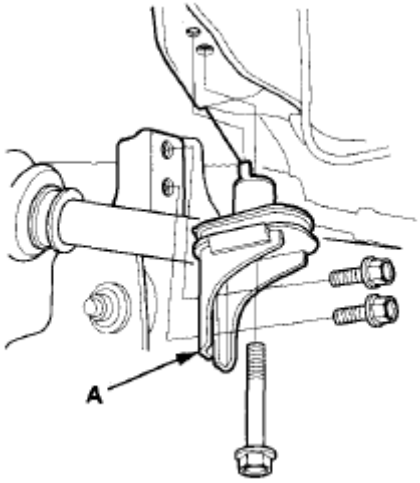

Fig. 59: Identifying Subframe Middle Mount
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Remove the lower transmission mount mounting nuts (A).

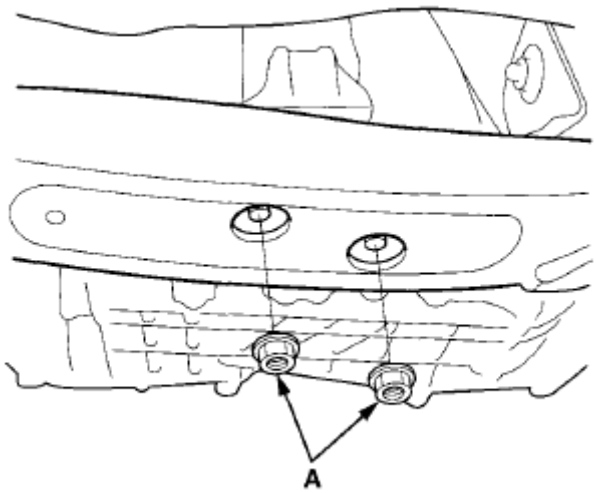

Fig. 60: Identifying Lower Transmission Mount Mounting Nuts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Disconnect the breather hose (A) from the breather pipe (B) on the transfer assembly (C).

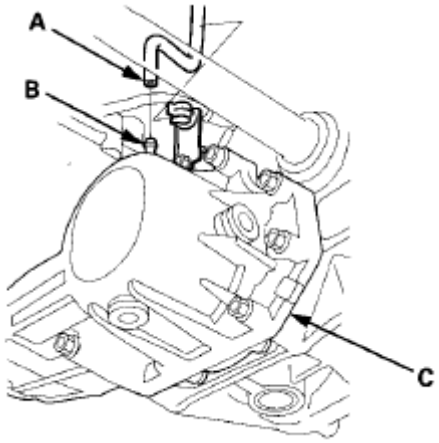

Fig. 61: Identifying Breather Hose, Breather Pipe And Transfer Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Remove the transfer assembly (A) and the dowel pin (B) from the transmission.

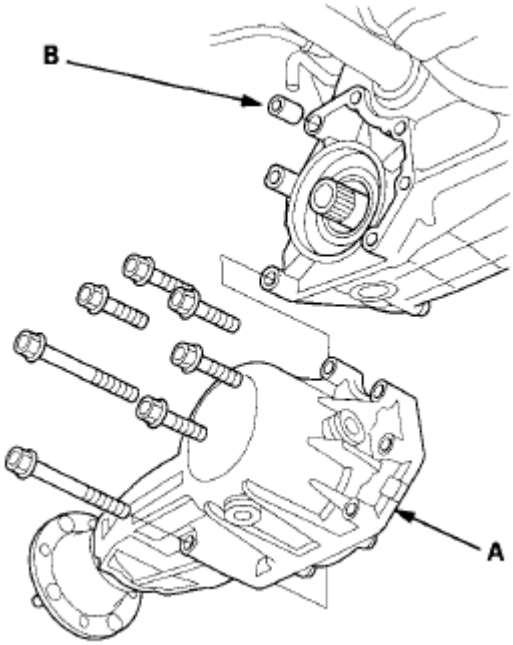

Fig. 62: Identifying Transfer Assembly And Dowel Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

47. Disconnect the vacuum hose (A) located under the front engine mount.

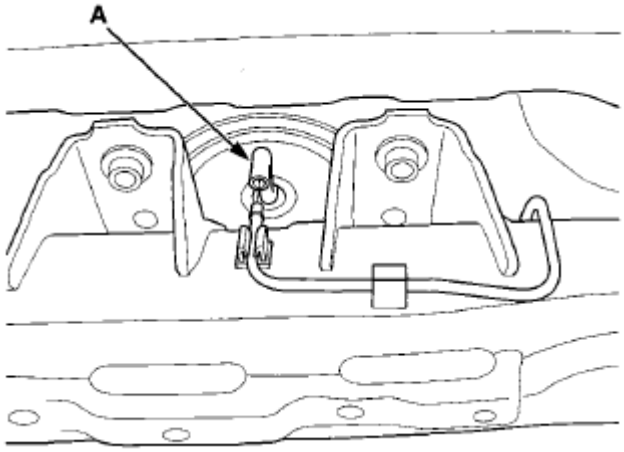

Fig. 63: Identifying Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Attach the subframe adapter (VSB02C000016) to the front subframe and hang the belt of the subframe adapter over the front of the subframe, then secure the belt with its stop.

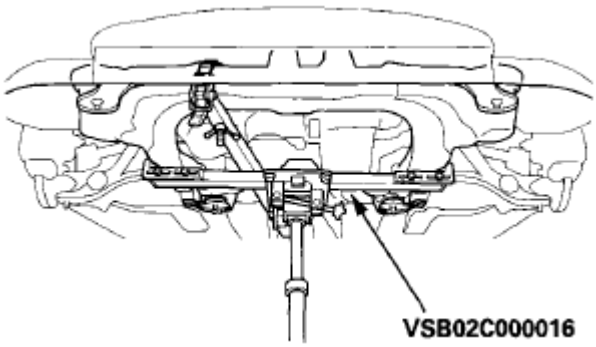

Fig. 64: Identifying Subframe Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Raise the jack and line up the slots in the subframe adapter arms with the bolt holes on the jack base, then securely attach them with four bolts.
50. Remove the front stiffener mounting bolts (A) and the front subframe mounting bolts (B), then lower and remove the front subframe (C).

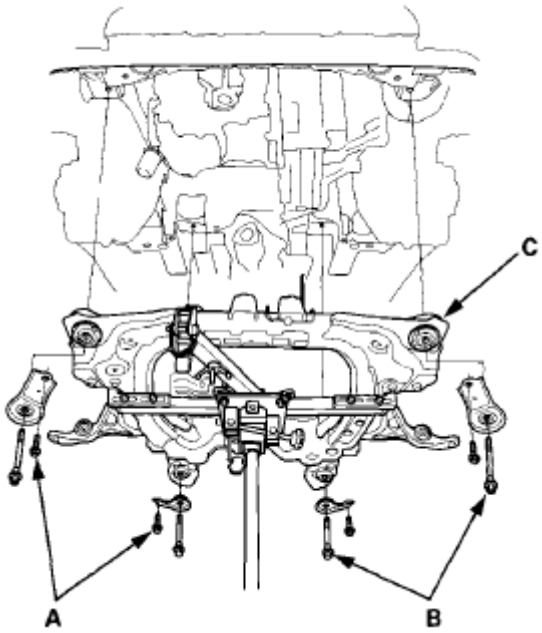

Fig. 65: Identifying Front Subframe, Front Stiffener Mounting Bolts And Front Subframe Mounting Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Support the transmission with a transmission jack.
52. Remove the front engine mount (A).

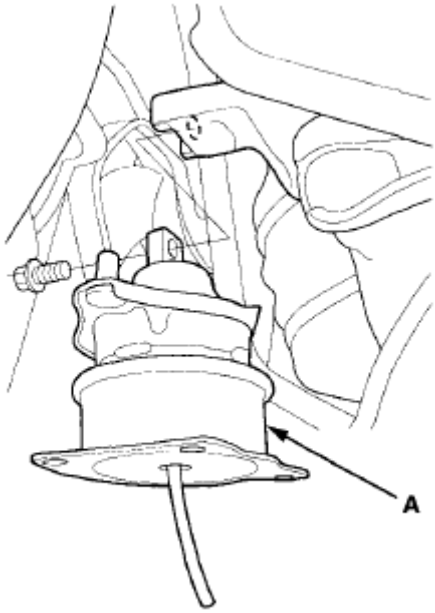

Fig. 66: Identifying Front Engine Mount
Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Remove the front engine mount bracket (A).

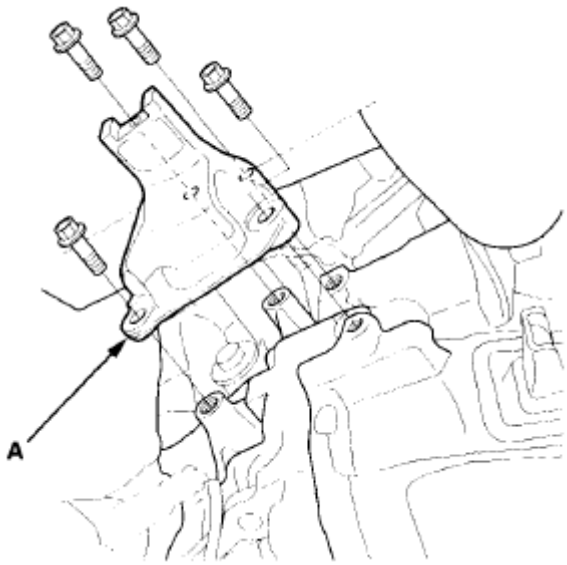

Fig. 67: Identifying Front Engine Mount Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

54. Remove the lower transmission mount (A).

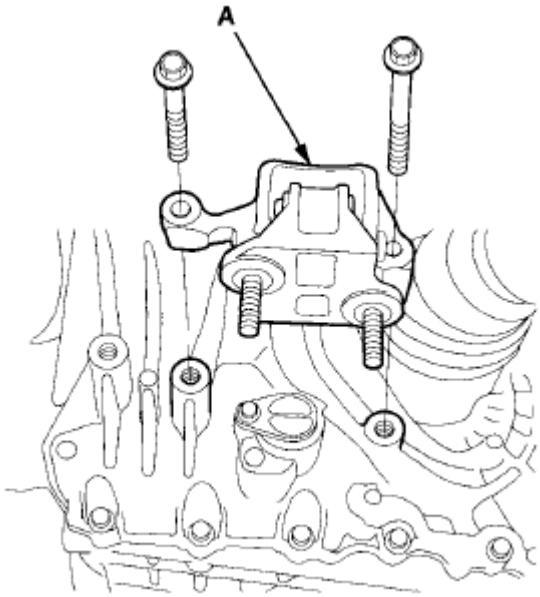

Fig. 68: Identifying Lower Transmission Mount
Courtesy of AMERICAN HONDA MOTOR CO., INC.

55. Separate the left driveshaft inboard joint from the differential (see **FRONT DRIVESHAFT REMOVAL**).
56. Separate the right driveshaft inboard joint from the intermediate shaft (see **FRONT DRIVESHAFT REMOVAL**).
57. Remove the intermediate shaft (see **INTERMEDIATE SHAFT REMOVAL**).

58. Remove the clutch cover (A).

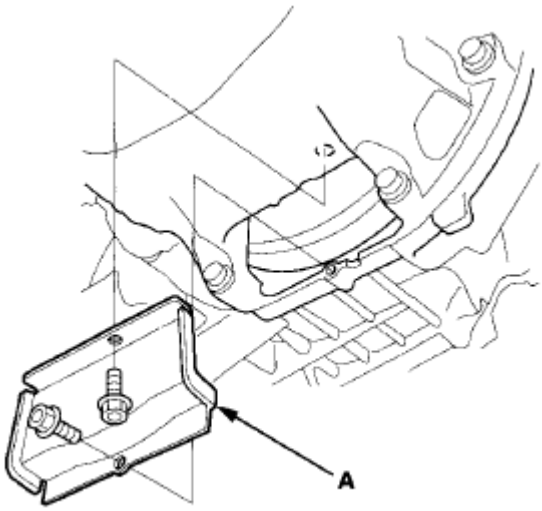

Fig. 69: Identifying Clutch Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

59. Remove the crankshaft position (CKP) sensor cover (A), and disconnect the CKP sensor connector (B).

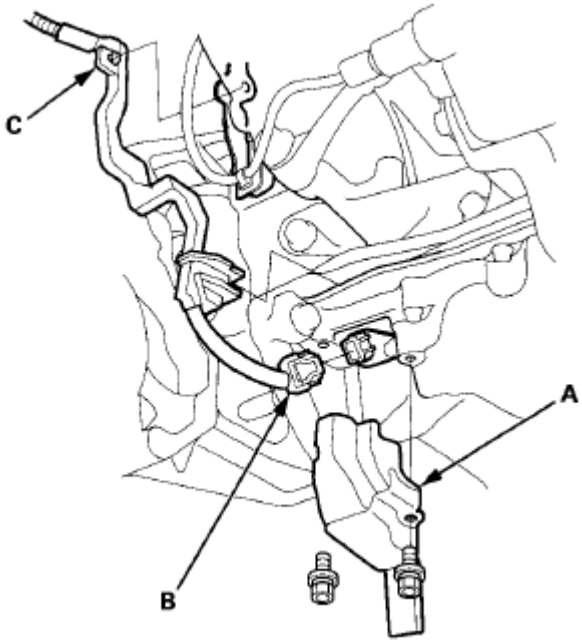

Fig. 70: Identifying Crankshaft Position (CKP) Sensor Cover, CKP Sensor Connector And Harness Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

60. Remove the harness clamp (C).

61. Remove the harness clamp bracket (A).

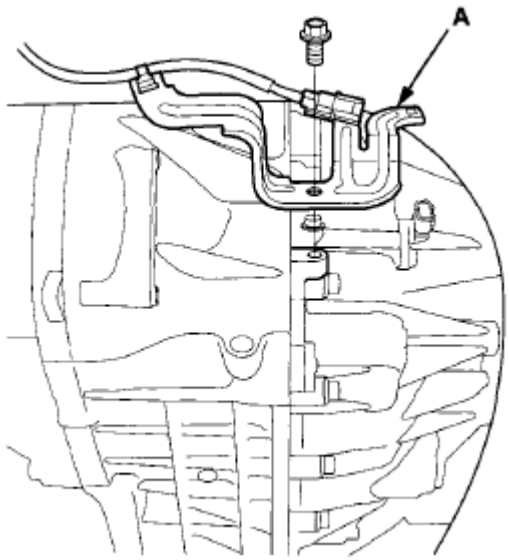

Fig. 71: Identifying Harness Clamp Bracket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

62. Remove the lower transmission mounting bolts. Front side

Front side

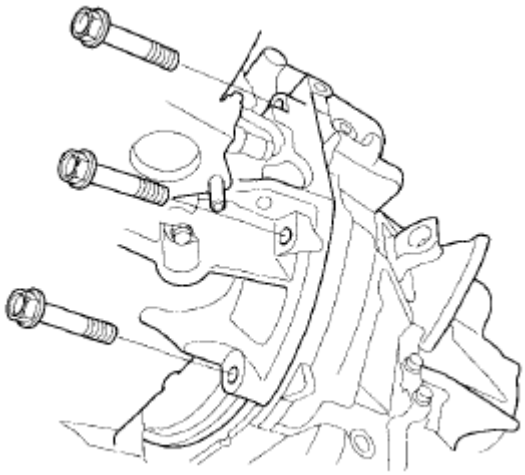

Fig. 72: Identifying Lower Transmission Mounting Bolts - Front Side
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear side

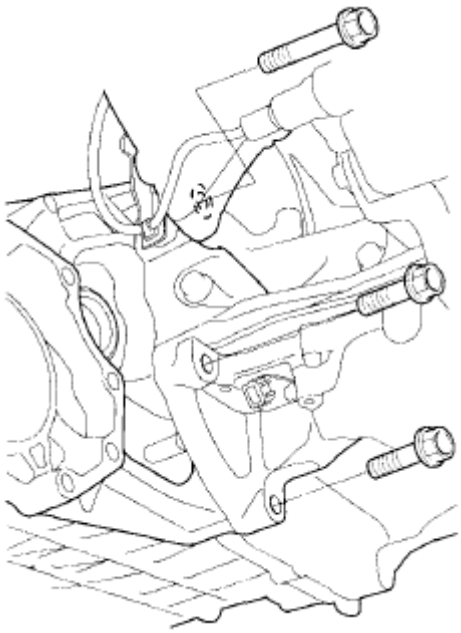

Fig. 73: Identifying Lower Transmission Mounting Bolts - Rear Side
Courtesy of AMERICAN HONDA MOTOR CO., INC.

63. Pull the transmission away from the engine until the transmission mainshaft clears the clutch pressure plate.
64. Slowly lower the transmission about 150 mm (6 in). Check once again that all hoses and harnesses are disconnected and free from the transmission, then lower it completely.

TRANSMISSION INSTALLATION

Special Tools Required

- Subframe Alignment Pin 070AG-SJAA10S
- Engine Support Hanger, A and Reds AAR-T1256*
- 2008 V6 Attachment Arm SIL02C000033*
- Subframe Adapter VSB02C000016*
- Engine Hanger Balance Bar VSB02C000019*

*: Available through the Acura Tool and Equipment Program 888-424-6857

NOTE: Use fender covers to avoid damaging painted surfaces.

1. Check the release bearing, and reinstall the release bearing and the release fork with the appropriate grease (see **TRANSMISSION SIDE**).
2. Make sure the 14 x 20 mm dowel pin (A) and the 10 x 20 mm dowel pin (B) are installed in the clutch housing.

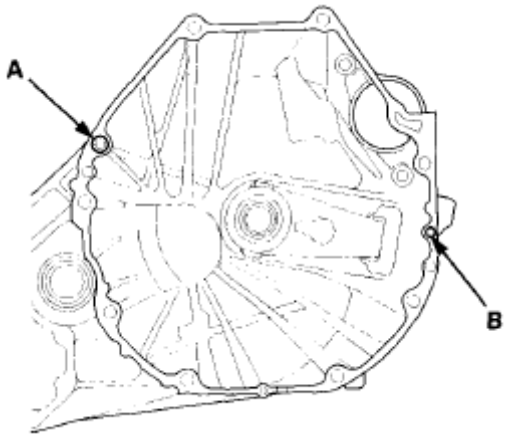

Fig. 74: Identifying Dowel Pins
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Place the transmission on the transmission jack, and raise it to the engine level.
4. Align the transmission mainshaft and the clutch pressure plate, then move the transmission inward until there is no gap between the transmission housing and the engine block.
5. Install the lower transmission mounting bolts. Front side

Front side

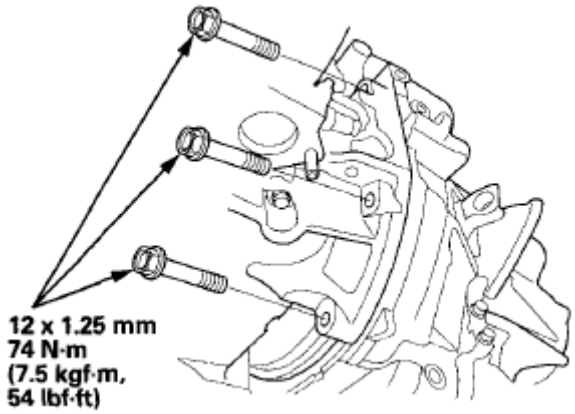

Fig. 75: Identifying Lower Transmission Mounting Bolts With Torque Specifications - Front Side
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Rear side

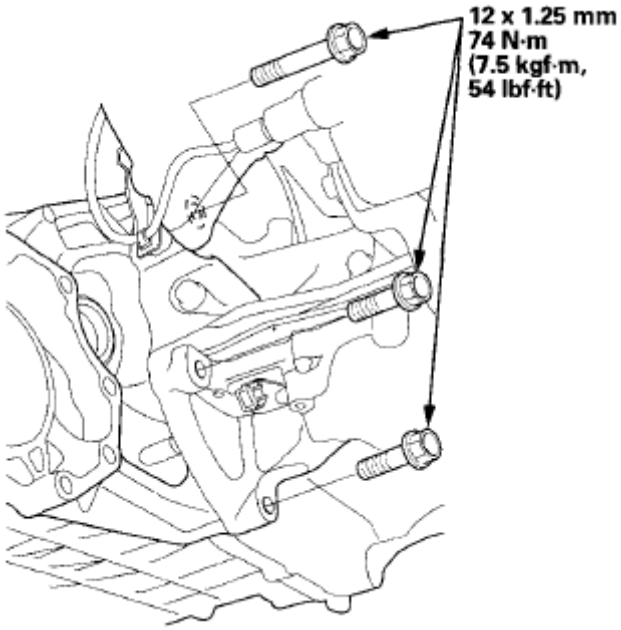

Fig. 76: Lower Transmission Mounting Bolts With Torque Specifications - Rear Side
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the harness clamp bracket (A).

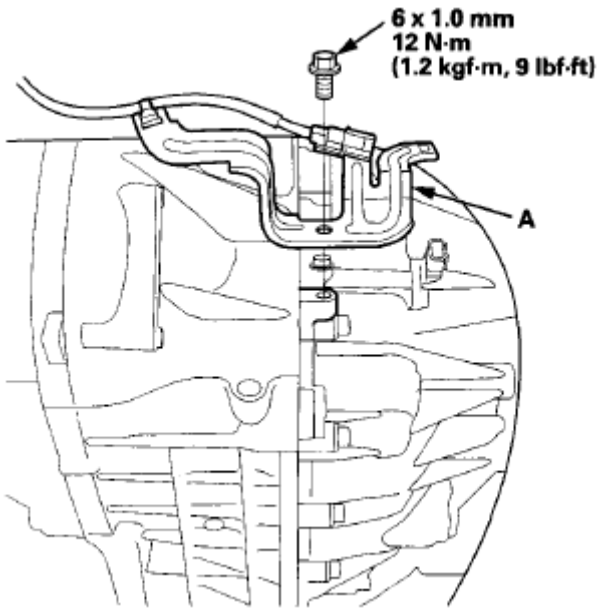

Fig. 77: Identifying Harness Clamp Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Connect the CKP sensor connector (A), then install the harness clamp (B) and the CKP sensor cover (C).

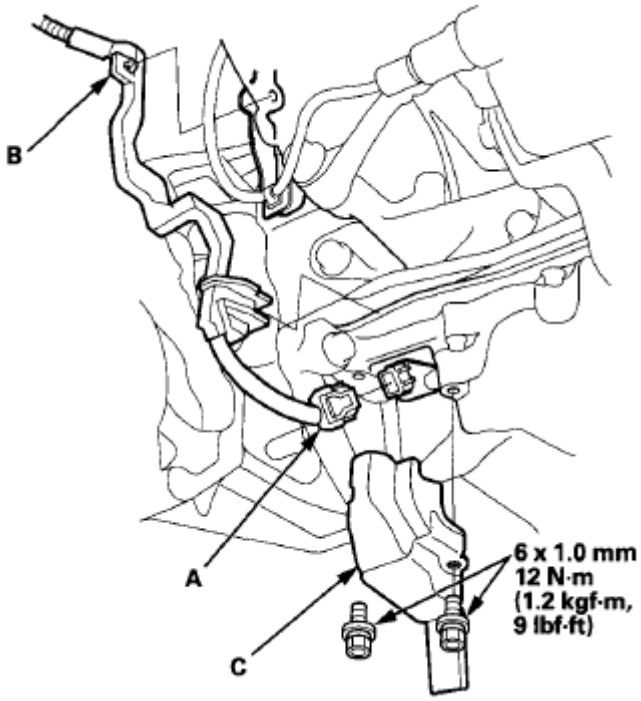

Fig. 78: Identifying CKP Sensor Connector, Harness Clamp And CKP Sensor Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the clutch cover (A).

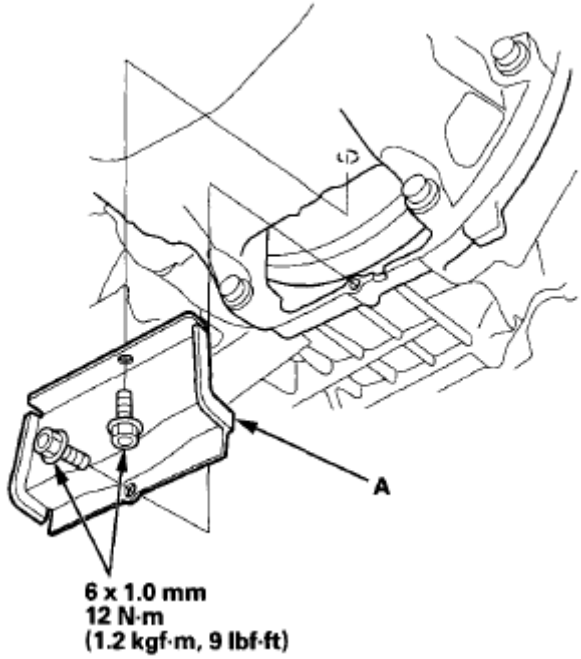

Fig. 79: Identifying Clutch Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the intermediate shaft (see **INTERMEDIATE SHAFT INSTALLATION**).
10. Install both driveshafts (see **FRONT DRIVESHAFT INSTALLATION**).
11. Install the lower transmission mount (A) with new bolts.

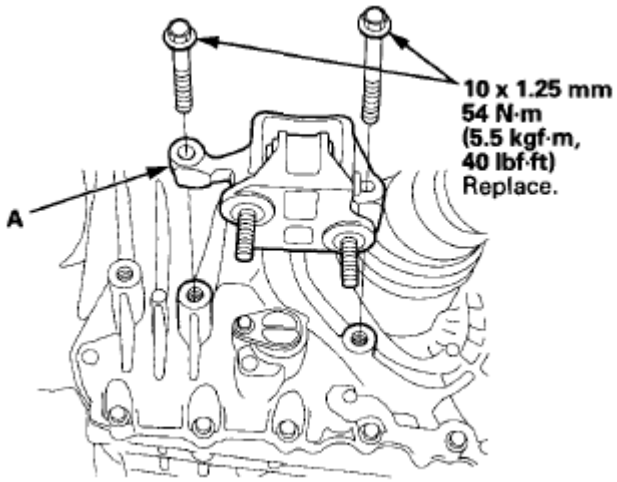

Fig. 80: Identifying Lower Transmission Mount With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the front engine mount bracket (A) with new bolts.

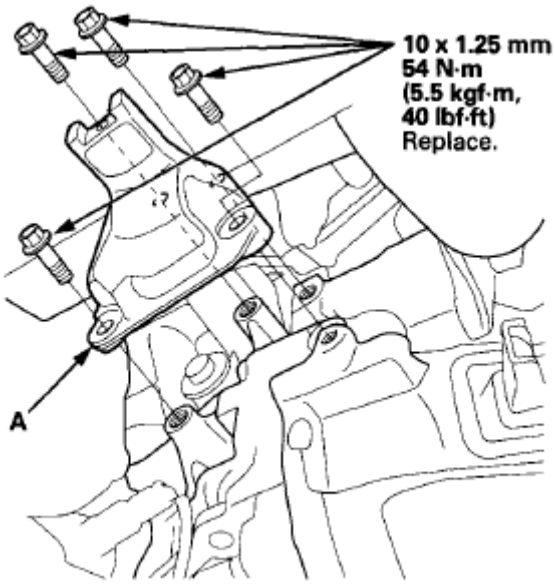

Fig. 81: Identifying Front Engine Mount Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the front engine mount (A) with a new bolt, loosely tighten.

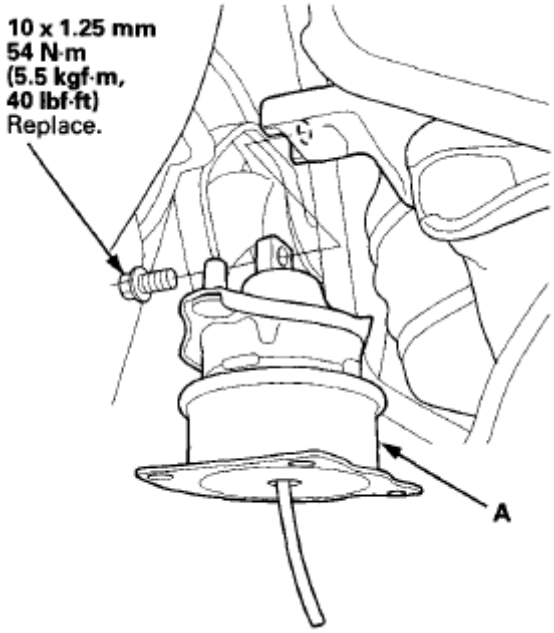

Fig. 82: Identifying Front Engine Mount With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Support the front subframe with the subframe adapter (VSB02C000016) and a jack.

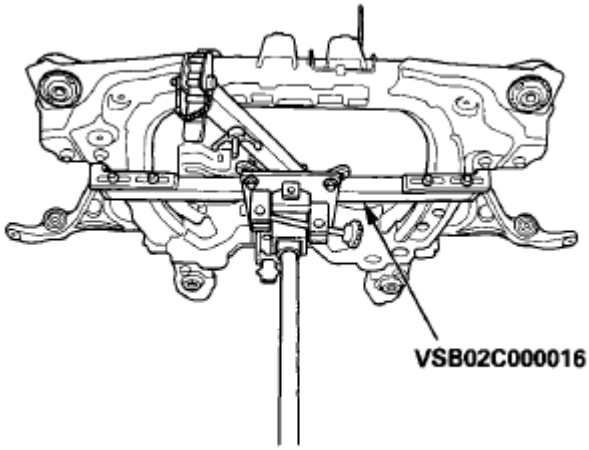

Fig. 83: Identifying Subframe Adapter
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Lift the front subframe (A) up to the body.

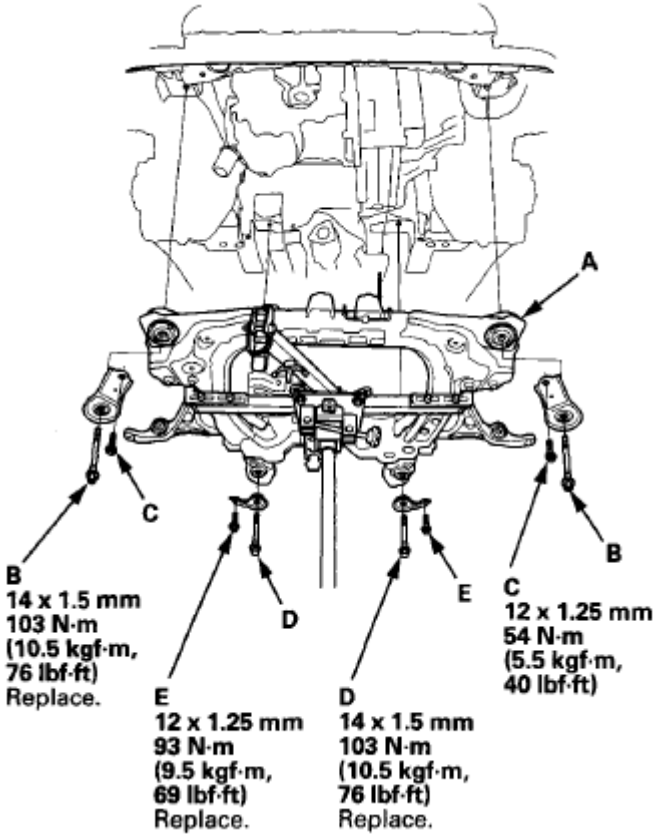

Fig. 84: Identifying Front Subframe And Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the front stiffeners; loosely install new bolts (B) to the body through the front subframe, and loosely install the bolts (C) to the body.
17. Install the rear stiffeners; loosely install new bolts (D) to the body through the front subframe, and loosely install new bolts (E) to the body.
18. Loosely tighten the front subframe mounting bolt (A) and the stiffener mounting bolt (B) in the right rear stiffener, until the front subframe insulator contacts the body; insert the subframe alignment pin (070AG-SJAA10S) through the positioning slot (C) on the right rear stiffener, through the positioning hole (D) on the front subframe, and into the positioning hole on the body.

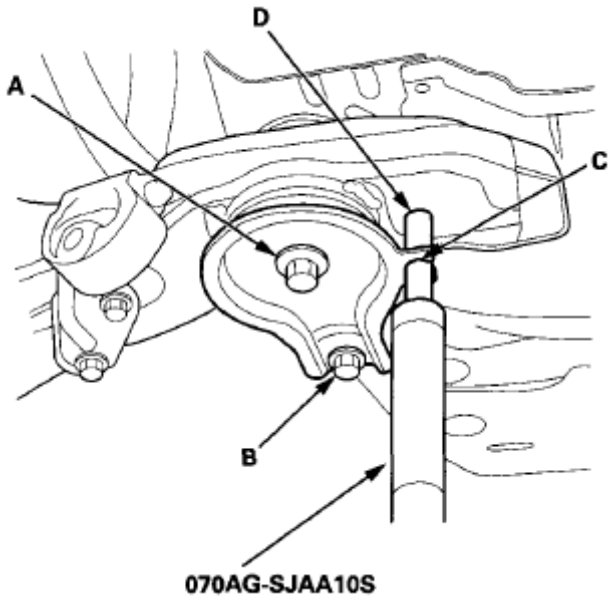

Fig. 85: Identifying Positioning Slot, Positioning Hole On Front Subframe, Front And Stiffener Subframe Mounting Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Loosely tighten the front subframe mounting bolt in the left rear stiffener in the same manner as in step 18.
20. Reinsert the subframe alignment pin through the positioning slot on the right rear stiffener, through the positioning hole on the front subframe, and into the positioning hole on the body, then tighten the front subframe mounting bolt to the specified torque.
21. Tighten the front subframe mounting bolt in the left rear stiffener in the same manner as in step 20.
22. Tighten the front subframe mounting bolts in the right front stiffener and the left front stiffener to the specified torque.
23. Check that the positioning holes and slots are aligned using the subframe alignment pin.
24. Tighten the front and rear stiffener mounting bolts to the specified torque.
25. Remove the subframe adapter and the jack.
26. Install the lower transmission mount mounting nuts.

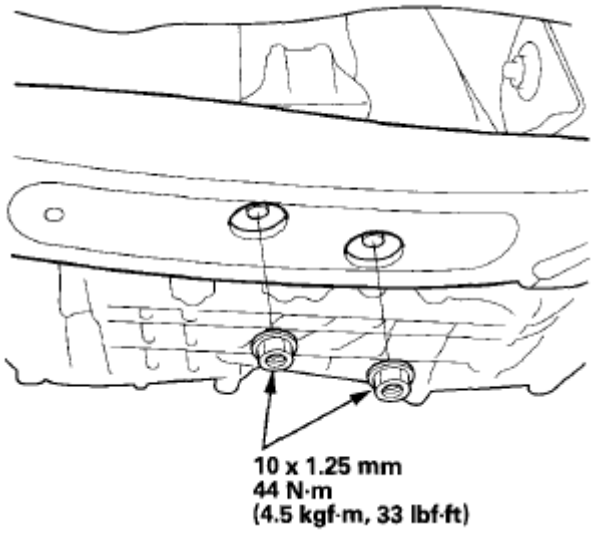

Fig. 86: Identifying Lower Transmission Mount Mounting Nuts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Install the subframe middle mount (A) on both sides with new bolts.

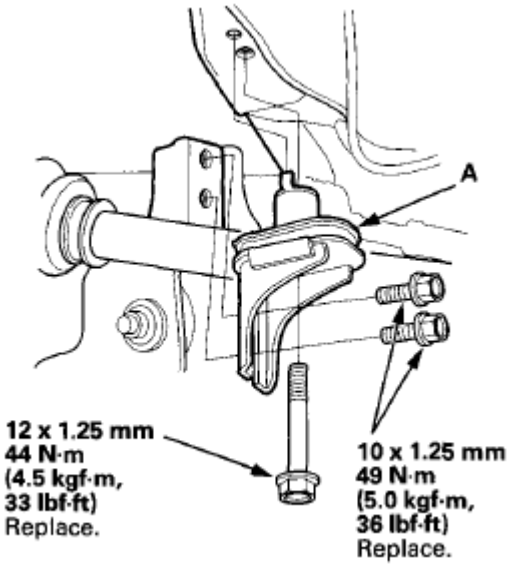

Fig. 87: Identifying Subframe Middle Mount With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Install exhaust pipes A and B (see **J37A4 ENGINE (WITH SH-AWD)**).
29. Install the dowel pin (A) in the transmission, and install the transfer assembly (B) on the transmission.

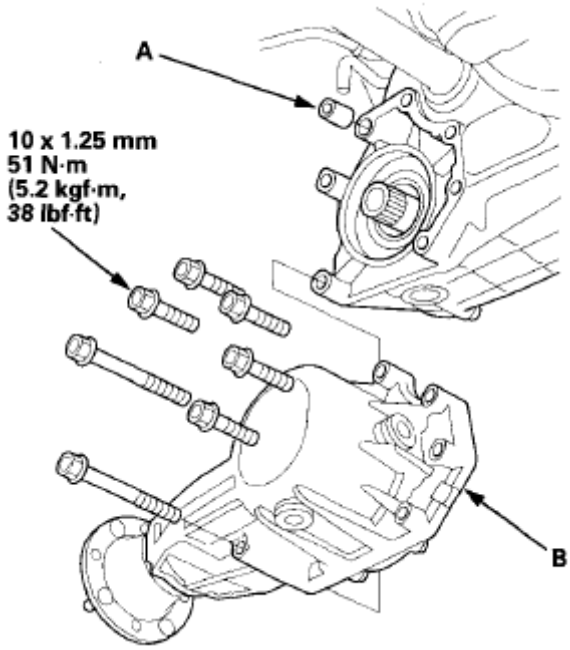

Fig. 88: Identifying Dowel Pin And Transfer Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Connect the breather hose (A) over the breather pipe (B) with facing the dot mark (C) to the rear side of the vehicle, and install the hose on the clamp (D) at the dot mark (E).

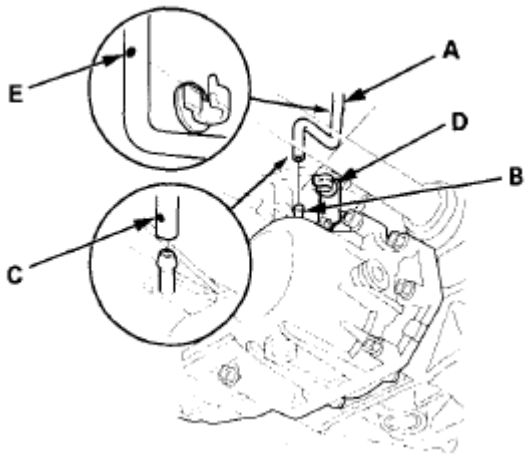

Fig. 89: Identifying Breather Hose, Breather Pipe, Dot Mark And Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Install the propeller shaft (see **PROPELLER SHAFT INSTALLATION**).
32. Connect the vacuum hose (A) located under the front engine mount.

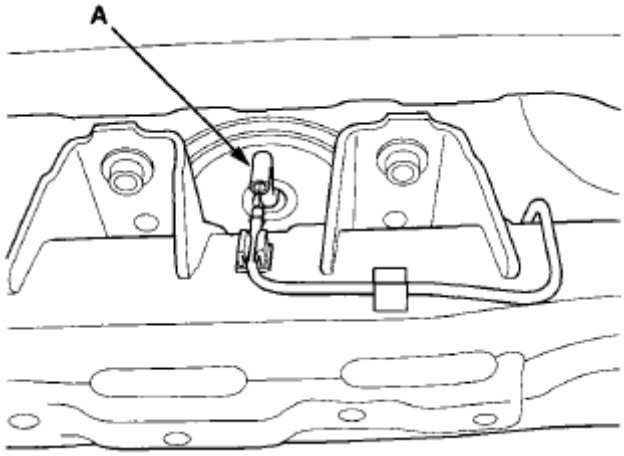

Fig. 90: Identifying Vacuum Hose
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Connect the knuckle ball joint and the lower arm (see **KNUCKLE/HUB/WHEEL BEARING REPLACEMENT**).
34. Install the cotter pin to the knuckle ball joint (see **KNUCKLE/HUB/WHEEL BEARING REPLACEMENT**).
35. Connect the tie-rod end ball joint and the knuckle (see **KNUCKLE/HUB/WHEEL BEARING REPLACEMENT**).
36. Install the cotter pin to the tie-rod end ball joint (see **KNUCKLE/HUB/WHEEL BEARING REPLACEMENT**).
37. Install the damper fork (see **INSTALLATION**).
38. Lower the vehicle.
39. Install the upper transmission mounting bolts (A).

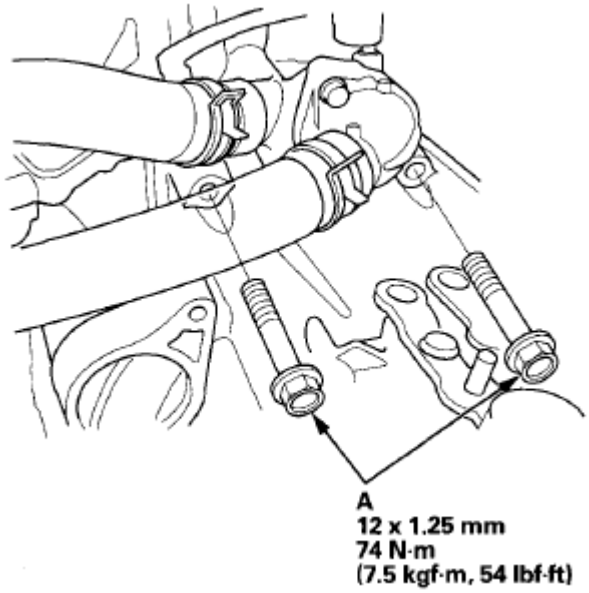

Fig. 91: Identifying Upper Transmission Mounting Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

40. Install the upper transmission mount bracket (A) with new bolts, and connect the ground cable (B).

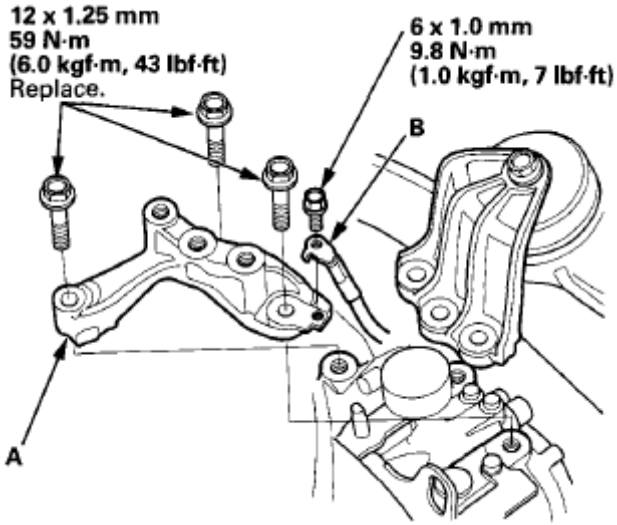

Fig. 92: Identifying Upper Transmission Mount Bracket And Ground Cable With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

41. Connect the upper transmission mount bracket (A) and the upper transmission mount (B) with new bolts loosely installed.

NOTE: If the bolt (C) was loosened by mistake during removal, the upper transmission mount must be replaced as an assembly.

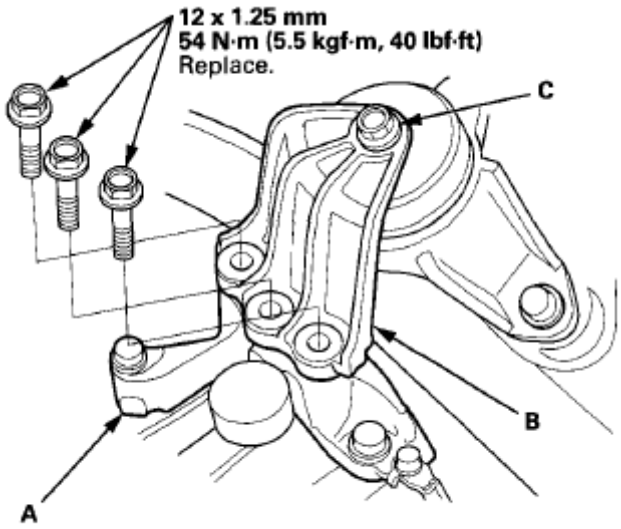

Fig. 93: Identifying Upper Transmission Mount Bracket, Upper Transmission Mount And Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

42. Connect the rear engine mount (A) and the rear engine mount bracket (B) with a new bolt loosely installed.

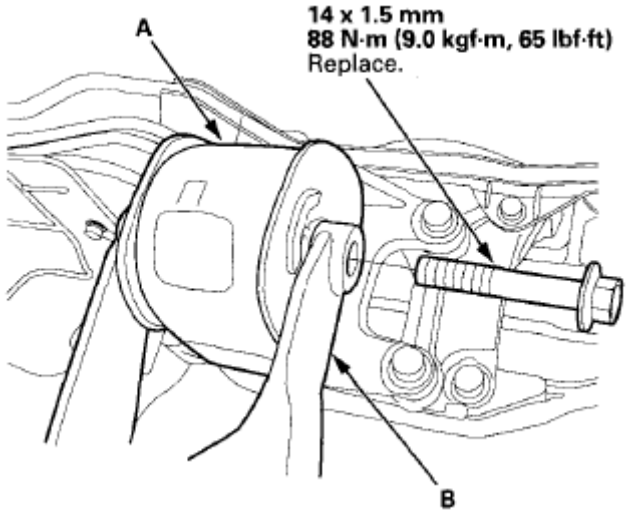

Fig. 94: Identifying Rear Engine Mount And Rear Engine Mount Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Connect the front engine mount (A) and the front subframe with new bolts.

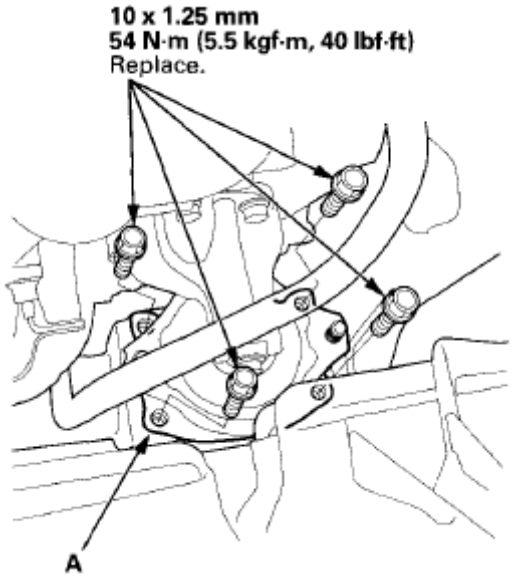

Fig. 95: Identifying Front Engine Mount With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

44. Install the front engine mount stop (A) and the vacuum pipe bracket (B) with new nuts, then connect the vacuum hose (C).

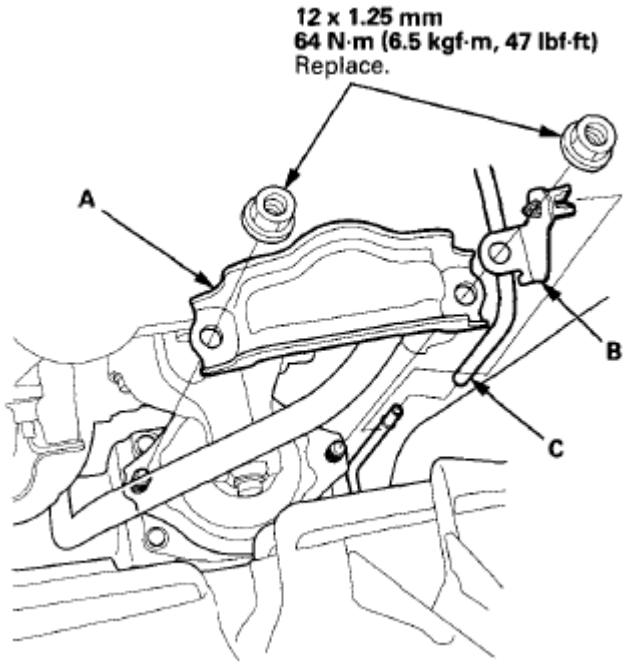

Fig. 96: Identifying Front Engine Mount Stop, Vacuum Pipe Bracket And Vacuum Hose With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Remove the engine support hanger, the engine hanger balance bar, and the 2008 V6 attachment arm from

the engine.

46. Torque the bolts that were tightened loosely in steps 13, 41, and 42.
47. Install the engine mount control solenoid valve bracket (A) to the rear cylinder head.

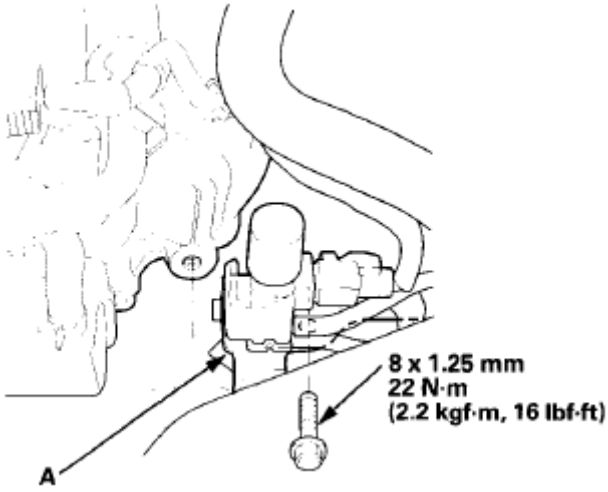

Fig. 97: Identifying Engine Mount Control Solenoid Valve Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

48. Install the connector bracket (A) to the front cylinder head.

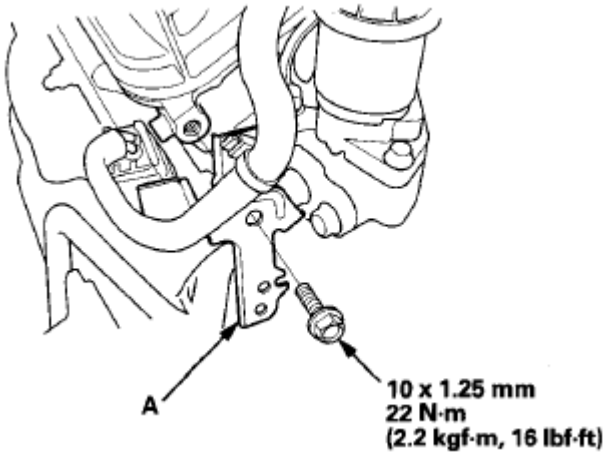

Fig. 98: Identifying Connector Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Apply a light coat of super high temp urea grease (P/N 08798- 9002) to the end of the slave cylinder push rod. Install the slave cylinder (A) and the clutch line bracket (B). Be careful not to bend the clutch line.

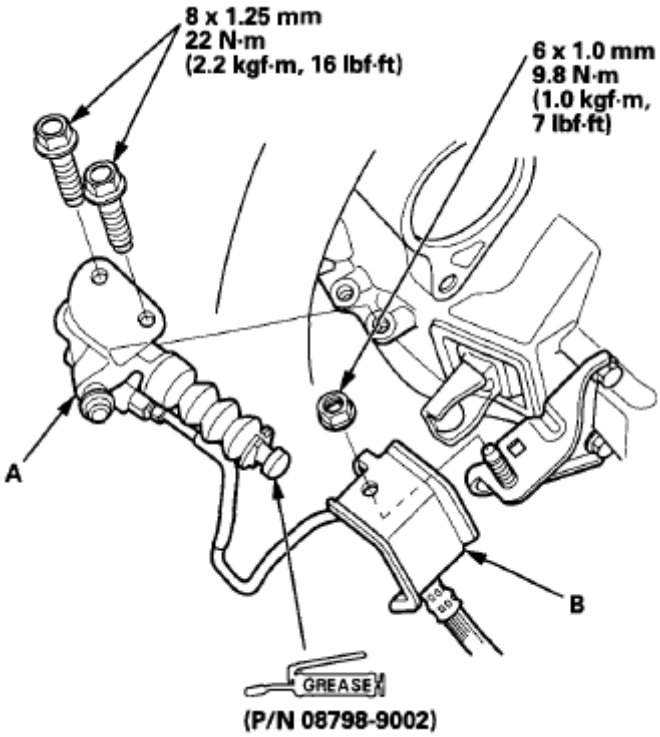

Fig. 99: Identifying Slave Cylinder And Clutch Line Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Apply a light coat of silicone grease (P/N 08C30-B0234M) to the cable ends (A) and connect the cable ends to the select lever (B) and the change lever (C), then install the shift cable bracket (D) and the lock pins (E). Do not bend or damage the shift cables.

NOTE: Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.

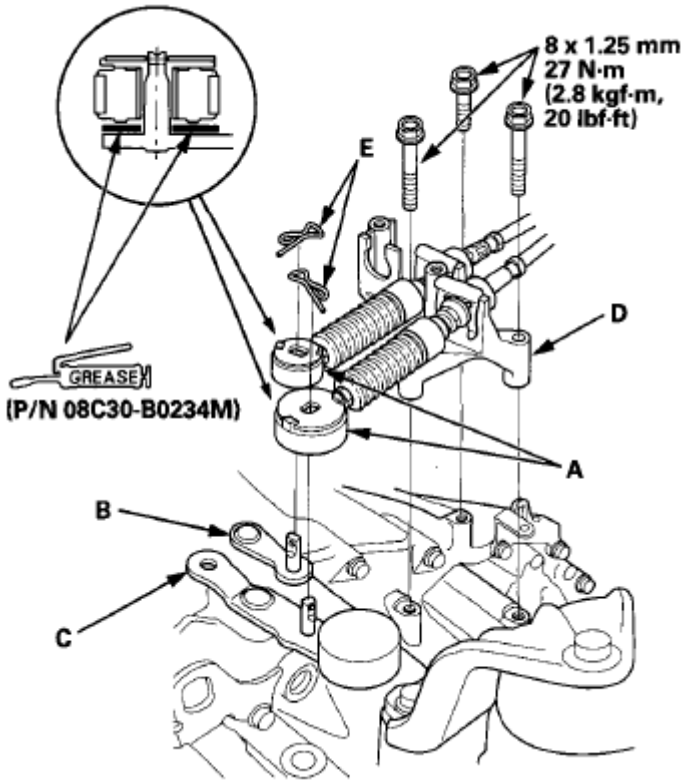

Fig. 100: Identifying Cable Ends, Select Lever, Change Lever, Shift Cable Bracket And Lock Pins With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

51. Install the harness bracket (A).

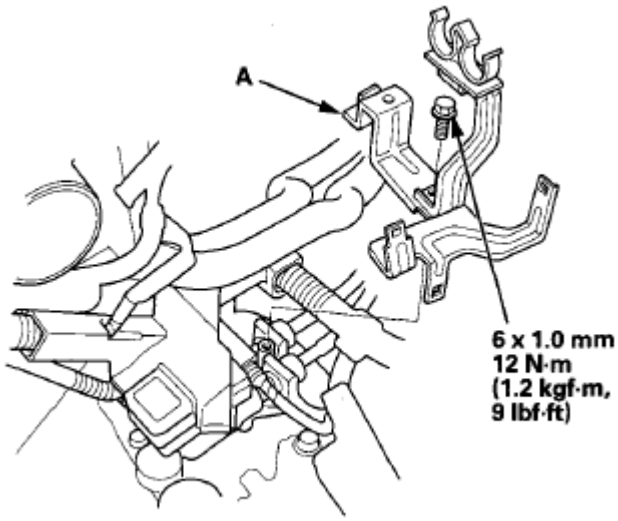

Fig. 101: Identifying Harness Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

52. Install the harness holder (A) and the harness clamps (B), then connect the reverse lockout solenoid connector (C).

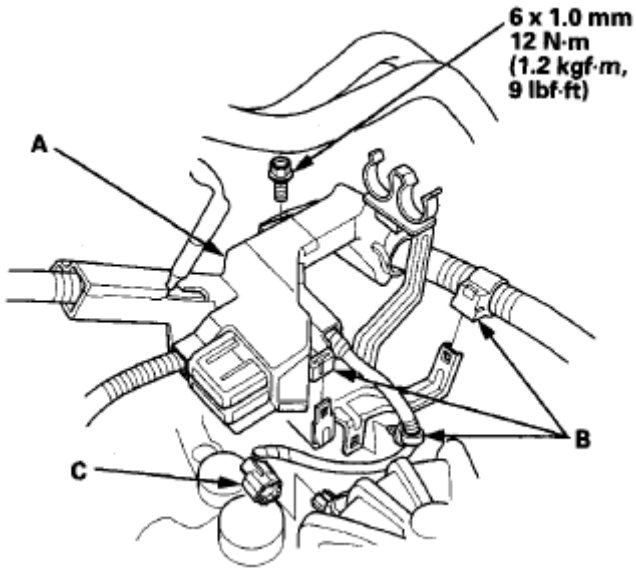

Fig. 102: Identifying Reverse Lockout Solenoid Connector, Harness Holder And Harness Clamps With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

53. Install the harness clamps (A), then connect the back-up light switch connector (B), the input shaft (mainshaft) speed sensor connector (C), the output shaft (countershaft) speed sensor connector (D), and the front secondary HO2S 4P connector (E).

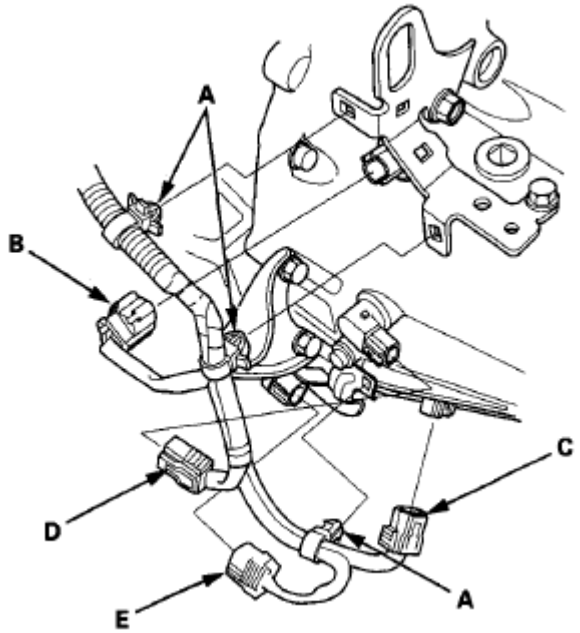

Fig. 103: Identifying Back-Up Light Switch Connector, Front Secondary Ho2S 4P Connector,

Harness Clamps, Input And Output Shaft Speed Sensor Connector
Courtesy of AMERICAN HONDA MOTOR CO., INC.

54. Install the starter (A) and the vacuum pipe bracket (B).

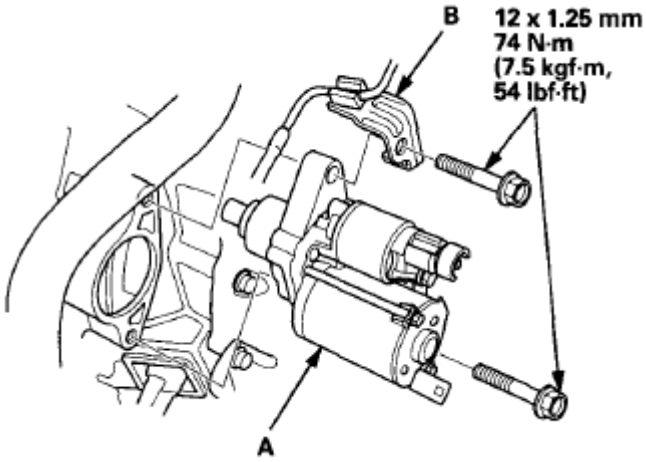

Fig. 104: Identifying Starter And Vacuum Pipe Bracket With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

55. Connect the positive starter cable (A) and the S terminal connector (B), and install the harness clamp (C).

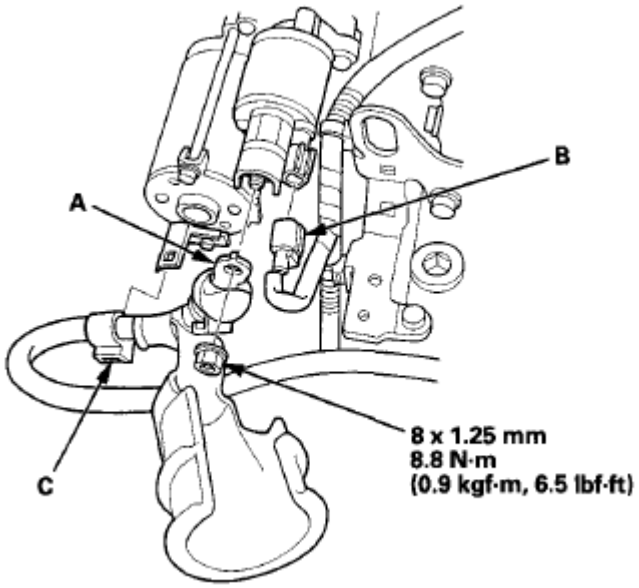

Fig. 105: Identifying Positive Starter Cable, S Terminal Connector And Harness Clamp With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

56. Loosen the upper steering joint bolt (A), and slip the lower end of the steering joint (B) onto the pinion shaft (C).

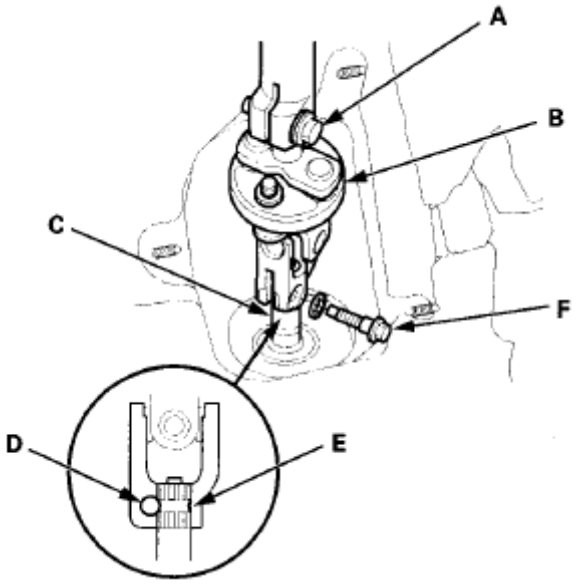

Fig. 106: Identifying Lower End Of Steering Joint, Pinion Shaft, Groove, Bolt Hole, Upper And Lower Steering Joint Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

57. Align the bolt hole (D) on the steering joint with the groove (E) around the pinion shaft, then loosely install the lower steering joint bolt (F). Be sure that the joint bolt is securely in the groove in the pinion shaft.
58. Remove the steering wheel holder tool (A).

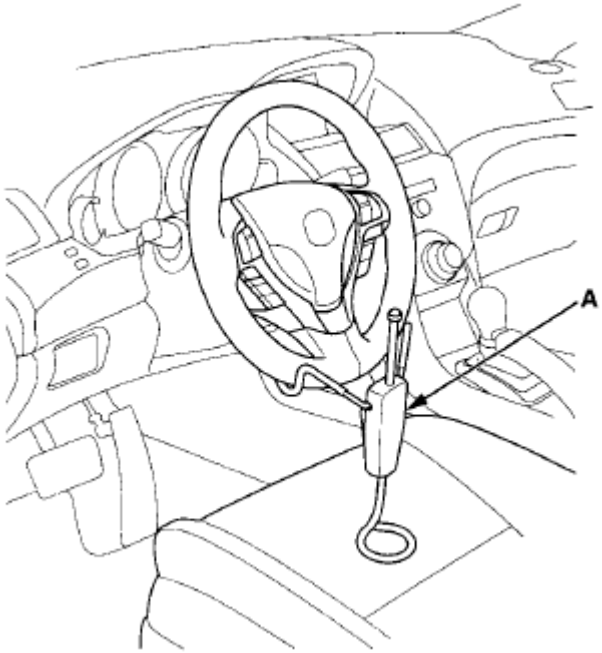

Fig. 107: Identifying Steering Wheel Holder Tool
Courtesy of AMERICAN HONDA MOTOR CO., INC.

59. Tighten the upper and lower steering joint bolts (A) to the specified torque.

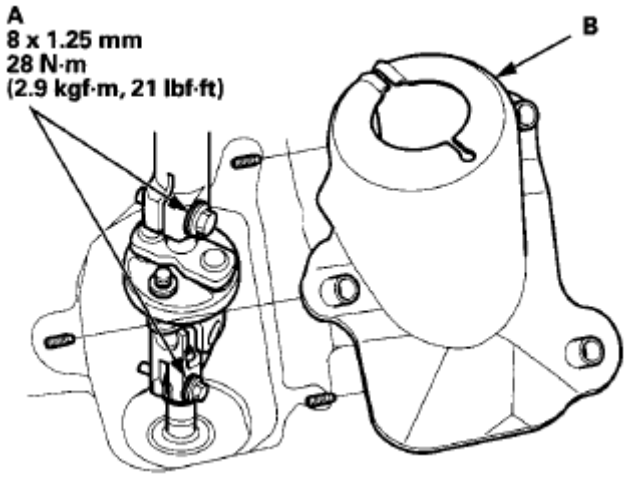

Fig. 108: Identifying Upper And Lower Steering Joint Bolts With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

60. Install the steering joint cover (B).
61. Install the harness clamps (A), then connect the EPS connectors (B).

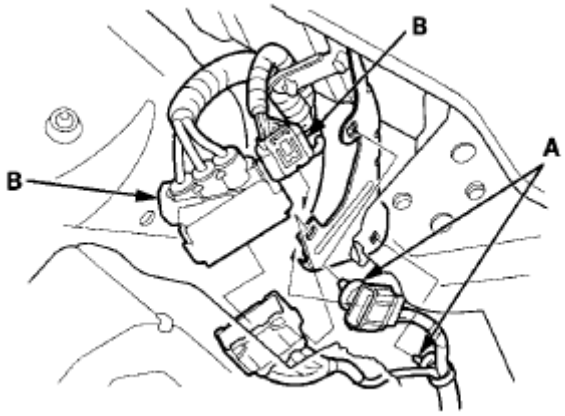

Fig. 109: Identifying Harness Clamps And EPS Connectors
Courtesy of AMERICAN HONDA MOTOR CO., INC.

62. Refill the transmission with MTF to the proper level (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**).
63. Install the battery base (A) and the harness clamps (B).

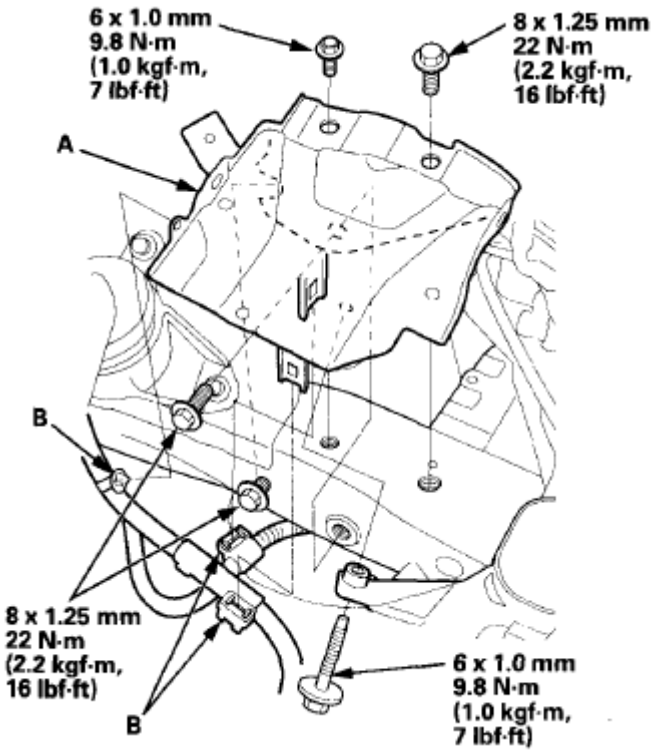

Fig. 110: Identifying Battery Base And Harness Clamps With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

64. Install the intake air duct (A).

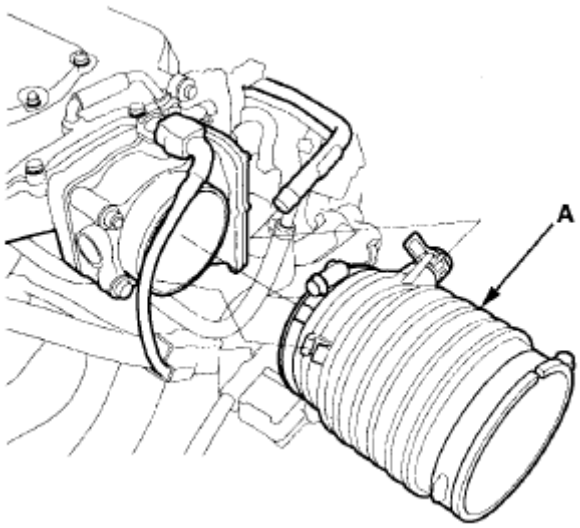

Fig. 111: Identifying Intake Air Duct
Courtesy of AMERICAN HONDA MOTOR CO., INC.

65. Install the air cleaner assembly (see **THROTTLE BODY CLEANING**).
66. Do the battery installation procedure (see **BATTERY REMOVAL AND INSTALLATION**).

67. Install the air intake duct splash separator (A).

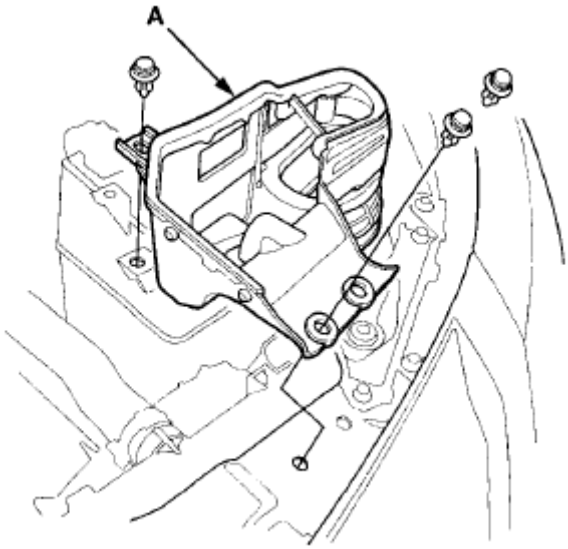

Fig. 112: Identifying Air Intake Duct Splash Separator
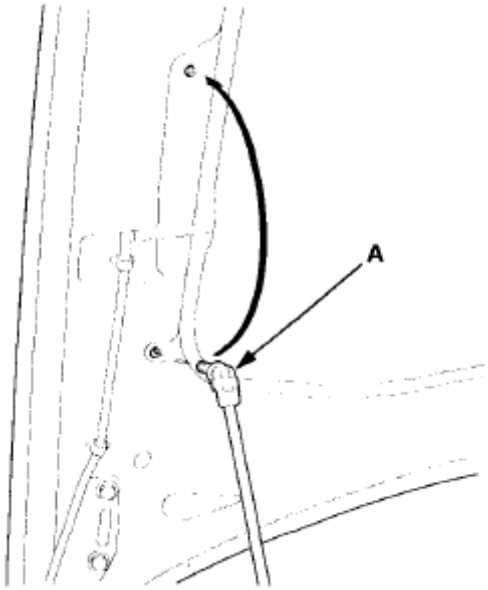
Courtesy of AMERICAN HONDA MOTOR CO., INC.

68. Install the front splash shield (see **FRONT SPLASH SHIELD REPLACEMENT**).
69. Place a floor jack under the lower arm, and raise the front suspension to load it with the vehicle's weight. Do not place the jack under the ball joint.
70. Torque the following parts to the specified torque.
    - Damper fork mounting nut
    - Damper pinch bolt
    - Lower arm ball joint nut
71. Install the strut brace (see **FRAME BRACE REPLACEMENT**).
72. Install the support strut (A) on both sides to the proper location.



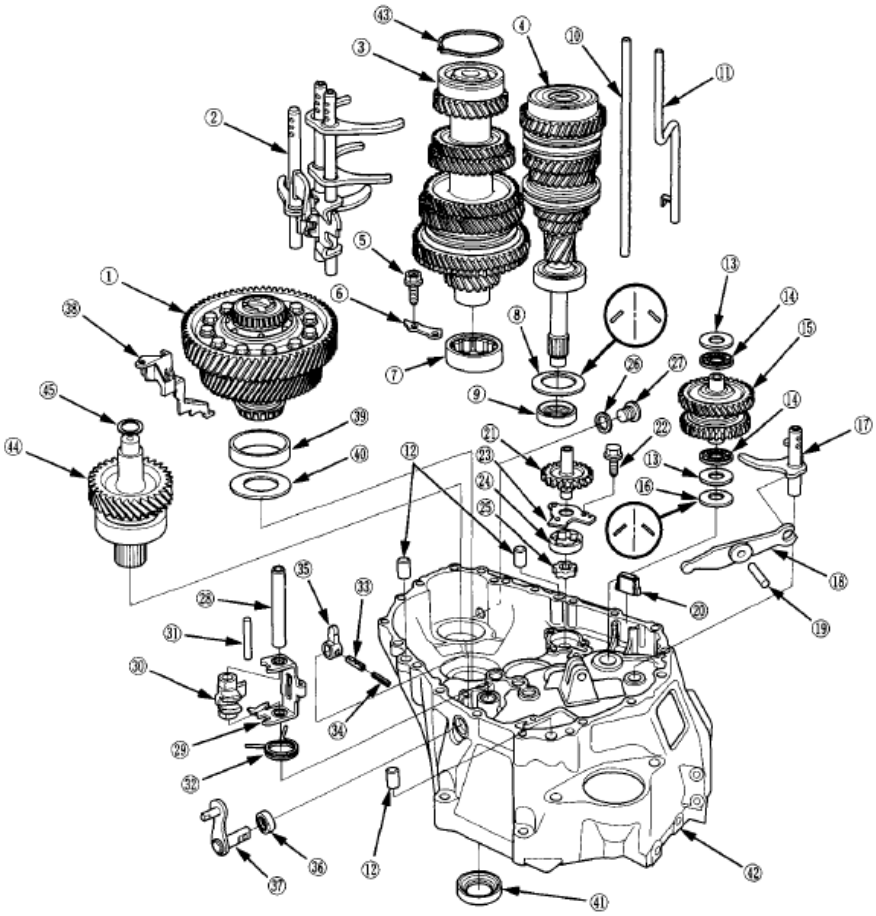


Fig. 113: Identifying Support Strut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

73. Install the engine compartment covers (see **ENGINE COMPARTMENT COVER REPLACEMENT**).
74. Check the wheel alignment (see **WHEEL ALIGNMENT**).
75. Check the shift lever and clutch operation.
76. Test-drive the vehicle.

NOTE: Place the clutch housing on two pieces of wood thick enough to keep the mainshaft from hitting the workbench.

1. Remove the release bearing and the release fork (see **TRANSMISSION SIDE**).
2. Remove the strainer cover (A), the O-ring (B), the strainer set spring (C), and the oil pump strainer (D).

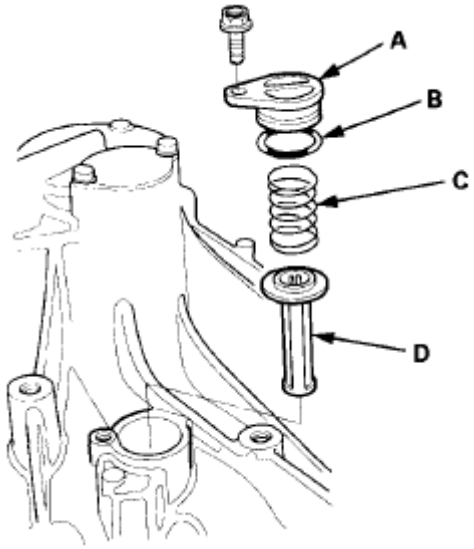

Fig. 116: Identifying Strainer Cover, O-Ring, Strainer Set Spring And Oil Pump Strainer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove transmission hanger A.

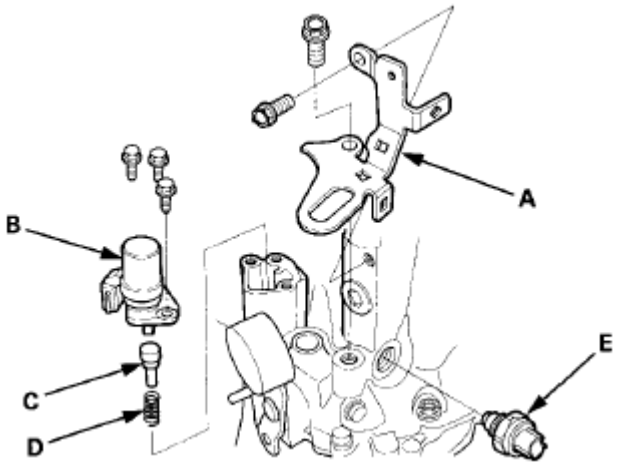

Fig. 117: Identifying Transmission Hanger, Reverse Lockout Solenoid, Lock Pin, Lock Pin Spring And Back-Up Light Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the reverse lockout solenoid (B), the select lock pin (C), the select lock pin spring (D), and the back-up light switch (E).
5. Remove the detent bolts (A), the 22.0 mm detent ball spring (B), the 26.1 mm detent ball spring (C), the 27.4 mm detent ball springs (D), the steel balls (E), the filler plug (F), and the 20 mm sealing washer (G).

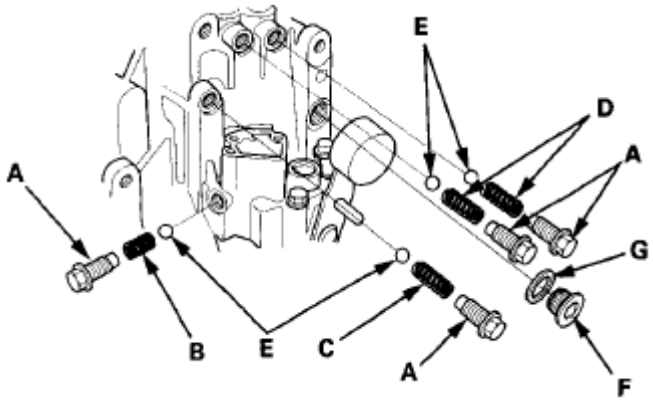

Fig. 118: Identifying Detent Ball Springs, Steel Balls, Filler Plug, Sealing Washer And Detent Bolts
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Remove the detent bolts (A), the 22.0 mm detent ball spring (B), the 27.4 mm detent ball spring (C), the steel balls (D), the input shaft (mainshaft) speed sensor (E), the output shaft (countershaft) speed sensor (F), and the O-rings (G).

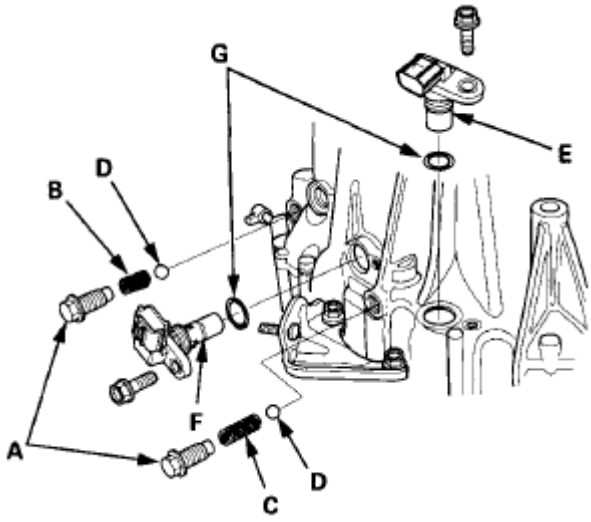

Fig. 119: Identifying Detent Ball Springs, Steel Balls, Detent Bolts, O-Rings, Input And Output Shaft Speed Sensor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Remove the fluid check bolt (A), the 6 mm sealing washer (B), the drain plug (C), and the 20 mm sealing washer (D).

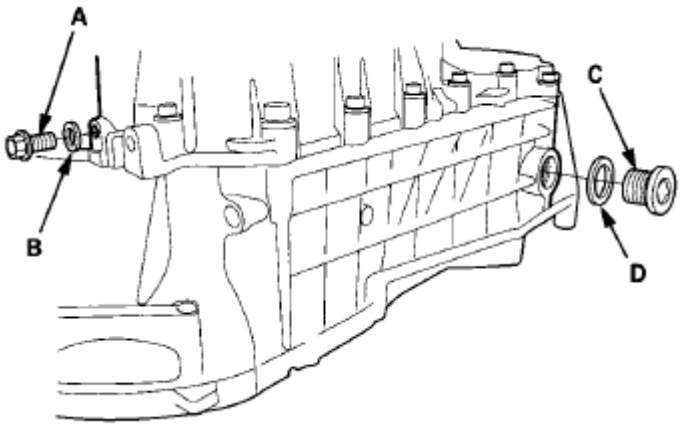

Fig. 120: Identifying Fluid Check Bolt, Drain Plug And Sealing Washers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Loosen the 10 mm flange bolts in a crisscross pattern in several steps, then remove them with the clutch line bracket (A) and transmission hanger B.

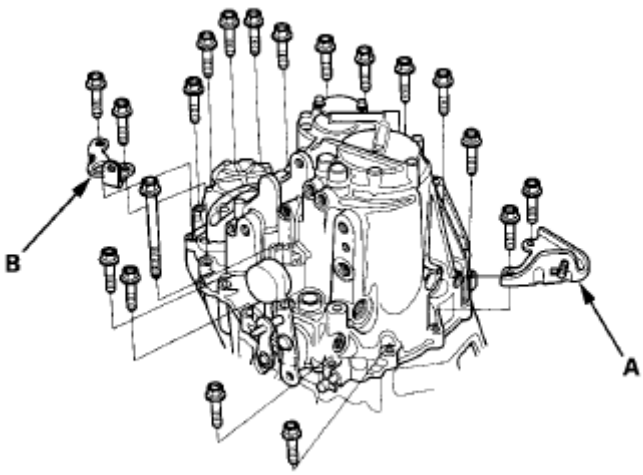

Fig. 121: Identifying Clutch Line Bracket And Transmission Hanger
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Remove the transmission case cap (A) and the O-ring (B).

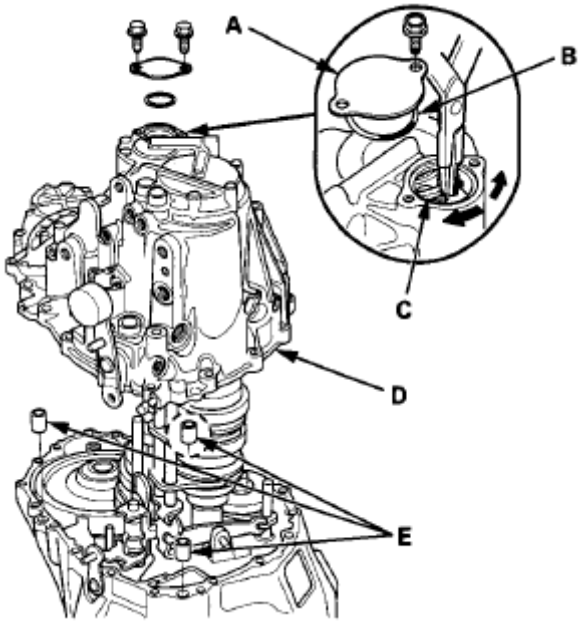

Fig. 122: Identifying Transmission Case Cap, Transmission Housing, Dowel Pins, O-Ring And Snap Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. While expanding the 75 mm snap ring (C) on the countershaft ball bearing with snap ring pliers, lift the transmission housing (D). Release the snap ring pliers, and remove the transmission housing and the three 14 x 20 mm dowel pins (E).
11. Remove oil guide pipe A, the oil guide pipe (B), and the magnet (C).

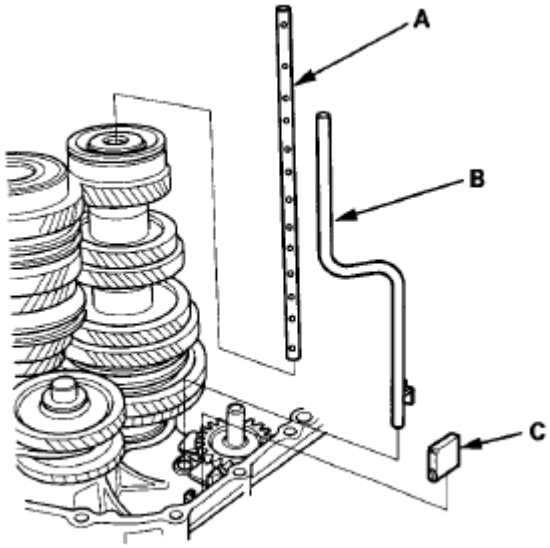

Fig. 123: Identifying Oil Guide Pipe And Magnet
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the 8 x 50 mm pin (A) and the reverse shift lever (B).

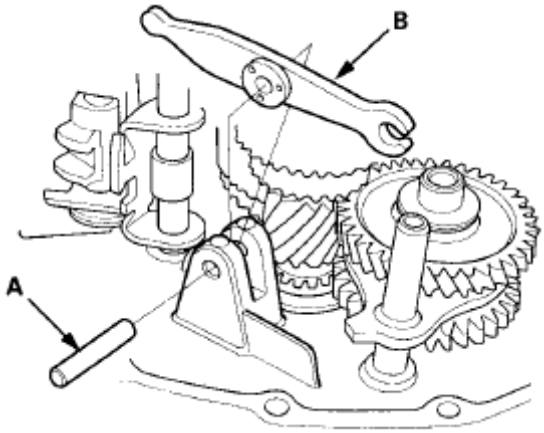

Fig. 124: Identifying Pin And Reverse Shift Lever
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Remove the 25 mm thrust washers (A), the 25 mm thrust needle bearings (B), the reverse idler gear shaft assembly (C), the 36 mm spring washer (D), and the reverse shift fork (E) as an assembly.

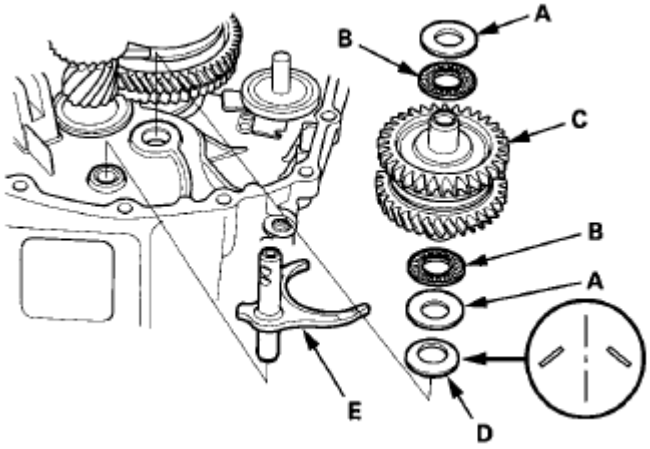

Fig. 125: Identifying Thrust Washers, Thrust Needle Bearings, Reverse Idler Gear Shaft Assembly, Spring Washer And Reverse Shift Fork
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Remove the 8x50 mm pin (A), the select return spring (B), the shift piece shaft (C), the shift piece (D), and the interlock (E).

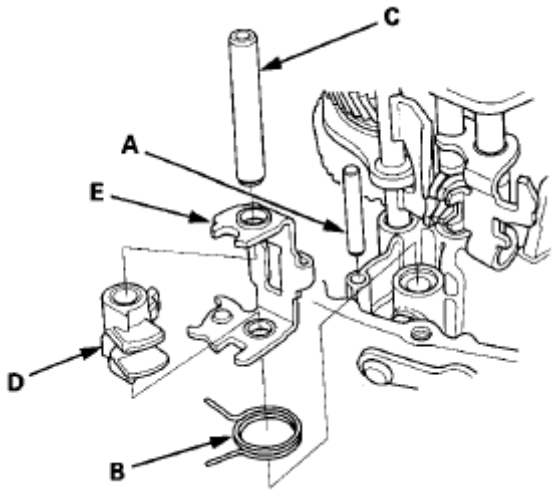

Fig. 126: Identifying Pin, Return Spring, Shift Piece Shaft, Shift Piece And Interlock
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Remove the 5 x 22 mm spring pin (A), the 3 x 22 mm spring pin (B), the select arm (C), the select lever (D), and the 14 x 20 x 4 mm dust seal (E).

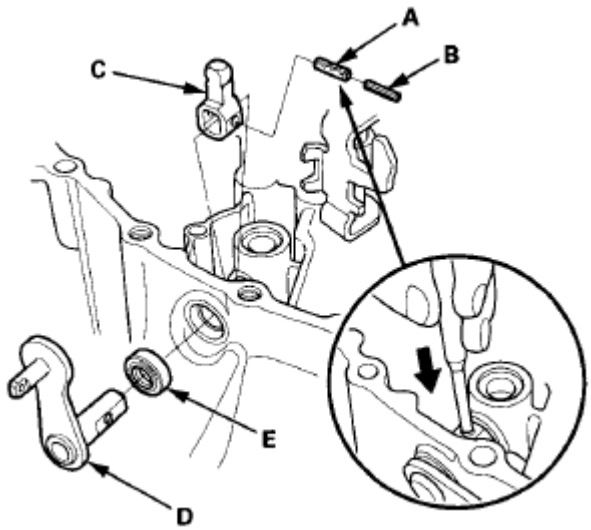

Fig. 127: Identifying Spring Pins, Select Arm, Select Lever And Dust Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Apply tape to the mainshaft splines to protect the seal, then remove the mainshaft assembly (A) and the countershaft assembly (B) with the shift fork assembly (C) from the clutch housing (D).

NOTE: Do not apply tape thick to damage the oil seal.

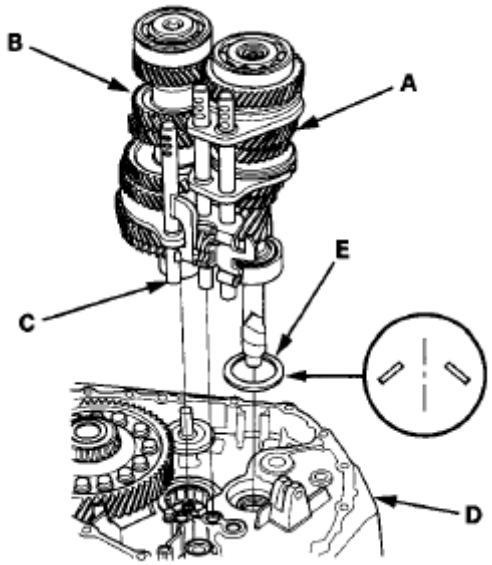

Fig. 128: Identifying Mainshaft Assembly, Countershaft Assembly, Shift Fork Assembly And Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Remove the 64 mm spring washer (E).
18. Remove the oil pump shaft (A) and the differential assembly (B).

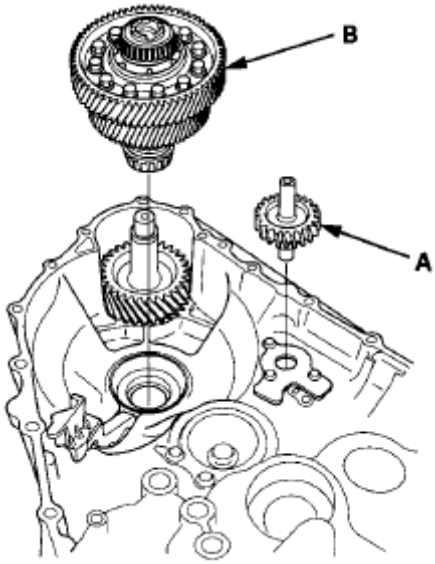

Fig. 129: Identifying Oil Pump Shaft And Differential Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Remove the transfer output shaft assembly (A).

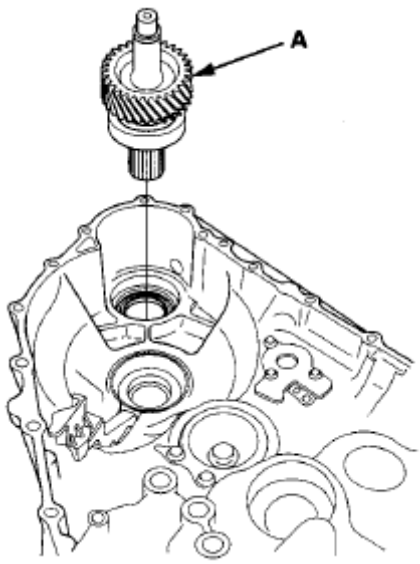

Fig. 130: Identifying Transfer Output Shaft Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

20. Remove the oil guide plate (A).

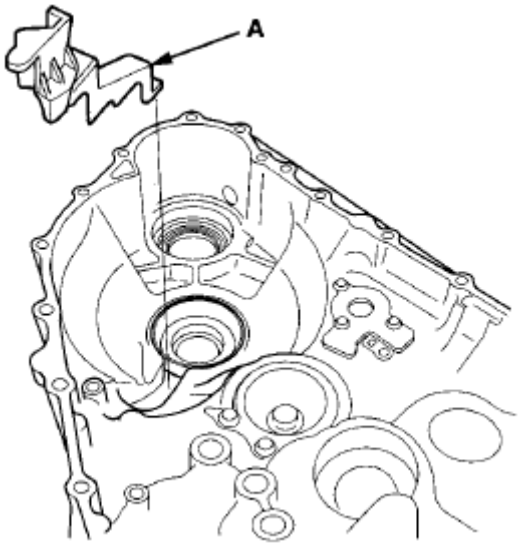

Fig. 131: Identifying Oil Guide Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Remove the oil pump plate (A), the oil pump inner rotor (B), and the oil pump outer rotor (C).

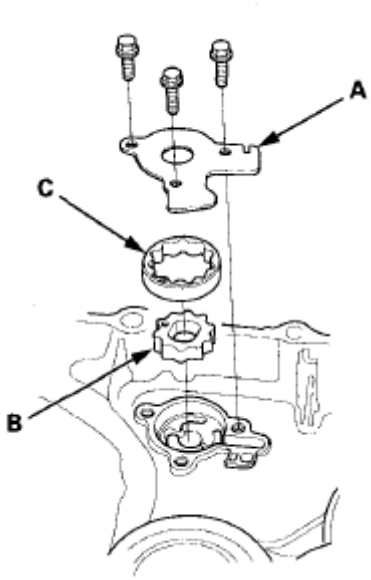

Fig. 132: Identifying Oil Pump Plate, Oil Pump Inner Rotor And Oil Pump Outer Rotor
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Remove the 87 mm shim (A) from the transmission housing (B).

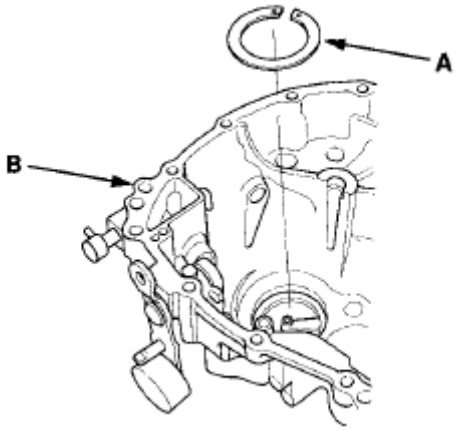

Fig. 133: Identifying Shim And Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Remove the 8 mm special bolt (A), the 8 mm spring washer (B), the shift arm (C), the change lever (D), and the 16 x 23 x 5 mm dust seal (E).

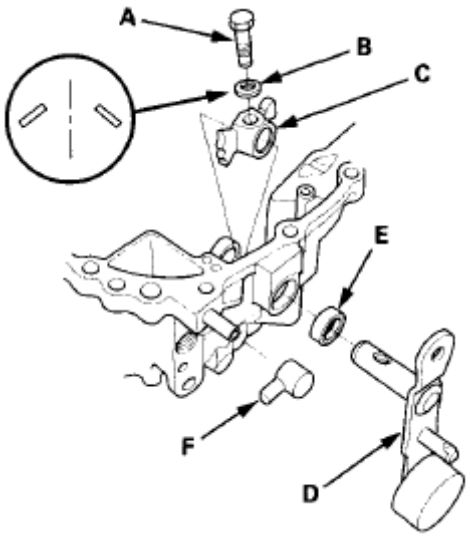

Fig. 134: Identifying Special Bolt, Spring Washer, Shift Arm, Change Lever And Dust Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

24. Remove the breather cap (F).

REVERSE SHIFT LEVER CLEARANCE INSPECTION

1. Measure the clearance between the reverse shift lever (A) and the reverse shift fork (B) with a feeler gauge (C). If the clearance exceeds the service limit, go to step 2.

   Standard: 0.15- 0.60 mm (0.006- 0.023 in)

   Service Limit: 0.7 mm (0.027 in)

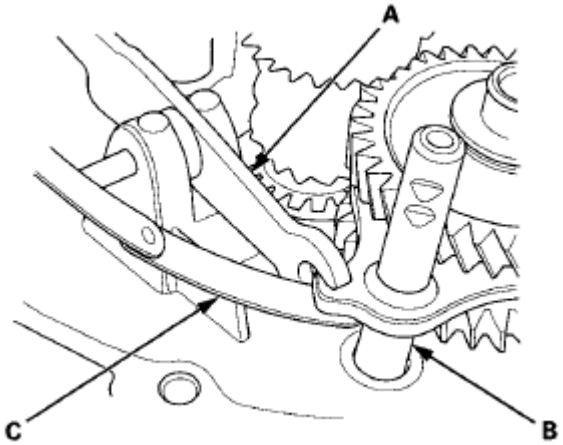

Fig. 135: Measuring Clearance Between Reverse Shift Lever And Reverse Shift Fork Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the width of the reverse shift lever.
   - If the width is not within the standard, replace the reverse shift lever.
   - If the width is within the standard, replace the reverse shift fork.

   Standard: 6.50- 6.75 mm (0.2559- 0.2657 in)

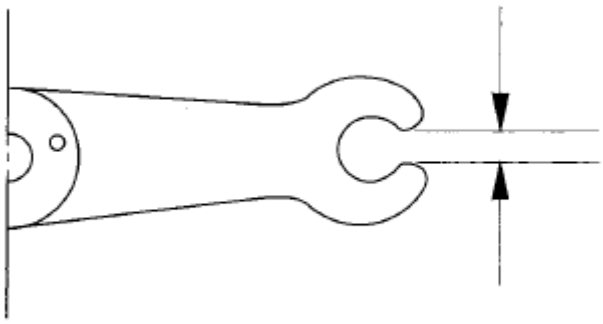

Fig. 136: Measuring Reverse Shift Lever Width
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the clearance between the reverse shift lever (A) and the reverse shift piece (B) with a feeler gauge (C). If the clearance exceeds the service limit, go to step 4.

   Standard: 0- 0.4 mm (0.000- 0.015 in)

   Service Limit: 0.5 mm (0.019 in)

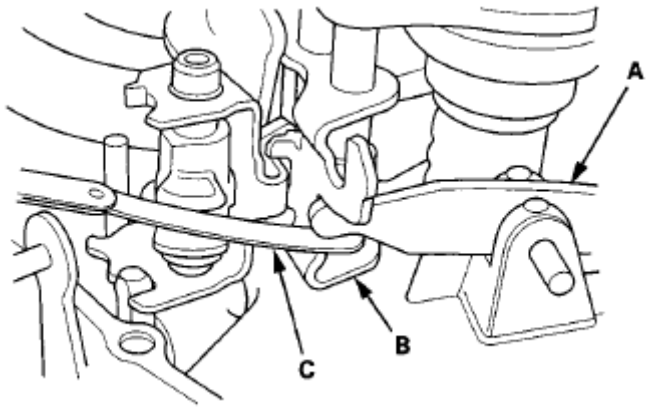

Fig. 137: Measuring Clearance Between Reverse Shift Lever And Reverse Shift Piece Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the width of the reverse shift lever.
   - If the width is not within the standard, replace the reverse shift lever.
   - If the width is within the standard, replace the reverse shift piece.

Standard: 13.0- 13.2 mm (0.512- 0.520 in)

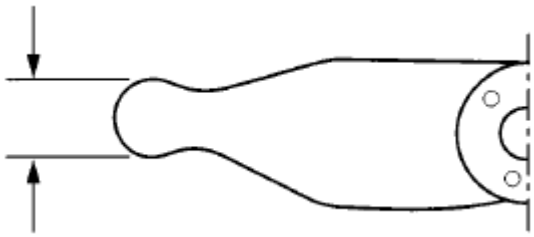

Fig. 138: Measuring Reverse Shift Lever Width
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SELECT ARM CLEARANCE INSPECTION

1. Measure the clearance between the select arm (A) and the interlock (B) with a feeler gauge (C). If the clearance exceeds the service limit, go to step 2.

   Standard: 0.05- 0.25 mm (0.002- 0.009 in)

   Service Limit: 0.5 mm (0.019 in)

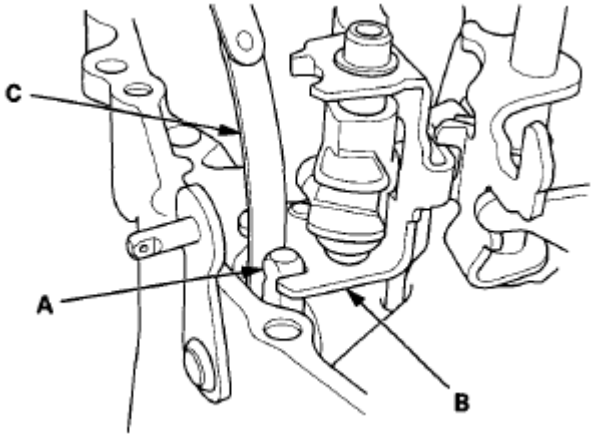

Fig. 139: Measuring Clearance Between Select Arm And Interlock Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the width of the select arm.
   - If the width is not within the standard, replace the select arm.
   - If the width is within the standard, replace the interlock.

   Standard: 12.9- 13.0 mm (0.508- 0.512 in)

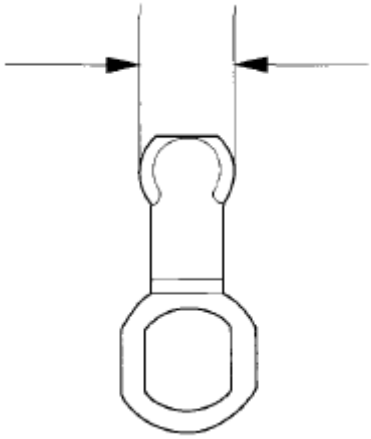

Fig. 140: Measuring Width Of Select Arm
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT ARM CLEARANCE INSPECTION

1. Measure the clearance between the shift arm (A) and the shift piece (B) with a feeler gauge (C). If the clearance exceeds the service limit, go to step 2.

   Standard: 0.26- 0.57 mm (0.010- 0.022 in)

   Service Limit: 0.75 mm (0.029 in)

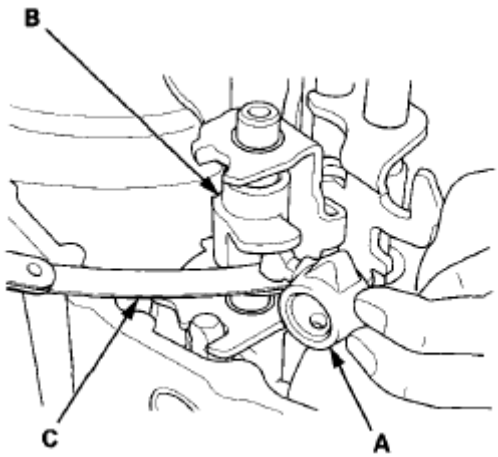

Fig. 141: Measuring Clearance Between Shift Arm And Shift Piece Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the width of the shift arm.
   - If the width is not within the standard, replace the shift arm.
   - If the width is within the standard, replace the shift piece.

   Standard: 13.6- 13.8 mm (0.535- 0.543 in)

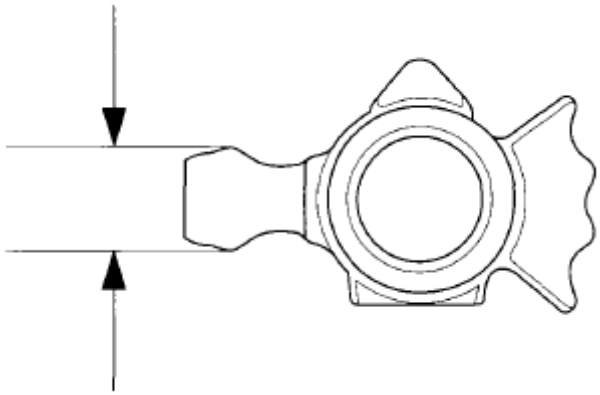

Fig. 142: Measuring Shift Arm Width
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OIL PUMP CLEARANCE INSPECTION

1. Measure the thrust clearance between the oil pump rotors (A) and the clutch housing (B) with a straight edge (C) and a feeler gauge (D).

   Standard (new): 0.03- 0.13 mm (0.001- 0.005 in)

   Service Limit: 0.15 mm (0.005 in)

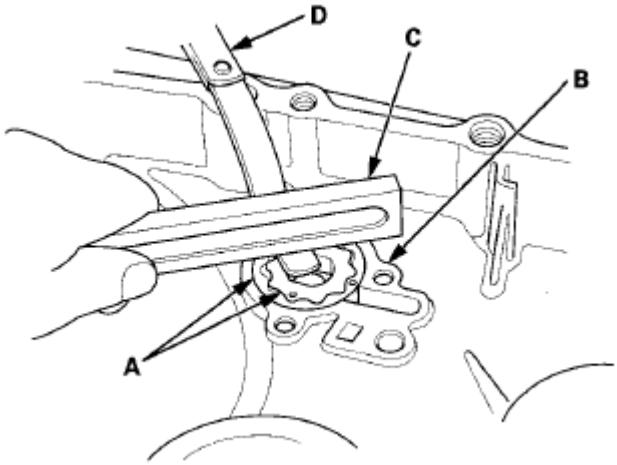

Fig. 143: Measuring Thrust Clearance Between Oil Pump Rotors And Clutch Housing Using Straight Edge And Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the side clearance between the oil pump outer rotor (A) and the clutch housing (B) with a feeler gauge (C).

   Standard (new): 0.1- 0.2 mm (0.004- 0.007 in)

Service Limit: 0.22 mm (0.008 in)

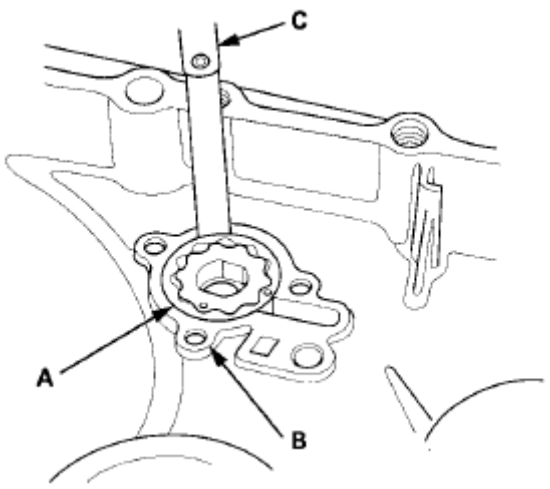

Fig. 144: Measuring Side Clearance Between Oil Pump Outer Rotor And Clutch Housing Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the side clearance between the oil pump outer rotor (A) and the oil pump inner rotor (B) with a feeler gauge (C).

   Standard (new): 0.14 mm (0.006 in) max.

   Service Limit: 0.2 mm (0.007 in)

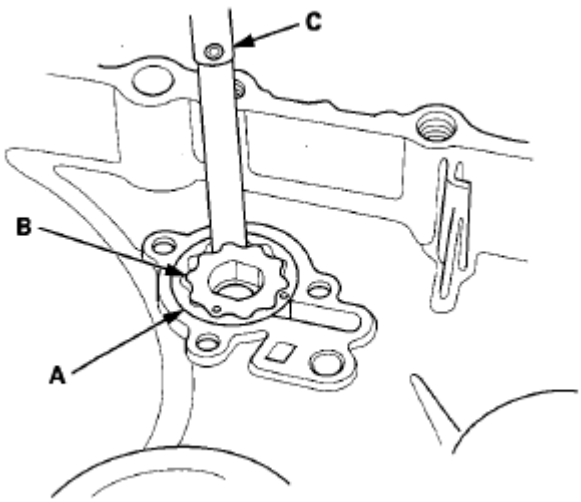

Fig. 145: Measuring Side Clearance Between Oil Pump Outer Rotor And Oil Pump Inner Rotor Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. If any clearance is not within the standard, replace the oil pump outer and inner rotors as a set.

SHIFT FORK CLEARANCE INSPECTION

1. Measure the clearance between each shift fork (A) and its matching synchro sleeve (B). If the clearance exceeds the service limit, go to step 2.

   Standard: 0.35- 0.65 mm (0.014- 0.025 in)

   Service Limit: 1.0 mm (0.039 in)

   1st/2nd, 3rd/4th, 5th/6th

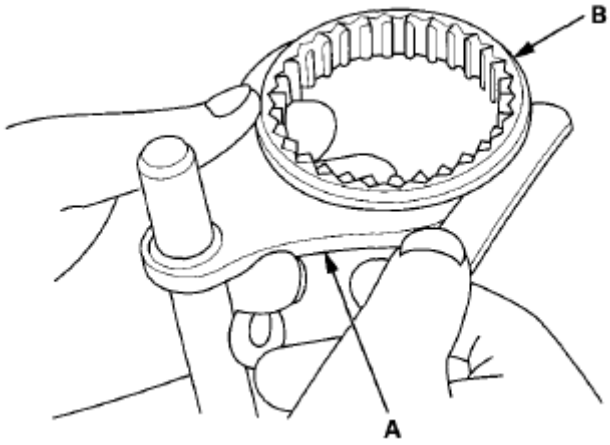

Fig. 146: Measuring Clearance Between Each Shift Fork And Its Matching Synchro Sleeve - 1st/2nd, 3rd/4th, 5th/6th
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Reverse

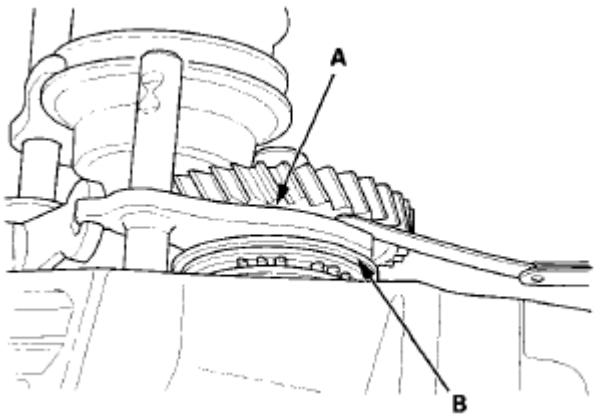

Fig. 147: Measuring Clearance Between Each Shift Fork And Its Matching Synchro Sleeve - Reverse
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the thickness of the shift fork fingers.
   - If the thickness is not within the standard, replace the shift fork.
   - If the thickness is within the standard, replace the synchro sleeve and the synchro hub as a set.
   - If one arm of the shift fork shows more wear than others, the fork may be bent and needs to be replaced.

   Standard:

   1st/2nd, 3rd/4th, 5th/6th:

   7.4-7.6 mm (0.291- 0.299 in)

   Reverse: 6.2- 6.4 mm (0.244- 0.252 in)

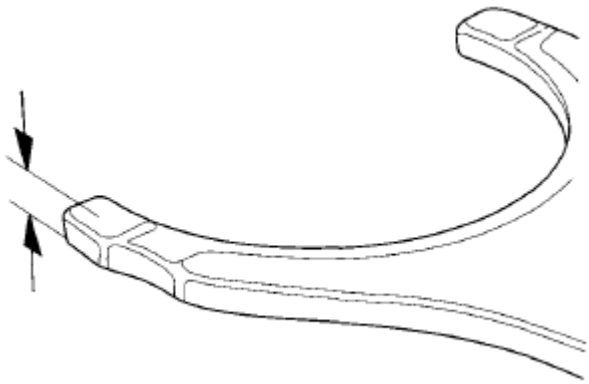

Fig. 148: Measuring Thickness Of Shift Fork Fingers
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the clearance between each shift fork (A) and the shift piece (B). If the clearance exceeds the service limit, go to step 4.

   Standard: 0.2- 0.6 mm (0.008- 0.023 in)

   Service Limit: 0.7 mm (0.027 in)

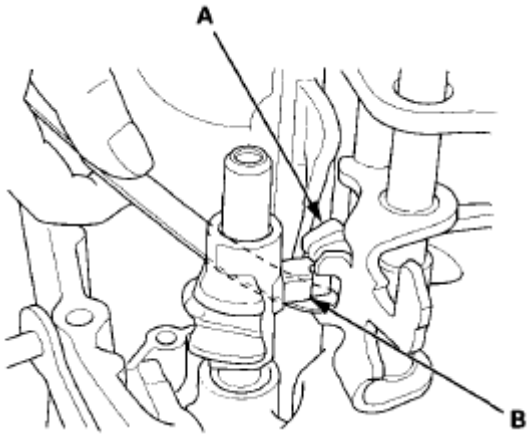

Fig. 149: Measuring Clearance Between Each Shift Fork And Shift Piece
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the width of the shift piece.
   - If the width is not within the standard, replace the shift piece.
   - If the width is within the standard, replace the shift fork.

   Standard: 12.8- 13.0 mm (0.504- 0.512 in)

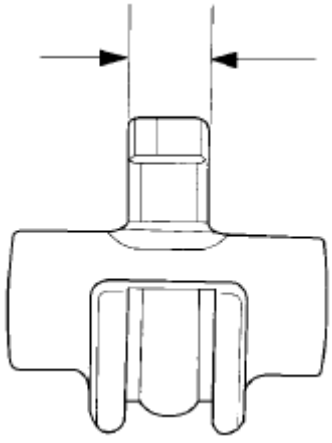

Fig. 150: Measuring Width Of Shift Piece
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT FORK DISASSEMBLY/REASSEMBLY

NOTE: **Prior to reassembling, clean all parts in solvent, dry them, and apply MTF to all contact surfaces.**

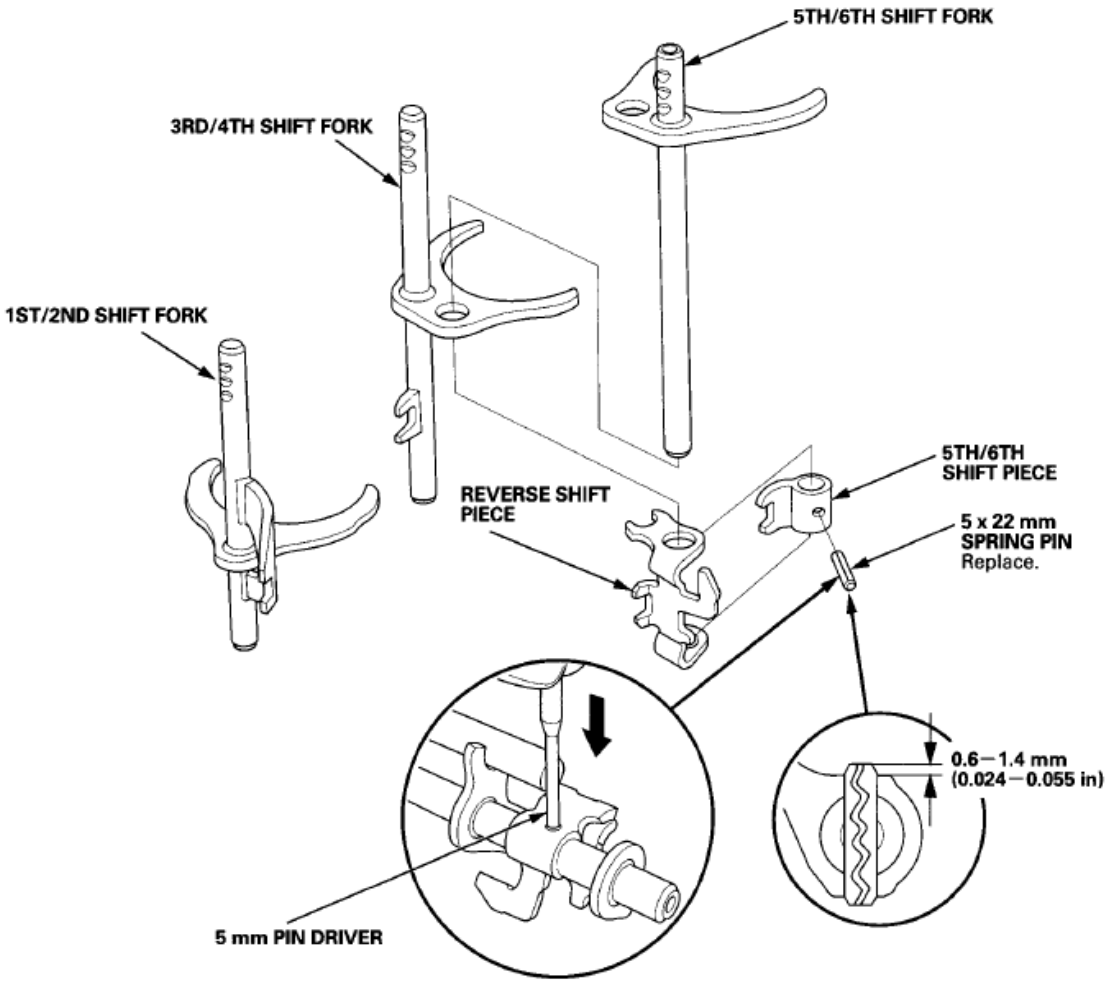

Fig. 151: Identifying Shift Fork Disassembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINSHAFT ASSEMBLY CLEARANCE INSPECTION

1. Support the bearing inner race with an appropriate sized socket (A), and push down on the mainshaft (B).

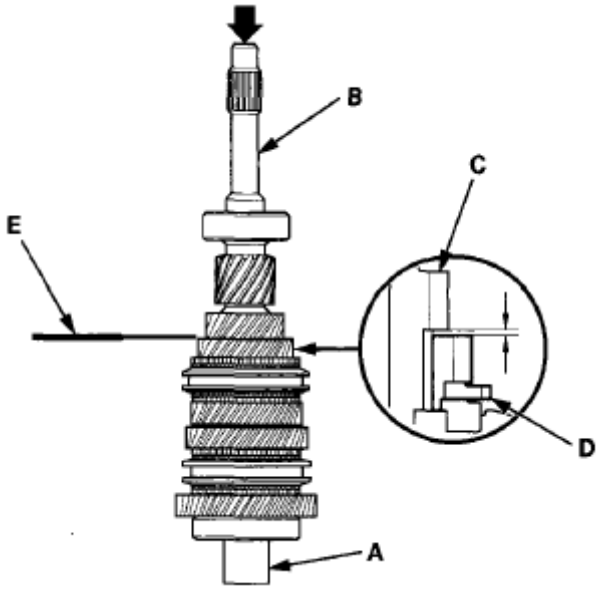

Fig. 152: Measuring Clearance Between 2nd Gear And 3rd Gear Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the clearance between 2nd gear (C) and 3rd gear (D) with a feeler gauge (E).
   - If the clearance exceeds the service limit, go to step 3.
   - If the clearance is within the service limit, go to step 4.

   Standard: 0.06- 0.19 mm (0.002- 0.007 in)

   Service Limit: 0.3 mm (0.011 in)

3. Measure the thickness of 3rd gear.
   - If the thickness is less than the service limit, replace 3rd gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub and the 3rd/4th synchro sleeve as a set.

   Standard: 23.89- 23.97 mm (0.9405- 0.9437 in)

   Service Limit: 23.8 mm (0.937 in)

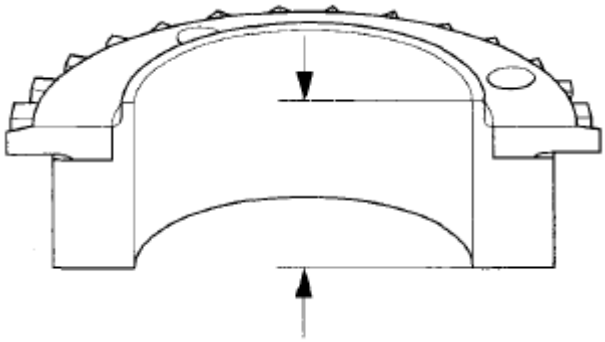

Fig. 153: Measuring Thickness Of 3rd Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the clearance between 4th gear (A) and the 4th/5th gear distance collar (B) with a dial indicator (C).
   - If the clearance exceeds the service limit, go to step 5.
   - If the clearance is within the service limit, go to step 7.

   Standard: 0.06- 0.19 mm (0.0024- 0.0075 in)

   Service Limit: 0.3 mm (0.012 in)

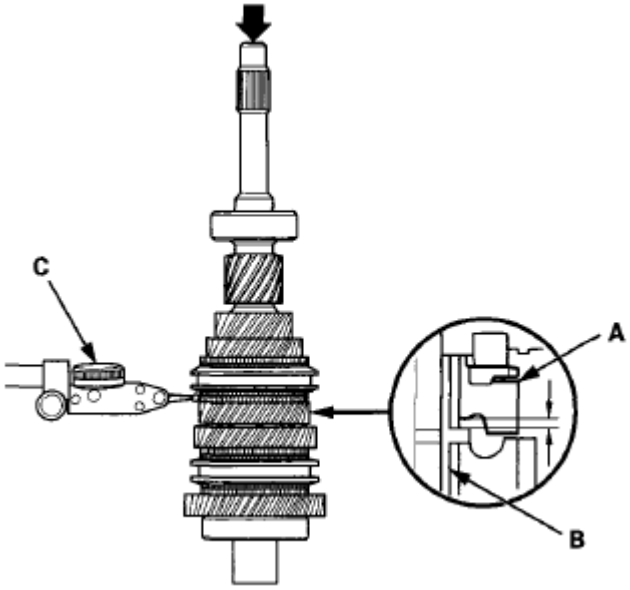

Fig. 154: Measuring Clearance Between 4th Gear And 4th/5th Gear Distance Collar Using Dial Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the length (1) of the 4th/5th gear distance collar as shown.
   - If the length (1) is not within the standard, replace the 4th/5th gear distance collar.
   - If the length (1) is within the standard, go to step 6.

Standard: 22.53- 22.58 mm (0.8870- 0.8890 in)

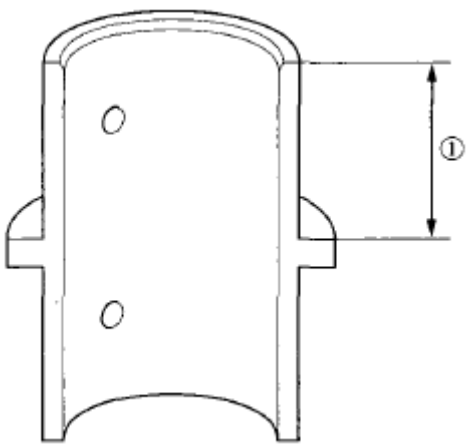

Fig. 155: Measuring Length Of 4th/5th Gear Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure the thickness of 4th gear.
   - If the thickness is less than the service limit, replace 4th gear.
   - If the thickness is within the service limit, replace the 3rd/4th synchro hub and the 3rd/4th synchro sleeve as a set.

   Standard: 22.39- 22.47 mm (0.8815- 0.8846 in)

   Service Limit: 22.3 mm (0.878 in)

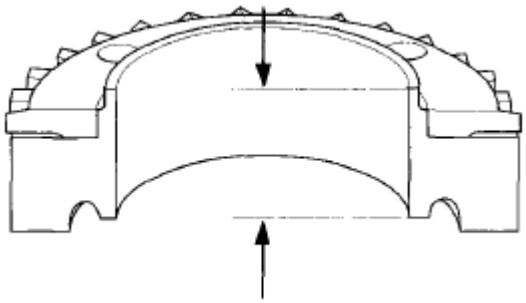

Fig. 156: Measuring Thickness Of 4th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Measure the clearance between the 4th/5th gear distance collar (A) and 5th gear (B) with a dial indicator (C).
   - If the clearance exceeds the service limit, go to step 8.
   - If the clearance is within the service limit, go to step 10.

   Standard: 0.06- 0.19 mm (0.0024- 0.0075 in)

Service Limit: 0.3 mm (0.012 in)

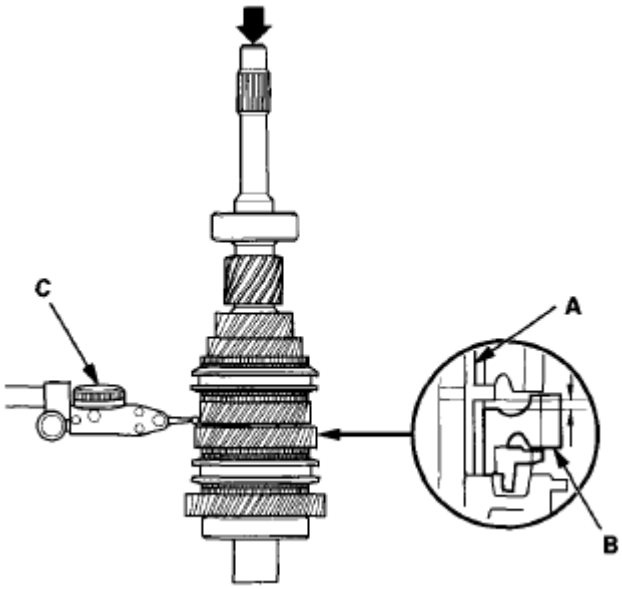

Fig. 157: Measuring Clearance Between 4th/5th Gear Distance Collar And 5th Gear Using Dial Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Measure the length (2) of the 4th/5th gear distance collar as shown.
   - If the length (2) is not within the standard, replace the 4th/5th gear distance collar.
   - If the length (2) is within the standard, go to step 9.

Standard: 22.53- 22.58 mm (0.8870- 0.8890 in)

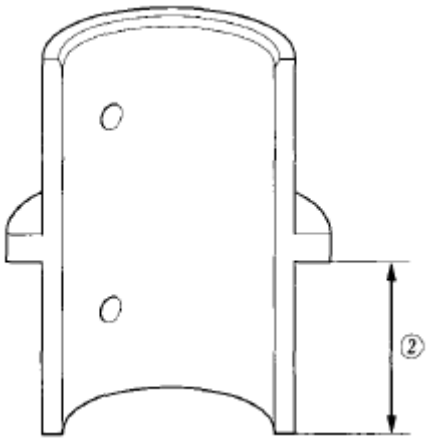

Fig. 158: Measuring Length Of 4th/5th Gear Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Measure the thickness of 5th gear.

- If the thickness is less than the service limit, replace 5th gear.
- If the thickness is within the service limit, replace the 5th/6th synchro hub and the 5th/6th synchro sleeve as a set.

Standard: 22.39- 22.47 mm (0.8815- 0.8846 in)

Service Limit: 22.3 mm (0.878 in)

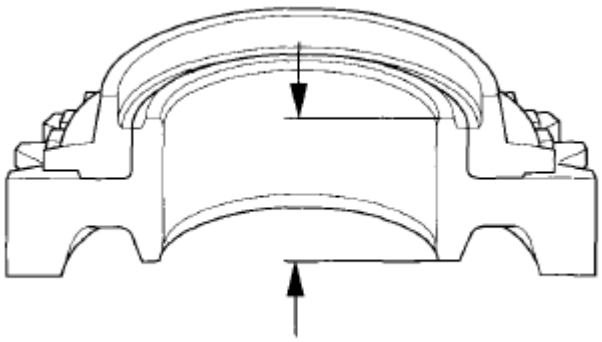

Fig. 159: Measuring Thickness Of 5th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Measure the clearance between 6th gear (A) and the angular ball bearing inner race (B) with a dial indicator (C). If the clearance exceeds the service limit, go to step 11.

Standard: 0.06- 0.19 mm (0.0024- 0.0075 in)

Service Limit: 0.3 mm (0.012 in)

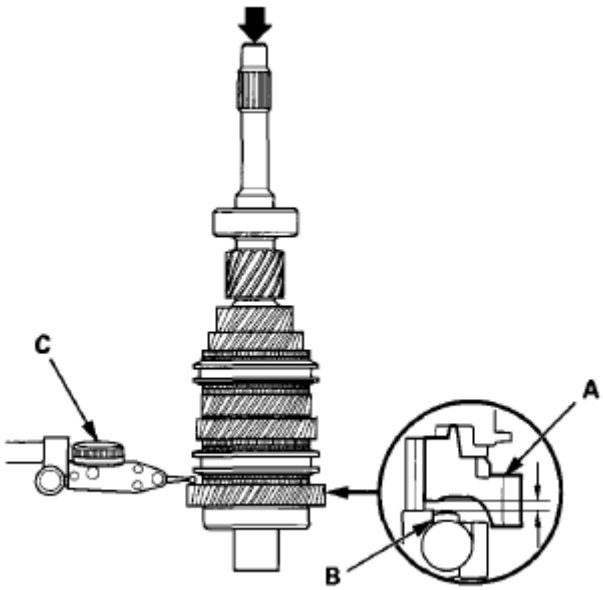

Fig. 160: Measuring Clearance Between 6th Gear And Angular Ball Bearing Inner Race Using Dial

Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Measure the length of the 6th gear distance collar.
    - If the length is not within the standard, replace the 6th gear distance collar.
    - If the length is within the standard, go to step 12.

    Standard: 26.03- 26.08 mm (1.0248- 1.0268 in)

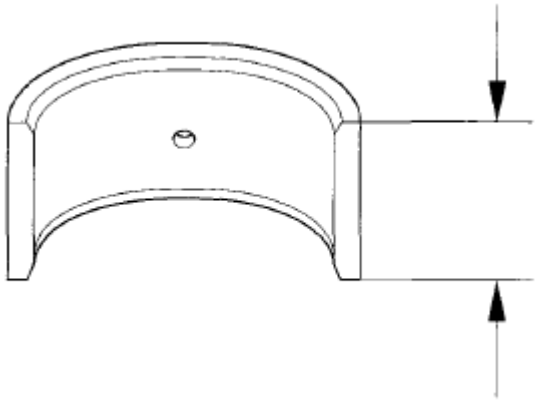

Fig. 161: Measuring Length Of 6th Gear Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Measure the thickness of 6th gear.
    - If the thickness is less than the service limit, replace 6th gear.
    - If the thickness is within the service limit, replace the 5th/6th synchro hub and the 5th/6th synchro sleeve as a set.

    Standard: 25.89- 25.97 mm (1.0193- 1.0224 in)

    Service Limit: 25.8 mm (1.016 in)

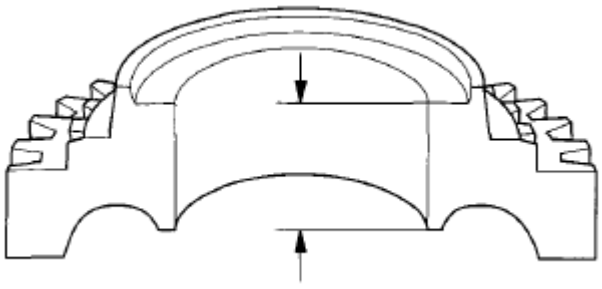

Fig. 162: Measuring Thickness Of 6th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINSHAFT DISASSEMBLY

NOTE: Refer to the EXPLODED VIEW in the Mainshaft Reassembly, as needed, when removing components pressed onto the mainshaft (see MAINSHAFT REASSEMBLY).

1. Support 6th gear (A) on steel blocks, and press the mainshaft out of the angular ball bearing (B) and 6th gear using an attachment (C) and a press (D).

NOTE: Do not use a jaw-type puller; it can damage the gear teeth.

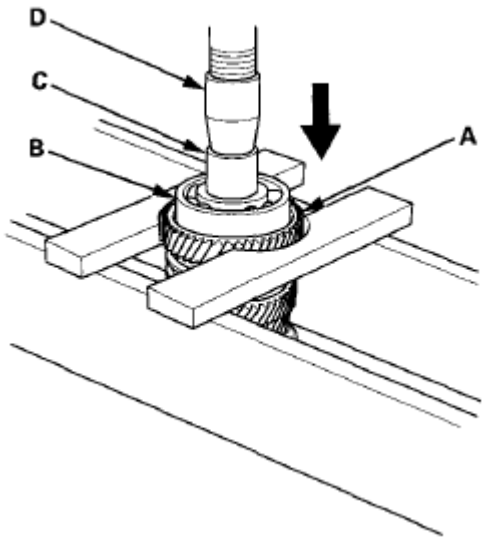

Fig. 163: Supporting 6th Gear On Steel Blocks And Pressing Mainshaft Out Of Angular Ball Bearing And 6th Gear Using Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Support 5th gear (A) on steel blocks, and press the mainshaft out of the 5th/6th synchro hub (B) and 5th gear using an attachment (C) and a press (D).

NOTE: Do not use a jaw-type puller; it can damage the gear teeth.

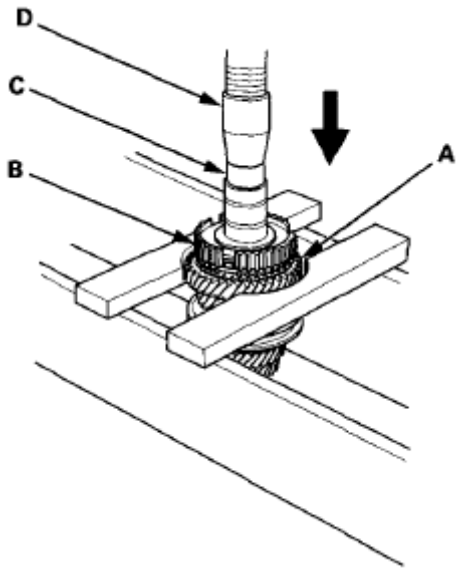

Fig. 164: Supporting 5th Gear On Steel Blocks And Press Mainshaft Out Of 5th/6th Synchro Hub And 5th Gear Using Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Support 3rd gear (A) on steel blocks, and press the mainshaft out of the 3rd/4th synchro hub (B) and 3rd gear using an attachment (C) and a press (D).

NOTE: Do not use a jaw-type puller; it can damage the gear teeth.

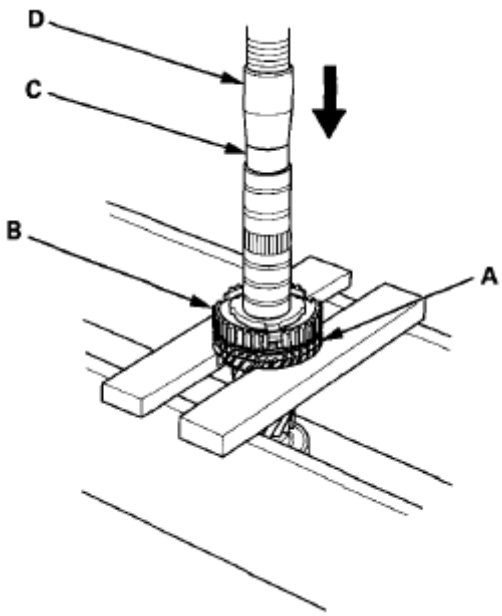

Fig. 165: Supporting 3rd Gear On Steel Blocks And Pressing Mainshaft Out Of 3rd/4th Synchro Hub And 3rd Gear Using Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Support the angular ball bearing (A) on steel blocks, and press out the mainshaft using an attachment (B) and a press (C).

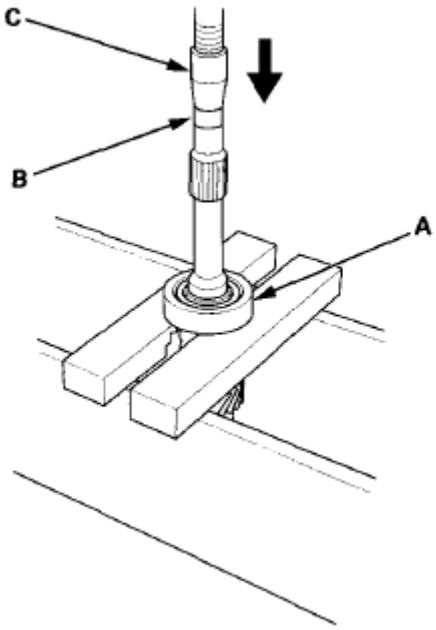

Fig. 166: Supporting Angular Ball Bearing On Steel Block And Pressing Out Mainshaft Using Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINSHAFT INSPECTION

1. Inspect the oil passage, gear, and bearing contact areas for wear and damage, then measure the mainshaft at points A, B, C, D, E, and F. If any part of the mainshaft is less than the service limit, replace it.

   Standard:

   A. **Ball Bearing Contact Area (Transmission Housing Side): 38.984- 39.000 mm (1.53480- 1.53543 in)**
   B. **6th Gear Distance Collar Contact Area: 38.984- 39.000 mm (1.53480- 1.53543 in)**
   C. **4th/5th Gear Distance Collar Contact Area: 41.984- 42.000 mm (1.65291- 1.65354 in)**
   D. **Needle Bearing Contact Area: 47.984- 48.000 mm (1.88913- 1.88976 in)**
   E. **Ball Bearing Contact Area (Clutch Housing Side): 28.002- 28.015 mm (1.10244- 1.10295 in)**
   F. **Pilot Bearing Contact Area: 19.967- 19.980 mm (0.78610- 0.78661 in)**

   Service Limit:

   A. **38.93 mm (1.5327 in)**
   B. **38.93 mm (1.5327 in)**
   C. **41.93 mm (1.6508 in)**

D. **47.93 mm (1.8870 in)**
E. **27.95 mm (1.1004 in)**
F. **19.91 mm (0.7839 in)**

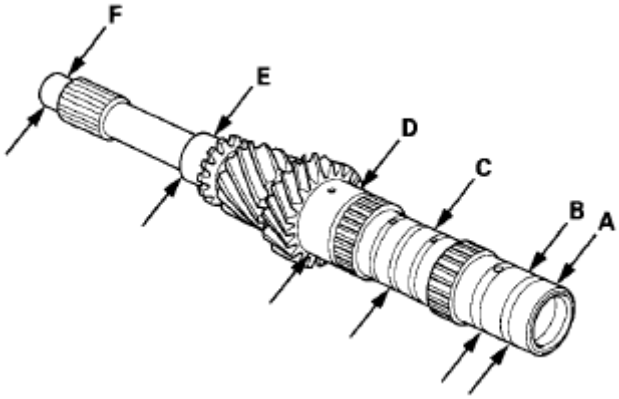

Fig. 167: Identifying Points On Mainshaft From Where Its To Be Check For Service Limit
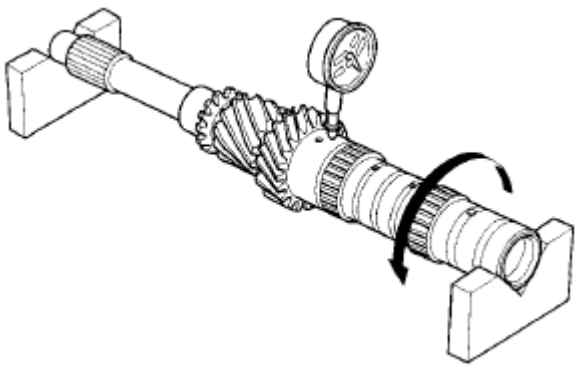
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the runout by supporting both ends of the mainshaft. Then rotate the mainshaft two complete turns while measuring with a dial gauge. If the runout exceeds the service limit, replace the mainshaft.

   Standard: 0.02- mm (0.0008 in) max.

   Service Limit: 0.05 mm (0.0020 in)



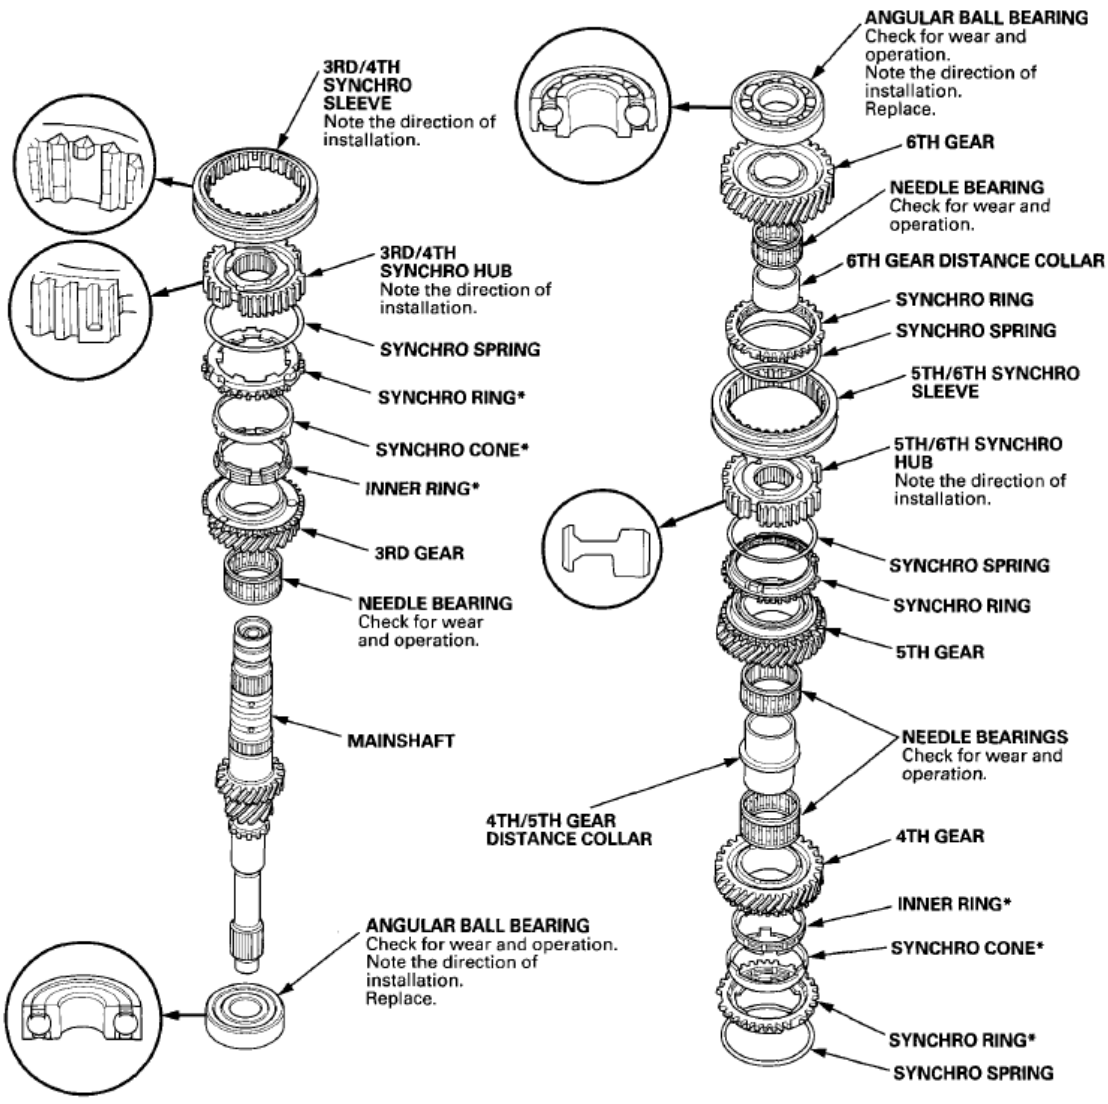


Fig. 168: Measuring Mainshaft Runout Using Dial Gauge

MAINSHAFT REASSEMBLY

EXPLODED VIEW

*: The components of the double cone synchro assembly.

Fig. 169: Exploded View Of Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Special Tools Required

- Driver Handle, 40 mm I.D. 07746-0030100
- Driver, 30 mm I.D. 07946-MB00000

NOTE: Refer to the EXPLODED VIEW, as needed, during this procedure.

1. Clean all parts in solvent, dry them, and apply MTF to all contact surfaces.
2. Press in a new angular ball bearing (A) using the 30 mm I.D. driver (B) and a press (C).

NOTE: Check the ball bearing install direction.

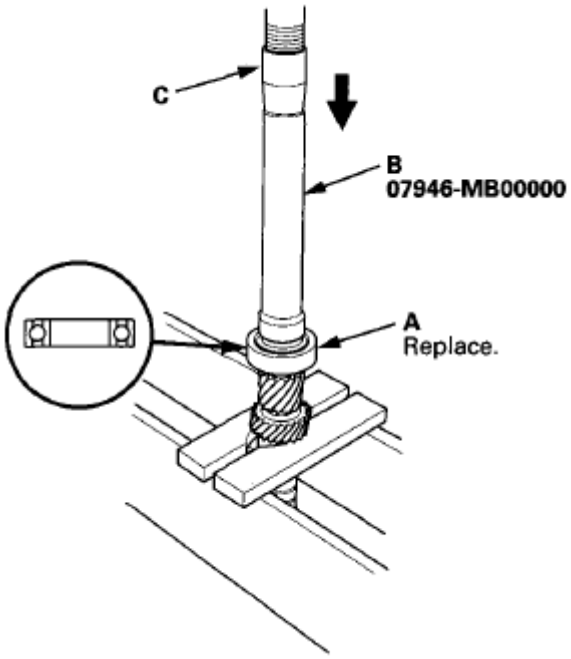

Fig. 170: Pressing Angular Ball Bearing Using I.D. Driver And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the needle bearing (A) and 3rd gear (B) onto the mainshaft (C).

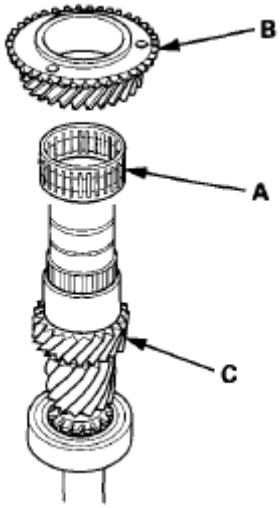

Fig. 171: Identifying Needle Bearing, 3rd Gear And Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the double cone synchro assembly (A) with the synchro spring (B) by aligning the synchro cone fingers (C) with the holes (D) in 3rd gear.

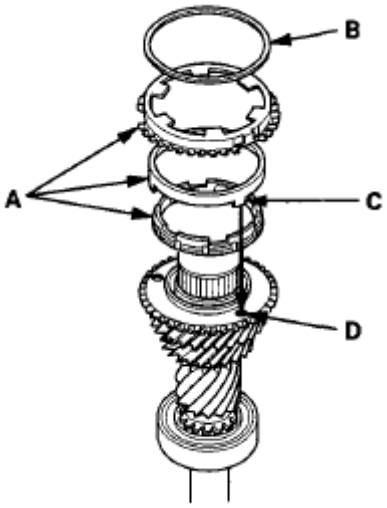

Fig. 172: Identifying Double Cone Synchro Assembly, Synchro Spring, Synchro Cone Fingers And Holes In 3rd Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the 3rd/4th synchro hub (A) by aligning the synchro ring fingers (B) with the grooves (C) in the 3rd/4th synchro hub.

NOTE: Make sure to install the 3rd/4th synchro hub in the direction shown.

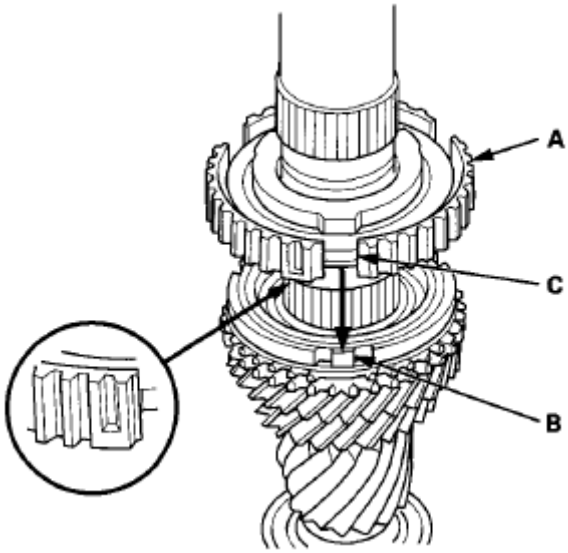

Fig. 173: Identifying 3rd/4th Synchro Hub, Synchro Ring Fingers And Grooves
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Press on the 3rd/4th synchro hub (A) using the 40 mm I.D. driver handle (B) and a press (C).

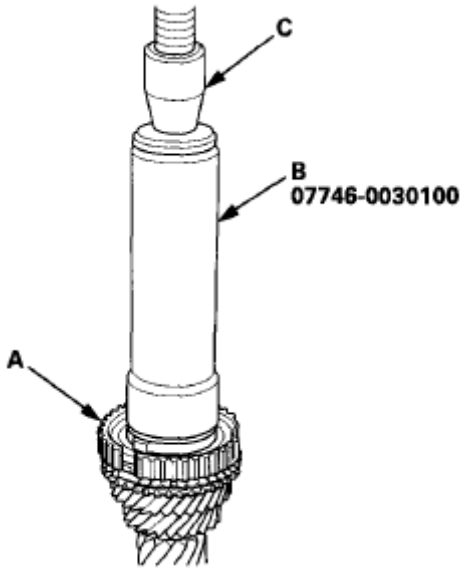

Fig. 174: Identifying 3rd/4th Synchro Hub, I.D. Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the 3rd/4th synchro sleeve (A) by aligning the stops (B) of the 3rd/4th synchro sleeve and the 3rd/4th synchro hub. After installing, check the operation of the 3rd/4th synchro hub set.

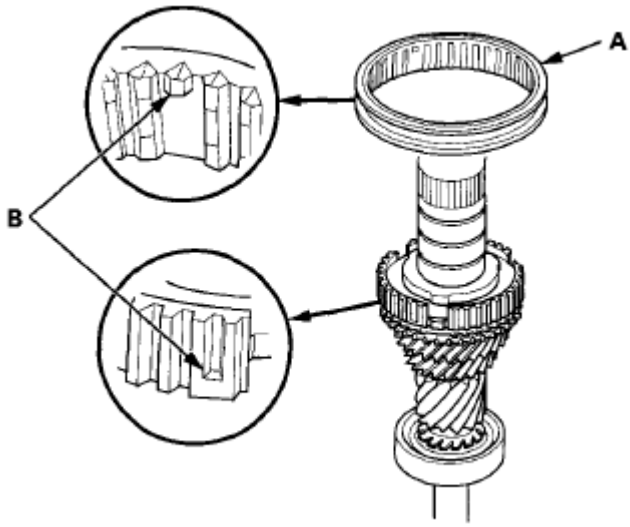

Fig. 175: Identifying 3rd/4th Synchro Sleeve And Stops Of 3rd/4th Synchro Sleeve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the double cone synchro assembly (A) with the synchro spring (B) by aligning the synchro ring fingers (C) with the grooves (D) in the 3rd/4th synchro hub.

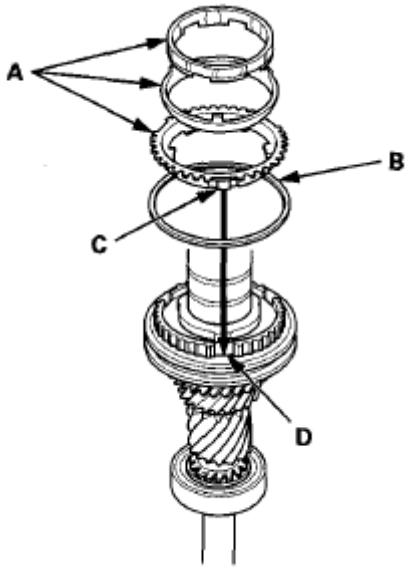

Fig. 176: Identifying Double Cone Synchro Assembly, Synchro Spring, Synchro Ring Fingers And Grooves In 3rd/4th Synchro Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install 4th gear (A) by aligning the synchro cone fingers (B) with the holes (C) in 4th gear.

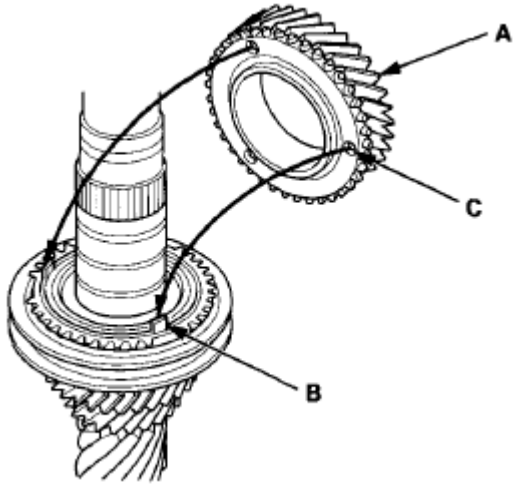

Fig. 177: Identifying 4th Gear, Synchro Cone Fingers And Holes In 4th Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Install the 4th/5th gear distance collar (A) with the needle bearings (B) and 5th gear (C).

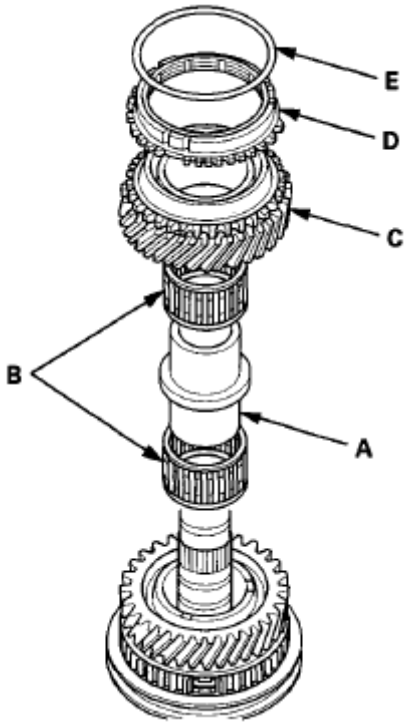

Fig. 178: Identifying 4th/5th Gear Distance Collar, Needle Bearings, 5th Gear, Synchro Ring And Synchro Spring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the synchro ring (D) with the synchro spring (E) onto 5th gear.
12. Install the 5th/6th synchro hub (A) by aligning the synchro ring fingers (B) with the grooves (C) in the 5th/6th synchro hub.

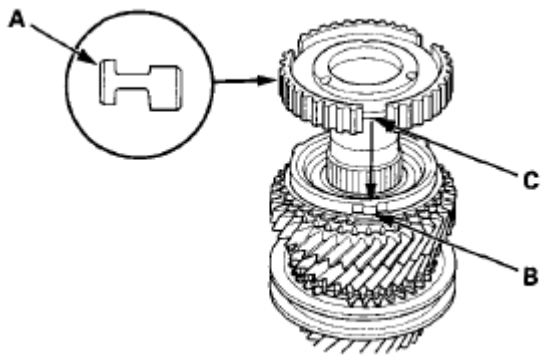

Fig. 179: Identifying 5th/6th Synchro Hub, Synchro Ring Fingers And Grooves In 5th/6th Synchro Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Press on the 5th/6th synchro hub (A) using the 40 mm I.D. driver handle (B) and a press (C).

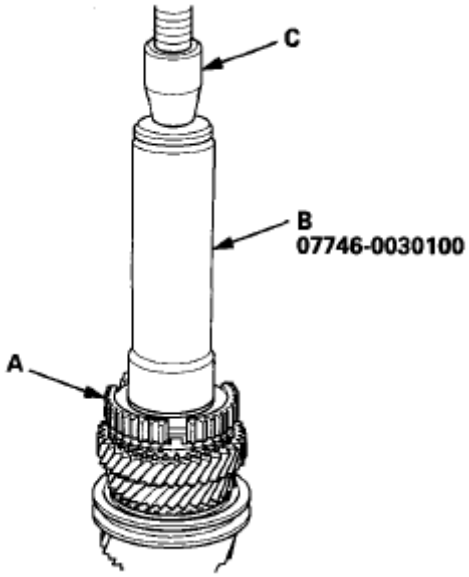

Fig. 180: Identifying 5th/6th Synchro Hub, I.D. Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the 5th/6th synchro sleeve (A) by aligning the slots of the 5th/6th synchro sleeve and the 5th/6th synchro hub (B). After installing, check the operation of the 5th/6th synchro hub set.

NOTE: Make sure to align the slots in the 5th/6th synchro sleeve as shown.

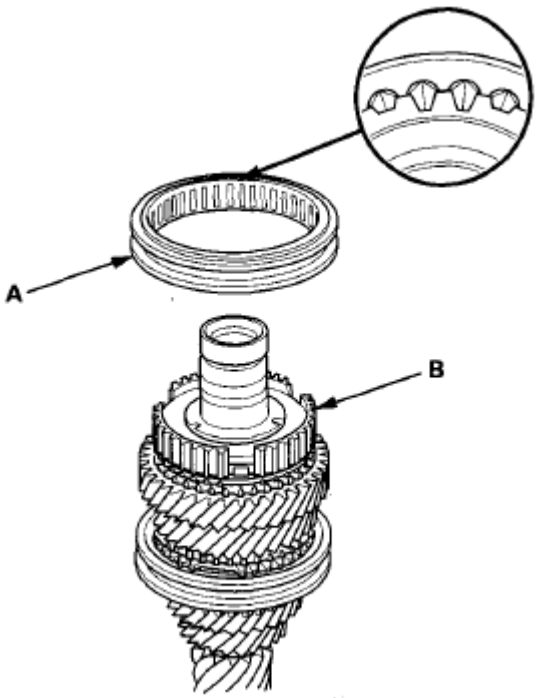

Fig. 181: Identifying 5th/6th Synchro Sleeve And Synchro Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Install the synchro ring (A) with the synchro spring (B) by aligning the synchro ring fingers (C) with the grooves (D) in the 5th/6th synchro hub.

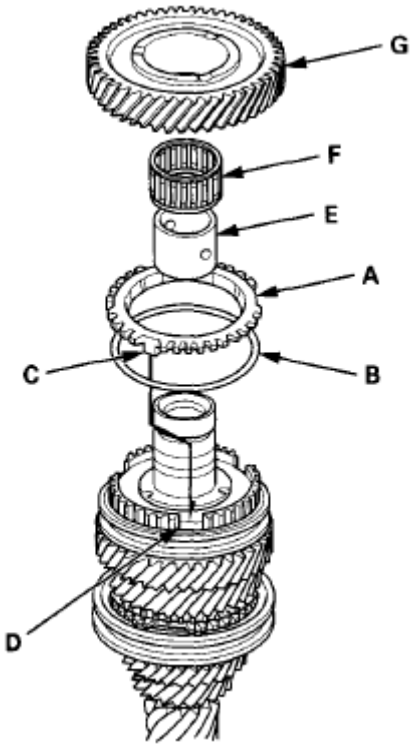

Fig. 182: Identifying Synchro Ring, Synchro Spring, Synchro Ring Fingers, Needle Bearing, 6th Gear, 6th Gear Distance Collar And Grooves In 5th/6th Synchro Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Install the 6th gear distance collar (E) with the needle bearing (F) and 6th gear (G).
17. Press on a new angular ball bearing (A) using the 40 mm I.D. driver handle (B) and a press (C).

NOTE: Check the ball bearing install direction.

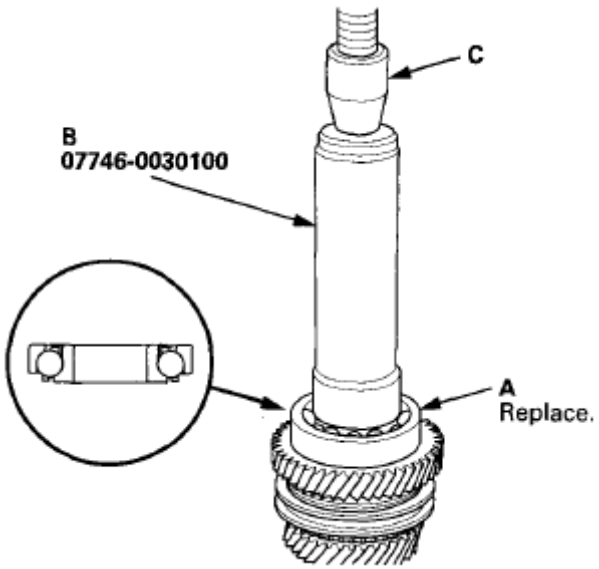

Fig. 183: Identifying Angular Ball Bearing, I.D. Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT ASSEMBLY CLEARANCE INSPECTION

NOTE: Before inspection, make sure the special bolt is tightened to the specified torque (see COUNTERSHAFT REASSEMBLY).

1. Measure the clearance between 1st gear (A) and the countershaft reverse gear (B) with a dial indicator (C).
   - If the clearance exceeds the service limit, go to step 2.
   - If the clearance is within the service limit, go to step 4.

   Standard: 0.04- 0.17 mm (0.0016- 0.0067 in)

   Service Limit: 0.28 mm (0.0110 in)

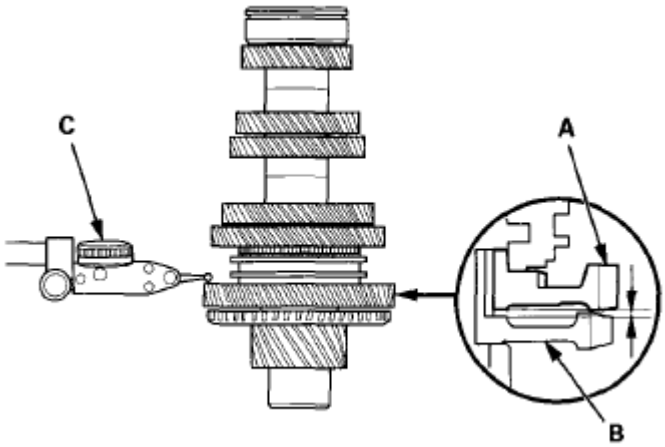

Fig. 184: Measuring Clearance Between 1st Gear And Countershaft Reverse Gear Using Dial Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the length of the countershaft reverse gear as shown.
   - If the length is not within the standard, replace the countershaft reverse gear.
   - If the length is within the standard, go to step 3.

   Standard: 23.03- 23.08 mm (0.9067- 0.9087 in)

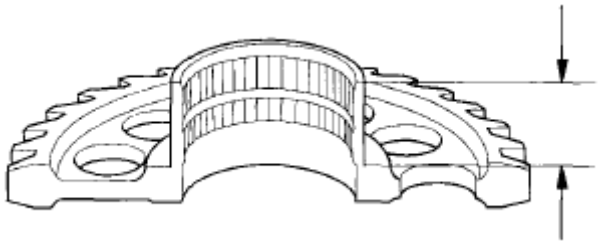

Fig. 185: Measuring Length Of Countershaft Reverse Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the thickness of 1st gear.
   - If the thickness is less than the service limit, replace 1st gear.
   - If the thickness within the service limit, replace the 1st/2nd synchro hub and the 1st/2nd synchro sleeve as a set.

   Standard: 22.91- 22.99 mm (0.9020- 0.9051 in)

   Service Limit: 22.86 mm (0.9000 in)

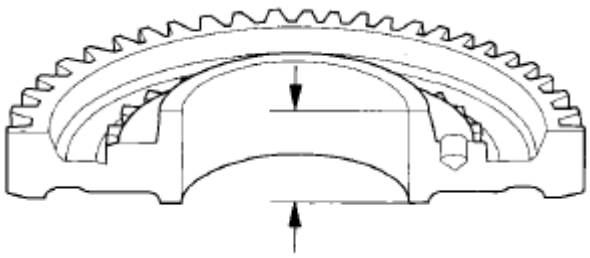

Fig. 186: Measuring Thickness Of 1st Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Measure the clearance between 2nd gear (A) and 3rd gear (B) with a feeler gauge (C). If the clearance exceeds the service limit, go to step 5.

   Standard: 0.04- 0.17 mm (0.002- 0.006 in)

   Service Limit: 0.28 mm (0.011 in)

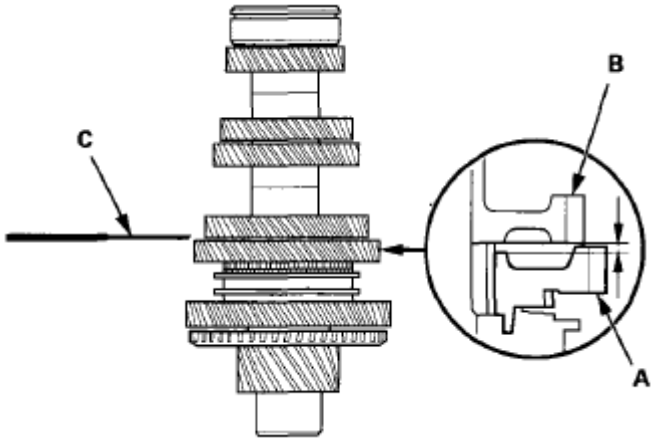

Fig. 187: Measuring Clearance Between 2nd Gear And 3rd Gear Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Measure the length of the 2nd gear distance collar.
   - If the length is not within the standard, replace the 2nd gear distance collar.
   - If the length is within the standard, go to step 6.

   Standard: 23.03- 23.08 mm (0.9067- 0.9087 in)

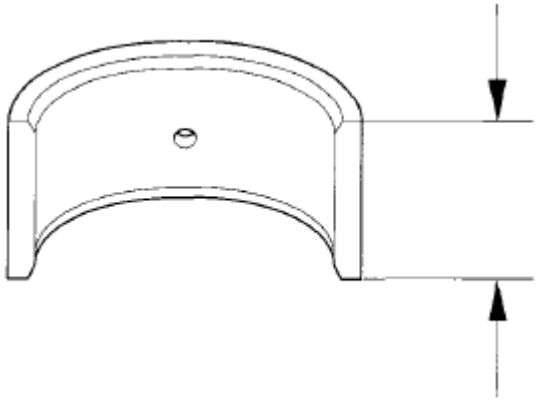

Fig. 188: Measuring Length Of 2nd Gear Distance Collar
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure the thickness of 2nd gear as shown.
   - If the thickness is less than the service limit, replace 2nd gear.
   - If the thickness is within the service limit, replace the 1st/2nd synchro hub and the 1st/2nd synchro sleeve as a set.

   Standard: 22.91- 22.99 mm (0.9020- 0.9051 in)

   Service Limit: 22.86 mm (0.9000 in)

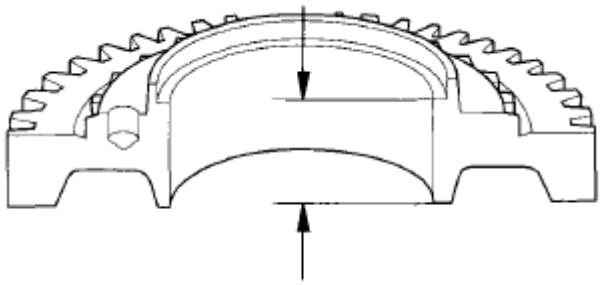

Fig. 189: Measuring Thickness Of 2nd Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT DISASSEMBLY

NOTE: Refer to the EXPLODED VIEW in the Countershaft Reassembly, as needed, when removing components pressed onto the countershaft (see COUNTERSHAFT REASSEMBLY).

1. Securely clamp the countershaft assembly in a bench vise with wood blocks.

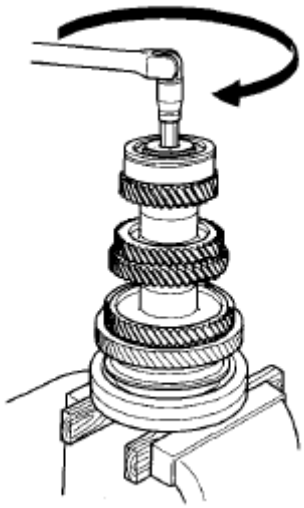

Fig. 190: Securely Clamping Countershaft Assembly In Bench Vise With Wood Blocks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the special bolt (left-hand threads).
3. Support 6th gear (A) on steel blocks, and press the countershaft (B) out of the ball bearing and 6th gear using an attachment (C) and a press (D).

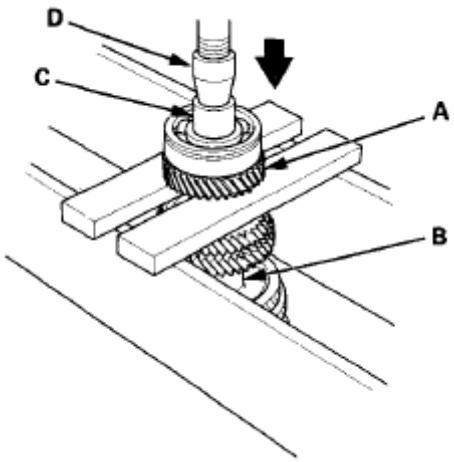

Fig. 191: Supporting 6th Gear On Steel Blocks And Press Countershaft Out Of Ball Bearing And 6th Gear Using Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Remove the 35 mm shim.
5. Support 4th gear (A) on steel blocks, and press the countershaft (B) out of 4th gear and 5th gear using an attachment (C) and a press (D).

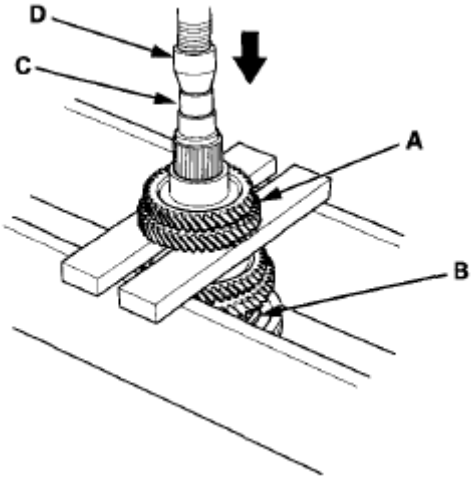

Fig. 192: Supporting 4th Gear On Steel Blocks And Press Countershaft Out Of 4th Gear And 5th Gear Using Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Support 2nd gear (A) on steel blocks, and press the countershaft (B) out of 2nd gear and 3rd gear using an attachment (C) and a press (D).

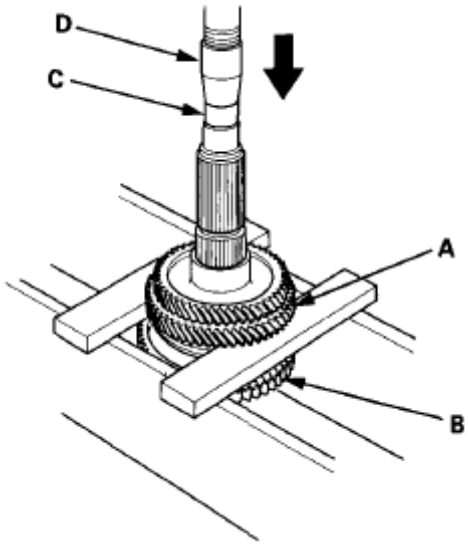

Fig. 193: Supporting 2nd Gear On Steel Blocks And Pressing Countershaft Out Of 2nd Gear And 3rd Gear Using Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT INSPECTION

1. Inspect the oil passage, gear, and bearing contact areas for wear and damage, then measure the countershaft at points A, B, C, and D. If any part of the countershaft is less than the service limit, replace it.

   Standard:

   A. **Ball Bearing Contact Area (Transmission Housing Side): 30.002- 30.015 mm (1.18118- 1.18169 in)**
   B. **2nd Gear Distance Collar Contact Area: 42.975- 42.991 mm (1.69193- 1.69256 in)**
   C. **Countershaft Reverse Gear Contact Area: 45.934- 45.950 mm (1.80842- 1.80905 in)**
   D. **Needle Bearing Contact Area (Clutch Housing Side): 43.974- 43.990 mm (1.73126- 1.73189 in)**

   Service Limit:

   A. **29.95 mm (1.1791 in)**
   B. **42.92 mm (1.6898 in)**
   C. **45.88 mm (1.8063 in)**
   D. **43.92 mm (1.7291 in)**

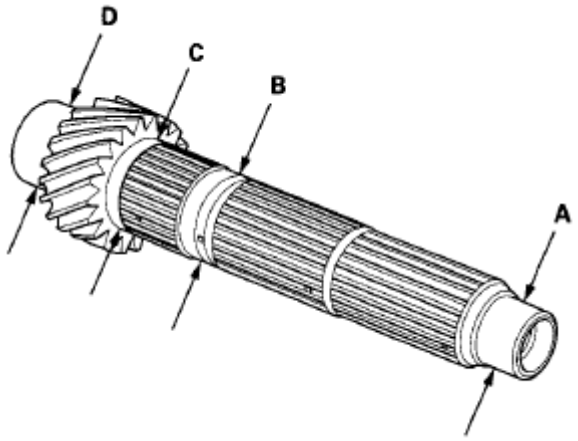

Fig. 194: Identifying Countershaft Contact Areas
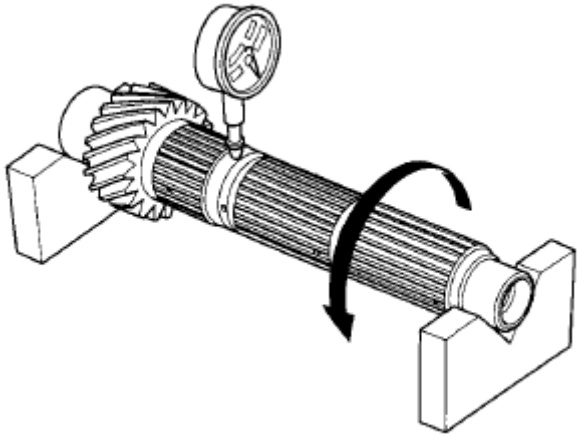
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the runout by supporting both ends of the countershaft. Then rotate the countershaft two complete turns while measuring with a dial gauge. If the runout exceeds the service limit, replace the countershaft.

   Standard: 0.02 mm (0.0008 in) max.

   Service Limit: 0.05 mm (0.0020 in)



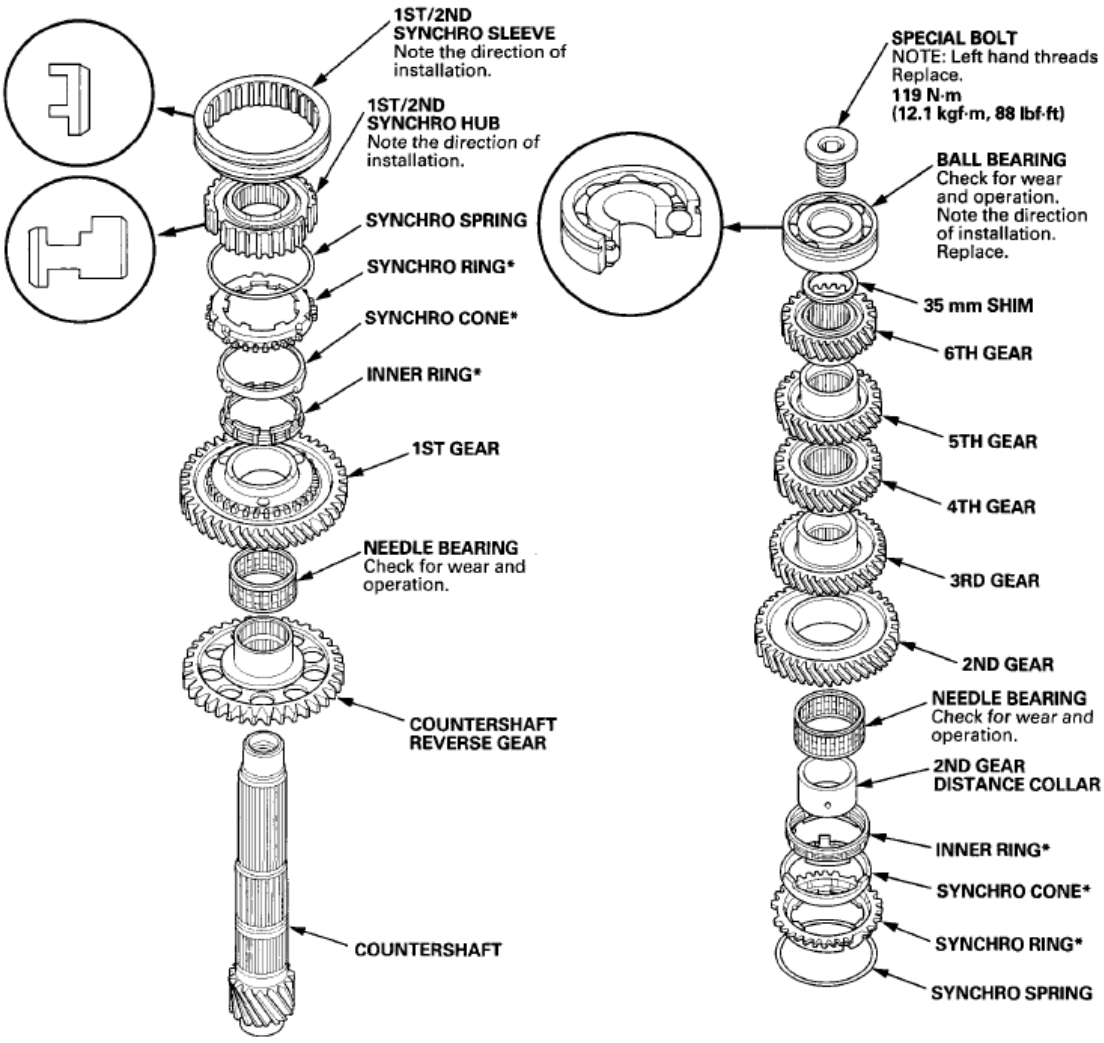


Fig. 195: Measuring Runout Of Countershaft Using Dial Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT REASSEMBLY

EXPLODED VIEW

*: The components of the triple cone synchro assembly.

Fig. 196: Exploded View Of Countershaft With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Special Tools Required

- Driver, 58 x 62 mm 070AD-PYZA100
- Driver Handle, 40 mm I.D. 07746-0030100

NOTE: Refer to the EXPLODED VIEW, as needed, during this procedure.

1. Clean all parts in solvent, dry them, and apply MTF to all contact surfaces.
2. Install the countershaft reverse gear (A) with the needle bearing (B), and 1st gear (C) onto the countershaft (D).

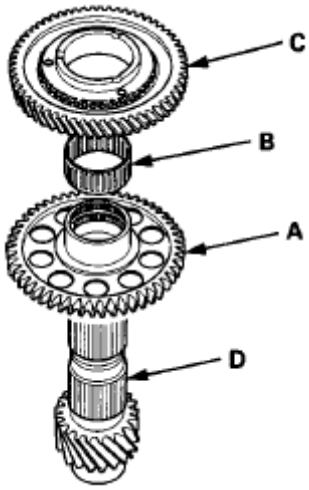

Fig. 197: Identifying Countershaft Reverse Gear, Needle Bearing, 1St Gear And Countershaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the triple cone synchro assembly (A) with the synchro spring (B) by aligning the synchro cone fingers (C) with the holes (D) in 1st gear.

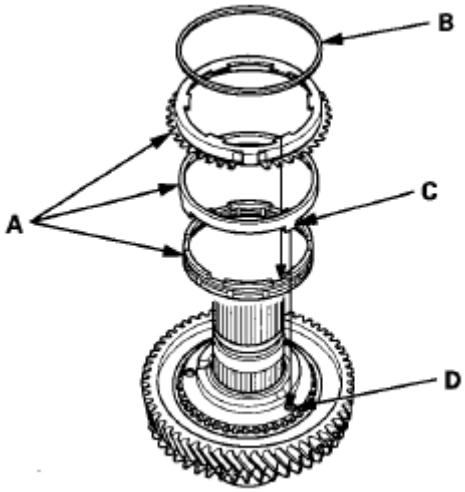

Fig. 198: Identifying Triple Cone Synchro Assembly, Synchro Spring, Synchro Cone Fingers And Holes In 1st Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the 1st/2nd synchro hub (A) by aligning the synchro ring fingers (B) with the grooves (C) in the 1st/2nd synchro hub.

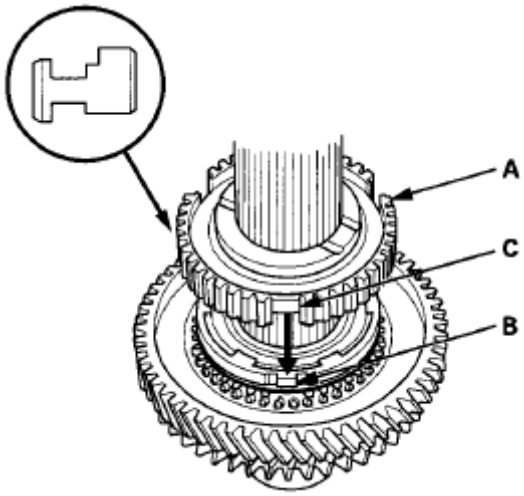

Fig. 199: Identifying 1st/2nd Synchro Hub, Synchro Ring Fingers And Grooves
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the 1st/2nd synchro sleeve (A) by aligning the slots of the 1st/2nd synchro sleeve and the 1st/2nd synchro hub (B). After installing, check the operation of the 1st/2nd synchro hub set.

NOTE: Make sure to align the slots in the 1st/2nd synchro hub as shown.

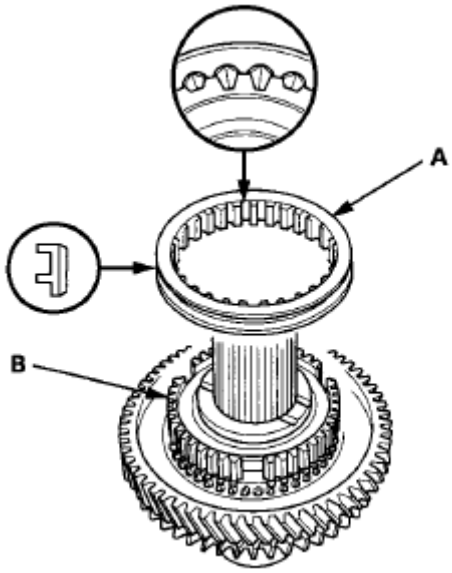

Fig. 200: Identifying 1st/2nd Synchro Sleeve And 1st/2nd Synchro Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the triple cone synchro assembly (A) with the synchro spring (B) by aligning the synchro ring fingers (C) with the grooves (D) in the 1st/2nd synchro hub.

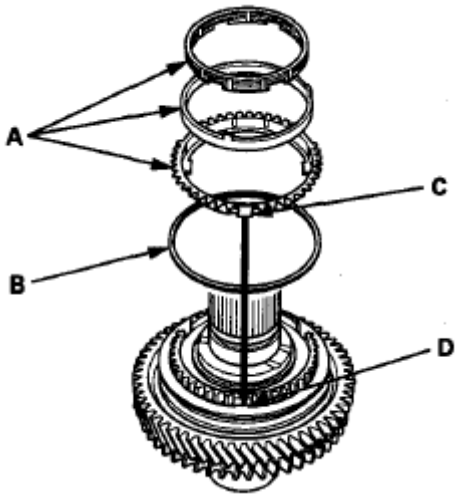

Fig. 201: Identifying Triple Cone Synchro Assembly, Synchro Spring, Synchro Ring Fingers, Grooves And 1st/2nd Synchro Hub
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the 2nd gear distance collar (A) with the needle bearing (B).

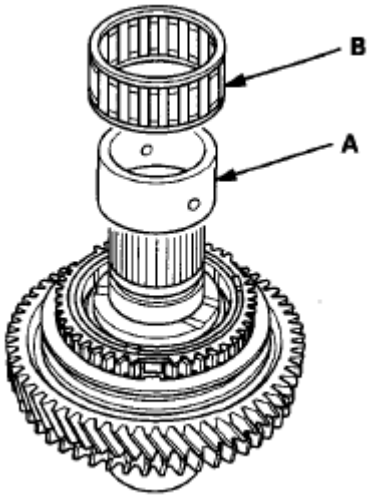

Fig. 202: Identifying 2nd Gear Distance Collar And Needle Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install 2nd gear (A) by aligning the synchro cone fingers (B) with the holes in 2nd gear (C).

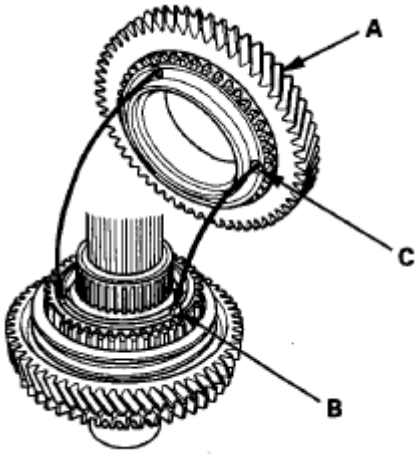

Fig. 203: Identifying 2nd Gear, Synchro Cone Fingers And Holes In 2nd Gear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Support the countershaft (A) on steel blocks, then press on 3rd gear (B) using the 58 x 62 mm driver (C) and a press (D).

NOTE: Do not exceed the maximum pressure.

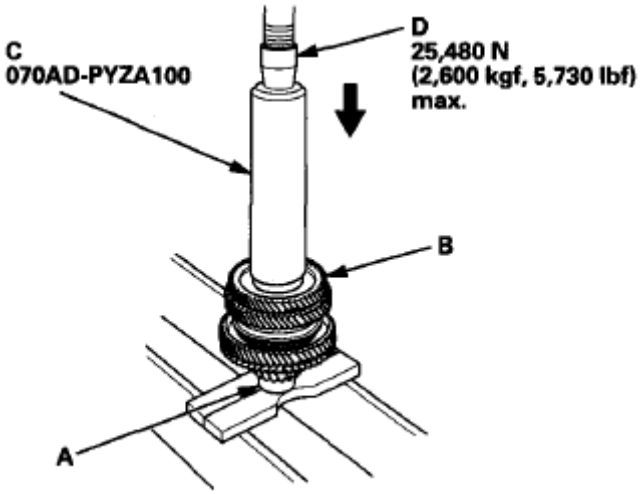

Fig. 204: Supporting Countershaft And Pressing On 3rd Gear Using Driver And Press With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Press on 4th gear (A) using the 58 x 62 mm driver (B) and a press (C).

NOTE: Do not exceed the maximum pressure.

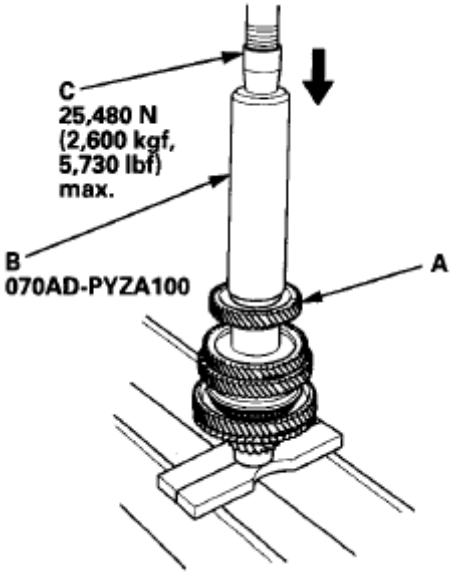

Fig. 205: Pressing On 4th Gear Using Driver And Press With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Press on 5th gear (A) using the 40 mm I.D. driver handle (B) and a press (C).

NOTE: Do not exceed the maximum pressure.

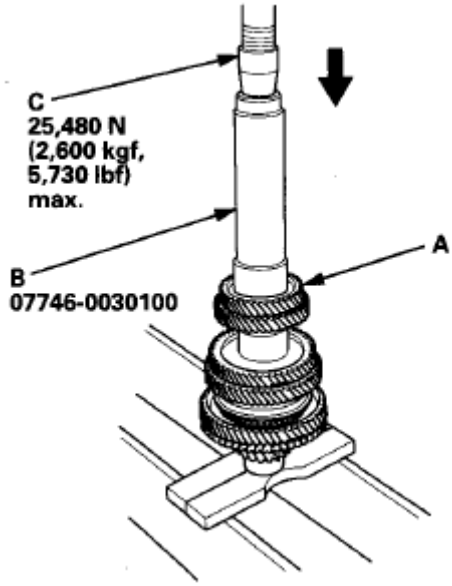

Fig. 206: Pressing On 5th Gear Using I.D. Driver Handle And Press With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Press on 6th gear (A) using the 40 mm I.D. driver handle (B) and a press (C).

NOTE: Do not exceed the maximum pressure.

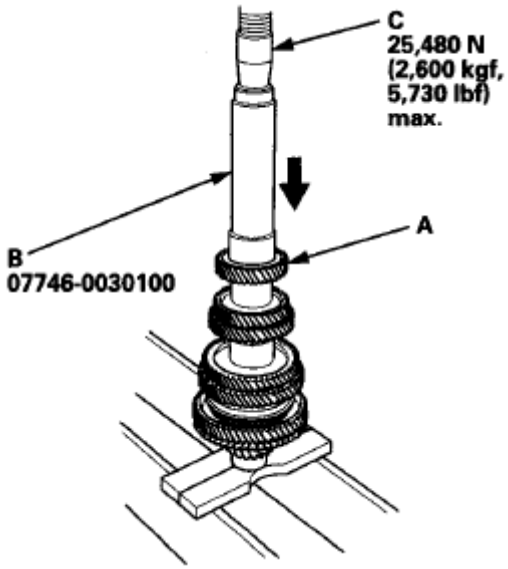

Fig. 207: Pressing On 6th Gear Using I.D. Driver Handle And Press With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the 35 mm shim (A), and temporarily press on the used ball bearing (B) using the 40 mm I.D. driver handle (C) and a press (D).

NOTE:

- **Use any size of 35 mm shim, and note size you used. Measurements taken in the following steps will determine the correct shim to use for final assembly.**
- **Make sure the ball bearing is installed in the correct direction.**

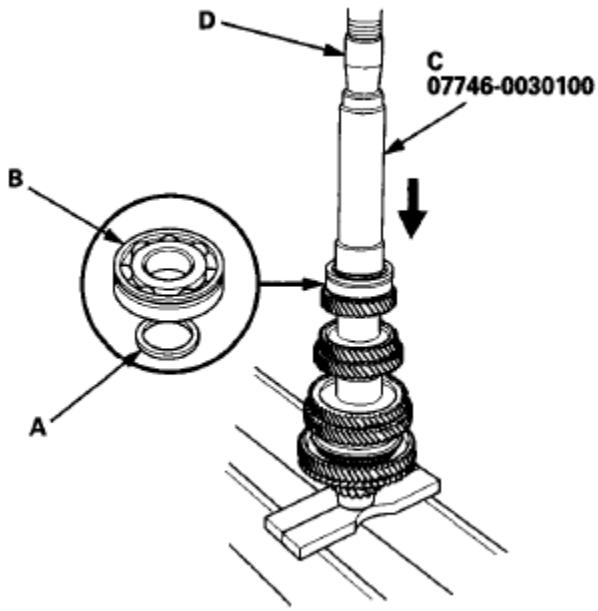

Fig. 208: Pressing On Used Ball Bearing Using I.D. Driver Handle And

Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Measure the clearance between the ball bearing (A) and the 35 mm shim (B) with a feeler gauge (C).

    Standard: 0.04- 0.10 mm (0.002- 0.003 in)

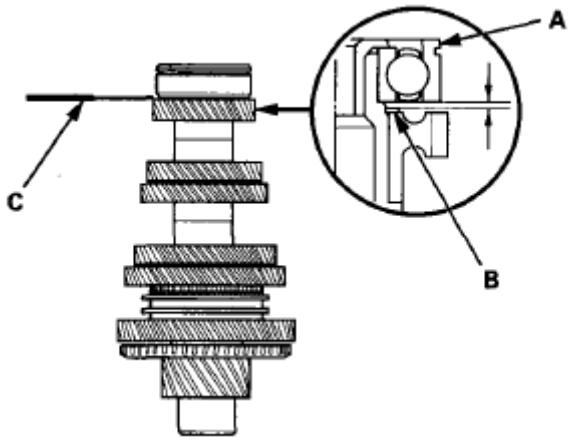

Fig. 209: Measuring Clearance Between Ball Bearing And Shim Using Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. If the measured clearance in step 14 is not within the standard, select another suitable 35 mm shim from the table, then go to next step to replace the 35 mm shim and the ball bearing with new ones. If the measured clearance in step 14 is within the standard, go to the next step to replace only the ball bearing with a new one.

35 MM SHIM

Type	Thickness
A	0.87 mm (0.034 in)
AA	0.91 mm (0.036 in)
B	0.95 mm (0.037 in)
AB	0.99 mm (0.039 in)
C	1.03 mm (0.041 in)
AC	1.07 mm (0.042 in)
D	1.11 mm (0.044 in)
AD	1.15 mm (0.045 in)
E	1.19 mm (0.047 in)
AE	1.23 mm (0.048 in)
F	1.27 mm (0.050 in)
AF	1.31 mm (0.052 in)
G	1.35 mm (0.053 in)
AG	1.39 mm (0.055 in)

H	1.43 mm (0.056 in)
AH	1.47 mm (0.058 in)
J	1.51 mm (0.059 in)
AJ	1.55 mm (0.061 in)
K	1.59 mm (0.063 in)
AK	1.63 mm (0.064 in)
L	1.67 mm (0.066 in)
AL	1.71 mm (0.067 in)
M	1.75 mm (0.069 in)
AM	1.79 mm (0.070 in)
N	1.83 mm (0.072 in)
AN	1.87 mm (0.074 in)
P	1.91 mm (0.075 in)
AP	1.95 mm (0.077 in)
Q	1.99 mm (0.078 in)

16. Remove 6th gear with the ball bearing and the 35 mm shim using a press (see step 3).
17. Repeat step 12 to install 6th gear.
18. Install the correct 35 mm shim (A) and a new ball bearing (B) using the 40 mm I.D. driver handle (C) and a press (D).

NOTE:

- **If necessary, replace the 35 mm shim with the correct one selected in step 15.**
- **Make sure the ball bearing is installed in the correct direction.**

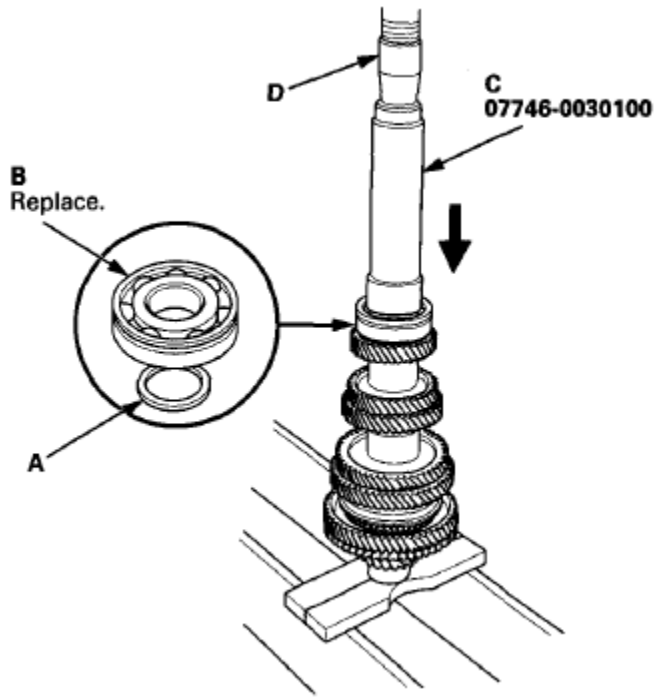

Fig. 210: Installing Shim And Ball Bearing Using I.D. Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Recheck the clearance between the ball bearing and the 35 mm shim with a feeler gauge.
20. Securely clamp the countershaft assembly in a bench vise with wood blocks (A).

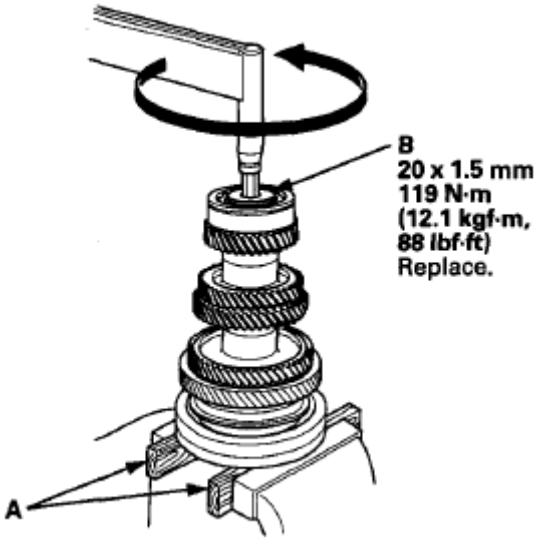

Fig. 211: Securely Clamping Countershaft Assembly In Bench Vise With Wood Blocks With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Tighten a new special bolt (B) (left-hand threads).

NOTE: Apply new MTF to the bolt threads and flange.

REVERSE IDLER GEAR SHAFT ASSEMBLY DISASSEMBLY/REASSEMBLY

NOTE: Prior to reassembling, clean all parts in solvent, dry them, and apply MTF to all contact surfaces.

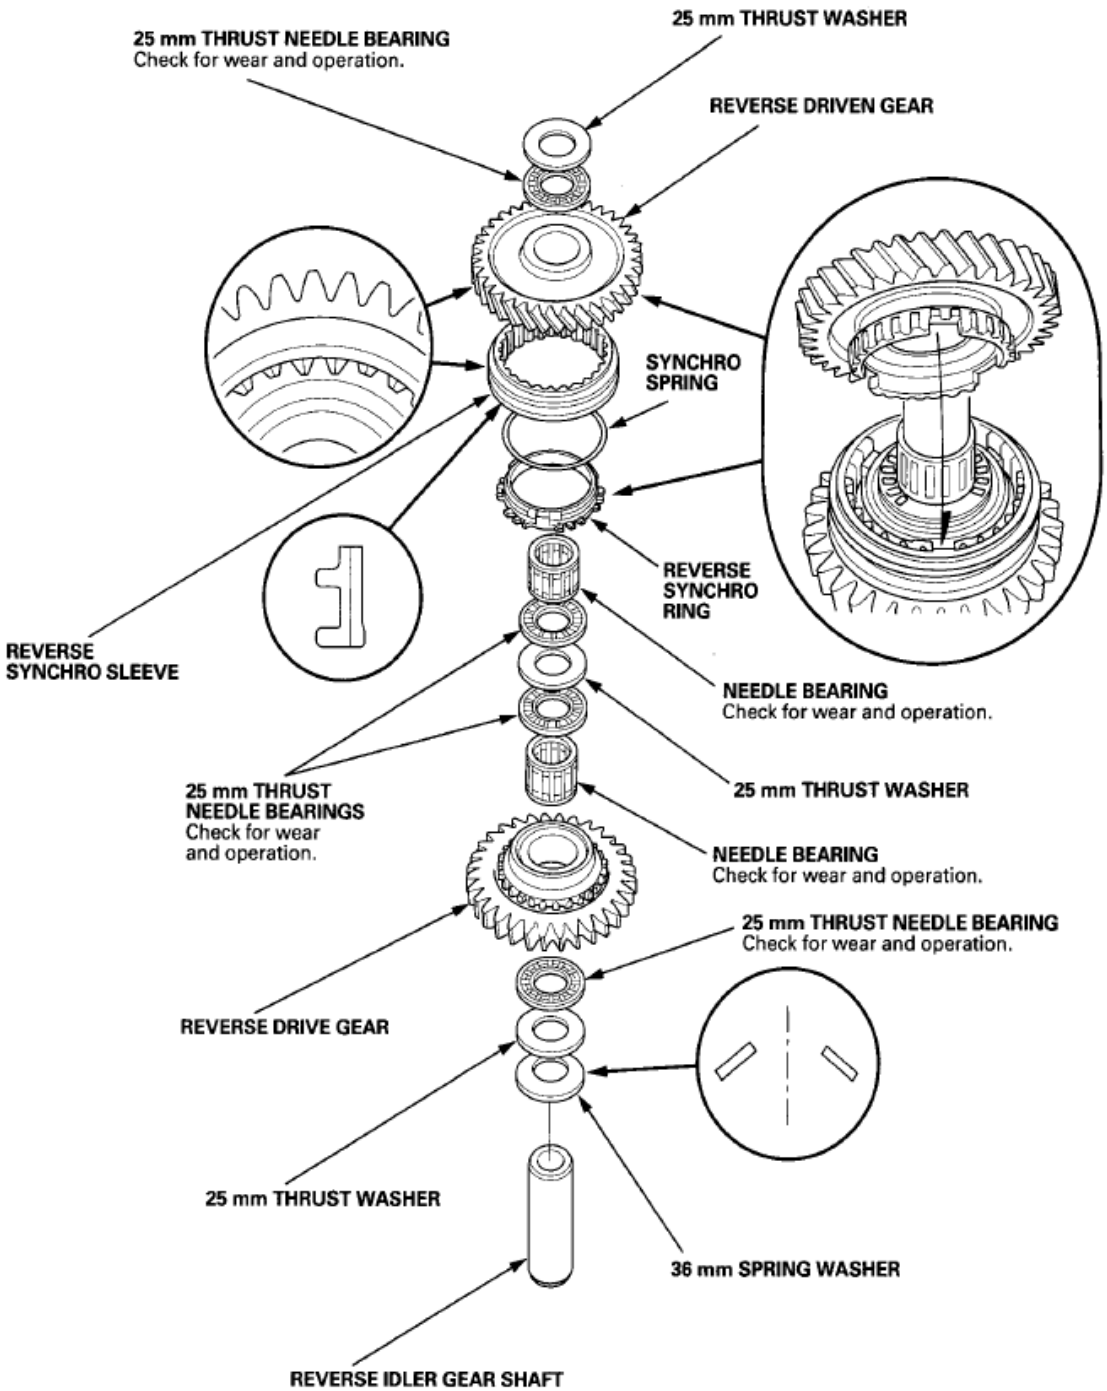

Fig. 212: Exploded View Of Reverse Idler Gear Shaft Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYNCHRO SLEEVE AND HUB INSPECTION AND REASSEMBLY

1. Inspect the gear teeth on all synchro hubs and synchro sleeves for wear (rounded off corners).
2. Install each synchro hub (A) in its mating synchro sleeve (B), and check for free movement. Make sure to match the three sets of longer teeth (C) (120 degrees apart) on the synchro sleeve with the three sets of

deeper grooves (D) in the synchro hub.

NOTE:

- **Do not install the synchro sleeve with its longer teeth in the 1st/2nd and 5th/6th synchro hub slots (E) because it will damage the spring ring.**
- **If replacement is required, always replace the synchro sleeve and the synchro hub as a set.**

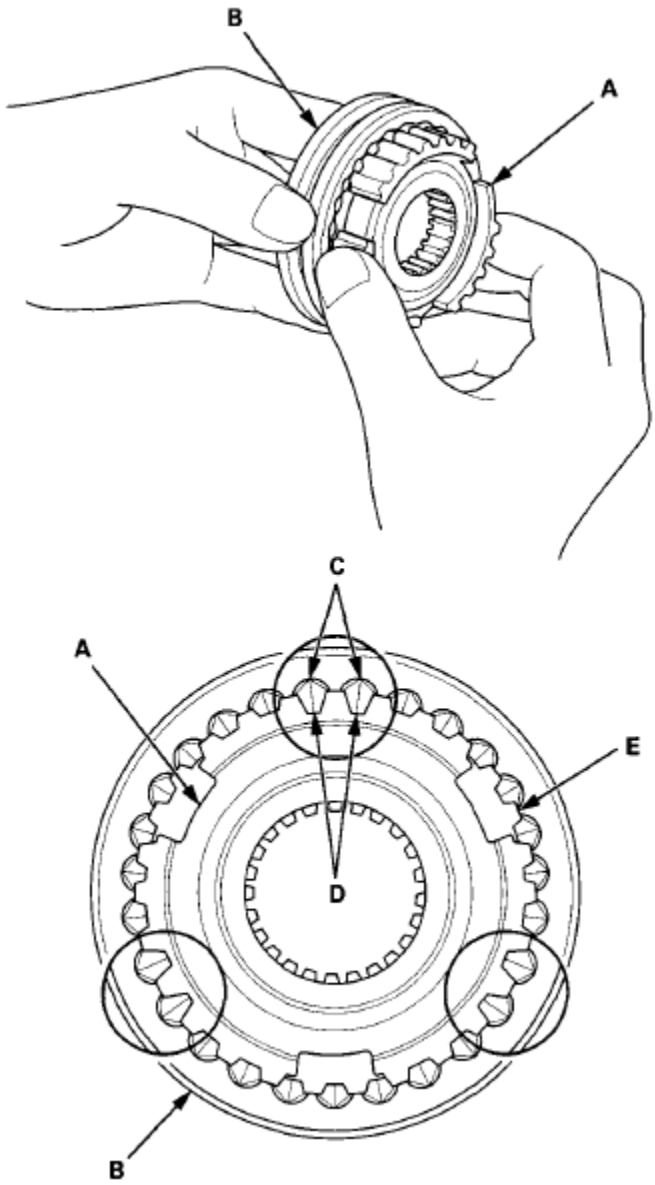

Fig. 213: Installing Synchro Hub In Mating Synchro Sleeve
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SYNCHRO RING AND GEAR INSPECTION

1. Inspect the synchro rings for scoring, cracks, and damage (A).

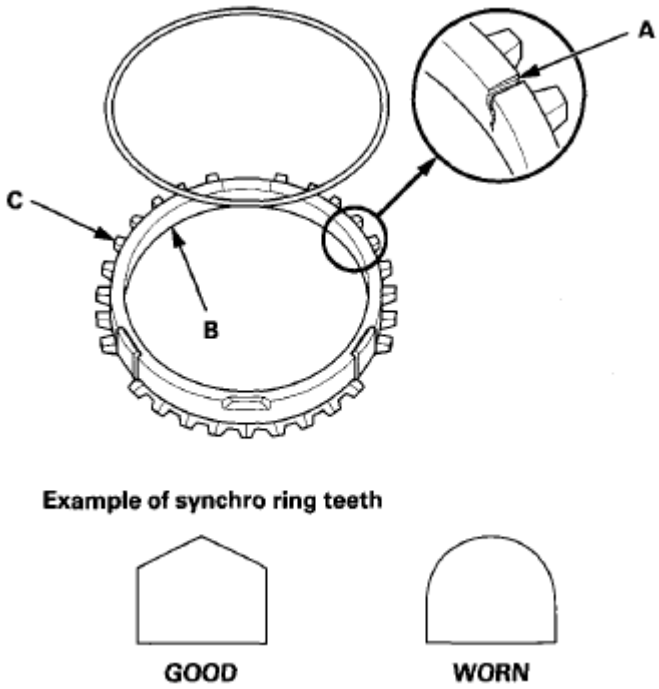

Fig. 214: Identifying Synchro Rings And Teeth Of Synchro Rings With Sign Of Cracks, Damage And Wear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Inspect the inside of each synchro ring (B) for wear. Inspect the teeth (C) on each synchro ring for wear (rounded off).
3. Inspect the teeth (A) on each synchro sleeve and matching teeth on each gear for wear (rounded off).

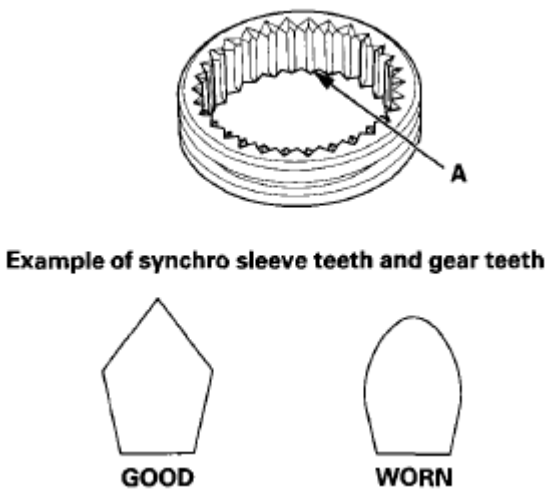

Fig. 215: Identifying Teeth Of Synchro Sleeve With Sign Of Good And Worn
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Inspect the synchro teeth on gear for scoring, cracks, and damage (A).

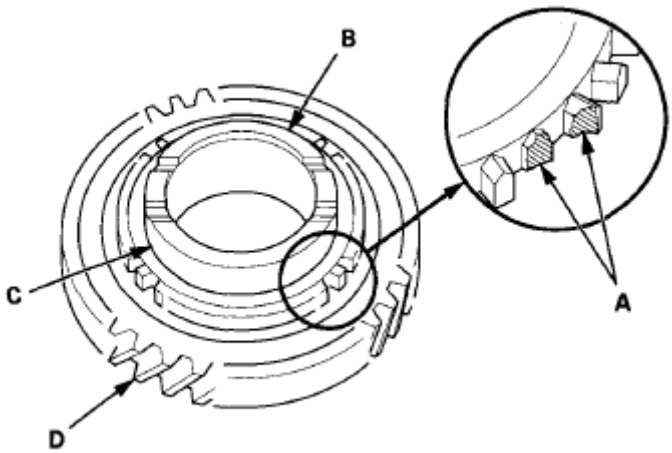

Fig. 216: Identifying Synchro Teeth, Thrust And Cone Surface With Sign Of Cracks, Damage And Wear
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Inspect the thrust surface (B) on each gear hub for wear.
6. Inspect the cone surface (C) on each gear hub for wear and roughness.
7. Inspect the teeth on all gears (D) for uneven wear, scoring, and cracks.
8. Coat the cone surface of each gear with MTF, and place its synchro ring on it. Rotate the synchro ring, making sure that it does not slip.
9. Measure the clearance between each gear (A) and its synchro ring (B) all around the gear. Hold the synchro ring against the gear evenly while measuring the clearance. If the clearance is less than the service limit, replace the synchro ring and gear.

Synchro Ring-to-Gear Clearance

Standard (5th gear): 0.70- 1.49 mm (0.028- 0.058 in)

Standard (6th gear): 0.73- 1.44 mm (0.029- 0.056 in)

Service Limit: 0.4 mm (0.016 in)

Double Cone Synchro and Triple Cone

Synchro-to-Gear Clearance

Standard: (1st Gear)

(1): Outer Synchro Ring (B)-to-Synchro Cone (C)

0.70- 1.19 mm (0.028- 0.046 in)

(2): Synchro Cone (C)-to-Gear (A)

0.70- 1.88 mm (0.028- 0.074 in)

(3): Outer Synchro Ring (B)-to-Gear (A)

1.12- 1.68 mm (0.044- 0.066 in)

Standard: (2nd Gear)

(1): Outer Synchro Ring (B)-to-Synchro Cone (C)

0.70- 1.19 mm (0.028- 0.046 in)

(2): Synchro Cone (C)-to-Gear (A)

0.70- 1.88 mm (0.028- 0.074 in)

(3): Outer Synchro Ring (B)-to-Gear (A)

1.12- 1.68 mm (0.044- 0.066 in)

Standard: (3rd Gear)

(1): Outer Synchro Ring (B)-to-Synchro Cone (C)

0.68- 1.19 mm (0.027- 0.046 in)

(2): Synchro Cone (C)-to-Gear (A)

0.48- 1.04 mm (0.019- 0.040 in)

(3): Outer Synchro Ring (B)-to-Gear (A)

0.95- 1.68 mm (0.037- 0.066 in)

Standard: (4th Gear)

(1): Outer Synchro Ring (B)-to-Synchro Cone (C)

0.70- 1.19 mm (0.028- 0.046 in)

(2): Synchro Cone (C)-to-Gear (A)

0.50- 1.14 mm (0.020- 0.044 in)

(3): Outer Synchro Ring (B)-to-Gear (A)

0.95- 1.68 mm (0.037- 0.066 in)

Service Limit: (1): 0.3 mm (0.012 in)

(2): 0.3 mm (0.012 in)

(3): 0.6 mm (0.024 in)

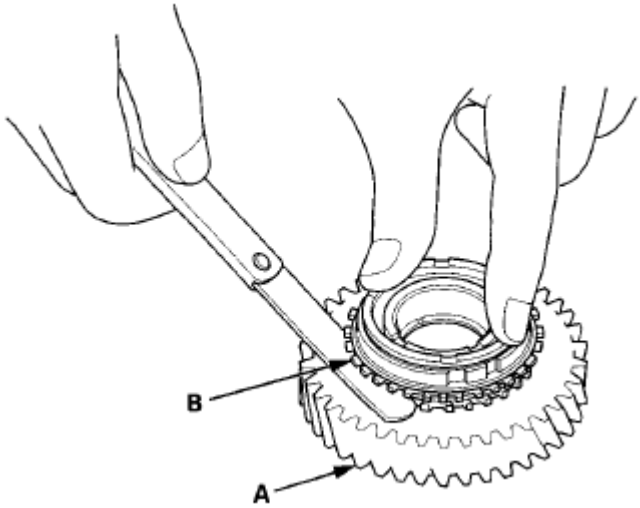

Fig. 217: Measuring Clearance Between Gear And Synchro Ring

MAINSHAFT OIL SEAL REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 42 x 47 mm 07746-0010300
- Driver Handle, 15 x 135L 07749-0010000

1. Remove the oil seal (A) from the clutch housing.

NOTE: Be careful not to damage the clutch housing while removing the oil seal.

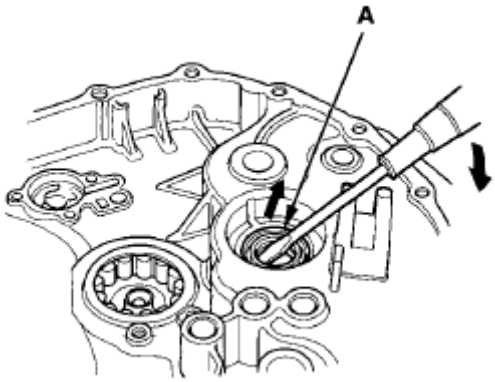

Fig. 220: Removing Oil Seal From Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Drive in a new oil seal flush with the clutch housing using the 15 x 135L driver handle (A) and the 42 x 47 mm bearing driver attachment (B).

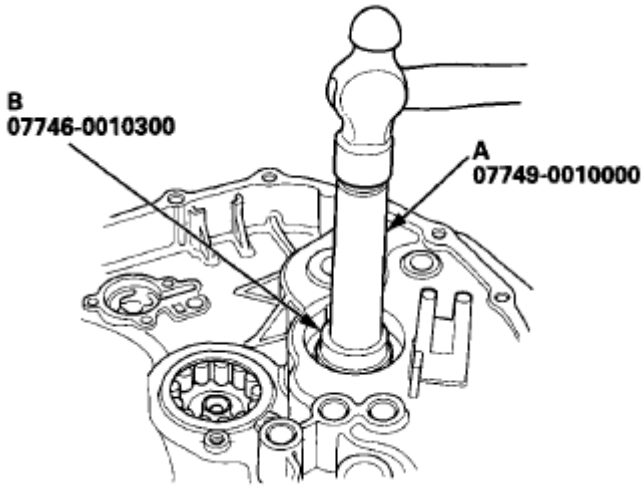

Fig. 221: Driving In Oil Seal Flush With Clutch Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

COUNTERSHAFT BEARING REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 72 x 75 mm 07746-0010600
- Driver Handle, 15 x 135L 07749-0010000
- Adjustable Bearing Puller, 45-75 mm 07YAC-0010100
- Slide Hammer 3/8"-16 UNF, commercially available

1. Remove the bearing set plate (A) from the clutch housing (B).

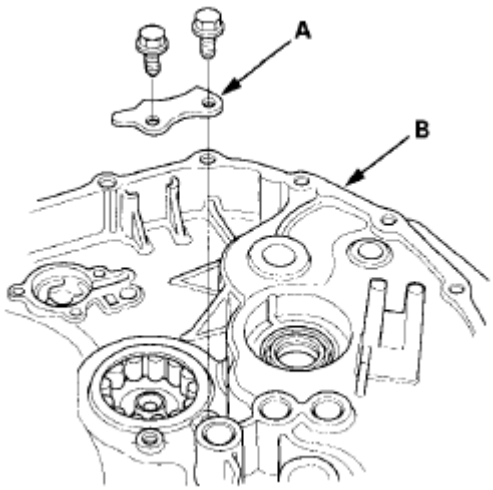

Fig. 222: Identifying Bearing Set Plate And Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the needle bearing (A) from the clutch housing (B) using the 45- 75 mm adjustable bearing puller (C) and a commercially available 3/8"-16 UNF slide hammer (D).

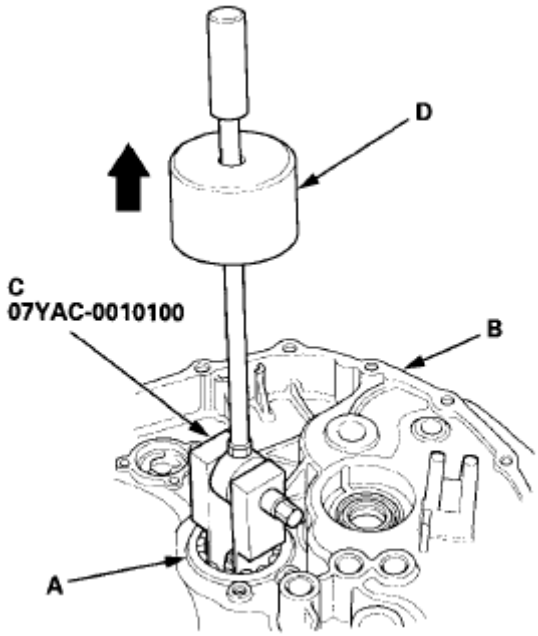

Fig. 223: Removing Needle Bearing From Clutch Housing Using Adjustable Bearing Puller And UNF Slide Hammer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new needle bearing (A) using the 15 x 135L driver handle (B) and the 72 x 75 mm bearing driver attachment (C).

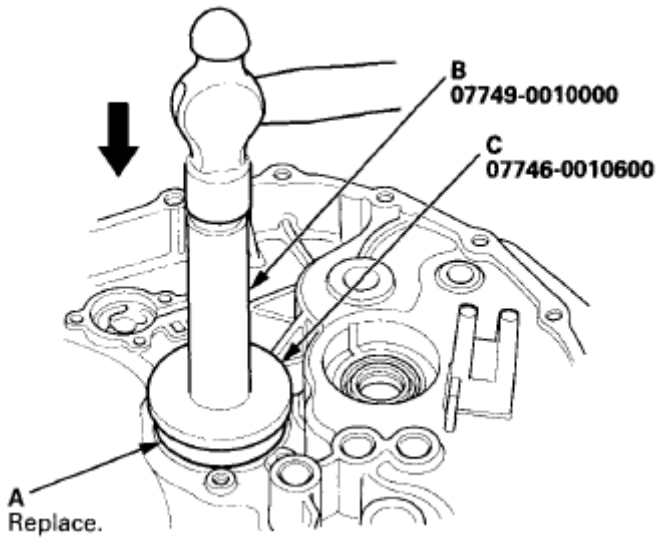

Fig. 224: Installing Needle Bearing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the bearing set plate (A).

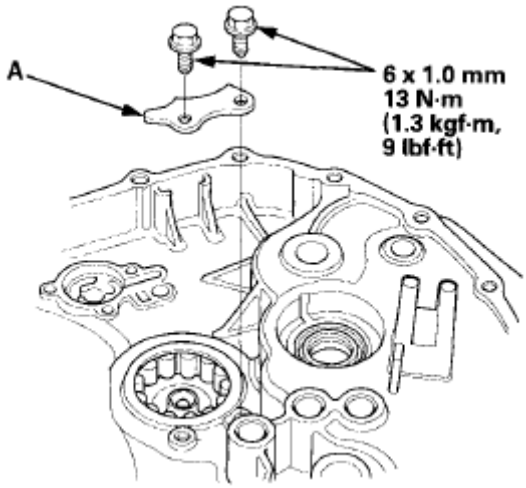

Fig. 225: Identifying Bearing Set Plate With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINSHAFT THRUST CLEARANCE ADJUSTMENT

Special Tools Required

- Mainshaft Holder 07GAJ-PG20110
- Mainshaft Base 07GAJ-PG20130

NOTE:

- **Take measurements at normal room temperature.**
- **Clean all parts thoroughly before installation.**

1. Remove the 87 mm shim (A) from the transmission housing (B).

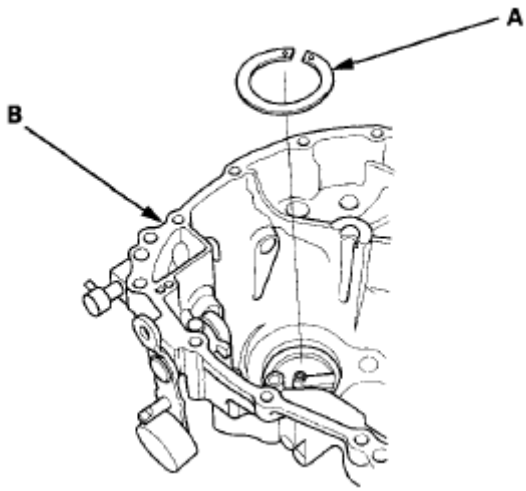

Fig. 226: Identifying Shim And Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the angular ball bearing (A), the 3rd/4th synchro hub (B), the 4th/5th gear distance collar (C), the 5th/6th synchro hub (D), the 6th gear distance collar (E), and the angular ball bearing (F) on the mainshaft (G), then install the assembled mainshaft in the transmission housing (H).

NOTE: The angular ball bearing is directional. If installed the wrong way, the measurements will not be accurate.

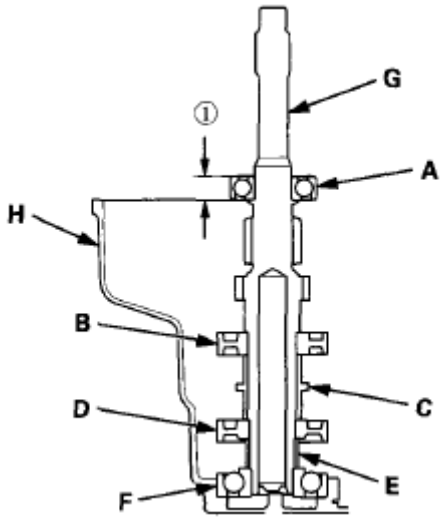

Fig. 227: Identifying Angular Ball Bearing, 3rd/4th Synchro Hub, 4th/5th Gear Distance Collar, 5th/6th Synchro Hub, 6th Gear Distance Collar, Angular Ball Bearing, Mainshaft And Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Measure the distance (1) between the rim of the transmission housing and the angular ball bearing with a straight edge and a depth gauge. Measure at three locations, and average the readings.
4. Measure the distance (2) (the depth of the clutch housing) with a straight edge and a depth gauge. Measure at three locations, and average the readings.

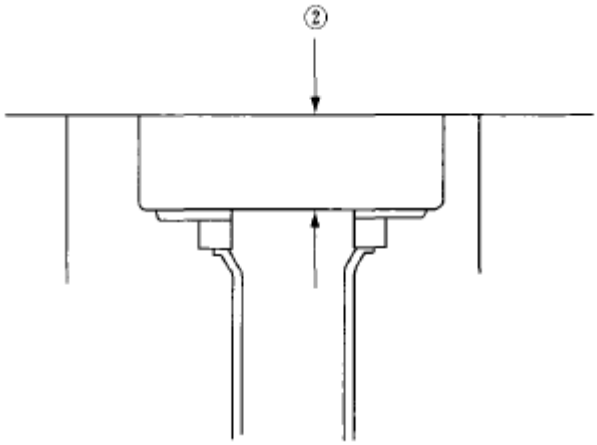

Fig. 228: Measuring Distance (Depth Of Clutch Housing) Using Straight Edge And Depth Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Shim Selection Formula

5. Select the proper 87 mm shim from the table. Follow the example below, and use the measurements you made in steps 3 and 4.

(Basic Formula)

(2) - (1) - (0.85 + 0.14) = shim thickness (maximum)

(2) - (1) - (0.85 + 0.21) = shim thickness (minimum)

- Subtract distance (1) (step 3) from distance (2) (step 4).
- 0.85 mm (0.033 in): Spring washer, a dimension in the installation.
- 0.14 mm (0.006 in): Minimum thrust clearance.
- 0.21 mm (0.008 in): Maximum thrust clearance.

(For example)

21.04 - 17.97 - (0.85 + 0.14) = 2.08 mm (0.082 in)

21.04 - 17.97 - (0.85 + 0.21) = 2.01 mm (0.079 in)

Take the middle value 2.04 mm (0.080 in) of the minimum value and the maximum value, and select the 0.93 mm (0.037 in) and 1.11 mm (0.044 in) shims.

NOTE: It is acceptable to select two 87 mm shims and put them together to get the required thickness. Make sure the washers are clean and dry to achieve an accurate measurement.

87 MM SHIM

Type	Thickness
A	0.60 mm (0.024 in)
B	0.63 mm (0.025 in)
C	0.66 mm (0.026 in)
D	0.69 mm (0.027 in)
E	0.72 mm (0.028 in)
F	0.75 mm (0.030 in)
G	0.78 mm (0.031 in)
H	0.81 mm (0.032 in)
J	0.84 mm (0.033 in)
K	0.87 mm (0.034 in)
L	0.90 mm (0.035 in)
M	0.93 mm (0.037 in)
N	0.96 mm (0.038 in)
P	0.99 mm (0.039 in)
R	1.02 mm (0.040 in)
S	1.05 mm (0.041 in)
T	1.08 mm (0.043 in)
U	1.11 mm (0.044 in)
V	1.14 mm (0.045 in)
W	1.17 mm (0.046 in)
X	1.20 mm (0.047 in)
Y	1.23 mm (0.048 in)
Z	1.26 mm (0.050 in)
AA	1.29 mm (0.051 in)
AB	1.32 mm (0.052 in)
AC	1.35 mm (0.053 in)
AD	1.38 mm (0.054 in)
AE	1.41 mm (0.056 in)
AF	1.44 mm (0.057 in)

6. Install the selected 87 mm shim (A) in the transmission housing (B).

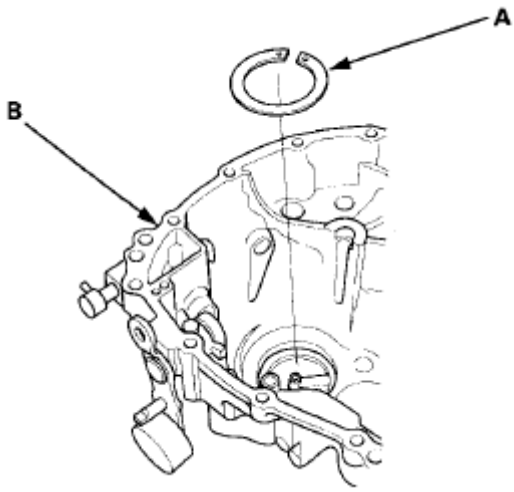

Fig. 229: Identifying Shim And Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Thoroughly clean the 64 mm spring washer (A) before installing it on the clutch housing (B).

NOTE: Be sure to install the spring washer in the direction shown.

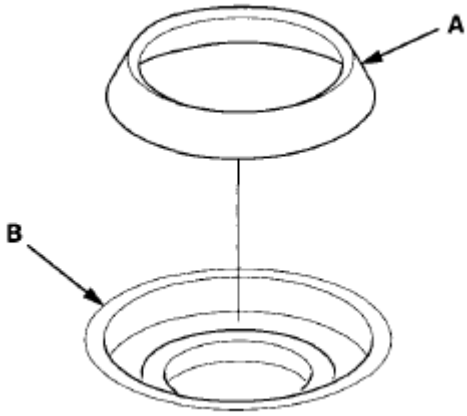

Fig. 230: Identifying Spring Washer And Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the assembled mainshaft in the clutch housing.
9. Place the transmission housing over the mainshaft and onto the clutch housing.
10. Tighten the clutch and transmission housings with several 10 mm bolts.

NOTE: It is not necessary to use sealing agent between the housings for this procedure.

11. Lightly tap on the mainshaft with a soft face hammer.
12. Attach the mainshaft holder (A) and the mainshaft base (B) to the mainshaft as follows:

- Back out the mainshaft holder bolt (C), and loosen the two hex bolts (D).
- Fit the mainshaft holder over the mainshaft so its lip is toward the transmission.
- Align the mainshaft holder lip around the groove at the inside of the mainshaft splines, then tighten the hex bolts.

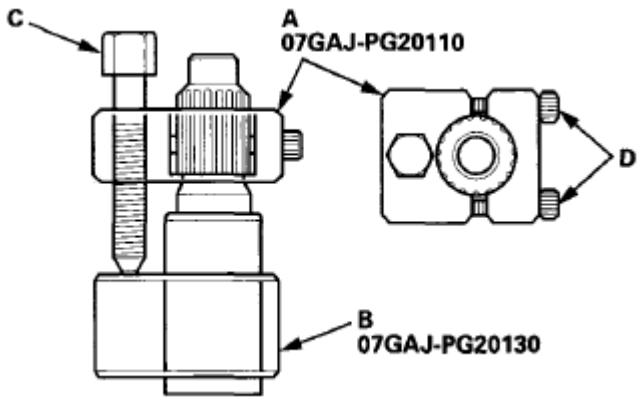

Fig. 231: Attaching Mainshaft Holder And Mainshaft Base To Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Fully seat the mainshaft by tapping on its end with a soft face hammer.
14. Thread in the mainshaft holder bolt until it just contacts the wide surface of the mainshaft base.
15. Zero a dial gauge (A) on the end of the mainshaft.

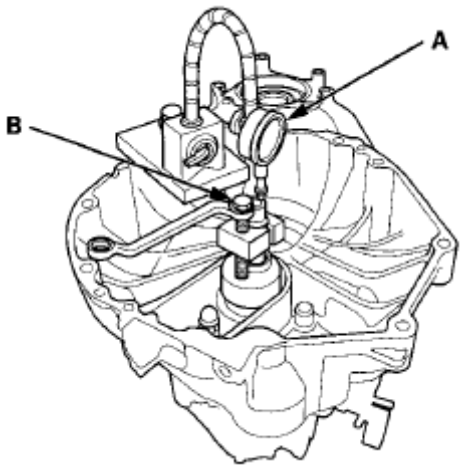

Fig. 232: Setting Dial Gauge To Zero On End Of Mainshaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

16. Turn the mainshaft holder bolt (B) clockwise; stop turning when the dial gauge has reached its maximum movement. The reading on the dial gauge is the amount of mainshaft thrust clearance.

NOTE: Do not turn the mainshaft holder bolt more than 60 degrees after the needle of the dial gauge stops moving. Applying more pressure with the

mainshaft holder bolt could damage the transmission.

17. If the reading is within the standard, the clearance is correct. If the reading is not within the standard, recheck the shim thickness.

    Standard: 0.14- 0.21 mm (0.0055- 0.0083 in)

TRANSMISSION REASSEMBLY

NOTE: Prior to reassembling, clean all parts in solvent, dry them, and apply MTF to all contact surfaces.

1. If any of the items listed were replaced, do the differential carrier bearing preload adjustment before reassembling the transmission (see **TRANSMISSION DISASSEMBLY**).
   - Transmission housing
   - Clutch housing
   - Differential carrier
   - Spacer
   - Differential carrier bearing and outer race
2. Press a new 16 x 23 x 5 mm dust seal (A) flush with the transmission housing surface, then install the change lever (B), the shift arm (C), the 8 mm spring washer (D), and the 8 mm special bolt (E).

NOTE: Be sure to install the spring washer in the direction shown.

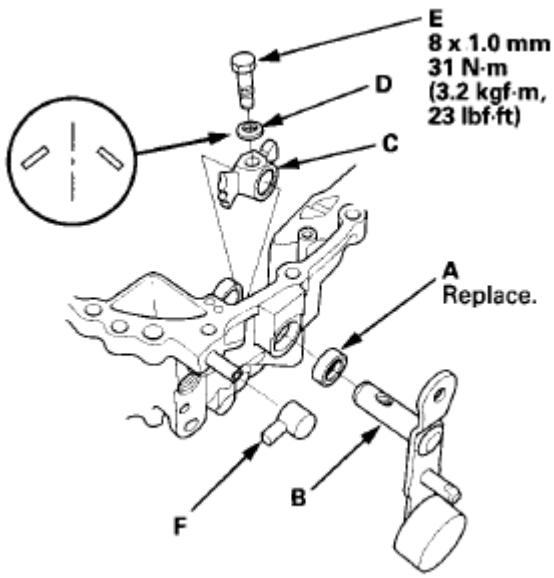

Fig. 233: Identifying Dust Seal, Change Lever, Shift Arm, Spring Washer, Breather Cap And Bolt With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the breather cap (F) with the arrow on the cap toward the front of the vehicle.
4. Select the proper size 87 mm shim (A) according to the measurements made during the Mainshaft Thrust Clearance Adjustment (see **MAINSHAFT THRUST CLEARANCE ADJUSTMENT**). Install it into the transmission housing (B).

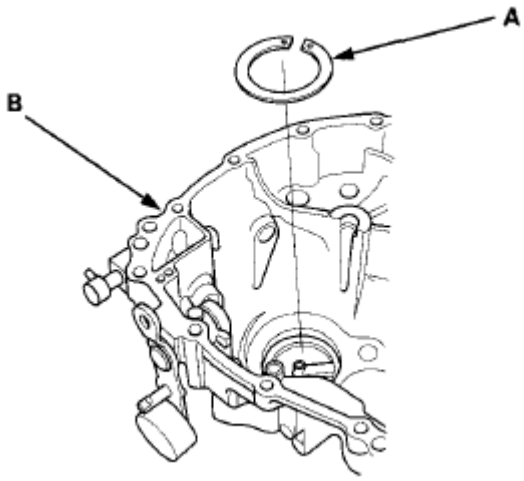

Fig. 234: Identifying Shim And Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the oil pump outer rotor (A), the oil pump inner rotor (B), and the oil pump plate (C).

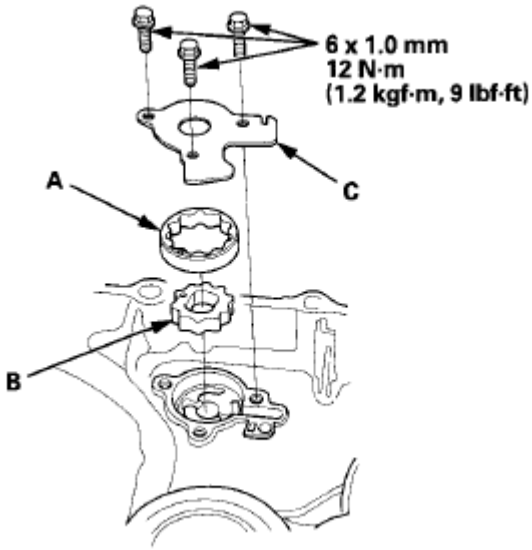

Fig. 235: Identifying Oil Pump Plate, Oil Pump Outer Rotor And Inner Rotor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the oil gutter plate (A).

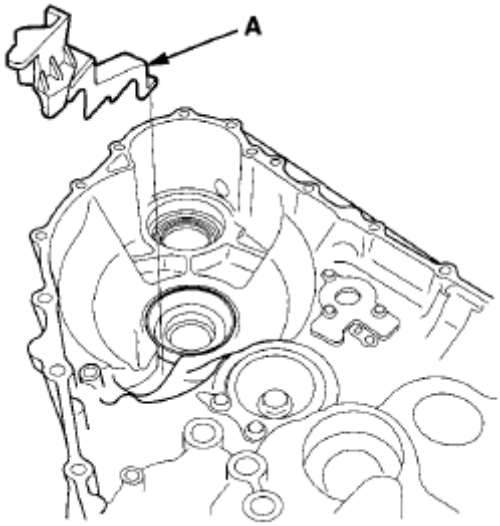

Fig. 236: Identifying Oil Gutter Plate
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the transfer output shaft assembly (A).

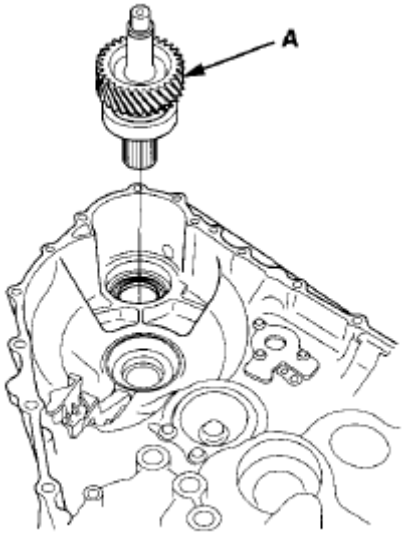

Fig. 237: Identifying Transfer Output Shaft Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the differential assembly (A) and the oil pump shaft (B).

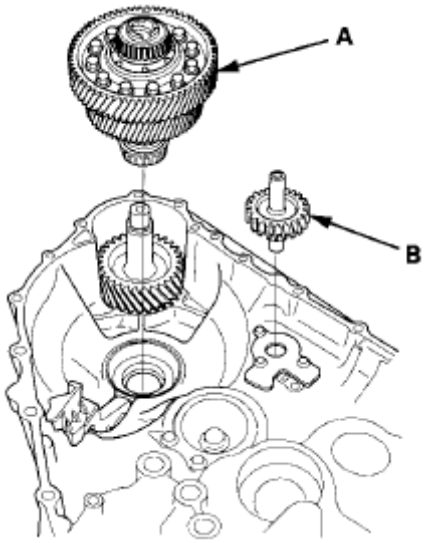

Fig. 238: Identifying Differential Assembly And Oil Pump Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the 64 mm spring washer (A).

NOTE: Be sure to install the spring washer in the direction shown.

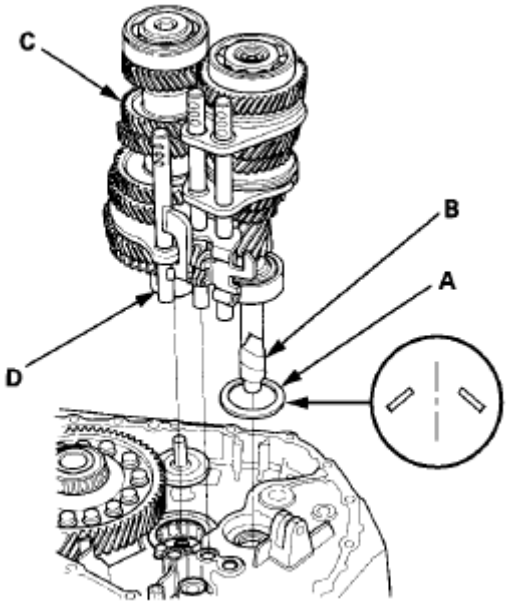

Fig. 239: Identifying Spring Washer, Mainshaft Splines, Countershaft And Shift Fork Assembly
Courtesy of AMERICAN HONDA MOTOR CO., INC.

10. Apply tape to the mainshaft splines (B) to protect the seal. Install the mainshaft and the countershaft (C) with the shift fork assembly (D) as an assembly.

NOTE: Do not apply tape thick to damage the oil seal.

11. Press a new 14 x 20 x 4 mm dust seal (A) flush with the clutch housing surface, then install the select lever (B), the select arm (C), a new 5 x 22 mm spring pin (D), and a new 3 x 22 mm spring pin (E).

NOTE: Make the seams (F) of the 5 x 22 mm and 3 x 22 mm spring pin are opposite side.

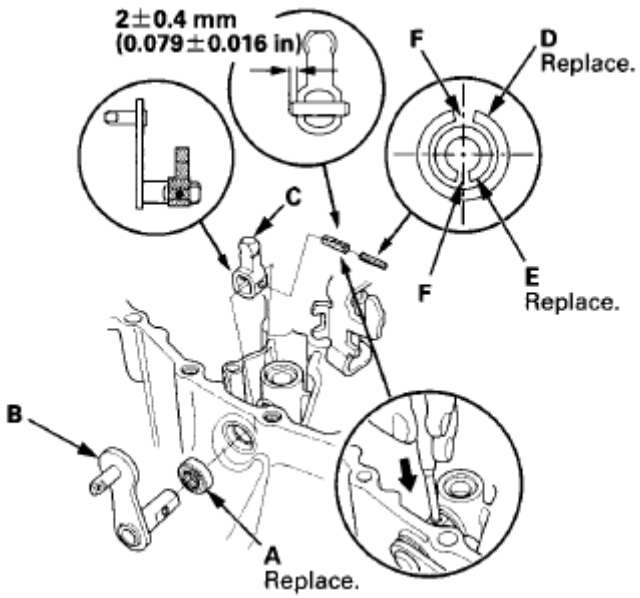

Fig. 240: Identifying Dust Seal, Lever, Arm, Seams And Spring Pins
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Set the select return spring (A), the 8 x 50 mm pin (B), and the interlock (C) as shown.

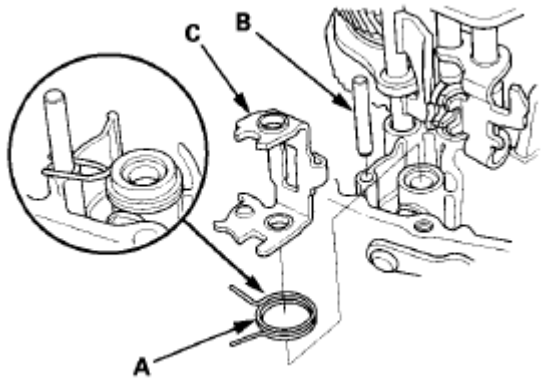

Fig. 241: Identifying Interlock, Return Spring And Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

13. Install the shift piece (A) and the shift piece shaft (B).

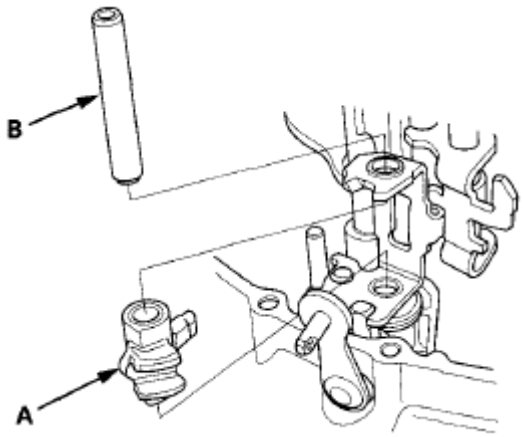

Fig. 242: Identifying Shift Piece And Shift Piece Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Assemble the 25 mm thrust needle bearings (A), the 25 mm thrust washers (B), the reverse idler gear shaft assembly (C), and the reverse shift fork (D) (see **REVERSE IDLER GEAR SHAFT ASSEMBLY DISASSEMBLY/REASSEMBLY**).

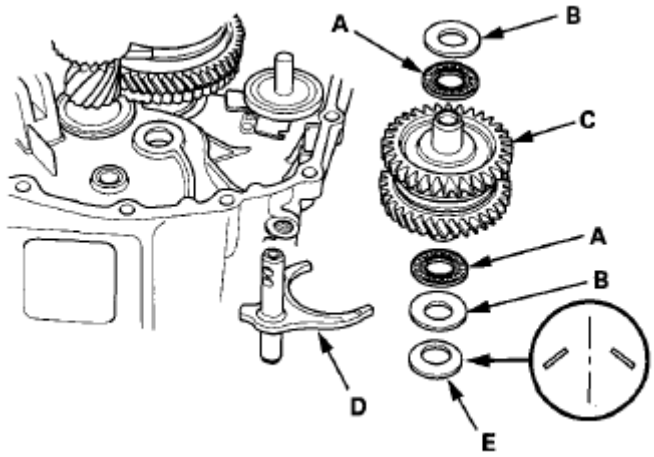

Fig. 243: Identifying Thrust Needle Bearings, Thrust Washers, Reverse Idler Gear Shaft Assembly, Reverse Shift Fork And Spring Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

15. Install the 36 mm spring washer (E) to the reverse idler gear shaft assembly.

NOTE: Be sure to install the spring washer in the direction shown.

16. Slide the reverse idler gear shaft assembly (A) on the rib (B) of the clutch housing, then install it into the hole (C) of the clutch housing.

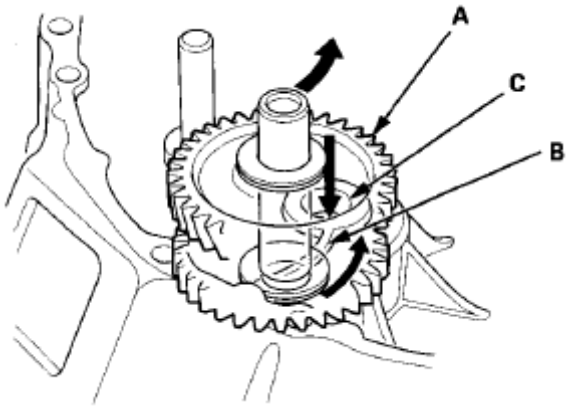

Fig. 244: Installing Reverse Idler Gear Shaft Assembly Into Hole Of Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Install the reverse shift lever (A) and the 8x50 mm pin (B).

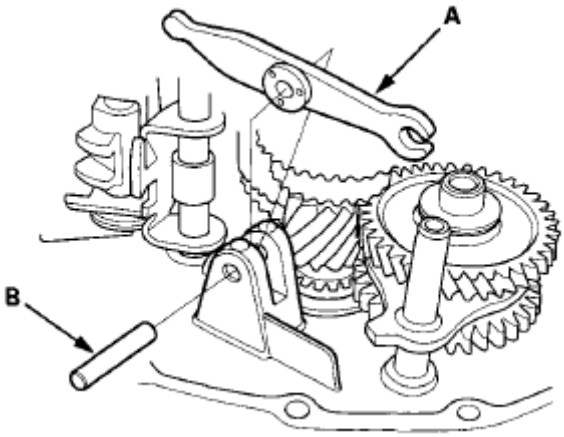

Fig. 245: Identifying Reverse Shift Lever And Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

18. Install oil guide pipe A, the oil guide pipe (B), and the magnet (C).

NOTE: Clean the magnet anytime the transmission is disassembled.

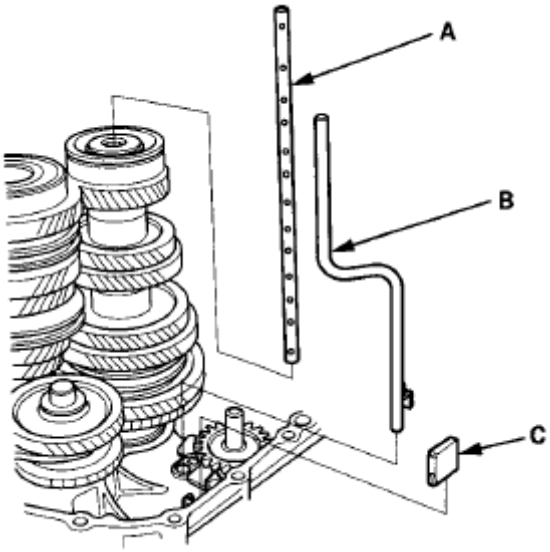

Fig. 246: Identifying Oil Guide Pipe And Magnet
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. Clean any dirt and oil from the transmission housing sealing surface.
20. Apply liquid gasket, P/N 08717-0004, 08718-0001, 08718-0003, 08718-0004, or 08718-0009 evenly to the clutch housing mating surface of the transmission housing. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

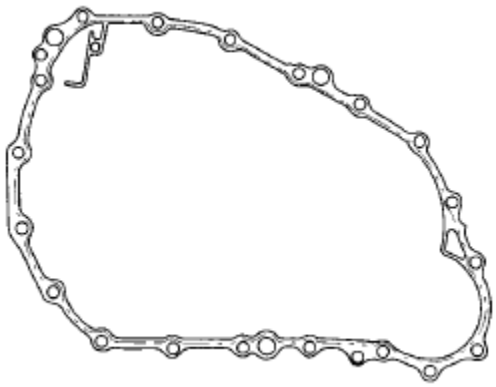

Fig. 247: Identifying Clutch Housing Mating Surface Of Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

21. Install the three 14 x 20 mm dowel pins (A).

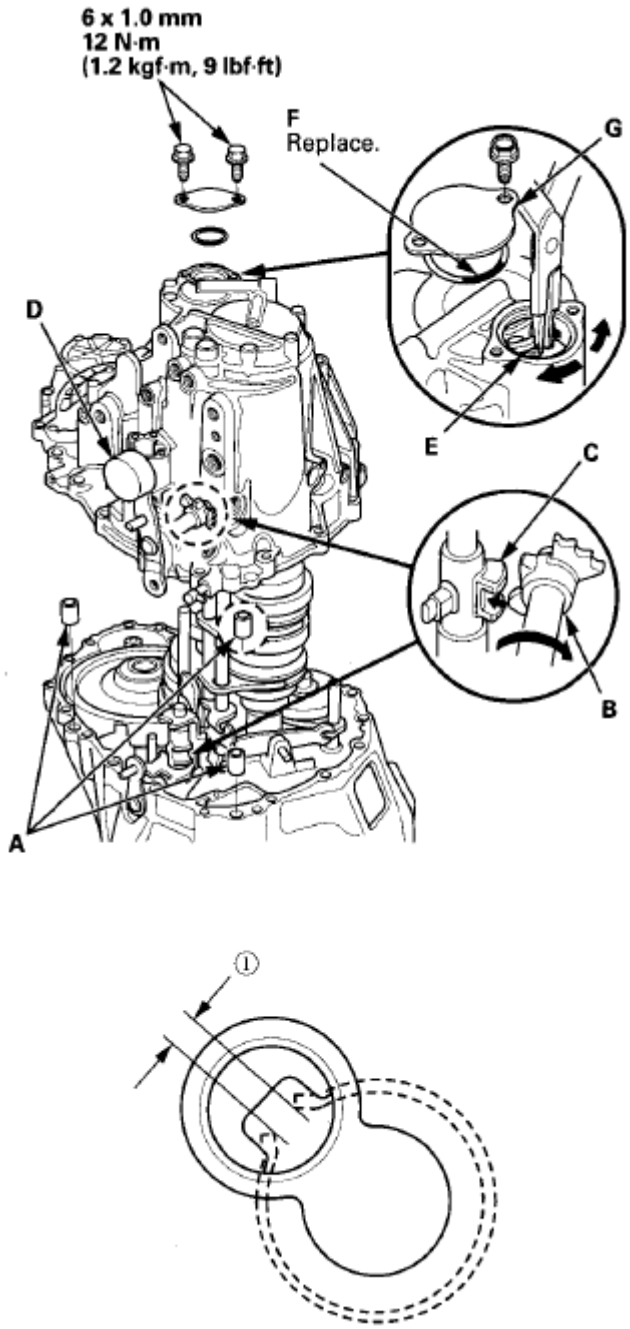

Fig. 248: Identifying Dowel Pins, Shift Arm, Groove Of Shift Piece, Change Lever And Snap Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Lower the transmission housing, then place the shift arm (B) in the groove of the shift piece (C) by turning the change lever (D).
23. While expanding the 75 mm snap ring (E) on the countershaft ball bearing using snap ring pliers, push the transmission housing down to start the countershaft ball bearing through the snap ring. Release the pliers, and push down the housing until it bottoms out and the snap ring snaps in place in the countershaft ball bearing snap ring groove.

24. Make sure the 75 mm snap ring is securely seated in the groove of the countershaft bearing.

    Dimension (1) as installed: 1.67- 9.42 mm (0.066- 0.371 in)

25. Install a new O-ring (F) and the transmission case cap (G).

    NOTE: Check the operation of the change lever and the select lever.

26. Install the 10 mm flange bolts finger-tight, with transmission hanger B and the clutch line bracket (A).

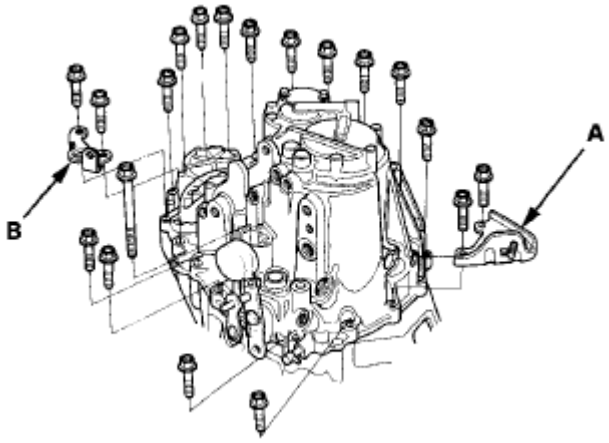

Fig. 249: Identifying Clutch Line Bracket And Transmission Hanger
Courtesy of AMERICAN HONDA MOTOR CO., INC.

27. Tighten the 10 mm flange bolts in a crisscross pattern in several steps.

    Specified Torque: 10 x 1.25 mm 44 N.m (4.5 kgf.m, 33 lbf.ft)

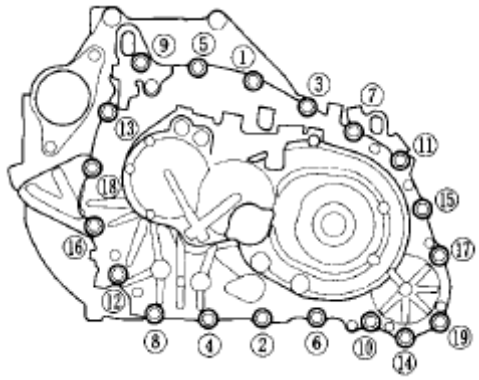

Fig. 250: Identifying Flange Bolts With Tightening Sequence
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Install the drain plug (A) with a new sealing washer (B).

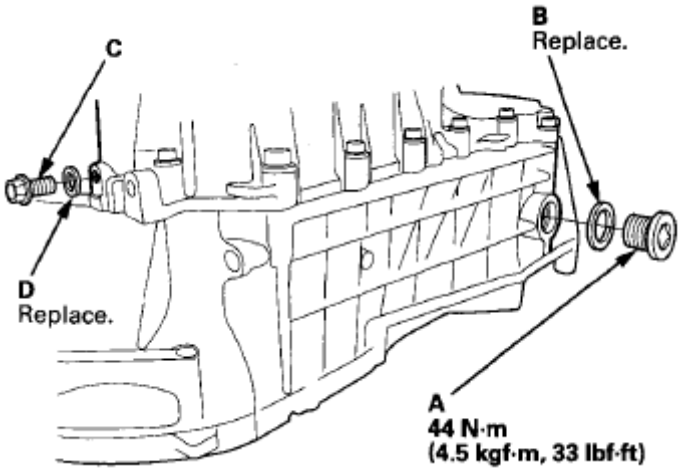

Fig. 251: Identifying Sealing Washer, Fluid Check Bolt And Drain Plug With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

29. Install the fluid check bolt (C) with a new sealing washer (D) by finger-tight.
30. Apply liquid gasket (P/N 08717-0004, 08718-0001, 08718-0012, 08718-0003, 08718-0004, or 08718-0009) to the thread of the detent bolts (A), then install the steel balls (B), the 22.0 mm detent ball spring (C), the 27.4 mm detent ball spring (D), and the detent bolts.

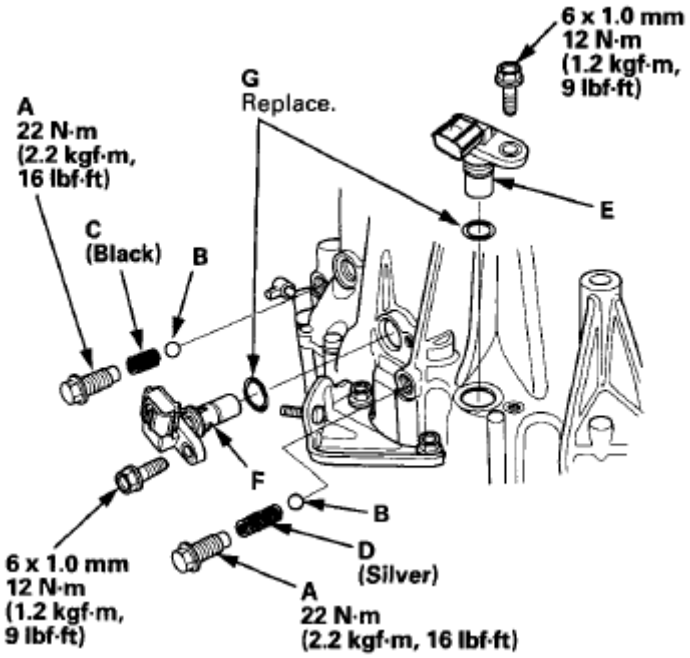

Fig. 252: Identifying Steel Balls, Detent Ball Spring, Detent Bolts, O-Rings, Input Shaft (Mainshaft) And Output Shaft (Countershaft) Speed Sensor With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Install the input shaft (mainshaft) speed sensor (E), the output shaft (countershaft) speed sensor (F), and new O-rings (G).

32. Apply liquid gasket (P/N 08717-0004, 08718-0001, 08718-0012, 08718-0003, 08718-0004, or 08718-0009) to the thread of the detent bolts (A), then install the steel balls (B), the 22.0 mm detent ball spring (C), the 26.1 mm detent ball spring (D), the 27.4 mm detent ball spring (E), and the detent bolts.

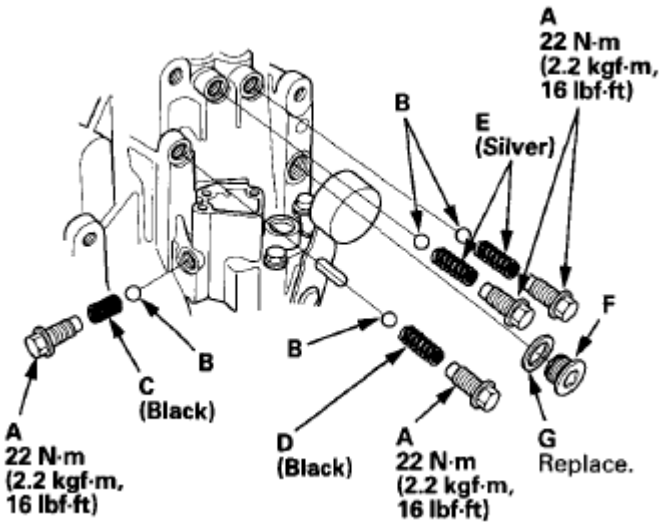

Fig. 253: Identifying Steel Balls, Detent Ball Springs, Detent Bolts, Filler Plug And Sealing Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

33. Install the filler plug (F) with a new sealing washer (G) by finger-tight.
34. Clean any dirt or oil from the reverse lockout solenoid sealing surface.
35. Apply liquid gasket, P/N 08717-0004, 08718-0001, 08718-0003, 08718-0004, or 08718-0009 evenly to the transmission housing mating surface of the reverse lockout solenoid. Install the component within 5 minutes of applying the liquid gasket.

NOTE:

- **If you apply liquid gasket P/N 08718-0012, the component must be installed within 4 minutes.**
- **If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.**

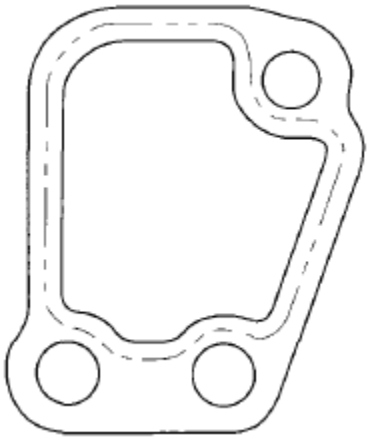

Fig. 254: Identifying Transmission Housing Mating Surface Of Reverse Lockout Solenoid
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Install the select lock pin spring (B), the select lock pin (C), and the reverse lockout solenoid (D).

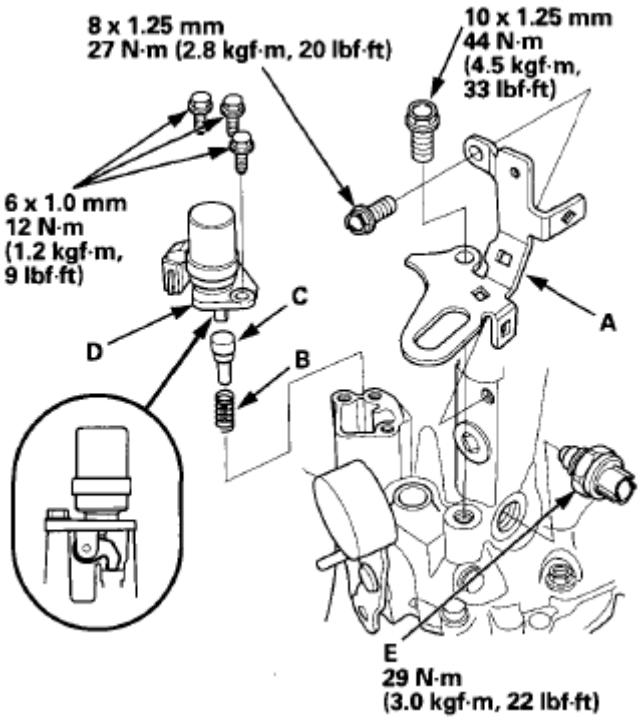

Fig. 255: Identifying Transmission Hanger, Lock Pin Spring, Lock Pin, Reverse Lockout Solenoid And Threads Of Back-Up Light Switch With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

37. Apply liquid gasket, (P/N 08717-0004, 08718-0001, 08718-0012, 08718-0003, 08718-0004, or 08718-0009) to the threads of the back-up light switch (E), and install it in the transmission housing.
38. Install transmission hanger A.

39. Install the oil pump strainer (A), the strainer set spring (B), and the strainer cover (C) with a new O-ring (D).

NOTE: Clean the strainer anytime the transmission is disassembled.

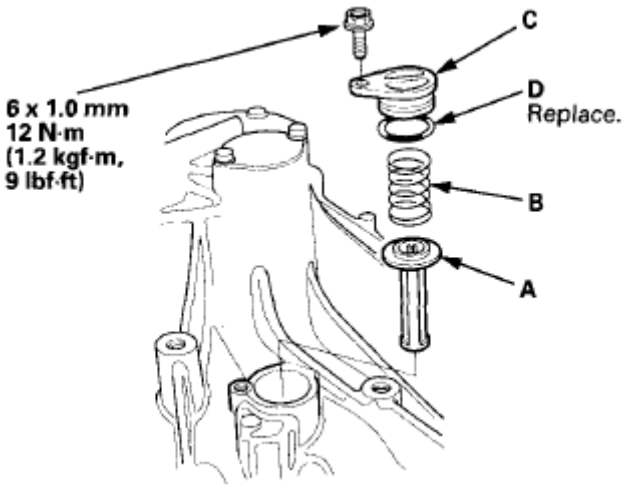

Fig. 256: Identifying Oil Pump Strainer, Strainer Set Spring, Strainer Cover And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

GEARSHIFT MECHANISM REPLACEMENT

NOTE: Make sure not to get any silicone grease on the terminal part of the connectors and switches, especially if you have silicone grease on your hands or gloves.

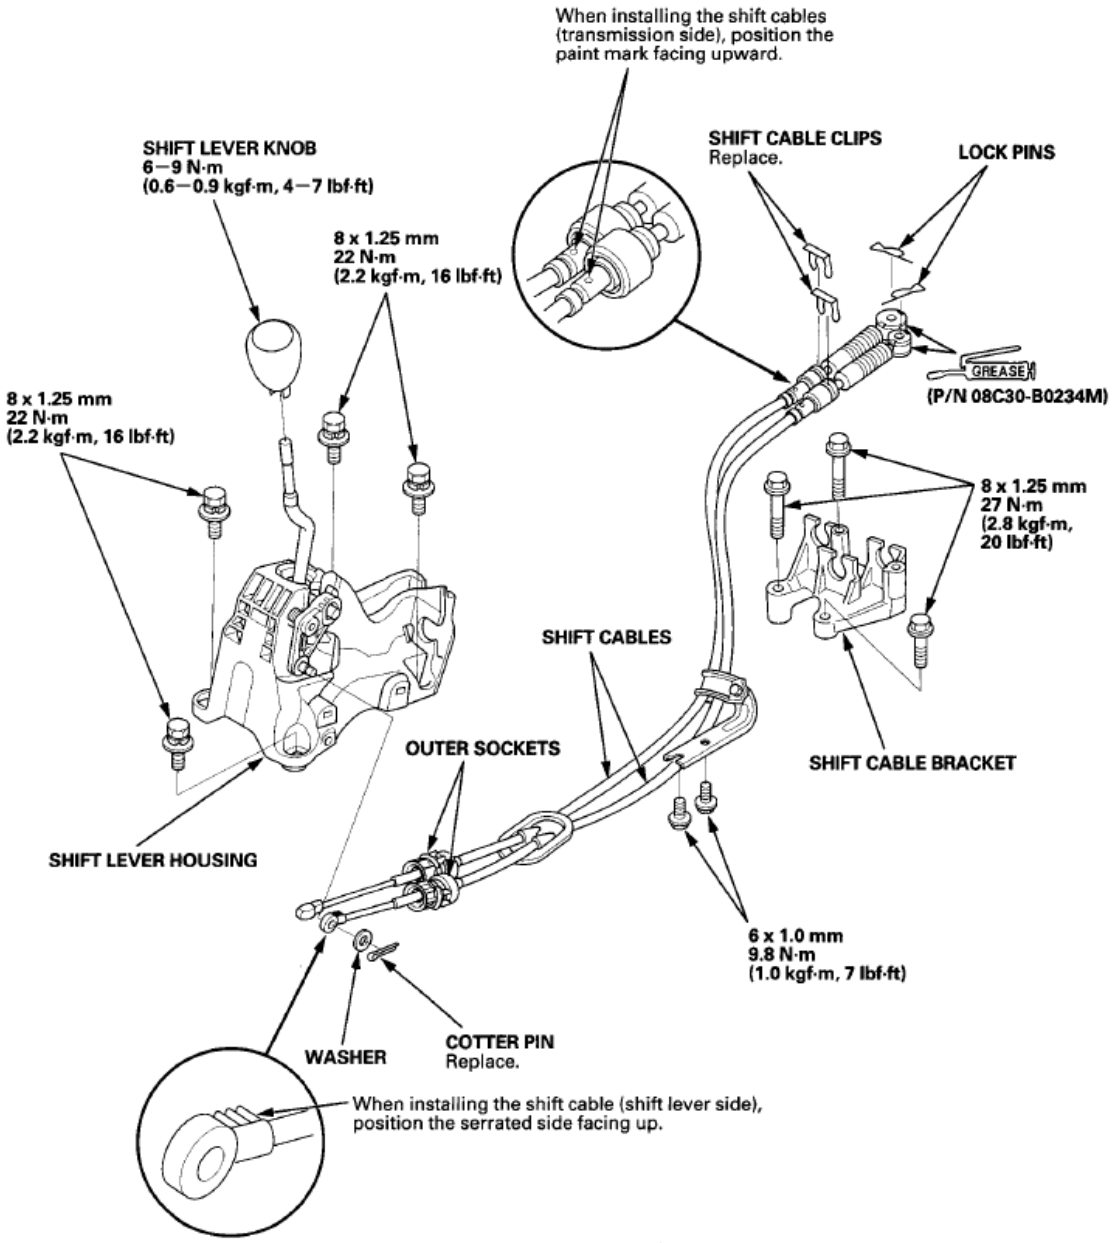

Fig. 257: Exploded View Of Gearshift Mechanism With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

SHIFT LEVER HOUSING REPLACEMENT

NOTE: Take care not to scratch the center console, the dashboard, and the related parts.

1. Remove the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).
2. Remove the harness clamps.

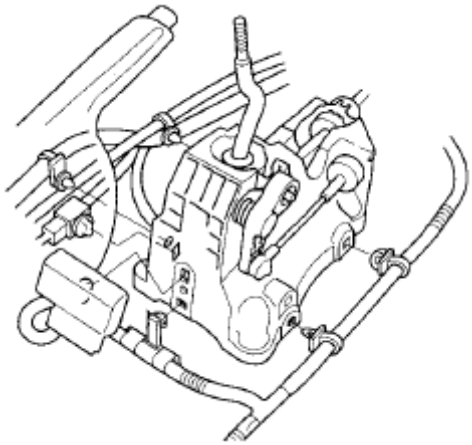

Fig. 258: Identifying Shift Lever Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the cotter pin (A), the washer (B), and the bolts.

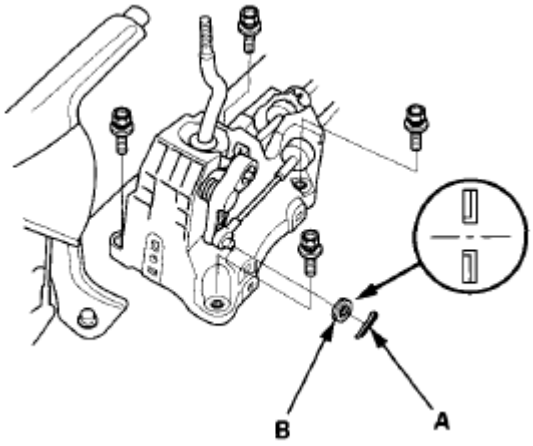

Fig. 259: Identifying Cotter Pin And Washer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Unlock the retainer (A).

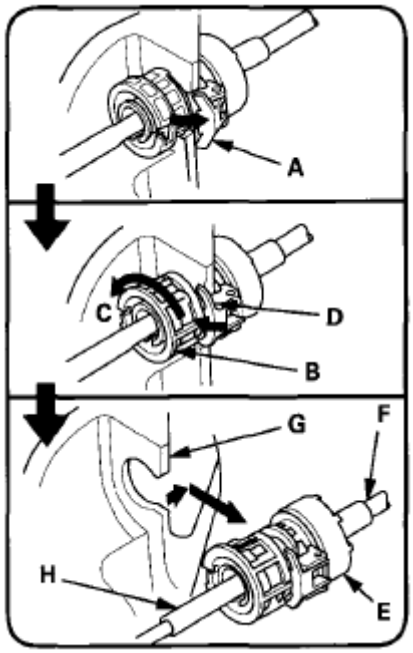

Fig. 260: Unlocking Retainer
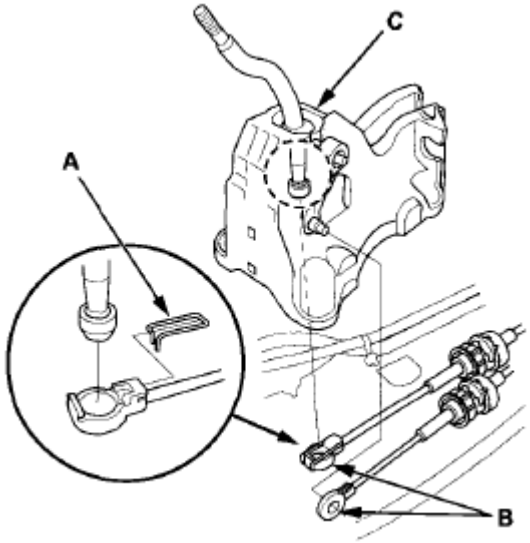
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Rotate the socket holder retainer (B) counterclockwise (C) until it stops, and push the retainer lock (D) into the socket holder retainer to lock the retainer.
6. Slide the socket holder (E) and the shift cable (F) out of the shift cable bracket (G). Do not remove the shift cable by pulling the shift cable guide (H).
7. Remove the clip (A), and disconnect the shift cable ends (B) from the shift lever, then remove the shift lever housing (C).



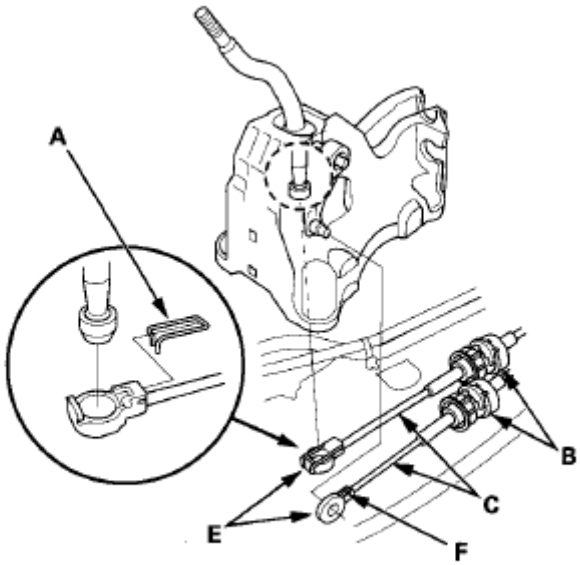


Fig. 261: Identifying Shift Cable Ends, Shift Lever Housing And Clip
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the clip (A).

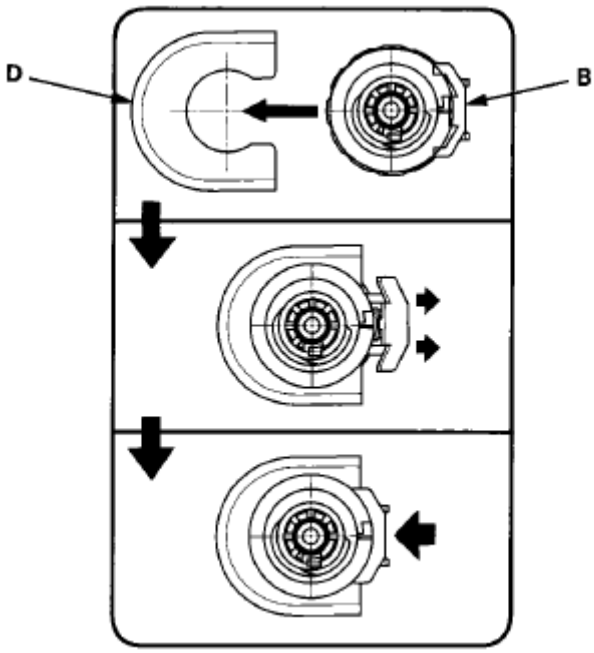

Fig. 262: Aligning Socket Holder On Shift Cables With Slot In Bracket Base
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Align the socket holder (B) on the shift cables (C) with the slot in the bracket base (D), then slide the holder into the base. Install the shift cable ends (E) to the shift lever then install the shift lever housing.

NOTE: When installing the shift cable, position the serrated side (F) facing up.

10. Install the bolts, the washer (A), and a new cotter pin (B), then bend the cotter pin ends.

NOTE: You can install the cotter pin from either direction.

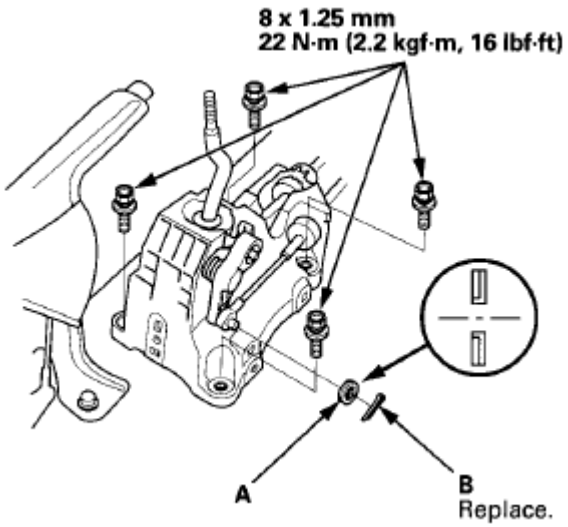

Fig. 263: Identifying Cotter Pin And Washer With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Install the harness clamps.

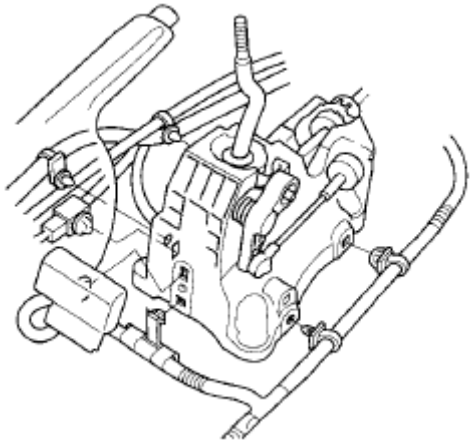

Fig. 264: Identifying Shift Lever Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Install the center console (see **CENTER CONSOLE REMOVAL/INSTALLATION**).

COMPONENT LOCATION INDEX

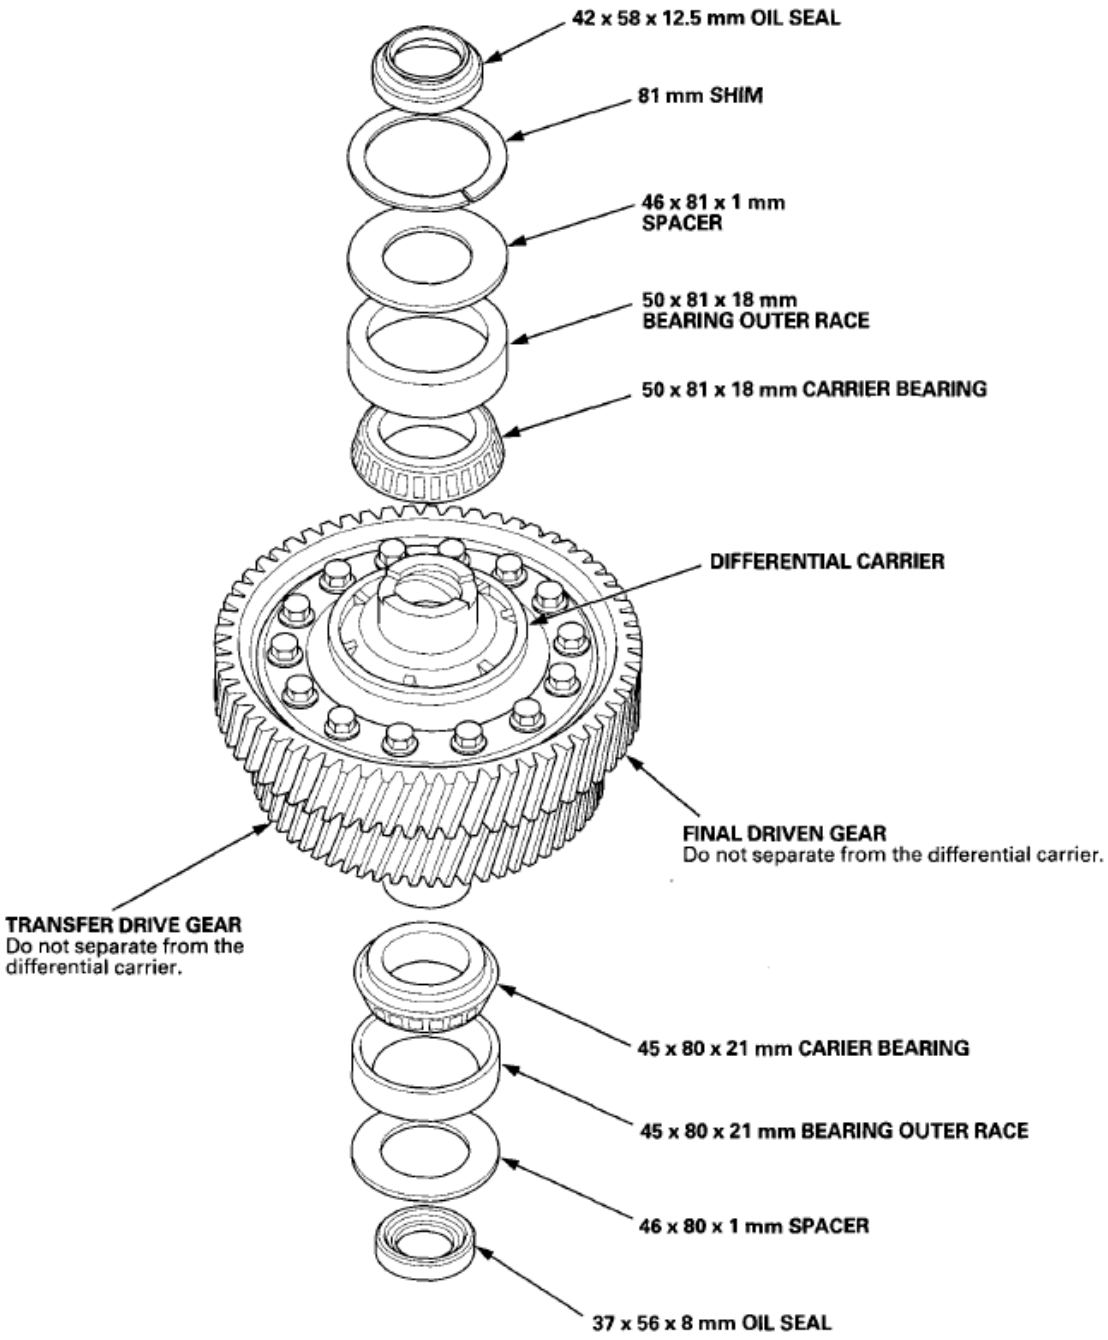

Fig. 265: Identifying M/T Differential Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BACKLASH INSPECTION

1. Install the driveshaft and the intermediate shaft into the differential assembly.
2. Carefully clamp the driveshaft (A) in a bench vise (B).

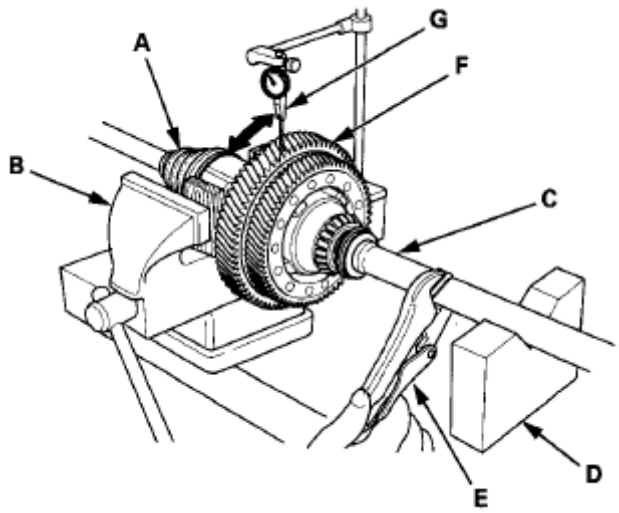

Fig. 266: Measuring Backlash Of Final Driven Gear Using Dial Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Place the intermediate shaft (C) on a V-block (D), then fix the intermediate shaft using vise grips or equivalent (E).
4. Measure the backlash of the final driven gear (F) with a dial indicator (G). If the backlash is not within the standard, replace the differential assembly.

NOTE: If it needs to replace the differential carrier, the final driven gear and the transfer drive gear as a set. Do not separate the final driven gear and the transfer drive gear from the differential carrier.

Standard (New): 0.6- 1.2 mm (0.024- 0.047 in)

CARRIER BEARING REPLACEMENT

Special Tools Required

Remover Installer, 22 x 37/46 x 52 mm 07PAF-0030100

NOTE:

- **The bearing outer race and the tapered roller bearing should be replaced as a set.**
- **Whenever the tapered roller bearing is replaced, do the carrier bearing preload adjustment (see CARRIER BEARING PRELOAD ADJUSTMENT) while reassembling the transmission.**

1. Check the carrier bearings for wear and rough rotation on the transmission or the clutch housing with the bearing outer race. If they rotate smoothly and their rollers show no signs of wear, the bearings are OK.
2. Remove the carrier bearings (A) using a commercially available bearing puller (B) and a bearing separator (C).

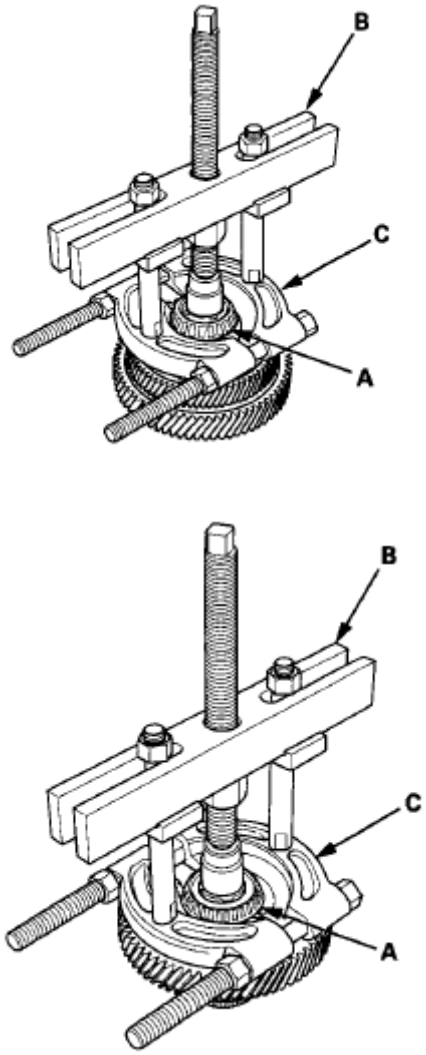

Fig. 267: Removing Carrier Bearings Using Bearing Puller And Bearing Separator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install new carrier bearings using the 22 x 37/46 x 52 mm remover installer (A) and a press (B). Press on each bearing until it bottoms out. There should be no clearance between the bearings and the differential carrier.

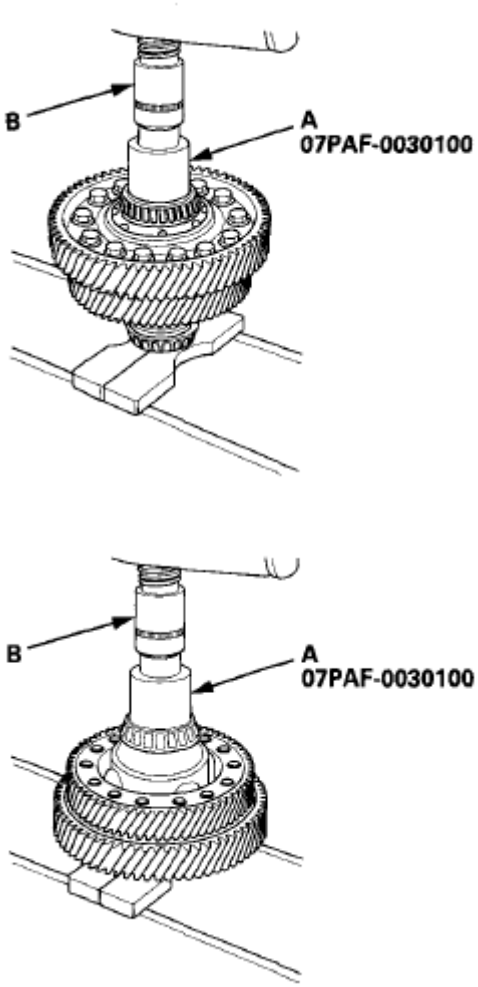

Fig. 268: Installing Carrier Bearings Using Remover Installer And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OIL SEAL REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment 07NAD-P20A100

1. Remove the oil seal (A) from the transmission housing (B).

NOTE: Be careful not to damage the transmission housing while removing the oil seal.

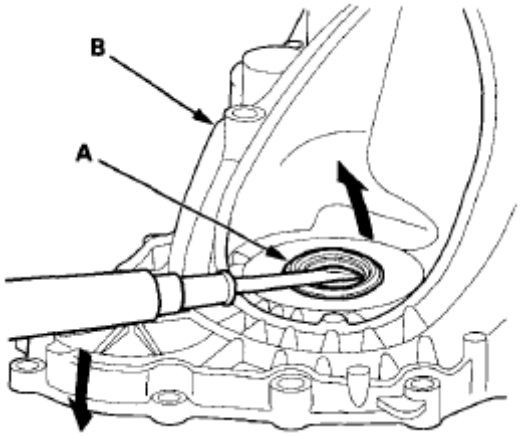

Fig. 269: Removing Oil Seal From Transmission Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the oil seal (A) from the clutch housing (B).

NOTE: Be careful not to damage the clutch housing while removing the oil seal.

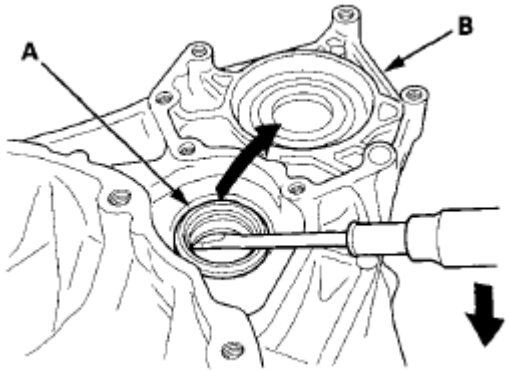

Fig. 270: Removing Oil Seal From Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new oil seal flush with the transmission housing using the 15 x 135L driver handle (A) and the oil seal driver attachment (B).

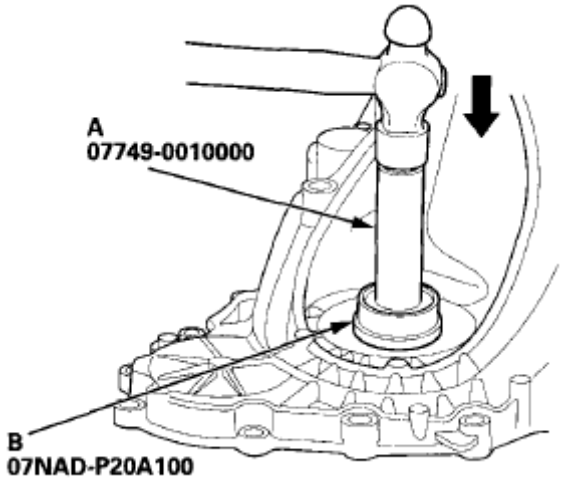

Fig. 271: Installing Oil Seal Flush With Transmission Housing Using Driver Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new oil seal flush with clutch housing using the 15 x 135L driver handle (A) and the oil seal driver attachment (B).

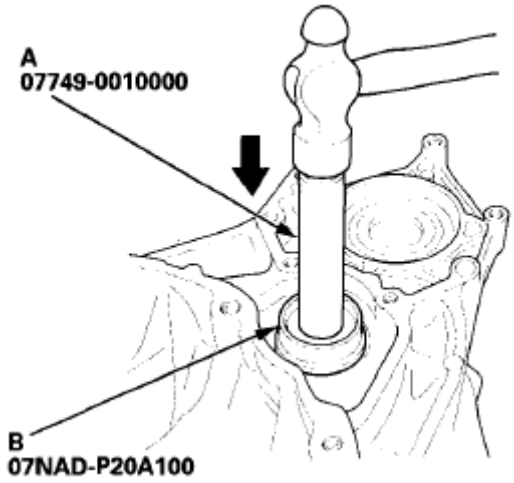

Fig. 272: Installing Oil Seal Flush With Clutch Housing Using Driver Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

BEARING OUTER RACE REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Bearing Driver Attachment, 78 x 80 mm 07NAD-PX40100

NOTE:

- **The bearing outer race and the tapered roller bearing should be replaced as a set.**
- **Whenever the tapered roller bearing and the bearing outer race are replaced, do the carrier bearing preload adjustment (see CARRIER BEARING PRELOAD ADJUSTMENT) while reassembling the transmission.**

1. Remove the oil seals from the transmission housing and the clutch housing (see **OIL SEAL REPLACEMENT**).
2. Remove the bearing outer race, the spacer, and the 81 mm shim from the transmission housing by heating the housing to about 212 CF (100 °C) with a heat gun.

NOTE: Do not reuse the 81 mm shim if the outer race was driven out.

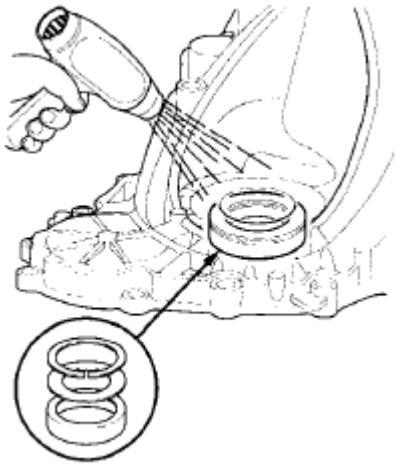

Fig. 273: Removing Bearing Outer Race, Spacer And Shim From Transmission Housing By Heating Housing Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the bearing outer race and the spacer from the clutch housing by heating the housing to about 212 °F (100 °C) with a heat gun.

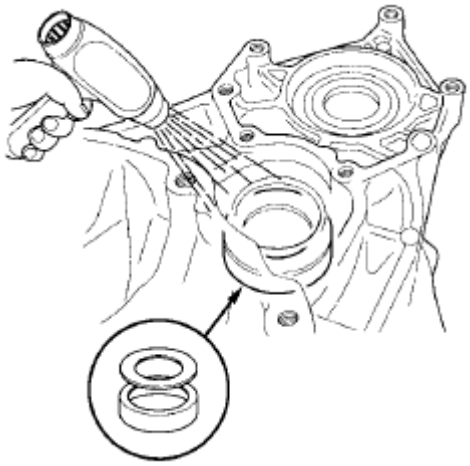

Fig. 274: Removing Bearing Outer Race And Spacer From Clutch Housing By Heating Housing Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install the 81 mm shim (A), the spacer (B), and the bearing outer race (C) into the transmission housing (D) using the 15 x 135L driver handle (E) and the 78 x 80 mm bearing driver attachment (F).

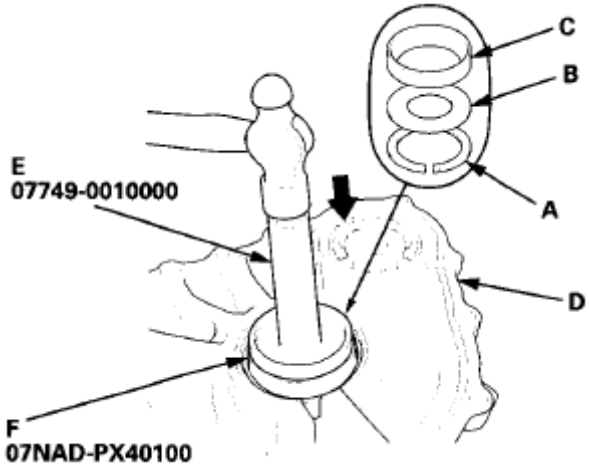

Fig. 275: Installing Shim, Spacer And Bearing Outer Race Into Transmission Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install the spacer (A) and the bearing outer race (B) into the clutch housing (C) using the 15 x 135L driver handle (D) and the 78 x 80 mm bearing driver attachment (E).

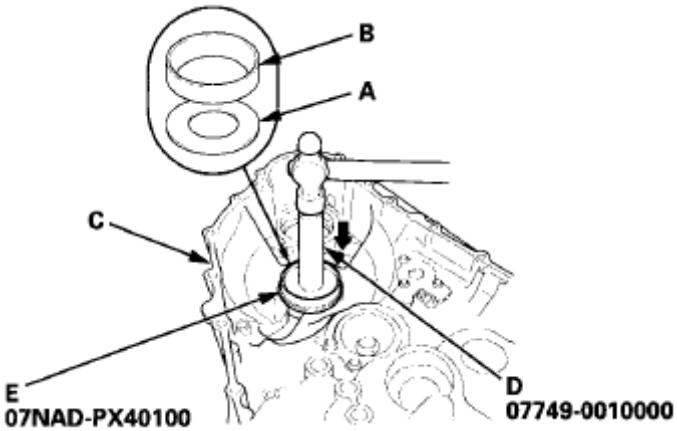

Fig. 276: Installing Spacer And Bearing Outer Race Into Clutch Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the oil seals into the transmission housing and the clutch housing (see **OIL SEAL REPLACEMENT**).

CARRIER BEARING PRELOAD ADJUSTMENT

Special Tools Required

Preload Inspection Tool 070AJ-0020101

If any of the items listed below were replaced, the carrier bearing preload must be adjusted.

- Transmission housing
- Clutch housing
- Differential carrier
- Spacer
- Carrier bearing and outer race

1. Disassemble the transmission (see **TRANSMISSION DISASSEMBLY**).
2. Install the 81 mm shim, the spacer, and the bearing outer race into the transmission housing, and install the spacer and the bearing outer race into the clutch housing, if they are removed (see **BEARING OUTER RACE REPLACEMENT**).

NOTE:
- **The tapered roller bearing and the bearing outer race compose the carrier bearing are always should be a set. Do not combine the other one.**
- **Note the thickness size of the used 81 mm shim.**

3. Install the differential carrier with the tapered roller bearing, and assemble the transmission housing and

the clutch housing using the 10 mm flange bolts by specified tightening torque (see step 27).

NOTE: It is not necessary to use sealing agent between the housings for this adjustment.

4. Rotate the differential assembly in both directions to seat the carrier bearings.
5. At normal room temperature, measure the starting torque of the differential assembly by rotating it in both directions using the preload inspection tool (A) and a torque wrench (B).

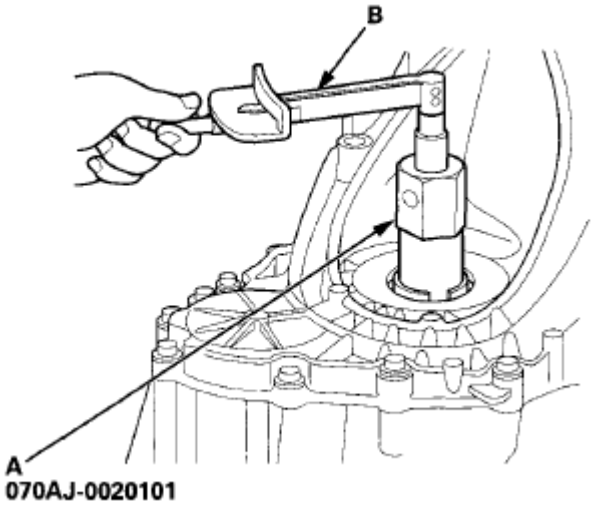

Fig. 277: Measuring Starting Torque Of Differential Assembly By Rotating It In Both Directions Using Preload Inspection Tool And Torque Wrench
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. If the carrier bearing preload is not within the standard, select an 81 mm shim that will provide the correct preload:
   - Compare the bearing preload you got on the first try with the standard preload of 3.43- 4.51 N.m (35-46 kgf.cm, 30-40 lbf.in).
   - If the preload you measure was less than standard, subtract it from the standard preload.
   - If the preload you measure was more than standard, subtract the standard preload from the preload you measure.

   Standard: 3.4- 4.5 N.m (35-46 kgf.cm, 30-40 lbf.in)

7. Subtract the appropriate thrust shim thickness from the middle of the standard preload: 4.0 N.m (41 kgf.cm, 36 lbf.in).

NOTE:
- **Each shim size up or down from standard makes about 0.3- 0.4 N.m (3- - 4 kgf.cm, 2.6- 3.5 lbf.in) difference in preload.**
- **Assemble only one 81 mm shim. Do not install two or more 81 mm shim combined.**

Example 1 (measured preload was less than the standard):

Measured preload: 2.1 N.m (21 kgf.cm, 18 lbf.in) with a 2.50 mm (0.098 in) thrust shim:

(1) Standard 4.0 N.m (41 kgf.cm, 36 lbf.in)

- Measurement 2.1 N.m (21 kgf.cm, 18 lbf.in)

1.9 N.m (20 kgf.cm, 17 lbf.in) less

The subtracted preload was 1.9 N.m (20 kgf.cm, 18 lbf.in) less than the standard, so you need a shim five sizes thicker than in measured (try the 2.65 mm (0.104 in) 81 mm shim, and recheck).

Example 2 (measured preload was more than the standard):

Measured preload: 4.8 N.m (49 kgf.cm, 43 lbf.in) with a 2.50 mm (0.098 in) thrust shim:

(2) Standard 4.8 N.m (49 kgf.cm, 43 lbf.in)

- Measurement 4.0 N.m (41 kgf.cm, 36 lbf.in)

0.8 N.m (8 kgf.cm, 7 lbf.in) more

The subtracted preload was 0.8 N.m (8 kgf.cm, 7 lbf.in) more than the standard, so you need a shim two sizes thinner than in measured (try the 2.44 mm (0.096 in) 81 mm shim, and recheck).

81 MM SHIM

Type	Thickness
A	2.05 mm (0.081 in)
B	2.08 mm (0.082 in)
C	2.11 mm (0.083 in)
D	2.14 mm (0.084 in)
E	2.17 mm (0.085 in)
F	2.20 mm (0.087 in)
G	2.23 mm (0.088 in)
H	2.26 mm (0.089 in)
J	2.29 mm (0.090 in)
K	2.32 mm (0.091 in)
L	2.35 mm (0.093 in)
M	2.38 mm (0.094 in)
N	2.41 mm (0.095 in)
P	2.44 mm (0.096 in)
Q	2.47 mm (0.097 in)
R	2.50 mm (0.098 in)

S	2.53 mm (0.100 in)
T	2.56 mm (0.101 in)
U	2.59 mm (0.102 in)
V	2.62 mm (0.103 in)
W	2.65 mm (0.104 in)
X	2.68 mm (0.106 in)
Y	2.71 mm (0.107 in)
Z	2.74 mm (0.108 in)
AA	2.77 mm (0.109 in)
AB	2.80 mm (0.110 in)
AC	2.83 mm (0.111 in)
AD	2.86 mm (0.113 in)
AE	2.89 mm (0.114 in)
AF	2.92 mm (0.115 in)
AG	2.95 mm (0.116 in)
AH	2.98 mm (0.117 in)
AJ	3.01 mm (0.119 in)
AK	3.04 mm (0.120 in)
AL	3.07 mm (0.121 in)
AM	3.10 mm (0.122 in)
AN	3.13 mm (0.123 in)
AP	3.16 mm (0.124 in)

8. Replace the 81 mm shim to appropriate one (see **BEARING OUTER RACE REPLACEMENT**).
9. With the appropriate size 81 mm shim installed in the transmission housing, check the initial preload again to verify the preload is within the standard.
10. Reassemble the transmission (see **TRANSMISSION REASSEMBLY**).

COMPONENT LOCATION INDEX

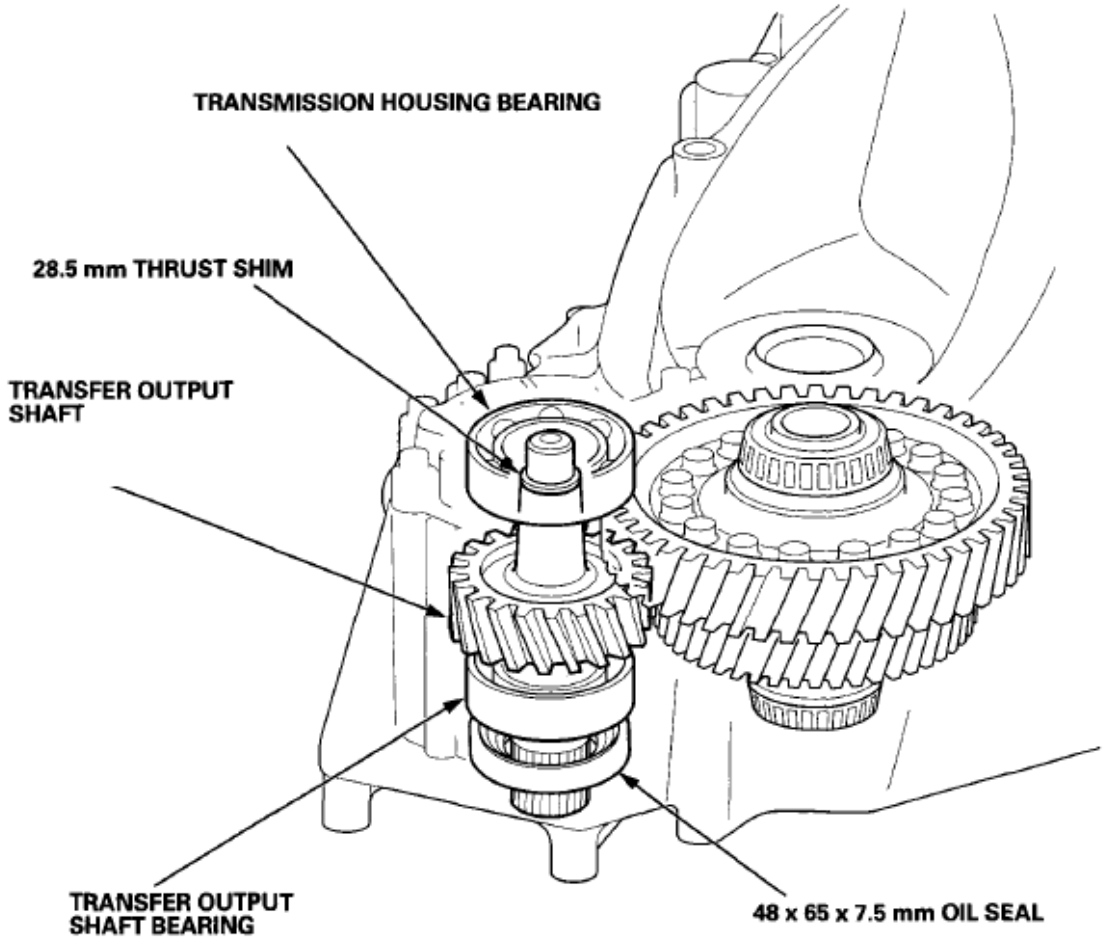

Fig. 278: Identifying Transfer Output Shaft Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER OUTPUT SHAFT BEARING REPLACEMENT

Special Tools Required

Driver Handle, 40 mm I.D. 07746-0030100

1. Remove the transfer output shaft bearing (A) using a commercially available puller (B), a bearing separator (C), and a spacer (D). Place the spacer between the transfer output shaft and the puller to prevent damaging the transfer output shaft.

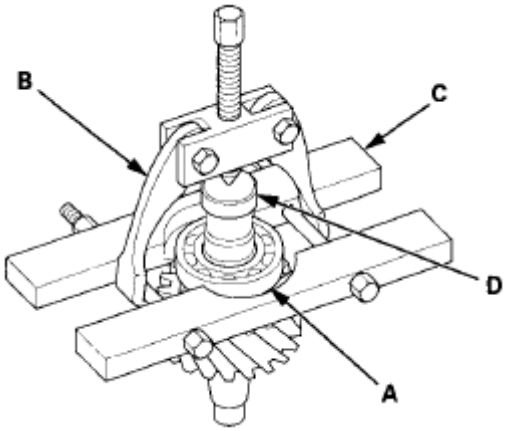

Fig. 279: Removing Transfer Output Shaft Bearing Using Puller, Bearing Separator And Spacer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing (A) on the transfer output shaft (B) using the 40 mm I.D. driver handle (C) and a press.

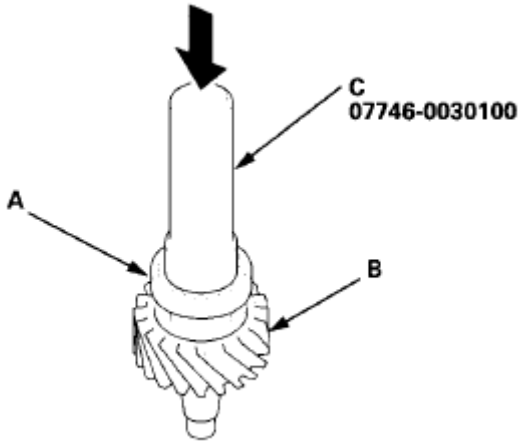

Fig. 280: Installing Bearing On Transfer Output Shaft Using I.D. Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

OIL SEAL REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment, 65 mm 07JAD-SH30100

1. Remove the oil seal from the clutch housing.

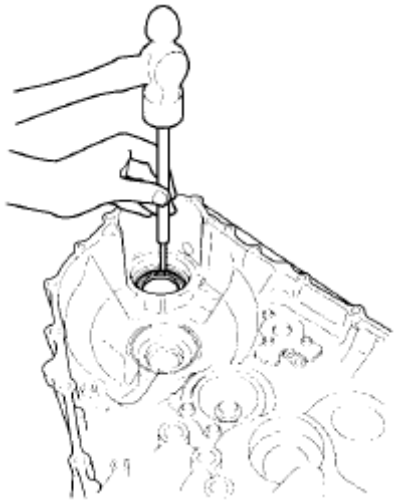

Fig. 281: Removing Oil Seal From Clutch Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new oil seal flush with the clutch housing using the driver handle (A) and the 65 mm oil seal driver attachment (B).

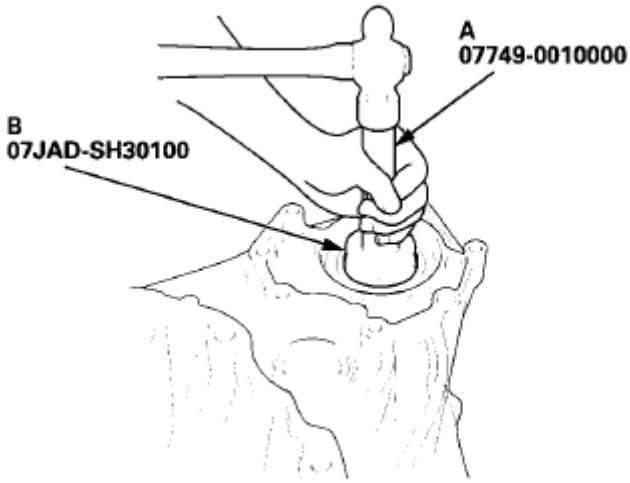

Fig. 282: Installing Oil Seal Flush With Clutch Housing Using Driver Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSMISSION HOUSING BEARING REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 72 x 75 mm 07746-0010600
- Driver Handle, 15 x 135L 07749-0010000

1. Remove the transfer output shaft bearing (A) from the transmission housing (B) by heating the

transmission housing to about 212 °F (100 °C) using a heat gun (C). Do not heat the transmission housing more than 212°F(100°C).

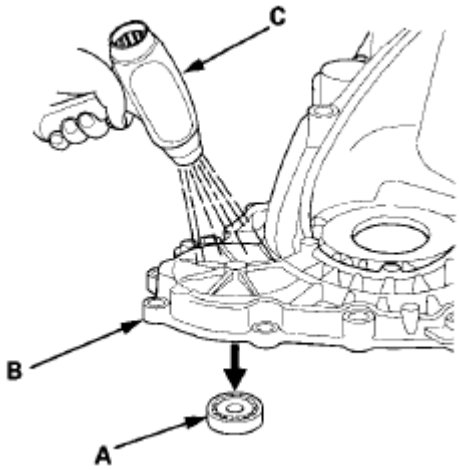

Fig. 283: Removing Transfer Output Shaft Bearing From Transmission Housing By Heating Transmission Housing Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing (A) in the transmission housing.

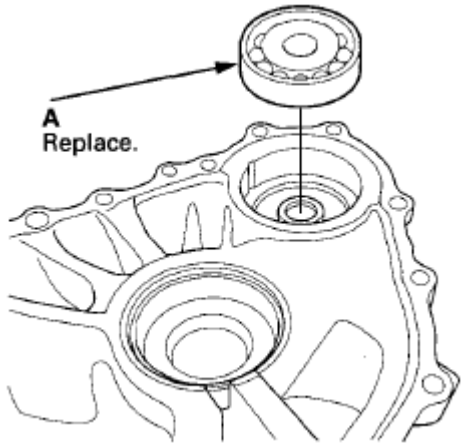

Fig. 284: Identifying Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Drive a new bearing until it bottoms in the transmission housing using the driver handle (A) and the 72 x 75 mm bearing driver attachment (B).

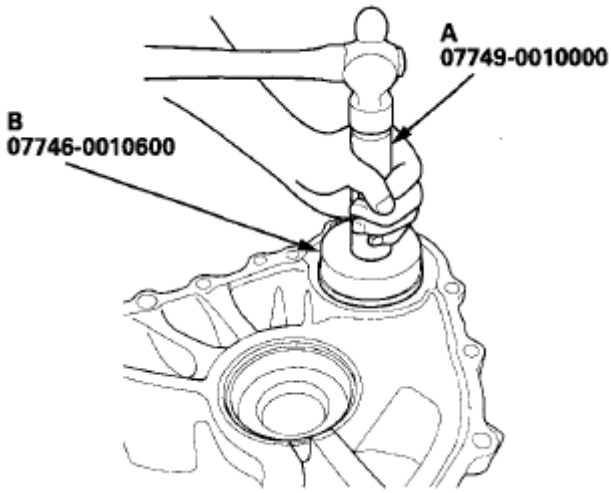

Fig. 285: Driving Bearing In Transmission Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER OUTPUT SHAFT THRUST CLEARANCE ADJUSTMENT

NOTE: If the transfer output shaft, the transfer output shaft bearing, the transmission housing bearing, the transmission housing, or the clutch housing were replaced, adjust the transfer output shaft thrust clearance with the 28.5 mm thrust shim.

1. Install the transfer output shaft (A) in the clutch housing.

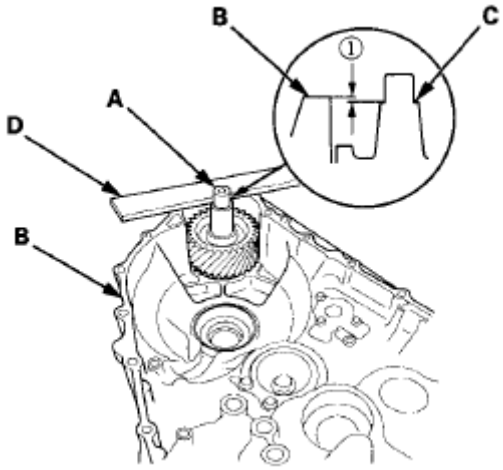

Fig. 286: Measuring Clearance Between Rim Of Clutch Housing And Thrust Shim Contact Area Using Straight Edge And Depth Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the clearance (1) between the rim of the clutch housing (B) and the 28.5 mm thrust shim contact

area (C) using a straight edge (D) and a depth gauge in at least three places. Use the average as the actual clearance.

3. Measure the clearance (2) between the transmission housing bearing (A) and the rim of the transmission housing (B) using a straight edge (C) and a feeler gauge (D) in at least three places. Use the average as the actual clearance.

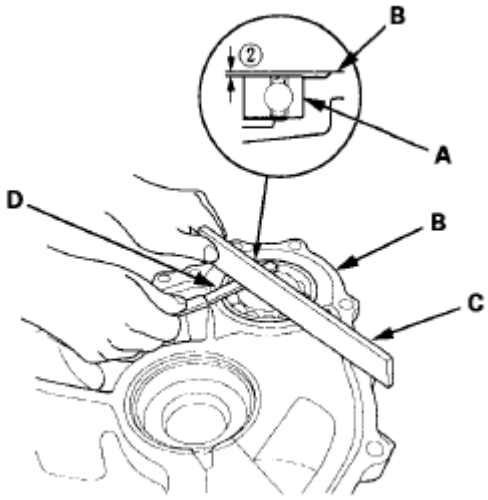

Fig. 287: Measuring Clearance Between Transmission Housing Bearing And Rim Of Transmission Housing Using Straight Edge And Feeler Gauge
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. To make the standard clearance, select a 28.5 mm thrust shim from the table; subtract the middle of the standard clearance from the sum of (1) and (2).

Standard Clearance:

0.08- 0.17 mm (0.003- 0.006 in)

Basic Formula

(1) + (2) - 0.13* = Shim thickness

Therefore, select a closest size shim from the table.

*: Middle of the standard clearance.

For Example

(1): 1.47 mm (0.058 in)

(2): 0.58 mm (0.023 in)

1.47 + 0.58- 0.13 = 1.92

Select the type F (1.92 mm (0.0756 in)) shim.

THRUST SHIM, 28.5 MM

Type	Thickness
A	1.82 mm (0.0717 in)
B	1.84 mm (0.0724 in)
C	1.86 mm (0.0732 in)
D	1.88 mm (0.0740 in)
E	1.90 mm (0.0748 in)
F	1.92 mm (0.0756 in)
G	1.94 mm (0.0764 in)
H	1.96 mm (0.0772 in)
I	1.98 mm (0.0780 in)
J	2.00 mm (0.0787 in)
K	2.02 mm (0.0795 in)
L	2.04 mm (0.0803 in)
M	2.06 mm (0.0811 in)
N	2.08 mm (0.0819 in)
O	2.10 mm (0.0827 in)
P	2.12 mm (0.0835 in)
Q	2.14 mm (0.0843 in)
R	2.16 mm (0.0850 in)
S	2.18 mm (0.0858 in)
T	2.20 mm (0.0866 in)
U	2.22 mm (0.0874 in)
V	2.24 mm (0.0882 in)
W	2.26 mm (0.0890 in)
X	2.28 mm (0.0898 in)
Y	2.30 mm (0.0906 in)
Z	2.32 mm (0.0913 in)
AA	2.34 mm (0.0921 in)

COMPONENT LOCATION INDEX

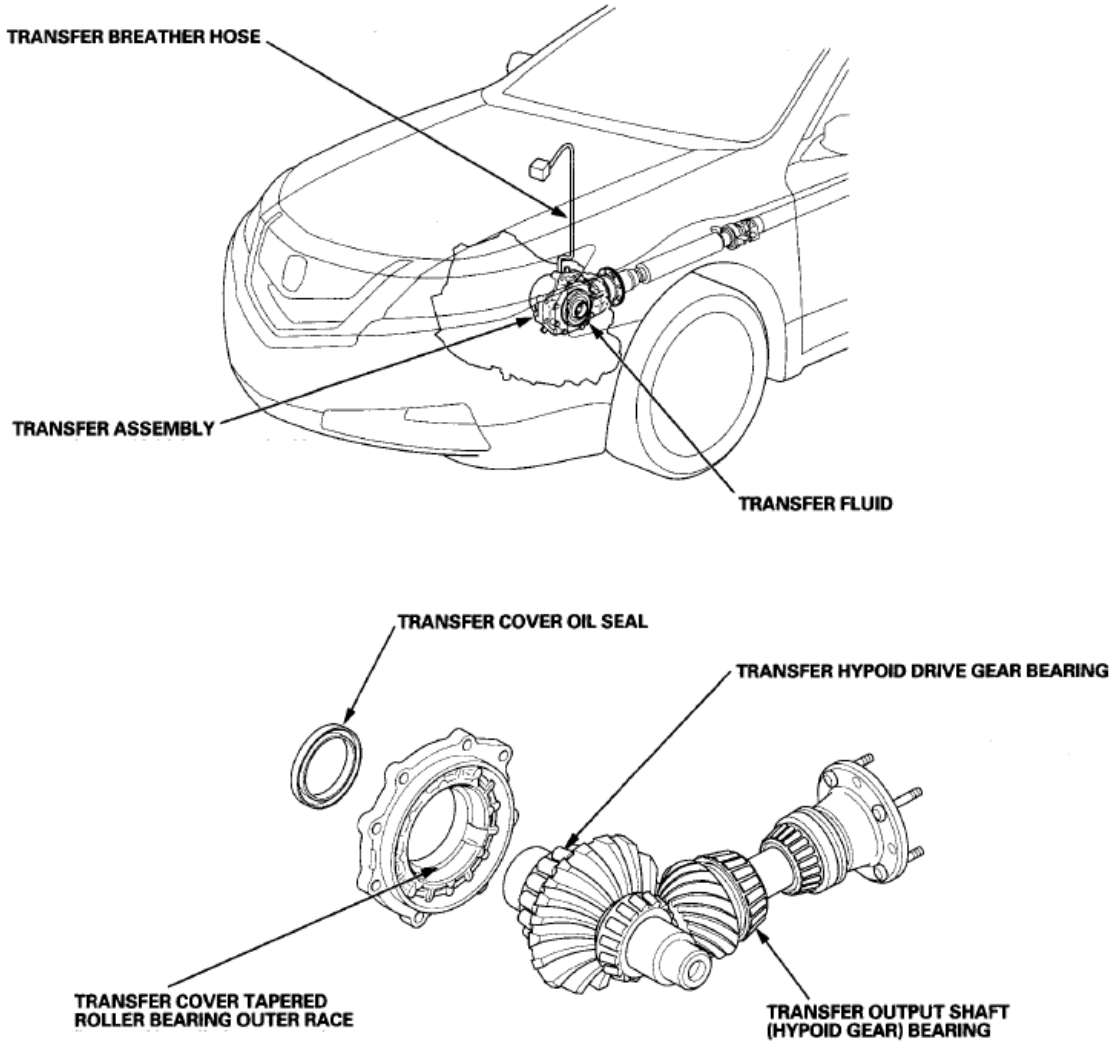

Fig. 288: Identifying Transfer Assembly Components Location
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER ASSEMBLY INSPECTION ON VEHICLE

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Shift the transmission into neutral.
3. Make reference mark (A) across the No. 1 propeller shaft (B) and the transfer companion flange (C).

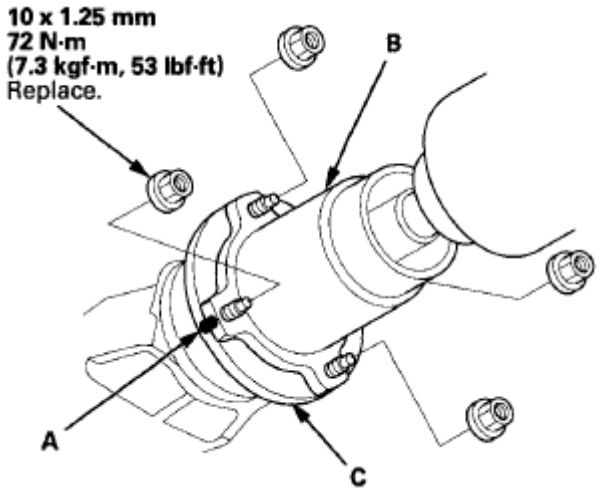

Fig. 289: Identifying Reference Mark, Propeller Shaft And Transfer Companion Flange With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Separate the No. 1 propeller shaft from the transfer companion flange.
5. Set a dial indicator (A) on the transfer companion flange (B); position the dial indicator tip (C) on the top of the bolt (D).

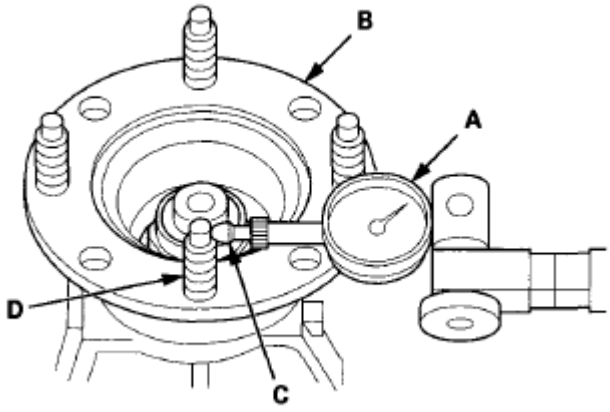

Fig. 290: Setting Dial Indicator On Transfer Companion Flange With Dial Indicator Tip On Top Of Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Measure the transfer gear backlash.

   Standard: 0.06- 0.16 mm (0.0024- 0.0063 in)

7. If the backlash is out of the standard, remove and disassemble the transfer assembly, and adjust the transfer gear backlash (see **TRANSFER ASSEMBLY REASSEMBLY**).
8. Check for fluid leaks between the mating surfaces of the transfer assembly and the transmission.
9. If there is a leak, remove the transfer assembly, remove the transfer cover, and replace the O-ring.

10. Check for fluid leaks between the transfer companion flange and the transfer oil seal.
11. If there is a leak, remove the transfer assembly from the transmission, and replace the transfer oil seal and the O-ring on the transfer output shaft (hypoid gear). If an oil seal and O-ring replacement is required, you will need to check and adjust the transfer gear tooth contact, the transfer gear backlash, the tapered roller bearing starting torque, and the total starting torque (see **TRANSFER ASSEMBLY REASSEMBLY**). Do not replace the oil seal with the transfer assembly on the transmission.

TRANSFER ASSEMBLY FLUID INSPECTION AND REPLACEMENT

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Remove the filler plug (A) and the sealing washer (B), check the condition of the transfer fluid, and make sure it is at the proper level (C).

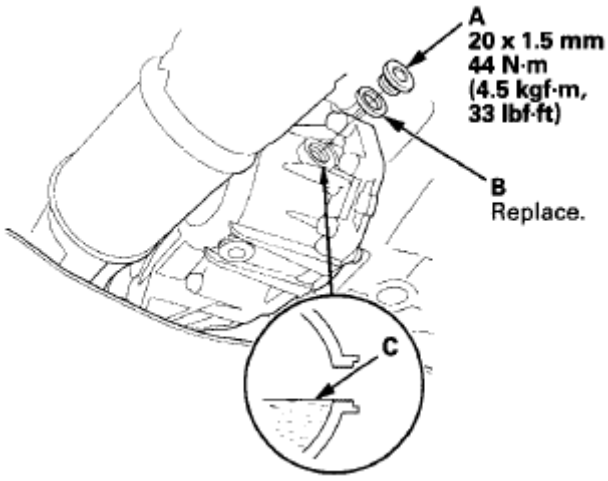

Fig. 291: Identifying Filler Plug, Sealing Washer And Proper Level Of Transfer Fluid With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. If the transfer fluid is dirty, remove the drain plug (A) and the sealing washer (B), drain the transfer fluid.

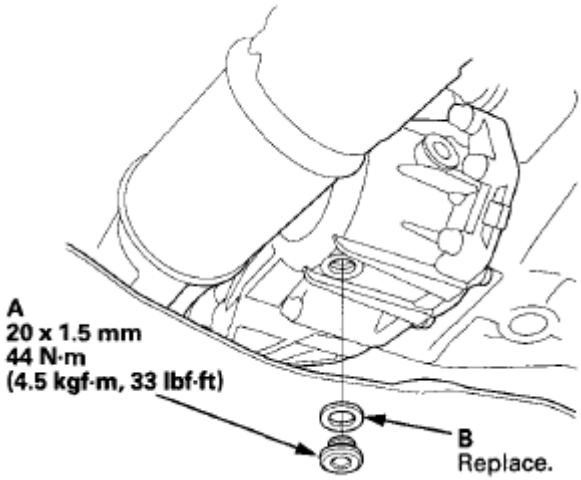

Fig. 292: Identifying Sealing Washer And Drain Plug With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Refill the transfer assembly with the recommended fluid (hypoid gear oil) through the filler plug hole until the fluid flows out. Use an SAE 90 viscosity hypoid gear oil, API classified GL4 or GL5 only.

   Viscosity:

   SAE 90: Above 0°F (- 18 °C)

   Transfer Fluid (Hypoid Gear Oil) Capacity:

   0.43 L (0.45 US qt) at fluid change

   0.45 L (0.48 US qt) at overhaul

5. Install the filler plug with a new sealing washer.

TRANSFER ASSEMBLY REMOVAL

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Shift the transmission into neutral.
3. Remove the drain plug (A), and drain the MTF.

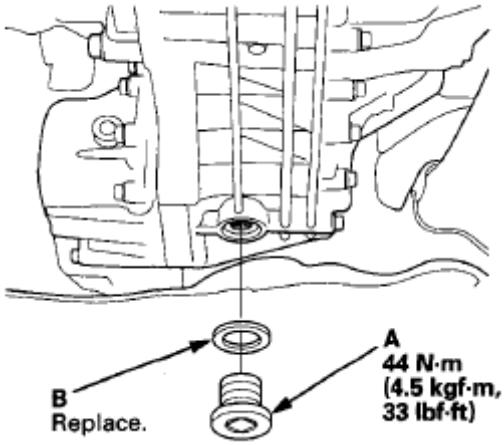

Fig. 293: Identifying Sealing Washer And Drain Plug With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Reinstall the drain plug with a new sealing washer (B).
5. Remove exhaust pipe A (see **J37A4 ENGINE (WITH SH-AWD)**).
6. Remove the bolt securing the transfer breather hose bracket (A), and disconnect the breather hose (B) from the breather pipe (C) on the transfer assembly.

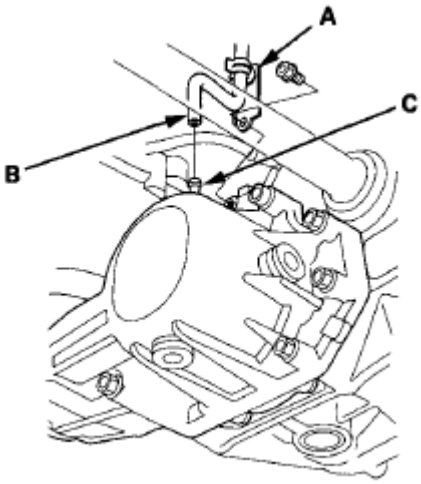

Fig. 294: Identifying Breather Hose Bracket, Breather Hose And Breather Pipe
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Make reference mark (A) across the No. 1 propeller shaft (B) and the transfer companion flange (C).

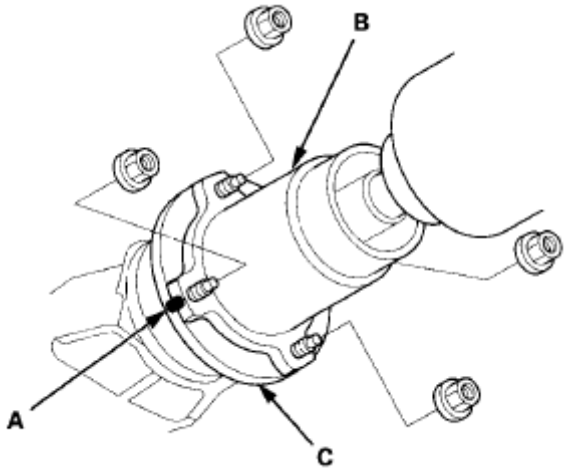

Fig. 295: Identifying Reference Mark, Propeller Shaft And Transfer Companion Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Separate the No. 1 propeller shaft from the transfer companion flange.
9. Remove the transfer assembly (A) and the dowel pin (B) from the transmission.

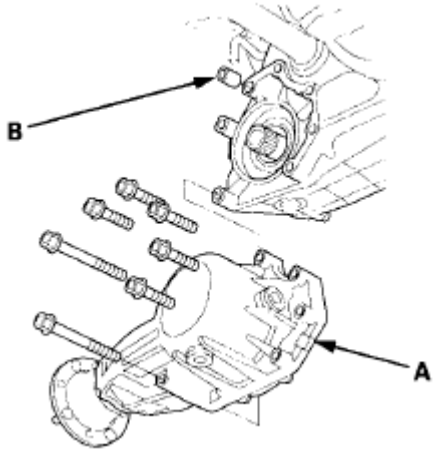

Fig. 296: Identifying Transfer Assembly And Dowel Pin
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER ASSEMBLY INSTALLATION

1. Clean the areas where the transfer assembly contacts the transmission with solvent, and dry with compressed air.
2. Install the dowel pin (A) in the transmission, and install the transfer assembly (B) on the transmission.

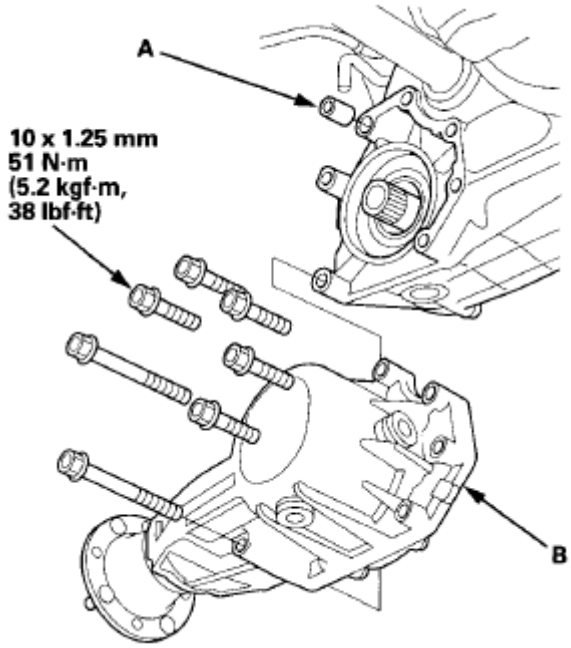

Fig. 297: Identifying Dowel Pin And Transfer Assembly With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the No. 1 propeller shaft (A) to the transfer companion flange (B) by aligning the reference mark (C) you made.

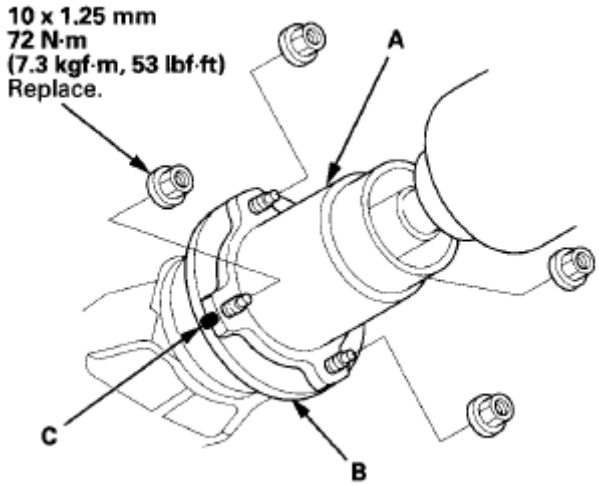

Fig. 298: Identifying Propeller Shaft, Companion Flange And Reference Mark With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Secure the transfer breather hose bracket (A) on the transfer assembly with the bolt, and install the breather hose (B) over the breather pipe (C) with facing the dot mark (D) to the rear side of the vehicle.

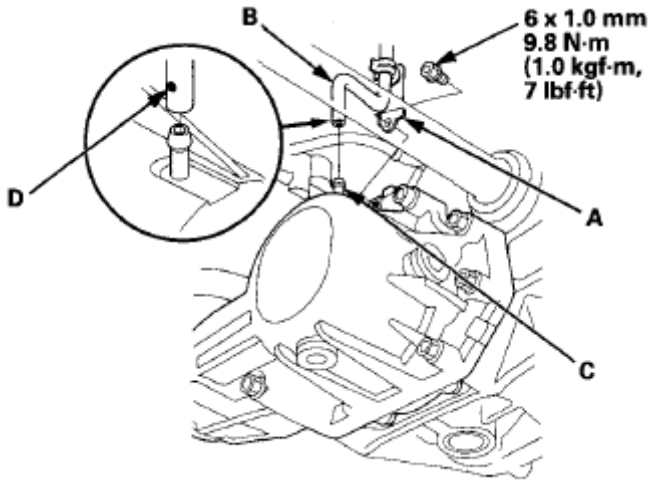

Fig. 299: Identifying Breather Hose Bracket, Breather Hose, Breather Pipe And Dot Mark With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Install exhaust pipe A (see **J37A4 ENGINE (WITH SH-AWD)**).
6. Check the fluid level, and refill the transfer assembly with transfer fluid (hypoid gear oil), if necessary (see **TRANSFER ASSEMBLY FLUID INSPECTION AND REPLACEMENT**).
7. Refill the transmission with MTF (see **TRANSMISSION FLUID INSPECTION AND REPLACEMENT**).
8. Test-drive the vehicle.

TRANSFER BREATHER HOSE REPLACEMENT

1. Raise the vehicle on a lift, and make sure it is supported securely.
2. Remove the transfer breather box (A) from its bracket (B).

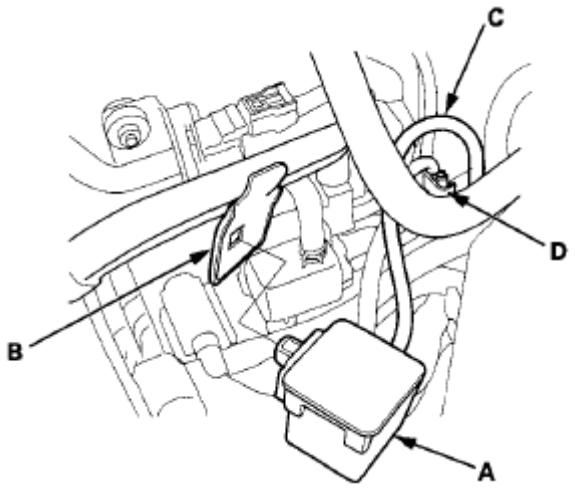

Fig. 300: Identifying Breather Box, Bracket, Breather Hose And Hose Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Remove the breather hose (C) from the hose clamp (D).
4. Remove the breather hose (A) from the hose clamp (B).

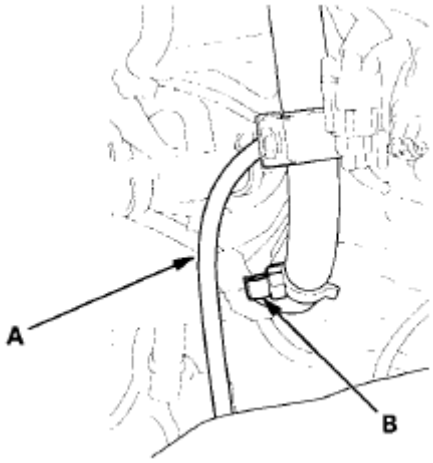

Fig. 301: Identifying Breather Hose And Hose Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Disconnect the breather hose (A) from the transfer breather pipe (B), and remove the breather hose from the hose clamp (C).

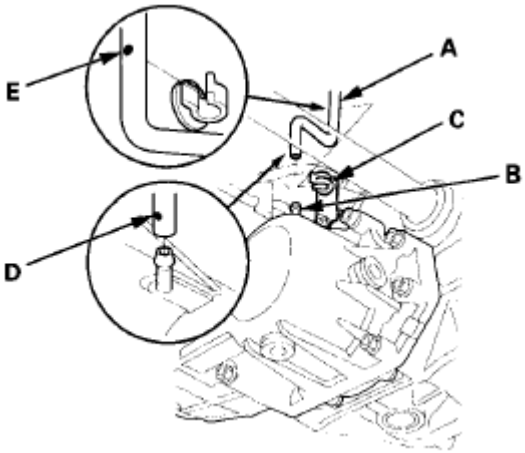

Fig. 302: Identifying Breather Hose, Breather Pipe, Hose Clamp And Dot Marks
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Connect the breather hose over the breather pipe with facing the dot mark (D) to the rear side of the vehicle, and install the hose on the hose clamp at the dot mark (E).
7. Install the breather hose (A) on the hose clamp (B).

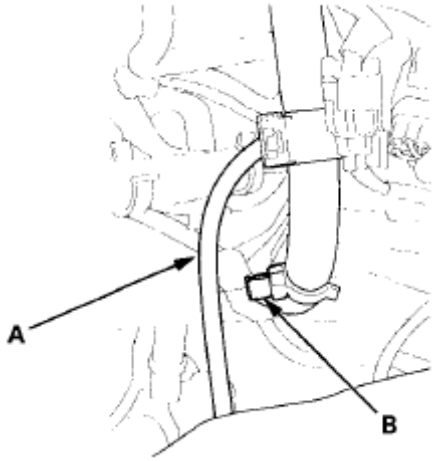

Fig. 303: Identifying Breather Hose And Hose Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the transfer breather box (A) on its bracket (B).

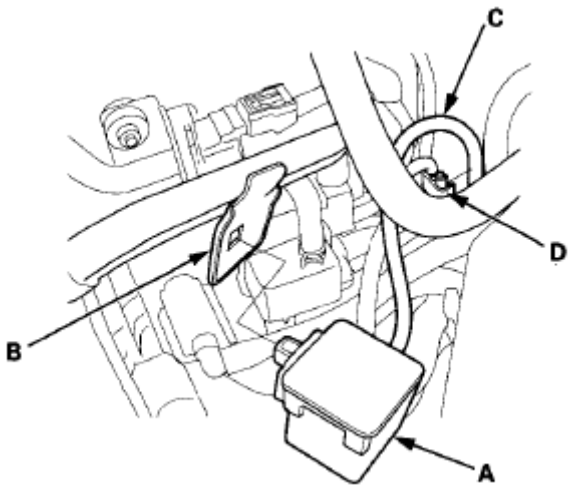

Fig. 304: Identifying Breather Box, Bracket, Breather Hose And Hose Clamp
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the breather hose (C) on the hose clamp (D).

TRANSFER ASSEMBLY INSPECTION

NOTE: To prevent damaging the transfer housing, always use soft jaws or equivalent materials between the transfer housing and a bench vise.

Transfer Gear Backlash Measurement

1. Set a dial indicator (A) on the transfer companion flange (B); position the dial indicator tip (C) on the top of the bolt (D).

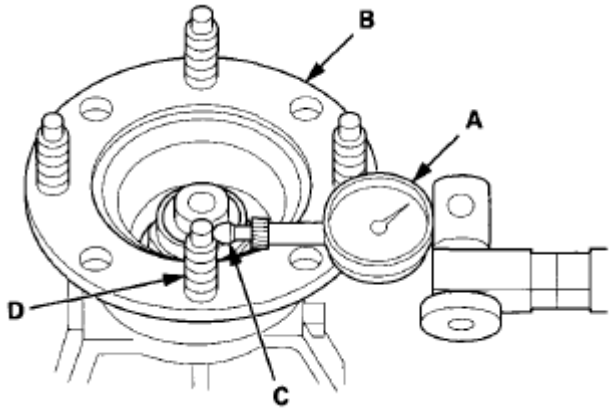

Fig. 305: Setting Dial Indicator On Transfer Companion Flange With Dial Indicator Tip On Top Of Bolt
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Measure the transfer gear backlash.

   Standard: 0.06- 0.16 mm (0.0024- 0.0063 in)

   Total Starting Torque Measurement

3. Secure the transfer housing (A) in a bench vise (B) with soft jaws.

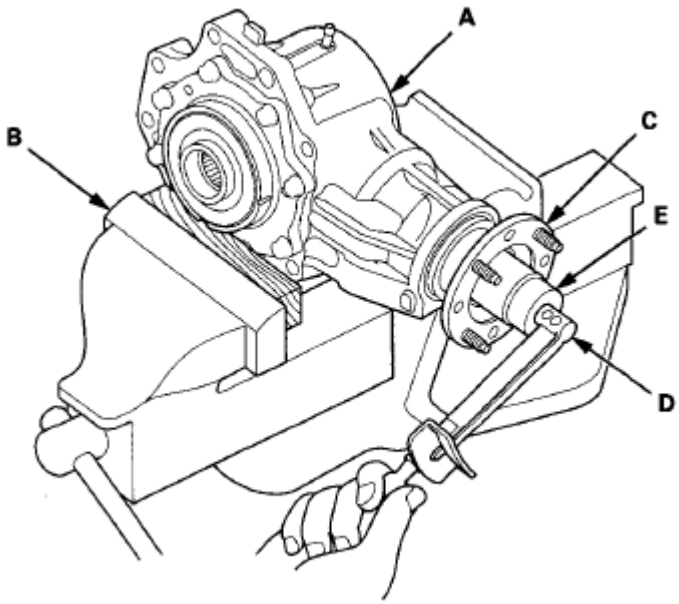

Fig. 306: Securing Transfer Housing In Bench Vise With Soft Jaws And Measuring Starting Torque At Companion Flange Using Torque Wrench And Socket
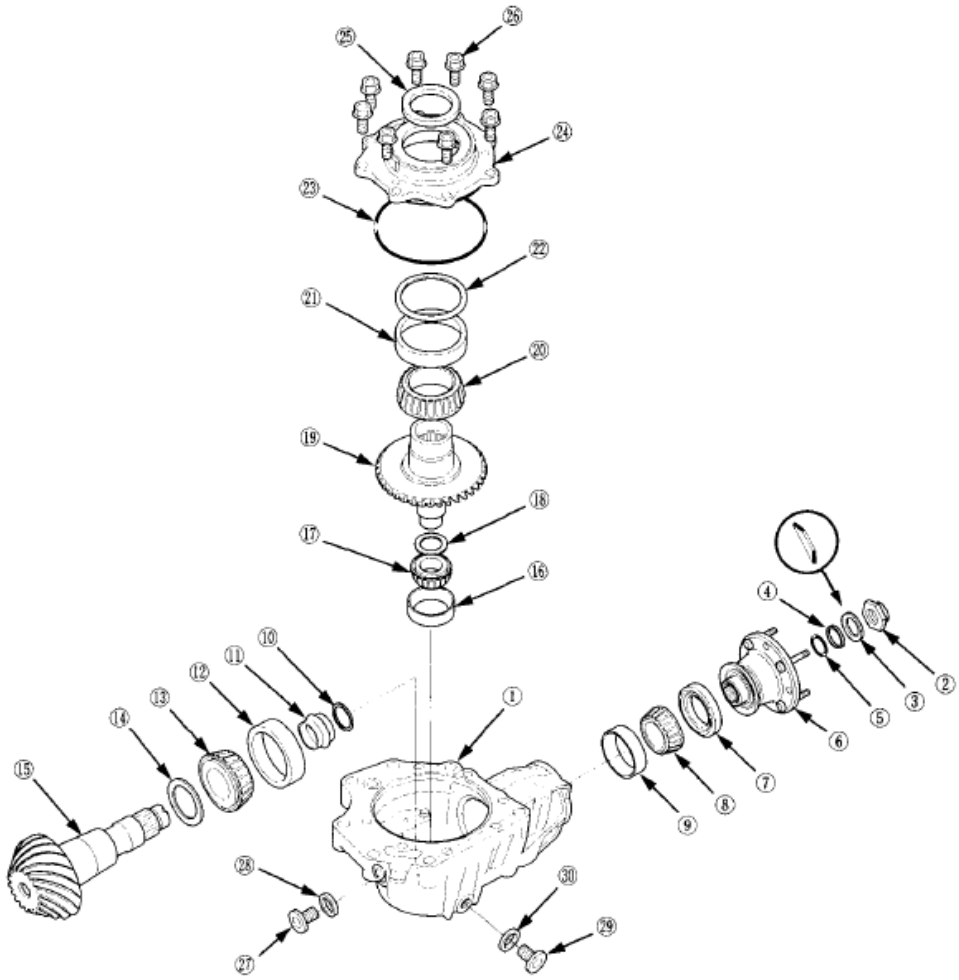
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Rotate the transfer companion flange several times to seat the tapered roller bearings.



5. Measure the starting torque at the companion flange (C) using a torque wrench (D) and a socket (E).

   Standard: 2.64- 4.23 N.m (26.9-43.1 kgf.cm, 23.3-37.4 lbf.in)

6. If the measurements are out of the standard, disassemble the transfer assembly, and repair it.

Courtesy of AMERICAN HONDA MOTOR CO., INC.

Special Tools Required

Flange Holder 07XAB-0010101

NOTE: To prevent damaging the transfer housing, always use soft jaws or equivalent materials between the transfer housing and a bench vise.

1. Remove the transfer cover (A) from the transfer housing (B).

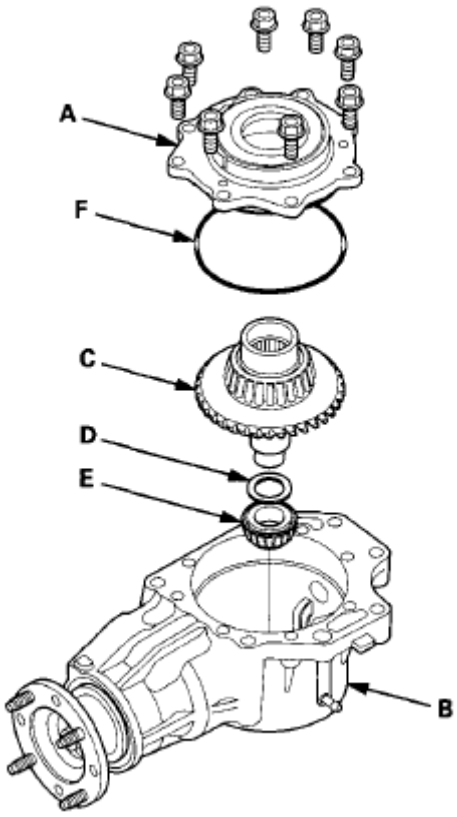

Fig. 308: Identifying Transfer Cover, Housing, Hypoid Drive Gear/Shaft Assembly, Thrust Shim, Tapered Roller Bearing And O-Ring
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the transfer hypoid drive gear/shaft assembly (C), the 25 mm thrust shim (D), and the tapered roller bearing (E).
3. Remove the O-ring (F) from the transfer cover.
4. Remove the oil seal from the transfer cover (see **TRANSFER COVER OIL SEAL REPLACEMENT**).
5. Drain the transfer fluid (hypoid gear oil) from the transfer housing (see **TRANSFER ASSEMBLY FLUID INSPECTION AND REPLACEMENT**).
6. Cut the stake on the locknut using a chisel.

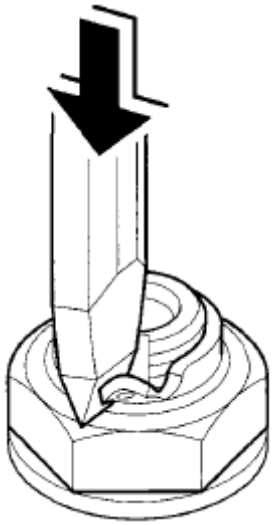

Fig. 309: Cutting Stake On Locknut Using Chisel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Secure the transfer housing in a bench vise with soft jaws.

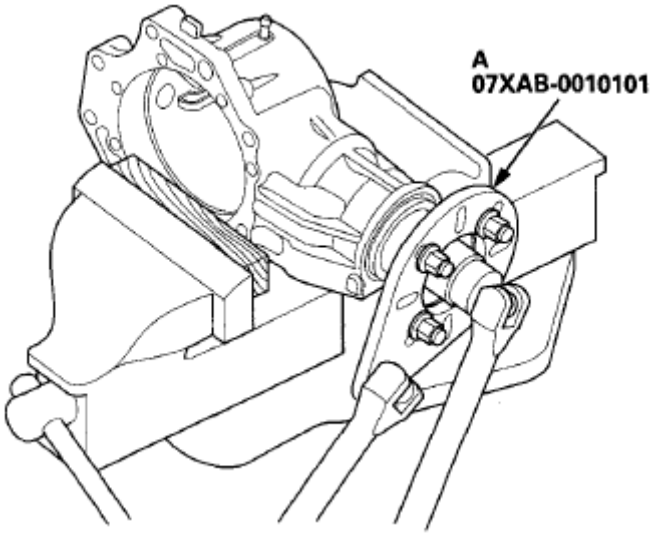

Fig. 310: Securing Transfer Housing In Bench Vise With Soft Jaws
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Install the flange holder (A) on the companion flange, then loosen the locknut.
9. Remove the flange holder.
10. Remove the locknut (A), the conical spring washer (B), the back-up ring (C), the O-ring (D), and the companion flange (E) from the transfer output shaft (hypoid gear) (F).

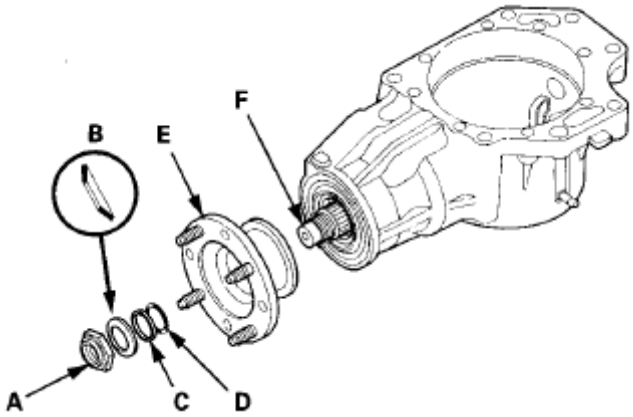

Fig. 311: Identifying Locknut, Conical Spring Washer, Back-Up Ring, O-Ring, Companion Flange And Output Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

11. Remove the transfer output shaft (hypoid gear) (A) from the transfer housing (B), then remove the thrust washer (C) and the transfer spacer (D) from the transfer output shaft (hypoid gear).

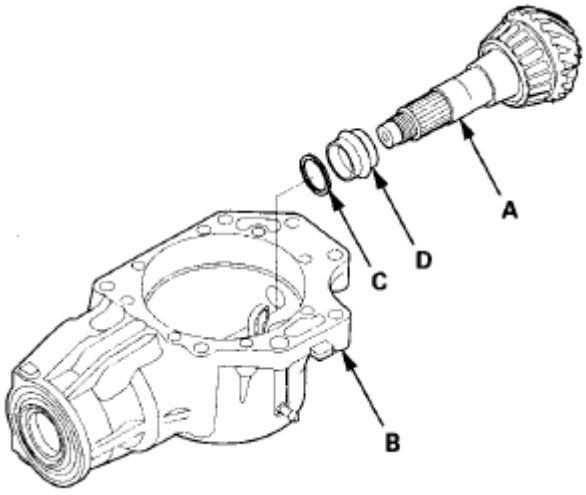

Fig. 312: Identifying Output Shaft (Hypoid Gear), Transfer Housing, Thrust Washer And Transfer Spacer
Courtesy of AMERICAN HONDA MOTOR CO., INC.

12. Remove the oil seal (A) and the tapered roller bearing (B) from the transfer housing.

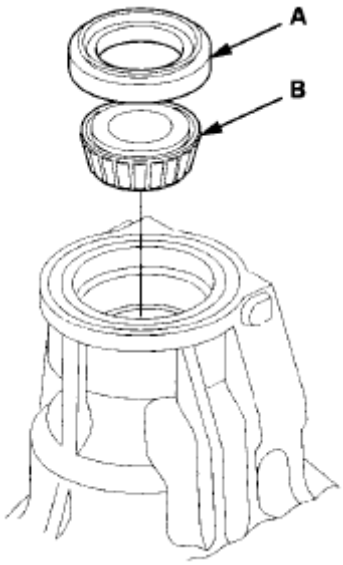

Fig. 313: Identifying Oil Seal And Tapered Roller Bearing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER HYPOID DRIVE GEAR BEARING REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 42x47 mm 07746-0010300
- Driver Handle, 15 x 135L 07749-0010000
- Installer Attachment 40 mm 07LAD-PW50601

1. Remove the tapered roller bearing (A) from the transfer hypoid drive gear (B) using the 15 x 135L driver handle (C), the 42 x 47 mm bearing driver attachment (D), a bearing separator (E), and a press.

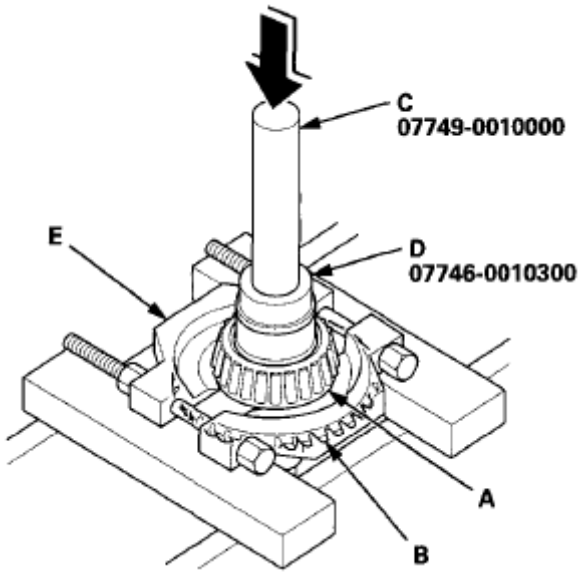

Fig. 314: Removing Tapered Roller Bearing From Transfer Hypoid Drive Gear Using Driver Handle, Bearing Driver Attachment, Bearing Separator And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new bearing on the transfer hypoid drive gear using the 15 x 135L driver handle (A), the 40 mm installer attachment (B), 42 x 47 mm bearing driver attachment (C), and a press.

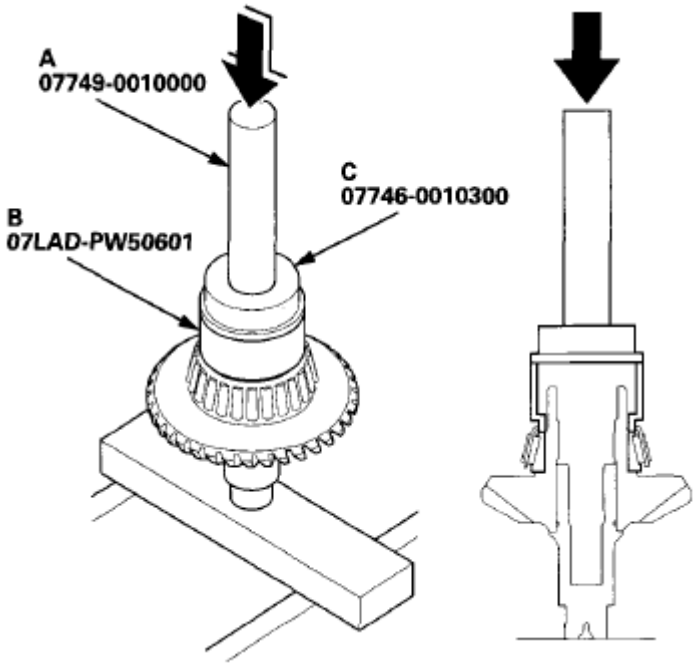

Fig. 315: Installing Bearing On Transfer Hypoid Drive Gear Using Driver Handle, Installer Attachment, Bearing Driver Attachment And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER OUTPUT SHAFT (HYPOID GEAR) BEARING REMOVAL/INSTALLATION

Special Tools Required

Driver Handle, 40 mm I.D. 07746-0030100

1. Remove the tapered roller bearing (A) from the transfer output shaft (hypoid gear) (B) using a bearing separator (C) and a press. Place a spacer (D) between the transfer output shaft and a press to prevent damaging the transfer output shaft.

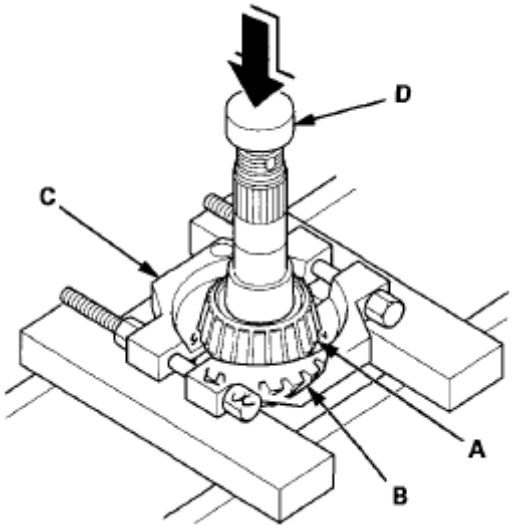

Fig. 316: Removing Tapered Roller Bearing From Transfer Output Shaft By Placing Spacer And Using Bearing Separator And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 40 mm thrust shim (A) over the transfer output shaft (hypoid gear).

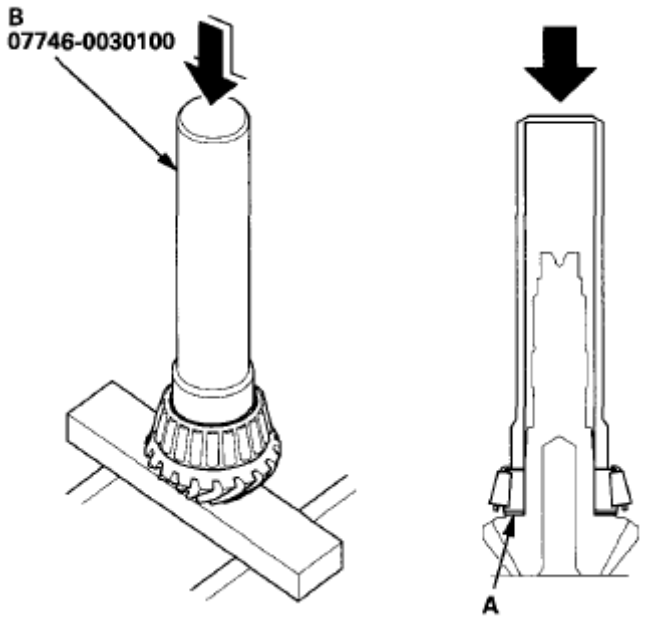

Fig. 317: Installing Thrust Shim Over Transfer Output Shaft (Hypoid Gear) Using I.D. Driver Handle
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install the tapered roller bearing over the transfer output shaft (hypoid gear) using the 40 mm I.D. driver handle (B) and a press.

TRANSFER HOUSING TAPERED ROLLER BEARING OUTER RACE REPLACEMENT

Special Tools Required

- Bearing Driver Attachment, 52 x 55 mm 07746-0010400
- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment, 65 mm 07JAD-SH30100
- Tapered Bearing Race Installer A 07MAF-SP0011A
- Installer Shaft 07MAF-SP0013A

NOTE: Replace the bearing outer race whenever the tapered roller bearing is replaced.

1. Remove the 52 mm bearing outer race (A), the 75 mm bearing outer race (B), and the 65 mm bearing outer race (C) from the transfer housing (D).

NOTE: Some bearing outer races (52 mm, 65 mm, and 75 mm) are press-fitted in the transfer housing and must be removed by heating the transfer housing.

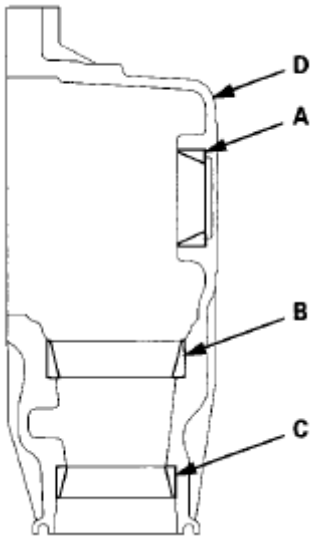

Fig. 318: Identifying Bearing Outer Races And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Remove the press-fitted bearing outer races (A) from the transfer housing (B) by heating the transfer housing to about 212 °F (100 °C) using a heat gun (C). Do not heat the transfer housing more than 212 °F (100 °C).

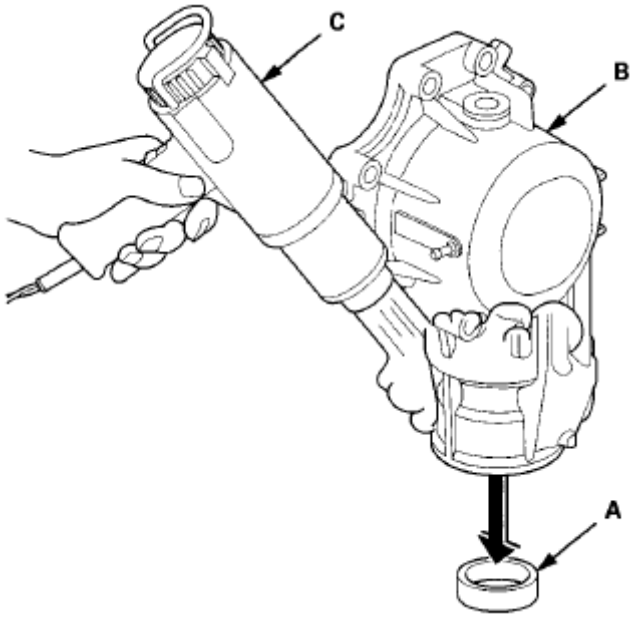

Fig. 319: Removing Press-Fitted Bearing Outer Races From Transfer Housing By Heating Transfer Housing Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Install a new 52 mm bearing outer race (A) until it bottoms in the transfer housing (B) using the 15 x 135L driver handle (C) and the 52 x 55 mm bearing driver attachment (D).

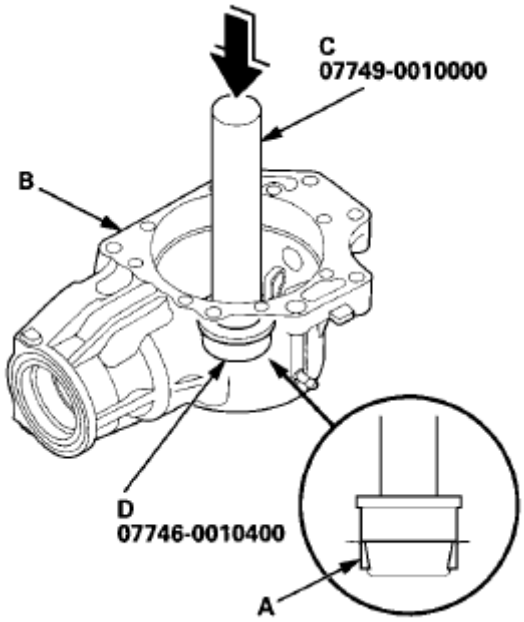

Fig. 320: Installing Bearing Outer Race In Transfer Housing Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Install a new 75 mm bearing outer race (A) and a new 65 mm bearing outer race (B) in the transfer housing (C), set the 65 mm oil seal driver attachment (D) and tapered bearing race installer A (E) over the bearing outer races, and install the installer shaft (F) through the 65 mm oil seal driver attachment (G) and installer.

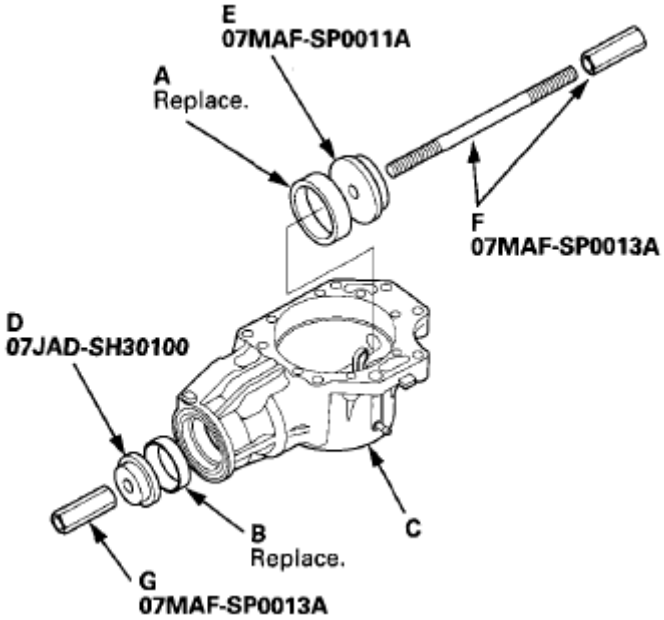

Fig. 321: Identifying Bearing Outer Races, Oil Seal Driver Attachment, Installer Shaft And Tapered Bearing Race Installer

Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Tighten the installer shaft nut (A) to install the bearing outer races (B) into the transfer housing (C) securely.

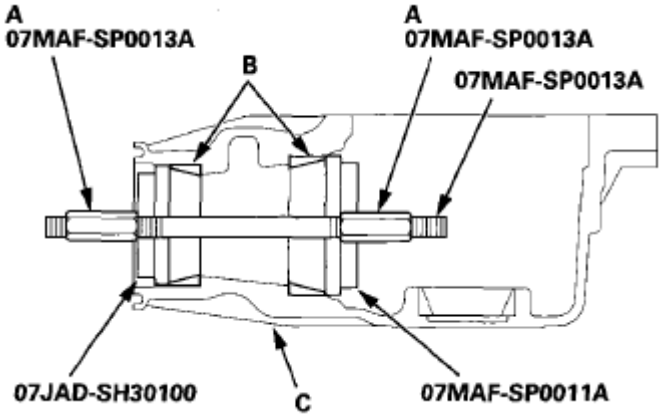

Fig. 322: Identifying Transfer Housing, Bearing Outer Races And Nut
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER COVER TAPERED ROLLER BEARING OUTER RACE REMOVAL/INSTALLATION

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Bearing Driver Attachment, 78 x 80 mm 07NAD-PX40100

NOTE: Replace the bearing outer race whenever the tapered roller bearing is replaced.

1. Remove the 80 mm bearing outer race (A) and the 80 mm thrust shim (B) from the transfer cover (C). If the bearing outer race is press-fitted, remove the bearing outer race by heating the transfer cover to about 212 °F (100 °C) using a heat gun (D). Do not heat the transfer cover more than 212 °F (100 °C).

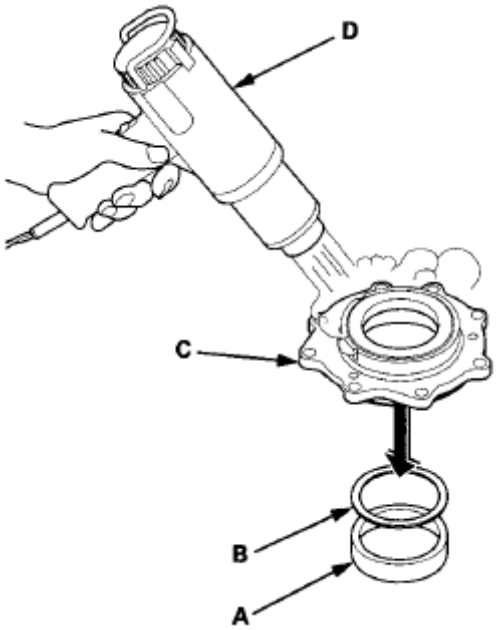

Fig. 323: Removing Bearing Outer Race And Thrust Shim From Transfer Cover By Heating Transfer Cover Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install the 80 mm thrust shim (A) and the 80 mm bearing outer race (B) in the transfer cover (C).

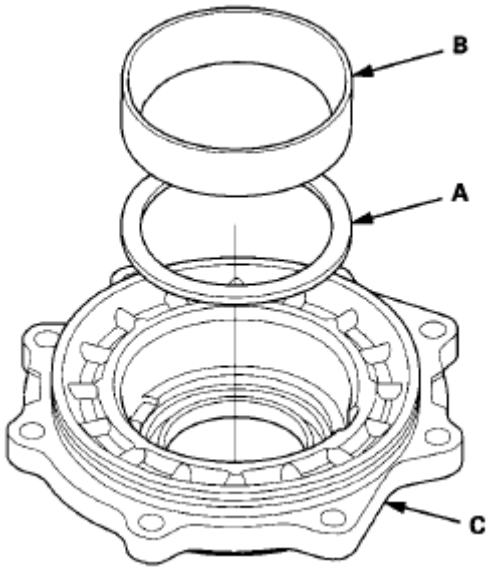

Fig. 324: Identifying Thrust Shim, Bearing Outer Race And Transfer Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

3. Drive the 80 mm bearing outer race securely in the transfer cover using the driver handle (A) and the 78 x 80 mm bearing driver attachment (B) so there is no clearance between the bearing outer race, the 80 mm thrust shim, and the transfer cover.

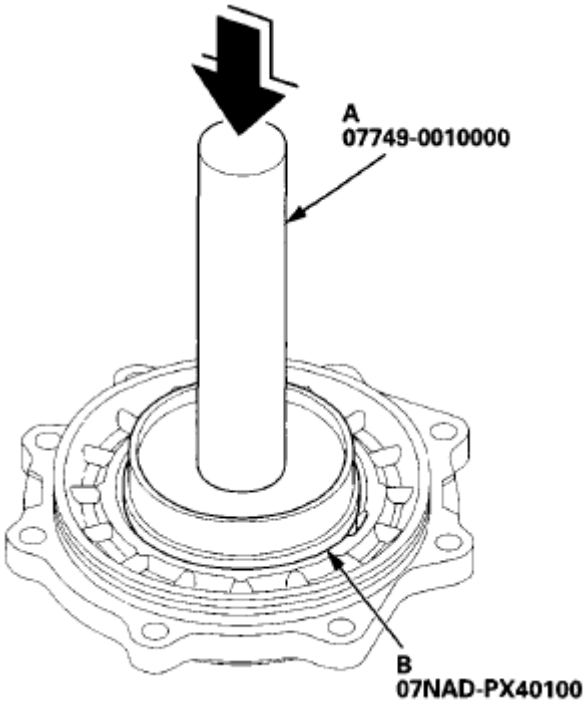

Fig. 325: Driving Bearing Outer Race In Transfer Cover Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER COVER OIL SEAL REPLACEMENT

Special Tools Required

- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment, 65 mm 07JAD-SH30100

1. Remove the oil seal (A) from the transfer cover (B).

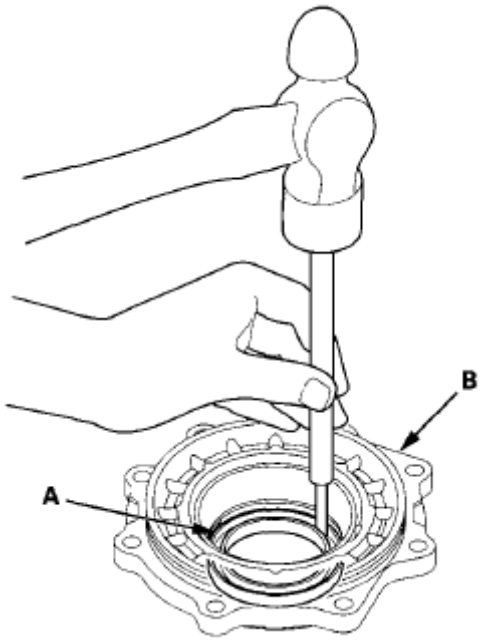

Fig. 326: Removing Oil Seal From Transfer Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

2. Install a new oil seal (A) in the transfer cover (B) to a height (C) of 0- 1 mm (0- 0.04 in) above the transfer cover surface using the driver handle (D) and the 65 mm oil seal driver attachment (E).

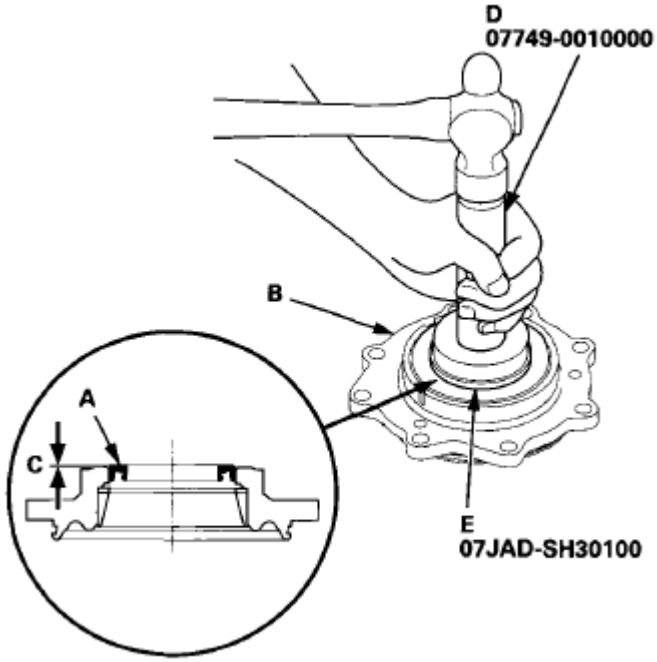

Fig. 327: Installing Oil Seal In Transfer Cover To Height Above Transfer Cover Surface Using Driver Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TRANSFER ASSEMBLY REASSEMBLY

Special Tools Required

- Driver Handle, 40 mm I.D. 07746-0030100
- Driver Handle, 15 x 135L 07749-0010000
- Oil Seal Driver Attachment, 65 mm 07JAD-SH30100
- Bearing Driver Attachment, 78 x 80 mm 07NAD-PX40100
- Flange Holder 07XAB-0010101

NOTE:

- **While reassembling the transfer assembly:**
  - **Check and adjust the transfer gear tooth contact.**
  - **Measure and adjust the transfer gear backlash.**
  - **Check and adjust the tapered roller bearing starting torque.**
- **Coat all parts with transfer fluid (hypoid gear oil) during reassembly.**
- **Replace the tapered roller bearing and the bearing outer race as a set if either part is replaced.**
- **Replace the transfer hypoid drive gear and the transfer output shaft (hypoid gear) as a set if either part is replaced.**
- **To prevent damaging the transfer housing, always use soft jaws or equivalent materials between the transfer housing and a bench vise.**

1. Select the 40 mm thrust shim if the transfer output shaft (hypoid gear) is replaced. Calculate the thickness of the 40 mm thrust shim using the following formula, and select the shim from the following table.

   FORMULA: A/100- B/100+C = X

   A. **Number on the existing transfer output shaft (hypoid gear)**
   B. **Number on the replacement transfer output shaft (hypoid gear)**
   C. **Thickness of the existing 40 mm thrust shim**

   X: Thickness needed for the replacement 40 mm thrust shim

   NOTE: The number on the transfer output shaft (hypoid gear) is shown in 1/100 mm.

   EXAMPLE

   A. **Existing transfer output shaft (hypoid gear) Number= +2**
   B. **Replacement transfer output shaft (hypoid gear) Number= -1**
   C. **Existing 40 mm thrust shim thickness = 1.05 mm**

X: Replacement 40 mm thrust shim thickness

X = A/100 - B/100 + C

= 2/100- (- 1)/100 +1.05

= 0.02 + 0.01 + 1.05 = 1.08 (mm)

Select type M 40 mm thrust shim of 1.08 mm (0.043 in)

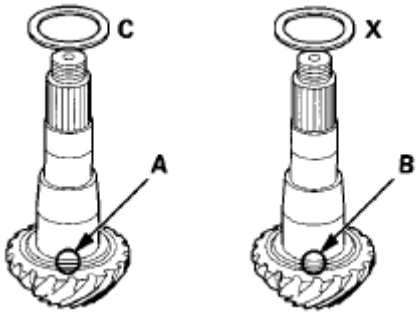

Fig. 328: Identifying Transfer Output Shaft And Thrust Shim
Courtesy of AMERICAN HONDA MOTOR CO., INC.

THRUST SHIM, 40 MM

Type	Thickness
A	0.72 mm (0.028 in)
B	0.75 mm (0.030 in)
C	0.78 mm (0.031 in)
D	0.81 mm (0.032 in)
E	0.84 mm (0.033 in)
F	0.87 mm (0.034 in)
G	0.90 mm (0.035 in)
H	0.93 mm (0.037 in)
I	0.96 mm (0.038 in)
J	0.99 mm (0.039 in)
K	1.02 mm (0.040 in)
L	1.05 mm (0.041 in)
M	1.08 mm (0.043 in)
N	1.11 mm (0.044 in)
O	1.14 mm (0.045 in)

2. Select the 40 mm thrust shim if the tapered roller bearing on the transfer output shaft (hypoid gear) is replaced. Measure the thickness of the replacement bearing and the existing bearing, and calculate the difference of the bearing thickness. Adjust the thickness of the existing 40 mm thrust shim by the amount of difference in bearing thickness, and select the replacement 40 mm thrust shim.

3. Install the 40 mm thrust shim (A) on the transfer output shaft (hypoid gear) (B), then install the tapered roller bearing (C) using the 40 mm I.D. driver handle (D) and a press.

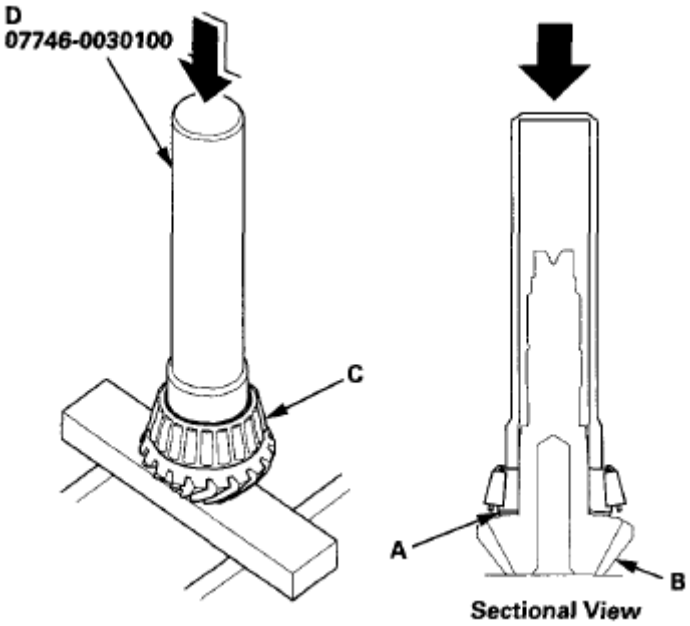

Fig. 329: Installing Thrust Shim On Transfer Output Shaft (Hypoid Gear) And Then Tapered Roller Bearing Using I.D. Driver Handle And Press
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Place the tapered roller bearing (A) on the bearing outer race of the companion flange side of the transfer housing, and install a new oil seal (B).

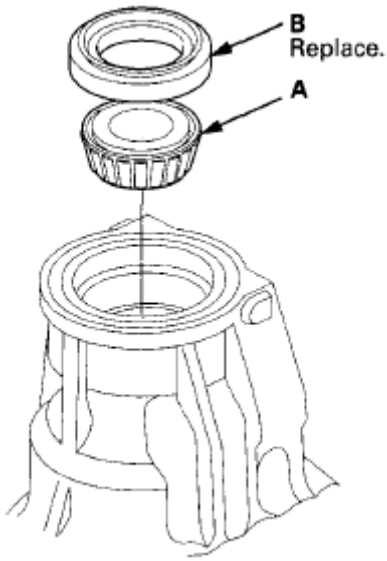

Fig. 330: Identifying Tapered Roller Bearing And Oil Seal
Courtesy of AMERICAN HONDA MOTOR CO., INC.

5. Drive the oil seal flush with the transfer housing using the 15 x 135L driver handle (A) and the 65 mm oil seal driver attachment (B).

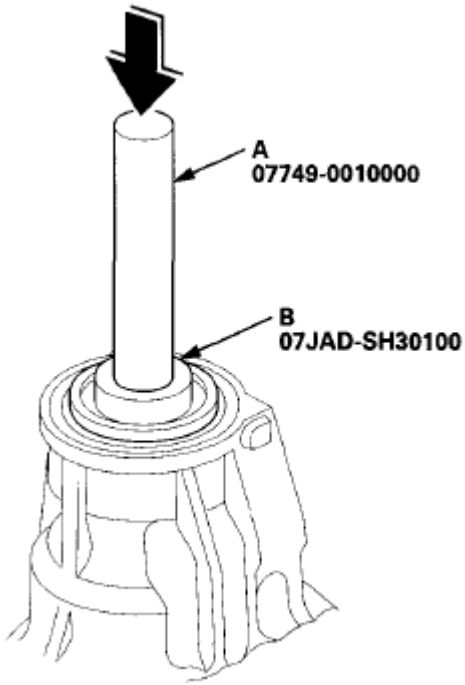

Fig. 331: Driving Oil Seal Flush With Transfer Housing Using Driver Handle And Oil Seal Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Install the transfer output shaft (hypoid gear) (A) in the transfer housing (B). Do not install the transfer spacer and the thrust washer on the transfer output shaft (hypoid gear).

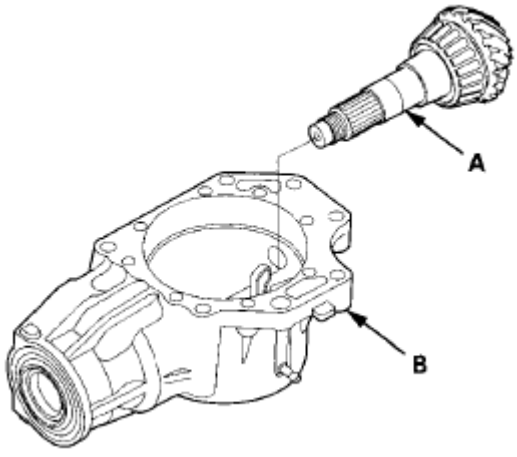

Fig. 332: Identifying Transfer Output Shaft (Hypoid Gear) And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Install the companion flange (A), the conical spring washer (B) (in the direction shown), and a new

locknut (C) on the transfer output shaft (hypoid gear) (D). Do not install the O-ring and the back-up ring.

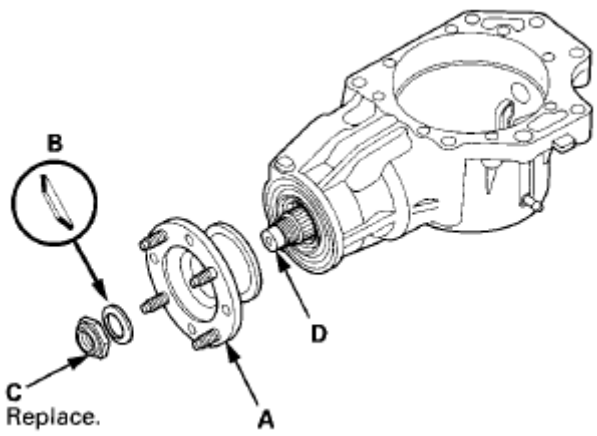

Fig. 333: Identifying Companion Flange, Conical Spring Washer, Locknut And Transfer Output Shaft
Courtesy of AMERICAN HONDA MOTOR CO., INC.

8. Secure the transfer housing (A) in a bench vise (B) with soft jaws.

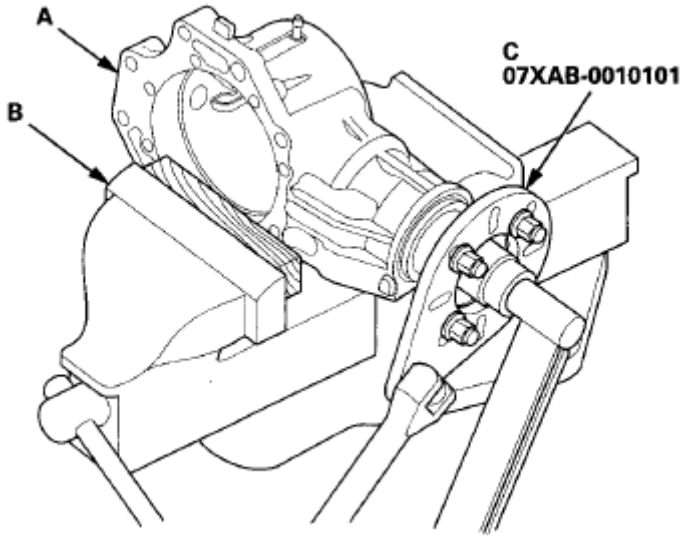

Fig. 334: Securing Transfer Housing In Bench Vise With Soft Jaws And Installing Flange Holder On Companion Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

9. Install the flange holder (C) on the companion flange.
10. Tighten the locknut while measuring the starting torque of the transfer output shaft (hypoid gear) so the starting torque is within 1.15- 1.71 N.m (11.7- 17.4 kgf.cm, 10.2 - 15.1 lbf.in). Do not stake the locknut in this step.
11. Remove the flange holder.
12. Apply Prussian Blue to both sides of the transfer hypoid drive gear teeth lightly and evenly.

13. Install the tapered roller bearing (A), the 25 mm thrust shim (B), and the transfer hypoid drive gear/shaft assembly (C) in the transfer housing (D).

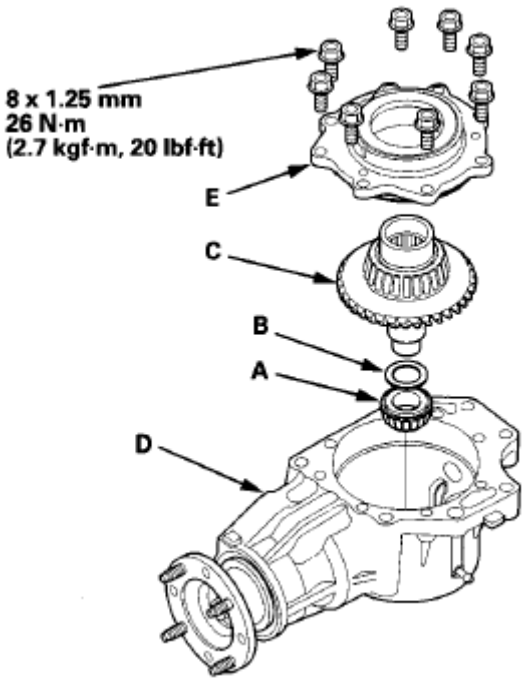

Fig. 335: Identifying Tapered Roller Bearing, Thrust Shim, Transfer Hypoid Drive Gear/Shaft Assembly, Transfer Housing And Transfer Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

14. Install the transfer cover (E). Do not install the O-ring on the transfer cover.
15. Rotate the companion flange in both directions until the transfer gears rotate one full turn in both directions.
16. Set a dial indicator (A) on the transfer companion flange (B); position the dial indicator tip (C) on the top of the bolt (D).

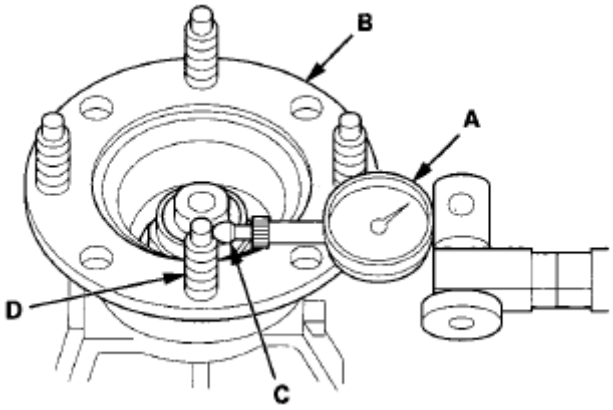

Fig. 336: Setting Dial Indicator On Transfer Companion Flange With Dial Indicator Tip On Top Of Bolt

Courtesy of AMERICAN HONDA MOTOR CO., INC.

17. Measure the transfer gear backlash.

    Standard: 0.06- 0.16 mm (0.0024- 0.0063 in)

18. Remove the transfer cover and the transfer hypoid drive gear/shaft assembly, and check the transfer hypoid drive gear tooth contact pattern.

    CORRECT TOOTH CONTACT PATTERN

Fig. 337: Identifying Hypoid Drive Gear Tooth For Correct Tooth Contact Pattern
Courtesy of AMERICAN HONDA MOTOR CO., INC.

INCORRECT TOOTH CONTACT PATTERN

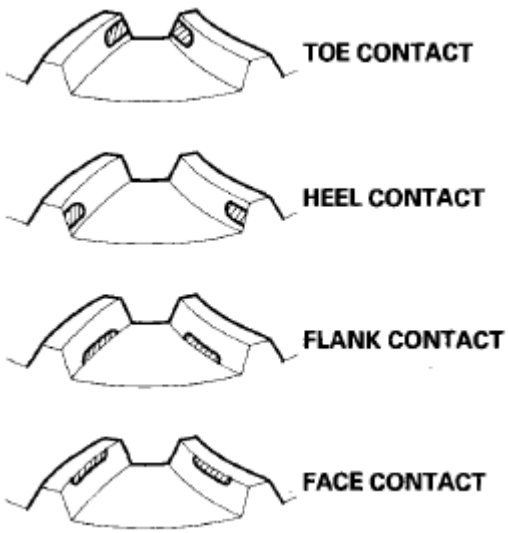

Fig. 338: Identifying Hypoid Drive Gear Tooth For Incorrect Tooth Contact Pattern
Courtesy of AMERICAN HONDA MOTOR CO., INC.

19. If the backlash is out of the standard, adjust the backlash with the 40 mm thrust shim, and recheck. Do not use more than two 40 mm thrust shims to adjust the backlash.
20. If the transfer gear tooth contact is incorrect, adjust the tooth contact with the 25 mm, 40 mm, or 80 mm thrust shim. Do not use more than two shims of each thrust shim to adjust the tooth contact.
    - Toe Contact

      Use a thinner 40 mm thrust shim to move the transfer output shaft (hypoid gear) away from the transfer hypoid drive gear. Because this movement causes the transfer gear backlash to change,

move the transfer hypoid drive gear toward the transfer output shaft (hypoid gear) to adjust the transfer gear backlash as follows:

  - Reduce the thickness of the 25 mm thrust shim.
  - Increase the thickness of the 80 mm thrust shim by amount the 25 mm thrust shim was reduced.

- Heel Contact

  Use a thicker 40 mm thrust shim to move the transfer output shaft (hypoid gear) toward the transfer hypoid drive gear. Because this movement causes the transfer backlash to change, move the transfer hypoid drive gear away from the transfer output shaft (hypoid gear) to adjust the transfer gear backlash as follows:

  - Increase the thickness of the 25 mm thrust shim.
  - Reduce the thickness of the 80 mm thrust shim by the amount the 25 mm thrust shim was reduced.

- Flank Contact

  Use a thicker 25 mm thrust shim to move the transfer hypoid drive gear away from the transfer output shaft (hypoid gear). Flank contact must be adjusted within the limits of the transfer gear backlash. If the backlash exceeds the limits, adjust as described under Heel Contact.

- Face Contact

  Use a thinner 25 mm thrust shim to move the transfer hypoid drive gear toward the transfer output shaft (hypoid gear). Face contact must be adjusted within the limits of the transfer gear backlash. If the backlash exceeds the limits, adjust as described under Toe Contact.

THRUST SHIM, 25 MM

Type	Thickness
1	1.70 mm (0.067 in)
2	1.73 mm (0.068 in)
3	1.76 mm (0.069 in)
4	1.79 mm (0.070 in)
5	1.82 mm (0.072 in)
6	1.85 mm (0.073 in)
7	1.88 mm (0.074 in)
8	1.91 mm (0.075 in)
9	1.94 mm (0.076 in)
10	1.97 mm (0.078 in)
11	2.00 mm (0.079 in)
12	2.03 mm (0.080 in)
13	2.06 mm (0.081 in)
14	2.09 mm (0.082 in)

15	2.12 mm (0.083 in)
16	2.15 mm (0.085 in)
17	2.18 mm (0.086 in)
18	2.21 mm (0.087 in)
19	2.24 mm (0.088 in)

21. Remove the transfer cover (A), the transfer hypoid drive gear/shaft assembly (B), the 25 mm thrust shim (C), and the tapered roller bearing (D) from the transfer housing (E) after adjusting the transfer gear backlash or the transfer gear tooth contact.

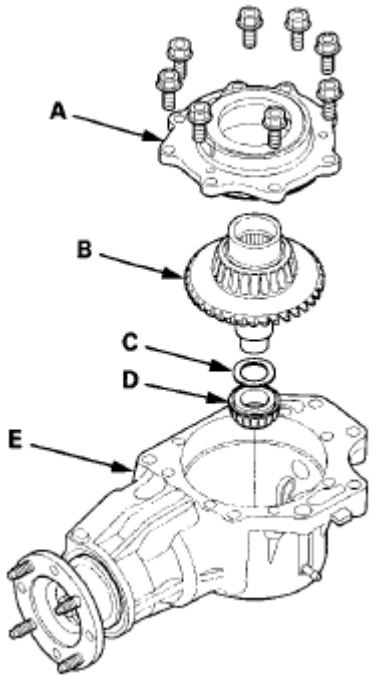

Fig. 339: Identifying Transfer Cover, Transfer Hypoid Drive Gear/Shaft Assembly, Thrust Shim, Tapered Roller Bearing And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

22. Secure the transfer housing (A) in a bench vise (B) with soft jaws.

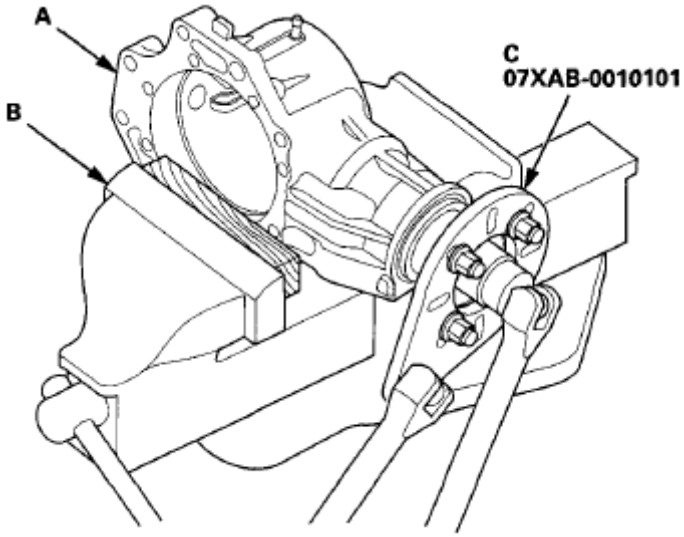

Fig. 340: Securing Transfer Housing In Bench Vise With Soft Jaws And Installing Flange Holder On Companion Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

23. Install the flange holder (C) on the companion flange, then loosen the locknut.
24. Remove the flange holder.
25. Remove the locknut (A), the conical spring washer (B), and the companion flange (C) from the transfer output shaft (hypoid gear) (D).

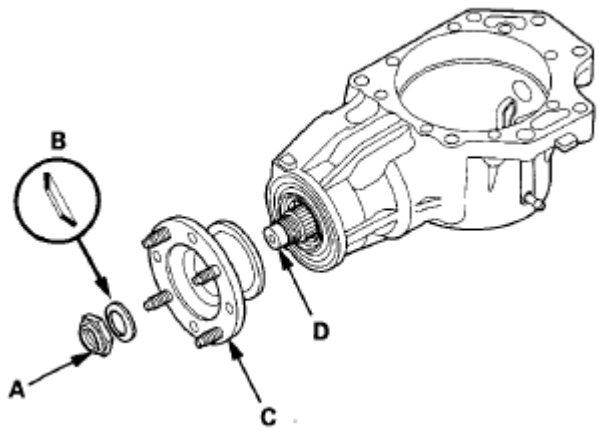

Fig. 341: Identifying Locknut, Conical Spring Washer And Companion Flange From Transfer Output Shaft (Hypoid Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

26. Remove the transfer output shaft (hypoid gear) from the transfer housing.
27. Install a thrust washer (A) and a new transfer spacer (B) on the transfer output shaft (hypoid gear) (C), and install them in the transfer housing (D).

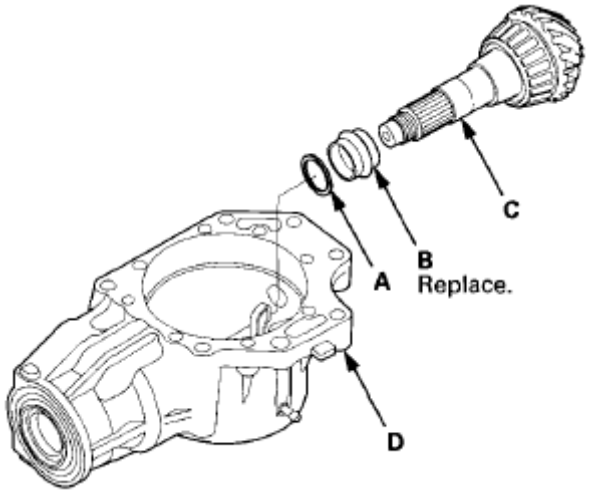

Fig. 342: Identifying Thrust Washer, Transfer Spacer, Transfer Output Shaft (Hypoid Gear) And Transfer Housing
Courtesy of AMERICAN HONDA MOTOR CO., INC.

28. Coat the threads of the locknut and the transfer output shaft (hypoid gear) with transfer fluid (hypoid gear oil).
29. Install the companion flange (A). Coat a new O-ring (B) with transfer fluid (hypoid gear oil), then install the O-ring, the back-up ring (C), a new conical spring washer (D), and a new locknut (E) on the transfer output shaft (hypoid gear) (F). Install the conical spring washer in the direction shown.

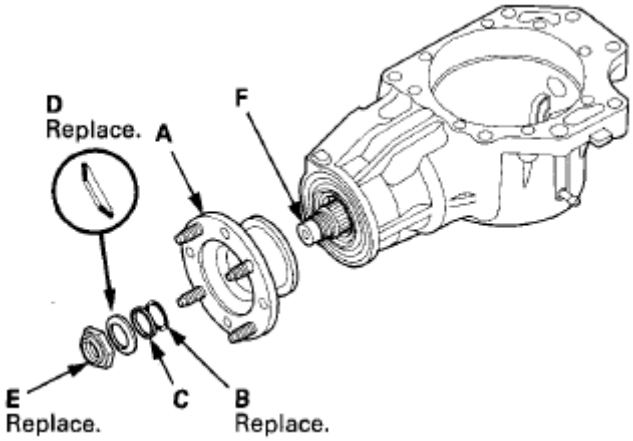

Fig. 343: Identifying Companion Flange, O-Ring, Back-Up Ring, Conical Spring Washer, Locknut And Transfer Output Shaft (Hypoid Gear)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

30. Secure the transfer housing (A) in a bench vise (B) with soft jaws.

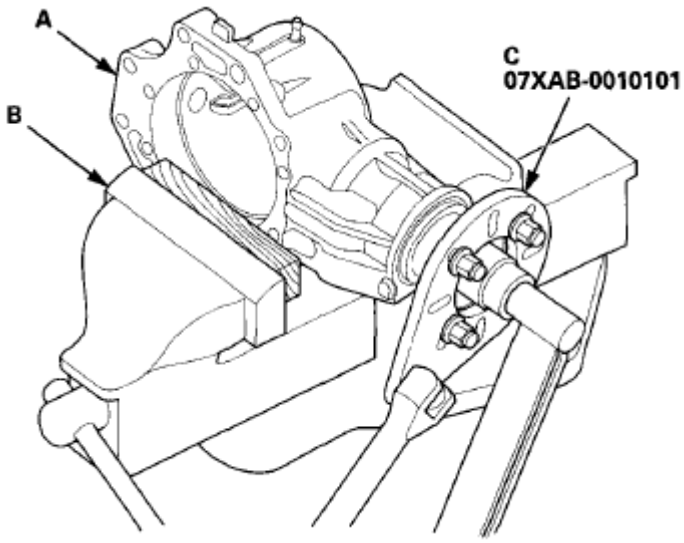

Fig. 344: Securing Transfer Housing In Bench Vise With Soft Jaws And Installing Flange Holder On Companion Flange
Courtesy of AMERICAN HONDA MOTOR CO., INC.

31. Install the flange holder (C) on the companion flange.
32. Tighten the locknut while measuring the starting torque of the transfer output shaft (hypoid gear) so the starting torque is within the standard.

Standard

Tightening Torque:

108- 294 N.m (11.0- 30.0 kgf.m, 79.6- 217.0 lbf.ft)

Starting Torque:

1.15- 1.71 N.m (11.7- 17.4 kgf cm, 10.2- 15.1 lbf.in)

NOTE:

- **Rotate the companion flange several times to seat the tapered roller bearings, then measure the starting torque.**
- **If the starting torque exceeds the standard, replace the transfer spacer and reassemble the parts. Do not adjust the torque with the locknut loose.**
- **If the tightening torque exceeds the standard, replace the transfer spacer and reassemble the parts.**

33. Remove the flange holder.
34. Stake the locknut to a depth (A) of at least 0.7 mm (0.03 in) using a 3.5 mm punch (B).

NOTE: Be careful not to make a crack on the locknut when staking.

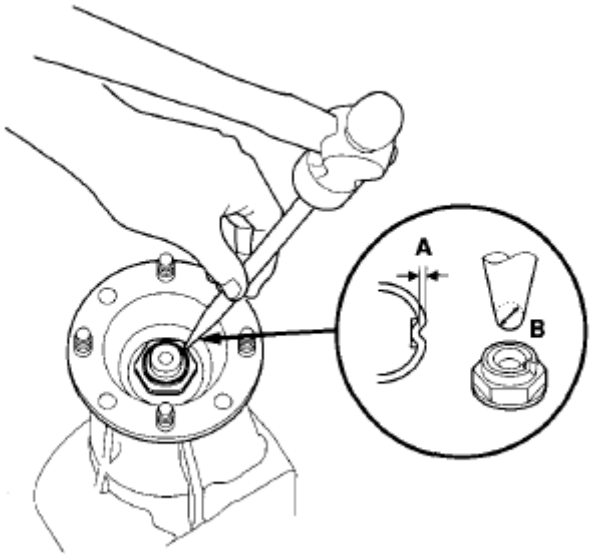

Fig. 345: Staking Locknut To Depth Using Punch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

35. Install the tapered roller bearing (A), the 25 mm thrust shim (B), and the transfer hypoid drive gear/shaft assembly (C) in the transfer housing (D).

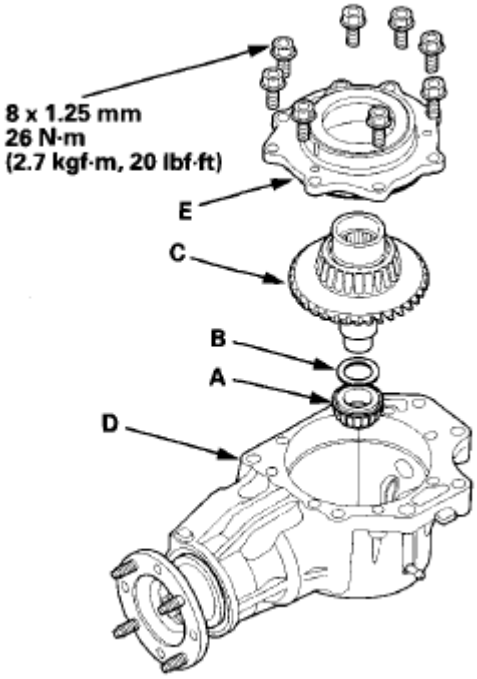

Fig. 346: Identifying Tapered Roller Bearing, Thrust Shim, Transfer Hypoid Drive Gear/Shaft Assembly, Transfer Housing And Transfer Cover With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

36. Temporarily install the transfer cover (E) without the O-ring. Install and tighten the bolts.
37. Secure the transfer housing (A) in the bench vise (B) with soft jaws.

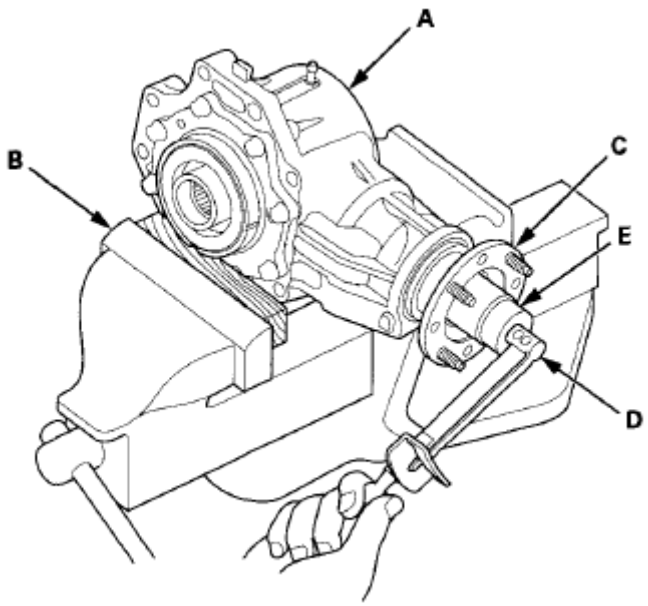

Fig. 347: Measuring Total Starting Torque At Companion Flange By Using Torque Wrench And Socket
Courtesy of AMERICAN HONDA MOTOR CO., INC.

38. Rotate the transfer companion flange (C) several times to seat the tapered roller bearings.
39. Measure the total starting torque at the companion flange by using a torque wrench (D) and a socket (E).
40. Calculate the transfer hypoid drive gear/shaft starting torque by using the following formula.

Transfer Hypoid Drive Gear/Shaft Starting Torque

Formula:

A - B = X

A: Actual total starting torque (measured in step 39)

B: Actual transfer output shaft (hypoid gear) starting torque (measured in step 32)

X: Transfer hypoid drive gear/shaft starting torque

41. Check that the calculated transfer hypoid drive gear/shaft starting torque is within the following reference value range.

Reference Value Range of Transfer Hypoid Drive

Gera/Shaft Starting Torque:

1.49- 2.52 N.m (15.2- 25.7 kgf.cm, 13.1- 22.3 lbf.in)

- If the calculated transfer hypoid drive gear/shaft starting torque is within the reference value range, remove the transfer cover from the transfer housing, then go to step 48.
- If the calculated transfer hypoid drive gear/shaft starting torque is out of the reference value range, go to step 42.

42. Remove the bearing outer race (A) and the 80 mm thrust shim (B) from the transfer cover (C). If the bearing outer race is press-fitted, remove the bearing outer race by heating the transfer cover to about 212°F(100°C) using a heat gun (D). Do not heat the transfer cover more than 212 °F (100 °C).

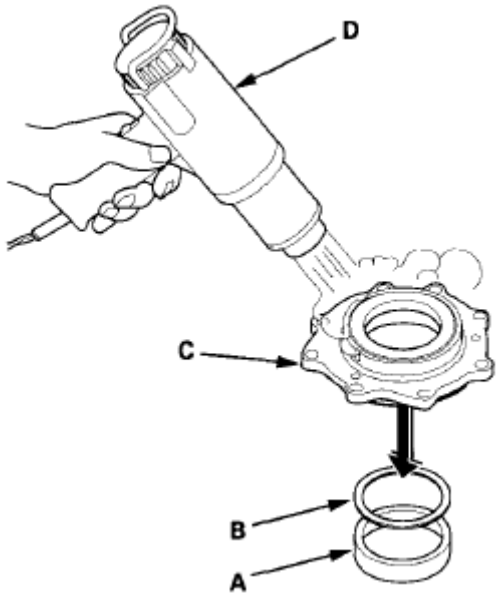

Fig. 348: Removing Bearing Outer Race And Thrust Shim From Transfer Cover By Heating Transfer Cover Using Heat Gun
Courtesy of AMERICAN HONDA MOTOR CO., INC.

43. Measure the thickness of the removed 80 mm thrust shim, and select a new 80 mm thrust shim in the table.

THRUST SHIM, 80 MM

Type	Thickness
A	1.52 mm (0.060 in)
B	1.55 mm (0.061 in)
C	1.58 mm (0.062 in)
D	1.61 mm (0.063 in)
E	1.64 mm (0.065 in)
F	1.67 mm (0.066 in)
G	1.70 mm (0.067 in)
H	1.73 mm (0.068 in)
I	1.76 mm (0.069 in)

J	1.79 mm (0.070 in)
K	1.82 mm (0.072 in)
L	1.85 mm (0.073 in)
M	1.88 mm (0.074 in)
N	1.91 mm (0.075 in)
O	1.94 mm (0.076 in)
P	1.97 mm (0.078 in)
Q	2.00 mm (0.079 in)
R	2.03 mm (0.080 in)
S	2.06 mm (0.081 in)
T	2.09 mm (0.082 in)
U	2.12 mm (0.083 in)
V	2.15 mm (0.085 in)
W	2.18 mm (0.086 in)
X	2.21 mm (0.087 in)
Y	2.24 mm (0.088 in)
Z	2.27 mm (0.089 in)
AA	2.30 mm (0.091 in)
AB	2.33 mm (0.092 in)
AC	2.36 mm (0.093 in)
AD	2.39 mm (0.094 in)
AE	2.42 mm (0.095 in)
AF	2.45 mm (0.096 in)
AG	2.48 mm (0.098 in)
AH	2.51 mm (0.099 in)
AI	2.54 mm (0.100 in)
AJ	2.57 mm (0.101 in)
AK	2.60 mm (0.102 in)
AL	2.63 mm (0.104 in)
AM	2.66 mm (0.105 in)

44. Install the 80 mm thrust shim (A) and the 80 mm bearing outer race (B) in the transfer cover (C). If you heated the transfer cover, let it cool to room temperature before installing the 80 mm thrust shim.

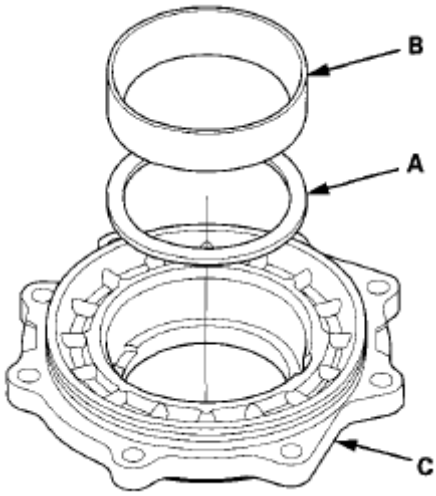

Fig. 349: Identifying Thrust Shim, Bearing Outer Race And Transfer Cover
Courtesy of AMERICAN HONDA MOTOR CO., INC.

45. Drive the 80 mm bearing outer race securely in the transfer cover using the driver handle (A) and the 78 x 80 mm bearing driver attachment (B) so there is no clearance between the bearing outer race, the 80 mm thrust shim, and the transfer cover.

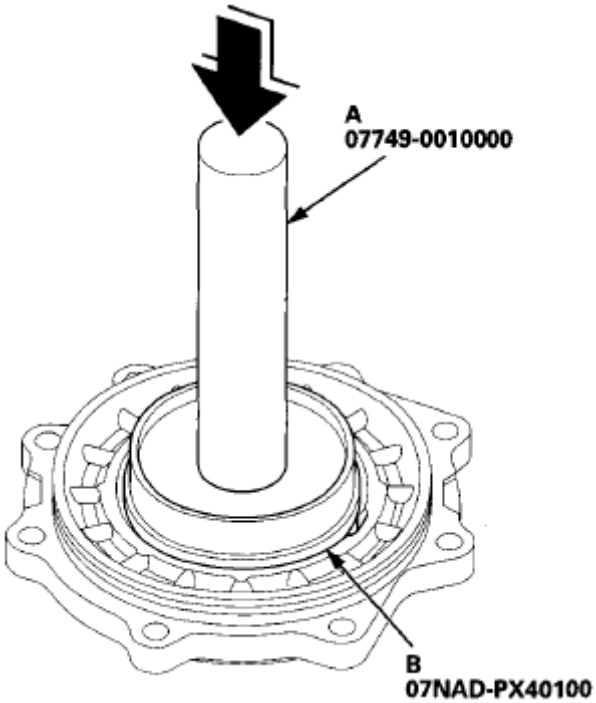

Fig. 350: Driving Bearing Outer Race Securely In Transfer Cover Using Driver Handle And Bearing Driver Attachment
Courtesy of AMERICAN HONDA MOTOR CO., INC.

46. Install a new oil seal (see **TRANSFER COVER OIL SEAL REPLACEMENT**).

47. After replacing the 80 mm thrust shim, recheck and make sure that the total starting torque is within the standard.
48. Install a new O-ring (A) on the transfer cover (B), then install the transfer cover on the transfer housing (C).

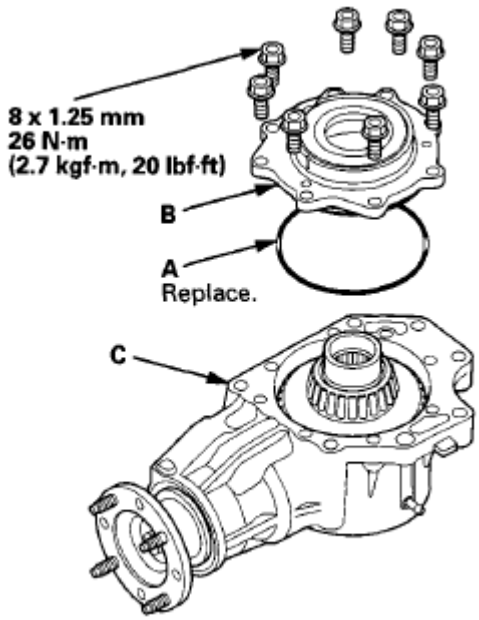

Fig. 351: Identifying Transfer Housing, Transfer Cover And O-Ring With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

49. Remove the filler plug (A), then refill the transfer assembly with transfer fluid (hypoid gear oil). Use an SAE 90 viscosity hypoid gear oil, API classified GL4 or GL5 only.

Viscosity:

SAE 90: Above 0 °F (-18 °C)

Transfer Fluid (Hypoid Gear Oil) Capacity: 0.45 L (0.48 US qt)

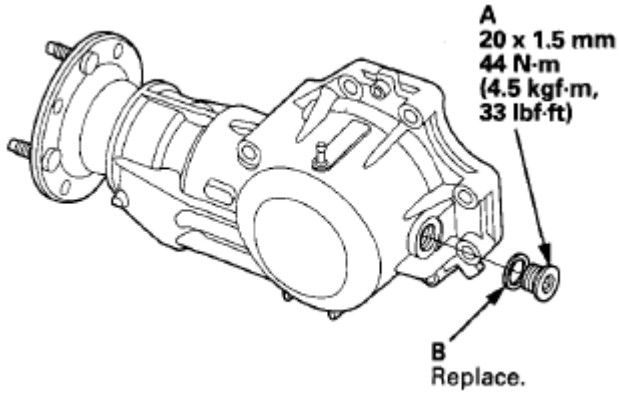

Fig. 352: Identifying Sealing Washer And Filler Plug With Torque Specifications
Courtesy of AMERICAN HONDA MOTOR CO., INC.

50. Install the filler plug with a new sealing washer (B).

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) (If automatic transmission maintenance is required)

The Acura TL SRS includes a driver's airbag in the steering wheel hub, a front passenger's airbag in the dashboard above the glove box, front seat belt tensioners in the front seat belt retractors, side curtain airbags in the sides of the roof, and side airbags in the front seat-backs. Information necessary to safely service the SRS is included in this Service Information. Servicing, disassembling, or replacing SRS items requires special precautions and tools, and should be done by an authorized Acura dealer.

- To avoid rendering the SRS inoperative, which could lead to personal injury or death in the event of a severe frontal or side collision, all SRS service work should be done by an authorized Acura dealer.
- Improper service procedures, including incorrect removal and installation of the SRS, could lead to personal injury caused by unintentional deployment of the front airbags, side airbags, side curtain airbags, and/or front seat belt tensioners.
- Do not bump or impact the SRS unit, front impact sensors, side impact sensors, or rear safing sensor, especially when the ignition switch is in ON (II), or the engine start/stop button is in the ON mode, for at least 3 minutes after the ignition switch is turned to LOCK (0), or after the engine start/stop button is pressed to select the OFF mode; otherwise, the system may fail in a collision, or the airbags or the tensioners may deploy.
- SRS electrical connectors are identified by yellow color coding. Related components are located in the steering column, center console, dashboard, dashboard undercover, in the dashboard above the glove box, in the front seats, in the roof side, and around the floor. Do not use electrical test equipment on these circuits.
